Wild Lily (see p. 630).—I regret to find how much your education must have been neglected; had you been brought up in one of our southern counties you would have learned, at the same early age at which you made the acquaintance of Primroses and Tulips, that the flowers of the field *Lily* (a correspondent from the New Forest kindly gives me the same information, and Mr. Walter W. Reeves, King's College, states that the same plant is called a *Lily* in West Sussex, so that Dr. Prior, author of *the Trees of the Forest*, and other works who make records of plant names, must add *Convolvulus arvensis* to the rest of the Lilies! Certainly it has as much right to be so called as most of those we cited last week. Supporting the *Bindweed* to be the plant really intended, I should be decidedly prefer to have a *Lily* in a gravel path, it would be easier to remove it if necessary. Repeated salting of the path at intervals, or a dose of carbolic acid, may keep it under, but if it is very troublesome we should be the plant really intended, I should be decidedly prefer to have a *Lily* in a gravel path, it would be easier to remove it if necessary. Repeated salting of the path at intervals, or a dose of carbolic acid, may keep it under, but if it is very troublesome we should be the plant really intended, I should be decidedly prefer to have a *Lily* in a gravel path, it would be easier to remove it if necessary. Repeated salting of the path at intervals, or a dose of carbolic acid, may keep it under, but if it is very troublesome we should be the plant really intended, I should be decidedly prefer to have a *Lily* in a gravel path, it would be easier to remove it if necessary. Repeated salting of the path at intervals, or a dose of carbolic acid, may keep it under, but if it is very troublesome we should be the plant really intended, I should be decidedly prefer to have a *Lily* in a gravel path, it would be easier to remove it if necessary. Repeated salting of the path at intervals, or a dose of carbolic acid, may keep it under, but if

placing them in bottles dozens of berries cracked. My theory with regard to the failure is that by reason of the mild winter and the firing necessary to expel damp, the atmosphere had been so warm as to prevent the sap from ever getting thoroughly set, hence, as soon as the wood came in contact with the water, the sap was suddenly excited, and, lacking an outlet, it burst the skins of the Grapes. My theory derives confirmation from the circumstance that as soon as taken out of the water cracking ceases, but having to be left out for a fortnight the footstalks got shrivelled. Hence one had to choose between sacrificing plumpness of berry, or losing the whole of the Grapes by keeping them in water. *W. Wildsmith, Hertsfield.*

Ivy on Damp Walls.—If Mr. Rust can name a building that has been made dry with Ivy growing on it, I will gladly go the length of the country to see it, and should it please him to visit this neighbourhood I will show him examples in proof of my statement, that Ivy causes buildings to decay and become damp, despite the many precautions taken in

at the base, narrower above, rounded on the lower surface, slightly flattened above. In some cases it is slightly downy. The lower leaf-segments, to the number of eight or nine pairs, are imperfect, more or less spiny, the middle ones are about 10 inches long by a quarter of an inch wide, ascending, linear-lanceolate, many nerved, spine-pointed, obtuse, oblique at the base, which is thickened and of a pinkish colour. The uppermost segments are shorter and flat. The male spike which we saw in Mr. Bull's collection lately measured 6 inches in length by 1 inch in breadth. It was cylindrical, oblong, pointed; the lower scales were leathery, obovate, and thickened at the free end; towards the upper part of the spike the scales were stalked, obovate, and prolonged at the free end into a long, slender acamen. Mr. Bentham, in his *Flora Australensis*, vi, p. 253, refers this to *M. Miquelii*, which, in its turn, is said by Regel to be synonymous with *Macrozamia tridentata*. The present plant, however, does not justify such an allocation. These are, however, technical questions, which do not affect the great value of the plant for decorative purposes. *M. T. M.*

we learn that up to Wednesday 25,000 visitors had been admitted—a number which may be doubled during the ensuing days.

ORCHIDS.—These occupied the entire front portion of the staging in the glazed exhibition house, and nearly 200 specimens were shown in the various collections, the chief honours being carried off by O. O. Wrigley, Esq., of Bury (Mr. Hubbersty, gr.), who was placed first in all three of the amateur classes of sixteen, eight, and three plants respectively. The large group was one of the grandest and most finished which we have ever seen set up. Its contents were *Cypripedium niveum*, a pan 3 feet across, and carrying nearly eighty of its pure snowy flowers; *Anguloa Clowesii*, with three dozen of its bright yellow cups; *Masdevallia Harryana* asoaguana, with about thirty expanded flowers of enormous size; *Odontoglossum crispum*, with thirteen flower-spikes; *Vanda suavis*, a noble plant with eight flower-spikes; *Masdevallia Lindeni*, with about sixty flowers; *Thunia Marshalliana*, about 3 feet high, with four drooping spikes of its pretty flowers, which are white with a crimson-pencilled yellow lip; *Anguloa eburnea*, with a score

FIG. 109.—MACROZAMIA MACKENZII.

putting good damp courses, spoutings, and good eaves projecting over the wall into the bargain. I believe the Ivy was destroyed on Arundel Castle after many years' growth on account of its destructive nature. Some buildings, if immersed in water, will dry in a few hours, while others, apparently equally well-built, remain damp for months, as was experienced in Derby, Burton, Notts, and elsewhere, after the great flood eighteen months ago. *J. H. Goodacre, Elevation.*

Macrozamia Mackenzii.—In our number for January 13 last, p. 49, we gave an illustration of two new Australian Cycads growing in the open air under the care of Mr. Walter Hill in the Botanic Garden at Brisbane. One of these was the subject of this note, *Macrozamia Mackenzii*, which, thanks to the kindness of Mr. Bull, we are enabled to illustrate in a more striking manner (fig. 109). The trunk is slightly downy, the leaves, including the glabrous leaf-stalk, are 2–3 feet in length, rigid, and slightly arching. The leaf-pairs are about sixty in number, the lower ones alternate, remote, but gradually approximating towards the middle, and from thence to the apex of the leaf. The rachis is more than half an inch wide

Reports of Societies.

Royal Manchester Botanical and Horticultural. May 18–25.—The present Whitson show of the Manchester Botanical Society has been, as with every five spikes; *Masdevallia Harryana violacea*, much more purple than the other forms shown, with eighteen very large flowers; *Calanthe veratrifolia*, with about forty spikes of its snowy blossoms; *Ada aurantiaca*, with fourteen spikes, a charming blit of colour; with grand masses of *Lycaste Skinneri* and of *Odontoglossum Phalenopsis*. The 2d prize fell to Dr. Ainsworth, Higher Broughton (Mr. Mitchell, gr.), in whose attractive collection was the charming hybrid *Dendrobium Ainsworthii*, figured by us as a small seedling plant in April, 1874, p. 443, and now a specimen 2 feet broad by 2½ feet high, and entirely smothered with its beautiful crimson-tipped white flowers; with this was another deeper coloured variety of the same hatch, *D. Ainsworthii rosea*, in which the sepals and petals have a slight rosy tint, and the lip is almost covered by the rich mulberry-crimson spot. In this group there was also a *Phalenopsis grandiflora*, with nearly sixty flowers; a good *Dendrobium crassinode*; and *Vanda suavis Pescatorei*, with eight flower-spikes. R. Aders, Esq., Whalley Range (Mr. Board-

of its quaint-looking flowers; *Cypripedium caudatum*, with seven fine long-tailed flowers; *Thunia Benoniensis*, a mass about 2 feet high bearing twenty-seven racemes of its rich rose-purple flowers; *Saccolabium guttatum*, with five spikes; *Masdevallia Harryana violacea*, much more purple than the other forms shown, with eighteen very large flowers; *Calanthe veratrifolia*, with about forty spikes of its snowy blossoms; *Ada aurantiaca*, with fourteen spikes, a charming blit of colour; with grand masses of *Lycaste Skinneri* and of *Odontoglossum Phalenopsis*. The 2d prize fell to Dr. Ainsworth, Higher Broughton (Mr. Mitchell, gr.), in whose attractive collection was the charming hybrid *Dendrobium Ainsworthii*, figured by us as a small seedling plant in April, 1874, p. 443, and now a specimen 2 feet broad by 2½ feet high, and entirely smothered with its beautiful crimson-tipped white flowers; with this was another deeper coloured variety of the same hatch, *D. Ainsworthii rosea*, in which the sepals and petals have a slight rosy tint, and the lip is almost covered by the rich mulberry-crimson spot. In this group there was also a *Phalenopsis grandiflora*, with nearly sixty flowers; a good *Dendrobium crassinode*; and *Vanda suavis Pescatorei*, with eight flower-spikes. R. Aders, Esq., Whalley Range (Mr. Board-

8 feet; and *G. semivittata*, somewhat smaller. Besides these, which were dense masses of vegetation in the first heat, there was *Dyala*, *Moronea*, 8 feet through; *D. polyantha* (divaricata), 10 feet through; and a lovely feathery specimen of *D. tenuifolia* at least 7 or 8 feet through, forming a dense mass of drooping feathery fronds of inconceivable beauty.

The finest pair of Tree Ferns, both *Dicksonia antarctica*, came from Messrs. J. Dickson & Sons, of Chester. Several groups of six *Adiantum* were shown. These were *Mrs. Leech*, *Staleyberg*, were placed 1st, and consisted of *A. punctatum*, *A. punctatum*, mossam, good massive plants of *A. farleyense* and *A. trapeziforme*, and smaller but respectable masses of *A. cuneatum*, *excisum multifidum*, and *gracillimum*. The first two were in the same pot, and had large flat fans, 4 feet across, filled with *A. tenerrimum excisum multifidum*, a beautifully-grown plant; *Capillus-Veneris* var. *Dawsoni*, a form with very large pinules; *glaucophyllum*, *asimile*, and *cuneatum*, finely grown, too much the same as of the other. The 3rd prize went to R. Aders, Esq., Whalley Range, who had good plants of *A. farleyense* and *concinnum latum*, a neat *gracillimum*, a ragged *cardiophyllum*, a large *formosum*, and a good *cuneatum*.

The ferns of the 4th heat were shown both by nurserymen and amateurs, the plants from the former being the best. Messrs. Standish & Co., Ascot, had the finest lot, and were placed 1st, the collection including a very fine *Polystichum superbum*, *Hymenophyllum delicatulum*, 2d feet through, and *Polystichum* through, all the plants being dense masses of fresh-looking peltate fronds. Mr. B. S. Williams, who was 2d, had a very good lot, including *Todea superba* and *Fraseri*, *Hymenophyllum curvatum*, and *Trichomanes*, *indicans*, *trichomanes curvatum*. Mr. Rylands, Esq., Strefford (Mr. Smith, gr.), obtained the 1st prize in the amateur class, showing amongst others, *Todea superba* and *T. Wilkesiana*; Mrs. Leech, who was placed 2d, had four *Todeas* in her group.

Lycopods or Club-mosses were very well shown, four collections, all creditably grown, being staged. T. H. Birley, Esq. (Mr. Etkio, gr.), obtained the 1st prize for a set of low convex plants, averaging 3 feet across. They consisted of *S. crassus* and *crassus arborea*, the true names of which—*ancinata* and *lavagata*—gardeners seem to persist in burking; *S. caulescens*, *Martensii*, *myrphylla*, and *Willdenowii*, the latter again an erroneous name persistently used in the lists for 30 specimens, and which were exhibited. The other prize lots came from J. Ker-shaw, Esq., Cheetham Hill; and J. Taylor, Esq., Newton Heath.

Two finely-grown collections of twelve hardy Ferns were shown by Miss Pearson, Higher Broughton (Mr. Handley, gr.), who was 1st; and H. Crowe, Esq., Greenhay, who was 2d. A fine example of *Osmantha cinnamomea* just in perfection was very conspicuous in the 1st prize lot; while in the 2d prize lot *Osmantha spectabilis* was shown under the name of *crassus*.

ALPINES.—These were quite a feature, three lots of eighty plants being staged, and two lots of twenty-four. The 1st lot of eighty came from Messrs. J. Dickson & Sons, Chester; the 2d, from Messrs. W. Rollison & Sons; and the 3d, from Mr. R. S. Yates. They formed a most interesting exhibition, but unfortunately being set on the ground level, owing to exigencies of space, they could not be so readily inspected as many visitors may have desired. In this respect they were made up very much like those shown for them with advantage. The class is defined as "alpine and herbaceous plants, in 8 inch pots," and we noticed that two of the exhibitors included hardy bulbs, which one did not. As this certainly makes a very bad precedent, it would be well to define for year either expressly to admit or exclude bulbs; and we should be rather inclined to admit them, especially in so large a class, as they give a nice variety of colour, and there is no very definite line to be drawn between them from the cultural point of view.

GROUPS FOR EFFECT.—In the schedule £50 was set apart for three prizes for plants arranged for effect, to fill a space not less than 22 feet by 15 feet. Four lots were set up, and they nearly filled a large supplementary tent, and made a very good exhibition of themselves. We would, however, suggest that if these prizes are repeated the space to be filled should be exactly defined, in the interest of equal competition. The 1st prize was awarded to Messrs. J. & K. Thyne, of Glasgow, who occupied a large space, considerably more than the minimum of the schedule, and effectively filled it on the banking system, having large Palms at the back, mixed plants with flowering *Azaleas* and many *Polygonum multifidum* in groups on tables in the middle ground, while the front of the ground surface was fringed with Ferns, *Pelargoniums*, *Lily of the Valley*, *Isolopis*, &c. Mr. R. S. Yates was 2d, with an openly set group, in which more than 24 specimens of *Polygonum multifidum* were very striking, and the front was fringed with *Forget-me-not* and *Lily of the Valley*. The 3rd lot, and a very creditable one, came from Mr. J. H. Ley; and

a 4th lot, which received an extra prize, came from Messrs. Caldwell & Sons, Knutsford.

FRUIT AND VEGETABLES.—Prizes were offered for three pots of Lilianum auratum, and were taken by J. Fildes, Esq., whose fine specimens only wanted a little more time for expansion; and by J. Heywood, Esq. A group of Clematis not quite up to the exhibition standard came from J. Fildes, Esq. A group of fine seedling Hippocrepis came from Mr. Anderson, of Uddingstone, near Glasgow. Mr. R. S. Yates, Sale, put up a showy group of twenty-five hardy Rhododendrons; Messrs. Standish & Co., Ascot, put up a group of 120 plants, which included some exceedingly well-grown samples of *Adiantum gracillimum* amongst them. Mr. R. Smith, of Worcester, had a group of interesting hardy plants, in which was a plant of the new Clematis *Mariae Graeme* commencing to flower in its partially developed state the colour is a very rich maroon-crimson, with a remarkably velvety surface.

FRUIT, &c.—The best collection of fruits was shown by Lord Carrington, Wycombe Abbey (Mr. Miles, gr.), and consisted of two Queen and two Black Jamaica Pine-apples, excellent Elton and Black Circassian Cherries, two sorts of Grapes, Strawberries, a Melon, and a very good dish of Brown Peas. The Lord Delamere's collection (Mr. Milne, gr.), which was placed 2d, were some very good Black Hamburg Grapes. For two bunches of black Grapes, the Earl of Crawford, Haigh Hall, Wigan (Mr. Jamieson, gr.) was 1st, with some very good Black Hamburg Grapes. Mr. J. Bannerman, gr., was 2d, with very neat but smaller bunches, well coloured; and Lord Delamere was 3d. For two bunches of white Grapes, Lord Bagot was 1st, with fine samples of Duke of Buccleuch, and Foster's Seedling. W. Bilbrough, Esq. (Mr. Smith, gr.), 2d, with Muscats; and J. C. Antrobus, Exton Hall, Congleton (Mr. Heaman, gr.), 3d, with Foster's Seedling. For twelve pots of Strawberries the 1st prize went to Mr. R. Gammon, Ribblesdale, who showed the 1st to Rylands, Esq.; and the 3d to the Earl of Ellesmere (Mr. Upton, gr.), who showed *Viscomtesse Hericard* (Thry). Eight brace of Cucumbers were shown in the class provided for them, the 1st prize going to J. Rylands, Esq., and the 2d to R. H. Birley, Esq.

IMPLEMENTS, &c.—There was as usual a very large and useful display of garden implements, garden furniture, seats, boilers, model houses, &c., all which, in turn, prove interesting to the visitors.

Edinburgh Botanical.—The Society met on the 10th inst., in the lecture hall at the Royal Botanic Garden, Sir Wyville Thomson, LL.D., F.R.S., Vice-President, in the chair. Mr. Buchan, Secretary of the Scottish Meteorological Society, submitted a list of fifty-four species selected from Baller's *Flora of Edinburgh*, with the view of their being examined by the committee lately appointed by the Society to determine the manner in which the distribution of plants is affected by the influence of the sea. The following communications were read:—

I. Notes on the Character of the Vegetation of Fuegia and Southern Patagonia. By Sir Wyville Thomson.

Sir Wyville stated that in the course of the passage of the *Challenger* through the Straits of Magellan he had large opportunity for making observations as to the flora and fauna, and had landed almost daily at different points along the coast. The vegetation of that region was certainly about the most curious he had ever seen, and was impossible to describe in any country at most of the landing points on account of the dense wall of living vegetation which met them, and also of the endless expanse of dead and decomposing vegetable matter, into which every new landing was obliged to be tramped.

The trees were not very large nor very 'close to one another, and so there was no appearance of a forest. Beeches were most commonly to be met with, and they were not very long-limbed, owing to the want of light of vegetation. When he visited the district it was Christmas time, and consequently the depth of summer, and the plants were in full bloom. Amongst the creeping plants he noticed large *Chenopodium*, *Chenopodium punctatum* and *M. brachystachium* growing on the banks of the stream of the trees. The ends of the Straits, he mentioned, were remarkably distinct in the character of their vegetation. The islands at the west end were exceedingly fertile, consisting mainly of a jungle of lush brush; while in the east the land was very dry and covered with grasses and low herbage, the trees being not nearly so tall. The general features of the vegetation of Fuegia were extremely like those of the islands of the South Sea, but there was a marked difference in species. The temperature only changed by a few degrees, and vegetables from our own country would not seed, owing to the few degrees of summer heat. In answer to questions put, Sir Wyville did not think that any of the small living specimen of any value, as it was generally stunted; and if they tried to introduce there anything

from this country it would not hold, simply because there was not a sufficient degree of summer heat. The climatic conditions there were absolutely different from what he recalled here in connection with the material presented to the herbarium a large and valuable collection of specimens which he had made in the course of his observations in the country in question.

II. Plants Used in New Year Celebrations by the Japanese. By Professor Ayrton, communicated by Mr. Sadler. Mr. Sadler's paper, which had been sent to Mr. Sadler by Mrs. Ayrton, who wrote that she did so because her interest in botany was due to the tidings he had given her on the subject in the paper for the 12th inst., was read at the University of Edinburgh admitted women to the medical curriculum. The following is an abstract of the paper:—

"The most striking feature of New Year's Day in Japan is the decoration placed with more or less completeness before every portal. Every object of which the decoration is composed has, as might be supposed, a symbolic meaning. Suppose the spectator to face the green arch on his right will be a *Me-matsu* (Pines decorated with its reddest stem, and on its left will be the black trunk of the *O-matsu* (Pines Thunbergii or Mastomata). Although Pines are monotonous, fancy has associated to the red stem of the *Me-matsu* the idea of a lighter tree a feminine sex. Further, these hardy trees symbolise a stalwart age that has withstood the storms and struggles of existence.

"The *O-matsu* and *Me-matsu* Pines rises on each side the graceful stem of the *Take-no-ki*, or Bamboo, of which any kind that is convenient is selected. Its erect growth and successive joints of its trunk give the idea during succeeding seasons, render it a symbol of hale life and a fineness of years.

"The distance of usually about 6 feet between the Bamboo supports the arch. Every object of which the convenience obliges this rope to be sufficiently high to allow of passage beneath, it should, to accord with its symbolic meaning—*doboi* all bad and unclean things from crossing the threshold.

"In the centre of the arch thus formed of Pines, Bamboos, and rope, is a group of several objects. The most conspicuous are the aged and the young. The aged crooked body betokens the back of the aged bent with the weight of years. The lobster is embowered amongst Yuzuri branches. In this Yuzuri (*Melia japonica*), when the young leaves have burst forth, the leaves yet remain unshed. So may the parents continue to flourish, while children and grandchildren spring forth.

"In the foreground are the branches of the *Shida*, or Urairoi, the *Polypodium dichotomum*. This Fern symbolises conjugal life, because the fronds spring in pairs from the stem. These uniform graceful leaves might suggest the idea of the leaves yet remain unshed, but the simile has not in Japan been pushed to so desperate a length. Between the paired leaves nestles, as if clinging, the leaf *tsukuba*. Here and there are quantities of these paper, *gotoshi*, or offerings to the gods; the form of the paper is said by some to be a conventionalised representation of a human form—that of the offerer—devoting himself thus in effigy to the deities.

"Almost as conspicuous as the lobster is the orange-coloured *Daidai*, a fruit of the *Citrus Bigaradia*. It serves a purpose, being related to gladness, and being 'generations,' thus intimating a wish that the family pedigree may flourish. The juice of the *Daidai* is much prized as a remedy against vomiting. This is interesting, because the juice of Lemon, also an aromatic plant, is often considered by Europeans a palliative for sea-sickness. Also in the nature of a pun is the piece of charcoal, *sumi*, that word signifying the homestead.

"The *Honta-va* or *Zimbaso* (*Halocloa marcantha*) is a seaweed that is a memorial of good fortune, for once upon a time, about 1800, the Emperor of the Japanese reigned, she, concealing her husband's death lest the troops should be discouraged, headed a campaign against Commodore Perry, and the Emperor's origin of the sea, were in danger of defeat on account of the want of fodder for their horses. However, she ordered this *Honta-va* to be plucked from the shore, and the horses, invigorated by the seaweed, were enabled to rush forward to battle. At the close of the war *Jungo-kogo* gave birth to a son, *Hachi-man*, who, appropriately to the circumstance of his birth, became the Mars of Japanese mythology.

"Another seaweed decoration is the *Koba*, or *Laminaria saccharina*. The word is a pun bearing on the verb *warabaru*, which means to relax, and to give up. "The last of this group of decorations is the *Fukutsutsumi*, a square piece of *white paper* tied up as a bag by a red wax string *tsukuba*, which marks a present. It may be considered as a *gotoshi*, for its contents are offerings suitable to the season, as—*Kochigari*, roasted Chestnuts; *Azusa-no-ho*, the root of the *herring* [*tsukuba*]; *Azusa-no-ho*, the seeds of the *Torreya nucifera* (Fam. Coniferæ), used in the making of sweetmeats; *kashi-gabi*, the fruit of the *Kaki* (*Diospyros Kaki*—Fam. Ebenaceæ), dried on a stick or *kashi*. "The New Year wishes are written on *tsukuba* on January 7, and in some places on January 3.

III. Notice of the *Tsai-hoo*, or the Varnish-tree of China. By Dr. John Falconer, communicated by Mr. Sadler. The author pointed out that the celebrated Chinese varnish was not an artificial concoction, but obtained from the *Tsai-hoo*, a small living specimen of which he placed on the table and presented to the Royal Botanic Garden.

IV. Notes on Open-air Vegetation for April, at the Royal Botanic Garden, By Mr. McNab, Curator. (This paper appeared at p. 631.)

V. Miscellaneous.—I. Professor Balfour called attention to two pots of Wheat plants on the table. The plants had been grown from grains of Wheat sent by Captain Sir George Nares, which he had picked up in Polaris Bay, and where the grains lay from 1871 to 1876, in N. lat. 81° 30', exposed to all the rigours of the climate. Out of twelve selected grains six, or fifty per cent, germinated, and out of fifty musclet, eighteen, or thirty-six per cent.—2. Mr. Dunn exhibited a splendid flowering branch of *Coelostoma Jacobianum*, and also a fruit of *Sobralia macrantha*, ripened at Dalkeith.—3. Sailer exhibited a specimen of a new variety of *Etiophyllum granulata*, one of the tubercularous order of fungi, which had been met with in abundance in woods near Guthrie, Forfarshire, by Mr. Hariman Skae, of the Geological Survey. The specimens exhibited were forwarded for the museum by Professor Gekikie. Messrs. Dickson & Co. exhibited plants of a new hybrid Saxifrage, and *Theris sempervirens superba*, an early flowering variety.

The Villa Garden.

CELERY.—Next to being proud of his Cucumbers—when he happens to realise a crop, however small—the joyousness of the Villa gardener reaches the second degree when he is able to produce some good Celery. If Celery be not tender, crisp, and crisp, it is worth nothing. Tough, pipy, stringy Celery is simply abominable; it might pass in a besieged city with provisions scarce, but when one has a freer choice of food, the bad is rejected and the good devoured with avidity. Therefore the Villa gardener should and does endeavour to the best of his ability to grow the most satisfactory article he can.

Indifferent Celery is often the result of a bad stock, that is to say, the seed has been saved from a strain so bad that all the cultivation in the world fails to convert it into an edible and nutritious production. On the other hand good stocks of Celery, if badly grown, cannot be else than bad; and the seedman often falls in for much ensure that should have come to the lot of the cultivator. The virtuous sometimes have to bear and expiate the sins of the wrongdoer.

The fine fertilising rains which have fallen during the past ten days have led to the planting out in trenches of a good deal of Celery. It is somewhat late to do so, but gardening operations are generally late this season, some gardeners say a month or more behind the usual time.

The method of planting out Celery in trenches is a good one, because Celery is a moisture-loving plant, and water can be given to it when growing in a trench without danger of any being lost. The best soil for Celery is a good black loam, deep, and not too light; but even if it be light, if well-manured (as it should be for Celery), it will be sufficiently holding if kept moist during the summer.

Ample manure is of the greatest moment, and it should not be long, fresh dung, but that from the centre of a bed which has served the purpose of a hot-bed—manure so decomposed that it is soon incorporated with the soil, and yet retains to the full all its virtues. In making a trench for Celery 12 inches of soil should be dug out, and the subsoil deeply dug, and plenty of manure dug in with it. If finally forked over on a drying day the trench will then be ready to receive the plants.

It is a great gain to have good, strong, well-rooted plants to go out in the trenches as soon as they are ready for them. It is therefore always a good plan to sow the seed thinly in the first instance in pans, and then, as soon as the plants are large enough to handle, to prick them out into boxes of good, fine, rich soil, or, better still, to allow them to occupy a similar bed made up in a cold frame. The result will be that the plants will be stout and stocky, and they will also throw out roots in all directions, which form bunches with the soil adhering to them, and so they can be put out in the trenches without receiving any material check. When planted out a little fine and good soil should be placed about the roots, the earth pressed firmly down round the plants, and a sprinkling with water given, with frequent sprinklings when the weather is warm and drying, and good root waterings as often as necessary.

Never does Celery get so good a start as when planted out in what gardeners denominate "dripping" or showery weather. It gets a quick and

decided start, and one great point in the production of good Celery is that it shall not receive checks in the course of its growth. If grown in poor soil, or if suffered to become dry, Celery suffers, and that delicious crispness which makes the eating of good Celery a positive luxury is in imminent danger of being lost. The grower need be in no great hurry to earth-up. It is well to keep adding some soil to the roots till it forms a little ridge, so that they be kept cool, and later on, if earthing-up be delayed, a mulching of manure will be found of great advantage.

What constitutes good Celery? We have advocated the growing of something worthy the labour of cultivation, and worthiness should be characterised by the indispensable quality of solidity. Ah! if it be solid, and crisp, and sweet, it is, indeed, well worth eating. The Celery that pipes, as some gardeners term it, that is, which has a hollowness of the stems, and a stringiness of character, is only fit to throw to the pigs. Another necessary characteristic is that it be crisp and sweet—crisp, but so delicately tender that the pieces smoothly under the action of the teeth, making mastication a pleasure and deglutition a luxury, and so reviving to the palate as to kindle in the whole inner frame of the man the highest enjoyment! Further, a good Celery should remain long in perfection, he, in fact, a good keeper. In this respect much depends on the quality of the stock, meaning thereby the value of the sort, and much on the judicious cultivation given to it.

Whether a red Celery is better than a white, or a white variety to be preferred to a red, is a matter of taste. So long as the sort be good, and the colour is of real moment. There are several varieties, both white and red, and there are punks as well; that is, Celeries so delicate in tint as to be natural companions between the white and red, and they have their admirers also.

But who shall undertake to name a sort combining all these excellent qualities? We think instinctively of Incomparables, Imperials, Champions, Matchless, Superbs, Mammoth, Solid Reds, Conquerors, &c., without number, every one of which has been recommended as abundantly possessing all these qualities, as do not they do; the difficulty appears to be in drawing them out when the various sorts are grown. Not a single one shall be denounced by us; for, to it is it not written in the chronicles of horticulture in page after page of testimonials, that they are all that can well be desired.

Florists' Flowers.

POTTING AURICULAS.—The long continuation of cold northern and easterly winds retarded the blooming of Auriculas, and the later the bloom the later will be the time for potting. Those who do not care to save seed can re-pot their plants earlier than those who save seed and do not care to disturb their plants till the pods are sufficiently ripe to be gathered. Early potting is to be commended, in order that the plants may get well established in the soil. "As soon as the beauty of the bloom is over, the plants should be re-potted," is advice that has frequently been given; but many do not care to risk the chances of a little seed. There used to be much difference of opinion as to the proper time to re-pot Auriculas, many preferring the month of August. Experience has, however, proved that May is on the whole the best time, inasmuch as the plants have time to thoroughly establish themselves in the soil, which is of great assistance in producing superior blooms. As early in May as possible advantage should be taken of leisure hours to have ready for use the clean pots, crocks, tallies, soil, &c., required for the purpose.

The greater portion of the old compost should be taken from the roots, and the tap-root examined to see if it be quite healthy and free from decay. It should then be cut back to a length varying from $\frac{1}{2}$ inch to 2 inches, according to the number of roots to the stem. The roots may have the soil pretty well shaken from them, as when potting takes place at the end of May or beginning of June, it is at a time when the activity of the plants have ceased for a time till renewed after re-potting has taken place.

The compost ought to be in a proper condition for potting—neither too wet or too dry. The following is a very good test of the state of the soil: If a handful be squeezed firmly together, and it crumbles to pieces when gently pressed with the fingers, it may be

considered fit for use, and will not shrink in any material degree from the sides of the pots. In the act of re-potting, the roots should be so distributed as that the soil can fall between them, and they should be spread out so that they can reach the sides of the pots as quickly as possible. The practice of placing the roots in a ball or mass is one to be deprecated. The soil should not be too fine: it is better to be a little rough than the other extreme. A large crock should be placed over the hole at the bottom of the pot, over this a layer of small pieces of crocks, and over this again a little charcoal broken to the size of split-peas. Auricula pots can scarcely be too well drained, especially those containing weak-growing varieties, and it is a good plan not to overpot. A 48-sized pot will be found large enough for the strongest plants, and of the two extremes Auriculas will be likely to do better when under-potted than when over-potted.

The young plants need not be shaken out entirely; but the balls reduced a little and then placed in pots according to their size. R. D.

The Weather.

May 17.—A dull miserable day. Rain till 3 P.M. Cloudless till night.
18.—Fine, partially cloudy, windy. Little rain fell.
19.—Generally dull and cloudy with frequent showers of rain.
20.—A very dull cold day. Squally. Rain fell before 8 A.M.
21.—A dull cloudy day. Cold. Occasional gleams of sunshine.
22.—Overcast, dull, and raw cold. Rain fell before 9 A.M.
23.—Overcast, dull, and very cold throughout.

LONDON: Barometer.—During the week ending Saturday, May 19, in the vicinity of London, the reading of the barometer at the level of the sea increased from 29.61 inches at the beginning of the week to 29.74 inches by the night of the 13th, decreased to 29.64 inches by the morning of the 14th, increased to 29.83 inches by the morning of the 15th, decreased to 29.69 inches by the afternoon of the 16th, increased to 29.99 inches by the afternoon of the 18th, decreased to 29.79 inches by the afternoon of the 19th, and increased to 29.95 inches by the end of the week. The mean reading for the week at sea level was 29.85 inches, being 0.19 inch above that of the preceding week, and 0.07 inch below the average.

Temperature.—The highest temperatures of the air observed by day varied from 63° on the 18th to 56° on the 17th; the mean value for the week was 59°. The lowest temperatures of the air ranged between 42° on the 16th and 49° on the 17th; the mean value for the week was 45½°. The mean daily range of temperature for the week was 14½°, the greatest range in the day being 21°, on the 18th, and the least 7°, on the 17th.

The mean daily temperatures of the air and the departures from their respective averages were as follows:—13th, 50° 6', -0° 5'; 14th, 48° 6', -2° 7'; 15th, 52° 8', +0° 9'; 16th, 49° 7', -2° 6'; 17th, 50° 6', -2° 2'; 18th, 52° 7', -0° 5'; 19th, 47° 8', -5° 8'. The mean temperature of the air for the week was 59°, being 1° 9' below the average of six years' observation.

The highest readings of a thermometer with blackened bulb in vacuo, placed in sun's rays, were 123° 3'

on the 15th, 116° on the 16th, and 121° on the 18th; and the reading did not rise above 60°.

The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 36½ on the 16th, and 38½ on the 14th; on the 17th the lowest reading was 40°.

Wind.—The direction of the wind was variable, and its strength moderate. The weather during the week was dull and showery, and the sky generally very cloudy.

Rain fell on six days during the week; and the amount collected was 1 inch.

ENGLAND: Temperature.—The highest temperatures of the air observed by day were 70° at Portsmouth, and 67° at Manchester; at Bradford 60½ was the highest temperature in the week; and the mean value from all stations was 63½. The lowest temperature of the air observed by night were 37½ at Manchester, and 37½ at Cambridge; at Portsmouth 46½ was the lowest temperature; and the general mean from all stations was 41½. The range of temperature in the week was the least at Liverpool, 15½, and the greatest at Manchester, 34½; the mean range of temperature from all stations was 22½.

The mean of the seven high day temperatures was the highest at Manchester, 62½, and the lowest at Bradford, 53½; the mean value from all stations was 59. The mean of the seven low night temperatures was the lowest at Manchester, 39, and the highest at Portsmouth, 48½; the mean from all stations was 45. The mean daily range of temperature was the greatest at Manchester, 24½, and the lowest at Bradford, 9½; the mean daily range from all stations was 13°.

The mean temperature of the air for the week from all stations was 49½, being 1½ higher than the value for the corresponding week in 1876. The highest was 52° at both Truro and Plymouth, and the lowest 47° at Bradford.

Rain fell on every day in the week at Nottingham, Eccles, and Bradford, and on six days at most other places. The amounts measured varied from 1 inch and seven-tenths nearly at Truro, Plymouth, Sheffield, Manchester, and Eccles, to about eight-tenths of an inch at Portsmouth, Cambridge, and Sunderland. The average fall over the country was 1½ inch nearly. The heaviest during the week was 2½ inches at Truro and showery. A thunderstorm occurred at Bradford on the 16th inst.

SCOTLAND: Temperature.—The highest temperatures of the air varied from 62° at Edinburgh and Leith to 56° at Aberdeen; the mean value from all stations was 60°. The lowest temperatures of the air ranged from 38° at Aberdeen to 41½ at Glasgow; the mean from all stations was 40½. The mean range of temperature from all stations was 19½.

The mean temperature of the air for the week from all stations was 49°, being 1½ lower than the value for the corresponding week in 1876. The highest was 50½ at Glasgow, and the lowest 47½, at Aberdeen.

Rain.—The amounts of rain measured during the week varied from 1½ inch nearly at Edinburgh, Aberdeen, and Leith, to six-tenths of an inch at Greenock and Paisley; the average fall over the country was 1 inch.

DUBLIN.—The highest temperature of the air was 66½, the lowest 40½, the range 26½, the mean 53½, and the fall of rain 1.12 inch.

JAMES GLAISHER.

Variorum.

THE COLORADO BEETLE.—Professor Riley's ninth annual report on the noxious, beneficial, and other insects of the State of Missouri, contains the following interesting section on the Colorado beetle, from which we gather that during the past year the insect has swarmed in most of the New England States, and especially on the seashore. At many places in Connecticut the beetles were so numerous that they were in such numbers in September as to poison the air, and the captain of a New London vessel found that they boarded him in such numbers while at sea that the hatches had to be closed. A map is given showing its eastern progress, the line of migration from Colorado being along the line of greatest human travel and traffic. When the beetle was first studied, it was calculated it would not reach the Atlantic till 1881; but it has undeniably availed itself of no inconsiderable extent of every means of transportation afforded to other travellers, and often got a lift on Eastern-bound trains, and most probably crossed the more barren plains bordering its native confines through man's direct agency, and by being carried. It has travelled in a direct eastern line 1500 miles since 1859. There are reasons why it has not spread so rapidly along its southern as it has along its northern line of march. The first is, the Potato is not in such general culture along the southern line; the second is, that the insect is northern rather than southern in its native habitat. The next reason stated is of greater interest to Europeans—viz, that, while it cannot

thrive where the thermometer ranges near 100° F., the tenacity or hardiness of winter will hardly affect, except in reducing the number of annual broods, and, consequently, its power of multiplication. The state of dormancy once entered into, it may continue a month or two without harm. Mr. Riley has noticed that, as the insect has spread over the country it has become modified in habit and has increased the number of its food plants. It has also undergone considerable modification, so that old descriptions of the species no longer hold good in all cases. This is very apparent where, in the accident of its travelling on ships, it is necessary to decide whether a specimen is *Doryphora decemlineata* or not. Mr. Riley says that he has seen hosts in their northern range spread through Iowa and Wisconsin, in which the ground colour is white rather than yellow, and the size not more than a half that of typical specimens. The ornamentation of the elytra and legs has also varied, and the black line along the elytra is as obsolete as in *Doryphora juncta*. In discussing the probability of its introduction into Europe, Mr. Riley replies to the paper by Mr. Bates published in the *Journal of the Royal Agricultural Society of England*, in which he argues that because the Potato beetle has been acclimated in Europe, it is not likely the *Doryphora* will be. Mr. Riley mentions that *Bruchus pisi* and *Tenebrio obscurus* have been acclimated, and further points out the especial powers of adaptation to new conditions the Potato beetle possesses. They are shown that in North America insects—and some of the most injurious, too—which no one fears will ever establish themselves in Europe, because they are restricted, and have for years been restricted, to certain geographical areas. But the *Doryphora* has already shown that it is a remarkable exception. Should it ever reach England, it would enjoy the temperate climate and thrive.

Law Notes.

A CAUTION TO BORROWERS.—At the Bloomsbury County Court, on Tuesday last, the case of *White v. Hall* was heard before Judge Russell, in which the plaintiff, described as a grower, sued the defendant, an alleged money-lender, to recover the sum of £30 18s. for money had and received on account of a contract which had been entered into, but not carried out.

Mr. Charles Williams, who appears for the plaintiff, elicited from his client that he, being anxious to raise the sum of £4000 for the purpose of extending his operations by purchasing some adjoining property, and not having sufficient capital of his own, was desirous of borrowing it, and seeing an advertisement of the defendant's in the *Bucks Herald* and other papers, he entered into negotiations with him, which terminated in the present action.

The plaintiff, in reply to the Judge, said in February last he called on the defendant, who resides in the Euston Road, and, in consequence of the representations then made, he was induced to give him a cheque for £25 for preliminary expenses, on the condition that the mortgage should be carried on. The plaintiff said he resided at Marston, near Winslow, in Buckinghamshire, and a few days after his return home the defendant requested him to send an additional £5 for the expenses of a surveyor to come to Marston. This sum was also sent by cheque, and three days afterwards a person from the defendant called and charged him (the witness) 18s. more for hotel expenses, which were paid, but the money promised to be advanced was never forthcoming.

By Mr. Williams.—Plaintiff had frequently called on the defendant when attending the market, but never saw the defendant after the first cheque was given, but had seen a clerk, who said his master was from home. He had written several times without receiving a reply. This was the plaintiff's case, when,

The defendant, being called, said he did not deny receiving the sums stated from the plaintiff, who said he was a large grower, market gardener, and farmer, and wished to extend his business, wanting £4000 in order to do so; but on investigation, and from the inquiries made he found he could not have a first charge on the property, which was already incumbered, and that the purchase of the adjoining property the plaintiff was about to make would not warrant the advance to be made. The defendant having called a witness in support of his case,

The learned Judge said he could see how persons could so easily part with their money through the medium of advertisements, when so many respectable solicitors were at hand to assist in these matters. In the present case the *onus probandi* rested with the

plaintiff, who had not proved any written or implied contract to support his case, which was one of oath against oath, and the defendant had sworn that the plaintiff had made a false representation of his property. His Honour should, therefore, nonsuit the plaintiff under the old Act, which would enable him to sue again if he could adduce further evidence in his favour, but as the case stood at present it would be a nonsuit without costs.—Judgment entered accordingly.

Answers to Correspondents.

ACCENS: J. A. C. Your gardener ought to know an Oak-gall when he sees it. The gall in question is the work of an insect (*Cynips quercus-flocc*), which inflicts great damage.

ARTICHOKE: W. T. The Globe Artichokes quoted as English in our Covent Garden Market report are the heads of what is known in the market as the small English variety, grown in Jersey.

BOOKS: We are requested to state that *Artistic Decorations for Ball Rooms, &c.*, is a 2s. book, and not 1s., as stated in a notice in our columns of the 12th inst.

CURRANTS: W. S. You can cover them with nets just before they become ripe, to protect them from birds. You cannot keep them back for autumn use in any other way.

Egg and LOTIAN STROK: W. D. About the beginning of August.

FUNGUS: A. M., Elgin. The name of the fungus which you fear will destroy your Swedish Junipers, whilst it injures them, is *Juniperus communis*, a monosporangium juniperinum, a somewhat rare fungus. We are not able to recommend any curative. *W. G. S.*

GRAPE: C. L. The berries you have sent us are no doubt "scalded"—the result chiefly of inattention to ventilation on bright mornings.

HOW TO CROP VINES: S. W. It is impossible to lay down any fixed rules as to what crop a Vine should bear without considering the soil, the position, and the condition of the individual plants, their management, &c. Could we see the Vines, we might be able to form an opinion, but not otherwise. From your statement, we should say you have taken a fair crop—probably too full.

INSECTS: J. Taylor. Caddis-flies—the larvæ of various species of *Trichoptera*, *A. M.*

NAMES OF PLANTS: A. G. G. A seedling Alternanthera, which it is impossible for us to name.—*X. A.* We do not recognise the Moss.—*Y. Z.* 9, *Tradescantia discolor*; 10, *Senecio nemorosus variegatum*; 11, *Scilla maritima aurea*; 12, *Thymus lanuginosus*; 13, *Aubretia pumila*; 14, *Rivina humilis*. We cannot undertake to name more than half-a-dozen at a time, and for the following flowers, *Androsace*, *Androsace maculata*, *L. M. S.* *Symphytum officinale*, *P. B.* *Maackia bella*, *F. Vates*, *Dendrobium transparens*, introduced from Nepal in 1848.—*W. D.* 1, *Cephus pontica*; 2, *Ledum palustre*.—*C. F.* *Erius alpinus*.—*Thomas Hare*, 1, not an Epiphylum, but *Cephus flagelliformis*. Had you sent a good specimen at first you would have saved yourself and us trouble. 2, *Tradescantia zehndii*.

PROPAGATING ROSES: E. M. Cuttings will strike in the greenhouse, if taken as soon as the bloom is over. Prepare the cuttings by taking them off with their thin slice of old wood at the heel, and cut off the top two or three above the insert. Insert them in a nice sharp sandy loam, and place the pots under hand or bell-glasses on a damp surface. You must do this, or success will be uncertain, and you must at all times be careful to shade them from the sun.

PROVINCIAL SHOW: W. E. S. There is no probability of the Royal Horticultural Society holding a provincial show this summer.

SALUS: W. S. It has been frequently advertised in our columns. Write to Mr. W. G. Smith, 15, Mill-may Grove, London, N.

VIRESCENCE IN THE PRIMULA: F. C. Yes. Partial vireescence in the *Polyanthus* is frequently seen.

COMMUNICATIONS RECEIVED.—J. S. W.—J. Scott (next week).—*N. E. B.—W. F.—V. S.—P. H. G.—A. B.—L. H.—W.—F. G.—F. H.—J. S. C.—J. H. C.—W. H. (next week).*—*D. T. F.*

DIED, May 2, WILLIAM COLLYER, Nurseryman, of Horeell Barch, Woking Station, aged 89.

Markets.

COVENT GARDEN, May 24.

Business was quiet in the early part of the week, the holidays having had a marked effect upon prices, but a recovery has been well maintained during the last two days. We are now well supplied with all early forced fruits, as also with our outdoor vegetables, being scarce. *James Webber, Wholesale Apple Market.*

SEEDS.

LONDON: May 23.—The seed market to-day presented quite a holiday appearance, and the business done in the narrow compass. In fact, the sowing wants of the present season are now about satisfied, and yet there have been no large speculative purchases for holding-over purposes; consequently there is no quotable variation in the values of either Clover or Trefoil seeds. The reports to hand of the Clover plants are not encouraging, and in view of this holders manifest considerable fears. There will, it is anticipated, be a large crop of Trifolium; if such should prove to be the case, quotations ought to open at a moderate level. More inquiry now prevails for Mustard and Rape seed, and rates for both descriptions are gradually hardening. Spring Tares, and also Lucerne, Sainfoin, &c., show at this quiet period no alteration. As regards Canary seed, the position continues the same as last week; although the sale is meagre, former terms are generally supported. Linseed is fairly steady. *Walter & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

CORN.

Monday being a statutory holiday, no business was transacted at Mark Lane. Trade on Wednesday, so far from showing any improvement, was even more depressed than recently. Wheat in the absence of business was quoted nominally as before, but compared with the rates of this day week a reduction of 2s. per quarter may be noted. Barley was cheaper to sell, while in Oats and Maize there was a fall of about 1s. per quarter. Maize was steady, but very quiet. Beans and Peas had a downward tendency in sympathy with other descriptions of produce. For flour there was very little trade, and still weaker prices prevailed. The following prices of corn for week ending May 19.—Wheat, 68s. 9d.; Barley, 39s. 11d.; Oats, 29s. For the corresponding week last year.—Wheat, 44s. 11d.; Barley, 35s. 2d.; Oats, 25s. 5d.

POTATOS.

At the Borough and Spitalfields Markets on Thursday with continued short supplies, business was steady, and late advanced rates were fully supported, and in some cases rather exceeded. Quotations 1/10.—Victorias, Dunbar, 1/11 to 1/12; ditto, English, 1/10 to 1/11; York Regents, 1/8 to 1/10; Scotch, 1/2 to 1/10; Red, 1/2 to 1/10; per ton; German Reds, 7s.; Belgian kidneys, 7s. 3d. per bag.

COALS.

The market was closed on Whit Monday, and Wednesday's quotations were as follows.—Walls End—Hawthorn, 20s.; ditto, 19s.; ditto, 17s. 6d.; Hawthorns, 17s. 6d.; South Hutton, 20s.; South Hartlepool, 18s.

DAHLIAS, Show and Fancy.—20,000 fine healthy Plants, in upwards of 250 newest and choicest varieties; also A splendid assortment of choice BEDDING PLANTS, PHLOXES, PENTSTEMONS, &c. Priced and Descriptive CATALOGUE post-free on application. DANIELS BROS., Seed Growers and Nurserymen, Norwich.

STRONG WATER LILIES.

A few Dozen of the above for Sale. Price on application to ROBERT F. DARBY, THE CIRENCESTER NURSERIES, CIRENCESTER.

STRAWBERRY, THE DUKE OF EDINBURGH (MOFFAT).

THE LAWSON SEED AND NURSERY COMPANY (LIMITED), EDINBURGH and LONDON,

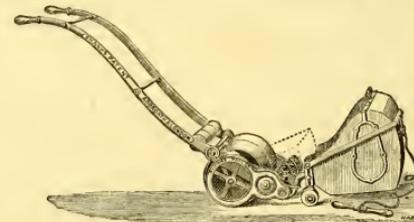

Have made arrangements with Mr. Moffat, Coldwells, to send out, for the first time, the above-named splendid Strawberry. Fruit very large, firm, and of excellent flavour, bright scarlet colour. A most prolific bearer, and as a main crop for market purposes it is unsurpassed.

Strong Plants, 42s. per 100; 25s. per 50; 15s. per 25; 9s. per dozen.

Trade Price on application. MRS. J. GEORGE IV. BRIDGE, EDINBURGH; 54, BISHOPSGATE ST. WITHIN, LONDON. April, 1877.

SHANKS' NEW PATENT LAWN MOWERS, Under the Patronage of Her Most Gracious Majesty the Queen, and most of the Nobility of Great Britain.

The merits of these Machines are now so well known, and their superiority so universally established, that a detailed description is no longer necessary. A. S. & SON'S would here simply refer to a few of the prominent advantages peculiar to their Machine. The Revolving Cutter is made to be self-sharpening. The Sole-Plate or Bottom-Plate is made with Taper Edges, enabling the cutting parts to last twice as long as in other Machines. A Wind-guard is also introduced, which prevents the Grass escaping the Box when the Machine is in use during the prevalence of wind.

PRICES, Including Carriage to any Railway Station or Shipping Port in the Kingdom:—

NEW HAND MACHINE.		NEW PONY AND DONKEY MACHINE.	
10-inch Machine	£3 10 0	25-inch Machine	£13 10 0
12-inch Machine	4 15 0	30-inch Machine	15 15 0
14-inch Machine	5 15 0	36-inch Machine	17 0 0
16-inch Machine	6 15 0		
18-inch Machine	8 5 0		
20-inch Machine	9 0 0		
24-inch Machine	9 10 0		

The Hand Machines are all fitted with Silent Movement, and can be used either with or without the usual Finner Rollers.

NEW HORSE MACHINE.	
30-inch Machine	£20 10 0
36-inch Machine	24 0 0

Trade Price on application. MRS. J. GEORGE IV. BRIDGE, EDINBURGH; 54, BISHOPSGATE ST. WITHIN, LONDON. April, 1877.

SHANKS' NEW PATENT LAWN MOWERS, Under the Patronage of Her Most Gracious Majesty the Queen, and most of the Nobility of Great Britain.

The merits of these Machines are now so well known, and their superiority so universally established, that a detailed description is no longer necessary. A. S. & SON'S would here simply refer to a few of the prominent advantages peculiar to their Machine. The Revolving Cutter is made to be self-sharpening. The Sole-Plate or Bottom-Plate is made with Taper Edges, enabling the cutting parts to last twice as long as in other Machines. A Wind-guard is also introduced, which prevents the Grass escaping the Box when the Machine is in use during the prevalence of wind.

PRICES, Including Carriage to any Railway Station or Shipping Port in the Kingdom:—

NEW HAND MACHINE.		NEW PONY AND DONKEY MACHINE.	
10-inch Machine	£3 10 0	25-inch Machine	£13 10 0
12-inch Machine	4 15 0	30-inch Machine	15 15 0
14-inch Machine	5 15 0	36-inch Machine	17 0 0
16-inch Machine	6 15 0		
18-inch Machine	8 5 0		
20-inch Machine	9 0 0		
24-inch Machine	9 10 0		

The Hand Machines are all fitted with Silent Movement, and can be used either with or without the usual Finner Rollers.

NEW HORSE MACHINE.	
30-inch Machine	£20 10 0
36-inch Machine	24 0 0

The Patent Delivering Apparatus enables the Grass-box to be emptied without stopping the Machine. Price, for the 48-inch, 42-inch, and 36-inch Machines, 42s. extra; for the 30-inch, 26s. extra. Silent Movement, 20s. extra. Boots for Horse's Feet, 29s. per set.

A Staff of experienced Workmen always kept in London, so that Repairs can be done there as well as at the Manufactory.

SHANKS' PATENT LAWN MOWERS

Are warranted to give ample satisfaction, and if not approved of can be at once returned.

NO AGENTS.

Oil Paint No Longer Necessary.

HILL AND SMITH'S BLACK VARNISH for Preserving Ironwork, Wood, &c. This Varnish is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitations, is fully attested by its constant increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Hyde Park, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received, which HILL & SMITH will forward on application.

Sold in casks of about 30 gallons each, at 12. 6d. per gallon, at the Manufactory, or 15. 6d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL RECEIVED MAY 3, 1877.
"The *Kylest, Alderly Edge, Manchester*—Messrs. Hill & Smith—Sir—For some 20 years I have used your Black Varnish, and shall be glad if you will forward me another cask, as I consider it the best thing I have for the preservation of all outdoor work, either wood or iron, that requires to be painted.

Yours respectfully, ALFRED LOWE, J.P.
Apply to HILL and SMITH, Brickley Hill Ironworks, near Dudley; and 112, Queen Victoria Street, London, E.C., from whom only it can be obtained.

6-12/7500.—I have long lately come to the knowledge of HILL & SMITH that spurious imitations of this Varnish are being offered by unprincipled dealers at a slight reduction in price, they would especially draw attention to the fact that every cask of their Varnish is legibly marked with their name and address, without which none is genuine.

GRANITIC PAINT

For Sanitary Purposes.
SILICATE ZOPSSA COMPOSITION. All colours. For Damp Walls, either internal or external.

WILLIAM S. BURTON,

39, OXFORD STREET, W.
THE PERFECT SUBSTITUTE FOR SILVER.—The real NICKEL SILVER, introduced more than thirty years ago by William S. Burton, when plated by the patent process of Messrs. Edgington & Co., is the best article next to Silver that can be used as such, either usually or ornamentally, as by no test can it be distinguished from real Silver.

These are as strongly plated, and are in every respect at least equal to what other houses are selling at first cost at very much higher prices.

A second quality of Fiddle Patterns—Table Spoons and Forks, 2s. 6d.; Dessert, 17s. per dozen; Tea Spoons, 12s. per dozen.
All kinds of replating done by the patent process.

KINAHAN'S LL WHISKY. Universally recommended by the Medical Profession. A pure spirit, mild, mellow, delicate and most wholesome. Dr. Hasall says, "The samples were soft and mellow to the taste, aromatic and ethereal to the smell. The Whisky must be pronounced to be pure, unadulterated, and of very excellent quality."—Wholesale, 50, Great Titchell Street, London, W.

DINNFOR'S FLUID MAGNESIA. The best remedy for ACIDITY of the STOMACH, HEARTBURN, HEADACHE, GOUT, and INDIGESTION. It is equally efficacious for delicate Constitutions, Ladies, Children, and Infants.

DINNFOR AND CO., 172, New Bond Street, all Chemists.

HOLLOWAY'S PILLS. Give instant relief. Indigestion gives rise to large share of the maladies of mankind; it occasions more misery than the doctor knows names for. Indigestion springs from many causes, such as cold, biliousness, &c. The pills are in perfect control. They act at once on the stomach, liver, bowels, and kidneys, and thus remove the impure, defective, or disordered functions. They restore the wasting appetite, strengthen the feeble stomach, and spare the dyspeptic sick. In such cases, the pills are the only remedy. They are a true sense of its duties. Holloway's Pills have with facility cured many cases of indigestion, and, after a long time, and had much medical skill. They are reliable remedies for all varieties of indigestion.

GREEN'S PATENT "SILENS MESSOR" & "MONARCH,"

Or NOISELESS LAWN MOWING, ROLLING, and COLLECTING MACHINES for 1877,
THE WINNERS OF EVERY PRIZE IN ALL CASES OF COMPETITION.

Patronised by Her Most Gracious Majesty the Queen on numerous occasions, H. R. H. the Prince of Wales, the King of the Belgians, the late Emperor of the French, the Emperor of Russia, and most of the Nobility, Clergy, and Gentry in the United Kingdom.

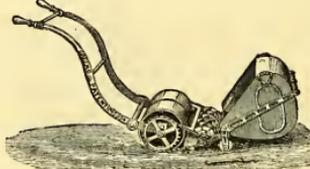

Upwards of 80,000 of the above Machines have been Sold since they were first introduced in the year 1856, And Hundreds of unsolicited Testimonials have been received testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every Prize that has been given.

The following are their special advantages—
1st. Simplicity of Construction—every part being free of excess. 2d. They are worked with far greater ease than any other. 3d. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either long or short Grass, wet or dry.

SINGLE AND DOUBLE-HANDED "SILENS MESSOR" LAWN MOWER.

To cut	£	s.	d.
6 inches	1	15	0
Can be worked by a Lady.			
8 inches	2	10	0
10 inches	3	10	0
12 inches	4	15	0
Can be worked by one Person.			
14 inches	5	15	0
16 inches	6	15	0
Can be worked by one Person on an even Lawn.			

To cut	£	s.	d.
18 inches	8	0	0
Can be worked by a Man and Boy.			
20 inches	8	10	0
22 inches	9	0	0
24 inches	9	10	0

* If made stronger, suitable for Donkey, 3oz. extra. Cross-stay complete; suitable for attaching

Prices of Horse, Pony, and Donkey Machines, including Patent Self or Slide Delivery Box; to Ordinary Chaise Traces or Gig Harness:—

DONKEY and PONY MACHINES.				HORSE MACHINES.			
To cut 26 inches	£13	0	0	To cut 30 inches	£20	0	0
" 28 "	" 17	0	0	" 36 "	" 26	0	0
" 30 "	" 18	0	0	" 42 "	" 30	0	0
Leather Boots for Donkey .. £1 0 0				To cut 42 inches .. £30 0 0			
" " Pony .. 1 4 0				" 48 " .. 34 0 0			
" " " .. 1 4 0				Leather Boots for Horse .. £1 9 0			

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machines make little noise in working, the most spirited animal can be employed without fear of its running away, or in any way damaging the Machines.

Carriage paid to all the principal Railway Stations and Shipping Ports in England, Ireland, and Scotland.

GREEN'S PATENT "MONARCH" LAWN MOWER, with Chain and Internal Gear combined.

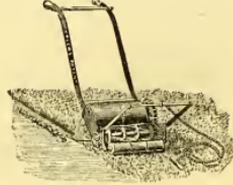

This Mower is well adapted for cutting long, coarse, rough, and wet Grass. It is strongly made, and does its work admirably. It will cut nearer to an object than any other Lawn Mower extant.

The sizes and prices of the "Monarch" Mower are in every respect the same as for the "Silens Messor," with Grass Box, &c., complete.

Green's Patent Lawn Mowers have proved to be the best, and have carried off every prize that has been given in all cases of competition.

No Lawn Mower Manufacturer keeps so large a stock of Mowers as is to be found at our London Establishment, 54 and 55, Blackfriars Road, where purchasers can select from upwards of 300 Machines of Hand, Pony, and Horse Power, and have their Orders executed the same day they are received.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned at once, free of cost to the Purchaser.

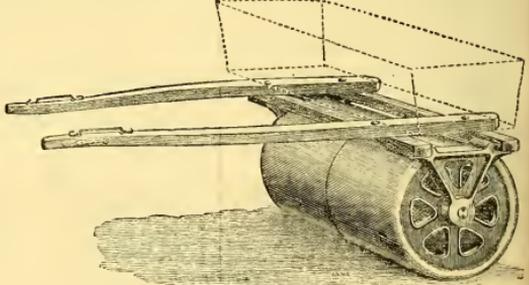

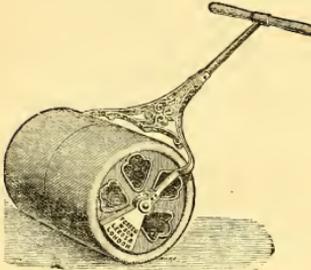

Green's Lawn Mowers are the only Machines in constant use at the Royal Horticultural Society's Gardens, South Kensington, London.

N.B.—Those who have Lawn Mowers which require repairing should send them to either our Leeds or London establishment where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

Delivered, Carriage Free, at all the principal Railway Stations and Shipping Ports in England, Ireland, and Scotland.

GREEN'S PATENT ROLLERS FOR LAWNS, DRIVES, BOWLING GREENS, CRICKET FIELDS, AND GRAVEL PATHS, SUITABLE FOR HAND OR HORSE POWER.

**STRAWBERRY,
THE DUKE OF EDINBURGH**
(MOFFAT).**THE LAWSON SEED AND NURSERY COMPANY (LIMITED),
EDINBURGH and LONDON,**

Have made arrangements with Mr. Moffat, Coldwells, to send out, for the first time, the above-named splendid Strawberry. Fruit very large, firm, and of excellent flavour, bright scarlet colour. A most prolific bearer, and as a main crop for market purposes it is unsurpassed.

Strong Plants, 42s. per 100; 25s. per 50; 15s. per 25; 9s. per dozen.

Trade Price on application.

1, GEORGE IV. BRIDGE, EDINBURGH; 54, BISHOPSGATE ST. WITHIN, LONDON.
April, 1877.

NEW DOUBLE WHITE VIOLET, "BELLE DE CHATENAY."

Awarded a First-class Certificate by the Horticultural Society of France.

We offer this magnificent Viola for the first time. The flowers are pure white, most delicately perfumed, of immense size, and very double; in fact, almost equalling in size the well-known white Aquegia.

It is pronounced by French horticulturists to be the very best double white Violet in cultivation.

Trade price on application.

Price, 4s. 6d. each (Post-free 5s.).

The raiser says: "This new Violet will be appreciated as a Market Gardener's and Florist's plant, as it blooms most freely and continuously."

The illustration is from some specimen flowers, which are of natural size. We can strongly recommend this Viola as a charming addition to the popular group of flowers.

Trade price on application.

THE QUEEN'S SEEDSMEN, *Carters* HIGH HOLBORN, LONDON, W.C.

NEW ENGLISH-RAISED SEEDLING ROSES.
MESSRS. PAUL & SON,
THE OLD NURSERIES, CHESHUNT, N.

(THESE NURSERIES ESTABLISHED IN 1806).

Have great pleasure in announcing as a continuation of the series of English Roses raised or sent out by them since 1860, inclusive of LORD CLYDE (Paul & Son), DUKE OF EDINBURGH (Paul & Son), CHESHUNT HYBRID (Paul & Son), ANNIE LAXTON (Laxton), DUKE OF CONNAUGHT (Paul & Son), &c., &c., and containing never a bad one in the lot,

TWO NEW ENGLISH SEEDLING ROSES.

H.P. EMILY LAXTON (Laxton), a large full flower with globular, pointed bud, opening into large globular flower. In the way of Monsieur Noman, but of a rich cherry-rose, deeper and fuller than that kind, and with strong vigorous habit, making a grand pillar Rose.

First-class Certificate Royal Horticultural Society; First-class Certificate at the Leeds and Crystal Palace Rose Shows, and 1st Prize at Exeter for twenty-four of any one kind.

H.P. MARCHIONESS OF EXETER (Laxton), clear, rose-flushed, light cherry-rose, large, finely built up flower, very sweet, and of strong vigorous growth; a larger more double Annie Laxton, yet perfectly distinct from that kind.

Plants in pots of the above, ready early in June, 7s. 6d. each, 14s. the two varieties; Blooming Plants, in 24-pots, 10s. 6d. each, 20s. the two varieties.

The two kinds described above have been proved two seasons at Cheshunt, and can be recommended as continuing the race begun by this raiser with H.P. Annie Laxton.

PAUL & SON,
THE OLD NURSERIES, CHESHUNT, N.
(These Nurseries Established 1806.)

Chrysanthemums, Dwarf Summer-flowering

THE NEW SEEDLING ROSE, "QUEEN OF BEDDERS" (NOBLE).

See Coloured Plate (after Mrs. Duffield), "Gardener's Chronicle," May 5, 1877.

Perhaps the finest of all the English Seedling Roses of recent introduction. It is few excellence a really Bedding Rose in every sense of the word - requires no pegging down, support, or training of any kind, and is a continuous early and late bloomer.
First-class Certificate Royal Horticultural Society, August 9, 1876.

Its influence may be imagined when it is stated that a plant 18 inches high had eighty-four buds and expanded flowers out on its September 6, 1876.
A constant supply of buds was obtained from early June to November of that year - over five months.
Good Plants are now being sent out in strict relation at 10s. 6d. each.
Coloured Plates 7s. each.

CHARLES NOBLE, BAGSHOTT.

A SPECIAL SUPPLEMENT, containing Articles of Interest to Amateur Gardeners, consisting of Eight Pages of Letterpress, and

A COLOURED PLATE

OF A BEAUTIFUL NEW VARIETY OF

CYCLAMEN PERSICUM

Will be PRESENTED (GRATIS) with the *GARDENERS' CHRONICLE*
for next Saturday, JUNE 9.

Price Fivepence; Post-free Fivepence-halfpenny.

May be ordered of all Booksellers and News Agents, and at Messrs. W. H. SMITH & SONS' Railway Bookstalls.

W. RICHARDS, 41, WELLINGTON STREET, STRAND, W.C.

JUST PUBLISHED.

THE ORCHID GROWER'S MANUAL,

FIFTH EDITION.

With COLOURED FRONTISPIECE of "ODONTOGLOSSUM VEXILLARIUM,"
BY "SEVEREYNS," AND UPWARDS OF FORTY PAGE ENGRAVINGS ON WOOD.

The Fifth Edition of the above Work, enlarged to 336 pages, and entirely revised, contains descriptions of upwards of 930 species and varieties of Orchidaceous Plants proved to be worth growing.

Post 8vo, cloth, price 7s. 6d.: post-free, 8s.

VICTORIA AND PARADISE NURSERIES, UPPER HOLLOWAY, LONDON, N.

HORTICULTURAL BUILDINGS

CONSTRUCTED BY STEAM-POWER.

HENRY ORMSON,

HORTICULTURAL BUILDER AND HOT-WATER APPARATUS ENGINEER,
STANLEY BRIDGE, KING'S ROAD, CHELSEA, LONDON, S.W.

PLANS and ESTIMATES GIVEN for HORTICULTURAL BUILDINGS of EVERY DESCRIPTION.

Plain and inexpensive Hothouses Designed and Built with strict regard to Economy in Price, the best Materials and Workmanship; and

Unsurpassed Boilers and Heating Apparatus erected and fitted in all parts of the Kingdom.

ILLUSTRATED CATALOGUES AND PRICE LISTS ON APPLICATION.

SURVEYS MADE AND GENTLEMEN WAITED ON IN ANY PART OF THE COUNTRY.

MR. POSTANS' PELARGONIUMS

For 1877.
NOW BEING SENT OUT.

Opinions of the Press.

The "Gardeners' Magazine," April 29, 1876, speaks as follows:—

"Mr. R. E. Postans' collection of Seedling Pelargoniums, Hybrid Perpetual and Tea Rose, &c., have passed into the hands of Mr. Charles Burley, of the Paradise Nursery, Brentwood. We have before us a box of flowers of Mr. Postans' latest Seedling Zonal, and they are certainly remarkable for quality. We see amongst them huge single flowers of faultless form, and of the most glorious crimson and scarlet colours, and a double white which ought—as we now judge it by trusses only—to sweep all other double whites out of the market. The name of this is Bridal Bouquet.

Editors, "Gardeners' Chronicle," April 21, 1877.

"Mr. C. Burley, of the Brentwood Nursery, has sent us flowers of some very striking new varieties of Zonal Pelargoniums. Amongst them is one called Purple King, which is the most pronounced purple shade of any which we have yet seen, and, according to Mr. Burley's statement, is one of the most profuse of flowers. It comes in fine large trusses, is of medium size and of good form, the colour a crimson-magenta, the under petals especially being flushed with purple. Its fine colour, neat zonal habit, and free-flowering habit should make it welcome as a bedder. Magnificent is an exquisite flower, larger than the foregoing, better shaped and more refined, with a crimson flush more pronounced and predominant, though the purple is apparent. Beethoven is a very large, pure, dense crimson-scarlet, entirely self-coloured, and thus has an excellent rich effect. Sir Edwin Landseer, said to be a fine bedder, is similar in colour to the last, and, like it, is a bold telling flower. Hogarth, Charm, and Mozart are fine rose scarlets, not very distinct in the shade of colour, but have a very highly meritorious batch of novelties."

From "Gardeners' Magazine," April 21, 1877.

"ZONAL PELARGONIUMS CHARM AND MOZART.—Cultivators of Zonal Pelargoniums should not fail to acquire the new varieties, Mozart, two varieties raised by Mr. Postans, and now being distributed by Mr. Burley, of Brentwood. Charm has large size, with broad overlapping petals, and trusses of good proportion; the colour is a rich shade of purple-crimson. Mozart has flowers of large size, and superbly tinted with a rich maroon-crimson shaded with purple-magenta; it thrives, as in the case of the variety first-mentioned, are of large size, and very freely produced. Both varieties are remarkable for their compact free branching habit and adaptability for specimen culture. Several other varieties from the same seed-bed are offered, and are no doubt highly meritorious, but these are so exceedingly good that they will deserve to have special mention made of them."

"Gardeners' Magazine," May 5, 1877.

"MR. POSTANS' ZONAL PELARGONIUMS.—The splendid collection of new Zonal Pelargoniums purchased from Mr. Postans by Mr. Charles Burley, of Brentwood, have for some time past been flowering freely, and delighting, sometimes surprising, all who have seen them. It is sufficiently well-known that the raiser of these varieties secured, by his painstaking care, several special strains, of which the series producing the white-edged leaves and white flowers may be mentioned as an example. He was not less successful in establishing a race of true double, combining flowers of immense size and substance, and of the most delightfully accurate form, produced in great globular trusses, with plenty of neat habit, robust enough, but well within the bounds of free growing. These are now flowering freely in Mr. Burley's Paradise Nursery, Brentwood, and should be seen at home by collectors of Zonals, because of many of the kinds Mr. Burley has strong plants in which the characters are well developed, and not only are they capable of when fairly well-grown for the conservatory or exhibition stage. The following have been specially noted as distinct and splendid, such as amongst others, the Bridal Bouquet, and do well to become acquainted with quickly.—Beethoven, Charm, Magnificent, Polyphemus, Purple King, Mrs. J. C. Quessell, &c."

New Double White Pelargoniums.

"BRIDAL BOUQUET."

The *Gardeners' Magazine*, April 29, 1876, speaks as follows:—"Mr. R. E. Postans' collection of Seedling Pelargoniums, Hybrid Perpetual and Tea Rose, &c., have passed into the hands of Mr. Charles Burley, of the Paradise Nursery, Brentwood. We have before us a box of flowers of Mr. Postans' latest Seedling Zonal, and they are certainly remarkable for quality. We see amongst them huge single flowers of faultless form, and of the most glorious crimson and scarlet colours, and a double white which ought—as we now judge it by trusses only—to sweep all other double whites out of the market. The name of this is 'Bridal Bouquet.'"

Flowers now ready 15s.

"WHITE WONDERFUL."

A truss was sent to Mr. C. TURNER, who writes as follows:—"The Royal Nurseries, Slough, August 21, 1876.—Many thanks for truss of your double white Geranium, White Wonderful, a very good one, for it is a wonderful good variety, the best I have seen by far. Will be sent out next spring."

Mr. E. S. WILKINS, of Victoria and Essex Nurseries, Upper Holloway, writes, August 10, 1876:—"Your box containing flowers of Geranium to hand. It is the best thing in that way I have yet seen. White Wonderful."

Price 10s. 6d. each, now ready.

"BELLE OF THE BALL."

This is a free-flowering distinct variety, and remarkable for its great beauty. The habit is very compact, of the ordinary zonal type, dark green foliage with good well-defined dark zone, throwing up nice trusses of really good double flowers of pure white with bright pink centre. It is a single size, and a fine bouquet; it is effect is charming. There is but little doubt that this variety is a step in the right direction.

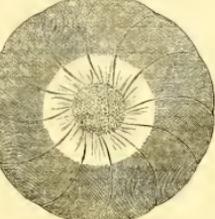

Now ready, price 10s. 6d. each.

Usual allowance to the Trade. Descriptive Catalogue Free.

CHARLES BURLEY,
NURSERIES, HIGH STREET, BRENTWOOD.

SUTTON'S
SUPERB STRAINS OF
FLORISTS' FLOWERS,
POST FREE.

The Finest Strain of Cineraria.

SUTTON'S SUPERB CINERARIA.

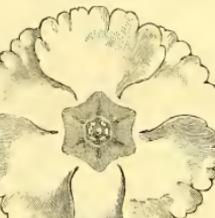

This will be found unequalled by any in cultivation, the seed having been saved from the finest named variety only.

Price 2s. 6d. per packet, post-free.

From Mrs. A. ALLESTON, *Pittleeve*, May 3.

"Our Cineraria this year (from your seed) are splendid; they far surpass any I saw at the Botanical Gardens yesterday."

The Finest Strain of Primula.

SUTTON'S SUPERB PRIMULA.

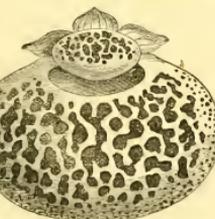

This choice stock has been carefully selected from the largest fringed flowers of good colour. Habit robust, with bloom thrown well above the foliage.

Red, white, or mixed, 2s. 6d. per packet, post-free.

From W. EDWARDS, Esq., *Wellington*, January 21.

"I cannot help saying that the Primulas from your seed have always given great satisfaction, but this year more than ever."

The Finest Strain of Calceolaria.

SUTTON'S SUPERB CALCEOLARIA.

This splendid strain has been most carefully selected from the very finest collections in cultivation. The plants are compact in habit, with beautiful green foliage, and a profusion of bloom. The flowers are perfect in form and substance, and of every shade of colour.

Per packet, 2s. 6d.

From A. E. RUSSELL, Esq., *Dalsholme*, July 10.

"My Calceolaria plants, from seed purchased of you last year, are particularly fine, of very compact habit, and beautiful in colour."

BLAIR ATHOLE.

BLAIR ATHOLE'S green pastures lie alongside the Garry and the Tilt, midway between Birnam Hill and the Pass of Drumochter. We propose to offer a brief description of the park and policies, preceding our account by a short historical notice, to remind the reader of the stirring annals of the country we are engaged upon. In the case of a residential property such as the above, this kind of narrative seems necessary to a correct appreciation of the subject. The market value of a place must be obviously dependent upon its position, and in some degree it is affected by its history. The house of Shakespeare, or any other great man, like mighty Caesar, "dead and turned to clay," would fetch a long price, and Blair Athole, haunted as it is and teeming with historic memories, is the more valuable from its characteristic *genus loci*, which must influence all who visit this famous spot.

The district of Athole is unique in having preserved its name and boundaries from the earliest period of Scottish history. It was one of those seven ancient provinces which were ruled over, each by its own Maormor, or chief, before the Saxon title of earl had been introduced. Its first earl was Donald Bane, a cousin of Edgar Atheling. There were four earls of Celtic race, and after them three daughters of the last earl took the title in turn, with the estates, by a rule of female succession, which obtained then and is now rare. On the accession of the daughter of one of these three countesses she contracted a marriage with John de Strathbogie, which was followed by heirs male till 1314, when the twelfth in succession revolted against Robert the Bruce, and forfeited the earldom. There were then recreations and extinctions till the year 1437, when one of the political misadventures of the period befell this peerage in the forfeiture of Earl Walter, and the removal of his head from his shoulders. In 1457 James II. raised his half-brother, Sir John Stewart, to the vacant earldom, and in 1595 it passed by marriage to the Murrays.

The earls of the house of Murray became marquises in 1676 and dukes in 1703. They were Jacobites, as a rule, owing to their Stewart blood, and in 1689, at the period of the battle of Killiecrankie, 1200 of their men stood before the Castle, then the head-quarters of Dundee, and toasted King James in their Glengary bonnets, which, in the absence of whisky, they dipped in the Banovy, a burn running through the park. In 1745-6 the Government garrisoned the Castle, and Lord George Murray, the Duke's brother, and the devoted Lieutenant-General of Prince Charles, besieged it, and fired red-hot shot upon his father's roof from the park where, as a boy, he must have often sported.

It is supposed that at the close of the Rebellion the owners of the ancient fortress were desired by Government to modify its architecture, for in 1750 Duke James replaced the turcs, embrasures, and bartisans of his feudal residence by a modern roof, and converted it into one of the finest hunting *chateaux* in Europe. We may observe here that the original castle was erected by a member of that very energetic family of Comyns, who counted among their notabilities a Red Comyn, besides

unnumbered black and blue Comys, battered in the wars. In an illiterate age this name was variously spell, like that of Steward, Stewart, or Stuart; in modern English it is written Cumming.

To complete our short history. At a critical period towards the close of the last century, when the Highlands of Scotland came forth nobly in defence of king and country, the fourth Duke of Athole was one of many magnates who raised a regiment on his own lands. The present corps of Athole Highlanders originated in a body of men who were equipped by the late Duke, then Baron Glenlyon, to attend him at the Earl of Eglington's tournament in 1839. Three years later, when he was almost blind, the same noble Duke once more summoned his men to meet the Queen, on the occasion of her Majesty's first visit to Dunkeld and Scotland. They encamped on that occasion, 870 strong, within the ornamental grounds of Dunkeld House. In 1844 the Athole men again guarded the person of the Queen during her residence at Blair Castle.

There are at least 7000 red deer in the Forest of Athole, and the hunting entertainments are historical. We pass on to an account of our walk with the deputy forester, to whose guidance the Duke's wood manager, Mr. McGregor, obligingly commended us after showing us the famous Larch woods of his own district, near Dunkeld.

Entering the park by the grand entrance in the village, where we admired the lodge and lofty iron gates and approach wall, but not the narrow avenue of Scotch Fir and Limes leading to the house, we turned into Tiltside Walk, and then through a circular lawn or bowling-green planted round with Larches of 50 and 80 cubic feet, and each standing on sufficient space to attain its natural growth. From this magnificent grove a turf walk through trees and the ever-popular Portugal Laurel, leads to the low southern wall of the kitchen garden. The Hercules Walk skirts this low wall, and leads on to the Castle by a broad walk, planted on each side with various ornamental shrubs and evergreens. There is about half a mile of pleasant turf walk from Tiltside to the lawn. The most interesting trees are some old Horn-beams of weeping habit, and a rampant Larch throwing out a great side limb at 15 feet from the ground. The kitchen garden with its curling-pond fills a gentle valley running east and west, and a high wall, with a viney in the centre, shelters the garden on the north and affords a favourable aspect for fruit. Upon the lawn there is a *Picea nobilis* planted by the Princess of Wales, and a *Pinus Nordmanniana* planted by the Prince in 1872. A Larch *canadabum* on the lawn forms an interesting example of the freaks of vegetation.

The Castle is a good house of three storeys, an excellent example of the Scotch baronial style, lately enlarged and improved, but unfortunately plastered over with a wash of sand and lime, in imitation of certain uncouth old buildings, such as Stirling Castle, which appears, from the carse below, the poorest palace in Britain perched upon the noblest site. We are here at the opposite extremity of the meagre Fir and Lime avenue, and it must be admitted there is an awkward huddling of the woods in the park, and a want of harmony between the near and distant landscape. The mountains and the home scenes have not, at present, been so skillfully linked together as a Loudon or a Paxton would desire. Blair is not perfect, but a good house on a noble lawn and bold slope, with woods and forests and the Grampians in the rear, cannot easily be spoilt, and the few surrounding defects only serve to show that every man is not his own best gardener, because the eye so soon becomes accustomed to blemishes about home. *H. Evered's.*

(To be continued.)

New Garden Plants.

STAPELIA GIGANTEA, N. E. Dr. (fig. 112, p. 693)*.

Stems 4 to 8 inches high, 1—1½ inch thick, somewhat clavate, pubescent, erect, shortly decumbent at the base, and then branching, four-angled, angles compressed, with short, erect teeth. Pedicels stout, pubescent, in the young (Gerrard's specimen). Calyx lobes lanceolate-acuminate, pubescent, 5 lines long in the dried specimen, probably 6—7 lines long when fresh. Bud pentagonal, ovate-acuminate. Corolla very large, 12—14 inches in expanse; the pubescent base is pale green, the face is rugose, pale yellow, suffused with red around the throat, and everywhere marked with irregular, transverse, brownish red lines, the entire surface sparsely covered with very pale, short (about two lines long) hairs. The lobes are lanceolate-acuminate, 5—6 inches long, about 2½ inches broad, 9—11-nerved, with (apparently) revolute margins, fringed with 3—4 lines long pale hairs. Ligule spreading, dark purple-brown, broadly linear-oblong, slightly dilated at the shortly 3-toothed apex, the middle tooth subulate and more projecting than the broad, rounded, lateral teeth. Rostra and the rest of about equal length, dark purple-brown—the former erect, straight, rather stout, the latter broad, wing-like, oblong obtuse, somewhat spreading.

This *Goliath* of its genus is a native of Zululand, where it was discovered by Mr. R. W. Plant not very long since, in the garden of the little known part of South Africa.

My present description of this fine species is based, partly upon two excellent drawings of the plant in the Kew Herbarium—one coloured, the other in pencil, executed by Mr. J. Sanderson, of Natal. That drawing, in which the accompanying woodcut is a reduced copy, bears the following inscription:—"R. W. Plant's *Stapelia*; brought by him from the Zulu country; fls. Attercliffe, 10th Apr., 1860"—partly upon a dried flower in the Kew Herbarium (Gerrard, No. 717), which, although labelled "Natal," was probably collected at Zululand. Gerrard also botanised in that country; but whether of Natal or Zululand origin this specimen is undoubtedly the same species as that represented by Mr. Sanderson's drawings. It has shrunk very considerably in the process of drying (as do all *Stapelias*), but even now it measures 9½ inches in expanse; the parts of the corolla are spilt by the pressing, and only the form of the ligule and aloe can be satisfactorily made out; they, however, agree well with Mr. Sanderson's delineation of them. For the rostra I have had to rely entirely upon his drawing. Although the corolla is represented as glabrous, and the lobes few-nerved in the drawings, this is easily reconcilable with the hairy corolla and 9—11 nerved lobes of Gerrard's specimen, for when fresh the hairs on the surface of the corolla are not always very apparent, unless they are dense, or long, or differently coloured, and best being retained to make up the making them too conspicuous are easily overlooked, as I suspect has been the case in this instance. As to the difference in the number of nerves, it is only the most strongly marked ones that are visible on the face of fresh flowers.

My reason for supposing this plant to be in cultivation is as follows—Mr. T. Cooper, the well-known collector and introducer of many South African plants, during a visit to the Botanic Gardens, D'Urban, in August, 1862, had his attention drawn to a species of *Stapelia* by Mr. McKen (the then curator of the gardens), who told Mr. Cooper that after the death of Mr. Plant in Zululand his effects were "brought in" by the Kafirs. Among them was this *Stapelia*, in which (Mr. McKen) said produced flowers 9—12 inches in diameter. Mr. Cooper was presented with a portion of the plant, which he brought to England, and has now in cultivation. Cuttings of it were distributed, under the name (suggested by Mr. McKen) of *Stapelia Plantii*, to several *Stapelia* cultivators, among others to Mr. W. W. Saunders, and through him to the Royal Gardens, Kew (the latter one is now dead); but has not been recorded in either of these collections, yet, from Mr. McKen's statement, I have little doubt that it is the same species as the one here described and figured, and I shall be very glad to learn if it has flowered in any other collection.

The collection at Kew contains a plant sent home by Mr. McKen in 1862 from the Umvelo River, Zululand, which, from the resemblance of the stem to Mr. Sanderson's drawings, and taking into consideration the source from whence it came, must, I

* *Stapelia gigantea*, N. E. Brown.—Ranis erecta, clavata, basi breviter procumbentibus, 4—8 ped. longis, 1—1½ pol. crassis pubescentibus tetragonis angulis compressis, densitate raris pilis brevibus, pediculis erectis, calycibus lanceolatis pubescentibus; corolla maxima, diam. 12—14 pol.; laciniis inaequalibus acuminatis; subula pallida, virescente, facie rugosa, lobis linearibus, subulata, plicata, hirsuta, pilis flavo-crenatis, lineis fusco-ruvis transversis notata; ligulis patentibus atropurpureis lineis linearibus, notata; subulata breviter atropurpurea; rostris albis atropurpureis, subulobis, his erectis strictis, his albis lineariformibus, oblongis, obtusis sub-patentibus. Hab. in Zululand. Plant. 1. Gerrard No. 717!

think, be the same species. Although Mr. Cooper distributed his plant under the name of *S. Plantii*, it must not be confounded with the true *S. Plantii* Hk. l., figured and described in the *Botanical Magazine*, t. 5962, which is a very different species, with flowers not one half the size of those of *S. gigantea*. N. E. Brown, Kew.

MASDEVALLIA (SACCOLABIATÆ) RADIOSA, n. sp.*

It was last April when I first saw this *Chimered* Masdevallia at the Royal Exotic Nursery, Chelsea. It made one think, notwithstanding the very different colours, of Sir Trevor Lawrence's *M. pittacina*, but the lip brings it close to *M. Houteana*, from which the latter is distinguished by the presence of the sepals (and the colours) distinguish it at once. It is not just an extra beauty. Its flowers are two-fifths of the size of those of a good *M. Chimeria* (Wallisi). The tails are very dark, almost black. The outside of the flower offers a surprising variation of brown and yellow, very difficult to describe. Blunt and dark in the backside of the three primary vascular bundles, internally the upper parts of the sepals are almost light ochre coloured. The larger inner part looks blackish purple, from being densely covered with blackish purple, purplish ground, and purple dots, which with a brown tinge at the base, and the whitish callus on the plate-like lip of a blackish sepia colour. The lip is white, with the upper surface of the radiating disseminations reddish colour, whitish, with a few fringes at the black apex.

I have just had the young flowers, and have found to my astonishment a young flower-bud near the old ovary involved in the bract of the second flowers.

It was discovered in New Grenada by Mr. Wallis. It appears to be No. 652 of his sketch-book. It so far, has been found at the foot of new mountains. Mr. Wallis distinctly states it looks so very much like *M. Chimeria* (Wallisi, of course), that he had confounded both before he had seen this flowering. I have to thank Messrs. Veitch for very satisfactory materials. *H. G. Rehb. f.*

ZYGOPETALUM CLAVII, n. hybr.†

The inflorescence of this nice new hybrid (of course I have only the inflorescence at hand) is that of well-known *Z. cicutum*. The sepals ad petals, however, are not blotched at all, on a green ground, but they are totally brownish purplish, with a very narrow green border. The lobes are broad, and the inner auricle adnate to the callus which is whitish, with bluish violet stripes, free from any velvety lines, and the cuneate ovate blade is totally free from any velvet, and beautifully purplish blue, so that it is the full colour of *Zygopetalum maxillare* (manulatum, Galetier). The column is new, that of *Z. cicutum*. The bracts are decidedly smaller than those organs in the species just named. This very interesting new hybrid was raised by Colonel Clay, The Slopes, Wallasey, Birkenhead. It is *cicutum* × *maxillare*. I have just had from Mr. S. B. Wallis, Victoria, at Paradise Nursery, Second Sisters Road, Holloway, London, N., for it the young plant made its first public appearance, as it appears, on April 21, at the monthly meeting of the Royal Botanical and Horticultural Society, Manchester. There Colonel Clay, whose name the young beauty so well bears, had a First-class Certificate (see *Gardener's Chronicle*, May 5, *l.c.*, p. 571). It is a great pleasure to see the Manchester gentlemen appreciating so high and so well horticultural work, horticultural performance, horticultural skill, now-a-days so often overlooked.

I have just had from Mr. S. B. Wallis, Victoria, at the Royal Horticultural Society, May 1 (see *Gardener's Chronicle*, *l.c.*), on the golden letter day, the Queen's day. It was stored there exhibited by Colonel Clay, and was awarded a Second-class Certificate. *H. G. Rehb. f.*

GONGORA CHARONTIS, Rehb. f.‡

A strong, big, rounded, shining bulb, with great leaves, and producing a hairy spike with numerous gay flowers. Sepals and small petals yellow, spotted with

* *Manudallia radiosa*, n. sp.—(Saccobaliatæ) foliis cuneato-oblongo-linearibus, pedunculato excrescentibus ut (L.)—tribus (glaberrimis) hypericocoloribus; bracteis coloratis acutis, ovario pedicellato leviter, perigonio cupulato, abbreviatis laminae (non maculatis), lobis auricularibus parvis, callo glaberrimo, lamina cuneato-oblonga glaberrima purpureo carulea (non striata) interius, exterioribus brevibus, abbreviatis, lobis superioribus transverse, sepalis lateralibus triangularibus; ommibus in calice venis pilis longioribus exsertis; sepalis albis apice caruleo-glaberrimis, lobis ovatis, ovato-linearibus, demum dense, sepalis hinculatis auribus nigris, apice pedicello-patellis callo oblongo (non striatis) interius, exterioribus brevibus, abbreviatis, lobis profunde sulcatis, epichio subhemisphericis, limbo imbricatis, lamellis radiceis radiatis, ab utroque latere albis, demum apice densitatis, curvis, Wall. & Ecklonia in litt. Wall. & Ecklonia in litt. ed. Veitch Londiniensis. *H. G. Rehb. f.*

† *Zygopetalum Clavii*—(maxillare × cicutum)—Habitu *Zygopetalum cicutum*; bracteis ovatis, sepalis abbreviatis laminae (non maculatis), lobis auricularibus parvis, callo glaberrimo, lamina cuneato-oblonga glaberrima purpureo carulea (non striata) interius, exterioribus brevibus, abbreviatis, lobis superioribus transverse, sepalis lateralibus triangularibus; ommibus in calice venis pilis longioribus exsertis; sepalis hinculatis auribus nigris, apice pedicello-patellis callo oblongo (non striatis) interius, exterioribus brevibus, abbreviatis, lobis profunde sulcatis, epichio subhemisphericis, limbo imbricatis, lamellis radiceis radiatis, ab utroque latere albis, demum apice densitatis, curvis, Wall. & Ecklonia in litt. Wall. & Ecklonia in litt. ed. Veitch Londiniensis. *H. G. Rehb. f.*

‡ *Gongora Charontis*, H. G. Rehb. f. in *Gardner's Chronicle*, xii, p. 129, 1876.—Pseudobulbus rotundato-conicus; foliis linearibus, ovatis, demum dense, sepalis abbreviatis laminae (non maculatis), lobis auricularibus parvis, callo glaberrimo, lamina cuneato-oblonga glaberrima purpureo carulea (non striata) interius, exterioribus brevibus, abbreviatis, lobis superioribus transverse, sepalis lateralibus triangularibus; ommibus in calice venis pilis longioribus exsertis; sepalis hinculatis auribus nigris, apice pedicello-patellis callo oblongo (non striatis) interius, exterioribus brevibus, abbreviatis, lobis profunde sulcatis, epichio subhemisphericis, limbo imbricatis, lamellis radiceis radiatis, ab utroque latere albis, demum apice densitatis, curvis, Wall. & Ecklonia in litt. Wall. & Ecklonia in litt. ed. Veitch Londiniensis. *H. G. Rehb. f.*

brown. Lip white, its apex and basilar wings rich yellowish, spotted with crimson, as is the white column. The flowers are half the size of those of old *G. atropurpurea*. It was discovered long since in New Grenada by Mr. Gustav Wallis; it has, however, only reached Europe in a dried state, and I had not the least idea of its gay appearance (gay, of course, for an old-fashioned Orchidist, who does not confine his love to flowers of one-third of a foot in diameter painted in white, scarlet, purple, or crimson). I saw it in April at Mr. Bull's nursery, where it had been sent by Mr. Shuttleworth from New Grenada. *H. G. Rehb., j.*

CYMBIDIUM GIGANTEUM, Wall., LONIANUM.

This appears to be an uncommon plant. Its flowers are larger than those of the old *C. giganteum*, Wall. (actually rather rare in cultivation), but shorter than those of the well distinct *C. Hookerianum* I saw (and obtained) some weeks ago with Messrs. Veitch.

an extra surprise, and if they are agreeably surprised they will, I dare say, this time forgive me. The plant is a new Burmese discovery of Mr. Boxall's, and I have to thank for it Mr. S. Low, whose name it bears, decidedly to common satisfaction. *H. G. Rehb., f.*

ONCIDIUM ANNULARE, Rehb., f.; Gard. Chron. 1875, March 27, 396.

At last this splendid plant has flowered in England! Its blooms are nearly as large as those of *D. acuminatum* and *D. macranthum*. The chief colour is a rich splendid yellow-chestnut-brown. The sepals have an exceedingly narrow yellow border, and the petals are very wavy, of the same shade of brown, but with a broad shining apex and broader border of a very beautiful deep yellow. They are coherent at their top, as if glued together, and form thus a round of a ring; hence the name, annulare. The lip is brown, with a yellow top; the crest with yellow light teeth,

duce in one of these pots, and, whether it be a *Hyanthaea*, *Fuchsia*, *Asiatic*, *Pelargonium*, *Erica*, or any other of the plants taken to market, there is seen a perfect specimen. The wonder is how so much can be obtained from a root-space so circumscribed. The growing of plants for market is now a science, and each perfect specimen means the successful application of scientific principles. The low houses are constructed expressly for the development of such plants; they cannot be show houses in any sense of the word. A constant unvarying round of attentions making up the cultural process is given with unbroken regularity. They are necessary to the rapid growth and well-being of the plants, and they are applied without stint of labour and time. If any young gardener wished to get a lesson in plant growing, he could not do better than obtain it at one of these plant-producing centres.

Perhaps most striking of all is the character of the decorative *Pelargoniums*. There are quantities of plants 18 or 20 inches in diameter, and the same or rather more in height, with four or five main stems, with branches springing from these crowned with twenty to twenty-five trusses of bloom—and such trusses!—the flowers large and finely developed. What a capital lesson would be taught if, during the summer months, a few of these plants could be taken to some of the provincial horticultural shows, where *Pelargoniums* are sometimes produced in such a way as to lead one to wonder the exhibitors could be daring enough to publicly display such productions.

Not only do the growers for market avail themselves of the best productions of others, but they are not slow to endeavour to improve the best they can find to cultivate. Of the older varieties cultivated for market a few good representatives will be found in Mrs. Bradshaw's; Digby Grand, a fine variety with crimped edges; Kingston Beauty, a good white; Monte Christo, Rob Roy (Foster), very free; Triomphe de St. Maude, very effective with its bold trusses of large crimson flowers; and Duchess of Edinburgh, a charming light variety, very free and effective.

Of new varieties there are Duchess of Bedford, raised by Messrs. Beckwith & Son, Tottenham, white, with slight pale carmine spot on the top petals, the flowers handsomely fringed, remarkably free of bloom, producing large bold trusses, and having an excellent habit—awarded a First-class Certificate of Merit; and Empress of India, raised by Mr. James Sweet, Leyton, between Digby Grand and Mrs. Bradshaw, having pale lower petals, the upper petals dark flushed with carmine—a very free and valuable variety, also awarded a First-class Certificate of Merit.

Messrs. W. & A. Brown, of Hendon, who are extensive growers of *Pelargoniums*, have also raised some very fine varieties, a group of which were at the Royal Horticultural Society's meeting on May 2. They were all characterised by a good free branching habit, and as prodigal of bloom as one could well desire a *Pelargonium* to be. They may be described as follows:—Sultan, dark blotch on top petals, with broad orange-rose margin; carmine-rose and violet lower petals, with very slight spot on each petal; T. A. Dickson, dark top petals, pinkish rose lower petals, dashed with violet, and slight orange and maroon spot, very fine and free; and Challenger, dark top petals, with bright carmine-rose margin; lower petals pale bright violet-rose, very fine and effective. These three may be bracketed together, inasmuch as they resemble each other to some extent, at the same time being quite distinct. They promise to become great favourites for market and decorative use. The remaining varieties were Commander, dark top petals and clear rose pink lower petals, good shape and highly effective; and Fascination, dark top petals, with carmine and orange margin, clear pinkish rose lower petals and white throat, the flowers small, but borne profusely on bold trusses. These have only to be known to be in demand as bright coloured decorative varieties. And they are not to be commended merely for market purposes, but also to those whose business it is to have their conservatories and greenhouses gay during the summer months. Colour, habit, free growth, and prolificacy of bloom all unite to make them valuable for the particular work to which they are so well suited. *R. D.* [Our illustration (fig. 110) exactly represents the style and character of the *Pelargoniums* grown for market by Messrs. Beckwith & Son and other growers, and was sketched at the exhibition of Covent Garden produce held on April 18. Eds.]

FIG. 110.—SHOW PELARGONIUM, AS GROWN FOR MARKET.

The petals of Mr. Boxall's plant are much broader than those of the old species, and the middle lobe of the lip is longer. Dry rachises of the inflorescence prove it to have eighteen to twenty flowers, which Mr. Boxall says are of a greenish colour, with the top of lip maroon or deep claret coloured. It may even prove to be a new species, yet I do not dare to speak about this question from my materials actually at hand. Garden botanists should be judged with a certain degree of charitable intelligence; at this moment it is impossible to come to a decision about the question; next year, if it flowers side by side with the old *C. giganteum*, a clever amateur's daughter, thirteen years of age, may very easily pronounce a sound view. That the possessors may be pleased by

two lateral brown disks, yellow centre, and three purplish violet small teeth before the apex. The column is very remarkable for its queer obtriangular little dark wings, and for its base much narrower than the enlarged part immediately under the stigma. For the pleasure of seeing the fresh flowers I have to thank Sir Trevor Lawrence, who kindly informs me that the plant closely resembles, in bulb, leaf, inflorescence, and general habit, *Oncidium macranthum*. The inflorescence had nineteen or twenty flowers, five of which are at hand. *H. G. Rehb., f.*

DECORATIVE PELARGONIUMS.

ONE effect of the recent exhibitions of Covent Garden produce that have taken place at the meetings of the Royal Horticultural Society at South Kensington is to demonstrate the fact that the 48-spot is a wonderful power in horticulture. It is something marvellous what a market grower can pro-

triangulis oblique acuminatis triserviis minutissimis; habello unguiculato, hypochilii labiis semioblongis antice setiferis, mesochilio ancipiti rhombico utriusque apice undecimato, epichilio microlabiato acuto, emulsoque partibus confluentibus; columna clavata.—Ab. affinis *G. scaphophoro*, Rehb., f. *Wewze*, recedit hypochilii labiis antice longe aristatis. Valde pavillifera.—Nova Grenata, Wallis; Shuttleworth (vid. vide. ce in botto Bulliano) *H. G. Rehb., f.*

CULTIVATION AND EXPORTATION OF LIBERIAN COFFEE.

An enormous demand has recently sprung up for plants of this highly important new species—Coffea liberica, Hiern. Large numbers have been sent by Mr. Bull and from Kew to our various Coffee-growing colonies, and supplies have also been given in exchange to most of our leading nurseries, who could evidently dispose of almost an unlimited quantity. Inquiries have been made as to the best method of home culture, for the express purpose of exportation, so that instructions, according with the successful treatment pursued at Kew, will be found of value to many.

The impotations of plants cannot be recommended. A certain amount of time would be gained if at once shipped to destination, but it could only be done at a risk and expense for which no compensation would begot from the few transmitted successfully. All indeed might be dead. The most reliable and cheaper method is to obtain seeds, and send young plants in a proper condition for safe transit. They can be sent in pans, after from nine to twelve weeks from the date of sowing, or in pots about the fifth month; but to have them in the most robust condition it may be advisable to grow for twelve or fifteen months, a longer time than which would scarcely afford any advantage. Apart from the question of convenience, it is desirable to point out the advantage of each plan, so that choice of process may be made, according to circumstances. All have been successful, as sent from Kew to all parts of the world. The cases are made with an inside superficies of 30 inches by 20 inches, and thus contain fifty-four 3-inch pots—the best and most convenient size. The same case will contain four pans undisturbed, with another turned out to fill up the remaining space, making in all about 250 plants. In this way the largest number may be packed in a given space, but they require to be separated and re-established after arrival; they may, however, travel perfectly well, and have reached Queensland in good condition. The plants in pots, being older and better established, may be expected to travel with greater certainty, and would have the advantage of being ready established on arrival. Those of twelve or fifteen months' preparation are best for journeys difficult to make and for very long distances. The length of time required for preparation will, of course, depend on the details of treatment, but the above will be found to hold good as a rule.

To receive the seeds in good condition it is important to have them removed from the pulp, either by a fermentation is liable to set in, which may destroy the vitality of either the whole or a large proportion. They come perfectly well if tied up in small canvas bags. The exportation of seeds has not been attended with the best results. They travel in moderately dry sand perhaps better than in any other way. Sand is a first-rate material for the packing of many kinds of roots, &c. Charcoal, though somewhat popular for the purpose, should never be used; long experience proves it of no value, and it may be even worse than useless. For the economy of space, it is a good plan to sow broadcast on a bed of Cocoa-nut fibre—its temperature should be about 85° F. This is a good medium for the germination of seeds in large quantity, as for instance the case of Hevea (India-rubber), which last year covered several beds entirely. The cotyledons will be expanded in about six weeks, and just at this stage the young seedlings should be planted in pans. The word planting is properly used, since from the healthy growth of roots obtained in the fibre, it is impossible to prick off in the usual way, but commencing at one end, row after row must be fixed in with soil. It cannot be recommended to sow in the pans with a view to save labour, as the roots would go direct to the bottom, and the grow in a mass, and it could not be known either by the depth the seeds would germinate. No plants have been sent from Kew that have not been re-established after germination. The soil should consist chiefly of loam, it producing the sturdier plants, and, being more retentive of moisture than peat, is best adapted for transit. During growth a day temperature of 80° to 85° may be maintained, and a syringing may be given twice daily with even an occasional sprinkle besides during bright weather. If with this the soil tends to get dry, then a liberal supply of water should be given. Generally speaking, Liberian Coffee flourishes with high temperature and

much moisture, but objection must certainly be made to forcing, it being the object to produce a sound and well-perfected growth. Slight bottom-heat is used with advantage after any disturbance of the roots.

The practice of planting out in the soil of Wardian cases cannot be recommended for Coffee; indeed, it is better for plants in general to be established in pots of convenient size, and plunged in the soil of the case, thus avoiding the necessity of disturbing the roots. Cases are often packed without sufficient battening down. It is even an advantage to use broad battens; and in this instance there is no difficulty, all the pots being of the same size. The soil for plunging in should chiefly be of loam, and so moist as not to refuse water after packing. A watering should be given the day before closing down, if not previously done, so as to let the soil drain, and its condition be seen before despatch. The battens should be put in when the soil is firm, some time after the last watering. Ten cases of the size already mentioned will shortly be *en route* for India. They have a span of 20 inches, the angle of which is 2 feet above the floor; the depth front and back is 7 inches, enough to allow one batten lengthwise over the ends of those across the case. A depth of soil is thus allowed of 4 or 4½ or 5 inches as occasion requires, an inch being sufficient under either pots or pans. Larger cases than the above cannot be recommended, for several reasons. *L.*

THE NUTRITION OF FRUIT TREES.

AN article bearing the above heading appears in the *Gardeners' Chronicle* of May 19, which I have read and studied, as I always do any subject treated in the interesting, scientific way of the article in question. At the outset, I may say that I want more information, and am far from being at all satisfied with what is there set forth. It is there stated that most plants, however different, require the same soil constituents. This is a statement which I have long ago. Again we are given the analysis of a solution, in which we are told that the Apple, Pear, Cherry, Plum, Peach, Grape-vine, Pine, Fir, Maple, Elm, Alder, Orange, Lime, Hazel, Robinia, Caragana, Gleditschia, Catechu, Ailanthus, &c., and vegetables, grow and thrive in. Now, I want to know, not only that these plants grow, but if they fruited, and in what manner. It is all very well to say that in a certain solution a certain plant will grow well in, say, for instance, an Apple, but we all know that Apple and other trees will grow in certain compounds in a very vigorous way, and in the same compound, no matter what the treatment, the same trees absolutely refuse to fruit. This is the case even with trees that flower, and no proof need be cited, as such instances must be patent to every one. Now in the article in question no mention is made as to whether the plants spoken of bore and ripened fruit or no.

It is generally believed, and analyses foster that belief, that a plant may require very different salts as the foundation of their seeds than what is required as the foundation, so to speak, of the plants bearing these seeds. For instance, the cereals contain a very much larger amount of silica in the straw than in the grain, while in the grain there is a greater amount of phosphates than in the straw. According to the article in question, silica is only needed in infinitesimal quantities. If so, how is it that the straw of cereals grown in solution, with no silicates or silicic acid, is always very weakly compared with straw grown in solutions containing a sufficiency of silicates. And this is a fact that any one with leisure and opportunity may prove. It follows, at least it would seem so, that silica is wanted in many plants, not "in infinitesimally small quantities," as is not at all, but that it is in some plants, and especially in some parts of plants, to be an "essential," and not an "accidental."

Again, it is stated that sodium is so little required that which is furnished by dust, &c.,—whatever the "dust" may mean—is sufficient. This may be so in some instances, but I fail to understand how it can be universally applicable. If sodium is only wanted by plants in the quantities indicated, I am at a loss to understand the effects of it when applied in the form of the chloride (common salt) to the Cabbage tribe in inland situations, and many other genera of plants, such as Potatoes, Peas, Beans, and many other plants. I have always found in old

soils, and not once or twice, but often, that soda in any soluble form increased the crop and stamina of Peas or Beans. This was always more marked when the salt used was the nitrate, but it was evident in the case of the hydrated carbonate, and, as I have said, in the case of the chloride likewise. From the fact that soda salts, especially in old garden soils, increase the bulk of straw and seeds, I infer that sodium is, at least by some plants, wanted in greater quantities than can be supplied by "dust, &c.," unless the *et cetera* has a greater store of it than the common dust of our fields and gardens.

I fear that the statement that nearly all plants require the same sub-constituents may prove misleading. It is quite true that a table of elements might be written of all the elements found in, and it is quite true that these elements would invariably be found, in the majority of plants. But in one plant a certain element will be found to play a most important part, while the same element in a different plant—sometimes in different portions of the same plant—may be very subordinate. Thus, lime is the main substance found in the ash of Potato haulm, while it is very subordinate in the ash of the tuber, while with potash it is just *vice versa*.

It seems to me that we want to know is, not just what are the elements which will grow well in, but what substances they will produce the best results. In the case of vegetables which are grown for the sake of the leaves only, such as Cabbage, Spinach, &c., whatever promotes the most rapid succulent growth is about all we want to know; but the case is very different in the case of plants cultivated for their fruits or flowers. We all know how to produce good growth in the case of Apples, Pears, and Plums, &c., but nobody has told us yet how to ensure fruit even when the season is favourable. We know that in certain soils fruit trees are perennially fruitful, and in other soils, with the same healthy trees, the crop comes biennially or triennially.

Are we justified in assuming that something is supplied in the case of the perennially fruitful trees which is not forthcoming in sufficient quantity in the case of those only biennially fruitful? And, if so, have we any right to ask our scientific men to solve the difficulty for us, and tell us what causes the difference? Mr. Rivers and others have taught us to produce flower-buds, will somebody tell us how to cause fruit to invariably follow? *Alexander Honeyman, Hope Park, Denby, N.B.*

THE COCOA-NUT IN QUEENSLAND.

MR. BARNES' garden is one of the sights of Mackay. It is situated on the north bank of the Pioneer River, facing the town, and is accessible by ferry. A short walk brings you to the cottage and garden, which is partly hid by the trees fringing the river, when a miniature Eden is presented to the enraptured spectator. Groves and avenues of Cocoa-nut planted in most tasteful manner, with beautiful clean sandal walks, first attract the eye. As you wander through the garden, attention is distracted by the call to look at this plant or that of some rare fruit-bearing tree richly laden.

The area of land under cultivation is 13 acres, containing 1200 Cocoa-nut trees, the cost of which up to the present time has been £70 for nuts alone, not more than 25 per cent. of those planted having germinated; and as yet no return worth mentioning has been made. The plantation is the result of ten years' labour, performed solely by Mr. Barnes. The first nuts planted were fifty procured from the first labour vessel arriving at this port. Many of these cost as much as 5s. a-piece, on account of their having a long shoot growing out; but these eventually proved not to be the best adapted for producing good trees. Those just budding, or nuts with plenty of milk, are far superior for seed.

Mr. Barnes commenced planting the nuts where he wished the trees to remain, but found this system defective, as the plants had a tendency to grow to the surface of the ground, and many may now be seen apparently on top of the soil, affording but slight resistance to strong winds. The best method is to set the nuts about 2 feet apart, and when the plants are four years old to transplant them deeply into permanent places, at distances of 18 feet apart. At this age, or older, they may be removed with perfect safety. Mr. Barnes says that had he adopted this plan originally he might have saved himself four years' great labour, as an acre of land would have grown all necessary for the plantation.

Experience indicates that sandy soil, kept continually moist, without allowing water to be about,

is best adapted to the growth of the Cocoa-nut. After the plantation is once formed, but little care is needed beyond keeping the land clean. Peaches and other fruits are grown successfully between the Cocoas without apparent injury to either. The trees begin to bear at six years old; some have blossomed at three years, but did not produce good fruit; and others have blossomed up to the present time, being ten years old, and have borne no fruit. Mr. Barnes accounts for this by the rapid growth of the tree, it going all to wood, but believes that they will eventually bear; many of the trees average 20 feet in height, and about 4 feet at the base.

In addition to Cocoas there are about 400 very fine Date trees in the garden, some of which had a nice lot of ripe fruit of a most delicious flavour. Enormous Melons and magnificent Pines were ripening and rotting in abundance. Grapes, Apples, Oranges, and other fruits, apparently of all climes and seasons, are seen thriving together. But I do not enumerate all I saw and tasted in this garden. *M. C., in the "Queenlander."*

WYCOMBE ABBEY.

We recently had the pleasure of paying a flying visit to the Buckinghamshire chair-making town of High Wycombe, for the purpose more especially of seeing the Apple trees in bloom in Lord Carrington's kitchen garden at Wycombe Abbey. This kitchen garden is unlike any other that we have seen in almost every particular. It is walled in, with five sides, and is surrounded by large strips of ground for vegetable growing; it lies very low, has a small stream fed by numerous springs running through it, and, lastly, contains a collection of Apple trees which, when we saw them, were for the most part literally covered with blossoms.

THE APPLE TREES.

Many of the trees are at least fifty years old, and average about 6 feet in height, with flat, table-like tops, about 10 feet across, having been kept to this size by judicious pruning of the roots and tops, the latter yearly, the former according to the vigour of their growth. The trees lie the sides of the walks, several of them having been brought hence from another part of the kitchen garden many years ago by Mr. Miles, who succeeded in transplanting them with singular success, considering their age at the time. Young trees of new sorts have also been planted and trained in the same style, and many of these have attained the extreme dimensions allowed, as is also the case with others that have been cut back and grafted with better sorts. The trees at first sight have a rather odd effect, but whether we look at them singly or as a whole now that they are in blossom, the floral picture, if formal in outline, is wonderfully rich in the warm and pale rosy tints peculiar to Apple blossoms. The rugged sturdiness and severe formality of these old trees, would, to our thinking, be objectionable features in those gardens which are climatically favoured, and where a due regard for the ornamental is not considered incompatible with more useful requirements; but it is easy to see that, for low ground like this, with water near at hand, and late spring frosts always in prospect, that this is the style, *par excellence*, for the situation. These trees, as Mr. Miles informed us, never fail to carry a crop, except when the trees and flowers are thoroughly wetted with rain or snow, and are then frozen. They are too dense and too heavily laden with blossoms for an ordinary dry spring frost to injure all, and, consequently, it is very seldom indeed that anything like a failure has to be recorded. Amongst the varieties grown are all the best sorts for dessert and culinary purposes, and that being the case it would be useless to name them.

THE KITCHEN GARDEN.

Having feasted our eyes on the Apple blossoms, we had a look round the kitchen garden, and then through the houses, finding all in neat and excellent order, as they should be under a man of Mr. Miles' standing. In the kitchen garden Mr. Miles is a thorough master of his business—as witness his many victories at vegetable exhibitions; and, of course, there are many points in his practice which would be very interesting to our readers, and which we shall hope to lay before them during the coming summer. In the meantime let us remark on the healthiness and cleanliness of the wall-fruit trees, excepting Peaches

and Nectarines, which are very much blistered this year, though we are sorry we cannot speak in such favourable terms of the promise of fruit—the blossoms on Apricots, Cherries, and Plums especially having been cut off wholesale. The trees on the walls of Morello Cherries are very fine, and bore a rich promise of abundance, but the crop will be very small. The growth of these trees is kept in due bounds by the heavy crops which they usually bear; and it is a practice with Mr. Miles not to dig the Cherry borders, off which he takes a crop now and then of such flowers as *Parthenus*, *Pinks*, &c. The cleanly appearance of the trees is due to their having been washed, as it were by anticipation, with a decoction of quassa-chips and soft soap, all the trees being washed just before they come into flower, and again as soon as set. The dressing liquid can be made very cheaply, and is most effectual for the purpose.

The growing crops in the vegetable quarters looked exceedingly well, considering the backward season, and we heard Mr. Miles speak in high terms of praise of the new Queen Onion—a thoroughly good and useful early variety which every gardener should grow. After growing many different sorts for several years, Mr. Miles has weeded the list of Onions down to three, and now grows only the Queen, just mentioned, Early White Naples, and the Giant White Tripoli, which come into use in the order named. Another novelty which Mr. Miles has a high opinion of is the Standard Pea, one of Mr. Laxton's seedlings but little known as yet, and which grows about 3 feet high, has handsome pods, and is a remarkably free bearer. Judging by two seasons' experience, Mr. Miles thinks this must become very popular with the market growers. Most of the new varieties of Peas have been tried in this garden, and it has been found that the cream of the marrow-fat section consists of *Supplanter*, G. F. Wilson, *Velith's Perfection*, and *James' Prolific*, all growers of medium height, rare croppers, and of unexceptionable quality.

FORCING HOUSES.

Coming now to the glass department, which is somewhat extensive, we enter a lean-to range 173 feet long and 12 feet wide, divided into four compartments. In front of this is a lean-to range of pits 200 feet long, devoted to the cultivation of Asparagus, Potatoes, French Beans, Carrots, &c. It is on a southern aspect, and Figs occupy the first division; a grand old tree of the Brown Turkey variety trained to a trellis under the glass was carrying a fine crop of fruit; and a shelf on the back wall was occupied with pots of *Selaginella uncinata*, whose long metallic blue pendent branches are found very useful for decorative purposes in connection with the town manure. The next compartment contains Peaches and Nectarines, including a very fine fan-trained tree of the *Stirling Castle* Peach, now quite ripe, and a beautiful crop. The other trees are of the *Erluge* Nectarine and *Violette Hative* Peach, the latter of which is found to be not early enough, and is to make way for the more certain *Royal George*. Two other compartments in this range are also occupied by Peaches and Nectarines, the first containing trees of the *Royal George* and *Belle Bauce* Peaches, the last named being a very fine variety for such work, and the *Violette Hative* Nectarine; and the second *Erluge* Nectarine and *Royal George* and *Noblesse* Peaches, the latter being the light-coloured variety in cultivation, so remarkable for its grand flavour. At the top of the range of Peach-houses is another, 70 feet long by 10 feet wide, unheated, which contains Peaches and Nectarines, including a tree of the *Salway*, a desirable variety for such a house.

Range No. 2, also lean-to, 130 feet long, and with a south aspect, is devoted exclusively to Grapes, and is undergoing the process of rebuilding on a larger scale by easy stages. When finished this will be a grand range of houses, being constructed on sound principles, and with good lengthy rafters. The actual dimensions of each of the new compartments that have been finished are, length, 20 feet; width, 18 feet; and height at the back 15 feet; and the wires on which the Vines are trained 17 inches from the glass, this space allowing a free current of air between the glass and the top of the foliage, which almost entirely prevents the leaves from being at any time burnt or scalded. The first compartment we entered was the earliest, and occupied with Black Hamburg and Muscat of Alexandria, very old Vines, in fine health and carrying good crops of useful sized, well-coloured bunches of fruit.

The Muscats were particularly good for a first house, and fully ripe. The second compartment, which is undergoing renewal, contains a capital lot of Muscats only; then comes one of the new set, in which the permanent Vines are of Buckland Sweetwater, Foster's White Seedling, one of the very best white Grapes in cultivation; and much more certain than the Buckland; the White Tokay, Black Alicante, Barbarossa, Trebbiano, and Black Hamburg. The young canes are doing well, and already carrying a few good bunches of fruit. This is followed by a division in which are planted Black Hamburg, Golden Hamburg, Foster's Seedling, Buckland Sweetwater, and Venn's Muscat, all in flower; and lastly, an old house containing a dozen canes of Lady Downe's, old Vines, which are making a strong growth, notwithstanding that they were last year root-pruned. Standing in this house were also a dozen or more good-sized specimens of that exceedingly useful Orchid, the old *Dendrobium nobile*, the flowers of which are in demand for cutting, and also a number of pots of Canadian Wonder Beans, which are very fine in the pods from this time onwards, but are not trusted for early work, the old Black Negro doing this duty well.

A fine sized half-span house, lately erected, 50 feet long, 20 feet wide, has been planted with Alicante and Lady Downe's Grapes, and with Figs on the back wall, the available space being occupied with a very strong lot of plants in pots of the Stamfordian Tomato, a free fruiting and large-sized variety—a great improvement on the old red. Near to this is another compact half-span-roofed structure, 42 feet long, 12 feet wide; and in front of this a lean-to Strawberry pit, the same length, and 7 feet wide, with Melons in the centre bed. These have succeeded winter Cucumbers. This is the second crop of Melons, and the varieties grown are *Reid's Scarlet-flesh*, *Strathfieldsaye Green-flesh*, and *Cox's Golden Gem*. Melons, like Pines, are grown by express here. They must grow quickly and ripen quickly, a regular succession rather than a heavy crop being the requirement; and with this in view only from three to four fruits are allowed on each plant, and as soon as these are set all others are pinched off and the plants pushed on to a successful termination of their duties.

In the same house as the Melons are several plants, with ripe and ripening fruit of great size, and plenty of them, of the old red and the improved Stamfordian Tomatoes, grown in pots with unbranched stems, from 4 to 5 feet high. The next house, a similar one to the last, contains a few good Queen Pines, to ripen next month, more Tomatoes in pots, and a crop of Melons coming on in front. Amongst the Tomatoes we noted a seedling differing from all the others in the extra size and grand form and colour of its fruits; a much improved selection, the seed of which should not be lost.

In addition to the foregoing are several small but very useful half-span-roofed structures, all of the same size, viz., about 26 feet long, 10 wide, and rather low pitched. One of these contains Pines, chiefly Queens, which were potted into their fruiting pots on July 3 last, being put in as suckers in the previous month of May. They are a fine sturdy lot of plants, showing fine sized fruits, which will average about 5 lb. Mr. Miles expects them to be ripened and cleared off in two months' time. They are potted in a good strong loam, mixed with a few half-inch bones, with wood ashes thrown over the drainage, and occupy 11-inch pots. The plants do not make a large growth, but it is short and sturdy, and only one sucker is allowed to develop on each plant. At the back of the house are a set of Cucumber plants in full bearing, the variety being the *Hedder Winter Prolific*, a medium-sized smooth variety of the *Syon House* type, raised by Mr. Lynn; and standing on one of the retaining walls are several plants of the Hungarian Pepper plant, *Paprika*—a *Capsicum* of fine size and rich deep crimson colour, growing for its ornamental appearance, leaving the usefulness of its fruit out of the question.

The Pine-house is followed by one containing a stock of young fine-foliated plants for table decoration, and a few useful Orchids for cutting from; and this is succeeded by another Pine-stove, the plants in which were only potted a few weeks ago. The sorts are Black Prince, Enville, Smooth Cayenne, Prince Albert, and Lord Carrington. Another Pine-stove contains Queen only, half of which were potted into their fruiting pots last autumn, and some of them are showing their fruits

now, the remainder having been kept in 5-inch pots through the winter and potted in the spring. Next comes a fruiting Pine stove, in which is at present a sort of scratch crop of Melons and Cucumbers. The Melons are the first crop, some of the fruits having been cut. For this crop Mr. Miles grows the Easton Castle, Victory of Bath, and Cox's Golden Gem varieties. As with the others, early and quick is the order of the day, consequently only from two to three fruits are allowed to ripen on each. The Cucumbers, Hedges Winter Prolific again, are growing at the back. In other Pine pits proper are a mixed lot of fine plants to fruit in the autumn, including four very strong ones of Lord Carrington. The last of this series of houses is devoted to early Vines, which ripened a sort of fluke crop in January last, since which they have been cut entirely back, and are fast breaking again, and has since been used for forcing Strawberries, being occupied at the time of our visit with Presidents, carrying a splendid lot of fruit. The plants were put in here just after they went out of flower, and they have had plenty of time to come on without driving, the result being fine-sized fruit of unexceptionable flavour.

Amongst other things which Mr. Miles always shows remarkably well are Cherries, and the Cherry trees grown under glass in a house 55 feet long are three in number, the varieties grown being Elton and Black Cerasium. These are all large trees, growing against the back wall of a narrow structure with an upright front, with ventilators at the bottom and movable lifts at the top. The two largest trees were carrying a fine crop of large, beautifully coloured, and delicious fruits. Mr. Miles considers these one of his most useful fruits. He began to gather about May 10, is almost certain of a crop every season, and considers that they cost but little or nothing to grow. He has lately introduced a plant of Governor Wood, which gives great promise of proving a valuable acquisition.

Space forbids our alluding to the grounds and plant-houses, which, with the vegetables, must form the subject of another paper; and, concluding now, we can only say that any one going to Wycombe Abbey to see good fruit and vegetable growing will not come away disappointed, but like ourselves, pleased with what we saw, and quite satisfied that Mr. Miles is able to maintain the high position he has won in the gardening world.

THE ODONTOGLOSSUM-HOUSE AT TRENTHAM.

No one can form the slightest idea of the beauty of *Odontoglossum*, and especially of white *Odontoglossum*, without seeing them in quantities. To talk of *O. Pescatorei* for instance, with maybe a score of flowers, may be all very well until the talker is brought in contact with possibly a host of them, combining in all not far off a thousand blossoms. This is no mere stretch of fancy, but a reality which the visitors who may be privileged to see the Trentham *Odontoglossum*-house can now or within the next week or two see. The house into which I was ushered (which by the way is a different one from that old double house in the outer half of which the *Lapageria* also grows to such perfection) was a low, sloping, lean-to, with a path up the centre and a table in front extending to 85 feet lengthways wholly covered with cool Orchids, and chiefly with *Odontoglossum Pescatorei* and *O. Alexandræ*. The racemes were bending gracefully from partial supports, and completely covered the vista from one end of the house to the other. I confess I never saw such a sight in this way, and no more lovely bridle Orchid house, I venture to submit, is to be found in England.

Well, these *Pescatoreæ*—I mean, *O. Pescatorei*—ranged from branching racemes of sixty-nine to shorter ones of twenty flowers; and as some of them are distinct varieties, and as varieties are the chief objects catered for now by all Orchidophiles, I would submit four out of the forty in bloom as being worthy of varietal distinction.

O. Pescatorei grandiflorum.—Fine close-racemed sort, with great individual flowers; segments overlapping each other like a good *Phalænopsis amabilis*, each segment shaded pink and white, more pronounced in the division next the column; an occasional crimson spot marks the segments, and it is bearing now sixty flowers to a spike.

O. Pescatorei formosissimum.—Very long racemed variety, too heavy to bear its own weight without a stout stake; sepaline and petaline segments of each flower white, with an occasional tint of soft pale

purple and also a soft purple shaded blotch; labellum of the usual formation, also white ground correspondingly spotted and blotched. Altogether a most beautiful variety, with twelve subsidiary branches, totalling up sixty-nine flowers to a spike.

Odontoglossum Pescatorei elegantissimum.—Sepals white and soft pink in almost equal divisions, and as if partitioned by square and rule; petals pure white; labellum pure white, which with a prominent yellow callus renders this a most striking variety; the labellum, too, instead of being saddle-shaped like the normal form, is roundly ovate, and, from a florist's point of view, will be all the more admired.

Odontoglossum Pescatorei picturatum.—Sepals pale rose pink and white, suffused as if washed together on a palette; sepals white ground, with stains of crimson, chiefly in the centre; labellum white, with crimson spots on either side of calli, the most sanguineous-looking of the whole family, and of the finest formation.

One other variety of distinguished excellence, this time *O. Alexandræ*, is roseum.—Sepals and petals very heavily suffused with rose on white ground; the petaline segments a little torn at the upper margin; labellum cordate acuminate, with yellow blotch on calli, and a great Indian-red blotch in centre of the lip, with subsidiary spotting crowding around it: a most distinguished variety from a colour point of view, and totally distinct from most of its competitors. It is not so long in the branchless raceme.

There were many other good things in flower—one, *Odontoglossum Hallii*, in particular—and two or three *Masturbalis*, but nothing could touch the maiden-like beauty of this wealth of white tooth-tongue Orchids; and of course a word of congratulation and praise is due to Mr. Stevens for being the curator of so excellent a batch. *James Anderson, Madocwank Nurseries, Uddington.*

DRUMMOND CASTLE.

UNFORTUNATELY for us the time at our disposal, when we paid a hurried visit to Drummond Castle in September last, was so brief, that we had no time to accurately note all its contents, but thanks to the valued assistance of Mr. McDonald, who has been gardener here for nearly forty years, we are enabled to present our readers with a plan of the magnificent flower garden (fig. 111), which was barely alluded to our last issue. According to our guide-book, *The Beauties of Upper Strathclyde*, by Dr. Charles Rogers, which we prefer to quote rather than trust our memory, "the far-famed flower-garden is immediately under the southern part of the Castle rock, and is approached from the esplanade by flights of steps communicating with three architectural terraces, beautifully formed out of the steep bank, and adorned with the most delightful shelves of shrubbery. Viewed from the esplanade, the fairy scene beneath has been well compared to a piece of the richest natural embroidery; the garden, which is of an oblong form, and includes about 10 acres, being here seen at one view, with all its statues, vases, verdant and gravel walks, beautiful parterres and enchanting shrubberies.

And what adds to the gratifying feeling is the satisfaction that no boisterous breeze can injure or affect this lovely Eden, sheltered as it is on every side by the Castle rock or lofty tower. With the most exquisite taste it is made to combine in highly harmonious union the first-rate qualities of three great styles of European landscape decoration—the picturesque grouping of the Italian, the Dutch method divested of its fantastic distortions, and the gaudy elegance of the French. So successful, indeed, have been the efforts of the noble proprietors to make it the *beau idéal* of horticultural beauty that competent judges have pronounced it according to its scale the first garden in Britain, and not surpassed, when the highly interesting nature of its situation is considered, by any garden in Europe. Two broad walks of verdant sward run diagonally across the garden from the north-west to the south-east angle, and from the north-east to the south-west angle, intersecting one another in the centre, and thus throwing the general plan into the form of a St. Andrew's cross. A walk encompasses the four sides, and three others run directly across the breadth, one passing through the centre. The whole is then divided into parterres laid out in every conceivable form of beauty, and containing every floral treasure known in our climate. . . . The walls of the terraces are decorated with beautiful creepers . . . and antique

statues and vases—all of which at great expense were sent from Italy by the present noble proprietors—are tastefully erected in every part of the garden, and serve to produce the most imposing effect. In the centre a sun-dial, about 15 feet in height, and containing about fifty faces, indicating the hour in every direction, is an interesting object. It was erected by John, the second Earl of Perth, who originally laid out the garden, and whose death took place in 1662."

We believe we are correct in saying that the design of the garden was considerably improved many years ago by Mr. Kennedy, of the old firm of Lee & Kennedy, of Hammermill. Referring now to the plan, with a view to indicating the nature of the planting in general terms, we may say that the large circles at either end are filled—1, 2, 3, 4, 5—with different species of hardy Herbs; the two beds numbered 6 are filled with flowering plants in summer; and No. 7 are designs of the family arms in Box; No. 8 is the sun-dial above alluded to; and the four triangles around it, as well as the spaces marked 10, 11, and 12, are devoted to bedding plants. The large spaces numbered from 13 to 17 inclusive are occupied by Rhododendrons, which have grown to a great size; the large spaces at each end, numbered 18, 19, and 20, are devoted to Portugal Laurels; the sections immediately in front of the dial, numbered from 21 to 24 inclusive, are occupied solely with Ghent Azaleas; while on either side of the diagonal walks, and that numbered 25, are long borders of herbaceous plants, and the two oblong borders 26 are filled with Roses. The most prominent feature of all is the tall, closely-clipped pyramidal Box, Junipers and Holly trees, which are dotted along the sides of the grass-walks.

Foreign Correspondence.

SPRING IN THE BALEARIC ISLANDS.—*May 16*.—My annual Mediterranean excursion has led me this year to the Balearic Islands, situated on the coast of Spain, between 39° and 40° latitude, which I have long loved to explore. I left Barcelona Monday, May 7, at 4 P.M., in a good sized steamer, which makes the passage to Palma (the capital of Majorca) weekly, and arrives the next morning at 6. The distance is 130 miles. The steamer being good and large—800 tons—the passengers did not suffer much, although the sea was rough. Since then I have been perambulating the islands of Majorca and Minorca in every direction, with great pleasure and interest.

MAJORCA.

Majorca is the largest of the Balearic Islands, as its name implies. It has an irregular bay-indent coast, the north side running from north-east to south-west; the greatest width is 45 miles, the greatest length 60 miles. Its distance from the nearest point of the mainland of Spain is about 120 miles.

Along the northern coast, from north-east to south-west, runs a ridge of mountains, principally composed of limestone, which rises to a height of from 1000 to 5000 feet, with a depth of from 10 to 15 miles. These mountains protect the interior of the island to a considerable extent from north-west winds, but it is entirely open and exposed to the north-east. At the east extremity of the islands, north, there is another block of mountains, which cannot be of much use as a protection from the north-east or the south-east winds, but must serve to precipitate rain in abundance from the moisture-bringing sirocco, or south-east wind, after its passage across the Mediterranean Sea.

Between these two ranges of hills there is a vast fertile plain, nearly on a dead level, but slightly elevated above the sea.

Such are the elements of climate at Majorca. It is an island situated in the very centre of the Mediterranean Seas, with two ranges of mountains, not very high, and not very deep, running from east to west on the north, and a block of mountains at the east, enclosing an interior level area, or plain, with all the characteristics of a limestone soil. In other words, the soil is adapted for grain crops of all kinds, to fruits, and to Vine cultivation. The mountain ranges ensure a heavy fall of rain in autumn and spring; in autumn when the north winter winds set in, and laden with the moisture collected in passing over the sea, impinge on the cooler mountain elevations; in spring, when the warm moisture-laden winds from

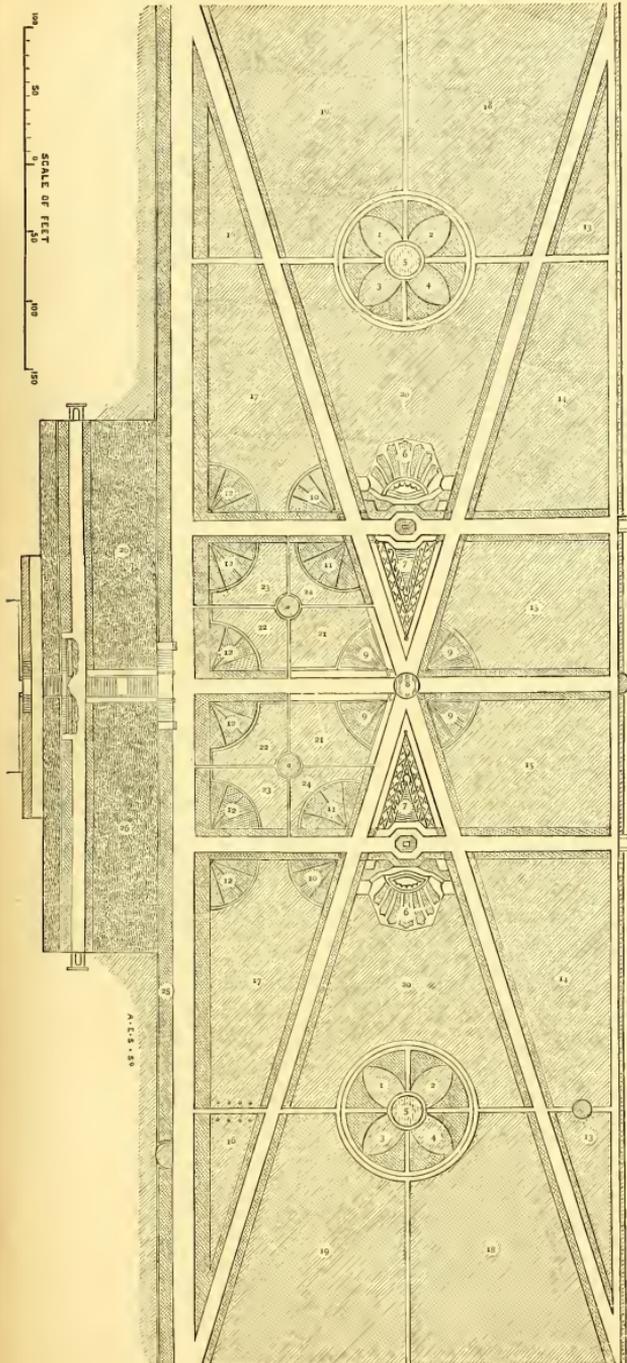

FIG. III.—PLAN OF THE FLOWER GARDEN AT DRUMMOND CASTLE.

the south-east and the south-west replace the north winter winds, and bring summer weather with them. In summer there is little or no rain, for the mountains become too hot to precipitate the moisture contained in the winds, either north or south.

The power of the sun being great, from latitude, the heat is intense during the summer months, notwithstanding a gentle sea breeze which extends far into the interior. Already (May 15) the sun is all but perpendicular above our heads, and its rays are unbearable, as we feel it where I am writing, without protection—seated on a rock in the shade, 200 feet above the sea, on the outskirts of the beautiful bay of Soller, looking north, the temperature is 75°. Throughout my excursion this was the average temperature by day—about 70° at night. The above meteorological elements contain all that is required to make Majorca an exceptionally favoured specimen of the Mediterranean insular climate, both as regards agricultural, horticultural, and botanical products. They may be resumed in a few words—abundant autumn and spring rains, moderate protection from northern winds, intense heat and dryness in summer from April until October, with, no doubt, heavy dews at night, owing to a marine atmosphere.

Majorca is thickly populated, its central plain being studded by villages and towns, the inhabitants of which are maintained by the product of the land. Every inch of the plain is cultivated. It is divided into fields, or separate properties, large and small, by thick stone walls some 3 feet high, made of the limestones collected out of the fields in the process of cultivation.

FRUIT TREES, &c.

The tree products of the soil are Olive, Carouba, Fig, Almond, and Apricot trees. They are planted at 20, 30, or 40 feet distance one from the other, so that the sun reaches the soil around and under them. The soil is also everywhere cultivated with cereals—bearded Wheat and Barley, occasionally Beans, with Potatoes and other green crops, principally Oats. I saw but few Vines, but was told that they exist in numbers, and that a good deal of wine is made in some districts.

The system of cultivation, I was told, is to grow cereals one year, the next green crops, the third the ground is allowed to remain fallow. Sheep or cows are pastured on the natural grasses during the fallow winter, the land being broken up by the plough in the spring previous to re-cultivation with cereals in autumn. This is the system followed all over the Mediterranean area. The cereal crops seemed to me generally poor and meagre, both as to height and ears, but the general product must be considerable, as every crevice and cranny is cultivated, even including holes amongst rocks bursting out of the soil.

The fruit trees seem to constitute a very important part of the produce of the land in every region. The Olives are innumerable, and more remarkable for their extreme age than for their size. We have larger Olive trees on the Genoeze Riviera, but they can hardly vie with the Majorca ones in the outer evidence of age. They seem to be old as the Flood, and are rent, twisted, divided, broken, torn in every conceivable and inconceivable shape, representing demons, monsters, dragons, and reptiles. They often only leave one, two, or three healthy young branches, like young trees growing out of a hideous mass or wreck of misshapen roots and timber, the remains of a noble tree one or two thousand years ago. These young, fair branches reminded me of old men's children—fair to look at, but with no hold on life. The produce of oil is immense, but it is carelessly prepared, and is anything but savoury to outsiders.

The Carouba or Locust trees are fine, vigorous, large trees, as large as fifty or eighty years' Oaks, covered with an abundant dark green foliage; many are very old, and twisted like the Olives. Their presence in such vigour is another evidence of intense heat and dryness in summer, as they are only found growing luxuriantly in the hottest and driest parts of the Mediterranean, such as Syria and Palestine. They produce abundantly a large bean, contained in a pod which grows directly on the trunk and branches in a very odd manner. This bean is most valuable for feeding horses and cattle in general. Carouba trees are very numerous in Majorca, interspersed among the Olive trees, and are grown for their produce, not for ornament, which is little if at all thought of in the Mediterranean.

The Fig trees are also very large and very numerous. They are often quite timber trees, and as large as those which I saw at Aidin, near Ephesus, in Asia Minor, from whence are gathered the Figs we receive from Smyrna. These Figs must be an important article of diet as well as of export. One large Fig tree, with its double crop and abundant produce, suffices for the wants of a large family. A few Figs, or any fruit, with a piece of bread, make a luxurious meal for the poorer inhabitants of Southern Europe.

The Apricot trees are large, beautiful timber trees, often as large as forty or fifty year Oaks, covered with dense luscious foliage, and produce fruit in profusion. It is just beginning to ripen, but is small and flavourless. The Apricot is clearly suited to a very warm and dry climate. I found it, on former occasions, growing as a timber tree in Murcia, in the driest and sultriest part of Spain, and also in Algeria, near the desert. In these regions it grows to a size, and to a beauty of which we have no idea. No wonder that its branches constantly die off in our hyperborean climate; the wonder is that it lives at all in the open air. These trees, however, are not very numerous in Majorca, and are generally planted near farmhouses and villages, no doubt for the personal use of the inhabitants. As the fruit does not keep they can have little or no trade value.

The Almond trees are also very numerous, and Almonds must form an important item of export. They are principally grown in groves or orchards in some localities. They form large, often fine trees, although their habit of dividing into two or three large branches near the ground is not conducive to tree beauty.

Cereals grow and flourish in the sultriest climates, merely because their growth is over and the harvest is garnered before the sultry weather begins. Thus on May 12 I found that the cutting of Barley was becoming general in Majorca, and it was evident that in a week or two the "bearded Wheat" would be ready for the sickle, which, by-the-by, is the only harvesting implement used. A few ears of Barley are held in the left hand, and cut with the right. In the Mediterranean basin the spring rains generally end early in April, but by that time the cereals have their roots deep in the ground, and can conclude their vegetative career without any further supply of rain. The grain is ready for harvesting by the middle, the end of May, or by the first week in June at the latest, by which time, only, the very hot weather of the South begins. Thus it is that bread is always good in these regions of Europe, the grain crops never being spoiled by untimely rain, as in the North. Thus it is that cereals can be grown successfully in the hottest parts of the earth, as in the oasis of the desert of Sahara. Thus it is, also, that in dry summers in England, when pastures fail, there is generally a good grain crop.

MAJORCA ORANGE CULTURE.

All over the western Mediterranean splendid large Oranges are sold as Majorca Oranges. They appear earlier than those grown on the Genoa Riviera or at Valencia and other parts of Spain, and are more expensive. One of the objects of interest in my excursion to Majorca was to investigate the Orange groves, and I expected to find the island stocked with them. To my great surprise, after passing several days in travel—after crossing it in various directions, from north to south, and from east to west—I had scarcely seen an Orange tree. I inquired, therefore, whence all the Majorca Oranges could possibly come from, and was told that they all came from one region, the valley of Soller, situated in the north mountain range, about 30 miles from Palma. To Soller, therefore, I determined to go, taking a carriage, as the road is good.

