Lady Dorothy Neville sent up from Kingston a fine flowering plant of *Strobilium*, and received a Cultural Commendation. Mr. C. Green, the Botanical Nursery, Reigate, showed *Prenanthes dissecta elegans*, an elegant, narrow, cut-leaved form, raised from a cross between *P. pinnata* and *Scandus arvensis*. From the Society's Garden Catalogue came a flowering plant of *Wigandia caracasana*, whose flowers are of a pretty purple colour. Sir C. W. Strickland, Bart., Hidenley, Malton, exhibited *Cattleya intermedia*, to show how it will grow on a piece of Oak wood. G. F. Wilson, Esq., rec'd. a vote of thanks for *Cucumis himalayensis*, which has very large deep-yellow flowers. A vote of thanks was also accorded to W. H. Michael, Esq., Cholmeley Park, Hightgate, for fine varieties of the *Angelicum* of Andrews and Anderson's series, a fine well-grown specimen of *Imantophyllum minimum* came from G. W. Chaplin, Esq., Roundfield House, Broxbourne; and Mr. Bennett, the Manor Farm Nursery, Stapleford, sent several large specimens of the new pink H.P. Rose *Duchesse de Vallombrosa*, and of an English H.P. variety named *Mabel Morrison*, a very distinct white flower, which the committee requested to see again. Hardy spring flowers were much noticed, and the following were named:—*Primrose*, F. & A. Smith, Dulwich, sent a fine variety of *Imantophyllum* called *Dulwich Beauty*.

FRUIT COMMITTEE.—H. Webb, Esq., in the chair. Mr. J. Jones, the Gardens, Bentley Priory, Stanmore, showed forced samples of the common *Seakale*, and of a variety which proved to be the same as one named *Lilywhite*, shown some time ago by Messrs. Stuart & Mein, of Kelso. The latter is of a pale yellow colour, and shows no trace of the purple tints peculiar to the common form; it was awarded a First-class Certificate. A Cultural Commendation was awarded to Mr. Rapley, gr. to R. Hudson, Esq., Clapham Common, for a fine brace of *Onosmodium* plants, one of which was a new variety, which measured about 30 inches in length. A box of Mushrooms was contributed by Mr. J. Hudson, gr. to J. Atkinson, Esq., Gunnersbury House, Acton.

Glasgow and West of Scotland Horticultural: *March 28*.—The first exhibition of the season took place in the City Hall, but the wet weather marred the prospects of the show, which was in most respects an excellent one, an abundance of material being at hand in the shape of plants, and a large number of selected foliated-plants, from the rich collections at Rawcliffe Lodge, and the Great Western Nurseries, and afforded an agreeable relief to what would otherwise have been an excessive display of colour. The Hyacinths were shown with numbers and good effect, and the collection of Bellied Nursery, Paisley, took first honours in the nurserymen's classes. Apart from the large collection of miscellaneous bulbous plants which contained some grand Hyacinths, those shown by him in the class of eighteen Hyacinths (distinct varieties) were an exceedingly good and well-balanced lot, well diversified as regards colour, and well-grown; Mr. John Sutherland, Victoria Nursery, Lenzie, being 2d with a collection scarcely less commendable as regards cultivation, but lacking brilliancy of colour, and which lent such a charm to the first lot. The 1st prize in the class for twelve Hyacinths was gained by Mr. George Irvine, of Port Glasgow; the 2d by Mr. Neil Glass, of Carbrook, Larbert; both collections being very good. The same remark also applies to the other

entries in this class, as also to the smaller collections of Hyacinths. Mr. Mathew Miller, of Bothwell, took the leading position in the class for six single and six double Hyacinths. Mr. Irvine, who carried off the prize for five Hyacinths, also secured the silver medal for the best single Hyacinth, with a fine specimen of Von Schiller. The classes for Tulips, Narcissus, Crocuses, &c., though well filled, were, as regards quality, decidedly below the level of the previous years. Those for Chinese Primulas, Cinerarias, Spiraes, *Deutzia gracilis*, *Cyclamen*, &c., were good; the Primulas from Mr. M'Lachlan, of Greenock, were remarkably well grown, as were also the Spiraes from Mr. A. B. Hutchinson, of Glasgow, and the Cinerarias from Mr. Dougall M'Dougall, gr., Craighead, Blyntyre. The Rhododendron collections contained a remarkably well-grown plant of the beautiful *R. Edutum*, from the gardens of Mr. Thomas Hill, Cathcart. The prize for six hardy spring flowering plants was easily won by Mr. Robert Todd, gr. to A. B. Stewart, Esq., Rawcliffe Lodge, with large masses of *Sibilla scirica*, Dog's-tooth Violet, double-flowering Cherry, Lilacs, Forsythia, and Charles X., &c. The other collections, and though much smaller, contained some good clumps of *Sibilla biliosa*, *Syrinchium grandiflorum*, *Triteilia uniflora*, various *Hepaticas*, &c.

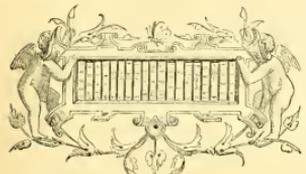

The plants for the most decorated attracted considerable notice. In the class open to gentlemen's gardeners and amateurs the 1st prize was gained by Mr. Todd, with *Calamus ciliaris*, *Aralia Veitchii*, *Croton undulatum*, *Dracaena Cooperi*, *Kentia Balmoreana*, and *Thrinax elegans*. Mr. George Irvine's collection of 2d, was also a pretty group, but his best plants being *Cocos Weddelliana*, *Aralias Veitchii* and *elegantissima*, and *Geonoma gracilis*. The other entries in this class were also very good. The nurserymen's class for selected plants attracted a very large number of entries, the 1st prize being awarded to Mr. Peter McKenzie, the 2d to Mr. John Sutherland. The *Abutilon Sellowianum* variegatum from Mr. McKenzie was exceedingly good. The collections of specimen stores and cuttings plants were also very fine, including some good Orchids which are here admissible amongst the collections of specimen plants, having no special class provided for them in the schedule, which is a very desirable arrangement. The 1st prize in this class was won by Mr. Stewart, Esq., these were not wanting, for we counted about one and a-half dozen distinct species amongst his collections on the various tables, his gardener (Mr. Todd) being 1st for the six specimen plants, and the 2d for the plant of *Rhododendron* both large and well-bloomed, the former being one of the finest specimens in the country; *Geoytis fuchsoides* was also very fine, as also two *Azaleas*, one red and one white. Mr. Beveridge, gr. to James Findlay, Esq., Glasgow, was 2d with a plant of *Rhododendron*. Countess of Haddington being a gigantic specimen, well grown and bloomed; *Epacris Eclipse* was also very fine, also his *Croton interruptum* and *Gleichenia Spenceana*. The same exhibitor carried off the chief prizes for single specimen plants, and also in the class for the three large specimens. Mr. D. McDougall, who came 2d for three, had a grand plant of *Rhododendron Princess Alice*. The *Azaleas* confined to 8-inch pots were also very good, the 1st prize being won by Mr. James Keppard, gr. of Beechwood, New Kilpatrick. One of the finest pot specimens of *Mignonette* that we have seen for a long time came from Mr. James Hutchinson. A finely coloured form of *Imantophyllum minimum* called *maximum* was the property of Mr. J. H. Bennet, of Kilmuir, which was highly commented by the judges, as was also a large box of cut *Rhododendrons* from Mr. James Graham, gr., Garscube, Maryhill; also some Cinerarias from Mr. Neil Glass, and a collection of plants from Messrs. Smith & Simons.

The fruit and vegetable collections were few but good in quality. The amateurs' collections were confined to the lesser hall, and, as a rule, were very creditable, but few in number. One gentleman, Mr. Peter Fox, being worthy of special mention, having gained a number of prizes. Mr. Mathew Miller, gr. to James Mann, Esq., of Bothwell, materially assisted the display here with a fine collection of Hyacinths, not for exhibition. Mr. A. B. Hutchinson, of Glasgow, & T. G. and Messrs. Austin & McAslan sent large and fine collections for exhibition, and were greatly admired, but space precludes us from entering more into detail at this time. A fine truss of the rare scarlet-flowered and white-grained variety of *Strawberry* with some cut blooms of Orchids from the Botanic Garden. A complete list of awards is published in the Glasgow daily papers of March 29. Robert Bullen.

Royal Caledonian Horticultural: *March 28*.—This exhibition, the following notice of which we condense from the *Sectarian*, was held as usual in the Music Hall, and was visited by a large number of spectators. A considerable amount of state was manifested in the arrangement of the brilliant and beautiful exhibits, the foliage plants intermingled

with the flowers affording an agreeable relief to what might otherwise have been an excessive blaze of colour; while they at the same time threw into admirable relief the beauty of a few specimens of a handsome. Apart from the bank of tropical foliage presented by the contributions of the Lawson Nursery Company, which filled the background of the orchestra, the eye rested with pleasure, on first entering the hall, upon the marvellous effect of the set of *Adiantum* plants, whose stately crowns, gemmed with the rich and rare blossoms, rose with perfect grace in front of the platform. The brilliant shades of the Indian *Azaleas* were no less attractive, their formal lines being well contrasted by the soft and graceful Palms and Dracaenas. Naturally one of the chief features of a spring show is the bulbous flowers; and it was admitted on all hands that a finer display of Hyacinths, Tulips, Narcissus, and *Cyclamen* has not been seen in Edinburgh. The Hyacinths were especially noteworthy for their general and uniform excellence. There was keen competition for the silver cup offered for the best eighteen Hyacinths, and the coveted prize fell to Mr. A. Kerr, Chapel, Leander. His spikes were superb in size and form. Mr. G. Maclure's 2d prize lot were very fine, but the size of the spikes was unequal—a remark which also applies to Mr. H. Sime's third dozen lot, which were of good quality, but not so good as those past their best. Mr. W. Young, an enthusiastic Hyacinth admirer, secured the premium for the best nine with spikes perfect both in size and form, and Mr. J. Martin's prize half-dozen were neat, but wanted a little more of the edge, Mr. G. Maclure being 1st for the lower half colour, and so on to Mr. J. Bald, whose plants were no better grown, but the colours of the cups were more delicate. Mr. J. Bald also exhibited his cultural skill with bulbs in the fine, well-grown Narcissus and *Cyclamen*. In the variegated plants, Messrs. Downie & Laird carried the palm for Hyacinths with eighteen splendid spikes—the most notable being *Lida*, Prince Albert, and Grand Lila. The same firm also secured the prize for a fine collection of *Cyclamen*; and among the bouquets the beauty of whose component flowers was only equalled by the taste with which they were made up; and for *Camellia* blooms of velvety texture and brilliancy. The 1st prize for table bouquets fell to Mr. J. Martin, who was also 1st for the 12-inch bouquets and the superb quality of the flowers of which it was made, it was rather formal in character. There was an artistic grace and freedom about Mr. G. Maclure's unmentioned bouquet that was absent from the others. Mr. G. Maclure's 2d prize lot were large and fine. Mr. McGregor was 1st for the pair, with a delicate *Phalaenopsis* and *Dendrobium crassinode*; and Mr. J. Paterson, Millbank, coming 2d with a fine *Dendrobium* noble and *Cattleya Trianae*, whose exquisite white and yellow colours were softened by the delicate fringe round the perianth. Mr. H. Rintoul's dozen cut blooms of *Marchal Neil*—the prince of yellow Roses—were deservedly admired, and no less so were the four pots of *Platydium* and *Phalaenopsis* which were also carried off by Mr. Paterson. Turning to the *Azaleas*, it is difficult to speak without exaggeration of their quality and beauty. Unquestionably there seems a friendly rivalry from year to year between Mr. J. Paterson and Mr. A. East in the cultivation of this showy class of plants, and the public receive the benefit in the increasing loveliness of the display furnished every spring. On this occasion Mr. Paterson seems to have devoted his recognised skill to the front rank, and his plants, and in particular his account in being first in every class. Mr. Paul, on the other hand, in the "four" class, has two plants not excelled in the show—a superb pyramid of the exquisite white *Marchal Neil*, and a fine specimen of *Marchal Stella*. In greenhouse plants Mr. Paterson was 1st in the "six" class—the plants comprising several beautiful Indian *Azaleas*, a fine *Acacia*, &c. Mr. H. Robinson was unexcelled for his splendid *Dracaena*; and among his table plants, which were awarded the 1st prize, were *Aralia elegans*, *Croton undulatus*, and *C. Disraeli*. For three greenhouse plants, Mr. D. Cameron was 1st. *Deutzia gracilis* was represented by many well-grown specimens, and the 1st prize was carried off by *Cyclamen*, Spiraes, and Lily of the Valley. The Ferns were quite up to the mark, including magnificent specimens of *Adiantums*. A competition of much interest, from the friendly rivalry involved in the matter, was the class of *Adiantum* plants by nurserymen. For many years past Messrs. I. Methven & Sons have deservedly carried off this prize, but on this occasion they were forced to give place in the front rank to Messrs. Downie & Laird, whose plants were rather more numerous than their team, and R. Camille de Kohan, than which finer have scarcely ever been seen in a show hall. Messrs. Methven's lot comprised a good Queen, the finest of hybridised whites; Lord Clyde, a rich dark crimson; and the *Adiantum* of the *Adiantum* class. It is but fair to notice that the latter are all hardy, while the Himalayan varieties in the 1st prize lot are greenhouse

plants. There was but little fruit. Of Grapes there were three exhibits—the Gros Colman bearing of Mr. M. Brodie, Glenmayne, placed 1st, were admirably kept; while the others had shrunk a good deal. Mr. J. Anderson's fresh Strawberries from Oxenford Castle were most tempting; and the Apples were good, and of fine quality.

Voices of Books.

Forests and Moisture: or Effects of Forests on Humidity of Climate. By J. C. Brown, LL.D. Oliver & Boyd, Edinburgh, 1877.

This volume is one of a series compiled by Dr. Brown primarily with a view to the requirements of South Africa, but applicable *mutatis mutandis* to other countries. The author starts by alluding to the quantity of moisture evaporated from the surfaces of leaves, in connection with which subject we are surprised to find no reference to the exact and accurate experiments of Laves and Gilbert, and others. From that subject the passage to the effect of forests on the humidity of the atmosphere and of the soil is natural, and this part of the subject is treated at considerable length, and will be found servicable for reference, the more so as a full analytical table of contents is prefixed to the work. For the most part the facts cited are familiar to those interested in this department of inquiry, but the author's personal experience has supplied him with other information which he has turned to good account. Alluding to a tree, presumably *Milletia Cafer*, in the trunk of which is found a reservoir of water, the author tells us that Mr. Chapman, the well known South African traveller, from whom he derived his information, "first saw the tree when he and his companions were suffering from thirst. Observing one of his native servants placing forked boughs against the tree and preparing to climb, he asked what he was going to do. 'Look for water,' was the reply. The man having mounted, cried: 'Here it is!' The hard wood had decayed, leaving a very deep hole, which was almost closed at the top, apparently by the spreading arch of subsequently formed bark. One of the companions of the man cutting then a twig or shoot from the root, cut through the bark of this at two places, 2 feet or 30 inches apart, treated this as boys in Europe treat branches of Alder of which they wish to make whistles: beating and pressing it, and drawing out the wood like drawing a sword from its sheath, he handed up the bark to the man aloft, who, using this as a suction pipe, soon quenched his thirst, and made way for the others in succession to do the same."

The author culls from various sources a large body of evidence, amply supporting his conclusions "that there are cases in which an extensive destruction of forests has been followed by a marked desiccation of soil and aridity of climate, and some cases in which the replanting of trees has been followed by a more or less complete restoration of humidity, or the planting of trees where there was none has been followed by a degree of humidity greatly in excess of what had previously been observed. That there are cases in which the rainfall within forests or in their immediate vicinity has been perceptibly greater than in the open country beyond, but that there are also cases in which it is alleged that the desiccation of some lands once clothed with forests and fertile, now treeless and barren and dry, may be attributable in part, if not in whole, to other causes besides the destruction of the forests, and cases in which the extensive destruction of forests does not appear to have extensively affected the quantity of the rainfall over a wide expanse of country." It is only by collecting all the evidence *pro* and *con*, and balancing it fairly, that we can hope to arrive at the truth in this matter, and although the statements in the latter part of the paragraph just cited appear opposed to those in the first part, yet

it is clear that the balance of evidence is in favour of the proposition which Dr. Brown lays down, and that the exceptions depend on local conditions yet to be discovered. Actuated by similar views the Forest Conference of Vienna in 1873 adopted the following resolutions, which were sent to the various Governments:—

"1. We recognise the fact that in order effectually to check the continually increasing devastation of forests which is being carried on international agreements are needed, especially in relation to the preservation and proper cultivation (for the end in view) of those forests lying at the sources and along the courses of the great rivers, since it is known that through the reckless destruction of them there results a great decrease of the volume of water, causing detriment to trade and commerce, the filling up of the river's bed with sand, caving in of the banks, and inundations of agricultural lands along the river courses."

"2. We further recognise it to be the mutual duty of all civilised nations to preserve and to cultivate all such forests as are of vital importance to the well-being (agricultural and otherwise) of the whole land, such as those on sandy coasts, on the sides and crowns, as well as on the steep declivities of mountains, and on the sea-coasts and other exposed places, and that international principles should be laid down, to which the owners of such protecting or 'guardian forests' should submit in order to preserve the land from damage."

"3. We recognise further that it is the case that we have at our disposal a sufficient knowledge of the evils (disasters in Nature) which are caused by the devastation of the forests, and therefore that the efforts of legislators should be directed to causing exact data to be gathered relating thereto."

— Another of Messrs. Macmillan's very useful primers is that devoted to *Philology*, and drawn up by Mr. John Peile. From the nature of the subject this work is so of elementary a character as some of its predecessors, but it is clearly written and full of interest. Students of natural history will be surprised to find how closely similar are the methods followed by philologists in their researches into the history and the inter-relationships of various languages, and of the words composing them, to those with which the naturalist is familiar. In speaking of the changes which have taken and are taking place in our own language, the author shows that these are not capricious or accidental, but are capable of explanation, at least in some cases, and we may therefore "expect that there are reasons for the other changes which are still obscure or unexplained, and so we must propose provisional hypotheses to account for these latter changes—hypotheses which we must surrender if a fuller knowledge shows that they are untenable." Again, it is shown how the peculiarities of the construction of words and sentences in certain languages point "to one common speech, and can be explained in no other way but as the daughters of a single parent language, precisely as the inter-relationships of plants point to a common stock or stocks from which existing forms have been derived. Considerations of this nature lead up to the final inquiries whether speech proceeds from thought, or thought from speech, and as to the origin of language." The author, in treating these matters in two short pages, unites boldness with caution when he tells us—"We may speculate, only let us remember how weak is the basis for our results." That such a book should be within the reach of every schoolboy sufficiently advanced to appreciate it, or of any young gardener desirous of self-improvement, is assuredly one of the signs of the times. Fifty—say, twenty years ago, even professed scholars would have found it difficult, if not impossible, to procure any work conveying so much general information on the comparative study of languages as is now compressed into 160 pages, at the cost of one shilling.

— Under the title *Reminiscences of Animals, Birds, Fishes, and Meteorology*, Mr. Kingsford has jotted down a number of isolated notes with reference to the natural history of the neighbourhood of Canterbury, and which will be of the more service as a record from the changed conditions of the localities. The very idea of an otter in the Stour now-a-days would be treated with the utmost scepticism, yet in 1827 the author of this volume tells us he killed one. Three bitterns in the Vauxhall Nurseries would, indeed, be *rare* *aver* now-a-days, though a lampry 3 feet long and 4 lb. in weight is recorded as having been lately captured. We entirely sympathise with the

author's tenderness for animals, and his reprehension of the cruel and useless tortures inflicted from mere wantonness, or so-called sport. We could wish that our anti-vivisection friends would take to heart this saying—"There is more honour due to the men who perform it (vivisection) purely for science than to keep foxes for the purpose of hunting and tearing them to death." The book, we presume, is chiefly intended for private circulation. Should it be thought desirable to give it wider circulation, a table of contents and index should be added, and the text carefully edited. It is much to be wished that other observers in various localities would jot down their observations as Mr. Kingsford has done.

— The last issued part of the *Compendio di flora Italiana* contains the description of the *Eriaceae*, *Campanulaceae*, and other orders, while the plates, 67–69, represent various genera of *Borragiaceae* and *Gentianeae*. In all the diagrams of the *Borragiaceae* that are given the scales in the mouth of the corolla are figured as forming part of the same cycle with the stamens, which is clearly an error.

— Messrs. Cassell have published the first part of a serial publication entitled *Familiar Wild Flowers*, figured and described by Mr. F. E. Hulme. It bids fair to be a pretty publication. We must await further instalments before we can say much as to its utility.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON FOR THE WEEK ENDING WEDNESDAY, APRIL 4, 1877.

MONTH AND DAY.	BAROMETER.		TEMPERATURE OF THE AIR.		HYGROMETRIC DEVIATIONS FROM GIBBS'S TABLES 4th Edition.	WIND.	RAIN-FALL.

March 29.—Overcast, dull, and wet till 11 A.M. Fine but cloudy afterwards. Very dark, with heavy showers at 7 P.M.
 — 30.—Fine, but dull and cloudy day. Cloudless at night.
 31.—A fine day, very cloudy at times. Cool breeze.
 April 1.—Overcast, dull, and wet throughout.
 2.—Fine, but dull and cloudy. Rain fell in early morning.
 3.—Fine, but very cloudy. Little rain fell in afternoon and evening.
 4.—Generally fine, but very cloudy. Thunderstorm in afternoon, accompanied with heavy rain and very large hailstones. Vivid lightning. Cloudless at night.

LONDON: *Barometer*.—During the week ending Saturday, March 31, in the vicinity of London, the reading of the barometer at the level of the sea decreased from 29.01 inches at the beginning of the week to 28.98 inches by the morning of the 25th, increased to 29.57 inches by the night of the 28th, decreased to 29.84 inches by the afternoon of the 29th, increased to 30.14 inches by the morning of the 31st, and was 30.07 inches at the end of the week. The mean reading for the week at sea level was 29.61 inches, being 0.11 inch above that of the preceding week, and 0.33 inch below the average.

Temperature.—The highest temperatures of the air varied from 61° on the 29th to 48° on the 26th; the mean for the week was 53°. The lowest temperatures of the air ranged from 38° on the 28th to 43° on the 30th; the mean value for the week was 40°. The mean daily range of temperature in the week was 15°, the greatest range in any day being 20° on the 29th, and the least 9° on the 26th.

The mean daily temperatures of the air were as follows:—25th, 47°; 26th, 43°; 27th, 45°; 28th, 45°; 29th, 48°; 30th, 46°; 31st, 45°; 4th, and the

departures in excess of their respective averages were 1.4°, 4.7°, 0.7°, 2.3°, 3.3°, 5.5°, 3.2°, and 1.4°. The mean temperature of the air for the week was 46° 1, being 3° above the average of sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed in sun's rays, were 117° on the 25th, 114° on the 27th, 111° on the 29th; on the 26th, 67° was the highest reading. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 34° on the 28th and 36° on the 31st; on the 30th the lowest reading was 48°.

Wind.—The direction of the wind was S.W. and S., and gentle in motion. The weather during the week was generally fine and mild, with frequent showers of rain. A lunar halo was seen on the 25th inst.

Rain fell on five days during the week; the amount collected was 0.98 inch.

ENGLAND: Temperature.—The highest temperatures of the air observed by day were 61° at Blackheath and 59° at Leicester; at Hull 52° was the highest temperature in the week. The mean value from all stations was 53°. The lowest temperatures of the air observed by night were 31° at Leicester, 32° at Hull; at Brighton and Norwich 30° was the lowest temperature. The general mean from all stations was 35½°. The range of temperature in the week was the least at Brighton, 16°, and the greatest at Bristol and Eccles, both 23½°. The mean range of temperature from all stations was 21°.

The mean of the seven high day temperatures was the highest at Blackheath and Leicester, both 55½, and the lowest at Bradford, 47; the mean value from all stations was 52½°. The mean of the seven low-night temperatures was the lowest at Eccles, 35°, and the highest at Brighton and Portsmouth, both 42; the mean from all stations was 38½°. The mean daily range of temperature was the greatest at Upton, 18°, and the least at Bradford, 8½; the mean daily range from all stations was 13½°.

The mean temperature of the air for the week from all stations was 44½, being 1½ higher than the value for the corresponding week in 1876. The highest was 46½ at Blackheath, Leicester, Brighton, and Portsmouth, and the lowest was 41½ at Bradford.

Rain fell on every day in the week at Manchester and Eccles, and on five days at most other stations. The amounts measured varied from 1 inch (nearly) at Bristol to a quarter of an inch at Leicester, Wolverhampton, and Liverpool; the average fall over the country was eight-tenths of an inch. The weather during the week was generally fine and mild, but showery. **Lunar halos** were seen on the 25th at Blackheath, and on the 27th at 28th at Cambridge. **Thunderstorms** occurred at Bristol and Birmingham on the 29th.

SCOTLAND: Temperature.—The highest temperatures of the air varied from 56° at Dundee to 50° at both Greenock and Perth; the mean value from all stations was 52½°. The lowest temperatures of the air ranged from 41° at Dundee to 35° at Greenock; the general mean from all stations was 33°. The mean range of temperature in the week from all stations was 19½°.

The mean temperature of the air for the week from all stations was 40°, being 1° lower than the value for the corresponding week in 1876. The highest occurred at Aberdeen and Leith, both 41°, and the lowest at Greenock and Perth, both 39°.

Rain fell to the amount of 1½ inch at Dundee and 1½ inch at Perth, at Aberdeen 3 quarters of an inch was measured. The average fall over the country was 1½ inch.

JAMES GLAISHER.

Law Notes.

WHAT CONSTITUTES DELIVERY OF GOODS?—*Reddyffe and Others v. Turner.*—At the Bloomsbury County Court recently the plaintiff in this action (a horticulturist of London) sued the defendant (a florist carrying on business in Sheffield) to recover the sum of £15 odd for artificial and other flowers supplied.

Mr. Charles Williams, solicitor for the plaintiff, said the goods in question were ordered from his client by the defendant for his customers at Sheffield, and were directed to be sent through Chaplin & Horne in December last, but when they arrived at Sheffield the defendant refused to receive them, and returned them to the railway company. The defendant had been repeatedly applied to for payment, and

as he denied his liability the matter was now brought before his Honour to decide.

The plaintiff corroborated the statement made by his solicitor.

It was urged on the part of the defendant that he was informed by the plaintiff when the goods were ordered that he had them in stock, and could be supplied at any time at a moment's notice. But notwithstanding this, they did not arrive at Sheffield within the stipulated time, and were too late for the purpose for which they were ordered. They were refused, and returned to the plaintiff, accompanied by a letter stating the reasons for their being sent back.

The plaintiff said the flowers had been sold, and sent as directed by the defendant, and therefore he refused to receive them back, or make any allowance, as they were much deteriorated in value.

At this stage of the case the learned Judge asked Mr. Williams how he could get over the Statute of Frauds in the present instance, as delivery to a common carrier is not a delivery to, or an acceptance by, a consignee? Having called Mr. Williams' attention to the *Eschewer Law Reports* in support of this view, Mr. Williams said that as the matter at present stood he must rule in favour of the defendant. But after hearing Mr. Williams the learned Judge consented to nonsuit the plaintiff under the old law, by which means he was entitled to sue again if he deemed it expedient to do so.

A COUNTY COURT ACTION BY A SOLICITOR AGAINST A SALESMAN FOR ONE SHILLING.—*Ashwell v. J. B. Thomas.*—This was an action brought in the Westminster County Court, in which the plaintiff, a solicitor, residing at St. Albans, sued the defendant, a Potato salesman of King's Cross and Covent Garden, to recover the sum of 1s. under the following circumstances.

The plaintiff stated that he ordered from the defendant in December last a sack of Potatoes, to be sent to his residence. He paid for the Potatos, but was charged 1s. on the sack, which was to be returned to him when he sent the sack back. He had returned the sack, and on demanding his shilling it was refused, on the ground that he had no ticket, and in consequence of which he brought the present action solely on principle. The return of the bag having been proved by a person in the plaintiff's employment, and the plaintiff's case closed, when J. Lewis said he was in the employment of the defendant as clerk, and would willingly have paid the plaintiff the shilling if he could prove that his sack returned was the defendant's, and would even now pay it if the plaintiff could produce his ticket.

In reply to the learned Judge, the witness said that the ticket was one which was always given to customers who had their sacks, and when they produced their tickets the deposit left on the bags would be returned to them.

The learned Judge wished to know whether this was the usual custom of the trade, and witness replied it was universally so, and that if the case was adjourned he could produce many salesmen from Covent Garden to prove it. Were the case otherwise it would offer a premium for stealing sacks, as any person by whom a sack was returned would be able to claim a shilling whether the sack belonged to him or not.

The learned Judge considered the custom a very reasonable one.

The plaintiff said the defendant's name was stamped on the sack upon which his Honour remarked that might be so, but it did not follow but that some other person might have returned the sack. Judgment must therefore be given in favour of the defendant.

Mr. Lewis applied for costs, which his Honour granted.

A DISPUTED TRANSACTION BETWEEN SALEMEN.—At the Westminster County Court the case of *Joel v. Cohen* was recently heard before Mr. Justice Bayley. Both plaintiff and defendant were salesmen in Covent Garden market, and the former sued the latter to recover the sum of £3 12s. for money alleged to have been lent to him.

The plaintiff stated that on July 26 last the defendant asked him for the loan in question in order to pay a bill, and he at once accommodated him, on the promise that he would be repaid on the following day, instead of which the defendant repudiated the debt.

Henry Edwards, a porter in the plaintiff's service, said he was present when the money was lent; and

John Defries, a salesman, gave corroborative evidence.

The plaintiff, in cross-examination, denied ever buying and selling goods in connection with the defendant, or that any implied partnership ever existed between them.

The defendant being called said, the plaintiff had not on July 26, or at any other time lent him a shilling, but they frequently bought goods together and sold them to retail dealers. On July 26 they bought a box of Melons, which was sold to a fruiterer for £3 12s., but as he had not yet been paid for them, and as the person to whom he had sold them had gone away and could not be found, he (the defendant) had sent it off as a bad debt, and never thought the plaintiff would sue him for it.

The learned Judge considered the plaintiff entitled to recover the sum sued for, together with the costs of his witnesses.

The defendant asked time for payment, which plaintiff would not consent to, as the defendant bought about £10 or £20 worth of goods in the market daily, and was well able to pay a small amount like this at once.

Judgment was accordingly entered for the plaintiff, with an order for immediate payment.

Obituary.

THE LATE MR. THOMAS DICKSON, OF CHESTER.

—Those who knew Mr. Thomas Dickson, and were brought into personal contact with him, will regret the comparatively early death of this estimable gentleman. He was a partner in the firm of Messrs. Francis & Arthur Dickson & Sons, and was the responsible head of the nursery department at Upton. The whole of his business life was passed at the Upton Nursery; it was there he gained his first knowledge of its practical duties. He was admitted a partner in the business in the lifetime of his father, the late Mr. Francis Dickson, and did much to develop the extensive nursery trade done by this well-known Chester firm. Until recently, when his illness assumed a more serious nature, he took a very active part in the management of the nursery, and was well known among horticulturists in Lancashire, Cheshire, and North Wales, where he made an annual business journey. He won local respect and esteem by his genial manner and gentlemanly bearing; he was a true friend to many gardeners whom he knew, and whom he was always ready to assist to the best of his ability. Many of these will bear of his death with lively regret. If, horticulturally speaking, his life was an uneventful one, it was nevertheless characterized by great activity; he had a high sense of the value of system and order, doing his work thoroughly and well. Among those who will most regret his decease will be the heads of departments at the Upton Nursery and a wide circle of private friends. He died in his forty-second year, and was buried in the cemetery at Chester.

—We regret to have record the death of **JOSEPH HUNT, ESQ.**, which took place at High Wycombe, on the 23rd ult. Mr. Hunt, who was 71 years of age, was well known amongst the older florists as a successful grower of Tulips and Pansies, and as having effected very great improvements in the quality of the Sweet William from the florist's point of view. Indeed some years since Mr. Hunt's strain of Sweet Williams enjoyed a particularly high reputation amongst growers, on account of the advance made towards the production of smooth-edged flowers.

Enquiries.

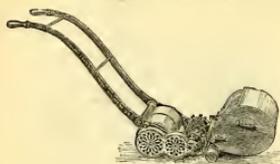

Has that questionable much shall learn much.—BACON.

180. CORCHORUS OLIORITUS.—Will anyone be kind enough to inform me what is *Corchorus olioritus*—an excellent *Corolla potageris* by French and Belgian gardeners—and how it is cultivated and sent to table? *E. S. D.*

Answers to Correspondents.

BAMBOOS FLOWERING: Y. The statement in one of the daily papers is based upon truth. Many of the Bamboos flower only after several years, and then die down. When, as this case happens, as a successful grower of Bamboos occurs in times of scarcity, the natives very naturally look on the bountiful supply of nutritious seed as specially providential. The subject has frequently been adverted to in our columns, especially

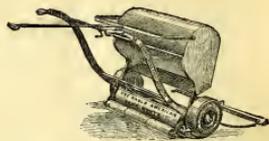

FOLLOWS & BATE'S NEW PATENT LAWN MOWERS, &c.

New Patent "Roller" Lawn Mower.

New Patent Lawn-Edge Cutter.

Royal Prize Medal Patent "Anglo" American Lawn Mower.

Upwards of 37,000 of these celebrated Machines have been sold during the past few years.

Patronised by Her Most Gracious Majesty the Queen; His Royal Highness the Prince of Wales; His Imperial Majesty the Emperor of Germany; His Imperial Majesty the Emperor of Austria; The Imperial Russian Government (for the Agricultural Museum at St. Petersburg); and members of the Nobility and Gentry of Great Britain.

Awarded Medal for Merit, Vienna, 1873 (the only Medal given for Lawn Mowers), Large Silver Medal (the First Prize) at the Meeting of the Royal Horticultural Society, Birmingham, 1872, and in addition, every First Prize whenever these Machines have been brought into competition in actual trial with other makes.

FOLLOWS and BATE here abstain from enumerating in detail the various good points "claimed" for other Machines, and content themselves with saying that their Lawn Mowers possess them all, and more also; they therefore solicit the favour of an application for one of their CATALOGUES, with Testimonials, before purchasing.

To be had from all respectable Ironmongers and Stationers in the United Kingdom, or from the Patentees and Manufacturers, FOLLOWS & BATE, Manchester.

F. & B. are the sole makers of the well-known Patent "CLIMAX" LAWN MOWER, with Back Delivery, from 25s. each; NEW PATENT LAWN-EDGE CUTTER, which entirely supercedes the Shears; PATENT GARDEN FLOUCH, &c.

Machines of any make Repaired or allowed for in Exchange.

**GREEN'S
 PATENT "SILENS MESSOR,"**

Or Noiseless Lawn-mowing, Rolling, and
 Collecting Machines for 1877.

The Winner of every Prize in all cases of competition.

The superiority of these Machines over those of all other
 makers is universally acknowledged. They will cut either long
 or short Grass, Beets, &c., wet or dry.

These advantages no other Lawn Mowers possess.
 They are the simplest in construction, the easiest to work in
 use, and are the most durable Lawn Mowers extant.

Every Lawn Mower sent out is guaranteed to give entire
 satisfaction, otherwise it may be returned at once free of cost to
 the Purchaser.

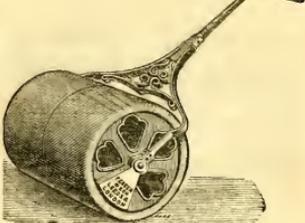

N.B.—Those who have Lawn Mowers to repair will do well
 to send them either to our Leeds or London Establishments,
 where they will have prompt attention, as an Efficient Staff of
 Workmen is kept at both places.

Descriptive Illustrated Price List free on application.

oz., 8844 oz., 8850 oz., 8856 oz.,

STEVENS' TRENTHAM GREENHOUSE BOILER,

After long experience, has proved the most SIMPLE, ECONOMICAL, EFFICIENT and LASTING BOILER extant; recently improved. For Illustrations, with full particulars, apply to the Sole Makers.

F. & J. SILVESTER, HOT-WATER ENGINEERS, &c., &c., Castle Hill Works, Newcastle, Staffordshire. Our Boilers are the only ones made with the sanction and under the inspection of the inventor, Mr. Stevens— all others being imitations.

AN EXTRAORDINARY BOILER.

During the Great Boiler Contest at Birmingham, in 1875, all Boilers were severely tested to prove their respective merits. One test was— How long can each Boiler go without Night Attendants? However, one Boiler proved this to a surprising degree, as after being shut up for twelve hours (from 9 P.M. to 9 A.M.), it still retained its heat in two feet of a inch pipes, and yet had more than a bushel of fire drawn from its furnace in the morning—equal in point of fact, to seventeen hours of continuous fire. What a boon to Gardeners. This was THE CHAMPION, 'Deards' Patent Close Coil Boiler, for Drawings and Prices of which send two stamps to Messrs. DEARDS, Boiler Works, Harlow, who now have their Boilers at work in every county of England except three. Amateurs will also find THE WONDER, a smaller kind of Boiler, equally as satisfactory, and certainly "the best thing" out. Awarded five First Prize Silver Medals.

For Sale, a STEVENS' IMPROVED TRENTHAM WROUGHT IRON HORTICULTURAL BOILER, 6 feet long by 3 feet diameter, fitted with Inlet and two Outlet Pipes, Fire-door and Grate complete. For price and particulars apply to HILL AND SMITH, Brierley Hill Ironworks, Dudley.

HENRY ROBINSON, IRONFOUNDER and ENGINEER, Newkays Foundry, Bristol Lane, Southbridge. 4-in. 3-in. 4-in. HOT-WATER PIPES, 21. 1d. 3s. 4d. 4s. 2d. per 6-ft. length. Ditto ditto ditto 2s. 7d. 2s. 10d. 9d. length. ELBOWS, No. 12 .. 11. 1d. 1s. 6d. 3s. each. No. 23 .. 11. 1d. 1s. 6d. 3s. each. SYPHONS, No. 23 .. 3s. 4d. 2s. each. Price List on application. Portable Pipes, Gold Medal Boilers, &c.

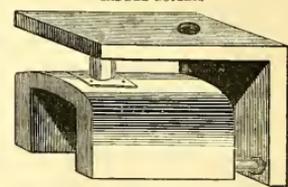

AGRICULTURAL LOCOMOTIVES, STEAM PLOUGHING MACHINERY, ROAD LOCOMOTIVES, TRAMWAY LOCOMOTIVES, STEAM ROAD ROLLERS.

For Prices, Description, and Reports of Working, apply to the Manufacturers,

AVELING & PORTER, ROCHESTER, KENT; 72, CANNON ST., LONDON, E.C. 2; and 9, AVENUE MONTAIGNE, PARIS.

AVELING & PORTER'S ENGINES have gained the highest Prizes at every important International Exhibition. The two Medals for Progress and Merit were awarded them at Vienna for their STEAM ROLLERS and ROAD LOCOMOTIVES; and at the last trials of the Royal Agricultural Society of England their AGRICULTURAL LOCOMOTIVES gained the First Prize after exhaustive trials, when one of their 10-horse power Engines, fitted with single slide and ordinary link-motion, indicated 35-horse power, with a consumption of three and one-fifth pounds of coal per horse-power per hour.

JONES'S PATENT "DOUBLE L" SADDLE BOILER.

These Boilers possess all the advantages of the old Saddle Boiler, with the following improvements—viz. the water-space at back and over top of saddle increases the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel, the cost of setting it is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought iron are not liable to crack. They are made of the following sizes—

Sizes.			To heat of		Price.
High.	Wide.	Long.	Inlet & Exit Pipes.		
30 in.	18 in.	18 in.	300	7 0 0	
20 "	18 "	24 "	400	8 0 0	
20 "	18 "	30 "	500	9 0 0	
24 "	24 "	24 "	700	12 0 0	
24 "	24 "	30 "	800	14 0 0	
24 "	24 "	36 "	1,000	16 0 0	
28 "	28 "	42 "	1,200	20 0 0	
28 "	28 "	60 "	1,800	25 0 0	

Larger sizes if required.

From Mr. CHARLES VOTING, Nurseries, Balfour Hill, S.W., May 29, 1875.

"Having given your Patent 'Double L' Boilers a fair trial in my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."

PRICE LISTS OF HOT-WATER PIPES and CONNECTIONS, with Boilers, of all sizes and shapes; or ESTIMATES for HOT-WATER APPARATUS, erected complete, will be sent on application.

J. JONES and SONS, Iron Merchants, 6, Bankside, Southwark, London, S.E. When ordering Boilers please refer to the above advertisement.

THE THAMES BANK IRON COMPANY,

OLD BARGE WHARF, UPPER GROUND ST., LONDON, S.E.

Hot-water Boilers, Pipes, Connections, and all Castings for Horticultural Purposes.

PRICE LIST on application, or Six Stamps for Descriptive CATALOGUE (Seventh Edition).

"GOLD MEDAL" BOILER. This Boiler is used by Mr. B. S. WILLIAMS at his extensive Nurseries at Holloway, who will certify as to its extraordinary capabilities of heating power, with economy in consumption of fuel.

Hot-water Apparatus erected Complete, or KEITH'S PATENT BOILERS, requiring no brick-setting. THE IMPROVED FLUED or CHAMBERED SADDLE BOILER. CRUCIFORM SADDLE BOILER. NEW PATENT "CLIMAX" BOILER (1874). See p. 36, *Gardener's Chronicle*. "GOLD MEDAL" BOILER (Birmingham, 1872). THE MATERIALS supplied at Wholesale Prices. "WITLEY COURT" BOILER (Silver Medal, 1872). PATENT "EXCELSIOR" BOILER (1871). "TRENTHAM IMPROVED BOILER," with Water-way End and Smoker Consumer. PATENT PAXTON INDEPENDENT BOILER. "TUBULAR" and EVERY OTHER BOILER of known Merit or Excellence.

W. G. SMITH & CO., HORTICULTURAL ENGINEERS, Victoria Works, Bury St. Edmunds.

SOLE MANUFACTURERS of BEARD'S PATENT METALLIC NON-CONDUCTING GLASS-HOUSES.—The Glass is fixed between two layers of prepared felt. The Ventilators are worked by a simple mechanical contrivance, and the whole structure is screwed together so as to render it quite portable. HEATING APPARATUS IN ALL ITS BRANCHES. ORNAMENTAL CONSERVATORIES and HORTICULTURAL BUILDINGS of EVERY DESCRIPTION.—For lightness, elegance and durability, these Houses cannot be surpassed. The best materials only are used in their construction. Great improvements have recently been made, to obviate the objections to iron houses. Very extensive works on this principle have been successfully executed. An Illustrated Catalogue forwarded post-free on application.

COWAN'S PATENT COMPENSATING SYSTEM OF HEATING,

FOR HORTICULTURAL, PUBLIC, AND OTHER BUILDINGS.

The most important discovery for saving the cost of fuel, for steadiness in heating power, and dispensing with night stoking. One Apparatus will do the work of several Boilers, and in some cases produce a profit.

Heating by the Ordinary Systems. Hothouses, Mansions, Churches, and other Buildings efficiently heated by other approved methods, where the Patent Apparatus cannot be adopted. A large Stock of the most improved forms of Boilers to select from.

HEAT and LIGHT. COWAN'S PATENT COMBINED GAS-MAKING and HEATING APPARATUS, By which Country Mansions and Public Institutions may be heated and lighted, in most cases free of cost.

HORTICULTURAL BUILDING. All structures specially adapted to the purposes for which they are required, built of the best materials and workmanship, at moderate prices.

Plans and Estimates free. An Illustrated Pamphlet free. All work done by the Company is guaranteed.

THE Cowan Patents Company (Limited), 21, WHITEHALL PLACE, LONDON, S.W., and The Vineyard, Garston, near Liverpool.

WANTED, a DRECHSLER'S WINNOWERING MACHINE, Second-hand will do; also CAULIFLOWER PLANTS. State lowest cash price, with Description. D. N. W., Fostedice, Dorslogh.

THE
New Patent Garden Pump.
Price 25s. complete.
(Packed for Rail, &c. extra).

THE GARDENERS' CHRONICLE
VOLUME for JULY to DECEMBER, 1876.
W. RICHARDS, 41, Wellington Street, Strand, W.C.

Improved Method of Fruit Culture.
THE MINIATURE FRUIT GARDEN
(8th edition) is now ready, and may be had for post for 3s. 6d. from

THOMAS RIVERS and SON, The Nurseries, Sawbridge-
worth; also of Messrs. LOWN and CO., Paternoster
Row, London, E.C.; and Messrs. EDMONDSON BROS.,
10, Dame Street, Dublin.

1 vol. 8vo., with about 12,000 Woodcuts, price 42s.
J. OUDON'S ENCYCLOPEDIA of
PLANTS: comprising the specific character, description,
culture, history, application in the arts, and every other
desirable particular respecting all the plants indigenous
to, cultivated in, or introduced into Britain. Corrected by Mrs.
Loudon. The plates of which have also been engraved.
This celebrated work is of the greatest utility to gardeners,
and, indeed, to all who have not access to great libraries. The
great recommendations of the work have also been enlarged,
which, although only minutiae, were nevertheless drawn by
Mr. Sowerby with such happy art, and so skillfully engraved by
Woodcut, that the plants could always be recognised, even by
those little acquainted with the vegetable kingdom. *Gardeners'
Chronicle*, London, LONGMAN'S AND CO.

Just Published,
AGROSTOGRAPHIA,
A Treatise on the Cultivated
Grasses.

REVISED EDITION, WITH ILLUSTRATIONS.

BOOK-KEEPER (ASSISTANT), or INVOICE CLERK.—Belgian; understands English and German, and corresponds in French and Flemish.—Z. Z., Post Restante, Ghent.

E P P S S C O C O A.—By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by careful application of the fine properties of well-selected Cocoa, Mr. Epps provided our breakfast table with a delicately flavoured beverage which may save us many heavy doctor's bills. It is by the judicious use of this Cocoa, and the Cocoa which may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack us at our weakest points and destroy our frailty. We are constantly being assailed by many fatal shafts by keeping ourselves well fortified with pure and healthful food and drink. Sold in packets. JAMES EPPS & CO., HOMEOPATHIC CHEMISTS, The Warehouse Street, London, W.

KINAHAN'S L.L. WHISKY.—Kinahan & Co. finding that, through the recommendation of the Medical Profession, the demand for their CELEBRATED OLD WHISKY for medicinal purposes is very great, submit with pleasure the following Analysis: Dr. Haasell—"I have very carefully and fully analysed samples of Kinahan's Scotch Whisky, and the analysis is soft and mellow to the taste, aromatic and fully equal to the best Scotch Whisky, and is of a pure, well-matured, and of the highest quality. The Medical Profession may feel full confidence in the purity and quality of this Whisky."—J. G. Griffiths, 10, Great Street, London, W.

ELLIS'S RUTHIN WATERS. PURE AERATED WATERS. ELLIS'S RUTHIN WATERS.—Crystal Springs, Soda, Potass, Seltzer, Lemonade, Liqueur, and for medicinal purposes. Crystals of Soda, &c. "R. ELLIS and SON, RUTHIN," and every Label bears their Trade Mark. Sold everywhere, and Wholesale by R. ELLIS & SON, RUTHIN, and by Messrs. London Agents: W. BERT and SONS, Henrietta Street, Strand, near the Square.

DINNEDORF'S FLUID MAGNESIA. The best remedy for ACIDITY of the STOMACH, HEADACHE, NERVOUSNESS, GOUT, and INDIGESTION, and the safest and most delicate Costicatives, Ladies, Children, and Infants.

DINNEDORF and CO. 179, New Bond Street, London, and all Chemists.

HOLLOWAY'S PILLS.—Health's Fountain.—It cannot surely be necessary to remind any intelligent reader that the purity of the blood determines the condition of health, and that the best medicine reaches out the slightest taint in the vital fluid and restores it to its normal state, and that this medicine supports the system in places of the fluids of decay. When epidemics are advancing and disease is steadily on the increase, it becomes every one to have a restorative like the Pills ready to set right any irregularity in the stomach, liver, bowels, or kidneys. Holloway's treatment is especially suitable for the young, delicate, and nervous, and whose vital measures would endanger little less than the epidemic.

Cures of Asthma, Coughs, and Diseases of the Chest, &c. See the Testimonials.

DR. LOCKOCK'S PULMONIC WAFERS.—G. M. TOWNSEND, Esq., F.R.S., Author of "Shakespeare's Life," &c., writes: "I was very much pleased to have found them to give immediate relief to myself, my wife, and children. I had been suffering for some time from a disease of the lungs, and witnessed their good effects on friends who were consumptive." They taste pleasantly. Price 2s. 1/4d. and 1/6d. per box. Sold by all druggists.

GOETIA, LADY ALBEMARLE.

First-class Certificate Royal Horticultural Society,

August 2, 1896.

A magnificent new variety, growing a foot high. Flowers $\frac{3}{4}$ to 1 inch across, and of the most intense glowing carmine-crimson colour, which being produced in wonderful profusion give the plants the most charming appearance. This is the finest annual ever sent out, and being extremely hardy and easy of cultivation, should be in every garden.

Seed, with full cultural directions, per packet, 1s. 6d., post-free.

"We have scarcely any plant of such a lively and cheerful colour as *Goetia*."
Villa Gardner, September, 1896.

"An extremely beautiful variety bearing flowers a inches in diameter, of a glowing crimson colour."
Gardener Magazine, August 5, 1896.

"A suitable and splendid variety, far superior to any other of the family."
Journal of Horticulture, &c., 1896.

May be had of all Seedsmen, and Wholesale and Retail of DANIELS BROS., THE ROYAL NORWICH SEED ESTABLISHMENT, Norwich.

E. G. HENDERSON & SON

Offer the following in Seed, of quality the best that can be had, at per packet:—

CALCEOLARIA—the variety of colours, size, and shape of the flowers is the result of many years' continual improvement. 2s. 6d. and 5s.

CINEARIA—the shape and brilliancy of colour in these flowers is of great importance. 2s. 6d. and 5s.

PRIMUM SINENSIS, crimson, scarlet, and white (better cannot be had), separate or mixed, 2s. 6d. and 5s.

CYCLAMEN PERSUM GRANDIFLORUM—brilliant colours, with large, pointed and perfumed flowers, is the quality here offered; 1s. and 2s. 6d.

BEGONIA, tuberous-rooted (each collection is unequalled), 1s. and 2s. 6d.

tuberous-rooted, double-flowered, mixed colours, 2s. 6d.

BALSAM—we trust to none but our own sowing-mixed, 2s. 6d. and 5s.

PINK, from named collection, 1s. and 2s. 6d.

CARNATION, mixed, 2s. 6d. See Catalogue for separate sections.

MIMULUS, superb strain, name as exhibited every year at the Royal Horticultural Society, 1s. 6d.

LOBELIA, Brilliant Improved, White Brilliant, Marine Blue, &c., 1s. 6d. and 2s. 6d.

LAUREL Improved, Defiance—the best red, Bluestone, and Magnifica, 2s. 6d.

PANSY—English, show flowers, 1s. 6d.

WALLFLOWER, double German, mixed colours, 6d. and 1s.

NOVELTIES IN FLOWER SEEDS.

ALONSO ALPHILOA.—New distinct species from Mexico, introduced by Mr. Noel, the distinguished collector, flowering freely. It is 12 inches up to 2 feet in height, producing long terminal spikes of pure white flowers with yellow eye. It is recommended for pot-culture, as in the conservatory will produce a succession of flowers throughout the autumn and winter when most acceptable for bouquets and table-decoration. It will be found a desirable and useful substitute for Lily of the Valley, as used in our bouquets with so charming an effect when arranged so as to overtop the other flowers by 1 or 2 inches.

BROWALLIA ROZELI, 1s. COPEA HIRUTA, 2s. 6d. HIRATA LEGANZA, 1s. AGRILUM SNOW-FLAKE, 1s.

MIMULUS BRILLANTISSIMA, seed set, 1s. OXALATA, fine plants (see description in Catalogue), 1s.

BERNARDINI, new annual form of this beautiful combination of colouring, 1s.

ERYNGIUM LEAVENWORTHII, ornamental plant, 1s. PIRAZIA ALBUM LACINIA, 1s. fringed-leaved Golden Feather, 1s.

ASTER, Freshlight, most beautiful and brilliant new quilled variety of colour, 1s.

SAXIFERGA NEPALENSIS, fine ornamental species for rockwork, 1s.

PAFAER UMBROSA, showy flowers, 1s.

LITRIS PUNCTICOSTATA, 1s.

CANTHARY BELLS, double filled flowers, beautiful variety of colours, 1s.

COPIEA KOZELI, 1s. BAMBUA GRACILIS, 1s.

PINE-APPLE NURSERY, MAIDA VALE, LONDON, W.

Herbarious and Alpine Plants (Illustrated).

THOMAS S. WARE'S CATALOGUE of the above for the present year is now ready, and includes the following:—Ferns, Mosses, Ranunculus, and Ornamental Grasses, Bog Plants, and Aquatics; also, a few Bulbs. Post-free on application. Hale Farm Nurseries, Tottenham, London.

GISHURST COMPOUND—

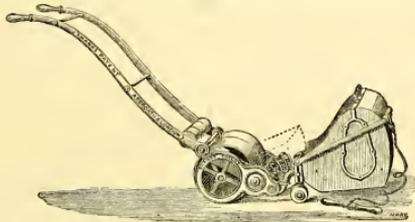

the best of the kind for the bedding Garden since 1859, against Red Spider, Midge, Thrip, Greeny, and other Blight, in solutions of from 2 to 3 ounces to the gallon of soft water, and 10 to 20 ounces to the bushel of dressing for trees and Fruit Trees.

Has acquired many preparations intended to supersede it. Sold Retail by Seedsmen, in Boxes, 2s., 3s., 4s., and 6s. Wholesale by FRICK'S PATENT CANE COMPANY (Limited).

SHANKS' NEW PATENT LAWN MOWERS,

Under the Patronage of Her Most Gracious Majesty the Queen, and most of the Nobility of Great Britain.

The merits of these Machines are now so well known, and their superiority so universally established, that a detailed description is no longer necessary. A. S. & SON would here simply refer to a few of the prominent advantages peculiar to their Machine. The Revolving Cutter is made to be self-sharpening. The *Sole-Plate or Bottom Blade* is made with *Two Edges*, enabling the cutting parts to last twice as long as in other Machines. A *Wind-guard* is also introduced, which prevents the Grass escaping the Box when the Machine is in use during the prevalence of wind.

PRICES,

Including Carriage to any Railway Station or Shipping Port in the Kingdom:—

NEW HAND MACHINE.		NEW PONY and DONKEY MACHINE.	
10-inch Machine	£3 10 0	25-inch Machine	£13 10 0
12-inch Machine	4 15 0	28-inch Machine	15 15 0
14-inch Machine	5 15 0	30-inch Machine	17 0 0
16-inch Machine	6 15 0		
18-inch Machine	8 0 0		
20-inch Machine	9 0 0		
24-inch Machine	10 0 0		

The Hand Machines are all fitted with Silent Movement, and can be used either with or without the usual Front Rollers.
 The Horse Machines are all fitted with Silent Movement, and can be used either with or without the usual Front Rollers.
 Price, for the 28-inch and 30-inch Machines, 30s. extra; 25-inch Machine, 5s. extra. Silent Movement, 12s. 6d. extra. Boots for Pony, 2s.; for Donkey, 20s. per set.
NEW HORSE MACHINE.
 40-inch Machine £8 0 0
 42-inch Machine 9 0 0
 44-inch Machine 10 0 0
 The Patent Delivering Apparatus enables the Grass-box to be emptied without stopping the Machine.
 Price, for the 42-inch, 44-inch, and 46-inch Machines, 30s. extra; for the 30-inch, 30s. extra. Silent Movement, 20s. extra.
 Boots for Horse's feet, 20s. per set.

A Staff of experienced Workmen always kept in London, so that Repairs can be done there as well as at the Manufactory.

SHANKS' PATENT LAWN MOWERS

Are warranted to give ample satisfaction, and if not approved of can be at once returned.

ALEXANDER SHANKS & SON.

Dens Ironworks, Arbroath; and 27, Leadenhall Street, London, E.C.

Rosher's Garden Edging Tiles.

THE ABOVE and many other PATTERNS are made in materials of great durability. The plainest sorts are specially designed for KITCHEN GARDENS, as they harbour no Slugs or Insects, take up little room, and once put down, incur no further labour or expense, as do "grown" Edgings, consequently being much cheaper. GARDEN VASES, FOUNTAINS, &c., in Artificial Stone, very durable, and of superior finish, and in great variety of design. F. ROSHER AND CO., Manufacturers, Upper Ground Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.; Kingsland Road, N.E.
 Agents for LOOKER'S PATENT "ACME FRAMES," PLANT COVERS, and PROPAGATING BOXES; also for FOXLEY'S PATENT BEADED GARDEN WALL BRICKS.
 Illustrated Price Lists free by post. The Trade supplied.

ORNAMENTAL PAVING TILES, for Conservatories, Halls, Corridors, Balconies, &c. from 25 per square yard upwards. Pattern Sheets, of plain or more elaborate designs, sent gratis, sent for post.
 WHITE GLAZED TILES, for Lining Walls of Dairies, Larders, Kitchen Ranges, Baths, &c. Grooved and other Stable Paving of great durability. Wall Copings, Drain Pipes and Tiles of all kinds. Roofing Tiles in great variety, Slates, Cement, &c. F. ROSHER AND CO., Brickmaking Tile Merchants. See addresses above.

SILVER SAND, fine or coarse grain as desired. Prices by Post per ton or truckload, on Wharf in London, or delivered direct from Pit to any Railway Station. Samples of Sand free by post.
 FLINTS and BRICK BURNS for Rockers or Ferrettes. KENT PILES or LOAM supplied at lowest rates in any quantities.
 F. ROSHER AND CO.—Addresses see above.
 N.B.—Orders promptly executed by Rail or to Wharves. A liberal Discount to the Trade.

Oil Paint No Longer Necessary.

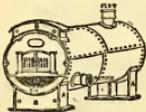

HILL and SMITH'S BLACK VARNISH for Preserving Ironwork, Wood, or Stone. This Varnish is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertisers, and its genuine quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is sold at the works at Windsor Castle, New Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received, which HILL & SMITH will forward on application.
 Sold in casks of 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 4d. per gallon carriage paid to any Station in the Kingdom.

UNQUALIFIED TESTIMONIAL.
 Clangville, Llanfyllfan, Carmarthen, Nov. 27, 1873.—"Mr. Lloyd Lloyd encloses cheque for £3 5s., amount due to Messrs. HILL & SMITH, and he considers the Black Varnish one of the most useful things he ever possessed."
 Apply to HILL and SMITH, Brierly Hill Ironworks, near Dudley, and 119, Queen Victoria Street, London, E.C., from whom only it can be obtained.
 CAUTION.—It has been lately come to the knowledge of HILL & SMITH that spurious imitations of this Varnish are being offered by unprincipled dealers at a slight reduction in price, which would especially be attended to the goods of very cheap of their Varnish is legibly marked with their name and address, without which none is genuine.

CRITCHLEY'S PATENT HEAT REGULATOR,
AN APPARATUS FOR REGULATING THE HEAT IN HORTICULTURAL BUILDINGS.

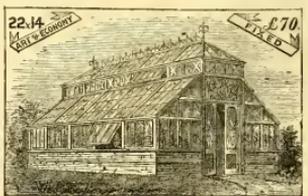

A. Iron Box fitted up water-tight, B. Pipe or Supply of Water from Boiler, C. Pipes for Circulating Hot Water, F. F. Pipes for Return of Water to Iron Box, G. Pipe for Returning Water to Boiler, H, I, J, K, Piston-Rods for Opening and Closing Valves.

The advantages of these Regulators are that houses may be kept at different degrees of heat, or the circulation of water and heat entirely stopped in one part and not in others. They have had ample opportunities of practically proving them, and unsubstantiated admit they are far superior to any other valve; in fact, I think it the greatest improvement that has come out for horticultural purposes.

The following Testimonial has been received:—"Brierley Castle, April 13, 1875. 'Gentlemen, - I am happy to inform you, now that the late severe winter is past, that the Hot-Water Apparatus erected by you does its work to my entire satisfaction. As to the two Heat Regulators, which represent thirty valves, I have had ample opportunities of practically proving them, and unsubstantiated admit they are far superior to any other valve; in fact, I think it the greatest improvement that has come out for horticultural purposes.'"
"I am, Gentlemen, yours truly, "R. H. CROWK, "Gardener to the Right Hon. Lord Fishburne."

Estimates and Plans furnished for Warming Gentlemen's Mansions and Public Buildings. Orders attended to in any part of the Kingdom, and guaranteed to answer their intended purposes. Prospects and Price Lists post-free.

ART-WITH-ECONOMY-APPLIED-TO-CONSERVATORIES

In consequence of the increasing demand for Conservatories, in which pure art is combined with moderate cost, T. H. P. DENNIS & CO. have been led to introduce designs of a character hitherto unknown. One of these designs, showing a house 22 feet 6 inches x 13 feet 6 inches, is annexed, and the result, as regards the extremely low price (which includes fixing, glazing, painting, carriage, &c.), has been attained only by special machinery and a system of interchangeable parts.

T. H. P. DENNIS & Co. are also prepared to provide and fix Hot-water Heating Apparatus and Horticultural Buildings of any dimension or description.

Full-sized specimens of Greenhouses, &c., and Hot-water Apparatus in work, can be inspected at Manshon House Buildings, London, E.C.

Gentlemen waited upon at their residences by experienced designers.

The Greatest Novelty of the Season.

MIMULUS MOSCHATUS HARRISONI.

Awarded a First-class Certificate by the
Royal Horticultural Society and Royal Botanic
Society of London, 1876.

This exquisite plant is a Hybrid between the Large Spotted Mimulus and the Giant Musk. The flowers are as large as the former, with the rich golden-yellow colour of the latter, exquisitely spotted on the lower segments with rich brown. Its habit is recumbent and neat, blooming at every joint, thus producing an abundance of elegant flowers which are brilliant and interesting. A few plants will effectually brighten and scent a Conservatory or Greenhouse. It will succeed admirably in all situations where it can be freely supplied with moisture, although a cool shady place is the best. Being an excellent Bedding Plant, and especially adapted for Rockwork, it will be rapidly brought into requisition, and its universal cultivation will quickly be accomplished. Its easy culture and other qualities will secure for it a popular and extensive sale. It continues in bloom from March until December, and retains its scent throughout the year. As a free-growing odoriferous plant it is admirably adapted for Asylums, Hospitals, and other Public Institutions.

NATURAL SIZE.

Harrison's New Musk.

OPINIONS:—

From THOMAS MOORE, Esq., *Chelsea Botanic Gardens*,
Nov. 17, 1876.

"I was much pleased with your hybrid Musk as exhibited at South Kensington. I think it likely to make a useful decorative 'everybody's' plant, fit for the conservatory or the cottage."

From SHIRLEY HIBBERD, Esq., *F.R.H.S., Stoke Newington*.

"Harrison's Musk is one of the most interesting of the novelties of the season, for the Musk in its old form is a universal favourite, and in this new variety we see it improved in all its attractive characters, so that it may rank with the finest flowers, while continuing to charm us with its refreshing odour."

From Mr. A. F. BARRON, *Chiswick Gardens, W.*,
Nov. 13, 1876.

"I like Mimulus Moschatus Harrisoni very much. It is as strongly perfumed as the ordinary Musk plants, with the addition of large yellow flowers, like the common Mimulus. It is sure to be largely grown as a window plant."

From Mr. R. DEAN, *Nurseryman, &c., Ealing*.

"MIMULUS MOSCHATUS HARRISONI.—This is a bold-growing perfumed Musk, with large yellow red-spotted flowers. In addition to the spotting, it may give us a race of scented-foliaged Mimulus with flowers as large and beautifully spotted as any now to be found on the improved varieties. This interesting hybrid was exhibited by Messrs. Harrison & Sons, Nurserymen, Leicester, and awarded a First-class Certificate of Merit—the highest award a new plant can receive."

From Mr. JNO. WELLS, *Nurseryman, Ongley Crescent, South Kensington, Ave. 13, 1876*.

"I was much pleased with your new Mimulus Moschatus Harrisoni when I saw it exhibited some time since, and consider it a great acquisition, and shall be glad to have some plants of it as soon as it is in commerce."

This beautiful plant will be distributed on or before
May 1.

Plants 5s. each; Six for 25s.; Twelve for 48s.
Orders booked and executed in rotation, as received.

IMPORTED ORCHIDS.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY, April 16, at half-past 12 o'clock precisely, a large importation of some hundreds of plants of CYMBIDIUM EBURNEUM, just arrived in splendid condition, several of the plants with flowers on them that have expanded in the cases while in transit; many of the plants are large and fine masses, with from six, eight, ten, to twelve growths each. At the same time will be sold immense quantities of many other choice ORCHIDS, such as VANDA STRIATA, CYMBIDIUM GIGANTEUM, VANDA CÆRULEA, V. CATHARTI; and some hundreds of good plants of AERIDES FIELDINGII (FOXBRUSH), DENDROBIUM FORMOSUM, D. NOBILE WALLICHII, hundreds of plants of the rare CÆLOGYNE BARBATA, various PLEIONES, and some good plants, just imported, of ONCIDIUM VARICOSUM varieties, O. ROGERSII type, and some healthy plants of ODONTOGLOSSUM VEXILLARIUM.

On view the morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN,

THE NEW ROSE, QUEEN OF BEDDERS (NOBLE).

Perhaps the Finest Rose for Bedding ever sent out.

COLOUR OF "CHARLES LEFEBVRE."

First-class Certificate Royal Horticultural Society, August 2, 1876.

Its inflorescence may be imagined when it is stated that a plant 18 inches high had 84 Buds and expanded Roses upon it on the 6th September, 1876, and flowered continuously from June until November, on the 20th of which month (1876) it was still in bloom.

Good Plants will be sent out, in strict rotation, at 10s. 6d. each,
COMMENCING FIRST WEEK IN MAY.

CHARLES NOBLE, BAGSHOT.

SUTTON'S CHOICE FLOWER SEEDS,
FREE BY POST OR RAIL.

Sutton's Improved Miniature Aster.

A profuse flowering variety, of dwarf compact habit, remaining in bloom for a considerable period, hence it is invaluable for growing in pots for conservatory or drawing-room decoration. We have this season succeeded in saving six distinct colours, which greatly increases the value of this beautiful Aster for bedding purposes.

Price per Packet, mixed, 2s. 6d.
Six varieties, separate, 5s.

SUTTON'S COLLECTIONS of CHOICE FLOWER SEEDS,

TO OBTAIN THE Best Garden Lawns and Croquet Grounds

SUTTON'S LAWN GRASS MIXTURE,

Which forms a close velvety turf in a very short time.

For making New Lawns or Croquet Grounds 3 bushels, or 60 lb., is required per acre, or a gallon to every six rods (or perches) of ground. For improving those already in turf, 20 lb. should be sown per acre.

March, April, and May are the best months for sowing. Price, 1s. 3d. per lb., 23s. 6d. per bushel, carriage free.

Instructions on the Formation and Improvement of Garden Lawns and Croquet Grounds. Gratis and post-free.

WINE AND THE VINE.

FOR many centuries this country was satisfied with the wine of its own growth. Vines, we are told, overran the walls of churches, and there were vineyards attached to several of the monasteries and religious houses. The chief wine district was in Gloucestershire, which, according to William of Malmesbury, boasted better Grapes and more vineyards than any other part of England.

Among the names that linger like old legends, and reveal something of the history of particular spots, that of "Vineyard Holm," a sheltered and sunny hollow of the Hampshire Downs, tells his own story. The warm slopes of the "vineyard hills" at Godalming were once hung with Vines, and country people still point to the hill as a spot where labourers once worked for a penny a day, and were well off, as they would have been in the eleventh and twelfth centuries, when the silver penny weighed as much as our threepenny piece, and beef and mutton were a farthing a pound.

Petrarch was mistaken in saying that the English drank nothing but beer and cider; they drank the juice of the English Grape unfortified with spirit. Vineyards were common for several centuries after the Conquest. The Abbey of St. Augustine at Canterbury, and the Priory at the same place, each had its vineyard. The Battle of Hastings was fought near the great plantation of Vines at Sandac. Domesday Book contained thirty-eight entries of valuable vineyards—one in Essex consisted of 6 acres, and yielded 20 hogsheads of wine in a good year. There was another of the same extent at Ware. Wine was made at the Royal palace of Woodstock and at Windsor Park, and an old manuscript roll in the Castle showed the yearly accounts of the cost of planting Vines, and the quantity of wine produced in the Little Park in Richard 11's time. Part of the wine was used in the Royal household, and part was sold, "the tithes thereof were paid to the Abbot of Waltham, then the parson of New and Old Windsor."

There are sites called "The Vine" at Rochester, Sevenoaks, and other places. In Edward 11's reign the Bishop of Rochester sent the King "4s. present of his drink, and winalth both wine and Grapes of his own growth at his vineyard at Halling." The vineyard at Peterborough was planted by the Abbot in the time of Stephen; Prior John, of Spalding, an improver and builder, planted both vineyards and orchards; and others were planted by the Abbots of Denny Abbey in Cambridgeshire, of Dunstable, St. Edmund's Bury, and other abbays. The Isle of Ely was called by the Normans "L'Isle de Vignes." The Bishop's yearly tithes of wine was three or four tuns, besides whatever liquor accrued to him by leases and escheats.

The clergy of the Romish church drank, in their palmiest days, a wine called "Theologium," which was only found in their establishments; and woe to the merchant who sent them wine of an inferior quality. After the battle of Poitiers, which was fought in a French vineyard, French wine became the fashion; and Cressy being won, and Edward 111. king, wines were poured into this country from Bordeaux, and were relished as the produce of English

provinces in France. Then came a long series of misfortunes, and within a hundred years of Cressy all the recent conquests and the inherited domains in France were lost, except the seaport of Calais. During this disastrous period the supplies of foreign wine were interrupted. For a while France was ruined, and considerable progress was made towards her final conquest by the extirpation of the population. At Cressy 30,000 Frenchmen of the rank and file fell, besides 1200 knights, and the blind old king, who had his horse led into the *mêlée* that he might strike one good blow. At Poitiers, the Black Prince's victorious forces killed 11,000 or nearly 13 Frenchmen per English bill and bow. The peasant insurrections of "Jacques Bonhomme" increased the general misery, and Petrarch, a witness of the widespread desolation, writes, "I could not have believed that this was the same France which I had seen so rich and flourishing;" then he goes on to describe the land uncultivated, the houses in ruins, the people in poverty, Paris burnt, its streets deserted and overgrown with weeds, the country a solitude. "War," said Henry V. when he invested Rouen, which was defended by the new artillery, "war has three handmaids ever waiting on her, Fire, Blood, and Famine;" and at Agincourt, when his band of archers bared their arms to use "the crooked stick and the grey goose wing," they killed 11,000.

During this long, dark period of French history her vineyards suffered terribly by the actual loss of population; but the extirpation of a people in an extensive country has always proved a tedious operation. At every interval of war in the case of France the population spread again over the desolated tract like a flood of waters broken loose; and, in spite of their calamities, we presently find the French once more prosperous and victorious, sweeping the Channel with their fleet, and seizing the semi-sacred "Theologium" freighted specially for the Church. It was impossible such a state of things could continue long, but while it endured the unwonted cry was occasionally heard on our southern coast: "The French! Out, out!—the French are upon us!" Two Cinque Ports, side by side on the Sussex coast, were burnt during one of these landings, and the "Theologium" yet remaining in the famous vaults of our chief wine ports (Rye and Winchelsea) was destroyed.

The above recital shows how the fortunes and circumstances of nations entirely changed, even in that slow age, within the short period of fifty years. Quitting the vineyards of our neighbours, we may recall the fact of the utter ruin of the gardens and vineyards of England, which we are assured by the best authorities occurred during the Wars of the Roses. Passing on, however, to later times, we once more meet historically with English wines and Vines. Dr. Ralf Bathurst made claret at Oxford in 1685; "as good as one could wish to drink;" and Sir Henry Lyttelton subsequently made wine at Over-Arly—a warm nook in Staffordshire. We could mention the names of many individuals who drank wine of English growth 170 years ago, and pronounced it good. Sir John Hamner loved his country's wines, so did Stephen Hales, the founder in England of vegetable physiology, who thought Dr. Shaw's vintage at Kensington equalled the lighter wines of France. The sites of Dr. Shaw's vineyard and of another at Hammersmith were not very favourable, yet so long as care was taken good wines were sold from both of them.

At Walham Green a Mr. Roque planted a vineyard in a field, and made wine for thirty years equal to that of Orleans and Anverre. A better site was at Pains' Hill, near Cobham, on the south side of a gentle hill, where the soil was warm, gravelly, and dry; and here the

Hon. Charles Hamilton made excellent champagne. There was a noble vineyard at Arundel Park, and in 1763 there were sixty pipes of English Burgundy in the Duke's cellars there—better than a great deal that is imported, and very superior to what is generally drunk in France. There was a vineyard on the steep southern face of a hill at Deepdene, Dorking; but Daniel Defoe, who commenced a *Tour Through the Island of Great Britain*, mentioned that in his time the gardens and vineyards at Deepdene were neglected.

English Grapes which had previously yielded good vinous juice, ceased to do so for a period of about twenty-five years from 1799, when a cycle of wet, cold summers and bad harvests commenced. This was a great blow to our modern vineyards, and prejudice and the lost prestige of the wines have completed their ruin. It is hard to say whether the *prestige* or the art of making the wine was lost first; but it is not too much to assert that, if the home-made wines of France were as badly managed as those of England are at the present time, they would be equally indifferent.

In the southern counties the Vine has clung tenaciously to its old sites, and while legends, dim memories, and characteristic names still attach to certain spots, and dedicate them to the Vine, the Vine itself overruns and adorns the cottage walls, and its produce frequently pays the cottager's rent.

We conclude with a few statistics in favour of improving the art of English wine-making. A common price of thin claret is 12s. per dozen, or 6s. per gallon. A much stronger English wine can be made from Graves and sugar at half that price. We are, therefore, glad to hear of an experiment in wine growing on the estate of the Marquis of Dute in Glamorganshire. There are many dry and sunny slopes in the warmest parts of England which might be profitably covered with the Vine. Sugar would assist the modern wine-maker. It cannot be maintained for a moment that home-grown wine will acquire the nutty flavour of good old foreign wine, but we still think that the commonest sherry wines, the sophisticated and unwholesome liquors too often sold as foreign wines, and the vile mixtures sometimes miscalled port, sherry, and champagne, might be excelled by wines of English growth. *H. Evershad.*

ERICA CODONODES.

THE beautiful specimen from which the accompanying engraving (fig. 70) of this chaste and charming hardy Heath was prepared, was sent to us in January last from the garden of the Hon. and Rev. J. T. Boscawen, Lamoran, Cornwall, where, as will be seen from the profusely flowered condition indicated in our woodcut, which is by no means exaggerated, it grows in the highest degree of perfection. Under such favoured conditions of climate it is perfectly hardy, as indeed it is in most parts of England, but in low-lying damp situations we have known it cut down to the ground by winters of exceptional severity. It, however, springs again from the root.

Erica codonodes was figured by Dr. Lindley in the *Botanical Register* (t. 1698), where he remarks concerning it—

"This species of Heath has the general appearance of *E. arboræ*, a plant which is a great ornament to rocky places in the south of Europe, where it grows intermixed with different kinds of *Cistus* and the wild *Arbutus*. But it seems essentially distinct in its larger flowers, more slender leaves, less hoary branches, and truly bell-shaped corolla, which has by no means the globular form of that of *E. arboræ*; its stigma is, moreover, very small, and not at all dilated or lobed, either when dried or recent. *E. polytrichifolia*, which we presume is the *E. arboræ* stylosa of English gardens, is equally distinct in the same characters."

The specimen figured by Lindley was grown by Mr. Wood, of Maresfield, in Sussex, where the plant is reported to be quite hardy, and to form a bush 10 to 12 feet high. There "it begins to blossom in

February, and continues till the end of May, disregarding both frost and snow, being often covered with flowers from top to bottom, and forming a most beautiful object. It thrives in light sandy peat." *T. M.*

TO HAARLEM AND AMSTERDAM.

MOST people who have never been to Holland entertain a prejudice against its cities. They imagine dingy crowded houses, whose conglomerated mass is separated only by narrow lanes, called "canals," which are stagnant water instead of wholesome solid pavement. The fancy picture is finished off by the additional touches of a heavy breathless atmosphere, deficient light, suffocating smells, and a plague of mosquitos. These notions may have been suggested or confirmed by the unhappy idea of calling Amsterdam the Venice of the North. Never was comparison less applicable. Omitting other differences, the nuisances expected to be met with in the Northern, are much more rife and intense in the Southern city.

The drive from the Hotel St. Lucas to the railway which is to take you from Rotterdam northwards, suffices alone to clear away the misconception. Fancy a very broad street, and in the middle of the street a wide water-way sufficient for the passage to and fro of seagoing vessels, and of course of multitudinous freshwater craft graduating in size through large, less, and least. These vessels are sufficiently crowded to show that the town is engaged in serious business, instead of leading a life of *dolce far niente*, part of whose sweetness, in Italy, is made up for poor living, pride, and poverty. The Dutch canal, too, is bordered on each side with trees that are well taken care of. Between the trees and the lines of houses, along each side of the canal runs a quay, which often of itself would elsewhere make a fair street. It is not intended to be asserted that there are no quays and canals more modest and more picturesque.

But, in Amsterdam especially, there is one great desideratum—no seats or benches are provided under those trees for weary walkers to rest upon. Economy cannot have been the cause of the want, for expense is not spared on the marble of the doorsteps. It may be meant as an intimation not to loiter—a practical application of the blunt motto on the old church clock, "Go about your business." Nevertheless, after prolonged wanderings along the labyrinthine quays of Amsterdam, a few minutes' repose now and then would be welcome. And you have no foot pavement to walk upon either; the space where a footstep should be, is rilled off with chains or palisadings, inclosing a small paved area in front of each house, not unfrequently of costly workmanship and materials. Something of the kind, perhaps copied from the Dutch, may be seen at Great Yarmouth; only, there, there are excellent foot-pavements. As a slight concession to pedestrians, Amsterdam's street gutters, in front of those railings, have wooden covers, to prevent splashing and other offences against neatness.

As at Antwerp, the northgoing railway station is close to the Zoological Garden, at whose entrance an avenue of macaws scream invitations to enter, in case you have an hour to spare. There are stations and stations, and, therefore, we look closely at the first Dutch station of importance which we enter. As might be expected, its main characteristics are comfort combined with ornamentation. The waiting rooms are well supplied with tables and chairs, and a deal of mahogany is used in the furniture. That for first-class passengers is like a drawing-room, with carpet and other pleasant extras. As in Belgium, the waiting-room is also a refreshment room, the convenience of which needs no pointing out.

On taking your ticket, you find the price marked on it, to the great satisfaction of suspicious travellers. The journey northwards is still a repetition of gliding over seemingly endless green plains, with little other variety than that some pastures seem better kept, *i.e.*, freer from weeds and Thistles than others. Besides grazing sheep and cattle, few other living creatures are seen than flocks of lapwings wheeling about, showing now a white front and now a black one, and a stork or two dancing and fluttering along in search of the Dutchman's mortal enemies, field mice, and other rodents which burrow in the dams and by the sides of canals; for, in Holland, the lettings-in of waters are even worse than the beginnings of strife. With so vast a horizon spread out before you, how small even the nearest objects seem as glanced at

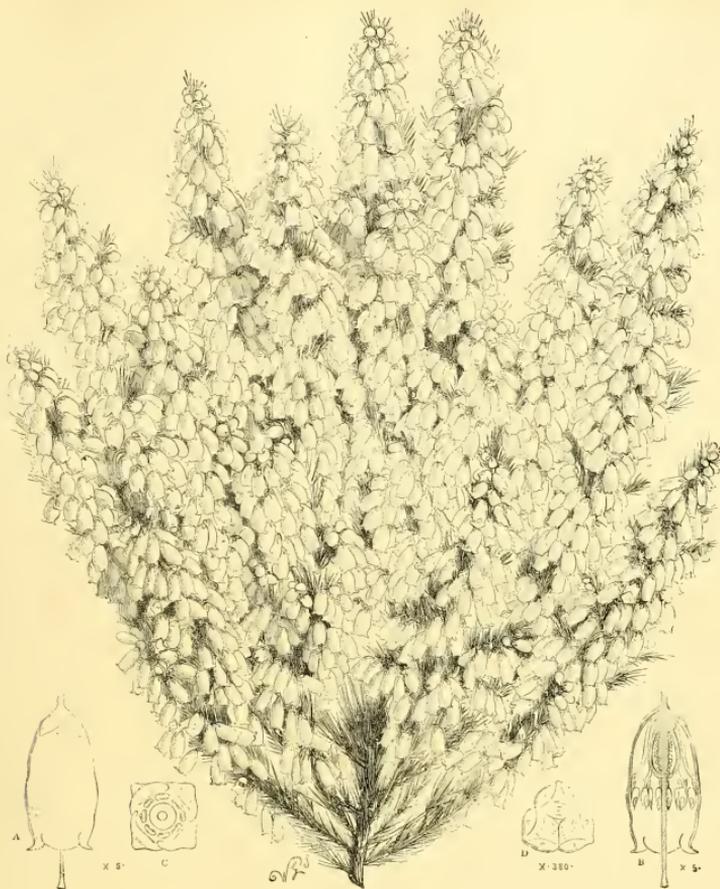

FIG. 70.—*ERICA CODONODES*, NAT. SIZE. A, FLOWER; B, SECTION; C, DITTO, SEEN FROM BELOW—ALL $\times 5$; D, POLLEN, $\times 380$.

from a railway carriage window. That yellow-flowered aquatic plant in the boundary ditch looks no bigger than a Daisy, although it is our common yellow Water Lily; a Naphar with no more than a Daisy's dimensions would be an acquisition to aquarium lovers. As we advance familiar names meet the eye and the ear—Schie-dam, calling up memories of long-drawn gossips over hot gin-and-water before going to bed on frosty nights; Delft, whose "old Blue" is now the rage; soon afterwards the Hague (*'sGravenhage*, in Dutch), where we have not time to stop to-day; Leyden, the learned, on which also we can only bestow a wistful look, being obliged, as the French say, to *brûler*, or burn it. From Leyden the railway skirts the chain of dunes or sandhills on the left that line the coast. On either side of the line are small fields or patches planted with garden bulbs and tubercules—Hyacinths, Tulips, Anemones, Ranunculuses—which, in the season of their flowering, break the monotony of the plain with charming bursts of bright colour. But the traveller will doubtless be aware that he is passing over ground of the highest interest on many other accounts besides floriculture.

You soon reach Haarlem, where you ought to stop awhile, there being every inducement to do so. Walking from the station along *Kruisstraat*, you find, close at hand to the right, *Funchler's Hotel*, which is excellent, with chambers like those of a private house, a dining-room almost too big and airy, looking as if it sometimes served for dancing and specchifying, but which the Amsterdam Exhibition will probably fill at times, and, far from least merit, capital cookery. *Artophagos Frenchmen* complain that, at Dutch hotels, the bits of bread beside your plate are absurdly small, and as light as sponge cake, but no penalty is incurred by asking for more.

Haarlem is a delightful town, which wears its Sunday clothes every day in the week. In spite of its 32,000 inhabitants and more it is so quiet, staid, and orderly, that you would say it was Sunday all the week long, did not its important markets and its vast horticultural and other produce prove that it must have working days. Everything about it is healthily neat and tidy, and kept in the most finished order. An air of perfect and unquestionable respectability and honourability pervades the whole place. The late police magistrate Walker, the author of *The*

Original (who was one of the first to be instrumental in reforming the overloaded profusion of English set dinners), believed that there were individuals so admirably constituted, that their personal cleanliness was always irreproachable, independent of washing operations. Haarlem looks as if rose from the earth a naturally bright and spotless town, like a fresh and immaculate meadow Mushroom, which no soil or speck was ever to touch without sharing its short-lived and fragile nature.

Moreover, the suburbs of Haarlem harmonise perfectly with its interior. They are simply delicious. True, there are no rocks nor brawling trout-streams; but there is a soft gradation through pleasant places, even though they bear such droll names as *Koekamp*, from the central great market-place to the *Wood of Haarlem*, which often make you ask yourself by the way whether you are traversing a *rus in urbe* or an *urbs in rus*. For besides restaurants, hotels, picture-galleries, and casinos interspersed, not too closely, you pass, one after another, inviting villas which, if ever to let, would not have long to wait for a tenant, each rivaling its neighbours in the finished order of its well-kept grounds, one favourite ornament of

a lawn being the trunk of a dead tree, whose hospitable top invites a pair of storks to rear their young upon it. Such invitations are accepted in confidence, without the slightest apprehension of being (as they would be in England) shot and stuffed immediately after their arrival from the South, by some accident lover of natural history. In the twilight of a summer's evening, the long-legged nestlings, standing up to walk or digest their supports, their forms being black against the glowing sky, look like metal birds stuck there for ornament.

Haarlem Wood and also the famous Hague Wood, are believed to be the remnants (with careful renovation) of an immense forest, once swarming with game, which stretched from one point to the other, and beyond them. At present, they show how the swampy desert may be made to uplift itself, flourish, and bloom. No wonder that many Amsterdam merchants make Haarlem and its environs their residence. N.B. Let not the agricultural tourist forget that close by is the marvellous drained Haarlem lake or sea, converted into fertile polders, which now produce abundant food for beast, and consequently for man.

One of Haarlem's lions is E. H. Krelage & Son's horticultural establishment, the most important in Holland, founded sixty-six years ago. You reach it by a pleasant five-and-twenty minutes' walk from the station or from Funckel's Canal, which shows you besides a couple of shady canals or "grachts"—you will find "grachts" in plenty at Amsterdam—the great High Street, so spruce and so plentifully bordered by Conifers, 150 metres long and 2 metres broad; besides the Lily grounds, containing lancifolium, longifolium, with more Lilies, and Lilies again; besides the auxiliary magazines, kept slightly warmed in winter, where Anemone and Ranunculus roots are dried on air stages, there are Strawberry plants to be prepared for exportation, many bound for America, while Spiræas and Lilies of the Valley are sent off by thousands of stooks. Queer old-fashioned names are not forgotten; you may have night-blooming Cereus in six or eight varieties; Elephants' Feet from 300 francs (£12) the pair to small petticoats to francs a-piece; the Old Man Cactus, Cereus senilis, values his venerable head of hair at from 40 to 150 francs.

It is wonderful to see what may be done on a very poor soil with the help of cow-dung and wooden walls, or boarded inclosures to break the wind, for the gusts from the North Sea must sometimes be furious. In spite of which it is found that Conifers and evergreen shrubs thrive well in the sandy soil; witness the healthy Pinusops and the collection of variegated Hollies. The Pinus Nordmanniana is valued to hold its own by its tardy growth. Abies Douglasii, however, proves more prosperous in England than here. Not to attempt a catalogue, I will merely mention Hyacinthus candicans, a colossal white late-flowering species from the Cape, with a stem a yard high, and Asclepias tuberosa, as plants requiring whose future fortunes little doubt can be entertained.

M. Krelage's general catalogue, *Hortus Krelageanus*, invites inspection of these interesting nursery catalogues, which gives the present writer the opportunity of thanking him for the great courtesy and patience with which his list was received, and, in return, it gives useful information respecting Haarlem itself and its environs, such as that the great organ plays from 1 to 2 on Tuesdays and Thursdays, entrance to the church gratuitous, on other days for a fixed honorarium; that pictures of the old and the new Dutch schools are to be seen at the Hôtel de Ville and elsewhere; that the house Johannes Eschsché on Zonen, type-foundry, are also the publishers of the *Haarlem-Weekblaad*, the oldest of the Dutch newspapers; and that there is a generally known, but desirable to know when you visit Haarlem.

With regret you take the ordinary train, which carries you to Amsterdam in half an hour. There is but one intervening station, Hilfweg, where on one side you have the old and the new (No. 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11), and on the other the pastures which replace the Haarlem Sea. It is through Dutch industry and courage alone that you are travelling on dry land. On

reaching Amsterdam, unless your topographical education is far advanced, you are advised to immediately engage either a guide and interpreter or a hackney carriage. As Prussian officers employ their leisure in the imaginary siege of foreign capitals, so intending travellers may profitably occupy their evening or two over the plan of that city just as well as with the last new game or puzzle, to see if they can discover the best way from one point to another, or contrive to find out any given address by means of its complete postal numbers, and names. Where, for instance, if you please, is J 563, Warmoesstraat J 564? †

ROSSIE PRIORY.

IN our number for November 1876 last we gave some particulars of the gardens at Rossie Priory, the seat of the Right Hon. Lord Kinnaird, and are now enabled to give a plan (fig. 71) of the kitchen garden and a portion of the pleasure-grounds, reduced to a scale of 100 feet to an inch. A reference to the plan on the opposite page will show that the houses which we have already described are situated on the left, with the kitchen garden quarters in front. This block includes eight vicinies, four Peach-houses, four orchard-houses, Pine-trees, and Pine-apple trees, plantations, greenhouses, Fig-house, Melon and Cucumber house, Mushroom-house, pits and frames for growing Melons and Cucumbers, and for protecting bedding plants, &c., propagating pit, two bathies, paint and glass shed, tool shed, fruit-room with cellar below, seed and store room, an open space for refuse (walled in), potting shed, and an open shed, &c. The gardener's house, B, is situated at the side of the kitchen garden, the quarters in which are lettered A, and from the kitchen garden the flower garden in the centre is reached by a path leading down some sloping bank of Laurels 3 feet high. The flower den is surrounded by Yew hedges 4 feet high and 2 feet broad, is tastefully designed, and was very effectively bedded-out when we saw it. Near by is a fountain, c. a fernery, e, a fine bank of Laurels, H, and a carriage drive, G. The Priory (which from the exigencies of space we cannot show) is reached by an almost direct line, the whole of the gardens and pleasure-grounds being situated on the southern slope of a high ridge of ground. We have already dealt in detail with the kitchen garden and it will therefore be unnecessary now to note a few of the leading Conifers with which the pleasure-grounds are so nobly ornamented.

Amongst the most notable specimens is one of Abies Douglasii, a very fine tree, but somewhat disfigured by the wind having broken some of the branches on the west side, where it is most exposed. It was planted in 1833, but has got good nursing in the shape of fresh soil or manure. Its height is 76 feet, girth at 3 feet from the ground 9 feet 2 inches, and the circumference of the branches, which lie on the ground, 56 yards. Taxodium sempervirens is represented by a beautiful plant in fine health, but which has had its leader broken several times by the wind: height, 47 feet; girth of stem, 6 feet 9 inches; and circumference of branches, which lie on the ground, 30 yards. It was planted in 1850. A specimen of Wellingtonia gigantea was introduced in 1856. It was grown from the first sent home by a son of the late Mr. Mathew of Goudiehill (a frequent contributor to our columns). Its height is 24 feet, girth of stem, 3 feet 3 inches; circumference of branches, 30 yards; and it is so vigorous and lush, though it has not received any particular attention.

Abies Menziesii is represented by a magnificent plant in the most robust health, growing on a dry gravelly subsoil, with not above 14 inches of light soil on the surface. Its height is 56 feet, girth of stem 7 feet 6 inches; circumference of branches, which lie on the ground, 38 yards. There are several younger plants of this in various parts of the grounds, all doing well. This tree ought to be more generally planted, as it is so useful, but as it is so much in demand for production of timber, which is spoken of as being hard and close-grained.

Anacaria imbricaria, planted about 1833. Height, 28 feet; girth of stem, 3 feet 3 inches; circumference of branches, 30 yards. In 1876 it was severely injured by frost. Cryptomeria japonica is a very handsome specimen: height, 34 feet; girth of stem, 3 feet 9 inches; circumference of branches, 18 yards. This plant has lost its leader several times with the winds, and has been another year without a leader. It was planted in 1837; its height, 36 feet 4 inches; girth, 4 feet 4, up to 5 feet 8 inches. The above are the measurements of 1871. Cedrus atlantica: height, 50 feet; girth of stem, 3 feet 7 inches; circumference of branches for 30 yards. When this tree was planted in 1833, it was found, in making some alterations, growing in a thicket of Laurels, which accounts for the stem being

so clear of branches. There are a few of the finest specimens of the new Conifer, but there are many other good plants scattered through the grounds, principally planted on the margins of the drives and walks, which Lord Kinnaird prefers to driving them altogether well walking through the grounds, which is always fresh interested in coming to a specimen when unexpected.

There are many fine trees of Silver Fir, upwards of 100 feet high and 4 feet in diameter. Most kinds of trees do well except Larch, which are subject to the disease. Although there are some remarkably fine specimens in sheltered situations, as a rule those planted within the last fifty years are not thriving.

THE SPECIES OF HELLEBORUS.

(Continued from p. 432.)

5. *H. viridis*, Linn. Sp. Plant., p. 784; Eng. Bot., t. 200; Hayne, Arzn., t. 9; Reich, Ic. Fl. Germ., t. 105; Gren. Fl. France, vol. 1, p. 41.—Aculeatis, bearing rounded annual tufts of one leaf and one flower-stem, with several flowers. Petals 6—8 inches long when fully developed; blades glabrous, not at all coriaceous, obscurely petate; segments crowded, oblanceolate, 5—6 inches long, 1—1½ inch broad above the middle, sharply irregularly cuneo-serrate in the upper half, acute, usually all simple, 3—5 on each side of the distal one, springing from a spreading axis about 1 inch long. Flowering stem about a foot high, bearing 3—6 distal flowers, and copious large leaf-like bracts deeply palmately cut, with incised linear segments. Sepals bright green, obovate or oblong, 1 inch long, spreading, and nearly flat. Petals ½ inch long, cuneate, with a short style. Stamens about half as long as the sepals; anthers narrow, oblong, ½ inch long. Follicles about four, as long as the sepals, strongly ribbed transversely; style persistent, erect, ½—1 inch long.

The typical form of viridis, as just described, is the only one that is known in the western half of Europe. It extends to Spain and Italy, and is said to reach Turkey. It is, I believe, truly wild in the woods of the limestone hills of the North of England, growing with such plants as *Actæa spicata* and *Aquilegia vulgaris*. Our west European plant is the *H. viridis* var. *Smithianus* of A. Braun, *Jour. Sem. Hort. Berol.* 1861, p. 4, and will be found figured satisfactorily in the works just cited. The principal forms which are distinguished from this by characters of slight importance are the following:—

Sepals green, as in typical viridis.	} A. DUMETORUM.
Sepals green, tinged with purple.	} B. RECCONI.
Sepals bright purple.	} F. INTERMEDIUS.
	{ H. PURPUREA.

(B.) *H. dumetorum*, Waldst. and Koch; Synops. Fl. Germ., p. 22; Reich, Ic. Fl. Germ., t. 105; Sweet, Brit. Flow. Gard., t. 109; *H. viridis* var. *dumetorum*, A. Braun, *Ind. Sem. Hort. Berol.* 1861, App., p. 14.—Habit of growth more slender. Leaf more distinctly pedate, the connecting axis of the lateral leaflets reaching a length of half an inch, the usually simple segments not so large, and more finely serrated; texture and veining of leaves and bracts as in typical viridis. Corymb 2—4 flowered; flowers smaller. Sepals green, ½—1 inch long.

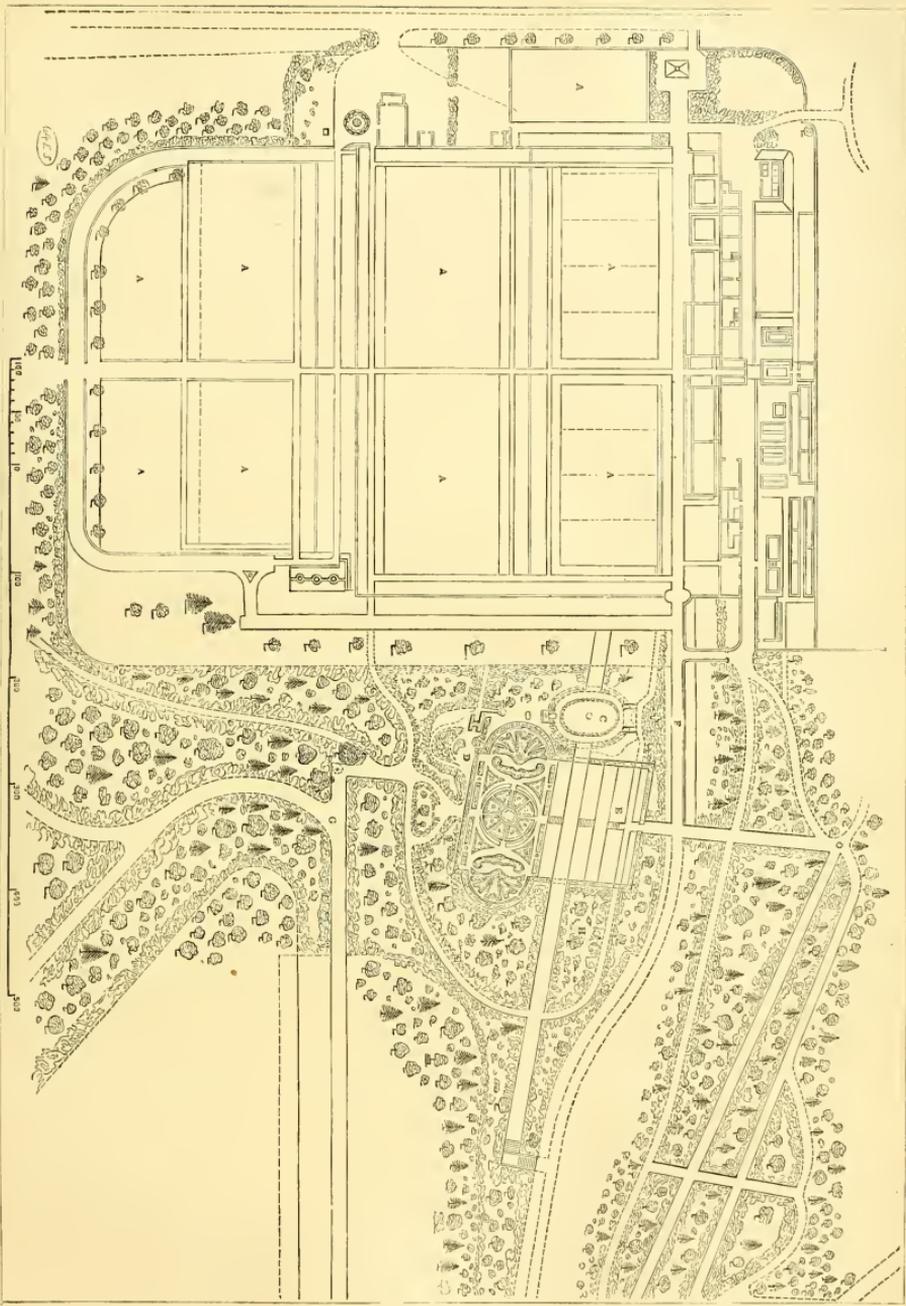

A native of Hungary, and other parts of Austria.

(C.) *H. laxus*, Host, Fl. Austr., vol. ii., p. 89; Reich, Ic. Fl. Germ., tab. 107; *H. viridis*, Jacq. Fl. Austr., tab. 105; *H. viridis* var. *jacquiniana* and *grandiflora*, A. Braun.—Habit of growth as robust as in typical viridis. Leaves more distinctly pedate, and the veining of the usually simple segments finer. Texture and veining of leaves and bracts as in typical viridis. Sepals broader in proportion than in typical viridis, and a paler green, 1½—2 lines long.

A native of Carinthia and other parts of Austria. This is connected with dumetorum by the form *H. pallidus*, Host, Fl. Austr., vol. ii., p. 90.

(D.) *H. Becconi*, Tenore, Fl. Nap., vol. iv., p. 254, tab. 150; Reich, Ic. Fl. Germ., tab. 103; *H. angustifolia*, Host, Fl. Austr., vol. ii., p. 90; *H. multifida*, Visiani, in Flora, vol. xii., part 3, p. 13; *H. intermedius*, Jacq. Fl. Austr., p. 224, t. 41, non Host.—Leaf more deeply pedate, and the segments of the usually obscurely pedate, with stronger veins, raised on the under surface, the main ones pubescent; segments 7—9, all deeply palmately cleft into linear lobes 2—3 inches long, ½—1 inch broad, sharply serrated and narrowed gradually to the tip. Flowering stems deeply forked, often 2 or 3 or 4 flowered. Leaves more like the leaves, much more compound than in typical viridis. Sepals green, roundish or obovate, finally about 1 inch long and broad.

FIG. 71.—PLAN OF THE KITCHEN GARDEN AND A PORTION OF THE FLEURISSE GARDENS AT ROSSIE PRIORY.

moved into larger pots, and the shoots kept well stopped back from time to time as required, these will succeed the early bloomed ones, and be found very agreeable to the season. Kalosantos may also have their flowering time retarded. If a few plants are now placed in a north house or a cool pit, with abundance of air and not much under the influence of the sun, they will bloom six weeks later than those which receive ordinary treatment. In the cultivation of pot Lilies one of the principal things to be secured is short vigorous growth; if ever they become at all drawn up the foliage is correspondingly weak, and their flowering abilities proportionally diminished. Watering tends so much to increase the continuance as exposure to the open air soon after they appear above the soil; this is best attained by placing them in cold frames, where the lights can be drawn completely off during the day. When the weather is too dry to admit of this, the pots are necessary so near the glass that there is no tendency to be drawn up, especially as the lights can be tilted high so as to give them almost as much air as if uncovered. As more head-room is required, the frames can be raised, and after this time there will be no danger from frost if the lights are shut down when there is an appearance of it: when there is not, the air is better left on. *T. Paines.*

ORCHIDS.—The great number of plants, the flowers of which are of fine form, rich colour, or in other respects showy and attractive, and also the numerous additions of choice varieties that are being continually made by the energy and enterprise of several of our artists, and the number of new plants which are being introduced to a new beginner as those the value of which may be reckoned by figures of a high amount. Among such are as fantastic in a pre-eminence degree may be named the *Brassias*, and though it may seem strange to speak of *Brassias* and *Brassias* as being new to a beginner, yet there are many who are in bloom, and out flowers are in demand, the singular and distinct appearance which a spike of *B. verrucosa* may exhibit amongst a number of other flowers will not be forgotten. There are many that will be grown and taken care of. This and *B. Lancana* and *Wraye* are interesting and deserving of culture, and though not by any means difficult to grow, are, however, often met with in a state which is not very pleasing and satisfactory. They should all be grown in pots, well drained, in a mixture of peat and moss, and when potted kept well above the rim of the pots, as the bulbs are liable through close contact with the soil to quickly turn black and rot. Place them in the Cattle-house, watering them sparingly until the roots are nicely pushed out towards the soil, when they may be treated to a good supply, and occasionally sprinkled overhead with a syringe; here they will grow freely, the foliage kept in a green and healthy state during the winter, and the spikes come up strong and freely. Another, in many respects similar to the above both in the style of growth, general appearance, and method of blooming, is *Cyrtocidium maculatum*; this is of a compact habit of growth, and grows in great abundance, succeeded on the bulbs of the previous season's growth bringing from six to a dozen flowers of a bright green and purple colour; it will succeed with similar treatment to the foregoing. *Aspidia lunata* is another that may be grown with ease. In appearance this much resembles some of the *Miltonias*—the foliage is of a pleasant green, the flowers are of good size, the sepals and petals being white spotted with brown, and the lip pale blue. This is a very pretty and interesting species. *Polypodium Lobbia* is again another that may be classed among the singular ones. This, however, requires to be grown in the East India-house. The flowers, which are of a distinct brownish yellow colour, appear in the autumn, and are of the peculiar formation of the labelium, which is so constructed that, with a very slight motion of the plant, the lip is thrown backwards and forwards as though it were set with a hinge. This will succeed very well in pots, kept in a cool house, and watered and supplied well with water, but when the growth is finished only a small quantity will be required, otherwise the flowers, instead of coming altogether, come up very irregularly. Small pieces may be freed from a block or grown in a pot, and should be allowed to come up very quickly and soon get established. *W. Swan, Fallowfield.*

FRUIT HOUSES.

VINES.—Look over Grapes in the fruit-gease once a week for decaying berries, and keep the bottles well filled up with soft water. Owing to the mildness of the weather, the fruit has been good, and well-ripened fruit is keeping fresh and plump. This is a busy month, as every house is now at work, and disbanding, tying, and thinning must have attention at a time when a thousand other things require a gardener's care. Late and early work making no progress must be disbanded, tied out, and well syringed until the bunches show. Close early with sun, and dispense with fire-heat as much as possible. If, through hard forcing, red-spider has made its way into the early house, no time must be lost in its removal, particularly in the early part of the season. Examine the borders, and if dry, a condition under which spider makes rapid progress, lose no time in thoroughly watering and mulching with well-rotted fresh cow-droppings. Perform this work early in the morning of a fine day, and keep a little air on the top sashes, to prevent injury from an overcharge of ammonia. Heavily cropped Vines do not always finish well; where this is the case they should not be hurried through the last stage, particularly at night, when the temperature should range low by means of extra ventilation combined with a liberal supply of dry, warm air by day. Where young Vines have to be planted this spring, the materials for the beds must be ready for use, and the soil must be protected from the weather. I prefer planting inside, with arrangements for taking the roots outwards when the first 6 feet of the inside border is well filled. A dry day should be selected for making the borders; let the soil be raised to 4 inches deep, and do not allow the soil to become warm before the Vines are planted, spread out the roots over the surface, having completely shaken them free of old soil. Cover with 6 inches of compost. Give them a watering with water containing 100 parts of guano to the surface with short dung. *W. Coleman, Eastnor.*

CUCUMBERS.—Favoured by mild, genial weather, Cucumbers are remarkably clean, healthy, and prolific. The soil has been raised to its usual level, and red-spider is less troublesome than usual; a cultivator must not, however, on this account allow his energies to slacken. To keep the plants in a satisfactory state, stopping and dressing over, now growth is so rapid, must be attended to twice or three times a week, as nothing injures the plants more than neglect in this direction. Neither must spider have uninterrupted possession. It will, therefore, be well to apply the usual remedies once a week to keep the plants clean. If the plants are in a state of stagnation from overcropping may have a portion of the old soil removed from the roots, and replaced with a rich compost of turf, lime rubble, and fresh horse-dung, into which new healthy feeding-roots will quickly find their way, and the foliage will be revived. Flag a good deal, some very slight material may be drawn over the roof as much for the protection of the young fruit as of the leaves; but the system of shading for the sake of saving roots must not be evinced. Plants in pits and frames may now have more water; stop and train thinly; add fresh earth to the hills as growth proceeds; closeabout 2 o'clock on fine days, and sprinkle overhead with water at a temperature of 85° or 90°. The next thing to be done is to commence removing the linings. Cover up at night with good dry mats, and give a little air at the back of each light. If newly formed beds continue too hot for the reception of the plants when they are in the best condition, they may be put out, at a distance of 2 feet in length and 6 inches in diameter may be laid across the bed in the centre of each light before the hills are made, and left open at the ends. The hills should be made small at first, and when the heat has declined to 85° the ends of the pipes may be closed, and more soil added at the roots push to the sides. *W. Coleman, Eastnor.*

PEACHES AND NECTARINES.—Considerable care and attention will now be requisite to regulate and check the exuberant tendency in the growths of the current year, so as to render the flow of the sap even in its operation over the whole surface of the tree. A considerable amount of pruning will be necessary to do this properly. To sustain a healthy and vigorous condition in the trees a plentiful leafage is indispensable, which should be well distributed in a manner which will admit of its perfect development. The tendency of the trees to overgrow, and to over-crop, must be allowed a good run, if the limit of the trellis will admit it, before being stopped, but those side shoots which issue from behind the fruit should be checked if they be vigorous, in order to assist the swelling off of the fruit. Every encouragement towards this object should be vigorously enforced by keeping both foliage and roots in a healthy state. Syringe the

trees with rain-water twice every day, and supply it, enriched with some manure agent, plentifully at the roots at this season, when a very good supply of ripe fruit is obtained from trees in pots and the fruit is approaching the colouring process the foregoing observations must be sedulously observed. Attend to the trees in later houses as before advised, remove a large portion of the fruit, when it is necessary off those trees before it becomes large, as at this season it can in general be relied on, and if left on will only be to the disadvantage of those which are required. *G. T. Miles, Weymouth Abbey.*

KITCHEN GARDEN.

Sowing for successional purposes will still require the constant attention of the kitchen gardener. It is hardly possible to point out within a week or ten days when such operations should be carried out, the seasons vary so much that though it would in one season be correct to recommend the sowing of the main crop of Carrots on April 16, in another it might not be possible until the 25th; at all events, experience tells us that somewhere about or between those dates is the best time, and when we recommended that this or that crop should be got in, our words must be taken with a grain of salt, and then or about that time be understood. With regard to the main crop of Carrots it should be got in once in a finely pulverized soil, one half of the crop should consist of James' Intermediate Scarlet, the other moiety may be divided between Red Sarrey and the Improved Altringham. Sow successional crops of Carrots in the following lion's share; if these could be sown in single rows with wide spaces between for other crops the produce would be greatly increased. Successional sowings of Broad Windsor Beans should be put in as soon as the previous sowing pushed through the surface. Another small sowing of early Turnips will be necessary towards the end of the month. The hot burning sun has such an injurious effect on the flavour of this crop during the summer that it can only be counteracted by copious sowing of successive crops. It is necessary, therefore, as far as possible, to sow the plots near the water supply as may be. The same precautionary remarks will apply equally to Turnip and other Radishes, which cannot be had in perfection in hot, dry weather, and in the middle of the month. Basil and Sweet Basil in pans, and forward them in a gentle heat, to be afterwards pricked out along the foot of south walls. Where salading is in constant request it will be necessary to make sowings of Lettuces, both Cos and Cabbage, in the middle of the month, ten days at present, and the quantity required to keep the breath to be sown. The same remarks will apply to Small Saladings. Spinach also must follow pretty nearly the same rule, as during the next three months the weather will be very much in favour of its running to seed. The ground should now be constantly stirred amongst Cauliflowers, Cabbages, Lettuces, and all other advancing crops; and as it is much to be feared that, owing to the mild and moist seasons, we shall find the bugs more than usually troublesome, it is advisable to dress the ground between the crops very heavily with lime previous to the surface stirring. The various beds sown with Brassica, Onions, and Parsnips, should also be occasionally dressed over with very quick lime; and if the destructive turnip-fly makes its appearance amongst the Brassica tribe, add dry soot and wood-ashes to the lime for the dressing. Throw up a good bed of fermenting material, consisting of straw, one-light hot bed, which will sow ridge Cucumbers and Vegetable Marrows for transplanting on the ridges early next month, for which purpose see that fermenting material is in the course of preparation. Where red Beet is in much request, sow a few boxes or pans may be sown and placed under shelter (a great heat is not necessary) so that they can be forwarded in any place secure from frost; they will be ready to transplant into a warm situation early next month, and are protected from frost for a week or so they will be fit for planting in advance of those sown in the open air at the proper season.

As neatness in this department is at all times a desideratum, means should be adopted at once in order to secure the freedom of the walks from weeds, which are now beginning to make themselves unpleasantly visible. Turning the gravel is a most excellent plan, but as the material of the walks is not always adapted for turning, and as time for so doing cannot be afforded, the use of a roller must be adopted, such as a thorough good dressing of soil, or sulphuric acid mixed with water in the proportion of 1 pint to 3 gallons, or of carbonic acid; but in no case must these be used in the most liberal manner. In these there are Box edgings: where hand weeding and turning over the gravel are the obvious remedies. *John Cox, Redleaf.*

THE Gardeners' Chronicle.

SATURDAY, APRIL 14, 1877.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, April 15	Sale of <i>Cyperidium</i> eburneum and other Orchids at Stevens' Rooms.
MONDAY, April 15	Royal Horticultural Society's Meeting of Fruit and Floral Committees, at 11 A.M.; Scientific Committee, at 2 P.M.; Exhibition of Government Garden Produce.
WEDNESDAY, April 18	Royal Botanic Society's Second Spring Show.
THURSDAY, April 19	Scientific Society's Meeting at 8 P.M.
FRIDAY, April 20	Scientific Apparatus, at Stevens' Rooms.
SAURDAY, April 21	Sale of Photographic Apparatus, &c., at Stevens' Rooms.

ONCE more an INTERNATIONAL HORTICULTURAL EXHIBITION, or rather an Internationale Tentoonstelling van Tuinbouw—the site that quaintest of quaint towns, AMSTERDAM. Twelve years ago, when such exhibitions were in their infancy, Amsterdam made an excellent second to Brussels, and both were eclipsed by our display in 1866. Since that time various towns—St. Petersburg, Florence, Paris, and others—have taken up the tale, and now once more it is the turn for Amsterdam.

At the time of writing this note confusion reigns supreme, and it will only be after the lapse of two days that the Exhibition will be pronounced ready for opening, and therefore what we may say is open to correction. Nevertheless, the impression we have gained up to this time is that as a flower show it is far behind its predecessor of 1865. Indeed, neither in point of cultivation nor of novelty is the present Exhibition at all remarkable. True it is more dispersed. Instead of being arranged wholly within the Crystal Palace as before, the plants are dispersed through various stoves, conservatories, and temporary arcades scattered about the garden which now surrounds the building. Probably, then, there may be more exhibits than in 1865, but they do not at present show to such advantage. Moreover there is a lack of exhibits from the great Ghent nursermen, few of whom, except M. LINDEN, are exhibitors on a large scale. Of British exhibitors, Mr. WILLIAMS amply sustains the credit, but he is left to do the honours for his country almost alone. That he has done it well no one who knows what his usual practice is will doubt. Nay, were it not for Mr. WILLIAMS, the show would indeed be a poor one. Of course we speak generally. There are some exceptions, to which we may hereafter refer. The general arrangements are far from good. Several hours elapsed after the jury were summoned before they were told off to work. When they began to do so, the Presidents of sections did not know who were to be their fellow jurors. The Secretary scoured the building for the President — the President hunted for the Secretary — Both set out in search of their company of jurors. When at length some of these were found—for the whole number was rarely made up—then began the search for the objects to be adjudicated on; No. 1 was here, No. 2 was a quarter of a mile away, No. 3 was nowhere, there were two No. 5's, and no No. 6, and so forth. All this might have been obviated by a little foresight and management—qualities which our Dutch friends are not usually deficient in. It must always be remembered that we are writing before the Exhibition is complete, and therefore much improvement may fairly be looked for; but at the same time we cannot too strongly represent to the managers of such exhibitions that it is little less than cruel to summon some hundreds of exhibitors, jurors, and members of Congress from all quarters of the globe, and then waste their precious time, when, if not wanted at the Exhibition, they might employ it so profitably and pleasantly elsewhere in the city. On the other

hand, cordiality and hospitality never fail on these occasions, and there is ample promise that the Dutchmen will be equal to the occasion in this particular. As not only objects of horticultural interest are represented, but also Tobacco, Cinchona, Cotton, and other vegetable products, so the number of jurors and members of Congress is very large; among them, as usual, is a large proportion of the horticultural and botanical notabilities of Europe.

To this we may add, that we have received a telegraphic message from Amsterdam, to the effect that Mr. B. S. WILLIAMS, of Holloway, has been awarded the Prize of Honour, as well as eight gold medals.

— We are authorised to state that Her Majesty the QUEEN has intimated her intention to VISIT THE EXHIBITION OF CHOICE FLOWERS to be held in the conservatory of the Royal Horticultural Society, South Kensington, on Wednesday, May 2; and that the flower show which was intended to have been held on the 1st will consequently take place as originally fixed. These changes backwards and forwards are some of the results of the recent meddling and muddling with engagements already fixed, announced in our last issue. The show of the Pelargonium Society is another case of accepted arrangements upset; and all for what? There are those who can tell, but the real reason is probably little suspected by the horticultural world generally.

— The Cryptogamic botany of the late Transit of Venus Expedition still affords ample results, inasmuch as two further contributions, read at the Linnean Society on April 5, afford evidence. Professor REINSCHE's article on the FRESH WATER ALGÆ OF THE CAPE OF GOOD HOPE, if technical, was at least beautifully illustrated by careful drawings of structural detail; and Mr. W. MITTENS' observations on the HEPATICÆ from near Cape Town equally attested accurate knowledge of his subject. But the Cryptogamy of our own islands does not seem exhausted, as Irish Lichens, by the Rev. W. LEIGHTON, stated.

— THE FERNS of MADAGASCAR evidently display an unlooked-for richness, since only last year Mr. POOL'S collection yielded a great number of new forms; but again another collection by Miss HELEN GILPIN, from the neighbourhood of Antananarivo, placed in Mr. J. G. BAKER'S hands, gives also good results. Of 150 species, seventeen are new—the points of interest concerning these having been laid before the Linnean Society on April 5 by Mr. BAKER, of Kew.

— We are glad to see, from a circular issued by the ROYAL MANCHESTER BOTANICAL AND HORTICULTURAL SOCIETY, that £5400 has been raised towards the extinction of the debt of £6000, which has for many years been hanging like a millstone about its neck. This being the Society's Jubilee Year, it is proposed to make a special effort to get in the remainder, so as to send it forth free on its mission of improving the tastes of the dense population which surrounds it, and of encouraging the art of cultivation, by continuing its annual exhibitions, which are second to none, and at which premiums are distributed with a liberal hand for high-class horticultural productions. The Society well merits this support at the hands of all who, having the means, take an interest in the advancement of horticultural science and the refinement of the public taste; for it has now for fifty years done good work in this direction, having distributed in prizes a sum amounting to nearly £40,000. The annual flower show is held in the Society's garden at Old Trafford during Whitsun week, this season being kept as a holiday in the district, and the working classes, who are admitted at a low price, embrace the opportunity thus afforded them in large numbers, upwards of 30,000 having been admitted annually during the past nine years, in which the Society has extended and remodelled its exhibitions. Mr. B. FINLAY, the Secretary and Curator, would gladly furnish forms of subscription to any persons willing to help in so good a cause. The Society's National Exhibition opens this year on May 18.

— Two correspondents have sent us some curious abnormal growths of *DENDROBIUM NOBILE*. They consist of young shoots, producing roots, thrown out from the old stems, but instead of leaves these shoots bear membranous sheaths, out of which issues a solitary flower. In one shoot of three flowers there are no leaves; in another there are two leafless sheaths with a flower issuing from within each, then two sheaths bearing leaves, and also having axillary flowers, and finally a terminal leaf with a smaller leaf in its axil. The flowers are also abnormal, the lip being elongated, and convex instead of concave. Our correspondents ask the reason for these freaks, which we cannot tell. Have they been observed elsewhere?

— On Thursday, April 5, a considerable number of POTATOS WERE PLANTED IN THE CHISWICK GARDENS under the personal superintendence of Mr. W. G. SMITH, with a view towards averting the usual murrain of the autumn. The ground selected is heavy, non-porous loam and loamy clay, and the principal position is between rows of trees, both representing highly favourable conditions for an attack of the disease. Most of the Potatos were planted in the same piece of ground where the disease was so unusually virulent in 1875, and the only natural position usually reserved for the disease has not been found. One-half the Potatos were planted whole, the other half cut; and the Potatos selected for trial were the following—1, American Early Rose (this is the Potato which suffered more severely than any other in the 1875 attack, and the Potato in all parts of which the resting-spores were found); 2, Lapstone; 3, Breeze's Prolific; 4, Paterson's Victoria; 5, Rintoul's Striped Don; 6, Regents. No farmyard manure or guano was used, but the material termed "Salus" was sifted into the furrows before and after planting, and the cut Potatos were dipped into the material.

— The large pair of CHUSAN PALMS (*Chamaerops FORTALE*) are now in splendid flower at the Victoria and Paradise Nurseries, and the best of the upright spikes are about 3 feet long; a large crop of seed is expected.

— The next meeting of the INSTITUTION OF SURVEYORS will be held on Monday evening, April 16, when a paper will be read by Mr. J. SHAW, on "The Rivers Pollution Prevention Act, 1876." The chair to be taken at 8 o'clock.

— Rather more than two years ago the eldest son of the late Mr. WILLIAM BARNES, of Camberwell, was unfortunately deprived of insanity by the means of supporting his wife and four young children, and it was thought by some friends of the family that something might be done to alleviate and render assistance in this dire calamity. A few old acquaintances of Mr. BARNES formed themselves into a committee, and an appeal was sent out, which resulted more successfully than the committee had anticipated, and an amount of £221 7s. 6d. was subscribed. The committee have now issued their report and a balance-sheet, showing how the fund has been administered, from which we gather that Mr. BARNES has been started in business as a milliner, at 37, James's Grove, Commercial Road, Peckham, and the committee hope, with every prospect of success; but the utter hopelessness of the recovery of her husband necessarily has a depressing influence on her exertions. In promoting the objects which the committee had in view, it transpired that the second son of the late Mr. BARNES, living in Natal, had expressed a wish to render assistance, and he offered to take charge of the eldest boy, aged 7 years, to educate and provide for him, and to start him in life when old enough. The boy has therefore been provided with an outfit, and sent to Natal, part of the expenses being allowed by the committee, and charged to the fund.

— In CRITCHLEY'S HEAT REGULATOR we have what appears to be a useful contrivance for regulating the distribution of heat in plant-houses. It is also claimed for it that the amount of heat may be more efficiently regulated by this than by other means, the valves being worked to a scale marked on the piston valves. There are no doubt other methods of accomplishing the same objects, but there is a simplicity about the arrangements in this case which commends itself as being preferable to the intricacy of distant

and often inconveniently placed valves, since the valves—which in this case are sluice-valves—are here all brought together to one square box, and consequently are all close at hand, and all easily accessible, so that the hot water can be turned off and on without any difficulty or loss of time. The facility afforded for turning on and shutting off the heat in particular houses, where several are heated from one boiler, seems to us one of the main advantages to be derived from Messrs. CATCHLEY'S apparatus, as the flow can be carried on through the regulator, and the pipes for supplying bottom or top-heat in a particular house shut off on one or both sides by closing the side valves, while the heated water flows on to the house or houses beyond. Any one house of a series can thus be either heated or not, without interfering at all with the heating of the remainder, and more readily

RIDER, of Bartholomew Close, E.C., the publishers of the *Timber Trade Journal*, will also be the publishers of the new journal, to which we wish every success, though we hope it will not interfere in any way with the proceedings of that useful institution, the Scottish Arboricultural Society.

— Mr. A. W. FALCONER, late gardener to S. SCHLOSS, Esq., Dowdon, Cheshire, has been appointed to the management of the gardens of Mrs. F. G. WILKINS, The Poppars, Leyton, in succession to Mr. WARD.

— The next exhibition of the BURTON-UPON-TRENT HORTICULTURAL SOCIETY is announced to be held on June 27th. We see by the annual balance-sheet that the Society is in a flourishing con-

dition, the resultant fluid various seedling plants of *Acacia arabica* were placed, as nearly equal as possible in point of development, and their growth noted for a period of one month. The increase in the weight of the seedlings ranged from 0.36 gramme (1 grain = 15 grains) to 0.19 gramme; the number of leaves from twenty-two to six, and the length of roots from 10 inches to 1½ inch. It will be seen that this experiment is an application of the process of water-culture, now so largely followed in experimental laboratories, and by means of which the effect of any particular salt upon the growth of plants may be observed by adding the salt to, or abstracting it from, the solution in which the plant is grown. A comparison of the soluble chemical contents of the soil with those of the solution used in the water-culture experiments shows the suitability or the reverse of the soil for

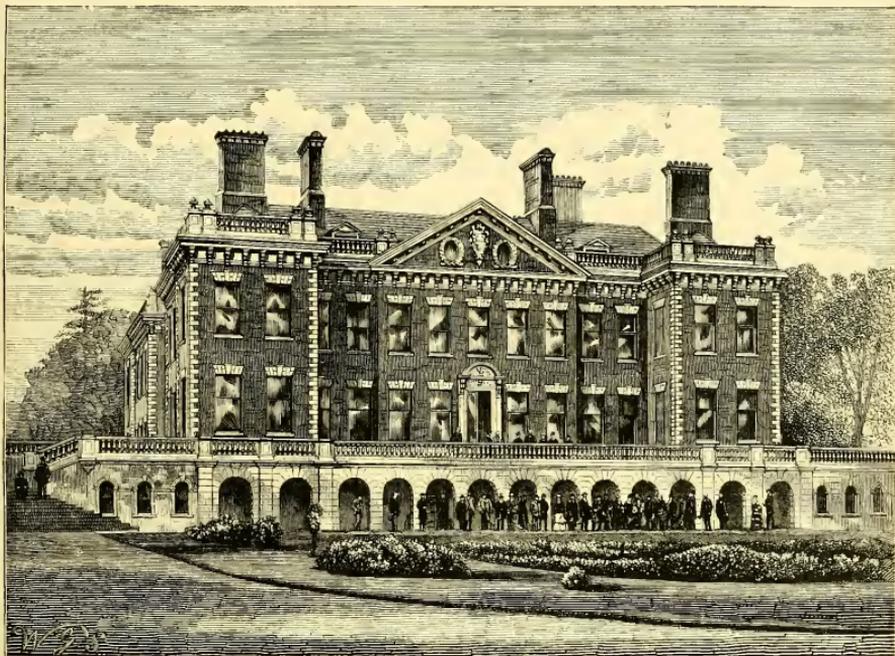

FIG. 72.—SHOBDON COURT, THE RESIDENCE OF LORD BATEMAN.

than by a complicated system of valves. The regulation of the amount of heat by the use of these particular valves does not appear to present any special advantage over that of other plans for effecting the same object, unless it be in their simplicity and accessibility. Those who have had them in use, including Mr. CRONK, gardener at Berkeley Castle, speak well of them; in fact, the latter writes that his two regulators, which represent thirty valves, are far superior to any other contrivance for effecting the same object.

— It is proposed to publish monthly a *Journal of Forestry* for the purpose of encouraging the study of forestry in its many aspects, scientific, practical, artistic, and economic. It is hoped that the new journal will be useful to foresters, land-agents, and landed proprietors, and furnish "all those other little pieces of news which are so pleasing to read and yet so difficult to obtain in a reliable form." Messrs.

dition, having a balance in hand of nearly £350, and as many as 1500 annual subscribers. The prizes offered are very liberal.

— Mr. A. G. HIGHT, of the Indian Forest Department, has been making some interesting experiments with a view to determine the EFFECT OF THE SOLUBLE SALTS in certain soils on the growth of plants. The plants experimented on were grown in watery extracts of the soils to be examined, and their vigour, size, and weight duly noted. Samples of five descriptions of soil were taken at a depth of 18 inches from the surface, and a watery extract prepared by pouring distilled water over them, and gradually heating the water to the boiling point. On cooling the water was poured off from the soil and set aside. On to the soil thus drained another quantity of water was poured, heated, and decanted as before, and so on for four times. The water from the four decantations was then mixed and filtered, and in

the cultivation of any particular plant. Mr. HIGHT'S experiments are very interesting and suggestive, but not as yet numerous enough to exclude or compensate sources of error, particularly that arising from natural variation in the vigour of individual plants from the same stock. How necessary this is to be attended to seems shown by the author's figures, which show in one case a variation in the same soil (experiments 4, 5, 6) of from 0.10 to 0.36 gramme, in number of leaves from thirteen to twenty-two, and in length of root from 2½ to 7½ inches. Nevertheless, we believe that a similar practical analysis of various soils carried out on a large scale would be productive of excellent results. We trust Mr. HIGHT may be encouraged to pursue his investigations in the future. Mr. HIGHT'S paper is in the February part of the *Journal of the Chemical Society*.

— The question, WHICH ARE THE BEST LATE GRAPES? is one of considerable importance, and one

to which an unanimous response can scarcely be expected. Some notes on this subject were published in our columns in January last, and Mr. HILL, of the Kewle Hall, whose name stands very high in the records of Grape-growing, has since then sent us some samples, accompanied by the following remarks:—

"I have grown a lot of different varieties of Grapes during the last twenty-eight years, grafted and otherwise, and have long since come to the conclusion that we have too many sorts. If I were asked to select six kinds for winter work I should name Lady Downe's Seedling, Alicante, and Mrs. Prince's Black Muscat as blacks; and Muscat of Alexandria, Mrs. Pearson, and Old Tokay, which are the latter in fact. Grape when well done—far before Trebbiano or Raisin de Calabre. For summer and autumn work I should have, of blacks, Black Hamburg, Snow's Muscat Hamburg grafted on Black Hamburg, and Black Prince; and of whites, Muscat, Foster's White, and Bredford Sweetwater. Chasselas also forces well. Were I tied down to four varieties only I should have Muscat of Alexandria, Black Hamburg, Lady Downe's Seedling, and Alicante. The latter I consider a fine Grape. This and Lady Downe's keep longer bottled than any I ever tried—and we were among the first to bottle Grapes in this country. Those I send were cut from the Vines the first week in January."

This sample reached us about the end of February, and was in every way perfect as to outside appearance, the berries being mostly plump, and the quality excellent. Lady Downe's was the best sample, and was plump and good, retaining its full flavour and all its good looks. Mrs. Prince's Muscat appeared to us to stand next best, the berries being very rich, but a little shrivelled, so that the appearance was not quite equal to that of Lady Downe's. Then came the Alicante, again plump and good, as perfect as any at this stage of its growth, and vying in quality with Lady Downe's. The Black Morocco which accompanied them was flat, being past its best, and deficient in flavour. The four samples were, however, taken altogether, as pretty an example of Grape-growing and Grape-preservation as any model meet with in a day's march.

— Bad news for CYCLAMEN growers! It was stated at a recent meeting of the Central Horticultural Society of France that the cultivation of the Cyclamen had been nearly abandoned in Paris, owing to the attacks of a fungus, against which no remedy had been found to avail.

— THE DISCOVERY of a NEW CONIFER in EUROPE is as interesting as unexpected. It inhabits the mountains of those "unhappy" countries, Servia, Bosnia, and Montenegro, and Dr. PAUCIE is the botanist who, after much consideration and research, and after taking the opinion of the late A. BRAUN, K. KOCH, and others, has described it as a new species under the name of PINUS OMORIKA. It belongs to the Abies section, and is most nearly allied to P. orientalis. Omorika is the Servian name of this tree, which Dr. PAUCIE describes as being of gigantic stature, equalling, if not exceeding, the loftiest of its European congeners. It is of slender habit, with rather short branches forming a pyramidal crown; by the loss of the trunk spruned, peeling off, the segments often break up in scales around the base of the trunk. The lower branches pendent, with the extremities only directed upward. Needles (leaves) of a silver-grey hue, small and short (about 5 lines long), usually obtuse; comes oval-oblong, 2 inches long, at first erect, gradually assuming a horizontal position, and finally pendent; when young of a beautiful violet colour, when mature reddish brown, with an intermixture of ash-grey. Scales of a roundish shape, faintly striated, and unequally toothed at the upper part. The forest-going particulars are from a lengthy article by CARL BOHLE in the Berlin Horticultural Society's *Journal*. Dr. REICHENBACH contributes some notes on the same subject to the *Botanische Zeitung*, n.s., 1877, from which it appears this tree—"whether species, variety, or climatic form"—is known by the name Omorika from the Adriatic to the Danube; and it is supposed that it was formerly more widely dispersed than appears to be the case at present. This is founded on the assumption that because the name is so widely understood, the tree yields a valuable timber. REICHENBACH regards it as a variety of P. orientalis, but, whether distinct or not, it is none the less interesting, and another illustration of the dis-

tribution of Conifers as exemplified by the Cedars, Pinus Peuce of REICHENBACH, &c. Both REICHENBACH and BOHLE had specimens before them, as well as a paper on the subject by PAUCIE himself.

— THE INTERNATIONAL CONGRESS OF HORTICULTURISTS and BOTANISTS, in connection with the great horticultural exhibition of PARIS next year, is to be held on August 18 and eight following days. The head-quarters will be at the rooms of the Central Horticultural Society and of the Botanical Society, 84, Rue de Grenelle Saint Germain.

— THE KIRKEY MALLERD AUCURIAS are now in fine condition, and the strong, stalwart trusses carry with them a rich promise of fine heads of bloom. A magnificent growth is the general characteristic—not a coarse, but a refined leaf development, and the Rev. Mr. HORNER anticipates that some of the choicest varieties will be in fine character. They are now in a roomy lean-to south house, and during the recent cold weather the plants have had the benefit of a little fire-heat. At this time of year the Auciaria is a greenhouse plant, and some warmth is absolutely necessary to the proper expansion and finishing of the pips.

— THE usual monthly dinner of the HORTICULTURAL CLUB took place on Wednesday, the 4th inst. There was a fair attendance. Mr. CANT, of Colchester, sent some dishes for the dessert of the Essex Spice Apple, in capital order, and a wit's of thanks was given to Mr. CANT for his courtesy.

— THE *Revue Horticole* reports the FRUITING of four plants of MUSA SINENSIS in the *Fleuriste de Paris*. They were planted out in the ground in a tropical-house in 1874, and in 1876 each of them showed an enormous inflorescence of more than 200 flowers, more than three-fourths of which set and ripened fruit. It is not stated what the quality of the fruit was, but the writer says that it is not only an exceedingly ornamental plant, but it may be profitably cultivated for its fruit.

— In addition to the gentlemen already named, the following have accepted the office of local hon. secretaries of the NATIONAL ROSE SOCIETY:—Capt. CARTER, for Hordham and West Sussex; J. L. CARTER, Esq., for Chilton and neighbourhood; and — CHEALES, Esq., for Tring and neighbourhood.

— AT CHISWICK HOUSE BEDDING-out has already commenced. Mr. EDMONDS finds it necessary to be early in order to have the beds well furnished by the time garden parties commence. Already the Calceolarias are bedded out, after having been duly hardened off, and then quite a fence of branches of evergreens are put round and about the beds. These serve to keep the plants quite snug, meanwhile they are having for an amended better able to withstand the dry influences that invariably accompany the sunny month of May. Lines of Echeverias are also marking the marginal lines of beds and borders. The hardy plants are got out to supply the framework of the floral pictures; by-and-by, when fear of danger is well past, the tenderer plants fall in to impart their particular touches of colour, and the picture is complete.

— Some huge plants of RICHARDIA ÆTHIOPICA are in fine condition in one of the glass structures at Chiswick House, and they are yielding an abundant number of the magnificent blossoms of the Marlborough House. They are in the warmest part of a house near the glass, and being abundantly supplied with water, alternated with occasional doses of liquid manure, the floral harvest is in keeping with the high cultivation. Mr. EDMONDS states it is an invaluable flower-yielding plant for this season of the year. In the same house a remarkable plant of Fuchsia Dominiana has been in flower for a considerable time past.

— THE BERLIN HORTICULTURAL SOCIETY has decided to hold no public exhibitions this year. In the first place the Society is poor, and it is the opinion of many of the members that flower and fruit shows are becoming too frequent to promote true horticulture, or benefit the public. The various com-

mittees will continue their labours, and there will be a private show on the foundation day. There is no doubt that flower shows, as a rule, do very little towards furthering horticulture, and it is a wise course not to spend the money of a society in the gratification of the outside public, because the public is a large body, and can afford to pay, and does pay, for the kind of recreation or instruction that suits its taste. Make your entertainment known, and then if the people do not come, you may guess there is a mistake somewhere—not far from home.

— The last number of the *Revue Horticole* contains a coloured plate of a rare Brazilian Bromeliad, LAMPROCOCCUS VALLEARIANI, a tufted plant with the habit and foliage of a Pine-apple. The central panicle of flowers is provided with numerous bracts of a pale rose colour and covered with greyish hair. Within the axils of these bracts are peduncles bearing five or six sessile flowers of linear oblong form. Both calyx and corolla are of a lilac colour.

— We have frequently had occasion to mention the POMOLOGICAL INSTITUTE of FROSKAU in Upper Silesia, Prussia, especially when the education of gardeners has been in question. Almost every gardener in this country who has attained eminence in his profession has done so by sheer perseverance and hard work in self-instruction, in gaining the theoretical knowledge necessary to enable him to carry out the higher flights of skill and to quell the complaint of men like these that most of their time, and even health, was sacrificed in attaining their object. Yet this would have been comparatively easy had they had the advantage of the assistance of competent instructors. Although this is the case, it is not at all likely that we shall soon have a national educational (practical and theoretical) establishment in this country. It is urged by some that our large nurseries answer the purpose fairly well, but this is an obvious mistake, requiring no explanation for those who have given the subject a thought or experienced the difficulties of the position. The state of affairs is in striking contrast to the provision made for the thorough instruction of gardeners in Prussia, where they are now, as we lately reported, agitating for the foundation of a high school of horticulture. The establishment at Proskau, though called pomological, is so comprehensive in its scope that the students have the opportunity of obtaining an insight into every branch of learning necessary to enable them to become accomplished gardeners, and this without any of the unimportant practical acquaintance with details of ordinary operations. The pupils are lodged, boarded, and taught in the Institution on payment of a very small sum, and in return they receive no payment for their labour. At present it accommodates thirty-six young men, but as the applications are always in excess of the vacancies, it is intended to enlarge the building. The area of land now under cultivation is about sixty-five acres, ten of which are devoted to a nursery of fruit trees. A large extent of it is occupied with a collection of fruit trees planted in irregular style, and termed the fruit park. Abutting on this is the stock collection, covering some 25 acres. The trees are all standards, and planted 24 feet asunder in the centre of grass strips, 8 feet wide. These grass strips are 30 feet apart, and the intervening tilled ground is devoted to the cultivation of various crops. Landscape gardening and flower gardening also form a part of the practical instruction; and there is a physiological and experimental department. As to the theoretical instruction, it would satisfy the wants of every branch of the profession.

— ON the occasion of the Spring Exhibition of the NEWCASTLE-ON-TYNE HORTICULTURAL SOCIETY on the 21st and 22d ult., an invitation was given to the whole of the public elementary schools in the town to pass through the exhibition on the morning of Thursday, the 22d ult., before the admission of the public. It was computed that some 2600 children were thus permitted to see the plants and flowers, and they all seemed much pleased with the treat afforded them. Through the forethought of the hon. secretary, each child on leaving the building had placed in his or her hand a paper setting forth the objects of the Society, and the terms of membership. Members of the third class subscribe 5s. per annum, and have privileges framed in a liberal spirit.

As a considerable number of the operative and artisan classes in Newcastle-on-Tyne take considerable interest in flowers, this means of bringing the claims of the Society before them through the instrumentality of the children appears to be a step in the right direction. The promoters are evidently alive to the importance of popularising horticulture, and it is not unlikely that some societies struggling with difficulties might appropriately take a leaf out of their book. Some of the most flourishing societies connected with horticulture up and down the country are those who bid for popular support, and when this is done in a proper manner the appeal is rarely made in vain.

— A very useful pamphlet, entitled *State Forestry: its Aim and Object*, has been published by Captain CAMPBELL WALKER, Conservator of the New Zealand forests. The pamphlet is based upon a lecture delivered at the Otago Institute, Dunedin, and though so far as details are concerned, it is intended to apply to New Zealand, yet the general principles laid down apply to all countries. We do not know any publication so certainly novel of so small a size, in which the objects to be attained, and the methods to be followed for that purpose, are so clearly and concisely laid down as in the pamphlet before us, which, it is to be hoped, may be reprinted, so as to obtain a larger circulation among foresters at home, in India and the colonies, than is possible under existing circumstances.

— A specimen of *CRINUM AQUATICUM*, grown by Sir CHARLES STRICKLAND, from material obtained at Grahamstown, South Africa, was exhibited at the last meeting of the Linnean Society, Mr. J. G. BAKER, of Kew, remarking that this showy plant, one by no means difficult to rear, had seldom been seen in Britain.

— In a lecture on the METAMORPHOSES OF PLANTS, before the botanical section of the *Scientific Gesellschaft für Vaterländische Kultur*, Dr. GOEPFERT mentioned, among other more commonly-known instances, a very striking Weeping Spruce Fir in the garden of the Villa Pallavicini, near Genoa, and a handsome weeping Dodonæ, 25 feet high, growing in the gardens of Baron FRANCESCONI at Intra, on Lake Major. Regarding the propagation of the so-called Snake Firs, he observed that BAKER had the seed of a specimen growing in Bohemia have altogether the normal growth and habit. A very remarkable Ivy, with an erect, unsupported stem 9 or to feet high, may be seen at Villa Pallavicini. The Irish Yew is of a more delicate constitution than the ordinary Yew, and is severely injured in very cold winters in Germany, whereas the common one is perfectly unsusceptible. Among recently noticed variegated and coloured-leaved trees and plants were *Populus tremula*, with dark purple foliage; and *Salix aurita* bibrata, with white variegated leaves. Of abnormal flowers and parts of flowers, Dr. GOEPFERT described a specimen of *Myosurus minimus*, which had the receptacle of some of the flowers doubled, and in others forked, nearly to the base; also compound ears of Wheat and Barley. Flowers coloured green were observed on plants of *Rosa Luteola*, *Lonicera castra*, *Erysimum Allfarra*, *Turritia glabra*, *Primula elatior*, and two *Dahlia*s, which latter, however, were not constant and soon reverted. The lecturer concluded with some remarks on the development of roots, alluding more particularly to the extraordinary masses of fine fibrous roots frequently found in drain-pipes. He had calculated the length, by weight, of a mass of roots of a Willow, probably of *Salix alba*, taken from a drain; it was about 4 feet long by 2 inches thick, and weighed a little over half a pound when dry. By selecting a number of the fibres, and taking their weight and measurement, the total length of fibres forming the mass was estimated at not less than 2000 yards. The foregoing particulars are from OTTO's *Hamburger Garten- und Baumzucht*.

— Dr. TSCHEPLOWITZ, assistant in the physiological department of the Pomological Institute at Proskau, has been making some experiments on the EVAPORATION OF WATER BY PLANTS, the results of which he lately communicated to the Botanical Society of Berlin, from whose *Monatsschrift* we extract the particulars. A small plant frequently transpires daily more than its own weight. It has been generally accepted that the more a plant transpired the greater

the increase of dry substance as compared to other individuals of the same species which have transpired less; but Dr. TSCHEPLOWITZ's experiments go to prove that this is not necessarily the case—in fact the contrary was almost the rule, though the processes may go on actively at the same time. One set of experiments was with seedling Peas about an inch high at the commencement. These were placed in a vessel for water culture, which was filled with water, the necessary nutrient substances added, and the whole weighed. After carefully placing the vessel the height of the water was marked, and after the lapse of five days the apparatus was again weighed, and the loss reckoned as evaporated water. Then the vessel was filled up to the original height with water, and the whole again weighed, the excess being regarded as the increase in the weight of the growing plant. This operation was repeated every five days. Dr. TSCHEPLOWITZ is of opinion that the increase of dry weight moves subject to the same laws as the increase of the total weight.

— From all that we can learn up to the time of going to press, there can be little doubt but that the EXHIBITION OF COVENT GARDEN PRODUCE, to be held at South Kensington on Wednesday next, will be a very successful affair. All the leading growers have signified their intention of showing the best examples they have of their special cultures; and we believe that the leading nurserymen also intend to contribute largely from their stores. We understand that Her Royal Highness the Princess MARY, Duchess of Teck, will open the exhibition at 1 P.M., and that in the evening the growers will dine together, at 7 o'clock, at the "Criterion."

— The nineteenth Report of the East Kent Natural History Society has some excellent remarks on the proper function of local MUSEUMS as educational institutes, and not mere curiosity shops. A museum should, in some sense, be a better sort of text-book or library of reference on the subjects it professes to embrace. What should we say of a library half the books in which were irrelevant, as to subject, with the professed object of the collection, and wherein the remainder were ill-selected, worse assorted, and unclassified for? And yet this is the condition of affairs in most cases of the kind. The zeal of amateurs cannot be expected to last for ever, and their exertions are more likely to be discursive than systematic. What is wanted in most cases is a competent and well-paid Curator, with sufficient assistance at command, and with intelligent appreciation and encouragement to support him.

— The relation which the various MINERAL INGREDIENTS OF PLANTS bear to the other constituents, and the office they fill, has received an interesting illustration of late at the hands of M. BOUÏE, who shows that, if lime be absent from the soil, the starch is less widely diffused and remains stored up in certain parts of the plant, instead of being generally distributed.

SHOBDON COURT.

SHOBDON COURT, the seat of the Right Hon. Lord Bateman, Lord-Lieutenant of Herefordshire, is much admired for its four handsome fronts, each varying from the other. It was built in the time of George I. by Viscount Bateman, in the Louis Quatorze style, but much more highly ornamented by the present Lord Bateman some fifteen years ago, with exceedingly handsome balustrades on the terraces at the east, south, and west fronts, and all round the eaves of the house. Here the geologist could at once remark upon the sad loss his lordship has sustained in listening in an evil hour to the persuasion of some architect or contractor to adopt Bath stone, which, on account of its massy easy weight, had been previously chosen. It has already, and in so short a space, proved an enemy prey to atmospheric influence, showing the noble proprietor that at vast expense the whole of this magnificent ornamentation must be renewed, next time most likely with the far more durable material dug from a quarry on the estate and without railway carriage.

The park is 3 or 4 miles in extent, and includes some very rich and picturesque scenery. Great admiration is always expressed at the size of the Spanish Chestnut trees, the Oriental Planes, the Cedars of Lebanon and the Atlas, one of the former measuring 18 feet

in circumference, still in healthy growth, but its top gone with the hurricane, the other in stately growth and in full vigour, measuring 18 feet 10 inches; a splendid deciduous Cypress, and a fine yellow Chestnut, but unfortunately each damaging the other from proximity, the Chestnut tree having several large bunches of *Mistletoe* on its branches.

The old trunk of the Cedar tree on the lawn, some 20 feet high and still living, has a perfect bole, measuring at 4 feet from the ground 18 feet 2 inches in circumference. Another Cedar in the grounds below, at 6 feet from the ground gave the enormous circumference for a Cedar tree of 21 feet 8 inches. These trees are the finest in the country, and were probably planted about the year 1758.

The view engraved (fig. 72, p. 466), taken from the gravel-walk beneath the arched front of the south terrace, includes portraits of Lord and Lady Bateman, several members of the family, and the visitors staying in the house, assembled on the balconied terrace above. The members of the Woolhope Club are assembled below, ready to start the park and woods, for a morning's pedestrianism, some in a carriage, and his lordship soon following with a pony for the assistance of the Rev. M. J. Berkeley.

From the high ground at the top of Shobdon Hill, which rises above the deer park, in which is a large herd of deer, may be seen on the Herefordshire look-out the valleys of Teme, Lugg, Arrow, with the woods, hills, and dales around Ludlow, Leominster, Weobley, Hereford, and Kingston—the Malvern, the Dimore Hills, Garston, Foxley, the Meerbatch Hills, Moccas country, and within the two last-named below, a fine glimpse, too, of the Aberystwyth, the Brecon Beacon, and other prominent landmarks. When the summit is reached, and the eye gazes in the opposite direction on Radnorshire, Montgomeryshire, and Shropshire, the vales of Lingen and Prestegise lie just underneath, while the country of Caracatus' retreat, Wapley, Coxwall Knoll, Croft Ambury, Brandon Camp, Car Caradoc, is all within range. Some there were who saw the Wrekin; enough for us that we saw the Glass over Ludlow, with Bringewood Chase and the High Vine, the latter our standpoint. The Church Streeton Hills, and Caradoc, and the Longmynd were clearly visible, and the road leading up to them, through a park of several miles, was bespiced with fine Scotch Firs and other trees and innumerable trees.

On the way from Kinglamb station to Shobdon Court, at 2 miles from the former, near a milestone at the junction of four roads and the old hostelry named from the *locus*, is the pedestal which commemorates the bloody battle of Mortimer's Cross, fought here from March 19 to 20 on a Condemna Day, 1455, when the Yorkists defeated the Lancastrians under Tudor, Earl of Pembroke, and secured the ascent to the throne of the Earl of March. It was the last great battle fought within the county.

A very curious circumstance may be here mentioned in reference to the hawfinch. Just before the members of the Woolhope Club arrived at Shobdon last autumn Lord Bateman picked up at the front door, quite recently killed, a fine specimen of the hawfinch, which had flown against one of the plate-glass windows to its own destruction. This rare bird has not been unaccountably found, and breeds some years in Herefordshire. It is an inhabitant of the more temperate climates of Spain, Italy, and France, visiting this island occasionally, and most generally in winter. These birds vary in plumage very much, scarcely two of them being alike. It is hoped the specimen will find its way to the Hereford Museum.

The church stands near the mansion, on the site of the former edifice. The old church was built by Oliver de Merlimont about the year 1150. It is said that Hugh de Mortimer gave Shobdon to his chief steward, Oliver de Merlimont, in the reign of King Stephen (A.D. 1135–54), and that the latter immediately proceeded to build a church. A little chapel of wood was the only ecclesiastical building which had previously stood there.

The style of the architecture of this ancient church, and the peculiarities of its sculpture, differ from the general character of that which is known to be Norman. There is much more refinement in the design generally, and more truth in the sculptured forms of the different living beings represented, than is seen in the character of the Norman period, and there is a

high artistic feeling in the composition of the whole, as well as in all the leading features, which would induce us to conclude that it has more of the character of the very early Irish school of design, of which we have but few examples left. Oliver de Merlimond also founded a small priory for canons near the church, which was afterwards removed from Eye, and finally to Wigmore.

In 1753 the old church of Shobdon was pulled down to make way for the present modern structure, the old tower being the only part retained; but even then the sculptured columns and arches were considered so extraordinary that it was determined to preserve them, and they were re-erected in their present position in the park.

THE ROYAL HORTICULTURAL SOCIETY.

MANY times I have felt disposed to express my very decided views I hold concerning the present position of the Royal Horticultural Society, because I believe my views to be largely held, and to represent the action of many of the horticulturists throughout the country. A little while ago, when I saw that "last letters" were being written, I determined to hold my peace, but since then the letters of Mr. Gilbert, Mr. Veitch, and Mr. Wilson, have in a measure changed the gardening public to say why they still decline to be charmed by the guinea membership. There is scarcely a village in England that does not contain one amateur gardener at least, and the Royal Horticultural Society should attract all these. How is it that it does not? I will shortly tell you. First let me ask what the Society does; and, secondly, let me point out what it ought to do. First, what it does.

1. It keeps up a fashionable and costly lounge at South Kensington.

2. It patronises and promotes flower-shows.

3. It gives prizes for new plants and for successful culture.

4. It keeps up an experimental garden at Chiswick.

Now what are these things worth? What South Kensington is worth we all know. It is a terrible drain upon the resources of the Society—a drain which diverts all its property into its proper work and which will go on so long as the Society is controlled by the debenture-holders, who naturally decline to see that they have lost their money, and who, not very unaturally, prefer the distant hope of a dividend to the immediate interests of horticulture. The debenture-holders decline to give votes to the "guinea men," because they know that the "guinea men" would vote for horticulture first, and for debenture-holders in the second place.

2. Flower shows, or "floral fetes" as we now call them, may be valuable to horticulturists, if they are properly adapted to large miserrymen, who very properly find in them their best advertisements. Most of us, however, think that it is this very tendency catch at popular applause, to prostitute horticulture to gala purposes, which led to South Kensington, and which has wrecked the Society. We all know that large flower shows lead to—the hacking about of huge plants from show to show, and to the encouragement, not of methodical gardening at home, nor of a genuine and wider love of the art, but of cultural quackery, and of the manufacture of "pot-bellies" for exhibition.

The Royal Horticultural Society has at South Kensington and elsewhere fanned the vulgar desire for these ostentatious galas, and now proposes to extend this policy.

3. The prizes and certificates are, on the whole, fairly and worthily given, and enable importers and growers to reach the public, but they could be given without a Royal Horticultural Society.

4. Chiswick.—I am sick of hearing of Chiswick. Chiswick is the one argument to silence us all. "Look at our experimental garden!" Well, let us look at it! What has been done at Chiswick? Nothing. Some one lately dared derision by saying that Chiswick was not only justified in itself, but justified the Society in all its doings, because some one had classified some Apples there. All the world knows, or may know, that there is no method at Chiswick for which a trained man of science could profess the faintest respect, and as for the empirical art of horticulture, I do not hesitate to say that more experiments are made in a month by such men as Mr. Speed, Mr. Denning, Mr. Stevens, Mr. Ingram, and many like them, than are made at Chiswick in a year. So much for the

"read to the sack." Now what, on the other hand, do we expect a Horticultural Society? Many things, here are some of them.

1. To hold meetings in London, such as are held by the other learned societies, for the reading of papers and discussion. This would lead, of course, to the publication of a proper series of valuable *Transactions*, and to the proper functions and management of a great special library.

2. To form and endow chairs for Professors of horticulture and allied subjects.

3. To establish in London or at Chiswick a system of lectures, which would soon lead to the formation of a horticultural board or college, whose certificates would be earnestly sought after by the younger professional gardeners.

4. To send lecturers in the winter months to deliver courses in other towns and at large establishments. Such lectures, I am in a position to say, would be cordially welcomed by the chief head gardeners in England.

5. To offer cups and prizes, not for gala competitions, but for those gardeners whose whole establishments, large or small, would best bear judging for general system, neatness, cultural excellence, and experimental results.

6. To hold a general summer gathering, like the gatherings of the Archaeological and other societies, where the reading of papers and general discussions would be arranged, and where horticulturists would meet, compare notes, and form mutual friendships.

7. To hold fortnightly meetings, as at present, and to give medals and commendations, as at present.

In a word, the function of the Horticultural Society should be to promote high culture and the introduction of new plants, to reduce the empirical or rule-of-thumb knowledge now possessed by our chief gardeners to some kind of scientific system, and to educate the rising generation of gardeners in the science of botany and the art of horticulture. The journals week after week are full of the conflicting opinions of leading gardeners on the commonest subjects—such even as Grape growing. Methodical investigation should and could settle these doubts, and explain these difficulties once and for all. Can our Royal Horticultural Society point to one single doctrine ever discovered and settled by it since it was founded? My scheme will be said by your readers to be ambitious. It is. My horticultural aspirations soar beyond the successful management of a gala, and beyond the delights of a lounge in a fashionable garden. *T. Clifford Allbutt, Leeds, April 6.*

[We print this letter as we believe it expresses opinions which are prevalent in the country; but we do not agree in the writer's estimate of the value of the work done at Chiswick, though we would willingly see that improved. Eds.]

THE JERUSALEM ARTICHOKE.

I HAVE more than once given out intimations that I had reason to believe that this esculent originated in the valley of the Mississippi, from a species of Sunflower (called *Helianthus dromicoides* by Lamarck), which is common there. The reason is (1) that the foliage, flowers, and mode of growth of this wild variety are much like those of the cultivated Artichoke, except that the tubers are long and slender—are commonly rootstocks rather than tubers. (2) But having planted these, and raised them in the garden for a dozen or fifteen years, I found that some tubers are long and narrow, and rather tough, while others are good "Artichokes." It is possible, however, that they had got mixed with the old cultivated plants, some of which grew near by. (3) But last autumn Professor John M. Coulter sent me, from Indiana, roots of the wild Sunflower in question; and I noticed that while some were quite like my original stock from Kentucky, others were shorter and thicker, and a few were to all appearance good Artichokes.

Now LINNÆUS, in the *Species Plantarum*, gives Brazil as the native country of *Helianthus tuberosus*, the Jerusalem Artichoke. We can trace the origin of this misconception, but, without entering into details, we will only say that these Artichokes no more came from Brazil than they did from Jerusalem. But LINNÆUS, in an earlier work (*the Hortus Cliffortianus*), says they came from Canada. That, on the other hand, seemed to be too far north, but I have thought it probable that they reached Europe by way of Canada, and Canada by way of the Great

Lakes and the Mississippi or Ohio. But I had not ascertained that any of our Indian tribes knew of this tuber, and had ever cultivated or used it. That was because I had not investigated the question as I should a botanical point, and because I did not apply to the proper source for information. The reference to a statement in Palfrey's *History of New England* made it appear that there was evidence upon this point somewhere in existence; and an inquiry made of our most learned scholar in Indian lore, Mr. J. H. Trumbull, of Hartford, Conn., now brings the facts to light.

It appears that SAGARD, in his *History of Canada* (1636) and in his *Grand Voyage*, mentions, as among the provisions of the Hurons, "roots that we call Canadiennes or Pommes de Canada, and that they call Oraquenta, which are not very common in their country. They eat them raw as well as cooked," &c. He mentions Potatoes ("potates") which he had seen on board an English vessel, and which, "they say, if cut in pieces and planted in the earth, in short time grow and multiply, like the Pommes de Canada."—This seems to show that the Huron Indians had Artichokes in cultivation. Still earlier, viz. in 1612, Lescaut, in his history, mentions roots found in the country of the Armonchipou (Canada and Northern New England), as big as Turnips, which were excellent eating, of a flavour reminding one of Caroons, and which, when planted, multiply in a marvellous fashion. Possibly these may be the tubers of *Apios tuberosa*, or ground-nut, but the account agrees much better with Artichoke. Now the evidence which the old herbalists furnish, and which Mr. Trumbull has looked up, make it clear that Jerusalem Artichokes went from Canada to Europe within a dozen years after the first settlement of Canada, viz. at Quebec. I cannot here enter into particulars; but suffice it to say, that the plant was received in England, "Anno 1617," and Italy, early enough to have got the name "Jerusalem Artichoke" established at the date of Johnson's edition of Gerard's *Herbals*, 1633; for this Jerusalem is doubtless an English corruption of *Girasol*, sunflower; and the plant was at a very early date cultivated in the Farnese Garden. *Asa Gray, in the "American Agriculturist."*

Home Correspondence.

The Ivy.—I have read with interest Mr. Grieve's article on the Ivy, and have great pleasure in bearing testimony to its usefulness and beauty when associated with buildings. Here nearly half the Castle is covered with it, and the plan pursued is to drive into the wall, about 2 feet apart, large clout nails diamond pattern, and from nail to nail is worked copper wire, simply twisting it round the neck of the nail, and passing on to the next. The wire is thus about 2 inches from the wall. The variety used is what is known as the Irish Ivy, which is by far the best for lofty buildings. The Ivy loves good soil to start in, and plenty of moisture, when it will soon reach a great height, the same as it does here, and will look beautiful all the year, as well as toning down a great mass of masonry. It also unquestionably has a great tendency to render any building dry and warm in winter. We cut the Ivy here annually the first week in April, with a sharp scimitar sort of hook, and the leaves cut off are carried to the deer in the park, who enjoy the change of food. In a very short time after cutting, the remaining fresh leaves are formed, giving to the building a pleasing appearance all through the following summer and winter. The great advantage of the nails and wire as described is that it completely secures the plant to the wall, and although it "souls" (weaver's "comes up from the coast" occasionally at the rate of 90 miles an hour, yet the Ivy is very seldom displaced, and looks after its washing as fresh as a Daisy, notwithstanding some of it being sixty years old. Some of the variegated varieties are very beautiful, and also many of the small green ones are very neat, but they are best for walls and buildings under 20 feet, and where their beauty is best seen when one is close to them. *F. Ruiz, Bridge Castle, Thurbridge Wells.* [We prefer alleged "being" in our experience, the quickest grower. Eds.]

Orange Blossoms.—I saw a question asked a few weeks ago, relative to the origin of the custom of placing Orange blossoms in bridal wreaths, and think I can now throw some light on the subject; for the Rev. James Niel, author of *Polestina*, has just published a most excellent lecture at Petersfield a few evenings ago, in which the "Apples" mentioned in Scripture as growing in Palestine were really Orange trees, and that the bride in the days of Solomon was decked with their blossoms; the figure "Apples of gold in pictures of silver," was also an allusion to the Orange, which bears fruit and blooms at the same time. *Helen G. Walton.*

Potato Planting.—I cannot say that Potato growers are having a good time yet. The winter proved to be an exceedingly trying one for keeping the tubers, and its comparative mildness induced a good deal of premature sprouting, much to the injury of the seed; and now that the planting time is upon us, and the fast passing days argue that the work should be done as speedily as possible, we are having heavy rains in such frequency that scarcely is the surface of the soil dry before it is wet again, whilst the water is still in the tubers, and the ground is so dry it is so desirable for Potato planting that it is better to wait a little than plant in the rain; but now the waning spring renders the planting a matter of necessity. Some persons who have no fear of late spring frosts here there they are planting their tubers in dry weather in March, and if no late frosts come they will be fortunate people; but as we have late sharp frosts five years out of six, all Potato hauls taken from the ground at the end of April stands but a poor chance of escaping the market. The same may be said of Potatos are being got in as fast as the weather will permit, the plough and the dibber being the most potent agents in planting. As fast as the ground is turned over men follow behind with the dibbers in order to fill the holes with the same soil as the ground. Others fill the holes in, and soon afterwards a harrow is sent over the ground, and all is finished. In this way a large breadth is soon got in. *A. D.*

Double Daisies.—Some of the most pleasing of spring garden flowers are found in the pretty double Daisies, a few of which may be found in almost every cottage garden in the kingdom. It is perhaps quite correct to say of the Daisy that it is too common and too well cultivated to be worth notice. It has many advantages, it is perhaps somewhat despised by many gardeners. Yet there are properties in the Daisy that should render its cultivation more generally favoured; there is considerable variety in colour of the flowers, and in the habit of the plant. Some are single, some bedding, ribbon bordering, and edging, whilst in the majority of sorts the flowers are so double and of such excellent form as to present capital models for florists who may be striving to improve things which need little more than a little Daisies in the garden, and the Giant White purity of colour that might vie with the snow-wreath, whilst in the Sweep and Bacchus are found sorts that in comparison are blood-red, and furnish a rich glowing tint that is of great effect amidst the too common pinks, yellows, blues, and whites of our hardy spring flowers. Although the Daisy does not depart from the two primary hues of red and white, yet in many flowers these are so blended as to produce some very charming shades of rose and pink, two of the very best of which are mixed hues perhaps being found in Rosy Gem, a large flat-petalled kind, having white petals heavily suffused with rose, and Early Gem, a large quilled kind, in which the two colours are about equally blended and so blended as to give a beautiful pink. The Daisy is infrequently given some excellent double flowers, and some of new form or colour. In this way persons may soon secure stocks of sorts quite new and distinct. The tendency of the Daisy to sport is found in the existence of the variegated kinds which have thus originated. *A.*

Waltham Cross Grape.—I would have written you in answer to H. F. C. G., but hoped that some one else would have done so for me on this subject. Your correspondent says that he knows "one or two noted Grape growers who have completely failed with it," but this information is of little value unless he would say in which way they had failed. He only gives us his own experience, and the fault with him is that Waltham Cross is a shy bearer. This statement surprises me, for here at Loxford Hall we have two rods of it, and for two seasons nearly, if not all the lateral showed three bunches each, and such bunches they were as to quantity and length. My own experience as I have seen it at Waltham Cross and here is, that it is one of the most free bearing sorts we have. It may not do well as a pot plant, but it had no opportunity of judging, but from the drift of your correspondent's letter he has only grown one cane of it as a pot Vine, which did not show fruit. Surely this experience was not enough to condemn a new Grape upon. As Mr. W. Paul

exhibited it at South Kensington, the Fruit Committee could not do less than grant it a First-class Certificate. I saw the bunch and tasted the fruit, and from that did not hesitate to order a cane. I believe the same bunch was figured in the *Florist and Pomologist*, and I should say that the artist has done it less than justice. As you have already alluded in referring terms to the fruit grown at Loxford it does not become me to say more on that head, except that none of our bunches come near in appearance the one shown in the *Florist and Pomologist*. Your correspondent also very kindly tells the Fruit Committee how they ought to do their work. "They should have growing specimens of the fruit before them." Surely if he is a practical man he must know that unless the committee could see the fruit, or unless the committee visited the garden where the fruit was growing. The first method would not do justice to the Grape, and no committee would undertake the other. Surely, I believe many "noted growers" visited the Vines of Mr. W. Paul, and were quite satisfied with the Vines at Waltham Cross. Further, the following valuable information is freely tendered to us:—"There are several good practical gardeners on the committee who would grow the plants either in Vines or likely to be fruitful or not. No gardener, or "noted grower" either, could tell this unless it was in fruit or showing, and then a child could tell just as well. J. Douglas, Loxford Hall, Herts, Es., April 9."

The Rose House at Gunnersbury.—In your issue of June 3 last, "R. D." describes a new Rose-house at Gunnersbury in which the plants are planted out in beds; it would be much to my interest to know whether the rose house you refer to at the present time: have the plants been forced at all, and if so, how does their produce compare with pot culture? Doubtless in quantity and quality they are equal if not superior, but are they as much under control as the plants in pots? Bloomed at the same time? The relative qualities of the varieties grown would also much oblige. *An Amateur*. [In order to reply fully to the queries of "An Amateur" I have just inspected the Rose-house at Gunnersbury, and I am bound to say the rose house sight is now a most attractive and instructive one. The house is yielding from 400 to 500 beautiful blooms per week, and cutting has gone on uninterrupted since August. The Roses were trained over the top, the house was shut up early, and for fortnight, and then fire-heat was employed, and it has been continued ever since. The produce compares in the most favourable manner with flowers obtained from plants in pots. As in the house I saw some splendid blooms of Marechal Vallant, Charles Ledre, Dupuy Jamin, Madame Victor Verdier, Gloire de Dijon, Madame d'O, Madame Jules Margottin, Bouquet Faicot, President, and Chesnut Hybrid, I may now name a splendid Rose or two more. The plants are all planted out in raised beds 2 feet in depth, and though the roots may have got away beyond the confines of the house in some instances they are perfectly under control. The constant cutting has been granted, and the sides of the house, after the flowers are removed from the points of the leading shoots, lateral buds break forth freely and produce blossoms. The Gunnersbury house is one of the most successful illustrations of Rose culture under glass to be met with around London. *R. D.*]

Loberia Emperor William.—Permit me to say a few more words in reply to Mr. Bester's statement at p. 376, wherein he admits that I have given a true history as to the origin of this variety, and yet claims the credit of its being raised by me. I do not, and I emphatically deny. He also infers that he gave Mr. Brownell a pinch of the seed from which he raised it, which is an erroneous statement, as the packet of seed from which it originated was purchased by Mr. Brownell for 1s. in February, 1874, which was two years and a-half previous to its gaining the certificate; and in the spring of 1873 myself and others in this neighbourhood were in possession of it before Mr. Bester had even seen it. *E. Morgan, The Butts, Harrow-on-the-Hill.*

Lilium giganteum.—Though this Lily may be flowered in a pot, it is extremely doubtful whether so vigorous a growing plant can do as well under such treatment as when planted out. About three years since I bought two rather small bulbs, one of which was planted in an open border in light sandy loam with a spit or two of well-rotted manure dug in about 2 feet below the surface. It was then left undisturbed, and in the autumn the plant was raised to the stem measured 7½ feet high and 1½ inches in girth at the base, bearing fifteen bulbs. The bulb being completely exhausted, as I believe is invariably the case with this Lily after flowering, has left behind six offsets, and removing two of the best I have found the roots of the old bulb were very large and penetrated deeply into the soil. The other bulb was potted, and, though it has been throughout under the

care of a most experienced gardener, is not yet sufficiently strong to bloom. *Charles F. Knight, Sevenoaks.*

Double Narcissus.—When I sent you the double and single forms of *N. Talamonius* on March 28, I promised to send you the double and single forms of *N. Penderelensis* also. The double form of this is, that is to say, the double and the single are found growing more or less together. You will see they are far removed from the *Talamonius*. I have only met with the double in any quantity in one part of England, but I will be glad to plant you a few if it possesses in the wild state, from having the trumpet generally complete and full of petals. Indeed, the tendency in the wild state is to be semi-double, as in one of the accompanying specimens; whereas in my soil the tendency is to increase in double form and to develop a rose flower instead of a trumpet. I find this the case also with the double form of *Talamonius*, and the double form of *cernuus*. This latter, growing on stiff loamy soil, invariably retains the trumpet perfect. The specimens I send of the double, Parkinson calls *Pseudo-Narcissus anglica flore pleno*—Mr. Gerald's double *Dafodil*, who, Parkinson states, first discovered it in the world, finding it in a poor woman's garden in the east part of England, where, first before the woman came to live there; and he goes on to say—"I have heard since it is natural to the Isle of Wight." The specimens sent are the most varied I could find, the semi-double being almost the only one in the quarter of the garden. *Barr, 12, King Street, Covent Garden.* [In several of the specimens sent the flower is so completely full that the trumpet portion is altogether obliterated. *Eds.*]

The Wetteranne.—Some time since one of your correspondents asked the question, What sort of tree is the Wetteranne of the Alps?—to which, as far as I have observed, no answer has been given. Allow me to give in elucidation of this subject some extracts from a short manuscript on the subject by Z. de Berlepsch, translated by the Rev. Leslie Stephen. It will appear that the word does not signify a species of the Pine or Fir, but a Pine tree of peculiar shape and abnormal growth, owing to exposure to the weather on high mountains. The higher boundary of the forest lies behind us. It reaches to 5000 or 5500 feet above the sea. Higher up the mountains are only fresh green alpine pastures, with short close turf, interrupted occasionally by scattered bushes of pine and fir, and by Larches. To these bold outposts of the forest belong especially the Wetteranne, or Weather-Pine. The Wetteranne, which rises in isolated positions on the alpine meadows at heights of 6000, and in the Gisons of 7000 feet, is a hermit grown up by itself. . . . a solitary tree on an alpine pasturage, which, as implied by its name, has a thoroughly weathered appearance. It is generally a Pine, whose heavy and far-extended branches begin a few feet from the ground, and in the normal shape, the form is repeated by the young branches up to the top, forming a thickly wooded and sheltering roof. Often, however, it is a form which sets at defiance all common laws of growth. . . . It does not look like one tree; it seems to be a mass of stems, or a mass of stems—a whole family of Pines. Here the straight coquetish shaft has been metamorphosed into a rough knotted cylinder of compressed and deeply marked wood. Its noble striving after its law of vertical growth has been broken up by the influence of the outward circumstances—storms, avalanches, and thunderstorms—have so knocked it about, broken it off short, and amputated its limbs, that it is covered over and over with rents and deeply scarred wounds, full of knots and malformations. But still he fights his way up with irresistible power of vitality—a noble fellow, full to the brim of energy, manly and inflexible, a character in whom every bone must be made to measure. And then the boughs, they have the same active nature, the same push at all hazards as the stem. Every little twig stands up for his own independent rights, and will be a bit of a tree on his own account. It is an illustration of the law of the survival of the fittest, *die fitteste*.—As the old ones sing, still twitter the young. Quite unlike the horizontal boughs of the lowland Pine, these boughs, after a short level shoot outwards, turn like a swan's neck upwards, and grow straight and more and more into the sky. But the boughs do not stand equally all round the stem, but on one side, where the lightning has scored and crashed, or the storm cut out the limbs, they are wanting, whilst on the opposite side boughs and leaves grow more thickly and more closely packed. Here and there withered dead stumps of boughs strike out, and help, with the long beardlike lichens, to give a wilder expression to the whole

picture. . . . A colossal specimen, three-pointed, like a hand raised for an oath, stands in the Valzeiner Alys at the entrance of the Prätigan, Grisons, whose stem, 4½ feet from the ground, is 7 feet in diameter.