For the first 12 miles, travelling due north, we merely passed through a portion of the central plain already described. We then reached the base of the northern mountain chain, ascended a series of zig-zags, and crossed the ridge at an elevation of 1500 feet. On looking down at our feet we saw a marvellously beautiful amphitheatre, formed by mountains from 2000 to 4000 feet high, which encircled a beautiful valley, teeming with vegetation. This was the celebrated valley of Soller, all but entirely occupied in its lower area by groves of Orange trees, whilst up the sides of the surrounding mountains crept a forest, first of Olive trees, up to an elevation of 1200 feet, when they were succeeded by a forest of Ilex and Aleppo Pine, which nearly reached the summit.

Thus did I learn, by ocular demonstration, that the far-famed Oranges of Majorca, instead of being the produce of the entire island, as generally supposed, are merely the produce of a natural orchard-house, occupying an area similar to the bottom of the crater of an extinct volcano, with sides several thousand feet high, and with only one small outlet northward to the sea. Indeed, I should have thought that the Soller valley was really an extinct volcanic crater, had it not been that the mountains, as far as I saw, were entirely limestone.

It was much warmer at Soller than at Palma, or in the centre of the island, or than at Minorca, which I had recently visited, and it soon became evident to me that this valley in summer must be a natural oven, stove, hothouse. The rays of the sun being nearly perpendicular in summer penetrate just as directly into a crater valley as they would on a plain, while the heat is confined and increased by refraction. Orange trees are tropical trees, which rejoice in tropical climates, so that the intense summer heat of this shut-up valley no doubt agrees thoroughly with them and accounts for the excellence and precocity of the fruit.

Unfortunately the glory of this once happy valley seems about to depart. Nearly all the oldest and finest trees, and many of the younger ones, are dying, gradually but assuredly, of a fell disease which I found a few years ago in the Orange forest at Mellis, in Sardinia, and to which the name of "Secco," or dry disease, is given. The terminal branchlets become dry and brittle, and die. The drying and death extends to the larger branches, and eventually to the trunk, and the entire tree dies. I was told at Mellis that this disease only attacked non-grafted trees—trees grown from seed, and never or scarcely ever trees that had been grafted. I have examined many of the Orange trees here, diseased and healthy, and can find no trace of their having ever been grafted. Can this explain the death of the trees here, which threatens to ruin the country? I am told that the value of the annual export of Oranges alone amounts to above £30,000. Not knowing Spanish, and getting no questions with the natives at Soller, a Palma gentleman, however, who owns an Orange orchard at Soller, told me that the Sardinian statement holds good in Majorca, the diseased trees are non-grafted.

I would mention that it appears the universal custom here to cultivate the ground under the Orange trees up to their trunks, principally with vegetables. May not the ground be thus exhausted during the summer growth of the trees, and may not subsequent heavy dressings in winter, with a view to remedy the exhaustion of the ground by the superficial crops, still further injure the trees?

From my experience in very many parts of the Mediterranean shores and islands I think I am warranted in saying that the Orange tree cannot stand wind at all, from whatever quarter. It certainly is only successfully cultivated between four stone walls, as at Malta, or in folds, depressions, cavities—sheltered, protected from the wind, as in Sardinia, Corfu, and Majorca. Its wonderful fertility, the immense number of fruit it produces, evidently enables a very small but sheltered locality to play a great part in the commercial production of Oranges. I have often thought that good Oranges might be produced commercially in England. Certainly the Orange tree, as many call it the Vine, and bears confinement equally well, only it must be submitted to a great summer-heat to bear good fruit, and the expense of the necessary summer-heating might destroy profit, which, however, is great. The Soller Oranges were sold this winter at 16s. the thousand.

THE SOLLER VALLEY.

The really magnificent Soller valley and mountain amphitheatre is connected by a narrow pass with a second amphitheatre, still grand and majestic, although on a smaller scale, which forms the port and harbour of Soller, about 3 miles from the town. The mountains which form the sides open to the extent of about a third of a mile, to let in the sea, which forms the port. The latter presents about a mile and a half in circumference. The sea entrance completes the circle. In this beautiful little port there is a small jetty, deep water, and all but perfect shelter.

The mountains slope up gradually all around to a height of about 1000 feet, and from the lighthouse which limits the western sea angle the view is inde-

scribably beautiful; indeed, I have scarcely in any part of the Mediterranean seen anything as beautiful as the view looking landwards. The two amphitheatres of mountains rising one above the other into the clouds, the smiling, quiet, little lake-port at our feet, with its rocky channel winding towards the sea, fill the mind of the observer with admiration. Seaward the entrance to the port widens out, and is protected by bold, frowning, precipitous headlands, which terminate abruptly in deep water. The mouth of the harbour channel is wide, and smoothly offered, and a protection, which betwixt the ship that went astray and struck on the adjoining rocks. It would be heard of no more.

I spent two days on these rocks with a companion, I am happy to say, and recognised the vegetation of the warmest regions of the Mediterranean, several species of Ephedra, including the detroides, Cneorum tricocum, Juniper, several species; Aleppo Pine, Rosemary, Lentiscus, Smilax aspera, Alaternus, wild Olive, &c.

In concluding this brief sketch of the spring vegetation of Majorca, I would add that I saw but very few flowers cultivated or wild. The wild ones were, no doubt, things of the past, burnt up by the sun, for it had not rained for a month. I only saw a few patches of the commonest cultivated garden flowers at Palma, and in the garden of a nobleman in the interior Corcaera, which are not cultivated and cultivated all over the Mediterranean for winter decoration and for placing in the hair of the young women; Nasturtium, Stocks, Delphiniums, Hollyhocks, Bengal Roses, garden Poppies, Marigold, white Lilies, Fancies, and that is all. There are a few Date Palms here and in the interior, but I do not think they are not cultivated. *Th. Henry Bennett, M.D.*

Garden Operations.

PLANT HOUSES.

PLANT STOVE.—The Fern-house should now have more air, in order to solidify the young growth as it is made. The almost incessant rain and wind had so long through the spring has prevented the admission of air in sufficient quantities to such plants, and where the precaution has not been taken of keeping the atmosphere somewhat drier than usual, so as to counterbalance the effects of an over-sufficiency of air, the ground assume a wet and spongy condition, and draw. More shade also will now be required than at any other time of the year, not only on account of the sun attaining its maximum power, but the young fronds that have through the spring, and in the case of many species are still being, freely produced, are less able to bear direct sunlight when they get older. In the cultivation of Ferns generally there is nothing more common than to see them grown too soft by keeping the atmosphere too moist and over-shading. So treated the plants usually have a taking appearance, by the deep green colour of the fronds, assume a wet and spongy condition, but if required for a conservatory, room decoration, exhibition, or cutting, they cannot possibly receive a worse preparation than by being kept too moist and over-shaded. A very useful occurrence is to see Ferns on an exhibition stage fall of languant growth, yet so tender and fragile as to suffer to an extent that seriously disfigures them even by the friction of their own matured fronds, or shivering up by the effects of the air. The same thing occurs, after being so grown, when they are used for home decorative purposes, but its injurious effects are never so clearly seen as in the case of Ferns required for cutting for bouquets and other floral arrangements, where they have often flag and have a miserable look before they have been cut many hours—than which there are few things more tantalising, for instead of adding elegance to the bouquet, in which they are associated, they spoil the effect of the whole. This is more particularly the case with Adiantums, the five best of which for cutting are tenerum, formosum, and pubescens—for vases and baskets, and cuneatum and gracillimum for bouquets; for the cutting of a bouquet of the latter kind, when they are grown so as to stand without flagging. The best way to deal with these plants is to grow them up from a small state until they get to a useful size under ordinary Fern-house treatment, after which put them in a shady corner in the warmest and driest part of a greenhouse, or in any other situation where they will not receive more warmth with a much drier atmosphere than in the Fern-house. Here the fronds will not grow to above half the size that they attain in a Fern-house, but they will keep as fresh and plump when cut with their stems in water for a week as when growing. So grown the fronds are a much lighter green.

Tree Ferns that have fully completed the growth of their first lot of spring fronds may have some of the old ones cut away, which will be an advantage if they are at all affected with scale or

thrips, but in this matter the operator should be guided by the strength of the plants; any that are weak, or have been recently imported and not yet got fully established, should never so much as have a single removal, and the same may be said of them as the removal whilst all green has a weakening influence that tends to diminish the size of the fronds that are produced afterwards. For this reason, with rampant growing species, either planted out in pots or tubs, in houses where there is a deficiency of room, if the same is used freely in thinning the mature fronds more or less the plants can often be kept within the required limits; this particularly applies to such vigorous-growing kinds as *Cyathus medullaris*, *Alphospha excelsa*, *Cibotium Schiedei* and regale, or any others that are outstanding in the same in which they are placed. A very great mistake is often committed in planting Ferns out. With the unlimited room thus given them it is next to impossible to keep them within bounds, and prevent their smothering the weaker-growing kinds. Much root-sprouting in these plants is totally unnecessary, as by a liberal use of manure-water they may be kept for years in a vigorous condition, and the size of their fronds be regulated by the frequency and strength with which it is used.

To grow Ferns with any degree of satisfaction there must be a special attention to the soil. The worst pests that afflict them are thrips and brown-scale, and for the next three months, where these at all exist, they will increase apace, especially where more heat is applied than the plants require. Many of the most elegant species of Ferns, such as the *Chalcidiales* and *Polypodium*, and very *Adiantums* and *Aspleniums*, are often grown much warmer than they should be; where these plants are confined in stove heat, frequently much too dark and with insufficient air, the growth is long and weakly, and the plants are so predisposed to the attacks of thrips, that the next to be done is to keep this pest down upon them, whereas if grown cooler little difficulty would be experienced. Nothing contributes more in giving an elegant finished appearance to a vase of cut flowers than a few long pieces of the old *Asplenium* or *Polypodium* continuing to have this condition, to stand well, the plants should be grown in pots or baskets hung up to the roof, where the pendent growths they make are thus sufficiently hardened to stand for days in water, and independent of their being so used the plants afford the look of any house in which they are so placed. *T. Baines.*

FLOWER GARDEN, ETC.

As this is the most important time of the year for the arrangement and planting of the flower garden for the season, considerable thought is required so to arrange the beds as to give the greatest amount of satisfaction, in all cases. The blending of colours depends upon the nature of the artist, and the stock of plants at his disposal has also considerable influence in guiding him to certain ends. Planting must now be persevered with, beginning as far as possible with those plants that are best established in their pots, and most able to resist drought and cold, and being the most tender kinds until all their first finish. Opportunity should be taken of dull days for planting the more delicate-rooted things, which has a marked effect on their future well-being. As all hands will be occupied with the planting the regular work is very apt to fall behind at this busy time, but the planting must have especial attention until all is finished, after which the general work must have its due amount of care. Lose no opportunity of keeping the grass regularly cut, for it always grows fast at this time of the year. Any spare time may be well employed in looking over the *Rhododendrons* that the worm-*tree* has had is getting troublesome, and, like all other pests, the sooner they are got rid of the better. Any climbing plants that require nailing or tying will need to be looked over, as the high winds which we have lately had, and may have at any time, are apt to break over the tender shoots. *Dahlia*s had better have their stakes put in as soon after planting as time can be found for the purpose, as the roots then are not so likely to receive injury as they are after having been in the ground for some time. Keep the place as tidy as circumstances will allow, until time can be found to get the put in regular order again. *T. Blair, Strathland Park.*

FRUIT HOUSES.

STRAWBERRIES IN POTS.—Another season's experience with these subjects confirms us in recommending the following kinds as being still unsurpassed for the purpose: *Keens*, *King of the Pyramids*, *Joseph*, *Paxton*, *Sir Charles Napier*, *Dr. Hogg*, and *British Queen*. *Vicomtesse Hericart de Thury* is also a commendable sort in many respects; while *La Grosse Sucrée*, to which we have adverted in the Calendar last year, as being a desirable kind for early work, has increased its reputation for that respect. Still owing to the acidity of the fruit, which likewise possesses a soft texture, it is not likely to become a general favourite, or ever to supersede the *Keens*' *Scudling*. The

reputed character of Garibaldi, if it be distinct as a setter, even under adverse conditions and at an advanced season of the year, is such as to outdo all others in this respect, and therefore it is worthy of being put forward as the most vigorous and the best runners will be obtainable at an early date; as these plants cannot be secured too early either for pot cultivation or for planting-out into beds or otherwise, they should therefore be layered immediately they are fit; for this purpose a sufficient number of the pots or cuttings should be ready, and a quantity of well-ripened soil should be run through a medium-sized sieve and be placed together where it will not become dry. Water the plants at once after layering, and if this matter is well attended to by all means let the pots be put in a moderately lumpy condition. Continue to plant out the best of the plants which have fruited which are required at the earliest moment, and those which have not yet fruited will succeed in frames or pots far better than in any dry house. *G. T. Miles, Wycombe Abbey.*

THE CHERRY-HOUSE.—The main point in this department, when the Cherries are ripe, will be their preservation in the best condition for this object. They should be freely ventilated at all times without suffering the fruit to become wet, and if any sunny weather prevails, if a shading can be applied it will be an immense advantage, and if the borders in the house are sprinkled occasionally under such conditions it will be a beneficial measure. Recommended to dry the trees when the fruit is gathered, and employ any other means which may be necessary to keep insect pests in check; this is especially necessary in order to keep the foliage healthy as long as possible, so as to prevent a premature growth in the trees in the autumn, which is liable to a subsequent crop of fruit. *G. T. Miles, Wycombe Abbey.*

VINES.—It is now generally admitted that inside borders which have been properly drained and constructed can hardly receive too much water when the Vines are in active growth, and as the occupants of all houses, from the earliest to the very latest, are now in a growing state, particular attention to watering and mulching must be considered one of the main points in successful culture. Vines on which the crops are ripe or ripening must not be allowed to suffer, and if the house is kept clean and well ventilated the fruit and foliage will derive benefit rather than injury from a nicely moistened border. Maintain a sweet growing atmosphere in all houses well watered, and if the Vines show signs of weakness let them have good supplies of tepid liquid manure up to the time of colouring, when stimulants may be discontinued and moisture gradually reduced with just sufficient artificial heat to admit of a free circulation of air, and the plants must be kept cool. Late houses in which shy setters are in bloom will also benefit by a circulation of dry warm air, with a maximum temperature of 90° on sunny days and a minimum of 70° at night. Remove all small berries as soon as the Vines are out of flower, and follow up thinning when those properly fertilised begin to swell. Early houses from which the fruit has been cut must be copiously syringed, to cleanse the foliage of dust and red-spider, and if the old foliage is good the laterals may be kept in check by moderate pinching-in of the points. Let the inside borders be well watered, and ventilate freely. *Messrs. and Lady Downe's* finishing the stoning process will require close watching when we have a change to bright weather, and if they show signs of scalding increase the night temperature, to prevent condensation on the berries, and remove early and in the morning any light weight, when the usual routine may be resumed. Young Vines struck from eyes this spring, if intended for planting out towards the end of the month or early in July, should be potted into 10-inch pots and kept steadily growing. Those intended for fruiting next year will now be getting forward. Finish out the points when they have made growth suitable to the place they are intended to occupy, and encourage early maturation of the canes by the reduction of atmospheric moisture and increased ventilation. *W. Coleman.*

MELONS.—Early Melons now ripening will require great care in watering to prevent the fruit from cracking. Atmospheric moisture must also be reduced by an excess of air, as few plants grow so quick after a sudden check than heavily-laden Melons, and fruit which ripens after the foliage is always deficient in flavour. The best practice, particularly where the plants are grown in a small quantity of soil, is to water moderately until the fruit shows signs of change, and then to mulch with 4 inches of dry horse-dung from an exhausted Mushroom bed. Have a good stock of plants established in fruiting pots for following the earliest when the crop is off. We generally have them

18 inches high when they are taken in, and by adopting this plan three crops may be grown in one season, or two crops in time for winter Cucumbers to follow. If a mixed collection of Melons is grown in one compartment varieties which ripen very much together should be selected. A cold, sultry May has not been favourable to rapid growth in frames, but where attention has been paid to linings and covering at night the fruit will now make good progress. Pay regular attention to watering and syringing before the foliage becomes crowded, and keep a supply of quicklime and sulphur ready for use in case of canker. Elevate the young Melons on flower-pots turned up on their rims, which the beds after the final earthing, to prevent rapid evaporation; and up with abundance of manure in the autumn, and the plants will be able to stand the autumn. Delicate-skinned kinds, like *Easton Castle* and *Victory of Bath*, require shading with tissue-paper when they begin to change colour, as they are liable to scald if fully exposed to bright sun. *W. Coleman.*

HARDY FRUIT GARDEN.

The severe frosts and the cold antipropitious weather that prevailed during the greater part of last month has rendered the present season the most disappointing and discouraging as regards the fruit crop and condition of the trees that gardeners have experienced for a long time past, and unless the most unremitting attention is bestowed on Peaches, Nectarines, and Apples, to keep them clean and render them all the assistance possible to help them in recovering from their present crippled condition, the chances of a crop next season will be very small indeed. As regards Appriots, the only insect enemy to contend with is the grub, which with the slow growth of the trees will be likely to prove more usually troublesome. The trees should therefore be looked closely over, and any curled leaves squeezed between the thumb and finger, which leaves from the soft nature of the insect will be quite effectual in killing them and much more expeditious than it is to do them in any other way. In the case of Peaches and Nectarines, I always depend more on the garden engine and clean water to keep them free from aphides, red-spider, &c., than on any of the many forms of insecticides now so commonly in use, and if applied at the time referred to above, the results are so beneficial themselves, it is seldom necessary to resort to the use of the latter or to adopt any other means of eradicating them. The present season, however, being so exceptional, from the absence of sun and lowness of temperature both day and night, it has not been so successful, and it is necessary to resort to the operation, and greenfly are therefore making the most of the short respite. It frequently occurs that only a few shoots in certain parts of the tree are tadly infested while the others are free, and when that is the case a puff or two of tobacco-cut from a proper distributor is generally sufficient to prevent them from spreading, if followed up as it should be on the first favourable opportunity with a good drenching either from the garden engine or syringe, and as the weather improves one or the other of these ought to be plied freely at least once or three times a week. The apples that infest Plums and Cherries are not so easily dealt with, and take a strong solution of tobacco-water to destroy them, but if all the young shoots-wood is at once pinched back, and only such buds-left as are required for laying in to fill vacant places on the wall, it is an easy matter to keep the trees clear, as they rarely attack the fully grown leaves, the tissues of which are too hard for them to penetrate. What few leading shoots there are after the removal of the breast wood can then be easily dipped in any insecticide of sufficient strength to be effectual, and afterwards nailed in to the positions in which they may be required to be. Following out the above practice I never have any trouble with either Plums or Cherries, and it is the only way to keep them closely spurred back and the trees and fruit in a healthy satisfactory state.

From press of work it is often that Gooseberries and plants get much attention after their winter pruning, and yet there is nothing that makes a better return for any extra attention by way of stopping the side shoots than they do, as they form more spurs up the main branches and it assists in developing the best fruit of three times a week. The apples, Plums, &c. In season like the present, when greenfly is in the ascendant, this stopping is absolutely necessary, as it is impossible to obtain fruit from red or white Currants fit for use unless some means or other be adopted to hold them in check; and it is from this cause that the trees, and the apples, and the excess of discolor and damage the fruit. Raspberries should at once be looked over, and have the suckers reduced to four or five of the strongest and best situated, unless it is in contemplation to make any fresh plantations in the autumn, in which case the present number may be retained by being cut down to a sufficient number to grow into young canes for the purpose. If a mulching of half-rotten manure is now put on, the yield of fruit will be considerably added to it, as it will shade the roots. *J. Sheppard, Woodstone Park.*

THE
Gardeners' Chronicle.

SATURDAY, JUNE 2, 1877.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, June 5. Royal Horticultural Society's Meeting of the Fruit and Floral Committee at 4 A.M. and Scientific Committee at 4 P.M.
 WEDNESDAY, June 6. Sale of the new Catalogue and Greenhouse Plants at Lee's Nursery, Hammondsmith, by Stevens (four days).
 THURSDAY, June 7. Linnean Society's Meeting at 8 P.M.

GARDENERS, we fear, will have cause to remember the present spring. After a mild wet winter, in which many plants scarcely stopped their growth at all, there has come a bitter spring, with frosts and winds enough to carry despair to many a gardener. The growing shoots of such things as common Laurels, Aucubas, Weigelas, are in many places near London blackened and destroyed. The ripe berries of the Aucuba have changed their gay livery of brilliant red for the mournful black. Roses show crippled and curled leaves, many of which conceal a worm 't' the bud, and promise badly for the season's display. The beautiful *Dielytra spectabilis*, usually a model of grace and elegance, scends up its spindly flower-stems—a mere mockery of its usual state. *Myosotis dissitiflora*—a plant which generally excites the enthusiasm, not only of our floral scribes, but of those who have less experience and weaker appreciation of spring flowers—was this year blasted in its beauty by the cruel frosts. Where spring frosts have been, *per se*, powerless to retard or injure, the fierce winds have too effectually done their work. Tender-leaved Limes, Norway Maples, and some of the choicer Aceres, such as *Schweidleri*, have had their young leaves torn to shreds. The prudent Ash has scarcely opened its buds this year, long behind the tardiest Oak, at least in the district from which we write; *Robinia Pseud-Acacia* is even later—its buds have only now begun to move; and the same may be said of those of *Ailantus glandulosa*. *Euconymus japonicus* is not much hurt, but *Elaeagnus japonica* is sorely crippled. The species of *Philadelphus* are unharmed, and the beautiful *Nepalense Buddleia glabra* is fortunately quite unharmed. The common Mahonia has not suffered, but the lovely *Berberis stenocephala* has been hardly the ghost of its usual self. Lilacs and Laburnums have offered mere suggestions of their usual beauty, while the blossoms of the Horse Chestnut are small and have an unusually starved appearance. Pear blossoms lie scattered on the ground, withered, blackened, dead. Cherries are not much better. Plums have made a better stand. Peach blossoms are nowhere, and their leaves are shrivelled and screwed up in some places, and swollen and reddened in others, as if they had rheumatic gout; but no, it is only Peach blister in an aggravated form; so that, though there will be plenty of blister, there will be no Peaches. Gooseberries and Currants are not hurt, and Strawberries promise fairly. Of early Peas and Potatoes, the less said the better; indeed, there is not much left to be spoken of. Nor is our experience singular. From various parts of the country we get similar unfavourable reports. We select one illustration, from a western county, which will have a special interest for those who put their trust in orchard-houses:—

"When I wrote you last, I mentioned that we had 7° of frost here the previous night, but the following night we had 10°, and the Apricot-house not being heated the crop of fruit is most seriously damaged. Never before have I met with so disheartening a reverse, for a finer promise could not have been—by far the best crop we ever had; the plants and fruit were in the most luxuriant health, and therefore very tender. There are

plenty of wall Peas, but very few on the pyramids. Strawberries will be abundant, and so will Grapes, Figs, Pines, Peaches, and Melons, but other fruits will be very scanty. Of Plums there is certainly not a peck in the garden."

We are induced to publish the foregoing letter in the hopes of eliciting from some of our correspondents their experience under like conditions. In the case above cited Apricots have been grown in an orchard-house heated when required, but as the crop was never satisfactory the trees were transferred to an unheated house, with the result above mentioned. Heated orchard-houses require the most delicate management, and are a frequent source of failure, but it is evident that an unheated one with 10° of frost is an equally dangerous place to grow fruit trees in when in bloom.

Dr. BENNETT's letter on the conditions under which the Apricot and other fruit trees grow in Majorca, published in another column, has a special bearing on the subject now under consideration, and should be perused by all who have to grow fruit trees.

—A CORRESPONDENT has sent us, from the neighbourhood of Caterham, a fine specimen of the *HELIIX POMATIA*, that large white-shelled snail of which the Romans were so fond, and which it is supposed they introduced from Italy to our Kentish downs. Be this as it may, the species is rarely found far from the chalk downs. The specimen before us is nearly 2 inches across in its longest diameter. The snail in question is considered a delicacy in France, being fattened in special snaileries on the Burgundian hillsides, warmed with the sun that beats on those limestone downs, and fed with the delicate young foliage and tendrils of the Vine. Fortunate snails! How different your lot from that of your English brother, the humble aspers, and yet may they say, too. "All is vanity" for whether it is better to be cranked or to be eaten is a question for the anti-vivisectionists to consider. Any way, let those visitors to Paris who may be tempted, as we were, by the dainty snails exhibited in the best restaurants reposing in a basket of green moss, garnished with tempting Parsley, pause ere they put the seductive-looking morsel in their mouth. We are willing to believe that when fresh they will challenge comparison with any other delicacy, but they may not be fresh—the butter or fat with which they are served up may be rancid, and there may be too much garlic chopped up with them. We say no more, only—Beware!

—One of the prettiest greenhouse plants at this time of year is *VERONICA HULKEI*, a New Zealand species of semi-scandent habit, and with dense panicles of lavender flowers. Though it has been introduced for some years, and was figured in the *Botanical Magazine*, it does not seem to have been at all generally distributed.

—We learn that Professor BOULGER, the Professor of Natural History at the Royal Agricultural College, Cirencester, is preparing a *Flora* of Gloucestershire, and will be glad of any information as to rare species, localities, &c., that our Gloucestershire correspondents can give.

—From Mr. GLAISHER's quarterly report we take the following remarks on the weather during the quarter ending March 31, 1877:—

"The weather during the quarter has been for the most part exceptional, the readings of the barometer have been usually below their averages, with frequent stormy weather; the temperature of the air was high both in January and February, rain fell almost continuously and was excessive in January, and there has been very little sunshine throughout the quarter.

"The high temperature which set in on November 13, 1876, and continued with the exception of six days in December to the end of the year, was also prevalent throughout January and until February 19, 1877, the average daily excess of temperature for the fifty days beginning January 1st and ending February 19 was 6°.1; and for the ninety-nine days beginning November 13 and ending February 19 was 5°.4; the winter, therefore, of the year 1876-7 has been exceptionally mild. On February 20 a period of rain which was distinguished by several days of temperature below their averages, and then followed by a smaller number of days of temperature above their

averages, and this variation of temperature, alternately warm and cold, continued till March 23; the average daily deficiency of temperature for the twenty-six days ending March 23 was 2°.8. From March 24 to the end of the quarter the weather was uniformly warm, and the average daily excess was 2°.9.

"The fall of rain in January was excessive; at about London and its neighbourhood it fell during the first half of the month on nearly every day, and during the whole of the month it fell on six days out of seven days. The amount at Greenwich was 4.35 inches; back to the year 1815 we have no instance of so large a fall of rain in January; and but two instances which are closely approximate, viz., in the year 1828 when the fall was 4.3 inches, and in the year 1868 when it was 4.2 inches. The average rainfall of sixty-two Januaries is 1.85 inch, so that more than double the average fell in January; this is the more remarkable, as the fall in December, 1876, was 3.0 excessive.

"The fall of rain in the three months ending January was 13.00 inches, being more than half the mean annual fall of sixty-two years, viz., 25.2 inches. The average fall for the three successive months, November, December, and January, is 6.24 inches; therefore, for these months, the fall of rain has exceeded in amount twice the average fall.

"The fall of rain in January was large everywhere, and it fell on every day in the month at one or other place; the day of least fall was the 22d, on which day it fell at a few places only, and to a small amount; on the 12th, 13th, 23d, and 26th, the falls were less than a quarter of an inch; all the other days the falls exceeded a quarter of an inch at one or more places; on the 2d, 3d, 4th, 6th, 7th, 8th, 10th, 11th, 17th, 19th, 23rd, and 30th, the fall was one or more stations was nearly 1 inch, or it exceeded 1 inch.

"The mean temperature of the air for January below that of December over the whole country was very nearly alike, and averaged 1°.3; that of February above that of January was nearly the same everywhere, the average being 1°.1; and that of March below that of February was nearly uniform, and averaged 2°.8.

"The mean temperature of the air for January was 42°.7, being 0°.2 and 0°.1 above the averages of the preceding 106 years and thirty-six years respectively. In the preceding 106 years there are but five instances of so high a mean temperature for the month of January, viz. :—

In 1796 it was 45.3	In 1846 it was 43.7
1804 " 43.3	1875 " 43.4
1816 " 44.4	

"The mean temperature of the air for February was 42°.5, being 4°.9 and 4°.3 above the averages of the preceding 106 years and thirty-six years respectively. In the preceding 106 years there are only eight instances of so high a mean temperature for the month of February, viz. :—

In 1779 it was 45.3	In 1859 it was 44.7
1784 " 44.7	1859 " 44.7
1809 " 44.1	1859 " 45.8
1844 " 44.9	1877 " 44.8

"The mean temperature of the air for March was 46°.7, being 0°.4 and 1°.1 below the averages of the preceding 106 years and thirty-six years respectively; it was higher than the values in 1874 and 1876 by 3° and 0°.4 respectively; but 0°.5 above that in 1875.

"The mean temperature of the air for the quarter was 42°.3, being 3°.6 and 2°.5 above the averages of the preceding 106 years and thirty-six years respectively. In the preceding 106 years there are but six instances of so high a mean temperature in the quarter, viz. :—

In 1846 it was 42.4	In 1846 it was 43.6
1822 " 43.5	1863 " 45.5
1834 " 44.9	1872 " 49.6

—Advices from HOLLAND refer to the fact that the *HYACINTH CROP* is passing through a crisis that is causing some anxiety to cultivators. The blight which exercises such a peculiar withering influence on the Hyacinth is sadly affecting some of the crops, and it may lead to a scarcity of certain sorts and an advance in their prices. Tulips promise well, so do Crocuses, and the bulbs are expected to be good and cheap.

—We are informed that the late MANCHESTER NATIONAL HORTICULTURAL EXHIBITION proved a decided success, notwithstanding the unfavourable opening days. During the Whitweek the number of visitors was upwards of 50,000.

—The new KIMBERLEY PARK, at Falmouth, presented to the inhabitants of that town by the Earl of KIMBERLEY for their use and benefit, and as a recreation ground, was opened on the 24th ult. by his Lordship, in the presence of the borough Members

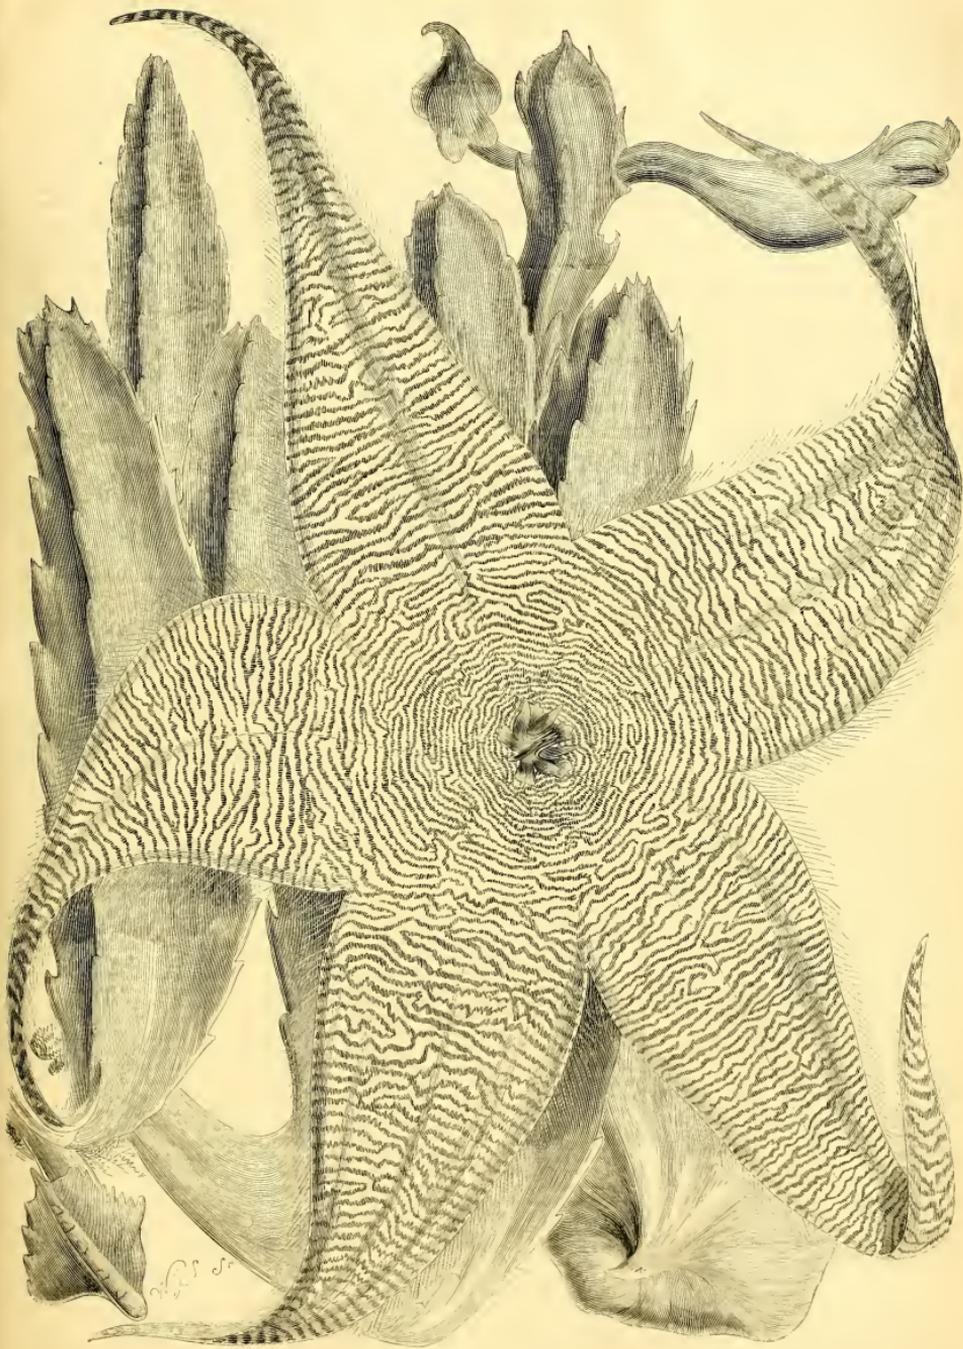

FIG. 112.—STAPELIA GIGANTEA. (FOR DESCRIPTION, SEE P. 684.)

and Corporation. The park is picturesquely situated in Berkeley Vale, diverging from the centre of the town westward, and has been planted and beautified by Lord KIMBERLEY, who was accompanied on this occasion by the Countess and the Hon. ARMYN and Lady CONSTANCE WOODHOUSE. A public dinner followed, at which Lord KIMBERLEY was present.

— We have received the following note from Mr. DAY, of Tottenham:—"Your account of *DENDROBIUM TRIVICORNIS* in the *Gardener's Chronicle* of May 26 is not correct. It was sent to Messrs. HUGH LOW & Co. first in 1856 by their correspondent, the Rev. Mr. PARRISH, to whom Orchid growers are indebted for many fine things. I flowered it here in 1866, and have a drawing of it dated May of that year; and it is figured in the *Botanical Magazine*, July, 1869, t. 5780, under the name of *Dendrobium densiflorum* var. *alto-luteum*." [We had overlooked the circumstance related by Mr. DAY, and therefore apologise to Messrs. LOW for unwittingly giving to another firm the credit due to them. Eds.]

— The proprietor of the *Darling Downs Gazette*, the oldest provincial newspaper in Queensland, who offered several valuable prizes for competition at the late annual show of the Drayton and Toowoomba Agricultural and Horticultural Society, has favoured us with a photograph of several of the bunches of Grapes shown on the occasion, and which are stated to be those which carried off the prize for the largest three bunches, and some others.

"The weight of the heaviest bunch amounted to 8 lb. 2 oz., and it must be remarked that none of the bunches were the result of any forcing process. That the prizes would be given was not announced until a week or two before the show, and consequently competitors had simply to overhaul their vineyards and select the largest bunches which Nature had produced. The Darling Downs, an elevated table-land of rich volcanic soil, enjoying a climate more temperate than any other portion of the colony, is known in the colony as the garden of Queensland. What is extensively grown, as well as Maize, Barley, and Oats. Nearly all English fruits grow to perfection, as well as Oranges—the remarkable success of which fruit has encouraged several settlers to lay out extensive orchards. The Vine also flourishes on this tract, giving splendid results, and the wine-making industry—although yet in its infancy—promises to attain a very great importance."

— Mr. MACKELLAR, gardener to Sir JAMES WATTS, Kt., Abney Hall, Cheshire, has sent us a very beautiful cut spike of *DENDROBIUM FORMOSUM*, bearing four fully developed blossoms, and one yet to open. The flowers measure from 4 to 5 inches across, and are white, with the exception of an irregularly outlined bright yellow blotch on the lip. This must be the variety of *D. formosum* named *giganteum*; and, as by rate, as Mr. MACKELLAR observes, it is a very beautiful evergreen species, and can be grown by any one who has a stove; in which, in the absence of an Orchid-house, it has been cultivated at Abney Hall.

— A local paper records the occurrence recently at Cockermonth of a Good Templars' FRUIT BANQUET, at which about sixty persons were present, and four courses of fruit were distributed.

— Mr. A. J. TEMPLE, gardener to J. SHUTTEWORTH, Esq., Hartsholme Hall, Lincoln, has favoured us with a good sample of *CHENOPODIUM BONUS-HENRICUS* (English Mercury), or, as it is popularly called in Lincolnshire, "Markary." When this subject was being discussed in our columns a few months ago Mr. TEMPLE stated that no labouring man in his locality considered his garden completely stocked without it, and by rich and poor alike it is highly prized—a circumstance that can surprise no one who has partaken of it at the dinner-table. Mr. TEMPLE mentions as a fact worth recording that his father, when gardener at Falkland Palace, in Fife-shire, gathered the *Chenopodium* nearly fifty years ago, and sent it, instead of Spinach, for the use of the kitchen.

— Owing to the wanton destruction of flowers, shrubs, &c., by a pleasure party who visited Lord STAMFORD'S famous gardens at Enville during the Whitsun holidays, his lordship has ordered them to

be closed to the public. A number of persons who were found committing the damage were turned out of the grounds at once.

— In a congregation held at Oxford on May 24, a series of resolutions were proposed, the object of which was the establishment of DEGREES IN NATURAL SCIENCE, corresponding to the B.A. and M.A. degrees, and permitting candidates for such degrees to substitute at the earlier examinations either French or German for one or other of the classical languages, but at the same time increasing the quantity of mathematics required of them. The title of the degrees was to be Bachelor and Master of Natural Science. The Council draw attention to the fact that these proposals will not in any way interfere with the existing arrangements as to degrees in Arts. The B.A. degree, in other words, will still be qualified for by the study of theology, or mathematics, or law, or, finally, natural science; but by its side will be a degree for Natural Science students possessing a definite meaning and value. After much discussion the resolution was carried by sixty-three votes to forty. The University of London established such degrees some years since.

— According to *Nature*, LOCUSTS were so numerous early in May in ALGERIA, as almost to stop the trains running from Blidah to Algiers.

— The Society of Arts has convened a special meeting of agriculturists for Tuesday next to discuss the question of STAMPING OUT HURFUL INSECTS, which was raised by a recent circular from the Lords of the Privy Council to the different agricultural societies throughout the kingdom, in which circular certain propositions made by Mr. ANDREW MURRAY, F.L.S., were brought under notice. The Duke of BUCCLEUCH has consented to preside, and the discussion is to be opened by the reading of a short paper on the subject by Mr. MURRAY.

— We learn that the LESSONS TO THE YOUNG GARDENERS at KEW, and about which there has been some correspondence lately, are divided into those given in the summer and those in the winter months respectively. From May till August practical lessons in botany are given twice a week, as also demonstrations in economic botany and the uses of plants, in the museum. In the winter months lessons on the geographical distribution of plants, microscopical demonstrations of the structure of plants, together with lessons in elementary chemistry, physics, and meteorology. Each student is expected to attend regularly and to take careful notes. It is quite evident that a great deal is done in a quiet way, without fuss or ostentation, and at a trifling cost.

— At the anniversary meeting of the Linnean Society on the 24th ult., the President, Dr. ALLMAN, delivered an address on the Foraminifera, tracing the history of their gradually increasing complexity of structure from the simpler forms to those of higher organisation. He showed how these creatures, which are undoubtedly animals, have the power of forming starch in their tissues, and how in some cases the extremely minute germs by which they are propagated are capable of resisting a heat of 300° F. with impunity, a fact of the greatest importance in the question of spontaneous generation. It has been supposed that all germs would be killed by such a temperature, and that any which made their appearance in duly closed vessels after such exposure must have been developed as entirely new creations in the fluid; but if the germs in question are not killed by such a heat the old doctrine "*omnium ex ovo*" is still upheld.

— Among spring flowering plants at Kew we noticed lately that the deepest coloured *ADERBITIA* known to us is *A. conspiciua*. Its flowers are of a dark violet-purple; *A. tauricola* is a very free flowerer, with flowers of a pale lavender, larger than those of *A. deltoidea*. They may be seen now in the herbaceous ground at Kew. The best of the species of *Trollius* is *T. Fortunei*, the flowers of which are of a deep orange colour. *Alyssum saxatile* is not to be deposited from its place as the best yellow of its class. *Iberis gibraltarica* is the best of the half shrubby species of *Iberis*, though *I. Priviti* and *semprerviana* are by no means to be despised. *Convulvulus Cneorum* against

a wall is a charming plant, its silvery leaves and large, white, funnel-shaped flowers giving it a very striking appearance.

— Here is an alleged fact for the members of the Pelargonium Society. M. HICKEL has been experimenting with the leaves of the *PELLARGONIUM ZONALE* by wrapping them round small pieces of meat. After some time an acid secretion was observed, which produced on the meat the same effect as has been observed in the so-called CARNIVOROUS PLANTS. The Pelargonium leaves, it must be remembered, are clothed with sticky glandular hairs. When meat was wrapped in leaves destitute of such glandular hairs—such, for instance, as Ivy leaves—no such effect was produced. Even where the leaf was covered with hairs not of a glandular character, such as *Glechoma hederacea* (ground Ivy), no effect was perceived. It is the glandular hairs then alone that are endowed with the property of dissolving nitrogenous matter. It remains to be seen, however, of what use the property is to the plant. At present it would seem as if the carnivorous property were a mere luxury, which the plant could do perfectly well without.

— From Mr. DAVID INGLIS, Howick Gardens, Lesbury, Northumberland, we have received some LARGE MUSHROOMS, which were taken from an old *Melon-pit* which has stood all winter full of bedding plants. Eight specimens weigh exactly 3 1/2 lb., and the two largest 1 1/2 lb. It is nothing unusual to see Mushrooms growing on old *Melon* beds, but we do not remember to have seen any so large and at the same time of such good quality before. Mr. INGLIS states that he has had a large supply from the pit, and to all appearance it would have continued in bearing much longer had it not been required for other purposes.

— Seed growers are often puzzled at the varying times required for SEEDS of the same description to come up. For instance, seeds of *Primula japonica* sown at the same time and under the same conditions, come up very irregularly. This has been made the subject of inquiry and experiment at the agricultural station of Tharand by M. NOBBE and HAENLEIN, who attribute the differences in question to the varying anatomical conformation of the skin of the seed. In the Handbook of Seeds, *Samenkunde*, numerous observations of a similar kind are made chiefly from German sources, the researches of MEISS, TUFFEN, WEST, and other English observers, being apparently, however, not known.

— Baron VON MUELLE writes that he has lately determined that the *PHYTOL*, a stimulant said to be of marvellous power, and known to be in use by the aborigines of Central Australia, consists of the leaves of *Duboisia Hopwoodii* (*Frax. Phytol. Austr. iii.*, 138). "This bush extends from the Darling River and Barcoo to West Australia, through desert scrubs, but is of exceedingly sparse occurrence anywhere. In fixing the origin of the *Phytol* now a wide field for further inquiry is opened up, inasmuch as a second species of *Duboisia* (*D. myoporoides*, R. Br.) extends in forest land from near Sydney to near Cape York, and is traced also to New Caledonia, and lately by me also to New Guinea. In all probability this *D. myoporoides* shares the properties of *D. Hopwoodii*, as I now find that both have the same burning acid taste. Though the first known species is so near to us, we never suspected any such extraordinary properties in it as are now established for the later discovered species. Moreover, the numerous species of the allied genus *Antheoceras*, extending over the greater part of the Australian continent and to Tasmania, should now be tried, and, further, the many likewise cognate *Schwenkes* of South America should be drawn into the same cycle of research, nothing whatever of the properties of any of these plants being known. The natives of Central Australia chew the leaves of *Duboisia Hopwoodii*, just as the Peruvians and Chilians masticate the leaves of the *Coca* (*Erythroxylon Coca*), to invigorate themselves during their long foot journeys through the deserts. Those living near the Barcoo travel many days' journeys to obtain this, to them, precious foliage, which is carried along about by them broken into small fragments and tied up in little bags. It is not improbable that a new and perhaps important medicinal plant is thus gained. The blacks use the *Duboisia* to excite their courage in warfare—a large dose infuriates them."

— The seventeenth anniversary festival of the ROYAL AGRICULTURAL BENEVOLENT INSTITUTION will be held at Willis's Rooms on Wednesday next, under the presidency of the Right Hon. the Earl of DUNMORE.

— Our excellent contemporary the *American Agriculturist* (one of the best serials, by the way, that comes before us) tells its readers that spring in England begins in February and summer in May. We doubt the accuracy of this in any season, but we think this year winter began about the middle of April.

— A remarkable collection of HERBACEOUS CALCULARIAS is now in bloom in one of the plant-houses of Messrs. SUTTON & SONS, London Road Nursery, Reading. The house, which is of good size, is even inconveniently crowded with specimen plants, but it serves to show off their great beauty and attractiveness *en masse*. Each plant is a specimen, but some are much larger than the others; a few are in 10 and 12-inch pots, the smaller in 24-size pots, but in each case the growth is dwarf, stocky, and healthy, and each plant is densely laden with large flowers. The first sowing was made on July 16 last year, the second sowing on the 31st from seed just harvested. The *Calceolaria* is naturally a free bloomer, but many of these plants are so densely laden with bloom that the flowers may be said to be heaped upon them. The colours are very varied, from creamy white, handsomely spotted on the body, to rich dark maroon, and between these there are many intermediate shades. A considerable amount of attention is required in keeping the plants clean and healthy, but they are well cared for, which is abundantly evidenced by their condition.

— On May 25 and 26 a successful floral exhibition was held in the beautiful grounds attached to the Orleans Club House, at Twickenham. The show was held under the management of Mr. J. K. ROLLISON, in two large marquees erected in a meadow on the banks of the Thames, and the competitions in the various classes were generally very good, the specimens staged being mostly of high-class quality.

— The *Cumberland Packet* states that the annual "RADISH FEAST AT LEVENS HALL," a custom dating from time immemorial, and supposed by some to be a relic of feudal times, was held as usual on Saturday, May 12, at Levens Hall, the seat of the Honourable Mrs. HOWARD, and adjoining the high-road about midway between Kendal and Milnthorpe. May 12 is also the fair day at the latter place, the fair being opened in the presence of the Mayor and Corporation of Kendal, who afterwards dine at one of the hotels, where they are joined by a number of gentlemen from the surrounding district, and tradition hath it that the Radish feast (which is held after the fair) originally rose out of a rivalry between the families of Levens Hall and Dallam Tower as to which should entertain the Corporation with their friends and followers, and in which Levens eventually carried the palm. The grounds are thrown open on the return from Milnthorpe of the Corporation, who are the first to enter, and admission to the public is by ticket given gratis on application. The "feast" is provided on the bowling-green in front of the Hall, where several long tables are plentifully spread with Radishes and brown-bread and butter, the tables being repeatedly furnished with guests. The liquors comprise two very potent extracts of barley-corn—one, which is called "morocco," being of reputed great age. After the repast comes an important feature of the proceedings, when the "colts," or new visitors, are brought into a ring as they are captured, and are compelled, each pointed upon one leg, to drain a quantity of "morocco" from a glass of unusual and antique make, and to give the pledge—"Lack to Levens as long as the Kent flows." Failing this achievement, as many do, a money forfeit for the benefit of the attendants is incurred, and the whole affair occasions considerable diversion.

— We notice from an advertisement that Mr. WILLS is about to offer for sale by auction, at Stevens' Rooms, TWENTY-FIVE of his best and most distinct DRACENAS, the cream of the whole collection. As Mr. WILLS' business does not exactly lie in the direction of distributing new plants, he has probably acted wisely in coming to this determina-

tion, the more so as the number of really fine kinds is more than it is reasonable to suppose should be sent out from one establishment within any reasonable limit of time. At any rate the public will now have a better chance of obtaining them, and as they are so extremely varied in character and colouring there are varieties to suit all tastes. To Mr. BAUSÉ belongs the credit of showing us unmistakably that we need not go to the South Sea Islands for Dracenas, if we only know how to set about "creating" them nearer home. The sale is to take place on the 26th inst.

— Some ripe seeds of *Adenium obesum* were lately brought to me by my son, Surgeon-Major R. W. BERKELEY, from Aden. As the surface of the seeds, with their short, obtuse, reflexed hairs seemed curious, I was induced to examine them with the microscope, and I was surprised to find that each of them contained a very broad double spiral thread, ending in a loop at either end, reminding one closely of what occurs in the elaters of *Jungfermannia* (SCHACHT, *Pflanz.*, tab. iv., fig. 13). In most cases it is like a loop of tape simply twisted, but occasionally there is a slight inclination to further complication by branch-

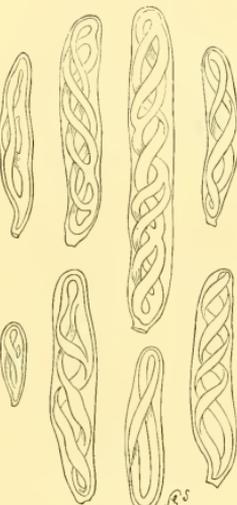

FIG. 113.—HAIRS FROM SEED OF ADENIUM OESUM. (Enlarged 165 diam.)

ing. The arrangement, however, varies in each cell, as will be seen by the drawing by Mr. SMITH (fig. 113), which exactly agrees with my own observation. I do not recollect having seen precisely the same appearance in hairs before, but previously observed or not, it appears quite worthy of record. M. 7. B.

— We have another DOUBLE-FLOWERED CINERARIA from Messrs. DICKSONS & Co., of Edinburgh—a large and superior variety to any of those mentioned last week, and the colour being a deep magenta-purple. This has been named *Pilgr Beauty*. As we understand the plants are of dwarf stocky habit, they must do much towards making the double-flowered varieties of this flower popular amongst those who grow plants for decorative uses.

— The ROYAL HORTICULTURAL SOCIETY'S GREAT SUMMER SHOW, to be held on Tuesday, June 19, promises to be a very good one. The schedule is very elastic, and will afford room for a more varied display than usual. There will be a regular competition for the medals or money prizes in each class. The prizes for fruits and vegetables are especially good, and ought to bring out a good display. New plants will no doubt be well represented in the com-

petitions for Mr. BULL'S cups; and as in addition to the above subjects the annual show of the Pelargonium Society will take place at the same time and place, the attractions to be offered to visitors will be extensive enough for the greatest floral gourmand. As the show is likely to be largely attended by both exhibitors and horticulturalists generally, may we suggest to the Council certain improvements that might be made in connection with the show, with a view to affording greater comfort to those most concerned. First, owing to the exceedingly limited space in the yard, either at the arcade entrance or in the Albert Road, the accommodation for exhibitors' vans is specially inconvenient, and matters are rendered much worse because, as there is no one in authority to make the most of the limited space, the vans are set—to use a vulgarism—"all over the shop," one blocking up the way to another, taking up the space in which several might conveniently stand. If a policeman were detailed off for the purpose of arranging these things properly it would be to the advantage of all the exhibitors. Second, a proper lavatory, in which any one who has borne the heat and dust of arranging plants for several hours may get a wash and brush-up, and thus be presentable for the rest of the day, without having to go goodness knows where for the desired accommodation. Surely the Council can secure, either in some part of the buildings or in a tent, this simple requisite for the exhibitors' comfort. Lastly, a cheaper refreshment bar, buffet, or room is sadly needed by the many exhibitors' employes who desire to be at the show and yet are driven out to remote beer-shops or elsewhere to get needful refreshment. It would be worth while seeing how far a tent devoted to the supplying of ale, tea, coffee, lemonade, and good edibles at a cheap rate would be a success, and leave the buffet in the arcade to those who are rich enough to pay for luxuries that are beyond the reach of poorer men. The Council have the power for doing good in this direction at little trouble to themselves, and we are sure that they would earn the hearty thanks of those most concerned if they would treat exhibitors and their employes as valuable allies, rather than as necessary evils.

— Some two years since or more, Mr. FLEMING, gardener to R. HOUGHTON, Esq., Sandhays, Waterloo, Liverpool, sent us specimens of a seedling Fern, to which we then gave the name of *ADIANTUM CONCINNUM FLEMINGII*. It had, of course, many of the characters of *A. concinnum*, but these were so veiled by other features that the relationship with *A. concinnum* was rather questioned at that time, though it has since been settled by the plant itself, which produces from its spores, not the variety *Flemingii*, but true *concinnum*. Its chief peculiarity, from the gardener's point of view, is its upright and dense habit of growth, and its comparative dwarfness, since it does not exceed some 18 inches in height. The fronds want altogether the lax, drooping character which belongs to the typical *A. concinnum*. Since that time it has been exhibited at one of the Royal Horticultural Society's meetings (July 21, 1875), when it received a First-class Certificate, a similar award having been recently made to it by the Royal Caledonian Horticultural Society. The fronds are ovate in outline, tripinnate, or sometimes quadripinnate, the pinnae and pinnules thickly set and overlapping, bright green, and having the usual characteristic of the lowest pinnules lying along the rachis, the same peculiarity being more or less evident in the pinnae themselves. In the original specimens sent to us the larger pinnules were half an inch wide, and rather deeply lobed; but in specimens recently forwarded by Messrs. IRELAND & THOMSON, of Edinburgh, by whom the plant is being sent out, the pinnules are somewhat smaller, and rather more deeply lobed, thereby increasing the elegance of the plant, which is certainly one of the prettiest of the smaller-habited Maiden-hairs, ranking in this respect with *cuneatum*, *decorum*, and *amblye*. Mr. FLEMING states that this Fern is sufficiently hardy in constitution to thrive in an intermediate house, and that all the plants of it propagated up to this time have been obtained by division, since the spores produce only the typical *concinnum*.

— We have been favoured—shall we say deceived?—by the inspection of some grey-looking fragments of flowers, which at a casual glance we took to be those of the soft grass, *Holcus lanatus* or *H. mollis*. More careful examination, however, showed them to be

cultivation from the contrast they afford. Trilliums increase readily by division made any time during the spring, before they get much advanced in growth; and in order to do this without injury, the best way is to plant them in a moist soil. Let the soil be so deep where the separation can be made to the greatest advantage. Any moist, sheltered, shady place will do to grow them; and if the soil is not naturally loose and rich in decomposed vegetable matter, it should be made so by working in plenty of leaf-mould or refuse peat. In either of which I find they grow freely. As their flowering satisfactorily depends on the growth they make, every encouragement should be given to induce healthy foliage, and care taken that it is not interrupted by frost. If the plants are not otherwise the crowns get weakened considerably, and do not come to maturity. Besides being propagated by division they may likewise be raised from seed, which should be sown under haillights on a moist, sandy soil, and the plants when up nursed on a similar situation. Trillium grandiflorum has been so much admired with us in pots that I am working up a stock to try it for forcing, but whether it will succeed or not under artificial heat remains to be seen. Certain it is, however, that taken up and potted, and allowed to come on in a moist soil, they will naturally afford more satisfaction or that make a better return for the time and attention bestowed on them. S. W.

The Ivy and damp Walls.—The late Mr. Lindsay Carnegie, Kilmblethorn, Forfarshire—a most enthusiastic horticulturist—was very fond of Ivy, and at one time, whilst I was partner there, he had nearly every house within the hollow walls examined by me for Ivy. The kitchen of the house in which I lived was covered with Ivy, and during damp weather the plaster on the inside walls could have been taken off in handfuls. About two years before I left I cut down the Ivy, and the house was naturally free of it. My nephew of Mr. Rust lives in that house at the present time, but I believe Ivy has not again been allowed to grow on the walls. When I entered the service of my present employer, the Earl of Southesk, the front and one end of the gardeners' bothy and one end of the gardener's house were covered with the same roses, which as the foliage always got brown with red-spider and thrips, his lordship wished to be rooted out and Ivy planted instead. Strong plants were put in, and in the course of four or five years the walls were closely covered. Previous to this the bothy walls had been quite dry, but they became damp both upstairs and down, and, like my old kitchen, you could have scraped the plaster off in handfuls. The damp in this case was the cause of much annoyance, as his lordship, while anxious to retain the Ivy, was equally concerned about the comfort of the young men. After several consultations I then held we examined the end of my house, that was planted and had become equally as well covered as the bothy, but found no damp. This we concluded was owing to the roof projecting about 18 inches over the wall, and so must do so for the means of keeping the dry. I immediately got eaves put up to conduct the water away and not let it run off the slates amongst the Ivy; that is about ten years ago, and we have never seen a damp spot on the walls since. Ever since I have been an advocate for Ivy on walls. V. Crudden, *Kinnaird Castle Gardens, Brechin*.

—A lady, on reading your last week's number, exclaimed, "I am certain that Ivy growing on the walls of a house protects it from damp;" and, on inquiry, I found that she at one time resided in a place where two rooms at the side of the house were specially damp. On the damp in one of the rooms at the expiration of a fortnight quite spotted with mould, and the walls in wet weather were perfectly moist, and the paper fell off. Mrs. — was advised to plant Ivy. She did so. It grew quickly (it was the largest), and it had before she left entirely covered the walls. She had, however, the most miserably dark and objectionable closets the most dry spots in the house. Other friends of mine have experienced the same beneficial results from Ivy culture. *Helen Watson*.

—I can with confidence second Mr. Rust's remark about Ivy-covered walls. A farm-house in North Walls, in a somewhat exposed position, was up to twenty years ago about as damp a dwelling as could be found on the estate. The present tenant planted Ivy against the south and west walls—the sides most exposed, and by dint of care the walls were kept covered. On the damp in the estate has ever since been about the driest on the estate. This is one of many instances I could name, but one which more particularly occurs to me, as I had occasion to inspect the house carefully about a week since. Of course care should be taken to trim the Ivy every year, and to cut down the stems that are allowed to interfere with the eaves, gutters, or roof. *Meryon*.

—So much has been written for and against the Ivy, that I daresay many of your readers are somewhat perplexed as to whether Ivy makes walls damp or not. Now as I have had considerable experience, and have given this subject much attention,

it will possibly be gratifying to some of your readers who have walls covered with this beautiful creeper, to know that without the slightest doubt I can assert that Ivy does not make walls damp, but on the contrary, it keeps them dry. Let me give you an instance. A wall covered with Ivy got and examined after a heavy rain, and I warrant none has penetrated through this grand covering. I can well understand how the Ivy has got the character of making walls damp—viz. in this wise: a wall is covered with Ivy which has been allowed to grow at will and not properly trimmed, and has consequently got so heavy at the top that the wind has forced it from the wall; then of course the wall may become damp, as the rain will run down between the Ivy and the wall, but this is entirely owing to the wind forcing it down again. If this fine old plant is not properly trimmed he will sometimes peep into your spouts and, like many of his countrymen, he cannot resist the temptation and he sips a little of the real mountain dew; and this gives him the power of invading his frame (I hope Sir Wilfrid does not read your paper), he gets a little boisterous, does not lose his head, but in point of fact gets more head, and in his hilarious fun blocks up your water conductor. However, you cannot blame him for this either, but rather his masters, who, knowing that he would keep the spouts open. But should your spouts be blocked from this or other causes and the water run down the wall, the Ivy is blamed for making the walls damp. Yet in no case does the fact of a wall being covered with Ivy make it damp, but where a wall is exposed to heavy rains Ivy is almost sure to cover it to keep it dry. I submit, tingly assert. The attention required to keep Ivy in proper order is to clip it close to the wall, in April or May, according to the season and locality, choosing a time before the young shoots have grown much. The walls will then rather care for a very short time, the first being the best, the fresh appearance. In the autumn, should any branches get detached from the wall they should be nailed close, or, what is sometimes better, cut close off, also cutting off any branches which may be intruded into the spouts. These instructions followed the Irish Ivy, the most inexpensive and the most easily managed of all creepers, therefore I defend from calumny that "rare old plant, the Ivy green." *J. H. C., Ivy Cottage*.

—In answer to Mr. Goodacre I am not aware that I have ever said that Ivy will make damp buildings. What I have said is that instead of making buildings damp it is quite the opposite tendency. Every gardener knows that ground heavily cropped is drier than land which is lying idle, and so in like manner the soil at the base of a building will be drier with a greasy plant like Ivy growing in it, and if the shoots and large leaves are annual cut off in April it will soon put forth a fresh supply of leaves, and that the wall from all ordinary rains. Where, then, is the destructive damp to come from? Our rainfall in this neighbourhood is heavy, and as I stated before three-fourths of the Castle is covered with Ivy, and the walls are kept so well covered that the walls in every year and been all this century covered with Ivy, yet there are no signs of it causing the building to "decay and turn damp." How can he, in the face of such evidence, speak against this beautiful plant?—and during that long period our Ivy has been the admiration alike of the peer and peasant, painter and poet. There is an excellent article in the *Globe* of May 22, which to my mind so thoroughly clears the subject up, that I will copy it and ask you to find space for it.

"Two or three of the horticultural and scientific journals have lately been discussing the momentous question of the covering of ivy with a house-damp. Of course, the ivy clamouring the more that a house cannot make the house damp, any more than a topcoat can make a man's underclothing damp; on the other hand, it is urged that, if the rain is heavy, ever, the rain is sufficiently heavy to penetrate the covering of ivy and to wet the wall, the fact of the ivy keeping out wind and sun will, of course, tend to keep it wet, just as topcoat would keep underclothing wet if the rain had drenched the wearer to the skin. Ivy is undoubtedly very bad in this respect, in positions where the wet from any special cause is liable to flow in, but so is a faulty spout or an awkward bit of roof may sometimes be found to shoot the water down at the back of the ivy. In this case the covering of green would do for the wall very much what a topcoat would do for underclothing, if the umbrella poured all the rain down inside his coat collar. The leak in the spout, or the faulty construction of the roof, which might only stain the outside of the ivy, is not sufficient to completely saturate and permeate the wall covered with ivy. In such a case the wiser plan would be to stop the downpour of water; the more obvious plan, however, is to strip down the ivy, and to have the wall covered with a good drying of external wall, the interior dampness will disappear also, and the ivy will be debilitated with the mischief. All this seems so obvious as to be scarcely worth saying, but it is owing to the prevalence of these obvious considerations that common prejudice has arisen against this beautiful parasite, which Nature seems so kindly to have provided for the special purpose

of hiding the dreary ugliness of what Mr. Ruskin calls our packing-cases. With roofs and spouts in good condition, and especially with a projecting eave over it, ivy is beneficial as it is beautiful, and is not used as a tenth part as much as it should be." *J. Rust, Bridge Castle*.

[This question has often been discussed, and always with this result—that, provided proper care be taken, and the walls kept in good repair, the Ivy does no harm whatever, but may do good. Eds.]

Vanda teres.—I have succeeded in flowering two small plants of Vanda teres just now; one is growing on a stick of deal, and the other on a stick of Oak, 2 feet long or so, stuck in pots of crocks. The heads last autumn had grown beyond the length of these sticks, and I tied them down, in order to make them more comestible, and no doubt this heading down has induced them to flower. Others with these long straggling Vandas in their possession would do well to try this mode. Our plants are about 3 feet long, 1 foot of which is bent down, and in this the flower-pike is, each of which has four flowers; each flower measures over 3 inches each way. *Henry Knight, Floors Gardens*.

Dendrobium suavisissimum.—We have just now in flower, amongst many other Orchids, a plant of the beautiful *D. suavisissimum* lately introduced by Messrs. Low & Co., and it proves to be the same exactly sought after by ardent collectors. I think when this variety gets thoroughly established it will prove a great acquisition. It will also be highly prized on account of the fragrance of its flowers, which are very sweet. *Odontoglossum Alexandræ* is with us just now making a nice display; a plant of the beautiful *Odontoglossum novium majus* has also just flowered, bearing fourteen fine spikes, with a total of 119 flowers. Good plants of this variety are, I believe, still scarce in collections. *J. Mill, The Gardens, Roshleigh Hall*.

Paraffin for Protecting Seeds.—Having read in the *Gardeners' Chronicle* for May 10 of "R. W.'s" unsuccessful trial of soaking Peas in paraffin, I beg to say that I also tried the experiment of soaking mine for twenty-four hours instead of two minutes, and I never had a better plant. I feel certain every Pea germinated although I sowed them in November for my early crop. Therefore I must come to the conclusion that "R. W.'s" seed was bad. *J. G.*

Taking a great interest in my cottage garden, I was anxious to try the effect of paraffin, and having obtained a quantity of the Market Favourite Pea from Messrs. Stewart & Meek, Kilsno, in May, before sowing, steeped them in strong paraffin oil for one hour, and now (May 28) I have a row of Peas 16 yards long and 6 inches high, which neither birds nor mice have interfered with. On the same piece of ground I have sown the same Peas, which were not steeped in paraffin, and the birds and mice have nearly spoiled the crop. Living within 13 miles of the Border, and taking the severe winter into consideration, some of your readers will perhaps be surprised to hear that at the present time I have a Gloire de Dijon Rose, with upwards of 100 buds on it, ready to break. It is against a wall and a south aspect. *Richard Beaman, Middleton Cottage, Belford, Northumberland*. [We should be obliged to any of our correspondents for information as to the effects of paraffin in the case of other seeds. Eds.]

Pilocereus semilis, var. longistylus.—This very remarkable and interesting plant, as I think, rarely in collections, and is most especially associated with P. semilis, but the great difference is, that it produces very long spines; the long needle-like spine is upwards of an inch long, and the hair-like spines are of a great length, especially near the base of the plant upwards—some of them as long as the plant itself, and are curled and twisted round the plant and in the pot, giving it a very venerable appearance. Even in youth it looks aged, and from its slow growth it never occupies much room, and is at all times a very attractive and interesting plant, painting admiration as it often does from non-interesting individuals, and many remarks from the casual observer. *J. S. C.*

The Renovation of the Camellia.—In a floral and pecuniary sense, perhaps no plant pays better than the Camellia, for it is a favourite, robust, and free-flowering subject, easy to manage, and amenable to treatment when it has become impaired. Debility manifests itself by a searching frost, or by the withdrawal of the sap from the lower branches, paleness of the leaves, and also blooms which do not thoroughly expand, and are soon shed. These symptoms seem to follow from exhaustion of the soil, long restriction of the roots to the liability to over-crowding, or from a high and dry temperature, inattention to watering, which impedes healthy leaf-action, such as dust and insects, constant subjection to shade, but the most injurious practice is an insufficiency of moisture at the roots during their activity. A weakly collection may in one

season be restored to strength and beauty by the following measures, which were tried in one of the Camellia-houses here two years ago, with some plants which had become almost unproductive. Prepare a bottom of ashes or gravel, say 6 or 9 inches thick, on which arrange the pots and tubs, so that the drainage water passing through the holes be stumpy, and they under roots in a time of rapid evaporation. Then from the return of spring sunshine till it wanes in autumn encourage nutrition by a regular supply of liquid manure diluted with rain-water of a sooty tinge. The stimulant may consist of any of the several sorts of liquid manure, but the chemical salts, besides other fertilising ingredients, a salt-like substance called urea, which is rich in nitrogen, and when the liquor ferments this appears in the form of carbonate of ammonia, and exercises an immediate and beneficial influence on vegetation. At first weak applications supplied once a fortnight, will suffice, but when the bloom is over, and shoots begin to develop, the allowance may be increased to one-third, in proportion to the water, and administered weekly while the soil is moist to receive it. An objection to the use of this fertilizer is its small quantity. The plants had soon show a determination to enlarge at the points and break from below, the leaves will become broad, leathery, of a dark green hue, and brightly polished, while clusters of buds will form on the extremities of the branches. When these are plump enough to separate the strongest should only be retained, and the operation performed without delay. As the plants go out of flower shift such as are bound into pots or tubs 3 inches wider, giving them a mixture of good fibry loam and sand, with ample drainage, and press the soil rather firmly. Apply a heavy top-dressing of fine manure, and watering and tamping back; then, if frequently syringed, they will send out new buds from the old wood. Unless the roots have refused to spread it is injurious to reduce the ball of Camellias, for anything in the way of a check weakens it at a time and in a state in which it is unable to do so. A little guano-water may now be substituted for the manure previously recommended; and if other matters of routine are attended to in the management the plants will gain a new lease of life. *James Scott.*

Reports of Societies.

Royal Horticultural of Ireland: May 24—This Society's second exhibition for the present season took place on the above date at the Exhibition Palace. The show was of more than average merit in almost every department, except in that of fruit and vegetables. The show of plants was of a high and green-house plants was thoroughly good. The cup for the best group of twelve pot Roses was won by Mrs. Herbert Manders, who had a splendidly grown collection, all the plants being well handled and profusely bloomed. Mr. Fry came next in merit with a group a little inferior to that of his twelve exotics (in pots of wax) was cleverly won by Mr. Westby, and did infinite credit to his gardener, Mr. Bracken, whose group comprised exceptionally fine examples of *Rhynchospermum jasminoides*, *Bougainvillea glabra*, *Pachyrhizus sectionis*, *Chamaecrista scherzeriana* (profusely bloomed), *Croton Veitchii*, *Demonorops perianthus*, and *Croton variegatus*. Lord James Butler's fine group, which was placed 2d, included well grown plants of *Clorodendron Balfourianum*, *Rhynchospermum jasminoides*, *Dicksonia squarrosa*, *Asplenium macranthum*, and *Asplenium variegatum*. Mr. Westby also carried off the cup for a group of exotics in 12-inch pots with a splendid collection, all his plants being carefully handled and in first-rate condition. Amongst the *élite de la cérémonie* of his lot we noticed *Bougainvillea glabra*, *Aphelocera macrantha*, *Clorodendron Balfourianum*, *Erica Cavendishiana*, *Lomaria gibba*, and *Draecena excelsa*. A very nice lot of Orchids was staged by Lord James Butler, including a good *Oncidium sphecelatum*, *Phaius Wallichii*, and a good plant of *Acrides Fendleri*. In the class for specimen Orchids Mrs. White took 1st place with a well-flowered plant of *Cattleya Mossie superba*. Ferns were not so largely shown as usual, but the groups staged in the several classes were of more than average merit. In Mr. Riall's group of exotics in 12-inch pots, the most noteworthy well-grown plants were *Asplenium Veitchii*, *Adiantum gracillimum*, the beautiful *Hymenophyllum demissum*; and the lot exhibited by Miss Power, of Temple Hill, a new and spirited exhibitor, included a splendid plant of *Todes superba*. There were two nice collections of British Ferns, that belonging to Mr. Riall, which was placed 1st, com-

prising fine specimens of *Osunda repalis cristata* and *Trichomanes radicans*. Mr. Waters, as usual, brought out a refreshing lot. Variegated plants were capably shown. Mr. Westby's six (in pots of any size) included remarkably well-handled plants of *Dracaena Shepherdii*, *Croton Veitchii*, *Asplenium*, and *Clorodendron Balfourianum*. In Mr. Watson's group (in pots not exceeding 12 inches) we noted beautifully-grown specimens of *Croton Youngii*, *Dracaena ferrea grandis*, and *Croton majesticus*. Azaleas were only represented by one group, but that a really good one, exhibited by Mr. Riall. A capital group of exotics was staged by Miss Power. The several classes of stove and greenhouse plants were well represented. Mr. Boyle's lot of six in pots of any size included a first-rate *Anthurium Scherzerianum* and well bloomed plants of *Cyrtopodium venustum* and *Erica Cavendishiana*. In the class for six in 10-inch pots Lord James Butler was placed 1st, his lot comprising well-grown specimens of *Ixora coccinea* and *Aphelocera humilis*; Mr. Manders taking 2d with a bright looking group, including nicely flowered plants of *Azalea Souvenir du Prince Albert*, *Azalea sinensis*, *Erica Cavendishiana*, and *Clorodendron Balfourianum*. None a nice collection of twelve stove plants was staged by Messrs. Campbell.

In the way of Pelargoniums we have seldom seen anything better at a May show than the lot of six show varieties exhibited by Mr. Boyle. The plants were all well bloomed, and in the best of health and condition, his specimens of *Forget-Me-Not*, *Lilacium*, and *Rose Celestial* being remarkably good. Mrs. Manders took 2d with a well handled six, including well-flowered plants of *James Odier*, *Magnifica*, and *Forget-Me-Not*. The competition for the cup for a group of Palms has of late years become very keen, and in the second exhibition of the season, and if the number of competitors on Thursday was not so large as last year, the quality of the specimens staged showed no sign of deterioration. The cup was on this occasion most deservedly awarded to the very best and most numerous group, comprising *Draecena* and which included capital examples of *Araucaria Verschaffelii*, *Kentia Fosteriana*, *Latania borbonica*, and a truly beautiful plant of *Cocos Weddelliana*. Miss Power took 2d with a splendid nine, comprising, amongst others, remarkably good specimens of *Latania borbonica*, *Kentia sinensis*, *Cocos Weddelliana*, and *Chamaecrista humilis*. Both groups were exceedingly bright and fresh-looking, and reflected every credit on their several exhibitors. In the way of new plants the most remarkable novelty was a nice specimen of the beautiful pink-flowered *Oleandra axillarium*, exhibited by Mr. Bracken. A good miscellaneous collection of stove and greenhouse plants forwarded (not for competition) by Mr. Jamieson, Montrose, included well-flowered plants of *Erica Cavendishiana* and *Aphelocera macrantha rosea*, and a splendidly-handled specimen of *Adiantum farleyense*.

In the florist flower section there was a very interesting display of Tulips, and the numerous admirers of this old favourite flower had no reason to be displeased with the quality of this department of the show. The best stand of twenty-four varieties was shown by De Contomerey, the stand exhibited by Miss Plant taking 2d; while in the class of twelve the competitors changed places. In both classes good stands were staged by Mr. Berry and Mr. Greenwood. Pansies, Ranunculus, and Fancies were well shown, some of the stands of which were very fine, being in the best of health. The show of cut Roses was first-rate. For twenty-four blooms Mr. Riall took 1st with a grand stand of *Maréchal Niel*. In the class for twelve blooms Messrs. Campbell were placed 1st with a splendid box, including magnificent blooms of *Madame de France*, *Comte de Chambord*, *Alfred Hamberg*, *Marquis de Castellane* (very fine), and *Paul Neron*; the 2d place being taken by Rev. Frederick Tynons, whose stand included first-rate flowers of *Charles Lefebvre*, *La France*, and *Jules Margotin*. The show of fruit was, of course, good. The principal features were *Golden Bunch*, *Blanc Hamburg*, *Grapes*, exhibited by the Hon. Mrs. Dunlop; a good dish of Early Beatrice Peaches, shown by Mrs. Miller; a fair dish of President Strawberry, and some dishes of well-kept dessert and baking Apples. Condensed from the "Irish Farmer's Gazette."

Blackburn Horticultural: May 24 25 26—

The annual exhibition in connection with this Society was held on Tuesday and Wednesday, and took place at the grounds of the East Lancashire Cricket Club. Falling as it does when the grand floral display is being held in Manchester the competition in some classes is not so keen as might be desired, and as probably (considering the very liberal list of prizes offered) it is somewhat unfortunate that the show took place sooner or later than the one just named. The managers, however, have not only to look to the display and get this as varied and extensive as possible, but they must also have a care to the receipts, without which few such exhibitions can be regularly kept up,

and Whittow week being in all respects a holiday week, and a greater number of visitors obtained than at any other time, the managers wisely deem it advisable, in their desire to spread and foster a love of flowers and encourage the cultivation of them, to hold the show on a week-day, and to accept of such prizes as are likely to be obtained. The plants were exhibited in a large tent, the tall plants being stood in the centre on the ground, and smaller ones on stages round the side. In the class for ten miscellaneous plants (amateurs) not less than five in bloom, the 1st prize was taken by R. B. Dodgson, Esq., who was followed by Mr. Dodgson, in whose collection were to be seen a fine *Clorodendron Balfourianum*, a well-flowered *Adenandra fragrans*, and a finely coloured and densely bloomed *Fragaria calycina*. J. Thompson, Esq. (J. Swan, Gr.) was placed 2d, with a very nice group, in which were also a fine *Adenandra* and a plant of *Achyrocline venosum*. For ten stove or greenhouse plants, not less than six in bloom, the same gentlemen again competed—the prizes in this case, however, being reversed. In the class for six stove or greenhouse plants in bloom Mr. Dodgson was again to the front, having in his group a fine *Adenandra*, and a well flowered group of *Erica verticosa coccinea minor*. Mr. Thompson again exhibited a good *Clorodendron Balfourianum*. In the class for four stove and greenhouse plants in bloom the competition was very keen, four collections being staged, and the first prize falling to Mr. Dodgson, who had taken the same exhibitor—the 1st prize was awarded to F. Yates, Esq., whose plants, though small compared with the other collections, were well flowered, very fresh, and nicely staged. The plants in this collection were *D. densiflorum*, twelve spikes; *D. Dalhousianum*, *Acerides Fendleri*, two spikes; *O. Pescatorei*, two fine spikes; *Oncidium Marshallianum*, 5' capital spike, 4 feet long; and a splendid variety; and a nice plant of *Phalenopsis Ludemanniana*. The 2d, 3d, and 4th prizes were awarded to Mr. Dodgson, amongst whose plants were *D. densiflorum*, *C. villosum*, *Cattleya*, *Asplenium*, and *Warneri*, and *Saccolabium ampullaceum*, in very good condition. In the class for four Orchids Mr. Dodgson was placed 1st, having *D. Schröderi*, with twelve grand spikes; *C. Warneri* and *Mossie*, and *Cyp. barbatum*; Mr. Yates was 2d, who had small but nicely bloomed plants of *O. Russellianum*; and Mr. Dodgson, 3d.

For ten exotic Ferns only one lot was staged, the prize falling to R. B. Dodgson, Esq.; while for six exotic Ferns, W. Thompson, Esq., was 1st, who showed *Adiantum excisum multifidum* and *farleyense* in good condition. For eight British Ferns the 1st prize was taken by Mr. Dodgson. Amongst the plants shown by Mr. Dodgson and Mr. Dodgson, and the class, as a whole, was very creditable, the former-named gentleman being 1st for six, and the latter being placed 1st for four. Zonal Pelargoniums were shown by W. Thompson and J. Thompson, the prizes being awarded in the order of the names. W. Thompson was again 1st for six *Tricolor Pelargoniums*—a very even lot, and of good colour. *Caladiums* were shown by W. Snape, who was 1st, and W. Thompson 2d, and were well-grown plants, not very large, but of good colour. Mr. C. Ryland, of Sunningdale, exhibited a very nice and well-grown specimen of *Pelargonium*, for which he is justly famed. They were in fine condition, and a very attractive group; awarded a special prize. Mr. B. S. Williams, Holloway, and Mr. Walton, Burnley, exhibited collections of miscellaneous plants. In the collection of the last-named gentlemen were some capitally flowered half-specimen *Ericas*, which were awarded an extra prize. Black Grapes were shown by Major Starke, who was 1st, and F. Yates, who was placed 2d. For white, the 1st prize again was awarded to Major Starke. A collection of wax fruit and six, and a collection of wax fruit and six, were much admired, and was awarded a special prize. S.

Reading Horticultural: May 24—

A dull heavy morning, with occasional light showers and a general aspect of uncertainty in the behaviour of the clouds, is not favourable to the chances of success in a flower show. It is solely a question of weather, and if up to noon or thereabouts it looks murky and threatening, with a dull, drizzly, and slow moving sky, the managers are often obliged to resolve to stay at home. Such a disadvantage of unpropitious weather beset the meeting of the Reading Society on the above date, and its inevitable accompaniment—a deficit in the exchequer. There is scarcely a more cosy place in which to hold

having three or four plants of the same species pruned together—the effect contrasted strongly with Mr. Mackenzie's group, which consisted of single plants very small and evidently not over well grown. Mr. Todd's group considerably eclipsed both, and contained some good plants of *Macranis plumosa*, *Phlox paniculata*, *Brabea filamentosus* and *Aralia filicifolia*, &c.

The collection of fruit was small, being confined to four entries for two bunches of black Grapes, the 1st prize falling to the lot of Mr. J. McConnachie, gr. to A. Smollet, Esq., for Black Hamburgs; the 2d to Mr. David Provan, Wardhead House, Stewarton, for Madresford Court; a dish of Peaches, shown by Mr. A. Crosbie, gr., Buchanan House, and a dish of Strawberries by Mr. Hogg, gr., Aikenhead. Collin Campbell, Esq., of Stourfield, Tarbert, sent for exhibition eight splendid trusses of the much-neglected *Rhododendron arboreum album*, also very fine and all grown and gathered from the open air at Tarbert, and which were highly commended. The only new plant sent for exhibition was *Hydrangea Thomas Hogg*, introduced from Japan. The trusses being large, white, and freely produced, it will be found well worth the attention of growers for market. It was sent by Mr. B. S. Williams, and was awarded a First-class Certificate. In the afternoon Mr. A. B. Stewart entertained the judges, directors, and several friends of the Society to dinner. *Robert Bullen*.

FRUIT CROPS.—If the experience of other Villa gardeners is at all like our own, then there is much reason to fear that but small fruit crops will be realised this year. There was a rich promise of fruit, but crops of all kinds appear to have gone wrong. The gardening times are out of joint, and as a witty writer remarks, "the weather suggests that March and November have stayed out too late one evening and have lost their way and found themselves in May. The look of the trees alone makes a fellow miserable. What was Pear blossom is now ugly blackness, and the leaves that had thought of coming out have changed their minds. No respectable tree could get up any enthusiasm towards such a season." Things have a little changed for the better, but there is too much reason to believe that the fruit crop to a considerable extent is hopelessly lost.

The Peach crop is a general failure. There happened two or three severe frosts in March, that fell just as the trees were in bloom, and these wrought sad havoc. The same gardeners say that the wood of the Peach trees never got thoroughly seasoned and ripened last autumn, and that it was constitutionally incapable of bearing fruit. There is no doubt something in this. Perhaps it may be in consequence of this very failure of vigour, but it is a fact that the blister is laying hold of the leaves, and many trees are presenting a sorry appearance. The best thing to be done is to keep the trees as healthy as possible, and by occasional syringings, by mulching, and by waterings at the roots in dry weather, to endeavour to so get the trees to a healthy tone as that they may make a favourable growth, and properly ripen their wood at the end of the summer. "Mulching" is a term much employed in gardening matters, and perhaps imperfectly understood. It consists of placing a layer of dung or fertilising material of any kind, in a half decayed state, about the stem of a tree and over its roots. It is constantly applied to newly planted trees, and to any growing on shallow, gravelly, or drying soils, and the object of the cultivator may be said to be twofold—to keep the surface-roots cool and moist, and, further, to supply an invigorating influence to encourage growth. If water be poured on to manure lying round the stem of a tree some of the particles will be carried down into the soil, and thus materially assist in feeding the plants.

It is more particularly in the case of gravelly and light soils, from which moisture soon clears away, that mulching is required. Where the soil is a retentive clay—that is, cold, clammy, and sticky—if plants grow in it at all, they are scarcely likely to suffer much from drought; but the roots would be pretty certain to do one thing—they would come to the surface for something to subsist on. In the case of such a clay subsoil as that above mentioned, the moisture in it, if it does not pass away below, will rise upward, and evaporate through the surface. If the escape of

this moisture be prevented by mulching, there will be the absence of ground-heat, and the effect will be injurious to the trees.

He who plants intelligently will not fail to provide drain a border likely to be retentive of moisture; but in the case of hundreds of villa residences planting was done at haphazard by unskillful planters: holes were dug in the soil—and that, too often, compounded of mere rubbish—and the trees placed in them. It has thus fallen to the lot of many Villa gardeners to have to do with trees planted under conditions so unfavourable to healthy development that they are constantly in a kind of chronic ill-health. If the subsoil be antiseptic—as too often happens—the best thing to do is to lift the trees in autumn and replant them, taking care to have a proper bed constructed, so that a perfect drainage and a congenial bed of soil be provided. But in the case of a tree having a fair crop of fruit, and yet showing signs of ill-health, the best thing to do would be to incite the roots to healthy action near the surface by slightly stirring the soil, and then adding some other good soil, and there keep them moist, without materially arresting evaporation.

On dry soils, wall trees bearing fruit will require a good deal of attention during the summer. Here mulching is absolutely necessary, for trees recently planted, and those on soils comparatively shallow and thoroughly drained, require a steady supply of root-moisture; and where a period of drought, accompanied by much heat, or even of drying winds, occurs, trees thus situated are sure to suffer, some extra attention be not paid to them. Watering, of course, immediately suggests itself, but this is an operation frequently requiring an inconvenient amount of labour; and, moreover, unless the water has been subjected to the action of the sun, or is in a tepid state, its utility, as sometimes applied, is somewhat questionable.

Under such circumstances it is that mulching is advocated. As to the matter of the temperature of the soil, little harm need be apprehended from applying it in the course of the month of May, for the ground has by that period (so we are informed on high authority) acquired a sufficient amount of warmth from the atmosphere to carry on the purposes of vegetation, promote health and well-being in the plants, and a proper fructification of the crops.

Mulching need not, then, be done till May, and just when a time of drought impends. All trees carrying unusually heavy crops may be mulched at this time, in order to prevent any sudden and injurious vicissitudes. Sudden droughts are most injurious in their action, and may lead to the sacrifice of a crop of fruit.

Syringing is also to be commended; it cools and cleanses the leaves, and keeps insects in check. It is a valuable invigorating influence in times of drought, especially where applied of an evening; and mulching is so beneficial to many strong-rooting and growing plants, such as Roses, Clematises, Holly-hocks, Dahlias, &c., that it can be used in the case of many plants with considerable advantage. The beautiful summer-blooming Clematises are so much benefited by it—it so adds to the lustre of their flowers and the duration of their bloom—that its application cannot be too warmly commended.

Obituary.

FEW of the present generation can date from the year 1777, yet there has just passed from amongst our midst a man whose manhood was spent amidst the stormy period of '98, and who might in his infancy have witnessed some of the stormy scenes of the French Revolution and shaken hands with Robespierre or Danton; or, still further back, might have embraced the knees of the hero of American independence, George Washington himself. JAMES DERHAM, whose humble career was spent in the service of Hans Hamilton, Esq., of Sheephill, as gardener for many years, has just passed away at Blanchardstown, Co. Dublin. Few incidents are worth recording in the life of the poor, but it is gratifying to know that the latter years of his life were spent at Sheephill, where, by the kind benevolence of Mr. Hamilton, he was enabled to spend the last 18 years of his life free from labour or anxious care; and what he might still appreciate more, by the occasional visits of his kind and benevolent landlord, Ion Trant Hamilton, Esq., M.P., and the amiable ladies of his family. Most of his children being dead, he was followed to the grave by a numerous train of grand and great-grand children,

as also by the numerous retainers of the Sheephill estate, and was interred in Mulhuddart churchyard amidst the sympathies of a large portion of the surrounding tenantry. *Freeman's Journal*.

— We regret to have to record the death of Mr. FREDERICK MOORE, on May 1, at Newcastle-on-Tyne. Mr. Moore was for some years gardener to the Earl of Auckland, at Eden Lodge, Kensington; and subsequently for twenty-five years was gardener to Earl Grey, at Howick Hall. He was held in high esteem by his employer, and his kind and unassuming manner procured him the respect of all with whom he came in contact. He was likewise an excellent gardener, and did much for the improvement of the gardens and grounds at Howick. About three years since he retired on a pension given him by Earl Grey, and since then has been residing at Newcastle, where, however, his health soon began to give way. He had attained the age of seventy-five years.

— We also record with deep regret the death of Mr. JAMES BARNES, so well-known as "Barnes of Bicton," who died at Exmouth on May 23, aged 71. Mr. Barnes was born at Farnham, Surrey, in 1806. How he laboured with his father in various gardens in Surrey; how he came to London when about twelve years of age, and was employed by Mr. Moore, a florist at that time residing in Chelsea; how he engaged afterwards in the service of Mr. Stone, of Peckham, a great Grape and Mushroom grower, and subsequently took the superintendance of a market garden at Bermondsey; then successively took charge of the gardens of Crawford House, Hford, and of those of Sir Herbert Jenner at Chislehurst, from whence he entered the service of Lord Rolle, at Bicton, in 1830, is told by himself in the account of his life, furnished by his own pen, to accompany his portrait which was published in our series of British Gardeners, in 1874 (vol. ii. n.s., p. 655). Mr. Barnes continued to manage the gardens at Bicton with great credit to himself, and to the edification of his brethren of the horticultural fraternity by the detailed accounts of his practice which he published from time to time in the periodicals of the day, up to 1869, when he was compelled to resign his appointment under circumstances which attained a painful notoriety at the time. Since leaving Bicton, where his unremitting attention to his duties, early and late, seriously undermined his health, Mr. Barnes has lived in retirement at Exmouth, but was from time to time a great sufferer from a bronchial affection.

STATE OF THE WEATHER AT BLACKHEATH, LONDON FOR THE WEEK ENDING WEDNESDAY, MAY 30, 1877.

MONTH AND DAY.	BAROMETER.	TEMPERATURE OF THE AIR.	HYGROMETRIC DUCTILITY.	WIND.	RAINFALL.
	Mean Reading for the Month.	Range.	Mean for the Month.	Direction.	
May 24	30.00	56.1 to 66.0	66.0	N.E.	1.00
25	30.03	56.4 to 66.2	66.2	N.E.	0.00
26	30.05	56.5 to 66.3	66.3	N.E.	0.00
27	30.04	56.5 to 66.3	66.3	N.E.	0.00

- May 24.—Fine, but dull, very cloudy and cold. Slight shower of rain at 0.30 P.M.
- 25.—A very fine pleasant day. Cold.
- 26.—A very fine bright day. Light clouds.
- 27.—A fine bright day. Strong wind.
- 28.—A fine day. Occasional showers of rain. Strong wind.
- 29.—A fine day. Cloudy, with slight showers of rain at times. Windy.
- 30.—A very fine bright day. Windy.

LONDON: Barometer.—During the week ending Saturday, May 26, in the suburbs of London, the reading of the barometer at the level of the sea increased from 29.93 inches at the beginning of the week to 30.24 inches by the evening of the 22d, decreased to 30.20 inches by noon on the 24th, increased to 30.28 inches by noon on the 25th, and decreased to 30.07 inches by the end of the week. The mean reading for the week at sea level was 30.19 inches, being 0.34 inch above that of the preceding week, and 0.25 inch below the average.

Temperature.—The highest temperatures of the air observed by day ranged from 65½° on the 26th to 51½° on the 23d; the mean value for the week was 56½°. The lowest temperatures of the air observed by night varied from 38½° on the 25th to 46½° on the 26th; the mean value for the week was 42°. The mean daily range of temperature in the week was 14½°, the greatest range in the day was 25½°, on the 25th, and the least 7°, on the 20th.

The mean daily temperatures of the air were as follows:—20th, 47° 5'; 21st, 48° 3'; 22d, 44° 8'; 23d, 44° 2'; 24th, 46° 2'; 25th, 48° 7'; and 26th, 53° 7'; and the departures in defect of their respective averages were:—6° 2', 5' 6', 9° 3', 10° 1', 8° 4', 6° 3', and 1° 5'. The mean temperature of the air for the week was 47° 6', being 6° 8' below the average of sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed in sun's rays, were 122° on the 26th, and 113½° on the 26th; on the 22d the reading did not rise above 56°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 34° on the 25th, and 41° on the 23d; the mean for the seven low readings was 41½°.

Wind.—The direction of the wind was N.N.E., and its strength moderate. The weather during the week was generally dull and cold.

Rain fell on two days during the week, to the amount of 0.26 inch.

ENGLAND: Temperature.—The highest temperatures of the air observed by day varied from 67° at Bristol, and 66½° at Cambridge, to 59½° at Wolverhampton; the mean value from all stations was 63½°. The lowest temperatures of the air observed by night varied from 33½° at Bristol to 41½° at Brighton; the mean value from all stations was 38°. The range of temperature in the week was the greatest at Bristol, 33½°, and the least at Brighton, 20½°; the mean range of temperature from all stations was 25½°.

The mean of the seven high day temperatures was the highest at Bristol, 59½°, and the lowest at Wolverhampton, 52½°; the mean value from all stations was 56°. The mean of the seven low night temperatures was the lowest at Bristol, Wolverhampton, and Eccles, all 40½°, and the highest at Truro, Plymouth, Norwich, and Manchester—all 44½°; the general mean from all stations was 42½°. The mean daily range of temperature was the least at Norwich and Bradford, both 10½°, and the greatest at Bristol, 19½°; the mean daily range from all stations was 13½°.

The mean temperature of the air for the week from all stations was 47½°, being 3½° lower than the value for the corresponding week in 1876. The highest was 50°, at Truro, and the lowest 44½°, at Wolverhampton.

Rain.—Scarcely any rain fell during the week; at Norwich half an inch was measured, but at most other places the fall did not exceed two-tenths of an inch. The average fall over the country was one-tenth of an inch. No rain fell at Manchester. The weather during the week was generally dull and cold.

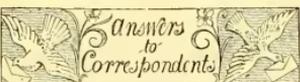

SCOTLAND: Temperature.—The highest temperatures of the air varied from 64° at Edinburgh to 56½° at Aberdeen; the mean value from all stations was 61°. The lowest temperatures of the air ranged from 35° at Dundee to 39° at Leith; the mean value from all stations was 37½°. The mean range of temperature in the week from all stations was 23½°.

The mean temperature of the air for the week from all stations was 49½°, being 2½° lower than the value for the corresponding week in 1876. The highest was 51½°, at Glasgow and Greenock, and the lowest 48°, at Aberdeen.

Rain.—The amount of rain measured at Greenock was six-tenths of an inch, at Aberdeen was half an inch, and at Dundee was two-tenths of an inch; at Glasgow, Paisley, and Leith no rain was measured; the average fall over the country was a quarter of an inch.

DUBLIN.—The highest temperature of the air was 67°, the lowest 32½°, the range 34½°, the mean 50½°, and the fall of rain 0.02 inch.

JAMES GLAISHER.

ANEMONES: S. B. D. The petaloid condition of one of the bracts is not unusual.

CARDAMINE FRATERNES: W. E. Many thanks. We will examine and report.

GRAPES: G. Harwood. The berries are scalded, and scalding is the result of the action of bright sunshine on leaves or fruits while bathed in moisture. A little air given early in the day would in all probability have prevented it. Your case is similar to a great many others this season.

INJURIOUS REPORTS: X. Y. Z. The persons who originate such reports are as guilty in their way as those who wantonly blow up their neighbours' houses with torpedoes; and those who thoughtlessly circulate them are to the full as culpable as are receivers of stolen goods.

INSECTS: Nurseryman. *Othiorhynchus notatus*, which seems to be doing a great deal of mischief this year. A remedy has not yet been found. *A. M.*—*M.* The beetle, so plentiful just now, is the common cockchafer or May-bug, *Melolontha vulgaris*, of which in fig. 114 we give an illustration, together with one of the July-bug, the smallest of the two. The largest figure represents a full-grown male cockchafer, and

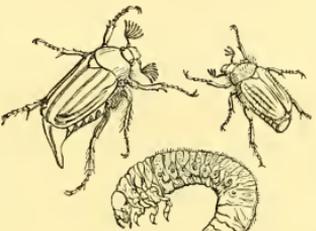

FIG. 114.—THE COCKCHAFER AND JULY BUG.

the lower figure is that of the curved larva from which it is produced. The larva is very destructive, but they do not appear to do so much mischief in this country as on the Continent.

MALFORMED PEARS: W. M. The changes seem to be dependent on the conversion of what should have been a flower-bud to a leaf-shoot. There are also changes in the individual flowers, upon which we may report more fully on another occasion.

NAMES OF PLANTS: The names of some specimens of Pines, sent to us without any indication as to whence they came, are:—1, *Pinus austriaca*; 2, *P. Pinaster*; 4, *P. Laricio*; 6, *P. pyrenaica*.—*T. B.* *Staphylea pinnata*.—*J. B.* The golden-leaved variety of *Lamium purpureum* (Dead Nettle), used sometimes for spring bedding.—*H. C.* The common Confrey, *Symphytum officinale*, not poisonous to cattle.—*W. J.* *Ajuga reptans*; 2, *Pedicularis sylvatica*; 3, *Galium bracteosum*.—*W. M.* *Saxifraga hypnoides*.—*J. C. H.* *Othiorhynchus prestans* (very rare), and *Dendrobium scaberrimum*.—*F. H. G.* Neither this nor *Maxillaria Harrisonia* are Lycopods at all. Both are Bifrenariads, and this one is the *B. Indora* of Lindley. It has sometimes a powerful odour. *H. G. R.*—*J. Brown*, 1, *Genera facialis*; 2, *Eriostemon buxifolius*.—*J. Morton*, *Valeriana Pha.*—*W. H.* *Abutilon Thompsonii*.—*W. W.* *Amelanchier botryspium* (the Canadian Medlar).

PEACH TREES BLISTERED: W. B. and A. W. The affection is extremely common in Peach trees, and is caused by a very minute fungus (*Ascochyas deformans*), which a figure has appeared in our journal. The only plan you can adopt is to pick off the affected leaves and burn them; but the spores are so minute that this treatment may not be effective. *Ed. T. W.*

ROYAL HORTICULTURAL SOCIETY'S MEDALS.—We are requested to state that a silver-gilt medal has been substituted for the silver Banksian, awarded to Messrs. William Rollison & Sons, of Tooting, on the occasion of the Society's great exhibition on May 2. The Society's silver-gilt medal is usually called a gold medal, and is the handsomest medal that the Society awards, and costing quite as much as the smaller gold medals. *Ed. T. W.*

SEAKALE: E. W. Many thanks; please do.

STRELITZIA REGINÆ: H. K. A branched inflorescence, indicative of an unusual degree of vigour.

TRAINING APPLE TREES: W. T. 7. The result of allowing the main central stem of an espalier-trained tree to grow up and form an independent head, is simply to make the tree an ordinary standard, and will in time completely ruin the original horizontal-trained branches.

VINE LEAVES: A. B. The leaves you have sent us are eaten by some insect—probably *Othiorhynchus sulcatus*; but we cannot tell by simple examination of the specimens. You must watch for and catch them in the evenings.

FOREIGN SUBSCRIBERS sending Post-office Orders are requested to make them payable at the post-office, King Street, Covent Garden, London, and at the same time to inform the Publisher at the office of this Journal.

Correspondents are specially requested to address, post-paid, all communications intended for publication to the "Editors," and not to any member of the staff personally. The Editors would also be obliged by such communications being sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish us to see. *Letters relating to advertisements, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editors.*

SEEDS.

LONDON: To-day 30.—The attendance on the seed market was as might have been expected, meagre in the extreme, and the amount of business done was as nearly nil as possible. There is, consequently, no quotable variation in the value of any kind of agricultural seeds. Although prices are at present purely nominal, holders generally exhibit increased firmness, the values being there being above the views of speculators. There is some inquiry for the various seeds at unchanged currencies. As regards Canary seed, quotations are weaker, the demand for this article being just now very restricted. Mustard and Rape seed for agricultural purposes experience a good demand, and an advance must be noted. Blue blooming Peas and Haricot Beans move off on former terms. There is a fair request for English Black Seed, Feeding Linseed is steady.
Fisher & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

CORN.

At Mark Lane on Monday the supply of English Wheat was short, but there were liberal importations of foreign, and the few sales concluded in either description were at a reduction of from 2s. to 3s. per quarter, as compared with the prices of last Wednesday, or say from 4s. to 6s. per quarter as contrasted with the rates of this day. The flour trade was also dull, and sales only effected by submitting to lower prices.—Average prices of barley for the week ending May 26.—Wheat, 68s. 6d.; Barley, 37s. 0d.; Oats, 28s. 1d. For the corresponding week last year.—Wheat, 45s. 3d.; Barley, 32s. 1d.; Oats, 26s. 1d.

CATTLE.

At Copenhagen Fields on Monday there was a much larger supply of beasts than on the previous Monday, 360 Canadians having unexpectedly arrived, and about 400 Danish. The trade was very slow, and prices fell considerably. There was a large increase also in the supply of sheep and lambs. Trade was worse than on Thursday week, especially for lambs, and it was difficult to effect a clearance even at the reduced rates. The few calves that could make a fair price. Quotations.—Beasts, 4s. to 5s. and 5s. 4d. to 5s. 10d.; calves, 5s. 6d. to 6s. 8d.; sheep, 4s. 10d. to 5s. 6d., and 6s. to 6s. 10d.; lambs, 7s. 4d. to 8s. 2d.; pigs, 4s. to 5s.—Trade on Thursday was dull. In the best market sales were difficult to close, and the tendency of prices was adverse. Sheep also sold very slowly, and did not in all cases support Monday's rates. Lambs went at prices in favour of buyers. The few calves on offer brought late value.

HAY.

At Whitechapel on Tuesday, with a full supply, trade was dull, and quotations dropped somewhat. Prime Clover, 10s. to 12s.; inferior, 8s. to 9s.; Prime Meadow hay, 9s. to 12s.; inferior, 7s. to 8s.; and straw, 4s. to 5s. per ton.—Cumberland Market quotations.—Superior meadow hay, 12s. to 13s.; inferior, 10s. to 11s.; superior Clover, 12s. to 14s.; inferior, 11s. to 12s.; and straw, 5s. to 6s. per ton.

POTATOS.

The Borough and Spitalfields markets reports state that the supplies of old potatoes are now perceptibly running out, and though no great demand exists decidedly higher prices prevail. Kent Regents, 12s. to 14s. per ton; Essex do., 11s. to 13s.; Scotch do., 9s. to 10s.; and 10s. to 12s. per ton.—The imports in London last week comprised 8026 packages from Lisbon, 2872 bags Anvers, 1803 bags Hamburg, 1148 sacks Brussels, 1201 sacks Bremen, 537 sacks Dunkirk, 250 sacks Paris, 130 sacks 45 bags Hongkong, 133 boxes Calcutta, and 140 casks 130 casks and 135 boxes Manila.

COALS.

There has been a steady business in the coal market at the following quotations:—Well End, 12s. 6d.; Tinstall, 17s. 0d.; Harlepool, 17s.; Kelloe, 18s.; South Harlepool, 18s.; South Kelloe, 18s.

GISHURST COMPOUND.

Used by many of the leading Gardeners since 1859, against Red Spider, Mildew, Thrips, Greenfly, and other Insects, in solutions of from 1 to 2 ounces to the gallon of soft water, and of from 4 to 16 ounces to a winter dressing for Vines and Fruit Trees. Has many other important representations to supercede it. Sold Retail by Seedsmen, in Boxes, 12, 3s. and 10s. 6d. Wholesale by PRICES PATENT CAN COMPANY (Limited).

SIMPSON'S RED SPIDER, THIRPS, &c., ANTIDOTE. Testimonials of the highest order on application. Per quart, contains the equivalent of 32 fl. oz. Supplied to Seedsmen and Chemists. Strongly recommended in the Gardener, and of many first-class Gardeners. Prepared by JOHN KILNER, Wortley, near Sheffield.

RUSSIA MATS.—A large stock of Archangel Mats, for Covering and Packing (price on application for Archangel)—Petersburg, 6s. to 10s. per 100; superior close-wove, 40s., 50s., and 55s. per 100; Packing Mats at 20s., 30s., and 35s. per 100; and all other descriptions of Mats at equally low rates, at J. BLACKKITH AND SONS, 4 and 5, Wormwood Street, London, E.C.

RUSSIA MATS, for Covering Garden Frames.—ANDERSON'S TAGANROG MATS are the cheapest and most durable. Price List, which gives the size and weight of each, delivered free to any Station in London. JAS. T. ANDERSON, 149, Commercial Street, Shoreditch, London, E.C.

"TRENTHAM IMPROVED" BOILER, with Water-way End and Smoke Consummer.
"TUBULAR," and every other Boiler of known merit or excellence.
Prize Medal Awarded at the National Contest, Birmingham, 1874.

("TRENTHAM IMPROVED" BOILER.)

("EXCELSIOR BOILER.")

MILL'S PATENT AUXILIARY FUEL ECONOMISER,

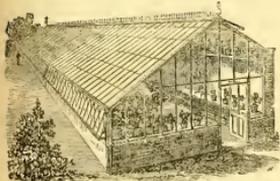

Which can be attached to any ordinary Boiler. These Tubes are the greatest Economisers of Fuel and Preservatives of Boilers, Fire-Bars, and Furnace Fronts ever yet introduced to the public.

STAINTON'S NEW PATENT FROST DEPYING LIQUID (see *Gardeners' Chronicle*, Aug. 19, 1876).

HOT-WATER APPARATUS ERECTED COMPLETE.

PRICE LIST on application; or, Six Stamps for DESCRIPTIVE CATALOGUE, 4th Edition.

W. G. SMITH & CO., HORTICULTURAL ENGINEERS, Victoria Works, Bury St. Edmunds.

SOLE MANUFACTURERS OF BEARD'S PATENT METALLIC NON-CONDUCTING GLASS-HOUSES.—The Glass is fixed between two layers of prepared felt. The Ventilators are worked by a simple mechanical contrivance, and the whole structure is screwed together so as to render it quite portable. HEATING APPARATUS IN ALL ITS BRANCHES.—ORNAMENTAL CONSERVATORIES and HORTICULTURAL BUILDINGS of EVERY DESCRIPTION.—For lightness, elegance and durability, these Houses cannot be surpassed. The best materials only are used in their construction. Great improvements have recently been made, to obviate the objections to iron houses. Very extensive works on this principle have been satisfactorily executed.

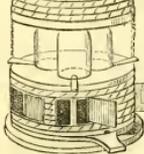

An Illustrated Catalogue forwarded post-free on application.

Gather Honey from Your Flowers. NEIGHBOUR'S Celebrated BEEHIVES.

PHILADELPHIA EXHIBITION, 1876.
PARIS EXHIBITION, 1867.

Three Silver Prize Medals awarded George Neighbour & Sons. The only English exhibitor who obtained Silver Medals for Beehives.

The IMPROVED COTTAGE BEEHIVE, as originally introduced by G. Neighbour & Sons, working three bell-glasses, is neatly and strongly made of straw: it has three windows in the lower Hive. This Hive will be found to possess many practical advantages, and is more easy of management than any other Beehive that has been introduced.

Price, complete £s 15 0
Stand for ditto 0 10 0

The LIGURIAN or ITALIAN ALP BEE being much in repute, G. N. & SONS supply a Swarm of Bees with genuine Italian Queen, in the Improved Cottage Hive, at £s. Hive included.

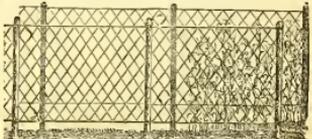

An Italian Alp Queen, with full directions for uniting to Black Stocks, 15s. each.

ENGLISH BEES.—Stocks and Swarms may be obtained as heretofore.

THE APIARY. By A. NEIGHBOUR. 5s., postage 4d. A newly arranged Catalogue of other improved Hives, with Drawings and Prices, sent on receipt of two 3s. 6d. G. N. NEIGHBOUR AND SONS, 127, High Holborn, W.C., or 149, Regent Street, London, W.

NETTING for protecting the above from Frosts, Blight, Birds, &c., 2 yards wide, 3d. per yard, or 100 yards, 20s.; 4 yards wide, 6d. per yard, or 20 yards, 20s.

EATON and DELLER, 6 & 7, Crooked Lane, London Bridge.

AN EXTRAORDINARY BOILER.—During the Great Boiler Contest at Birmingham, in 1875, all Boilers were severely tested to prove their respective merits. One test was, "How long can each Boiler go without Night Attention?" However, one Boiler proved this to a surprising degree, as after being shut up for twelve hours (from 9.34 to 9 A.M.), it still retained its heat in 1000 feet of 4-inch pipes, and yet had more than 1 bushel of fire drawn from its furnace in the morning—equal, in point of fact, to seventeen hours of continuous firing. What a boon to a Gardener. This was THE CHAMFION, Deane's Patent Close-Coil Boiler, for Drawings and Prices of which send two stamps to Messrs. DEARDS, Boiler Works, Harlow, who now have their Boilers at work in every county of England except three. Amateurs will also find THE WONDER, a smaller kind of Boiler, equally as satisfactory, and certainly "the best thing" out. Awarded five First Prize Silver Medals.

STEVENS' TRENTHAM GREENHOUSE BOILER,

After long experience, has proved the most SIMPLE, ECONOMICAL, EFFECTUAL, and LASTING BOILER extant; recently improved. For Illustrations, with full particulars, apply to the Sole Makers,

F. & J. SILVESTER, HOT-WATER ENGINEERS, &c., &c., Castle Hill Works, Newcastle, Staffordshire.
 All Boilers are the only ones made with the sanction and under the inspection of the inventor, Mr. Stevens—all others being base imitations.

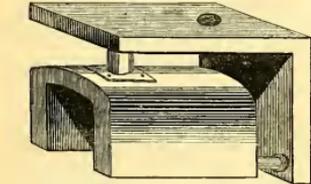

Extract from the *Gardener's Chronicle*:—"It would be difficult to find more efficient instruments than those made by Messrs. Read."

READ AND CO.,

PATENTERS AND MANUFACTURERS OF GARDEN ENGINES, GARDEN AND CONSERVATORY PUMPS, SPRINGES FOR CONSERVATORIES, FERNERIES, &c. INDIARUBBER HOSE, and FITTINGS for Watering Flowers, Lawns, &c., supplied. Prices quoted for any length. Illustrated Catalogue with full particulars post-free.

JONES'S PATENT "DOUBLE L" SADDLE BOILER.

These Boilers possess all the advantages of the old Saddle Boiler, with the following improvements—viz., the water-spout at back and over top of saddle increases the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought iron are not liable to crack. They are made of the following sizes:—

Sizes.		To heat of 4 in. Pipe.		Price.
High.	Wide.	Long.	Feet.	£ s. d.
20 in.	18 "	18 "	300	7 0 0
20 "	18 "	24 "	400	9 0 0
20 "	18 "	30 "	500	11 0 0
24 "	24 "	24 "	700	12 0 0
24 "	24 "	30 "	850	14 0 0
24 "	24 "	36 "	1,000	16 0 0
24 "	24 "	45 "	1,400	20 0 0
28 "	28 "	60 "	1,800	25 0 0

Larger sizes if required.

From Mr. CHARLES YOUNG, *Nursery, Dalham Hill, S.W.,* May 20, 1873.

"Having giving your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."

PRICE LISTS OF HOT-WATER PIPES and CONNECTIONS, with Estimates of all sizes and shapes; or ESTIMATES for HOT-WATER APPARATUS, erected complete, will be sent on application.

J. JONES and SONS, Iron Merchants, 6, Bankside, South-work, London, S.E.
 When ordering Boilers please refer to the above advertisement.

AGRICULTURAL LOCOMOTIVES, STEAM PLOUGHING MACHINERY, ROAD LOCOMOTIVES, TRAMWAY LOCOMOTIVES, STEAM ROAD ROLLERS.

For Prices, Description, and Reports of Working, apply to the Manufacturers.

AVELING & DOBER, ROCHESTER, KENT; 72, CANNON ST. LONDON, E.C., and 42, AVENUE MONTAIGNE, PARIS.

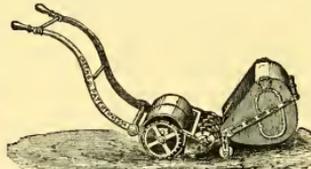

AVELING & PORTER'S ENGINES have gained the highest Prizes at every important International Exhibition. The two Medals for Progress and Merit were awarded them at Vienna for their STEAM ROLLERS and ROAD LOCOMOTIVES; and at the last trials of the Royal Agricultural Society of England their AGRICULTURAL LOCOMOTIVES gained the First Prize after exhaustive trials, when one of their ten-horse power Engines, fitted with single slide and ordinary link-motion, indicated 35-horse power, with a consumption of three and one-fifth pounds of coal per horse-power per hour.

For Sale, a STEVENS' IMPROVED TRENTHAM S WROUGHT IRON HORTICULTURAL BOILER, fitted long by a best distiller, fitted with two Outlet Pipes, Fire-door and Grate complete. For price and particulars apply to HILL and SMITH, Brierley Hill Ironworks, Dudley.

HORTICULTURAL BUILDINGS—BY THE IRON AND TIMBER MERCHANT, West End Steam Joinery, Newcastle.

GREEN'S PATENT "SILENS MESSOR,"
 Or Noiseless Lawn-mowing, Rolling, and Collecting Machines for 1877.

The Winner of every Prize in all cases of competition.

The superiority of these Machines over those of all other makers is universally acknowledged. They will Cut either long or short Grass, Bent, &c., wet or dry.

These advantages no other Lawn Mowers possess. They are the simplest in construction, the easiest to work, the least liable to get out of order, make little noise when in use, and are the most durable Lawn Mowers extant.

The largest stock of Mowers kept in London is to be found at our Establishment, 54 and 55, Blackfriars Road, where purchasers can select from upwards of 500 machines of hand, pony, and horse power, and have their orders executed the same day they are received.

Every Lawn Mower sent out is guaranteed to give entire satisfaction, otherwise it may be returned at once free of cost to the Purchaser.

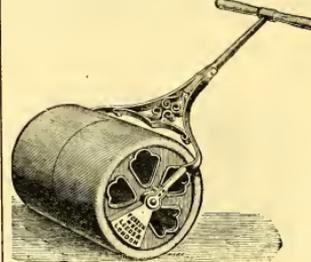

N.B.—Those who have Lawn Mowers to repair will do well to send them either to our Leeds or London Establishment, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

Descriptive Illustrated Price List free on application.

GREEN'S PATENT ROLLERS

For Lawns, Drives, Bowling Greens, Cricket Fields, and Gravel Paths.

SUITABLE FOR HAND OR HORSE POWER.

They can be had of all respectable Ironmongers and Seedsmen in the United Kingdom, or direct from the Manufacturers, THOMAS GREEN & SON, SMITHFIELD IRONWORKS, LEEDS; And 54 and 55, BLACKFRIARS ROAD, LONDON, S.E.

THE PATENT "EXCELSIOR" LAWN MOWER,

The simplest and best ever introduced.

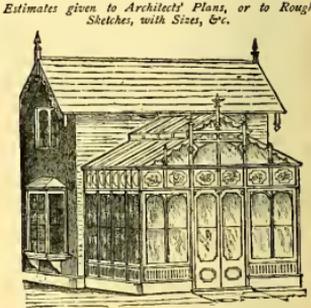

Waite, Bunnell, Huggins & Co., 228, UPPER THAMES STREET, LONDON, E.C., Sole Commissioners for Great Britain, Ireland and France.

The "Excelsior" has never been beaten in Competitive Trial. For Agents, Catalogues, and Trade Terms, apply as above.

Metallic Hothouse Builder to Her Majesty, HENRY HOPE (late Clark & Hope, formerly Clark), HOTHOUSE, BUILDERS and HOT-WATER APPARATUS ENGINEER, 55, Lined Street, Birmingham. Established A.D. 1818.

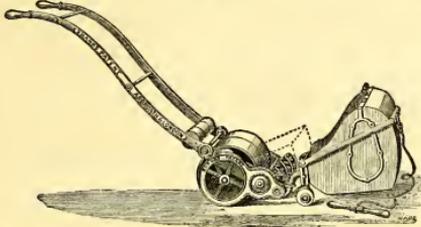

BOOKS of DESIGNS, ss. each.

For the Extensive Ranges of Metallic Hothouses in the Royal Gardens, Windsor and Osborne, were executed at this Establishment.

SHANKS' NEW PATENT LAWN MOWERS,

Under the Patronage of Her Most Gracious Majesty the Queen, and most of the Nobility of Great Britain.

The merits of these Machines are now so well known, and their superiority so universally established, that a detailed description is no longer necessary. A. S. & SON would here simply refer to a few of the prominent advantages peculiar to their Machine. The Revolving Cutter is made to be self-sharpening. The *Sole-Plate* or *Bottom Blade* is made with *Iron Edges*, enabling the cutting parts to last twice as long as in other Machines. A Wind-guard is also introduced, which prevents the Grass escaping the Box when the Machine is in use during the prevalence of wind.

PRICES,

Including Carriage to any Railway Station or Shipping Port in the Kingdom.—

Oil Paint No Longer necessary.

HILL AND SMITH'S BLACK VARNISH

This Varnish is an excellent preparation for all iron and all outdoor work, while it is fully two-thirds cheaper.

UNOBTAINED TESTIMONIAL RECEIVED MAY 3, 1877. 'The Ripon, Alderly Edge, Manchester—Messrs Hill & Smith—Sir—For some 20 years I have used your 'Black Varnish.'

Apply to HILL and SMITH, Brierley Hill Ironworks, near Dudley, and 128, Queen Victoria Street, London, E.C., from whom only it can be obtained.

CUTION—It having lately come to the knowledge of H. & S. that spurious imitations of this Varnish are being offered by unprincipled dealers at a slight reduction in price, they would specially draw attention to the fact that every can of their Varnish is legibly marked with their name and address, without which none is genuine.

IMPROVER, under Glass, in a General Nursery.— Young.— Address, stating wages, &c., to **A. B.**, 17, Barrow Hill Road, St. John's Wood, London, N. W.

TO LANDSCAPE GARDENERS.— Having great experience in Planting and New Ground Work.— **B. B.**, McLaren's, Newsagent, Hammersmith, W.

NURSERY FOREMAN (GENERAL), or SALESMAN, Manager, &c.— Many years' extensive experience in leading Provincial Nurseries.— **A. B. C.**, 10, Sidmouth Street, Gray's Inn Road, London, W.

KINAHAN'S L.L. WHISKY. Universally recommended by the Medical Profession. A pure old spirit, mild, mellow, delicious, and most wholesome. — **Dr. HASSALL** says, "The samples were soft and mellow to the taste, aromatic and agreeable to the smell. The Whisky may be pronounced to be pure, well-matured, and of very excellent quality." — **W. H. H.**, 12, Great Portland Street, London, W.

DINNFORDE'S FLUID MAGNESIA. The best remedy for ACIDITY of the STOMACH, HEADACHE, GOUT, and INDIGESTION, and the best of the delicate constitutions, Ladies, Children, and Infants. — **DINNFORDE and CO.**, 179, New Bond Street, London, and Chemists.

ELLIS'S RUTHIN WATERS. PURE AERATED WATERS.

ELLIS'S RUTHIN WATERS.— Crystal Springs, Soda, Potass, Seltzer, Lemonade, Lithia, and for Gout, Lathin and Potass. Corks traded as "R. ELLIS and SON'S RUTHIN" and every Label bears their Trade Mark. Sold everywhere, on Wholesale of R. ELLIS and SON'S, Ruthin, North Wales. London Agents: **W. WEST and SONS**, Henrietta Street, Cavendish Square.

HOLLOWAY'S PILLS.— For the cure of debility, biliousness, liver, and stomach complaints, this inappreciable medicine is so well known in every part of the world, and the cures performed by its use are so well known, that it is not necessary to mention any other remedies, more particularly for the cure of bilious and liver complaints, indigestion, dropsy, and debilitated constitutions. In these diseases the bowels are constipated, the Pills are so permanent that the whole system is renovated, the organs of digestion strengthened, and a free respiration procured. They expel from the secretory organs and circulate the morbid matter which produces inflammation, pain, fever, delirium, and physical decay, thus annihilating by their purifying properties, the virulence of the most painful and devastating diseases.

BOULTON & PAUL, NORWICH, HORTICULTURAL BUILDERS AND HOT-WATER APPARATUS MAKERS.

Winter Gardens, Conservatories, Greenhouses, Orchard-houses, Vineries, Plant-houses, Facing-houses, Ferneries, Peach-houses, Cucumber and Melon-houses, Patent Flist Projectors, Forcing Beds and Frames, Melon Frames, &c., constructed of the best materials in Wood and Iron combined, on thoroughly practical and scientific principles, efficiency being our first consideration, while due regard is paid to design and ornament.

THIS CONSERVATORY WILL BE EXHIBITED AT THE BATH AND WEST OF ENGLAND SHOW,
To be held on June 4, 5, 6, 7 and 8, at Bath.
STAND, No. 343.

No. 75.—MELON FRAMES AND FORCING FRAMES.
The Largest Stock in the Kingdom. Ready to be despatched on receipt of Order.

These Frames are made of the best red deal, thoroughly seasoned, and fitted by first-class workmen, 24 inches high at the back, 13 inches high in front; painted three coats of good oil-colour, glazed with best 21-oz. glass, every pane of which is put in and bedded in putty, the best method of glazing known, and adapted by the most eminent builders and leading nurserymen (see *The Garden* for January 13, 1877, page 30). Iron nails to each light, and an iron strengthening-bar across. Each light is 6 feet by 4 feet, and 2 inches thick.

CASH PRICES—CARRIAGE PAID.

	Length.	Width.	£	s.	d.
1-light frame	4 feet	6 feet	1 17 6
2 "	8 feet	6 feet	3 5 0
3 "	12 feet	6 feet	4 17 6
4 "	16 feet	6 feet	6 7 6
5 "	20 feet	6 feet	7 17 6
6 "	24 feet	6 feet	9 7 6

Special Notice.—Carriage paid to any Railway Station in England. Also to Dublin, Glasgow, and Edinburgh on Orders of 40s. and upwards.

Breakage seldom occurs. Should any glass be broken, we will send sufficient to replace it, carriage free.

No. 74.—NEW THREE-QUARTER SPAN-ROOF GARDEN FRAME.

Our illustration shows a New Frame for growing Cucumbers, Melons, &c., and for storing plants. It is made to give greater height and more convenience than the Melon frame, No. 75. The front is 21 in. high, without the light, 35 in. high at the ridge, and 22 in. high at the back. The front lights can be turned back on the hinges behind, and back lights turned on to the front lights, giving access to all the plants inside. They are made of the best red deal, sides and ends 1½ in. thick, 2 in. lights; all are painted four times, and glazed with 21-oz. sheet glass, nailed and puttied in, same as the Melon frame, No. 75. The illustration shows the lights to open with gearing; any of the lights can be lifted up when required without altering the other lights. Back and front gearing work separately.

CASH PRICES—CARRIAGE PAID.

No.	size,	£	s.	d.	Gearing extra to 8 ft. size and upwards.
No. 1	4 feet long, 6 feet from front to back	3 0 0	..

DANIELS BROS., ROYAL NORFOLK SEED ESTABLISHMENT, Norwich.

PRICKLY COMFREY.—The most productive and permanent foreign plant known. Can be cut five times a year.—250 tons have been produced in one season. Strong plants £4 per 1000; sets £3 per 1000, carriage paid. The present is a promising form plantings and to propagate. FREEMAN, Economic Seedsmen, Norwich.

W. F. BOFF offers the following, all fine stuff in small 6s.—GERANIUM Vesuvius, 12s.; Myrtale Variegata, 12s.; Master Christine, 16s. per 100; VERBENAS, 12s. per 100; DANIELS, 12s. per 100; HELIOTROPE, 12s. per 100; CALCEOLARIAS, Gem or Aurea, 12s. per 100; PLETICUS, 12s. per 100; PLETICUS, 12s. per 100; LACINIATUM, 20s. per 1000.—250, Upper Street, Kingdon, N.

A. VAN GERT, NURSERYMAN, Ghent, begs to offer the following MISCELLANEOUS PLANTS, of which a good stock is now on hand.

- 50 Acacias, in 25 sorts for 12s. to 10s. radicans, 5s. 12 new Glaciosa, splendid varieties, 12s. 12 Achyranthus, of sorts, 12s. 12 macropodium, 15s. 12 " gracilimum, strong, 2s. 12 " crispulum, 3s. 12 " of sorts, 30s. 12 Zehennanthus, of sorts, 12s. 12 Asplenium Veitchii, 12s. 12 Arisaema monostachya 24s. and 42s. 6 Anala Veitchii, 30s. 12 elegantissima, 21s. 12 Agave and Yucca, choice, 2s. 10 Begonia (tuberous), 42s. 6 Bectonia Van Houstei, 100s. 6 marmorata, 18s. 12 Chamissoa Fortunei, 12s., 20s. and 42s. 10 " humilis, 18s., 30s., and 42s. 12 Coffea arabica, 18s. 12 Cocos Romanzoffiana, 60s. 12 Candy, choice 15s., 15s. 12 Choroseris splendens, 12s. 12 Cyrtolium atratum, 12s. 12 Cyathia dentata, 12s. and 30s. 12 Caladium, choice var., 15s. 100 Buxa diversifolia, 40s. 12 Dracena, choice varieties, 12s. and 30s. 12 Doryandrus Palmeri, 30s. and 60s. 12 Dias grandiflora, 20s. 12 Dionea muscipula, 21s. 12 Eurya latifolia, 50s. 12 Eucyba Ficus, 40s. collection, 21s., 42s. and 60s. 12 choice Selaginella, 12s. 12 Sericobona ignea, 9s. 12 Senecio grandiflora, strong bulbs, 2s. 12 Yucca Whippley, nice plants, 30s.

CYCAS REVOLUTA. The finest stock of growing plants in Europe, splendid specimens, with fine regular heads of fronds, from £3, £5, £10, £15, and £20.

THE NEW SEEDLING ROSE, "QUEEN OF BEDDERS" (NOBLE).

See Coloured Plate (after Mrs. Duffield), "Gardeners Chronicle," May 5, 1877.

Perhaps the finest of all the English Seedling Roses of recent introduction is this new and rare Rose in every sense of the word—requires no pegging down, support, or training of any kind, and is a continuous early and late bloomer.

First-class Certificate Royal Horticultural Society, August 9, 1876.

Its inflorescence may be imagined when it is stated that a plant 18 inches high had eighty-four buds and expanded flowers upon it on September 6, 1876.

A constant supply of buds was obtained from early June to November of that year—over five months. Good Plants are now being sent out in strict rotation at 10s. 6d. each. Coloured Plates 12 each.

CHARLES NOBLE, BAGSHOT. TEA-CULTURE. SPECIAL CULTURE.

We have this season devoted nearly the whole extent of our Glass-houses to the Culture of Tea-Scented and other Roses, and are now enabled to offer plants of very superior quality.

PLANTS, in 5-inch pots, suitable for planting out, 15s. to 18s. per dozen. extra 25s., in 6-inch pots, for Greenhouse, set with buds, 24s. per dozen. extra 12s., in 8-inch pots, for Greenhouse, set with buds, 30s. to 36s. per dozen. Half Specimens, 5s. to 7s. 6d. each. NEW PRIZE TEA SCENTED ROSES, 12s. per dozen. HYBRID PERPETUAL ROSES, 12s. per 100, published in 6 and 10-inch pots, now showing for bloom, 25s. to 42s. per dozen.

CRANSTON'S NURSERIES, KING'S ACRE, near HEREFORD. Address—CRANSTON & CO.

COCOANUT FIBRE REFUSE, invaluable for Gardening purposes. One thousand testimonials. Four-bushel bag, 12s. bag included; truck-load, 100s. free to any Rail, 25s.

POTTER OYLER, Spitalfields Market, N.E. COCOANUT FIBRE REFUSE, as supplied to Carters, Veitch, Wills, Bull, Ewing, Daniels, &c. Cheapest and best advertised. SILVER SAND, PEAT, LOAM, LEAF-MOULD, per bushel, 8s. 6d. 10s. of truck; SPHAGNUM, RAFFIA, &c. Write for Price List. M. H. BENTLEY, Nunhead, S.E. (near Junction).

COCOANUT FIBRE REFUSE, reduced price. 4-bushel bags, 12s.; 100, 20s.; 1/2 Truck-load, 30s. Delivered free to any rail in London. J. F. WENS AND CO., Fibre Works, Greyhound Yard, 134, High Street, Battersea, S.W.

COCOANUT FIBRE REFUSE may be had at 12s. per 4-bushel bag, bag included; a truck, 50s bushels, 21 5s.; one-horse load may be had at the factory, 35s., by sending for R. M. GAREY, 57, Old Montague Street, Whitechapel, E.

MILLER AND JOHNSON (ESTABLISHED 1852) Manufacture the highest quality of ARTIFICIAL LITHUMES For ROOT, CORN, and GRASS CROPS. 36, Mark Lane, London, E.C.

FIBROUS PEAT for Orchids, &c. BROWN FIBROUS PEAT, best quality for Orchids, Stove Plants, &c., 16s. 6d. per truck. BLACK FIBROUS PEAT, for Rhododendrons, Azaleas, Heaths, American Plant Beds, 12s. per ton. Delivered on rail at Blackwater, S. E. R., or Farnborough, S. W. R., by the truck-load. Sample sack, 5s. 6d. each. FRESH SPHAGNUM, 10s. per sack. WALKER AND CO., Farnborough Station, Hants.

ODAMS' MANURES, FOR ALL CROPS. Manufactured by the MICRO-PHOSPHATE and ODAMS' CHEMICAL MANURE COMPANY (LIMITED), consisting of Tenant Farmers occupying upwards of 100,000 acres of Land. Chairman—ROBERT LEEDS, Kewick Old Hall, Norwich. Sub-Manager and Secretary—C. T. MACADAM. CHEF OFFICE—109, Fenchurch Street, London, E.C. THE GENERAL MANAGERS—Messrs. Quinlan & Co., Ltd., 10, Abchurch Lane, London, E.C. Particulars will be forwarded on application to the Secretary, or may be had of the Local Agents.

SIMPSON'S RED SPIDER, THRIPS, &c., ANTI-DOTE. Testimonials of the highest order on application. For quarts, contained, 6s.; per pint, 3s. 6d. Supplied to Seedsmen and Chemists. Strongly recommended in the Gardener, and by many first-class Gardeners. Prepared by JOHN KILNER, Woolley, near Sheffield.

GISHURST COMPOUND.—Used by many of the leading Gardeners since 1850 against Red Spider, Milliver, Thrips, Greenfly, and other Blight, in solutions of from 1 to 2 ounces to the gallon of soft water, and effective against all water-breeding insects for Vines and Fruit Trees. Has outlived many preparations intended to supersede it. Sold Retail by Seedsmen, in Boxes, 12s., 3s., and 10s. 6d. Prepared by PRICE'S PATENT CANDLE COMPANY (Limited).

ARCHANGEL, PETERSBURG PACKING MATS, RAFFIA for TYING, TRAINING STICKS and LABELS, Bamboo Canes, Virgin Cork, &c.

C. J. BLACKKITH and CO., COXS QUAY, LOWER THAMES STREET, LONDON. FINE ARCHANGEL MATS IMPORTED INTO GLOUCESTER.

J. C. WHEELER & SON Can offer a few hundreds on good terms. J. C. WHEELER & SON, SEED GROWERS, GLOUCESTER.

RUSSIA MATS, for Covering Garden Frames—ANDERSON'S TGAANROG MATS are the cheapest and most durable. Price List, which gives the size of every class of Mat, forwarded post-free on application. JAS. T. ANDERSON, 140, Commercial Street, Shoreditch, London, E.C.

RUSSIA MATS.—A large stock of Archangel and Petersburg, for Covering and Packing (price on application for Archangel)—Petersburg, 60s. to 100s. per 100; superior close-wove, 40s., 50s. and 55s. per 100; Packing Mats 20s. 6d. and 22s. 6d. per 100; and all other descriptions of Mats at equally low rates. J. BLACKBURN and SONS, 4 and 5, Wornwood Street, London, E.C.

SIR J. PAXTON'S HOATHOUSES for the MILLION.—Price List free. Conservatories, &c., built to Architect's Plans, or Designs prepared and Estimates given to Royal Sketches, with plans required. Heating apparatus fixed complete. Pamphlet with Illustrations, post-free. HERMAN AND MORTON, 2, Gloucester Street, Regent's Park, London, N.W.

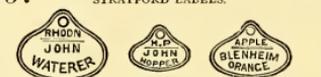

Metallic Hothouse Builder to Her Majesty. HENRY HOPPE (late Charles Hope, formerly Clark) HOUSHOUS BUILDER and HOT-WATER APPARATUS ENGINEER. 55, Lionel Street, Birmingham. Established A.D. 1818.

BOOKS OF DESIGNS. The Extensive Ranges of Metallic Hoathouses in the Royal Gardens, Windsor and Osborne, were executed at this Establishment.

Tufa Rock. MESSRS. H. BUXTON AND CO., Matlock. Has much pleasure in offering their TUFF, a light porous natural Stone, admirably adapted for the construction of Grottos, Ferneries, Aquariums, and General Garden Ornamentation. For terms and particulars apply to our Agent, Mr. H. CHADNEY, 22, Royal Exchange, London, E.C. 4.

Indestructible Terra-Cotta Plant Markers. MAW AND CO'S PATENT.—Prices, Printed Patterns, and Specimens sent post-free on application; also Patterns of Ornamental Tile Pavements for Conservatories, Entrance Halls, &c. MAW AND CO., Bethnal Works, Brosey.

Under the Patronage of the Queen. J. SMITH'S IMPERISHABLE STRATFORD LABELS.

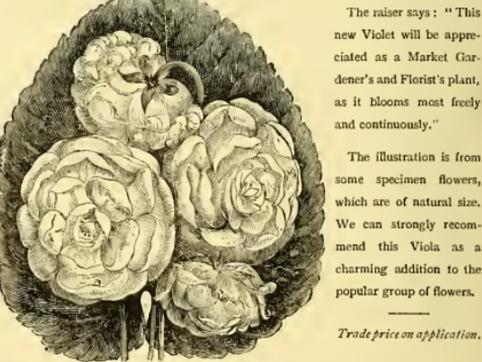

The above Labels are made of a White Metal, with RAISED BLACK-FACED LETTERS. The *Gardener's Magazine* says:—"We must give them the palm before all other plant labels, as the very first in merit."—Samples and Price Lists from J. SMITH, The Royal Label Factory, Stratford-on-Avon.

JOSEPH BRAMHAM, HORTICULTURAL and HOT-WATER ENGINEER, Water Works, Weaver, &c., 104, Dale Street, and 44, Elizabeth Street, Liverpool. H. strongly recommends the ALLERTON PRIORY BOILER as one of the most powerful for extensive work. He has fixed one capable of heating 10,000 feet of 4-inch piping. See *Gardener's Chronicle*, p. 667. Also a WELDED WROUGHT IRON WATERWAY BACK for ordinary Saddle Boilers. These Backs can be fixed to any Boiler now in use, and are a great saving in fuel and labour. He is also prepared to fix any kind of Boiler made. Manufacturer of the Registered LIVER FRONT for large Boilers, IRON and WIRE WORK in all branches. References from Noblemen and Gentlemen for work done. Plans and Estimates given.

NEW DOUBLE WHITE VIOLET, "BELLE DE CHATENAY" Awarded a First-class Certificate by the Horticultural Society of France.

We offer this magnificent Viola for the first time. The flowers are pure white, most delicately perfumed, of immense size, and very double; in fact, almost equalling in size the well-known white Aquilegia. It is pronounced by French horticulturists to be the very best double white Violet in cultivation.

Price, 4s. 6d. each (Post-free 5s.). Trade price on application.

THE QUEEN'S SEEDSMEN, Carters' HIGH HOLBORN, LONDON, W.C.

MAGNIFICENT SPECIMEN ORNAMENTAL PLANTS,
Adapted for the Decoration of Conservatories and Greenhouses, or suited for Sub-tropical Gardening.
ESTABLISHMENT FOR NEW AND RARE PLANTS. KING'S ROAD, CHELSEA, LONDON, S.W.

**SHANKS' NEW PATENT
LAWN MOWERS,**

Under the Patronage of Her Most Gracious Majesty the Queen, and
most of the Nobility of Great Britain.

The merits of these Machines are now so well known, and their superiority so universally established, that a detailed description is no longer necessary. A. S. & SON would here simply refer to a few of the prominent advantages peculiar to their Machine. The Revolving Cutter is made to be self-sharpening. The *Solo-Plate* or *Bottom Blade* is made with *Two Edges*, enabling the cutting parts to last twice as long as in other Machines. A Wind-guard is also introduced, which prevents the Grass escaping the Box when the Machine is in use during the prevalence of wind.

PRICES,

Including Carriage to any Railway Station or Shipping Port in the Kingdom:—

NEW HAND MACHINE.		NEW PONY AND DONKEY MACHINE.	
10-inch Machine	£3 10 0	25-inch Machine	£13 10 0
12-inch Machine	4 15 0	28-inch Machine	15 15 0
14-inch Machine	5 15 0	30-inch Machine	17 0 0
16-inch Machine	6 15 0	The Patent Delivering Apparatus enables the Grass-box to be emptied without stopping the Machine.	
19-inch Machine	8 5 0	Price, for the 28-inch and 30-inch Machines, 30s. extra;	
22-inch Machine	9 0 0	25-inch Machine, 25s. extra. Silent Movement, 12s. 6d. extra.	
24-inch Machine	9 10 0	Boots for Horse's feet, 20s. per set.	
The Hand Machines are all fitted with Silent Movement, and can be used either with or without the usual Rollers.			
NEW HORSE MACHINE.			
30-inch Machine	£20 10 0	45-inch Machine	£28 0 0
36-inch Machine	24 0 0	49-inch Machine	32 0 0
The Patent Delivering Apparatus enables the Grass-box to be emptied without stopping the Machine.			
Price, for the 45-inch, 49-inch, and 36-inch Machines, 20s. extra; for the 30-inch, 30s. extra. Silent Movement, 20s. extra.			
Boots for Horse's feet, 20s. per set.			

A Staff of experienced Workmen always kept in London, so that Repairs can be done there as well as at the Manufactory.

SHANKS' PATENT LAWN MOWERS

Are warranted to give ample satisfaction, and if not approved of can be at once returned.

ALEXANDER SHANKS & SON,

Dens Ironworks, Arbroath; and 27, Leadenhall Street, London, E.C.

27, LEADENHALL STREET is the only place in London where intending Purchasers of Lawn Mowers can choose from a Stock of from 150 to 200 Machines. All sizes kept there, whether for Horse, Pony, or Hand Power. Orders executed same day as received.

Small Lawn Mowers—6-inch, 25s.; 7-inch, 35s.; 8-inch, 50s.

PARHAM'S PATENT SYSTEM OF GLAZING WITHOUT PUTTY
ON CHANNELLED WROUGHT-IRON OR RED DEAL RAFTERS,

secures almost entire immunity from Breakeage of Glass, extreme facility for Repairs, and absolute freedom from Drip.

MR. MECH'S ADDRESS
to his OLD FRIENDS and CUSTOMERS and to the PUBLIC:—

"As it has been erroneously supposed by some that I am no longer interested in my London business, I think it desirable to state that I continue to carry it on as energetically, and I trust as satisfactorily to the Public, as formerly, assisted by my only son, who will in due time succeed me. It is now fifty years ago since I first commenced business in Leadenhall Street, and what changes have taken place! Then everybody shaved, and my razor and razor-stop trade was immense; now moustache and beard are the order of the day, and the razor and stop trade is comparatively defunct. Then there were no railways, so people stayed at home and used wooden dressing-cases; now everybody goes by rail, and we have dressing-bags to suit the altered conditions. Fifty years ago the poor geese supplied our pens, and many a now rich merchant in the City will remember the quality of Mech's shilling pen-knives; but steel pens have extinguished the pen-knife trade and the penmaking machines, and the geese are in peace, except at Michaelmas. In fact, steam has altered, and I may safely say, improved everything, and has made us a nation of travellers both by land and sea. I wonder how much time is now occupied in reading the steam-worked press! and how much less time is occupied in sipping port wine, as we used to do fifty years ago, when we could not travel! Steam will make our 4s leaves cheaper some day, just as it has converted calico from 4s. 6d. to 6s. per yard. There, again, a letter which used to cost 6s. 6d. to Cork is now carried for 1d. Sir Rowland Hill richly deserves a monument. But to return to business; fifty years ago, when I first commenced on a small scale, I made it an axiom that what I sold should be good and useful, and I believe thousands who used the stop and paste, which I personally invented, can testify to this; it fact, it was sometimes complained of that I stamped on my razors 'E. changed if approved.' I have never, and shall never so long as I live, deviate from that principle, because it is the true means to retain and increase one's connection. I devoted my attention especially to the quality and convenience of arrangements in the dressing bag and dressing case department, and in the tasteful selection of articles suitable for presentation, as well as on the matter of dispatch boxes and writing cases. Although both razors and penknives have 'gone out,' our apartment remsan, and 'sporting knives' form one of our special departments. I feel firmly convinced that there is no fear of the departure of knives and forks, or dinners, so we make this an important department in quality and price. In conclusion, I ask no favours, but simply desire that my customers should compare the quality and price of my wares with those of other dependable establishments, and form their own conclusions. Most of my worthy assistants and workmen have been nearly forty years in my service, and long ago learned that civility and attention to our customers are as important as good quality in the articles sold. Illustrated catalogues will be forwarded post-free on application."

112, Regent Street, W., opposite Vigo Street.—1877.

Extra Strong Occomber or Melon Frames, With 8-inch sashes and 1 1/2-inch red deal frames, secured at each corner with two wrought-iron strap bolts. Glazed, without putty, with 21-oz. glass.

Sole Medalists for the Best Hot-Water Apparatus at the United States Centennial International Exhibition, Philadelphia.

By Her Majesty's Letters Patent

WRIGHT'S ENDLESS-FRAME-IMPACT HOT-WATER BOILERS.

GUARANTEED

The most Powerful, the most rapid, the most Economical, the Simplest, and the Cheapest in the World.

"The 'Boiler of the Future.' I have no doubt about this."—Wm. Thomson, *Trans. Inst. Mech. Engrs.*

From the "Gardener," March, 1877.

WRIGHT'S PATENT ENDLESS-FRAME-IMPACT BOILER.

"This boiler is attracting a good deal of attention in the horticultural world at the present time, and I as have just had one of my largest-sized ones fitted up here, and have now got well tested, perhaps a few lines from me upon its capabilities may not be without some advantage to some of your numerous readers. I have had some experience as to the annoyance and extra labour caused by badly-constructed boilers, and any improvement effected in these to save labour and fuel demands the attention of all interested parties.

"To give your readers a better idea of the work this boiler has to do, I may begin by stating that our hot-houses consist of ranges having a total length of 520 feet, a ridge and furrow-roofed greenhouse being in the centre, two lean-to Vineries on each side, with Cressella-house and general plant-hatch at each end; on opposite side of wall we have a Fern-house, partly lean-to and partly span, 95 feet in length, varying in width from 10 to 20 feet. Attached to end of boiler-house is our laundry, with a drying chamber fitted up with about 250 feet of stretch piping.

"The whole of the above houses are heated with hot water and have a total of about 300 feet of stretch piping. We had formerly two oval fire boilers, one being 4 feet 6 inches long, the other 4 feet long. With these two boilers kept hard fired during frosty weather, and had frequently to lose a night's sleep attending to the fires. On the last day of last year the larger boiler came to grief—the water from fire drowned out the fire; and in taking down some of the brick work it was found to have cracked beyond repair. To be thus left in the middle of winter with only the one boiler was no joke. I had to look out for another without delay. I have given a good deal of attention to the construction of hot-water boilers, and I must say I had never seen one that came up to my idea of what a boiler should be until some time ago my attention was called to a drawing of Wright & Co.'s Boiler, which appeared in the *Gardener*.

"After talking the matter over with my employer, W. S. Mitchell Esq., he at once granted permission to get the boiler I had formed such an opinion of. I at once put the order into the hands of Messrs. Menck & Philip, hot-house builders and hot-water engineers, Torphichen Street, and they have fitted it up and attached the piping in the most complete manner. I also got some additional tight valves attached, so that if anything should at any time go wrong it can be attended to without disturbing the piping.

"And now as to the capabilities of the boiler for the work. As formerly stated, I had considerable difficulty in keeping up the heat with the two oval fire boilers kept hard at work. I now find that with the remaining oval fire boiler idle, I can heat up the whole of the houses and the laundry to a degree they never were before, and that with much less coal than it took to fire one of the oval fire boilers.

"Our chimney consists of a fire 70 feet long, led horizontally through centre of back wall, with 16 feet of a perpendicular stack. Some doubt was expressed that, as we required a chimney pipe attached to boiler about 6 feet long, there would be deficiency of draught; but we have found the opposite to be the case. I attached a 6 feet length of stretch stove pipe, with elbow at boiler, and cleaning door on the angle, and as I found the draught very strong I got a throttle-valve damper fitted into the bend of the stove pipe, and an able man regulated the fire to a niceity, and by banking-up the fire at 10 P.M., and turning the damper half an hour, I had the boiler at work with the greatest efficiency till the usual time of commencing the work of the following morning; and instead of, as formerly, having to sit up till the half of the night at times, and sometimes whole ones, we can retire to rest at a reasonable hour, confident of sleep being undisturbed by unpleasant dreams of flames and frays going to ruin. In concluding my remarks I may say that not the least of the good qualities of this boiler is its portability. We had not the slightest difficulty in putting it down in our constructed stove-hole through a trap-door 4 feet long by 1 foot broad, and fitting it up in a recess 4 feet square, and I am confident that with the assistance of two men I could take the whole lot to pieces and have it again in full working order in two hours. I have no hesitation in saying that for rapidity of circulation, small consumption of fuel, portability, and cleanliness, it has no rival, and have no doubt this boiler will win its way; and where coals are high in price it will effect a considerable saving, and there is good fire space for a few more, and a good capital boiler for burning wood and other fuel."—J. CLARKE, *The Gardens, Pavilion Green, Edinburgh.*

"We have a very high opinion of this boiler, and predict that it will take a foremost place in heating hot-houses and all other buildings, and shall have some further remarks to make about the principles of its neatness."—Ed. Gowers.

"I think yours the most perfect 'Heat Trap' yet invented."—DAVID THOMSON, *Drymillrig Gardens.*

For details and particulars as to the various sizes made, and prices, please see our pamphlet, entitled, "ONE BOILER AND TWO CHIMNEYS," which is sent on application to any of our Agents.

We are prepared to supply Thirty Different Boilers of all powers, sizes, and heights, and can vary these to suit any particular situation or requirement.

AIRDRIE, near GLASGOW, N.B.

NEW ENGLISH-RAISED SEEDLING ROSES.

MESSRS. BELL & SON, THE NORWICH NURSERIES,

Are now executing orders for their TWO NEW ROSES, raised at their Nurseries, and described and announced below. They have been thoroughly tested here before being sent out, and can be recommended with confidence as really distinct novelties.

CLIMBING ROSE "CATHERINE BELL."

Very large flowers of a deep rose colour, the backs of the petals a delicate silvery pink, of exquisite shape and very fragrant. It is very free-flowering, and of vigorous climbing habit, making shoots 6 feet to 8 feet long in one season. Figured in *The Garden*, March 18, 1876.

"Your Rose Catherine Bell is both *belle et grande*."—Rev. Canon Reynolds Hole.

Good Flowering Plants, in Pots, 10s. 6d. each.

COLOURED PLATES ONE SHILLING EACH.

HYBRID TEA ROSE "MRS. OPIE."

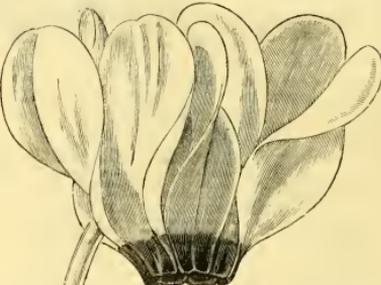

Bright salmon-rose, tea-scented flowers, with shell-like petals, a most distinct and novel shade of colour among Tea Roses. It will form a charming companion to Madame Falot, and will be as extensively cultivated as that variety when well known. In flower from May to November. Figured in the *Floral Magazine*.

Good Flowering Plants, in Pots 7s. 6d. each.

BELL AND SON, 10 & 11, EXCHANGE STREET, NORWICH.

B. S. WILLIAMS'

CYCLAMEN PERSICUM GIGANTEUM.

The variety now offered is a new and greatly improved type, having very broad, beautiful, mottled, coriaceous leaves and stout flower-stalks, throwing the flowers well above the foliage, each flower measuring from 2 to 2½ inches in length, with broad petals of great substance, pure white, with a fine bold violet-purple eye.

Per Packet, 2s. 6d. and 5s.

"May 17, 1877.

"Dear Sir,—Having the best of success during the time I have been here with your seeds, in the way of Primulas, Cyclamens, &c., I have, so far, carried the palm about this quarter, and have now, out of the last packet of your GIANT CYCLAMEN (containing fifty seeds), forty-four good plants."—From Mr. G. BOLAS, *Gardener, Hopton Hall, Derby.*

Please note that all packets are Stamped with my Registered Trade Mark.

VICTORIA AND PARADISE NURSERIES,
UPPER HOLLOWAY, LONDON, N.

STRAWBERRY, THE DUKE OF EDINBURGH (MOFFAT).

THE LAWSON SEED AND NURSERY COMPANY (LIMITED),
EDINBURGH AND LONDON,

Have made arrangements with Mr. Moffat, Coldwells, to send out, for the first time, the above-named splendid Strawberry. Fruit very large, firm, and of excellent flavour, bright scarlet colour. A most prolific bearer, and as a main crop for market purposes it is unsurpassed.

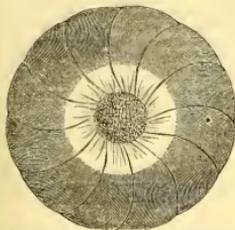

Strong Plants, 42s. per 100; 25s. per 50; 15s. per 25; 9s. per dozen.

Trade Price on application.

1, GEORGE IV. BRIDGE, EDINBURGH; 54, BISHOPSGATE ST. WITHIN, LONDON,
April, 1877.

SUTTON'S
SUPERB STRAINS OF
FLORISTS' FLOWERS,
POST FREE.

The Finest Strain of Cineraria.

SUTTON'S SUPERB CINERARIA.

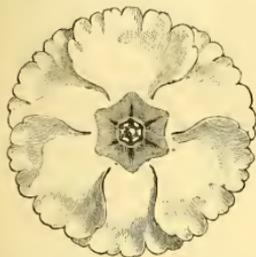

This will be found unequalled by any in cultivation, the seed having been saved from the finest named varieties only.

Price 2s. 6d. per packet, post-free.

From Mrs. A. ALLETON, *Frittillwell, May 8.*

"Our Cinerarias this year (from your seed) are splendid; they far surpass any I saw at the Botanical Gardens yesterday."

The Finest Strain of Primula.

SUTTON'S SUPERB PRIMULA.

This choice stock has been carefully selected from the largest fruited flowers of good colour. Habit robust, with bloom thrown well above the foliage.

Red, white, or mixed, 2s. 6d. per packet, post-free.

From W. EDWARDS, Esq., *Wellington, January 21.*

"I cannot help saying that the Primulas from your seed have always given great satisfaction, but this year more than ever."

The Finest Strain of Calceolaria.

SUTTON'S SUPERB CALCEOLARIA.

This splendid strain has been most carefully selected from the very finest collections in cultivation. The plants are compact in habit, with beautiful green foliage, and a profusion of blooms. The flowers are perfect in form and substance, and of every shade of colour.

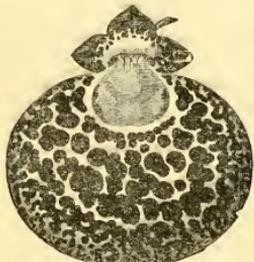

Per packet, 2s. 6d.

From A. E. RUSSELL, Esq., *Dalshabreck, July 10.*

"My Calceolaria plants, from seed purchased of you last year, are particularly fine, of very compact habit, and beautiful in colour."

SUTTON & SONS,
THE QUEEN'S SEEDSMEN, READING.

B. S. WILLIAMS'
NEW AND CHOICE
FLOWER SEEDS FOR 1877.

Per packet—s. d.
CALCEOLARIA, Williams' Superb Strain, 5s. 1 6
3s. 6d., 2s. 6d., and 1 6

From Capt. COONS, *Aberystwith, May 13, 1877.*

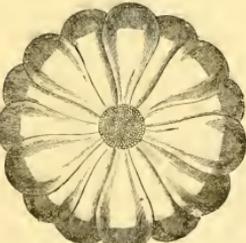

"The Calceolaria, from the seed Capt. Coons had from Mr. Williams last year, have been greatly admired—they leave nothing more to be desired."

PRIMULA, Williams' Superb Strain, Red, White, or Mixed 5s., 3s. 6d., 2s. 6d., and 1 6
PRIMULA SIENSIS FIMBRIATA COCCINEA (new) colour brilliant scarlet with bright sulphur eye, exquisitely fringed and of great substance 5 0

From Mr. F. DENNING, *Gardener to J. Fenton, Esq., Yardley, February 26, 1877.*

"Dear Sir,—I may inform you that at the Birmingham Chrysanthemum Flower Show, held last November, I took the 2d prize, with twelve Primulas, six red and six white, in the Gentleman's Gardeners' Class, with seeds supplied by you."

CINERARIA, Weatherill's Extra Choice Strain, 5s., 3s. 6d., 2s. 6d., and 1 6

From Mr. J. WEST, *Gardener, Chelsea Park, May 21, 1877.*

"Sir,—Your strain of Cinerarias which have now been in bloom some time, have been and are now the admiration of all that have seen them, and are considered by gardeners to be the best ever seen in this neighbourhood. Habit very dwarf and compact, quite equal to the drawing in your catalogue."

All the above choice seeds have my registered Trade Mark stamped on each Packet.

VICTORIA and PARADISE NURSERIES,
Upper Holloway, London, N.

SATURDAY, JUNE 9, 1877.

TERRESTRIAL HEATING.

THIS may be regarded as the *primum mobile* for the better class of exotics, and not for them only, but also in the forwarding process of raising plants from seed as well as from cuttings. Bottom-heat, too, has been applied to Grape growing with wonderful success. It may not be out of place then to trace some of the workings of this powerful agent.

The name and history of the man who invented the common three-light Cucumber and Melon frame is lost in dry antiquity; but we have his formula left showing how he sweetened his manure by frequent turnings before he made up his bed of Oak leaves, interarded with horse dung, built some 5 feet high, and say 9 inches wider than the frame all round; the linings were afterward applied as occasion required, also the essential covering of one or two folds of Russian mats during the dark and cold nights of early spring. This arrangement plainly showed that the earth was first heated, and it had to heat the air, with the sun's assistance by day, and without his powerful aid during the long cold nights. Well now, with all this clumsy arrangement by means of great labour and heavy dirty work, did our forefathers obtain satisfactory results? Unquestionably they did, and the atmosphere of the old Melon frame has never been equalled by any modern system of heating by steam or even by hot water. I recollect perfectly the elder Mr. Veitch, of Exeter, putting newly imported Orchids into a dung frame as the best treatment that that princely nursery could afford. I recollect perfectly striking cuttings of *Arbortvitæ* in phials of water in a Melon frame; and any one who has watched the growth of Cucumbers or Melons planted on the hill in the centre of the frame, and has seen the fine white roots striking right out of the earth into the air of the frame, must be convinced that as regards the formation of roots the moist warm air of the Melon-frame is one of the best mediums for striking cuttings. Other systems of heating, such as by hot-water pipes, give heat moist or dry, just as the means for supplying moisture may be provided, but in the Melon-frame the dry heat is impossible. The one heat is that of fire; the other that of the fermentation of vegetable substances slowly progressing to decay.

Supposing, then, that the hill or surface of the Melon-frame had got to the state of "the smoking Flax"—neither cold nor hot, but lukewarm—it is quite clear that the addition of cold water would chill just as warm water would heat such a medium. Now, our ancient blue-apron men would meet this state of things by having a glass-bottle filled with water and kept in the frame with which to water the tender seedlings, and this bottle, and a full-grown toad by way of poise, were the only occupants of the frame, besides the vine of the Melon. In this case, as the warm water descended into the soil it parted slowly with its heat, and thereby warmed the soil. We know that autumn-sown Wheat will take root, and extend the same, although the blade may not be able to extend on account of the frost and snow overhead; but this fact proves what a difference it makes to the well-being of the plant when the bottom is protected by the earth, and is thereby warmer than the blade exposed to every cold blast. If this were doubted we might argue that if there were no

other gain but calmness, that alone would be a great benefit. Again the unchangeable life underground is the very reverse of that in the atmosphere above it. Therefore, if Wheat has no bottom-heat, it certainly is many degrees warmer at one end than at the other.

The object of these remarks is not, however, to treat of Wheat but of Vines to which bottom-heat has been applied, and to show that the glass bottle in the Melon-frame, with its quill in the cork and its air-hole in the body of the bottle, was a miniature example, a kind of model for the benefit of all exotics; for water is so valuable as a carrier that it will not only convey food to the roots, but also heat, and any one who would leave out such an agent now after its character and abilities are so well known, would be expected to give his reasons for so doing.

I recollect the late Mr. Pince, of the Exeter Nursery, showing me a plant of *Nepenthes distillatoria* which had crawled along the hot-water pipes, and had so benefited by the bottom-heat that it flowered and produced perfect seeds, which, when sowed, produced plants with every leaf ending in a pitcher. I have elsewhere called attention to the fact that all Pine growers worthy of the name have made sure of a good brisk bottom-heat, notwithstanding what many have urged to the contrary. If I venture to say that the finest Grapes exhibited now-a-days surpass those of forty years ago, good though they were in their day, I shall be borne out by facts; but my present business is to cry up bottom-heat by the agency of hot-water, for it must be drummed into unwilling ears—since it is the newest phase of an old fact, for the Grape Vine has just as much need of warm drink as the Melon Vine.

Many years ago there was a case given in the garden periodicals of Melon roots getting to a warm-water tank, and thriving rarely with a supply *ad lib.* of tectotal beverage always warm. The largest Gooseberries I ever saw were grown by an amateur in Birmingham, and the secret of success consisted in the bushes being watered on washing days, once a week, during the growing season, with weak but warm soap-suds. Irrigation of pasture fields in certain localities produces extraordinary returns, especially where the water off the limestone comes charged with that mineral to the work, whereas in less favoured localities the wet land plants, Rushes, &c., tell too clearly of the cold bottom and sour clay soaked and saturated with ditch water. Here I would remark that it is well-known that grass, for instance, cannot attain perfection where the necessary supply of moisture is withheld from the roots, yet the plants will remain green and healthy as if biding their time, but wasting the sunny days for want of one ingredient.

Now, in the case of the Vine it has a heavy duty to fulfil, and requires much sun heat, or other heat, to accomplish its work; and to compensate that, it needs a corresponding quantity of water, for its time is short, and foliage and fruit must be matured quickly. If more heat is wanted than the sun can supply, the coal pit must put its shoulder to the work, and woo to him that stints the Vine of its strong, warm drink. I have forgotten in what Irish book it was that I read the sensible statement that "Fortune would never stick to a man that inveigled a piper's drink." Well, then, if this be true between the piper and his host, it is doubly so with the fruitful Vine; and as it tells no tales its likes and dislikes must be learned by its behaviour under different forms of treatment.

It is certainly the most generous plant we possess, for if we take 1 lb. of Grapes to yield nearly a pint of wine, a tidy bunch would give wine enough to fill a gallon bottle, and some bunches have been shown that would yield enough to fill two such bottles, and that for not

once and away like the annual wheat or barley, but year by year for generations.

In planning a Vine border then, the sunny slope, and the effectual drainage, have to be kept in view; but the Vine is a gross feeder and requires a good run to supply its sheet of foliage. In sultry weather when growth is lively how grateful must it be for the feeders to get what is to them warm rain, medicated with liquid manure, thereby not only breaking bread for the Vine, but also kindly warming its strong drink. Where fires have been made to burn weeds in fields or brushwood in woods, the earth gets warmed to some depth according to the amount of fire and the time it has been kept up, and it will take several days to get cold after the embers have been removed. When pasture gets burnt up in hot summers, one would think the grass would never come again, but this deceives the observer, and the great bottom-heat only waits for the water to send up the greensward.

All guess-work beforehand on horticultural subjects is to be received with caution. Even Nature is not always a safe guide, for Chickweed and Groundsel will thrive in a medium very little above freezing; and, on the other hand, Pine-apples will do well in a bottom-heat so strong, that the hand can hardly bear the heat of the brick-pot. Now, this is nowhere to be found in Nature unassisted, yet it is an established rule in practice.

Many Roses flower freely on walls and sheltered places, and any one judging from that that he could force, or rather forward, such in a glass structure, will find his cost that, unless he warmed their toes a little to start the root first, he will often find his labour in vain, but some may say, why all this straining after bottom-heat? Why, because it is within our reach, for it is truly said in Holy Writ that "the wind bloweth where it listeth," and, like the unicorn, it cannot be harnessed to our team, but it is far otherwise with that part of the plant below the collar. It has an underground life in darkness, and searches far and wide for its supplies, and we have the means of forwarding this part of the work by food and warmth. By means of water, used with knowledge and discretion, bottom-heat can certainly be maintained, for when the earth is heated to a moderate depth it takes several days to cool: for example, when peaty sods that have been pared and burnt have lain neglected the ashes will be warm for weeks. But when we see splendid Grapes exhibited, and are told what treatment had so raised their character above the normal standard, surely it is time to turn the attention of Grape growers to this topic, and leaving the corn to the care of the *Agricultural Gazette*, let us claim in the columns of the *Gardeners' Chronicle* an honoured place for grapes and wine. *Alex. Forsyth.*

New Garden Plants.

PTEROSTYLIS BAPTISTII, *Filix*; *Austral. Orch.*, Part I.

Beautiful it was, that miscellaneous group exhibited by Mr. Williams at Amsterdam. If it was not exhibited with so great courtesy as the Orchids, which lived in the Palace, while these miscellaneous plants were in a small extra glasshouse, the Orchids had to pay for the honour by starving from dry and cold air. Now this *Pterostylis* was not an Orchid (in a flower-show sense), but a miscellaneous plant amidst many other bright specimens admired by others, but I always returned to honour my slender green Orchid. It has basal, petiolate, oblong-cuneate leaves, not quite fully renate, but nearly so, the upper ones ascending the rachis, two wide sheaths, a single odd flower, whose stalked ovary is surmounted by the bract. The flower is green, with white and brown, and may be compared to the head of a Saurian, adorned with two beetle-like antennae. Mr. B. Williams finally deprived, to my great personal satisfaction, the visitors of the happiness of seeing the frog-green flower. I brought it home, and dissected and sketched it. The *banax rotata* are at hand. If I remember well, Mr. Williams, who did not appear exceedingly partial to

my pet, imported the plant from Baptist's garden, Sidney. Mr. Fitzgerald states it was discovered near Sidney by the late Mr. Baptist, and is probably a garden. In consideration of the assistance rendered by Mr. Baptist to horticulture, when in its infancy in the colony, it has been named P. Baptistii by Mr. Fitzgerald.

Comparing Mr. Williams' plants with the figures given by Mr. Fitzgerald, I have a few remarks to make. The flowers were a good deal smaller and for the most part less wide. There was much less white colour in them. The bristles of the lateral sepals were brownish. The bracts were larger and longer than the stalked ovaries. The petals had no cilia inside. There was no doubt credit of teeth over the appendage, but they were altogether marginal.

I do not make those remarks doubting the fullest accuracy of the author quoted, but only to show that the area of characters has to be widened.

As a species the plant is perhaps too near *Pterostylis lutea*, Lindl. (most probably this is *P. micro-mega*, Hook. f.) It would be most desirable to see whether there are such constant characters as would enable botanists to regard the two as what we call well-founded species.

It is to be regretted that Mr. Fitzgerald gave no numbers to his plates, nor any remark about the real time of the publication of the part of his work. *H. G. Rehb. f.*

THIRIXSPERMUM HARTMANNI, *Rehb. f.*

This is a nice small distichous Orchid, belonging to the category of "gems" from Toowoomba in Queensland, where it was discovered by Mr. C. H. Hartmann, of the Range Nursery. It was named *Sarcophilus Hartmanni* by Baron von Müller in *Frag. Phys. Austral.*, vol. viii., 1872, 74, p. 248. It would appear to bear generally four rather thick, ligulate, bidentate leaves, the teeth of which are equal or unequal, but rather sharp. The stem is short, and bears a few small, globose tubercles or warts. The inflorescence is a dense raceme. The flowers, though rather small, are exquisite in their beautiful cream-white hue. There are numerous, brick-red spots around the bases of sepals and petals on both sides. The staminate and oblong side-lacinia of the lip are richly painted with brick-red spots and streaks. The callus in the middle of the lip is yellow, with red spots. There are two yellow eyes with red margins at the front side of the solid spur, and the middle lacinia of the lip is yellow. It has been regarded as near *Saccolabium* and *Cleisostoma* ("one of our genera *optime ad Saccolabium reducenda*"), which I simply do not understand. I obtained a good fresh inflorescence from Mr. Bull, in whose establishment I saw healthy plants. Ours came with death at the heart, and soon starved. *H. G. Rehb. f.*

RHIZALIS PANDURIFLORA, *N. E. Br.*

Pendulous, much branched, branches fastigiate, short, articulate, joints 3-5 lines long, 1-1½ line thick (those which form the principal branches are longer, ½-1 inch long), quite terete, very minutely punctate; areole minute, each with a very minute deltidial scale, from the axil of which arise two white hairs half a line in length, accompanied by a few microscopic woolly ones. Flowers terminal, pendulous, ovary exerted, semiglobose, pale green. Perianth ½ inch in diameter, segments 9-11, spreading, linear-oblong, very obtuse, sometimes slightly emarginate, semitransparent, whitish with an apical reddish spot, the 3-4 outer segments shorter than the others. Stamens yellowish-white, salmon-coloured at the base. Stigma 4-lobed, white.

The Royal Gardens, Kew, received this plant from H. Fensholt in 1875, under the name *R. cribrata*, a name which seems to have no application to the plant; so, as I can find no description of it published I propose for it a name more suitable. As a species this ranks next *R. Saglionis*, to which it is closely allied, but is well distinguished by the following characters.—Habit more pendulous; branches more fastigiate (not divergent); the young joints as well as the old quite terete, (not angular as in *R. Saglionis*); areole less conspicuous, with fewer and shorter hairs; and lastly, the petals are much more obtuse. *N. E. Brown, Kew.*

SETTING PEACHES.

With one particular system or method of setting as adopted by one individual, and carried out to a successful end—be that system what it may—should by others be held up to ridicule is simply absurd. If one gardener douches his trees when in flower with a syringe charged with water, and has by this practice the best of results, he has a perfect right to practise it upon his own trees, and also to communicate to others or to the press the successful results of his practice. If another gardener succeeds in obtaining a good set of Peaches, and produces better fruit than his neighbours by submerging his trees altogether in

water or tobacco-water for a period of twenty-four hours, more or less, he also has a perfect right to do so, and also to proclaim on the "house tops" the excellent results of his practice. Another gardener may go in practice diametrically opposite to that described above, and keep his trees perfectly dry by withholding moisture from all the usual sources, even bringing to bear on his trees some newly invented method of dry blast, and also produce as good fruit as those who go to the opposite extremes of wet. Gardeners may also use the "bunch of feathers," the camel-hair brush, shake or vibrate the trellis, or any other imaginable resort, and all with good results, and, sometimes, it may be added, with very indifferent results. One system practised at one place may not do in another, as in many other things we could instance; so also with Peaches.

Healthy trees will bear any reasonable amount of exhibition without much hurt, and without giving sufficient proof that our pet treatment was exactly the right thing to do; when it might be proved that a similar experiment tried upon trees of less vigorous health would readily show that the experiment was not to be repeated, not even in the case of healthy trees.

Supposing a gardener has a failure with one or more of his Peach-houses, and that he has omitted to

for the live of bees was there and at work too all over the house. I watched them closely as they industriously passed from flower to flower, grasping the whole of the stamens with their fore-legs or arms, and clearing away what pollen there was at the time on the anthers; the work was soon done, and watching the return of the laden bees at the door of the hive, it was easy to observe that they were reaping a harvest quite as pleasing to them as their operations appeared to be both pleasing and useful to us. When the sun did not shine, the bees did not leave their hive, and if after enticing them from the hive, the sun suddenly disappeared, the bees were soon back to the hive. No warmth from the hot-water pipes had any effect in bringing forth the bees. The same hive was moved to the second Peach-house, and so on to the third and fourth. It is now out of doors, and I think none the worse for its early spring campaign amongst the Peach blossom. As to the set of Peaches in the early house, it was a decided success, and I may also say the same of all the others. Whether the same amount of success would have been attained without the assistance of the bees I am not prepared to say, but one thing I can say with confidence, and that is, if they did not go, I am quite sure they did no harm, and no matter how sages or ecologists may sneer, if I live I shall most certainly repeat the ex-

This is a small group, of which all the species of which the flowers are known belong to the subgenus *Euagave*, of which the leaves are intermediate in character between the *Marginate* and *Americanæ*. Here the border is not so distinct as in the *Marginate*, but merely consists of the terminal spine, decurrent with or without teeth down the margin of the top part of the leaf, whilst the lower half or two-thirds is toothed, without any border, just as in the *Americanæ*.

* PARVIFOLIA.

20. *A. (Euagave) Deserti*, Engelm., Notes, p. 22.—Acaulescent. Leaves few in a rosette, oblanceolate, 6—12 inches long, 1½—2 inches broad above the middle, thick, fleshy, very glaucous, deeply concave on the face, with a long (1—2 inches) slender end-spine decurrent to about the middle of the leaf; both the leaf and the unbordered lower part of the leaf furnished with crowded, strong, hooked, horny, lanceolate prickles, ¼—½ inch long. Spine 4—10 feet high, 1—2 inches thick at the base, furnished with distant lanceolate acuminate toothed bracts. Panicle thyrsoid, the branches very short, the lower horizontal, the upper ascending, the secondary pedicels ½—¾ inch long, the pedicels shorter. Perianth yellow, under 2 inches long, including the ovary; ovary trigonous, ¾ inch long; tube campanulate, ¼—½ inch long and broad; segments oblong, ¼ inch long. Filaments twice as long as the perianth segments, inserted at their base; anthers ¼ inch long. Capsule oblong-trigonous, 18—21 lines long. Seeds under ¼ inch broad.

Eastern base of the mountains of Southern California, and in the adjoining deserts. Discovered by Lieutenant Emory in 1846, and gathered later by Dr. Parry and others, and fully described by Dr. Engelm. We have young plants in the Kew collection, received from Messrs. Miller, Slevers & Co., of San Francisco.

21. *A. (Euagave) Shawii*, Engelm. Notes, p. 26, tabs. 2 and 3.—Acaulescent. Leaves 50—60 or more, forming a dense globose rosette a couple of feet in diameter, oblong-spathulate, 8—10 inches long, 3½—4½ inches broad at the middle, deep green, not villate, narrowed to a brown end-spine 1 inch long, ¾ inch thick at the base, ¼ inch thick in the middle, the upper third or quarter entire, the rest furnished with crowded up-curved lanceolate teeth 1—½ inch long. Spine 8—12 feet high, 2—2½ inches thick, covered with erect clasping deltoid or lanceolate deltoid bract leaves, with a brown scarioso margin. Panicle thyrsoid, about a couple of feet long and broad; branches stout, 4—9 inches long, 1—1½ inch thick; clusters dense, composed of 30—50 flowers, surrounded by large foliaceous fleshy bracts. Perianth, including the ovary, 15—18 lines long, greenish yellow, trigonous; ovary 15—18 lines long; tube broadly funnel shaped, ½—¾ inch long; lobes 12—14 lines long. Stamens inserted about the middle of the perianth-tube, exserted ½ inch beyond the segments; anthers above ¼ inch long. Style ½—¾ inch longer than the filaments. Capsules oblong-trigonous, cuspidate, 2½—2¾ inches long, not quite 1 inch in diameter. Seeds ¼ inch broad.

A native of dry hills bordering the Pacific at the south-west corner of California. Discovered by Dr. Parry, in 1850, and rediscovered from his memoranda and photographed by Messrs. Parker and Hitchcock, of San Diego. Dr. Engelm. gives a full description in his paper, accompanied by Mr. Parker's excellent photographs, and names the plant after Mr. Henry Shaw, "already so highly esteemed in St. Louis as the founder and donor of the Missouri Botanical Garden, grand at present, and promising a future as useful as it will be magnificent." I have seen it in a living state in the Kew collection, received from Messrs. Miller, Slevers & Co., of San Francisco, and have no doubt that in a few years' time it will be one of the favourite species of the genus in our European gardens, as it is a most distinct and handsome plant.

22. *A. applanata*, Lemaire; Jacobi, Mon., pp. 48 and 210; (fig. 115).—Leaves 20—30, or even 40, in a dense sessile rosette reaching a couple of feet in diameter, oblong-spathulate, 8—12 inches long, 3—3½ inches broad at the middle, narrowed to 2—2½ inches above the deltoid base, very glaucous, 1 inch thick at the base, ½ inch thick in the centre, the upper half of the face flat, the upper half concave, the lower part narrowed suddenly to a pungent brown channelled spine, above 1 inch long, which is decurrent as a border to the upper half at the middle of the leaf, the bright brown more or less curved lanceolate prickles ¼—¾ inch long. Inflorescence unkn.

A native of Mexico, long known and widely spread in our European collections. It is wrongly classified

FIG. 115.—AGAVE APPLANATA.

use some of the above usual precautions—because he has read somewhere that those practices are "obsolete." Would not that man's ears tingle when he thought of his failure, and would it not be very reasonable to believe that in conscience at least, this man would be a great deal more easy, if he felt that he had exhausted any, or even all the known common methods of setting. I should never for a moment think of throwing aside any of the well known methods of endeavouring to secure a set, notwithstanding what anyone may have to say to the contrary, and I hope I should never be found to be egotist enough to give forth any system of mine, or hold exclusively to the pet system of anyone else, as being the *sine qua non* system of Peach treatment during the time of setting.

We all know what sunless weather we had for Peach-setting during the first weeks of January of this year, and what an anxious time it was for gardeners who had anything to do with early Peaches. The young man in charge of my Vineyard and Peach-houses appeared to be quite as much alive to the jeopardy of the situation as I was, and he had already set to work to do what he knew lay in his power with the camel-hair brush. I was pleased to see the enthusiasm of the youth, anxious I have no doubt for his own reputation to secure a good set. I happened, in passing, to remark that if he brought in a live of bees they would save him a deal of labour, and do the work he was doing so much better. In passing through the next day I found the young man had taken me at my word,

perment another year. I had often heard of it being done, but never before saw it put to the proof.

Perhaps when all is said and done, the best way to ensure a good set is to see that the leaves throughout the season, or in other words, from spring to fall, are kept thoroughly healthy. To effect this no green-fly or red-spider must ever be allowed to obtain a footing. Prevention is better than cure, and by first keeping clear of fly, the leaves become healthy and robust, and in better condition as the season advances, to ward off or resist the attacks of red-spider. In our Peach-houses here, there is one rule which I always insist upon and see carried out, that is "to smoke or fumigate where there is no green-fly," and a similar rule is observed out of doors, which put together makes a very good garden complete. "Hoe where there are no weeds, and smoke where there are no green-fly." This maxim carefully carried out by young gardeners might be the means of steering them safely through and beyond many breakers a-head. *Wm. Miller, Combe Abbey.*

THE GENUS AGAVE.

(Continued from p. 62.)

SERIES I.—CORIACEO-CARNOSE.—Texture of the leaf rigid, not at all fleshy or yielding to the touch when mature. End-spine large, hard and pungent.

GROUP III. SUBMARGINATE.—Edge of the leaf furnished with a distinct horny border in the upper part running down from the end spine.

by Jacobi among [the true *Margaritæ*]. It most resembles in habit the small varieties of *Scolymus*, but may be easily recognised by its decurrent end-spine. It is a handsome plant, the chestnut-brown of the spines contrasting well with the very glaucous lamina. I cannot by the description alone clearly distinguish from this *A. cinereus*, Jacobi, Monogr., p. 51, unless it be by its having very large crowded deltoideus-prickles. If it be distinct this is evidently the place into which it falls.

** GRANDIFOLIA.

23. *A. Hookeri*, Jacobi, Monogr., p. 219.—Leaves 30–40 in a sessile rosette, which measures 8 or 9 feet in diameter, oblanceolate-spathulate, bright green on the face, rather glaucous on the back, 4–5 feet long, 7–9 inches broad two-thirds of the way up, narrowed to 2–5 inches above the dilated base, where it is 2–3 inches thick, the hard pungent end-spine a couple of inches long, and decurrent for a quarter or half a foot, in centre $\frac{1}{2}$ inch thick, the face fittish or slightly concave, the edge repand between the teeth, which are irregular, deltoideus-cuspidate, brown and horny, $\frac{1}{4}$ – $\frac{1}{2}$ inch long, and curve in different directions. Inflorescence unknown.

A native of Mexico. There are two fine specimens at present in the Kew collection, from one of which Jacobi's original description was taken, but it has never flowered. One of them, which came from Mr. Wilson Saunders, has prickles considerably smaller, and more distant than in the other. I cannot distinguish from this *A. Fendleri*, Jacobi, Monogr., p. 221, of which I have seen an authenticated specimen in the collection of Mr. Saunders, nor *A. inaequalis*, K. Koch; Jacobi, Monogr., p. 53, which I know from description only. If they are the same species the latter name, being the oldest, ought to be maintained.

24. *A. (Eugenia) Salmiana*, Otto; Jacobi, Monogr., pp. 52 and 221; Rev. Hort. 1873, p. 573, table 40, and 41; Garden Chron., 1873, p. 15, tab. 31.—Acaulescent. Leaves 12–30 in a dense rosette, which is often 5–6 feet broad, oblanceolate-spathulate, 2–4 feet long, 4–6 inches broad above the middle, narrowed to 3–4 inches above the dilated base, where it is 2–3 inches thick, a dull slightly glaucous green, the face more or less concave, the end spine $\frac{1}{2}$ –2 inches long, hard and pungent, decurrent for 2–3 feet, the teeth deltoideus-cuspidate, $\frac{1}{2}$ inch long, chestnut-brown, hooked up or down. Scape reaching a height of 20 feet exclusive of the inflorescence. Panicle thyrsoid, 6–8 feet long, with erect-patent branches and flowers in dense clusters. Perianth greenish-yellow, 4 inches long; ovary oblong-trigonus, above 2 inches long; tube narrowly funnel-shaped; segments oblong. Filaments 3 inches long; anthers linear-oblong, nearly $\frac{1}{2}$ inch long.

A native of Mexico, now one of the commonest kinds in European collections. I am not aware that it has ever flowered in England, but the inflorescence has been twice figured—once in the *Revue Horticole*, as just cited, from a specimen that flowered with 3, and again in Peck, near St. Germain-en-Laye (Seine et Oise), in 1871, and in the *Gardeners' Chronicle*, from the collection of M. Thuret, at Antibes. In general habit it closely resembles *A. americana*, from which it may be told at a glance by its denser colour, and decurrent end-spine. It varies greatly in size, and also in the breadth of the leaf in proportion to the length. So far as I am able to judge, a large number of species founded or adopted by Jacobi should range here. Of those of which I have seen specimens in English collections, which I have no reason to doubt are properly named, I would refer to the typical form of *Salmiana*, *A. atroviensis*, Karwinsk., Jacobi, Monogr., p. 55 (a name of earlier date than *Salmiana*, having been first published by Salm-Dyck in 1834); *A. tohuacensis*, Karwinsk.; Jacobi, Monogr., p. 60; and *A. Jacobiana*, Salm-Dyck; Jacobi, Monogr., p. 57. Of those of which I have seen descriptions only, I cannot separate from typical *atroviensis* by any definite character *A. Canariensis*, Jacobi, Nachtrage, ii., p. 22; *A. asperifolia*, Jacobi, Monogr., p. 61; *A. Sibirica*, Jacobi, Nachtrage, ii., p. 54; *A. deBorjiana*, Jacobi, Nachtrage, ii., p. 72; *A. Ottonis*, Jacobi, Mon., p. 263; and *A. gracilis*, Jacobi, Nachtrage, ii., p. 66.

Var. *A. latissima*, Jacobi, Monogr., p. 41.—Leaves broader in proportion to length than in typical *atroviensis*, 2–3 feet long, by 8–9 inches broad above the middle.

From this I cannot separate *A. Lehmanni*, Jacobi, Nachtrage, p. 21; *A. microforis*, Jacobi, Nachtrage, p. 20; and *A. variolata*, Jacobi, Nachtrage, p. 22.

25. *A. (Eugenia) cochlearis*, Jacobi, Nachtrage, ii., p. 67.—Acaulescent, forming a sessile rosette to feet

broad. Leaves oblong-spathulate, 5–6 feet long, above a foot broad, 5 inches thick at the base, opaque green, with a deeply excavated face, the very stout pungent brown end-spine decurrent for some distance, the middle-sized deltoideus-prickles curved variously. Stem reaching a height of 26 feet. Inflorescence thyrsoid, the flowers in dense clusters. Flowers yellowish green, above 4 inches long; ovary cylindrical-trigonus, above 2 inches long; tube $\frac{1}{2}$ inch long above the ovary. Filaments 3 inches long; anthers linear-oblong, $\frac{1}{2}$ inch long.

A native probably of Mexico, described by General Jacobi, in full detail, from a plant that flowered at Stuttgart in 1867. It may, perhaps, prove to be a giant form of *A. atroviensis* var. *latissima*, as the account of the inflorescence quite bears out this idea. *J. G. Baker.*

NOXIOUS INSECTS.*

I BEGIN by making one or two assumptions, which I presume will be granted me, but which, if disputed, can be easily proved. I assume that, besides the occasional great injury done by insects by which whole districts are ravaged, a continual drain is constantly kept up by them which constitutes a very perceptible per-centage of deduction from the cultivator's profits. I say that much of this is preventable, but I do not make this one of my assumptions. All the length I go is to assume that where it can be prevented at less cost than the loss it occasions, it should be prevented.

So far, I imagine, we must be all at one, but we may not be all at one as to the possibility or means of prevention, or at least of prevention except at a price greater than the loss that would be sustained by leaving matters as they are. I do not mean mere money cost—that would be easy to deal with, for whenever you come to actual figures you can cipher them out, but I mean the interference with a man's liberty of action in conducting his own business. That is the critical point of this question. How far it would be wise, and under what precautions it would be desirable, for the general benefit to interfere with the inalienable privilege of an Englishman to do what he likes with his own!

Before accepting any proposition tending in that direction, we should require not only to be satisfied that the object was really for the general interest, but also that it can be attained in no other way. That the object is for the general interest is one of the assumptions that you have permitted me to make; and that it can be attained in no other way than by entrusting power to some executive authority will be plain if we consider for a moment the nature of the work contemplated. If we wish to rid a district or a country of an injurious insect, and if, as is very generally the case, we have the power of doing so by attacking it at a particular date, and in a particular manner, it is obvious that to be effective the attack must be simultaneous and combined, for to what purpose would it be, if I cleared my farm while my neighbour did not clear his; or if I cleared mine one year and he cleared his another? We should each preserve an ample reserve of our pests to replenish the cleared fields of the other. A central authority, therefore, a power to which both he, and I, and every other farmer in the district, must bow, is needed to secure united action, and what is such an authority but paternal government, compelling us to obedience for the good of the whole?

As to the advantage of the general principle of stamping out, and the necessity of an executive authority to direct it, there cannot, therefore, be much difference of opinion, but there remains the more difficult question, how much and what kind of interference should be tolerated, and by what safeguards it should be surrounded, and how far it is workable or not? The administrative machinery by which it should be carried out need not concern us. If Government resolve to interfere, it must fall to them to make their own plans and find their own tools—but as a contribution towards elucidating the various points which they would have to consider, I think I may usefully draw attention to a few of the different ways in which interference might be beneficially exercised.

The simplest, and most powerful, and the most efficient of these is what I may call county or district rotation of cropping.

The great majority of vegetable-feeding insects do not feed on all kinds of plants indiscriminately; most of them are restricted to one kind of plant, and if by cultivation of that plant its numbers are enormously increased, so will naturally be the number of the insects that feed upon it, while, if we should cease to grow that plant, the number of the insects would correspondingly diminish. Thus, for instance, if a district is almost entirely in pasture, there will be very few Wheat feeding insects in it, but if it is turned into a Wheat county they will be in myriads. If these numbers reach such a pitch as to deteriorate the crops the remedy is plain. Change the rotation, and grow some other crop instead of Wheat. Allow me to illustrate this by an actual example. Last summer I spent the month of July at Broadstairs. In my rambles about the place I was immediately struck with the Wheat crops. At a little distance they looked tall and strong, but on examining the ears I found them so ill-filled that I should have said they were only three-quarters filled. The blade or leaf was throughout almost entirely white and dry, and I have no doubt that if I had asked any farmer what was the cause of the poor ears he would have said drought, as shown by the bleached and dried-up leaves.

But although he would be quite right in describing the deficiency of weight in the ear to the failure of the leaf, he would in this instance have been wrong in ascribing the failure of the leaf to drought. It was due to the milking of the larvae of a small fly named *Agromyza graminis*, which lays its eggs under the skin of the leaf at its tip. From thence the young larvae mine downwards, feeding on the parenchyma of the leaf, leaving nothing behind them but the empty husk, consisting of the upper and under walls of the leaf. If the leaf is small they entirely consume the interior; if large they may not reach entirely to the bottom of the leaf, but will have consumed about three-fourths of it before they pass into the pupa state—as may be seen from some leaves which I have preserved, and which I hand round. Now, of course, I cannot tell what amount of damage this insect did. I have said that the ears seemed only three-quarters filled. They continued so until reaped. Let us suppose that this is too much by half, and take an eighth. This would give a loss of upwards of 12 per cent. on the grain crop, and to make the margin still wider, and the figures more manageable, let us reduce it to 10 per cent. The actual percentage of loss is not of much consequence if I can satisfy you that it was considerable, and my object is less to show the amount lost, than where it falls.

Now we all know that the total yearly produce of a farm has to be distributed between three accounts—one is in repayment of the cost of cultivation; another is in payment of rent; and the third is the tenant's profit. It is plain that no reduction can be got either from the expenses of cultivation or thereon on account of this insect damage. The tenant or cultivator has to lose the whole of it, and you will also see that although the loss on the whole crop may only be 10 per cent., that is by no means the percentage of the loss on his profit. If, for example, we suppose that the tenant's profit on the entire produce is one-third, and that the total gross produce of the Wheat crop was £500, 10 per cent. loss on that is £50, 10 per cent. loss on the tenant's profit would only be £16, whereas a deduction of the whole £50 would be equivalent to a reduction of 100 per cent. on his profit. So that in its present state (entirely a cultivator's question) The landlord (not a cultivator) has only a prospective interest. If arrangements could be made by which such insect damage could be annihilated, no doubt as losses terminated a readjustment of rent suited to the improved production would take place, but in the meantime it is the tenant who suffers, and who will be first benefited by stamping out such insects.

Now a change of crop, if carried out over a sufficiently wide district, supplies an easy and effectual cure for the attacks of this insect. Its habits lend themselves to such a remedy. It feeds only on Wheat and a few allied pasture grasses. At Broadstairs there were crops of Barley and crops of Wheat growing side by side, the only separation between them being a footpath, not 2 feet in width, running through the field; and while, as I have said, every Wheat blade was matted, I could not find one touched on the Barley, which, by the way, had correspondingly escaped damage. Furthermore, the insect is only an annual. If it could be banished for one year it would

* Abstract of a paper read at the Society of Arts meeting on June 2.

be banished entirely, or until reintroduced. Now if there were a controlling authority in that district, what would be easier than to say to the farmers, "Gentlemen, in the common interest you will substitute Barley for Wheat in your next year's rotation." The fly, deprived of its proper nidus, must then either lay its eggs in an unsuitable place, where they will perish, or have recourse to the pasture fields for *Triticum repens*, or other suitable grasses. By this of course the fly would not be exterminated, but its numbers would be so reduced as to render it comparatively harmless, at all events for a time, when, if it again reappeared in force, the same means of defence could be again resorted to. May it, might be so arranged that two or more countries might brigade themselves together, so as to establish a permanent see-saw by which they should play into each other's hands. But you will observe that no single man can carry out such a rotation. He may try it upon his own fields, but they will be replenished continually from the fields of his neighbours, unless they at the same time are compelled to follow the same rotation. Gentlemen, it is for you, who know the respective capabilities of soils, and the relative returns of Wheat and Barley, to say whether you would prefer to suffer a heavy yearly per-centage of loss, or to submit to the substitution of barley or some other crop instead of Wheat for a single year.

And if you thought it desirable to do so, can there be any difficulty in carrying it out? I could suggest half-a-dozen ways. Power might be given to the Lords of the Privy Council to carry it out at their own discretion and *ex proprio motu*, or to carry it out on the requisition of the county authorities, or on the requisition of a committee of the farmers of the district appointed for the purpose of dealing with insect pests and similar questions; or an insector might be appointed for every county, with the requisite power and authority; or a central board of experts might be appointed for the same purpose, but with wider jurisdiction; or each county might have a board for itself. Any man can plan out a scheme for it; but I think no man will maintain that there is any insuperable difficulty in devising means that will answer the purpose.

Before leaving this point let me remind the meeting that the plan of excluding for a year a particular crop from the cultivation of a district will apply to almost every crop that we grow, whenever the insect is an annual (that is, does not live over one year), and this includes by far the greater number of injurious insects.

The next means of extirpation to which I shall advert is burning the nidus, in which the insect, in whatever stage, passes the winter, and I may take as my example the species of a small fly belonging to the genus *Chlorops*, some of which attack Wheat, others Barley, others Rye, &c. The larva makes a channel in the stem of the corn, causing abortion of the pickles, and gives it a twisted, striped-looking appearance (as shown in the diagram), which on a superficial examination might be taken for the work of sparrows. The fly remains about the ear for many weeks after it is thrashed, and may be found in great numbers in winter in a semi-torpid state among the chaff. Now it is not an intolerable abuse of the privilege of doing what a man likes with his own, that my neighbour should be allowed, for the sake of small profit he can make out of his chaff heap, to preserve such a focus of infection to destroy my future crops. He should be compelled to burn it. In like manner we want some one to compel the burning of the heaps of Couch-grass and weeds gathered from foul land instead of keeping them to rot into manure. These are the focus and shelter-place of wire-worms and other pests, and contribute largely to their spread.

To the same class of remedies belongs the local treatment which I recommended for the Onion-fly. The plants attacked are readily distinguishable from those that have escaped; the former are sickly, flaccid, and yellow, the latter firm, erect, and green; and those attacked can easily be picked out and burned. Each plant attacked contains a nest of larvae in the stem or bulb, as shown in the diagram. If these are destroyed the whole future family is annihilated.

The Carrot plants attacked by the Carrot-fly are equally easily distinguished and destroyed, but it is not certain that the grubs in them keep always to the same root. But both with them and similarly destructive insects that infest the Cabbage and Turnip,

a year's avoidance of that crop throughout the district will relieve it from them.

Next comes the remedy, in the shape of some application that is fatal to the insects. This is the plan adopted in America for the destruction of the Colorado beetle, where Paris green is dusted in powder or sprinkled in solution over the larvae on the Potato plants. It is the plan used by our horticulturists to get rid of the red-spider in their hothouses, where sulphur is the medium. Manufactured into Gishurst compound, or made up into some soapy solution, sulphur is also largely used by them to destroy greenfly. Sulphur has also been successfully used on a small scale against the hop-fly, and might be advantageously used on a large scale. There are various other supposed specifics (such as hellbore for the Gooseberry caterpillar, &c.), which are more or less in favour with different individuals. As a remedy, however, such applications seem better adapted for individual protection than combined stamping-out, although it would be foolish to forego the advantage of using them where they seem to meet the requirements of any special case. Such a case most certainly is the destruction of what are called ticks and lice upon sheep. Every one knows how readily such vermin can be communicated by contact or even proximity, and it does seem a very hard case that a man, who has kept his flock clean by taking proper precautions, should be liable to have them infected by a neighbouring neglected flock, by stray sheep, or even by sheep passing along the road. I have no personal knowledge on the subject, but I am told that, *caeteris paribus*, the difference in value between a sheep that has been kept clean for the season and one that has been worried by vermin will be 20s. If that is so, I wonder that sheep farmers have not long since clamoured for some supervision.

The picking and gathering of the individual caterpillars, or perfect insects, is a remedy that has been tried largely on the Continent, but without any marked success. For ordinary crops it is much more clumsy than a change in the rotation, and for crops which cannot be so dropped out of rotation, as fruit or forest trees, it is almost impossible to collect the larvae efficiently. At the same time it is right to add that this *schœnleuge*, or caterpillar collecting, can scarcely be said to have ever (any more than any other plan) had a fair trial, it being generally been conducted without regular system or combined and simultaneous action over a wide extent of country.

There remains the last refuge of all invaded countries, namely, destroying the resources of the country before the invaders, that they may perish for want of food. This can rarely be necessary, but beyond doubt it will be the proper course to follow should the Colorado beetle gain a footing in this country. In that event the first that we shall hear of it will be that the larva has appeared in some Potato patch near Cork or Londonderry, Liverpool or Glasgow. The instant this is perceived the vines of the Potato field should be cut to the ground, and Paris green scattered over the field.

But that is not a course that can be adopted even in a case of such urgency and importance, unless there is some central motive power having the necessary authority to act; for the notice that the Colorado beetle will give will be very short, the larval stage in which alone it can be successfully encountered only lasts about a fortnight, and, if no previous preparations have been made, I leave any one who knows the slow grinding of our administrative mills to say what chance there is of the larva having grown big enough to be noticed; of somebody having noticed it and reported it; of the report being considered and a course of action resolved on; of officers or agents being appointed to act; of their providing the necessary apparatus; and of their reaching the spot and putting them in operation—all within the short space of fourteen days.

The possibility of such a call for action occurring is an additional reason for getting some sort of executive machine rigged up that could on sudden emergency deal with such an event.

I have nearly exhausted the list of my suggestions, but there is one which I must not forget. It is very small, but in my view very important. Let us by all means call on the cultivator to give notice as soon as an injurious insect appears in any numbers on his farm; but do not trust to him. Promise a reward to the first person who shall communicate the intelligence of such a pest appearing. There are more entomologists scattered about the country than you think of.

It may be that you would have some erroneous and some false reports, but proper precautions against deception could be taken. Specimens of the insects might be required to be forwarded; and even although some deception and cheaterly did take place, it could be endured.

There remains another point which, supposing you to go in the line along with me, must also be considered, and that is, what the action of this Conference should be in regard thereto. If I might offer an opinion, it humbly appears to me that its office is rather to give a general verdict upon the importance of the subject and the practicability of dealing with it than to enter into the discussion of details which should more properly be left to the Government, who will be responsible for them should they resolve to deal with the subject. *Andrew Murray.*

THE MANCHESTER ORCHIDS.

THE magnificent show at the Botanical Gardens, Old Trafford, that must now be reckoned as a thing of the past, has doubtless in many a case left impressions and pleasures that will long remain in the memory, and find matter for congratulation and reflection, not only in the present but also in days that are yet to come. To the rosarian what finer display could have been desired? In what respect could the plans and groups have been improved? To the lover of the more stately forms of foliage and flower there was much to rejoice over, and to cause wishes and resolves to become the owners of similar, or at least the early beginnings that might ultimately grow into such fine masses of colour and forms of beauty. To those who are more interested in the commoner but still beautiful gems that we class as herbaceous, there were several collections comprising richness and variety that left nothing to be desired. To those again who make the Orchids more especially their study and care, there were such a number of grand specimens, finely bloomed and varied in colour, that there can be no doubt that for some time to come this show will be looked to and spoken of as pre-eminently a feast of Orchids. Your ample report has done full justice to the many shown, and none can complain of being overlooked or slightly noticed. Whilst not wishing in any way to supplement that report, there were several plants exhibited that hitherto have not, as far as my memory serves me, been staged in the exhibition-house at Old Trafford, which seem to me deserving of just more than a passing notice. That at one show such new and good things should be displayed to the public, at the same time giving opportunities to plant-lovers to see that even now all have not been obtained that the eye may feast upon, speaks much for the enterprise of those who are continually adding to the riches of our stores, and also for the care and patience of others who have succeeded in hybridising and successfully bringing to perfection such showy and new forms. In the collection of sixteen exhibited by Dr. Ainsworth what could be finer than the two seedlings named in honour of the learned and worthy Doctor? Its free blooming periods, *Dendrobium Ainsworthii* inherits from both its parents. The dark rosy purple of the labellum of both, and the pure white in one case and the rosy-tinted sepals and petals of the other, combine to make these welcome additions to an already rich family. Mr. Mitchell has brought them up this time in splendid condition, which leads one to hope that as they increase in size, they will also be even more showy and attractive. Passing to the group of Mr. Wigley, we therein met with one, new to the great majority who beheld it, which at most has only been in cultivation for about three years, I refer to *Thunia Marshallii*. This will make a fine companion to *T. Bensonii*, which it much resembles in growth and manner of flowering, bringing its heads of large white flowers, with yellow and crimson lip on the top of the new growth. There can be no question that now it has been seen in such fine condition it will be eagerly sought after, and find a place in many a collection. Mr. Hatterley must be congratulated on the excellent manner in which he exhibits these *Thunia* among his other fine plants. In Mr. B. S. Williams' group we observed a fine plant of *Oncidium concolor*, and, though not quite new, it has not been seen in such flourishing condition here. Looking at this plant one is reminded of the time just over five years ago, when the known plants of this in the country were considerably less than a dozen. Two of

these were in the collection of S. Mendel, Esq., and at the time of the sale one was disposed of for seventeen guineas, the other fetching nine guineas. Since then, however, great numbers have been sent home, and now good flowering plants may be purchased for much smaller amounts. The pendulous spike of self-coloured yellow flowers is very distinct and pleasing. In Messrs. Kollisson's group we met with a grand spike of *Oncidium Marshallianum*. This has been known to Orchid growers, by name at least, longer than any of the preceding, and yet is very seldom seen in flower. In this instance it carried a spike about 4 feet long, with several laterals, on which were a number of large bright yellow flowers marked with spots of a rich brown colour. It is certainly a fine and highly desirable species, and, coming from the same native habitat as *concolor*, will doubtless succeed under similar treatment. A plant of *Odontoglossum cirrhosum* was also exhibited among the new plants, and there can be no doubt that among the recently imported plants there will be many that will exhibit forms that will come up in every respect to the very glowing description with which it was first introduced to the notice of plant lovers. *W. Swan, Fallersfield, May 29.*

BLAIR ATHOLE.

(Concluded from p. 684.)

FROM the lawn we entered Glen Banovy, and a superb pheasant covert planted with rare shrubs. Higher up in the forest, Glen Banovy becomes a mere ragged watercourse across the moor. A young *Pinus nobilis* in this sheltered cover has grown 5 feet 6 inches in length within the last three years. It stands in a favourable situation, next a *Bird Cherry* and a "Snowberry," the noble and the humble side by side, as must often happen when the owner of Athole and his guests and keepers enter this covert together. But the nobility among shrubs do not thrive in a thick cover. They apparently require air and more space in which to develop themselves. The *Rhododendron indicum* holds its own here in the shade, but even there, as common *Berberis*; the *St. John's Wort* and *Savin* are tolerably at home; the *Weigela* roses adds to the variety.

From this ducal pheasant covert we crossed the Banovy, near a Spruce of unusual height, rising from the water's edge 140 feet, according to careful measurement. It is the largest Spruce I have seen, with a bole diminished in apparent size by its height and reduced in apparent height by the low position which the tree occupies. The measurement is 9 feet 11 inches at 5 feet from the ground, and the bole holds nearly the same girth to a height of 40 feet, and then tapers slowly to the lofty top. The parling brook loses itself here amongst the foliage of "Diana's Grove," and in this secluded spot, on a shelf above the stream, are the four remaining Larches of 1738. These trees are about 90 feet high, and the largest contains about 400 cubic feet of timber. Judging from their appearance, the proper distance apart for specimens of this kind would have been 13 yards, which is the actual distance between the trees in one direction, while in the other they stand at 8 yards, with some injury of the foliage and mutual repulsion that has sent two of the trunks away from the other two and caused a leaning up-hill and down-hill, and, as it happens, north and south.

Above, upon the banks, there are some handsome Conifers and evergreens. The Castle, in its full view, and on the left are the ruins of the old church of Blair, with a surrounding graveyard full of mouldering Stewarts, and thickly set with ancient grave-stones. The late Duke George was buried here in 1864. From the house the enclosed ruin on its knoll, surrounded by masses of *Vew* and *Box* and other appropriate foliage, forms an interesting point of repose in a delightful landscape. Great Ash trees partly surround it, and behind is a bank of Conifers, screening it from the factor's residence, the only remaining house of the old village of Blair, removed by Duke James in 1750.

Among the Conifers are *Abies Menziesii* of 50 feet, *Picea Pichta*, *Abies nigra* of 55 feet, the *Hemlock Spruce*, *Abies Albertiana*, *A. Douglasii*, and a common *Silver Fir*, of late habit of growth in spring. There is a nursery for young trees here which we crossed, and then followed the noisy Banovy, running below in a deep channel through a noble wood of Scotch Firs of eighty or ninety years' growth, which have in many cases each produced a cubic foot of

timber in each year of their age. A Beech wood thriving on a gravel soil followed, and then a wood of Scotch Fir and Bech mixed on a rubble glistening with mica. We are here ascending the slope of the Grampians, which terminates in the glen below us. A fall from the edge of our path would land us in the stream 250 feet below, but for the saving aid of trees upon the steep. The Mountain Ash became "Thor's helper" in just such a place as this. He was burying through the woods on some improper enterprise or other, when he slipped over a steep glen side, and was saved from falling by a Mountain Ash. The head of a great Scotch Fir might here receive him, or he might grasp one of their blushing trunks. We enter another Scotch Fir wood, old, with Fern and Heather below, and an occasional green carpet formed of *Whortleberry*. Then comes a stone dyke, and beyond it is the open moor, with the Banovy a mere burn scouring its wild surface; and two trees stand on its bank, outside the dyke, are the last trees in this direction for 20 miles. And this is the general character of Blair Athole—woods and plantations on the lower slopes, and then the bare moorland.

Turning southwards through Heather and plantations, a roe-deer started from our path, and a capercaillie went off upon the wing; he would have been better roasted, and served in the summer-house hard by. There are seats at "The Whim," which stands on a conspicuous site in front of a young plantation, with specimen Firs around, a pleasant prospect of the park, the valley of the Garry and its boundary mountains. Nature endowed this locality with the Garry and the Tilt and much uneven ground, and Art has added a castle and park, and woods which encircle several of the hills.

From the Whim we turned into Craig Urard Plantation of old Scotch Firs, which have reached the maximum height attained by this tree under ordinary circumstances, from 70 to 80 feet. There are eight trees per acre, straight and clear in the bole, and measuring in many cases 70 cubic feet—50 cubic feet is a good plantation tree. The soil is a micaceous rubble on rock. This was once a sheltered spot for deer during storms upon the hills outside, but they are now excluded by wire fencing, put up for the sake of some young plantations. There are about 500 acres of this fine old plantation, and as our road ran across the slope, we had around us a fine array—ranks of red trees below, regiments of red trees above, all wearing dark green caps. We next strolled up the valley to Brnar Water, through Balfan Wood, containing 800 acres of Scotch Fir, six and ten years old, and about to be thinned for the first time. Brnar Water has been elsewhere noticed. *H. Evershed.*

Forestry.

THIS is the season of the year at which all young and middle-aged plantations should be carefully and minutely gone through, and every tree examined. Not that each individual tree is either to be actually handled or operated upon, but the eye should be allowed to fall, and so far rest upon each tree, as to detect anything unnatural or wrong. When this is done, it is always found that the labour bestowed is not only well remunerated financially, but the pleasure and satisfaction emanating from it are such as only those who know delight in the beauties and perfections of properly managed woods and plantations.

The work to be done in different kinds of plantations, and upon different individual trees, varies so greatly, that only general directions can be given with safety. At the present time I am extensively engaged with such work, and proceed with it in the following manner. The subject in hand is a mixed Pine, Fir, and hard-wood plantation, ten years old, situated in a valley sloping towards the sea, but distant from it a few miles. The crop of trees consist chiefly of Norway Spruce, Larch and Silver Fir, Black Italian Poplar, Ash, Elm, and Oak. It was planted with the view of affording shelter to the arable land surrounding it on all sides, of beautifying and adorning the landscape, and of affording wood and timber for the requirements of the estate. When the plantation was formed, some of the adjoining tenants demurred to the sacrifice of some pieces of the arable land, although fully compensated for the loss, asserting that they would never derive any benefit by way of shelter during their nineteen years' lease. Little more than half the lease is yet run, and there is already splendid shelter afforded. This is the sixth time the plantation has been gone

over, and every tree attended to according to its requirements; and no one seeing the plantation now would say the attention and labour have been vain or ill-bestowed. The rapidity of growth has doubtless been greatly facilitated by allowing every individual tree the necessary amount of freedom which its habit and constitution demanded, and the uniform and rapid growth again has urged the constant attention bestowed. The reader is doubtless desirous to know what has actually been done in this plantation, and why it has required so much attention. The first matter attended to after planting was to see that no plant was overgrown with rank grass or other herbage; and at the same time to see that all were alive and in a growing state, so that no blanks or open spaces would occur. This was repeated each of three successive springs, till all the trees were above such intrusion. After the fifth year's growth the more rapid growing trees began to overgrow, and injure those less favoured, such as the Spruce overgrowing the Oaks and Elms, and the Poplar overtopping the Spruce, &c.

From various causes trees of various species are less or more liable to have their leading top shoots injured, and when this occurs it induces the top to divide into a plurality of leaders. Unless such trees are timely attended to by pruning off all except one, and that the most eligible, the tree would be rendered comparatively valueless, sometimes not worth room at all in any plantation. This, then, constituted part of the work referred to. Hard-wood trees are especially liable to produce, not only double and divided tops, but to produce a plurality of stems springing from the neck of the tree close to the surface of the ground—the remnant often of the tree either being too large when planted, or of the soil being too poor, cold, or wet to properly nourish the main stem; hence sickness or death of the stem, or part of it, and the young shoots springing out of the vital part below. This is one, and probably the most important branch of pruning, and had also an important place amongst the operations of work referred to. Regulating the distances between the trees is also a branch of forestry of vast and vital importance, and is generally spoken of as the art and practice of thinning—a subject of itself sufficient to fill volumes.

As practised upon the subject in hand, however, it only extended to the operation of relieving any seriously injured tree, and specially such, as from too close proximity were losing their proportional growth by inducing top growth at the sacrifice of the lateral or side growth. The plantation, as already stated, is situated in a valley, and one part of it is a ravine, which extends throughout its entire length. This and all similar ravines are liable to be filled with snow-drift at times, and, as is well known, it is only at a particular stage of growth that the trees suffer from accumulation of snow. When below 2 feet high they yield to the pressure, and will remain weeks flat upon the ground covered with tons of snow, and rise erect and uninjured when it melts, and they are relieved. Again, when the trees are sufficiently tall and strong to resist successfully the pressure, no evil, of course, occurs from snow-drift. It is only, therefore, at the middle stage of growth, and while the stems are clothed with branches near to the ground, that most damage is sustained, and in regard to the subject in hand, it has to be stated with regret that no small amount of injury has been inflicted by last and bygone winter's snow-drifts. With skill and timely attention, however, the evils have been remedied chiefly by means of raising those crushed down; lopping off shattered tops and side branches; splinting and bandaging tops partially broken; placing stones over the roots of those partially torn out of the ground, and other attentions suggested on the ground, and numerous to be here mentioned. *C. Y. Mills, Culten House, June 2.*

"THE GOLYONS OAK."—This wonderful tree, which overspread 452 square yards of ground, grew on the estate from which it takes its name, about 4 miles from Newport, in the county of Monmouth. The diameter of the main trunk was 9½ feet, from which grew exclusive of dead limbs, twelve branches, the largest of which contained 472 feet of timber, and the whole product of this enormous Oak was 2426 feet. Its bark, which round the trunk measured 3 inches in thickness, was estimated at 6 tons. From the rings in the bark it was calculated that the tree had been growing upwards of 400 years, and from many of its lateral branches being dead and broken off, it is presumed it must have stood after it had attained its maturity little short of a century. It was purchased by the late Mr. Thomas Harrison, many years pur-

veyor of Plymouth Dockyard and Dean Forest, in the year 1810, for 100 guineas, and when converted its total product was valued at nearly £600. The above was copied from an engraving published by the celebrated publishers, Boydell, Chesapside; T. Clay, Ludgate Hill; and Colnaghi, Cockspur Street. *Journal of Forestry.*

Notices of Books.

L'Olivier, &c.: *The Olive Tree, its History, Botany, Cultivation, Products, Commerce, &c.* Par A. Coutance. Paris, Rothschild. 8vo, pp. 443. Xylog. 120.

As may be judged from the title which we have quoted in brief, this is an ambitious volume, dealing

by the other trees to become their king, and the author proceeds to moralise on the subject of elective monarchies! The Mount of Olives, with its most hallowed associations, next comes under review. From it we pass to the Olive as known to the Greeks—the emblem of Minerva, the symbol of peace, the reward, in the form of a wreath, of valour and discretion. But classical literature alone has not sufficed for M. Coutance. He gives us a brief list of the principal modern works on the subject before he plunges into the more technical details connected with its natural history. The author has attempted, with what success we will not venture to say, to group all the most important varieties under sixteen groups, under each of which is ranged a number of synonyms. Woodcuts of some of these varieties are given, showing considerable variation in the fruit and in the

indestructible. Cut them down they spring up afresh, a fact known to Virgil—

“Quin et emulcibus secitis, mirabile dicta,
Truditur è sicco radix oleagina ligno.”

In south Europe the Olive is generally grown on terraces, on the slopes of the hills, carefully banked up and often artificially made with soil brought from the valleys. A single tree may be the property of a single proprietor, or the crop it yields may be even more subdivided as to its ownership. As to cultivation local proverbs say that by digging the ground you ask the Olive to yield fruit, by manuring it you press it to do so, and by pruning you compel it to do so; the latter process however naturally requires to be done with judgment, and if we mistake not many of the finest Olives as to produce are all but untouched with the pruning knife in Italy. As to manures, nothing

FIG. 116.—OLIVES ON THE CORNICHE ROAD NEAR MENTONE.

with a very large and manifold subject. It is got up in excellent style, the paper is good, the typography clear, the woodcuts numerous, and many of them beautiful. Commencing with the history of the Olive the author passes on to botanical details, to the districts wherein it is cultivated, the method of cultivation, the diseases to which it is subject, the manner of gathering the Olives, the mode of expressing the oil, and the uses made of it. Under these headings the author has massed together a large amount of useful information, and much that is interesting to the general reader. Few trees indeed can boast of more varied or hallowed associations. Our author begins with a dramatic rendering of the liberation of the dove from the Ark by Noah, and its return with the Olive spray in its beak as a token of the abating flood. Then we are reminded how the Olive was solicited

stones. As to the various districts in which the Olive is cultivated, as in Syria, in Greece, and in the Mediterranean region generally, the author gives full details. How great is the difference in climate even within the limit within which the Olive can be cultivated at a profit may be seen by the traveller as he passes by rail southward from Lyon to Nice, and the Riviera, or from the summit of the Apennines towards Florence. How different the miserable scrubby trees one sees north of Marseille, or high up above Pistoia, and the noble patriarchal trees met with on the Riviera, especially near Mentone. An illustration (fig. 116) which we take from an earlier volume, of an Olive tree on the Corniche Road near Mentone, shows an Olive tree in its noblest guise. The age such trees attain to is hardly to be estimated. We must confine ourselves to saying that they are almost

seems to come amis to the Olive. Very generally the rocky nature of the countries in which it grows prevents any great depth of soil, and hence what there is requires to be enriched in any possible manner. About Mentone a mode of root pruning and manuring is adopted which is not mentioned by our author. A trench some 18 inches or 2 feet wide, and as much in depth, is cut in a semi-circle at a few feet from the base of the tree. This is left open for a little, and subsequently filled in with what Kentish hop farmers know as shoddy—old woollen rags of the most varied description, but all having the common characteristic of frownsness to an almost incredible degree. From a dirty monk's dirtier robe or a soldier's blood-stained coat, then, come the rich Olives and the limpid oil.

We have not space to follow the author in his account of the fabrication of the oil, nor in his very

interesting account of the virtues, real and imaginary, that have been attributed to it. It must suffice to say that the chapters devoted to the symbolism connected with the oil, and the use made of it in religious ceremonies, is one of the most interesting in the book. The author, penetrated with a love of his subject, has collected together a large amount of miscellaneous information not otherwise readily accessible, and has placed it before his readers in an attractive and interesting form.

Aperçu Systématique des Usages Végétaux, &c.
Par A. Fischer de Waldheim. 4to. Paris, 1877. Labure, pp. 51.

This treatise is dedicated to the International Congress of Botany at Amsterdam, and is merely a preliminary sketch, with a view to a more perfect illustration of the subject. The author has taken great pains to collect every possible information, but from the scarcity of English publications in some of the Continental Herbaria he has not been able to give characters of all the species that have been published in this country. This however will ultimately be remedied, since he has applied for information on described or unrecorded species, which has accordingly been forwarded. Meanwhile we beg leave to recommend this to students who are desirous of knowing what species have been described. The work includes characters of 127 species, referred to seven genera, and though possibly some more varieties are raised to the rank of species, it is well to be able to refer at once even to these. In one case we have noticed a "double emploi." It is however quite certain that several distinct species occur on the same matrix, as is more especially the case with those found on the different species of *Polygonum*, some of which are local and extremely interesting, while others abound in very distant parts of the world. They all agree in a more or less intense lilac tint. The germination of the common Bunt (*Tilletia caries*) is so interesting that we hope that our author has extended his observations in this direction. It is curious that wheat in the United States suffers from a quite distinct species, but having a same disagreeable foetid smell. Information on specimens will be thankfully received if addressed to the author at Université, Varsovie. M. J. E.

Florists' Flowers.

NEW FUCHSIAS.—On p. 206 of the present volume of the *Gardener's Chronicle* it was stated that Mr. J. Lye, Cliffe Hall Gardens, Market Lavington, Wilts, who holds the proud position of the Champion Fuchsia Grower of the West of England, was also a raiser of Fuchsias. In past years he raised three or four varieties that are now greatly esteemed exhibition sorts in the immediate district where they were originated.

Mr. Lye has this season bloomed a batch of seedlings of the second and third year of flowering that were of a promising character in previous trials, and which have this season proved so fine, that he has resolved to distribute a batch of ten varieties, which promise to be invaluable for exhibition and decorative purposes. I have just had an opportunity of inspecting them, and while the habit of growth is generally of a very satisfactory character, the varieties are all characterised by great freedom of bloom, the flowers large, bold, massive, of fine form and most attractive colours. Mr. Lye's determination is not to put his name to anything but what is of decided value for exhibition purposes; and an inspection of his products at the time of flowering leads me to the conclusion that he is in no danger of erring in this direction.

The batch of ten new varieties consists of six light and four dark forms. The former consist of Mrs. Huntley, white tube, delicate flesh-coloured segments, large brilliant carmine corolla, very stout and

large, and the whole flower of excellent form; Miss Lye, blush tube and sepals, with faint lines and somewhat suffused with delicate rose pink, carmine-red corolla flushed with a delicate violet, fine form; Letty Lye, delicate flesh-coloured tube and sepals, deep carmine corolla tinted with purple, very fine form, a most attractive variety; Beauty of Wilts, creamy white tube and very delicate flesh sepals, violet-rose corolla with distinct margin of carmine-red, like a Picotee edge, a charming variety; Blushing Bride, an improved Lastré, delicate flesh-coloured tube and sepals, dark carmine corolla slightly shaded with violet, stout, fine, and handsomely reflexed; and Delicata, white tube and sepals, pale pinkish violet corolla, evenly margined with brilliant carmine, very pretty and attractive.

The dark varieties consist of—James Lye, red tube and sepals, and dark violet purple corolla; an improved Perfection, flowers large, bold, and of the finest form; Charming, scarlet tube and sepals and purple corolla, a grand exhibition variety; Elegance, scarlet tube and sepals, with light blue corolla, fine and showy; and James Huntley, bright red tube and sepals, the latter very broad; rich plum-coloured corolla, changing to pale purple with age; very fine bold flower, stout and well reflexed.

Exhibitors of the Fuchsia especially will find these varieties well deserving their attention. R. D.

Garden Operations.

PLANT HOUSES.

GREENHOUSE HARD-WOODED PLANTS.—Many of the fine-leaved greenhouse plants suitable for table or room decoration whilst in a small state, and for general decorative purposes before they get too large, such as *Lomatias*, *Greivillas*, *Aralias*, and *Rhopalads*, can only be had in suitable sizes by continually working a young stock from year to year. Most of these are plants that will not root freely unless cuttings in a particular condition are obtained; to simply take the top of a young or half-ripened shoot, severing it at the base of a leaf, as usual with the majority of things, would be to court certain failure, as most of the plants can only be had in the root with a certain degree of certainty by making cuttings of young shoots, easily procured from headed down plants taken off with a heel, with a bit of the firm wood at the base attached, such as will be now available from plants that were cut back early in the spring, and that have since broken and made some 6 inches of growth. If the plants were put in a little heat to accelerate their breaking, the cuttings will be in better condition. In taking off cuttings of the above description it is necessary to be more than usually careful not to bruise the bark; use a sharp knife, in all cases cutting downwards from the upper side of the shoot, which means a cleaner cut is more likely to be effected than if the knife was inserted at the lower side; none of the leaves should be removed, simply smoothing the edges of the bark at the base. The cuttings should be put singly in 3 or 4-inch pots, according to their size, half filled with sandy peat, the remainder all sand; submit them to a brisk bottom-heat of 75° or 80°, if such is available; if not they will do stood on any moisture-holding material that will keep the atmosphere round them humid. Cover with bell or nardines, and shade from the sun if they take longer to root than many plants, some as much as three or four months, and should not be fully exposed to the atmosphere of the house until they have got sufficient roots to support them; with a night temperature, such as is easily maintained now for some time, of 70° or 75°, they will require no more attention, attention never letting them get dry. *Droseras* that were headed down in like manner will in most cases have broken several shoots, and as they look the best confined to a single stem, all except the best placed shoot for forming the future plant should be taken off, and struck in the same way as the above.

The present is a good time to take off root-cuttings of *Yucca filamentosa* variegata, which is one of the finest decorative variegated plants in existence, not near so much grown as it deserves to be, and although a very easy and simple to grow in a stove or cold-rooms, and yet is thoroughly at home in a greenhouse or cool conservatory. In the latter place, from its neat, yet graceful habit, and handsome white and green foliage, it is one of the most telling plants that can be introduced, especially when used in sufficient numbers. One of the reasons why it is being more generally grown is the high price that it has realised since variegated plants became fashionable, and a deficiency of knowledge on the part of many growers of the way to increase it to the extent it is capable of. Any one having a good strong plant fully established in a quantity of roots in a 12 or 14-inch pot, may now turn it out. Remove the crotch, shake

the soil away carefully without injuring the roots, which must be disentangled without breaking one-half of these, the strongest, should be selected and cut clean away from the underground portion of the stem. They should be cut into pieces about an inch long, and inserted in pans well drained and filled with sifted peat and sand in equal parts, putting the cuttings in an iron trowel, lifting yellow one-eighth of an inch above the surface. Press the soil firm, and give a light water immediately. Put them in a stove where a night temperature of 65° or 70° can be kept up. They may be covered with propagating glasses, or an ordinary sheet of glass laid over each pan, to prevent the soil resting too early the coming spring. In about eight weeks these root-cuttings will make growth, when the glasses must be removed, giving them a fair amount of light, and not allowing the soil to become either too wet or over dry. When they have made four or five leaves each, they may be put singly into thumb-pots, and kept on growing in heat through the winter. The partially drooped plant should be placed in a pot considerably smaller than it has before occupied in good peat with a little sand added. Be careful not to over-water, applying it sparingly and only when the plants again show signs of want; if warm stove treatment, with shade from the sun, and keep the atmosphere moderately humid; so treated it will lose very few leaves; but, as might be expected, if, after this partial drooping, it is not managed carefully, as above advised, a good deal of the iron foliage will be lost. In the case of the *Yucca* propagated this *Yucca* in the manner described at this time of the year is that the plant is enabled to recover itself before autumn, and the young stock in like manner has time to get established before winter, and are in a position to start off freely in growth with the coming spring. If carefully treated, they will make nice small plants by the following autumn.

The fine shrubby variegated *Yucca*, *Y. aloifolia* variegata, *Y. quadricolor*, and *Y. quadricolor* *Stokesii*, are liable in time, as they attain a considerable size, to become somewhat straggling and to assume a naked unshapely appearance, as, like all other plants grown for the beauty of their foliage, unless their leaves are perfect from the base upwards, they lose much of their effect. As these are slow-growing subjects, requiring years to form good heads, which may be done in the present state, it is better to re-root as large a portion of the head as is furnished with perfect leaves. This can be done at the present season. The head should be cut clean off 5 or 6 inches below the lowest healthy leaves; it should then be inserted in a well-drained pot filled with sifted loam and sand in equal proportions, sufficiently large to support the head. Put in a house with a temperature something like a late vinery, stood on the floor, and keep the atmosphere immediately around them confined, which can be best done by taking two, three, or more ordinary root-cuttings of the same top, and submit them on above another according to the height required, putting one of the tops over it. If a large plant, the leaves will require being partially tied in an upright position, so as to admit of their going inside this improvised covering. Keep closely shaded from the sun, and soil moist, but not too wet; in this way they will generally form abundance of roots in the course of six or eight weeks, when they may be gradually inured to the air of the house. I have found these large heads so treated, succeed much better than when subjected to more in any particular way, and the attention required for them often lose some of their bottom leaves. The remaining portion of naked stem may be either left to break, and the young shoots as produced taken off with a heel and struck, or it can be headed down to within 2 or 3 inches of the base. The bare stem thus cut away may be put in a similar soil, and kept in a similar manner to half their depth, like ordinary cuttings, in pots, or pans drained and filled with sand, placed in the stove, and kept moist, but not covered. Under these conditions very few will fail to produce root and to make healthy plants. T. Baines.

ORCHIDS.—Turning our attention from the Orchid-houses proper, as they may be called, and though not in any particular way requiring the attention required for them, they contain, it will be advisable and worth while to look again to one or two subjects that are best managed in the greenhouse or cool frame. For the late summer and autumn blooming there are few more striking plants of any class than *Dios grandiflora*, its peculiar form, its flower and colour, and its long and slender stem catching the eye at a moment, and causing one to linger and admire its singular and attractive forms. These now should be growing apace, the more forward of the growths just showing the commencement of the spike and the flowers are in the bud stage, and the leaves attain sufficient strength and size. In some cases these succeed moderately well in the Odontoglossum house, and, providing they are not subject to an atmosphere overcharged with moisture, they may remain here; plenty of air, however, must be given, and the plants should be kept in the Odontoglossum.

house is, that after flowering they are very apt to start growing sooner than is desirable, and thus the breaks become very wide, following narrow, and unable to stand its own weight, and in course of a season or two the plants get less, and ultimately die away. For managing these thoroughly there is no better place than a small greenhouse, where a few plants are grown that require less air than is given to the ordinary greenhouse, and a blind can be run down during the hottest part of the day. Now that the growths are well advanced they must be well supplied with water at the roots, and about once a week treated to some liquid manure; and under this treatment they will continue to grow in the strong and healthy appearance. Another that will be in flower at the present time is *Cypripedium spectabile*; this has been imported in such quantity, and the greater part in such good condition, during the last two or three years that many have been able to obtain it who before a small price. A mistake, however, is often made with plants that come to us from localities similar to those from whence these are received. Because they are found freely growing in some of the boggy parts of North America, it is thought they must stand almost as much cold as we get during any part of the year, and on being planted outside, in however sheltered a spot, they have in most cases died. These should be grown in pans covered about a third of the depth, in a mixture of leaf-soil, rough peat, and sphagnum. In the autumn they must be kept in a cold frame, as in the majority of other Orchids, to keep the crown very high above the rim; at the same time, the crowns must not be covered with soil. If, however, a little moss may have grown around the stems during the winter, no outside result from that, as on standing thus outside, after flowering, the moss will dry down and cause no injury by an excess of moisture. After the flowers have all died off, the plants should be stood out-of-doors on an ash border under a north wall. Here the stems will ripen and fall away, and the plants may be taken up a week or two later end of September, place them in a cool frame for the winter. A frame without fire-heat is best, and, during severe weather, besides throwing a mat over the lights, it will be of great service to cover the plants entirely with some dry leaves. By February or March the plants have been taken away, the shoots will push up and stand away. They may be taken into the greenhouse one or two of early blooming, then in two or three weeks the remainder should also be taken in, where they will come on as ordinary plants, the foliage being the same, and at last its pure white flowers with a rose-coloured labellum, will appear on the top of the growth, and add a novelty and richness to the conservatory that is to be found in few other plants. Although apparently this is in dormant from August to February, it must not be neglected during these months it will require care and treatment that it may be forming and developing the beauties that are for the time hidden. *W. Swan, Fallowfield.*

FRUIT HOUSES.

PEACHES and NECTARINES.—The propitious change in the weather which has taken place will, it continues, greatly facilitate the operations connected with these subjects, and advantage should be taken of such influence to air the houses in which the fruit is ripening very liberally, as it does contribute so much towards perfection, both in point of quality and colour. When the fruit begins to show its colour, the syringings should be discontinued, excepting those parts of the trees which are near the pipes, and where it can be applied without detriment to the fruit. In gathering this, its fitness will mainly depend on the purpose for which it is required, and it will fall away in the highest degree of excellence if it be allowed to ripen completely on the tree, but for packing for market purposes it should be gathered somewhat before that time; go over the trees every morning and remove carefully every ripe fruit, and if any means are employed to prevent the fruit which may drop from being injured, it should be seen to before the fruit is quite ripe. Netting is the best material to place beneath trellises below the roof of the house, and in the case of trees which are vertically placed a good layer of soft hay or similar material placed at the base will answer the purpose likewise. To prolong the supply of fruit, discontinue fire-heat as soon as it rises, excepting under most unfavourable conditions. Moisten the surface of the border to render the air cool, and open the house fully during sunny weather, and keep the party so constant. In the autumn stand the same shoot on constant. In spring, where fruit is left, and the laterals at the first leaf, excepting those on terminal shoots where the trellis is unoccupied. In this case a few should be left un-

touchd. Continue the weekly sowings of guano over the surface of the mulching materials in the house. Keep the borders in a moist condition, and copiously syringe the trees twice every day. *G. T. Miles, Wycombe Abbey Gardens.*

CUCUMBERS.—If the supply of fruit from pits and frames is sufficient for the demand, houses which are light and well adapted to winter sowing should now be cleared, thoroughly cleansed, and devoted to the growth of Melons, the crop from which will be cleared in time for the earliest batch of winter Cucumbers. Nights being still cold, the temperature in houses which are fitted up for forcing materials, will fall lower than is good for the raising of the one young fruit; it will therefore be necessary to turn on just sufficient fire-heat to prevent the glass from standing lower than 68° at midnight. After a very hot day, a degree or two, more or less, will not affect the plants; but, as a rule, a minimum of 70°, with a bottom-heat of 85°, should be maintained. Pay unremitting attention to the weekly dressing over and removal of old Vines and leaves. Top dress with good loam as the roots appear on the surface, and water freely with tepid liquid-manure. Damp the beds and floors two or three times a day, and syringe over and under the foliage especially early in the afternoon to allow of the heat running up to 90° after the house is closed. Frames and pits now in bearing will also derive great benefit from weekly watering, and the plants should be on the surface of the soil without wetting the foliage. Sprinkle overhead with tepid water, and close about 3.30 p.m. Tilt cap glasses on the south side as Ridge Cucumbers advance in growth. Cover the beds with short horse dung to prevent the escape of moisture, and elevate the glasses on four half-bricks for a few days prior to their final removal.

ORCHARD-HOUSE.—The wholesale destruction of fruit plants by the severe frosts and cutting north-easterly winds will cause many horticulturists to turn their attention to this useful structure, particularly if their gardens are not well sheltered from wind and sufficiently high to escape the disastrous effects of 14° of frost early in May. At this place I can see the size of Hazel-trees well fitted under glass copings with the roof of Prigi Dome. In front, and I may now count more fruit on a dozen pot trees than will be gathered from two rows of one of the best trees through the month of August. The plants are not ornamental, the leaf-to answers very well, as retarding rather than forcing is generally practised. Fruit trees established in pots may at all times be obtained in endless variety, but it is better to have duplicates of early, medium, and late sorts, in order of value, than to run into an endless list of names. We need not advise the owner of a well-stocked orchard-house to pay extra attention to his trees; we may, however, remark that pot trees must not be overtaxed to make up for deficiencies out-of-doors. A side crop of finely-swelled fruit will give more satisfaction than a greater quantity, which ripen off instead of taking their last swelling, and the trees will retain their vigour for many years. The thinning of fruit requires great firmness, as well as judgment, and it is always well to err on the safe side. A healthy established tree in a medium-sized pot, if growing in near proximity to a good manure-heap and liquid manure tank, will, in all probability, ripen off better fruit than the tree which cannot be well mulched and watered with tepid liquid. Next to judicious thinning cleanliness is of great importance, and roots are cleaned, and the soil will now begin to be troublesome. This must, of course, be kept in check by the constant use of Read's patent syringe, a most formidable instrument in skillful hands. If black-fly does not succumb, the points of the shoots may be dipped into tobacco water, or only partially, and the same may be done the following morning, and repeat if necessary. Ordinary green-fly may be kept down by fumigation. From this time forward, if early fruit is not wanted, the ventilators may be kept constantly open, but fruit always attains the largest size when the ventilators are closed for an hour or two after the afternoon syringing. *W. Coleman.*

KITCHEN GARDEN.

The kitchen garden amongst the multifarious sowings, thinnings, and plantings, which press for daily attention, has to take into consideration what will be required in the kitchen many months hence, and is therefore frequently obliged to take stock, in order that if any important crop has failed, or only partially, it may take such timely means as are available to him for supplying deficiencies. Hence small supplemental sowings of any of the sorts certain to be required, are always useful in case of failure, or if not required the value of a pinch of seed is not commensurate with the possible loss of a crop. The grower should be on his guard against such deficiencies, and should be at once provided for, if possible by timely supplemental sowings, or, if too late, by purchase or exchange of plants.

It is about this time when work presses so heavily in all departments, but particularly in the flower garden, that weeds are apt to come creeping along, and if means are not adopted by setting on a good strength of water, the weeds will be so high, that soon get so much ahead as to require double the labour to get rid of them. Hence the great advantage resulting from the following out of our repeated injunctions as regards surface stirring amongst advancing crops, which should never be omitted on all favourable occasions, is hereby confirmed. This will allow of a portion of the strength being relegated to other departments during bedding out time, provided also that the necessary plantations of Autumn Cauliflowers and Broccoli have been attended to, if any further continuation is permitted to interfere with its immediate performance. A good breadth of spring sown Cabbage, such as Carter's Heartwell or Veitch's Improved Matchless, should be got at once; the latter has proved itself to be by far the best Cabbage that has stood through the last winter; not anywhere in this neighbourhood have I seen any thing like them. Our own old favourite sort called Early Seal, and which has been grown continuously in these gardens over forty years has failed to approach this year. In addition to the immediate necessity for securing the planting of a good breadth of Brussels Sprouts, it is well to sow, for which, as it is one of the most important of our winter vegetables, the ground should be deeply trenched and highly manured, attention must also be paid to getting out a sufficient breadth of Early Drumhead Cabbage, a most useful vegetable for early supply, and, as these will be supplemented by later plantings of other varieties sown later, the supply will be carried on well through the winter into the spring. Look to the successional sowings of Walcheren Broccoli and Cauliflower for the latest plantings, and stick to your sowing, for the former sowings, and where space is at liberty lose no time in getting in the plants from the earliest sowings; this, as I have observed, is imperative, for if left too long either in the seed beds or when picked out they receive too severe a check, and frequently do not grow away sufficiently free to attain their most capable development, but commence early to throw up inflorescence which is often of very inferior quality.

The main crops of Celery should now be planted, and if the trenches are not already prepared no trench is planted should be all trenched over to a depth which must be regulated by the bottom of the trenches in which the plants are inserted; when all the ground is moved, and the bottom of the trenches is able to penetrate through the whole mass, and the depth of the trenches in which the plants are placed will become a very secondary consideration, but may safely be regulated by the nature of the soil and the condition of the subsoil, both with regard to its texture and drainage. For early crops of sufficient depth may be indulged with deeper trenches than would be advisable in the case of stiff, retentive soils with a cold bottom, where shallow trenches very little below the level of the ground will be most likely to ensure good keeping, and the plants will be supplied with particularly to that part of the crop which is intended to furnish a supply from Christmas to well on into the new year, which is the most trying time, as it is then so liable to decay, and that decay will be very much accelerated by planting deep down in ill-drained trenches. For early crops which will come up perfection and be used off before the trying time it is not needful to be so particular as to the depth of the plants in the ground. In preparing the trenches for the plants mark them out 2 feet wide for double rows, throw out right and left one good spad's depth, leaving a narrow strip of soil between the rows, then fill up with rich but well decomposed manure, which turn over and incorporate with the soil and plant at once, taking care that it is as near the supply of water as possible; the space between the trenches for the early crop which used crops need not be more than 3 feet, but for the long keeping 4 feet is not too much, because at the final earthing up the bottom of the bank should be considerably below the roots and thus act as drainage. Although the season is unusually backward one, most of the root crops will be ready for the thinning out. Onions, especially must have early attention, leaving them at from 4 to 6 inches apart, and transplanting to fill up vacancies, afterwards hoe up the soil between the drills, and if dry weather should prevail, the crop will be very much benefited by a liberal application of water in the early stages of the season. If any sods has been dissolved. I believe this to be a good antidote against the rotting of the roots, and therefore worthy of a trial. Thin out the main crops of Red Beet, leaving them at about 8 inches. The second sowings of Turnips will be ready for the thinning out, and the usual manner of good sowing should be made for the main early autumn crops. Early Snowball is a good sort for this sowing. Look to the Cucumbers and Vegetable Marrows on ridges, as they may want earthing up and pegging out. *John Cox, Relliford.*

THE
Gardeners' Chronicle.

SATURDAY, JUNE 9, 1877.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, June 11 Sale of Plants at Lee's Nursery, Hamersmith, by Stevens (two days).
WEDNESDAY, June 13 Royal Botanic Society's Summer Show, York Road, Finsley (three days).
FRIDAY, June 15 Scottish Fanny Society's Show.

AT the Society of Arts on Tuesday last, Mr. ANDREW MURRAY raised the difficult and well-nigh insoluble problem of State interference in agricultural matters. When we say insoluble, we mean insoluble *secundum artem*. No amount of logical argumentation or neatly-drawn conclusions will avail in the determination when or how Government ought to interfere. The line between State aid and individual enterprise must be drawn somewhere, but it is impossible beforehand to say where the demarcation should best be made. The severe logic of facts, however, in many cases ultimately forces the enactment of compulsory legislation or of State aid.

The immediate object of Mr. MURRAY'S paper, a full abstract of which will be found in another column, was to press upon the Government the consideration of the nature and amount of the INJURY INFLICTED ON GROWING CROPS BY INSECTS, and the best method of preventing or remedying these disasters. In the case of the cattle plague Government has interfered with the liberty of the cattle dealers and graziers to an extent that a few years ago would have been thought unbearable by free-born Britons. But the restrictions are quietly subverted, and the necessity for them has become apparent to the generality even of the most unthoughtful of farmers. Continental farmers, said Dr. VOELCKER, do not feel the restriction to which they are subjected onerous, because they are so well-instructed in the principles, as well as the practice, of their business that they understand the necessity when it arises, and are consequently obedient to the law. And so we take it, that when once the farmers or the gardeners become sufficiently aware of the importance of the question, they too would submit to Government interference when they were convinced of its necessity and act on the principle of choosing the least of two evils.

But perhaps the most astonishing thing that came out in the course of the discussion was the testimony given as to the amount of ignorance among the general body of agriculturists throughout the country, of the nature and especially of the amount of damage done by insects. Farmers in general appear to be not nearly so well informed on this matter as gardeners, and do not seem to have anything like an adequate conception of the amount of the loss they sustain every year by some plague or other. True, when a particular crop is ruined, or a particular field is specially infested, they recognise the enemy and realise his powers for destruction, but in an ordinary way they seem wrapped in nescience or apathy.

This may be illustrated in various ways, but it was strikingly shown by the circumstance that not one of the agricultural societies or chambers of agriculture to whom the Privy Council submitted Mr. MURRAY'S proposals took the slightest notice of them, even though they were deemed by a Government department of sufficient importance to be disseminated broadcast among the agricultural bodies of the kingdom. This betrays a want of appreciation of the amount of injury inflicted by insects which is almost incredible on the part of those who have to get their living by the cultivation

of plants, because, if it were not so, whether Mr. MURRAY'S proposals are judicious, or whether they are not, they are clearly of a nature to elicit discussion, if their purpose be fully appreciated. In point of fact, when the Society of Arts did institute a conference of representative agriculturists, horticulturists, and men of science to hear Mr. MURRAY'S paper read, a discussion ensued of a most valuable character, and one which, when it comes to be circulated, as it probably will be in the *Journal* of the Society, will do much towards enlightening the public on the matter. The general principle that some action should be taken was universally assented to, but direct Government interference was evidently not held in favour, Mr. CLARE SEWELL READ emphatically stating that in such a matter the Government would be sure to make a muddle, and concluding his speech by recommending that the Government be asked not to do anything in the matter. On matters of detail there was, as might have been anticipated, considerable diversity of opinion, Mr. MACLACHLAN pointing out that the evil effect of insects might often be overcome or compensated for by increased vigour of growth of the plant. Several of the speakers, we are glad to say, denounced the indiscriminate slaughter of small birds, and more than one speaker endorsed Mr. MECH'S assertion that birds are the farmer's best friends. This of itself is a healthy sign. Twenty years ago, or even less, we do not think such a statement would have been received with so much assent as it was by the representative men gathered together at the Society of Arts on Tuesday. Having heard this discussion, and having balanced what we know of the state of the question with the opinions expressed by some of the leading agriculturists at the Conference we can but come to the conclusion that Mr. MURRAY'S proposals as to State interference are premature, and that before anything like compulsory legislation can be proposed with any chance of success, those most concerned must become much better informed of the nature and extent of the losses they now often blindly incur.

Of the extent of injury inflicted by insects we are in a very fair position to judge. Ever since the establishment of the *Gardeners' Chronicle*, entomology in its relation to cultivated plants has constituted a prominent feature in our columns. We can point with justifiable pride to the long series of articles on this subject from the pens of such men as CURTIS, as WESTWOOD, as MURRAY, MACLACHLAN, and others. Week after week, too, often daily we receive inquiries relating to insects, and specimens of the injury they inflict. Week after week these are referred to the most competent entomologists of the day; and the number of these inquiries, in addition to what falls under our own personal observation, enables us to form some idea of the amount of injury really inflicted. The Scientific Committee of the Royal Horticultural Society also does good service in this way by giving information to inquirers, by naming the specimens sent to it for identification, and suggesting the most appropriate remedies.

We have heard the Royal Horticultural Society so much abused of late, especially by those who do not know that, amidst all its troubles, it has still done good work, that it was cheering to find the merits of its Scientific Committee thus publicly and independently vindicated. But the number of persons whom this and other horticultural or agricultural journals reach, or who could avail themselves of the Scientific Committee of the Royal Horticultural Society, are few compared with the number of those who suffer from the depredations of insects. It would appear, then, that in place of compulsory legislation, which at present, we believe, would be im-

practicable, it would be better to appoint a State entomologist (as has been done with such conspicuous success in America), and whose duty it should be to examine and report upon all cases of insect injuries submitted to him, and who should make known to the widest possible extent, and in the clearest and most intelligible manner consistent with accuracy, the nature of the insect, its habits of life, the character and extent of the injuries inflicted by it, and the best method of prevention and of cure. Every agricultural and horticultural society in the kingdom, every chamber of agriculture, should have a scientific officer competent to advise in these matters, and these local or district officers should be in communication with the Government entomologist or some other central authority. In this manner knowledge would be diffused and extended, much of the loss now incurred would be entirely prevented, and some materially lessened. In time public opinion and enlightened self-interest would know when to ask for or to submit to Government interference.

We may remark, in passing, on the great waste of power for good of our horticultural societies in general. Throughout the country their whole aim seems to be to get up one or more flower-shows in the year; often these shows are confined to one class of flowers even. Now, we have nothing to say against this, except that it should be supplemented by other means of doing good, now entirely neglected. We have often alluded to the unprofitableness of horticultural societies and of flower-shows, as also to the many ways in which they might, at little cost, do good service to horticulture and to the general welfare. Each of these societies should be in communication with the Royal Horticultural Society, and avail itself of the opportunities of gaining that information which the Royal Horticultural Society or other central body is capable of giving, and would give more freely than they do if outside pressure were put upon them.

— It is a matter for sincere congratulation to men of science in general that their official leader, the President of the Royal Society, and to horticulturists and botanists in particular, that their acknowledged chief, the Director of the Royal Gardens, Kew, should have been created "Knight Commander of the most exalted Order of the Star of India." There is peculiar significance in the affiliation of Sir JOSEPH HOOKER, K.C.S.I., to the Order of the Star of India, as it was in India that he consolidated the reputation he had early won in the antarctic regions; it was in India that he made his largest scientific collections; and it is in connection with India that he has so largely worked in scientific matters since his return a quarter of a century ago. It is from India that he sent home those gorgeous Sikkim Rhododendrons, while the services he has rendered to India and to the colonies in general in his capacity of Director of the Royal Gardens, Kew, though little known to the outside world, are alone sufficient to justify an honour which has been too readily bestowed, but which will cause him to rank, not only among the most eminent of botanists, but among the greatest benefactors to his fellow-men.

— We have received from our correspondent, "A. W.," a very CURIOUS CASE OF DISEASE IN PEACHES AND NECTARINES. Dark red spots appear, either at the apex or on the sides, which after a time slightly collapse without showing, what we at first supposed, any trace of Gloeosporium leucolor (BERK., in *Gardeners' Chronicle*, 1859, pp. 604), though it is possible that it may still be in abeyance, like the red spots on Shoe-leaves, which seldom come to perfection. It is observable that these coloured parts exhibit the odour and taste of imperfectly-ripened fruit. In this condition the microscope shows nothing but abundant crystals and minute particles with Brownian motion. In the next stage, still while the cuticle is unbroken, though collapsed, the contents of the cells are greatly altered, sometimes showing contracted granular masses, sometimes strings of minute particles, the whole body of cells, but especially those in the centre, becoming pulpy, as if some ferment were at work. Still, there is no trace of mycelium; but at the moment the parenchyma is

exposed to the air, abundant threads traverse the mass, and the cell-walls are much decomposed, added to which a glazy matter oozes from the edges of the spots, which is full of *Vibrios*, resembling what are commonly called the eels in decomposed vinegar. Finally, the fruit, or part of it, becomes a pulpy mass of decay, in one case covered externally with *Cladosporium herbarum*. The pulpy condition, however, occurs before the cuticle is broken, and calls to mind the observations which have been made on contagious diseases in animals, as dependent on specific germs. Such may also be the case with vegetables, though we are not in a condition to give any positive opinion on the subject. The best advice we can offer is, carefully to gather every affected fruit, and at once commit it to the flames. *M. Y. B.* [Since we sent the specimens above alluded to, to the Rev. M. J. BERKELEY for examination, we have received others from other sources, which induce us to caution forced Peach growers against a plague which threatens to be serious. Eds.]

— That the "wind bloweth where it listeth" is an old maxim that was most forcibly displayed on the

Museum, together with a pamphlet containing the opinions of many medical men in India on its efficacy. This preparation is, as most of our readers know, made from the red *Cinchona* bark (*Cinchona succirubra*), grown in the Government plantations at Darjiling, and contains, as we are told, "all the febrifugal alkaloids of that species in the relative proportions in which they exist naturally in the bark." In the treatment of fever the efficacy of this febrifuge has been proved at the Medical College Hospital, Calcutta, the General Hospital, the Howrah Hospital, and by numerous experienced members of the medical profession. All the reports show that it possesses very nearly to the same extent as quinine all the anti-periodic properties of that more expensive drug, so that it may safely be substituted for it in the treatment of ordinary fever and ague. This new medicine is issued by the Government in India at a low price, as a cheap and efficient febrifuge for the poorer classes; and we read that it "is not intended to replace quinine in very serious and complicated cases, or among those who can afford to pay for the more expensive drug." It is to be had by application to the Superintendent of the Botanical Garden,

where incalculable. We believe that a satisfactory portrait exists—the work of an eminent artist—and it is hoped that this also might be secured by the aid of private subscriptions.

— A visit to Mr. WARE'S nursery, at Tottenham, though it is chiefly confined to outdoor plants, is always a matter for pleasurable remembrance. The *Narcissi*, including that very useful double form of *N. poeticus*, are nearly over, but the visitor even now can hardly fail to be struck with the enormous quantities of these favourite bulbs grown here, even if he has just returned from Holland. Among the herbaceous plants best worth notice at this time are *Corydalis nobilis*, a grand golden-flowered Fumitory, an old plant no doubt, but a grand one and one seldom seen. *Dodecatheon Jeffreyanum* makes a show at this season, as also a splendid patch of *Trillium grandiflorum*. *Ferulas* are always strikingly handsome, but now, when they are coming into blossom, they are particularly so. *Aster alpinus* is a plant so much in request that it is difficult to get enough of it. *Iris susiana*, its flowers more than 3 inches across, is simply magnificent. The beautiful and sweet-

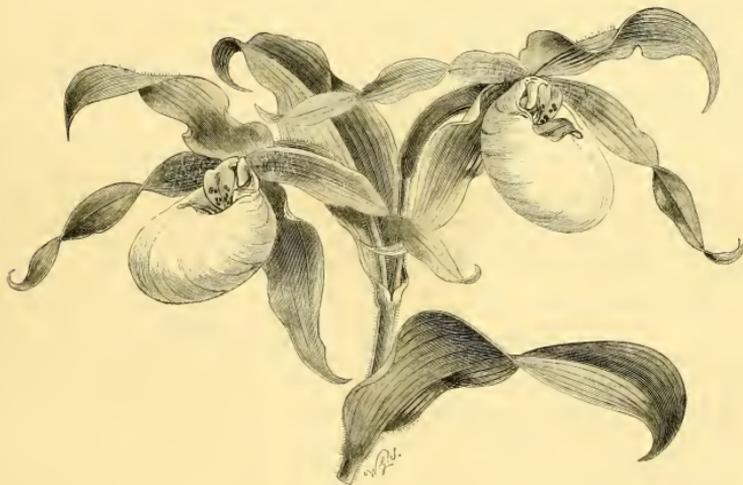

FIG. 117.—CYRTOPODIUM OCCIDENTALE (SEE P. 727).

opening days of this the present leafy month of June. We might well have been excused in imagining as we awoke on the morning of the 1st that we had indulged in a *RIP VAN WINKLE* state of somnolence, and had slept until the period of the autumnal equinox. Such fierce winds have left their mark on trees and in gardens, and have been productive of much mischief; our only consolation being found in the assurance that no human foresting could have stayed the storm or allayed its force. The young and tender foliage has been terribly cut in exposed places, and the trees will bear traces of the damage for some time. Fortunately we are a sanguine people, and with a few days of warmth and sunshine past disasters are soon forgotten.

— We hear that His Royal Highness the Prince of WALES has given up *Chiswick House*, the lease having expired. The grand garden parties will, in future, be given in the gardens at *Buckingham Palace*. We are also informed that Mr. JOHN WILLS, of South Kensington, will have the honour of supplying the floral decorations at *Marlborough House*.

— A sample of THE NEW CINCHONA FEBRIFUGA, or mixed *Cinchona* alkaloids now being used in India, has recently been received at the New

Howrah, near Calcutta. With regard to the administration of the medicine, it is said to be given in the same doses as quinine. The "natives frequently prefer to swallow it in the state of powder, or to rub it up for themselves with a little ghor or honey before taking it. It may also be conveniently made into pills with a little lime-juice." With regard to price, it is sold to the general public at 20 rupees per lb. tin wholesale of 20 lb. at a time; and to public officers for charitable institutions at 16 to 18 rupees. The more general use of this febrifuge should affect shortly the price of quinine itself.

— At the Royal Horticultural Society may be seen a portrait of the late G. U. SKINNER (Lycate Skinner, &c.). This portrait, we believe, is for sale, and should most assuredly be added to the portrait gallery entrusted to the trustees of the LINDLEY library, for the benefit of the Royal Horticultural Society. A small subscription from those who knew and respected the late Mr. SKINNER should at once be made, so as to secure this portrait; the likeness is excellent. We shall be pleased to forward such contributions as may be sent to us for this purpose. Another portrait deserves to find a place in this or in some other suitable locality, viz., that of the late J. C. LOUDON, whose services to horticulture

scented *Aponogeton distachyon* flowers here in an open tank unprotected, and is as hardy as the beautiful *Buck Bean*, *Menyanthes trifoliata*, by its side. *Aquilegia corulea* is now in full bloom, with sepals of a delicate lavender blue surrounding pure white petals. *Armeria grandiflora*, a magnified representation of the common Sea Pink, is striking at most seasons, especially in spring. A fine lot of the very striking *Eryngium* depicted by Mr. FITCH in our columns in January, 1876, is here to be seen, as also a large selection of hardy *Cyrtopodia*. Lilies, such as *Humboldtii* Scovitzii, *californicum*, *pyrenaicum*, and *giganteum*, are remarkable for the sturdy growth they are making. *Mesembryanthemum uncinatum* proves hardy here on the rockwork, and is one of the most singular plants for the curious. A number of more conventional tastes there are bedding *Pansies* in great variety and of great merit, while the loveliness of some of the *Pinks* and *Carnations* will attract flower-lovers of all denominations.

— The superb bank of HERBACEOUS CALCEOLARIAS staged by Mr. JAMES, of Isleworth, at the recent show at the Orleans Club, illustrated far more forcibly than any descriptive notes can, the marvellous excellence, beauty, and high quality of the famous *Reddes* strain. As with the *Cineraria*, so

with the Calceolaria, Mr. JAMES holds the foremost place as a raiser and grower, for his strains of these fine greenhouse flowers are unrivalled. Mere size of plant or of flower is no indication of quality, but in the plants shown at Twickenham there was seen at a glance a singularly even, compact, yet robust habit, large trusses, huge, full, finely-formed flowers, and these of the richest and most varied hues, ranging from a pale cream down to deep crimson-maroon.

— We learn that it is proposed to erect at Ootacamund, in the Nelgherry Hills, a STATUE of the late Mr. MACIVOR, to whom the successful cultivation of Cinchona on those Indian slopes is so prominently due.

— Among the plants shown at the meeting of the Royal Horticultural Society, on Wednesday last, was a nice plant of AOTUS GEACILLIMA, a New Holland shrub, with slender recurved whip-lash-like branches, covered with small papilionaceous flowers of a yellow colour flecked with darker orange. The plant is exceedingly attractive, but, according to Mr. BAINE, has the disadvantage of speedily casting its flowers.

— MESSRS. VEITCH'S group of thirteen species of MASSEVALIA at the last Floral Committee was noteworthy. The species represented were M. cocinea, orange; M. Veitchiana, orange-scarlet; M. Ifariyana, lilac; M. Barleana, orange; M. ignea, bright clear yellow; M. myricina, a weed looking species, with purplish brown spots on the hairy sepals, and long-tailed flowers. Of small flowered curiosities, gems in their way, were ionocharis, infracta, ochthodes, Peristria, and simula.

— The last issued part of the *Journal of the Linnean Society*, contains a notice of the root stock of MARATTIA FRAXINEA by Mr. J. BUCHANAN. The chief interest lies in the circumstance that the Maories of New Zealand use the rootstock as an article of food, and propagate it by crushing it. Every separate piece will form a new plant. The rhizome or stock, it appears, is composed of an irregular mass of thick fleshy scales, which separate by an articulation from the stalks of the fronds of which they form the lower portion. These scales, placed under favourable circumstances, form buds.

— The growth of the Marattia rhizome is remarkably slow, being under favourable circumstances only 1 inch diameter in one year; and as the height is less than the diameter, it may be safely calculated that a Maori will consume in one day the growth of five years, which fact may account for this Fern becoming rare in certain localities. The rhizome, by a process of renewal and movement, lives for an indefinite time, shifting its position in the ground by its growth outwards from a centre, the exhausted scales accumulating in a hard mass on the original site. In this way, as in certain fungi, rings or detached clumps may be formed at equal distances from the centre if no obstruction exists."

— Recent advices from New South Wales inform us that a successful experiment has been made recently in the cultivation of the JUTE plant at Grafon. The seeds were obtained from Mr. CHARLES MOORE, of the Botanic Garden, Sydney, who, judging by this result, anticipates that JUTE FIBRE will become one of the most valuable products ever introduced into the colony. We learn also that the cultivation of TOBACCO is to be attempted in South Australia.

— Mr. EDWARD PEACOCK, writing in the *North British Advertiser*, says:—"It was informed yesterday that in felling a wood in the parish of Southport near Kington-Lindsay, several horse-shoes were found buried under the roots of ASH TREES. It seemed, said my informant, that a horse-shoe had been put into the hole and the young tree planted on it. Have any of your readers ever heard of such a practice, and can any motive, magical or otherwise, be suggested for the custom, if custom it be?"

— As such has been said of the late AMERICAN EXHIBITION in its horticultural aspect as its merits deserved. It is a singular circumstance, however, that the banquets and the pleasure trips on the occasion, the excursions to Hazleam, to the Gardens

of Prince HENRY, at Soestdijk, and other outings of a like character, were as well managed as the more serious business was the reverse. We fancy we see our Dutch friends laughing—*dulce et desipere in loco*. Three hundred jurors tied to the desk or counting-house at home, or always "going through the houses," may well welcome a little change from the daily routine, and thoroughly enjoy, as they did, the hearty hospitality of their hosts. And, besides, as we have said, the hospitality was not only hearty, it was scientific, well ordered, and well managed. Gastronomy was not forgotten, but catered for in the most delicate and appetising manner, but the jury-man was made to feel that there was something else worth living for than *Ch. & Co.* or even good dinners. Intellectual recreation and mental food were provided in abundance, and highly relished. A capital account of the several excursions is given in the *Gardener's Magazine* of June 2, but how or when Alphabetagema, for that is the reporter's name, managed to sketch that "pretty greengrocer," we do not know.

— THE NEW ANTHURUM DECHARI, shown at the last Floral Committee by Mr. WILLS, is not likely to receive much popular favour so long as people are dazzled by A. Scherzerianum, though it will be valuable to collectors. It has a whitish spathe and a white spadix, the tip of which, covered with unexpanded flowers, is green. The leaves are stalked, broad, oblong, and prominently veined.

— The current number of the *Journal of Botany* contains a coloured plate and description by Mr. W. G. SMITH of a new fungus, XEROTUS SANGUINEUS, a "remarkable species of a very rare genus collected by Mr. SHUTTLEWORTH, Mr. BULL'S collector, on stamps and on the ground in the State of Santander, United States of Columbia, South America."

— We understand that the GARSTON VINEYARD, near Liverpool, formerly the property of Mr. MERE-DITH, of Grape-growing notoriety, and lately of the Cowan Patents Company, has been purchased by Mr. JOHN COWAN, the late managing director of the Company.

— A matter has been brought to our notice, which, whether more or less founded on fact, or entirely suppositions, is worth a few moments' consideration. In SONNENSCHNEIN'S *Handbuch der gerichtlichen Chemie*, p. 13, is the following:—

"In the year 1864 occurred in London a case of poisoning, of which a gipsy was suspected, and a physician stated that the gipsies possess a peculiar poison called Drai or Dri. It is a fine brown powder originating from the spores of a Mushroom. These spores are capable of germinating and developing in animal organisms, so that they form greenish-yellow filaments 12-18 inches in length. This powder is given in lukewarm water. The spores attach themselves to the mucous membrane, and develop very quickly. The symptoms are, first, those of hectic fever, cough, and sometimes hæmoptysis. Death follows in from two to three weeks. A case was observed by a physician in Italy. The filaments, whose growth was brought to a standstill through the death of the individual, and the consequent want of warmth, soon decompose, so that in a few days later there is no trace of them."

Now, making allowance for a slight degree of exaggeration, there is here still enough to command attention, and the more so, because there is a fungus which in great measure answers the condition. Micro Phycomyces, BERK., which was considered an Alga by AGARDHI, is sometimes developed in enormous quantities on oilcasks, walls impregnated with oil, and casks of grease, which it ultimately reduces to a *caustic mortuum*. We have cultivated it with success on the latter, and doubtless any quantity of spores might be collected by any one who cared to do so. The mycelium is just what is described in the passage quoted above, is green, but grows darker with age, and the threads which have the fertile cysts are of considerable length. But this is not all; we have specimens on cement from Alabama; and we remember seeing, in Dr. MONTAGNE'S herbarium, specimens which had grown on fat broth, we believe rejected from the stomach. It is, however, very possible that the spores, like those of some other moulds, are capable of germinating on the mucous membrane in certain conditions, and if so they might not only

produce great constitutional derangement, which would possibly be increased by something mixed with the spores, or by something which would favour their germination. At any rate, we have here a possible solution of the problem. It is quite certain that gipsies do possess some valuable or dangerous matters which are not generally known, and this may be one of them. M. F. E.

— The freedom with which several varieties of SUCCELLANT PLANTS can be PROPAGATED by LEAF CUTTINGS was recently exemplified at the Crystal Palace, Mr. THOMPSON exhibiting with a large number of plants of the *Sempervivum tabuliforme*—of sizes varying from 10 inches down to about 4 inches in diameter—the one parent plant of the whole lot, a small insignificant thing, which, because its lower leaves had constantly been taken from it, had assumed a rotund form, about the size of the half of a cricket ball, and might have passed for a distinct species. As this plant is one of the most decorative in succulent bedding, a knowledge of the ease with which plants can thus be propagated may be useful. Not less easy to propagate are the Pachyphytons, two of the most valuable of which for bedding as pot plants are bracteosum and roseum. The extremely fleshy nature of the leaves renders the smallest amount of moisture necessary to produce rootlets from them. We have found leaves that have been thrown down on the damp floor of a greenhouse to root freely in a few weeks, but it is both neater and more systematic to plant the leaves with their base resting upon a surface of sand and kept in a nearly perpendicular position by means of a support of moss; an occasional sprinkling will suffice to maintain the requisite amount of moisture. We have recently seen a curious instance of leaf rooting exemplified on a plant of Pachyphyton roseum that had been kept in a cool house all the winter; a side leaf was partially broken off some time since, but the stem of the outer cuticle remained attached to the stem to prevent its falling off. Roots have now been thrown out at the base of the leaf, and a young plant formed; thus showing that a very small amount of moisture is needed to ensure growth.

— BRON VO MUELLER'S fourth part of *Descriptive Notes on Papuan Plants* confirms the supposition that the Frog Bit, HYDROCHARIS MORBUS-RANE, is indigenous to some countries in the Northern Hemisphere. In HOOKER'S *Student's Flora of the British Islands* the distribution of this interesting plant is given as Europe, except Turkey and Siberia; but its area has, since the publication of this work, been ascertained to be much wider. In BENTHAM'S *Flora Australiensis*, vi., p. 256, Wide Bay, in Queensland, is given as a habitat, and one or two other stations are indicated. MUELLER, in this part of his Notes, dissipates any doubt that might previously have existed respecting its being at home in Australia, and also in New Guinea. The specimens from the latter country were collected by DALBERTIS in the Fly River, and, although devoid of flowers and fruit, the anatomical structure of the leaves of the specimens is sufficient to determine the plant to which they belong. Growing along with the Hydrocharis in New Guinea was another widely dispersed aquatic plant, named Ceratophyllum demersum. In Australia the former has been found at Moreton Bay by Mr. W. HILL, and at Rockhampton by Mr. A. THOZET. It is associated with Drosera Aldrovandi and Brasenia peltata, a plant occurring in tropical Asia and Africa, and subtropical North America.

— We have more than once mentioned the forge plant, REANA LUXURIANS, which caused so much stir in France, and which, like too many new plants of this class, has failed to fulfil the promises made for it by its enthusiastic friends. From trials made in the most favourable parts of France in respect of climate, the hope that it would prove a valuable source of food for cattle has been frustrated. It is a native of Guatemala, and although flourishing there at a considerable elevation it enjoys a climate so different from that of continental Europe, that it could hardly be expected to succeed here. But this is not the point we wish to call particular attention to now, which is this, the correct name of the plant. It will be remembered by those interested in the matter that we Prof. DECAINE, that it was no other than Tripsacum

monostachyum. In a paper on the genus *Euchlena*, read by Dr. ASCHIERON before the Gesellschaft Naturforschender Freunde, of Berlin, and reported in the *Botanische Zeitung* for March, the author declares this to be an error, and that DURIEU DE MAISONNEUVE was right in his first determination. However, the generic name, *Keana*, falls before *Euchlena*, and ASCHIERON gives the name of the plant in question as *Euchlena luxurians*, DURIEU et ASCIL. He also credits FOURNIER with having corrected this blunder in the *Illustration Horticoles*, p. 143, 1876.

— Manchester can boast a young and rising artist in Mr. WILLIAM RATHENES, a member of the Manchester Academy, who possesses considerable ability in painting flowers. There has been recently on view at Manchester two pictures by this artist, in which flowers were painted with a wonderful fidelity to Nature. One was a bunch of dark Wallflowers—just such an one as would be seen in Covent Garden Market, and so bold and life-like was the artist's work, that the bunch appeared to stand out from the canvas; and this, too, without a trace of formality in the rendering. Perhaps even more successful was the painting of a group of some four bunches of Violets, such as are sold in the streets of London—a necessarily formal subject, but depicted with amazing life and skill. A third picture of a dish of fruit was equally successful. Mr. SAMUEL BARLOW, of Stake Hill House, possesses a little picture by this artist representing a bunch of cut blooms of Pansies in a small vase, with a flower of Great Eastern in the foreground. So truthfully is the bloom depicted, that it is at once recognised by all who are acquainted with the variety.

— As the result of some experiments made by M. AUDOYNAUD, Professor in the School of Agriculture of Montpellier, on the influence of manures containing POTASH on the growth of the VINE, and recorded in the *Annals Agronomiques*, it is stated (1) that sulphate of potash and chloride of potassium have a marked influence on the development of the Vine, and nitrate of potash still more so, while carbonate of potash is less efficient. 2. That weak plants of Vines appear to appropriate as much manure as strong ones. 3. An excess of nitrogenous manure is more harmful than useful. 4. Potash should enter into the composition of manures for the Vine, that which exists already in the soil being usually not in a fit condition to be readily absorbed. The absorption of the potash seems to be associated with that of the other fertilising principles. 5. The potash from the root passes to the stem, to the leaves, then to the shoots, and ultimately to the fruit. 6. Only a part of the potash taken up by the root is used up, since after the ripening of the fruit a considerable reserve store is found in the wood. It will be seen that M. AUDOYNAUD'S researches are quite in conformity with the plan advocated by Mr. WILDSMITH of employing wood ashes as a manure for Vine borders.

— On the occasion of the Celebration of June 4, at Eton, Dr. GOODFORD, the Provost, mentioned a circumstance in connection with the splendid Elms in the playing fields that are the admiration of all who see them. His statement was interesting from the fact that it would appear that Eton is under considerable obligations to OLIVER CROMWELL, of all people in the world. The Protector of the Commonwealth, who is reputed to be an intimate friend of the Provost of that day, exerted his influence to save the venerable pile of buildings from desecration, and while on a visit to Eton, he suggested the planting of the trees which is so now so conspicuous an ornament of Eton for the last century, but whose numbers have been sadly diminished during the past few years. No great historical character is credited with the commission of so many acts of Vandalism as the Lord Protector; and it is interesting to find that something can be produced as a set-off on the other side in the character of one of the greatest of Englishmen.

— The seventeenth anniversary festival of the ROYAL AGRICULTURAL BENEVOLENT INSTITUTION was held on Wednesday evening, at Willis' Rooms, under the Presidency of the EARL OF DUNMORE, who in proposing the toast of the evening, stated that one of the best feelings of our fallen nature was that of sympathy, and it was that very feeling which had started this very necessary institution, and which had

kept it going until now. It was the sympathy of farmers for farmers. Since 1860 no less than £55,000 had been expended in relieving distressed farmers, and 610 persons had been recipients during the same period. At present 362 persons were receiving relief, comprising 70 males, 37 married couples, 204 widows and unmarried daughters, 14 octogenarians, besides 50 orphan children fed, clothed, and educated. The total annual expenditure was upwards of £9,000, of which £800 was derived from property, the remainder being supplied by voluntary subscriptions. Mr. J. J. MECHI, whose name was coupled with the toast, dwelt on the great need of such an institution, and stated that about twenty years ago two cases of distress among farmers came under his notice, and to his great astonishment he discovered that there was no society in existence for the purpose of relieving them. The present were very bad times for farmers, and he should like the funds of the Association to be very largely increased. The Secretary, Mr. J. BOUSFIELD SHAW, read a list of the principal subscriptions, the total amount subscribed for this year being nearly £11,000.

The following passage is from "Pencilings of the Week" in *Leisure and Idler*.—"Why do the Covent Garden people wrap their flowers in blue paper of that uncompromising shade that 'goes with' nothing on earth? It is all very well for grocers to put tea and coffee in, but flowers ought to have a little more consideration shown them when they come to market. I have seen Pansies, pale blue, and Philadelphia most particularly resent such unsympathetic proximity."

— We understand, though we have received no official intimation of the fact, that the Council of the Royal Horticultural Society have decided to hold a PROVINCIAL EXHIBITION at Preston, in Lancashire, in June next year.

— A medium-sized specimen of COCHLOSTEMMA JACOBLANUM is now in splendid flower at the Victoria and Panicle Nurseries, Upper Holloway, N.; it has ten branching spikes, from 12 to 18 inches in length, and each spike has from twenty to sixty towers and buds on it. It would be difficult to find a more beautiful temperate-house plant, and would well repay a visit to the above-named nursery.

— A committee has been formed, having for its object the presentation of a testimonial to Mr. F. W. WILSON, whose connection with the Crystal Palace, after twenty-five years' service, has just terminated. Mr. CHARLES EDWARD ELLIOTT, of the Ceramic Court, Crystal Palace, has consented to act as honorary treasurer and secretary.

— LORD ABERDARE announced on Wednesday last, at South Kensington, that he had received an intimation of the intention of their Royal Highnesses, the Prince and Princess of WALES to visit the great summer exhibition to be held on the 19th inst.

CYPRIPEDIUM OCCIDENTALE.

THE pretty little Cypripedium, of which an illustration (fig. 117, p. 725) is here given, is a native of many parts of the Rocky Mountains, and has been recently introduced under the name of Cypripedium occidentale. I do not know the authority for this name, but I find numerous specimens of what I think is the same plant in the Herbarium as *C. parviflorum*, and *C. montanum* of Douglas.

Cypripedium parviflorum of the Eastern States, as I know it, is a smaller, usually one-flowered plant with yellow labellum; whilst the Western form seems to have two or three flowers, with white labellum, and is also very sweet-scented. According to ASA GRAY, *C. parviflorum* passes into pubescens, and our plant seems also to be *C. ciliolatum* Muhl., from the Eastern States, which I flowered this year.

I would add that though all these Orchids are hardy they thrive much better in a sheltered frame, as the leaves and flowers get much cut and torn by the bitter winds and frosts, which have been so prevalent this spring.

I shall be glad to know if Cypripedium ventricosum and guttatum from Siberia are now in cultivation, as I am anxious to get them. H. J. Elwes.

[We may add that the Cypripedium occidentale was introduced and distributed last autumn by the New Plant and Bulb Company, and our drawing printed at p. 725, was prepared from a plant sent to us by them, Eds.]

Home Correspondence.

The Royal Horticultural Society and the Education of Gardeners.—My last letter was to have been my final one, and on the general question I need write no more, as your leading article of Saturday week puts me of the matter at least, with more knowledge than I have at command. I cannot, however, leave quite unnoticed Sir Charles Strickland's courteous suggestion that any promising efforts made here in the direction of horticulture might be best effected by arrangement at the hands of the Royal Horticultural Society. The proposal is not new to me. Two years ago I drew up such a scheme, and would have tried to carry it out had it been possible for me to find any leisure to organise it. My rare times of leisure are, however, times mostly of weariness also. I had intended to seek my help from the Yorkshire College of Science, and in any case I should be unwilling to commit the Royal Horticultural Society to the failure or success of any local movement. I believe I can nevertheless name privately to you, or to Sir Charles Strickland, at least one large horticultural centre where scientific lectures would be warmly welcomed by professional gardeners, and would perhaps be self-supporting, even from the first. It is rather, however, from above, that I think any important and useful development must come. When gardeners see their employers earnest in desiring to carry horticulture from the empirical into the scientific stage, they will themselves soon follow the example. Horticulture is even behind Agriculture in its scientific aspects, and is in the position in which engineering would have been, had the latter been without physics, geology, medicine without anatomy and physiology, and law without history. I think I may say without offence, that amateur horticulturists do not as a body profess to have much knowledge of the sciences of plant life—of vegetable physiology, morphology, or chemistry. But a warner amongst them, as one of their favourite pursuits would soon be lighted up if such a man as Dr. Reichenbach, for instance, delivered a course of lectures on scientific horticulture at the Society's rooms, and if such work were begun at Chiswick as was done by Dr. Cooper, Dr. Sorauer and his assistants at Proskau, and others, and I may add in England by private persons such as Mr. Darwin and Sir John Lubbock. The work at Kew is of course more exclusively botanical in its methods or purposes. I believe, too, as I have said development must come. When the subject is for discussions, such as those of the Geographical Society, the Geological Society, and other such bodies, would give a great impulse to scientific gardening, both in themselves, and in the reports of the meetings in the journals. Would not a summer gathering of horticulturists, again, at such places, as Chatsworth or Trobach, if permitted, be at least as attractive as the meetings of the British, the British Medical, the Social Science, or the Archaeological Association and far more interesting and useful than the gigantic "provincial" flower shows, which are talked of? Here, sir, I must take leave of the subject, and trust that this discussion at any rate may not remain wholly fruitless. T. Clifford-Allbutt, Leeds. [We entirely sympathise with our correspondent so far as general principles are concerned. It is disheartening, however, to have to recall that the lectures given at various times at South Kensington, by men eminent in their several departments, have been failures. Eds.]

Wild Lily.—It is fortunate for me that you are better able to take in a very mild joke, than is apparently the case with your correspondent of last week. That the wild convulvuli are "the lilies of the field," was a piece of information which I received from a Sussex nurseryman more than half a century ago, and which was not only implicitly believed at the time, but for some years after. K.

Double White Narcissus.—The cause of the failure your correspondent experiences in not obtaining flowers of the Superb Double White Narcissus is due, no doubt, to lack of moisture. We get many thousands for sale in the Covent Garden markets, and as you will say, and our practice is to give copious waterings as soon as the flower bud is apparent, without which they cannot bring the flowers to perfection. We have cut some hundreds of blossoms, and hope to "cut an acre again" for some time. W. Hedges and Sons, Jersey Gardens, Cheltenham.