It is yet a benevolent, hospitable tree—a *hospice* erected by Nature, with shelter and asylum, to whose protection the cattle fly with sudden black stags and broken rain clouds discharging their burdens, or hallstorns rattling down in thick masses. But also in the sultry height of summer, when the sun is near the zenith, and over the whole broad alpine meadow no shady spot is to be found, the cattle intuitively seek the Wetterstein, and stand comfortably in its cool, refreshing shadows. To this double service in good and bad weather it probably owes its name as much to its appearance. I have only to add to this that it is the *Beech* of some southern usually, and in this place, to mention in particular the Pinus Cembra. John M. Gillington, Knapp Hill, April 9.

Mistletoe.—Considering the interesting nature of this parasite, and its exceedingly ornamental character when seen clinging to the branches of evergreen trees, leading to the fact that in the winter months it is a wonder that worked plants of it are not more an article of commerce among nurserymen who make trees and shrubs a speciality of their trade. In parks and dress gardens, and in having a few of the more ornamental branches laden with the above would be a most interesting feature, and as it is such a very easy matter to get it established, and the present the proper time to set about its propagation either by grafting or seed, any one desiring to introduce it into a garden should do it by one or other of these methods. Although the Mistletoe does best on the Apple, Thorn, or Lime, it succeeds on many other kinds of trees, even to the Oak, but its presence on this appears to be of its rare occurrence, not as it is in the time of the Oaks.

Drawn when it was held in such veneration. Where suitable trees abound, it might be found a very profitable plant to grow, thus combining utility with ornament, as there is always, and is ever likely to be, an immense demand for it, not only for use for decorative purposes at the native season of Christmastide, when in certain circles it gives license to swains and blushing maidens, and causes a good deal of hilarity.

In places where Mistletoe once gains a footing the seeds are shed from the tree, and the birds, by constantly devouring them frequently find themselves incommoded by the viscid fluid that sticks to their bills with glue-like tenacity, and to rid themselves of it they wipe their beak on the branches, thus depositing any seeds which may be attached to the beak. As we wish to introduce this novel plant we have only to imitate the sweet songsters of our woods, and stick the seed in like manner on any clean young branches of the particular tree on which we wish to have it grow.

Success depends a good deal on the way the berries ripen than on anything else, as it is just as impossible for the seed of Mistletoe to grow in an immature state as it is in the case of any other plant, and many have given up all attempts to get it established through the berries, and to have the berries at the wrong time. One might as well collect those of the Holly while green, and expect them to grow, as to get the Mistletoe before March, at which time they are fully ripe; and as the winter has been so exceedingly mild the berries have remained unmoistened, so that the present season affords an excellent opportunity of obtaining them in a state in which they will be likely to germinate. Those who have to get them from a distance should be careful to have them all gathered from the plant, and directly they arrive, at once placed on the branches of either a Thorn, Crab, Lime or Apple; but it is useless doing this on the thick hard bark, the cuttings of which get the seed almost perfectly dry. Choose, therefore, nice young branches on the most prominent part of the trees, and on these stick the berries by simply breaking the skin so that the viscid flesh may be rubbed on and cause the seed to adhere. If placed on the under sides of the large twiggy shoots, they are more safe from the keen eyes of birds, and it is quite as well to ward these off by tying a piece of thin muslin around the branch so as to cover the seed, thus making success in this matter almost certain. It is interesting to watch the swelling and germinating process through its various stages, so that, independent of the beauty of the plant and its novel character, there is much pleasure to be derived from it almost immediately after the seed is placed in a position favorable to its growth. Mistletoe may also be propagated by grafting, which should be done in April or early in May, but as this is a difficult operation to perform, and there is not much gain in point of time, it is scarcely worth the trouble unless the grower is a person pretty well skilled in that branch of gardening. Like most parasites, the Mistletoe is a great robber, living at the expense of the tree to which it attaches itself. It will therefore be advisable in introducing it not to apply one's own labor to the propagation of it of much value, as their fruit-bearing powers will

not be so great when they have to support a plant that causes such a drain on the sap and is constantly taxing their energies. F. Sheppard.

Potatoes.—During the last season, an experiment was raised in the haum from the ground succeeded so well (at least, a lesser quantity of disease coincided so completely with the Potatos tested, that possibly some of your readers may be inclined presently to try the plan. Looking at the influence which date has been shown to have on the sprout of Peronospora, I had lines of strong tarred twine taken at about 22 inches from the ground between the rows of Potatos, the cords supported by stout pegs, so that the haum was kept from lying on the ground during its whole life. The arrangement allowed a great deal of sunshine and free passage of air between the rows for some weeks longer in the early stage of growth than is usually the case, and by occasionally nipping off some of the tips of the shoots they were kept in manageable length, and had healthy foliage (not disfigured as usual by yellow and decaying leaves in large numbers), till in the natural course of things it withered in autumn. At Christmas, when the few months of storing had tried the crop, the Potatos which had been grown as usual were for the most part diseased, but those which had been grown with the raised haum had only a small percentage bad, and continue in excellent condition for household supply. The sorts experimented on were Paterson's King, which I had already seen in your column (I had the same garden the previous year), and a few lines of Jersey Blues. Of course, the comparative absence of disease may be only from coincidence, but I hope to try the experiment again this year on a larger scale; and will be glad to hear should you have any other experiment, and would kindly give the results, it would be of much interest. O.

Silene Hookeri × S. Elizabethae.—I wrote on the evening before a meeting of the Royal Horticultural Society, in order to be submitted to the Scientific Committee, and in great haste to catch the post; a note of the above hybrid, and of a cross I effected thereon, but without reading over what I had written. I found on reading it over in your publication of March 24, giving a report of the meeting that, having left a sentence unfinished, I had made many of it, yet as it was not in your column I did not think it worth troubling you to correct it. But there was a more important mistake, unintentionally committed, about which Mr. Thompson, of Ipswich, feels aggrieved, and very justly I find, and I had much to say to him, yet as I had not time to do I had got the Silene Hookeri from Messrs. Backhouse & Son, and believing it to be so, I stated that it was an introduction of theirs from Oregon. Mr. Thompson writes:—"Now, as this plant had been merely introduced by myself from California and supplied by me to them (Messrs. Backhouse & Son) on more than one occasion, I hope you will not think me unduly sensitive if I ask a rectification on the subject." I am aware that Messrs. Backhouse had been merely introduced by myself from California, and sent to them, but I was informed that they arrived dead. As I was the first to raise and offer for sale, I hope you will not think I ask too much in begging that this may be put on record in any way you may prefer. I did not know the occurrence, and I think it certainly by no means improvable." I cheerfully comply with Mr. Thompson's request, and think it but common justice that he should have the credit of introducing the S. Hookeri as a living plant into this country, and all the more so as I had not time to do this acknowledgment and correction, that in his annual catalogue I find the descriptions of his many very important introductions set down with exemplary modesty, and rarely, if ever, overstatement. I have no doubt that he would be glad to have his name in his account of it (*Bot. Mag.*, tab. 6051), observes that it had been discovered some forty years ago in woods of the Wahlamet, in Oregon, and has been gathered repeatedly since by various collectors in different parts of Oregon and California, and as this Professor Bolander had sent seeds to Mr. Thompson, of Ipswich, who forwarded living specimens to Kew, which flowered there in May, 1873; with all this history it is coming from California, rather delicate for our climate; and it is to be hoped that Mr. Thompson may succeed in getting it from Oregon, whose severer climate will insure greater hardihood. I. Anclerson-Henry, Hay Lodge, Trinity, Edinburgh, April 11.

Rainfall in 1876 at Fota, Sligo, Co. Cork.—The rainfall recorded here was—January, 2.30 inches; February, 1.99; March, 3.59; April, 3.28; May, 0.11; June, 1.01; July, 1.49; August, 3.29; September, 6.83; October, 5.20; November, 7.25; December, 8.10—total, 47.64 inches. The number of days on which rain fell was—January, 13; February, 20; March, 15; April, 13; May, 12;

June, 9; July, 5; August, 11; September, 16; October, 16; November, 21; December, 24—total, 165 days. The coldest day was January 22, 19°; and the hottest, June 26, 90° in shade. Although we had a very dry summer the rainfall was over the average by several inches. W. Osborne, Fota.

Foreign Correspondence.

CAMBRIDGE, MASS.: *Acclimatization.*—There can be, judging from past failures in acclimatization, but little hope that plants can be accustomed, save by the very slow process of natural selection, to new conditions of temperature. But there is much to be gained by cultivators if it be borne in mind that individuals of widely spread species vary to a remarkable degree in their power to withstand cold, and that this power is increased in proportion to the distance at which the parent plant is found from the Equator, or above the level of the ocean.

But few references in garden literature to this subject have come under my notice. In the volume of the *Gardener's Chronicle* for 1861, p. 239, the Editor, commenting on the severe winter of 1860-61, notices that in a lot of seedling *Amarantus* a portion have been killed, while the rest are uninjured. This is accounted for on the supposition that the seed from which these plants had been raised had been collected in widely different localities and elevations, and that those seedlings only which had been raised from seed collected at high elevations, or towards the southern limits of the species, had been able to withstand the severe ordeal of the English winter. In the same article importers of seeds of certain not very hardy plants are very sensibly advised to procure their supplies from certain regions in which these plants are known to thrive naturally.

In the volume for 1876 Mr. Maw calls attention to the fact that certain herbaceous plants, principally Sedums of the Mediterranean regions, are more hardy in his garden when brought from the coldest localities where they are known to exist, than are individuals of the same species collected in Barbary and Algeria.

I find no other allusion to this important subject, for the records of certain trees, especially of the Scotch Pine and the European Larch, are more robust when collected under certain favourable circumstances, and which has been noticed by most recent writers on arboriculture, is hardly analogous, and can be sufficiently explained in other ways. It is well, then, to chronicle a conspicuous example of this power of certain individuals of a species to withstand a much lower temperature than others, which has come under the notice of American dendrologists. Experiments extending over many years have proved that two Conifers from the Pacific coast, *Abies Douglasii* and *Abies Menziesii*, were unable to withstand, with any certainty, the severe winter of the Northern Atlantic States, and their cultivation had practically been abandoned there. In 1862 Dr. Parry visited the mountains of Colorado, and sent here a large collection of plants and seeds of that region, and among them seeds of these two Spruces, which form vast forests on the eastern slopes of the Rocky Mountains, ascending to fully 9000 feet above the sea-level.

The plants raised from this seed have now stood the test of a dozen years of exposure here without the slightest injury, although within that time several winters have occurred remarkably destructive to plant life. With a view of making the experiment as complete as possible these young plants have been widely distributed through several of the northern States, and without exception, so far as I have heard, not a single one has ever been at all affected either by the climate or the very different soils in which they have been planted. So then it is necessary to go to the highest elevation where these trees grow, to collect the seed, and we add at once to the short list of Conifers capable of supporting the New England climate two trees of first-rate importance, although all previous efforts with these same species had been unsuccessful so long as the source of the supply of seed had been the lower elevation of the Pacific coast range. The importance of Dr. Parry's introduction can hardly be exaggerated. It has already supplied us with valuable and unworked material for plantations, and its true importance has a wider significance in the fact that it furnishes another indication that it is a general law of plant life that different individuals of

the same species vary remarkably in their adaptability to different climates—a law which, in imposing new duties on experimental horticulture, promises to its observers results of the greatest practical value. C. S. Sargent, Cambridge, March, 1877.

Notices of Books.

Die Pflanzen-Welt Norwegens, &c. (The Plant-World of Norway.) By Dr. Schübler. (Christiania: Brögger. (Williams & Norgate.)

The first part of this very valuable contribution to the literature of cultural botany appeared some years since, and was issued in an English version, under the title of *Synopsis of the Vegetable Products of Norway*.

In the present publication we have a systematic account of all the more important wild and cultivated plants of Norway. The subject is treated, not from the point of view of the descriptive botanist, as in the ordinary Floras, but in a form which will excite interest in the general student of natural history, and satisfy the wishes of the intelligent cultivator of plants or student of economic botany, as well as of the historian, the philologist, and the jurist. We have in this way an account of the general and topographical distribution of the more important species, details relating to the use made of them, the method of cultivation adopted, as well as historical details and other matters of interest. For instance, in the case of the common Elder, we are told that it grows wild as far as the 63° N. lat., while in a cultivated state, or as an escape from cultivation it extends to lat. 67°, flowering in the latter part of August or beginning of September. At Drömnethin, in lat. 63°, it produces ripe berries. The largest Elder in Norway is in lat. 58°, on the S.W. coast. It is about 26 feet in height, with a diameter of head of 25 feet. The names of the cultivated varieties are then given. Under the head of Roses the author mentions a Rose which produced on the same shoot a white Moss Rose, and a second Rose, destitute of moss, and resembling a bloom of the common Rosa canina. This is by no means a solitary instance, but such cases are always deserving of record. Illustrations of some of the more peculiar varieties and forms of Conifers and other trees are given, which add greatly to the interest of the book, and bear witness to the almost unquenchable vitality of trees in certain cases. Some of the woodcuts showing trees which have been blown down by the wind, and fallen in point.

In some cases the felled or uprooted trunk has rooted at both ends, and from the centre have sprung "laterals" which have assumed large dimensions, and at the same time reproduced the form of the parent tree. In the appendices are given alphabetical lists of the plants, with their polar limits of distribution, other lists showing the period of opening of flowers for ten years, in various localities. Associated with these are various climatal details, information relating to the appearance of insects, the migrations of birds, &c. The whole is terminated by a full alphabetical index. We can only express our sense of the great value of this publication by hoping that it may speedily be rendered accessible to English students by means of as good a translation as its great merits call for.

Florists' Flowers.

MEAL-LEAVED AURICULAS.—When looking over the Rev. F. D. Horner's splendid collection of Auriculas at Kirkby Malzeard a few days ago, I was much struck with the exceeding beauty of the many varieties with handsome mealed foliage. One great attraction about the Auricula is the many changes of leaf garb it assumes during the year, but especially now when the flowers are being put forth. Then it is that the Auricula, when grown as Mr. Horner grows it, puts forth such a grandeur of leaf develop-

ment, as if no dress was too good at the time of the birth of the flowers, or no leaf garniture too rich and exuberant so that the flowerets thereby attained a sweeter bloom.

The large majority of the Auriculas with mealed foliage are comprehended in the white-edged class. There are a goodly number of self-flowers with mealed foliage, but there is no grey-edged with mealed foliage as one sees it in the case of Smiling Beauty—that exquisite queen of Auriculas—Taylor's Glory, Ne Plus Ultra, &c. In the case of some of the grey-edged flowers, there is just a dash of meal on the inner leaves in the form of a kind of thin-powdered flame up it, and this it takes on at flowering time, when the leaves are vigorous in development.

In the white-edged class we get varieties with leaves densely mealed above and below, overlaid with a farina of the most delicate character. The most striking are Smiling Beauty, Taylor's Glory, Taylor's Favourite, the leaves of which are toothed like a saw, and have in addition a dense beading of meal; Earl Grosvenor, Ann Smith, Catharina, Lady Sale, John Simonite, Trail's Beauty, Regular, Gaines' Model, and McDonald's Miss Arckley. There are a few white-edged flowers with mealed foliage that are apt to come grey on the edge, among them may be mentioned Trail's Beauty, True Briton, Maria, and Lady Sale. Trail's Beauty is a white-edged flower, so short of white on the edge as to be in the character of a whitish or grey grey edge.

In the grey-edged class Colonel Champey's is perhaps the particular variety that has the most densely mealed leaves. Charles E. Brown, Privateer, and some others have the meal on their leaves as above stated.

There is no green-edged Auricula with mealed foliage, for as the old growers termed it, they have "green grass;" there may be sometimes a dash of meal about the buds, but none on the foliage.

In the self class there are a number of varieties with handsome mealed foliage, such as Pizarro, Duke of Argyle, Miss Brightley, Lord of Lorne, Vulcan, Charles Perry, Meteor Flag, Topsy, Fanny Crossland, Simonite's Yellow, Mrs. Sturrock, Petronella, Smith's Pensioner, Smith's Garland, Eliza, &c.

And one great attraction in a collection of Auriculas is the green-leaved forms alternating with those with mealed foliage. The self class illustrates this diversity in a remarkable manner, for of those having green foliage may be enumerated Othello, Ruby (this sometimes has a few grains of meal so delicately spread over the leaves, as if they had fallen from a fairy snow-cloud); Lord Lee, William Lightbody, Lord Clyde, Nimrod, Blackbird, Spalding's Metropolitan, and Lowe's Mackin.

What is known as *Primula Auricula* var. *marginata* is one of the most handsomely mealed of Auriculas, and the young leaves are most richly powdered at mid-winter. It is a variety of the yellow Auricula, with flowers of a deeper and more golden yellow, and it is in every respect a most interesting and desirable plant for pot culture. R. D.

— A variety of the DOUBLE PRIMROSE, named *Violacea*, appears to be a welcome addition to this class of spring flowering plants. It is quite distinct in character, the flowers of a violet-purple colour, large and full, and it appears to be of vigorous growth. A collection of double Primroses now comprises a goodly number of varieties, for there are the white, lilac, blue, violet, rose, Scotch, red, purple, crimson-purple, crimson, bright red, sulphur, Giant yellow, and Giantess yellow, in all thirteen sorts, and perchance this list may not exhaust all the known varieties that are in cultivation. It would be interesting to know to what happy circumstance we were indebted for the first double Primrose, and how the above large and varied collection has originated.

Forestry.

THAT branch of forestry comprising the relief of plants from everything that impedes their growth and development, is of such vital import that it demands more than a general remark or passing observation. Myriads of plants perish year by year, from no other cause than that of being choked with grass and other luxuriant herbage. It is often a subject of enquiry, and also of dispute, which season of the year is best for clearing forest trees of rank herbage, such as Furze, Bracken, Nettles, Thistles, and such-like,

because on the one hand the sudden and severe exposure, caused by cutting down that which surrounded and confined the plants, is more felt in winter than summer, and on the other, some species of trees are so like the summer herbage in colour as to render the work of clearing them with sharp instruments extremely hazardous. The richest and best ground in a plantation is generally productive of such herbage as destroys the young trees, and instead of such districts producing timber trees proportionately valuable as the grounds on which they grow, the very reverse is the case, and there is frequently no crop at all. Such ground as produces strong herbage of rapid growth indicates the presence of a richness and fertility just in proportion, and but for the circumstance that the young plants are overgrown and destroyed in the first year of their growth, they would throughout their lives maintain their superiority. In such cases it is quite evident that unless the plants are cleared the first season before they complete their period of growth, the young wood is immature and unfit to withstand the winter when the herbage falls down and leaves them exposed. The kind of work most pressing at the present time is, in most cases, that of clearing last year's plants of the decayed grassy herbage that envelops them, and excludes them from sun and air. Many plants, too, will be found lying flat upon the ground, and completely covered with grass as if to hide them entirely from view. Such plants, of whatever species, are unable to extricate themselves from their position, and only require one more year's growth to accumulate over them to complete the work of their destruction.

From the time I commence spring planting there are a number of boys and women employed putting in plants both in the forest and the nursery, and, as often occurs, during intervals of frost, sometimes a whole day, and sometimes only part of a day. During such frosty weather, unless accompanied with snow, I employ the planters, under the superintendance of a competent man, to do the work of clearing young trees in the nearest plantations. In some cases the grass is best cleared off with the hand in a glove, as thereby no injury results to the plants, as sometimes happens with sharp instruments. In other cases a hooked piece of strong wire stuck into a wooden handle is used for drawing the withered grass away from the plants. The two processes of clearing are not applicable only to decayed and tender herbage, but also to Whins, Heaths, Brambles, and such-like, which must of course be cut with the hook-bill or hand-bill, an instrument I have often recommended for such work. When herbage of any kind is cut or disengaged from the plants the operator should give it a tramp down with the foot to prevent it from blowing about and adhering to trees, fences, &c.

In seasons such as this, when severe snowstorms have occurred, accompanied by winds and dril, much damage may have been done to trees and young plantations in ravines and sheltered places. It is not plantations of one, two, or three years' growth that suffer most from heavy lodgments of snow, but those of older growth, say from ten to twenty years. Trees of small and slender growth yield to the pressure, and, though buried for months underneath the snow, will rise and erect themselves as if nothing had happened. Not so, however, with older trees, they are often broken, bruised, and mangled to such a degree as never again to be restored. With regard to such damage all should be done that can be done, leaving Nature to do the rest. Larch and hard woods, where much injured should be cut over, the latter near the ground, if required, but the former will only reproduce a leader if a fair proportion of branches are below the fracture, and not otherwise.

Some trees can be put erect, and remain so, by simply putting a turf as a brattice to that side to which they incline. Others require a forked piece of wood, say a young tree with divided top, cut to the required length to form a prop or temporary support. Others require only to have their broken branches pruned off, and so on with others, treating each as the surgeon does his patients in the battle-field.

At this season of the year in particular the good old proverb should be borne in mind. "As the twig is bent the tree inclines." In a general sense every tree should be seen at this particular season of the year to be in its true and proper position, since in a short time its condition becomes fixed and established unalterably.

Since I began of late years to pay special attention to this particular branch of forestry, I have seen the

results to be good, and far beyond what the most sanguine could have anticipated. The expense per acre for clearing plants differs so widely from various causes that an estimate even the most general would do more to mislead than guide upon the subject. Sometimes a woman or lad will clear 1200 plants per day, while at other times, with equal diligence and application, they will not clear over 600.

At whatever cost or sacrifice, however, the work should be done, and should never be neglected. Better that only 100 acres be planted annually, and properly looked after and attended to, than 200 acres treated in the too common but profitless manner. As a rule, the soils and situations naturally most capable of producing good and profitable crops of trees of all others produce the worst, and often, indeed, none at all, an effect produced by the very obvious cause—the rank herbage choking the young and tender plants in their infancy, and no hand outstretched to save them. *C. Y. Michie, Cullen House, Cullen, April 7.*

PROFITABLE GARDENING AND ROTATION OF CROPS.—Under this heading it is proposed to throw out a few suggestions to Villa gardeners as to a judicious selection of garden crops. It is a common practice to attempt too much—to crowd too many things, say, into a piece of kitchen garden, as if the cultivator were under the impression he must grow something of every article enumerated in a seed catalogue.

In cropping a piece of garden ground its size should be the first consideration in deciding on what should be grown. The ordinary wants of a family will pretty well determine what quantity should be sown of each article, and if it should happen that there is a superabundance of any particular thing—which is likely enough to happen with crops that come in with a glut and go out of condition quickly—it is, after all, rather pleasant to be able to make a present to a neighbour while the produce is in its prime, which is far better than leaving the crop to run to seed or rot on the ground, and so become wasted.

Next follows a very useful rule, which can be heartily commended to Villa gardeners—make it a rule to clear off any crop as soon as it ceases to be useful; and if the ground is wanted in a restricted size never attempt to grow anything respecting which there is room to doubt it will not afford an adequate supply; therefore it is a good plan to grow only those things likely to be manageable and to furnish a fair return.

Most Villa gardeners who have a piece of kitchen garden like to grow a few leading things, such as Cabbage, Kale, Brussels Sprouts, Cauliflowers, and Sprouting Broccoli, as they are all good and useful. These seeds are sown in seed beds, and then planted out as soon as the ground can be cleared for the purpose. In planting out select the very best and strongest plants, and leave the worst behind, and give these good plants all the attention they deserve, and they will repay it. It is a common error to delay sowing these things till the end of April, which is much too late, for the plants can scarcely be planted out permanently before the dry weather sets in, and thus they do not get a good start, and grow into size by the winter. If it should be thought desirable to save a few plants for seed, let the very best plants of the truest character be set apart for the purpose, and be well attended to, so that the seed may become well matured.

In setting in one's mind what articles are to be grown, it needs to be borne in mind that Carrots, Parsnips, and Beet require a deep, friable, and rich mould, and if of a sandy character so much the better. Such a soil is necessary, that the growing roots may thrust themselves well down into it. Then Cabbages, Broccoli, Brussels Sprouts, Kales, &c., require a good rich loam and plenty of manure; it is almost a waste of time to put the plants into a poor soil. Beans prefer fields by farmers to prepare such ground in the open air, and they are much soil for Wheat. If a piece of ground be broken up for the first time, it is always a good plan to grow a crop of Potatoes on it, for there is no crop that equals

Potatoes in commencing a course of culture with a view to mellowing and preparing a new soil, and fitting it for general culture.

So far as it can be carried out in a restricted piece of ground, a proper rotation of crops is very important. It is an old adage among gardeners that sowing. They held that a change of crop was necessary to "clean the ground." The "best rule for a rotation course," writes an old gardener, "is never to follow across with another belonging to the same family. After Peas it would be folly to plant Peas or Beans, though the sort might be different; after Cabbage, no Broccoli, Cauliflower or Kale should be planted; and it is not well to grow Potatoes on the same patch two seasons running, though a course of winter culture and fair manuring may, in most cases, render the ground quite fit for Potatoes again."

And in arranging crops it is very important to bear in mind the state of the ground in so far as it is affected by previous manuring, for it is a sheer waste to plant a crop that will do on poor soil in one that has been much enriched, merely for the sake of a change. Celery is always a favourite vegetable, and there is no Villa gardener but makes a point of growing a little Celery if he can possibly do so. Now, good Celery cannot be grown without abundance of manure, and when it is liberally given there is this advantage—that the ground, instead of being exhausted, is in excellent condition for growing Onions the succeeding year. Beet, too, is commonly grown, because so good for eating, but it does best on ground that has not been manured for two seasons, because it is not wanted large; the same with Onions for pickling, which should be sown on the poorest soil in the garden. After Peas and Potatoes, Carrots and Parsnips may be grown; they would do better than as if they followed Cabbage and Broccoli on heavily-manured ground.

It has been laid down by old gardening authorities that it is advisable in all cases to succeed every spindle-rooted crop—such as Carrots, Parsnips, &c.—with one that has fibrous roots, such as Peas, Beans, &c., and *vice versa*. Dependent upon it, there is much reason and sound advice in this; it is one of those sensible suggestions that may be advantageously pressed on the attention of all gardeners.

Natural History.

CHAFERS.—Is it not a fact that the chaffer is now much scarcer with us than it was thirty years ago?—at least such is my impression. I have a distinct recollection when a boy that, with others, we used to assemble in the road, armed with boughs, in the early summer evenings, when the chafers were on the wing, and invariably flying from west to east, and found it fine fun to knock them down wholesale as they passed over. The flight was regular in the evening, and literally in crowds; but now the chaffer is almost a novelty, indeed it is quite a rarity in this part of the kingdom. At that time, living at the old nursery grounds at Hill, Southampton, my recollection is strengthened by the fact that the men used to be put to shake and beat the Beech and Hornbeam hedge that ran here and there across the nursery, and the insects lodged in them were so numerous that they were swept up in the pathways and thrown into a large tub of water to destroy them. The chaffer, in its winged form, is a ravenous vegetarian, and does infinite mischief to those trees to the leafage of which it has special affinity. Why the appellation cockchafer is invariably given to this insect I cannot say, but I believe as boys we had no difficulty in deciding which in our naturalistic vocabulary were "cock" and which "hen" chafers. Perhaps the continuous war

made upon the winged insect has done more to reduce its numbers, and it is equally probable that the enlightenment which, thanks to the Peas, has spread among agriculturists, has done something towards promoting greater toleration for that useful bird, the rook, the natural enemy of the chaffer grub. If these birds are ill, to them the axiom most specially applies—

"Thy Rater than those ill we have,

Than fly to others that we know not of."

A. D.

NIGHTINGALES.—A friend of mine tells me that he heard two of these birds sing beautifully in Holt Forest, near Farnham, on the 5th; and another Liss resident says she heard the nightingale on the 4th in a small wood close to the village; so the "Eos," as we Welsh people call Philomela, has put in an appearance early this season. *Helan Watney, Liss.*

STATE OF THE WEATHER AT BLACKHATH, LONDON FOR THE WEEK ENDING WEDNESDAY, APRIL 11, 1877.

MONTH AND DAY.	BAROMETER.		TEMPERATURE OF THE AIR.		HYGROMETRIC DEVIATIONS FROM TABLE 5th Edition.	WIND.	RAINFALL.
	Mean Reading Reduced to Sea Level.	Deposure from Average.	Range.	Mean for Day.

Mean	30.39	-0.35	56.41	57.4	85	S.W.	0.29

- April 5.—Fine, but cloudy; frequent showers of rain.
- 6.—A fine day, partially cloudy and showery.
- 7.—Fine, but cloudy day. Showers at times.
- 8.—A very dull day, rain fell continuously after 3 P.M., and very heavily in the evening.
- 9.—Fine, but cloudy and dull; rain fell after 4 P.M.
- 10.—Fine day, very cloudy till night, then cloudless. Rain fell heavily in morning.
- 11.—Dull and cloudy; fine at times. Thunderstorm, with rain in afternoon.

LONDON: Barometer.—During the week ending Saturday, April 7, in the suburbs of London, the reading of the barometer at the level of the sea decreased from 30.07 inches at the beginning of the week to 29 inches by the afternoon of the 4th, increased to 29 inches by the morning of the 7th, and was 29.66 inches at the end of the week. The mean daily temperatures of the air were, being 0.05 inch below that of the preceding week, and 0.37 inch below the average.

Temperature.—The highest temperatures of the air observed by day varied from 67° on the 4th to 52½° on the 1st; the mean value for the week was 57½°. The lowest temperatures of the air ranged from 37½° on the 7th to 45½° on the 1st; the mean for the week was 41½°. The mean daily range of temperature in the week was 16½°, the greatest range in the day being 22° on the 4th, and the least 7°, on the 1st. The mean temperature of the air for the week was as follows:—April 1, 48°; 2d, 45°; 3d, 49°; 4th, 53°; 5th, 46°; 6th, 45°; 7th, 45°; and the departures in excess of their respective averages were—3°; 8°; 4°; 3°; 5°; 8°; 3°; 1°; 6°; 0°; 4° and 0°; 3°. The mean temperature of the air for the week was 47½°, being 3° above the average of observations extending over a period of sixty years.

The highest readings of a thermometer with blackened bulb in vacuo, placed in sun's rays, were 120° on the 4th, 116° on the 5th, 110° on the 6th, and 111½° on the 7th; on the 1st the reading did not rise above 64°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 34½° on the 7th, 36½° on the 6th, and 37½° on the 5th; the mean value for the week was 39°.

PAXTON'S CALENDAR.

New Ready, a New and thoroughly Revised Edition of the

COTTAGER'S CALENDAR OF GARDEN OPERATIONS.

ORIGINALLY COMPILED BY THE LATE SIR JOSEPH PAXTON, M.P.

OPINIONS OF THE PRESS.

"It has been carefully revised by an experienced gardener, and the lists of vegetables, fruit, and flowers, have been corrected by the substitution of the most approved modern kinds, in place of those which were mentioned in the first edition, and many of which have ceased to be worthy of cultivation. It is a thoroughly sound, practical treatise; but it has been so long before the public, and so deservedly appreciated, that any special commendation of it now is unnecessary."—*Midland Counties Herald*.

"This is a handy volume, consisting of seventy pages of letterpress and illustration, containing much and varied information likely to prove useful to all cottagers, &c., who possess a garden. To all such, who require a cheap and reliable book of reference, we heartily recommend it."—*Lloyd's*.

"We are quite glad to see this useful little book once more, and it is like a whiff of perfume from the heather in bloom to read on the wrapper 'two hundred and twenty-six thousand.' We advise all who are interested in the promotion of cottage gardening to sow this little book broadcast."—*Gardener's Magazine*.

"The information conveyed in this little book is well adapted for all persons having small plots of ground. The necessary operations for each month are clearly laid down, and are of a thoroughly practical nature. The sorts of both fruit and vegetables are well selected, many of them being excellent in quality. To our readers who are interested in the cultivation of their flower and kitchen gardens, we can safely recommend this as being a most concise and useful work."—*Little Messenger*.

Price 3d., Post Free 3½d.

W. RICHARDS, 41, WELLINGTON STREET, STRAND, LONDON, W.C.

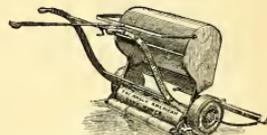

FOLLOWS & BATE'S NEW PATENT LAWN MOWERS, &c.

New Patent "Roller" Lawn Mower.

New Patent Lawn-Edge Cutter.

Royal Prize Medal Patent "Anglo" American Lawn Mower.

Upwards of 37,000 of these celebrated Machines have been sold during the past few years.

Patronised by Her Most Gracious Majesty the Queen; His Royal Highness the Prince of Wales; His Imperial Majesty the Emperor of Germany; His Imperial Majesty the Emperor of Austria; The Imperial Russian Government (for the Agricultural Museum at St. Petersburg); and members of the Nobility and Gentry of Great Britain.

Awarded Medal for Merit, Vienna, 1873 (the only Medal given for Lawn Mowers), Large Silver Medal (the First Prize) at the Meeting of the Royal Horticultural Society, Birmingham 1874, and in addition, every First Prize wherever these Machines have been brought into competition in actual trial with other makes.

FOLLOWS and BATE here abstain from enumerating in detail the various good points "claimed" for their Machines, and content themselves with saying that their Lawn Mowers possess them all, and more also; they therefore solicit the favour of an application for one of their CATALOGUES, with Testimonials, BEFORE PURCHASING.

To be had from all respectable Ironmongers and Seedsmen in the United Kingdom, or from the Patentees and Manufacturers, FOLLOWS & BATE, Manchester.

F. & B. are the sole makers of the well-known Patent "CLIMAX" LAWN MOWER, with Rack Delivery, from 55s. each; NEW PATENT LAWN-EDGE CUTTER, which entirely supersedes the Shears; PATENT GARDEN PLOUGH, &c.

Machines of any make Repaired or allowed for in Exchange.

PARHAM'S PATENT SYSTEM OF GLAZING WITHOUT PUTTY ON CHANNELLED WROUGHT-IRON OR RED DEAL RAFTERS, secures almost entire immunity from breakage of Glass, extreme facility for Repairs, and absolute freedom from Drip.

CUCUMBER AND MELON FRAMES AND PORTABLE PLANT PRESERVERS.

It is most extensively adopted, and meets with unqualified approval.

WILLIAM PARHAM,

Horticultural Builder and Hot-water Engineer,

NORTHGATE WORKS, BATH;

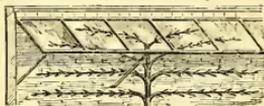

AND

280, Oxford Street, London, W.

* Full size Specimen Houses and Drawings of many important Works which W. P. has carried out may be seen at either address.

ILLUSTRATED CATALOGUES AND PRICE LISTS free.

Designs and Estimates prepared free of charge for Horticultural Buildings and Hot-water Works of any magnitude.

A Crop of Fruit in Spite of Frost

It made a certainty by the use of

PARHAM'S PATENT GLASS COPING, of which many miles are in use.

TESTIMONIALS AND SPECIFICS FREE.

Price, with 21 ounce glass and iron framing, 2 feet wide, 21. 6d.; 3 feet wide, 37. 9d. per foot run.

GALVANISED WALL WIRING AND ESPALERS.

Holdfasts, 5 in. long, 1s. 6d. per dozen. Raddisseurs, 3s. per dozen. Eyes, 4 in. long, 4½d. per dozen. No. 13 Wire, 2s. per 100 yards.

Every Saturday, of any Bookseller or News Agent, Price Threepence,

Each half-yearly Volume complete in itself, with Title-page and Index,

THE ATHENÆUM:

JOURNAL OF ENGLISH AND FOREIGN LITERATURE, SCIENCE, AND THE FINE ARTS, MUSIC AND THE DRAMA.

THE ATHENÆUM

Is so conducted that the reader, however distant, is, in respect to Literature, Science and Art, on an equality in point of information with the best-informed circles of the Metropolis.

THE AGRICULTURAL GAZETTE (ESTABLISHED 1844).

A Journal for Landowners and Tenant Farmers.

Every Monday, Price 4d.; Post Free 4½d.

THE following article on this Journal appears in the February number of the Lancaster Farmer, a high-class American Agricultural Journal, published at Lancaster, Pa., U.S.A.:

"Thirty-two imperial quarto pages weekly (eight of which are supplementary) constitute the superficies of the Agricultural Gazette, 'an illustrated journal for landowners and tenant farmers,' published at No. 7, Catherine Street, Covent Garden, London, W.C., England, by Alexander K. Bruce. Printed on faintly buff-tinted paper of superior quality, and remarkably well-finished and plainly impressed type. Its 'make up' is very compact, its contents of a superior quality and of a diversified scope; in short, it is a perfect *modus vivendi* to the agriculturalist and rural economist. It contains valuable weekly market reports; 'discussions of farmers' clubs and societies; weather diagrams; tabulated statistics; synoptic parliamentary proceedings, in addition to the usual matter found in agricultural papers; and last, not least, each number contains nearly one hundred advertisements from five lines to a whole column. We are intensely American—from the heels of our boots to the crown of our hat—and we have always respected the greatest faith in 'Yankee Doodle'; but such spectacular manifestations as the Agricultural Gazette, the London Times, and especially our visits to our late Centennial and International Exposition, admonish us that our country does not occupy—either physically or intellectually—the whole of the largest circle which can be drawn within a square, and all other parts of the world only the outside corners. And in the spirit of this metaphor we are in sympathy with the editor of the Agricultural Gazette in his strictures on the Queen's speech, which practically includes all other interests of her realm within a similar circle, and pushes the interests of agriculture out into the corners, if he recognises them at all. We are much in the same category on this side of the water.

"The farming population that can sustain such a journal as the Agricultural Gazette must be more than ordinarily a reading people; therefore, whatever progress we may be making on this side of the Atlantic, in the establishment of public schools, and the diffusion of knowledge, we may find that they are keeping pace with us in the old world. They probably have not as many readers as we have, in proportion to the population, but there may be more of that practical 'John Bull' solidity about their reading than we possess. If we permitted ourselves to descend to selfishness, we might envy the Agricultural Gazette its liberal advertising patronage. If any of our readers desire to patronise a foreign journal, in addition to their own local paper, we commend to them the Agricultural Gazette, as one that would be likely to realise all their expectations."

LONDON: CROSBY LOCKWOOD AND CO., 7, Stationers Hall Court, E.C.

ADVERTISEES are requested to note that although we do not object to receive Letters to be called for, we cannot undertake to forward them.

WANTED, a WORKING PARTNER-SHIP in an Established Nursery Business. The Advertiser has had considerable experience, and is willing to invest a few hundred pounds.—Full particulars to W. E., The Nursery, Northolt, London.

Brentwood School District. WANTED, a GARDENER and PORTRESS.—The Board of Management requires the services of a Married Couple (without children preferred), as Gardener and Portress at their School at Brentwood, Essex. Salary, £60 per annum, with 10s. per week for board, and with furnished lodge, ratons, and washing. The Man must be able to train the boys in Practical Gardening. For further particulars apply to the Clerk of the Schools. Application must be made upon Forms to be obtained at my Office, to be returned not later than Tuesday, April 24, instanter. EDWARD S. PARKER, Clerk pro tem. Office, 213, Kingsland Road, London, E., April 4.

WANTED, as GARDENER, a single Man, who understands the Management of Flower and Kitchen Gardens, Greenhouses, Pits, Fruit Trees, &c. Help is constantly given in the Garden, and comfortable lodging provided. Good wages. The Gardener must be the care of two or three Cows.—Rev. A. CROWDY, Titsey Rectory, Limsfield, Surrey.

WANTED, a married Man, as HEAD WORKING GARDENER, where three or four Men are placed on the premises, and have satisfactory testimonials, proving him thoroughly up to Flower and Kitchen Gardening, and as a skilful and experienced cultivator. To T. W. H., Post-office, Basingstoke, Hants.

WANTED, MAN and WIFE, without incumbrance, as Gardener and Landwman. Good character indispensable. Apartments, road, and gas found.—Apply, to Mr. GARDNER, employments and wages expected, to R. B., Point House, Blackheath, S.E.

WANTED, as UNDER GARDENER, a single Man, must understand Cows. Lodging found.—G. HOWARD, Oaklands, Crickelewood, Kilburn, N.W.

WANTED, a Young Man, with some knowledge of the Propagation of Camellias, Azaleas, Ericas, and other plants, for the duties of a MANAGER, Heath Nursery, Morden, near London.

WANTED, a PROPAGATOR, that can undertake to strike Heaths in large quantities; a young man not objected to. Character and abilities will be strictly investigated.—B. MALLER, Lewisham, Les, S.E.

WANTED, Two Young Men, accustomed to Indoor Nursery Work. Preference given to those who have a desire to engage for two or three years. References required, and stated. None of the above to be taken. Messrs. FISHER, HOLMES, and CO., Handsworth Nursery, Sheffield.

WANTED, a Young Man, in the Houses, Garden, and Kitchen, &c.—E. COOLING, Mile Ash Nurseries, Derby.

WANTED, in a Garden, TWO YOUTHS, about 17 or 18, who wish to improve.—Address, with full particulars, to ALPHA, Post-office, Stokenchurch, Oxon.

Knifeman.

WANTED, a practical Man, as KNIFE-GRINDER, for a Provisional Nursery, near London. Apply to a suitable person, in the Agricultural Chronicle Office, W.C.

WANTED, a MAN, competent to Overlook and take Charge of the Painting and Glazing Department. One with a knowledge of other duties connected with Repairing and Altering of large stonework, &c., is competent. Several pairs of hands would help under him (Gardens being independent of his department).—E. G. HENNING, AND SON, Pine-apple Nursery, Maid Vale, London, N.W.

WANTED, in the South of England, a thoroughly confidential, conscientious Man as CLERK, CASHIER, &c., in a first-class Fruit, Flower, Greenhouse, and Florist's Establishment, who will accompany us to the Trade and the Management of a Shop, and also a good Salesman, who is able to supply the public with the best references for character and ability, as the situation will be both permanent and confidential.—Messrs. NUTTING and SON, 10, Bury Street, E.C.

WANTED, as BOOK-KEEPER and CORRESPONDENT, an energetic Man, capable of taking the general Correspondence of the Nursery Business, preparing Catalogues for Distribution, &c.—Full particulars and salary expected, &c., to A. B., Messrs. Hunt & Son, 6, Lendalhill Street, London, E.C.

WANTED, a young Man, as ASSISTANT SHOPIAN.—E. COOLING, 18, Iron Gate, Derby.

WANTED, as TRAVELLER, an energetic business Man having a good knowledge of the Nursery Business, and who has already had some success in securing a similar situation.—Address, with full particulars and salary expected, &c., to A. B., Messrs. Hunt & Son, 6, Lendalhill Street, London, E.C.

Traveller.

WANTED, for an old-established and extensive General Nursery and Seed Business, an energetic, steady, and industrious Man, with a good knowledge of Plant Culture, and a good knowledge of the business. Apply, stating age, if married, or single, salary expected, experience in the business and as a Traveller, also to what parts of the country, to T. C. Hatfield, near Chislehurst.

Carpenter and General Repairer.

WANTED, a MAN who understands all kinds of Carpentry, Painting, and all general household repairs. Good employment, and cottage food.—Apply, stating amount of wages wanted, &c., to GARDENERS and COMPANY, King's Edge Nursery, near Hereford.

WANT PLACES.

Head Gardeners.

JOHN LAING AND CO. can at present recommend several energetic and practical Men, of tested ability and first-rate character. Ladies and Gentlemen in WANT of GARDENERS and BAILIFFS, or GARDENERS for First-rate Establishments, or Single-hand Situations, can be suited, and have full particulars by applying at Stansfeld Park and Rutland Park Nurseries, Great Hill, London, E.C.

B. S. WILLIAMS, having at the present time several very excellent GARDENERS upon his Register, is desirous of placing them in Situations where they will be most useful. B. S. W. would at the same time beg to intimate that when a Gardener is applied for, he will be most anxious to get a short list with him, so that he would prevent unnecessary correspondence and delay.—Victoria and Paradise Nurseries, Upper Holloway, London, N.

E. G. HENDERSON

GARDENERS and SON have many excellent GARDENERS of approved testimonials for ability now waiting in their Nurseries for re-engagement.

E. G. & Son will be pleased to answer any enquiries from Noblemen and Gentlemen requiring such or Five-apple Nurseries, Maids Vale, London, W.

KINAHAN'S LL WHISKY. Universally recommended by the Medical Profession. Is of the purest quality, and is of excellent quality in strengthening a debilitated constitution than any other medicine in the world. Persons of a nervous habit of body, and all who are suffering from weak digestion, indigestion, or from a general debility, are benefited by this Whisky. It is also a fine trial. Coughs, colds, catarrhs, and other ailments are also within the range of the salutary powers of this very remarkable medicine, which may be used either as a permanent, or as a superfluous or temporary, but complete and permanent. They are as mild as they are efficacious, and may be given with confidence to delicate females and young children. Their action on the liver, stomach, and bowels is immediate, beneficial, and lasting, and restores the health in every case.

DINNFERD'S FLUID MAGNESIA. The best remedy for ACIDITY of the STOMACH, HEARTBURN, HEADACHE, GOUT, INDIGESTION; and the safest aperient for delicate Constipation. DINNFERD AND CO., 175, New Bond Street, London, and all Chemists.

HOLLOWAY'S PILLS. — These Pills are of excellent quality in strengthening a debilitated constitution than any other medicine in the world. Persons of a nervous habit of body, and all who are suffering from weak digestion, indigestion, or from a general debility, are benefited by this Whisky. It is also a fine trial. GREEN'S PATENT "SILENS MESSOR" & "MONARCH,"

Or NOISELESS LAWN MOWING, ROLLING, and COLLECTING MACHINES for 1877,

THE WINNERS OF EVERY PRIZE IN ALL CASES OF COMPETITION.

Patronised by Her Most Gracious Majesty the Queen on numerous occasions, H. R. H. the Prince of Wales, the King of the Belgians, the late Emperor of the French, the Emperor of Russia, and most of the Nobility, Clergy, and Gentry in the United Kingdom.

Upwards of 80,000 of the above Machines have been Sold since they were first introduced in the year 1856, And Hundreds of unsolicited Testimonials have been received testifying to their superiority over all others.

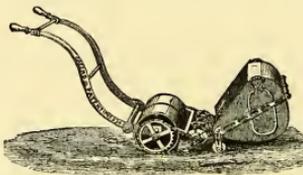

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every Prize that has been given.

The following are their special advantages—

- 1st. Simplicity of Construction—every part being free of access.
- 2d. They are worked with far greater ease than any other.
- 3d. They are the least liable to get out of order.
- 4th. They make little or no noise in working.
- 5th. They will cut either long or short Grass, wet or dry.

Leather Boots for Horse	£1	9	0				

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machines make little noise in working, the most spirited animal can be employed without fear of its running away, or in any way damaging the Machines.

Carriage paid to all the principal Railway Stations and Shipping Ports in England, Ireland, and Scotland.

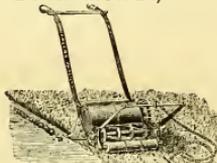

GREEN'S PATENT "MONARCH" LAWN MOWER, with Chain and Internal Gear combined.

This Mower is well adapted for cutting long, coarse, rough, and wet Grass. It is strongly made, and does its work admirably. It will cut nearer to an object than any other Lawn Mower extant.

The sizes and prices of the "Monarch" Mower are in every respect the same as for the "Silens Messor," with Grass Box, &c., complete.

Green's Patent Lawn Mowers have proved to be the best, and have carried off every prize that has been given in all cases of competition.

No Lawn Mower Manufacturer keeps so large a stock of Mowers as is to be found at our London Establishment, 54 and 55, Blackfriars Road, where purchasers can select from upwards of 500 Machines of Hand, Pony, and Horse Power, and have their Orders executed the same day they are received. The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned at once, free of cost to the Purchaser.

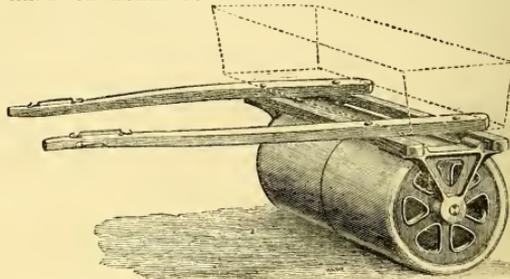

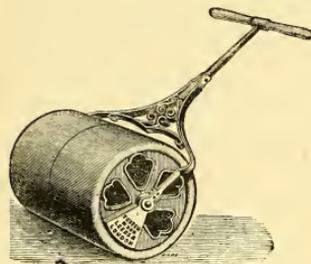

Green's Lawn Mowers are the only Machines in constant use at the Royal Horticultural Society's Gardens, South Kensington, London.

N.B.—Those who have Lawn Mowers which require repairing should send them to either our Leeds or London establishment, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

Delivered, Carriage Free, at all the principal Railway Stations and Shipping Ports in England, Ireland, and Scotland.

THE NEW ENGLISH ROSE, QUEEN OF BEDDERS (Noble).

Coloured Plates of this Magnificent
BEDDING ROSE,

Drawn by Mrs. DUFFIELD, may be had for
12 stamps each.

CHARLES NOBLE, BAGSHOT.

CRANSTON'S NURSERIES.

ESTABLISHED 1785.

SPECIALITIES.

ROSES, FRUIT TREES, CONIFERS.

Address — CRANSTON & CO.,
KING'S ACRE, near HERFORD.

GOETIA, LADY ALBEMARLE.

First-class Certificate, Royal Horticultural Society,
August 2, 1876.

A magnificent new variety, growing 4 feet high. Flowers 3½ to 4 inches across, and of the most intense glowing crimson-crimson colour, which being produced in wonderful profusion give the plants the most charming appearance. This is the finest annual ever sent out, and being extremely hardy and easy of cultivation, should be in every garden.

Seed, with full cultural directions, per packet, 1s. 6d., and 5s. free.

"We have scarcely any plant of such a lovely shade of colour."—*The Villa Gardener*, September, 1876.

"An extremely beautiful variety bearing flowers quite 4 inches in diameter, of a glowing crimson colour."—*Gardener's Magazine*, August 15, 1876.

"A remarkable and splendid variety, far superior to any other of the Family."—*Journal of Horticulture*, Aug. 3, 1876.

May be had of all Seedsmen, and Wholesale Retail of

DANIELS BROS.,

THE ROYAL NORFOLK SEED ESTABLISHMENT,
Norwich.

TOTTENHAM NURSERY, TOTTENHAM, N.

VALUABLE IMPORTED ORCHIDS.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY, April 23, at half-past 12 o'clock precisely, a fine importation of RARE ORCHIDS, collected and sent home by Mr. F. Klaboch, consisting of a large quantity of the rare UROPEDIUM LINDENI, in finest condition, containing masses of altogether unusual size, freely breaking and growing; a fine lot of the beautiful PESCATORIA DAYANA, and the rare BATEMANIA WALLISIA MAJOR, in finest condition; many large plants of BOLLEA COLESTIS, ODONTOGLOSSUM ROEZLII and O. VEXILLARIUM, from a new district; together with a great quantity of ONCIDIUM KRAMERI and ODONTOGLOSSUM CIRRHOSUM. Also the new MAXILLARIA SPECIOSA, described by Professor Reichenbach in the *Gardener's Chronicle*, August 12, 1876; a new ONCIDIUM, in the way of O. WELTONI, and a quantity of Established and Cool ORCHIDS.

Can view the morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN,
LONDON, W.C.

IMPORTED ORCHIDS.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, April 26, at half-past 12 o'clock precisely, a large importation of Plants of CYMBIDIUM EBURNEUM, also a quantity of Plants of the handsome and rare COLOGYNE BARBATA, one of the handsomest Cologynes known, giving snow-white flowers in the way of *Cologyne cristata*, but with erect spikes and the flowers not wavy, the lip bordered with ciliate fringes; and a quantity of Plants of the beautiful DENDROBIUM FREEMANII, a large number of Plants of AERIDES FIELDINGII (FOXBRUSH), DENDROBIUM HOOKERIANUM, D. NOBILE WALICHI, VANDA STRIATA, DENDROBIUM CARINIFERUM, D. JENKINSII, and others; good Plants of the rare ARUNDINA BAMBUSIFOLIA, which gives large Cattleya-like flowers of a light purple colour, with rich violet-purple labellums; also a quantity of good Clumps, each containing a number of tubers, just starting into growth, of DISA GRANDIFLORA; and at the same time a large number of good Tubers of the blue-flowered DISA, D. HERSHELLII; also some good Plants of ODONTOGLOSSUM PESCATORII, O. CORONARIUM, O. CRISPUM (ALEXANDRÆ), and O. TRIUMPHANS, &c.

On view the morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN,
LONDON, W.C.

LYE'S FAVOURITE.—The handsomest and best Potato ever offered. Indispensable for Exhibition. This variety will be the greatest Prize Winner of the season. We have purchased the entire Stock of Mr. James Lye, Clyffe Hall, Market Lavington, and parties wishing to grow this remarkably handsome and beautiful variety should order at once, as the stock is getting very limited. It can only be obtained direct from us. Price 5s. per lb. Orders of 2oz. and upwards carriage free.

DANIELS BROS., The Royal Seedsmen, Norwich.

Cheap Bedding Geraniums.

AVENUE TREES.

PLATANUS OCCIDENTALIS (true), 10 to 18 feet high, and girthing 4 to 8 inches at 4 feet from the ground.

LIMES, 12 to 20 feet high, and girthing 6 to 10 inches at 4 feet from the ground.

POPULUS CANADENSIS NOVA, 15 to 16 feet high, and girthing 6 inches at 4 feet from the ground.

ANTHONY WATERER

Has to offer many thousands of the above. They may be seen growing at Knapp Hill. They are straight, handsome, and well rooted, and altogether the finest Trees of the kind to be found in any nursery in Europe.

KNAP HILL NURSERY, WOKING, SURREY.

SPECIAL NOTICE.

APRIL and MAY the best Season for Transplanting HOLLIES.

W. M. CUTBUSH & SON

POSSESS MANY THOUSANDS OF

VARIEGATED AND OTHER CHOICE HOLLIES,
AT THEIR "BARNET NURSERIES,"

varying from 2 to 6 feet, bushy, all transplanted in 1874, and will move with splendid roots.

An Inspection invited, or Prices, &c., sent on application.

EXTRA STRONG IRISH and OTHER IVIES.

WM. CUTBUSH & SON have a very large Stock of IVIES in Pots, which they are offering at low prices, to be had on application—specially low to the Trade.

HIGHGATE NURSERIES, N., OR BARNET, HERTS.

**THE NEW ROSE,
QUEEN OF BEDDERS (NOBLE).**

Perhaps the Finest Rose for Bedding ever sent out.

COLOUR of "CHARLES LEBEVRE."

First-class Certificate Royal Horticultural Society, August 2, 1876.

Its inflorescence may be imagined when it is stated that a plant 18 inches high had 84 Buds and expanded Roses upon it on the 6th September, 1876, and flowered continuously from June until November, on the 20th of which month (1876) it was still in bloom.

Good Plants will be sent out, in strict rotation, at 10s. 6d. each,
COMMENCING FIRST WEEK IN MAY.

CHARLES NOBLE, BAGSHOT.

The Best Hardy Bedding Plant.

CLEMATIS JACKMANII.—Flowers rich purple, 4 inches across, and so profuse as to completely cover the leaf. Begins to bloom in June, and continues until severe frost. It is perfectly hardy, and the stock improve annually. The only secret of success is a rich soil, to keep up free growth. Extra strong plants, 18s. per dozen. Other sorts of Clematis and Climbers in great variety. Descriptive List on application.

RICHARD SMITH, Nurseryman, Worcester.

New Bedding Tropaeolum.—"Hunter" **DOWNIE and LAIRD** have much pleasure in offering for Spring delivery the above Tropaeolum, which has been raised by Mr. Andrew Hunter, gardener to Lord Shand, New Hall, House, near Edinburgh. This is an excellent Bedding Tropaeolum, surpassing its parent Cooperi, being of a dwarfier habit, and we can with perfect confidence commend it. The Editor of the *Gardener's Chronicle* says, "It grows about 6 inches high, is very neat and compact in habit, and a most profuse bloomer, the flowers being of medium size, nice form, and of a bright scarlet colour." Price, per dozen plants, 12s.; each, 2s. 6d. Usual discount to the Trade.

West Coates Nursery, Edinburgh.

BLOOMING RHODODENDRONS.

Two Hundred Thousand good healthy plants, having not less than five up to ten and fifteen buds each, of the finest named hardy kinds, will be supplied at from 4s. to 8s. per 100, and 18s. to 30s. per dozen.

Samples, with lists of the sorts, will be forwarded on application.

KALMIA LATIFOLIA.

Well furnished and healthy and covered with bloom-buds, 15 to 18 in., at 12s. and 18s. per doz., or 4s. per 100.

HARDY AZALEAS.

The finest English and Ghent varieties, splendidly budded, 4s. to 8s. per 100, or 18s. per dozen.

ANTHONY WATERER,

KNAP HILL NURSERY, WOKING, SURREY.

FIFTY THOUSAND MAGNIFICENT

DWARF ROSES, in POTS.
ROSES for BEES or Southern Railways at 12s. per 100. TEA-SCENTED ROSES, superb, established in 6-in. pots. Adapted for greenhouse or conservatory, 30s. per dozen, 100s. per 100. Descriptive CATALOGUES on application. **WILLIAM WOOD AND SON, The Nurseries, Marcelland, Litchfield, Sussex.**

PEAT.—A few hundred Tons of superior Peat, delivered at the Farnborough Stations on the South Western or Southern Railways at 12s. per ton. **W. TARRY, Ballif, Farnham, Surrey.**

Fibrous Peat for Orchids, &c. E. T. best quality. **BROWN FIBROUS PEAT**, 6s. 6d. per truck. **BLACK FIBROUS PEAT**, for Rhododendrons, Azaleas, Healths, American Planting, &c., 7s. per ton. For silver plants, 12s. to 14s. per ton. R. or Farnborough, S. W. R., by the truck-load. Sample sack, 5s. 6d. each. **Fresh SPHAGNUM**, 10s. per 50 bushels. **WALKER AND CO., Farnborough Station, Hants.**

COCOA-NUT FIBRE REFUSE, invaluable for Gardening purposes. One thousand tons available. Four-hashed bag, 1s., bag included; truck-load, loose, free to any Rail, 3s. **POTTER OYLER, Spitalfields Market, N. E.**

COCOA-NUT FIBRE REFUSE, new-made.—Reduced price, 20 bushels, 4s. 6d., and 20s. or 1 truck-load, 40s. Delivered free to any rail in London. **J. STEVENS AND CO., Fibre Works, Greyhound Yard, 134 High Street, London, E. C.**

COCOA-NUT FIBRE REFUSE, as supplied to Carter, Veitch, Wills, Bull, Daniel, Laing, Henderson, Dickson, &c., per bushel, 10 bush 5s. per 100; truck, 40s. free to rail or wharf. **PEAT, LOAM, SAND, LEAF MOULD, &c.**, per bushel, bag, or truck. **FRESH SPHAGNUM**, 10s. per 50 bushels. **M. H. BENTON, Nunhead, S. E.**

ODAMS' MANURES,
FOR ALL CROPS.

Manufactured by the NITRO-PHOSPHATE and ODAMS CHEMICAL MANUFACTURING CO. (LIMITED), consisting of Tenant-Farmers occupying upwards of 150,000 acres of Land. **Chairman—ROBERT LEEDS, Kenwood Old Hall, Norwich.**

Sub-Manager and Secretary—C. T. MACADAM.
CHIEF OFFICE—109, Fenchurch Street, London, E. C.
WESTON SQUARE, LONDON, E. C. For particulars will be forwarded on application to the Secretary, or may be had of the Local Agents.

MILLER AND JOHNSON

(ESTABLISHED 1852)
Manufacture the highest quality of **ARTIFICIAL MANURES** FOR ROOT, CORN, and GRASS CROPS. 35, Mark Lane, London, E. C.

IRWING'S MILDEW COMPOSITION, in Bottles, 12s. 6d. and 3s. each. One Gallon Cans (to make 100 gallons of mixture for spraying), 12s. each, 2s. each. Two Gallon Cans, 2s. each.

Mildew or Red Spider are effectually prevented or destroyed by merely painting the affected parts with the composition mixed with white-wash. No direct application to the foliage is then necessary.

Royal Norfolk Nurseries, Eaton, Norwich.

GISHURST COMPOUND.

Used by many of the leading Gardeners since 1859, against Red Spider, Mildew, Thrips, Greenfly, and other blights, its solutions from 1 to 2 ounces to the gallon of soft water and of from 4 to 16 ounces as a winter dressing for Vines and Fruit Trees. Has outlived many preparations intended to supersede it. Sold Retail by Seedsmen, in Boxes, 2s. 6d. and 1s. 6d. Wholesale by PRICE'S PATENT CANDLE COMPANY (Limited).

SIMPSON'S RED SPIDER, THRIPS, &c. ANTI-DOTE. Testimonials of the highest order on application. Per quart, condensed, 6s.; per pint, 3s. 6d. Supplied to Seedsmen and Chemists. Strongly recommended by the *Gardener*, and by many first-class Gardeners. Prepared by JOHN KILNER, Wortley, near Sheffield.

BEST & CHEAPEST INSECTICIDES

Duty Free, under permission of the Hon. Board of Customs.

THE "LONDON" TOBACCO POWDER,
"Horticultural" Tobacco Juice, also **TOBACCO PAPER, CLOTH and CORD.**

Particulars on application, **CORRY & SOPER,** BONDED TOBACCO STORES, SHAD THAMES, LONDON, S. E.

All Proprietary Insecticides and Manures kept in stock. **RUSSIA MATS.**—A large stock of Archangel and Petersburg, for Covering and Packing (price on application for Archangel)—Petersburg, 60s. to 100s. per 100; superior close-wove, 40s., 50s. and 55s. per 100; Packing Mats at 20s., 30s., and 35s. per 100; and all other descriptions of Mats, at the lowest rates. **J. BLACKBURN AND SONS, 4 and 5, Wormwood Street, London, E. C.**

Wholesale Russia Mat Merchants. **MARENDAZ AND SONS**, 10, Finsbury Street, Covering and Packing. **W. C. IMPORTERS OF RUSSIA MATS, RAFFIA FIBRE, &c.** Large stock of TANNED GARDEN NETTING, RABBIT NETTING, TIFFANY, &c., at wholesale prices for the trade.

RUSSIA MATS, for Covering Garden Frames.—ANDERSON'S TAGANROG MATS are the cheapest and most durable. Price List, giving the size of every class of Mat, forwarded post-free on application. **JAS. T. ANDERSON, 149, Commercial Street, Shoreditch, London, E. C.**

MR. POSTANS' PELARGONIUMS FOR 1877.

CHARLES BURLEY

Has much pleasure to announce that he is now prepared to distribute part of those magnificent new Zonal and other Pelargoniums purchased by him of R. B. Postans, Esq. The following form part of the collection, and are the magnificent varieties spoken of so highly by the Editor of the *Gardeners' Magazine*, as being "matchless in form and colour." The whole have large trusses, and with flowers of perfect form.

To be sent out in May in good strong plants.

The "Gardeners' Magazine," April 29, 1876, speaks as follows:—

"Mr. R. B. Postans' collection of Seedling Pelargoniums, Hybrid Perpetual and Tea Roses, &c., have passed into the hands of Mr. Charles Burley, of the Paradise Nursery, Brentwood. We have before us a box of flowers of Mr. Postans' latest Seedling Zonals, and they are certainly remarkable for quality. We see amongst them huge single flowers of faultless form, and of the most glorious crimson and scarlet colours, and a double white which ought—as we now judge it by trusses only—to sweep all other double whites out of the market. The name of this is Bridal Bouquet."

BEEHOTHVEN.

A magnificent variety, velvety crimson upper petals, lower petals purple-magenta, with shades and streaks of claret; large flower, of perfect form, immense trusses standing erect over a beautiful green zonal foliage.

Price 6s. 6d. each.

OHARM.

A grand variety with globular trusses of immense size, bearing beautiful round flowers of perfect form, of purple-crisse shaded carmine, upper petals shaded crimson, trusses standing well up over a neat dark green zonal foliage; branching habit, free bloomer. This variety was awarded a Floral Certificate at the Royal Botanic Society, Regent's Park, in June, 1876.

Price 7s. 6d. each.

HOGARTH.

Fine large well-formed flowers of crimson-maroon, shaded carmine and purple-magenta, with veins of claret in lower petals; the flowers are of a thick leathery substance, borne on fine large globular trusses, standing on thick footstalks well up over a remarkable good branching habit of good zonal pleasing foliage.

Price 5s. each.

MAGNIFICENT.

Fine shaped flower of soft rosy purple, upper petals shaded crimson-maroon with shades of carmine round the edge of petals, with a striking white eye; flowers of great substance and of the true floral form, on fine bold trusses of great size, standing well over a fine dark zonal foliage; the habit is all that can be wished for in a Zonal Pelargonium.

Price 5s. each.

NEW BEDDING ZONAL PELARGONIUMS.

PURPLE KING.

This is a plant of dwarf branching habit, with small foliage of dark green, slightly zonal, flowering freely, throwing up nice trusses with round flowers of a marvellous colour, blue-magenta, edges of petals shaded carmine; it is, without exception, the finest colour in this way, and a good bedder.

Price 5s. each.

The above set of Ten Varieties for £2 10s.

NEW BEDDING PELARGONIUMS WITH WHITE VARIEGATED FOLIAGE.

MRS. J. C. QUENNEL.

A splendid silver-edged variety of great beauty; the plant is of free growth and makes wood freely, growing like an ordinary scarlet Geranium, with fine large globular-shaped leaves, very broad white leaf margin, centre emerald-green, producing nice trusses of a splendid bright pink; flower of good shape.

This is a grand variety for bedding purposes as well as pot-work.

Awarded a Floral Certificate of Merit by the Royal Botanic Society of London, June, 1876.

Price 10s. 6d. each.

MRS. HANBURY.

A handsome silver-edged Pelargonium, of great merit. A remarkable free grower, with pure white broad leaf-margin, the centre of leaf dark green, throwing up a profusion of good trusses of nice shaped pure white flowers, with bright pink eye or centre; this is the finest in this direction yet seen.

Price 10s. 6d. each.

In June, 1876, when exhibited at the Royal Botanic Society's Gardens, Regent's Park, some Plants of the above two Pelargoniums were stolen from my van on its way home. Any one giving information that will lead to the conviction of the thief, shall receive a reward of £5.

NEW SILVER TRICOLOR PELARGONIUM OF THE SEASON 1877.

MRS. R. B. POSTANS.

Somewhat similar to Proteus and Lady Dorothy Neville in leaf making, but much more colour, of free growth, with splendid round leaves of good size. Models of perfection.

Price 15s. each.

"BRIDAL BOUQUET."

This is a charming variety, and described by the editor of the *Gardeners' Magazine* as a miniature bridal bouquet. The plant is of moderate growth, and resembles a common Zonal Pelargonium, with round leaves and branching habit, throwing up good trusses of magnificent flowers of pure white, each pip resembling a miniature bridal bouquet; the lower petals are of fine substance and form, quite round, while the centre is raised oval, the exact shape of a bridal bouquet. Single flowers of this beautiful variety, when a piece of Maidenhair Fern is placed behind it, makes a pretty buttonhole.

The *Gardeners' Magazine*, April 29, 1876, speaks as follows:—"Mr. R. B. Postans' collection of Seedling Pelargoniums, Hybrid Perpetual and Tea Roses, &c., have passed into the hands of Mr. Charles Burley, of the Paradise Nursery, Brentwood. We have before us a box of flowers of Mr. Postans' latest seedling zonals, and they are certainly remarkable for quality. We see amongst them huge single flowers of faultless form, and of the most glorious crimson and scarlet colours, and a double white which ought—as we judge it by trusses only—to sweep all other double whites out of the market. The name of this is Bridal Bouquet."

Plants in May, 1877.

"WHITE WONDERFUL."

Habit that of an ordinary Zonal Pelargonium, with medium-sized dark green foliage, with a pleasing dark zone; growth very compact, throwing up trusses of good sized double white flowers of rare substance and shape; each flower is remarkable for its peculiar form, and may fairly be said to be strictly novel inasmuch that it is a good shaped flower with five petals, then comes another layer of petals of not quite the same size, and then a few irregular centre petals; it is a pure white and a fine variety. Every one who has seen the plant in bloom has been delighted with it.

A truss was sent by Mr. C. Turner, who writes as follows:—"The Royal Nurseries, Slough, August 21, 1876.—Many thanks for truss of your double white Geranium White Wonderful, a very good one, for it is a wonderful good variety, the best I have seen by far. Will it be sent out next spring?"

Mr. H. S. Williams, of Victoria and Paradise Nurseries, Upper Holloway, writes, August 30, 1876:—"Your box containing flowers of Geranium to hand. It is the best thing in that way I have yet seen. White Wonderful."

Price 10s. 6d. each, in May.

"BELLE OF THE BALL."

This is a free flowering distinct variety, and remarkable for its great beauty. The habit is very compact, of the ordinary royal type, dark green foliage with good well defined dark zone, throwing up nice trusses of really good double flowers of pure white with bright pink centre; the single pips are famous for bouquets, the effect is charming. There is but little doubt that this variety is a step in the right direction.

In May, price 10s. 6d. each.

USUAL ALLOWANCE TO THE TRADE.

DESCRIPTIVE CATALOGUE FREE.

By Her Majesty's  Letters Patent

RENDEL'S PATENT SYSTEM OF GLAZING
 CONSERVATORIES, PLANT-HOUSES,
 Orchard-houses, Greenhouses, Rose Temples
 And other Horticultural Structures.

Under the Patronage of

- His Royal Highness the Prince of Wales
- His Royal Highness Prince Christian
- His Highness the Maharajah Duleep Singh
- His Majesty's Commissioners for Parks and Gardens.
- His Majesty's Government, Royal Arsenal, Woolwich, War Department
- Royal Engineers, Woolwich
- Metropolitan Board of Works
- Commissioners of Sewers
- Corporation of Birmingham
- His Grace the Duke of Rutland
- His Grace the Duke of Portland
- His Grace the Duke of Sutherland
- His Grace the Duke of Devonshire
- The Most Noble the Marquis of Exeter
- Most Noble the Marchioness of Anglesey
- The Right Hon. the Earl of Strathmore and Warrington
- Great Western Railway Company
- London and North-Western Railway Company
- Great Northern Railway Company
- South Devon Railway Company
- The Royal Aquarium and Winter Garden Society, Westminster
- The Royal Horticultural Society, South Kensington
- The Royal Gardens, Chelsea
- The Botanic Gardens, Chelsea
- Wolverhampton Slating Rink
- Leicester Furling Mill
- Royal Hotel, Blackfriars
- Chelsea Swimming Bath Company
- Blackpool Winter Gardens
- Rhyl Winter Gardens
- Birmingham Winter Gardens, Aston Park
- And One Thousand of the Leading County Families in the United Kingdom.

SPECIAL ADVANTAGES

Rendle's Patent System of Glazing.

This system is now being universally adopted by Her Majesty's Government, several of the leading Railway Companies, some of the principal Corporations, including the Metropolitan Board of Works, Commissioners of Sewers, and the New Winter Garden Companies throughout the country.

There will be an enormous saving in the Maintenance and Repairs of Roofs on this System—say from 50 to 90 per Cent.—and there is no reason why a roof should not be as perfect in 20 years as the first week, because all the perishable materials, such as wood, iron, or paint, are completely covered by the glass from the destructive influences of the weather.

Another grand recommendation is, that there is no breakage from contraction or expansion either from heat or cold, as the glass has full play in every direction. Tens of thousands of squares are broken from this cause every year. Nor is there any breakage from vibration of large Railway Roofs in heavy gales of wind, or from the passing of express or fast trains. Indeed, it is well known that a puttyed roof is never perfect in a station where express trains run through.

In adopting this System, all the exorbitant expenses of re-painting, re-puttying and re-glazing are completely done away with; and if it were now in use throughout several of the Great Railway Companies, such an enormous saving would be effected that it would have a considerable influence in supplying an addition to the yearly dividends.

Summary of Special Advantages.

- 1.—Saving of from 80 to 90 per Cent. in maintenance and repairs.
- 2.—No breakage from contraction or expansion, from heat or frost.
- 3.—No breakage from vibration caused by heavy winds or passing trains.
- 4.—Squares of glass can be instantly replaced.
- 5.—The construction is very strong and durable.
- 6.—The glass can be put on in one-fourth the time of the old plan.

For all the other advantages see Illustrated CATALOGUES and BOOKS OF DESIGN, which can be obtained from the Inventor and Patentee—

WILLIAM EDGE CUMBE RENDEL,
 3, WESTMINSTER CHAMBERS, VICTORIA ST.,
 LONDON, E.W.

 **SUTTON'S CHOICE FLOWER SEEDS,**
 FREE BY POST OR RAIL.

Sutton's Improved Miniature Aster.

A profuse flowering variety, of dwarf compact habit, remaining in bloom for a considerable period, hence it is invaluable for growing in pots for conservatory or drawing-room decoration. We have this season succeeded in sowing six distinct colours, which greatly increases the value of this beautiful Aster for bedding purposes.

Price per Packet, mixed, 2s. 6d.
 Six varieties, separate, 5s.

SUTTON'S COLLECTIONS OF CHOICE FLOWER SEEDS,

To produce a beautiful and continuous display during Summer and Autumn.

	Free by Post or Rail.	£	s.	d.
No. 1 Collection of Flower Seeds	2	2	0
No. 2 Collection Ditto	2	11	0
No. 3 Collection Ditto	1	1	0
No. 4 Collection Ditto	0	15	0
No. 5 Collection Ditto	0	10	6

Small and useful Collections can also be had, from 2s. 6d. to 7s. 6d., free by post.

Full particulars may be had, gratis and post-free, on application.

TO OBTAIN THE

Best Garden Lawns and Croquet Grounds
 SOW
SUTTON'S LAWN GRASS MIXTURE,

Which forms a close velvety turf in a very short time.

For making New Lawns or Croquet Grounds 3 bushels, or 60 lb., is required per acre, or a gallon to every six rods (or perches) of ground.

For improving those already in turf, 20 lb. should be sown per acre.

March, April, and May are the best months for sowing.

Price, 1s. 3d. per lb., 22s. 6d. per bushel, carriage free.

SATURDAY, APRIL 21, 1877.

THE AMERICAN FRUIT SUPPLY.

FOLLOWING rapidly the new project of supplying England with fresh American meat has come the extensive development this winter of the fruit trade with that country, specially in Apples. For the past twenty-five or thirty years American Apples have found their way to the English market, but only in comparatively small quantities. One difficulty was the ocean transportation. Fruit that would keep well in America for months, was found rapidly to deteriorate when barrelled and stowed away in the hold of a vessel, even during the short time occupied in making the passage. The only variety that for a long time was supposed to possess the necessary keeping quality, was the Newtown Pippin, but as this Apple was expensive, and some seasons poor in quality, the shipments were very limited. In 1866, however, experiments were made with Spitzenbergs, Baldwins, and Greenings, which proved successful, as the fruit arrived in good order. For six years shipments of these varieties were made, more or less financially successful.

In the fall of 1873 our Apple crop was almost a total failure, while that of the United States and Canada was unusually abundant, with consequently low prices. Shipments to this country proved very remunerative, and the quantity sent over that year was greater than the total shipments of the previous ten years. From that period, however, up till last autumn, the shipments of Apples from America have been light, as our orchards have yielded fairly. Last season our crop of Apples again failed, while that of the United States and Canada was enormous, and of excellent quality, excepting the Newtown Pippin. The American fruit trade has thus received a new impetus, and been placed this winter upon a more systematic and permanent basis than has hitherto governed it. A large New York produce house has taken up the shipment of fruit to this country. One of the firm has spent this winter in England attending to the reception and sale of Apples shipped from that port. The other member of it has attended to the selection of the fruit in America, its packing and shipment in proper condition. The results so far are stated to have been most successful, and what has hitherto been regarded as a hazardous series of ventures is now put on a firm and solid business footing.

From the middle of October until the end of March almost every steamer leaving New York for Liverpool or London has carried shipments, varying from 500 to 3000 barrels. In December alone no less than 90,000 barrels of Apples were landed at Liverpool. From this port Manchester, Birmingham, Hull, Bristol, and the metropolis have been supplied. The fruit has found much favour with consumers, and its abundance has kept down the prices to such a figure as to extend the demand largely.

During the cold weather but little difficulty is experienced in transporting the fruit. With the approach of warm weather, however, certain means must be employed to protect it during the sea voyage. Arrangements for this purpose have now been made, and the fruit for the future is to be conveyed as the fresh beef is—in compartments of steamers properly refri-

gerated. The first shipment in this manner was made from the *Algeria*, of the Cunard line, which brought over a fortnight ago 2300 barrels, and landed them at Liverpool in perfectly good order. Large shipments were made also to Glasgow and London. From Canada unusually large shipments were made, from Montreal, Quebec, and Portland, and the quality of the fruit was excellent. New England fruit found its outlet to us at Boston, and, although not so fine in quality as that from Canada or New York, has still been well received, and sold rapidly though at lower prices.

The greater portion of the Apples sent from New York come from the western portion of that State. On arrival each barrel is opened, inspected, branded, and shipped in most cases direct from the railway station.

The new refrigerating process which has facilitated the transportation of meat from America will operate in largely developing the shipment of not only Apples at all seasons across the Atlantic, but also of more delicate fruits, such as Peaches, early summer Apples, Pears, Grapes, and Cherries.

Those who have not visited America—in which term I include Canada and the United States—have but little conception of the fruit resources of the country, both in extent and quality. The area in orchards for various kinds of fruit was in 1875 no less than 1,500,000 acres; the shipment in Apples alone amounted in 1873 to 1,185,803 barrels, and about the same are retained for home consumption. From the few kinds of American Apples which have reached us, a very limited idea is formed of the varieties grown there; there are, however, over sixty fine varieties of Apples, ten or eleven varieties of the common Siberian Crab, and ten other descriptions of the same fruit. Of Pears there are no less than sixty-seven different kinds, and of Peaches quite a large number, ripening in succession from July till October. Many of the varieties of Apples exceed in fineness of quality anything we have ever seen here, but their tenderness has hitherto prevented their transportation. We may now, however, expect to receive them; and that American Peaches—now manageable as a perishable fruit by refrigeration—will be as well known in London as they are in New York in the month of August. *M.*

LOW NIGHT TEMPERATURES IN RELATION TO SLIGHT IN- EQUALITIES OF SURFACE.*

In a valuable paper on the Temperature and Humidity of the Air at Different Heights, recently published in the *Transactions of the Royal Society of Sciences at Upsal*, Dr. Hamberg gives an account of some interesting observations made by him with the view of defining with some exactness the influence of the inequalities of the earth's surface on the temperature of the air during night. The instruments of observation were a dry and a wet bulb thermometer, at a height of 3 inches above the surface, and a similar pair of thermometers at a height of 5 feet. The thermometers were fixed to little posts, and their bulbs were protected from direct radiation.

Over ground the surface of which is uneven and covered with grass the temperature close to the surface is generally higher over those portions which rise above the rest. Thus over even a small elevation of from 1 to 3 feet the temperature is frequently 2° or more higher than the general level of the plot of ground. On the other hand, a trench or depression 1 or 2 feet below the general level is often 2° or more colder than what is observed on the borders of the depression and over the general level. At the bottom of a ditch 5 to 8 feet deep, and with double the depth, the temperature fell on one occasion 10°·8 lower than that on the remaining side of the ditch.

Open drains for field irrigation always indicated, when covered with grass, 2° to 5°·4 greater cold than

the margins of the drains. But when the sides and bottom of the drains were composed of bare clay, the reverse held good.

A tree, a bush, a pond, or a stream, raised the temperature all round, or, to speak more correctly, arrested to a great extent the fall of the temperature. The temperature was sensibly higher over shrub than over long grass, in accordance with what Galisher sawed in various years ago; and it was sensibly higher over sand than over grass.

At the height of 5 feet the temperature also varied with the inequalities of the surface, but not nearly to the same extent as at 3 inches from the ground. On a meadow the temperature fell one night to 40°·5 and 48°·9 at the surface, and at a height of 5 feet respectively; on the summit of a hillock, 150 feet high, at the same heights, it fell to 50°·2 and 51°·3; whereas in a trench on the top of the hillock it fell to 45°·3 and 50°, and on another night to 39°·9 and 45°·5. On a steep but equal sloping side of a hillock 100 feet high, the differences between the temperature at the top and the temperature observed all down the sides almost to the foot were comparatively slight, being only from 2° to 3°·5. But at those places where it sloped less, the difference became greater; where it expanded out into a little plain, still greater; and where it formed a depression the greatest differences were noted, in some cases greater even than the differences between the very summit and base of the hillock. In all these cases, when long grass took the place of shorter grass, the temperature was observed to fall more rapidly. In

the streets of town the temperatures at 5 inches, 5 feet, and 200 feet, were at midnight 57°·2, 57°·4, and 57°·9; and at 0.30 A.M. 56°·8, 57°, and 57°·6 respectively.

The bearing of all this on horticulture is very evident. To secure the best protection for tender plants in spring when a night's frost may be productive of a ruinous loss, a gently sloping surface, if possible, be selected. But if there be no choice, and the plant-beds must be made on a level piece of ground, let the beds slope slightly from the centre line on both sides to the trenches which separate them. Let the trenches furthermore be kept open from grass, weeds, leaves, and other litter, which being bad conductors of heat, will only retain and store up the cold of radiation; and let care be taken that the earth of the trenches be not kept loose by raking, but be beaten or trodden into as firmly compacted a mass as possible, so that the heat of the soil may the more readily be conducted to the surface to counteract the cold rapidly increasing there through the effects of nocturnal radiation.

MARKET PLANTS.

THE *Dracena* is a favourite market plant, as it is so invaluable for decorative purposes, and can be used in many ways, being of a somewhat lasting character. Those who grow them for market propagate them with remarkable rapidity, and the work is commenced about the month of November by cutting up the stems of a plant into segments, each one having an eye. These are planted in cocoanut fibre on a strong bottom-heat, and they soon commence to grow. In this way cuttings are obtained much as one would get them in the case of Dahlias. When the cuttings are from 3 to 4 inches in length they are taken off, put singly in small pots in a brisk bottom-heat, and root in ten or twelve days. The *Dracena* is a rapid-growing plant when properly treated; an example of D. Shepherd, struck from a top cutting at Mr. H. B. Smith's, Faling Dean Nursery, in December, 1874, by the spring of 1876 had grown into a remarkable fine specimen 7 feet in height.

Dracenas are also propagated by leaf cuttings; that is, an eye is taken off with a leaf attaching to it, which is of great assistance in getting it to break into growth. The head of a good plant can be removed at an eye or two below the lower leaves, and will quickly make an independent plant, whilst its removal leaves the whole of the stem of the plant available for propagating purposes, by the process already explained.

The best *Dracenas* for market purposes are those with thickly striated foliage, such as Cooperi, terminalis, melina, Shepherdii, Hendersoni, amabilis, rubra, which is one of the best, and a few others. These retain their colour and brightness well when employed for furnishing, and are therefore liked in

the market. Dull-leaved *Dracenas* are rejected, and indeed are not grown. D. Shepherdii stands and lasts remarkably well. When sent to market in August and September the plants are in 48-pots, but from November till January and later they are sent in 32-pots. D. stricta, which is a very good and handsome variety, requires a 32-pot in order to grow into a good plant.

Curculigo recurvata is an acceptable market plant, and much liked for its bold recurved foliage, and for its lasting quality. It is propagated by offsets, which are thrown up from the roots and taken off when strong enough; and they strike in small pots plunged in bottom-heat, and make good plants in twelve months, being of rapid growth. The variegated form is almost too expensive at present to be used for market growth, and the suckers will only strike root in the spring.

Aspidistra lardia variegata is a good market plant, and valued for furnishing. It is increased by cutting up the roots at any time, but is best done in early spring. The plants in a cool house for a month or six weeks, but stands well. It is an excellent plant for a close confined room if the leaves are occasionally cleaned from the deposits of dust that are inseparable from an indoor position.

Crotons are good market plants, and especially C. variegatus, C. Weismanni, and C. undulatus. They are propagated by means of top and side cuttings taken in early spring, put in pots and plunged in cocoanut fibre, and when rooted treated similarly to the *Dracenas* already described.

Among market Palms, *Chama borbonica* holds a high place. The plants are raised from seed, sown in seed pans in January, or broadcast in a stove frame, in a strong bottom-heat, say of from 90° to 100°. In six weeks the seedlings appear above the soil, and in eighteen months they are fit to grow in 48 and 32 sized pots. The plants are grown on plunged in tan. After the fourth or fifth leaf the true character of the plant is taken on.

Eucharis amazonica is almost a perennial market plant, for it can be had in flower at any time by placing the plants in a cool house for a month or six weeks, and then starting them into growth in heat. The growers for market state it is a plant very impatient of being retopped; and it does not flower till well established in the pots in which it is growing. Liquid manure made from fresh cow-dung is applied to it when in a growing state.

Ferns are in large demand and include such valuable decorative forms as *Adiantum canescens*, *Ghiessbreghtii* (scutum), *formosum*, *macrophyllum*; *Pteris argyræa*, *serrulata*, &c.—about ten being the leading favourites. These are raised from seed in order to supply the quantity required. The seed is sown in pots under bell glasses, and as soon as the seedlings can be handled they are pricked off into pots and kept close under glass. It is the custom to mingle powdered brick with the soil, and also to place a little on the top to keep the soil open.

Ficus elastica is increased by means of cuttings made of the points of the shoots, and the soft stems. They strike best in leaf-mould and sand, in thumb-pots, in bottom-heat, and occupy from four to six weeks in striking root.

And *Strelitzia regina* struck from cuttings taken from the top, while the stalks are also cut up after the plants have broken into growth in heat. When the plants have been sufficiently hardened off they are planted out of-doors during the summer, where they become established, and are again potted in autumn. In this manner good dwarf stocky plants are obtained.

The foregoing are but a few leading subjects, but were statistics collected of the numbers annually taken into the London market, their magnitude would astonish many. The one aim of the cultivator of market plants is to grow on his plants into size as rapidly as possible, at a minimum cost of time and labour. Some of the most laborious work done in the nursery trade is that performed in these plant-growing establishments, and at the height of the season, when propagation is carried on at high pressure, and with a wonderful rapidity, an unceasing attention is requisite. A successful propagator is a man of great ability. He has little chance of being heard of out of his own immediate sphere, but his practical genius is one of no common order; and young men desirous of improving their knowledge as plant cultivators could find no better school for doing this, than in one of the nurseries where plants are so largely grown for market purposes. R. D.

* Abstract of a paper read by Mr. Buchan, Sec. Scottish Society, Edinburgh, at the April meeting of the Botanical Society, Edinburgh.

DASYLIRION LONGIFOLIUM.

We are indebted to M. Jean Verschaffel, Ghent, for forwarding to us the following particulars relating to the flowering of this plant at Hyères (as it is believed for the first time in Europe), under the care of M. Geoffroy Saint Hilaire, the Director of the Jardin d'Acclimatation. M. Geoffroy Saint Hilaire sowed seeds of the plant in 1868, which he had received from MM. Haage & Schmidt, of Erfurt. The following year three of the seedlings were planted out in the open border, where they grew vigorously. The winter of 1870-71 was exceptionally severe, but did them no injury, though the thermometer was for several days 6° below freezing-point of Centigrade.

mixed in with the male flowers. No seeds were, however, produced; the inflorescence gradually dried up, but fortunately the plant itself did not die, but produced a number of sets from the axils of the upper leaves. Our drawing (fig. 73) is from a photograph. In addition to this *Dasylium*, *Yucca filifera* and *Livistona sinensis* (syn. *Lantana horbolicna*), also produced flowers last autumn at Hyères.

SOLOMON'S SEAL.

BEAUTIFUL as this grand old plant is in beds or borders, it is never seen in anything like the state of perfection, or appears half so lovely, as when taken

the purpose. Grown as a border plant, half its beauty is lost, but place it on a stage or shelf in the greenhouse or any other elevated position and then it is singularly attractive and commands admiration.

As a pot plant for window recesses in rooms it is simply perfection, and being so cheap and so readily forced or brought into bloom, it may be enjoyed by every one who has the convenience of a common hot-bed frame to bring it on; or, failing this, an ordinary sitting-room window will do, only in that case it requires a little more time to get it into bloom. For any of the above purposes it should be potted up at once, in doing which it is important to select good strong fleshy roots with plump fat crowns, as it is only such that produce strong shoots and flower in the free manner desirable—although, as before observed, the plants are valuable without those highly ornamental appendages. As the roots have elaborated in themselves all or most of what is essential for their growth and blooming, there will be no necessity to give them much pot-room, as a very little soil will suffice, and they may therefore be put into 6 or 7-inch sizes, which will hold quite sufficient for their support, and be more handy and quite large enough for room decoration. Light rich sandy loam suits them best, and the number of pieces of root for each pot may vary from three to six, according to the kind of specimen desired; each, however, should not be less than from 4 to 5 inches long, terminated by a good plump crown, from whence the young shoots arise. If wanted to flower early plunge the pots in any hot-bed at work, where they can enjoy a bottom-heat ranging anywhere between 65° and 75°, or stand them in any stove or forcing-house, in either of which places they will come on rapidly and assume those delicate tints of green that render them so exceedingly attractive at this season. As soon as they get sufficiently high and begin to show bloom they may be removed to the greenhouse or sitting-room window, where they will be found to last a long time in perfection.

Solomon's Seal is a plant that admits of ready increase by division of the root; and in order to get these strong and fit for forcing they should be dug up and separated at least once in every two years, which may be done any time during the winter or spring before they commence to make their growth. A deep loose sandy soil suits them best, as they can run freely in it, but it should be made rich and light by working in plenty of vegetable mould, such as leaf-soil or any mild rotten manure. In borders they rarely get fair treatment, as they are generally left pretty much to themselves, when they soon become overcrowded and starved from the rapidity with which they multiply their roots and stems, and exhaust the soil within their reach. It is from this cause that a frequent division of their roots becomes desirable, indeed absolutely necessary, if grown for the purpose of forcing for greenhouse or room decoration, as without it they would not be sufficiently strong to produce satisfactory results.

From its naturally vigorous habit it is a plant that adapts itself to almost any position, and appears to succeed equally well in either sunshine or shade, as we have immense tufts of it growing in moist sand, where they never get a particle of sun, and although this is the case, they are equal to any in the most favoured situations. It is, therefore, well adapted for growing near the margins of woodland walks, in the hardy fernery or wild garden, in either of which positions it forms one of the most interesting and effective plants it is possible to have, as it associates well with all the surroundings. S. W.

GREEN MAIZE, OR GREEN CORN.

To an American who has for many years kept the run of all that has been published in English horticultural journals on Maize as a table vegetable, it is very gratifying to see at last an article which shows that the writer has some knowledge of his subject. I refer to the communication by "T. S.," in the *Gardener's Chronicle* for November 12 last, who shows, what I have frequently insisted upon, that there is no good reason why Maize, at least in proper condition for the table, should not be raised in many parts of England. Some ten years or more ago, seeing from the articles published in his journal, that one of the English horticultural editors was quite on the wrong track in his experiments with Maize, using varieties from the Southern States, which would be altogether too late,

FIG. 73.—DASYLIRION LONGIFOLIUM.

Fears were entertained that the plants might rot, but they did not suffer in any way. In the middle of April, 1876, they had attained a height of 90 centimetres (about 3 feet), measuring from the ground to the point where their long recurved leaves fall over the plant. From the centre of two of the plants pushed a thick shoot like a great Asparagus, 10 cent. in diameter, covered with rose-coloured bracts, which dried up as the inflorescence grew. This latter formed ultimately a large panicle with numerous but short and dense branches, 1 m. 25 cent. high, and covered with myriads of flower-buds which speedily opened. Flowers were sent to M. Naudin for examination, which proved to be male flowers with a rudimentary pistil. M. Naudin considered it might be a *Liliasceae*, or an exceptional form of *Juncaceae*; MM. Tulane arrived at the same conclusion. M. Germain de Saint Pierre, who also examined the flowers, referred it to the same group. He found a few fertile or bisexual flowers

up and forced, as then its delicately tinted pale green foliage is always charmingly fresh, and a real treat to behold. Even without its unique silver bell-shaped flowers that all strong shoots produce in such profusion quite to their summit, it would be a most desirable plant to cultivate, affording, as it does, one of the choicest bits of greenery it is possible to have, to dress in with hardy Ghent Azaleas, Lilacs, and many other forced flowers that have no foliage of their own to adorn them, and set them off to advantage. There is no question that the leaves of any plant, of whatever kind it may be, always associate better than any others with the bloom they produce, but when these cannot be had it is necessary to substitute some other, and no better or anything half so lasting and satisfactory can be had as the well-known *Convallaria Polygonatum*, the growth and gracefully pendent habit of which is all that can be desired for

and moreover, of varieties so inferior for the table that they are never used by those who know better, I took the pains to set him right. I procured seeds of several of the most esteemed varieties, and sent them to him with such suggestions as to their culture as seemed proper. While I know that the seeds reached their destination, I have not yet heard that they were tried, or, if so, with what result.

In the first place, a word about the nomenclature of the plant. The term *Maize* is not in common use in this country, it being called "corn" or "Indian Corn." The table varieties, for the reason to be given presently, are called "sweet corn;" it is always in the unripe condition when used as a vegetable, and is known as "green corn" or "corn on the cob" until the kernels are plucked and greengrocers' shops, and inquire for our markets, he would be told that there was no such article to be had. The stem or culm of the plant is the stalk, the panicle of staminate flowers which appears at the summit is the tassel, the collection of pistillate flowers (and grain) on a dense spike is the ear, the leaf involucre, which surrounds the ear, is called the husk, or in some parts of the country, shuck; the long thread-like pistils are, collectively, known as the silk; the grain, that is, the green part of the kernel, the pericarp is the "hull;" and the floral envelopes, which are very small and abortive, the "chaff." The receptacle or rachis upon which the kernels are crowded is the "cob." It is rather amusing to see your correspondent direct that the "cobs" must be boiled until tender. So much for names.

The ordinary field varieties of Indian Corn have, when ripe, a hard, smooth grain, presenting a great variety in size, shape, and colour, the grain within being either mealy or starchy. These varieties are almost innumerable, and show the wonderful plasticity, so to speak, of the plant, which has adapted itself to every climate, from that of Hudson's Bay to that of the Gulf of Mexico. These field varieties are not used in the Northern States for the table, nor are they elsewhere if better sorts are known. Under the name of "sweet corn" we have a set of varieties that are as different from field corn as the wrinkled or marrow Peas are different from the round Peas, and the difference is of a similar character. In sweet corn we have greater firmness and a finer flour, and a much larger amount of sugar; the kernel in these varieties never fills out in ripening, but is always shrivelled and irregular, as are the marrow Peas.

The varieties of sweet corn are numerous, the catalogues of our seedsmen offering from ten to fifteen, and rarely a year passes but some new kind is offered. The varieties differ greatly in earliness, height of stalk, size of ear and of kernel, as well as in the number of rows (of kernels) to the ear, and there is a marked difference in sweetness and table qualities generally. The earlier varieties are smaller in all respects, and generally less sweet than the later.

Besides the named varieties, there are many local ones not known in the seed trade. Those who grow corn for the markets of New York and other cities have their own particular varieties, or rather strains, which they have established by careful selection; earliness and a good-sized and well-shaped ear are the main points with them, and it is only in the later varieties that we find that delicious sweetness and flavour so much prized by connoisseurs. It may be remarked that, in the green Peas, green corn rapidly deteriorates in quality after it is plucked, and those who depend upon the markets for their supplies do not know the possible excellence of either.

Among the early varieties of the catalogues, Early Narragansett and Early Minnesota are the best very early sorts; Crosby's New Sweet comes next. For the general crop I know none superior to Triumph, though Asylum and Moore's Concord are both good. Perhaps the very sweetest and best of all is the Mexican, but it is unfortunately black, or rather dark purple, and does not look tempting upon the table, though it is less popular than its mealy "desire." Stone's Evergreen is an excellent late variety.

Indian Corn is decidedly a hot-weather plant; with us, near New York, the middle of May is the usual time for sowing, though I usually put in a row or two soon after Peas are sown, and let it take the chances; if it happens to be an unusually warm spring, a gain is made of a week or more; if not, there is only the loss of the seed. It should have the warmest and richest soil, and being a rank feeder, may have any quantity of manure. It is sometimes sown in hills,

but I always sow in rows, 3 to 4 feet apart, according to the variety. A furrow is first ploughed, a garden spade, a good supply of fine manure is put into the furrow, earth is drawn over this, and the seed is dropped at about 6 or 8 inches apart, and covered with the hoe, patting the earth down firmly over the seed with the flat of the hoe. Though a very robust plant when well established, Indian Corn is delicate when young, and the crop must be thoroughly worked from the first appearance of the plants until it gets large enough to shade the ground. A horse-cultivator is run between the rows, and the work finished with the hand-hoe. The old plan of earthing-up is now abandoned by good cultivators, and flat culture generally practiced. When a few inches high the superficial plants are cut out, leaving those which remain a foot apart.

Green corn is seldom grown in our market gardens proper, it being regarded as a farm rather than as a garden crop. Farmers who live within easy reach of a market find it an excellent cleansing crop; the thorough cultivation, as well as high manuring it requires, puts the land in fine condition for any other crop; the fodder, after the ears are marketed, is of sufficient value to pay all the expenses of cultivation.

As to the proper time for plucking the ears, your correspondent "T. S. J." gives excellent directions. The grain should be "in the milk," not too small nor too ripe; and soon becomes able to judge of the proper condition by feeling of the ear through the husks. As soon as the ears are plucked the stalks should be cut off by the ground, and after wilting a few hours they may be given to milk cows, for which they are the best possible green food, or they may be cured for winter use. They require some care in curing, for if in too large masses they fermented, it is difficult to get them against a fence or other support, so that the air can circulate through them. When cured they should be stored under cover. Cut into small bits with a fodder-cutter, wet, and allowed to stand a few hours, and then sprinkled with Indian Corn meal, they form most excellent winter fodder for cows.

As to cooking for the table your correspondent's directions to boil for half an hour are proper, though twenty minutes is usually long enough. He is mistaken in the idea that boiling makes the corn tender; it coagulates the contents of the kernel, with excessive cooking will only lengthen it. The general way of serving is *à la mode*. The husks being stripped off, and all remaining silk removed, the ears are boiled for twenty minutes, and served hot. There is but one way to thoroughly enjoy sweet corn, and that is to eat it from the cob. The over-gentle have the kernels cut from the cob, but this, to a real lover of sweet corn, is to spoil it. Butter and salt being first mixed upon the plate—some add pepper—a portion of the ear is dressed with the salt and butter, by the use of the knife, and the kernels thus buttered are—well, not to put too fine a point upon it—grazed off. To be sure a fine young lady does not appear at her best when she thus plays the part of a rodent, but whoever has once tasted sweet corn at its best will forgive appearances, knowing the inward satisfaction that accompanies them. The silversmiths make "green corn-holders." A handle is furnished with prongs which are thrust into each end of the ear, and allow it to be held without touching the corn with the fingers. This is a superfluous refinement, adopted by but very few. Those who have imperfect teeth usually slit the kernels by drawing sharp knife-lengthways of the rows; this cuts through the rather tough hull, and allows the contents to slip out readily. Some boil the corn and cut it from the cob, which is readily done with a sharp knife, cutting down from one end of the ear to the other, taking two or three rows of the kernels at a time. The kernels thus cut off are seasoned with salt, butter, and milk, or cream, and served like peas. A more delicate way is to slit the kernels by running a sharp knife lengthways of the rows, and then scraping out the contents with the back of the knife. Our furnishing stores sell "corn cutters," which slit the kernels and press out the contents at one operation, and do it very rapidly.

During the season we endeavour to have sweet corn—no matter what else there may be—at dinner every day. Last season, on account of the unprecedented drought, some of our crops failed, and there were wide gaps in the supply. It is our custom to cook more than will be disposed of at dinner, to have a supply for breakfast. What is left from the dinner is cut by means of the "corn cutter" above referred to,

and either dressed like Peas, or, what is greatly to be preferred, made into fritters.

Corn Fritters.—To two coffee-cupfuls of corn, removed from the cob to above directed, add three well-beaten eggs, one small cupful of flour, and stir well together; add cream or milk to thin it, so that it will readily drop from the spoon, and fry, as for other fritters. These are sometimes called "corn oysters," but they are good enough to stand on their own merits.

Your correspondent, "T. S. J.," seems to appreciate the whole subject much better than any of his countrymen who have written upon green corn, even if he does call it "green Maize;" and if you will give me his address I shall take much pleasure in sending him seeds of our choicest varieties. If, as I suspect, he has only experimented with field corn, and likes that (as many do who know nothing better), I should like to be by, and see his first essay with one of our choice varieties—the "Triumph," for instance. If large tears of gratitude do not roll down his cheeks I am mistaken in the man.

Some Europeans do not at first take kindly to green corn. When I meet one, and with an indication as to how far he has become Americanised, I ask, "Do you like green corn?" If the answer is in the affirmative, I am sure that he will remain in the country. Our great abundance of Tomatoes, our Water-Melons, our huge Blackberries, and other peculiar American products, Europeans seem to accept much sooner than they do green corn. Some five years ago a story went the rounds of the papers, which showed Pat's view of this favourite vegetable. At our hotels green corn is set before each person as a matter of course: a newly arrived Irishman, seeing that others partook of it, gnawed away at his corn with much satisfaction. A Continental culture, looking but bare "cobs" left, he called to the attendant—"Waither, an' will ye be affier putting some more peps on these shiblicks!" G. T., Bergen Co., N. J.

AGRICULTURE AND GARDENING IN COSTA RICA.

(Continued from p. 490.)

TOBACCO being a Government monopoly is very little grown, but what there is of fine, strong, aromatic quality. Unfortunately, much of the aroma is lost in the bad method employed in curing the leaves. The climate of the higher plains is too cold and damp for the successful cultivation of Cotton and Indigo. Colonial culture has never been so successful, but formerly Wheat and Barley were grown on a small scale. Now the meal can be procured from California and Chili at a cheaper rate than it can be produced in the country itself. If the restrictions on Tobacco growing were removed, there is no doubt that Tobacco would soon become a valuable article of export to the European markets.

Maize yields in the warmer parts of the country two crops of grain, besides a crop of green fodder, in the same year. In the elevated plains, however, the growers are satisfied with one harvest in the year, but they select the less fertile soil for the Maize plantations. The shoots are valuable food for cattle, especially in the dry season, though during this part of the year the draught oxen are chiefly fed upon Sugarcane. The cane attains a height of 10 to 13 feet in ten months, and is then cut before the inflorescence is developed and the root-stocks throw up fresh shoots. As the plantations are made at different seasons there is no regular harvest-time.

Respecting the plants cultivated in gardens, an enumeration of some of the more striking subjects in Mr. Carmigil's garden, which may be regarded as the best in the country, will give some idea of the capabilities of the soil and climate. The hedges are formed of Coffee bushes and tall Roses, and the flower-beds are edged with Box, or more commonly with *Pilea macrophylla*, an indigenous plant. Others, again, are bordered with the native *LOBELIA CLIFORTIANA* and *nicotiana*. *Londium particulifolium* is a charming plant on the margin of a small brook. The commoner weeds among the Cabages, Onions, and other vegetables are *Chenopodium amrosiodioides*, *Galinoga parviflora*, *Helosiodium leptophyllum*, *Lepidium virginicum*, *Verbena litorea*, *Browallia demissa*, *Leonorus sibiricus*, *Eriothora rosea*, *Jægeria hirta*, various species of *Paspalum*, *Panicum*, *Eragrostis*, &c. Some Apple trees were pointed out as great rarities in the country, where, in consequence of their getting no period of rest, they do

not flourish well and bear very little fruit. In fact, the only fruit tree grown with any degree of success, and in quantity, is the Peach, and this only in the more elevated parts on the declivities of the volcano of Irazu. Among other cultivated plants may be mentioned *Albizia leonensis*, *H. rosea-sinensis*, *Pavonia Tiphalea*, *Tagesa patula*, *Encalypta globulosa* (some fine old trees), *Bixa orellana*, *Punica Granatum* (always with single flowers), *Asparagus officinalis*, *Acnistus Plumerii* (forming part of the hedge surrounding the garden), *Bouvardia* spp., *Ocimum Basilicum*, *Origanum*, *Lycopersicum*, &c. Added to these the universally dispersed plants of cultivation, and one may form a picture of the variety and richness of the vegetation. The shrubby *Sida*, probably *S. acuta*, was the species of the fulgent group, with splendid large scarlet flowers, attracts our attention near the entrance, and presently we become aware of the almost stupefying odour of *Clerodendron fragrans*. The glorious *Geraneaceae* plant, *Kohleria tetragona*, afterwards found growing wild, was here seen for the first time. It has velvety leaves, and large red velvety flowers.

Among noteworthy trees in Mr. Carmichael's garden were various species of *Melaleuca*, and which were regarded as great curiosities, some *Conifers*, a species of *Thuja*, *Juniperus virginiana*, and a *Pinus* with the leaves in bundles of five. Small plants of the *Thuja* are exceedingly dear, as are also some other plants which are only grown under difficulties. In the beds were *Dahlia*s, *Asters*, *Zinnias*, species of *Rudbeckia*, *Gladioli*, *Amaryllides*, *Lilium*, numerous species of *Begonia*, *Tropaeolum*. In the vicinity and around the house were observed *Convolvulus*, *Fasson-flowers*, various fine *Aroids*, &c. Growing in pots were numerous indigenous *Orchids*, belonging principally to the genus *Epidendrum*, *Bromeliaceae*, &c.; but among the most favoured were numerous varieties of *Viola tricolor*. In conclusion Dr. Polakowski mentions that the *Coccos* of Costa Rica is of superior quality, equally as good, or perhaps even better, than the celebrated *Coccos* of Nicaragua; but scarcely sufficient for the wants of the country is grown. The formation of a *Coccos* plantation is expensive, as the trees do not yield a good crop before the seventh year.

OLD-FASHIONED PLANTS.

The rage for new plants does not abate, and we hope anything of transcendent merit will never cease to receive due recognition and appreciation, but in the rage for things that are new, in some at all events, it strikes me as possible that many old tried and trusted friends are forgotten. Well, we do not despise the lady or gentleman who makes a hobby of the *Auricula*, or the *Fansy*, or the *Picotee*; there must be an immensity of zeal and intensity of pleasure also devoted to the improvement, or even the desire to improve—for all do not succeed—the quality of those beautiful flowers.

I am not a florist in the enthusiastic sense of the word—I cannot afford to be, and even if I could my sympathies lie in another direction. But we live in an era in which there is a great need of old tried flowers. Those who at one time used to decorate their halls and staircases with foliage plants must now have flowering ones. I think there is a very agreeable change in our system of decoration throughout, I mean in the combination of flowering and foliage plants, and even the introduction of flowers themselves. The one is a relief to the other. If there is a regular demand for home decoration on an extensive scale, of course we must presume that there are facilities for growing plants in proportion to the demand for them, in which case the process is a simple one, and the line clear, always keep the home signal at "danger," and you are never caught napping.

We often hear how well public decorations are done and how effectively; such opinions may be readily endorsed, and why? Because there is a choice of material. If there is a chance call made on a private establishment, the means are not always at command to make an elaborate effect. The best artist in the world cannot put out more than a few plants. Much, however, may be done by growing what I would call "accommodating" plants, and not expensive ones either. I believe there is nothing so healthy and refreshing as a tour among your friends every three months or so; you always learn or unlearn something before you return, and probably make up your mind that after all you are a good bit behind in some things. When I make

a raid on one or two of my particular friends, I always get what would be called in racing phrasology the "tip," but in horticultural language, I must say a "winkle," about something. I must ask your readers not to expect that I have made any remarkable discovery, such as heat without cost, or any remark of that sort; I am merely about to reintroduce a few old friends which I have forgotten in a market-garden, but whose adaptability for fashionable decoration stands unrivalled. On visiting a neighbouring garden the other day I was shown into a house arranged tastefully with the following old plants, and an odd one or two more.

The centre of the middle stage was occupied with *Dendrobium* noble, some plants of which were over 4 feet through, and remarkable for their strength and freedom of flowering; in the old *Eranthemum pulchellum*, such plants as I never saw before—a perfect blaze of their lovely blue flowers, a colour not over plentiful at this time of year. The new *Poinsettia plenisima* was well done, but seems to lose the largest of its leaf-bracts before the centre is formed and appears to advantage; I have, however, great hopes of it turning out well. I think new plants bear an analogy to young gardeners, they have to overcome a good deal of opposition and prejudice, and are often content with the "tip" of the tongue. There were here huge masses of the old *Begonia manicata*, and another old variety, either *hydrocotylifolia* or *Paxtoni*; but both are grand winter-flowering plants, and their value for any purpose of decoration cannot be overrated. *Passacalceae*—the *Passacalcea* with its long racemes of scarlet pendent streamers, is worth growing for more than one purpose. It must be elevated on inverted pots to be seen at its best, and occupy points of vantage. In the same house were a *Convolvulus*, and a *Phalenopsis*, and seven nice samples of *Phalenopsis*, including the queen of *Orchids*, *Phalenopsis amabilis*, which was in its best dress, having a fine spike of flowers just on the turning point. I think it would be well to resuscitate the cultivation of many old plants, which I need not name. Every leaf or joint of these old *Begonias* can be made into plants in a few months where there is a little top and bottom-heat at command. Cuttings of other things mentioned, and many more not named, may be put in now, and grow on without interruption for the next three months, when they will make fine plants. They must then be gradually hardened off, and kept in cold pits or frames in the full blaze of the sun through the winter months. In the latter part of autumn, and when taken indoors again, they should occupy a house which can be kept at a temperature of 50°, and a rather dry atmosphere. A high moist atmosphere is sure to induce a growing rather than a flowering tendency, especially in such plants as *Libonia*, *Seriographis*, &c. *W. Hinds, Utterpool.*

NOTES ON OPEN-AIR VEGETATION AT EDINBURGH.*

The early part of the month of March was considered good for gardening operations, being in general dry and cool, but without much of the wind for which March is proverbial. Towards the end, however, rain fell in abundance, and scarcely ceased for five consecutive days, viz., from the 23d till the 28th. The month commenced with slight snow, and frost has been prevalent throughout. The temperature in general being rather below an average, vegetation has been kept much behind. The general weather we had during the early part of February brought forward vegetation very rapidly, and on March 31 it may be said to be nearly at a standstill. Many of the open-air plants reported to be in bloom during February have since fallen back, and although others have come into flower, few of them show that vigour which they generally do at this season. Hazels and Filberts were beautiful during the early part of February with their long, drooping yellow catkins, but became perfectly brown in consequence of the frost which prevailed in the latter part of the month of February and beginning of March. Similar injury was also observed in the drooping catkins of the *Garrya elliptica*, while the Alder, particularly the *Alnus cordilica*, which was richly covered during the month with its brownish yellow catkins, did not suffer, notwithstanding the frost they had been exposed to. Flowers of the early *Rhododendrons*, *R. dalmanicum*, *R. praecox*, *R. atrovirens*, and *R. dauricum*, were all injured, while the *Rhododendron*, *Noddingum*, and the other large *Rhododendron* hybrids have been very scarce this spring, the buds not having been properly matured during the long wet unseasonable autumn, and now it is rare to see flowers of the early varieties in the open air, kinds which are

generally very common at this season. *Thuja*s, *Biota*s, and other allied coniferous shrubs, are suffering much from a browning of their branches, similar to what took place during the month of April last year, and which resulted in the total destruction of some, and the disfigurement of others. In all these cases, where points of the branches had to be removed from injury (such as *Thuja aurea*, *Fortunei*, *uncinata*, *Knightii*, *orientalis*; also *Cupressus sempervirens* and *torulosa*), the new shoots produced during last summer on those left are again much disfigured. The leaves of many species of the genus *Pinus* have also become very brown, such as *Pinus patula*, *densiflora*, *contorta*, *Fremontiana*, *Bruita*, *maricata*, *subulata*, *Benthamiana*, as well as some specimens of *Larix*, and even the Scotch Fir. This mischief is evidently caused by the long moist autumn and winter, succeeded by a lengthened although not very severe frost, and afterwards followed by a few days of hot sun, upon unpeeped wood. Early fruit tree blooms on walls have also suffered from frost; owing, however, to the unusual number of buds produced a moderate quantity may yet be saved, although it is feared that the long summer wet autumn will be much against a proper setting of fruit, unless extra fine weather should prevail. Many of the early spring bulbs, particularly those growing in low situations, have been very deficient in bloom, the bulbs in such cases having rotted in the ground. It is difficult as yet to say what effect the late excessive damp will have on the roots of many herbageous plants other than bulbs, particularly those with somewhat fleshy roots; it will be possible to ascertain the extent of damage till the season is further advanced. Some important kinds have already suffered, the roots in many cases being infested with grub, wireworm, and other underground vermin.

The scarcity of vegetables for spring planting, such as early *Cabbages*, *Savoy*s, and *Greens*, is something quite unprecedented at Edinburgh, cartloads being usually seen in our markets at this time. The drought which immediately followed the sowing of the seed last year, prevented a healthy germination, and was afterwards followed by an unusual wet autumn, and at a moderate temperature. To this, and the changeable weather experienced during winter, may be attributed their scarcity. Fortunate holders are receiving high prices for them. The scarcity seems to be general throughout Scotland, as few yet arrive by railway.

Excess of moisture has also been much against the printed tallies, commonly used for naming the open-air plants in the garden; many of them have been rendered totally illegible—a circumstance which has not been observed to the same extent at any former period.

On the last day of February fifty species of plants were counted in flower on the rock garden, many of these have since suffered from frost. On March 31 seventy-five species and varieties were counted in bloom, the most conspicuous being *Andromeda floribunda*, *Bulboodium vernalis*, *Corydalis augustifolia*, *Diondia Epipactis*, *Draba aizoides* and *cuspidata*, *Epigaea repens*, *Erica carnea* and *E. carnea alba*, *E. hibernica* alba, and *E. h. nana*; *Erythronium Nuttallianum*, *Viola hutchinsonii*, *Viola filices*, *Heptacapsa andrea*, and other varieties of *Viola*, *Hydrilla*, *Erica reticulata*, *Merendera canescens*, *Omphalodes verna*, *Primula denticulata*, *marginalis*, *Palinuri*, *purpurea*, and *viscosa*; *Saxifraga crassifolia* ovata, *grandiflora* and *bryoides*; *Scilla biflora*, *alba* and *taurica*; *Sisyrinchium grandiflorum* album, also *Narcissus nanus* and *pumilus*.

Of the plants selected for annually recording their dates of blooming, the following is the third list of the series—

	1877.	1876.
<i>Scilla biflora taurica</i>	March 4	March 3
<i>Andromeda floribunda</i>	" 10	" 13
<i>Erica reticulata</i>	" 10	" 13
<i>Draba aizoides</i>	" 11	February 21
<i>Aubretia grandiflora</i>	" 12	February 17
<i>Narcissus pumilus</i>	" 14	March 13
<i>Andragopus vernalis</i>	" 17	" 18
<i>Viola hutchinsonii</i>	" 18	" 18
<i>Erythronium dens canis</i>	" 23	" 20
<i>Heptacapsa andrea</i>	" 23	" 20
<i>Ribes sanguineum</i>	" 25	" 30
<i>Oxolus vernalis</i>	" 27	" 23
<i>Sisyrinchium grandiflora</i>	" 27	" 23
<i>Corydalis toleda</i>	" 28	" 28

During March the thermometer was twenty times at or below the freezing point, indicating collectively

* Read by Mr. M'Nab at the April meeting of the Botanical Society of Edinburgh.

130°; while 98° were registered during the corresponding month last year—the lowest rankings being on the mornings of the 1st, 4th, 15th, 20th, 21st, and 22d, when 17°, 23°, 20°, 18°, 23°, and 24° were respectively indicated. The highest morning temperatures were on the 11th, 14th, 27th, 28th, 29th, and 31st, when 41°, 41°, 36°, 37°, 37°, and 42° were registered. Although 492° of frost had been recorded during the last five months, particularly in the neighbourhood of Edinburgh, it has never been at any one time of such intensity as to produce strong bearing ice.

SCONE PALACE.

EIGHT centuries ago, in the reign of King Constantine, Scone was a royal city, with a monastery, to which was conveyed from Iona a stone seat, for the coronation of the Scottish kings down to Alexander III., the last of an ancient race, and Robert Bruce, the founder of a new dynasty. In 1359 the venerable building, whose relics, with here and there a stone coffin, are now ornamental objects in the Palace gardens, became a blackened ruin, and in the following century the famous Abbey (founded early in succession to the monastery) became a temporal lordship, granted by James VI. to Sir David Murray, afterwards Viscount Stormont, the ancestor of the Earl of Mansfield, the great Chief Justice, and of the present Earl of Mansfield, the present Lord of the Crown. Even in Scotland there are few sites with a richer substratum of historic interests than Scone. The ancient buildings are all gone, the Palace is of the present century, the coronation chair is in Westminster Abbey, and Boot Hill, where the Scottish chiefs paid homage, each standing on his own ground, which he brought with him stuffed in enormous boats—all is gone or greatly altered, but, *manus etiam*! as in the case of the fairies, the perfume of these things remains.

The site of Scone was well selected on the rich alluvial banks of the River Tay, 2 miles from Perth. It is a rather light and most productive soil, with a moist subsoil. After crossing Perth Bridge by the North Inch, you turn up the left bank of the stream, and presently reach the park, with its timber and Highland cattle by the road-side. A mile further on you pass the Cow Park, and a notable row of black Italian Poplars along the margin of a rivulet. The most curious had a diameter at the base of 11 feet 9 inches at a foot from the ground, that of the largest one could hardly have exceeded 73 inches, which is exactly the circumference of an innkeeper of unusual size who has allowed me to measure and report him—his weight being 23 stone 10 lb. The Poplars will grow bigger yet. There is a wood on the right here, and on the left a glimpse of extensive gardening, hedges without and walls within, and masses of such trees as spring on good ground round a lordly residence. Two or three small substantial houses on the right are rendered attractive by gardens and creepers. The Tropæolum specimen—a lovely, but, I fear, a local trader—drew me to the pretty cottage of the clerk of the works, where a lad—a schoolboy at the "fair city" of Perth—answered my knock, and conveyed me to the house I sought. It does not satisfy a schoolboy of the Highlands, or his mother, to direct and show a visitor the road by pointing and explaining; he takes him to the spot. And there I found Mr. Halliday, who was portrayed in your columns in 1875, and 1876. Mr. Halliday occupies a fit dwelling for a gardener of distinction—a house bordered in Box shrubs, clipped Yews, and Portugal Laurels with ripe berries.

We plunged at once into the midst of groves and gardens, which held us till dark, when we passed near the Palace, and close to a tree planted by Mary Stuart, and arrived at Boot Hill, but could see nothing. A little further on Mr. Halliday rapped something with his stick; it was a stone coffin, invisible, and, I believe, empty. "Here," said Mr. Halliday, at another spot, "is the original gateway to the Abbey;" and he rapped the said gateway, which gave out a sound like Ivy, and some drops were showered about, but we could see nothing. Within the gateway the Palace windows shone across a wide open space, where the Abbey stood. Outside the gateway is an interesting object, which Mr. Halliday rapped. It was the market cross of the village of Scone, which now stands at a distance, and was once clustered here close to the Abbey walls. And here, in the midst of the groves and shrubberies, there is

still a parish graveyard and a right of way thereto. Mr. Halliday with a stick—or it might have been a weeding-hoe—pointed out all these things with his usual vigour that damp, dark night, and I heard his rap, the right of way. We then arranged for my return by daylight, and by daylight we visited the Pinetum, where hundreds of stately specimens of conifers stand on a lawn, forming a terrific acromy for the eye, and I am compelled all that kind of tree to teach in regard to structure, growth, size, and beauty.

There are several remarkable trees here and elsewhere in the grounds, to be noticed hereafter. The Pinetum is entirely enclosed by the kitchen garden wall and by shrubberies. We passed round it to reach an avenue of Sycamores, 300 years old at least, extending each side of the path, called Chantry Gate, which brought us into a spacious flower garden decked with numerous permanent shrubs besides the more ephemeral plants. The west part of the 15 acres of the old Abbey grounds, and it brought us to the Palace slopes or lawn before the windows. When a house stands on ground well elevated above the general level of the park it is sometimes fortified by a wall and terrace, the terrace being narrow and the wall a break-neck affair—or the park may be reached by one uniform slope, or by several. The latter plan is adopted here, and a low wall, handsomely built and ornamented with Ivy and other creepers, divides the park from the open space. The trees in the lawn are, several specimens there, including the Mary Stuart Sycamore, of 13 feet girth at 5 feet. This is on the south-west of the quadrangular Palace, which covers an acre of ground, and facing the park and the Tay. On the opposite side of the building are the principal entrance, the old Abbey gateway, and the avenue of Limes beyond. Round about Scone Palace is a favourable field for either gossip or dignified narration, but it may concern the reader more to know that 10 yards, from row to row, is the distance of the Limes apart, and that the trees are now ten years old, and will interlace and form an arch in ten years, when they will have been sixty years planted. They are now 56 feet high, and 6 feet 7 inches in girth at 5 feet. Thirty years ago they were moved further apart, which may have checked their growth.

There is a Lime tree rather older than the above in the park, south-east of the Palace, 8 feet 6 inches at 5 feet, and 76 feet high. It was planted by the present Earl of Mansfield, and contains a great deal of foliage and a great deal of timber. The tree is a pyramidal one, in the case of some others of this species, but columnar, with a conical top. A still more remarkable tree for the amount of timber produced in a single lifetime, is an Oak of sixty-eight years old, growing in the pleasure grounds. It is 70 feet high, 7 feet 11 inches at 5 feet, and 6 feet 4 inches at 3 feet, and 5 feet at 36 feet. The cubical contents are 120 feet. The grandeur and growth of this young Oak, its exquisite proportions, its expressive trunk, and the abounding life and power of quick expansion which seems to breathe in every branch and twig, are surprising. I have not seen another younger of sixty-eight so big and so full of promise wearing such a marked expression of present and continued growth. What may it not arrive at 500 years hence! Kip Van Winkle was a melancholy man, waking up to find his gun-barrel rusted and his friends gone; and I never envied him his resuscitation until I saw this hopeful Oak, which must be feeding, one would think, on land manured by the mouldering dust of several woods. Of the million Oaks planted by the Earl of Mansfield between 1804-14 this one excels the rest in beauty and in the quantity of timber it has packed beneath its bark in a given period.

In a letter from Mr. Halliday on the subject of the trees of Scone, he mentions that a writer has lately fixed upon a neighbouring and inferior Oak, the same age as the above, in proof of the advantages of pruning. A not uncommon blindness of the eye, Mr. Halliday thinks, prevented his observing that the unpruned tree had done better than the one which had been treated according to the method he recommended.

Next, in point of interest, to this noble native, is the tree which is the special pride and ornament of Scone, as the introduction of Mr. Douglas, who served his apprenticeship in these gardens.

Mr. Halliday informs me that the two specimens of Abies Douglasii of the first importation (1826-7) measured respectively in September, 1844, 31½ feet and 28 feet in height, and 40 inches and 31 inches in

circumference of the stem at the ground. In 1876 the best of these trees measured 9 feet 5 inches at 5 feet, and contains 138 cubic feet of timber, the bole measuring timber up to 7½ feet. The girth of its trunk at 2 feet is 10 feet 21 inches, and at 3 feet 9 feet 61 inches. This timber-producing tree has yielded very little seed; the other tree, the larger of the two, 1844, but not so small, has borne much seed, and its growth has been checked by its fertility. The first cones of this parent tree of 1826-7 were gathered in 1844, but they yielded no seed. During the next eight years £500 were gathered from it in the shape of marketed seed. In 1853 this fruitful tree yielded 20,000 cones, which produced 12,000 stout healthy plants counted at eighteen months old. Twenty good seeds were found in each cone the following season, and this has been the average yield up to the present time. The cone of top from this tree was 16,000 in 1873; the last fruitful year, and has now reached a total yield of about 200,000, or 4,000,000 plants, each worth 1s. when planted out at three years old, and 20s. at twenty years old, when planted on good land. Even if we allow 25 per cent. for losses by accidents, there remains a large balance of wealth, to say nothing of beauty, created from one tree, and widely distributed by Lord Mansfield among his friends.

In the first search at Scone there is a memorial to Mr. Douglas, who lost his life, as my readers will remember, by falling into a trap set for savage animals in the Sandwich Islands. On Lord Mansfield's estate at Lynedoch, the same Mr. Luxurians on the same timber-producing soil. Close to the graves of Bessie Bell and Mary Grey there is a specimen 9 years 5 inches in circumference of the trunk at 5 feet from the ground; and on this interesting site there is a Silver Fir whose trunk measures, at 2 feet, at 3 feet, and at 6 feet from the ground, 14 feet 2 inches, 15 feet 10 inches, and contains, as measured by Mr. Halliday, 4931 cubic feet, including bark and top, which contain together 39 feet or 38 feet of bark, and about 1 foot of top above the point where the trunk diminishes to a girth of 24 inches.

The Pinetum at Scone Palace is a stately plantation of exotic trees, placed at regular and sufficient intervals for their full development. One of its most attractive specimens is the Deodar average, composed of trees 30 to 40 feet high. There are also specimens of Picea nobilis from the first importation of 1846. The one we measured has a trunk 7 feet in girth at 4 inches above the ground. The Picea Finnsapo is one of the ornaments here at 20 feet high. The Wellingtonia is in fruit. The Cryptomeria japonica misses here the western breeze which softens the climate of the west coast of Scotland, and is much cut up by the wind in spring. The only other tree which does not seem quite happy at Scone is the Siberian silver-striped Pinus Cembra, which has shed the leaf in some cases as if something were wrong at the roots. All the other trees are vigorous, including a row of stiff, sturdy Irish Yews, tied and trimmed a little at top so as to give them pointed, conical heads. The variegated Yew at twenty years is here pretty, but small compared with the above, the variegation being a sign of impaired vigour.

To add two more to the large list of trees which luxuriate here, there are two Ashes, 11 feet 9 inches, and 11 feet 8 inches, respectively, at 5 feet. Their height is 100 feet.

In the kitchen garden, the last of the Pines, Peaches, and Pears, drew attention on October 10. In a Peach-house, 182 feet long, the Salway Peach still hung in great numbers on most healthy and fruitful trees in pots, each with a movable zinc rim for holding earth, annually removed. Each tree is shifted once a year. There is a small plant outside, the Gentiana, which will not blossom or live everywhere, and is here every seven on a ribbon, blue, broad, and beautiful, and early 2120 feet long. We are all drawn towards things which are at once simple, clever, and useful, and I should certainly have wished to spend some hours in a very interesting turf house, 70 feet long, in which numberless plants are brought on, till they are brought out and promoted to the conservatory or elsewhere. The walls are 3 feet thick at bottom, and are lined outside with a mixture of gaster and coal-ashes. Inside they have been smoothed and washed, and they are always dry.

In the engraving (fig. 74) which accompanies this article the frontage of the wall, fencing the park from the lawn, shows the gain in height outside by the removal of earth. The apparent extent of the lawn is considerably less than its actual area. *H. Everett.*

Notices of Books.

The British Manufacturing Industries. Edited by G. Phillips Bevan, F.G.S., &c. London: Edward Stanford.

The last issued volume of this most useful series contains articles on salt preserved provisions, and bread, by J. J. Manley, M.A.; sugar refining, by C. Haughton Gill; butter and cheese, by Morgan Evans; and brewing and distilling, by T. Pooley, B.Sc. These articles are scarcely within our province for notice, except perhaps that on sugar refining; nevertheless, we are assured that the subject of the preservation of food as well as the manufacture of bread and biscuits are matters of such general interest and importance that the articles, which are written in a very attractive and instructive form, will

boiling and subsequent refining is, of course, treated of rather fully, this practical portion being illustrated by woodcuts. The statistics are of great interest, showing, as they do, the rapid rise in the production of sugar from the Beet. In 1857 the total produce from this plant was 650,000 tons, while in 1877 it rose to 1,110,000 tons, since which time it has still been increasing.

— Professor Lange, of Copenhagen, has just published, under the title of *Souvenirs de l'ancien Jardin Botanique*, an historical account of the Botanic Garden under his charge. The old garden, it appears, is about to be abandoned, in favour of a new one in a more open part of the city, and which will be more thoroughly representative of the present state of science. The Copenhagen garden dates from 1600, and among its Professors have been Fuiren,

provinces and sub-divisions of our Indian Empire, will be included, as well as those of all the more or less independent States embraced within the limits of our Indian dominion. The book will be divided for convenience into three volumes, which will be issued at intervals of about four months. Each volume will have, on an average, about fifty coloured plates, with their accompanying letterpress.

— The Calcutta Central Press Co. announce the publication of an illustrated book on *Birds' Nesting in India*: a Calendar for Egg-collectors, and a Popular Guide to the Habits and Breeding Seasons of Birds. By Captain G. F. L. Marshall, R.E.

— Messrs. Macmillan announce the publication in eighteen monthly parts of *The Forces of Nature*, a popular introduction to the study of physical phenomena, by Amédée Guillemin, translated from the

FIG. 74.—SCONE PALACE, PERTH, THE SEAT OF THE EARL OF MANSFIELD.

be read with satisfaction by all who purchase this little volume.

It is difficult, perhaps, to tell which is the most important to mankind generally—the production of salt or the production of sugar. The object of our journal, however, leads us to Mr. C. Haughton Gill's article, which we find opens with a very brief history of sugar from the "honey made by the hands of man" of Herodotus, to the discovery and manufacture of Beetroot sugar at the end of the last century, and the estimate of the annual production of sugar from this source at the present time, which amounts to more than 1,000,000 tons. The chemistry of sugar is next briefly treated of, and a description of the manufacture of cane and Beetroot sugars follow. In the first, the canes, after being cut, are passed through rollers, so that the juice is squeezed out. For Beetroot many methods have been adopted, the oldest and most general plan still in use being to rasp the root to a fine pulp, which is placed in woollen cloths and submitted to hydraulic pressure. The system of

Kylling, Oeder, the founder of the *Flora Danica*. In 1778 the site was changed to Charlottenborg, and associated with it were Rottböll, Holmskjöld, Hornemann, Schouw, Oersted, and Vahl, while among the gardeners Hollboell deserves special mention. Among the more remarkable trees in the garden is a tree of the \times *Syringa rothomagensis*, a hybrid between *persica* and *vulgaris*. It is divided at the base into several subdivisions, some of which are very thick. The height is 26 feet, with a diameter of head of 20 feet. It was planted in 1797, twenty years after the raising of the hybrid by Varin at Rouen.

— The *Game Birds of India*, by A. O. Hume and Captains C. H. T. and G. F. L. Marshall, is announced to be published in three volumes in the autumn. The size of the book will be royal 8vo (10½ inches \times 6½ inches), identical with *Stray Fashers* (vol. iii.) and *Shelley's Birds of Egypt*. The game birds of Ceylon, Burmah, and in fact of all the

French by Mrs. Lockyer, and edited, with additions and notes, by J. Norman Lockyer, F.R.S.

Quin (Macmillan & Co.).—The Agricultural Text-book, by Professor Wightton (Wm. Collins, Sons & Co.).—The Indian Forester.—The New Practical Window Gardener, by John R. Mollison (Groombridge & Sons).—Animal Products, by P. L. Symonds (Chapman & Hall).

Florists' Flowers.

THE AURICULAS at LOXFORD HALL.—A recent inspection of Mr. Francis Whitburn's fine collection has convinced us that one, at least, of the Southern growers is likely to hold his own at the great Auricula tournament at the Crystal Palace on Tuesday next, and that if he is much beaten, a rare treat is in store

for the visitors. The collection under Mr. Douglas's care has grown considerably in dimensions during the last few years, and now includes all the modern sorts, as well as the greater portion of the old favourites of the last generation of florists. Right well, too, does Mr. Douglas grow his plants, and though the season has been sadly against the Auricula, the Loxford Hall plants are in wonderful health and vigour, and throwing trusses of fine size and excellent character. It is a rare treat to see how even the "miffy growers" thrive under Mr. Douglas's care; and the comparatively easy manner in which he propagates the "shy" sorts is really a triumph of cultural skill. No oddling treatment does the Auricula receive here, and the result amply attests the soundness of their fare. A good sound loam, with about a fifth part of some sweet rotten manure, is the compost they are grown in, and through the summer months they are freely exposed to air and rain alike. The fancy composts of the older florists (the so many ounces of pigeon's manure, if you like) finds no place on Mr. Douglas's potting-bench; no double distilled essence of goose-gang gets into his water-pot; plain honest fare is what the plants like, and if Mr. Douglas does nothing more for florists' flowers than to expose the fancy compost fallacies, he will at least deserve the hearty thanks of every amateur for doing that.

Mr. Douglas is strong in all the "edges" as well as the selfs, and the breadth and liberality of his floral notions is well testified by his high regard for the show alpines. In the white-edged section of the good and Gay's Glory have fine forms for some weeks, and one somewhat regrets that his best truss was developed a week or two too soon for the Palace show. With a waxy paste, reddish plain body colour and pure white edge, it is a grand flower, and stands second only to Heap's well-named Smiling Beauty, the body colour of which is black, the paste dense, and the tube of beautiful form. It is in all respects a very refined flower, and throws a fine truss of pipes, numbering from a dozen upwards. Hopworth's Tumbler is the last of the white-edged section, with a body colour and dense white paste. A favourite with the Northern men is Summerscales' Catharina, and though small it is a very neat flower, but does not throw a large truss. Annie Smith (Smith) is the purest white of all, and a very pleasing variety, notwithstanding its fault—a somewhat angular past. Amongst the very best, too, in this section is Smith's Ne Plus Ultra, a pure white, with rich chocolate body colour, and rather pointed petals. McDonald's Miss Arkley, a reddish purple body colour, and the good and Gay's Lady Sale, also show up well—the latter especially having nice foliage, and throwing a fine large truss.

In grey edges, Heady's George Lightbody is generally considered the finest, and it is here in grand character. Sykes' Complete, a very old variety with a fine black body colour, is very correct in its markings, and still stands to the fore. Sophia Damaresque is not much known, but it is a grand flower, with a purplish plum-coloured ground, and pipes of fine size. Cunningham's Jon's Stratagem, is a new one, generally appreciated by the Northern men, but it is fine with Mr. Douglas. Lightbody's Robert Trill has a dense paste, bright gold tube, black body colour and fine grey edge, which, however, sometimes comes green. One of the strongest growers, and most handsomely mealed of plants is Turner's Colonel Champey's, the ground colour in which is violet. The points are generally correct, and it is a very showy variety, though our Northern friends do not much exhibit it. Heady's Alderman Charles Brown is of somewhat recent introduction, and an improved flower of the Ring-leader (Kenyon) and General Bolivar (Smith) type. The last named is a fine old variety, that cannot be dispensed with. A good and well-marked flower is Waterhouse's Conqueror of Europe, which has the distinction of producing the largest pipes in its class; and the only variety that matches well with it is Fletcher's Ne Plus Ultra. Other choice varieties in this class are Dickson's Duke of Cambridge, with its rich plum-coloured ground and fine edge, which sometimes comes almost green; Kent's Queen Victoria, a very neat flower, the body colour of which is black, and the tube and paste very regular; Reid's Dr. Horner, which has a black body colour, and has been shown as a white-edged variety, though it certainly belongs to the greys; and Grimes' Privateer, a good old sort, with a fine body colour and very narrow edge, like that of Campbell's Confidence,

which has a fine paste and very dark ground colour. Of new varieties Walker's Peverell of the Peak has fine qualities, and is very promising; and Kay's Alexander Meiklejohn is generally a very refined flower, though it does not throw a large truss and is rather a miffy grower.

The leading varieties in the green-edged section are Leigh's Colonel Taylor, Heady's Alderman Wishey, which has a bright yellow eye and good dark body colour, the single pipe the best of all, but the truss is not large—the best truss here numbers seven; and that may be considered fine; Cunningham's St. Augustine, a new Scotch variety, with a good golden eye, fine black body colour, and well defined dark green edge; Campbell's Admiral Napier, which would stand very high but for its angular paste; Ashton's Prince of Wales, of a pure grass-green, and dense paste; Trill's George Lightbody, a very good green, but deficient in body colour; Oliver's Lovely Ann, of which there are two varieties in cultivation, the best having a fine broad petals and bright green edge; Pollitt's Highland Laddie, and Booth's Freedom, which has an intense black body colour, and a very dark green edge.

Amongst the selfs we noted Puhman's Ellen Lancaster, a new variety, and one of the very best of the dark coloured ones, though not so round a flower as Kay's Topsy, which is a great favourite, and has finely mealed foliage; Campbell's Pizzaro, dark maroon, and one of the best of the Falkirk growers (and one that has raised many good ones but with little regard for convenience of growing so). Amongst the violets nothing can compare with Turner's Charles J. Perry (a worthy memorial of a most worthy man); the colour is rich to a fault, but the tube is not so bright as it might be; however, let that pass: the pipe are of grand size, and it is a free grower. Lightbody's Meteor Flag has finely mealed foliage, but it is not so bright a shade as the last-named, and has a defect in its thin watery paste. Spalding's Metropolitan, too, is not so pure in colour as C. J. Perry, and its flowers are rather thin. Spalding's Royal-poll's tube is the finest in this collection, and a fine flower it is. Sim's Vulcan has black flowers, which form a beautiful contrast with its handsome mealed foliage; Spalding's Blackbird stands well amongst the dark ones; and Sim's Eliza, a reddish maroon, is of fine size, and a showy flower; Lightbody's Lord Clyde, dark maroon, is also fine; and Netherwood's Othello has very dark rose-leaved petals and a fine gold tube.

For the alpines we have left but little space, but we must first of all mention a most interesting one, Mr. Douglas's in Diadem, a beautifully shaded crimson-velvet flower, of fine size and form. Turner's Beatrice, and the same raiser's Bronze Queen, are also flowers of merit, the latter being a prettily shaded flower; and the first-named a bright shaded purple, with very large pipes, which we measured, and found to be 2 inches across. W.

THE NATIONAL CARNATION AND PICOTEÉ SOCIETY'S SOUTH'S SHOW.—You will greatly oblige by permitting me to inform your readers that this show will be held in the Royal Aquarium, Westminster, in conjunction with a display of cut Roses, for which the Aquarium Company offer £55 in prizes, on the 25th of this month, Thursday, July 18th to 20th.

Schedules of these prizes, and those for the Carnations and Picoteés, are in the press; and by the time this notice meets your readers' eyes I shall be ready, and shall most gladly forward them to all persons interested.

The promoters of the Carnation and Picoteé show accept this proposition of the Aquarium Company in the belief that the display of Roses would give an additional attraction to the show of Carnations and Picoteés, and they therefore offer a large sum to those friends who so readily and generously responded to their appeal for the means of offering suitable and adequate prizes.

That response disposed, I presume to believe, of the perverse and absurd statement that "florists' flowers were hopelessly at a discount in the South;" but I shall not think the reputation perfect and complete until the Carnation and Picoteé growers of the South, aided as they may be, and as an assurance of the same, by their brethren in the North, who have convenience for hastening the bloom, have provided a display of these lovely flowers such as Mr. Dombrain never before looked upon, and such as shall elicit universal admiration. I invoke the aid of my fellow florists in this way, and if we succeed, I am sure we shall, I shall be repaid tenfold for the pleasant labour it has entailed upon me. E. S. Donnell, 11, Chatham Terrace, Larkhall Rise, Clapham, S. W.

Natural History.

BIRDS AND FLOWERS.—PIMROSES and Cowslips (especially the latter), where they grow in small quantities on garden banks and like spots, are sadly pecked about by the birds this year. They eat part of the petals off in some instances (pick them like a caged bird does any green plant within its reach), and destroy numberless blossoms in this way. The present winter having been so very mild, no lack of vegetation was so to harden the soil, and a fair proportion of winter berries, one can but feel surprised that the birds should attack spring flowers so vigorously. *Helen E. Watney.*

THE HAWFINCH.—In your notice last week of Shobdon Court, the seat of Lord Bateman, you allude to the hawfinch being a rare bird in the locality, only occasionally visiting this island. In Middlesex and Hertfordshire it certainly now breeds every year. Within 5 miles of the City, in Caen Wood, Highgate, I have frequently seen these birds, and two years ago I picked up a young hawfinch alive in my garden here and kept him for nearly a week before he became tame and a brilliant roosting at the hand and eating heartily Hemp and Millet seed, raw Peas, Beans, or Lettuce. He was kept in the same room with a linnet, whose song he soon learned to mix with his own, and the combination of the two was a strange jargon, unlike anything in bird song I ever heard. *F. Miles, Bourne-side, Southgate, N.*

—I think nearly all the authorities on birds describe the English grosbeak or hawfinch as being of a shy and retiring disposition; I was, therefore, somewhat surprised the other day to see one of them making himself very much at home in a dove's cage which stands open within a few feet of the windows of my house. He comes very regularly, and seems greatly to enjoy his meals. He also objects in a most emphatic manner to the sparrows, chaffinches, greenfinches, &c., who intrude upon him, totally ignoring their prior claims to a share of the good things. Of course they make some show of resistance, but by the aid of his powerful beak all disputes are quickly settled. *Maurice Young, Milford Nurseries, Goldsmithing.*

Garden Operations.

PLANT HOUSES.

PLANT STOVE.—There are a few small-growing plants that in the general preference for flowering subjects are lost sight of, though sufficiently interesting to deserve a place in the most select collection. Amongst these may be named the Australian Pitcher-plant, *Cephalotus follicularis*, and *Dionea muscipula*, which, although sometimes classed as greenhouse plants, succeed better in a somewhat warmer and closer atmosphere. The present is the best season for propagating the *Cephalotus*, which is increased by division, taking off the small offsets that are formed round the base of strong plants, placing them singly in the smallest sized pots, well drained and filled with an equal mixture of fibrous peat and sphagnum, both chopped quite fine, to which add a fourth of sand; keep them moist, and in a cool shade, shading slightly until they have rooted, after which give more air, standing them as near the glass as possible, potting on as required; but, as it is a small rooting subject, it must never have too much room. It is now time to pot the *Dioneas*; these plants increase naturally, much in the manner of Lilies, by the crowns sprouting up where the flower-stems have been produced the previous year; they succeed well in a similar compost to the *Cephalotus*, singly in small pots kept a little close, and watered rather warmer than an ordinary greenhouse. The pots in which both the above plants are grown, when in either a small or full sized state, should be kept plunged in larger pots or pans filled with sphagnum, which helps to keep them equally moist, neither of them being able to bear any approach to a dry condition at the roots, nor do they like the atmosphere being too dry. There are few flowering subjects that do not attain a large size more effective for decorative purposes, than *Anturium Scherzerianum*, but those who desire to increase slow growth with inability to be increased quickly by division, and the general reluctance felt to breaking up large specimens, there are few plants in which it exists in sufficient numbers to admit of its being used to the extent it deserves. I have now the one found to succeed the best in a much lower temperature than it was generally subjected to when it was first introduced, it can when in flower,

THE Gardeners' Chronicle.

SATURDAY, APRIL 21, 1877.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, April 23	Sale of Imported Orchids, at Stevens' Rooms.
TUESDAY, April 24	Crystal Palace's National Auricula Society's Show.
WEDNESDAY, April 25	Sale of Herbaceous Plants, Shrubs, Roses, &c., at Stevens' Rooms.
THURSDAY, April 26	Royal Horticultural Society of Ireland: Sale of Imported East Indian Orchids, at Stevens' Rooms.
FRIDAY, April 27	National Auricula Society's Show at Manchester.

IN December of last year a correspondent, who signed himself merely as a "Constant Reader," sent us a very handsome DOUBLE LAPAGERIA ROSEA, the merits of which were such as strongly to attract our attention, and induce us to recommend that the fortunate owner should take means to propagate it by layering. The flower in question appeared as a sport upon a branch, and doubtless if that branch were duly layered it would in due time produce these much-to-be-desired flowers. But apart from its beauty as a double flower of unusual symmetry and regularity, it presented certain peculiarities of structure to which it may be useful to advert. It is not indeed necessary to enter into details which would be of interest mainly to botanists, but the principles involved were such as to afford useful lessons in the way of practical cultivation. They do not, indeed, offer any particular novelty, but their importance is such that repetition becomes excusable.

Briefly, then, the peculiarities of the flower in question depended upon variations in the processes of growth and of development respectively. Sometimes the one must have been active while the other was passive, and *vice versa*. Sometimes both had manifested themselves in an equal degree, at other times both had been temporarily suspended or arrested. Before we go further we must define clearly what we mean by growth and development. By growth, then, we mean the formation of new or additional tissues, by which means the bulk, substance, or weight of the plant are necessarily increased. Development is merely the change or progressive modification of tissues or structures already formed, a change intimately connected with the adaptation of that tissue or of that structure to fulfil particular purposes.

The two processes are indeed not always easily distinguishable as they pass one into the other, but as a rule they are easily recognised, and we need not stay to consider exceptions. Growth must precede development, and it may proceed without it. Growth may and generally does accompany development, but development need not necessarily accompany growth. Growth and development may go on at the same time in the same flower or at different times. If a proper balance be maintained between growth and development, then the flower or other organ is normal according to its kind or type. But, if the balance between the two processes be disturbed, then the flower or other organ becomes necessarily abnormal or distorted. Again, the question of time has to be considered: the two processes must not only be symmetrical as to form, so to speak, but they must preserve a correct rhythm. Growth and development must take place at certain times, and last a certain time. What that time is, and what its duration, depend, of course, on circumstances. All that we are concerned with now is the fact that in symmetry, as well as in rhythm, and in both together, the just equilibrium must be maintained, or the flower or other organism becomes distorted and abnormal. Thus, in any flower there are natural periods of growth, alter-

nating with periods of no growth or arrest, and periods of development, alternating with intervals of non-development or arrest. In the flower of Lapageria, for instance, which has served as a text for these remarks, the sepals, petals, and stamens were normal, the balance of growth and development normal to the flower, and the time at which those processes had taken place had not been interfered with, but, after the formation of the stamens, at a period when undisturbed ordinary circumstances the growth and development should go on in the formation of the pistil, four additional rows (one within the other) of petals were formed. Growth was clearly not arrested, but rather exaggerated, unduly manifested; development, on the other hand, was checked, or at least it showed itself in the formation of petals instead of running on into the construction of the pistil with its ovules or rudimentary seeds.

The importance of a clear conception of the facts we have been alluding to will be admitted by every gardener. In the culture of Cauliflowers, for instance, the tendency to "bolt," that is, to develop flower-stalks and flowers, is not one which the gardener looks on with complacency, nor does he regard with any greater satisfaction the tendency which his Pelargoniums have in some seasons, or when over-watered, to run to leaf, at the expense of the flowers—growth in the latter case predominates over development. The swelling of Strawberries, of Pines, of Grapes, is a process of growth; the ripening of the wood, the setting, the stoning, the colouring of fruits, are matters of development. Between the two processes there is sometimes an antagonism, as every gardener knows to his cost. Again, though general principles remain unaltered, there is much room for individual variation even among plants of the same kind. What is so conveniently called the "habit" often varies materially even in seedlings from the same pod. Such things test the power of observation and the tact of the gardener, and serve to distinguish the intelligent workman from the man of routine, who owns no rule but that of his thumb. The conditions which are favourable to growth, are not always the same as those which are beneficial in the case of development; indeed, as we have seen, the two processes are often antagonistic. Practically the matter resolves itself mainly into a proper regulation of the amount of light, heat, air, and water to be given to plants at different times, according to varying outward circumstances and in accordance with the individual requirements of particular plants. As many plants of varying habits have often to be grown together in the same house, it is evident that in most cases a compromise must be hit on, and this again tests the ability of the gardener, who has to produce the greatest amount or best quality of produce compatible with circumstances.

If we had to point out wherein young inexperienced gardeners and amateurs most usually fail, it would be in the due regulation of the amount and time of watering plants in relation to light and heat. More failures we believe occur from negligence or carelessness in this particular than from any other breach of the laws by which plant culture is regulated.

— THE illustration on the next page, fig. 75, represents a very fine specimen of *CHOROZEMA CORDATUS SPLENENSIS* belonging to Mrs. J. H. VIVIAN, Singleton, Somerset, whose gardener, Mr. JAMES BIRLEY, kindly favoured us with the photograph. The plant measures 24 feet 6 inches in circumference, and is about 8 feet in height. It was struck from a cutting five years ago. This variety of *Chorozema* lasts in flower from Christmas to the middle of March, is invaluable for cutting, and when grown in small pots comes in most useful for table decoration.

— We are by no means sure—or, if the expression be preferred—we entertain a strong feeling that the best thing in the recent Amsterdam Exhibition was one which finds no place in the catalogue, and of which,

up to the time we left, we were unable to discover the exhibitor. It consisted of an exhibition of a very large number of BOOKS, &c., of various dates and languages, relating to the history of the gardening with books of the seventeenth century, and including Mr. BAKER'S recent monographs. Amongst them was a list in Dutch of an auction sale (February 5, 1637) of Tulip bulbs, in which one was knocked down for 4200 guilders (a guilder = 1*s.* 8*d.*). Another, a mother and her child—that is to say, a bulb with an offset, sold together for 5000 guilders. The total amount realised by the sale was 90,000 guilders. Tulips were at that time sold by weight, and in one engraving here exhibited, there is a sarcasm pointed up to speculative florists, which might not be inapplicable in some cases at the present day. A huge fool's-cap, Florus Gecks Kap, is shown serving as a tent, in which Tulips are being weighed and sold. A figure, which may represent Good Taste or Common Sense, is blinded, and her hands tied behind her, while Flora is shown in the distance on a donkey surrounded by mocking small boys and others, who chastise the unfortunate goddess with birch rods, &c.

The managers of the South-Western Railway are to be complimented on their appreciative preservation of some NATURAL CHAINS, the night, in less grovelling hands, have been converted into hard cash. On the steep sides of the slopes that border the railway cuttings in North Hants the wild Primrose is seen growing in great abundance, and just now affords no small amount of pleasure to the swift-passing traveller. It will be well if the out-of-the-way *locale* of these charming spring flowers should remain undiscovered by those thieving vandals who rob our hedgerows and woods of myriads of wild flowers, almost exterminating some kinds in various localities, as the unfortunate plants are soon killed by the ungenial surroundings of the metropolis. Probably it will not long hence ere we awake to the fact that such wild flowers, as well as wild birds, need special legislation for their preservation.

— THE WOOD ANEMONES are just now very charming indeed at the sides of the pleasant woodland walks at CASTLE ASHBY, Northampton, the seat of the Marquis of NORTHAMPTON. In many semi-wild nooks and corners the visitor comes upon patches of the single rose, *A. nemoralis*, and its double variety, the common rose, which is this season quite highly coloured, and here and there the scarce double rose variety. For years past a rich bed of decayed leaves has been accumulating, and in this these Anemones flourish with native freedom and vernal loveliness. It is curious to note that in some places the single rose variety has leaves of quite a bronzy hue, in others the leaves are quite green; peculiarities of soil or exposure may have something to do with this. The yellow *A. ranunculoides* and the pretty pale blue *A. pennina* are also present and very gay indeed. It simply requires the gorgeous *A. fulgens* to give completion to a group of spring plants that are highly attractive. While the woodland walks are aglow with floral life, the terrace spring flower garden is quite backward, owing to the wet dull season; during May and June it will be very effective, and about the second week in July the present occupants have to give place to the summer bedding plants, and they are planted out in nursery beds till autumn comes round once more.

— There are about the country some plants that may be said to possess a kind of historical interest. One of these is the grand old *CAMELLIA RETICULATA* AT CHISWICK HOUSE. Planted by Mr. CHARLES EDMONDS in 1829—very nearly half a century ago—it has proved this season as splendidly floriferous as at any period of its career. It has been literally clothed with flowers, and a considerable number of buds were removed, so thickly were the trees studded with them. The average diameter of the flowers was 7 inches. The measurement of a few of them was specially made by Mr. EDMONDS. The plant is so confined in the narrow dome in the centre of the large Camellia-house at Chiswick that it is a pity a new habitation was not built over it, to give it ample space in which to develop its branches. Bushels of flowers have this season been cut from it for Marlborough House. Close by it are the remains of a fine hybrid *Elæagnodendron* named Metropolitana, raised many years ago by the late Mr. JOHN RONALDS, of Brentford. The specimen at Chiswick

FIG. 75.—SPECIMEN OF CHOROZEMA CORDATUM SPLENDENS.

House is the original plant, and it is a very fine variety, with large heads of well-formed bright red flowers. It is so robust in constitution as to be nearly hardy, and is of a different habit to most Rhododendrons, growing strongly and flowering freely at the points of the shoots every year. This Rhododendron is becoming much crowded, and, unhappily, is dying in some of its parts, perhaps from old age. Perhaps with the demise of this plant it may become utterly lost to cultivation.

— Not long ago we gave an Austrian's opinion of gardening in France and England, and the state of horticulture in Austria as compared to that of our own country. The comparison was perhaps too favourable to our gardens and gardeners, and having reproduced that, it is no more than fair to hear what there is to be said on the other side by a more patriotic writer. M. CZULICK, in a recent number of the *Wiener Gartenfreund*, "On the GARDENS AND

GARDENERS OF GREAT BRITAIN," certainly goes to the extreme in the opposite direction. After admitting that our gardens exceed all Continental gardens in richness and beauty, he suggests that it is possible that this superiority is not due to the skill of our gardeners, but is simply the consequence of favourable climatal conditions, and the cheap way in which whole shiploads of plants are obtained from our various possessions. Many ships that would otherwise return empty are laden with valuable plants. Our winter is not worth mentioning, and our summers moderately hot and moist: hence the construction of our glass-houses is cheaper and better adapted for plant-growing than any that can be adopted in Austria. If Austrian gardeners took no more care of their plants than English gardeners, there would not be a plant left alive at the end of the year. Besides, Austrian gardeners have other difficulties to contend against, of which their English colleagues can form no conception; and

it has been repeatedly proved that Englishmen can do anything else in Austria except gardening. Then look at the money the English spend on their gardens, often paying several hundred pounds for a new plant, though this must be regarded as arrogance, whereas the Austrian gardeners have almost nothing. And so the writer goes on. Of course there is a good bit of truth in his exaggerated statements, but he appears to have lost his temper and prudence, to put it no stronger, because his wealthy countrymen spend their money wastefully on horses, instead of encouraging horticulture, and because English gardeners have been held up as a pattern. He thinks Austrian gardeners would beat their English compeers, if they only had the chance. Well, perhaps they might in their own country; but transfer them hither, and give them three months' dull, foggy weather for fruit and flower forcing, and they would find that English gardeners have their difficulties, and that success on their part is the triumph of skill in their profession.

appears is known as "Douglas Fir, Red Fir, Black Fir, Douglas Spruce, Red Spruce, Black Spruce, Hemlock, Oregon Pine, Western Pitch, Bear River Pine, Swamp Pine, and perhaps others. Moreover, nearly all of the names are also applied to other species."

Home Correspondence.

Royal Horticultural Society.—A good many of the would-be guinea Followers on lists and others, have sent in their names here, or direct to the Society, as willing to become guinea members, but many have not yet decided how to act; perhaps the best hope of influencing them by trying to show the present position of the Society. The nurserymen at and near London can, if they please, make the fortnightly shows at South Kensington beautiful ones; it will be worth their while to do so if enough of Fellows and of the public see the plants they exhibit. All the shows held this year have been, whether notwithstanding, good ones. When the beauty of these shows becomes generally known, there is little fear of their not being sufficiently well attended and so continued; there will be more interest in the guinea subscriptions of all living near London, and so it may be expected that very good new subscribers will join the Society. If this be so, whatever may have been the case in the past, it is probable that the South Kensington garden will pay both its direct cost and that of furnishing it with plants grown at Chiswick. Therefore there is no reason why all money subscribed by horticulturists, in order to promote horticultural science, should not be applied to purchase horticultural processes at a small profit where, and that South Kensington, instead of being a charge, should be a benefit, as providing gratis a good place for committee meetings and shows. Of course, among the nurserymen who make the shows there are some really good horticulturists, and a wish to do so is now be a great object to induce as many as possible of the best scientific horticulturists of the country to join the Society, as until they do so it will never be the great representative Society it should be. The guinea membership, with hope of a guinea in the future hereinafter, will help this. Some of the very best country horticulturists, among them the Rev. H. Harpur-Crewe and Mr. George Maw, have already become guinea members; and last, but not least, Mr. Isaac Anderson-Henry, of Edinburgh, has sent me his name to go in as a guinea member, with the hope of greater privileges hereafter. It is now of the greatest importance that as many of our best horticultural science as possible should join the Society. It was feared by some that guinea Fellowship or membership would stand in the way of the higher subscriptions, this appears to have not been the case. I may perhaps give one instance in proof of this: an old friend sent me his name for our guinea list, but when the time of joining the Society came he, for the sake probably of the transferable ticket, not only became a £2 2s. Fellow himself, but made his wife and daughter-in-law £2 2s. Fellows also. *George F. Wilson, April 11, 1877.* E.S. April 14. I had written the above before Dr. Clifford Alibant's letter, p. 472, appeared. He is wrong about the Chiswick work, which has been really useful. I think there is much that is right in his criticisms on the same, and his aspirations to a Society of the future, but the difficulty is, who is to bring about this good new state of things? We seem travelling in a circle. The Society, while it has to trade with South Kensington and to show visitors for its funds, will look Mr. Wilson's charge of front and country horticulturists will not join till the Society becomes more purely horticultural, and the Society will not become more horticultural till the country horticulturists join the Society. I have not yet any forwarder? No one has come forward to start a new society on a more scientific basis; so surely it is our wisest present course, to try and improve and strengthen the existing society, and the way to do this is to think to me the horticulturists, and to give by a great influx of new good country garden members, to become guinea Followers hereafter. *George F. Wilson.*

—Permit me to thank Dr. Clifford Alibant, of Leeds, for his outspoken letter in last week's *Gardeners' Chronicle*. I agree with him in the main. I may also add that since Mr. Wilson's charge of front and the extraordinary letters of Messrs. Veitch and Gilbert, I should assuredly decline to accept a guinea Fellowship under the proposed conditions. To give up the best of quality of our plants, and to go to the aid of dishonour, with a view of forcing equality afterwards, looks amazingly like securing a Fellowship under false pretences, and is a course which I trust will receive no support from honourable men. *D. T. Fish.*

—I have fighting, scolding, or arguing in a newspaper, but I found it impossible for me, as an old and attached member of the Royal Horticultural

Society, to read the letter in your last issue, by Dr. Clifford Alibant, and hold my tongue. Anything more unkind, unjust, and untimely than your correspondent's remarks I never remember reading, even among the many attacks made upon the Society during the irritation of our most troubled times. Can your correspondent have made himself acquainted with his subject, made sure of his facts, or studied the history of the great institution upon which he is about to condemn? It seems incredible. Dr. Alibant's programme of work proper for a horticultural society is excellently well drawn, and is, with a few immaterial exceptions, an accurate description of what every great center of horticultural science has been well and truly carrying out year after year, decade after decade, from her birth until now. Hot, strong, and unlikable as is the language of your correspondent, there are a few signs of every earnestness worth of better things. Will he excuse me for saying that such qualities are much needed at the present time, and would be well employed in furthering the efforts of those who are now, with daily increasing energy, in rallying round their Society, and determined, if possible, to succour and save her? The Royal Horticultural Society has been too long a butt for the arrows of ill-natured and ungenerous criticism; neglected by those who should have stood by her in her distress, and who like the shepherd, were hawked at by every mouthing wolf. We want now sympathy and support, and I have every reason to believe both are at hand. I have picked every correspondent to hang to, to plead for, to lengthen it out, very unwillingly believing that such objections as these in it must have arisen from imperfect information. *A Country Fellow.*

Dendrobium pulchellum.—Having noticed Mr. Payne's eulogium on *Dendrobium Fierarii* in your issue of the 13th inst. in your columns, it was a pleasure to state that there is very fine specimen of the latter at Ashted Park Gardens, which had 700 flowers fully expanded when I was there a week ago. It was suspended in a basket in the greenhouse, and was so crowded with blossoms that not a vestige of the basket was visible; it was literally one ball of yellow and pink, and this plant in particular fully deserved the praise Mr. Payne lavished upon it. *Wallace Morris, Epom.*

The "May" for Church Decoration.—I think Mr. Fish has never helped in church decorations, or he would not recommend any of the cut blossom of the May for the purpose, and as to "lettering" it had need be executed by fairies half an hour before the sun sets, and as to its beauty, it would be more quickly or loses its form more completely. Plants may answer, but certainly not the blossoms cut. *B. T., Clifton Rectory, April 11.*

Decorative Plants: Hardy Ferns.—Amongst the many kinds of plants used for conservatory decoration this season, none in its way surpasses the many fine forms of the Lady Fern. They are of such a beautiful green and so delicate in their appearance, that nowhere scarcely can they be said to be out of place. Some of the plain varieties of *Athyrium Filix femina* are very pretty, but some of them are so finely tasselled that for decoration they may be said to surpass the common forms. These Ferns are of the most easy culture, and indeed where favourable they will grow on themselves on the borders of any of the plants that stand. The great kinds also do this, so that they could be used again (lifted, potted, and grown on) to better advantage if desired. For the summer decoration of the conservatory, when there is plenty of open ground-out-of-doors, we find varieties such as *Ferns* very useful for conservatory work amongst *Fuchias*, *Liliums*, &c. Though they are common, or varieties of hardy plants, they are none the less beautiful. Another very fine form of British Fern is the crested *Osmunda regalis*; in a gentle heat it is also now in fine foliage. Then there is the *Polystichum angulare proliferum*, which is interesting at all seasons for its profliferous character; it may be termed a perennial for conservatory work, as it keeps in good appearance all the year. Many make a speciality of growing fine forms of hardy Ferns alone, but when grown or set amongst other fine flowering plants, such as Azaleas, they show to the best advantage, as the fine green and the rich coloring agree so well together. *R. M.*

The Double Poinsettia.—My employer purchased a small plant in a thumb-pot last April, and I kept it in a dormant state for three months in a cold house. It commenced to grow about the end of August, and in the beginning of September, and showed its buds in the beginning of December. I measured it to-day (April 16), and found that its height is 21 inches. The head is divided into four branches, which are again divided into ten distinct heads, from 4 to 5 inches in diameter, the entire head being 12 inches in diameter, and of brilliant scarlet; and from its appear-

ance I should say it will last quite another fortnight, making the Poinsettia season of six months' duration. This is a grand specimen, and as far as I can see, will be long before it will be grown as plentifully as the old one. It cannot be said of this as of many new things—that we have to get rid of an old friend to make room for the new one. One great recommendation of the new variety is that it comes in at the time the old one sheds its bracts, and its great value as a decorative plant has become more apparent daily up to this date. Another year, when we have strong plants to start with, and we have no doubt that such beautiful specimens will be raised, we will not argue with the old one. *Richard Shore, Gr. to Kez, James Hogworth.*

LOBELIA PUMILA MAGNIFICA, or Emperor William.—Mr. Morgan's strange letter on p. 473 induces me to trouble you with a few more last words. Mr. Brownell told me he raised his *Lobelia* from seed procured from me; I may have been mistaken about having given it him, but that is of no great importance. As far as I know I did not pretend to have seen it at Mr. Brownell's till the autumn of 1874, previous to which time I had received the two First-class Certificates I spoke of in my previous letter. I had had my plant about a year and a half in the nursery, and it was before I exhibited it, and claim priority of possession; at all events I took the first steps to make it known to the public, and now three years after it is rather late in the day to set up a counter claim, even were it done at the moment of its issue. I am on the other party; not that so small a matter is of any importance to me, still I feel bound to defend myself from Mr. Morgan's charge of having made a false statement in the matter. *John Beter.* [The subject may well be allowed to drop now. Eds.]

Selborne and Gilbert White's Grave.—On visiting Selborne churchyard last Saturday, for the purpose of seeing the famed old naturalist's grave, I was much shocked to find it entirely covered over with mortar, broken bricks, pieces of slate, &c., the top of the headstone alone being visible. They are repairing the church, but surely a finer spot may be found whereon to throw the rubbish than Gilbert White's last earthly resting-place. One Selborne I spoke to informed me, with considerable pride in his own opinion, that the grave was the property of "strangers." "Because of Gilbert White's writing about it," I replied; adding, "I am sorry to see his grave so little cared for." "Oh, I don't know him," was the answer I *Hein Watson.*

Eucalyptus globulus in Lancashire.—It may be a matter of interest to many people to know that the *Eucalyptus* has stood a winter out-of-doors in Lancashire. From its conduct here I am disposed to think that it ought to live and thrive in the South of England in warm, sheltered situations. My plan here was planted out about the end of last May, and it would perhaps be very difficult to find a more favourable situation out-of-doors than the one the plant occupies. It is planted on a sloping bank, where its roots are comfortable and dry, and protected on all sides by tall-growing trees, but not crowded so as to be injurious to growth. I think it seems reasonable to suppose that a rather elevated, dry position like this will be conducive to the formation of hardy plants in winter situations. I have seen a very milky character than plants which are treated to a liberal compost. The latter treatment is a means of procuring inevitable death from the first visit of sharp frosts in November, whilst the former leaves a long-hope of escape, in a somewhat moderate and moderate growth to be harder, better ripened, and better able to withstand the effects of our changeable climate. I have no faith in any one succeeding to grow the *Eucalyptus* out-of-doors as far north as we are, except under peculiarly favourable circumstances. I also think that the soil cannot be too poor, and I am much mistaken if restriction of the roots would not have a tendency to promote growth a character that would give some hope of preparing it to stand an average English winter. With the exception of a little pains in selecting a proper situation, in giving poor soil and limited root-room, and in protecting for a winter or two, and then chronicle results? *W. Lind, Otterpool.*

An Extraordinary Set of Peaches.—On a recent visit to Clumber I was astonished at the enormous quantity of fruit just set in the early Peach-houses, the Nectarines being equally heavily laden. The bearing wood, which is equally distributed from the lower part of the tree to the top, is literally clothed with fruit from base to point, the trees themselves being in the most robust health and fine examples of skilful management. Mr. Miller will require to exercise no small amount of care in the entire head of the tree, and the quantity of fruit to prevent over-ripening, although I

dare say the task will be a pleasant one. These results have been obtained, I am informed, without artificial fertilisation in any form. What will the advocates of the syringe say to this? Will Mr. Simpson avow that, had Mr. Miller syringed the trees when in flower, the soil would have been heavier? If not, why use the syringe, or the camel-hair pencil, or bunch of feathers, at all? If all other conditions are equal, and the flowers are perfectly developed, is artificial fertilisation necessary? *Vitis*.

Primroses Indoors.—Where these beautiful spring flowers are found in our woods they are usually in such profusion, and increase so fast from seed, that no objection need be raised to the plan which I pursue, and which I recommend to others when it is proposed to decorate rooms with Primroses. I cut off the whole plant above the roots and below the leaves, and place it in a saucer of water. The effect is improved by an edging of five or six plants of the Dog Violet treated in the same way. *W. T. T.*

Adiantum Capillus-Veneris var. cornubiense.—Amongst the many beautiful species and varieties of British Ferns the Maidenhair has no rival, and one might doubt if it were possible that any abnormal form could surpass the parent form in graceful elegance, but the var. *cornubiense*, represented by the annexed woodcut (fig. 76), occupies the same relative position to *A. Capillus-Veneris* that the beautiful *farleyense* does to *A. tenerum*. Like that variety, it is much larger in all its parts, the large wedge-shaped pinnules being divided into numerous and deeply parted lobes; and, like that, it does not produce seeds. The fronds are from 12 to 15 inches long, very delicately membranaceous; the pinnules an inch or more broad and an inch long, deeply multifid, the margins dentate-lobate. Both indusium and sori are wanting. As in the var. *farleyense*, the involucre, instead of taking the form of *indusium* and becoming reflexed, are extended in continuation with the free-fered veins, and subdivided into numerous slightly dentate and rounded lobes. The honour of discovering this beautiful Fern and introducing it to cultivation is due to Mr. H. H. Trevithick, of Hayle, who found it growing on the rocks by the sea, and near his home. The name I have chosen for it will mark it as one more, and not the least valuable, of the many beautiful Fern sports found in this county. *T. J. Jermans*.

Foreign Correspondence.

RETROSPECTIVE VIEW OF A JOURNEY THROUGH NATAL.—After having travelled the length and breadth of Natal, visited its most important places of business and interest, wandered along the banks of its principal rivers, and received hospitality from many of its adopted children, I can now at my leisure look back upon all the various scenes which have passed before my eyes, and combining them all together in taking a comprehensive view of the whole colony, come to the conclusion that with all the drawbacks possessed by Natal, it is a pleasing country to the eye, and holds out many temptations, in spite of difficulties, to intending settlers. The natural scenery of the country does not possess that awful grandeur to be witnessed in the Himalayas or Andes, but it is pleasing and picturesque. The long flats on the coast land, the undulating, broken, and often rugged country inland, with here and there small plains and elevated plateaus, the whole interspersed with a complete network of rivulets and rivers, make a favourable impression upon the mind of the casual observer.

The climate is not at all disagreeable, rather warm on the coast, but very pleasant and suitable for Europeans up-country in fact; and, although in the middle of the hottest time of the year, I have fairly shivered with cold during the night, especially towards morning. Rain is plentiful during the summer months, as a rule, and a sufficient quantity of dew falls in the dry season, or what we would call winter; and it is a common occurrence to have frosts, even ice, after 30 miles from the port of Durban. The geological formation is very peculiar, and the various phenomena to be seen in passing across country is striking and often difficult to account for. Travelling from Durban to the foot of the Drakensberg Mountain, the strata, which are for the most part horizontal and undisturbed, appear in regular succession from the Zuluian, now forming the coast, to the gneiss and shale of the Drakensberg. After leaving the coast alternate beds of claystone, porphyry, gneiss, and silurian sandstone make their appearance, until, after passing Pieter Maritzburg, greenstone and a shale containing numerous fossilis,

principally reptilian, and the remains of a bygone and vast vegetation appear. In places where now for miles and miles a bush or a tree cannot be seen, one spit deep reveals a rank vegetation, which must, geologically speaking, be of recent extinction. In general the flats and valleys possess a deep and fertile alluvial soil, but for the most part the hills are horribly stony, and fit only for sheep. Several important minerals and earthy products have been discovered, and gold was found a few years since on the Tugela River; indications of coal are numerous, and a few mines are now working at Newcastle, in

there is but a poor demand—and I believe in the best of times the markets are easily flooded; so that until there is a crying demand agriculturally, Natal will never rank as an important and prosperous colony.

A great deal of land is taken up and cultivated to a certain extent by the Kaffirs, who are yearly increasing at a rapid rate; and now numerous Kaffir kraals are to be seen, with patches of cultivation and small herds of goats and cattle, where a few years ago none were to be seen. A great many of the old colonists apprehend an imminent danger from what they call the meditated and gradual encroachment of the Kaffirs,

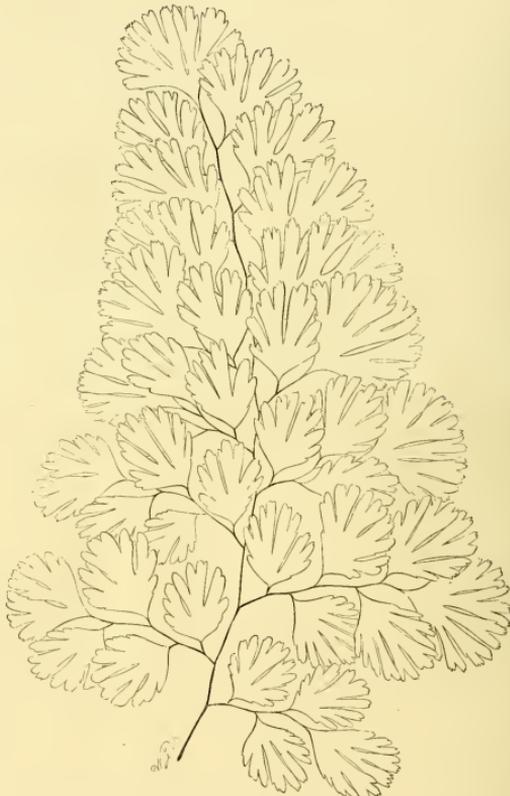

FIG. 76.—ADIANTUM CAPILLUS-VENERIS VAR. CORNUBIENSE.

the north of the colony, but, judging from what I have seen of coal indications and of exposed strata, clearly showing forth the fact that the whole formation of Natal seems to have undergone a vast amount of heat and destruction from Plutonic agency; in fact, everything seems to have been thoroughly baked, and yet there are barely any indications of volcanic action.

The agricultural and horticultural departments of the colony are but in their infancy, and at present stopped from developing, by innumerable difficulties—horse sickness, cattle disease, dry summer, want of transport, and the unsettled affairs in the Transvaal. This last difficulty seems to have thrown a gloom over the whole colony, and caused a complete stagnation of trade; the markets are full, and

but from all my observations I believe the danger is imaginary and groundless. They have a perfect right to take up land when, complying with the demands of Government, they cultivate Meales (Indian Corn), breed goats and cattle sufficient for their own consumption, and generally some for the markets; moreover, they are the original occupants of the soil, and no Christian people or Government would ever take measures to prevent them from settling down amongst a white community, whose influence, if for good, would soon tend to elevate the Kaffir to a fit and proper standard of life; but, alas! it is too often the contrary, for the great thirst for wealth and possession prevalent in this colony generally transforms the so-called Christian man into a would-be aggressor, held

in subjection by the philanthropic part of the community.

The principal articles of cultivation amongst the farmers are Meales, forage (Oats), Yams, and Tobacco. For these four products there is always a good demand, and this year (owing to the unusually dry season) especially. Tobacco is about the most paying crop when grown successfully, but it cannot be depended upon, for droughts, heavy storms, and insects have often a pernicious effect upon the plants. The mode in which the farmers, both Dutch and English, prepare the Tobacco for the markets is rather strange, and I believe peculiar to South Africa. The plants on coming to perfection are cut and stripped of their leaves, the leaves are separately strung on twine and suspended in long rows in a dry shed; afterwards they are sweated or fermented in a box, then by a slow process they are twisted, leaf by leaf, into large coils resembling rope, generally three-quarters of an inch in diameter; the rope Tobacco is then measured out and rolled into 3 lb. and 4 lb. twists, which are at once ready for the market.

Botanically speaking, the vegetation of Natal is rich, not that it possesses the teeming beauties of a South American forest, the umbrageous occupants of a Ceylon jungle, or the majestic ornaments of the Australian bush; these, to my mind, would here be out of place, that is, they would not agree with the geological features of the country; nor the stunted jungle coast, the scattered trees often on the interior, with the plateaus and plains covered with all its descriptions, is in perfect accordance with all surrounding things. Acacias, with a few other Leguminosae, are the almost universal occupants of the bush inland, and the farms and settlements have all a surrounding vegetation of *Eucalyptus globulus* and *Melia Azadirachta*, which have been introduced and thrive remarkably well. Down on the coast the low forests possess a much greater variety, and a more floriferous class of plants. *Ficus* are well and abundantly represented, comprising upwards of a hundred species to my knowledge. Amongst the Tree Ferns are *Cyathea Dregelii*, frequently seen between Durban and the Drakensberg; it is of small habit, but rather graceful; *Alsophila capensis*, very plentiful in damp ravines, often with a caudex to feet high, and fronds 7 to 8 feet long by 3 feet broad. It has a very scaly and compact appearance, and having seen it growing at an altitude of 3000 feet, I am certain that it would grow in sheltered positions at home. *Davallia nitida*, *D. thalictifera*, *Asplenium obliquum*, *A. varians*, *Phymatodes elongata*, *Polypodium lanceolatum*, *P. trioides*, *P. Phymatodes*, *Stenochloa tenuifolia*, and a few *Elaphoglossum* are more or less abundant on trees and moist rocks from the coast to the Drakensberg; a few of them are strangely limited to certain altitudes. *Gleichenia polypodifolia*, *G. umbraculifera*, *Hymenophyllum tubridigense*, *Trichomanes pusillum*, *T. psylliferum*, *Cyrtopteris fragilis*, confined to the Drakensberg; *Adiantum Capillare*; *Veneris* in abundance. *A. zebicoides* we saw in splendid condition at Karkloof, a good collecting place about 30 miles from Maritzburg; *Hypolepis Bergiana*, *Cheltonia capensis*, *C. hirta*, *Pteris geraniifolia*, *Platyloma hastata*, *P. Calomalensis*, *Pteris cretica*, *P. flabellata*, *P. aquilina*, *Lomaria discolor*, *L. attenuata*, *L. prostrata*, *Blechnum australe*, *Asplenium Kraussii*, *A. monanthemum*, *A. eburneum*, *A. humulatum*, *A. ceratophyllum*, *A. hecidioides*, *A. Adiantum-nigrum*, *A. cucullatum*, *A. fucoides*, *A. foveolatum*, *A. Filix-femina*, *A. aspidifolium*, *Didymochloa lunulata*, *Aspidium aculeatum*, *A. purgens*, *A. capense*, *A. falcatum*, *Nephrodium Bergianum*, *N. Thelypteris*, *N. athamanticum*, *N. inaequale*, *N. unitum*, *N. molle*, *Oleandra articulata*, *Polypodium vulgare*, *P. incanum*, *Nothochloa Eckloniana*, *Gymnogramma totta*, *G. argentea*, *G. aurea*, *G. lanceolata*, *Acrostichum conforme*, *A. spatulatum*, *Osmunda regalis*, and *Todea africana*. These are but a few of the common species met with in a run through the colony; several others I have not as yet been able to identify.

Flowering shrubs and trees are very scarce and possess very little beauty, except the *Erythrina*s, of which I have met with at least ten different species, some of exquisite beauty and well worth cultivation at home; in fact, the finest sight of bloom ever witnessed by myself and party was a plant of *Erythrina*, growing at the foot of the Umgeni Falls. The herbaceous plants are numerous, and in their representations embrace a good many of the natural

orders, the chief of which are *Asclepiadaceae*, *Leguminosae*, *Scrophulariaceae*, *Compositae*, and *Malvaceae*. There are *Lobelia*s in all varieties of colour, and magnificent climbers in abundance, generally *Cucurbitaceae*. The most pleasing and striking part of the Natal flora is the vast amount of bulbs, &c., distributed all over the grass lands of the interior. Being rather a bad time of the year for bulb flowering, I was more or less disappointed in this respect. *Homalium pubescens* was growing luxuriantly on the Moor River, and three other species had past recognition; *Crimum aquaticum* was in abundance; two *Strumaris*, *Nerines*, and some magnificent *Amaryllis* adorned the plain and hill-sides, with their massive umbels of brilliant-coloured flowers; also what I took to be two *Pancretium*s, *Agapanthus umbellatus* and *A. precox*; a small *Aloe* with a deep salmon-coloured flowers, elegant; a deep scarlet and double-flowered *Triton*, also a *Medea*, *Saxifraga paniculata*, *Ecomis pinctata*, *E. striata*, and one with very broad racemes of purple-tinted flowers; *Ornithogalum* and *Masonias*, *Asparagus ethiopicus* and *A. flexuosus*; *Gladioli*, embracing at least twelve distinct species, not considering the numerous variations of colour to be seen on all sides; some of the *Gladioli* are extremely rich in colour, and found at a considerable altitude. *Tritonias* are abundant, one especially fine in its bloom, producing large panicles of bright scarlet flowers, and forming a wondrous contrast with the old wood of the mountains, and numerous *Convolvulus* occur in all directions. *Calla ethiopicus* grows everywhere, and one species with variegated leaves has a cream-coloured spathe with a deep purple centre. The epiphyllous *Orchids* are scarce, but the terrestrial ones plentiful. *Phajus*, *Disa*, *Lissochilus*, and *Satyrium* are well represented families. *Christypher Muddi*.

Reports of Societies.

Amsterdam International Horticultural Exhibition.—Unless we gave a catalogue and a list of what we saw of our own country, it is impossible for us to do more than to say that we do not know that we can add much of interest to the hurried report which we gave of the Amsterdam Exhibition in our last issue. Of course, order was excited of course at last, but up to Saturday, the time of writing this, no list of prizes had been issued. The scattered manner in which the exhibits were disposed, some in sheds, some in stoves, and relatively few in the Palace, where sassage-machines, garden tools, and steam engines were exhibited, prevented anything like a fine pictorial effect, such as was given in 1865. In fact, without unduly depreciating the Exhibition as a whole, and without overlooking the merits of sundry exhibits, it may be said that it has been, as an exhibition, the least successful of any of the International series, and gives rise to the doubt whether exhibitors are not getting tired of them, making them mere bazaars rather than exhibitions of superior cultivation, or of new, rare, or interesting plants.

Mr. Williams' success, telegraphed to you, was fairly earned. The extraordinary prize, granted to M. Linden for his miscellaneous exhibition, shown not for competition, was also richly deserved. An extra gold medal was given by the City of Hamme to Messrs. Broet and Van der Vliet, of Haarlem, for the best collection of Dutch plants. This firm also took the lion's share of the first prizes in the classes open for competition; Messrs. E. H. Krelage, J. van Waveren, Co., B. van Waveren, & Co., Mr. A. F. Byvoet, and others also taking prizes. Later on we shall doubtless be in a position to speak more at length as to the awards, as the Palms of M. Lemonnier, of Brussels, the *Cacti* of Von der Heiden, various collections of hardy Conifers, besides those who have already mentioned, must certainly not have been overlooked by the jury, whose principle of action seems to have been to give a prize of some sort to every exhibit no matter how small.

Four large span-roof sheds were erected for the exhibitions of *Hyacinths*, *Tulips*, &c., but were not half filled; much better displays of bulbs have been frequently made by London nurserymen at various horticultural exhibitions in London.

We noted the following as among the best of the *Hyacinths* :—Dark purple to black: *General Have-lock*, very fine; *Uncle Tom*, *La Negresse*, *Rake*, *Ferack Khan*. Dark blue and purple: *Hadyn*, *King of the Blues*, *St. Henry Have-lock*, *Sarkit*, *Black and Blue*, *Black and Blue*. Crisp Petals: very fine: *Lord Palmerston*, light eye; *Prince Talleyrand*, *Lord Derby*, *Blondie*, very fine; *Voltaire*, light eye. Dark red: *Vuurbaak*, *Incomparable*, *Linnaeus*, *Pellissier*. *Chabry*, *Chabry*, *Chabry*, *Chabry*, *Chabry*, *Chabry*, *Schiller*, *Mazouly*, *Josephine*. *Royal red* or pink:

Garibaldi, *Cavagnac*, *Cosmos*, *Lina*, *Koh-in-noor*. *Blush*: *Wellington*, *Anna Paulowna*, *Princesse Amelie*. *White*: *La Grandesse*, *fine*; *La Belle Blanchisseuse*, *Anna*. *Yellow*: *Ida*, very fine; *Chelidonium*, *Chelidonium*, *Chelidonium*. *Falcons* and *Hyacinths* was not equal to what we expected. The show was held in the immediate vicinity of the *Hyacinth* country, and it was natural to suppose that all the principal growers would be represented. We saw many fine flowers, but it seems that many of the principal growers are satisfied with growing, and even a national movement of this kind was not sufficiently enticing to induce them to depart from their recognised line of business. There were some fine flowers in the sheds, but they certainly were not equal to what we are accustomed to see at the flower shows in England, and not superior, if equal, to what we saw by hundreds and thousands in the grounds at Haarlem and Overveen.

A series of sheds open in front were arranged on the outside of the Exhibition grounds. These were filled with miscellaneous collections of plants of very little merit, the following being the only exceptions. The *Acacia* was the best of the evergreen trees exhibited. In collection No. 133 were splendidly grown plants of *A. verticillata*; *A. ulcifolia*, a grand specimen, with fine robust habit and splendidly bloomed; *A. pendula*, with its graceful form of golden-yellow flowers; *A. saligna*, forming a fine mass; *A. farnesiana*, and the plant a perfect specimen; *A. spiralis*, shown in excellent condition; *A. pentadenia*, *A. ovata*, *A. Drummondii* and *A. armata*. If specimens like the above were to be seen at our own exhibitions, they would be so much neglected by English gardeners as they are. There were also some pretty good pyramidal *Camelias* and some medium collections of *Azaleas* from several exhibitors, but nothing extra. The fine collections we have seen exhibited in Belgium and elsewhere.

Several groups of standard Tea and Hybrid Perpetual Roses were very creditably shown, but fearfully handled by the people who were arranging them. The roses were very fine, and many of them, and some of our other Rose growers, watching their plants being handled so roughly: probably the Dutch artists would have speedily come to grief; we never saw Roses so handled before. The most interesting being kept before the opening day, as well as many other things. The Dutch have much to learn yet before they can compete with Belgian and English horticulturalists with any hope of success.

Orange trees, curiously trained as fans, *Yuccas*, *Aloes*, and other additional plants, *Ficus*, *Follage plants*, *Rhododendrons*, &c., were displayed among the plants mentioned above, but were not of sufficient merit to be described individually.

The Congress meetings were very numerously attended by botanists and horticulturists of all nations, our own being relatively very meagrely represented. The arrangements were such that a great deal of valuable time was lost, and a great deal of unprofitable talk made use of. The Congress itself was opened by Prince Alexander of the Netherlands, who throughout the whole exhibition has shown himself most sympathetic, and anxious to make the stay of the visitors agreeable. The Baronister, the Minister of Finance, and other officials followed, and then Professor Rauwenhoff of Utrecht read a paper on the subject of the exhibition, and abstract of which we may give at another time. Vice-Presidents from various nations were chosen, and the Congress subsequently divided into three sections for botany, horticulture, and economic products respectively.

At the first meeting of the botanical section M. de Dary was elected chairman, with Professor Deketoff, M. Morren, and M. Masters as Vice-Presidents. Various papers were read, amongst others by Mr. Weddell, who showed a new species of *Populus*, *Populus caudata*, from which the cell tissue had rotted away, and which assumed the form above mentioned. Dr. Ascherion showed the rachis of a palm (*Phoenix dactylifera*) from which a bluish colour, from the oasis of Jupiter Ammon. Dr. Engler read a communication on the *Araceae*, Dr. Radlkofler on the *Sapindaceae*. In the horticultural section M. Delevalerich showed specimens of the *Hama* cotton seedling mentioned in our last issue, and which it is asserted is the result of a cross between *Gossypium vitifolium* and *Albimoschus esculentus*. There is nothing impossible about it, but the evidence, as far as we could make out, was not very conclusive; at any rate it is not a very important matter, and of doubtful commercial value. But the question of most interest, and for which a conjoint meeting of both sections, under the presidency of Professor Rauwenhoff, was held on Saturday evening, was that relating to all those countries, and especially *Kaimosi* of cultivated plants. The subject was started last year at Brussels, under the auspices of the *Fédération Belge*, and it was hoped that in the interval something practical would have been arrived at; but this seemed far from having been accomplished,

and after some discussion a resolution was passed, that Mr. Moren be requested to prepare a model sheet to be exhibited and discussed at the next Congress.

If we have felt it obligatory to comment on the needless loss of time and imperfect arrangements for the Exhibition and Congress—for which none are in a position to be more than thankful to ourselves, and which will be readily accorded by those who know the amount of forethought and vexation and labour required to bring these matters to a successful issue, it is more compulsory on us to acknowledge in the warmest terms the cordial hospitality of the Dutch. Our Dutch friends in this particular do not make much ado about nothing. They are a quiet and unostentatious folk, but there is in their hospitality a sense of good will and truly heartfelt welcome more satisfactory than any professionaliveness characteristic of some other nations. The Burgomaster's reception, the banquet presided over by Prince Henry, were good illustrations of this. But, as we have occasion to speak of some indifferent arrangements, it behoves us to speak of one entertainment provided by the municipality and bulb growers of Haarlem, which was a perfect model of orderly methodical arrangement, well planned, well carried out, affording the greatest amount of pleasure and interest, with the least amount of confusion and fatigue. This comprised within a space of four or five hours a visit to the museums of the town, an inspection of one or two bulb grounds, an organ concert, in which the quality of the musical organ was particularly marked, a rich treat to the hearer, then a light luncheon and a speech of welcome from the Burgomaster, and then a drive through the woods and bulb fields and back to the *table d'hôte* train to Amsterdam. The whole was done without tedium or confusion. The kind of excursions to be taken are those to the palace and gardens of Prince Henry at Soestdijk (where is a fine collection of Agaves and other plants), and to the new North Sea Canal, which by its length and its importance to the shipping of Amsterdam, is as noteworthy as the Suez Canal.

Royal Horticultural: April 18.—H. Webb, Esq., in the chair.—The only business transacted at the general meeting at 3 P.M. was the election of nineteen Fellows, and fifty gynaecum members.

SCIENTIFIC COMMITTEE.—Dr. J. D. Hooker, C.B., Pres. R.S., in the chair.

Dammara robusta.—The Chairman exhibited some branches of this Conifer, illustrating their deciduous nature. A large specimen of this species, which under the most favourable conditions in one of the large public buildings in London first shed its leaves, and afterwards branches, from 2 to 3 feet in length, fell off, much as *Taxodium distichum* and some other deciduous Conifers throw off their ultimate branches in autumn. As in the petioles of some large pinnate leaves, there is an immense mass of cellular tissue surrounding the vascular portion at the articulation with the main stem.

Injured *Rhododendron Leaves*.—On behalf of Lieutenant-Colonel C. L. Cooke, Tiverton, Devon, Dr. Hooker showed injured foliage of various Himalayan *Rhododendrons*. A letter was read explaining that the injury could not be due to cold, any particular soil, or any cultural conditions. The leaves eventually fall away, the shoots perish, and the plant dies. It was the opinion of some members of the committee that the injury was caused by the action of the sun on hot floors. The leaves were infested with a fungus, but which, according to Dr. Cooke, is never destructive.

Fritillaria and other Bulbous Plants in Flower.—Both Mr. Elwes and Mr. Harpur-Cree exhibited some interesting and rare species of *Fritillaria*, *Muscari*, *Tulipa*, &c. The most gentlemanly and the most beautiful many-flowered *Fritillaria* from California, which in its dull green and purple-tinged flowers resembled a *Helicopsis*; it was probably a luxuriant state of *F. incandens*, *Hort.* *Bot. Am.* t. 193. Mr. Elwes had also a fine *Muscari* from Sicily, possibly *M. maximum*. Mr. Harpur-Cree exhibited *Tulipa pulchella*, perhaps a variety of *T. sibirica*, a very elegant anemone species; and a *Muscari*, supposed to be a new species, with dark purple, highly pinnate segments. Also *Fritillaria latifolia*, *Tulipa græca*, & a species collected by Mr. Elwes in Asia Minor, *Muscari Strangwayi commutatum*, &c.

Diseased Vine Leaves.—Mr. Henley, on behalf of Mr. Moren, read the original report, which was committed to the cause of the spotting and gradual decay of Vine leaves taken from a Vine under gentle forcing. No traces of insect or fungus agency could be seen, and it was suggested that it might be owing to defective nutrition or defective energy.

Rhododendron.—The Hon. and Rev. J. T. Boswell exhibited a splendid truss of flowers of a Himalayan *Rhododendron*, which Dr. Hooker thought was a cross between *R. argenteum* and *R. græcum*. The flowers were of a most beautiful red bell-shaped. It was cut from a fine tree growing at

Tregothan, Lord Falmouth's Cornish residence. Mr. Boswell also showed a seedling variety, named Mrs. Townsend Boswell, the flowers of which are bluish white with pink buds.

Life-size Portrait of the Rev. M. J. Berkeley.—Mr. Worthington G. Smith sent a sketch of the head and part of the bust of the Rev. M. J. Berkeley, which was intended to be an excellent likeness, and several members expressed the wish that the original or a copy should some day be found in the Library.

FLORAL COMMITTEE.—W. B. Kellogg, Esq., in the chair. First-class Certificates were awarded on this occasion to H. J. Elwes, Esq., Preston, Cirencester, for the beautiful *Tulipa Griegii*—a fine bold flower of a rich scarlet colour; to Mr. R. Dean, Reading, for three new and distinct varieties of *Primula cortusoides*, distinguished respectively under the names of *corœula* alba, purpurea, and maxima—the first named being a very fine white, purpurea rich purple-lilac, and maxima a beautiful flower, rose, lilac, underneath and white in front; to Mr. G. Smith, Hedge Lane, Edmonton, for a fine gold-laced dark maroon *Polyanthus* named Duke of Wellington—a novelty at these meetings, such an award has never before been conferred; to Mr. R. Dean, Reading, and to Messrs. G. Beckwith & Son, for fancy *Pergaronium* Duchess of Bedford, as a decorative plant. It is a free grower, and remarkably floriferous, the trusses being of good size, and the flowers white, with a yellow eye and purple spots. It must prove a grand market and decorative plant. Silver medals were awarded to Messrs. Wm. Kollinson & Sons, Tooting, for a group of standard *Azaleas*, numbering some two dozen, all of which carried fine heads of bloom, and were of rich colour; to Mr. R. Dean, Reading, Berkhamestead, for a large group of admirably flowered *Rhododendrons*, and small collections of *Azaleas* and *Roses* in pots; to Mr. B. S. Williams, and Mr. John Wills, South Kensington, for admirable groups of *Rhododendrons* and fine flowering house plants; and to Messrs. Osborn & Sons, Fulham, for an attractive collection of fine-foliage subjects. Bronze medals were voted to Mr. R. Dean, Ealing, for a choice assortment of hardy spring-flowering plants; to Mr. Turner, Slough, for a good display of show and alpine *Auriculas*; and to Messrs. Croucher & Bolter, Kewal New Town, for a small collection of miniature succulents. Several new plants were exhibited by Mr. R. S. Williams, and Messrs. Brook & Co., and a choice sample of a fine new hybrid *Mignonette*, a vigorous but somewhat coarse variety. A group of decorative plants shown by Mr. Aldous, Gloucester Road, South Kensington, was accorded a vote of thanks.

FRUIT COMMITTEE.—H. Webb, Esq., in the chair. A Cultural Commendation was awarded by this body for a good brace of *Telegraph Cucumbers* by Mr. R. Cooper, gr. to R. S. Taylor, Clapham Common; and a vote of thanks was passed to Mr. Tillery, gr. to the Duke of Portland, for examples of late kept Grapes, which included Lady Downe's, Royal Vineyard, and a black seedling variety of Lady Downe and W. S. P. The latter. A remarkable instance of fasciation in the stem of a Cucumber was shown by Mr. Bennett, of Rabley; and samples of a small seedling Apple, named Baron Liebig, came from Mr. James Pink, gr. to Lord Sondes, Lees Court, Faversham.

THE EXHIBITION OF COVENT GARDEN PRODUCE was held in the arcades on either side of the Royal Exchange, and a most beautiful display of flowers it proved to be, notwithstanding the shortness of the notice that the growers had. There were not quite so many exhibitors taking part in the show as we expected to have seen, but the arcades would hold no more, and the exhibitors who did come did so very largely, and deserve all praise for their efforts to make the show a success. The Society was very liberal in its acknowledgment of the more meritorious collections, and all seemed well pleased with the results of the judging, but one individual, who, being aggrieved at having a silver medal only awarded to him, rejected the prize, and marked his cards "not for competition." To act in this way is unbecoming a grower of flowers. We shall do him the favour this year of not awarding him a medal, but we shall urge the gentleman to learn to accept defeat more cheerfully before he enters a competition again.

We are glad to say that the attendance of visitors was very good, the conservatory and arcades being well filled to the utmost. It is to be regretted that we have not had the pleasure of recording for some time. In the morning the exhibition was visited by the Duke and Duchess of Bedford, who carefully inspected the various collections, and appeared to be well pleased with the show. The afternoon was spent in the general exhibition, and the exhibitors themselves, desire that a similar exhibition should be made annually, and that a sum of money should be raised for the purchase of cups and other suitable prizes. This was mentioned by the Hon. and Rev. J. T. Boswell, and we are glad. Not the least of the good results likely to accrue from

this exhibition is the promotion of a good understanding between the Duke and his tenants in the market, the better to be met, the more the Duke spoke to all his tenants who were present, and asked for any suggestions that they could make with a view to improving the market, or the convenience of the standstill, and the more the Duke's tenants were reasonable alterations that were required should be attended to. Shortly before 2 o'clock the Duke of Teck arrived in company with Her Royal Highness the Princess Mary, Duchess of Teck, and two of the children, and the most distinguished visitors were attended in their tour round the show by the President, Lord Aberdeen, and other members of the Council. In the conservatory the Duchess of Teck accepted from a young lady—Miss March—a handsome bouquet prepared by the exhibitors.

Turning now to the exhibition proper, we commence our notes with Class 1, which was for "A collection of plants," and in which gold medals were awarded to Messrs. G. Beckwith & Son, Tottenham; Mr. John Reeves, Acton; Mr. Herbert, Kew Nursery; Richmond; Messrs. J. & J. Hayes, Lower Edmonton; Messrs. Hawkins & Bennett, Lily Garden, Twickenham; and Messrs. H. R. & G. Wright, Turner Road, Lee. Messrs. G. Beckwith & Son made the most splendid display of show and fancy *Pergaronium*, the space occupied by their plants being 10 feet in length and 10 feet in width. The whole of the plants were in the regulation market pots, of fine proportions and development, with an abundance of flowers of various colours, and a good variety of colours. The same firm also showed a very valuable new *Heliotropium*, raised from the variety known under the name of *Florence Nightingale*. Plants of the new sort, which is a good one at all points, have been sold in the market for some time, but it was not named until today when it was introduced from Scotland. Mr. John Reeves also put up a grand group of plants, which included very showy masses of *Hydrangeas*, such *Pergaronium*, *Mignonette*, the Lily of the Valley, *Richardias*, and double white *Primulas*, effectively mixed with Maidenhair Ferns, *Helicopsis*, *Gardenias*, *Fuchsias*, *Roses*, *Spiræas*, and *Crotons*, *Dracænas*, *Coleus*, and small *Falms*, &c. Mr. Herbert's large, richly furnished, and most tastefully arranged group of plants consisted of *Palmæ*, small *Yuccas*, and *Spiræas*, grand masses of Lily of the Valley, the culture of which Mr. Herbert is a master; *Azalea rosea punctata*, an old and wonderfully free flowering plant of pleasing colour; *Primula cortusoides* anemosa, small *Telegraph Cucumbers*, and a fine group from Bourton, in the way of a *Telegraph Cucumber*. Messrs. J. & J. Hayes, of Lower Edmonton, contributed very largely, filling a stage about 80 feet long and 6 feet wide, the whole forming a dense mass of flowers. The subjects exhibited were *Telegraph Spiræas*, Show, Zonal, and Tricolor *Pergaronium*, *Cinerarias*, *Fuchsias*, *Fairy Roses*, *Cytisus*, *Azaleas*, *Ericas* and *Verbenas*, all being well grown and thoroughly well bloomed. Messrs. Hawkins & Bennett, Lily Garden, Twickenham, had a fine group of *Pergaronium*, arranged in pink, white, and scarlet, and in colour, all in small pots, and well grown and flowered. The same firm also showed large bunches of cut flowers of *Pergaronium* and Maidenhair Ferns, and Messrs. H. R. & G. Wright, Turner Road, Lee, staged a fine and effective group of *Palmæ* mixed with *Ferns*, *Anthuriums*, *Dracænas*, and a few *Orchids*, consisting principally of *Dendrobium nobile*. Silver medals were awarded to Messrs. W. & A. Brown, of Covent Garden, for a choice group of *Palmæ*, Zonal and *Pergaronium*, *Fairy Roses*, and *Fuchsias*, together with numerous examples of a compact and very free-flowering variety of *Silene* and of *Myosotis disciflora*. The *Silene* is evidently a new plant, and we are glad to see it in the hands of many a gardener. To Mr. James Puttick, Park Road, Acton, for a beautiful display of Show and Zonal *Pergaronium*, neatly grown and admirably flowered, and *Helicopsis* magenta and purple Stock, &c. To Mr. G. Poulton, Fountain Nursery, Ainger Road, Edmonton, for a group of *Spiræa japonica*, consisting of over 130 plants in 48-pots, splendidly grown and flowered. To Mr. H. B. Smith, Ealing Green, for a fine group of *Telegraph Cucumbers*, and other fine-foliage plants, *Ferns*, *Scalaginellas*, &c. To Messrs. Hooper & Co., Covent Garden, for an effective group of *Palmæ* and *Ferns*, *Caladiums*, *Polka Coleus*, and other fine-foliage subjects. To Mr. Thomas Paget, Clapham, S.W., for a large group of plants, mostly *Cytisus racemosa*, mixed with *Spiræa japonica*, *Palmæ* and *Dracænas*, *Ferns*, &c., and to Messrs. Barr & Sugden, King Street, Covent Garden, for a large group of cut blooms of *Narcissus* in a dozen varieties. In this last group of plants in display of these showy hardy flowers which has ever been seen, and was especially rich in variety.

Cut flowers of choice quality being still scarce and valuable, was perhaps the reason why bouquets, and to some extent sprays of flowers, were rather poorly represented. But certainly the present tasteful fashion

of using enormous masses of costly flowers gave the makers no inducement to exercise their ingenuity, as the sacrifice would have been too great." The great inducement to this vulgar profession is that both the exhibitors and purchasers suffer, and the result of a bridal or ball-room bouquet of the present form is inconveniences, as many flowers being laid up together in one bouquet as would make at least two far prettier than we do now, and the bride or the bridegroom, who profit little by this extravagance. It is the old story of a display of wealth. In spite of this difficulty one or two of the exhibitors were very successful; but we were gratified to see that the same inducement the acquisition of butterfly and humming birds on bouquets. For a bridal bouquet Messrs. Walter Wood, Parnley & Co., Knightsbridge, were awarded a silver medal. It was the least objectionable as regards size, but it was almost overdone with Fern, and the wiring of orange blossom on small-leaved Myrtle rather spoiled the otherwise natural effect. A bouquet of the same class exhibited by Mr. James Brownich, Buckingham Palace Road, was highly Commended. As a tasteful arrangement of flowers it did not suffer by comparison; but *Hoteia japonica* is now a common plant, and flowers of this were largely used. The same florist, deservedly as the fagon goes, gained a silver medal for his ball-room bouquet. A bronze medal was also given to Mr. Dickson, of Covent Garden, for a group of three bouquets, and Mr. J. Aldous received a similar reward.

Messrs. Wood & Parnley exhibited the only set of table decorations, for which they obtained a bronze medal. Though rather heavy, and the central flower being the objectionable addition of the evergreen humming birds, they had the merit of not being overdone with flowers. *Rhodante Mangliesi* and *Jonquils* were the most conspicuous flowers, interspersed with Ferns and variegated foliage.

Dried and dyed flowers should not be altogether desired, especially in a city where fresh flowers are so plentiful. Indeed, if they were not dyed unnatural colours there would be nothing to say against them, for are they not next to fresh ones? Messrs. Hooper & Co., of Covent Garden, had a great display of such things, and were rewarded with a bronze medal.

Fern cases (filled) were exhibited by Messrs. Barr & Sugen, Bromwich, and Dick Radclyffe, taking prizes in the order named. The great blemish in the two latter exhibits was the great display of ferns, which contrasted very unfavourably with the graceful, elegant, and sober-coloured foliage of the Ferns and other plants contained in the cases. The plain bronzed cases of Messrs. Barr & Sugen showed nothing disagreeable, and the ferns were of the best plants. Window cases and boxes filled with plants were exhibited by Messrs. Barr & Sugen only, and very pretty they were, but pots of *Rhodante Mangliesi* alternating with *Tulips* in a window-box struck us as a little incongruous.

The only exhibitors of collections of fruit were Messrs. Webber & Co., and Messrs. J. & W. Draper, both of the Central Avenue, and gold medals were awarded to both firms. The collection shown by Messrs. Webber & Co. consisted of fine examples of Smooth Cayenne Pine from the Azores, and also from home growers, the former being more dumpy in shape than the English grown specimens. Large Pear-shaped Shadocks from the West Indies, fresh Broad Turkey Figs from Guernsey, new and old figs, grapes, Large Black Currants, and a collection of English grown Early Beatrice Peaches and Strawberries, Blood Oranges from Valencia, Bananas from Madeira, Cob Nuts from Kent, Easter Beurré Pears from California, English grown Pineapple de Lez ears, a beautiful coloured English Apple of name unknown; and Mandarin Oranges from Sicily, &c. In the Messrs. Draper's collection we noticed Pomeles of fine size from the West Indies; Lemons and Tangier Oranges from Palermo; and Blood Oranges from Valencia; Lady Apples in fine condition, from Montreuil; white Grapes from Fontainebleau, Calville Blanc, Golden Russet, and Dieu D'onne Apples from Montreuil, Easter Beurré Pears from Meaux, and Tomatos from Toulouse, &c.

In a class for Vegetables and salading materials, the Messrs. Draper also took a silver medal with a capital collection, which included numerous examples of Cos and Cabbage Lettuces, fine curled Endive, long white Turnips, short Horn Carrots, Cardoon, green Peas, and Spanish Asparagus grown in the neighbourhood of Paris; Giant Asparagus from Argenteuil, Cauliflowers from Angers, Globe Artichokes from Avignon, and French Beans from Toulouse. A similar award was also made to Mr. Parnley, Covent Garden, for a capital collection of home-grown produce, consisting of Rhubarb, Cabbages, Seakale, Parsley, Beet, Mint, spring Onions, long and round Radishes, Cabbage and Cos Lettuces, &c., all of fine quality, and put up in the best market style. Mr. M. Aldous, of Guernsey, had a bronze medal for a good sample of Myatt's Ashleaf Kidney Potatos; and from Messrs.

Beer & Sons, Cheswood Gardens, Worthing, came seven brace of fine Telegraph Cucumbers.

The exhibitors and their friends, to the number of about 25, dined together in the evening at the "Crown Tavern," under the presidency of the Marquis of Tavistock, who was supported by several members of the Council of the Royal Horticultural Society. The usual royal toasts were proposed by the Chairman, and these were followed by "The Health of the Duke and Duchess of Bedford," proposed by the Vice-Chairman, Mr. John Hayes, and acknowledged by the Chairman, who spoke briefly and to the point, and then stated that it was his desire to assist in every way that he could the progress of the horticulture, and the welfare of the tenants in Covent Garden. Mr. T. Rollison proposed "The Royal Horticultural Society," and Lord Alfred Churchill, responding, said the Council of the Society were grateful for the services that had been rendered by the exhibitors in making such a fine display, and remarked that the Society was becoming more prosperous. Mr. Willis proposed "The Exhibitors," and the toast was acknowledged by Mr. Herbst, Mr. Webber, and Mr. Brownich. "The Market Gardeners" was then given, and responded to by Mr. Ponnart, of Twickenham; and "The Press," acknowledged by Dr. Hogg. The able services rendered by Messrs. Barron, Howard, and Dickson, and the prompt and efficient manner in which the arrangements for the exhibition, were next suitably acknowledged, and the meeting broke up at a late hour.

Royal Botanic, April 18.—The show on this occasion was somewhat limited as to quantity, but the subjects were mostly above the average quality, so that a very good effect was produced. The principal subjects consisted of groups of nine pot Roses, for which Messrs. Barron, of Cheswood, and Mr. Turner, of Slough, showed in competition, the 1st prize going to the former, for dwarf stocky well-bloomed specimens of rather small size, those from the latter exhibitor having apparently during the late fall weather been rather more neglected, and got them into blossom. Indeed, in this respect, neither collection was quite at its best. A bank of about fifty exceedingly well-grown and profusely bloomed fresh-looking plants from the Messrs. Veitch & Sons, of Exeter, with the prettiest and most numerous of new Roses of 1875-1876, consisting mostly of his own seedlings, shown by Mr. Turner, gave quite a character to the show, which may be regarded as mainly a show of spring or early Roses. In this latter collection Messrs. Barron and Turner were very noticeable. In the nurserymen's classes for Azaleas Mr. Turner and Messrs. Ivery & Son, of Dorking, showed good collections of six, Mr. Turner having one two splendid examples of high cultivation, Apollo and Duc de Nassau, being especially good. The amateurs' Azaleas, contributed by Mr. Katty, gr. to R. Thornton, Esq., The Hoe, Sydenham Hill, Mr. James, and Mr. Wheeler, were also creditable examples. Messrs. James and Sons, of Exeter, showed a dwarf well-bloomed plant of variety of his fine strains, which quite eclipsed a competing collection from Mr. Ford, gr. to J. G. Mega, Esq., in which, though the plants were good, the varieties were very inferior in quality. One collection of twelve Auriculars was staged by Mr. Turner. Miscellaneous groups were shown by Mr. B. S. Williams, Messrs. Veitch & Sons, and Mr. Wheeler. Mr. James had a fine bank of Cyclamens, still fresh and in flower, with two groups of plants, well-flowered, of *Clerodendron biflorum*—Mr. Walker, of Thame, had two boxes of cut Roses, one consisting of good blooms of *Maréchal Niel*; and last, but not least, a very effective and creditable group of *Orchids*, by Messrs. Barron, gr. to J. G. Mega, Esq.

A few interesting novelties were shown. Messrs. Veitch & Sons had Botanical Certificates awarded for *Acalypha muscica*—a plant in the way of A. tricolor, with cordate-ovate, serrated leaves of a yellowish green, flecked with dark green, and flushed with a copper red hue; for *Coleus multicolor*, from the South Sea Isles, a distinct-looking plant, with ovate acuminate, incise-serrate leaves, in which maroon and copper bronze replace the ordinary green colour on the leaflets; for *Chrysanthemum*, a very distinct and a bright-looking variety with long drooping leaves, of very variable form, some being linear-oblong nearly normal in outline, and others more or less depressed, and in the upper half, but all marked with a clear bright yellow variegation; and for *Pulsatilla* from Hoflontium (figured at p. 365, vol. vi.), which has large deflexed clear green smooth three-parted leaves on longish erect petioles. They had also *Calceolarias*, by Messrs. Veitch & Sons, with green edge; and *Croton* variegated with longish irregular-shaped leaves variegated with creamy yellow and rose, and coarse-looking. Mr. B. S. Williams, of Holloway, had a Botanical Certificate for *Adiantum neo-guineense*, by Messrs. Barron, gr. to J. G. Mega, Esq., W. Terry, Esq., Peterborough House, Fulham, and another for *Hemanthus Terryi*, a plant with dark

purplish red stem-sheaths, green leaves, later than the flowers, and a globose head of flowers, consisting of narrow pink spreading perianth segments, and erect filaments tipped with yellow anthers—a pretty plant, related to *H. multibras* and *tenudioris*, but apparently distinct. Mr. Williams showed also *Croton* Prince of Wales, with long broadly linear leaves, which are here spiralled twisted, rather irregular at the base, and are marked with a pale yellowish green; it will probably improve in colour as the season advances.

Among florist's flowers the only awards were to Messrs. Fair & Son, for a splendid H.P. Rose Margaret Bessant—a refined, full, smooth-petalled deep crimson shaded with maroon, and to Mr. James for two of his splendid *Cinerarias*, Lord George Hamilton, magenta-rose, very smooth and rich, with grey disk; and Sarah Winter, a large purple-rose, with broad white ring around the dark purple centre. Messrs. Ivery & Son exhibit a rose-coloured Azalea, called Rose Ivery, of which there was too little to judge. Mr. Turner also showed an Azalea called Bon jour de Commerce, a compact free-blooming, semi-double, fiery orange, with rather small flowers, but no doubt good as a market or decorative plant.

The Villa Garden.

OUTSIDE WINDOW BOXES.—During the prevalence of these terrible east winds, tender plants in outside window boxes are having a sad time of it. The east wind is in a terrible rage, and there is no mercy in it; for the last few days it has been blowing with the force of a northern hurricane chilled with frost blasts, and sending messages from the winter that its power was being made manifest by Hyacinths across the way, which receives the full force of the dry, harsh, biting wind, presents a sad appearance, for the flowers are damaged beyond hope of recovery, and the prostrate blossoms are rapidly withering.

Some side protection would have saved the flowers. A kind of wooden shutter the width of the box, 9 inches in height, painted green, and securely fixed, would have effectually screened the flowers on the east side. A handy carpenter could soon contrive to construct and fix such a side-screen, which should be removable at will. Window gardeners seldom think of the necessity for providing against emergencies of weather, notwithstanding they have a great fondness for flowers, and will cheerfully undergo some expense to beautify their boxes. And then comes a time of blustering east winds in April, and lo! a few hours lay low all the floral beauty of an arrangement that, during the prevalence of sunny, genial spring weather, was charming to look upon.

To-day, as we write, while a chilling east wind is thus raging, in some of the most aristocratic parts of London there are many external window-boxes filled with pretty flowers, generally far too fragile to cope with such weather, that are rendered almost worthless in one short day. It is, however, a matter of small concern in many instances, for the boxes are filled by contract, and injuries are remedied as soon as they are received. But there are hundreds of flower-loving spirits who give their boxes a careful and undeviating attention, because they are difficult to obtain, costing money, that cannot always be spared. To such it is of some moment that their plants be preserved to them as long as possible, and various shifts are resorted to to ensure their well-being. They are sometimes devoid of artistic merit, but they serve the end for which they were constructed.

A screen formed of some permanently growing plant is the best that can be extended to them. The best form is that of a stout wire frame fitted to the window, but arching slightly at the top. It should be made of a sufficient width to protrude some 3 inches beyond the width of the box at the bottom on either side, so as to afford a screen from side winds. It matters but little from which quarter the wind blows, there will be certain to be a strong current of air passing up or down the street, sometimes both ways at once, so erratic is the course of the wind on a gusty day. This wirework can be fastened securely to the wall of the box, and also to the brickwork forming the frame of the window, and then it would be secure against the action of east winds. It should be painted of a cheerful hue of green. By planting the Irish or some other suitable Ivy at each end of the box it can be trained up and over the wire framework, and eventually it becomes a green frame to the window. A

piece of wirework might be fitted along the front of the box, and to this the wirework might be fastened; or the front of the box might be reserved for flowering plants to hang over during summer, such as *Trochilium*, *Convolvulus mauritanicus*, Ivy-leaved *Pelargoniums*, &c.

The box should be spacious enough to afford room for the Ivy and also room-space for plants. During the winter it might be filled with *Hippuritan* evergreen or variegated plants, such as *Eucrymus*, *Asclepias*, *Reticospora*, *Thapsi* sempervirens; and with these might be mingled *Laurestinus*, and anything that would flower. Such plants as these bear removal once or twice a year; and the plants could be lifted from the box at the beginning or middle of May, potted, and stood by in the shade till October or November, and then be planted in the boxes, without disturbing the ball of roots in doing so, but pressing some soil firmly about them at the time of planting. During times of severe frost such plants would gain little or no harm if kept dry at the roots. There is no reason why the plants should not be taken out of the box at the beginning or middle of March, and the box again filled with any pretty hardy spring plants, such as *Primroses*, *Daisies*, *Fancies*, *Abutilons*, &c.; or some of the plants at least could remain in the box, and the spaces be filled up with the plants above-named.

If the front of a house were fitted up with window boxes with wire-screens, there is no reason why Ivy alone should be used in all cases. Some delicious creepers might also be employed, such as *Virginia Creeper*, *Clematis*, *Hops*, *Jasmine*, *Lonicera*, &c., to give a different shade of foliage, mingling with which would be pleasant flowers. But the Ivy is certain to suggest itself; for it is so easily managed, can exist in a dry soil for a time without injury, does not readily shed its leaves, always affords green foliage, and defies sun and wind. How appropriate are Mrs. Hemans' chery lines:—

"It changes not as seasons flow
In changeless silent course along:
Spring finds it verdant, leaves it so—
It outlives summer want."

"Autumn wean on rusted stain
Upon its fadeful glory flings;
And winter o'er it sweeps in vain,
With tempest on his wings."

April 13.—A fine day, partially cloudy. Cool.
14.—A dull cloudy day. Fresh breeze from S.W.
15.—A fine but dull and cloudy day. Rain fell in early morning.
16.—Fine, but generally cloudy and cool.
17.—A fine day, cloudy. Gale. Cloudless at night.
18.—A very cloudy, but clear, day, with frequent showers of hail and rain. Gale of wind.
19.—Overcast, dull, cold, and windy throughout. A little rain fell at 9 P.M.

LONDON: *Barometer*.—During the week ending Saturday, April 14, in the vicinity of London the reading of the barometer at the beginning of the sea increased from 29.66 inches at the beginning of the week to 29.71 inches by the morning of the 8th, decreased to 29.52 inches by the morning of the 10th increased to 30.07 inches by mid-day on the 12th, de-

creased to 29.08 inches by the afternoon of the 13th, and increased to 30.18 inches by the end of the week. The mean reading for the week at sea level was 29.81 inches, being 0.25 inch above that of the preceding week, and 0.12 inch above the average.

Temperature.—The highest temperatures of the air observed by day ranged from 58° on the 10th to 52° on the 12th; the mean value for the week was 55°. The lowest temperatures of the air observed by night varied from 24° on the 12th to 43° on the 10th; the mean for the week was 41°. The mean daily range of temperature in the week was 14°, the greatest range in the day being 18° on the 13th, and the least 11° on the 9th.

The mean temperatures of the air and the departures from their respective averages were as follows:—8th, 48° 3', +2.9; 9th, 48° 9', +3.3; 10th, 50°, +4.3; 11th, 47° 9', +2.1; 12th, 41° 8', -4.1; 13th, 45° 5', -0.6; 14th, 45° 6', -0.7. The mean temperature of the air for the week was 46° 9', being 1° above the average of sixty years' observations.

The highest readings of a thermometer with blackened bulb *in vacuo*, placed in sun's rays, were 114° on the 12th, and 103° on the 11th; on the 8th the reading did not rise above 73°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 33° on the 12th, 35° on the 13th, and 36° on the 10th; the mean for the seven low readings was 32° 15'.

Wind.—The direction of the wind was variable, and its strength gentle. The weather during the week was dull and showery, and the sky cloudy. A slight *thunderstorm* occurred during the afternoon of the 11th, and fell on six days during the week; the amount collected was 1.57 inch.

ENGLAND: *Temperature*.—The highest temperatures of the air observed by day were 63° at Truro, and 61° at Bristol; at Sunderland 48° was the highest temperature; the mean value from all stations was 57°. The lowest temperature of the air observed by night was 30° at Eccles; at Portsmouth 40° was the lowest temperature; the general mean from all stations was 36°. The range of temperature in the week was the greatest at Truro, 28°, and the least at Sunderland, 12°; the mean range of temperature from all stations was 27°.

The mean of the seven high day temperatures was the highest at Truro, 58°, and the lowest at Sunderland, 46°; the mean value from all stations was 52°. The mean of the seven low night temperatures was the lowest at Eccles, 37°, and at Portsmouth 40° was the lowest temperature; the general mean from all stations was 41°. The mean daily range of temperature was the greatest at Blackheath, Leicester, and Cambridge, all 14°, and the least at Liverpool and Sunderland, both 7°; the mean daily range of temperature from all stations was 11°.

The mean temperature of the air for the week from all stations was 45½°, being 4° higher than the value for the corresponding week in 1876. The highest occurred at Truro, 63°, and the lowest at Sheffield and Sunderland, both 41°.

Rain fell on five days in the week at most places, at Sunderland 1½ inch was measured, and at Blackheath 1¼ inch, while at Truro and Plymouth a quarter of an inch only was recorded; the average fall over the country was nine-tenths of an inch. The weather during the week was dull and showery, and the sky generally was cloudy. *Thunderstorms* occurred at Leicester during the evening of the 10th, and at Blackheath during the afternoon of the 11th.

SCOTLAND: *Temperature*.—The highest temperatures of the air ranged from 50° at Paisley and Leith, to 40° at Glasgow; the mean value from all stations was 48°. The lowest temperatures of the air varied from 27° at Paisley and Perth to 30° at Greenock; the general mean from all stations was 29°. The mean range of temperature from all stations was 19°. The mean temperature of the air for the week from all stations was 38½, being 1½° lower than the value for the corresponding week in 1876. The highest was at Greenock, 40°, and the lowest at Edinburgh, 35°.

Rain.—The amount of rain measured during the week was 1.10 inch at Edinburgh, 1¼ inch at Aberdeen, to a quarter of an inch at Greenock. The average fall over the country was nine-tenths of an inch.

DUBLIN.—The highest temperature of the air was 61°, the lowest 34°, the range 27°, the mean 47°, and the fall of rain 1.10 inch.

JAMES GLAISHER.

Obituary.

We regret to announce the death, on March 31, of Mr. WILLIAM FOSTER, nurseryman and seedsman, of Strood, Gloucestershire. The deceased gentleman, who was in his 78th year, was placed at the age of 15 years (about the close of the Peninsular War) in Hank's nursery, at Pontefract, at that time perhaps

the most important establishment of its kind in the North of England; and from that time he had depended solely on his own industry for a livelihood, for home he had none to return to. When he had gained some knowledge and experience here, he came to London, and entered the service of Messrs. Gray & Sons, of the Brompton Park Nursery. At the close of the three principal nurseries, namely, those of Lee's, Malcolm's, and Gray's, and the *employés* were known respectively as Lee's gentlemen, Malcolm's lions, and Gray's slaves. Of these nurseries, Lee's is the only one now in existence. With the Messrs. Gray Mr. Foster stayed for some years, the latter part of which he represented them in the country, travelling for nine months every year on horseback. In this way he travelled through most parts of England, and over a great portion of Scotland. He left London about forty-five years ago, and after a short engagement in Cirencester, commenced the business, at Stroud, in the management of which he took an active interest until within a few weeks of his death.

Equities.

He that questeth shall learn much.—BACON.

182. JUSTUS HEURNIS.—Can any of your readers give information concerning the collector, Justus Heurnis, mentioned in the preface to *Thunberg's Flora Capensis*, p. 5, as to the vessel in which he sailed to the Cape, &c.? I shall be greatly obliged for any communication through the medium of this paper. *N. E. Brown, Herbarium, Kew.*

Answers to Correspondents.

ALOCASIA MACROPHLEA VARIEGATA: *A Constant Reader*.—To grow *Alocasia macrorrhiza* variegata successfully it is necessary in the first instance to choose young plants that have a right balance of colour in the leaves.

If when the plants are small they are green, they generally are too delicate to grow freely; if too green they rarely, if ever, afterwards attain sufficient colour, although a plant that is almost wholly green will produce flowers varying from green to a pale yellowish white. Those should be selected that are about half green and half green, taking them off with some roots attached; when they have got three or four leaves each, put singly in small pots and cover with a bell-glass till they have got established; give more room-room as they require it through the summer, and about February they may be moved into 20 or 30 inch pots. The plants like very rich soil, equal parts rotten dung and good loam will answer the best for it; in this it will grow strong and colour beautifully. Confine the roots but rarely any influence in inducing it to colour, in the case of a vigorous subject like this it will prevent its making satisfactory progress.

ARAUCARIA GUNCELSA GLAUDIA: *F. E. N. Aruacaria* excoela glauca is certainly a greenhouse plant, and therefore admissible in a collection of stone and greenhouse fine-foliated plants; but what comparative value a judge would attach to a handsome specimen we cannot tell, but he would probably give precedence to an equally fine specimen of a Croton or Palm.

AZALEAS: *F. Calvert*. There is nothing in the schedule restricting the twelve *Azaleas* to single blooms of each. Such an exhibition would be a very poor one as compared with your exhibit in trusses of three.

BLUE GUM TREE: *A Country Subscriber*. If you should have any more of them the protection of a greenhouse or frame, there should be no difficulty in getting seedlings, but they would, of course, germinate quicker and grow better in a house than in the open sheltered localities, but whether, in your case, it would require protection during winter, we cannot say, as you have given no data to form an opinion on.

CATERPILLAR: *A Country Subscriber*, p. 478. It is difficult to find a remedy for the first stage of attack of the Apple moth when it affects the buds of orchard growth on such a large scale, but something may be done for the prevention of it, and burning all attacked buds that are in reach. For future preservation, as soon as the caterpillars begin to spin their webs, they may be easily destroyed by the hatch shaking the boughs on which they sit quiet during the day, so as to make them fall on a sheet spread beneath, and then to see that they do not escape. Apple moth, *Gardener's Chronicle*, 1849, p. 560. Lime dusting, burning fires of rubbish near, or anything that would make the smell annoying to the work, the grub disposition would be then of service, but probably at present there is nothing to be done but what little can be managed in the way of picking off buds.

GUN LICENCE: *Walsley*. If you use the gun for any other purpose than scaring birds you must take out a licence.

INSECTS: *K. Julius guttatus*. No absolute remedy known. Try traps made of hollow Potatoes, &c., into which the Jull may come. *A. M.—Constant Reader*. Larva of the Daddy Longlegs? Try sprinkling with blue-green.

NAMES OF PLANTS: *W. D. F.* *F. Polystichum angulare proferum*.—*G. O. C.* *F. Polystichum caucasicum lobatum*.—*Walsley*, 1, *Erica carnea*; 2, *Helicoborus scutellariifolius*.

AGRICULTURAL LOCOMOTIVES,

STEAM PLOUGHING MACHINERY,
ROAD LOCOMOTIVES, TRAMWAY LOCOMOTIVES,
STEAM ROAD ROLLERS.

For Prices, Description, and Report, of Working, apply
to the Manufacturers,

AVELING & PORTER,

ROCHESTER, KENT: 72, CANNON ST., LONDON,
E.C. 1; and 9, AVENUE MONTAIGNE, PARIS.

AVELING & PORTER'S ENGINES have gained the highest
Prizes at every important International Exhibition. The two
Medals for Progress and Merit were awarded them at Vienna
for their STEAM ROLLERS and ROAD LOCOMOTIVES:

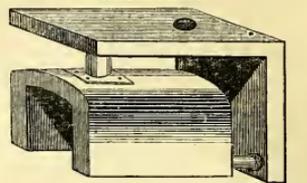

and at the last trials of the Royal Agricultural Society of
England their AGRICULTURAL LOCOMOTIVES gained the
First Prize after exhaustive trials, when one of their 10-horse
power Engines, fitted with single slide and ordinary link-
motion, indicated 35-horse power, with a consumption of three
and one-fifth pounds of coal per horse-power per hour.

AN EXTRAORDINARY BOILER.—

During the Great Boiler Contest at Birmingham, in
1875, all Boilers were severely tested to prove their respective
merits. One test was, "How long can each Boiler go without
Night Attention?" However, one Boiler proved this to a sur-
prising degree, as after being shut up for seven hours (from
9 P.M. to 9 A.M.) it still retained its heat in 1000 feet of 4 inch
pipes, and yet had more than 7 bushel of fire drawn from its
furnace in the morning—equal, in point of fact, to seventeen
hours of continued firing! What a boon to Gardeners. This was
THE CHAMFON, Deards' Patent Coal Coll Boiler, for
Drawings and Prices of which send two stamps to

Messrs. DEARDS, Boiler Works, Harlow,
who now have their Boilers at work in every county of England
except three. Amateurs will also find **THE WONDER**,
smaller kind of Boiler, equally as satisfactory, and certainly
"the best thing" out. Awarded five First Prize Silver Medals.

JONES'S PATENT "DOUBLE L" SADDLE BOILER.

These Boilers possess all the advantages of the old Saddle
Boiler, with the following improvements—viz. the water-space
at back and over top of saddle increases the heating surface to
such an extent that a "PATENT DOUBLE L SADDLE
BOILER" will do about twice the amount of work with the same
quantity of fuel; the cost of setting is also considerably reduced,
and likewise the space occupied, at the same time these Boilers
are simple in construction, and being made of wrought iron are
not liable to crack. They are made of the following sizes:—

Sizes.			To heat of 4-in. Pipes.	Price.
High.	Wide.	Long.	Feet.	£ s. d.
20 in.	18 in.	18 in.	300	7 0 0
20 in.	18 in.	24 in.	400	8 0 0
20 in.	18 in.	30 in.	500	9 0 0
24 in.	24 in.	24 in.	700	12 0 0
24 in.	24 in.	30 in.	800	14 0 0
24 in.	24 in.	36 in.	1,000	16 0 0
24 in.	24 in.	42 in.	1,200	20 0 0
28 in.	28 in.	48 in.	1,500	25 0 0

Larger sizes if required.

From Mr. CHARLES YOUNG, Nurseryman, Batham Hill, S.W.

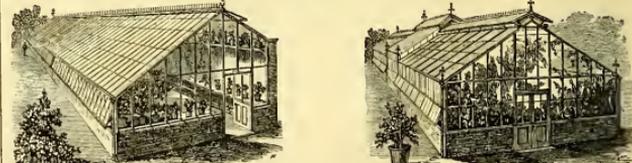

"Having given your Patent 'Double L' Boilers a fair trial
at my Nurseries, I beg to say that they are most satisfactory.
I consider them the best in use, and without doubt the most
economical of all boilers: they will burn the refuse of other
tubular boilers I have in work."

PRICE LISTS OF HOT-WATER PIPES AND CONNECTIONS,
with Boilers, of all sizes and shapes; or ESTIMATES for
HOT-WATER APPARATUS, erected complete, will be
sent on application.

**J. JONES AND SONS, Iron Merchants, 6, Bankside, South-
wark, London, S.E.**
When ordering Boilers please refer to the above advertisement.

W. G. SMITH & CO., HORTICULTURAL ENGINEERS,

Victoria Works, Bury St. Edmunds.

SOLE MANUFACTURERS OF BEARD'S PATENT METALLIC NON-CONDUCTING GLASS HOUSES.—
The Glass is fixed between two layers of prepared felt. The Ventilators are worked by a simple mechanical contrivance, and the
whole structure is screwed together so as to render it quite portable. HEATING APPARATUS IN ALL ITS BRANCHES.

ORNAMENTAL CONSERVATORIES and HORTICULTURAL BUILDINGS OF EVERY DESCRIPTION.—
For lightness, elegance and durability, these Houses cannot be surpassed. The best materials only are used in their construction.
Great improvements have recently been made, to obviate the objections to iron houses. Very extensive works on this principle have
been satisfactorily executed. An Illustrated Catalogue forwarded post-free on application.

MESSENGER & COMPANY,

CONTRACTORS, MIDLAND HORTICULTURAL BUILDING
AND HOT-WATER ENGINEERING WORKS, LOUGHBOROUGH,

Req. to inform their numerous Patrons and the Public
generally, that having erected new, more extensive, and com-
modious works, fitted with the best steam-power machinery, for
the construction of Horticultural Buildings in wood or iron,
plain or ornamental, large or small, they are in a position, from
their great facilities and experience, to carry out with dispatch,
in the best manner, at very moderate cost, the orders with
which they are entrusted. Only the most highly well-assorted
timber used. Glasshouses erected on Messenger's patent
principles are, owing to mechanical arrangements, very strong,
most durable, light, elegant, perfect efficiency for purpose
intended is guaranteed; are economical in cost and maintenance.
Messenger's Patent Boilers, Flexible Jointed Hot-water Pipes
and Valves, are now in use in many thousands of instances,
with the greatest success. Particulars on application. Plan,
and Estimates forwarded. Letters and Estimates waited upon.

The Plans of Landscape Gardeners, Architects, and others carried out. Richly Illustrated CATALOGUE post-free for 33 stamps.

Useful Publications.

MY GARDEN: Its Plan and Culture, and a General Description of its Geology, Botany, and Natural History. By ALFRED SUDS, F.R.S. Illustrated with more than 1500 Engravings on Wood.

To rank it in the same class as Gilbert White's "Natural History of Selborne" is very high praise, but in some respects it is even higher. It is a book which undoubtedly has ... but they are very few compared with the amount of information contained in its pages. Mr. Suds's "My Garden" is indeed a book which ought to be in the hands of every one who is fortunate enough to possess a garden of his own; and it is certain that some things in it form which he may profit. —From "Nature."

THE COTTAGE GARDENER'S DICTIONARY. With a Supplement containing all the New Plants of the Year 1876. Edited by GEORGE W. JOHNSON. Post 8vo, 6s. 6d.

THE BOTANIST'S POCKET-BOOK. By W. R. HAYWARD. Containing, arranged in a tabulated form, the nomenclature of British and Foreign plants, with their local names, &c. &c.

This volume is intended as a handy pocket companion for the botanist in the field, and will read him as readily on the spot the plants he may meet with in his researches. Besides the characteristics of species, are contained in it, the names, Common Name, Soil and Situation, Colour, Growth, and Time of Flowering of every plant, arranged under its own order.

"The diagnoses seem framed with considerable care and judgment, the characteristics having been well selected and contrasted."

SOWERBY'S ENGLISH BOTANY. Containing a Description and Life-size Drawing of every British Plant. Edited and brought up to the present standard of scientific knowledge by J. BOWEN (Bath, Wm.), LL. F.R.S., &c. With Popular Descriptions of the Uses, History, and Characters of each plant, by Mrs. LASCELLES, Author of "Wild Flowers of the British Isles," &c. &c. The Figures by J. C. SOWERBY, F.R.S.; J. De C. SOWERBY, F.R.S.; and W. G. SOWERBY, F.R.S. London: J. Edward Sowerby. Third Edition, entirely revised, with Descriptions of all the Species by the Editor. Eleven volumes, bound in cloth, £14. 12s. in half morocco, and £18 3s. 6d. whole morocco. Sold separately, or in parts, 2s. 6d. each.

WOOSTER'S ALPINE PLANTS. In two parts, each containing Fifty-four Coloured Plates, with one or two Figures on each Plate, Descriptions, and accurately Coloured Figures (drawn and engraved expressly for this work) of the most striking and beautiful British Alpine Plants. Edited by DAVID WOOSTER, Joint Editor of the latest edition of "The Encyclopaedia of Horticulture," &c. &c. London: "Hortus Britannicus." Super-royal 8vo, cloth gilt, 25s. The First Series, with Fifty-two Coloured Plates, 25s. London: GEORGE BELL and SONS, York Street, Covent Garden, W.C.

ADVERTISERS are requested to note that although we do not object to receive Letters to be called for, we cannot undertake to forward them.

To Nurserymen.

MANAGER, SUPERINTENDENT, SALERMAN.—Age 32.—Middle-aged, married, no family; twenty years' experience in the Nursery Business, as well as of England, good at Ball-room and Table Decorations, Bouquets, Seed Trade and Accounts, and the General Routine of Nursery Business. Desires respectable references given for character and abilities.—W. P., 16, Norfolk Buildings, Waterworks Road, Edgemoor, Birmingham.

TRAVELLER.—T. FOX, late of Tooting, is in want of a situation to Sell or Commission Nursery Stock, or Covent Garden Produce.—T. F., *Gardener's Chronicle* Office, W.C.

To Horticultural Builders, Hot-water Engineers, and Plumbers.—J. H. DRAUGHTSMAN, &c.—The Advertiser, who has had long experience in Designing and Carrying Out of Horticultural and other Works, and in Representing London Firms, will, in consequence of the sale of property, shortly be disengaged, and is desirous of an engagement as above.—Testimonials and references, upon application.—H. J., *Gardener's Chronicle* Office, W.C.

BOOK-KEEPER, or CLERK, in a Nursery or Seed Business.—Age 39; first-class references.—K. W., 41, Ebury Street, Westminster, London, W.

STEWARD, and CLERK OF WORKS on an Estate.—Has had long experience in Designing and Carrying Out of Work and Repairs, in Planning and the Management of Timber Park and Land, also in Horticulture and Landscaping.—References.—J. H. D., *Gardener's Chronicle* Office, W.C.

BAILIFF (WORKING), or BAILIFF and GARDENER.—Married, no encumbrance; large experience in Stock, Wide good Dairy and Poultry work, having through death of late employer. Unexceptional references.—L. V., Mr. Baxendale, Nurseryman, Guildford.

P P S S S C O C O A : GRATEFUL-COMFORTING.

"By a thorough knowledge of the natural laws which govern the operations of our human frame, we can regulate the action of the fine properties of well-selected Cocoa, Mr. Epps has provided for infants and invalids a most delicious and nourishing beverage which may save us many heavy doctors' bills. It is the judicious use of such articles of diet that a constitution may gradually but surely be restored, and the system will free itself from pure blood and a properly nourished frame."—*Civil Service Gazette*. JAMES EPPS & CO., HOMEOPATHIC CHEMISTS, 48, Thredeedle Street, and 170, Piccadilly.

KINABLY'S RUTH WHISKY. Universally recommended by the Medical Profession. A pure spirit, mild, delicious, and most wholesome. Dr. Hassall says, "The samples were soft and mellow to the taste, aromatic and fragrant, and the odor was pronounced to be pure, well-matured, and of very excellent quality."—Wholesale: 20, Great Titchfield Street, London, W.

ELLIS'S RUTHIN WATERS. PURE AERATED WATERS.

ELLIS'S RUTHIN WATERS.—Crystal Springs, Soda, Potass, Seltzer, Lemonade, Lithia, and for Gout, Lithia and Potass. Cords brewed by R. E. ELLIS, SON & CO., 10, Abchurch Lane, London, E.C. Wholesale and Retail by their Trade Mark. Sold everywhere, and Wholesale by G. ELLIS, SON & CO., 10, Abchurch Lane, London, E.C. W. BEST AND SON'S, 10, Henrietta Street, Cavendish Square.

DINNEFORD'S FLUID MAGNESIA. The best remedy for ACIDITY of the STOMACH, HEARTBURN, HEADACHE, GOUT, and INDIGESTION. It is only country adapted for delicate Constitutions, Ladies, Children, and Infants.

179, NEW BOND STREET, LONDON, W. DINNEFORD AND CO., Wholesale and Retail, to all Chemists.

BROCHMITTS, COUGHS, COLDS, ASTHMA, SHORTNESS OF BREATH, PHLEGM, TWO DR. LOCOCK'S PULMONIC WAFERS give immediate relief. They are only country adapted for delicate Constitutions, Ladies, Children, and Infants.

THE name in the Government Stamp, and the Trade Mark ("Dr. Locock") on the label. They instantly relieve all disorders of the Bronchus and Lungs, Bronchitis, Asthma, Consumption, Coughs, Colds, Rheumatism, and taste pleasantly. 12, to 15d. and 3s. 9d. per box.

HOLLOWAY'S Medical Discoveries. Diseases of the Lungs throughout the winter will manifest themselves on the approach of warmer weather, unless the blood be freed from impurities, and the body be strengthened by the use of the Pills. These Pills have long since established the highest reputation for the full and efficient manner in which they accomplish this purpose. They are the only Pills that, without injuring every tissue, and successfully grapple with all deleterious substances, can be taken in any season, and in any climate. Holloway's Medicine promotes comfort, cheerfulness, health, and strength. The Medicine is admirably adapted for the weak and delicate, who are unable to bear other purgatives, and whose digestions are upset by spring's variations and summer's heat.

FOLLOWS & BATE'S PATENT LAWN MOWERS.

AWARDED MEDAL FOR MERIT, VIENNA, 1873,

(The ONLY Medal given for Lawn Mowers);

Large Silver Medal (the First Prize), at the Meeting of the Royal Horticultural Society, Birmingham, 1872;

W. FANE TUCKER, Capt., Hon. Sec. T. H. S.

Bradford Tor, Torquay.

NEW PLANTS

FOR 1877.

B. S. WILLIAMS

BEGS TO ANNOUNCE THAT HE IS NOW SENDING OUT FOR THE FIRST TIME
THE UNDERMENTIONED NOVELTIES:—

ABUTILON, "PRINCE OF ORANGE."

A garden hybrid of free branching habit, and a most profuse bloomer, producing a succession of bloom nearly all the year. The colour is of a pale orange, richly veined with orange-scarlet. This will make a fine plant for conservatory decoration.

Price 10s. 6d. each.

*** ABUTILON ROSEFLORUM.**

A garden hybrid raised in this establishment, the result of a cross between A. Darwiniell and A. Boule de Neige; it has the dwarf free branching habit of the first-named parent, and the fine bold well-shaped flower of the second; the blossoms are produced in great profusion, and are rosy pink, shaded and veined with a richer tint of the same colour.

The *Gardener's Chronicle* says of this plant:—"Year new hybrid Abutilon is a very pretty and distinct variety, with bell-shaped drooping flowers of a pleasing salmon-tinted rose colour veined with rosy crimson. It will no doubt make a very useful decorative plant."

Price 10s. 6d. each.

AGALYPHA MUSAICA.

A very handsome species, imported by us from the South Sea Islands. The leaves are large and deeply serrated, of a bronzy green, richly variegated with various shades of orange, coppery red and crimson. This plant was one of the twelve New Plants which obtained the Gold Medal at Amsterdam, April, 1877.

Price 21s. each.

*** ADIANTUM PALMATUM (Moore).**

This handsome and distinct species, now offered for the first time, will make an excellent companion to A. farleyense, owing to the large size of its pinnae and the length of its fronds. It was discovered by M. Roel at an altitude varying from 50,000 to 11,000 feet, in Peru—a fact of great importance, as it may be cultivated in a greenhouse at temperature. Mr. Moore says of this beautiful Fern:—"The rhizome is creeping, and the fronds are of an indefinitely elongate form. A very noticeable feature in the plant is the flexuose or zigzag character of the rachides, most marked near the apex of the fronds and the rachides of the primary pinnae. The pinnales are herbaceous in texture, smooth, large, from 1 to 1½ inch in breadth, distant and very distinctly stalked, the stalks varying from ¼ to ½ of an inch; the terminal ones are usually wedge-shaped, while the lateral ones are usually truncate at the base, so as to become semicircular in outline; they are deeply cut down into from three to five large lobes, which are again more or less parted; an oblong sorus terminating each of the divisions in the fertile portions." This has received a First-class Certificate.

Price 21s. each.

AGERATUM, "LADY JANE."

A very superior distinct and compact form of Ageratum, with dense green foliage and robust constitution, growing from 12 to 14 inches high. The flowers when fully expanded are a bright blue, produced in abundance throughout the season. It is admirably adapted for either beds or lines.

Price 3s. 6d. each, 30s. per dozen.

*** ANTHURIUM ORNATUM.**

The Anthuriums comprise a very large family, many of them are unsurpassed for the beauty and usefulness of their flowers, and others for the magnificence of their foliage; but the one now offered combines both these features in well-grown plants. The petioles are about 3 feet long, leaves light green and cordate in shape, from 9 to 12 inches broad, slightly veined with white; the flowers are thrown well above the foliage on stout flower-stalks; the spathe, which is pure white, is from 6 to 8 inches in length, and 2½ in breadth, tapering towards the apex; the spadix, which is about 6 inches in length, stands up very conspicuous, being nearly black, but covered with a violet hue, slightly dotted with white. This most interesting plant should find a place in every collection.

Price 42s. to 63s. each.

ARALIA FILICIFOLIA (Ch. Moore).

This is a very elegant foliage plant, suitable when small for table decoration. The stems are of a deep olive colour, blotched with pale green; the leaves are dark green, glabrous, twice pinnately divided, with a single lobe at the end; the pinnae are about eight in number on each side of the midrib, each one being divided nearly to the base into linear, minutely saw-toothed and spine-pointed segments. The younger leaves are more finely cut than those first formed. It forms a pretty subject for dinner-table decoration an account of its extreme elegance. This plant was introduced by us from the South Sea Islands.

Price 21s. to 42s. each.

ARECA FLAVA.

This elegant and distinct species was raised from the same importation of seed as A. purpurea, but is totally distinct from that plant. The stem and petioles in this species are orange-yellow; leaves pinnate, pale green in colour.

Price 21s. each.

ARECA PURPUREA.

An elegant, neat growing Palm. Leaves pinnate; the stem and petioles are of a bronzy purple colour, which makes a very striking contrast to the pleasing green colour of the leaves. We have only at present seen this Palm in a young state, having raised it from seed received from Madagascar. It is very distinct, at least in the small state, from any Palm in cultivation; and on account of its dwarf and compact habit, and its graceful appearance, will be found to be admirably adapted for dinner-table decoration.

Price 21s. each.

*** CROTON CAMPTOPHYLLUS (Masters).**

A very narrow leaved form. Leafstalk ½ to ¾ inch, green in the centre, paler at both ends. Leaves 6 to 8 inches long by ½ inch wide, in form linear-oblong, dilated at the base, and with a central yellow stripe. The apex of the leaf is obtuse or shortly pointed. The leaves are variously twisted and curved. This species makes a good dinner-table plant. One of our introductions from the South Sea Islands.

Price 21s. each.

CROTON FALCATUS (Masters).

A loose form of habit; leaves 12 to 18 inches by 9 to 3 inches, leafstalk 1 inch long, pink in the centre, paler at each end. The leaves are strap-shaped, dilated and rounded at the base, sword-shaped, or sickle-shaped, with a dark purple midrib and margins, and with irregular blotches of yellow. The under surface is pale purple with green veins. This will make a splendid and distinct exhibition plant. Also one of our introductions from the South Sea Islands.

Price 21s. to 42s. each.

*** CROTON FASCIATUS (Masters).**

A bold, broad-leaved form; leaves 9 to 10 by 4 to 5 inches; leafstalk about 1 inch long brownish in the centre, paler at either end. The blade of the leaf is inversely egg-shaped, tailed rounded at the base, of a lively green colour, traversed by bright yellow veins, and marked with a few irregular spots and blotches. It is a fine variegated kind, of bold habit, and will prove a fine plant for exhibition purposes. One of our introductions from the South Sea Islands.

Price 31s. 6d. each.

CROTON MICROPHYLLUS.

This pretty graceful growing Croton is a garden hybrid raised in this establishment; the leaves are from 9 to 13 inches in length, and ½ an inch in breadth, lanceolate in shape; the stem and petioles are yellow, tinged with crimson; the leaves are sometimes half coloured, whilst in others the costa is marked with crimson, surrounded with a band of rich yellow—the margin pale green, splashed and speckled with the same colour. Will make a pretty table plant.

Price 21s. each.

CROTON NOBILIS.

This is a very elegant and distinct species, of free branching habit, with drooping leaves 18 to 24 inches in length, and about ½ an inch to 1 inch wide; ground colour dark green, the midrib being in the young state orange-yellow, changing with age to bright crimson; the remainder of the leaf is beautifully blotched and marbled with orange-yellow and crimson. This plant will be found invaluable as a decorative plant on account of its rich markings, and the graceful habit of growth. This was discovered by our collector, Mr. Goldie, in New Guinea, who says it is one of the most beautiful species he has seen.

Price 21s. each.

*** CROTON PARADOXUS (Masters).**

A narrow-leaved form, with short foot-stalks, purplish in the middle, paler at either end. The blade of the leaves measures 10 to 12 inches in length by ½ inch in width, the leaves are in form linear-oblong, with a spiny point. They are at first green, but subsequently become variegated with yellow or cream-coloured stripes and spots, especially in the centre, on either side of the pink midrib. The under surface is paler, and the central portion of a pale pinkish tint. Some of the leaves are twisted in the centre, others are "interrupted," the blade not being continuous throughout. This will form a compact plant for table decoration. Introduced from the South Sea Islands.

Price 21s. each.

*** CROTON, "QUEEN VICTORIA."**

We have great pleasure in offering the first hybrid Croton that has been raised in this country. It is the result of a cross between C. Weismanni and C. interruptum. It far exceeds in beauty any of the imported species offered up to the present time. It is of medium growth and free branching habit, a most desirable feature in the formation of good specimens; the leaves when well matured are from 9 to 14 inches long, and about 2 inches broad, oblong-lanceolate the ground colour of the leaf is rich golden yellow, beautifully mottled with green; the midrib and the primary veins are of a rich magenta colour, changing with age to a vivid crimson; the margin of the leaf is unevenly handed with crimson, often extending as far as the midrib; and so harmonising with the rich yellow as to produce a gorgeous effect. It has received a First-class Certificate.

Price 42s. each. Also a few extra-sized plants, prices on application.

B. S. WILLIAMS' NEW PLANTS, 1877—(Continued).

DENNSTÆDIA DAVALLIOIDES YOUNGII (Moore).

The following description of this beautiful plant is taken from the *Gardener's Chronicle* of March 24, 1877:—"This new garden Fern comes to us from Australia. It is no doubt very nearly related to the old *Dicksonia davallioides*, *Adiantum davallioides*, now referred to the genus *Dennstaedtia*, but it is much larger in its growth than we have ever seen that plant, of which for practical purposes it may therefore be regarded as a giant form. In its native state it is said to produce fronds 7½ feet in length, and so seen in this country, under pot culture, it has caudices as thick as one's finger, and fronds of 7 or 8 feet in length. To this stout and vigorous constitution it adds the elegance and gracefulness of minute subdivision, so that its roots, though large, are utterly devoid of coarseness, and it is, in fact, a remarkably ornamental plant, well adapted for occupying any bold and prominent position in a stove rocky, or even as a pot plant in a collection of stove or greenhouse Ferns it will always hold its position. The caudex, as already described, is as stout as one's finger, and of creeping habit, progressing forward somewhat freely, and throwing up its airy spreading fronds at intervals. The stipes is stout, nearly ½ inch in diameter, and of a dark brown colour, green-brown above, and quite smooth. The fronds are nearly ovate in outline, and decoupanate, the pinnae 1½ foot long, the pinnules 2 to 6 inches long, lanceolate-acuminate, and the ultimate pinnules, those of the third order, ½ to ¾ inch long; these ultimate pinnules are obliquely obovate, deeply cut into blunt toothed lobes, of which those at the base of the anterior side are the largest. The sori are small, placed near the base of these ultimate lobes in the sinus of one of the anterior marginal teeth. The fronds are herbaceous in texture. It will thus be seen that this Fern, while growing to a large size, is one of the most finely cut of all the large-growing sora, of herbaceous texture, and when throwing out its boldly arching fronds, from an elevated position on rockwork, or from a large pot set up on a pedestal, it will have a very fine effect. It was unanimously awarded a First-class Certificate by the Floral Committee when exhibited at South Kensington on the 7th inst., and gained a similar award at the spring show of the Royal Botanic Society on Wednesday last."

Price 10s. 6d. to 21s. each.

DIFFENBACHIA MARMORATA.

The leaves of this fine variety are from 2 to 18 inches in length, and about 6 inches broad, ovate in shape; the colour is light green, unevenly splashed and spotted with creamy white, representing a variety of caricatures; the leaves are of a thick leathery texture. It is one of the handsomest and most distinct species we have seen.

Introduced by our collector, M. Paris, from New Grenada. This plant was one of the twelve New Plants which obtained the Gold Medal at Amsterdam, April, 1877.

Price 42s. each.

ERANTHEMUM, "EL DORADO."

This is a very fine species, with ovate leaves, from 4 to 6 inches long, and from 3 to 4 inches broad; the ground colour is a bright golden yellow, slightly smoky and tinted with pale green. This species will make a charming addition to this ornamental group of plants.

One of our introductions from the South Sea Islands. This plant was one of the twelve New Plants which obtained the Gold Medal at Amsterdam, April, 1877.

Price 10s. 6d. each.

NEW FIG, "HARDY PROLIFIC."

The fruit of this hardy Fig is about the medium size, pear-shaped, rather tapering towards the stalk. The flesh is very sweet and luscious. It was introduced from France some few years ago, and has proved itself perfectly reliable. It must become a general favourite, as it is a very abundant bearer either in pots or in a cold house, as well as on an open wall; it is also pens rather than any other variety we know of.

Price 10s. 6d. each. Extra-sized Fruiting Plants, 21s. each.

NEW FUCHSIAS FOR 1877.

FUCHSIA "BEATRICE."—This is a single variety, the tube is rather short and stout, sepals deep crimson; corolla reddish-purple, good-shaped flower. Price 7s. 6d. each.

FUCHSIA "MONSTROSITY."—The tube of this flower is rather short and stout, also the sepals; these are of great thickness, and instead of reflexing in the usual way, peculiarly clasp the corolla, which is purely shaded with violet. This variety is of good habit, and must become a splendid exhibition flower. Price 7s. 6d. each.

FUCHSIA "CLIPPER."—Tube and sepals carmine-scarlet, broad and well reflexed; corolla deep purple shaded with violet. This is a single variety, and will make a good exhibition plant. Price 7s. 6d. each.

FUCHSIA "IMPROVEMENT."—The tube and sepals of this variety are pure white, the latter well reflexed, of good substance, the corolla carmine shading to rose. This is a seedling raised from the old *Duchess of Lancaster*. Price 7s. 6d. each.

FUCHSIA CARMINATA.—Tube and sepals bright carmine, the latter very broad and well reflexed, showing well the corolla, which is a deep violet; the petals are very round and smooth. This will become a favourite for exhibition and general purposes. Price 7s. 6d. each.

FUCHSIA "MRS. BURROUGHS."—The tube of this variety is long and stout, pure white; the sepals are also white, and much reflexed; the corolla, which is barrel-shaped, is a crimson-lake. Price 7s. 6d. each.

* FUCHSIA PENDULÆFLORA.

The character and growth of this hybrid species is quite distinct, and being of rather a robust growth will become valuable for pillars or trelliswork for the conservatory; the leaves are from 2 to 4 inches long, ovate, acuminate, and glabrous, having a violet midrib; the flowers are produced in clusters from the axils of the leaves and the terminal shoots; the tubes are from 3 to 4 inches in length, trumpet shape, rich crimson shaded with maroon.

Price 10s. 6d. each.

* GLADIOLUS PAPILO (Butterfly-flowered Gladiolus).

This beautiful species was introduced from Cape Colony some few years ago in the *Key Gardens*, where it flowered, and was figured; and the following are a few extracts taken from the *Botanical Magazine*:—"The Cape Colony abounds in species of *Gladiolus*, amongst which that now figured appears the most beautiful, though not the most gorgeous, but has hitherto been much known. Nothing can well exceed the delicacy of the pale purple of the upper petals or the vividness of the deep purple and golden yellow markings of the lower ones." We received this from one of our correspondents at the Cape.

Price 10s. 6d. to 21s. each.

NEW LATE KEEPING BLACK GRAPE, "ALNWICK SEEDLING."

This Grape was exhibited before the Fruit Committee, South Kensington, February 6, 1876, under the name of "Clive Hones Seedling," a name the committee have since thought fit to alter. The following is the description given by the Fruit Committee:—"It is a seedling between the Black Morocco and an unnamed variety raised at Worsley. The bunch shown was of fair size and well shoudered, and the berries large, oval in form, and jet-black in colour, with a thick skin; the flavour was decidedly good, partaking of the rich sparkling flavour of the Black Morocco, but much sweeter." It has kept well till February, and will, no doubt, keep longer and prove a better Grape for general cultivation than the "Black Alicante." This has been awarded a First-class Certificate.

B. S. W. has much pleasure in offering this fine Grape, believing it to be a decided acquisition; the stock offered is from the original plant. Early orders are respectfully solicited, as the stock is limited.

To be sent out in October. Price will be duly advertised.

* HIBISCUS DENNISONII.

The habit and character of this *Hibiscus* is quite distinct to any other species; being very dense and compact with thick glossy leathery ovate-shaped leaves; the flowers are large, of a creamy white, and very handsome; admirably adapted for pot culture.

Price 10s. 6d. each.

IRIS ROBINSONIANA.

(The Wedding Flower of Lord Howe's Island.)

A gigantic species, attaining a height of 6 feet or more, with proportionately large sword-shaped leaves, and large pure white flowers marked with golden yellow on the outer petals. The flowers are about 4 inches in diameter, and very evanescent, but as they are numerous and quickly succeed each other, the plant retains its beauty for a long time, and is one of the most beautiful species ever imported. It is a native of Lord Howe's Island.

Price 21s. each.

LOBELIA, "BLUE GEM."

This variety grows about 6 inches high, and is of medium growth, a little more spreading than "Compacta"; it produces an abundance of large coral-blue flowers, with a white eye. This *Lobelia* is a splendid bedder, and cannot fail to become a general favourite for bedding purposes.

Price 5s. each, 42s. per dozen.

NEW PORCING PINK, "DUCHESS" (Clarke).

There are few plants to excel the Pink, especially in the months of March and April; this can only be obtained by having such habit of growth that will withstand a little excitement in the early months; the variety now offered is by the same raiser as "Lord Lyons," "Derby Day," &c. This will be found quite distinct to any previously offered. The colour is of delicate and beautiful tint of lilac-pink, with faint rosy lilac blotches in the centre, the petals large, stout, and finely rounded, with a rich perfume; the flowers are large and solid, without the bursting of the pods which is a defect in most Pinks. The habit is robust and vigorous, and blooms in great profusion. A valuable early forcing variety.

Price 10s. 6d. each.

* PANAX LACINIATUS.

This very elegant plant will be a valuable addition to a class much in request for table decoration; it is of medium growth, and when about 2 or 3 inches in height its elegance can scarcely be surpassed. The stem is smooth and slender, slightly notched with brown, the leaves are alternate, and the leaflets deeply cut or lacinated, of a light or pleasing green colour. Native of the South Sea Islands. Awarded a First-class Certificate.

Price 10s. 6d.; extra sized plants, 21s.

* PÆLAGONIUM, "DR. MASTERS."

A splendid forcing variety, belonging to the group of "Capt. Fisker" and others. It is of dwarf stumpy habit, a most important feature in a Forcing *Pælagonium*; the trusses, which are large, are thrown well above the foliage in great profusion, it is semi-double, the upper petals having large blue blotches in the centre, with a narrow margin of rich crimson, the lower petals having a smaller blotch, with a broader margin of the same colour as the upper; this will prove most invaluable for market purposes and for bouquets.

Price 10s. 6d. each.

PHOTINIA SERRULATA VARIËGATA.

A pretty variegated shrubby growing plant, its habit of growth is more branching than the original type; the leaves are striped and spotted, at first with creamy white, changing when matured to a rich golden yellow, with an uneven margin of the same colour; will do well in cold house or conservatory; we expect it will prove hardy in some parts of England.

Price 21s. each.

ILLUSTRATED NEW PLANT CATALOGUE NOW READY, POST-FREE TO ALL APPLICANTS.

* Coloured Plates can be supplied of these Plants, at 1s. 6s. each.

VICTORIA AND PARADISE NURSERIES, UPPER HOLLOWAY, LONDON, N.

CATALOGUES.—His Excellency Pierre Wolkowitsch will feel greatly obliged if Nurseriesmen and Seedsmen will kindly send him their Catalogues. They should be forwarded (by post) to
S. E. PIERRE WOLKOWITZ, Secrétaire de la Société Impériale d'Horticulture de Russie, St. Petersburg.

GODETIA, LADY ALBEMARLE.

First-class Certificate Royal Horticultural Society, August 2, 1876.

A magnificent new variety, growing a foot high. Flowers $\frac{3}{4}$ to 1 inch across, and of the most intense glowing carmine-crimson colour, which has been produced in wonderful profusion give the plants the most charming appearance. This is the finest annual ever sent out, and being extremely hardy and easy of cultivation, should be in every garden.

Seed, with full cultural directions, per packet, 1s. 6d., post-free.

"We have scarcely any plant of such a lovely shade of colour."—*The Villa Gardener*, September, 1876.

"An extremely beautiful variety, bearing flowers quite 4 inches in diameter, of a glowing crimson colour."—*Gardener's Magazine*, August 5, 1876.

"A remarkable and splendid variety, far superior to any other of the family."—*Journal of Horticulture*, Aug. 3, 1876.

May be had of all Seedsmen, and Wholesale and Retail of

DANIELS BROS.,

THE ROYAL NORFOLK SEED ESTABLISHMENT, Norwich.

ZONAL GERANIUM.

On May 1, with the New Dahlias,

JOHN KEYNES

will be prepared to offer one of the finest ZONAL GERANIUMS ever yet before the Public.

J. K. trusts his long experience and care will be sufficient guarantee for the quality and character of this splendid variety. It was raised by Mr. Wm. Dodds. A great truss of flower, splendid bedder, lively majesta colour, quite a new shade from any other. Has been the admiration of all in the beds at Salisbury.

"JENNIE DODDS,"

Price 18s. per dozen. One-third off where twelve or more are ordered.

SALISBURY.—April 22, 1877.

E. G. HENDERSON & SON

Offer the following in Seed, of quality the best that can be had, at per packet 1—

- CALCEOLARIA**—the variety of colour, size, and shape of the flowers is the result of many years' continual improvement; 1s. 6d. and 2s.
- CINERARIA**—the shape and delicacy of colour in these flowers is of great importance; 1s. 6d. and 2s. double-flowered, 2s. 6d. and 5s.
- FRIMULA SIMENIS**, crimson, scarlet, and white (better cannot be had), separate or mixed, 1s. 6d. and 2s.
- FRIMULA**, double-flowered, true from seed, 1s. 6d. and 2s.
- CYCLAMEN PERSICUM GRANDIFLORUM**—brilliant colours, with large-size petals and perfumed flowers, is the quality here offered; 1s. and 2s.
- BEGONIA**, tuberous-rooted (our collection is unequalled), 1s. and 2s. 6d.

NEW ENGLISH-RAISED SEEDLING ROSES.

MESSRS. PAUL & SON,

THE OLD NURSERIES, CHESHUNT, N.

(THESE NURSERIES ESTABLISHED IN 1806),

Have great pleasure in announcing as a continuation of the series of English Roses raised or sent out by them since 1860, inclusive of LORD CLYDE, DUKE OF EDINBURGH, CHESHUNT HYBRID, ANNIE LAXTON, DUKE OF CONNAUGHT, &c., &c., and containing never a bad one in the lot,

TWO NEW ENGLISH SEEDLING ROSES.

H.P. EMILY LAXTON (Laxton), a large full flower with globular, pointed bud, opening into large globular flower. In the way of Monsieur Noman, but of a rich cherry-rose, deeper and fuller than that kind, and with strong vigorous habit, making a grand pillar Rose.

First-class Certificate at the Leeds and Crystal Palace Rose Shows, and 1st Prize at Exeter for twenty-four of any one kind.

H.P. MARCHIONESS OF EXETER (Laxton), clear, rose-flushed, light cherry-rose, large, finely built-up flower, very sweet, and of strong vigorous growth; a larger more double Annie Laxton, yet perfectly distinct from that kind.

Plants in pots of the above, 7s. 6d. each, 14s. the two varieties; Blooming Plants, in 24-pots, 10s. 6d. each, 20s. the two varieties.

The two kinds described above have been proved two seasons at Cheshunt, and can be recommended as continuing the race begun by this raiser with H.P. Annie Laxton.

PAUL & SON,

THE OLD NURSERIES, CHESHUNT, N.

(These Nurseries Established 1806.)

MR. J. C. STEVENS will SELL by AUCTION, at his Great

Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, May 3, at half-past 12 o'Clock precisely, Four Established Plants of the new and distinct PHALENOOPSIS VIOLACEA. This is an extremely difficult species to import, and it is the first time established plants of it have been offered. Also a few good Established Plants of the new and distinct CYPRIPIEDUM DRURYI; likewise a small Collection of Established ORCHIDS, including the following and many other rare kinds:—

ODONTOGLOSSUM ODORATUM
AERIDES QUINQUEVENERUM
ODONTOGLOSSUM KOEHLII
BRASSAVOLA GLAUCA
AERIDES LOEBII
ODONTOGLOSSUM VEXILLARIUM
SACCOLABUM GUTTATUM
ODONTOGLOSSUM PHALENOOPSIS
ODONTOGLOSSUM NERVUM
PALUMBINA CANDIDA

TRICHOPLIA CRISPA
VANDA TERES
ONCIDIUM BIFOLIUM MAJUS
ODONTOGLOSSUM CIRRHOSUM
MASEOVALLIA VETCHIANA
DENDROBIUM AUREUM
CATTLEYA MENDELII
CATTLEYA XANTHINA
ODONTOGLOSSUM SEPTENTRIONALE
ONCIDIUM CONCOLOR

Also some imported ORCHIDS from Rangoon.

On view the morning of Sale, and Catalogues had.

COLOUR OF "CHARLES LEFEBVRE."

First-class Certificate Royal Horticultural Society, August 2, 1876.

Its inflorescence may be imagined when it is stated that a plant 18 inches high had 84 Buds and expanded Roses upon it on the 6th September, 1876, and flowered continuously from June until November, on the 20th of which month (1876) it was still in bloom.

Good Plants will be sent out, in strict rotation, at 10s. 6d. each, COMMENCING FIRST WEEK IN MAY.

CHARLES NOBLE, BAGSHOT.

DR. DENNY'S PELARGONIUMS.

Messrs. JAMES VEITCH & SONS

Are now sending out these fine new Zonal Pelargoniums, remarkable for the size of their trusses brilliant colouring, and fine shape of their flowers.

They are the best yet offered for pot culture for Conservatory, and comprise the following Varieties:—

HEATHER BELL, price 10s. 6d. each.
AMAZON, price 7s. 6d. each.
IRENE, price 7s. 6d. each.

CLEOPATRA, price 7s. 6d. each.
NYANZA, price 5s. each.
EGERIA, price 5s. each.

GLOBOSA MAJOR, price 5s. each.

Price of the above set of seven, one plant of each, 42s.

DISTINGUÉ, a double bluish white, 7s. 6d. each. | EDELWEISS, double, nearly pure white, 7s. 6d. each.

Full descriptions of the above are given in J. VEITCH & SONS' CATALOGUE OF BEDDING PLANTS, which will be forwarded free on application.

ROYAL EXOTIC NURSERY, KING'S ROAD, CHELSEA, S.W.

STRAWBERRY, THE DUKE OF EDINBURGH (MOFFAT).

THE LAWSON SEED AND NURSERY COMPANY (LIMITED), EDINBURGH and LONDON,

Have made arrangements with Mr. Moffat, Coldwells, to send out, for the first time, the above-named splendid Strawberry. Fruit very large, firm, and of excellent flavour, bright scarlet colour. A most prolific bearer, and as a main crop for market purposes it is unsurpassed.

Strong Plants, 42s. per 100; 25s. per 50; 16s. per 25; 9s. per dozen.

Trade Price on application.

1, GEORGE IV. BRIDGE, EDINBURGH; 54, BISHOPSGATE ST. WITHIN, LONDON. April, 1877.

NEW PELARGONIUM, DUCHESS OF BEDFORD.

MESSRS. BECKWITH & SON, TOTTENHAM, N.,

Have much pleasure in offering the above Pelargonium as the best White ever sent out, and having a large Stock can offer it at once.

It has received a First-class Certificate from the Royal Horticultural Society.

Price for Strong Plants, in 5-inch pots, coming into flower, 7s. 6d. and 10s. 6d. each; a few Large Specimens, in 24-size pots, 2 guineas each.

TOTTENHAM NURSERY, TOTTENHAM, N.

BEAUTIFUL ORCHIDS

At unprecedentedly low prices.

MR. WILLIAM BULL

Is constantly receiving Importations from his Collectors and Correspondents abroad, and offers the following at the low prices annexed:—

GOOD SELECTIONS OF ORCHIDS
made, at 2, 3, and 4 guineas per dozen.

By sending names of those already possessed, different varieties can be given, and purchasers will have a good selection made for them.

NEW PLANTS for 1877.

Mr. Wm. BULL'S Illustrated CATALOGUE is now in the Press, and will be issued in a few days, and can be had on application, price 1s. It contains Names, Descriptions, and Prices of a quantity of New Plants, now being sent out for the first time.

Establishment for New and Rare Plants,
KING'S ROAD, CHELSEA, LONDON, S.W.

SUTTON'S
CHOICE FLOWER SEEDS,
FREE BY POST OR RAIL.

Sutton's Improved Miniature Aster.
A profuse flowering variety, of dwarf compact habit, remaining in bloom for a considerable period, hence it is invaluable for growing in pots for conservatory or drawing-room decoration. We have this season succeeded in saving six distinct colours, which greatly increases the value of this beautiful Aster for bedding purposes.

Price per Packet, mixed, 2s. 6d.
Six varieties, separate, 5s.

SATURDAY, APRIL 28, 1877.

SOOCIETY OF PAINTERS IN WATER COLOURS.

A FEW hours may be pleasantly and profitably spent in the exhibition-room of this Society at 5, Pall Mall East. The exhibition contains several excellent figure subjects, manylandscapes of uncommon truth and beauty, and a few pictures illustrative of flowers and fruit. To our thinking (especially at the water-colour exhibitions), the landscape painters are always in the ascendant. 15, "The First Snow of Autumn on the Sea Fell Range," H. Moore, is an admirable picture. 17, "Loch Marce—a Lifting of the Mists at Sunset," Alfred W. Hunt, is extremely natural and beautiful: the rising mists and the effects of distance are excellent. 20, "Snowdon" (or as the catalogue gives it, "Snowdon"), Thomas Danby, appears to us to be far too hard and harsh, and to fail in the good qualities of the last; and in those of 47, "The Unveiling of the Mountain," Alfred P. Newton; in this, the effect of mist being blown off a snow-clad mountain is finely rendered. 51, "On the Way to School," R. Thorne Waite, is a beautifully painted group of happy English rustic children going to school; one child carries a few plants of ripe corn; it is harvest time, the golden corn-fields are seen in the distance, and the field-labourers of autumn are busy at work: strange to say, the artist has introduced Irises in full flower by the brook side, forgetting that these plants belong to the spring and summer, and not to the autumn, moreover the plants painted belong to the gorgeous purple Irises of our gardens, which do not grow wild by English brook sides at any season.

64, "A Golden Swarm," E. K. Johnson, is a large and elaborate picture, containing several excellently painted figures grouped in a garden full of flowers of all sorts, as Roses, Poppies, Campanulas, Scabious, Cloves, Nasturtiums, Sweet-Williams, Larkspurs, Violas, &c., all evidently studied from Nature with great care; by an oversight of the artist, most of the Violas are made to face the spectator. 119, "View from the Orme's Head—Sunset," Robert Barnes, is a finely executed and admirable landscape, painted by the famous figure-artist who has so long delighted us with his excellent paintings of children, and his equally excellent drawings on wood of similar subjects for the *British Workman* and *Band of Hope Review*. A man of true genius succeeds in all he undertakes 126, "A Break in the Clouds," Francis Powell, is remarkable as a painstaking study of sea and sky only. 151, "Spring Flowers," Maria Harrison, is a study of Acacias, Camellias, and Anemones, and much better than previous efforts by this artist; the picture is, however, weak and poor both in drawing and colour. 178, "Yellow Water Lilies and Rushes" (i.e., Bulbushes), by the same artist, is better than the last, but lacking the truth and spirit of Nature. 183, "Fruit," by the same artist, is far more ambitious, and in the same degree less successful than the two former; the drawing is poor throughout, especially in the Vine leaves, and no rose-orn could endure to look upon the red Roses on the left of the picture. 182 and 147 are unworthy of a place on the walls; the drawing in both is that of a mere beginner, and

the colour belongs to the Berlin-wool school. 199, "Geraniums and Wallflowers," E. F. Brentnall, is a richly painted picture of these flowers, grouped together with one or two white Anemals in a formal vase; the combination of rich red-brown colour in the Wallflowers and the scarlet of the Geraniums is remarkable, and suggestive for future efforts. The principal flower of the scarlet Geranium is shown with four only instead of five petals, the fifth having fallen on to the table at the base of the vase, where it may be seen. 274, "Peaches," Maria Harrison—the fruits are well painted, but the foliage is bad in drawing and colour; the admirable and ubiquitous moth puts in his usual appearance. 209, "The Rock Rose, &c.—Mountain Flowers," by the same artist, is a group of Helianthemum with a spray of some little wild Geranium, moderately well executed. 218, "An Interesting Scroll," F. Alma Tadema, A.R.A., a small classic picture of a young man seated amongst marble columns, and intently reading a scroll; the drawing, perspective, and colour, are perfect, and every portion of the picture is the result of ripe study and correct knowledge; the classic feeling extends to the ivory-inlaid frame. 277, "Hiding," Robert Barnes, is in its way a gem of drawing and colour. 289, "Blackberries, and the Blossoms," Maria Harrison, has the merits and defects of the other pictures by this artist; the flowers of the Musk Mallow are shown in the background, but no leaves or stems are visible.

There is a complete flood of Venetian subjects in this year's Exhibition. For a time the Grand Canal has been deserted, and the slums have been selected for illustration. Possibly these Venetian holes and corners may have great æsthetic merits, but we have similar side alleys in plenty and equally curious, bordering our English Grand Junction Canal. There are several figure subjects of the first class, especially two by Sir John Gilbert, which have all the solidity of oil, with the brilliant transparency of water. Birket Foster has two conscientiously-painted pictures, less in size than usual (as is now frequent with this artist), being figure subjects set in excellently painted landscape.

As we said before, the transcripts of English landscape bear the palm; the works of this nature are numerous and thoroughly well executed. Whenever we see these mimic running brooks, sunlit meadows and leafy glades, the opening bars of the never-dying "Pastoral Symphony" sound in our ears, and make us long for the unbounded pleasures of a country life.

HAARLEM AND ITS BULB FIELDS.

A VISIT to Haarlem and its bulb fields, together with an inspection of the numerous and spacious warehouses where the bulbs are stored, can alone serve to furnish a reply to the question—Where do all the bulbs come from? Hyacinths and Tulips constitute the chief field crops of the immediate vicinity of Haarlem; Crocuses are grown elsewhere; while Narcissi, Frithyllarias, Spixes japonica, Anemones, and Ranunculi, though grown in considerable, may, large quantities, are still quite subsidiary to Hyacinths and Tulips. At a short distance from the sea, protected from the severer blasts by low dunes or sand-hills, but still wrapped in an atmosphere laden with saline moisture, the Hyacinths and Tulips are grown in oblong rectangular beds, about 4 feet in width, each containing about 500 bulbs more or less. The soil is almost pure sand, with little or no "heart" in it; indeed, it seems only to serve as a means for diffusing coarse manure, which is applied in enormous quantities. In the spring the land is dug, if such a term can be applied to the mere stirring which so light a soil demands; the manure is dug in in profuse abundance, and Potatos are planted. When these are removed in August, the land is deemed fit for the planting of the Hyacinth bulbs. In the German agricultural col-

leges the method of water-culture is largely adopted for experimental purposes. Particular plants are grown in water, to which, according to circumstances, definite quantities of particular salts are added. In this manner, by careful observation and experiment, the exact proportion of any particular ingredient that may be requisite as food is ascertained. Now the bulb culture at Haarlem reminds us every much of the method of water-culture just alluded to. The sand in which the bulbs are grown corresponds to the water, the manure to the particular salt added to the water for feeding purposes. How little cohesiveness there is in the soil is shown by the circumstance that the workmen aforesaid their heavy wooden sabots flat pieces of board wherewith they beat down the loose soil pretty much as the natives of Dungeness on the shores of Romney Marsh employ "backsters" to enable them to walk the more easily on the loose shifting shingle of that locality. Even horses are provided with similar "sand shoes." The flowers are carefully cut ere they wither, in order that the bulbs may not be too much exhausted, and in order to prevent the attacks of mildew, which would endanger the foliage and proper ripening of the bulb. Hence one sees in the canals boatloads of cut Hyacinth spikes, the pathways and roads are strewn with the fragrant blossoms, rubbish heaps are made beautiful to the eye and pleasant to the nose by the mounds of parti-coloured blooms. Children come staggering along bearing huge bunches of the flowers, just as English children do with Cowslips or Primroses, and dainty young ladies trip along with their more select assortment,

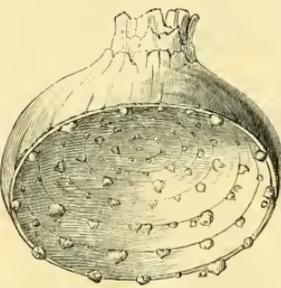

FIG. 77.—HYACINTH PREPARED FOR PROPAGATION.

the final destination of which may be seen as one passes the windows of the residents. But the bulk of the "spoils," if we may so call it, is returned to the land. Fancy manuring with Hyacinth flowers: and yet this is what is done, just as English farmers plough in their green crops or their stubble. No doubt this is a profitable practice, but on the spot the visitor is apt to wonder why the perfume manure does not utilize the flowers for the manufacture of perfume as they do about Nice.

The multiplication of Hyacinths has been described in these columns on frequent occasions, so that it may suffice to say, that it depends on the great tendency that the bulbs and bulb-scales have to throw off adventitious buds or offsets. By slicing the base of the bulb or by scooping out the central portions (see fig. 77) a large crop of small bulbs is formed along the injured edges. Particular varieties differ much in their power of producing these offsets, but it may serve to give some idea of the quantities required, and of the time occupied in getting up a stock, when we say that on the average a period of five years is required to get up a stock of a new variety. As may be imagined the land is extremely valuable, so that not an inch of space is wasted, and only those bulbs which can be grown profitably are cultivated. Crocuses, for instance, do not pay for cultivation on such highly rented land.

The warehouses in which the bulbs are stored after lifting, resemble fruit-rooms on a large scale. They are solid, well-built substantial structures of two or three storeys. Every acre is taken to ensure an equable temperature and freedom from damp. The bulbs are placed on wooden trays, ranged one

above another, and every means taken to secure thorough ventilation. Single varieties, and we think with justice, are the most in demand in England, but the French still prefer the double ones. Among the single white varieties, La Grandesse was this season particularly fine; Snowball is another very fine white, and Belle Blanchissime is another; while among double whites La Tour d'Auvergne may be mentioned. Schiller is a fine pink variety; Noble par Merit is of a similar colour, but double. J. van de Meer is also a good rose-pink colour, of dwarf habit. Tubifera, of similar colour, is remarkable for its large bells; while Romeo is to be admired for its deep rose colour. Macaulay is perhaps the best red. Among blues, King of the Blues deserves special mention, for its colour and nice dwarf habit. Biensenk (P) is a single blue with a noble spike; General Javelock is a dark blue flower of much merit; Sol-faterre, when seen in quantities, is very striking, presenting a mass of pink flowers with yellow tips. Hayden is one of the best lilacs.

Narcissi were a little past their best at the time of our visit, the poeiticus section not being yet in bloom. Among the Polyanthus section, Bazelman major (white) and Newton are among the best, while of the bicolor group the form known as Horsfield is even an improvement upon Empress. The variegated Crown Imperial is not very popular in England, but here, seen in quantities, it is remarkably effective.

One bulb farm is very much like another, though they vary in extent, and notably in clean cultivation and general keeping. Our notes were principally taken in the establishments of Messrs. Bijvoet, Krelage, and Polman Moij, to whose kindness we are indebted for much of the information contained in these cursory notes.

BELSFIELD GARDENS, WINDERMERE.

A DETAILED account is given of this fine place, the seat of H. W. Schneider, Esq., by your able correspondent, Mr. Baines, at p. 743, December 12, 1874, and as I had the pleasure a week or two ago of calling upon Mr. Chaplin, Mr. Schneider's efficient gardener, I have thought that a few notes, respecting the very fine collection of specimen and half-specimen plants at Belsfield, would prove interesting. On entering the kitchen garden, where the principal ranges of glasshouses are erected, and which is situated on a nice slope facing south and south-west, we come to the Azalea-house, where there is a good collection. We next come to the hard-wooded plant-house; the centre stage is occupied with a considerable number of huge specimens and also numbers of half specimens in the best of health. The plant-stove is a commodious structure, where there are many plants of great dimensions, comprising *Medinilla magnifica*, 11 feet high and 9 feet through, with 17 bunches of flowers; *Allamanda Hendersoni*, *Cheloni*, and *nobilis*, 4 feet high and 6 feet through; two nice plants of *Freesia calycina* major, 4 feet high and 4½ feet through; several pairs of *Eucharis amarantha*, 4 feet high and 3½ feet through; *Clorodendron Balfourianum*, 4 feet high and 6 feet through; *Gardenia florida* and *G. radicans*, by the dozen, from 3 to 4 feet high and 3 to 3½ feet through, well set with flower-buds. In the same house there is a nice healthy stock of small plants for decorative purposes.

The Camellia-house is occupied with a good collection of Camellias, which are planted out, and looking remarkably well—hundreds of flowers, and fine leathery foliage. In a small house of Orchids, which are growing vigorously, are several pairs of *Dendrobium nobilis*, 4 feet high and 6 feet through, all of which had flowered well; fine pots of *Calanthe Veitchii* and *C. vestita rubro-oculata*, the bulbs of which were very strong; good examples of *Oncotoglossum*, *Lycastes*, &c.

There is a good propagating house, with a pathway down the centre. On one side is a clean and healthy stock of small plants for decorative purposes, consisting of *Crotons*, *Dracenas*, *Aralias*, *Palms*, *Coleus*, &c., in variety. On the opposite side are the propagating cases, all full with the various bedding plants and cuttings of the case is a good example of *Bertolonia superbumis*, 15 inches through.

The fernery reached, we were much struck with a wonderful specimen of *Davallia Mooreana*, 6 feet high and 11 feet through, a very fine plant. In the same house are large specimens of *Cibotium Schiedei*, *Cyathea Smithii*, *C. dealbata*, *Todea superba*, *Lomaria zamiatifolia*, *L. gibba*, *Adiantum farleyense*,

A. gracillimum, and numbers of small plants in variety of Adiantums, Peris, Davallias, Lycopods, &c.

The conservatory, which is a noble structure, was very gay with flowering and fine-foliage plants, conspicuous amongst which are plants of *Monochlamis eucifera*, 4 feet high and 1/2 feet through, covered with bloom—a good old plant very seldom seen grown well; *Azalea mollis* and *A. sinensis* (the best variety of the latter), Lily of the Valley, *Spiraea japonica*, *S. palmata*, Lilacs, Hyacinths, Tulips, and Narcissus, in quantities, and a complete mass of bloom. The house, on the whole, was a fine sight, and the plants were arranged with good taste. There are numbers of frames, most of them heated with two rows of 4-inch piping, the occupants of which are Cinerarias, Calceolarias, Polyanthus, Pansies, Violets, bedding plants, &c., all in good health. Vines, Pines, and Peaches are grown extensively, and in all the different houses showing fruit most satisfactorily; there are Strawberries in all stages of growth, and promising for a good crop.

It is gratifying to know that Mr. Chaplin has not only worked up a most creditable collection of plants at Belsfield, but has, through the kind permission of Mr. Schneider, erected a commodious house for the young men to live in; the house is pleasantly situated on an elevated site close to Lake Windermere, and is fitted up with the best accommodation, comprising kitchen and back kitchens, mess and sitting-rooms, with nice bedrooms on the second flight, where all is furnished in the most comfortable manner, with wardrobes, drawers, beds, bedding, carpets, &c. I feel sure that nothing has been spared to make everything comfortable for the young men at Belsfield; and I think were head gardeners only to place the matter reasonably before their employers the dilapidated and out-of-the-way places too often met with in which young gardeners have to live, would in most cases be replaced and made comfortable homes for them. [A very good suggestion. Ed.] Any one who may feel disposed will find Belsfield well worthy of a visit, and I know will receive, as I did, the utmost kindness from Mr. Chaplin. The gardens throughout speak for themselves as to Mr. Chaplin's good management and general abilities as a gardener. R. Greenfold, Warwick.

GUERNSEY FRUIT.

BEFORE the end of this month most fruit shelves will be empty, and it is time to look forward to the new year's produce. There are, however, a few Apples and Pears whose late-keeping properties deserve notice. With me the best Apples now, and which will keep well into May, are decidedly Baldwin (the American Woodpecker) and the too little grown Pomme d'Api (Lody Apple). A dish of these two Apples intermixed is not to be beaten just now, as the Baldwin has become of a rich tawny brown, and the Pomme d'Api, having had some leaves removed in August, is richly coloured with flames of scarlet. Neither Apple has, of course, the favour of an earlier fruit, but they are firm and good. Reineette du Canada is kept in the best manner, and is as usual a Duke of Devonshire and Court Penda-Penda. I have, like, but neither in good condition. The last—such a favourite of our youth—hardly thrives on the Paradise stock in strong soil, but thrives. Many fine sorts were gone by the end of March, among these White Nonpareil, Ueiller's Golden Reineette, and Lodgemoor Nonpareil. Sykehouse Russet is a splendid Apple. The kitchen varieties did not keep well this winter. Rymer was exhausted during March. As to late Pears, I have now but two sorts remaining, of which very few, but I doubt if they will ever ripen.

The last Covent Garden produce show did not, I see, bring forward anything remarkable in Apples and Pears—at least, of English growth. Presently native produce will be superseded by that from California and the South of Europe, unless we plant more good sorts, and thin out more of the crop so as to get finer fruit.

The Guernsey produce has done well at the show in the early Fothergill, the best receiving a bronze medal. It should be remembered that the island is considerably smaller than Jersey, and has an inferior exposition, being also loftier generally. Both islands, however, have many rivals, and increasingly so, in early growths.

Among the numerous catalogues sent me the best

foreign one is certainly that of one of Messrs. Simon-Louis (near Metz), which is painstaking, and aspires to be a good fruit manual, very cheap, and worthy of being studied. In it the famous Chaumontel Pear is styled the "Guernsey Chaumontel," an honour which will be disputed. Among the nineteen synonyms attached is that of "Bûche de Chaumontel," which the late M. André Leroy, of Angers, told me he considered to be the original designation. A German friend of mine who has spent several summers in this island took this winter some very good specimens of the Chaumontel Pear from me to Prince Bismarck, whom he knows well, and has just brought me the message that the great Chancellor considered them the "most delicious Pears he had ever eaten," adding that "he had always heard that Guernsey—not Jersey but it here solemnly remarked—was noted for its Pears." This is a new feature in fruit history, it being generally customary to rank all Channel Island produce as "Jersey growth." In the midst of impending misery and bloodshed how strangely does this sound, but it also speaks well for the Prince's sense of right, and shows, at least, does not approve of the Channel Islands being classed with France at the last London shows! T. C. Brabant.

M. CHARLES VAN GEERT'S NURSERY, ANTWERP.

ON the out-kits of Antwerp, surrounded, indeed, on all sides by houses, is the nursery of M. Charles Van Geert. It is of considerable extent, flat in surface, alluded to as a hill, and situated in a fine collection of hardy trees and shrubs, destined for ornamental purposes, and for the fruit garden. A small but choice collection of herbaceous plants is also to be seen here, and in the houses a collection of the most useful and popular greenhouse and window-garden plants. The nursery in question serves as a kind of show-card for the larger establishment belonging to the same proprietor at some little distance from the town. The plants are for the most part grown in oblong rectangular beds, or quarters, nearly square in all but one end, and contrast in variety being grown side by side for the purposes of comparison and study—a plan as advantageous to the vendor as to the purchaser. Hornbeam hedges and arcades, such as are common in the Low Countries, but which have been for the most part discarded in England, traverse the garden in various directions. For training fruit trees the following very simple method is adopted:

—Poles some 9 or 10 feet long, previously creosoted, are plunged into the ground, and made to incline one to the other at the top—say, A—the pairs of poles being connected together at the top by a cross-bar. The trunks of the trees are placed along the poles, and the shoots trained, as may be desired, by training-sticks affixed in various directions. The plan is simple and efficacious. The durability of the kyanised poles is shown by the circumstance that some put up in 1866 seem as sound now as when first erected. Flax refuse, under the name *sluis*, is largely used for bottom-heat in the same manner as is the similar material known in the Edinburgh nurseries as "pok."

The special features of the nursery consist in the excellent collections of conifers, viz. Hollies, Boxes, and other evergreens being for the most part tender for the climate. The plant lately sent out as *Othera japonica* seems to be the same as *Ilex japonica*, at any rate it is here grafted on the Holly. *Ilex camellifolia* is a particularly handsome form, which does well here, while *I. crenata* major is interesting from its close resemblance to *Rhododendron ferrugineum*. Among deciduous shrubs noticeable early in April were bushes of *Forstythia suspensa*, all albae with flower, and the beautiful *Cercas sinensis pendula* roseo, which, grafted on a clean stem of a common Cherry like a standard Rose, makes a most ornamental shrub for the lawn or margin of the shrubbery. The red-leaved Peach is also effective, not only for its blood-red leaves but for its flowers. It was interesting also to notice the change of habit in *Cephalotaxa drupacea*. The original branches ascend so as to give the shrub a fastigiata form, but as the bush grows older the lowermost branches assume more or less of a horizontal direction, thus forming a cup round the central mass. Without writing a catalogue we cannot enter into further details as to this nursery, but it is one which the connoisseur in hardy plants will do well to visit when the opportunity presents itself.

THE GENUS AGAVE.

(Continued from p. 56.)

9. *A. (Littia) xylantha*, S. Lindley; Jacobi, Monogr. pp. 45 and 209; Nacht., p. 157. Bot. Mag., t. 5660-1 (fig. 84) — *Aculeatus*. Leaves not more than twenty in a rosette, ensiform, diverging irregularly and often curving, 1½–3 feet long, 2–3 or even 4 inches broad at the middle, scarcely at the narrowed distal ends, towards the apex 1½ inch wide, and 1½ inches from the point 1 inch long, ¼ inch thick in the centre, a slightly glaucous dead green, not vittate on the face, marked with a few darker green lines on the back, furnished with a broad continuous horny border and few very large irregular hooked denticle often containing teeth, which reach a length of 1½ inch, and a breadth of ¾–1 inch, with the green of the blade running into that at the base in a semicircle. Scape 5–6 feet long, its bracts subulate, all ascending, the lower ones 6–8 inches long. Spike dense, rather shorter than the scape, its bracts linear subulate, 1½ inch long; peduncles round, and teeth each ½–1 inch long. Perianth green, 1½ inch long; ovary oblong-cylindrical, 2 inch long; tube campanulate, very short; segments lanceolate, ascending, ½–1 inch long. Filaments inserted at the throat of the tube, 2–3 times the length of the segments; anthers above ¼ inch long.

A native of Mexico, long known, and now widely spread in collections. A full colour figure will be found in the *Botanical Magazine*. The broad horny border of the leaf, and the broad irregular teeth, distinguish it at a glance from all the other species of the section. *A. Vanderdonckii* of gardens belongs to a *Pertulla* (fig. 82), hybrid, and *xylantha vittata* (fig. 80), are three garden names for a striking dwarf variety with vittate leaves and smaller, more crowded deoid-cuspidate prickles than in the type. I cannot by the description distinguish from the dwarf forms of this species *A. amaranensis*, Jacobi, Monogr., p. 46; *A. Kochii*, Jacobi, Monogr., p. 211.

** PARVIFOLIE.

10. *A. (Littia) Possegerii*, Salmädy; Jacobi, Monogr., pp. 40 and 205; *A. Leckwigiella*, Torrey, in Bot. Mex. Founds., p. 113; *A. hemisphaerica* Engelm. Notes, p. 18, in part.—*Trifida*. Leaves 6–12 inches long, 2½–3½ inches broad at the middle, narrowed gradually from the base to a brown pungent point 1 inch long, ¼ inch thick in the centre, ½ inch thick at the base, dull green, with a broad pale midrib and a few dark lines, the face marked with numerous distinct green lines down the back, the margin furnished with a continuous straight moderately broad edge, the teeth moderately close, lanceolate, uncinata, 2–3 lines long. Scape, including the spike, reaching a length of 6–10 feet. Perianth 15–18 lines long. Ovary oblong or oblong-cylindrical; tube very short; segments purplish, ½ inch long. Filaments quite twice as long as the segments; anthers 1½ inch long. Capsule oblong, 8–12 lines long.

A native of Texas and the North of Mexico, gathered by Karwinski, Wright, and others. My description of the leaves is taken from the plant as grown in the London collections, and of the flowers from Dr. Engelman's notes and the numerous specimens in the Kew herbarium. There is no published figure, and I am not aware that has flowered on this side of the Atlantic. The English name is *mitis*, with *A. heteracantha*, but the two plants as grown in the English collections are, I think, distinct. *A. Possegerii* is much dwarfer than *heteracantha*, with not more than half as many leaves, which are narrowed gradually from the base to the point, and few larger more spreading prickles.

11. *A. Kerchovei*, Lemaire; Jacobi, Monogr., p. 213 (fig. 78); *A. Beauvernei*, Lemaire; Jacobi, Monogr., p. 215.—*Aculeatus*. Leaves 20–30 in a rosette, stiff, rigid, typically ensiform, 6–12 inches long, 1½–2 inches broad above the dilated base, narrowed gradually to a pungent spine 1 inch long, dull green, with a distinct pale central band, ½ inch thick at the centre, ¼ inch thick at the base, rounded on the back without any stripes of dark green, the margin with a continuous moderately broad grey border, the irregular grey lanceolate curved teeth ½–1 inch long. Inflorescence unknown.

Introduced from Mexico about 1864 by Verschaffel, and named by Lemaire in compliment to the Baron Kerchove von Osselghem. It is now widely spread in our collections. I saw at least half a dozen different forms in Mr. Peacock's in 1872. The most striking varieties are *incarnis*, distributed by Orgueil, dwarf, with spines entirely obsolete; *pedunculata*, leaf 1 foot long, 2½ inches broad above the dilated base, without any central band; *macrodonata*, Lemaire, figured in Mr. Saunders's set of photographs, and the same plant

now at Kew, [leaves 1½ foot long, 1 inch thick at the base, ½ inch thick in the middle, without any distinct central band and with copious irregular grey lanceolate prickles 3-4 lines long; and *diplocantha*, Lemaire, with very few distant, small, often geminate teeth. Judging from the description, *A. rigidissima*, Jacobi, Nachtrag, ii, p. 66, differs only

A native of Mexico, introduced recently by Verschaffelt. I have seen it only at Mr. Peacock's. It comes nearest Kerchovi, but the leaves are more numerous, thinner and narrower, and the border is narrower and the teeth smaller. Perhaps it may be, as suggested by Baron Von Ellemeet, a dwarf form of *lophanta*.

This also is probably a Mexican species, but I do not know its history; and although it is now widely spread in our collections, I do not find any account of it in print. It is marked by its dwarf habit, bright green vitiate leaves, of which both the edge and prickles remain brown longer than usual. I take a plant which I examined in Mr. Peacock's collection

FIG. 78.—AGAVE KERCHOVEL.

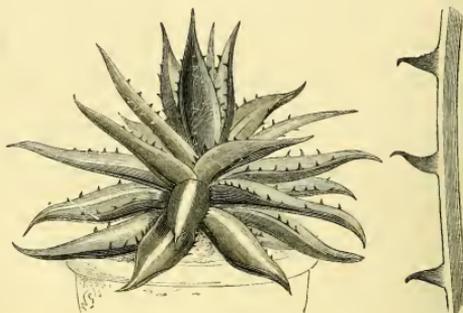

FIG. 79.—AGAVE ROELIANA.

FIG. 81.—AGAVE XYLACANTHA.

FIG. 80.—AGAVE XYLACANTHA VITTATA, HORT. = TERBELLA, HORT.

FIG. 82.—AGAVE FERBELLA, HORT.

from Kerchovi by its more minute distant detoid teeth.

19. *A. Niswoni*, Hort. Verschaffelt.—Acaulescent. Leaves 30-40 in a rosette, stiff, rigid, typically ensiform, 5-6 inches long, ¼-½ inch broad above the dilated base, narrowed gradually to a pungent spine ½ inch long, ½ inch thick at the base, ¼ inch thick in the centre, glaucous green, with a distinct pale central band, margin with a continuous very narrow grey border, furnished with copious linear spines ½ inch long. Inflorescence unknown.

13. *A. Rozliana*, Hort. (fig. 79).—Acaulescent. Leaves 20-30 to a rosette, stiff, ensiform, 6-7 inches long, 1-1½ inch broad at the middle, narrowed to a bright reddish brown, pungent spine ½-¾ inch long, bright glossy green, with a distinct pale band down the centre, ¼ inch thick at the base, ¼ inch thick at the middle, broadly rounded on the back without any darker green lines, margined with a continuous moderately broad border, red-brown at first, fading into grey when old, furnished with copious spreading lanceolate little curved teeth 3-4 lines long. Inflorescence unknown.

under the name of *Agave Inghamii* to be a variety of the same species with broader leaves, 1½-2 inches broad at the middle, 1-1½ inch above the dilated base. Even the typical plant, as will be seen from the figure, has leaves much less ensiform than those of Kerchovi.

14. *A. Victoria-Regino*, T. Moore, in Gard. Chron., n.s., vol. iv., p. 485, with woodcut; Flore des Serres, xli., p. 169, with woodcut; *A. Consideranti*, Carrière, in Rev. Hort. 1875, p. 499, fig. 68.—Acaulescent.

Leaves 40—50 to a rosette, stiff, rigid, lanceolate, $\frac{1}{2}$ foot long, 18—21 lines broad above the dilated base, narrowed gradually to a rather obtuse point, which is tipped by a black persistent spine $\frac{1}{2}$ inch long, which has usually 2—3 small denticled cuspidate spines on each side of it, $\frac{1}{4}$ inch thick in the centre, dead green, margined with a continuous white border, like that of filifera, not splitting up into threads, but leaving distinct white vertical bands where it is pressed against the neighbouring leaves. Inflorescence unknown.

A native of Monterey. My notes were taken upon Mr. Mason's specimen at the exhibition of the Royal Horticultural Society in October, 1875. It is a most striking and curious species, and doubtless should be regarded as forming a distinct group.

Erratum, p. 369.—The leaves of *Agave splendens* are 2 feet long, not 12 feet, as printed. *J. G. Baker.*

BRITISH GARDENERS.

ALEXANDER ANDERSON.

MR. ANDERSON, the subject of the present illustration, was born in the parish of Redgorton, in Perthshire, on July 24, 1820, soon after which his parents removed to the parish of Kinnoull, in the vicinity of Perth, and in the parish school there he received the greater part of his education.

When sixteen years of age he was apprenticed for three years to the Messrs. Dickson & Turnbull, nurserymen, Perth, to learn the profession of a gardener. The nurseries at that time were under the superintendence of Mr. Anderson, the present proprietor, and those who know him will bear out the statement that a more energetic man could not have been found for drilling his pupil into active habits in the acquirement of his profession. After going through the usual initiation in digging, raking, pruning, &c., for a time, he was transferred to the glass department, where the propagating of choice and ornamental plants was extensively carried on. Here he began to learn the names of plants, the remembering of which proved to be somewhat difficult at first, but he found that by writing them over once or twice they were impressed on the memory with little trouble, and this practice he has often recommended to young men since. The collections of herbaceous, bulbous, and exotic plants were extensive, and afforded an excellent opportunity of getting familiar with their names and characters, and by drying specimens, and forming a herbarium of alpine and exotic plants, he made fair progress in gaining knowledge. During the summer season he devoted his spare time to making, on those occasions in search of alpinists, collecting, drying, or arranging specimens, as circumstances required, and by the end of his apprenticeship had thus acquired a rather bulky collection. In winter he devoted the time to improving his education, by attending evening school, from which, it is his desire to record, that he gained much advantage, his elementary training being thus kept in practice, and a better appreciation of the value of the same made him more the more industrious. In this respect he was happily situated, as the "Fair City" afforded ample opportunities for young men improving themselves.

"During my last year of apprenticeship," he writes, "I was afforded the opportunity of seeing a little of the first part of forestry, by being sent out in charge of some contract planting, which the firm had undertaken, the produce of which are now large trees. My engagement having now been fulfilled, I was sent as a journeyman to Invermay Gardens, then under the care of the veteran Mr. Nichol, a renowned Pine and Grape grower in those days. Here I found a rich locality for alpine plants, many of which were new to me; but I only remained a short time. I next went to Kinnaird Castle, in Forfarshire, under Mr. Howell, who, after I had been some time there, promoted me to the charge of the forcing department. I remained here for two years, when I was recommended to Mr. Easson, of Camperdown, Forfarshire; at that date one of the best-managed gardens in the country. Mr. Easson (now factor on the estate) was a most exemplary man and a good gardener. The first Earl of Camperdown used to say of him that 'he

did more good than the parish minister.' After being here for some time I was placed in charge of the houses, which were pretty extensive, though Pine growing was being abandoned. I spent over two years here, and profited not a little, as a better managed place I have never seen, taking the allowance for doing so into account.

"I had been engaged for three months before I left to go to Oxenford Castle, Edinburgh, as foreman under the gardener, a man of most indomitable energy and tact, fond of landscape work. His time being fully occupied with the changes and improvements in the park and grounds, the management of the garden and houses consequently devolved a good deal upon me. Sir John Dalrymple had succeeded to the Earldom of Stair shortly before this as eighth Earl, and had set about remodelling the place.

"After seeing a good deal of rough work gone through in road-making, terracing, pulling down and building up, when nearly 20 years here I was recommended by the late Mr. M'Nab of the Royal Botanic Gardens, Edinburgh, as gardener to Lord Southampton, Whitebury Lodge, Northamptonshire, where I stayed two years. Having saved a few pounds in money, I took the advice of the late Mr. J. C. Loudon to some extent, and spent £40 in travelling and ac-

ing all the principal gardens in and around London. I never regretted this outlay, and though not on the Continent, as Mr. Loudon advised, I profited considerably by seeing many of the best places in England.

"I was then offered the remodelling of a fine old place in Dorsetshire (Kingston House), once the residence of the famous Mr. Pitt, by Mr. Ferguson, of Aylesbury, who had undertaken the work and the supplying of the plants. I had to come to London before it was quite finished, and did not return; and being asked at this time to become a candidate for my present situation, I did so, and being successful in my application I entered upon my duties in September, 1848.

"I have had the honour to serve three successive Earls of Stair during the time I have been here—over twenty-eight years. They have all been great patrons of horticulture, and I have received every encouragement from them, and most of all from the present Earl, who has authorised me from time to time to renew the whole of the glass structures on the place upon more modern principles than hitherto, and otherwise permitted me to effect improvements in the place when necessary. During my gardening career I have endeavoured to have as few hobbies as possible (we all have some), dividing and devoting my energies as equally to all subjects under my care as circumstances

would permit. I never was a keen competitor in the general acceptance of the word, but I have entered the lists occasionally, with what results the records of the Royal Horticultural and London and Royal Caledonian Horticultural Societies will testify. Certificates of merit and money prizes from the former, and medals from the latter, for collections of fruit and vegetables, at various times have been won. My great aim through life has been to make two blades of grass to grow where one grew before, and sometimes I have succeeded."

On the occasion of the fruit show at South Kensington on Nov. 6 and 7, 1861, we find, on reference to the *Proceedings of the Royal Horticultural Society*, i. 707, that Mr. Anderson carried off the first prize for a collection (twenty-two dishes) of Pears, thereby beating all England, though, as the *Scottish Farmer* observes, "Oxenford is by no means a land of Goshen, either as regards soil or climate." To him, "therefore, belongs the greater meed of credit for producing under the circumstances better Pears than those with which they were brought into competition, although grown in some of the very best gardens in England"—to wit, Frogmore and Heckfield. "Mr. Anderson, opening his mind to the subject, is to be checked enough upon over-luxuriance and late and imperfect ripening. The sorts of Pears exhibited as above, as we learn from Mr. Anderson, were these:—Beurré d'Areberg, Beurré Diel, Beurré de Capiaumont, Beurré Clairgeau, Buchanan's Spring Beurré, Colmar, Colmar d'Areberg, Crassane, Doyné Grits, Duchesse d'Angoulême, Easter Beurré, Flemish Beauty, Glou Morcean, King Edward's Louise, Louise of Jersey, Marichal à la Cour, Marie Louise, Napoleon, Poire Neill, Rouisse Louch, Suseite de Bayar, Winter Nellis.

Forestry.

ERECTING and maintaining cheap, substantial and efficient FENCES around plantations is a department of work connected with forest operations which has hitherto received but little attention. The question of fencing is a primary consideration, if for no other than this reason, that the money so expended is sunk for such a length of time that, whether with or without interest, it amounts to a very large sum by the time the plantation is ripe either for cutting down or laying open for pasture. Indeed it is frequently found that the principal and interest of the money laid out upon fencing a plantation has amounted to a sum exceeding that of the value of the trees it was erected to protect. I shall not attempt here to enumerate, describe, or specify the different kinds of plantation fences in common use, but assume that a plain, substantial common iron fence upon wooden posts is approved of and adopted. Such fences possess advantages over all others peculiarly their own. They can be erected on the shortest notice, are the cheapest of any other of equal service, are adapted to any climate, soil or situation, and subject to every conceivable modification as a plantation fence. So much for the primary advantages of wire fences, and now for their future and continuous maintenance. This no doubt depends greatly upon the kind and quality of the materials of which they are composed. Iron pillars and standards are considered the most durable framework for a fence, and next to iron mature Larch or old Scots Pine. I removed a fence last year composed partly of malleable iron and partly of Larch, and found many of the iron pillars $1\frac{1}{2}$ inch square quite eaten through with rust, not only at the surface of the ground, but at other parts. The iron pillars, standards, also of malleable iron, $1\frac{1}{2}$ by 1 inch, were completely eaten through, and it was remarkable to

notice also how differently different pillars were affected by corrosion—some being comparatively little worn, while others were nearly extinct. The fence had stood over forty years, and was fully and freely exposed to the influences of the sea, from which it was distant from a half a mile to one mile. The Larch posts in the fence were of sound wood, evidently cut in the winter season, and erected with the bark on. They, too, like the iron pillars, differed greatly as to decay, nor were they invariably most decayed at the surface of the ground—some indeed were quite sound there, while the upper parts were completely rotten. The fence, as far as could be ascertained, never in any way received paint or other application for preserving it. To appearance the iron and wire had originally been painted, but the wood was neither charred, tarred, nor in any way treated for preservation, nor had the iron or wire, apparently been for at least 30 years.

A frequent enquiry is, What can be done to wooden posts in order to make them last longest? The answer I am prepared to give is, Do nothing to them at all, at least if the wood is well watered and hard grown. Crocoting wood, as in preparing railway sleepers, either by placing the posts in tanks or barrels, and allowing them three or four weeks to absorb the liquid, is unquestionably of great advantage to sappy, young timber. In the case of iron-wood, and when the opportunity is at command it should be adopted on the ground of economy; for young Scotch Fir posts, Spruce and Young Larch, &c., will endure at least three times longer by crocoting than otherwise. By placing the posts vertically in the liquid, it enters the vessels of the wood by absorption, while by hydraulic pressure it is forced into them as is done in preparing railway sleepers, pine wood, and large scantlings. Opinions are very conflicting regarding the effects of peeling or shaving off the bark of posts, and this is not to be wondered at, when so many and diverse influences are operating upon the wood. The question also of charring posts is one of no small importance, and ought to be settled for the guidance of those of limited experience, and small means and opportunities of arriving at a conclusion. To my mind it does no good, and therefore must do injury, for by the process a certain portion of woody tissue is lost without any equivalent advantage being gained. After a wire fence is erected, and the wood is dry, the whole fence should be gone over with a coating of tar, natural bark (except that of all protections against decay), should be dressed with Archangel tar in a hot state, unless in the heat of summer, when it is liquid enough without heating. It should be heated only, and not boiled, as in the latter state it encrusts too much, and falls off in scales. The wire, staples, and all iron-work should receive a coating of prepared coal-tar, which costs about 6d. per gallon. The latter operation should be frequently repeated, say every third or fourth year, according to distance from the sea, exposure, and quality of wire, &c. Though coal-tar is frequently applied to wood-work of various kinds (and I participate in its application), it does no good by way of preserving timber or wood of any kind. It darkens the wood and makes it all of one hue, but beyond this its good effects are imaginary.

In erecting wire fences some secure the posts by means of pitting them, and ramming the earth in with a beater; others dispense with the earth taken out, and secure them with stones instead, at least at the surface; others, again, neither use the natural earth taken out of the holes nor stones, but strong clay instead, which they never preserves the posts longest sound. Some, again, drive the posts with heavy mallets, first making holes with an iron piercer the exact shape of the foot of the post that fits it.

All these, and many more systems and practices of erecting wire fences are adopted, each possessing some modicum of advantage over others. But with these, as with most other things, certain effects are produced, and some only a very slight connection with the assigned cause, and it not infrequently happens that between certain effects and believed causes no connection whatever exists. This is very evident in regard to charring posts. As to the use of the iron-staple, but few take the pains of examining the charred broken post, and observing that it is not the charcoal that has decayed and given way, but the wood underneath the charred surface which the charring helps to drive away. Having, however, already exceeded my limited space, I must conclude for the present, and take up the subject again. C. Y. Michie, Cullen House, Cullen, Aberj. 23.

Florists' Flowers.

SENDING OUT DAHLIAS.—The first day of May is the traditional time for the dealers to send out Dahlias. It is a custom which has prevailed in the trade for years, and though under special circumstances the time for sending out new varieties may be hastened by a few days, yet the first day of May is the usual time for commencing. It requires up to that time to get the plants well hardened off and fit to travel, and nurserymen have cleared away by that time the heaviest pressure of their spring orders. After all, there remains but a little space of time in which to crowd many details—not much more than two months, and during that time the work of propagation is carried on at high-pressure. The roots are placed in the propagating-pits early in, and towards the middle of, February. Propagation commences according to the number required of any one variety, some being in greater demand than others. As a rule, cuttings taken through March make the best plants, as they are of the right age not to become stunted with long keeping—a danger which begets some, and they are in good time without forcing. The first cuttings are often too large and sappy, and are thrown aside, unless it happens to be some scarce variety, and then all that can be struck. The cuttings are first of all put into suitable-sized pots in which to strike, and planted in a brisk bottom heat, frequently in dung-heated pits. As soon as the cuttings strike root they are potted singly in thumb-pots, again placed in a bottom-heat to root thoroughly, and then in a frame with a somewhat cooler temperature. Finally, they are placed in cold frames on an ash bottom, kept close for a few days, and then allowed to have air till somewhat hardened off. Towards the end of April it is necessary to get the plants arranged in their sorts for sending out. Advantage is taken of a fine morning to get this done. The plants are taken from the frames, each variety is placed together, and when the process of sorting is complete they are returned to the frames according to the numbers they bear, for it is an invariable rule to keep the varieties under number, beginning with the lowest and going on to the highest. This greatly facilitates the execution of orders. As soon as the plants are arranged they are sprinkled overhead, the lights shut down close, and they soon recover from any flagging caused through exposure.

Mr. Keynes of Salisbury, Mr. Turner of Slough, and other large growers send out thousands of Dahlias during the first three weeks of May. The plants are in thumbs, or very small 6o pots, a stake being placed to each plant and securely tied. They are laid in layers in oblong hampers, and carefully packed with soft moss, and in this manner the plants may be sent to the northernmost parts of Ireland or Scotland without taking harm. As soon as the plants are received they are unpacked, sprinkled, kept close for two or three days to recover the effects of the journey, then repotted, and grown on as fast as possible.

A goodly number of plants is always left on hand after the May and June trade is over. They are generally taken from the small cut-out-pots, and then staked out-of-doors in some out-of-the-way place for the summer. In the autumn, when the foliage has quite died down, they are turned out of the pots, and are sold as pot-roots during the winter. Some varieties throw better blooms from pot-roots than from cuttings struck in spring, and this is one of those matters of observation that falls to the experience of Dahlia cultivators. Sometimes persons are found ridiculing the "jargon of florists," but it really represents a number of useful facts reduced to practice.

An old florist once found it necessary to caution purchasers of new Dahlias against being too covetous, and indicating the lesson he wished to convey from his experience. He states that on one occasion he cut off the tops of some plants as soon as they were received from the nursery. By this operation he certainly doubled the number of his plants, but at what a loss?—for he goes on to say he so weakened his plants in constitution that they became incapable of producing either early or perfect blooms. They had already been subjected to as great a strain in the way of increase as they could well bear. R. D.

—The award of a First-class Certificate to a GOLD-LEAF POLYANTHUS is an event so novel at South Kensington that it deserves more than a passing notice. It is not the fault of the Floral

Committee that many years have passed since any gold-leaf Polyanthus received such honour, as that body has proved itself cheerfully ready to recognise merit in that direction at the first time of asking. Theault has rather been found in the fact that some stocks of the gold-leaf Polyanthus had so far degenerated that flowers worthy of recognition as both new and meritorious were not to be had. Mr. Smith's worthy name Duke of Wellington is probably the beginning of a new break of a favourite but too long neglected old florist's flower; others will no doubt soon follow in its wake, and the comparative regeneration of the gold-leaf Polyanthus may thus become a pleasing reality.

Garden Operations.

PLANT HOUSES.

GREENHOUSE HARD WOODED PLANTS.—Oranges.—These plants will now be much better for being in a close warm temperature, something similar to that which Camellias like. Large plants that have stood in conservatories through the winter will be benefited if they can be transferred to a vinery now in active root, and well filled with soil. Such plants, which require more root-room should now have larger pots or tubs. With careful management Oranges may be kept in a healthy condition with simple greenhouse treatment, but when no heat is given them during the season of making their roots, they rarely make so many roots as when grown warmer; consequently should not have so much pot-room, and ought to be very carefully watered during the winter. Like all other large-leaved evergreen plants, they cannot bear to have their soil about the roots, or to be kept on the other hand, it never must receive so much water as to become sodden. When Oranges get into a bad condition through loss of root they very soon show it by the sickly condition of the leaves and their premature decay, together with the weak branches dying off. With plants that are in this state the best thing is, before growth commences, to turn them out of the pots, remove all soil that is at all sour or in an unhealthy condition, cutting all decayed roots back to the healthy portions, and planting them in new pots or tubs only large enough to admit the reduced ball and a couple of inches of new soil all round. Bottom-heat is absolutely necessary to restore these plants when in the condition above described, but to the best advantage, and to the greatest profit, neither would it be advisable to put them there as the temperature is usually too high for them even in a healthy state, and when out of condition, like all other plants, they cannot bear too much excitement; under any circumstances, however, the night is sufficient with a proportionate rise by day. If on the floor of a vinery at work, as already hinted, a body of fermenting material could be placed, and the pots or boxes plunged, it would be the most certain means of restoring them to health. As soon as they have had an accession through the spring and are now out of bloom, should be cut freely back before growth has commenced—the erect growing kinds especially, if not subjected to this treatment annually, soon get naked and unightly at the bottom. Successful flowered plants of Acacias and Gen's are should be similarly treated, and if all can have a place in a little closer atmosphere for a couple of months they will be much benefited. Habrotamnus elegans is a most striking plant, and one of the best of the single-stemmed stems from 4 to 6 feet high, according to the dimensions of the house it is to occupy. From its ability to make rapid growth it can be got up to a useful size in a very short time. If young healthy plants are selected, and single-stemmed stems kept trained to a stick until they have attained the required height, then stopped as necessary during the summer so as to induce the production of a sufficient number of shoots at the top to form a head, and all that break out below the head rubbed them plenty of pot-room, they will need nothing more.

Azaleas, though not generally so treated, very well bear cutting back. The natural habit of the plants is such that with a reasonable amount of foresight as to stopping and training in their younger stages, they will not often get naked or leggy at the bottom; but where they have been allowed to get into this condition, they will bear cutting in so far as a reduction to half their size. Further than this it would not be safe to go, for with these, as with most other plants, especially such as are of a hard woody nature, there is a considerable loss of root consequent upon heading back; but cutting-in must only be practised on plants that are in a healthy condition, with plenty of roots, as if deficient of these, and consequently in a weak state, heading back would be most likely entail their destruction. After being thus cut-in the plants, if possible, should be stood in a house or pit where the atmosphere can be kept a little close and somewhat moist.

SOFT-WOODED GREENHOUSE PLANTS.—Early-sown *Cinerarias* intended to come into flower by the close of the year will be ready for pricking off later than usual. This is not to be allowed; the seedlings to stand crowded together in the seed-pot, for if ever these plants become drawn no after-treatment can give them the stout, sturdy appearance, with large heavy leaves at the bottom, which is the mark of all management. A little more seed should now be sown to furnish plants to succeed the earliest. A sowing of *Primulas* ought to be made, and the double varieties should be increased from cuttings, though all the plants be necessarily small. The plants with the whites alone are of much worth for cutting, as the black-tinted and different shades of red have a dingy appearance in bouquets or vases. Cuttings strike freely in an ordinary warm temperature, and to be successful in the cultivation of these plants, so as to get them to a considerable size and increase fast, they should be treated to an intermediate temperature and plenty of light. Where subject to a cool, damp atmosphere through the winter they make little progress. Put them well up to the leaves, leaving no bare stem, by which means they are much less liable to rot off at the collar. *Solanums* should at once be planted out; cuttings and seedlings after previously being sufficiently hardened, and other plants which are kept close in large pots, and most of the soil shook from the roots; they ought to have a situation fully exposed to the sun, receive water at the roots when the weather is dry, and occasionally a syringing overhead, which goes through the summer. A lifted and potted in the autumn, are very much superior in their foliage to those that are grown in pots altogether, but it is necessary to plant them out early, or the berries do not acquire their good colour and firmness of nature. They will stand a good many degrees of frost. *T. Loines.*

FRUIT.—The majority of the plants in the different divisions will now be showing signs of growth and activity; in some cases, however, the latter advances will chiefly be devoted to the formation and maturing of the flower-spikes and the blooms, for which that flower is the period of greatest activity, it is well ascertained that the treatment given should in some degree at least, and that so far as it can be managed in a mixed collection, be in accordance with the varying stages of growth in which the individual plants may at any given time be found. In the case of the annuals of water at the roots, as well also as the atmospheric moisture that is required to perfect the blooms of the greater part of the *Dendrobiums*, is a much less quantity than the same plants require when growing in a house, and is particularly so, and not only do these suggestions apply to this, but also to many other genera. Yet, though it may seem that such a course is the most reasonable, there are a few that, as it were, demand individual treatment to their benefit, up to the blooming and early fruiting condition. *C. Cambridgeana* may be cited as one of these. For after the growth is formed and the flowers have appeared, the newly made bulb commences to rot, and for the next three months at least it will be necessary to give the plants a plentiful supply of water; the newly forming roots may thoroughly plump up the new growth, for the strength and vigour of the bulb made this season will in this case, more than in many of the others, indicate pretty certainly the size and healthiness of the one we may look for the following season. The chaste and lovely *D. Devoniana* will now require careful treatment, for it is very apt to start into growth before the flower buds are formed along the bulbs, in which case the young breakings, as it were, of the part of the plant called the flowering bulb, and as a consequence the number of flowers is perceptibly lessened, for, instead of flowering freely a good part of the length of the bulb, the blooms are only developed at very irregular intervals. To counter this it is best at present to withhold water, to be subjected to much heat, for if it is kept just quietly moving, and but a small quantity of water given, the flowers come in much more freely and last much longer in freshness and beauty than if they were to be in a hot and then stood or hung in a cool house. Strong bulbs of this will sometimes bring four, five, and even six flowers at a single joint, in which case it is one that is justly admired, and deserving the high commendation that are given to what is highly to be considered the usual tints of this species. *D. Bensoni*, *litiflorum*, *crystallinum*, &c., on blocks or in baskets, will also be showing flower. These may now be dipped in water a few degrees warmer than the present state of the air, but do not be misled by the practice of keeping them at present continually wet, but see that the previous dipping has well drained away or the young breaks damp off. This remark applies to *D. Bensoni* more particularly, for when this is not in active growth the water required is of the smallest

quantity. The collection as a whole must now have greater attention in the matter of water. The quantity must be increased at the roots, the atmosphere at the same time, by damping the floors, walls, and syringing between the pots, &c., must also be considerably moistened. See, however, that once a day the houses are permitted to get moderately dry, that the superfluous damp may be got rid of. This could be accomplished by the admission of fresh air, which now may be given at every favourable opportunity, using chiefly the bottom ventilators. Should the soil, however, be very hot and clear, a little top-dressing may be given. Be careful to lay down the blinds at such times, that nothing may be caught by the fierce rays of the sun. *W. Swan, Fallowfield.*

FRUIT HOUSES.

PINES.—After a prolonged continuance of murky and sunless weather such as we have experienced this season, there will be a tenderness in the foliage of plants which are subjected to high degrees of temperature, which will render it liable to injury from powerful sunshine; watchfulness will therefore be necessary whenever it is likely to be potent, the ventilators at the top of the house should be slightly raised, and the blinds drawn down, so that the condensed moisture betimes, and the materials if required for shading purposes be ready at hand. Amongst the many contrivances in this way, none in our estimation meets the case with so little trouble and expense as a mixture of no. 11 kail with some slacked lime to give it consistency; this should be applied on the outer surface of the glass with a brush when it is dry, and for a considerable time it will serve to accomplish the object desired, without the necessity of any light from the plants. Shading Pine plants, excepting those without pots, is still a questionable matter with many; we, however, practise it annually in the case of houses with large squares of glass which contain plants in near proximity to the sturdy growing section of plants, such as *Queens*, *Smooth Cayennes*, &c., not more than 3 feet from the glass when they are fruiting, and slightly less when in course of preparation for fruit. The ordinary means of shading from the top of the pots the erect-growers require proportionately more, which is usually supplied by giving these sorts the back or middle place, as the state of the structure may require. Let the ordinary means of shading be used, and the materials be judiciously performed; keep the temperatures well up, as before indicated; and let the maximum point be the rule, with the aid of solar influences. *G. T. Miller, Wyeombe Abbey.*

VINES.—Examine the inside borders in early houses where the Grapes are taking their last swelling, and, if necessary, give sufficient water to keep the soil in a healthy growing state until after the fruit is cut. The soil, however, should be kept in the dry range, a little fresh matting to keep the moisture in the borders. Keep up a constant circulation of warm air, but avoid draughts. Allow the temperature to rise 85° with sun-heat, gradually reduce it in the afternoon, and in the evening to 70°; if the temperature in the house range low at night. Watch for red-spider, and sponge with clean or weak tobacco-water if sulphur is objected to, as White Frontinam and some other delicate kinds are sometimes injured by its use on the pipes. If the outside mulching has become cold a portion of the heaviest may be removed, leaving sufficient to protect the surface-roots from injury and to prevent the borders from becoming dry. The usual attention to stopping, tying, and removal of surplus canes, and the fruit successions should not be neglected for a single day, as every branch which is not wanted increases the strain on the Vines, and rots those intended to ripen. *Muscats*, in many sorts, will now require a high range of temperature, and should be kept at 70° by night, with a little air. Go over the bunches with a camel-hair pencil when the sun is shining, and keep the points turned up to the light. Take advantage of every ray of sunshine in the day, with fire-heat, and close about 3 P.M., according to the state of the weather, with plenty of moisture, when the fire-heat may be shut off until the house falls to within 5° of the night temperature, and the sun not exceed 60°. Examine inside borders, and water freely with tepid liquid manure; if well-drained they cannot receive too much when the Vines are in active growth. Newly planted Vines should be kept close and moist until they have taken a good range of soil, after which they may be encouraged to make short-jointed wood by judicious ventilation and full exposure to light. *W. Coleman, Eastnor Castle.*

CUCUMBERS.—The past mild winter having been unusually favourable to the continuous growth of Cucumbers, old plants which have been in bearing since November will now begin to present an untidy appearance, and if they have been having a good chance are that they will not be free from red-spider.

Where this is the case, and the house is divided into compartments, this section should be cleared of its occupants, all secure and fastenings removed, the glass, woodwork, and walls thoroughly cleaned, and new hills may be formed for the reception of vigorous young plants, which will come into bearing in a very short time after this date, and give less trouble with moisture than the old plants. Let the hills for summer work be placed as far as may be convenient from the pipes which supply top-heat. Use loam somewhat heavier than that recommended for winter, and secure bottom-heat, and manure removing materials in preference to that which is given off by hot-water. If old plants may be retained, crop lightly, give more water at the roots—tepid liquid manure answers best, top-dress with good loam, and syringe with tepid water, and keep wood and fastenings material should be of the lightest texture, and I look upon this as being more necessary to the protection of fruit than foliage. Plants in pits and frames will now be coming into bearing; dress over as often as the state of the weather permits, and keep wood and fastenings tight and clear of the glass. Use glasses for keeping the fruit clean and straight. Ventilate freely early in the day, and close about 3 P.M. with plenty of moisture. If after renovation of the linings steam is likely to be troublesome, it should be left on at night. *W. Coleman, Eastnor Castle.*

KITCHEN GARDEN.

The ground hitherto occupied by the various waterings and Broccoli will now be ready for turning up in preparation for future crops, and on such plots as require deep digging, the soil should be turned to the bottom of the trench and a dressing of lime spread over them to hasten decay and check the increase of slugs; if manure is required it should be spread over the surface and forked in after the trenching is finished. Plots which were reserved for winter crops, and in this, and in that case the old stems should be wheeled to the rubbish yard, the manure required be spread over the surface and deeply forked in with long-tined three-pronged spades; and previous to getting in fresh crops, the surface should be well stirred, and the whole surface thus disturbed, will be of great advantage, especially after such a mild winter.

Considerable attention will be required in keeping up successional sowings of the various sorts of Peas for salads, and before recommended, the various sorts of summer Lettuces, both *Cos* and *Cabbage* varieties, may with great advantage be sown in drills and thinned out to the requisite distances, and if this is done at short intervals, and the plants are not over-tempting; at the same time where a large supply is required it is scarcely possible to avoid transplanting, in the case of the *Cos* varieties, as ground becomes vacant, these however will require more copious supplies of water, and have little to do with the ground the next ten days it will be safe to get in the main crops of *Scarlet Runners* and *Dwarf French Beans*; deeply trenched and highly manured ground will realize an abundant and succulent produce. The *Scarlet Runners* may be sown in rows, or what is better, single rows with spaces between sufficient to occupy five or six rows of *Walthein Cauliflower* or *Dean's Snowball Cauliflower*, both of which would leave the ground vacant about the same time as the *Runners*, and the shade afforded by the tall Beans would be of great advantage to the well-toing of the *Cauliflowers*. The principal sowing of *Red Beet* should now be got in once; in a light and deeply trenched soil, well manured the previous year, and the plants well watered, and the straight and uniform root is a great desideratum, if it is necessary to manure the ground for the crop, it should be done late in autumn or early in winter, and no opportunity omitted to knock it out, so as to get the soil to be in the best state for the sowing, for if the manure is turned on in lamps the roots will surely send out forks in search of it, and as these are liable to be broken off when preparing for cooking, the Beet when placed on the table will have little to show for it, a great portion of its colour. Successional sowings of *Pearl and Windsor Beans* must be kept up, and as the present sowings of *Peas* will be coming to maturity during the hottest parts of the year, the present and all succeeding sowings should have little extra attention by way of keeping the roots cool; an excellent way is to take out a trench and fill it with good manure on which to sow the seed, but if this cannot be done recourse must be had to a thick covering of manure on each side of the rows and the plants, but the best of all is to get the sowings of *Celery* will now be ready for pricking out; see that the plants are properly supplied with water and shaded for a few days, as the great object is to avoid checking a free growth. All the sorts of Broccoli which have been sown in the winter months have especial attention, and it is probable that the spaces intended for them are yet occupied, the plants should be at once pricked out to a sheltered border and shaded. *Turnsole Sprouts* will also come under the same rule, but the best crop of these should be permanently planted out in rich soil as soon as the plants are large enough. *John Cox, Kellinf.*

THE
Gardeners' Chronicle.

SATURDAY, APRIL 28, 1877.

APPOINTMENTS FOR THE ENGLING WEEK.

		[Royal Horticultural Society: Meeting of Fruit and Floral Committees, at 11 A.M.]
WEDNESDAY, May 9		[Scientific Committee, at 1 P.M.]
		Opening of Messrs. G. Jackson & Sons' Horticultural Exhibition at Regents' Park.
THURSDAY, May 10		Sale of Orchids, at Stevens' Rooms
		Linnæan Society: Meeting, at 8 P.M.
FRIDAY, May 11		Sale of Orchids, at Stevens' Rooms.
		[Sale of Scientific Instruments at Stevens' Rooms.]

AN example has been set at the rising city of PETERBOROUGH, in the arrangements for a PUBLIC PARK, that may be advantageously imitated by many other towns. In some instances we fear this example comes too late, but there are as yet many towns with an increasing population that have open plots of lands within easy distance, which have not been cut up into irregular patchwork by little independent land-jobbers and speculative builders. It is these towns, which have escaped this petty building mania that has too often resulted in making suburbs hideous, that we would invite to consider what has been done at Peterborough. With a view to convey to our readers the importance of this question, we have given a reduced illustration on p. 533. This plan of the park and land towards and around it, which is systematically laid out for building upon, almost speaks for itself. But there are a few details which are full of interest.

Peterborough has sprung into a town of importance simply because it is the junction of four leading railway systems, viz., the Great Northern, the Great Eastern, the London and North-Western, and the Midland. Stamford ought to have been in this enviable position, but through the prejudice and nearsightedness of some landowners the Great Northern Railway was prevented from running parallel with the great north turnpike road. Stamford, therefore, has stood still while Peterborough has increased greatly in manufacturing and commercial importance, upon which naturally follows a greatly increased and increasing population. The Great Northern Railway Company's repairing works are a mile or so north of the town, where a suburban village, which oddly enough has been named "New England," has been built; while Messrs. BARFORD & PERKIN'S works for steam-ploughs, steel mills, water-ballast rollers, and other machinery and implements, have greatly increased of late years, and added to the business and prosperity of the town. We mention these points because the projectors of the admirable arrangements which we have illustrated have reserved plots for other factories; and negotiations, which have been so far successful, are going on with a view to establish branches of factories which are now flourishing at Nottingham, Derby, and other midland towns. It is thus shown, we may add, that a rare combination of refined taste and business foresight has guided the few enterprising promoters of this land project, who in less than two years have transformed a farm and a few straggling plots of land into one of the best laid out suburban estates that we know of in connection with any town.

The estate altogether consists of about 146 acres. The land was mainly bought of the Ecclesiastical Commissioners, who, we are informed, have acted very meritoriously in disposing of land at fair prices when it was represented to them that to do so would promote the prosperity of the city. This estate may be described as in the form of a Jew's-harp, and, as will be seen, it has something of the form of that instrument—the two roads which form the handle of the figure running con-

veniently down to the centre of the town, that is, to the top of The Causeway, as the wide street in the centre of the city is termed.

The details of the transformation of this estate are something marvellous, considering that it was originally a speculation by four men of business, and that they have taken less than two years, as we have intimated, to carry them out. The outlines would of course be the first object with men who set themselves to work so systematically. There are two miles of main road on the two sides and around the head of the estate. This road is uniformly 50 feet wide, and it is planted on both sides with Plane, Lime, and other trees, 23 feet apart. The proprietors have had one sale—the darker shaded plots of our illustration being the result—a part of the conditions of that sale being, the vendors hold themselves responsible for 5 miles of drainage under the roads and other places, and for 10 miles of fencing in front of and between the plots. There are 500 plots laid out, of various sizes to suit the taste and means of purchasers. Conditions are at the same time very properly laid down for purchasers to abide by. In some instances, when the plots are short and suitable for small houses, the gardens in front are to be 12 feet in depth. This arrangement, with the 50 feet roadway, will give an open space of nearly 21 yards between the fronts of these houses. At other parts a frontage of 30 feet must be left, and at other places there must be a reserve of 50 feet, so that there will be front gardens varying from 12 feet to 50 feet for planting with shrubs and making into flower beds, while the width between the lines of houses will range from upwards of 20 yards to nearly 35 yards. These conditions refer to the roads of the narrower part of the estate near the town. The restrictions in regard to the style and value of the houses in the semicircle at the head of the estate, and beside the roads looking over the park, are more in harmony with the large grounds which are set out in the plans.

The park, as will be observed, is in the form of a horse-shoe, and conveniently situated in the centre of the estate. It is 22 acres in extent, and the way in which it has been laid out is most convenient and tasteful. It is divided into four quarters by promenades, which run at right angles from a raised mound in the centre. The raised mound is about 8 feet high and 150 feet in diameter. A pagoda will be placed in the centre for shelter at all times, and for the use of a band on gala days; this is approached by four sets of stone steps. The promenades are 25 feet wide, and ornamental trees are planted on each side. The fringe of the park is formed of raised beds and serpentine walks, the background of the beds being planted with choice shrubs and permanent flowering plants, while nooks and fringes are left for Pelargoniums and other summer bedding-plants. The north-east and south-east quarters are left in turf for such games as football, bowls, and cricket matches. The north-west quarter is reserved for ornamentation by choice shrubs and plants, while the south-west quarter is being supplied with a small lake and a sunken pool and fountain, bordered with rock-beds, for the growth of aquatic and other suitable plants. Any one who has seen the Lower Grounds at Aston, near Birmingham, may anticipate what a charming spot is here designed by the proprietors.

This park, however, has been formally offered to the Corporation of the City, and as the terms are very easy, and certainly easier now than they will be again, the authorities, we should think, will not let the opportunity slip out of their hands. One part of the terms is singularly fortunate. A few years ago the widow of a successful tradesman of the city made a present of 4 acres

of valuable land to the Corporation on condition that it should be preserved as a recreation ground in memory of her husband. This recreation ground (A) has, however, never been properly appreciated: the Corporation have not ornamented it in any way, and it is left as a bit of rough pasture for boys and girls to romp on as the fit takes them. The proprietors of the estate, however, have offered to make an exchange of a part of their park for these 4 acres of recreation ground. As this enclosure is nearer the city, and, therefore, more valuable for a factory or other business premises, they have offered 3 acres of the park in its present state for 1 acre of the recreation ground. This will cover 12 acres of the park, and, therefore, leave only 10 acres to be purchased with money by the Corporation. Fortunately the benevolent lady who presented the recreation ground is still living, and has kindly consented to the exchange being made, expressing her pleasure at the same time that her gift is likely to aid in leading to something more worthy of the town. On these grounds we hope, with Mrs. STANLEY—the name of the lady referred to—that the Corporation will meet the liberal offer made by the present proprietors of the park, and secure for ever an open space that will be a worthy imitation of the noblest acts of our own time, and a perpetual example for posterity to emulate.

We may add that in the absence of Government exercising any paternal control over the arrangement of building lands adjacent to rising towns, men of business there, either as enterprising private men or in their corporate capacity, may advantageously pay a visit to Peterborough, and see for themselves how great and good a work may be done, both for the present generation and for posterity, by a few neighbours taking a matter of this kind in hand and setting to work with energy, judgment, and good fellowship. The proprietary, we are informed, has recently been converted into a company of six shareholders. Another sale of plots has, we believe, taken place this week, but we have not heard the result. We are informed, however, that the original shares would readily sell at a premium of from 25 to 30 per cent. While, too, the main chance has always been well looked after in this enterprise—as it always should be if men would have the power of doing good—the moral interest of the people has not been overlooked, for sites have been set apart for churches, schools, clubs, and other modern institutions; indeed, nothing of importance appears to have been overlooked. This is why we say this estate is worth visiting, and the action of its proprietors worth imitating.

—THE AMSTERDAM BOTANIC GARDEN is by no means worthy of so large and wealthy a city, and forms an unpleasant contrast with the neighbouring zoological garden. The outdoor department is specially meagre, partly, indeed, from want of space. The most remarkable tree in it is a *Toxodum distichum*, with the habit of an English Oak rather than of a Conifer. Its clean unbranched bole can barely be spanned by two men with outstretched arms, and the whole aspect is so different from ordinary specimens of this species that it is at first difficult to persuade one's-self of its identity, particularly when devoid of leaves. A shrub marked *Ribes grossularioides*, neither leaves nor flowers of which were expanded at the time of our visit, is also remarkable for its habit, the upper branches spreading horizontally or slightly bending downwards at the tips, forming a flat-topped shrub of peculiar appearance. The glass-houses are numerous, mostly lofty, narrow and ill-suited for plant growing. Most of them, moreover, are double-glazed, and, in some cases, the outer covering is removed during the summer months. Fine specimen Palms, Pandanus, Cycads, and Tree Ferns, constitute the chief features of the collection, but some of them are suffering from the restricted space in which they are placed. We may briefly enumerate

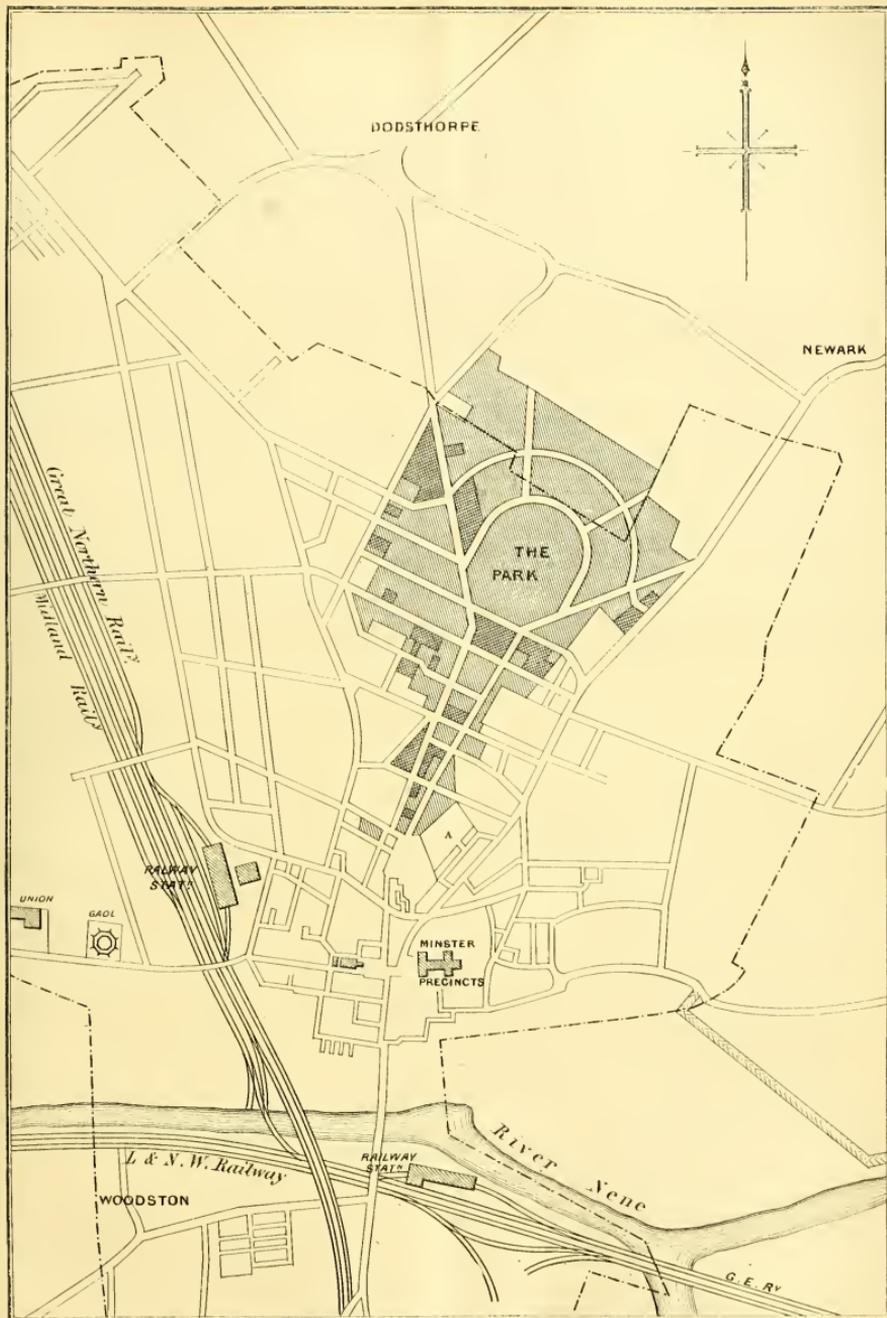

FIG. 84.—PLAN OF THE LAND COMPANY'S ESTATE, PETERBOROUGH.

the following species as being well represented:—Palms.—*Phoenix spinosa*, *Calamus gracillimus*, *Sabal umbraculifera*, very fine; *Asrocaryum Ayriei*? *Caryota Cumingii*, *Arecia rubra*, &c. Cycads.—*Ceratopteris mexicana*, female plant, in fruit; *Cephalotaxis Altsteinii*, *E. Lehmanni*, *E. longifolius*, a noble specimen with a trunk 16–17 feet high, and as thick as one's body; *Cycas circinalis*, dividing at the summit into three branches; *C. Rumboldii*, of which the top has been cut off, but from which new offshoots are in the course of formation; and a very handsome specimen of *Cycas glauca*, and *Zamia Mitquiana*. Among Ferns we may cite *Alsophila australis*, *Angiopteris Willinkii*, and various species of *Cibotium* and *Cyathea*. A lofty specimen of *Strelitzia augusta* also deserves notice, as well as a bush of *Cestrum aurantiacum* loaded with white pyriform berries. In one of the greenhouses are fine specimens of *Protea cynaroides*, *Banksia serrata*, *Knightsia excelsa*, and other Proteads, now rarely seen in this country. The Victoria-house serves in winter-time as a store-house for Heaths and other plants which are turned out in summer. The collections as a whole make one think that the Amsterdam folk by no means appreciate the richness of their possessions, or understand the requirements of students.

—The decoration of wild banks, wilderness walks, and the like, if judiciously done, is one of the most satisfactory of garden procedures. We have in view just now a stretch of undercliff covered in places by a thicket of common wild CLEMATIS. Why not introduce here and there among it plants of *Clematis Jackmanni*, or other of the gorgeous varieties of this genus? In the undercliff at Folkestone, as also in the Isle of Wight by Ventnor, and many similar localities, there would, with a little care at first, be ample means of establishing these plants in quantities sufficient to provide for a large amount of deperdition by small boys, and yet leave a large surplus for those whose stiffened limbs would only permit them to admire at a little distance. At Folkestone just now plantations of black Austrian Pine are being made along the slopes of the sandstone cliff, and temporarily fenced off, so that it would be easy to introduce the *Clematis* likewise.

—The next meeting of the INSTITUTION OF SURVEYORS will be held on Monday evening, April 30, when the adjourned discussion on the paper read by Mr. J. SHAW at the last meeting, on "The Rivers Pollution Prevention Act, 1876," will be resumed. The chair to be taken at 8 o'clock.