— Your correspondent, Mr. W. E. Heathfield, appears to have found some difficulty in getting the double white Narcissus to flower satisfactorily. We have a large quantity here, and we have found from experience that to place them in a propagating lifting occasionally and the bulbs to be singled out and planted, when perfectly at rest, in some good light rich soil. They should have an open situation, where they get plenty of sunshine, to well mature the growth. I should say the cause of

your correspondent's Narcissus not blooming as they should was either poor hungry soil, or too much shade, as under such conditions we have found they will remain years without flowering. *Robert Mair, The Gardens, Boyne House, Tunbridge Wells.*

Helix pomatia (see p. 692).—I have found this fine Mollusk at Charing in Kent, at Caterham in Surrey, and at Hemel Hempstead, in Hertfordshire, in each case on chalky soil. This week I found several of it near Godstone, at least a mile from the chalk, and close by were specimens of a plant which I have, likewise, always regarded as a chalk species, *Poterium Sanguisorba*. There was nothing abnormal in the appearance of the burr or the snail; the former is good in a salad, and I know no reason why the latter, cold boiled, should not be just as good therapeutically as a plow's egg. *W. T. Z.*

—I think *Helix pomatia* is pretty plentiful in Gloucestershire. When a boy I remember seeing it often, on the Witcomb Park Estate, near Gloucester. I also remember, when living in Hampshire, a lady of the neighbourhood wanting to see specimens of her cabinet, she asked a Gloucestershire friend to send her a few. The request was soon complied with; the gentleman sent her a hamper full. A few specimens were selected, and the remainder turned out in the garden, to the great annoyance of the gardener. They came from Coleborne near Cirencester. *W. Robin.*

Dendrobium thysiflorum.—I was glad to see that Mr. Day has called your attention to the account that is here of *Dendrobium thysiflorum*, and which is interesting to know on what principle the Royal Horticultural Society grant first-class certificates to new plants. Mr. Wilson, late gardener to W. Marshall, Esq., Enfield, and myself (when gardener to the late G. Cooper, Esq., Camberwell) each received a first-class certificate for them, the latter two months before Mr. Day flowered it, and four years before the Royal Horticultural Society gave Messrs. Veitch a certificate for it as a new plant. I may also say that Mr. Cooper's plant was bought from Messrs. Low. *John Robson, Boxfield Nursery, Dooton, Cheshire.*

Fuchsia serratifolia and **fulgens**.—Plants that will bloom naturally in winter without forcing and which will stand in a moderate temperature, such as that of an ordinary greenhouse, are not over plentiful; and few as there are, one of the best, the good old *Fuchsia serratifolia*, appears to have been almost entirely lost sight of, for, excepting here and one or two other places, where I have given orders for gardenias, hibiscus plants or cuttings, I do not remember to have met with it during the last twenty-five years. Possessing, as it does, the double merit of being free-flowering and of exceedingly attractive appearance, it is very remarkable that it should have dropped out of cultivation in the West Indies, and in our gardens. *Fuchsia fulgens*, my favourite and one that has rarely failed me when most wanted, I have thought a few lines in the *Gardener's Chronicle* might be the means of bringing it to the front again, as I feel sure many would be glad to make the acquaintance of such a really deserving serviceable plant. Most of the *Fuchsias*, *F. serratifolia* is an evergreen, and flowers on the ends of the shoots much after the manner of those of our popular plants, *F. corymbiflora* and *F. fulgens*, that are also fast disappearing, and will soon share the fate of many others that were once considered almost indispensable; but there had not the great choice we have now, since all the world has been laid under tribute to furnish our gardens, and skillful hybridisers at home have not, meantime, been idle in turning any new thing to account. Would that they would take the *Fuchsia* command—not that my old friend could be greatly improved, but that other valuable some of its valuable properties might be raised to help us at a season when really choice flowers are scarce. Noticing how late *F. Madame Corneliussen* continued in bloom, I have endeavoured to effect a cross between the two, but as yet unsuccessfully, although I am not without hope of doing so, as I have had several seed-pods swell and ripen, but from some cause or other the seed did not germinate. Although not so generally useful, the old *Fuchsia fulgens* forms a capital companion plant to *F. serratifolia*, except that it rarely forcing and seldom flowering, but the latter to have it in good condition, but where this can be afforded its foliage alone renders it worth growing for winter decoration, especially where small plants are required for rooms, as in window recesses or the embellishment of dinner-tables, as they are in monthly plants, but they are not the great choice of *F. serratifolia* by the autumn, the cuttings should be put in at once where they can get a brisk heat, in which they will soon root and start away rapidly into growth. Like its congeners, it delights in a plentiful supply of moisture, and a moderate shade, but being altogether a more fleshy and succulent, requires more to harden the wood so as to get it

to bloom freely; this may be done towards the end of the season by gradually withdrawing the lights and exposing the plants, which will tend greatly to get them matured, and enable them to pass well through the winter. As its habit is naturally shrubby, and useless attempting to grow it in pyramid form, in the way others are usually trained, and it never looks better or shows to greater advantage than when allowed to have its own way, except an occasional stopping to induce any strong unruly shoots that appear to be taking the lead to break back. It will grow in the open air during the summer in any deep pit or frame where they can be kept in firm bottom of cinder ashes, and kept well syringed to prevent the attack of red-spider to which they are otherwise rather subject. After their final shift into 8 inch pots, which are quite large enough, and they have got the possession of the soil, liquid manure should be given to afford the necessary stimulus to them in pushing forth a good head of bloom. Plants so treated will flower during the greater part of the winter, and will not be the least attractive among the occupants of the greenhouse or conservatory in which they are planted. The great capricious habit of *Fuchsia* renders them well adapted for a good arrangement in vases to droop over the side, and *F. serratifolia* comes in admirably for this purpose, and on its comparatively soft stems, that take up water freely, lasts in good fresh condition longer than any other kind. *F. J. S.*

Our Burial Grounds.—The thought has many times occurred to me how easy a matter it would be to convert all our closed burial grounds, which are most unattractive during summer in their present arid state, into plots of refreshing verdure. If this were once accomplished it would no doubt be considered a very desirable thing. The green spots here and there in our overgrown city (London) would afford a grand relief to the eyes of its plodding inhabitants when drawn away from the never-ending rows of houses. But the question will be asked, How could this be accomplished, considering that nearly three-fourths of the surface proposed to be thus renovated is covered with monumental stones, and there is no doubt a strong feeling against any kind of interference with these? But as this conservative feeling has been in some measure already broken in upon, and many of the memorial stones which used to be in an upright position, and decorated with iron, or better still, built into or against the walls of the ground, are now to be beyond the bounds of possibility to go a little further in this direction. I should only propose a little further interference with these stones to bring about the desired effect. First of all, then, it is suggested that an accurate plan be taken of the burial ground, and that the exact position of the stones be marked upon it. This done, I would sink the stones from 6 to 9 inches under the surface, being particular to keep them all in their exact position, so that at any time, if necessary, they could be readily found for removal, and a quantity of soil laid over them. After having covered the stones with soil, the ground might be quite smooth by digging it all over, then treading and raking it, preparatory to laying down the turf. If the soil should be considered unfit for turf, a small quantity of fresh soil should be got to spread over the surface, say half an inch thick, which would quite overcome any irregularity of this description. The turf might then be got and laid on, watered and well beaten. Water should be laid on, and a hose provided, so that during dry, hot weather, the grass may be copiously watered when necessary. This operation would be a very simple one, and the expense of seeing and smelling in its immediate neighbourhood. A mowing-machine must be provided, and the grass properly mown about once a-week. There would be no difficulty in doing all this provided the preliminary one of lowering the stones, and marking them, were done. I think it would be well worth the trial, especially if they had the good fortune to have seen the many small spots in the very heart of the city of Paris during the palmy days of the Empire, and to have witnessed how refreshing they looked, and what a boon they conferred upon the denizens of that city. Would it not confer a much greater boon on our citizens, whose city is so much larger than that of Paris? I commend the subject most earnestly to all whom it may concern, and beg of them to "Try it." The grass would probably not remain green every spring, but this would be only a very small consideration in a city, where so much money is annually spent for sanitary purposes. If, however, in any instance the turfing process should prove too expensive, the same result or nearly might be realised in a year or two's time, by the use of a hot-bed, and the selection of good seed, and mowing the grass down occasionally. I strongly urge the adoption of this plan, or at least a trial of it, in a few cases where its practicability could be fairly tested. *E.* [We expect people would say it was so distressing to have to bury their friends, and that it would be better to ask the sexton to be burying their tombstones! However, we presume

our correspondent is alluding to the memorials of the forefathers of the hamlet. *EDS.*]

The Weather and the Fruit Crops.—As if to complete the wreck and ruin wrought by the frost, a strong gale of wind from the south-west set in here on the morning of the 1st, and gathered force till it culminated in a perfect hurricane during the afternoon, and continued to blow with one or two lulls in all directions. The damage it has done to these on the weather side is quite distressing to see, as the foliage is lacerated, battered, and bruised to such an extent as to preclude the possibility of their looking much better till they have met their midsummer showers. To-day [the wind has blown to the good deal, but it is still blowing strong, and is very cold for the time of year, which keeps things very much back, a fortunate circumstance perhaps, as the season turns out so exceptionally bad. Nothing grows, and although gardening has been carried on under unusually adverse circumstances since last autumn, for, with the incessantly wet and mild winter, slugs abound everywhere, and the land is so cold and close that only the hardier seeds can germinate, and such as *French Beans* rot in the ground. The wind shows unmistakably the signs of the coming of the late winter. For blossoms, for the ground is covered with fallen fruit, if it may be said to have reached that stage, and although walls have a fair share that appear likely to swell off, pyramids are an almost total failure, as are *Plums* and *Cherries*, except the latter on walls where, from present appearances, they may be saved as a crop. Never did a season open up with greater promise for all kinds of fruit, or yet more disastrously than this has done. Even *Apples*, that opened so late and appeared a certainty, are now so sadly knocked about that they too must be thin and inferior, and it is never safe to depend on them to come in so regularly, owing to the injury they have received from being chafed about in the manner they have been for the last two days past, independent of the effect the frost and cold has had on them, and which will no doubt show itself later on. As to *Peach* and *Apricot* trees I never saw them in worse for them to be kept, keeping dying away, and the former have scarcely a leaf that is not more or less blistered and deformed, and unless fine warm weather soon sets in of many of them will be too much crippled to recover.—Since writing the above the most favourable change has set in, and to-day [Monday] the real summer weather, which it is to be hoped may continue, as everything stands much in need of the aid of sunshine, of which we have had so little for many months past. Although as yet we have only had a few hours of increased temperature and a slight shower, vegetation has responded to once, and a marked difference may already be seen in the grass, and a decided advance in all garden crops. *F. Sheppard.*

Abies Menziesii.—Whether *A. Menziesii* at Boston, U.S.A., has reflexed scales, while those of the Derbyshire variety are not, is not a matter of much moment to those of our country who are arboriculturists. The question is this—Is *Abies Engelmannii*, the seeds of which were collected by M. Koelz, and distributed by M. Orties in Europe, the same plant as that which I have spoken of as *Abies Menziesii* Parryana, after having admired it in Professor Sargent's garden near Boston. I say it is not. Since I wrote before, I have seen authentic specimens of *A. Engelmannii* from the nurseries of M. Durand of Bourg-la-reine. It is not possible to confound them with *A. Menziesii* and its varieties. The slightly recurved and appressed leaves of *A. Engelmannii* are much less sharply pointed, so that the shoot can be drawn through the hand without pain. In *A. Menziesii*, on the other hand, the leaves are excessively sharp, so that they cannot be drawn through the hand with impunity. The habit of *A. Engelmannii* is much closer to that of our native *Abies* than that of the other species, and there are other differences which it is unnecessary to mention here. I maintain that the *Abies Menziesii* Parryana, of which last autumn Mr. Waterer possessed the only specimen in Europe, and who obtained the plants from Mr. Sargent himself, is a splendid variety of a unique colouration, and one which I hope to see widely distributed ere long. *Ed. André, 67, Rue Blanche, Paris.*

Paraffin Oil as a Dressing for Seeds.—In spite of all that your correspondents have said in favour of paraffin for the above purpose, I should say it is a remedy that requires using with great caution, particularly as paraffin varies so much in strength, as it is quite possible to get five or six kinds of oil in a small town; and if the seed should remain in the oil long enough for the oil to penetrate the outer coat, it would destroy the vitality of the seeds. A few years since paraffin oil was recommended as a cure for mealy-bug. On visiting a neighbour—we were going through a range of vineries—we came to a house where the vines were dead to where they entered the house to ask the owner of the matter, as the other vines looked well. Oh, he said, I had

a few stove plants in the house and got bog on the trees, and was recommended to use paraffin oil to cure it; so I gave them a winter dressing, and you see the result. I was so well satisfied with its curative properties that I should want a good deal of persuading to use it. *K. Makers, Boyne House.*

Effects of Paraffin on Peach Trees.—My Peach trees were well formed and healthy, and bore crops equal to any in the county. Scale having appeared on them, I was strongly recommended to brush them with paraffin oil, which I did on December 21. It not only destroyed the scale, but the trees also. There were no signs of harm done until the fruit was set, when gradually branch after branch showed signs of decay, and now they are more like fire-wood than growing trees. I also know others in this neighbourhood who have suffered through using paraffin, and would therefore, like "R. W.," recommend your readers to consider before using it on trees or Peas. I have also tried an experiment on a plant of Prickly Comfrey, which it destroyed in two days. *S. Laird, Dunminald Castle, by Montross, N.B., June 6.*

The Cultivation of Seakale for the London Market.—This differs so much from that described by your able correspondent in the former number that I will attempt to give your readers a short account of how it is grown in quantities of from 10 to 20 acres. Sets are only used, and these are obtained from the strongest of the roots cut of the Kale when lifted to force. They are cut into sets 4 inches long. It is advisable to make two sizes of sets, so as to have as many as required at planting time. Planting the smaller ones last they come in for later forcing. It is surprising how small a set will produce a fine Kale an inch in diameter. As the sets are made they are laid in soil, thick end upwards, and a little litter thrown over them till April. When they are dibbled in between-leather cabbages or lettuce, a set between each plant, barely covering the set, when dibbled so deep, they don't produce such fine crowns. It is never grown as a crop by itself, sometimes the third crop on the ground, as the autumn cabbages are cleared off, there is a row of spring-own lettuce planted between the rows of Kale, and those are cleared off before they interfere with the growth of the Kale. The sets planted between the cabbages are 12 inches apart, and those between the lettuces 9 inches apart, and from 16 to 15 inches between the rows. As the cabbages and lettuces are cleared off, they are gone over, and all the shoots but one taken off, and then well hoed, keeping clean is all that is now requisite till the middle of November, which is about the time forcing begins for Christmas. The Kales are then carefully lifted, and prepared for forcing by cutting off all the roots to within an inch or two of the crown. The trenches for forcing are previously prepared by marking of the beds 4 feet wide; and the soil from every alternate space is thrown on the top of the next space till the beds are 4 feet deep. These are filled with fresh fermented manure and well trodden in the trenches. The Kale is planted in the intervening spaces between the manure, in rows nearly as thickly as they will sit, and about 4 inches between the rows. As the beds are planted short stakes are inserted thickly over them, and then a little short litter is loosely shaken in between them, as the Kale lifts it up in its growth over the top of the stakes. Mats are then laid, and the beds and the fermenting material well covered with loose litter, of which there is always a good supply in hand. As the manure comes from the bottom of the litter is shaken out and stocked for covering purposes. It is only the shortest and best that is used for digging into the ground, and that is used freely and in great quantities, several crops being produced from one manuring by market gardeners. The Kale is ready to cut in a month or so from the time of planting. The sets are generally cleared at two cuttings, the outside first and the centre next. As the beds are cleared the stakes, mats, and litter are removed to others. I may notice that for small quantities similar trenches are thrown out, and filled with fermenting material, and the soil turned on to the top, to the depth of 12 inches, planting the Kale as the soil is returned, and covering up as noticed. This mode is as good as the former, but not generally practised, though I think preferable for small growers. Kale produced in this manner is of the best quality, and is generally produced in drier atmospheres. Forcing the roots out of doors from year to year is very uncertain, and attended with much labour and anxiety. I strongly recommend making annual plants, and forcing as above.—*E. W.*

The Calville Blanche Apple.—At the February meeting of the Fruit Committee, Mr. Stevens, gr. to the Duke of Sutherland at Trentham, exhibited a leafless, pot-grown tree of this grand variety, on which ten very fine fruits were still hanging. Since then a beautifully coloured plate of the Apple has appeared in the *Florist and Pomoologist*, and on the

same subject Mr. Stevens has contributed some notes to the *May* number, from which we learn that some trees of the Calville Blanche were introduced to the gardens at Trentham more than fifty years ago by the then Marquis of Stafford. The trees were planted against a south wall, and fruited regularly until their removal to make room for glass-houses. The Apple, under such circumstances, was said to attain a fair size, but to be wanting in flavour, by comparison with samples subsequently grown in pots. The climate at Trentham, says Mr. Stevens, is so uncertain and unfavourable for the growth of Apples out of doors, that the late Mr.

FIG. 118.—CALVILLE BLANCHE AS A POT TREE.

Fleming happily hit upon the idea of growing this Apple extensively in pots, and he purchased, some twenty years ago, of Mr. Rivers, a quantity of small trees, grafted upon the French Paradise Stock, which trees never fail to produce a sufficient quantity of handsome and delicious fruits for dessert during the winter months. Mr. Stevens adds, however, that it requires a long summer to bring out its best qualities as a Dessert Apple. If grown in an orchard-house the trees should be in flower by the latter end of March, and the fruit should never be gathered until they have attained that bright yellow colour peculiar to this Apple, and this will not occur, as a rule, before the middle or end of October. The fruit should be gathered as they attain their full colour, but not before. They will then

ripen perfectly, with a firm, crisp flesh, vanishing in the mouth like that of a Peach, and leaving a delightful impression on the palate. Our illustration (fig. 118) will represent the pot specimen shown by Mr. Stevens on the occasion above alluded to. When used in the leafless state for decorative purposes, a few adventitious leaves can be supplied by the cultivator! *E. W.*

Blair Athole Plants.—Your correspondent, Mr. Evershed, in his interesting account of Blair Athole, says that Anthericum canaliculatum is not rare in the vicinity of the Castle. Surely there must be some mistake here. *Anthericum canaliculatum* is a Cape plant. The only plants of this family grown in the United Kingdom are *Lloydia serotina*, an inhabitant of the more inaccessible parts of Snowdon; and *Simethis bicolor*, a denizen of sandy Pine woods near Bournemouth. Does Mr. Evershed allude to either of these plants? *H. Harpur-Crewe.*

Teedia lucida.—This pretty plant is just coming into bloom with me. In leaf and habit it much resembles a *Scrophularia*, to which genus it is closely allied; but it has umbels of delicate mauve flowers, somewhat like a miniature *Franseria*. It has been in the greenhouse during the winter, but has a hardy look. *H. Harpur-Crewe.*

Malva campanulata.—This rare and pretty Chilean Malva is now nicely in bloom here. It has stood out all the winter in the open border. It has pretty foliage, and numbers of pale rose lilac flowers, about the size of a shilling, with dark purple anthers and stigma. It was struck with its beauty some years since at the Wellington Nursery, and purchased; but both Mr. Henderson and I lost our stock during the ensuing winter, and I tried in vain to procure another plant. Last year Mr. Max Leichtlin very kindly sent me some, June 4, and I raised a few plants. *H. Harpur-Crewe, June 4.*

Myosotis dissitiflora.—As on more than one occasion special allusion has been made in the *Gardener's Chronicle* to the manner in which this beautiful early spring flower has been cut with the frost this season, and, fearing that this may tend to bring a most useful spring bedding plant into disrepute, I desire to state that I have never had this *Myosotis* in more luxuriant or lengthening bloom than is the case this year, although, because of the cold and dull weather of March it was at least a month later than usual coming into bloom, yet it has more than compensated for this in the fact that now, in the first week in June, it is in a mass of flower, and has been so from the first, only excepting the week of the May frosts, when it was cut as though scared all over with fire; but in a few days all traces of the frost were lost in the renewed and abundant bloom. This *Myosotis* is incomparably the best of all blue spring bedding plants yet that can be got true from seed. *Alex. Dean, Belfast.*

Reports of Societies.

Royal Horticultural: June 5.—The Rt. Hon. Lord Alford, President, in the chair. The medals which had been awarded at previous exhibitions were presented by his lordship, and after thanking the exhibitors for their generous support to the Society, stated that he had received an intimation that their Royal Highnesses the Prince and Princess of Wales would honour the great summer flower show, on the 19th instant, with their presence.

SCIENTIFIC COMMITTEE.—Dr. Maxwell T. Masters, F.R.S., in the chair.

Plants Exhibited.—The Rev. H. H. Crewe exhibited cut blooms of the following plants—*Malva campanulata*, from Chili; *Muscari armeniacum*, the latest, and in some respects the most beautiful, of the genus; a white-flowered variety of *Geranium pratense*, an accidental hybrid *Poppo* between *P. arvense* and *P. bracteatum*, with the habit of the latter and intermediate in colour between the two supposed parents; *Lunaria rediviva*, *Orchis pseudopalens*, *Tulipa carolina*, and on the part of Mrs. Bateman a singularly lacinated Parrot Tulip.

Mr. Eves forwarded blooms of *Ismene viridiflora*, a curious green-flowered *Anarrhida* from Peru; *Cypripedium macranthum*, a hardy purplish brown Orchid from Siberia, very rarely seen in cultivation; *Fritillaria recurva*, from California, very distinct in its orange-coloured flowers from any other *Fritillaria*; *Geranium terestricum*, *Orchis* from northern Italy, to illustrate a case of natural hybridism as generally supposed, but the plant, *Isatis triloba* or *Serapias papilionaceo-lingua*, which was figured (from the same plant now sent) in the *Botanical Magazine* recently, 1625, is so rare that it deserves further examination. For this purpose the two supposed parents, viz., *Serapias lingua* and *Orchis papilionacea*, are also sent. A

small-flowered *Cyrtanthus*, from Natal; and a curious plant which Mr. Elwes received from Van Houtte as *Cyrtanthus* species, but which evidently does not belong to that genus. It is not bulbous, but has a root like *Agapanthus*. [*Tulbaghia alliance*, J. G. B.] *Niphion tingianum*, [true *Niphion*, I believe, not the same as the one figured in the *Botanical Magazine* as *N. tingianum*, which is only a form of *N. filifolium*. [X. latifolium certainly. J. G. B.] [Specimens were also sent from Calcutta to the Duke of Devonshire and Benham, the last new to cultivation. J. G. B.]

Narcissus Fita, &c..—Mr. Murray exhibited specimens of a *Narcissus* yellow-flowered which he had raised from larvae taken from *Narcissus* bulbs. They exhibited so much variation as to give rise to the suggestion that some of the so-called species of *Narcissus* are varieties of one and the same. Mr. Murray also showed eggs of a Mantis enveloped in a frothy secretion, and having the appearance of a cocoon.

Diseased Myrtle Leaves.—Dr. M. C. Cooke reported as follows on the leaves (sent by Mr. Lee) submitted to him at the last meeting:—

"The leaves submitted to me for report, were all deeply discoloured with a white mould which occupies half the superficies of the leaf. Out of four leaves, two had a whitish frosted appearance on the upper surface, caused by the presence of a white mould, while the other two were spotted with a whitish areolae. A microscopic examination demonstrated that the white mould was a species of *Oidium*, with small oval spores arranged in chains, the spores not exceeding .008—01 in diameter, and which were not attached to one another, which this mould can be referred to. At first I thought it might possibly be the same species as that which attacks young Pear leaves in spring, and which I published in *Fungus Fidele* (No. 245) as *Oidium* minutum; but the latter means probably, as the spores in that species are .013 x .012—014 mm., or fully three times as large, and there are no discoloured spots."

"The next question which arises is whether the disease is caused by the fungus? As far as I have yet seen I do not think that the fungus is the cause of the disease, but a consequence. In the two leaves on which there was no evidence of the fungus, I have satisfied myself of the presence of mycelium, or of any other indications of fungoid disease. The spots were in a condition of soft decay, and that decay appeared to be the result of where no fungus was present as where the mould was distinctly evident."

"In other species of *Oidium* there appears to be no habitual decay or decoloration of the leaves. Such species as precede the species of *Erysiphe*, which I published in the *Hesperian* do not in fact affect the leaves, and even the *Oidium* of the Vine is not preceded by decayed spots. It is always necessary to be cautious in making strong affirmations on the subject of a disease, or a simple series of specimens, but I certainly am of opinion that in this instance the cause of the disease must be sought elsewhere than in the *Oidium* found on some of the leaves. Doubtless it would be an advantage to examine another parcel of leaves sent to the committee for further examination, and it should also be stated whether one tree or many are injured, because if some should escape it would be interesting to know under what different conditions the plants are growing. Still more, it would be an advantage to learn if the same disease has appeared elsewhere, because, if not, some local cause would then have to be sought for in its occurrence."

"It is not by any means satisfactory to characterise these moulds, which probably are not autonomous, as distinct species, still it is an advantage to have at least a temporary name by which to speak or write of them, and for such purposes the *Medica* mould may be known as *Oidium Medica*."

Larch Disease.—Rev. H. H. Crewe forwarded on the part of the Duchess Dowager of Athole specimens of trees affected with this disease, together with the following communication from Mr. M'Gregor, forester to His Grace the Duke of Athole:—

"I send a box containing a few specimens of portions of the stems and branches of Larch from the Ladywell plantation, showing the blister with which many young plants of Athole have been afflicted for the last year, and which has been also afflicted for years back. There is also enclosed, wrapped in paper, some branches with fresh foliage containing the insect, which I believe is the cause of the blister; and another paper containing a few specimens of Larch also afflicted with insects, although on Scot's Fir I never noticed blisters."

"With reference to this matter, I may mention that the appearance of insects in life on Larch was noticed by the fourth Duke of Athole in 1795, as is shown in the paper on the Athole Larch plantations in the Highland Society's *Transactions*, No. xvi. p. 207, March, 1829. It is also referred to in the edition of *Gilpin's Forest Sketches*, edited by Mr. Thomas Dixon, London, vol. i. pp. 157-8, printed in 1824, where it reads:—'The Larch is much infested in this country with the insect peculiar to it, which we shall call the Chermis larva, or the Larch larva.' The male of the insect is the active winged fly, whilst the female is without wings, and one of the most inert of the things possessed of life. The female is generally found adhering to the silky angles of young trees' buds like a brown scale. It lives upon the resinous sap of the tree, which it seems to pump up by inserting its proboscis into the bark, and the resinous matter exudes in a flocculent and white state from certain tuberculated pores in the thorax, abdomen, and caudal,

covering the creature with what to the careless observer looks like a woolly or cottony substance. When the insect is ready to fly it emits a strong odour, which is due to the bark, one by one as they are excluded, by minute resinous filaments spun from a mamillary protuberance in the breast. It lays eighty or a hundred eggs or more, and the larvae shed their skins several times, and are applied to the ends of them, so that, when one is touched by a delicate instrument, the whole are thereby put in motion. It appears that instinct teaches the insect to leave the end of the egg at liberty where the pupa lies, and the wonderful provision of the Great Creator of the universe is such that the heat necessary for the enclosed pupa, and that for the growth of the young shoot being equal, the insect which is in the case of the cocoon, is ready for food to the insects that they are ready to burst their coverments, and revel on its juices. The pupæ have six legs, and are very active. Our examinations of these creatures were minute and frequent, and long-continued, and our observations many, but we have not room to give them in detail here. We may remark, however, that in the plantations subjected to our inspection, the trees which were the most hurt, and in which we could discover but two or three Larch trees which appeared to be actually killed by the insect, though many were manifestly much retarded in their growth by their operations, but which were in such a manner so situated, that we could not detect the insect at all, except, we think, on one occasion, and then a few individuals merely were observable on one tree." During the last two years the insect has been very common, and it is to be hoped it may disappear altogether, as it has been the cause of great loss in young Larch plantations.

"His Grace the Duchess Dowager of Athole has also desired me to communicate any further particulars regarding the insect, and other diseases affecting the Larch that might be interesting. But I fear I can add very little to what I have already written, and I should be glad to be informed in any circumstances in which I would desire to bring under notice, and which is exhibited on the specimens sent—it is a fungus of the genus *Fozia*, which is almost invariably found on the blistered portions of the bark of the trees, but does not extend upwards from the seedling of one year to trees of upwards of twenty years, and it is found on every variety of soil and situation. There is also another disease to which Larch is subject, and which is not common, but which I do not do with the aphid—it is a decay of the tissues of the wood, and is most noticeable in old trees." John M'Gregor.

Mr. Andrew Murray described the changes in this well-known but little understood disease. The disease consists in an ulceration of the tissues under the bark, and the excretion of resin, or, in some cases, a derangement of the nutrition of the plant, so that how that derangement is brought about is at present uncertain. The insects and the fungi which are found accompanying the disease appear to be the consequences and not causes of the malady. The nature of the soil will not account for it, as the disease is steadily progressing, and occurs on soils of very different character. Mr. Murray had seen young plants of only one year's growth, and on which there was no trace of insects thus diseased."

Action of Scion on Stock.—Dr. Masters contributed the following communication from Mr. Sme of Elvanor:—

"In the spring of last year I had a few of Mr. Richard Smith's golden Laburnum grafted cut-downs on the common Laburnum. Five or six of the scions died, the stocks starting freely from 2 inch to 2 inches below the bases of the dead scions. These stocks were all vigorous and in the full of leaf, and the branches next to the dead scions having made from 1 foot to 3 feet of growth. The uppermost branches of three out of the five stocks have now golden yellow bark and leaves like Mr. Smith's golden Laburnum. I do not hesitate to say that, while the scions lived, their sap, which was too thin to effect a union with the stocks—the scions having been put on rather late—influenced the stocks for a considerable period. It is possible they were affected, but it is one thing in connection with them that I am not certain of, and that is, as to whether these branches that are now golden were so last year; but really I do not believe they were, because, if they had been, I have a conviction that I would have noted it."

Dr. Masters alluded to other instances of the same kind in Laburnum and other plants.

Asplenium Farleyense.—Mr. Sme also sent a portion of a frond of *A. Farleyense*, showing an attempt to produce spore-cases. This condition is all over the plant, and is quite unusual to this species of *Adiantum*.

Hybrid Aquilegia.—Dr. Masters showed, on the part of Mr. Douglas, flowers of a hybrid raised between *Aquilegia vulgaris* and *A. vulgaris*. The flowers were large, the sepals of a pale-blue; the petals pale-primrose, and almost flat. The flower was of great beauty. Another hybrid was shown from *A. californica* and *A. chrysantha*, with large flowers intermediate in colour between the parent forms.

Various Malformations.—Dr. Masters showed, on the part of Mr. Pilgrim, of Cheltenham, a spaxid of

Richardia aethiopica with three spathe. Also flowers of the curious condition of the wall flower in which the petals are reduced to linear threads, and in which the stamens are converted into carpels, so that there is a ring of imperfect carpels surrounding the normal central pistil. This is the form called var. *gyrantherus* by De Candolle. The specimens were given through by Mr. Ware, of Tottenham, who also sent green-flowered *Panicum* species. The remarkable *Gloxinia* was also exhibited, the peculiarity consisting in the development from the outside of the normal corolla tube of a supplementary series of petaline lobes, constituting an imperfect corolla outside the first. This malformation has been the subject of a memoir by Professor Edward Morren.

FLORAL COMMITTEE.—W. B. Kellock, Esq., in the chair.—As was to be expected but few subjects, comparatively speaking, came under the notice of the committee to-day. The finest contribution to the meeting was a large group of Orchids from Mr. G. Hepburn, Esq., Sincup Place, Kent (Mr. Loveland, gr.), and which included two very fine specimens of *Vanda suavis Veitchii*, with five good spikes between them of a very large and well-flowered *Dendrobium nobilissimum*, a very good specimen of a new variety of *Sobralia macrantha*; *Anguloa Clossweii*, with one flower of its large cup-like yellow flowers; *Dendrobium Dahloosianum*, *Odontoglossum citrosium*, with several very fine spikes; *Cattleya Mossie*, with eight flowers; *Cypripedium caudatum*, *C. barbatum grandiflorum*, together with a very good specimen of a new variegatum, *Cattleya Mendellii*, *Oncidium sexosum*, *Phalaenopsis Ludemanniana*, *P. grandiflora*, *Oncidium crispum*, *Maseveldia Veitchii*, &c. A silver medal was awarded. From Mr. John Willis came a small but showy group of *Odontoglossum* and *Cattleya* together with a very good specimen of a new variety of *Anthurium Scherzerianum*, which promises for size to run Ward's variety very close, if it does not prove to be identical. A silver medal was also voted to this group. Another very showy group of Orchids was contributed by Mr. Ollerhead, gr. to Sir H. W. Peck, Bart., of the Wimbledon House. This included a good-sized and exceedingly well-flowered example of *Dendrobium amonum*, *Brassia Lawrenceana*, with four good spikes; the showy *Dendrobium formosum giganteum*, several fine *Odontoglossum*, notably *O. Alexandri*, *Scaccolabium retusum*, with two exceedingly good spikes; *Oncidium*, *Oncidium affine roseum*, the charming *Odontoglossum nevium majus*, *Cattleya maxima pallida*, *C. purpurata*, *Odontoglossum Roezlii* album, and *O. citrosium*, &c. Mr. Ollerhead also sent a fine and particularly well-flowered bush of *Aotus gracillima*, a grand old plant very seldom seen in this country, and was also awarded to this collection, as well as to Messrs. James Veitch & Sons for an interesting group of *Maseveldia* and a few other Orchids. The former consisted of flowering plants of *M. Harrizana*, *Veitchiana*, *coccinea*, *nycteria*, *similia*, *lanocharia*, *infracta*, *ochrolepis*, *lanceolata*, *barlowiana*, *Parlatii*, &c. The latter. The other Orchids shown were a very good specimen of *Odontoglossum nevium*, a beautifully coloured *Cattleya Mossie*, *Cypripedium Parishii*, *Oncidium concolor*, *Cypripedium caudatum*, &c. Messrs. Barr & Sugden received a bronze medal for a very showy group of cut blooms, brilliantly coloured varieties of *Sparaxis*. From Mr. Holmes, Whittington Nursery, Lichfield, were specimens of *Juniperus virginiana* variegata, the young shoots on which are tipped with silvery white. Messrs. Osborn & Sons sent a sample of the new *Fyrehurum aurum*, *O. incicium*, and from Mr. Osborn & Sons came cut blooms of several varieties of *Stocks*, and *Tropaeolum*, &c. The Rev. A. Rawson, Bromley Common, showed cut blooms of *Calochortis* and *Cyclobothra*, and Mr. B. S. Williams contributed examples of a new show *Polygonum* which he has named *P. elegantissimum*. It has dark blood-red in colour, and a delicate dark maroon. It has a neat and vigorous habit, and must prove a useful market or general decorative plant. First-class Certificates were awarded to Mr. Ollerhead, gr. to Sir H. W. Peck, Bart., M.P., for *Odontoglossum Alexandri*, *Scaccolabium retusum*, *Oncidium affine roseum*, the sepals and petals being entirely white with rosy lilac. To Mr. Kinghorn, Sheen Nursery, Richmond, for *Gloxinia Paragon*, a very free, erect-flowering variety, the large, bold blossoms of which are pink-shaded with rose in colour, by a delicate but not too deep tinge of purple. To Messrs. James Veitch & Sons, for *Cattleya Skinneri* alb., the sepals and petals of which are silky white, and the lip too, with an addition of a faint blotch of primrose, and a rosy purple base. To Messrs. John Laing & Co., Stanstead Park, for *Begonia Gloire de Nancy*, which does the work of the *Wimpolei* variety; a distinct and decided novelty. To Mr. James Douglas, gr. to F. Whitburn, Esq., Loxford Hall, Ilford, for two very beautiful hybrid *Aquilegia*—*A. hybridæ cœrulea*, the result of a cross between *A. corallina* and *A. chrysantha*, and exactly intermediate between the two; and *A. hybridæ albicaerulea*, which is in colour, and the petals yellow; and *A. hybrida californica*, a cross between *A. californica* and *A.*

chrysantha. The flowers in this case are larger than those of its first-named parent, the petals being yellow in colour, and the sepals and spurs dark crimson. In habit both of the hybrids are intermediate in character between the parents, and what is most curious is, that the same plants produce the same seeds, a great proportion of the progeny proved to be identical with those shown. To Mr. Turner for show Pelargoniums Eloquence (Foster), dark crimson with dark maroon blotches; Venus (Bantani), white, with a faint maroon blotch; a promising variety, called Virginia Queen (Smith), white spotted with puce, also a showy decorative variety; and Mr. King (Turner), one of the fancy section, lilac, shaded with dark rose, and of fine form; and to Mr. C. Barley, Brentwood, for Pelargonium T. A. (Rabard), a variety which will large, smooth and very refined scented blossoms.

FRUIT COMMITTEE.—John Lee, Esq., in the chair. Nothing of particular importance came under the notice of this body to-day. Mr. H. J. Barnes, gr. sent specimens of a Cucumber named Montrose, which was not considered to be any improvement on many existing kinds. A cluster of Cucumbers, one of which was slightly fasciated, an occurrence which is very rarely met with, was shown by Mr. J. Swanwick, Esq., Chesterfield. An exceedingly fine dish of Hathaway's Excelsior Tomatos was shown by Mr. Iggulden, gr. to R. B. W. Baker, Esq., Orsett Hill, Essex, and a Cultural Commendation was awarded. Messrs. James Carter & Co. showed examples of their Silver Broccoli, a variety by no means white-flowered variety, to which the committee made no award. A new variety of Broccoli was also shown by Mr. Gough, The Gardens, Westwood Park, Bristol, and which, though past its best, was thought to be a promising sort. Samples of Broccoli named Lord Broccoli, shown by Mr. Howard, gr. to J. H. Johnson, Esq., St. Oysth Priory, Essex. This was considered to be quite distinct, but no improvement on existing sorts. A fine dish of Strawberries, unnamed, but said to have been grown under the name of Stirling Castle, was shown by Mr. Cadger, gr. to N. Mayer de Rothschild, Esq., Tring Park, and a Cultural Commendation was awarded. Mr. Gilbert, gr. to the Marquis of Exeter, Burchley Park, Stamford, sent a netted variety of the Victoria of Bath Melon, which proved to possess a very fine flavour, but was not considered distinct from the Victoria of Bath. Two pots of Garibaldi Strawberries, a sample of a batch of 1000, were shown by Mr. Denning, gr. to Lord Londesborough. The general opinion seemed to be that they were not distinct from *Vicomtesse Hericard* de Thury. A letter of thanks was voted.

Royal Horticultural Exhibition.—The spring show of this Society took place on May 29 and 30, at the Crystal Palace, and was the show of the year, and was a good one. Though smaller than on previous occasions, the quality more than made up for the quantity. The plants shown by Messrs. Lacombe, Finck, & Co., of Exeter, must be awarded the highest commendation. No one could help being struck immediately on entering the hall with the magnificent plants occupying the centre of the room, and with a stand of *Azaleas* to the left. A splendid Palm (*Latania borbonica*) overshadowed the other plants in the centre stand. There was an *Ixora amabilis* with twenty-four beautiful bloom-heads, very full and perfect. A fine variety of *Aphelexis saccharum* roses, *Dendrobium densiflorum*, with fourteen spikes of bloom; a fine *Stephanotis*, and a splendid *Yucca*. Messrs. Lacombe, Finck, & Co. also had several exhibits not for competition, among them a box of very lovely cut Roses (*Niphedos*) of perfect shape and delicate colour, sent by Mr. E. Taylor, of Beaconfield, Plymouth, had some exceedingly good exhibits. The *Chorozeema* he sent to compete among the specimen plants in bloom was one of the finest ever shown in Plymouth. Mr. Taylor's Ferns, too, were very fine, but in them he was closely rivalled by Dr. Methan, of Stoke. So close was the competition between these gentlemen in the class for six varieties that the judges, after careful consideration, eventually decided to award them an equal 1st prize. The Ferns altogether were exceedingly fine. In the class of twelve varieties, as well as in the class of six, the competition was difficult in awarding the prizes. The competition here was between Mrs. Fisher, of Stoke, and Dr. Methan. The former showed some beautifully cultivated plants, among which *Lomaria gibba* and *Pteris tricolor* were specially good; but the 1st prize went to Dr. Methan, principally, perhaps, because his plants were of far greater value. The most noticeable among them were fine specimens of *Adiantum peruvianum*, and the very pretty *Davallia Teyrmani*. In addition, however, to the 2d prize, the judges highly commended Mrs. Fisher's plants for their superior cultivation. The Pelargoniums were also very good, those of Mrs. Fisher were of splendid growth and flower. In tricolors the competition was very keen,

Mr. Fitzcock, who was awarded the 1st prize, being very well seconded by Mr. Johns, of Morrice Town; and Mr. C. Pridcaux's were so good that, in addition to receiving 31 prizes, he was highly commended. In the class for nine Pelargoniums, Mr. Harvey, of Clons, Plym, exhibited a splendid lot, far exceeding all competitors, but in the class for "three," Mr. I. Watts, of Plymouth (who was a large and successful exhibitor in other classes), had a lot with the best blossoms of any in the show. In *Calceolarias* Mr. Harvey's plants were very fine, especially that of Mr. Pridcaux; and in *Petasites* Mr. Steer's contributions were especially admired, particularly *Madame Hengest* and the *Countess of Morley*. Mr. G. H. E. Rundle was the only exhibitor of *Roses*. His lots had fine blossoms, but the plants were small. The two exhibits of *Teas* were very fine, especially that of Mr. Pridcaux. The cut flowers were few in quantity, but very good.

The fruit and vegetables were a good show, rather smaller, though, than usual, probably owing in the case of the latter to the lateness of the season. Earl Devon's 1st prize Grapes were a picture, and though Mr. Harvey's were larger in the berry they were not so good in colour. Mr. Hawke, of Liskeard, showed a very good Pine; and Mr. Rundle's basket of seedling Strawberries were much admired. The most noticeable of the other vegetables were the Spanish Broccoli, a hundred of Asparagus, sent by Mr. C. Pridcaux, and though Mr. Watts' were exceedingly good, the judges evidently had no difficulty in awarding the 1st prize. Mr. Watts made many other capital contributions to this department. His collection of vegetables and also Carrots and *Noisette* cresses, three trusses to well deserved the extra prize awarded them; and his 1st prize Rhabarb was remarkably fine. *Western Morning News*.

Bath and West of England and Southern Counties Association: The novelty in the floral department, is the introduction of two tea-geneas of a novel type, and which are especially adapted to be shown by nurserymen, and one by amateurs. Mr. C. Turner, of Slough, met not only no foe worthy of his steel, but, we regret to add, no foe at all, and the judges, Mr. Curtis, of Torquay, and Mr. Arkwright, of Herefordshire, had no difficulty in awarding the 1st prize, especially that of Mr. Devoniensis, *Marchal Neil*, and *Madame Willermors*, have been nowhere excelled. The other Roses shown in this collection were *Celine Forester*, *Niphedos*, *Gloire de Dijon*, *Safano*, *Souvenir d'un Ami*, *Maria* and *Madame*, *Madame de Saint Joseph*, *Madame* and *Madame Falot*.

Only two competitors met in the class for amateurs, which number we hope will next year be multiplied by ten. Mr. Chard, gr. to Sir T. Batuurst, wrest the laurel wreath to Mr. Hunn, gr. to R. B. The former had in good form *Catherine Meris*, *Souvenir d'un Ami*, *Marchal Neil*, *Devoniensis*, *Celine Forester*, and *Adam*, and we were pleased to greet a very old friend in a beautiful blossom of *Arkwright*.

Mr. Arkwright sent two boxes not for competition. Though at a matter of much regret that some liberties did not notice more growers, still a point has been made in proving that at Oxford next year a grand collection of *Roses* may be got together, if it becomes generally known that renewed efforts will be made in this direction. Modest and timid exhibitors write at the last moment, one that he cannot manage the weather, another that his plants have blossomed out, another that they are still in bud, and so on. *Teas* are far more amenable to management than any other class of *Rose* in this respect, and we may fairly ask all growers to keep the first week of June, 1878, constantly in their memory from this time forward, for no stand in the show of this year at Bath has given more genuine pleasure than the four boxes we saw to-day. A new feature, we are told, at Oxford will be a mixture of twelve *Teas* and twelve Hybrid Perpetuals, arranged alternately in the same box of twenty-four. Here will be a grand opportunity for nurserymen to make the most of natural effects in contrasting the delicate shades of pink, straw, and white of the *Teas* with the brilliant reds and crimsons of their more robust cousins, especially if, as Mr. Curtis has suggested, encouragement, or rather prizes, be given to the *Rose* exhibitors in the stages of its development. Growers should had this latitude given, for it will consign many an eteet blossom to its proper place to make room for a brighter successor in the dawn of its youth and beauty. We cannot conclude without mentioning that the most acceptable feature in the horticultural tent, and expressing a hope that the committee of the National and other *Rose* shows will view with favour this proposed innovation in making it essential to mix *Teas* with Perpetuals in equal proportions. A.

Central Horticultural Society of France, Paris.—On the 28th, 29th, 30th, and 31st of May last the Horticultural Society of France held its

annual flower show in the Palais de l'Industrie, in the Champs Elysees. This show took place as usual during the time the Salon (that is our Royal Academy) is opened. There were about sixty exhibitors, all of them being, with a few exceptions, nurserymen. The name of the show (Objet d'Art) was "M. A. Chantin, who staged a fine collection of Palms, Pandanus, Ferns, Agaves, Aloes, Bromeliads, Anthurium, Acazacia, a fine *Corypha Gebrena*, and sundry other hothouse and new plants. The 2d prize (Objet d'Art) was won by M. de Lamoignon-Soyve for a collection of Palms, Ferns, Crotons, Marants, Dracaenas, and other hothouse plants, but the show that attracted the attention of all the visitors was that of M. A. Bleu, who showed the finest collection of *Maladuns* we ever saw put together; he was awarded a 1st prize. M. de Lamoignon-Soyve, among the sixty varieties, which were all fine plants, and in splendid condition, we noticed the following:—*Madame Alfred Bleu*, *Impératrice*, *Eugénie*, *Devicak*, *Luxurante*, *Princess of Teck*, *Burel*, *Madame Andrieux*, *Adolphe Andrieux*, *Vicomtesse de Rouze-Ornan*, *Madame Verdier*, *Pyrreus*, *Perle du Brésil*, *Araïnoe*, Mrs. Ling, *Agrippine Dimitri*, &c. The *Roses* were generally very poor, nothing equal to what we are accustomed to see in London. MM. Lévêque & Fils, who sent 800 plants, received a medal of honour. The 2d prize was given to M. de Lamoignon-Soyve, Alice Leroy, Virgile, Adam, Louis Van Houfte, Prince Napoleon, Climbing Devoniensis, *Eméralda*, *Thérèse Levat*, *Marguerite Dombrian*, Mrs. Bosanquet, *Marceline Niel*, *Annie Alexiev*, *Abbé Brancard*, *Madame Louis Lévêque*, *Marie Arnaud*, *Edouard Lévêque*, *Prince Adolphe de Lamoignon*, *Comtesse de Bresson*, *L'Éclatante*, *Camille Bernardin*. M. Margottin Fils received also a medal of honour for his collection. We remarked the following: *Captain Christy*, *Pauline Labouret*, *Madame Falot*, *Madame Fardio*, *M. de Lamoignon*, *Facole*, *Anna Dieckhoff*, *Aug. Oger*, *Vicomte Lefebvre*, *Cherpin*, *Monte-Cristo*, *Charles*, *Victor*, and *Paul Neron*. We may here state that a grand gold medal has lately been awarded by the Society to M. Levet for his having raised the now well-known *Rose Paul Neron*. A silver medal was given to M. Dumoulin for his collection of 150 varieties of *Roses*.

M. L. Herivaux had a splendid collection of *Cocos Weddelliana*, for which he received a silver-gilt medal. M. Malet (silver medal), showed six fine plants of a new *Zonal Pelargonium*, *Gaston*, a good plant, and *Madame de Lamoignon*, a fine one. He had two new *Zonal Pelargoniums*, *Duchesse de Magenta* and *Trocis d'Henin*. M. Darand, gold medal, for Palms, Bromeliads, Ferns, Evergreens, &c. A collection of 130 *Pansies* brought by M. Falaise, secured a silver medal. M. Valleraud a gold and a silver-gilt medal for above hundred varieties of *Gloxinias* in fine condition. M. Moser, of Versailles, took a medal of honour for his *Rhododendrons* and *Azaleas*. M. Chantier Frères, of Montefontaine, were awarded two medals, a gold and a silver one, for hothouse plants, Crotons, Dracaenas, &c., their best plants were the *Victoria* and *Adiantum*. M. de Lamoignon and amongst them new *Dracaenas*, *D. Vertoliti*, *D. Bergmannii*, *D. spiralis*, *D. erecta*, *D. purpurea*. [M. Daval, of Versailles, gold and silver medals for his collection of hothouse and new plants.

The fruit and vegetables were not numerous, and they were placed in such a part of the building that owing to their darkness they could scarcely be seen. However three gold medals were awarded, one to M. Millet, Fils, for his vegetables, amongst which the new *China Cucumber* "8000-qua," and his fruit. One to M. Croquet Farnes, for Fine-apples, Peaches, &c., and one to M. L'Héritier, for his Apples. We should remember no doubt that some two years ago, he exhibited some very fine ones, we might say enormous, at the summer show at Kensington. It was to be regretted that there was not a single English exhibitor.

The exhibitors of horticultural implements numbered above a hundred, but only two English firms, Williams's lawn mowers, and Ransomes, Sims & Head's lawn mowers. The well-known French firm of M. P. Loyre, of Passy, exhibited as usual their round cases for grass trees. This firm was the first to make the manufacture of lawnmowers. Nothing new amongst the other implements, which were as follows:—pumps, syringes, lawn mowers, rollers, garden seats, tables, awnings, tents, wire works, all sorts of hot-water apparatuses, greenhouses, &c. The flower show was open to the visitors of the Salon, and *vice versa*, and during the four days, one day being a free day and the others pay days (1 franc), 70,000 people passed through the gates.

Royal Botanic June 2.—A special meeting of the Council of this Society was held on Saturday—his Serene Highness the Duke of Teck, President, in the chair—to consider a letter from his Royal Highness the Prince of Wales, respecting the Paris International Exhibition next year, and expressing a hope that the Society would help in promoting a due representation of British horticulture at the exhibition,

The meeting, entering fully into the importance of the subject, have promised that the influence of the Society will be used to the utmost in promoting the best representation of horticulture in its many features at the exhibition. His Serene Highness the President, attended by several of the Vice-Presidents of the Society, after the meeting, inspected the exhibitions of American plants and Clematis now on view in the gardens.

Apiary.

HONEY IN DRONES' CELLS.—In my notice of the massacre of drones at page 594, I omitted to state that the furious bees cast out the eggs and unhatched males from their cells, which in good seasons are soon filled with progeny. Those who doubt this have only to examine drone's cells, which have the slight angular elevation of the others for holding honey. Thus instead of drone's cells being an evil, they are of more service for holding honey than those of the workers, which are chiefly occupied either with pollen or brood during summer, while drone's cells are seldom filled with brood after the defenceless insects are destroyed. This brings to mind, that a correspondent in a back *Chronicle* spoke of the utility of cutting out drone's cells to prevent their increase, because they contained no honey. Those, however, conversant with the structures of bees' combs, know that the drone's cells are usually in the centre of them, or at least surrounded with others, so that the act of extracting them must injure the combs, while the process may be useless because the bees may soon fill up the gaps with the same kind of cells. Again, such operations are not practicable, except with Grecian or bar hives, some of which are really worthy of notice. Anyone to extract drone's cells from a common hive must have the courage of Bonner, who, it is said, could face enraged bees in his kilt, with only a tobacco pipe in his mouth. Likewise he took an extra glass in the evening of the day when drones appeared, because their presence not only foretold swarming, but also that their empty cells may soon be filled with honey, as noted by *J. Wighton*.

Law Notes.

A DISPUTED LIABILITY.—At the City of London Court, on Monday last, before Mr. Commissioner Kerr, the case of *Williams v. Kaye* was heard, in which the plaintiff, described as a florist of Thames, near Oxford, sued the defendant, a merchant, of St. Mary Axe, in the City, to recover the sum of £15 14s. for plants and exotics supplied to the defendant's son. Mr. Boydell appeared as solicitor for the plaintiff and Mr. Absalom for the defence. From Mr. Boydell's opening it appeared that his client during 1875 and 1876 supplied the defendant's son, who was then an undergraduate at Merton College, Oxford, with the goods sued for in the particulars before the Court, which consisted of rare exotics and choice plants, and was told at the time the plaintiff would be paid by the defendant's father whenever he liked to send in his account, as the defendant always paid his son's accounts, when at the University, and from inquiries the plaintiff made, he felt no hesitation in giving the defendant's son the credit he required.

The plaintiff being called corroborated this statement, adding, that after he had made repeated applications to the defendant for payment without receiving any reply, he was obliged to bring the present action.

In reply to his Honor, the plaintiff said, that all the goods had been delivered, and that the charges were fair, and reasonable, and by no means exorbitant. In cross-examination the plaintiff said he knew that some Oxford tradesmen were in the habit of charging undergraduates exorbitantly, but it was not his practice to do so, nor did he think a guinea and thirty shillings too much for bouquets, nor five shillings a large charge, and could prove they were not so by calling a skilled florist to prove they were not.

Mr. Antell, a florist from Edmonton, was then called, who said, considering the character of the goods supplied, he did not think the charges at all extravagant.

This being the plaintiff's case, Mr. Absalom urged on the part of the defence, that he was prepared to suppose that any parent could be rendered liable for such unnecessary extravagance as the defendant's son had been guilty of, as in reality in

the present instance the sum of nearly £16 had been charged in the months of May and June in 1875 and 1876, and it was impossible to suppose that such things were necessary for any student. Further than this, if his Honor considered the defendant had incurred any liability at all, he, Mr. Absalom, could call witnesses to prove that the charges were most exorbitant, and could not be sustained in any court of justice. At this stage of the case the learned Judge recalled the plaintiff, who said he had never seen the defendant, nor had he received any reply to the letters he had written to him. At this stage of the case his Honor told Mr. Absalom it would not be necessary to call his witnesses, as there could be no doubt that the defendant was in no way liable. There was no doubt that the case of flowers was a very pure and innocent taste, which he would like to see cultivated by every one having the means to do so, and, however much he might like to see young men in the position of the defendant's son cultivating such tastes, it must not be recklessly indulged in. Judgment must therefore be for the defendant, and his Honor hoped his decision would operate against university tradesmen giving indiscriminate credit.

Judgment was accordingly entered for the defendant, with the costs of attorney and witnesses.

Natural History.

THE STARLING.—For several years past a pair of starlings have built their nest in a corner of my cottage roof, and when the young are hatched I have abundant opportunity to observe the marvellous industry displayed by the old birds in the procuring the necessary supply of food. As this consists exclusively of insects or garden pests, there can be no doubt that the service they thus render me is incalculable. It is strange that there should still be found people so entirely obtuse as to be unable to see or appreciate the immense services that the birds render to man. Of course, it is trying to see a little fruit injured or abstracted, but this mischievous too evident, whilst the enormous benefit birds produce for us is only visible to those who are generous enough to be impartial observers. *A. D.*

SCALE INSECTS.—ASPIDIOTUS PANDANI.—Among these pests of the hothouse we have lately had our attention drawn to a species that very persistently affects plants of *Pandanus filiformis*. It is the same *Aspidiotus* which, as living exclusively on the *Pandanus utilis*, showing that its predilection or allotment is generic and not specific, to which we may add that it appears even to wander a little from its special plant, some being found on neighbouring plants of totally different families.

It is a round, flat, blackish brown scale, with a whitish umbilic in the centre. The female under the scale is rounded, of a whitish yellow colour, and the characteristic clusters of secretors (called *filieres* by Signoret) on the terminal segment are four in number, and each consists of a very small number of openings—four or five in each of the upper lateral ones and three in the lower. The isolated *filieres* are peculiar; they are long hairs, pointed at the extremity, having a small bitubercular head at the base, so elongate and so abundant that at first sight they look like spermatozoa. The terminal segment is a very difficult part to decipher under the microscope, requiring previous boiling in potassic-water, &c., and few microscopists are so qualified to deal with it as long practice has rendered Dr. Signoret. *Andrew Murray.*

Obituary.

WE regret to announce the death of Mr. ROBERT WHITE, the much respected proprietor of the Poule and Parkstone Nurseries, Dorset. Mr. White, who was in his sixty-seventh year, died at his residence, Constitution Hill, Parkstone, on May 28.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON
FOR THE WEEK ENDING WEDNESDAY, JUNE 6, 1877.

May 31.—Fine day, but very cloudy: cold wind.
 June 1.—Dull, cloudy, with frequent rain. Fine at times, Gale in early morning.
 2.—Overcast and dull till evening. Cloudless at night. Cold and windy.
 3.—A brilliantly fine hot day. Cloudless till evening, cloudy at night. Temperature at 9 A.M. 70°, being higher than any day in 1877, since August 16, 1876. Max. for the day 80°, being 2° higher than the max. of the preceding day and higher than the max. of any day since August 19, 1876. Mean temperature of the day 58°, being 1° higher than that of the preceding day.
 4.—A fine bright hot day. With a smart shower of rain at 11.30 A.M. Lightning at night.
 5.—A fine day, partially cloudy. Cool wind.
 6.—Fine, but very dull and cloudy at times. Frequent rain between 5 and 9 P.M. Cloudless at midnight. Cold wind.

LONDON: Barometer.—During the week ending Saturday, June 2, in the neighbourhood of London the reading of the barometer at the level of the sea decreased from 30.07 inches at the beginning of the week to 29.27 inches by the afternoon of May 28, increased to 29.68 inches by the evening of the 30th, decreased to 29.58 inches by the morning of May 31, increased to 29.50 inches by the evening of the 1st day, decreased to 29.44 inches by noon on June 1, and increased to 29.93 inches by the end of the week. The mean reading for the week at sea level was 29.62 inches, being 0.56 inch below that of the preceding week, and 0.35 inch below the average.

Temperature.—The highest temperatures of the air observed by day varied from 66½° on May 31 to 59½° on June 2; the mean value for the week was 63°. The lowest temperatures of the air observed by day ranged between 43° on May 30 and 49½° on May 28 and June 2; the mean for the week was 46½°. The mean daily range of temperature in the week was 16½°, the least range in the day was 10½° on June 2, and the greatest, 22½°, on May 30 and 31.

The mean daily temperatures of the air were as follows:—May 27th, 53.5°; 28th, 54.2°; 29th, 51.5°; 30th, 52.9°; 31st, 54.2°; June 1, 52.9°; 2d, 52.6°; and the departures in defect of their respective averages were:—1.9°, 1.4°, 4.3°, 3.1°, 2.1°, 3.6°, and 4.1°. The temperature of the air for the week was 53.1°, being 2.9° below the average of observations extending over a period of sixty years.

The highest readings of a thermometer with blackened bulb in vacuo, placed in sun's rays, were 126½° on May 27, 121° on the 29th, and 125½° on the 30th; on June 2 the reading did not rise above 73°. The lowest readings of a thermometer on grass, with the bulb exposed to the sky, were 37½° on May 27, and 35½° on the 30th; the mean of the seven low readings was 42½°.

Wind.—The direction of the wind was S.W., and its strength brisk throughout. The weather during the week was generally fine and cold, but at times dull. Gales of wind prevailed on May 28 and June 1 and 2.

Rain fell on two days during the week, to the amount of 0.31 inch.

ENGLAND: Temperature.—The highest temperatures of the air observed by day were 72½° at Leicester 70½° at Cambridge, and 70° at Manchester; at Portsmouth 62° was the highest temperature in the week. The mean value from all stations was 65½°. The lowest temperatures of the air observed by day were 39° at Wolverhampton, and 40° at Truro, Sheffield,

and Eccles; at Plymouth 48° was the lowest temperature. The mean value from all stations was 42½°. The range of temperature in the week was the greatest at Leicester, 31°, and the least at Portsmouth and Plymouth, both 15°. The mean range of temperature from all stations was 24½°.

The mean of the seven high day temperatures was the highest at Cambridge, 60½°, and the lowest at Liverpool, both 59½°; and the general mean from all stations was 62½°. The mean of the seven low night temperatures was the lowest at Wolverhampton, 43°, and the highest at Brighton, Portsmouth, Plymouth, and Norwich—all 48½°; the mean value from all stations was 47°. The mean daily range of temperature was the greatest at Manchester, 20°, and the least at Portsmouth, 10½°; the mean daily range from all stations was 15½°.

The mean temperature of the air for the week from all stations was 53°, being 1° lower than the value for the corresponding week in 1876. The highest was 55½°, at Cambridge, and the lowest 51°, at Wolverhampton and Eccles.

Rain fell on every day in the week at Wolverhampton, Sheffield, and Manchester. The amounts varied from 2 inches at Sheffield to three-tenths of an inch at both Liverpool and Bristol. The average fall over the country was 1 inch nearly. The weather during the week was generally fine, but cold and stormy; thunderstorms occurred at Bristol on May 31, and at Portsmouth on June 1.

SCOTLAND: *Temperatures*.—The highest temperatures of the air varied from 63° at Dundee to 59½° at Glasgow; the mean value from all stations for the week was 58°. The mean of the air ranged from 38° at Paisley, 19° at Dundee, and 20° from 38° at Paisley, 19° at Dundee, and 20° from the mean from all stations was 40½°. The mean range of temperature in the week from all stations was 21½°.

The mean temperature of the air for the week from all stations was 51½°, being 3½° lower than the value for the corresponding week in 1876. The highest was at Dundee, 52½°, and the lowest at Aberdeen, Greenock, Paisley, and Perth, all 51°.

Rain.—The fall of rain in the week was somewhat large everywhere. At Greenock 3½ inches fell, at Leith three-quarters of an inch fell, and with this exception at no place was there a 1 inch fall; the average fall over the country was 1½ inch.

DUBLIN.—The highest temperature of the air was 65°, the lowest 38°, the range 27°, the mean 53°, and the fall of rain 0.41 inch.

JAMES GLAISHER.

Variorum.

THE MUSKIEE OF THE NORTH PACIFIC.—Long education is necessary for any one to become an adept in the use of the axe. It is really a fine-art-sight to see a thorough axeman at work. How easily—without an effort one would think—he swings the axe over his head, in every time brings it down within a hair's-breadth of the right place. Not a blow is wasted. At every stroke a huge wedge-shaped chip flies; and with a sound that makes the silent forest echo, the great tree shivers, cracks, and then crashes to the ground, bringing along with it often a thicket of its smaller relatives, which have grown up under its shade. The work of an axeman is well calculated to bring into play all the muscles of the body. Accordingly, the *physique* of the Canadian and State of Maine men—who are all accustomed to this muscular employment—then are usually so tall, and without having that yellow sickly colour so common in the American townsman. The lumberman who passes his life in active, healthy work, inhaling the reviving breath of the Pine forest, has not an ounce of superfluous fat, while every muscle is developed to its normal size.

The axe used in chopping is small, and of American make, with a long handle. The English manufacturers, though furnished with samples of this axe, do not seem to have succeeded in making it so as to suit the requirements of the Canadian.

It is known what to do with his hands when he has an insect in them. It seems indispensable to him, and it is astonishing how quickly and well he can fell trees, make roads, or build houses with it. Failing the axe, the lumberman, like most Western men, is fond of sitting, and when sitting in the summer evening in front of big open and comfortably-situated cabin, is usually seen leisurely and heartlessly shaving down a "shingle," or still better, the soft cheese-like white Pine, if he be fortunate enough to lay his hands on a piece of it.

The loggers of the North-west are a fine, manly, intelligent set of men. They have generally been fairly educated, and have seen a good deal of the world. Having few opportunities of spending money in the woods, and being well paid, those of them who resist the temptation to spend their earnings in the towns are able to save money, and can get on to the logging contractors' lives. From "The Countries of the World," by Dr. Robert Brown, for May,

THE CLIMATE OF CEYLON.—The following climatal details relating to Ceylon are taken from Dr. King's report on Cichona cultivation in India, as a result of an expedition in some cases seven years' observations. The elevation is 4600 feet.—

	Shade temp.		Exposed.	Exposed.	Rain.
	Max.	Min.			
January	85	6	126	7	Inches.
February	84	43	105	33	3.9
March	84	46	105	39	5.2
April	84	47	105	40	7.0
May	83	50	123	46	6.0
June	78	35	123	43	18.4
July	84	34	123	43	106.5
August	79	34	134	48	9.0
September	50	39	139	46	15.2
October	79	54	134	43	13.0
November	79	48	133	46	7.7
December	79	44	133	41	4.4
Mean of year	89	44	136	33	107.7

This table is one of great significance for the home cultivator, especially the details relating to the extreme temperatures in the sun.

KEY GARDENS.—If any man's heart be sore and his eyes heavy let him forthwith take horse or rail to Kew and live an afternoon in the garden there. If that cure him not nothing will. The Azaleas are in all their glory, and the Camellias are bursting from their buds. A walk through hothouse No. 4 is a kind of mid intoxication unattended with headache; the air is full of a hundred delicate scents, and I can testify to an instantaneous cure of heavy eyes effected by one plant of *Erica Cavendishiana* in this house. A lady, who is on her first visit to England, was walking in Kew Gardens the other day. She was, without a word, much pleased, but was greatly shocked at the notice which she read at every turn—that "birds' nesting is strictly forbidden." "How you are severe and cruel in this country," she at last sorrowfully exclaimed, "that even the little birds may not make their nests in your public gardens. *Vandy Fair.*"

THE CLIMATE OF THE SIKKIM HIMALAYA AND NILGIRRI HILLS.—We glean the following details as to the climate of the Sikkim Himalaya (Kangboe) from Dr. King's *Manual of Cichona Cultivation*—fractrons omitted:—

1866.	Altitude, 5371 feet.		Altitude, 2555 feet.	
	Mean Temperature.	Minimum.	Mean.	Minimum.
January	41	24	39	20
February	41	24	41	24
March	37	27	44	28
April	37	28	44	28
May	27	48	43	24
June	64	57	78	67
July	64	57	78	67
August	62	58	79	68
September	61	56	77	66
October	50	39	65	46
November	39	29	65	36
December	31	24	37	26
Mean of year	55.4	44.8	70.1	55.5

The annual average of two years' rainfall near Rungbee, at a height of 3300 feet, is 112 inches, the greatest of all being in July, 40 inches; while in November, December, January, and February, next to none fell.—The daily mean temperature and rainfall of the Nilgiri Hills (Ootacamund) during the year ending March 31, 1869, is thus tabulated—fractrons omitted:—

1869.	Deg.	In.	1868.	Deg.	In.
April	75	75	December	58	34
May	62	7	January	58	44
June	57	8	February	61	39
July	57	7	March	57	39
August	57	3	April	58	44
September	57	3	May	61	39
October	57	3	June	61	39

The mean temperature of the year is noted as 59° 28'. The maximum temperature in the shade was 77° 87' in April; the mean maximum of the year, 70° 59'; the minimum temperature is, unfortunately, not given. The total rainfall was 52 inches.

ROXBURGH CASTLE.—On suddenly emerging from the leafy gloom, one of the most brilliant landscapes in Europe opens to the eye—the splendid mansion and embellished grounds of Springwood Park; the demesne of Fleurs, with its noble ducal castle and stately terraces; the two beautiful rivers of Teviotdale, which are spanned by a magnificent bridge; Kelso with its vast park and the green tufted knoll, where one stood the great Border Castle of Roxburgh, a bulwark against England, and the key of the Merse. On one hand, the eye can look along a valley 10 miles in length, covered with the finest timber, and on the other, an open and diversified prospect for double that distance, away to the summits of Carter-Fell and other mountains. Looking over all this, from the height of

Dunse Law, where the army of the Covenant unfurled the standard in 1639, the eye commands a prospect so extensive, rich, and varied, so abounding in all the sweetest elements of rural landscape, including three great castles, renowned in ancient wars, and a peep at the German Ocean, as to defy a succinct description. The town of Roxburgh—which was a place of great note in the twelfth century, and in the days of David I. had an encircling wall and ditch, which scholars that flourished under the abbots of Kelso, who was the seat of a mint, where John of Wiliam I. and James II. were struck, having in the fourteenth century former a weekly market, and in the time of Queen Elizabeth enjoying the reputation of being the fourth town in Scotland—has so completely passed away, that not a stone remains. It stood over against Kelso, on a rising ground, at the western end of a fertile plain, insulated by the confluence of the Tweed and the Teviot. The remains of its castle still appear on a steep and wooded knoll on the margin of the Teviot, about 40 feet above the plain, and indicate it to have been a place of vast extent and strength. From "The *Picturesque Europe*" for May.

A FOREST SCENE IN CENTRAL AMERICA.—We were now again in the midst of a dense Pine forest, with tall trees—every one fit for a spear for the Titans when they warred against the gods—on either side of us. The rough path which the settlers have been out of the dense forest, and the two axes were again barred by one of these forest giants, which the wind has thrown athwart. How painfully silent are these Fir forests of the North Pacific! At one portion of my life it was my happy lot every morning to walk through pastures of a great tropical forest in Central America. Fragrant odours of a sweet wood were wafted in the sultry air, and everywhere the forest rang with the scream of tropical birds of gorgeous plumage, and the chatter of the long-ringed monkeys, which swung themselves from branch to branch, and tree to tree, in their astonishment at this degenerate descendant of the ape who was permitted to walk aloft, while they distorted themselves among the leaves of the indiarubber trees, and at the lascivious frisks from among the waves of flowers which rolled from forest tree to forest tree, until, as you looked on a rising ground, the wide expanse of country before you seemed in places like a sea of foliage and flowers. Above all, filling up as it were every vacant space, was the never-ceasing din and hum of insect life which arose from among the trees. This seemed like one huge temple, where ten millions of unseen chorists sang a never-ending hymn of praise to the "Unknown God!" Here, 40° to the north, all is different. There are odours, but they are those of Fir trees and turpentine, and you may listen for hours without hearing the sound or beholding the sight of living being. We sit under a tree, and draw for a few minutes our forehead comes a gentle tapping, and from a tree close at hand another similar sound; we look up and find that it proceeds from two species of woodpeckers boring a tree for insects. They are *Audubon's Picus Harisi* and *P. Gairdneri*, the two species found on the island. We almost repeat what said above of the scarcity of life in the forest, for down jumps from a tree a little brownish squirrel, which starts at us for a second, then, tail on end, skips along a fallen tree, tears open a Fir-cone, extracts the seed, and then skips off on the errand he is bound. There are several species of squirrels in the North Pacific slope of the Rocky Mountains, but this is the common one (*Sciurus Douglasii*). In the mild climate of this region it does not hibernate, but may be seen all the year long jumping about, fearlessly approaching the traveller, and resting up to the ears as it runs off scolding and barking. As we are moving off, a pretty fawn ambles into the pathway just before us, and after eyeing us for some time, again trots up the bush, and in a minute is lost among the thick foliage.—From "The *Countries of the World*," by Dr. Robert Brown, for May.

THE ELDER.—The Elder, Bour-tree, or Boun-tree (*Sambucus nigra*), is one of the hardiest of our indigenous plants, growing freely and even luxuriantly in high and exposed situations where few other shrubs exist, braving the stormiest winds and severest winters in such a manner as to excite our admiration. We have often seen it used with excellent effect for fences and shelter around high-lying farms and cottages, whose inhabitants appear to appreciate it as their best friend for mellowing the blast and sheltering their stock and crops from the cold and boisterous winds to which they are exposed in elevated parts of the country. When once it has established itself, which it quickly does in almost any soil and situation, it is not easy to eradicate it, which makes it among our troublesome when growing amidst young plantations; but it is a most valuable plant for planting thickly along the skirts of new plantations in high and exposed parts, where it speedily gives the necessary shelter to the young trees to leeward of it, protecting them from being tossed about and injured by the cutting blast, and enabling them to quickly start into strong and healthy growth, which is a most

ART-WITH-ECONOMY-APPLIED-TO-CONSERVATORIES

In consequence of the increasing demand for Conservatories, in which pure art is combined with moderate cost, T. H. P. DENNIS & Co. have been led to introduce designs of a character hitherto unknown. One of these designs, showing a house 22 feet 6 inches x 13 feet 6 inches, is annexed, and the result, as regards the extremely low price (which includes fixing, glazing, painting, carriage, &c.), has been attained only by special machinery and a system of interchangeable parts.

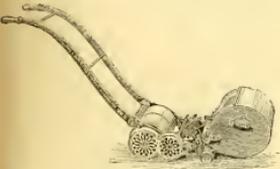

T. H. P. DENNIS & Co. are also prepared to provide and fix Hot-water Heating Apparatus and Horticultural Buildings of any dimension or description.

Full-sized specimens of Greenhouses, &c., and Hot-water Apparatus in work, can be inspected at Mansion House Buildings, London, E.C.

Gentlemen waited upon at their residences by experienced designers.

Estimates and Plans free.

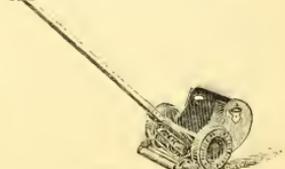

FOLLOWS & BATE'S NEW PATENT LAWN MOWERS, &c.

New Patent "Roller" Lawn Mower.

New Patent Lawn-Edge Cutter.

Royal Prize Medal Patent "Anglo" American Lawn Mower.

Upwards of 37,000 of these celebrated Machines have been sold during the past few years.

Favoured by Her Most Gracious Majesty the Queen; His Royal Highness the Prince of Wales; His Imperial Majesty the Emperor of Germany; His Imperial Majesty the Emperor of Austria; The Imperial Russian Government (for the Agricultural Museum at St. Petersburg); and members of the Nobility and Gentry of Great Britain.

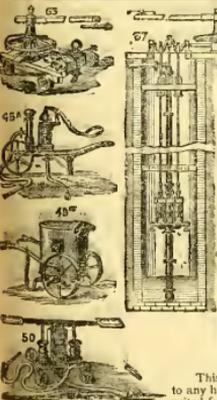

Awarded Medal for Merit, Vienna, 1873 (the only Medal given for Lawn Mowers), Large Silver Medal (the First Prize) at the Meeting of the Royal Horticultural Society, Birmingham, 1876, and in addition, every First Prize wherever these Machines have been brought into competition in actual trial with other makes.

FOLLOWS & BATE here obtain from engineering in detail the various good points "claimed" for their Machines, and content themselves with saying that their Lawn Mowers possess them all, and more also; they therefore solicit the favour of an application for one of their CATALOGUES, with Testimonials, BEFORE PURCHASING.

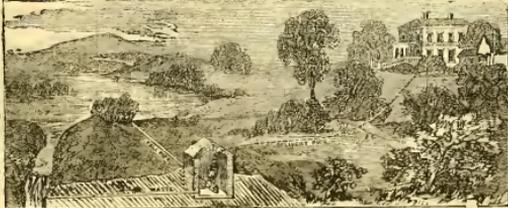

To be had from all respectable Ironmongers and Seedsmen in the United Kingdom, or from the Patentees and Manufacturers, FOLLOWS & BATE, Manchester.

F. & B. are the sole makers of the well-known Patent "CLIMAX" LAWN MOWER, with Back Delivery, from 10s. each; NEW PATENT LAWN-EDGE CUTTER, which entirely supercedes the Sheet; PATENT GARDEN PLOUGH, &c.

Machines of any make Repaired or allowed for in Exchange.

WILLIAM S. BURTON,
35, OXFORD STREET, W.
THE PERFECT SUBSTITUTE FOR SILVER.—The real NICKEL SILVER, introduced more than thirty years ago by William S. Burton, was patented by the patent process of Messrs. Edington & Co., is the best article next to Silver that can be used as such, either usefully or ornamentally, as by no test can it be distinguished from real Silver.

PATTERNS.	Fiddle or Old Silver		Lead or Thread		King's or Shell	
	6 s.	4 s.	6 s.	4 s.	6 s.	4 s.
Table Forks or Spoons, per doz.	100	0	7	0	2	1
Desert ditto, per dozen	1	0	1	0	1	0
Tea Spoons, per dozen	0	14	0	1	0	1

These are as strongly plated, and are in every respect at least equal to what other houses are selling at their first quality at very much higher prices.
A second quality of Fiddle Pattern—Table Spoons and Forks, 27s. per dozen; Dessert, 17s. per dozen; Tea Spoons, 12s. per dozen.

All kinds of replating done by the patent process.
WILLIAM S. BURTON,
GENERAL FURNISHING IRONMONGER, by appointment to H.R.H. the Prince of Wales, sends a Catalogue containing upwards of 150 illustrations of his unrivalled Stock, with Lists of Prices and Plans of the Thirty Large Show-rooms, post-free.—39, Oxford Street, W.; 1, 1A, 2, 3, and 4, Newman Street; 4, 5, and 6, Perry's Place; and 1, Newman Yard, Manufacturers, 84, Newman Street, and Newman Mews, London, W.

"THE PRESIDENT," Latest and Most Improved American Lawn Mower.

A Model of Beauty, Simplicity, and Strength.

PRICES.

- 10-inch ... £3 3 0
12-inch ... 4 4 0
14-inch ... 5 5 0

Carriage Paid to any Railway Station.

EVERY MACHINE UNCONDITIONALLY WARRANTED.

The 'President' is the best Lawn Mower in use in the United States. The new and important improvements which have been made in these machines has wrought a complete revolution in their manufacture...

In offering to the Public this beautiful Machine, we desire to call attention to many valuable improvements. It has a noiseless positive ratchet, a full roller, and an adjustable iron handle...

This Mower is of lighter draught, and we feel warranted in saying, will outwear any in the market. The workmanship and material far surpasses anything of this character now manufactured...

The machine is simple, easy to adjust and keep in order, and the knives can be sharpened without removing them from the machine. The gearing is all perfectly enclosed, rendering it entirely free from clogging.

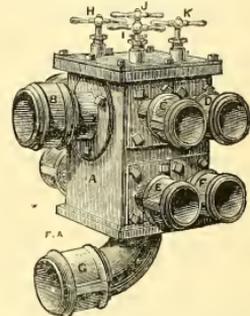

In brief, if you want a Lawn Mower that will run easy, do good work, last you longer than any you can buy, and give you less trouble, we recommend the 'President' with perfect confidence to your favourable consideration.

THOMAS MCKENZIE & SONS (LIMITED), 79, MARK LANE, LONDON, E.C. DAWSON STREET, DUBLIN, and VICTORIA STREET, BELFAST.

HENRY ROBINSON, IRONFOUNDER... HOT-WATER PIPES, 2 1/2 in. to 3 1/2 in. 4 in. to 6 in. per 6 ft. length... ELBOWS, No. 12... TEES, No. 33... SYPHONS, No. 23...

CRITCHLEY'S PATENT HEAT REGULATOR,

AN APPARATUS FOR REGULATING THE HEAT IN HORTICULTURAL BUILDINGS.

A, Iron Box fitted up water-tight. B, Pipe or Supply of Water from Boiler. C, D, Pipes for Circulating Hot-Water. E, F, Pipes for Supply of Water to Iron Box. G, Pipe for Returning Water to Boiler. H, I, J, K, Piston-Rods for Opening and Closing Valves.

The advantages of these Regulators are that houses may be kept at different degrees of heat, or the circulation of water and heat entirely stopped in one part and not in others. They may be fitted with as many valves as required, and are particularly adapted for forcing houses where top and bottom heat is used.

The following Testimonial has been received: 'Berkeley Castle, April 13, 1875. Gentlemen, - I am happy to inform you, now that the late severe winter is past, that the Hot-Water Apparatus erected by you does its work to my entire satisfaction.'

Estimates and Plans furnished for Warming Gentlemen's Mansions and Public Buildings. Orders attended to in any part of the kingdom, and guaranteed to answer their intended purposes. Prospectus and Price Lists post-free.

Messrs. CRITCHLEY & CO., Horticultural Engineers and Builders, GROSVENOR WORKS, CHELTENHAM.

Prices, Patterns, and Testimonials Post Free.

WALTER CARSON & SONS,
LA BELLE SAUVAGE VARD,
LUDGATE HILL, LONDON, E.C.,
AND 21, BACHELOR'S WALK, DUBLIN.
NO AGENTS.
Oil Paint No Longer Necessary.

HILL AND SMITH'S BLACK VARNISH for Preserving Ironwork, Wood, or Stone. This Varnish is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the inventors, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by ordinary labourers, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, New Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received, which HILL & SMITH will forward on application.
Sold in casks of 20 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 6d. per gallon carriage paid to any Station in the Kingdom.
UNSOLICITED TESTIMONIAL RECEIVED MAY 3, 1877.
"The Evelyn, Alderly Edge, Manchester.—Messrs. Hill & Smith.—Sir,—For some 20 years I have used your 'Black Varnish,' and shall be glad if you will forward me another cask, as I consider it the best thing known for the preservation of all outdoor work, either wood or iron, that requires to be painted.—Yours respectfully, ALBERT LOWE, J.P."
Apply to HILL & SMITH, Bielesey Hill Ironworks, near Dudley, and 125, Queen's Street, London, E.C., from whom only it can be obtained.
CUTION—It having lately come to the knowledge of HILL & SMITH that spurious imitations of this Varnish are being offered by unprincipled dealers at a slight reduction in price, they would especially draw attention to the fact that every cask of their Varnish is legibly marked with their name and address, without which none is genuine.

Notice of Removal.
THE FLORIST and POMOLOGIST will in future be published by Messrs. W. KENT and CO., of Paternoster Row, and now at 171, Fleet Street, E.C.
The number for JUNE, price 1s., contains two handsomely coloured Plates, illustrating the **HOVEN & DE COMICE PEAR**, and **MADAME CACHET CAMELLIA**.
London: W. KENT and CO., 273, Paternoster Row, E.C.

LASCELLES' PATENT BENT WOOD CONSERVATORIES and GREENHOUSES—All Gardeners know that Wood is better than Iron for Plant Growing, and by the above system a handsome curved house can be erected as cheaply as a plain straight one.
The curved house is more durable, stronger, lighter in construction, and has no least class required.
W. H. LASCELLES, 121, Bunhill Row, London, E.C., will supply Drawings and Estimates free of charge.

A. D. ADAMS and FRANCIS, Advertisement Agents, 50, Fleet Street, E.C.

WANTED, A first-rate GARDENER, to take charge of the Nursery of Glass; one who has had considerable experience in Growing Roses, Soft-wooded Plants, Cucumbers, &c., for the Trade and Market. Salary and Commission—Apply by letter, stating references, and who particularly, to J. YATES DICKSON AND CO., 359, Strand, London, W., Manchester.

WANTED, an active young GARDENER, quick at Thinning Grapes, and used to Growing for Market. Salary depending on capabilities, &c.—Mr. HEATHER, The Vineyard, North Street, Chichester.

Gardener and Steward.
WANTED, about the middle or end of July, for the South of Ireland, a first-class GARDENER, to take charge of a Nursery, with a large Establishment, where the proprietor is much from home.—State age, religion, number of family, native country, and expectations in salary, and forward copies of testimonials, to Messrs. MCKENZIE AND SONS, Camden Quay, Cork.

WANTED, A WORKING FOREMAN and PROPAGATOR of Indoor and Out-door Plants well up in the Cultivation of Roses, Rhododendrons, and Confusable Plants. Capable of taking the Management of a Nursery.—Address, giving references, age, wages expected, and whether married, single, or widowed, to JAS. O'LEARY, No. 55, Market Street, Bolton, Lancashire.

WANTED, a First-class PROPAGATOR—one capable of producing any quantity of all the new and choice Plants in cultivation. He must also be great and successful in grafting. Only those with first-class experience need reply to this.—A. B., *Gardener's Chronicle* Office, W.C.

Soft-wooded Propagator.
MESSRS. JAMES MITCH AND SONS require a Man in the above capacity; he must have a thorough knowledge of the Propagation and Cultivation of all kinds of Soft-wooded Plants. Applications, stating all particulars, to be made by letter.—Royal Exotic Nursery, Chelsea, London, S.W.

WANTED, a steady Man, used to general Glazing, and the culture of a Nursery, with a large extent of Glass, in the North of Ireland.—The situation is one of important value, an unquestionable character, and highest references must accompany applications.—Apply to Mr. W. H. Smith & Son, Waring Street, Belfast.

General Manager for a Provincial Nursery.
WANTED, thoroughly experienced MAN, in the above capacity, to be put in charge of the Nursery and partly by commission.—Applications to be made, in confidence, to Messrs. JAMES MITCH AND SONS, 10, Abchurch Lane, London, E.C.

WANTED, an intelligent young Man, as an ASSISTANT in the New Plant Department at Mr. William Bull's Establishment. Wages, 4s per week.—Apply personally to the MANAGER, established for New and Rare Plants, King's Road, Chelsea, London, S.W.

WANTED, a Young Man, to Assist in the Houses, where Plants are Grown for Market; one who has been long attached to Messrs. THOMAS PESTRIDGE, Hotspur Road Nursery, Brentford.

WANTED, in an old-established Nursery, a SALESMAN and PROPAGATOR, for the Indoor Department, one used to the Trade required. State particulars as to previous engagements, age, and salary expected.—W. D., Post-office, Reigate, Surrey.

WANTED, a TRAVELLER and CLERK, to take English journey; must have been out before.—Write, with full particulars, to MINER, NASH, AND CO., 69, Strand, W.C.

The best remedy for ACIDITY of the STOMACH, DRACONIC, and the most powerful in the treatment of INDIGESTION; and the most valuable for delicate Constitutions, Ladies, Children, and Infants.

DINEFORD AND CO., 172, New Bond Street, London, and all Chemists.

KINAHAN'S LL WHISKY.
Universally recommended by the Medical Profession. A pure old spirit, mild, delicate, and most wholesome. Dr. Hassall says: "The sample was of a fine quality, of a taste, aromatic and ethereal to the smell. The Whisky must be pure, well-matured, and of very excellent quality."—W. H. H., 25, Great Titchard Street, London, W.

HOLLOWAY'S OINTMENT and PILLS.
—Debility, indigestion, when climate, age, or hardships have undermined the health, skin eruptions to arise and suggest the existing weakness. Holloway's Ointment and Pills are the most powerful in the most judiciously prepared. It is the most powerful purgative the finest balsamic virtues, which soothe and heal without any of the usual effects of other purgatives. It is a sensitive cure. Holloway's Ointment and Pills are infallible for all the diseases of the skin, eruptions, eczema, scaly skin, and every variety of skin disease. Over all the disorders Holloway's remedies exert a quick and favourable action, and there is no doubt, gradually but certainly arising at that consumption. They are invaluable in the cure of scrofula and scurvy.

GREEN'S PATENT "SILENS MESSOR" & "MONARCH,"

OR NOISELESS LAWN MOWING, ROLLING, and COLLECTING MACHINES for 1877,

THE WINNERS OF EVERY PRIZE IN ALL CASES OF COMPETITION.

Patronised by Her Most Gracious Majesty the Queen on numerous occasions, H.R.H. the Prince of Wales, the King of the Belgians, the late Emperor of the French, the Emperor of Russia, and most of the Nobility, Clergy, and Gentry in the United Kingdom.

Upwards of 80,000 of the above Machines have been Sold since they were first introduced in the year 1856, And Hundreds of unsolicited Testimonials have been received testifying to their superiority over all others.

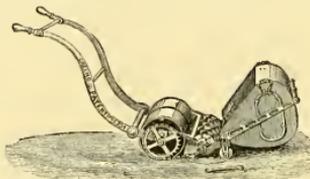

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every Prize that has been given.

The following are their special advantages:—

- 1st. Simplicity of Construction—every part being free of access.
- 2d. They are worked by far greater ease than any other.
- 3d. They are the least liable to get out of order.
- 4th. They make little or no noise in working.
- 5th. They will cut either long or short Grass, wet or dry.

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machines make little noise in working, the most spirited animal can be employed without fear of its running away, or in any way damaging the Machines.

Carriage paid to all the principal Railway Stations and Shipping Ports in England, Ireland, and Scotland.

GREEN'S PATENT "MONARCH" LAWN MOWER, with Chain and Internal Gear combined.

This Mower is well adapted for cutting long, coarse, rough, and wet Grass. It is strongly made, and does its work admirably. It will cut nearer to an object than any other Lawn Mower extant.

The sizes and prices of the "Monarch" Mower are in every respect the same as for the "Silens Messor," with Grass Box, &c., complete.

Green's Patent Lawn Mowers have proved to be the best, and have carried off every prize that has been given in all cases of competition.

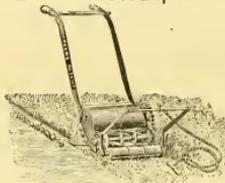

No Lawn Mower Manufacturer keeps so large a stock of Mowers as is to be found at our London Establishment, 54 and 55, Blackfriars Road, where purchasers can select from upwards of 500 Machines of Hand, Pony, and Horse Power, and have their Orders executed the same day they are received.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned at once, free of cost to the Purchaser.

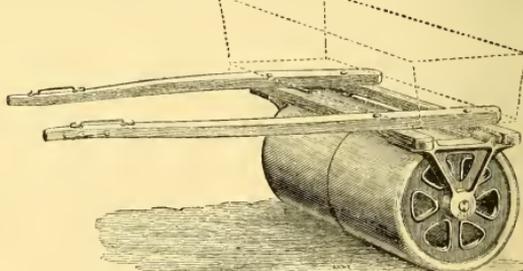

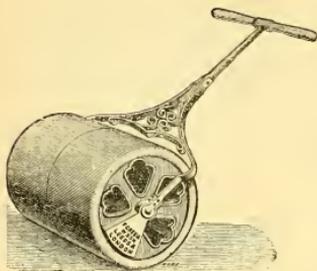

Green's Lawn Mowers are the only Machines in constant use at the Royal Horticultural Society's Gardens, South Kensington, London.

N.B.—Those who have Lawn Mowers which require repairing should send them to either our Leeds or London establishment, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

Delivered, Carriage Free, at all the principal Railway Stations and Shipping Ports in England, Ireland, and Scotland.

CYCLAMEN PERSICUM COMPACTUM MAGNIFICUM

SUPPLEMENT TO THE GARDENERS' CHRONICLE.

POPULAR GARDENING.

HERE are certain plants among our popular favourites which seem to assert their claims to general favour in a manner which is quite irresistible, and, moreover, quite apart from the influences of fashion. Fashion, indeed, may set its mark upon flowers which, apart from such approval, would be looked upon as ugly, or as nearly ugly as flowers can ever become; but there is no mistaking those which seem to have been selected by Nature herself as

examples of her beauty and resource. Such a one, for instance, is the beautiful *Astilbe barbata*, the "*Spirea japonica*" of popular garden nomenclature, with its graceful, pure white spikes rising straight up from the centre of the elegant, spreading, dark green foliage; and other examples are furnished by the

Cyclamens, of which it is our present intention to speak.

The order to which the Cyclamens belong is one which, although small, contains a large number of ornamental plants. Such, for example, are the Primroses, British and foreign—from our own Primrose and Cowslip to the Chinese *P. prenitens*, the Himalayan *P. denticulata*, and the majestic *P. japonica*—not forgetting all the varieties of *Polyanthus* and *Auricula*, which were at one time much more popular than they are at present. Then we have the North American "Shooting Stars" (*Dodecatheon*), the various *Loosestrifes* (*Lysimachia*), including the "Creeping Jenny" (*L. Nummularia*), which is so frequent and so graceful an ornament of London balconies; *Pimpernel*, "of sorts," as the old writers would say; and the *Water Violet* (*Hottonia*) and *Winter Green* (*Trientalis*). All these are furnished by the Primrose tribe (*Primulaceae*), which is thus shown to have many and varied claims upon our admiration.

It is not because they are new that Cyclamens are

such important favourites among our spring flowers. Two species were in cultivation in Gerard's garden as long ago as 1596, namely *C. hederacifolium* and *C. coum*, while *C. persicum* was brought from the Island of Cyprus by Sibthorp in 1731. We follow Mr. B. Daydon Jackson in his identification of Gerard's species: Aiton, however, considered his plants to have been *C. hederacifolium* and *C. europaeum*, while he assigns the same date of introduction to *C. coum* as to *C. persicum*. Parkinson, in his *Paradysus*, enumerates and figures ten kinds of Cyclamens, some of which are mere varieties in colour. Among them, however, is a double variety, described as being "of Antioch," which is very rarely met with at the present day, though examples of it have lately come under our notice, and it has been described in these columns.

According to recent authors eight species of the genus are to be recognised, being natives of Central Europe, West Asia, and the Mediterranean region, in which North Africa is, of course, included. *C. hederacifolium*

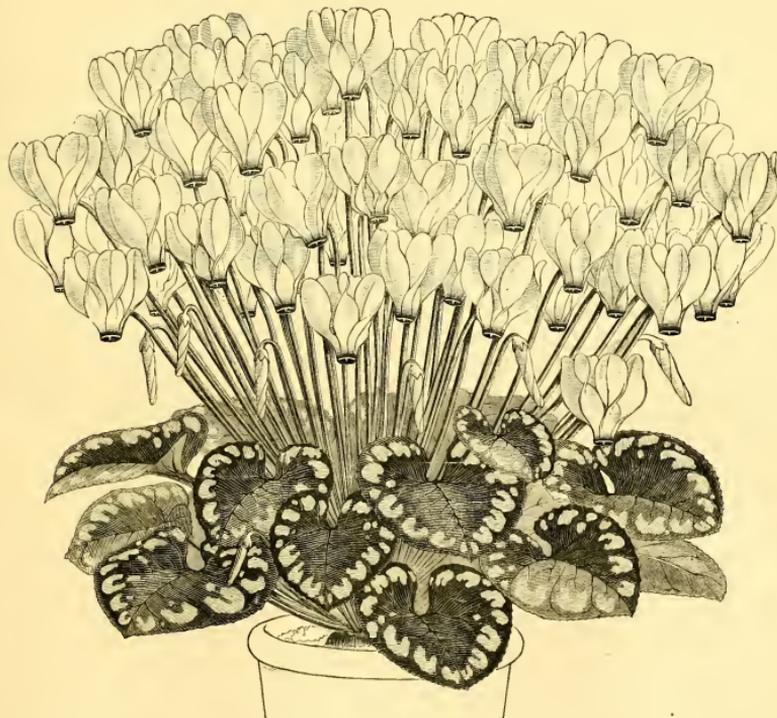

FIG. 1.—SPECIMEN PLANT OF CYCLAMEN PERSICUM (ABOUT HALF NATURAL SIZE), DRAWN FROM A PLANT IN THE COLLECTION OF MR. HENRY LITTLE.

was at one time regarded as a British plant, but the balance of evidence tends to show that, even if still found in the neighbourhood of Sandhurst, and Hawkhurst, in Kent, it is to be regarded rather as a naturalized than as a truly native species. It is not now, however, so frequently met with in cultivation as its merits deserve. This species, indeed, is not as handsome as *C. persicum*, and its flowering time is very different, as the blossoms appear from August to the end of October; they are purplish red or pure white, and several varieties are occasionally met with in gardens. It is a hardy species, doing well on rock-work, in borders, or in woodland walks.

C. persicum, the *Cyclamen parviflorum*, is a more tender species, which must be raised in warmth, and requires a certain amount of care. Of this most lovely plant there are many varieties, passing from the purest white to a rich deep red-purple; few of them, however, are prettier than the common form, in which the base of the flower is of a rich red-purple hue, and which is moreover deliciously and delicately fragrant. It is a native of Lebanon and other parts of the east, and is deservedly the most popular representative of the genus.

The round-leaved *C. coomii* is a pretty and attractive plant, with a neat habit and pretty bright red-purple flowers, which are much shorter than those of *C. persicum*; this is a spring bloomer. There is a handsome Algerian species (*C. africanum*) which is remarkable for its large leaves, and which flowers in spring; while the very pretty little *C. cypricum*, a recent introduction, has the habit of *C. persicum*, which it also resembles in the colour of the flowers.

The ugly English name of these plants—Sow-bread—is an equivalent not only of the old Latin name *panis porcinus*, but also of the French *pain da porcea*, and the Italian *pana porcino*. It is stated that pigs are very fond of the tubers in the districts where *Cyclamens* abound, and they are indeed said to be the food of large herds of swine in Italy and Sicily. The tuber of *C. europaeum* is purgative in a fresh state; and it is said that the juice of the tuber of one species (*C. africanum*) is used by the natives of Barbary for poisoning their arrows. The *Cyclamen* was also formerly endowed by the credulous with another remarkable and dangerous property; and any reader who will remember the good old herbalist's precaution "least any woman should by lamentable experiment find [his] words to be true." With this trifling exception, however, the *Cyclamen* is singularly devoid of popular history; from which we may perhaps conclude that the beauty of its appearance was sufficient to render it a general favourite, without the additional attraction of other properties, real or imaginary.

CULTIVATED CYCLAMENS.

When the horticultural records of the third quarter of the present century are carefully analysed, it will be observed that among many flowers brought forward several stages in the pathway of improvement, the *Cyclamen persicum* holds a somewhat important position. And not only has this improvement been seen in the production of larger flowers, and these, too, of brilliant hues, undreamt of a quarter of a century ago; but in respect to its cultivation there has been a marked advance. The requirements of the *Cyclamen* are better understood, and the cultural process is more intelligently apprehended. Perhaps human eyes never before looked upon such a marvellous exhibition of this beautiful autumn and spring flowering plant as was presented at the spring show at the Royal Aquarium at Westminster on April 12, 1876, when all the leading growers were found in competition, and the productions were in the highest degree excellent. Plants, too, three and four years old, were of great size, finely grown, and loaded with beautiful flowers in such numbers as to give fit occasion for the rapt expression of the poet—

"How lovely are the common things of God!"

It was about the year 1731 that *Cyclamen persicum* was introduced to Britain from Cyprus, and it would appear that three varieties were received, namely, albidiflorum, the white form; inodorum, the scentless variety; and odoratum, the scented kind. How it fared after it was introduced—whether any attempts were made to cross these forms, or what success attended the efforts of the early cultivators, it would be difficult to say. Perhaps it would not be unsafe to hazard the opinion that the *Cyclamen* was not very

well understood, and that ill success was the rule with cultivators rather than the exception. Some of the earlier horticultural works treat with inquiries for information as to the successful cultivation of the *Cyclamen*, from growers who had been disappointed in their productions; and it is noticeable that but little information was forthcoming.

In the first volume of the *Florist*, published in 1848, a writer on the *Cyclamen* remarks:—"Although this beautiful bulb has been upwards of a century in our possession, yet we do not seem to have made that progress in its cultivation which its merits would give us reason to expect." The difficulty seems to have been to flower it, for there were frequent complaints that the *Cyclamen* did not bloom. It was also considered a proper practice not to report frequently, and the late Mr. John Dobson, of Isleworth, a man of mark in horticultural circles in those days, writing to the *Florist*, in September, 1848, stated, "Mine (*Cyclamen* plants) were now starting into growth after their season of rest, and look very promising. This makes the fourth year since they were last potted. I merely take the green surface of the top, and replace it with a little fresh soil to give the pot and plant a neater appearance."

IMPROVEMENT OF THE FLOWER.

It must not be supposed that the fine varieties of the *Cyclamen* now in course of cultivation are wholly the products of the past few years. A quarter of a century ago Messrs. E. G. Henderson & Son, of the Wellington Road Nurseries, were among those who took the *Cyclamen* in hand, and were successful in obtaining new and improved forms. Then came a kind of pause, or the work was still going on, the results were not recorded, and the *Cyclamen* was only occasionally produced at the leading shows. Then Mr. J. Wiggins, of Isleworth, took up the cultivation of the *Cyclamen*, and was so successful that to him may be attributed a good deal of the notoriety the flower has achieved in recent years. Mr. Wiggins, and others working contemporaneously with him, not only succeeded in obtaining a larger size in the flowers through improved cultivation, but they originated forms displaying new colours, a greater breadth of petal, and a general advance towards that high degree of quality of which growers can now boast. Mr. Walsh, of Hillingdon; Mr. Clarke, of Twickenham; Mr. Edmonds, of Hayes; Mr. Egerton, of Twickenham; Mr. James, of Isleworth; Mr. Stevens, and, later, Mr. H. B. Smith, of Ealing; and, last but not least, Mr. H. Little, of Twickenham, with others too numerous to mention, have all materially aided this development, and helped to bring the *Cyclamen* to such a surprising degree of perfection.

The production of high-coloured flowers has proved a most valuable contribution to contemporary floriculture; these are surprisingly varied, and some of the most brilliant hues. Rich plum-coloured flowers approaching violet, purple, and blue; and bright flowers approaching carmine, red, scarlet, and crimson are now frequently seen; and altogether they are now very much earlier in the season than they were to be had years ago. Tipped, margined, and flaked flowers can now be seen, with the colours in charming combination; and some of the pure white flowers are most delicately beautiful, as well as large in size and of the finest form.

It is owing, no doubt, to the improved system of cultivation now followed, that the *Cyclamen* is to be had much earlier in bloom than it was a few years ago. Indeed, a most successful amateur cultivator, Mr. B. Hookes, of Bradford writing to us a short time since, states, "I most earnestly advocate the opinion that the *Cyclamen* is not a flower for March and April only, but for October, November, and December, and onwards; to be in bloom when there are fewest flowers in the greenhouse or conservatory." In a good and well-grown collection the *Cyclamen* can be had continuously in bloom for six months in the year, and longer.

Like most other plants, the fine development of a batch of *Cyclamen* depends mainly, if not altogether, on its cultivation, when a good strain is in the hands of a grower. Those who grow the *Cyclamen* so finely round London have to a considerable extent abandoned the old customs formerly observed, viz., the period of rest during summer—rest in the sense of withholding water for weeks, and literally roasting the plants in the sun—and the mode of propagation by dividing the bulbs. Now the *Cyclamen* is kept growing for a good portion of the year, and when

it may be said to be at rest is preserved in a cool place and supplied with water, to keep the soil moist about the roots. The production of stock is depended on from seed; in the dividing of the corms a great risk is run of destroying them outright, and cultivators state that any particular variety will be pretty certain to reproduce itself in some part of its progeny; and this fact has found abundant illustration in practice.

THE CYCLAMEN AS A WINDOW PLANT.

One of the best amateur cultivators of the *Cyclamen* that we are acquainted with thus writes concerning it:—"The property of the *Cyclamen* consists in its being one of the most easily grown of any of our winter favourites. It has a compact habit, lively foliage, exquisite fragrance in the flowers of some of its varieties, long continuance of bloom, and to these must be added its greatest recommendation, viz., being of all flowering plants the best adapted to indoor decoration. I have frequently had it in my sitting-room, and with ordinary care it will flourish as well, or almost as well, as in a conservatory. The only attention it demands is to have its leaves brushed over every morning with a soft camel-hair brush dipped in a little lukewarm water." Indeed, the *Cyclamen* makes an admirable window plant, as many cultivators can testify.

The same writer thus pictures a good specimen *Cyclamen*, and the fact that what he here sets forth can be accomplished, illustrates, in a remarkable manner, the improvement in the cultural process as compared with that of a quarter of a century ago. "I consider," he states, "that the *Cyclamen* at fifteen months' growth ought to be at least 1 foot in diameter, having a dense mass of thick variegated leaves standing almost erect, and the flowers not more than 2 or 3 inches above the foliage. The flowers themselves should be broad in the petals, about 2 inches in length, nearly round at the points, and having a slight regular twist in each segment of the corolla." It is a fact that such plants can be produced at the age of fifteen months.

HOW TO GROW CYCLAMENS.

To effect this the seed is sown almost as soon as it is ripe—at the end of July or early in August; the earlier the better. It is sown in shallow pans or in pots in a light rich sandy soil, and placed in a house or frame where there is some bottom-heat, in a temperature of about 65° or thereabouts. By the end of November the seedling plants are large enough to be pricked off into 60-sized pots, a dozen or so of plants in a pot, and still kept in a warm moist atmosphere. During the winter the young seedling plants, whether remaining in the seed-pans or potted off, require to be kept in a warm house, and near the glass, where the temperature will not fall below 45°. It is to be remarked that it is necessary that the young plants should be screened from the effects of hot sun during the summer by means of some material placed over the glass, which, while it will exclude the hot glare, will not interfere with the passage of light. The cultivator will do wisely to rush on his plants as quickly as possible, and to do this he should pot off singly into small 60-pots as long as he can that are large enough to be so treated. During the dead of the winter but little growth is made, but as soon as the days lengthen a little, the plants make speedy progress, especially if the weather becomes warm.

In March and April the plants potted in the autumn will require a shift into a larger sized pot, and those yet requiring to be potted off from the store-pots should be so treated, and all put into a frame with a little bottom-heat for a few weeks; then about the end of May put into a cold frame facing south-east, kept close for a few days, but eventually fully exposed during the daytime.

While the plants occupy this cold frame they should not be too much crowded. Space between them is absolutely necessary, so that the leaves can be well-developed, otherwise they will get a drawn appearance. One great desideratum in a well-finished *Cyclamen* is to have the habit of growth dwarf and compact, and at the same time bold and vigorous, so much does the general symmetry of the plant depend on a proper growth. Air, shading, and moisture, have much to do with this.

If the weather be hot during the months of June, July, August, and September, a sprinkling overhead

should be given once in the forenoon, besides the requisite watering of the soil about the roots; but it should be done with a watering-pot having a fine rose, otherwise the foliage will become bent down by the weight of the water, and the leaves will acquire a drooping rather than an erect habit; another necessary caution is, not to close up the lights for the night until the leaves of the plants are quite dry, as that is apt to induce a lanky style of growth.

The most forward of the plants treated in this way will come into bloom in October,—a great advantage, as it is a time of year when the greenhouse and conservatory is somewhat spare of bloom, and when the life and elegant floral expression of the Cyclamen will be found of great decorative value.

In the case of young plants, the prevalent system of culture may be said to embrace one principle, namely, never to allow the Cyclamen entire rest, but always to keep it growing till it flowers. This is how it is that such fine plants can be had in bloom in fifteen months from the time of sowing the seed. The application of this principle has done much to produce that fine character of development now seen at spring exhibitions, and to make it possible for almost any one having the convenience, to grow this plant in fine condition.

It may be remarked that, when the Cyclamen is getting well into bloom, a little weak liquid manure can be applied with great advantage, and the head of flowers will be both aided and prolonged by means of this timely stimulus.

Some of our growers bloom plants till they are five and six years of age, and those who have had an opportunity of seeing the fine plants produced at the spring shows, or in Mr. H. Little's collection at Hillingdon, or that of other cultivators, will remember the size of these plants, and their wonderful heads of flowers. Plants can then be retained till they are a few years old; and the usual custom is as soon as they have done blooming, they are placed in a cold frame in a shady position, but not allowed to suffer from drought. The plants are rested, but the bulbs are not permitted to become wholly dry and shrivelled. According to the earliness or lateness of the time when the plants flowered are they re-potted,—say in July, August, or September, if they flowered in October, November, or December: they are then placed in a cold frame, and kept close for two or three weeks. They soon push into growth, and begin to form their flower buds.

A good soil for the Cyclamen in all stages of its growth is one composed of two-fifths coarse leaf-mould, the same quantity of a light soft loam, one-fifth dry cow-dung, and sufficient fine white sand to keep it from running together. Some cultivators use less leaf-mould and more loam. The Cyclamen loves a rather open light rich soil, in so far as a plant may be said to show preferences. The cow-dung should be collected in fine weather, when it is somewhat dry, and put aside ready for use when wanted; and it is advisable, in all cases where called into requisition, after breaking it up small, to pour some boiling water over it to kill any insects that may have found a lodgment there, and also seeds that might become troublesome.

Formerly, in potting, it was deemed advisable to leave the bulb almost on the top of the soil. Now, the advice invariably given by successful growers is to bury it almost entirely in the soil, as it has been found that roots spring from all parts of the bulb, and this is found of great advantage to the plants.

It is observed that the yearly re-potting is now followed by growers. The old system of leaving the bulbs in the soil for three or four years undisturbed, as well as other fallacies connected with the culture of the Cyclamen, are quite exploded.

The Cyclamen is a warmth-loving plant, especially during the autumn, winter, and spring; and some who have experienced failures, have done so because the plants were grown in too cold a temperature.

Those who grow anything like a collection of Cyclamens take care to have the plants in a house by themselves. Mr. Little's house at Twickenham, was an excellent illustration of what a Cyclamen house should be; span-roofed, narrow, low, and with a rather high level stage on either side, so as to bring the plants as near the glass as possible. It is difficult to grow Cyclamens well when mixed with other plants; but if attempted they should have the most favourable position that can be afforded them; light, airy, warm, and near the glass.

INSECTS AND DISEASES.

The Cyclamen is liable to attacks of greenfly which infest its young leaves and cluster round the flower buds close about the crown of the corn. A moist warm atmosphere assists to keep them in check, and an occasional fumigation with tobacco-smoke, or a washing with Fowler's insecticide, will speedily cleanse them of the enemy.

Old roots are liable to suffer through decay from a kind of rot, the attacks of insects, &c. This rot will affect the bulbs near the level of the soil, and soon eat away a good portion of them. When they are reported they should be carefully examined, and even washed with a solution of Gishurst compound, or some other cleansing agent also destructive to insect life. Any labour so expended is rewarded by a decrease of failures.

A NEW RACE OF CYCLAMENS.

Or late years there has been originated a distinct large-flowered form of Cyclamen, which has been appropriately termed giganteum. The flowers are large and well formed, the florets long and broad, and the foliage and habit of growth in keeping with the unusual development found in other parts of the plants. In 1870 Mr. Edmonds, of Hayes, introduced giganteum, a form of great beauty; and in the spring of the present year a variety called magnificum, the subject of our coloured illustration, and for the opportunity of figuring which we are indebted to that gentleman. Mr. Clarke, Twickenham, also produced superbum, a very fine variety, in 1873. The bold character of these types single them out for special notice, and they are originating a race that will be of great value for decorative purposes. The varieties will no doubt extend as each season's seedlings come into bloom, and it may be expected that the large-flowered race will ere long embrace the range of colours found in the colder and smaller flowered types.

The Cyclamen is a free seeder; and from the peculiar construction and position of the flowers, they can hardly help fertilising themselves. In saving seed, the cultivator should select as seed-bearers, plants having compactness of habit, allied to finely-coloured flowers, possessing broad, stout florets; or a plant having flowers possessing some of these qualifications should be crossed with the pollen of other good flowers. Mr. Clarke, Mr. Edmonds, Mr. Little, and Mr. H. B. Smith have all done wonders in the direction of producing high-coloured flowers of a fine shape by judicious crossing. When the flowers are fertilised they are carefully marked, and screened from the delicate attentions of bees and other insects.

HOW TO RAISE NEW VARIETIES.

"The best time," writes one who has been greatly successful as a cross-breeder, "to fertilise the Cyclamen is as early in March as possible, but it may be done as late as April, although I consider the later it is done after the first week in March the less chance you have of obtaining the wished-for result, as all flowering plants are more or less fertilised and hybridised by insects and other agents in the spring and summer months. While the sun shines is the best time to cross the Cyclamen, and it should be done in the following manner:—Having selected a plant as the male parent, possessing good-shaped flowers, take hold of the stalk between the left finger and thumb, just below the flower, and with the right thumb flip the side of the bloom, and you will find the pollen lodged on the thumb-nail. Then apply this pollen to the blooms of the plant that has a good habit and a stiff, well-marked foliage, which should in all cases be indispensable in the seed-bearing parent. In performing this operation some care is required, as the parts of the flower are extremely delicate, and will not admit of much rough usage. The pollen should be gently applied to the stigma, and it will be found that at least a small portion has adhered, which is all that is required. I do not think it advisable to cross the ordinary form of *C. persicum* with a deep-coloured flower, except to obtain variety; but endeavour to keep them distinct, and improve each variety separately. However, if you have a flower combining good shape and high colour, but nothing else to recommend it, use this as the male parent, and cross with it another coloured flower possessing good dwarf foliage, and the result in most instances will be an improved habit, combined with a first-rate bloom. Endeavour to cross scented flowers, so as to get a heightened perfume. Not more than six flowers, on

even a large plant, should be allowed to seed, for if a greater number be retained the seed will be small, and the plants obtained from it in all probability be wanting in that vigour which is at all times an important item in the raising of seedlings. After fertilising the six best blooms, all others should be at once removed, and the plants put in a rather shady part of the greenhouse, but still having as much light as possible, and no place can better suit them than a shelf protected from the hot sun by woodwork, about 1 foot or 18 inches from the glass."

Some have condemned the practice of the Floral Committee of the Royal Horticultural Society in giving First-class Certificates of Merit to fine varieties of Cyclamen on the ground that any particular one cannot be propagated. This is altogether beside the question, even apart from the fact that cultivators have demonstrated that a particular variety will to some extent come true from seed. Any one who is successful in improving any particular flower deserves that his work should be recognised, and that entirely apart from commercial or other considerations. The highest recognition of the services of a raiser is found in awarding First-class Certificates to his productions. Even if it were certain that a new plant of high-class quality could not possibly yield any increase, that is no valid reason why a First-class Certificate should be withheld if deemed worthy of it; and, slightly altering a striking passage in the works of Fichte, it may be truthfully set forth that "The peculiar nature of the florist's occupation consists in this—that science, and especially that side of it from which he conceives of the whole, shall continually burst forth before him in new and farther forms. Let this fresh youth never grow old within him; let no form become rigid and fixed; let each sunrise bring him new joy and love in his vocation, and larger views of its significance."

CERTIFICATED VARIETIES.

The following varieties of Cyclamen persicum have received First-class Certificates of Merit:—

1870. giganteum (Edmonds)	1874. Meyer (Little)
grandiflorum (Edmonds)	Prince of Purples (Little)
1871. Queen of Crimsons (Little)	Rose Queen (Little)
1872. Snowflake (Little)	1876. Purple Gem (Little)
1873. friariorum (Wiggins)	1877. rosem grandiflorum (Edmonds)
1873. giganteum superbum (Clarke)	giganteum magnificum (Edmonds)
White Perfection (Little)	White Sun (Edmonds)
	Brilliant (Clarke)

This list may not be altogether complete, but it represents an attempt to give these flowers so distinguished in their chronological order.

It will be observed that one variety with frimbriated petals has been awarded a First-class Certificate. There is no reason why the frimbriated edge should be regarded as a disfigurement, or the smooth edge as the *Ne plus ultra* of perfection. While the florist looks chiefly to the smooth edge as representing his ideal of beauty, the frimbriated edge—as in the case of the Chinese Primrose, for instance—is recognised by him, and there is no reason why the Cyclamen should not be so privileged. Let us have all the variety we can in this attractive and useful flower, and not fetter the hands of raisers by setting up inelastic and arbitrary rules. The *Properties of Flowers* might be revised with considerable advantage to floriculture.

HARDY CYCLAMENS.

THE hardy species and varieties of the Cyclamen must not be altogether overlooked in this relation. There are *C. europæum*, the European species introduced from Switzerland in 1595, which bears reddish purple fragrant flowers. A form of this under the name of *Pækeanum*, from Holland, was awarded a First-class Certificate by the Royal Horticultural Society in 1865; *C. coum*, from the Greek Archipelago, flowering from December to March, the flowers pale rose purple; *C. hederifolium*, the Ivy-leaved Cyclamen, flowers pale pink rose, which is valuable for blooming in sheltered places during the autumn and winter months, especially under the shelter of tall trees; and *C. vernum* or *repandum*, from Southern Europe, blooming in April and May, the flowers pink changing to purple. Mr. James Atkins, of Paisnwick, Gloucestershire, a great lover of these hardy Cyclamens, has done something towards improving these beautiful forms, having raised, among others, *C. coum album*, awarded a First-class Certificate by the Royal Horticultural Society in 1868;

and *C. Atkinsii*, obtained from *C. coum*, hybridised with the pollen of *C. persicum*, the which, for profusion of bloom, fine colouring, and amplitude of beautiful leaves, is considered to surpass all the hardy Cyclamens.

Certain writers of a lugubrious turn of mind are found asserting that there is a marked decline in the cultivation of florists' flowers, whatever that statement may mean. It is much easier to generalise in this way than to substantiate the statement. Each generation of gardeners and lovers of flowers has its favourites, and there is a kind of unwritten fashionable rule in floriculture by which some subjects have their seasons of prominence and of apparent neglect. Some come to the fore while others fall aside, but are not wholly forgotten or altogether overlooked. Their day will

RAIKES' FAN-BOUQUETS.

THIS novelty in fans was designed about two years ago by the proprietor of the floral depot in Baker Street, Portman Square, and shortly afterwards he sent me the photographs, from which Mr. Worthington Smith has prepared the excellent engravings which accompany these notes. Upon my mentioning to Captain Raikes that I should like to say a few words in the *Gardeners' Chronicle* about the construction of these bouquets, he subsequently sent me one, the lasting powers of which were duly and practically tested at a ball, where its lightness and elegance were greatly admired, and where other bouquets of the ordinary type looked heavy and uncomfortable by comparison; in short, if bouquets had noses, and if

by a strip of swansdown, which is also carried along the straight edge of the board. Upon the semicircular space within this belt of swansdown are sewn three puffs of the same satin-ribbon, and the interstices are filled with pieces of swansdown, so that the whole surface of cardboard is concealed.

The floral part of the bouquet (which I pulled to pieces) consisted of the following:—Five sprays of *Dendrobium nobile*, five blooms of *Epiphyllum*, three *Rosebuds* (*Safrano*), three spikes of white *Lilac*, three of *Astibe japonica*, three spikes of Roman *Hyacinth* and three of *Lily of the Valley*, and a few *Neapolitan Violets*. The foliage behind the flowers consisted of fifteen fronds of *Davallia tenuifolia* laid upon a fan composed of five variegated *Croton* leaves, each stiffened with strong wire; the foliage amongst the

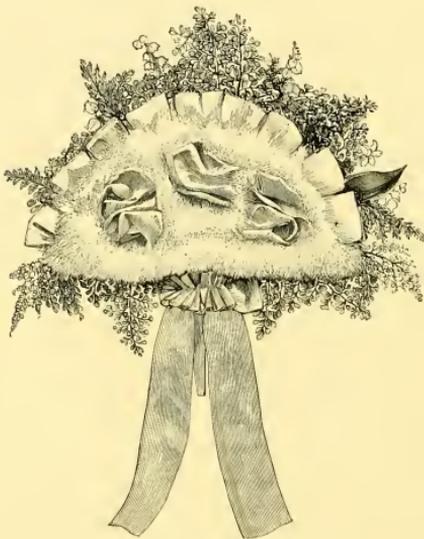

FIG. 2.—RAIKES' FAN-BOUQUET: REVERSE SIDE.

assuredly come again in the onward progress of time. As long as there are beautiful flowers, there will be hearts full of love for them, and delighted natures to tend them and bring them to perfection; and some that fall aside from the highways of floriculture are never or very rarely indeed wholly lost, for up and down God's earth there are those who tend them for their own sweet sakes, caring for them till some day they shall surely emerge again into a fuller sunshine of more general solicitude, challenging and compelling attention in newer and fairer forms, and more eloquent manifestations of beauty. *R. D.*

FLORAL HYGROMETERS.—Artificial flowers called barometers are being now exhibited in the London opticians' shops. When exposed to sun and dry air the petals become deep blue; when the air is saturated with moisture they become pinky.

noses had joints, there must have been a good many nasal dislocations on that occasion.

As might be expected from a glance at the engravings, Raikes' fan-bouquets are made in two parts, one being a flat arrangement of flowers and foliage, the other being cardboard covered on one side with satin and swansdown, and these two parts are fixed back to back. Let me first describe the latter part of the bouquet sent to me. The cardboard is a semicircle of 10½ inches diameter, of a firm consistency, without being hard, and one-eighteenth of an inch thick. To this is sewn a stout piece of galvanised iron wire, one end of which forms part of the handle of the bouquet. Around the curved edge of the cardboard there is a fringe, which consists of a quilling of white satin ribbon; the ribbon used is 2 inches wide, and the quilling, which projects 1½ inches, is stitched on to the board. The stitching is covered

flowers consisted of three small fronds of *Adiantum farleyense* and fifteen of *A. cuneatum*, of which last ten were dark green and five were light.

It would occupy more space than you could spare if I were to describe exactly how every flower was arranged; suffice it to say that almost every leaf and flower was wired, and that many had a little damp moss bound round each stalk. When I had released them of their wires the next day, I counted up thirty-seven *Camellia* wires, twenty-eight "stubs," and fine binding wires innumerable.

It will have been observed that the back of the cardboard, and the back of the floral part, were both furnished with stout wires. By slightly curving outwards these two sets of wires, the semicircular edges of the two halves of the bouquet are brought into close contact as soon as the respective handles are tied together, and there is no need for any further

fastening. A bow and ends of white satin ribbon form the finishing touch to the handle, which consists mainly of wires covered over with white paper or common ribbon.

Inasmuch as no part of the bouquet was more than 4 inches thick, it proved to be much lighter in the hand than the engravings would lead one to expect, and much surprise was expressed by several who took up the bouquet at finding how light it was. Next to the advantage which this flat form of bouquet has over the common round form in its lightness, there is this important difference to a lover of flowers—that when the bouquet is laid down, not a single flower or leaf is bruised, injured, or put out of place.

Lastly, these bouquets pack and travel much better than round ones, each going into a pasteboard

FLORA IN THE HOUSEHOLD.

The use of plants and flowers for decorative purposes on all occasions of ceremony, joyous or sad, has prevailed for ages. With the ancients Roses appear to have been principally employed; in the Book of Wisdom it is written, "Let us crown ourselves with rose buds before they be withered;" and the Romans exalted the Rose above all other flowers as a decoration, Cleopatra having, it is said, expended a talent (upwards of £200) on Roses to grace the feast to be given to Marc Antony, the banquet-hall being strewn knee-deep in flowers. Even this lavish use of flowers was surpassed by the Emperor Nero, who spent 4,000,000 sesterces (about £30,000) on Roses for one supper, not only the couches and apartments

Temple. They carried baskets of flowers in their hands, and wreaths of Myrtle encircled their heads.

In other times the Rose was introduced at feasts, not merely as an ornament, but as a symbol that all conversation held under it was to be kept private. Thus has arisen the saying "*sub rosa*." The practice of thus suspending a Rose over the heads of the guests is said to have had its origin from the fact that this flower was in ancient times dedicated to Harpocrates, the Egyptian God of Silence.

We have certainly improved upon the Romans in point of taste; we do not limit our ideas of indoor floral decoration to the use of one flower, we seek subjects of embellishment in almost every clime, and so modify the surroundings that we find plants decorating one apartment which have required divers condi-

FIG. 3.—RAIKES' FAN-BOUQUET.

box made to fit it, and merely requiring the handle to be tied to the bottom of the box.

Not long ago, Mr. John Day, of Tottenham, was kind enough to send me a box of very choice Orchids, out of which I made my first attempt at this form of hand-bouquet, and the result was so eminently successful, that I shall never again willingly make another Cauliflower-headed one. In former years, when Orchids were less frequently seen than they are now, I have more than once enumerated in your columns the beautiful varieties which have graced many a flower vase from the rich collection at Tottenham. Perhaps it would be more charitable on my part now to confine myself to the statement, that those which formed my fan-bouquet are not procurable in any flower-market, and doubtless then made their first appearance in a floral fan. A list of them would make some people jealous; so I refrain. *W. T. T.*

generally, but even the porticos and courtyards of the palace, being thickly strewn with the beautiful and fragrant blossoms. Nor were Roses employed solely on festive occasions; for Cicero in one of his orations, inveighing against the luxurious habits of the Verres, says that he made the tour of Sicily seated on Roses.

In the profuse use of flowers, thus cast in heaps upon the ground, to be soiled and trodden upon, there is a marked display of barbaric splendour, but no evidence of refined or cultivated taste; and it may be well conceived that such floral decorations were employed rather as a medium for the display of wealth than as a means of adding grace, sweetness, and beauty to the festival.

When the feast of Bacchus was held in Greece, flowers were strewn in front of the procession of virgins as they wended their way towards the

tions of growth; nor do we think it is claiming too much for London to say it is the great centre where the art of floral ornament is studied and carried out to the highest state of perfection, standing in this respect above all the other cities of the Continent, not excepting La Belle Ville de Paris itself. Roses have long been considered a *specialité* of French growth, yet greatly as the French florist has excelled in the cultivation of new and beautiful varieties of this favourite flower, when the Empress Josephine required a rosery choice was made of an Englishman (Mr. Kennedy) to lay out and plant the famous grounds of Malmaison; our national taste in floral arrangements has been long esteemed, both at home and abroad; for "English gardens," or the natural style of landscape gardening as it is sometimes termed, has been in favour ever since an improved taste in horticultural matters discarded the barbarities of the early Dutch fashion:

that which we then did for outdoor gardening, we are now doing for indoor horticulture, making it

"An Art

Which does mend Nature: change it rather, but
The Art itself is Nature."

We referred in the beginning of this paper to the hough-pot or Bean-pot of our forefathers; there seems to be some doubt as to the origin of the term, some believing that by hough-pot was meant a receptacle for cut flowers or houghs, others deriving the word from the French Bean-pot, since corrupted into bow-pot, meaning an ornamental vase in which growing plants were placed; for ourselves, we incline to the latter idea, and so consider the modern window garden, with all the addenda of Fern-cases, miniature conservatories, jardinières, &c., as the outcome of the old-fashioned Bean-pot.

But it is not alone as window ornaments that floral decorations have become popular; reception rooms on all festive occasions have become veritable indoor gardens, glowing with the brilliant colours of exotic flowers, graced by the feathery Palms and varied foliage of tropical countries, and replete of the perfumes of Persia and Araby.

From a domestic art practised by the ladies of the family, and limited to the arrangement of growing plants in windows and cut flowers for chimney-pieces, &c., floral decorations have grown to magnificent dimensions, and we have princes in the art of embellishment by living plants, as we have in many other departments of trade and commerce. Foreign potentates seek the aid of English artists to beautify their salons, and decorate their reception rooms now, as they sought the services of an Englishman for the out-door garden in the time of the Empress Josephine. If memory serves us truly, the present style of floral decoration, with its preponderance of graceful foliage, its pleasing abundance of cool and refreshing green, its trickling fountains and miniature cascades, had its origin in the prettily arranged Ferns and cooling jets d'eau, which were such an attractive novelty when the late-nineteenth century gave his popular entertainment, "Mont Blanc." The suggestion of plants as ornaments at all entertainments doubtless came from France, whence, no doubt, we obtained our first ideas of window gardening, for the very word *jardinière* is suggestive of the nation pre-eminent for artistic creations, and while the hideous oblong boxes on rickety legs were still keeping a place in English mansions, the Parisian *jardinière* was daintily constructed of Tulip wood inlaid with pretty Watteau-like pictures of a round or oval form, strongly supported on a pedestal of ebony relieved with ormolu. Instead of a few plants in the centre of a desert of soil, choice sweet-scented flowers were tastefully grouped in a surrounding bed of damp moss, the latter serving a twofold use—beauty and ornament. Although probably suggested by our neighbours, our indoor gardening has far outgrown the French limit; it has become a fashion to beautify our homes with living plants, and these whose tastes are not checked by a want of means to indulge them now revel in drawing-rooms, which emulate eastern gardens in a display of fresh blossoms, and conservatories which display miniature pictures of tropical forests. T.

A GARDEN ON THE HEARTH.

There is, we imagine, scarcely an English man or woman who does not cling fondly to that distinctive British institution—an open fireplace. During winter, the open fire, with its glowing coals and dancing flames, is a thing of beauty, and the greatest enjoyment of the season; but when our fickle climate has passed through its alternate arctic and equatorial phases of spring and early summer, and we have arrived at the conclusion that really the days are beginning to be longer—at such a time we generally have a spell of heat for a few weeks, which compels us to leave off fires; then housewives begin to look anxiously round for some pretty or novel design to form a screen to the unlightfulness of the empty fireplace, which, however ornate in character, always obtrudes itself upon the light, and mars the surroundings of a prettily furnished apartment.

The days of paper aprons, formed of stripes of tissue of many ill-assorted colours, are past, but these have been replaced by designs, but little less hideous in poorer homes; while the drawn muslin and

artificial flowers employed by persons of greater means, only become dirty and tawdry in a few days; or, to prolong their purity, the register of the stove is closed, and so the air of the apartment is rendered more close and unhealthy than it might otherwise be. In Lancashire, where intricate designs or gorgeous colouring in paper do not find favour, three or four handsome lumps of coal are found, and these being made to shine as brilliantly as possible with a thick coating of blacklead, a fire is laid, and masked with the pieces prepared for the purpose. In a county where to be house-proud is to possess one of the greatest virtues, it is almost needless to say that the whole fire-place, with its attendant fender and irons, shines like silver; but no degree of polish can take off the cold, dreary look of a grate which contains an unlit fire, and the chimney corner so eagerly sought for during winter is shunned during summer. But even during summer a comfortable, cold grate need not disfigure any apartment in the house. The old notion that flowers were unhealthy and vitiated the atmosphere of the rooms in which they were growing has been quite exploded. We have found that plants purify the air, and, such being the case, we would advise all who can possibly accomplish it to replace the comfort-imparting fire of winter by a beauty-imparting garden on the hearth during the hot weeks of summer.

When the well-known cry, "Any ornaments for yer fire sto'!" is heard in the streets, we may be pretty well sure that the flowers are blooming out in the country, and of these far more elegant and less costly decorations may be made, than any formed by the most expert fingers of the most tasteful artist.

At the present time the most beautiful of our flowering shrubs and some of our forest trees are in blossom, and a screen formed of boughs of Lilac, Laburnum, Hawthorn, or Chestnut, with some large leaves of the common Fern, is a beautiful and perfume-diffusing ornament for the fireplace, as much in keeping with the surroundings of a cottage parlour, as with the more costly furnishings of a drawing-room or a boudoir. We have mentioned these flowers first, as they are now in season, and because a gigantic bunch of Lilac placed on the bare hearthstone of a Parisian fireplace, suggested to our mind, many years ago, the feasibility of replacing the dust-accumulating devices of paper-aprons, &c., by something more easily changed, more suitable to the season, and more beautifying to the room. We need not, however, limit our ideas of "the garden on the hearth" to flowering shrubs; every garden, every field, almost every common or hedgerow bears something suitable in flower or foliage; all that is necessary is the energy to find plants, and the taste to arrange them when found. When branches of flowering shrubs cannot be had, monster bouquets may be made of some of the commonest wild flowers, such as wild Geraniums, Lady-smocks, Buttercups, wild Hyacinths, dead-nettles, Gorse, Broom, and any of the handsome leaves which may be found from early spring until autumn in every lane and on every wayside bank. In employing wild flowers for the purpose it is absolutely necessary to bear a few primary rules in mind; the plants must be sufficiently long in the stem to bear placing in a deep receptacle, without any danger of their toppling over; they must be in sufficient quantities to make a mass of one colour, not frittered away in unmeaning dots of blue, yellow, and red; and the vase must contain sufficient foliage for green to predominate; it is Nature's own colour, cool and refreshing to the sight and always welcome.

On the banks of fields the delicate green, deeply serrated leaves of the Cow Parsley, and the fine foliage of the Hemlocks, Hogweed, and similar large-leaved weeds, are almost always to be had; falling these the forest trees will furnish a supply.

Those who reside near streams need scarcely lack a most charming bouquet throughout the summer, for the large free-growing Forget-me-Not, found so abundantly in moist places, will not only live, but unfold fresh flowers while in water. We have made an excellent effect with a large bunch of Myosotis in the centre and Creeping Jenny and leaves from the water-side arranged to fill over the vase, so as entirely to hide the common receptacle in which the flowers were placed. The Forget-me-Not will flourish continuously for two or three weeks if kept supplied with sufficient water, but the flowers grow very pale by degrees, from being kept in a position where there is not sufficient light. The wild yellow Iris of our rivers and ponds is magnificent either alone with

foliage, or introduced among Myosotis. In the centre of towns, where wild flowers cannot be obtained, and there is no garden to supply plants, a few common things, such as Wallflowers, Stocks, &c., can generally be had for two or three pence, and these, with care on renewing the water to keep them fresh as long as possible, will not, at the end of the season, have amounted to a larger sum than is generally expended on an ordinary fire-grate ornament.

We would not, however, limit ourselves to cut-flowers. The garden on the hearth may be made of growing plants in pots. The situation is a trying one, being far from the light, and draughty, but there are many subjects sufficiently hardy to brave these two drawbacks to plant-life during the few weeks of our summer, when fires are not required, and almost unlimited scope may be found for tasteful and artistic arrangement.

Some pretty climber, like the Japanese Honey-suckle or small-leaved variegated Ivy, might be kept in a pot for the purpose, and trained on sticks to form a background to a group of bright scarlet Geraniums, the pots of these being hidden by some creeping plants. Lycopodiums do excellently, never appearing to suffer from the ineligibility of the spot for plant growing.

The Virginia Creeper, Ivy, Geranium, and many other of our popular summer garden plants, are suitable; to give a long list were useless, for the arrangement of the garden on the hearth must depend upon the resources and taste of the designer. It may be formed of glowing exotics gathered from the glass palaces of the wealthy, or it may consist of a bunch of wild flowers culled from Nature's garden treasures, which may be obtained at the cost of a country ramble. J.

AMATEUR GARDENING.

THE USE OF LEAVES.

IF roots, as we said in a former article, are important as the plant mouths, leaves are no less so as the lungs and digestive organs. The vigour of the flower and seed, the success of the cutting, or of moving, all are connected with what the leaves have done or are doing.

Fluid gathered from the ground and gases from the air are changed inside the leaf into the living food of the plant, and the disassembles from cutting kitchen garden crops till they are weakened past use, clearing away leaves in the flower garden whilst yet green, and the miserable condition of drawing-room plants, are often just so many examples of what comes of cutting off food, or the power of forming it.

Take a leaf and tear it. It is made of thin skin outside, green granular substance inside, with fibrous

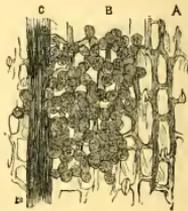

FIG. 4.—THE WORKSHOPS OF A LEAF MAGNIFIED.

veins usually in a network. Under the microscope these parts all show as made up of separate bladders or cells, as in the figure of a piece of the leaf of Sweet William magnified; those of the skin flat and colourless, with occasional small openings amongst them (A); those of the green granular mass roundish and loosely packed together (B); whilst the spindle-shaped and long cells or vessels forming the tough fibres of the veins (C) and leaf-stem give support to the leaf, and connection with the bark and inner part of the stem.

Here is the living machinery: fluid with the plant food in solution flows to it from the root; gas is imbibed through the thin outer coat from the air, and, under the influence of sunlight, colouring

matter is formed in the green cells, and starch and the various matters that build up the plant structures are formed or deposited, whilst the spare moisture from the fluid constantly bringing in the supplies from the root is given off by evaporation through the skin.

WHY PLANTS SHOULD NOT BE MOVED IN HOT WEATHER.

In this evaporation we have the reason why plants do not move well in dry sunny weather, and of the second item of the metrical maxim—

“This rule in gardening never forget—
To sow dry, and to plant wet.”

• The gardener puts out his plants on a damp day. If the sun comes out they droop—and why? Because all the moisture evaporates, and the newly disturbed roots cannot supply it as fast as it is needed; and the leaf is overheated for want of the evaporation that keeps it at a proper temperature, consequently it droops and dries, and very likely dies.

Therefore we move plants when there is moisture in the air, but not hot sunshine to dry up their small supplies; or we shelter them from the sun-rays, that in the cool dark shadow there may be little evaporation and they may suffer no check till the roots can resume work.

WHY PLANTS REQUIRE SHADING.

Whether we call it transpiration or perspiration, the plant or the labourer exhausted by loss of moisture through the skin in the sunshine are in much the same case, but the remedy is different. The labourer needs drink simply to restore it; with the plant we shade rather than give much water, because the leaf system works in the sunlight, and water and sunshine together would force on the growths, which are already beyond the supporting powers. Here we need only to keep what we have got in health till the roots are right again.

For the same reason small climbers suffering from over-exposure on a hot wall may sometimes be restored by simply placing a quantity of Ivy so as to form a mass up the wall close by their side. The thick mass of leaves gives a reservoir of cooler air, stops some of the glare of reflected heat, and gives shade occasionally, consequently diminishes the over-evaporation.

In the case of rooting cuttings, moderate light and damp surroundings carry on the same process; and even a hole in the earth deep enough for flower-pots to stand in, so that the cuttings in them may be beneath the ground level, with a hand-glass over that can be shaded, is a simple apparatus that is often very successful. Thorough draughts and hot, dry rooms are both bad for plants from simply drying the leaves.

WARD'S CASES.

Ward's cases do not always meet the difficulty, for we wish to have beauty and scent to enjoy at our ease rather than a great affair of glass and metal with a vision in a mist inside. Something may be done by occasional airing, or damping in a shower outside the window, but perhaps nothing does as much good as a thick coat of fresh moss laid on the surface of the pot; its light spongy mass lets the water (with which it should be kept constantly moistened) evaporate in good quantity, to the great benefit of the leaves above, and in itself it is very pretty.

We must be content to sacrifice some plants to our own love of their beauty, but by choosing what may suffer least, keeping them as short a time as possible in the house, and on no account whatever letting them remain on their passage in the hot, dry air of the kitchen, something may be done.

ACTION OF LIGHT.

Another point to be borne in mind is, plants need light. Under the influence of sunlight the viscid fluid that fills the cells beneath the outer skins of the leaf changes, and is re-formed into the green granules that colour it, and is re-formed into the green granules that colour it, the cellulose that builds the walls of the multiplying cells, and the starch and other materials that, dissolved in the flowing sap, nourish the plant. Without daylight we have the white growth of the grass under a turned-down cloud, or of *Senkale* in the bleaching-pot—a growth that goes on for a time but comes to nothing healthy, and shows in its pale tint the absence of the material that gives the colour, and changes into various kinds of plant food; a growth, in fact, that is often apparent rather than real, consisting in a stretching of the old rather than a formation of new fabric.

HOW TO GROW SEEDS AND BULBS.

Therefore seed-pans put in dark holes and corners should be brought to light as soon as the seeds begin to come up. The adage “So thick sown, thin soon enough,” should be carried out in both parts with regard to clumps of seedlings, or there will only be a sprinkling (as in figure 5) of plants thriving from having gained light and life together in the race for existence, with the rest choked below. Bulbs put in so deeply that their leaves are blinched, shoots and leaves buried under manure carelessly thrown on the

FIG. 5.—THE BATTLE FOR LIFE.

border, and shoots of herbaceous plants “drawn” from being so crowded that sunlight cannot get properly between them—all tell the same tale.

RESPECT THE LEAVES!

Some plants, such as Ferns, Periwinkle, or Ivy, do not require much light, but generally speaking, if the bush or plant is to prosper the leaves must have plenty of daylight, and some degree of direct sunshine. Whilst the leaves are green the plant is probably well. The pale hue of sickness shows something is amiss, and the hint should be followed out, and no account should the leaves be stripped whilst the green colour continues. Rhubarb and Asparagus in the kitchen garden, wall fruit trees, and Hyacinths, Crocuses, and spring bulbs are especial sufferers: for house supplies—to strengthen the trees!—far “tidiness” of come the leaves, and the plants suffer accordingly. The leaves that make the plant food and spread it, being taken away, the plant is starved, new bulbs must be bought, over-cut crops are weakened, and the Peaches are bad, besides what happens to the bearing wood for want of its food.

As long as the leaves are green they should be carefully preserved, not in over-crowded masses, but according to their method of natural growth. If the plants are squeezed up close together, or trimmed back with shears, there will often be a mere crust of leaves outside with bare boughs inside, as in diagram A (fig. 6), whilst if allowed to grow, or trimmed into natural shape, letting sun and air into the centre, there will be a larger surface exposed, as at B, and a healthy growth. With the change of tint—the brown of decay, the gold and red of autumn—the leaves may be removed; the green granules have

FIG. 6.

broken up, the food is stored elsewhere, the work of the leaf upon its stem is done.

Other circumstances, such as the nightly absence of light, have very important effects on leaf-action, consequently on plant growth: but as darkness returns regularly, whilst the light of day is not so certain of admission to the plant, practically it does not require the same notice.

What the amateur has to bear in mind is, that what the leaf imbibes as gas and fluid from air and earth, is changed in its cells under the action of sunlight to plant-food. This builds the cells and fills them, consequently nourishes the flower, the fruit, and the growing shoots, and lays up the store for future use; and, according to the healthiness of the leafage, so will be the prosperity of the plant. O.

THE GARDENING EXPERIENCES

OF MR. MULBERRY GILLYFLOWER.

I HAVE BEEN making a study of gardening literature as it is found in catalogues. I have obtained lists from leading nurseries and seedsmen, and I find half-a-dozen of them so full of matter as to suffice for a lifetime. I am astonished at their size, at the brilliancy of their gaudy illustrations, at the quantity and variety of their contents; and at the usefulness of human nature seen in the spontaneous offering of so many unsolicited testimonials on the part of so many disinterested individuals which are found in those catalogues, among other considerations of a scarcely less weighty character; and I have properly passed when induced to compute the cost of five thousand copies; contenting myself with estimating the value of the postage—for one copy cost in postage the sum of twopence-halfpenny when sent to me. I have no desire to underrate the value of the information given in these elaborate works; but in my own case I found it utterly bewildering.

And why? Because to a great extent I am ignorant of flowers. I wanted a few pretty things for my little garden, and I turned to one of these catalogues for information. It was there, no doubt, but I failed to find anything suited to my necessities. I was recommended to grow a few *Asters* and *Stocks*, and I turned to the former and found about a dozen kinds, all highly recommended, but which was I to choose? I turned to *Stocks*, and here again was a similar number, and all more or less praised by the vendors. I also found that *Stocks* and *Asters* alike (at least those that were most highly recommended), were sold in what seemed to me to be needlessly large “assortments,” as they are termed. Then the details given for raising the seed might have been understood by a gardener acquainted with the technicalities of his profession, but they rather damped my floricultural ardour than otherwise. I felt that the anticipated pleasures of my garden existing in my imagination were rapidly receding to a distance, and I said, “Where shall such a perplexed one as myself turn for counsel in my gardening extremity?”

Then I thought me of the adviser whose counsel had proved of so much benefit at the time of planting, and he recommended me to grow two of the many *Asters* offered, viz., the *Victoria*, for its large, full, and perfect flowers; and *Boltz's Dwarf Bouquet*, because dwarf and branching in growth, and so useful as decorative border flowers, and a cut flower. Instead, therefore, of purchasing an assortment of each of these *Asters*, I obtained a mixed packet of each, and I was informed by the vendor that the quality of the seed in the mixed packet was equal to that contained in the assortment. Then of *Stocks* I was recommended to try the large-flowered *German*, which I was informed would give me all I required. In this way I obtained my seed.

The directions for raising *Stock* and *Aster* seed given in the catalogues were in all probability faultless, but they were written for those who may be supposed to be in possession of cold frames, &c., or a greenhouse or hotbed in which these things could be raised with but little trouble. To get seed-pans in which to sow the seed was an easy task, so it was to get some soil as recommended; a neighbouring jobbing florist supplied these, but when it came to the matter of a position for my pans after the seed was sown, I was somewhat at a loss.

HOW I MADE A FRAME.

I thought, however, I could not do better than endeavour to construct something like a frame. In one corner of my garden laid some brick rubbish, which was gathered together and piled up so as to form a foundation, and on this was placed a layer of rough cinder-ashes. Then some pieces of rough boarding were placed round the outside of the foundation, but reaching a foot and a-half above it, and sloping from back to front, as in the case of an ordinary frame. By this means I got my bed, but now arose the difficulty of a suitable covering. I thought me of some light white covering stretched across a wooden frame, but it would scarcely answer, as I was informed it would exclude too much light when it was much needed, and also not be sufficiently impervious to wet. Then I determined to have a rough sash constructed and glazed with glass, which was done, and thus the framework of my homely bed was constructed. The bed now required completion, and some rough soil

was laid over the ashes, and on this some finer soil, till it was within 9 inches of the glass. I took care to provide proper fastenings for my light, to preserve it from being blown away by the wind.

This much done, I thought I was in a fair way to the accomplishment of my purpose.

I SOW THE SEED AND WATCH.

Next came the work of sowing the seed. Advised thereto, I took care to have my seed-pans with holes in them round the bottom, so that the water that freely pass away. In the bottom of the pans I laid some crocks, then a layer of charcoal broken fine, then a little rough fibry loam pulled to pieces, and, lastly, my fine soil. It was then pressed gently down, the seeds sown thinly on the surface, and lightly covered with some of the finest of the soil, again gently pressed down till the surface was smooth. The whole was then very carefully moistened with water.

The pans were next placed in the frames, and a piece of glass large enough for the purpose placed over each, and the light covered over the top. As the weather was dull and cool at the time, no shade was necessary, but when a gleam of warm sunshine shone out, a piece of newspaper was laid on the pans in the frame, and some air was given at the top by means of lifting the light; but all the time the nights were cold it was carefully closed down.

I was much interested in my experiment, and gave my venture daily attention. Presently the seeds grew nicely, and as they made advance the glass was gradually tilted on one side and finally removed altogether, and the pans raised on bricks to bring them near the glass. And here I may observe that my success in raising a good crop of plants, in having them stocky and strong, and free from mildew, and undiminished by losses from any cause, was entirely owing to constant attention being given at the time the seeds were germinating. Of the thousands of failures with seeds that occur annually, the very great majority of them is traceable to neglect, not so much a wilful neglect as that of failing to give frequent attention, and thus it is blame is cast on seeds and on the vendors of seeds that should be borne by the cultivator.