—*TILLANDSIA USNEOIDES*, a wonderfully curious form of Bromeliaceae, is flowering in the stove at Kew. It is a rootless epiphyte, forming a tangled mass of wavy, slender stems and narrow leaves, all over silvery, with minute scales, bearing tiny green flowers of delicate perfume. It is a native of the West Indies, Central America, and the South United States, growing in great profusion on the Cycas trees on the Mississippi, and basking in large leaf-like masses it gives the trees a strange, gaunt appearance. In Jamaica it is known as "Old Man's Beard," and is called also American Moss. It is used in America in the preparation of an ointment for hæmorrhage; the stems are used for stuffing purposes, after removal of the outer parenchyma, by steeping in water. In this condition it is known as vegetable hair, and is said to have been imported to this country. The stems are remarkable from being without spiral vessels. The leaves are so brittle as to be scarcely distinguishable from the stems at a short distance, and are curious from nearly all being terete for a space near the middle, while either channelled or flat above and below that portion. The flowers are produced about two together at the ends of the branches, the petals are narrow, bright green, and translucent, spreading above the tips of the sepals. It has been said that *Tillandsias* have no roots, but this, though true of the present and perhaps some other species, is not true of all, as an inspection of the plant in the house will testify. The cultivation of the *Clematis* is not difficult, provided a healthy growth to commence with. It is nearly always received dead, or nearly so, often from being packed in large damp masses. For cultivation it should be laid thinly on suspended pieces of Tree Fern stems, with the temperature and moisture of a stove. It will live a long time without water, but is easily weakened by struggling to grow

in a dry atmosphere. The stems on which it is placed should be treated with water as if to grow an Orchid. Seeds of this plant, gathered from the same importation, have germinated.

—There is just now in bloom at Mr. KINGSTON'S nursery at Richmond some fine GLOXINIAS, both named varieties and seedlings, and among them is a pure white erect-flowering variety with blossoms of a snowy whiteness and of the finest form. It is named *Comtesse de Naidailac*. Lord Derby, with the lobes shaded maroon, and a pure pale cream-colored throat; and *Duchess of Teck*, crimson, with a shaded lilac margin, are also very fine. Among the seedlings raised by Mr. KINGSTON there are some delicately reticulated flowers that have much novelty of character.

—One of the finest Palms shown at the recent Amsterdam Exhibition was a young plant of *PLECTOCOMIA ELONGATA*, the stem and under-surface of the leaves of which are covered with white meal, the stem, moreover, bearing regular spiral coils of formidable spines. The large pinnate leaves ran out at the points into a long lash-like tendril, beset with hooked prickles.

—We learn that M. PLANCHON is to edit the *Flore des Serres* of VAN HOUTTE, an announcement which will be received with satisfaction by all those who are interested in the correct determination and nomenclature of the plants they cultivate, while the subscribers in general will be glad to receive something more than mere repetitions of the plates of the *Botanical Magazine*.

—We have received from Mr. JOHN GRAY a fine bloom of *SOLANDEA GRANDIFLORA*, cut from a specimen flowering at Lord BROWNSLOW'S, Ashridge Park. The bloom, which is of an orange-yellow colour, and much resembling a *Brugmansia* in form, measured nearly a foot in length. The foliage is very handsome, and we agree with Mr. GRAY that such a beautiful subject should be more often seen in collections.

—Mr. J. MAFERSON, late foreman at Hatfield under Mr. BENNETT and Mr. THOMSON, has been appointed to succeed Mr. W. GARDNER in the management of St. G. R. PHILLIPS' garden at Weston House, Shipton-on-Stour. Mr. GARDNER has been at Weston House forty-four years.

—The last number of REEGL'S *Gartenflora* contains some particulars of the CLIMATE of different parts of RUSSIA and its effects on vegetation. The writer also gives some statistics of the quantity of fuel consumed in the botanic gardens of St. Petersburg during the first half of last December. While we were busily engaged keeping the water out, our friends in St. Petersburg were combating the fierce cold. From December 1 to 15 the temperature for a part of the time there was from 63° to 75° of frost, and during the remainder of the period from 40° to 63° of frost. The average quantity of fuel used daily in the botanic gardens was 150 centners of coke and 13 cords (7 feet square by 2½) loads of solid Birch wood, and 2 cords (7 feet every way) of Pine wood! We do not know the extent of the glass in the Petersburg garden, but the expense of preserving the collections through the winter must be enormous!

—We learn from the *Wiener Gartenfreund* that a movement is being made in Austria to obtain an Act for the PROTECTION OF BIRDS, for which committees are forming in all parts of the empire.

—For the next two or three weeks the FRUIT ORCHARDS will be decked in all their beauty, and persons in search of joys yet untasted may well give the country a few visits whilst the trees are robed in their floral coverings. If the keen cold east winds of last week present the total of weather severity to be experienced in the east, and a continuation of such a critical period of Blackthorn winter we may look upon the abundant Plum blossom as safe to produce a good crop. Last year, although an immense bloom was seen, no fruit followed, and, although the deficiency was generally attributed to the severe frosts and ungenial weather that prevailed during the blooming period, there can be little doubt that the heavy crops

of the preceding year affected the fertility of the blossom. The Pear trees are remarkably full of bloom, many being literally masses of white, and if only a tith should set, there will be an abundant crop. The Apple trees also are full of promise. Some will be a perfect gale of flower; the *Max* *Collins* especially will soon be singularly beautiful. The ripe fruit of the *Apple Blossom* renders the most ornamental of all hardy fruits, and, therefore, the first week in May will find the orchard districts peculiarly attractive. Cherries, as with other standard fruits, are full of all the promise that masses of flower blossoms can give. Gooseberries constitute one of the most valuable of bush fruits, and present appearances indicate a very plentiful crop. With nearly all our hardy fruits it is entirely a question of weather, and remembering the comparative rest enjoyed by the trees last year, there is good reason to hope for an abundant crop of all kinds.

—A 'cute American suggests, as an efficacious mode to discover the DIFFERENCE BETWEEN A MUSHROOM AND A TOADSTOOL, "to eat it." If you live in a Mushroom, if you die it's a toadstool. This method may possess the merit of originality, but it will not bear the test of experience, inasmuch as if it is a Mushroom you are no wiser in future difficulties, and if it is a toadstool the tragic result renders the knowledge gained of no further use to the experimenter, and certainly the game is scarcely worth the candle. Probably it is wisest in all cases of doubt to give yourself the benefit of the doubt, and abstain from partaking of the tempting fungus.

—A plant rarely seen now, but which is worthy of being more frequently grown, is *COSMOTHES DEVOSIANA*, a Genetard with small, opposite, ovate, somewhat fleshy leaves, and irregularly funnel-shaped white flowers. The plant is a trailer, sending out adventitious roots, and is well adapted for hanging baskets for conservatories. We saw it lately so employed in the Botanic Garden at Brussels, and were struck with its effectiveness for the purpose mentioned.

FERTILISATION OF PLANTS.*

I PURPOSE devoting this and the remaining contributions to self-fertilisation. Before, however, making out my case, I would wish to guard against being misunderstood; for my criticisms have, I fear, led readers to imagine I would undervalue Mr. Darwin's laborious investigations and their important results. This would be far from my intention. The chief of these results may be briefly summed up thus:—1. Crossing with a distinct stock usually gives enormous advantages, which are continued into subsequent, often many generations. Every element of vigour and prosperity is enhanced. This is clearly established. 2. That more moderate advantages accrue from an intercross with another plant of the same stock, and that the relative advantages of such, over self-fertilisation, gradually disappear in successive generations. 3. The crossing of different flowers on the same plant generally does little or no good, such benefit being mostly (?) in the case of self-sterile plants. 4. Self-fertilisation. This last, Mr. Darwin says, is "injurious," and produces "evil results." Now, it is here where I am compelled to differ from his conclusions, and my previous criticisms to be made a matter of dispute at this point. Allowing for individual exceptions, I maintain that, as a broad general principle, self-fertilisation in the vegetable kingdom is not "injurious" in any ordinary sense of the term. I may be wrong, but that is my conviction, and the present communication will supply my reasons for so thinking.

On p. 26, while recommending his readers to study certain cases in particular, in which "the crossed plants are superior to the self-fertilised in a marked degree," Mr. Darwin adds:—"As instances of self-fertilised plants being equal or superior to the crossed, the experiments on *Bartonia*, *Canna*, and the common Pea ought to be read; but in the last case, and probably in that of *Canna* [and he might have added *Bartonia*, for the plants were unhealthy], the want of superiority in the crossed plants can be explained;" the explanation being, that as *Canna* and the Pea have been long cultivated by self-fertilisation, intercrossing did little or no good. But there are other

* *Cross and Self-Fertilisation of Plants*. By C. Darwin. Murray.

instances, such as the case of "Hera," *Mimulus*, *Reseda*, *Echscholzia*, &c., to which this case does not apply, and which were much superior to their interested rivals.

I will now quote three passages of importance. "We should always keep in mind the obvious fact, that the production of seed is the chief end of the act of fertilisation; and that this end can be gained by hermaphrodite plants with incomparably greater certainty by self-fertilisation than by the union of sexual elements belonging to two distinct flowers or plants" (p. 3). In speaking of the superiority of self-fertilised seedlings of *Ipomoea* to those raised from flowers fertilised by pollen taken from other flowers on the same plant, he says:—"This is a remarkable fact, which seems to indicate that self-fertilisation is in some measure more advantageous than crossing, unless the cross brings in, as is generally the case, some decided and preponderant advantage" (p. 61).

Lastly, Mr. Darwin observes:—"The most important conclusion to which I have arrived, is that the mere act of crossing by itself does no good. The good depends on the individuals which are crossed differing slightly in constitution" (p. 27).

Considering them in detail, I shall endeavour to show how self-fertilised plants can and do fulfil the conditions here spoken of by Mr. Darwin.

The following are some of the chief facts connected with the self-fertilisation of plants:—

1. The majority of flowering plants are self-fertile, and very few are known to be physiologically self-sterile.

2. Many are morphologically, but not physiologically self-sterile.

3. Both physiologically and morphologically self-sterile plants become self-fertile under changed conditions.

4. Flowers may become self-fertilising (1) by the withering of the corolla; (2) perhaps by its excision; (3) by closing; (4) by remaining closed, never having opened; (5) in the absence of insects; (6) by transportation to a different climate; (7) by reduction of temperature.

5. Highly self-fertile varieties may appear under cultivation.

6. Self-fertilisation may be secured by special constructive adaptations.

7. Inconspicuous and cleistogamous flowers are habitually and highly self-fertile.

8. Self-fertility does not decrease, but may increase in successive generations.

9. Though plants may acquire increased constitutional vigour by crossing, self-fertile plants may gain the same by transportation to other climates.

10. Of plants requiring insect agency and self-fertilised, the latter are best fitted to survive under migration.

11. When free from competition, self-fertile plants are equal and often superior to the intercrossed.

12. There is no waste of energy with self-fertilised plants, as occurs in the production of a profusion of pollen by intercrossing and anemophilous plants.

13. Highly self-fertile and long cultivated self-fertilised forms derive little or no benefit from an intercross, and may derive none when a cross with a new stock. All self-fertile plants are in every way as healthy as the normally intercrossed plants.

1 to 4. Plants may be physiologically or else morphologically self-sterile, or both combined; but under certain circumstances many, and probably all such plants acquire or regain the power of self-fertilisation. Mr. Darwin records several cases, as, for example, the Brazilian *Echscholzia*, of which he says, "their self-sterility had evidently increased greatly by being reared for two generations in England." It was similar with Abbot's Darwinia. Some plants of *Reseda odorata*, as already stated, are self-fertile, while other plants are self-sterile. *Verbascum phoeniceum* fluctuates in the same way; and while *V. Thapsus* is self-fertile, *V. nigrum* is self-sterile. *Lobelia fulgens* was self-sterile in Germany, but Mr. Darwin found it self-fertile. This, like the Brazilian *Echscholzia*, appeared to become self-fertile in consequence of the lower temperature of England; for the latter became again self-sterile in Germany. Orchids may be both morphologically and physiologically self-sterile, while even in some cases the pollen acts as a poison on the stigma of the same flower.

Mr. Darwin regards such self-sterility merely as an "incident," and not due to natural selection to prevent self-fertilisation.

Plants adapted for insect agency may be, and generally are, however, self-fertile. This occurs with many Leguminosae; *Pisum sativum* is habitually self-fertilised, so is *Phaseolus vulgaris*, but *P. multiflorus* has not yet retained the power, and is still flowered, such as pale varieties of *Pedicularis*, *Primula* and *Dianthus*, may gradually become self-fertilising by maturing their stamens and pistil together.

In speaking of the "immediate cause" of self-sterility Mr. Darwin attributes it to the enviring "conditions." These, I think, should be called the "proximate" causes, the immediate or ultimate cause being, as I conceive, the preponderating influence of the corolla and nectariferous whorls, which thus by undue growth destroy the equilibrium between the essential organs. Whatever, therefore, may be the cause at work which checks the growth, or develops the energy, in whatever way shown by the corolla, glands, and nectaries, and perhaps in part the stamens, that same energy is now diverted into the pistil, which thus matures simultaneously with the stamens, and, therefore, earlier than it would otherwise have done. What led me to draw this conclusion was an examination of the order of "emergence," as well as the subsequent growth of the floral organs of a large number of plants; such order being frequently as follows with flowers having conditions, that is, sepals, stamens (if in two rows), that opposite the petals, and lastly the corolla. The latter grows subsequently very rapidly, and then, of course, exceeds the other parts very greatly. On the other hand, with inconspicuous self-fertilising flowers, the pistil often emerges simultaneously with or before the stamens. The former condition I take to be the immediate cause of protandry, and the latter that of self-sterility; or if the pistil becomes too much stimulated the equilibrium is again destroyed, and protogyny is the result. But if energy be diverted from the corolla, as seen in the pale *Pedicularis*, then it passes into the next whorl which appears in the order of succession, *i.e.*, the pistil; this latter now retaining its power of growth arrives at maturity simultaneously with the stamens, and self-fertilisation is the result.

Under heading No. 4 I have given six causes, and possibly there may be others which may thus bring about self-fertilisation.

Mr. Darwin alludes to withering of corollas of *Viola tricolor*, and I can corroborate this, for I have noted that of *Tradescantia virginica* in September last when the corollas shrivelled and matted round the ovary, thus keeping the style bent down upon it and the stigma in contact with the anthers; a number of capsules ripened, and the seeds contained perfectly formed embryos. Mr. Darwin alludes to *Buttercup* fertilising themselves by closing at night, and perhaps we may generalise upon that; at all events it is suggestive that flowers which close in diffused sunlight (as *Anagallis arvensis*, *Mesembryanthemum*, *Daisies*, &c.), in the evening, or at night, may do so for this very purpose.

The above observation led me to deduce the expectation that if the corolla were cut out, the protandry of one or otherwise sterile flowers might become self-fertilising; and I was most agreeably surprised to find cases recorded by Mr. Darwin which exactly fulfilled my prediction, though the operation was performed for a different purpose. "Karr," writes Mr. Darwin, "removed the whole corolla from a considerable number of flowers, and these yielded seeds. Flowers which are self-fertile would naturally produce seeds under these circumstances, but I was greatly surprised that *Delphinium Consolida*, as well as another species of *Delphinium* and *Viola tricolor*, should have produced a fair supply of seeds when thus treated" (note, p. 420). Now, such a result exactly corroborates or proves my deduction, but I hope to test it fully this year, and would be extremely glad if any one would assist me in doing so by thus removing the corollas together with some of the stamens, as well as alone, especially before development, and carefully protecting those flowers thus mutilated from the approach of insects; for of course it need only be done in the case of protandrous flowers.

Another cause of self-fertilisation is the lowering of the temperature. Allusion has already been made to this in the case of the Brazilian *Echscholzia*, which, though self-sterile in South America, became self-

fertile in England. Mr. A. Bennet also called attention to the fact that some of our wild flowers, when they blossom in winter, do not open their buds, and are self-fertilising in consequence, and I can corroborate his observations by many other instances. The *notations* being, as I believe, that the reduction of temperature checks the growth of the corolla and the secretion of the glands.

Again, certain white and pale coloured varieties are great seeders; and this, again, I suspect, is another cause of the same kind, for whiteness represents loss of vigour. Mr. B. T. Lowce informs me that he found the garden Balsam became white if the soil was deprived of ammonia, but if it be artificially supplied the colour returned—an important fact, to which I would call the attention of horticulturists. If such be the true explanation of protandry and self-fertilisation, the question is resolved into one of degrees of compensation, and, so far at least, has nothing to do with "injuriousness" whatever. In fact, it is an absolute loss (and therefore an "injury") to a plant to be self-sterile, for its facility of propagating is therefore largely, if not entirely, checked.

Though I agree with Mr. Darwin that "the inefficiency of a plant's own pollen [physiological] is in most cases an incidental result [of differentiation], and has not been specially acquired for the purpose of preventing self-fertilisation," I cannot agree with him as drawn to a different conclusion for morphologically self-sterile plants, for he adds:—"On the other hand, there can hardly be a doubt that dichogamy . . . that the hetero-stylid condition of certain plants, and that many mechanical structures, have all been acquired so as to check self-fertilisation and to favour cross-fertilisation;" and yet he shows that when plants lose their dichogamy they regain great self-fertilising powers, which he then considers to be an advantage to the plant. Elsewhere, too, Mr. Darwin says "it is difficult to avoid the suspicion that self-fertilisation is in some respects advantageous."

My explanation is that it is simply an unavoidable result of the loss of equilibrium between the pistil and corolline and nectariferous whorls. As long as insects visit a flower they are continually keeping up a sort of irritation at that region; the whole weight of the insect is often thrown upon the corolla. If it be a terminal flower, the insect alights on any petal or petal, and nothing induces the power to become irregular, but if the power be solitary, or slight, on the anterior side and so (I assume) thetically, until it can be demonstrated or disproved) causes the corolla to be bilateral, by determining a flow of nutriment to that part; though what innate forces may regulate the special peculiarities of structure in different flowers is at present quite incomprehensible.

This constant irritation and the continual drain upon the secretive organs must stimulate them to develop more and more, just as a man's arm increases by work, or the mamme may be made to secrete for prolonged periods; so that, in my view, it is not that insects have gone to the flowers because they were first conspicuous, but have actually themselves determined their conspicuousness. The process may have been a slow one, only affected in many generations; the result has been that nourishment has been delayed from the pistil, and the flowers have become in the majority of instances dichogamous. On the other hand, in the absence of insects, there is no such increase of energy in the outer whorls at the expense of the gynoecium, so that the balance is restored and self-fertilisation resumed. *George Henslow.*

(To be continued.)

Home Correspondence.

The Cucumber Disease and "Salus."—Will Mr. Worthington Smith kindly come to my aid in fighting the Cucumber Disease? Starting in an entirely fresh house, everything went merrily as marriage bells until the first Cucumbers were cut, and then the old enemy appeared on the under and True, though seeds, and in fact, plants, to make doubly sure, were had from a fresh place. The plants were instantly pulled up and burned. The disease has, however, got hold of other varieties, and we are now cutting a few, but a speck of sal, mixed with Salus, which eats through the leaves, and utterly destroys them in a very short time. The *Salus* seems to penetrate through them, causes them to bleed a sort of exudation, and then they are gone, if it does not kill the spores it destroys the leaves and the plant. But will it destroy the spores or prevent them

pushed, are also far more lasting than those gathered at the natural season. No good fairies would think of fixing May or other flowers on to the dry gallery altar, and pulpit fronts or other boards, as Holly leaves are impalpable for lettering, which appears to be your correspondent's ideal of church decoration, otherwise the flowers could not fade in half an hour. By simply mounting flowers for lettering, as for bouquets or wreath-work, with a medium of damp material, the durability for lettering, which appears through the longest services—or days either for that matter, as your correspondent will find after a fair trial. *D. T. Fish.*

Running to Waste.—The missing link in our life is being cherished up. The working man now able he will to save something, and there is a safe place where he may put it, in the Post Office Savings Bank. It is not enough to open certain doors, write up certain inscriptions, and trust to a general diffusion of the land; it is necessary that the man coming into contact with the man, and giving him at least equal opportunities for saving as for spending. It is true we are very slow in these matters, but experience has taught us that it is not enough to establish savings banks, and to let their magnetic influence to draw people to its doors. Happily the law has recognised this fact, and has provided collectors in many districts in connection with the Post Office Savings Banks, and the results to be seen in the streets. The good savings banks agencies as these do a vast deal towards encouraging habits of prudence and thrift among the working classes. Among a large portion of those who earn wages the possibility of saving seems hardly to have entered their thoughts. The working man has his various tradesmen that he has dealings with, and why not have his banker also? Let him have such a friend, and the publican and the pawnbroker perhaps may feel the change for the worse; but the butcher, the farmer, and the working man will be so much the better. Taken in the aggregate, the earnings of the working classes at the present day are colossal, and it is very grievous to see in many cases how this magnificent revenue is misapplied and wasted. The more frequent the money pours in, the more recklessly it is very often flung away. It is in vain to hope that the working classes will be raised to their true dignity while this process goes on. No rate of wages will effect a substantial improvement unless it depends chiefly on two words—industry and frugality—and that, is waste neither time nor money, but make the best use of both. Without industry and frugality nothing will do, and without them no other Diligence will do good, and no good will be done. It often seems as if the mass of working men were unconscious of the value of money. Let the man who spends his wages as fast as he gets them look at the gin palace. He there sees what his money can do in the way of its waste. He would rather be a beggar dwelling, if he would only learn to put his money in the right place. Let him be told that the State has taken some care of him, and has provided a bank where all he can save will be absolutely safe. Let him be told that his friends in the State would be glad to invite him to hand over his money, and will show him exactly what he is to do. It is not the interest of employers, and certainly it is not the interest of society at large, that the enormous collective wages of the working classes should run to waste. A saving man is a safe man, and one who by bestirring himself in youth generally secures both leisure and ease in old age. We admit that habits of saving are not unknown to those classes, but that which has been said in this paper is only a matter of fact, and on the rich harvest that remains to be reaped, and every endeavour should be made to help the working man to save. He can generally be trusted to earn and get good wages, but what to do with his money when he has it is the question on which the State should break down, and where he most needs the grasp of a part and friendly hand. The folly of many one in this is that he is always looking for something to turn up. By too much waiting things often turn down. The law of life is as inexorable as the law of the tides. There are certain styles of behaviour which lead to honour, usefulness, and success. I should like to fire the ambition of young people especially to be industrious, and to exercise foresight and economy. A gloomy aspect should never be put on their expectations. There is little hope of a young man if he begins life cowed down. One smile of encouragement is often of more value to him than gold. I would say to you, Young man, do not fret or complain; go to work as hard as you can, and stick to your work, and be careful of your hard-earned earnings. It is a welcome document that tells of providence among their working classes. No doubt there are instances of improvidence, but they can be amended, and this paper, if its character is to be kept before the public eye with wearisome persistency. With some doubtless it is often a true though a sad sketch, but it is a relief to turn from those to a higher grade of the community—higher, because they see

their opportunities more profitably. There are thousands who earn good wages, and who, if they used means aright, might gather a little store against old age, or the probable contingency of ill-health. There is room too for a lettering party to lay by, as there are abundant facilities for the humblest equally with the richest in the savings bank. Still there are fewer persons using this provident organisation than there might be, far fewer than the happiness of the poor would seem to be entitled to. It is something, however, to know that if we are not as exemplary in this respect as we might be as a nation, still we are tending towards improvement. Glasgow, for instance, has nearly three millions of money in the collection of its savings bank, and has nearly a hundred thousand depositors, mostly working men. Providence is a virtue in itself, and that it is also a benefit to the community in a variety of ways the use of those banks by class for class when they were despised, the above statement sufficiently demonstrates. It is quite evident that when once a person opens an account he is reluctant to withdraw his money, and takes it out in the smallest possible dribbles that his expenditures will allow. Thus the savings banks have to do with the bank organisation more extensively. The more we take this counsel the better for ourselves and for the community. *John Downie, West Coates, Edinburgh.*

The Gold Medal given by the City of Hamburg to Messrs. Elvort Brothers (see p. 505).—This beautiful gold medal was not sent by the City of Hamburg, but by the Gartenbau-Verein für Hamburg, Altona and Umeyged. H. G. Ribb. f.

Local Museums.—While fully endorsing your remarks on this subject (p. 471), I should like to offer a word of advice to those who may propose to start one of the kind. I had the pleasure of examining a monoyllable, initiated with the third letter of the alphabet—of local museums, is the omission to empower the curator to refuse to exhibit objects which are unsuitable. I know the difficulties which surround this question. Mr. Alderman Somersley sends a head of a South African antelope, or something else which has as little to do with the objects for which the museum was created as a Queen Anne's sherry penny or an American Indian's tomahawk, and yet must be placed in the collection, because the worthy alderman presented it! Then, again, empty shelves and cases look so ugly; and it is so nice to see the room filled, no matter how. Much of this is due to the originators, and they would only determine beforehand the objects to be shown; the particular museum shall illustrate, and authorise the "return with thanks" of all objects which do not conduce to this end. *An Old Curator.*

American Blight on the Auricula.—Not having seen the Auriculas that were alleged to be infected with the American blight, I know nothing about them practically, but the mention of the matter in the papers has suggested to me that a random shot by one whose eyes are shut might, by a fluke, hit the mark. I once had a dry border covered with *Lysimachia Nummularis*, the common Moneywort, and this was attacked by a *Phylloxera* to such an extent that the roots were literally embedded in the white flocculent matter peculiar to the insect. My random shot is in that direction; and I suggest that, if the *Lysimachia* is not allowed, so as to give the Auriculae the *Shilley Hibberd, Stoke Newington.*

The Proposed "Journal of Forestry."—I observe at p. 469 a paragraph in reference to the proposed *Journal of Forestry*, in which, while welcoming the announcement of the new venture, you express the hope that the proceedings of the meeting of that useful body, the Scottish Arboricultural Society. As chairman of the meeting of those gentlemen who resolved upon supporting the efforts to start such a journal, and as one of the Vice-presidents of the Scottish Society, and of this journal will be also a valuable aid to the Society in recruiting its ranks by disseminating and making known to a wider area than its own immediate membership its usefulness and worth. *Robt. Hutchison, Carlisle.* [We are glad to learn that the relations

between the proposed new journal and the Society are such as our correspondent states, and heartily wish it success. E.D.s.]

Hurricane at Inverary Castle.—During the raging of the storm on the 16th inst., several large Silver Fir, Beech, and Spruce trees of the old Castle of Lehanon, were blown down, but the chief injury caused by the last wind was where the old Beeches were forked in their branches, owing to the wet penetrating quite down through the trunks and the branches were rent asunder, and when the whirlwind got in amongst the branches, they were twisted out and tossed about in all directions. Outwardly those old Beeches look fair and healthy, but within they are full of rotteness and decay. *John Cain, Inverary Gardens.*

Extraordinary Set of Peaches.—"Vitis" in this week's issue is unfortunate in citing Mr. Miller's practice against the irrigating theory of setting Peaches. Has not Mr. Miller, according to his own statements in the *Gardener's Chronicle* about two years ago, been a "setter with the syringe of twenty year standing?"—and does not his present success show that he is quite right? We cannot suppose that Mr. Miller has at this date given up a practice that he had demonstrated by nearly a quarter of a century's experience to be the best. Our early Peaches this winter set every flower. They were thinned twice before stoning and once afterwards, and "Vitis" or any one else, is welcome to come and see what sort of a crop is on the trees now in blossom. I have not a word to say, I may state that I have never advocated "camel's-hair pencils," "bunches of feathers," or other "artificial fertilisation" practices of that kind. "Vitis" should keep himself read in the *Gardener's Chronicle*. *F. Simpson, Wootley.*

The Weather in North Notts.—The unprecedented rainfall of 22.03 inches has been registered here in six months, namely:—1876—October, 2.91 in.; November, 3.59 in.; December, 6.05 in.; 1877—January, 4.29 in.; February, 2.55 in.; March, 2.64 in.; total, 22.03 in. The rainfall in April is likewise much above the average, for up to this date (23) 2.65 inches have fallen. From the continued soddened state of the soil vegetation is very backward in this district, but there is now a good opening, and should the weather the wind has shifted out of the cold north-easterly currents into the south, and the temperature has risen considerably in the last few days. Gooseberries and Currants are in full flower at present, and should the frost now be over, there should be a very early abundance of blossoms. Of late years the crops of these fruits have been injured by spring frosts two years out of three here. Pears, Plums, and Cherries are likewise showing abundance of blossom-buds, which are now about opening, and should the weather now keep favourable, heavy crops may be expected, to make up for the losses last year. The Apples, being later in flowering, stand a little better chance of setting their fruit this year, and they likewise promise well as regards fall crops. The Apricots, Peaches, and Nectarines have set plenty of fruit here, but the trees, being protected on the walls with glass coverings, they are independent of the weather. *William Tilley, April 23.*

A Floriferous Tulip.—The following remarks may probably interest several of your readers. Having in my garden a Tulip which appears to be a permanent variety, having for the last three seasons produced two flowers on one stalk, and this year I was greatly surprised on looking at it to find from four lower stalks, each with one flower on one stem, another, two on another, and one on the fourth, a much weaker stalk. I never remember seeing such (except in the *Talpa persica*) till I first saw this three years ago with two flowers on one stem. It is growing in the border under the house, which has not been disturbed for years. Perhaps some of the readers of the *Gardener's Chronicle* may have noticed a similar case. *F. S. C.*

Ivy on Damp Walls, &c.—While highly appreciating the beauty and usefulness of the many varieties of Ivy for covering unsightly buildings, forming picturesque and quaint objects, and other decorative purposes, yet there are many unwelcome and serious objections to its use in covering costly buildings and good workmanship, for, let the building be brick, stone, or wood, it will soon spoil and decay if it be covered with Ivy. The practice of planting Ivy on houses for the purpose of keeping them dry is a great mistake. The notion that Ivy will keep a house dry is deeply erroneous, and the more I have been thoroughly convinced of the reverse being the case. I may instance a coach-house covered with Ivy, in which the damp was spoiling the carriage; if the Ivy was destroyed, and the place soon became quite

dry again. One of the lodges to this place was stripped of its coat of Ivy by a severe gale; it remained only a few days, and the lodge-keeper begged us to destroy it, as the place had not been free from dampness for many years. I might give many other illustrations in proof of my statement. I saw a piece of Ivy growing through a wall 14 feet thick, the size of one's wrist, and had the appearance of a tree, and as it increased in size. The parish church steeple here, which is 100 feet high, was once covered to the top with Ivy; it is now cleared off, and shows the destructive nature of its old green coat. Foresters generally have a dislike to Ivy growing on trees, and its spoils, and even kills them if grown on plaster-covered walls it soon causes the plaster to decay. Ivy will not adhere to perfectly dry walls or dead trees without some kind of fastening. The Irish Ivy is the best for covering, but the rapeseed and the best growers. *H. Gooding, Ebbw Vale.* [On buildings should be kept closely cut in. Eds.]

Clianthus puniceus.—At Woodstock Park may be seen a very fine specimen of *Clianthus puniceus*, or Glory Pea of New Zealand. At this time of year the plant is in full bloom, and the colour of its gorgeous racemes of coral-like blossoms. The plant here is planted out in the conservatory and trained up the rafters and spondrils of the house; it also covers part of the trellis of the back wall. The plant in question is very hardy, and has been allowed to ramble and blend its shoots with those of *Wistaria chinensis*, which is planted at the other end of the same house, and, as if by common consent, the two plants are always in bloom at the same time, when the effect is very beautiful. I would strongly advise those who may have to cover large pillars, &c., in lofty conservatories to try those two plants trained up and through each other, and allow the Glory Pea to make plenty of young wood, and they cannot fail to have pillars or arches of great beauty and elegance. *G. Dodd, Woodstock Park.*

Primulas: their Culture and Treatment.—These are the most useful greenhouse plants we have, and yet many fail to grow them to perfection. I generally sow the seeds on March 1 in pans filled with fine sand, and a shallow wooden frame. The soil in the pans is pressed down and covered with silver-sand, and then sprinkled over with water, and allowed to stand a few minutes before the seeds are sown. The seed-pans are placed in the Cucumbers and shaded with a cold frame, and the surface over when dry, and when they come into rough leaf I move them into an intermediate house for a few days, then put into 48-sized pots. The compost I use is made up of two parts loam, one of sand, and one of rotten manure mixed with a little cocoa-nut fibre, a few bones and oyster-shells broken fine and mixed all together; they are then put back into the intermediate house till the next move into 30-sized pots, and then I put them into a cold frame till the final move into 18 size, which are the pots I use for flowering. I generally grow about seven dozen, and flower one-half from September till March, while from the other half I take off the flower-spikes until the beginning of March; these are now in full bloom. As regards watering, I may say I never give water overhead, and during the winter months I never let them get too wet or too dry; if Primulas ever get thoroughly dry they seldom recover from it. I had a very fine specimen of *Primula* of blooms of my own growing which are 2 inches in diameter; this strain of seed, which I have grown for the last fifteen years, was obtained from the firm of Dickson, Brown & Tail, Manchester. *S. Brooks, Morfield, Ebbw Vale.* [A very good sample indeed. Eds.]

Reports of Societies.

The National Aricula Society's Show at the Crystal Palace. *April 24.*—The first Southern show of the National Aricula Society has come to an end, leaving behind it only pleasant memories. It was truly a grand show as to quality, and in the matter of extent was considered on all sides to have been the largest ever seen. It was a great day for the Artists, of whom there was a strong gathering, and many were the hearty greetings between the redoubtable growers of North and South, old friends in print and by correspondence, though strangers in the flesh. Owing to the backwardness of the season, the Northern florists generally were better time, so that but few could compete with their Southern rivals. Those, however, who did come up to town—i.e., the Rev. F. D. Horner, Mr. Ben Simonite, and Mr. S. Cooper, of Timperley, were in the best form, and all well liked the board of the most valuable prizes. The Rev. F. D. Horner was especially impressive, and showed in fine form; and Mr. Ben Simonite, the worthy Sheffielder, contributed some magnificent blooms—if he does live in the most smoke-begrimed

spot in the busy Northern town. Mr. James Douglas and Mr. Turner well represented their Southern friends, though they were not so successful in the prize lists; but with the enthusiastic florist a defeat to-day means a determined struggle for victory on the morrow, and our Northern friends must look well to their plants for next year, or their Southern friends will have to say as they did at a show in the South next spring was a settled thing, which at present it is not, but the expression of a hope that the National Society would make a Southern show an annual fixture in its programme, was so unanimous that we have no reason to doubt, but the little doubt of its being the correct thing to do, or that it will be done. The success of the show on this occasion was too decided to allow of its being dropped; and judging by the great amount of interest in the show, by the general approval of the Crystal Palace, and the admirable arrangements made by the Company's officials, Mr. G. Thomson and Mr. F. W. Wilson, we can only hope that the Crystal Palace may again be the trying place. In the afternoon the judges, exhibitors, and friends of the movement lunched together, Mr. Charles Turner, in the absence of the President, F. Whitburn, Esq., taking the chair. The toast of the day was "Success to Floriculture, especially desiring continuance and prosperity to the National Aricula Society," proposed by Mr. Turner, and replied to in most suitable terms by the Rev. F. D. Horner. "The Judges" was replied to by the Rev. F. Tymons, Cloghran, Drumcondra, Ireland; and "The Exhibitors," proposed by Mr. Llewellyn, was acknowledged by Mr. Ben Simonite and Mr. James Douglas. "The Horticultural Press" was proposed by the Rev. F. Tymons, and responded to by Mr. Shidey Hibberd and Mr. Thomas Moore. The Escovee of the Southern Show was proposed by the Rev. F. D. Horner, and replied to by Mr. E. S. Dodwell, who bore testimony to the valuable assistance which had been received from Mr. Thomson and Mr. Wilson. The judges were the Rev. F. Tymons, Mr. Thomas Moore, Mr. F. Douglas, Colonel Napier, and Mr. Charles Turner, and all awards were received with great satisfaction.

In the class for twelve dissimilar varieties there were five competitors, and the Rev. F. D. Horner, Kirky Malzeard, Ripon, came in 1st, with John Simonite, Clontarf, Dublin, in 2nd, Duke of Devonshire, Smiling Beauty (Heap), Fizaro (Campbell), Champion (Fage), Ann Smith (Smith), Freedom (Booth), George Lightbody (Heady), Anna (Trail), Prince of Greens (Trail), Charles J. Perry (Turner), and Lancaster (Lancaster), Topsy (Kay), Admiral Napier (Campbell), Charles J. Perry, Robert Trail (Lightbody), Eliza (Sims), Smiling Beauty and Lancashire Hero (Lancashire); and Mr. Turner, Slough, 4th, with Mrs. Sturrock (Martin), Crucifix (Clegg), General Nell (Trail), Robert Trail (Lightbody), J. Waterston, Charles J. Perry, Colonel Champey, Pandora (Turner), Squire Chilman (Wilmer), Lord Elgin (Finlayson), Peacemaker (Turner), and a seedling. The other competitor, Mr. H. Jones, Arrow Hill, Clontarf, Dublin, took 5th, Duke of Devonshire, Wellington (Dickson), Formosa (Smith), Miss Willoughby (Hutton), Charles J. Perry, Squire Smith (Chapman), General Bolivar (Smith), Counts of Wilm (Cheetham), Duke of Cambridge (Dickson), and Ironclad (Folger), taking two seeds.

For six dissimilar varieties, the Rev. F. D. Horner was also 1st, with Lancashire Hero, Prince of Greens, Smiling Beauty, Fizaro, George Lightbody, and Trail's Anna; 2d, Mr. James Douglas, with Beauty of the North (Lloyd), Charles J. Perry, Admiral Napier, Colonel Champey, and Lancashire Hero; 3d, Mr. Ben Simonite, with Lord Palmerston (Campbell), Sims' Eliza, Fanny Crossland, Lancashire Hero, Beauty, and Lovely Ann (Oliver); 4th, Mr. Turner, with George Lightbody, and Queen (Horsefield), Charles J. Perry, Mrs. Sturrock, Admiral Napier, and Colonel Champey; 5th, Mr. H. Jones, with General Nell, Countess of Dunmore (Lightbody), Eliza, Miss Willoughby, Formosa, and Countess of Wilton.

Again, in the class for four dissimilar varieties, was the Rev. F. D. Horner 1st, with Smiling Beauty, George Lightbody, Prince of Greens, and Fizaro; Mr. Turner coming in 2d here with Charles J. Perry, Colonel Champey, Alderman Vardy, and Mrs. Sturrock; Mr. Douglas 3d, with Smiling Beauty, Eliza, Colonel Champey, and a green-eyed seedling; and Mr. H. Jones, with General Nell, Heald (Wilson), Mrs. Smith (Smith), and Miss Willoughby.

In the class for pairs the Rev. F. D. Horner also held his own, coming in 1st with George Lightbody

and Charles E. Brown; Mr. James Douglas 2d, with Lady Lancaster (Gairns), and Charles J. Perry; Mr. Ben Simonite 3d, with Charles E. Brown and S. Cooper; and Mrs. Budge 4th, with Charles E. Brown, the Rev. B. H. Margetts, Lyddington, Uppingham, 4th, with Napoleon (Trail) and Beauty; and Mr. Turner 5th, with Charles J. Perry and Colonel Champey; Mr. H. Jones showing General Nell and Formosa.

In the four classes for single specimens the Rev. F. D. Horner was well-nigh invincible, taking by far the largest share of the awards. For a single green-eyed variety he was 1st with Duke of Devonshire, Prince of Greens, 3d with Colonel Taylor, 4th with Lancashire Hero, and 6th with Rev. George Jeans (Trail); Mr. Douglas being 5th with Lord Palmerston, 7th with Lovely Ann, and 8th with a seedling—a promising flower, with a deep violet purple body colour. Amongst other varieties shown we noticed Countess of Dunmore, from Mr. S. Cooper, The Hollies, Timperley; George Lightbody, Anna, Imperator, and Apollo (Beeton), from the Rev. F. D. Horner; Highland Boy (Bollock), from Mr. Douglas; Lady A. Wilbraham (Oliver), and Sir John Moore (Lightbody), from Mr. Turner.

In the grey-eyed class seven out of the eight prizes offered went to the Rev. F. D. Horner, viz., the 1st, with George Lightbody, 2d with Duke of Devonshire, E. Brown; 4th, with Alma (Lightbody); 5th, 6th, and 7th, with Lancashire Hero; and 8th with Alexander Meiklejohn (Kay). The 2d prize went to Mr. Douglas, who had Robert Trail; Mr. Douglas also had the 3d prize with George Champey, George Lightbody, and John Waterston, and Mr. Turner examples of his Colonel Champey and Fletcher's Mary Ann.

With white-eyed varieties the Rev. F. D. Horner took the 1st prize with Duke of Devonshire, 2d, with Smiling Beauty; 2d, with Catharina (Surremances); and 4th, with Taylor's Glory; Mr. Douglas came in 3d, with Catharina, and 5th, with Ann Smith; and Mr. Turner 6th, with Heady's Arabella.

The next class, which was single self, was better contested, and five out of the eight prizes fell to the Rev. F. D. Horner. These were, the 1st with Fizaro, 3d with Duke of Argyll (Campbell), 4th with Blue Bell, 5th with Metropolitan, and 6th with Duke of Devonshire. Mr. Douglas was 2d with the new Ellen Lancaster (Folman), Mr. Ben Simonite with a rich rose crimson seedling, and Mr. Turner 7th with Pendelo (Turner). Ellen Lancaster also came from Mr. Horner, Metropolitan from Mr. Douglas, and Mrs. Smith, Master Hole (Turner), and Lord Lee from Mr. S. Cooper; and Formosa from Mr. Turner.

Three fine collections of fifty plants each were staged, and they made a fine display. The 1st prize went to Mr. Turner, with Mr. Douglas, and the 3d to Mr. S. Cooper. Space forbids our giving the names of more than a few shown in this class, and we have selected for mention only such varieties as were not exhibited in any of the previous classes. In Mr. Turner's collection these were, Duke of Devonshire, Clipper (Turner), Garnet (Turner), James Douglas (Turner), Sarah (Downing), Prometheus (Turner), Sir Robert Peel (Finlayson), Prince Alfred (Turner), Mireole (Turner), Eclipse (Martin), Superb (Heady), Calypso (Turner), Apollo (Hudson), Metropolitan (Parker), and the following apples, which have all been raised at Slough—Mrs. Llewellyn, Percival, Mrs. Thomson, Mrs. Carter, Sensation, Dolly Varden, Elsie, Edith, Topsy, and Livings; and in Mr. Douglas' collection these were, Duke of Devonshire, the other classes Lady Sophia Dumaresque, Miss Arkley (McDonald), True Briton (Hepworth), Unique (McLean), Perfection (Smith), Marie (Chapman), St. Augustine (Cunningham), and Alice (Simonite). Mr. Douglas had Lightbody; 3d, Prince, Brilliant, Miss Reid, Elcho, Edgar, and Mercury.

For a dozen dissimilar alpinas Mr. Turner was 1st, with Nat Norman, John Ball, Dolly Varden, Facets, Victoria, Queen Victoria, and Mrs. Cooper's Beauty; 2d, Queen Victoria, Mrs. Eleanor, and Veauvins; Mr. Douglas was 2d with Spangle, Beatrice, Sydney, Masterpiece, Elcho, Edgar, Bronze Queen, King of Crimsons, Mercury, Brilliant, and Miss Reid.

In the following class, which was for six alpinas, Mr. Turner was 1st, with Queen Victoria, Bronze Queen, Queen Victoria, Mrs. Llewellyn, Topsy, Dolly Varden, and John Ball; Mr. S. Cooper was 2d with Neatness, Ovid, Brilliant, Dazle, Beatrice, and Diadem; and Mr. Douglas 3d, with Bronze Dragon, Brilliant, Beatrice, and Dazle.

Mr. Douglas came 1st in the single specimen class with a remarkably large, almost black velvet self-seedling, subsequently named Silvia; Mr. Turner being 2d, King of the Belgians, 3d with Distinction, 4th with Miss Vasey, 5th with Nat Norman, and Mr. S. Cooper, 6th with Diadem.

The premier Aricula in the show was a beautiful plant, with a tuess of eight perfect pips, of George Lightbody, shown by the Rev. F. D. Horner. First-class Certificates were awarded by the Judges

to the Rev. F. D. Horner for the splendid white-edged Auricula, the *Simonne* (Walker), in which Mr. Horner considers an even better flower than Heaps' Smiling Beauty. To Mr. Ben Simonne for Auricula Frank Simonne, a splendid white-edged variety, with a rich violet body colour; Talsman, a green-edged flower of beautiful form, the black body colour being well defined; William Bradshaw, grey-edged, with rather narrow dark maroon ground, but fine paste, and good yellow eye; and Fanny Crossland, a striking flower belonging to the white-edged class; the body colour is violet, and the paste good, but the eye is not quite bright enough. To Mr. Turner, for Clipper, a fine dark self, and Peacemaker, a grey-edged variety; also to the same exhibitor for alpinas John Ball, a strikingly beautiful self, of a dark glossy black colour, and rich gold tints; Mrs. Thomson, also a beautiful self; and Distinction, which belongs to the same type. To Mr. R. Dean, for three novelties in alpine Auriculas, named Charming, Mrs. Cooper, and Captivation, all of which have well-defined lace edgings. Charming has a dark purple body, laced with pale lilac; Mrs. Cooper is larger than the last-named, of a deep maroon shade, laced with pale rose; and Captivation has a maroon ground with pale ochre facing. There are no doubt the forerunners of a beautiful race, which we hope Mr. Dean will do his best to increase.

The Polyanthuses shown were generally of so poor a quality that they need not specially be alluded to. We must, however, mention that Mr. Dean received Certificates for Polyanthus Avalanche and Purity, both very fine whites; and Mr. G. Smith for gold-laced Polyanthus Duke of Wellington. The general effect of the exhibition was considerably heightened by a fine group of forced Roses, *Auroras*, &c., contributed by Mr. Turner, and which were most effectively backed up by an excellent assortment of handsome foliage plants belonging to the Crystal Palace Company, whose garden superintendent, Mr. Thomson, also filled one of the long tables with an interesting assortment of succulent plants, admirably grouped in a geometrical pattern.

Natural History.

THE HAWFINCH.—At least one family of these birds have bred here during the last few years. Two years ago they made sad work with the Peas, and either two or three were caught in the net. Last summer I had the young ones in my hand, after they had flown from the nest, and I put one in a cage, in the hope that the old birds would feed it, as the bullfinch does. The cage was hung up on a tree, and left undisturbed, but at the end of the second day I found the bird dead. The old birds are very shy, and perhaps they had not fed it. The other members of the family I saw several times afterwards. Their nest was on a Scotch Fir in the pleasure-grounds, and about 40 feet from the ground. The birds have been seen here again this spring, about 100 yards from the same tree. About four years ago I found a fine adult specimen caught by the head in a wire netting near from the same place. It was nothing the worse for its mishap, and rewarded its deliverer by a peck on the hand with its powerful bill that turned the skin blue. I suppose the hawfinch has been found as far north as this before, but not often. I have lately topped the tree where the old nest is, but it does not appear to be tenanted as yet. It is a twiggy looking structure, but it is too high up to be examined, and is placed in an inaccessible part of the tree. *J. Simpson, Worsley Hill Gardens, Sheffield.*

A short account of this bird may be interesting to some of your readers. As a resident in Middlesex, I have had opportunities of observing the habits of this bird. It breeds here every year, and orchards seem to be the favourite nesting-place. I have known as many as three nests within a few yards of each other, and all built in Apple trees, which they seem to prefer to any other.

The nest is made of twigs and lichen, lined with fibrous roots, in which are deposited from four to six eggs, of a pale olive-green ground, streaked with grey and spotted with black. Sometimes the eggs are without any spots, but they are always streaked with grey. The young ones and parents continue in company long after they leave the nest. They are destructive birds in the garden, eating green Peas, Cherries, &c., and about the time the *Vew* berries are approaching maturity they may be seen in numbers, and the small branches they nip off with their powerful beak when searching for the berries completely strip the ground, making one think that squirrels had been at work. They are certainly very shy birds, and on the first approach of danger make for the highest trees in the neighbourhood. *W. E. T.*

HATCHING OF ROOKS.—I want to ascertain the earliest and latest periods at which rooks are hatched. Can your obliging correspondents help me? Gilbert White has but little to say of the natural history of the rook. *George H. Haydon, Bell'hem Hospital, S.E., April 21.*

Notices of Books.

L'Afrique Centrale; Etude sur les Produits Commercialisables. Par M. Bernardin. Avec une carte. Gand: C. Annot-Breacknach.

Professor Bernardin of Melle has just issued another of those little books, which, when brought together, useful records of the hints of economic plants. The present pamphlet does not, as hitherto, deal with any special class of plants or special products, but is an enumeration of the resources of Central Africa under the above title. The products of the three kingdoms of Nature are all enumerated, those of the vegetable kingdom being placed first, as they are by far the largest and most important; the arrangement of these is on a commercial system, that is, textile fibres are brought together, then oils and fats; dye-stuffs, spices and narcotics; drugs, food-grains and starches; caoutchoucs, wools, and flowers. Under the first heading, that of fibres, we find a notice of the Baobab (*Adansonia digitata*), and the application of its bark for paper-making. The Bamboo is next treated of, and its recent introduction for a similar purpose to the last, that of a paper material, is discussed. As an illustration of the careful collation of recent facts, M. Bernardin not only quotes from Mr. T. Rostklee's pamphlet on Bamboos contained in a paper material, but refers also to the writings of Stanley and Cameron; indeed, more than once through the forty-six pages of which the pamphlet is composed the author shows himself alive to modern facts and discoveries. The oil of *Trichilia emetica*, Vahl, a meliaceous plant, is used by the natives in the preparation of their food, and is described as being of excellent quality. M. Bernardin tells us that the seeds are imported to Rotterdam by the Commercial Society of Mozambique, and the oil is extracted in Cologne for the manufacture of soap. On the subject of Cola or Kola nuts we have nothing that is really new. *Cola acuminata* is of course credited, and rightly so, with furnishing one kind; but the bitter Kola is still referred to a species of *Garcinia*. With regard to caoutchouc, the author thinks that *Landolphia owariensis* and another species of *Landolphia*, together with a species of *Ficus*, furnish the bulk of African caoutchouc. Other plants, however, help to swell the African produce.

These notes will serve to show that the pamphlet is made up of interesting matter.

Obituary.

WE regret to record the death, on the 17th inst., at the age of 57 years, of Mr. DAVID WAUGH CUNNINGHAM, for many years gardener to Lord Eghly, Moor Park, Rickmansworth, by whom he was highly esteemed; and formerly gardener to the Bishop of London at Fulham.

We have also to record the death, on the 24th inst., at Hastings, in her sixtieth year, of Mrs. MARY ANN CUTBUSH, widow of Mr. WILLIAM CUTBUSH, late of the Barnet Nursery, Herts.

An intimation has also reached us of the death, on the 20th inst., at 18, Melville Terrace,

E. Linburgh, of Mr. JOHN GAVIN, who for upwards of forty-three years was head gardener to the Earl of Moray, at Donibristle, Fife-shire. Mr. Gavin was in the eighty-fifth year of his age.

- April 19.—A fine bright day, partially cloudy. Windy Cloudless at night. Cool.
- 20.—A fine bright day; generally cloudy. Cool.
- 21.—Overcast, dull, and wet till 6 P.M. Fine after.
- 22.—A cloudy, but bright day, with occasional rain. Disturbance heard about 6 P.M.
- 23.—Fine, generally cloudy. Thunder and lightning at 4 P.M., accompanied with rain.
- 24.—A fine bright day. Heavy clouds, distant thunder and rain till half 7 P.M. Cloudless at night.
- 25.—A fine day, but generally cloudy. Cool.

LONDON: Barometer.—During the week ending Saturday, April 21, in the vicinity of London the reading of the barometer at the level of the sea decreased from 30.18 inches at the beginning of the week to 29.67 inches by the afternoon of the 16th, increased to 29.66 inches by the night of the same day, decreased to 29.58 inches by the night of the 17th, increased to 30.25 inches by the morning of the 20th, and decreased to 29.75 inches by the end of the week. The mean reading for the week at sea level was 29.86 inches, being 0.05 inch higher than that of the preceding week, and 0.09 inch below the average.

Temperatures.—The highest temperatures of the air varied from 58° on the 20th to 43° on the 18th; the mean value for the week was 49½°. The lowest temperatures of the air ranged from 32½° on the 20th to 40° on the 15th; the general mean for the week was 37°. The mean daily range of temperature in the week was 12½°, the greatest range in the day being 25½° on the 20th, and the least 8½° on the 21st.

The mean daily temperatures of the air for the week are as follows:—15th, 45½; 16th, 43½; 17th, 38½; 18th, 37½; 19th, 42½; 20th, 43½; 21st, 44½; and the mean reading for the week at sea level averages were 1°, 5°, 3°, 6°, 8°, 0°, 2°, 5°, 4°, 7°, and 3°. The mean temperature of the air for the week was 42°, being 5° below the average of sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed in sun's rays, were 117° on the 19th, and 116° on the 20th; on the 21st the reading did not rise above 53°. The lowest readings of thermometer on grass, with its bulb exposed to the sky, were 29° on the 20th and 31° on the 18th; on the 15th the lowest reading was 37°.

Wind.—The direction of the wind was E.N.E. and E., and its strength brisk. The weather during the week was dull, cool, and the sky generally cloudy. Gales prevailed on the 16th and 17th.

ENGLAND: Temperature.—The highest temperature of the air observed by day were 62½ at Cambridge, and 61° at Leicester; at Wolverhampton 52½ was the highest temperature; the average value from all stations was 56½°. The lowest temperatures of the air observed by day were 28½ at Bristol, and 29° at Cambridge and Eccles; at Sunderland the lowest temperature; the mean value from all stations was 33½°. The range of temperature in the week was the greatest at Cambridge, 33½°, and the least at Brighton, Lewisham, and London, all 19°; the mean range of temperature from all stations was 15½°. The mean of the seven high day temperatures was

the highest at Truro and Cambridge, both 53°, and the lowest at Wolverhampton, 49°. The general mean from all stations was 49°. The mean of the seven low night temperatures was the lowest at Wolverhampton, 35°, and the highest at Truro, 42°; the mean from all stations was 38°. The mean daily range of temperature was the greatest at Cambridge, 46°, and the least at Hull, 8°. The mean daily range from all stations was 14°.

The mean temperature of the air for the week from all stations was 42½°, being 1½° lower than the value for the corresponding week in 1876. The highest was 46°, at Truro, and the lowest 39½°, at Wolverhampton.

Rain was measured at Plymouth to the amount of 2½ inches nearly, and at Truro 1½ inch fell, but at Norwich and Stratford one-hundredth of an inch only was half an inch. The weather during the week was generally dull and stormy, and the sky cloudy. Gales occurred generally over the country on the 16th and 17th. Solar hail was seen at Bristol on the 20th inst.

SCOTLAND: *Temperatures*.—The highest temperatures of the air ranged from 49° at Edinburgh to 54° at Aberdeen; the mean from all stations was 51°. The lowest temperatures of the air varied from 28° at Perth and Dundee to 34° at Greenock; the mean from all stations was 30°. The range of temperature in the week was the greatest at Edinburgh, 28½°, and the lowest at Aberdeen, 21°; the mean range from all stations was 26°.

The mean temperature of the air for the week from all stations was 42½°, being 1½° lower than the value for the corresponding week in 1876. The highest was 43°, at Greenock, and the lowest 41°, at Perth.

Rain.—The fall of rain varied from 1½ inch at Greenock, to one-tenth of an inch at Aberdeen and Leith; the average fall was half an inch.

DUBLIN.—The highest temperature of the air was 59½°, the lowest 32½°, the range 27°, the mean 45½, and the fall of rain 1.69 inch.

JAMES GLAISHER.

Variorum.

MEADOW FLOWERS, fair and sweet,
Can ye feel the summer?
Can ye hear her dainty feet
Coming softly, light and fleet—
Will ye not outrun her?

Spring up, white Anemone,
Graceful as court lady;
King, ye Harebells, merrily,
Hyacinths, stand ye by;
She will greet you, ye may be.

Blushing red, Rose Campion fair,
Like a rustic beauty,
Hides behind the Maidenhair,
White Veronica, like a nun;
Open blue eyes from duty.

She is coming, is our queen,
Softest breeze shall waltz her;
Palmly bows of freshest green
Wave where'er her robe is seen,
Little brooks bring laughter.

Every joyous scent and sound
Rises swift to greet her;
Even the loud incense organ
Shares the fragrance of the ground:
Let us go and meet her.

S. Williams, in "Good Things."

FARMING IN THE CASE OF GOWRIE.—This had always been considered purely cow-growing land. The produce some 20 or 25 years ago would hardly be credited—50 or 60 bushels per Scotch acre, or 60 or 70 imperial—but then it was comparatively a virgin soil, being an alluvial deposit; and no land can stand successive grain cropping unless manured. On the continent of America, and in certain parts of the crops have been taken, the land is allowed to run to waste, and fresh land taken into cultivation. As I have said, rents rose considerably during the war; they were paid in money, with a proportion of Barley, which was nearest the market, and in this the Tay. When I succeeded at the end of 1826 prices of grain had fallen considerably, and I found a large amount of arrears due. In 1828 I had the estate valued, the consequence being a reduction of rents to the present extent of 40 per cent. At the same time being aided by the advice of a very able land steward, I came to the conclusion that bare fallow, though advisable for cleaning foul land, would not restore its fertility, and that pure straw was applied to the land, trodden down in open courts by Highland cattle taken in for a few shillings a head. In 1833 I was fortunate enough to procure a first-rate tenant well versed in green crop cultivation, and he was the first man in this district who tied up cattle to feed. The land was

drained (so shallow) by a wedge-shaped piece of clay being taken out and inverted—gorge or branches being sometimes inserted in these drains, cut at the bottom of high ridges. This was followed by stone, wood, and concrete drains, afterwards horse-shoe tiles, made by hand, were used, then pipe-drain-iron was introduced by Lord Tweeddale, made by a machine on the principle of a Neapolitan macaroni machine. I erected tile-works, and the tenants were supplied at cost price, cutting the drains themselves, but still too shallow—feet instead of 4 feet, and not acknowledged as the proper depth. The prices of grain continued to vary considerably, I resolved to adopt a plan tried by a friend of mine, Lord Wolloughby d'Eresby, of grain rents for the clay lands, and half grain and money for the blue lands. Facilities were given for adopting this plan, on account of the prices of grain being struck annually, calling "Fairs' prices," for the purpose of fixing the stipends of ministers. The average number of bushels corn was considered as 12 bushels of Wheat, 18 of Barley, 18 of Oats—and a third was calculated as a fair rent; two-thirds being counted for expenses and farm profits. Of course I rested with the tenant to add to the profit by the improvement of the land. On lands of superior quality an addition of 1 or 2 bushels was considered a fair rent. That the grain rent was fairly calculated appeared on going over the books of the tenant referred to for the last thirteen years of his nineteen years' lease, when it was found that there was only a difference of £30 during that time from his original money rent. His books also showed that notwithstanding a large outlay the first six years the tenant had lived comfortably with his family, and at the end had more than doubled his capital. Farming even then paid well, we had not then to contend with unpropitious seasons, and expense of working the farm. Horses costing now about £90 could then be purchased for £30 to £35. Farm servants' wages were £9 to £10 a year, with cottage, meal and milk, fuel and garden; now single men's wages, with lodgings as before, are £30 or £35. With great advance in saddlers' and blacksmiths' bills, I believe this increased expenditure is only to be met by improved manure and steam cultivation. *Lord Kinnaird, in a Letter to Mr. Falconer King.*

Law Notes.

ACTION BY A GARDENER FOR ILLEGAL DISTRESS.—At the Marylebone County Court, on the 12th inst., the case of *Isford v. Jones* was heard before Mr. Sergeant Wheeler and a jury, in which the plaintiff, described as a master gardener, carrying on his business at Victoria Road, Kilburn, sued the defendant, a former landlady of the plaintiff, to recover the sum of £50 as damages in consequence of injuries he had received in course of his business through illegal distress made upon him by the defendant under the following circumstances.

The plaintiff, being called, stated that he formerly occupied Chapel Cottage, Kilburn, of which the defendant was the landlady, and upon which property he had erected extensive greenhouses; but finding more eligible premises he gave defendant notice to quit, but before that three months' notice had expired the defendant had followed him to his present address, and put a broker into possession, who, after remaining in possession three days, and taking an inventory, was paid the sum of £10 and left, and the present action was brought to recover the sum now sued for, an excessive and illegal distress. The plaintiff put into Court a mass of documentary evidence in support of his claim, and stated that he had since that time commenced the defendant had paid £13 into Court, and had brought a counter action for £30 for dilapidations.

At this stage of the case the learned Judge said that it was purely a question of amount, inasmuch as the defendant by paying £3 into Court had acknowledged the plaintiff's right, but the question as to it was clear from the documentary evidence before the Court that the defendant had no right to levy a distress until a quarter's rent was due, which in this instance was not the case; then again, as the counter-claim could not legally be maintained, he should present the plaintiff's claim to the jury, and strike out the counter claim. His Honour, after addressing the jury on the whole facts of the case, they, without retiring from the box, returned a verdict in favour of the plaintiff for £15 *os. 6d.*, with costs.

Enquiries.

He that questioneth much shall learn much.—BACON.

183. HARDINESS OF *ARACARIA EXCELSA*.—I have a fine *Aracaria excelsa*, too large for my conservatory, which I am thinking of planting out-of-doors next month in a spot as sheltered as I can find. Can any of your readers inform me if they know of any planted out-of-doors, and if it will be likely to live? Of course I should mat it up in a severe winter. If I remember right a few weeks ago it was stated in your paper or the *Field*, that it was sufficiently hardy to live. *R. Thornton, High Cross, Framfield, Sussex, April 2.*

184. *TRICHOFLIX SUAVIS*.—Can any of your correspondents be good enough to use the *Trichoflix suavis* to which you have flowers on a spike, as I have a plant now with two flowers of four each? *T. C. H. (We think not. EDS.)*

185. THE DADLY LONGLEGS.—I shall be greatly obliged if you or any of your correspondents can inform me of a method of destroying, without injury to vegetation, the larvae of the Tipula olereacea, or Daddy Long-legs, which is so destructive to the grass in the vicinity of London. I have tried several remedies, but none answer the purpose, but we believe the most effective and safest plan is to frequently roll the grass with heavy rollers. *EDS.*

186. CHARRED BONES.—Will you kindly inform me if you have any experience in the use of charred bones instead of charcoal for potting purposes? I have a supply of such bones, and think it is possible they might be of service instead of the charcoal. *M. H. (We have no experience. Will some of our readers kindly answer this question? EDS.)*

Answers to Correspondents.

ECCLESIASTICAL NURSERYMEN: *P. G. S.* If the Hon. and Rev. gentleman chooses to turn nurseryman there is nothing to prevent him from doing so, but he should not, however, be allowed at any time to compete at a flower show in other than nurserymen's classes.

GARDENERS' TESTIMONY.—The expiration of seven years' lease, unless he is a nurseryman, or the lease contains a stipulation to the contrary, cannot legally cut down such trees as Gooseberries and Currants, &c., unless they have been purchased and planted then during his tenure. We cannot say where you can purchase the small book, relating to garden law, which was published some years ago.

GRAMMATOPHYLLUM: *Duffier*. These plants require to be potted in well-drained peat, and to receive the gentlest treatment, and to be kept in a greenhouse, to be grown in a moist stove, in company with such subjects as Indian Orchids.

INSECTS: *J. P. S.* *Pulvinaria vitis*. *A. M. S. Thallitis*. *Chrysomelidæ*.

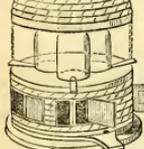

LATHYRUS: *J. T. R.* Both the species may generally be met with in botanic gardens, but neither the seeds of the one nor the tubers of the other are cultivated for food, so far as we know.

MELON: *A. H. H.* We should think not, but have never tried it. The variety in question would no doubt grow in the open air, but then the fruit would be worthless we should think.

NAMES OF PLANTS: *G. R.* The flower faded before we could identify it, but it may be *Narcissus Ponicus* var. *angustifolius*, which we cultivated in 1876, or the variety *ortus*, which follows very close upon it.—*J. Maund* is right in supposing his seedlings to be common Spruce.—*R. C. Appleton*. The *Cattleya* is a variety of *C. Mossii*. The *pseudobulb* are, we believe, those of the Dove-drover, *Peristeria alata*.—*J. Hillman*. 1, *Begonia argyrostigma*; 2, *Hibbertia divaricata*; 3, *Phlox*; 4, *Phlox*; 5, *Phlox*; 6, *Phlox*; 7, *Phlox*; 8, *Phlox*; 9, *Phlox*; 10, *Phlox*; 11, *Phlox*; 12, *Phlox*; 13, *Phlox*; 14, *Phlox*; 15, *Phlox*; 16, *Phlox*; 17, *Phlox*; 18, *Phlox*; 19, *Phlox*; 20, *Phlox*; 21, *Phlox*; 22, *Phlox*; 23, *Phlox*; 24, *Phlox*; 25, *Phlox*; 26, *Phlox*; 27, *Phlox*; 28, *Phlox*; 29, *Phlox*; Gather Honey from Your Flowers.
NEIGHBOUR'S Celebrated BEEHIVES.
 PHILADELPHIA EXHIBITION, 1876.
 PARIS EXHIBITION, 1875.
 Three Silver Prize Medals awarded George Neighbour & Sons. The only English exhibitors who obtained Silver Medals for Beehives.

The IMPROVED COTTAGE BEEHIVE, as originally introduced by G. Neighbour & Sons, working, three bell-glasses, is neatly and strongly made of straw; it has three windows in the lower Hive. This Hive will be found to possess many practical advantages, and is more easy of management than any other Beehive that has been introduced.

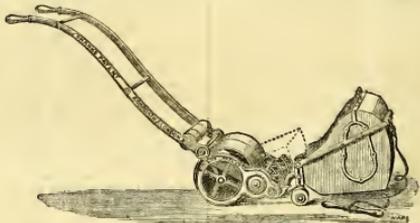

Price, complete £ 15 0
 Stand for date 0 10 6
 THE LIGURIAN or ITALIAN ALP BEE being much in repute, G. N. & Sons supply a Swarm of bees with genuine Italian Queen, in the Improved Cottage Hive, at £4, Hive included.
 An Italian Alp Queen, with full directions for uniting to Black Stocks, 3s. each.

ENGLISH BEES.—Stocks and Swarms may be obtained as heretofore.
 THE APIARY, By A. NEIGHBOUR. 5s. postage 6d.
 A newly arranged Catalogue of other Improved Hives, with Drawings and Prices, sent on receipt of two stamps.
 GEO. NEIGHBOUR AND SONS, 127, High Holborn, W.C., or 149, Regent Street, London, W.

SHANKS' NEW PATENT LAWN MOWERS,
 Under the Patronage of Her Most Gracious Majesty the Queen, and most of the Nobility of Great Britain.

The merits of these Machines are now so well known, and their superiority so universally established, that a detailed description is no longer necessary. A. S. & SON would here simply refer to a few of the prominent advantages peculiar to their Machine. The Revolving Cutter is made to be self-sharpening. The *Sole-Plate or Bottom Blade* is made with *Two Edges*, enabling the cutting parts to last twice as long as in other Machines. A Wind-guard is also introduced, which prevents the Grass escaping the Box when the Machine is in use during the prevalence of wind.

PRICES,

Including Carriage to any Railway Station or Shipping Port in the Kingdom.—

NEW HAND MACHINE.		NEW FONY and DONKEY MACHINE.	
10-inch Machine	£3 10 0	25-inch Machine	£13 10 0
12-inch Machine	4 15 0	28-inch Machine	15 15 0
14-inch Machine	5 15 0	30-inch Machine	17 0 0

THE HUNDRED GUINEA CONSERVATORY

ART-WITH-ECONOMY-APPLIED-TO-CONSERVATORIES

FIXED
GLASS
PIERCED
IRONWORK

In consequence of the increasing demand for Conservatories, in which pure art is combined with moderate cost, T. H. P. DENNIS & CO. have been led to introduce designs of a character hitherto unknown. One of these designs, showing a house 22 feet 6 inches x 13 feet 6 inches, is annexed, and the result, as regards the extremely low price (which includes fixing, glazing, painting, carriage, &c.), has been attained only by special machinery and a system of interchangeable parts.

T. H. P. DENNIS & Co. are also prepared to provide and fix Hot-water Heating Apparatus and Horticultural Buildings of any dimension or description.

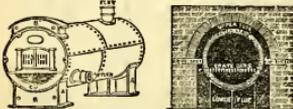

Full-sized specimens of Greenhouses, &c., and Hot-water Apparatus in work, can be inspected at Mansion House Buildings, London, E.C.

Gentlemen waited upon at their residences by experienced designers.

THE TERMINAL SADDLE BOILER.

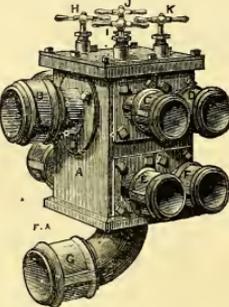

First-class Certificate, 1869; Highly Commended, 1873; and First-class Certificate, 1876.

"This Boiler possesses the rare merit of sucking all the heat from the fire."—*Gardener's Magazine*, p. 254.
"I have no doubt the Best Boiler that will burn any kind of fuel is the Terminal Saddle."—*Journal of Horticulture*, p. 277.
"For its moderate cost and real efficiency the Terminal Saddle is one of the very best."—*The Gardener*, p. 95.
Prospectus post free.

T. JONES, Temple Street, Manchester.

CRITCHLEY'S PATENT HEAT REGULATOR,
AN APPARATUS FOR REGULATING THE HEAT IN HORTICULTURAL BUILDINGS.

A, Iron Box fitted up water-tight. B, Pipe or Supply of Water from Boiler. C, P, Pipes for Circulating Hot Water. F, F, Pipes for Return of Water to Iron Box. G, Pipe for Return of Water to Boiler. H, I, J, K, Piston Rods for Opening and Closing Valves.
The advantages of these Regulators are that houses may be kept at different degrees of heat, or the circulation of water and heat entirely stopped in one part and not in others. They may be fitted with as many valves as required, and are particularly adapted for forcing houses where top and bottom heat is used. They may be fixed in any part of the apparatus most suitable for working, without regard to the position of the Boiler.

The following Testimonial has been received:—
"Berkeley Castle, April 23, 1875.
"Gentlemen, I am happy to inform you, now that the late severe winter is past, that the Hot Water Apparatus erected by you does its work to my entire satisfaction. As to the two Heat Regulators, which represent thirty valves, I have had ample opportunities of practically proving them, and unhesitatingly admit they are far superior to any other valve; in fact, I think it the greatest improvement that has come out for horticultural purposes."
"I am, Gentlemen, yours truly,
"R. H. CRONK,
"Gardener to the Right Hon. Lord Fitzharding."

Estimates and Plans furnished for Warming Gentlemen's Mansions and Public Buildings. Orders attended to in any part of the kingdom, and guaranteed to answer their intended purposes. Prospectus and Price Lists post-free.

OUTDOOR WORK. It is especially applicable to **WOOD, IRON, BRICK, STONE & COMPO.** CAN BE LAID ON BY UNSKILLED LABOUR. Sold in all Colours. 2 cwt. free to all Stations. Prices, Patterns, and Testimonials Post Free.

WALTER CARSON & SONS, LA BELLE SAUVAGE YARD, LUDGATE HILL, LONDON, E.C., And 21, BACHELOR'S WALK, DUBLIN. NO AGENTS. Oil Paint No Longer Necessary.

HILL and SMITH'S BLACK VARNISH for Preserving Ironwork, Wood, or Stone. This Varnish is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and it is used cold. It is used in the grounds at Windsor Castle. In the course of many years hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received, which HILL & SMITH will forward on application. Sold in casks of about 30 gallons each, at 12. 6d. per gallon, at the Manufactory, or 12. 6d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL. "Grandly, Limp, suppur, Carminative, Nov. 27, 1873—'Mr. Lloyd-Lloyd excites me for £3. 2s. amount due to Messrs. HILL & SMITH, and he considers the Black Varnish one of the most useful oils he ever possessed.' Apply to HILL and SMITH, Brierley Hill Ironworks, near Dudley; and 118, Queen Victoria Street, London, E.C., from whom only it can be obtained. CAUTION—If having lately come to the knowledge of HILL & SMITH's Black Varnish, and if you are being offered by unprincipled dealers at a slight reduction in price, they would especially draw attention to the fact that every cask of their Varnish is legibly marked with their name and address, without which none is genuine.

GRANITIC PAINT for Sanitary Purposes. SOLICITE ZOPHISA COMPOSITION. All colours. For Damp Walls, either internal or external. LIQUID SOLICITE ZOPHISA COMPOSITION. Colours. For Preserving Stone, Brick, or Cement. All washable and durable. To be had genuine only of the Original Manufacturers—HILL and SMITH, Brierley Hill, LONDON, & C.

H. VAN HULLE, Botanical Gardens, Ghent, Belgium.

Useful Publications.

MY GARDEN: Its Plan, Soil, and Culture, together with a General Description of its Geology, Botany, and Natural History. By **ALFREDO SIESE, F.R.S.** Illustrated with more than 1500 Engravings on Wood.

To rank it in the same class as Gilbert White's "Natural History of Selborne" is very high praise, but in some respects it is a better book than that work undoubtedly has, but they are very few compared with the mass of useful information contained in this work. "Siese's My Garden" is indeed a book which ought to be in the hands of every one who is fortunate enough to possess a garden of any size, and in certain fine and interesting instances it is from which we may profit. —*From "Nature."*

THE COTTAGE GARDENER'S DICTIONARY. With a Supplement containing all the New Plants introduced into the year 1866. Edited by **GEORGE W. JOHNSON.** Post 8vo, 6s. 6d.

THE BOTANIST'S POCKET-BOOK. By **W. R. HAYWARD.** Containing, arranged in a tabulated form, the chief characteristics of British Plants. Fcap. 8vo, 10s. 6d.

This volume is intended as a handy pocket companion for the botanist in the field, and will enable him to identify at the spot the plants he may meet with in his researches. Besides the characteristics of species and varieties, it contains the Botanical Names, Common Names, Soil and Aspect, Colour, Growth, and Time of Flowering of every plant, arranged under its own name.

"The diagnoses seem framed with considerable care and judgment, the characteristics having been well selected and

clearly stated." —*From "The Gardeners' Chronicle."*

SOVEREY'S ENGLISH BOTANY. Containing a Description and Life-size Drawing of every British Plant. Edited and brought up to the present standard of scientific nomenclature by **J. BOWELL (late Sykes), LL.D., F.R.S.** With a Popular Description of the Uses, History, and Traditions of each plant. By **MRS. LAKESTER.** Author of "The Flowers, Fruits, and Trees of England."

The Figures by **J. C. SOVEREY, F.L.S., F.S. & C.** and **John Edward Smith, F.R.S.** Third Edition, entirely revised and enlarged, includes all the Species by the Name. 12mo, cloth, 4s. 6d. in half Morocco, and 5s. 6d. whole Morocco. Sold separately, or in parts, 2s. 6d. each.

WOOSTER'S ALPINE PLANTS. Second Series, containing Fifty-four Coloured Plates, with one or two Figures on each plate. Descriptions and accurately Coloured Figures (drawn and engraved expressly for this work) of the more striking and beautiful of the Alpine plants. Edited by **DAVID WOOSTER,** Joint Editor of the latest editions of "London's Encyclopaedia of Gardening and Plants," "London's Horticultural Glossary," &c.

The First Series, with Fifty-two Coloured Plates, 25s. London: **GEORGE BELL and Sons, York Street, Covent Garden, W.C.**

Warne's Useful Books New Volume.

HARDY PLANTS FOR LITTLE FRONT GARDENS. By **S. STACKHOUSE.** Intended for the use of the amateurs who, residing in towns, have to indulge their love of flowers and taste for gardening under special difficulties. Selected Lists of Plants, with especial modes of Cultivation and Preserving them.

FREDERICK WARNE and CO., Bedford Street, Strand, London, W.C.

Farms, Estates, Residences.

Any one desirous of Renting a Farm or Residence, or Purchasing an Estate, can have copies of the

E P P S ' S C O C O A.—A GENUINELY COMFORTING.

By the operation of its natural laws which govern the organs of digestion and nutrition, and by careful application of the most improved and approved process, Mr. Kippes beverage which may save us many heavy doctor's bills. It is by the judicious use of this beverage, that a weak constitution is gradually built up. Hundreds of strong enough to resist every temptation to disease, and who, wherever there is a weak point, may escape many a fatal shaft by keeping themselves well fortified with pure blood and vigour. It is the only beverage which is sold in this country, and is sold in every part of the world. **JAMES EPPS AND CO., HOLBORN-ENTRY CHEMISTS, 41, THE MARK LANE, LONDON, E.C. 4.**

KINAHAN'S LL WHISKY.—Universally recommended by the Medical Profession. It is pure old spirit, mild, mellow, delicious, and most wholesome. **Dr. Hissall says**, "I have samples were safe and agreeable to the taste, aromatic and ethereal to the smell. The Whisky must be pure, and of fine quality, well watered, and of very excellent quality."—Wholesale and Retail, **Great Tintinn, London, W.**

DINNFORDE'S FLUID MAGNESIA.—The best remedy for ACIDITY OF THE STOMACH, HEADACHE, GOUT, and INDIGESTION; and the safest agent for delicate Constitutions; Ladies, Children, and Infants.

DINNFORDE & CO., 172, New Bond Street, London, and all Chemists.

HOLLOWAY'S PILLS.—A few doses of these Pills should be taken by every one at the commencement of the Spring, as they give the system a proper order, and give new life, vigour, and energy to those who feel weak, nervous, exhausted, and out of sorts; they impart a freshness to the natural energies, and enable the hard-worked man of business to apply himself with energy to his work. They are equally beneficial to those who are debilitated during the winter, and renovate the whole internal organization. Their action is mild and yet effective, and this valuable quality renders them so desirable for the family. Full directions accompany them, and therefore no mistake can possibly occur.

GREEN'S PATENT "SILENS MESSOR" & "MONARCH,"

Or NOISELESS LAWN MOWING, ROLLING, and COLLECTING MACHINES for 1877,

THE WINNERS OF EVERY PRIZE IN ALL CASES OF COMPETITION.

Patronised by Her Most Gracious Majesty the Queen on numerous occasions, H. R. H. the Prince of Wales, the King of the Belgians, the late Emperor of the French, the Emperor of Russia, and most of the Nobility, Clergy, and Gentry in the United Kingdom.

Upwards of 80,000 of the above Machines have been Sold since they were first introduced in the year 1856, And Hundreds of unsolicited Testimonials have been received testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every Prize that has been given.

The following are their special advantages:—
1st. Simplicity of Construction—every part being free of access. 2d. They are worked with far greater ease than any other. 3d. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either long or short Grass, wet or dry.

SINGLE AND DOUBLE HANDED "SILENS MESSOR" LAWN MOWER.

* If made stronger, suitable for Donkey, 30s. extra.

Prices of Horse, Pony, and Donkey Machines, including Patent Self or Slide Delivery Box; Cross-stay complete; suitable for attaching to Ordinary Chaise Traces or Gig Harness:—

DONKEY and PONY MACHINES.

To cut 26 inches	£15 0 0	Leather Boots for Donkey	.. £1 0 0	To cut 30 inches	£22 0 0	To cut 42 inches	£30 0 0
" 28 "	17 0 0	" " Pony	.. 1 4 0	" 36 "	26 0 0	" 48 "	34 0 0
" 30 "	18 10 0					Leather Boots for Horse	.. £1 9 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machines make little noise in working, the most spirited animal can be employed without fear of its running away, or in any way damaging the Machines.

Carriage paid to all the principal Railway Stations and Shipping Ports in England, Ireland, and Scotland.

GREEN'S PATENT "MONARCH" LAWN MOWER, with Chain and Internal Gear combined.

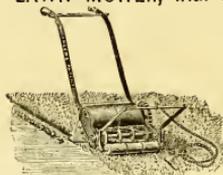

This Mower is well adapted for cutting long, coarse, rough, and wet Grass. It is strongly made, and does its work admirably. It will cut nearer to an object than any other Lawn Mower extant.

The sizes and prices of the "Monarch" Mower are in every respect the same as for the "Silens Messor," with Grass Box, &c., complete.

Green's Patent Lawn Mowers have proved to be the best, and have carried off every prize that has been given in all cases of competition.

No Lawn Mower Manufacturer keeps so large a stock of Mowers as is to be found at our London Establishment, 54 and 55, Blackfriars Road, where purchasers can select from upwards of 500 Machines of Hand, Pony, and Horse Power, and have their Orders executed the same day they are received.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned at once, free of cost to the Purchaser.

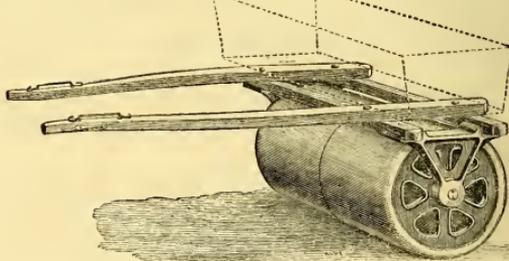

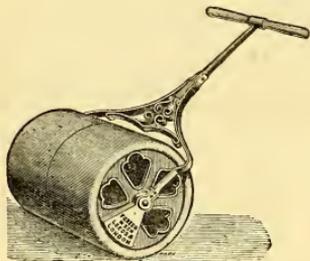

Green's Lawn Mowers are the only Machines in constant use at the Royal Horticultural Society's Gardens, South Kensington, London.

N.B.—Those who have Lawn Mowers which require repairing should send them to either our Leeds or London establishment, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

Delivered, Carriage Free, at all the principal Railway Stations and Shipping Ports in England, Ireland, and Scotland.

GREEN'S PATENT ROLLERS FOR LAWNS, DRIVES, BOWLING GREENS, CRICKET FIELDS, AND GRAVEL PATHS, SUITABLE FOR HAND OR HORSE POWER.

To Parties Purchasing New Houses. H. W. WALTON begs to intimate to the above that he has for sale an unrivalled collection of FLOWERING and FOLIAGE PLANTS of extra size suitable for immediate effect, which must be cleared out to make room. Also an immense stock of STOVE and GREENHOUSE PLANTS of all the newest and most approved varieties. H. W.'s CATALOGUE is now ready, and will be forwarded post-free on application to H. WALTON, Edge End Nurseries, Enderfield, near Burnley, Lancashire. Edge End is distant from Burnley, 3 miles; Accrington, 5 miles; Stalton, 14 miles; Bradford, 30 miles; Manchester, 20 miles; Huddersfield, 20 miles; Leeds, 33 miles; Wakefield, 40 miles.

Presented (by post) on application, NEW CATALOGUE, for 1877. MESSRS. H. B. AND SON'S DESCRIPTIVE LIST for this Spring, free by post on application. Their stock of Florist and Bedding and Stove Plants generally, are surpassed by few, if any, either in extent or quality, all the newest and best varieties being constantly added to the variety classes, and every pains taken to keep the varieties true to name. Another great advantage to purchasers is that none of the plants offered are taken directly from a warm propagating house and sent off, but are all carefully hardened and most of them potted off singly, and are thereby fitted to travel either by rail or post without the slightest injury. A great proportion are autumn-struck plants, and many of the undermentioned can be sent by post—Abutilum, in variety, 3s. 6d.; Aesculus, 20s. per 100. Achmees, in variety, 3s. 6d.; Ageratum, in variety, 8s. 9d.; Begonias, tuberosa, 6s. and 9s. per dozen. Calceolarias, Golden Gem, 8s. 9d. per dozen. Camellias, 30s. and 42s. per dozen. Carnations and Picotees, 12 plants, 6s.; 25 pairs, 20s. 6d. Carnations, true, in variety, 20s. per dozen. Centaureas rugulosa, 3s. per dozen. Chrysanthemums, near 10,000 now ready, 20s. per 100, 6s. per dozen. Clematis, in variety, 60s. per 100, 9s. per dozen. Coleus, in variety, 40s. per 100, 3s. per dozen. Cyclamen, in variety, 6s. and 9s. per dozen. Dactylis elegantissima, 5s. per 100, 12s. per dozen. Dahlia, 2s. per 100, 4s. per dozen. Delphinium, splendid sorts, 9s. to 12s. per dozen. Euphyllium, 9s. to 12s. per dozen. Ferns, store and greenhouse, 9s. to 12s. per dozen. Fuchsia, 30s. per 100, 3s. per dozen. Gardenia florida, 6s. to 12s. per dozen. Greenhouse Plants, 9s. to 12s. per dozen. Geranium, Tricolor, 3s. 6d. per dozen. " " " Ricolor, 20s. per 100, 3s. per dozen. " " " Silver-edged, 3s. 6d. per dozen. " " " Double, 20s. per 100, 3s. per dozen. " " " Zonals, for bedding, 15s. per 100, 3s. per dozen. " " " Zonals, for pot culture, 3s. to 6s. per dozen. Gladioli, to name, 6s. to 9s. per dozen. " " " splendid seedlings, 40s. per 100, 3s. per dozen. " " " Brechtleyensis, 20s. per 100, 3s. per dozen. Helianthemum, 2s. 6d. per dozen. Herbaceous Plants, 40s. per 100, 3s. per dozen. Arches, Pinks, and Flumms, and Heliotropes, in variety, 2s. 6d. per dozen. " " " Hesperis, 4s. per dozen. The Oldfield Nurseries, Altrincham.

OSBORN & SONS,

FULHAM NURSERIES, LONDON, S.W.

NEW ENGLISH-RAISED SEEDLING ROSES.

MESSRS. PAUL & SON,

THE OLD NURSERIES, CHESHUNT, N.

(THESE NURSERIES ESTABLISHED IN 1806).

Have great pleasure in announcing as a continuation of the series of English Roses raised or sent out by them since 1866, inclusive of LORD CLYDE (Paul & Son), DUKE OF EDINBURGH (Paul & Son), CHESHUNT HYBRID (Paul & Son), ANNIE LAXTON (Laxton), DUKE OF CONNAUGHT (Paul & Son), &c., &c., and containing never a bad one in the lot,

TWO NEW ENGLISH SEEDLING ROSES.

H.P. EMILY LAXTON (Laxton), a large full flower with globular, pointed bud, opening into large globular flower. In the way of Monsieur Noman, but of a rich cherry-rose, deeper and fuller than that kind, and with strong vigorous habit, making a grand pillar Rose.

First-class Certificate Royal Horticultural Society; First-class Certificate at the Leeds and Crystal Palace Rose Shows, and 1st Prize at Exeter for twenty-four of any one kind.

H.P. MARCHIONESS OF EXETER (Laxton), clear, rose-flushed, light cherry-rose, large, finely built-up flower, very sweet, and of strong vigorous growth; a larger more double Annie Laxton, yet perfectly distinct from that kind.

Plants in pots of the above, ready early in June, 7s. 6d. each, 14s. the two varieties; Blooming Plants, in 24-pots, 10s. 6d. each, 20s. the two varieties.

The two kinds described above have been proved two seasons at Cheshunt, and can be recommended as continuing the race begun by this raiser with H.P. Annie Laxton.

PAUL & SON,

THE OLD NURSERIES, CHESHUNT, N.

(THESE NURSERIES ESTABLISHED 1806.)

Delivered on rail at Blackwater, S. E. R., or Farnborough, S. W. R., by the truck-load. Sample sack, 5s. 6d. each.

Fresh **SPIGHNUM**, 10s. 6d. per sack.

WALKER and CO., Farnborough Station, Hants.

LOAM.—Exceedingly fine Yellow, delivered into trucks on the South-Eastern, London, Chatham and Dover, and London, Brighton and South Coast Railways. Samples and price on application to J. BENKLY, Hops Nursery, Deptford, S.E.

MILLER and JOHNSON
(Established 1825)
Manufacture the highest quality of
ARTIFICIAL MANURES
For ROOT, CORN, and GRASS CROPS.
36, Mark Lane, London, E.C.

ODAMS' MANURES,

FOR ALL CROPS.

Manufactured by the NITRO-PHOSPHATE and ODAMS' CHEMICAL MANURE COMPANY (LIMITED), consisting of Tenant-Farmers occupying upwards of 150,000 acres of Land. **CLASMAN—ROBERT LEEDS**, Kewick Old Hall, Norwich.

Managing Director—JAMES ODAMS.

Sub-Manager and Secretary—C. T. MACADAM.
Chief Office—109, Finchurch Street, London, E.C.
WESTERN COUNTIES BRANCH—Queen Street, Exeter.
Particulars will be forwarded on application to the Secretary, or may be had of the Local Agents.

EWING'S MILDEW COMPOSITION, in Bottles, 1s. 6d. and 3s. each. One Gallon Case (to make 100 gallons of mixture for spraying), 12s. each. Two Gallon Case, 6s. each.

Mildew or Red Spider are effectually prevented or destroyed by merely painting the hot pipes with the composition mixed with white-wash. No direct application to the foliage is then necessary.

Royal Norfolk Nurseries, Eaton, Norwich.

GISHURST COMPOUND.—Used by many of the leading Gardeners since 1859, against Red Spider, Mildew, Thrips, Greenfly, and other Blights, in solutions of from 1 to 2 ounces to the gallon of soft water, and of from 4 to 16 ounces as a winter dressing for Vines and Fruit Trees. Has outlived many preparations intended to supersede it. Sold Retail by Seedsmen in Boxes, 1s. 6d., and 10s. 6d. Wholesale by PRICE'S PATENT CANDLE COMPANY (Limited).

SIMPSON'S RED SPIDER, THIRPS, &c., ANTI-DOTE.—Testimonials of the highest order on application. For quack condensed 6s. 6d. per pint, 3s. 6d. Supplied to Seedsmen and Chemists. Strongly recommended in the *Gardener*, and by many first-class Cultivators.

Prepared by JOHN KILNER, Wortley, near Sheffield.

SATISFACTION ABROAD.

INDIA.

D. MCGREGOR, Superintendent Anandale Garden, Simla, March 8, 1877.

"Dear Sir,—Having seen the Plants sent out from your Firm to Mr. Freeman at Simla, I will feel obliged if you will send me your Catalogue, as I intend sending you an order for both Plants and Seeds at once."

CAPE OF GOOD HOPE.

"Lewenshof Garden, Cape Town, November 28, 1876.

"Dear Sir,—I hasten to inform you that since I wrote to you on the 21st inst. the plants have come to hand and are doing well. I am very glad they arrived before my departure from home, so that I could attend to them, and may now safely leave them during my absence to the care of my gardener. Allow me to thank you for the care you have taken in the proper transmission of the plants, which I have no doubt will do well.

"Believe me to be, dear Sir, yours truly,

"P. J. KOTZE."

SWANLEY, KENT.

STRAWBERRY, THE DUKE OF EDINBURGH (MOFFAT).

THE LAWSON SEED AND NURSERY COMPANY (LIMITED), EDINBURGH and LONDON,

Have made arrangements with Mr. Moffat, Coldwells, to send out, for the first time, the above-named splendid Strawberry. Fruit very large, firm, and of excellent flavour, bright scarlet colour. A most prolific bearer, and as a main crop for market purposes it is unsurpassed.

Strong Plants, 42s. per 100; 25s. per 50; 16s. per 25; 9s. per dozen.

Trade Price on application.

HOT-WATER APPARATUS ERECTED COMPLETE.

PRICE LIST on application; or, Six Stamps for DESCRIPTIVE CATALOGUE, 4th Edition.

BEST & CHEAPEST INSECTICIDES

Duty Free, under permission of the Hon. Board of Customs.

THE "LONDON" TOBACCO POWDER, "Horticultural" Tobacco Juice, also TOBACCO PAPER, CLOTH and CORD.

Particulars on application, CARRY & SOPER, BONDED TOBACCO STORES, SHAD THAMES, LONDON, S.E.

All Proprietary Insecticides and Manures kept in stock. RUSSIA MATS.—A large stock of Archangel and Petersburg, for Covering and Packing (price on application for Archangel)—Petersburg, 6oz. to 2oz. per 100; superior close-woven, 4oz., 3oz. and 2oz. per 100; Packing Mats at 5oz., 3oz., and 2oz. per 100; and all other descriptions of Mats at equally low rates, at J. BLACKBURN AND SONS, 4 and 5, Wormwood Street, London, E.C.

Wholesale Russia Mat Merchants. MARENDAZ AND FISHER, James Street, Covent Garden, W.C. Importers of RUSSIA MATS, RAFFIA FIBRE, &c. Large stock of TANNED GARDEN NETTING, RABBIT NETTING, TIFFANY, &c., at wholesale prices for a quantity.

RUSSIA MATS, for Covering Garden Frames.—ANDERSON'S TADANROF MATS are the cheapest and most durable. Price List, which gives the size of every class of Mat, forwarded post-free on application. JAS. T. ANDERSON, 149, Commercial Street, Shoreditch, London, E.C.

RUSSIA MATS, for Covering from Frost. From 3oz. to 2oz. per 100; packing from 2oz. GUNNY BAGS, from 3d. each, delivered free to any Station in London. SUTHERLAND, SON AND CO., 11, Fenchurch Buildings, Fenchurch Street, London, E.C.

Peat, Loam, Sand, Birch Brooms. HARRIET SCOTT, Dealer in all kinds of GARDEN MATERIALS, such as STAKES, RODS, HURDLES, WATTLES, BAVINS, PEA STICKS, PIMPS, MOSS, &c., delivered free. Price List on application. H. S. begs to notify that Mr. Uwins is no longer in her employ. Firm Maker to the Crystal Palace Company. Woodside, S.E.

Glass, Glass, Glass. HENRY WAINWRIGHT, GLASS MERCHANT, Alfred Street, Boar Lane, Leeds, has in stock all sizes of Glass at prices not to be surpassed by any house in the trade. 2oz. tapers, at 1d., 3d. for 123. 6d. Also dealers in VULCANISED INDIARUBBER HOSE PIPES, for gardening purposes.

Rosher's Garden Edging Tiles.

THE ABOVE and many other PATTERNS are made in materials of great durability. The plainest sorts are especially suited for KITCHEN GARDENS, as they last on Slugs or Insects, take up little room, and, once put down, incur no further labour or expense, as do "grown" Edgings, consequently being much cheaper. GARDEN VASES, FOUNTAINS, &c., in Artificial Stone, very durable and of superior finish, and in great variety of design. F. ROSHER AND CO., Manufacturers, Upper Ground Street, Blackfriars, E. S. E.; King's Road, Chelsea, S. W.; Kingland Road, E.

Agents for LOOKER'S PATENT "ACME FRAMES," PLANT COVERS and PROPAGATING BOXES; also for FOXLEY'S PATENT BEADED GARDEN WALL BRICKS. Illustrated Price Lists free by Post. The Trade supplied.

ORNAMENTAL PAVING TILES, for Conservatories, Halls, Corridors, Balconies, &c., from 3d. per square yard upwards. Pattern Sheets, of more elaborate designs, with prices, sent for selection. WHITE GLAZED TILES, for Lining Walls of Dairies, Larders, Kitchen Ranges, Baths, &c. Grooved and Other Staircase Faving of great durability. Wall Copings, Drain Pipes and Tiles of all kinds. Roofing Tiles in great variety, Slates, Cement, &c. F. ROSHER AND CO., Brick and Tile Merchants. See addresses above.

SILVER SAND, fine or coarse grain as desired. Prices by Post per Ton or Truckload, on Wharf in London, or delivered direct from Pits to any Railway Station. Samples of Sand free by post. FLINTS and BRICK BURNERS for Rockeries or Ferneries. KENT PEATS or LOAM supplied at lowest rates in any quantities.

F. ROSHER AND CO.—Addresses see above. N.B.—Orders promptly executed by Rail or to Wharves. A Liberal Discount to the Trade.

WOOD TRAINING STICKS and TALLIES, commended by Royal Horticultural Society. BAMBOO CANES, RAFFIA for young VIRGIN CORK, ARCHANGEL and other MATS, PACKING MATS, &c. Wholesale prices on application to C. J. BLACKBURN AND CO., CO.'S QUAY, Lower Thames Street, London, E.C.

Indestructible Terra-Cotta Plant Markers. MAW AND CO.'S PATENT.—Prices, Printed Patterns, and Specimens sent post-free on application; also Patterns of Ornamental Tile Pavements for Conservatories, Entrance Halls, &c. MAW AND CO., Beetham Works, Brossley.

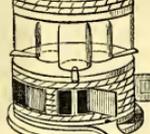

Under the Patronage of the Queen. J. SMITH'S IMPERISHABLE STRATFORD LABELS.

The above Labels are made of a White Metal, with RAISED BLACK-FACED LETTERS. The Gardeners' Magazine says:—"We must give these the palm before all other plant labels, as the very first in merit." See Samples and Price Lists free. J. SMITH, The Royal Label Factory, Stratford-on-Avon.

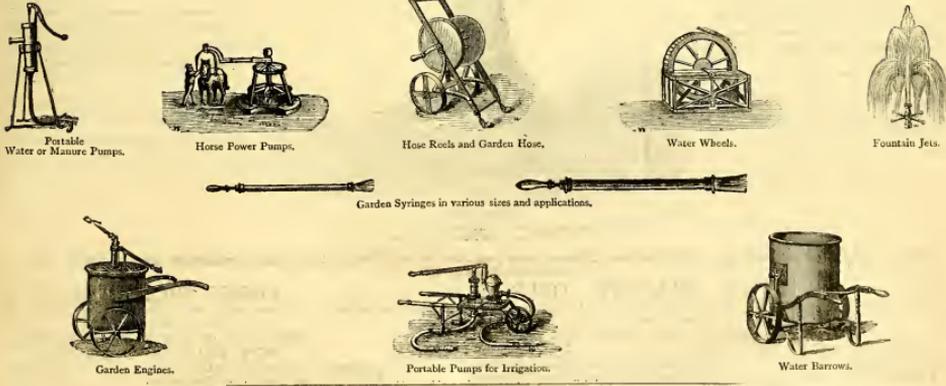

Gather Honey from Your Flowers. NEIGHBOUR'S Celebrated BEEHIVES. PHILADELPHIA EXHIBITION, 1876. PARIS EXHIBITION, 1867.

Three Silver Prize Medals awarded George Neighbour & Sons. The only English exhibitors who obtained Silver Medals for Beehives. THE IMPROVED COTTAGE BEEHIVE, as originally introduced by G. Neighbour & Sons, working three bell-shaped frames, is made of straw; it has three windows in the lower Hive. This Hive will be found to possess many practical advantages, and is more easy of management than any other Beehive that has been introduced. Price, complete £1 25 0 Stand for ditto 0 to 6 THE LIGURIAN or ITALIAN ALP BEE being much in repute, G. N. & Sons supply a Swarm of Bees with genuine Italian Queen, in the Improved Cottage Hive, at £4. Hive included. An Italian Alp Queen, with full directions for uniting to Black Stocks, 15s. each.

ENGLISH BEES.—Stocks and Swarms may be obtained as heretofore. THE APIARY, by A. NEIGHBOUR. 5s. postage 4d. A newly arranged Catalogue of other Improved Hives, with Drawings and Prices, sent on receipt of two stamps. GEO. NEIGHBOUR AND SONS, 127, High Holborn, W.C., or 149, Regent Street, London, W.

JOHN WARNER & SONS, HYDRAULIC and SANITARY ENGINEERS, BELL and BRASS FOUNDERS to HER MAJESTY (ESTABLISHED 1763), THE CRESCENT FOUNDRY, CRIPPLEGATE, LONDON, E.C., AND THE FOUNDRY WORKS, WALTON-ON-THE-NAZE, ESSEX.

FULL LIST OF HORTICULTURAL WATERING IMPLEMENTS UPON APPLICATION. Estimates supplied for Pumping Machinery of every description, for Steam, Water, Wind, Horse, or Manual Power, upon receipt of Description of Requirements.

PRIZES FOR NEW PLANTS.

WILLIAM BULL, F.L.S.,

HAVING OFFERED THROUGH THE ROYAL HORTICULTURAL SOCIETY

ONE THOUSAND POUNDS FOR NEW PLANTS

Of his own introduction, begs to announce that Twelve Silver Cups and Money Prizes as follows (the Fifth Annual Series) will be awarded at the Royal Horticultural Society's Great Summer Show, to be held at Kensington, on Tuesday, June 19, 1877. Particulars of these Prizes are given at pages 167 to 171 of Mr. William Bull's Catalogue of New Plants for 1877. The Prizes to be awarded on Tuesday, June 19, will be as follows:—

FOR PRIVATE GROWERS.

1st Prize, a Silver Cup, value ..	15 Guineas
2d Prize, a Silver Cup, value ..	10 Guineas
3d Prize, a Silver Cup, value ..	6 Guineas

FOR NURSERYMEN.

1st Prize, a Silver Cup, value ..	15 Guineas
2d Prize, a Silver Cup, value ..	10 Guineas
3d Prize, a Silver Cup, value ..	6 Guineas

In each and all cases the above Prizes are offered for Twelve New Plants of Mr. W. Bull's introduction, and sent out since the commencement of 1874. The Plants available for these Prizes to comprise only those announced in Mr. W. Bull's Catalogues, as sent out by him for the first time. The Catalogues can be easily referred to, or a List of the Plants had on application.

In each and every entry the names of the Twelve Plants to be exhibited must be sent with the entry. Exhibitors can only compete for one Prize at a time in each class.

The Twelve Plants must be twelve distinct species or varieties, but each may be composed of one or more individual plants, if grouped in one pot, pan, or vase.

Any Exhibitor winning either of these Prizes, and having previously won two of Mr. William Bull's Silver Cups, can have Money instead of the Cup, if preferred.

PRIZE CUP.

Specially Designed by Messrs. Elkington & Co. to be awarded for Mr. William Bull's New Introductions.

Mr. William Bull will also give the following PRIZES this year, for 12 NEW PLANTS of his introduction, sent out since the commencement of 1874:—

FOUR SILVER CUPS,

As follows, will be given at the Grand Summer Exhibition of the Glasgow and West of Scotland Horticultural Society to be held in the Crystal Palace Conservatory, Royal Botanic Gardens,

GLASGOW, on May 23, 1877:—

FOR PRIVATE GROWERS.

1st Prize, a Silver Cup, value ..	10 Guineas
2d Prize, a Silver Cup, value ..	6 Guineas

FOR NURSERYMEN.

1st Prize, a Silver Cup, value ..	10 Guineas
2d Prize, a Silver Cup, value ..	6 Guineas

The above Prizes are confined to Growers in Scotland.

In each and all cases the above Prizes to be offered for Twelve New Plants of Mr. W. Bull's introduction, and sent out since the commencement of 1874. The Catalogues can easily be referred to, or a List of the Plants had on application. In each and every entry the names of the Twelve Plants to be exhibited must be sent with the entry. Exhibitors can only compete for one Prize at a time. The Twelve Plants must be twelve distinct species or varieties, but each may be composed of one or more individual plants, if grouped in one pot, pan, or vase.

A SERIES OF SILVER CUPS, and MONEY PRIZES,

as follows, will be given to those not having previously won any of

MR. WM. BULL'S SILVER CUPS:

FOR PRIVATE GROWERS.

1st Prize, a Silver Cup, value 15 Gs. and £10
2d Prize, a Silver Cup, value 10 Gs. and £7
3d Prize, a Silver Cup, value 6 Gs. and £5

FOR NURSERYMEN.

1st Prize, a Silver Cup, value 15 Gs. and £10
2d Prize, a Silver Cup, value 10 Gs. and £7
3d Prize, a Silver Cup, value 6 Gs. and £5

In each and all cases the above Prizes are offered for Twelve New Plants of Mr. W. Bull's introduction, and sent out since the commencement of 1874. The Plants available for these Prizes to comprise only those announced in Mr. W. Bull's Catalogues, as sent out by him for the first time. The Catalogues can be easily referred to, or a List of the Plants had on application.

In each and every entry the names of the Twelve Plants to be exhibited must be sent with the entry. Exhibitors can only compete for one Prize at a time in each class.

The Twelve Plants must be twelve distinct species or varieties, but each may be composed of one or more individual plants, if grouped in one pot, pan, or vase.

THREE SILVER CUPS,

As follows, will be given at the Great International Horticultural Exhibition, to be held at

CARLISLE, on Sept. 6, 7, and 8, 1877:—

FOR PRIVATE GROWERS.

1st Prize, a Silver Cup, value ..	15 Guineas
2d Prize, a Silver Cup, value ..	10 Guineas
3d Prize, a Silver Cup, value ..	6 Guineas

 Chelsea Swimming Bath Company
 Blackpool Winter Gardens
 Royal Winter Gardens
 Birmingham Winter Gardens, Aston Park
 And One Thousand of the Leading Cosy Families in the United Kingdom.

SPECIAL ADVANTAGES

Rendle's Patent System of Glazing,

This system is now being universally adopted by Her Majesty's Government, several of the leading Railway Companies, some of the principal Corporations, including the Metropolitan Board of Works, Commissioners of Sewers, and the New Winter Garden Companies throughout the country.

There will be an enormous saving in the Maintenance and Repairs of Roofs on this System—say from 80 to 90 per Cent.—and there is no reason why a roof should not be as perfect in 20 years as the first week, because all the perishing materials, such as wood, iron, or paint, are completely covered by the glass from the destructive influences of the weather.

Another grand recommendation is, that there is no breakage from contraction or expansion either from heat or cold, as the glass has full play in every direction. Tens of thousands of squares are broken from this cause every year. Not is there any breakage from vibration of large Railway Roofs in heavy gales of wind, or from the passing of express or fast trains. Indeed, it is well known that a puttled roof is never perfect in a station where express trains run through.

In adopting this System, all the everlasting expense of repainting, re-glazing, and re-glazing are completely done away with; and if it were now in use throughout several of the Great Railway Companies, such an enormous saving would be effected that it would have a considerable influence in supplying an addition to the yearly dividends.

Summary of Special Advantages.

- 1.—Saving of from 80 to 90 per Cent. in maintenance and repairs.
- 2.—No breakage from contraction or expansion, from heat or frost.
- 3.—No breakage from vibration caused by heavy winds or passing trains.
- 4.—Squares of glass can be instantly replaced.
- 5.—The construction is very strong and durable.
- 6.—The glass can be put on in one-fourth the time of the old plan.

For all the other advantages see Illustrated CATALOGUES and BOOKS of DESIGN, which can be obtained from the Inventor and Patentee—

WILLIAM EDGEcumBE RENDEL,
 WESTMINSTER CHAMBERS, VICTORIA ST.,
 LONDON, S.W.

NEW PLANTS FOR 1877.

MR. WM. BULL'S
 ILLUSTRATED
CATALOGUE
 for 1877

Is now ready, and can be had on application, price 1s.

It contains Names, Descriptions and Prices of the following New Plants, which are now being sent out for the first time:—

- ARALIA FILICIFOLIA,
- ANTANTHE RUBRONODOSA,
- CHAMLEDORA EBURNEA,
- COLEUS PICTUS,
- CROTON HENDERSONI,
- „ REX,
- CURMERIA WALLISII,
- CYCAS PLUMA,
- CYRIPEDIUM DRURYI,
- DIFFENBACHIA CHELSONI,
- „ VELUTINA,
- DIFLADENIA ORNATA,
- „ REGINA,
- DIFLAZIUM ARNOTTHI,
- DRACENA AMPLIATA,
- „ CRUENTA,
- „ MINIATA,
- „ MIRABILIS,
- „ NIVALIS,
- „ ROBINSONIANA,
- „ ROSEO-PERFECTA,

- „ TRIUMPHANS,
- „ VESTALIS,
- „ VIVICANS,
- DRACONTIUM ALBOSTIPES,
- „ ANNULATUM,
- „ CARDERI,
- ENCEPHALARTOS HILDEBRANDII,
- EUCALYPTUS CITRIODORA,
- GYNOMORPHA MERTENSII DOBROY-DENSIS,
- HIBISCUS (ROSA-SINENSIS) COLLERII,
- IRIS ROBINSONIANA,
- LOMARIA DALGAINRSLE,
- MACROZAMIA MACKENZII,
- NEPHRODIUM TRUNCATUM,
- PANAX LACINIATUM,
- PHEXIN RUPICOLA,
- PLECTRANTHUS FETIDUS,
- SADLERIA CYATHEOIDES,
- SMILAX SHUTTLEWORTHII,
- STANHOPEA SHUTTLEWORTHII.

NEW REGAL PELARGONIUM
 "PRINCE OF WALES."

This is an exceedingly handsome variety of this new and popular class of Pelargoniums. It is of excellent habit, very free blooming, and produces good trusses of large effective flowers; they are not really double, but from their fullness of form and extra number of petals, which are prettily undulated, they have the appearance of being so. The colour is a bright vermilion, with light centre and light edge to the petals, the superior ones being marked with light crimson and darkly blotched.

One Guinea.

MR. WILLIAM BULL'S

ILLUSTRATED CATALOGUE FOR 1877
 Contains Names, Descriptions and Prices of the above, and can be had on application, Price 1s.

Establishment for New and Rare Plants,
 KING'S ROAD, CHELSEA, LONDON, S.W.

SATURDAY, MAY 5, 1877.

MAY DAY.

MAY-DAY as a popular festival appears to have fallen out of fashion; like all else dependent upon the capricious tastes of humanity, May-day revels have had their rise and fall, their seasons of greatness and neglect, being doubtless at the height of their popularity during the reign of Elizabeth—those piping times of peace, when—

Every man eat and safety,
 Under his own Vine, what he planted;
 And sang the merry songs of peace to
 To all his neighbours.

May games were at this period held in every village which boasted a convenient green whereon to erect the May-pole—this latter being the gift of the lord of the manor, who never regarded such festivities with churlishness, but would bestow the tallest and straightest tree from his plantations for the occasion, and gave countenance to the proceedings, not only by his own presence, but by that of his family also.

The rustic rose betimes in every hamlet to fetch home green boughs from the woods with which to decorate the fronts of their cottages, and to intertwine with flowers to form garlands; the village maidens also were stirring at dawn, for the dew which sparkled on the grass on the first morn of May was supposed to have potent charms, and she who bathed her face with its cool crystal drops would become as fair as a Lily and red as a Rose; this pretty conceit indeed abides in the North to the present time, and many a Scotch lassie would not miss the beautifying spell, though it cost her a night's repose. For some time before the fatal morn of joyous May" what hopes and fears must have agitated the breast of every village maiden who had the slightest claim, either by reason of her beauty or amiability, to be made the queen of a day!

The custom of choosing a May-queen, the gathering of garlands and the dancing on the green, have all become things of the past, but the memory of them lives in undying verse. Tennyson has immortalised the flower-crowned queen of past times, and the "Queen of the May" has become as familiar in our mouths as household words.

When the May-pole was erected and the garlands were hung, when her majesty was chosen and attended to her flower-decked chair of state, when her subjects had paid their allegiance, then the sports and games began. Foremost among these was dancing, which was led by the sovereign of the mimic court, as it was in her palace at Richmond by Elizabeth, whose "ordinary exercise was six or seven galliards in a morning, besides music and singing." At the same time as the courtiers danced their "grave measures and corantes" in stately halls and hospitable manor-houses, the peasant youths and maidens tripped the comely country round, and the recreations which became the courtly gentleman to adopt were no less becoming in the squire, the yeoman, ploughman, the trader, the artisan, and the apprentice; the accomplishments enumerated by Roger Ascham as worthy of attainment being "to ride comely, to run fair at the tilt or ring, to play at all weapons, to shoot fair in bow or surely in gun, to vault lustily, to run, to leap, to wrestle, to

swim, to dance comely, to sing and play of instruments cunningly, to hawk, to hunt, to play at tennis, and all pastimes generally which be joined with labour, used in open place and in the daylight, containing either some fit exercise for war or some pleasant pastime for peace."

All alike joined in these diversions and met on common ground to display their strength and skill: he was best man who could hold his own against all comers. The frequent and neighbourly commingling of all degrees of people used the bonds of kindness between all classes to be closer knit, and judging from the chroniclers of the time there was much less jealousy between rich and poor than at the present day—every one knew his station, and felt a just and worthy pride in fulfilling its duties.

As the reformed religion spread and Protestants became more puritanical in their ideas, the most passionate invectives were hurled from the pulpit against May-day games and similar seasons of merry-making, which were not few and far between during the supremacy of the Catholics. At first the Puritans directed their reprobations solely against such sports as were played on the Sabbath-day; so long as a popular festival fell on one of the six days devoted to labour the people were left to enjoy it, although bitter denunciations were levelled against the dancing schools (then greatly patronised), which were called academies for teaching "the noble science of heathen divinity," and the musicians, who were admonished thus—"Give over your occupations, you pipers, you fiddlers, you minstrels and you drummers, you tabretters and you fluters, and all other of that wicked brood." Sweet music, they held, "at first delighteth the ears, but afterwards corrupteth and depraveth the mind." Fortunately, such severe views were not held by the whole of the reformed clergy, who were willing to abolish whatever might be supposed to have had a papistical or idolatrous meaning in the procession, but who considered that it was unchristian, even on a Sunday, after evening service, "to shoot at the butts, to play football, or even to see an interlude;" thus, for many years, public opinion had been divided.

The celebration of May-day, with all its pastoral simplicity, never appears to have been revived with the spirit it was at one time kept. It became almost obsolete with the pranks of the "Lord of Misrule" and his noisy court of lusty mummings. Of all this bravery, but little beyond the tradition has descended to us. In remote districts "St. George and the Dragon" is sometimes played in the farmhouse kitchen, but it is but a sorry representation of the fun and frolic cherished as being common some two or three centuries ago; and even "Jack-in-the-Green," that once popular burlesque of May-day celebrations, is rapidly dying out. It is true that in certain villages there still exists a farcical semblance of distinguishing the May that the sorry exhibition is one to arouse pity rather than mirth. A few poor, wretchedly-clad girls, having made a collection of tawdry finery and dingy artificial flowers, deck themselves out, and carrying ill-made garlands with the same materials, pass from door to door begging remembrance for "St. George's May." The dolls given to them may represent the collections made for the poor at all ancient festivals, but the representatives of the queen do not carry with them even a shadow of the freshness and beauty which surrounded their predecessors; and which made them always welcome, doubtless, as a picturesque embodiment of the charms of the season.

Hawthorn buds may be gathered on the first of May—in exceptional seasons—but even calculating by the old style we should seldom find employment for many lads and lassies to pick a bunch in May, for the hedges would be sparsely clothed that depended on present outdoor vegetation for its floral beauty. T. S. J.

New Garden Plants.

STAPELLA GRANDIFLORA, Mass., VAR. LINEATA.

N. E. Br. (fig. 85).

Stems erect, branching at base, 6—12 inches high, 1—1½ inch thick, visibly pubescent, 4-angled, angles compressed but becoming thicker on the more rounded sides; to 4-toothed, teeth erect; flowers produced at the base of the young branches. Peduncle 3—5 lines long, very stout, generally 3-flowered (one central and one on each side), or rather with three buds, the two lateral ones being either dropping away, or by abortion 2- or 1-flowered, pubescent; pedicel stout, 1½ inch long, 2 lines thick, pubescent. Bud ovoid, apex obtuse, slightly depressed. Calyx lobes 5 lines long, lanceolate acute, pubescent. Corolla with 5 lines diameter, the back pale green, pubescent, the face everywhere transversely rugose, the disk dull purple-red covered with erect purple hairs (not matted together); the apical half to two-thirds of the lobes is glabrous; the margin distinctly ciliated with long hairs, the outer rows being white, the inner pale purple; from the base to half way towards the apex dull purple with numerous transverse pale yellow undulated lines: the apical half is filled up with dark purple-brown, which projects towards the base of the lobe in the form of a cone, giving the apex the appearance of being occupied by a large diamond-shaped blotch. Ligulae lanceolate acute, concave, spreading, recurved at the apex, dull reddish brown, paler at the apex. Rostra and pale yellow, shading with purple at the tip. Petals 5, the outer ones recurving, triquetrous, 5 lines long; also 3 lines long, adnate to the rostra for three-quarters of their length, broad, oblong apex rounded, entire or sub-entireolate. In fruit the peduncle and pedicel are 6—7 inches long, 1 inch thick at the base, tapering to the hooked apex, pubescent.

My identification of this plant as a variety of *S. grandiflora*, Mass., requires a little explanation, especially as no specimen of Masson's is preserved, and at least two other plants have already been identified with Masson's *S. grandiflora*—viz., that figured in the *Botanical Magazine*, t. 585, to which Hawthorn later on gave the name *S. speciosa*, and which differs widely from its more common form, the yellow and dark purple-brown inner corona, the yellow markings in the figure being intended for reflections. Secondly, that figured in Jacquin's *Staphelia*, t. 59, which appears to me to differ in the more compressed petals and the dark purple-brown inner corona.

Masson's figure, though characteristic, is a poor one, without dissections, and his description is still worse, yet the two following peculiarities appear 1st.—The petals of the inner corona are covered with five yellow lines radiating from the centre. The flower is figured as seen from the front, and the rostra, whatever outline they may present in profile, would appear as five radiating linear or subulate processes. The description says "peduncle sepe trifidus." These two characters, whilst absent from the *Bot. Mag.* and Jacquin's plants, are both present in the plant here described. The three-flowered peduncle is very peculiar, the short peduncle is branched like a trident or the Greek letter Ψ , but generally only the central flower develops—the two side ones, after growing to some size, becoming abortive, sometimes by the suppression of one or both of the lateral buds: the peduncle is one or two flowered; many of the genus are one-flowered; but in the present plant, as in the peduncle branches in an irregular manner or the pedicels are aggregated. In no other species that I am acquainted with does the peduncle branch in the peculiar manner of the present plant, which was fitted to the rostra "pediculus tri-lobatus."

For a long time I considered this as a new and distinct species, intending to publish it under the name of *S. flaviorostris*, but last October I received from Mr. Justus Cordery a flower exactly like that of my plant, but with the core of the rostra of a purple brown, the transverse yellow lines being absent: this nicely bridged over the difference in colour between this plant and Masson's, and after a long and careful consideration of the subject I can only come to the conclusion that Mr. Cordery's plant is *S. grandiflora*, Mass., and the one here described a variety of it, differing in nothing but the transverse yellow lines on the corolla lobes. For my knowledge of the plant I am indebted to Sir Henry Barkly, who sent me specimens and living plants to the Royal Gardens, Kew; from one of the latter my drawing was made. It appears to be a widely spread form in South Africa. Sir H. Barkly, in a note sent with his specimens, states that he has recently got it from the mountains of Colesberg, Griqualand West, and Victoria West. The woodcut represents its young stems, when fully developed they are 9—12 inches high, and the angles are thicker and more rounded; the pubescence is distinctly viscid to the touch, and the plant is very fertile. The following specimens of it are pre-

served in the New Herbarium—Sir H. Barkly t. 1 and 2 at his list of plants in 1874.

For the plant described by Jacquin (*Staphelia*, t. 59) as *S. grandiflora*, I propose the name *Staphelia obtusa*. A specimen of MacOwan's in the New Herbarium, bearing the same number (1197) as the one on the variety above, but sent some years later, agrees exactly with Jacquin's figure. N. E. Brown, Kew.

GREENHOUSE PLANTS.

THEIR CULTURE AND MANAGEMENT.

CROWEAS.—These belong to a limited family of plants, introduced from New South Wales, that are of comparatively small habit of growth, dense and bushy, producing their lively dark red star-shaped flowers, for two or three months in succession through the autumn, at a time when greenhouse-flowering subjects are few. Croweas have many things to recommend them to the general cultivator, not the least of which is their easy growth and adaptability for decorative purposes, especially for the conservatory, where by regulating the time that they commence growing a succession of the plants may be had so as to furnish some in flower from the commencement of August, to be succeeded by others that will keep in bloom till the close of the year. They will also bear, whilst in bloom, placing in a confined situation in conservatories or similar places much better than most hard-wooded subjects; they likewise have the property of flowering freely in a very small state. Plants the first year grown from the usual nursery sized stock will just bloom as plentifully in proportion to their size as when older. When they get large and are well managed, they are very useful for exhibition, if required for this purpose, the nature of the flowers being such that they will bear a deal of knocking about without being crushed or disfigured. They make moderately strong roots, that are not at all delicate or liable to injury from causes that would result in the death of more tender things; yet they do not form them in such large quantities as to need so much pot room as many plants. All the kinds will grow in loam, and in it, when of a good description, the colour of the flowers is often a little higher; but in peat they generally make quicker progress, and where the latter can be had of a fair character I should recommend it in preference to loam, using about one-sixth or seventh of clean sharp sand intermixed.

Although the Croweas do not require anything above a cool greenhouse temperature to grow them, they are amongst a certain number of plants that will bear and make much more progress by having their growing season lengthened through being started in a little warmth in the winter. Their time of flowering can also be regulated by this. Plants that are thus started into growth in slight heat in February will bloom early in August if required to be succeeded by others, the growth of which commenced with the advance of the season. Where there is means for submitting them to a temperature of 50° in the night, and 60° or 70° by day, they may be started about February. I should advise the young stock to be started at that time. Healthy plants in 6-inch pots, obtained any time through the autumn, will be suitable to commence with. In selecting these, choose such that have been properly attended to in stopping the shoots, so as to have enough branches to start with, for if they have not been kept cut back they will have assumed a too spare habit, and lack the first essentials to form close bushy specimens.

At the commencement of the year cut in the whole of the preceding summer's growth, leaving the shoots about 6 inches long from the point where they were shortened to the previous season; tie them out in a horizontal position, and about the time and in the temperature above advised place them where they will receive a fair amount of light, slightly damping them overhead with the syringe once a day; and here they soon commence growth, and be in a condition for potting. They will require a 2-inch shift, with a fair quantity of drainage, using the soil in a moderately lumpy state, and pressing it solid in the pot. Replace the plants in a similar temperature to that they have been in, and here they remain until the beginning of May, when there will be enough solar heat to keep them on growing without the assistance of fire; after this, they will do along with other ordinary hard-wooded stock, requiring

like treatment through the summer as to air, syringing overhead, and closing the house or pit they occupy with the sun upon it in the afternoon. They will not need any stopping of the shoots, except such as happen to grow considerably stronger than the rest. The reason that it is not advisable to stop these plants in the summer, as prescribed in the cultivation of most hard-wooded subjects, is that if pinched back nothing is gained, as it rarely has the effect of causing shoots to break

When their blooming is over, remove the plants to where they will receive ordinary greenhouse treatment as to temperature, air, and water, cutting them back as in the preceding season so as to reduce the shoots to 6 or 8 inches in length from the point they were shortened to the year before, and again starting them in a little heat as previously, or if a succession of bloom be required, a portion of the stock may be allowed to commence their growth later on in the greenhouse. This year they will bear a 3-inch

through the growing season. In this way Croweas may be kept for years in a thriving, healthy state.

The following varieties are all worth growing:—

C. saligna major: A large-flowered form of the Willow-leaved *C. saligna*, and much superior to the old variety.

C. s. latifolia: As its name implies, a broad-leaved kind, with large flowers of great substance.

C. s. elliptica: A free-growing variety, and equally free in flowering; has elliptic-shaped leaves.

C. s. stricta: An equally desirable sort, the habit of the plant more upright than the others.

Insects.—Croweas are not much subject to the attacks of insects; green-fly will sometimes affect them, but can be easily killed, the nature of the plants being such as to bear without injury a strong application of tobacco-smoke. The use of the syringe to promote growth during the early part of the season prevents their suffering through red-spider. Brown-scale is troublesome if it gets upon them, but can be destroyed by strong application of insecticide when the plants are at rest in the winter. Should white-scale get upon them there is not much chance of eradicating it thoroughly, as it requires a stronger dressing of insecticide than the leaves will bear. *T. Baines.*

HAARLEM AND ITS BULB GARDENS.

HAVING had the satisfaction of inspecting some of the Dutch bulb gardens, I purpose briefly to record a few facts and ideas resulting therefrom. As you very justly remark in your article on the same subject in the *Gardener's Chronicle* of Saturday last, the only way to answer the often-asked question, "Where do all the bulbs come from?" is to visit Haarlem when the Hyacinths and Tulips are in flower. The occasion of the International Exhibition in Amsterdam gave myself and others the opportunity of witnessing such a sight as every one should see at least once before he dies, for if there is such a place as a paradise of flowers, it must be in and around Haarlem. I naturally expected to see the Hyacinths in great quantities, but this, as well as the gorgeous splendour of the colours, far exceeded my expectations. The general tidiness of the bulb gardens, too, is a noticeable fact, to the credit of the proprietors.

It has been acknowledged over and over again that England is the best place to see Hyacinths in pots, and therefore it may be assumed that our cultivators know the requirements of the plant. It struck me, however, on looking at the soil in the Haarlem gardens that, as a rule, the soil used in England is much too retentive. Sand and water appear to predominate in the Hyacinth home. No doubt the sand is very much enriched by large applications of cow-manure, but I believe if a more sandy soil were used for pot-plants, and the necessary nourishment given in the shape of liquid manure prepared from cow-dung, an improvement would be seen in the ordinary displays of Hyacinths in pots. I cannot help thinking that much of the success seen in the bulb gardens is attributable to the dampness of the soil, for there is water everywhere in and around the different gardens or farms. It cannot be otherwise, but wet, and yet the bulbs are not in the water, the gardens being all above the water level, and, to make it doubly safe, the beds are all divided by sunken alleys to a depth extending below the bulb.

The question is often asked why we cannot grow Hyacinths year after year in this country in the same way as they do in Holland, and it requires but little consideration to arrive at a correct solution of the reason why. I believe it is well understood that nothing weakens plants so much as to ripen their seed, having then, as it were, performed their purpose—reproduction. This fact appears to be thoroughly understood by the Dutch cultivators, as they seldom allow the Hyacinth to expand all its flowers before they remove them. This being done, the whole of the energies of the plant are devoted to the storing up of nourishment to enable it to carry out Nature's purpose another time. That bulbs can be grown out-of-doors from year to year with tolerable success, and that they cannot be grown in pots the second year, proves the soundness of the Haarlem system. In an ordinary way the flowers in the borders do not last so long as those in pots, consequently the bulb is not so much exhausted in the border. The stormy weather experienced a few weeks ago unfortunately proved this matter more fully than

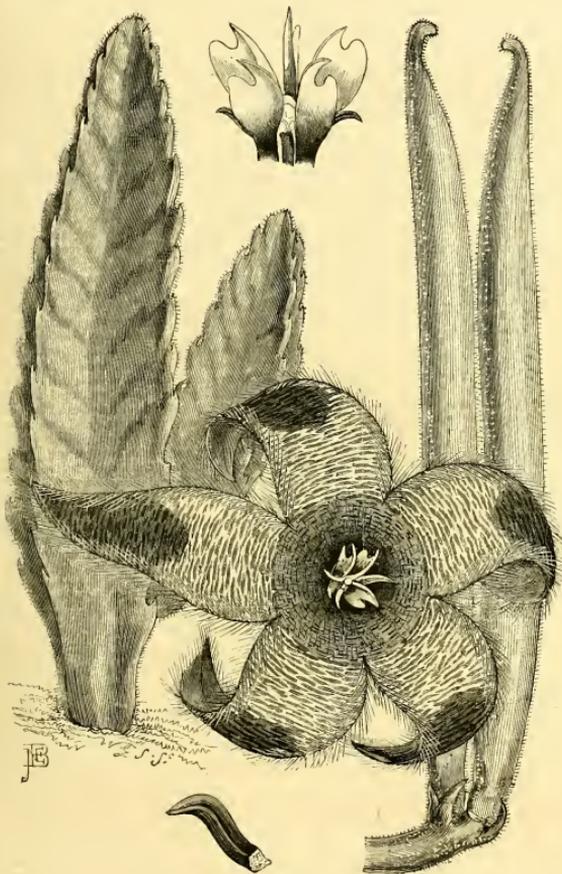

FIG. 85.—STAPHELIA GRANDIFLORA VAR. LINEATA.

out, several from each, as in the case of most things, but simply stops growth altogether for the season, and hastens their flowering. Where there is not the convenience of a house in which they can receive a little heat early, as above described, all the difference in their treatment required is to pot them later, about April, with the other hard-wooded greenhouse plants, and treat through the summer as before advised, but by the latter method they cannot be expected to make so much growth, nor flower so early. When they come into bloom they will make nice little plants for standing on front shelves, or in any prominent position.

shift, using the soil in a little more lumpy state, and keeping the strongest shoots well tied out, so as to clothe the base of the plants, treating them through the season as heretofore. The treatment required during subsequent years will be similar in every way, always cutting the shoots well back before growth begins, or a sufficiently dense, bushy condition will not be maintained. It is not necessary to increase the size of pot beyond 15 inches in diameter, as this will be big enough for full-sized specimens. After the plants have been in pots of this size for a year or two they should be regularly supplied with manure-water

pleasant, having broken off very many flowers that were just opening. Where this occurred the foliage has assumed a stiff, robust habit, while others, still retaining their flowers, have a lank, attenuated appearance.

To return to the Haslem bulk fields, we find that although the soil is naturally very sandy, it is made more so by constant dressings of the sand brought from the dunes or sand-hills, and this, with the heavy dressings of cow manure, enables the cultivator to grow the same crop on the same piece of ground every second year, yet it may be considered as a three years' rotation. When the ground is well manured Potatoes are planted, then Hyacinths after the Potatoes are taken up, and the next autumn Tulips take the Hyacinths' place, at least this is the system I understood one celebrated cultivator (Mr. F. Van Velsen, jun.) pursued, and his cult garden may be considered second to none, as all other flowers were to be seen anywhere. In many cases the robust character of the plants was very apparent. In this establishment was raised that splendid Hyacinth, the King of the Blues; it bears a splendid spike, and for late pot-work is invaluable. Mr. F. Van Velsen has a large stock of this fine variety, as well as of many others. Some of the more effective varieties seen were, of doubles, Eclipse, carmine, extra fine; Noble par Merite, blue, purple eye; Anna Maria, blue, pink eye and Madame de Sael, pale rose. Amongst single varieties the most conspicuous—Amy, bright red, fine for massing; Masterpiece, very fine rose; Robert Steiger, Von Schiller, Vuurbaak, bright red, very effective; General Havelock, a fine black; King of the Blues, before mentioned; Mimosa, fine large dark variety; Regulus; William the First; Bird of Paradise, a very fine yellow; Grande Vedette; La Grandesse, a very fine white; La Vestale, Mammoth, Thaba, Thémistocles, Charles Dickens, Havelock, and Tolens. My visit was rather early, so that the Tulips in perfection, still enough was seen to give an idea of the magnificence of the whole; the Duc Van Tholl varieties were very charming, and Canary Bird, single yellow, is very fine and highly recommended; the varieties of Claremore, rose striped and gold, are very good; Proserpine and Van der Neer should be in every collection. *George Thompson, Crystal Palace.*

FERTILISATION OF PLANTS.*

(Continued from p. 535.)

5. ALTHOUGH in many cases it would appear that intercrossed plants are absolutely more fertile than the self-fertilised, yet Mr. Darwin raised during his experiments some highly self-fertile varieties, which "yielded more seed and produced off-pring growing taller than their self-fertilised parents, or than the intercrossed plants of the corresponding generation." Such were "Hero" and the white variety of Mimulus, and a pale variety of Dianthus, while equal-styled Primulas proved more fertile than ordinary plants of the same species legitimately fertilised by pollen from a distinct individual. The ratio of the intercrossed opponent to "Hero" was only 100:106, but in the eighth generation two other "Heroes" appeared, whose ratios were as 100:111 and 100:150. Their off-pring, however, were not preserved.

6. Mutual adjustments of the essential organs, as well as special constructions, are often to be met with, in thus secure self-fertilisation. Mr. Meehan thus describes *Melampyrum americanum*: "The curved apex of the pistil is clasped by the stamens and held in contact with the pollen, just as in a cleistogamous Violet." The same occurs with small-flowered Epilobiums, while the styles of *Malva rotundifolia* curl backwards, as H. Müller has described, and it is the same in other small-flowered species, in order to intertwine amongst the anthers. In *Salvia clandestina* the elongated stigma curls back in a similar manner, and between the anthers, which burst, and the stigmas, as in other species, but sideways, facing the stigma. The position of the filaments in a position arching over the pistil is very common, as in small-flowered Ranunculi, Potentilla, &c. Such positions appear to be often the normal ones while in the bud, and have thus been retained after the flower has expanded. In flowers with a large number of stamens, Buttercups, &c., the outer stamens burst first, but if the pistil be not crossed, then the inner which develop later, perform the function.

* Cross and Self-Fertilisation of Plants. By C. Darwin. Murray.

7. Inconspicuous flowers are very numerous, and, as H. Müller observes, "must be self-fertilising, or they would become extinct;" and it is observable that they form the majority of our weeds, are excessively vigorous and amongst the commonest of plants. The origin appears to be by degradation from conspicuous conditions, as many of them have irregular flowers, such as *Fumaria officinalis* and small-flowered Clovers, which could only have arisen originally by insect agency. I do not agree, therefore, with Prof. Dyer, who regards cleistogamous flowers as "probably survivals of the original type" (*Nature*, Feb. 15, p. 331), for in all cases I consider them as degraded forms of their more conspicuous congeners, but reverting to self-fertilisation. I cannot, therefore, accept Mr. Darwin's conclusion that some plants "have actually had their flowers purposely rendered inconspicuous;" I take it to be simply and purely a result consequent on the absence of insects.

9. With regard to the facts of intercrossing and of self-fertilisation we must be careful not to confound the means with the end. Crossing does *per se* no good unless it bring new constitutional elements. This Mr. Darwin clearly proves. But I do not think he seems to see that self-fertilisation is not injurious except in the sense that a plant cannot introduce into itself the same vigour as when selected plants are introduced into other countries, then they may become excessively vigorous, as the British weeds have done in New Zealand.

And it is a significant fact that while, with scarcely an exception, such plants are self-fertilising weeds, their conspicuous allies are wanting. Thus *Malva rotundifolia* has established itself in New Zealand, Society Islands, Sandwich Islands, Abyssinia and Japan, but *M. sylvestris* and moschata are conspicuous by their absence, excepting the former, which is in Japan, proving that there is no *a priori* reason why it should not have done elsewhere. *Euphorbia Peplus* and *heliocarpa* are present in New Zealand, both of which Mr. Bennett showed were self-fertilising, but no other species is known. *Rosa ruginosa* is the most conspicuous flower, but oddly enough this is the only British Rose which has established itself in America.* Once more, five of the small flowered species of British *Stellaria* are scattered about the world, one of which, the highly self-fertile *S. media* or *Chickweed*, is found in New Zealand, Tahiti, the Sandwich Islands, American Islands, Small Islands, South Africa, South America, South Australia, Tropical Asia, Hong-kong, Japan, Madeira; but the larger flowered proterandrous *H. holostachya* conspicuous by its total absence from any of these far-distant localities. The inference would appear to be that the necessary insects required to cross conspicuous proterandrous species not being there, such plants have died out, if formerly introduced; and the self-fertilising weeds have thus proved themselves "the best fitted to survive in the struggle for life," in accordance with Mr. Darwin's remark on a 407. "If any entomophilous species ceased to be visited by insects it would probably perish, unless it were rendered anemophilous," or self-fertilising.

The next four headings (10 to 13) refer to the relative vigour displayed by self-fertilised plants, and as each has been already alluded to in previous papers little need be now added; I would, however, allude to the case of *Lobelia fulgens*. Of this plant three pots containing twelve self-fertilised individuals beat their intercrossed opponents in the mean ratio of 116:100, which in three pots all the intercrossed beat their opponents in the ratio of 100:73;—the mean ratio for intercrossed compared with the self-fertilised being as 100:91, that is, very nearly equality. Now this case, together with that of *Hero* and the white *Mimulus*, would seem to show that when a large number of plants are cultivated or grown for many years, self-fertilised plants may arise quite equal, or even superior to the intercrossed; and as many of Mr. Darwin's experiments were made on single or very few generations, and with even less than the plants above, it seems very considerably the relative value of such cases.

14. There is a section in chapter viii., p. 303, headed, "On the Transmission of the Good Effects from a Cross, and of the Evil Effects from Self-fertilisation." The test was in the heights of the plants raised by the intercrossing both the previously intercrossed and also self-fertilised plants. Of the fifty-four species cultivated Mr. Darwin selects three

only: the first, *Nemophila*, which unduly favoured self-fertilisation, must be struck out, as Mr. Darwin says of it, "This experiment was quite worthless." The second is *Viola tricolor*: the previous generation gave the ratio of the heights of the intercrossed to the self-fertilised as 100:42, but of the descendants from both derived by crossing and producing "an abundance of very fine capsules," it was as 100:82. That is to say, the self-fertilised had improved by the cross, but that the intercrossed had inherited its advantage. The third and last example given is *Lathyrus odoratus*. The first two generations gave the usual ratios as 100:80 and 100:88 respectively, and the ratio of the heights of their off-pring (now derived in both cases from an intercross) as 100:90. Hence, the same remark applies to this as to *Viola*. Mr. Darwin adds:—"These two lots of seeds were likewise tried by being sown under several unfavourable conditions in poor exhausted soil, and the plants whose grandparents and great-grandparents had been crossed showed in an unmistakable manner [my italics] their superior constitutional vigour." Turning back to page 159, it appears that some seeds were sown in the same pot with a *Broomrape*, others in poor soil in a shady place in the shrubbery. The ratio of the heights of the first lot was 100:88, of the others 100:98—that is, practically the same; for Mr. Darwin elsewhere considers 96 to 100 as equivalent to 100. I do not see, therefore, that the results quite justify the above description. The points which are clearly proved are, first, that constitutional superiority gained by intercrossing is transmitted to the off-pring; and, secondly, that nothing here tends to prove the descendants of the self-fertilised to be worse than their progenitors. Indeed, when we read that Mr. Knight's varieties of Peas, originating from a cross, were subsequently propagated in an abundance as a marketable product for sixty years, and that they were afterwards self-fertilised, we see what is meant by "the evil effects;" we may rather ask, was not the "cross" somewhat beholden to the power of self-fertilisation to be able to be kept up so long? Then the question suggests itself, Was the dying out of these varieties or of Mr. Laxton's due to degeneracy, or mainly to fresh varieties competing with them in the market and superseding them?

If we regard the undoubted benefits derived by crossing as a positive good, then it would seem fairer to say that self-fertilisation gives purely negative results.

If two people marry who are consumptive, we might in justice speak of the evil effects or injuriousness of the union, as revealed in their consumptive children. But of the great number of habitually self-fertilising plants, which by their vigour and abundance get called troublesome weeds, as *Senecio vulgaris*, *Cardamine hirsuta*, and *Stellaria media*, &c., nothing can possibly be said which justifies those terms. Hence the heading above quoted should have been "On the Transmission of the Good Effects from a Cross" alone, or with the addition, "and of the correlative negative results of self-fertilisation."

The general inference appears to be this, that self-fertilisation is *per se* not injurious in the ordinary sense of the term, as implying, for example, weakness of constitution, but only in that a plant cannot introduce by that agency fresh constitutional elements; such being the case, the average vigour of such plants remains stationary. If, however, it can acquire such, in nature by migration to a different locality, artificially made soil, then the self-fertilised may completely outstrip the intercrossed and beat them in every way. The sole, but doubtless a great, advantage of crossing, lies in such being an important means of introducing fresh constitutional peculiarities. On p. 438 Mr. Darwin observes, "That certain plants, for instance *Viola tricolor*, *Digitalis purpurea*, *Sarothamnus scoparius*, *Cyclamen persicum*, &c., which have been naturally cross-fertilised for many or all previous generations, should suffer to an extreme degree from a single act of self-fertilisation is a most surprising fact." The inference, however, I would draw is, that these plants probably represent a condition approximating absolute self-sterility, and one generation is not enough for them to recover their full self-fertility; absolute self-sterility having been reached by some species, the number of which "is not at present large" (p. 341). Hence I would group both kinds under the one common cause of sexual differentiation, due to insect agency. *Viola* seems to show—if I may express it metaphorically—that Nature found

* From a list of British plants in New Zealand, by Kirk, in *Transactions of New Zealand Institute*, 1868, vol. 1, p. 157.

she had gone a little too far, and ran the risk of having no offspring at all, and so adopted cleistogamous flowers as well.

This leads me to contest another of Mr. Darwin's

under *Domestication*, vol. ii., p. 149, he gives, what seems to me, the correct explanation, that "the sexual elements of the same flower have become differentiated in relation to each other, almost like

When we consider what the plants are which are thus absolutely or more or less self-sterile, we find them scattered about and in no way of—in other respects—low type, as correlation would, *a priori*, lead us to expect; e.g., *Eschscholzia*, *Corydalis*, *Reseda*, *Lobelia*, *Verhascum*, *Passiflora* and *Orchids*, as *Oncidium*, &c. Now these have either allied species partially or quite self-fertile, or may often become so on changed conditions, that instead of their sexes being not sufficiently, I should prefer Mr. Darwin's former explanation that they were too highly differentiated, and that when they become self-fertile, as *Eschscholzia* in England, it is a recovery of, or reversion to, self-fertilisation. Such is my impression: readers can now form their own conclusions as to which they may think is the more probable. *George Henslow*.

A NEW VARIETY OF COTTON.

M. DELCHEVALERIE, the Inspector of Agriculture of Cairo, laid before the recent Congress of Amsterdam some specimens of a new Cotton plant found growing in Egypt. In a field of Cotton, among which were found some *Bahmich* (*Hibiscus esculentus*), a certain Cheik-el-Celed of the environs of Chib-el-Kom, in Lower Egypt, noticed some specimens of fastigate Cotton plants, quite different to the others, and similar in habit to the *Bahmich*, or *Bamia* plant. The stems are about 8–10 feet high, straight, and with relatively few branches, and those ascending not spreading as in ordinary Cotton plants. Hence the planters of that region did not hesitate to call them "Kot-Bahmich." They collected the seeds carefully, in order to plant them separately. The following year they obtained nearly half a *faddan* (about half an acre) of them, of which the seeds were collected in the same way, and Egypt this year already possesses important plantations of this new variety of Cotton. The first samples which arrived in the market of Alexandria were distributed among several merchants, who sent them to Liverpool, where they were classed above "fair Cotton," and neatly fetched the price of "good fair."

M. Delchevalerie, in a note addressed to the Congress, suggested the idea that this Cotton is a hybrid production between *Hibiscus esculentus* and the Egyptian Cotton itself, and he proposes this summer to make some experiments at Cairo, in order to ascertain if this be so. If this hybridisation has really taken place between the *Hibiscus* (*Abelmoschus*) *esculentus* and the Cotton, the fact will be of great importance from a scientific point of view, for it may give rise to other experiments in artificial fertilisation between other genera of the same family. Similar facts are not unprecedented in the records of horticulture. However this may be, the new Cotton plant is taller than the ordinary Cotton. It is erect, and scarcely branched, with the exception of two or three small branches at the base, which allow of the plants being planted closer. It has not the shrubby form of the ordinary Cotton plant, which has numerous branches, themselves branched and producing here and there at the joints a capsule of cotton on a long peduncle, as seen at fig. 87. On the contrary, in the new Cotton plant, the principal branch is straight and not branched: see fig. 86. The capsules grow on the principal stem in clusters in the axils of the leaves, and are likewise borne on long axillary stalks. The roots are more tap-shaped than those of the ordinary Cotton, whose root fibres moreover spread more horizontally (fig. 88). And what is more important is, that the new variety produces much more Cotton. The cultivators of this new Cotton plant have assured M. Delchevalerie that they have obtained fifteen quintals of it per *faddan*, in the rich soil of the Delta, while the ordinary Cotton does not produce half that quantity. M. Delchevalerie informs us that he has instituted a series of experiments at Cairo on the cultivation of this new Cotton plant, and he has kindly promised to let us know in due season the results of his researches concerning this important question.

We have already alluded to this Cotton, specimens of which may be seen in the Kew museum, though by no means equal to those exhibited at Amsterdam. Young plants are also growing at Kew and with Col. Trevor Clarke.

FIG. 86.—DIAGRAM SHOWING THE HABIT OF THE BAHMICH COTTON.

conclusions. On p. 455, in the passage beginning "It is an extraordinary fact" [to end of paragraph], he regards the more or less self-sterility of many species as due "to the sexual elements not having become sufficiently differentiated;" but in *Animals and Plants*

those of two distinct species," and he further adds, in direct opposition to his present work:—"We may conclude that it has been naturally acquired for the sake of effectually preventing self-fertilisation." This he now rejects (see p. 345).

Foreign Correspondence.

ABIES MENZIESII.—In the number of the *Illustration Horticole* for December, 1876, I alluded to a variety of *Abies Menziesii* which I had admired the preceding autumn in Professor Ch. Sargent's garden at Brookline, near Boston. I named this plant *Abies Menziesii* var. *Parryana*, in honour of Dr. C. C. Parry, who brought the seeds of it from the mountains of Colorado.

On January 13 of this year this beautiful tree was mentioned for the first time in the *Gardeners' Chronicle* (p. 48), when speaking of the young cuttings brought by Mr. A. Waterer from Mr. Sargent's garden.

Some weeks after, on February 17, M. Origies, of Zurich, wrote in the same journal (p. 214), saying that *Abies Menziesii* of Colorado was the same as the *A. commutata* of Professor Parlatore (or A. Engelmanni, Parry), the seeds of which were collected in 1874, in Colorado, by M. Roelz. M. Origies adds that those nurserymen who received these seeds from him will be glad to learn that their young plants are the same as those which adorn Professor Sargent's garden at Boston. It is impossible for me to place confidence in M. Origies' assertion concerning a plant which he has never seen, and consequently cannot verify. Since the publication of M. Origies' note, I have satisfied myself that the tree in Mr. Sargent's garden is really a form of *A. Menziesii*. After my visit to Boston, Dr. Engelmann, of St. Louis (Missouri), saw the specimens to which I refer, and after a critical examination confirmed my opinion. A year ago Dr. Parry himself, seeing again the plant of which he had brought home the seeds, was of a similar opinion; and one must not think that he judged this from a single specimen, but from a collection of several hundreds, taken under the utmost variety of conditions. The fine specimen with decided blue tint may be considered as the extreme form of the deviations from the type, to which others gradually revert.

Even in its youngest state, *A. Menziesii* may be distinguished from *A. Engelmanni* with the greatest ease. The young plants of *A. Menziesii* are characterised by a thick grey bark, and strong broad leaves, with sharp points that a spring of this tree cannot be pressed between the hands without sharp pain being felt. This character may not be recognised by the reflexed tips of the scales of the buds.

In *A. Engelmanni* the bark is very thin, scaly, and of a light brownish-red or greyish-purple colour. The appearance of the tree when young is almost identical with that of *A. nigra*, with which, at first sight, it might easily be confounded. The leaves are much more slender than those of *A. Menziesii*. They are 6 to 9 lines in length, and scarcely 1 line in breadth; they terminate in a short but not very sharp point, and a branch may be taken in the hand without any pain being inflicted. By this simple test Dr. Parry, who is more acquainted with these trees in Colorado than any other botanist, was able to distinguish between the two, even with his eyes shut.

On seeing the two species side by side, it is seen that *Abies Engelmanni* begins to grow in spring, a full month before *A. Menziesii*. The reason of this is, that plants growing wild at a great height or in northern countries, on being transplanted to a warmer climate begin to open their buds at the approach of the first spring-like day. This is fatal to them, for the late frosts invariably destroy their young shoots. In this manner *Abies pichta* (A. Sibirica) bears perfectly well the severe winters of North Russia and the British States, where the spring is late but continuous, but in France and England only forms miserable shoots which are cut off every year by the spring frosts. Under this category comes, unfortunately, *Abies Engelmanni*, for in America it is developed before any other species of Conifer, and the culture of it cannot be recommended anywhere but in the North of Europe. Thus it thrives perfectly at St. Petersburg, where fine specimens may already be seen. It is not so with *A. Menziesii*, and its divers varieties, which have nothing to fear from the climate of Central Europe. In the case of *A. M. Parryana* (which may also be called *A. M. coloradensis*, if it is wished to characterise this variety according to its geographical habitat), its hardiness is certain; and the altitude at which it grows is a sure guarantee, and I have no hesitation in saying that when the gardens of Europe possess it (which will not take place just yet, as Mr.

Waterer's young plants have not yet left his nursery), it will be universally acknowledged to be the most beautiful of all the species of *Abies*. I will conclude by adding that the greater part of the above information was obtained from Professor Sargent himself. *Ed. Andrié, 67, Rue Blanche, Paris.*

Natural History.

HATCHING OF ROOKS (see p. 539).—It may perhaps answer a portion of Mr. Haydon's inquiry to mention that in Yarrell's *British Birds*, vol. ii., p. 99, he gives notes of a rook's nest with eggs at Gainsborough; rook's hatching young in a warm sheltered valley in Cornwall, and also of rooks building and hatching in Oxfordshire; and another instance (without locality recorded) of rook's nest with young in it: all these during the month of November—the respective dates of the three first mentioned being 1817, 1836 and 1844. With regard to the early hatching I cannot find in such books as I have at hand any information beyond reference to the "general hatch in April" and the young being able to fly about the end of May.

Here (in the vicinity of Isleworth) the note altered about the 20th inst. this year, and last year a thorough egg-shell was found under the trees on April 26. The sitting was then under exceptional difficulties from the late snow, and the birds were much disturbed by it on their backs, and (reasoning by analogy) very fretful.

Many of the nests were new last year, so that the whole operation of twisting off live twigs, building and plastering, could be watched throughout; this year the repairs have been limited to sticks put in—no new plastering appears yet requisite. O.

— In reply to your correspondent relative to the earliest and latest periods when rooks are hatched, I may state that, as near as I can judge, the first rooks were hatched with me about April 9. Many of the young rooks are now quite strong. The number of nests in my trees is thirty-two: the hatching still continues. This rookery has only been in existence about five years; it commenced with one nest. The rooks are fed every morning, and are now so tame as to come within 3 feet of my breakfast-room window. Their nests are close to my house—some in a tree which covers a portion of the roof. I have, therefore, ample opportunity of observing their curious and most intelligent ways—a pleasure to myself much greater than the ignorant and useless and barbarous custom of shooting these most useful birds. *K. K., Tullyfort, Exeter.*

— The earliest period I have known rooks to hatch is the end of March, the latest about the middle of May. I think it is generally known that the male regularly supplies the female with food during the period of incubation. I suppose it is equally well known that they have their regular roosting places, only occupying the trees where they breed for a few months in early spring and summer. I may add the roosting place they frequent is a wood five miles distant from this place. *W. E. T., Wandsworth, N.W.*

Florists' Flowers.

THE annual exhibition of the ROYAL NATIONAL TULIP SOCIETY is fixed to take place at the Manchester Botanical Gardens on Whit Friday, May 25, but, judging from present appearance, there is every probability of a scarcity of flowers, the season being late; and the dull weather and cold north-easterly winds are very much retarding the flowers. If mild sunny weather, with warm genial showers, were to commence at once, there would be some

chance of flowers being in at the time; but another week of the prevalent unspring-like weather will seriously affect the show. So far the Tulip bloom is full of promise; it is now only a question of suitable weather to bring the flowers out. A bold, vigorous growth characterises Mr. Samuel Barlow's beds at Stakehill House, Chadderton; and there is the promise of many breeders breaking into rectified flowers. This tendency manifests itself in the foliage while the plants are forming and throwing up their flower-stalks. The leaves take on a kind of streaked yellow appearance, just such an indication as an uninitiated person would associate with ill-health; but all these plants are not only in good health, but will certainly produce rectified flowers. There will be a greater number of "breaks" than usual in the Stakehill beds. The physiology of the Tulip is indeed a wonderful feature in plant life; and it is only those that are constantly engaged in cultivating it that come to fully understand these remarkable characteristics. Let us hope the face of Nature will yet smile on the efforts of the cultivators, and reward them with fine bloom at the time it is required for exhibition purposes.

— The condition of the DWARF ROSES in the grounds of Stakehill House, Chadderton, the residence of Samuel Barlow, Esq., forcibly illustrates the difficulty of cultivating the queen of flowers in the open air in the environs of Manchester. In the beds on the lawn the Roses have died down nearly to the ground—in remarkable contrast to the South, where the plants have scarcely ceased to grow vigorously all the winter. The atmosphere appears to be charged with conditions destructive to the well-being of many plants, and the Rose suffers keenly. In the Tulip garden, which is at a higher elevation, and in a sheltered position, the plants look a little better, but sadly at the best. Hollies and Rhododendrons, among evergreens, succeed the best, but their leaves become quite overlaid with a sooty deposit, that clings to them with such tenacity as to need an alkali to effectually cleanse them. Primroses and Pansies, in the open border, have a bad time of it during the winter months; the most durable plant is the Daisy, and the beds of those of the crimson, pink, and white varieties are becoming very effective on the lawn. Gardening in certain localities has its disadvantages, as well as its pleasures, and in the neighbourhood of large manufacturing centres all that forethought can conceive and skill apply is necessary to ward off, or at least mitigate, the effects which, if unchecked, lead to direful results.

Garden Operations.

PLANT HOUSES.

PLANT STOVE.—Gloxinias intended to come into flower later in the season, and which are wanted for use in conservatories kept a little closer than an ordinary greenhouse, must not through the early stages of their growth be treated to so much warmth as those that are to remain altogether in the stove; and quickly, as with most other plants, if pushed on quickly by too much warmth, it is essential, and is necessarily much tender and less calculated to bear a cooler atmosphere when in bloom than if they had been grown slowly all along. These remarks apply also to Achimenes and Tydies, the whole of which should be kept near the glass, with a moderate amount of air and very little shade. The temperature of an intermediate house will suit them better than the ordinary stove, which is too close and moist. They will do very well on the front shelf of a vinery where there is upright glass, so as to give them the requisite light, or, still better, in a low pit, where they can stand near the glass. It is essential, in this respect, to look well ahead and see that there is a sufficient number of such plants as these prepared for conservatory decoration during the latter part of summer. Plants of *Clerodendron Balfourianum* started late and kept moving slowly are fine and long-enduring objects for the same purpose; for them a slight shade, even at 55° is essential, and it is surprising the length of time the flowers will last. The stately growing *C. fallax* can be employed in the same way, as also the exquisitely scented *C. fragrans*, a plant now seldom seen, but which possesses the advantage of occupying little room, being headed right down to the surface in the winter, and from its unsurpassed perfume it deserves a place wherever sweet-scented flowers are held in estimation. It is

now a good time to put in cuttings of the *Clerodendrons*, to be grown slowly and kept in small pots through the summer, in which case they will occupy very little space, and do not rot, and with a liberal water supply will make decorative plants of more general use than larger specimens. If a little Balsam, *Globe Amaranthus*, and Cockscomb seed is now put in they will be ready for use in the autumn. The advantage in the use of such plants as these is, that they can be stood about without hesitation when in flower under other things, and in dark corners, where their flowers are not so conspicuous. It will be advisable to put subjects of more permanent character and greater value. The stock of *Bouvardias* should now be looked over, to see that there is sufficient for next winter and spring use. One-year-old plants that have flowered through the winter, should be cut down, placed in a close warm temperature, and syringed daily overhead, but too much water must not be given to the roots. As soon as they have broken into growth turn them out of the pots, reduce the ball fully one-half, replacing them in the same pots, and adding to the soil a good portion of leaf-mould and a moderate quantity of sand. When they have well rooted into this, give them a size larger pot, or, still better, if they are convenient at hand, to put them into the pots, and plant in frames, lifting and repotting them in the autumn. The latter system of management is much to be preferred with young stock that has been struck during the winter, as so many conveniences attend it. The plants will grow much larger than they will under pot culture, with a proportionately increased ability to produce flowers in quantity. Large old plants may be cut back and treated similarly. The young shoots that break after cutting in the same pots, and which in length will make good cuttings if taken off with a heel; some of these should be put in, as it is always well to keep up a sufficiency of young plants. For the like purpose, when the stools are shooed out, some roots may be taken off. At the present time the potted early and are strong and in good condition at the roots will now be furnished with a plentiful supply of flowering shoots, which in the case of those that have been pushed up with strong heads will be showing long. With this in view, it is the practice to train the shoots over the trellises as soon as the flower-heads are discernible, yet whatever purpose the plants are grown for, whether for home decoration or exhibition, it is not to be done until the buds are open; they are thus bent down it causes the buds near the base to break into growth, which has the effect of starving the advancing bunches of bloom. It is much better not to train the plants until the flowers are open. The best plan is to insert half-a-dozen tall sticks inside the rims of the pots, with a strand of bast tied round the top, so as to enclose the shoots, and keep them in an erect position until the time comes for bending them down. Where they do not done their work, and when wet with the syringe, causes them to break out from the bottom. Pot specimens of *Bougainvillea glabra* should have their stools similarly supported, for they, like the *Allamandas*, unless kept in an erect position, do not set their flowers freely at all, as the shoots, when bent down by their weight in a horizontal position, cease to grow longer, and commence breaking out from below. The omission to note the habits and requirements of these and other things in little matters of this sort is frequently attended with strong, well-grown, and in other respects well-managed plants not flowering in any like the profusion they otherwise would. *T. Baines*.

FLOWER GARDEN, ETC.

In sheltered places that are not subject to late spring frosts, and where early flower gardening is desired, some of the hardiest plants, such as *Campanula*, which has previously well prepared, may be planted out in the beds they are to occupy for the summer, as the ground in most gardens has had a thorough soaking of rain last winter and spring. The plants now turned out will require less water than usual—merely enough to settle the soil about their roots as the work proceeds, and after each bed is finished let them be shaded with a few branches, which will protect them from cold winds, and keep the plants from taking any harm from a slight frost, and not an unfavourable early earthing as a general rule, especially in situations where it is attended with risks, but in certain places where such work can be done with safety and an early cutting is expected, under the conditions I would say, may be done at the time when the weather is favourable, and much may be done with careful management and attention. Perhaps it is scarcely necessary to say that at this time, and a season like the present, all watering should be done in the early part of the day. Any plants that are turned out after mid-day will not suffer if left without water until the following morning. Keep the hoe going wherever weeds make their appearance, and I find that this season they are a very plentiful crop, the weather

having been so favourable for their growth. Let the grass be well kept down at this time; when the attention and labour is so much occupied with other matters the proper keeping of the place is apt to be neglected. The sowing of walks may be done before the ground gets too hard and dry for the operation, and let every part of the ground be left in the best order possible. *T. Blair, Strathland Park*.

FRUIT HOUSES.

STRAWBERRIES IN POTS.—In general these plants are the easiest of those with that terrible pest, the red spider, which, at this time, most abound, and increase in number so rapidly that it is scarcely possible to have them in the houses where high degrees of heat are kept up without it being communicated to the permanent occupants. Under such hazardous circumstances caution should be exercised in the distribution of them about the houses, or most probably the common crop of fruit may thereby be much deteriorated, if not spoiled altogether. In the case of vineries, Peach-houses, or Melon-houses, where the crops are considerably advanced, they should now be excluded. In some places, however, it is indispensable to use the late vineries for these plants; if so, keep the plants free from contact with them. Plants which are placed on shelves and fully exposed to the air and light should be well syringed every two days, and have special care bestowed on the watering, particularly if means, in the way of saucers or turves, are not employed, by which a certain degree of moisture is constantly secured to the roots. An occasional sprinkling should also be given to plants in pots where they are closed up in the afternoon. As soon as from six to twelve perfect fruits are well set remove the rest. As those plants which have not set sufficiently matured to get out into the ground, it should be done without further delay. Care should be given to imbed the balls of soil firmly in the ground, or they will not succeed satisfactorily, and water should be applied after they are planted. This method is a very commendable practice, as the yield of fruit from such plants in the succeeding year is sometimes enormous. *G. T. Miller, Wycombe Abbey*.

THE CHERRY HOUSE.—From the time the fruit commences colouring and henceforward until it is gathered, the trees and fruit should be kept free from moisture; to supply the deficiency in this respect in some cases, a portable smoke-plant, which may be in the house should be syringed and damped occasionally as the case may be. At this stage the borders in which the roots are placed should also be kept well supplied with water, and the water should be especially large and finely-mashed fruit should not be expected. Permit all the terminal shoots and others which are left to furnish a supply of young wood for the subsequent season to develop themselves, and when the limit of their growth is delayed, further progress; keep these tied-in neatly as they advance, and pinch-in the rest at about the fifth leaf from the starting point. Should insects, such as the black or green fly, be present in any degree on the surface of the leaves, they may be removed without delay; for this operation select a calm evening, and have everything inside the house perfectly dry. When the house is densely filled with smoke take away the appliance at once; a neglect of this precaution is sometimes attended with injurious consequences, through the flaming of the materials which are left unexhausted. If a thinning of the fruit be necessary this should be done as soon as sure indications of its progress are visible. At this time the plants may be secured from frost by being covered with safety, but with an increased degree of heat a little air should be retained on at the apex of the house constantly. Let the apertures for ventilation be covered with netting before the Cherries are ripe, or the same may be done after the usual manner, but do not make an attack on them immediately. *G. T. Miller, Wycombe Abbey*.

ORCHARD-HOUSE.—The dark, sunless weather which prevailed throughout April having considerably checked vegetation, at one time very forward, fruit trees in the unheated orchard-house as well as out-of-doors are now later than they have been for some years past. The sowing of seeds, therefore, will be more favourable to trees under glass, and there is now every prospect of excellent crops of fruit. Where precautionary measures have not been taken before the trees in this structure come into bloom it frequently happens that the fruit, when it becomes mature, is not fruit is properly set, when fumigating cannot be resorted to with safety. Where this is the case the affected trees should be well dressed with Pooley's tobacco-powder, which may remain on the foliage until it has blown out of the house, and the fruit should be well fumigated with tobacco-paper. Always syringe the trees after smoking, which should be repeated after an interval of three or four days. Give sufficient water at the roots to thoroughly moisten the soil when necessary, but avoid the pernicious practice of

constant dribblings. Syringe freely on fine days, and apply the garden-engine occasionally on bright evenings, when all danger of severe frost has passed away. As soon as the fruit on the Peaches and Nectarines have attained the size of Peas, they should be slightly thinned; rub off all small, badly placed fruit, which would rob those intended to ripen, and, if plentiful, leave only those which are placed on the upper side of the branch, and which are the most desirable. The disbudbing of pot-trees does not always receive the attention it deserves. The process should be carried on gradually to avoid checking the flow of sap, until, by disbudbing and pinching, the requisite number of shoots are left forming a cone-like tree. When the present bearing wood has been removed in the autumn it sometimes happens that two or even three shoots may be allowed to extend from the base of the bearing branch, but as a rule one will be found sufficient. Stop all the leading shoots on full-sized trees when they have made six or eight leaves. Train the succession shoots above alluded to outwards, and stop the strongest when they have attained a foot or more in length. *H. Coleman, Eastnor*.

HARDY FRUIT GARDEN.

The cold cutting winds that prevailed during the middle of last month passed like a blast over this part of the kingdom, and have had a most injurious effect on the tender foliage of Peaches and Nectarines, causing them to curl and blister in the most alarming manner. The trees are now in a state of prostration over them and pick off any leaves that show such malformation as to preclude the possibility of their righting themselves again, which they are rarely able to do even under the most favourable conditions. The general rule prevalent this year, that the leaves are so injured, for the part affected to thicken and go on enlarging till the whole energy of the tree is taken for their support, as the young growth seldom makes any headway to the most monstrous are removed, and the trees are confined to the leaves, but extends to the bark of the young wood likewise, which enlarges at the particular part in like manner, and in such cases that too must be cut out, and the next best situated leaf to take its place. This may be done the first disbudbing, which should now be proceeded with without delay, and in carrying out the operation due regard should be paid to so leave the young shoots as to keep the wall well supplied with young wood. In some instances, if considered, a few handsome well-formed trees are desired, what young growth is left for laying-in should be on the upper side of the branches, as then the training can be of the most regular and uniform nature. In other cases, if not the case were they left indiscriminately above and below, as is frequently done where the work is entrusted to inexperienced or improperly trained hands to perform. Not only is blister or frost prevalent this year, but it is equally troublesome owing to the same causes, and a close watch must, therefore, be kept, for if left to themselves for only a few days, they increase at such a marvellous rate as to quickly spread over the trees and the ground. As with all other insects that attack plants, the best way is to assail them directly they put in an appearance, which is a great saving of both time and material, and is the only way of leading to satisfactory results. By having at hand some tobacco-water with which to wet any shoots infested, or tobacco-dust with a proper distributor with which to put it on while the disbudbing is taking place, the further spread of these pests may at once be stopped, and with a good watering from a garden-engine or syringe, the trees may be kept in the morning and fine day, the trees may be thoroughly cleansed when they will be able to advance in growth without further check or hindrance. All the harder fruits, such as Apples, and Pear, which are now in the state of abundant crops, and with anything like fair weather the present season will, from all appearances, be one of the best as regards these that we have had for many years past. Any of the above that may have been grafted should now be looked over to see that there are no cracks in the clay to let air to the scions, for if this takes place and is not remedied, failure is inevitable. In cases where such has occurred, it will be advisable to remove it altogether and replace it with fresh, but this can only be done in such a way as not to disturb the grafts, which are now effecting an union, and are easily detached. Advantage should be taken of the moist condition of the ground to get all Strawberry beds mulched down with short stable litter, by doing which at once many times the labour will be saved later on when the foliage is more advanced, and there is greater difficulty in moving about amongst them. No more is this early littering down advantageous in this way, but it is the means of securing the plants from frost, which is a great consideration with such a plant as the Strawberry, that requires the greatest uniformity and a cool medium for the roots to feed in—a condition they would not enjoy unless sheltered in this way. It has been stated to rest on the soil. *J. Sheppard, Worcester*.

Gardeners' Chronicle.

SATURDAY, MAY 5, 1877.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	May 7	Sale of Shells at Stevens' Rooms.
TUESDAY,	May 8	Sale of a Collection of Shells and Natural History Specimens at Stevens' Rooms.
WEDNESDAY,	May 9	Sale of Shells and Greenhouses Plants at Stevens' Rooms.
FRIDAY,	May 11	Sale of a Collection of Specimen Plants at Terry Hill, Sittinsborough, by Stevens.
SATURDAY,	May 12	—Crystal Palace: Great Flower Show.

NO one who knows the uphill work which the Council of the ROYAL HORTICULTURAL SOCIETY have had during the last few years in their relations with the Commissioners and debenture-holders, in their efforts to diminish the debts of the Society, and to extricate themselves from the fetters of South Kensington, will grudge them their triumph of Wednesday last. True, the debenture-holders cling on like the old man of the sea in the *Arabian Nights*. True, the South Kensington fetters are as yet not one whit loosened. Wherein, then, lies the triumph which was undoubtedly legitimately won on the occasion in question? It was not in the exhibition, grand as that was, for all through last year the shows were generally excellent, and on one or two occasions particularly so. The triumph consisted in having the arcades and conservatory densely packed for hours with visitors. Last year and the year before, as we have said, splendid shows were held, but the public kept aloof. The exhibitors, however, have stuck to the Society through all its evil days, and that they were largely disinterested in so doing is proved by the fact that on some occasions the prizes were not claimed in order not to add to the Society's embarrassments, and specially by the fact that though fine displays were made the general purchasing public did not come to see them. This time, however, their patient, persevering endeavours to prop up the old Society were rewarded by the approval of Royalty, and by the presence of such a crowd of visitors as has not often been seen at Kensington, even in its best days. It was, then, the visit of the QUEEN which brought this crowd together, and which may prove the turning point in the Society's fortunes. So long as circumstances compel the Society to maintain the South Kensington garden, so long will it be essential to success that the countenance of Royalty, and the support of the general public as distinguished from horticulturists proper, be secured. While admitting the desirability of conciliating the general public, spreading a taste for horticulture among them, and inducing them to contribute to the Society's coffers, we trust that the interests of pure horticulture will always be made paramount, and the proper functions of the society duly fulfilled. Better by far to have a small society doing its own work efficiently than a large one striving, by means of floral bazaars and other more fashionable means, to cater for fashionables and sight-seers, and wasting its means and its energies on objects not horticultural. To keep the Society to its proper work the active support of the horticulturists of the country is required, and if now they do not come forward when the ball is at their feet, they must not complain if their interests are not sufficiently cared for. Horticulture, in its widest and best sense, must be the aim of the Society, and to make it so horticulturists must come in, assert their unquestioned rights, and keep the management of the Society in their own hands. In any case, the success of Wednesday last proves the soundness of judgment of those who deprecate the attempt to found a new Society, but who have sought, and are seeking, to reinstate the Society in popular favour and to increase its power of doing

good horticultural work. As to the show itself, it was, as we have said, one of the largest and best ever got together at South Kensington. Being held in the arcades, there was little scope for that picturesque grouping which is so grateful when the large tents are made use of. But the groups of plants were of such unusual excellence and variety, that a right royal display was fittingly made. The QUEEN, accompanied by the Duchess of EDINBURGH and the Princess BEATRICE, broke in upon the committees when engaged in their work, so that HER MAJESTY had so far the opportunity of seeing how the work of the Society is done. Escorted by the President and the members of the Council, the QUEEN sauntered slowly through the building, examining now this, now that collection, and receiving the loyal homage of the members of the several committees.

The Scientific Committee was specially honoured—its President, Dr. HOOKER, who is also the President of the Royal Society, accompanying the Royal party and explaining the more noteworthy objects exhibited. The QUEEN on leaving expressed her pleasure at her visit, and we do not think these were mere words of courtesy, for HER MAJESTY looked pleased; and undoubtedly the horticulturists, who yield to no class of HER MAJESTY'S subjects in their loyalty were delighted to see among them once more their QUEEN, and to feel that their efforts to diffuse a knowledge of the glories and wonders of Creation and to contribute to the material and mental welfare of mankind, are still sanctioned and approved as they were in the days when the broad-minded PRINCE CONSORT had the sagacity to include horticulture among those arts and sciences which in the interests of the nation at large he did so much to promote.

AT the present season, when the preparation of PRIZE SCHEDULES will be brought under the consideration of the managers of flower-shows, it may be useful to invite attention to one or two points which past experience has shown to be important.

And first of all, we would indicate that Fitness—fitness to the locality and the materials which it affords for making a show—should be well studied in the framing of a prize schedule. What are the most fitting subjects to invite in each locality will be, or should be, best known to the very persons most immediately concerned. It generally happens in country districts—and it is for the framers of schedules for country societies that we chiefly write, since in the larger towns and cities which can support a good horticultural society there is generally a well-trained and experienced staff to make the arrangements—that there are certain subjects not far off, known to be cultivated with success, and the schedule should be so framed as to draw out these, and at the same time stimulate competition in these particular directions. The first object in holding a show should be to ensure a successful gathering by all fair and honourable means, and therefore every facility should be afforded for bringing in the materials existing in each locality. Once popularise a show by this means, so as to gain and retain the support of the public, and all the beneficial influences arising from its stimulating effect on competitors will follow in due course.