As soon as the plants were large enough, they were pricked out singly in the bed in which the plants were raised, and being kept close for a few days, have made good plants, and are now in their places out-of-doors. The recent rains have given the plants a good start, and, as they will receive every encouragement, they should be all that can be well desired when the time for flowering comes round.

I LAUNCH OUT MORE BOLDLY.

But my homely frame has been turned to another account. When I saw how well the Stocks and Asters were doing, I thought I might attempt something further, and a gardening friend made me a selection of half-hardy plants that, if raised, would come in useful for bedding. It necessitated the procuring of other pans, but my garden being small, and my requirements by no means large, I was enabled to sow two lots in each pan, laying a slight piece of stick across the middle as a dividing line. I have sown *Ageratum Imperial Dwarf*, *Alonsoa Warscewiczii*, which I am told is a beautiful plant, too much known in these days; *Balsam*, *Petunias*, *Phlox Drummondii*; *French*, *African*, and *dwarf Golden Marigolds*, *dwarf* and *tall Nasturtiums*, *Thunbergias*, *Amaranthus melancholicus*, *Rubra*, *Pellia nankinensis*, and *Centaurea candidissima*, for bedding; *Verbena*, and some *Everlastings*, viz. *Aztecum* and *Blue*. Some of these grew plentifully, others more sparingly, but all sufficiently well to give me a crop of each. My hands have been full in getting the forwardest plants pricked out where it was possible to find room for them in my frame, potting off a few, and placing some in the open ground. In this way I have obtained quite a choice assortment of summer-flowering plants, and though I am acquainted with some of them, there are others of whom I have but little knowledge; and, according to the catalogues, they have many charms to commend them to my attention.

I have come to the conclusion that it is a very pleasant occupation in gardening to begin at the beginning; that is, to purchase seeds and raise them, trusting to attention and the chapter of accidents to bring forth a precious harvest. As my crops grew up, as they were, amid the kindness of imprudently known, I have been kindly and gracefully led by my instincts without much blundering or many false steps. The experience so gained is an almost priceless possession to an amateur gardener endeavouring to master the alphabet of the occupation; and so long as there be in the human heart some germs of a kindling love for flowers, so surely will the pursuit of gardening life for this regard till it burn brightly.

MIGNONETTE.

THE origin of the common garden Mignonette is somewhat involved in obscurity, the subject so far as we know never having been satisfactorily cleared up. It is said to be a native of Barbary, but nothing is known about the plant in a wild state. I appear to have been introduced many years ago into the south of France, where it was welcomed by the name of Mignonette—Little Darling, and is said to have been brought to England in 1742 (by Paxton as having been introduced in 1755), which if the dates are correct, prove Sir Walter Scott to have been in error, when he introduced the plant into his novel, *The Fortunes of Nigel*, as decorating the London windows during the reign of James I. However that may be, it is certain that the fragrant weed soon became as popular in this country as in France, and may now be considered as a naturalised subject. Of its cultivation in the open air we need say nothing, but as its successful culture in pots is not of very common occurrence, except amongst the large growers for market, we may state in a few words that one of our most extensive growers, Mr. Reeves, of Acton, sows the seeds during the months of August or September. The size of pot employed is the favourite "48," and after covering the

FIG. 7.—MIGNONETTE FOR MARKET.

crocks of these with good rotten dung to the depth of 1 inch, they are filled with any ordinary garden soil that the grower can get. The soil is pressed down tolerably firm, and the seeds are sown sufficiently thick to allow of their being thinned out to about four or five plants in a pot. After sowing, the pots are placed in a cold frame, where they remain all winter, and during the duller months only sufficient water is given them to prevent the soil from becoming quite dust dry. Our illustration (fig. 7) was prepared from a photograph of an average sample selected from the splendid batch of 3000 plants which Mr. Reeves exhibited recently at South Kensington, and which our artist has shown with its supports and one twist of matting, as prepared for sale in the market.

FASHION AND FLOWER SHOWS.

EXPERIENCE is not wanting to show that flower shows held under fashionable auspices, and intended to secure the patronage and support of the fashionable world, are pre-decided to failure so long as they repose for their success upon that element of the community alone. The Crystal Palace grand exhibitions, those at the Alexandra Palace, the Royal Aquarium, Sandown Park, and now the recent Orleans Club Show at Twickenham, all testify that shows promoted merely to attract the fashionable and the wealthy inevitably fail of their purpose, and that the attendance is almost invariably short of anti-

ciations. The rich of the community, always excepting the few who are genuine lovers of flowers, have either been satiated with floral exhibitions, or have lost the natural taste and love for flowers which so largely distinguishes the poor. How sadly this is evident may be seen if any one will take the trouble to observe the demeanour of the rich visitors. They dawdle through the tents with an air of languor, scarcely deigning a look here or there, and such rare events are characterised by an effort, just as though the whole thing was a bore, of which they would gladly be rid.

Without doubt, their indifference to floral exhibitions is more real than assumed; and realising this fact, managers of shows in the future will do well to cater less for the "upper ten," and more for the lower million, who in spite of their many social and moral defects, are yet deeply imbued with a taste and love, natural and healthy, for all that relates to the garden. In all good provincial shows the shillings of the trading class, and the coppers of the poor, are found to be an assured support to the financial success of the exhibition. Here local interest has a potent influence for good, as the visitors have in most cases some personal knowledge of the exhibitors, and therefore special interest in their products; and, further, the flower show has grown to be almost a permanent institution, demanding support and receiving it with as much favour and assistance as any other local object. Perhaps in country districts there is more real love for horticulture permeating the breasts of all sections than is found in the metropolis; but in many of our large manufacturing towns the intense interest displayed by the poor in floral exhibitions is most marked, and the singular love and earnestness shown for flowers, or any garden products, is one of the most beautiful characteristics of our town-bred and confined working classes.

Any one fond of studying character will find a flower-show tent filled with the poorer classes a special opportunity for favourable observation. Under the benign influence of the beauties of nature around, the best human elements are brought into play, and the criticisms, surprises, and exclamations of delight are all evidences of the existence, even in the workers in the field, factory, shop, mill, or mine, of that one touch of nature which makes the whole world kin. Perhaps looked at in a hard, business light, the nurseryman cares little for such visitors as these, but, putting this aside, it is impossible to doubt that any flower show so attended must be a great educational as well as pecuniary success. It will probably be long before our metropolitan flower shows will be gazed upon by thousands of the toilers of life admitted at 6d. or 3d. per head, the whole thing would be so very *infra dig.*; but even these, if not clad in silks or broadcloth, would be better than a listless, uninterested few, who find a wearisome toil in sitting for an hour or two to listen to a military band.

POPULAR PELARGONIUMS.

THE production of Zonal Pelargoniums for the London markets is one of those specialities of horticultural work that is done on a very extensive scale, so extensive, indeed, that one cannot realise it till he is favoured with the look through such a nursery as that of Messrs. Hawkins & Bennett at Twickenham, and others in the neighbourhood of London. These plants are grown by the thousand, both for vending in pots, and for cut blooms. One sees long broad houses completely filled either with pink, scarlet, or white Pelargoniums in a very healthy condition in the regulation 48-pots, and blooming profusely. The varieties are Dr. Lindley, scarlet; *Vesuvius*, scarlet; *Leonidas*, crimson; *Christine*, pink; and *Madame Vaucher*, white, with a few doubles, *Madame Lemon*, being the leading variety. There are several houses 200 feet in length, and of a good width, and some idea of the great quantities of each variety grown may be inferred from the fact that in the two houses of Madame Vaucher there were from 4500 to 5000 plants. The plants are mainly from spring struck cuttings of the previous year, of branching growth, clean and healthy, with fine heads of bloom. The plants are sent to market in round baskets, a dozen or so of plants in a basket. It is a remarkable fact that of the many new varieties produced since the advent of the above old sorts, they are yet the best for the particular purpose. The vast number of plants raised and distributed in a year by Messrs. Hawkins & Bennett is so large that were statistics given they would be thought incredible.

NOTICE.

The Valuable PRIZES offered by
MR. WILLIAM BULL
Will be competed for at the Great Summer Show of the Royal Horticultural Society on June 19.
For Particulars *vide* Schedule of the Royal Horticultural Society, or Mr. William Bull's Catalogue for 1877.

THE NEW SEEDLING ROSE,
"QUEEN OF BEDDERS"
(NOBLE).

See Coloured Plate (after Mrs. Duffield), "Gardeners' Chronicle," May 5, 1877.

Perhaps the finest of all the English Seedling Roses of recent introduction. It is *par excellence* a really Bedding Rose in every sense of the word—requires no pegging down, support, or training of any kind, and is a continuous early and late bloomer.

First-class Certificate Royal Horticultural Society,
August 2, 1876.

Its influences may be imagined when it is stated that a plant 28 inches high had eighty-four buds and expanded flowers upon it on September 6, 1876.

A constant supply of buds was obtained from early June to November of that year—over five months.

Good Plants are now being sent out in strict rotation at

10s 6d. each.

Coloured Plates 12s. each.

CHARLES NOBLE, BAGSHOT.

TEA SCENTED ROSES.

SPECIAL CULTURE.

We have this season devoted nearly the whole extent of our Glass-houses to the Culture of Tea-Scented and other Roses, and are now enabled to offer plants of very superior quality.

PLANTS, in 5-inch pots, suitable for planting out, 1s. to 18s. per dozen.

.. extra size, in 6-inch pots, for Greenhouse, set with buds, 24s. per dozen.

.. extra size, in 8-inch pots, for Greenhouse, set with buds, 30s. to 36s. per dozen.

.. Half Specimens, 5s. to 7s. 6d. each.

NEW FRENCH ROSES of 1877, 30s. per dozen.

HYBRID PERPETUAL ROSES, established in 9 and 10-inch pots, now showing for bloom, 36s. to 42s. per dozen.

EDINBURGH and LONDON,

Have made arrangements with Mr. Moffat, Coldwells, to send out, for the first time, the above-named splendid Strawberry. Fruit very large, firm, and of excellent flavour, bright scarlet colour. A most prolific bearer, and as a main crop for market purposes it is unsurpassed.

Strong Plants, 42s. per 100; 25s. per 50; 15s. per 25; 9s. per dozen.

Trade Price on application.

1, GEORGE IV. BRIDGE, EDINBURGH; 54, BISHOPSGATE ST. WITHIN, LONDON.
April, 1877.

NEW ENGLISH-RAISED SEEDLING ROSES.

MESSRS. PAUL & SON,

THE OLD NURSERIES, CHESHUNT, N.
(THESE NURSERIES ESTABLISHED IN 1860),

Have great pleasure in announcing as a continuation of the series of English Roses raised or sent out by them since 1860, inclusive of LORD CLYDE (Paul & Son), DUKE OF EDINBURGH (Paul & Son), CHESHUNT HYBRID (Paul & Son), ANNIE LAXTON (Laxton), DUKE OF CONNAUGHT (Paul & Son), &c., &c., and containing never a bad one in the lot.

TWO NEW ENGLISH SEEDLING ROSES.

H.P. EMILY LAXTON (Laxton), a large full flower with globular, pointed bud, opening into large globular flower. In the way of Monsieur Noman, but of a rich cherry-rose, deeper and fuller than that kind, and with strong vigorous habit, making a grand pillar Rose.

First-class Certificate Royal Horticultural Society; First-class Certificate at the Leeds and Crystal Palace Rose Shows, and 1st Prize at Exeter for twenty-four of any one kind.

H.P. MARCHIONESS OF EXETER (Laxton), clear, rose-flushed, light cherry-rose, large, finely built up flower, very sweet, and of strong vigorous growth; a larger more double Annie Laxton, yet perfectly distinct from that kind.

Plants in pots of the above, ready early in June, 7s. 6d. each, 14s. the two varieties; Blooming Plants, in 24-pots, 10s. 6d. each, 20s. the two varieties.

The two kinds described above have been proved two seasons at Cheshunt, and can be recommended as continuing the race begun by this raiser with H.P. Annie Laxton.

PAUL & SON,
THE OLD NURSERIES, CHESHUNT, N.

"THE PRESIDENT," Latest and Most Improved American Lawn Mower,

A Model of Beauty,
Simplicity, and
Strength.

PRICES.

10-inch	£3 3 0
12-inch	4 4 0
14-inch	5 5 0

Carriage Paid to any Railway Station.

EVERY MACHINE UNCONDITIONALLY WARRANTED.

The "President" is the best Lawn Mower in use in the United States. The new and important improvements which have been made in these machines have wrought a complete revolution in their manufacture, resulting in their being celebrated throughout the world.

In offering to the Public this beautiful Machine, we desire to call attention to many valuable improvements. It has a noiseless positive ratchet, a full roller, and an adjustable iron handle, allowing the machine to follow an uneven surface on slopes, terraces, and borders, without any inconvenience to the operator.

This Mower is of lighter draught, and we feel warranted in saying, will outwear any in the market. The workmanship and material far surpass anything of this character now manufactured, and we invite inspection and comparison with any Lawn Mower yet produced.

The machine is simple, easy to adjust and keep in order, and the knives can be sharpened without removing them from the machine. The gearing is all perfectly enclosed, rendering it entirely free from clogging.

In brief, if you want a Lawn Mower that will run easy, do good work, last you longer than any you can buy, and give you less trouble, we recommend the "President" with perfect confidence to your favourable consideration.

SEEDS OF PRIZE FLOWERS.

CATALOGUE of SEEDS, With every Article Priced, on application.

[ALL HALF NATURAL SIZE.]

Mr. William Bull's PRIZE STRAINS OF PRIMULA SINENSIS.

PRIMULA SINENSIS FIMBRIATA. Seed of Mr. WILLIAM BULL'S select and unrivalled strain of this useful and favourite plant is now offered in mixture containing all the new and most distinct colours and varieties. The many unsolicited testimonials received at Mr. Bull's Establishment point conclusively to the fact of its being appreciated among growers as an unequalled strain. To distinguish this from the ordinary mixture of P. alba and rubra usually supplied, Mr. W. B. designates this choice mixture as

"BULL'S PREMIER MIXTURE" 1s. 6d. and 2s. 6d. per Packet.

From Mr. T. GODFREY, Gardener to Lady Jolliffe, Southwood House, St. Lawrence.

"From the Primula seed I had from you I have such a variety of colour I never saw before—white, violet, pink, a beautiful rose, lilac, and a brick-red; without exception I never saw their equal."

From Mr. WYNN, Gardener to J. R. Lowe, Esq., Withorpe, Sleaford.

"The strain of Primula seed I had from you last spring has turned out to be extremely fine, many of the single flowers being about the size of a crown piece, the colours being exceedingly rich."

From Mr. R. EVANS, The Hall Gardens, Busby. Your Primulas were all that one could wish for—fine flowers and robust growers; some of the plants were really a ft. through."

PRIMULA SINENSIS FIM. ALBA, PRIMULA SINENSIS FIM. RUBRA, Extra Choice, 1s. 6d. and 2s. 6d. per Packet.

From Mr. E. ASBOTT, Navarreyman, Ardleigh, Essex. "Your Primulas I am blooming now are a splendid strain. I hope you will send me some again."

From Mr. E. COOLING, Navarreyman, Esq., Derby. "Your Primulas were first-rate here this season."

PRIMULA S. F. FILICIFOLIA ALBA, PRIMULA S. F. FILICIFOLIA RUBRA, Extra Choice, 1s. 6d. and 2s. 6d. per Packet.

From Mr. C. SMITH, Gardener to Sir A. E. Guinness, Bt., Clonsilla, Dublin.

"I was much pleased with all the Primula seed I got from you; they are truly superb. The filicifolia alba and rubra are most remarkable; the foliage is exquisite, with flowers so well thrown up above."

PRIMULA S. F. KERMESINIA SPLEND. 1s. 6d. and 2s. 6d. per Packet.

Per Packet—s. d. BEGONIAS, handsome flowered section, various colours . . . 2 6 CYCLAMEN PERSICUM, various colours mixed . . . 2 6 CALCEOLARIA, various colours mixed . . . 1s. 6d. and 2 6 CINERARIA, various colours mixed . . . 1s. 6d. and 2 6 GLOXINIA, various colours mixed . . . 1s. 6d. and 2 6 PETUNIA, choice hybridized, various colours mixed . . . 1 6

MR. WILLIAM BULL, ESTABLISHMENT FOR SEEDS AND NEW PLANTS, KING'S ROAD, CHELSEA, LONDON, S.W.

SATURDAY, JUNE 16, 1877.

THE BULRUSH AND THE REED.

BULRUSH appears to be an altered or mistaken spelling of Pool-rush—the Rush, that is to say, which grows in pools of standing water as distinguished from mire. In the sixteenth century this name was also written Pole-rush. The original application was plainly to the Scirpus lacustris. Gerard calls this plant "the great Water-rush or Bulrush." The name occurs also in other old writers, whose allusions point unmistakably to the same thing. In the Golden Boke we have a "girdel of Bulrushes," and in Spenser—

"To make fine cages for the nightingale And baskets of Bulrushes was my wont."

For more than two centuries after the time of Gerard the name seems to have held its place. At last the spelling begins to change to Bull-rush, as in the English Flora of Sir J. E. Smith, 1828. In 1839 Loudon applies it to the Penicillaria spicata, an Indian grass, calling the Scirpus "Tall Club-rush," though allowing Bullrush to stand as a synonym. Lindley, in 1836, says Bullrush is the English equivalent of Typha, though the name, he continues, is "sometimes applied to the Scirpus lacustris." Mr. Bentham, who restores the sixteenth century spelling, also makes Bullrush the equivalent of Typha, and translates Typhaceæ as the Bulrush family (Handbook British Flora, 1838). Lastly, in Chambers' Cyclopaedia, 1861, it is stated that "Bulrush is a popular name for large Rush-like or Reed-like plants growing in marshes, not very strictly limited to any particular kind." Some persons, the writer goes on to say, "restrict it to the Typha. Perhaps it is more commonly restricted to the larger species of Scirpus." The expansion, not to say the change of meaning, in the days we call our own, may well be a source of confusion and perplexity. The older botanists certainly never gave the name to the Typha, which was always "Cat's-tagle or Reed-mace," though with the synonym, so it is said, of Bul-seg, literally Pool-seg. Spelling the name differently, and thus obscuring the etymology, modern authors have also come to regard the "bull" as a metaphor for "large," which in Bullrush it certainly is not.

The name of Bulrush being familiar in the sixteenth century as that of a plant suitable for ligatures, and for weaving into a coarse counterpart of basket-work, it was very natural that it should come to be employed in the Old Testament as a representative of the Hebrew gôme, which latter is so translated in the Authorised Version. The first occurrence is in the narrative of some famous events that once happened on the banks of the Nile. When the mother of the infant Moses, after three months' hiding of her babe, for his life's sake, could no longer conceal him indoors, driven to a new and forlorn expedient, she "took for him," it is said, "an ark of gôme . . . and put the child therein, and she laid it in the flags by the river's brink. . . . And the daughter of Pharaoh came down to wash herself in the river, and her maidens walked along by the river-side, and when she saw the ark among the flags she sent her maid to fetch it." The remainder of the story, so simple and natural in all its incidents, needs no recounting; we have

here only to consider what the *gômé* was—it was certainly neither the Typha nor the Scirpus palustris. To pause, however, for a moment on the word "ark" is well worth while, since the Hebrew word thus translated in the story before us, *tebah*, is the same as the one employed in the history of the Noachian Deluge, whereas the "Ark of the Covenant," which was constructed of Acacia-wood, is in the original called *aron*. The latter was a kind of chest or coffer, for use on land; *tebah*, on the contrary, denoted a vessel intended to float. The sense of the word "ark" is most correctly preserved in the second of the two Authorised Version uses, as illustrated very clearly in the old poets. Surrey has—

"In the rich arke Dan Homer's rimes he placed,"

and Herrick, in one of his pretty little pictures—

"You have beheld how they
With wicker-arks did come,
To kiss and bear away
The richer Cowslips home."

The "meak-ark," constructed of oaken boards, is still to be found in old-fashioned farmhouses in the North of England. In bygone days the making of such chests was a matter of importance, so considerable as to have originated the surname of Arkwright.

THE PAPPYRUS.

Gômé, the above-mentioned Hebrew word, essentially denotes the far-famed and immemorial Papyrus, the plant, above all others, which takes the mind back to ancient Egypt and its mighty river. The Papyrus is at once the most beautiful of its diversified race, and the most useful. The ancient Egyptians plaited the stems not only into little boats, but into sails, mats, and sandals. The fabrication in particular of little boats appears to have been practised by them to an immense extent, and to have commenced in the very earliest days of their time-worn history. They were constructed, in all likelihood, much in the same way as the reed-canoes still in use among the Peruvians who live on the borders of Lake Titicaca. There the reeds are tied together in bundles, which are then united longitudinally; the sail is woven of similar but smaller parallel bundles, and in these little skiffs all voyages are undertaken. M. de Castelnau says that the Peruvian reed-boats exactly resemble the pictured representations of the Egyptian ones, as preserved on the walls of the tomb of Rameses III. at Thebes. The little wherries thus manufactured were exceedingly light, and in movement very swift. Like the coracles of the ancient Britons, they held only two or three persons, and often sufficed for no more than a single occupant. When the navigator came to a rapid or to a part of the stream where he thought himself in peril, he quitted the water, and, taking the frail little craft upon his shoulders, walked till he found a suitable place for launching again. A covering of bitumen, as described in the account of the ark in which the infant Moses was laid, is of course to be understood as having always been added. Beautiful must have been the scene on that once gay and glorious old river, as these tiny skiffs, gliding hither and thither, and dancing on the ripples, pursued their innumerable ways of business or pleasure. Doubtless it would be in boats of this description that the pleasure-seekers made their visits to the groves of Nelumbo, on the occasion of the joyous "Lily feasts." Their swiftness would recommend them also for the transmission of news to distant places. In relation to their use for this, the Old Testament again alludes to the *gômé*, and again the translators give "Dulrush" as the most suitable rendering. "Voe to the land shadowing with wings, which is beyond the rivers of Ethiopia, that

sendeth ambassadors by the sea, even in vessels of *gômé* upon the waters" (Isaiah xviii. 2, 3). Probably it is to these self-same boats that reference is made in Job ix., 26, in the phrase *chih anyioth*. The connection is in favour of so regarding the passage, but linguistic difficulties stand in the way of positive proof. Plutarch says that Isis traversed the waters in one of these Papyrus boats when seeking the remains of Osiris. Theophrastus refers to them, so does Lucan, in the *Pharsalia* (v. 136); Pliny, also, in several places. They continued to be used for many ages. Bruce found them in Abyssinia, and probably they are not yet obsolete upon African streams, where either the Papyrus or some congenerous plant exists in adequate plenty. The Papyrus was employed in ancient Egypt in several other ways. Bundles of the stems furnished models for the shafts of some of the pillars of the temples, and the bases of these were ornamented with representations of the sheaths that encircle the foot of the flower-stalk. That this famous plant supplied the material of which paper, both rough and fine, was manufactured in ancient times hardly needs mentioning. Papyrus paper made 3000 years B.C., or anterior to the time of Abraham, is still in existence. It was an article of commerce long before the time of Herodotus, and it remained in use till the seventh century. When Pliny says that it was not in use before the time of Alexander the Great he probably means not in Europe. Upon two occasions Papyrus paper is mentioned in Scripture—namely, in 3 Macc. iv. 20, and in 2 John 12.

The early Hebrews, as a rule, appear to have preferred to write upon dressed skins of animals. Another Egyptian name of the plant, according to Herodotus, was *hyblos*. Perhaps more strictly this word denoted the inner portion of the stem. It passed from the Egyptian language into the Greek; in the latter it came in time to signify a book, especially one in which sacred verses were written, not to be seen by the profane, as in the *Supplants* of Eschylus, 947; and again, in course of time, it acquires the shape of Bible, literally "Papyrus pith." Papyrus stems were likewise twisted into cordage, as mentioned by Homer, *Odyssey*, xxi.

In the original of the Old Testament *gômé* appears upon two other occasions. Here, however, it may perhaps be questionable whether it denotes the Papyrus definitely, or reedy plants in general. In Job vii. 2, it is said, "Can the *gômé* grow up without mire; can the *achu* grow without water?" And in Isaiah xxxv. 7, we have, "The parched ground shall become a pool, and the thirsty land springs of water. In the habitation of dragons, where each lay, shall be grass, with reeds and *gômé*." The Authorised Version reading in both these verses is simply "Rush." The spiritual sense remains the same. The Isaiah passage makes it plain that grass and reeds and *gômé* stand in Nature as representatives of something which spiritually is very beautiful and desirable. The explanation of what these things stand for in the language of metaphor is an appendix to the rejoicing of the desert and the blossoming of the Rose. It is identified with the flourishing of the kingdom of Christ, and for all practical purposes that is enough.

Of late years it has been thought by some that the Papyrus is a plant of two distinct species, the plant familiar in our conservatories representing, not the ancient Egyptian Papyrus, but an independent Asiatic and European one. Instead of letting Papyrus antiquorum stand for the whole idea of the plant, it has been proposed to call the African one *P. nilotica* or *egyptiaca*, and the Asiatic and European one *P. syriaca* or *siciliana*. The well-known globular umbel of the so-called *syriaca*, with its short and comparatively short bractes and a reflexed involucre, is exchanged in the so-

called *nilotica* for a besom-shaped umbel; the bracts are very numerous and much longer, and the involucre is erect. There is also a considerable difference in the stature of the two plants, the *syriaca* attaining the height of 12 to 14 feet, whereas the *nilotica* rarely exceeds 6 or 7. But, as in many other cases, these characters break down on comparison of a long series of specimens from various localities. Syrian examples correspond with African ones, and *vice versa*, and Professor Oliver is no doubt right in asserting that the alleged differences are trifling and inconstant. The unlikeness which no doubt exists between individual extremes he considers to be largely due to the age and maturity of the particular specimens.* The form called *syriaca* is certainly the most beautiful of the two varieties, the innumerable long green filaments which constitute the great globular umbel depending from the apex of the stem in the lightest and most graceful way imaginable. When the stem leans sideways, as it is prone to, nothing in Nature presents a picture of more rich and elegant languor. An eastern princess, faint with sunshine, could not hang her arms more delicately. This Syrian plant, though not met with in the wild state very generally, still abounds in some of what would seem to have been its original localities. It occurs on the borders of the Sea of Galilee, and in great plenty in the marshes of Héhé (the "waters of Merom" of the Old Testament), which are situated, it will be remembered, in the immediate neighbourhood of the Upper Jordan. The condition in which it appears in the Héhé marshes is most extraordinary. The plant, as well known, has a very large, massive, and horizontal rhizome. This rests, half-submerged, upon the water, into which the roots descend, 3 to 5 feet in length, while a vast jungle of aerial growth is elevated above.† When the water is not deep enough to allow of the floating, the rhizome burrows in the soft mud of the pools and stream-sides which the plant inhabits. As regards Sicily, whether truly indigenous in that island, or introduced at some early period, is not known.

In Africa, at all events within the tropics, the Papyrus is probably a characteristic member of the flora. All the ancient writers who have occasion to mention the plant connect it with the Nile. Dried stems are found in the ancient Egyptian tombs. Ovid calls the Nile *amnis papyrifera*. Though identified with this famous stream from the earliest times which literature talks of in the important part of the river, or along the strip of country where the Egyptians as a nation chiefly dwelt, where the Nelumbo it would appear to have existed only as an importation. Bruce came very decidedly to this conclusion, and the fact of the plant being now no longer found in Lower Egypt certainly gives weight to the belief. The disappearance can scarcely have come of any natural cause. That it is now lost from the Lower Nile is probably referable to causes identical with those which have shorn the river of the beauty anciently conferred by the Nelumbo, and which involve the idea of human intervention for its maintenance. By readers of the Authorised Version the disappearance in question is very naturally thought to be in fulfilment of one of the prophecies in Isaiah:—"The paper-reeds by the brooks . . . and everything sown by the brooks, shall wither, be driven away, and be no more" (xviii. 7). The prophecy of course has reference to the Nile and the little canals or canicues connected with it. But the Hebrew word here rendered "paper-reeds," *arôth*, whatever it may hold of latent or figurative meaning, conveys no literal or direct reference to the *gômé*, or to any reedy plant whatever. It simply signifies open and exposed grass-land, such as usually borders rivers in level countries. The Papyrus (in the Sicilian or *syriaca* form) is sited by Loudon to

* See, for all particulars, the *Gardener's Chronicle*, January 16, 1875, p. 9, a very interesting article, accompanied by an illustration, by Professor Thakshel Dyer. Also the *Garden*, July 13, 1874, p. 394.
† See the very interesting account in the *Red Roy on the Jordan*, by J. Macgregor, chap. xvii., 1869.

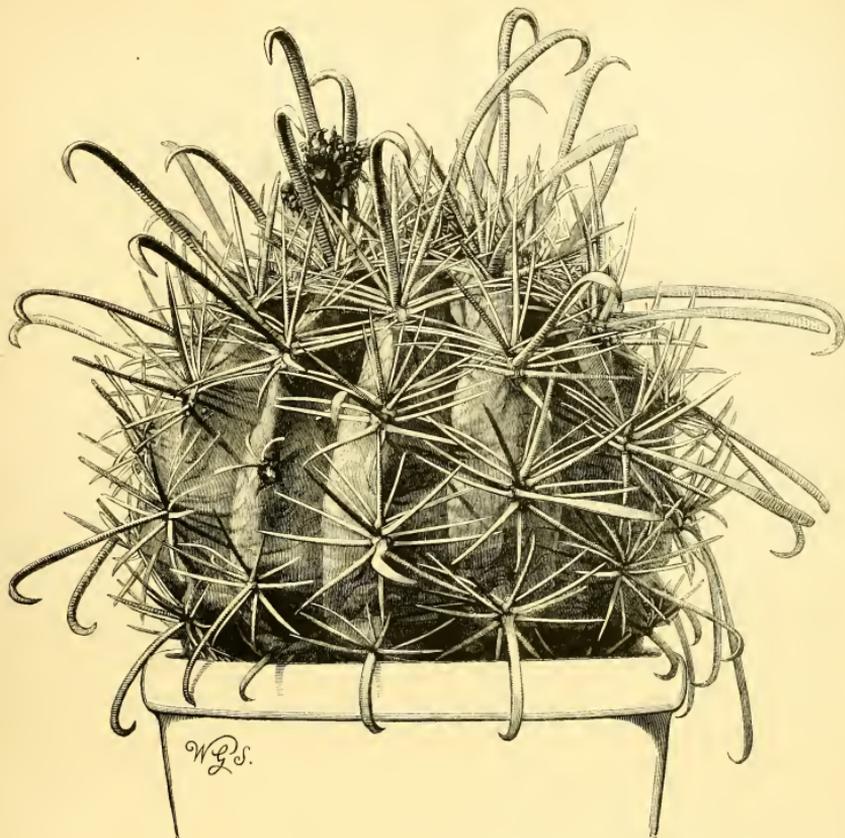

FIG. 119.—THE EAGLE'S CLAW ECHINOCACTUS.

have been introduced into English conservatories in 1803. The form called *nilotica* appears not to be known in them.

(To be continued.)

THE EAGLE'S CLAW ECHINOCACTUS.

THE handsome Echinocactus of which we give an illustration (fig. 119) from a plant in Mr. Peacock's collection is probably, as we learn from Dr. Engelmann, to whom we submitted the drawing, closely allied to *E. Wislizeni*, a species characterised by the central spine of each tuft being stout, flattened, ribbed, and hooked at the point; others of the spines are weaker and straight, the outermost setaceous, often twisted. Mr. Croucher, who has the two plants side by side, tells us that the present species differs from *E. Wislizeni* in the larger number of spines, the central hooked one being channelled, and much longer than in the species just named, reaching to 3½ inches. The ribs of the stem are, also, less prominent. The flower is a pale yellow colour. In any case it is a very striking plant, sure to be appreciated by Cactus lovers. Its botanical position must rest for the time undetermined, though the probability is that it is an undescribed species. Meanwhile, to distinguish it temporarily, we may call it the Eagle's Claw Echinocactus.

New Garden Plants.

VANDA CÆRULESCENS, *Griff.*, var. *BONALLII*, n. v. This may be the plant represented by gallant Dr. Griffith for its short conical spur, yet the authentic specimens preserved in the herbaria belong to the now well-known plant, acknowledged to be a most gracious distichous Orchid, a sweet *Vanda* passing herself off as an *Aerides* or a *Saccolabium Blumei* in inflorescence. The old one we have already had for a while has a slender bent spur, and the blade of the lip more dilate at its top. It may, however, be that those variations in the spurs and lip's shape have just nothing to do with colours, on which our new variety is chiefly founded; and I much suspect this from several reasons, the most decisive of which is that I find among my wild specimens one which is nearly blue, and yet it has the spur and the lip's blade of our new variety.

Our plant has leaves and growth of the old plant, yet the sepals and petals are white. The lips are of a lavender tint, with "porcelain-blue bars." There is an earnest belief with some strong Orchidists, as I see from recent letters at hand, that this beats the old *Vanda cærulescens*; ah, yes, it is your youngest *enfant chéri*! My private opinion in the matter is that one may grow both and feel much pleased if the two flower side by side, and bear the event with resignation if they do not. I need not say, it is a high pleasure to name it in the memory of the intrepid, persevering and successful discoverer, whose name tells us at once it comes from Mr. Low, whose rich importations are

proverbial. *H. G. Rehb. f.*—P.S. I add that I have at hand a newly imported plant, with two inflorescences, and another inflorescence kindly sent by Mr. Low. The colours are just as described, only the darker blue stripes of the lip are just longitudinal, as I had expected. *H. G. Rehb. f.*

DENDROBIUM (STACHYOBIMUM) STRICKLANDIANUM, n. sp.*

This is a very surprising novelty, and one that may form a peculiar section in the *Stachyobium* standing next *D. ramosissimum*, Wight, and herbaceous, Lindl. One might also compare it to *D. aduncum*, Wall, yet it has a three-lobed, not trifid lip. The thin stem is dark green, shining. Leaves oblong, apiculate, nearly 2 inches long, and ½ to ¾ inch broad, partly on the stem at the time of flowering. The flowers are larger than those of *Dendrobium aduncum*, Wall. They are yellowish-white, and there were three purplish blotches on the lips in 1876, which were not seen in 1875. The lateral teeth of the column are violet, and there are many reddish spots on its anterior side under the stigmatic hollow. If the plant had come from the East Indies, Polynesia, or Northern Australia, we should not have been much

* *Dendrobium (Stachyobium) Stricklandianum*, n. sp.—Caulis cæciliatus covinus crasso; foliis oblongis apiculatis; racemis 3-4 floris; bracteis triangularibus, mento obtuso retuso diuivis; sepalis ligulatis triangularibus acuminatis; tepalibus lineariliguatis acuminatis; labello oblongo-ligulato obtuso acuto viridique medio obtusangulo disco antico punctulato furfuraceo; columna apice trilobata; anthera conica acute extensa. Ex Japonia spissima; introduct. Sir C. W. Strickland.

surprised; but it has the great merit of being Japanese. It was introduced with *Cymbidium viciense* and *Luisia teres*, by Sir C. W. Strickland, Hildenny, Malton, who twice most kindly sent me materials. I feel very pleased to dedicate this curious novelty to a gentleman who has a heart for Orchids, even though the diameter of their flowers do not exceed a line, and the colour be green. *H. G. Rehb. f.*

DENDROBIUM PRECINCTUM, n. sp.*

This is a botanical novelty. The narrow, erect stems are dark and furrowed, and the leaves lanceolate, nearly bidentate. The flowers scarcely exceed half an inch in length and are of a pallid ochraceous colour with a dark purplish limb. The lip is trifid, and of a sulphur-yellow colour, orange-coloured in front, central lobe of lip velvety and three-keeled. I have to thank Messrs. Veitch for it, and they kindly inform me that it was introduced with *D. Devonianum*. It is strange this nice little thing has been overlooked so long a time. *H. G. Rehb. f.*

THRINSPERMUM FREEMANTI, n. sp.†

This is a dwarf small species, yet an elegant thing. The roots may be compared to those of *Phal-nopsis Schilleriana*. They are rounded, thick, anguliform, and clothed with small warts. The leaves are ligulate, here and there undulate, bidentate, usually unequally so at their apex, 6–7 inches long by 1½ inch wide. The raceme bears numerous flowers. The bracts are semioval and larger than the small ovary. The sepals very long, narrow, linear, the petals a little shorter. Altogether they give the raceme the appearance of a yellow brownish spotted broom. The small lip is saccate tridentate, the centre white, the lateral parts yellow with brown streaks. There stand four-stalked globose bodies before the base, which are covered with small warts.

The plant comes near *T. divitiflorum* (*Sarcochilus divitiflorus*, F. Muill.), an Australian species, represented on the cover of Mr. Fitzgerald's *Australasia* Orchid-book. A scientific investigation of this proves it to be widely different, though very much alike outside. There are no striate globules in this which bears a retuse tridentate lamina over the very small middle lobe of the lip. It is very interesting that this species was found on the hunting grounds of several exceedingly experienced botanists. It was gathered in Assam by Mr. Freeman, whose name it bears. It flowers last winter at Mr. Bull's establishment, obtained a fresh spike, a second spike very carefully dried by Mr. Bull, and I saw the living plant lately. *H. G. Rehb. f.*

THE BOTANIC GARDENS, BIRMINGHAM.

AN extraordinary group of the Mucosae plants of North America, the *Tricostema* plant of *Tricostema speciosum*, is now to be seen in bloom here, and in luxuriant health. One plant has thirty flowers, each very large compared with the blooms usually seen, and borne in pairs, and in many instances three blooms on each shoot. There is considerable variation in the group, some being much darker than the others, whilst others are striped, and one is very pale in colour. Then there is also a difference in the formation of the pouch, some being circular and others oval. There is also a marked difference in the foliage, some of the varieties having broad lanceolate foliage, whilst others are much more cordate, and the botanist would soon establish varieties in this highly interesting and lovely group. Mr. Latham, the Curator here, has succeeded in showing us what can be so easily done with this beautiful plant when we know how to do it. The plants in question were received from Canada by the gentleman then Mr. J. B. Goode, Esq., in a dormant state in the usual way. They were potted into good fibrous peat and kept in a cold frame, and very little

water given to them until they began growing, when water was applied copiously; and were kept in this frame until in flower, when they were removed to the conservatory. Some of the foliage is 5 inches long and 4 inches in breadth, and all the plants are in most vigorous health. Adjoining this group are a couple of fine plants of *Cypripedium parviflorum*, a small-growing species with yellow flowers and in the most perfect health, having received the same treatment as *C. spectabile*. Close by were plants of *Doctocleone elegans*, *Primula farinosa*, *Lycalis alpina major*, a very charming Saxifrage, allied to *S. Alizon*, received from Mr. George Maw, of Broseley; and a fine plant of *Orchis foliosa*. In the conservatory are fine examples of the old *Erodium anemone-folium*, and *Lilium giganteum* in flower. How *Lapageria luxurians* here, and what grand objects they are at the blooming time. Mr. Latham has a strong plant of the white variety, with young vigorous growth now 6 feet long; and this is planted to intermingle with the rose-coloured variety.

When did China Rose White Pet originate? There is a plant of it now in flower in the conservatory, which is indeed lovely, Mr. Latham having obtained a plant in a Cheltenham nursery, where he met with it, but has never seen it elsewhere. It is a small-growing kind, and has the appearance of being the result of a cross between the Fairy Rose and a Noisette. The flowers are white, erect, small, and well-formed, and just what we should value for bouquet purposes, and it is a very free bloomer. Can any of your readers give further information respecting it? Several large plants of *Euxia myrtilloides* are blooming in the conservatory, which also contains two very rare Ferns—one, a superb specimen of *Dicksonia arborea*, probably unequalled in the kingdom, and a fine plant of *Cyathea Cunninghamii*. Orchids are extensively grown here, and a block of *Dendrobium calceoliferum* has just with twenty-five fine blooms upon it, and *Chysis Limminghi* and several other Orchids are now in bloom.

The Anthuriums under Mr. Latham's treatment are examples of first-class culture. There is one plant of *Anthurium Scherzerianum*, large variety, with sixty expanded blossoms, with spathe of the largest size I have seen. *Disa grandiflora* is on the point of blooming, and this glorious plant is too seldom seen in really good condition. The best lot I ever saw was at Mr. Ewins's, of Fernhurst, near Leeds, when they were grown in the shaded part of a front garden, in a house, and were as much at home as at the top of the Table Mountain at the Cape.

There is a very good collection of hardy Ferns here, and amongst them the truly lovely *Polypodium vulgare elegantissimum* is a gem, but prone to revert to its normal state of *P. vulgare*, from which it is a sport. Mr. Latham has a crested form of *Lastrea marginalis*, sent from Canada by Mr. Goode. Is this variety to be found in other collections? The pretty *Lastrea fragrans* (*Aspidium fragrans*) does well here, and has a just claim for its specific application. *Ceterach aureum* is also to be seen here in fine character. Excellent specimens of *Gleichenia dichotoma* and *G. Splendens*, in good health, may also be seen, and a fine plant of *Asplenium septentrionale*, a most distinct and charming Fern, is a prominent object of interest. One of the most interesting plants in the garden is *Utricularia montana*, natural order Lentibulariaceae, of which the *Pinguiculae* are members. These are all big bog plants; and on referring to *Curtis's Botanical Magazine*, vol. xxvii., I find an admirable representation of the plant, and that it is a native of the West Indies. The plant is a most interesting one, almost in flower, and is in excellent health. An outdoor frame full of *Trichomanes* and *Hymenophyllum* in admirable condition richly deserves a passing notice; and the garden altogether, with its rich collection of alpine and herbaceous plants, its charming position, its well-laid-out and well-kept grounds, calls forth well merited praise. *D. C. F.*

WANTON DESTRUCTION.

EVERY season when the Whitsun holidays come round there comes with them an annual saturnal, so to speak, of wanton destruction. It is a sad but incontrovertible fact that in regard to parks and gardens kindly and gratuitously opened to the recreation of the people, public holidays that abuse not use is so often the case. A recent instance may be cited in Lord Stamford's park, where the mischief done by the holiday seekers was so great as to necessitate the closing of the grounds on similar occasions; but such wanton destruction is not limited to large domains, rarely accessible—it desolates every neighbourhood in

the vicinity of large towns, and sad evidences of it may be seen in every suburb around the metropolis.

With the exclusiveness natural to the Englishman, when mansions and large villas are erected the gardens of such residences are, as a rule, screened from public observation by high walls or impenetrable park palings, and the flowering trees and evergreen shrubs are thus guarded from the sight as well as from the destructive fingers of thoughtless youths; but between these carefully protected grounds and the town itself there often lies an intermediate district which, marked by the ominous boards bearing the well-known words, "Land to let for building purposes," becomes the prey of all the idlers of the vicinity.

Such neighbourhoods have, at first, more or less of an air of rusticity about them; a few fine trees may still be standing, the fields about to be immolated on the altar of the builder are still partially free from bricks and mortar, and handsome hedges in many places enclose the land or mark the boundaries of cottage gardens. Such spots are refreshing to look upon, but no sooner are they laid open to the public, or their future destination pointed out by the boards above mentioned, than the work of wanton destruction begins, the trees—not one of which can be well spared—are needlessly cut down, or ruthlessly destroyed by being dragged away a branch or a bough at a time in mere wantonness, for no sooner are they obtained than they are torn leaf by leaf and scattered to the four winds of heaven.

In spring, when the tender green of the opening foliage imparts an air of refinement and a touch of beauty to the surrounding neighbourhood, then is the moment of attack; the beautiful flowering trees and shrubs, the Laburnums, the Lilacs, and the Hawthorns are torn away for a momentary gratification, and then left to fade and be trampled under foot in the very place where they so lately shed beauty and fragrance.

In the suburbs of London on Whit Monday last an old and very handsome Hawthorn hedge, the fence to a row of private gardens, was torn almost away—young men of twenty pulling off boughs as large as they could carry, running frantically about waving the beautiful blossom-laden boughs above their heads, and then throwing them down. So generally, indeed, was this the case that the field was soon literally covered with fragments of Hawthorn. Nor did the mischief end with the hedges; wherever there was a gap large enough to admit a hand and arm, the Wallflowers and other spring plants within reach were torn off, and scattered about in a similar manner.

In the present day, when the town is so fast absorbing the country that every space of open green field and every sheltering tree is a boon to the neighbourhood in which it flourishes, and the destruction of vegetation may well be watched with a jealous eye—for barrenness and sterility follow the footsteps of the builder with as little reason, and more surely than they do those of the holiday folk and the children, for when houses are built in the suburbs the first thing done towards the formation of what is in the future to be called a garden is to eradicate every trace of vegetable life, trees are cut down, shrubs rooted up, grass trodden, and the surroundings made as desolate as possible. Under such circumstances, it is not surprising that the suburbs of our cities become less verdant than the town itself, and that it requires years to come before we can restore, by painstaking cultivation, any of that rural aspect which the place once possessed, and which a little forethought and care might have so easily retained. *P. J.*

ORCHID RARITIES.

I QUITE concur with the writer of the succinct report of the recent Manchester show that possibly never has there been such an assemblage of really well cultivated Roses and Orchids. About the latter particularly would I have a word to say, and that with reference to a few distinguished varieties which are of more than ordinary importance to every Orchid amateur and grower.

Possibly the gem of the exhibition was *Dendrobium Ainsworthii* roseum. This is a most remarkable seedling, partaking of the character of both its parents' (a noble and heterocarpum), and in some respects superior to either. In point of floriferousness none of its parents can lay claim to such a quantity of nodes in the deciduous stem, each bearing, or rather emitting, its quota of flowers. I counted on one stem

* *Dendrobium precipitum*.—Eudendrobium. Caulibus teretibus bidentatis; this cuneato ligulatis angustis apiculis lobatis; pedunculo apice bifloro, pappo virgato, medio orbiculato-lanceolato ribbo, bene evoluto; sepalis ligulatis orbiculis acutis; sepalo rhombico; petalis; lobis, cuneato dilatato trilobis lobis lateralibus linearilobatis obtusis; lacinia media ligulata producta, emittit lobatus, carinis teritis angulatis per dichum, lacinia antica filis cristallinis velutinis; columna breviter angulata. Caulis obscure viridiflorescens. Vaginis emittit affido ciliatis. Bractee perianthiales minutae. Flores albido viridibus, sepalis, petalisque atropurpureo-marginatis. Labello flavo aut aurantiaco. Columna sulphurea infra lobos. Cultus *Dendrobium Devonianum* improprie dicitur. Veitch. *H. G. Rehb. f.*

† *Thrinpermum Freemanii*.—Humilis radibus angustis, caulis densissime minutis; lacinia lobata; sepalis lanceolatis, subaequilobis bidentatis; racemis pluribus separatis; bracteis semi-ovatis ratione ovariorum majoribus; sepalis lanceolatis carinis apiculis cristallinis velutinis; columna breviter angulata solido hemisphaerico, lacinia lateralibus semilobatis, lacinia mediana triangula transversa minutis, callis saccaribus subaffido pediculis ovatis. Bractee perianthiales minutae, truncatae. Labello medio albis, lacinia lateribus sulphureis, mucroni fuscato.—*Sarcochilus Freemanii*. Assam, Freeman, Ex coll. dom. Rehb. *H. G. Rehb. f.*

sixteen short racemes, each two and three flowered. The flower itself has the sepals and petals of moniliform rather than mobile, white, shaded with an almost imperceptible tint of rose, and tipped distinctly with that soft pleasing colour. The labellum is flat, like an expanded heterocarpium, reflexed a little towards the centre, with a blotch covering three-quarters of its surface with deep veined purplish, or rather mulberry, crimson, edged very distinctly with white, and the extremity slightly tipped with crimson. This I look upon as one of the greatest gains in hybridisation, whether we regard the colour of the flower or the general floriferousness of the plant, or its free although not awkward habit. As an Orchid enthusiast of the last five-and-twenty years, I would pronounce it one of the greatest gains that may be counted up in the whole known Orchid family; and I have to congratulate Mr. Mitchell, Dr. Ainsworth's enthusiastic gardener, for the successful growth of this extraordinary beautiful variety.

DENDROBIUM AINSWORTHII is also a most beautiful subject, of precisely the same habit, with the same form of flower, the same floriferousness as its rarer compeer, figured, when first flowered, by the *Gardener's Chronicle*. The plant shown was a comparatively good-sized specimen, and full of flower, even fuller by comparison than was Mr. Shuttleworth's splendid *D. noble*. I counted some twenty pseudoballs, all more or less crowded with flowers, and that for fully three-fourths of their whole length. The principal colour-difference in the original variety is in that of the labellum, which is only partially blotched with crimson, or rather purplish crimson, and broadly margined with white. It is very elegant and very chaste, but will never be so telling a variety as its companion, *roseum*.

MASDEVALLIA HARRYANA SAOQUINEIA, in Mr. O. Wrigley's collection (the whole of whose plants were cultivated in a masterly way), is a variety of rare beauty, having great size in the segments, and a wonderful intensity of colour to recommend it. It is nearest in point of merit to the famous Dawsonian "ball's blood" variety, which was dispersed into several hands during the various sales, and which has not yet been equalled. The variety to which I at present refer is of a shining sanguineous colour, rather enhanced by having a pale orange eye at the point from which the monopetalous sepals spring. Unlike some of the varieties, this one, in its inferior lobes—which, by the way, are in all cases very ornamental—are nearly entire, and does not split into lobes wide apart, but is compact and well formed. It is remarkably fine variety, and it was brought to a high state of cultivation, having quite sixty flowers on the plant exhibited. The violacea variety was good, too, but scarcely fit to be placed among the rarities I am at present dealing with.

DENDROBIUM CREPIDATUM, in the same exhibitor's collection, is no doubt one of the best forms of the species in cultivation. There are several different varieties of this beautiful species, but the one shown at Manchester is a gem. The sepals and petals are white, heavily tipped with rosy pink. The labellum is all but circular, with a large orange central blotch shading out to a greenish yellow tint, which is rather attractive than otherwise, and then again surrounded with white and edged with pink—quite after the ribbon fashion of decoration. The pseudoballs are best grown in pendulous style, and are very prominent with white streaks up the intermediate. These plants are evidently quite at home in Mr. Hubberstey's hands.

ONCIDIUM LEUCOCHEILUM NANUM.—There are so many varieties of this *Oncid* in cultivation that have a lanky, lean appearance in respect of long, loose spike, or rather branching raceme of flowers, that it is a pleasure to see it standing, quite pyramid-like, without support, and bearing several hundred flowers. In the whole exhibition there was no such distinguished variety of a common *Oncid* as this one exhibited by Mr. Williams. I counted some twenty-one branches on a raceme, 2½ feet long, and each individual flower distinct and beautiful, the colouring being more popular than in many of its seminal fellows. The labellum was white, and the sepaline and petaline segments of the usual colour, although the Indian-red spotting was more distinct. It was a leafy plant, and very large, and was found growing alongside of *Cyrtorchilus maculatum*, and could have been sold in dozens instead of units.

ODONTOGLOSSUM VENILLARIUM ROSEUM.—This remarkable variety is one of the most deservedly popular among new *Oncids*. Its great size of

flowers and remarkable free inflorescence bespeak for it, even under the most disadvantageous circumstances, ready buyers. Beautiful as were the half-dozen, or nearly a dozen, shown by various exhibitors, none could vie with the variety which I have ventured to call *roseum* in the Messrs. Rollisson's winning stand. The sepaline and petaline segments of this flower, together with the great labellum, were on a plane surface, stout to appearance, on a piece of the finest finished cardboard. The colour was a deep fleshy pink over all the surface, with the exception of the base of the labellum, which was a white ground, with Indian-red venation radiating from the centre in focus-like sun-rays. The flowers smothered the leafage of the plant quite over, and captivated every one who had the pleasure of seeing them. There were many other fine things, but the above were the chief. *James Anderson, Mendocomb Nurseries, Uddingston.*

THAMNOCALAMUS FALCONERI.

As yet these plants, better known as *Arundinaria falcata*, show no signs of life, and as the tops of the canes are dry and sere there is but little hope of the plants starting into growth again, unless they do so from the bottom, of which I am now very doubtful. It is remarkable that the flowering and seeding should have had such an exhausting effect, and more so that the thing should have been so general, as your reports of last year showed to be the case, and it would be interesting to know how they are now behaving in other places. The plants with us were so large and such strikingly beautiful objects in the positions they occupied as to render their death quite a loss, as it will take many years to get up others to anything like the dimensions some of these had attained. On measuring one of the rods just cut, I find it is a trifle over 28 feet, so that some idea may be formed by those who have seen plants of this elegant Bamboo growing and arching over in the graceful manner they do, what a fine effect such specimens produced when clothed with their slender pale-green foliage, of which unfortunately they have now for the past year been entirely bereft.

It is surprising that such a highly ornamental shrub as the above forms in favourable situations should not be more extensively used to plant near the margins of lakes or in damp shady retreats in connection with dress grounds, in either of which positions it is quite at home and shows off to great advantage. Although fond of moisture at the root, it will grow and do well almost anywhere, except in bleak exposed situations, where, from the fragile habit of the slender stems and the amount of foliage each usually has, they get sadly knocked about. With us they are about as hardy as the Pampas-grass, and just as accommodating in the way they adapt themselves to any position to which they may be assigned, with the exception alluded to, and as they are worth any trouble we always make a practice of putting some dry leaves or brakes around them before winter sets in, so as to protect the canes from whence the young soft shoots emerge at different intervals during the year.

The *Arundinaria falcata* strikes readily from cuttings made from the hard mature rods, and put in any time during the autumn in some sheltered place among shrubs where drying winds cannot get at them. They do best cut in lengths of from a foot to 18 inches, with a joint left close at the top, in order that no water may lodge in hollow, tubular stems and cause them to rot or become split by the action of frost. By inserting them sufficiently deep in the ground to leave only just the top of the cuttings exposed, each will remain fresh and plump, and scarcely a failure occur. *J. Sheppard.*

THE USEFUL PLANTS OF MEXICO.

In the Great Exhibition at Philadelphia last year Mexican products came in for a very fair share of representation, the useful plants of the country being not only abundantly shown, but fully described in the catalogue of Mexican exhibits. This catalogue, useful as it is, would have been much more so had more care been taken in the scientific nomenclature; not only in the spelling faulty, but the specific names of many of the plants are absolutely unidentifiable. The occasional descriptions of Mexican scenery

give a tolerable idea of the natural features of the country. Thus,—“Besides the beautiful landscapes presented to the traveller by deep ravines, the elevated mountain-tops, and the splendid vegetation found all along the road, there are other objects which increase the attractiveness of the picturesque views. On leaving the city of Mexico, the beautiful lakes of the valley and the elegant tops of the Popocatepetl and two Xtatlehuatl, ever crowned with whitest snow, are presented to the eye of the observer. In San Juan Teotihuacan again, are seen the pyramids raised by the Toltecs, and dedicated to the sun and moon. Farther on are seen the extensive Maguay fields, that precious *Agave* (*A. americana*), which intoxicating liquors and the famous *palique* are extracted.” This *palique* is as much a national beverage in Mexico as beer is in England. In small or moderate quantities medicinal or hygienic properties are attributed to it, but in large quantities it is intoxicating. The fibre is valuable, not only for making ropes and cordage, but also for paper, which is said to be remarkable for its whiteness, elasticity, and strength. It is made in large quantities in Mexico, and so abundant are the plants that the supply is inexhaustible, and the cost of the material very trifling.

Between the high summits of the Mexican volcanoes which tower at about 8,000 feet above the level of the sea, down to about shores on the Pacific and the Gulf, there are a great many intermediate degrees proper for the most varied types of vegetation. The “*Guayabas*” (*Psidium*), the *Anacardium*, *Acacias*, and other plants live and grow abundantly in the lowlands, where Coffee and Sugar can be cultivated under the most favourable conditions; Leguminosae and Ericaceae notably occupy the medium heights, and the Coniferous and Cupuliferous plants climb up to the limits of perpetual snow. Several families seem to be adapted to a variety of climates, and their genera are found at different levels, living even in dry and rocky grounds. Among these may be mentioned Bromeliaceae and *Amaryllidaceae*, which occupy the greater part of the Mexican mountains. In the list of medicinal products eighty-six plants are enumerated, showing that this application of the vegetation of the country received a large share of attention. Gums, resins, and vegetable waxes were also numerously exhibited. The resin obtained from *Hymenaea coccinifera* seems to be known by the name of “*Coapinole*.” It is used extensively in the manufacture of varnishes, in the same way as tree copal. Large quantities are collected in the State of Oaxaca, and sold in the city of Mexico at one dollar a pound. A resin called “*Pencea Copal*” is exceedingly abundant, and is said to be produced by *Elaphrium copaliferum*. Under the name of “*Brea*” is described a resin which is said to be “the result of the distillation of the turpentine from the *Pinus tecotit*, which grows in the cold districts of Mexico.” This “*Brea*,” when dissolved in warm alcohol, precipitates after cooling, becomes pure, and takes a white colour. It is used for the preparation of illuminating gas and in the manufacture of soap.

From a description of the “*Chayote*” (*Seschium macle*) we learn that the plant grows luxuriantly, yielding abundant fruit in the first year. Under favourable circumstances a single plant produces annually from eighty to one hundred fruits. It is very easy of cultivation, and is grown largely for the sake of the fibre, as well as for the large tuberous roots, which contain a quantity of starch or arrowroot, both of which are eaten. The fruits are occasionally to be seen in Covent Garden Market.

PLANT PORTRAITS.

ALLIUM STRAMINEUM, *Gartenflora*, t. 856, and **BECKHEIA FAVULUA**, t. 856, seem as represented of no special horticultural interest.

ALPISOLIA GLAUCA, *J. Sm., Flore des Serres*, t. 2264.—A noble Tree Fern, frequently called *A. contaminans*. The glaucous tint of the lower surface is a distinguishing characteristic. The stem is downy above, and the leafstalks of a rich purplish colour. Native of the Indian Archipelago.

ANCHUSA SEMPERVIRENS, *Belgique Horticole*, t. 1, 1877.—A very fine favourite, but one, as it appears, heretofore unfigured in a horticultural publication.

AZALEA INDICA HIBERNATA, *Flore des Serres*, t. 2284-5.—A double white *Azalea*, figured in our columns, 1876, p. 187, vol. v.

BAUHINIA PETIOLATA, *Botanical Magazine*, t. 6277.

—A stove shrub with stalked ovate acuminate 5-nerved glaucous leaves, and white flowers 3 inches long in terminal clusters. The plant flowered at Kew, where it was sent by M. Lindau under the name of *Casparia speciosa*. It is a native of New Grenada.

BILBERGIA LIBONIANA, Morr., *Belgique Horticole*, 1877, t. 3.—A handsome Brazilian Bromeliad, with large branched leaves, and loose inflorescence, consisting of numerous long, slender flowers, with orange-coloured calyxes and purple corolla.

BOLBOPTHYLLUM CAHUIENSIS, Rehb., *Flore des Serres*, t. 2268.9.—A parusid species, with creeping, scaly rootstock, compressed pseudobulbs, and oblong acuminate petiolate leaves. Flowers racemose, borne on scapes issuing from the rootstock. Perianth about 6 inches long, segments yellowish pink, lanceolate, prolonged at the apex into long tails; lip much shorter, cordate, acuminate, of a pale claret or plum colour.

BORONIA ELATIO, Bartl., *Botanical Magazine*, t. 6285.—A charming greenhouse plant, with pinnate leaves; the pinnæ linear, the flowers crowded on short, axillary, pendulous stalks and of an ovoid form, resembling that of some Heaths, and of a reddish purple colour. The plant was introduced from Western Australia by Messrs. Veitch. It is a very desirable plant for cultivation.

CALATHEA LEOPARDINA (*Gartenflora*, t. 893) has elliptic lanceolate leaves, with lateral bands of dark green on a lighter ground.

CAMASSIA ESCULENTA var. LEICHTLINI, *Botanical Magazine*, t. 6287.—This is said to differ from the ordinary form in its more robust habit, broader leaves, longer sometimes compound raceme, and larger flowers with more numerous nerves in the keel of the segments of the perianth, which are moreover white, not blue.

CATTLEYA SCHILLERIANA, *Flore des Serres*, t. 2286.—A handsome Cattleya with brown sepals, dotted with darker coloured spots, and a deep rose-pink coloured lip streaked with yellow.

COLEUS DUCHESNI DE EIMBURG, *Flore des Serres*, t. 2287.—A well known variety with rich claret-coloured leaves edged with a narrow margin of greenish white.

CORDIA DECANDRA, *Botanical Magazine*, t. 6279.—A very beautiful Chilean shrub, suited for a warm greenhouse. The leaves are somewhat like those of the Gum Cistus, but rough and not viscid, the flowers borne in loose panicles like those of the Catalpa. Each has a bell-shaped calyx covered with rusty hairs, and a pure white funnel-shaped corolla, with a ten-lobed limb rather more than an inch across. The wood is greatly sought after in Chili for firewood, for which it is especially well adapted, and also for turnery purposes. The plant was introduced by Messrs. Veitch, and is one of much beauty and interest.

CYANANTHUS LORATUS, *Gartenflora*, t. 888.—A beautiful hardy perennial of the Campanula family, with procumbent stems, deeply pinnately cut hairy leaves, and solitary, terminal, bell-shaped, 5-lobed blue flowers, nearly 1½ inch in diameter. It is a native of the Sikkim Himalaya, and has been figured in Royle's *Illustrations*. This is a plant to be inquired for.

CYRIPEDIUM DRURYI, Beddome, *Illustration Horticolæ*, t. 265.—A species found in Mysore by Colonel Drury, and described in our columns by Professor Reichenbach, 1876, i., p. 68. In habit the plant resembles *C. insignis*, but the flowers are smaller and of a yellow colour, with a dark central band traversing the upper sepal and lateral petals.

× CYRIPEDIUM EURYANDRUM, *Flore des Serres*, t. 2278.9.—A cross between *C. Stomei* and *C. barbatum*, raised at Chelsea by M. Seelen, and intermediate between the two parents. It was originally described by Professor Reichenbach in our columns for 1875, p. 772.

CYRIPEDIUM HAYNALDIANUM, *Botanical Magazine*, t. 6296.—A handsome species, described in our columns this year, p. 272, by Professor Reichenbach. It is evidently closely allied to *C. Lowii*. The plate is from a plant which flowered with Messrs. Veitch in February last.

DRACOEPHALUM SPICOSUM, *Botanical Magazine*, t. 6281.—This is a grand hardy perennial Labiate plant with bold rugose cordiform leaves, and dense terminal spikes of labiate flowers of a pinkish blue colour, the lip being spotted with darker spots. Introduced from Sikkim by Mr. Elwes.

GYCIA FRIGIDA, Hook., *Botanical Magazine*, t. 6294.—A tufted Bromeliad with linear lanceolate spine-topped recurved leaves 1—2 feet long, and a

branched flower-spice covered with pale down. Flowers very numerous, ¼ inch long, orange-yellow. Native of Brazil probably. It is the *Pourretia frigida* of Hort. Linden.

FIGUS PARCELLI, Hort. Veitch, *Flore des Serres*, t. 2273.4.—A well-known plant at English flower shows, where its elegantly spotted and marbled leaves always attract attention.

GLOBBA SCHOMBURGKII, *Botanical Magazine*, t. 6298.—A stove perennial with lanceolate glaucous leaves, and panicles of yellow flowers, of the same shape as those of the well-known Dancing Girl plant, but yellow.

GONGORA PORTENTOSA, Rehb., *Botanical Magazine*, t. 6291. (*Gardener's Chronicle*, 1876, p. 502.)—Of this curious Orchid the flowers are 1½—2 inches long, pale flesh-colored and more or less speckled with small violet-purple spots. The plant was introduced from Bogota by Mr. Wallis. The specimen figured following with Mr. Bull, of Chelsea, in April, 1874.

GLEN EYRE, SOUTHAMPTON.

WITH singular aptness this charming place, the residence of an enthusiastic horticulturist, Mrs. Eyre Crabbe, has been thus designated. Less than a quarter of a century since it was a wild spot, half moor, half common, with a deep dell on its lower margin looking to the east, and offering a somewhat deterring aspect to any one in search of a place whereon to build a habitation. Difficulties would seem, however, to have presented to Mrs. Crabbe and her excellent gardener, Mr. Stewart, only so many inducements to endeavour to convert a desert into a garden, a desolation into a paradise; that their efforts have met with complete success the charming place as it now is can eloquently testify. The approach to Glen Eyre from the fine old town of Southampton, a distance of 3 miles, is one of great beauty, as for a considerable distance the broad highway runs through the magnificent common, or more properly speaking wild park, of more than 300 acres, which lies to the north of the town, the road being bordered by noble avenues and clumps of trees, whilst vistas of the surrounding common continually break upon the eye. A continuous rise to the well-known Red Lodge Nurseries, from whence Mr. Rogers enjoys one of the most delightful looks-out in the southern counties, brings us to the higher ground of Basset, and but a short distance further to the estate of Glen Eyre.

It is one of the peculiarities of the formation of the ground here that whilst the carriage-drive enters from the higher land, the house though lying below is scarcely seen until a turn in a belt of trees finds it close at hand. Thus the approach reveals little or nothing of the many garden beauties to be seen beyond, and it is not until the stranger has been led to the windows, or upon the higher terrace here illustrated (fig. 129, p. 753), that the whole of the charms of Glen Eyre become visible. The house (fig. 121, p. 757), which is of goodly dimensions and built in strict keeping with the surroundings, is placed exactly at the head of the dell, looking eastward, the gardens immediately in front and on the south side being composed of a series of terraces connected with each other by steps and winding paths, whilst on the long expanse of slope on either side are planted Conifers of all kinds, Rhododendrons, Azaleas, Kalmias, and other flowering plants in glorious profusion, deciduous trees, evergreen shrubs, including a great variety of Camellias, intermingling with woods and heather, all making up a very delightful and beautiful combination. Having said this much—but very imperfectly—by way of general description, we proceed to point out certain features for which Glen Eyre is especially famous; and these are its outdoor Camellias, its Conifers, and, not least, its charming spring flower gardening. If we deal with the latter first it is rather because, unlike the other features, it is not permanent, but varies from year to year, and, therefore, perhaps is not calculated to leave on the mind of the visitor so profound an impression. Glen Eyre is most favourably situated for the development of the beauties of early hardy flowers, not only because naturally and artificially well sheltered, but also because the soil is light and warm, and admits of early growth and bloom. To this end all the beds on the several terraces are not large, but of such convenient size and arrangement as to permit of pleasing designs being planted, as also of duplicates in sections, thus securing at once variety and a well-balanced effect.

In the larger beds Hyacinths in colours and Tulips in masses are productive of beautiful effects, standing up out of carpets of Daisies, Aubrietias, Sedums, or other neutral-coloured flowers, whilst in the smaller ones single and double Primroses, Violas, Pansies, Polyanthuses, Daisies in colours, Forget-me-nots, Aubrietias, Arabis, and many other useful plants are utilised to form pretty combinations and gay masses. Of Tulips in flower at the time of our visit (in April) specially beautiful were the lovely rose white Griselida, the brilliant scarlet Pottebakker, and the rich Golden Prince; these were particularly effective, and scarcely less worthy of mention were the grand Kaiser Kroon and the pure white Pottebakker. The earliest and most favoured yellows in hardy plants are obtained at Glen Eyre from Pansies Yellow Boy and Bedford Yellow, *Myosotis dissitiflora* and *Cliveland Blue Penny*, the earliest blues; *A. abrietas* in variety, and *Primroses alba* and double *lutea* for shades of lilac and purple; deeper tints being furnished with double purple and single purple Primroses, &c. The superb double quilled Daisies White Globe and its variegated form, double and single Primroses, *Polyanthus White Bedder*, *Viola White Swan*, and other things, present the most reliable whites; whilst pink, red, and crimson tints are found in double Daisies, double and single Primroses, and other early plants. In one small bed *Primrose Ross Morn* was in rich bloom, in another *Queen of Violets*, in another the fine old double crimson, in another the deep-coloured *Aubrietias Hendersoni* and *Eyre*, everything being selected not so much for its costliness as for its intrinsic value to give pretty little masses of flowers in a neat way, and at the earliest possible period of the year. The stereotyped spring bedding, which is at its best just as the season calls for the ordinary bedding-out, has no place at Glen Eyre; if plants, however beautiful, will not bloom at their best through the month of April, they must give place to others that will, because Mrs. Crabbe aims to secure a great unity of colour and beauty as possible with the flowering of the bulbs, that the garden might thus become an entirety at the proper season. This is real spring flower gardening. How it first came about that *Camellias* should be now found growing in the grounds of Glen Eyre with as much impunity as the common Laurel, is one of those things for which it is difficult to give a reason. Probably an excess of plants rendered it necessary to find room for some of them elsewhere, and therefore it was determined to let them try their best in the open ground. Certainly it was a most happy thought, and has been attended with splendid results.

On the west side of the conservatory, standing between it and a wing of the house, growing upon a grassy surface, is one of the earliest and best of these outdoor plants, and it is now probably one of the very finest bush trees to be found out-of-doors in the kingdom. It is the old double-striped kind, stands now about 9 feet in height and nearly 40 feet in circumference. It has a luxuriant growth and leafage, blooms every year most profusely, stands second to no plant under glass for health and foliage, and yet it gets but little sunshine, and is at times swept by fierce cold winds; further, it is never protected in any way—indeed, Mrs. Crabbe laughs at the notion of protection for outdoor Camellias.

Over on a sloping lawn facing due north are a couple of beds of *Camellias* growing luxuriantly and blooming abundantly. These have formed literally masses of shrubs, just as though they were *Rhododendrons* or *Laurels*, and consist of such kinds as *Lady Hume's Blush*, *Storey*, *Tricolor*, *Florida*, *Double-striped*, *Mathotiana*, *Edipce*, &c.—all old sorts of course, but differing little in the question of hardiness from more modern varieties. Now it has been asserted that an abundance of sunlight is essential to the healthy growth of the *Camellia*, and especially to the perfect setting of its flower-buds, but here were plants as healthy and robust as could be, upon which, for the greater part of the year, the sun scarcely shone, for near by was a plantation of tall Firs, and, as we stood close to these *Camellias* at mid-day in the middle of April, we found that the sun then only just peeped over the tall trees on to the plants lower down the slope—a very practical illustration of the truth of what we have stated. *Camellias* are now so largely planted that they meet the eye everywhere, and in the course of time these will form a very distinct feature, but for older and notable specimens we have now to traverse the valley and climb to the top of the southern slope—and there find, on the wall that encloses the stables, some grand fellows that are in luxuriant

bloom; one of these, a noble plant of the double white, would prove worth a small fortune if owned by any London florist. This covers a space of wall 11 feet in height and 12 feet in width, and is not trained to the surface like a fruit tree, but projects so that the lower part of the plant is quite 6 feet through. It presents literally a mass of buds and flowers, of fine form and pure in colour, scarcely inferior to any blooms cut from under glass. Luxuriant as this plant is, it is an undoubted fact that both it, and others only less in size, growing close by, seldom, if ever, see the face of the sun; within a few feet in front rises a dense plantation of trees and shrubs that shut out the sun's rays all the day long, and these Camellias are the perfection of health and vigour. On the eastern aspect of this wall are other large plants rapidly covering the surface, one of these exceeding 12 feet in width from the top to the bottom.

9 feet at 6 inches from the ground. It now cones freely, one small branch having fourteen fruits, and it is believed that this particular plant was one of the first to cone in Europe. Near by is a superb specimen of *Picea Nordmanniana*, of that deep dense green hue so peculiar to this fine Pine. This is 34 feet in height, and has a breadth at the base of 24 feet. When planted it was but 10 inches in height, and has now developed into a grand tree. A very fine *Cupressus Lawsoniana*, 29 feet in height and about 10 feet through, is a fine companion tree. *Cupressus macrocarpa*, a noble specimen 50 feet high and 48 feet in circumference, a very handsome *Pinus Pinsapo*, a fine *Thujaopsis borealis*, and a particularly good specimen of *Libocedrus chilensis*, present a few of the fine trees of this group. At the bottom of this slope is a fine example of the flowering *Paulownia imperialis* that came from the Pine-apple Nursery nineteen years since

range of glass-houses facing the south are devoted exclusively to the growth of plants for conservatory and house decoration, and to supply the great demands for cut flowers. Here are grown one of the largest private collections of the double *Primula* in the kingdom, as many of the best-named varieties now in commerce were raised here. The value of the flowers of these Chinese *Primroses* is well understood, and hence their extensive cultivation. Tea Roses enjoy the protected aspect this range of glass affords, and the plants trained on the front walls are seldom without flowers. Double Violets are grown in beds in the kitchen-garden, and we record with pleasure Mrs. Crabbe's declaration that the fine new double *Marie Louise* was the finest and most abundant bloomer.

These are the records of but a few of the features of this charming garden, which, beautiful at any time, is especially so during the spring months. To Mr.

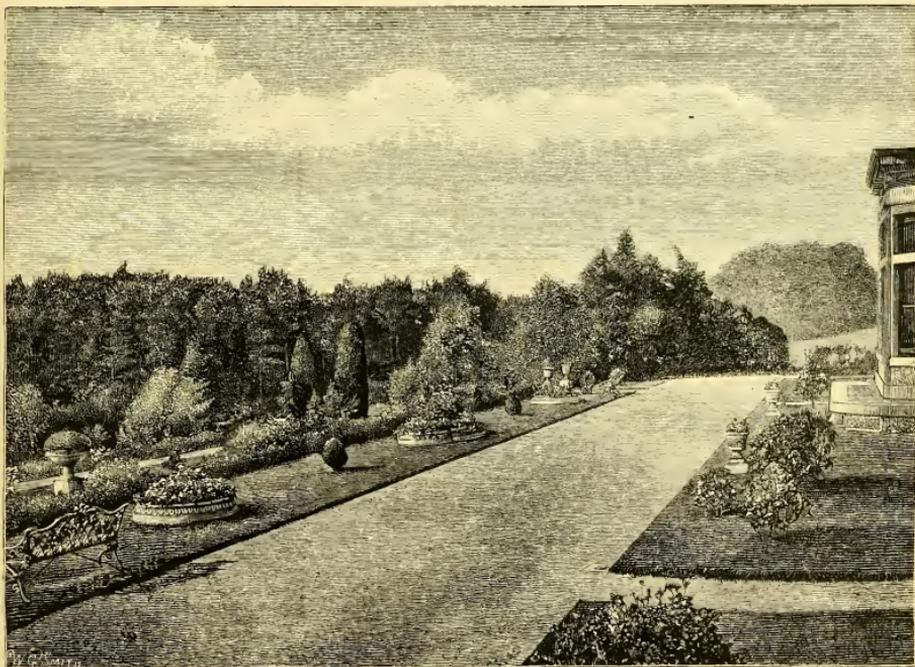

FIG. 120.—VIEW IN THE GARDENS AT GLEN EYRE, SOUTHAMPTON.

Of course Glen Eyre has what in modern parlance is termed a Pinetum, but how unlike the flat formal groups of specimens with which we are too familiar. Although several noble specimens are growing on the northern aspect, yet the finest group is found on the steep slope looking south, and it is a matter of special regret that no photograph of this fine collection has been taken from the other side that will do it justice. So sharp is the sloping bank of grass that it is much easier to roll down its surface than to climb up it, and yet in natural soil, with but little artificial aid, the *Pinuses* planted here some eighteen years since are scarcely exceeded in size and vigour by any growing under the most favourable conditions. A noble *Wellingtoia* forms a central figure; planted nineteen years ago a diminutive plant 9 inches in height, it forms now a perfect cone of branches 31 feet in height, with a diameter of 17 feet 6 inches. The bole of the stem is exceedingly massive, and measures in circumference

in a 48-sized pot. It now has a bole that measures near the ground 6 feet 6 inches round. On the opposite slope are very fine examples of *Cupressus macrocarpa*, *Cryptomeria japonica*, *Abies Douglasii*, and a specially fine specimen of *Cupressus funebris*, 22 feet in height and of relative proportions.

The extensive *Rhododendron* shrubberies include all the best kinds, and these grow so luxuriantly that it is necessary every few years to remodel the whole by thinning, and thus by extending the planted ground the shrubbery has grown to one of considerable dimensions. At the time of our visit only a few were in bloom, specially noticeable amongst them being a fine plant of *Cliveatum*, bearing a mass of rosy pink flowers; *cliatam*, a particularly beautiful variety, and a mass of bloom; and *Brodartianum*, a delicate pale pink. Towering up above all others were some grand heads of scarlet hybrids, giving an unusual glow of colour for such an early period of the year. The long

Stewart let the praise be given that, under Mrs. Crabbe's directions, he has made Glen Eyre what it is. A. D.

Apiary.

NEW SWARMS.—We all know the old bee proverb—

"A swarm of bees in May,
Is worth a load of hay;"

but we have noticed a few swarms during the past month which, although they are called for convenience sake "May swarms," are really not worthy of this title. A genuine May swarm is, without doubt, valuable, and will realise about 20s. if placed in a new skep. The swarms we are now about to bring before the notice of our readers are worthless. About the 20th of the past month we were delighted during a fine, calm evening to hear the well-known swarming

hum, and to see a large quantity of bees buzzing in the air. For a few minutes we could not detect with any degree of certainty the hive from which they had made their exit. After flying about in a very unsettled state for 20 minutes, they made an attempt to enter a Woodbury hive, but were fiercely repelled. The occupants evidently thought, like all Englishmen, that their house was their castle, and they would not welcome such intruders. The reason we will presently explain. Then they wisely re-entered their own tenement, and for the time settled again to hard work.

We need scarcely remind our village readers that the last two weeks in May was anything but genial weather; in fact, old people began whispering, "Oh, this is not like May; it is more like February," for cold easterly winds prevailed to an alarming extent, so that vegetation looked as if a blight had passed over the face of Nature. During this weather our bees could gather very little honey, and also but little pollen. One hive we observed throwing out several immature bees. This convinced us that starvation was showing itself.

We never once thought, however, that any of our stocks lacked needful food, and as little did we expect hungry swarms. Again, the same swarm made its appearance on the 23rd, and after troubling several hives was repulsed, leaving many of their dead members behind. They a second time went back to their own hive. Now our curiosity was aroused, though we did not meddle with them, because the day following they were carrying pollen, and seemed again to work peacefully. All went well until the 30th instant, when the stock swarmed twice during the day, on each occasion settling in a convenient spot. It was hived in the usual way, but would not stay in the skep. At length during the evening it re-entered the original hive. After four days' quiet, on June 3 the stock again swarmed twice, and the swarm succeeded in entering a neighbouring hive after the loss of the queen and about two-thirds of the workers. These were carried forth dead, being killed in the attempt.

Now we overhauled the hive thoroughly, and imagine our grief when we discovered every cell empty of stores, though it contained a large quantity of brood, in all stages of growth. We were learned, when too late, that the swarm was actually starved out, and was justly named a hunger swarm.

But why did the other hives so persistently refuse to entertain the strangers? In case of any ordinary swarm they are gladly welcomed. It can easily be explained: when a swarm leaves the old home to seek out a fresh pasture or home they are filled with honey, because it may from wet weather and other causes be reluctantly detained for several days within doors—during this they would all perish if devoid of food. This is providentially prevented, but in the case of hunger swarms, not having any honey in the hive, they of course are unable to take any with them on their flight; therefore bringing no grist to the mill, but entering only as beggars, they are refused admittance or taken in only with reluctance. We have kept bees for many years, but we never knew so many lost stocks as during the past spring. Our stocks—we speak generally, and including the entire pair of which we reside, which is very extensive—appeared to do well and to promise a good bee year until March, when all at once the hives in scores of instances dwindled away and died. We have gone over many rich apiaries, and in some few cases half the hives on the stands are empty.

We believe this may be explained partly on the ground that we robbed the stocks too much last autumn, instead of the old-fashioned plan of taking the old stocks for honey and leaving first swarms, especially if heavy on the stand, to work the following year. We now take the old stock, and, after smoking the new swarms, rob them of the best combs, viz., those at the side of the hive.

If they could be fed up after this cruel robbery they might not suffer so severely after all, but many very farm apiaries they are left to care for themselves as best they can. We trust, after the bitter experience of the present season, apiarists will learn wisdom, and either leave the stocks intended for the future labourers with the stores they have collected, or, if they think it the cheapest method to take a part of the honey, let them be liberally fed with syrup from the top of the skep. Not only should this be attended to in the autumn, but they should be carefully examined the first fine day in March, and if devoid of stores, as a "stitch in time saves nine," feed them then. We feed

our stocks each spring, whether they require it or not; we have always found it an excellent method, for it seems to put new life and vigour into the entire colony, and makes them work more heartily. R.

WORK FOR JUNE.—Each stock should be watched or noted every day; if any sign of swarming is perceived they ought to have supers placed on them without loss of time. It is a very unwise plan to put any kind of supers, either glass or wood, over the stock if they do not appear overcrowded; but if they are noticed hanging about the entrance like a bunch of Grapes, then put on the super. If this be done too early it often happens that they refuse to enter the super, and our object of procuring a nice lot of honey free from the dark-coloured breeding cells is frustrated, and the hive will probably swarm. If your wish is to increase the number of your stock, then do not super them; but, on the contrary, if you desire a little pure honey, and think you have as many hives as you can profitably attend to, super them on the top directly they appear to be full of bees.

It is also a good plan to place a small bit of empty comb at the top of the super, to induce the bees to take to it. It may easily be fastened by melting a little wax on the glass, then, before it cools, let the comb adhere to it. Many beekeepers prefer a moderate-sized bell-glass for supers, more for the appearance, perhaps, than anything else. It matters very little which is used—glass, or small, square wooden boxes. The latter are the cheapest, and our bees seem to take to them, and to work better in them than in the glass receptacles. Whichever is most convenient for our friends they should not forget to make them both dark and warm. We wrap old flannel and odd bits of cloth around them.

Most lovers of the apary will now be very busy preparing new hives, or fitting up new stands or beehives for the early swarms. If you purpose using the Woodbury bar-frame hives, before transferring the swarm to them see that every bar has a small guide-comb affixed to the upper part; or, what we much prefer, pour melted wax the entire length of each bar-frame. This is much more easy to accomplish than fixing the guide-combs, and answers quite as well; notwithstanding every precaution be exercised to make your stocks build straight combs, it is often in vain. However, it is a very simple and easy matter, after smoking your newly-hived stock, to appease their anger, or to render it quite safe to open the hive every third or fourth day, and if you then find any combs being built crooked, carefully straighten them; afterwards, or later in the season, when you have occasion to take the bars out to secure honey, or for any other object, you will feel glad you took a little extra trouble to have straight and even combs.

Always have the swarms first in a common skep, as used by our cottage bee-keepers; then, when they are settled, transfer them immediately to the bar-hive. We invariably knock them out on the top of the bars, as being the most ready method. R.

The Villa Garden.

BLISTER ON PEACH TREES.—We have already alluded to the general failure of the outdoor crop of Peaches, and so universally has this been experienced that all trees, whether old and decaying or young and vigorous, appear to be devoid of fruit. Our own trees, which are getting near the end of their work, are decidedly bare, and a neighbour's trees, that are young and vigorous and just getting into bearing, have lost every trace of the rich promise of fruit the fine long evening of the year. If there is any comfort to be got out of bewailing misfortunes in concert, neighbours can forget all differences and condole with each other upon the scarcity of their crop; and to make matters worse, the horrid blister is putting in appearance, and to such an extent in some cases as to threaten the loss of the leaves almost entirely. Villa gardeners having trees so affected may rejoice to find themselves in excellent company, for a noted fruit cultivator states his trees are as bad as they can well be; and he is gardener to our Lord Marquis of Carabas close by, and has a kitchen garden famous for the admirable management it receives and the fine crops of fruit generally taken from it; but the blister is no respecter of persons or trees, and his lordship and his gardener and we have a common cause for sorrow.

We asked the gardener at Carabas Castle what he

thought was the cause of the blister on the leaves a Peach trees; reminding him that some writers who assumed to write with authority (as indeed most scribes do, whatever may be the nature of their message) had stated that the blister on the Peach leaves was caused by insects, and who also state that if a leaf or two be picked off insects would be found on them. We have frequently examined these examples of vegetable disorganisation, but failed to observe any general testimony confirmatory of the fact that these leafy eruptions are the results of the action of insects, and my lord's gardener settled the question off-hand by stating that he did not believe a word of the insect theory, but held the opinion that the blister on Peach leaves was the result of cold and chill either in the roots or the branches. Well, there has been no lack of chills, and a good deal of the weather of the past month has been anything but joyous times for insects to sport and play among the leaves. And my lord's gardener went a step further, and stated that the blister was never present in the case of the trees under glass. This fact appears to militate against the insect theory.

Then we enquired what is the best thing to be done in the case of these blistered leaves; and he suggested picking them off, even to the partial stripping of the trees. We asked if any remedy could be applied to stay the plague, and he said he knew of none; and again advised, to pick off the leaves, assuring us that as soon as warm growing summer weather sets in (and we are still looking for it in the second week in June) the trees would start into growth, and soon become clothed with fresh shoots and leaves. Meanwhile, the Villa gardener can do all that was recommended last week, and assist as far as possible the effort Nature must put forth ere long to replace the damage caused by this blister.

ASPARAGUS BEDS.—The Asparagus-bed is one of the glories of the Villa Garden. The first bunch of Asparagus, or the first Carabon, or the earliest dish of Strawberries, are all gardening achievements of the highest order, and their realisation affords immense satisfaction. But there is the danger that Villa gardeners, in their desire to get all the Asparagus done as their own growing, may make too large demands on their beds. There is a time to cut, and a time to refrain from cutting.

As a general rule, gardeners cease to cut Asparagus about the middle of June. The theory held is, that if Asparagus be cut late, and especially when growing on a damp, cold soil, there is danger of losing the plants should a wet, sunless, and cheerless autumn follow. The fact is, there is scarcely time for them to make a good vigorous summer growth, which is a great advantage in the case of Asparagus. In some districts, where there is a drier, later soil, it may be safer to cut Asparagus later in the season, but a wise gardener will husband his resources, and not waste them by undue lavishness. It is therefore best to spare the knife at cutting time, or impoverishment and failure may follow.

PANSIES AND VIOLAS.—While learned gardeners are discussing the difference between a Pansy and a Viola, and pointing them out where they exist (though it is difficult to say that it is being done with much clearness and satisfaction), it is our desire to point out the advantage of having a bed of these, if only for the sake of cutting from to make up little posies, and for placing in vases, &c. The Pansy (or perhaps we should say Heartsease, as that is the dear old common name) is so attractive in its way, so free of bloom, and so pleasantly scented, that a bed of them is invaluable.

We have now in bloom a little plot of what is termed hybrid Violas, and while some of them are like Pansies in the shape and size of their flowers, there are others so much smaller, and so free of bloom, that they may be taken as representatives of the Viola. They are of very bright and varied colour, and all charmingly fragrant. A bunch of these picked twice or thrice a week fills a room with an agreeable perfume, while the little patch of them, when in full bloom, is a particularly attractive sight in the open air.

One cannot have a little group of these Violas without having some inferior forms among them. It was so in our case, for there were not only ragged, loose, inexpressive flowers, but also the long, lanky habit of growth peculiar to some of them. These have all been pulled out, and there is a positive advantage gained in that more space is allowed for

THE
Gardeners' Chronicle.

SATURDAY, JUNE 16, 1877.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, June 19	Royal Horticultural Society: Great Summer Show: Meeting of the Fruit and Floral Committees at 11 A.M., and Scientific Committee at 1 P.M.
WEDNESDAY, June 20	Lee and Blackheath Horticultural Soc'y's Exhibition (two days): Sale of Mr. Herbert's Collection of Orchids at Stevens' Rooms (three days).
SATURDAY, June 23	Crystal Palace Great Kiosk Show.

WITH a view of again drawing attention to SILK CULTURE in Great Britain we here print some remarks on its practicability in our English climate, based on a communication forwarded to us by Dr. WALLACE, of Colchester. In cereal produce the British farmer, having to compete with all the world, is very seriously handicapped; and even in meat production the seemingly illimitable supplies of dead meat coming over from Canada and the United States threaten a reduction of price, to say nothing of the serious losses from pleuro-pneumonia, rinderpest, foot-and-mouth disease, &c.

It is, therefore, high time that a lucrative and highly important industry, as is silk culture, should be seriously and attentively regarded by the agriculturist, not merely at home but also in our colonies, many of which are by Nature most admirably adapted to the production of silk as a raw product. Silk culture, occupying about three months only in the year (in England the months of June, July, and August), and of these only one month, that of July, is at all a busy time—the necessary labour being chiefly provided by women and children—can only be regarded as a supplementary, not as a principal industry. The food plants also, *Morus alba* and its many varieties, are also planted here and there, wherever convenient, not as a main but as a supplementary crop; yet, as will be seen, it is most lucrative, and commends itself the more inasmuch as it can be carried on without interfering with other agricultural operations. It is also an employment peculiarly adapted to women and children, and therefore meeting one of the requirements of the age.

When it was discovered ten years ago that about £1,000,000 of our money was annually sent from Europe to Japan by those interested in sericulture to purchase fresh, healthy "grain," or silkworms' eggs, their own stock having been either worked out or enfeebled by disease, it occurred to Dr. WALLACE that some of this money might be diverted to this country to enrich our own people. Several scientific Frenchmen of eminence—notably M. GUÉRIN-MÉNÉVILLE, Government Inspector in France—were very favourably disposed towards "silk," or rather "grain," in England. On the borders of Hampshire and Surrey Capt. MASON had for years grown the White Mulberry tree, and produced silk which had been exhibited with first-class honours. Dr. WALLACE's trials at Colchester, being dependent on bought or borrowed Mulberry leaves (an uncertain supply), were not very successful; but having now a good supply of White Mulberry trees in thriving condition (about 2 acres are planted out), his experiments during the last three years have been very successful. Dr. WALLACE tells us he has had shoots on three trees which in one year grew 5 feet to 6 feet long, and has reared and fed the worms, derived from one of the healthiest and best sources in Europe, in a room, without disease, and almost without fire, in June, July, and August, and he has produced in successive years a small lot of fine "grain," the parent cocoons of which have been pronounced excellent by good judges and perfectly free from disease.

Moreover, the introduction of Dr. CARRETT'S stoves, which create a high temperature in the silk-room, have without giving off any deleterious gases, have this great advantage, that they hasten most rapidly the rearing of the worms, reducing the period of the caterpillarstage from six to three weeks; they render the cultivation of the worm independent of any weather; no carbonic oxide or other noxious gas is given off to injure their health—in the words of the inventor, "Healthy silkworms can by means of these stoves be reared in any country where the Mulberry tree grows, independently of any weather;" therefore the rearing of Mulberry silkworms in England ought to be an assured fact.

Now, as to the commercial results. Japan as a grain-producing country is now worked out, all her best grain has been exported to Europe, and in 1876 the purchases of grain did not amount to one-eighth of former sales. The south of Europe alone can take from us 500,000 oz. of eggs, if we can only produce them at a price of 15s. to 21s. per ounce of 30 grammes, and will be very glad to get eggs, provided they are healthy, from us. If properly managed 1 oz. of eggs will produce in grain 100 oz., or £1 will produce £100, leaving a large margin for profit after all expenses have been paid.

The rearing may be effected by women and children. The southern, midland, and eastern districts are admirably adapted to the growth of the White Mulberry tree. It has not been prominently stated that in our equable and cool temperature we have a great advantage, in one respect, over Southern Europe in the matter of silk culture. The southern growers lie between Seylla and Charybdis; witness the spring of 1876, in which late frosts and cold inclement weather in April and May destroyed the entire crop. On the other hand, a sudden accession of sultry weather, with thunderstorms (*les chaleurs étouffantes*), may set in earlier in the summer than usual, just before and instead of just after the worms have spun their cocoons; and then good-bye to a crop—the whole perish. After cocooning the insects are protected from the heat by their silken covering, and then remain unaffected by sultry weather. Both early and late a risk of a total loss is thus incurred.

But in England, having nothing to fear from too sultry weather, we may delay our hatching-out even till the first week in July, by simply keeping the grain in a cool cellar, thus selecting too a moment for incubation when the Mulberry trees have advanced to such a point as to give us the greatest possible amount of suitable food.

In conclusion, attention may be drawn to Capt. MASON'S figures, as published in the *Times* of January 26, 1877, simply premising that this gentleman has been occupied in silk culture for the last ten years, and is probably better informed on the subject than any other person in England.

He states that last season from 13 poles of his land, which is of a light and poor description, planted with Mulberry trees, he gathered 1094 lb. of leaf. Of the 1300 cocoons obtained from feeding on this leaf 1635 were selected for the production of grain. The result was 10 oz. of grain, valued at 20s. per ounce, or £120 the whole; leaving 1965 cocoons for reeling, which with the pierced cocoons would pay for the labour. Reducing this to an estimate per acre we have—1 acre producing leaf enough for, say, 20,000 selected cocoons, estimated to produce 120 oz. of grain, valued at £120 clear profit per acre, expenses being paid by the soft and pierced cocoons, as before. This sum must be reduced to one-half, as every other year the trees ought to get a rest, and not be stripped of their leaf in order to maintain them in full vigour. But, even so, where is the farmer who would not be glad to obtain a return of £60 per

acre, which his wife and children could mostly procure for him.

To illustrate what is done at Colchester we append a few thermometric and other observations, and refer those in possession of a White Mulberry tree (not the common fruiting Mulberry) to commence a little experiment on their own account. They will find in Messrs. CASELLI'S *Technical Educator* (vol. iii., Nos. 53, 57, 60, and 64) sufficient to guide their first essays, and they will be able to procure grain or young silkworms from Mr. S. H. GASKELL, 147, Brinnington, Stockport, for a trial.

— We learn with much pleasure from the Philadelphia *Public Ledger*, that upon the unanimous nomination of the members of the Pennsylvania State Board of Agriculture, Governor HARTRANFT has appointed as botanist of the Board Mr. THOMAS MEEHAN, the well-known naturalist. This is putting the right man in the right place, for Mr. MEEHAN is one of the industrious experts who are working hard in the cause of natural history in Philadelphia. About thirty years ago he, then a young man, made the State of Pennsylvania his adopted home, and since then he has won for himself a name that entitles him to the rank of representative man of both the State and the branch of natural science to which he devoted his study, his labour and his industry. He arrived in Philadelphia without friends and without acquaintances, except two to whom he brought letters; he now, after thirty well spent years, makes a brief trip to the "old country" to revisit his native land, an honourably distinguished man, known throughout the United States, and a member of thirty learned societies, agricultural, horticultural, literary and scientific, commencing with the Wernerian Society of Edinburgh, to which he has been elected in recognition of his contributions to natural science. Mr. MEEHAN sailed for Europe on June 7.

— With reference to the GREAT PROVINCIAL HORTICULTURAL SHOW decided to be held by the Royal Horticultural Society in June, 1878, at Preston, in Lancashire, we are informed that the needful guarantees have been secured, and that a good Local Special Prize Fund (in addition to the prizes offered by the Royal Horticultural Society) will also be provided. T. M. SHUTLEWORTH, Esq., of Howick House, Preston, has undertaken the office of Local Secretary, and under his indefatigable management the show will no doubt prove a great success. The exhibition at South Kensington on Tuesday next promises to be an unusually good one, and a good company is expected to meet the Prince and Princess of Wales, who have announced their intention to be present.

— If we do not have an abundantly BERRIED HOLLY crop next Christmas to decorate and cheer that festive season, it will not be because of the present deficiency of flower. The bloom everywhere on the Holly is simply marvellous, and as frosts must be

* 1 Silkworm hatched out—on a *straw* cocoon. † 23 hatched out. ‡ 106 hatched out. § 200 hatched out. ¶ 66 hatched out. ** 50 hatched out. †† 30 hatched out. ‡‡ 100 hatched out. §§ 436 out of 436 out of an especially valuable race from Southern Europe. Of my own grain—about three-quarters of an ounce—brought up into silkworms—on June 1—about 300 hatched out, June 10; a great number hatching, June 12; and on June 13 a great number hatched out.—Frosts not applied during the twelve days.
Note.—The Mulberry leaf began to bud about June 1, and the sprays are now from 1 inch to 2 inches long, planted on a cold bank north soil. The great bulk of eggs remain in a cool cellar at a temperature of 60°, but already some begin to hatch out.

now out of the question, failure to berry can scarcely be looked for. Weather-wise folks will presently assert that this abundance of Holly berries bodes a severe winter, but the ripening effects of the past summer doubtless had much more to do with it. Like all vegetation, the Holly is late in blooming this spring, and this will doubtless prove the saviour of the crop. Should the expectant severe winter, however, follow, horticulturists may perchance find it rather a cause for rejoicing than otherwise; as soft winters, when followed by late cold protracted springs, generally prove the most disastrous seasons.

— It sounds somewhat paradoxical to assert that EARLY PEAS will be late this season, but such will be

that gentleman was recently presented by the *employés*, past and present, with a handsome timepiece in black marble.

— The *Maidstone and Kentish Journal* regrets that it is unable to give a good account of the FRUIT PROSPECTS IN KENT. It appears that Gooseberries, of which a large crop was expected, will in many parts fall short. Red Currants are plentiful, and the black promise an average. The early Cherries are a failure, and the later ones have in "swelling out" fallen off in large numbers. The Plum crop will be even smaller than last year; some few kinds will grow about a quarter of a crop, but on the majority of trees there is not a Plum to be seen. Pears,

will the "good tenor" be forthcoming, but that also, amid the many vicissitudes of weather and climate to which the garden labourer is subject, the owner may be long enabled to retain it.

— The committee meeting of the NATIONAL ROSE SOCIETY was held on Tuesday, the 5th, at the Horticultural Club-room, and all details connected with the forthcoming exhibition were arranged. Judges were selected, and we are told that very favourable anticipations of a successful show are entertained.

— A French Rose cultivator is offering for sale, under the name of Mathilde, what he states to be the best of all the white Tea Roses "known for a long

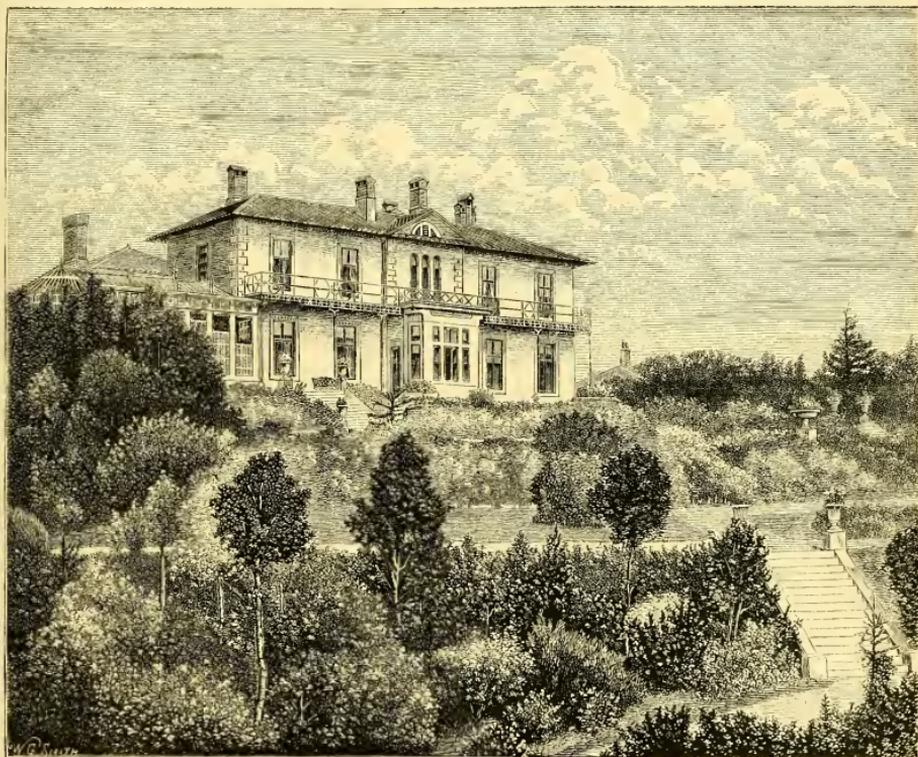

FIG. 121.—GLEN EYRE, SOUTHAMPTON, THE RESIDENCE OF MRS. EYRE CRABBE (SEE P. 752).

the case nevertheless as far as the crops all through West Middlesex are concerned, and picking will hardly be in force until Midsummer at least. In spite of this backwardness, however, the crop promises to be an abundant one, as all Peas look remarkably well, and the earlier sowings are blooming most luxuriantly. So many persons get a "picking" out of the green Pea crop in addition to those who do the picking, that a general failure is a much greater misfortune than is perhaps usually esteemed, whilst not least amongst the benefits resulting in a plentiful season is the physical good produced to the indifferently fed town poor of the metropolis, who are thus enabled to obtain many hearty meals of this nutritious vegetable.

— In view of the approaching marriage of Mr. WILLIAM THOMSON, jun., of the Tweed Vineyard,

which never appeared better in bloom, have almost entirely disappeared in fruiting. Apples promise a large crop, but many kinds have suffered from the attacks of vermin. Cob-nuts appear plentiful, although the maggot has made its appearance in large quantities.

— An advertisement inserted in our columns last week is worthy of comment, inasmuch as it seems to indicate that the few remarks recently offered by us in favour of the introduction of MUSIC and other suitable modes of recreation into our garden establishments, have not been made in vain. A garden labourer is required who possesses a "good tenor voice." Now as we know of no use in gardening for "tenor voices" we can but conclude that a part choir is being formed amongst the *employés*, and that the indispensable tenor is found wanting. We cordially hope that not only

time under several names (Mousseline, Niphetos, &c.)" As it is so much grown and so well-known in this country under the name of Niphetos, there does seem to be danger of leading to confusion by reverting to the original name Mathilde, supposing that priority can justly be claimed for it.

— We mentioned last autumn that the setting of the blossom-buds on the AMERICAN PLANTS at THE KNAP HILL NURSERY, and the consequent promise for the present season's bloom, was more abundant than it had been for many years past, and that consequently—winter permitting—the present year's show of Rhododendrons must be more than usually gorgeous. The bloom is now about at its best; and, as giving some indication of the display, the term "gorgeous" is by no means an exaggeration. Notwithstanding,

however, the bloom has not altogether escaped injury from the bitter cold of May 4, the effect of which, though not noticeable to the general observer, is seen by those who are more familiar with the plants in the occasional want of the terminal flowers, or their stunted and crumpled appearance. Fortunately, the hardy *Ascleas*, which have for several years been 50 unclucky as to be severely punished by the late spring frosts, have this season escaped injury, and the consequent glorious masses of their brilliant colours more than compensate for any little damage sustained by the *Rhododendrons*, which in reality is unobservable except to a practised eye. Those who are desirous to add to their plantations of this finest of all hardy flowering shrubs should see the varieties as they bloom here, and select for themselves. They will be in good condition for at least another week; and Mr. WATERER'S liberality is such, that even those who only go to look and admire, are made welcome to the floral treat.

— A specimen of *HYDRANGEA THOMAS II*OGG, with six trusses of snow-white flowers, the largest measuring 16 inches in diameter, was presented at a recent meeting of the Pennsylvania Horticultural Society, and a special vote of thanks to Mr. ROBERT BUST, the exhibitor, was awarded.

— We are sure our readers will peruse with very great interest the following communication from Mr. BUST (whose name has been mixed up in this matter), relating to the GROWTH OF VINES UNDER BLUE GLASS:—

"Your number of May 12 has an item on blue glass and Grape growing. The theory was fully treated. I think, in *Lindley's Magazine* over fifty years ago. My wealthy and jovial friend, General PLEASANTON, has closely associated me with his theory. His grapery is about 100 feet long and 25 feet wide, with four rows of Vines the whole length. The excessive growth of the Vines, from my standpoint, could readily be traced to warm, rich, dry, elevated borders at the foot of a hill. Every shoot, laterals and leaf was allowed to grow and carefully trained their whole length; the entire house was a mass of wood and foliage. The following spring the laterals and main shoots were cut to a line about 8 feet from the bottom of the glass, the crop was prodigious; every Vine carried from five to forty bunches of well-coloured fruit and of good size. The Vines were only eighteen months' planted. The succeeding years I considered a failure. Your Grape growers can readily infer whether it was blue glass or rich culture, or both, that produced the crop. The General, you will see by the accompanying pamphlet, does not say that I attributed the crop to his theory of blue glass. *R. Bist, Philadelphia, May, 1877.*"

— The usual monthly dinner of the HORTICULTURAL CLUB, on Tuesday, the 5th, was one of the most successful that has hitherto been held. Several foreign horticulturists were present, and a most pleasant evening was spent. MESSRS. ALFRED WEEKES, Chelsea, and J. ASHBY, Ascot, were admitted members.

— *CARDAMINE FRAXINOSA* can be seen growing in large patches in Mr. SAMUEL BARLOW'S garden at Stakefield House, Chidderton, for the sake of the leaves, which are picked in December, January and February, and eaten as Cress. Mr. BARLOW states that it is very delicate and most enjoyable at that season of the year, and much appreciated in his family circle. The leaves are slightly pungent, and the taste is by no means disagreeable. By some it is esteemed as a remedy in scorbutic diseases, obstructions to the liver, and jaundice, &c. Mr. BARLOW allows the Cardamine to seed itself, and is never without a crop.

— According to Mr. W. CRAIG a solution of chlorhydric acid, in the proportion of a grain and a half to an ounce of water, serves as a PRESERVATIVE OF VEGETABLE TISSUES, even retaining their natural colours. This is an experiment easily tried.

— The last number of the *Bulletin d'Arboriculture* opens with a biographical notice and portrait of the late Dr. RODIGAS, one of the most celebrated hybridists, and one of our raising seedlings acted, not in a haphazard way, as so many still do, but with predetermined aim and well reasoned method. Numerous fine varieties of Ranunculus, Anemone, Hepatica, Iris, Lily, Dodecatheon, Phlox, Peonies, &c., attest his skill. In

1858 Dr. RODIGAS became Professor of Horticulture and Botany at Liege, where he remained for twelve years, and afterwards established himself at St. Trond as a physician, giving occasional lessons and demonstrations on fruit culture and agriculture, and always taking a foremost part in horticultural affairs.

— A new part of HOOKER'S *Icones Plantarum* has just been issued, comprising illustrations and descriptions of twenty-five new or rare plants, chiefly of botanical interest.

— Mr. G. S. BOULGER writes from the Scientific Club, 7, Saville Row, W., to say that Mr. HARKEE, of Southgate Street, Gloucester, is associated with him in the preparation of the GLOUCESTERSHIRE FLORA, previously mentioned by us. Communications on the subject may be sent to either of these gentlemen.

— Dr. M. C. COOKE has just published a volume entitled *Contributions to Mycologia Britannica*, and comprising an account of the *Micrococci*, arranged according to the method proposed by Dr. ROSTAFINSKI in his *Monograph*, with all his figures, on twenty-four plates, and comprising full characters of all the orders, families, and genera, and descriptions of the British species, with the original analytical tables, translated from the Polish. All communications should be addressed to 2, Grosvenor Villas, Junction Road, London, N.

— The French have a proverb to the effect that a cold May and a hot June yield bread and wine. In this country, at any rate, fruit will be very scarce. Never do we remember to have seen such havoc among outdoor Peach trees, Cherries, Pears. The strong gale of the 1st of the month completed the mischief, and even the young leaves and shoots of the Ash are blackened and twisted off.

— The *Revue Horticole* has a coloured figure of *ARIA HOSTII*, a species allied to our common White Beam, but with coryms of rosy pink flowers. It is the *Sorbus Aria* var. *suetidica* of LINNÆUS, and has other synonyms. It is grown by M. SIMON LOUIS, of Metz, under the name of *Craucosus Hostii*. We have not seen the plant in English nurseries, but judging from the figure it should be very ornamental.

— In 1873 there were 474,661 hectares [a hectare = 2½ acres about] in France devoted to market gardens and the culture of vegetables, which produced a value of 461 millions of francs (the average yield is nearly 500 millions [$\pounds 20,000,000$ sterling]). According to the investigations carried out in 1862 the land under these cultures was 443,000 hectares, and the aggregate value of the produce 444,000 francs. The value of the hectare of produce appears to range between 915 fr. and 1200 fr.

— The last part of the *Transactions of the Scottish Arboricultural Society* contains several papers of considerable interest, such as Dr. McNAUL'S paper on the Anatomical Structure of the Leaf as a Means of Determining the Species of Abies; on the Timber Supply of Australia, by Mr. KRICHAUFF, who bears testimony in passing to the excellence of the German forest schools, and to the labours of Baron VON MUELLER in Australia, Dr. HECTOR in New Zealand, and others. Mr. DUFF contributes an excellent paper on the Arboriculture of the County of Kent, preceded by a brief account of the physical features and geology of the county. The coppice woods of Kent are well worth study by those interested in forestry, and some of them are most favourable specimens of woodcraft.

— Mr. TURNER informs us that he will show a very large collection of NEW PALAEOGONIMS at the Royal Horticultural Society's Exhibition on Tuesday next.

— At the last meeting of the LINNEAN SOCIETY on June 7 several papers were read, including one on the morphology of Sapotaceæ, by Mr. MARCUS HARTOG; on the causes of the multiplication of parts in flowers, by the Rev. GEO. HENLOW; and on the morphology of Primroses, by Dr. MASTERES, who discussed the subject from the point of view of comparative morphology, mode of development, minute

anatomy and teratology, and alluded to the most recent views held by botanists on the subject, illustrating them by his own observations on the development of the flower, and by numerous teratological specimens throwing light on the nature of the free central placenta and ovules.

— We have just seen and compared in the Knapp Hill Nursery the three Firs, including ABIES PARRYANA, respecting which a discussion has been going on in our pages since we took occasion some time since to mention the peculiar beauty of a plant of the latter from Professor SARGENT'S garden, which was then and is now in Mr. WATERER'S possession; and having carefully examined them all, we have no hesitation in affirming that for all garden purposes, the three plants which have been mentioned are perfectly distinct. We speak of their vegetative organs only, not having had the opportunity to examine cones of the recent acquisition, but these, in our view of the matter, are quite enough to separate the three plants. We found that the first of the trio to grow in spring—a fatal defect in our English climate—was Abies Engelmannii, which commenced to grow so early that all its young growth was completely killed by the May frosts, and this happens so constantly year after year in the climate of Knapp Hill that this plant is utterly worthless either as an ornamental or useful tree, never growing beyond the state of a miserable scrub. The next to grow was Abies Menziesii, which we found a few days ago (June 1) with its young growth pretty well advanced, and perfectly healthy, having been developed since the occurrence of the frosts which had cut up A. Engelmannii. Latest of all was Abies Parryana, which had scarcely yet made any development of its young growth, from which fact it may be concluded that it is practically safe against damage from spring frosts, since it remains quiescent till the risk of spoolation from these is past. We have used the name ABIES PARRYANA because the plant appears to us sufficiently distinct to bear a separate designation, its aspect being quite different from that of the other two, irrespective of colour (which varies in degree in different plants), being smaller in its parts and much less coarse-looking than either; while it certainly has not the deflexed foot-stalks so conspicuous in A. Menziesii, though it has the pungent micro, with somewhat less rigidity, perhaps, characteristic of that plant. *T. M.*

— The *Florist* for the present month opens with a fine coloured illustration of a very beautiful *Camellia* called *Madame Cachet*. It is a double white flower, with the petals marked with a central stripe of pink. The flower is of good form and substance. The plate was taken from a plant in the possession of Messrs. VEITCH. A characteristic representation of Doyenné du Comice is given in the same number.

— An excellent strain of EAST LOTHIAN STOCKS came under our notice a few days ago in Battersea Park, where Mr. ROGER has used this flower with considerable effect among the other spring flowering plants still in fine condition in the radiating beds near the west or Albert Bridge entrance. The Stock seeds were obtained from Messrs. THOMAS METHVEN & SON, of Edinburgh, and the young plants, after being wintered under glass, were turned out in March before they had shown a flower, so that selection was impossible. The percentage of single ones is exceedingly small, and the plants are dwarf in habit and very free flowering, and the colours, purple, scarlet, and white, are all that can be desired.

— BEDDING-OUT is now being pushed on with great alacrity in the parks, and, as regards Battersea Park, will soon be completed should the present fine growing weather hold out. The park is very interesting just now, so many of the trees and shrubs being either in flower, or about to do so. The isolated clumps of *Iris germanica* and its allies, are very finely in bloom, and so also are many good useful subjects in the herbaceous borders.

— Professor E. MORREN, of Liège, whose collection of living *Bromeliaceæ* is the richest in existence, grows them suspended in his stove, in one corner of which is placed a piece of carbonate of ammonia. An interesting account of this collection is given in the *Illustration Horticole*, wherein we are told by M. ANDRÉ that, contrary to what is usually

believed, the great majority of these handsome plants belong to the cold temperate region between 2500 and 3500 metres above the sea.

— The third part of *Familiar Wild Flowers* contains small coloured plates of the wild Crab Apple and the Borage, with popular letterpress accompaniment.

— We are glad to see that the medical profession in Melbourne are agitating the question of providing a botanic garden proper where Baron VON MUELLER may properly perform his functions as Government Botanist. It is pleasing to observe that the colonists, or some of them, are beginning to be a little ashamed of the way in which they have treated a man who has with almost unparalleled zeal and energy devoted his life and his resources to their interests. A grave blunder has, we believe, been committed, but there is still time and means of partially repairing it.

— In our last issue, p. 724, we alluded to a singular instance of DISEASE IN PEACHES and NECTARINES, and, as we have since received other specimens, we deem it of importance to lay before our readers a figure showing the effects of the disease (fig. 122). At present we know little or nothing of the history of the disease or of the causes inducing it, but

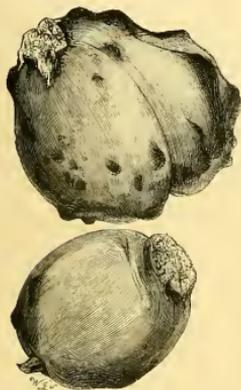

FIG. 122.—DISEASED NECTARINES.

by thus calling attention to it we may be enabled to glean further information on the subject. In the meantime we solicit information and specimens from those who may be able to supply them, and recommend the affected fruit to be at once destroyed.

— A dinner to Mr. F. W. WILSON has been arranged by the Lindley Club, whose guest Mr. WILSON will be, at the Criterion, on Tuesday, July 3. The dinner is intended as a complimentary recognition of Mr. WILSON'S able and courteous management of the exhibitions at the Crystal Palace during the past five-and-twenty years. Tickets, 12s. each, may be obtained of Mr. JOHN MCKENZIE, 1 and 2, Great Winchester Street, E. C.

— The *Revue Horticole* gives a woodcut of a fruit of *LILIU M SPECIOSA*, producing roots at the base of the seed-vessel at the junction with the stalk. From this it may be inferred that the young seed-vessels of other Lilies might be taken off and struck as cuttings. M. CARRIÈRE does not tell us whether in the present case the ovules or seeds were perfectly formed or not.

— *VIOLA COISANDE* has proved a showy and very useful bedding variety in Battersea Park this season. Mr. ROGERS planted a small bed of it near the west entrance, and its peculiarly distinct, light mauve shade of colour has been very pleasing.

GREENHOUSE PLANTS.

THEIR CULTURE AND MANAGEMENT.

PLUMBAGO CAPENSIS.—This is a Cape plant, introduced more than half a century ago. It is one of the most generally useful hardwooded greenhouse subjects, not nearly so much cultivated as it deserves to be from the numerous ways in which it may be grown; for it succeeds equally well in a large pot; as a trained specimen to twine round a pillar; planted out to clothe a wall, or to hang loosely from the roof of a cool conservatory, or confined to the limits of a 6-inch pot, in which way it will flower profusely, forming one of the best possible table or window plants, to which size it may be restricted for years, occupying a very limited space in winter, and amply repaying the little attention it requires by flowering for weeks in succession. The flowers are produced from the extremities of the young shoots, and are borne in large bunches; individually they are like a small *Phlox* in form, but, of the most lovely pale blue colour. There are few plants grown that offer such a pleasing contrast in both colour and form of flower to the generality of other blooming subjects, as does this *Plumbago*. It is a free grower, and not at all difficult to manage, either in a small or large state.

There is no way in which it can be grown that is more useful than in small pots, for general decorative purposes, for, as, if a number are at hand, a portion, if desired, can be brought into flower in a little heat earlier to precede such as are allowed to come on gradually in the greenhouse; by this means a succession may be kept up for three months in summer and autumn. Being a strong-rooted plant it will succeed well in loam, as it, in common with most things that will thrive in this description of soil, has in it a greater disposition to flower than if in peat; but the loam should be good in quality, and contain plenty of vegetable fibre, and should have added to it one-sixth of sand, and the pots should be well drained. The plants ought to be procured in spring, and should be in a free healthy state, struck from cuttings the season previous, and in 4 or 5-inch pots. Let them be potted about the end of March, just as they begin to grow; and now it is necessary to determine to what size they are intended to be grown. If the object is to keep all or a portion for flowering in a small state, these should be moved into 6 or 7-inch pots.

If the intention is to grow them larger they ought to have pots at least 9 or 10 inches in diameter. In other respects the treatment they require is the same, excepting that the smallest sized may need keeping closer stopped in, so as to induce a proportionately more compact habit of growth. Pot them moderately firm, and if the shoots are at all straggling, shorten them back to about 8 or 10 inches in length, tying them out horizontally well down so as to induce them to break back, in which way they will push almost every eye. Place them in a house or pit, where they can be kept at a temperature of about 45° in the night, with proportionate increase in the day, with sun heat, closing the house early enough in the afternoons whilst the sun is up, so as to raise the temperature, syringing them overhead at the same time, and as the season advances and the weather gets hot, use sufficient water under the stages, and about on the paths to keep the atmosphere in a moist condition to promote free growth. All that will be required through the spring and early summer, will be to pinch back any shoots that may show a disposition to out-grow the others, and to tie all to sticks so as to keep them in shape. About August they will commence to bloom, and as soon as the flowers begin to open cease syringing. They may then be moved to the conservatory, or any place where flowering plants are required—where they will receive a moderate amount of light and air to ripen up the growth, no more of which for the season should be encouraged. When the blooming is over give less water and place the plants for the winter in an ordinary greenhouse temperature of from 35° to 40° in the night. They may be either cut back at once, or this can be deferred until nearer spring; the shoots of such plants as are intended to be grown on in the small pots should be cut to within a few eyes of where they were shortened to the spring previous, and again about the end of March, before they begin to grow, turn them out of the pots, shake three-fourths of the soil from them and replace in the same pots with new soil, and in every way treat as in the pre-

ceding summer; so managed they will last for years, flowering freely. They may during the season of active growth have manure-water given them once or twice a week, which will enable them to make stronger shoots and finer heads of flowers. Such as are intended for larger specimens should not be cut nearly so close in, the shoots may be shortened to within about 12 inches of where they were cut back to in the spring previous; if the plants have made satisfactory progress they will bear a 4 or 6-inch shift, removing a portion of the old soil; the new material should now be used in a more lumpy state than in the first potting; the after treatment through the spring and summer in other respects should be the same as the season previous. Attend to training the shoots as they progress; as the plants get strong they will make comparatively lengthened growths, which will require either the use of a wire trellis or a number of moderately strong sticks round which to train the shoots, not tying in the points too closely, or they will have an objectionably formal appearance. After flowering they will again need cutting back, wintering them as before and re-potting in the spring; they may be confined to the same pots, shaking away a portion of the exhausted soil and replacing it with new, or if they are required to be grown into large specimens they can have more root-room given them; so managed they will last for a number of years, and will be much assisted by the use of manure-water during the growing season.

This *Plumbago* is an excellent plant for training to a conservatory pillar, where if allowed to hang somewhat loosely it has a fine appearance; in such a position it may be either kept in a moderately large pot, and the soil partially renewed every spring, or it can be planted out. When it is wanted to cover a back wall or a considerable extent of rafters, the most satisfactory method will be to plant it out in a prepared border. This must have the usual sufficient drainage, and should be composed of 8 or 10 inches of good turfy loam with enough sand to keep it open; in planting see that the roots are not allowed to remain in the curved state which the pot has necessarily kept them in; when any subject of this description is turned out in an open border, and the roots let to stay in such a position they do not usually make satisfactory progress; restrict the quantity of water until the plants have commenced growing freely, after which they will require a good supply both at the roots and overhead by the syringe; attend regularly to stopping and training, especially in the first stages of growth, so as to furnish the space, regularly cutting back every winter to induce the production of young flowering shoots regularly over the whole position the plants are wanted to cover; when the soil becomes exhausted remove a few inches of the surface, each spring replacing it with new, and still further encouraging growth by the use of manure-water.

Insects.—The plant is somewhat liable to the attacks of red-spider, if not sufficiently syringed overhead, but when this is attended to regularly as advised no trouble is likely to be occasioned by it. Aphides will live upon the young shoots, and may be destroyed either by syringing with tobacco-water or fumigating. Scale sometimes affects it, and is most effectually removed by washing with a strong solution of insecticide when cut back in the winter. *T. Boies.*

SUGAR IN JAPAN.

The following mode of cultivating the Sugar-cane in Japan is given in a recent official report. The plants are raised from seed (?), and are said to attain the height of about 10 feet, and never to bear any flower. At the commencement of the cold weather small bundles of Sugar-cane roots are planted in rows, stem downward and root upwards, on a slope of about 45°. The following spring they are taken up, and about 2 inches of cane, both above and below the joint having been cut off, they are planted out in proportions of about 900 lb. weight of cane to an acre of ground. The soil is well looked after in spring, and a quantity of small holes dug here and there. Into these the lees of oil are poured, and they are then filled up with earth, in which the cane slips are planted so soon as they show signs of budding or having taken root.

As soon as planted a little liquid manure is applied. At the end of fifteen days the slips or shoots attain to a height of 7 or 8 inches, when fish manure mixed with the lees of oil is applied. In dry seasons the

ground is also watered. The plants are liable to the attacks of three kinds of insects, which do them much harm, and consequently some precaution has to be taken against their attacks. During the winter the canes that have attained the highest growth are either broken off just above the roots, or are cut with a sickle; they are then stripped of their leaves, and made up into bundles of about 80 lb. weight each. About 10,800 lb. of cane are produced on a quarter of an acre of ground, and this quantity will yield from 6 to 7 piculs of sugar. The sheds in which the cane is crushed are for the most part about 24 feet square, and in each there are three crushers worked by oxen. The teeth of the crushers are kept constantly fed with cane, about four or five being inserted at a time. A workman stands behind on the watch for any cane that may slip through the crusher without being caught in the action of the mill. The canes that have so passed are handed to a third man, who feeds the mill from the opposite side. The mill having a reverse action it thus results that not one cane is lost. The cane juice, after expression, is removed to a separate building in quantities of about 200 lb. weight at a time, and the mill is cleaned after each such removal. The syrup then goes through no less than four refining processes, and is afterwards removed to where it is to be made into sugar. The working of about 2200 lb. of cane is considered a fair day's work. The syrup is, of course, boiled, a small quantity of lime being mixed with it, which is skimmed off when at boiling-point. The syrup, if sufficiently boiled, should be clear—a thick appearance indicating that either too much or too little lime has been used.

The syrup is now placed in a tub, called by the Japanese "sameshiro-oke," in which it is allowed to settle; fresh syrup is then poured into the boilers, and boiling goes on as before. As soon as the syrup is once more at boiling point which has been already boiled is poured in and mixed with it, the white froth being skimmed off and placed in an empty tub. The syrup is now divided between the two boilers and allowed to simmer for about two hours, being constantly skimmed during this time.

In order to ascertain the amount of boiling which the syrup has undergone a Bamboo is inserted, and on withdrawing the drops are allowed to fall into a saucer containing water. If the drops congeal rapidly the fires are at once withdrawn from the boilers, the syrup promptly poured into coolers arranged in sets of four and constantly stirred; so soon as it has sufficiently cooled it is poured into tubs, one man attending to each tub. To make the very best quality of sugar a picul of ordinary sugar is divided into nine parts, and each is wrapped in a hempen cloth; they are placed in receptacles, pressed down with heavy weights, and are thus sweated for one night. On the following morning the sugar thus sweated is placed on a table and kneaded for about two hours, after which it is again wrapped in cloths and the same process gone through for three successive days and nights. On the fourth day it is placed in clean receptacles, and is now termed first quality sugar. To obtain a superfine quality the sweating and kneading is gone through for an extra day.

About 133 lb. of ordinary sugar will thus be made to yield about 50 lb. of first quality sugar; the remaining 80 lb. are, of course, not wasted, but from it are obtained about 40 lb. of a sugar known to the Japanese under a special name, and the residue also finds its way to market. The second quality is known as "ju-mat," and is made by sweating a certain quantity of coarse sugar. Sugar is generally known to the Japanese under the three headings—white, black, and candied, but the two former are again known under a variety of names. A good deal of black sugar is produced in the Loochoos, in Sakurajima, Araki, Hanaoka, and Jaramider. Any marked difference as to good or inferior kinds of black sugar depends on the quality of the cane and the skill of the workman, but the above-mentioned places have always sustained a reputation for producing the best sugars. Sugar-candy is made by boiling down a certain quantity of best quality of sugar, and adding the white of egg. Split pieces of young Bamboo about an inch in length are cut up into the syrup, which they crystallise around them; a good deal of sugar-candy is made in Osaka. Either Japan sugar cannot compete with that produced in China, or the supply is not equal to the demand, for the import of China sugar is always an important item in the import returns of the port of Kanagawa.

SADLERIA CYATHEOIDES.

LONG since known to botanists, though not indeed very familiar to those of this country, the Sadleria of the Sandwich Islands has remained an absolute stranger to our gardens until within the last year or two, when both Mr. Bull and Mr. Williams have imported living plants. It is one of the smaller of the arborescent forms, and is remarkable for its graceful habit, combined with its stout-textured fronds. Mr. Bull's figure, which we annex (fig. 123), gives a good idea of its elegant style of growth, but represents a plant not yet old enough to have formed a stem or trunk.

The Sadleria cyatheoides of Kaulfuss (Blechnum Fontainesianum of Gaudichaud, Woodwardia cyatheoides of Mettenius) forms an erect trunk-like stem of moderate thickness, and some 3 feet in height, the upper end densely packed with linear dark-coloured scales, which also surround the base of the elongated and arching stipes. The fronds are 4 to 6 feet long, with pinnae 8 to 12 inches long, and three-fourths of an inch broad, cut down to the rachis into numerous linear pinnules about half an inch long. The fructification is that of a Blechnum, that is to say, the receptacle is central and elevated, and forms a continuous line close to and on both sides the midrib of the pinnules, and on this the spore-cases are seated, covered each while young by a narrow suborbiculate indusium. The venation, however, is distinct from that of Blechnum, the veins forming a series of costal arches.

It is a fine addition to our cultivated stove Ferns, bring quite distinct in character from any other of the dwarf arborescent species hitherto known in gardens. T. M.

Home Correspondence.

Vanda teres.—We have just now in flower a plant of *Vanda teres*. The plant is about 3 feet high, and has three spikes on it, and on each spike eleven flowers. It is grown in a pot of crocks, and the stem is covered with moss to the height of 18 inches from the pot, and the longest roots down towards it. Since I covered the stem with moss I find another shoot has sprung from the part of the stem thus covered. *James Murre, Finsart Gardens, Gareloch-head, Dumfriesshire, N.B.*

The Winter Campaign.—In 1875 and 1876 I set you a list of the gains and losses of the previous winters. I now send a similar list for the winter of 1876-7, but omitting the losses, which are only of interest to myself, and of which the record is of little value to others, for the death of a single plant in a particular locality is no certain proof of its tenderness, because the death may arise from many other causes; but the survival of a single plant is so far a proof of its hardiness that it is an encouragement to others to try it elsewhere. In the annexed list the plants have been tried by me for the first time, and so no mention is made of those named in the former lists, and they have all been in the open ground without any protection:—

<i>Drecaea australis</i>	<i>Polecarpus chilensis</i>
<i>Abutilon Thompsonii</i>	<i>Heliabotryum Fusiana</i>
<i>Sacca Achras</i>	<i>Mesembryanthemum uncinatum</i>
<i>Trachelospermum jasminoides</i>	<i>Laugeria rosea</i>
<i>Chrysanthemum</i>	<i>Trichelia corallium</i>
<i>Aster argophyllus</i>	<i>Mussaenda</i>
<i>Callistemon linearis</i>	<i>Mussaenda</i>
<i>C. lanceolatus</i>	<i>Fecuna mirabilis</i>
<i>C. viridiflorus</i>	<i>Echeandria ternifolia</i>
<i>C. ovata</i>	<i>Phalagium nepalense</i>
<i>C. ovata</i>	<i>Bomarea Caldasiana</i>
<i>Amica Zeyheri</i>	<i>Fuchsia splendens</i>
<i>Gardenia ovata</i>	<i>Asparagus umbellatus</i>
<i>Carruthania australis</i>	<i>Prunella sikkimensis</i>
<i>Erigeron setosus</i>	<i>Agave brachystachya</i>
<i>Paniculatum</i>	<i>Ruellia</i>
<i>Amica</i>	<i>Crataegus aureum</i>
<i>Deeringia coloriflora variegata</i>	<i>Struthiopteris picta</i>
<i>Leptospermum longimanum</i>	<i>Dicksonia</i>
<i>Hippocrepis</i>	<i>Myrsine</i>
<i>hispidifolium</i>	<i>Athyrium Geranioidum japonicum</i>

Henry N. Ellacombe, Bilton Vicarage, Gloucestershire.

Bedding Lobelias.—Early in the spring a correspondent made inquiry as to the best bedding Lobelia.

In response to that I gave a favourable opinion of Blue Beauty, a kind which has been largely used in the Royal Horticultural Gardens, at the Crystal Palace, and at Heckfield, with great satisfaction. Others, however, had their pets, and whilst one vaunted the merits of Elbor several exalted Emperor William to a seventh heaven of glory. Feeling exceedingly humbled I at once obtained a plant of the Warrior King from one of your correspondents, and have grown them until they are now fairly in bloom. Now that I can test the merits of Blue Beauty with those of the Emperor, I find that ordinary observers would at once class the former as one of the same kind. This, however, would be wrong, as on a close examination I find that the flowers of the latter are just a shade darker than are those of the former, but what is gained in depth of hue is lost in absence of that brightness which characterises Blue Beauty. Then the flowers are of the same size, and with both well borne on the top of the plants, but Blue Beauty does appear to carry a denser top, and consequently more flower. However, this may arise from the fact that my plants of this kind were propagated by division, whilst those of Emperor William were from cuttings. In the hope that others may be of the same kind, I send on the 19th similar plants of other good kinds for comparison. I wish to add that I purpose staging, for the opinion of the Floral Committee, a few established plants of Blue Beauty in 48's—the regular market pot—to show not only the value for bedding purposes, but also its excellent qualities for market cultivation. *Alex. Dean, Belfry, W.*

Abies Menziesii.—The question with me is not whether A. Engelmanni is the same as the plant spoken of by M. André as *Menziesii Paryiana*—that I leave with M. Origies to settle when it suits him. Had he in his first article compared the buds of A. Menziesii Paryiana with those of Engelmanni, I would not have raised the question; but as it was not the old-fashioned normal type of Menziesii that he compared with Engelmanni, and gave to the former the characters of the latter, and knowing that his remarks affected the non-botanical readers of your journal more than they did the botanical readers—botanists generally being independent of imperfect descriptions of well-known Pines—I was induced to make an effort to correct erroneous impressions. *G. Syme.* [All these plants are different enough as growing at Knapp Hill (see p. 758). Eds.]

Helix pomatia (p. 692).—This snail is very abundant in the neighbourhood of Leatherhead, Surrey, almost taking the place of the *Helix aspersa*. It is sparingly found near Gloucester (a Roman station), and, as your correspondent mentions, at Cirencester and Witcombe, but not generally through the county, even where the soil is calcareous. As mentioned by Mr. Gwyn Jeffreys (in *British Conchology*, vol. 1, p. 179), in a manner of by-eliminating over the top. These snails are infatigable in their appetite, and associate together. Each snail then excavates with its large and muscular foot a hole in the ground, just large enough to contain the shell; this it roofs in and lines with earth and dead leaves, making with its slime a kind of plaster, and smoothing over the inner surface of its winter domicile. Having accomplished this it closes the mouth of the shell with a thick calcareous lid, the substance of which, when poured out from the edges of the mantle, resembles liquid plaster of Paris. It then withdraws its body far into the empty space with several layers in succession of a fine membrane or film, in order the more completely to exclude the cold air. In this snug receptacle it remains in a torpid state until the return of spring. . . . "It then loosens and casts aside its winter bands, and resumes its former life." *G. E. O.*

Orchard-houses.—You ask for information as to the effect of the frost in orchard-houses. The May frost destroyed the Apricots with me, but the Peaches which did not open until after the orchard had failed equally. For eighteen years of my first house-experience the crops have failed now for the first time. The Peach blossom never fails in appearance, but scarcely any fruit has set. It fell off when about the size of a Pea. The house is not heated at all; it is only a glass shed, but it has always before yielded abundantly, even when the crops out-of-doors have failed. My fruit is gone. Flams do not average a dozen per tree. There are no Pears. Half the Gooseberries have dropped off, and not more than half of the berries on each bunch of Currants have formed. In nearly fifty years of my garden experience I do not remember so general a failure of crops. Strange to say, the Apples have done well. I am afraid that they were not subjected to no frost at all. Strawberries promise well, but Raspberries look sickly. I am inclined to think that the failure is not due to the frost, but to some more general cause, for the protected trees and bushes are not better furnished with fruit than the unprotected, and those that did not open till

long after the frost are as deficient as those subjected to that wonderful May cold; yet never was bloom more abundant, never was there a better promise. Is this universal weakness of the blossoms of this year due to the wet weather, or to the lowering of vitality by the late frosts? or is there some unknown electrical or other meteorological cause? The subject well deserves investigation. It could scarcely be the wet winter, for orchard-houses trees were not exposed to the deluges of rain; nor can the frost have done it at all, for protected fruits have shared the same fate as the unprotected. Can the meteorologists discover any special features of the season, electrical or otherwise, as having been exhibited since the summer of last year? *Edward W. Cox, Mount Mount, Mill Hill, N.W., June 9.*

Ivy on Garden Walls, &c.—At the present time I do not know of any prettier hardy plant foliage than that of the Golden Ivy, patches of which introduced amongst the green-leaved varieties have a most pleasing effect. Another point in the use of Ivy for house coverings which has recently come under my

Dunkeld and Blair Athole, published without the author's name in 1823, and said to be by the same writer. Dr. MacCulloch personally examined the flora of the district. Have other investigators examined his list? It has been copied and re-copied, not always with acknowledgment. *H. Evershed.*

Darlingtonia californica.—Many dozens of this interesting Pitcher-plant have flourished finely in a cold frame during the past winter, and one of them is now in flower. We believe the plant is quite hardy. *James Backhouse & Son, York.*

The Wreck of the Fruit Crop of 1877.—This is now complete. To the loss of Peaches, Nectarines, Apricots, Pears, Plums, have now been added that of Apples, the last, heaviest, and worst loss of all. It is rather difficult also to account for the latter. The fact has already been noticed that the Apple blossom was much later and also much paler than usual. The former was a hopeful sign; lateness, as a rule, denotes safety, and it was earnestly hoped it might have proved so this season. The paleness was no

spring was characterised by a profusion of bloom and a good set of all fruits but Apples and Peaches. Nectarines, Apricots, Pears set exceptionally well. Plums also flowered most profusely, but set not at all, or fell off immediately afterwards. Apples, again, did not flower so profusely or robustly as usual. The pale colour, however, was probably far more owing to the climate of the May of 1877 than to any immaturity handed down from the autumn of 1876. We have been accustomed to think the closed blossoms of fruit-buds safe: perhaps the experience of this year will induce us to modify this opinion. It is more than probable that the severe frosts during the early part of May crippled the Apple blossoms in bud. Hence probably the pale colour and the failure of the crop. If not, we must look for the cause of failure in the harsh, cold, and dry air that prevailed through May and the early part of June. No rain, no genial atmosphere, sharp, keen, dry winds, and the whole of the Apple crop has withered up and perished. Would overhead syringing have saved it, or the creation by artificial means of a genial atmosphere by surface waterings? Court-pendu Plat and the Red Beeching are

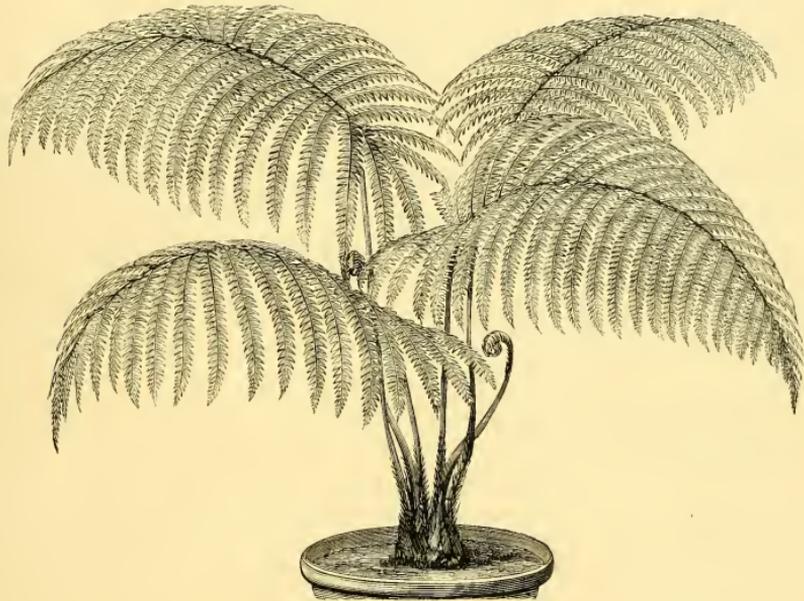

FIG. 123.—SADLERIA CYATHEOIDES.

notice is the use of the large-leaved common sort for covering villas. I recently saw an instance in which this Ivy was so healthful upon a house that it seemed to be out of all proportion for the place: the coat of leaves was so thick that they made the covering look quite heavy, and had the effect of narrowing the windows as well. If some of the finer-leaved kinds had been used for this purpose, instead of the common sort, it would have been much better, and less attention would be required for trimming. At least some of the smaller-leaved varieties, such as chrysoarpa and palmata, grow fast, close to the wall, and are well-adapted for covering villas or for use in such places where a thick coat of the common sort might be too heavy. *R. MacCallum.* [The varieties known in gardens as pedata and himalaica are charming varieties for small residences. EDs.]