Then, again, Definiteness of Purpose should be made a leading principle in framing the classes of a prize schedule. Competitors cannot set up their exhibits advantageously, nor can the judges render full justice to their merits, if there is anything indefinite about them—anything left to the discretion of the judges, for example, as is too frequently the case. If a class requires each exhibitor to stage, say, eight Pelargoniums in pots below a defined size, the competition is equal; and as a consequence, every exhibitor knows exactly what to do; the

judges also can exactly compare the collections, and the best wins. But if the groups are undefined as to number, and unlimited as to size of pots, and one man brings ten plants and another six, the pots, moreover, being various in size, the largest exhibitor generally wins, unless his plants are so much inferior to those competing against them that they are hopelessly beaten. Or, to take another very common case: perhaps a "group of plants" is asked for. Now if, in such a case, A. brings a score of moderately meritorious examples, well set up, and B. a group of half as many really good plants carelessly staged, the chances are that A.'s poor plants get the prize, which does not properly belong to them, simply because the setting up finds most favour with judges. A "group" should be defined somehow, both for the exhibitors and the judges' sakes. The fairest way, if it be a group of large size, is to define the space it is to occupy; but if a smaller one, the number of plants to be admitted; but in any case it should be defined, and the wording of the schedule should define it clearly.

Another point in show management should be prominent. The regulations say that exhibits are to be ready by a specified hour, yet exhibitors will hang over their arrangements, and secretaries and stewards will allow them to do so, till that hour is often long past. Then the judges have to scramble with undue haste over their work, with the risk of making mistakes in distributing the rewards. There is no need for this laxity of management. Ten o'clock, if that be the hour named, should mean ten o'clock and not one minute later. The work of arrangement can just as easily in almost all cases be completed by ten or eleven o'clock; it only requires courteous whipping-in by those in charge of this part of the arrangements.

Then again some person or persons, who may be forthcoming when wanted, to guide the judges, should know exactly what is the extent of competition in every class, and where every exhibit is to be found. Valuable time is lost when judges are turned in to an extensive exhibition without this kind of information, and have to find out the exhibits as best they can. Being strangers generally, they cannot be expected to know at sight the whereabouts of the competing subjects, which they can only ascertain by a laborious search through all the exhibitors' cards—these latter, in many cases, not too legible, nor, according to some systems of entry, always giving the required information. We call this state of things Inconvenience, and it is one of the evils to be guarded against by every possible means, as also is that of failing to show distinctly by some well-defined mark the exact limits of adjacent collections.

In the interest of fair and just judgment the competing plants, or sets of plants, should, if it be possible, be staged in close contiguity. It is simply impossible to compare satisfactorily two or three collections of a dozen Pelargoniums or Orchids, let us say, if they are set out of sight of each other, and the judges have to carry them far "in the mind's eye," and yet judges are too often required to accomplish such and even greater impossibilities. Everything which can be done to do away with or avoid any or all of the evils at which we have hinted, will be found to be something accomplished towards bringing a flower show to a successful issue; and should be provided for in the schedule and its accompanying regulations.

— The plant, *EULALIA JAPONICA* VAR. *ZERINA*, of which we give an illustration (fig. 89, p. 565), has been figured previously in the *American Agriculturist*, from which publication we learn that the grass in question was introduced from Japan by Mr. HOGG. Since that time it has passed into the hands of Mr. W. BULL, Messrs. VEITCH, and perhaps

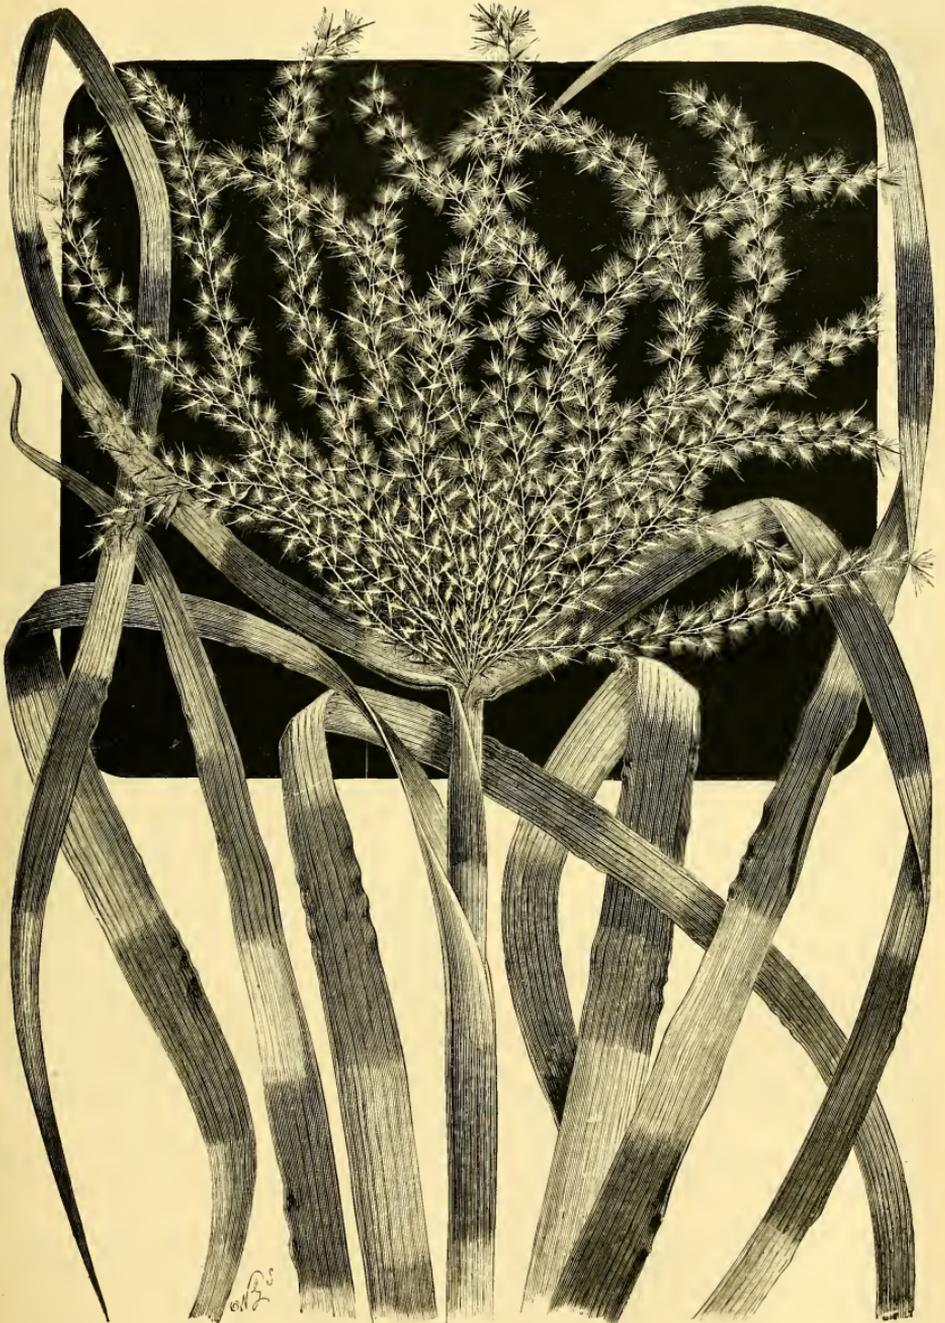

FIG. 89.—EULALIA JAPONICA VAR. ZEBRINA.

others of our nurserymen. Our plate was taken from a specimen furnished us by Mr. BULL, and in order to show the beautiful character of its inflorescence a dark background was rendered necessary. It is, however, for its foliage that the plant will principally be prized. As in the case of the Rush lately figured by us the variegation is transverse, taking the form of cream-coloured bars crossing the green ground of the leaves at tolerably regular intervals, hence our American contemporary has proposed to call it the *Zebra Eupalia*. The plant will probably prove hardy, and in that case it will form a very desirable addition to the garden, by reason of the novelty and peculiarity of its variegation.

— We learn that it is proposed by the growers for COVENT GARDEN to hold an EXHIBITION OF FRUIT AND VEGETABLES as sent to market, in the ensuing autumn, at South Kensington. Much praise is due to these exhibitors for the spirited way in which they carried out their novel and interesting exhibition at South Kensington at the two last meetings. As illustrations of successful culture, the exhibits were remarkably instructive.

— Probably few of the many horticulturists who visited the recent Auricula show at the Crystal Palace failed to notice the two splendid specimens of the climbing *RUSCUS ANDROGYNUS* that form such a superb evergreen covering to a portion of the galleries close to the fountain at the southern end of the building. A more useful plant for the purpose it is desired to serve it would be difficult to find, and it is as a greenhouse climber, enabled to display its luxuriant growth only in some such giant building as the Crystal Palace. Mr. THOMPSON, the garden superintendent, and his directors, have good reason to be proud of these fine plants, as this *Ruscus* is somewhat rare, and probably these specimens are the finest in the kingdom. This variety, although herbaceous in its habit of growth, is yet evergreen, as the long shoots that emanate from the roots, much like the growth of the Hop plant, retain their vigour and leafage for several years, and those that die off are annually replaced by others that run up to a height of 30 feet like bare rods before a leaf is developed. The highest growth of fully developed shoots is not less than 40 feet, and on these, right to the floor, hang the long deep green branches covered with pointed leaf-shaped phyllodes. These branches are about 30 inches in length, the phyllodes being alternated on either side to the extremity of the stem. These leaf-like organs hang down one over the other in rich luxuriance, and form a screen of deep flossy green. The flowers resemble small green buds, and are borne in triplets on the edges of the leaf-like branches. The plant is singularly difficult to propagate, as layers, cuttings, and hybridisation of the blossoms have been tried in vain, and only by division of roots can stock be produced; this, however, would in the case of these noble plants be partial destruction, at least for a time, and therefore their increase appears to be indefinitely adjourned.

— We have received a schedule of prizes amounting to upwards of £350, to be awarded at a flower show to be held at the Orleans Club House, Twickenham, the late residence of the Duc D'AUJALE, on May 25 and 26 next. The show will be under the superintendence of Mr. THOMAS R. ROLLISSON, of Tooting.

— We are informed that Mr. C. GREEN, of Reigate, so well known in connection with the garden of Mr. WILSON SAUNDERS, has been appointed to superintend the gardens of Sir GEORGE MACLEAY, at Pendell Court, Bletchingley.

— Mr. JACKSON, late gardener to the Right Hon. Lord KESTEVEN, Caswick Hall, Lincolnshire, has been appointed gardener to Sir CHARLES DU CANE, at Bixtard Park, Essex.

— We have received from Messrs. BACKHOUSE & SON, of York, a specimen of the very beautiful *PRIMULA SPECTABILIS*, a dwarf hardy perennial, of Auricula-like habit, found on the Eastern Alps. It belongs to the section of Primroses with fleshy leaves, the form of the leaf being elliptic-lanceolate or lanceolate, and the margins cartilaginous and entire.

The flowers grow about six in an umbel, and are about $\frac{1}{2}$ inch across, and of a pure dense puce purple, very showy. According to the late Mr. WOOD, it affects mountain gravel. It will be quite an acquisition amongst alpine flowers.

— We learn that Mr. ROGER CUTLER, the active secretary of the Gardeners' Royal Benevolent Institute, has, after thirty-five years' service at the Westminster Office, retired upon a liberal pension, and carries with him the hearty goodwill and esteem of the directors. Mr. CUTLER will henceforth devote the whole of his time to the duties connected with the Gardeners' Benevolent.

— We notice with much pleasure that the University of Edinburgh has conferred on Mr. J. B. LAWS, of Rothamsted, the honorary degree of Doctor of Laws. Professor MACKAY, in the absence of the Dean of the Faculty of Law, on presenting him to the Chancellor of the University, said:—"I now present to your lordship JOHN BENNETT LAWS, a constant patron of the Horticultural, who has done more than any Englishman for the application of science to agriculture. Educated at Eton and Oxford, Mr. LAWS commenced in 1834 the experiments which have rendered his estate at Rothamsted the classic ground of scientific agriculture. He has supplemented and corrected the theory of LIEBIG with reference to the fertilising agents necessary to call forth the productive properties of the soil, and by the use of the comparative method has given valuable indication of the different manures appropriate to different crops. His experiments, tested by rigorous scientific method, are recorded in the four volumes of the Rothamsted Memoirs."

— The injury to crops by worms, maggots, flies and insects generally, having recently been engaging considerable attention, YOUNG'S PARAFFIN LIGHT AND MINERAL OIL COMPANY have issued a circular which calls the attention of agriculturists and others to the value of paraffin oil as a preventative remedy. "Experiments have shown that this oil can be applied so as to produce no injurious effects on the seeds and plants, while at the same time it is so obnoxious to animal life as greatly to lessen, if not altogether to prevent, those destructive insects which every farmer has occasion to deplore." The following directions for the use of paraffin oil are added:—"Add a wine-glassful of paraffin oil to a 30-gallon cask of water, agitate thoroughly, allow the mixture to settle, skim off the oil that rises to the surface, and employ the water—1. For soaking the seeds before use; 2. For sprinkling the ground between the rows or drills after the plants have been sown. Care should be taken to avoid sprinkling the plants." The experiment is well worth trying, and we shall be glad to have the experience of any of our readers who may apply the test.

— We have received from Messrs. DOWNIE & LAIRD, of Edinburgh, a truss of a very promising seedling RHODODENDRON, named JOHN DOWNIE. It is of good size and very compact, the individual flowers being large, and of a pale rosey claret colour, with darker spots.

— A fine plant of the magnificent COCHLIOSTEMA JACOBINIANUM is profusely flowering in the stove at Kew. It has eight or more panicles, three of which are together in full bloom. It is even grand as a foliage plant, but possesses also the most beautiful flowers of pink and blue, of large size and in great number, interesting as well from a botanical point of view for their venous structure. An explanation of this was given in our volume for 1868, p. 264, and subsequently in the *Journal of the Linnean Society*, where some corrections of the original statement were made. The present specimen is one of a group with several others of beauty and much botanical interest. One of these is the *Tillandsia usneoides*, referred to last week, now flowering; for the first time in cultivation, of which a figure, with description, will appear in the *Botanical Magazine*. Another Bromeliad, as if for contrast, is here in flower. This is *Nidularium fulgens*, with broad imbricating leaves, the inner of which are coloured scarlet, and form a gay nest for the inflorescence, above the level of which it does not seem to grow. The habit of *Nidularium* is perhaps too well known to need further

description. There is also a plant of *Pitcairnia tabulariformis*, showing a table-top spread of light-green leaves, the level of which is just being disturbed by the issue of an inflorescence. Not the least interesting is a pan of the rare *Streptocarpus Saundersii*, each plant now composed of only one solitary leaf, or rather one of the cotyledons, with one or more panicles of pretty white and lilac flowers, appearing to come from its base. Next in point of interest is a specimen of the very curious and grotesque *Atractis Cristata*. As regards showiness, specimens of *Medinilla magnifica* is second only to the *Cochliostema*; though not large it is very floriferous. Among the smaller growing Gesneriaceae and Melastomaceae are found some of the most beautifully coloured leaves in cultivation. Here is a specimen of *Crotonia fulgida*, with bronze and silver leaves and crimson flowers, perhaps the most handsome of its genus in cultivation. On another shelf is a fine pan of *Bertolonia Van Houttei*, having more brilliantly coloured leaves than any other plant of the Melastomaceae, and, by-the-way, showing an unusual feature, that of growing from leaves, just as a Begonia; several species, however, may perhaps do the same, as does also *Phyllagathis rotundifolia*, a very rare plant of the same order. An elegant specimen of *Cocos Weddelliana*, so large as likely soon to flower, is a conspicuous member of the group. Lastly requiring notice is *Torenia Fournieri*, a new species of this extremely pretty but much neglected genus. The other species in cultivation are *T. asiatica* and *T. pulchra*, both grown in the Royal gardens. *T. Fournieri* is most nearly allied to the former; it has smaller flowers, but more deeply coloured, and with a yellow blotch on the lower lobe in addition.

— The May number of the *Journal des Roses* treats at some length the characteristics and history of the Rose Beauty of Glazenwood (Fortune's Yellow), and gives a pretty full account of our newly formed National Rose Society. The principal paper, however, and one that English rosarians will probably enjoy, is on THE ROSE IN ENGLAND (La Rose en Angleterre), by Mr. WHITLEY HERBER, who amidst his many employments finds time occasionally to contribute original articles to foreign periodicals.

— Several very charming PLANTS are IN FLOWER on THE ROCKWAY at Kew. First, there is *Tillium grandiflorum*, than which no spring-flowering plant, has more chastely-formed white flowers, with such handsome foliage. Another white-flowered plant of the highest merit is *Ranunculus alexandricus*. It might, from the purity of its aspect, be justly styled the Queen of Crowfoots. *Houstonia coriaria* is without rival for rockwork, as one of the most diminutive and sweetest of sky-blue gems to be found. *Lithospermum prostratum* is also blue, but with great depth and mass of colour. It is quite an essential for the present position. *Anemone palmata*, with rich yellow flowers, is always considered a most select species. It does not, however, make much display. Several *Primulas* are very pretty, among which are *P. spectabilis*, with pinkish purple flowers; the more common *P. viscosa*, and its variety also, which always will be one of the most indispensable. *Lithospermum orientale* is a great ornament, and will be so for almost any climate, producing as it grows a multitude of yellow flowers; this, with all its desirable qualities, is somewhat of a rarity. The old *Cardamine trifolia*, bearing a profusion of white flowers, with dwarf and dense foliage, still retains an important position with choice plants. *Dentaria digitata* is very showy, with large purple flowers. *Arenaria baccata* covers the ground with a level cloth of green, and is sprinkled over with an infinite number of white star-like flowers.

— Mr. BERNARD DYER, F.C.S., of 17, Great Tower Street, London, Member of the Society of Public Analysts, has been appointed Analytical and Consulting Chemist to the Devon County Agricultural Association.

— Some boxes of SOLOMON'S SEAL (*Polygonatum multiflorum*), shown by Mr. R. S. YATES, of Sale, Cheshire, at the meeting of the Manchester Botanical Society, on the 27th ult., attracted much attention by the splendid growth of the plants and the abundance of bold spikes of flower they carried. The clumps are lifted from the open ground when

they have made a growth of from 4 to 6 inches, planted in the boxes, and brought on into flower under glass. When the boxes are neatly covered with bark they are very ornamental in entrance halls, window conservatories, and in any place where they can be protected from external cold and have light and a little air. The flower-stems are much prized in a cut state for decorative purposes, their bold, arched appearance being highly effective in large vases. After the clumps have done blooming they rest for a year, and are again similarly employed as necessity arises.

— In some parts of Cheshire the common PRIMROSE is utilised in a pleasant manner by the cottage residents on the highways. In cases where a Quick hedge fronts the cottage garden by the way-side, a bank is thrown up on the road-side, with a border some foot or so in width, and on this is sown a line of common Primroses, and very pretty they look in full bloom. The woods being so full wayfowers would no doubt respect the bright little Primrose garden; but near to large towns it would be in considerable danger of molestation.

— We are informed that The Highlands, Jersey, the property of CHARLES KIPLING, Esq., a notice of which appeared in our columns of December 25, 1875, is to be sold by auction at the Grand Hotel, May 15, by Messrs. G. & H. LUMLEY, of St. James's Street.

Home Correspondence.

Royal Horticultural Society.—Dr. Allbutt finds fault with the Horticultural Society for not establishing schools and lectures for teaching young gardeners scientific gardening. Perhaps Dr. Allbutt is not aware that there is such a school for gardeners already at the public gardens at Chelsea, and that he is not aware also that a grant of public money was lately made to provide the young gardeners with lectures on scientific gardening, but the young gardeners to a man refused to attend them. So long as there is this public school for gardening in the immediate neighbourhood of Chiswick, and so long as the experience of that school is similar to what I have stated, I certainly shall not be inclined to spend the money of the Horticultural Society in trying to compete with King. I do not agree with Dr. Allbutt respecting the work done at Chiswick. The lists of fruits and their synonyms, and the reports of the trials of flowers and vegetables, are known to many in foreign countries as well as in England, though they seem not to be known to Dr. Allbutt. As far as I know, these reports are the only means by which a purchaser can learn whether the multitude of plants advertised as new are really such or only old varieties with a new name. No doubt there is room for more work of this kind to be done at Chiswick than is done at present, and I hope that, if a few more of those who care for gardening will join the Society, it will be able, as it certainly is willing, to undertake more of this work. At present I fail to perceive either the justice or common sense of finding fault with the Society in the manner that Dr. Allbutt does, so long as not one in ten of those throughout England who are interested in horticulture either belongs to the Society or in any way helps in carrying out any work for the promotion of horticulture. Allow me also to say, in answer to the letter signed "Exhibitor," that the change of day was made solely for the convenience of the exhibitors, and in consequence of a memorial signed by all the principal exhibitors at the Society's shows, praying that the day might be altered from Wednesday to Tuesday. C. W. Strickland, Hildesley, Malton.

— If not my argument, I hope his own appropriate quotation (p. 3) will convince Dr. Clifford Allbutt to throw in his lot with us, and to influence his horticultural friends to do likewise. George F. Wilson, Hatherbank, Weybridge Heath.

The Tulip Literature at Amsterdam.—As you have mentioned the collection of books, pamphlets, &c., relating to the Tulip exhibited at the Amsterdam horticultural show, allow me to say that these books, &c., are all from my private collection. There are about a hundred volumes, comprising several collections of drawings of Tulips from the time of the Tulipomania (1624-1637), and as well all the editions of the pamphlets of that time. This collection, which could have been made yet more extensive if time had permitted, was made up in a hurry a few days before the opening of the show, amongst much other business, in consequence of the desire expressed by one of my friends abroad, who wished to look over the Tulip literature. As it was a collection not asked for in the programme,

I was not sure sufficient space would be allowed to it, therefore it was not shown in that extent which would have given a perfect oversight of it. Had there been time to do so, I would have given a critical list of the various things shown in this collection too, with the intention of soliciting offers of such books, pamphlets, drawings, manuscripts, &c., which are wanting in this collection, and which belong to it, as it is my intention to complete my collection on the Tulip (as I am trying to do for other bulbous plants) as much as possible. F. H. Krings, Haarlem.

Dasyliiron longiflorum.—In our notice of this plant at p. 493, we stated that the flowers had been produced in the garden of M. Geoffroy St. Hilaire. It appears, however, that this is an error, and that the plant really bloomed in the garden of M. Genotens, of Hyeres. Several of the flowers were more or less

FIG. 90.—FLOWERS OF DASYLIIRON LONGIFLORUM.

imperfect; those that we now represent were among the most perfect. They were drawn by M. Germain de Saint-Pierre—a well-known French botanist.

Drechsler's Fanigator.—Several years ago, when Mr. Drechsler brought out his patent fanigator, he was, for want of suitable mechanical means, obliged to adopt wire for its rotary cage, and which experience has proved does not last long enough to give satisfaction. In carrying out improvements on the first machine

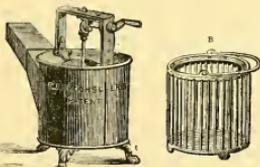

FIG. 91.—DRECHSLER'S FANIGATOR.

Mr. Drechsler's object was to keep to the round bars, to avoid forging, drilling, and rivetting; to get the whole cage cast in iron, and, if possible, in one piece; to hold the cage firmly at the two ends by a central spindle without obstructing the passage of the tobacco-pan; to make more room inside for a larger cage by removing the gearing to the outside; to remove the useless lid, as by turning no smoke passes out there; and to make the top of the outside funnel-shaped to receive the materials. These things are easy enough of conception, but to make a suitable cage like this for the foundry was the difficulty, which has, however, now been got over, the whole being cast in iron in one piece, even the spindle by which it is made to revolve being also cast into it; and the whole so fixed that it cannot be shaken out of its place, nor get broken or worn out by fair means. To put the fanigator into use, first procure some dry paper, shavings, &c., and set fire to it in preference to using coal or coke. By turning, the machine has a tendency to form a whirl of fire in the centre, and

as long as this is in the centre of the material it works all the faster, but the cage must be kept full to prevent the fire passing to the spot, and when the machine gets too hot it must be sprinkled. The machine, of course, made for speed, and to operate from without. There is no need of stopping to refill, as the ashes fall out as fast as produced. It may, of course, be used inside a house where there is no other choice. The plain cage (fig. 91 B) is also made of cast-iron, and is nearly identical with the one (fig. 91 A). As coke has to be used in this, small pieces only should be selected. This has been made to meet the wants of those who do not care to go to the expense of the more perfect machine, which costs two-thirds more than the cage.

Adiantum Capillus-Veneris cornubiense.—I have not the least objection to Mr. Teyrman's description of the Adiantum Capillus-Veneris cornubiense, which is very accurate; but I cannot help saying that it has been well known to me and other Cornish gardeners for more years than I like to name. I have grown it freely here for more than thirty years, and an glad that Mr. Trevithick has found it; I fear, however, that this fresh notice of it will lead to its destruction, as a new railway is now open to a terminus too near, I fear, to save it from the hands of excursionists. Happily, there is another habitat on the same coast some miles distant, where I hope it may still escape; but, at any rate, will not help to expose it. T. Phillips, Forthgoulden, Truro.

Enterprise in the Seed Trade.—The latest development of enterprise in the seed trade consists of a London seedsmen sending some sharp lads—not at all too well-bred or polite—into the suburbs to leave at the houses of respectable persons a packet addressed to the occupier of the house, containing an illustrated pamphlet on the growth of flowers, and twelve packets of flower seeds, with the intimation that its value is a shilling, and that, if not returned and a shilling paid for it, it may be given up to a person calling for it later. The seedsmen appears to be borrowing the idea from the vendors of packets of needles, &c., which are generally left by one ill-looking fellow, and called for by another, who is not slow to abuse non-purchasers, especially when the refusal is made through a timid female. On Tuesday, the 1st, a lad left one of these packets at my house, and, on opening it and discovering its contents, I called to him to take it back, but he refused to do so. On the 2d inst. an even more disagreeable fellow called for the packet, when I informed him that as the lad who left it with me had refused to take the packet, the goods had been left in my care for one night, and for the custody of the packet I made a charge of one shilling, which I had to pay before he would give it up to him. He said nothing, but went away and amused himself by copying the name of the house in which I reside. The babbiat of this enterprising seedsmen is in the vicinity of Haverstock Hill, N. Y. Z.

Marchal Niel Rose.—A charming sight is at present to be seen in the Rose-house of E. Mastone Grahame, Esq., of Coltongrey, near Crieff. When visiting this place the other day, I saw one plant of Marchal Niel covering the entire roof of the house, 20 feet by 14 feet, and having upwards of 300 blooms fully expanded and of large size, and as many buds were still unexpanded as will render it attractive for many weeks longer. Mr. McAra, the gardener, estimates that, when done flowering, upwards of 1000 blooms will have been produced. As some renders may not be aware of the suitability of the Marchal Niel Rose as a stock for Marchal Niel, I may state that for some years a yellow Banksian was trained up the centre rafters of the house. This was previously cut in to supply young wood, and in the autumn of 1874 every shoot was built up the stem, producing the above grand result. Mr. McAra's success induced him last spring to bud newly-rooted cuttings of the Banksian with the Marchal Niel, and he has succeeded in producing beautiful table plants from 2 to 3 feet high, forming a single stem, with six to eight blooms on each plant. G. C.

Cucumber Disease and "Salus."—I shall be very glad to give Mr. Fish my opinion of the disease he mentions if you will allow me. I consider Mr. Fish to be wrong in both the points he brings forward; first in attributing his disease of Cucumbers to a fungus, and second, in dressing his Cucumbers plants externally with "Salus." I may be allowed to ask Mr. Fish if he or any one else has seen the fungus he mentions? If not, I may say that I have not seen it? For my part I have never seen any fungus of moment destroying a Cucumber plant. I have little doubt that the disease mentioned by Mr. Fish is in some way brought about by the presence of microscopic "salus" or "salutis" on the Cucumbers plants. These (as present unnamed) worms were first described in the *Gardener's Chronicle* by Mr. Berkeley as affecting the roots of Cucumbers, and causing the well-

that it would be profitable if some of these dwarfed plants were grown and offered for sale. I have sent them home from China in pots with no other protection than the sky of an American clipper, and they were much appreciated. Great praise is due to the enterprising nurserymen who send out collectors for foliage plants, &c., that would have passed without a notice a few years back, and I admit to be about as common in China as they are here. There is always a demand for novelty in plants, especially when such plant will last and requires little care and can be kept in a room or at a window. C.

Reports of Societies.

Royal Horticultural: May 2.—*First Great Summer Show*.—On Wednesday last Her Majesty the Queen paid her first visit to the Society's gardens at South Kensington since the death of the Prince Consort, and as the weather was fine, the display of flowers one of the finest that has ever been seen in the gardens, and the attendance of visitors very large, it may be confidently hoped that a very favourable impression on the Queen's mind has been passed, and that good management only is now required to maintain and extend the popularity and enthusiasm manifested on all sides as a consequence of Her Majesty's visit. For the last twenty years the exhibitors have endeavoured to pass through the depression in the Society's affairs, not so much through the reduction of the prizes, or the non-award of prizes at all, as from the absence of visitors to the shows. The exhibitors have more-over to their shoulders to the weight of a medal, would send splendid displays at a very short notice, but when it became known that the Queen intended to pay a visit to the gardens they determined to exceed all former efforts, and make a show such as would be worthy of the occasion. As we have already stated this was done, and the result was more than could have been anticipated, all the available space in the large conservatory, both the arcades and the long galleries, and the exhibition arranged for the most part with gay flowering plants. It was indeed a success—and the thanks of the Society are specially due to Mr. Barron for his untiring exertions in getting the show together; for his admirable disposition of the various exhibits in the conservatory; and for his judicious arrangements that he carried out for the comfort and convenience of visitors and exhibitors alike. To Mr. Wills also thanks are due for the spirited way in which he contributed to the decoration of the entrance-alcove, and the exhibition was so arranged that it was made without any ceremony. Her Majesty, accompanied by H.L.H. the Duchess of Edinburgh and H.R.H. the Princess Beatrice, and attended by the Countess of Caeldon and Lady Emma Osborne, Sir Thomas Biddell, General Pombey, Colonel Lyndock Gardner, arrived at the Queen's Gate entrance at a quarter to 12 o'clock, and was received by the President, Lord Aberdare, Lord Alfred Churchill, H. Webb, Esq., Colonel Trevor Clarke, G. T. Clark, Esq., B. Eckford, Esq., W. Perry, Esq., and Mr. Hogg, members of the Council. Her Majesty was conducted through the exhibition by the President and Dr. Hooker, C.B., who pointed out the more interesting subjects exhibited. When Her Majesty reached the conservatory the Duchess of Bedford, accompanied by the Marquis of Tavistock, had the honour of meeting the Queen; and Her Majesty was also pleased to accept a very handsome bouquet from the hands of the Duke of Wills, and the Princess Beatrice a similar one from the hands of Messrs. Veitch & Sons. She appeared to thoroughly enjoy the floral treat that had been prepared, and seemed especially to be interested in the hardy flowers common in English gardens. She seemed now to be interested which more closely concerns us—the plants and their exhibitors. We may preface our remarks by stating that, with the exception of the novelties shown before the Floral Committee, and noticed in another place, there was nothing that called for the large notice which it has received; hence we must treat the exhibits in a general rather than a detailed manner. We may commence in the large conservatory, in the centre of which were exhibited by Messrs. Whitburn & Young, of Millford, a set of ornamental window flower boxes, showing the adaptability of their zygorphic process for that style of decoration, and which Her Majesty did not fail to inspect. Mr. John Wills contributed an extensive and admirably grouped collection of fine-leafed and flowering plants in the centre of which he had arranged one of his delightful little decorative surprises, an irregular bed of *Selaginella denticulata*, studded with *Roses*, *Gloxinias*, &c., with the central path of S. densa, the group as a whole securing for Mr. Wills the award of a gold medal. Mr. B. S. Williams also received a gold medal, for a very effective group of flowering and fine-leafed plants.

From Messrs. Kollison & Sons, Tooting, came a group of about three dozen admirably-flowered staminate *Azaleas*, which gained a silver medal; and a similar award was made to Mr. Terry Slough for a showy group of *Palms*, *Azaleas*, &c., and a fine display of show and alpine *Azaleas*. Messrs. Lane & Son, Great Berkhamstead, staged about thirty very beautiful plants, and received a silver medal; and from Mr. Bull came a small collection of *Orchids*. Several examples of *Mimulus moschatos* Harrisoni came from Messrs. Harrison, of Leicester. A fine assortment of stove and greenhouse plants came from Messrs. Les & Sons, of South London, and a beautiful display of *Orchids* was made by Sir Trevor Lawrence, M.P., which gained a silver-gilt medal. Smaller groups of *Orchids* were also shown by Sir Henry Peck, M.P., Wimbledon (Ollenhed, gr.); W. Terry, Slough, Peterborough House, Fulham (Mr. Roberts, gr.); and J. W. Miles, Esq. Shirehampton (Mr. Perry, gr.), both of the last-named exhibitors receiving bronze medals.

The Western Arcades contained a remarkably fine group of *Cyclocladon* plants, which deservedly gained a gold medal for Mr. William Bull; a magnificent collection of too seedling *Dracenas*, of medium size, well grown, and highly coloured, from Mr. John Standish & Co., Ascot, which also gained a gold medal; a very extensive and beautiful group of forced *Khan-dodendrons*, Ghent *Azaleas*, &c., from Messrs. Lane & Son, which also gained a gold medal; a very effective group of fine-leafed plants from Messrs. Veitch & Sons, which gained a silver medal; a nice group of miniature succulent plants from Messrs. Croucher & Boller, 73, South Row, Kensington Town, which gained a bronze medal; a handsome group of fine-leafed plants from Messrs. Osborn & Sons, Fulham, to which was awarded a silver medal; a group of fortysplendidly-flowered *Rhododendrons*, which gained a silver-gilt medal, from Messrs. Lane & Son; a group of well-flowered *Roses* in pots, and a handsome box of cut blooms of *Roses*, from Messrs. Paul & Son, Old Nurseries, Chesham, which gained a silver Banksian medal; and a group of fine-leafed plants from Messrs. J. G. Water & Co., to which a bronze medal was awarded.

In the Eastern Arcade the visitor first came upon a display of Fern cases, made by Mr. J. Brownish; and next upon a very choice group of plants from Messrs. John Standish & Co., Ascot, which included some gracefully grown specimens of *Adiantum gracillimum* and *Conium maculatum*, together with *Clematis*. A silver medal was awarded to the group. A silver medal was also given to Messrs. G. Jackman & Sons for a beautiful group of a dozen and a half well flowered *Clematis*. From Mr. T. Spear, Eastleigh, came a nice group of hardy spring-flowering plants, which gained a bronze medal. To Messrs. John Laing & Co., Stanstead Park, S.E., a silver medal was voted for a large and good group of fine-leafed and flowering plants; and Mr. J. Ley, Royal Nursery, Croydon, received a silver-gilt medal for a fine group of *Palms*, Ferns, *Crotoms*, and other handsome-leaved subjects. A similar award was also made to Messrs. Barr & Spedden, for a magnificent display of cut blooms of *Narcissus*, numbering 100 species and varieties. The same firm also received a silver medal for Fern cases, and a bronze medal for window decorations. A nice collection of well-grown gold and silver Tricolor *Pelargoniums*, shown by Mr. C. G. Water, of South London, was highly Commended. Mr. John Burley, Hereford Road Nursery, Bayswater, received a silver medal for a good group of large *Palms*, &c.; and to W. E. Hubbard, Esq., Leonardslote, Horsham (Mr. S. Osborn, gr.), a silver Banksian medal, which was also awarded to R. Thompson, Esq., of the same nursery (Mr. A. Katty, gr.), for a group of about thirty flowering *Azaleas*; and to J. G. Heppner, Esq., Sidecup Place, Kent, for a fine collection of about thirty *Orchids*. Mr. C. G. Water, of South London (Mr. James, gr.), contributed a showy group of *Cyclamen*s, *Cinerarias*, and *Calceolarias*; and *Polyanthuses* in numbers came from Mr. H. Parr, The Gardens, Harrow Weald Park, Stanmore, and Mr. William Caudwell, of South London.

The Eastern Corridor was devoted almost exclusively to collections of plants, fruits, and vegetables, exhibited by growers for Covent Garden market, and a magnificent show they again made. Messrs. J. & J. Hayes, Edmoneton, were awarded a silver-gilt medal for a large and fine bank of flowering plants, consisting of *Cinerarias*, *Deutrias*, *Pelargoniums*,

Fuchsias, *Hydrangeas*, *Roses*, *Heaths* and *Liliums*, &c., all of splendid quality. Messrs. Hawkins & Bennett, Lily Gardens, Twickenham, received a silver medal for a grand display of *Campanula*, *Rose*, and *Zonal Pelargoniums*, tastefully arranged in the form of festoons; and Mr. J. Puttick, Acton, had a bronze medal for a group which consisted mainly of *Mignonette*, *Richardias*, *Pelargoniums*, and very dwarf *Hydrangeas*, &c. Mr. Keenan, of South London, had a group of plants, including numbers of *Richardias*, *Pelargoniums*, *Coleus*, *Hydrangeas*, *Lilies*, *Heliotrope*, *Spiraeas*, &c., and was awarded a silver-gilt medal for a grand display of *Campanula*, and a group of beautifully grown *Mignonette*, consisting of 1000 plants—a wonderful show in this sweet little favourite, for which he also received a silver medal. Mr. Thomas Pearce, Hayes, Kent, contributed a collection of *Campanula*, *Rose*, and *Fuchsias*, all cleanly and well grown, and was awarded a bronze medal. From Mr. J. Poulton, Fountain Nursery, Angel Road, Edmoneton, came a group of 200 beautifully flowered plants of *Spiraea japonica*, which also gained a bronze medal. Mr. J. Seahrough, Ponder's End, Enfield, received a silver medal for a fine batch of *Pelargoniums* and *Fuchsias*; and Messrs. G. Beckwith & Sons, Edmoneton, were voted a large silver medal for an enormous collection of splendidly flowered *Pelargoniums*. Bronze medals were also awarded to Mr. P. Ladds, Bexley Heath, Kent, for an excellent group of *Spiraeas* and *Pelargoniums*; and to Mr. T. Petridge, Brentford, for a nicely coloured, low, small bronze *Pelargonium* group, consisting of *Campanula*, &c. Westbourne Grove, W., for a fine bank of flowering plants and cut flowers of *Pelargoniums*; and to Mr. E. Sawyer, Edmoneton, for a collection of plants, numbering about 250, and consisting mainly of *Deutrias*, *Calceolarias*, *Lily of the Valley*, *Pelargoniums*. Silver medals were awarded to Mr. T. C. Paget, Royal Nursery, Clapham, for a grand group of *Spiraeas*, *Palms*, *Ferns*, arranged in lines of each and dotted with *Dracenas*; and to Mr. H. B. Smith, Ealing Dean Nursery, for a large and most effective group of beautifully flowered little *Fuchsias*, *Spiraeas*, *Dracenas*, and *Ferns*, good and silver Tricolor *Pelargoniums*, &c.; to Messrs. H. K. & G. Wright, Turner Road, East Ham, for a group of fine-leafed plants, principally *Palms* and *Dracenas*, mixed with a few *Orchids*; and to Mr. James Sweet, Leyton, Essex, for a group of *Pelargoniums*, *Heaths*, *Fuchsias*, and *Cyrtis*, &c., all of fine quality. Mr. G. Brad, Witcomb Road, Tottenham, was awarded a silver medal, and a similar award was made to Mr. Poupart, Mortlake, for a collection of cut flowers of *Pelargoniums*, *Primroses*, *Fansies*, *Narcissus*, *Wallflowers*, *Sweetwills*, &c.

Fruit and vegetables were represented here in only small quantities, but those staged were of very high quality for the season. Messrs. Webber & Co., Central Avenue, Covent Garden, took a silver-gilt medal for an interesting group of flowering plants, which included two dozen handsome *St. Michael's Pines*, new black and white *Grapes*, *Apples* and *Pears*, and Sir C. Napier's Strawberries; and Bronze medals were awarded to Mr. J. Poupart, Twickenham, for a remarkably good display of vegetables and herbs, some forced and others from the open air; to the Rev. J. R. Watson, Gunnersy, for new Black Hamburg and Muscat of Alexandria *Grapes*; and to Mr. W. Farley, gr., Valentines, Ilford, for a fine collection of *Apples*, *Grapes*, and *St. Michael's Pines*. Mr. W. Ingram, Vine Nursery, Aylesbury, also sent a nice sample of Black Prince *Grapes*; and from Mr. E. C. Mott, Potter's Bar, came half-a-dozen bunches of the Improvements of *Cucumbers*, in the shape of baskets of *Ferns* and *English salad* materials, were contributed by Mr. W. J. Smith, 374, Kingsland Road, N.E.; and a very good sample of *Muskmelons* shown in clumps, as grown, by Mr. J. Walker, Thame, Oxon.

TABLE DECORATIONS, BOUQUETS, &c.—The competition and display in this, as in the other classes, much exceeded what we have chronicled in the previous show. Perhaps it would not be going too far to say that on this occasion the metropolitan decorative florists were fairly represented; but if this assumption is correct, then the results were disappointing. In the table decorations, many were admired and deserving of the highest praise, there was, on the other hand, also much meriting condemnation. The great and principal faults were, in the bouquets, the large size and crowded packing of the flowers, and in the table decorations, many were made in disregard of natural and agreeable contrasts of colour. Of course these faults were not common to all the exhibits, but, according to our notion, the bouquets were nearly all too large. A bouquet for the hand should be of considerable number, but not so burdensome or inconvenient to the bearer, and each of the few different kinds of tastefully contrasted flowers and foliage used should show its natural characters. Quantity, even with quality, cannot make for bad taste, and although Her Majesty graciously

"Herewith I send three flowers of a curious Erynean Daffodil—*Narcissus muticus* of J. Gay. It is evidently very near to our own wild Daffodil, but has a much longer, narrower cylindrical corolla, and is very variable, as will be seen by the three forms sent, all picked from the same small bed of collected bulbs. I also hand you two flowers of the large lance-juncus coloured *Narcissus*, and also two forms of the pretty little *C. Mawi*, sometimes known as *C. carulea* in gardens. The larger form of *C. Mawi* has its stem stamens in a curious petaloid state. *F. W. Barbidge*."

Plants Exhibited.—The Rev. Mr. Harpur-Crewe showed flowers of the handsome *Tulipa Orphanides*, *T. Clusiana*, *T. Haageri*, *T. fragrans*, *T. Eichleri*, and others; also the Mentone form of *Scilla italica*, &c. Mr. Green showed flowers of a *Crimson* from the garden of Sir George Mackay, called *Scabro-pedunculatum*. Mr. Elwes showed, among other things, *Hyacinthoides* of Boissier—a species in the way of *Susiana*, but less effective.

FLORAL COMMITTEE.—W. B. Kellogg, Esq., in the chair.—First-class Certificates were awarded to Messrs. James Veitch & Son for the magnificent Anemone Brownii figured and described in this journal at p. 745, vol. vi.; for *Lomaria discolor bipinnatifida*, a beautiful fern, raised for Cole; and for a very fine reddish brown-coloured, deep-cut leaf—a novelty certainly, but it is difficult to see why it was certified.

To Mr. John Wills, for *Dracena Mrs. Bland*, one of the best specimens raised from *D. concinna*, crossed with *D. Reginae*, dwarf, dense-habited, and brightly-coloured plant, that will prove valuable for decorative purposes. To Mr. E. S. Williams for *Aralia filicifolia*, a beautifully-cut Fern-like plant, with Mr. James and Deafus, &c. and barred, and for *Adiantum Willamitii*. A second-class Certificate was also awarded to Mr. Williams for *Xytopetalum Clavii*, the result of a cross between *Z. maxillare* and *Z. crinitum*. To Mr. W. Bull for *Phlox Lindleyi*, and *Phlox multicolor*. Mr. B. Kellogg, Esq., for *Agave schidigeri* princeps—a striking plant with somewhat narrow leaves, boldly and distinctly banded in various directions with white, and is numerous rather broad filamentous processes. It is a very interesting raised plant, and the specimen on the Certificate, was awarded a gold medal. To Messrs. W. & A. Brown, of Hendon, for show *Pelargonium Mrs. J. A. Dickson*, Sultan, Fascination, and Commander. To Mr. Turner for show *Auricula Sarah*, a beautiful self, and also a blue and white variety; purple; for *alpine Auricula John Ball*, noticed in our last. To Mr. Sweet, Leyton, for *Pelargonium* Empress of India, a white show variety, with darkly banded petals, and very suitable as a decorative plant.

To Messrs. Paul & Son, for *alpine Auricula* new H. P. Rose, Emily Laxton. To Mr. James, for *Cineraria Mrs. Beck*, a large, smooth, recurved flower, of a rich lilac shaded magenta colour, and fine white eye. To Mr. James, for *alpine Auricula F. Withnar*, Esq., Loxford Hall, for *alpine Auricula Prince*, a large black-velvet-coloured self, with a rather pale yellow paste; and for *alpine Auricula Florence*, a very large, almost black self, with a yellow centre. The flower measures nearly 2 inches across, and is of fine form. G. F. Wilson, Esq., Heather-ink, Weybridge, sent a flowering plant of *Mitella cordifolia*, a rare hardy plant for rockwork and borders, with white flowers, and a habit of growth somewhat similar to *Tilimna*. Mr. Stevens, gr. to the Duke of Sutherland, Trentham, showed a late flowering variety of *Cologne cristata*—a plant about 3 feet across and splendidly fringed. In addition to the plants above named, Messrs. Veitch exhibited several plants of the *alpine Auricula*, named Thomas Hogg, but the flowers were too green to warrant an award from the committee.

FRUIT COMMITTEE.—John Lee, Esq., in the chair. Sir Henry W. Peck, Wincoblen Hill (Mr. Overhead, gr.), exhibited several very fine ripened fruits of *Musa Cavendishi*, and received the award of a gold medal. A Cultural Commendation was awarded to Mr. P. Batters, gr. to Mrs. Tristram, Fowley, Liphook, for a good sample of Black Hamburgh Grapes. From Mr. C. Haycock, gr. to R. Leigh, Esq., Barham Court, Maidstone, came a fine dish of James Veitch Strawberries, and three brace of Colonel King of the Carabots and G. H. Miles, Wyncombe Abbey Gardens, exhibited three nice Jamaica Pine-apples and a ripe Melon, for which he was awarded a Cultural Commendation. From Mr. W. Cox, gr. to Earl Beauchamp, Madresfield Court, came some examples of some grown Grapes, from Mr. Batters, gr. to Mrs. Willis Fleming, Chilworth Manor, sent a good dish of Maclean's Little Gem Peas, grown in 8-inch pots in a cool house. Mr. Stevens, Trentham, contributed some fine fruit-bearing branches of *Chaenactis*, and Mr. Viscount Eversley, Heckfield, had a Cultural Commendation for a fine dish of Auguste Nicotise Strawberry. An excellent dish of Oscar Strawberries came from Mr. Hills, gr. to Sir T. Edwards-Moss, Bart., Otterspool, Liverpool.

Manchester Botanical and Horticultural: April 27.—One of the pleasant monthly meetings of this Society was held on the above date, and with it took place the annual Northern exhibition of the National Auricula Society. Some of the leading plant growers of Manchester are invited to attend these meetings, which bear the same relationship to the Manchester Society as do the meetings of the Floral and Fruit Committees to the Royal Horticultural Society. The only regret is that the plants are not so numerous as the public appear to desire. The Manchester Town Hall, which is very imperfectly lighted from without.

The great feature of this meeting was a magnificent group of plants sent by J. Broome, Esq., Didbury (gr. to Mr. Wills). Among the most interesting and finely grown and flowered examples of *Cypripedium caudatum*, *Odontoglossum vexillarium*, *O. species* in the way of triumpans and charmingly marked; *O. luteum*, with two very fine spikes; *O. Halli*, *O. Alexandræ*, *O. hystrix*, *Aerides Fieldingii*, *A. virescens*, *Clasium Mendelii*, *Oncidium serratum*, nicely bloomed; *O. sphacelatum*, very large; *Phalaenopsis Luddemannii*, *P. Schilleriana* and *P. amabilis*, *Strobilium* and *Strobilium curvatum*, *Strobilium Indian Atacama cristata*, *Anthurium Scherzerianum*, *Clerodendron Balfoarium*, *Geonoma gracilis*, said to be one of the finest plants in cultivation; *Cocos Rheediana*, *Raphia fabeliformis variegata*, some of the best of several kinds of *Yucca filamentosa*, &c. The gold medal of the Society was awarded to this fine group. W. Leech, Esq., Fallowfield (Mr. W. Swan, gr.), had the bright, clear yellow *Dendrobium* *D. D. devonianum*, with ten capital spikes; *Odontoglossum Patriciæ* and *O. species*, in excellent form, and very handsomely spotted with purple; *Madevalia Veitchii superba*, having more of the purple glow on the flowers than is generally seen; *Exochilus Frederici*, a bold and striking form, the long tube and sepal bright rosy crimson, white crest and rosy purple lip—awarded a First-class Certificate; *Colax japonica*, *Cattleya citrina*, &c. S. Schloss, Esq., Osborn Villa, Bowdon (Mr. Cardwell, gr.), had *Polioth violacea*, bearing racemes of white berries, changing to a purple tint with age; a very fine *Anthurium Scherzerianum*, a superbly grown example of *Terminalia elegans*, a capital specimen of *Gleichenia dicarpa*, admirably well grown, &c. The silver medal of the Society was awarded to Colonel Clay for a seedling *Xytopetalum*, the petals claret-brown, the lip wholly suffused with pale purple. This was raised between *Z. crinitum* and *Z. maxillare*, having the growth of the latter, and the colour of the former. The same award was made to *Sarracenia Filides*, a large bold form, the pitchers handsomely tinted with gold, from James Filides, Esq., From Samuel Barlow, Esq., Sticklehill Hill, Chadderton, Manchester, came a large plant of a new and fine *alpine Auricula*, several of the fine hybrid *Rhododendrons* raised by Miss Davies, Ormskirk; baskets of show and *alpine Auriculas*, *Polyanthus*, *Primroses*, &c., and a well-grown specimen of *Cypripedium villosum*, with forty-three flowers, all of which were interesting. To Mr. R. S. Yates, Sale, sent some boxes of Solomon's Seal, finely grown and flowered; a vase of lovely forced Roses, a box of cut blooms of some early flowering hardy *Rhododendrons*, &c.

The National Auricula Exhibition.—This annual show was scarcely so large as that of last year, owing to the flowers of several of the leading exhibitors not being in bloom; and especially was this true of those residing in the Todmorden district, which is looked upon as one of the best in England, as far as the Auricula is concerned. It is always the means of bringing together a great number of the Northern florists; and so far from the taste for the Auricula declining in the North it would appear to be on the increase, and our enquiries are daily being made for varieties to cultivate. The Auricula has long been a favourite with the Lancashire florists. When it was first introduced to the county is not exactly known, but it is generally supposed to have been brought into the present possession of the county when the Flemish weavers, driven by atrocious cruelties from their native land, came to England about 1570, and settled in Lancashire and Norwich. Lancashire then became a manufacturing district, and it is well known that the Flemish weavers brought their collections of Auriculas and Tulips with them, and thus they were distributed to different places in England. In 1725 the Auricula was extensively grown by the florists of Middleton and the surrounding neighbourhood, and since that time the cultivators have steadily advanced weavers.

The more elastic conditions under which Auriculas were recently shown at the Crystal Palace were absent this year, and, in consequence, the supports allowed to the trusses in the South are not so numerous as in the North, the reason being that it is considered if the flower-stem will not maintain its truss of flowers in an erect position it shows want of adequate cultivation. The result is that the

strongest of stems, though the plants being turned out of the pots to assist in lightening the carriage to the show, added to the heat of the room, become limp and ungainly in appearance, and with a great loss to the floral effect. Visitors desirous of inspecting the flowers have to handle them, and it is sometimes quite snapped off. There is no class for twelve Auriculas at Manchester, the premier prize being for six plants, in order to give the growers of small collections a chance of competing; and in all the classes for pots, Anna Frey, one of our best plants are competing, as much difference in class as possible is required. The short grass used at Manchester for stuffing the pots to keep the plants in an erect position is not nearly so good as the moist green moss used at the Crystal Palace, and the extra attention paid in the North to the general effect in the arrangement of the competing collections of plants than there is in the South. The lessons taught at the Crystal Palace will no doubt be pondered, and bear fruit by-and-by.

At Manchester the Rev. F. D. Horner, Kirkby Malzeard, Ripon, was again for the fore, being placed 1st with six dissimilar varieties, one at least of each of the classes. The varieties were, green-edge, Booth's Freedom and some others, Anna Frey, one of our best plants and Lancashire Hero, the last named having a truss of ten splendid pipes; white-edge, Smiling Beauty; and self, C. J. Perry; as perfect a half dozen of each of the flowers have to handle them, and it is sometimes quite snapped off. There is no class for twelve Auriculas at Manchester, the premier prize being for six plants, in order to give the growers of small collections a chance of competing; and in all the classes for pots, Anna Frey, one of our best plants are competing, as much difference in class as possible is required. The short grass used at Manchester for stuffing the pots to keep the plants in an erect position is not nearly so good as the moist green moss used at the Crystal Palace, and the extra attention paid in the North to the general effect in the arrangement of the competing collections of plants than there is in the South. The lessons taught at the Crystal Palace will no doubt be pondered, and bear fruit by-and-by.

In the class for two varieties it is required they be dissimilar both in variety and class. The first condition is the variety winning the premium prize may be really intended to prevent the same flowers being shown in two classes, as for instance grey-edge George Lightbody, which can sometimes be shown both as a grey and green edge. Here the Rev. F. D. Horner was again 1st with grey-edge C. E. Brown and white-edge Smiling Beauty. 2d, Mr. T. Mellor, Ashton-under-Lyne, with grey-edge General Bolivar, and self, Pizarro. 3d, C. S. Roys, Esq., with green-edge Prince of Wales, the edging being of a vivid dark green; and with as many long and fine pipes. 4th, Esq., Timperry, with green-edge Emperor, and self Mr. Sturrock. There was a good competition in this class, not less than ten pairs being staged.

In the classes for the best grey, green, white edge, and self, a large number of flowers were shown, and the task was before the judges a most difficult one, being their patience and endurance of judgment to the utmost. A premium prize and eight other prizes are given in each class, and it is a condition of the competition that the variety winning the premium prize may win once more in the class; others only once. In these classes competing plants have not less than three expanded pipes, but in the pans there must not be less than five pipes. As a rule the plants were shown with as many good pipes as possible.

The premium grey-edge was Lancashire Hero, so destitute of meal on the edge as to be practically a green-edge. It came from the Rev. F. D. Horner. Then followed Emperor, shown by Mr. B. Simonite, Geo. Lightbody and Lancashire Hero followed in the order of merit. The green-edge was also shown. The premium grey-edge was George Lightbody, shown by Mr. S. Barlow; and the Rev. F. D. Horner came next with a pair of white and green edge, the Lancashire Hero, Dr. Horner, a fine new variety, raised by Mr. J. Read, of Market Rasen; Samuel Barlow, new and very promising; C. E. Brown, General Bolivar, Syke's Complete, and Alexander Melkiele, the pip fine, but somewhat rough on this occasion. The

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, MAY 3, 1877.

Table with columns: MONTH AND DAY, BAROMETER, TEMPERATURE OF THE AIR, Hygrometric Data, WIND, RAINFALL. Rows for April 26-30 and May 1-3.

April 26.—A dull cloudy day. Cold. Cloudless at night. 27.—A fine day, cloudy and cold. Strong wind. 28.—Overcast, dull and dull throughout the day. 29.—A dull rainy day. Steady rain from 3.30 P.M. to 6 P.M. 30.—Fine but dull and cloudy. Cold. May 1.—A dull, overcast day. Cold and raw. 2.—A fine day, but cloudy and cold. Cloudless at night.

LONDON: Barometer.—During the week ending Saturday, April 28, in the suburbs of London the reading of the barometer at the level of the sea decreased from 29.80 inches at the beginning of the week to 29.55 inches by the afternoon of the 23d, increased to 29.93 inches by the evening of the 26th, decreased to 29.72 inches by the morning of the 28th, and increased to 29.83 inches by the end of the week. The mean reading for the week at sea level was 29.77 inches, being 0.09 inch lower than that of the preceding week, and 0.19 inch below the average.

Temperature.—The highest temperatures of the air varied from 61° on the 22d to 43° on the 28th; the mean value for the week was 54°. The lowest temperatures of the air ranged from 34° on the 24th to 38° on the 22d; the mean of the week was 38°. The mean daily range of temperature in the week was 16°, the greatest range in the day being 23° on the 24th, and the least 8° on the 28th.

The mean daily temperatures of the air and the departures from their respective averages for the week were as follows:—22d, 51° 7'; 23d, 45° 1'; 24th, 44° 7'; 25th, 43° 2'; 26th, 41° 8'; 27th, 43° 1'; 28th, 45° 6'; 29th, 45° 1'; 30th, 44° 3'. The mean temperature of the air for the week was 44° 3', being 3° 6' below the average of sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed in sun's rays, were 124° on the 22d, 121° on the 24th, and 118° on the 23d; on the 28th the reading did not rise above 53°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 27° on the 24th and 29° on the 24th; the mean value for the week was 34°.

Wind.—The direction of the wind was mostly from the E.N.E., and its strength moderate. The weather during the week was generally dull and cold for the season. Thunder was heard on the 22d, 23d, and 24th.

Rain fell on three days during the week; the amount collected was 0.12 inch.

ENGLAND: Temperature.—The highest temperatures of the air observed by day were 71° at Portsmouth, 61° at Nottingham, and 61° at Blackheath; at Bradford 50° was the highest temperature; the greatest at all stations was 53°. The lowest temperatures of the air observed by night were 29° at Cambridge, and 29° at Nottingham; at Truro 42° was the lowest temperature; the general mean from all stations was 54°. The range of temperature was the greatest at Portsmouth, 33°, and the least 13°, at Bradford; the mean daily range of temperature from all stations was 23°.

The mean of the seven high day temperatures was the highest at Portsmouth, 60°; at Nottingham at Bradford, 47°; the mean value from all stations was 51°. The mean of the seven low night temperatures was the lowest at Wolverhampton, 34°, and the highest at Truro, 45°; the general mean from all stations was 37°. The mean of the seven days of temperature in the week was the least at Bradford, 8°, and the greatest at Portsmouth, 19°; the mean daily range from all stations was 13°.

The mean temperature of the air for the week from all stations was 43°, being 41° lower than the value for the corresponding week in 1876. The highest were 49° at Portsmouth, and 49°, at Truro; and the lowest 41°, at Wolverhampton, Sheffield, Bradford, and Sunderland.

Rain.—The fall of rain was generally larger in Yorkshire and Durham than elsewhere. At Bradford, Leeds, and Hull about 1 1/4 inches, and at Sunderland 1 1/2 inch (nearly) was measured, whilst at Blackheath one-tenth of an inch only fell. The average fall over the country was six-tenths of an inch. The weather during the week (with the exception of Sunday, the 22d) was generally dull and cold. A slight thunder-storm occurred generally on the 22d inst. Lunar halos were seen at Bristol on the 22d and 24th.

SCOTLAND: Temperature.—The highest temperatures of the air varied from 55° at Paisley to 46° at Leith; the mean value from all stations was 50°. The lowest temperatures of the air ranged between 31° at Paisley and 35° at Glasgow and Greenock; the average value from all stations was 33 1/2°. The mean range of temperature from all stations was 16 1/2°.

The mean temperature of the air for the week from all stations was 41°, being 3 1/2° lower than the value for the corresponding week in 1876. The highest occurred at Glasgow and Aberdeen, both 42 1/2°, and the lowest at Edinburgh, 29 1/2°.

Rain fell to the amount of 1 1/4 inch at Paisley and 1 inch at Greenock; at Perth half an inch fell; the average fall over the country was three-quarters of an inch.

DUBLIN.—The highest temperature of the air was 56°, the lowest 29°, the mean range 27°, the mean 45°, and the fall of rain 0.05 inch.

JAMES GLAISHER.

Variorum.

THE WOODMAN'S CRAFT.

O, the woodman's craft is a godly craft, He sings through sun and showers; As strong and brown as his hatchet's haft, As simple as the flower;

Of pleasure or toil he nothing lacks, As he carols his song and he swings his axe In spring-drenched forest-lowers.

When all the winds of March are blown, The Apple-boughs nod and sigh, When swallows from the South have flown, And little clodders, scudding

Across the sun, scatter seeds in their rays. Full merry and fair are the woodland ways When April streams are flooding.

With throatslooms the groves ring out; Round hut and byre and shieling, High, low, and near and round about, The blue-backed birds are wheeling;

And saucily boasting his robber name, The cuckoo prides, nor cares for shame, Where eggs are for the stealing.

Beneath the Ash, whose barren head Still looms all dark and frowning— Beneath the gracious green and red That maketh the young Oak's crowning—

Last autumn's leaves can scarcely hide The tufts of Primrose, morning-eyed, With cloak of winter's browning.

Then merrily ring the axes keen Where the willow trees are swinging; And goody shows the broad blade's sheen, The sunbeams backward flinging,

The hicket's many a leafy glade Ring clearer than the ringing blades With woodmen's jovial singing.

A godly craft, and a gentle craft, And a craft no evil fearing, Is that who live by beave and haft Where thicks are for clearing,

As the good man's hatchet swings aloft, And the good wife sings from the binding-croft.

When summer days are nearing, B. Montgomery Ranking, in "London Society."

Answers to Correspondents.

BLUE LIGHT: B. D. We have had no practical experience, and theoretical grounds should doubt the advisability of using blue glass.

CAMELLIA LEAVES: W. P. D. There is no trace of fungi on the leaves, and we cannot otherwise account for the spots.

DOUBLE VIOLET: J. Laing. The double white violet you send is a very fine thing, the flowers pure white, fully double, and quite an inch across.

HOTEL: W. E. The correct name is Astilbe barbata, the other name synonym.

INSECTS: S. Burton. The insect found feeding on your Vine leaves is a weevil, Otiorhynchus sulcatus, a well-known pest of gardeners.

INSECT IN POTATOES: A. G. B. Said by hemipterists to whom it has been shown to be the pupa of Kevdus

personatus, but the opinion not given with confidence, and seems doubtful, A. M.

MAIZE: W. H. G. Bath. From the leading American seedsmen, Orange Phoenix, A. N. odors, A. N. MEASURING: Novice. Your question does not come under our province. Get the nearest carpenter or painter to give you a lesson on the subject.

NAVES OF THE JAMES SCRIBNERI maxims.—C. A. Stringer.—Parmanium africana.—Rob. The Montpellier Maple, Acer mopansuense.—A. Novice. Fritillaria Melegris.—John E. Daniel. Corrected names.—Orange Phoenix, A. N. odors, A. N. Harrison; a. Lycaete aromatica.—P. H. G. The Dendrobie bought at Stevens' is D. Fiedlyanam, which has not been seen with Sir Trevelyan before. The flowered variety was on July 15, 1875; of Schlimmia trifida may be the first time it flowered in England. H. G. Kitchin.—U.S. 1. Narcissus incomparabilis var. Orange Phoenix, A. N. odors, A. N. Pittosporum undulatum.

POLYANTHUS: 7. W. An ordinary gold-laced variety. The lacing is too narrow for the florist's standard.

SEAKALE LILYWHITE: Stuart & Mein. The sample received proved, when cooked, to be of good colour, very tender, and of excellent flavour. There can be no doubt about its being a great improvement on the ordinary variety.

SEEDS FROM ABBEY: J. Meadows. 1. Desmodium; 2. Desmodium gyrans, a native of the East, India, and of herbarious habit; 3. Desmodium cajanifolium, an evergreen from Caracas.

SPIREA JAPONICA: A. Novice. Divide the crowns after flowering, in June, in a rich soil. They require plenty of moisture while growing. In Holland this plant is grown in great quantities for green manure, amongst the Hyacinths, in pure sand and cow-dung. See 566.

VINES: C. B. P. The injury done to your Vine leaves has not been caused by any constitutional disease in the Vine, but, as we believe, by the action of a brief period of bright sunshine after the dull weather lately experienced, intensified perhaps by delayed ventilation. Scalding is the term applied by gardeners to this form of injury, and there is plenty of it this spring.

Markets.

COVENT GARDEN, May 3.

A fair amount of business has been doing during the week, a good supply of all kinds of fruit being to hand. Grapes still continue to fall in value, the demand not keeping pace with an increased supply. Forced vegetables remain the same. James Webber, Wholesale Apple Market.

VEGETABLES.

Table with columns: Articles, per bush, Horse Radish, per bush, Leeks, per bush, Lettuce, per doz, Cauliflowers, per doz, Spinach, per bush, Tomatoes, per doz, Peas, per doz, Beans, French, per doz, Potatoes, per bush, Onions, per bush, Mushrooms, per doz, Carrots, per doz, Parsnips, per doz, Cabbages, per doz, Celery, per bundle, New Frs., per doz, Cauliflowers, per doz, Lettuce, per bundle, Spinach, per bush, Tomatoes, per doz, Peas, per doz, Beans, French, per doz, Potatoes, per bush, Onions, per bush, Mushrooms, per doz, Carrots, per doz, Parsnips, per doz.

SEEDS.

LONDON: May 2.—Inactivity of demand, and a tendency to lower prices, characterise just now the trade for agricultural seeds. For the moment, indeed, owing to recent failures, the seed market must be described as quite disorganised, and for some articles it is almost, and in fact impossible, to fix the value. For some two or three weeks longer a dragging demand may be expected. As soon as the present backward season is over is over we may look for greater steadiness; and an approximate idea can then be formed as to holding-over rates. For grass seeds there is a moderate request at unsatisfactory quotations. Sainfoin and Lucerne move off on former terms. Spring Tares, in sympathy with the strong advance in all descriptions of grain, are 12s. to 22s. per cwt. dearer. Hemp, Rape, and Linseed are also stiffening in price. Canary seed, under the influence of a strong speculative inquiry, exhibits a marked advance. Fine Peas, with a lively sale, are also considerably higher. *John Adams & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

CORN.

At Mark Lane on Monday Wheat was from 6s. to 8s. per quarter dearer than on Monday 28th night, and at this advance holders were not very ready sellers. Barley was quoted about 3s. per qr. higher. Malt was very much more money. In Oats there was a rise of from 2s. to 3s. per qr. on the week; Maize effected an advance varying from 2s. to 4s. per qr.; Beans and Peas were about 2s. dearer; while as regards four countries' Corn, the market was 5s. to 6s., and American barrels from 3s. to 4s. more money than on Monday 28th night. The top price of town-made flour, 100s. was raised 6s., or to 106s. per sack. On Wednesday trade was quieter, and offered sales some reduction from the rates of Monday had to be submitted to. This applies to all classes of produce.—Average prices of corn for the week ending April 28.—Wheat, 55s. 10d.; Barley, 40s. 6d.; Oats, 25s. 8d. For the corresponding week last year.—Wheat, 44s. 11d.; Barley, 34s. 1d.; Oats, 26s. 3d.

CATTLE.

At the Metropolitan Market on Monday prices for beasts advanced, and a fair clearance was effected. Trade was not very active for sheep, and prices on the average were scarcely as good as last week. Scarcely any advance was noticed in lambs, but choice carcasses were scarce and dear. Quotations.—Beasts, 4s. 4d. to 5s. 4d., and 5s. 6d. to 6s.; calves, 5s. 10d. to 6s. 10d.; sheep, 5s. to 5s. 6d., and 5s. 8d. to 6s. 4d.; lambs, 4s. 4d. to 8s. 4d.; pigs, 4s. to 5s. 6d. and 5s. 10d. There was very little change in the trade. The few beasts to be sold still at about Monday's value, though quotations did not range quite so high. Sheep moved off at a moderate demand. Prime calves were in fair request, but lambs met no inquiry.

HAY.

Business at Whitechapel market was firm on Thursday, with a steady demand. Quotations.—Clover, best, 102s. to 125s.; inferior, 85s. to 95s.; hay, best, 102s. to 125s.; inferior, 75s. to 85s.; and mixed, 45s. to 57s. per load.—Camden Market quotations.—Superior meadow hay, 122s. to 140s.; inferior, 110s. to 120s.; superior Clover, 122s. to 140s.; inferior, 110s. to 120s.; and straw, 55s. to 60s. per load.

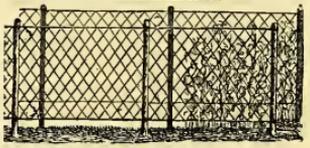

POTATOS.

The Borough and Spitalfields markets reports for Monday gave business as being steady. Kent Regents, 95s. to 120s. per ton; Essex do., 85s. to 120s.; Scotch do., 90s. to 120s.; Victoria, 130s. to 160s.; do. Scotch, 115s. to 120s.; Hales, 140s. to 170s. On Thursday English and Scotch were firm, and foreign sold unevenly. Quotations.—Victoria, 140s. to 160s.; Kent Regents, 120s. to 150s.; Scotch do., 120s. to 140s.; French round, 8s.; German reds, 8s. to 8s.; Belgian kidneys, 10s. per ton.—The imports into London last week, comprised 19,524 bags from Antwerp, 14,710 Hamburg, 1845 Bremen, 124 Harting, 1200 London, 1289 Ghent, 1000 Danzig, 153 packages 50 bags Malta, 116 bags Calais, 76 Rotterdam, and 50 sacks Rouen.

SHAW'S TIFFANY, ELASTIC NETTING, CANVAS, &c., for Shading, Protecting, and other Horticultural Purposes. For Samples and Prices apply to JOHN SHAW AND CO., 97, Oxford Street, Manchester.

THE BEST LAWN MOWERS RANSMOS' AUTOMATON & REVERSIBLE

DELIVERED FREE. TRIAL ALLOWED. FULL ILLUSTRATED LISTS FREE ON APPLICATION TO RANSMOS, SIMS & HEAD, IPSWICH.

THE NEW SEEDLING ROSE, "QUEEN OF BEDDERS" (NOBLE).

See Coloured Plate (after Mrs. Duffield), "Gardeners' Chronicle," this day.

Perhaps the finest of all the English Seedling Roses of recent introduction. It is *par excellence* a really Bedding Rose in every sense of the word—requires no pegging down, support, or training of any kind, and is a continuous early and late bloomer.

First-class Certificate Royal Horticultural Society, August 2, 1876.

Its inflorescence may be imagined when it is stated that a plant 18 inches high had eighty-four buds and expanded flowers upon it on September 6, 1876,

A CONSTANT SUPPLY OF BUDS WAS OBTAINED FROM EARLY JUNE TO NOVEMBER OF THAT YEAR:
OVER FIVE MONTHS!

Good Plants are now being sent out, in strict rotation, at 10s. 6d. each.

COLOURED PLATES ONE SHILLING EACH.

CHARLES NOBLE, BAGSHOT.

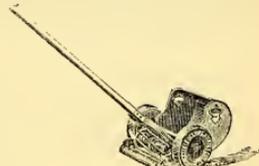

FOLLOWS & BATE'S NEW PATENT LAWN MOWERS, &c.

New Patent "Roller" Lawn Mower.

New Patent Lawn-Edge Cutter.

Royal Prize Medal Patent "Anglo" American Lawn Mower.

Upwards of 37,000 of these celebrated Machines have been sold during the past few years.
Patronised by Her Most Gracious Majesty the Queen; His Royal Highness the Prince of Wales; His Imperial Majesty the Emperor of Germany; His Imperial Majesty the Emperor of Austria; The Imperial Russian Government (for the Agricultural Museum at St. Petersburg); and members of the Nobility and Gentry of Great Britain.

Awarded Medal for Merit, Vienna, 1873 (the only Medal given for Lawn Mowers), **Large Silver Medal** (the First Prize) at the Meeting of the Royal Horticultural Society, Birmingham, 1872, and in addition, every First Prize wherever these Machines have been brought into competition in actual trial with other makes.

FOLLOWS AND BATE here abstain from enumerating in detail the various good points "claimed" for other Machines, and content themselves with saying that their Lawn Mowers possess them all, and more also; they therefore solicit the favour of an application for one of their CATALOGUES, with Testimonials, before purchasing.
To be had from all respectable Ironmongers and Seedsmen in the United Kingdom, or from the Patentees and Manufacturers, FOLLOWS & BATE, Manchester.

F. & B. are the sole makers of the well-known Patent "CLIMAX" LAWN MOWER, with Back Delivery, from 22s. each; NEW PATENT LAWN-EDGE CUTTER, which entirely supersedes the Shears; PATENT GARDEN PLOUGH, &c.

Machines of any make Repaired or allowed for in Exchange.

HORTICULTURAL BUILDINGS.

MESSINGER & COMPANY

HAVE PLEASURE IN ANNOUNCING THE ISSUE OF THEIR NEW

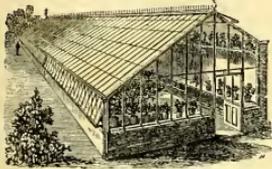

ILLUSTRATED BOOK OF DESIGNS

OF HORTICULTURAL BUILDINGS and HOT-WATER HEATING APPARATUS, containing very numerous Engravings of every description of Plain and Ornamental Fruit and Plant House, with Heating Apparatus to same; also Heating Apparatus adapted to Private Residences, Churches, &c. As the Illustrations are taken from EXISTING STRUCTURES erected by Messinger & Co. (which may be seen by permission), Gentlemen by consulting their Catalogue ensure a successful result.

Sent Post-free for Thirty-three Penny Stamps on application.

MESSINGER & COMPANY, HORTICULTURAL BUILDERS and HOT-WATER ENGINEERS, LOUGHBOROUGH.

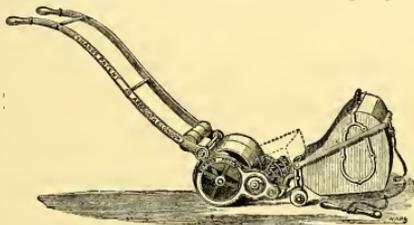

W. G. SMITH & CO., HORTICULTURAL ENGINEERS,
 Victoria Works,  Bury St. Edmunds.

SOLE MANUFACTURERS OF BEARD'S PATENT METALLIC NON-CONDUCTING GLASS-HOUSES.—The Glass is fixed between two layers of prepared felt. The Ventilators are worked by a simple mechanical contrivance, and the whole structure is screwed together so as to render it quite portable. HEATING APPARATUS IN ALL ITS BRANCHES. ORNAMENTAL CONSERVATORIES and HORTICULTURAL BUILDINGS OF EVERY DESCRIPTION.—For lightness, elegance and durability, these Houses cannot be surpassed. The best materials only are used in their construction. Great improvements have recently been made, to obviate the objections to iron houses. Very extensive works on this principle have been satisfactorily executed. *An Illustrated Catalogue forwarded post-free on application.*

**SHANKS' NEW PATENT
 LAWN MOWERS,**
 Under the Patronage of Her Most Gracious Majesty the Queen, and
 most of the Nobility of Great Britain.

The merits of these Machines are now so well known, and their superiority so universally established, that a detailed description is no longer necessary. A. S. & SON would here simply refer to a few of the prominent advantages peculiar to their Machine. The Revolving Cutter is made to be self-sharpening. The *Sole-Plate or Bottom Blade* is made with *Two Edges*, enabling the cutting parts to last twice as long as in other Machines. A *Wind-guard* is also introduced, which prevents the Grass escaping the Box when the Machine is in use during the prevalence of wind.

PRICES,

Including Carriage to any Railway Station or Shipping Port in the Kingdom:—

NEW HAND MACHINE.		NEW PONY and DONKEY MACHINE.	
10-inch Machine	£3 10 0	25-inch Machine	£13 10 0

Metallic Hothouse Builder to Her Majesty.
HENRY HOPE
 (late Clark & Hope, formerly Clark),
 HOTHOUSE BUILDER and HOT-WATER
 APPARATUS ENGINEER,
 55, LISEBURY STREET, E.C. Established A.D. 1828.
 BOOKS OF DESIGNS, 5s. each.
 24" The Extensive Ranges of Metallic Hothouses in the Royal Gardens, Windsor and Osborne, were executed at this Establishment.

SIR J. PAXTON'S HOTHOUSES for the MILLION.—Price List free. Conservatories, &c., built to Architects' Plans, or Designs prepared, and Estimates given to Rough Sketches, with sizes required. Heating apparatus fixed complete. Pamphlet, with Illustrations, post-free, 3d.
HEEMAN & MORTON, 2, Gloucester Street, Regent's Park, London, N.W.

**GREEN'S
 PATENT "SILENS MESSOR,"**
 Or Noiseless Lawn-mowing, Rolling, and
 Collecting Machines for 1877.

The Winner of every Prize in all cases of competition.

The superiority of these Machines over those of all other makers is universally acknowledged. They will cut either long or short Grass, Bent, &c., wet or dry.

These advantages no other Lawn Mowers possess.

They are the simplest in construction, the easiest to work, the least liable to get out of order, make little noise when in use, and are the most durable Lawn Mowers extant.

The largest stock of Mowers kept in London is to be found at our Establishment, 54 and 55, Blackfriars Road, where purchasers can select from upwards of 500 machines of hand, pony, and horse power, and have their orders executed the same day they are received.

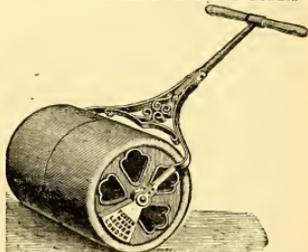

Every Lawn Mower sent out is guaranteed to give entire satisfaction, otherwise it may be returned at once free of cost to the Purchaser.

N.B.—Those who have Lawn Mowers to repair will do well to send them either to our Leeds or London Establishment, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

Descriptive Illustrated Price List free on application.

GREEN'S PATENT ROLLERS

For Lawns, Drives, Bowling Greens,
 Cricket Fields, and Gravel Paths.
 SUITABLE FOR HAND OR HORSE POWER.

They can be had of all respectable Ironmongers and Seedsmen in the United Kingdom; or direct from the Manufacturers,

THOMAS GREEN & SON,

SMITHFIELD IRONWORKS, LEEDS;
 And 54 and 55, BLACKFRIARS ROAD, LONDON, S.E.

P. S. C. C. O. C. A. GRATULATORY.—COMFORTING.

"By a thorough knowledge of the natural laws which govern the operation of digestion and nutrition, and by careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided for Families and Individuals a delicate, flavorful beverage which may save us many heavy doctor's bills. The judicious use of such articles of diet that a constitution may be gradually weakened, until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating about us, ready to invade and overthrow our frames. We are thus expiring daily by neglecting to fortify our system with pure blood and a properly nourished frame."—Civil Service Gazette. Sold only in packets, labelled JAMES EPPS AND CO., HOMEOPATHIC CHEMISTS, 48, Threadneedle Street, and 179, Piccadilly.

KINAHAN'S LIQUOR.

Universally recommended by the Medical Profession. A pure old spirit, mild, mellow, delicate, and most delicious. Dr. Haasall says, "The samples were soft and mellow to the taste, and pronounced to be pure, well-matured, and of very excellent quality."—Wholesale: 20, Great Titchfield Street, London, W.

ELLIS'S RUTHIN WATERS.

PURE AERATED WATERS.

ELLIS'S RUTHIN WATERS.

Crystal Springs, Soda, Potass, Seltzer, Lemonade, Lullin, and other systems is awarded Gold Medals, and bears their Trade Mark. Sold everywhere, and Wholesale by R. ELLIS & SON, RUTHIN, and every Large London Agent: W. BEST AND SON'S, Henrietta Street, Cavendish Square.

DINNEFORD'S FLUID MAGNESIA.

The best remedy for ACIDITY of the STOMACH, HEARTBURN, HEADACHE, GOUT, and INDIGESTION. It is a powerful agent for delicate Constitutions, Ladies, Children, and Infants.

Solely prepared by D. DINNEFORD AND CO., 179, New Bond Street, London, and all Chemists.

HOLLOWAY'S PILLS and OINTMENT.—Each quarter of the year tests the constitution, and discovers its weakest link. By the variable temperatures of the present season the system is overtaxed, and the result is constipation, disordered digestion, and biliousness are generally more frequent. These ailments have both pain and hazard by their frequent recurrence. The pills have the advantage of the early use of these infallible remedies, which will not only rubrath upon the skin nearest the seat of disease, extracts most wonderfully purifying, and never fails to disengage all noxious matters and removing all temporary obstructions, thus restoring healthy action to the organ. While the Ointment gently renews disordered action, Holloway's Pills should be taken to remove all contaminations from the blood.

CHOICE FLOWER SEEDS FOR 1877.

We would call the attention of the Public to our Collection of the same.

We possess over 5000 Plants of the **COMMON GREEN HOLLY,** fit for immediate removal, from 2 feet to 10 feet.

Also a very large and choice selection of **GREEN and VARIEGATED VARIETIES.**

Prices of any of the above will be given on stating the height required.

OSBORN & SONS,
FULHAM NURSERIES, LONDON, S.W.

NEW WHITE LOBELIA, "THE BRIDE."

JOHN PERKINS & SON

Have much pleasure in offering the above Novelty as the best pure White Lobelia ever sent out.

It is free flowering, very dwarf habit, and we can with perfect confidence recommend it.

PRICE PER DOZEN, 9s. USUAL DISCOUNT TO THE TRADE.

52, MARKET SQUARE, NORTHAMPTON.

WM. PAUL & SON

(Successors to the late A. Paul & Son—Established 1806),

PAUL'S NURSERIES, WALTHAM CROSS, HERTS,

Respectfully invite Inspection of their large Collection of Specimen and Half-specimen

ROSES IN POTS, now finely in bloom.

Visitors by Railway can enter the Nurseries from the Platform, Waltham Station, Great Eastern Railway, half an hour's ride from London.

WM. PAUL & SON can supply fine plants, in pots, of the **NEW ROSES**, Magna Charta, 5s each; Queen Eleanor, 3s. 6d. each; Queen of Waltham, 2s. 6d. each; Star of Waltham 2s. 6d. each. The New French Roses of 1877, in strong plants, 2s. per dozen. Older Roses, in pots, hardened plants for present planting, all the leading kinds, 10s. 6d. to 18s. per dozen, £3 15s. to £6 per 100.

Priced Descriptive **CATALOGUE** free by post on application.

PAUL'S NURSERIES, WALTHAM CROSS, HERTS.

STRAWBERRY, THE DUKE OF EDINBURGH (MOFFAT).

THE LAWSON SEED AND NURSERY COMPANY (LIMITED), EDINBURGH and LONDON,

Have made arrangements with Mr. Moffat, Coldwells, to send out, for the first time, the above-named splendid Strawberry. Fruit very large, firm, and of excellent flavour, bright scarlet colour. A most prolific bearer, and as a main crop for market purposes it is unsurpassed.

Strong Plants, 42s. per 100; 25s. per 50; 15s. per 25; 9s. per dozen.

Trade Price on application.

1, GEORGE IV. BRIDGE, EDINBURGH; 54, BISHOPSGATE ST. WITHIN, LONDON, April, 1877.

NEW ENGLISH-RAISED SEEDLING ROSES.

**MESSRS. BELL & SON,
THE NORWICH NURSERIES,**

Are now executing orders for their TWO NEW ROSES, raised at their Nurseries, and described and announced below. They have been thoroughly tested here before being sent out, and can be recommended with confidence as really distinct novelties.

CLIMBING ROSE "CATHERINE BELL."

Very large flowers of a deep rose colour, the backs of the petals a delicate silvery pink, of exquisite shape and very fragrant. It is very free-flowering, and of vigorous climbing habit, making shoots 6 feet to 8 feet long in one season. Figured in *The Garden*, March 16, 1876.

"Your Rose Catherine Bell is both *belle et grande*."—Rev. Canon Reynolds Hole.

Good Flowering Plants, in Pots, 10s. 6d. each.

COLOURED PLATES, ONE SHILLING EACH.

HYBRID TEA ROSE "MRS. OPIE."

Bright salmon-rose, tea-scented flowers, with shell-like petals, a most distinct and novel shade of colour among Tea Roses. It will form a charming companion to Madame Falcot, and will be as extensively cultivated as that variety when well known. In flower from May to November. Figured in the *Floral Magazine*.

Good Flowering Plants, in Pots, 7s. 6d. each.

BELL AND SON, 10 & 11, EXCHANGE STREET, NORWICH.

NEW DOUBLE WHITE VIOLET, "BELLE DE CHATENAY."

Awarded a First-class Certificate by the Horticultural Society of France.

We offer this magnificent Viola for the first time. The flowers are pure white, most delicately perfumed, of immense size, and very double; in fact, almost equalling in size the well-known white *Apuquia*.

It is pronounced by French horticulturists to be the very best double white Violet in cultivation.

Trade price on application.

Retail Price—Strong Plants, 4s. 6d. (Post-free 5s.)

The raiser says: "This new Violet will be appreciated as a Market Gardener's and Florist's plant, as it blooms most freely and continuously."

The illustration is from some specimen flowers, which are of natural size. We can strongly recommend this Viola as a charming addition to the popular group of flowers.

Trade price on application.

THE QUEEN'S HIGH HOLBORN,
SEEDSMEN, *Carter's* LONDON, W.C.

LOBELIA EBOL, the best of all, 3s. per dozen, 12s. per 100. All the best Bedding Violets and Fanseles, names and prices per dozen, 10s. and 1000, on application.

H. CANNELL begs to intimate that **FUCHSIA MISS LUCY FINNIS**, is the most remarkable variety sent for many years, and will afford the utmost pride and pleasure wherever seen. For description and illustration see **H. C.'s FLORAL GUIDE**, sent free for twelve stamps. Fine plants post-free 2s. each, established, 2s. 6d. This would create quite a sensation in any show, as it blooms in summer.

H. CANNELL has now many thousands of the various varieties of the family of **FORGET-ME-NOTS**. *Disidifera* is now a splendid sight. Fine young plants, 6 inches across, full of bloom, 12s. per 100.

Grand addition for Carpet Bedding, **MENTHA P. GIB-ALTARICUM** was greatly admired wherever seen, last season, and pronounced by all to be a decided acquisition. 100 cuttings post-free for 5s.; fine young plants, 7s. 7d., strong established, 14s. per 100; special price per 1000.
Swanley, Kent.

LOAM.—Exceedingly fine Yellow, delivered into truck on the South-Eastern, London, Chatham and Dover, and London, Brighton and South Coast Railways. Samples and prices on application to **J. BERKLEY**, Hope Nursery, Deptford, S.E.

COCOA-NUT FIBRE REFUSE, newly made—Reduced price, 20 bushels, 6s. 8d.; 100, 6s. 0d.; Truck-load, 60s. Delivered free to any rail in London. **J. STEVENSON & CO.**, Fire Works, Grayshod Lane, 134, High Street, Battersea, S.W.

COCOA-NUT FIBRE REFUSE, invaluable for Gardening purposes. One thousand testaments. Four-bushel bag, 1s. 1d. included; truck-load, loose, free to any Rail, 3s.
FOTTER OYLEN, Spitalfields-Market, N.E.

COCOA-NUT FIBRE REFUSE may be had, at 6s. per one-horse load, of **M. GAREY**, Manufacturer, 57, Old Montague Street, Whitechapel, E.

COCOA-NUT FIBRE REFUSE, as supplied to Carter, Veitch, Wills, Bull, Daniels, Laidig, Henderson, Dickson, &c., 3d. per bushel, 12s. bushels for 100; truck, 35s. free to rail or wharf. **FEAT, LOAM, SAND, LEAF MOULD**, &c., per bushel, bag, or truck. **FRESH SPHAGNUM**, 8s. 6d. per bag.
M. H. BENTOTE, Nunhead, S.E.

MILLER AND JOHNSON (ESTABLISHED 1852) Manufacture the highest quality of ARTIFICIAL MANURES 3s. 6d. Mark Lane, London, E.C.

Flourish Peat for Grasses, &c.
Quality for Orchids, Store Plants, &c., 2/6 6d. per truck.
BLACK FIBROUS PEAT, for Rhododendrons, Anemias, Heaths, American Plant Beds, 1/2 per ton.
Delivered on rail at Blackwater, S. E. R., or Farnborough, S. W. R., by the truck-load. Sample sack, 5s. 6d. each.
FRESH SPHAGNUM, 10s. 6d. per sack.
WALKER AND CO., Farnborough Station, Hants.

ODAMS' MANURES, FOR ALL CROPS. Manufactured by the NITRO-PHOSPHATE and ODAMS' CHEMICAL MANURE COMPANY (LIMITED), consisting of Tenant-Farmers occupying upwards of 120,000 acres of Land. Chairman—**ROBERT LEBDS**, Keppel Old Hall, Norwich. Managing Director—**JAMES ODAMS**. Chief Office—109, Fenchurch Street, London, E.C. Western Office—BRANCO—Queo Street, Exeter. Particulars will be forwarded on application to the Secretary, or may be had of the Local Agents.

SIMPSON'S RED SPIDER, THIRPS, &c., ANTI-DOLE. Testimonials of the highest order on application. Per quart, condensed, 6s.; per pint, 3s. 6d. Supplied to Seedsmen and Chemists. Strongly recommended in the Gardens, and by many first-class Gardeners. Prepared by **JOHN KILNER**, Wortley, near Sheffield.

GISHURST COMPOUND.—Used by many of the leading Gardeners since 1859, against Red Spider, Mites, Thrips, Greenfly, and other Insects, in solutions of from 1 to 2 ounces to the gallon of soft water, and of from 16 ounces to a winter dressing for Vines and Fruit Trees. Has quitted many preparations intended to supersede it. Sold Retail by Seedsmen, in Boxes, 12s. 3d., and 10s. 6d. Wholesale by PRICE'S PATENT CANDLE COMPANY (Limited).

TREE FERNS.

THE LARGEST AND BEST STOCK IN EUROPE.

WILLIAM BULL, F.L.S.,

Respectfully invites the Nobility and Gentry to an inspection of the above; also of his

MAGNIFICENT SPECIMEN ORNAMENTAL PLANTS,

Adapted for the Decoration of Conservatories and Greenhouses, or suited for Sub-tropical Gardening.

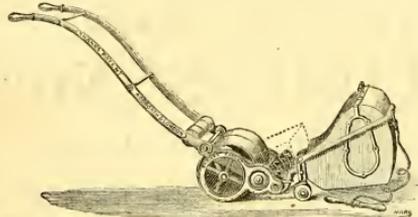

ESTABLISHMENT FOR NEW AND RARE PLANTS, KING'S ROAD, CHELSEA, LONDON, S.W.

SHANKS' NEW PATENT

LAWN MOWERS,

Under the Patronage of Her Most Gracious Majesty the Queen, and most of the Nobility of Great Britain.

The merits of these Machines are now so well known, and their superiority so universally established, that a detailed description is no longer necessary. As S. & S.O. would here simply refer to a few of the prominent advantages peculiar to their Machine. The Revolving Cutter is made to be self-sharpening. The Sole-Plate or Bottom Blade is made with Two Edges, enabling the cutting parts to last twice as long as in other Machines. A Wind-guard is also introduced, which prevents the Grass escaping the Box when the Machine is in use during the prevalence of wind.

PRICES,

Including Carriage to any Railway Station, or Shipping Port in the Kingdom:—

Table with 2 columns: NEW HAND MACHINE and NEW PONY AND DONKEY MACHINE. Lists various models and their prices in pounds and shillings.

NEW HORSE MACHINE.

Table listing prices for new horse machines in various sizes, including 30-inch, 42-inch, and 48-inch models.

A Staff of experienced Workmen always kept in London, so that Repairs can be done there as well as at the Manufactory.

SHANKS' PATENT LAWN MOWERS

Are warranted to give ample satisfaction, and if not approved of can be at once returned.

ALEXANDER SHANKS & SON,

Dens Ironworks, Arbroath; and 27, Leadenhall Street, London, E.C.

27, LEADENHALL STREET is the only place in London where intending Purchasers of Lawn Mowers can choose from a Stock of from 150 to 200 Machines. All sizes kept there, whether for Horse, Pony, or Hand Power. Orders executed same day as received.

Small Lawn Mowers—6-inch, 25s.; 7-inch, 35s.; 8-inch, 50s.

MESSINGER & COMPANY, CONTRACTORS, MIDLAND HORTICULTURAL BUILDING AND HOT-WATER ENGINEERING WORKS, LOUGHBOROUGH,

Reg to inform their numerous Patrons and the Public generally that having erected new, more extensive and commodious works, fitted with the best steam-power machinery, for the construction of Horticultural Buildings in wood or iron, plain or ornamental, large or small, they are in a position, from their great facilities and experience, to carry out with dispatch, in the best manner, at very moderate cost, the orders with which they are entrusted. Only thoroughly well-selected timber used. Glasshouses erected on Messinger's patent principle are, owing to mechanical arrangements, very strong, most durable, light, elegant; perfect efficiency for purpose intended is guaranteed; are economical in cost and maintenance. Messinger's Patent Boilers, Flexible Jointed Hot-water Pipes and Valves, are now in use in many thousands of instances, with the greatest success. Particulars on application. Plans and Estimates forwarded. Ladies and Gentlemen waited upon.

The Plans of Loughborough Gardeners, Architects, and others carried out. Richly Illustrated Catalogue is post-free for 35 stamps. Illustrated CIRCULAR of Messinger's Improved Patent Tubular Saddle Boiler free.

Sole Medalists for the Best Hot-Water Apparatus at the United States Centennial International Exhibition, Philadelphia.

By Her Majesty's Letters Patent

ENDLESS FLAME-IMPACT HOT-WATER BOILERS.

GUARANTEED

The most Powerful, the most rapid, the most Economical, the Simplest, and the Cheapest in the World.

"The 'Boiler of the Future.' I have no doubt about this."—WM. THOMSON, Dundee Fireworks.

From the "Gardener," March, 1877.

FRAME-PATENT

ENDLESS FLAME-IMPACT BOILER.

"This boiler is attracting a good deal of attention in the horticultural world at the present time; and as I have just laid one of their largest-sized ones fitted up here, and have now got it well tested, perhaps a few lines from me up to your gallows may not be without some advantage to some of your numerous readers. I have had some experience as to the annoyance and extra labour caused by badly constructed boilers, and my improvement effected in these is save labour and fuel demands the attention of all interested parties.

"To give your readers a better idea of the work this boiler has to do, I may begin by stating that our hot-rooms consist of a range having a total length of 100 feet, of which the two lower-roofed greenhouses being in the centre, two lean-to Vuesires on each side, with Cannel, more or general plant-houses, each end; on opposite side of wall we have a Fern-house, partly lean-to and partly span, 95 feet in length, varying in width from 20 to 30 feet. Attached to end of boiler-house is my laundry, with a drying chamber fitted up with about 250 feet of 4-inch piping.

The whole of the above houses are heated with hot water, and have a total of about 300 feet of 4-inch piping. We had formerly two oval flue boilers, one being 10 feet long, the other 4 feet long. With these two boilers kept hard fire we always found great difficulty in keeping up the temperature during frosty weather, and had frequently to keep a single sleep attending to the fire. On the last day of last year the larger boiler came to the end of its life, and was blown down the fire; and in taking down some of the brickwork it was found to have cracked beyond repair. To be thus left in the middle of winter with only one boiler was a very serious matter, and I was obliged for another without delay. I have given a good deal of attention to the construction of hot-water boilers, and I can assure I had never seen one that would give up to me what a boiler should be after some time ago my attention was called to a drawing of Wright & Co.'s Boiler.

"After talking the matter over with my engineer, W. S. Mitchell Jones, Esq., he at once granted permission to get the boiler I had mentioned such an order was sent to the works and into the hands of Messrs. Mickle & Philip, hot-water builders and hot-water engineers, of the Leam Street, and in a few days they fitted it up and attached the piping in the most complete manner. I also got some additional tight valves attached, so that if anything should happen at any time it could be attended to without disturbing the piping.

"And now as to the capabilities of the boiler for the work. As formerly stated, I had considerable difficulty in keeping up the heat with the two oval flue boilers kept hard at work. I now find that with the present boiler, with a low fire, I can heat up the whole of the houses and the laundry to a degree they never were before, and that with much less coal than it took to fire out of the oval flue boilers.

"Our chimney consists of a fire 70 feet long, led horizontally through centre of back wall, with 18 feet of a perpendicular stalk. Some doubt was expressed that, as we required a chimney pipe attached to boiler about 6 feet long, there would be deficiency of draught; but we have found the opposite to be the case. I attached a 6 feet length of 8-inch stove pipe, with elbow at boiler, and cleaning door at single angle, and it worked very strong. I used a large iron flange fitted into the band of the stove pipe, and am able to regulate the fire to a nice degree by making use of a damper at the top, and I can regulate damper fully half round. I can leave it to its work with the greatest confidence till the usual time of commencing labour in the following morning, and I am satisfied as to its capability to sit up firing the half of the night at times, and sometimes whole ones, with no trouble, and no loss of portability. We had not the slightest difficulty in putting it down in our courtyard, and fitting it through a trapdoor, 10 feet long by 2 feet in height, and fitting it up in a room 6 feet square, and I am confident that with the assistance of two men I could take the whole to pieces and reassemble it in full working order in two hours. I have no hesitation in saying that for rapidity of circulation, small consumption of fuel, portability, and cleanliness, it has no rival, and have no doubt this boiler will do its way in, and where coils are high in price it will effect a considerable saving, and so there is good fire space in it, and I will be a capital boiler for burning wood and other fuel."—J. CLARK, The Gardens, Farnham Green, Edinburgh.

[We have a very high opinion of this boiler, and predict that it will take a foremost place in heating hot-houses and all other buildings, and shall have some further remarks to make about the principles of it next month.—Ed. Gardener.]

"I think yours the most perfect 'Heat Trap' yet invented."—DAVID THOMSON, Drumwright Glasgow.

For details and particulars as to the various sizes made, and prices, please see our pamphlet, entitled 'The Best and Simplest Hot-Water Boilers,' which will be handed to all applicants, post-free.

We are prepared to supply Thirty Different Boilers of all powers, sizes, and heights, and can vary these to suit any particular situation or requirement.

WM. WRIGHT & CO., HOT-WATER ENGINEERS, AIRDRIE, near GLASGOW, N.B.

"ARCHIMEDEAN" AMERICAN LAWN MOWERS,

Will Cut Long and Wet Grass (as well as Dry and Short) without Clogging.
They are especially adapted for Cutting Slopes, Steep Embankments, under Shrubs, and close up to Trees, &c.; and are also extremely light in draught, simple in construction, well made, and not likely to get out of order.

THE NEW SEEDLING ROSE, "QUEEN OF BEDDERS" (NOBLE).

See Coloured Plate (after Mrs. Duffield), "Gardeners' Chronicle," May 5, 1877.

Perhaps the finest of all the English Seedling Roses of recent introduction. It is *par excellence* a really Bedding Rose in every sense of the word—requires no pegging down, support, or training of any kind, and is a continuous early and late bloomer.

First-class Certificate Royal Horticultural Society, August 2, 1876.

Its inflorescence may be imagined when it is stated that a plant 18 inches high had eighty-four buds and expanded flowers upon it on September 6, 1876,

A CONSTANT SUPPLY OF BUDS WAS OBTAINED FROM EARLY JUNE TO NOVEMBER OF THAT YEAR:
OVER FIVE MONTHS!

Good Plants are now being sent out, in strict rotation, at 10s. 6d. each.

COLOURED PLATES ONE SHILLING EACH.

CHARLES NOBLE, BAGSHOT.

The Greatest Novelty of the Season.

MIMULUS MOSCHATUS
HARRISONI.

Awarded a First-class Certificate by the Royal Horticultural Society and Royal Botanic Society of London, 1876.

This exquisite plant is a Hybrid between the Large Spotted Mimulus and the Giant Musk. The flowers are as large as the former, with the rich golden-yellow colour of the latter, exquisitely spotted on the lower segments with brick brown. Its habit is recumbent and neat, blooming at every joint, thus producing an abundance of elegant flowers which are brilliant and interesting. A few plants will effectually brighten and scent a Conservatory or Greenhouse. It will succeed admirably in all situations where it can be freely supplied with moisture, although a cool shady place is the best. Being an excellent Bedding Plant, and especially adapted for Rockwork, it will be rapidly brought into requisition, and its universal cultivation will quickly be accomplished. Its easy culture and other qualities will secure for it a popularity and extensive sale. It continues to bloom from March until December, and retains its scent throughout the year. As a free-growing odorous plant it is admirably adapted for Asylums, Hospitals, and other Public Institutions.

TESTIMONIAL.

From Mr. J. SHERRATT, *Biddulph, May 5, 1877.*
"Herewith I enclose cheque for your New Musk. The first gardener who saw it ordered the whole lot. Please forward me twelve plants more forthwith."

Plants 5s. each; six for 25s.; twelve for 48s.
Orders booked and executed in rotation, as received.

JAMES BOYD & SONS,
HORTICULTURAL BUILDERS

In Wood or Iron, and Manufacturers of Hot-Water Apparatus

FOR HEATING HOTHOUSES.

Churches, Mansions, Public Buildings, Harness Rooms, &c.

PAISLEY.

ESTABLISHED FORTY YEARS.

Our Works (which are now the most extensive in the Trade) being situated within a few miles of Glasgow, we are enabled to forward Materials at the Lowest Rates, by Rail or Water.

Having extensive Sawing and Moulding Mills, employing skilled workmen in all branches of the trade, and giving our whole attention to the business, we can execute any orders entrusted to us at *unusually low prices.*

From the "Gardeners' Chronicle," p. 813, December 23, 1876.

"Amongst the improvements now being carried out by Mr. Smith at Mentmore, the princely seat of the Baroness Meyer de Rothschild, near Leighton Buzzard, we would especially mention the New Palm Stove just erected by the firm of Messrs. James Boyd & Sons, of Paisley. This structure, which is a plain span-roofed building with a lantern ridge, is intended by Mr. Smith for the growth of large Palms, &c., in tubs. It is about 86 feet in length, 30 feet in width, and 27 feet in height. For a large house like this, totally devoid of all ornamentation or filigree work, it is one of the handsomest and best constructed we have seen, and is well worthy of inspection.

HOTHOUSES ERECTED BY US

MAY BE SEEN AT—

- Mentmore, Buckinghamshire.
- Hatfield and Nyn Park, Hertfordshire.
- Ragley, Alcester, Warwickshire.
- Haydon Hall, Finner, Middlesex.

SATURDAY, MAY 12, 1877.

SOME FRIENDLY FERNS.

IN an eloquent essay, called the *Queen of the Air*, Mr. Ruskin finds a mystery, "perhaps a personality," in every plant. He is not alone in this conception. Some wild Ferns collected and potted by a lady in Surrey, acquired in a little while an unquestioned quality of personality; we well remember these fascinating plants, and the fate that overtook them. The native Ferns of Surrey are numerous, and a beautiful collection had been removed from their birthplaces in shady lanes and obscure nooks to the home-made fernery of an old road-side house. On entering the front gate by a flight of steps from the road you found yourself in a narrow space between the house and the garden wall, and in this recess, shaded by old lichen-stained and Ivy-covered walls, and overlooked by windows filled with flowers, the Ferns flourished amid broken lumps of grey-tinted sandstone. In a conspicuous position was *Polystichum angulare*, with a magnificent tame toad generally at home in the central cavity of the plant. A number of the lesser Ferns were nestled among the stones, and a never-to-be-forgotten *Moonwort* had been removed by the lady's own hand from an adjacent down—where *Moonworts* grow by dozens—and set in an open corner in its own earth, in the centre of a spit of turf, just as it grew on the hill. Among the Ferns there was not one more personal and friendly than the little *Moonwort*, which had grown to the usual stature which distinguishes its kind, on some smooth turf in the immediate neighbourhood. The site borrows the name of "Rough" from some clumps of furze; its turf is as smooth as velvet, and well suited for a canter or a stroll; or you may stand on the crowning point, and breathe the fragrance of a furze and fern-clad broom-bedecked sandhill of sunny Surrey; or you may recline and sit upon a Cistus, or lay your head upon the wild Thyme growing on an ancient molehill. Persons afraid of rheumatism and sitting on the ground should by all means interpose something underneath, in order to avoid damp. A lover of forty, or thereabouts, once "popped the question," sitting on this very "Rough," but first he popped his gloves beneath to intercept the damp.

The view from the "Rough" is a perfect Surrey scene, such as scores of artists have transferred to canvas, and hung in the *salons* of the Academy, as invitations to the public to visit Surrey. To reach the "Rough" you arrive at Dorking, climb Coast Hill after passing Westcoate, and ask your way to Abinger. Once basking on the wild Thyme the prospect is delicious, and there are, or were, dozens of *Moonworts*, which we basked there as a boy, and peppered rabbits on the same spot, and having to leave it for a home elsewhere a *Moonwort*, potted in its own earth—a little 2-inch plant—went with us, and for years put forth its leaves in spring, and prattled, as it seemed, of the "Rough" at Abinger, of rabbit shooting, and other matters. The lady's *Moonwort* was dug from the same spot, close to the granite cross which marks the spot where Bishop Wilberforce centered those last steps across the velvet turf to his unexpected grave. She had removed it herself to an open end of the fernery, where it

might find the air it needs. And all her pets on an early summer had unfolded their first fronds, when, on a moonlight night, a score of them vanished, and have never since been seen.

The manner of their going has remained a mystery. The only facts we can relate are, that in the early morning a pair of eyes from an upper window peeped down into the fernery below. They were the bright eyes of the lady already mentioned. Without pausing to describe her dress, we shall only say that the sun has rarely risen on anything more pathetic than her aspect as she peered out of that upper window and missed her Ferns. The front door opened almost on the instant, and between two banks of flowers in pots glided a figure clad all in white, and passed at once to the fernery. This was the mistress of the missing plants, their sustainer and friend, whom we have already seen at the upper window. Looking down with her bright eyes in the early dawn, she had observed the rumpled state of the ground below, and her instantaneous suspicions were now being confirmed. Two score at least of her late companions had departed, and ever since we saw her in the early dawn lamenting her Ferns, with long-drawn "Oh's!" and little runs and keen inspections of each spot whence a Fern and a friend had departed, we have never for a moment doubted the "personality" of plants. Nor has the lady herself. The language she used on the occasion proves that her Ferns did possess a personality. "I am perfectly convinced," she said, "they would have never walked off themselves." They had been dragged forcibly away by persons coming for the purpose, like the Romans when they perpetrated the Rape of the Sabines; and as the Sabine ladies became reconciled to their new protectors, so the ravished Ferns, no doubt, each acquired another "personality" in some other garden, and became the pets of a new owner.

Every cultivated Fern and flower has been entrusted with the mission of attaching those who love them to their homes by indescribable ties, which, in the case just mentioned, only the toad remained to represent. "Poor toady!" the lady was heard to exclaim, "if there is only you and I left now—what shall we do?" And about this time the gloves were laid upon the ancient mollusc on the "Rough," and so she found another friend besides the toad. But this is only an aside; the main point of our narrative is the friendship and seeming "personality" of plants. It was not strictly true about the Ferns being the lady's only vegetable friends in that delightful, old, grey, and lichens-ensured residence, and the garden round about, for there was a feathered Sumach she was much attached to, and several Arums and other plants tended by her own hands, indoors and out. Still the remark, "Only you and I left now, toady—what shall we do?" shows how cruel a loss is suffered in the theft of Ferns of your own collection, and the sympathy which may subsist between plants and their owners. *H. Evershed.*

New Garden Plants.

DENDROBIUM GRIFFITHIANUM, *Lindl.*,
Bot. Reg. xxi., sub. 1756.

I only knew this in a wild state, from Griffith himself, in Dr. Lindley's and my own herbarium. I may perhaps have had it fresh, but in miserable, wretched single flowers, which are quite insufficient to ascertain a Dendrobium. It is a small elegant orchid, much in the way of the rare *D. Palpebre*, Lindl., but with yellow flowers, an entire elegant spur, not constricted below its apex, and small, very acute, thick leaves. Like *D. Palpebre* it has a lax inflorescence, and very obscure narrow bracts. The well known *D. densiflorum*, Walp., boasts its overlaid dense raceme, its broad conspicuous bracts, oblong leaves, and a much longer stem. I do not believe that *D. Palpebre*, Lindl.,

has to be combined with *D. Griffithianum*, Lindl., as Dr. Lindley himself suggested, since its spur and its lip (and its colour) appear constantly different. I have obtained it several times fresh, only through Mr. Low's kindness, and it is Mr. Low once more who has sent me the *D. Griffithianum*, as it was Mr. Low who introduced the beautiful *D. savissimum*. *H. G. Rehb. f.*

ÆRIDEES CRASSIFOLIUM, *Parv., Rehb. f.*

At length I have fresh flowers at hand, though I would not have them. It surprises me what I expected, and I have a certain feeling that it is just the kind of all the *Ærideas*. While the flower is of the warmest purplish colour, quite exceeding the flowers of *A. falcatum*, Lindl. (*Larpenite*, Hort.), and *Houlietianum*, *Rehb. f.*, it appears to keep its short leaves, since I remember well to have seen it at different times in the collections of Mr. Day and Messrs. Low, when the Rev. C. Parish's showy discovery was introduced with very high regard. I myself suspected it might be a local changing form of *A. falcatum*, Lindl.; now I have seen it fresh and compared with my dry specimens, I do not hesitate to believe it a very good distinct species, though it is scarcely possible to distinguish it by dried materials. The spur is straight in *A. falcatum*, Lindl., it is bent under an angle in this species. The side lacinia of the lip are much broader and shorter in this than in the old species. The two keels on the disk of the lip stand close together at the base, they then get contiguous, and diverge again, arching on both sides. Quite the contrary in *A. falcatum*, where they begin by being distant, and are convergent in the middle of the lip. For this beauty I have to thank my excellent correspondent, Mr. Stuart Low. *H. G. Rehb. f.*

BLUE GLASS FOR VINES.

A GENTLEMAN near Dundee has, as we learn from the *Dundee Advertiser*, taken measures to put to the test General Plesanton's assertions as to the influence of blue glass on the growth of Vines, already alluded to in these columns. General Plesanton's book is the work of a real humourist, so that we can have almost any notice of the matter, unless as a recreation from more serious occupations. The effects of blue glass on vegetation are pretty well known to physiologists, at least so far as laboratory experiments are concerned, and they are not such as to induce a practical man to grow his plants under a blue ray. The best of all ways, however, is to do as Mr. Spence has done, and try it on the large scale. We need hardly point out that the excessive growth alleged to have taken place is not likely to be of that nature which results in well-jointed, well-coloured Grapes, or sound constitution. Here is what the *Dundee Advertiser* has to say on the matter, and we should be glad in due time to hear what our friends in that neighbourhood have to report;—

"Some time ago a copy of General Plesanton's book came into the hands of Mr. Spence, of Coventry Bank. He read it, was amazed, and was inclined to laugh at the whole thing as absurd, or a piece of Yankee brag. It struck him, however, that although 'blue light' might not develop a hedgehog into an elephant, it might still have a stimulating influence on vegetation. He was struck by this conviction by the fact that General Plesanton read his paper in the first instance before a respectable scientific society; and, further, that Mr. Buis, having a reputation at stake, would have speedily contradicted the General's statements if they were not according to fact. It so happened that Mr. Spence was creating a conservatory, and he resolved on satisfying himself as to the effects of the blue-violet ray. Mr. Spence's vineries differ from those of General Plesanton, inasmuch as the roof is not double pitched. They are built against a lofty wall, and have a fine southern exposure. There are two forcing houses, each 30 feet by 15, separated by a transverse section of about the same dimensions running out from the wall. This construction necessitated a modification of the American plan, and Mr. Spence has, by an ingenious arrangement of the glass at the top of the wall, made sure of the violet ray travelling over all the plants. One of the houses is covered with blue glass in the usual fashion with white glass; the other is fitted up with rows of blue glass, casting a violet ray in the manner described by General Plesanton. With the exception of the rows of coloured glass, the two houses are exactly the same in every respect. As to soil, it may be mentioned that in the conservatory the manner Mr. Spence took a large quantity of turf off his lawn, which was allowed to rot, and in the fall of the year it was appropriated for the purpose of Vine growing. It was placed in both houses, and in both cases bones and bone-meal from Rosewell were used as manure. On January 13 last the two

houses were stocked with Vines, of equal age and of the same variety—Black Hamburgs. On the same day, in order farther to test the influence of the blue-violet ray, Potatoes were planted in both houses. The Vines and Potatoes were placed so as to ensure the same conditions. On the 15th morning the Vines were found to be gone, about with the advice and under the superintendence of Mr. Lawrie, an intelligent and experienced gardener. Heat was put on in both houses on February 6, and the temperature has since then been kept equal, the white house from position having if anything the advantage. On the 21st morning the Vines were found. The Potatoes which have had the advantage of the 'blue light bath' standing 3 feet above the surface, and so vigorous is the growth, although carrying the full strength of stem, they will require to be staked. In the white house they stood only 2 feet high. The Vines, again, which are bathed in violet, have grown 2 feet 4 inches, and have a strong vigorous look. Those in the white house, on the other hand, are only 13 inches. Those acquainted with Vine culture will be able to estimate the different results by the following details. A regular note of progress has been kept, and the results have been given in full as they came. The progress made under the colour ray averaged fully an inch every twenty-four hours. On March 8, exactly a month from the date of forcing, the Potatoes under the white glass stood 14 inches above the ground, while under the blue glass they stood 25 inches. The Vines, again, at same date had nearly doubled their growth. The white glass plants, while under the blue they had attained a height of 16 inches. As a further instance of the stimulating influence of the ray it may be mentioned that a Camellia was pointed out to us which had been removed into the 'blue' house because of the sickly look, but which in its new quarters had grown 3 inches in two days. Mr. Lawrie, who has had a life-long experience, says nothing like it has before come under his notice. It would seem, therefore, that there is 'something' in the blue lights, notwithstanding the ridicule to which General Plesanton's pretensions have been subjected. Had he confined himself to Grape culture, he would not have claimed for the 'blue light bath' greater virtues than were ever claimed for the Morrison Fil, the 'discovery' might have received more attention than it seems to have done from practical men. As it is, judging from Mr. Spence's experience, the matter is worth trying on a large scale. The Vines are growing. There is evidently enough in the 'discovery' to induce further experiment, and those who may be inclined to go into it need not be deterred by the experience of the Connecticut Cucumber grower, who—as the *Danbury Newsman*, with his usual veracity and fine appreciation of the finer points of horticulture, has recently endeavoured to convey the Mammoth Cucumber which he reared under 'blue glass.'"

SWEET-SCENTED GREEN-HOUSE PLANTS.

It always seems to me a pity that the plants in the mixed greenhouse are limited in variety, and that a show of flowers, even if only of one or two sorts, is the one point aimed at. We all know the look of the medium-sized greenhouse in small places, which is "always gay." In winter it is bright with Chinese Primroses and Dutch bulbs, succeeded in spring by *Cinerarias*, *Azaleas*, or *Pelargoniums*, *Calceolarias*, and *Fuchsias* in summer, with Japan Lilies and *Chrysanthemums* in autumn. If the owner of the greenhouse is omnivorous in his love of plants, the result is disastrous in the overcrowded state of full use. Mr. Lawrie's plants—Camellias with yellow foliage, Heaths in a drying state, or we might rather say dead, or in the amateur's mixed greenhouse when a Heath is observed to be unhealthy, hopeless mischief has been done. But setting aside Heaths, which are an acknowledged difficult family to grow in mixed houses, look at the wretched state of the so-called hard-wooded plants, and we must own that *Eperacis* and *Cytisus*, &c., are uninteresting when past blooming; and it strikes me in these ordinary greenhouses, so cramm'd up with plants, that no plant should be admitted that is not for some reason or other always interesting. For instance (1), plants of sweet-scented foliage; (2), those whose habit or varied growth is peculiar; (3), plants whose secret-vessels are interesting or ornamental, thus having two crops of beauty; or such as should be studied from the seed-pan and known in their different stages of growth, as *Acacias*, certain species of which in their young state could never be known by one unacquainted with the changes they go through; (4), climbing plants, including those that are not for some reason or other always interesting, viz., twining plants, leaf-climbers, tendrill bearers, hook and root-climbers. A selection

from these four sorts of plants, with a sprinkling of the ordinary flowering occupants of the greenhouse, along with Ferns, Aloes, and succulents, would make the amateurs' greenhouse always varied and instructive, enabling them to appreciate more highly and learn better from botanic or large establishments which they may be in the habit of visiting. I do not see why we should encourage growth and progress in our plants, and get mentally contracted and stunted ourselves.

SWEET-SCENTED PLANTS.

To begin with plants of sweet-scented foliage, both soft and hard-wooded, as they give an immediate return. Soft and succulent growth and sages are the most we have more than thirty varieties of Cape Polygoniums of distinct perfume, but half that number would be a choice selection of the sweetest, leaving out the beautifully cut Phacelia's-foot and glutinosum sections, as the greatly adheres to them, and they stick to the cut flowers they are mixed with, and stain gloves and dress when worn. Capitatum, or rose-scented, and its variegated variety, Lady Plymouth; quercifolium, or Oak-leaf; Fair Helen, an Oak-leaf; the oddest; Fair Emily, Prince of Orange and its variegated variety; lemon-scented, nutmeg-scented, Radula or Stag's-horn, citrodorum and its minimum variety, Lady Scarborough (of the citrodorum section), lotanum or Peppermint, abrotanifolium or Tansy-leaved, Citronella or balsage section, Laurencianum or serrulatum. There is great confusion with even these unsatisfactory names, but I have selected those by which they are most generally known.

Balm of Gilead (*Cedronella triphylla*) one seldom meets with, and *Verbena* (*Aloysia citrodora*) is never grown of sufficient size to cut freely from. The Pine-apple scented *Salvia*? is another pleasant smelling plant; *Lavandula Spica* (French Lavender), and *Prostanthera lasiantha*, are sweet and useful for cutting, lasting long in water, as are also *Cedronella incana*, and a *Scutellaria* (?) with pale lilac blossoms, both labiate plants of pleasant smell, while *Teucrium Marum*, not perfectly hardy, may have a place. *Humea elegans* overtops all other perfumes, and adheres to whatever it touches, but many are partial to it.

Of hard-wooded plants the sweetest are the *Diosmas* and *Adenandras* (heath-like plants), *Leptospermum* (allied to the Myrtles), and *Boronia*s. *Diosma*, capitata, fragrans, ciliata, and speciosa are fresh and fragrant, lasting weeks in water, and retaining their leaves and sweetness when dead; but beware of *D. crenulata*, the intolerable smell of whose foliage is not counterbalanced by its beautiful white starry flowers, in bloom in December.

The *Diosmas* and *Adenandras* are so mixed up in nurseries that it is prudent to see and smell the different sorts for one's self, and not vaguely order by a catalogue. Of *Leptospermum*, bullatum and scoparium are desirable. The latter is covered with its little Myrtle-like flowers, which ripen their seed and come up freely. All these small-leaved plants take up little room and are not affected by insects. *Boronia tetrandra* has a very sweet leaf when bruised, not unlike the smell of the flowers of the well-known *B. scrulata*, and the charming *B. megastigma*. *B. alata*, again, with a good-sized lilac flower, has as perfumous a smell as *Diosma crenulata*, and they are a pair to be avoided; nevertheless that great charm of foliage belongs to them—viz., that unless bruised or drawn through the hand they do not give out their perfume like flowers, and are therefore innocuous. At the same time the perfume of its opposite, is always there in its true character, unlike a flower which has an evanescent time of perfection, and which requires careful study to witness the change of perfume. In the case of the individual who looks for sweetness in foliage there will be a hundred who sniff at every flower, and yet never know the real delicious fragrance of a Rose, Carnation, Stock, or Mignonette in its perfection. How annoying it is to the thoughtful observer to have a sweet-smelling flower cut too soon, or when past its best; too early or too late in the day, when it has had too much or too little sun; too damp or too dry. Bees at flowers are like wasps at fruit, they do not see in perfection; not having their instinct, and not using our own reason and thought, we lose very much enjoyment we might have from sweet-smelling plants. Of greenhouse plants the Musk-scented *Aster agrophyllus* is worthy of a place, both for the silver-type of its perfume, which is brown underneath, as well as for its perfume, for those who like it. A Citron should be grown for its leaves alone, so refreshing; and Myrtle, say four varieties should certainly be included. Every one likes sprays of Myrtle, but because it is almost entirely a few give a place in the greenhouse for good-sized shrubby plants that will bear cutting and bruising *ad libitum*, and with foliage unbroken by frosts and winds. With the numerous new varieties of this evergreen I conclude the list of greenhouse plants with sweet foliage. F. J. Hope, Warley Lodge.

ANTIPODAL HYACINTHS.

WANDERING through the Amsterdam show lately, we came on a dozen or so of Hyacinths growing in the singular fashion depicted in our sketch (fig. 93). A glass pot filled with earth is placed on the top of a glass vase filled with water. In the upper pot two Hyacinth bulbs are placed, the one with its growing point directed upwards, the other in the reverse direction. The one Hyacinth shoots upwards into the air, the other is directed downwards into the water. The latter, of course, appears magnified by the glass and the water. There is no sign of the inverted Hyacinth endeavouring to regain its natural upward growth, as we should expect it to. Perhaps some of our Dutch friends who see this will kindly explain how the feat is accomplished. On the spot

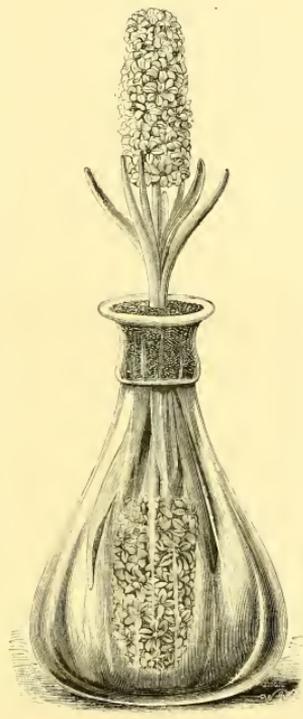

FIG. 93.—ANTIPODAL HYACINTH.

all the explanation we could get was from a wag of a Dutchman, who, in reply to our enquiry, stated that the lower bulb was an Australian, i.e., Antipodal variety!

THROUGH SARDINIA.

REMOTE from the busy haunts of tourists and the bustling centres of commercial life, Sardinia is a delightful retreat in which to enjoy the beauties of Nature, or to study the characteristics of Northern vegetation. Throughout the island the vegetable products of Europe are found side by side with those of Northern Africa. Palms grow along the shores, and their graceful outlines stand out clear against the bright blue sky; in sheltered nooks the Date tree waves its fanlike crown; huge Cacti stretch their thorny boughs, laden with Figs, along the ground; Orange trees delight the smell and sight with their

fragrant blossoms and golden fruits. In spring Almond trees display their branches laden with silver flowers; Fig trees, with their large leaves of pale green, shade the scorched ground; and the wild Vine covers the hill-sides with its vigorous shoots. Attempts have been made to add to the glorious vegetation by acclimatizing intertropical plants in the island. These attempts, made on a small scale in public and private gardens, have been attended with fair success; but it would be an error to suppose that these plants can ever become objects of extensive culture in Sardinia, where they require a special treatment, and succeed only in some favoured spots along the shores.

The climate of Sardinia would be one of the finest and healthiest in Europe were it not for the exhalations of the numerous marshes, which infect all the parts of the island adjacent to the sea. Winter can scarcely be said to exist; the sun is warm even in January, and the sky is seldom clouded. The moderate cold of January is succeeded by eight months of intense heat, and the thermometer rises to 86° and 90° in the shade. Rain is rare, and falls chiefly in March and April. The marshes are a great obstacle to the development of agricultural industries, and the labourers who are obliged to work in the plain, working on them esteem themselves fortunate when they escape with a few months' suffering from fever. The area occupied by these marshes is about half a million acres, and they have an average depth of 18 feet. The western part of Sardinia is the most beautiful and picturesque district of the island, and, indeed, is almost the only portion of it accessible to the ordinary traveller. In all other parts communication is almost impossible, especially in the northern and eastern regions, where there is scarcely a path, and which still are what they have been for centuries—an utter wilderness, traversed only by roving shepherds. The shepherds of Sardinia are a thoroughly nomad race, scattered over all parts of the island. Some are owners of the flocks they keep, others are only their guardians. They wander from place to place with their flocks, taking their families with them, and subsisting chiefly upon game, milk, and fruits. They visit the rude stone huts which serve them as homes not more than once or twice in the year; and abandon the most fertile parts of Sardinia, and is noted for its Grapes and Oranges. The town is beautifully situated upon a gentle slope, and surrounded by numerous low hills. The hills and mountain slopes are cultivated in terraces, and planted with Vines, Oranges, and Mulberry trees. To the north and east are extensive forests of Cork trees and wild Olives. Many of the former are remarkable for their size and age. A few miles from the village of Ploeghes there is a magnificent tree of this species, whose trunk at a few feet from the ground measures 40 feet in circumference, and the Olive trees also attain colossal dimensions. To protect them against the floods, which in winter frequently descend in torrents from the mountains, they are surrounded by low walls, the number of which gives a peculiar aspect to the landscape. The Olive is the most extensively cultivated tree in Sardinia, whose soil seems to be peculiarly adapted to its requirements. Until very recently a royal decree was in force which conferred letters of nobility upon every Sardinian who had planted a certain number of these trees, and on the other hand there was a law, dating from the seventeenth century, which declared those persons excommunicated who destroyed the Olive trees of their enemies. The tree is propagated by cuttings, and is planted in the proportion of about forty trees to the acre. It grows slowly, and begins to bear at four years, but does not yield a full crop until the tenth year, when the average return is 20 gallons of Olives per tree. The Sardinian Olives are plump, juicy, and full-flavoured, and only require improved culture to take a far higher place in the market than the Olive trees of Spain. From 7 to 9 gallons of ripe Olives are required for 1 gallon of oil under the primitive system of pressing practised in the island.

The most mountainous part of Sardinia lies in the vicinity of Macomer, midway between Sassari and Oristano. The mountains are almost all covered from their bases to their summits with dense forests of superb Firs, Chestnuts, Oaks, Beeches, and Larches. The underwood consists mainly of Pistacia, Cistus, Erica, Globularia, and the like. The soil of these mountains is reddish, and very fertile, but as yet it is wholly in a state of Nature. In this district there are barren desolate plateaus whose solitude is broken only by the flight of the eagle or the hoard of the savage mountain. Here and there are rich valleys, in which few miserable hovels built of loose stones and turf are the only signs of man's presence. These tuffs seldom contain more than one room; chairs and tables are regarded as superfluities, and the inmates sleep upon beds of leaves covered with goatskins. On one side of the hut a small piece of ground, seldom more than an acre in extent, is planted with Grapes and Maize in wild confusion. The wealth of the inhabitants of this district consists in flocks of goats and pigs, which are fed on the rich natural pasturage of the valleys, and on oats and acorns in the forests. The natives are a tall, well-made race, but almost African in the swartheness of their complexions.

On the royal road, about 70 miles to the south of Sassari, lies the town of Oristano, near which is the village of Milis, justly celebrated for its Orange groves. Milis is a lovely little village, whose white houses and picturesque church contrast pleasingly with the verdure of the orchards amid which it is embosomed. The road thither from Oristano leads through a well cultivated piece of country, with a row of low hills on either side. The old Oaks and Chestnut clothe the heights, and the hedges are composed of Laurels and Cacti. The soil round about Milis is of volcanic origin, and particularly suited for the growth of Orange trees. The orchards are 300 in number, and contain upwards of half a million of trees, which produce twelve millions of Oranges annually. From a pavilion which stands higher than any of the others, the visitor can obtain a magnificent view over the surrounding district, which is certainly the garden of Sardinia. Hedges, and thickets of volcanic rocks, and an orchard in all directions over the country. The Orange groves are surrounded by hills, which with their heavily wooded summits, protect them on all sides. Here and there upon the slopes are rude huts, encircled by wild, neglected vineyards. The Orange orchards are the most attractive feature, and merely to enjoy a walk through them is alone worth the voyage to Sardinia. One of the finest is that belonging to the Marquis di Boyl. This orchard contains 10,000 trees, many of which reckon their years by centuries; it is grafted for 400 years. One of the finest in this garden is especially worthy of notice—the trunk is 4 feet in diameter, and to the splendour and sweetness of its flowers and fruits it joins the height and majesty of the Oak. The productiveness of these trees is enormous, and some individuals yield as many as 5000 Oranges yearly. Early in the month of May is a good time to visit Milis, as well as the island generally. The Orange groves are then in their spring beauty, and animated by the song of birds, and by the murmur of thousands of little brooks, which water the huge black rock.

On the way from Oristano to Cagliari lies (near the village of Monastri) the broad plain of Campidano, one of the richest and best cultivated parts of the island. The soil in this district is also volcanic, and very fertile—it often returns 50 bushels of Wheat or Maize for one; but at present, despite the patient industry of the inhabitants, the plain does not produce one quarter of what it would under a modern system of culture. The agricultural implements have not been altered since the days of the Romans, and are in the main almost identical with those of the Sardinian peasant toils hard but earns little, and is heavily oppressed by the agents of the Spanish and Italian nobles to whom the greater part of the island belongs, and who squander their revenues in Madrid or Rome. The peasants are wholly without capital, and conduct their operations in the most primitive manner. The estates are very large, but the farms rarely exceed 20 or 30 acres. The tenure is hereditary, and the tenants are, to a certain extent, serfs, they cannot alienate their farms unless they provide other occupants on the same terms. Upon the death of the tenant, his heir pays a fixed sum to the proprietor, and about 20 per cent. of the annual produce to the State; in the collateral line the last sum amount:—to 50 per cent. In the case of sale a year's

extra rent must be paid to the proprietor; this condition renders sales very rare, and binds the tenant to the soil. The land-tax, which amounts to about one-fourth of the revenue, is borne on the official valuation, which is very inexact. The farmers are restricted to the culture of certain crops; Wheat is the chief grain crop, but Maize is also largely grown. The harvest begins in June, and the grain is trodden out by the feet of horses in the fields. Beans are largely cultivated as fodder; they are sown in November, as the hot dry winds of spring retard their growth. The tenant depends chiefly upon his Olive crop for his rent. Palms are also largely planted, and every village has its grove of these graceful trees. Attempts have been made to establish the culture of the silkworm, and Mulberry trees have been largely planted; but the intense heats of May and June are as fatal to the insect as the fickleness of the weather elsewhere. The houses of the farmers are constructed of bricks or stones, have only one storey, and each of the rooms is entered from an outer balcony. The farm offices comprise a large barn, a poultry-house, and an open yard for cattle. The peasants seldom eat meat, green vegetables preserved in oil, cheese and bread compose their fare. Agricultural labourers live in large villages far from the fields; and during the busy season they are lodged in temporary huts at the scene of work.

Beautiful as many parts of Sardinia there is a general air of barrenness and wretched neglect lying heavily over the land, and in traversing its uninhabited plains and dense forests it is difficult to believe that one is still in Western Europe. Sardinia, with an area of six millions of acres and a highly fertile soil, could support in comfort two millions of people, yet its present population does not exceed half a million of badly-clothed, ill-housed, semi-starved peasants and herdsmen. J. D. W.

COCHINEAL IN THE CANARIES.

A VERY depressing report on the general prosperity, or rather the reverse property, of the island of Grand Canary reaches us from the British Vice-Consul. The immediate cause of this decline, we are told, is to be met with in the depreciation of cochineal, the only important product of a country that depends exclusively on its agriculture. The ultimate causes, however, seem to be many and complicated. The large profits realised from cochineal in former years led to its exclusive adoption wherever the Cactus could be made to grow. These profits were squandered in extravagance, even before they were made, and as the merchants of the article fell, the growers themselves fell in debt to the merchants. At last a time came when the production of cochineal yielded little or no profit, but there was no other product to take its place, and the growers were unwilling to cut down the Cacti on which they had employed so much of their capital. The production continued to increase, and the prices to diminish. The advances made by the merchants to the growers not being in many cases covered by the value of the crops, credit was to great extent suspended; merchants would sell goods only for cash, and the wages of the workers diminished, but had to be made at smaller profits. Coined bullion also had to be exported to cover the adverse balance of trade, and this increased the difficulty of exchange.

It has been stated that the immediate cause of the decline in property was the depreciation of cochineal, and that this was brought about by the too-extended production, consequent upon large profits. But these profits were driven to an abnormal height by circumstances independent of any legitimate supply and demand. One was (and still is) the competition among the buyers, who are generally dealers in imported goods, and who are not only compelled to make their returns in cochineal (there being no other article of export), but obtain a readier sale thereby for their importations, either through barter, or by causing more coin to circulate. This caused the price of cochineal to rise in the island and to fall in the consuming markets, the loss by the shipper being covered by the profit on the sale of his importations. The margin between the profit on one article and the loss on the other, became gradually less and less. Another circumstance consists in the gigantic frauds that have been committed in the island, the effects of which are still being painfully felt. One of these frauds was to ship a

large number of bags filled with Barley and stones on board a vessel called the *Candida*, and to insure them as holding cochineal; the vessel was lost under most suspicious circumstances, but the shipper received the insurance money.

The present depressed state of the island is clearly attributable to its almost sole dependence upon its agricultural produce, which is chiefly centred in one article—namely, cochineal; and the depreciation of this article, together with the difficulty or impossibility of at once substituting another product that may yield better returns.

FLOWER FARMING.

THE JASMINE cultivated in the South of France for perfume's purposes is *Jasminum grandiflorum*, which is propagated by grafting on the common wood *Jasmin*, J. officinale. The whole process of cultivation, together with the cost of labour and the average returns, are given in the last number of M. Dehérain's excellent *Annales Agronomiques*. From this it appears that cuttings of *Jasminum officinale* are planted in rows nearly 3 feet apart, each cutting being at a distance of 5–6 centimetres from each other. In May the ground is hoed (*binage*), and water is applied during summer as may be required. In order to secure a crop of some kind, the first year vegetable cuttings are sown between the rows. Leeks are found to be beneficial, but Radishes and Peas (*Pisic chiches*) are deemed injurious to the Jasmies. The vegetable crop covers the expense of the yet unproductive *Jasmin*. In the second spring the Jasmies are fit for grafting. Ordinary cleft-grafting is practiced, the stocks being headed down to an inch or two above the soil. A good workman, aided by a woman to tie the graft, will work 1000 to 2000 Jasmies a day, the man earning five francs, and the woman a franc and a half a day.

In June the grafts are uncovered, and watering is freely practiced, according to circumstances. Stakes are then placed along the line, about 3 to 4 feet apart, and tied together by reeds fixed horizontally 18 inches or so above the soil. To this supports the young shoots are tied. At the end of August flowers are produced, but in the following years they are yielded considerably earlier.

It is necessary that the flowers be gathered perfectly dry: hence if there is seen during the night to be an imminent chance of rain, men are sent into the town at 3 o'clock in the morning to rouse the women and summon them to the farm to pick the flowers before the rain comes. The women are summoned by what is called in *Provence patois* the "gratia," this being a large shell (*coquillage*), which serves as a horn.

In November the plants are earthed-up to a height of 18 inches, so that the base of the grafts may be protected from frost. In the third year, in January, watering is effected by liquid manure, the earth is drawn away from the base of the stem, the stakes are removed, and all the dead branches are pruned. The stakes are removed, and the process of irrigation is practiced as before. The irrigation of the flower farms at Grasse have the right to make use of the sewage of the town, which is collected in cement tanks, and distributed by irrigation. In the early spring, as above stated, the solids of the sewage are applied with the liquid, the sewage being stirred up for the purpose, but during the summer the liquid sewage alone is used for purposes of irrigation. The irrigation for Tuberoses and Jasmies is effected at the rate of 60 litres a minute, or 43,200 litres per diem of twelve hours. A hectare of ground is considered to be sufficiently irrigated in eight days; at each operation then a quantity of water equal to more than 345,000 gallons is made use of. It is calculated by M. Haueyes that 1000 plants of *Jasmin*, grafted and planted in good soil, furnish in the second year after grafting 50 kilogrammes of flowers, but less in poorer soils. In subsequent years the production of flowers is very much larger, so that it is estimated that in the first year 3200 kilogrammes of flowers per hectare are produced; in the second year 5000. The women who pick the flowers get 45 centimes a kilogramme, each kilogramme being sold in the perfume-makers at 2 fr. 25 cent. The general duration of a plantation of *Jasmin* is stated to be fifteen to twenty years. The net annual receipts from a hectare of ground established as a *Jasmin* plantation are estimated to be about 5800 fr., but this is only in favourable seasons—at other times spring frosts, hail, wind, and other causes

greatly diminish the profits. The production of these beautiful perfumes from the foulest of matter, is one familiar enough to the gardener, but the general public hardly realise a fact of so vast practical moment to them, and one which might serve to point many a moral.

Another fact not generally known is, that many perfumes, called Lilac, Heliotrope, Sweet Pea, &c., are not extracted from the plants whose name they bear, and whose fragrance they more or less successfully simulate, but that they are fabricated by the perfumers who cunningly mixes together in certain proportions the essences derived from various flowers, and which when thus blended afford the required fragrance.

THYRSACANTHUS RUTILANS.

Of all plants that flower during the early spring months the above is, I think, without exception, the most graceful and beautiful, and quite unapproachable for its decoration—a purpose for which it is peculiarly adapted, and where it shows off its elegant tub-shaped blooms to the best possible advantage. These are suspended on long thread-like stems, that depend from the tops of the plants in the most graceful manner, and being of a bright scarlet colour the effect is greatly heightened by the contrast of the white cloth length, and the artificial light they are usually seen under. Besides being of such use in the above kind of embellishment, the *Thyrsacanthus rutilans* is particularly suitable for standing in vases on brackets or other elevated positions in rooms, or any situations of that kind, where it can stand clear above other plants. Considering its highly ornamental character, the ease with which it may be grown, and the great length of time it lasts in perfection, it is surprising one so seldom meets with it except where large collections are grown, but were it better known its merits would, I am sure, make it much sought after and more appreciated than it now is.

Those who are not so fortunate as to possess plants of it, will find the present a good time to obtain them for the purpose of growing for themselves, for they are got fresh from the nursery, the best way to do this is to keep the plants rather dry for a week or ten days and in such a position that they can have plenty of sun and light to harden the growth somewhat before taking off the tops to form cuttings. This may then safely be done with the certainty that each will strike, provided it is placed singly in a small pot in sandy soil, the pots being stood where they can get a brisk moist heat such as a propagating box affords. Failing this, the next best situation is to plunge them in damp moss on a slate in the stove, and to cover them with a bell-glass, over which a piece of paper or something of that kind should be laid during the day to keep off the sun. So treated they will soon root, when they will require more light and air to prepare them for shifting into larger pots. These should be 6 inches in diameter, which is the handiest size for table decoration and such-like uses. When required for this kind of work the plants should be grown with single stems, and therefore should not be topped, but allowed to grow to any height they may attain during the summer, which under good management will range from 2 feet to 2 feet 6 inches, and when furnished with their long pendulous flower-stems robed with blossoms and dangling in the graceful manner they always do, form objects of great beauty.

After severing the heads for cuttings, the old plants should be kept dry for a few days till the wound heads over, and then plunged in bottom-heat to induce them to break, when they should be partially shaken out and re-potted in fresh soil consisting principally of fibry loam and well decomposed leaf-mould, in which they greatly delight. Any that may be treated as above, will form several stems, varying in number according to the beds left at the time of cutting them back, and if these are regulated and tied out they will form good specimens for conspicuous places in warm conservatories or green-houses, where they can stand clear of other plants or be elevated above them. During the summer months *Thyrsacanthus* does best in pits or small hot houses plunged in some light loam material such as half-decomposed leaves or cocoa-nut fibre, to prevent a too rapid desiccation of the roots, which is sure to take place unless the pots are protected in some way.

Such subjects as these, and others of a like nature having thick fleshy stems, can always be grown and

made to flower in a much more satisfactory manner when they can be treated apart from the usual occupants of the stove, where as a rule they get a greater amount of shade than is desirable, and which therefore prevents their making that firm mature growth so essential for producing plenty of blossom. In pits or low houses the conditions are favourable to this, as they can have full exposure to sun and light, and are altogether more under control. The only insects that are at all troublesome are the brown or tartle scale, which may readily be got rid of by careful hand-washing, if done before they get from the stems to the leaves, where it is not so easy to dislodge them. Y. S.

Florists' Flowers.

THE WALLFLOWER.—The Wallflower has been termed "that sweet old flower, that has so long dwelt on walls and old ruins, hallowing their mouldering remains." The description is decidedly poetical, but quite true, and many an old piece of wall is beautified in springtime with this good old flower.

It is one of the most extensively grown of our common garden plants. Acres upon acres of the Wallflower are grown round London for supplying the markets of the rich and famous city with fragrant posies in the pleasant springtime. But this season the spikes of rich dark flowers are not being gathered so early as they were some years ago, and the Wallflowers are late in the early spring that so many were inclined to foretell, it is in many of its features a remarkably late one.

He who grows Wallflowers for market is particular in two respects: first, in having a good strain with a low bushy habit; and, secondly, in sowing early in the spring in order to have well established plants by the end of the summer to stand the winter. Any one who has observed the plantations of Wallflowers being grown for market will have noticed the dwarf and stunted bushy growth, the branches insinuating from the stalks almost down to the soil in which they are growing. From the point of each branch, and also from the points of the lateral growths, flowers are given forth, and thus a well-bloomed plant of a dark Wallflower forms a capital bouquet in itself; and as precocity is a matter of considerable importance—for happy is the man who can be first in the market with bunches of Wallflowers—the practice prevails among the market growers of marking a few of the earliest plants to bloom, provided colour and habit can also be had in combination.

Of the common Wallflower there are several varieties, not one of which but deserves a place in the garden. The fine dark-headed strain of the variety grown for market is one; a variety with larger and looser flowers, named Young Blood-red, is another, but it lacks the peculiar branching habit belonging to the market strain. Then there is the dwarf and early yellow flowering type, that is extremely pretty in early spring, and is best known as the Belvoir Castle Dwarf Yellow, plants of which are now to be seen in the Queen's Garden and other markets. When this is quite true in character the stalks and buds should be of a pale whitish green, without any trace of dark about them. This strain is much used by Mr. Ingram in his charming spring garden at Belvoir Castle, Grantham. To have it true to character it should be grown from seed every year, care being taken that it is saved from the correct type. What is known as the Golden Tom Thumb Wallflower is a fine strain for decorative purposes when true to character; the flowers are large, well formed, and of a pure golden-yellow colour. It is of somewhat vigorous growth, and almost too tall to deserve the name of Tom Thumb. It invariably comes very true from seed, and appears as if it had been well selected at the outset.

The German single Wallflowers, so called because the seeds are imported from Germany, supply tints of crimson, blue, purple, yellow, &c., some of which are very attractive, and when grown in beds of mixed colours make a good display. But they are generally deficient in habit, throwing out a thin spike, and having but few side branches. The choice old double kinds, such as the double yellow, double orange, double purple, double dark, &c., good and valuable though they are, are too much banished from our gardens in the present day; still they are occasionally met with in cottage gardens, grown so fine as to fill the observer with envy. These cannot be propagated

by seed like the single varieties, but are increased by cuttings, which root freely when properly managed. Then there is the strain of double German Wallflowers obtained from imported seed, some of which are very large and bold, but of quite a different habit of growth to that of our English double Wallflowers. The German strain is much prized for the large fragrant flowers it produces by those who have a fondness for double flowers, but they are much later in blooming than the English single varieties.

The Wallflower does well in almost any soil, but especially in a good rich sandy loam, where its numerous root fibres can fasten themselves in the soil. The ground intended to be planted should be deeply dug, and so made ready for the plants. A piece of soil that has been manured for a previous crop will do well for Wallflowers.

The market growers sow their seed early in February and March, so as to transplant at the end of April or early in May. It is a good plan to pinch off the top-root up to the fibres, and then the roots are put forth laterally in the soil. Advantage should be taken of showery weather to put the plants out, and the soil should be pressed in firmly about the roots. They soon lay hold of it, and the plants become well established by the time dry summer weather sets in. If transplanting be deferred later, it scarcely gives the plants time to make growth before dry weather comes, and they do not fill out and become nice and bushy.

The cooler and moister the weather at the time the Wallflower blooms, the richer are the crimson flowers that give the blossoms. The flowers of the finest strain of dark Wallflowers will turn yellow when hot dry weather sets in, as it sometimes does in early spring. The more holding the soil the better will be the flowers under any circumstances. The stronger and more firmly rooted the plants the better are they enabled to stand the rigours of winter. R. D.

Foreign Correspondence.

SPARTA: THE KERMES OAK.—I have been making a tour for some months in Greece, and now send you a specimen of the Holly-leaved Oak [*Quercus coccinea*], from the neighbourhood of Anafika, in Laconia, together with the small red gall, which is gathered from it in the summer, and which is still exported from Gythium, as it used to be from Marathonis, near Cape Matapan, in the days of the Phœnicians. This, like the cochineal, is not a natural product of the tree, but results from the attack of an insect, producing a similar result. While the public mind has been much attracted of late to the remarkable discoveries by Dr. Schlieffman of the extraordinary deposits of gold and jewels in the adjoining district of Argolis, in the supposed tombs of Agamemnon and others, it will be no doubt interesting to your readers to find that antiquarian matters of equal interest to them exist in the district of Laconia, celebrated for possessing, amongst others, the historical city of Sparta or Lacedæmon. The shrub in question abounds on the lower spurs of the range of Mount Taitjetum, and more or less through the part of Greece. Referring to this shrub, the late Panopæus writes, "ἡ ἄκρως ἀεικλήσθη φύλην" (*Hist. Plant.*, lib. 2, c. 8) and Pausanias refers to it as follows—"Ἔλας" The leaves are smoother than those of the Lentisk (*σάουρος*), which is equally abundant in the same locality; "but in other respects it resembles that plant." "The fruit is like that of the Nightshade (*σπέρχονος*), but in size is equal to the Yetch (*ἄροβος*). On this there breeds a small insect, which when the fruit is ripe becomes a fly resembling a gnat (*σάουρος*); the fruit of the cocculus is therefore gathered before the fly is hatched, and its blood is then a dye for wool." This is so far correct. It appears, moreover, that the insect has a great preference for the young wood. The berry does not appear, as some have described it, as a fruit would do, but is the result of the puncture of a gall-fly. As the fly seldom visits the plant when large, the mode of attracting it is by burning the bushes, which in consequence send out new shoots near the ground which are frequented by the fly. The gall so produced produces a finer colour, and labour of collectors is centralised. It is interesting to note the statement of Pausanias, that it is used as a dye for wool, as it is now almost confined to the African trade, and is sent to Tunis in order to dye the fez, a woollen cap. It is curious that the plant growing near it, and not, on a casual inspection, dissimilar, bears a somewhat similar name to the *σάουρος*,

viz, the *oxyris* or Leutisk. The Phoenicians, though celebrated for their grand dye, the purple—the use of which by any but imperial persons was forbidden in Rome by repeated edicts—would be only too glad to obtain a substitute, and indeed irrespective of such edicts a commoner dye would be required for the more numerous but poorer persons; and as the berry, described as “*επιρροια*” by ancient writers, was easy of access to the Phoenicians, it is reasonable to assume they would have stations on the coast, as Strabo and others state they had in Britain for the purchase of tin. There are two such settlements, or rather stations bearing their name, “Phoenicus,” close by this district—one near Hydmyd in Messenia, and the other at the eastern side of Cythera, now Cerigo, an island just south of the present place of export. It is interesting to note further that this article still continues in its old channel of commerce, while with us the cochineal is the rich red dye; the Tiansians, almost successors to the Carthaginians, are the great purchasers of the *επιρροια*, as no doubt the Sidonians and Carthaginians were of old. *J. S. Phoid.*

Apiary.

MASSACRE OF DRONES.—This could not escape the notice of ancient naturalists. Pliny and others considered that the drones were stung to death by the workers; but their views of the habits of the insects are too much mixed with the fabulous, in fact they considered that the queen bees were males. This false belief prevailed to the “middle ages.” Hunter, however, mentions the “workers harassing them [drones] to and fro without stinging them,” and nearly the same may be said of Bonnet, while Huber and Reaumur assert the “slaughter of drones is effected by the stings of the workers.” Those who hold this belief consider that the bees insert their stings between the segments of the abdomen of the drones. This, however, does not accord with my former statement of the bees throttling the drones with their mandibles in the vital part under the wings. Those conversant with bees know that they live a considerable time after their abdomens are crushed, nay, severed from their bodies, and the same with wasps. Again, Dunbar and Bevan speak of bees using their stings in combats among themselves. The latter, however, seems to have doubts, because he found the dead bees had their wings, meaning that they generally leave the poisoned darts in the wounds. Now if this be so in their combats with the drones, it would be equally fatal to themselves. Bevan, however, qualifies this a little, at least he observes:—“By allowing the bee to draw out her sting gradually when we ourselves are stung—which, if we have sufficient firmness to remain still she would instinctively do by bringing the barbs close down to the sides of the dart—the life of this insect might be preserved, and pain in the wounded part be much lessened, but the excitement of both parties seldom admits of such forbearance.” When stung by bees I pluck the stings from the wounds, without using prescribed remedies, because the pressure or rubbing when applying them tends only to excite the poison in wounds, as scratching does Nettle stings. *J. Wighton.*

Natural History.

TIME OF ROOKS HATCHING.—Bird nature is in many respects not unlike human nature. Some are precocious and hasty in their combinal arrangements, whilst others are dilatory and backward. Then, again, there are accidents to be encountered—death in the shape of poison, or the gun, often takes away the head of the family or his mate, even before the house is constructed (I picked up four dead birds in one day, under the trees here, that had evidently been poisoned), and a fresh mate has to be sought, and the family arrangements are delayed. During the severe gale that occurred on April 13 last year many of the nests were blown out of the trees, and the helpless young perished. The old birds immediately commenced putting the eggs to rights, and many of the birds, again, and there were young birds in the nest as late as the end of June, and perhaps an odd nest or so later. This year again the hatching is late, and will be very uneven, as during a gale that happened some time ago many nests were blown down. An old man that has worked here more than forty years says the rooks are later in building and hatching than they

used to be. However that may be, there is, I think, no doubt that rooks like ourselves are very much influenced by circumstances over which they have no control. Judging from my own observation, I should say the hatching season here extends from about April 4 to the end of June, according to season and circumstances. *E. Hobday, Ramsey Abbey, Hunts.*

THE STORK.—Our pages have recently contained, *A Propos*, of the great Exhibition at Amsterdam, a descriptive account of the bulb-fields at Haarlem, and of the method of culture there adopted. We have now to mention a gardeners' friend, and one

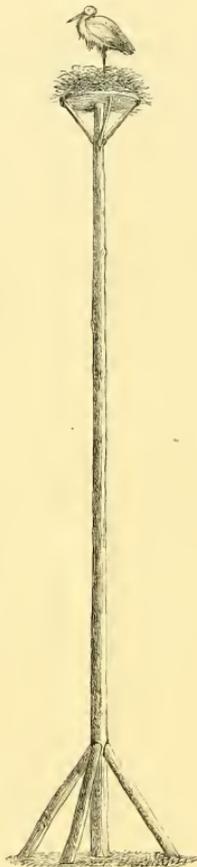

FIG. 94.—STORK'S NEST.

so useful, and so protected by the kindly feeling of the Hollanders, that it would be as great a sacrifice to kill a stork as to shoot an albatross. They are encouraged to build on the hoestops, and among them bulb-gardens may be often seen a tall pole, some 30 feet or so high, set up for the bird to build its nest upon (fig. 94). Curious is it to see the old birds encouraging the timorous young ones in their first flight from the top of one of these poles to the neighbouring house-roof. The stork arrives in Holland from the south early in April, and makes himself useful as scavenger-general, by diminishing the number of frogs, mice, moles, and other gardeners' foes.

EARLY ARRIVALS.—I heard the cockraze on the 3d, and the wyrrneck on the 21. *B. W. Hunts.*

Garden Operations.

PLANT OPERES.

GREENHOUSE HARD-WOODED PLANTS.—With young plants of all the varieties of *Pimelea* it is not advisable to let them bloom where the object is to get them on in size without the shoots, as they will be well now to cut back the shoots without waiting till the flowering is over as in the case of larger plants; if shortened back at the present time it will admit of the young after-growths being stopped once through the summer, and still give time for the shoots to be produced after this getting strong and fully matured before autumn. In the case of *P. spectabilis* especially, if the growth is not commenced sufficiently early in the season there is not time after stopping for the wood to get strong enough. A mistake that is frequently made in the cultivation of these plants, particularly the strongest growers, is not shortening the shoots sufficiently back, by which means, through the short duration of the leaves as compared with many greenhouse plants, they get naked and bare at the bottom—an unsightly condition they are much often seen in than any other hard-wooded subjects; the shoots should be cut back fully one-half from the point to which they were stopped last season. More than most other hard-wooded plants, it is also essential that whilst in a small state the strongest branches should be bent rigid down to the top of the pot, for if this is neglected in their first stages it is next to impossible, from the erect upright nature of the shoots, to accomplish this afterwards. All plants that are thus treated should be freely syringed through the summer, and the atmosphere about them kept as moist as circumstances will permit. Inattention to this is certain to result in the getting infested with red-spider to an extent that completely spoils them. Young stock of other strong-growing plants, such as *Chorozemas*, *Polygalas*, *Acanthas*, and *Eriostemons*, should be similarly cut back, and the strong growths kept tied to the stem. *Leschenalia biloba* ought also to have the shoots shortened; *L. formosa* and *L. intermedia*, being naturally of a more branching habit, do not require so much stopping, but in their case the strong growths should be kept tied out, which tends to throw more vigour into the weaker ones. Regularly attended to the training of all twining plants, such as *Kennedias* and *Gompholobiums*, so that their shoots are not allowed to become entangled; if neglected at a few weeks at this season extra labour is entailed, as well as injury to the growth. Young plants of *Daphne indica* that have been in a little heat for the last six or eight weeks, and that are in strong condition, should now have the points of the young growths pinched out; the after breaks will furnish them better than if allowed to go on without stopping. The different varieties of *Statice* should also be similarly treated as to warmth, by which means they will make as much progress in one season as they would in two with ordinary greenhouse temperature. Give them the lightest position the house or pit they are in will afford, with a thin shade when the sun is powerful. These, especially the more erect habited kinds, like *S. Holfordii*, must have their shoots attentively regulated, or from their upright tendency they soon become unsightly. The wood, although of a sturbon nature, will bend, the principal difficulty being in preventing their splitting in the forks of the shoots, to stop which they should be braced together with a strong bast. Use the syringe freely to these, as they are subject to thrips, aphides, and spider.

SOFT-WOODED GREENHOUSE PLANTS.—*Kalanthes*, for conservatory and greenhouse decoration.—There are few more effective plants than these for flowering in small or moderate sized examples, lasting, as they do, for a considerable time, and coming in at a season when the majority of spring blooming subjects are over. If grown in numbers as they deserve to be, they give variety to the sameness which too great quantities of *Fuchsias* and *Zonal Perargoniums* present. They strike readily in any part of the growing season. There is no better time than the present, if strong shoots that have not formed flowers are now taken off about 6 inches in length, and inserted singly in 3-inch pots, or if the object is to bloom them next year it will be well to put half-dozens in 6-inch pots. When well rooted give them a shift, and stand out-of-doors in the full sun. During the summer the growth will get ripened so as to ensure their flowering. Tropaeolums of the *Tricolorum* section should have their shoots kept trained so as to furnish the bottom of the trellis, or whatever support is given them. Seeds of these useful plants should now be sown in heat; they will make nice blooming stock in two years. They may also be propagated from cuttings. Large plants of *Calla schlipocarpa* may now be divided and planted out in light rich soil; they should be where their requirements for water are not likely to be overlooked, for, upon being duly supplied with this depends much of their ability to acquire strength,

which will enable them to bloom well the coming winter and spring. For general purposes they are much more effective grown in single pots than in pans, than a few large specimens. Planted out during the summer, lifted and potted in autumn, their growth is much more compact than when confined altogether to pots. *Chrysanthemums* should now shortly be required to begin flowering, and it is necessary to produce runners, more or less, according to the shape they are to be grown in; one-fifth of manure will not be too much, added to good loam and a moderate amount of sand. Pot firm, and in many cases they are better sown in a separate pot to which, syringe freely as soon as they have got fairly to growth. *T. Britica.*

ORCHIDS.—Whilst the *Odontoglossum-house* is now gay with many fine and showy varieties, more especially those of the *Alexandre*, *Pescadore*, and *triumphant* type, it will also be advisable to have a look forward to those of a different stamp that flower later on in the season. Where a number of plants of *Alexandre* are grown, so free and accommodating is it that all the year round there will scarcely be a week past but what some spikes of this will either be in flower or getting well advanced in bud; this, however, cannot be said of many of the others, and so long when the buds of any sort commences, it must be treated with care, so that in due time the desired spikes of flowers may be produced. Where a fine variety of *O. bicinctum* has been obtained, it is well worth growing; its tall, upright spikes, and the colour of the flowers, together with its very attractive blossoms; there are, however, some varieties of this that are so deficient in colour, and the flowers of such small dimensions, as to be quite worthless. Plants of *O. granatum* will be doing well; they need little water, and *O. Inesleyi*, and the *leopardinum* variety of this latter, to see that, as the breaks push up and the leaves expand, no water lodges in the heart of the breaks, for though when growing they may have a good deal of water, they are so very open and loose, it should run quickly away from them, otherwise the stout fleshy roots are very liable to turn black and rot, and when the roots of these are once checked, whether by rotting or by being injured in any way, they do not start rooting again so readily and freely as many of the smaller rooting species. *O. hastulatum* is a stately and beautiful one for summer and early autumn. This does not, however, always do quite satisfactorily with the same treatment as is given to the others; and if it is placed in the cool end of the *Cattleya-house* the few extra degrees of heat will help it to form finer bulbs and stouter leaves. The small-growing *O. Rossi majus* is one that, on account of its long lasting quality, should be obtained. In flowering, it is necessary during the winter months, the blooms will remain in freshness and purity for a period of from eight to ten weeks. This can be grown very nicely in small pots and hung up on the roof, but when such choice sorts are suspended in such a position it will be more incumbent upon those who have charge of them to see that they are not overlooked in the matter of water and cleaning. The young breaks of this, and, in fact, of many of the others, are liable to be attacked with yellow-tips; this increases so rapidly and injures the tender leaves so much that as soon as any such happens to be seen, the breaks must be carefully sponged, and in doing so hold the plants on their sides, then as the fly gets disturbed they will fall to the ground. If this precaution is not taken they will quickly run down the shoots and hide away among the roots and bulbs, and the plants in a day or two will be as bad as ever. At best they will need to be gone over once or twice a year, but with a little perseverance they will soon be got rid of. Should any yellow thrrips make their appearance in the hearts of any of the plants, pull a little tobacco dust in the centre of the young growth; this they cannot stand, and it will soon clear them away. On days, however, when the leaves have come up a bit higher, go over them carefully and sponge the dust clean off. *W. Spoon, Fallowfield.*

FRUIT TREES.

VINES. The long-winded-for change from dark gloomy weather to brilliant sunshine has already brought about a great improvement in forcing-houses. Vines especially have made rapid progress, and where the early closing principle has been followed up, firing will have been considerably reduced, notwithstanding the low night temperatures which still prevails. After so much hard firing red-spider must be closely watched, and if the inside borders have not been copiously watered, it will soon become troublesome, as the syringe in the hands of some is not used with a judicious hand. Early Grapes now ripe or approaching that stage will require just sufficient artificial heat to keep up a circulation of dry, warm air, and to prevent the temperature from falling below 58° at night. Gradually reduce manure but do not discontinue the damping of walls and floors on fine days, and ply the syringe freely to the foliage as the crop is cleared. In old houses the

small spinning-spides are often very troublesome amongst ripe Grapes, and must be prevented from getting on to the bunches, or, otherwise, they will soon disfigure the delicate bloom. Lady Downe's, Kempsey Alicante, and other shy-setting late-keeping kinds, should be treated as Muscats until the fruit is set, when the usual methods may be followed. We should have less frequently of Lady Downe's shrinking after removal from the Vines if they were encouraged forward with a little heat early in the spring. Muscats have set well in a temperature of 60°; also a certain number of the Hambrogs, which are not so quickly quenched by a bottom-heat of 60°. The Hambrogs may be thinned as soon as they are out of bloom, but Muscats should stand over for a few days to allow the perfectly fertilised berries to take.

Pot Vines which are intended for fruiting next year should now receive the final shift into 12 or 14-inch pots. Use good turfy loam and crushed bones somewhat dry, and let it be warmed before it is placed against the young roots. Shade from bright sunshine, and give but little water until fresh rootation sets in, when short-jointed wood must be secured by full exposure to light near the glass, plenty of air in the fore part of the day, and watering being continued with a moderate charge with ammoniacal fresh horse-dung. *W. Coleman, Eastnor.*

PEACHES and NECTARINES.—During the period which precedes that of the last stage of development in the fruit of these trees, every precaution should be taken in the way of freeing the foliage, &c., as far as possible of insect pests, being in the degree of excellence attainable in this form in the present season, and the fruit is so delicate that the leaves at this time. The most formidable enemy to contend with now will be that almost inextinguishable foe, the red-spider. If this pest does in the least degree abound now, it should be dislodged from the plants, as when springing must necessarily be somewhat abated. It often happens that even where a well-directed course of syringing is regularly observed at this pest, which in general infests the wider and more tender side of the leaves, will, and hereabouts will increase rapidly, and is spread unnoticed until severe havoc is made. This is more especially the case in houses where the trellis is near the glass, and the direction of the syringing is in the wrong way, and the light heat these should be lifted, and a forcible drenching be given from an engine, otherwise the water should be plied rapidly against the glass from inside the house. This, however, is not so the case with the fruit, and in many instances it can be had much more profusely by giving a little timely attention to such fruits as are placed on the weaker branches, which as the fruit increases will be naturally inclined to be so, to an untoward position for the purpose. Those fruits which are so situated, and will admit of being raised "carefully," should be elevated by placing them across the trellis and underneath them a thin pliable piece of cloth that will admit of their being operated fully and freely about them. As the colouring process is proceeding take advantage of favourable conditions to freely ventilate, and at this time somewhat drier atmospheric state will be beneficial. Maintain the temperature at night at about 65°, slightly open the house at top at 70°, and increase or diminish the supply of air throughout the day according to existing circumstances, and if these permit leave a chink of air on constantly. Proceed with the syringing of the fruit in the same manner as all exuberant growths checked; as the lateral shoots advance stop these above the first leaf; keep the mulching materials constantly moist, and the border containing the roots in the same condition. I hereby intimate that I am not a party to any of the proceedings hereinafter mentioned. *G. T. Miles, Wycombe Abbey.*

MELONS.—The early Melons are now swelling to a large size, and an excellent variety, the *Victoria of Bath*, is the first to show signs of setting. If not already done, the supports should be placed under them at once, as they never swell so kindly when their weight is supported entirely by the vines. Small pieces of deal boards 6 to inches square, suspended by a cord on a sloping position to prevent lodgment of water, best answer the purpose. The extra firing occasioned by the cold, unless weather having been favourable to the spread of red-spider in houses where a portion of the soil is not oblong, and the cement materials, the cultivator must be constantly on the watch, with the usual remedies for its extermination, as good Melons cannot be expected if the foliage ripens before the fruit. In good hands, the red-spider is prevented from doing much mischief, but the enemy, from making headway. Successions are now setting a profession of clean healthy fruit, and will require similar treatment to that recommended for the early crops. If the plants are not supplied with water as the fruit begins to swell; but if planted out on hills watering should be deferred

until they have attained to about the size of Walnuts, when the cutting and thinning of the laterals may be once more resumed.

Melons in frames must have abundance of light and full exposure to sunshine. Ventilate with caution until you have a chance to milder weather; close shut half-past two in the evening, and open the glazing when the fruit begins to swell. Keep up the linings, as Melons worn eating cannot be grown without heat, and use good dry mats for covering at night. Take advantage of a mild day for the setting of fruit; if still in bloom then use a warm and rank soil, and apply a fork for canker at the base of the stem, and watch a mixture of quicklime and sulphur. *W. Coleman, Eastnor.*

KITCHEN GARDEN.

The cold, sunless, and inclement weather of the last few weeks appears to have given a very retarding effect upon vegetation generally, but more particularly upon the young advancing plants of spring-sown crops, which are stagnated to an unusual extent, and not able to grow away out of the reach of frost, or vermin, have not for several years been the cause of so full of worms and slugs, and unless a relentless war is proclaimed against them we must not look for very great success with the tender young crops; since the want of a warmer and more genial atmosphere, to stimulate growth, is especially exposed to their ravages. Hence there has seldom occurred a season in which the liberal application of quicklime to all plots of ground in process of preparation for future cropping, is more likely to do good, than in the present season. The same must also be persevered in amongst all growing crops, to which also constant attention must be paid in regard to surface stirring in all departments, which is not only very favorable to the growth of the crops, by opening the soil to atmospheric influence, but disturbs and assists in the destruction of vermin.

If the early-sown main crops of Parsnips, Carrots, Onions, &c., appear likely to be deficient in quantity, no time should be lost in getting in a compensating later crop. Successional sowings of Peas in trenches with manure, for which such sorts as *Ne Plus Ultra*, Knight's Tall Marrow, and Calverwell's Prolific Marrow are well suited, should be got in. As this may be called a main sowing, and in such a way as when the crop is wanted, should double the usual quantity should be sown; and if the system of cropping will admit of very wide spaces between the rows there will be no fear of an abundant produce, particularly if, as they are sown, they are well kept well watered, & dry weather. Another good sowing of Broad Windsor or Early Longpod Beans should be got in; here also the quantity should be increased, as it will soon be getting too late to sow with advantage, for the purpose of obtaining several successional sowings of Lettuces and other salad requisites. Advancing crops also will require attention in thinning-out and transplanting, and liberal supplies of water will be necessary to keep them in a growing; and succulent state. Cucumbers and Melons, if Marrows sown in the frame some time back will now be ready to transplant on the ridges, which should be prepared at once, and the plants should be shaded at first, and have the protection of hand-lights until they are well established. It will soon be safe to plant out Tomatos against the open walls, for which purpose they should now be under a process of hardening off. Chillies and Capsicums supply depends upon the same rule where they are too much under the same rule, but are much more profitably cultivated under glass. Bary and Sweet Basil should now be hardening off for planting under a south wall. The pricking out of the various seedlings of the young plants should be done as fast as they become large enough; this is preferable to having them so thick in the seed-beds as to become drawn. The hoe or tormentor should now be at work in dry weather amongst the main crops of Potatoes, not only for the prevention of weeds, but also for opening up the soil to the influence of the sun and wind.

The planting out of new beds of Asparagus is by many practical gardeners deferred to this season of the year, when the plants have more time to settle, and the practice is a good one, as when the operation is carefully performed the beds will be well furnished throughout, as the plants will grow off at once in a well-prepared soil, and soon become better established than those that have been in the ground for a long time in the cold earth for a couple of months. The preparation of the beds will consist of deeply trenching the soil, and incorporating therewith a liberal supply of rich manure; during the winter a spring of the beds should be frequently forked over, and if necessary broken up and pulverised. A moist day should be selected for planting, an operation which should be carried out as quickly as possible when once the plants are lifted, as the roots will very soon begin to expand, and be blown and sun. After planting the beds should be liberally covered over with some rich, well-decayed manure and should receive a slight sprinkling of salt. *John Cox, Rolford.*

THE
Gardeners' Chronicle.

SATURDAY, MAY 12, 1877.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	May 14	Sale of Imported Orchids at Stevens' Rooms. Sale of Imported Greenhouse Plants at Stevens' Rooms.
TUESDAY,	May 15	Floral Committee Meeting of the Fruit and Floral Committees at 11, and Scientific Committee at 17, Royal Botanic Society: Summer Exhibition, Royal Botanic Society: Orchids at Stevens' Rooms.
WEDNESDAY,	May 16	Royal Manchester Botanical and Horticultural Societies: Grand Whitestone Exhibition (seven days).
FRIDAY,	May 18	

THE town of Hull was one of the first to establish a public garden for the instruction and recreation of its inhabitants, and the HULL BOTANIC GARDEN has long enjoyed a well-earned reputation, to which the labours of its present Curator, Mr. J. C. NIVEN, during many years, has not a little contributed. The old garden has, however, from another point of view, been gradually falling in the fulfilment of its mission, and has, indeed, almost entirely ceased to answer the purposes for which it was established, being almost crowded out by bricks and mortar. From the rapid growth of the town it has become surrounded by houses and submerged in a smoky atmosphere, whilst its position, so long as it occupies its present limited site of six acres or thereabouts, cuts off all hope of its being enlarged, and thus in some measure increasing, or at least retaining, its former usefulness. The time has therefore come, and this has been well urged in the comments of the local press, when the town must either be deprived of a public garden altogether, or else must set about providing a new one better adapted to its present requirements. The proprietors of the present garden have, it appears, determined to wind up the present Company; and the scheme for acquiring a more open and favourable site has been so far advanced that plans have been prepared and negotiations entered upon for the purchase of the ground.

The site selected for the new garden is the best to be found in the neighbourhood. It forms a triangle whose base is the line of the Cemetery, the dense plantations of which will afford ample shelter from the northerly blasts; the other two sides being bounded by the Beverley Railway line on the one hand, and the Hornsea and Withernsea line on the other. Within these limits is contained an area of 56 acres, which, with the exception of a small portion to be sold for villa sites, it is intended to devote to the purposes of the new garden, so that, including the cemetery and the railway lines, there is a space of more than 100 acres open for ever; and should the site, as possibly it may, at some future day become encircled by a widely extending town, it will be invaluable as a gigantic lung, and thus contribute largely to the health and well-being of the inhabitants.

The plan proposed to be adopted, and which we have reproduced at fig. 96, p. 599, has been prepared by Mr. NIVEN, who has evidently grasped his father's mantle, and proved himself a worthy son of the venerable landscape gardener of Dublin, Mr. NINIAN NIVEN. The plan indicates a breadth of conception which is highly creditable to him as a landscape artist. It is thus described by the *Eastern Morning News*:—

"A noble structure of glass, 400 feet long, will form the important feature of the place, and this, raised upon an ample terrace and flanked with smaller houses running north and south, will enclose a quadrangle of nearly 2 acres in extent, which will show out from the public view all the arrangements for the necessary manipulating processes. A vision of Palms with their graceful foliage, Tree Ferns and glorious Water Lilies—*azuræ*, erismone, and white—rises before us as we contemplate the proposed design for this noble structure; and fondly

do we hope, and, indeed, we have every faith, that a vision so agreeable will not prove visionary. Fronting this small crystal palace will be an extensive flower garden, arranged in sunken panels, where *Flora* will doubtless hold an undivided sway. An extensive lawn, nearly the size of the present garden, with an orchestra and refreshment saloon combined, where 20,000 or 30,000 people may find ample rooming, will be the central feature in the garden, and towards the apex of the triangle it is proposed to have a large sheet of water, surrounded by *Rhododendrons* and spanned by rustic bridges, of sufficient capacity, we apprehend, for boating purposes during the summer, and qualified to form a winter natural skating rink. Doubtless with the large extent of land available portions will be set apart for archery clubs, lawn tennis, croquet, and various other outdoor games, amongst which a good bowling-green would be a source of amusement, and would soon popularise a game at present little known in the East Riding. Alike, too, as a novelty would be a maze or labyrinth, to which, as shown on the plan, the north-west triangular corner may be devoted, where the seclusion of FAIR ROSAMOND'S bower and the stories of the siltken thread may at some future time be realised."

But, besides these provisions for mere amusement and healthful recreation, a goodly extent of ground is to be devoted to botanical purposes. A large collection of hardy plants, arranged in their natural orders, is intended to be introduced, which will afford the student ample and varied illustrations ready to his hand; groups of interesting trees and shrubs will be interspersed through the plantations, adding to the natural beauty of the place a botanical interest as well. It is further proposed to erect a building on the north side of the crystal quadrangle, which will answer the combined purposes of a council-room, lecture-hall, museum, and botanical library.

Most heartily do we wish success to a scheme which will tend to improve and elevate the town, as well as contribute to the healthy recreation of the inhabitants. A horticultural establishment, such as the proposed garden will be, has a very strong claim on the support of not only the inhabitants of the town, but of the entire East Riding of Yorkshire, whose large landed proprietors should willingly lend a helping hand should it be required.

The scheme for the establishment of a new garden was laid before the proprietors of the present garden at their annual meeting on the 2d inst., this being preliminary to a town's meeting being called. The difficulty, which at one time threatened to be a serious one, of getting all the proprietors to acquiesce in the sale of the present garden, has been surmounted, and the large majority of the proprietors here, as we have already mentioned, decided to wind up the present concern, with the object of facilitating the bringing out of the new scheme, which appears to have every prospect of being carried out, as about £6000 capital has been already promised, and there are numerous applications for the building sites.

We gather from the *Hull News*, that the capital of the new company is proposed to be £30,000 in 3000 £10 shares, but seeing that a large amount is derived from the sale of that portion of the land devoted to building sites, when such a sale is completed the capital required will not exceed £15,000. These sites, however, will not acquire their full value until the garden has become some little time established. A prospectus of the new corporation will shortly be issued.

— ABOUT the end of February last we were favoured by Mr. W. J. CROSS, gardener to Lady ASHBURTON, Melchet Court, Romey, a photograph of a fine example of the showy and useful *CELOCYCLE CHRISATA*. The specimen (fig. 95) bore some twenty-five spikes, or about 150 flowers, and measured about 5 feet over. Some ten or twelve years ago the plant was growing in a 6-inch pot, and that it should now occupy one 30 inches in diameter speaks well in Mr. CROSS' favour as a grower. The rustic pot it is seen growing in is mentioned by Mr. CROSS as being externally a good imitation of Elm bark. It was made by Mr. JOHN MATTHEWS.

— The son of one of our most respected nurserymen has again distinguished himself at the University of London. Mr. JOHN NEVILLE KEYNES, of Pembroke College, Cambridge, has at the M.A. examination secured the medal for Moral Philosophy.

— On the 23d inst. several of the leading nurserymen and florists of Edinburgh took advantage of the annual visit to Scotland made by Mr. JOHN KEYNES, of Salisbury, to invite the veteran florist to a complimentary supper at the Albert Hotel. The chair was taken by Mr. JOHN DOWNIE, and Mr. DAVID SYMES acted as croupier. The Chairman, in proposing the health of Mr. KEYNES, alluded to his long and successful career as an exhibitor, and to the high esteem in which he is held amongst florists, whilst the fact of his being at the present time Mayor of Salisbury proved conclusively that his fellow townsmen were not unmindful of his high character, and of the long services which he has rendered to the town in its municipal government. Mr. DOWNIE concluded by expressing a hope that Mr. KEYNES would be long spared to come among them. Mr. KEYNES replied in suitable terms, and said that he deeply felt the gratifying honour his brother florists had paid to him.

— We have received for publication the following copy of a letter received by the President of the Royal Horticultural Society from Sir T. M. BINDULPH, relative to the QUEEN'S VISIT TO THE GARDENS on the 2d inst. :—

"Buckingham Palace, May 2, 1877.

"DEAR LORD ABERDARE, — I have been desired by the QUEEN to express to you and to the Council of the Horticultural Society how much Her Majesty admired the magnificent exhibition of flowers and fruit displayed in the gardens to-day, when Her MAJESTY visited them with Princess BEATRICE and the Duchess of EDINBURGH.

"The QUEEN also was much satisfied with the arrangements made for her reception. — I am truly yours,

"T. M. BINDULPH.

"The Lord ABERDARE, &c."

— At a special meeting of the Scilly Isles Agricultural Society, held on May 1, at St. Mary's, several prizes were awarded for the best fifty heads of ASPARAGUS. The 1st prize was awarded to Mr. BARNES, of Holy Vale, St. Mary's, whose fifty heads measured 8 inches in length, and weighed 5 lb. 12 oz. Four lots were shown, the united weight of the 200 heads being 22 lb. 8 oz. One of the heads measured 3½ inches round and weighed 3½ oz. Prizes were also awarded for Asparagus at the meeting of the Society held in March. The Asparagus season began in the Scilly Isles in February, when the first cutting from the open air was made. It is now drawing to a close.

— Mr. THOMAS SHINGLES, lately of Bicton, has been appointed to succeed the late Mr. CRAM in the management of the gardens at Tortworth Court, Gloucestershire.

— We observe that the Rev. M. J. BEKKELEY, M.A. and Dr. MAXWELL MASTERS, F.R.S., have been re-elected Examiners in Botany and Vegetable Physiology to the University of London.

— In the Royal Nurseries, Acton, Messrs. JOHN STANDISH & Co. have a house containing four plants of STEPHANOTIS FLORIBUNDA, on which there are now over 1100 trusses of flowers, some of which have from twenty to thirty flowers in a truss. Such a sight is not often seen, and we are sure Messrs. STANDISH & Co. will be pleased to show it to any one who may care to pay a visit to the nurseries.

— In all probability a magnificent display of OPONTOGLOSSUM VEXILLARUM will be on view at Mr. BULL'S nursery next week. No less than about 150 plants will then be in bloom, and the number of flowers on the spikes varies from three to seven. In the matter of colour, too, there are great variations.

— Mr. JOHN KIRK has been appointed gardener to Lord BOLTON, Bolton Hall, Yorkshire.

— We have recently had an opportunity of seeing the new ROSE QUEEN OF BEDDERS, which Mr. NOBLE has advertised by means of a coloured plate in our

last number. Judging from the starchy nature of the stock and the abundant blossoms it is now throwing up it may be considered as likely to prove a good feeder, the flowers now produced as well as those borne late in the season are, as we learn from Mr. NOBLE, of the brilliant crimson tint shown in the plate, which is from a drawing by Mrs. DUFFIELD, but in the height of summer the colour takes on more of the purple or rosy hue. For the purpose indicated, namely, flowering in beds, it is no doubt well adapted.

— The following Orchids are flowering at the present time in Mr. H. G. ELLIOTT'S choice collection at Hackney:—*Cymbidium eburneum*, *Phalenopsis amabilis*, *grandiflora*, *Lil. Demianiana*, *rosea*, *Schilleriana*, and *Mammil*, with thirty flowers; *Cypripedium barbatum*, *barbatum biflorum*, *niveum*, and

dium caudatum, with twelve flowers, while *Saccolabium guttatum*, *Cattleya Mendelli*, and *Odontoglossum vexillarium* were also conspicuous in this excellent collection. A silver medal was most deservedly awarded.

— We learn from Messrs. WILLIAM PAUL & SON, Waltham Cross, that their collection of Roses in pots under glass, numbering some hundreds of plants, is now coming into bloom, and promises a fine display of flowers. The proprietors will have much pleasure in showing the plants to any one who may favour the nurseries with a visit.

— French papers record the death, in his 56th year, and on April 14, of M. AUGUSTE RIVIÈRE, the Superintendent of the Luxembourg Gardens in Paris. The gardens under his charge, and specially

as much as almost the whole of the prizes are offered by members of the seed trade or friends of Potato culture, and the Royal Aquarium Company. Out of a total of fifty-seven prizes not less than fifty are thus provided for, leaving only the small sum of about nine guineas to be found by the committee. In this respect the support received from the trade has been most encouraging, and shows how cheerfully that support will be given if the object be meritorious, and the promoters worthy of confidence. It is worthy of remark that, out of the large number of trade donors, only two insist upon the condition to close their donations against fellow-members of the trade; and so strong is the objection felt against these conditions, that the committee, strong in the liberal support they have so far received, have resolved to have none but open classes next year. The comparatively small amount of the prizes to be

FIG. 95.—*COELOGYNE CRISTATA*.

concolor; *Lælia cinnabarina*, *Aerides Warneri*, *Saccolabium carvifolium*; *Dendrobium Barberianum* (a fine variety), *crystallinum*, *Devonianum*, *nobile*, *thyriflorum*; *Cattleya Mossie*, *Odontoglossum vexillarium* (several nice spikes), *Rochila*, *Alexandra*, *membranaceum*, *gloriosum*, *Pescatorei*, *triumphans*, *septentrionem*, *niveum majus*, and *Andersonianum*, the latter being the finest variety Professor REICHENBACH says he has seen; *Masdevallia Harryana*, *Veitchii*, *ignea*, *Peristeria*, and *Benedicti*; *Oncidium nubigenum*, *Krameri*, and *Papilio*; and *Sophrontes grandiflora*.

— At the late exhibition at South Kensington a group of some forty or fifty fine specimens of Orchids was exhibited by J. G. HEPPEN, Esq., Sidcup Place, Kent (Mr. LOVELAND, gr.), and which we omitted to notice in our last issue. Mr. HEPPEN has but recently entered the horticultural arena, but what plants he has shown hitherto have been in splendid condition, and we believe a brilliant career as an exhibitor is before him. Among the plants staged we noticed a fine specimen of *Cypripedium*

the collections of Orchids and Bromeliads, were particularly noteworthy. M. RIVIÈRE was a man of marked intelligence—one who felt that a plant was a thing to be studied, and not merely grown. In consequence horticultural literature, and the meetings of horticultural societies were enriched by frequent pertinent observations from him. In a letter received from him but a few weeks since, he entered into some detail as to the plan of a memoir that he was drawing up on the Bamboos cultivated in France, and especially those in Algeria.

— The show of bloom of that almost unrivalled Orchid, *Lælia majalis*, promises to be finer with Messrs. JAMES BACKHOUSE & SON this season than they have ever known. One plant has two blooms from one stalk.

— The schedule of prizes of the International POTATO EXHIBITION to be held at the ROYAL AQUARIUM, Westminster, in October next, now being issued, is somewhat unique in its character, in-

provided by the committee, however, does not render a liberal subscription list any the less necessary, as the expenses incidental to the exhibition are large, and for the past two years have left a considerable deficit that has been provided for by a few members of that body. Only considerations of expense have prevented the carrying out of the proposal to have a good vegetable competition also with the Potatoes; and if the prizes and other necessary funds are forthcoming, the committee will be only too pleased to add such competition to their present specific work.

— The *Florist* has a coloured plate representing the PREMIER PEACH, a fine variety raised a few years since in the Royal Gardens, Frogmore, as the result of a cross between the *Grosse Mignonne* and *Belle-garde*. The fruit is large, round, and of even outline, with a slight suture extending generally to the apex; the skin is purplish red, becoming very dark when fully exposed to the sun, and often having spots and blotches of dark red on the shady side and near the base. The flesh is tender, juicy, and melt-

ing, with a delicious flavour, and the flesh peels freely from the stone. It is not subject to mildew, and is generally free from the other ills to which Peach trees are subject.

— The WHEAT RUST appears to have found its way to California. In a paper read before the San Francisco Microscopical Society (April 5, 1877), Dr. H. W. HARKNESS alluded to the great injury occasioned to the Wheat crop by *Erysiphe graminis*, D. C. He says:—"The pest, which appears for the first time this spring, termed by the farmers 'white rust,' or 'mildew,' is one which may well excite the fears of the agriculturist. It has already invaded the more mature fields within the limits of four or more of our heaviest grain-producing counties, where at least a half million acres of Wheat are in great peril, some of it already destroyed."

— We are pleased to hear that the annual White-side exhibition of the ROYAL MANCHESTER BOTANICAL AND HORTICULTURAL SOCIETY, which opens on Friday next, promises to be one of the—probably the finest of the series which has been held.

— LOVERS OF NOBLE TREES, and especially of those which have artistic associations, observes the *Athenaeum*, will regret to learn that one of the magnificent Elms in front of the Manor House at Chiswick, a tree which POPE and HOGARTH must have known quite well, and which the latter drew in the etching styled "Mr. RANBY'S HOUSE at Chiswick," was blown down in a late gale. Mr. RANBY was Surgeon to the King; he attended Sir R. WALFORD in his last illness, and is said to have sat to HOGARTH for the hero of "A Rake's Progress," probably in the marriage-scene. He was much in the confidence of GEORGE II., and attended at the battle of Dettingen; and is often mentioned in memoirs of the time, and was buried in Chelsea Hospital, near CHELSEAN.

— The *Revue d'Horticulture Belge* for the present month contains a coloured plate of ANTHONY DARWINI TESSELMAN, a variety with yellow mottled leaves, and red flowers. It is stated that this variety was obtained as a graft hybrid between A. Darwini and A. Thompsoni, the former having been grafted on the latter.

— The Swiss Government has made a proposal to the Vine growing countries of Europe to establish an International Congress to devise means of defence and mutual security against the ravages of the PHYLLOXERA.

— The opening lecture of the BOTANICAL CLASS in the UNIVERSITY OF EDINBURGH was delivered on the 1st inst. by Professor BALFOUR, for the thirty-second time, at the Royal Botanic Garden. Notwithstanding the early hour (8 A.M.) and the frosty morning (27° Fahr.), there was a large attendance, many being scarcely able to find standing room. The lecture hall, which is only seated for about 250, ought to be greatly extended. The enrolled students in 1874 numbered 354; in 1875, 343; and in 1876, 343. The walls of the hall were covered with large water-colour drawings illustrating different forms of vegetation, from the microscopic moving spore, to the giant productions of tropical countries. On the tables were arranged numerous living plants in pots, including many of medicinal and economic value. Amongst them were Winter's Bark, Chocolate, Tea, Coffee, Sugar-cane, Breadfruit, Cow-tree, Banana, Date, Ipecacuan, Pepper, Cocchineal-Cactus, Lignum-vitæ, Cassava, Oil Palm, Gum Arabic, Balsam of Peru, Quassia, Socotra Aloe, Camphor, Rice-paper, New Zealand Flax, Indiarubber, Gutta-percha, Blue Gum, Allspice, Sarsaparilla, and a large plant of Coca (*Erythroxylon Coca*) in fine foliage and flower. There were also on the table flowering plants of *Duringtonia californica*, *Sarcocolla flava*, *S. purpurea*, *Bowditchia volubilis*, and *Rhododendron Edgeworthii*, the flowers of which filled the room with a delightful perfume.

— The last number of the *Bulletin d'Arboriculture* contains a coloured plate of a PEAR called Monchallard, a suitable variety for market purposes, bearing well, and capable of transport without injury. The tree is vigorous habit, the fruit of medium size, turbinate, the peduncle is long, inserted vertically in a

shallow basin. The skin is thin, yellow, dotted with greyish green spots, and slightly flesh-coloured on the sunny side. The flesh is delicate white, melting, sugary, with a slight acid and aromatic flavour. The fruit is ripe in August and September. The Pear is of French origin.

— MESSRS. GEORGE JACKMAN & SON'S EXHIBITION OF CLIMATES, which opened on the 21 of this month, is held as usual in the long corridor in the Botanic Gardens, Regent's Park, and comprises a collection of about 250 plants, which are well worthy of inspection, though the collection as a whole is scarcely so advanced in flower as usual, owing to the sunless spring. Among the newer flowers the most noticeable are Mrs. Hope, a handsome, vigorous plant of the languinous type, satiny-mauve in colour, with a slightly darker bar; Maiden's Blush, a large-flowered variety of the patens type, of a delicate bluish-white colour, the bar rose lilac at the base, and of a creamy colour; Robert Hamby, with bold, well-filled flowers of the languinous group, in colour a bluish-lilac, flushed at the edge with a reddish purple, and having the bar tinted with the same; Duchess of Teck, also of the languinous type, is a pure white six-sepal flower; when freshly opened it has a faint mauve bar down the centre. Amongst older and better known kinds the following, amongst others, are in good form:—Aurelian, Fair Rosamond, the Queen, the Countess of Lovelace, Lady Caroline Nevill (probably the most striking plant in the collection), Lucie Lemoine, Yesta, and Sensation. The exhibition will be open for another week or two, and will be in better condition next week as a consequence of the improvement in the weather.

— The annual dinner of the INSTITUTION OF SURVEYORS will take place after the annual general meeting, on Monday, May 28, at the Freemason's Tavern. Members and Associates who propose to be present are requested to intimate their intention to the Secretary.

— A local paper reports that a CONCERT was recently given at the MELCHET PARISH SCHOOL-ROOMS, under the leadership of Mr. W. CROSS, of Melchet Court Gardens. In addition to being a first-class gardener Mr. CROSS is also an excellent musician, and finds time during the winter evenings, not only to cultivate a taste of music for his own pleasure, but also to conduct a class composed of school-garden young men and servants and *employés* on the estate. In this direction, in an out-of-the-way and somewhat secluded locality, it is found possible to provide for both the head-gardener and his young men a source of recreation and enjoyment of the most elevating kind, from which, by reason of the distance large gardens are generally removed from populous centres, gardeners are too often debarred. All head-gardeners are not musicians, and unfortunately too few cultivate any kind of literary accomplishment; they are, therefore, thrown upon very meagre resources for finding suitable pastime and recreation. It is well to enforce study upon young gardeners to a certain extent, but this is of little use unless their immediate superior is capable of giving them some practical instruction and assistance; but combined exertion to acquire theoretical knowledge on the part of head and assistants would result in a considerable amount of good. One or two evenings per week devoted to literary labours of a studious kind, and an equal portion of time devoted to the requirement of some useful accomplishment, such as music, drawing, reading aloud, &c., would tend to make the often solitary life of gardeners much more pleasant and endurable than it is the case now.

— According to a statement made to the French Senate, and reported in the *Journal Officiel de la République Française*, the area of VINEYARDS AFFECTED BY PHYLLOXERA now amounts to 200,000 hectares, the total area under Vine culture being less than 2,300,000 hectares (3 hectares = rather less than 2½ acres). The average value of each hectare of Vines is 6560 francs, though in some cases it is as high as 15,000 francs. The average annual value of the crop throughout France is 1,508,000,000 francs. From these and other statistics which we cannot find room for, it is estimated that if the Vines were totally destroyed there would be a loss of 12 milliards of francs in capital, and of an average of 1 milliard 300 millions of francs. In

many cases the Vines are grown by small proprietors, cultivating with their own hands one or two hectares; and the loss of their Vines will, of course, prove to them extremely disastrous. From another source we learn that the produce, which in 1865 amounted to 68,943,000 hectolitres (one hectolitre = about twenty-two gallons), and in 1869 to more than 71,375,000 hectolitres, fell to 35,759,000 hectolitres in 1873. These facts are still more clearly shown, if we estimate the amount of produce in certain departments only. Thus in the departments of the south and south-west the produce in 1869 was 36,162,418 hectolitres, whereas in 1876 it was 14,122,101 hectolitres. One consoling fact is that the Phylloxera seems to lose its vitality in proportion as it extends northwards to the centre of France. It seems to propagate itself more rapidly in those vineyards exposed to the south than in those with a north or north-east aspect. Some parts of Burgundy and the Champagne district are at present quite uninfested. The methods of cure proposed may be grouped under four heads:—1st, the destruction of the infested Vines; 2d, submersion; 3d, the application of insecticides; 4th, the introduction of American Vines. As to the first proposal, it may be remarked that it is only in the second year of their presence on the roots of the Vine that their effects become visible, and hence it is necessary to uproot all the Vines, and not merely those which present visible signs of the attack of the insect. This stamping-out process may be accompanied by a disinfection of the soil of the vineyard and of the adjacent district by means of petroleum, the use of sulpho-carbonate of potash, and other means. Submersion of the Vines for a period of from fifty to sixty days has been very effectual, but unfortunately it is a proceeding which, in most cases, owing to the situation of the ground or the nature of the soil, is quite impracticable. So far as concerns insecticides, sulphide of carbon, sulpho-carbonates, and the removal of the bark, are the only plans worthy of serious consideration. Sulphide of carbon appears to be the most valuable insecticide both as regards its efficiency and convenience of employment. Sulphide of carbon is used in the following manner:—A mixture is made of three-fourths of sulphide of carbon and one-eighth of oil of gas-tar. The dose to be employed per metre is ten grammes, and the liquid must penetrate the soil to the depth of from 30 to 40 centimetres, holes being made of that depth about 30 to 40 centimetres from the base of each Vine. The operation requires to be effected in April or May, again in June, and again in September or October. The price of the sulphide of carbon is much less than that of the sulpho-carbonates. Of the use of American Vines as Stocks we may speak on another occasion.

LEYDEN.

So many associations cluster round Leyden that it requires a strong sense of the value of space in the *Gardener's Chronicle* to avoid dilating on some of the botanical writers, who by their deeds have made the renown of Leyden, especially that great and worthy master Boerhaave. His catalogue contains a history of the garden and a list of 6000 species. The garden it appears was founded so far back at 1577, and its first greenhouse dates from 1599. A very few words must suffice to indicate some of the more important contents of the Botanic Garden. Like most Continental establishments of a like nature, it is ill kept, and visitors from England will miss the neatness and good keeping they are accustomed to at home. This, however, is an affair primarily of money, then of climate and soil. After all, in a botanic garden one looks more at the contents of the garden, and of its suitability for teaching purposes, than at the neatness of its walks, or even the cultivation of the plants.

First, then, in speaking of the plants in the garden, let us pay homage to a tree planted by LINNÆUS. Only the trunk, or the stump of a trunk, now remains, but to see this having been nearly buried in the ground level by the fall of an artificial or heretical Gymnocladus, typifying perhaps the "natural system" which has superseded the artificial classification of Linnæus. Enough, however, remains of the original trunk to enable fresh shoots to be put forth yearly, and in the middle of April a growth of new shoots with fresh green leaves and newly-developed flowers testified to the life which exists in a tree even when it is cut down, and may serve to typify

the undying renown of the great Swede. The tree is *Lonicera alpigena*, and a spray of it was by the thoughtful kindness of the Professor reverently deposited within the pages of our *Foreign Broadshov* for safe transmission to England. Next to this the most noteworthy tree is a noble Weeping Beech, the branches of which sweep gracefully downwards to the ground and resting on it for a short space curve again upwards. The area covered by the branches cannot be less than 135 feet in circumference, the trunk itself at 5 feet from the ground being of such a thickness that a man with outstretched arms can barely span it.

experience. Rather we suspect the form and dimensions given to the houses are the outcome of convention and routine, and will not be changed till the taste for horticulture becomes more general among the upper and middle classes than it now is. The walls of the stove-houses are studded with small oblong pieces of stone projecting from the wall, which serve to retain moisture and to afford foothold to the Aroids and other climbing plants. The collection of Aroids, by the way, is worthy of notice, though far from equal to that at Kew. The aerial root of one species (*Monstera Selloi*) is trained round and round the stove

summer to make room for the *Victoria*. Around the inner circumference of the building runs a tank divided into numerous compartments, and well adapted for the growth of a great variety of Nymphæas and other aquatic.

In the cool houses and conservatories the plants at this season are so crowded that it is difficult to see them, and it is clear that they have to undergo a pretty severe struggle for existence; whereas the care of the gardener under more propitious circumstances is so to place his plants as to prevent this injurious internecine conflict, but under the circumstances of

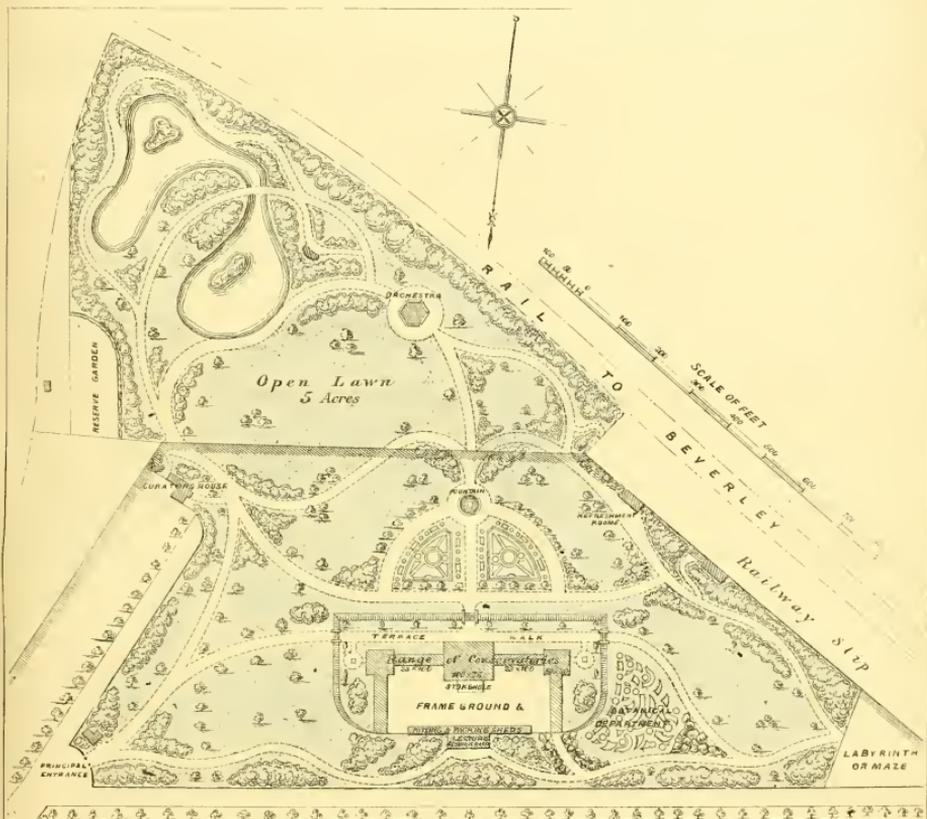

FIG. 95.—PLAN OF THE PROPOSED NEW BOTANIC GARDEN AT HULL.

Other noteworthy trees are fine specimens of *Ginkgo biloba*, *Glyptostrobus pendulus*, and *Diospyros virginica*. Beneath the shade of one of these trees the culture of a fungus, *Peziza tuberosa*, is effected. The fungus is introduced on the rhizomes of *Anemone nemorosa*; both thrive for a time, but after a year or so the *Anemone* dies, leaving the *Peziza* master of the situation—a barren victor, however, for, having destroyed its host, the guest speedily perishes also.

The glass-houses are numerous, lofty, narrow, and ill adapted for plant growing according to our notions, but suited it may be to a severer winter climate than ours, and to a greater fall of snow than we usually

under the roof rafters for a length of at least 45 metres. The other houses contain the usual assortment of botanic garden plants—Palms, Cycads, Tree Ferns, Pandanads, and the like, including many fine specimens, but none that we saw in our rapid inspection of any special importance in point of description or rarity. Ferns and Lycopodiums are well represented, and among the latter are good illustrations of *Lycopodium nummularifolium* and *L. Phlegmaria*.

The *Victoria*-house is a circular structure of glass and iron, with a depressed and vaulted roof. The central tank is circular, and in the winter season is occupied by Pandanads and various tropical aquatic or semi-aquatic plants, which are dispossessed in

faulty construction and insufficient house-room the struggle must necessarily go on with severity.

The mode of labelling adopted here is worth notice: the name is written on a piece of paper, and this is inserted into a glass tube the thickness of one's thumb, sealed at one end and drawn out into a point at the other. The pointed end is thrust into the ground or pot. What the average duration of these labels is we could not ascertain, but the first impression is not favourable. It was very interesting to the writer to compare the state of the garden now with its condition as described in these columns in 1850 by the late Mr. Masters, of Canterbury, but as his visit was paid in autumn and mine in early spring when the

leaves were not out, and the house plants too tightly packed in their winter quarters to be well seen, the comparison was not very satisfactory. The Orchids, however, do not appear any better than they were described a quarter of a century ago. *The Rambler.*

Home Correspondence.

The Frosts.—The disastrous frosts of the past week appear nearly to a national calamity, but they will be the effect of stimulating growth to the introduction of schemes for the better protection of fruit. Glasshouses are, of course, the most efficient protectors that can be devised, but they are not within the reach of all. I have, I think, found a method that is within the reach of most persons at a small expense. Having observed that tender plants in pots may be preserved during severe frosts by laying them on the ground and covering them with mats or canvas, I potted several Pear trees into No. 2 pots last autumn; they have stood through the winter without protection, and were covered with stout and well-conditioned blossom. When the dour east wind gave notice that a heavy visitation of frost might be expected, the trees were placed in a position to occupy a small compass when laid down, and were covered with a mat of a dozen trees of the finer sorts of Pears, each capable of bearing three or four dozen fruit, were simply laid down and covered with mats. I am happy to say that the trees have successfully passed through the heavy order of the night of Wednesday, Thursday, and Friday, the mats being removed during the day, the trees remaining recumbent. After the necessity for protection is passed, which we may fairly hope will arrive before Midsummer, the pots should be ranged in a regular order on the ground, and the surface of the soil covered with loose manure. Little water will be required, and if the sides of the pots are perforated to allow the emission of roots into the surrounding soil, the trees will be entirely self-supporting, and may remain in the same position until the next inclement spring returns. The plants when required will submit to the excision of the roots outside the pot without injury. A few dozen Pear trees will give a good supply of fine fruit, and with good cultivation will give a reward that will rival that of *Francis Rivers, Strawberrytown, in the "Times," May 9.*

The Fruit Prospects.—Since writing my notes of last week a week of severe frosts has fallen on the fruit crops withering, especially Peaches, Nectarines, Apricots, where badly protected, are swept off. The frost ranged from 7° in high localities to 12° in lower. The air has been extremely harsh and dry by day as well as severely cold at night. Many of the cherries are also quite black—and the plum and Plums look suspicious. Gooseberries in low-lying gardens are destroyed, and the upper fruits on the bushes almost everywhere. Pears, unless the very earliest, seem yet safe, as do Apples probably, though many of the late sorts are in danger. The Onions had been sown with hot iron on the upper edges. To-day, the 8th, the wind has veered round almost midway between east and south, and the air is much warmer. It has, however, been a trying day for the crippled fruit, and a day of sun and sunless and without a cloud. Showers and genial growing weather are now much needed, alike for fruit crops, vegetables, and flowers. Peas have made little ground; Cauliflowers planted out some weeks since have almost disappeared. The Onions hug the ground, and look yellow rather than green; and Parsnips and Carrots seem unable to break ground at all—Potatoes are cut off without their roots, which looked splendid until the last few days, have since their heads and stems withered with a yellowish drooping tinge; in fact, several mornings the young shoots drooped and were hard as ice. The Myosotis disitiflora is much later than usual here this season, having just got into full beauty. Every flower in the zone or high up at a fire had passed over it. *Dieltras* are cut right down, or bent double. Most of the *Peonies* are blackened, and a choice selection of Dean's Improved *Primulas* and *Polyanthus* have had most of their colour frozen out of them. Anemones, Tulips, and those flowers endowed with the power of closing at night, have fared best; and the *Daisies* are looking now about the brightest and most beautiful and least scathed of all the flowers of the garden. *D. T. Fish.*

The Weather in East Anglia.—The month of May has come in amid exceedingly cold weather, in this locality at least, and the thermometer this morning (May 4) indicated 9° of frost, and it is to be feared that the fruit crop has seriously suffered. The plants as large as the hand, and many of them destroyed, the very few fruits which appear to have escaped are those which happened to be placed between a branch and the surface of the wall. The

bloom of Pears, Plums, Gooseberries, &c., is very abundant, but is at present in that stage of advancement when most likely to suffer from a low temperature. Should, however, a tith of the bloom come early, there will be more than a chance. Apples are not sufficiently forward to have sustained injury. Notwithstanding the mild winter we have had, crops in general are backward. Asparagus in the open air was just beginning to come in—and this is not the case here, but the usual fact, which had ventured to peep through the soil was last night killed. Potatoes were yesterday 4 or 5 inches high, but are now blackened and killed to the surface of the ground. Some fine beds of *Dieltras* specialities were just coming into bloom, but are now a mass of decaying vegetable matter. Such are a few of the casualties of the night of May 3, as experienced here, and it is much to be feared that our case will not be found to be an exceptional one. *P. Grievs, Culford, Bury St. Edmunds.*

Fruit Prospects.—The severe frosts that occurred on the nights of the 4th, 5th, and 6th, have sadly marred the unusually bright prospects this part of the country presented of a most abundant fruit crop. Generally, from the cold wind and the frost, and more or less strongly up to the time, the surface of the ground had become so thoroughly dry as to modify the effects of such a depression of temperature, and the consequences would have been much more serious. Had it not been for the backwardness of the blossom through absence of sun, there is yet hope that they may have escaped, but at present it is impossible to form a correct estimate as to the damage, for even these may fall off in a week or so after the frost. The heavy fruit and a radiation of heat. Gooseberries are already doing so, as you may see from the enclosed specimens; and Cherries and Plums must follow, as they already show irregularities of shape resulting from frost-bite. The sharpest night was on the 4th, between the 3rd and 4th, when the glass registered 15° of frost, and showed 10° at 6 o'clock in the morning, which is 1° or 2° colder than at any time during the winter. *J. Sheppard, Woolverston.*

Severe Frost.—It may interest you to know that we had last night the severest frost of the year in this locality. The thermometer registered 12°, standing at 20° Fahr. This is 2° lower than any of the past winter frosts registered here. *James Salter, Baringfield, Basingstoke, Hants, May 5.*

—Some of your readers may like to compare notes as to the effects of the late severe frosts to Lilies growing out-of-doors. The meteorological authority of our district has given me the exact temperatures as follows:—On the 31st, the thermometer at 4 feet from the ground, rose gradually, descended to 25°, and the radiation thermometer on the grass to 21.75° on the 4th. The corresponding readings were 23.5° and 19°.75°. In the open border, unprotected, *L. californicum* Humboldtii, Martagon, dalmaticum, Szovitsianum, Browni, praevarium, chalcidicum, tinnium, and autumnum appear to be unharmed; out of very many *L. auratum* a few seem a little touched, but though I longed for the white parsons with which my friend and neighbour, Mr. McIntosh, shelters his favourites, the great yellow seem to be all right. Some of them are from 2 to 3 feet high. I measured one stem 2½ inches in circumference at the base. The outside leaves of *L. giganteum* are cut badly, but one measuring 1 foot to inches in height, and 6½ inches in circumference, has a stem 1½ inches in diameter, and the stem and inner leaves appear to be untouched. Among border plants in bloom I noticed *Primula cortusoides* amena a good deal cut, *Anemone palmata* and *A. Pulsatifida* untouched. The more forward buds of *Prunella*, *Dielytras*, *Delphinium*, *Colchicum*, and *Trillium* in the shade unharmed, *Asiella japonica* cut hard. A large clump of *Cypripedium spectabile* had some shoots browned; *Adonis vernalis*, with its glorious yellow, seem to be all right. Here in Northamptonshire the 1st of May is still a great day with the village children, who instead of making themselves smart with shabby finery, dress up their dolls and arrange them on a framework, cone-shaped, which they carry on their heads; and when the dolls have the appearance of a tall cone, 7 feet high, composed of dolls large and small, and flowers, surmounted by a fine Crown Imperial, always supplied by a kind friend, who has a wonderful garden, out of which always comes a great number of flowers on my visits to this garland about fifty little girls, all neatly dressed in their Sunday best, patrol the village, singing songs, from early morning till 4 P.M., when they assemble

for tea in the school-room, now numbering nearly a hundred. The tea is paid for out of the money they collect, and the balance is divided amongst the children. When retired, and after they play a game of hill dack, so in some villages it is called. May Day is still a bright spot in child-life. *B. T.*

Odontoglossum crispum roseum.—The highest coloured variety of this plant (O. Biontii) we have seen has recently flowered with us. It is not merely "rosy" in tint, but real rose colour, the petals only showing the faintest tinge of green. The flowers are large, petals and sepals broader than average, and finely blotched with heavy dashes of a rich, warm cinnamon-brown. The margins of the petals are more torn, so as to form quite a fringe. *James Backhouse, Cox-Son, York Nurseries, May 8.*

Adiantum gracillimum.—No doubt the case of A. Minor's plant losing its fronds in the manner described, is though its not having any rest during the winter. I obtained a half-giant plant in November, 1875, and stood it at one end of the stove with other plants of the same kind. In the month of March, I potted it in the following March in a 9-inch pot and again in June in a 12-inch pot, but soon after it began to go in the same way as A. Minor's, but it was still a good size by August, and in November I had it put in a lower temperature and kept it through the winter. At the beginning of March I had it put in the stove, and it is now a grand specimen of healthy fronds over 3 feet in diameter. I would advise A. Minor to turn out his plants in the month of March, six months, and if not rooted to take away carefully any loose soil and re-pot again with good fibrous loam and about one-fourth coarse sand. I grow *Adiantum farleyense* in all loam and sand, and find it does well in it. *C. Raffill, Tredgar Park.*

Carnation Souvenir de la Malmaison.—If Mr. Johnson would, please to give me a specimen of his *malmaison* of Carnation, as I should be glad to have this Carnation, he would confer a great boon on very many of us who have to supply flowers at all seasons in unlimited quantities, and who would gladly learn how to produce such a profusion of it above during the dull seasons of the year. *W. C. B.*

The New Cucumber Disease.—It seems needful to restore the adjective when such an accomplished fungologist as Mr. Smith writes to say not fungus but worms. This disease, as I pointed out several times last year—see *Gardener's Chronicle*, Sept. 2, p. 303—was a kind of galling or gummy gum on the roots, or swelling at the roots, referred to by Mr. Smith. Samples were forwarded to the Editors of the *Gardener's Chronicle* last August, and from thence I presume to Mr. Berkeley, who gave a description of it in the *Gardener's Chronicle*, August 25, p. 269, wherein he says that he had never seen the disease in such a virulent form as in the specimens which had just been forwarded. He refers the disease to the fungoid genus *Gloeosporium*, and says it attacks Grapes, Peaches, Melons, Cucumbers, and is probably capable of being transferred from the one fruit to the other, and that it might be of great consequence were it to spread widely. I have forwarded specimens of foliage and an analysis of the same to the Editor of the *Chronicle*, and enough to favour the readers of the *Gardener's Chronicle* with his views concerning it. I shall also try Salus at the roots, and sulphurous acid on the leaves, as recommended by my most courteous correspondent, and I shall be glad to hear of the result. I heartily thank for their kind attention to my inquiries. I specially thank "R." for his caution about the acid, and would venture to give another to intending purchasers. Most of us are in the habit of testing the potatoes of the plants, and last year I was obliged to reject the latter plan with the sulphurous acid, it proved so volatile and so potent as almost to turn me over on the spot. I shall try it at once, and report its effects on the *Gloeosporium* spores. I fancy a weak mixture of Salus, with sulphuric acid, would have arrested the pest. The young shoots, as in the case of the plants last year, seem to put forth special efforts to outgrow it, and continue healthy. Merit notes reveal as well as prove one's friends. I permit me to thank you very much for the seeds of the seeds from fresh localities as a likely means of getting rid of the disease, and especially to Mr. Coombe, of Tabley House Gardens, Knutsford, for Cucumbers and Melons that have long been grown so successfully in East Anglia, and especially in West Cheshire, far from the trying climate of East Anglia. *D. T. Fish.*

—Since writing my last note I have had an opportunity of examining the leaves, stems and fruit of *Delphinium* and *Asiella japonica*, &c. *D. T. Fish.* After making a most searching examination I have been unable to detect anything further than I have seen before. The diseased parts

show a few threads and spores of *Acremonium*, *Phoma*, *Diplodia*, *Gloeosporium* and a few imperfect fungi. Whether the *Gloeosporium* is capable of producing disease in the first instance is more than I can say, for I have seen little of it, and I have never seen it in sufficient quantity upon Cucumbers to warrant the belief that it is the cause of serious disease. In certain cases it may, however, be considered as a parasite, but the experience, for no cases with abundant fungi have ever fallen under my observation. A drop of distilled water applied to the decayed fragments of the leaves from Hardwicke soon set swarms of bacteria and moulds free. *W. G. S.*

Bac throa thum Newell.—This is a very decided improvement on *Bac throa thum elegans*. Being at Repton Hall a day or two ago, Mr. Newell, the raiser, pointed it out to me growing on the back wall of a lean-to plant-house, along with another plant raised at the same time. The two plants in question were the best of a batch of seedlings raised from seed of H. elegans, believed to have been crossed with *H. fascicularis*, and although considerably resembling both in habit and general appearance *H. Newellii*, is in every way superior. It is very early in flower, and most abundant bloomer, and all who saw it exhibited at the Royal Botanic and Royal Horticultural Societies shows last spring know how much it exceeds its parents in brilliancy of colour and in the size of its flowers, which are nearly half larger. It is a very fine plant, besides it is good in its way, having flowers almost as large, but lacking its beautiful bright crimson colour. *W. G. S.*

The National Rose Society.—A meeting of the committee of this Society was held at the Horticultural Club, Adelphi Terrace, on Wednesday last, when further arrangements were entered on, and a goodly number of members enrolled. The whole of the details connected with the show are to be entrusted to Mr. W. G. S. as secretary, and Mr. G. as the practical manager of the Crystal Palace flower show, and afterwards connected with the Alexandra Palace, and I am confident that exhibitors will find their wants carefully attended to. I want of space in this main article, however, is becoming more and more limited, and I have no other alternative in carrying out their plans of bringing a Rose show into the very centre of the fashionable part of business London. We would, therefore, strongly urge lovers of roses to send their names to the committee for the purpose of obtaining two admission tickets, giving them the *entrée* for an hour before the public are admitted. *H. H. D'Ombrain.*

Peach Setting.—Many thanks to Mr. Dodd for his valuable information on the setting of Peaches and Apricots. As a grant set of Peaches can be secured without the aid of the syringe, &c., may I ask its advocates what are its special advantages, for without exact information as to its real effects upon the reproductive organs is it not likely to prove a dangerous instrument in the hands of amateurs and inexperienced gardeners, like myself, who being anxious to secure a good crop of Peaches, might be tempted to use the syringe in order to make "assurance doubly sure." In reply to Mr. Simpson respecting Mr. Miller's theory and practice in Peach setting, I believe I am quite correct in saying that Mr. Miller did not allow the syringe to be used in the early Peach-houses from the time of the first flowers opening until all the trees were out of flower; whether Mr. Miller has discontinued the use of the syringe prior to this time, I am not in a position to say. I am not able to place my hands on the articles Mr. Simpson mentions, but if my memory serves me aright the pith of Mr. Miller's remarks was to the effect, not that he had used the syringe for twenty years, but that he had used it for twenty years prior to the time when Mr. Simpson sought to enlighten the horticultural world on the subject, and had not noticed any baneful effects on his crops of Peaches. *Vitis.*

The Royal Horticultural Society.—When you write such excellent leading articles as that of last Saturday you may well dispense with more letters from me. At the same time the fear of many of us is that this success in London Kensington means a new rivet in the fetters of the Society. Sir Charles Sturt has failed to get the justice or good sense of my finding fault with the Royal Horticultural Society, so long as not one in ten of the horticultural public belong to or help the Society. How differently my different minds speak for fact, I have enough to say in the very fact that I find a great part of my justification. Sir Charles states that something of that which I desire to see was tried at Kew, and failed. I admit that I was but partially aware of this, and can now only express my regret for the result. Sir Charles has promised me some day find time to investigate this matter; at present I can only say that young gardeners, as a rule, certainly seem to me to desire knowledge not in a less, but in a larger degree than most young men of the same position; and in large gardens I continually hear

men, both young and old, regret that nothing wider and more permanent than the rule-of-thumb knowledge is to be had in the rest. Meanwhile, let me earnestly beg such influential and able supporters of the Royal Horticultural Society as Sir Charles Strickland not to plead this supposed failure at Kew until a patient inquiry shall prove to the full what the failure was, and the scope and plan of the reform that to its inherent fertility. As to Chiswick, let me repeat that I know fairly well what work is done there, and of how great technical value it is; but I need not go again over the reasons which impel me to ask for something else as well. *T. Clifford-Albutt, Leeds, &c.*—P.S. In my last letter, for "aches," I read "makes" and for "mens," read "Mens" agitated *molem*.

—Probably neither Dr. Clifford-Albutt nor Sir Charles Strickland are aware that not very long ago the Council of the day did try to bring forward lads of a superior class at Chiswick Gardens. The experiment promised very well, but youths of their age, especially when clever, are rather kittle cattle to manage, so there was a disturbance, and there probably being other pressing matters on hand, the trial was not continued. I for one much regret this. Two young men whom I remember at Chiswick produced the best at South Kensington for the good positions which the knowledge of plants and useful introductions gained in the Chiswick Gardens have helped them to get into, and to fill most gracefully and creditably. *Geo. F. Wilson, Ipswich.*—I have a "disturbance" alluded to by Mr. Wilson, as "the other pressing matters on hand," which prevented the Council of the day from doing little more for the scheme than the issuing of the programme, which was in the execution, and only wanted carrying out in its entirety to have brought about a great success. *Eds.]*

—Having read with great interest the correspondence respecting the Royal Horticultural Society, I beg to ask if the new feature of introducing Covent Garden produce to the exhibitions has had such effect on the Council and the public, that the former can afford to distribute the medals to the market dealers on the following meeting day, while the gardeners who have so long and so ably supported the Society have to wait for months, and in some cases years, before they receive their awards. *An Exhibitor.*

Tulips.—The only Tulip I brought before the Scientific Committee on May 2 was a large and fine form of *T. Orphanides*, received from the Continent under the name of *T. wickiana*. *T. T. Wilson*, of Clusiana fragnans, and a smaller form of *Orphanides*, were exhibited by Mr. Elwes. *H. Harpur-Creese, Drayton-Buchamp Rectory, Tring, May 7.*

Dale Testimonial.—I shall esteem it a great favour if you will permit me to apply, through your Hon. Correspondence, in behalf of the movement lately started for the presentation of a testimonial to Mr. J. Dale, long and honourably known as gardener to the Honourable Society of the Middle Temple. You recall that in the month of May, 1861, one of the great growers of specimen Chrysanthemums, and that he employed the Pompons as bedding plants with such success that when the late Mr. Salter prepared his book on the Chrysanthemum he wrote of the plants for massing, and reproduced Mr. Dale's arrangements and colours. But it is less known, and I wish now to make it more known, that my old friend has laboured with zeal in the promotion of floriculture in the metropolis. He was one of the first to do so, but giving of his time and talent freely in aid of the many societies of amateur florists that have of late years risen in all the suburbs of London. Of the value of these societies none can entertain a doubt, but in consequence to the best of my knowledge I am afraid the depressions that prevail in this great city, and are not only antipathetic to smoke and darkness and contaminated air, but to the demoralising influences that are typified in the gin-shop and the pawnbroker's sign. Many have laboured to inaugurate a new school of London florists, but none with more steadfastness, more cheerful self-sacrifices, or more practical effect than Mr. Dale. But as the patriot is immortal only in the memory of mankind, so our friend is immortal in the republic of the garden. By the "march of improvement," and of his youth by the touch of Time, should now begin to live in the hearts of such as appreciate his labours, and of their attachment proof may now be given by their subscribing to the testimonial I hope that it will be possible to make him an elegant present, and in such a way as shall constitute the event a little landmark in the history of London floriculture. Mr. J. S. Hodson, of the Printers' Pension Society, 20, High Holborn, is the secretary, and the writer is the proposed appointed treasurer. I am anxious the members of societies that have benefited by Mr. Dale's devotion to their interests should be well aware of this movement, for we shall not keep it long away, and only those who are prompt in subscribing will be sure of

the opportunity of doing the graceful thing. *Shirley Hibbard, Bridge House, Stoke Newington, N.*

Orchids in April (Devonshire).—I venture to send you a list of Orchids which I have had in flower during April. Though it does not equal Mr. Sergeant Cox's in number (p. 68), it presents a few species which he has not included. My collection is but a small one. *P. H. Goss, Sandwulf, Torquay.*

Orchids in Flower in March, at Forest Farm, Windsor Forest, the residence of — Bowring, Esq.—As your columns are now and then affording us some interesting notices of the beautiful flowers in various parts of the kingdom, I may here mention some of the most attractive I saw in bloom in the extensive collection of the above gentleman, during a recent visit to his respected gardener, Mr. Stredson, who with his own hands has conducted this class as well as an able cultivator. The collection consists of some 2000 plants, numbering 500 species. The plants are in various stages of growth, including some fine specimens. The following were in flower:—

- Ada aurantiaca.*
Coloniae Stedii.—Its long flowering period makes it very attractive.
Coloniae pandurata.—This plant had flowered for the second time in seven months.
Cypripedium.—Of these there were twelve varieties in flower, the most noticeable were C. Pearcei and C. Stonei, with nine fine flowers.
Cymbidium chrysomum.—This species was remarkably good; the almost pure white flowers, with its unique habit, made it very interesting.
Dendrobium.—Of these there were ten varieties in flower, conspicuous among them was a fine plant of *D. aggregatum majus*, producing ten spikes clothed with its showy yellow blossoms.
Lycaste Skinneri.—With its rich coloured blooms, proves one of the most desirable of our winter-flowering Orchids.
Mesaspidium sanguineum.—This had produced about ten spikes, well furnished with its beautiful wax-looking flowers.
Oncidium latifolium.—Mr. Bowring possesses numerous varieties of this grand class, of which *O. Pearcei* is the most notable. A plant not so well easily managed, it had about 100 perfect blooms.
Oncidium.—Of these there were six species in flower. *O. serotinum* was the largest. A plant not so well easily managed, it had about 100 perfect blooms.
Phalaenopsis.—Of these two species were in flower. *P. amabilis* was very good.
Zygopetalum cristatum, with variegated flower.
Has time permitted, I could have noticed other objects of interest in the above collection. *J. F. McElroy.*

Trichopilia suavis.—In reply to "T. C. H.'s" inquiry in your last number, I think it is not unusual for *Trichopilia suavis* to have four flowers on a spike. The small plant which I sent to the Royal Horticultural Society's meeting, on April 4, and which was noticed in the *Gardeners' Chronicle*, had six spikes and twenty-three flowers, and I have had another plant this year with the same number of flowers on seven spikes. *J. F. Hepburn, Sidcup Place, Kent.*

Does Ivy Make Walls Damp?—Speaking generally, I should say, No; but indirectly think it may, under certain circumstances, have a tendency, not to create but to encourage dampness in a building covered with it, even when well kept. When houses are built in wet, ill-drained situations the damp ascends upwards from the subsoil through the foundations, and when the damp is driven up into the walls to a considerable height; and the covering of Ivy

prevents the walls from drying so rapidly as they otherwise would have done—at least, such have been the conclusions I have drawn from several instances of that class, under my own observation. Of course, builders say there are ways and means of preventing damp ascending through the foundations; and no doubt there are, but they are often neglected or the work improperly done. *E. Hobday.*

Abnormal Inflorescence of *Dendrobium nobile*, &c.—Having noticed your remarks about the abnormal growths of *Dendrobiums* in a recent issue, and in reply to your inquiry if it is a common occurrence, I herewith send two pieces; and if these are similar to the ones you refer to, they frequently occur, and possibly where the plants tend to grow more than to flower they occur most frequently. What might be considered more singular is the flowering of the *Calanthe vestita* from the apex of the bulb instead of in the normal way, which is from the base. Several such instances *Calanthes* have come before me. *Obtuser.*

Roots in Interior of Turnip.—The enclosed are fragments of roots growing inside a weevil gall in a white Turnip. I have opened many similar galls for years without meeting with any growth of the kind. The gall was unusually large, about an inch over, otherwise just as these *Ceutorhynchus pleurostigma* galls usually appear, and inside it was almost full of roots. The two main points of growth were about at the two opposite ends of the hollow chamber, three-sixteenths of an inch beneath, outer end of the root, and the fall-grown weevil burr lying amongst them. *E. A. O.*

Hardy Hybrid Rhododendrons.—The meeting of the Manchester Botanical and Horticultural Society held on April 27 contained one feature of more than ordinary interest, and that was the sweet-scented hybrid *Rhododendrons* raised by Mr. Isaac Davies, Brook Lane Nursery, Ormskirk, and exhibited as part of a large and interesting group of plants by Samuel Barlow, Esq., J.P., Stakehill House, Chadderton, Manchester. The plants, though small, were laden with blossoms, large, finely formed, pure, and generally deliciously fragrant; they represent the patient, skillful work of years—the result, a new race, forming a most welcome contribution to the class of *Rhododendrons* in this country. The culture, good enough to exalt the reputation of the raiser for years to come, valuable for spring work and for making bright and cheerful the interior of greenhouse and conservatory. It is only a few days ago Mr. Davies raised an interesting hybrid *Rhododendron*, which he named *multiflorum*, bearing white flowers, and remarkably free of bloom as well as early to flower. This hybrid was crossed with *R. Edgeworthii*, and the results of the cross were seen in the fine new varieties recently exhibited at Manchester. To the newest variety, one named *foribundum*, the Manchester Council awarded a First-class Certificate of Merit. It is about equal in hardiness to *R. multiflorum*, flowers large, erect, open, pure white in colour, and with emarginated margins; habit compact, flowering freely on small plants, very early, as it blooms in the middle of April without forcing. Other fine varieties were *Countess of Derby*, having a habit of growth intermediate between the best variety of *R. multiflorum* and *R. Edgeworthii*; the flowers are large, pure white in colour, the perfume of a remarkable sweetness. Quite tiny plants were laden with the huge blossoms. This is a grand contrast with the *foribundum*. The seedlings of the same parentage, the flowers pure white, and fringed on the margins, and there is a band of pale rose purple on each side of the corolla. *Lady Skelmersdale* has pure white flowers, but more trumpet-shaped than the preceding, and the petals giving an appearance of fine form to the blossoms. It is a most attractive variety. Mrs. James Shawe is another white-flowered variety, also remarkably free. *Duchess of Sutherland* is very fine indeed, a robust growth, with large, somewhat-formed pure white flowers, beautifully fringed on the margins. It may be remarked that though the flowers of several of the foregoing are white, they are yet quite distinct in character, and differ considerably in form. *R. grahamii* hybrid is also a fine variety; a seedling from this species crossed with a hardy large-flowered variety, the habit intermediate between the two parents, the blossoms pale flesh-colour, and very free-blooming and attractive. This is supposed to be quite new in character. With *R. Gibsonii* hybrid, a seedling from *R. Gibsonii* crossed with *R. glaucum*, of a bushy habit and very free-blooming, the flowers bell-shaped, mottled on the upper segments of the corolla with light ground, and this is new during the winter in sheltered situations. The seedlings of *R. multiflorum* are no doubt hardier in character than is generally supposed. There are possibly many places in which they could be safely trusted out-of-doors all the winter. But apart from

their value as outdoor decorative plants, they are of such a nice bushy growth, so free blooming, the flowers so bold in appearance and handsome in form, so fragrant and so easily cultivated, as to constitute them an invaluable class of plants for greenhouse decoration, and especially for working out striking effects in conservatories. *R. D.*

Roses under Glass.—I am very much obliged to you and to "D." for his explanation of the Rose house at Gunnersbury. I see the house stands in the corner of the garden, and is not a small one, as I thought. My house is a lean-to, which is not the best for Rose growing. I have about 150 flowering plants, and so easily cultivated, as to constitute them a little over a year old, and I cut between fifty and sixty a-week off them. In cutting the flowers I always cut the shoots back to about two eyes, which break again very freely and flower. By so doing I can keep the plants always in nice trim. The ones that have flowered best with me are *Souvenir de la Malmaison*, one of the best; *Mrs. Bosanquet*, very free and pretty; *Adam, Souvenir d'un Ami*, *Goubault*, *Catherine Mermet*—the best of these four, which resemble each other; *Gloire de Dijon*, *Aracmelles*, *Bellefleur d'Anjou*, *Cheshant Hybrid*, *Devoniensis*, *Elise Sauvage*, *Henry Bennett*, small; *Madame Camille*, one of the very best; *Madame Denis*, *Marchionni*, *Niphetos*, *Perle de Lyon*, *Perle de Portugal*, *Rubens*, *Safano*, *A Fleurs Rouges*, nice in bud; *Souvenir de David*, *Souvenir de Paul Neron*, *Vicomtesse de Cazes*, very fine; *Lamarque*, *Madame Caroline Kuster*, *Rève d'Or*, *Triomphe de Rennes*, and *Victoire de Nemours*, very fine growers, but are not inclined to flower all the way up, I think they would do better as climbers. Among the H.P.'s which have done best are *Alfred Colomb*, *Alphonse Damazin*, *Bounty* of *Waltham*, *Boule de Neige*, *Dame Bernadette*, *Estacade* de *Snozal*, *Charles Lefevre*, *Charles Roulillard*, *Comtesse de Chablant*, *Comtesse d'Oxford*, *Duke of Edinburgh*, *Fisher Holmes*, *François Lacharme*, *General Jacquemont*, *Madame Victor Verdier*, *Sir Garnet Wolesey*, *Comtesse de Saxe*, *Perle de Malmaison*, and others, and *Duchess and Archduke Charles*, which are quite worthy of a place, though they are but Chinas. To fact, people thinking of growing Roses in pots should make a diligent search among the Chinas, and especially the *Perle de Malmaison*, which is a quantity of good Roses. The Roses in question I allude to are at *Carolina Park*, *Granton*, near *Edinburgh*, and can be seen at any time. *W. Paul, Edinburgh.*

Pumpkin Preserve.—The dull sunless weather, accompanied with cold cutting winds, has been anything but favourable for the fruit crops, and bright though the prospects appeared but a short time back, it is greatly to be feared we may again have a season of the kind, and the hard frosts which we are now so certainly shall of Peaches, Nectarines, and Apricots, the latter of which will be greatly missed, on account of the delicious preserve they make. Although by no means equal to this estimable fruit, an excellent one is made from the hardier and more numerous, we certainly shall of Peaches, Nectarines, and Apricots, the latter of which will be greatly missed, on account of the delicious preserve they make. Although by no means equal to this estimable fruit, an excellent one is made from the hardier and more numerous, and if it were possible to find anything to impart the Apricot flavour, it might readily pass muster for that purpose, so closely does the colour and consistency resemble the other, soiled with sugar, for the purpose of making. I do not report in this article the success of some of the larger Vegetable Marrows or Pumpkins is already used largely for the purpose of adulteration in making marmalades, but be this as it may, as the principal use intended was to raise a note to be despatched during the winter when other fruits are scarce, and I venture to predict that eventually they will be extensively grown to supply their place at that season. For the past three years Pumpkin preserve has been the principal sweet used in this country, and it we have formed a strong liking, so much so that we should greatly miss it, and would rather be without almost any other kind of jam usually made from common garden fruit. For using with boiled rice or cream, it is superior to any other fruit jam, and is delicious, as it is likewise for tarts, or indeed for any of the many uses to which preserves are put. When grown for this purpose it is essential that the Pumpkin be fully and perfectly mature, a condition they are not likely to be unless planted in a sheltered position, and left on the plants till the end of September or middle of October. The fruit of the *Mammoth Gourd*, which is by far the best, assumes a rich warm reddish yellow hue when perfectly ripe, and is very much improved as a solid fruit, if sown in Turnip, to the colour and texture of which it bears a close resemblance. Any one desirous of giving them a trial should at once obtain seed, and sow the same singly in pots of light rich soil, and then stand them in a hotbed frame, to assist

them to germinate. They should then be nursed on near the glass till the end of May or beginning of June, shifting them on meantime as they require it, so as to get them as strong as possible before planting them out under handlights on any waste bits of ground, or better still, on the rubbish heap, where their gross feeding roots can find plenty of decomposing vegetable matter to help them. Where there are such unsightly objects of this kind, or any other unlovely buildings to cover, it cannot be better or more profitably carried out than by planting one or two *Mammoth Gourds* to ramble over, for if well attended to, they will, in the warm month of June, be able to produce several hundredweight of most excellent jam, or to cook in tarts with Apples and to use for such-like culinary purposes in which way they may be made to eke out the supply and form a useful and agreeable article of diet, if set in the right way. Where the top of the plant is trimmed to look as though the roots have a rich moist medium to feed in, and there are many places where such large handsome looking leaves and noble fruit would be quite as ornamental as some of the sub-tropical plants now so extensively used in most gardens. Some I had last season had fruit as large as a man could fairly lift, the heaviest of which weighed 16 lb., and measured over 7 feet round, and when seen growing as these were elevated positions, and the plants were so effectually trained, they should be cut and stored in a shed or any cool airy place out of reach of frost, where, if kept dry, they may be preserved sound and good till February or March, provided they are not cut or damaged in any way, and if intended for use as the fruit for preserving, it should be divided into thin slices for convenience of being peeled, and after that is done and any soft spongy part in which the seed is found embedded cut away, the solid part should be sliced into thin pieces, and weighed, and if intended for jam, it should be weighed. If wanted to keep long, to every pound of fruit add three-quarters of a pound of lump sugar, and for flavouring divide either an Orange or a Lemon to every 10 lb. of Pumpkin, and boil briskly for an hour keeping well stirred, to prevent it sticking to the bottom of the pan and becoming burnt. When done, the Oranges or Lemons should be taken out, which may the more readily be done if put into small muslin bags before boiling. Essence of Ginger or any other flavouring may be used according to fancy. *S. W.*

Pippin Apples.—Those who are acquainted with Apples know that many of them are called Pippins, but yet many are ignorant of the origin of the popular name. However, it is not difficult to trace either the dots or the spots, or to the fact of the original trees being raised from pips or seed. The latter alternative is not, however, tenable, because all varieties of Apples have the same origin, yet some of them are not called Pippins—*Rumex*, *Ranunculus*, and *Nonparis*; and many, especially of the large kinds, have local names, while others are named after those who have raised them from pips or cobbles. We never hear of seedlings or ungrafted trees being called cobbles, an odd name indeed, and may be the name means also a stone or small pebble; and it has occurred to me that perhaps this may be the origin of the term "stone fruit," owing to the cobbles or stones in the heart. Pippin, however, as applied to Apples, is of ancient use, even as early as the time of King Henry VIII. Maschale "brought Pippin from over the sea . . . and planted them in Plumstead in Sussex" while Shakespeare says, "We will eat year's Pippin of your own grafting." This may be your Pippin, yet it is pretty conclusive, that Pippin is derived from the spots on Apples, and not from their being produced from ungrafted or seedling trees raised from pips. *J. Wighton, Cussy Park.*

Salpiglossis.—Although many annuals produce extremely showy flowers, the *Salpiglossis* is, in most of them, so short that they are not of much value for general decorative purposes. There are a few, however, that are almost indispensable for the embellishment of beds and borders, and that possess the double merit of being so easily cultivated, and of being the warmest in this category must be placed the different varieties of *Salpiglossis*, all of which are remarkable for the beauty of their many-coloured large Lily-like blooms. Most of these are richly veined and marked with various shades of red, yellow, orange, buff, or pale yellow grounds, and when seen in large masses the effect is most striking. Chilli has yielded us many floral treasures, not the least of which are the above, and as they are so easily raised, and are very sportive in their manner of flowering, they should be looked for by a little careful hybridising and selection. If planted in deep rich soil they branch freely and flower with the greatest profusion, but, like all annuals, they are susceptible of excessive drought, and do not bear over-watering. The best way to raise them is to prepare a bed by trenching it to a good depth, and as the operation proceeds to work in and mix well with the soil some thoroughly decomposed manure, keeping the same sufficiently low down as not to be nearer

the surface than 6 inches or so. After raking the surface fine (seed) may be sown thinly in rows at about 15 inches apart any time after the middle of April, or the plants may be raised under glass in the usual way, with other half-penny annuals, and planted out when the weather is favorable. Although I have not yet tried them for pots for early spring blooming under glass, I intend to do so; and if they are as accommodating in this way as Stocks, Schizanthus, and Rhodanthes, they would be most useful for greenhouses at that season, and impart quite a fresh feature in the decoration of such structures, as their flowers are quite of a different type and character to any others then in use. For this purpose it will be necessary to sow toward the end of August, and to winter the plants on shelves near the glass. 7. S.

Notices of Books.

Notes for Observations of Injurious Insects. Published by T. P. Newman, 32, Botolph Lane, E. C.

During the last ten years attention has in some degree been directed by the Government Collection of Economic Entomology at Bethnal Green and in other ways to the great annual loss throughout the country from attacks of insects on the common food crops, and where attempts have been made to counteract the injuries that have been done. But attention needs to be directed more generally to the subject and in many cases more knowledge is needed before remedies other than experimental can be applied.

With a view to this the pamphlet, which is published by those well qualified to undertake the subject, gives a list of about sixteen insects (chiefly selected as injurious to the crops, but occasionally as coincident with particularly warm seasons), accompanied by short descriptions of the insects, and their method of injury, and by clearly drawn figures, mostly taken from articles in the *Gardener's Chronicle*, so that the most untraced observer can rarely be lost either where to look for the subject or in uncertainty whether he has got the insect intended. A short introductory note gives details of the exact points as to number and dates of appearance, any peculiarities in soil, season, or surroundings, such as manure and drainage, which may be supposed to tell on the recurrence of what both to the country and to individual growers may too truly be known as "pests," and requests notes from those who are interested in the subject. For this purpose the pamphlet is accompanied by a columned sheet, for entry of the monthly observations, which are solicited, and all necessary reference is given as to where to apply for further information, and to forward the returns, which, if procurable, would be eminently useful.

It is impossible, without some co-operation of this kind, to meet the subject. Entomologists are not usually acquainted with the practical economic workings. Agriculturists have rarely the opportunity of knowing the life histories of the insects, and if this desirable cooperation could be had, it would be the digest of the monthly returns which it is intended to form into a report for presentation to the observers would contain a mass of practical information of great practical value.

It is much to be wished the matter may be taken up by those who have opportunities of observation. The pamphlet and sheets for monthly returns may be procured gratuitously on application to the publisher, Mr. Newman, 32, Botolph Lane, London, E. C.

—The second part of Mr. Elwes' superb monograph of the genus *Lilium* has appeared, with coloured plates of the following species:—*L. giganteum*, *L. philadelphicum*, *L. davuricum*, *L. giganteum*, *L. carolinicum*, *L. candidum*, *L. tenuifolium*, and *L. chalcidonicum*. Of the climate in which *L. giganteum* is raised, the author thus speaks from personal experience:—

"In 1870, during my journey in the almost unknown mountains of Sikkim to the frontiers of Tibet, I saw this noble plant growing abundantly in the Lachen Valley, at about 8000 to 9000 feet elevation. There it flourishes in a climate which may be best described by saying that for many weeks it was impossible to dry thoroughly our tents, clothes, L. bedding; the rainfall, though by no means equal to that of the Khasia hills, or even the lower valleys of Sikkim, is almost continuous from April to October; and though the mornings are often bright and sunny, a dry afternoon or night is rare. In this moist though not ungenial climate the vegetation is of the

richest and most varied description. Nearly all the most beautiful genera of the north temperate zone throughout the world are here represented by one or more species; and in addition to these, many plants belonging to the tropical Malayan flora are abundant. The gigantic Lily towers in all its glory above most of the other herbaceous plants, sending the air for yards around with its sweet perfume in the month of July, and lying buried under the snow from December to March, when it again begins to push forth leaves."

—Dr. J. C. Brown, whose efforts in promoting the cause of rational forestry and of economic botany have often been noted in these columns, has published in a pamphlet addressed to the Right Hon. Lord Provost of Edinburgh, the office-bearers of the Scottish Arboricultural Society, and "all others whom it may concern," *A Plea for the Creation of a School of Forestry in Connection with the Arboretum at Edinburgh*, noticed in our descriptive Supplement of the Edinburgh Botanic Garden. The plan of study recommended by Dr. Brown ranges over three years, and comprises the study of the natural history of trees, the management of forests according to their varying circumstances and varying requirements, engineering, mechanical philosophy, mathematics, drawing, chemistry, meteorology, geology, conveyancing, minor surgery, &c. In the autumn months tours of observation are recommended in the forests of Britain, France, Germany, &c. Details are given of the existing forest schools in the various countries of Europe, and of the requirements for the Forestry Department of India. Every one at all conversant with the subject is alive to the desirability of establishing such a school, but there is necessarily considerable difference of opinion as to the best method of establishing it. It appears to us that a national school of gardening is required quite as much as one of forestry, and the question arises whether the two could not be combined in a sort of agricultural university, wherein the general principles of the sciences and arts common to all these pursuits could be taught to all the students, while at a subsequent period of their pupillage they might pass into special departments, according to their requirements. Edinburgh would be an excellent site for such a university. In any case we wish Dr. Brown's advocacy every success.

—The first number of the *Journal of Forestry*, to which we lately alluded, has been published by Messrs. Rider, of Bartholomew Close. It is in large 8vo size, well printed, and as to matter gives excellent promise of success. According to the programme, forestry is to be treated under the following heads:—Description, History, Science, Law, Hygiene, Economy, Practice, and, lastly, in its picturesque aspects. There is plenty of scope here for well-considered judgment. We are glad to see that the new-comer commences by strenuously advocating—as we have done from time to time—the establishment of a proper school of forestry in Great Britain, in order that we may keep pace with other countries, and be enabled to supply a thoroughly well trained body of officers for service in the higher departments of forests at home, and more especially in India and the colonies. Among other contributions to this number, Mr. R. Hutchison appropriately deals with the subject of what should be done in woods during the summer months, while the Editor contributes a very useful statistical paper on the prices realised for forest produce in different districts of Great Britain during the last winter. No doubt this will be extended in the future, and will constitute a most valuable feature of the publication. Forest work for the month is a good summary of woodcraft for the month, but requires modification in details, so as to adapt it to varying localities. Our experience of first numbers is that, as a rule, the publisher is to those that come after, and if that rule be followed in the present case it may be safely said that the readers of the *Journal of Forestry* will have ample cause for satisfaction that such a journal has been established.

The Villa Garden.

ANNUALS IN THE FLOWER GARDEN.—There are hundreds of persons who can be counted among the lovers of flowers, as fired with some ambition to cultivate a few plants, who every spring and summer fall back upon some of the many annuals found in the seed lists, and make a very pretty display indeed. It is surprising when any one can do with a few annuals when they make a proper selection, prepare the ground for their reception, and tend them while they are growing and coming into bloom.

That there has been a marked decline in the cultivation of annuals cannot be doubted. They are not now nearly so much grown as they used to be, and that, not because they are thought to be less useful and effective than formerly, but because gardening fashions change; the things that are grown in one generation are neglected in another; and if the most casual observer cannot fail to notice that in regard to gardening, as in many other pursuits and observances, people are very much swayed by fashion, and he is thought to be in danger of falling behind the age who does not participate somewhat in what the society of the age deems to be the correct thing.

That it has come about that many a small garden that used to be made bright and pleasant with a few annual flowers have become tenanted by other occupants, and *Lobelia*, *Alternanthera*, *Coleus*, *Pyrethrum*, *Mesembryanthemum*, &c., have taken the place of the things that, up to the time of the advent of the new fashion, were deemed suitable and satisfactory. When the soil and situation are suitable, no one will be disposed to quarrel with the employment of some of the newer foliage and flowering plants; but where it is not so—as where a clayey earth abounds, or the garden is on the north side of the house—where it is cold and sunless, and where *Coleus* and *Alternanthera*, *Lobelia* and *Mesembryanthemum* drag out but a sorry existence, the results are by no means satisfactory, even if during the day the sun occasionally shines on the spot.

A simple and effectual mode of making a little garden look gay during the summer season is by the employment of a few annuals. But the first thing to do is to make a proper selection. There are several pretty dwarf-growing varieties that are indispensable, such as Sweet Alyssum, white; *Calandrinia speciosa*, rose; *Campanula Loric*, white, and also the white variety; the crimson, white, and blue *Campanula*; *Clarkia integrifolia*, Tom. the rose; *Convolvulus*, minor, blue, and the white also; the dwarf *Burkwood's Indian Pink*; the white and orange *Eryschtolida*; *Eucharidium grandiflorum*, rosy crimson; *Gilia tricolor*; the double *Jacobines*, blush-purple and white; *Lupinus nanus*; *Mignonette*; the blue, white, and spotted *Nemophila*; dwarf *French Poppy*; *Silene pendula compacta*, rose; the red and white *Virginia Stock*; and the red *Saponaria calabrica*. From these a selection might be made suitable for small or large gardens. The foregoing, however, are all of dwarf growth, and are best adapted for small gardens, but there are many fine showy

of taller growth that would have to be used in a large garden.

Supposing a garden has a long border on one side which is open to the sun, say 4 feet or so in width—here is scope for making a pretty display with annuals. Along the back might be planted Sweet Peas, *Convolvulus major*, *Tropeolum aduncum* (Canary-flower), and tall Lupines. A few bunches of pea-sticks should be employed for the climbing annuals to attach themselves to. If these could alternate with Dahlias, Chrysanthemums, Foxgloves, Delphiniums, and the taller growing Michaelmas Daisies, the display would be varied and continuous. Then in front of these might come such good things as *Malva grandiflora*, crimson, and the new rose-coloured variety, which is very pretty; the double white and double yellow Chrysanthemums, the admirable and useful hardy annuals—*Ceropsis Drummondii*, yellow; *C. grandiflora*, yellow and dark; and *C. nigra speciosa*, dark crimson; *Erysimum Perofskianum*, orange; *Godezia*, The Bride, white and carmine; and *G. Whiteley*, white and crimson; double *Larkspur*, *Oxyria chrysanthemoides*, *Linum grandiflorum rubrum*, *Chrysanthemum pinatum*, and *Whitavia glonoides*. Then a few tender varieties already named would come into the front, with such other plants as would be likely to do well among the annuals. What an interesting garden this would make, and it would also be very instructive.

A very small quantity of seeds of some of these annuals suffices for several sowings, and by means of a little expenditure of attention and labour successful sowings might be made during the summer, thus continuing and prolonging the display. Directly any one batch begins to decay, out with it, and make another sowing; growth soon takes place, and annuals are speedily blooming.

And this leads up to the matter of preparing the soil for sowing. Annuals are very often disappointing, simply because they are sown under conditions deadly hostile to their well-being. A sower goes forth to sow on some hard piece of ground, caked by drying winds, and burnt by the sun. He simply contents himself with stirring the surface soil over so slightly, soos the seeds, covering it very thinly with a coating of earth, and calls it sowing. What is the result? The seeds lie till a shower of rain falls, then they spring up weakly, grow imperfectly, flower sparsely and disappointingly, and the conclusion reached is—I shall not attempt to grow annuals again. How can annuals be expected to behave themselves well under such circumstances? Simple as they are, they are yet messengers charged with the tenderest messages of love and beauty from the bountiful hand of Nature, and they should be properly received and tended by those to whom they are sent.

The soil for annuals should be as carefully prepared for them as for any other garden crop. It should be deeply dug, crumbled to pieces, and then have mingled with it some rich soil to make it kindly in nature, invigorating and holding; and then the seeds carefully and thinly sown, a little of the fine rich soil laid on the top, and the whole gently pressed down, and sprinkled with water if the weather be dry. The seeds cannot fail to grow if there is any power of vitality in them, and the plants are strong and bushy. And while they are making growth, if the weather continue dry, let it not be thought too much trouble to sprinkle the plants occasionally with water, and protect them as far as possible from the ravages of slugs and such-like. All this nurture is a kind of promising investment; in due time it will be repaid with a welcome harvest of flowers.

Then there is the matter of thinning out the plants. This duty is sadly neglected. Very often a large number of plants in a very small space are left to struggle for existence as best they can, and with a disheartening result; but if they were thinned out to a few of the strongest, there would yet remain enough. A few vigorous plants in preference to a number of attenuated ones; the stronger will bloom more abundantly, with a superior excellence, and a surer gratification to the cultivator.

Obituary.

We deeply regret to announce the sudden death, on April 27, of MR. ALEXANDER CRAMB, gardener to the Earl of Ducie, Tortworth Court, Gloucestershire. Mr. Cramb, whose portrait and autobiography we had the pleasure to publish in our issue for June 5, 1875, had been gardener to the Earl of Ducie for many years, and was held in high esteem by his noble

employer, as well as by a large circle of horticultural acquaintances. It had been arranged, we believe, that he was to retire from the management of the gardens at Tortworth at midsummer next; and his friends were looking forward to his enjoyment of a well-earned pension, when he suddenly died of heart disease in his sixty-eighth year.

On May 1, at Wimbledon, JOHN RUSSELL REEVES, F.R.S., F.L.S., of Woodhays, Wimbledon, and Hutton, Sussex, formerly in the H.E.I.C.S. in China, aged 73, Mr. Reeves when in China was the means of introducing several fine plants to this country, some of which, such as *Reevia thyrsoidea* and *Spiraea Reevii*, bear testimony by their names to the good service he rendered to botany and horticulture. Mr. Reeves was, a few years since, a member of the Council of the Royal Horticultural Society, and was always a zealous patron and promoter of horticulture, while his amiable manners and consistent principles proved him the respect of all with whom he came in contact.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, MAY 9, 1877.

May 3.—Fine and bright till 11 A.M., overcast and dull evening, then cloudy. Few drops of rain in afternoon. Cold.
 4.—A fine day, very cloudy at times. Raw cold.
 5.—A fine bright day, partly cloudy. Cold.
 6.—A very fine clear day. Cold wind.
 7.—A very pleasant day, warm, but cool.
 8.—A brilliantly fine day. Warm.
 9.—A fine bright day, warmer. Overcast at night. Few drops of rain about 8 P.M.

LONDON: *Barometer*.—During the week ending Saturday, May 5, in the vicinity of London the reading of the barometer at the level of the sea increased from 29.53 inches at the beginning of the week to 30.49 inches by the evening of the 5th, decreased to 29.55 inches by the afternoon of the 5th, and was 29.56 inches at the end of the week. The mean reading for the week at sea level was 30.10 inches, being 0.23 inch lower than that of the preceding week, and 0.14 inch above the average.

Temperatures.—The highest temperatures of the air observed by day varied from 54° on the 5th to 48° on May 1, the mean value for the week being 51½°. The lowest temperatures of the air observed by night ranged from 28½° on May 4 to 40½° on April 30; the mean value for the week was 34½°. The mean daily range of temperature in the week was 17°, the greatest range of the day being 25½° on May 5, and the least 11°, on April 29.

The mean daily temperatures of the air were as follows:—April 29, 44.6°; 30th, 44°; May 1, 40°; 2d, 42°; 3d, 39°; 4th, 37½°; 5th, 39½°; and the departures in degree of their respective averages were:—4.5°, 5.4°, 9.8°, 8.1°, 11.4°, 13.7°, and 11.5°. The mean temperature of the air for the week was 49.2°, being 9.2° below the average of observations extending over a period of sixty years.

The highest readings of a thermometer with blackened bulb in vacuo, placed in sun's rays, were 100° on April 30, 103° on May 4, and 125° on the 5th; on April 29 the reading was not rise above 59°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 27° on May 3 and 4, and 23° on the 5th; the mean of the seven low readings was 31½°.

Wind.—The direction of the wind was N.E., and

its strength gentle. The weather during the week was generally dull, dry, and cloudy for the season, the sky was mostly cloudy.

Rain fell on Sunday, April 29; the amount measured was 0.22 inch.

ENGLAND: *Temperature*.—The highest temperature of the air was 64° at Portsmouth, at Bradford 50½° was the highest temperature in the week; the mean value from all stations was 54°. The lowest temperatures of the air were 21° at Cambridge, and 25° at Eccles; at Plymouth 35½° was the lowest temperature; the mean from all stations was 29½°. The range of temperature was the least at Liverpool, 18½°, and the greatest at Cambridge, 33½°; the mean range of temperature from all stations was 24½°.

The mean of the seven high day temperatures was the highest at Portsmouth, 56½°, and the lowest at Sheffield, 46½°; the general mean from all stations was 50½°. The mean of the seven low night temperatures was the lowest at Eccles, 20½°, and the highest at Plymouth, 38½°; the mean value from all stations was 35°. The mean daily range of temperatures was the greatest at Eccles, 20½°, and the least at Norwich, 11°; the mean daily range of temperature from all stations was 15½°.

The mean temperature of the air for the week from all stations was 41°, being 3½° lower than the value for the corresponding week in 1876. The highest occurred at Portsmouth, 43½°, and the lowest at Wolverhampton, 30½°. The mean range was 38½°.

Rain.—Scarcely any rain fell during the week. At Blackheath a quarter of an inch fell, but at most other places little or no rain was measured. The average fall from all stations was three-hundredths of an inch only.

The weather during the week was dull, cold, and dry, and the sky cloudy. Snow fell at Bradford, Hull, and Sunderland on May 3, 4, and 5.

SCOTLAND: *Temperature*.—The highest temperatures of the air varied from 55½° at Edinburgh to 50½° at Aberdeen; the mean value from all stations was 54°. The lowest temperatures of the air ranged from 27° Perth to 33° at Leith; the general mean from all stations was 39½°. The mean range of temperature from all stations was 23½°.

The mean temperature of the air for the week from all stations was 40½°, being 5½° lower than the value for the corresponding week in 1876. The highest was 42½° at Greenock, and the lowest 39½° at Aberdeen.

Rain.—The amounts of rain measured at Edinburgh, Aberdeen, and Leith were 0.04 inch, 0.03 inch, and 0.06 inch respectively; at Dundee, Greenock, Paisley, and Perth no rain fell; the average fall from all stations was 0.03 inch.

DUBLIN.—The highest temperature of the air was 56½, the lowest 28½, the range 28½, the mean 44½, and the fall of rain 0.08 inch.

JAMES GLAISHER.

Law Notes.

A SALESMAN'S DISPUTE.—*Thomas v. Carroy*.—This was an action brought by one salesman in Covent Garden against another salesman to recover the sum of £6, under the following circumstances. The plaintiff—or whom Mr. R. Bartlett, solicitor, of Bedford Street, appeared—stated that on the 12th of January last he sold the defendant ten crates of Broccoli, at 9s. 6d. a crate, and that they were delivered according to order, but only two crates were accepted and the rest returned to the plaintiff, who refused to receive them, and on application being made for payment the defendant refused to pay; hence the present action. In cross-examination by Mr. Lawrence, the defendant's solicitor, admitted having received £47, £52, £28, and other sums subsequently, and not allowing to the present claim.

The solicitor for the defence argued that his client was in no way liable, as the goods were not what he bought. Those he saw were quite fresh, but those received were not fit for human food, being completely rotten. E. Carroy, the defendant, said the plaintiff introduced some Broccoli to him which were very good. Two crates were sent at once, but when the night arrived, he could not sell them. The price agreed upon was 9s. 6d. per crate, and the next day he sold two crates to a costermonger for 2s. 9d. each, as they even were not fit for sale in the market at 12s. 6d., which was the market price on the day.

In cross-examination by Mr. Bartlett, the defendant said it was not an unusual thing to buy goods in the market upon the representation of a fellow-salesman, but in the present instance he considered he had been imposed upon, and thought he was justified in

resisting payment. He never had an account, nor was 2s. 6d. each for the two crates he had, ever charged him. He ordered the goods early in the morning, and they were delivered in the evening during his absence; he had been present he would not have taken them in. H. Stevens, the defendant's carman, said that in the absence of his employer, and seeing the condition of the goods, he refused to accept them, and put them close to the plaintiff's stall in the market.

Thomas Thornycroft was examined, and said he had been for twenty years a salesman in the market; he examined eight of the crates of Broccoli, which he said were only fit for cows, and he should have refused to take them in. This being the case for the defendant—

The learned Judge considered that the defendant had bought the goods in question (as was the custom of the market) upon the faith of the plaintiff's representation, and as the defendant was not present at their delivery, and as they must have become deteriorated in value on the following day, gave judgment in favour of the plaintiff for the amount claimed, with costs.

Answers to Correspondents.

AMATEUR CLASSES AT EXHIBITIONS. A. B. C. asks if any one who grows fruit on a large scale should be allowed for medals for exhibition. We have seen at a local exhibition in the gardeners' or amateurs' classes. He states that at nearly all the exhibitions in his vicinity the classes are under the headings: "Amateurs," "Amateurs and Gardeners," and "Amateurs who do not keep a garden." [We have no hesitation in replying that such a person as is above described could not be admitted.]

BLACK FLY: A Very Old Subscriber. 4 oz. of quassa chips in a gallon of soft water ten minutes, and dissolve in it as much of soft soap. Stir it up, and strain the water twice or three times. The next day wash them with clean water.

BOOKS: Amateur, Practical Hints on Planting Ornamental Trees, by Standish and Noble; Bradbury, Agnew & Co. CEDAR OF LEBANON: W. Irvine. The production of perfect seeds by the Cedar of Lebanon is not at all uncommon.

CINERARIAS: G. Rogers. The flowers received are wanting in form and substance, as well as in depth of colour. They are a slight improvement on the ordinary run of Cinerarias, but not so well compared with Mr. James' strain, which exhibits the highest excellence yet obtained in this flower.

CUCUMBER: H. W. C. The above seed we have sent you specimen to Mr. Smith for examination.

DEFECTIVE PINE-APPLE: Enquirer. If a large number of plants thrown up fruit together in a defective state, the cause of it is undoubtedly what we have ascribed to the lack of application of extreme temperatures, or to the heat of heat about the plants or at the roots, or at both, at the time the plants are on the point of starting into fruit. At this critical period also the repetition of such plants, particularly during the winter months, will likewise sometimes lead to it, unless very great care is exercised in keeping the heat about them uniform. Young vigorous plants are more susceptible of injury in this way than others. G. T. M.

DISCLAIMER.—Messrs. Edwards & Cowell, seed merchants, 58, Haverstock Hill, and Mr. R. J. Wood, the Bedford and Haverstock Nurseries, Haverstock Hill, write to state that they have no connection whatever with the enterprising seedsmen whose questionable doings were commented upon at p. 579 of our last issue.

DOUBLE VIOLETS.—Your correspondent should furnish you with the name of the variety of the double variety of a patent being taken out for the production of double Violets far surpassing those of Parma, Nice, and the Mediterranean, and attaining the size of a water lily, but I am afraid it is not so important as heard of the other day, so by parity of reasoning we may expect to see Violets as big as Caniflowers some day in our columns.

ELWES' MONOGRAPH OF LILIES: A. B. This splendid work is published by subscription. You should apply to H. J. Elwes, Esq., 6, Tenterden Street, Hanover Square, London, W.

EULALIA JAPONICA: We have received from Messrs. John Laing & Co., Forest Hill, London, some finely figured in our columns.

EVENING PRIMROSE: J. R. (Eranthis biennis. GREEN TULIP: H. W. C. We are sorry we cannot give you with certainty why your Tulips have not behaved themselves, probably because growth has been in some way more favoured than development; but we cannot quite agree with you that they are not so healthy, but we are glad to hear of your interest for the philosophers, as showing how flowers are made.

FRUIT: J. B. The house may run up to 82° in the middle with sun-heat, but should stand at about 70° at night, with a little air on.

FLORAL CLOCK.—Professor Balfour, in his (125) Book of Flowers, gives the following list of plants which are attracted to the attention of Linnaeus, and he conjectures that he calls a floral clock, in which the hours of the

day were indicated by the opening of certain flowers, and which were hence called "horological." The following is a specimen of such an arrangement of flowers, in which the hours indicate the periods of waking from sleep, it is given by De Candolle* from observations made at Paris:—

Table with 2 columns: Flower name and Hours of Waking. Includes Ipomoea purpurea, Ipomoea Nil (Flor de Noite), Tropaeolum, Papaver nudicaule, Nicotiana glauca, Hypochaeris maculata, Species of Senecio and Hieracium, Solanum, Camellia, Mesembryanthemum barlotium, Anagallis aeneas, Calendula arvensis, Arenaria rubra, Geranium, Scilla pomeridiana, Silene noctiflora, Eranthis biennis, Lychinis vespertina, and others.

Names of Plants: V. T. The fruit of Medicago Euphratica (fig. 97), a native of the Levant. The plant has been introduced in the popular mind by the Passion of Our Lord. On the leaves may be seen the signs of the wounds, while the curved and spiny thorn symbolises the crown of thorns.—H. F. A. Enquirer. We wish to identify the plant by the single leaf.—J. Clark. The seedling Fern appears to be Cyrtomium falcatum.—G. H. F. 1 and 3 insufficient; 2, Polystichum capense; 4, Selaginella cuspidata; 5, a fern with a pinnatifid saccus; the Alexandrian aroidium.—T. W. Ruscus racemosus; the Alexandrian Laurel. We could not identify the Amyraldis.—S. T. Saxifraga triactyloides; the three fingered Saxifrage; 2, next week; 3, Sedum Sieboldi variegatum.—T. H. The plants next week. The weevil

FIG. 97.—FRUIT OF MEDICAGO EUPHRATICA.

in the Bean is Bruchus rufimanus.—Saxifraga. Erophila vera.—W. D. 1, Allium substriatum apparently; 2, Polygala myrtilloides.—J. M. Acaia armata var.—J. F. A. 1, Frutillaria dasyphylla; 2, F. green. —S. T. 1, An Epiphylum, which we cannot name from flower alone; 2, Mesembryanthemum spectabile.—J. V. V. Eria ornatum and Cyrtandium pendulum. —E. R. 1, Fuchsia splendens, probably; but why not send good specimen? 2, Apocynon ditachyoides.—B. G. H. Rhamnus alaternus.—J. B. Andrews. Bromus maximus.

NITRATE OF SODA: Enquirer. Nitrate of soda 80 to 100 lb. per acre sown in spring. The object of the Chiswick trials was only indirectly practical, the experiments were intended to test the effect of various manures on different plants grown separately, and not in association with others as in ordinary pasture land. Bearing this in mind, and remembering the caution given, the Chiswick trials, especially the annual series, may be relied on.

PHORMIUM COLORENSIS VAR.: James Clelland. We have not seen this variety in flower, but have no doubt it is very different in character to the normal type, P. tenax, which is green and white, and somewhat inconspicuous. Neither can we say what time will intervene between the spike and flowering and the flowers opening. We have no doubt that it may be raised from seed, but most likely the majority of the seedlings will be green.

PLANTS FOR EXHIBITION: A. Adams. Six good and fine plants for exhibition.—Black Douglas, Marchal McMahon, Reine Victoria, Chieftain, Mrs. Harrison Weir, Rev. C. P. Peach. Six silver-edged Pelargoniums.—Albion Cliffs, Little Top, Miss Kingsbury, Flower Queen, May Queen, Princess Alexandra, Six Zonal Pelargoniums.—Corsair, Ivanhoe, Lady Sheffield, Wellington, Jealousy, White Clipper. Four choice plants from Edmonds, Model, Lord Charles Symmetry. Four light Fuchsias.—Arabella Impey, Margarina, Lucre, Venus de Medici.

SCENTED GRASS HILL: G. E. B. The grass you allude to is Polypogon fragrans. Hierosepe borealis; see Eng. Bot. Suppl. t. 204; is also called Hierosepe fragrans and H. odoratus. SINGLE-HANDED GARDENERS: C. Dyke. A single-handed gardener is one who has no regular assistance, or has no occasional assistant only.

TEA PLANTATION: M. D. Write to Mr. Smith, Curator of the Royal Botanic Gardens, Kew.

* De Candolle, Physiologie Végétale, iv. 484. See also Eng. Bot. Suppl. t. 204, p. 275, and Végét. Illustration, Phlox. Oct. p. 271.

UNFRUITFUL VINES: John Nicoll. The over-heavy crop of that year may be the cause of this year's unfruitfulness. Vines will not stand over-cropping. VINES: L. J. It is impossible for us to tell with any certainty what may be the cause of your Vines dying. We think you should think, first, in a bad condition. Examine them, and, if necessary, apply fresh soil. The paraffin oil with which you have dressed the stems will kill the young shoots. In this instance.—W. K. Wigram. Your Vines are not suffering from any disease; the affection is owing to excessive chills—i.e., very close, warm, atmosphere at one time succeeded by extreme cold and damp.

VINERY: Frank Carpenter, Christchurch. It gives us much pleasure to reply to your queries. We have no doubt that if the root of your vine were at a lower angle than the one you suggest, it would be subject to rotting; the best form of house for your part of the world would be a flat span-roof with the ead facing the wind and sun. The fruit of your neighbours' Vines was not produced by the sun burning the leaves, but rather through their being kept too close and damp and dark afterwards.

* Correspondents are specially requested to address, post-paid, all communications intended for publication to the "Editors," and not to any member of the staff personally. The Editors would also be obliged by such communications being sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish us to see. Letters relating to Advertisements, or to the supply of Paper should be addressed to the Publisher, and not to the Editors.

CATALOGUES RECEIVED.—Messrs. Dick Radclyffe & Co., 120, High Holborn, London, W.C., Catalogue of Vegetable and Flower Seeds.—J. Linden (Ghent, Belgium), Illustrated Catalogue of New Plants, &c.—Messrs. Ireland & Thompson (Craiglough Nursery, Comely Bank, Edinburgh), Catalogue of Stove and Greenhouse Plants, Ferns, Palms, Orchids, and List of Bedding Plants.—Messrs. Nunn, Neuner, & Co. (Louisville, Kentucky, U.S.A.), Illustrated descriptive Catalogue.—Messrs. Carter & Co. (High Holborn, London, W.C.), Catalogue of New and Choice Plants.—Messrs. W. & A. G. Nicholson (London, W.C.), Illustrated Catalogue of Horticultural and General Nurseries.

COMMUNICATIONS RECEIVED.—J. U. (many thanks).—G. D. V.—J. W. L. Hastley.—C. L. S.—T. D. M.—Sir W. S. I.—W. H. D.—J. R.—H. W. C.—Burley.—C. E. W. S.—P. S.

Markets.

COVENT GARDEN, May 10.

A good supply, with trade somewhat slack, has caused a decline in most kinds of hothouse fruits, the hat few sunny days having had a marked effect upon the quantity arriving in the market. As for common outdoor vegetables have advanced considerably, though Asparagus, owing to the large quantities arriving from abroad, is making less than its value. James Webber, Wholesale Apple Market.

VEGETABLES.

Table with 2 columns: Vegetable name and Price. Includes Artichokes, Asparagus, Beans, Beet, Cabbages, Carrots, Cauliflowers, Celery, Cucumbers, Endive, Garlic, Herbs, Potatoes, Radishes, Spinach, and Turnips.

FRUIT.

Table with 2 columns: Fruit name and Price. Includes Apples, Colts, Grapes, Lemons, and Oranges.

CUT FLOWERS.

Table with 2 columns: Flower name and Price. Includes Anemones, Bellis, Bouvardias, Camellias, Carnations, Chrysanthemums, Cyclamen, Daffodils, Eranthis, Eucharis, Fuchsias, Geraniums, Helianthus, and Tulips.

PLANTS IN POTS.

Table listing various plants in pots such as Azalea, Begonia, Bouvardia, Calceola, etc., with prices per dozen.

SEEDS.

LONDON: May 9.—As is usual at this period very little business is just now passing in agricultural seeds. The sowing season is, of course, drawing to a close, and as yet there has sprung up scarcely any speculative buying for holding-over purposes.

CORN.

At Mark Lane on Monday, rates for Wheat were quoted as on Monday's slight, but trade was very slow, and offers of less money were not altogether rejected.

CATTLE.

At the Metropolitan Market on Monday buyers of beasts were very indifferent as to making purchases, seeing that all sold here must be slaughtered within the market area. Prices were consequently lower.

HAY.

The Whitechapel report of Tuesday states that there was a good trade for fodder, and the market is firm. Prime Clover, 100s. to 120s.; inferior, 85s. to 95s.;

POTATOS.

The Borough and Spitalfields reports of Tuesday state that good Potatoes, of which there are moderate supplies, continue in moderate request at previous quotations.

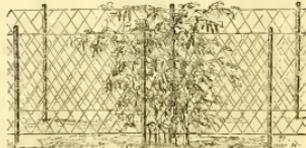

HORTICULTURAL IRON AND WIRE WORKS.

R. HOLLIDAY, Iron and Wire Works, 2A, Portobello Terrace, Notting Hill Gate, London, W.

GALVANISED WIRE PEA TRELLISES.

Used season after season, and neat-looking as useful.

6 feet wide and 3 feet high 3s. each.
6 feet wide and 4 feet high 4s. each.
6 feet wide and 5 feet high 5s. each.

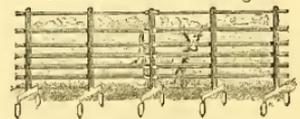

J. B. BROWN & CO., 99, CANNON STREET, LONDON, E.C.

Established over a Quarter of a Century.

Is in use over many thousand miles, and has been awarded the Medals and highest Commendation of all the leading Agricultural Societies.

Continuous Bar Iron Fencing.

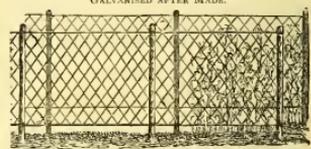

With bars secured by F. M. & Co.'s Patent Self-locking Joints, which effectually prevent the uprights being pushed aside, and are independent of loose pins, wedges, or staples.
IRON ENTRANCE and FIELD GATES, IN WROUGHT AND CAST IRON.

E. T. ARCHER'S "FRIGI DOMO."

Patronised by Her Majesty the Queen, for Windsor Castle and Frogmore Gardens, the late Sir J. Paston, and the late Professor Lindley, &c.
MADE OF PREPARED HAIR AND WOOL.
A perfect non-conductor of heat or cold, keeping a fixed temperature where it is applied. A good covering for Pits and Forcing Frames.

THOMAS'S IMPROVED PEA TRELLISES.

FOR TRAINING PEAS, INSTEAD OF STICKS. GALVANISED AFTER MADE.

Prices, in Panels of the undermentioned sizes only, without stakes:—
6 feet wide, 3 feet high 2s. 6d. each panel.
6 feet wide, 4 feet high 3s. 6d.
6 feet wide, 5 feet high 4s. 6d.

Thomas's Pea and Seed Grapes.

NEW PATTERN, GALVANISED. Five per cent. discount allowed for prompt cash on Orders amounting to 20s. and upwards.

J. J. THOMAS & CO., PADDINGTON WIREWORKS, 281 and 365, EDGWARE ROAD, LONDON, W.

Gather Honey from Your Flowers.

NEIGHBOUR'S Celebrated BEEHIVES. PHILADELPHIA EXHIBITION, 1876. PARIS EXHIBITION, 1875.

Three Silver Prize Medals awarded George Neighbour & Sons. The only English exhibitors who obtained Silver Medals for Beehives.
THE IMPROVED COTTAGE BEEHIVE, as originally introduced by G. Neighbour & Sons, working three bells, is neatly and strongly made, it has three windows in the lower Hive. This Hive will be found to possess many practical advantages, and is more easy of management than any other Beehive that has been introduced.

SILVER MEDAL AWARDED AT Birmingham Meeting, Royal Agricultural Society, 1876.

HIGHEST HONOR AT THE Centennial Exhibition, Philadelphia.

Specialty adapted for Pumping in Gentlemen's Homes and Grounds. No Labor Required.
HAYWARD TYLER & Co., 84, WHITECHURCH STREET, LONDON.

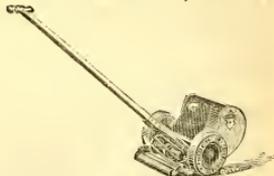

FOLLOWS & BATE'S NEW PATENT LAWN MOWERS, &c.

New Patent "Roller" Lawn Mower.

New Patent Lawn-Edge Cutter.

Royal Priss Medal Patent "Anglo" American Lawn Mower.

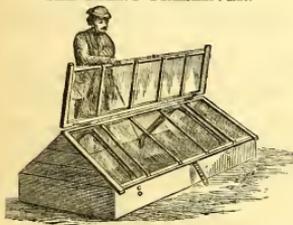

Upwards of 37,000 of these celebrated Machines have sold during the past few years. Patrons by Her Most Gracious Majesty the Queen; His Royal Highness the Prince of Wales; His Imperial Majesty the Emperor of Germany; His Imperial Majesty the Emperor of Austria The Imperial Russian Government (for the Agricultural Museum at St. Petersburg); and numbers of the Nobility and Gentry of Great Britain.

Awarded Medal for Merit, Vienna, 1873 (the only Medal given for Lawn Mowers), Large Silver Medal (the First Prize) at the Meeting of the Royal Horticultural Society, Birmingham, 1872, and in addition, every First Prize wherever these Machines have been brought into competition to actual trial with any other machine. FOLLOWS AND BATE have obtained from enumerating in detail the various good points "claimed" for other Machines, and content themselves with saying that their Lawn Mowers possess them all, and more also; they therefore solicit the favour of an application for one of their CATALOGUES, with Testimonials, before purchasing.

To be had from all respectable Ironmongers and Stationers in the United Kingdom, or from the Patentees and Manufacturers, FOLLOWS & BATE, Manchester. F. & B. are the sole makers of the well-known Patent "CLIMAX" LAWN MOWER, with Back Delivery, from 25s. each; NEW PATENT LAWN-EDGE CUTTER, which entirely supersedes the Shears; PATENT GARDEN FLOUGH, &c. Machines of any make Repaired or allowed for in Exchange.

BOULTON & PAUL, NORWICH, HORTICULTURAL BUILDERS AND HOT-WATER APPARATUS MAKERS.

No. 60.—PATENT PORTABLE UNIVERSAL PLANT PRESERVER.

These excellent span-roof frames are made with wood sides, to which are bolted iron girders to carry the lights. These lights will turn completely over and lie on the other side while attending to the plants inside. They are very portable; a man can easily remove the small size, two men can carry any size up to 25 feet by a feet. The use to which they may be applied is unlimited, as almost any class of plants can be grown in them.

CASH PRICES—CARRIAGE PAID on Orders of 40s. and upwards.

No. 64.—PATENT PLANT PRESERVERS, ARRANGED TO BUILD ON BRICK WALLS.

This is the Practical Gardener's and Nurseryman's favorite frame, now largely used for storing the great quantities of bedding plants in winter, and in summer for growing Melons, &c. This is made for building on brickwork, as shown by section of No. 64.

Section No. 64 shows the frame built on brickwork, with a pit sunk low enough for making a bed for growing Cucumbers, Melons, &c. This form can be made up to any length required.

Carriage paid to any Railway Station in England, also to Dublin, Edinburgh, and Glasgow.

CASH PRICES—CARRIAGE PAID. Including 4 glass ends to each length, painted 4 times, glazed with 28-oz. glass. Carriage paid.

See our Exhibits at the Bath and West of England Show, to be held at Bath on June 4, 5, 6, 7 and 8, 1877.

Carriage paid to any Railway Station in England, also to Dublin, Edinburgh, and Glasgow.

Packing Cases are charged, and half of the cost allowed if they are returned in good order, carriage paid, to our Works, within a month of delivery of the frame. New Illustrated CATALOGUE of Conservatories, Greenhouses, Peach Houses, Forcing Houses, &c., post-free, on receipt of 2s. penny stamps, the cost of which will be deducted from the amount of first order.

No. 75.—MELON FRAMES AND FORCING FRAMES.

The Largest Stock in the Kingdom. Ready to be despatched on receipt of Order.

These Frames are made of the best red deal, thoroughly seasoned, and fitted by first-class workmen, 24 inches high at the back, 12 inches high in front; painted three coats of good oil-colour, glazed with best 28-oz. glass, every pane of which is nailed in and bedded in putty, the best method of glazing known, and adopted by the most eminent builders and leading nurserymen (see The Garden for January 13, 1877, page 30) iron handles to each light, and an iron strengthening-bar across. Each light is 6 feet by a feet, and 2 inches thick.

CASH PRICES—CARRIAGE PAID.

Breakages seldom occur. Should any glass be broken, we will send sufficient to replace it, carriage free.

No. 74.—NEW THREE-QUARTER SPAN-ROOF GARDEN FRAME.

Our illustration shows a New Frame for growing Cucumbers, Melons, &c., and for storing plants. It is made to give greater height and more convenience than the Melon frame, No. 75. The front is 24 inches high without the lights, 22 inches at the ridge, and 22 inches high at the back. The front lights are turned back on the lights behind, and back lights turned on to the front lights, giving access to all the plants inside. They are made of the best red deal, sides and ends 2 1/2 inches, 3 inches high, all are painted 4 times, and glazed with 28-oz. glass. Each glass, nailed and putted in, same as the Melon frame, No. 75. The illustration shows the lights to open with gearing; any of the lights can be lifted up when required without altering the other lights. Back and front gearing separately.

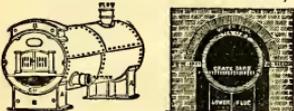

CASH PRICES—CARRIAGE PAID.

STEVENS' GOLF TRENTHAM GREENHOUSE BOILER,

After four experience, has proved the most SIMPLE, ECONOMICAL, EFFECTUAL, and LASTING BOILER extant; recently improved. For Illustrations, with full particulars, apply to the Sole Makers,

P. & J. SILVESTER,
HOT-WATER ENGINEERS, &c., & c.,
Castle Hill Works, Newcastle, Staffordshire.
Our Boilers are the ONLY ones made with the patent and under the inspection of the inventor, Mr. Stevens—all others being base imitations.

COWAN'S PATENT COMPENSATING SYSTEM OF HEATING,

FOR HORTICULTURAL, PUBLIC, AND OTHER BUILDINGS.

The most important discovery for saving the cost of fuel, for steadiness in heating power, and dispensing with night stopping. One Apparatus will do the work of several Boilers, and in some cases produce a profit.

Heating by the Ordinary Systems.

Hothouses, Mansions, Churches, and other Buildings efficiently heated by other approved methods, where the Patent Apparatus cannot be adopted.

A large Stock of the most improved forms of Boilers to select from.

HEAT AND LIGHT.

COWAN'S PATENT COMBINED GAS-MAKING and HEATING APPARATUS,

By which Country Mansions and Public Institutions may be heated and lighted, in most cases free of cost.

HORTICULTURAL BUILDING.

All structures specially adapted to the purposes for which they are required, built of the best materials and workmanship, at moderate prices.

Plans and Estimates free. An Illustrated Pamphlet free.

All work done by the Company is guaranteed.

HILL and SMITH, Brickey Hill Ironworks, Dudley.

THE
New Patent Garden Pump.
Price 25s. complete
(Packed for Rail, 2s. extra).

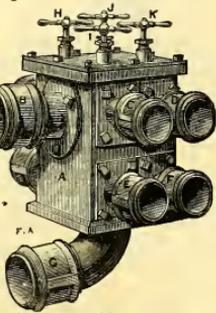

This Pump is on an entirely new principle, and for ease of working and portability stands unrivalled.
Illustrated Catalogue of Garden Engines, Pumps and Sprinklers gratis & post-free.

NYE & CO.,

373, OXFORD STREET, LONDON, W.

CRITCHLEY'S PATENT HEAT REGULATOR,

AN APPARATUS FOR REGULATING THE HEAT IN HORTICULTURAL BUILDINGS.

A. Iron Box fitted up water-tight. B. Pipe or Supply of Water from Boiler. C, D, Pipes for Circulating Hot-Water. E, F, Pipes for Return of Water to Iron Box. G, Pipe for Returning Water to Boiler. H, I, J, K, Piston-Rods for Opening and Closing Valves.

The advantages of these Regulators are that houses may be kept at different degrees of heat, or the circulation of water and heat entirely stopped in one part and not in others. They may be fitted with as many valves as required, and are particularly adapted for forcing houses where top and bottom heat is used. They may be fixed in any part of the apparatus most suitable for working, without regard to the position of the Boiler.

The following Testimonial has been received:—

"Berkeley Castle, April 13, 1875.
"Gentlemen,—I am happy to inform you, now that the late severe winter is past, that the Hot-Water Apparatus erected by you has worked to my entire satisfaction. As to the Heat Regulator, which represent thirty valves, I have had ample opportunities of practically proving them, and unhesitatingly admit they are far superior to any other valve; in fact, I think it the greatest improvement that has come out for horticultural purposes."
"R. H. CHAMBERLAIN,
"Gardener to the Right Hon. Lord Fitzharding."

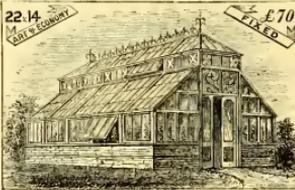

Estimates and Plans forwarded for Warming Gentleman Mansions and Public Buildings. Orders attended to in any part of the kingdom, and guaranteed to answer their intended purposes. Prospectus and Price Lists post-free.

LASCHELLES PATENT BENT WOOD
CONSERVATORIES and GREENHOUSES.—All Gardeners know that Wood is better than Iron for Plant Growing, and by the above system a handsome curved house can be erected as cheaply as a plain straight one.
The curved house is more durable, stronger, lighter in construction, and no bent glass is required.
W. H. LASCHELLES, 7, rue Faidherbe, Rouen, E.C., will supply Drawings and Estimates free of charge.

CARSONS' PAINT,

PATRONISED BY THE QUEEN,

And 21, BACHELOR'S WALK, DUBLIN.
NO AGENTS.

Oil Paint No Longer Necessary.

HILL and SMITH'S BLACK

VARNISH for Preserving Ironwork, Wood, or Stone. This Varnish is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitations, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, the best Lawn Tennis Courts, the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received, which HILL & SMITH will forward on application.

Sold in casks of about 30 gallons each, at 12. 6d. per gallon, at the Manufactory, or 11. 6d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL RECEIVED MAY 3, 1877.
"The Works, Alderley Edge, Manchester.—Messrs Hill & Smith.—Sixty or some 20 years I have used your 'Black Varnish,' and shall be glad if you will forward me another cask, or I consider it the best I have known for the preservation of all outdoor work, either wood or iron, that requires to be painted."
—Yours respectfully, ALFRED LOWE, J.P.
Apply to HILL and SMITH, Brickey Hill Ironworks, near Dudley; and 125, Queen Victoria Street, London, E.C., from whom the Varnish is sent.

CAUTION!—It having lately come to the knowledge of HILL & SMITH that spurious imitations of this Varnish are being offered by unprincipled dealers at a slight reduction in price, they would especially draw attention to the fact that every cask of their Varnish is legibly marked with their name and address, without which none is genuine.

GRANITIC PAINT
for Sanitary Purposes.
SILICATE ZOPHISA COMPOSITION. All colours. For Detailed list on external.
LIQUID SILICATE ZOPHISA COMPOSITION. Colourless. For Preserving Stone, Brick, or Cement. All washable and durable. To be had genuine only of the Original Manufacturers.

THE SILICATE ZOPHISA COMPOSITION AND GRANITIC PAINT, now sold, removed to
45, Fish-street Hill, London, E.C.

HOUSE
BUILDINGS
E.C.

In consequence of the increasing demand for Conservatories, in which pure art is combined with moderate cost, T. H. P. DENNIS & Co. have been led to introduce designs of a character hitherto unknown. One of these designs, showing a house 22 feet 6 inches x 13 feet 6 inches, is annexed, and the result, as regards the extremely low price (which includes fixing, glazing, painting, carriage, &c.), has been attained only by special machinery and a system of interchangeable parts.

T. H. P. DENNIS & Co. are also prepared to provide and fix Hot-water Heating Apparatus and Horticultural Buildings of any dimension or description.

Full-sized specimens of Greenhouses, &c., and Hot-water Apparatus in work, can be inspected at Mansion House Buildings, London, E.

Gentlemen wanted upon at their residences by experienced designers.

Estimates and Plans free.

GREEN'S PATENT "SILENS MESSOR" & "MONARCH,"

Or NOISELESS LAWN MOWING, ROLLING, and COLLECTING MACHINES for 1877,

THE WINNERS OF EVERY PRIZE IN ALL CASES OF COMPETITION.

Patronised by Her Most Gracious Majesty the Queen on numerous occasions, H.R.H. the Prince of Wales, the King of the Belgians, the late Emperor of the French, the Emperor of Russia, and most of the Nobility, Clergy, and Gentry in the United Kingdom.

Upwards of 80,000 of the above Machines have been Sold since they were first introduced in the year 1866, And Hundreds of unsolicited Testimonials have been received testifying to their superiority over all others.

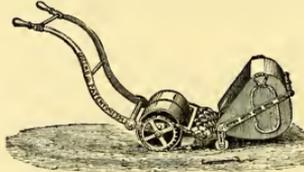

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every Prize that has been given.

The following are their special advantages:—

- 1st. Simplicity of Construction—every part being free of access.
- 2d. They are worked with far greater ease than any other.
- 3d. They are the least liable to get out of order.
- 4th. They make little or no noise in working.
- 5th. They will cut either long or short Grass, wet or dry.

SINGLE AND DOUBLE-HANDED "SILENS MESSOR" LAWN MOWER.

To cut 6 inches	£ 5	d.
Can be worked by a Lady.	1	15 0
To cut 8 inches	2	10 0
Ditto.		
To cut 10 inches	3	10 0
Ditto.		
To cut 12 inches	4	15 0
Can be worked by one Person.		
To cut 14 inches	5	15 0
Ditto.		
To cut 16 inches	6	15 0
Can be worked by one Person on an even Lawn.		

To cut 18 inches	£ 8	s.	d.
Can be worked by a Man and Boy.	8	0	0
To cut 20 inches	8	10 0	
Ditto.			
" 22 "	9	0 0	
Ditto.			
" 24 "	9	10 0	
Ditto.			

* If made stronger, suitable for Donkey, 30s. extra.

Prices of Horse, Pony, and Donkey Machines, including Patent Self or Slide Delivery Box; Cross-stay complete; suitable for attaching to Ordinary Chaise Traces or Gig Harness:—

DONKEY and PONY MACHINES.

To cut 26 inches	£ 15	0 0
" 28 "	17	0 0
" 30 "	18	10 0

Leather Boots for Donkey	£ 1	4 0
" " Pony	1	4 0

HORSE MACHINES.

To cut 30 inches	£ 22	0 0
" 36 "	26	0 0
" 42 "	28	0 0
" 48 "	34	0 0
Leather Boots for Horse	£ 1	9 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machines make little noise in working, the most spirited animal can be employed without fear of its running away, or in any way damaging the Machines.

Carriage paid to all the principal Railway Stations and Shipping Ports in England, Ireland, and Scotland.

GREEN'S PATENT "MONARCH" LAWN MOWER, with Chain and Internal Gear combined.

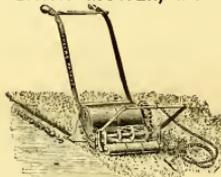

This Mower is well adapted for cutting long, coarse, rough, and wet Grass. It is strongly made, and does its work admirably. It will cut nearer to an object than any other Lawn Mower extant.

The sizes and prices of the "Monarch" Mower are in every respect the same as for the "Silens Messor," with Grass Box, &c., complete.

Green's Patent Lawn Mowers have proved to be the best, and have carried off every prize that has been given in all cases of competition.

No Lawn Mower Manufacturer keeps so large a stock of Mowers as is to be found at our London Establishment, 54 and 55, Blackfriars Road, where purchasers can select from upwards of 500 Machines of Hand, Pony, and Horse Power, and where their Orders executed the same day they are received.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned at once, free of cost to the Purchaser.

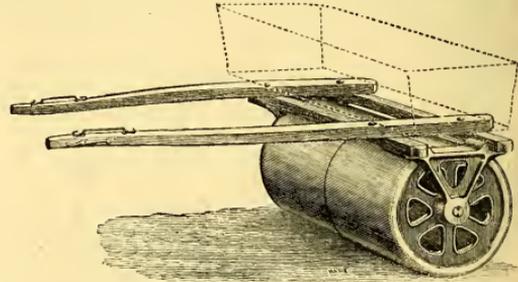

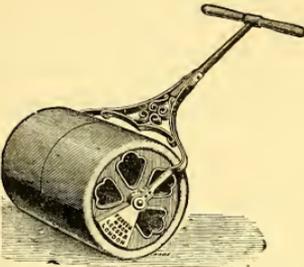

Green's Lawn Mowers are the only Machines in constant use at the Royal Horticultural Society's Gardens, South Kensington, London.

N.B.—Those who have Lawn Mowers which require repairing should send them to either our Leeds or London establishment, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

Delivered, Carriage Free, at all the principal Railway Stations and Shipping Ports in England, Ireland, and Scotland.

GREEN'S PATENT ROLLERS FOR LAWNS, DRIVES, BOWLING GREENS, CRICKET FIELDS, and GRAVEL PATHS, SUITABLE FOR HAND OR HORSE POWER.

Agents for Manchester—JOHN HEYWOOD. Agents for Scotland—Messrs. J. MENZIES & CO., Edinburgh and Glasgow.

SUPPLEMENT TO THE GARDENERS' CHRONICLE.

FLOWER GARDENING.

ANY of the most palpable errors and serious mistakes in flower-gardening have arisen from supposing that these two—cultivators and artists—who between them make and furnish the flower garden, must necessarily be combined in the same person. No

doubt many cultivators are also men of refined taste, and also of considerable capacity in the designing, laying-out and furnishing of flower gardens—artists may also be found who are accomplished cultivators—but there is no necessary nor natural relation between skill in cultivating plants, and taste in designing, laying-out, or even furnishing gardens; and the sooner the fact is recognised and acted upon the better.

Now if this be true—and it is—neither is taste transmissible by laws of primogeniture or entail, nor is it purchasable by wealth. Money can do almost anything—purchase houses, lands, a seat in Parliament, social status, &c.—but it is powerless to buy a cultured intellect or polished taste; and some of the most absurd and vulgar vagaries ever attempted in the world furnished by the creation of those whose wealth furnished them with the opportunity of revealing their inherent poverty and vulgarity of mind in the mansion or the garden. It cannot be too often repeated, that there is no royal road to good, true, and beautiful flower-gardening, any more than there is to painting, eloquence, or genius of any sort.

Perhaps the greatest weakness of modern flower-gardening, as of art of all kinds among us, is the want of originality, its chief bane the opposite, that is, servile imitation. Whatever is or has been, is held to be right, and is repeated evermore. Our literature is partly to blame for this. Practice, or that is, is extolled; theory, or what may or should be, is contemned; while originality is strangled with a sneer, and imagination is politely bowed out of the domain of horticulture. And yet the quickening of the latter faculty is one of the most pressing needs of the day to lead horticulture on to higher victories in discovery, in literature, general practice, and especially in improving the designs and furnishing of our flower-gardens. If there is a place for the imagination in scientific inquiry—and there is—there is assuredly a much higher and more important place for the exercise of the same brilliant and creative faculty in the embellishing of our flower-gardens. Unfortunately, too, exactly in the ratio of the decadence of the imagination is the persistency and invariableness of our imitation. We are, in fact, a nation of imitators. It saturates our habits, clips the wings of our art, and runs riot in our gardens. Imitation robs thought of its freshness, gives tricks of style to our literature, degrades painting into copying, with few exceptions—making all the men and women, the seas, rivers, landscapes, of our island alike, and designing and planting thousands of gardens up and down the country on the same pattern.

Imitation has ever been the bane of British flower gardens. Men run after styles and pursue art in masses, as dogs hunt in packs or sheep feed in flocks. Now and then some strong mind arises and bursts the bonds of uniformity by the force of his brilliant imagination, and for a time his fashion or style prevails. It was so with such great men as Capability Brown, Cuthbert Repton, Elegant Price, Flowery Nasmyth, Antique Nesfield, Encyclopædic Loudon, and others. Each has broken through to some extent existing

styles, and been followed by hosts of imitators. No harm would have come to the art of flower-gardening had the imitators taken the best of each master for the time being, and by the force of their genius and imagination made each master's work contribute to the general improvement of flower-gardening. Imagination, pluming its wings, as it were, on the best works of others, would thus make smooth the coils of vantage from which to rise higher, and do yet better and more beautiful things with flowers and flower gardens. Instead of this, almost each style, however commonplace, has been extolled as perfect in its turn.

At one time curved lines of beauty were so much in vogue that even the straight lines of square houses were considered highly offensive to the rules of taste. Straight walks, roads, fences, plantations were considered a sin against the laws of culture and of taste. Another revolution of the wheel of capricious fashion turned all the lines of beauty into Dutch canals, and the straightest, shortest line between any two parts was held to be the line at once of mathematical precision and of artistic propriety. Now almost equal great changes have taken place in the furnishing of flower gardens as in the outlines of the walks, beds, or borders.

MIXED BORDERS.

The mixed style, which included everything from stately trees or shrubs in the centre of large clumps to dwarfs, annuals, alpinas, or succulents, hugging the turf at the extreme edges, was the proper thing for many years. The chief art of furnishing resolved itself into a matter of heights, breadths, and consequently distances—by no means such a simple affair as modern flower-gardeners may suppose. For only think of the special knowledge required to master such details concerning the hundreds of species and varieties of plants grown in many of the old flower gardens. This plan also has many merits, and is consequently being revived. It suffered severely from the straining of a few general rules. So inexcusably at one time was the rule of the uniformity of stature in each form of bed or border enforced, that the head of a plant or its natural habit, or both, were sacrificed rather than it should prove too high for its place. The most ridiculous efforts were often made to keep others low enough. Stakes were excessive in number, and often enormous in bulk. The isolation of the plants was carried to extremes, as was the intermixture of species and varieties. The garden often became a confused medley, in which there was more timber and bare earth than beautiful plants. All individuality and most of the beauty of many of the plants were utterly destroyed by what may be termed the uniform birch-broom style of training and tying. The result was often monotonous and tiresome in the extreme, and it was often quite refreshing to rush away from the stiff and tame sameness of the flower garden into the more pleasing because more free art of the tangled woods. But there was a grand richness of material in the old style. Were the plants but thrown into groups or families, and early allowed to display their beauty in a natural state and in sufficient breadths to produce a distinct impression—on which the eye and nose could rest with pleasure before passing on to the next group of plants—more pleasure could be got out of the old plants than many of the modern ones.

The eccentricity and irregularity of the form of the old beds and borders also gave an air of quaintness and of freshness to them. The outlines were often so erratic that one might have thought they were formed by a shower of ballast from a balloon scudding before the blast or caught in a whirlwind. This irregularity of boundary lines running apparently

where it listed, in defiance of all rules of art and principles of congruity, was often the only touch of Nature that redeemed old flower gardens from the dominance of the most dismal art—the only spark of genius that flashed up from the dying embers of the most dead and lifeless uniformity of furnishing.

BEDDING OUT.

It is a libel, however, on Nature to call the old mixed or dotting system, in which each herbaceous plant of similar height, whether Golden Rod, Phlox, or what-not, was made as like as possible in size, height, and general outline to its neighbour, the natural style of flower-gardening. As Nature is ever the inspirer and teacher of Art, and Art is ever catholic, she hates narrowness and isolation. There was more of Nature and also of art in the massing and bedding out than in the mixing or dotting style. Nature masses always—dots, isolates, seldom or never; or if she dots at all it is mostly on an already furnished base, as Buttercups and Daisies on the verdant sward—the first example, and still the richest illustration of pinchusion flower-gardening. Does any one question that Nature masses her beauties on a large and magnificent scale, let him away to the brown heaths and shaggy woods, and see what grand breadths of light and shade, of grave and gay, she forms of brilliant flowered heaths, golden Brooms and Furze, contrasted with dark Fines, Weeping Willow, or silver Birches. These are but samples drawn at a venture from Nature's full lesson-book of the science and practice of grouping in masses, or bedding-out flowers and verdure.

It was, however, quite natural that the introducers of the new style should fall into some mistake. The state of art among nations and men, the civilisation of peoples, may be more correctly gauged by their decorations than by almost any other test. The rage for colour is a sure test of want of taste or of a low state of civilisation. Hence the glaring colours of savages, the dubs in the homes of the poor; and it was the glare that destroyed all repose, and consumed, as it were, by its brilliancy the higher-classed beauty in so many flower gardens. The primary colours were used in such excess that each garden became a sort of tricolor, contending over every bed and border. The contrasts were too startling, the harmonies mostly in major keys or high colours; and there was a glaring want of neutral tints and greens to insure rest and suggest repose. All this, however, has been corrected by criticism. The cry that the flower-gardener had caught the blues, the jaundice, or the scarlet fever, had its desired effect. The colours became more subdued, better balanced, more beautifully mixed, blended and toned down into softer, sweeter harmonies, resembling more the melting strains of the lute than a trumpet summons to battle.

In fact there was and still is far too much of the battle spirit in the combats and contests of modern flower gardening. It is a strife for mere numbers rather than for excellence, as if thousands posted in the wrong place in an unskillful manner could cover or hide up the want of either by their mere mass. And then everybody imitated his neighbour's garden, and monotonous run to seed in the gay days of the bedding-out or grouping system of furnishing flower gardens. Each garden everywhere was but a counterpart of every other garden everywhere else. Hosts of observers scoured the country, note-book in hand, to duly chronicle results, and bedding-out systems were taken bodily from your pages, and displayed on hundreds of other gardens, just as a bale of cloth might be purchased from a draper's, and rolled out and served to scores of customers. Or, better illustra-

tion still, garden arrangements were transferred from places for which they were adapted to others for which they were more suitable. From the pages of this journal to the beds of thousands of flower gardens, with as little thought of adaptation as a block of type is conveyed from the composing-room to the machine-room. This endless repetition and servile imitation, making each garden but a double of another, satiated the public taste and caused a rebound from gay to grave in flower gardening.

SUBTROPICAL GARDENING.

In other words it prepared the way for the next step in advance—leaf or subtropical gardening. This system has the promise of introducing new and different materials to our flower gardens. It added a new dignity and stature to the plants hitherto used for greens, and provided the elements of a far richer variety of filling and furnishing. The place for subtropical gardens, however, should be in combination with flowering plants, and not separated from them, as has generally been done. New furniture also often requires new rooms. Ladies who are *au fait* at adapting papers, carpets, furniture, ornaments, to the size and character of houses and plants will understand our meaning. No doubt one of the greatest drawbacks to the effective display of subtropical plants has been and is the planting them in the old beds or borders. Beds or borders of suitable forms and sizes for such plants as *Verbenas*, *Calceolarias*, *Pelargoniums*, &c., are probably altogether unsuitable for *Cannas*, *Solanums*, *Viguidas*, *Castor-oils*, *Tobaccos*, &c. The effect and grandeur of many of these fine plants are planted down into insignificance by the small circular, elliptical, diamond, square or other shaped beds in which they are planted. These "little goods" with large subjects so common in our parks and in private gardens, have done a good deal to bring subtropical gardening into ridicule.

It, however, like the bedding-out system, has sufficient vitality to survive all opposition and to be improved by it. Few things add more to the richness of a flower garden than fine-foliage plants in sufficient masses to throw out with better effect the brilliance of the coloured leaves and flowers—distant points losing themselves by distance or change in the form or level of the ground marked with fine-foliage plants like *Sisley*, *Cannas*, *Masses*, *Palms*, *Ferns*, skirting the sides of pools, lakes, streams, reflecting back their noble foliage from their crystal depths; the sides of valleys, gentle mounds and elevations, shady nooks and corners, warts, snug recesses—these add somewhat similar spots from the most effective places for planting with subtropical plants. The mere height of the plants and massive spread of their fine foliage suggests the propriety of planting them in considerable masses. Neither is it by any means necessary that the masses should be all green. Even among some of the largest subtropical plants, such as *Cannas*, there is a rich diversity of coloured leaves, which in the various forms of *Beet*, *Colens*, *Amarantus*, *Collifoot*, *Perilla*, *Iresine*, *Cineraria*, *Centaurea*, *Alternanthera*, &c., furnish an assortment of colours almost as rich and gay as the usual run of flowering plants. As a curious instance of those contractions in art which are far from numerous, it may be noticed in passing that those who have been the least in stern condemnation of an excess of coloured flowers in gardens, have been most prodigal in the introduction of high-coloured foliage. In avoiding *Sisley*, how many fall into *Cherry-bill*!

Subtropical gardening, however, is sure to hold its own, and to improve with practice. It is based on sound principles, and its place and practice are every year becoming better understood. It is not a substitute for flowers, but a rich support and addition to them. Foliage plants should be to flowers what the painter's sky, clouds and background are to the lovely landscape. But a garden of leaves only is something like a picture without a central subject, a novel without a plot—a magazine wholly padding, without a substantial article.

RIBBON GARDENING.

In striking contrast to subtropical is that of ribbon gardening. As its name implies, it consists of bands of colour of varying or uniform width, arranged in straight or in waving or curved lines. The colours may be arranged on the principles of harmony or contrast, and the different bands may also be separated from each other by neutral colour or bands of black, white, or green. One ground-colour may also be

used for the groundwork of the ribbon, with one or more striking bands of colour run through it. It is about this method of furnishing flower-gardens affords unusual facilities for the display of coloured leaves and flowers with striking and pleasing effects. The variation alike in the arrangement and the relative truth or mass of the different colours, may be endless. Some prefer only a few simple colours several rows deep, or, in other words, a bold ribbon, with only two or three bands; others, again, elect to have a ribbon with ten or a dozen bands of colour all of one width; others repeat the same colours severally times in succession. There is also much scope and variety in the matter of edging. These may be either contrast or harmonise with the chief colour of the ribbon, and generally add greatly to the interest and beauty of the ribbon.

PATTERN BEDS.

Closely associated with, or rather a branch of ribbon bordering, is the picking-out style. Beds or borders are thus arranged in solid blocks of colours, separated by straight or waving ground-lines of varying width between the blocks. The blocks or masses of the kind may also be varied in form, size, and coloring. A common plan of picking-out ribbon borders is to pick out circles, ellipses, diamonds, or other patterns, and carry a band of one or other colour, from a foot to a yard wide, of low stature, round the picked-out masses. Then, again, on wide borders, straight lines may follow these waving lines in the back and front of border. This disposition forms yet other blocks to fill up the space between the waving and the straight lines, so that this arrangement provides three series of high or massive masses, or waving, or solid lines, and also a series of straight lines back and front of the ribbon borders.

Single specimens or groups of quite a distinct character of plants form another good variety of the picking-out style. Specimens or groups of *Fuchsias*, *Humesas*, *Yuccas*, *Dracenas*, *Palms*, *Cannas*, &c., among flowering plants, impart much variety and freshness to ribbon borders or large beds arranged on the picking-out style.

A change of lines in parts of beds and borders sometimes affords as much variety as a change of plants; it also enables dwarf plants to be used with excellent effect at times in new positions. The entire beds or borders are also often worked out with scrolls or pieces of embroidery, in which elegance of design, and softness and beauty of colour, vie with each other for the mastery. Few modes of furnishing are more beautiful than those which are carried out with taste and judgment, and wherein the amount of each colour, as well as its place, is arranged with care and judgment.

Pinus beds and borders are also very effective. These consist generally of one ground colour, furnishing the surface thirly with one shade or hue. *Verbenas venosa* and *Purple King*, *Golden Feather*, *Pyrethrum*, *Lobelia speciosa*, and other dwarf varieties, *Iresine*, *Amaranthus melancholicus*, the variegated *Mesembryanthemum*, &c., are favorite plants for groundwork. Over and among these, exactly as pins are stuck into a cushion, other plants, such as *Mangles*, *Lady Plymouth*, *Flower of Spring*, *Lady Cullum*, or other silver variegated or golden tricolor *Pelargoniums*, *Sisley*, *Perilla*, scabret *Pelargoniums*, &c., are set into the groundwork. The flowers, planted on blue or purple grounds, are, upon the whole, the most striking and pleasing arrangements in pincushion gardening.

MOSAIC BEDS.

Almost the latest fashion in flower gardening is the carpet, tapestry, or inland style. Various patterns are chosen and filled in with blocks or masses of colour, separated by dividing masses, lines, or broad bands of other colours. Carpet bedding differs chiefly from the pattern-bedding style in the plants being as nearly as may be of one height, so as to represent a textile or woven fabric of uniform texture, or slightly varying in thickness; the more perfectly to imitate the raised parts of Brussels and other carpets. The resemblance is carried further by the use of made or sunk walks, furnished with *House-leeks* and other succulents laid on edge, to exhibit the thickness of the carpet. Pretty, very pretty, it may be, but carpet bedding can by no title claim to art. It belongs rather to the work of the flycatcher than the higher flights of the falcon. It is also like some novels—wonderfully poor in plot,

clever delineations of character, or useful lessons of any sort, but groaning beneath piles of upholstery and tinkered groundwork, and rich feasts of wines and viands.

Carpet bedding is rich in colouring, privileged in its waste of plants, whilst smashing bricks, coloured pebbles, sand, or gravel, or even paints, would cover a carpet on the ground as well or better, and relieve the plants from a most unnatural position and suffocating proximity to each other. Plant life and beauty are far too sacred and valuable to be merely worked up into gaudy patterns, like so many hands of coloured wools. The piling up of succulents in this style of gardening is a reckless waste of plant beauty and little or no regard to a prosecution of art, reminding one of the elaborate embellishments of the pastry cook and confectioner rather than of the simplicity and chasteness of the painter. The true place for succulents is the rockery, to contrast and heighten the grace of Ferns by their quaint stiffness of form and dwarfiness of stature. It is surprising that, with the enormous influx of succulents into our gardens, so few of them have found a rockery for themselves, or have been mixed with Ferns, with alpine flowering plants, and such grand subjects as *Foxgloves* and *Snurpagnons*, and many other of the noblest and best, and added to the verdure of Ferns by their glow of coloring. Succulents would be in their proper places in such situations, and would form a link between the more femine style of flower garden, and the more flowing style and higher art of the so-called wild garden—a contradiction in terms, but a convenient expression, indicating the want of formal training and arrangement, in which the plants and grouping often reach a grade beyond the reach of more formal art.

NECESSITY FOR VARIETY.

The chief charm in flower-gardening is to have a little of all good styles, and as great a variety of plants as practicable. Where there are several gardens or groups of flower-beds, each should be as different from the other in design as possible. Repetition of the same notes is not more tiresome in music than in flower-gardening. The different styles, the variety of plants employed, and their distinctness and freshness of arrangement, should give analogous pleasure to the different rays and notes in music. The transitions need not be too sudden, but the succession should be so arranged, a series of gradations, one may proceed from the trimmest, stiffest art of hard-and-fast geometrical designs and furnishing to land at last in groups of *Pampas-grass* shooting up against dense masses of *Fir trees*, *Ferns* drooping over a waterfall, or *Weeping Willows* reflecting their exquisite grace from a brook fringed with aquatics.

Next to monotony, the chief weakness of modern flower-gardening is excess of material. Artistic arrangement, floral or leaf beauty, is nothing worth in the estimation of many men, both can be reckoned by thousands and tens of thousands; in fact, it is no exaggeration to assert that many gardens are so covered with flowers that it is impossible to see their beauty. They are just as if an artist were to value his picture chiefly for the amount of valuable colour he could contrive to dab on to it. It is just so with many gardens. You cannot see the beauty for glare. Gravel and grass are cut down to the narrowest, that more and yet more plants may be crowded into a limited space.

Just as a much better landscape may be cut out from a few gardens than can be seen by step, and so the greatest improvement that could be effected in hundreds of flower gardens would arise from turning down one-half or three-quarters of the flower-beds and borders. Sufficient beauty to satisfy all the requirements of refined taste is quite a different thing to a prodigal display that speedily satiates or suggests vulgarity. Excessive display is always unsatisfactory. Many flower gardens remain one of a lady always arrayed in her richest apparel, and the whole of her jewels and finery, grace and modesty are apt to be lost sight of beneath her excessive ornaments. It is so in degree with overplanted, over-coloured gardens. Moderation and simplicity are essential principles of landscape art, that should be carefully applied in the decoration of flower gardens. In avoiding overcrowding the opposite end of this planting should not be indulged in. Some gardens through the very evils of an excessive number of beds and borders never are, but always to be, beautiful. The plants are placed so wide apart that they seldom meet the eye, and the sense of this poverty of plants is by no means what it might be if the plants were of flowers. Reduce the beds and borders as much as

good taste may require, and do it with a bold and firm hand, but let those that remain be well and fully furnished. To have them otherwise is like hanging an unfinished picture on the most prominent place on the wall. Works of art should be fully finished or furnished, or put out of sight. Exactly the same rule applies to gardens. Better a bed a yard across, well filled and prettily arranged, than a score of beds that never grow into full beauty until the frost has taken in his grasp. No doubt gardens must grow into beauty, but careful planting and skilful preparation hasten the process and bring out the artist's ideal as speedily as may be. It may also be useful to remind some that though plants are among the highest and most beautiful works of art, they need vulgar food to make them grow into beauty and sweetness, and that, however tasteful the arrangement and good the material, the result will be a partial or complete failure unless the plants are duly prepared for their places, and the place duly cultivated and enriched for the plants. To avoid blots and blanks in the flower garden culture and manure are both needed.

Modern flower-gardening, too, has also become a thing of permanent beauty. It is not a mere flash of spring, summer, or autumn beauty, as of yore, but rather a succession of panoramas passing through the seasons with stately grace, dignity, and beauty. Early spring plants and bulbs garland the young year with freshness and fragrance the most charming and sweet. Summer has its garniture of later flowering plants and its brilliant glow of annuals. These again are succeeded by the more elaborate and desirable, though less brightly beautiful arrangements for autumn. And winter, stern and cold, has its garden of shrubs and Christmas Roses, Golden Aconites, &c. All this succession of flower-gardening involves an amount of taste, care, and labour altogether unknown and unthought of a few years ago. The garden artist and furnisher has to paint four pictures a-year instead of one. His imagination, genius, taste, are ever on the rack, and he is fortunate indeed if he can please himself and gratify others by enwreathing the flower-garden with verdure, enriching it with beauty, and filling it with fragrance from January to December. P.

CARPET BEDDING.

ALTHOUGH a system of recent introduction, carpet bedding has nevertheless taken a firm hold upon those who have to furnish our flower gardens, and certainly when the plants composing these carpet beds are well chosen for their decided colouring and lasting properties, there is no kind of bedding more pleasing and effective. It also educates the gardener's eye in providing true geometric figures where-with to display his colours, for although carpet bedding is most attractive and fascinating when faultlessly carried out, nothing is more open to objection when the figures are inaccurate.

Geometry is truth, and all figures in carpet bedding must be truthfully delineated, or the result will be a miserable failure. Hence the desirability that even one, before introducing this style of decorative gardening, should thoroughly master his designs on paper before he attempts to reproduce them with coloured plants upon his beds. They must be laid out and planted to correct lines, and we kept them afterwards, to be effective; and we would here suggest that in commencing this practice simple forms should be preferred to the more elaborate ones. They are much easier to produce, and quite as effective, and these latter kinds may be introduced hereafter when the system is better understood by the operator if it is deemed desirable to do so. There are many people, no doubt, who will remember the surprise and admiration caused by the novel and effective bed in Battersea Park produced by planting the centre with *Coleus Verschaffeltii*, and the margin with *Centaurea candidissima*. This bed, seen in the after-part of the day, with the sun lighting up the brilliant colouring of the *Coleus*, and its quiet silver edging, has left an impression on our memory never to be forgotten. This may, we think, be considered one of our earliest and most successful attempts at carpet bedding; and although we now prefer more intricate plans and much shorter pile to our carpets, still we do not forget our first surprise, and beds now filled with similar plants will not fail to arrest the attention of all spectators of good taste, although they may be immediately surrounded by

their more elaborate successors. The patterns that may be worked out upon this system are almost endless, and not only geometric designs, but even the imitation of forms and colours of insects has been attempted, with tolerable success and very questionable taste. The coloured spots on the wings of a butterfly are much too intricate and beautiful ever to get them properly delineated with plants: a few colours worked into a pretty simple pattern will always be preferable.

PLANTS MADE USE OF.

At the earlier period to which we referred the materials for this kind of ornamentation were very scanty, for although they were all around us they had never been utilised, as the demand for them had not yet come. One scarcely dreamt of using such plants as *Sempervivum*, *Echeveria*, *Sedum*, *Cerastium*, and a long list of other hardy or half-hardy plants which figure so largely in our present compositions, and which were seldom found previously except on cottage roofs, stone walls, or in our neglected herbaceous borders. The most important hardy plant in carpet-bedding is doubtless the *Pyrethrum Golden Feather*. It is easy to produce, effective in composition, and lasting in its properties; it may be kept to the most rigid forms, is decided in colour, and well covers the ground. These we consider to be indispensable qualities in first-class carpet-bedding plants. It will come true from seed, and if this is sown early in March in a cold frame, or even in the open ground, it will produce good plants by the time it is required to plant out. Its normal form, the *Pyrethrum Parthenium*, is a British plant, and is almost as common in gardens of all grades as the Dandelion, and is as difficult to eradicate. Its excellent offspring also possesses this tenacious quality, and by letting a few old plants seed in the herbaceous border a good stock of young plants will appear the following spring.

The numerous varieties of *Alternanthera*, although, of course, tender plants, possess all the good qualities requisite for us being more constant and of a more decided colouring than any other hardy annuals, and their cuttings taken in spring from the old plants, and struck in dung heat under a cap-glass, or in the cucumber frames. The plants want heat in winter, or they will damp off. *Alternanthera* are found in China, India, Central America, and the adjacent islands. When introduced, ten or twelve years ago, they were carefully cultivated in stoves, and were considered far too tender for open-air cultivation in England; after-experience has, however, proved them to be amongst the most useful plants for our carpet-beds, and it will be seen by referring to the lists accompanying the designs given with this Supplement how largely these plants figure in their composition and how well adapted they are for producing the most perfect effects. In forming carpet beds the ground should be thoroughly covered, and the plants chosen should be of uniform growth or such as will bear reducing to this state without impairing their beauty; they should also be of decided colours, and we should prefer them confined to foliage plants only, as being more constant and of a more decided colouring than flowers. If ever Nature should be so sportive as to give a blue leaf equal to our yellows and reds, there would scarcely be a necessity for using flowers at all; at present, however, we must have blue, and the dwarf *Lobelia* seems to be the most fitting for the purpose—although we know to our sorrow that they often fail us just at the time we want them most, and their places have to be filled with the best material at hand, which not infrequently mars the beauty of the design for a considerable period, if not for the remaining part of the season. Succulent plants of such kinds as *Pachyphyllum bracteatum*, *Echeveria metallica*, and some of the smaller kinds of *Aloes*, may be introduced into the beds, and with excellent effect. The ground, however, under them should be quite covered with a neat growing plant, such as *Sedum glaucum*, *S. acre*, or *Antennaria tomentosa*. Any reliable plant, however fast its growth (so that its foliage is dense and its colour suitable), will answer the purpose—hardy plants being in all cases preferable, as they are generally good under the shaly times that render ours. We have, however, seen the toothed moss, *Scagina denticulata*, used for such purposes with excellent effect, but this has been where the beds have been well drained with some rough material, such as stones or bricks, and raised from 9 inches to 1 foot above the surrounding surface. Many tender plants will grow and thrive under such circumstances that will scarcely exist if planted in the

ordinary way. The drainage being perfect, no stagnant water can possibly find a lodgment, and consequently the soil is rendered warm and healthy.

In the beds so most admired at Cleveland House, Clapham Park, last season, the central portion of the circular bed was carpeted with *Sedum glaucum*, and dotted over with *Nertera depressa*, and this was spoken of in the highest terms of praise by all who saw it. A woodcut of this bed was given in the *Gardener's Chronicle* of December 1, 1876, p. 717, to which we would refer our readers if they wish to see the whole of the arrangement.

POSITION OF THE BEDS.

In placing carpet beds upon the lawn great care should be taken in choosing the proper place for them, so that the surroundings enhance rather than detract from their beauty. They should be placed in warm nooks well backed up with some of the leafy kinds of subtropical plants or with shrubby borders if the shrubs be rich in colour and well kept in foliage, always bearing in mind that they should be open to the south, with a point to east and west, so as to secure as long a period of sunshine as possible. This is indispensable to bringing out the bright colours of the plants. The contrary effect will be produced if a damp shady spot be chosen. We have often seen them placed on a gentle slope, the lower part of the bed being raised so as to bring the surface level with a surrounding of subtropical plants, and the effect has been excellent. In such positions bright colours will show up well. When planted on a level surface and quite out in the open, the grey and white colours will contrast favourably with the green grass, and the colours of the plants in juxtaposition will be heightened by the presence of the white. These beds may also be introduced with advantage into geometrical flower gardens, care being taken to plant the beds only in the design which bears a strict comparison to each other, so that when viewed from an elevation, as from the upper windows of the house, they shall not incongruously in the arrangement. We do not mean to imply that a series of circular or other beds of equal form, and these we would advise should be used for the purpose. If the garden takes the form of a square, circular beds are often placed at the corners, and sometimes a second series of beds is introduced, partaking more or less of the form of an oval in their arrangements, and these also may be used for carpet-bedding plants.

The general plan of an oval shape on a square piece of ground, then the square bed at the four corners may be used for carpet-bedding plants, and a central bed may be planted with foliage plants, which will serve to improve the general effect. If more beds are desired, a series of long narrow borders on all sides to form a kind of framework to the garden may be introduced, and the centre bed may in this case be planted with foliage plants, always bearing in mind that in this style of arrangement we are working out a pattern which must be properly and regularly balanced, or the result will be disappointing. The latter management also must be well kept up all who are interested in this subject, and enable them to judge for themselves what will be best for them to imitate and what to avoid in regard to fixing upon unsuitable positions, &c. They will also be able to study, with a view to imitate, those combinations of colours which are most suited to their taste, and will learn better how to arrange them from actual sight than from description.

PREPARATION OF THE BEDS.

In preparing the beds for the plants a good rich light friable loam, with an admixture of peat soil and a small quantity of manure, will be found the most suitable, but any light and tolerably rich soil will do for them. The bottom should be well broken up or trenched about 18 inches deep, and about 6 inches of good soil kept upon the surface. Where the ground is low, or naturally damp and stiff, the bottom

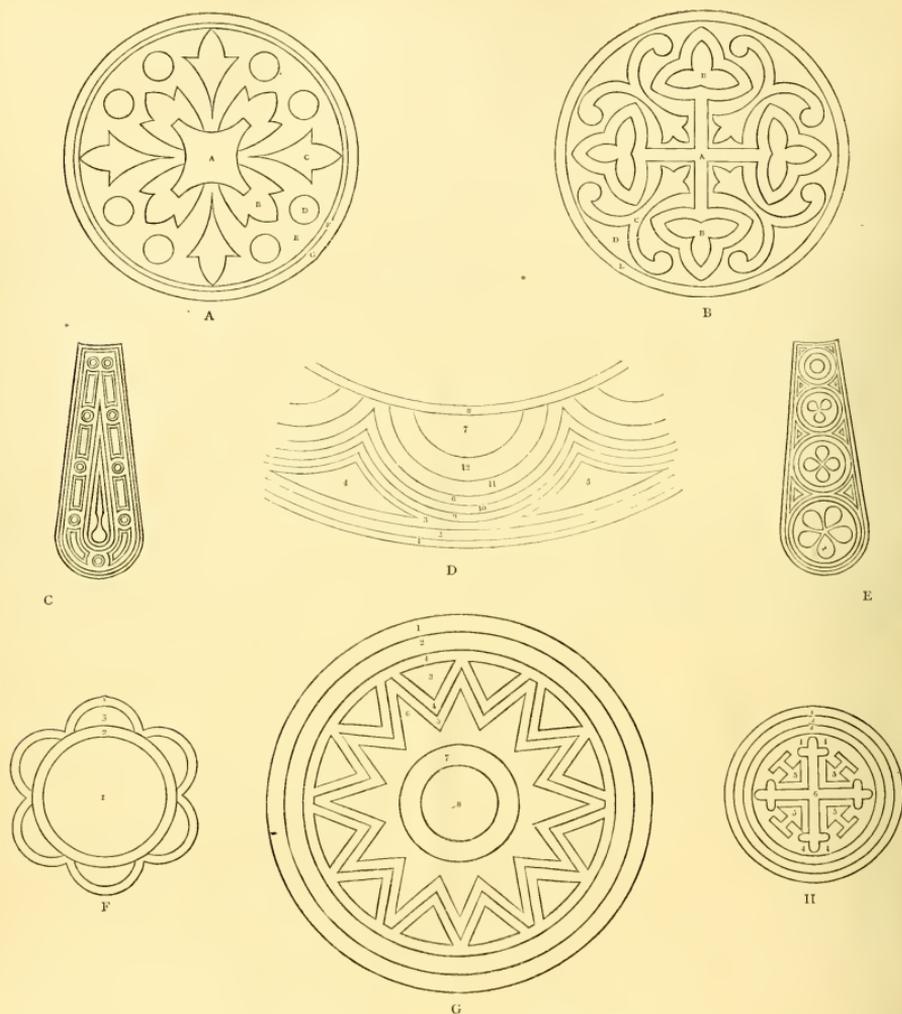

FIG. 1.—DESIGNS FOR CARPET BEDS.

should be taken out, and filled up to a depth of 9 inches, with broken bricks or rough stones, a drain-pipe being also carried through to take away all superfluous moisture. Upon this a layer of turf should be placed, turned sward downwards, or any other rough material that may be at hand, may be used to prevent the soil from working down amongst the stones, and thereby choking up the drainage. This being done, the soil may be put on, which in this case should be fully a foot deep. The bed should then receive a good watering, which should be repeated three or four times in order to get the whole thoroughly settled. As soon as this is accomplished, and the bed is sufficiently dry and firm, and the surface carefully levelled, it will be ready to receive the design, which we will suppose has been already prepared upon paper. If the bed is too wide to reach across conveniently, a broad

plank or planks should be put over it with the ends supported on boxes, or other convenient rests, just sufficient to clear the surface, and from which the gardener will mark out the design and put in his plants. By this means he will avoid treading on the soil, or otherwise interfering with his plan. For making up the sides of the beds a little clayey loam mixed with cow-manure is often used, and this will generally hold together during the season, and prevent the edgings of the bed giving way in watering or during a long continuance of rainy weather. Moreover, it is quite a common practice of late to plant the edging with *Sempervivum* or *Echeveria*, or such-like plants, and this soil appears to suit them very well. Certainly they very much improve the appearance of the beds, but where used for this purpose on level grass they should be kept back a sufficient distance

not to come in contact with the mowing-machine, for this would at once destroy their neat rosette-like appearance, and also show a painful want of care on the part of the workman.

ILLUSTRATIVE DESIGNS.

Having said so much generally about the system, the position of the beds, and the mode of preparation, we will now make a few remarks upon the several designs given in our coloured plate, and accompanying this article.

A (fig. 1) is selected from many beds which appeared in the Crystal Palace grounds during the summer of 1875, and we feel sure these designs must have sorely tried the brains and the patience too of the producer, Mr. Thomson, for they were numerous and very intricate, and not only geometric but, as we have

GARDEN PLANS—CARPET BEDDING

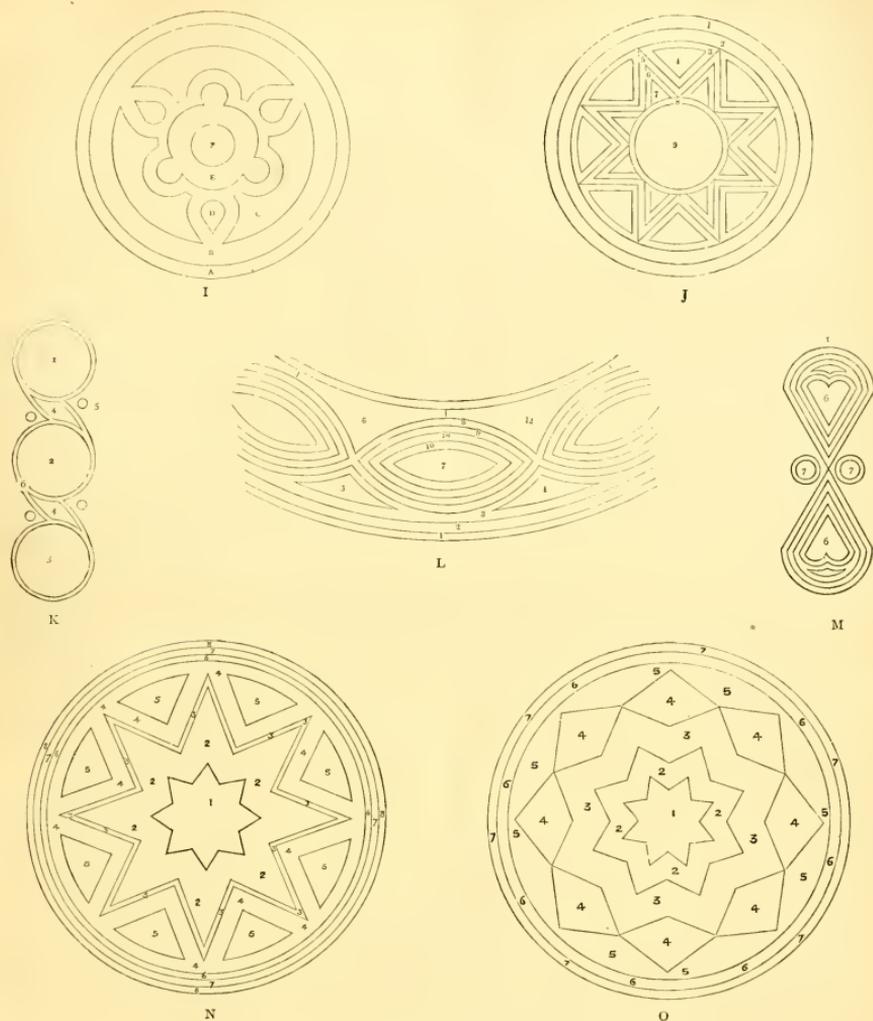

FIG. 2.—DESIGNS FOR CARPET BEDS.

said, insect forms were brought into requisition to gratify the various tastes of the many visitors who flock to that favourite resort. The design is a pleasing one, but we think its effect would have been enhanced if the central part of the *B* beds had been lengthened, and the small circles left out. Their form does not harmonise with the other parts, and they strike one as being an afterthought, and put in to supply the deficiency of the middle figure. This bed was one of a large number arranged on the sloping grass which surrounds the roseray, and could be seen to eminent advantage from the roseray walk, which was raised about 2 feet above it. The *Mesembryanthemum cordifolium variegatum* formed a very pretty groundwork to the various colours, and the whole had a very pleasing effect.

The plants were arranged in the following order:—*A* and *C*, *Lobelia blue King*; *B*, *Coleus*; *D*, *Alternanthera versicolor*; *E*, *Mesembryanthemum cordifolium variegatum*; *F*, one row of *Alternanthera magnifica*; and *G*, *Echeveria secunda glauca*.

B (fig. 1) is another example of these beds. The pattern is very intricate, and requires good keeping to preserve all its outlines. It was composed wholly of foliage plants, which perhaps rendered it less difficult than if there had been a mixture of flowering plants. The apple-green colour of the *Tagetes signata pumila* foliage harmonised well with the Golden Feather *Pyrethrum*, and there was a charm also in the novel use to which it was applied and the singular fitness of its prettily divided foliage for such a purpose. It is one of the few annuals that grow

and keep healthy until destroyed by frost, and we think it is worthy of being more extensively used in carpet bedding. The arrangement in this bed was—*A*, groundwork of *Pyrethrum Golden Feather*, and *D*, *Alternanthera amabilis latifolia*; *B*, *Tagetes signata pumila*; *C*, Ivy-leaved *Pelargonium Duke of Edinburgh*; and *E*, *Echeveria secunda glauca*.

The bed *C* (fig. 1) is one which was carried out at Cleveland House, Clapham Park, in 1874, and consists of a central dagger-shaped mass of *Alternanthera versicolor*, in a setting of *Pyrethrum*, outside which is a single row of *Alternanthera amabilis*. Then follow a series of oblong panels, alternating with circular beds; the oblong panels are planted with a centre of *Echeveria secunda glauca* bordered by *Alternanthera paronychioides*. The circles consist of a centre of

Pyrethrum encircled by Alternanthera amena. The setting round these beds consists of Mesembryanthemum cordifolium variegatum, and the whole is surrounded by two bands—the inner of Alternanthera amena, the outer of A. paronychioides.

D (fig. 1) is one of many examples carried out by Mr. McIntyre in Victoria Park, and it is also represented in the lower half of the central circle in our coloured plate in the shape of a broad margin to a bank of shrubs. We rather question the policy of putting in so many lines of colour, and think a bolder effect would have been produced by increasing their breadth and lessening their number. We also think that if the half circles had been pink instead of white they would have been more effective, i.e., by moving the Pelargonium Christine (D 10) to the top, and the Centaurea (D 7) lower down. Still we much doubt if the mixing of foliage and flowers is desirable, as the latter are almost certain to fall before the former, and then the effect as a whole is marred and spoiled; but no doubt the difficulty of procuring sufficient colours in the leaf plants has led to this practice, to which also has contributed the anxiety felt in making every combination distinct. The plants in this bed were arranged in the following order:—1, Stellaria graminea aurea; 2, Lobelia pumila grandiflora; 3, Echeveria secunda glauca; 4, Alternanthera amena spectabilis; 5, A. magnifica; 6, Coleus Verschaffeltii; 7, Pelargonium Flower of Spring; 8, Agrostis magnifica; 9, Pelargonium Flower of Spring; 10, P. Christine; 11, P. Crystal Palace Gem; 12, P. Waltham Seedling. Scale: 8 feet to 1 inch.

E (fig. 1) is another of the Cleveland House designs, and consists of four circular masses with triangular patches in between, and each enclosing from one to five radiating egg-shaped masses which are thus planted:—The central spots consist of—1, Pyrethrum in a setting of Alternanthera magnifica, encircled by Mesembryanthemum cordifolium variegatum, and then again by Alternanthera paronychioides major. The triangles consist of a centre of Semperivivum calcareum bordered by Echeveria secunda glauca. The whole is bordered by two bands—the inner of Alternanthera paronychioides major, and the outer of Pyrethrum. These designs (C and E) will serve to show what an infinite number of forms may be used even in a single bed. We prefer C to E, as the arrangement is better adapted to a long bed, and tends to make the bed longer in appearance, while E has the opposite effect; but as they appeared in the summer of 1874, they were much admired, and very deservedly so.

F (fig. 1) is another bed from Victoria Park, and the central portion being filled with Coleus Verschaffeltii, we no doubt very effective, but we think the general effect would have been better had the white margin been broader and the Cerastium Biebersteinii being used instead of C. tomentosum (F 2), and an outside circle substituted for the segments. We have no doubt, however, that in this age, when we are always seeking after something new, the inventive faculties are sorely taxed. The following is the arrangement of plants employed:—1, Coleus Verschaffeltii; 2, Cerastium tomentosum; 3, Lobelia pumila grandiflora; 4, Mesembryanthemum cordifolium variegatum.

G (fig. 1) is also one of the forms taken from Victoria Park in the summer of 1874. The plants used in this composition are all good, and the arrangement of the colours excellent. We should, however, have left out No. 5, and increased the breadth of No. 4, and we think this would have improved the general appearance of the design. It was filled with the following plants:—1, Echeveria secunda glauca; 2, Alternanthera magnifica; 3, A. amena; 4, Golden Feather; 5, Echeveria secunda glauca; 6, Alternanthera amena spectabilis; 7, Golden Feather; 8, Coleus Verschaffeltii.

H (fig. 1) is also from a design produced in Victoria Park, and occupies the centre of our coloured plate. It is quaint in shape, but the figures fit in well, and altogether make an attractive bed. We think, however, that a darker colour for the central cross would have been preferable, and we should have liked the system of Alternanthera spectabilis, and the Cerastium in No. 4. This, of course, would have necessitated a slight alteration of colour in the margin, by reversing the positions of Nos. 2 and 3. The red colour would thus show through the central portion, and made it appear more to advantage by being surrounded with the white of the Cerastium. The plants used in this bed were the following:—1, Echeveria secunda glauca;

2, Alternanthera paronychioides major; 3, Mesembryanthemum cordifolium variegatum; 4, Alternanthera amena spectabilis; 5, Golden Feather; 6, Cerastium tomentosum.

I (fig. 2) is also given in the coloured plate, is a design taken from Battersea Park, and was planted by Mr. Roger in the following manner:—1, A. amena; 2, Echeveria secunda glauca; 3, tomentosum carpeted with Sedum anglicum; 4, Alternanthera paronychioides major; 5, A. versicolor; 6, A. amena; 7, Leucophaea Brownii; 8, Semperivivum montanum. This was one of the most chaste and satisfactory beds we saw during the whole season. The several breadths and the arrangement of the colours were excellent; it was not too large, and the forms composing the design were simple and effective.

J (fig. 2) is from Victoria Park, and is also shown in our coloured plate. We confess our preference for the wavy lines, which we think better adapted in every way for the display of colour than the angular ones, but no doubt each plan has its admirers. We consider the central part of this rather too large, and we think that two lines of colour would have produced a better display in the angles than the larger number; the marginal ring around the centre would also have been better a little wider. The plants used were, proceeding from without inwards:—1, Echeveria secunda glauca; 2, Stellaria graminea aurea; 3, Alternanthera amena major; 4, Pyrethrum Golden Feather; 5, Lobelia pumila grandiflora; 6, Mesembryanthemum cordifolium variegatum; 7, Alternanthera paronychioides major; 8, Echeveria secunda glauca; 9, Coleus Verschaffeltii.

K (fig. 2) is another form taken from Battersea Park, and which looked very effective. It was placed near the margin of the walk, and its bright colours and novel arrangement were very pleasing. We think, however, if the margin had been a little broader it would have been in better proportion. The small bands of blue uniting the circles, and the round tufts of colour on either side of the bands were novel, and looked well. This is also represented in our coloured plate. It was planted with the following plants:—1, 2, and 3, Tricolor Pelargoniums carpeted with Viola cornuta, and Bronze Pelargoniums carpeted with V. cornuta alba; 4, Lobelia Blue King; 5, pairs of succulent plants, and 6, Thymus aureus variegatus. The last-named plant does not retain its bright variegation long enough, so that it would be better to substitute Mesembryanthemum cordifolium variegatum.

L (fig. 2) is a portion of our large coloured drawing. It is taken from a design produced in Victoria Park, and, like fig. 1, forms part of a margin to a large bank of shrubs. This, we think, is much more suitable for the purpose than D, as all the figures may be considered perfect, and it would look equally well if carried out in a straight line. We are, however, inclined to think that in this pattern a bolder effect would have been produced if the number of the colours had been less and the bands increased in breadth; and by doing this perhaps the flowering plants might have been dispensed with. It was planted with the following:—1, Echeveria secunda glauca; 2, Mesembryanthemum cordifolium; 3, Pyrethrum Golden Feather; 4, Lobelia pumila grandiflora; 5, L. pumila aurea; 6, Pelargonium Vesuvius; 7, Coleus Verschaffeltii; 8, Pelargonium Flower of Spring; 9, P. Christine; 10, P. Vesuvius; 11, P. Crystal Palace Gem; 12, P. Madame Radersdorf; 13, P. Christine. Scale: 8 feet to 1 inch.

M (fig. 2) is also taken from Victoria Park, will be easily recognised by all who saw it there. It may be called, for want of a better name, the Hour-Glass bed. This bed was very well arranged. The plants employed were the following, and they were placed in the order given, commencing at the outside margin:—1, Echeveria secunda glauca, followed inwards by lines of Alternanthera amena, A. paronychioides major, Cerastium tomentosum, Golden Feather, and 6, Alternanthera amena spectabilis; 7, Mesembryanthemum cordifolium variegatum, edged with Echeveria secunda glauca.

N (fig. 2) was produced in Battersea Park in the summer of 1870, and before the system had become so common as it is now; it was filled entirely with leaf plants, and may be called in every sense of the word a carpet bed. The patches of colour were broad and effective, and the arrangement was in every way satisfactory. This is a simple pattern, and one we would commend to young beginners, as it is as easy to produce as it is pleasing when finished. It is,

we think, as an angular pattern a very desirable one, although we must again state our preference for the circular form of design. It was filled as follows:—1, Golden Feather; 2, Alternanthera amena; 3, Santolonia incana; 4, Alternanthera paronychioides; 5, A. amena; 6, Golden Feather; 7, Alternanthera amena; 8, Echeveria secunda glauca.

O (fig. 2) is another design taken from Battersea Park, and is one of the most curious and tortuous of the whole. To view this pattern properly it should be placed considerably below the eye, as in looking across the bed the lines are very conflicting. It was furnished, however, with good plants, and no doubt looked well, as both plants and colours were lasting. At that time the beds were smaller, and the use of flowers was not so prevalent in carpet bedding as it is now. The following list will indicate the manner of planting:—1, Santolonia lavandulifolia; 2, Alternanthera magnifica; 3, Golden Feather; 4, Alternanthera amena; 5, Santolonia incana; 6, Alternanthera amena; 7, Echeveria secunda glauca.

AN APPEAL FOR SYMPATHY.

I'm a gentleman-help! to the rescue, kind friends,
I have nothing in Nature to do;
I never was able to make both the ends
Of my income to meet, it is true.
My character's good, tho' I'm bound to confess,
In the stocks I have oft "put my foot";
I've lost "in the pound," like an ignorant ass,
And come out with nothing to boot.
Now, gladly a gardener's place I would take,
I'm rapidly running to seed;
I flatter myself I'm a pretty good rake,
And a pretty good judge of a weed;
In moistening my clay I'm well known,
Indeed I have done it with tears;
My "diggins" still voted the neatest in town,
And I've [howed] for my living for years!
For a keeper well fitted, so give it a name,
All fish comes in well to my net!
I can shoot like a bird, know each move of the game,
And rather enjoy heavy wet.
I've a very nice cottage, and my great distress,
My knowledge of cattle's a drower's,
And if my game-books sometimes get in a mess,
I can make it all up at the covers.
As a coachman or groom I would offer to live,
I know what should be done to a colt;
A capital bargain I always can drive,
Or wait (for my dinner) at table.
I'll run you a horse; or if I wanted within—
So I've versatile mind I have got.
If your chief cannot properly make up his "tin,"
I can cook sams, or "put on the pot."
So ere you condemn this my movement, I beg
To give me a chance to be called;
Don't think though in need that I look a "brake leg"
Or light-fingered, 'cause of my fist!
I want to do something, and quickly, in hopes
To get a little more to pick out of the pot.
Go out for a sailor—"know all the ropes"—
My cry now is, gentlemen—Help!

The Tatler.

HOW TO RESTORE FADED BUNCHES OF LILAC OR FADED ROSES.—Plunge the cut ends of the flower-stalks into boiling water, or char the cut end of the stalk in the flame of a candle.

GARDENING FOR AMATEURS.

It must be expected that in all matters there should be occasional difficulties, sometimes great, sometimes mere mistis vanishing before a gleam of sunshine, and of the latter sort are many of those besetting ladies' gardening and that of amateurs generally.

What is needed is usually a slight knowledge of the principles of vegetable growth, rather than a study in detail of the operations in that "good book of gardening" perpetually asked for, but which is by no means so helpful as might be supposed, for, when with infinite labour and difficulty, all specified necessities have been collected together, the success of the plant supplied with them is apt to be as great as it would be if the lady amateur inserted one of her own children in the soup instead of setting him to drink it, and for a similar reason—it is starved.

Plants as well as animals must be fed, and the disappointments met with arise usually from a want of knowledge of how the food is to be taken in and assimilated.

If what, to speak familiarly, we may call the mouths in the roots, the lungs in the leaves, and the veins in the twigs are choked or destroyed, the sufferer must succumb. The "gardening book" without the principles of growth being understood is of little comparative value, the botanical treatise without a practical application is often wearisome, but by taking some of the chief points in amateurs' gardening, with the reasons of their success and

growth, which have the power of drinking in the moisture laden with what is to be assimilated into food.

By way of illustrating these matters we may refer to fig. 3, which shows a mass of root-fibres from a well-rooted cutting. A plant with such a mass of feeders will move well. Compare this with fig. 4, showing an old stump with a few woody twisted roots, all wood, and with little or no fibres. A plant pulled up or dug up with such roots is not likely to thrive when replanted. Fig. 5 shows the tip of a young root-thread very highly magnified. It will be

through a bladder, and whether it unites the plant or not it goes through the cell-coats just the same. If the plant has a large quantity of salt, or anything poisonous to it, put where it can melt and be drawn in, it will be poisoned; and if it has what agrees with it, and helps to build up the cells of which it is composed, it thrives; and the reason for choosing particular soils or manure is because they contain the things of which the plant is in great part composed.

Potash, soda, lime, phosphorus, and other kinds of mineral food are dissolved out of the earth. The bad smells of the manure heap show the presence of gases, which in the earth are taken up by water, and so drunk in by the plant; and because if the plant keeps taking food from the ground it needs to have its supplies replaced as much as a tethered animal, therefore we give manure or fresh soil, or move it to an unexhausted spot. For this reason it is good to dig in vegetable refuse, and so restore to the soil what the plant took out, and to have a small supply of two or three different kinds of food (so to call the different kinds of soil most frequently needed) at hand. Most plants of common garden growth find in common garden soil all that they need, but some like (that is to say, are partly composed of) lime, silica, or other matters, and will as little thrive without their proper food as a lion on vegetable diet, or a sheep on a piece of meat.

The plant must have a sufficiency of proper food, but also it should not have too much, especially of manure, or a rank and bloated growth will follow, probably with little blossom in proportion to the leaves.

If the soil is too dry the plant is starved, because the food must be absorbed in moist form. Again, a

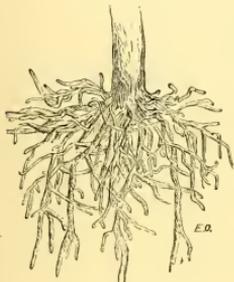

FIG. 3.—FEEDING ROOTS.

FIG. 4.—HOLD-FAST ROOTS.

seen that there is a central mass of fibres (b), surrounded by a thick layer of cells or hindlers, all more or less permeable to fluids. The extreme tip is covered with a little cap of dry cells (a), which do not absorb fluids, and which act as a protecting covering to the tip of the root beneath them, preserving the growing point from injury as it thrusts itself into the soil. In many cases the young root-fibres have an additional means of imbuing liquid food in the shape of very minute hairs (fig. 6), which by their extreme fineness can penetrate between the particles of the soil, if only there be a

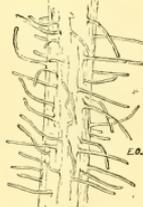

FIG. 6.—ROOT-FIBRE, WITH ROOT-HAIRS MAGNIFIED.

failure, some aid may be given. The lady's cultivated taste is invaluable in the flower garden, and anything which may make the task more tempting to her in the lighter parts, such as removing favourite plants, pruning and budding, sowing seeds, or storing roots and bulbs, is a benefit to all.

THE NUTRITION OF PLANTS.

In the first case—that is, in the special points to be thought of in moving plants—we may begin at the very beginning of applied botany, for we have to do with the root, that is, with what is the chief food supplier. Plants, being living and growing bodies, must have the material which they are made of—the food, that is, by which they are nourished from somewhere outside themselves. Great part of this food is sucked in as moisture by the roots, some part is supplied as air or gas by the leaves, and in the leaves also the change is wrought of the moisture or sap into what is requisite to feed the plant, but this process we can refer to presently. The first step of absorption is necessary before we go on to assimilation.