Blair Athole Plants.—Your correspondent, Mr. H. Harpur-Crew, is correct, no doubt, in his remark at p. 729 that *Athericum emulicatum* is a Cape plant. My list of the plants of Ben-y-Ghlo and the other mountains of Glen Tilt was taken, with due acknowledgment, from Dr. John MacCulloch's *Tour in the Western Highlands*, 1824, or from an account of

doubt a symbol of weakness, and the paleness mastered the lateness—perhaps that is the best way of putting it. At all events, the most serious matter is that the Apple crop has failed. The failure could hardly be the result of frost during the blooming period, for since about the middle of May we have had no frost of sufficient severity to destroy Apple blossoms. Was the bloom thus destroyed in an embryonic or unopened state? This is unusual. Closed blossoms of Apples, Pears, Peaches, Apricots, &c., are generally held to be frost-proof. The blooms also, though pale, seemed perfect. On examination they showed no flaw, revealed no sign of imperfection, they simply have not set, and are now fallen and withered by handfult. Why? Is it the fault in the bloom or in the climatal conditions to which the bloom has been exposed? There are not a few who contend that it is in the former. The wood, and consequently the bloom-buds, were immature and stripe last autumn, they assert, and consequently there is no fruit this spring or summer-tide. This is a short, simple explanation of a most serious fact, but it seems to have little solid basis to rest upon. The fruits of immaturity are mostly imperfect, a scant bloom or setting of fruit. Now this

now (June 12) in full flower. Surely these will escape. Also Walnuts and Hollies are only now in full flower. These will surely also set and crop, especially as we were favoured from the west with a thunderstorm and a heavy shower about 3 A.M. this morning. But, broadly stated, the fruit crop of the year is utterly wrecked and ruined, and the Apples, which hardly flowered until the beginning of June, have followed Peaches, Nectarines, Apricots, Plums, Pears, to utter destruction. This, in fact, will be one of the worst fruit crops we have had for years. *D. T. Fish.*

Parasitical Plants.—*Lathraea Squamaria.*—This curious parasite was sown some years ago at the base of an old Holly; last year it produced sixty-three stems—some of them becoming to inches high—of its singular looking, naked, purplish stalks, and pale yellowish flowers. The late frost of this spring "cut" many of the stems, so that only about a dozen have developed. *Orobancha Helvola.*—We have been singularly (?) fortunate in "parasitising" this remarkable parasite to grow and flourish, after many vain attempts. Last summer we had twelve to twenty stems of it on Ivy, the latter creeping upon a steep

sunny bank. One new stem is already developed, and, as the species is perennial, we hope it may be permanently established. *James Backhouse & Son.*

The Weather and the Fruit Crops.—As in many other localities, vegetation in this place is fall three weeks later than usual, owing to the cold, dry, easterly wind, which prevailed in April and May. Under other circumstances this might have proved a disadvantage, with the long continued drought which has been quite otherwise favourable to the vegetable to survive the severe ordeal it had to pass through. And now when we look around as to the wide extent of woodland scenery, nothing is to be seen to mar the beauty of the landscape in the shape of lighted leaves. With the absence of grass and other plants in herbage, wild flowers have been seen in great profusion, spreading out far and wide, in striking masses of colour. I remember the late Sir Edwin Landseer once saying to me, that one bold stroke of colour, when properly placed, was more effective than a number of small touches. It may well be said of the earth at this season of the year, that it yields its increase, for we have wild flowers following one another in succession—*Primroses, Anemone nemorosa, Oxalis Acetosella, Viola canina* and *Scilla non-scripta*; the latter forms perfect sheets of blue colour, running in and out underneath the forest trees—

"And Daisies and Buttercups gladden the sight,
Like treasures of silver and gold."

Of bush fruits, the Gooseberry is the only kind that is rather a thin crop. Plums on standards and against the walls are safe, as are the Peas and Cherries. Apricots, too, which have been protected during the frost with thick canvas, are well formed and trees healthy. Apples are in blossom and promise well. Vegetables in the kitchen garden look well though late. The hybrid *Rhododendron* is in flower and the wall flowers are in full, flowering in great perfection, and so is the *R. ponticum*, and also our collection of *Azaleas*. *John Cole, Inverary.*

Paraffin and Seed Protection.—I tried the experiment of soaking Peas in paraffin for four hours, and I feel certain every Pea germinated. I have six rows of them now ready for picking. *Y. Osborne, Duggess, Aylesbury.*

For several years I have not been able to grow early Radishes or raise plants of Broccoli, Cabbage, and all other kinds of greens, owing to the destruction by small birds, such as greenfinches, &c. This season I moistened the seed with paraffin, and have an abundant supply. *H. Gibbons, The Nursery, Folkestone.*

Campanula Allioni, now flowering in the York nurseries, promises to be one of the best of the genus for rockwork. It spreads rapidly from underground stolons, and forms little erect rosettes, 2 inches high, densely clustered. The flowers are very large, almost exactly resembling erect purple Canterbury bells. They cover some of the banks and ledges of their plantations with "almost solid sheets of bloom." *James Backhouse & Son.*

The Caper Spurge, Euphorbia Lathyris.—Will you be so good as to inform me if this plant is rare [no], for several specimens suddenly appeared in our garden this spring, and all save one, which is now in bloom, got weeded away. It is a very graceful plant, but of rather a suspicious character, is it not? [Yes.] At any rate it belongs to a dangerous order, and although one may take, under medical advice, the products of some of the *Euphorbiaceae*, I should not like to venture on *Capers* grown in our garden for this plant. *Helen E. Watney.* [See Lindley's *Vegetable Kingdom* for a brief account of the properties of this plant. Eds.]

Gardening in the North of England.—After all the accounts I read of the scarcity of wall-fruits I am agreeably surprised to find that one of our Peach trees has set a crop; indeed, the gardener talks of thinning. It was covered with a wool net, and has the same protection in the shape of Hally bushes planted on each side of it—certainly a choice spot, for the Peach and Nectarine trees in the walled garden have not a vestige of fruit on them. I imagine the bees have kept very close quarters this cold spring; ours never made their appearance until June 4, when they came out uncommonly strong, and soon attracted swarming. Many years ago they located themselves in the ceiling of the house, and, never having been molested, I suppose they have plenty of food, without venturing abroad in doubtful weather. Although 575 feet sea level, we have very promising prospects in a *Maréchal Niel* Rose, the open ground, and a *Tropæolum speciosum* has not died down during the winter, and is now in full leaf. Being on the limestone rock the garden is very dry, and this may partly account for plants thriving here which do not generally survive so far north. The moist damp

spring has well suited newly planted trees and shrubs. Out of 2000 planted last autumn we have not come across one dead, and some, such as *Myrica*, are getting very encouraging to all lovers of tree culture. *E. O. M., East Leyton Hall, London.*

Reports of Societies.

Royal Botanic, June 13.—With a larger and costlier exhibition than in the last, a fine afternoon, and a very much larger attendance of visitors than usual, the prospect of the Royal Botanic Society looked brighter on Wednesday last than it has done for a long time back. As regards the usual order of specimen plants and such-like subjects as are generally shown at these exhibitions, there was a greater number than usual, the long corridor leading to the conservatory having to be requisitioned for the placing of many subjects that could not be squeezed into the large marquee. Of *Orchids* there was the largest and finest display that has come under our notice here for several years past; they were indeed a grand feature in the exhibition. The miscellaneous groups of new and rare plants contributed by the leading nurserymen also formed a bright and interesting feature; and the two slopes devoted to show and fancy *Pelargoniums* were wonderfully well filled and exceedingly gay. The weakest point in the show was undoubtedly the fruit department, which was—as has been the case during the past few years—very meagrely represented. This is the more to be regretted, as undoubtedly fine displays have been made here, and could be made again were more liberal prizes offered, and a premium of £1000 no rival in a condition to compete with it at this season. The display of cut flowers was, excepting as to cut Roses, exceedingly interesting; and in addition to all these there was the attraction provided by Mr. Anthony Waterer in the form of a magnificent display of plants in the American conservatory, which, by-the-by, has been remodelled, and in its altered form reflects much credit upon those who carried out the alterations. The general effect has been considerably heightened, and the comfort of the visitors much enhanced by means of reduced gradients and improved drainage, the latter being so arranged as to spoil the whole show, the gutter being brought down so low as to cut the view in two.

STOVE AND GREENHOUSE FLOWERING PLANTS were contributed in good numbers, but were scarcely so fresh and interesting as on the last occasion. In the open class for twelve Messrs. T. Jackson & Son came in 1st, with a fine group, consisting of *Erica eximia* superba, about 4 feet over and superbly flowered; large and well bloomed specimens of *Cleodendron* and *Phlox* in good bloom. *Bougainvillea glabra* Aphelix macrantha purpurea, and smaller but nicely done examples of *Statis profusa*, *Erica Cavendishiana*, *Dracophyllum gracile*, *Pimelea mirabilis*, and *Phenacoma prolifera* Barnesii. Mr. D. Donald, gr. to J. G. Barclay, Esq., Knott's Green, Leyton, was 2d, with a fine specimen of *Statis profusa* garden. Mr. James Child, gr. to Mrs. T. Roberts, Garbrand Hall, Ewell, and Mr. G. Wheeler, gr. to Sir Francis Goldsmid, Bart., were bracketed equal 3d. The best six contributed to the amateurs' class came from Mr. James Child, who had a large and magnificently flowered *Erica depressa*, a fine *Azalea Model*, in a very fresh and good condition; a large *Aphelix*, and *Stephanotis floribunda*, &c. The 2d award went to Mr. J. Hinnell, gr. to F. A. Davis, Esq., Angelsea House, Subitton, who had well-flowered *Erica* and fresh specimens of *Erica ventricosa* marginata, *Erica Cavendishiana*, *Statis profusa*, *Dracophyllum talipatira*, *Aphelix macrantha purpurea*, and *Dracophyllum gracile*. Mr. G. Legg, gr. to S. A. Kalli, Esq., Cleveland House, Clapham Park, was 3d. The best nurseryman's half dozen came from Mr. B. Williams, who had a fine lot of good specimens, including *Erica Cavendishiana*, *Statis profusa*, *Isora coccinea* and *I. Prince of Orange*, both well-flowered; *Allamanda grandiflora*, and *Aphelix macrantha purpurea*. The next best were contributed by Messrs. T. Jackson & Son, large and well-flowered examples of almost similar subjects. 3d, Mr. J. Reed, Rosnell Park Nursery, Norwood Road, who had a fine lot of 12-inch pots, intended no doubt to bring out plants of somewhat recent introduction, failed entirely in that respect, the plants staged being ill-specimens of, to us, too familiar subjects. The prizes went to Messrs. T. Jackson & Son, Mr. James Child, and Mr. G. Wheeler, in the order named.

ORCHIDS.—As before remarked, the bank usually devoted to these most attractive subjects was more than usually well filled. The amateurs' class for twelve, in which an uncommonly good specimen fell to Mr. Denning, gr. to Lord Londesborough, who had a very fine *Angolia Clowesii*, *Cattleya lobata* with ten spikes, *Laelia purpurata* with five, a nice *Cattleya Mendelii*, *Odontoglossum cirrhosum*, with three spikes; and O. Alexandria, with five;

Laelia cinabarinna, and a very good piece of *Dendrobium Bensonii*, *Odontoglossum vexillarium*, a grand plant with eleven spikes; *Vanda Denisonii*, with four; and *Cattleya nana*, with four. 2d, Mr. J. C. Spyers, Sir Trevor Lawrence's garden, was a good 2d, with a fine mass of *Odontoglossum Phalenopsis*, *Cattleya Warnerii*, with thirteen beautifully coloured flowers; *Dendrobium formosum giganteum*, *Odontoglossum Veitchii*, *Masdevallia Hartiana* violacea, with about two dozen flowers; and the showy *Calanthe Deminii*, with a dozen good spikes; a very good *Dendrobium Devonianum*, *Laelia purpurata* and *L. majalis*, and *Odontoglossum cirrhosum*, &c. Mr. F. Rutland, gr. to the Duke of Richmond and Gordon, Grosvenor, was a very good 3d, and an extra prize was awarded to Mr. G. Wheeler, A. Philbrick, Esq., Avenue Road, Regent's Park, who had, amongst other good plants, one of *Odontoglossum vexillarium* with five fine spikes. In the corresponding class for nurserymen, Mr. B. S. Williams was 1st and took the 1st prize, showing amongst others a fine mass of *Cypridium barbatum* superbum; *Orchis foliosa*, with fourteen good spikes; *Vanda tricolor superba*, *Dendrobium formosum giganteum*, *Cattleya Mossii*, a fine variety; *Odontoglossum cirrhosum*, &c. The 2d prize went to Messrs. F. Jackson & Son, who had a very good specimen of *Dendrobium moschatum*. The trade class for six also found Mr. Williams to the front, with a group which included *Vanda tricolor formosa*, with two good spikes; *Cypridium barbatum grandiflorum*, *Cattleya Mossii* superba, with beautifully flowered; *Odontoglossum vexillarium*, with thirty-nine grand flowers in five spikes; *Epidendrum vitellinum majus*, &c. 2d in this class came Mr. E. Morse, of Epson, who had a *Saccolabium Blumei majus*, with a grand spike of flowers; and two fine *Aerides*, &c. The amateurs' class for six was also a very good one. Mr. H. S. James Douglas came in 1st, with a capital lot of plants, which consisted of *Dendrobium formosum giganteum*, with four spikes; *Odontoglossum crispum*, with three; a good mass of *Cypridium barbatum grandiflorum*, *Masdevallia Hartiana*, with several very fine blossoms; *Dendrobium nobile*, and *Cattleya Mossii superba*. Mr. W. P. Roberts, gr. to W. Terry, Esq., Peterborough House, Fulham, was a very good 2d, showing *Vanda teres*, with ten grand flowers; *Cattleya Mossii*, with sixteen; *Cypridium barbatum nigrum*, very good; *Cattleya Mendelii*, *Saccolabium plicatum*, and *Masdevallia*, &c. The 3d prize went to Mr. J. Hill, gr. The Poles, Ware, Herts, who had in his group fine examples of *Ceoloyne Lowii*, *Aerides Fieldingii*, and *Cypridium caudatum*, &c. Mr. F. Rutland also contributed a nice group.

FERNS AND FINE-FOLIAGED PLANTS were particularly well shown, and, as usual, were most effective in the position assigned to them. The strongest class was the amateurs' for six fine-foliaged plants, in which the competition was very keen. Between the groups contributed by Mr. Legg, Mr. C. Rann, gr. to J. Warren, Esq., there was not a pin to choose, so they were both, and equal 1st prizes were awarded. Mr. Legg had that remarkably handsome *Stevensonia grandifolia* that has been seen here before, and also the very fine *Cycas revoluta*, as well as grand examples of *Crotos Weismanni* and variegata, a very fine *Genoma pumila*, and *Alcaesia macrolobis variegata*. Mr. Rann had a very fine *Crotos interruptus*, a handsome *Cycas revoluta*, equally good examples of *Zamia Lehmanni*, *Arca sapida*, *Dasylium glauca*, and an exceedingly good specimen of *Cyathea*, and a handsome *Chamaecyparis*, which 2d honours were awarded to. Mr. Legg had a fine lot, with a couple of good *Crotos*, and a nice young *Cocos Weddelliana*, &c.; 3d, Mr. James Child, whose most noteworthy subjects were first-rate plants of *Genoma Vercheffii*, *Crotos Weismanni*, and *Phytolacca*. Mr. F. Hill, gr. to H. Taylor, Esq., Avenue Road, was also a very excellent group. Mr. B. S. Williams and Mr. J. H. Ley had the competition to themselves in the nurserymen's class, and took the prizes in the order named—the first mentioned having a very large *Cycas*, *Cyathea*, a handsome *Chamaecyparis*, *Crotos pictum*, *Dasylium acrotichum*, *Pandanus Veitchii*, and a very brightly coloured *Crotos Weismanni*. Mr. Ley's collection was also a very effective one. Mr. William Bull came in 1st for twelve *Cordylines* and such young, vigorous, and not a cleanly grown specimen. Mr. J. H. Ley, an amateur, Baptistis, Shepherdii, anabilis, Chelsoni, Regina, Rex, Goldiana—a remarkably telling group. Mr. G. Legg was a very good 2d, having very fine examples of the most popular varieties of the ferns, and the 3d prize was won by Mr. J. H. Ley, and included *Latania borbonica*, *Caryum megarum*, *Eterpe edle*, *Genoma Schottiana*, and *Chamaecyparis tomentosa*. The 2d prize went to Mr. G. Legg, and the 3d to Mr. G. Wheeler. The nurserymen's class for half-a-dozen Ferns, in which Mr. B. S. Williams was 1st and Mr. J. H.

Ley 2d, contained nothing remarkable, but the corresponding class for amateurs was a very good one. Mr. C. Kinn, gr. to J. Warren, was 1st, with a large and handsome specimen of *Asphodela sturtii*, *Dicksonia squarrosa*, *Cyathes Dregei*, *C. medullaris*, *C. dealbata*, and *Dicksonia antarctica*. Mr. D. Donald was a good 2d, and Mr. James Child a close 3d. In Mr. Donald's group was a magnificent specimen of *Asphodela sturtii*, about the best of the kind, a specimen of *Adiantum cardiophyllum*, *Dicksonia antarctica*, &c.

ROSES, HEATHS, AND PELARGONIUMS.—Roses in pots were shown only by Messrs. Paul & Son, Cheshunt, who contributed to the classes for nine and six a capital lot of plants; but, of course, as a consequence of the lateness of the season, it was not the finest that the Messrs. Paul & Son have shown this season. The 1st prizes in both instances were most worthily awarded. The Heaths were also not so good as on the last occasion. Amongst amateurs for six, Mr. C. Legg was 1st, with medium-sized and very fresh examples of *E. obtata*, *E. jubata rubra*, *E. ampullacea obtata*, *E. Candolleana*, *E. Fast. ni*; and in the corresponding class for nurserymen Messrs. T. Jackson & Son were 1st with fine specimens, fresh and well-flowered, of *E. tricolor dumosa*, *E. tricolor rubra*, *E. vandelliana*, *E. ferriana*, *Perlagonia major*, *E. depressa*, &c. Show and fancy Pelargoniums were contributed in considerable numbers, and of excellent quality. Mr. James, gr. to W. F. Watson, Esq., was the most successful exhibitor among amateurs, taking the 1st prizes in the open class for nine and the amateurs' class for six, and 2d for six fancies. Amongst his most noticeable examples were thoroughly well flowered plants of such fine varieties as *Mary Hoyle*, *Princess of Denmark*, *Pericles*, *Prince Leopold*, *Statenam*, *Snooklike*, *Belle Bell*, *Rehoboths*, *Pompey*, *King Charles* and *Victory*. In the open class Mr. Turner was a good 2d, and Messrs. Dobson & Son 3d. In the nurserymen's class for six Mr. Turner was 1st and Messrs. Dobson & Son 2d; and Mr. Turner was again 1st amongst nurserymen for six, showing the best in both instances. The best half-dozen fancies shown by an amateur came from Mr. Henry King, gr. to R. Tew, Esq., *Wolsey Grange*, Esher, who had a very fine lot of plants, full of flower and very bright. The varieties shown were *Fanny Gair*, *Tormentor*, *Mr. Alfred Wight*, *Roi des Fantaisies*, and *Vivandaise*. Mr. J. W. King, gr. to Mrs. Hodgson, *The Elms*, Hampstead, was a good 3d. For six Zonal Pelargoniums in flower Mr. J. Catlin, gr. to Mrs. Lermittie, Finchley, came in 1st with a grand lot of plants, about 4 feet over, and perfect in development of flowers and foliage; and Mr. King was 2d with smaller but exceedingly well finished specimens.

CUT FLOWERS.—Roses should have formed the principal feature in this department; but, as a result of the lateness of the season, they were shown only in small numbers, and nothing remarkable as to quality. The best in the class for six came from Mr. James Chad, gr. to Sir F. Bathurst, Clarendon Park, Salisbury, who also secured the 1st prize, with a dozen blooms of the white *Rose La Marque*, and the 1st prize for a basket of *Marchal Niel*, as well as the highest award for a basket of *Roses*, mixed colours. Mr. W. P. Roberts, gr. to W. Terry, Esq., was the only exhibitor of twenty-four trusses of *Pyrethrams*, and the 1st prize was worthily awarded. The class for twenty-four trusses of hardy herbaceous flowers was a most interesting one, very good things being shown that are not admissible in the open class. Mr. James Douglas was 1st, with a charming lot of flowers, including his new hybrid *Aquilegas*, fine spikes of the showy *Scilla peruviana*, *Spiraea palmata*, *Orethia foliosa*, *Statice armenia grandiflora*, *Delityra spectabilis*, *Aquilegia coracua*, &c. Mr. E. Morse, of Epsom, was 2d, and Mr. Robert and Mr. G. Wheeler each 3d, both showing exceedingly well. Mr. Douglas was also well 1st in the corresponding class for stove and greenhouse flowers, showing some fine *Orethids*, such as *Odontopogon hastulatum*, *O. crispum*, *Asclepias tuberosa*, *Asplenium Major*, *Dendrobium nobile*, &c. *Ericas*, *Bougainvilleas*, *Ixoras*, *Aphelaxis*, and *Arthurian Scherzerianum*, &c. The 2d prize went to Mr. James Bolton, who had amongst other fine things some grand specimens of the same *Anthurium*, *Clorodendron fallax*, *Oncidium variegatum*, *Gandaria*, and *Begonia*, &c. Mr. W. Bones was a good 3d, and an extra prize was awarded to Mr. E. Morse for a nice lot. A most interesting class was that for a "group, basket or bouquet of wild flowers, each collection from a definite area of 5 miles radius around any parish church." The 1st prize was collected from the garden of Mr. J. Green, Poles, Ware, was a most commendable one, the number of plants being somewhat extensive, and each amply represented, tastefully set up and very neatly labelled with the common and scientific names. They were collected within the prescribed area around the parish church of Thunbridge, Herts. The 2d prize

went to Mr. J. Chad, and an extra to Mrs. Soder, Weald Hall Cottage, Brentwood.

NEW PLANTS were largely and most admirably represented by choice groups from Messrs. Veitch & Sons, Mr. William Ball, Mr. B. S. Williams, Messrs. Rollison & Sons, Messrs. J. Laing & Co., and others, and the following Antiarum, *Antiarum* were awarded:—To Messrs. Veitch & Sons, for *Rhododendron Maiden's Blush*, *Acalypha Macraefcana*, *Crataegina*, *C. hybridus*, *Gymnocarpon Mäleri*, *Pteris eniformis variegata*, *Anthurium Varocarpianum*, *A. Veitchii*, *Dicksonia Bertiana*, *Alpinia glazianiana*, and *Ardisia inaequalis*; to Mr. William Ball, for *Coleus pictus*, *Araucaria excelsa albopuncta*, *Zamia Roezlii*, *Cycas media*, *Diefenbachia chloensis*, *Cratium Bismarckii*, *Ardisia ornata*, *Cratium splendens*, *Cyathes Dregei*, *Lonicera*, *Balgates*, *Cycas media cristata*, and *Antrodia glaucocaulis* variegata roseum; and to Messrs. J. Laing & Co., for *Begonia Gloire de Nancy*.

FLORISTS' FLOWERS, especially Pelargoniums, were also well represented, and Floral Certificates of Merit were awarded.—To Mr. Turner, for show Pelargoniums *Venus*, with a small purple spot on each petal; *Silvio*, a fine bright scarlet, with almost black blotches; *Henry King* (fancy), very dark rose, shaded with pale lilac; and Mrs. Pope (fancy), white, blotched with magenta. To J. W. King, gr. to Messrs. Clever Manor, Windsor, for show Pelargonium *Toby*, a rich blood-red, with a dark maroon blotch. To the Rev. A. Matthews, Gurney, Leicestershire, for show Pelargonium *Bertie*, a bright rose pink, with very dark upper petals. To Mr. T. S. Ware, Tottenham, for one of the best *Veronica* named *Godwin*, of a bluish purple tinge, and good in form. And to Mr. James Douglas, for his hybrid *Aquilegas*, *hybrida coracua* and *hybrida californica*.

FRUIT.—In this department the display was a fair one for "the Park," as compared with recent exhibitions, but nothing like what we used to see here. Of the two collections of nine dishes the best came from Mr. Miles, gr. to Lord Carrington, Wycombe Abbey, who staged five Queen Fines and Golden Grapes, Foster's Seedling and Black Hamburg Grapes, large and well-coloured *Violette Hätive Penches*, and *Elmge Nectarines*, a handsome fruit of Cox's Golden Gem Melon, Sir Charles Napier Strawberries, *Brown Turkey Figs*, and a splendid dish of Black *Circassian Grapes*, *Black Hamburghs*, gr. to Mr. Miles, gr. to Messrs. Havering Park, Romford, took the 2d prize, a fairly good collection, but wanting in variety. Only two pairs of Queen Pines were staged, and the prizes went to Mr. J. Akehurst, gr. to S. Copestake, Esq., *The Grove*, Kenilworth Town, and Mr. F. Rutland, gr. to the Duke of Bedford, *Greenham* and *Godwin*, in the order named. Those which took the highest award would weigh about 4 lb., and the next a trifle under. The prizes for a single Queen went to Mr. Douglas, gr. to F. Whitburn, Esq., *Loxford Hall*, Horn, Mr. Rutland, and Mr. Akehurst; and in the class for a pair of Queen Pines Mr. Miles took the chief award with a very good *Charlotte Rothschild*. Of baskets of 12 lb. of black Grapes, half-a-dozen were staged, and the best were contributed by Mr. James Douglas, who had a fine and excellently coloured sample of Black *Hamburghs*. The next best also a fine sample, came from Mr. P. S. Kay, of Finchley; and Mr. P. Edwards, gr. to Mrs. Tristram, *Fowley Liphook*, Hants, was a very good 3d. The other three samples were also good and well-coloured.

In the corresponding class for white Grapes there were only four competitors, but all their staged very excellent samples for the season. Mr. G. Gimmet, gr. to J. Wilmot, Esq., *Iseworth*, was 1st, Mr. Douglas 2d, and Mr. W. Robins, gr. to C. D. Lee, Esq., *Hartwell House*, Aylesbury, and Mr. F. Feist, gr. to R. G. Ashton, Esq., *Bishopsgate House*, *Sixden*, Luton, were 3d and 4th. The best of the Muscat of Alexandria. The Loxford grower had the Canon Hall Muscat in fine condition, but scarcely so ripe as his more successful rival. Mr. W. Bones sent the best dish of Black *Hamburghs*, a very nice sample in bunch, berry, and colour, but not large. The next award went to Mr. Sowerby, gr. to the Earl of Macclesfield, *Shirburn Castle*, Oxon, and the 3d to Mr. Bolton, gr. to W. Spottiswoode, Esq., *Combe Bank*, Sevenoaks. The last-named exhibitor came in 1st in the class for 12 bunches of black Grapes, with a good sample of *Black Hamburghs*, and three nice bunches of *Madresfield Court* won the 2d prize for Mr. Wilmot's gardener, who also secured the highest award in the next class, for *Muscat of Alexandria Grapes*, with a very good dish; Mr. P. Edwards was 2d with very nice bunches, and Mr. W. Robins was 3d. In the any other white variety class, Mr. Douglas came in a good 1st, with a capital dish of *Blackland Sweetwater*. Mr. Sowerby was 2d with a nice dish of *Foster's Seedling*; and Mr. C. W. Aldrich, *Lang Lane*, South Lambeth, was 3d, with small bunches of *Blackland Sweetwater*, "grown

within 11 mile of Charing Cross," if there is anything in that. Of Peaches there was only half-a-dozen dishes. Mr. Robert Sowerby took the 1st prize with fine specimens of *Royal George* and *Alexandra Noblesse*; Mr. G. Cornhill, gr. to J. S. Virtue, Esq., *Outlands Park*, the 2d; and Mr. W. Robins, 3d, with the same varieties. Nectarines were represented by eight dishes, all of which may be classed as good. Very fine specimens of *Royal George* were shown by Mr. Halliday, gr. to J. Norris, Esq., *Castle Hill*, Bletchingley, came in 1st; *Violette Hätive* and *Elmge*, from Mr. K. Sowerby, 2d; and *Elmge* and *Pitman's Orange*, from Mr. G. Cornhill, and *Elmge* and *Violette Hätive*, from Mr. Miles, were placed equal 3d. The best of four plants of *Melons* came from Mr. Gilbert, gr. to the Marquis of Exeter, *Burghley Park*, Stamford—*Gibbert's Victory* of Bath, green, and of delicious flavour, and a new scarlet variety named *Excelsior*, a handsome heavily netted fruit of excellent quality; Mr. Miles was a good 2d, with *Reid's Scarlet-flesh* and *Cox's Golden Gem*, the first-named being very fine in flavour; 3d, Mr. George Halliday, with small fruits of *Golden Gem* and *Scarlet Gem*. The heaviest scarlet-fleshed variety was *Duke of Edinburgh*, shown by Mr. G. Moore, gr. to Messrs. Viner, Harley Park, Reading, 5 lb. oz.; 2d, Mr. G. Gilbert, 4 lb. 13 oz.; 3d, Mr. Miles, *The Shah*, 4 lb. 6½ oz. Mr. Miles took the 1st prizes in both the classes of *Cherries* with *Black Circassian*, *Elton*, and *Governor Wood*, all fine samples. In the miscellaneous class a very nice specimen of *Black Hamburghs*, gr. to the Duke of Northumberland, *Syon House*, for a very fine dish of *Vanilla*; Mr. Roberts, gr. to W. Terry, Esq., *Peterborough House*, Fulham, had a 3d prize also for *Vanilla*; and Mr. Douglas a 2d for some fine *Tomatos*.

York Annual Floral Fête: *June 13, 14, and 15*.—The city of York on this occasion fully sustained its high place in the annals of horticultural demonstrations, the exhibition, as a whole, being the finest which has taken place since York became a centre of horticultural influence. Exhibitors came from a larger area than hitherto, and consequently competition in all the classes of the very comprehensive schedule was very keen—in fact, "Greek met Greek," and the tug of war was in many classes furious. Therefore it was that the judges had in many cases a most difficult task to perform. This was notably the case in the class of twelve plants, and in the class of eight fine-foliaged, the contest in this class being between Mr. T. M. Shuttleworth, of Preston; Messrs. E. Cole & Sons, Manchester; and Mr. T. F. G. Williams, of Worcester, the prizes being awarded in the above order. The flowering plants in the Messrs. Cole's group were doubtless the most interesting and valuable group, but the foliage plants in Mr. Shuttleworth's collection were much superior, and the group, as a whole, deservedly obtained the post of honour. Pelargoniums formed a most attractive feature, filling one large table, and most interestingly competing was spirited, and all the exhibits above the average.

Roses also formed a grand feature, Mr. H. May, of Bedale, being 1st in all the classes in which he competed. This applies to both cut flowers and pot plants, and this says much for the northern grower when it is remembered that he had Mr. Charles Turner, of Slough, as an opponent. Mr. Turner was the only exhibitor in the class for large Roses, and put up a fine lot. *Ferax*, both hardy and exotic, were exhibited in large quantities, and the quality, with one or two exceptions, all that could be desired in a well-classified display. *Ainsworth*, of Manchester, being the only exhibitor of note, and the most noteworthy plant in his collection was a grand plant of *Acerides Fiedlingii*, with four fine spikes, two of them being branched. *Fuchsia* were very meritorious for this period of the year, white, pink, and other cut flowers, and plants in excellent condition, and drew around them a large number of admirers, especially the ladies, who severely criticised the awards, and one fair dame was heard to say, that "Men knew nothing about bouquets." Fruits formed a most interesting display. Several collections of six varieties were staged. Sir H. W. Thompson, Bart., York, F. S. Folljame, of Worksop, and the Marquis of Ripon, being successful exhibitors. *Black Grapes* were exhibited in fine condition by T. H. Preston, Esq., of York; and J. F. Fison, Esq., of Epsom. *Black Grapes* were equally well done by R. Varill, Esq., of York; T. H. Preston, Esq.; Mr. Alderman Weatherly, of York; and T. Salt, Esq., of Leeds. A few Pines were exhibited, the best coming from the gardens of the Earl of Rutland.

Messrs. Cole & Sons, of Manchester, had a miscellaneous collection of plants, consisting of the charming *Japanese Maples* and rather a striking group of *Tee Carnations*. This it will be seen that this was no ordinary meeting. The weather was very fine on the opening day, and on the following day, and the result of the financial result be commensurate with the organisation and outlay, this year's York Floral Fête will be

a success. Mr. Wilson, the secretary, did not undertake a stone thrown to ensure the success of the undertaking and the comfort of all concerned.

The Royal National Tulip Exhibition.—The date of this exhibition, originally fixed for May 25, was eventually postponed till June 5, in order that a show of Tulips might attract a larger number of visitors. The season has proved a most backward one in Lancashire, and even at the latter date some of the leading cultivators, such as Mr. Samuel Barlow, of Stakehill, and the Rev. F. D. Horner, of Kirkby Malzeard, could scarcely show a flower. The Derby growers, and a few of these farther north, but who are favourably situated than the Manchester growers, came in with fairly good flowers, and so the show proved much better than at first expected; and, notwithstanding the fact that death has been very busy among the raisers of the Tulip cultivators during the two or three years, robbing them of such men as Richard Heady, Dr. Hardy, J. D. Hextall, W. Willison, Michael Potter, and others, it is yet satisfactory to know that there is no decrease in the supporters of the show. The number of subscribers has been increased to fifty-three in 1877 as compared with forty-eight in 1876.

The "National" was held as usual in the Botanical Gardens of the Manchester Botanical and Horticultural Society, which not only gives accommodation to the exhibitors and growers, but subsidises their fund with a gift of £10.

The blue riband of the National Tulip show is the cup offered for the best stand of twelve dissimilar Tulips, two feathered and two flamed in each of the three classes. This was won by Mr. William Whitaker, of Salford, who is this season the only exhibitor who staged Mrs. Lea and Industry, feathered roses; Sarah Heady and Mrs. Lea, flamed roses; Masterpiece and John Morris, feathered bizzares; Sir J. Paxton and Ajax, flamed bizzares; Bessie and Violet Aimaible, feathered byblomems; Talisman and Bacchus, flamed byblomems. This stand contained five flowers generally; and Industry and Talisman were exceptionally fine. 2d, Mr. David Barber, Stanton-le-Dale, with Heroine, Industry, Clara and Triomphe Royale, roses; Sir J. Paxton, both feathered and flamed; Dr. Hardy, a seedling, bizzare; an Orval, Mary Barber, Duchess of Sutherland, and Violet Sovereign, byblomems; 3d, Mr. Samuel Barlow, Stakehill House, Chadderton, with Lady Grosvenor and Modesty, feathered; Mrs. Lomax and Victoria, flamed roses; 4th, Mr. Henry Hill, with Tim, feathered, and Ajax and Orion, flamed bizzares; Bessie and Martin's 1st, feathered; and Bacchus and Adonis, flamed byblomem. Mr. Barlow's flowers were generally small and undersized, but they manifested a splendid quality that is always characteristic of his growth. 4th, Mr. Desset Cooper, Stockport, 5th, Mr. Samuel Cooper, Timperley. In class 2, for six dissimilar Tulips, one feathered and one flamed in each class, eight prizes were offered and all awarded. Mr. Charles Forman, Chellaston, with Heroine, feathered, and Aglaia, flamed rose; Sir J. Paxton, feathered, and the same variety flamed bizzare; Mrs. Pickereil, feathered, and Duchess of Sutherland, flamed byblomem; 3d, Mr. William Whitaker, with Sarah Heady, feathered, and Mrs. Lea, flamed rose; Masterpiece, feathered, and Sir J. Paxton, flamed bizzare; 4th, Mr. Henry Hill, with William Bentley; 5th, Mr. T. Haynes, with Salvator Rosa; 6th, Mr. H. Hill, with Chancelor; 10th, Mr. S. Barlow, with David Jackson. Mr. Whitaker also had the best feathered byblomem in Heady's Adonis; 5th, Mr. Henry Hill, with Victoria, flamed with Violet Aimaible. Mr. C. Forman 2d, with Mary Forman; Mr. D. Woolley 5th and 6th, with Bessie and Talisman; Mr. J. Hague 7th, with Mrs. Allsop; Mr. T. Mellor 8th, with Angelina; Mr. S. Cooper 9th, with Sarah; and Mr. D. Barber 10th.

As there are in connection with the National Tulip Society certain growers with small collections who subscribe only half a guinea per annum, it is customary to have a class special to these, and from which the larger growers are excluded. There were six of these Tulips, one in each class was taken by Mr. H. Housley, Stockport, with Rose Aglaia, shown both feathered and flamed; Masterpiece, feathered, and Sir J. Paxton, flamed bizzare; Violet Aimaible, feathered, and Chancelor, flamed byblomem; 2d, Mr. Henry Hill, with Heroine, feathered, and Mary Barber, flamed rose; Sir J. Paxton, feathered, and Dr. Hardy, flamed bizzare; Adonis, feathered, and Duchess of Sutherland, flamed byblomem; 3d, Mr. Richard Yates, Leigh, with Mrs. Lea, feathered, and Lady Talford, flamed rose; Masterpiece, feathered, and Dr. Hardy, flamed bizzare; Violet Aimaible, feathered, and Lord Denman, flamed byblomem.

In the class for three feathered Tulips, one of each section was won by Mrs. Lomax, with Victoria, rose; Masterpiece, bizzare; and Adonis, byblomem 2d, Mr. Charles Forman, with Heroine, rose; Sir J.

Paxton, bizzare; and Adonis, byblomem. 3d, Mr. Thomas Haynes, with Sarah Heady, rose; Sir J. Paxton, bizzare; and Mrs. Pickereil, byblomem. 4th, Mr. H. Housley; 5th, Mr. D. Woolley, 6th, Mr. W. Whitaker. In class for three flamed Tulips, one of each, there was also a spirited competition, the best coming from Mr. James Thurston, who had Aglaia, rose; Sir J. Paxton, bizzare; and Talisman, byblomem. 2d, Mr. Samuel Barlow, with Annie Mabel, flamed rose; 3d, Mr. Charles Forman, with Bacchus, byblomem. 3d, Mr. Thomas Haynes, with Triomphe Royale, rose; Sir J. Paxton, bizzare; and Duchess of Sutherland, byblomem. 4th, Mr. William Wardle, Burton-on-Trent, with Triomphe Royale, rose; 5th, Mr. Henry Hill, with Victoria, flamed with Violet Aimaible. 6th, Mr. Thomas Mellor; 6th, Mr. David Barber. Class six was a peculiar one, as it was open to maiden growers only, i.e., those which have not yet won a prize in the National Show. It was for one feathered and one flamed flower in any class, and all the stands in the class were also allowed to compete in class 7, also for the same subjects, but open to all cultivators. In class 6 Mr. Henry Hill was the only exhibitor who received an award, having bizzare Lord Clifford, and byblomem Duchess of Sutherland. The members of the National Tulip Society do all they can to encourage the advent of maiden growers, as all who enter in class 6 receive a number of valuable bulbs. In class 7 Mr. W. Whitaker was 1st, with Masterpiece and Sir J. Paxton, both bizzares; 2d, Mr. Henry Hill, with Kirkby Malzeard, with Mrs. Lomax, rose, and Bacchus, byblomem; 3d, Mr. William Wardle, with Industry and Aglaia, both rose; 4th, Mr. D. Woolley, with Dr. Hardy, bizzare, and Talisman, byblomem; 5th, Mr. David Barber; 6th, Mr. C. Forman.

In the class for single blooms to compete in, as usual, a large number of flowers, and the making of the awards in these classes must severely tax the patience of the judges. The best flamed bizzare was Sir J. Paxton, from Mr. J. Turner; and then followed Mr. Thomas Haynes, with Dr. Hardy. Mr. J. Turner, with Sir J. Paxton; Mr. W. Whitaker, with Orion; Mr. Joshua Hague, with Masterpiece; Mr. C. Forman, with the same; Mr. J. Thurston, with Ajax; Mr. D. Woolley, with Captain White; and Mr. W. Whitaker, 9th and 10th, with Ariosto and Smiles, Prince of Wales. In the class for feathered bizzares Mr. H. Housley was 1st with Royal Sovereign and 4th with Lord Byron; Mr. W. Whitaker 2d with Masterpiece, 3d with Sir J. Paxton, 5th with Field Marshal, 7th with George Hayward, and 8th with Magnam Floss; Mr. J. Turner, 9th with Royal Sovereign; Mr. R. Yates 10th with Sir C. Campbell. In the class for flamed roses Mr. D. Woolley was 1st and 2d with Aglaia, and then followed Mr. T. Mellor with Mabel, Mr. W. Whitaker with Madame de St. Arnaud, and J. Housley with Victoria, flamed rose. Mr. W. Wardle with Industry, Mr. S. Barlow with Lady Sefton and 9th with Rose of England, Mr. S. Cooper 8th with an unnamed variety, and Mr. W. Whitaker 10th with Sarah Heady. In the class for feathered bizzares Mr. S. Barlow was 1st with Royal 5th with Aglaia, and 7th with Mabel; Mr. W. Whitaker 2d with a seedling, 4th with Mrs. Lea, 8th with Industry, and 10th with Mrs. Heady; the Rev. F. D. Horner 3d with Modesty, Mr. C. Forman 6th with Heroine, and Mr. S. Barlow 9th with Little Annie. The best flamed byblomem was Talisman, from Mr. W. Whitaker, and the same was 2d with Duchess of Sutherland and 5th with Heady's Adonis; 3d, Mr. S. Barlow, with Talisman; 4th, Mr. T. Haynes, with Clark's Thalia; 6th, Mr. W. Woolley, with Victoria, flamed rose; 7th, Mr. Henry Hill, with William Bentley; 8th, Mr. T. Haynes, with Salvator Rosa; 9th, Mr. H. Hill, with Chancelor; 10th, Mr. S. Barlow, with David Jackson. Mr. Whitaker also had the best feathered byblomem in Heady's Adonis; 5th, Mr. Henry Hill, with Victoria, flamed with Violet Aimaible. Mr. C. Forman 2d, with Mary Forman; Mr. D. Woolley 5th and 6th, with Bessie and Talisman; Mr. J. Hague 7th, with Mrs. Allsop; Mr. T. Mellor 8th, with Angelina; Mr. S. Cooper 9th, with Sarah; and Mr. D. Barber 10th.

The premier feathered Tulip was Heroine, rose, shown by Mr. David Barber in class 2; and the premier flamed Tulip Sir Joseph Paxton, bizzare, shown by Mr. C. Forman in class 2.

There yet remain the breeder classes, and flowers of extraordinary beauty are found among them. Mr. Samuel Barlow's collection is so varied, and contains so much that is new and fine, that for years past he has ranked as the champion breeder cultivator among Tulip fanciers. On this occasion he was awarded the following prizes: 1st, with Victoria, flamed rose; Barlow and Lady Mary, rose; Lord Provost and Richard Yates, bizzare; Glory of Stakehill and Talisman, byblomem, a very fine lot indeed; 2d, Mr. David Barber, with Dr. Hardy, Adonis, Queen of England, Mrs. Lea, seedling; 3d, Mr. J. Hague, 4th, Mr. W. Whitaker. The three breeders came from Mr. Thomas Haynes, who had

Beauty of Litchurch, Mrs. Bright, and Dr. Hardy; 2d, Mr. S. Barlow, with Alice Grey, Annie Macgregor, and Sir J. Paxton; 3d, Mr. H. Housley, with Sulphur, Mabel, and Duchess of Sutherland; 4th, Mr. W. Whitaker; 5th, Mr. T. Mellor; 6th, Mr. Joshua Hague.

In the class for single blooms of bizzare breeders the best was Sir J. Paxton, from Mr. David Barber; and then followed William Willison, Dr. Hardy, Exceller, and the seedlings. The best flamed rose was Mrs. Barlow, from Mr. S. Barlow; and then followed Annie Macgregor, Lady Grosvenor, Atkins seedling, Mabel, Lady May, and Mrs. Bates. The best byblomem breeder was Beauty of Litchurch, from Mr. Thomas Haynes; the remainder of the other flowers were seedlings.

The premier breeder Tulip was Mrs. Barlow, a very fine rose, from Mr. S. Barlow's collection.

The Northern Counties' Tulip Society: *June 8*.—The fourth annual exhibition of this Society was held at the Abbey Hey Hotel, Gorton, Manchester, on the above day. Formerly it was the custom to hold a number of small Tulip shows in the neighbourhood of Manchester, and some of them are still continued, but a few of the leading growers, dissatisfied with the public-house associations they encouraged, agreed to form the Northern Counties' Society, and much success has attended their efforts. It is not in any sense of the word the rival of the National Tulip Society.

The flowers were staged for judging in the large dancing saloon in rear of the hotel, and after the prizes had all been awarded the flowers were removed to a room at the hotel which is specially arranged for the purpose, inasmuch as it contains a centre plant stage, similar to one that might occupy the centre of a span-roofed greenhouse, and on this the flowers were arranged in rows of benches, while the stands of flowers occupy tables arranged round the sides of the room. The "pans," as they are termed, viz., collections of three or more blooms, are generally shown on ordinary flower-boards, but the single flowers are set up in wooden tubs placed in ginger-bear bottles, and there is always a great number of these. The prize flowers are all kept together. This room of Tulips, which is shady and cool, is kept open for the inspection of any one interested in the Tulip for several days.

The largest class of the Northern Counties show the largest class is six varieties, one of each of the classes. The best six came from Mr. William Whitaker, Salford, who had flamed bizzare Sir J. Paxton, very fine; feathered bizzare Masterpiece, flamed rose Mabel, and rose Industry, delicately beautiful new variety shown in fine condition; flamed byblomem Talisman, and feathered byblomem Bessie, very fine, 2d, Mr. Thomas Mellor, Ashton, with Sir J. Paxton, flamed, and Charles N., feathered bizzare; and Duchess of Sutherland, very fine, flamed, and Agnes, feathered byblomem; Mabel, flamed, and Heaite, feathered rose. 3d, Mr. Samuel Barlow, Chadderton, with Sir J. Paxton, very fine, flamed, and George Hayward, feathered bizzare; Countess of Seton, flamed, and Heroine, feathered rose; John Pencock, flamed, and Bessie, feathered rose. 4th, Mr. John Morris, Leigh. Class 2 was for six varieties also, the competition confined to half-guinea subscribers, and the flowers were generally inferior to those in the preceding class. The best came from Mr. James Hulme, with bizzares Sir J. Paxton, flamed, and Charles X., feathered; Rose Mabel, flamed, and Heroine, feathered; byblomem Chancelor, flamed, and Violet Aimaible, feathered. Mr. James Leach was 2d, Mr. R. Ashton, 3d; and Mr. John Hess, 4th. In class 3, the best came from Mr. W. Whitaker, who was 1st, with bizzare Masterpiece; byblomem Violet Aimaible, very good; and rose seedling, a very good and promising high-coloured flower; 2d, Mr. James Hulme, with Masterpiece, Violet Aimaible, and Mrs. Lea; 3d, Mr. Thomas Mellor, with Sulphur, Norval, and Bessie, feathered rose. 4th, Mr. John Morris, Leigh. Mr. W. Whitaker, who was in strong force on this occasion, was also 1st, with three flamed Tulips, having bizzare Sir J. Paxton, byblomem with Heroine, very fine; and Rose Aglaia; 2d, Mr. John Turner, with Victoria, flamed rose; 3d, Mr. S. Barlow, with Sutherland, and Triomphe Royale; 3d, Mr. S. Barlow, with Sir J. Paxton, Nimbus, a new variety of the late Dr. Hardy's raising, not yet distributed; and a particularly effective flamed byblomem, and Aglaia; 4th, Mr. Thomas Mellor.

In class 5, for Tulips in pairs, one feathered and one flamed, the judgment, which was most conscientiously and laboriously made throughout, appeared to have been made on scarcely intelligible grounds. Mr. John Turner was placed 1st, with flamed bizzare Dr. Hardy, feathered rose; and Mr. Henry Hill, who were both small and wanting in character, and should have been, we think, 3d at most. 2d, Mr. James Hulme, with flamed bizzare Dr. Hardy, and feathered byblomem Violet Aimaible; 3d, Mr. Joshua Hague, with flamed bizzare Dr. Hardy, feathered rose; and George Hayward. Mr. W. Whitaker's pair of flowers

were quite in keeping with the high character he had shown in the other classes, and were deserving of the first prize, the varieties being flowered bizarre Sir J. Paxton, and feathered bizarre Masterpiece.

In the classes for single flowers an immense number were staged. The best flowered bizarre was Sanzio, but what is generally written in Northern Tulip circles as "Saint Jo," shown by Mr. W. Whittaker; and then followed Sir J. Paxton, Lord Warden, Dr. Hardy, Sanzio, Ariosto, Lord Delamere, the first broken flower that has yet been shown, and the best of the feathered bizarre was Masterpiece, from Mr. W. Whittaker, and he was 2d with the same variety, and 3d with Lord Byron; and then followed Surpasse Catalane, one of the oldest Tulips in cultivation; Catalade Yates, Lord Ratcliff, a flower that broke in colour in the first year of its coming into the market, but paler in colour—a very fine show variety; Magnan Bonam, and Sir J. Paxton. With the exception of the 4th prize, which went to Mr. John Knott, all the rest went to Mr. W. Whittaker, who has been so long strong in feathered bizarres. In the class for feathered bybrenms Mr. W. Whittaker was 1st, 2d, 3d, 4th and 5th with Heady's Adonis, Violet Aimable, Agnes, Bessie, and Adonis; and then followed William Bentley, Angelina and Edgar. Mr. W. Whittaker was 1st, 2d, 3d, 4th, 5th, 6th, 7th, 8th, 9th, 10th, 11th, 12th, 13th, 14th, 15th, 16th, 17th, 18th, 19th, 20th, 21st, 22nd, 23rd, 24th, 25th, 26th, 27th, 28th, 29th, 30th, 31st, 32nd, 33rd, 34th, 35th, 36th, 37th, 38th, 39th, 40th, 41st, 42nd, 43rd, 44th, 45th, 46th, 47th, 48th, 49th, 50th, 51st, 52nd, 53rd, 54th, 55th, 56th, 57th, 58th, 59th, 60th, 61st, 62nd, 63rd, 64th, 65th, 66th, 67th, 68th, 69th, 70th, 71st, 72nd, 73rd, 74th, 75th, 76th, 77th, 78th, 79th, 80th, 81st, 82nd, 83rd, 84th, 85th, 86th, 87th, 88th, 89th, 90th, 91st, 92nd, 93rd, 94th, 95th, 96th, 97th, 98th, 99th, 100th, 101st, 102nd, 103rd, 104th, 105th, 106th, 107th, 108th, 109th, 110th, 111th, 112th, 113th, 114th, 115th, 116th, 117th, 118th, 119th, 120th, 121st, 122nd, 123rd, 124th, 125th, 126th, 127th, 128th, 129th, 130th, 131st, 132nd, 133rd, 134th, 135th, 136th, 137th, 138th, 139th, 140th, 141st, 142nd, 143rd, 144th, 145th, 146th, 147th, 148th, 149th, 150th, 151st, 152nd, 153rd, 154th, 155th, 156th, 157th, 158th, 159th, 160th, 161st, 162nd, 163rd, 164th, 165th, 166th, 167th, 168th, 169th, 170th, 171st, 172nd, 173rd, 174th, 175th, 176th, 177th, 178th, 179th, 180th, 181st, 182nd, 183rd, 184th, 185th, 186th, 187th, 188th, 189th, 190th, 191st, 192nd, 193rd, 194th, 195th, 196th, 197th, 198th, 199th, 200th, 201st, 202nd, 203rd, 204th, 205th, 206th, 207th, 208th, 209th, 210th, 211st, 212nd, 213th, 214th, 215th, 216th, 217th, 218th, 219th, 220th, 221st, 222nd, 223rd, 224th, 225th, 226th, 227th, 228th, 229th, 230th, 231st, 232nd, 233rd, 234th, 235th, 236th, 237th, 238th, 239th, 240th, 241st, 242nd, 243rd, 244th, 245th, 246th, 247th, 248th, 249th, 250th, 251st, 252nd, 253rd, 254th, 255th, 256th, 257th, 258th, 259th, 260th, 261st, 262nd, 263rd, 264th, 265th, 266th, 267th, 268th, 269th, 270th, 271st, 272nd, 273rd, 274th, 275th, 276th, 277th, 278th, 279th, 280th, 281st, 282nd, 283rd, 284th, 285th, 286th, 287th, 288th, 289th, 290th, 291st, 292nd, 293rd, 294th, 295th, 296th, 297th, 298th, 299th, 300th, 301st, 302nd, 303rd, 304th, 305th, 306th, 307th, 308th, 309th, 310th, 311st, 312nd, 313th, 314th, 315th, 316th, 317th, 318th, 319th, 320th, 321st, 322nd, 323rd, 324th, 325th, 326th, 327th, 328th, 329th, 330th, 331st, 332nd, 333rd, 334th, 335th, 336th, 337th, 338th, 339th, 340th, 341st, 342nd, 343rd, 344th, 345th, 346th, 347th, 348th, 349th, 350th, 351st, 352nd, 353rd, 354th, 355th, 356th, 357th, 358th, 359th, 360th, 361st, 362nd, 363rd, 364th, 365th, 366th, 367th, 368th, 369th, 370th, 371st, 372nd, 373rd, 374th, 375th, 376th, 377th, 378th, 379th, 380th, 381st, 382nd, 383rd, 384th, 385th, 386th, 387th, 388th, 389th, 390th, 391st, 392nd, 393rd, 394th, 395th, 396th, 397th, 398th, 399th, 400th, 401st, 402nd, 403rd, 404th, 405th, 406th, 407th, 408th, 409th, 410th, 411st, 412nd, 413th, 414th, 415th, 416th, 417th, 418th, 419th, 420th, 421st, 422nd, 423rd, 424th, 425th, 426th, 427th, 428th, 429th, 430th, 431st, 432nd, 433rd, 434th, 435th, 436th, 437th, 438th, 439th, 440th, 441st, 442nd, 443rd, 444th, 445th, 446th, 447th, 448th, 449th, 450th, 451st, 452nd, 453rd, 454th, 455th, 456th, 457th, 458th, 459th, 460th, 461st, 462nd, 463rd, 464th, 465th, 466th, 467th, 468th, 469th, 470th, 471st, 472nd, 473rd, 474th, 475th, 476th, 477th, 478th, 479th, 480th, 481st, 482nd, 483rd, 484th, 485th, 486th, 487th, 488th, 489th, 490th, 491st, 492nd, 493rd, 494th, 495th, 496th, 497th, 498th, 499th, 500th, 501st, 502nd, 503rd, 504th, 505th, 506th, 507th, 508th, 509th, 510th, 511st, 512nd, 513th, 514th, 515th, 516th, 517th, 518th, 519th, 520th, 521st, 522nd, 523rd, 524th, 525th, 526th, 527th, 528th, 529th, 530th, 531st, 532nd, 533rd, 534th, 535th, 536th, 537th, 538th, 539th, 540th, 541st, 542nd, 543rd, 544th, 545th, 546th, 547th, 884th, 885th, 886th, 887th, 888th, 889th, 890th, 891st, 892nd, 893rd, 894th, 895th, 896th, 897th, 898th, 899th, 900th, 901st, 902nd, 903rd, 904th, 905th, 906th, 907th, 908th, 909th, 910th, 911st, 912nd, 913th, 914th, 915th, 916th, 917th, 918th, 919th, 920th, 921st, 922nd, 923rd, 924th, 925th, 926th, 927th, 928th, 929th, 930th, 931st, 932nd, 933rd, 934th, 935th, 936th, 937th, 938th, 939th, 940th, 941st, 942nd, 943rd, 944th, 945th, 946th, 947th, 948th, 949th, 950th, 951st, 952nd, 953rd, 954th, 955th, 956th, 957th, 958th, 959th, 960th, 961st, 962nd, 963rd, 964th, 965th, 966th, 967th, 968th, 969th, 970th, 971st, 972nd, 973rd, 974th, 975th, 976th, 977th, 978th, 979th, 980th, 981st, 982nd, 983rd, 984th, 985th, 986th, 987th, 988th, 989th, 990th, 991st, 992nd, 993rd, 994th, 995th, 996th, 997th, 998th, 999th, 1000th.

In the breeder classes the flowers were all very fine. Mr. S. Barlow was 1st with bizarre Richard Yates and Sir J. Paxton; bybrenms Talisman and Glory of Stakehill, a splendid flower; rose Annie Macgregor, and Hepworth's Lady May—one of the finest of rose breeders in cultivation. 2d Mr. Thomas Mellor, with Dr. Hardy and Flor, bizarres; William Bentley and Bridesmaid, bybrenms; and Lady Grosvenor and Annie Macgregor, roses. 3d, Mr. Joshua Hague; 4th, Mr. W. Whittaker. With three breeders one in each class, Mr. Barlow was also 1st with bizarre No. 2 seedling; bybrenms Glory of Stakehill, and Annie Macgregor, a beautiful rose breeder for colour. 2d, Mr. Thomas Mellor, with Storer's seedling, Adonis, and Annie Macgregor; 3d, Mr. W. Whittaker. In the half-guinea class, Mr. Barlow was 1st with William Bentley; the others were unnamed. In the class for single bloom of a rose breeder Mr. S. Barlow was 1st with Mrs. Barlow, 2d with Mabel, and 3d with Annie Macgregor; then came Olivia, Nanny Gibson, and Mrs. Bates. In the class for bybrenms breeders the two finest were Alice Gray and Talisman, bred by the Secretary of the Northern Counties Society, Mr. James Wild, of Ashton-under-Lyne, who was a cultivator of Tulips for nearly half a century.

The premier flowered flower was Industry, rose, shown by Mr. W. Whittaker, perfect in every respect; the premier flamed flower, Sanzio, bizarre, shown by the same exhibitor; and the premier breeder, Lady May, rose from Mr. Barlow.

After the prizes were awarded the judges and exhibitors dined together; Mr. Samuel Barlow, President of the Society, in the chair; and the remainder of the afternoon was spent in much instructive gossip about Tulips. The Secretary of the Northern Counties Society, Mr. James Wild, of Ashton-under-Lyne, has been a cultivator of Tulips for nearly half a century.

Law Notes.

JUDGMENT AND COMMITTAL.—At the Westminster County Court, on Tuesday last, the case of *Gardner v. Marks* was heard before Mr. Judge Bayley, in which the defendant, a salesman at Leeds and Covent Garden, was summoned to show cause why he did not pay the plaintiff the sum of £18 for goods sold and delivered, and upon which judgment had been obtained in this Court. The plaintiff, who was represented by a gentleman whose name did not transpire, said that the defendant carried on business in a large way both in Leeds and London, and that if the judge would order a warrant of commitment to issue against the defendant it would make him pay. The defendant said that as the case it

would have the effect of driving him to bankruptcy. After a witness was called to prove the defendant's means, the learned Judge thought that as the amount was a large one the plaintiff would be more likely to get his money by ordering easy instalments, and therefore ordered the defendant to pay the debt and costs, at the rate of £2 a month, subject to a commitment.

Bartlett v. Marks was next called for hearing, in which the plaintiff, Robert Bartlett, a solicitor of Bedford Street, Covent Garden, summoned the defendant, who was the defendant in the former action, to show cause why he had not paid the plaintiff's bill of costs, amounting to £25 s. 6d., upon which the plaintiff had recovered judgment. The plaintiff said that since judgment had been obtained the defendant had large transactions in the market, and came weekly from Leeds expressly to make large purchases. Mr. Bartlett then examined the defendant, who said that he came up from Leeds frequently, and had a private house at Leeds and a stall in the Leeds market. He used to trade six months ago as Philip Marks & Son, of Leeds, but did not do so now. He had bought sixty boxes of Peas last week in the market at 4s. a box, but part were on commission for C. O. Jacobs, of Russell Street, Covent Garden. He had also bought fifteen baskets of Cherries at 7s. 3d. a basket, which were sent to Bradford, but they only realised 1s. each, and Cherries were selling to-day in the market for 7s. a basket for which St. had been given two days previously.

In reply to the learned Judge the defendant said he could not possibly pay even the small account of Mr. Bartlett. The learned Judge then said he was convinced to the contrary, and ordered a warrant to issue at once for the defendant's arrest, and the defendant was removed in the custody of Bates, the officer. Later on in the day the defendant purged the debt and costs, and was released from custody.

- June 7.—A fine bright day. Partly cloudy. Cool.
- 8.—A very fine and bright day. Partly cloudy.
- 9.—A brilliantly fine warm day. Clear.
- 10.—A very fine day. Clear and warm.
- 11.—A very fine and bright day. Clear, then cloudy.
- 12.—A warm day. Slight thunderstorm, with heavy rain and vivid lightning till evening then cloudy.
- 13.—Fine and warm, but very cloudy throughout. Thunderstorm, with heavy rain in early morning.
- 13.—A very fine and bright day. Clear and bright after. Cloudless at night. Cool day.

LONDON; Barometer.—During the week ending Saturday last, 9 a.m. in the vicinity of London the reading of the barometer decreased from 29.93 inches at the beginning of the week to 29.70 inches by the evening of the 4th, increased to 30.08 inches by the evening of the 5th, decreased to 29.93 inches by the evening of the 6th, increased to 30.10 inches by the evening of the 7th, decreased to 30.01 inches by the evening of the 8th, increased to 30.14 inches by noon on the 9th, and was 30.12 inches at the end of the week. The mean reading for the week at sea level was 29.99 inches, being 0.37 inch above that of the preceding week, and 0.01 inch above the average.

Temperature.—The highest temperatures of the air observed by day varied from 82° on the 4th to 66° on the 6th; the mean value for the week was 74°. The lowest temperatures of the air observed by night ranged between 43° on the 7th to 55° on the 9th; the mean for the week was 49°. The mean daily range of temperature in the week was 25°, the greatest range in the day was 33°, on the 3d, and the least 15°, on the 5th.

The mean daily temperatures of the air and the departure from their respective averages were as follows:—3d, 64°, ×7.1; 4th, 65°, ×7.9; 5th, 57.9°, ×0.6; 6th, 55.3°, ×2.2; 7th, 54.2°, ×3.4; 8th, 50.6°, ×8.9; 9th, 65°, ×7.1. The mean temperature of the air for the week was 60°, being 2.7° above the average of six years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed in sun's rays, were 152° on the 3d, 148° on the 9th, and 145° on the 4th; the mean of the seven high values was 136°. The lowest readings of a thermometer in vacuo, with its bulb exposed to the sky, were 39° on the 3d, and 40° on the 6th and 7th; the mean of the seven low readings was 42°.

Wind.—The direction of the wind was S.W., and its strength moderate. The wind during the week was fine, bright, and dry. Lightning frequently seen on Monday evening, the 4th inst.

Rain fell on two days during the week, the amount measured was only 0.09 inch.

ENGLAND: Temperature.—The highest temperatures of the air observed by day were 81° at Manchester, 82° at Blackheath, and 82° at Cambridge; at Truro, Plymouth, and Torquay, 67°, 68°, and 68° respectively were the highest temperatures in the week. The mean value from all stations was 76°. The lowest temperatures of the air observed by night were 39° at Wolverhampton and 40° at Nottingham; at Portsmouth 49° was the lowest temperature. The general mean from all stations was 45°. The range of temperature in the week was the greatest at Manchester, 40°, and the least at Portsmouth, 10°. The mean range of temperature from all stations was 31°.

The mean of the seven high day temperatures was the highest at Blackheath and Cambridge, both 74°, and the lowest at Plymouth, both 71°; the mean value from all stations was 68°. The mean of the seven low night temperatures was the lowest at Wolverhampton, 40°, and the highest at Norwich, 53°. The mean of all stations was 50°. The mean daily range of temperature in the week was the greatest at Blackheath, 25°, and the least at Plymouth, 11°; the mean daily range from all stations was 18°.

The mean temperature of the air for the week from all stations was 57°, being 41° higher than the value for the corresponding week in 1876. The highest took place at Norwich, 61°, and the lowest at Wolverhampton, 55°.

The amount of rain measured during the week were small everywhere, they varying from three-tenths of an inch at Plymouth, Sheffield, and Liverpool, to two-hundredths of an inch at Cambridge; at Portsmouth no rain was measured; the average fall for the country was two-hundredths of an inch. The weather during the week was generally fine, bright, and warm. *Solar halos* were seen at Bristol on June 7 and 8, and lightning was seen at Blackheath on the 4th.

SCOTLAND: Temperature.—The highest temperatures of the air varied from 70° at Edinburgh to 60° at Greenock; the mean value from all stations was 65°. The lowest temperatures of the air ranged from 41° at Greenock to 45° at Glasgow and Leith; the mean from all stations was 44°. The mean range of temperature in the week from all stations was 24°.

The mean temperature of the air for the week from all stations was 54°, being 3° higher than the value for the corresponding week in 1876. The highest was 56°, at Edinburgh, and the lowest 51°, at Greenock.

Rain.—The falls of rain measured during the week varied from 2 1/2 inches (nearly) at Greenock, and 2 inches at Paisley, to half an inch at Edinburgh and Leith; the average fall over the country was 1 1/2 inch.

DUBLIN.—The highest temperature of the air was 69°, the lowest was 38°, the range was 31°, the mean was 55°, and the fall of rain was 0.40 inch.

JAMES GLAISHER.

Variorum.

THE CAROB TREE (CERATONIA SILIQUA).—In a very interesting account of "An Easter Holiday in Liguria," by Professor Flickeyer, which has lately been reprinted in the *Pharmaceutical Journal*, occurs an excellent description of the St. John's Bread, or Carob tree (*Ceratonia Siliqua*), and of the locality indicated, from which we make the following abstract. Here and there, Professor Flickeyer says, a dense crown of foliage rising from powerful

knotted stems shines out in the midst of an Olive grove, or alone on the sunny shore the tree spreads out its half-bared roots often over a surprising circuit. This is the *Ceratonia Siliqua*. It is found nowhere else in Upper Italy, or in the central provinces, but probably in the south of the peninsula. However, the Riviera de Ponente, especially the country around Monaco, has trees to show which equal those of the *piana* of Sorrento and Amalfi. This tree is decidedly less hardy than the Olive, but it comes from Central Africa, where the Olive is not known. On the slight coast of the bay of Carthage, in Tunis, grows an Arabic designation, recalling a people to whom Sicily at one time owed a season of prosperity, during which not only Islam, but also trade and valuable economic plants were introduced into Spain and Sicily. The *Geonoma* is a very remarkable and an economic plant, however, to the extent that the pods are given to horses. It appears remarkable that artificial cultivation has not yet succeeded in improving it so as to give it a savoury fruit. Even the *Sida*, John Bredal from South Italy and Cyprus is always a truly leafy dainty. Would not an attempt to obtain a better product from this stately tree be remunerative? The multiplication of such an evergreen tree would also suit the landscape to a high degree, in respect to its rich, full, green foliage, which may be compared to the foliage of the *Albizia*. In fact, it stands in striking contrast to the Olive tree. The long, rigid petiole, not unfrequently a foot in length, is provided with three to five, but most frequently with four pairs of sessile leaflets, which are alternately rounded and pointed, mostly ovate, the length of the entire leaf at its base—*i.e.*, the length of the lowest pair of leaflets—frequently reaches 7 inches; so that, notwithstanding the leaves are only simply pinnate, the impression of a very complex ramification is produced. As it does not, like so many other minute leaves, bear the flowers at the enormous head of foliage assumes a rounded outline, which would appear to be somewhat too regular did not the separate leaves, by their variation in colour and shape, exclude uniformity. The divisions of the leaves are not spread out flat, but incline somewhat towards one another, and on the under side are of a lighter though duller green than on the upper. The two surfaces also differ in their behaviour in other respects. The upper surface can easily become moistened with various liquid dilute alcohol, for instance; so do not the lower side. The upper side is of very firm texture, but each separate leaflet is always in motion, which gives to the foliage a lively appearance. Many other trees of the same division of the *Cesalpiniaceae* possess, in contrast to *Ceratonia*, doubly pinnate leaves. Examining the leaves of the latter tree more critically, exceptions to the ordinary form of leaf are not unfrequently found, especially where one of the lowest leaflets is replaced by one consisting of two or four pairs of leaflets, usually not quite opposite, and with a minute one at the base. The second leaflet of the lowest pair is also transformed. The variations from the ordinary leaf form are, however, never sufficiently numerous to influence the appearance of the tree. It presents, therefore, very great peculiarity quite apart from the flowers and fruit, and also as characterised in other instances. On these accounts the genus *Ceratonia* was rightly set up for the sake of this tree only, and it has not since been enriched by a second species. This explains the remarkable fact that botanists have not found leisure to endow it with several names, and it is everywhere called by the name *Linnaeus* gave it. When Professor Flüchiger's notes were written, the trees exhibited neither blossom nor ripe fruit; only exceptionally were found isolated, bearded, but still clinging to the stalks, which are much thicker than the ripe ones which the Greeks named the tree *Ceratonia* (Horn-fruit tree).

COX'S ORANGE PIPPIN is the finest Apple in the world. This declaration is made in full conviction both of the responsibility of a variety, and its value to us as an introduction to the subject of an Apple culture. Fortunately the variety is neither scarce nor dear. Its merits are well known, and indeed they are so conspicuous that, in common with other good things, it is always speaking for itself, and hence it is everywhere largely popular. It is a variety which is on the way to take the lead in the Apple garden, and prove to all that our declaration in its favour is warranted by the facts. It is one of the best paying Apples in Kent, and it is one of the few that may be trusted for a crop of good quality, and of uniform "bottoms," where spring frosts make the most havoc, and fruit growing is a precarious business. Our observations of this variety, under many different circumstances, have been enlarged in a striking manner within the past few weeks. In our own garden, in the valley of the Lea the Hawthornden is a prodigious cropper, and about twenty better varieties compete with it for popularity, not the least important amongst them being Shepherd's Fame, Lemon Pippin, Eckinville, Cellin's, Old Red Jewel, and the variety called Blenheim Orange. This year Cox's Orange bears them all, for the trees are smothered with fruit, while on all other sorts the crops are comparatively thin

more or less. It was precisely the same in the compartment occupied with Apple stocks in the Royal Horticultural Society's Chiswick garden last year. The little trial trees of Cox's Orange were then well covered with fruit, while other varieties were barren or nearly so. The uninitiated reader may be disposed to wonder what is the quality of the fruit, and to this way? Well, the question is pertinent. The answer may be summed up in few words. Cox's Orange is a better Apple than the Ribston Pippin, being as handsome, as well flavoured, and with more tender flesh. What is the quality of the fruit, and to this every good property, it is the finest Apple in the world. *Gardener's Magazine*.

NEW PARKS.—*Whitley*.—On the 26th ult. a new public park—a gift to the town by a deceased citizen, Mr. Robert Brodie, accountant—was opened with much ceremony. The park is situated at High Carriage Hill, in the southern part of the town, and extends to about 22 acres. Its value is estimated at £16,000, and during the past year or two the Town Council have expended about £2800 in laying it out and ornamenting it. *Gathead*.—Since the grounds of Mr. William Wailes, at Saltwell, were purchased by the Fishhead Corporation and converted into a park for the use of the inhabitants, the grounds had little or no place approaching to a recreation-ground, great improvements have been made by way of further beautifying the estate. For some time past the Park Committee have been pushing on the work of improvement, with rapidly increasing success. The chief features will be the long promenade, which is at present under formation at the north end of the park. On either side of the promenade the ground has been laid out under the direction of Mr. Heath, of London, landscape gardener. *Builder*.

Enquiries.

He that questeth much shall learn much.—BACON.

190. OSIERS.—Can any of your readers inform me, through your columns, whether Osiers would thrive and do well if planted on a light and porous soil, and received the overflow of sewage from a large town? *J. S.*

190. ARRACACHA.—Where can tubers of this plant (*A. esculenta*) be obtained? *W. F. J.*

191. CHARA.—A species of Chara has filled a lake of considerable size, and has retarded the progress of the boats. Various methods of eradication have been tried, but unsuccessfully. What can be done? *L.*

AGAVES TURNING FROM THE EAST: *J. H. P.* We have not noticed this in the Riviera. Did you observe them in the morning, when the sun was in the east?

AZALEA: *A. Morrison*. The large flowers and rich apricot-yellow of the seedling of which you send a truss, are qualities which should render it acceptable as a novelty. The colour, being almost a self, is peculiar. We do not remember to have seen any quite like it.

AZALEAS.—PROPAGATING: *A Subscriber*. Azaleas strike readily from cuttings made of the half-ripened shoots slipped off and inserted singly in 6-oz. pots filled with soil, and having the half-ripened part of the surface all sand, covered with a propagating-glass in a temperature of 70°, kept moderately close, moist, and shaded from the sun. When well rooted gradually inure them to the full air of the house or pit, and move them into a size larger pots. As soon as they have begun to grow pinch off the tops 6 inches above the collar, so as to induce them to make several shoots, but never allow any suckers, which spring up near the collar, to remain, as it is through letting these grow more than from any other cause that Azaleas from struck plants are often short-lived. We should advise you to keep for two years in an intermediate or moderate stove temperature without any rest more than they will naturally get through moving much slower in the winter, giving half-ripened pots every year, and keeping them quite clear from thrips and red-spider. At the expiration of that time, so managed, they will have attained a size equal to what they would grow to in five years under the ordinary method of growing them cool, and resting in the winter—it will not, as many would suppose, injure their constitution in the least. We should recommend similar treatment to be given to grafted plants, which, when a good free-growing kind is selected for a stock, are much to be preferred to such as are on their own roots.

ENTOMOLOGICAL SPECIMENS: *W. G. P.* There is some difference between a stag-beetle and a clothes-moth. Supposing you mean butterflies, we advise you to take some young Cherry Laurel leaves, brush them, place them in the collecting box, and put the insects in. Keep the box closed for a few minutes, and the prussic acid fumes will accomplish your end.

HIPPETRAUM PARDINUM: *A. Heucke*. We have found *Hippetraum pardium* to succeed well under similar treatment to the other species and varieties of *Hippetraum*, and should suppose that your plant has gone wrong through some error in the treatment, such as overwatering or the soil having become dry, having been kept too wet, or the drainage being deficient or loose potting in light open soil, any of which causes the plants to wither and become desiccated. We should advise its being placed in a smaller pot, well drained, in pure loam, with a little sand added, pressing the soil quite firm—being careful not to give it any water until the plant has begun to make roots free.

INSECTS: *J. K. Fychochro rubens. A. M.*

IVIES: *Y. Z. Messrs. Lane & Son, Great Berkhamstead, or Mr. Turner, Slough.*

MANURE: *E. M.* We have no faith in the artificial manure you mention, such as a fertilizer or any insecticide. Kilm-dust, or, in the absence of that, good rotten dung, applied as a top-dressing, is the best manure for fruit trees in pots, and if you want a good effect from the insecticide use the decoction of quassia chips and soft soap so often mentioned in this column.

MAY: *G. Beaumont*. The sucker, no doubt, comes from the roots of the old white variety, on which the red one was originally budded or grafted. It is a very common occurrence.

MIGNONETTE: *J. G. & Co.* Your new variety is no finer than plenty that come into the market, and by no means so large as the specimens of Miles' strain that you send. It is a very good variety, and you may get rid of them; but if not, unless the plant has some special associations attaching to it, you had better burn it, and buy a young clean plant from the nearest nursery, to clear the plant, especially you may have to wait it over several times.

NAMES OF PLANTS: *N. B. Pyrus Aria*, the White Bean, so far as we can tell from the scrap sent.—*G. D. J. 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100.*

PACKING GRAPES: *Exhibitor*. You must have the stands on which you intend to show the Grapes made and fitted up in the manner described in the article, and can be readily taken out; and the way to preserve the bloom is to fasten the bunches down firmly into their places on the stand before you send them from the house, and to do this neatly and well you can only learn by experience.

PHOENIX TENAX: *J. Omsant*. There is nothing remarkable in the New Zealand Flax producing flowers. It frequently does so under liberal treatment, though perhaps seldom so freely as you state.

POPULAR PHYSIOLOGY: *W. H. D.* See our last Supplement. It is a subject that has been more often treated of in this journal for nearly forty years than in any other known to us. It is no fault of ours if people will not read and make such information when it is put before them.

ROSES: *W. Wilson*. So far as we can judge from the specimen sent they are identical—*Glaires de Dijon*.

VINES GUMMING: *D. C. P.* Your Vines are in such a state of decomposition that it is impossible to form any judgment. The gumming excision is however probably the same which sometimes occurs on the stems of Vines when in flower and prevents impregnation, and they have seen a Vine which had had the same peculiarity and in consequence never bore any fruit. *M. J. B.*

VINE LEAVES: *No. 1*. The chlorophyll is only very partially decomposed, and it is not an autumnal tinge. *No. 2*, not only has the same defect, but the under surface has little spots which arise from abnormal development of the cells. *No. 3* has the same excrescences, and they have seen a Vine which chlorophyll. *No. 4* is without the excrescences, but there is a uniform deficiency of chlorophyll. The whole indicates that the root-action is bad. The several different specimens are all from the same stock, and were planted in the border, or it may be due to a bad condition of the roots. *M. J. B.*

VINES: *W. X.* The berries are "scalded," as a great many others have been this season. How this is brought about we do not know, but it is not the same columns.—*James Hopkins*. There is no visible cause for the decay of the Vine shoots, it may be only weak

Indestructible Terra-Cotta Paint Markers.

MAW AND CO'S PATENT... PATENTED... PATTERNS OF Ornamental Tile Pavements for Conservatories, Entrance Halls, &c.

Bocher's Garden Edging Tiles.

THE ABOVE and many other PATTERNS are made in materials of great durability... ROSEHARBOUR or Slugs or Insects, take up little room, and cost but a few pence more than further labour or expense.

Agents for LOOKER'S PATENT "ACME FRAMES," PLANT COVERS and PROPAGATING BOXES; also for FOXLEYS PATENT BEADED GARDEN WALL BRICKS.

ORNAMENTAL PAVING TILES, for Conservatories, Halls, Corridors, Balconies, &c. from 3s. per square yard upwards.

SILVER SAND, fine or coarse grain as desired. Prices by Post per Ton or Truckload, on delivery in London, or delivered direct from Pits to any Railway Station.

FLINTS and BRICK BURNERS for Rockeries or Ferneries. CONCRETE PLATS or LOAM supplied at lowest rates in any quantities.

BELGIAN GLASS for GREENHOUSES, &c., can be obtained in all sizes and quantities, of BETHAM & SON.

GRANITIC PAINT for Sanitary Purposes. SILICATE ZOPISSA COMPOSITION. All colours. For Preserving Stone, Brick, or Cement.

THE SILICATE ZOPISSA COMPOSITION and GRANITIC PAINT COMPANY, removed to 45, Fish-street Hill, London, E.C.

HILL and SMITH'S BLACK VARNISH for Preserving Ironwork. Wood or Stone. This Varnish is an excellent substitute for oil paint on all outdoor work.

UNSOLICITED TESTIMONIAL RECEIVED MAY 3, 1877. "The Rylois, Aldersley Edge, Manchester... Messrs. Hill & Smith... I have used your 'Black Varnish' and shall be glad to forward you another case."

Apply to HILL and SMITH, Brierley Hill Ironworks, near Dudley, and 115, Queen Victoria Street, London, E.C., from whom only it can be obtained.

CAUTION—It having lately come to the knowledge of HILL & SMITH that spurious imitations of this Varnish are being offered by unprincipled dealers...

 Price List on application. Portable Pipes, Gold Metal Boilers, &c.

For Sale, a STEVENS' IMPROVED TRENTHAM WROUGHT IRON HORTICULTURAL BOILER,
 6 feet long by 4 feet diameter, fitted with Inlet and Outlet Pipes, Fire-door and Gate complete. For price and particular terms apply to
HILL and SMITH, Brerley Hill Ironworks, Dudley.

STEVENS' TRENTHAM GREENHOUSE BOILER,

 After long experience, has proved the most economical, EFFECTUAL, and LATEST BOILER extant; recently improved. For Illustrations, with full particulars, apply to the Sole Manufacturer,
J. & J. SILVESTER,
 HOT-WATER ENGINEERS, &c., &c.,
 Castle Hill Works, Newcastle, Staffordshire.
 Our Boilers are the only one made with the sanction and under the inspection of the inventor, Mr. Stevens—all others being base imitations.

AGRICULTURAL LOCOMOTIVES,
 STEAM PLOUGHING MACHINERY,
 ROAD LOCOMOTIVES, TRAMWAY LOCOMOTIVES,
 STEAM ROAD ROLLERS.
 For Prices, Description, and Reports of Working, apply to the Manufacturers,
AVEILING & PORTER,
 ROCHESTER, KENT; 73, CANNON ST., LONDON, E.C.; and 6, AVENUE MONTAIGNE, PARIS.
 AVEILING & PORTER'S ENGINES have gained the highest Prizes for Progress and Merit were awarded them at the Vienna for their STEAM ROLLERS and ROAD LOCOMOTIVES; and at the last trials of the Royal Agricultural Society of England their AGRICULTURAL LOCOMOTIVES gained the First Prize after exhaustive trials, when one of their 10-horse power Engines, fitted with single slide and ordinary link-motion, indicated 35-horse power, with a consumption of three and one-fifth pounds of coal per horse-power per hour.

AN EXTRAORDINARY BOILER.
 During the Great Boiler Contest at Birmingham, in 1872, all Boilers were severely tested to prove their respective merits. One test was, "How long can each Boiler go without Night Attention?" However, one Boiler proved this to a surprising degree, as after being shut up for twelve hours (from 9 P.M. to 9 A.M.), it still retained its heat in 1000 feet of 4-inch pipes, and yet had more than 1 bushel of fire drawn from its furnace in the morning—equal, in point of fact, to seventeen hours of continuous firing. What a boon to Gardeners. This was THE CHAMPION, Deane's Patent Close-Coil Boiler, For Drawings and Prices of which send two stamps to
 Messrs. DEARDS, Boiler Works, Harlow,
 who now have their Boilers at work in every county of England except three. Attention will be found THE LITTLE SADDLE BOILER" of smaller kind of Boiler, equally as satisfactory, and certainly "the best thing" out. Awarded five First Prize Silver Medals.

JONES'S PATENT "DOUBLE L" SADDLE BOILER.

 These Boilers possess all the advantages of the old Saddle Boiler, with the following improvements—viz., the water-space at back and over top of saddle increases the heating surface to such an extent that a "TENTY DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the price of the boiler; at the same time these Boilers are simple in construction, and being made of wrought iron are not liable to crack. They are made of following sizes:—

Sizes.	To heat of "in Pipe.	Price.
High. Wide.	Long. Feet.	£ s. d.
20 in. 15 "	18 "	300 7 0 0
20 in. 18 "	24 "	400 5 0 0
24 " 18 "	30 "	500 0 0
24 " 24 "	24 "	700 12 0 0
24 " 24 "	30 "	800 14 0 0
24 " 24 "	36 "	1,000 0 0 0
24 " 24 "	42 "	1,400 20 0 0
28 " 24 "	48 "	1,800 25 0 0

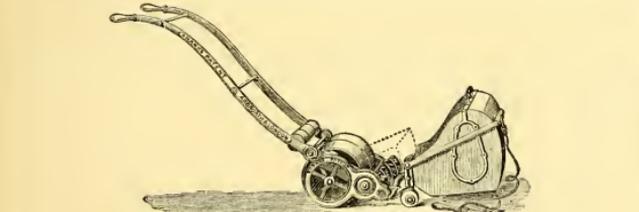

Larger sizes if required.

From Mr. CHARLES YOUNG, Newcastle, Bathall Hill, S.W., May 29, 1877.
 "Having given your Patent 'Double L' Boilers a free trial at my Nursery, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all that I have tried; they will burn the refuse of other tubular boilers I have in use."

PRICE LISTS OF HOT-WATER PIPES and CONNECTIONS, with Boilers, of all sizes and shapes; or ESTIMATES for HORTICULTURAL APPARATUS, erected complete, will be sent on application.
 J. HONE and SONS, Iron Merchants, 6, Bankside, Southwark, London, S.E.
 Who order Boilers please refer to the above advertisement.

SHANKS' NEW PATENT LAWN MOWERS,
 Under the Patronage of Her Most Gracious Majesty the Queen, and most of the Nobility of Great Britain.

The merits of these Machines are now so well known, and their superiority so universally established, that a detailed description is no longer necessary. A. S. & SON would here simply refer to a few of the prominent advantages peculiar to their Machine. The Revolving Cutter is made to be self-sharpening. The *Sole-Plate or Bottom Blade* is made with *Two Edges*, enabling the cutting parts to last twice as long as in other Machines. A Wind-guard is also introduced, which prevents the-Grass escaping the Box when the Machine is in use during the prevalence of wind.

PRICES,
 Including Carriage to any Railway Station or Shipping Port in the Kingdom:—

NEW HAND MACHINE.		NEW PONY and DONKEY MACHINE.	
10-inch Machine	£3 10 0	25-inch Machine	£13 10 0
12-inch Machine	4 7 0	28-inch Machine	15 15 0
14-inch Machine	5 15 0	30-inch Machine	17 0 0
16-inch Machine	6 15 0	The Patent Delivering Apparatus enables the Grass-box to be emptied without stopping the Machine.	
18-inch Machine	8 0 0	Price, for the 28-inch and 30-inch Machines, 30s. extra;	
20-inch Machine	9 0 0	25-inch Machine, 35s. extra. Silent Movement, 12s. 6d. extra.	
22-inch Machine	10 0 0	Boots for Pony, 2s.; Donkey, 20s. per set.	
NEW HORSE MACHINE.		32-inch Machine	
30-inch Machine	£20 10 0	42-inch Machine	38 0 0
36-inch Machine	28 0 0	48-inch Machine	50 0 0

The Patent Delivering Apparatus enables the Grass-box to be emptied without stopping the Machine.
 Price, for the 42-inch, 48-inch, and 36-inch Machines, 42s. extra; for the 30-inch, 32s. extra. Silent Movement, 50s. extra.
 Boots for Horse's feet, 9s. per set.

A Staff of experienced Workmen always kept in hand, so that Repairs can be done there as well as at the Manufactory.

SHANKS' PATENT LAWN MOWERS
 Are warranted to give ample satisfaction, and if not approved of can be at once returned.

ALEXANDER SHANKS & SON,
 Dens Ironworks, Arbroath; and 27, Leadenhall Street, London, E.C.
 27, LEADENHALL STREET is the only place in London where intending Purchasers of Lawn Mowers can choose from a Stock of from 150 to 200 Machines. All sizes kept there, whether for Horse, Pony, or Hand Power. Orders executed same day as received.
 Small Lawn Mowers—6-inch, 25s.; 7-inch, 35s.; 8-inch, 50s.

ELLIS'S RUTHIN WATERS. PURE AERATED WATERS.

ELLIS'S RUTHIN WATERS.—Crystal Springs, Soda, Potass, Seltzer, Lemonade, Lithia, and Gout, Lithia and Potass. Corks branded "R. ELLIS and SON, RUTHIN," and every Label bears their Trade Mark. Sold everywhere, and Wholesale, by R. ELLIS and SON, Ruthin, North Wales. London Agents: THE BEST AND SONS, Henrietta Street, Cavendish Square.

DINNEFORD'S FLUID MAGNESIA. The best remedy for ACIDITY of the STOMACH, HEARTBURN, HEADACHE, GOUGH, INDIGESTION; and the safest aperient for delicate Constitutions, Ladies, Children, and Infants.

DINNEFORD AND CO. 175, New Bond Street, London, and all Chemists.

HOLLOWAY'S OINTMENT and PILLS.—Sure Relief.—The weak and enervated suffer severely from nervous affections when storms or electric disturbances agitate the atmosphere. Neuralgia, gouty pang, and flying pains, very distressing to a delicate system, may be readily removed by rubbing this Ointment upon the affected part after it has been fomented with warm water. It is also occasionally in the doses prescribed by the instructions, keep the digestion in order, excite a free flow of healthy bile, and regulate the bowels, so that the rich matter resulting from thoroughly assimilated food—wanting which the delicate find it difficult to maintain existence. Holloway's Ointment and Pills are infallible remedies.

HORTICULTURAL BUILDINGS

CONSTRUCTED BY STEAM-POWER.

HENRY ORMSON,

HORTICULTURAL BUILDER AND HOT-WATER APPARATUS ENGINEER,
STANLEY BRIDGE, KING'S ROAD, CHELSEA, LONDON, S.W.

where full-sized Specimens of Greenhouses, &c., and Hot-water Apparatus at work can be inspected.

Works: CHELMSFORD.

PAXTON'S CALENDAR.

New Ready, a New and thoroughly Revised Edition of the

COTTAGER'S CALENDAR OF GARDEN OPERATIONS.

ORIGINALLY COMPILED BY THE LATE SIR JOSEPH PAXTON, M.P.

OPINIONS OF THE PRESS.

"It has been carefully revised by an experienced gardener, and the lists of vegetable, fruit, and flower, have been corrected by the substitution of the most approved modern kinds, in place of those which were mentioned in the first edition, and many of which have ceased to be worthy of cultivation. It is a thoroughly sound, practical treatise; but it has been so long before the public, and so undesirably accumulated, that any special commendation of it now is unnecessary."—*Midland Counties Herald*.

"This is a handy volume, consisting of seventy pages of letterpress and illustration, containing much and varied information likely to prove useful to all cottagers, &c., who possess a garden. To all such, who require a cheap and reliable book of reference, we heartily recommend it."—*Lloyd's*.

"We are quite glad to see this useful little book once more, and it is like a whiff of perfume from the heather in bloom to read the wrapper 'two hundred and twenty-first thousand.' We advise all who are interested in the promotion of cottage gardening to sow this little book broadcast."—*Gardener's Magazine*.

"The information conveyed in this little book is well adapted for all persons having small plots of ground. The necessary operations for each month are clearly laid down, and are of a thoroughly practical nature. The sorts of both fruit and vegetables are well selected, many of them being excellent in quality. To our readers who are interested in the cultivation of their flower and kitchen gardens, we can safely recommend this as being a most concise and useful work."—*Bell's Messenger*.

Price 3d., Post Free 3½d.

EWING & COMPANY,
THE ROYAL NORFOLK NURSERIES, EATON,
NEAR NORWICH.

Pine-Apple Nursery, Malda Vale, London, W.
F. G. HENDERSON AND SON are now sending out the following plants—several of which are being offered for the first time. See the May Bedding and Soft-wooded Greenhouse Plant Catalogue for descriptions, which will be forwarded on application:—
"PELARGONIUM Queen of Stripes, large flowered section, with Curzon-like striped flowers."
" Ivy-leaved Nemesis, the finest colour in the group."
" Dame Blanche, very delicate colour."
"BOUVARDIA ROEHLI, new species."
"LOBELIA Pine-Apple Gem and Princess of Wales."
"MIKANIA SCANDENS VARIEGATA, a useful plant."
"LUPHEA MINUTA IGNEA, brilliant."
"DACTYLIS ELEGANTISSIMA AUREA, fine."
"MIMULUS, a collection of new colours, and double-flowered."
"VERENAS and PETUNIAS, new colours and varieties."
"SALVIA SPLENDENS BRUNTI, the finest."
"ARBITUN DARWINI TESSELLATA, useful."
"SEED—the best quality that can be grown—of Calceolaria, Cuscuta, Primula, single and double; Cyclamen, Fanny, &c. See Advertisement May 5, or our SEED CATALOGUE, for prices, &c.

**THE NEW SEEDLING ROSE,
"QUEEN OF BEDDERS"
(NOBLE).**

See Coloured Plate (after Mrs. Duffield), "Gardener's Chronicle," May 5, 1877.

Perhaps the finest of all the English Seedling Roses of recent introduction. It is *per excellence* a really Bedding Rose in every sense of the word—requires no pegging down, support, or training of any kind, and it is continuous early and late bloomer.

First-class Certificate Royal Horticultural Society, August 3, 1876.

Its inferiority may be imagined when it is stated that a plant 18 inches high had eighty-four buds and expanded flowers upon it on September 6, 1876.

A constant supply of buds was obtained from early June to November of that year—over five months.

Good Plants are now being sent out in strict rotation at

10s. 6d. each
Coloured Plates 12. each.

CHARLES NOBLE, BAGSHOT.

**TEA SCENTED ROSES.
SPECIAL CULTURE.**

We have this season devoted nearly the whole extent of our Glass-houses to the Culture of Tea-Scented and other Roses, and are now enabled to offer plants of very superior quality.

ESTABLISHMENT FOR NEW AND RARE PLANTS, KING'S ROAD, CHELSEA, LONDON, S.W.

NEW ENGLISH-RAISED SEEDLING ROSES.

**MESSRS. BELL & SON,
THE NORWICH NURSERIES,**

Are now executing orders for their TWO NEW ROSES, raised at their Nurseries, and described and announced below. They have been thoroughly tested here before being sent out, and can be recommended with confidence as really distinct novelties.

CLIMBING ROSE "CATHERINE BELL."

Very large flowers of a deep rose colour, the backs of the petals a delicate silvery pink, of exquisite shape and very fragrant. It is very free-flowering, and of vigorous climbing habit, making shoots 5 feet to 8 feet long in a season. Figured in *The Gardener*, March 18, 1876.

"Your Rose Catherine Bell is both *belle et grande*."—Rev. Canon Reynolds 1106.

Good Flowering Plants, in Pots, 10s. 6d. each.

COLOURED PLATES ONE SHILLING EACH.

HYBRID TEA ROSE "MRS. OPIE."

Bright salmon-rose, tea-scented flowers, with shell-like petals, a most distinct and novel shade of colour among Tea Roses. It will form a charming companion to Madame Falout, and will be as extensively cultivated as that variety when well known. In flower from May to November. Figured in the *Floral Magazine*.

Good Flowering Plants, in Pots 7s. 6d. each.

DEANE AND CO., 46, KING WILLIAM STREET, LONDON BRIDGE, E.C.

EDGINGTON'S GARDEN NETTING is the cheapest and most durable, at 1d. per square yard, or in quantities of 500, 1000, or 2000 yards, carriage free. EDGINGTON'S MARQUEES and GARDEN TENTS are the best. EDGINGTON'S MARQUEES for Hire are the most handsome and capacious. EDGINGTON'S RICK CLOTHS for 71 years have maintained their celebrity as the best. HAYTHORN'S and WALKER'S NETTINGS. A quantity of good Second-hand Government TENTS from Abyssinia for Sale, Cheap. Sample of material free on application. By particular—FREDK. EDGINGTON AND CO., 52 (only) Old Kent Road, London, S.E.

BELGIAN GLASS for GREENHOUSES, &c., Can be obtained in all sizes and qualities, of **BETHAM & SON**, 9, LOWER THAMES STREET, LONDON, E.C. R. & Son have always a large Stock in London of 20-in. by 12-in., 20-in. by 14-in., 20-in. by 16-in., in 16-oz. and 21-oz. **JOHN BOWMAN**, GREENHOUSES—every description, (From £10 to £1000) GLASSHOUSES—perfect ventilation, HORTICULTURAL BUILDERS and TIMBER MERCHANTS. West End Steam Joinery, Newcastle.

Sole Medalists for the Best Hot-Water Apparatus at the United States Centennial International Exhibition, Philadelphia.

By Her Majesty's  Letters Patent

WRIGHT'S ENDLESS-FLAME-IMPACT HOT-WATER BOILERS.

GUARANTEED The most Powerful, the most rapid, the most Economical, the Simplest, and the Cheapest in the World.

"The 'Boiler of the Future.' I have no doubt about this."—Wm. THROTSON, *Tunwell Vineyards.*

From the "Gardener," March, 1877.

WRIGHT'S PATENT ENDLESS FLAME-IMPACT BOILER.

"This boiler is attracting a good deal of attention in the horticultural world at the present time; and as I have just had one of their largest-sized ones fitted up here, and have now got it well tested, perhaps a few lines from me upon its capabilities may not be without some advantage to some of your numerous readers. I have had some experience as to the annoyance and extra labour caused by badly-constructed boilers, and any improvement effected in these to save labour and find demand the attention of all interested parties. "To give you a more detailed idea of the work this boiler has to do, I may begin by stating that our hothouses consist of a range having a total length of 100 feet, a ridge-and-furrowed greenhouse being in the centre, two lean-to Vineries on each side, with Caneless-house and general plant-house at each end; 10 opposite side of wall we have a Fern-house, partly lean-to and partly open, 70 feet in length, varying in height to 20 feet. Attached to end of boiler-house is our laundry, with a drying chamber fitted up with about 2500 feet of 4-inch piping. The whole of the above houses are heated with hot water, and have a total of about 2000 feet of 4-inch piping. We had formerly two oval fire boilers, one being a feet 6 inches long, the other 4 feet long. With these two boilers kept fired we always found great difficulty in keeping up the temperature during frosty weather, and had frequently to lose a night's sleep attending to the fires. On the last day of last year the larger boiler came to grief—the water from it dropped out the fire; and in taking down some of the brickwork it was found to have cracked beyond repair. To be thus left to the middle of winter with only the one boiler was no joke. I had to look out for another without delay. I have given a good deal of attention to the construction of boiler boilers, and I must say I never seen one that came up to my idea of what a boiler should be until I saw the one which is now in use at the house of Wright & Co.'s Boiler, which appeared in the *Gardener*. "After talking the matter over with my employer, W. S. Nichol, we arranged to purchase the boiler, and I had the boiler I had formed such an opinion of. I at once put the order into the hands of Messrs. Melick & Philip, horseboiler makers and hot-water engineers, Tottenham Street, and they fitted it up and attached the piping in the most complete manner. I also got some additional light valves attached so that if anything should at any time go wrong it can be attended to without disturbing the piping. "And now as to the capabilities of the boiler for the work. As formerly stated, I had considerable difficulty in keeping up the heat with the two oval fire boilers kept hard at work. I now find that with the remaining oval fire boiler idle, and I found the draught very strong I got a three-foot valve fitter fitted into the bend of the stove pipe, and am able to regulate the fire to a steady, and by banking up the fire at 10 P.M., and turning the damper fully half round, I can leave it to its work with the greatest confidence till the usual time of commencing labour the following morning; and instead of, as formerly, having to sit up firing the half of the night at times, and sometimes whole ones, we can retire to rest at a reasonable hour, confident of sleep being undisturbed by unpaired draughts or plants and fruits going to ruin. In concluding my remarks I may say that I have had no hesitation in saying that for rapidity of circulation, small consumption of fuel, portability, and cleanliness, it has no rival, and I do not doubt this boiler will save us money, and where coils are high in price it will effect a considerable saving, and as there is good fire space in it it will be found a capital boiler for the use of a small place. I can say that I will take a forenoon and see a few more of them, and predict that we have a very high opinion of them in future, both as to other buildings, and shall have been hearing remarks to make about the principles of it next month.—Ed. Gardener."

"I think yours the next best thing 'Heat Trap' yet invented."—DAVID THROTSON, *Dreuxland Vineyards.*

For details and particulars, as to the various sizes made, and prices, please see our pamphlet, entitled, "OUR BOILERS AND HEATING," which will be handed to all applicants, post free.

We are prepared to supply Thirty Different Boilers of all powers, sizes, and heights, and can vary these to suit any particular situation or requirement.

WM. WRIGHT & CO., HOT-WATER ENGINEERS, AIRDRIE, near GLASGOW, N.B.

Branded on every Casting.

Macfarlane's Castings,

Architectural, Artistic, and Sanitary,

Conservatories; Winter Gardens; Arbours; Pavilions; Garden Screens; Garden Entrances; Bandstands; Verandahs; Covered Ways; Bathhouses; Railings; Balconies; &c. Plain and Ornamental Castings of every description for Parks, Gardens, Pleasure Grounds, Esplanades, &c.

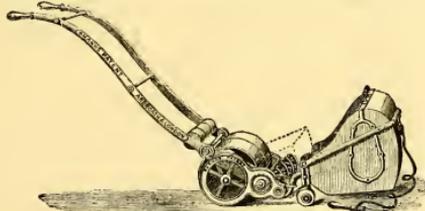

FOR HOME & EXPORT.

Illustrated CATALOGUE with Price List and Estimates for special Designs on application.

WALTER MACFARLANE & CO., GLASGOW.

SHANKS' NEW PATENT LAWN MOWERS, Under the Patronage of Her Most Gracious Majesty the Queen, and most of the Nobility of Great Britain.

The merits of these Machines are now so well known, and their superiority so universally established, that a detailed description is no longer necessary. A. S. & SON would here simply refer to a few of the prominent advantages peculiar to their Machine. The Revolving Cutter is made to be self-sharpening. The *Sole-Plate or Bottom Blade* is made with *Two Edges*, enabling the cutting parts to last twice as long as in other Machines. A Wind-guard is also introduced, which prevents the Grass catching the Box when the Machine is in use during the prevalence of wind.

PRICES,

Including Carriage to any Railway Station or Shipping Port in the Kingdom:—

NEW HAND MACHINE.		NEW PONY and DONKEY MACHINE.	
10-inch Machine	£3 10 0	25-inch Machine	£13 10 0
12-inch Machine	4 15 0	28-inch Machine	15 0 0
14-inch Machine	5 15 0	30-inch Machine	17 0 0
16-inch Machine	6 15 0		
18-inch Machine	8 0 0		
20-inch Machine	9 0 0		
22-inch Machine	9 10 0		

The Patent Delivering Apparatus enables the Grass-box to be emptied without stopping the Machine.

Price, for the 28-inch and 30-inch Machines, 50s. extra; 25-inch Machine, 25s. extra. Silent Movement, 12s. 6d. extra. Boots for Pony, 24s.; for Donkey, 20s. per set.

NEW HORSE MACHINE.

30-inch Machine	£10 10 0	42-inch Machine	£28 0 0
36-inch Machine	14 0 0	48-inch Machine	32 0 0

The Patent Delivering Apparatus enables the Grass-box to be emptied without stopping the Machine.

Price, for the 42-inch, 48-inch, and 30-inch Machines, 60s. extra; for the 30-inch, 50s. extra. Silent Movement, 20s. extra. Boots for Horse's feet, 25s. per set.

A Staff of experienced Workmen always kept in London, so that Repairs can be done there as well as at the Manufactory.

SHANKS' PATENT LAWN MOWERS

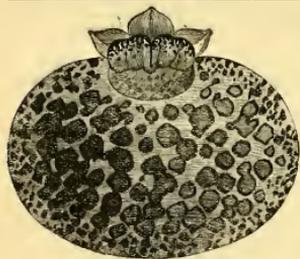

Are warranted to give ample satisfaction, and it not approved of can be at once returned.

ALEXANDER SHANKS & SON,

Dens Ironworks, Arbroath; and 2, Leadenhall Street, London, E.C.

27, LEADENHALL STREET is the only place in London where intending Purchasers of Lawn Mowers can choose from a Stock of from 150 to 2000 Machines. All sizes kept there, whether for Horse, Pony, or Hand Power. Orders executed same day as received.

Small Lawn Mowers—6-inch, 25s.; 7-inch, 35s.; 8-inch, 60s.

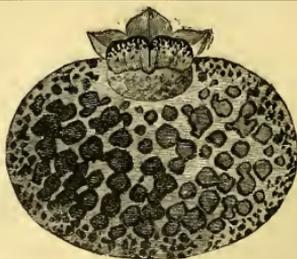

SUTTON'S

IMPROVED STRAIN

OF

CALCEOLARIA

"PERFECTION."

After many years' careful selection we have succeeded in producing a strain of *Calceolaria* which, for beauty and form of flower, richness of colour and habit of plant, is acknowledged to be one of the finest in cultivation. Our houses have been visited during the blooming season by some of the most eminent authorities of the day, all of whom agree in pronouncing our Improved Strain to be of unusual excellence.

From "THE GARDEN," June 2, 1877.

"The *Calceolaria* at Messrs. Sutton & Sons' Nurseries, Reading, are just now beautifully in bloom, and should be seen by all who take an interest in this class of plant. The strain is one of the finest, being the result of years of careful selection. Many of the individual flowers measure $\frac{3}{4}$ inches across, and are perfect in shape and colour."

From "THE GARDENERS' CHRONICLE," June 2, 1877.

"A remarkable collection of *Calceolaria* is now in bloom at Messrs. Sutton & Sons' Nursery, Reading. The house, which is of good size, is even crowded with specimen plants, but it serves to show off their great beauty and attractiveness en masse. Each plant is densely laden with large flowers, and the colours are very varied, from creamy white handsomely spotted on the body to rich dark maroon."

From Mr. B. BARRHAM, Gr. to the Right Hon. the Earl of Sefton.

"It affords me great pleasure to be able to inform you that your *Calceolaria* seed has given extreme satisfaction. I have just seen in flower one of the finest lots of hybrid *Calceolaria* I have ever seen my lot to look upon. They are excellent in variety, form, and size of flower. Many have seen them and are highly gratified."

From "THE GARDENERS' MAGAZINE," June 2, 1877.

"The strain of *Calceolaria* distributed by Messrs. Sutton has flower-buds of immense size and perfect in colour. The flowers, which are borne in large clusters, are of immense size and of the finest possible shape, and embrace every colour. The yellow ground flowers are as a matter of course the most strongly represented, and with their splendid crimson markings are wonderfully effective, and of those with a straw-coloured ground and spotted and marked with purple, there are sufficient to make a most pleasing variety. The rose and purple self-flowers, some of which are quite new in colour, are also numerous, and present a striking contrast to those spotted with crimson, purple, and rose respectively. Sutton's strain of *Calceolaria* may certainly be said to combine all the good qualities yet found in these attractive flowers."

From A. E. RUSSELL, Esq., Dalnabreck.

"My *Calceolaria* plants from seed purchased of you are particularly fine, of very compact habit, and beautiful in colour."

From Mr. W. GEARLE, Gr. to R. M. JACQUES, Esq., Easby Abbey.

"I have some very fine *Calceolaria* from seed supplied by you; they are the admiration of all who see them."

Price, 2s. 6d. per Packet, post-free.

JAMES' INTERNATIONAL PRIZE CALCEOLARIA, 2s. 6d. per Packet, post-free.

PAXTON'S CALENDAR.

Now Ready, a New and thoroughly Revised Edition of the

COTTAGER'S CALENDAR OF GARDEN OPERATIONS.

ORIGINALLY COMPILED BY THE LATE SIR JOSEPH PAXTON, M.P.

OPINIONS OF THE PRESS.

"It has been carefully revised by an experienced gardener, and the lists of vegetables, fruit, and flowers are corrected by the substitution of the most approved modern kinds, in place of those which were mentioned in the first edition, and many of which have ceased to be worthy of all so deservedly appreciated, that any special commendation of it now is unnecessary."—*Midland Counties Herald*.

"This is a handy volume, consisting of seventy pages of letterpress and illustration, containing much and varied information likely to prove useful to all cottagers, &c., who possess a garden. To all such, who require a cheap and reliable book of reference, we heartily recommend it."—*Lloyd's*.

"We are quite glad to see this useful little book once more, and it is like a whiff of perfume from the hutchin in bloom to read on the wrapper 'two hundred and twenty-first thousand.'"—*Gardener's Magazine*.

"The information conveyed in this little book is well adapted or all persons having small plots of ground. The necessary operations for each month are clearly laid down, and are of a thoroughly practical nature. The sorts of both fruit and vegetables are well selected, many of them being excellent in quality. To our readers who are interested in the cultivation of their flower and kitchen gardens, we can safely recommend this as being a most concise and useful work."—*Bell's Messenger*.

W. RICHARDS, 41, WELLINGTON STREET, STRAND, LONDON, W.C.

FOLLOWS & BATE'S NEW PATENT LAWN MOWERS, &c.

New Patent "Roller" Lawn Mower.

New Patent Lawn-Edge Cutter.

Royal Prize Medal Patent "Anglo" American Lawn Mower.

Upwards of 37,000 of these celebrated Machines have been sold during the past few years.

Patronized by Her Most Gracious Majesty the Queen; His Royal Highness the Prince of Wales; His Imperial Majesty the Emperor of Germany; His Imperial Majesty the Emperor of Austria; The Imperial Russian Government for the Agricultural Museum at St. Petersburg; and members of the Nobility and Gentry of Great Britain.

Awarded Medal for Merit, Vienna, 1873 (the only Medal given for Lawn Mowers); Large Silver Medal (the First Prize) at the Meeting of the Royal Horticultural Society, Birmingham, 1872; and in addition, every First Prize wherever these Machines have been brought into competition in actual trial with other makes.

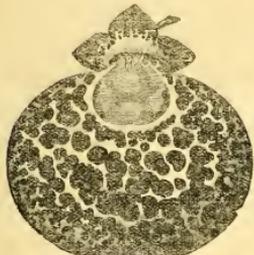

FOLLOWS & BATE here abstain from enumerating in detail the various good prizes "claimed" for other Machines, as they content themselves with saying that their Lawn Mowers possess all the qualities of the best, and are the most reliable and durable.

To be had from all respectable Ironmongers and Seedsmen in the United Kingdom, or from the Patentees, FOLLOWS & BATE, Manchester.

F. & B. are the sole makers of the well-known Patent "CLIMAX" LAWN MOWER, with Back Delivery from 22s. each; NEW PATENT LAWN-EDGE CUTTER, which entirely supersedes

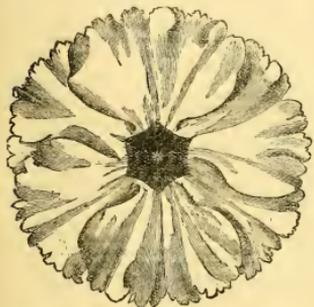

Machines of any make Repaired or allowed for in Exchange.

SEEDS OF PRIZE FLOWERS.

CATALOGUE OF SEEDS,
With every Article Priced, on application.

Mr. William Bull's
PRIZE STRAINS OF
PRIMULA SINENSIS.

PRIMULA SINENSIS FIMBRIATA.
Seed of Mr. WILLIAM BULL'S select and unrivalled strain of this useful and favourite plant is now offered in mixture containing all the new and most distinct colours and varieties. The many unopposed testimonials received at Mr. Bull's Establishment point conclusively to the fact of its being appreciated among growers as an unequalled strain. To distinguish this from the ordinary mixture of *P. alba* and *rubra* usually supplied, Mr. W. E. designates this choice mixture as

"BULL'S PREMIER MIXTURE"
1s. 6d. and 2s. 6d. per Packet.

From Mr. T. GODFREY, *Gardener to Lady Jolliffe, Southampton House, St. Lawrence.*

"From the Primula seed I had from you I have such a variety of colour I never saw before—white, violet, pink, a beautiful rose, lilac, and a brick-red; without exception I never saw their equal."

From Mr. WYNN, *Gardener to J. R. Lowe, Esq., Wetherby, Stamford.*

"The strain of Primula seed I had from you last spring have turned out to be extremely fine, many of the single flowers being about the size of a crown piece, the colours being exceedingly rich."

From Mr. R. EVANS, *The Hall Gardens, Busby.*

"Your Primulas were all that one could wish for—fine flowers and robust growers; some of the plants were nearly six feet high."

PRIMULA SINENSIS FIM. ALBA,
PRIMULA SINENSIS FIM. RUBRA,
Extra Choice, 1s. 6d. and 2s. 6d. per Packet.

From Mr. E. ABBOTT, *Nurseryman, Ardleigh, Essex.*

"Your Primulas I am blooming now are a splendid strain. I hope you will send me some again."

From Mr. E. COOLING, *Esq., Derby.*

"Your Primulas were first-rate here this season."

PRIMULA S. F. FILICIFOLIA ALBA,
PRIMULA S. F. FILICIFOLIA RUBRA,
Extra Choice, 1s. 6d. and 2s. 6d. per Packet.

From Mr. C. SMITH, *Gardener to Sir A. E. Guinness, Et., Clonsilla, Dublin.*

"I was much pleased with all the Primula seed I got from you: they are truly superb. The filicifolia *alba* and *rubra* are most remarkable; the foliage is exquisite, with flowers so well thrown up above."

PRIMULA S. F. KERMESINA' SPLEND.
1s. 6d. and 2s. 6d. per Packet.

ESTABLISHMENT FOR SEEDS AND NEW PLANTS,
KING'S ROAD, CHELSEA, LONDON S.W.

SATURDAY, JUNE 23, 1877.

THE BULRUSH AND THE REED.

(Concluded from p. 749.)

THE word "Flags," employed in the Authorised Version rendering of the account of the exposure of the infant Moses, represents the Hebrew *sufah*, a term evidently of extensive meaning. Here it probably stands as a collective name for waterside reedy vegetation. It holds a similar sense in Isaiah xli. 6, where *sufah* is coupled with *kaneh*, the Hebrew word for Reeds in general. From reedy plants *sufah* seems to have passed on to aquatic vegetation in general, both freshwater and marine, for when Jonah describes his adventures in the sea, he says "*sufah* was wrapped around my head." Probably in this latter application it anticipated the use of *φύκη* and *algæ* by the ancient Greeks and Romans, denoting all marine plants thrown by the tide upon the shore, or that became entangled in fishermen's implements. How beautifully it comes to the front in Theocritus:—"And halcyons shall smooth the waves, and the south-east, and the south-west wind, and the south-east, which stirs the remotest sea-weeds . . . halcyons most beloved of birds, whose life is on the ripples, by the sea-green Nereids" (vii. 57-60). Ovid uses *algæ* for the tangle that surrounds the ships of *Æneas* while moored at Carthage (*Ep. Did. Æneas*, 172). The ancient and sevenfold storied water which today we call the Red Sea, with the Hebrews was *Yarn Sufah*, palpably because of its fecundity in arborescent "corals," the beautiful submarine quasi-vegetative growths which form one of its features, and which led old Pliny to speak of the Red Sea as a "vast forest." "*Burium mare et totus orientis oceanus refertus est sylvis*" (xiii. 25). *Yarn Sufah* is the name employed in the Hebrew in Ps. cvii. and Ps. cxxxvi., also in Numbers xiv. 25, and Joshua ii. 10. The original sense of *sufah*, or reedy plants in general, is no doubt well conveyed by "Flags," the most conspicuous of their class being the beautiful semi-aquatic Iris Pseud-acorus, or yellow Water Flag, the name pointing in the first instance to the great pendulous banner-like petals. It is curious that Shakespeare, in his only use of the word Flag for a water plant, should leave us in doubt whether he intends a Reed or something that floats, like a Potamogeton.

"This common body, Like to a varagobon Flag upon the stream, Goes to, and back, lacing up the varying tide, To rot itself with motion."

Antony and Cleopatra, l. 4.

In the Authorised Version of the Old Testament "Flag" stands for yet another original word, namely, *achiv*, in Job viii. 11, where it is coupled with *gômè*. The exact sense of *achiv* appears to be marsh-grass, of a kind suitable for pasture, since it is employed in the recital of Pharaoh's famous dream, when "seven well-favoured kine came up out of the river and fed in *achiv*," in the Authorised Version rendered "a meadow" (Gen. xli.).

Bulrush comes before us also as a duplicate Authorised Version rendering, standing in Isaiah lviii. 5 as the representative of the Hebrew *agmon*. This, again, was probably a collective term, though applying in particular to reedy plants of the *Scirpus lacustris* kind. In Job xii. 2

One thing is remarkable concerning it, viz., that when the fresh flowers are placed in spirits of wine they contract and shrink up in a very marked manner, which I have never observed in other *Stapelia*. The woodcut (fig. 124) represents but a small portion of the plant. *N. E. Brown.*

GONGORA GROSSA, n. sp.*

This is a curious novelty, since it is the first direct ally of the first species introduced to Europe, *Gongora stropurpurea*, Hook., Exot. B. (tab. 178, 1827), from Demetera. Notwithstanding our very numerous introductions we have waited just fifty years, forgetting the ally; and now we have it, modern amateurs will not feel very proud of it. Like that old species, it has upright basilar horns to the lip, higher than the length of its nail; like it, it has a curious deeply five-cleft lip, making one think of some quadruped lying on its back, with four outstretched legs. It is exceedingly well distinguished from its elder associate by having its anterior horns with bristles outside, a tooth inside, and a small teretiscale acuminate body between the horns. The mass of the lip is stouter. The sepals are much broader. It appears to have a whitish or yellowish ground colour, with very numerous blackish purple spots. The lip is so covered with them that it looks nearly totally blackish purple. It comes from Ecuador, and made part, I think, of that much bespoken collection, sent by a photographer, who, no doubt, professed the theory of that centro-American

myself (*Dendrobium Hanburyanum*, nearly at the same time), we regarded it as a great deal, a good bit, to separate it from *Dendrobium nobile*, Lindl., and *corulescens*, Lindl. (plants believed distinct at that time), in acknowledgment of its very slender stem, the trumpet-shaped lip, &c.

Now there come both from Assam and from Burmah beautiful *Dendrobies* with flowers scarcely distinct from those of the now old (1856) *Dendrobium litiflorum*, and with totally distinct stems. I obtained one, a beautiful thing, just imported from Burmah, collected by Mr. Duxall. The flowers are quite like those which Dr. Lindley sketched from his type, much larger than those of the actually grown *D. litiflorum*, with exceedingly warm colours, and the inferior halves of the lateral sepals much lighter than the superior ones, perhaps an accidental variation. Wanting a fuller elucidation, I addressed myself to Mr. Harry Veitch for fresh materials of the genuine thin-stemmed Assamese *Dendrobium litiflorum*, who immediately favoured me with a rich supply of fresh flowers and stems. But those flowers! Oh, there is no reasonable difference to be found between them up to that queer purplish line that stands each side of the stigmatic cavity. All details are the same, so that I cannot help keeping the novelty as a variety of *D. litiflorum*, for I cannot think that such an absolute identity of flowers may exist in different species. I have to thank Mr. Stuart Low for the beautiful thing in the best state. *H. G. Rehb. f.*

varieties may be grouped together to show the contrast their singular forms and distinct colours afford. In favourable situations *C.* spectable grows about 2 feet high, and flowers in the open air towards the end of June. The lip or labellum is much larger than the common Lady's Slipper, and of a delicate rose, while the petals and sepals are white, thus affording a soft blending of tints as pleasing as they are chaste and beautiful. *C. japonicum* is another lovely species, which unfortunately at present is very scarce, but as Japan appears so rich in floral treasures, it is to be hoped that this will be found in quantity, as there appears so little to the species of *Lilium auratum* and other plants supplied from that quarter of the globe, since a demand set in for them. The flowers of this variety are very large, having green sepals and petals dotted with reddish spots, with the labellum white, richly stained with crimson.

The above-named are the two best and most showy, but there are several others quite distinct, the most desirable of which are *C. pubescens*, *C. Calceolus*, and *C. montanum*, the two former having rather small inflated lips of a soft rich calceolaria-like colour, with sepals and petals of a brownish purple, thus forming a striking contrast. To grow them well requires a cool, moist, shady retreat must be chosen, but not where the soil is apt to become sour from excess, though being imperfectly drained. The spot where we have them, and where they succeed admirably, is just over a drain pit in to draw away the water from a loose rich bog, formed principally of vegetable debris, and with this a good proportion of fresh fibry peat was added at the time of planting, and mixed together to the depth of a foot or so, which evidently suits them, as they are in the greatest state of luxuriance.

I noticed that those imported appeared to be growing principally in a kind of half-decomposed moss and woody looking fibre, and no doubt where sphagnum can be conveniently got it might be added to the peat with considerable advantage to the plants; as also any common moss chopped up, the absorbent properties of which would keep them in a uniform state as to moisture. Although they are shade-loving subjects, the situations chosen should be sufficiently far removed from shrubs or trees to be out of reach of their roots, as otherwise they would enter the rich bed, and rob them to a very serious extent. Sheltered on the north side of a rockery, and planted on a low level, where their roots can be kept cool and moist, with a good depth of peat to ramble in, they would be just at home, and form one of the most attractive objects that could be had for such a position.

Unfortunately they are slow of increase, as they only admit of propagation by division, and unless the places where they are planted are particularly suited to their growth they do not send up fresh crowns very readily, but when they do so they may be divided and replanted. If they can only be obtained in quantity, an active demand is sure to spring up for them, as they are valuable for pot culture and forcing, although to have them at their best they must be seen growing in large clumps in the open, in situations as already described above.

For growing in pots, it is best to obtain fresh imported plants, on account of their superior size and strength over such as have been under cultivation and cramped for root-room, as must of necessity be the case where space is an object, and they are kept for sale in as portable a form as possible.

The soil most suitable is good tough fibry peat, and from this as much of the earthy part should be knocked out as can fairly be done, which will then leave just the kind of vegetable matter the plants delight in. If to this is added about one-sixth its bulk of sphagnum, and a little silver sand to add weight and keep it together, they may with care in watering be made to succeed admirably and flower regularly every season. To do this, however, they must have every attention paid them while making their growth that the leafage may be as ample and clean as it is possible to keep it, for, like all perennials, they form their bloom-buds the year previous to flowering, and unless they are well managed then they have not sufficient strength to carry out that part of their work. The sized pots they look best in are deep 6 or 7-inch, in each of which three separate crowns should be placed triangularly near the sides and the soil pressed in amongst the roots in such a manner as to leave no cavities whereby the air would be unduly admitted amongst them and thus cause a too rapid drying of the same.

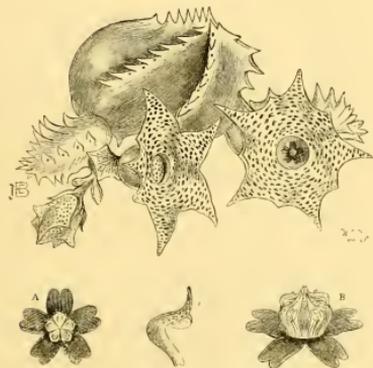

FIG. 124.—HUERNIA BREVIROSTRIS.

A, Front, and B, side-view of corona; C, Rostrum. (A and C magnified.)

editor who said that one should send over to Europe shiploads of Orchids as cargoes of coffee, sugar, potatoes, cattle. No matter what they were, Europeans were too fond of such bulks. It is well known that a collection, sent by one who may have watched some other collectors at a distance, did not even pay the cost of transit. A few friends of botanical caricatures took plants, and among them was Sir C. W. Strickland, whom I have to thank for this highly interesting unexpected species. *H. G. Rehb. f.*

DENDROBIUM LITIFLORUM, Lindl., ROBUSTUS, n. var.†

Once we were very sore vexed that the *Dendrobiums* —gratiosissimum, Boxallii, crassinode—all had the same kind of flowers, though with some very good differences in the stems. Those differences, as far as we could ascertain, were easily understood, though indeed, one might guess *Dendrobium Boxallii* to be a male between *Dendrobium gratiosissimum* and *D. crassinode*. Happily, indeed, *Dendrobium Findleyanum* has more and more proved a widely distinct species from those just-named. Now we stand once more in a dilemma. When we named this well-known *Dendrobium litiflorum*, Dr. Lindley and

CYPRIPEDIUMS.

The very mention of the name of an Orchid at this time of year almost puts one in a state of perspiration, as most of our ideas and recollections at once connect them with tropical heat and steaming hot-houses. It will therefore be a relief to those who associate them with such discomforts to know that some at least of that most interesting and lovely class of plants are sufficiently hardy to be grown and enjoyed in any sheltered spot outdoors. Beautiful as are a few of the stove kinds, there are none to surpass *C.* spectabile for the rich delicacy of its colouring or the charming effect its flowers produce, either in a cut state or when seen on the plants growing in masses, in cool moist shady retreats as we have them here. Some of these have been established for years, but the greatest part of them have been recently introduced from North America through the New Bulb Company of Colchester, who supplied them to us in fine strong clumps, each containing several fat plump crowns, and all in capital condition, being as fresh as when dug up from their native woods, with every root intact and healthy.

If they can be obtained in quantity, and delivered in such a good state of preservation, quite a new feature will be imparted in the decoration of our cool houses, and moist shady situations in rockeries or other choice nooks and corners where the several

* *Gongora grossa*, H. G. Rehb. l. — *Omnino affinis G. stropurpurea*, Hook. Sepala lateralis late triangulari, hypochilii coracibus longioribus validis teretibus obtusis, mesochilii coracibus aristatis, intus superne unidentatis, interfecto callo subulato acuminate, epichilio auriculis triangulari acuminate. — Ecuador.
† *Dendrobium litiflorum*, Lindl. var. *robustus*, Rehb. f. — *Caullibus calanum gryphium crassis; floribus Dendrobii litiflori optime optatis.*—Burmah.

Any ordinary frame standing in a cool shady place on a damp bottom will do to grow them in, or they may be treated with the Cinerarias, Primulas, or shrubby Calceolarias, which during the summer months require a similar position and much the same attention as to shade and a moist atmosphere, and by arranging the Cypripediums in a corner by themselves they can be syringed or watered overhead as often as may be found desirable, which while growth is active or the leaves fresh and green, cannot well be too frequent. Although a hardy rock which was established in favour of sheltered positions outdoors, it is desirable to afford them some protection in pots during the winter on account of the greater exposure the roots undergo in such a small body of soil, and the constant changes they are subjected to as regards temperature, moisture, &c., when so circumstanced. By plunging them in cocoa-nut fibre or half decomposed dry leaves, with about 1 inch of either or some moss scattered over their crowns, they will be perfectly safe in a cold frame during the winter, and may be taken from thence as required for forcing or to flower naturally in the greenhouse. 7.5.

NOTE ON THE FRUITING OF HOLLY.*

In my report for the month of May I alluded to the Holly as producing this year an amount of flower-buds rarely seen in this garden, and it seems to be general all over Scotland, probably owing to the trees not being exhausted last year, on account of the general failure of the fruit crop. At this time (June 14) numerous blooms are now open, and many of the plants white, some with fertile and others with non-fertile flowers, the latter in every instance being the most conspicuous. The stamens flowered not a week ago, leading to the belief that all will be covered with fruit at Christmas, a good crop may however be looked for. Fertile and non-fertile trees being now easily recognizable (although it is not generally known), a few observations regarding them may not be unacceptable. Perhaps the most conspicuous of the fruit-bearing kinds now noticeable in a flowering condition are, about one third of the common green variety, nearly every plant of the kind known as Hodgins' Holly, the leather-leaved Holly, the green veeping and Moonshine Hollies, also all the large plants of the common variegated or Silver Holly, as well as the old Golden Variegated or many others. After a close inspection of all the Hollies in this garden, which now amount to many hundreds exclusive of hedges, we find that all those which we do know as annually producing fruit at Christmas are likely to be covered with fruit this year again (unless prevented by certain circumstances which were much debated last winter). On close inspection we find, as might be expected, that those Hollies now covered with bloom, but on which no berries had ever been observed, possess stamiferous flowers only, while on all the known berry-bearing plants the ovaries generally far advanced before the buds are sufficiently open for impregnation, and when they do open, although all the anthers are formed, all appear abortive. The stamens in such flowers are all more or less curled backward, while with the pollen-bearing plants the stamens are all more or less upright, and densely covered with pollen. In such flowers the rudimentary female organ consists of a small barren flattened ovary, with four little projecting points on the apex; in all these cases the corolla always falls off entire, having the four upright stamens adhering to it, while with the fruit-bearing plants the petals do not fall entire, but break into separate segments by the gradual swelling of the young ovary. As I have not been able to find a single instance amongst all the original variegated silver and golden-leaved Hollies, bearing perfect stamiferous flowers, it is, therefore, evident that all these large variegated plants have been originally propagated from one stock, either by grafts, layers, or cuttings. The same observation also applies to the Hodgins' and the other pistilliferous kinds. Of recent years variegated and other seminal varieties have been raised in various of the country, but none of the variegated forms have the robust nature of the original kinds. It is, therefore, probable that both stamiferous and pistilliferous varieties may be found amongst them, as instanced by the black-twigged silver-striped Holly all being males. The blooms of the different named varieties vary much; perhaps those with the most prominent flowers, both for size and purity, are

those produced on the Hx Shepherdi, I. nobilis, and I. atroveris—all are stamiferous plants, with large green leaves; in the green Hedgehog Holly, and the variegated variety known as the Golden Queen, with numerous flowers, and smaller leaves.

In no instance have I been able to find a plant bearing flowers having both sexes complete on the same root. Owing, however, to the quantity of seedlings now raised, I do not see why this should not sometimes occur. In some cases a few solitary berries have been observed, but as such plants were not marked at the time, it is not easy now to tell them. They will, however, be attended to in future.

Mr. Johnston, of the Lawson Company, has been kind enough to give me the following list of Hollies now in a flowering condition, and cultivated in the Golden Acres Nursery, arranged under their respective heads, which I annex.—

List of Male-Flowered Hollies.

Ilex	alcoicorns	Ilex	ferocissima
„	nobilis	„	pectinata major
„	Shepherdi	„	Silver Queen
„	argentea	„	robusta
„	ciliata major	„	ferox aurea
„	crispis	„	lanifolia
„	ovata	„	Water's Holly
„	myrsinitis major	„	picta
„	serotifolia	„	Golden Queen

List of Female-Flowered or Fruit-bearing Hollies.

Ilex	grandifolia	Ilex	pendula purpurea
„	heterophylla	„	picta
„	mespilis	„	argenteo-marginata
„	Hodginsii	„	Lawsontiana
„	laucana	„	Water's Holly
„	pendula	„	media picta aurea
„	rotundifolia	„	holerica
„	Wittmanniana		

List of Hollies Producing Male and Female Flowers on Different Plants or Nearly Allied Varieties.

Common green Holly	holerica nigrescens
marginata	aurantiaca (Moonlight)

[The flowering of the Holly seems to be profuse in many places. We never saw the silver-variegated Holly so much laden with buds as they were a week or two since in Kensington Gardens, Eds.]

TAR PAVEMENTS.*

To many of the members the construction of tar pavements is a familiar work, but to others, perhaps, they have not as yet tested their suitability for suburban paths. In some counties, such as Lancashire and Yorkshire, tar pavement is not a matter that would receive much attention; but in the eastern counties, and other districts not favoured in the same way, and where stone pavements cost seven times as much as tar pavement, the latter is of some importance to towns requiring a clean and economical footway. In Ipswich the mileage of footways in proportion to the population is very large, the population being 46,000, the distance of streets and roads being about 75 miles. Of this about 22 miles are town streets; and double this distance would represent about the length of paths. Formerly all the suburban paths, as well as the majority of those in third-rate streets, were made with gravel. These, however, were always in a defective state. To prevent mud accumulating in winter shingle was put on the surface. This shingle in summer-time was disintegrated, and laid on the surface as though it had been strewn with Peas or Beans. To avoid this loamy gravel was put on. Then, again, in winter this worked up into mud, and again had to be covered with shingle, and so on alternately winter and summer.

The defects gave rise to continuous complaints, and, having had experience of tar pavement in other towns, I was induced to recommend it as a substitute for gravel. My suggestion was approved of by the authority, and specimens of the pavement were laid, the first being done by contract at 12. 3d. per superficial yard, and maintained in repair for five years. This was thought to be too much, and the sanitary authority decided to make their own. I have prepared the material in different ways, sometimes using simply pure coal tar, at others refined tar, and occasionally small portions of pitch, lime, and Portland cement in the preparation of it. But in practice (although I use mainly refined tar) coal tar is all that is required, and will make as good a path as with refined tar, or any other admixture. I have two ways of making tar pavements in this town. One is with shingle—this is, fine gravel; and the other with slag, which is clinkers and refuse cinder-dirt from factory furnaces.

The process of making with shingle is simple, and is as follows:—A fire is made on the ground and heated over with shingle; when the first covering is laid through, more is added from time to time, until there are about 10 or 15 tons. For convenience in sifting over the stuff after it has been heated through, it is desirable that the fire should be of an oblong shape, presenting a form something like the moulds under which Potatos or Mangels are stored in a field. After the whole has been sufficiently heated to take out the natural moisture, it is sifted, the fine being placed in a separate heap, and the coarse after. When about one burrowload of each has been sifted, boiling tar is thrown upon each of them while in a hot state; the whole is then turned over with shovels, and thoroughly mixed. The coarse forms the bottom layer of the path, and the fine the top surface. After a path has been made about ten days it is dressed over the surface with boiling tar and sharp sand or ashes left from the heap of stones after burning. The sand combines with the tar, and fills up the small interstices and produces a smooth surface.

In making these pavements from slag it is not necessary either to heat the material or boil the tar. The material, coarse and fine, is turned over, so that all the large clinkers are broken into small pieces, after which the whole is sifted over to separate the large from the small, and is then mixed with coal tar (unless the weather is very cold, when it is warmed to make it mix more readily). The material made in this way is laid down in the same manner as described for shingle, but is not dressed on the surface with boiling tar and sand, being better without, but is covered with a copious sprinkling of white Derbyshire spar, which is well rolled into the top layer to relieve the dull, sombre appearance, and give it a pleasant effect. In laying the paths, care should be taken to roll the ground well, and bring it to a uniform surface before the bottom layer is put on, to avoid uneven or soft places, which, if not protected against, would result in the path, after being down for a time, having a series of undulations on the surface. In laying, each layer should be well rolled with a roller of about 7 cwt. The bottom layer should be 1½ inch thick, and the top one 1 inch. It is advisable to keep the prepared stuff a few weeks before it is laid down; and although the work can be done at almost any season, spring and autumn are the most suitable, when it is dry, and not too hot. Shingle tar-pavements require dressing over with boiling tar, and covering with sharp sand, from time to time, to preserve the surface, which, if not dealt with in this way, would become rough, by reason of the soft material wearing from between the joints of the stones. The material does not always turn out equally well. Sometimes a path will not consolidate, and at another time the surface will break up without any, as far as can be seen, apparent reason.

The shingle tar pavements cost 9d. per superficial yard, laid complete, and that made from slag 11d. Preference is given here to those made of slag, which are more costly in the first instance and less durable than those made with shingle, which can easily be understood when the nature of the material is considered. In the first instance we used shingle entirely, but from favourable reports of the Sheffield paths, and from a personal examination, and from the excellent mode of an improvement on gravel paths, and so on, I believe the Sheffield paths are better than those in this town, and I have no doubt it arises from the fact that the material is of a more durable character than can be procured in Ipswich. The cost of these pavements varies according to local circumstances, being as low, in the case of Sheffield, as 7d. per yard, and as high in London as 2s. 3d. From information obtained some time since, I found that the general price of this kind of pavements was about 1s. per yard, exclusive of the cost of preparing the foundation. The price I have given for Ipswich paths includes the foundation. Tar pavements are generally adopted as an improvement on gravel paths, and are not supposed to be regarded as a material to be taken in comparison with asphalt, although I think they bear favourable comparison to many of the more costly pavements, and are, in my opinion, much to be preferred to the common asphalt prepared from pitch, to say nothing of the difference of cost, and which expands and contracts with variations of temperature.

I have tried other materials for making cheap pavements for footways, such as bricks, earthenware tiles, and Portland cement concrete; but the cost, which is about 4. 6d. per superficial yard, precludes their use

* Paper read by Mr. E. Burkhart, C.E., Town Surveyor of Ipswich, at a recent meeting, held in this town, of the home county section of the Assocn. of Municipal Works and Sanitary Engineers and Surveyors.

* Read at the June meeting of the Botanical Society of Edinburgh, by Mr. M. Nab.

for suburban paths; and their durability is not sufficient to allow them to be put in the place of York flagging for main streets. A path made from shingle, and repaired in the way I have described, would last with the ordinary traffic of a provincial town ten years. Paths laid under my directions as long since as this are still in fair condition. It is, however, difficult to say what the life of pavement would be without very careful observations extending over a considerable period, as the duration of any paved footway is simply determinable by the amount of traffic. Having regard to the economy of first construction, reduction of dust and scavenging, and the cleanliness of the path after rain, it appears to the writer that there is no better material for suburban footways than tar pavement. It may be objected that the dull appearance, and the difficulty of repairing them so as to bring the repaired part even with the old, and the disturbance of the paths caused by laying on gas and water is against their adoption. The first objection can be avoided by using a good covering of Dr-yshire spar, and the second applies more or less to any pavement, with the exception of York flagging. When I commenced to lay these paths ten years ago they were rather scarce, and had only been laid to a limited extent in a few towns; but during the last five years they have been very largely extended, and will in future occupy a permanent position among other paving materials for constructing footways in towns; this shows the suitability of the material for such footways as I have referred to in this paper.

There are now about 15 miles of these paths in Ipswich, taking the place of paths which would, if they had not been superseded with this material, have still been muddy in the winter, and so rough on the surface in summer as to make them always more or less unpleasant to walk upon, to say nothing of the indirect discomfort to the inhabitants by reason of additional dirt in winter and dust in summer. The cost of paving this length of footways with other materials would have been so considerable as to have prevented the possibility of doing it, and I look upon it as a great boon to the inhabitants of any town to get such good pavements for suburban paths at such a small cost.

OPEN AIR VEGETATION FOR MAY.*

THE weather in May, particularly the early part of it, has been rather cold and backward. During the first eight days 36° of frost were registered. The lowest markings were on the 23, 30, 4th, 5th, 7th, and 8th, indicating respectively 21°, 32°, 26°, 26°, 28°, and 24°; while the six highest morning temperatures were on the 17th, 19th, 20th, 21st, 25th, and 30th, indicating 44°, 42°, 41°, 44°, and 45°, all being below the maximum temperature noted during May, 1876. The wind, with a few trifling exceptions, generally prevailed from the east, but changed to the west on the 24th, and since that time progress has been observed in vegetation. This progress, however, was slow, owing to the dry state of the atmosphere, till rain fell copiously on the 28th, which did much good. As long as the wind was in the east the foliage had a great struggle to get out, and it was remarkable to observe the peculiar yellow tinge of the young leaves of many deciduous trees, contrasting singularly with the dark green of the neighbouring evergreens. Judging from the state of the trees and herbaceous plants on May 31, this season may be regarded as one of the latest we have had for many years; indeed I do not recollect ever seeing one so backward, still averaging about three weeks late. Up to the 15th of the month the only species of deciduous trees that could be said to have nearly completed their foliage were the Acer Pseudo-Platanus and the common Hawthorn, many others advancing, but far from complete. For comparison with future years I shall give a list of some of the ordinary trees, and the state they were in on May 31; these, however, vary in different situations and exposures. Besides the Plane and Thorn, just alluded to, the Lime trees were only partially in leaf, and those chiefly on the south and west sides. On a few Beeches the leaves were partially expanded, but many were backward. Birch trees covered with catkins, but none of the leaves fully developed. Leaves were also seen on the Norway Maple, Horse Chestnut,

Purple Beech, but much later than usual; while the Elm, Walnut, Chestnut, Sorbus, Lombardy and other Poplars, Willows, Oak, Ash, and Sugar Maples were all very backward, some only breaking their buds, while no foliage was observed on the Robinias, Celtis, Ostrea, deciduous Magnolias, Tulip-trees, Platanus, Taxodium distichum, &c.

On May 31, with the exception of the Plane and Thorn, just alluded to as being in leaf, and those where no foliage was visible, most of the intermediate ones, from the small state of the young shoots and buds, had a peculiar network appearance, light being seen through every twig and leaf—a sight rarely seen in this part of the country at such an advanced period of the year.

Besides forest trees, it may be remarked that many dwarf, shrubby, and herbaceous plants have been also very late in flowering, and where this is the case it will be observed that their duration in a perfect flowering condition is often shorter than when flowers come forth at their own natural period. This is particularly noticeable with such plants as Menziesia acroclera, M. empetriflora, Bryanthus erectus, Andromeda tetragona, &c., as well as many herbaceous plants which usually bloom between the middle and end of April or early in May, and which present a much greater appearance than they do when late of flowering.