WHAT THE ROOT DOES.

The root is usually distinguishable from the stem by growing downwards, avoiding the light, and not having buds, and its double office is to hold the plant firmly in its place and to gather up food. Sometimes, as in Turnips and Beet, the food is stored for future use, but commonly the root is made up of a great mass of fibres getting smaller and smaller at each forking down to the tips. The thick part of the root, with its bark-like outside, has nothing to do with collecting food, it is only the youngest parts, the finest fibrils or hairs at the extremity of the newest

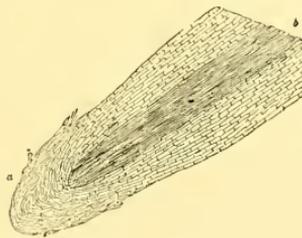

FIG. 5.—SLICE OF ROOT-FIBRE, HIGHLY MAGNIFIED.

little moisture to tempt them. A perfect fringe of these fine hairs may often be seen when the roots have got into something they like, as the gardeners say.

For these reasons a plant should be moved with a good ball of earth, so that the fibres may be kept safe from injury, for if the small fibrils are broken off the plant suffers, if a large proportion of the root is broken off it dies, and in the simple principle that the mouths must be preserved which feed the plant lies the safeguard against one large class of difficulties.

NATURE OF THE FOOD.

Another consideration is the food imbibed. The plant has but little power of choice. What is given is drawn through the thin coats of the minute cells of which the fibrils are formed, much as moisture goes

plant in a pot is often starved, because the earth is exhausted, and the water can soak no food out; and yet, again, manure must be decayed to be of use as food, or (though a little may be washed off the long straw) the crop it is intended to feed will be grown and dead before it has softened into a soluble condition.

HOW THE ROOT GROWS.

When the plant is in a natural state, the method of growth of the roots provide it with all necessary supplies. The rootlets, as has been said, lengthen at the extremities, and creep through all the little crevices and passages they can find, constantly taking new mouths to new food. In the soil of the garden subject to artificial difficulties, this is the reason why we keep the roots from being trampled on, and fork the borders to keep the soil open and free. Therefore also it is not good, except in particular cases, to use sifted earth, for it clogs hardly together, and therefore we often put brick rubbish and rough lumpy vegetable mould, or morsels of turf, that there may be sufficient passages for the roots; and here also is the reason of one of the most frequent disappointments to the amateur in moving plants. Some special plant is admired in a neighbour's garden, and a specimen is kindly bestowed; but who would offer a plant all loose earth? So, accordingly, before it is paped up, the remnants of a ball are smoothed, and kneaded, and patted, till it is as tough as a ball of dough, and the root-fibres are tightly fixed in the mass.

When a plant is to be moved it should be raised with as much earth as will come with it, so as to preserve all the fibres as much as possible, and if it has to go through any treatment that hardens the

outside of the ball, this should be carefully loosened, so that the fibres may be freed and laid round it when set in its new position, so as to have a fair course before them. With moderate care ordinary flowering plants with fibrous roots may be usually moved successfully at any time, excepting in the depth of winter, when the roots are nearly dormant, and might probably decay at the broken tips instead of making good the injury, or in great heat when the young growths require more moisture than the suddenly diminished fibrils could afford. Also they should not be moved when on the point of flowering, for all the forces of the plant are directed to this as the main object of its life, and, if the supply of food is then cut off, so will be the proper development of the flowers.

The great principle to be learnt here is that the root-fibres are the mouths of the plant; if these are destroyed or food is withheld, or they are prevented from reaching food, the plant dies of starvation; if instead of proper nourishment fluid that is unsuitable is imbibed, the plant is stunted or poisoned, and if too much is given it will be correspondingly unhealthily in its growth.

It is those who are inclined to pursue the subject in its details, there is every opportunity in the botanical books now-a-days to be procured with all necessary information condensed into short form, and given in clear language. Here it is only proposed to give a few of the simplest principles involving the common causes of success and failure. On another occasion we shall hope to have something to say as to the uses of leaves. O.

MY GARDENING EXPERIENCES.

By MR. MULBERRY GILLYFLOWER.

HOW I came to love flowers and gardening is a question I sometimes put to myself, and thousands of persons are constantly putting the same question to themselves, and finding considerable difficulty in answering it. The liking for flowers and the desire to cultivate them very often come suddenly to men and women both, just as a cold does, or a rise in the price of stocks, or the announcement of a dissolution of Parliament, or the first notes of the cuckoo in April. A regard that, for what is known to the contrary, may have lain slumbering for years in the human heart, awakens up in a twinkling; and a strong desire being born, its gratification must be ministered to. It is by a species of sudden conversion that numbers of men and women become gardeners—without a previous thought that any part of their nature could find an answering sympathy in that direction. Men are no more born gardeners than they are born with a possession of other required talents; such as a love of display, the desire to contribute to a gardening party, to become a town councillor or mayor, &c. Some get into the charmed circle early in life, others in middle age, some not till the leaves of their tree of life are turning sere and yellow by reason of advancing age. To all such, young and old, gardening becomes a real, satisfying, delightful pleasure.

My desire to be a gardener sprang up in me when I assumed the duties and responsibilities of a householder, and took possession of a residence with a walled garden to back and front. The outgoing tenant left me some shrubs, a few trees, some fruit trees also, and the flower and kitchen garden as bare of vegetable life as the asphalted roadway in Cheshire. I don't know what my predecessor had grown in the flower garden, but it looked, when I took possession, as if it had been made the recreation ground of some fowls. So hard and stoney in appearance was it that it might have been employed as a threshing-floor, or the trial ground of a traction-engine. Ornamental gardening was clearly at a discount at Cheshire Villa.

I thought I would make this howling wilderness to smile (figuratively, of course), and purchasing a spade, set about the task of digging it. After such a winter—which abundantly realised the remark of the poet—"the rain it raineth every day"—and the effects of drying east winds, coupled with the fact that the soil was of a clayey character, its state may be imagined. But *Luzula omnia vincit* was my motto.

I took my spade in hand, and commenced operations on the dust of the earth. I shall never forget the hours during which I endeavoured to instigate a downward motion to the spade, and so make it a clearing influence. The stubborn earth would not yield, and I soon found myself entertaining the con-

dition of the unjust steward, "I cannot dig." As Artemus Ward remarked, "It was not my forte."

A stont labourer armed with a pickaxe soon accomplished the task, and I had the satisfaction of seeing before me a surface of baked clay, like the fragments of a rock. By dint of much hammering and beating, these were at last reduced to something like powder, and made workable. But ere anything could be planted it was necessary something should be added to the soil to make it fit for the growth of plants and seeds. Acting on the advice of my labourer, I obtained some mortar rubbish from a house in course of demolition, some sand or gritty matter and dung, and the whole added together and well mixed ultimately gave me a mould of a satisfactory character.

Knowing but little of shrubs, I consulted a nurseryman, and he has supplied a few Laurels, Aucuba japonica, variegated Hollies, Lilac, Berberis Darwinii, Syringa, Guelder Rose, and some standard and dwarf Roses. These were carefully planted by my labourer, and against the walls of the house have been planted the Gloire de Dijon Rose, Clematis Jackmanni, Pyrus japonica, and the red-berried Pyracantha. Some of my friends strongly recommended rockwork, with a little fountain set off with shells; others were for laying the flower-garden wholly with turf, leaving no space for plants and flowers; but I am now glad I took their advice, and look out upon what has been done with considerable satisfaction. All that is required is warm weather and mild rains to assist in establishing the plants in the soil, and encouraging them to put forth growth.

I declare to you from what has been done, that it is not to trust to the wishes or plans of persons inexperienced in gardening, as to the best way to lay out a plot, or the proper things to plant. Had I done this, disappointment and failure would have followed. I left myself in the hands of a nurseryman accustomed to the work, first ascertaining his ideas, and then, when they commended themselves to my common-sense notions, commissioned him to carry them into effect. As I personally superintended the progress of the planting, I got some useful suggestions as to how to do the right thing in the proper way. If there is no nurseryman one can consult, there is generally some capable gardener to be met with, whose knowledge and experience can scarcely fail to benefit the enquirer. There is nothing like beginning well; the subsequent work, if rightly executed, is all the more satisfactory in consequence.

VILLA GARDENERS' BOOKS.

Hardy Plants for Little Front Gardens. By S. Stackhouse. London: Frederick Warne & Co. Price 1s. 12p.

This is a very useful little volume, intended for the possessors of tiny front gardens, of which gardens (as the author rightly observes) there exist "hundreds and miles" in the neighbourhood of the metropolis. The book contains useful hints, in plain and simple language, for the culture of numerous common but favourite plants, advice as to the economising of space, for covering unsightly walls and fences, and for raising rockwork, &c. For those who wish to pursue the study of plants still farther the names of many books are mentioned, and the volume is interspersed with appropriate quotations from the works of various authors. We can recommend this unpretending book to the numerous possessors of tiny gardens, the pleasure derived from the cultivation of such being wholly disproportionate to the size of the "piece of ground."

The New Practical Window Gardener; being Practical Directions for the Cultivation of Flowering Plants in Pots, Balconies, Windows and Glassed Cases, &c. By John R. Mollison. Illustrated. Groombridge & Sons. Pp. 204.

Another volume devoted to window gardening, a branch of horticulture happily greatly on the increase amongst the dwellers in towns, who, until they try, have no idea of the numbers of plants that will live and thrive in rooms and in a town atmosphere. The third case introduced by the late Mr. N. P. Ward will further serve to increase the facility of planting growing where many of the conditions are unfavourable, and for the management of these Mr. Mollison gives us plain and practical directions. A misprint, which might lead to some confusion, occurs on p. 70, where "callus" is twice spoken of as "calice." The botanical details indeed require revision throughout,

while some of the woodcuts would have been better omitted, e.g., that on p. 90, albeit the little book contains a great deal of just the sort of information which window gardeners want.

Artistic Amusements, including Colouring Photographs, Engravings, Chromo Printing, Transparencies, Penmanship, &c. Office of the Wellington Street, Strand, W.C. Price 1s. Pp. 48.

The title of this little brochure aptly describes its contents. Ladies who devote themselves to artistic pursuits, and labour for "hazards," devoted to the promotion of some philanthropic object, will find numerous hints in this small volume. Painting on china, "Queen shell-work," and a variety of what we may perhaps be excused for terming "fancy-work," are herein described, and quick brains and clever fingers will appreciate the directions which are luckily given.

Artistic Decorations for Ball Rooms, Halls, Passages, Dinner and Supper Tables. Illustrated. Price 1s. Pp. 80. Swaner Office, 32, Wellington Street, Strand, W.C.

A little handbook devoted to the arrangement of flowers, full of useful hints for those who fill their houses, rooms, or windows with the most exquisite of ornaments. Bouquets, buttonholes, small vases for brackets, and the like, are not forgotten. Directions are given for wiring Rock-roses, Camellias, and other flowers, and numerous useful hints as to the uses of tints and the selection of appropriate flowers for different occasions are supplied.

The Miniature Fruit Garden. By Thomas Rivers. Price 3s. 6d. Pp. 182. Longmans, Green & Co.

We have to announce the appearance of the eighteenth edition of this little book, a fact which is sufficient to show the very high esteem in which it is held by the class of Villa Gardeners for whom it is intended. But little is added in the present edition, the publication of which is superintended by Mr. T. F. Rivers, the son of the veteran author. It is almost needless to commend this special attention of amateur gardeners and cottagers, while those who grow for market on a large scale may also find some valuable hints.

The Natural History Journal. Conducted by the Societies in Friends' Schools. Price 4s. 11p. 5s. York: William Sessions, 15, Low Ousegate.

This is a monthly periodical, published in the hope of increasing the love of natural history, which is very often inhaled in boys and girls, and which will, it is to be hoped, tend to direct their energies in a less cruel direction than it frequently takes now. This evil propensity arises less from natural cruelty of disposition than from utter thoughtlessness and ignorance. The little publication contains notes respecting birds' eggs, a remarkable case of perception in a dog, hints for botanical collectors, and, for which small prizes are to be given, and other matters. There is one thing, however, we must protest against, and that is, the destruction of unlucky Coleoptera by plunging them into boiling water. Surely immersion for some time in chloroform would be equally efficacious, and more merciful.

Garden Recipes. Edited by Charles W. Quin. London: Macmillan & Co. Pp. 158.

A book devoted chiefly to directions for destroying the many pests which are the scourge of the gardener, such as the Apple maggot, crickets, millipedes, rats and mice, ants, &c. Liquid manures are also treated of, and the preservation of flowers, the making of skeleton leaves, the cure of insect's stings and a variety of other subjects all more or less interesting to horticulturalists. If we are not mistaken these recipes were originally published in *The Gardener*, a fact which should have been noticed in the preface, we think; nevertheless, the book is likely to be a useful one for Villa Gardeners, as it is not only arranged alphabetically but has an index as well.

The Window Observatory, &c. By H. King, Capt. R.N. London: Crosby, Lockwood & Co.

There is a palpable connection between horticulture and the sun, but that with the stars is not so obvious. The author's object in this little book, in advocating the general use of the transit instrument for private gardeners, is not only to present a simple means for obtaining the correct time, but to lead the way to a most interesting pursuit; and it may be predicted that if one more enjoyment be added to those of a country life, neither greenhouse, shrubbery, nor reservoir in course of construction, the author, Mr. H. King has accomplished his task so simply that no one need be alarmed at the formidable ideas connected with transit instruments.

IRELAND AND THOMSON have pleasure in intimating that their CATALOGUE of STOVE and GREENHOUSE PLANTS, FERNS, PALMS, ORCHIDS, &c., is now ready, and will be forwarded post-free on application.

ADIANTHUM FLEMINGII.—A sport from *A. concinnum*, and is in every respect much superior to the species that produced it. Its dense, compact, serrated habit, with the dark green colour of the fronds, which in their young state are of a beautiful brownish red, constitute a most decided acquisition for exhibition purposes, and is almost without an equal as a table Fern. Price 10s. 6d. and 21s. each.

NEW BEDDING PLANTS for 1877.

I. & T. desire to call attention to the following splendid novelties.

LOBELIA, St. Martin's Blue, new bronzed-leaved, price 12s. per dozen, 4s. per 100.

GOLA, Sir Walter Scott, splendid new bedding, price 12s. per dozen, 4s. per 100.

GERANIUM, Marchioness of Huntley, new bronze, price 18s. per dozen.

For detailed descriptions see *Gardener's Chronicle*.
I. & T. are now sending out the above. Orders will be executed in rotation.

Cranleigh Nursery, Comely Bank;
Seed Warehouse, 30, Waterloo Place, Edinburgh.

CRANSTON'S NURSERIES.

ESTABLISHED 1785.

SPECIALITIES.

ROSES, FRUIT TREES, CONIFERS.

Address—CRANSTON & CO.,
KING'S ACRE, near HEREFORD.

ZONAL GERANIUM.

With the New Dahlias.

JOHN KEYNES

is now prepared to offer one of the finest ZONAL GERANIUMS ever yet before the Public.

J. K. trusts his long experience and care will be sufficient guarantee for the quality and character of this splendid variety. It was raised by Mr. Wm. Dodds. A great truss of flower, splendid bedder, lively majenta colour, quite a new shade from any other. Has been the admiration of all in the beds at Salisbury.

"**JENNIE DODDS**,"

Price 12s. per dozen. *Order out where twelve or more are ordered.*

SALISBURY.—April 22, 1877.

BLOOMING RHODODENDRONS.

Two Hundred Thousand good healthy plants, having not less than five up to ten and fifteen buds each, of the finest named hardy kinds, will be supplied at from £5 to £10 per 100, and 18s. to 30s. per dozen.

Samples, with lists of the sorts, will be forwarded on application.

KALMIA LATIFOLIA.

Well furnished and healthy and covered with bloom-buds, 15 to 18 in., at 12s. and 18s. per doz., or £5 per 100.

HARDY AZALEAS.

The finest English and Ghent varieties, splendidly budded, £5 to £7 10s. per 100, or 18s. per dozen.

ANTHONY WATERER,

KNAP HILL NURSERY, WOKING, SURREY.

TEA SCENTED ROSES.

SPECIAL CULTURE.

We have this season devoted nearly the whole extent of our Glass-houses to the Culture of Tea-Scented and other Roses, and are now enabled to offer plants of very superior quality.

PLANTS, in 5-inch pots, suitable for planting out, 15s. to 18s. per dozen.

„ extra size, in 6-inch pots, for Greenhouse, set with buds, 21s. per dozen.

„ extra size, in 8-inch pots, for Greenhouse, set with buds, 30s. to 35s. per dozen.

„ Half Specimens, 5s. to 7s. 6d. each.

NEW FRENCH ROSES of 1877, 30s. per dozen.

HYBRID PERPETUAL ROSES, established in a and 10-inch pots, now showing for bloom, 35s. to 42s. per dozen.

CRANSTON'S NURSERIES, KING'S ACRE, near HEREFORD.

Address—CRANSTON & CO.

NEW ENGLISH-RAISED SEEDLING ROSES.

MESSRS. PAUL & SON, THE OLD NURSERIES, CHESHUNT, N.

(THESE NURSERIES ESTABLISHED IN 1806).

Have great pleasure in announcing as a continuation of the series of English Roses raised or sent out by them since 1860, inclusive of LORD CLYDE (Paul & Son), DUKE OF EDINBURGH (Paul & Son), CHESHUNT HYBRID (Paul & Son), ANNIE LAXTON (Laxton), DUKE OF CONNAUGHT (Paul & Son), &c., &c., and containing never a bad one in the lot,

TWO NEW ENGLISH SEEDLING ROSES.

H.P. EMILY LAXTON (Laxton), a large full flower with globular, pointed bud, opening into large globular flower. In the way of Monsieur Noman, but of a rich cherry-rose, deeper and fuller than that kind, and with strong vigorous habit, making a grand pillar Rose.

First-class Certificate Royal Horticultural Society; First-class Certificate at the Leeds and Crystal Palace Rose Shows, and 1st Prize at Exeter for twenty-four of any one kind.

H.P. MARCHIONESS OF EXETER (Laxton), clear, rose-flushed, light cherry-rose, large, finely built-up flower, very sweet, and of strong vigorous growth; a larger more double Annie Laxton, yet perfectly distinct from that kind.

Plants in pots of the above, ready early in June, 7s. 6d. each, 14s. the two varieties; Blooming Plants, in 24-pots, 10s. 6d. each, 20s. the two varieties.

The two kinds described above have been proved two seasons at Cheshunt, and can be recommended as continuing the race begun by this raiser with H.P. Annie Laxton.

PAUL & SON, THE OLD NURSERIES, CHESHUNT, N.

(THESE NURSERIES ESTABLISHED 1806.)

TREE FERNS.

THE LARGEST AND BEST STOCK IN EUROPE.

WILLIAM BULL, F.L.S.,

Respectfully invites the Nobility and Gentry to an inspection of the above; also of his MAGNIFICENT SPECIMEN ORNAMENTAL PLANTS,

Adapted for the Decoration of Conservatories and Greenhouses, or suited for Sub-tropical Gardening.

ESTABLISHMENT FOR NEW AND RARE PLANTS, KING'S ROAD, CHELSEA, LONDON, S.W.

STRAWBERRY, THE DUKE OF EDINBURGH (MOFFAT).

THE LAWSON SEED AND NURSERY COMPANY (LIMITED), EDINBURGH AND LONDON,

Have made arrangements with Mr. Moffat, Coldwells, to send out, for the first time, the above-named splendid Strawberry. Fruit very large, firm, and of excellent flavour, bright scarlet colour. A most prolific bearer, and as a main crop for market purposes it is unsurpassed.

Strong Plants, 42s. per 100; 25s. per 50; 15s. per 25; 9s. per dozen.

Trade Price on application.

1, GEORGE IV. BRIDGE, EDINBURGH; 54, BISHOPSGATE ST. WITHIN, LONDON.
April, 1877.

NEW WHITE LOBELIA, "THE BRIDE."

JOHN PERKINS & SON

Have much pleasure in offering the above Novelty as the best pure White Lobelia ever sent out.

It is free flowering, very dwarf habit, and we can with perfect confidence recommend it.

PRICE PER DOZEN, 9s USUAL DISCOUNT TO THE TRADE.

52, MARKET SQUARE, NORTHAMPTON.

Highly important Sale of Choice Imported and Established ORCHIDS.

MR. J. C. STEVENS will **SELL** by **AUCTION**, at his Great Rooms, 38, King Street, Covent Garden, W.C., on **WEDNESDAY**, May 23, at half-past 12 o'clock precisely, a large quantity of Imported and Established ORCHIDS, comprising 1500 **DENDROBIUM BENSONIÆ**, many of them of unusual size; 300 **DEN. DROBIUM WARDIANUM**; many hundreds of fine plants of the lovely and hitherto rare **DENDROBIUM LUTEOLUM**; fine plants of **AERIDES LOBBI** or **VEITCHII**, producing branched flower-spikes 2½ feet in length; masses of **CYPRIPEDEUM BONALLI**, **CYMBIDIUM GIGANTEUM LOWIANUM**, **DENDROBIUM SUAVISSIMUM**, **D. DEVONIANUM**; fine established plants of **PHALENOPSIS SCHILLERIANA**, **P. LUDEMANNIANA**, **ODONTOGLOSSUM CIRRHOSUM**, in quantity, **O. HALLI**, **ONCIDIUM VARICOSUM**, and a specimen plant of **ODONTOGLOSSUM VEXILLARIUM**, with four flower-spikes and twenty-seven leaves.

On view the morning of Sale, and Catalogues *hæa*.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

NEW ENGLISH-RAISED SEEDLING ROSES.

MESSRS. BELL & SON,
THE NORWICH NURSERIES,

Are now executing orders for their **TWO NEW ROSES**, raised at their Nurseries, and described and announced below. They have been thoroughly tested here before being sent out, and can be recommended with confidence as really distinct novelties.

CLIMBING ROSE "CATHERINE BELL."

Very large flowers of a deep rose colour, the backs of the petals a delicate silvery pink, of exquisite shape and very fragrant. It is very free-flowering, and of vigorous climbing habit, making shoots 6 feet to 8 feet long in one season. Figured in *The Garden*, March 18, 1876.

"Your Rose Catherine Bell is both *belle et grande*."—Rev. Canon Reynolds Ho. *ltd*.

Good Flowering Plants, in Pots, 10s. 6d. each.
COLOURED PLATES, ONE SHILLING EACH.

HYBRID TEA ROSE "MRS. OPIE."

Bright salmon-rose, tea-scented flowers, with shell-like petals, a most distinct and novel shade of colour among Tea Roses. It will form a charming companion to *Madame Falcot*, and will be as extensively cultivated as that variety when well known. In flower from May to November. Figured in the *Floral Magazine*.

Good Flowering Plants, in Pots, 7s. 6d. each.

BELL AND SON, 10 & 11, EXCHANGE STREET, NORWICH.

THE THAMES BANK IRON COMPANY,

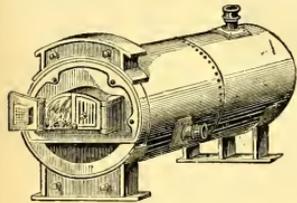

Old Barge Wharf, Upper Ground Street, London,
SURREY SIDE, BLACKFRIARS BRIDGE.

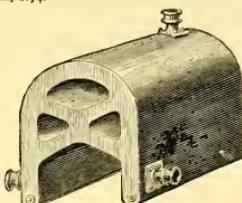

HOT-WATER BOILERS,
PIPES, CONNECTIONS.

NEW PATENT "CLIMAX" BOILER (1874). See P. 666, 1874, *Gardeners' Chronicle*.
"GOLD MEDAL" BOILER (Birmingham, 1872).
PATENT "EXCELSIOR" BOILER (1871).
The largest and most complete Stock in the Trade; upwards of Twenty Thousand Pounds' worth to choose from.

"WILEY COURT" BOILER (Silver Medal 1872).
"TRENTHAM IMPROVED" BOILER, with Water-way End, and Smoke Consumer.
"TUBULAR," and every other Boiler of known merit or excellence.
Prize Medal Awarded at the National Contest, Birmingham, 1874.

("TRENTHAM IMPROVED" BOILER.)

("CRUCIFORM" BOILER.)

MILL'S PATENT AUXILIARY FUEL ECONOMISER,
Which can be attached to any ordinary Boiler. The Tubes are the greatest Economiser of Fuel and Preservatives of Boilers, Fire-bars, and Furnace Fronts ever yet introduced to the public.
STANTON'S NEW PATENT FROST DEFYING LIQUID (see *Gardeners' Chronicle*, Aug. 19, 1876).
HOT-WATER APPARATUS ERECTED COMPLETE.
PRICE LIST on application; or, Six Shillings for DESCRIPTIVE CATALOGUE, 4th Edition.

CHOICE FLOWER SEEDS
For Present Sowing.

Our own superb strains, guaranteed of unsurpassable quality. Post free on receipt of P.O.O. or Stamps.

Rev. E. W. Mason, Curzon, for Collection of Grapes. Bronze Bankian.
Mr. J. S. W. Mason, Kingsland Road, N.E., for English and Foreign Salad. Bronze Bankian.

ADDITIONAL NEW AND RARE PLANTS FOR 1877.

OFFERED FOR SALE BY Messrs. JAMES VEITCH & SONS.

SATURDAY, MAY 19, 1877.

THE ROYAL ACADEMY.

THERE are but few pictures of the first class representing flowers and fruit in the Royal Academy this year, and but few pictures in which these objects occupy a prominent position, indeed the whole exhibition is below the usual average in high-class pictures, though the number of works displayed is somewhat larger than usual, and well-painted landscape is well represented by numerous and well-executed works. Passing by various figure-subjects, cattle pictures and portraits, we first notice, in the left-hand corner, by the Undercliff, 71, "A Spring Morning by the Undercliff," an excellently painted landscape, with Primroses, Dandelions, Hart's-tongue Ferns, Orchis mascula, &c., and a hedge-hog in the left-hand corner: there is a lovely spring air about this picture. 72, "Milking Time, Jersey," E. Douglas, is a well-executed picture, in the style of Landseer and Ansell, of cattle, with a landscape background, and a group of Horse-Mushrooms in the left-hand corner. 74, "Gillyflowers and Cherry Blossoms," H. Fantin, an unsatisfactory group of Wallflowers and double Cherry blossoms. 88, "The Fairy Ring," Valentine W. Bromley, two rustic children within a ring of fungi. We have many times seen rustic children better painted, and the fungi do not belong to the Fairy-ring Champignon but to Agaricus fascicularis, which usually grows in tufts at the foot of a tree. We greatly regret this young artist's very recent death at Harpenden, where fairy-rings have of late attracted so much attention from Dr. Gilbert. 99, "Study of Fruit and Flowers," two little Roses, an Apple, and a few Grapes, a tolerable little picture, with the inevitable jar which has stared us at no so many former pictures. 101, "Cowslips," G. D. Leslie, R.A., a beautifully painted picture of elegant country children with Cowslips (judging from the bag), for Cowslip wine. 106, "Fruit," Eleanor S. Wood, a well painted picture, after the style of Lancelotti, but middle-aged connoisseurs have seen the half-peeled Orange far too often. 117, 118, 119, 120. These are four figure subjects, by L. Alma-Tadema, meant to symbolise the seasons. "Spring" is a fair girl with a Cyclamen in a field of Anemones dotted with Pines, exactly such a field as was engraved in the Gardeners' Chronicle a year or two ago. "Summer" is symbolised by females in a small circular bath-room, with a background of mosaic, one nude figure crowned with flowers reposes in a small circular marble bath with Rose petals floating on the surface of the water, whilst a middle-aged and rather ugly female reposes in an uncouth attitude on a seat. "Autumn" is the interior of a Roman wine-cellar, with an olive-skinned dancing Bacchante, furnished with a torch, pouring out a libation of red wine before a figure of Bacchus. "Winter" is a group of muffled figures at the base of a column, warming themselves before a brazier in the form of a medieval castle: the wintry landscape and the effect of light in this picture are remarkably well done. The four pictures are very excellent, but less important in design and detail than the usual productions of this admirable artist. 148, "Pa-mela Concealing her Correspondence Between the Tiles," C. Landseer, R.A. In this picture

AICALYPHA MUSAIICA.

An erect-growing species, much branched and well furnished with handsomely coloured foliage. The leaves are large, obovate in shape, sharply pointed, and with the edges deeply serrate. The foot-stalks being short, the plant forms a goniolium of the Acalyphas, among which this plant is one of the most distinct for decorative effect. It received a Certificate of Merit from the Royal Botanic Society, April 18.

Price 21s. each.

COLEUM TUCULICOLOR.

A new and distinct species, introduced by us from the Solomon Islands, and presenting much striking novelty both in the form and colour of its leaves. The leaves differ chiefly from the usual type in having the teeth of the edges greatly elongated and rounded at the tip. In colour it is remarkable for the amount of rich shades of crimson red, rose, &c., into which the leaves sport; some of the young leaves having also a bright yellow for its ground color marked with white dots. All the shades of colour is the foliage contrasted fully with the bright green of the stem and foot-stalks. It is a very beautiful plant, and will be found among the most useful of its tribe for decoration. It received a First-Class Certificate from the Royal Horticultural Society, May 2; also a Certificate of Merit from the Royal Botanic Society, April 18.

Price 7s. 6d. each.

DRACENA ROBINSONIANA.

One of the most distinct Dracaenas yet introduced: it is a robust growing variety. The leaves of their foot-stalks have a length of from 15 to 20 inches, with a breadth of from 3 to 3 1/2 inches; the ground colour is a light silvery-green, with a broad striped band of bronzy crimson and greenish white, more broadly in some leaves than in others; the petioles are margined with crimson.

The colouring is unlike that of any other Dracaena, and marks the plant as being distinct, and in no way allied to it will prove one of the finest of the many Dracaenas recently introduced.

It received a First-Class Certificate from the Royal Horticultural Society, May 2, and a Certificate of Merit from the Royal Botanic Society, May 16.

Price 21s. each.

LOMARIA DISCOLOR BIPINNATIFIDA.

Of all the Lomarias yet introduced to British gardens this is certainly one of the most pleasing and attractive, not only on account of its light cheerful color, but also for its elegant habit and its beautifully divided fronds, which have characteristics quite distinct from any other genus.

It is a sub-arboreal Fern: the fronds are numerous, and spring from the crown of a short robust stem, arching, and from 18 to 24 inches in length; the pinnae are very close set, so as to overlap each other, and are cut to the rib, the outer subdivisions being slightly curved; they are sub-concave in texture, and of a soft light green in colour. In some of the latest formed fronds the subdivisions of the pinnae are smaller and more distinct.

This truly fine Fern, and one of the most elegant for decorative purposes, was introduced to us from Malacca through our Peter Veitch. It received the award of a First-Class Certificate from the Royal Horticultural Society on the recent exhibition of the 15th of May. It is one of the most distinct of all the smaller Lomarias, and is well worth culture. -The Garden, May 5.

Price 21s. and 84s. each.

PAVONIA WIOTI.

A very striking flowering plant, of which we have introduced the entire stock from Messrs. Mackay & Co., of Leige. It is the most acceptable form of the genus, and of few plants really valuable for their bloom introduced during late years.

We take from the Gardeners' Chronicle of June 14, 1876, the following remarks on this very interesting and new flower plant: "In habit and foliage it presents nothing different from familiar types of the genus, which when Malacca through our Peter Veitch. It received the award of a First-Class Certificate from the Royal Horticultural Society on the recent exhibition of the 15th of May. It is one of the most distinct of all the smaller Lomarias, and is well worth culture. -The Garden, May 5." The entire calyx here consists of two whorls of narrow slender bright red petals, the outer whorl being the larger, and this with its base equals the closed corolla. Both the latter and the calyx are of a red black. From the mouth of the erect tubular corolla the bright red staminal column protrudes about one inch, and bears numerous blue anthers.

As the flowers continuously throughout the year, but most freely in the winter months; it also commences to bloom when only from 2 to 4 inches high, and a small plant has from 10 to 15 blooms at one time. Also with its regular and pleasing foliage it will be exceedingly valuable for decorative purposes. It is also of few plants that so readily and easily flowered. It requires an intermediate temperature.

It has also received the award of a First Prize as the best new plant at Cologne, Brussels, Antwerp, Liege, and Paris.

Price 31s. 6d. each.

ROYAL EXOTIC NURSERY, KING'S ROAD, CHELSEA, S.W.

Roses, Hollyhocks, Sunflowers, and other flowers, are introduced, but they are all bad and unnatural. 159, "Spring Flowers," Miss M. D. Mutrie, is an excellent picture of Azaleas, Violets, and Narcissus, with a peacock-feather fan for a background. 223, "Spring Time," Marian Chase, is a pleasant and tolerably correct painting, introducing Cowslips, Orchis mascula, and Nettles, but the picture is totally deficient of light. 233, "Spring Flowers," is a creditable little flower picture, but the Primroses are shown (perhaps purposely) as quite withered. 273, "The Sound of Many Waters," J. E. Millais, R.A., a landscape picture of lichen-clothed old red sandstone rocks, tumbling waters, and Firs and Larches, one of this famous artist's best landscapes. 352, "Wallflowers," H. J. Rhodes, is a well-executed flower subject. 353, "Field Mice," C. T. Rope, is notable for the introduction of the scarlet Peziza coccinea on a decaying branch. 358, is a capital portrait, by Lowes Dickinson, of Arthur Grote, Esq., late one of the Council of the Royal Horticultural Society. 388, "Basket of Roses," H. Fantin, an unsatisfactory picture, but the drawing of the foliage is good. 435, "Wild Flowers of South America," Miss A. F. Mutrie. This is a truly admirable picture both in drawing and painting; it represents a magnificent group of Orchids, such as *Odontoglossa*, *Cattleyas*, *Masdevallias*, &c.; and several species are introduced, and all are readily recognisable. The whole picture is very satisfactory, but if the real flowers were placed beside the representations, the colours of the latter would fall immensely; no artificial colours can approach the gorgeous purples and scarlets found in the species of *Cattleya* and *Masdevallia*. Experienced artists, who don't risk failure, seldom attempt them, because they know the originals to be simply unapproachable; inexperienced artists, however, often attempt them. 509, "A Baptism of Flowers," Albert Goodwin, is a charming picture of woodlands with young Beeches in spring; the ground is carpeted with Wood Anemones, Bluebells, and Primroses, amongst which are country children at play; in the foreground is a dowdy old woman with her back to the spectator, making her way towards a churchyard; the old woman is being pelted (baptised) with Primroses from the hands of the children. 640, "Snow in Spring," G. H. Boughton. This is one of the best pictures in the Academy, and represents a group of young folks with Hogarth's dog overtaken by a slight snowstorm in a woody place, 659, "The Passing Storm," J. C. Adams, appears to be an excellent landscape, with truthful effect of lurid sunlight after a storm, and deserves a far better position on the walls. 656, "The Source of a River," J. MacWhirter, an excellent study of a river-source, rich with wild flowers, Ferns, and Brambles, all well done; in the foreground is a white Foxglove and some red fungi, painted from memory, not Nature.

Teaching now the water-colours, we have 661, "Carrations," Emily Wympyer, which gives a correct idea of these plants. 663, "Lichen, Bark and Blossom," Miss B. Palmore, is a marvel of minute workmanship, but the entire picture, including the moth, is as flat and lifeless as a pancake. 655, "On the Tree-top," Emma Cooper, is a wren perched on *Acucuba* berries growing from nowhere in particular. 681, "The Twins," Edith M. Knapping, two red Roses very badly done. 613, "Azaleas," Helen C. Angell, not well executed, and the foliage very unsatisfactory. 695, "A Jug of Flowers," J. Jessop Hardwick, an indifferent study of Anemones and Polyanthus Narcissus. 697, "Cloisonnée enamel and flowers," Mrs. A. Lukis Guérin, a richly painted little drawing, much better than the ordinary run of the Academy floral subjects. 731, "Daffodils, Roses, &c.," W. J. Muckley, is a large group of flowers, thoroughly well

drawn and boldly painted—a floral picture of quite the first class. This picture, which consists of single and double Daffodils, Roses, Azaleas, Cinerarias, Tropæolums, &c., should be carefully studied by all would-be painters of flowers. 737, "Fallen," Mrs. Pfeiffer, a Eucharis bloom dropped amongst grass and Dandelions; the stock butterfly here puts in his eternal appearance. 739, "Azaleas and Pyrus japonica," J. Jessop Hardwick, an indifferent study of the plants mentioned. 775, "Mushrooms," J. Bligh, very good and natural. 783, "A Study of Herrings," A. G. Adams: this pair of dried bloaters is quite a relief after the flood of insipid Azaleas. 792, "A Bunch of Plums," J. Sherrin, is excellent, but how many times, alas, have we seen this bunch of Plums (like the overlasting Azaleas) before! 803, "Pansies," Emily Wympyer, is rich in colour and natural. 817, "Pine and Shell," J. Sherrin: this is a Pine apple and a snail-shell; these snail-shells are quite as great a nuisance as the Azaleas. What a change and relief it would be if some of the snail-shell painters would give us a slug or a worm or some other humble organism. 835, "Flowers," W. J. Muckley. Our remarks on 731 equally apply to this second bold and excellent picture of Rhododendrons, &c.: the perspective of the foliage is uncommonly good and correct. 840, "Fruit," Eleanor S. Wood: this is a "scenic" picture of Grapes, Pomegranates, and our too familiar and very old friend the Melon with a slice removed. 842, "Peonies," A. C. H. Lummore: a good picture of Peonies, but with the leaves too flaccid. 852, "A Bough of Plums and Apples," W. Kimpel, well executed, but we fancy we have seen it at least a hundred times before. 862, "A Bunch of Apples," J. Sherrin, a beautifully painted picture, the foliage being especially good. 897, "Azaleas," Anne Jenkins, very good, but we prefer Dandelions in figure. 875, "Roses," Helen C. Angell, well executed Roses in a glass. 884, "Cinerarias," Miss Lewellyn: this is a very good study of these plants in a common red garden pot; the drawing and colour are alike good. 887, "Azaleas," Constance B. Philipp, same as the other Azaleas, but we hope to see less of them in future. 903, "Sunflowers," Miss E. Walker: this study from Nature is thoroughly well done, the drawing and colour is bold and decisive and very natural, the tiger-moth is hardly seen. 1389, "Azaleas," C. Symonds: this is a somewhat rough painting in oil of white Azaleas, and of little interest. 1399, "Camellias and Azaleas," Miss M. D. Mutrie, a far more exact and truthful picture of these plants than the majority previously mentioned in this report.

Of figure-subjects there are many excellent examples, painted by such masters as Millais, Leighton, Alma-Tadema, Poynter, Herkomer, Gilbert, Long, and others, but we have no space for extended reference to these works, or, indeed, to many of the beautiful and truthful, or, indeed, which adorn the Academy walls. The life-size bronze of an athlete wrestling with a python, by Mr. Leighton, is one of the finest statues we have ever seen.

New Garden Plants.

PEZOTOPORA ROEGLII, Rehb.

This, the *Zygopetalum Roeclii* of my herbarium, has finally flowered with Sir Trevor Lawrence, who was so very kind to send me both flowers—one in December, 1876, and one in January, 1877. It is exceedingly difficult (as I have before stated, when describing *Bollea exaltata*) to make up one's mind as to the identity of fresh flowers of this alliance with the wild-grown, dried, shrivelled flowers. After having carefully sketched and described the fresh flower, one has to get it into just as miserable and shrivelled condition as the wild specimen, and then one comes to the point. Notwithstanding some insignificant discrepancies, I feel persuaded Sir Trevor has had the good fortune to flower the genuine plant. And what a flower it is! Can it be recommended

better, than by stating it is near Mr. Day's noble *Pezotopora*? In lieu of its usually rich violet-purple, this one boasts sepals and petals with splendid purpluro-rose colour with a very little green at the base. The blade of the lip, excepting the callus and the base of the column, too, are just of the same colour. I feel very thankful to Sir Trevor Lawrence for sending me these glorious flowers.

Speaking of those bulbless *Maxillarias*, I am sorry to state that some of my English correspondents, who tell me not only their pleasures, but their cares and sorrows too, deeply complain of the ingratitude of this group, which they feel inclined to place on the list proscribed Orchids. My private experience at Hamburg Botanic Garden is this, that these plants dislike a treatment with sphagnum, sand, wood, coals, and bricks alone. Give them good, rich wood soil in profusion, fresh air, good circulation, and good water, free of any manure, and they will thank you immediately by offering you numerous finger-like roots, as if they wanted to shake hands with you. But let us never forget the individual value. As the best people weave or feed as *Apocynum androsaemifolium*, and the best of us as *Sparganium angustifolium*, good plants. Thus, after seven years' troubles, we have just witnessed the predicted death of a *Vanda coerulea*, always declared a candidate for death, although other individuals of the same species have proved very well under the same treatment. H. G. Rehb, f.

PINUS OMORIKA, Panic.

At p. 470 of the present volume will be found some notes on this tree, and from the same source (*Monatsberichten der Gesellschaft der Gartenbauern*, &c.) we now extract the original description, given below, and the following additional particulars. One of the most noteworthy characters, Dr. Bolle says, pointed out by Dr. Panic, resides in the glaucous upper surface so you cannot grow certain miserable individuals to good plants. Thus, after seven years' troubles, we have just witnessed the predicted death of a *Vanda coerulea*, always declared a candidate for death, although other individuals of the same species have proved very well under the same treatment. H. G. Rehb, f.

THE GENUS AGAVE.

(Continued from p. 529.)

SERIES I.—CORIACEO-CARNOSUS.—Texture of the leaf rigid, not at all fleshy or yielding to the touch when mature. End spine large, hard and pungent.

Group 11. Marginata.—Edge of the leaf furnished all the way down from the top to the bottom with a distinct heavy border of the same texture as the teeth.

Having last time dealt with the Marginata with ensiform leaves, I proceed in the present paper to describe those in which the leaves are oblanceolate or oblong, at any rate decidedly narrowed from the middle to the top of the dilated base.

* GRANDFOLIA.

15. *A. Andrieuxii*, Jacobi, Nachtrage, p. 19.—Acaulescent. Rosette 5 feet broad and nearly 3 feet high. Leaves numerous, oblong-spathulate, 2 feet long, 7 inches broad, with a long strong pungent terminal spine, dull opaque green, not vitate, bandied and glaucous beneath. Petioles furnished with a straight grey-brown edge, and remote regular large denticulate teeth. Inflorescence unknown.

A native probably of Mexico. I know it only through Jacobi's description. It is the giant of the Marginata, and the only large species of the group with leaves of the *Solymus-amœna* type of form.

16. *A. Demetrianæ*, Jacobi, Monogr., p. 218.—Shrubly caulescent. Leaves very long, lanceolate-spathulate, nearly 2 feet long, 3 inches broad at the middle, narrowed to 2 inches above the base, and to a

* *Arbor exaltata*, comae anguste pyramidatis, laminae brevibus subverticillatis superioribus erectis, mediis horizontaliter patentibus sc inferioribus pendulis, ovatis, serratis, reticulis aciculis spinosis, nervo utriusque prominulo, foliis striatis, reticulis aciculis spinosis nervo utriusque prominulo, obsolete truncatis, apice acuminatis, venter aciculis cartilagineis superioribus paginae extimæ glaucis; stralibus sat parvis oblongis in ramis variegatis longitudo erectis, horumque in partibus ovatis, serratis, reticulis aciculis spinosis, nervo utriusque prominulo, obsolete truncatis, apice acuminatis, venter aciculis cartilagineis superioribus paginae obovatis alba ovata-cuneatis, subulnibus obovato-cuneatis, integris triplo brevioribus. *J. Panic.*

pungent brown point $\frac{1}{2}$ inch long, opaque glaucous-green, not vittate, but furnished with broad transverse deeper and paler-coloured bands, the base $1\frac{1}{4}$ inch thick, furnished with a distinct, narrow, continuous horny repand border, and broad, small teeth. Inflorescence unknown.

A native probably of Mexico. Described by Jacobi from the collection of the gentleman at Antwerp after whom it is named. So far as I am aware, no specimen has ever reached this country.

is one of the most handsome of these dwarf Marginatae. *A. Rohanii*, Jacobi, Monogr., p. 43, is a dwarf variety, with vitate leaves of a deeper green; and apparently *A. Leguayana*, Hort. Verschaffelt, which I have seen at Mr. Peacock's, is a narrow-leaved variety of this species (leaves $\frac{1}{2}$ foot long, $1\frac{1}{2}$ inch broad at the middle).

18 *A. Peacockii*, Croucher, in Gard. Chron. 1873, p. 1400, tab. 283.—Acaulescent. Leaves 40—60 to

and 207; Nachtrage, p. 15; Wochenschrift, 1869, p. 177; fig. 99; *A. Desmetiana*, Hort., non Jacobi; *A. Regeliana*, Hort., non Jacobi.—Acaulescent. Leaves 30—40 in a dense rosette, rigid, lanceolate-spathulate, 8—14 inches long, $1\frac{1}{2}$ —2 inches broad at the middle, narrowed to $1\frac{1}{2}$ inch above the dilated base, bright green, not vittate, $\frac{1}{2}$ inch thick at the base, $\frac{1}{2}$ inch thick in the centre, the point pungent, $\frac{1}{2}$ —1 inch long, the margin furnished with a continuous broad grey border, with copious, deltoid-cusp date teeth $\frac{1}{2}$ — $\frac{1}{2}$ inch long. Inflorescence unknown.

FIG. 98.—AGAVE HORRIDA VAR. MICRANTHA.

FIG. 99.—AGAVE HORRIDA, TYPICAL FORM.

FIG. 100.—AGAVE GHIESBREGHTII.

FIG. 101.—AGAVE GILBEYI.

** PARVIFOLIE.

17. *A. Ghiesbreghtii*, Lemaire; Jacobi, Monogr., p. 42; fig. 100.—Acaulescent. Leaves 30—40 in a dense rosette, rigid, lanceolate, 9—12 inches long, $2\frac{1}{2}$ —3 inches broad two-thirds of the way up, narrowed to 2—2 $\frac{1}{2}$ inches above the dilated base, bright glossy green, not vittate, $\frac{1}{2}$ — $\frac{1}{2}$ inch thick at the base, $\frac{1}{2}$ inch thick in the centre, the pungent end spine $\frac{1}{2}$ inch long, the border narrow, red-brown till a late stage, the back not striated with deeper-coloured lines, the copious irregular lanceolate-deltoid teeth 2—3 lines long. Inflorescence unknown.

A native of Mexico, introduced by Verschaffelt in 1862. It is now widely spread in our collections, and

a rosette, rigid, oblanceolate-spathulate, 9—12 inches long, 2 inches broad above the middle, narrowed to $1\frac{1}{2}$ inch above the dilated base, dull glaucous-green, with a pale central band, $\frac{1}{2}$ inch thick at the base, $\frac{1}{2}$ inch thick in the centre, end spine an inch long, the edge bordered with a moderately broad continuous horny line, at first red-brown, the subsistent deltoid cuspid curved prickles 3—4 lines long. Inflorescence unknown.

Introduced by Roelz, from Tehuacan in Central Mexico. Closely allied to Ghiesbreghtii, from which it differs mainly by its opaque glaucous vittate leaves. I have seen it only at Mr. Peacock's.

19. *A. horrida*, Lemaire; Jacobi, Monogr., pp. 43

A native of Mexico, introduced by Verschaffelt in 1862, and now widely spread in our collections. It is well marked by its dwarf habit, bright green colour, continuous broad border, and large grey teeth. There are many varieties, of which the following are the principal:—

1. *maculata*.—Leaves 50—60, broader than in the type (about 24 inches). Spines larger than in the typical form. Seen at Mr. Peacock's.

2. *micranantha*, fig. 98; *A. grandidentata*, Jacobi, Monogr., p. 207.—Border of the leaf narrower and spines smaller than in the typical form.

3. *Gilbeyi*.—*A. Gilbeyi*, Hort. Haage and Schmidt; Gard. Chron. 1873, p. 1205, fig. 270; Regel, Gartenfl. 1874, p. 89, with woodcut; fig. 101.—Leaves about thirty, not more than 3—4 inches long, 2 inches broad,

dark green with a pale stripe down the middle, the broad as broad as in the type, with 3-4 large spines on each side. Introduced by Koel from Tehuacan.

Treuequaria.—*T. treuequaria*, Jacq., p. 65.—Koch, *Wochen*, 1859, p. 173; *Nachtrag*, II., p. 105.—Leaves obovate, glaucous-grey, about 4 inches long by 1 inch broad, the border very broad, and the few teeth very large and curved.

I cannot make out clearly from Jacobi's elaborate description how his A. Magretiana, *Monogr.*, p. 215, a plant unknown in England, differs from horrida; A. horrida has been widely distributed in gardens under the names Desmetiana and Regaliana, but the plants described under these names by Jacobi are apparently different, and both belong to the group V., Rigida. This concludes the group II., *M. triginta*.
F. G. Baker.

THE NUTRITION OF FRUIT TREES.*

DR. GOEPPERT, in an article printed in most of the German gardening periodicals, on the necessity of scientific knowledge for the real advancement of horticulture, laid particular stress on the urgent need of the early investigation of the laws of the nutrition of plants, with especial reference to the determination of the indispensable elements as distinguished from those accidentally present in vegetable substances. Representing the first institution established in Germany for the purpose of conducting scientific researches bearing upon horticulture, Dr. Sorauer has taken up this subject with the intention of prosecuting his studies in this direction to the utmost of his power and resources. What follows is for the greater part in his own words.

With regard to the elements necessary in the food of cultivated plants the following facts may throw some light on the matter. At this experimental station, for three years past, trees belonging to various genera have been cultivated in nutrient fluids. From the circumstance that they are successfully cultivated, and exhibit a normal development, it must be assumed they obtain in sufficient quantity all that is absolutely necessary for their nutrition. The manner of procedure recommended by Dr. Goepfert for solving this question has not been followed, because it leads to disappointments, and because it can be replaced by something simpler. Goepfert proposed that soils, and the plants that flourished perfectly in them, should be submitted to analysis. This would take us direct to the goal if plants absorbed none but the necessary elements, which is not the case. Hence analyses would have to be made of a number of different soils, and samples of the same plants growing in them, in order to arrive at an approximate idea as to which of the ash constituents were accidentally present, and which are essential. Again, a chemical analysis of a plant growing in the earth gives no certain clue to the quantity of each of the constituents at least requisite to build up a gramme (15 grains) of the dry substance of the plant in question. A glance at a series of analyses of the same plant is sufficient to teach us how widely diverse the percentages of the various ash constituents are from different soils. To give a single recent example (Dieckmann's *Centralblatt für Agrar-chemie*, 1871, vol. 3, p. 435). See a series of analyses of *Lacera* grown in different soils—

	Granitic soil.	Chalky soil with flints.	Clayey soil with chalk.	Very chalky soil.
	P. cent.	P. cent.	P. cent.	P. cent.
Silicic acid	0.99	0.44	0.47	0.38
Ferric oxide	0.75	0.45	0.72	0.60
Magnesium carbonate	0.50	7.15	10.11	9.05
Calcium sulphate	7.31	1.84	1.31	6.50
Calcium phosphate	14.94	4.11	10.76	10.71
Calcium carbonate	11.42	48.25	49.68	30.49
Potassium carbonate	48.41	39.92	30.50	26.99
Potassium and sodium chlorides	6.67	3.90	0.68	6.98

The way in which this question has been investigated at Proskau has already been mentioned. The results obtained from (herbaceous) plants that had been thoroughly burnt in distilled water or quartz sand that had been thoroughly burnt to show that very different plants invariably require only the same ash constituents for their growth, and it was reasonable to suppose that woody plants would need no other nutrient substance. This assumption has also been confirmed. The ash constituents are presented in the form of the familiar nutrient salts. The water which the plant

* By Dr. Paul Sorauer, Director of the Experimental Station for Vegetable Physiology at the Faculty of Agriculture at Proskau. Condensed from the *Monatsschrift des Vereines zur Beförderung des Gartenbaues* for February, 1877.

uses and evaporates is replaced from time to time. According to the nature of the experiment, the nutrient solution is renewed within certain given periods. The solution was never of a higher concentration than 0.5 per cent., and the various salts were represented in the following proportions:—

Potassium phosphate	0.5 milligramme equiv.
Magnesium sulphate	0.4
Potassium chloride	0.2
Calcium nitrate	4.00

To which was added a small portion of phosphoric acid and oxide of iron. In this solution the following plants have been successfully cultivated:—Apple, Pear, Cherry, Plum, Peach, Grape Vine, Pine, Fir, Maple, Ash, Elm, Elder, Orange, Lime, Hazel, Robinia, Caragana, Gleditsia, Calycanthus, Ailanthus, &c.

Thus it will be perceived that trees belonging to the most distinct families require no other nutrient substances than our cultivated cereals do, and it will scarcely appear too venturesome to assume that the majority of plants can live upon these substances. If silicic acid and sodium, which are usually found in the ash of plants, be indispensable, the quantities needed are so infinitesimally small that that accidentally conveyed to the plants in dust, &c., is sufficient. A few plants, such as the salt-marsh plant, are an exception to this, and require a larger quantity of common salt. But very few plants are peculiar to certain soils, and therefore all garden plants may first be tried in the nutrient solutions, and, in case of failure, recourse may be had to analyses of the soil and plants.

So far as our fruit trees and the others enumerated above are concerned, these experiments have advanced the nutrition question to another stage. We now know what ash constituents must be present, and further experiments must determine the smallest quantity of each separate nutrient substance requisite to form 1 gramme of dry matter. But this part of the inquiry is of little importance from a practical point of view, as we are able to insure a surplus of all of the substances in the soil even after the heaviest crop. The principal substances, such as nitrogen, potash, and phosphoric acid, we can always increase by manuring, and as fruit trees require the same food as cereals, we can regulate the manuring according to the principles laid down in agriculture. In the main it resolves itself into a question of the presence of water, for water furnishes the solvent for all the elements of the soil. As cultivated trees, it should be remembered, have a different root-apparatus from the wild tree, which usually pushes a tap-root or a few main branches deep into the soil, into layers less exposed to fluctuations of temperature and moisture. So the wild tree has an advantage over the cultivated one in being able in dry seasons to pump the water from deeper layers of soil [and we may add that it is not so easily blown down]. In so far as this goes, they are right who recommend not cutting the roots of scedling trees. But trees raised in nurseries must of necessity be root-pruned in transplanting, usually on or less each time of re-planting, or when planted in their final destination few of them would live. Such trees can neither go wide nor deep for their water; hence the cultivator should pay more attention to the arrangements for maintaining an ample supply of water within reach of the roots of his trees. A question for science to solve is, how much water does a tree use in the production of a given weight of dry matter, and does the quantity vary with the conditions under which the tree is growing? These points will be the subject of future communications.

PLANT PORTRAITS.

ABUTILON ROSE-FLOREM., *Floral Magazine*, t. 253.—A new hybrid, stated to have been raised between A. Boule de Neige and A. Darwinii. It is of dwarf, fern-flowering habit, the flowers rose-coloured. (Williams.)

AGAVE SARTORI., *Botanical Magazine*, t. 6292.—One of the section *LUTEA*, distinguished from all the fleshy-leaved race by its caulescent habit. It was described under three different names by Jacobi, and under a fourth by Todaro. The figure now given is from a plant which flourished in the collection of W. W. Saunders, Esq.

ANTHURIUM DECHARDI. E. And., *Illustration Horticole*, t. 269.—A very handsome, white-spathed

Aroid, similar to A. Patini and A. floribundum, but with larger spathe. The plant will probably be grouped ultimately, along with the species just named, under the new genus *Amomophyllum*, lately established by Dr. Engler, in the *Gardener's Chronicle*, 1877, p. 319. A. Dechardi is one of M. Andri's discoveries in New Grenada, and he thinks so highly of it that he proposes to place it in the future as a plant for the million, like *Chilodactylus*.

AQUILEGIA CHRYSANTHA., *Gartenerflora*, t. 895.—This is the yellow-flowered Columbine concerning which there was some discussion in our columns in 1873.

CALLIPHERIA SUBESENTATA., Baker, *Botanical Magazine*, t. 6289.—This is the plant which has been grown in some gardens under the name of *Eucharis candida*, but it is not the true E. *candida* of Planchon, which was sent out by Mr. Bull last year. The plant has stalked ovate oblong leaves, and a truss of white funnel-shaped flowers, borne on a long scape. The figure is taken from a plant which flourished in the garden of M. H. Beaufoy, Esq., South Lambeth.

MASSANGEA (CARAGANA) MUSICA., *Illustration Horticole*, t. 268.—This is the Bromeliaceous plant, with beautifully marked leaves, which was originally sent out as *Tillandsia Musica*, and is named by M. André Caragana, but which is likely soon to be constituted by M. Morren as a new genus, under the name *Massangea*. In any case the orange bracts and yellow flowers, though rather showy, will not vie in beauty with any of the best of the plant order, so that it is still for its elegantly marked foliage that the plant will be valued in stores.

CATASETUM GNOMUS., André, *Illustration Horticole*, t. 250.—A species with lanceolate sepals of a greenish colour, spotted with purple spots, lateral petals lanceolate, shorter than the sepals, and of a violet colour; limb whitish, three-toothed, the central one hooded, sprinkled on the outside with purplish spots. There appears to be some doubt as to the specific identity of the plant, which will doubtless be cleared up by our learned friend, Dr. Reichenbach.

GLADIOLUS OCHROLEUCUS., Baker, *Botanical Magazine*, t. 6291.—A Kaffrarian species, with spikes of medium-sized straw-coloured flowers, introduced from the Transvaal by Mr. Bull. Independently of its intrinsic merit, it will probably prove useful to the hybridist.

NIPHEA ROEHLII., Regel, *Gartenflora*, t. 896.—A new species of *Niphea*, with ovate-stalked downy leaves and small whitish flowers on long stalks. It does not appear to be of much horticultural importance.

ONTOGLOSSUM CERYANTHA., *Floral Magazine*, t. 254.—A very fine variety of a new well-known Orchid, which was exhibited at the Royal Horticultural Society lately by Sir Trevor Lawrence. The figure is superior to that of many others in this publication.

PRIMULA PARRYI., *Gartenflora*, t. 894.—A species from the Rocky Mountains, with sessile oblong glabrous leaves, and numerous umbellate flowers borne on a scape. The flowers are of a purplish colour.

PRIMULA "ROSY MORN.", *Floral Magazine*, t. 255, is one of Mr. R. Dean's seedling forms, of a rich magenta colour, with a yellow eye.

RESTREPIA ANTENNIFERA., *Botanical Magazine*, t. 6288.—An Orchid which has been known for many years, but of which, as it appears, no satisfactory figure has previously been published. The plant is a native of the mountains of New Grenada and Venezuela, at 6000 to 10,000 feet elevation. It is a plant for the connoisseur rather than for the generality of Orchid growers.

RONDELETTA BACKHOUSII., Hk. f., *Botanical Magazine*, t. 6290.—A beautiful shrub, needing stove or warm greenhouse treatment, with spotted stalked ovate acute leaves, midrib red on the under-surface. The panicles are terminal and many-flowered, each flower about 3-½ inch long, salver-shaped and rose-coloured. The plant was received from Messrs. Backhouse, of York, and is probably of tropical South American origin. In any case, it is a most desirable but little known plant.

THAPSIA CARGANEA., *Botanical Magazine*, t. 6293.—An Umbelliferous plant, to which great interest attaches, as being the "Thapsia" of Dioscorides, celebrated in olden time for its healing powers, and supposed, but erroneously, to be the Silphium of the ancients. The plant was lately introduced by Dr. Leard, but it is an old denizen of our gardens.

VENIDA CERULESCENS., *Floral Magazine*, t. 256.—Of this a good spike is depicted from the collection of Messrs. Veitch.

LIBONIA FLORIBUNDA.

In the condition in which one usually sees this plant, the specific name appears a misnomer, and yet under a certain mode of treatment it really is one of the most floriferous and useful little plants it is possible to have for winter decoration, lasting as it does a very considerable length of time in bloom, besides being of an exceedingly neat and showy character; indeed, so serviceable is it, that I know of no plant I could so ill spare, as it is one on which I place the principal dependence from November to May, during the whole of which time the plants are studded with thousands of flowers, which, being of scarlet and yellow, quite outdo some of the flowers intended for winter decoration, with its hybrid variety *L. penhosiensis* as an edging, or interspersed among the glowing *Serico-graphis*, with which it is closely allied, the effect is most charming; and, as it requires no heat beyond that of a warm greenhouse, it is doubly valuable on that account. Of perhaps equal merit is *x. L. penhosiensis*, a cross between the above and *Serico-graphis Ghiesbreghtiana*, the leaves of which partake more of the character of the latter in a particular form, the flowers intermingling between the two, as it is likewise in general habit and size.

To get either of these sufficiently large to be serviceable, and in good condition for next autumn, cuttings should be put in at once, but before doing this it is better to place the old plants in a gentle moist heat to start them into fresh growth, in which state the young tips always strike more readily than when taken from them before they are on the move. Any close-confined place suitable to strike *Verbenas* or other soft-wooded stuff of that kind will do to stand them in—a situation in which they will root readily and soon be fit for potting off, which should be done in light soil, consisting principally of fibry peat or well-decomposed leaf-mould and sand. A nice hot-bed, such as a Melon or Cucumber frame, will be the fittest place for them to get a start, or, failing either of these, any light shelf in the stores where they can be kept well syringed both morning and afternoon till the weather is sufficiently warm to remove them to some of the cold pits or frames to complete their summer growth. This may be done by the end of May or June, when the plants will be ready to be planted in flats filled with sufficient leaves or other fermenting material in which to plant the plants so as to afford them a very slight bottom-heat and screen the pots from the sun—a matter of much importance on account of the desiccating effect it has on the roots, and which is a frequent cause of throwing the plants into that semi-leaves half-starved flowerless condition they are so often seen in.

The soil for the final shift should be composed of good fibry loam and leaf-mould, or peat and the former, in about equal proportions, with a fair sprinkling of sand to keep it open and porous. In this they should be potted somewhat firmly, and have the points of the shoots nipped out from time to time to induce a close bushy habit. In order to assist them as much as possible, choose early in the afternoon, having previously given a good syringing to engender a thoroughly moist atmosphere—a condition in which they greatly delight. By the end of August they should have completed their growth, and the whole secret of success in getting them to bloom satisfactorily lies in having them properly ripened, which can only be done by full and free exposure to both sun and air. Of course this must be done by degrees, or the leaves will become burned or discoloured, but by taking advantage of a dull day or two on first withdrawing the lights any injury of this kind may easily be obviated.

So long as the weather remains at all fair after the first week or so of hardening, they may with advantage be left uncovered day and night, but every care should be exercised in keeping them properly watered and well vented overhead at least once a day when ever it is at all hot and sunny. Treated in this way they will be covered with flower-buds by the end of October, when they should be moved to the greenhouse, and stood in some light position to expand their blooms, or if a few are wanted early they may be subjected to a little more heat, but in this caution is needed, for if the transition is too great or sudden, the leaves are sure to fall, and many of the buds likewise. Where extra large plants are desired, it is necessary to keep them from heat so long, and to prune back the shoots after flowering, much in the

way that *Pelargoniums* are treated; when, if placed in any forcing house at work, they will soon break, and should then be partially shook out and re-potted, afterwards returning to the same or a similar position to give them a start.

By pegging out the side branches after the potting has taken place, so as to form a good foundation or frame, it is an easy matter to have four-year-old plants at least 2 feet through forming dense bushes, which, with proper ripening of the young growth, as advised, are sure to be taken with a day. The largest and best of ours are of that description, and in 8-inch pots, which afford ample room for the roots if planted during the summer and well cared for as regards water, &c. An easier way of growing this *Libonia* is by planting it out in warm, sheltered positions in the open—a practice that has at least one recommendation in its favour, and that is, that it secures a thorough hardening and ripening of the twiggly shoots, on which, as before observed, so much of the success depends.

If treated in the above manner an ordinary garden frame should be made use of for the purpose of planting them in, towards the end of May, which, after they get a fair start, can be lifted and removed altogether, thus leaving the plants fully exposed till the autumn, when they should be lifted with good balls and kept close for a time, to get them established in their pots, in which they will be greatly assisted by copious syringing. Before planting them out, the bed in which they are to be grown should be properly prepared, either by putting fresh soil to a depth of 6 or 9 inches, or by a large admixture of leaf-mould or refuse peat, or any vegetable matter of that kind in a thoroughly decomposed state, so as to induce plenty of fibre close home, otherwise it will be a difficult matter to get them up with a sufficiently large ball to ensure their well-doing. 7. 5.

BRUSSELS BOTANIC GARDEN.

EVERY visitor to Brussels is familiar with the imposing appearance which the range of conservatories, placed on a commanding site facing one of the Boulevards, makes. But if this were the only claim the Botanic Garden had upon notice, it might well be passed over in this place. The fact is, however, that after having languished for some time as a private concern, the garden and its adjuncts have quite recently become Government property, and awakened to a new and flourishing existence, under the direction of M. Crépiau, who is ably seconded by a competent and zealous band of assistants. We believe that for this happy state and happier promise Belgian botanists owe their gratitude in great measure to the venerable Dumortier, who, as a legislator, has not forgotten his early allegiance. On the contrary, he has given signal proof of his devotion, and in the organization of the botanical department has rendered services which will not readily be forgotten. The extent of the garden, including the space occupied by the buildings, is about 6 hectares. It may be said that as a scientific establishment it dates only from 1870, the year of its purchase by the Government. Until that time it had been but a horticultural institution, the collections of which were of little or no use to the public.

There is now a much more varied and extensive collection than the house of plants was at all prepared to see, the houses unfortunately being more built for show than for culture; and there is a well-arranged herbarium lodged in a spacious and well-lighted room nearly 150 feet in length, which also contains a small working library. This herbarium has for its nucleus that of the late Von Martius, whose fine collections of dried plants and of vegetable products were acquired by the Belgian Government. Subsequently to the rich European acquisition, M. Bommer and Crépiau have been added, so that there is every prospect of this establishment taking rank among the most important of its kind on the Continent.

On entering the garden from the street the visitor is at once struck with the instructive system of labelling. In the case of the trees, not only the names, popular and scientific, and the natural order of the tree are given, but a sketch-map of the world on a small scale is affixed, on which is indicated by patches of colour the geographical distribution of the tree in question. The herbaceous plants are arranged according to the method of M. Dumortier, and planted in large circular beds. These are subdivided

by concentric beds, divided by radiating paths—a plan which is very convenient for classificatory purposes, and is less unsightly than the rectangular beds frequently adopted. Small wicker screens of a hood-like form, about 2 feet in height and a foot wide, are also adopted to screen the more tender plants from the burning sun, to which they are subjected in the exposed area of the garden, the soil of which is, moreover, very light. The glasshouses, seven in number, comprise one very long narrow range with a circular center surmounted by a dome, intended to receive the collections of fossil plants and of fruits, which might with much advantage be converted into a fine Palm-house. In addition to this fine range, the architectural pretensions of which are greater than its qualifications for plant growing, there are numerous smaller houses, the whole containing a larger and more varied collection than might be expected, while the cultivation is decidedly superior to that pursued in so many of the botanic gardens of the Continent. We confess our inability to see why the requirements of botanical science and botanical instruction should be deemed incompatible with good cultivation. M. Lubbers, the curator, seems determined to show that there is no necessary antagonism, and to put in practice those physiological dictates as to plant life which in many botanical establishments are reserved for the class-rooms.

Some of the plants, we may mention, suffered indirectly from the Franco-German war. After Sedan, as may be remembered, many French soldiers took refuge in Belgium. The hospitals and other institutions of Brussels were, with noble humanity, devoted to the care of the sick and suffering, and even the cellars of the botanic garden were utilised for medical stores, among them chloride of lime, the emanations from which in one night effected serious damage to the plants, many of which, such as a fine specimen of *Encyclanthes Alstemii*, still show traces of the injury. *Fandanus furcatus* flowers every second year in this establishment. Palms, Cycads, Aroids, and succulent plants are well represented. Among the former are fine specimens of *Livistona oliveiformis* and *Sabal Blackburniana* and *Ubraculifera*.

Tree and other Ferns, including fine specimens of *Angiopteris pruinosa*, *Teymanniana*, and other species, form a distinctive feature of the collection. They form the objects of special study on the part of M. Bommer, who has been so kind to nominate even a moderate selection of these plants, but we may at least allude to a plant which M. Bommer considers to be a hybrid between *Blechnum brasiliense* and *Lomaria gibba*, between which, in truth, it seems to be intermediate. It was a chance seedling found growing in the vicinity of the two species above-named. In any case it is a distinct form, and has been aptly named by M. Bommer as *x Blechnum lomarioides*. This Fern has appeared in English gardens on several occasions, and was shown under the name of *Lomaria gibba major* so long since as 1868. *Hemidictyon marginatum* is here found to thrive best when its roots are in water.

Of Orchids there is already a collection of some 350 species, but in the matter of Orchid culture English growers have little or nothing to learn from their Continental friends. *The Rambler*.

GREENHOUSE PLANTS.

THEIR CULTURE AND MANAGEMENT.

SWAINSONIAS.—These handsome flowering plants are natives of New South Wales, and are deserving of general cultivation; they bloom freely from July to September, coming in at a season when flowering subjects are scarce; they are of somewhat straggling habit, very distinct from most others that require similar treatment as to soil and temperature; they continue opening a succession of flowers for many weeks, produced in bunches from the current season's wood. This continuous flowering habit, and these Swainsonias are especially useful for conservatory decoration, although those who want flowering subjects for exhibition during the latter part of summer will find them of service. They are free growers, and will succeed well in a mixture of peat and loam, in equal proportions; or, if peat cannot be had of good quality, they will grow in loam, particularly if it contains plenty of fibre, so as to maintain it in a healthy state for some years; this is always an important condition, that cannot be too often impressed upon those who have not had much experience in the cultivation of things of this kind. It

frequently happens that a certain soil, either peat or loam, will answer for a time, but soon gets into a state that precludes the possibility of the plants grown in it keeping in health, and when such things are put in soil of this nature that do not well bear partially shaking out and a renewal of the material in this way, an unsatisfactory condition is sure to follow. If the usual nursery-sized young plants are begun with they should in April be moved into larger pots; supposing them to have plenty of healthy roots, they will bear a 2-inch shift. These are not delicate-rooted subjects, but they require efficient drainage and a porous soil; for this reason add one-seventh sand, incorporating it evenly with the soil. Swainsonias like tolerably hard potting, consequently use the potting lath freely, so as to make the soil firm. If the plants have any straggling shoots they should when potted be shortened back, at the same time tying them well out, so as to induce the lower eyes to break; if this is not done with these plants nothing but the topmost eyes

bright weather they will be benefited by a little shade. About the beginning of August again cover them, and stop any shoots that are taking the lead. Continue the use of the syringe until the middle of September, when the advent of cooler weather will render it not necessary. Through this and the preceding month admit air freely to mature the growth before the autumn gets too far advanced. All through the growing season give sufficient water, as when in active growth they require more moisture in the soil than some plants, but from the time in the autumn when they cease to make much more progress, and during the winter, apply only enough to keep the roots slightly moist. Winter them in a light house in a temperature of 40° in the night. Again repeat about the same time in the spring. The second season they will do with a 3-inch shift, using the soil now in a little more lumpy state, but still with enough sand to keep it open and porous. Stop the shoots, and use a moderate number of neat

S. galegifolia alba: a white-flowered form of the above.

S. coromillifolia: purple flowers.

S. Osbornii and *S. Rollissonii*.

Insects.—Aphides sometimes attack the young growth, for which fumigate. As already mentioned they are liable to red-spider, but the continued use of the syringe recommended through the growing season will, if persisted in, always keep them clear from this pest. If they become affected with scale, these must be kept under by sponging and the use of a soft brush. *T. Balms*.

ADOLPHE BRONGNIART.

The following autobiographical notice of the late eminent French botanist has been placed at our disposal by his son, M. Edouard Brongniart, to whom, as to M. Rothschild, through whose intermediation it was forwarded to us, our hearty thanks are due. It

THE LATE ADOLPHE BRONGNIART.

will break, which prevents the possibility of their acquiring sufficient shoots to furnish the future specimens properly. After potting use no more water for two or three weeks than may be requisite to keep the ball from getting too dry; let the atmosphere be a little close until they begin to rot, have the stage on which they stand moderately moist, and damp the plants overhead every afternoon. Continued and free use of the syringe is necessary all through the growing season, not alone to promote growth, but to keep down red-spider, which is liable to become troublesome if the plants do not receive enough water overhead. Swainsonias will flower in a small state if allowed, but it is not advisable to let them bloom the first season, as they would not make flower enough for it to be worth while sacrificing the growth, which its presence would prevent being made; consequently, all the shoots should have their points pinched out about the beginning of June, again tying down the strongest. This is essential, as these plants are apt to push much of their strength into a portion of the shoots, leaving the remainder weak; but by keeping these stronger ones led out the strength becomes equalised. In very

sticks to keep them in their places, and afterwards for training them to. After potting treat them as in the preceding year as to syringing, air, shade, and water at the roots. The shoots must not be again stopped, but as they advance train them to the sticks, in which position they will begin to flower about July, when the plants can be taken to the conservatory, where they may remain until the blooming is over, when they should be at once cut-in moderately, placed in their winter quarters, and treated as before. Give 3 or 4 inches more pot-room in the spring, according to the quantity and condition of the roots. No stopping of the shoots will be required this season, but they should be trained regularly to the sticks, and treated through the summer and autumn as previously.

If it is not deemed desirable to grow the plants into large specimens, they may the ensuing spring, and for a year or two following, be kept in a good flowering state by the use of manure-water; in this case it should be supplied regularly every other time or so that they require water, but it must not be given too strong.

The following varieties are worth a place:—

S. galegifolia: a handsome red-flowered kind.

forms the supplement to what we have already published on the subject at p. 274, vol. v.

Adolphe Brongniart, son of Alexander Brongniart, one of the most celebrated geologists of the beginning of this century, was born in Paris in 1801, and devoted himself from his youth to the study of natural history, under the direction of his father. The study of medicine was associated by him with that of botany and zoology. He became Doctor of Medicine in 1826, and 'agrégé' in that faculty in 1827. He had previously published some zoological and botanical papers in the *Memoirs* of the Museum of Natural History, and an *Essai d'une Classification Naturelle des Champignons* (1825). In 1824, in association with MM. Audouin and Dumas, he began the publication of the *Annales des Sciences Naturelles*, a journal which is still continued, and which contains numerous memoirs of M. Brongniart on vegetable anatomy and descriptive botany, among which may be cited the 'Memoir on the Generation and Development of the Embryo in Phanerogamic Plants' (1827), a memoir to which the prize for experimental physiology was awarded by the

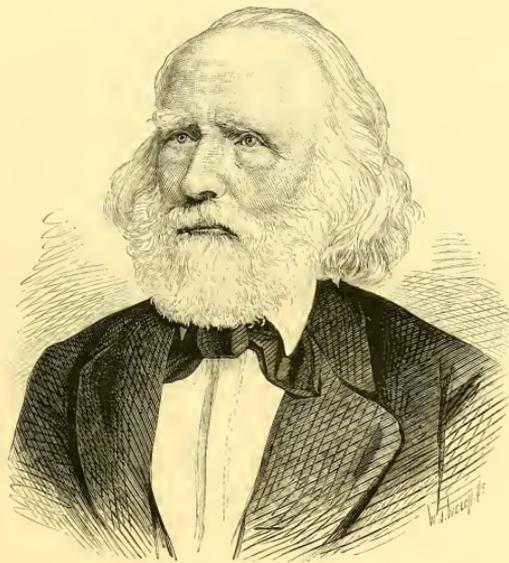

Academy of Sciences in 1827; 'Researches on the Structure and Functions of Leaves' (1830); monographs on Rhamnus and Bruniaceae, &c. His researches on fossil plants, of which he was one of the first to make a careful study, were published at this time in his *Prodrôme d'une Histoire des Végétaux Fossiles*, and in his *Histoire des Végétaux Fossiles*, the published portion of which forms a quarto volume with numerous plates. After the publication of these works M. Brongniart, who had during two years (1829-30) acted for M. Cuvier at the Collège de France, and for M. Desfontaines at the Jardin des Plantes (1831-1832), was nominated, on the death of the latter botanist in 1833, to the post of Professor of Botany and Vegetable Physiology at the Muséum d'Histoire Naturelle, and was likewise elected his successor at the Institute in 1834. His lectures, which in a three years' course ranged over all departments of botany, were continued almost without intermission to the period of his decease. In

has not been generally adopted among us, yet his physiological researches on the formation of the ovule and of the embryo, his numerous monographs, and especially his labours in the department of fossil botany, placed him among the foremost whom British men of science delight to honour. His courtesy and kindly demeanour likewise endeared him to those strangers and young botanists who had occasion to consult him.

ALEXANDER BRAUN.

By a singular coincidence it has fallen to our lot to have to present to our readers in the same number portraits of two deceased botanists, each among the foremost in his own country—one in France, the other in Germany. The circumstance is eminently suggestive, not only of a comparison of the doings of the two men, but also of their national characteristics. This would, however, be out of place in this journal, and

the leaves, the other independent of it and dependent on structural causes. These morphological observations and the speculations connected therewith at length bore fruit in the remarkable work by which he is best known in this country, a translation of which was published in 1851 by the late Professor Henfrey, under the title of the *Rejuvenescence of Plants*. This work is characteristically German in its amount of speculative thought and practical observation, at the same time theoretical matters are not only based on observed facts but kept within due control—which is more than can be said in the case of all German philosophers. Of like nature is his dissertation on the question as to what is to be considered the individual unit in a plant, which is complete in itself, from which nothing can be taken without rendering it imperfect, to which nothing can be added which is not superfluous. These requirements in the higher plants are supplied by the shoot or expanded bud. Teratological investigations naturally occupied much of his attention, and he was always alive to their value as indicating the laws of growth. Some

THE LATE ALEXANDER BRAUN.

1843 the botanical garden of the Muséum was planted in a larger area, and in accordance with a method of classification devised by the Professor, who published on this occasion a small volume under the title of *Enumération des Genres des Plantes Cultivées au Muséum d'Histoire Naturelle de Paris suivant l'ordre établi dans l'École de Botanique en 1843*. A second edition of this work appeared in 1850. The *Nouvelles Annales*, the *Archives du Muséum*, the *Annales des Sciences Naturelles*, and the *Compte Rendus de l'Académie des Sciences*, contain many memoirs of M. Brongniart on vegetable anatomy, on fossil plants, and on various points in systematic botany. In 1852 M. Brongniart was named Inspector-General of Superior Education, by virtue of which appointment he was for several years a member of the Imperial Council of Public Instruction. He was made a Chevalier of the Legion of Honour in 1834, Officer in 1846, and Commander in 1864."

M. Brongniart died in the spring of last year. In this country his qualifications were highly valued, and, although his system of classification

would demand more space than we can give to it. Alexander Braun was born at Regensburg, in 1805, and died at Berlin on March 29 of the present year. He filled the office of Professor at Giessen, at Friburg in Brisgau, and for several years past at Berlin. As early as 1822 we find him writing on the species of Oxalis and on the plants growing wild in the neighbourhood of Carlsruhe, but he first became famous by his celebrated paper on the arrangement of the scales of Fir cones in 1830. The explanation of the difficult and complex question of Phyllotaxis was thus established on its present basis, and amongst other excess the floral arrangements of *Delphinium* were thus explained by him. Morphological investigations were ever a favourite pursuit with him. He was one of the first to insist on the importance of ascertaining the relative position of the carpels to the bracteoles, and to explain the anomalous position of certain carpels by pointing out the existence, potential if not actual, of a second row of carpels. In his paper on spiral torsions in flowers he points out that there are two kinds of torsion—one which is in accordance with the spiral arrangement of

of his latest publications indeed have had reference to the unusual conformation of plants and to the structure of Cycads. But while it is his morphological publications which have hitherto brought him most repute, Braun was a keen, judicious, and accurate systematist. He early studied the Algae, Charas, and Equisetums; he gave as a descriptive enumeration of the species of *Selaginella* cultivated in gardens, and in the annual issues of the *Dietsch Societät* he described various plants cultivated in the fine botanic garden of which he was the head, and whose reputation has so much increased under his direction. Dr. Braun took an active part in the work of the Berlin Horticultural Society, and was ever ready to assist the science to which his life was devoted.

Florists' Flowers.

THE LOVES OF THE FLORISTS.—It is often very amusing to discover the accidental truth of florists' descriptions of flowers to the distinguished public characters after whom they are named. The following, for instance, are taken from the spring catalogue of one of our leading florists:—Lord Elcho, fine

bold flower, good for exhibition; Prince Bismarck, very dark and double; Lord Granville, dark and satiny; Lord Derby, pure true blue, clear eye; Lord Beaconsfield, bright carmine and brilliant crimson, of great substance, few flowering, distinct; Mr. Gladstone, dark and very incurved (a soft-wooded plant); Samuel Plimsoll, large, and very constant, of perfect form, extra fine; John Bright, a fine improvement on earlier forms, and the best of this class ever sent out. This exhausts the list of statement popular with our English florists, and the fitness of the descriptions of the flowers to the distinguished personages after whom they are named makes one suspect more than mere coincidence, and that it is due to the subtle likeness which exists between all living things, and which close observers of Nature like gardeners are quick to catch and identify. By no act of unconscious cerebration would a gardener ever identify any flower of earth or heaven with Mr. Lowe, *N. in the "Globe,"* [A brimstone-coloured Hollyhock named Match Tea has been suggested as appropriate: Ems.]

DOUBLE STOCKS.—Irrespective of any kind of selection or manipulation for the purpose of specially promoting the production of double flowers, there is not a strain of double Stocks in existence that naturally produces more double flowers on the average than does the old Purple Queen, or, as here it is locally termed, the Twickenham Purple. From 70 to 75 per cent. I have regularly found to be the proportion of double flowers. A bed of this kind now in flower looks at the first glance as though all the plants were double, and, I find, gives exactly 80 per cent. of double flowers—an average high enough to suit the most exacting, considering that the proportion of singles gives a poor seed crop. The Scarlet Queen does not give such a high proportion of doubles, as its average is about 65 per cent. These kinds are much appreciated by market growers for cutting from after the Wallflowers, as they furnish such a large quantity of sprays or branches of flowers. Of course double kinds are most desirable, but, double or single, all are cut, and oftentimes none are left to give seed; this is, however, of little consequence, as good seed can always be had in the locality from some of the cottagers, who cultivate a few for that purpose.

In gardens where it is desirable to secure good masses of flower during the month of May there dwarf scarlet and purple Stocks are very showy beds, but to be well done they should be planted out in the summer in the beds where they are to bloom. This arrangement, however, is difficult to carry out in beds specially devoted to bedding displays. Although not so valuable for market work, yet the Brompton strains are, perhaps, more favoured, especially by cottagers, who dearly love to have a few fine spikes of the deep scarlet Giant standing out in brilliant array in their gardens. Without doubt a huge spike of either the scarlet or white double Brompton is a grand flower, which can scarcely be rivalled by any other hardy biennial. If it does not largely grow from the seed, the leading spike is taken off before its fine qualities are developed, and the side shoots furnish but a meagre handful. The Brompton Stock should be grown only as a decorative border flower, and then if the plant be robust its rich and massive beauties are fully displayed. The white Brompton gives of double flowers about 50 per cent., and the best strain of scarlet about 40 per cent. Intermediate Stocks are so commonly grown in pots that it has got to be an article of belief that they can only be properly seeded in pots. This is however wide of the truth, as they seed well and produce as large a percentage of double flowers in the open ground as when grown in pots. To get a good plant in the open, however, it is necessary that they should be turned out from pots towards the end of April, or if lifted from the seed-bed in the ordinary way they root badly, and do not readily get established. If potted up singly into small sixties, or two plants in a large sixty, and kept in a cold frame for winter, they will turn out in April with a good mass of roots, and are ready for removal. Intermediate, both white and scarlet, give from 75 to 80 per cent. of double flowers, and the proportion left for seed is few enough to pay for their cultivation for that purpose. That well-known summer Stock, Mauve Beauty, has for several years well maintained its double character, invariably giving 75 per cent. of double flowers. A. D., *Budfont*.

—Among the TULIPS employed in the ornamental gardens in the Regent's Park is a novel double variety, named ROZENKROON. It is quite distinct in the section, and gives us something of the charming rose colour of the fine single variety Proserpine in a double form. The flower-stalks are stiff and erect, and it is both a striking and an effective bedding sort. The old Gloria Solis is also very good, and stands up well, better than its more double and telling colleague, Tornesol, as the latter is apt to hang its head in heavy rain. The double varieties appear to be better adapted for bedding purposes when only Tulips are employed than the single forms, as they are more durable, standing exposure better, and not shedding their petals so quickly.

—When examining a mixed border of hardy flowers in an old-fashioned garden a few days ago, we were much struck with some groups of TULIPS, some eight bulbs of one variety forming a group. Quite telling spots of colour were thus obtained, and the decaying effects heightened from the fact that the colours of the varieties employed were alternated. Such well-known sorts as Couleur Cardinal, Scarlet Van Thol, Vander Neer, White Pottebakker, Golden Prince, and Royal Standard among the singles; Ja and Gloria Solis, Rex Rubrum, Rozenkroon, La Candeur, Tornesol, Yellow Tornesol, and Duke of York, among the double varieties, are well adapted for grouping in borders in this manner.

—The flowers of the double white sweet-scented NARCISSUS, and also of the POBY'S NARCISSUS, are largely grown for cutting for market, and at this season of the year bunches of fragrant blossoms are to be met with. In some of the fruit gardens it is found that Gooseberries will do well under standard Pears, and they are planted in lines between the trees. Then between the Gooseberry bushes are planted clumps of Narcissus, and here they remain till they get well established, when they throw up an abundance of flowers. They are also grown in other ways, but the one just indicated can be commended on the ground of economy of space and the flowers of both forms of the Narcissus appear to be very fine this year, in common with those of most other bulbous plants.

Forestry.

FENCES.—My last paper, on erecting and maintaining plantation fences, was for want of space so far incomplete as to necessitate its being taken up again. Cheapsness and efficiency, I may again repeat, are essential conditions to be observed in erecting plantation fences. Other conditions do not merit their respective claims, and are entitled to no consideration if they deserve. The claims of appropriateness and good taste ought always to be regarded, and it will be found, though contrary to what many believe, that in erecting fences of whatever kind, good taste, or what pleases the eye, may be observed, without increasing the expense to any appreciable extent; indeed, as a rule, an unsubstantial and badly erected fence is always an eyesore, while a substantial and well-erected one is a pleasing object. The lines, curves, and positions of fences, too, are far more the product of forethought and judgment than of expense, at least a well-learned line and good position of fence may be as cheap as one the very opposite. Nor does it by any means follow that because a fence is made to look well that it is a dear one, or because it is unsightly that it is a cheap one.

Tastes in individuals differ as widely as their faces, hence the variety and diversity of shades, colours, forms, compositions, and patterns met with all over the country. Some have a fond liking for green, because they say grass and foliage in general is of that colour. Others dislike green, but are fond of blue, because the sky is blue. Some again like stone colour, some prefer oak colour, some again see most beauty in brown or mahogany. That there is no hard, fast, and fixed rule for taste is now generally admitted, and it is well always to consult those who are entitled to be pleased with the object, as to their wishes, and specially so respecting shades and colours. I had once the honour of erecting fences upon an estate where the proprietor had an equal dislike of blue or tarred colour. The fences referred to were wooden palings, and were fences of various descriptions. The extent of fencing was too great to admit

of painting with oil paints, because of the expense, and the alternative acted upon was to steep the wood in a solution of bark, Alder or Oak, with the addition of a little quick-lime. The wood in the sawn state was allowed to remain in the steep from ten to fourteen days, at the end of which it was taken out, of a reddish-brown colour, which fortunately pleased the proprietor's taste, and not only retained the colour permanently, but the wood was evidently improved in durability, at least the softer and younger descriptions of it was so.

It is often difficult to know how best to colour palisade garden fences so as to please the eye. To paint them with even the cheapest description of oil paints, without the surface of the wood being first planed and dressed, is simply impracticable. Tarring with coal-tar renders them too dark and dull for ordinary tastes, and is besides offensive both to smell and touch. If we seek diligently, however, and long enough, we usually find, and so it has proved in my case. An excellent substitute for paint and coal-tar is found in the following prescription, which is both cheap and simple in its application, and highly beneficial to the wood.

COLOURING FENCES.

The composition is as follows, and it may be made and used by any person of ordinary capacity. A box, tins, pail, or barrel, is first provided of any dimensions, to be made up to a quantity to suit the work, and comparatively air and water-tight, so as to admit of covering up to confine steam and retain water. A bushel, less or more, of quick-lime is provided, reduced to a fine powder, and passed through a sieve or screen as in preparing mortar for plaster-work. To the lime water is added, and the mixture is brought to the consistency of thick cream. To each bushel of lime one-sixth part of common coarse salt should be added; but the mixture a short time, say fifteen minutes, skimming off the froth as the boiling goes on, and by slow degrees during the boiling add for every 5 bushels of lime and water 1 lb. of potash and 4 quarts of fine sea or river sand. Apply either hot or cold with a common whitewash brush, when it will adhere to the wood, and remain so as long as oil paint. If the colour is too light to please the taste, a little ochre, red-lead, or other colouring matter may be added, to suit the desired shade.

WIRE NETTING.

Since rabbits have become so plentiful over many parts of the kingdom as to render crops, whether trees, cereals, or vegetables, unsafe, wire netting has become a new and indispensable requisite. It is found that any width of netting less than 30 inches is too little, and the meshes should not be less than 1½ inch, and for garden protection 1½ inch. No. 17 gauge is a good strength of netting, and which I generally use. In erecting the netting, a small common No. 6 or No. 7 wire should be extended along the posts to attach the top of the netting, and on no account allowed to hang loose, otherwise persons in climbing over the fences are certain to crush it down, and otherwise injure it. The evil of burrowing through below the netting has to be provided against also, and there are various methods of doing so; some place bricks on edge, some put down slab deals or paling rails, some put the netting 2 or 3 inches into the ground, and others fold it back a few inches upon the ground, and peg it down till such time as the grass grows up and secures it. I have tried all the modes enumerated, and found each to possess some peculiar advantage, and at same time present some disadvantages. The burying or folding of the netting, for example, increases the cost of the fence just to the proportional width buried or folded at the bottom. Bricks are expensive, and wood soon decays.

Another method I have tried of securing the bottom of the netting is by means of setting a single row of stones in the form of a causeway along the front or exposed side. In order to place the stones properly, a narrow trench or notch is taken out with the spade, and the stones set carefully all along close to the netting. I have tried this method, and it is also very secure, for no sooner do the feet of the rabbits feel the hard stones than they desert from further attempts at burrowing. It is also most durable, from the nature of the material used. Wire netting, I may add, can at present be bought at 8s. per lineal yard, galvanised, and of the description above given. Cheaper and weaker netting is not commendable, as strains and accidents soon render it unsafe, durable and inefficient. C. J. Michie, *Cullin House, Cullin, May 12.*

Garden Operations.

PLANT HOUSES.

PLANT STOVE.—One of the greatest mistakes made in plant culture by those who have not had much experience, is to perform different operations, especially such as potting, at a fixed time, often whether the plants require it or not. It is no uncommon occurrence to see the occupants of a particular house potted indiscriminately all at once, whether or not the state of the roots is such as to warrant it. Although stove plants are by no means so impatient as greenhouse subjects of treatment slightly at variance with what they like, yet it is always better to move a plant when it is commenced to grow; neither does it matter in the potting of stove plants about the weather being hot and dry, or a circumstance that is so prejudicial in its effects upon hard-wooded greenhouse plants; consequently, any stove subjects that at the time of the general potting were not in a condition for moving, may now receive a shift. As to the cultivation of stove plants, as in all others in the matter of root-room, it is necessary to discriminate between those that will succeed in moderate-sized pots, and others that never attain anything like their wonted size and vigour with the comparatively small amount of root-room. It may be taken as a rule, that all plants of a deciduous character that through the winter have the soil kept very dry whilst in a state of rest, and at the annual potting bear a good portion of their roots to have rotted, do not need large pots, as plants of an evergreen character that of comparatively little of the old soil removed, with no reduction of the roots. Plants of the former description, when their roots have got fully hold of the soil, may be repotted by the use of manure-water, be kept growing vigorously without requiring a second potting such as the evergreen kinds that were moved early will frequently need about this time. Where any work of this kind is necessary it is well to attend to the plants first that have yet to be made will not receive the full benefit from the new soil. Dipladenias required for exhibition purposes should have their shoots trained round the trellises as soon as the flowers begin to open, so that there is no need to stop them; and in the conservatory for some time during the hottest part of summer it is well to let the shoots remain for some time yet growing in the usual manner near the roof, for the reason that when once bent down they do not rise so readily as when they are allowed to grow so that in their turn will flower yet might not be in bloom at the time wanted. To give that most useful plant, *Bougainvillea glabra*, the deepest shade of colour, it is capable, as has been already noticed, of standing much longer on the plants as soon as they are formed and whilst yet in their green state, before they have acquired much colour, the plants should be moved into a cooler house than the stove, where they will gradually get into their lower temperature, and tested; this *Bougainvillea* attains a colour almost equal to *B. spectabilis*. Where the flowers are required for cutting it is especially advisable to subject it to this treatment, and so managed they will stand in an ordinary conservatory for two months with little perceptible alteration; and in this way a few moderate sized plants grown in 10 or 12-inch pots, and not trained too closely, are very effective during the summer among the comparatively few flowering subjects then at command. In the case of plants of a similar character that are intended for use in the conservatory about mid-summer, should now, if possible, be put in a house or pit where they can receive more air and a lower temperature, so that the plants should afford them. The result of this preparatory process for a few weeks is that they do not show the effect of the change to any serious extent, and will remain in much better condition until the summer is far advanced. The same remark also holds good in respect to all plants of a like tender character required for table or room decoration. If a few spring-stemmed *Coleus* of the many fine coloured varieties that now exist are moved into a cooler house, and kept growing in a little shade, with water, they will make useful decorative plants in the course of a few weeks, their bright colours harmonising well with either flowering or other fine-leaved subjects. Where climbers are grown to the rafters, or irregularly in any way under the roof and of a strong free habit of growth, they will now require attention, so as to keep them within bounds, removing a portion of the shoots entirely if necessary, otherwise they soon exclude light to an extent that does away with the possibility of anything succeeding properly under them. Cuttings may be put in yet of any, either winter or summer-flowering stock, of which there appears to be a deficiency; in the case of the former they will not get so large as those that are put in by some, but will come very useful for successional flowering; with summer blooming plants of a

permanent character and quick growth there is yet time for them to attain sufficient size to make nice small flowering specimens for the summer. Where there is an intention to increase the stock of *Impatiens* by taking off crowns or breaking up large plants together, this should be done immediately after flowering, before growth commences; but as there is no set time for their blooming, and in different seasons, it is better to do as they are treated, there can be no particular time of the year assigned for their propagation, but as with many they will now be done flowering, it will be a suitable time for division: keep them for a few weeks in a moderate shade in a moist and airy atmosphere. With the advancing season the worst description of insects will increase apace. These will require unremitting attention to their destruction; and plant culture, in this respect, is the same as in the case of plants where they are not kept well under it is useless to attempt the growth of many of the very finest flowering plants that need heat. *T. Baines.*

FLOWER GARDEN, ETC.

The weather is now favourable for garden operations, which it is hoped may continue. Planting may be pushed forward with energy and care. Proceed with the plants that are well prepared and hardened off, reserving the more tender and late sown ones for later, by which time the ground will be getting warmer and in a more congenial state for subtropical plants. If any of the beds are more sheltered than the others these had better be done first. Heat, which is not after all so much to be feared, is the vent of frost, which may come at any time this month. The ground generally being in good condition as regards moisture, the plants will not require so much water after being turned out in the beds, and cold hard water, if it can be avoided, should never be used for plants of any description. Whatever style of gardening may be adopted, the material made use of ought to be planted so as to give satisfactory results. Slow growing plants which require a long time to do well, and their sowing should always be planted thicker than those of stronger growth. After the planting is finished a small hoe may be run through the beds, which will encourage the plants to root, and give the ground a more finished appearance. If the plants are to be cut in damp or showery weather, the work is then much more easily done. I find the late frosts have killed the young shoots on the Box hedges and edgings, but Roses do not seem to have suffered much, and the fruit crops. The last few days has made a visible difference in the appearance of the grass. The mowing-machines must now be kept at work, for the lawns require to be cut after the manner of a lawn, and the Dalries being in full bloom a few days after they have been gone over. Keep the general work as well forward as the busy season will permit. *T. Blair, Shrubland Park.*

FRUIT HOUSES.

FIGS.—If the growths require any regulation whereby sunshine, light, and air may be rendered more fully operative, it should be done just prior to the fruit commencing to colour; and in order to give it every assistance to develop itself freely, all growths which require it should be stopped, of course excepting the terminal shoots, which should be allowed to grow, the laterals, which will need attention in this way now, will be confined to subsequent growths proceeding from laterals which were formerly pinched, and may of course produce a second crop, but should be nipped off at the second or third leaf from the last branch, and this procedure be continued as it becomes necessary throughout the season. With the exception of Strawberries no fruit which is grown under similar conditions is so much improved in quality as Figs are, at this time of the year especially, by a proper course of treatment being applied during the ripening process; a matter of such moment should therefore evoke especial interest in this particular. Borders which have been well saturated as before indicated, will contain sufficient moisture as to dispense with further applications of it till such time as the first crop of Figs ripened, and should not be suffered to become dry, but should have given to it whatever may be necessary betimes in the day. Keep the heating medium constantly warm, and insure a circulation of warm air, by means of the ventilators at the apex of the house open a little at night. The minimum temperature should be about 65°, and the maximum under solar influence about 90°, with a current of air passing through the house, and in Figs, as in other crops, if the springing should be abandoned until the crop of fruit is gathered, and then be resumed again for the benefit of the succeeding crop. As

soon as the fruit is gathered from very forward trees in pots, proceed with the use of the syringe over the trees as a general rule, and in the case of the winter crop of fruit if it be plentifully formed, on such trees. In later houses copiously syringe the trees twice every day at this season, to keep the atmosphere moist and to keep down red-spider, and ventilate as previously recommended. *George T. Miller, Wyeombe Abbey Gardens.*

HARDY FRUIT GARDEN.

The favourable change in the weather that set in on the 9th has already had a most beneficial effect on Appricots, Peaches, and Nectarines, all of which have made considerable progress since that date, and with general advantage to give the attention to keep them clear from aphides, the injuries & effects of the cold cutting winds and late frosts may soon be effaced. As regards fruit in every garden I have yet visited, it is almost a total failure, and I never remember seeing trees of the above kind in a worse plight than they did a fortnight or so back, as most of the young wood in Apricots was completely killed, and scarcely a leaf on Peaches or Nectarines could be seen but what showed unmistakable signs of having been killed by the end of the season. In cases where the final disabbling of these has been unavoidably delayed, no time should be lost in carrying it out, that the strength of the trees may be concentrated in the proper channel, and so have a fair chance of giving the attention to keep them active life those ubiquitous pests of the garden, red-spider, and unless the garden energy or syringe is brought into early use, their rate of increase will be something marvellous, and will do the trees a good deal of harm. The proper time to do this is late in the afternoon, as then the bricks absorb a good deal of the water, and give it out slowly during the night, much to the benefit of the foliage, and it is of almost equal importance, to the great detriment of the colonies of spider lurking in the crevices behind to supply forth with the return of solar heat and renew their attacks. Apricots will require close watching for some time to come to keep them free from grubs, which are generally more or less troublesome at this season. The most expeditious way is to go over the trees and squeeze between the thumb and finger any leaves or young growths that are curled or appear likely to have these destructive creatures on them. The foliage can be done much quicker than hand picking, and is equally efficacious. Plums, too, are frequently affected in the same way, and if not attended to suffer even more severely than Apricots, that renew their foliage more readily.

Of all grubs, however, the Gooseberry caterpillar is the most voracious, and perhaps the most difficult to extirpate once they effect a footing. The old adage that prevention is better than cure is especially applicable in their case, and hearing this in mind I always strike some fresh-slaked lime and straw over the bushes, which answers the double purpose of manuring the ground and killing the larva. In cases where they have already put in an appearance, the best remedy is to get a quantity of Foxglove leaves and stems, and use them in the manner of a mulch, or hot water after being brained to let out the juice they contain. After standing a few hours the liquid should be strained through a fine hair sieve or piece of muslin, and applied through a syringe so as to wet the whole of the leaves and stems, and to get them open. Hellbore powder dusted over while the dew is on the bushes is likewise useful, but not so effectual as the above.

The double-bearing Raspberry, which is so useful in the autumn, and in the winter, and which, however, will now require attention by way of thinning out the young shoots, which should be done so as to leave only six or seven of the strongest and best situated, unless the shoots are very far apart, in which case more may be left, and in order to afford them every assistance possible, mulch the ground heavily with rotten manure, to keep their roots in a uniform state, but never dig amongst them or disturb the soil beyond what is requisite with the hoe, to eradicate weeds. To insure more early raters of Strawberries for laying in pots, forced plants should be turned out at once in well enriched soil, in some convenient situation, where they can be kept well supplied with water to give them a start. Not only are they good for this purpose, but they are also very useful for forcing, and where they can be had should be planted in preference to runners, as they never fail to produce abundant crops in the year following, and often afford a few dishes of fruit the same autumn, when the weather is favourable. In the case of Gooseberry, but of little value till autumn, the blooms now on them should be picked off, when they will flower again later on. *W. C. Sheppard, Woodroving.*

THE

Gardeners' Chronicle.

SATURDAY, MAY 19, 1917.

APPOINTMENTS FOR THE ENING WEEK.

WEDNESDAY, May 23	Glasgow and West of Scotland Horticultural Society's Summer Show.
THURSDAY, May 24	Royal Horticultural Society of Ireland; Second Spring Show.
	London Society's Anniversary Meeting, at 3 P.M.
	Horticultural Society's Spring Show.
FRIDAY, May 25	Orleans House Club (Twickenham) Horticultural Exhibition (two days).

PARTICULAR attention has always been given to determining the TEMPERATURE in which this or that PLANT is accustomed to live, and importance has been attached to certain temperatures, sums of heat, annual, summer, or spring means, to the neglect of the changes within certain limits. Further, the so-called records of the temperature of the air are usually the readings of thermometers on walls or fences, or in frames, and principally in the shade, sometimes 2 or 3 feet high, and sometimes much higher. But the temperatures which prevail in lesser heights above the ground, in which many plants live, have been too little observed. Again, the insolation temperature has not been sufficiently taken into account, for this frequently deviates from the temperature of the air. In the experimental garden at Proskau a number of thermometric observations were made by DR. TSCHAPLOWITZ during the course of last summer on a plot of clayey soil, in which Beetroot and other vegetables, and Helianthus annuus, and other annual plants were growing. The temperatures and their courses were observed at depths of 2 and 3 decimetres (about 7.9 and 11.8 inches) below the surface of the ground, and at 1 and 5 decimetres (about 4 and 20 inches) above the surface, in all cases under the influence of the direct rays of the sun. In addition to these observations, where desirable, the prevailing temperature at 1 metre, or 1.5 metre (about 40 and 50 inches) above the ground was noted. And at the same time the temperatures of the leaves of Beet, &c., the stems of luxuriant plants of Helianthus, were determined. The latter were obtained by inserting a slender thermometer, graduated into tenths (fourths of Fahr.) of degrees, as deeply as possible in the stem. In this way a number of curves of temperature were obtained for comparison. Considerable difficulties attend the determination of the prevailing temperatures on the surfaces of leaves. Theoretically they should lie between the dew-point and the temperature of insolation read from a thermometer hanging against a leaf in full sunshine. But it is difficult to determine the temperature of any substance, and still more so to express in figures the amount of warmth communicated by one body to another. Experiments were made with chlorophyll, green paper, &c., on the bulbs of thermometers to ascertain roughly the best absorbing power of the surface of leaves. Although these experiments must be regarded as very imperfect, and were not instituted till October, the results indicated a great difference in the power of absorbing heat by leaves, according to their aqueous contents, structure, coloration, &c. There was considerable diversity in the experiments themselves, but in all cases they showed as the sun descended a temperature of 3° to 5° Fahr. higher than that indicated by naked thermometers close by; and in solitary cases the difference was as great as 7° to 9°. Large leaves of Beet, &c., were quickly plucked and pressed in quantity around the bulb of a thermometer, and the temperatures thus obtained were compared with those of a thermometer hanging close by the plants between 12 and 15 inches

above the ground. The following table illustrates this experiment:—

	9 A.M.	10 A.M.	11 A.M.	12 P.M.	2 P.M.	3 P.M.
July 18:—						
Naked thermometer ..	11.6	12.8	15.2	16.5	22.0	15.5
Temperature of leaves ..	9.5	10.5	16.8	21.0	23.0	25.3
July 29:—						
Naked thermometer ..	19.1	19.0	23.0	16.3	26.0	23.5
Temperature of leaves ..	15.0	17.8	20.5	23.0	25.0	26.0

On a subsequent day it happened that, while the observations were being taken, the sun suddenly appeared from behind a dense cloud. This was about 8.30. The temperature of the naked thermometer fluctuated between 20° and 20° 4' C., and leaves of different plants had shown 18°, 18° 3', 17° 9', and 18° 2' C.; but after the appearance of the sun, a plant could not be found which gave a temperature of 17°, and they were all between 16° and 17°. However, after the lapse of half an hour they had recovered their normal temperature in relation to the course of the sun, as expressed by the figures in the above table. It is quite explicable that the afternoon readings should be higher than those of the forenoon. The high insolation temperature of July, the relative stillness of the air, and the high specific warmth of the water which the plants slowly evaporate, have probably something to do with it; and it appears that the sudden fall of the temperature of the leaves just recorded should be ascribed to the more rapid evaporation; in fact, that it was the cold of evaporation. The temperature of the points of the leaves differed widely from that of their bases. The point of union of leaves on the top of a Beetroot, in which a hollow for the bulb of the thermometer was rapidly cut out, exhibited some singular fluctuations corresponding neither to the insolation temperature at 40 inches above the ground nor to the temperature of the soil at a depth of 8 inches. They seem to be connected with evaporation, but the observations on this point are too incomplete to afford any trustworthy information.

DR. TSCHAPLOWITZ gives tables of a considerable number of sets of observations, but we have space for no further comment on the present occasion. His remarks on the whole series of observations have not reached us yet in full, but if they contain anything of interest we shall make some extracts from them.

THE CASCADE AT CASERTA, near Naples, represented at fig. 104, is one of those pieces of architectural and engineering gardening, on the merits of which opinions are likely to differ beyond hope of reconciliation. The mountains for miles around form the collecting ground, whence the water is conveyed by canals and aqueducts to a tunnel in one of the mountains, from this it falls some 50 feet into a basin, and from thence in a series of leaps in a straight line down the slope of the hillside, in full view of the palace, as shown in our illustration. The impression at a little distance is of a sheet of glass placed on a sloping surface, and is not proportionate to the vastness of the construction and the immensity of the volume of water, while the rigid formality of the whole reminds one of a railway cutting, or some other strictly utilitarian fabrication. Those who remember the cascade down the hillside at Chatsworth will have little difficulty in supposing that the cascade at Caserta supplied the idea for that on the banks of the Derwent.

We understand that at the forthcoming show in the horticultural department of the Bath and West of England Society, to be held at Bath, June 4—8, two ten-guinea cups, one for amateurs and one for nurserymen respectively, will be awarded to cut blooms of TEA ROSES. A jury of three nurserymen will be told off to judge the amateurs' collections,

and a similar number of amateurs will pass sentence on the nurserymen's productions.

— We are informed that a large ROSE SHOW will be held at the ALEXANDRA PALACE, on Saturday, June 30, for which a liberal schedule is being prepared. The schedule will shortly be ready, and may be obtained on application to Mr. JOHN A. MCKENZIE, 1 and 2, Great Winchester Street Buildings, London, E.C.

— A VERY CURIOUS FORM OF DISEASE has lately been forwarded to us, which occurred in SOME CAMELLIAS planted out in a bed, the house in which they are planted being shaded with canvas. The leaves are very pale and the shoots weak, but there does not seem any reason to believe that they have been affected either by cold or drought caused by radiation, still less by direct action of the sun. The leaves are regularly spotted over with brown specks, which look at first much like the work of some thrips, and this in fact may possibly be the first cause, but if so the subsequent effect is very curious. Each speck, whether orbicular or irregular, consists of a dark brown hard disc surrounded by a raised border, the brown tint sometimes spreading beyond the border, and more rarely extending over a considerable portion of the leaf. The disc consists of leaf-cells distorted, the walls being gorged with brown matter, similar to that occurs in so many morbid conditions of vegetables, with the cuticle very dense. Very rarely there is a slight cavity of a paler tint filled with minute cells, which have very much the appearance of the early stage of the fructification of some Spheria, though like the whole, as in some observations on pustules in the animal kingdom, there is merely a simulation of fungi. The hardening of the discs so as to resemble cortical cells is very curious whatever the cause may be, which might possibly be difficult to discover even on the spot. *M. J. B.*

— MR. WAINWRIGHT, the talented gardener at Rushton, near Kettering, has lately sent us a Potato, which exhibits a condition somewhat like that figured at vol. iii, p. 247 of this journal. Professor DYER very properly suggested that the tubers produced within the original tuber [sometimes] owed their position to "an inversion of the rind of the Potato and to the gradual absorption of the cells of the central portion from the pressure exerted by the ingrowing tubers." In the case before us only a single tuber has been generated, so that we have been able to trace its origin to an inverted bud, at the same time a quantity of spores being thrown off at the base of the bud, and running over the tuber so as to look like an exaggeration of the copper-ew. The tuber was not formed till the shoot had penetrated for an inch and a quarter, its whole course being marked by the conversion of the cell-walls into brown matter, as in the Potato murrain, which reminds one of the effect on adjacent cells of the penetration of the young Peronospora. *M. J. B.*

— What a magnificent ornamental tree the DOUBLE BLOSSOMED CHERRY is! In the forecourt gardens of many houses in the suburbs of London there are large trees, every branch of which is wreathed with densely-packed lines of pendant blossoms. The beauty of the tree when in full bloom is best revealed when looked at beneath. Year after year shows no diminution of its marvellous floriferousness.

— The occurrence of various forms of what were formerly described as species of *Rhizomorpha* in mines, without a trace of fruit, makes it always matter of interest when they are found in fructification. A specimen from the Wharfedale Silkstone Collieries has lately been forwarded to us, in which the tawny, strongly-branched mycelium bears an abundant crop of a minute form of *Agaricus velutipes*. In such cases the normal characters are seldom preserved, and the gills, even when well formed, do not bear spores. In that before us the pilei do not exceed a quarter of an inch, many very much smaller, and though the greater part of them show the usual characters, in one the gills are decurrent with an umbilicated pileus, so as to resemble an *Omphalia*. There is no doubt, however, about the species. HOFFMANN has figured in his work on the fungi of the Hercynian mines an *Agaric*, under the name of *Agaricus myurus*, which is clearly a mere form of *A. galericulatus*. With it two forms of

Rhizomorpha appear, one white and the other a black kind, which is very common in this country under decayed bark. This has not, we believe, ever been referred to its origin, though one form has been traced to a Polyporus, and another to Xylaria. It is probable that this is a state of the very common Agaricus galeritatus. The Rhizomorpha is clearly very abundant in Austria, as it is a popular remedy amongst the peasantry for diarrhoea in horses. M. J. B.

— THE FRUIT ORCHARDS round London have been very gay and attractive for weeks past, but now that the Apple trees are coming into bloom they are taking on some of the most charming hues they have

serve to give occupation in their own quarters to marauders among birds, and so keep them from the fruit garden, and the sin of stealing—if their natural propensity to prey on fruit is to be regarded in such a light. A selection of Apples worked on the Paradise stock might form a portion of a list of deciduous flowering trees, and the hint is freely offered to catalogue makers.

— THE CLIMBING TROPÆOLUMS are most effective greenhouse and conservatory plants at this season of the year, for when well established in pots they bloom with great freedom. An excellent illustration of this fact is afforded in one of the houses in Mr. KINGHORN'S nursery, at Sheen, Richmond. The

growth will set in after the recent rains, and blossom will soon appear. One large field of Peas of several acres in West Middlesex contains Sangster's No. 1 for the earliest crop, then Laxton's Supreme, Harrison's Glory, Vetch's Perfection, and a local selection of a somewhat similar character. Peas in well-manured ground ought to get such a start now as will result in heavy crops.

— The following are the PARKS and OPEN SPACES placed by Parliament under the control of the Metropolitan Board of Works:—Finsbury Park, 115 acres; Southwark Park, 63; gardens on the Victoria, Albert, and Chelsea Embankments, and in Leicester Square, 14; Blackheath, 267; Hampstead Heath,

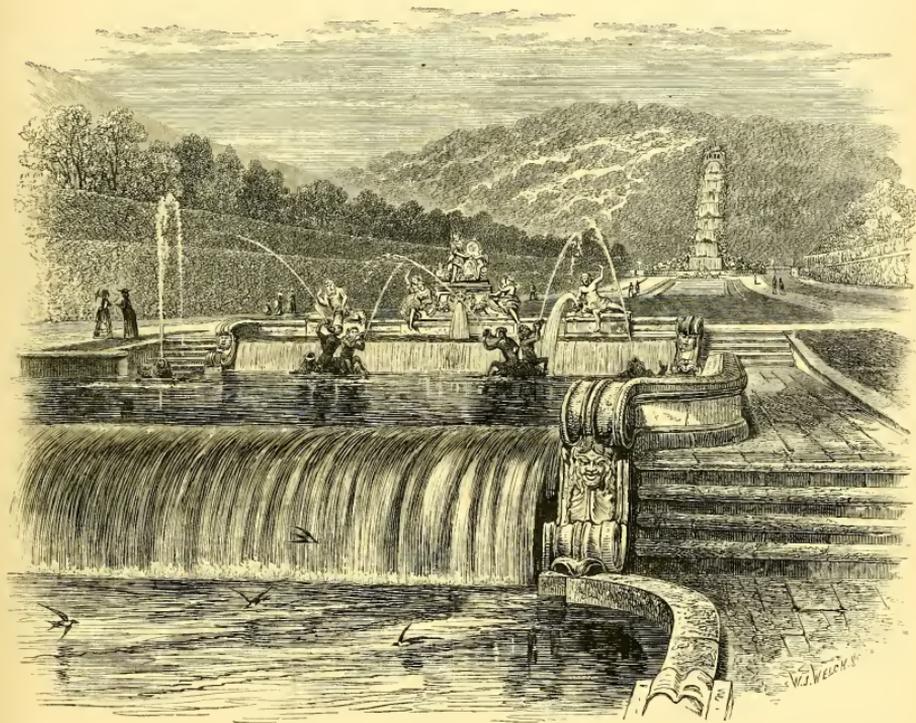

FIG. 104.—THE CASCADES AT C SETA, NEAR NAPLES.

yet displayed. The blossoms of the Plum, Pear, and Cherry, are almost, if not quite wholly white, but when the Apple blossom expands charming tints of pink and pale rose are prevalent. The Maxx Codlin, one of the earliest of the Apples, is largely grown for market, for in addition to its being early it is invariably a large cropper, and will fruit when the trees are quite young. At the time of blooming the trees can be readily detected, and just now they are forming sheets of blossom, of a lively pink tint. As fruit cultivators are generally agreed that this Apple is well suited for shallow soils and exposed situations, and as it does not make a rapid growth, it appears to be thus well adapted for shrubby borders, the fringes of woods, and indeed for many places where it is desired to produce effects in the landscape. Plums and Cherries might be associated with it in shrubberies and belts of trees, and any fruit produced would

varieties employed are Triomphe de Gand, and Ball of Fire, scarlet; Vesuvius, crimson; and Triomphe de Hyras, yellow. The plants are in good sized pots, and stand on the stage, the shoots being trained up pillars, and then along the roof of the house. The pots stand in pans, and a little manure water is occasionally given. It is when the plants get a hard and woody stem that they flower so freely, and the number of blossoms produced is very large.

— The lateness of the season is seen in the MARKET PEA CROPS, which are this year considerably behind their usual forwardness. In 1876 the Pea blossom was much injured by frost on April 28, but now on the forwardest, Sangster's No. 1, the flowers are beginning to be seen, and the buds were tinged by the frosts of the 6th and 7th inst., which will tend to make the crops later still. But a vigorous

240; Shepherd's Bush Common, 8; London Fields, 27; Hackney Downs, 50; Well Street Common, 30; North Mill Field, 20; South Mill Field, 28; Clapton Common, 61; Stoke Newington Common, 51; waste land at Dalston Lane and Grove Street, Hackney, 1; Tooting Beck Common, 144; and Tooting Graveney Common, 63; total, 1093½ acres. Negotiations are going on for acquiring the following open spaces:—Clapham Common, Boxal Heath, Plumstead Common, Wormwood Scrubs, Brook Green, Elbrook Common, and Parson's Green—in all 607 acres.

— Those of our readers who have attended as exhibitors at the fruit and flower shows at the Crystal Palace, and whose business has brought them in contact with Mr. F. W. WILSON, the Company's manager of shows, will regret to hear that the long connection

between that gentleman and the Crystal Palace Company has been somewhat suddenly severed, owing to a scheme of retrenchment originated by the Board of Directors, which has also involved the retirement of the General Manager, Mr. WILKINSON. Mr. WILSON has been in the company's service a quarter of a century; for many years of that time as Natural History Superintendent, and latterly as manager of most of the popular natural history exhibitions held at Sydenham. As such it was Mr. WILSON'S privilege, as we know it was his pleasure, to meet a great number of exhibitors, by whom, on account of his energetic character, straightforward, manly conduct, and naturally disposition, he held in high esteem; and we feel sure that they will regret as much as we do that such long and valuable services as Mr. WILSON has rendered to the Crystal Palace Company should have met with such a poor reward from its economy-stricken Directors.

— To the majority of gardeners the MORELLO CHERRY is chiefly known as a wall tree only; as the cultivation of it as a STANDARD is mostly limited to market gardens, and even in these its growth is far from common. As seen just now in full bloom standard trees of from ten to twelve years of age are verdant pictures, graceful in appearance, and beautiful with thousands of snow-white petals, like diamonds. The well-known spray-like growth that invariably characterises this Cherry on walls adds greatly to its beauty as a standard, and its slender pendulous growth brings it in appearance near to the Weeping Willow. As a market tree it is one of the most profitable of fruits, as it seldom fails to produce a crop, and this is sold at a good price at per dozen pounds, either for tarts or preserving. In isolated places the birds manifest a special fondness for the fruit of the Morello, but no complaint is made where grown in bulk; perhaps the very abundance of fruit generally found in extensive fruit orchards renders the depredations of the birds less perceptible. With the strong taste that prevails for flowering and other decorative trees on lawns and conspicuous places in gardens, it is remarkable that the Morello Cherry should have been almost overlooked. In habit it is an excellent companion tree to the Laburnum, blossoms with great freedom, and retains its bloom on as long as most other spring blooming kinds, and when covered with its rich coloured ripe fruit it presents an object singularly graceful and beautiful. There are few of the ordinary decorative trees that can claim to produce a fruit crop capable of utilisation. In this respect the Morello Cherry has special claims upon the planter, as it so admirably combines the useful and the ornamental.

— The daily papers record the fact that FOREST FIRES are making great ravages in North-Eastern New York, Long Island, Massachusetts, New Hampshire, Maine, Pennsylvania, Canada, and near St. John, New Brunswick. The large part of the White Mountains is in flames. The summer hotels in danger, and the railways are interrupted. A great number of mills and dwellings have been destroyed, and hundreds of persons are destitute.

— We are glad to find that the very small disused brying-ground now called by a euphemism the DRYLY LANE GARDEN has been reopened. It will remain open to the poor under a new code of regulations, daily from 10 till dusk. It will be remembered that on the first occasion of its being opened a few tiny shrubs were trampled down by the throng. Let any one who has a garden of his own, or who can gain access to a breezy common, take a tour of inspection in the squalid courts of Dryly Lane, and then say whether acres of breathing space are not required instead of the miserable little area dignified by the name of a garden. Surely those who would make capital out of what disturbance took place do not know what Dryly Lane is, and do not know the urgent need of any means of promoting cleanliness and godliness in the wretched dwellers in the neighbourhood.

— A correspondent asks us to tell him of any means of destroying the WILD LILY on a GRAVEL PATH. We know, or think we do, a Lily when we see one, and are not altogether ignorant of the nature of a gravel path, but a wild Lily on a gravel path is indeed a puzzle to us. We may say at once that a wild Lily,

truly so called, on a gravel path, is a myth of the Mrs. 'ARRIS description; but, still, what can be meant by the word Lily? This is only another illustration of the worthlessness of popular names. Speak to a botanist of a Lilium or a Lily in its proper signification, and he knows what you mean, but in popular parlance there are African Lilies, Attamaco Lilies, Barbadoes Lilies, Belladonna Lilies, Blackberry Lilies, Brisbane Lilies; other "Flax Lilies" called Cape Coast, Corua, Cuban, Day, Fire, Flax, Lycoris, Guernsey, Ixia, Jacobean, Knight's Star, Lent, Mexican, Persian, Pond, Prairie, Rock, Rookwood, St. Bruno's, Scarborough, Superb, Swamp, Trumpet, Whiteman, say nothing of Water Lilies, Lilies of the Valley, and Lily of the Valley Tree, and perhaps more. Now not one of these has any claim whatever to be called a Lily; moreover, we do not think any one of them is likely to be wild on a gravel path.

— We are glad to welcome a new part of the *Flora des Serres*, the first which has appeared since the death of its founder, LOUIS VAN HOUTTE. It opens appropriately with a portrait and memoir of the distinguished horticulturist, the memoir, however, containing little that was not made public at the time in the horticultural journals. The editorship, as we had occasion to mention, has been confided to M. J. E. PLANCHON, to the great satisfaction of those who are interested in the correct nomenclature and botanical history of the plants they cultivate. We shall take an early opportunity of alluding at greater length to the contents of this part.

— Professor ASA GRAY this writes to us with reference to the vexed question of the DIRECTION OF SPIRAL GROWTH:—

"In the *Gardener's Chronicle* for January 13 ALEXANDER BRAUN (whose death we now deplore) is cited as one in the formidable list of botanists who view the direction of a coil or turn of a spiral, &c., from the inside, and who would therefore say that the overlapping of the corolla lobes in a Gentian was to the left, in a Periwinkle to the right. Now I have at this moment happened to glance at an early paper by Professor BRAUN upon such 'torsions,' published in the *Flora*, 1859, and a French translation in the *Ann. Sci. Nat.* of the same year (vol. 380); here he takes the opposite view, and speaks of *Gentiana* as uniformly turning to the right, and *Vincis* to the left, just as BENTHAM and HOOKER now express it. Now, was not this view adopted, probably, on account of its naturalness, and given up afterwards in deference to Linnean authority?"

— We were hardly prepared to find so great variation and so small an amount of RAINFALL as 38 inches in the island of Jamaica, as is recorded in the *Jamaica Gazette* of March 1, from which it appears that during the year 1876 the rainfall at various parts of the island was respectively 125, 117, 62, 40, and 38 inches (omitting fractions).

— According to the official report of the BOTANICAL GARDENS OF JAMAICA the establishment in question is in a satisfactory condition, and a large number of useful plants have been propagated and distributed. The Librarian Coffee is doing well, especially on the lower altitudes, where plants only planted out a little over a year have borne fruit. Coffee culture is largely increasing in Jamaica, and on the southern slopes of the mountains it is stated that the wholesale destruction of the forest for Coffee cultivation has materially lessened the rainfall and other conditions of moisture, thus rendering the climate comparatively dry, and therefore peculiarly fitted for the successful cultivation of Coffee. Cocoa is largely and successfully grown, the climate and labour resources of the island being peculiarly favourable to it. Sugar-cane, Pine-apples for the New York market, Divi-Divi, Cocos-nuts, Cinchona, Eucalyptus, and Jalap, are all successfully grown in the island.

— Mr. WILLIAM GORRIE has been well-advised in reprinting from the *Transactions of the Agricultural Society of Scotland* the description of the TREE MALLOW (*Lavatera arborea*), as an agricultural plant for cattle feeding, papermaking, and other purposes (Edinburgh: NELL & Co.) The Tree Mallow is a native of the sea coasts of this country, and even where not native thrives admirably, as on the

Kentish coast near Sandgate, where it may be seen growing close to the sea, and may be used for sheltering newly planted trees, &c. It is by no means an unattractive plant in such situations, and we are glad to find Mr. GORRIE advocating its culture for papermaking purposes, cordage, &c., as well as for the sake of its seeds, which furnish a valuable feeding stuff for cattle. From what we ourselves have seen on the small scale, and from the evidence Mr. GORRIE puts before us in his pamphlet, we would urge those interested, and who have the opportunity, to make the trial. The plant is a little tender in some situations, though native on the Bass Rock, Fife, Perth, but on the west coast of Scotland and the Western Isles, the south and west coasts of England and Wales, and in Ireland, the plant would probably do well.

— Dr. UHLWORTH proposes to continue the NOMENCLATURE BOTANICUS of FEEFFER, so as to include the names of all orders, genera, species, and varieties of plants published from 1859 to 1876 inclusive. Of the great value of such a publication to all who have to make use of the literature of botany, it is needless to speak. If carried out in the same elaborate and exhaustive manner as the *Nomenclator*, it will be a marvel of human industry and patience.

— In the *Monatsschrift des Vereines zur Beforderung des Gartenbaus* (Berlin) for April, Dr. K. KOCH gives some particulars respecting THE NURSERY OF BOSKOP, in Holland, and its neighbourhood. Nearly the whole population is engaged in the pursuit of raising forest trees, fruit trees, Roses, &c., for export. The area devoted to this purpose is from 500 to 1000 acres—a small area, of course, in comparison with the large extent of land under this culture in Britain, though large for a single locality. Three-fourths of the business is with Germany. With England, it is stated, the annual export amounts in value from 25,000 to 30,000 gulden—about £2125 to £2625. The principal plants sent to this country are variegated Hollies, dwarf Roses, hardy Azaleas, Planes and other deciduous trees. A rough estimate of the value of bulbs and tubers exported is fixed at £170,000. In this communication Dr. KOCH says nothing respecting the novelties he met with in principal trees and shrubs, the study of which was the primary object of a prolonged visit.

— At the St. Augustine's (Canterbury) Petty Sessions, on Saturday last, a man named JOHN BROWN was charged with stealing a quantity of Watercress, value 3s., at Ash-next-Sandwich, the property of Wm. FOAD. The prisoner (who pleaded guilty) and another man, not named, being having absconded, took a truck over to Ash during the night of Thursday and filled it with Watercress from the garden of the prosecutor, who traced Cress on the road from his premises to the St. Martin's Hill turnpike-gate, Canterbury. He went to a lodging-house in that city, and there saw a large quantity of Cress, which he identified as his, it being marked with soot. The Bench sentenced the prisoner to two months' hard labour.

— Mr. W. THOMSON sends us a leaf of Gros Colman Grape, with two side lobes and one terminal one on a long slender stalk. We never saw such an occurrence in a Vine leaf before, but it is what might be expected to occur in any palmately divided leaf.

— At the Society of Arts lately, Mr. WILLIAM TAYLER entertained his audience with an amusing lecture on "Thaumatodendra" (?), or the WONDERS OF TREES. Most of his illustrations are well-known to students of tree lore, but are none the less interesting on that account. We cite the following passages from this lecture:—

"There are new tales of portents at Coomassie; one, especially, of the truth of which we are assured, is certainly, at least, a very singular coincidence. The word Coomassie means 'the town under the tree,' and was so-called because the founder sat under a broad tree surrounded by his warriors, while he laid out the place for the future town. The market-place was marked off around the tree, and it naturally became the great festive tree of the town. On the 6th inst. the day upon which Sir GARDNER sent his ultimatum to the king, a bird of ill-omen was seen to perch upon the tree, and half an hour afterwards a tornado sprang up, and the festive tree was levelled to the ground! This caused

a profound sensation in Coomassie, which was no little known by the letter of the day upon which the fish tree had fallen."

Alluding to the Banian, the lecturer proceeded:—

"But the most remarkable evidence of the extraordinary power of the pendent roots of the Banian has been lately exhibited in the celebrated Temple of Juggernaut. The great Hindoo Temple of Juggernaut is notorious throughout the world. Built at a cost of half million was, being, it is black with age. After seven centuries this sacred place, which has suffered from droughts and encroachments of age, has been suddenly found to be on the verge of destruction. The seeds of the Banian and Peepal tree have got under the foundations; and the whole fabric has become loosened. The ruin is first indicated by the fall of some large stones, just after the gods had left the temple on the last car festival. Had they fallen a few minutes before they would have been smashed to atoms. This catastrophe has, as may be imagined, caused great consternation, and is likely to have a disastrous effect on the *prétige* of the great Juggernaut. It is a curious coincidence that the most celebrated Hindoo temple should have been thus undermined by trees: but sacred, if not divine, by the whole Hindoo nation. Is it accident—or Nemesis?"

Here is what is said of Lady GRIMSTON's tomb:—

"I dare say some here present will have heard of the very strange incidents connected with the tomb of Lady ANNE GRIMSTON, in Tewin Water Churchyard, Hertfordshire. As far as I have been able, and after much inquiry, to ascertain, Lady ANNE GRIMSTON was, if not an unbeliever, at least a sceptic, and was occasionally heard, which she herself would soon believe that trees would, after her death, grow out of, as some say, her heart, others her tomb, as that there should be a resurrection of the body from the grave. Lady ANNE GRIMSTON, as did her ancestors before her, died: she was buried, and a substantial tomb enclosed with an iron railing was erected over her remains: twelve months after burial seven small saplings of an Ash tree appeared close to the tomb; they were allowed to grow; superstition probably preventing all interference; they grew, and after some time they raised the solid tomb from its distance from the ground, at the same time supporting it with their branches, and at the present time, in exact accomplishment of the alternative suggested by Lady ANNE, seven full-grown Ash trees are in full foliage around the tomb, the principal tree having germinated from that part of the tomb in which the heart of the deceased was situated.

Here is another singular coincidence:—

"One other remarkable instance of mysterious, or at least unaccountable growth, is now, and has for many years, attracted attention and surprise at Ross, in Hertfordshire: the story, which has been related to me by several eye-witnesses, is this:—The Man of Ross is a name and character which has been immortalised in the well-known lines of Pope. He was peculiarly partial to the Elm tree, many of which he had cherished with peculiar devotion. So long as he lived, no one presumed to interfere with his cherished favourites; but after his death several trees made their appearance at the door of the church, gradually forced their way into the interior, passed through the Man of Ross' pew, and grew up together inside the church, where they were still growing side by side, occasionally lopped when rising so high as to touch the roof."

NOTES ON OPEN-AIR VEGETATION FOR APRIL.*

THE weather during April upon the whole has been cold, and much against open-air vegetation, perhaps more so than has been observed on April 30 for many years: the wind nearly the whole month having an easterly tendency except on the 20th, when it got round to the south-west, and a few hours' warmth was the result, which brought forward the flowers of the Norway Maple and certain Elms, also the young leaves of some of the Hawthorns, besides greatly increasing the size of the leaf-buds of certain Planes and Horse Chestnuts, but without expanding them. After that day the wind got round to the east again. Vegetation has progressed very slowly, so much so that the forest vegetation, with the exception of the few examples quoted, has quite a wintry appearance. Herbaceous vegetation is also far behind, the diminutive condition of many plants being very marked. Some of the ordinary early blooming plants have been also late of flowering. The Crown Imperial (*Fritillaria imperialis*), which is often past at this time, is

scarcely yet in perfection. Many Scillas and other spring bulbs which usually flower in March are now in full bloom, and even the common Crocus may still be found in flower, and Snowdrops were also procurable about eight days ago. Standard plants of Ribes sanguineum have not been particularly good this season, their flowers being still much behind. Many other examples might be quoted, the foregoing, however, are sufficient to show the backwardness of vegetation. In my report for March I stated that certain species of Cupressinæ had suffered severely. The browning complained of is still going on, and many of the plants then noticed are permanently disfigured.

During the month of April the thermometer has been ten times at or below the freezing point, indicating collectively 50°; the six lowest temperatures were on the 10th, 11th, 12th, 14th, 20th, and 25th, when 26°, 26°, 23°, 24°, 23°, and 27° were respectively registered; while the six highest night temperatures were on the 5th, 9th, 15th, 16th, 21st, and 22d, indicating respectively 39°, 40°, 40°, 40°, 42°, and 38°. The prevalence of low night temperatures of late has been remarkable, nor can it be explained while so much snow lies in various parts of the country. Throughout April the six highest night temperatures, as already noted, only amounted to 23°, being lower than had been noticed during the corresponding month last year, when the six highest indicated collectively 29°, all counted above zero, or 47° above the freezing point for April, 1877, and 101 for April, 1876.

On April 30 ninety-seven species and varieties of plants were counted in flower on the rock garden, while the corresponding day last year 122 were noticed. The most conspicuous at the present time are *Adonis vernalis*, *Anemone nemorosa bracteata* alba, *A. Robinsoniana*, *Aubrietia grandiflora*, *Colchicum soliboliferum*, *Diondia Eppactis*, *Draza arborescens*, *Erica herbica alba*, *E. h. intermedia*, *E. h. nana*, *Erythronium grandiflorum*, *E. giganteum*, *E. g. roseum*, *Fritillaria aurea*, *Orobancha elegans*, *Polygala Chamæboxus*, *Primula ciliata purpurata*, *P. denticulata*, *P. helvetica*, *P. integrifolia*, *P. nivalis*, *P. purpurea*, *P. vulgaris*, *Pulsatilla bracteata*, *Paschikiana scilloides*, *Saxifraga cordifolia*, and *S. retusa* extend to the limits of our own requirements. The following spring plants complete the list annually recorded to show the period of flowering:—

	1877.	1876.
<i>Symphylanthus caucasicum</i>	April 8	March 13
<i>Narcissus Pseudo-Narcissus</i>	" 12	April 3
<i>Adonis vernalis</i>	" 12	" 5
<i>Fritillaria imperialis</i>	" 14	" 11
<i>Hyoscyamus physaloides</i>	" 16	" 2

In my monthly returns "on open-air vegetation" it is not usual to give any remarks on the vegetation of the current month; but as the present month of MAY, so far as it has gone, has been rather an exceptional one, I cannot refrain making a few observations in order to show the amount of cold we have had up to this time. Frost has been seen, more or less, every morning, with two exceptions, varying from 1° to 8°, making collectively (up to this date, May 10) 30°, the exceptions being on the 9th, when the thermometer stood at 33°, and on the 10th (this morning) at 37°.

The frosts experienced during the May months for the last twenty-three years are given in a table on p. 523 of the twelfth volume of the Botanical Society's *Transactions* for 1876-77. In May, 1855, were registered in 1861, 21, and in 1859, 13, in 1874, 16, and in 1876, 26°. From this table it will be seen that during four years no May frosts were noticed, during five years 1° only each year were recorded, and for twelve years from 2° to 6° were registered.

It is difficult at the present time to say with exact certainty the period vegetation is behind former years, probably not less than three weeks. For twenty-eight consecutive seasons we have had the young branches of the Beech, each 5 inches long, to hand to the students attending the botanical class. On the 8th, 9, or 10, to show an example of an alternate leaf this year no shoot is yet out of its winter scales. Many other examples of open-air trees to show venation and prolepsis daily occur, all, however, behind; and while other plants are now in good condition, such as the *Fritillaria imperialis*, which is generally past at this time for class purposes.

In consequence of the length of time leaf-buds have

been pent-up, caused by the long ungenial spring, it is but reasonable to expect that as soon as a favourable change takes place, and the present moisture in the ground we shall observe a rapidity in the development of foliage such as we have not before seen.

Home Correspondence.

Lessons to the Young Gardeners at Kew.—SIR C. W. RICHMOND has mistaken in supposing that the system of instruction given to the young gardeners at Kew has proved a failure. That the contrary is the case is shown in my several annual reports to the Government on the progress and condition of the Royal Gardens since 1874, when the lessons were commenced. The system in question consists of evening lessons (not lectures) given to the young gardeners in the elements of structural, physiological, and geographical botany, chemistry, and meteorology, both for their general improvement and for the special purpose of qualifying them for holding appointments in India and the Colonies, as well as in scientific establishments at home, for which a knowledge of plants and their uses is an indispensable qualification and their useful products, is required. Those who commence a course are required to go through it, and to keep full notes of the subject taught in it; these notes are frequently inspected by the instructors, and finally reported on to the Director. At the end of the session a certificate of attendance at any course is given, but only in case of the notes having been satisfactorily kept; and further, the certificate of conduct &c., which every young gardeners carries away with him from Kew when he leaves its service, states whether he has or has not availed himself of these lessons. It is true that the original proposal to give such instruction was, when first announced, met with dissatisfaction by a majority of the young gardeners then at Kew, who expressed a wish that instruction in floriculture and bedding out should be substituted for it. This wish was, of course, not entertained, and the system, which once began, was cordially received by the young gardeners, and continues to give excellent practical results. Many applications have been made to me by outsiders for permission to participate in the instruction, but the system, being lateral, is not likely to be extended to the limits of our own requirements. Its success or failure does not in any way affect the question of the expediency or otherwise of the Horticultural Society instituting courses of instruction in horticulture proper, but the department of which such as fruit and vegetable growing) are not practised at Kew. *F. D. Hooker, Director, May 14.*

Productive Pig Trees.—THE Rev. Canon Agles, Barnack Rectory, has a Fig tree which occupies one side of a south roof. For twenty years past it has been yearly either pruned or nailed, and has not increased in its simply enormous. Another reverend gentleman in this quarter (Stamford) has one of the same variety that overtops the wall from 5 to 6 feet, and which I have repeatedly seen laden. Fig trees under the rule-of-thumb system of culture certainly bear fruit, but not with such freedom as the naturally grown trees. Three years ago I felt determined to try a similar plan, and am thankful to say with the best results. This season the promise is so good that I have treated the new shoots with a tie to the wall and main stems. *R. Gilbert.*

Abies Menziesii and A. Engelmanni.—M. ED. ANDRÉ's notes on *Abies Menziesii* and *A. Engelmanni* on p. 562 of your issue for May 5 are very interesting, in so far as they are correct; but I have a suspicion that the department of which he gives respecting this species (admittedly, however, not all of his own proving) is inaccurate, and calculated to mislead and hinder cultivators of such plants in Britain from adding to their collections one of the most beautiful and hardy of Spruces. I inform us that young plants of *A. Menziesii* are readily distinguished from Engelmanni by the tips of scales of their buds being reflexed. I have never seen *Menziesii* with reflexed scales; and I ask, in your examination of the specimen sent, whether he is correct in this statement. (In the specimen sent *Menziesii* the scales are not reflexed.) They also show that the leaves of Engelmanni are not "more slender" than those of *Menziesii*, but that the former is "more to a long, and the latter, the most formidable" of Spruces; and, as to the scales of its buds, they are decidedly recurved. But to prove this, pray never examine them in damp or rainy weather, as then they are more or less straightened out, and addressed to the buds, as if to prevent the lodgment of water. Furthermore we are informed that "on seeing the two species side by side, it is seen that *A. Engelmanni* begins to grow in spring a full month

* Read at the May meeting of the Edinburgh Botanical Society, 19, J. McNab, Curator of the Royal Botanic Gardens.

before A. Menziesii;" and that under cultivation "in America it is developed before any other species of Conifer, and the culture of it should not be recommended anywhere but in the North of Europe." We are certainly much indebted to Mr. André for telling how A. Engelmanni behaves in America, Russia, and France, and I shall now have pleasure in letting him know how it behaves here in Derbyshire. To do so it is necessary to state that the oldest plants here, as far as I can ascertain, were brought from France, and to compare them with plants of other species it is only fair that they all be of the same age, and growing on the same ground-level and subjected to the same conditions of life. I find that the branches of all kinds of these plants, and I believe, paradoxical as it may sound, are always last to start—have gone on uninterrupted by frost for at least seven years, and now (May 12) they are just commencing to grow, the majority of the buds being yet apparently dormant. They have entirely escaped the rather severe frosts experienced towards the close of the last and the beginning of this week. Plants of Menziesii, on the contrary, have already grown an inch or more, and many of their newly-made shoots are killed. Yesterday two years ago had a quantity of Engelmanni Spruce, Nordmanni Fir, and common and golden Yews, growing together on a low-lying part of our ground; they had made from 1 to 3 inches of growth, when an early frost in the night drove us back to where they had started from, without injuring a leaf of the Spruces. Lastly, the reason which M. André gives for Engelmanni beginning to grow in the spring is that "plants growing at a great height, or in high northern latitudes, on being transplanted to a warmer climate, begin to open their buds at the first spring-like day." If M. André is right, I would ask you what is the pine tree on the upper reaches of the Rocky Mountains, when transferred to England is notably the last of all our Pines to start in the spring? Here at present it shows no sign of life, but our native Scotch and other firs from warmer latitudes grow nearly as far on the same ground level, have made from 2 to 3 inches of growth. My knowledge of the climatal and other conditions of life of the numerous forms of Coniferæ in their native habitats is too limited to warrant me in attempting to explain why M. André has given a reason for. Nevertheless, it is not without reason that I believe that there is no characteristic more strongly impressed on plants than their inherited tendency to start into growth at a certain time, and under the conditions of life of the specific habitat admit of, even when they are, under cultivation, subjected to moderately different conditions. We see this exemplified in certain Cypressæ raised in Britain from seeds collected by me in the year 1851, near California; they make a double growth in one year, the second growth late in the autumn, and even form their catkins and flower before Christmas—its very best proof of them having made a second growth. It is exactly here they grow, and I believe, that the want of moisture at their roots towards the close of the "dry season" checks and helps to mature their growth early in autumn, and then the periodical warm showers which begin to fall on or about November 1 reinvigorate them, and they begin to grow. *George Syme.*

The Oak and the Ash.—What will the weather prophets say this year when they make their observations on the relative expansion of the leaves of these trees? Last year the Ash was some three weeks later than the Oak, but this season the two were nearly almost simultaneously [not in our garden. Eds.], so that there is little to choose between them. The reason is probably to be found in the fact that the Oak is later in expanding, as almost all deciduous trees are, but the Ash being one of the very latest finds the weather sufficiently genial to allow of its expanding its leaves at the usual period. If this has any significance in relation to the weather we may look for one of those happy seasons which are neither too wet or too dry, too hot or too cold, and suits everybody. Such a season may well be expected to prove a meteorological millennium. *Alex. Dean.* [In this matter the great individual variation of particular trees seems always to be overlooked. In South Middlesex, the Ash being one of the very latest finds of Oaks, one in leaf, others not so forward as the tardy Ash, which has scarcely begun to move. Eds.]

The Cucumber Disease Stamped Out.—Last spring I sent for your inspection some fruits and foliage of Cucumber plants very badly infected with the disease commonly called galling. After my communication I made several attempts to get rid of the disease. I procured seeds of plants from a distance, experimented with different soils, &c., raised seedlings and planted in a new house that never before had a Cucumber plant in it; but, alas! no matter

where they were grown, the too well-known symptoms quickly put in an appearance; the gunning in the fruit and stems and the crippled foliage soon made their appearance. Not one Cucumber presented for the table did I cut the whole of last year. With Melons and Vegetable Marrows the disease proved quite as fatal, even at long distances apart. I struggled on till this year, sowing and planting in all directions, till I was nearly worn out. Not one Cucumber did I reap, all my efforts being in vain. In this stage I felt somewhat puzzled as to what should be my next attempt. I then determined to root out and burn every plant on the place. The two houses where the Cucumbers were growing were thoroughly washed, hauled, every particle of soil and all that was movable was cleared out; we next gave the houses a good washing with strong soap and water as hot as it could be applied, and afterwards three coats of paint inside and out. The walls and pipes were well scoured and dressed with hot lime and turpentine several times. After all being made pure, instead of commencing again I gave the houses a rest for more than two months, throwing open all the ventilators and fully exposing them to wind and weather. On December 13 I closed the house and made another sowing of Telegraph and Tender and True; the plants came up and had a healthy look, and as the days lengthened made rapid progress. At the first fruiting time, on May 17, and I am pleased to say that from that day till this not the least symptom of disease has appeared on the plants or fruit. I attribute my success chiefly to the two months' rest, the thorough disinfecting of the place, and syringing the plants with a weak solution of a weak solution of sulphur. Should any one be labouring against this most tantalizing disease I recommend them to put the above remedy into execution, and I feel sure success will crown their efforts. The fruit and foliage I send you on the 17th inst. is that of Tender and True, and I think when you have seen it you will agree with me that the Cucumber disease is stamped out. [Certainly so for the specimen received is concerned. Eds.] *C. Bloxham, Gr. to Sir P. D. F. Duncombe, Bart., Brickhill Manor, Blechingly.*

Flowering of Phormium Colensoi.—Permit me to inform your correspondent, James Clelland, who inquires about the blooming and sending of Phormium Colensoi, that this handsome variegated plant was first introduced to me here in the summer of 1875, producing a spike of inconspicuous brown and green flowers, similar to those of the unvariegated kind, each horn-shaped tubular flower being filled to the brim with a species of exceedingly pungent resinous matter, and wasps. It did not flower, 'set or ripen seed, which was of little consequence, as seedlings of this plant come up, not as you say in your answer mostly green, but invariably all white or cream colour, and being devoid of chlorophyll cannot live. *W. G. Wood, Edgemoor, Queensland, Co. Cork, Ireland, May 13.*

Antipodal Hyacinths (see p. 591).—In reference to the zonals made in your last issue respecting the above, I beg to say that it is no new thing, as I have had one in my possession for the last quarter of a century, but simply under the name of Hyacinth of the modern style of make than what I have, as mine is of the upright, plain style, like the old-fashioned Hyacinth glass, but is 2 feet high without the bell, which is about 6 inches high, and this is taken off the zone, as it is used, as it is in fact, as a vase when not in use, which is the mode of cultivation I simply get a little moss and place at the base of the bell, to keep the soil, if you use soil, from falling through; unless you use all moss or cocoa fibre. Place the bulb in the centre close to the bottom, of course with the roots towards the inside, and then fill with the ingredients you use, placing the other bulb in the usual way, as in ordinary planting. You can then place them in the dark to rot, as is customary, and when they are sufficiently developed they can be placed in the vase, which is filled with water, and the one grown up and the other down. It is much the best to use bulbs both of one habit as near as you can, as sometimes one gets ahead of the other, and spoils the appearance. You can use both of one colour or different colours. The Narcissus answers quite as well to grow in them. The water will require to be frequently changed, as it is very apt to get green, and when it spoils the appearance, but a little charcoal is very beneficial in the water. A few gold fish would be of great use in the vase, and would excite a great interest, but that is according to taste. I like the style of the figure given in preference to the one I have, as it is more modern in appearance and looks handsomer, and would stand much sary. The object of the drawing is to show the arrangement of the drawing-rooms, &c., for a centre, and smaller ones on each side it looks very grand, in fact it is worth having all interested in the cultivation of the Hyacinth. *J. S. C.*

The Frost and the Fruit Crops.—Throughout the fine fruit gardens in West Middlesex the frost has proved very destructive to the Plum and Pear blossom, and of both the fruit the crop will be light. Plums had largely set, but the fruit were frozenthrough, and are fast falling; whilst three-fourths of the Pear blossom is literally blackened and useless. Cherries have not so largely suffered as the bulk of the blossom was not expanded, whilst Apples, unusually late, have almost entirely escaped. Gooseberries were largely favoured by an abundant leafage, but much of the fruit is injured, and will presently fall. Strawberries promise well, but few of the earliest blooms have suffered. Strawberries show a wonderful blossom, and the recent fine rains and general warmth may assist to produce a heavy crop of fruit. *A. D.*

Foxgloves.—The great improvement that has been effected in these during the last few years renders them very desirable plants to cultivate, especially where they can be accommodated with a tolerably open situation near woodland walks or semi-wild places, for either of which positions they are eminently adapted up to the summit of the garden, and here and there, as generally seen, they should be planted in large, bold masses, in imitation of Nature, who never scatters her treasures with a sparing hand, but is lavish and prodigal to an extraordinary degree, and the most beautiful flowers that we possess follow her teaching. Although Foxgloves will grow almost anywhere and in the poorest of soils, there is no comparison between them and such as are liberally treated, a striking instance of which was apparent here in the year 1876. In ground so prepared the ground reached the height of upwards of 7 feet, with huge spikes of flower as striking as they were beautiful. Any one, therefore, who would see them at their best should prepare for them in like manner, by breaking up the soil to a good depth at the particular spot it is intended to grow them, and, as they send their roots far down, to work in towards the bottom a good dressing of rotten dung, on which they will feed, and last double the length of time in bloom they otherwise would yield. In ground so prepared they should be sown in irregular patches, so as to be as informal as possible, and thinned out to distances of about a foot apart; or a better way will be to sow at once in light rows, and an stilling in the autumn, and in narrow rows, to stand till large enough to plant out, which they will be by the autumn, and sufficiently strong to bloom freely the following summer. By weeding out any inferior kinds, and saving seeds only from the best, more and most distinct, deterioration may be prevented; and if any showing superior qualities are cross-fertilised improved strains will be the result. Those we have were obtained from Ivery of Dorking, and so large and finely marked are the oldest varieties of Gloxinias, in which in form and general appearance they bear a close resemblance. *S. W.*

Verbenas: Store Pots.—Verbenas at this time of year, after so many croppings, may be said in many cases to be of little service for planting out, but if encouraged to grow when the striking season is over they will come in useful for furnishing cut flowers. Store pots of Verbenas turn out most profitable; when early in the spring they get a good shift like single plants in good strong soil, they then grow very much more luxuriantly. For keeping Verbenas, too, during the winter, it is a good plan to have a layer of good strong soil at the bottom of the cutting pots, as they often damp off from want of vigour. *Robert Mackenzie.*

The Weather in South Lincolnshire: Fruit for Prospects.—The thermometer ranged very low for the first eight days in May, viz.—May 1, 32°; cold with hail, wind N.; 2, 35°, cloudy, N.W.; 3, 30°, cold with hail, N.; 4th, 23°, cold with snow and hail, N.E.; 5th, 26°, clear, frosty, hail—N.E.; 6th, 24°, clear, frosty, hail—N.E.; 7th, 26°, clear, frosty, hail—N.E.; 8th, 28°, clear, frosty, N.E.; 9th, 35°, thunder, stormy rain, S.E.; 10th, 40°, stormy, thunder, lightning, with heavy fall of rain and hail; three-quarters of an inch fell in four hours. Pears, Cherries, and Plums were full, but few in hand; sufficient much; Apricots, where not well protected, are destroyed; early Potatoes cut down to the ground; early Peas are sipped; Asparagus making its appearance, all cut down; Box-eggs, young mow all in, and according to their hardness. Apples are not yet in bloom, and, as far as we can see, are safe, with an abundant show of bloom-buds. *D. Lumdin, Bloxholm Hall Gardens.*

Ivy.—Notwithstanding what Mr. Goodacre has said respecting Ivy tending to make buildings damp, I still affirm that it has quite the opposite tendency. I

lived in a house for eleven years which was completely covered with Ivy, and all the year round the soil at the base of the leaves was dry and hard, and the house was perfectly dry. Again, the stables here are some 20 feet high, and the walls are all covered with Ivy, and neither the horses, if they could, nor the men who sleep in the bedrooms over, have any reason to complain of damp in the building as dry as a chip. If the Ivy encourages damp, how does it come to pass that every April we exercise our fire brigade on the Castle, for the twofold purpose of washing out the gutters, and of drying and giving the plants a thorough soaking? The Ivy is a giving plant, and drinks up a quantity of moisture. All buildings should have a "damp course," to prevent the damp rising in the walls. It can be either lead, slate, cement, or a mixture of any of these, and is good for that purpose. Let this be attended to, and the spouting of the caves made perfect, and there will be fewer complaints about damp in buildings. I like to see the saddle put on the right horse, and therefore say—

7. "A rare old plant is the Ivy green."

7. *Rust, Erythra Castle.*

Weeping Beech Trees.—In the interesting account given by your correspondent "Rambler," of the Botanic Garden at Lewes, mentions the Weeping Beech as of large size. There is an extremely handsome tree of the same kind at this place. The trunk at 4 feet from the ground is 8 feet in circumference; the diameter of the branches 4 feet north and south, 74 inches east and west: this would give a circumference of about 240 feet. I am desirous of knowing whether this is a large tree of the kind, and I shall be obliged by your answer to 70 years' residence. *E. H. Mynnell Langley, Dorset.* [Certainly a fine specimen.]

Aerides crassifolium, Parish and Rehb. f.—I was very glad to see this charming plant referred to by Professor H. G. Reichenbach fil. in your last issue (see p. 599). Four years ago R. B. Dodgson, Esq., of Blackburt Fold, Blackburn, sent me a specimen of Mr. Whitehead, carefully lifted down a vigorous little plant growing in a basket suspended near the roof and showed it to me as one of the good things sent home by the "big white man," the Rev. Mr. C. P. Parish, and distributed by Mr. Stuart Low, I remember Mr. Whitehead handled the plant most carefully, and gave a start of joyful surprise when a young flower-stem was detected pushing its way from the axil of one of the twenty-five carmine or anemine-purple flowers which he exhibited at the Blackburn flower show on May 25, 1873, where it was much admired by myself, Mr. Gower, and other visitors. It appears quite distinct in habit from Lady Larpent's *Aerides* (A. falcatum). The flowers being larger, more richly coloured, and far more gracefully arranged on the spike. A. Houlettianum, a buff-intined form of the last-named species, exhibited by Sir Trevor Lawrence last year at South Kensington, is another distinct plant, and is known in English gardens as A. Mendeli; indeed, it was exhibited, and I believe certificated, under that name. My description of this plant, published in the *Garden* in May, 1873, will interest Professor Reichenbach, as he has so nearly we agree as to the affinity of this lovely plant.

"A robust and well-grown specimen of the rare species (*Aerides crassifolium*) has at last been flowered by Mr. Whitehead, gardener to F. B. Dodgson, Esq., of Blackburn, Lancashire. It has been called 'the best' which is very laudable, and, in fact, considering we have the noble A. Fieldingi, and the still more handsome and rare A. Schröderi. This new specimen is the Messrs. Low's importations, and is easily distinguished, even when not in flower, by its broad, thick leaves, and dense habit. Its flowers call to mind those of A. falcatum Larpente, being similar in colour and habit, but they are produced on a long, drooping spike. Their colour is also much deeper and more effective than that of the last-named species, being a soft, clear anemine-purple, shading off into white at the base of the segments. The petals and sepals, belonging to this species is similar to that found in the petals of *Phalenopsis Ludemanniana*, but they are twenty times as long on a spike. The plant will doubtless be exceeded as the plant develops itself. This *Aerides*, as has just been stated, is as yet very rare, but I think it clear, and reasonable to suppose, that it may be something superior to those of others, it is doubtless soon find its way into the most select collections." *F. W. B.*

The *Marchal Niel Rose*.—You did me the favour to insert in your number for May 6, 1876, an

account of my method of growing the *Marchal Niel Rose*. I am again adopted the same plan, with the exception of not having cut the fifty yellow *Roses* (of the two single shoots), most, if not all of which, have measured at least 5 inches across. The plant is now cut back to two single buds, each of which, I expect, will again grow to the usual length of 21 to 22 inches in the course of the present season. *Max Holburn, Herts, May 15.*

Protecting Peas with Paraffin.—Having seen in the *Gardener's Chronicle* a short time since a letter from one of your correspondents stating a way of protecting Peas from rats, mice, birds, &c., by coating the Peas for two minutes in benzoline before sowing, I acted on his advice, with the following result. I procured some good sound seed of Culverwell's *Profric* marrow, soaked them in benzoline for two minutes, and sowed them in the usual way. After watching them very carefully for some considerable time, to see if the mice or rats did trouble them, I found they did not interfere with them at all; which put out your correspondent's statement as far as mice and rats are concerned, but not one of which came up, and on close examination I found the Peas rotted in the ground. I write this in hopes it will save some of your readers from trusting to such a dangerous experiment. *R. W.*

Reports of Societies.

Crystal Palace, May 12.—The Crystal Palace on Saturday last presented a more than usually gay appearance—the occasion being the annual May show, and an display of plants much superior to any other that has been seen here for several years—a circumstance the more remarkable, inasmuch as only two prizes were offered for competition in each class, the directors, in the fit of economy that has so suddenly overtaken them, having disallowed the sums usually given as third and fourth prizes, though we believe that late in the day such prizes were awarded to those who deserved them. Another cause of complaint amongst the exhibitors was the non-provision of the usual breakfast, which was not given, though no doubt that effect had been issued, and some of the exhibitors, to be sure, endeavoured to remain at many hours through the usual passes being withheld. Such practices are mean, not economical, and can only be practised once with any effect. We believe the prevalent feeling amongst exhibitors is in favour of the system which provides third and even fourth prizes, the amounts, though small, contributing "something towards expenses"—a very heavy item when large plants are in question. In addition to the plants and cut flowers being of a much improved order of merit, we have to notice an improvement in the arrangement of the show, which met with the hearty approval of the visitors and exhibitors. For a number of years past the staging has been erected in narrow parallel lines down the centre and sides of the grand promenades on either side of the central transept, a plan which prevented anything like an effective arrangement of the subjects sent in for competition. On the present occasion all this was done away with, and instead four large broad sets of staging had been erected in the centre. These broad and rather low stages were admirably fitted at Saturday, and the general effect produced was a most decided improvement upon the old style.

FLOWERING PLANTS.—The display of flowering and fine-foliaged stove and greenhouse plants was especially good, and showed in considerable numbers. The leading class for flowering plants was that for nine open to amateurs, in which Mr. Chapman, gr. to J. Spode, Esq., Hawkesyard Park, Rugeley, came in 1st. The most noticeable subjects in this fine group were specimens of *Chorozeema Chandleri*, a bush about 5 feet over, and splendidly flowered; *Dracophyllum gracile*, about 4 feet through and well bloomed; *Bougainvillea glabra*, of about the same dimensions, and full of flowers; *Fimelia mirabilis*, a large well-flowered bush; *Erica odorata*, a plant about 3 feet through, and beautifully flowered—one of the most meritorious plants in the show; *Ixora coccinea*, a fine and profusely bloomed plant; *Anthurum Scherzerianum*, &c. The 2d prize went to Mr. B. Peed, gr. to Mrs. Tredwell, St. John's Lodge, Lower Norwood, who also staged an admirable group, conspicuous in which were a grandly flowered *Eparis Eclipse*, about 4 feet high and the same through; *Chorozeema Chandleri*, about 5 feet high and 3 through, well and evenly flowered; very good examples of *Clerodendron Bal-*

fourianum, *Imantophyllum miniatum*, *Azalea Exstrane*, and *Erica Cavendishiana*, together with admirably flowered plants, such as *Erica verticosa*, *Erica calycina*, and *Convolvulus*. Mr. Tudgey, gr. to T.F. Grosveold Williams, Esq., Henwick Grange, Worcester, came next in order of merit, having a capital lot of plants, which, however, were scarcely forward enough in bloom. The corresponding class for nurseries contained only one entry—that of Messrs. T. Jackson & Son, Kingston, to which the 2d prize only was awarded, the plants being much behind time in the development of their blossoms. The amateur class for six, was won by Messrs. T. Turner, Garbidge Hill, Ewell, who were bracketed equal 2d. The form had good-sized, well furnished, and admirably flowered specimens of *Erica verticosa coccinea* minor, *Clerodendron Balfourianum*, *Ixora coccinea*, *Erica eximia* superba, *Chorozeema Chandleri*, &c.; and the latter equally fine examples of *Erica dentata*, *Azalea coccinea*, *Clerodendron Balfourianum*, *Darwinia tulipifera*, and *Aphelisis macrantha purpurea*, &c. Mr. B. Peed contributed amongst others the specimens of *Azalea coccinea*, *Clerodendron Balfourianum*, and a beautifully flowered bush of *Eriostemon pulchellum*, about 5 feet high and 4 feet through. In another group, shown in the same class by Mr. Bristow, gr. to G. Campbell, Esq., Woodhall, South Walsham, the plants were of a more three spikes, and a fresh, nicely flowered ball-trained plant of *Euphorbia splendens*—not a frequent visitor at flower shows now-a-days.

The open and amateurs' classes for eight and six *Heaths* respectively were well contested. In the amateurs' class, the 1st prize in the prize list was taken by Mr. G. Legg, gr. to S. A. Kalli, Esq., Cleveland House, Clapham Park, who appears to be as much at home with *Heaths* as he is with fine-foliaged plants and carpet bedding. The plants which he staged in this class were of a most excellent even size, clean and vigorously grown, and thoroughly well flowered, the varieties being *E. insignis*, *depressa*, *Caodollanea*, *Victoria*, *Cavendishiana*, and *tuberosa*. The second prize went to Mr. Tudgey, who had a capital lot of plants fully in flower, and in the case of a specimen of *E. elegans*, which was very fine. A well-flowered but unevenly-matched group came from Mr. Peed, the best being examples of *E. eximia* superba, *persepolis*, and *monticola*, &c. The open class for eight brought out Messrs. T. Jackson & Son, Mr. Peed, and Mr. Legg, who stood in the order of merit as named. The Kingston firm had large and nicely-flowered plants of *E. depressa*, *affine*, *viridis*, *ampullacea*, *obovata*, *Eximia*, *viridis*, *Wilsoni*, and *perspicua* nana. Almost equally good were the specimens of *E. verticosa grandiflora*, *elegans*, *Cavendishiana*, *eximia superba*, *verticosa coccinea* minor, &c., from Mr. Peed. Mr. Legg's plants were small but splendidly flowered, and an extra prize was awarded to them.

AZALEAS have not been so well shown for some time, being represented here both in considerable numbers, and generally in grand condition. The leading exhibitor of *Azaleas* at the present time, Mr. Ratty, gr. to T. Turner, was the successful competitor for the 1st prize in the open class for nine, and the amateurs' for six, with a splendid lot of plants. In the first-named class Mr. Ratty showed plants from 5 to 6 feet in height and 4 feet through, perfect cones of richly-coloured plants, such as *Azalea coccinea*, *Victoria*, *Georgiana*, *Model*, *Beauty of Europe*, *Eulalie Van Geet*, *Holloriana*, *Dac de Nassau*, *Mrs. Fry*, and *Criterion*. Mr. James Child came in 2d with a group of somewhat smaller plants, profusely bloomed. Mr. Turner turned the tables on the exhibitor who was awarded to Mr. Turner for a capital lot of standards. In the amateurs' class Mr. Ratty staged a set of standards of immense size and almost flat-headed, the leading show being *Kingstonia*, *Victoria*, *Eximia*, *viridis*, *Wilsoni*, *perspicua*, *obovata*, *Coquette de France*, &c. Mr. B. Peed, who was 2d here, also showed well; and in a group from Mr. J. Bristow we noticed a charming cone about 5 feet high of *Azalea sinensis* alba. Mr. Turner turned the tables on the successful amateur in the class for twenty in 9-inch pots, showing an evenly matched, well flowered lot of half specimens, conspicuous amongst which for their brightness of colour and general excellence being *Apollo*, *Eugenie Marci*, *Chorozeema Chandleri*, *Souvenir du Prince Albert*, and *Mons. Cavellier*, &c.

ORCHIDS were not represented so well as usual, either in number or quality. Mr. B. S. Williams amongst many others, was the exhibitor of the best order named, *Azalea*, which had *Vanda tricolora* insignis, with three spikes, and *Bombia macrantha*

promptly and courteously replied to my letter to him that he sent me a fragment of a dissected plant. I have examined and compared it carefully with *Urocytis colchici*, and arrived at the conclusion that Dr. Farlow had some justification for his opinion that it was distinct. The spore masses are rather smaller, and darker in colour. When the spores of the two species are mixed together upon a glass slide and placed under the microscope the spores appear to be distinguished with facility, so that there is really an appreciable difference between them. Notwithstanding this, I am of opinion that the differences are of a doubtful character, and that the spores may be distinguished by local influences, and external conditions generally. Whilst Dr. Farlow would regard it, somewhat reservedly, as a new species of *Urocytis*, I should think it should term it *Urocytis colchici* var. *capitata*. It raises the old question of limitation of species, and upon this it is unnecessary to enter. Let each man be persuaded in his own mind.

New Variety of Mushroom.—Mr. Worthington Smith exhibited a drawing, with dissections, of a new and apparently very distinct variety of the common Mushroom. The original plants were grown on shelves by Mr. John Walker, of Thame, near Oxford. Mr. Smith stated that the plants in question differed in several important points from the ordinary Mushroom, the most striking being the presence of bold, white, cloth-like flukes on the top, after the manner of *Agaricus muscarius*, but without patches of green, and the remains of a white cloth veil, which completely enveloped the young plants in infancy, after the manner of the members of the subgenus *Amanita*, to which *Agaricus muscarius* belongs. This is foreign to *Peziza*, to which the Mushroom belongs. Mr. Smith expressed his belief that the new plants were hybrids between the Mushroom and some other *Agaric* at present unknown. In the new edition of the *Agaricæ*, there is a *Peziza* which has a new variety of *Agaricæ*, close to the common Mushroom, and named *Clotiosa*. This sub-genus is distinguished by the presence of a universal veil, distinct from the cuticle of the pileus, analogous with *Amanita*, and agreeing with it in its shape, with the new variety of Mushroom in question. The flesh of the Thame Mushroom changes to faint rose or yellowish sienna (at length darker) on being cut or broken. The edges of the crowded gills are at first white, at length brownish, and finally black. The spores feel the same size as, but paler in colour than, those of the ordinary Mushroom. The whole plant is very fleshy, somewhat dry, and with a powerful odour; stem hollow, with a distinct pile.

It is a Mushroom of the first class, and the table.

Grafted Cherry Tree.—The same gentleman showed a drawing of a singular grafted Cherry tree, now growing near Harpenden. The point of attachment between the stock and scion is 7 feet from the ground line; the smooth stock (wild Cherry) is upwards of 3 feet in circumference, whilst the gnarled and rugged scion is more than 6 feet in circumference. The sudden disparity in size of the stem gives the tree an extraordinary appearance.

Malformed Primroses.—Dr. Masters showed specimens of malformed Primroses, which had been referred to him at a previous meeting, as well as others which he had since obtained from Miss W. de Beccles, and their correspondents. The changes in these were numerous and interesting, the most remarkable consisting in the change of stamens into carpels, the anthers bearing ovules instead of pollen. In some instances the stamens were lobed or divided, some of the lobes bearing ovules, while others were rolled round into secondary carpels, with distinct styles and stigmas. Dr. Masters made some remarks on these flowers, as illustrating the peculiarities of the structure of Primulacæ, due, as he considered, to the presence of choripetalous stamens, while the petals become doubled or many times repeated by splitting, the stamens also split off from the petals, and the placentas detached in like manner from the carpels; and exhibited drawings of the flowers made by Mr. Worthington Smith. Mr. G. Fenelon also showed drawings made from similar flowers, and made some comments on the singular changes presented. A fuller account of these remarkable flowers will probably be published on another occasion.

Malformed Calceolarias.—Dr. Masters showed a drawing of the malformed Calceolarias shown at the last meeting by Mr. F. W. Burbidge. The chief peculiarity consisted in the formation of a flattened, petal-like lobe at the junction of the filament with the anther.

Hermaphrodite Flowers of *Capsella Luvoniana*.—Dr. Masters exhibited drawings of an autogamous one of *Capsella Luvoniana*, specimens of which were not examined by Sir Syms, of the Elvston Nursery. In the same spike the lower scales bore anthers, while the upper bore ovules. One of these scales bore on its outer and lower edge two anther cells, and on the centre of its inner surface a solitary stalked erect ovule.

in the chair. With a large exhibition at the Crystal Palace on the previous Saturday and another one at Regent's Park on Wednesday, it was not to be expected that much would be shown here to-day, and such proved to be the case. The principal contributions consisted of a small group of the Roses from Messrs. Girdle, Veitch & Son, and a pair of half specimen Azaleas from Mr. Charles Turner, and a nice collection of stove and greenhouse plants from Messrs. Cutbush & Sons, Highgate. The Roses shown by Messrs. Veitch were all half specimens, well-grown and nicely flowered, the sorts best represented being *Baronne de Rothschild*, *La France*, *Madame Lacharme*, *Alfred Cochard*, *Captain Christy*, *Alpha Rose*, *John Hopper*, *Duke of Edinburgh*, *Charles de Beek*, *Duc de Nassau*, and *Comte de Paris*. A silver medal was awarded for the group. The same firm also sent a fine lot of plants of the new creamy white *Hydrangea*, *Thomas Hogg*, which appears to be a strong grower, and certainly throws large trusses of flowers. Also four new varieties of *Azalea mollis*, one of which, named *Coerule de Paille*, a free flowering plant, with straw-coloured blossoms, to which a First-class Certificate was awarded. *Aurantiacum* and *Flaberrima* have orange and white, and the *Comer paille* is white with yellow base. *Dracena Robinsoniana*, also shown by Messrs. Veitch, is an upright growing plant, with green and crimson and yellow striated leaves. This was also awarded a First-class Certificate. The *Fuchsia* *Comer paille* was awarded for the fine group of *Azalea* above alluded to, and which contained amongst others beautifully-flowered and finely-colored examples of *Souvenir du Prince Albert*, *Roi Leopold*, *Charles de Beek*, *Duc de Nassau*, and *Comte de Paris*. Mr. Turner, and the beautifully-colored new *Jean Vervaeke*, &c. To Messrs. Cutbush & Son a silver medal was voted for the group of stove and greenhouse flowering and fine-foliated plants, containing a number of the most favoured ones, and which are now rarely seen. Among them were nicely-flowered plants of the pretty Australian *Hypocylonia robusta*, *Erica reginiana*, *Boronia serrulata*, *Erica mirabilis*, *Correa cardinalis*, *Erica persulcata* alba, a nice flowering species, with small white blossoms; *Chorozema Henchmannii*, &c. Sir Trevor Lawrence, Bart., M.P. (Mr. Spyners grower), received a First-class Certificate for *Ocandium crispum marginatum grandiflorum*, a very large-flowered variety, as its name implies; a *Calla* *Albiflora*, a plant of the same genus, with white, spiky, of *Ocandium* *triumphans superbum*; and a botanical Commendation for *Hoelleia Lowiana*, a singular-shaped, lemon-yellow-colored and sweet-scented Orchid, described at p. 484, vol. ii., 1874, and p. 154, vol. iii., 1876, in *Solms-Laubach's* *Botanische Mittheilungen* by the late Albert Bruchmüller, who sent the stock to Mr. Low; and *Ocandium metallicum*, "a surprising novelty," described by Professor Reichenbach, at p. 394, vol. v., 1876. The same gentleman also showed a specimen of *Ocandium* *triumphans superbum*, a remarkably vigorous and healthy plant, with three spikes of splendidly colored flowers, of *Cattleya Schilleriana*, a rare plant, and one that is generally considered very difficult to grow; and a specimen of *O. citroscentum* roseum, with very delicately colored flowers.