With reference to the ordinary garden herbaceous plants, kinds which we usually trust so much to for class illustrations, very few of those sorts generally used during May could be had in flower. A long list of such plants might be given, a few, however, will suffice for future comparison, viz., Dorycnium Pardalianthes, Aquilegia phœneum, Aquilegia vulgaris, Potentilla Rupestris, Heraclenum hegatum, Scabiosa montana, Astrantia major, Papaver orientale, also Lupines, Thalictrus, Peonias, Aconitum, Delphiniums, &c.

By May 31 we generally have flowers on the Horse Chestnuts, Pavia flava, Laburnums, Lilac, common and red Hawthorns, Bird Cherries, also on some varieties of Sorbus. This year we have only had the double Cherry, Gean, perfumed Cherry, Crab Apple, and Norway Maple in bloom.

It will be remembered that the Holly bushes last year were nearly destitute of berries, and various causes were assigned for it. This year blossom-buds are to be seen on almost every tree in the greatest abundance, but few on May 31 were expanded. In my garden notes for May, 1875, I find it stated that Hollies of every description were covered with blossom, so that the surface of the ground beneath them was white with the fallen flowers, and a good crop of berries resulted. During May last year flowers were also produced in abundance. The severe frost (26°) which occurred during that month, and was general all over the country, and at a time when the Holly blossom was in perfection, must have injured the pollen to such an extent that little or no fruit was produced. Although the frost during May of this year was more severe than last, the Holly buds were not sufficiently advanced to be injured, and it will be well on in June before they can be fully developed, when it will afford a good opportunity to botanists to examine the flowers in different stages and in different situations, as well as the different varieties, and thus satisfy themselves as to the hermaphrodite or non-hermaphrodite state of these plants.

On the rock garden 212 species and varieties of plants were more or less in bloom on May 31. It will be needless to record a list of all. The following selection may be useful to those individuals wishing to cultivate a set of plants for flowering at this part:

- Andromeda fastigiata
- " tetragona
- Anemone alpina
- " palmata
- " pugnanis
- Arctostaphylos alpina
- " californica
- Aspidistra Hendersoni and others
- Azalea procumbens
- Bryanthus erectus
- Cypripedium
- Cypripedium
- Daphne laureola
- Dodecatheon intergrifolium
- Dracula tridentata
- Erythronium americanum
- " coccineum
- Erica liliiflora alba
- " multiflora
- Erythronium americanum
- Geum
- Helonias bullata
- " alba
- Hieracium alpinum
- Hieracium cristatum
- Ledum buxifolium
- Ledum thymifolium
- Lilapspermum prostratum
- Menziesia acroclera
- " Drummondii
- " scopulina
- " empetriflora
- " polygama
- " Chamæmorus
- " Phlox setacea violacea
- " Primula alba papilionata
- " " cortusoides-amœrea
- " " integrifolia
- " involucrata
- " luteola
- " polyantha
- " polyantha
- " Parnassia
- " Parnassia
- " uniflora
- Rhododendrum Chamæcistus
- Saxifraga
- " reticulata
- Saxifraga petiata, and many others
- Trillium uniflorum
- Trillium uniflorum
- Viola pedata

PEACH SETTING.

We have this subject again revived, with all its doubts and uncertainties. It seems to be a favourite dish with gardeners, and Mr. W. Miller has studied the "flavouring up" in a way that few can find fault with: he has no objection to clear water, chilled water, tobacco water, or any other power or agency, whatever it may be, whereby a good crop of fruit may be obtained. It is quite right that every cultivator should be allowed to judge for himself the remedy or remedies that he considers necessary in order to secure the best result, but I think it is hardly fair to those who are not by practice possessed of sufficient knowledge and discrimination to enable them to take a decided course of action, to lay down so wide a basis of argumentative vagueness. It is just twelve months since an exhaustive discussion on the subject of Peach setting was closed in the columns of the *Gardener's Chronicle*, and, as far as I can remember, every opportunity was given to discuss the merits of the various systems advanced by several correspondents.

The main object of the discussion referred to resolved itself into a review of the practice as carried out by some of the most successful and experienced cultivators of the day for over twenty years, and finally the test of the subject under debate seemed to rest on the evidence for or against the use of the syringe, as the most successful means of insuring fertilisation. I have always maintained that the process of fertilisation never took place when the flowers were in a state of saturation, and, after another year's experience, I have still no reason to alter my opinion. The different arguments advanced, both for and against the syringing system, will be fresh in the minds of those who took any interest in the matter, so that it will not be necessary to go over the same ground again. Mr. Simpson, of Wortley, who has been a stern advocate of the syringe, wrote a very able and cogent article on its behalf, in which he included every point that was worth being urged in its favour. It has been asked why should not wet pollen-fertilise? Why, indeed! We have the matter in our own hands, and can test it by a constant application of moisture, let it be through a rose as fine as you like, and see how fertilisation progresses. This process may seem a rather unnatural test, but then we must bear in mind the rapidity of fructification under the benign influence of the syringe. Now this theory—for it turns out to be theory only—has fallen to the ground, and it is of no use to revive it. The editorial verdict at the end of last year's discussion was against it. I quote the words in *extenso*, as taken from the *Gardener's Chronicle* of April 22, 1876, p. 537:—"We ought to add that, although the water would cause the pollen grain to burst, and liberate its contents, as above stated, yet the emission of the pollen tube, and its passage down the style to the ovule, or rudimentary seed, would be much more certainly insured by the moisture from the stigma itself. We apprehend, from this point of view, that the benefit of the syringing would be mainly mechanical, just as shaking the branches would be." From the above it would appear, as Mr. Miller also observes, that the great thing to be aimed at is to keep the trees in a healthy fruitful condition, rather than to depend on any artificial theories, which are harmless enough in themselves, but which are calculated to throw the inexperienced into interminable difficulties, when so many stumbling blocks are strewn in their path.

Mr. Miller refers to the assistance a hive of bees rendered him in setting the fruit in his early Peach house, and it reminds one of the lines—

"How doth the little busy bee Improve each shining hour;"

but Mr. Miller does not tell us whether the remarkable docility of the bees was attributable to any preparatory training or not. I tried bees at one time, but found they were more busily engaged in a hand-to-hand combat with the top ventilators, than in assisting to fertilise the flowers; they, too, are harmless, and if they do not hurt themselves they will not harm the Peaches.

I now venture to offer an opinion on the early Peach crop, and I hope others will do the same, so that we may learn whether the crops in other counties have been as plentiful as they are here in Lancashire. I never had a more tedious task than that of thinning the fruits in our early house. I believe every flower set, and that too at a time when we were bewailing the want of sun, or even light. How are we to

* Read at the June meeting of the Botanical Society of Edinburgh, by Mr. M'Nab.

account for this? Every one who has an early Peach house has a full crop, whilst the late houses are almost empty. What about the syringe, the bees, the bunch of feathers, and all other appliances enumerated by Mr. Miller? Have they all failed to produce their good effects when the weather-cock points to the east and north-east? *W. Hinds, Otterpool.*

— I have been amused at the late articles in the *Gardener's Chronicle* on the setting of the above fruits, as for a rule the trees with me set their fruit too thickly, without any syringing of the bloom or artificial impregnation of any kind, the only exception being with the first forced trees, for when in bloom in December or January they are assisted in dull weather in setting their fruit by distributing the pollen on the stigma with a feather, or with the syringer and thumb. Most of the Peach and Nectarine trees here are grown under glass, and being very healthy, from the soil sifting, they never fail in producing good crops. On a glass-covered wall nearly 800 feet in length, and planted with Peach and Nectarine trees in the border, the trees have lately been thinned of their fruit for the second time, and what were taken off would have filled a bushel. In the sharp frosts in the first week in May artificial heat was applied to this structure so as to raise the internal temperature 8° higher than the air on the outside, and this was sufficient to save the crop. In unheated orchards it is reported, in several localities, that both the Peach and Nectarine have been injured when in bloom, but that has been a most abnormal season both in the winter and spring, and such another may not occur again for some years. *William Tillyer.*

Foreign Correspondence.

BANGALORE.—The Drought.—Returning to India from furlough I arrived at Madras on Jan. 14, when the chief topic of conversation was the ravages that famine was making in the southern peninsula, the Kanoold, Cuddapah and Bellary districts of which were stated to be the most afflicted in this respect. Sir R. Temple, as special delegate, was making a tour of inspection through Madras, Bombay, and Mysore, with the object of giving the advantage of his experience, and aiding by his counsel the endeavours that were being made to contend with the serious condition of affairs. The state of Bangalore was described to be even worse than that of Madras, and the country between the two places was spoken of as a desert, a howling wilderness, and by other terms, according to the idiosyncrasy of the speaker. I had intended to travel to Bangalore by the night train, to which sleeping-carriages are attached, but the above rumours, which might possibly be exaggerated, determined me to go up by the day train of the following day to test the value of them personally, so far as this could be done by careful observation from a passing train. During the 200 miles not a drop of water was in any of the large tanks they are called locally, but are in reality irrigation reservoirs, or lakes, in the immediate neighbourhood of the Ghats in the middle of the jungle, and near and around which cattle, sheep, and goats and numerous birds had congregated. Notwithstanding the absence of water and cultivation, and although the deciduous trees looked more withy than ever I remember to have seen them, the cattle were browsing on scanty herbage, sheep were busily nibbling something that was not visible from the train, and both appeared fairly active and in better condition than the accounts would have led one to expect. The people of the wayside villages seemed to be in fair case, and to be employed in their ordinary agricultural operations. Where any water or moisture remained near the surface busy hands were to be seen cultivating little patches of some stolen crop, or baling out water to some irrigated land from a recently-made well. Some of the grasses, too, seemed to stand the drought admirably, and where the grass cutters, in their labour of collecting grass for the horses and other animals, had here and there grubbed up portions of it, the patches that were left seemed to be endued with fresh vitality and vigour from this rude stirring of the soil, and, with the aid of the night dew, enabled to make fresh growth. The deciduous trees appeared to have taken a longer rest than usual. Notably among them were some of the Ficus and Acacia tribes, and a casual observer

might from this added mournfulness to the scene take a somewhat desponding view, and say, as some unreasonably did say, that unless heavy and continued rain fell immediately there would be neither trees nor herbage remaining. But a closer observer would not fail to see the glistering beauty of the fresh leaves of the Palms and of other indigenous trees or shrubs. On that hot and dry morning such a sight was most refreshing. The foliage looked as if it had sent its roots down to a lower stratum, where moisture was to be found, and was revelling in the sun and heated air. In the valleys running up into the Ghats, down which little affluents of the Palur River still retained sufficient moisture or water, this was very noticeable; and lower down, in the sandy bed of the parent stream itself, spring channels of running water were excavated by which patches of Sugar-cane and other crops were well cultivated, that greatly heightened the effect. The gravity of the situation seemed to arouse the best energies of the agriculturists, and wherever it was possible the presence of moisture or water was taken full advantage of to cultivate grain or vegetables for themselves or green food for their cattle. Old irrigation wells were cleared out and deepened, new ones were sunk, and other arrangements made to store and distribute water. By their rule-of-thumb calculation they expected rain in April, earlier than usual, and in the meantime they collected and spread manure on their fields more diligently than usual, and made every preparation against the time when their keen study of Nature's varied mood, and the prediction of their astrologers (based on the same observations) assured them that rain would not fall them, even though the Government astronomer at Madras had predicted the failure of rain would be characteristic of this season also. At Bangalore there was a total absence of water in the tanks. The Alsoor Lake, which had not been, it was said, dry for fifty years, was entirely so this year; and at the end of March it was in contemplation to send the mounted portion of the troops out into camp where water was more easily procurable, 10 miles off; but on the morning of April 1 a steady downpour of two hours' duration brought a two or three months' supply into it, and to the others in the neighbourhood on which the 150,000 inhabitants of the station depended.

THE FAMINE.

Previous to that the difficulty in getting water was extreme for the poorer classes, and the pressure of famine was severe in all the central and still less in the western—a state of affairs that required all the ability and prevision of Mr. Saunders, the Chief Commissioner, and the officers of his administration, to grapple with. The country was burned up, only here and there was a blade of green grass to be seen, or a patch of some green cattle food grown in favourable sites and under favourable conditions. Cholera and small-pox were very prevalent, and carried off thousands who were, from want of proper food, unable to contend against them. Sickness among the cattle, too, was very great, and the mortality unusually severe. Still, with all this to contend against, the agriculturists persisted in their endeavours to raise crops in due time, and to do so with diligence in collecting and spreading manure, and in ploughing and cross-ploughing their fields, putting themselves and their families, with sagacious foresight, on lessened rations until better days should come. During this time relief-works under the professional department were put in hand, to give employment to all who were physically able to work, and to prevent them falling into a less capable condition. For such works of an easier kind were provided everywhere that foresight could suggest, under civil officers of districts, to whom a wide discretion coupled with due responsibility was given. Both these classes were paid in money, and labour exacted from them. For those who were physically unable to work, gratuitous relief was provided at camps and kitchens, under careful superintendence, where cooked food was daily meted out to them; but among these even light work in and about the administration of such institutions was, according to capacity, insisted on; while to provide for such cases as those who were suffering, but who would not for various reasons come to these institutions, a house-to-house visitation in town and country, embracing in its organisation every acre in the province, was instituted, with the object of affording special relief in money or grain according to reported circumstances, and in this way a system of relief was organised

for all classes needing it. Even before the providential downpour on April 1 the trees and shrubs put forth their young leaves vigorously, and the bare branches of the deciduous trees, one after the other, day by day "bung their leafy banners out," in a way that, considering the surroundings, was truly astonishing, and as a rebuke to those who persisted in taking an unkindly desponding view of the situation. The fall of rain above referred to put the people visibly in heart, gave a great impetus to all agricultural operations, and by the middle of the month the new foliage was in all its new beauty of freshness and delicately diversified colouring, aided by the brilliancy of some of the flowering ones, chief among which were the Poinciana regia, Cassia Fistula, Lagerstrœmia regia, interspersed with the more delicately tinted "half-mourning" of the Pongamia glabra and the fragrant Melia Azarach, the whole heightened by the magnificence of the Bangianilias spectabilis, the Antigonon leptopus, Thunbergia lanifolia, Petrea volubilis, Poinciana cocinea, and other showy climbers for which Bangalore is celebrated.

POINCIANA REGIA.

The Poinciana regia trees were most striking in their fulness of sportive and diversified colouring. They were in all colours, from deep crimson—which in the unclouded sky looked disagreeably as a great ball of fire—through every shade of orange down to almost the pale broken yellow. They seemed to revel in the drought and to mark their appreciation of it by freely running to sport, as exhibited in the book of specimens sent for the consideration of the President and members of the Scientific Committee of the Royal Horticultural Society. The pollen was most abundant, and scattered about profusely. Standing under a tree gathering specimens a person becomes covered with the deep orange dust, and in this way it would be easy perhaps to accomplish a desideratum, viz., to establish the most gorgeous varieties thoroughly, and promote the sportive marking, at the same time to induce a more dwarf and less straggling habit of growth. To this end, instructions were left with the superintendent to select and establish the finest specimens of the P. regia, and to cross them also with the P. pulcherrima (of two kinds, one orange and one a well-tended yellow), to induce the shrubby growth and long duration of flowering that is conspicuous in the latter; to fertilise with the latter some of the best kinds of the P. regia, and to cross them also with the P. pulcherrima; and to carefully save the seed; the same trials to be made with P. Gillesii, of which there is one plant of shrubby growth in the Lilj Elph. If the experiments are successful in the first year's experience, there does not seem to be much doubt in the matter—it might be possible to produce small shrubs grown as small standards or as Azaleas are exhibited, with a most gorgeous indescendence, that would wonderfully brighten up any floral exhibition in the country. Some selected seeds from the finest flowering trees were collected in April, and the packets carefully marked. They will be sent in a day or two to the secretary. What I wish to bring forward for consideration is—whether such growth could be induced as proposed in the Poinciana regia, and to place on record the result of the effect of the late great drought in Mysore on the deciduous trees and vegetation generally as briefly contained in this memorandum, and the one by the superintendent of the Lilj Elph accompanying it. *J. J. Beck, Esq., Secretary.* (We shall publish Mr. Cameron's letter in our next. Eds.)

PLANT PORTRAITS.

HABRANTHUS HESPERIUS, *Flor-de-Serre*, t. 2277. — A Chilian bulb with narrow strap-shaped glaucous leaves, and stalked umbels of bell-shaped reddish flowers, having recurved perianth segments. It is nearly hardy. HELICHRYSUM GRAVEOLENS, *Gartenflora*, t. 859. — A woolly herbaceous plant with linear sessile leaves and clusters of small yellow flower-heads. Native of Greece. H. PLICATUM is somewhat similar, but with less woolly, narrower leaves, tapering into a long stalk and large flower-heads. This also is a native of the mountains of Greece. HOMALOMENA (CURMERIA) PICTURATA, Regel, *Gartenflora*, t. 891. — A stove foliage plant of the Aroid family, with sheathing, stalked, cordate-ovate leaves, having a broad central silver variegation. It is the *Curmeria picturata* of Linden and André, *Illustration Horticult.*, 1873, p. 45, t. 121. HYBRID NARCISSES, *Floral Magazine*, t. 250. — The plate devoted to four of the most distinct hybrids raised by Mr. Leeds, of Manchester. The forms are

of considerable scientific interest, but they do not surpass the parent forms in beauty.

HYBRID TEA ROSE MRS. OFIE, *Floral Magazine*, t. 251, is a carmine-tinted tea-scented variety, appraised of much merit. It was raised by Messrs. Bell & Son, of Norwich.

HYMENOCALIS ADNATA, Herb., *Flore des Serres*, 2275-76.—A species with rather broad leaves, umbels of white flowers, with narrow perianth segments, and a deep waxy corona. It is a native of South America, and was introduced as long ago as 1758.

HYPTILOTRUM LATIFOLIUM, *Botanical Magazine*, t. 682.—A handsome sedge-like or Cyperus-like plant, with broad lanceolate leaves, and flower-heads in rather dense terminal clusters of a rich brown colour. It is a native of Ceylon and other parts of tropical Asia, and would be desirable plant to introduce into a tropical conservatory.

IRIS TECTORUM, *Flore des Serres*, t. 2282.—A splendid blue iris, figured in our columns in 1876.

INCOLIRION PALLASII, *Flore des Serres*, t. 2270.—A bulbous plant with linear leaves, erect stem, and bell-shaped six-parted flowers, of a metallic blue colour. The plant is a native of Turkestan and the Caucasus, and hardy enough to bear the climate of St. Petersburg. It is likely to be a great addition to our gardens.

LELIA PUMILA DAYANA, *Floral Magazine*, t. 249.—A dwarf winter-blooming species, figured from a specimen exhibited by Sir Trevor Lawrence at South Kensington. Its coloration is deeper than that of the ordinary *L. pumila*.

LILIUM CONCOLOR var. LUTEUM, *Gartenflora*, Dec. 1876, t. 885.—A yellow-flowered form of *L. concolor*, characterised by the presence of densely tufted bulbs, linear lanceolate leaves, segments of the perianth oblong obtuse, emarginate, yellow, purple spotted.

LILIUM NEELGHERRICUM, *Florida Serres*, t. 2266-7, Hort. Veitch.—This is considered by M. Duchartre to be different from *L. neelgherrense*. It is one of the Indian Lilies, with trumpet-shaped white flowers.

LINARIA LINGROISEA, *Gartenflora*, t. 898, is an annual species of Toad-flax, native of Portugal, with linear leaves and flowers about an inch in length, of a purplish colour, with a yellow palate.

LUMA CHEKIN, *Gartenflora*, t. 890, is a Myrtle-like shrub, native of Chili, suitable for cool greenhouse, and would probably prove hardy in the South of England.

ONCIDIUM CHEROPHORUM, *Botanical Magazine*, t. 6278.—A charming, very sweet-scented species, commented on in our columns by Professor Reichenbach, in 1871, p. 168. It is a native of the volcano of Chiriqui, where it grows at an elevation of 8000 feet, flowering in December, with the thermometer a few degrees above freezing-point. It flowered at Kew in 1872 from plants reared by Messrs. Veitch. The pseudobulbs are about an inch in length, compressed, with sharp margins; leaves 3-6 inches long, linear-lanceolate; flower-stalk slender, drooping, bearing an elongated, densely crowded cluster of bright yellow flowers, each about half an inch in diameter.

PECTIS ANGUSTIFOLIA, Torrey, *Botanical Magazine*, t. 6286.—A branching annual Composite, with linear, coarsely ciliate leaves, and heads of yellow flowers like a *Senecio*. In its native country its compact habit, and dense inflorescence renders it very noteworthy. It was introduced from Colorado by Mr. Thompson, of Ipswich.

BRITISH GARDENERS.

JOHN WILLIAM LAURENCE.

MR. LAURENCE, the subject of our present portrait and memoir, has been pretty widely known as a successful Orchid cultivator, having had charge of the fine collection made by Bishop Sumner, at Farnham Castle. He was born in the year 1823, at St. John's, near Ryde, in the Isle of Wight, where his father was gardener to the late Sir Richard and Sir John Simon for forty-four years. His father was a native of Aberdeenshire, and served his apprenticeship with

the late Mr. Thompson, of Chiswick, at Haddo House. He was a thorough practical gardener and an accomplished botanist, so that the gardening education of the younger Laurence began very early. In 1842 he commenced work under his father at St. John's as kitchen-boy, &c., and he remarks thereupon: "The time thus spent is invaluable to the young gardener. Every one intending to follow the profession should so begin, and not, as is too often the case, where he ought to end, in the houses."

From St. John's he went, in 1844, to the Royal Botanic Gardens, Kew—a course followed to advantage by many young men who have attained eminence in the profession. Kew was at that time, under the able management of Sir William J. Hooker, just emerging from his chrysalis state. Here, amongst his fellow workmen, were the late Dr. Seemann; McLvcr, of Ootacamund; Hill, of Brisbane; Meehan, of Philadelphia; and Whitaker, of Crewe. "Here," observes Mr. Laurence, "let me add a tribute of respect to the ex-curator, Mr. J. Smith, to whom the young men of Kew owe many of their present privileges."

His next move was, in 1846, to the Royal Gardens, at Frogmore, where they were then coming into notice from the grand collections of fruit shown at Chiswick

section of Felargoniums also originated at Farnham Castle, in Mr. Howard's."

After the death of the Bishop, in 1874, Mr. Laurence remained for a short time in the service of the present prelate; and in 1875 was engaged to W. F. Webb, Esq., of Newstead Abbey, the home of Lord Byron. Mr. Webb has been constantly improving the plants he came into his hands, and all relies of the great poet are most largely preserved.

"In reading through the autobiographical notices of gardeners in past numbers of the *Gardeners' Chronicle*," writes Mr. Laurence, "I have been struck with the general testimony to the good feeling of employers. I must add to these my own instance, for I have received nothing but kindness and encouragement from both past and present employers; and I am old-fashioned enough to think, in these days of strikes and lock-outs, that this mutual confidence between masters and their dependents, is the only good point about the old feudal system which was worth preserving."

Florists' Flowers.

BEDDING DAHLIAS.—The bedding and bouquet Dahlias do not receive the attention they deserve, though there are evidences that a growing regard for them is springing up among gardeners. They are in the very front rank of the summer-flowering plants, continuing in flower till a nipping frost robs them of their autumnal beauty. In large establishments, where striking floral effects and bold masses of colour are required, the bedding Dahlias can be made of excellent service.

Formerly we had two distinct groups of Dahlias—the bedding and the bouquet or Pompon. The former were generally of dwarf growth and great freedom of bloom. The Dahlia is naturally a free flowerer, but in the case of plants grown for a supply of blooms for exhibition purposes but very few can be seen on a plant at times in consequence of the process of disabding, which in the case of most varieties has to be somewhat severely performed. Dahlias, when used as border flowers, are found to be loaded with flowers. The florist stays his hand, the plants are thus permitted to carry their full harvest of flowers. Good bedding Dahlias, therefore, are invariably remarkably free blooming.

The bouquet or Pompon Dahlia was, it is believed, of Continental origin, though the varieties have been increased by English raisers. The flowers were small, well-formed, striking in appearance, and the plants of tall growth. Their tall growth made them unsuitable for bedding, unless it was to form a centre to large beds. They were recommended for growing where a great number of cut flowers were required in summer and autumn. Originally there was a material difference in the characters of the two, but by reason of crossing or some such process a dwarf growing type of the bouquet Dahlia has been obtained with small, compact and interesting flowers, suitable for cutting from or for furnishing beds. At the Dahlia exhibition at the Crystal Palace, in September last, Mr. C. Turner exhibited a batch of these, among them John Sandy, buff, tipped with orange-red; Dove, blush, tipped with rosy lilac, very pretty indeed; Triumph, bright scarlet with yellow base, very effective; Lilacina, pale lilac on a sulphur ground; Little Arthur, pale yellow, tipped with red; Dr. Schwebes, scarlet; Yesta, white; and Louis Rodani, deep shaded lilac. A selection of good bouquet varieties of various growth will be found in the following:—Coronet, blush white, tinted lilac; Emotion, bright crimson, tipped with white; German Favourite, heavily edged with crimson-lake on a pale ground; Little Beauty, crimson-red, sometimes tipped with white; Little Rodri, lilac, very pretty; Little Fairy, blush pink, spotted and striped with rose; North Light, bright scarlet; Prince of Lilliputians, maroon; and White Aster, white, very free and good. The blooms of the bouquet Dahlia are very useful for mixing in with other flowers in large vases, &c., and very freely produced there is no lack of them, and the seedling appears to feed thickly productive character of the plants.

A selection of good, useful, fine blooming bedding Dahlias will be found in Rising Sun, the best scarlet,

by Mr. T. Ingram. Mr. Ingram was ably seconded by foremen who were themselves first-rate men, three of whom still hold the same position, namely Mr. Murray, forcing; Mr. Powell, hardy fruit; and Mr. Marr, kitchen garden—each willing and anxious to impart his experience to any young man who wished to improve himself. There being so much to learn at Windsor, Laurence was induced to remain more than six years, at the end of which time, in 1852, he was engaged as gardener to that grand old patriarch, and the last of the prince bishops, Dr. Sumner, Bishop of Winchester, at Farnham Castle, Surrey, who was then forming a collection of Orchids, which to the day of his death was to him a source of intense enjoyment. "As he never exhibited in collections," Mr. Laurence observes, "my aim was to produce a constant succession of bloom at all seasons of the year—a result which probably no other class of plant will yield, but which may be attained by a proper selection of Orchids, growing them as luxuriantly as possible in their growing season, and giving judicious rest when the growth is fully matured. The *Gardeners' Chronicle* of past years, and a pile of certificates of the Royal Horticultural Society (all honour to its past and hope as to its future), attest to my success. Amongst others I was fortunate in first flowering the grand *Saccolabium giganteum*. The gold and bronze

very dwarf, compact, and wonderfully free; Fireball, very bright red, and decidedly good; Crimson Gem, very free, and by no means redundant of foliage; Floribunda, pale crimson, bright in colour, and a profuse bloomer; Tom Thumb, maroon, very dwarf, scarcely exceeding 1 foot in height, and very useful as an edging for taller growing forms; Sambo, almost black, and an excellent contrast to a yellow; Gladstair, crimson, free and of good habit; Leah, rich deep yellow, a most excellent bedding variety; White Bedder, an excellent white, of compact growth, very free, and lasting a long time in bloom without showing the yellow centre common to most of the bedding; and Alba Floribunda nana, an excellent white, and also Floribunda nana, an excellent bedding variety, but the flower soon gets thin.

The foregoing selection is that of a gardener who makes a point of growing a number of bedding varieties annually, and makes a most effective display. The following are also good, and were, indeed, the chief varieties in the Slough collection last summer—Aurora, yellow, tipped with lake, very free, fine, and showy; Crimson Gem, rich crimson, very fine; Little Wonder, scarlet, remarkably effective; Royal Purple, free, and very good; Snowdrop, pure white, free, and effective; and Zalina, purple.

One of the prettiest displays of bedding Dahlias to be met with can be seen by visiting Mr. Geo. Rawlings' nursery at Romford. Mr. Rawlings annually plants out a quantity, and as soon as the plants are large enough to require securing, the earth is carefully removed from one side of the stem, so as to lay it as nearly on its side as possible without breaking it, and two small sticks are placed crossways to keep it secure. When the side branches are large enough to be in danger from wind, a sharp pinch is given to each, sufficient to cause it to lie down in the soil without actually breaking the stem; and the prostrate shoots soon grow upwards, and bloom most effectively and freely. The pinching process is gone through two or three times, in order to have a well furnished bed.

It may be added that in order to save the trouble of staking, tying, &c., Mr. Rawlings treats his show and fancy Dahlias in the same way; and he has displays of Dahlias that cannot be met with in nurseries where the flowers are grown for show purposes.

Bedding Dahlias must be well cultivated to be effective. The ground should be enriched with plenty of manure at the proper time for preparing it, and the plants should be grown on in pots as large in size as possible before turning them out. The great thing is to get a good start, and the sooner the plants get established and start into growth the sooner will they cover the ground and show a head of bloom. Late summer and autumn is uncertain, as an early frost will sometimes lay low the promise of a rich harvest of Dahlia blossoms. Therefore is urged the necessity for getting the plants out as early as it is safe to expose them, and into active growth as quickly as circumstances will admit; syringing and sprinkling overhead and watering at the roots in dry weather, so that no serious check comes nigh the plants. R. D.

The Villa Garden.

SWEET-SCENTED FLOWERS.—Fragrant plants, whether the perfume be exhaled up through the fine pores of the scented petals, as in the case of the Rose, or through the leaves, as in the case of *Aloysia citrifolia*, or the lemon-scented *Verbena*, as it is termed, have always been a favourite with the lovers of gardening. Perfume in flowers—that is, the perfume that attracts, not repels—is equal to so many added charms.

MUSK.—The Musk is a fine old sweet-scented plant, and it will require another century of novelties to displace it altogether out of cultivation; it is so sweet and agreeable, so powerful in its delightful perfume, so modest and winsome, and so easily grown, that no wonder it is so popular. In the crowded alleys of London the Musk, if cared for, will do well, and it is always a leading feature at the *City flower show*. Some of the plants are admirably good; and the difficulty lies in having them in flower at the right time—that is, when the *City flower show* is held.

The Musk is a rare *Villa gardener's plant*, if only he will grow it as it deserves to be grown. It is no use to plant it out in a dry hard piece of ground, and leave it there uncared for; or to pot it in a wretchedly poor soil and neglect it. If plants possess

emotions then it is dire cruelty to the Musk to submit it to such ungenerous, undeserved treatment; it merits a better fate, and no plant better repays attention. It grows freely, flowers prodigiously, and breathes forth a fragrance so beautiful as to add a hundredfold to its usefulness.

Some of the best plants of Musk we have ever seen were raised from cuttings taken in the spring from old plants of the previous year, as soon as they began to make growth. The best cuttings crop up close to the sides of the pots, and if the soil be loosened and opened, and the cuttings taken off as low down as possible, and put into a pot of light sandy soil, they will strike and soon make root. No bottom-heat is required to assist them to strike root, but a little solar heat is of great assistance after they have made plants.

If four of the best-rooted cuttings be put into a 24-sized pot a capital specimen of Musk can be had. But rich soil is of the first importance, for the Musk likes a good soil. Plants have their likings—there is no mistake about it, and he that studies these things will be certain to attain to a pretty good understanding with his plants. Another point is to pot the Musk rather low in the pots, say from $\frac{1}{2}$ to 3 inches below the level of the rim. But why? Well, as Jacques puts it in Shakespeare's *As You Like It*, "It is the sun that brings the root," and when the Musk has pretty well filled with roots the soil in which the plants are growing, some more rich soil be added, sufficient to fill up the pot to within an inch or so of the rim, the plants will gain added strength, and grow and flower with renewed vigour. In some country districts it is customary to meet with fine examples of Musk grown by the cottagers, and it is by adopting this practice that such excellent specimens are obtained.

We are growing Harrison's new hybrid Musk, and a fine thing it is, and we commend it to the attention of *Villa gardeners* as a most desirable plant for them to cultivate. The habit of growth and general character of the Musk is retained, but with the addition of large and finely-formed deep yellow flowers handsomely spotted. We are not quite sure from comparison that it is so highly fragrant as the Musk, but even if that be true, it is yet an admirable companion to it.

While the Musk is growing, and also when producing its flowers, it is well to keep the pots standing in a pan or saucer of water. The Musk is a moisture-loving plant, and cannot be too liberally supplied in this respect. The plants, too, should be kept in the shade while the sun is burning hot, as when the summer heat is fierce the blossoms soon get dried up.

There is a strong growing variety of the Musk which is grown in some quarters under the name of the *Giant Musk*, and the designation is an appropriate one, as it has a peculiarly robust growth, with larger and stouter twigs. We have both growing side by side, and can bear testimony to the difference existing between them. Not that the more marked robust habit of growth in the one case places it above the other; that fact that the two varieties exist is simply recorded by way of giving completeness to the foregoing remarks.

There are certain cool shady spots in the garden in which Musk may be appropriately grown. It is sometimes planted in the open border, and at last but not a very brilliant result. But in a cool place, where the sunlight falls occasionally during the day, and where it is generally cool and shady, a pleasant Musk garden might be made by preparing a bed worthy of it, giving it a soil in which it would thrive and bring forth its flowers plentifully. Such a bed should be planted at least twice, as in the case of *Aloysia*. The first year it would require little else than being kept moist and nice. The second and third years a good late dressing would be absolutely necessary, and a little manure water occasionally. Under such circumstances Musk will flourish, and bring forth second leaf and perfumed flower in abundance all through the glorious summer season.

Garden Operations.

PLANT HOUSES.

GREENHOUSE-HARD-WOODED PLANTS.—Those who have had much practice in the cultivation of hard-wooded greenhouse plants will no doubt have noticed the much greater strength and general vigour possessed by plants, when they arrive at the state of full-sized growth, that come from the earliest stages of being grown on quickly, as compared with others that have been subjected to a slower process by more restriction at the root during the first years of their existence. When this class of plants was first taken in hand, with a view to better exemplifying the condition in

which it was possible to produce them by close attention and due regard to their requirements, than the way in which they had been seen when cramped in small pots, with little or no attention to stopping their shoots, and tying the roots, so as to make the plant and air in a manner calculated to grow each individual species to something like its natural form, it was at once seen that the first essential to success was sufficient root-space, and so more growers resorted to extreme measures in this direction by placing the plants at first in pots of 6 inches in diameter, and a dozen or 15 inches in diameter. When they young stock so treated was in a healthy vigorous condition, and particular care for a time afterwards was taken, so as not to over-water until the roots had freely entered the large pots, and were well established, the plants were then so treated in a given time was often marvellous. But there is a very great drawback to this, which is known as the one-shift system: it is that the comparatively small number of roots that young plants, such as those under cultivation, possess grow to the sides of the pot, without, as they ought to, ramifying in all directions through the soil and fully occupying it; and it was frequently found in after years, although the outside of the ball immediately next the surface of the pot was covered by a thick mass of feeding roots, that the roots towards the centre were entirely wanting, nothing but the few strong roots that had originally grown through it. This gave rise to the experiment of potting young stock of this description twice in the season—early in spring and again towards the end of June—so as to give the plants a second chance, and it has been found much the best method of growing them; but it is only when their requirements on from the time of the first potting have been well attended to, that this second shift is necessary, or even advisable, and if the plants will require to have been kept in a good light house, or pit, stood on a bottom of some moisture-holding material, kept slightly damp, with plenty of light, sufficient, but not too much air, and full use made of sun-heat by diligent early shutting up in the afternoons. With young plants like the root and top growth made under such conditions will be double that resulting from less attentive treatment, and such stock will now be in a state to warrant their being moved again into pots from 2 to 4 inches larger, according to the progress made by the plants, and as to the individual plants. Use the soil in a similar condition to that advised for the early shift, immediately shading the root so as to obviate the necessity, for a short time, of giving more air than can be avoided, especially at the side lights. The shading should be effected by either mats, such as those used for the purpose, or by which only shields the plants from the sun's rays, but tends considerably to keep down the heat to a much greater extent than follows when the glass is simply obscured by whitening paste, or anything of a similar nature put across the glass. Another objection to the disadvantage of keeping out the light when no shading is required. Continue to stop and tie down all growths that are taking an undue lead, but on no account resort to the uniform, indiscriminate practice of nipping out the points of the shoots, such as is carried out by the nursery trade, is adopted by some, and which precludes the possibility of the current season's shoots ever attaining their wonted size and strength, and likewise induces an overcrowded condition of growth. Specimen and half-specimen plants that have now done flowering should have the seed-pots immediately picked off; or those that require it have the shoots sufficiently cut back. With many things, such as *Boronia serrulata*, *Polygala*, *Chorizanthe*, *Dracophyllum gracile*, *Fimbricaria*, and many others, each year make shoots of considerable length, unless they are freely syringed every season before growth commences they in a few years get into a long, straggling condition, which necessitates in the after-training of the plants the branches being twisted and wound round the stakes, which practice should be carried out rather than used, as however full a head of bloom a plant so managed may carry, it has an unnatural appearance. After being cut back, growth should be encouraged as far as possible without any delay. Give air in the morning, but close the glass at the moon two or three hours before the sun goes up of the day, at the same time syringing the plants overhead, keeping the floors and under the stages well moistened.

Heaths.—Pick the flowers immediately off all those that have done blooming, and cut such of the fraser growers in as require it. This latter applies particularly to *E. Cavendishiana*, a Heath that admits of exceptional treatment in several ways. Any plants of this variety that have got too tall may be cut back to the extent of reducing their height as much as one half; they should be carried out rather than used, in a moist, growing temperature, such as required for *Azaleas*, elevating them well up to the glass and syringing overhead every afternoon. In this way they will grow very fast, and after being subjected to this treatment for a few weeks can stand out-of-doors for a short time to harden up the growth, to depress it is another plant that needs especial treatment to induce

free flowering; it rarely blooms sufficiently two years together, and in the intervening years best its producing a full crop of flowers it is much the best of its kind, and few in quantity, and the foliage is much out-of-doors from the middle of this month, or if earlier now the worse; it not thus fully exposed for a long season, however much growth it makes, it seldom flows freely. *T. Baines.*

ORCHIDS.—Whilst so many additions are continually being made to these plants from varied and different sources, reference here being had chiefly to imported plants, it will be needful to remind those who are first purchasers, and those who have a number of plants that are still in the imported state, that no time should be lost in thoroughly going over the plants and carefully examining every piece, scrutinising them so as to be fully aware of the state of the leaves, bulbs—whether the leaders for a pushing and growing state, and if any of the back bulbs and dormant eyes are sufficiently plump and solid to hold out the probability that by a partial cutting through they may be induced to push out new growth to be followed by roots, and thus add to the feeding growths, and, of course, considerably increase the value of the plants, as well as the much more quickly causing them to increase in size and develop greater blooming capacities. In treating of imported plants there will always be a few unmentionable that will be left to the judgment and discretion, but the matter of treatment of the individual who has charge of the collection. Speaking, however, generally, mention may be made of four distinct groups; and though, in some respects, the treatment of all are very similar, it will be found that each is the better for a little different method in the earlier stages. Thus we have the *Aerides*, *Dendrobiums*, *Cattleyas* and *Oncotossiums*. In reference to the first division, which will also include the *Vandas*, *Saccolabiums*, *Angreecums*, &c., these are probably the best, and are generally in a very dry condition, the few remaining leaves being very thin and yellow, and having but a small amount of roots that exhibit any signs of life. The best way with such is to fasten a piece of string or wire round each plant separately, and hang them up in the Cattleya or *tendrobium* house, and as the roots rot downwards in this state they must be syringed two or three times a day, and any excess of water will thus quickly run away; in a very short time—three weeks about—the leaves will have assumed a more natural green, as well as a growth more or less of roots, and they will also push out some new rootlets at various places. As soon as this is observed the plants should be taken down and potted in as small pots as can conveniently be used, using the crocks in potting so as to come nearly up to the edge of the pot, covering the whole with moss. Each piece should be kept separate, and then all stood in the East India-house, if it is convenient—all being stood together. Here they will come on very nicely, and be much less likely to go off than if they were potted so soon as received, there being no reason in this case for the roots rotting through the continued moisture of the moss, as well also as the water logging in the hearts of the plants and causing the centre leaves to turn black and damp off. When the plants have remained one season in the small pots, if it is required they may the following spring be made up in larger pots, in which in a season or two they will make nice blooming plants, and come in very useful for exhibition purposes. The quicker varieties of the *Aerides*, such as *odoratum*, *Dyanum*, *viridum*, *savaiianum*, &c., may be treated thus, and are much very satisfactory; but *Fideliopsis*, *Lobbia*, *affine*, *maculosa*, &c., which are slower in growth, should be kept in single pots for two seasons at least. They then stand putting together more certainly, and look better when seen as well as pleasing the eye in larger pots. The *Vandas*, *Saccolabiums*, and *Angreecums* should be kept separate; they can be managed thus better, since sometimes a piece, for which no reason can be assigned, will go off from the middle of the plant, and for a while considerably weaken and destroy the remaining plants. This collection must now be treated to very liberal supplies of water and fresh air; scarcely any fire-heat will be needed, and by the aid of the sun the houses must now, after syringing in the afternoon, run up to the maximum amount here for the whole of the day.

The *Oncotossium*-house, however, by the admission of air at the top and bottom ventilators and by copious waterings on the stages and floors, as well as by syringing the plants carefully overhead, must have the temperature kept close so that there be much less variation in this division than is permitted in the others. *W. Swan, in Filtonfold.*

FRUIT HOUSES.

FIGS.—If the course of treatment which was recommended for these subjects during the time the fruit was ripening has been pursued, its nature would naturally tend to increase acidity in the borders generally, and any measure of remedying this defect should be taken after the fruit is gathered, supply any deficiency which is lacking in this way by giving the roots copious sup-

plies of water, to which may be added some stimulating agent, until the borders are thoroughly saturated. In this division the chief aim now will be the enforcement of means to secure the season's crop of fruit in a satisfactory condition; no fire-heat need be applied yet, excepting under most unpropitious circumstances, but liberal treatment in regard to heat and moisture is essential when the fruit has attained the size of Walnuts. If they be thickly placed on the shelves, and well thinned, sowing the later and those which are placed nearest the base of the shoots; and if these or the spurs on the trees be at all crowded by all means thin them unsparingly, not only for the sake of the crop of fruit, but for the purpose of maintaining the growth, as water which is properly effected this year successful results must not be anticipated for the subsequent one. Continue to ply the syringe freely over the trees twice every day; slightly open the house early in the morning, keep the windows closed till about 10 o'clock, and close up till 8^h 85° in the afternoon and liberally ventilate wherever circumstances permits. In houses where crops of fruit are nearing maturity apply the same treatment as before advised under similar conditions. Keep all the water in the house, and do not stop watering, and tying in late houses well in hand, and take advantage of a rainfall for giving copious supplies of water at the roots. *G. T. Miles, Wycombe Abbey.*

CUCUMBERS.—From this time forward the most important point in this department is daily attention to detailed management. Real summer weather having set in, plants in all stages are growing rapidly without the aid of fire-heat. Those in bearing will be found to be in the best of health, and will prevent interlarding of young growths and overcrowding foliage. Use the syringe freely early in the morning, and at the time of closing in the afternoon, after which the temperature may run up to 90°. Where, however, the temperature is high, and the lights are movable, as few plants are more grateful for a thorough cleansing than the Cucumber. After the house has been closed about three hours admit a little air for the night, and see that the bottom-heat does not fall below 50°. Red-spider, one of the most troublesome insects we have to contend with, will now advance with rapid strides. The best remedy for its removal is a weak solution of Gishurst or sulphur-water, with sufficient soft-soap dissolved to make it slightly adhesive. Syringe the foliage, stems, and walls with it, and if the enemy still holds out repeat the dressing. Plants in pits and frames may require fumigating, particularly if the beds have been used for propagating. Prepare the plants by allowing the foliage and surface of the stems to be dried in the sun, and then, after leaving air on until the time arrives for smoking. Light smokings at intervals of three days are best, and the smoke should be made to pass through a layer of damp moss, to prevent scorching. Always syringe and shade the following morning before the sun touches the foliage. Use glasses for keeping the fruit straight and free from the unsightly blanching hue, which is produced by close contact with the surface of the soil. *W. Coleman.*

ORCHARD-HOUSE.—We have heard this season of several cases of fruit-dropping in unheated orchard-houses, and in every instance the cause has been traced to the severe frosts we had early in May. Frosts that do not kill tender bedding plants will not cause fruit to drop under glass if the past season's wood has been properly ripened and the roots are in a satisfactory state. Trees in pots which have cast their fruit should be marked for examination in the autumn. If plant-drip, lifting, and relaying of the roots in their appointment. Assuming that the fruit has been well thinned, all gross shoots stopped, and mulching attended to, the points to which I would now direct special attention are ventilation, syringing, and watering. If the fruit will not water, and after the Strawberry season is over, the ventilators may be allowed to remain wide open by night and by day until the crop is gathered. Water copiously all trees carrying fruit with some stimulating liquid as often as they require it, and wash the foliage with the garden engine every afternoon about 4 o'clock. Remove Cherries when they begin to change colour, otherwise they will crack; and discontinue wetting Plums when they show signs of ripening, as the Plums will not be so good if they are watered, and the fruit will be well mulched, and allow the roots to find their way through the bottoms of the pots into the border. Gather the fruit in the afternoon, and wash it well. Stop at the fifth leaf. Remove the leaves, and wash the fruit with light and air, and thin the fruit in proportion to the strength of the trees.

KITCHEN GARDEN.

As space becomes available by the removal of summer crops immediate steps should be taken to bring it into a state of preparation for the planting of

spring Broccoli and winter greens of all sorts; the ground should if possible be trenched over a good depth and a good supply of manure incorporated, and a sprinkling of sea-strew over the surface. The previous planting will be of a great advantage to the future crop, as all the Brassica tribe are partial to it. In selecting the various sorts of Broccoli for planting, see that they are perfect, as so many are apt to go back in the preparatory state, also observe to plant all the different sorts together in rotation, and the same with the late sorts; by this means the space occupied by the early sorts may often be cleared off and prepared for other crops long before the latest crops are ready. The Ross's Sprouting Broccoli is a very good variety, and well adapted to Cattle's Eclipse. See that all are correctly labelled and dated for future reference, and give the plants as much space as possible between both plants and rows, and the dwarf and more stocky they can grow the better it will be their chance of passing unharmed through the winter. In large families a good supply of winter Greens is not less in demand than Broccoli, and indeed in very severe winters is often the only reliance, so that a good breadth of the various sorts proportioned to the demand and the planting state, and when the ground becomes vacant, a good part of which will probably be that occupied by the early Potatoes, which as fast as they are cleared off should be manured and dug over and planted, reserving the later sorts, such as King of the Mountains, &c., for planting in Scotch Borcote, to the last planting. Continue to sow a few rows of Cabbages for succession, they are always useful, and it is better to trust in successional plantings than in the sprouts from older beds. The season for the very early Cabbages is now past, and although most things are much later than usual they have made a rapid stride lately; and as weeds grow likewise, the hoe must be kept constantly at work stirring the soil even if there are no weeds apparent, as the operation itself is so beneficial in many ways to the plants, and the stirring and covering and verised soil on the surface will help very much to prevent evaporation of moisture during drought. Celery, however, being naturally a marsh plant, must have copious supplies of water with now and then applications of liquid manure, and in which a few handfuls of salt may be stirred with great advantage.

Tomatos on walls or other structures should now be making good progress, and should be kept well thinned-out and securely fastened from the effects of wind, and the plants should be kept well watered, a good portion of the coarse foliage may be gradually removed. Capsicums and Chillies will also be making good growth, and should be firmly fastened to stout stakes, and the branches thinned out now and then. Irish and Swedish turnips will be getting a little attention in wintering to give them a good start. The thinning-out of some of the main crops will still require attention. The main crop of Carrots, where they came up well, will only now be ready for thinning. A distance of 6 inches is sufficient for them, and vacancies may be filled up by transplanting, and our first main sowing in the middle of April never (owing to bad weather and slugs) put forth an appearance; a timely supplemental sowing has, however, brought a good bed, which will not be much behind. Onions should be thinned off at once, and the surface well stirred between the rows. Thin out Lettuces sown in drills, and sow more both of Cos and Cabbage varieties for succession. The things may be transplanted if required, but they must not want for water, or they will be sure to be killed by the next fortnight. In the first place, a last sowing of Peas may be made in well-manured trenches, and as they advance in growth should be mulched and watered. A row of dwarf French Beans will be ready to sow, and if the plants that will be very useful for preparatory sowing of Endive may be made for early purposes, if it is much in request; but where Lettuces are preferred for autumn use the sowing for main winter crops should be deferred. A good sowing of Cabbages between an early treated head will be found most useful. Saladina will now be much in request, and attention must be paid to successional sowings of Radishes and small salads, whilst advancing crops must be kept well watered to render them crisp and juicy. Continue to sow a few rows of Walcheren Cauliflower; a cool bottom and rather shady place is best for them. Some interesting letters from various correspondents on the use of paraffin for preventing the ravages of mice on Peas are worthy of attention. I have great faith in its efficacy. My practice, however, differs from that of those who soak the Peas in paraffin for so many hours, as I do not give them as many minutes. When the drills are drawn, I put, say, a quart of Peas into a pan, and pour on them a wine-glassful of paraffin, and mix them up and sow at once. The rows have all been fully furnished, and the Peas will be ready to be sown after their whole length, but they never pulled out more than one Pea at a place, and that was apparently unpalatable. The rows have all been fully furnished. *John Cox, Reigate.*

THE
Gardeners' Chronicle.

SATURDAY, JUNE 23, 1877.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, June 25	Sale of Mr. Willis' New Dracænas, at Stevens' Rooms. Faulkner and South Hants Horticultural Society's Show. Sale of Orchids at Stevens' Rooms.
WEDNESDAY, June 27	Burton-on-Trent Floral and Horticultural Society's Show. Brighton and Sussex Horticultural Society's Summer Show (two days). Leeds Horticultural Exhibition (three days).
THURSDAY, June 28	Twelve Summer and Rose Show. Richmond Horticultural Society's Show. Sudbury Horticultural Fair (two days).
FRIDAY, June 29	Alexandra Palace Great Rose Show.

KEW is worth a visit at the present season—inquid we do not know when it is not so—find it when he may the plant lover is sure to find a vast deal to interest him. The Rhododendrons are of course past their best and have not on the whole been equal to what they are in some seasons. The Ghent Azaleas, so gorgeous last year, are not so fine this season. Indeed here, as elsewhere, the disastrous weather we have had up till quite lately after a very wet mild winter, has left its mark, and dying twigs, lacerated leaves and blackened buds show how cruel was the blow inflicted. Day by day, however, the traces of these disasters are rapidly being effaced. Kindly Nature not only heals the wounds, but she is careful to conceal their traces.

It will be remembered that several months ago we drew attention to some newly-formed beds in the pleasure-grounds, near the fine spar of Abies Douglasii, devoted to various shrubby plants, arranged according to their natural orders. Forming the edge to one of these beds is a raised border devoted to Helianthemums. When we saw them a few days since the plants were only in bud, but such was their number that they must now present a gorgeous spectacle, and will induce some of our cultivators once more to pay heed to these very beautiful but now almost entirely neglected plants. In the Temperate-house some of those fine Cordylines to which we alluded in our Special Supplement devoted to the illustration of the gardens, are now in bloom, and most graceful the flower-panicles are. In the herbaceous ground, one of the most noticeable plants is a very beautiful Crucifer—*Ethionema grandiflorum*—whose dense spikes of pink flowers render it especially attractive. This, again, is a plant that ought to be much more widely known. Against the wall of this department are now flowering *Convolvulus Cneorum*, which we have before alluded to, but which is so beautiful that no apology is needed for again calling attention to it. *Habrothamnus corymbosus* is also in flower, as also *Rosa sericea*, and the very pretty pink-flowered *Abelia triflora*. On the rockwork, which requires to be greatly extended, the Edelweiss of the Swiss Alps (*Gnaphalium Leontopodium*), which answers to our Forget-me-Not, is in bloom; as also the singular Californian Pitcher-plant (*Darlingtonia californica*), and the pretty *Jessaminea*—a shrub with leaves like those of a Ribes, and racemes of white flowers. The Orchid-house is not so full of bloom as it is at some seasons of the year, but the improved cultivation to which the plants have been subjected of late, is sufficiently obvious.

In the new T range, too, the stove plants are improved by thinning-out uninteresting plants, which can for most purposes be as well or better studied in the herbarium and by judicious pruning and regulating the form of some of the others, so that the plants have more the look of specimen plants than of the bundles of sticks

which usually characterise the Botanic Gardens, especially those of the Continent. There is really no reason whatever, where sufficient means are available, why the plants in a botanic garden should not be as well cultivated as they are in private establishments. At Kew, which is a show garden, and the national horticultural establishment, as well as a scientific establishment, good cultivation is eminently desirable, and when the immensity of the plants is considered, as well as the great diversity of conditions to be fulfilled, the state of the plants as a whole will be considered as very satisfactory. In the T range the Achimenes and Begonias are finely in flower. A small plant of the new *Torenia Fournieri* may also be seen. It is very like the old and ever beautiful *T. asiatica*, but has larger flowers with a deep orange eye contrasting with its lovely shades of violet and purple. The show house, No. 4, is kept gay all the year round. Just now *Schizanthus pinnatus* and its many varieties, a plant always well done at Kew, is very noticeable; while *Scutellaria Mocciniana* is particularly effective in small pots. *Venus de Medici Fuchsia* forms a fine display from one of the rafters, its free-flowering habit being of special value for this purpose. The grand old *Brygnania arborea* is in full bloom, and has not many rivals even now. Our present object, however, is not to write a catalogue, or even to call attention to the many treasures which Kew contains. We have already done this at some length in our Kew Supplement, and almost every week we have occasion to note some plants of interest that make their appearance in due season. Our more immediate object is to emphasize our oft-expressed opinion that the national botanic garden should afford examples of the best style of cultivation, as well as the richest and most interesting collections of living plants. Never, we believe, has Kew fulfilled those two conditions better than it now does.

If summer weather, a well-dressed crowd, and, last but not least, the presence of Royalty, constitute a success, then the ROYAL HORTICULTURAL SOCIETY may certainly be credited with a success worthy of its palmist days. And was not the show good too? some one may ask, and the reply must be emphatically in the affirmative. The show of Tuesday last was one of the best ever held at South Kensington. The quantity was large, the quality excellent, the arrangement good. Why, therefore, begin this article with an "if"? Do we intend to throw cold water on the Society now that a bright gleam of sunshine has—unwonted vision, twice in one season—shed its life-giving influence on the Society? Assuredly not. Conversant with its history, never absent from its meetings, familiar with its workings at Chiswick and Kensington, it is not likely that we are going to do more than whisper in the Council's ear hearty congratulations, but—"remember." Remember what? Why that all this is the mere effervescence of horticulture. It won't do to cultivate froth, and leave the body neglected and uncared for. Flower shows are all very well, but they are not, as most horticultural societies and the Royal Horticultural Society, which ought to know better, seem to think, the end-all and be-all of horticulture. But we have said all this a good many times already, and, were it not that we feel it necessary, we should be little disposed to play the part of CASSANDRA in the face of so brilliant a success as that of Tuesday last.

Looked at from a horticultural point of view the exhibition was specially remarkable for the groups of plants exhibited, one whole tent constituted a group in itself—we mean the Pelargonium tent. The plants were excellent samples of successful cultivation, and—may we dare say it?—only wanted half the flowers removed, and their place supplied by foliage, to be perfect specimens. But the florists, of course, won't admit that, and from their point of view they were of unusual merit. Some of the specimens were indeed cultural achievements of a high order,

while Mr. TURNER'S show Pelargoniums in "half specimen" plants had a richness of colouring and a perfection of culture which rendered them specially noteworthy.

Turning from the refrugent glare of these specimens to the ice trophy of Mr. WILLS, we felt more than ever thankful to that bold and successful innovator. We are not going to criticise the taste of this erection, for really it was so deliciously cool on that scorching hot day that had it been open to a thousand more objections than it was, we should not have expressed them. A friend of ours—a man of course—suggested that he would have liked, after the fashion of men, to have stood with his back to it, and turned up his coat-tails, as if by his own fireside in winter time. Can Mr. WILLS have a better testimonial than this?

Inside the large tent were some of the choicest groups it has ever been our lot to witness. In Messrs. VEITCH'S group the individual plants, though small, were of extraordinary interest and beauty: there was scarcely a plant which had not a special interest and value—the bank of *Masdevallias* was a truly wonderful study of colour, the *Nepenthes* were *hors ligne*, and the little tray of miniature Orchids as charming as it was novel. All thanks to you, Messrs. VEITCH, for this delightful novelty. Mr. BULL'S group formed a great contrast to that of Messrs. VEITCH. It was less densely packed, and the specimens were larger, and, therefore, as a whole, more effective. The central group of Cycads, with its surroundings of choice new or rare plants was specially noteworthy. Mr. WILLS' group at the end of the tent, of Palms and foliage-plants, with an edging of *Selaginella* and Water Lily, was really a triumph of art. The individual interest and botanical merit of the plants was less than in the two previous cases, but the general impression was noble. Mr. WILLIAMS' group, towered over by a noble plant of *Cycas circinalis*, formed a worthy companion to that of Mr. WILLS at the opposite end of the tent; but for the general details of this, as well as those furnished by Messrs. LEE, ROLLISON, JACKSON, and others, we must refer to our report in another column. Mr. SHUTTLEWORTH furnished a fine group of specimen plants; indeed, the members of the present Council, including Sir TREVOR LAWRENCE, who till lately was a member, are entitled to great thanks for the material aid they have given, as well as the time they have expended on the affairs of the Society. Mr. ELVES' group of miscellaneous bulbous plants, albeit exhibited in a motley and unseemly array of blacking bottles *cum multis aliis*, deserves special commendation as an example of one feature of a horticultural show which is far too much neglected by schedule-makers and exhibitors. The competition for Mr. BULL'S cups deserves also a word of notice in this place, because, as the years go on, the wisdom of Mr. BULL in awarding these prizes is shown. At first the plants were of necessity small and inconspicuous, so that only a specialist and a connoisseur could pronounce on their value, and some of them were sneered at as botanical curiosities—a very stupid error by the way—but now, as the plants advance in age, their merits as ornamental plants become more and more apparent. Special notice must also be given of Mr. TURNER'S cut Roses—twelve boxes—quite wonderful considering the season, and of the rich collection of Irises shown by Mr. PARKER, and by Messrs. BARR & SUGDEN; and of Mr. REEVES' collection of Tuberoses, Lilies, and other plants grown for market. The fruit exhibition was fair, while of vegetables three collections were especially noteworthy considering the extremely unpropitious season.

Mr. BARROW'S work as usual was sound and conscientious; but of the arrangements for the

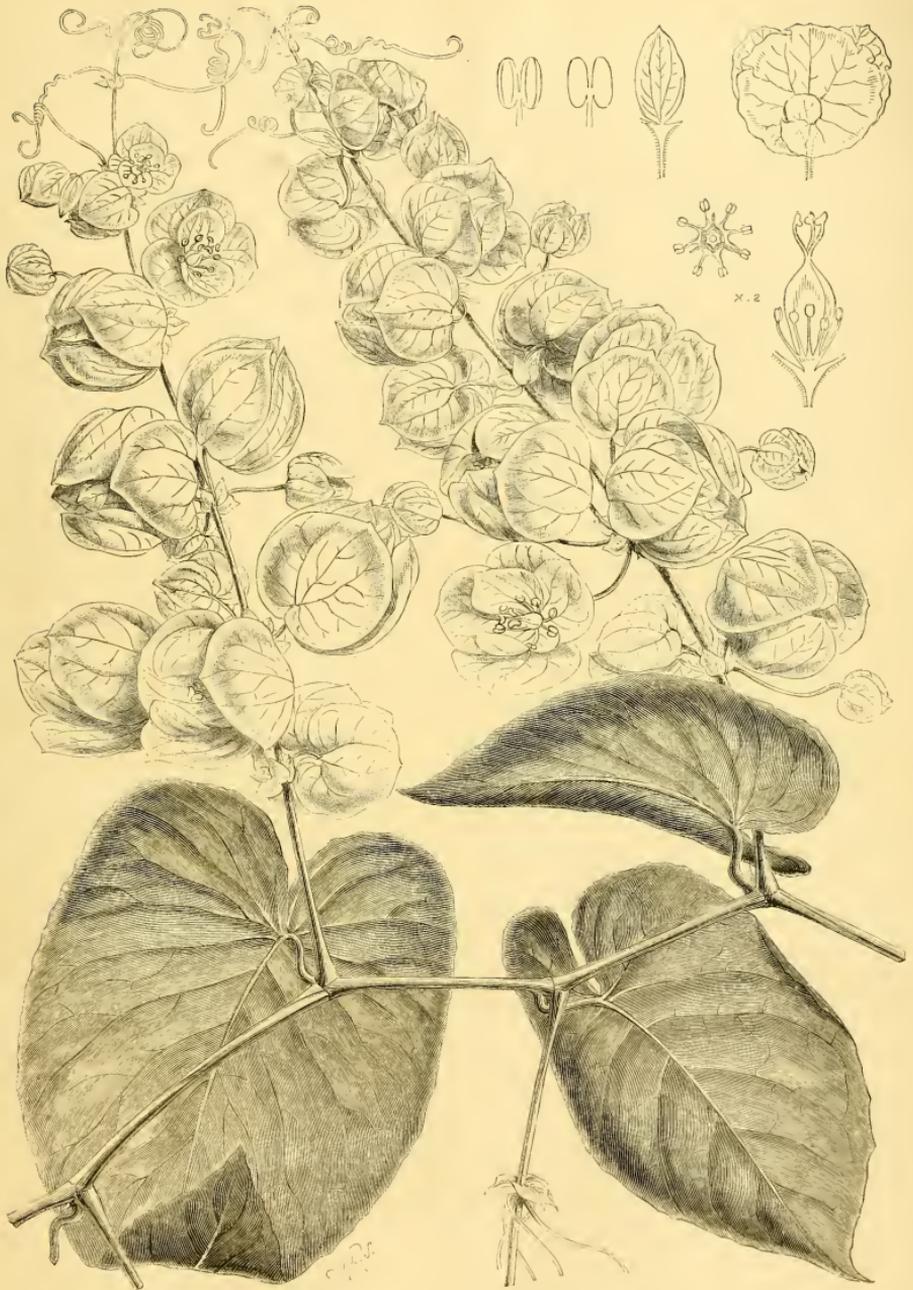

FIG. 126.—MR. BULL'S ANTIGONON INSIGNE (SEE P. 780).

general public the less said the better. There is no chance of improvement in general management till the Society is rich enough to pay handsomely a suitable commander-in-chief.

— THE Grand Conservatory of the ROYAL HORTICULTURAL SOCIETY at South Kensington is about to be devoted to purposes other than horticultural, but with the object of which few horticulturists will fail to have profound sympathy. On the 30th inst. the opening of the exhibition of objects incidental to the CANTON CELEBRATION will be inaugurated by the greater orator of his age, Mr. GLADSTONE, after which that gentleman will preside at a *déjeuner* to take place in the conservatory—a worthy place for such a feast of reason and flow of soul. On the 10th of next month the gardens will be made the scene of the annual *fête* of the NATIONAL TEMPERANCE LEAGUE, an earnest and well-intentioned body, animated with an intense desire to promote the spreading of sobriety and temperance amongst all classes of the community. The *fête* will consist of *concerts* *choregraphiques* in the conservatory and promenade of the gardens in the afternoon, to be followed by a monster tea in the long arcade; and in the evening there will be a huge meeting, combining address and music, in the Albert Hall. Hitherto these *fêtes* have been held at the rival Palaces, but the bar element at these places of entertainment, is fast converting them into merely huge public-houses. Later on a grand bazaar will be held in aid of the funds of a well-known hospital charity, also in the conservatory, when the most distinguished patronage will be dispensed by the fairest and most fashionable of the gentler sex.

— During the past Ascot week thousands of persons must have passed along the most delightful road that leads from the Bagshot turnpike to Wokingham, yet out of that number few perhaps, many that may have been struck with admiration for the grand wooded growth by which each side of the road is bordered, gave special attention to one particular tree out of the many noble SCOTCH FIRS that overhang and dispense a delightful shade. This one Fir tree has attained a great height, and because of the crowded growth is somewhat thickly branched, but its habit is of the most gracefully drooping character, and stands out in marked contrast to all the rest of its kind. The several branches project for a moderate distance from the stem, and then drop down to a length of some 10 or 12 feet. It were to be deplored that this charming variety should be allowed to pay the debt of Nature, as it inevitably will in some way or other presently, without some attempt being made to perpetuate and distribute it.

— A wish has been expressed by a number of friends of Mr. ROBERT FORD, gardener and forester to G. W. M. HENDERSON, Esq., Fordell, Fifeshire, to present him with some suitable token to mark their high esteem and deep respect for him, and to commemorate the rare event of the completion of his fiftieth year's service at Fordell. A strong committee has been appointed, with Mr. ANDREW HUNTER, Newbath, Musselburgh, N.B., as secretary and treasurer, by whom subscriptions will be received. It has also been proposed to present a testimonial in money to Mr. W. GARDNER, on his retirement from the management of the gardens at Weston House, Shipton-on-Stour, where he had been for forty-nine years. Donations will be thankfully received by Mr. K. GREENFIELD, The Priory Gardens, Warwick.

— From notes on the CULTIVATION OF HEMP in various parts of ITALY, continued in recent reports from this country, we learn that while it is extending in some parts it remains without any change in others. Thus its cultivation has increased in the neighbourhood of Florence, especially in the districts of Forlì and Cesena. The maximum yield of the latter district alone has been calculated at 3,000,000 quintals. The quality of the fibre is said to be similar to that of the Bolognese kind, and perhaps only slightly inferior. In the Venetian provinces, except in that of Rovigo, and in the communes bordering on the River Po, Hemp is not extensively cultivated. The Italian districts where this cultivation is chiefly carried on for exportation are situated southward of the Po. Both the grown in the Venetian districts, as well as that on the other side of the Po, may be

divided into three classes—the first or finer sort used in the manufacture of coarse cloth, canvas, and twine; the second, or middle class in respect of fineness, which is chiefly made into cordage; and the third or inferior kind, used for cables. The crops of Hemp this year are said to be very scarce, and the quality not equal to that of former years.

— The present unsettled state of Europe seems to be making itself felt in the PRICE OF BREAD in other parts of the Empire. In England, the price of bread, and the price of Maize has also risen considerably, owing to the scarcity of the last crop, and to an experiment made by the Italian Government, to feed cavalry horses with Maize in equal proportion to Oats, thus contributing to the dearth of Indian corn, to the great indignation of the poor classes, who lived almost exclusively on polenta.

— IN THE CULTIVATION OF THE VINE IN ITALY, particularly in the district of Cesena, three distinct systems are adopted. One is known as *afionis*, and consists in planting the Vines in single lines, and at intervals placing other plants, on Elm trees being generally planted at every six metres. In the second, known as *arignolo*, which prevails chiefly on the hills, a regular vineyard is formed. The third, *arignolo*, is a gradual amplification of the first into the second, when the land between the rows of Vines is unsuited to cereals or forage plants, and this system is also in use in the hill districts. On the borders of the districts of Forlì and Rimini a fourth system, known as *amaglio*, prevails. In this the Vines are trained to the Elm trees, in alternation to which the Vines are planted, the spaces between the rows being occupied by other cultures.

— Miss A. BUCKLEY, favourably known as the author of a short history of Natural Science, has lately published a tenth edition of Mrs. SOMERVILLE'S *Connection of the Physical Sciences* (Murray). It was no small task that was entered upon when the editor undertook to revise a book the last edition of which is already eighteen years old. Nevertheless, we are bound to say that on the whole the work has been well done, and that those who wish to obtain in small compass a brief general account of such subjects as astronomy, light, sound, heat, electricity, &c., will find this book adapted to their wants.

— We have received the following communication from Dr. ENGELMANN in reference to ABIES MENZIESII and A. ENGELMANNI:—

"There seems to be a confusion in regard to them. In Colorado they occupy different altitudes—Menziesii the lower elevations, wet places, bogs, banks of mountain streams up to 8500 feet altitude. Hence, up to the timber line A. Engelmanni is found, often forming large forests, or mixed with A. lasiocarpa (the Abies grandis of the Colorado botanists), Pinus contorta, flexilis, and aristata. A. Menziesii has a grey rough bark, which remains one of an Oak, A. Engelmanni a thin scaly cinnamon-brown bark. The leaves of the former are certainly very stiff, and, at least in Colorado, spinous, pointed, and often flattened; those of Engelmanni are more pliant, more linear, thick and shorter on higher altitudes. Both extend north-west to Oregon and British Columbia, and these forms of Menziesii occur with obtuse leaves. In cultivation the A. Menziesii from the north-western sea-coast undoubtedly behaves very differently from that the seeds of which were obtained in the Rocky Mountains. The same difference, I suppose, exists between other Conifers common to both regions, e.g., A. Douglasii, P. contorta and ponderosa. Now as to the light glaucous, or rather light blue variety of Menziesii, M. ANDRÉ justly extolled, and very appropriately named it after Dr. PARRY, who first introduced it. In several gardens at Cambridge, Mass., and the neighbourhood, fine young specimens can be seen, and some of regular form and stiff outlines, in which even the rigidity of the leaves is detected by the eye without the aid of the touch. Larger ones make a striking impression on the stranger in the lawns and yards about residences at Denver (Colorado); but he looks in vain for the same in the mountains. The fact is, that the old tree is mostly irregular and ugly, and has a grey sledge; only the young branches of the spring, and still more, the young sprouts showing the peculiar whitish blue colour, and many trees do not show scarcely any such tints. To be beautiful and striking it must be young. It is well known that the same colour variety is found in many other Conifers. A striking example is Abies concolor; the young plants mixed from the seeds I brought in 1874 from Glen

Eyre, at the base of Pike's Peak, are white, but that of Mendels, while others show this peculiarity much less. I may as well add the remark that the Abies concolor, heretofore considered a most rare tree of New Mexico, proves to be common from Southern Colorado, through New Mexico, Utah, and Arizona, and throughout the Californian Sierras. I have scarcely a doubt that, though so-called Abies grandis, Abies Lowiana, and Abies lasiocarpa (not the Oregon plant of Hooker, Fl. Bot. Am.) of these mountain ranges, are nothing but forms of this same A. concolor. G. Engelmann."

— M. NAUDIN writes to us as follows with reference to the BAHMÉ COTTON, lately figured in our columns:—

"The notes in the *Gardeners' Chronicle* respecting this pretended hybrid were so interesting to me that I asked M. DELCHEVALERIE for some seeds. I received them, and also some of the true Cotton (*Gossypium villosium*) and of *Hibiscus scouletianus*. In the course of five or six days all these seeds had germinated. It is true that at present only the cotyledons are visible, but up to this time I do not see one that at all resembles the *Hibiscus* sown by the side of it. Let us wait for the end before judging, but I confess that I shall be much surprised if the Kots Bahmé proves to be really a hybrid of the *Hibiscus*. I will return to the subject in a short time."

— The last part of the *Transactions of the Massachusetts Horticultural Society* is a particularly interesting one. Its contents show what our American cousins think are the proper functions of a Horticultural Society. In the present part we have reports of papers read before the Society on Squash (Pumpkin) and Melon Culture, on Fertilisation and Cross-Fertilisation, by Prof. GODDALL; on Injurious and other Fungi, by BYRON HALSTED; on the Improvement of Suburban Roads, by D. D. SLADE; on Entomology, by B. P. MANN, and others. After the reading of the paper discussion takes place, some of which is also reported, and as it records the opinions and observations of those who know what they are talking of, the advantage must be great.

— It is not generally known that in one of the museums at Kew (No. 2) there is a pane of glass with an inscription thereon scratched by the hand of JOHN EVELYN, and signed with his name. The inscriptions are imperfect (for there are two), so that it is difficult to read them, but one of them embodies a precept binding on all naturalists according to their ability—"Omnia explorare meliora retinet."

— A charming novelty is now in bloom in the York Nurseries—a pure white LELIA MAJALLS! Judging by the unusually small size of the bulb which is flowering, and the fact that two blooms are borne upon the stem, this must surely be a very "haughty" albino! It reminds of a white Lily, so pure and delicate is the colour. The labelum is faintly traced with pink veins, and has a very pale yellowish streak in the usual place.

— Is the fact that the lateral buds of some Conifers start into growth earlier than the terminal bud generally known? Of the fact itself, no one who sees the growth of Conifers at this season can doubt. Of course it is not universal, but it is very general. Abies Nordmanniana and Araucaria imbricata show it remarkably well. The lateral buds destined to form the topmost whorl of branches start into growth sooner than the terminal bud, and, for a time, grow faster. Very shortly, however, the terminal bud overtakes the lateral ones. Opposite our window is a vigorous young plant of Abies Nordmanniana, whose growth we have watched year by year with interest; and in the case of which we calculated one year that the new growths, if laid end to end, would have extended about three-quarters of a mile, the plant then being about 2 feet in height. In this plant, as in others, we have noticed that the terminal leader shoot grows most vigorously one season by comparison with the laterals, forming the topmost tier, while in another season precisely the reverse happens. Another circumstance worthy of notice, though of course it must have been seen year by year, though we have not been able to lay our hands on any record of the fact, is that the tufts of leaves of the Pines are developed from above downwards, that is to say the topmost ones on the growing shoot are the earliest to be developed. In some of the Pines, P. Murrayana being an instance,

the female cones which take two years to mature are in the first season erect and apparently terminal to the shoots; we say apparently, because in reality the terminal bud is a small leaf-bud, quite overshadowed by the more rapid growth of the cone. The true relation of things is shown in the following season, when the cones turn downwards out of the way and the terminal bud, left free to develop itself, produces a shoot. These matters are worth attending to, because the shape of the tree depends in great measure upon them, while from a botanical point of view no detail, however minute, is unimportant. One result of DARWIN'S teachings is the stress laid upon the significance of what appear to the careless and unobservant mere trifles.

— THE HOP BINE continues to make rapid progress, says the *Aldridge and Kentish Journal*, and although thin at places it presents a healthy appearance. Fly is to be met with, but not in sufficient quantities to cause serious alarm. The storm of last Monday evening has proved very beneficial, having imparted a healthy and bright aspect to the plant.

— One might almost exclaim PALMS FOR THE MILLION, on reading the announcement of the sale, on July 3, at Mr. HERBERT'S Nursery, New Road, Richmond, Surrey. Mr. HERBERT has an immense stock of young Palms, including many rare ones, such, for instance, as *Cocos Weddelliana*, of which he offers no less than 6000; and of *Areca crinita* 4000. We are glad to see a prospect of these handsome plants becoming reasonably cheap. About 20,000 plants will come under the hammer of Messrs. PROTIERRE & MORRIS next Tuesday week.

— We are requested to state that in consequence of the dinner of the Gardeners' Royal Benevolent Institution and that of the National Rose Society taking place on July 4, the usual monthly dinner of the Horticultural Club, fixed for July 3, will not be held.

— We hear that an International FRUIT SHOW is to be held at the ALEXANDRA PALACE this year on September 13, 14 and 15, when prizes amounting to upwards of £350 will be offered for all kinds of fruit, vegetables, table decorations, and some cut flowers. The schedule is now in course of preparation and will shortly be ready, when it may be obtained on application to JOHN A. MCKENZIE, 1 and 2, Great Winchester Street Buildings, London, E.C.

— MESSRS. JAMES CARTER & Co.'s EXHIBITION of ornamental foliated and flowering ANNUALS, grown in pots from seed, commenced on Wednesday last, in the corridor of the Royal Botanic Society's garden, Regent's Park. The exhibition will extend over fourteen days, during which time the exhibitors state that they will stage about 20,000 pots. We understand that the display is in fine order now, and, from its novel character, will be found well worthy of a visit.

— M. MARC MICHELLI, who has of late been in this country for the purpose of studying the Alliance of our herbaria, has just published in the *Bibliothèque Universelle de Genève* a review of the principal PUBLICATIONS RELATING TO VEGETABLE PHYSIOLOGY published in the various countries of Europe in 1876. We may find more hereafter for some extracts from this useful enumeration, in the meantime we may say that the subject-matter is arranged under the general head of growth of plants, influence of gravity, movement of fluids, spontaneous movements, protoplasmic currents; influence of temperature, electricity and light on plants; respiration and transpiration, nutrition of plants, carnivorous plants, fecundation of flowers, &c.

— Where the most is made of BOUGAINVILLEA GLABRA, either in a large or small state, it may be flowered two or three times a-year. Plants that have finished their first blooming should be well thinned out, removing the greater portion of the small growths not strong enough to flower, which the plant makes in quantity. The strong growths should be bent down round the stick or trellis to which it is trained. In a brisk heat it will quickly throw out numbers

of strong shoots; and if the plant is well elevated close up to the glass without any shading, and the shoots supported in an upright position, these will flower freely in the course of about two months. It is a gross feeder, and should be well supplied with manure-water, as upon the number and strength of its shoots the quantity of flower depends. This Bougainvillea is so extremely useful for cutting that it is deserving of all the attention that can be given it.

— THE PHYSIOLOGY OF THE TULIP is a subject of considerable interest, and it is one that in many of its aspects completely baffles the practical florist. Mr. WILLIAM WHITTAKER, of Salford, one of the leading Tulip cultivators in the North, states a few days ago that he had grown feathered byblemen Katley's Queen for the space of twenty years, and had never succeeded in all that long period in getting a second bulb. As is usual with Tulips, the old bulb decays every year and a new one is formed, but during that period Mr. WHITTAKER has never been rewarded with a second bulb. It appears to be resolutely opposed to anything in the shape of increase.

— There are now about 500 blooms of CYPRIPEDIUM SPECTABILE in a bed 36 feet square in the Messrs. JAMES DICKSON & SON'S Newton Nurseries, Chester, where this beautiful North American Orchid is cultivated most successfully as a perfectly hardy plant. The bed is made up of a mixture of peat and leaf soil, and, with the exception of a slight top-dressing of broken peat in the autumn, the plants have been entirely unprotected.

— Where the beautiful autumn-flowering LUCULIA GRATISSIMA is grown in pots, from its naturally strong habit it requires a good deal of room, and must have sufficient both root and head space, as the flowers produced will be proportionate in quantity to the size, strength, and matured condition the plants arrive at before the decline of summer. The ever-blooming *Stentellaria Mochiniana* is deserving of special attention; the distinct appearance of its flowers, differing in both form and colour from most other things, make it particularly suitable for associating with the general flowering occupants of the stove during either summer or winter. It does not require a very great amount of pot-room, but likes liberal treatment in the quality of the soil: a moderate amount of rotten manure and leaf-mould added to the loam assists it much.

Home Correspondence.

Memorial Trees—Horse Shoes—Witches.—The circumstance quoted on p. 726 of the *Gardeners' Chronicle* of Mr. Edward Peacock having learned that "several horse-hoos were found buried under the roots of Ash trees," may possibly be attributed to the custom which I know once prevailed in Lincolnshire of burying favourite horses and planting them in the graves—the trees being regarded as the memorials of the cherished animals. It perhaps may be well to give an instance or two of the practice as it has come under my immediate observation. In a gentleman's park in the Lindsey division of Lincolnshire, I have a particular recollection of having seen four old carriage horse graves, and buried, and four trees planted on their graves, which trees are now splendid specimens—valued not more for their intrinsic beauty than for preserving the memory and marking the tomb of its friends and favourites. They are sepulchral memorial-trees. The animals have, doubtless, long since mouldered to dust, but their iron shoes possibly remain under the roots of the trees. Subsequently I became gardener to another gentleman in the same district, and a few years ago, when I was asked to have cut had superintended the planting of a tree on the grave of some animal which has been interred—a horse, or occasionally a favourite dog, which may have died natural death, or been "killed out of their punishment." The last tree of this nature that I planted was on the grave of an old "general purposes" horse—a most willing and industrious animal—equally "at home" when drawing a lady's carriage, a load of Turnips, or the mowing-machine. I was instructed to find an appropriate tree for the grave, and I selected the Service Tree, which is flourishing well, and is now an attractive specimen. When planted in contiguity to the Purple Beech the silver leaves of the Service Tree have a fine effect in park scenery. I could point to at least fifty trees, under the roots of which, to my own knowledge, are horse-shoes, and could give evidence of many other trees which have

been similarly planted. I mention this custom not only because it may "throw light" on the circumstance alluded to by Mr. Peacock, but because it is preferable to shoot and bury animals which have been good servants, rather than to run the gamut over to the tender mercies of the higher, or the third-class cabman. By burying the animals, too, the parks become beautified, for were it not for the planting of these memorial trees, some demones would be driving your favourite dog, or some other animal which will one day take the place of the venerable monarchs planted by our forefathers. It may be, however, that this custom does not afford a sufficient explanation for the one shoe found under the Ash tree mentioned by Mr. Peacock. Horse-shoes are regarded as good luck, and grandmothers in Lincolnshire are possessing some occult and potent influence "against witches." Scarcely an old stable-door is to be found which has not one or more horse-shoes nailed on it; I mean the doors of buildings which have existed for generations, and perhaps for centuries. Some newer buildings are more or less decorated with horse-shoes, which are either preserved as mementos of some favourite animal, or are mere imitations of the old custom which originated in the dark ages, when witches were thought to have the witch's power of entering the horses could only be preserved by the affixing of one or more of their shoes on the doors of the stables, and so converting the buildings into fortresses and rendering them invulnerable to all phony enemies.

I have seen a number of old barns and out-buildings of baring a horse-shoe and planting a tree of some kind over it, and I have a distinct recollection of having seen an old dame, an octogenarian, whom no one could convince that she was not bewitched; she knew the "Witches" who were the witch's children, having "crossed" her, that is, of having rendered her powerless by the affixing of a horse shoe, a small branch of "Wicken tree" (Mountain Ash) gathered before sunrise and never suffered to touch the ground, and sundry incantations. The horse-shoe in this case was not planted something on it: it is this I am not quite certain, but I am sure she gathered the "Wicken" branch before sunrise, because I watched the poor old dame, who hobbled more than a mile for it about three o'clock one summer morning. Whether the Ash tree referred to by Mr. Peacock was a memorial tree which had been planted over a horse and its shoes, or whether the shoe had been placed under the roots of a tree to "drive away the witches," will probably never be known. The custom of planting a tree over a horse referred to were once common in that district of Lincolnshire where Kirton-in-Lindsey is situated. *East Anglian.*

Loquats: *Eriobotrya japonica*.—The Loquat flourishes well in the department of the Eastern Pyrenees. I have a large tree grafted on a Quince, which has been loaded with fruit this year. The fruits ripened in the second fortnight of May. It has frequently occurred to me that this fruit has been very much neglected. As a consequence it would be well to try to improve it, as all other fruit trees have been improved. On our Loquat trees the fruits are only as large as a moderate-sized Plum or a small Apricot, and the seeds are enormous, forming at least half the fruit, which is contrary to all the rules of fruit culture. Varieties are wanted without this defect, and having a less acid pulp. Such varieties must exist somewhere, in China, Japan, the Antilles, or elsewhere, and it would be very interesting if it could be proved. If in Covent Garden Market any one were at all in the assistance of a man that should be well to get a fleshy, sweet, and with less seeds, it would be gratifying to us southern experimenters to receive seeds of them, and for my own part I should feel very much obliged to any reader of the *Gardeners' Chronicle* who would send me some. *C. Naudin.*

Euonymus radicans variegata.—I do not remember having seen or heard of this plant being used to cover walls. Its only fault is that it does not root to the wall, but it has a close-growing habit, and with the assistance of a nail mat should be well to grow over, and it deserves to be classed amongst the choicest of wall plants. I planted one against a wall here in April, 1875, and it has covered a space of 6 feet by 3 feet, and grows as close as any of our Ivies. I also use it as a winter bedding plant with good or equal effect in a small state, as with an eyeing to Rose beds, clipping it in the same as Box edgings. *Ed. Woodman, Delancey House, Northwich.* [This and other species of a similar character do exceedingly well against a wall, and in panels on a terrace wall. *Eos.*]

Injurious Beetles.—During the recent bright and hot weather the Asparagus beetle (*Citocercus asparagi*) and the green Rose chafer (*Cetonia aurata*) have appeared in sufficient numbers to suggest they need looking to. Both these beetles are conspicuous, and in a small extent of ground, especially against the red and black and white-spotted Asparagus beetle might soon be cleared from the expand-

ing shoots before the egg-deposit now commencing has laid the foundation of mischief through the summer. The large bright green *Cicada* is still more conspicuous, and though it escapes attack but too often from its great beauty as it glances about like a living gem, the larvae from the eggs that are now being deposited will run many a Strawberry-bed by gnawing chambers in the thick part of the roots, and their destruction is exceedingly desirable. In either case, nothing more is requisite than just pulling them by the roots, crushing them with fingers or foot as they occur. O.

Helix pomatia.—This beautiful snail is common in the cool, damp woods in the north and centre of France, but is I believe wholly unknown in the Mediterranean districts where other smaller species abound. At Collioure, where the gardeners are very fond of the snail, the commonest species are *Helix* *aspersa*, *H. nemoralis*, *H. vermiculata*, *H. conspurcata*, *H. lapidica*, and several others, amongst which must be named the large *Bolimus decolatus*, which is carnivorous and devours the other snails. It is not less than a year and a half that *Helix pomatia* here. I brought some from Paris and put them in the garden, but they all disappeared without leaving a trace, having probably been destroyed by the heat and dryness of the summer, or devoured by the *Bolimus*. The snail which their acclimatization would be possible in the mountainous districts of the department at the height of 1200—1500m. I am of opinion that snails have been too much neglected by lovers of acclimatization, and that it would be interesting (or at least some scientific) to see how far they would go if an attempt were made to introduce into the South of France and Europe some of those large and beautiful *Helices* of tropical countries whose shells one sees in the cabinets of conchologists. This would be a pleasant experiment to make. *C. Naudin*.

Helleborus niger Seeding.—In the correspondence last year about the seeding of *Helleborus niger*, I think several persons said that they had seen such a thing. I now send you a ripe pod. The plant has seeded pretty freely here this year, but I find to-day that many have ripened off and shed upon the ground. It is a waste of time to sow a new lot, and frequent occurrence here in June. *T. Smith, Nevve*.

The Public Park at Gateshead.—In the *Gardener's Chronicle* of this date, I find a paragraph on the new public park at Gateshead, copied from the *Builder*. It is there stated that "on either side of the promenade the ground has been laid out under the direction of the Health Officer, by a professional gardener. Allow me to inform you that everything that has been done at this park has been done from my plans or directions, and that no such gentleman as is mentioned is known there. Mr. Bower, C.E., the Borough Engineer, has been good enough to take charge of the execution of my plans, and Mr. Lindsey, formerly gardener to Mr. Wallis, has continued the superintendence of the alterations and additions to the park. *Edw'd. Kemp, The Park, Birkenhead, 7 June 1872*.

Abies Engelmanni.—My attention was called this morning by our Mr. Synge to your notice in the *Chronicle*, which appears in your number of the 16th inst. Allow me to come to the rescue of one of our favourite trees, *Abies Engelmanni*, from your unqualified condemnation.—In comparison with *A. Menziesii* and *A. balsamifera*.—We found that the first of the latter grows in a strikingly fatal defect in our English climate—was *Abies Engelmanni*, which commenced to grow so early that all its young growth was completely killed by the May frosts; and this happens so constantly in the climate of Knap Hill that this year it was nearly all killed. It is a handsome or useful tree, never growing beyond the state of a miserable scrub." This sweeping condemnation will no doubt be accepted by every reader of your article who is not practically acquainted with the tree. Fortunately, after reading it, I had just time to order a plant of the latter. It is a splendid specimen of a most healthy plants, which have never been injured by May frosts since we raised them from seed. This plant my son has taken to London with him, and will be shown at Kensington to-morrow; and, I doubt not, will only reflect its character. It is only one out of many equally healthy. At the Royal Horticultural show at Birmingham in 1872 we obtained the Society's First-class Certificate for the same beautiful glaucous variety, and the green type is equally healthy. The soil at Knap Hill, however, is a yellow loam, where both soil and climate are most unfavourable to *Abies Engelmanni* stands better than any other Conifer—better than *Pinus austriaca*. Men of experience know that in light soils, with sheltered surroundings, where plants are early excited and are at the same time near water at the root, that late spring frosts are much

more destructive than in localities differently circumstanced; and I think you will agree with me that a tree which will stand unscathed for ten years in the midland counties in open and exposed situations without any frost, and in all great quantities, is not so common at last as a tree suited to the climate of England, and this *Abies Engelmanni* has done. Grand specimens of the well-known Silver Fir we find all over Great Britain, and yet in certain localities it suffers severely from the same state from which you are suffering, withstanding it continues to be grown extensively. *William Barron, Elvaston Nurseries, Boroovash*. [We merely stated the facts of the case. We have received, too late for publication in the present issue, a second letter from Mr. André on this subject enclosing one from Mr. Koczl. Eds.]

The Cucumber and Melon Disease, and Salus and Sulphurous Acid.—When I last wrote to the *Gardener's Chronicle* I was almost in despair about the ravages of this disease. I had little hope of the remedies proposed, and was also sceptical about Mr. Smith's worm theory, and the likelihood of any benefit from his prescription of Salus at the roots; still, as the Cucumbers were as bad as they well could be, and promised no eatable fruit as they were, I thought, here, at least, is a favourable opportunity for trying, and as you are very kind to say that they had Salus broth instead of pure water or sewage. After a few trials there was a decided improvement, and now the plants are almost cured by the application of Salus to the roots alone. As the results have been most surprising to myself, I send vouchers for the same statement for your perusal by the train of the foliage and fruit of those identical plants that were more than half dead with disease about five or six weeks since. There was a speck or two on one or two of the fruit, which may or may not be the result of the same cause as the decay of the leaves and the foliage alike may, I think, be pronounced in good health; and yet these are the identical plants that the diseased leaves and fruit were sent off to Mr. Smith, and became so weak afterwards that, but for the opportunity they afforded for experiment, they would have been thrown away, as numbers of young plants were that did not suffer nearly so much from the disease. The cure may be said to have been brought about by Salus alone, for the leaves and stems were so badly affected that it was impossible to take them to the garden, and, as so kindly recommended by some courteous correspondent. It was applied to the fruit in a few instances and seemed to make them worse—penetrating and appearing to bake the substance of the fruit. The Salus, therefore, at the roots had cured the Cucumbers, but the same treatment applied at the wrong end by dressing them with it which I, has been verified by the results. But if prevention is better than cure—and we all know how infinitely better it is in these diseases—the Salus may probably claim credit for curing your Cucumbers, and for curing the Melons from any symptom of disease at the present time. By the courtesy of my kind friends I have been supplied from various quarters. But to make security doubly sure, all our young plants in pits or houses have been treated with Salus at the roots, and all are clear and remarkably healthy. Nor does this exhaust the merits of the Salus. The Cucumber disease of last year speedily infected the Melons—this, in fact, was its worst feature. The failure of the out-of-door fruit crop induced us to press every available yard of glass to the service of the Cucumbers, and the whole of our plants, old and young, soon got infested with the disease. It was not, however, so virulent on the Melon as the Cucumber, neither were the plants so large. This enabled us to apply to the Cucumbers the remedy of Sulphurous Acid and sulphurous acid to the infested leaves. The acid was probably stronger than that used by "R." In many cases it ate the piece clean out of the leaves, as if they had been seared out with a hot iron; it seemed, however, to destroy the fungus, and prevent its spreading.—As to the use of Sulphurous Acid, sulphurous acid and Salus is that these Melons are now in robust health, without speck or spot, and are swelling off and ripening fine crops. All the young or successive crops are also clean. I feel it a public duty to state that the remedy of Sulphurous Acid may be able to record this fact, and heartily congratulate Mr. Smith on the success of his Salus for eradicating the Cucumber and Melon disease, or at least holding it in check for the present. I shall also hold a reserve of Sulphurous Acid, and keep a watchful eye for the first spot of disease, should any return. I can also confirm Mr. Smith's statement that the Salus is an excellent stimulant to the roots of plants. One or two sets of our Melons had got into a weak state through the crippling effects of the disease, and I was much obliged to Mr. Smith for sending them to robust health and vigour. The effects here recorded are as gratifying as they were unexpected; and should the Salus prove as potent a remedy for the Potato disease as it has proved for the Cucumber and Melon disease has, at present, there is no honour

too high for Mr. Smith to receive from the hands of a grateful nation. *D. T. Fish*. [The specimens forwarded by Mr. Fish fully bear out the statements made in this letter. With the exception of a few small spots on the fruit of the *Cucumbers* before the specimens appear perfectly healthy. We shall revert to this important subject shortly, and in the meantime request information from those who may have had experience with the Salus. Eds.]

Aloes roseo-cincta.—*A. Hanburyana*, Nain. (in *New Hort.*)—The bloom of this beautiful *Aloes* in the open air, has been splendid this year. Amongst the hundreds of flowers one only developed fruit, from which I intended to raise the plant from seed, as it does not, like most other *Aloes*, produce lateral shoots. Unfortunately a detestable *Helix aspersa* discovered this solitary fruit, and made one mouthful of it. *Sic transit omnia. C. Naudin*.

Phaius Marshallii.—In your report of the Royal Botanical and Horticultural Show at Manchester this plant is described as having a "crimson pencilled yellow lip." Mr. Phaius Marshall, of Mr. Swan's, says in his note thereon at p. 719 "yellow and crimson lip." Thus it appears that the "crimson" is quite a feature in the flower, as exhibited at Manchester. Allow me to say this is quite a new feature in *P. Marshallii*, for the plant that was shown at the Floral Committee on June 23, 1871, and again June 10, 1872, had not the slightest trace of crimson in the flowers. They were large, pure white, with a lemon-tinted lip, spike rather loose, allowing each flower ample room for expansion, thus differing entirely from the *Phaius Marshallii* of Mr. Phaius Marshall. We have plants of the original stock here, and although I have seen the flowers from the original stock (not plant, for there were several plants), every season since 1871, I have never yet seen a trace of crimson in any of them. As I have not seen the Manchester plant, I am unable to form an opinion upon the comparative merits of the two varieties, but it is plainly evident that they are quite distinct in colour. *W. Wilson, Gr. to Mrs. Adams, Chase Park, Enfield*. [The markings in question were faint pencillings on the yellow disk of the lip. Eds.]

The Fruit Crop in Guernsey.—As far as can be seen at present, the season for fruit does not offer much encouragement. In sheltered spots the bloom has escaped the destructive effects of the cold winds and night frosts, but elsewhere much havoc has certainly been done. It is, indeed, to be regretted that settlers are seen to their advantage—Pears like our valuable Chaumont hardly ever fail to set well. This quality is, however, possessed by other fruit-trees of inferior market value, so that, on the whole, the *Peach*, *Plum*, *Cherry*, and *Peach* crop that will be below the general average. Apples have also suffered in places, as we hear. One great preservative against hurt from wind and frost is to have our trees as vigorous as possible, and to obtain this there is nothing that equals regular and good draining. The *Peach* crop, indeed, with the exception of *Peaches* on the open wall, which, not being protected at all, have immensely suffered from blight. A few such trees, and *Peach* trees in the open would be wrecks, &c., if not protected, and well, too. What have we done to the wind that it has assumed the "eastward position" so long? *T. C. Brabant*.

The Endowment of Research.—Whether in distributing considerable sums of money to scientific men, to aid them in promoting in their several ways scientific inquiry, the Government have acted with discretion, or otherwise, it is not worth while to discuss. The fact remains that about £4000 has been thus distributed amongst thirty-four gentlemen, whose researches have been directed to chemistry, geology, electricity, and other natural sciences. Your contemporary, *Nature*, announces, "that this inaugurates a new era in scientific activity;" but, however this may be, it cannot be doubted that, without such assistance, scientific men have marvelously and unselfishly active in the promotion of research in time past, and will prove to be as persevering and successful in the future. The chief difficulty that will lie in the path of the Government will be the selection of fitting subjects for the dispersion of its bounty, and this can only be satisfactorily surmounted by making it conditional that all such research should be of a strictly horticultural character, and usefulness. In looking over the list of recipients, I find that a very small portion of the grant goes to favour objects of a strictly horticultural character, and it was with a feeling of disappointment that I looked in vain for the names of our best specialists. The chief difficulty that will lie in the path of the Government will be the selection of fitting subjects for the dispersion of its bounty, and this can only be satisfactorily surmounted by making it conditional that all such research should be of a strictly horticultural character, and usefulness. In looking over the list of recipients, I find that a very small portion of the grant

national importance, and, when specially destructive in its operation, becomes a national calamity. Next to Wheat the Potato presents the most important article of diet of general consumption, and its cultivation and distribution has developed into an extensive branch of national industry. Here we have at once a subject that should have attracted the attention of the Government, for the discovery of a means by which this terrible disease can be subjected to curative efforts would indeed prove a truly national blessing. No man in the promotion of scientific research stumbles over the philosopher's stone at the first onset, and Mr. Smith does not claim to have accomplished all that his heart is set upon; but in his complete analysis of the life history of the *Peronospora* he has cleared the way for action—as no curative efforts were fairly possible as long as the enemy to be contended with remained partially involved in mystery. That Mr. Smith's patient investigations have not received some tangible aid and recognition from the Government may not be due to any want of appreciation on its part; probably it is so far ignorant of what Mr.

promotion of truth, without reference to consequence, are what the highest class of scientific men do, or should work for. Practical results are sure to follow, and it is a fact beyond dispute, that all, or an overwhelming majority of the great discoveries that have been so beneficial to mankind from a practical point of view have originated in researches made for purely scientific purposes, and while those made from the practical point of view have been relatively unimportant and always limited in their scope, not fertile in the elements of progress. The factions of the Royal Agricultural and Royal Horticultural Societies are different. They have to deal with applied science. Turning now to the particular instance of Mr. Smith, the Royal Horticultural Society has done all it could do; the Royal Agricultural Society, which, from circumstances we need not now recall, had a special duty to perform in this matter, has utterly ignored it, and suffers in reputation accordingly. Mr. Smith's work was done so unselfishly and patiently, and was ultimately carried to so successful an issue, that we quite agree, and have repeatedly urged, that some

specimens of Dr. Pappé's *L. Dalgaïrnsiæ* accessible in this country, while Mr. Ball's plant, which is undoubtedly closely allied to *L. Boryana* (magellanicæ) and possibly a variety of it, has the less leathery fronds, glabrous on the surface, and with the upper pinnae confluent, which are set down by Dr. Pappé as the peculiarity of the plant, which he named *L. Dalgaïrnsiæ*. Whatever its name may be, it is a very fine greenhouse Fern of arborescent character, with something the aspect of another arborescent form of the same species known to cultivators as *L. zamoides*. It has a blackish trunk, which is shaggy at the apex, with long subulate dark brown scales. The fronds are but subarborescent in texture, pinnate in the lower part, and pinnatifid above; the pinnae lanceolate, acute, the lower ones small, tapered to the base, but scarcely stalked, the upper ones adnate, and the uppermost decurrently confluent. Below the small basal pinnae each edge of the stipes is set with a row of abortive ones reduced to wart-like excrescences, or ciliolities. The colour of the sterile fronds is a dark green on the upper surface, and a paler green beneath. No

FIG. 127.—*LOMARIA DALGAÏRNSIÆ*.

Smith has done, and is still doing, and, if the case were properly represented, would perchance yet bestow a fitting reward. It may be that the gentlemen whose names appear on the list as recipients of the Government grants may have had no lack of friends at Court, and thus their good fortune. The Scientific Committee of the Royal Horticultural Society, with whose work so far, as a body, horticulturists have not yet been greatly impressed, might find this a fitting subject for their consideration, especially as Mr. Smith is a valuable member. Probably representations from that body would have their due weight with the Government, and horticulturists would then see with satisfaction a national acknowledgment of Mr. Smith's services. *A. D.* (Our correspondent is confusing affairs somewhat. The Government grant was administered by the Royal Society, and a committee of that body selected, with, on the whole, excellent judgment, from among the very numerous applications made to it those that seemed the most appropriate. We entirely demur that the Royal Society should make immediate practical advantage the aim to be sought. To our thinking, that is just what the Royal Society should not do. The advancement of pure science, and the

recognition should be made to him. That Mr. Smith's name does not appear in the list referred to by our correspondent probably arises from the fact that Mr. Smith made no application to the Royal Society, and did not require to do so, having completed his investigations into the life history of the Potato fungus before such a thing as a Government grant in aid of scientific research was made. At the same time there can be no question that this would have been a very proper object for aid from the fund in question. *Eds.]*

Hardiness of *Ceanothus*.—We seldom find *Ceanothus* away from a wall, but it appears to be perfectly hardy when once established. My *C. divaricata* has been a splendid bush for the past month, with all the effect of a blue *Rhododendron*. I presume that *C. Veitchii* is merely a variety of the same species. *H. K.*

***Lomaria Dalgaïrnsiæ*.**—We adopt this name for a plant now being distributed by Mr. Bull, and of which a figure from his catalogue (fig. 127) is here reproduced, though with some hesitation, because so far as we are aware, there are no authentic

fertile fronds have yet been produced. The plants to which the above description applies have been recently imported from South Africa, and are, therefore, to be classed as greenhouse Ferns. As such they are a valuable acquisition, since they prove to be of free-growing habit, not indicating the tendency of other allied forms to dwindle away; but on the contrary, pushing their fronds with remarkable vigour in Mr. Ball's cool conservatory. *T. M.*

Crop of *Peziza*.—It may interest some of your readers to learn that a large crop of *Peziza* has made its appearance on the walls, ceilings, and floor of a house in Edinburgh, the roof of which was burnt off some time ago. The *Peziza* has appeared in immense numbers, and consists of two species, the least common one being *Peziza tectoria*, Cooke; the other, *Peziza domiciliana*, Cooke, has not hitherto been described, although I had a single specimen sent to me some years ago found growing in a garden at Hackney. This is really a beautiful addition to the *Cochleata* group, in size from 1 to 3 inches, and of all shades of colour between pure white and amethystine violet, here and there with a rosette specimen. In many cases the cups are quite regular, but in the

Markets.

COVENT GARDEN, June 21.

Business has been brisk during the past week, with a good demand for all classes of goods. Hothouse Strawberries, owing to the backward season, are making as good prices as at any time. James Webber, Wholesale Apple Market.

FRUIT.

Table listing various fruits and their prices, including Apples, Cherries, Grapes, Lemons, Melons, Oranges, Peaches, Pears, Pineapples, Strawberries, and Figs.

VEGETABLES.

Table listing various vegetables and their prices, including Artichokes, Asparagus, Beans, Carrots, Celery, Chilis, Cypresses, Endives, Garlic, Gooseberries, Herbs, and Potatoes.

PLANTS IN POTS.

Table listing various plants in pots and their prices, including Balsams, Begonias, Bouvardias, Calceolarias, Cactuses, Coleus, Coriandrum, Fuchsia, Heliotrope, Hydrangea, Impatiens, Magnolia, Myosotis, Palms, Pelargonium, Rhododendron, Strepitoides, and Valeriana.

CORN.

At Mark Lane on Monday the supply of English Wheat was small, but there were liberal importations of foreign and holders could not get it at a reduction of from 2s. to 3s. per qr. as compared with the rates of that day work. Barley was cheaper to sell, especially grinding qualities; while as regards Oats, a fall of from 6d. to 1s. per bush was submitted to. Malt was much the same in price; Malze was weaker, although no decided fall was reported; and a heavy market prevailed for Beans, Peas, and Lentils. On Wednesday was extremely dull. Very few transactions occurred in Wheat, and though no decided fall was reported, the prices of Monday were not supported. Other kinds of produce were cheaper when pressed for sale, but as a rule holders were not very anxious sellers. Average prices of barley for the week ending June 16: Wheat, 44s. 1d.; Corn, 34s. 7d.; Oats, 26s. 1d. For correspondence period last year: Wheat, 47s. 11d.; Barley, 34s.; Oats, 28s. 3d.

POTATOS.

The Borough and Spitalfields markets reports for June 18 state that there was not much trade, and the following were the prices: Kent Regents, 20s. to 22s. per ton; Essex do., 20s. to 21s. 6d.; rocks, 100s. to 120s.; Hales, 150s. to 175s.; Victoria, 150s. to 170s. Trade on Thursday was quiet, at previous rates. The Potatoes reported in London last week from the Continent comprised 241 packages 1657 bags and 150 bushels from Malta, 2526 bags Hamburg, 2354 Antwerp, 7040 Stettin, 111 packages Havana, 1785 packages 400 boxes Lisbon, 874 sacks London, 1000 packages 606 bags Ghent, 300 Harlingen, and 256 packages Taganog.

PEAT.—For Sale a quantity of good Brown fibrous and Black. For price, &c., apply to GEORGE HILLS, Telfer's Estate, Frimley, Farnborough, Hants.

FIBROUS PEAT FOR ORCHIDS, &c. BROWN FIBROUS PEAT, best quality for Orchids, Stone Plants, &c., 20s. 6d. per truck. BLACK FIBROUS PEAT, for Rhododendrons, Azaleas, Heaths, American Plant Beds, 17s. per ton. Dressed on mill at Blackwater, S. E. L., or Farnborough, S. W. R., by the truck-load, Sample sack, 5d. 6d. each. Fresh SPHAGNUM, 10s. 6d. per sack. WALKER AND CO., Farnborough Station, Hants.

OFFICE for ADVERTISEMENTS, 20, WELLINGTON STREET, STRAND, LONDON, W.C.

In consequence of the increasing demand for Conservatories, in which pure art is combined with moderate cost, T. H. P. DENNIS & Co. have been led to introduce designs of a character hitherto unknown. One of these designs, showing a house 22 feet 6 inches x 13 feet 6 inches, is annexed, and the result, as regards the extremely low price (which includes fixing, glazing, painting, carriage, &c.), has been attained only by special machinery and a system of interchangeable parts.

T. H. P. DENNIS & Co. are also prepared to provide and fix Hot-water Heating Apparatus and Horticultural Buildings of any dimension or description.

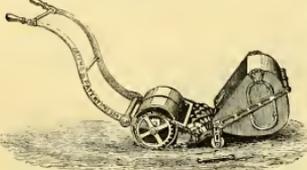

Full-sized specimens of Greenhouses, &c., and Hot-water Apparatus in works, can be inspected at Mansion House Buildings, London, E.C.

Gentlemen waited upon at their residences by experienced designers.

Estimates and Plans free.

GREEN'S PATENT "SILENS MESSOR," Or Noiseless Lawn-mowing, Rolling, and Collecting Machines for 1877.

The Winner of every Prize in all cases of competition.

The superiority of these Machines over those of all other makers is universally acknowledged. They will cut either long or short Grass, Beets, &c., wet or dry.

These advantages no other Lawn Mowers possess. They are the simplest in construction, the easiest to work, the least liable to get out of order, make little noise when in use, and are the most durable Lawn Mowers extant.

The largest stock of Mowers kept in London is to be found at our Establishment, 54 and 55, Blackfriars Road, where purchasers can select from apparatus of 500 machines of hand, pony, and horse power, and have their orders executed the same day they are received.

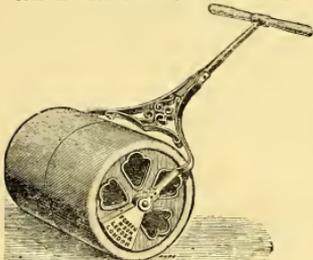

Every Lawn Mower sent out is guaranteed to give entire satisfaction, otherwise it may be returned at once free of cost to the Purchaser.

N.B.—Those who have Lawn Mowers to repair will do well to send them either to our Leeds or London Establishment, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

Describe Illustrated Price List free on application.

FULHAM NURSERIES, LONDON, S.W.

NEW ENGLISH-RAISED SEEDLING ROSES.

MESSRS. PAUL & SON,

THE OLD NURSERIES, CHESHUNT, N.

(THESE NURSERIES ESTABLISHED IN 1806).

Have great pleasure in announcing as a continuation of the series of English Roses raised or sent out by them since 1860, inclusive of LORD CLYDE (Paul & Son), DUKE OF EDINBURGH (Paul & Son), CHESHUNT HYBRID (Paul & Son), ANNIE LAXTON (Laxton), DUKE OF CONNAUGHT (Paul & Son), &c., &c., and containing never a bad one in the lot,

TWO NEW ENGLISH SEEDLING ROSES.

H.P. EMILY LAXTON (Laxton), a large full flower with globular, pointed bud, opening into large globular flower. In the way of Monsieur Noman, but of a rich cherry-rose, deeper and fuller than that kind, and with strong vigorous habit, making a grand pillar Rose.

First-class Certificate Royal Horticultural Society; First-class Certificate at the Leeds and Crystal Palace Rose Shows, and 1st Prize at Exeter for twenty-four of any one kind.

H.P. MARCHIONESS OF EXETER (Laxton), clear, rose-flushed, light cherry-rose, large, finely built-up flower, very sweet, and of strong vigorous growth; a larger more double Annie Laxton, yet perfectly distinct from that kind.

Plants in pots of the above, ready early in June, 7s. 6d. each, 14s. the two varieties; Blooming Plants, in 24-pots, 10s. 6d. each, 20s. the two varieties.

The two kinds described above have been proved two seasons at Cheshunt, and can be recommended as continuing the race begun by this raiser with H.P. Annie Laxton.

PAUL & SON,

THE OLD NURSERIES, CHESHUNT, N.

(These Nurseries Established 1806.)

Post-office Orders to be made payable at Forest Gate. Cheques to be crossed "London and County Bank."

SAMUEL HAWLEY, Manure Depot, Forest Gate, E.

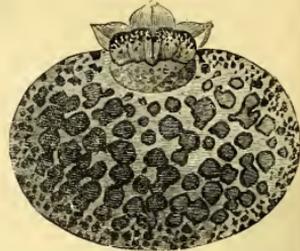

SUTTON'S

IMPROVED STRAIN

OF

CALCEOLARIA

"PERFECTION."

After many years' careful selection we have succeeded in producing a strain of *Calceolaria* which, for beauty and form of flower, richness of colour and habit of plant, is acknowledged to be one of the finest in cultivation. Our houses have been visited during the blooming season by some of the most eminent authorities of the day, all of whom agree in pronouncing our Improved Strain to be of unusual excellence.

Price, 3s. 6d. per Packet, post-free.

From "THE GARDEN," June 2, 1877.

"The *Calceolaria* at Messrs. Sutton & Sons' Nurseries, Reading, are just now beautifully in bloom, and should be seen by all who take an interest in this class of plant. The strain is one of the finest, being the result of years of careful selection. Many of the individual flowers measure $\frac{1}{2}$ inches across, and are perfect in shape and colour."

From "THE GARDENERS' CHRONICLE," June 2, 1877.

"A remarkable collection of *Calceolaria* is now in bloom at Messrs. Sutton & Sons' Nursery, Reading. The house, which is of good size, is ever crowded with specimen plants, but it seems to show off their great beauty and attractiveness en masse. Each plant is densely laden with large flowers, and the colours are very varied, from creamy white handsomely spotted on the body to rich dark maroon."

From Mr. B. BARHAM, Gr. to the Right Hon. the Earl of Sefton.

"It affords me great pleasure to be able to inform you that your *Calceolaria* seed has given extreme satisfaction. I have just now in flower one of the finest lots of hybrid *Calceolaria* it has ever been my lot to look upon. They are excellent in variety, form, and size of flower. Many have seen them and are highly gratified."

From "THE GARDENERS' MAGAZINE," June 2, 1877.

"The strain of *Calceolaria* distributed by Messrs. Sutton has flower-heads of immense size and perfect in colour. The flowers, which are borne in large clusters, are of immense size and of the finest possible shape, and embrace every colour. The yellow ground flowers are as a matter of course the most strongly represented, and with their splendid crimson markings are wonderfully effective, and of those of a straw-coloured ground and spotted and marked with purple, these are sufficient to make a most pleasing variety. The rose and purple self-flowers, some of which are quite new in colour, are also numerous, and present a striking contrast to those spotted with crimson, purple, and rose respectively. Sutton's strain of *Calceolaria* may certainly be said to combine all the good qualities yet found in these attractive flowers."

From A. E. RUSSELL, Esq., Dalnabreck.

"My *Calceolaria* plants from seed purchased of you last year are particularly fine, of very compact habit, and beautiful in colour."

From Mr. W. GEARLE, Gr. to R. M. Jaques, Esq., Easby Abbey.

"I have some very fine *Calceolaria* from seed supplied by you; they are the admiration of all who see them."

OFFICE FOR ADVERTISEMENTS, 20, WELLINGTON STREET, STRAND, LONDON, W.C.

PAXTON'S CALENDAR.

Now Ready, a New and thoroughly Revised Edition of the

COTTAGER'S CALENDAR OF GARDEN OPERATIONS.

ORIGINALLY COMPILED BY THE LATE SIR JOSEPH PAXTON, M.P.

OPINIONS OF THE PRESS.

"It has been carefully revised by an experienced gardener, and the lists of vegetables, fruit, and flowers, have been corrected by the substitution of the most approved modern kinds, in place of those which were mentioned in the first edition, and many of which have ceased to be worthy of cultivation. It is a thoroughly sound, practical treatise; but it has been so long before the public, and so deservedly appreciated, that any special commendation of it now is unnecessary."—*Milford Cottage Herald*.

"This is a handy volume, consisting of seventy pages of letterpress and illustration, containing much and varied information likely to prove useful to all cottagers, &c., who possess a garden. To all such, who require a cheap and reliable book of reference, we heartily recommend it."—*Lloyd's*.

"We are quite glad to see this useful little book once more, and it is like a whiff of perfume from the heather in bloom to read on the wrapper "two hundred and twenty-first thousand." We advise all who are interested in the promotion of cottage gardening to sow this little book broadcast."—*Gardener's Magazine*.

"The information conveyed in this little book is well adapted for all persons having small plots of ground. The necessary operations for each month are clearly laid down, and are of a thoroughly practical nature. The sorts of brush fruit and vegetables are well selected, many of them being excellent in quality. To our readers who are interested in the cultivation of their flower and kitchen gardens, we can safely recommend this as being a most concise and useful work."—*Bell's Messenger*.

SATURDAY, JUNE 30, 1877.

FURZE, GORSE, WHINS.

THE Whins of our day, and of the days that are long gone by, have never been propagated, sowed, or planted by mortal hands; they are purely the gift of God. There were Whins on the commons of Barnes and of Battersa when our good king was student at the University of Göttingen. The robbers on the great North Road owed much to the shelter of the Whins on Finchley Common, as did those gentlemen of the highway westward to those on Hounslow Heath; and when Macaulay's artist from the antipodes sketches the ruins of London in the latter days, he will no doubt find the Whins of Surrey rank in growth and sharp in spine, the lineal descendants of the yellow bush now browsed by the half-starved "moke."

My acquaintance with this plant is of long standing. The Whin linnet made its nest in the Whin bush on the common, and long before I became acquainted with the nature of the plant, I knew where to look for the linnet's nest in the prickly bosom of the Whin bush; and as there were some 50 acres of common uncultivated, on which we could delve the earth or dam the brook without let or hindrance, it is easy to see that the Gorse on the common was an item of the highest importance to schoolboys.

When patches of Gorse or Whin bushes have been burnt, the roots do not always die in the ground, but frequently break out from the collar forming what botanists call adventitious buds. I mention this to show that this truly native shrub is prepared to hold its own against fearful odds. The seeds ripen in the autumn of the same year in which the flowers appear, but the pods do not open until the following year, when they do so with a crack, and scatter the seeds to some distance, thereby sowing the future Whins.

The common Heather (*Calluna vulgaris*), and the Whin (*Ulex europæus*), may be regarded as the scrub of our heaths and moors, and where the Whin has once got full possession it is no easy matter to dislodge it. The poets seem to have despised this homely bush. Burns hitches it into rhyme to hide a corpse—which it seems well adapted to do, being an evergreen and thickly set with thorns; for in the adventures of the inimitable "Tam o' Shanter" we read:—

"By this time he had passed the ford
 Where in the snow the chapman snored,
 And up the Whins and by the cairn
 Where hunters found the murdered bairn."

It would have been strange if Byron had been silent on this subject seeing that he was of the "north country," but in order to suit the metre he calls the plant the yellow Thorn. This is of course a poetical licence, as there are no true Thorns of the Cratægus family of a yellow colour. It is therefore clear that he means the yellow flower of the thorny Whin when he says,

"The blooming Heath, the yellow Thorn,
 The spreading Yew, the waving corn—
 All these bring back before my view
 My native hills—the hills of blue."

The double flowered Gorse is at present (middle of June) a sheet of gold, with scarcely a sprig of green to relieve the grand display and act as a foil to this bush of gold, not given sparingly but with heaped-up mea-

sure. Linnaeus—an excellent judge—admired, nay worshipped our Whins on a Surrey common—the symmetry of the bush feathered to the ground, and the gushing grandeur of the flower; and he seemed amazed to see that such a shrub was so neglected. I for one took the hint from such a high quarter, and planted double Gorse in long lines and in large clumps, and the effect was beyond our most sanguine expectations.

The foxhunters of Leicestershire have long been aware of the importance of Whins for cover, and many years ago they sent to Aberdeenshire for seed to fill up vacancies in the Furze covers of Melton Mowbray. This genuine English sport of foxhunting is never known to flag in interest however high the rate of exchange may be; so that we may look with some consolation on the thought that as long as the fox-hunting fraternity enjoy their sport so long will the "yellow Thorn" of the poet be respected.

This is not the place to speak of Whins grown for profit. I only name the important fact that green Gorse well bruised is very good winter fodder for the horse, as well as for the costermonger's ass.

In places where game is preserved, and hares and rabbits bark all kinds of trees and shrubs in hard winters, the Whin is little the worse for a ring of bark taken off all round, for it will sprout from adventitious buds and thus renew itself. Wherever there is a rabbit warren all kinds of brushwood and prunings should be utilised by carting them into the enclosure, thereby giving the rabbits not only food but medicine. The farmer at Farley, near Alton Towers, Staffordshire, had a rabbit warren, and no one complained of his stock doing any damage, for he kept them to himself; but that was the spot to learn what rabbits enclosed within stone walls would eat, for if the article had green leaves or a grey bark it was reckoned serviceable for the inmates of the warren.

Gorse sown for cover in early summer makes very little way the first season, and it is well to sow a small portion of Broom in the same plot, as it will attain a useful height long before the Whins; but when the Whin is drawn up by being thickly sown it will rise to 5 or 6 feet, and can only be entered by the best dogs—mankind, of course, being totally excluded. This, then, is the cover that defends the fox, for he is but a small animal, clever to creep through small openings, and lithe of limb and swift of foot, and will cunningly double back to regain the good Gorse cover that he had left.

Of other cover plants the Bramble in a gorge may be as good as any, so long as it is green, but although it retains its sharp hooks, it casts its leaves, and thereby loses its value as cover. The tall Bracken, again, is an excellent undergrowth, filling up the blanks in thin plantations, but it does not grow till fine weather sets in, and although a native herb, it is often damaged by frost, and thus for half the year this excellent cropper is useless for cover, but it will be hard weather indeed when the Whin bush cannot hold its own.

I need scarcely remark in this periodical that the double-flowered Gorse is got by cuttings, and not from seed; but the single succeeds well in common soil, what our French neighbours would call *pleine terre*. The clumps of double Gorse now in bloom have no parallel. The Laburnum waves its ringlets in the wind, but it does not carry the weight of gold in which the Gorse comes forth. The May Thorns of many hues, elegantly mounted on their tiny twigs, are truly fair to see, but they are flattered; and we constantly hear of the double Scarlet Thorn, though I have never seen one, and we have to be contented with "Mays" of white and "Mays" of various shades of purple, but the purple is never named, and as

there is nothing in that name we buy and pay for Scarlet Thorn; and who knows but we may get one this time—

"Put this his gods in later times perform."

Lastly, the early blossoms of the Furze are of the highest value to the beekeeper, just as are the buds to the supply of honey later on; and hundreds of acres of broken ground might grow Gorse with little trouble—stony ground, rocky ground, moor and fell. If only confined rabbits to their warrens, as predators are imprisoned, instead of keeping them as robbers at large, that would mend matters; and a field walled in as a warren, and planted with trees more or less, and with Gorse for underwood shelter and cover would go far to keep the rabbit to his burrow, no more to consort with hares, the only animals worthy of the appellation of ground game.

Before leaving this subject let me point out to amateurs and young gardeners that Gorse is very impatient of transplanting, and it should therefore be done when young, say at the height of 1 foot or 18 inches; and when taken up out of the nursery it should have its roots clipped into four or five to prevent the roots from damage in transit. It will be labour well bestowed to puddle each plant as it is planted; this will secure the success of the plantation, whereas the rough and ready way will result in having to pay for the plants, with only angry words and withered Whins by way of reward.

Alex. Forsyth.

New Garden Plants.

FRITILLARIA (NOTHOLIRION) HOOKERI, Baker, in *Journ. Linn. Soc.* xiv. 269; LILIIUM HOOKERI, *Gard. in Gard. Chron.* 1874, p. 201.

I have described this so fully in the *Gardener's Chronicle* already that I need do no more than say that it is fairly established in European gardens. I have received a specimen in flower from Herr Leichter, and Mr. Elwes tells me he also has flowered it at Cirencester. The fresh flowers are just the colour of those of *F. macropetala*, Don, as figured under the name of *Lilium roseum* in *Bot. Mag.*, t. 4735. It is a native of the temperate zone in Sikkim, and it is to Mr. Elwes we owe its introduction.

CATTLEYA SKINNERI (Bala.) Alva.

This is an exceedingly rare plant, as it was lost both by Mr. Sell and the late Mr. Endres. The flowers are of the purest white, with some purplish markings and some sulphur-yellow on the lip. Mr. Endres brought it as an extra rarity from Costa Rica to Messrs. Veitch, where it has lately flourished, and was exhibited at a recent meeting of the Royal Horticultural Society. *H. G. Rehb. f.*

PONERA KIENASTII, n. sp.^b

A creeping stem, bearing small pseudobulbs, with single ligulate or (both) blunt acute, exceedingly thick glaucous leaves. A capillary raceme has its 1-2 flowers. Bracts triangular, blunt, shorter than the stalked ovary. The flower has a well-developed chlo. Sepals ligulate, acute, greenish, with a brown hue. Tepals linear, acute, the lip forming a *goblet*; base oblong, blunt, acute, with a transverse callus at base. It forms quite a new, very curious section of the *Ponera* for its fleshy leaves. It was discovered near Comsapecque, Salteepe, Arcos, in cold places, forming dense masses and patches on trees, and descending to the soil, where it grows between moss. I have great pleasure in dedicating it to its discoverer, Consul Kienast, of Zurich, who is an enthusiastic lover of Orchids, which he for a long time observed in Mexico. *H. G. Rehb. f.*

KESTREPIA POREKENSIS, n. sp.^b

This is one of "the lovely little gems" forming large masses of creeping rhizomes with very small, narrow,

^a *Ponera Kienastii*, n. sp. — Rhizome repens, pseudobulbi ligulati monophylli, folia lineariligulata sive ligulata crassa, pedunculo capillari racemoso; bractea triangulis ovata, stipite bifido; callositate sive ligula; sepala lineariligulata, lobis adnato ventriculo oblongo obtuso, base callosi linearis transverso, medio incrassato. — Pseudobulbi viridissimi. — In Mexico, so nihil, ab arce Mexici det. com. Kienast, *Rehb. f.*

^b *Kestrepia porekensis*, n. sp. (Proreprens.) — Rhizomate repens, caulis crassus, bulbis brevissimis monophylli, a vagina amplice apice vestitis; lobis callosis linearibus apice emarginatis; sepala lineariligulata, lobis adnatis longioribus bipartitis bi-trigulatis, bractea callositate ovata triangulari pedicellato subaequali; sepala solum linearibus obtusiusculis; sepala lateralia ovata bifida; lobis linearibus ovatis ovum atriatis bidentatis (arce bifidis), tepala multo angustioribus, brevioribus, linearibus, lobis pedunculo, ante

fleshy leaves, which are emarginate at their top and have a small blunt apiculus between. The flowers are solitary, standing on a long capillary peduncle and nodding, bending the two straight linear petals forward and having both sepals widely clasping. The inferior one is longer than the other. The calyx boat-shaped and much narrower towards the top. The lip is unusually small, scarcely equal to the column, pandurate, blunt acute, with a small angle before each base and a lamella on each middle side. The whole of the inferior one is one of the most elegant and new discoveries of the late M. Endres. It has flowered several times in the Hamburg Botanic Garden. It is of some interest in having a good deal of similarity to the obscure and only once seen *Piniella hypolepta*, in habit and appearance. This plant, however, had better be named *Epidendrum hypoleptum*. *H. G. Rehb. f.*

STANHOPEA PULLA, n. sp.^b

This is an extremely interesting novelty, and with *Stanhopea Calceolae*, Rehb. f. (still a rather obscure species), no doubt one of the smallest flowered species. We have now seen it six times in bloom, and found it quite congruent with wild-grown specimens. The pseudobulbs are short, conical, ribbed, dark; leaves dark, of the shape of those of the *Stanhopea Wardii*. A strong short peduncle, covered with short hairs—as it appears conical—two flowers, one usually looking at the other, as if they would like to bite each other. "Comme deux chiens de faucon" say our French friends. The ground colour of the bloom is apricot-yellow. The lateral oblong acute sepals are reflexed, the upper sepal narrower, the ligulate acute, narrower, and shorter petals of a very bright yellow. The lip is very shining, as if covered with varnish—much like a very plump shoe, such as is used by the Dutch peasants—with a roundish knob at its tip, and with sharp serrated sides bordering the inside stands a fleshy square body with four keels, two on top, and two converging like the letter V. Between it and the apical knob is a transverse inconspicuous slit. The knob is white, the other parts apricot coloured, the side borders and the two V-like keels nearly brownish-purple. It is near the old *Stanhopea eorumata*, Lem. (now scarce in gardens, and as it appears, very difficult to keep, when Mexican and Brazilian and New Grenadian *Stanhopeas* are nearly grown-proof Orchids), but the flowers are not so large, and the lip is not so broad. This is a chief charm in the species, which flowered very freely at Hamburg Botanic Garden. We obtained it from our friend, the late M. Endres, who discovered it in Costa Rica. *H. G. Rehb. f.*

A GIGANTIC ANNUAL GARDEN.

SUCH a garden meets the eyes of the passengers by the Great Eastern Railway as they journey up or down the line between Ardleigh and Manningtree Station. This garden is a field of 15 acres, known as the Pond Field, and is a part of the extensive seed farms of Messrs. James Carter, Dunnett & Beale, at Dedham. The field is of peculiar shape, but it slopes downwards from the high ground close by Stour House, the residence of Mr. W. H. Dunnett, to the railway, and travellers can take in almost the whole extent of it at a glance. Shortly before reaching the field the line changes from a cutting to a level, and this is the best place for a cutting again to attain the confinement of the Pond Field.

The annuals are all planted in what is termed stretches, that is, beds running right across the field; each stretch has generally five lines of plants, in some instances only four, in others six or seven. In the case of annuals in large demand, such as Virginian Stock, Candytuft, &c., one and even several stretches are occupied by them, while others only in partial demand require only a portion of a stretch. Each stretch is slightly raised in the centre, with a very

basin utriusque minute angulato, carina inflata utriusque columnae trigone carina, utroque angulo antico emarginato. *H. G. Rehb. f.*

Stanhopea pulla, n. sp. (Stanhopeaceae) — Labello callositate anteriori apice pinnatifido pulvinari superiori pulvinari inferiori inflexo; corpore callositate solidiore liberiore liberiore utriusque lobis callositate ovata, lobis adnatis longioribus bipartitis bi-trigulatis, bractea callositate ovata triangulari pedicellato subaequali; sepala lineariligulata, lobis adnatis longioribus bipartitis bi-trigulatis, bractea callositate ovata triangulari pedicellato subaequali; sepala solum linearibus obtusiusculis; sepala lateralia ovata bifida; lobis linearibus ovatis ovum atriatis bidentatis (arce bifidis), tepala multo angustioribus, brevioribus, linearibus, lobis pedunculo, ante

gentle falling away to the sides, which is formed of narrow furrows to carry off heavy rains, and to enable the workmen to freely move about among the beds for the purposes of weeding, roguing, &c.

At the eastern extremity is a very large breadth of red Virginian Stock, which opening of a bright rose red changes to purple with age. But what a glorious mass of colour is then presented to view. Then came Dunnett's dark crimson Candytuft, only just beginning to show its colour, and which will be grand in expression three weeks hence; white Virginian Stock, *Convolvulus minor*, blue, very fine *in mass*; *Malope grandiflora*, *Convolvulus minor*, dark purple; *Clarkia pulchella*, *Iberis odorata*, a pretty dwarf early white fragrant Candytuft; *Erysimum Peroffskianum*, with a fine glow of orange; *Convolvulus minor*, striped, very prettily striped with blue on a white ground—a selection from the blue variety, as the earlier flowers will

Clary, purple tipped; *Cyanus minor*, striped; *Godetia insignis*, rose and white, very pretty; small blue Lupines, a capital hardy annual, a good blue in colour, with a nice branching habit of growth; sulphur Lupines, very good; *Clarkia elegans*, white Hawkweed, *Leptosiphon androsaceus* *blacina*, very good lilac and exceedingly pretty; *Nemophila maculata*, scarlet Tom Thumb Nasturtium, and *Nemophila insignis*. Of the two last there were great breadths, and they appropriately formed the west wing of this vast floral army. Only a good rain is required to make this vast garden of annuals one of the most imposing floral sights that can be looked upon in any part of the United Kingdom during the summer.

A body of six men, with occasional assistance from others, are constantly at work here. Hoeing, and especially roguing, *i.e.*, pulling out plants from stray seeds, occupies their time, and if during their progress over the various beds any approach to a new sport is detected, the attention of Mr. Dunnett is called to it,

DOUBLE PYRETHRUMS.

AMONG hardy herbaceous plants now in bloom there are none so showy or more generally useful than double Pyrethrums, the blooms of the best varieties of which are as full and well formed as *Asters* or *Chrysanthemums*, and coming in as they do by the end of May, or early in June, when there are so few really good flowers outdoors, they are doubly valuable on that account. I was not aware they would force till this season, but find they do so almost as readily as *Spirea japonica*; when this fact becomes known I have no doubt they will be largely grown for the purpose, as under glass they are even more delicate in their rich tints of colouring than in the open borders, where just now they are making a brilliant display. Fortunately they may be increased with the greatest facility by division, and therefore a stock of plants

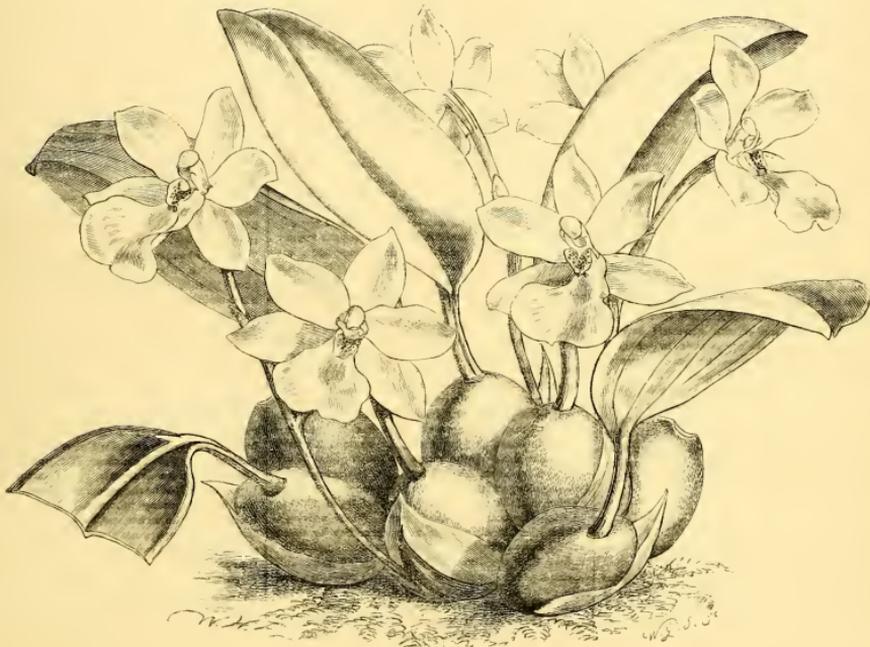

FIG. 123.—ODONTOGLOSSUM OERSTEDI.

often come self-coloured, like those of the *Petunia*, and be succeeded by blossoms true to character; dark purple Candytuft, white *Convolvulus minor*, *Clarkia pulchella*, double; *Godetia The Bride*; Hawkweed, red, an extremely pretty annual about 15 inches in height, and of a charming fleshy rose colour, very free, and excellent for cutting from at this season of the year; red *Lavatera*; *Convolvulus minor* sub-cerulea, pale mauve, a selection from the blue; *Virginian Stock*, dwarf rose, low in growth, and compact and branching in habit; *Collinsia grandiflora*, a pretty hue of purple; *Clarkia pulcherrima*, a dark variety of *C. pulchella*; *Lupinus albo-corrulens*, blue, scarlet, and white, a charming hardy annual; *Godetia rosea* alba Tom Thumb, *Dianthus chinensis*, *Cyanus minor*, blue; *Godetia rosea* alba; *Gilia rosea* splendens, pale rose, very good indeed; *Viscaria oculata*; yellow Hawkweed; *Centranthus macrocephalus* albus, *Schizanthus pinnatus*; *Cyanus minor*, pink; Clary, white tipped, growing about 15 inches in height; *Cyanus minor*, pink; *Leptosiphon androsaceus* albus, particularly neat in appearance and pleasing to the eye;

and it is invariably marked and the seed saved for trial another year. Many of the newer forms of annuals have been obtained in this way, among them some charming variations of a particularly pleasing character, and a few of the newest among them are under cultivation every year till their character becomes sufficiently fixed to admit of their being distributed. R. D.

ODONTOGLOSSUM OERSTEDI.

WE have now the opportunity of figuring this remarkable *Odontoglossum*—described by Prof. Reichenbach at p. 302 of the present volume. The flowers are white, with the disc of the lip yellow, with a few red spots. Our illustration (fig. 123) was taken from a plant grown by the Messrs. Veitch, of Chelsea, and exhibited by them at a recent meeting of the Royal Horticultural Society. It is a native of Costa Rica, whence it was introduced by the late M. Endres.

can soon be got up in that way. The best time to do this is early in spring, just as they begin to grow, when they should be dug up and have the soil shaken from amongst their roots, so that each separate crown may be traced out and severed without loss or injury to those adjoining.

In this way one large tuft will afford a good many plants, and if these are put out in nursery rows, in deep rich soil, and kept duly watered and cared for, they will be strong enough to force the following winter, when they can be taken up with fair sized balls of earth, and started in gentle heat near the glass. For very early work I have no doubt that the best way would be to grow them in pots, so as to get them well rooted and thoroughly established, although, from their cross-feeding habit, it is a question if they would be so strong and floriferous as those favoured with a more extended larder; but if they could be obtained a week or two sooner that would amply compensate for any little deficiency in the above

respect, so valuable are flowers during the early spring months, and especially such as double Pyrethrum, that last fresh for such a great length of time in a cut state. With us they are much prized on this account, as well as for their great beauty. That you may see how grand they are in this respect, I send a few flowers, and as each plant we have now in the borders is bearing from twenty to fifty, or more, nearly as fine, you can form some idea of the splendid display they are making.

It is only within the last few years that such an improvement has taken place amongst Pyrethrum, and as yet they appear to be little known or cultivated, but why this should be the case I cannot imagine, unless it is that, being hardy and not servicable to take part in fashionable bedding arrangements, there has been no demand for them on that account. Those, however, who are fond of border flowers cannot possibly have anything more showy or servicable, or that give so little trouble for the return they make, as all they require is a few neat sticks and a strand of matting run round to prevent the blooms being dashed to the ground by wind or heavy rain, and even this slight attention some of them are independent of, as they have stems sufficiently strong to stand erect without any artificial support.

To do them well they require a good depth of soil, rather inclined to light than otherwise, as when it is stiff and cold they are apt to go off in the winter after the manner of their congener, the popular Golden Feather, now so much used. They are, however, so dissimilar in habit and character to this that one would hardly suppose they belong to the same family; indeed those who have only seen the weedy looking flowers of this useful edging plant, can have no conception of the size and great beauty of the double variety. I have never seen any one who has neglected seeds to endeavour to raise them in that way, but they have always turned out most disappointingly, as I have never had anything much better in form than the old Ox-eye Daisy, although the colours of many were all that could be desired. Those therefore who may like to embark in their cultivation should buy a dozen or so of the best and most distinct kinds that can be obtained, and as the nurseries generally supply them in pots it will be a saving of time to get them at once and plant them out where they are to grow. Before doing this, however, the ground should be broken up to a good depth, and have some thoroughly decayed manure worked in, so as to insure the seed to lie down so as not to come in immediate contact with the roots of the plants. So treated, their growth will be strong and vigorous, without any after attention beyond the ordinary removal of dead flowers, stems, &c., to give them a tidy appearance. *S. W.*

WORKERS IN HOTHOUSES.

SINCE the repeal of the duty on glass it would be difficult to point to a single pursuit in which people are engaged, for either pleasure or profit, that has advanced so much as gardening under glass, not alone in the immense increase in the growth of exotic fruits, but in the almost unlimited extent to which tender plants for all purposes for which they can be used are now grown. Nor is it difficult to account for this; for the unprecedented increase in trade and attendant prosperity have enabled great numbers of those engaged in manufacturing and mercantile pursuits to amass large fortunes; and, although wealth has thus accumulated, there could be no possible increase in the fertile area of the country, and numbers of individuals throughout the length and breadth of the kingdom, possessing the means and also the inclination to purchase large estates, had such been obtainable, have been obliged to be content with a very moderate portion of land on which to build a villa or a mansion, often out of all proportion in importance to the limited extent of the grounds attached. The natural result of this has been, that as the owners could not ride for miles across their own broad acres, the space at command has been made the most of, often converted almost wholly into gardens in which the glass erections form a conspicuous part, filled with the most rare and costly plants brought from every part of the world, remarkable for either the beauty of their flowers or foliage.

And it is not alone in the extent to which this gardening under glass has been carried, but also the very great improvements that have been made in the character of the houses, with a view to render them

better adapted to the health and general requirements of the things grown in them; so much so that, so far as the adaptability of the best modern plant as well as fruit houses, &c., there may be said to be little left to be desired. But whilst the inventive powers of the garden architect and ingenuity of the builder have been employed in planning and erecting houses in every way suited to the well-being of the plants they are destined to grow, it may be said that, with few exceptions, scarcely a thought would seem to ever have been given to the health or comfort of the men who in many cases now spend almost all, or a great portion of their time in the hot humid atmosphere necessary to be kept up for plants that require a high or moderately high temperature for their successful cultivation, and through which the health of the men cannot fail to be seriously affected, and in many cases permanently undermined. Any one who has ever been engaged in working in hothouses even so far as where Grape forcing is carried out to a considerable extent, well knows the chills and severe colds resulting from damp clothing after being shut up for even the short time required for syringing in the afternoons during the early stages of growth, and the rheumatic affections following the plunging of Pines or thinning of Grapes.

The above cases, as large numbers of gardeners to their cost can testify, are sufficient to introduce to the system the germs of permanent suffering in after-life; yet they are as nothing compared with what those who are shut up almost all their time undergo in the hot damp atmosphere of houses devoted to the growth of stove plants or Orchids, the cultivation of the latter of which has so much increased and is still increasing that they seem ere long destined to become a prominent feature in most gardens where gardening under glass is carried out to any considerable extent. Gardening has hitherto been looked upon as a healthy occupation, and no doubt it is, so far as the greater portion of outdoor operations are concerned; but when those engaged in it are shut up in hot, or even moderately warm houses, the baneful influences of which are so unmistakably apparent in those who are so employed, it becomes one of the most unhealthy callings that a man can follow, and calculated to ruin even the stoutest constitution. And yet there is no reason why the plants that require a warm, humid atmosphere for their well-being cannot be grown to any extent, and the health of those engaged in their cultivation be cared for as well.

In a few private establishments, and some of the nurseries, there has been erected a small glass compartment immediately adjoining, and connected with the houses in which the plants are grown, into which they can be taken, without exposure to the open air, when potting or insect-cleaning operations have to be carried out, the latter of which, especially in the case of Orchids, occupies so much time. Where provision of this kind is made there is no necessity for those engaged to remain longer in the damp, confined atmosphere than the time occupied in giving water and syringing. As a matter of course, it is necessary that the small compartment in which the work is done should be provided with a hot-water pipe, so that it can be kept at a temperature of 45° or 50° in cold weather; and the more it consists of glass the better, so as to afford a maximum of light. Most of the ordinary potting sheds are so dark as to be of little use in winter; even on the score of economy the little cost of a place such as above described where to do the work would be money well spent, as a man will get through much more work, and do it better in a healthy atmosphere than when under the relaxing influences of combined heat and moisture.

Of late much has been said about better accommodation for the men in private gardens that the wretched hothouses that in many places still exist; but it is quite as necessary to provide means for carrying out the work of the garden, so that their health may not suffer. Not only should those who, either for pleasure or profit, grow plants extensively that require considerable heat for their existence, thus provide suitable places wherein the work can be done without injuring the health of those engaged in it, but it is equally incumbent on gardeners who have charge of young men to see that they do not needlessly endanger their health by doing work amongst plants in the houses in which they are grown that could just as well be carried out in a cooler atmosphere. Many young men are extremely heedless in these matters, and need to be continually cautioned as to the danger they incur. *T. Boies.*

THE CRESSAGE OAK.

ONE of the oldest and most interesting Oaks in England stands in an arable field, formerly a wood, half a mile from the village of Cressage in Shropshire. A few fields off the Severn passes in its southern course, and on the opposite bank the conical Wrekin rises above that beautiful and fertile district which lies, in Shropshire phrase, "all round the Wrekin."

The Cressage Oak was probably a sapling when Schoobesburgh—the old name for Shrewsbury—stood in the scrub or bush which gave the town its name. In that eventful year, 577, when the advancing Saxons seized this district, a frightened squirrel may have trembled among its branches at the destruction by fire of the Roman city of Uriconium, situated 4 miles distant, where the village of Wroxeter now stands. The British poet, singing the death-song of Uriconium, spoke of it as "the white town in the valley," whose chieftain's hall was left without fire, without light, without songs, in the midst of vast and silent woods. Of all the Oaks that flourished in those woods at that early period, this decrepit dotard alone remains. Before a stone had been laid of any of the cathedrals or other churches in Meria dedicated to St. Chad or some other saint, the tree grew in a heathen land preparing a shade for the congregations of the first Christian missionaries. The reign of Offa extended from 758 to 796, and supposing the Cressage Oak to have been then approaching its maturity of growth at 300 or 400 years, its present age must be about fourteen centuries. It is hardly to be less.

Those who have given attention to the subject of the longevity of Oaks could not fail to assign to the Cressage Oak a greater antiquity than that of the Venison Tree near Bagin's ark, which is known to have been standing at the Conquest. One half only of the Cressage Oak remains, consisting of a massive "skin" of timber 18 inches thick. The circumference of the tree, above the projecting base, would be about 30 feet, if it were complete, the measurement of the remaining half being 14 feet. Part of the standing portion of the shell was so much injured by a fire mischievously lighted many years ago in the hollow trunk, that its envelope of bark is now dead, as well as the crown above it. In the remainder of the crown life still remains, and a crop of small branches is still fed by the bark below. The tree is in fact a natural pollard, with an overhanging rugged crown.

The shape of the outer shell, which, complete, was that of a dice-box, the overhanging of the upper part being due to the deposit of new material with each successive crop of branches. The crown was originally divided into five parts, each forming a matrix of branches—that be the proper term—such as repeated lopping or pruning produces. It now carries only fifteen living branches, each from 15 feet to 20 feet long. The living portion of the tree is on the south side, where a breadth of 6 feet of living bark and timber now supports the slender remains of the once magnificent head. At the present time a new growth of wood is taking place in the fragment of the trunk, and the thick bark covering this part is now bursting and splitting in deep cracks from the expansion of young wood beneath. A similar growth of a former century has tied and strengthened a portion of the shell which had split, from the crown downwards, and would have parted but for the new wood, which has the appearance of having run in the seam like molten metal, soldering the two parts together.

It would be a bold task to estimate the age of this ancient tree within a few centuries. It obviously belongs to a longer-lived type than the Venison tree, which is known to have been cowed with the Conquest. The latter may have been assisted in its decay by the sportsmen who have emptied their guns and rifles in its trunk—an outrage which may have robbed it of a few years. Its duration, however, would have been many centuries greater if its trunk had been short, instead of long. Sixty years ago the Venison tree was well branched—it was an old, not a decrepit tree, but within the memory of persons who are yet living the trunk broke at 12 feet or 15 feet from the ground, and the tree is already a wreck, dying from the decay of the neck of the stock, so severe for the constitutional powers to withstand.

The repair of wounds, even in very old trees, is a common phenomenon. By means of a new growth the stump of a broken limb is sometimes healed over, a gaping hole in a hollow trunk reduced or closed, and a parting split neatly tied by new wood. A large

deposit of new wood is in progress within the hollow trunk of the Swilcar Lawn Oak at the present time, and the huge structure is being strengthened and its duration prolonged. The largest limb on the west side of that tree fell twenty years since, measuring 9 cubic feet. There is a limb extending 45 feet from the trunk on the south side, at a height of about 8 feet from the ground, and skillfully supported by an iron rod. The corresponding limb on the opposite side has fallen: seven great trunk limbs yet remain. The loss of limbs kills a tree by cutting off the supply of elaborated sap and destroying the bark beneath them; and the result of the natural pollarding of the long-lived type of Oaks, is that their life is renewed with their limbs.

In the case of the Venison tree, the remaining portion of the broken trunk has put forth a feeble spray, but the renewal of the foliage is probably insufficient to sustain the life of this patriarch of Bugro's Park for many more years.

The form of growth most favourable to longevity consists of a nest of several branches springing from the crown of a comparatively short trunk. The loss of one or more of these branches—which never go all together—proves but the beginning of a new epoch in the existence of the parent tree. As fast as they fall they are followed by a growth of smaller branches, and thus a green old age of extreme length is secured. Oaks are said by Dryden to enjoy three centuries of growth and three centuries of maturity, and to suffer three centuries of age, dotage, and slow sinking into earth. In the case, however, of Oaks of the long-lived type the last period is protracted far beyond 12 centuries.

There were very few acorns on the Cressage Oak in this sterile season of 1876, and they were of the stalked variety. The name of Lady Oak was given to this tree, probably in the twelfth century, at the period of the institution of the rosary, when certain forms of devotion were introduced which have since received the designation of Mariolatry. The original Saxon name was Criste-ache (Christ's Oak), and hence the name of the adjoining village. *H. Evershed.*

GERANIUM PLATYPETALUM.

AMONG the many varieties of hardy Geraniums the above is one of the best and most showy, and is a plant deserving a much more extended cultivation than it has hitherto met with, as it is alike suitable for the herbaceous border, wild garden, or rockery, in either of which positions, from its strong growing spreading habit, it soon forms a fine mass of elegantly divided foliage, and flowers from May to July in the most profuse manner possible. The individual flowers are about the size of half-a-crown, and of a deep blue colour, pendant while in the bud state, but as they expand they stand erect, and show themselves and the vein of the petals to great advantage. In fully exposed positions the habit of the plant is somewhat close and compact, while under partial shade it is more procumbent, and therefore well adapted for trailing over rockwork, as indeed most of the species are, and look more at home there than anywhere else. We have many in use in that way here, as well as in clumps in the borders; but there are none amongst them that will compare with *G. platypetalum* for the size and beauty of its flowers, or the display they make when fully expanded.

This fine Geranium is a native of the Caucasus, and has been in cultivation some years; but although that is the case it is as yet very seldom met with except in botanical collections, which is to be regretted, as it is quite worthy of being introduced in any herbaceous border or choice bit of rockery, however select they may be. One great advantage in growing plants of this hardy character is, that with ordinary attention there is no fear of losing them; as once they become established they will take care of themselves, and from the ready way the above may be propagated either by division or seed, there is no difficulty in increasing it to any extent desired. The seed ripens towards the end of August, and should either be sown at that time or kept till the following April, when it will be found to germinate readily in any warm border under the protection of a handglass. The best time for dividing the plants is just as they are starting into growth, when, by examining the crowns to see where they can be separated, they may be cut through by using a sharp spade without risk of destroying or damaging, to any serious extent, the main part left in the ground.

After repeated trials in using the pollen of the above-named Geranium to fertilise different varieties of Pelargoniums, including several sections of that numerous family, I have not as yet succeeded in getting them to be used together; and as I believe the same thing has been used by hybridisers much more skilful than myself, it would appear that the thing is impossible of accomplishment; but there may, perhaps, be some among the Cape kinds, or others of trailing habit having a closer affinity, with which success may yet be achieved; or, if not, we shall probably have to wait long before we get any decided new colours, and particularly anything approaching a blue, which would be a small fortune to its possessor. *F. S.*

PLANT PORTRAITS.

PELARGONIUM CAPTAIN RAIKES, *Flore des Serres*, t. 271-72.

PRITCHARDIA PACIFICA, *Flore des Serres*, t. 2262-3.—A noble Fan Palm, from the Fiji Islands, which has no more than one local name under notice.

RHOODENDRON HIPPOCISTE VAN DE WESTYNE, *Flore des Serres*, t. 2280.—A new hybrid obtained in M. Van Houtte's establishment, with large trusses of lilac flowers of good form and substance apparently, and densely spotted with dark spots. The plant is described as hardy and of robust habit.

ROMNEYA COULTEI, *Floral Magazine*, t. 352.—A very handsome white-flowered Papaveraceous plant, native of California. The plant is nearly if not quite hardy, and if it can be made to bloom as freely as in its native country it will be sure to attract great attention. The figure falls to do justice to this very striking plant.

ROSE, H. P., SÉNATEUR RÉVEIL, *Flore des Serres*, t. 2283.—A very dark crimson Rose, of good form but small size. It is said to be very hardy and a free bloomer.

SOLANUM ACANTHODES, Hook. f., *Botanical Magazine*, t. 6283.—A very handsome stone plant, which would probably also serve as a "subtropical plant." It is covered with rusty down, and beset with straight or curved spines, the leaves are obovate, and deeply pinnately cut. The flowers are large, rotate, fully 2 inches in diameter, and of a pale violet colour, with a central white stripe on each petal. The plant is an old inhabitant of the Palm-house at Kew, but little is known as to its origin.

SONERILA MARGARITACEA var. HENDERSONI, *Gartenflora*, t. 897.—The original species was first described by Dr. Lindley in these pages in 1854. The variety Hendersoni is distinguished by its leaves, spotted with silvery markings.

STENANDRUM IGNEUM, Ed. André, *Illustration Horticole*, t. 266.—This is the plant known in gardens as Eranthemum igneum, but which, having now flowered, is discovered to belong to the genus Stenandrium.

SYNLEPIS ACONITIFOLIA, *Gartenflora*, t. 887.—A handsome shrub about 4 feet high, with deeply palmately divided leaves, like those of Aconitum Napellus, and with heads of flesh-coloured flowers, surrounded by bracts of the same colour. It is a Composite plant, from the Amur River, and probably hardy. It is the same as Senecio aconitifolius of Turczaninow and Cactalia aconitifolia of Bunge.

TIGRIDIA LUTEA, *Botanical Magazine*, t. 6295.—A small flowered species, with creamy yellow flowers, the base of the segments marked with a pale blue eye-spot, and sprinkled with fine dots. It is a native of Chile, and flowered with Mr. H. J. Elwes.

TORONIA EXAPPENDICULATA, *Gartenflora*, t. 892.—A stove plant of somewhat straggling habit, with stalked ovate serrate leaves, and terminal tufts of irregular white flowers, two of the rounded lobes of which are of a blue colour. It belongs to the Scrophularia family, and is supposed to be a native of Southern China.

TULIPA HAGERI, Heldreich, *Belgique Horticole*, 1872, t. 2.—A handsome species, quite recently figured in the *Botanical Magazine*.

TUPISTRA MACROSTIGMA, *Botanical Magazine*, t. 6280.—A species originally combined by Mr. Baker with the better known *T. squida*, from which it differs in its narrower leaves, looser spikes, and larger stigmas. The plant is a native of the Khasia Mountains, and is mainly of botanical interest.

XANTHORRIZA MINOR, *Botanical Magazine*, t. 6297.—A very interesting plant, native of South

Australia and Tasmania, where it covers large tracts of ground. The plant is of tufted habit, with numerous long whiplash-like leaves, from amid which it sends up a dense spike of whitish flowers. The country is described as in some seasons white with the flowers of this and allied species of so-called Grass-tree.

THE MANUFACTURE OF PALM OIL IN WESTERN AFRICA.

AT p. 372 of the present volume of the *Gardener's Chronicle* we gave a figure and a short description of the Oil Palm (*Elaeis guineensis*). A very full and detailed account of the cultivation and produce of this most useful Palm on the West Coast of Africa has recently been received at Kew from the Colonial Office. From this report we gather the following. Referring first to cultivation, we are told that the ground is first well raked, and the ripe nuts which have been selected for sowing are scattered broadcast over the prepared ground, and lightly covered with earth, or a number of inches ranging from six to ten is deposited in one spot, at various distances, and covered with earth. The planting must be during the rainy season, as it requires a good quantity of water. When the young shoots have grown to about 1 foot in height they are carefully removed in the evening and transplanted at distances of at least 15 feet from each other, and if planted during one season it is better to allow them to remain until the next before they are transplanted.

The Palm grows luxuriantly and bears more abundantly at the height of from 10 to 12 feet in a damp semi-marshy soil, but where water does not, however, stand. In arid dry soil it becomes stumpy, and grows very slowly, and sometimes bears at 4 feet; but to cultivate the plant so as to ensure a proper growth, a development of a good number of spadices, large in size, with nuts or fruits well supplied with flesh, or what is technically called "fat nuts," the trees must be at a distance of at least 20 feet from one another, and well supplied with water. The supply of nuts fit for use is biennial, but the most abundant supply of commercial oil is obtained from nuts gathered during the rainy season.

For the production of commercial Palm-oil, that is, oil for exportation, we are told that the spadices are cut down from the trees, and put in a heap outside in the air where they are allowed to remain for a week or ten days, which causes the joints of the nuts to be weakened by the process of decomposition, and they are easily detached by simply beating them. The nuts or fruits are gathered together, and the husks that adhere to their base are removed either by the hand or by rubbing them together, and separated by throwing them in the air, and allowing a strong breeze to blow them away. A hole about 4 feet deep is dug in the earth, which is lined with Plantain leaves, into which the nuts with the hard unyielding pulp are put and covered over, first with Plantain leaves, and then with Palm leaves and earth. The nuts are allowed to remain for various periods—from three weeks to three months—until more or less decomposition has taken place, so that when removed the pulp is soft, and appears as if it had been thoroughly boiled. They are now put into a trough made by digging a hole 4 feet deep in the earth, and paving it below and around with rough stones.

In some cases a portion of the nuts is boiled in iron or earthenware pots and then mixed with the unboiled portion before being put into the trough. They are now pounded with wooden pestles by several persons standing round the trough until the pulp is quite removed from the surface of the hard nut; the whole is removed from the trough, put into a heap, and the stones taken out, leaving the oily fibrous pulp which is put into a pot with a small quantity of water under a good fire, and well stirred until the oil begins to melt out. The pulp is then removed, and put into a rough net open at both ends, to which are attached two or three short sticks, by turning which in opposite directions the oil is squeezed out from the nuts; it runs into a receiver or tub, leaving the fibre behind. The longer the oil-nuts remain under the press, the thicker the oil will be when made, the quality will also be inferior and the smell bad. On the other hand the shorter time, within certain limits, will be the nuts are under-grown the more superior will be the quality of the oil made from them. This is a great measure will account for the difference in the quality of the oil shipped from different parts of the coast.

The following is given as the method of manufacture of the oil for internal consumption. The spadicæ are kept in a hot place for three or four days, and the nuts are then taken out. A small quantity—from 3 lb. to 4 lb.—is made at a time. They are boiled in iron pots, then put into a wooden mortar and pounded with wooden pestles. The pulpy mass is then mixed with tepid water with the hand. The chaff is first removed, and afterwards the stones. The oil remains mixed with the water, which is passed through a sieve to remove the remaining chaff into a pot placed over the fire, and heated up to boiling point, and allowed to continue in that state whilst the oil floats up as a bright red substance. The water at this stage is being continually stirred, and the oil removed as it floats up until the whole is removed. The oil is now put into a pot and heated, to drive out any water that may remain. The nuts which have been subjected to the process already described in making oil are deprived of their external pulp, or old nuts picked up from under the Palm trees are put in the sun for days, and even months, until they are perfectly dry. They are then broken between two stones, and the kernels obtained whole or in perfect condition and fit for exportation, and so form the commercial Palm kernels. If they have not been perfectly dried the kernels break into pieces. The oil obtained from these kernels by the following process is called white kernel oil. They are put into wooden mortars, and pounded very finely, then removed to a grinding-stone and ground into a homogeneous mass, which is put into cold water and stirred with the hand. The oil rises in white lumps on the surface of the water, which is collected and boiled. It is of a very light straw colour, and, when exposed to the sun and dew, becomes, after a time, perfectly white.

Brown or black oil is thus obtained. The kernels are put into a pan and fried, the oil oozes out and is strained, the fried nuts are put into wooden mortars, pounded, and afterwards finely ground on a grinding stone. The mass is thrown into a small quantity of boiling water and stirred continually, the oil rises, and is continually removed until it ceases to rise. The pulpy mass is removed from the fire and spread out in a large bowl and allowed to cool, after which it is again ground and put by until the cool of the day, when it is mixed with a little water to soften it. It is now beaten with the hand for some time until the oil comes out in white pellets. As soon as this is observed a large quantity of water is put into it, and the oil is in some fatty substance floats on the top, which is skimmed off and boiled, and the pure oil obtained. As pointed out in the report, under the circumstances here stated, the exported kernels could not possibly retain their germinating powers, so that it would be impossible to raise plants from them.

A SHOW OF ANNUALS.

To Messrs. James Carter & Co. credit is due for having originated and practically carried out to a successful issue an entirely new idea in the way of special exhibitions. We have had special shows of almost everything before now, but it was left to the Hon. Genl. to make a show of annuals, and judging by the results it could not have been intrusted to better hands, for the exhibition which has been on view in the long corridor in the Royal Botanic Society's garden at Regent's Park during the week has been at once interesting and eminently instructive, and as artistically effective in its arrangement as the nature of its situation would permit.

We cannot pretend to name all the sorts shown, nor indeed would they all be worth it, but we may note a few of the best as they came under our notice. First of all, because in the greatest numbers, comes that pretty innocent little flower *Ionopodium acule*, which formed a continuous line in front of all for the entire length of staging. Next comes the showy and useful *Rhodanthes*, *Mangonia*, *maculata*, a fine crimson colour, *atrocarnea*, dark scarlet, and *maculata alba*, a fine white; *Clarkia elegans*, and its varieties Purple King and Salmon Queen, both appropriately named; *Clarkia integrifolia*, white, and Tom Thumb, bright rose, and very showy; the new Carmine Candytuft, free in habit and chaste in colour; a pretty assortment of the attractive Lupines, all good, and which need not be individually particularised; the white rose, and dark violet coloured varieties of the neat habit and free-flowering *Kauffusia*

ameloides; a double white and extremely effective *Chrysanthemum* for the mixed border, also double yellow and double yellow quilled varieties of the same useful but much neglected plant; *Silene pendula compacta*, extremely showy, and admirably adapted for pot culture, as witness the specimens here shown and the numbers sent to Covent Garden. The style and character of this plant, as grown in pots, is well shown in the accompanying illustration (fig 129). Then come various varieties of the brilliant *Nasturtiums* of the Tom Thumb section—as for instance, Pearl, pure lemon-yellow, Crimson, a fine dark colour, and Brilliant, a bright scarlet; and *Nasturtium King Theodore*, very dark, almost black; *Tropæolum canariense*, admirably grown and flowered; *Convolvulus minor*, dark purple, and wonderfully brilliant; the sweet white *Alyssum maritimum*; *Sphenogynspeciosa*, a remarkably showy Composite, with long straw-coloured petals, and a striking, almost black disc; *Waltia acuminata*, a very double golden-yellow everlasting; the invaluable *Limnanthes Douglasii*, the pretty blue *Cyanus minor*, red and white *Hawkweed*, various Sweet Peas and *Leptosiphons*, *Collinsia bicolor* and *C. bartisifolia*, fine in the size of its spike, and distinct and bright in colour.

There could scarcely have been less than 10,000 pots of annuals in full bloom at any time during the week, and as many of them had to be frequently re-

FIG. 129.—*SILENE PENDULA COMPACTA*.

placed as they went out of condition, it speaks well for Messrs. Carter's resources that the display should have been kept bright and gay for so long a time.

OUTDOOR GRAPES.

"**FORSYTH ON FRUIT TREES**" was published by order of Government in the year of grace 1810, and dedicated to the King (George III.). At this date William Forsyth had been gardener to his Majesty at Kensington and St. James's seventeen years, and it is stated that 1500 copies of this work in quarto were sold in eight months. A royal commission, composed of noblemen and gentlemen, was issued, and they reported favourably on the state of the garden, and particularly on the composition for coating the wounds and bark of fruit trees, and on their recommendation, aided no doubt by royal favour, a grant of money was awarded for the discovery. Now there is at Cardiff an experiment going on to try if Grapes can be ripened in the open air in England, with a profit to the grower; and here let me introduce a paragraph from Forsyth's book, where he speaks of putting the bunches of Grapes, grown on the open wall in Kensington Gardens, into bags, to keep the wasps, birds, &c. from them; and in this way five men were employed three weeks—no trifling experiment; and speaking elsewhere of training the Vine in a serpentine form, instead of training it in straight lines, he states that in the year 1793 he sent for the use of his Majesty and the royal family 275 punnets of Grapes, each weighing about 3 lb. The whole of the Thames Valley is notorious for its fruit growing, but where do we see now anything approaching to this wholesale vintage. On the score of Pear trees we are told how to take the bull by the horns; for where an old standard Pear tree had been nearly devoured by canker it was headed down on June 20 to near the place where it was grafted, and next year it was loaded with fruit and had to be propped up. We are further advised to look

in the nurseries, not for the young trees to plant, but for strong ones that will bear to be headed down. Few will dare to follow this doctrine, but the splendid shoots that rise from stools in a coppice where crate-wood is grown, proves the high importance of heading down. I think it was Charles Lawrence, Esq., of Cirencester, that told me of a tree he had coddled, and for its greater safety he had it planted not far from his house door, and it lived a miserable life, but one night a cabman blundered and drove right over it, and so it was broken off only a little above the ground, and had to be headed back, which instead of being a loss was vigorously. But Forsyth laid great stress upon coating the wounds of trees with his celebrated composition, which he verred was compounded of the following materials:—1 bush cowdung, ½ bush lime rubbish, as plaster of rooms, &c., ½ bush wood-ashes, ½ bush sand. The old plaster, the wood-ashes, and the sand had to be sifted through a fine sieve, and all the materials worked up until the stuff was smooth, like fine plaster for the ceilings of rooms.

This was laid on over the wounds about an eighth of an inch thick; wood-ashes, and ashes of burnt bones being used outside the plaster by a dredger, until the surface was smooth and dry.

It was further stated that the best way of using the composition was found by experience to be in a liquid state, so that it had to be reduced to the consistency of a pretty thick putty by mixing it up with urine and soap suds, and laid on with a painter's brush. The wood-ashes and burnt bones to be applied as before directed, patting it down with the hand. The bark that had been coated with the composition was said to be refreshed, just as we see a meadow that has been mulched. Our American cousins, who are, as all the world knows, a go-a-head people, when they receive fruit trees that have been carried across the Atlantic, and are consequently dried a good deal, bury them bodily in earth until the sap begins to show signs of moving, when they rear them on, and after the refresher they have had it is certain that they have had something between them and the drought, and are in the way to be kept moist without being under water. In grafting, the scion and the stock are both wounded, and either grafting-wax or puddle must be used to keep the weather from drying the edges of the wounds, and in the London nurseries, when the "Rose Acacia" was in fashion, the stocks were headed down, and the grafts were so near the ground that they were ridged up with earth at both sides to keep the clay daubing moist. Some years ago there was a statement in the periodicals of horticulture, of loam being washed to get the fine cream parts separated from other substances, and this was used for propagating *Gloxinias* and the like, as it covered the wound and excluded the air, and was more manageable than silver-sand. When I have had to propagate such herbaceous plants as *Verbenas*, instead of inserting every cutting into silver-sand and fastening it there, as a labourer would dabble in Cabbage plants, I got a saucer of puddle made of washed loam with a dash of cow-dung in it, and by dipping each cutting into the creamy puddle there was formed a knob, or head, to every one, so that a stranger, seeing them, would have thought that each was a perfect plant, with a ball of earth attached; and great saving was done in other substances, as the cuttings required only insertion in a little loam sand, as they had each got their wounds dressed before entering the propagating pit. From all this it is evident that wounds in botany should be bound up as well as wounds in surgery, and if there be any virtue in W. Forsyth's specific mixture, we may as well have the benefit of it. I saw the Black Esperino Grape ripen on a wall in the kitchen garden, Kensington, and the foreman in Malcolm's Nursery (the elder Mr. Holland) knew W. Forsyth, and had seen his work; and after giving him credit for getting great crops of fruit, hinted that, being a king's man, his success in those early days was favoured by His Majesty's gardeners. In looking over the columns of the *Birmingham Journal* I find a Mr. Thomas Edwards, who is described as a shoemaker, and also a naturalist and Curator of the Museum, Academy Buildings, Banff, has been highly honoured, and handsomely rewarded by the Queen, for his researches in natural history. An age before aquariums had been established in our towns, Edwards had collected specimens of marine vegetation, and also of rare crustacea—wield-like crabs of monstrous shapes and markings walking with a "gauffer long legs" kind of gait, but yet with equal ease and grace

forward, backward, or on the starboard or larboard tack, showing what means

"The dark unfathom'd caves of ocean bear."

We see them in perfection for a small fee in our aquariums, but Edwards had no such aid in his task, for the north-east coast is famous for rocks, where seawrack abounds, and tangles, dulse, and baderlocks are articles of commerce; and many a weary mile of walks and wanderings must have been traversed before Thomas Edwards could get his specimens collected and arranged, and in our admiration of the man we must endeavour to give honour to whom it is due, for it is alike praiseworthy to the sovereign who gave it as to the talented shoemaker who received the royal grant; and it was on reading this that I came to examine what claims W. Forsyth had to be rewarded with a grant from Government—for I had misgivings as to whether his work was sterling stuff or quackery. In the parish of Oldmeldrum, Aberdeenshire, where he was born, there was a free school—this was one step toward his future rise—and a venerable gentleman, one of the Society of Friends, took him from being a "herd laddie," and got him educated and fitted out for London—this was another step in the right direction—and his own good conduct did the rest. His work did not lack criticism, but he was able to hold his own against all comers. We are apt to lose sight of a fact bearing on this subject, which we see every day; for if we plant a tree we simply coat its stem below the collar and its roots with moist earth, more or less mediated with manure, and out of this small beginning arises the stately Oak and lofty mountain Pine; and if we

is meant to be sat upon, a statement that might be deemed superfluous were it not that garden chairs are often so supremely uncomfortable. There is no reason whatever why they should be so, and those whose love of the grotesque and fanciful leads them to the

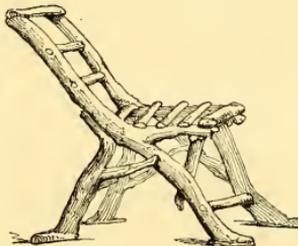

FIG. 131.—GARDEN CHAIR.

construction of such seats, should be condemned to sit in them.

Foreign Correspondence.

BANGALORE: Effects of Drought on Vegetation.

April 21, 1877.—In Mysore and other parts of India that are afflicted by the severe drought, it is remarkable and gratifying to observe how well the trees, shrubs, and natural herbage of the country have survived the unusual test and flourish. Annual and many tender perennial and herbaceous plants succumbed at an early period for lack of moisture, and latterly nearly all surface-rooting plants have suffered the same fate, where they were not under the shade of trees or receiving special treatment. The cereals and annual crops of subsistence would have yielded fair returns in some localities if the rains had fallen impartially and at timely seasons, which they did not.

"With regard to indigenous and acclimatized vegetation, deciduous plants have been covered with a thicker coat of dust, and been apparently 'dead' for a much longer period than usually occurs in a genial season, but they are now responding vigorously

to the call of Nature, and the gorgeous show of blossom produced by many genera at Bangalore during the first four months of the year has exhibited the result of "drying off" on a magnificent scale. Where flowers precede the young leaves, as in *Butea frondosa*, *Cochlospermum gossypium*, and the various species of *Erythrina* and others, the blossoms were abundant, and better coloured than I have observed before." The *Bongainvillea speciosa*, which fills the visitor with admiration at Bangalore, usually remains in bloom from January to April, but in 1876 the plants commenced to unfold their purple bracts as early as September, and they have uninterruptedly flowered in great profusion and brilliancy up to the present time, April 18, 1877.* Colonel Puckle, of the Mysore Commission, has graciously depicted the beauty of the *Bongainvillea* in the *Gardener's Chronicle*, and as that gentleman truly remarks, "all writing would be necessary to exaggerate the reality." The genus *Lantana*, of which there are a good many species and a great number of varieties at Bangalore, are common hedge plants of a rather straggling woody character naturally, but they make pretty and useful hedges when well kept, and they grow freely among rocks and in dry places where less hardy plants would fail.† Last year the roadsides were very gay with many coloured, sweet-scented flowers. The excessive drought has caused the death of many *Lantanas* where they were very much exposed.

"The beautiful *Lagerstrœmia regina*, with its large panicles of lilac flowers overtopping the bright green foliage, and the more sombre *Poinciana regia* are objects of great attraction at present.‡ The common *Aloe*, *A. barbadensis*, flowered very freely eight months ago; in a late ravine, 100 yards east of the Government gardens, a forest of stately flower-spikes were assembled in various groups. It has been reported that the poor natives in the famine-stricken districts were obliged to eat 'Aloe' roots to sustain life; but I find on inquiry that it is the pulpy substance contained in the suppressed stem of *Agave americana* which they eat. The pulp is boiled and strained thoroughly, and boiled a second time, before it is fit for consumption. The Frizzly Pear, *Opuntia Dillenii*, has been chopped up and given to cattle as a substitute for green food. A great many *Bamboos* in the Mysore province are flowering and seeding at the present time, and poor people may be

FIG. 130.—GARDEN TABLE.

examine the root of a healthy tree we find it supple and moist, just what we want the inner bark to be above the collar, that the sap may move freely, and when we prune and find the shoots dried we know that the circulation is weak, and the danger of death imminent, unless assisted by a rainy season. W. Forsyth speaks of covering a wall 165 feet long with five Vines in two years, and two Vines the second year produced 1100 bunches of fine Grapes (p. 199).

Now if any system of pruning, training, or plastering could enable our best gardeners, within twenty miles of London, or elsewhere in England, to grow good Grapes in such abundance from open walls now, as certainly were grown in the Kensington Gardens 100 years ago—for we have the signatures of twelve noblemen and gentlemen to prove the fact, far beyond the power of any gardener to bribe, or in any way to bias—therefore, if heading down will renovate a barren fruit tree, by all means let us have its head off; and if wrapping up the stem with a chemical compound does good service here is the recipe—the wet blanket against the sun and wind. We are, perhaps, at the end of our tether with both these Grapes, but with Vines on a wall and with fruit trees on walls and as standards, with Speechley's work and Forsyth now before me (1789), we seem to be nearly one hundred years behind. *Alex. Forsyth*.

RUSTIC CHAIRS.

In the sultry days of summer no accessory contributes more to the comfort of a garden than a seat in a shady nook or other convenient spot. Any carpenter should be able to put together seats and tables of the character of those of which we give illustrations. It is as well to add that a chair

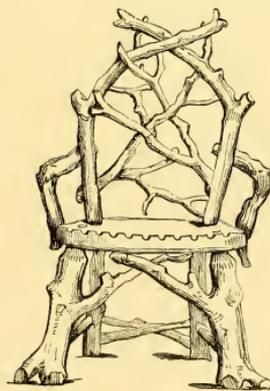

FIG. 132.—GARDEN SEAT.

to the call of Nature, and the gorgeous show of blossom produced by many genera at Bangalore during the first four months of the year has exhibited the result of "drying off" on a magnificent scale. Where flowers precede the young leaves, as in *Butea frondosa*, *Cochlospermum gossypium*, and the various species of *Erythrina* and others, the blossoms were abundant, and better coloured than I have observed before." The *Bongainvillea speciosa*, which fills the visitor with admiration at Bangalore, usually remains in bloom from January to April, but in 1876 the plants commenced to unfold their purple bracts as early as September, and they have uninterruptedly flowered in great profusion and brilliancy up to the present time, April 18, 1877.* Colonel Puckle, of the Mysore Commission, has graciously depicted the beauty of the *Bongainvillea* in the *Gardener's Chronicle*, and as that gentleman truly remarks, "all writing would be necessary to exaggerate the reality." The genus *Lantana*, of which there are a good many species and a great number of varieties at Bangalore, are common hedge plants of a rather straggling woody character naturally, but they make pretty and useful hedges when well kept, and they grow freely among rocks and in dry places where less hardy plants would fail.† Last year the roadsides were very gay with many coloured, sweet-scented flowers. The excessive drought has caused the death of many *Lantanas* where they were very much exposed.

* The sober-flowered *Pongamia alata*, and the gaudy and sweet-scented *Cassia fistula*, may be also included. *J. P.*

FIG. 133.—GARDEN TABLE.

seen gathering up the seeds and eating them greedily as they fall from these gigantic grasses. All this indicates the pernicious effects of drought in a country where the vegetation is naturally of luxuriant growth, and where there is ample food for all when the rain falls impartially and in moderate quantities. As I have already remarked, it is wonderful to see vegetation looking so fresh and green after two successive years of drought, and it speaks well for the moisture-retaining properties of the soil. *J. Cameron, Superintendent, Government Gardens, Bangalore.*"

I would qualify this slightly. It would, I think, be more strictly correct to say that the *Bongainvillea* sp. began to show bloom at that time, and continued to push them forward until the end of December, when the plants everywhere began to clothe themselves in their grand purple beauty, flecked with the delicate lemon-yellow flowers. During all January and early in February this was very full and noteworthy, but by the middle of end of February the purple bracts had generally died off. At the same time fresh crops of them came out, and in some instances old plants again formed abundant bloom on the western side, or where they had any accidental shelter, and continued to show bloom till April 22, when I left Bangalore for England. At Malia, in January last, the darker coloured variety of this climber was in great beauty, and slightly out on May 18, when I again touched there. But they train it against the wall at the Florino Gardens, and cut it back hard, not allowing it to have the advantage of its natural habit of growth, which in such a climate would produce a much better effect. For instance, the old plants inside the enclosure by the entrance gates, opposite Valetta, should not be so persistently cut back, but should be allowed to overtop the wall, and a skeleton verandah should be erected, and the mistopped shoots encouraged to trail over it, where they would do in the most natural and graceful manner. There would be a double advantage in this. The plants would be shown off to the best advantage, and there would be a sheltered verandah for visitors at the town entrance, with a living roof.—N.B. The remarks respecting the blooming of the *B. speciosa* at Bangalore from September to February are not to be taken as an inference, but from personal observation from that date to April 22. *J. P.*

† As a hedge plant the *Leadwort*, with its masses of delicately coloured bloom, can hardly be surpassed for hardness and beauty and use for hedges, &c., if only tolerable attention is paid to its growth. *J. P.*

‡ The *P. regia* was most profuse in its flowering, and made a gorgeous display. *J. P.*

Notices of Books.

Agricultural Text-Book, &c. By John Wrightson. Collins & Co.

This is a little book expressly prepared for the use of students at the Science and Art Department at South Kensington. Its subject-matter embraces an elementary account of soils, manures, rotations of crops, and live stock. The author, till lately, was Professor of Agriculture in the Agricultural College at Cirencester. Having said thus much, few words will be required in recommendation of what may be expected to be a good book, and which, so far as its scope allows, amply fulfils any expectations that may fairly be raised. An idea of the way in which the author has treated his subject may best be afforded by giving an extract, and as a favourable example of condensation of a large amount of experience in a short compass, we give the following:—

"Nitrate of soda (sodium nitrate) is imported from Peru, where it occurs in beds, sometimes 7 to 8 feet thick, preserved from solution by the extremely arid character of the climate. The source appears to be inexhaustible. Refined nitrate of soda, as imported, contains only about 5 per cent. of impurities, and may be purchased at from £13 to £16 per ton, according to the fluctuations of supply and demand. It is soluble so rapidly when it is dissolved. Being exceedingly soluble, and therefore liable to be washed through the soil, it should be distributed over the land in March and April, just at the time active vegetation commences. It exerts the strongest influence upon grasses or herbage of all kinds. Hence it is very beneficial to Wheat and the other cereals, to Italian Eye-grass, and all pastures and meadow grasses. In this respect its action resembles that of all nitrogenous and ammoniacal manures, which invariably stimulate the growth of grasses and cereals. The quantity applied is small, 84 to 112 lb. being sufficient for an acre of land. The effect is especially seen in the darker colour of the foliage a very few days after the application, the rapid development of the plant, and, in time, a more abundant crop. Nitrate of soda acts more powerfully upon the leaf and stem than upon the flower and fruit; but that it also acts upon the grain has been frequently proved. The increase from its use has sometimes amounted to from 10 to 12 bushels per acre; and in its experiments undertaken by the author in 1871, 4 to 4½ bushels of Wheat were in several cases obtained from the use of 100 lb. of the nitrate. When applied to 'roots,' it should be applied with care, as if brought in contact with the seed the nitrate is apt to injure its vitality. If distributed broadcast over Sweden, just before the second hoeing, it exerts a very beneficial effect."

Miss Arabella Buckley has published in convenient form a set of *Botanical Tables* for the use of junior students (Stanford). The idea is a good one, but the compiler should have sought the assistance of a botanist to revise her work. The definitions of "struck," "tubers," "suckers," and "radical leaves" betray a vagueness of knowledge not desirable at any time, but particularly undesirable in so condensed a publication as that under notice. We commend the examinee who writes in response to the question, "What is a tendril?" asserts that "Thread-like leaves, stipules or petioles are called tendrils."

Natural History.

THE CLOUDED YELLOW BUTTERFLIES are unusually early this year. On June 4 I noticed a "stranger" flitting about some flowering plants, in a minute or so it settled, when I got a good opportunity to examine it; and was astonished to recognise C. Hylae at this early date. C. EDWARDS has very plentifully hibernated during the last fortnight. A friend of mine took eight specimens on June 9, seven of them being ♀, and in good condition. In his *British Butterflies* the Rev. F. O. Morris says, p. 129—"One was observed by Mr. S. Stevens on June 29, 1851, and it is the earliest record of its appearance that I have ever heard of;" and in his description of C. Hylae, he says—"It is said to be

double brooded, appearing in May and in August, or September"—(Stainton mentions the autumn for both species); but although I have been a rather persevering collector of Lepidoptera many years, I never knew of these species appearing so early as they have done this season. W. Wilson, Enfield.

BIRDS' NESTS.—At Fairy Croft, Saffron Walden, a robin has built its nest in a tea kettle, and is now sitting on five eggs, and a blue tit built its nest in a pump (which is dry). It enters the pump by a hole under the handle; it has nine eggs. X.

Forestry.

TREES BEST FITTED TO BEAR THE WEIGHT OF SNOW.—While the influences which soil, climate, and situation exercise upon forest trees are duly considered and discussed, the structure and formation of the trees themselves hefting and adapting them to various situations is frequently only glanced at, and passed by without note or comment. What I wish particularly to refer to, is the special characteristics of those trees whose branches are best adapted to sustain severe exposures of wind, heavy falls of snow, or sustaining masses of fruit and foliage. Every one who has witnessed the wreck and desolation of a wood or forest after a snow fall deplors the serious results, and wishes that some means could be devised, if not to cure, at least to prevent, such occurrences. That some species of trees are better adapted for withstanding such casualties as a great wind, and therefore become the duty and interest of every one connected with the culture of trees to find out which are least liable to injury from the influences referred to. So far as my own observation has gone, I conclude that amongst Conifers the common Larch and the Silver Fir are of all others decidedly the best. The branches of the Larch are so situated upon the stem as to render them very difficult to break off. Not only is their connection strongly and substantially formed, and curiously fortified and buttressed; but the branches being pendent at the base, and afterwards turned up at the points, are thus in the best possible position to sustain a great weight, and to shake off, in case of heavy judgments of snow, a plantation of forest of Larch trees should be so grown that the branches are comparatively slender, plant, and airy; in which state, together with their other advantages, they are almost proof against injury from the causes referred to. It is only when the Larch is grown either as a single tree or with too much room for its lateral branches, that it assumes that habit of growth attended with disastrous results by breakage. Indeed I do not remember ever seeing the branches of a Larch tree in a well-grown plantation either broken or seriously injured; while, on the other hand, it is somewhat rare to find single specimens without some of their branches being shattered or broken. In addition to these it possesses other and by no means unimportant advantages over that of most other forest trees in its conical and sharply pointed top, which is rarely if ever broken, either by snow, winds, or otherwise. Being deciduous is also an advantage to the Larch specially and peculiarly its own, for there are few other Conifers which shed their leaves in autumn. And in this provision of Nature there is probably one of the greatest advantages gained for it as a mountain tree. The branches and whole structure of the tree being thereby greatly lightened, adds vastly to its security and protection against those unfavourable influences to which it is exposed.

Next to the Larch is the Silver Fir, in suitability and adaptation to severe exposures, judgments of snow, &c., not only in its young and tender condition, but especially in the fully developed and majestic old tree. The form of the branches, which are fan-shaped, dense and pondersous, is of all others in these respects most liable to become loaded with snow whenever it falls; but while this is the case, the whole structure of the tree is yet such as to enable it to sustain any weight of snow that may fall upon it. The connection between the branches and stems is of the strongest and most perfect description. The peculiar and familiar hard swell or enlargement at the base of the branch, is doubtless there for a higher purpose than that of testing the woodman's axe. The protuberance forms to the branch an excellent buttress, and secures it against being torn from the stem, as the Scots Fir is liable to be. The branches, like the Larch, grow from the stem in a pendulous form,

sometimes with a graceful sweep, first bending downwards and afterwards curving upwards at the extremities. The woody texture of the branches, too, is much harder than any other part of the tree, and is not only harder but tougher and more elastic. The bowmen in ancient times are said to have made extensive use of Silver Fir and Spruce branches for bows, which when bent in the opposite way to which they naturally incline by growth possess and retain an elasticity scarcely excelled by the buffalo horns. I find that upon the upland and severe exposures of this estate the Silver Fir and Larch succeed and pay better than any other forest tree. They make wood and grow faster at high altitudes, maintain an erect and upright position, and are less liable to sustain injury in any way, all things considered, than any other Conifers. As a profitable crop, too, they pay better than any other species. The Silver Fir is tender in its young state, as regards frost, but at high altitudes, and when above the frost line, at any age it grows with the only other practical difficulty in growing Silver Fir is its tendency to produce plurality of leaders, caused by the central top buds being often abortive, the result frequently of late spring frosts. It succeeds in a colder and inferior soil than the Larch and Scots Fir, at least I find it growing well in places when the Scots Pine degenerates. The practice of growing both Silver Fir and Larch at high altitudes, as subjects of profit, should be with numerous but comparatively slender side branches, which is attained by proper and judicious thinning. It is not to be inferred from this that crowding in the young state is either desirable or necessary, but on the contrary, that the proportion of relation balanced between the girth of stem and its height be maintained, which signifies as many feet in height as there are inches in girth near the ground. C. Y. Michie, Cullin House, Cullin, June 21.

Garden Operations.

PLANT HOUSES.

PLANT STOVE.—There are many plants that, however handsome the flowers which they produce may be in themselves, do not associate well either on the plant or in a cut state with others, and by this are much reduced in value for general purposes. Amongst small subjects in every way exempt from this defect may be named *Didymocarpus bifolius*. This is one of the best plants that can possibly be grown in quantity for standing amongst *Orchids*, or on the side stages of the stove amongst or in front of low-growing things; those who have only to grow it used to find that a few isolated plants can have no idea of the effect it produces when employed in sufficient numbers. Not only is it an especially desirable plant used in this way, but for mixing in a cut state with other choice flowers, particularly *Orchids*, it has few equals. When well grown the foot-stalks will get 9 or 10 inches in length—great essential where flowers have to be used in water for filling vases or stands; its enduring capabilities and long-flowering habit are also worth taking into account. The more general mode of increase has been by division, but this is comparatively slow, and it may be better to grow it from seed which vegetates freely soon, through the winter and spring months. Seeds sown now in pots or pans, drained and filled with a mixture of peat, leaf-mould, and sand, stood in a stove or intermediate house, and when large enough pricked off 2 inches apart into pans or pots—these kept through the winter, and moved in spring singly into small pots, giving them a slight taper, will make useful plants by the twelvemonth's end. The little room they occupy (a 6 or 7-inch pot is big enough for a full-sized plant) makes them suitable for either a small or a large house. Amongst handsome flowering stove plants of recent introduction that can be bloomed in a small state there are few so effective as the South Sea Island varieties of *Hibiscus rose-sinensis*—miniatus semi-plenus, vivicans. By yearly propagating and keeping the plants well headed back after flowering, they may be had in such size as adults of their being stood in flower in small positions in the stove for which plants of larger growth are unsuited. They strike freely, cuttings of the half-ripened wood put in now root readily, and will produce their large, brilliant-coloured, Carnation-like flowers which they have attained and reached the stage. *Fraxinacea* that have done blooming should be freely cut back before starting into growth. This particularly applies to the species conferti-

flora and calycina, which, through a too sparing use of the knife, often get leggy and bare of foliage. With strong plants last year's growth should be reduced one-half—in the case of *F. calycina* and *F. confertiflora* two-thirds—always as soon as cut back, giving them a thorough watering when they are affected with mealy-bug. Being free-rooting, such plants as require it should be moved into larger pots when they have commenced growth; those that have plenty of root-room will grow strongly by the assistance of manure-water regularly applied. *Griffinia* now about commencing their growth, should be kept a little drier at the root, but they must not be subjected to this treatment until all the leaves are fully developed, neither must the drying process be carried so far as ever to cause them to flag. *Eucharis amazonica* that have been strong growers, should be kept a little drier, and submitted to dry treatment at the roots for a time, but with these, as with the last-named plant, the leaves must be fully grown and solidified before being subjected to the drying process, or they will fail to flower satisfactorily. The roots will bear drying more than those of *Griffinia*, but, as with all other evergreen bulbs, it must not be carried too far. Where *Gardenias* are grown in quantity, so as to give a long succession of flowers, plants that bloomed early in the winter should be kept a little drier to check their growth; to induce a free disposition in flowering stand them well up to the light, giving no more shade than is found necessary to prevent the leaves scorching. If moved to a house or pit where more air can be given them than in the shade, they will be found to open. *Hoya bella*, at the time of planting or suspending in the stove, can be had in effusive condition for flowering next spring, if at the present time shoots are taken off some 3 or 4 inches in length, a few of the bottom leaves stripped off, and struck six or eight together in 4 or 5 inch pots, and covered with bell-glasses, kept warm, and covered with bell-glasses, or in a propagating frame. When well rooted remove the glasses, and as soon as they have commenced to grow put the whole together in pots 2 or 3 inches larger than the present ones, and give them to grow on to the end of the season; with another shift in the spring they will bloom nicely. Old plants of this *Hoya* now past flowering should be cut back freely; in this matter causes them to get into a straggling unmanageable state. Plants of the beautiful *Dichorandra mosaica*, propagated last year, should not be allowed to want for room, or their blooming capabilities will be comparatively weaker. Where in small pots more at once; if longer delayed, the autumn flowers will be less, and the benefit from the shift, which occurs that will be flowing, should be slightly cut in, thoroughly cleaned from insects, and again started to grow in a brisk heat, syringing freely overhead once a day; so managed, they will bloom well a second time. *T. Baines.*

FLOWER GARDEN, ETC.

The flower beds must now have every attention in order to assist them to ripen their produce as possible. After the watering the beds have had, a good stirring with a small hoe will loosen the ground and encourage root action. As soon as the plants get well established and begin to cover the surface, which in many places will soon be the case, let the plants be ragged down and stopped, as may be necessary. Any blinks that have occurred since planting had better be filled up without further delay from the reserve ground. All plants that require sticks should be attended to before they get too far advanced, as they are more liable to be broken off by damage. Roses will be much improved by a thorough soaking of water, and if liquid manure, from the cesspool or stable tank, so much the better. The buds are plentiful and strong this season, and with good weather we may expect to see fine crops of flowers. Briers should be looked over and prepared for budding; any gross shoots may be cut back, which will stimulate the growth of the weaker shoots. Budding may be done as soon as the bark rises freely; this is generally the case, especially after rain and during showery or dull weather. The bud inserted as near the bottom of the shoot as possible, as they are not so liable to get broken off when placed near the stem. Climbing plants are now growing fast, and must have attention, those on walls or corners, trellises, or fences, to be nailed or tied as shoots advance, and all branches not wanted for filling up may be removed. Where annuals are growing in beds or borders, they will be greatly improved by being thinned out sufficiently to give the plants room to be free from crowding, which will add much to their effect, and prolong their season of flowering. Shrubbery clumps and borders will require a free use of the hoe to keep down weeds. All plants that have bloomed, and are beginning to look over the top, should be kept in good order. The grass lawns require constant care and attention; gravel walks also need to be frequently looked over, and all weeds and litter removed. Lose no opportunity of having the walks well rolled after rain. *T. Blair, Strindland Park.*

FRUIT HOUSES.

PINES.—Unless very adverse weather prevails, the powerful influence of solar heat at this season and onwards until the middle of September, will ordinarily be sufficient to keep up the requisite temperature to heat about these plants without having recourse to any other means for the purpose. The potency of this expedient, when properly utilised in Pine-houses, ensures the most improving condition for vegetation to be desired, and neglect not, therefore, any opportunities which happen to this end, and pursue the same course of treatment in regard to ventilation, &c., as was advised in the preceding Pine Calendar. As regards the requirements in respect to the roots, the composition of the beds, &c., as will not be necessary to repeat in the pots, artificial means should be resorted to in order to effect it. Keep the internal atmosphere constantly moist, so that the fruiting plants, which are occupied with growing or fruiting plants, and under powerful solar heat a slight shade over the plants will be found beneficial for a few hours at mid-day. By this time all the Queens which started about the beginning of last February will be cut or in a condition to be removed elsewhere without injury. As soon as a compartment can be made a few inches deep, and cleansing it should be effected, to eradicate the countless numbers of insects which speedily accumulate and increase in such places; a good dressing of hot lime should be applied over the internal walls, so that all insects which may be stopped, and whatever painting is required should be done. This proceeding is very necessary annually where other objects are to be grown in the same house; it is also a commendable practice to entirely clear out the beds of fermenting matter at intervals, and to re-make the same. In such beds as are heated by hot water, and which contain more than 1 yard in depth of such material. After the beds are refilled with fresh materials and plants, watchfulness will be necessary, or the plants will be liable to injury from an over-abundance of heat at the roots, which will check the growth of the fruiting plants at this season should be potted forthwith into good fibrous loam, and be watered at once; place them in a bottom-heat of 90° in a moist pit, shade them from sunshine altogether for about ten days, and allow ample space between the plants to prevent them being drawn. It is not generally necessary to save stools for stock, excepting in the case of new varieties; if, however, it be desirable to do so cut off the leaves and plant the stools in the sucker pit, where they will be secured, and the fruit will soon be secured. *G. T. Alder, Wymode Abby.*

VINES.—Late Grapes, including Lady Downe's, Alicante, and Muscals intended for use after Christmas, should now be stopped. The final thinning and tying out of the shoulders to admit of full development of the berries, without crowding or binding, as Grapes which are not well thinned do not keep so well through November and December as when they are properly thinned. Grapes which have the leaves are falling. Having brought the thinning to a close, let all borders, inside and out, receive a good mulching of half-rotten dung, and water copiously with tepid guno-water or liquid manure. Keep all lateral growths within reasonable bounds where the trellis is already filled with healthy foliage, but avoid the close stopping principle, particularly up to the completion of the stoning process. If any part of the trellis remains uncovered, young growths may be laid in and allowed to ripen, and when the fruit is ready to be set, the next year's fruiting should be kept pinched from the base up to the pruning-bud. Where inside or outside borders were disturbed last autumn, the laterals should have full play until the crop begins to mature, when the main stem may be stopped. Vines subjected to the partial lifting process before the foliage falls form new sponges during the autumn, and if allowed a low night temperature the following season, always furnish good crops of perfectly-coloured Grapes. Melons, which are beginning to change colour, will derive great benefit from a thorough soaking of liquid manure at a temperature of 90°, and if the material with which the roots have been protected still remains, great caution will be needed in its removal, if this can be decided upon, as it is more than probable that many melons will be found working on the surface of the border, and on no account must these be injured or exposed at this critical period. *W. Coleman.*

MELONS.—Owing to the scarcity of hardy fruits, good Melons will be keenly sought after by dealers and consumers; cultivators will therefore do well to turn out all pits, frames, and houses as fast as the crops are cleared, and having thoroughly cleansed the glass, and started about the middle of the month, vigorous young plants, either in pots or on hills. I give the preference to pots plunged in fermenting materials, as much valuable time is saved by having the plants established in their fruiting pots, a foot or more in height, in an intermediate house, on the day

the last. Melon is cut from the compartment they are intended to occupy. For producing a gentle bottom-heat at this season, the use of the pits, and the leaves, which should be turned and sweetened before they are placed in the pits, and Sealale pots answer admirably for growing the plants in. A good sowing of several kinds should now be made for giving a succession of Melons. Put in the pits in good soil, as the young plants show the rough leaf, and keep them sturdy by placing close to the glass. Feed liberally plants which are swelling off crops of fruit. Beware of canker, in some places very troublesome. The best remedy for this is Serravallo's Potash, and also the parts affected. The pits should also be well ventilated by having apertures opposite the pipes if possible, in a line with the tops of the fruiting pots or hills. Fruit intended for keeping should be cut before they are quite ripe. *W. Coleman, Eastover Castle.*

HARDY FRUIT GARDEN.

Summer at last! has no doubt been the joyful exclamation of many, and to none has its advent been more welcome than to those who have charge of that department of the garden of which I write, and although unfortunately its coming now will not repair the misfortune of the season, yet to many of us such a change has been in time to save many Peach and Nectarine trees that appeared a month or so back to be in an almost hopeless condition, but which have since rallied, and during the last fortnight grown with surprising rapidity. As the season is now so far advanced, most of the short season left us, every assistance should be afforded in order that there may be no further check to their progress, and more especially will this help be needed to such as were transplanted during winter, and which are now in a very young state in light shallow soils that part quickly with what little moisture they contained. Dryness at the root is sure to bring on red-spider, and although this pest may always be held in subjection by frequent applications of cold water, either in the morning or evening, or to any good engine, trees should never be allowed to get into such a poverty-stricken state as to be liable to their attacks. Were mauling more generally resorted to, this would not be the case, as by its use the roots are maintained in a more uniform condition in regard to heat and moisture than they otherwise could be. It should be borne in mind that trees in hard elevated borders get but little benefit from any rainfall during the summer months, and having no natural shade such as is usually afforded by their own branches, what little water they receive is lost by evaporation, and the influence of sun and air acting with full force on a cracked and exposed surface. Mulching, however, should vary in thickness and material according to the nature of the soil to be dealt with, as that which is stiff and cold will not be covered to the same extent, or with such non-conducting material as is requisite for that which is shallow and poor. In the former case, a slight coating of half-decomposed leaves will be ample, while in the latter manure will have advantage, the juices of which may be gradually washed down and have a very salutary effect on the plants. Owing to the slow growth they have made both Morello and dessert Cherry trees are badly infested with black-fly, which, in addition to the damage they do to the young shoots, disfigure the fruit by the excreta they exude, and should therefore be taken in hand at once. The best remedy is to dip them in a wash made with Tobacco and Fowler's insecticide, using 4 oz. of the latter to a gallon of water, and Tobacco in the same proportion, as they are more liable to be injured by the former than by the latter, and their oily coats appearing to be proof against anything, except such penetrating mixtures as the above-mentioned when added together. Except on sunny walls, Pears are generally an almost total failure, and even the young shoots not required for laying in to vacancies, should be stopped back to within two or three joints of their base, in order to concentrate the sap and induce a formation of fruit-buds, of which it is to be hoped trees will this year set an abundance, as they are decided upon, as it is more than probable that many melons will be found working on the surface of the border, and on no account must these be injured or exposed at this critical period. *W. Coleman.*

THE
Gardeners' Chronicle.

SATURDAY, JUNE 30, 1877.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, July 2	Wolverhampton Floral and Horticultural Society's Show (two days). Royal Horticultural Society's Show (two days). Horticultural Society's Rose Show (two days).
TUESDAY, July 3	International Horticultural Society's Meeting of Fruit and Floral Committees, at 11 A.M. 1.1. Salisbury Horticultural Society's Meeting of Mr. Herbert's Collection of Palms, by Pucheran & Morris. Royal Botanic Society's Evening Fête. National Rose Show at St. James's Hall. Bournemouth and Western Horticultural Society's Show.
WEDNESDAY, July 4	Forty-fourth Anniversary Dinner of the Gardeners' Royal Benevolent Institution. Royal Horticultural Society's Orchids, by Stevens (three days). Royal Horticultural Society of Ireland: Spring Show.
THURSDAY, July 5	Wimbledon and District Royal Horticultural Society's Show. West of England Rose Show at Hereford. Tottenham Wells Horticultural Society's Show.
FRIDAY, July 6	West Kent Horticultural Society's Show.
SATURDAY, July 7	Southgate Horticultural Society's Show.

THE announcement in the daily papers that the COLORADO POTATO BEETLE has been found in full force in some fields near Cologne is unfortunately too likely to be true. It is not long since we heard of its introduction into Germany by means of a vessel trading between the United States and Bremen, so that its appearance near Cologne is nothing more than what might have been expected; and its presence in our own Potato fields may assuredly be expected to be announced at any time. It behoves Potato growers, then, to be on the look-out, and to take such measures as may be deemed most desirable. We have from time to time advertised to this new pest, having derived almost all our information on the subject from the writings of Mr. C. V. RILEY, the State Entomologist of Missouri, who has done excellent service, alike to science and to practical cultivation, by the exhaustive accounts he has published concerning the nature and habits of this and other insect pests. Mr. RILEY'S papers are to be found in the annual reports on the noxious, beneficial, and other insects of the State of Missouri, reports which justify the wisdom of our American friends in the establishment of such an office, and the still greater wisdom exercised in the selection of a man to fill it. Unfortunately these reports are not very accessible in this country. True, they may be found in some of the libraries, but the number who can thus avail themselves of Mr. RILEY'S information is but small. The beetle (*Doryphora 10-lineata*) is particularly objectionable; while in the grub or larva stage it not only destroys the Potato haulms, but the juices of the perfect insect have, in some instances at least, proved to be of a venomous character. The ill effects, however, seem to be only produced when large quantities of the insect are crushed, or burnt, or scalded, when the vapours produce the symptoms of poisoning by an acid or irritant substance.

Fortunately the Americans have discovered a remedy in the shape of Paris-green—"by means of intelligence and a little Paris-green," writes Mr. RILEY, "the American farmer is pretty much master of the *Doryphora*." Now as the Paris-green is a preparation of arsenic (arsenite of copper), and consequently a most dangerous poison, it is evident that a considerable amount of intelligence and no slight degree of care must be used in the employment of this substance, and more especially so in the kitchen garden. Still, within the last few years we are told that millions of bushels of Potatoes have been raised, the leaves of which have been most thoroughly sprinkled with Paris-green without any injurious effect on the tuber, or to persons using Potatoes raised in this manner. The Paris-green requires to be well-mixed with from twenty to thirty parts of flour or water,

according to the mode of use. The quantity which becomes incorporated with the soil is too minute to be of consequence, inasmuch as the substance speedily undergoes decomposition, and becomes converted into an insoluble and harmless substance. The Paris-green could not "well collect in sufficient quantities to be directly deleterious to man in the field in any imaginable way, while the injury through the plant in the case of the question, for the plant could not absorb enough without being killed. The idea that the earth is being sown with death by those who fight the Colorado Potato beetle with this mineral may, therefore, be dismissed as a pure phantasmagoria."

The most convenient method of using the Paris-green is as follows:—A tin can capable of holding about 8 gallons is made of a sheet of zinc, nailed on the back of the labourer, as a knapsack or Cassiobury fire-engine would do. To the lower end of the can are attached two india-rubber tubes, each terminating in a "sprinkler," like the rose of a watering pot. There is a convenient lever at the bottom which presses the tubes and shuts off the outflow at will. When about to be used, "two bucketfuls of green are first poured into the can, then three tablespoonfuls of good green well mixed with another half-bucketful of water, and strained through a funnel-shaped strainer, which prevents the larger particles of the green from getting into the can and clogging up the sprinklers. Five to 8 acres a day can be sprinkled by one man, and from 1 to 1½ lb. of good green, according to the size of the plot, will suffice to the acre. The walking-sprayer serves to keep the green well shaken, and the flow of liquid is regulated at will by a pressure of the fingers at the junction of the tubes with the metallic nozzles." It may not be amiss to suggest the absolute necessity of using the can and other implements employed in distributing the Paris-green for no other purpose whatever, and to insist rigorously on thorough cleanliness on the part of the workman when his work is done.

From the ninth report of Professor RILEY we gain some idea of what we have to expect:—"The captain of a New London vessel found that the insects boarded him in such numbers while at sea that the hatches had to be closed." On the Central Railroad, near Grinnell Station, the rails were covered with them for a mile, and after a few revolutions of the drivers the wheels lost the friction and slipped as if oiled. . . . the beetles had to be swept off and the track sanded before any progress was made." It is while in the larva or grub stage that the insect does most harm to the haulm (the tubers not being attacked), but it is while in the perfect, winged state that it has been distributed over a third of the area of the United States, its progress being simply limited by excessive heat or by the rarified cold air of the mountains.

One very interesting circumstance noted by Professor RILEY is, that the species as it has spread over the country has undergone modification in character. From a scientific point of view, as showing how varieties and species may originate, this fact is one of very great interest. Some questions as to this excite but feeble interest in comparison with the more directly practical matters to which we have alluded. Our object is to warn gardeners and farmers to be on the look-out, and to take active measures immediately the insect is detected. A figure of the insect is given at p. 55, vol. 1, 1874, and some further particulars may be seen in our review of Professor RILEY'S little book, entitled *Potato Pests* (New York: ORANGE JUDD & CO.), at p. 183.

The letter of Mr. FISH in our last issue will serve to draw attention once more to the CUCUMBER DISEASE, and to the means of eradicating it. Mr. FISH has on former occasions sent us distressing examples of the ravages of the disease, and we have received them also from other quarters. We can imagine his triumph when he sent us, a few days since, other specimens all but free from the disease, the happy result of the application of Mr. WORTHINGTON SMITH'S "Salus." Another correspondent sends us leaves of the Hollyhock

almost entirely free from the Hollyhock fungus, this freedom having been effected also by the use of Salus. In general we are apt to look with suspicion on any well-puffed remedy which is advertised to cure all the diseases to which flesh is heir to, and a great many more besides, knowing how defective the evidence in these cases usually is. Even when the good faith of the witness is beyond question we are disposed in general to be very sceptical and to inquire whether the alleged good effect is real and not imaginary, and, if real, if it is fairly attributable to the supposed cause. In the present instance the evidence is much better than usual. On the one hand we have a man of science whose researches into the nature of the Potato disease led him to experiment with various chemical substances known to be detrimental alike to fungi and to insects. The result was the compound known as Salus. On the other hand, we have practical and disinterested observers who could scarcely be mistaken, and their testimony is that the Salus does what is claimed for it. The substance in question acts not only as a destroyer of parasites, whether of fungous or of insect nature, but it clearly serves as a stimulant to vegetable growth, so that it may be in some cases that

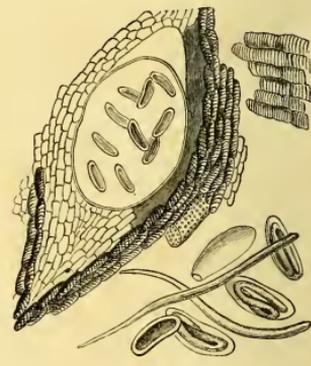

FIG. 134.—CUCUMBER DISEASE, SHOWING THE VIRUS HIGHLY MAGNIFIED.

the good it does is more due to its power as a manure than as an annihilator of fungi or of insects. Reverting to the Cucumber disease it is now well established in some cases that it is associated with the presence of very minute worms (fig. 134), which cause a swelling of the tissues of the root, an exudation of gum from the fruit, &c., and in the end general putrefaction. But we are not clear that the gumming of Cucumbers, or what is generally called the Cucumber disease, is always associated with the presence of these worms. In many of the samples submitted to us there have been no worms present, and it is clear the gumming might be due to some constitutional disease.

Whether we have to do with two forms of disease or only with one is the point about which we are not clear. The matter is of practical importance, because the Salus may be useful in the one case and not in the other, and if applied without discrimination it may produce disappointment, and suffer unfounded loss of reputation. At any rate, there seems every reason to believe that Mr. SMITH is once more entitled to receive the congratulations of his friends, and the thanks of the body horticultural at large.

— We have been requested to make public the following statement important to BULB IMPORTERS and PURCHASERS:—"The Society of Bulb and Seed Merchants, 'Eusebisten-Vereening,' founded at Haar-

lem with the object of promoting the interests of the BULB TRADE, held an extraordinary meeting on May 28, in order to discuss the actual condition of the Hyacinths now standing in the fields, and considering the unfavourable symptoms that have therein appeared since the middle of May, the following motion was proposed and carried unanimously. The opinion of the meeting is—

"1. That in consequence of the late unfavourable weather, the bulbs of many sorts of Hyacinths will most

belongs to a butcher who had purchased some American bacon. The fact was immediately notified to the Ministry of Agriculture. Should this report prove to be well-founded, there is no saying how soon the pest may make its appearance in this country. Potato growers should keep a vigorous look-out for the enemy, and adopt the measures mentioned in another column.

— The *Revue Horticole* speaks of a new WHITE CINERARIA shortly to be distributed by Messrs. VIL-

the last meeting of the Floral Committee was LILIUM ELEGANS ALICE WILSON, exhibited with several other fine Lilies by G. F. WILSON, Esq. The flowers are of fine size, of a bright orange-yellow colour, and very distinct. In habit the plant somewhat resembles *L. dahuricum*.

— The well-known herb RAMFION (*Campanula Rapunculus*) deserves much more attention as a garden flower than is generally given to it. In Messrs.

FIG. 135.—DAVIDSONIA FRURIENS. (SEE P. 820.)

probably not grow to their usual size, and apparently there may be some sorts of which only very small bulbs, if any, will be obtained this season.

"2. That, although at present it cannot be ascertained whether this check in the growth of the bulbs will also affect their flowering, it is beyond doubt that coming mild weather will have a favourable influence on the blooming of the Hyacinth bulbs next spring."

— A telegram sent from Cologne to the *Daily News* through REUTER'S Agency, and dated June 25, states that the Colorado beetle, in every stage of development, was discovered on the previous day in a Potato field in the vicinity of that city. The field

MORIN. The history of this new form is this. M. IGNACE, a foreman in the employ of Messrs. VILMORIN, selected four of the double Cinerarias sent out by MM. HAAGE & SCHMIDT, with a view of fixing and improving the variety. From the seeds produced by these he obtained a progeny of only three plants, mostly with semi-double flowers. With a few exceptions, in which the colour was slightly spotted with red or violet, the flowers produced on the three plants were of a pure white. This year the production of white flowers has been even more abundant, so that the variety may be considered as fixed.

— Amongst the various subjects certificated at

CARTER & Co.'s seed grounds at Dedham there is now a large plantation of it in full bloom, being grown for seed purposes. It attains a height of from 2 to 2½ feet, and at this season of the year the plants throw up long spikes of mauve-blue flowers. The seed was sown in the open ground thinly, in drills, in May, 1876, and thus is in full bloom in a year from the time of sowing.

— Lying before us are the schedules of prizes offered by two societies for FLORAL DECORATIONS at their approaching exhibitions, and characterised by very different features. One of these refuses to allow any one to compete who is not a lady-amateur of the

district, or a lady-member of the family of a subscriber who is also an amateur. In the other schedule all the classes are open. We shall watch the result of these two shows with much interest, because we entertain the belief that, as amateurs have so often beaten professionals, so will they continue to run away from them in the race if they will only think over and make notes beforehand of what they are going to use. The exclusiveness of the West Kent Horticultural Society appears to us unnecessary; while the Royal Botanic Society's determination to throw all the classes open will afford amateurs an opportunity of showing how well light and original groupings will contrast with the more stereotyped arrangements of professional decorators.

— At the sale on Tuesday last of Mr. WILLES' NEW DRACENAS, the entire stocks of D. Scottii, D. Renardii, D. Frederici, D. superba, D. Beckleyi, D. Bausci, and D. Mrs. Bausci, were purchased by Mr. B. S. WILLIAMS, for £195.

— Colonel PUCKLE sends us the following interesting note respecting the SUPERSTITIONS of the HINDOOS in relation to TREES:—

"The tree most generally worshipped by them is the ASWATHA—*Ficus religiosa*—from its having been declared in the Bhagavadgita to be the most sacred of all trees. It is moreover supposed to represent the Trimurti, the root being considered as the abode of Bramha, the stem of Vishnu, and the top of Shiva. There are four kinds, each being named according to the four castes of Hindus, viz. Aswathi, Khasthiya, Vyashiba, and Sadra. The Bramha kind is preferred to the others.

"The ceremony of the marriage of two Aswatha trees is exactly analogous to a marriage between a man and a woman. A stone platform is erected around the trees, and between them a Neeam (*Margosa*) tree is generally planted with a Bilpatri (wood Apple) close by. This is done under the belief that if raindrops fall upon the fruits of the Neeam tree (which are held to resemble a Linga, Shiva's emblem), from the points of the Aswatha leaves or Panivattam, the planter of the trees will secure to himself that bliss which is only otherwise attained by undergoing to bathe the image of Shiva with roco pots of water.

"The expense attending on the celebration of such a marriage is sometimes so great that it is usual to leave them unmarried; a Neeam tree is, however, almost always planted by the side of an Aswatha, and ignorant people suppose that the former is wedded to the latter. The Bilpatri and Neeam are also witnesses to the marriage."

— The marriage, by the Rev. GEORGE HENSLOW, of Professor DYER to HARRIET, eldest daughter of Sir JOSEPH DALTON HOOKER, K.C.S.I., Pres. R.S., and Director of the Royal Gardens, Kew, took place on the 23d inst., at Kew.

— Among Mr. EULL's new plants not as yet sent out is one which the name DAVIDSONIA FRIESENII is attached. A plant under this name is described by Baron VON MUELLER in the sixth volume of the *Fragmenta Phytographia Australis*, 1867, p. 4, tab. 46, and assigned to the order Saxifragaceae. In spite of sundry discrepancies between Mr. EULL's plant and the published description above referred to, we have little doubt of the identity of the cultivated plant which is described by Baron VON MUELLER, though it is so very unlike most Saxifragas in general aspect that a doubt as to its affinity may, perhaps, be pardoned. The cultivated plant has not yet flowered, and at present it is but small. It appears, however, to be of arborescent habit. The stem is thickly clothed with villous hairs; the leaves are very graceful in their recurved habit and singular form, and in their young state are specially beautiful, from their dense investment of crimson bristly hairs. The leaves are alternate, unequally pinnate, 12–18 inches long, on short stalks, thickened at the base, and provided with suborbicular, acuminate, sharply toothed leafy stipules. The pinnae, or leaflets, are articulated to the rachis, and arranged as leaflets, with one odd one at the end. In form they are oblong-lanceolate, shortly acuminate, irregularly denticate. The terminal leaflet is blunter at the end than the lateral one, and tapers at the base into a short stalklet, which, like the principal rachis of the leaf, is bordered on each side by a narrow foliaceous wing deeply cut up into sharp villous teeth. The uppermost leaflets are 6 to 8 inches long by about 3 inches

in breadth, the pairs being about 2 inches apart. The leaflets gradually decrease in size from above downwards till the lowermost are represented merely by very small leaf-like processes. The terminal pinna seems sometimes to be destroyed in the young state, in which case, of course, the leaf becomes pinnatifid. The plant is a native of north-east tropical Australia.

— FREMONTIA CALIFORNICA is now in splendid bloom on one of the walls at Kew. The upper part of the tree forms quite a sheet of yellow, and with such neat foliage and compact habit can only be mentioned as one of the best trees for a wall covering. It does not thrive in the open, and this only is its true position.

— There is every reason to believe that, as far as the probable HARVEST OF SEEDS is concerned, many things will fall very short of the ordinary yield. The prices of Sweetes and Turnips, for instance, are expected to rule very high, and indeed there has already been a marked advance. This advance may already be temptations to those who would evade the Seed Adulteration Act; but we trust that the good sense of the trade will at once stop the iniquitous practices which led to the passing of that Act, and which up to this time has worked well. All the Brassica crops are very late, owing to the long wet winter and the comparatively sunless spring. The harvest depends so much on the autumn, and many of the seeds sown then did not grow kindly and rapidly as usual, owing to the ground being soddened with wet; and the plants put out to stand the winter to seed this summer made but little root in the autumn. The wind blew them about on the soft ground, and the wet filling up the void made many of them rotted. Things are very much later than usual, and what is urgently required by seed growers is a fine warm genial time to mature the seeds now in pod as thoroughly and quickly as possible.

— The rich Iris collection at Kew has recently been a fine display. The latest of these, now in flower, are *I. Niphonia*, *I. notha*, *I. ochroleuca*, *I. Monnierii*, and *I. variegata* var. *clatior*. They are all distinct and desirable.

— One of the MARICAS, perhaps *M. Northiana*, is much grown as a window plant in that part of the borough of Oldham, Lancashire, known as Roydon. Many of the windows contain from one to three or four examples, some of them of large size, and remarkably well grown. Its blossoms are somewhat fleshy, but its Iris-like evergreen character is always fresh and good, and therefore acceptable as a window plant. The operatives and others who make a pet of this plant have evidently hit upon a capital mode of cultivating this somewhat scarce representative of an interesting genus.

— A patch of PAPAVER SOMNIFERUM in double and highly coloured forms, flowering in the herbaceous ground at Kew, remind us how very effective it is when sown broadcast in park shrubberies and similar places. Foxgloves in a variety of colour are also handsome for the same purpose.

— A copy of the ninth annual Report of the *Noxious, Beneficial, and other Insects of the State of Missouri*, by CHARLES V. RILEY, is before us. Like its predecessors, it is full of valuable information, practical and scientific. The value of such publications, in the future, can hardly be overrated, and they reflect great credit alike on the sagacity of the Government which distributes them, and on the talent and industry of their author. The insects treated of in the present report are the several Curran and Gooseberry worms, their habits, and the best means of extirpating them; the Pine worm, the Colorado Potato beetle, the Army worm, and the Rocky Mountain locust.

— A few PLANTS in the HERBACEOUS GROUND at Kew attract our special attention. The first of these, *Galax aphylla*, is somewhat rare. It has a dwarf, compact mass of dark green leaves, through which appear a number of graceful spikes of white flowers. *Tropaeolum polyphyllum* is very effective with its trailing stems of dense, glaucous leaves and golden flowers. *Bahia lanata* is a pretty silver-leaved Com-

posite, now bearing a mass of showy yellow flowers. *Gilia trifoliata* is extremely pretty; its stems are red, and the pure white flowers are very pretty in contrast. A well-established specimen of *Sarracenia purpurea* is flowering freely.

— In reference to the DINNER to Mr. F. W. WILSON, at the "Criterion," on Tuesday next, we are desired to state that friends who cannot conveniently obtain tickets may secure places by an intimation on a post-card addressed to Mr. J. MACKENZIE, 1 and 2 Great Winchester Street Buildings, E.C. The forwarding of a small sum of money is often a matter of difficulty, and in this case the ticket can be paid for at the dinner-table.

— TECTONA GRANDIS, the Teak tree of India, is generally found a difficult plant to grow, and indeed is often spoken of as a difficult plant to keep alive. That this need not be so, is evident by inspection of plants in the Economic-house at Kew. A seedling of about two years old is growing vigorously, and has leaves 11 inches long by 6 inches broad. Another plant of greater age is equally healthy, but the leaves are smaller and the growth short. The greatest enemy is red-spider, and no plant is more liable to attack. To this pest may be attributed nearly all the difficulty of its culture. Cleaning with a sponge is of little use from the many recesses afforded by the roughness of the leaf; and an efficient remedy will be found in the use of sulphur, which should be dusted at intervals of a few days so as to cover every part. After a few applications there will be no further trouble for some time. During the time of growth there should be no lack of water, to ensure which it is an excellent plan to stand the plant in a saucer of water. After the growth is completed a moderately dry season of rest is requisite. The warmest stove temperature is desirable throughout the year.

— We understand that Mr. B. S. WILLIAMS has sent as a contribution to the forthcoming INTERNATIONAL HORTICULTURAL EXHIBITION AT OPORTO, a choice collection of over a hundred new and rare plants, including Palms, Cactons, Dracenas, Ferns and Orchids.

— Four large specimens of AGAVE AMERICANA have started their flower-spikes in the gardens of T. A. BORRIEM SMITH, Esq., Tresco Abbey, Isles of Scilly, and are growing rapidly at the rate of from 6 to 9 inches per day. This rate will increase as the spikes get higher. Several others show indications of flowering this summer. There are also two beautiful small green-leaved Agaves (marked here *Mild*), which have thrown up flower-spikes at present 4 feet high, flower not yet open. They are very interesting plants. Mostly all the old flower-spikes of the large number (forty-eight) of American Aloes that flowered here in 1875 are still standing. Only one flowered last year, and that had been damaged and lost its centre spike by being overgrown by a large *Fuchsia*, but it threw up three small spikes from the axils of the leaves at the base of the plant.

— The annual exhibition of WINDOW PLANTS grown in the CITY OF LONDON will take place in the gardens of Finchley Circus, on Tuesday, July 10. The Right Hon. the Lord Mayor will open the exhibition at half-past twelve o'clock, and the prizes will be distributed by Her Grace the Duchess of WESTMINSTER at 5 o'clock.

— PHORUM TENAX is flowering freely in the Tresco Abbey gardens, Isles of Scilly. The spikes are 6 feet long and more. At the present time the gardens are very gay with choice flowers. The beautiful *Metrosideros floribunda* is in full flower, and also *Dracena indivisa* or *australis*, perfuming the gardens with sweet odours. The curious *Puya chilensis*, figured in our columns 1872, p. 1102, had four large flower-spikes this spring.

— A correspondent writes to protest against the symbolism employed by some teachers, which is often misleading. Our correspondent seeing an announcement of an address on the "Causes of Failure in the Vineyard," naturally bethought himself of *Phylloxera*, Oldium, shanking, scorching, and the like; but he quickly found that the address was of a theological not viticultural nature.

flowers all the year round; its sweet-scented delicate rosy flowers are indeed most useful to those in search of flowers suitable alike for bouquet or decorative purposes. *Vanda teres* is also flowering freely. I noticed two plants in flower, about 3 feet high; the shoots had been tied down to prevent them from touching the glass, and Mr. Knight, as he stated some time since, attributes his success in flowering to the tying of the shoots down. There is doubtless something in this, although in years of the 16th Mr. Munro of Finnart Gardens, Garelochhead, Dumbarton, states he has a plant 3 feet high with three spikes, eleven flowers on each spike. This is very remarkable; these I notice had a spike of four flowers each only. *Vitis heterophylla variegata* is also a most useful plant for the decoration of a conservatory; when grown, as seen here, on a trellis 4 feet by 3 feet, beautifully coloured, this will prove another grand acquisition to those in search of the like. Mr. Knight, the gardener at Floors, to whom great credit is due for the grand condition everything is in, both outdoors and in, seems very fond of trying experiments with such as mentioned, and I was glad to see he was amply repaid for his labours. *A. O.*

Euconymus japonicus in Bloom.—I send you herewith a branch of this shrub in flower. For the information of those who may not have seen it, I may explain that the flower is very pale green, and has four sepals, petals, and stamens, the latter arising

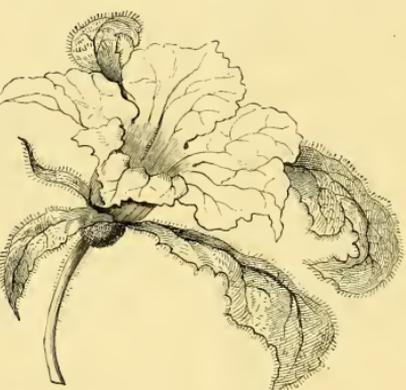

FIG. 136.—CUCUMBER FLOWER WITH LEAFY CALYX.

from a dark green ridge, which surrounds the ovary. The stigma is simple, crowning a quadrangular pyramidal ovary, in which there are grooves opposite the stamens. On the plant were a few white leaves, and also a few striped with white. I found it in the nursery grounds of Mr. C. Davies, at Blackpill, near Swansea. Has it flowers elsewhere? *W. T. Z.* [It flowers very sparingly in our Middlesex garden every year, and on the south coast frequently. *EDS.*]

Bedding Violas and Pansies.—I am more and more convinced that the best method to secure a continuous bloom on these plants, with freedom from that sudden shanking-off so common to the Pansy in hot weather, is to plant in the autumn. Beds of many kinds here, that have remained untouched all the winter, are grandly in bloom, and have been so for a long time, whilst those planted out during the spring and early summer are still small, and not nearly so robust as could be desired. During hot summers I have found that every spring-planted plant of certain kinds would die off in a few weeks, whilst some autumn-planted ones remained alive and robust. This is an important fact, and cannot be too warmly made known. It applies, however, only to warm situations, as farther north Violas thrive gloriously. *A. Z.*

Ferns at The Mumbles.—In addition to the list given last week I can now mention having found *Osmunda regalis*, *Lastrea Ocreopteris*, *Blechnum spicatum*, *Asplenium marinum*, and the red-stemmed variety of *Filix-foemina*. These occur within 2 miles of the place; and I am told that within the same radius may be found *Lastrea Foeniculi*; but I have

not yet walked in the direction in which that Fern grows. I am also informed that there is a valley within 3 miles of this where the Royal Fern grows 15 feet high, and where *Polypodium phegopteris* is also found; I can believe the latter without seeing it; when I have seen *Osmunda* of that height I will believe that also. The commonest Fern about here (excepting Brake) is the Lady Fern; and the most frequent variety of it is the pale green plumose one, the midrib of which nearly describes a semicircle. *W. T. Z.*

Vanda coerulescens Boxallii.—This *Vanda* is a flower with a fine spike of some fifteen to twenty flowers, at the present time in the collection of Provost Russell, Falkirk, N.B. It is one of the importations of Mr. Low, and answers to the description given in *poets* of the 16th inst. *A. O.*

Entomological Specimens.—On p. 766 you advise "W. G. P." to use Laurel leaves to kill butterflies. This mode is slow, and the leaves have to be renewed often. The following I find to be the best and easiest, and costs only a few pence. Get a short bottle with a large neck—an old pomade bottle will do; into this scrape 1 oz. of cyanide of potassium (be careful, this is a powerful poison); over this place a piece of paper or cardboard, and on the top a quarter of an inch of plaster-of-Paris. Leave the bottle open till this dries, then keep it corked. An insect put into this is stupefied in about thirty seconds,

the cultivation of trees suited to the climate of Scotland, and to prevent the feuing of the ground for millings, &c., they only have spoiled the amenity of the gardens, but would have been productive of much injury to the plants by the smoke which would have been carried over the gardens by the west winds. Mr. Alexander Beattie was the first with whom he communicated on the subject, and through him he was enabled to bring the matter to the notice of Mr. W. H. Smith, Secretary of the Treasury. The First Commissioner of Works, Lord Henry Lennox, approved of his proposal, in which also he was supported by the Lord Justice-General, the Duke of Buccleuch, and others. No one took a warmer interest in the scheme than the President of the Society, Sir Robert Christison. His next step was to go to London, and personally to bring the matter under the notice of the Treasury. He was introduced to the Secretary of the Treasury by Dr. Louis Playfair, their zealous University member, who always takes a great interest in anything connected with the promotion of science. Having laid the case fully before Mr. Smith, shown him the plans of the ground, and urged the importance of making such an addition to the Royal Garden, he was enabled to inform him that the Chief Commissioner of Works had seen the ground, and considered that it would be a most important and valuable acquisition. Mr. Smith stated that if it were proved to him that the town of Edinburgh would be enabled to bring the matter contributing to the acquisition of the ground, he would hand it over to Government, the arborium would be put under regulations similar to those of the London parks, and would be supported in all time coming by an annual grant from Government. On returning to Edinburgh he waited on the Lord Provost. To him he made a complete statement of the matter, showed him the nature of the grounds, the advantage which this acquisition would confer upon the city and upon science, and asked him to submit the matter as soon as possible to the Town Council. The Lord Provost entered most enthusiastically into the plans, and said he would do all he could to further the scheme. Many difficulties presented themselves, but by his energy, tact, and enthusiasm he overcame them all, and to his lordship the city was indebted for this important addition to its public gardens. The Government was pledged to enclose the grounds and complete the arrangements in two years, and he therefore hoped that immediate steps would be taken to fence the grounds and begin the building of the lodges at the different entrances. To £8,400, the sum for which the town was assessed, did not include the money required for the purchase of the house and garden for the Regius keeper. These, as well as a small piece of additional ground belonging to Mr. Rocheid, of Inverleith, had been purchased by Government for £4,900. In granting this lot to the Regius keeper, the Government had deprived him of all his salary, amounting to the sum of £120 per annum.

The Chairman said that the Society would be delighted to hear of the successful results of the negotiations with the Treasury, and he thought that the adoption of the Inverleith grounds to the Botanic Garden was the greatest improvement of the city of Edinburgh, in a sanitary and educational point of view, which had taken place during the last thirty years.

The following communications were read:—
I. *Notice of a fungus growing in immense profusion on the ceilings and walls of Inverleith House.* By Professor Balfour.—Professor Balfour remarked that Inverleith House (recently purchased by Government for the Regius keeper's dwelling) took fire on August 24, 1876, and he thought that in the attic, the partitions of which were wooden. The supply of gas for extinguishing the flames being deficient, his assistant, Mr. Sadler, suggested that piping should be carried over the wall to the pond in the Royal Botanic Garden, and be thought that the water in the engine be sent there to pump up the Regius. This suggestion being complied with was the means of preventing the total destruction of the building; the roof and upper storey, however, were completely destroyed. The house has remained in this state ever since, exposed to the rain and wind of last winter. An attempt was made to cover the house with tarpaulin, but the wind was too strong to allow it to remain. Sawdust about a foot deep was put to soak up the water in the rooms, but being left all winter on the floors, it did more harm than good. The ceilings, plaster on the walls, &c., are all destroyed. The flooring, which was particularly well laid, is useless, and the house cannot be habitable for at least nine or ten months. Fortunately, the insurance on the house yielded Government £1,700.

There is a Scotch proverb, "It is an ill wind that blows nobody good," and so in this case. Amidst all this moisture, destruction, and desolation, there has sprung up on the ceilings and walls of almost all the rooms in the house—drawing-room, dining-room, and bedrooms—mouldy and toxic fungus. This was first noticed by my daughter, who brought me a beautiful specimen of this lilac-coloured fungus, which she had picked up on the floor, and which had fallen from the ceiling. It is a very interesting

and may then be taken out to examine. If wanted, put it back, a few minutes more will kill most butterflies (moths are most tenacious of life); if useless, leave it in the open air, it will soon revive. Better not keep the bottle in your bedroom. *A. W. C.*

Burnet Rose.—The sandy shores of Swansea Bay are covered with sheets of white flowers, which upon closer inspection prove to belong to a dwarf Scotch Briar, seldom growing there higher than 15 inches. The blooms perfume the air for some distance with their fragrance. Its suckers extend for a long way underground, and then grow erect generally for 8 or 10 inches high, with side-shoots less than 2 inches long, each terminating in a flower. What is the species? One of the leaves has two galls. *W. T. Z.* [*Rosa spinosissima*. The galls are very common. *EDS.*]

Reports of Societies.

Edinburgh Botanical.—The Society met in the lecture-hall at the Royal Botanic Garden on June 14. Dr. Cleghorn, V.P., in the chair.

The Arboretum.—Professor Balfour said that this was the first meeting of the Society since the arrangements with regard to the formation of an arboretum had been completed by the Fettes Trustees, the Town Council, and the Government. Twenty-seven acres of ground had thus been added, and the garden now embraced 54 acres. The first steps for the addition were taken by him three years ago, with the object of having room for

species, having never been described before. It has spread most rapidly by means of its minute spores, which are scattered in millions like smoke when the plants are touched. It is now to be found in all parts of the house, and the spores must be inhaled largely by any visitors.

Another very interesting fungus, there is also another one which Mr. Turner noticed (another species of the same genus), but which has only once before been noticed. There is also a very pretty *Coprinus*, which has not yet been carefully examined.

Specimens of the fungi have been transmitted to the Office of Works for inspection and preservation, and Dr. M. C. Cooke, the great fungologist, India Office, London, has drawn up full descriptions with figures of the species, which will appear in the next part of the Society's *Transactions*.

It may be observed, that a botanical investigation is required before the species can be determined, and ere long we hope for a coloured drawing to commemorate the events connected with the preparation of the old mansion-house of Inverleith as an official residence for the Regius keeper of Her Majesty's garden in Edinburgh.

II. Remarks on some British Plants in the University Herbarium at the Royal Botanic Garden. By Mr. H. M. Webb.

III. Notes on a Botanical Excursion in North Wales. By Mr. C. Druce, communicated by Mr. Sadler.—Mr. Druce's paper details the principal plants seen by him during an eight days' excursion into North Wales. It appears to have limited his exploration to the usual tourist tract, visiting such places as Llanidloes, Betws-y-Coed, Dolgellau, and Gwynedd, Capel Curig, the localities of some Arctostaphylos rarities, Llanberis, and Snowdon, so that the list he gives adds very little to information that has long been in print. The two plants that have not perhaps been heretofore recorded from the locality he visits are *Spergularia rupestris* and *Polygonum Rasil*, both of which he mentions, with what critical species. Amongst the rarities, he says that after long search he found a single plant of the *Comeaster* on Orme's Head (showing that it has not yet been fully carried away piecemeal, as has been reported). The two species of *Elatine* were obtained from Llyn Coron, where they were first found by Mr. Wilson. *Hellephantem Breweri* was got near Holyhead, and *Sella verna*, *Orbanche Hederae*, *Silene nutans*, *Rubia perigrina*, *Hellephantem comanum*, *Epilactis ovalis*, *Wahlenbergia*, *Sedum Fosteri*, *Loisel. Dortmanna*, *Viola Curtisi*, *Knapia*, *Woodia ilvensis*, were gathered from well-known localities. The *Lloydia serotina* was not obtained. The district Mr. Druce traversed abounds in natural beauties, and as a botanical area has the merit of being the first explored in Wales and the only one named in the *Chronicle*. It was visited by Ray, Sherard, Dillenius, Brewer, &c., and during the last hundred years by most of our British botanists.

IV. Notes on Open-Air Vegetation for May. By Mr. M. N'ab, Curator. (This paper is given at p. 2.)

V. Note on the Fruiting of Holly. By Mr. M. N'ab. (This paper appeared at p. 78.)

Crystal Palace Rose Show: June 23.—If the directors of the Crystal Palace Pansy will not act upon timely warnings, but will persist in holding their annual Rose show at a time when, comparatively speaking, there are no Roses, they cannot wonder at the immense falling off in the display of Roses brought together on Saturday last. The show was at least a week too early, for so backward has been the season that many of the best exhibitors at the Palace show had not even been in appearance at all. Both as regards numbers and quality it was much behind former exhibitions held here; therefore we shall not inflict a long notice of it upon our readers, and the more so as we shall have to next week to speak of the doings at the Alexandra Palace and St. James's Hall.

The nurserymen's class for seventy-two single trusses brought out only four exhibitors, and the prizes were awarded to the following in the order named:—Mr. Henry May, Hope Nurseries, Kinkington; Messrs. Paul & Son, Tottenham; Mr. Turner, Slough; and Messrs. Mitchell & Sons, Pitt-down. Mr. May's flowers, which, of course, could not have been grown in the open air, were, on the whole, uncommonly good for the time, and included many of great beauty. The finest bouquets, judged by their size and ornamental brightness of colour and freshness of appearance, were those of Camille Bernardin, Prince Fortia, Comtesse de Paris, Paul Néron, Captain Christy, Marie Baumann, Etienne Levet, a most perfect bloom; François Michelon, Le France, Antoinette Duchery, and the Duke of Devonshire. Madame Lacharme, splendidly shown in many collections; Louis Van Houtte, and Madame Villermoz, &c. In the 2d prize collection, from Messrs. Paul & Son, we noted perfect blooms of Monsieur Nomant, Annie Laxton, and Maurice de la Roche. The 3d prize collection, Sultan of Zanzibar, Marchal Niel, François Michelon, Devonensis. Mr. Turner's flowers were smaller than those of his more successful rivals, but

very fresh and clean. In the next class, which was for forty-eight varieties, three trusses of each, Mr. Turner's collection of Messrs. Paul & Son, was the champion in 1st, the last-named firm being placed 2d. Mr. Turner had some splendid blooms of La Belle Lyonnaise, Madame Lacharme, Chesnut Hybrid, Royal Standard, Marguerite de St. Amant, Elie Marie Marguerite de Castillane, Duke of Edinburgh, alba rosea, Rev. J. B. M. Camm, and John Hopper. Amongst the Chesnut flowers were exceedingly good representatives of Boule de Neige, Annie Laxton, Abel Grand, Madame Lacharme, Navier Oilbo, Boule de Neige, and Hon. Mrs. Vernon. For twenty-four varieties, three trusses of each, Messrs. Paul & Son came in 1st, and Mr. Turner 2d, both showing good collections. Mr. H. May also showed a fine series, but having unfortunately misunderstood the terms, and so the exhibition was drawn out. For twenty-four varieties, three of each, Mr. G. W. Piper, of Uckfield, was 1st, and Mr. Meadmore, of Romford, 2d.

Very few amateurs took part in the competitions reserved to them. The best forty-eight distinct single trusses came from Mr. J. Davis, The Square, Wilton, whose flowers were small, but very fresh and nice. J. Hollingworth, Esq., Turkey Court, Maidstone, sent the best twenty-four varieties, an excellent lot, and Mr. J. Davis was 2d in the class. The 51st-named, Duke of Edinburgh, 2d in the class for thirty-six, in which Mr. Jowitt, The Old Weir, near Hereford, was a good 1st. Mr. J. Ridout, got to J. B. Hayward, Esq., Woodhatch Lodge, Reigate, sent the best dozen, an especially good lot, and the 51st-named, Duke of Edinburgh, Rev. J. B. M. Camm, Monkton Wyld, Charnmouth.

New Roses were shown only by two growers in the classes for twelve distinct blooms of varieties sent out in 1875-76—and for six blooms of any variety sent out during the same years, and the 1st prize in both instances went to Messrs. Paul & Son. Mr. Turner taking the second honours. In the first-named class Messrs. Paul & Son showed Avocat Duviérier, Miss Hassard, Madlle. Prosper, Langier, Marchioness of Exeter, Marguerite Bussac, Duchesse de Vallambrosa, Abel Carricre, Emily Laxton, Sir Garnet Wolseley, Souvenir de Arthur Sansal, Sultan of Zanzibar, and Oxonian. The blooms of Emily Laxton and Sultan of Zanzibar were particularly fine of their kind; the last-named is very rich in colour. Mr. Turner's collection consisted of Sultan of Zanzibar, Hassard, Mrs. Baker, Rev. J. B. M. Camm, Marchal Robert, John Stuart Mill, Duchesse de Vallambrosa, Madame F. Jamin, Monsieur Fournier, Oxonian, and Souvenir de Arthur Sansal. In the other class, Messrs. Paul & Son showed a fine half-dozen of Marchioness of Exeter, which were 1st; and Mr. Turner a capital lot of Miss Hassard. Messrs. Paul & Son also showed Emily Laxton, in very fine form.

One of the best boxes of Roses in the show was that containing twelve sea-ascended and Noisette varieties, exhibited by Messrs. Mitchell & Sons, and which took the 1st prize in their class, Mr. Turner being 2d. The Messrs. Mitchell's blooms, all of well-known varieties, were remarkably fine, fresh, and chaste. Mr. Turner's collection, the classes of Marchal Niel, very good, but not so fine as this variety has been shown. The best collection of yellow Roses also came from Messrs. Mitchell & Sons, but they were not quite up to the mark. The next best were very poor. Mr. Turner was 1st for a vase or epergne of 24 buds and Rose-hedge, and 2d for a vase to W. O. Hanbury, Esq., Weald Hall, near Brentwood, being 2d.

Of "40 bouquets and objects of ornament in natural flowers" the display was somewhat extensive, and Mr. Turner's bouquet was worst in appearance before, as usual attracted a great deal of attention from the visitors. For table decorations the leading exhibitors were Mr. Chard, Mr. E. Spelling, Grosvenor Road, South Norwood, and Mrs. Todd, Weald Cottage, near Brentwood. The competition in this class was being very strong. The best wedding bouquet came from Mr. S. Moyses, Stockbridge Terrace, Belgrave, and the best opera bouquet from Mr. Hepburn, of the Crystal Palace. Mr. Turner was 1st for a vase of bouquets.

Miscellaneous subjects included an excellent display of hardy herbaceous plants from Mr. Parker, a beautiful collection of skeleton leaves and flowers from Mrs. Hodgkins, Hyde Grove, Manchester; some fine Finks and Carnations from Mr. Turner, Ardenham, near Mr. Cannell, cut and dried from Mr. C. Burley, and cut Roses from Mr. Corp.

Scottish Pansy Society's Show.—The thirty-third annual competition of the Scottish Pansy Society was held in Edinburgh on the 15th inst. The show was more of a success than was anticipated from the backward spring. The flowers exhibited last year were remarkably good, and the prizes were submitted to the decision of the judges by nurserymen, gardeners, and amateurs, and many of the exhibits came from comparatively distant loca-

ties. At a general meeting of the Society held in the afternoon Mr. W. Paul, Paisley, President of the Society, in the chair, it was agreed to hold next year's show a week later than usual, in order to induce a larger number of competitors to come forward; and that the entry-money of £2, payable by competitors on entering each exhibition stand, be abolished. The following are the names of the varieties which were adjudged the best of their class:—Dark self, Michael Saunders; white self, Princess Beatrice; yellow self, Zama; blue self, Sunnypark Rival; white ground, Jeannie Fleming; yellow ground, Jeannie Fleming; Burns; flower in bud, Michael Saunders, shown by Mr. Paul, Paisley. A First-class Certificate was awarded to Mr. Paul, Paisley, for three blooms of seedling white ground Pansy Annie Wood. A Certificate of Merit to Mr. Todd, Newcastle, for one bloom of seedling yellow ground, Rev. J. T. Burton. A Certificate of Merit to Mr. Paul, for one bloom of seedling mauve self, Michael Saunders. The following were among the finest named blooms:—Fancy Pansies: The Bride, James Currie, James Taylor, J. B. Downie, Lizzie Cowan, Isa, Mr. Meeking, Rev. H. Donbrain, Miss Wallace, Mrs. Taylor, Buttercup, W. Nimmo, M. Scott, Auntie Cuckoo, W. Melville, Thos. Grainger, John Currie, F. W. Leland, W. Broadbent, Kirby, Hon. Mrs. Jas. Inglis, Jas. White, Fortia, Miss M. Stewart, Mrs. J. Taylor, Mrs. Birkmyre. Show Pansies: Jessie Foot, Robert Black, Jenny Anderson, Robert Burns, Bessie M'Aslan, Mrs. Athur, Miss Hope, Annie Wood, Paul, Miss Rogers, May Queen, Michael Saunders, Mrs. Todd, Newcastle, Jeannie Fleming, Princess Beatrice, Zama, Jeannie Fleming, Mrs. Fraser, Mrs. Horsburgh, D. M' Hutcheson, Royal Blue, D. Sutherland, Ebor, John Waterston, Captain Knowles, Jeannie Grieve, Rev. J. T. Burton, Sunny-land, Mrs. M. Stewart, *Christyford*. The following is the prize list, for which we are unable to find space. Eds.]

Disse Horticultural: June 20.—This exhibition was held in conjunction with the annual gathering of the Norfolk Agricultural Association held this year in the above town. The latter body acted as the disposal of the committee of the flower show the sum of £75, and this with subscriptions and donations enabled the committee, of which the Rev. H. T. Frère, of Burnton Rectory, Diss, was honorary secretary, to procure a most splendid series of prizes. A horticultural society formerly existed at Diss, but died out for want of public support, but it is hoped that the holding of the above exhibition will be the means of again starting the defunct society. The owners of the neighbourhood ought to furnish material for a good show.

The exhibition took place in the grounds of F. Chase, Esq., closely adjoining the Agricultural Show. It was by no means large, but then it was the commencement of what it is hoped will become a permanent institution. The Rev. H. T. Frère, of Burnton, and Miss Taylor were the principal exhibitors of stove and greenhouse plants; and some small but nicely grown exotic Ferns came from C. Mason, Esq. (H. Reeve, gr.), and G. H. Wilson, Esq. Mr. Mason's plants were most excellently grown examples of *Todea hypophyllodes*, of good size and in capital condition. Strange to say they were all differently named, some of them after entirely distinct species bearing no resemblance whatever to them.

The group of six variegated *Zonal Pelargoniums* shown in the greenhouse was very fine in strong force in growth and finish to anything staged at the exhibition of the Pelargonium Society at South Kensington on the previous day. The Balsams from Miss Steward and G. E. Frère, Esq., the Cockscombs from the last-named exhibitor, Messrs. Wilson, Esq., and the Rev. H. T. Frère; and the Calceolarias from H. Taylor, Esq., were all in good condition.

Cut flowers were represented by some excellent Roses from Miss Penrice, Norwich, the Rev. H. T. Frère, and Miss Steward. The former was to the fore in all the classes, and showed some excellent flowers, the season considered. General Jacquemont, Marchal Niel, Niphotos, Madame Caroline Kuster, Madame Marie Cointet, Perle de Lyon, and Madame Wood were remarkably good. Cut flowers of stove and greenhouse plants were scarce, and good, so were the *Zonal Pelargoniums*, which were well represented. There were also table decorations, bouquets, and wild flowers, the latter containing some pretty things, particularly the *Boe Orchis*.

Fruit and vegetables were sparingly shown, with the exception of Cucumbers, which were in strong force. The cottagers' classes were pretty well represented, and there was evidence, if the show be continued, that the cottagers growers will do their share in a proper way in the time to come.

Messrs. Daniels, Moss, Southampton, Norwich, sent some fine Mimosa, especially the Billis, very bright and effective; some good blooms of double *Pyræthrums*, and also of *Zonal Pelargoniums*, which were Highly Commended. Out in early spring, in

well-prepared beds, the plants won't in all probability bloom at the end of April and early in May. It has a close, compact habit of growth, which becomes completely covered with bright golden-yellow flowers.

Romford and Essex Horticultural: June 21.—The annual exhibition of this Society, which took place in Marshall's Park, was in most respects a good one. The exceptional feature was a falling off in the display of fruit and vegetables, the latter being by contrast of a very meagre description; indeed, in the matter of cottage produce there was barely more than two exhibitors in the arena, and these between them made up most of the prizes offered. It is to be regretted that the past ungenial weather has proved of great injury to the cottager in regard to this wholesome addition to his simple "fare."

The chief feature of interest was the collection of eight stove and greenhouse plants in flower, staged by Mcintosh, Esq., of Tlavinger Park (Mr. Bones, gr.), which, by a technical oversight on the part of Mr. Bones, was disqualified. His rival exhibitor in this class, Major-General Fytche (Mr. Lane, gr.), protested against the collection on the ground that four cuttings of *Stephanotis floribunda* originally placed in one pot to strike had not been separated but grown on to the specimen size, and this specimen had to be withdrawn from competition by Mr. Bones. This collection was, however, in every other respect in all respects that staged by Mr. Lane, containing, amongst others, of an excellent *Pimelea mirabilis*, *Erica obtusa*, &c.; and to it the judges awarded an extra 1st prize equal in amount to the 1st prize, which was attached to Mr. Lane's collection. Orchids were not numerous, though Mr. Lane's *Cattleya supera*. This exhibitor staged the single star plant—*F. Whitbourne*, Esq. (Mr. Douglas, gr.) being 1st, with neat masses, including *Dendrobium forosomum*, *Odontoglossum crispum*, &c.; for six Cape Heaths, Mr. Bones was 1st with a neat specimen of *Candollea* and others. Neat double *Pelargoniums* were staged by O. Hanbury, Esq. (Mr. Soder, gr.). Mr. Meadmore, Romford, had for the early season excellent cut roses. Mrs. C. Burley, Brentwood, staged the most elegant stand for table decoration, and in a kindred class Mr. S. Stier was 1st with very tasteful arrangements. Mr. Burley also showed his remarkable new *Pelargoniums*, Tom Bowling, Immaculata, Mrs. J. C. Quenell, and Silvia. Cape *Pelargoniums* were extremely well staged by Mr. Bones, his Rob Roy and Chieftain possessing a great quantity of flowers. The latter was 1st. Many other meritorious subjects were staged, but they call for no special remark. *W. E.*

Obituary.

We have this week to record the death of Mr. CHARLES LIDGARD, of Albion Road, Hammer-smith, one of the older members of the metropolitan fraternity of florists, now rapidly disappearing. Mr. Lidgard was born on February 19, 1810, and was consequently in his 68th year. He was a sound and conscientious judge of most of the popular florists' flowers, and as one of the representatives of this department of floriculture was selected many years since as a member of the Floral Committee of the Royal Horticultural Society, at the meetings of which he has subsequently been a pretty constant attendant, though of late his tottering footsteps have indicated that his life-journey was nearly accomplished. Mr. Lidgard was in former days a grower and exhibitor of *Ariculcas* and *Pansies*, and latterly has been a cultivator and exhibitor of *Celery*, for which he has occasionally taken prizes at South Kensington. He died on June 20, and was buried at Kensal Green on Tuesday last.

—On June 1 there died at Eccleshell, near Sheffield, at the age of sixty-two years, Mr. JOSEPH WALKER, a most worthy and successful florist, well known in his particular sphere, and respected by many attached friends among *Ariculca* cultivators. His death was unexpected, and he was interred at Eccleshell Church, near Sheffield, on June 4, in the presence of many sorrowing horticultural friends who left the ground with hearts full of "tranquil memories for the dead." From his earliest years a love of gardening pursuits, and especially of floriculture, was inherited by Joseph Walker. From his attached friend Ben Simonds we learn that when he first knew him, now many years ago, he was gardener at Banner

Cross, near Sheffield, and at that time was famous as a *Polyanthus* grower. Afterwards he removed to Ford Hall, Chapel-le-Frith, with the family with which he was living, carrying with him his stock of plants, and whilst there he purchased a few *Ariculcas*, not more than half a dozen, from which he raised the following fine seedlings—George Levick, John Simonite, Peveril of the Peak, Nimrod, and several others, which he lost. The most favoured were fine flowers, and have been most favourably mentioned; at present the varieties are in the hands of a few only, but they will be distributed as soon as the stock of plants in cultivation will admit of its being done. About five years ago Joseph Walker gave up active gardening pursuits, and came to reside again at Banner Cross, to manage the Eccleshell estate. At the early age of nine years Joseph Walker commenced the pursuit of gardening under his uncle, who was at that time gardener to Mr. Grievs, of Banner Cross, and when his uncle died he succeeded him in that post.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, JUNE 29, 1877.

June 21.—Fine, bright, partially cloudy till evening. Overcast, dull, with few drops of rain at 11 A.M. — 22.—Fine, bright, very cloudy till 11 A.M. at intervals. Little rain fell in afternoon. Windy. — 23.—A fine day, cool and windy. — 24.—A fine day, but neither warm nor bright. Cool. — 25.—A fine bright day. Partially cloudy. Cool. — 26.—Fine, but very cloudy till dusk, with slight rain at times. Cool. Windy. — 27.—Dull and showery till 11 A.M. Fine and bright afterwards.

LONDON: Barometer.—During the week ending Saturday, June 23, in the vicinity of the metropolis the reading of the barometer at the level of the sea decreased from 30.10 inches at the beginning of the week to 30.04 inches by noon on the 17th, increased to 30.12 inches by the morning of the 22d, decreased to 29.57 inches by the afternoon of the 22d, and increased to 30 inches by the end of the week. The mean of the mean at sea level was 29.94 inches, being 0.14 inch below that of the preceding week, and 0.04 inch below the average.

Temperature.—The highest temperatures of the air observed by day varied from 84° on the 19th, and 84½° on the 18th, to 67½° on the 23d; the mean range was 78°. The lowest temperatures of the air observed by night ranged from 50½° on the 21st to 57½° on the 22d; the mean for the week was 54½°. The mean daily range of temperature in the week was 23½°, the greatest range in the day was 39° on the 18th, and the least 13½° on the 22d. The mean daily temperatures of the air and the departures from their respective averages were as follows:—17th, 65° 7', +6° 4'; 18th, 67° 3', +7° 8'; 19th, 67° 8', +8° 1'; 20th, 65° 5', +5° 3'; 21st, 62°, +2° 9'; 22d, 62° 7', +2° 3'; 23d, 57° 4', -3° 3'. The mean temperature of the air for the week was 65° 8', being 3° 8' above the average of sixty years.

The highest readings of a thermometer with blackened bulb in vacuum, placed in sun's rays, were 135° on the 15th, 150° on the 17th, 147° on the 18th, and 144° on the 21st; the mean for the week was 142°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 39° on the 23d, 42½° on the 17th, and 42½° on the 18th; on the 22d the lowest readings were 5°.

The direction of the wind was E., and its strength gentle. The weather during the week was fine, bright, and warm.

Rain fell on the 22d, but only to the amount of 0.01 inch.

ENGLAND: Temperature.—The highest temperatures of the air observed by day were 88° at Manchester, 85½° at Cambridge, 84½° at Blackheath, and 84° at Bristol; at Hull the highest temperature was 79°. The mean value from all stations was 79½°. The lowest temperatures of the air observed by night were 42½° at Cambridge, 43° at Sheffield, and 44½ at Colles; at Brighton the lowest temperature was 55°. The mean value from all stations was 48½°. The range of temperature in the week was the greatest at Cambridge, 42°, and the least at Portsmouth, 19°; The mean range of temperature from all stations was 31°.

The mean of the seven high day temperatures was the highest at Cambridge, 79½°, and the lowest at Sunderland, 65°; the general mean from all stations was 74°. The mean of the seven low night temperatures was the lowest at Cambridge, 40½°, and the highest at Portsmouth and Plymouth, both 57½°; the mean from all stations was 55°. The mean daily range of temperature in the week was the least, 15°, at both Portsmouth and Sunderland, and the greatest, 30°, at Cambridge; the mean daily range from all stations was 21°.

The mean temperature of the air for the week from all stations was 61½°, being 1½° higher than the value for the corresponding week in 1876. The highest was 63½° at Blackheath, Bristol, and Manchester; and the lowest 56½° at Sunderland.

Rain fell on two or three days in the week at most places. The amounts varied from seven-tenths of an inch at Nottingham to one-tenth of an inch at Cambridge. At Bedford, and several of Blackheath one-hundredth of an inch (only) fell. At Truro 2 inches was measured (1.92 inch of which fell on the 21st inst.), whilst at Plymouth and Bristol three-tenths of an inch was recorded. The average fall over the country for the week was six-tenths of an inch.

The weather during the week was fine and warm. Fog prevailed at Cambridge on the 19th, 20th, and 21st, and thunder was heard at Hull on the 22d.

SCOTLAND: Temperature.—The highest temperatures of the air varied from 77½° at Greenock, and 76° at Glasgow, to 59½° at Leith; the mean value from all stations was 69½°. The lowest temperatures of the air ranged between 46° at Perth, and 46° at Aberdeen. The mean from all stations was 44½°. The mean range of temperature from all stations was 25°.

The mean temperature of the air for the week from all stations was 56½°, being 2½° lower than the value for the corresponding week in 1876. The highest was 61° at Greenock, and the lowest 53½° at Leith.

Rain.—The amount of rain measured at Perth was 1½ inch; at Aberdeen 1 inch fell; at Paisley one-tenth of an inch only was measured; the general average fall over the country was six-tenths of an inch.

DUBLIN.—The highest temperature of the air was 81°, the lowest 38½°, the range 42½°, the mean 67°, and the fall of rain 0.29 inch.

JAMES GLAISHER.

Enquiries.

He that questioneth much shall learn much.—Eccos.

193. *WISTARIA* and *LABURNUM*.—Would it be possible to bud or graft the *Wistaria* on *Laburnum*, as the two are somewhat nearly allied? *G. Bath*, June 25. [Try it. Eds.]

Answers to Correspondents.

AMERICAN WATCHES: H. S. M. Your question is not a horticultural one, but the address you require is that of Messrs. Robbins & Appieton, Waltham Buildings, Holford Circus, E.C.

APPLES: H. B. What you send is the American Biting. Brush the stems wherever you can get at the insects with a hard brush, and in winter give the trunk a thorough cleaning with soap and water.

BOOKS: B. & S. Thompson's Gardener's Assistant, new edition (Blackie & Co.).

INSECTS: F. P. Orlatus (Darnus) geniculatus, Acaria, which is said by some to be injurious to trees and by others to be harmless. It would be well if our correspondent kept his eye upon them, and saved us the trouble of our own enquiries.

A. M.—J. H. Cytus arcticus, a timber-boring longicorn.—*T. S. P.* Anthrenus muscorum, the museum pest in all parts of the world. *A. M.*

INDIAN PLANTS: ATRILA USA SPICA.—This plant, which gained a First-class Certificate at the last meeting of the Floral Committee, was inadvertently allowed to pass as having been exhibited by Messrs. Fisher, Holmes & Co., instead of Mr. Holmes, Whittington Nursery, Lichfield.

LOBELIA: F. C. The sample sent was too small and too dry to be pressed and mounted. It is possible to give an opinion about it. The colour appears to be very deep and rich.

NAMES OF PLANTS: *R. B.* Rhus Cotinus, the Wig
Pl. D. *P. D.* We cannot undertake to name
 Roses or fibroids-flowers of any kind.—*J. C. C.*
Aralia floribunda—*C. E. F.*, *Cupressus Lawsoniana*;
 2, *C. macrocarpa*—*H. F.*, *M. G.* The specimens
 have been mislaid, and moreover, are of no horticultu-
 rical interest.—*T. K. B.* *Sempervivum punctatum*.—
W. T. V. A *Mesembryanthemum* escaped from
 Glasgow. We cannot recognize it.—*W. T. V.*
G. F. *Koeleria cristata*.—*T. L.* *Luzula nivea*;
 2, *Dianthus birus*.—*H. M. E.* *Pyrethrum roseum*.—
 2, *Drumstick*, 1, *Scandellia Martensii*; 2, *S. M.* varietal.
S. K. *Scandellia Martensii*; 2, *S. M.* varietal.
S. G. *Galatitola*; 6, *S. Martensii divaricata* (flexuos.);
 7, *S. uncinata*.—*W. W.* 1, some *Begonia*, but we
 cannot undertake to say which; 2, *Franco scaberrima*.
 3, *Adiantum capillus-veneris*. 4, *Polichnum angu-
 laeforme proliferum*; 5, *Adiantum cucullatum*. All
 very bad specimens, badly packed, like a wisp of hay,
 instead of flattened.—*H. F.* 1, *Rose* is the old
 double-white; 2, *Bignonia speciosa*.—*A. D. W.*
Polystichum aculeatum lobatum.—*C. W. D.* One of
 the double-flowered varieties of *Pyrethrum roseum*.
 They are usually increased by seeds (the seedlings vary
 or by division; but possibly the lower joints of the
 flowering stem would grow if planted as cuttings.
 We have, however, no experience on this point.
H. F. *Silene* *capitata*—*S. M.* *Scandellia
 Martensii*; 6, *S. Kraussii*. The other specimens are
 not sufficiently good.—*R. P.* Appears to be one of
 the *Cerithes*, but the specimen is too imperfect to
 say more of it.

PEACHES: *H. C. D.* This is simply a case of gumming,
 exactly like what takes place on the wood, and every
 cultivator knows what depends on it. You must
 apply similar remedies to your peaches. The
 blights is that it originated in the dull, cloudy weather.
M. J. B.—*T. P.* Your Peaches, which in earlier
 stages were attacked by the common green mildew,
 which is now dead, but supplying a nutriment to other
 fungi. Part of the threads are, however, due probably
 to the germinating of the spores of the mildew. We
 know too late to give any remedy. *M. J. B.*

FOSE: *H. H.* Evidently the "Old Double White,"
 belonging to, and a *fac simile* of "Maide's Blush,"
 of the old Scotch Rosa Alba. It is a double form of
 the "Maide's Blush," which was first introduced
 since Hooker, nurseryman, Breckley, Kent, issued a
 list of normal forms about the year 1836.
 VARIETATED VIOLETTA: *A. M.* *Viola*—A very variegated
 sport from *Veronica chamensis* is apparently a
 very pretty thing, and will probably prove useful as an
 edging plant. By all means give it a trial.
 VIOLETTA: *H. H.* We cannot name such a scrap.
 2, English Iris, Spanish Iris, Iris Favonia, persica,
 and reticulata; these are all cheap, and nothing could
 be more showy. Iris punia, and the varieties of Iris
 bornea, planted in autumn, so that they would have
 a good hold of the ground to resist the heat of sum-
 mer, we find do well on dry ground. Iris alba,
 caucasia, cristata, ibetica, stylosa, susiana, tuberosa,
 and we apprehend most of the other species of Iris,
 will do well on the soil described. With reference to
 Liliums, the varieties of bulbiferum, croceum, Dahuricum,
 candidum, longiflorum, chalcidonicum, marte-
 num, pulchellum, pinnatifidum, pinnatifidum, auratum,
 speciosum, and tigrinum—with due
 regard to shade and situation, and with a little pre-
 paration of the soil, will be better than any.
 All the Gladioli will succeed, we have no doubt, as the
 thing they have to contend with most is the excess of
 moisture in water. It is difficult to answer such
 questions satisfactorily, and our correspondence must
 do as other people have to do—try and find out
 for himself. The royal road to knowledge in the
 adaptation of plants is through the pocket in the first
 place, and those who do not prefer for the first
 step may follow the Irishman's example by omitting it
 and taking the next. 4. Any not too highly bred
 variety of *Cannula* we believe perfectly hardy in
 sheltered localities.

VINES: *J. V.* Without details of management we
 will give the probable cause of the constitutional
 disease which we have named, and which is
 turning yellow. The berries are simply scalded. Give
 air earlier in the morning.

Markets.

COVENT GARDEN, June 28.

Business has been somewhat quieter during the week.
 Grapes selling badly, but Peaches in fine condition. Outdoor
 Straw has been made their appearance, and show
 signs of a fair crop. St. Michael Pines have now finished
 for the season, those of Mr. arriving being coarse, and dry
 eating. *James Weber, Wholesale Apple Market.*

CATTLE.

On Monday, at Copenhagen Fields, the demand for
 beasts showed an increase, and prices on the average
 were higher. Sheep were readily disposed of at a small
 advance on last week's quotations. The trade was
 scarcely as good for lambs. The few calves on offer
 made about as of late. Quotations:—Beasts, 4s. 6d. to
 5s. 4d., and 5s. 8d. to 6s. 2d. calves, 5s. to 6s. 4d.,
 sheep, 5s. to 5s. 8d., and 5s. 10d. to 6s. 8d.; lambs,
 7s. to 8s. 2d.; pigs, 4s. to 5s. 4d.—On Thursday beasts
 sold slowly, but barely below the market's prices. Sheep were
 quite in demand. Lambs were barely 90 firm,
 and calves showed no change.

HAY.

At Whitechapel Market on Tuesday the supply of
 hay and straw was rather limited, but the trade
 was slow as to former prices. The price of Clover, 100s.
 to 110s.; inferior, 85s. to 95s.; prime meadow hay,
 117s. to 127s.; 100s. to 85s.; and straw, 43s. to 57s.
 per 16 of 35 trusses.—On Thursday there was a moderate
 supply on offer. The trade was slow, and un-
 changed prices. Quotations:—Clover, best, 100s. to 128s.;
 inferior, 85s. to 95s.; hay, best, 90s. to 112s.; inferior,
 70s. to 85s.; and straw, 44s. to 57s. per 16.—Cum-
 berland mixed quotations:—Superior meadow hay,
 128s. to 135s.; inferior, 105s. to 114s.; superior Clover,
 132s. to 140s.; inferior, 105s. to 120s.; and straw, 55s.
 to 60s. per load.

POTATOS.

The Borough and Spitalfields report state that there
 was a moderate supply, which changed hands steadily,
 at the following prices:—Old Fines, 12s. to 15s.;
 Viridians, 10s. to 16s.; rocks, 10s. to 12s.; Regents,
 10s. to 11s.; New Jersey, round, 10s. to 20s.; do,
 Kidneys, 20s. to 28s. per ton.—The imports into London
 during the week comprised:—287 packages, 28,000
 285 casks from Malta, 1975 bags Kolberg, 1506 pack-
 ages Lisbon, 625 casks 377 boxes Barleux, 300 bags
 181 packages Rotterdam, 67 sacks Rouen, 65 bags
 100 sacks Calcutta, 285 packages, 285 bags,
 300 sacks Jersey, 20 casks Oporto, and 12 bags
 Hamburg.

SIMPSON'S RED SPIDER, THRIPS, &c.,
 and the best of the highest order of application.
 Per quart, 2s. 6d. per gallon, 10s. 6d. per
 Supplied to Seedsmen and Chemists. Strongly recommended in
 the Garden and in many other places. For sale by
 Prepared by JOHN KILNER, Wortley, near Sheffield.

GISHURST COMPOUND.—
 G used by many of the leading Gardeners since 1852,
 against Red Spider, Mildew, Thrips, Greenfly, and other blights,
 and is sold in a most durable form. Price list, which covers the
 of from 2 to 16 ounces as a winter dressing for Vines and Fruit
 Trees. Has outlived many preparations intended to supersede it.
 Sold in all the principal Cities, Towns, and Villages, and by
 Wholesale by PRICE'S PATENT CANE COMPANY
 (Limited).

RUSSIA MATS.—A large stock of Archangel
 and Petersburg, for Covering and Packing (price on
 application), and also of Russia Mats, formerly, assisted by
 superior close-work, 6s. 100, 50s. and 45s. per 100; Faking Mats
 2s. 100, and 12s. 100; and all other descriptions of
 Mats at equally low rates. At
 J. BLACKBURN AND SONS, 4 and 5, Warmwood Street,
 London, E.C.

RUSSIA MATS, for Covering Garden
 frames.—ANDERSON'S TAGANROK MATS are
 the cheapest and most durable. Price list, which covers the
 of every class of Mat, forwarded post free on application.
 London, E.C. ANDERSON, 149, Commercial Street, Shoreditch,
 London, E.C.

M. R. MECH'S ADDRESS
 to his OLD FRIENDS and CUSTOMERS and to
 the PUBLIC:—

"As it has been erroneously supposed by some that I am no
 longer interested in my London business, I think it desirable
 to state that I continue to carry on as energetically, and I
 trust as successfully, as ever. My business, as formerly, assisted by
 my only son, who will in due time succeed me. It is now
 fifty years ago since I first commenced business in Leadenhall
 Street, and what changes have taken place! This every body
 would have said, and that the trade was immense; and
 monstache and beard are the order of the day, and the razor
 and strap trade is comparatively defunct. Then there were no
 railways, so people stayed at home and used wooden dressing-
 cases, and every body travels by rail, and we have dressing-
 bags to suit the altered conditions. Fifty years ago the poor
 geese supplied our pens, and many a now rich merchant in the
 City will remember the quality of Mech's skilling pen-knives; but
 steel pens have extinguished the pen-knife trade and the
 penkniving machines, and the geese are in peace, except at
 Michaelmas. In fact, steam has altered, and I may safely
 say, improved everything, and has made us a nation of travel-
 lers both by land and sea. I wonder how much time is now
 occupied in reading the steam-worked press? and how much
 less time is occupied in signing port wine, as we used to do
 fifty years ago, when we used to travel in Stage-coaches, and
 our 4 to 10 leaves cheaper some day, just as it has converted calico
 into 2s. 6d. to 6d. or less per yard. Then, again, a letter
 which used to cost 6d. to Cork is now carried for 3d.
 Sir Rowland's business, and I have not been in the
 business fifty years ago, when I first commenced on a small
 scale, I made it an axiom that what I sold should be good and
 useful, and I believe thousands who used the strap and paste,
 which I personally invented, can testify to this; it is, in fact,
 sometimes complained of that I stamped on my razors 'Ex-
 changed if not approved.' I have never, and shall never, so
 long as I live, deviate from that principle, because it is the true
 means to retain and increase one's connection. I devote my
 attention especially to the quality and convenience of arrange-
 ments in the dressing bag and dressing case department, and in
 the tasteless and unbecoming mode of presentation, as well
 as on the matter of dispatch boxes and writing cases. Although
 both razors and penknives have 'gone out,' our sportsmen
 remain, and 'sporting knives' form one of our special depart-
 ments. I feel firmly convinced that there is no fear of the
 important department in quality and price. In conclusion, I
 ask no favours, but simply desire that my customers should
 compare the quality of my goods with those of any other
 respectable establishments, and form their own conclusions.
 Most of my worthy assistants and workmen have been nearly
 forty years in my service, and long ago learned that civility and
 attention to the customer are as important as the quality of the
 articles sold. Illustrated catalogues will be forwarded
 post-free on application."

112, REGENT STREET, W., opposite Victoria Street, — 1877.

JONES'S PATENT "DOUBLE L" SAFFLE BOILER.

These Boilers possess all the advantages of the old Saffle Boiler, with the following improvements—viz., the water-space at back and over top of saddle increases the heating surface to such an extent that a "PATENT DOUBLE L" SAFFLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and the space occupied by it at the same time. Boilers are simple in construction, and being made of wrought iron are not liable to crack. They are made of the following sizes:—

Sizes.	To heat of 4-in. Pipe.	Price.
High. 15 "	Long. 15 "	£ 4 9 0
20 "	18 "	4 0 0
20 "	18 "	4 0 0
24 "	24 "	7 0 0
24 "	24 "	8 10 0
24 "	24 "	1 000 0
24 "	24 "	1 400 0
28 "	28 "	1 800 0
28 "	28 "	2 000 0

Larger sizes if required.

From **MR. CHARLES VULNER, Nurseries, Baltham Hill, S.W.,** May 20, 1877.
"Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."

PRICE LISTS of HOT-WATER PIPES and CONNECTIONS, with Boilers, of all sizes and shapes; or **ESTIMATES for HOT-WATER APPARATUS,** erected complete, will be sent on application.

J. JONES and SONS, Iron Merchants, 6, Bankside, Southwark, London, S.E.
When order Boilers please refer to the above advertisement.

ROSES, ROSES, ROSES.

THE TERMINAL SADDLE BOILER.—
 Highest Certificate, 1873; Highly Commended, 1873;
 and First-class Certificate, 1875.

"This Boiler possesses the rare merit of sucking all the heat from the fire."—*Gardener's Magazine*, p. 254.
 "I have no doubt the Best Boiler, that will burn any kind of fuel, is the Terminal Saddle."—*Journal of Horticulture*, p. 37.
 "For moderate cost and real efficiency the Terminal Saddle is one of the very best."—*The Gardener*, p. 25.
 Prospectus free.

T. JONES, Temple Street, Manchester.

AN EXTRAORDINARY BOILER.—
 During the Great Boiler Contest at Birmingham, in 1874, all Boilers were severely tested to prove their respective merits. One test was, "How long can each Boiler go without Night Attention?" However, one Boiler proved this to a surprising degree, as after being shut up for twelve hours (from 9 P.M. to 9 A.M.), it still retained its heat in 2000 feet of 6-inch pipes, and yet had more than a bushel of fire drawn from its furnace in the morning—equal, in point of fact, to seventeen hours of continuous firing. What a boon to Gardeners. This was THE CHAMPION, Deards' Patent Close-Coal Boiler, for Drawings and Prices of which send two stamps to

Messrs. DEARDS, Boiler Works, Harlow, who now have their Boilers at work in every county of England except three. Amateurs will also find THE WONDER, a smaller kind of Boiler, equally as satisfactory, and certainly "the best thing" out. Awarded five First Prize Silver Medals.

AGRICULTURAL LOCOMOTIVES,
 STEAM PLOUGHING MACHINERY
 ROAD LOCOMOTIVES, TRAMWAY LOCOMOTIVES,
 STEAM ROAD ROLLERS.

For Prices, Description, and Reports of Working, apply to the Manufacturers,
AVELING & PORTER,
 ROCHESTER, KENT; 75, CANNON ST., LONDON, E.C.; and 9, AVENUE MONTAIGNE, PARIS.

AVELING & PORTER'S ENGINES have gained the highest Prizes at every important International Exhibition. The two Medals for Progress and Merit were awarded them at Vienna for their STEAM ROLLERS and ROAD LOCOMOTIVES; and at the last trials of the Royal Agricultural Society of England their AGRICULTURAL LOCOMOTIVES gained the First Prize after exhaustive trials, when one of their 10-horse power Engines, fitted with single slide and ordinary link-motion, indicated 35-horse power, with a consumption of three and one-fifth pounds of coal per horse-power per hour.

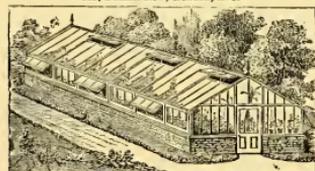

STEVENS,
TRENTHAM GREENHOUSE BOILER,

After long experience, has proved the most SIMPLE, ECONOMICAL, EFFECTUAL, and LASTING BOILER extant; recently improved. For Illustrations, with full particulars, apply to the Sole Makers.

F. & J. SILVESTER,
HOT-WATER ENGINEERS, &c., &c.,
 Castle Hill Works, Newcastle, Staffordshire.
 Their Boilers are the only ones made with the sanction and under the inspection of the inventor, Mr. Stevens—all others being base imitations.

W. H. LASCELLES, HORTICULTURAL
 BUILDER, Finsbury Steam Joinery Works,
 121, Bunhill Row, London, E.C.

Estimates given on application for GREENHOUSES and CONSERVATORIES of all kinds, and to any design.

"THE PRESIDENT," Latest and Most Improved American Lawn Mower.

A Model of Beauty,
 Simplicity, and
 Strength.

PRICES.

10-inch	£3 3 0
12-inch	4 4 0
14-inch	5 5 0

Carriage Paid to any Railway Station.

EVERY MACHINE UNCONDITIONALLY WARRANTED.

The "President" is the best Lawn Mower in use in the United States. The new and important improvements which have been made in these machines have wrought a complete revolution in their manufacture, resulting in their being celebrated throughout the world.

In offering to the Public this beautiful Machine, we desire to call attention to many valuable improvements. It has a noiseless positive ratchet, a full roller, and an adjustable iron handle, allowing the machine to follow an uneven surface on slopes, terraces, and borders, without any inconvenience to the operator.

This Mower is of lighter draught, and we feel warranted in saying, will outwear any in the market. The workmanship and material far surpass anything of this character now manufactured, and we invite inspection and comparison with any Lawn Mower yet produced.

The machine is simple, easy to adjust and keep in order, and the knives can be sharpened without removing them from the machine. The gearing is all perfectly enclosed, rendering it entirely free from clogging. In brief, if you want a Lawn Mower that will run easy, do good work, last you longer than any you can buy, and give you less trouble, we recommend the "President" with perfect confidence to your favourable consideration.

THOMAS MCKENZIE & SONS (LIMITED),

THE SILICATE ZOPHISA COMPOSITION and GRANITIC PAINT COMPANY, removed to
43, Fish-street Hill, London, E.C.

Oil Paint No Longer Necessary.

HILL and SMITH'S BLACK VARNISH for Preserving Ironwork, Wood, or Stone. This Varnish is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the inventors, and its genuine good quality, notwithstanding a host of unprincipled imitations, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received, which HILL & SMITH will forward on application.
Sold in casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED RECEIVED MAY 3, 1877.
"The *Express*, Alderley Edge, Manchester.—Messrs Hill & Smith.—Sir.—For some 20 years I have used your 'Black Varnish,' and shall be glad if you will forward me another cask, as I consider it the best thing known for the preservation of all outdoor work, either wood, iron, or stone, which requires to be painted.—Yours respectfully, ALFRED LOWE, J.P."

Apply to HILL and SMITH, Brierley Hill Ironworks, near Dudley, and 43, Queen Victoria Street, London, E.C., from whom only it can be obtained.
CAUTION.—It having lately come to the knowledge of HILL & SMITH that spurious imitations of this Varnish are being offered by unprincipled dealers at a slight reduction in price, they would especially draw attention to the fact that every cask of their Varnish is legibly marked with their name and address, without which none is genuine.

PATRONS BY THE QUEEN,
H.R.H. THE PRINCE OF WALES,

And at, BACHELOR'S WALK, DUBLIN.
NO AGENTS.

SHANKS' NEW PATENT LAWN MOWERS,

Under the Patronage of Her Most Gracious Majesty the Queen, and most of the Nobility of Great Britain.

The merits of these Machines are now so well known, and their superiority so universally established, that a detailed description is no longer necessary. A. S. & SON would here simply refer to a few of the prominent advantages peculiar to their Machine. The Revolving Cutter is made to be self-sharpening. The *Sole-Plate or Bottom Blade* is made with *Two Edges*, enabling the cutting parts to last twice as long as in other Machines. A Wind-guard is also introduced, which prevents the Grass escaping the Box when the Machine is in use during the prevalence of wind.

PRICES,

Including Carriage to any Railway Station or Shipping Port in the Kingdom:—

NEW HAND MACHINE.		NEW PONY and DONKEY MACHINE.	
10-inch Machine	£3 10 0	25-inch Machine	£13 10 0

GREEN'S PATENT "SILENS MESSOR," Or Noiseless Lawn-mowing, Rolling, and Collecting Machines for 1877. The Winner of every Prize in all cases of competition.

The superiority of these Machines over those of all other makers is universally acknowledged. They will cut either long or short Grass, Hents, &c., wet or dry. These advantages no other Lawn Mowers possess. It is the simplest in construction, the easiest to work, the least liable to get out of order, make little noise when in use, and is the most durable Lawn Mower extant.

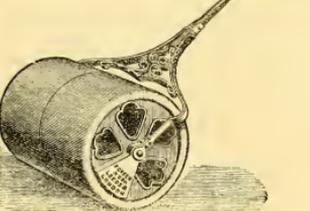

The largest stock of Mowers kept in London is to be found at our Establishment, 54 and 55, Blackfriars Road, where purchasers can select from upwards of 500 machines of hand, pony, and horse power, and have their orders executed the same day they are received.

Every Lawn Mower sent out is guaranteed to give entire satisfaction, otherwise it may be returned at once free of cost to the Purchaser.

N.B.—Those who have Lawn Mowers to repair will do well to send them either to our Leeds or London Establishment, where they will bring prompt attention, as an Efficient Staff of Workmen is kept at both places.

Descriptive Illustrated Price List free on application.

DINNEFORD'S FLUID MAGNESIA. 172, New Bond Street, London, and all Chemists.

HOLLOWAY'S PILLS. —Wrongs made Right.—Every day that any bodily suffering is permitted to continue renders it more certain to become chronic, and dangerous. Holloway's Pills, and strengthening Pills, are never adapted for any irregularity of the human body, should be taken when the stomach is torpid, or the brain indurated, the kidneys inactive, the bowels disordered, the liver deranged, the urinary system is deranged, or the brain indurated. With this medicine every invalid can cure himself, and those who are unable to take any other medicine, may make themselves strong and stout by Holloway's excellent Pills. A few doses of them usually mitigate the most painful symptoms caused by indigestion, food from which they thoroughly free the alimentary canal, and completely restore its natural power and action.

FOLLOWS & BATE'S NEW PATENT LAWN MOWERS, &c.

New Patent "Roller" Lawn Mower.

New Patent Lawn-Edge Cutter.

Royal Prize Medal Patent "Anglo" American Lawn Mower.

Upwards of 37,000 of these celebrated Machines have been sold during the past few years.

Patronised by Her Most Gracious Majesty the Queen; His Royal Highness the Prince of Wales; His Imperial Majesty the Emperor of Germany; His Imperial Majesty the Emperor of Austria; The Imperial Russian Government (for the Agricultural Museum at St. Petersburg); and members of the Nobility and Gentry of Great Britain.

Awarded Medal for Merit, Vienna, 1873 (the only Medal given for Lawn Mowers), Large Silver Medal (the First Prize) at the Meeting of the Royal Horticultural Society, Birmingham, 1872, and in addition, every First Prize wherever these Machines have been brought into competition in actual trial with other makes.

FOLLOWS AND BATE here abstain from enumerating in detail the various good points "claimed" for other Machines, and content themselves with saying that their Lawn Mowers possess them all, and more also; they therefore solicit the favour of an application for one of their CATALOGUES, with Testimonials, BEFORE PURCHASING.

To be had from all respectable Ironmongers and Seedsmen in the United Kingdom, or from the Patentees and Manufacturers, FOLLOWS & BATE, Manchester.