Messrs. William Paul & Son, Pall's Nursery, Waldham Cross, sent half-a-dozen boxes of cut blooms of *Roses*, containing many fine flowers, to which a bronze medal was awarded. H. J. Elwes, Esq., Preston, Cirencester, was awarded a First-class Certificate for *Cypripedium candidum*, with a white slipper-shaped lip, yellow staminoide, and bronze-colored sepals and petals, with a delicate odour of a very distinct and pleasant character. A specimen of *Tulipa undulatifolia*, dark scarlet; *Calceolaria crenatifolia*, bright canary-yellow; and *Eilseena longipetala*, white, and *Cypripedium candidum*. Mr. Oberlander, of Sir R. W. Feek, M.P., sent a very distinct *Arctostaphylos orthoceras*; and J. D. Llewellyn, Esq., Penllegre, Swansea, sent cut flowers of a Sikkim *Rhododendron* from the open air. To Mr. Cannell, The Nursery, Swatley, a vote of thanks was accorded for a dozen bunches cut from a small group of new Clematises, which included the following varieties:—*Undine*, double, rose purple; *Milla*, Torriani, single, rose pink; *Madame de France*, fine size; *Margaret Dunlop*, lavender-blue, and fine size; *Xerxes*, large deep bluish purple, and the President, a large plum-purple flower, with a pale bar. Mr. Wills received a bronze medal for a small group of *Antirrhinum* in variety, and a similar one was made to Mr. Mayo, Com Market Street, Oxford, for two boxes of beautiful cut blooms of the *Marchal Niel Rose*. From Mr. R. Dean, Kanelagh Road, Faling, came a small group of plants, which included a very fine specimen of a very distinct and healthy cut flowers of *Saxifraga granulata* fore-flores, one of the very dwarf and pretty white *Veronica repens*, the distinct *Viola pedata*, *Sempervivum Boissierii*, a bronzy leaved distinct form; and *Polyanthus Vulcan*, a very dark velvety black flower with bright golden centre.

FRUIT COMMITTEE.—H. Webb, Esq., in the chair. The only subjects that came under the notice of the committee to-day were a brace of *Tender* and *True Cucumbers*, sent by the raiser, Mr. Jas. Douglas, of F. Whitburs, Esq., to show that they were the same plant, and indeed the same branch, they will vary in the length of the neck; an excellent dish of *Grosse Mignonne Peaches*, from Mr. Samuel Jenks, of G. D. Lynam, Esq., Brambley, Esq.; *Gristed*; specimens of *Ward's Longford Hybrid*, in the style of *Scarlet Gem*, but no improvement on it, from Mr. Ward, of the Earl of Rudon, Longford Castle; a so-called white American Cucumber, more resembling *Ward's Longford Hybrid*, sent by Mr. J. Wright, Esq., Osmaston Manor, Derby; and several seedling Cucumbers of no particular merit from the same gentleman. Votes of thanks were accorded to all.

Royal Botanic. *May 16.*—The first summer exhibition of this Society was held in the large marquee in the Society's gardens on Wednesday last, and it has seldom been our lot to attend a more successful one. The show tent, with its grass-green covered slopes and undulating forms, and its roof to most of our readers—was filled to overflowing with an admirable selection of the usual subjects that come in for exhibition at this season. If the exhibition be, comparatively speaking, a poor one, and if it looks like a show of flowers, it must leave our readers to imagine what the display to-day, which was really admirable from whatever point it was looked at; and Mr. Coomber, the garden superintendent, must be congratulated on the happy results of his gathering from various compartments and miscellaneous collections sent in. We can only regret that the exhibition was not seen by so large a number of visitors as it deserved to be, in consequence of the rain and the unfavourable weather—most unpropitious for a flower show, drenching showers of rain falling at frequent intervals throughout the day. As was to be expected, a number of the plants shown to-day had also appeared in many of the competitions held at the Crystal Palace, but, last, but not the least, the cool, sunless weather had been favourable to the preservation of their flowers, and none of them looked any the worse for their visit to Sydenham.

STOVE AND GREENHOUSE FLOWERING PLANTS were admirably shown, especially in the amateurs' class for ten, in which Mr. Chapman, gr. to J. Spode, Esq., Hawkensyard Park, Rugeley, came in first; Mr. B. Peel, gr. to Mr. Tredwell, Lower Norwood; and Mr. H. G. Peck, gr. to Mr. H. G. Peck, Esq., Henwick Grange, Worcester, 3d. The plants staged were with few exceptions the same as those shown at the Crystal Palace, and therefore need not be further alluded to. That the class was, however, a good one may be gathered from various examples of *Ademanda fragrans*, *Darwinia tulipifera*, and *Eriostemon lineofolium*. The nurseryman's class for twelve included collections from Messrs. T. Jackson & Son, Kingston; Mr. B. S. Williams, Holloway; and Mr. J. Peck, Roupell Park Nurseries, Norwood; and the prizes went in the order named. The most remarkable specimen in Messrs. Jackson's group were of *Darwinia tulipifera*, *Rhododendron formosissimum*, a very distinct *Arctostaphylos orthoceras*, *Azalea Baron de Veitve*, &c. Mr. E. Tulge had the finest half dozen amongst amateurs, which comprised a very well flowered and fine specimen of *Erica elegans*, a remarkably good *Darwinia tulipifera*, *Azalea Cochard*, *Erica verticillata magnifica*, very good; *Anthurium Scherzerianum*, and *Aphelax macrantha rosea*, the last-named not being quite out. Mr. Chapman took 2d honours, with a very fine lot selected from his group of plants for Saturday. G. Legg, gr. to S. A. Ralli, Esq., Cleveland House, Clapham Park, was 3d, with beautiful young specimens of *Darwinia tulipifera*, *Erica Cavendishiana*, *Epacris Elchiae*, *Allamanda grandiflora*, *Croton*, *Croton Balfourianus*, &c. and an extra prize was awarded to Mr. James Child, gr. to Mrs. Torr, Garbond Hill, Ewell, the most showy of his plants being *Bougainvillea glabra*, *Azalea concinna*, and *Darwinia tulipifera*. In the corresponding class for amateurs, Mr. G. Legg was 1st, Messrs. T. Jackson & Son were again placed 2d, and Mr. B. S. Williams 2d.

Roses have seldom, if ever, been shown better by either Mr. Turner or Messrs. Paul & Son, Chesham, than they were by these renowned growers to-day.

Mr. Turner especially was in grand form, winning the 1st prize in each of the three classes devoted to the ever-popular flower, with specimens as regards size and beauty—like those which have never been seen before. The Cheshunt plants were but little indeed behind those which gained the 1st prizes, being in all respects marvels of cultivation—of which any grower would be proud to have the open class for six Mr. Turner was with a magnificent lot, the largest plant of all being one of Paul Ferns, from 6 to 7 feet high, and about 5 feet through, with splendid foliage and a superb lot of buds. Next in importance was a fine glass bush of Edward Morren, about 4 feet high and 6 feet through, and most profusely flowered—and such flowers—the finest Edward Morren we have yet seen. The other specimens, also, were good. Messrs. J. and S. Duke of Edinburgh, G. Forster, and Paul Verdier, Messrs. Paul & Son's group, which came in 2d, consisted of large and exceedingly well-flowered bushes of Edward Morren, Victor Verdier, Docteur Andry, Celine Forestier, John Hopper, and Charles Lawson. It is hardly to be expected that amateurs should make a good fight with the nurserymen; nevertheless, the third prize in this class was taken by an amateur—Mr. Moorman, gr. to the Misses Christy, Coombe Bank, Kingston, who put up a capital lot of well-bloomed plants. Next year we propose to set a class for six Roses confined to amateurs. In the nurserymen's class for nine, Mr. Turner's 1st prize group consisted of large and very fresh plants, clothed with beautiful foliage and thoroughly well flowered. The winners on a first-class basis were, in descending order, as also were those on a grand bush of Miss Ingram. Juncos, Victor Verdier, Maréchal Vaillant, Charles Lawson, Midlle, J. Levett, M'delle, Victor Verdier, and La France, were also very good. Messrs. Paul & Son were 2d, and had a fine group of well-flowered specimens of Elis Morel, Horace Vermet, Marquis de Castellane, John Hopper, President, Marie Baumann, Dupuy Jamin, and La France. In the class for twenty in 8-inch pots the same order of merit was observed, both growers showing remarkably well.

AZALEAS were in excellent form, and by their size and brilliancy of colour added much to the general effect. The 1st prize for six went to Mr. Ratty, gr. to R. Thornton, Esq., The Hoe, Sydenham, who showed the best specimens he had at the Crystal Palace on Saturday, and they were still in very fine order. Mr. James Child was a good 2d with large and particularly well-flowered clean and fresh specimens; and Mr. G. Wheeler was 3d. In the second round of the competition, the plants which Charles Turner was 1st, showing a splendidly flowered group of dwarf standards with large-sized heads. The specimens of Duc de Nassau and Comtesse de Flandre were densely covered with magnificent blossoms. For six in 12-inch pots Mr. Turner also came in 1st, with a beautiful lot of standards and pyramids of medium size, and all finely bloomed. Grandis, Charmer, Mons. Thibaut, Roi de Holland, and Duchesse de Flandre were the best of the brightly coloured ones, and Apollo the finest among whites. Mr. Ratty was a good 2d. For six in 12-inch pots Mr. Ratty came in 1st again, with a very good group of small pyramids, thoroughly well bloomed, especially the specimens of Roi des Doubles, and Duchesse Adelaide de Nassau; and Mr. G. Wheeler was 2d with medium-sized and beautifully flowered examples of Elegantisima, Model, magnifica, perfecta elegans, Leopold I., and Criterion; 3d, Mr. James Child.

THE HEATHS were in excellent form, as we have seen them here. Only one group of twelve was shown in the nurserymen's class, and to that, which came from Messrs. T. Jackson & Son, and consisted of medium-sized, nicely-flowered plants of well-known sorts, the 1st prize was awarded. The best of the brightly-flowered plants were staged in the open class for six in which Mr. G. Legg came in 1st, Mr. B. Peck 2d, and Mr. G. Wheeler, 3d. For twelve in a class confined to amateurs, Mr. G. Legg also came in 1st, with a fresh, clean, and neatly grown set of plants of medium size, mostly very well flowered; E. Victorine Lindleyana, depressa, insignis, Candolleana, and Cavendishiana, Mr. B. Peck being a good 2d, and Mr. E. Tudgey, 3d.

THE PALMS were fairly presented as to numbers, as well as in quality. For 1st prize for six in the division confined to amateurs was won by Mr. E. Tudgey, who had large plants of *Alphosia australis*, *Dicksonia antarctica*, and *Cyathes dealthata*, and smaller but very good ones of *Davallia Mooreana*, *Adiantum polypodioides*, and *Gleichenia*. For six in the nurserymen's class Mr. Wheeler was 2d. The nurserymen's class for six brought Mr. B. S. Williams to the front with large and very fresh plants of *Davallia Mooreana*, *Gleichenia rupestris*, and *Asplenium Clivii*; and also *Cyathes dealthata*, *Dicksonia antarctica*; 2d in the same class was Mr. J. H. Ley, with a very unevenly matched set, consisting of tall specimens of *Alphosia Van Geertii* and *Dicksonia antarctica*, a fine fresh plant of *Neottoptis australis*, a good *Davallia Mooreana*,

a half specimen of *Gleichenia dichotoma*, and a small plant of *Platyercium alaicorum*.

THE FOLIAGE PLANTS were admirably shown, and provided abundant material for creating strong contrasts with the flowering subjects. Mr. G. Legg, gr. to S. A. Ralli, Esq., Clapham Park, came in an easy 1st amongst amateurs for six with a remarkably fine group, which consisted of a tall specimen of *Peperomia*, *Dioscorea Shepherdii*, splendid bushes of *Crotons Weismanni* and variegatus, and a noble young *Stevensoniana grandifolia*, &c.; 2d, Mr. E. Tudgey, with a good selection from his Crystal Palace group; 3d, Mr. H. Hill, gr. to H. C. Taylor, Esq., Clapham Park. For six in the nurserymen's class Mr. B. S. Williams was 1st with a notable plant of the distinct *Cycas Armstrongii*, and large, well-furnished examples of *Caladium Bronngiartii*, *Maranta Veitchii*, *Dasylium acrotichium*, *Croton pictus*, &c. In the corresponding class for nurserymen, Mr. B. S. Williams was 1st amongst nurserymen with a large and very fine *Cycas circinalis*, a remarkably good *Chebearopsis humilis*, large, well-furnished and brightly coloured plants of *Crotons Weismanni* and *Youngii*, and handsome specimens of *Pandanus Veitchii* and *Dasylium acrotichium*; and Mr. John H. Ley, who had large and finely coloured *Crotons variegatus*, and *angustifolius*, a very good *Alocasia Lowii*, *Cocos Weddelliana*, &c., was 2d. In the open class for six Mr. G. Legg was 1st with a group of which Mr. J. H. Ley came in 1st with an interesting assortment, most noticeable amongst which were *Cycas revoluta* and *circinalis*, *Dion edule*, *Yucca filamentosa variegata*, *Zamia Lindenii* and *duplata*, *Agave filifera*, *Spathoglottis*, and *Strobilanthes* came in 2d, including such subjects as *Agave densiflora*, showing for flower, *Salmiana americana variegata*, *Geminiifolia filifera*, *aloifolia variegata*, and *univittata*; various species of *Cycas* and *Encephalartos*.

THE ORCHIDS, as usual, made a very effective display on the slope usually devoted to them. Mr. Denning, gr. to Lord Londesborough, came in 1st in the amateurs' class for six, with *Odontoglossum citreolum*, with three fine spikes; *Cattleya superba*, with four richly coloured flowers; *Dendrobium Parishii*, with four beautiful spikes of delicately coloured blossoms; *Aerides Veitchii*, with one spike; *Odontoglossum Pescatorei*, with five nice spikes; and *Odontoglossum Roezlii*, with fourteen good flowers. For six in the nurserymen's class Mr. G. Legg was 1st, and splendidly flowered *Oncidium ampliatum majus*, *Cypripedium Stonei*, with four very fine flowers; a good specimen of *Cattleya Mossie superba*, &c. Mr. F. Newman, gr. to W. J. M. May, Cr. Market Street, Oxford, was 2d, with 3d, showing nicely flowered specimens of *Dendrobium Falconeri* and *Wardianum*, a very good *Phaleonopsis Luddemanniana*, *Cypripedium Stonei*, and *niveum*. Mr. H. Heims, gr. to F. A. Philby, Esq., Avenue Road, Regent's Park, showed half-dozen, which included a large and admirably flowered specimen of *Dendrobium densiflorum*, and was awarded an extra prize. In the nurserymen's class, Mr. B. S. Williams was 1st with a fine fresh group, including *Cypripedium niveum majus*, with five spikes; *Odontoglossum Pescatorei*, with two spikes; *Oncidium Marshallii*, very good; *Vanda suavis*, with four beautiful spikes; a fine *Dendrobium densiflorum*, and a good pan of *Cypripedium niveum*. Messrs. Jackson & Son were a close 2d, showing fine dry-flowered plants of *Vanda suavis*, *Odontoglossum citreolum roseum*, a beautifully coloured variety; *Cattleya Mossie superba*, and *Saccolabium tuberosum*, with six good spikes, &c. Mr. H. Heims, 3d, with *Vanda*, *Avenue Road*, Regent's Park, showing half-dozen, and was awarded an extra prize.

SHOW PELARGONIUMS, in the absence of Mr. Ward's famous specimens, did not show up so well as usual, and, as regards competition, there was none, only one exhibitor appearing in each of the three classes. Mr. G. Legg, gr. to W. Watson, Esq., Clapham Park, had the 1st prize for nine, his plants being from 2 to 3 feet across, very neatly grown, and full of flowers, not yet, however, at their best. Mr. James was also awarded the 1st prize in the amateurs' class for six with a fine group of half-dozen plants, which gained the 1st prize for Mr. Turner in the nurserymen's class were a little more forward in bloom, but not so good as specimens as Mr. James' plants. *Isabella*, *Maid march*, &c. were the best of the varieties staged, and they are all good in form and colour. Mr. James also secured the highest award in the class for nine *Calceolarias*, with very nice plants about 15 inches over, with plenty of fine-sized flowers. For six in the nurserymen's class Mr. G. Legg was 1st, with a group of nine *Calceolarias*, with 2d. Old-fashioned hardy herbaceous plants, i.e., plants that were introduced previous to the commencement of the present century, were represented by a solitary specimen shown by Mr. Robert W. Terry, Esq., Peterborough House, Fulham, to which the 1st prize was awarded. The plants shown were *Silla campanulata* and its white variety, *Abrietta deltoidea*, *Narcissus poeticus*, and *Iris germanica*.

NEW PLANTS were not shown in such great numbers as we have seen them at previous summer exhibitions here. The principal Certificates of Merit were awarded to Messrs. Low & Co., Clapton, for *Dendrobium suavisimum*, a very fine new species in the style of *D. Cambridgeanum*, the flowers being of a bright orange colour, and the fringed lip blotched with dark crimson; to Messrs. J. and S. Duke of Edinburgh, for *Lomaria discolor* var. *pinnatifida*, *Dracena terminalis alba*, *Aralia filifolia*, *Adiantum Williamsii*, *Microlepis antirrhifolia*, and *Croton Andreanus*, the veins of whose broad elongated leaves are picked out by a reddish brown colour margined with yellow; to Mr. Anthonir Brownii; to Messrs. Bell & Sons, nurserymen, Norwich, for *Adiantum Capillus-Veneris* var. *corymbiforme*; to Messrs. E. G. Henderson & Son, for *Blandfordia flammea* var. *elegans*, whose large flowers are of a reddish brown colour margined with pale yellow; and to Messrs. William Rollinson & Son for *Azalea indica Rollinsonii*, a very dwarf and free flowering "hardly Japanese plant," the flowers of which are double, and of a soft rose pink colour. Floral Certificates were awarded to Messrs. George Jackson & Son, for *Clematis Lady Egmout*, a fine eight-sepalled flower, white, shaded with mauve, in colour; and for *Clematis Shode*, also a large and perfect eight-sepalled flower, of a bright satiny mauve colour margined with a lighter shade of mauve, and to the C. *linguata* type, and are free and vigorous growers. To Mr. Noble, Bagshot, for *Clematis Xerxes*, C. Margaret Dunbar, and C. Midle, Torriani, and to Messrs. E. G. Henderson & Son, for *Mimulus cardinalis*, a very fine plant, with flowers of a bright blue blotched with crimson. A striking new *Petunia*, named Mount Beauty, was shown by Mr. Kingsbury, Bevois Valley Nursery, Southampton. The flowers are about 3 inches across, and have a wide, open, fluted throat, with a lighter colour and a centre filled with very purple, the prevailing colour of that part of the flower which surrounds the throat. It is evidently a strong-growing and free-flowering variety, and certainly very distinct.

THE MISCELLANEOUS CLASS was, as usual, a very extensive and important one, many varieties being shown which the schedule does not otherwise provide for. The four half-circular sloping banks which flank the centre of the show tent were filled with collections of plants contributed by Messrs. James Veitch & Sons, Mr. G. Legg, Mr. J. H. Ley, and Mr. B. S. Williams. Mr. J. H. Ley. The first-named firm filled two of these slopes, the first and the most effective one being composed of dwarf forced *Rhododendrons* and *Ghent Azaleas*, the brilliant colours of which were admirably set off by plants of *Campanula*, *Primula*, and *Japanese Maples*. The second slope occupied by the Chelsea firm was filled with a similar group of half-specimen Roses to that shown at South Kensington on the previous day; and being margined with Japanese *Acer*, with a very white and cheerful effect. The group from Mr. Williams was also remarkably attractive, being composed of good specimens of various *Palms*, *Dracenas*, *Cycads*, and *Tree Ferns* at the back, with such flowering subjects as *Orchids*, *Veronica*, *Geraniums*, and *Campanulas*. The *Orchids* the most noticeable were *Cattleya Mendellii*, *Dendrobium crassinode*, *Barberiana*, *Oncidium leucochilum*, *Odontoglossum gloriosum*, *Oncidium sacodes*, *Cypripedium acule*, &c. Other good plants also here represented were the fine hold-leaved *Anthurium crystallinum*, several of the elegant new *Aralias*, *Crotons*, dwarf *Palms*, *Agaves*, and such-like fine-leaved subjects. The Forest Hill group, which occupied the third slope, consisted mainly of neat specimens of handsome-leaved plants, such as *Palms*, *Dracenas*, *Aralias*, *Caladiums*, and *Bicolor Pelargoniums*, &c. This collection occupied the slope conjointly with a small group of new and rare *Fortifolia* plants, and a group of *Leaves* of the large show tent we came across a miscellaneous group of stove and greenhouse plants, from Mr. G. Wheeler, gr. to Sir Francis Goldsmid, Bart.; another group of *Rhododendrons* and *Ghent Azaleas*, and a group of *Orchids* and *Campanulas* from Messrs. James Veitch & Son; an attractive collection of forced *Rhododendrons* and stove and greenhouse plants, from Messrs. James Cutbush & Son; a large collection of *Orchids* and *Campanulas* from Messrs. J. and S. Duke of Edinburgh; a group of new and rare flowered *Musk*, from Messrs. Harrison & Sons, Leicester; a small group of new *Clematises*, from Mr. Noble, Bagshot; an exceedingly fine collection of hardy herbaceous plants, from Mr. R. Parker, Tooting; a group of new and rare flowered *Musk*, from Messrs. May & Co., Cr. Market Street, Oxford; a showy collection of alpine *Auriculas*, and two boxes of cut flowers of brilliantly coloured *Tulips*, from Mr. Turner; and a nice group of *Azaleas*, from Messrs. Ivory & Son, Dorking. To most of these subjects extra prizes were awarded.

SUNK FLOWER-BEES.—In small Villa gardens, where any variety in the common arrangement is acceptable, a little circular flower-bed sunk in concave form to the tiniest possible central pool, instead of being raised in the usual convex mound, has a very good effect. For the little pool (if nothing better offers) a small tub, or a piece sawn off the end of an old cask, and well sunk in the ground, answers excellently, of any size that may be liked—a couple of feet across, and about 10 inches or a foot in depth, is a convenient measurement.

With a little care the plants, and any picturesque rock-like pieces of stone, or burl, may be arranged round this, so as to give the appearance of a natural cistern; the small quantity of water is useful as being always at hand, warmed, and aired for special needs; whilst the constant emptying and refilling, easily managed by a few buckets of water, keeps the tiny pool in order.

The slightly sunk position, with its moist air and protection from drying draughts over the roots, appears to suit many plants perfectly, and gives a picturesque "bit" of natural grouping of water, rock, and varied landscape, which is always attractive in itself, and with care it is always (except in the dead of winter) bright with some flowers.

Crocuses and Hyacinths of different kinds, first with flowers and then with foliage, look well amongst the stones; Irises, double Calchas (a most effective and permanent plant), hard Ranunculi, low Damask Rose bushes, Campanulas, S.weet Williams, and endless old favourites according to taste, succeed in date of flowering; and their foliage bending over the pool, or standing up in rich luxuriance, is always ornamental.

As the brown tint of the withering leaves of the balls is not an eyesore amongst the few morsels of rock, they may be allowed to pass quietly away, and any bright temporary flower planted by the side reveals the spot. But however it may be arranged, the little sunk bed is usually a favourite spot with visitors, and a great convenience to its amateur owner.

- May 10—A fine day, cloudy, cool breeze.
- 11—Overcast and dull till 1 P.M. Fine, bright, but cloudy after.
- 12—Cloudy and dull with occasional rain. Thunder heard in rain.
- 13—Dull morning, very dark at times. Occasional light rain till 1 P.M. Fine after P.M.
- 14—A dull overcast day, frequent thin rain.
- 15—Dull with frequent thin rain till noon. Fine and bright till 4 P.M. Cloudy after.
- 16—Dull, with frequent showers of rain. Fine and bright at intervals.

LONDON: Baromet.—During the week ending Saturday, May 12, in the vicinity of the metropolis the reading of the barometer at the level of the sea decreased from 29.86 inches at the beginning of the week to 29.50 inches by the afternoon of the 9th, increased to 29.59 inches by the morning of the 10th,

decreased to 29.52 inches by the evening of the same day, and increased to 29.61 inches by the end of the week. The mean reading for the week at sea level was 29.65 inches, being 0.45 inch below that of the preceding week, and 0.20 inch below the average.

Temperature.—The highest temperatures of the air observed by day ranged from 69° on the 5th to 54° on the 6th; the mean value for the week was 62½°. The lowest temperatures of the air observed by night were 40° on the 5th to 45° on the 6th; the mean value for the week was 39½°. The mean daily range of temperature in the week was 23°, the greatest range in the day was 33½°, both on the 7th and 8th, and the least 12°, on the 11th.

The temperatures of the air and the dew-point and the departures from their respective averages were as follows:—6th, 41° 5', 10° 1'; 7th, 47° 5', 4° 2' 8"; 8th, 50° 1', 6° 0'; 9th, 54° 3' 2"; 10th, 52° 3' 4"; 11th, 49° 4' 6"; 12th, 47° 4' 7"; 13th, 51° 3' 5". The mean temperature of the air for the week was 49°, being 2° 5' below the average of sixty years' observations.

The highest readings of a thermometer with blacked bulb in vacuo, placed in sun's rays, were 135° on the 7th, 138° on the 8th, and 130° on the 6th and 9th; on the 12th the highest reading was 81°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 25½° on the 8th, 26° on the 7th, and 27° on the 6th; the mean for the week was the least at Liverpool, 20°, and the greatest at Cambridge, 43°; the mean range of temperature from all stations was 34½°.

Wind.—The direction of the wind was variable, and its strength gentle. The weather during the week was fine and bright. Distant thunder was heard on Saturday afternoon, the 12th inst.

The wind was strong during the week; the amount collected was 0.28 inch.

ENGLAND: Temperature.—The highest temperatures of the air observed by day were 69° at Blackheath, 68½° at Cambridge, and 67½° at Leicester; at Sunderland 56° was the highest temperature; the mean value for all stations was 49°. The lowest temperatures of the air observed by night were 25½° at Cambridge, and 26° at Sheffield; at Liverpool 39½° was the lowest temperature; the mean value from all stations was 31°. The range of temperature in the week was the least at Liverpool, 20°, and the greatest at Cambridge, 43°; the mean range of temperature from all stations was 34½°.

The mean of the seven high day temperatures was the highest at Cambridge and Manchester, both 64½°, and the lowest at Sunderland, 51°; the general mean from all stations was 57½°. The mean of the seven low night temperatures was the lowest at Manchester, 34½°, and the highest at Brighton, 43½°; the mean from all stations was 39°. The mean daily range of temperature was the greatest at Manchester, 29½°, and the least at Sunderland, 10°. The mean daily range from all stations was 18°.

The mean temperature of the air for the week for all stations was 46½, being ½° above the value for the corresponding week in 1876. The highest was 49° at Blackheath and Brighton; and the lowest 42½° at Hull.

Rain.—The amounts of rain measured during the week at the several stations varied from 1½ inch being the least at Bradford and Hall; the average fall from all stations was half an inch.

The weather during the week was generally fine and bright. Thunder was heard at Wrotesley in the north and at Weymouth in the south. The highest winds were seen at Bristol on the 7th, 8th, and 9th inst.

SCOTLAND: Temperature.—The highest temperatures of the air ranged from 58½° at Greenock and 51° at Leith; the mean value from all stations was 54½°. The lowest temperatures of the air varied from 28° at Perth to 35° at Greenock; the mean value for the week was 42°. The mean range of temperature in the week from all stations was 22½°.

The mean temperature of the air for the week from all stations was 44½, being 3¼° below the value for the corresponding week in 1876. The highest happened at Greenock, 46°, and the lowest at Edinburgh and Leith, both 43½°.

Rain.—The fall of rain at Edinburgh was three-quarters of an inch; at Aberdeen one-tenth of an inch only was measured; at Perth no rain fell; the average fall over the country was a quarter of an inch.

DUBLIN.—The highest temperature of the air was 59½°, the lowest 31½°, the range 28½°, the mean 49°, and the fall of rain 0.05 inch.

JAMES GLAISHER.

Answers to Correspondents.

ABNORMAL MELON: E. M. The condition is not unfrequently in Cucumbers, but we have never seen it so great an extent as in your specimen. It is the result of a check to growth in the fruit.

BOOKS: James Hopton. If you will state exactly what your requirements are we will endeavour to enlighten you. **Books for sale.** A book of orders, such as you require is published at 1/4, Fleet Street.

DAISY: J. S. Mantou. A malformed flower, of no value.

NAMES OF PLANTS: H. B. T. Ionopodium acule.—*C. E. F.* The Ivy is probably a chance variety, which we cannot undertake to name.—*S. H. W. Trevisan.* Brassia Justiana.—*H. Hartley.* Dendrobium pulchellum and the rare Odontoglossum Ruckertianum.—*F. S. Cary.* 1. *Grevillea rostrata*; 2. *Agrostis nemoralis*; 3. *Agrostis prostrata*, a form of *V. luceriana*; 4. *Saxifraga cernua*.—*H. B. Senio* perianth.—*F. Barr.* 1. *Scilla maritima*; 2. *Hyacinthus non-scriptus*; 3. *Senecio (Kleinia) articulata*; 4. *Asclepias curassavica*; 5. *Senecio mikanioides*; 6. *Kivina humilis*.—*H. J. A. Watson.* 1. *Oxalis stricta*; 2. *Oxalis maculata*; 3. *Alyca reptans*.—*S. 2.* *Pellagium ardens*.

PANDANUS VETCHI: P. G. R. Both *Pandanus Vetchii* and *P. paniculatus variegatus* should be in a shade when the sun is upon them, but never in cloudy weather, as the more light they receive without the unobstructed rays of the sun coming directly upon them the better they will colour, though at the time our correspondent requires them (August) the white colouring of the leaves formed first in the season is not usually so pure as whilst they are young.

PROFESSIONALS AND AMATEURS: W. F. T. A gentleman's gardener who is allowed to occasionally sell fruits, plants and seeds, is not actually an amateur, but by this means, should certainly be classed as an amateur.

RHODODENDRONS AND LAURUSTRIS: F. C. F. Both may be pruned back with advantage. It shows a sad want of care and attention on the part of some. The only remedy that we can suggest is to insert a plentiful supply of pieces of Potatoes and Carrots about an inch under the surface of the soil, and examine these every morning, burning all the worms that you catch. You must either follow this plan up closely or turn out the Vines and the border too, and start afresh.

THE OLIVE: G. Bath. It would doubtless be hardy against a wall.

WILD LILY: W. F. C. If our correspondent will oblige us with a specimen we may be able to tell him what to do.

WIREFORMS: A. D. C. If your statement as to the numbers of the border is exaggerated, it shows a sad want of care and attention on the part of some. The only remedy that we can suggest is to insert a plentiful supply of pieces of Potatoes and Carrots about an inch under the surface of the soil, and examine these every morning, burning all the worms that you catch. You must either follow this plan up closely or turn out the Vines and the border too, and start afresh.

Markets.

COVENT GARDEN, May 17.

There has been a marked improvement in our market during the week, and all classes of goods have been more readily cleared, prices remaining much the same. French importations consist of Cherries, Apricots, Asparagus, Peas and Beans, Tomatoes, and young Carrots and Turnips, all of which are arriving in large quantities. Cabbages, Cauliflowers, and young Potatoes being us, but do not arrive in as good condition as earlier in the season. **James Webber, Wholesale Apple Market.**

Strongly recommended in the Gardening and Horticultural Journals. Prepared by JOHN KILNER, Wortley, near Sheffield.'

GISHURST COMPOUND.
Used by many of the leading Gardeners since 1859, against Red Spider, Mildew, Thrips, Greenfly, and other Blight, its solutions of from 1 to 2 ounces to the gallon of soft water and of from 4 to 20 ounces as a winter dressing for Vines and Fruit Trees. Has outwitted many preparations intended to supersede it. Sold Retail by Seedsmen in 1s., 2s., and ret. 6d. Wholesale by PRICE'S PATENT CANDLE COMPANY (Limited).

AGRICULTURAL LOCOMOTIVES,
STEAM PLOUGHING MACHINERY,
ROAD LOCOMOTIVES, TRAMWAY LOCOMOTIVES,
STEAM ROAD ROLLERS.

For Prices, Description, and Reports of Working, apply to the Manufacturers.

AVELING & PORTER,
ROCHESTER, KENT; 72, CANNON ST., LONDON,
E.C. 2 and 9, AVENUE MONTAIGNE, PARIS.

AVELING & PORTER'S ENGINES have gained the highest Prizes at every important International Exhibition. The two Medals for Progress and Merit were awarded them at Vienna for their STEAM ROLLERS and ROAD LOCOMOTIVES; and at the last trials of the Royal Agricultural Society of England their AGRICULTURAL LOCOMOTIVES gained the First Prize after exhaustive trials, when one of their 10-horse power Engines, fitted with single slide and ordinary link-motion, indicated 25-horse power, with a consumption of three and one-half pounds of coal per horse-power per hour.

AN EXTRAORDINARY BOILER.
During the Great Boiler Contest at Birmingham, in 1875, all Boilers were severely tested to prove their respective merits. One test was, "How long can each Boiler go without Night Attention?" However, one Boiler proved this to a surprising degree, as after being shut up for twelve hours (from 9 P.M. to 9 A.M.), it still retained its heat in 1,000 feet of 4-inch pipes, and yet had more than a bushel of fire drawn from its furnace in the morning—equal, in point of fact, to seventeen hours of continuous firing. What a boon to Gardeners, this is THE CHAMPION, Deards' Patent Close-Coil Boiler, for Drawings and Prices of which send two stamps to

Messrs. DEARDS, Boiler Works, Harlow, who now have their Boilers at work in every county of England except three. Amateurs will also find THE WONDER, a smaller kind of Boiler, equally as satisfactory, and certainly "the best thing" out. Awarded five First Prize Silver Medals.

For Sale,
STEVENS' IMPROVED TRENTHAM WROUGHT IRON HORTICULTURAL BOILER,
6 feet long by 3 feet diameter, fitted with Inlet and two Outlet Pipes, Firebrick, and Grate complete. For price and particulars apply to
HILL AND SMITH, Brierley Hill Ironworks, Dudley.

W. G. SMITH & CO., HORTICULTURAL ENGINEERS,
Victoria Works, Bury St. Edmunds.

SOLE MANUFACTURERS OF BEARD'S PATENT METALLIC NON-CONDUCTING GLASS-HOUSES—The Glass is fixed between two layers of prepared felt. The Ventilators are worked by a simple mechanical contrivance, and the whole structure is screwed together, so as to render it quite portable. **HEATING APPARATUS IN ALL ITS BRANCHES.**—ORNAMENTAL CONSERVATORIES and HORTICULTURAL BUILDINGS OF EVERY DESCRIPTION.—For lightness, elegance and durability, these Houses cannot be surpassed. The best materials only are used in their construction. Great improvements have recently been made, to obviate the objections to iron houses. Very extensive works on this principle have been satisfactorily executed.

An Illustrated Catalogue forwarded post-free on application.

"ARCHIMEDEAN" AMERICAN LAWN MOWERS,

Will cut Long and Wet Grass (as well as Dry and Short) without Clogging.

They are especially adapted for Cutting Slopes, Steep Embankments, under Shrubs, and close up to Trees, &c.; and are also extremely light in draught, simple in construction, well made, and not likely to get out of order.

AWARDED

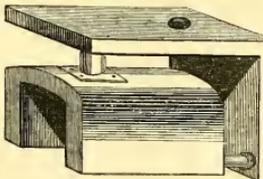

Grand Diploma of Honourable Mention, Vienna, 1873.
Silver Medal, Vienna, 1875.
Silver Medal, Homburg, 1869.

PATRONIZED BY

HER GRACIOUS MAJESTY THE QUEEN,
H. R. H. THE PRINCE OF WALES,
H. R. H. THE EMPRESS OF GERMANY,
H. R. H. THE EMPRESS OF AUSTRIA,
THE LATE EMPEROR OF THE FRENCH,
THE PRINCE OF EGYPTE.

And many of the Nobility and Gentry of Great Britain.

JONES'S PATENT "DOUBLE L" SADDLE BOILER.

These Boilers possess all the advantages of the old Saddle Boiler, with the following improvements—viz., the water-space at back and over top of saddle increases the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought iron are not liable to crack. They are made of the following sizes:—

SIZES.			To heat of 4-in. Pipe.		
High.	Wide.	Long.	Feet.	£ s. d.	
30 in.	18 "	18 "	400	0	0
30 "	18 "	24 "	400	0	0
30 "	18 "	30 "	500	0	0
30 "	24 "	24 "	200	12	0
24 "	24 "	32 "	850	14	0
24 "	24 "	38 "	1,000	10	0
24 "	24 "	44 "	1,100	30	0
28 "	38 "	50 "	1,800	23	0

Larger sizes if required.

From Mr. CHARLES YOUNG, Nurseries, Batham Hill, S.W., May 29, 1877.

"Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."

PRICE LISTS OF HOT-WATER PIPES and CONNECTIONS, with Boilers, of all sizes and shapes; or ESTIMATES for HOT-WATER APPARATUS, erected complete, will be sent on application.

J. JONES and SONS, Iron Merchants, 6, Baskade, South-west, London, S.E.

When ordering Boilers please refer to the above advertisement.

FOR SALE an Ornamental Span-roof CONSERVATORY, 21 feet long by 15 feet wide; is constructed of Wood, Iron, and Best Glass, with a Lantern in centre supported by Ornamental Iron Columns; suitable for placing on a lawn, or facing against a house. To be sold at a considerably reduced price. May be seen on the premises.
HENRY ORMSON, Horticultural Builder and Hot-water Engineer, Stanley Bridge, King's Road, Chelsea, London, S.W.

COWAN'S PATENT COMPENSATING SYSTEM OF HEATING,
FOR HORTICULTURAL, PUBLIC, AND OTHER BUILDINGS.

The most important discovery for saving the cost of fuel, for steadiness in heating power, and dispensing with night stoking. One Apparatus will do the work of several Boilers, and in some cases produce a profit.

Heating by the Ordinary Systems.

Hot-houses, Mansions, Churches, and other Buildings efficiently heated by other approved methods, where the Patent Apparatus cannot be adopted.

A large Stock of the most improved forms of Boilers to select from.

HEAT and LIGHT.

COWAN'S PATENT COMBINED GAS-MAKING and HEATING APPARATUS, By which Country Mansions and Public Institutions may be heated and lighted, in most cases free of cost.

HORTICULTURAL BUILDING.

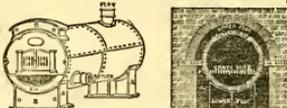

All structures specially adapted to the purposes for which they are required, built of the best materials and workmanship, at moderate prices.

Plans and Estimates free. An Illustrated Pamphlet free.

All work done by the Company is guaranteed.

43, Fish-street Hill, London, E.C.

Oil Paint No Longer Necessary.

HILL AND SMITH'S BLACK VARNISH for Preserving Ironwork, Wood, or Stone. This Varnish is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitations, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, New Garden, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received, which HILL & SMITH will forward on application.

Sold in casks of about 30 gallons each, at 12. 6d. per gallon, at the Manufactory, or 12. 6d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL RECEIVED MAY 3, 1877.
"The Ryley, Alderly Edge, Manchester."—Messrs. Hill & Smith—"Sir,—For some 20 years I have used your Black Varnish, and shall be glad if you will forward me another cask, as I consider it the best thing I know of for the preservation of all outdoor work, either wood or iron, that requires to be painted."
—Yours respectfully, ALBERT LOWE, J.P.

Apply to HILL and SMITH, Brickley Hill Ironworks, near Dudley; and 115, Queen Victoria Street, London, E.C., from whom only it can be obtained.
CAUTION.—It having lately come to the knowledge of HILL & SMITH that spurious imitations of this Varnish are being offered by unprincipled dealers at a slight reduction in price, they would especially draw attention to the fact that every cask of their Varnish is legibly marked with their name and address, without which none is genuine.

GREEN'S
PATENT "SILENS MESSOR,"
Or Noiseless Lawn-mowing, Rolling, and
Collecting Machines for 1877.

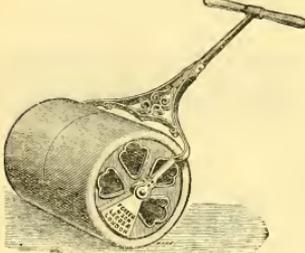

The Winner of every Prize in all cases of competition.

The superiority of these Machines over those of all other
makers is universally acknowledged. They will cut either long
or short Grass, Bent's, &c., wet or dry.
These advantages no other Lawn Mowers possess.
They are the simplest in construction, the easiest to work,
the least liable to get out of order, make little noise when in
use, and are the most durable Lawn Mowers extant.
The largest stock of Mowers kept in London is to be found
at our Establishment, 54 and 55, Blackfriars Road, where
purchasers can select from upwards of 500 machines of hand,
port, and horse power, and have their orders executed the
same day they are received.
Every Lawn Mower sent out is guaranteed to give entire
satisfaction, otherwise it may be returned at once free of cost to
the Purchaser.
N.B.—Those who have Lawn Mowers to repair will do well
to send them either to our Leeds or London Establishment, where
they will have prompt attention, as an Efficient Staff of
Workmen is kept at all places.
Descriptive Illustrated Price List free on application.

MR. MECH'S ADDRESS
to his OLD FRIENDS and CUSTOMERS and to
the PUBLIC.

"As it has been erroneously supposed by some that I am no
longer interested in my London business, I think it desirable
to state that I continue to carry on as energetically, and I trust
as satisfactorily to the Public, as formerly, assisted by a new
first son, who, since I first commenced business in Leadenhall
Street, and what changes have taken place. Then everybody
thought that I had retired from the pen-and-ink trade and
moustache and beard are the order of the day, and the razor
and strap trade is comparatively defunct. Then there were no
razors, no people who shaved, and used wooden shaving
cases; no everybody travels by rail, and we have dressing-
bags, and all other conveniences of fifty years ago; the poor
cases supplied our pens, and many a now rich merchant in the
City will remember the quality of Mech's shilling pen-knives;
and I have seen the same quality of pen-knives in the
penknapping machines, and the geese are in peace, except at
Machines. In fact, steam has altered, and, I may safely
say, improved everything, and has made us all, as travellers
both by land and sea. I wonder how much time is now
occupied in reading the steam-worked press? and how much
less time is occupied in sipping port wine, as we used to do
fifty years ago, when we could not travel? Steam will make
us 4s. longer cheaper some day, just as it has converted calico
from 4s. 6d. to 6s. or less per yard. Then, again, a letter
which used to cost 6d. to Cork is now carried for 1s.
Sir Rowland Hill really deserves a monument. But to return
to business; fifty years ago, when I first commenced on a small
scale, I used to put an ad. which should be good
and useful, and I believe thousands who used the strap and paste,
which I personally used, and which they could not do
without, sometimes complained of that I stamped on my razors.
"Exchanged if not approved." I have never, and shall never
so long as I live, do away from that principle, because it is the true
means to retain and increase one's connection. I devoted my
attention especially to the quality and convenience of arrange-
ments in the dressing and shaving case, and to the
in the tasteful selection of articles suitable for presentation, as well
as in the choice of the material, and in the quality of the work.
Although both razors and penknives have "gone out," our sportsmen
remain, and "sporting knives" form one of our special depart-
ments. I firmly convinced that that principle, and the
departure of knives and forks, or dinners, so we make this an
important department in quality and price. In conclusion, I ask
no more of you, but simply to compare the quality and price of my wares with those of other
dependable establishments, and form their own conclusions.
Most of my worthy assistants and workmen have been nearly
forty years in my service, and long ago learned that civility
and attention to our customers are as important as good quality
in the articles sold. Illustrated catalogues will be forwarded
post-free on application.
112, Regent Street, W., opposite Vigo Street.—1877.

 T. C. PAUL, Covent Garden Market, W.C., opposite the Church.

THE NEW SEEDLING ROSE, "QUEEN OF BEDDERS" (NOBLE).
See Coloured Plate (after Mrs. Duffield), "Gardeners' Chronicle," May 5, 1877.

Perhaps the finest of all the English Seedling Roses of recent introduction. It is *per excellence* a really Bedding Rose, in every sense of the word—requires no pegging down, support, or training of any kind, and is a continuous early and late bloomer.
 First-class Certificate Royal Horticultural Society, August 4, 1876.
 Its influence may be imagined when it is stated that a plant 18 inches high had eight-four buds and expanded flowers upon it on September 6, 1876.
 A constant supply of buds was obtained from early June to November of that year—over five months.
 Good Plants are now being sent out in strict rotation at 10s. 6d. each.
 Coloured Plates 2s. each.

CHARLES NOBLE, BAGSHOT.

TO OBTAIN THE

Best Garden Lawns and Croquet Grounds

SUTTON'S LAWN GRASS MIXTURE

Which forms a close velvety turf in a very short time. For making New Lawns or Croquet Grounds 3 bushels or 6 pounds is required per acre, or 1 gallon to every 6 rods (or perches) of ground.
 For improving those already in turf, 20 pounds should be sown per acre.
 March, April and May are the best months for sowing.
 Price 3s. 6d. per lb., 25s. 6d. per bushel, carriage free.

From Mr. J. Mansueti, Gardener to S. Foster, Esq., Le Court.
 "The Seed you sent me last year turned out uncommonly well. Several gentlemen who came to Le Court could scarcely credit, from the appearance of the lawn, in August it was as fine and thick as it never seen some lawns that had been laid down for three years."

Instructions on the Formation and Improvement of Garden Lawns and Croquet Grounds Gratis and post-free.

Lutton's Sons

VINES, IN POTS.

Also, by far the largest and most carefully grown Outdoor NURSERY STOCK in this part of England.

LISTS FREE.
EWING & COMPANY,
 THE ROYAL NORFOLK NURSERIES, EAST, NEAR NORWICH.

IRELAND AND THOMSON have pleasure in intimating that their CATALOGUE of STOVE and GREENHOUSE PLANTS, FERNS, PALMS, ARCHES, &c., is now ready, and will be forwarded post-free on application.
ADANTUM FLEMINGII—A sport from A. Concinum, and is in every respect much superior to the species that produced it. Its leaves, compact, somewhat like those with the dark green colour of the fronds, which in their young state are of a beautiful brownish purple tint, constitute it a most desirable acquisition for exhibition purposes, and is almost without an equal as a table Fern. Price 10s. 6d. and 21s. each.

NEW BEDDING PLANTS for 1877.
 I. & T. Desire to call attention to the following splendid novelties:—
LOBELIA, St. Martin's Elbow, new bronzed-leaved, price 12s. per dozen, 4s. per doz.
LOBELIA, Queen of the Coast, splendid new bedding price 12s. per dozen, 4s. per doz.
GERANIUM, Marchioness of Huntley, new bronze, price 18s. per dozen.
 For detailed descriptions see *Gardeners' Chronicle*.

- 50 Acaecia, in 3s. sorts for 40s.
- 10 Adiantum fureleyense, 21s.
- 12 " macrophyllum, 12s.
- 10 " gratichium, strong, 21s.
- 12 " crispatum, 9s.
- 12 " of sorts, 10s. per doz.
- 12 Asplenium nidus, 7s.
- 12 Asplenium Veitchii, 21s. and 44s.
- 12 Arca monostachya 24s.
- 12 " 22s.
- 6 Aralia Veitchii, 30s.
- 3 " elegantiissima, 21s.
- 12 Agave and Imperial Dwarf, 21s.
- 12 Begonia (tuberosa), 21s.
- 100 Heliconia Van Houttei, 24s.
- 6 " macrantha, 18s.
- 12 Chamaerops Fortunei, 18s., 30s. and 42s.
- 10 " humilis, 18s., 30s., and 42s.
- 12 Coffea arabica, 40s.
- 12 Cocca Komaroviana, 30s.
- 12 Croton, choice varities, 15s.
- 12 Choroetia splendens, 12s.
- 12 Cyrtomium atratum, 15s.
- 12 Cyathus dealbata, 18s.
- 12 Caladium, choice varities, 15s. and 24s.
- 12 Doryanthes, Palmeri, 30s. and 60s.
- 6 Diomea muscipula, 21s.
- 12 Eurya latifolia, 30s.
- 12 choice Ferns, own selection, 21s., 42s. and 63s.
- 3 Gooderya pubescens, 21s.
- 25 Gemma macrantha, strong bulbs, 20s.
- 12 Gardenia Florida, 9s.
- 12 " radicans, 9s.
- 12 " Obovata, splendid varities, 18s.
- 12 Grevillea robusta, 15s.
- 12 Fovea, 12s. per doz.
- 12 Higginsoni, of sorts, 18s.
- 6 Jaccandra mimosaefolia, 18s.
- 12 Lantana borbonica, table plant, 18s., 20s. and 60s.
- 100 Livistonia humilis, 25s. per seedlings, 80s.
- 12 Agave and Imperial Dwarf, 21s.
- 12 Misa ensete, 30s. and 60s.
- 12 Mitrasa coccoloba, 12s.
- 12 Pandanus utraque, cuttings, in stores, 30s.
- 12 choice Cereus, table size, 30s. and 60s.
- 100 Puccinia reclinata, 3-1/2s. per doz., 60s. 6d.
- 12 Picebrachia filifera (the Queen of Palm), 30s. and 60s.
- 12 Pycnosperma Alexandrara, 30s. and 60s.
- 12 Passiflora, of sorts, 12s. to 40s.
- 12 choice Stove Plants, middle size, 24s. to 40s.
- 12 choice Stove Plants, 18s. and 30s.
- 12 choice Orchids, 63s.
- 12 Succulent plants, 18s. per dozen, strong growing plants, 12s. to 40s.
- 10 " 10s. 6d. 20s.
- 10 " 10s. 6d. 20s.
- 12 choice Staghorn, 18s. and 30s.
- 12 Sarcocolla ligata, 9s.
- 12 Soliya sagittata, 9s.

The finest stock of growing plants in Europe, especially specimens, with fine regular heads of fronds, from 1/2s. to 1/2s. 1/2s. and 4/2s.

Verbenas for the Millon.

SIDE can now supply, for cash, strong, healthy, spring-stuck Verbenas, free from disease of any kind, at 6s. per 100; well-hardened, extra good plants, 2s. per 100, including Purple, Scarlet, White, Pink, and many other shades of colour. All true to name, and package free.

CALCEOLARIAS, aurea floribunda, and other varieties, good strong plants, 6s. per 100, 6s. per 100.

ESTABLISHMENT FOR NEW AND RARE PLANTS, KING'S ROAD, CHELSEA, LONDON, S.W.

NEW DOUBLE WHITE VIOLET, "BELLE DE CHATENAY."

Awarded a First-class Certificate by the Horticultural Society of France.

We offer this magnificent Viola for the first time. The flowers are pure white, most delicately perfumed, of immense size, and very double; in fact, almost equalling in size the well-known white Aquilegia.

It is pronounced by French horticulturists to be the very best double white Violet in cultivation.

Trade price on application.

The raiser says: "This new Violet will be appreciated as a Market Gardener's and Florist's plant, as it blooms most freely and continuously."

The illustration is from some specimen flowers, which are of natural size. We can strongly recommend this Viola as a charming addition to the popular group of flowers.

Trade price on application.

By Her Majesty's Royal Letters Patent

WRIGHT'S ENDLESS-FLAME IMPACT HOT-WATER BOILERS.

GUARANTEED The most Powerful, the most rapid, the most Economical, the Simplest, and the Cheapest in the World.

"The 'Boiler of the Future.' I have no doubt about this." - Wm. Thomson, F.R.S.E., F.R.S.

From the "Gardener," March, 1877.

WRIGHT'S PATENT ENDLESS-FLAME IMPACT BOILER.

"This boiler is attracting a great deal of attention in the horticultural world at the present time; and as I have just had one of their largest-sized ones fitted up here, and have now got it well tested, perhaps a few lines from me upon its merits may not be without some advantage to some of your numerous readers who are anxious to express some opinion upon it. It is an extra labour caused by badly-constructed boilers, and any improvement effected in those to save labour and fuel demands the attention of all interested parties.

To give your readers a better idea of the work this boiler has to do, I may begin by stating that our handsome compact range having a length of 120 feet, a ridge- and furrowed green-house being in the centre, two lean-to Vineries on each side, with Cane-house and general glass-house on each end; on opposite side of wall we have a Fern-house, partly lean-to and partly span, 50 feet in length, varying in width from 10 to 20 feet. Attached to end of boiler-house is our laundry with a drying chamber fitted up with about 250 feet of 4-inch piping.

The whole of the above houses are heated with hot water, and have a total of about 2000 feet of 4-inch piping. We had formerly two oval fire boilers, one being 4 feet in diameter, the other 4 feet long. With these two boilers kept had fired we always found great difficulty in keeping up the temperature during the winter, and had frequently to lose a night's sleep attending to the fires. On the last day of last year the larger boiler came to grief, the water in it dropped on the fire; and in taking down some of the brickwork it was found to have cracked beyond repair. To be thus left in the middle of winter with only the smaller boiler was no joke. I had to look for another without delay. I have given a good deal of attention to the construction of water boilers, and I must confess I had never seen one that came up to my idea of what a boiler should be until some time ago my attention was called to a drawing of Wright & Co.'s Boiler which appeared in the 'Gardener.'

"After talking the matter over with my employer, W. S. Thomson, Esq., he at once granted permission for me to get the boiler I had formed such an opinion of. I at once put the order into the hands of Messrs. Mickle & Phipp, horticultural builders and hot-water engineers, Tottenham Street. They have fitted it up and attached the piping in the most complete manner. I also got additional material valves attached to the boiler. If anything broke at any time go wrong it can be attended to without disturbing the piping.

"As formerly stated, I had considerable difficulty in keeping up the heat with the two oval fire boilers kept hard at work. I now find that with the remaining oval fire boiler still in use, and the whole of the houses and the laundry to a degree they never were heated before, I can burn much less coal than it took to keep the two oval fire boilers.

"One chimney consists of a 75 ft long, led horizontally through centre of back wall, with 15 feet of a perpendicular stalk. Some doubt was expressed that, as we required a chimney pipe attached to boiler about 5 feet long, there would be the deficiency of draught; but we have found the opposite to be the case. I attached a 6-foot length of 8-inch stove pipe, with elbow at right angles down to the angle, and I found the draught very strong I got a throttle-valve damper fitted into the bend of the stove pipe, and am able to regulate the fire to a great extent; and by banking up the fire at 10 to 12 ft. from the damper fully half round, I can leave it to its work with the greatest confidence for an unusual time. I have tried the following: instead of, and instead of, as formerly, having to sit up firing the half of the night at times, and sometimes whole ones, we can retire to rest at a reasonable hour, confident of sleeping undisturbed by unpleasant dreams of plants and fruits going to ruin. In concluding my remarks I may say that the less of the good qualities of this boiler is its portability. We had not the slightest difficulty in putting it down in our contracted stable, through a trap-door 4 feet wide by 6 feet long, and fitting it up in a recess 4 feet square, and I am confident that with the assistance of two men I could take the whole to pieces and have it again in full working order in two hours. I have no hesitation in saying that for rapidity of circulation, economy of fuel, simplicity of construction, and that it has no rival, and have no doubt this boiler will win way; and when coals are high in price it will effect a considerable saving in the cost of a good fire space in a house, or a capital boiler for burning wood and other fuel." - J. CLARK, The Gardener, Farnley Green, East Leeds.

"I think yours the most perfect 'Heat Trap' yet invented." - DAVID THOMSON, Drumsdunrig Gardens.

For details and particulars as to the various sizes, mode, and cost of our complete, entitled 'Heat Trap' and 'HEATING,' which will be handed to all applicants, post-free.

We are prepared to supply Thirty Different Boilers of all sizes, heights, and capacities, and can vary them to suit any particular situation or requirement.

SATURDAY, MAY 26, 1877.

ATHOLIA.

THERE is not an estate in Britain more affluent in waterfalls than the Duke of Athole's, extending as it does over the cloud-compelling peaks of the Grampians, and over a country of mountain burns, the feeders of the Garry and the Tay.

The principal source of the fountains of Athole is situated 17 miles from the Castle and 1450 feet above the level of the sea, in the Pass of Drumochter, between the Boar of Badenoch and the Athole Sow. Just here the streamlets are small, and at the point where they are balanced, so to speak, upon the ridge of the watershed, some run to the Garry, some to the Spey. Mr. Geikie, writing of the courses of the glaciers, tells us that, "the glacier of Loch Garry split upon the watershed and sent one branch into Glen Garry and the other into Glen Truim," and so to the Spey. Above where the ice parted in the ice age, the waters now part—a pebble might sometimes turn them either way; and near here, at the Inn of Dalwhinnie, in 1861, the Queen, travelling adventurously through the country, stopped to dine and sleep. The story is told in the 'Journal of Our Life in the Highlands.'

The Royal party in that last expedition round about the Grampians from Balmoral reached the forlorn and elevated inn at nightfall on October 9, without bringing food. Two lean fowls snatched from the perch lost their lives in consequence, and were placed on the parlour table with tea, the only beverage. The frightened maids refused to wait at table. "Mary and Maxted, Grant, Brown and Stewart," were engaged drying their clothes in the commercial room; they afterwards dined on meagre fare, and nothing to drink but tea. We are told that on this cheerless night there was "no pudding and no fun." It rained, and the little rill before the door was very instant rising; and 50 miles distant at Perth there is often as sudden a rising of the river from the swelling of all the streams from Dalwhinnie to Perth Bridge.

Next day the party passed Loch Garry, lying darkly as in a den among the mountains. It had been a good night for the Duke of Athole's waterfalls; and as they rode along they presently met the Duke on a chestnut pony, "in his kilt and shooting jacket as usual," coming out to attend the Queen. Some more heavy showers fell, early autumn showers, interrupted by a glorious sun breaking through the clouds. The Garry is described in this attractive narrative as rolling along by the roadside, "over large stones, and forming perpetual falls, with Birch and Mountain Ash growing down to the water's edge."

Soon the travellers see in the distance Ben-y-Ghlo, the source of the Feudar and the Tilt, which tumble through Irlair Athole park. Then they passed the Falls of Bruar, a stream which commences at a spot where Aberdeenshire, Inverness-shire, and Perthshire meet upon the heather and the high ground of Athole Forest, and which crosses twenty-two miles of wild moor, and flows into the Garry three miles above Irlair.

The finish of the Bruar is beautiful. For half a mile at the end of its course the stream dashes and tumbles through a narrow glen, and sometimes passes through deep, long chasms,

which are spanned at salient points by bridges, reached from above by winding paths. The deepest fall is 60 feet perpendicular. An ornate shelter hut commands it from the edge of a convenient precipice, where you may observe the animating noise and flow of the water, and the ingenuity of the Duke in planting several of the ledges and steps above the stream. Burns had spoken to the Duke on the subject of the bare sides of this glen, and Bruar Water had been made to apostrophise his Grace in these and other charming verses:—

"Would thou my noble master please
To grant my highest wishes,
He'll shade my banks w' thowering trees
And bonnie spreading bushes."

The difficult places were planted by letting boys down in baskets, with their pockets full of Fir plants and young bushes, which they set in the crevices, and covered with earth led down for that purpose.

Since the Duke brought his Royal guest past this spot a railway has been laid up the valley, and thousands of acres of the slopes above have been covered with Scotch Fir; and 2 miles from the Castle there is now a baronial lodge. It was at this point that the party entered the park. They were afterwards driven forwards on their journey in a carriage specially constructed for fugal districts and precautionary, like Noah's Ark. The journal we quote from describes it as a "boat—a mere boat," put on four wheels.

It is the same lower down the valley, and as far as the Gramplains extend—the pebble reefs in the rivers Garry and Tay everywhere bespeak streams well fed in the rainy season; and the high flood-marks on Perth Bridge, dated 1814 and October, 1847, with the lowest water-mark of that dry summer, 1859, tell the same story as the pebbles, of varying water supply.

Walking from Birnam past Lady Well and along the main road, the Bruar runs, unseen for the most part, but not unheard, parallel with the road, and many feet below it. We remember capercalzie getting up into the Fir trees to roost, and sometimes getting down again alarmed as we passed. The river became more and more noisy among the trees, recent rains having increased its flood. For a mile there was a perpetual sound of tumbling waters on the right, and presently there came from Rumbling Bridge the roar of one of the Duke's best waterfalls; and in a sort of shanty looking down the foaming stream towards the bridge, was an artist of a world-wide fame studying the effects of moonlight on the rushing water. We must leave the task of describing rapids, torrents, and cascades, to him and to the poets. Immediately around Blair Athole there is much movement of the mobile element in the various glens, each with its stream issuing from some parent loch among the mountains.

Walking along Tiltside, the Feudar is seen not far from the Castle, falling from a high rock into the larger stream below. An arched grotto has here been erected in the steep bank opposite, in which the reverberation is heard with curious effect, and a Tulip tree stands upon the bank above. You may reach it by a steep ascent through Hazel and other underwood, and you will observe that the timber of Tiltside and the grass upon its banks have been enriched by a bed of limestone which crosses the forest from Braemar, improves the pasture of the park, and then passes southwards through the country—a superior seam, excellent everywhere for the dairy or for sheep. Presently the glen begins to wind, its deep channel takes a wider sweep, and upon the steep ledges of the river banks all sorts of Fir stand, spiral and beautiful. Gilpin, who absented the Beech and Bramble, described the Scotch Fir as a dark spot upon the landscape, especially when young. It is so sometimes, but not always, and all old fellows ought ways to praise youth in its best aspects, and

to respect and admire it. It is unbecoming to have youth decry by age. The Scotch Fir is dark on sunless days, and in ascending Glen Tilt in bright weather we found its trunks red in the sunlight, and its exquisite green foliage deeply tinged with blue.

Beyond the Tulip tree a bridge crosses the Tilt, and from that point you follow its swinging course, with water music on your left and echo on your right. The slopes are about as steep as those of a Gothic roof, and this is not an uncommon style of hill architecture among the wider glens. In ascending higher the trees are gradually left behind, till the Sloe with purple fruit, the Rowan with drooping berries, and the Hazel with changing leaf, struggling against the breath of autumn, keep company together. A Birch leaft follows, and a little forest with leaves brown, yellow, and ochreous, dead but lovely, and awaiting the first wind that will sweep the hillsides with its gay, decaying leaves, and red fruit. A little higher the Alder still stood robust and green, resisting the season of change—a gloomy tree nearer home, but not uncheerful in so wild a scene.

Beyond this tree limit is the Marble Lodge, in which a keeper lives. At Forest Lodge, 8 miles from Blair, the road for carriages ends, and bare steeply bound the glen on either side.

A high bank at Dalcroneach overhangs the Tilt, and looks up a glen towards Loch Loch, where one of the Comyns of Badenoch rests under a cairn. Near this spot are "the Pudding Burn," *Alt na marag*, and "the Brook of the Nose," *Alt na sròin*, illustrating the richness of the Celtic language in nomenclature. These streams were named from the following incidents: Comyn had seized the castle of Macintosh of Tirin, murdered his family all but one, and seized his lands. The one child who was saved, on attaining manhood, attacked Comyn at Blair, drove him up Glen Tilt, and shot him near Loch Loch; and at *Alt na sròin*, during the rout, a nose fell into the stream, and at *Alt na marag* another person received a gash, and the stream was named "the Pudding Burn." The view here is very fine, and here the party we left in the boat upon wheels took luncheon, attended by the pipers and the people and by Sandy McAra, the head keeper, "old and grey," the wild strains of the pibroch sounding softly amid the hills, and Glen Tilt looking like a long, straight furrow drawn down the mountain side.

The cavalcade set off again and crossed the celebrated ford of the Tariff—Poll Tariff it is called—the Duke leading the Queen's pony on one side, a trusty servant leading on the other, Sandy McAra, the guide and the pipers, playing all the time, marching in advance. In the middle of the stream the current proved sufficiently strong and deep, but all waded through in safety, and soon after the road became precipitous. From this point the Tilt becomes narrower and narrower to the spot where the travellers emerged from the pass upon an open valley. And here, where the waters part and the Bainoch runs towards the Dee, the Duke of Athole finds a boundary. Along the ridge his forest meets those of Mar and Badenoch, his armies of deer unite with those of neighbours, and all troop over the hills together.

At the "county march," where Perth and Aberdeen meet, the cavalcade halted. The Duke produced some whiskey and a silver flask, and proposed a toast, and rather than rob the waterfalls of Dee he took his whiskey neat; and then there was a great cheering, a little starting on the part of "my pony, good Inchroy," and then the parting.

Dr. John Macculloch examined the flora of Ben-y-Ghlo in 1824. He says:—"On this mountain is found, in abundance, one of our rarest and most elegant of alpine plants, the

Azalea procumbens, as it also is on the range of hills opposite. The neighbourhood of Blair is, indeed, a tempting field for the botanist. Near the dense and trailing cushions of this delicate shrub, and even among its bright crimson flowers, it is not unusual to find the rare *Rubus arcticus*, with its elegant berry, and the still rarer *Cornus suecica*. The *Rubus Chamæmoris* and the more ordinary alpine plants are found in profusion, and in one place there is a miniature forest of the *Betula nana*, a plant almost limited to this spot.

"The rare Lichen (*Platyisma*) *nivale* occurs all over Ben-y-Ghlo, the Lichen (*Cetraria*) *islandica* almost covers the ground in some places. On the calcareous skirts of Glen Tilt, the *Dryas*, with the *Satyrion viride* and some other rare Orchidaceæ, are seen everywhere; and here, even in the bed of the stream, at a lower elevation than I have ever elsewhere seen it, the rocks are covered with the long trailing stems and brilliant crimson flowers of *Saxifraga oppositifolia*. Here also the cushioned *Silene acaulis* grows at a low level, while there are few of the alpine *Saxifragæ* which are not found somewhere; the golden flowers of the autumnalis decorating every rill and cascade. In the wet ground above the Anthericum calycatum occurs in profusion, as does the *Trollius*, a plant far from common in Scotland. About Blair the delicate starry flower of the *Trientalis* is the Daisy of the heaths and woods, as the two commoner *Pyrola* emulate the Lily of the Valley in profusion as they do in odour. In the Fir woods also the very rare *Prunella secundiflora* is abundant, and near the Feudar I found the most rare of our plants, the *Convallaria* (*Polygonatum*) *verticillata*, only known as yet in one other place (in Scotland), near Dunkeld. Of the fungi, the park and woods of Blair are a perfect magazine, containing almost every *Agaricus* that exists, together with a great number of species in all the other genera." *H. Evershed.*

New Garden Plants.

*HESPERANTHA LONGITUBA, Baker.**

This pretty Arix-like Irid has just been introduced into cultivation by Max Leichtlin, Esq. It is widely spread through the eastern provinces of Persia, extending northward through Kaffaria to Natal. It is a new neighbour of the old *Hesperantha falcata*, *Ker* (*Ixia falcata*, *Bot. Mag.*, tab. 566), with which it agrees in its flowers being fragrant and expanding in the evening. It differs by its longer and more grass-like leaves and larger flowers, with a longer perianth-tube and much larger spathe.

Bulb small, ovoid, with firm membranous dark brown tunic. Leaves two or three in a distichous nearly basal rosette, the base more redly clasping the scape below the middle, bright green, glabrous, grass-like in texture, the fully-developed ones reaching a length of 6 or 9 inches, and a breadth of 3 or 4 lines. Flowering-stem reaching a height of 1 foot, with 5 or 6 large erect spike of from three to eight flowers. Spathe-valves entire, green tinged with red at the flowering time, the outer one lanceolate-oblong, varying from 1 inch long in the lower part of the spike to $\frac{3}{4}$ inch at the upper, clasping round and hiding the stamens and inner valve of the spathe. Perianth-tube cylindrical, usually protruded from the spathe; segments of the limb oblong, $\frac{1}{2}$ — $\frac{3}{4}$ inch long, the inner ones white, the outer much tinged with reddish-brown. Filaments $\frac{1}{2}$ inch long; anthers linear, sagittate at the base $\frac{1}{2}$ inch long. Entire portion of the style not protruded from the tube of the perianth, its three falcate subulate branches as long as the anthers. *J. G. Baker.*

ANTHURUM SPATHOPHYLLUM, N. E. Br.

Whole plant quite glabrous and smooth. Stems (in the new plant, but perhaps forming a stem with age); petiole 3—6 inches long, 2—2½ lines thick,

* *Hesperantha longituba*, Baker.—Bulbo parvo ovoides, tunica brunnea membranacea; foliis prostratis basialibus 2—3 linearibus glabris scapo brevioribus; scapo gracili folio unico reducto etiam tubo cylindrico limbo longiori, segmentis oblongis, interioribus albidis, exterioribus rubris suffusis; filamentis sagittatis at base $\frac{1}{2}$ lin. longis. Entire portion of the style not protruded from the tube of the perianth, its three falcate subulate branches as long as the anthers. *J. G. Baker.*

trigonus, flat on the face, the three edges narrowly membranous margined, green; geniculus 3-4 lines long, tumid, trigonus, green, and margined as in petiole; blade 16-24 inches long, 1 1/2-2 1/2 inches wide, narrow lanceolate, attenuate-cuneate in a straight line from middle to base, apex acuminate, texture about like that of thick paper, bright green above, pale greyish green beneath, impunctate; midrib prominent, rounded or obtusely triangular above, more prominent beneath and acutely triangular, with a membranous dorsal keel (continued up from the petiole); lateral veins 16-30 on each side of midrib, varying according to length of leaf, impressed above, prominent beneath, rather distant, erecto-patent, curved, all forming a continuous pseudo-nerve 2 1/2-3 lines distant from the margin, or those in the basal part running into the margin or forming short pseudo-nerve of 2-3 anastomosing veins, and then excurrent to the margin. Petiole 7-10 inches long, 1-1 1/2 line thick, trigonus, slightly compressed, the edges membranous margined, sometimes with a fourth edge or keel on one side in the upper part, pale green. Spathe about 1 1/2 inch long, 1-1 1/2 inch broad, erect, deeply concave-hooded or boat-shaped, broadly ovate, apex shortly acuminate, sub-obtusely with a short mucro, base amplexicaul, very shortly

repal on a narrow line over the lateral sepals. The broad lateral sepals forming part of the tube are very concave of course, and at once most apparently rounded on their upper margin. Now, if they are artificially expanded, they form a very broad body over the entire tube, and this suggested the name "lata." My first knowledge of this plant was due to Messrs. Veitch, who introduced the plant I think at the same time with *M. attenuata*, Rehb. f. I obtained fresh flowers in September last from Mr. Day, and I saw the plant with its metallic shining flowers at this gentleman's Orchidic Eldorado a few weeks ago, before the days of Amsterdam, and carried home with me the beloved lady of a two-flowered peduncle. *H. G. Rehb. f.*

DENDROBIUM THYSIFLORUM.

THE accompanying illustration (fig. 105) of this showy Orchid was prepared from a photograph of a plant which produced ten spikes of flowers, in the collection belonging to Sir William Marriott, Downs House, Blandford. *D. thysiflorum* is an introduction from Moulmein, whence it was introduced into

remarkable for the length of time it continues to produce a succession of flower than for opening them simultaneously, as in the case of most plants the blooming of which is of shorter duration; for this reason it is more suitable for general decorative purposes than for the exhibition stage. It is of comparatively easy growth, and succeeds well in moderately close pent, containing a fair amount of fibre with a good sprinkling of sand. It is a tolerably quick grower when well managed, soon acquiring a useful size and flowering freely in even a small state.

Those commencing its cultivation will find it the best to procure plants in the autumn, after the summer's growth is completed. Select the usual nursery size, such as are young and free in growth, and have been stopped so as to cause them to have plenty of shoots, bushy, and not long or straggling. Keep them for the winter in an ordinary greenhouse temperature, where they will receive a fair amount of light; as at the latter end of March they should be moved into pots a couple of inches larger than those they have hitherto occupied. This is a strong-rooted plant, and will bear the soil using in a moderately lumpy state, mixing the sand well with it previously to use. Put an inch of crocks for drainage, and ram the soil pretty firm. Cut back the shoots to an uniform length of 6 or 8 inches from where they were last stopped to, and tie them well out. The wood is of a somewhat weak character, consequently will require a moderate number of sticks for support. Be sparing of water until the roots are at work in the new soil, and keep the atmosphere a little close till the young growth begins to push, after which admit more air in the early part of the day. As the weather gets warm close the house with sun-heat, and damp overhead with the syringe, at the same time keep the material on which they stand moist. Shade will not be required, as the plant will bear any amount of sun.

As already stated, it is a free-flowerer, producing its blooms from the current season's shoots, yet the first season's growth will rather be to get the plants on in size than the production of flowers; consequently, about midsummer all the strongest should be stopped, so as to cause them to break back. Continue to keep the branches well tied out, and also the use of the syringe until the middle of August, when give more air night and day, so as to ripen up the growth, at the same time discontinue syringing and maintain a drier atmosphere; keep on this treatment through the autumn, merely guarding against too low a temperature on cold nights. Through the winter a temperature of about 40° in the night should be kept up, giving no more water at the roots than necessary to preserve the soil in a healthy condition. Again about the end of March report, giving a 3 inch shift, in soil similar to that which was advised the preceding season, stopping and tying-out the shoots as before. Let the treatment during the spring be in every way as recommended last year. By the end of July they will most likely begin to show flower; as soon as these make their appearance discontinue the use of the syringe, and give plenty of air and light. When the bloom commences to open the plants, if required, may be placed in the conservatory, where they will keep on flowering for many weeks; after which they can be removed to the greenhouse, and wintered as previously. It will be advisable in this time to go over them and shorten their shoots back, as this will be better done now, when the plants have attained some size, than in the spring as heretofore. Give them another shift about the time advised the preceding seasons; they should again have pots 3 inches larger, and be treated in every way as hitherto recommended as to potting, syringing overhead, and water at the roots; by the time of flowering they will have got to a useful size, and be found attractive.

This *Mitrasia*, from the free but somewhat weak habit of the shoots, requires cutting back after flowering to within 6 or 8 inches of the point from whence the season's growth has commenced. Twelve or 14-inch pots are large enough to grow even the largest plants in, as after they get into that size they may be kept in the free but healthy condition by the use of manure-water during the growing season.

Insects.—The plant is sometimes affected with red-spider, but if the syringing advised whilst in active growth is attended to, it will be kept in check. Should black fly or mealy bugs appear, fumigate with tobacco, or syringe freely overhead with tobacco-water. *T. Baines*.

FIG. 105.—DENDROBIUM THYSIFLORUM.

decurrent; pale green inside and out. Spadix 10-12 lines long, 3-3 1/2 lines thick, slightly clavate, very obtuse, quite sessile, projecting forwards, pale yellow. Ovary 6-celled, cells 1-ovulate.

The dimensions given in the above agree with the *Kew* specimen, but as I fancy that it is rather a young plant, they may possibly be considerably increased in a more adult state, as is usually the case with *Andurium*. I know nothing of its native country, no record of it having been kept. *N. E. Brown*.

MASDEVALLIA LATA, Rehb. f.*

Among the plants of the late Mr. Zahn, one of the recent botanical martyrs (drowned in a stream) from Central America to Messrs. Veitch, was a curious *Masdevallia*, much in the way of *M. bicolor*, Pöpp., Eadl., and *aurorapurca*, Rehb. f., yet with some extra quality. It produces two flowers at once, and whether it may hereafter develop more such organs, who knows? To judge from the very thin peduncle one would, however, scarcely expect it. The flowers are dark reddish brown, with ochre-coloured tints, and such is too the colour of the upper

of this country by Messrs. James Veitch & Sons, who obtained a First-class Certificate for it from the Floral Committee on April 6, 1870. It has the habit of *D. densiflorum*, but is a stronger grower, and produces splendid spikes of flowers, the sepals and petals of which are white, and the lip a rich golden yellow.

GREENHOUSE PLANTS.

THEIR CULTURE AND MANAGEMENT.

MITRASIA COCCINEA.—This is a dense-growing evergreen plant that produces freely its handsome mitre-shaped scarlet flowers during the summer and autumn, at which time it forms a conspicuous object in the greenhouse or conservatory. It was introduced about the middle of the present century from San Carl de Chiloe, and is another of the number of handsome species comparatively neglected. It is more

omnibus perigonum suo caudale bene superantibus (prope his longioribus); sepalis a cuneata basi puzduratis apice lidenatis; media unilamelis; labelli lamina ligulata apice utriusque angulata, angulis in laminam anticam, semioblongam denticulatam descendentes, superficie disci superioris denticulata; columna apice trifida, laciniis lateralibus obtusis, laciniis medianis acuta. —America Centrali; Zahn!

* *Masdevallia lata*, Rehb. f.—*Afinis M. aurorapurca*, Rehb. f. foliis cuneato-oblongoangulatis acutis; pedunculo obliquato (uni-bifloro), mento angulato, tubo brevi inferius amenti angulum deinceps angulato; sepalis impari pro parte herbis brevius angulatis in caudam longam extensis; sepalis inferioribus lobis semicirculari expansis longe caudatis; caudis

THE SPECIES OF PRIVET.

To the last number of the *Flore des Serres* M. Decaisne contributes a revised list of the cultivated species of Privet, Ligustrum. The following species are enumerated:—

1. L. VULGARE, Linn., common Privet; Europe.
Var. α . *f. foliosa*,
 β . *buxifolia*.
2. L. OVALIFOLIUM, Hance, oval-leaved Privet;
Japan. Syn., *L. reticulatum* and *L. californicum*.
3. L. IBOYA, Sieb., Iboya Privet; Japan. Syn.,
L. ciliatum, *Sieb.*, *L. amurense*, Carrière, not of Maximowicz; *L. Roxburghii*, Hort.; and
L. zinnieri, Hort.
4. L. QUINTOU, Carrière, Qaihou's Privet; Japan.
(M. Qaihou is the garden superintendent at the Jardin d'Acclimatation, of Paris.)
5. L. MASSALONGIANUM, Visiani, Massalonghi Privet; Khasia and Neilgherri Mountains. Syn., *L. myrtifolium*, Hort.; *L. spicatum*, Hort., non Don; *L. longifolium*, Hort.
6. L. LUCIDUM, of Acton, shining Privet; China. Syn., *L. Roxburghii*, of Blaine; *Olea clavata*, Wight, Icon, 763; *Phyllrea paniculata*, of Roxburgh; *L. japonicum*, Hort., not of Thunberg; *Lucidum* var. *macrophyllum*, Hort.; *magnoliifolium*, Hort.
Var. α . *c. coriaceum*, Revue Hort. 1874, p. 418, fig. 56.
 β . *L. japonicum variegatum*, Hort. (Produces vegetable wax.)
7. L. JAPONICUM, of Thunberg; Japan. Syn., *L. Kellermanii*, *L. spicatum*, *L. springerianum*, *L. lucidum*, Hort. (not of Aiton); *L. macrophyllum*, Hort.; *L. Kellermanii*, Van Houtte, Cat. γ . *Sieboldi*, Hort. γ . *L. coriaceum*, Hort.; *L. glaberrimum*, Hort.; *L. ovalifolium*, Hort. (not of Hasskarl).
Var. α . *variegatum*, Syn., *Ligustridium japonicum*, Spach.
8. L. INSULENSE, Decaisne (China?). Syn., *L. Stanoutii*, Hort. (not of D.C.).
9. L. COMPACTUM, Hook. and Thoms.; Himalaya. Syn., *L. oblongifolium*, Hort.; *L. longifolium*, Carrière; *L. lanceifolium*, Carrière; *L. Simonii*, Carrière.
10. L. ROBUSTUM, Hook. et Thoms.; Himalaya. Syn., *L. nepalense*, Hort., not of Wallich; *Phyllirea robusta*, Roxburgh; *Visiania robusta*, D.C.
11. L. NEPALENSE, Wall. Nepal. Syn., *L. spicatum*, Don; *L. vertutum*, Hort.
12. L. HOOKERI, Decaisne; Nepal. Syn., *L. nepalense*, var., Hook. Bot. Mag. 2911; *L. Wallichii*, Visiani, not of Blume.
13. L. SINENSE, Loureiro; China. Syn., *L. willowum*, Rev. Hort. 1875, p. 299; *L. Iboya villosum*, Hort.
14. L. STANTONI, D.C.; China. Syn., *L. chinense*, Carrière; *L. chinense nanum*, Hort.; *Phylarodora leucantha*, L. Mar. Moore, in Trimen, Journ. Bot. 1875, p. 229.

Excluded Species.

L. carolinum, Desfontain—Lippia species; *L. spicatum*, Jacques—*L. multiflorum*, Hort.; *L. amurense*, Hort. Sbatat—*Lippia ligustrifolia*, G. Thuret; *L. cotinifolium*, Jacq.—*L. Linociera cotinifolia*.

MARÉCHAL NIEL ROSE.

SOME brief notices in recent numbers of the *Gardeners' Chronicle* on this kind of yellow Roses suggest the desirability of a few remarks on its management, inasmuch as not a few are unable to meet with success. Of course at present the plants coming into bloom are those cultivated under glass, where the treatment is comparatively easy, where appliances are at hand not to be met with out-of-doors. Indeed, except in specially favorable localities, the Maréchal is only fit for the Rose-house. It is so easily excited into growth that its early development suffers from the ungenial springtide which of late years, at least, appears to have become a characteristic of our climate. To those whose plants are under glass it will be sufficient to remark that the use of the syringe and abundance of liquid manure are the chief cultural points that require attention now. In case long rods of the season of 1876

have been made, showing much succulence and little promise of bloom, the top of such must be nipped out and the branches bent down, which will cause them to throw out laterals which will flower later on. This latter mode of treatment may also be pursued with plants on walls or trellises, and, where specimen flowers are required, it will be well to condescend to dibbling in time. But it is to the trees in the open ground we wish to direct special attention, because, being an early Rose, as we have hinted above, they will require additional care. These likewise must have frequent applications of liquid manure, the best way of administering which has been found to be as follows:—

In a circle round the plant, at such a distance from the collar as the roots are judged to extend to, let several holes, from 10 to 12 inches deep, be dibbled, into which let the stimulating fluid be poured, and immediately cover the surface with a mat of straw to the reach of the spongioles, which will greedily suck it up for assimilation by the organs of nutrition. This is a most important point in giving manure in this form, because that which only comes into contact with the more solid roots is little better than waste. Another way is to dig a trench a few inches deep round the tree, to be kept filled till the adjoining soil has been thoroughly saturated therewith. It will be as well to add that pot plants are best watered by immersion, and especially so in the case of those which are in flower. Both these methods are far more immediately effective than any mulching. Guano, drainings from the stable or cowhouse, a decoction of sheep droppings, or a solution of fowl-house scrapings, all make excellent liquid manures.

One secret of success with Maréchal Niel is patience. The plants must be well established—young or fresh ones can never be expected to afford much display; indeed for the first two or three seasons it would be advantageous to the future welfare of the trees if they were not allowed to flower at all. Such self-denial, it must be admitted, is difficult to practise, but the benefit is undeniable.

Plants now obtained are necessarily those in pots, and purchasers cannot be too urgently recommended to have only specimens on their own roots, and large in preference to small, even at enhanced cost—they are cheaper in the end, as time and nursing are thereby saved, and risk of failure at the period for turning them out is reduced to the minimum. As to "worked" plants, it is well ascertained fact that Maréchal Niel will not do on the Manetti. Many stocks have been tried for it, such as Gloire de Dijon, Climbing Devoniensis, and others. Mr. Harrison, of Darlington, states he has a stock called the "Napoleon" which does it well, and is admirably fitted for the purpose to suggest that as this variety is really a Noisette, some of the older strong growing kinds of budding habit should be experimented upon when the following season arrives. The Rose is so superb, and plants upon their own roots take so long in reaching a productive size, that it is worth any amount of trouble and experience to discover a certain mode of propagating it. Lastly, we have to refer to the Briar, upon which sometimes the variety succeeds and makes fine plants, and very often not. There is a peculiarity of this Rose when worked upon the tree which the writer has never seen discussed in print, but has often remarked at the great Rose nurseries, the buds take and appear to grow freely for a time, then they stop. Next they turn sickly looking and yellow, and finally snap off at the neck with a puff of wind, or even with a touch. Upon examining the base it will be perceived that a hard callus has formed, in appearance much resembling a "callus" before roots are emitted. We have seen on many as fifty plants of this kind, and of a couple of nursery rows of 200, some with four or five branches from the stem of the original bud. The cause of this singular phenomenon is a topic too extensive and abstruse for discussion in the present paper. We have alluded to it to emphasise the advice as to "own root" plants, and as a suggestion for opening up—it may be—an interesting discussion in the pages of the *Gardeners' Chronicle* further on.

W. D. PRIOR.

SEAKALE AND ITS CULTURE.

AMONGST the various plants adapted to culinary purposes which are only used in a blanched or whitened condition, induced by the exclusion of solar light, such as Celery, Endive, &c., the Cramble maritima, or Seakale, stands pre-eminent, and its season of usefulness usually extends from Christmas until about the end of April.

The plant is perfectly hardy, being indigenous to Britain, and is found in a wild state in various places on the sea coast growing in light sandy or stony soil.

It belongs to the great natural order Cruciferae, which order comprises a large number of plants most valuable for culinary purposes, and they are considered to possess a greater proportion of azote than any other tribe of plants; many of them are also possessed of considerable antiscorbatic properties, the result of acrid volatile principle very conspicuous in the Herbs Raddish and the Turnip; but in the case of the Seakale this is entirely dissipated by the process of blanching, which does not, however, diminish its diuretic and diaphoretic properties; the plant is, consequently, never used for culinary purposes unless when in a thoroughly blanched condition, and has in that state been long esteemed as a wholesome and delicious vegetable, and is said to have been known and used in this country at a period so remote as to give rise to the supposition that it was first produced from seed, and the plants very little, at all, from the original type; so that there is, I believe, only one variety in cultivation, and this is of course improved by culture. The plant is grown and blanched in various ways, and submits very readily to forcing at almost any period of the year.

In some localities on the southern coast of England the root of the plants growing in a wild state are during the winter, or as soon as the leaves have decayed, covered to the depth of a foot or more with sand, and a shingle or brickwork covering, which is excellent and thoroughly blanched but in the middle or end of March. In gardens a similar result is secured by growing the plants in lines at a distance of 4 feet, more or less, from each other, covering the roots in early spring with a depth of 6 or 8 inches of finely sifted cinder ashes or sand, and this may be covered with a portion of soil obtained by digging out a trench between the lines of plants; while to accelerate the production of Kale the trench should be filled with warm fermenting stable manure, which should be frequently turned and fresh material occasionally introduced in order to communicate a genial warmth to the soil, which will have the effect of exciting the plants into earlier growth. Where the natural soil is of a light dry character, the covering of sand or ashes may be dispensed with.

It has been said that the season of this excellent extends from Christmas to the end of April. Attempts, however, are frequently made to have it in at an earlier period than that just named, but this is accomplished at a considerable sacrifice, as it necessitates the commencement of forcing at a time when the crops are still in blossom, and the leaves of plants still green, so that such production is generally weak and of inferior quality. In order to have Kale fit for use at Christmas the plants should be introduced to heat about the last week of November, or not later than the first of the following month.

Various methods of forcing are resorted to, most of them being attended with similar success—such as filling pits in which Cucumbers or Melons have been grown during the summer with fresh manure, which should be well trodden down, and allowed to settle for a week at least, when 9 or 10 inches of any light common garden soil should be placed upon it, in which the roots should be planted as closely together as possible, and the temperature of the structure should be about 65°. In order to entirely exclude light, the roof should be covered with mats or Prigi Domino, and over which should be spread an additional covering of dry litter; or a hotbed may be formed of stable-yard manure in the usual manner, upon which soil should be placed as has been recommended, and the plants, after being carefully taken up, should be planted in this, and after being well watered to settle the soil about the roots, each plant or group of plants should be covered with an ordinary Seakale-pot or box, when all should be well covered up with light dry littery manure, taking the necessary care to prevent the heat produced from becoming too intense.

Seakale of good quality may also be expeditiously produced by potting the plants and placing them in a Mushroom-house, a propagating-pit, or in any similar structure where heat and moisture can be furnished and withheld. One of the best methods, however, of producing this esteemed vegetable in the greatest possible perfection at either an early or a late period of the year is to grow the plants in pits prepared expressly for the purpose. These pits should be about 6 feet in width and of any desired length. The walls should be formed of 9-inch brickwork, and several of the lower courses should be pigeon-holed, if forcing is intended to be accomplished by the use of fermenting materials, such as stable manure, tan, or

tree leaves. But much labour may be saved by using for this purpose hot-water pipes. The back wall of the pit should be about a foot higher than that of the front, and the aspect should be south or south-east. The walls should be protected by a plate of wood, and fixed in the plate of the back wall should be hooks or staples of iron, on which light but strong wood shutters should be hung when the process of forcing commences. The shutters will have the desired effect of entirely excluding light, and in order to more fully secure this condition they should be kept covered with straw or any littery material, so that the Kale is produced perfectly blanched, as well as being quite clean, without being in contact with any decaying or fermenting substance.

The pit may be more or less sunk in the ground, as may be desired, or as circumstances will permit, for should there be reason to apprehend the rise of water, great depth had better be avoided; it should, however, be constructed to contain at least 2 or 2½ feet of good light rich soil in which to plant the Kale, and under this, say 1½ foot of bricks or flints to surround and cover the hot-water pipes; and in order to have sufficient command of heat for a pit 6 feet wide, not less than three lengths of 4-inch pipes will be required: two lengths have been found to be insufficient for the purpose.

At a distance of 6 feet from each other, 4-inch cast-iron pipes should be placed vertically, the lower end resting upon the stratum of flints or bricks and over the hot-water pipes, and this will be found to give sufficient surface-heat, as 1 foot of space between the surface of the soil and the wood shutters will be enough.

A pit so constructed should have the shutters removed as soon as forcing is over, if the weather be sufficiently mild. The plants should have proper attention as regards watering when necessary, manuring, keeping clean, &c., when they will submit to moderate forcing for many years, and continue to have a good supply of Kale, and they can be readily replaced by young plants when this is found necessary.

Where Seakale is extensively grown for market purposes, and where land is of great value, it is, I believe, seldom forced in the soil where it grows. But in private establishments, where a moderate but continuous demand has to be met, this is the most universally adopted method; and it is only for an early supply that a portion of plants are taken up and forced in various structures, as has been already alluded to, and old plants are generally selected for the purpose.

Seakale is generally planted in beds about 4½ or 5 feet wide, each bed containing three lines of plants; and when about to be forced the ordinary Seakale-pots with loose tops or lids are placed upon them, and all are then surrounded and covered up with warm fermenting stable manure mixed with tree leaves, and it then becomes necessary to carefully guard against the fermenting material becoming too warm, which would be not unlikely to prove fatal to the plants, although they are capable of enduring very considerable amount of heat. An excess of it is sure to produce weak and inferior Kale, so that it is always advisable to thrust a few sticks into the material, and its temperature can be ascertained by withdrawing and feeling the same with the hand. Tree leaves are generally to be preferred to stable manure, as the heat they engender is more mild, equal, and lasting.

It is also better to grow and force the plants in lines than in beds, as in the latter case the plants in the central part of the beds are very liable to get over-heated. A plantation of Seakale plants should be formed in lines running if possible north and south at a distance of 2½ or 3 feet from each other; each alternate line should be lifted for the purpose of early forcing, and those remaining will of course be at the distance of 5 or 6 feet from each other, and the plants should be 2½ feet apart, so that each may have a pot placed over it, and be well covered up with tree leaves, and should be occasionally examined to ascertain the temperature, as well as to know when the Kale is fit to be cut.

Seakale plants may be successfully raised from seed and also from cuttings. The seed should be sown thinly, early in the month of March, either in lines or in beds about 4 feet wide, with 1-foot alleys between them. The soil should, if possible, be light but rich, deeply dug or trenched, but without manure; and

when the plants are large enough to handle they should be thinned out so as not to be closer than 6 inches from each other. The soil in which they are growing should be occasionally stirred up, so as to keep them free from weeds during the ensuing summer, and so treated they will be ready to plant out by the middle of the following March in soil which should be duly prepared, and where they are intended to be grown and forced. Before planting the small straggling roots should be neatly trimmed off the plants, leaving only the straight tap-root with the crown or bud at the top. The planting may be effected with a dibble or setting-stick, and should the weather be dry the plants should have one good watering, and will generally require no further care than merely keeping the soil free from weeds.

When it is intended to raise plants from cuttings, these should be formed from pieces of the roots of plants which have just been forced, selecting for the purpose pieces about 3 or 4 inches in length, with, if possible, a bud or eye at the top, but this condition is not absolutely necessary, as nearly every portion of the roots will form buds; and to induce them to do this they should be spread out thinly on the surface of the soil in any convenient situation, and covered with about 2 inches of light soil or sand, and by the middle or end of March most of the cuttings will be found to have formed several eyes or buds, all of which, excepting the top, strongest, or best placed, should be rubbed off; and they should then be planted out where they are intended to remain, and receive in all respects treatment similar to what has been recommended for seedling plants. P. Griev.

THE VEGETABLE PRODUCTS OF ASTERABAD, PERSIA.

A VERY interesting account of the produce of Asterabad, Persia, is embodied in a recent report to the Foreign Office. The whole trade of the province of Asterabad does not amount, it seems, to more than £160,000 a year, and yet the province teems with valuable fruits and other vegetable produce. With regard to the climate we read that there is a remarkable difference between that of the southern shores of the Caspian Sea and the plateau of Persia between which rises the elevated range of the Elburz; for while the latter is dry, these provinces are noted for their dampness, and their vegetation is quite tropical. Swampy forests cover the whole surface of the lowlands lying at the foot of the Elburz on its northern face, in which every description of fruit tree grows luxuriantly; thus Walnuts, Nuts, Pomgranates, Mulberries, Plums, Grapes, Apples, Pears, Hops, and various kinds of berries grow wild in the forests; their quality is necessarily inferior, but they afford ample subsistence to the poor, who are in consequence inclined to be indolent. In summer the vegetable gardens produce every kind of Melon and Cucumber, and the vast quantities of this crude fruit consumed by the lower classes generates various sorts of fever, which prevail between the months of July and October. Owing to the great abundance of water on the surface of the soil everywhere, Rice is grown very considerably, but the culture of the Malberry tree is what absorbs the greater part of the attention of the inhabitants. The extensive plantations of this tree to be seen all over the plains. The younger the trees are, the more prized is the leaf as food for the silkworm, and old trees are usually cut down to make room for new plantations.

Near the foot of the mountains Boxwood grows in abundance, particularly in the district of Tenckabon, in the province of Mazenderan. Upwards of £27,000 worth of this wood was purchased at Rostow last year by an English firm, of Liverpool, and the great profits made by the individuals have induced many people to engage in this trade this year. Box-wood was formerly cut down in large quantities in the mountainous regions of the Caucasus, but disputes having arisen as to the rightful ownership of the forests, the Russian Government has, within the last few years, prohibited its being cut; hence it has been sought for in these provinces. It is a wood that grows very slowly, and requires much time to attain the size required for the market. It is thus probable that a very few years will see the end for a time of this branch of trade in this part of Persia. Already, in Ghilan, it has become scarce, but vast forests of it are still to be found in Mazenderan. The Governor of Ghilan, with a view to making the Persian

Government proficit by this rising industry, has thought fit to obtain the Shah's sanction to prohibit the further cutting of this wood and *loupe* without a special permission, and this measure has given rise to great dissatisfaction both amongst the owners of Box-wood forests and those engaged in cutting and exporting this timber.

In the valley of Elburz, through which the Seffudrud runs from the plateau of Persia to the Caspian Sea, the Olive tree grows freely, and Olive oil of a very fair quality might be produced if proper presses were employed; as it is, the oil, extracted by the most primitive methods, is thick and unsuited for the table; it is principally used in the manufacture of soap. Oranges, Lemons, Mandarins, and all the various descriptions of this kind of fruit are plentiful. Unfortunately the water of 1874-75 destroyed many trees; the loss accruing to the inhabitants of Ghilan alone from this calamity is estimated at not less than £200,000. Tobacco of the quality grown on the shores of the Black Sea, and known under the name of Bofra, has been tried at Kesh, and the quality produced is not inferior to the original stock. The governor, Nasir-ul-Mulk, who is both enlightened and enterprising, has, at the suggestion of the British Consul, written to Constantinople for a large supply of *ranja* and *Leitch* seeds; and should these qualities, so famous in Turkey, be suitable to this climate, the growth of this plant may attain some importance in the course of time. Owing to the great similarity of the climate of these shores with that of the foot of the Himalayas, where a fair quality of Tea is produced, it has been supposed that this plant would succeed here, and Tea seed has been applied for from that part of India to try it. Unfortunately the person who had first suggested this idea, and who had made overtures to the Persian Government for the establishment of a Tea plantation in Ghilan, has been obliged to quit the country on account of ill-health, and this notion has apparently been abandoned.

HÆMANTHUS MULTIFLORUS AND ITS ALLIES.

MR. KEIT, the present Superintendent of the Botanic Garden at Durban, in Natal, has just forwarded to Kew a dried specimen—living plant to follow—of a very fine *Hæmanthus*, allied to the well-known *H. multiflorus*, of which we have already published, and named after the lady who discovered it, Mrs. Katherine Saunders. We had flowers of the same plant from Mr. Sanderson in 1869, but nothing more, and as it is still unnamed and undescribed I have pleasure in fulfilling Mr. Keit's request. As we now know much more about this group of species than has ever found its way into print, and they are of great horticultural interest, and there are no satisfactory descriptions in existence of the species already known, I propose at the same time to pass the whole group under review, and to describe two other new species which I have been for some time intending to publish.

This group of *Hæmanti*, of which three species are already published, is marked by its large thin leaves, comparatively narrow and fugitive bracts, and by its loose globose umbels of very numerous flowers, in which the segments of the perianth spread horizontally or even become reflexed when fully expanded—thus offering a decided contrast in habit to the three other groups, of which we may take *H. panicatus*, *H. carneus*, and *H. coccineus* as the type. It will be found characterised as a genus under the name of *Nerissa* in Salisbury's *Genera Plantarum*, p. 131, with a character drawn up from *H. multiflorus*, which was the only species with which Salisbury was acquainted.

As we know the species now, they stand as follows, including the three novelties:—

1. *H. multiflorus*, Martyn, Monog. com loone; Bot. Mag., t. 961 and 1995; Andr. Bot. Rep., t. 318; Bot. Lil., t. 204; Lodd. Bot. Cab., t. 912 and 918; Fiore des Serres, t. 32.—Bulb globose, 1½–3 inches in diameter, with a tuft of cylindrical root fibres, stoloniferous. Leaves 3–4, produced on a short spotted stem, contemporary with the flowers, sheathed lower down with many deltid root-furrow leaves; blade bright green, oblong acute, nearly a foot long, 3–4 inches broad when fully developed, narrowed gradually at the base to a short broad, flattened petiole, furnished with nine or twelve indistinct vertical ribs on each side of the midrib, which are connected by obscure cross bars about a line

apart, dying down in November or December. Scape arising from the bulb on one side of the leaf-stem, about 1 foot long, much spotted with purple, produced in April or May. Bracts of the spathe linguulate, 1½–2 inches long, green, flushed with red, soon withering and withering, the dense expanded globe umbel half a foot in diameter. Pedicels 1½–2 inches long, mixed with many linear bracts. Flowers as many as a hundred in one umbel; ovary oblong, ¼ inch long; perianth deep red; tube cylindrical, ½–¾ inch long; reflexing bright red segments, 1 inch long, 1½–2 inches long. Filaments bright red, erecto-patent, 15–18 lines long; anthers linear-oblong, versatile, ¼ inch long. Style bright red, protruded nearly a couple of inches from the perianth tube. Fruit a scarlet berry.

This has been cultivated in our greenhouses for more than 250 years, and is figured by Vallet in his *Jardin du Roy Henri Quatre*, which was published in 1608. The wild specimens which I have seen have been gathered at Sierra Leone by Borone, Barter, and others, and at Fernando Po by Barter, the latter at an elevation of 5000 feet above sea-level.

2. *H. abyssinicus*, Herb. Amarnyl., p. 228; Kunth, *Ven.*, pl. p. 587; *H. delagoensis*, Herb. Amarnyl., p. 228; *H. tenax*, Herb. in Bot. Mag., p. 589; Kunth, *Enum.*, vol. v., p. 587; *H. multicaulis*, A. Rich. Fl. Abyss., vol. ii., p. 312.—Habit entirely of *H. multicaulis*, the leaves being produced upon a separate stem after the flowers expand, and the scape lateral. Fully-developed leaves not seen. Bulb of the year globose, a couple of inches in diameter, with membranous segments; the old bulb represented by a short thick tube beneath it. Scape a foot or more long, much spotted in the lower half. Umbel very dense, reaching a diameter of 3–6 inches when fully expanded. Bracts of the spathe linear or lanceolate, 1½–2 inches long, fugacious. Pedicels ½–¾ inch long. Ovary globose, ½ inch long; tube cylindrical, ½–¾ inch long; reflexing linear segments, ¼ inch long. Filaments bright red, 1 inch long; anthers oblong, ½ inch long. Style protruded from the perianth tube 1½ inch.

Spread through Tropical Africa from Mozambique and Delagoa Bay (Forbes), to Zambesi Land (Kirk, Meller, Waller), Abyssinia (Salt, Quartin-Dillon), the White Nile country (Petherick), and Guinea (Barter, E. Vogel). It is obviously very near *H. multicaulis*, but I have never seen the fully developed leaves. According to Dr. Quartin-Dillon, its Abyssinian name is *Iamboba* ambassa, or lion flower, and the natives attach the bulbs to their garments as an amulet.

3. *H. rupestris*, Baker, n. sp.—Bulb of the year 1 inch thick, with many tunicated coats, the bulb of the previous year remaining attached at its base as a short firm tuber. Leaves on a special stem, lateral as regards the scape, not fully developed till after the flowers fade. Fully developed leaf with a petiole and membranous lamina each ½ foot long, the latter oblong, spotted, rather obtuse, 3–4 inches broad, rounded at the base, with indistinct vertical and transverse veins, the central main veins 1–¾ inch, and the transverse veins under half a line apart. Style slender, lateral, 1–1½ foot long. Umbel dense, 3–4 inches in diameter, bracted by 3–4 oblong-lanceolate reflexing leaves 1–¼ inch long. Pedicels ½–1 inch long. Ovary globose, ½ inch long; tube cylindrical, 1 inch long; perianth-segments narrow, linear, 1 inch long. Filaments as long as the perianth-segments; anthers oblong, ½ inch long. Style protruded from the perianth-tube 1 inch.

A native of rocky places near Nupe, in Guinea, discovered on the Niger Expedition of 1859 by Barter. It is close ally to *H. multicaulis*, but the umbel is not more than half as large; all the parts of the flower are smaller, and the leaf has a different vein and shape, and a petiole as long as the lamina.

4. *H. Katherina*, Baker, n. sp.—General habit entirely of *H. multicaulis*. Leaf-stem reaching a length of 1 foot, bearing 3–4 produced leaves crowded together with the flowers, with a petiole 2–3 inches long, and an oblong lamina 1 foot long, 4–5 inches broad, rounded at the base, and rounded at the point to a small cusp; main veins 9–10 on each side of the distinct costa, the central ones ½ inch apart, the transverse veins half a line apart, simple or anastomosing, both veins and veinlets very much more distinct than in *H. multicaulis*. Scape above 1 foot long, lateral as regards the leaf-stem. Umbel dense, 6–7 inches in diameter when expanded, bracted by 5–6 fugitive green spathe-valves 2 inches long. Pedicels ½–¾ inch long. Ovary oblong, ½ inch long; perianth-tube cylindrical, 1 inch long; segments lanceolate, reflexing, deep red, ½–¾ inch long. Filaments erecto-patent, above 1 inch long; anthers oblong, ½ inch long. Style protruded from the perianth-tube 1½ inch.

A native of Natal, discovered by Mrs. Saunders and Mr. Sanderson, as already stated. It differs strikingly from *H. multicaulis* in the veining of the leaf and in the proportion in length which the tube of the perianth bears to its segments.

5. *H. cinnabarinus*, Decaisne, in Van Houtte's *Flore des Serres*, tab. 1195; Hook. in Bot. Mag., t. 534; *Floral Mag.*, new series, t. 245.—Rootstock of the year hardly at all bulbous, that of the year before present at its base as a globe oblong above-tuber, from the top of which issue the coalescent cylindrical root-tubers, about four in a radial rosette, from the centre of which the scape springs, fully developed at the same time as the flowers, with a channelled petiole 6–8 inches long, and an oblong, subacute membranous lamina, 6–8 inches long, with a 3 ribs broad at the middle, which is narrowed gradually to the petiole; veins moderately distinct, those of the centre of the leaf ½ inch apart, the transverse veins 1–1½ line apart. Scape slender, about 1 foot long. Umbel 20–40 flowered, 3–4 inch in diameter when fully developed, bracted by 4–5 linguulate fugacious bracts about an inch long. Pedicels ½–1 inch long. Ovary globose, ½ inch long; perianth tube ½–¾ inch long; reflexing deep red lanceolate segment ½–¾ inch long. Filaments as long as the perianth segments; anthers oblong, ½ inch long. Style protruded about an inch from the perianth-tube.

Gathered by Mann at Ambas Bay, on the banks of the Bagroo River, and at an elevation of 4000 feet on the Cameroon Mountains. Easily to be distinguished from *H. multicaulis* by its long petiole, the segments which spring direct from the rootstock and by its central scape.

6. *H. rotularis*, Baker, n. sp.—Bulb of the year little thickened, that of the previous year remaining at its base in the form of a large, hard, oblong tuber. Leaves springing direct from the top of the root-stock, fully developed at the same time as the flowers, with a channelled petiole about 4 inches long and an oblong sub-acute membranous lamina 7–8 inches long, 3–4 inches broad at the middle, narrowed gradually to the base, and veinlets both very distinct, the central veins 1–½ inch apart, and the transverse veinlets above half a line apart. Scape central, slender, under a foot long. Umbel dense, about 4 inches in diameter when expanded, bracted by about half-a-dozen lanceolate bracts 1 inch long. Pedicels ½–¾ inch long. Ovary oblong, ½ inch long; perianth-tube cylindrical, ½ inch long; segment 1 inch long, twice as long as the tube. Filaments as long as the segments; anthers oblong, ½ inch long. Style protruded from the perianth-tube 1½ inch.

A native of the forests of Yomba, in Guinea, discovered by Barter in the Niger Expedition of 1859. It is close ally to *H. cinnabarinus*, from which it differs in the bracts and leaves.

The following key may help to show the general relationship of the species:—

Subgenus *NERISSA*.—Spathe of 5–6 fugitive valves. Segments of the perianth spreading widely when expanded.

Scape lateral. Leaves produced on a special stem.

Perianth-segments twice as long as the tube.

Expanded umbel 6–7 inches in diameter.

Perianth-segments lanceolate; anthers 1 inch long.

Perianth-segments linear; anthers ½ inch long.

Expanded umbel 3–4 inches in diameter.

Perianth-segments half as long as the tube.

Scape central. Leaves produced direct from root-stock.

Bracts shorter than the umbel.

Transverse veins not very close nor distinct.

Bracts as long as the umbel.

Transverse veins very close and distinct.

I have also seen two other species of the group in a state too incomplete to describe at present.

J. G. Baker.

Notices of Books.

Theorie des Gartenbaues, von Max Kolb, Inspektor am Königlichen Botanischen Garten zu München. (Theory of Horticulture, &c.) 1 vol., 8vo, 388 pp., with woodcuts. Ulmer, Stuttgart.

This is one of a series of volumes devoted to scientific horticulture in course of publication by the firm named above; and, as reasons seem to be given for its interest for horticulturalists of all countries. In the first place it is now nearly forty years since Lindley's celebrated work on this subject first appeared, and although its high character soon gained for it the position of a standard text-book wherever horticulture was practised, and caused it to be translated into

nearly all the principal languages of Europe, it has in some respects long been out of date, nevertheless it has never been replaced by any special work, and the scattered literature of the discoveries and researches of the last forty years is practically out the reach of all those having little leisure time, even if they are so fortunate as to have access to a good library.

The want of a work embodying the results of recent researches in horticulture, and embracing all the countries which have been using Lindley's book; and our author appears to have undertaken to satisfy this want for his own country at least. How far he has succeeded can better be proved by actual use of the book than by a hasty examination of its contents. The perusal of certain passages suggests the desirability of the compiler of a work of this nature having the co-operation of colleagues in other countries, especially in those countries whose literature is little known to him, in order to enable him to refer to it thoroughly; or otherwise there is a danger of his being too highly lined with the writer's nationality to become a generally accepted standard authority on the subject on which it treats, because in many cases he has to depend upon others for his information of what has been done abroad. This may be complete and trustworthy, or it may be imperfect and distorted. We shall presently give an illustration of our meaning; but let us first describe the plan and scope of the book before us. Following a short preface is a preliminary section, which embraces the history of the primary division and chapters, and the headings of each paragraph and reference to the pages where they commence. This occupies nearly eight pages, and is so complete that it compensates to some extent for the absence of an index; but an index in a work of this description is of inestimable service. The headings of the principal sections will give some idea of the scope and plan of the work, which opens with an introduction in which the importance of combining scientific knowledge with practical experience is insisted upon. The sections comprise the following points: history of the theory of vegetable nutrition; morphology of the cell and tissues; external organs; vital processes; nutrition; metals found in the ash of plants and their importance; plant-ash and soils; absorption of the nutrient substances; course of the substances taken up; assimilation and metastasis; products of assimilation; influence of light on plant life; heat and cold in their relations to vegetation; mould and subjacent rocks and formations; origin of soils; physical properties; absorption of nutrition from the soil; rotation of cultivated plants; condensation of gases by particles of soil; temperature of the soil; observations on some of the less important properties of the soil; moisture in the soil; climate and situation; plant diseases; the theory of compensation; of manuring; manures, natural and artificial. Many of these sections are divided into a dozen or score or more chapters and paragraphs, so it will be understood that with less than 400 pages of rather large print, some of the questions are very briefly discussed. Indeed, in some cases important and serious questions are assumed. However, brevity with perspicuity is of the first importance, and if the writer has sometimes sacrificed the latter, it is perhaps to those only who know nothing of the subject at starting. Sachs' *Text-Book of Botany*, of which an English edition exists, has been, as most be expected, very largely drawn upon; and a number of the cuts illustrating morphology are derived from this work. The chemistry of plant life is pretty fully discussed, even to the descriptions of the elements; and forty pages are devoted to the products of assimilation. We do not say this is too much, but more space, in our opinion, should have been given to experimental investigation directly bearing upon a rational theory of horticulture.

Of course it would be impossible to describe in detail the mode of conducting every experiment that has led to an important discovery, or furnished some useful fact of interest to the practical cultivator of plants; but something more than an ascertained fact or a generalisation is required by the beginner to give him an interest in the subject. This brings us to the explanation of some of our reasons for saying that it has been done in foreign countries. In the chapter on the "mineral theory" the author quotes the late Baron von Liebig's distorted and perille objections to the distinctions recognised by Dr. J. B. Lawes between the artificial manures employed in his experiments, because for convenience he restricted the term mineral to the incombustible or ash-constituents. In quoting

this, and in what he says respecting the theory altogether, Kolb appears to be quite ignorant of the magnitude and importance of the experiments which have been carried on at Rothamsted by Dr. Lawes for about thirty-five years. In spite of his grand discoveries Liebig was wrong in his original theory of the nutrition of plants, and it was the experiments at Rothamsted that proved its fallacy. Liebig held that the presence of ammonia in the manures was unnecessary; this was disputed by Dr. Lawes, and his experiments, which are still being continued, conclusively prove in all cases that in the absence of ammonia from the manures the produce is very little above that of the unmanured plots. In one of his early works, Liebig maintained "that the supply of ammonia is unnecessary for most of our cultivated plants, and that it may be even superfluous, if only the soil contain a sufficient supply of the mineral food of plants, when

the inorganic manures furnished the mineral substances only. In this way the practical man Lawes endeavoured to explain the doctrine of vegetable nutrition, but Liebig, nevertheless, held fast to his views, combated this theory, and sought proofs of his own. Still he was unable to account for the failure of his manures. Liebig contended that the atmosphere was sufficiently rich in ammonia, that plants could easily obtain all they required, whilst Lawes considered the addition of ammonia as indispensable necessary. Moreover, if Lawes' theory were correct, it would be impossible to maintain the ever-decreasing fertility of a field, for in no case could ammonia have been applied in quantity at an outlay that would permit of its being employed as manure. Finally Liebig succeeded in finding the cause of the inefficiency of his artificially compounded manure. After submitting step by step all the new facts to a

he treats of the theory of manuring. In fact, in our opinion, too little is said respecting the practical application of theoretical knowledge, and the apparent contradictions which practice furnishes. Theories dogmatically set forth, without any saving clauses, and without a careful examination of the various modifying conditions to which they may be subjected, do little good, because it frequently ends in their being altogether rejected. Had our author been aware of the results of the numerous series of experiments carried on at Rothamsted, he would have perceived the necessity of giving some of them, even if he could not accept them as facts himself. Thus, for instance, it is found that field results with Barley, as well as with Wheat, grown for twenty years in succession on the same land, are entirely inconsistent with the mineral theory as first put forward by Liebig and explained by Kolb. Then with regard to the general

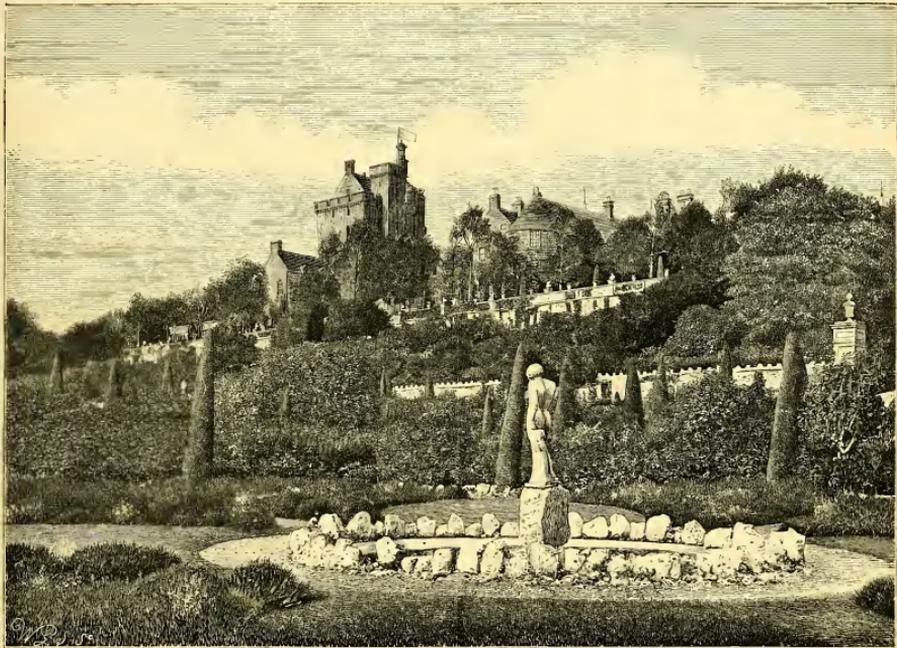

FIG. 106.—VIEW IN THE FLOWER GARDEN AT DRUMMOND CASTLE. (SEE P. 660.)

the ammonia required for their development will be furnished by the atmosphere."

Subsequently he changed his opinion on this point and sought to cover it by claiming ammonia as included as a mineral element in his mineral theory. Strictly speaking, of course, ammonia salts are mineral substances, but Baron Liebig distinguished between mineral manures and ammonia, as the above quotation shows. But all this has been so fully explained in several of the reports on their experiments, drawn up by Messrs. Lawes and Gilbert, that it is sufficient to mention it here. Here we quote Kolb:—"As Lawes' investigations and observations led him to the conclusion that ammonia and phosphates are the favourable manures, he set up a theory which culminated in the proposition that manures should be divided into two classes, organic and inorganic. The organic, to which ammonia was referred, were those which by decomposition supplied the plants with carbonic acid, water and nitrogen; whilst

careful and searching trial, he discovered the law of the power of absorption by the soil of plant nourishment. As already observed, Liebig had thought that the alkalies must be offered in an insoluble form, or they would be carried away by water into lower layers of soil out of the reach of most plants. But, on the contrary, the soil possesses the highly remarkable property of being able to fix chemically and physically all the elements requisite for vegetable nutrition. Let any one who would obtain an insight of this fact try the simple experiment of allowing water mixed with a nutrient solution to percolate through a layer of earth, and the water which has passed through will be almost pure, whilst the nutrient substances will be held fast by the particles of soil." From the foregoing extract it will be seen that the author is imperfectly acquainted with the present position of the theory of vegetable nutrition, not only in this country, but also as embodied in the later views of his eminent countryman. This appears again further on, where

statement that land manured with farmyard dung only will gradually deteriorate and finally become exhausted. At Rothamsted the average annual crop of Barley for twenty years on the same land, manured with farmyard dung, at the rate of 14 tons per acre, is not far short of 50 bushels of grain (or more if reckoned at only 52 lb. per bushel) and 30 cwt. of straw. It is a noteworthy fact, too, that with this kind of manuring there has been the greatest increase of produce, and especially of corn, over the second, as compared with the first ten years. It is true that mineral and nitrogenous manures together, gave for twenty years in succession on the same land, rather more of both corn and straw than farmyard manure. On the other hand, mineral manures alone gave very poor crops, and the quantity fell off considerably during the later years, whereas with nitrogenous manures alone there was a much higher yield, less decline in the later years, and, fair, though not full, crops were obtained

for twenty years in succession. Finally, with regard to the particles of soil fixing the elements required as food by plants, this statement needs qualifying, as we are taught by an examination of the analyses of the drainage water collected at Rothamsted. Now, although we have considered it our duty to expose what we look upon as the weak point in this new *Theory of Horticulture*, we have much pleasure in saying that in most other respects we believe it will be found to meet the requirements of practical men. *W. B. Hensley.*

Apiary.

LIGURIAN, OR ITALIAN BEES.—One great obstacle in keeping these bees is the difficulty of preserving them pure. I prefer either to have pure black or pure Italian stocks; hybrids, if my limited experience is worth anything, are exceedingly irascible insects, but the pure-bred bees I consider very peaceable. The only method to keep the breed select is to have the apiary at least 3 miles away from the black bees; and there are many districts where this could be done with ease.

I have seen it stated on good authority that the Ligurians are longer lived than the common bees; if this be so, it will not only account for the stronger stocks, but for their excellent swarming properties. It is generally admitted that as a rule they swarm earlier and later than the black stocks. A friend assures me his hybrid stocks even send out good swarms three weeks in advance of the other bees. I can generally promise swarms at least a fortnight before my neighbours, but on the other hand I am compelled to watch them most jealously towards the close of the honey harvest, when swarms issue, as they frequently do quite unexpectedly. To prevent my stocks becoming too weak from this over-swarming propensity, I again return them back into the hive. This, however, should be regarded as a great point in their favour. I am quite aware there are some writers who look upon the Italians as mere novelties, which like other new things will soon wear out, and under this poor plea they declare they do not swarm earlier or more frequently. I have often heard it said, "the proof of the pudding is in the eating." I think a little observation, side by side with our common bees, will convince any one that they are much superior in every respect.

Another point is worthy of notice;—they are much less sensitive to cold and damp weather. I cannot speak so clearly upon this subject, though Langstroth and Neighbour, after many and very careful experiments, both unobscuringly believe them to be far harder. In exposed districts they would be more profitable, from the fact of their being less sensitive to the variable weather we often experience.

It is not a difficult thing to Italianise the whole apiary, after a pure queen is once secured, though I would not recommend any bee-keeper to be over anxious to do this, unless his apiary is isolated and at least a considerable distance away from any stand tenanted by black stocks.

Having stated these few points in their favour, viz., their incessant activity, constant diligence in making the most of every favourable moment, excellent swarming qualities, peaceable behaviour, and their being less sensitive to cold, &c.—this is sufficient to induce every enthusiastic bee-keeper to give them a fair trial—I may now be allowed to say a few words, not exactly in their favour, for I must in justice confess they are determined thieves and burglars. About the first instance I ever received about this was during the first autumn they were in the neighbourhood.

A friendly bee-keeper came hastily one day to request my attendance in her garden. Upon reaching her bee-hive I discovered a terrible slaughter going on.

Such a fierce battle I never witnessed before or since, for I speak justly when I say many thousands of the common bees lay strewn on the ground dead and dying, whilst in the air they closely resembled a swarm just after emerging from the hive. Making inquiries, I learned she had most injudiciously been feeding her stock with liquid sugar, some of which had been spilled over her straw hives. This had naturally excited her own stocks, and in the end led to the robbery and consequent slaughter. For a few minutes I could do nothing to stop the fray, for my friend caused me to laugh immoderately by seeing her excitedly dancing, and exclaiming "Oh! the yellow races. Oh! the dirty wasps. Wasps always live by thieving!" In a

short time I succeeded in diminishing the crowd of combatants by closing up the entrance to all the hives, leaving only room sufficient for one to pass at a time. When quietude was restored in the evening we found two stocks out of the three completely depopulated—certainly not a hundred bees remained alive. This is scarcely credible when I assure the reader that the Ligurians had come a distance of half a mile, and had finished their task most thoroughly in, perhaps, six hours, for a very little honey could be found in the two empty hives after the fight.

I am sorry, after giving them all the praise I think they deserve, to give them so bad a character to finish up. Where a mixed apiary is kept, it will not please to be always in fear of a war coming on at any moment, though if the hives have a small entrance it is the only and best protection that can be given them; generally, if the stocks are strong, they will take care to jealously guard their treasure.

In conclusion, I may be permitted to give a short history of this bee, taken from M. Hermann's pamphlet.

"The yellow Italian Alp bee is a mountain insect. It is found between two mountain chains to the right and left of Lombardy and the Rhaetian Alps, comprising the whole territory of Tessins, Veltin, and South Graubund. It thrives up to the height of 4500 feet above the level of the sea, and appears to prefer the northern climate to the warmer, for in the South of Italy it is not found. The farther one goes from the Alps the less handsome they are found, as, for example, in Nice, until they are entirely lost in lower Italy in the black species. We must, therefore, look for the original in Switzerland, and we can call them with as much right Apis helvetica, as the Genoese call them Apis ligustica. Some learned men have called them Ligurian bees, but that name has neither historical nor geographical claim, and not one bee cultivator of the whole district of the Italian Alp bee knows what kind of insect Ligurian bees are. The Alps are their native country, therefore they are called yellow Alp bee, or tamed house bees, in contradistinction to the black European bees, which we might call common forest bees, and which on the slightest touch fly like lightning into your face.

"The Italian yellow bee differs from the common black bee in its longer, more slender form, and light chrome-yellow colour, with light brimstone-coloured wings, and two orange-red bands, each $\frac{1}{2}$ inch wide. Working bees as well as drones have this mark. The drones are further distinguished by the bands being scalloped like the spotted water serpent, and obtain an astonishing size, almost half as large again as the black drones. The queen has the same marks as the black queen, but is much more conspicuous and lighter; she is much larger than the black queen, and easy to be singled out of the swarm, on account of her remarkable bodily size and light colour. The bees are almost transparent when the sun shines on them.

"This race has nothing in common with the black bees, which can be instantly seen by their ways and manner of building. The cells of the Italian bees are considerably deeper and broader than those of the black bees. Fifteen cells of the Italians are as broad as sixteen cells of black kind."

Dzierzon says: "I am so firmly convinced that the Italian bee is the *ne plus ultra* in beauty, good nature, industry, and ability to defend herself, that for this reason I would exchange her for no other. That she may be maintained thriving and pure in our climate is manifested by thirteen years' experience, during which she has been improved by careful breeding."

I hope the day is not far distant when the Italian bee will be more generally known, when I am satisfied it will maintain its position. *R.*

Natural History.

GOLD FISH.—I bought in the Bayswater Road yesterday some gold fish about 2 inches long. My vendor assured me that they would always remain under 3 inches. They were from Japan. Is he justified in so pronouncing? It tells much for the sense of the present generation that this large and respectable shop, containing solely aquaria and similar things, should be able to exist so far west as Bayswater, near Queen's Road. *East Somerset, Winscombe, May 19.*

Garden Operations.

PLANT HOUSES.

GREENHOUSE HARD-WOODED PLANTS.—Specimen hard-wooded plants flowering during the coming month will require slight shade in the middle of the day, not only to prolong the duration of their bloom, but to preserve the colour of the flowers. Even such subjects as *Aphelexis* and *Phœnochaia*, if fully exposed to the sun for a few days, take on a bleached appearance, and it is worth while to keep them in good condition as long as we can, even when only required for ordinary decorative purposes. All plants that have done blooming, and that seed to any great extent, should, immediately the flowers are faded, be picked over before the seeds are formed. It is no uncommon occurrence to see such things as *Acrostyllum venosum*, *Episcia*, *Eriostemon*, *Acrostyllum venosum*, *Episcia*, *Eriostemon*, *Acrostyllum venosum*, *Episcia*, *Eriostemon*, &c., left for weeks after blooming expending their energies in the useless production of seeds, where every day so lost is a serious drawback. *Aczales* differ from many plants in the time at which they require shade, inasmuch as they rarely the slightest movement of the roots until after flowering, although if in good condition they will have made 2 or 3 inches of young growth, and as it is unadvisable to stop them before root-action has fairly commenced, the time of potting must be regulated by this. Where, as in most places, they are to be in flower to form a succession, the potting will need to be done at different times. Those that bloomed a few weeks ago and want more root-room should now be potted in larger pots, and have got to starting like the size they are required do not need repotting so often as many things, as they can be induced to make strong growth by the assistance of manual stimulants during the growing season, yet it is not well to let the roots be kept on growing from last autumn in a little warmth, many will have their pots now very full of roots; and if such receive a moderate shift at once, and are kept in a warm moist atmosphere, there is yet plenty of room for them to make considerably more growth. In the winter season, when the plants are growing, such as those under consideration, there is often a great mistake made in their early stages by the shoots being stopped with the intention of producing a bushy habit, which would be much better deferred until the ground has been prepared for the specimen on a larger scale, by confining the plants to fewer branches, keeping them more open in the centre. Plants so treated will live much longer than such a bushy habit, by persistent stopping, until a fully furnished specimen has been obtained at more than a fourth the size they are required to attain. We frequently hear objection taken to any bending or twisting of the shoots of these and other hard-wooded subjects, on the plea that it gives the plants an unnatural appearance, and that the young shoots are not in the early stages of the plant's growth bent down near the base all the art of the cultivator can never afterwards maintain equal strength and blooming capabilities betwixt the base and top. It is through this cause that three-fourths of the hard-wooded pot plants we see are much weaker at the bottom than the top, and ultimately become bare and naked; for if the strongest natural most vigorous branches are allowed to hold an erect position up to the top of the plant, no amount of bending or twisting will prevent them drawing more their share of the sap, and in this way starving the weaker and lower shoots. A half or full-sized specimen plants that are in a healthy condition, yet produce but a great number of shoots, may be improved by at this time thinning-out from one third to one-half of the weakest; those that remain will be thereby strengthened; at the same time the leaves will get more light, and be correspondingly stouter in substance, and better calculated to perform their allotted functions, many fewer falling off in the autumn. If any trace of thrips or red-spider exists they will now increase apace unless means are taken by dipping with spraying with tobacco-water or ink, by their destruction. Wherever *Aczales* are expected to grow and flower in the way they are capable of, I must again urge the necessity of keeping these two most pernicious insects completely under. The work of insects are unsatisfactory in condition so often complained of with *Azaleas* in the open, the majority of cases owes its existence to the injury done to the leaves by these insects. A daily free use of the syringe, with plenty of moisture in the atmosphere, and never allowing the plants to wither, will get rid of the red spider at the root, are amongst the best means of keeping them down. Both old and young plants that are now making growth, will be benefited by the application of Standen's manure, which, after trying every thing I have heard recommended in the shape of

liquid or solid stimulants, I have found to be unequalled for these Azaleas. *T. Baines.*

ORCHIDS.—That the plants in these houses may now make and perfect all the increasing growth it is destined to, they will be found to require, as usual, to increase the temperatures during the night and early morning to the maximum readings they should have at any time. The length of daylight also being now nearly at its greatest, it will be necessary to draw the curtains together, and to command so that with increasing heat and moisture and a well-regulated atmosphere, the young growths as they push up may be assisted, and thus develop the strength and vigour which is apt to be only, as it were, partially developed in these houses. In the case of the various divisions when all are treated in a regular, and what may be described as the usual and ordinary, method; there are times, however, when for particular exhibitions, or from causes of a special nature, some few plants may be required at an earlier period than that in which they would come under the usual manner of treatment. When such is the case it will be necessary to take them from the beds in the day-time, and to place them in one where the temperature is a few degrees warmer, and where during the day 10° to 15° of extra heat is given; sometimes, however, it happens that a few plants from the East-India-house require a little sooner; if these, therefore, can be stood in a house of small dimensions by themselves, and treated to a higher range of temperature, it will be found that such a course is much more satisfactory and safe than to subject the whole of the plants in the house to a cooler heat, that the extra heat may be brought on just a little sooner. The night, or rather early morning temperatures, must now be as nearly as follows:—East-India-house, 70°; Dendrobium-house, 55° to 70°; Cattleya-house, 65°; Odontoglossum-house, 60° to 65°. The houses which left for the night must be several degrees above these numbers, the temperatures gradually falling to those just stated; and the fire in the morning must then be put on so that the heat may be advanced 1° or 2° in the day to be bright and clear, several degrees extra by sun-heat must also be permitted. Thus with a healthy and brisk-growing temperature the plants will come on in a healthy and flourishing condition. At the time of writing (May 21) the plants which keep the first rank are, in the order in which they stand, the following:—*Phajoloba*, what of plants, but with a keen cutting north-east wind, so different to what is expected at this period of the year, one must take account of what the outer circumstances and weather is, and use all precautions that can be made to prevent the plants from being overdone by making rapid growth, broad leaves of a deep shining green indicating a good and vigorous action at the roots. Give these now plenty of water at the roots, and about once a week treating them to some liquid manure occasionally sprinkling them overhead with clear tepid water. The *Masdevallias*—*Veitchii*, *Lindleyi*, *Harrayana*, &c., will now be ablaze with their singularly formed and richly coloured flowers. It is surprising and also very pleasing to notice the distinct markings that are to be found among them, and when one of unusual richness of colour is obtained it is much to be preferred to those of a lighter and therefore less striking colour. *M. Harrayana* is especially likely to be met with where the shade and shape are so dissimilar that one feels almost inclined to think they should be grown under distinct names. The singular *Restrepia antennaria*, the flowers of which, both in colour and form, bear a striking resemblance to a beetle or fly, though it is possible in every collection where *Masdevallias* are grown, for the treatment required for the one suits the other exactly. The short spike of this should not be cut off, for, like *M. tovarensis*, it will push out flowers the second year, and thus add to the number of blooms the plant is capable of producing. Give these now plenty of water at the roots, air at every favourable opportunity, and carefully protect them from the direct rays of the sun. *W. Swan, Fallowfield.*

FRUIT HOUSES.

PINES.—The spring-started plants which have been placed in fruiting pots, so that the roots be in a satisfactory state, be making growth very freely. To ensure its being of a sturdy robust habit the plants should be placed about 2 feet apart every way, and common every-day requirements should be attended to, such as if possible to keep the plants in a moderate degree of air-heat about the plants up to their minimum point of 85°, and close up finally for the day with a moderate degree of sun-heat in the forenoon. If, on the other hand, the weather be very hot, the plants should be content with about 65° at night and 70° in the daytime; under these circumstances such a variation in temperature will not be injurious if the heat at the roots is kept uniformly from 80° to 85°. In the case of Queen plants, these degrees of heat being established for the base of the pots; many vexatious disappointments in the way of defective fruit would undoubtedly be avoided if due attention was paid to this

important matter. In the fruiting department lack of that indispensable element—sunshine—with its natural consequences, will be the means of retarding in some degree the ripening of forward fruits. It will be necessary, however, to use artificial means commensurate with the purpose of about 75° to 80° constantly, and in proportion to the supply of fire-heat a corresponding amount of moisture should be applied under any circumstances. Lightly dew the plants overhead with clear tepid water whenever the axis of the fruit is visible, and in the case of the Queen plants, the suckers are very apt to disturb the erect position of the fruit; this matter should be seen to and obviated by means of a small stake, as nothing is more objectionable to its appearance than a one-sided curve of the fruit. In the case of the Queen plants, the base of the crown should be removed as soon as they appear, and also any superfluous suckers beyond the one fruit kept for stock. Plants which are swelling off the roots freely will need much care in regard to watering. This matter should be managed by a practised hand, as water should be given copiously whenever it is required, mixing with it some stimulating agent, and applying it at the same temperature as advised for the base of the plants. In the case of the Queen plants, shade should be taken of solar heat to keep the temperature about the plants at its maximum point, 90° to 95°. Close up the house with it at 85° or 90°, and at all times when there is a prospect of a sunny day slightly open the shut botoms in the morning. *G. T. Miller, Wycombe Abbev.*

ORCHARD HOUSE.—Fruit trees in the unheated orchard-house will now be seen to be in a satisfactory state for some years, and up to the present time there is every appearance of a continuation of dark, cold, and sunny weather. Where root-action is good, and the earliest Apricots and Peaches are swelling kindly, disbudbing and pinching of the fruit may be proceeded with, and where the young fruit makes a stand when they have reached the size of horse-beans, thinning had better be deferred, as it is more than probable that many of them are imperfectly fertilised, and will, as a matter of course, be liable to fall. The use of the syringe may also be regulated by external conditions, particularly in the afternoon, when the foliage should be kept dry, as we may yet have a repetition of the 5th inst., when the thermometer marked 14° of frost. Let all be managed in the most judicious manner with tepid water. Ventilate with care on the south or west side, and if the sun does shine endeavour to raise the temperature 10° to 15° by closing early. All trees, whether in pots or planted out, may now be planted in the ground, but the soil must consist of rotten dung, old turf, and lime rubbish, thoroughly mixed and laid on lightly. For the borders half-decayed manure is best, as it absorbs and holds the water in, which will be necessary until we have a change to milder weather. Hand-pick grubs from Apricots, Plums, and Cherries. Dress Peaches and Nectarines with Pooley's tobacco-powder for the destruction of black or brown fly, and fumigate with tobacco-paper for the ordinary green aphid. *W. Coleman.*

CUCUMBERS.—With the atmosphere constantly charged with thick black vapour sufficiently dense to veil the earth from the influence of the sun, accompanied by a keen wind from the north-east, attention to the fires is as important as it was in December, and in proportion to the amount of fire-heat so must be the amount of plants to fall bearing, particularly in a free growing state and clear of red spider and thrips, which spread so fast at this season if left only for a few days in undisturbed possession. Keep the growths thin and orderly by going over the house at least twice a week. Remove the stems and old leaves on which the enemy lurks, at each dressing. Syringe occasionally late in the evening with a solution of Gishurst Compound, half an ounce to the gallon of water. Give plentiful supplies of liquid manure to plants that fall bearing, particularly if growing in pots, and sprinkle the flowers at night with the same, the ammonia from which will greatly stimulate the young growths, and so enable the plants to distance their insect enemies. If a steady supply of fine straight fruit is the object, over-cropping must not be allowed, neither must the fruits hang too long on the Vines. Shade as little as possible, providing the young fruits do not get scorched by the sun; in some houses this may be very troublesome, as it mars the appearance, and so affects the value of the fruit. The best remedy is early ventilation with very slight shading until condensed moisture has passed away. Make fresh sowings of the best sorts, as soon as the weather is so far advanced as to be raised about this time soon come into bearing, are more pleasing to the eye, and produce much finer fruit than those which have passed through a dreary spring. Plants in frames must be kept in healthy growth by

regular attention to the linings and covering at night. Let the supply of moisture be regulated by the weather, and keep rather on the dry side until it becomes more genial. *W. Coleman.*

KITCHEN GARDEN.

In the general department constant attention must be given to the complete stirring of the surface amongst all advancing crops, and for the final earthing up is one of the greatest aids to successful cultivation which the kitchen gardener can put in force, for by it not only may the incipient weeds be kept in check, but by the breaking up of the surface the soil is exposed to the beneficial influence of the sun and air, and a much more vigorous growth results. As a rule I do not hold with mounding-up where it can be avoided. Many of the root crops are ready to be thinned out, and attention to the plants which are ready, and should be thinned out to 9 inches apart, possible vacancies being filled by transplanting. Turnips on warm borders are also progressing well, and must be thinned to 6 inches. The earliest sown Early Horn and French Forcing Carrots may stand at 4 inches apart, and in all these crops, either during the process of thinning out or after it is finished, the ground must be thoroughly disturbed, taking care to leave no footmarks. The surface soil of the beds of spring-planted Cabbages will require to be loosened up either with a three-pronged tormentor or pricked over with a steel fork. I am a great advocate for the latter tool, as, although taking a trifle more time, it makes neater and more effective work. The final earthing up of Potatoes will now be over, and the final earthing up, taking care to leave the ridges with broad tops. The principal crops of Broccoli and Cauliflower for autumn and early winter use should now be got in at once. The Waltheiren variety will require to be sown with importance, as, generally comes in first and by seasonal plantings gives a continuous supply until the advent of frost, when it is no longer to be depended upon; and here it is that Veitch's New Self-Protecting Autumn and Winter Broccoli will be of importance, as its habit of growth it requires a sort of some severity to reach the young heads. Deane's Snowball Cauliflower is a most excellent auxiliary to the early supply. Veitch's Autumn Cauliflower, a grand sort not to be despised, will not, having a protecting habit, growth requires to be watched and protected in case of early morning frosts in the autumn; and to complete the list, Snow's Winter White when true will come in about Christmas, and in mild weather carry on a good crop, and will be of great value, as it will grand force at command the only obstacle to a supply of Broccoli all the year round is the want of sufficient manual labour, or space, and proper conveniences for storing during the winter months. Now is a good time to get in the sowing of the Peas, and to sow the crows, taking care also to cut back all crows which are throwing up flower.

No delay must now take place in planting out Tomatoes in any vacant spaces in the garden, either with an east, west, or south aspect; Capicorns and Chillies, on the contrary, must be planted at the foot of a south wall in the most sheltered parts of the garden, as also must Bush and Sweet Basil. Early spring Cauliflowers will be much benefited by liberal applications of liquid manure at weekly intervals. If not already planted, a row or two of the earliest Celery should be got in at once for very early culture purposes, and the trenches intended for the main crop should be marked out at once, and the soil thrown out on each side, so that spaces between may be planted with Lettuce or Early York or Little Pixie Cabbages, a lot of which will come off before the final earthing of the Celery. The richest and fattest dung which can be secured will be best for the purpose, and the soil for the main crop to be got in early next month. The late sowings of the same will now be ready, and should be pricked out at once. Frequent sowings, thinnings, and transplanting of Lettuce are requisite to keep a good supply, as also of the various sorts of water in dry weather. In the matter of blanching also it is best to tie up a few at a time when they are quite dry. See also that they are free from aphides, which are often to be met with on them at this season. The sowing of Radishes and small saladings at frequent intervals must not be omitted. Radishes come very tender, crisp, and succulent when watered in the early morning when the sun is shining hot upon them. Sow a pint of the best of West's Golden Wonder, and a pint of the best of the new variety, the Earl of Arundel's Ultra, British Queen, and Knight's Tail Marrow, must not be omitted. Advancing crops must have the necessary attention paid to stirring the surface of the soil, watering, mulching, and staking such as are forward, and to become watered and staked for the time. I am obliged to recommend particular attention to planting out the main crop of Brussels Sprouts in well prepared ground, giving them plenty of room, *John Cox, Redfern.*

THE
Gardeners' Chronicle.

SATURDAY, MAY 26, 1877.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, May 28 { Sale of Stove and Greenhouse Plants by
Messrs. Arlingtall & Hoad, at Old Traf-
ford, Manchester.
FRIDAY, June 1 { Opening of Mr. Anthony Waterer's exhibition
of Rhododendrons, &c., at Regent's Park.

SOME letters which have lately appeared in our columns draw attention once more to a subject often alluded to by us—the HIGHER EDUCATION OF GARDENERS. There

insularity to consider as in many respects unsuitable for adoption here. There is no country in the world where practical gardening is better carried out than in our own. That will be readily admitted. At the same time it is equally indisputable that in no country does the well educated, well trained gardener hold socially so low a position as he does here. Where, for instance, would it be possible for any well-trained gardener—a man who has worked his way up from the position of crock-boy to that of head gardener—to be obliged on occasion to be beholden to the nurserymen for a slender pittance, while he patiently waits, often for months, sometimes for years, for something to turn up. Can this be right? On the one hand it condemns a man whose attain-

most beneficial and engaging amusement for those of lesser means, it is obvious that neither to Government aid, nor to private aid, can we look for those means and appliances which are requisite to lift the practitioners of horticulture to a position commensurate with the higher requirements of the art. So long, too, as our horticultural societies exert themselves almost exclusively to conciliate the good-will of the fashionable idlers of the metropolis and other large towns, and promote flower shows as if they were the be-all and end-all of horticulture, so long will it be vain to look to them for substantial advance in the science and practice of horticulture. Far be it from us to undervalue gardening, either as a recreation or as a means of providing for the luxu-

FIG. 107.—THE FLOWER GARDEN AT DRUMMOND CASTLE.

is assuredly no country where horticulture forms a more important branch of enterprise, whether commercial or æsthetic, than in our own—we are afraid we must add, there are few where the education of its practitioners is less cared for than in our own. In Germany, in France, in Belgium, in America, the provision for the higher education in all branches of knowledge required by the agriculturist, the forester, and the horticulturist, is far in excess of what is provided here. This may be one result of the less paternal system of government under which we live—a system no one would wish to change. At the same time, daily experience shows us that we might do well to imitate, in such fashion as is most consistent with our national habits, the best features of some of those countries which we are apt in our

ments justify a better fate, to labour at a common labourer's wages; on the other it keeps up a system of patronage, which may be injurious alike to the self-respect of the workman, and the interests of his future employer. Under existing circumstances, neither the workman, nor the nurseryman are to blame for this. They are obliged to conform to the system as it is, and it is not to either of them that we can fairly look to initiate a better one. To what quarters, then, can we look for improvement in this particular? It is not consonant with our habits to look to the Government for aid—we are far more disposed to look to private enterprise and individual initiative in these matters. But considering that gardening is chiefly looked on as a means of subserving the luxurious requirements of the wealthy, or as providing a

rious tastes of the wealthy. We should be false to our creed and our profession if we did anything of the kind. We simply plead that Horticulture has beyond this a higher duty to perform. It has to supply the actual physical needs of mankind, it has to minister to their bodily welfare, it has also to sweeten their toil, to lift them up who are floundering amongst the sordid cares of every-day life, to recreate them mentally and bodily. It is the parent of agriculture, and its business is to foster and promote the cultivation in the best and most suitable manner, in all climates and under all circumstances, of all those plants which minister to the needs of man, whether for food, for clothing, for medicine, for all the manifold uses which bodily comfort and mental improvement demand. Looked at from this point of view,

will any one say that the means at present available in this country for the education of gardeners are sufficient? Gardeners themselves are apt, when these questions are broached, and when a higher education is suggested, to ask, "Will it pay?" Our reply to this has in part been already given. Does it pay to remain as you are? A rank and file of ordinary gardeners there must ever be, and these cannot expect the prizes of the profession, though they may participate in the advantages which must accrue from the general advance of the whole body. And this general advance cannot be expected unless the working power of the mass be increased, and this cannot be, unless a more general and a higher system of education prevail. Does it pay?

themselves, is not larger than in the much larger class who have not enjoyed even such advantages as have hitherto been offered. The letter of Dr. HOOKER in our last issue is eminently suggestive from this point of view, but the education of the gardener is, under present circumstances, only a very subsidiary part of the work done at Kew. Much is done there in a quiet way, but it is done of free goodwill for the most part, not as a part of a regular system. If it were discontinued to-morrow no one would have a right to complain. Whether the plan now followed at Kew could be developed into something more important, is not a question we care to enter upon at present. We would simply point out once again the urgent necessity that exists for

preserve their vitality. For many years Dr. CASPARY has made the Nymphæaceæ, or rather the genus *Nymphaea*, his special study, and it has been his object to cultivate as many forms as possible in order to test the value of characters which can only be imperfectly seen and appreciated in dried specimens. In his endeavours to introduce different species he has gained some experience in the conveyance of their seeds which may prove useful to some of our readers. Sent dry from the tropics, and exposed to great heat on the journey, they are almost certain to lose the power of germinating; and sent in water they are quite certain to rot. Dr. CASPARY lost many valuable consignments from various parts of the world before he thought of the means described below. True, it is only in part new, and no more than the adaptation of an old idea. It is simply drying the seeds quickly after collecting, and then squeezing them into moist

FIG. 108.—DRUMMOND CASTLE AS SEEN FROM THE FLOWER GARDEN.

Does it pay to remain all your life in a subordinate position, at a rate of remuneration not equal to that earned by other artisans who have not to exercise the forethought that you do, and who are not expected, as you are, to have knowledge at their fingers' end under every variety of circumstances? On the other hand, ask those who, by virtue of a superior training and a better education, have qualified themselves for better positions, whether it pays. Are they not better off? Do they not hold better social positions than those who have not enjoyed such advantages? Take the men who have had some sort of training beyond the rule of thumb as at Kew, at Chiswick, and elsewhere. Their numbers are indeed small, but see whether in proportion the number of those who have succeeded in life, and who have raised

schools and colleges such as they have in Belgium, in Germany, in France, and in America, and wherein the agriculturist, the forester, the gardener might receive that thorough training, theoretical and practical, which are requisite to enable them to cope with the new and ever varying circumstances which are arising at home and abroad, to develop and extend our national resources and raise the social status of the practitioner.

— In a recent number of the *Botanische Zeitung*, Dr. R. CASPARY describes a new African Water Lily, which he names *Nymphaea zanzibariensis*. But it is not so much for the sake of the new species that we refer to it here, as for the opportunity of repeating his instructions respecting the best way of transmitting seeds of these beautiful aquatics for long distances, to

loam or clay in a tin box. When the clay or loam is dry the box is soldered down air-tight. In this way the seeds may be sent for any distance without losing their vitality. Dr. CASPARY has also frequently received good seeds sent from very distant countries, which had been embedded in moistened powdered charcoal, and otherwise treated as with clay or loam. J. M. HILDEBRANDT, who discovered and introduced seeds of the new species described by CASPARY, used white carbonate of lime (chalk), and when the seeds arrived they were in a solid mass of this substance. They were at once put into a basin of water, which was kept at a temperature of 22° R. (81° 3 Fahr.) They lay dormant for two months, and then germinated in numbers. Many plants were safely wintered in 1874-5, and in the course of 1875 seven strong plants in large bowls produced flowers. In 1876 one tuber was planted in a box 4 feet square, and this was sunk in a tank 23 feet

n diameter in a house in the Botanic Garden at Koenigsberg. Treated thus it developed into a fine plant, and bore flowers up to 9 inches in diameter, and always two or three together; and the leaves were more than this, the most beautiful of the genus—exceeding even *N. gigantea*. The sepals are of a deep green, and destitute of spots on the outside, with a broad crimson margin, and of a deep violet-crimson within. Petals deep blue, with a whitish spot at the base, the outer ones crimson near the base; and the outer filaments yellow. Dr. CASPARY concludes with an appeal to those in a position to do so, to send him seeds of African species not in cultivation, especially the forms found in Lower Egypt in the late-mentioned Rice fields; and he is willing to pay 30s. or 50s. or more, for good seeds of a species. He would be glad to get the *N. corulea* *B. albidora* of SIEBER. Such fruits should be selected from which the parts of the flower have rotted away, and placed in a moist box. In the course of three or four days those containing mature seeds will have burst; and the seeds should then be placed in warm water to allow the coat to rot off, which will take place in a day or two. The seeds which have sunk to the bottom should then be taken out, slightly dried, and packed in the manner described above.

—We have received from the Rev. T. C. BEBIAULT, Richmond House, Guernsey, some good examples of the BALDWIN and LADY APPLES, which go far to prove how well they can be grown in that island. The Baldwin is a famous American Apple, which, like most other of the Transatlantic varieties, does not do well in this country, and the fine, even-sized, and finely coloured pommes before us are certainly the best that I have ever seen or noticed. The Lady Apple (Api, or Pomme d'Api) is better known to us, and a pretty little fruit it is for the table.

—It has been proposed to present a testimonial in money to Mr. JAMES MITCHELL, on his retiring from the management of the gardens at Newbyth (Sir DAVID BAIRD'S, Bart.) Mr. MITCHELL'S friends will be sorry to learn that illness, of a nature which precludes the possibility of his resuming employment in future, has necessitated this step. Donations will be thankfully received up to June 8, 1877, by Mr. R. P. BROTHERSTON, Tynninghame, Prestonkirk.

—DARLINGTONIA CALIFORNICA is flowering in the open air at the rockwork near the T range at Kew. It has been in this position with the protection of a bell-glass for the last two years, and has grown from a small seedling during that time. There are about fifteen leaves, the largest of which is 7 inches long, and the scape is about the same in height. It is growing in a pot, with the same mixture as for *Sarracenia*, and plunged up to the rim.

—A correspondent relates that in travelling from Petersfield to Midhurst, about a month since, he was much struck with what may be almost called a NATURAL ARRANGEMENT OF THORNS AND FOLIAGE. It appears that at the intermediate stations there are thin Quick Thorn hedges about 3 feet high and 9 inches through, in front of which are narrow borders for flowers. At one of the stations the hedge, at the time referred to, was richly ornamented with the common Wallflower, which had grown up between the thorns, and was in full bloom, the flowers harmonising very prettily with the apple-green of the young foliage of the Thorn. The Wallflower had, no doubt, been self-sown, and had gained strength previous to the Thorn coming into leaf. Moreover, the latter had proved an excellent support to the Wallflowers, the shoots of which had penetrated the whole of the south side and top of the hedge, and covered it with its fragrant flowers.

—The last number of the *Illustration Horticole* contains a coloured figure of a new Aroid of so extraordinary a character that it is likely to attract much attention, and to be as popular as the Anthurium Scherzerianum. The new-comer, of which as yet we know nothing but what is told us in the publication in question, is an Anthurium of tufted habit with ovate lanceolate deeply cordate green leaves, and slender spades surmounted by an open cordate-ovate orange-red leathery spathe, 3-4 inches across, placed at the base of a cylindrical spadix of a yellow

colour, with a broad central band of white. M. LINDBER has appropriately dedicated this startling novelty to his countryman, M. ANDRÉ, by calling it ANTHURIUM ANDREANUM. M. ANDRÉ, it appears, met with this plant in the province of Choco, in New Grenada, and does not hesitate to affirm that it is superior in beauty to A. Scherzerianum. We await the appearance of this remarkable plant with great interest.

—THE EXHIBITION OF THE ROYAL NATIONAL TULIP SOCIETY has been unavoidably postponed, owing to the lateness of the bloom. The show was originally fixed to take place during Whit sun week (May 25), in connection with the usual grand show of the Royal Manchester Botanical and Horticultural Society; but as it was found quite impossible to carry it out at that date, the executive committee have decided to postpone the meeting till June 5, when the annual exhibition will be held in the same place (Manchester Botanical Gardens) and under the same conditions as those published in the schedule of prizes already issued.

—We have received from Messrs. DICKSONS & Co., 1, Waterloo Place, Edinburgh, some flower-heds of DOUBLE CINERARIAS, which are very much superior to any we have previously seen, and which leads us to hope that these double varieties may yield us a distinct type of decorative plant. The flower-heds are of large size—1 inch to 1½ inch across, and as full double as the best forms of double Jacoba. Pink Perfection and The Prince are different shades of magenta, and Queen of Violets is of a rich purple-violet hue. Such varieties as this must be very serviceable when grown for decorative purposes.

—Mr. HARRISON, gardener to the Earl of DEEVE, at Knowlesy, has sent us a splendid raceme of flowers of ALPINEA NUTANS—a fine old plant not often seen in flower, though, as Mr. HARRISON remarks, no plant is more easy to manage. A tropical heat and a deep bed of rich soil is what it requires to grow in. After it has done flowering withhold water for a time, then thin out the old flowering stems, give a good soaking of water and start again. Treated in this way it will flower two or three times a year. The compound drooping raceme of waxy white flowers, with yellow and beautifully feathered crimson lip, is very striking.

—We are requested to state that the ten-guinea cup offered for competition by nurserymen in the horticultural department at the forthcoming Century Show of the Bath and West of England Society at Bath is for twelve distinct varieties of Tea Roses, three blooms of each, and not as advertised in our last issue, for "twelve cut blooms." The amateurs' class is for twelve single blooms.

—A general dealer of Shadwell was recently charged before Mr. LUSHINGTON, at the Thames Police Court, with having in his possession 4½ tons of tea, the duty on which had not been paid, and which the defendant accounted for by stating that he had a contract with Clamberlain's Wharf for their rubbish, of which tea-dust formed part, and a farmer from the Barking Road, who gave evidence on behalf of the defendant, stated that he had been in the habit of buying tea refuse from him at, or a load for Mushroom growing. This is something new in Mushroom culture—certainly new to us. Can any of our correspondents enlighten us as to the *modus operandi* of growing "buttons" in tea-dust?

—The Royal Horticultural Society's Gardens at South Kensington were visited on Monday last by 6936 persons, who, paying an admission fee of 2d. each, contributed £57 16s. to the funds of the Society.

—THE FLOWER SERMON annually preached on Whit Tuesday at the parish church of St. Katharine Cree, in the City, attracted a crowded congregation last Tuesday evening. This sermon was, says the *Daily News*, marked in the City the advent of spring flowers for so many years, that the Rector, the Rev. Dr. WHITTEMORE, now sees the children who attended this annual service at its commencement bringing their own children to hear in their turn the lessons from the flowers which they cherish among the reminiscences of their

youth. The service is altogether a happy and interesting one. The church is filled with children and young persons, each of whom has brought flowers of some kind. The preacher looks down upon a novel garden, and aided no doubt by the inspiration of happy juvenile faces and the fragrance of magnificent bouquets, discourses chattily to the little ones upon the text of the day, which is always chosen by its reference to some flower, or fruit, or tree, or to the flowery spring. A bouquet is placed in the pulpit by a hand that has recognised the preacher's good offices in the same way for many years, and always at the beginning of the sermon this little attention receives a passing word of thanks. The hymns sung speak of flowers in nearly every line, and some of them are composed specially for the service. Dr. WHITTEMORE preached this year on the Fig tree, founding his discourse on the words in the third chapter of Habakkuk—"Although the Fig tree shall not blossom, yet I will rejoice in the Lord." He announced at the outset that by next year the pews in the church will be modernised, so that the high flossers and children will be seen to better advantage. The Rector, in pressing home a great many lessons from the Fig tree, incidentally drew a refreshing picture of the now crowded neighbourhood of his church in the days when monastic gardens were there, in which the monks cultivated Fig trees. He reminded the older people in the congregation that trees used to grow in some of the City courtyards, which were supposed to be the remains of Fig orchards, though now the district was so altered that to some it would seem singular that the flower sermon should be preached in it. The name of Fig Church Lane, and old pictures of the neighbourhood showing ladies weaving garlands, conveyed an idea of the once rural aspect of the spot.

—RUBUS DELICIOSUS is extremely pretty in flower on one of the walls at Kew. It grows in the form of a shrub, has very ornamental Currant-like leaves, and bears in profusion snowy-white flowers, 2½ inches across. Its fruit is about the size of a Blackberry, and is of agreeable flavour; but for the flowers alone its claim to a conspicuous position is indisputable. It grows best in peaty soil.

—The use of iron for general purposes, as well as for strictly horticultural uses, is so large that any means of OBVIATING the destructive effect of RUST deserves attention. Rust is an oxide of iron, and as every one knows to his cost who has to do with iron buildings, it is peculiarly destructive in damp situations. But rust is not the only oxide of iron; there are others; and among them the black or magnetic oxide of iron, which is all but imperishable under ordinary agencies. Professor BARFF has ascertained that if any iron article be exposed to the action of superheated steam at a very high temperature, it will become coated with a film of this magnetic oxide, which is harder and more resisting than the original iron. Articles so treated resist any exposure to the weather, and are rendered for all practical purposes imperishable so long as not broken. Supposing all that is claimed for the process to be borne out, and there seems no reason to doubt it, this discovery will be one of the highest importance to all who have to use iron in any shape or form. For garden structures the new discovery will be of the greatest use, and the painter's bill will be correspondingly diminished.

—The fifth part of Baron VON MUELLEN'S descriptive notes on PAPUAN FLORA has appeared. Many of the plants mentioned were collected by Mr. GOLDIE. Among them are two species of *Nageia*, the only Conifers yet known in New Guinea with the exception of a species of *Arucaria*, found by Signor BECCAL.

—M. RIVIERE'S successor at the Luxembourg Gardens, Paris, is M. JOLIBOIS, the foreman of the houses under M. RIVIERE.

—According to M. BOUCHARD, as cited in the *Press*, the preparation taken by TOROISTS against coming cold (in days or seasons) may give useful indications to farmers and others. For some years he has been guided by such indications in the management of his conservatory. At the end of autumn, when the winter is going to be severe, the tortoisés bury themselves deeply, so as to be wholly concealed.

Before a mild winter, on the other hand, they bury themselves only a few centimetres, just protecting the apertures of their carapaces. In January last they ventured even to walk out, but on approach of the late cold of February they ensconced themselves anew. One day in March, the thermometer being at 10° C., M. BOUCHARD noticed his tortoises bury themselves; that night the mercury fell to 2° above zero C. Again on April 1, the thermometer being at 40° in the sun, his most sensitive subject went into the ground. On the 2d there was hoar frost. Several other like cases are given.

— DR. ENGLER, of Munich, has just published in the *Novo Acta* of the Imperial German Academy of Naturalists an important memoir on the comparative morphology of the ARAÇEÆ. This may be looked on as introductory to the monographs of the species about to be undertaken by the same author in the *Flora Brasilienis* and in DE CANDOLLE'S supplementary series of monographs.

— It is usually thought that Wheat is the most nutritious of all our cereals, and this opinion is current in almost all works relating to food. Recent investigations by Professor WANKLYN and MR. COOPER, as quoted in the *Press*, appear to give the first place to Rye. Rye contains more gluten. It is pronounced by these one-sided richer than Wheat. Rye, moreover, is capable of thriving in almost any soil.

— DR. LAUDER LINDSAY'S collection of LICHENS has been offered, with all the cabinets and fittings in which it is contained, as a donation to the ROYAL BOTANIC GARDENS OF EDINBURGH, on the conditions that (1), a small room be provided for its accommodation in connection either with the Government Herbarium, or with the Museum of Economic Botany; and that (2), it be kept in proper order for purposes of reference or study either by the curators of the soil, herbarium or museum, or by any of the numerous students of the Edinburgh School of Botany. But it is understood that no such donations can be accepted, by reason of the very inadequate accommodation provided by Government for the more essential requirements equally of students and teachers. There is urgent need, for instance (1), of a new commodious lecture-room; (2), of a greatly enlarged museum; (3), of laboratories for microscopic, physiological, and other research; (4), of several special rooms attached either to the herbarium or museum buildings suitable for the reception and maintenance of such donations as that now referred to.

— We understand that the Rev. Canon HOLE has consented to preside at the dinner of the NATIONAL ROSE SOCIETY, which will be held in St. James's Hall on the day of the Rose show.

— Under the title "MALESA," Signor BECCARI has just published in quarto form the first part of a publication intended to comprise the botanical results of his travels in the Malay Archipelago, Papua, &c., during the years 1855-76. In this first part some fifty species of Palms are described; also the process adopted by the natives of New Guinea for extracting sago from the stem of *Metroxylum* Rumphii.

— We learn from Mr. CROUCHER, gardener to J. T. PEACOCK, Esq., that a plant of *FOURCOYEA LONGEYEA* is now flowering in the Alexandra Palace collection of succulents. The flower-stem is 14 feet high, and branched as in *Agave americana*, but the flowers, greenish white in colour, are not very conspicuous. As fine-foliage plants the *Fourcoyæ* are very handsome, but their flowers are of little interest.

— From the *Baister Nachrichten* we learn that a course of practical and theoretical INSTRUCTION TO FEMALES ON VEGETABLE GROWING, &c., has just been concluded at Baden. From the nature of the instruction offered, it appears that the care and management of the garden is regarded as a part of the duty of the wives and daughters of the peasantry. But it was not limited to gardening and the preparation and preservation of garden produce, nearly every branch of housekeeping being taught. The most proficient in a systematic examination received prizes of suitable books. Cooking is, perhaps, the branch in which our

country housewives of the same class most need instruction.

— We have received EUGEN ULMER'S catalogue of teaching apparatus and text-books for agricultural, horticultural, and other institutions. The diagrams, which may be procured of any dealer in foreign books, and which are sold at the same price, it is stated, as they are sold at in Germany, deserve the attention of teachers who have not the time or talent to draw their own. Among those interesting the gardening community we may note diagrams of the most important meadow grasses, and other plants, and fodder plants; also those explanatory of the raising and training of fruit trees, diseases of plants, and those illustrating the structure and development of the principle types of plant life. Reduced representations of an example of each life is given in the catalogue, and, judging from these alone, the diagrams are most faithfully executed. Some of the botanical diagrams we have actually seen, and we can vouch for their accuracy. Moreover, they are very cheap, and they are large enough for an ordinary class-room.

— In the *Botanische Zeitung* of April 13 is the first part of a preliminary report on CINCHONA STUDIES, by OTTO KUNZLE. The writer has spent some time in the Dutch plantations in Java, and has given a detailed account of the Cinchona culture, and his results should be read by all interested in Cinchona cultivation. He says the mode of cultivation now adopted by the Dutch in Java is more suitable and more productive than the system practised by the English in India. The trees are planted like our orchards, in rows, and the soil chosen for the purpose is cleared forest land, at an elevation of about 5000 feet above the sea, with a gentle slope, so that the rain does not flow away too quickly. Among the forms of Cinchona cultivated in Asia the writer distinguishes only four species, and all the others he regards as hybrids of various parentage. He states that the species of no genus intercross more freely and spontaneously than those of Cinchona, and he gives some curious information respecting the products of different classes of hybrids.

DRUMMOND CASTLE.

ABOUT 3 miles south of Crieff, the capital town of Upper Stratharn, and a place famous alike for the mildness of its climate and the highly romantic scenery which surrounds it, stands the noble pile of buildings, Drummond Castle, the ancestral home of the Drummonds, Earls of Perth, and the scene of many stirring events during the feudal ages. It is now the property of Lord and Lady Willoughby de Eresby, and is known amongst gardeners far and wide for the remarkable size and beauty of its flower garden, and as well amongst tourists as one of the glories of Upper Stratharn. Passing out of Crieff over the old bridge which spans the Earn on the south-western side of the town, the visitor to Drummond Castle turns sharp to the left and enters a magnificent avenue of trees some two miles in length and composed principally of Ash, Beech, Horse Chestnuts and Sycamores, which said avenue has been described as "finer than the Italian Boulevards of Paris, and grander than the Linden Alley at Berlin."

Be that as it may, it has certainly a grand and imposing appearance, and forms a noble approach to the entrance gate to the Castle, an elaborately decorated piece of workmanship brought from Italy, and supposed to be more than 300 years old. Passing through this massive and elegant piece of masonry, as every distinctly dressed person is allowed to do, in order to inspect the gardens, the visitor is at once struck with the curious appearance of the narrow avenue formed of Beches of enormous size, and which, a mile and a half in length, leads up to the rock on which Drummond Castle stands. Enjoyable, indeed, is this drive from the entrance to the Castle, the ground on the left being beautifully undulated, and dotted here and there with noble trees, while the charming combinations of wood and water, hill and dale, form a series of panoramic views on the right, which must be seen to be appreciated. The Castle itself is not seen until some distance from the avenue is reached, when it suddenly comes into view on the left.

Passing under an archway into a large courtyard a

view of the flower gardens is quickly obtained from the top of a flight of steps, which is shown in the illustration on p. 661, fig. 108. The garden is situated some 30 or 40 feet below this point, and covers some two acres of ground. The view over the whole and its charming surroundings attests beggars description. But the reader may obtain some idea of its singularly beautiful character by imagining himself as standing in the centre of the masonry shown in the foreground of fig. 107, the view in which consists of a portion only of the garden.

Before descending into the garden below, those who choose to ascend to the top of the highest tower, shown in fig. 106, p. 657, and fig. 108, can do so, and we may say that ample indeed is the reward for the labour involved, so ample is the scenery that greets the eye from this cogn of vantage. The beautifully wooded park, with its varied undulations, forms a background to the noble garden. "On the west, at a distance of 2 miles, is Tarlone, rising 1400 feet above sea-level, its top covered with Larch, while from its base to half-way up the hill a fine contrast is offered by the sombre Spruce. The bold Benchozie, with the gulf-like ravine of Glen Turrit, appears in the background far away. On the north is the town of Crieff, backed up by the Knock. On the east an intricate park with branching Willow trees rearing their foliage above its surface, and rising, as it were, from out the dead, while beyond you see windings of the Earn gliding over the plain. Southwards the extended hills of the Pentlands rise in great variety, studded with trees of every hue and configuration, might well be supposed the haunt of Dryad nymphs and Sylvan demigods." In our next issue we shall publish a plan of the garden, and must till then reserve our remarks on its contents.

Home Correspondence.

Hyacinthus candicans.—This little known but exceedingly beautiful plant has generally been treated as a greenhouse or conservatory plant. Two years ago, however, a notice in one of the horticultural journals stated that it had been flowered successfully in the Botanic Garden, Dundee. The notice was drawn up, that it might probably be found to be almost, if not entirely hardy. I have now to state that I sowed the seed of *H. candicans* in the summer of 1876 in the open ground, and that it germinated freely. In the early winter I protected the young plants slightly, but thinking that this was labour lost I afterwards neglected them, and left the little bulbs exposed to the severe frosts of the early spring, which totally destroyed the incipient blossom of the common *H. non-scriptus*. During the month of December and January. On examination, however, I found the bulbs, of the size of white Spanish Beans, quite fresh, and throwing out roots in the month of March. This was an agreeable surprise. I am now taking care of my little treasures, and expect that by next season they will be flowering bulbs. This proves that the *H. candicans* is not only hardy, but more hardy than most of our spring bulbs. Can you inform me what is the native country of this beautiful plant? *J. E., Secretary of Kirkcaldy, Scotland, [It is South African. Eds.]*

Fungus Spawn from Garden Beds and Mushroom Rooms.—During the last two or three years various quantities of *F. sporophorus* have been sent us in long cord-like masses of spawn from the above localities. The cords are a little less in diameter than window cords, and almost as tough. In some instances they have been pulled out by the ends in large masses, and have been of my little treasures, and expect that by next season they will be flowering bulbs. This proves that the *H. candicans* is not only hardy, but more hardy than most of our spring bulbs. Can you inform me what is the native country of this beautiful plant? *J. E., Secretary of Kirkcaldy, Scotland, [It is South African. Eds.]*

The Double White Narcissus.—Can any of your correspondents explain the cause of the double white Narcissus frequently failing to develop the flower when at the period of bloom? In a garden at Brighton, where bilious plants in general give splendid results, I have raised one of these flowers from quantities of these bulbs. They throw up a flower-stalk, and shortly before the time for blooming the bud becomes flabby, yellow, and falls. I have seen hundreds of these failures in beds not my own and though I have planted them in the most advantageous relation to sun or dampness, cold or protection, I have seen the same effect result. I have given up

these elegant and late spring ornaments to a garden in consequence. *W. E. Heathfield, Arthur's, May 21.*

The Royal Ascot Grape.—I send to-day, per rail, a small box, containing a small bunch of the Royal Ascot Grape. It has done so well with me this season that it appears well adapted for early work and pot culture. The bunch sent is from a small two-year-old vine. It has forty-six grapes, some a little larger, all well coloured and swelled. It is planted out in a small house with four other Black Hamburgs. It ripened quite a fortnight earlier. It does not show any signs of shanking. *W. E. Heathfield, The Gardeners' Chronicle, May 21.* [A very pretty sample, with finely-welled, stone-colored berries, evidently adapted for early work. Eds.]

Protecting Seeds with Paraffin.—"R. W." in your last week's paper assumes that soaking Peas for two minutes in paraffin before sowing, destroyed the seed and caused them to rot in the ground. I can only say that it is not my experience either last year or this year. I have now three rows of Maclean's Little Gem four hours in paraffin before planting. Although I am quite a novice at gardening I have implicit faith in the paraffin to keep off the birds and also the grub and caterpillars. Last week I sowed in paraffin, and then I treated as usual: I first sowed them and then I got some dry sawdust and slightly saturate it with paraffin and then sprinkle the beds liberally with the sawdust. The only objection to this mode of treatment is that, paraffin being a volatile substance, the effect of the oil disappear in about a week, and it is necessary for the ground to be again slightly sprinkled with either another coating of the sawdust or with water and oil mixed. Last year I sowed my maclean Cabbage in a mixture of paraffin and sawdust, and paraffin to two gallons of water thoroughly incorporated by stirring, and the effect was to cause all the butterfly caterpillars to disappear. A Gooseberry tree covered with grubs I treated in the same way, with success. One week after the sowing I had had no more than the slightest trace of paraffin remained on the Cabbage. I can therefore vouch for the fact that paraffin oil does not injure vegetation, and I hope some of your readers who have tried the experiment will confirm what I have said. *G. W. Heathfield, May 21.*

Let not the public be alarmed or panic-stricken because "R. W." having "soaked his seed Peas in benzoin for two minutes" previous to sowing them, has lost his crop. I have this spring sown Peas in the same way, first sowing of Peas, and the result has been that, whereas the mice and birds almost destroyed my first sowing, they have not touched the later sowings where paraffin was used, and not a Pea I believe has come up, whereas the first sowing crops coming on as I could wish. I merely placed the Peas in a shallow dish with a little paraffin, and then shook them till they were all smeared, when they were at once sown. I intend next year to adopt the plan of sowing Peas, instead of both Peas and Oats, with perfect success, as far as keeping off rooks and other birds, but the process is attended with more trouble than in the case of paraffin, as with that care must be taken to dry the prepared seeds well before it has time to stick. The winter Peas which were not so treated suffered much from the ravages of both wood pigeons and pheasants. But after using the tar we were able to dispense with bird-keepers entirely, and to employ only a few boys in case of compulsory education, as no small boys can now be employed as bird-keepers. The seed, owing to the season, was some time coming out of ground, and I was rather laughed at by my neighbours, but I have the laugh on my side now.

If "R. W." had used paraffin instead of benzoin, he would have to look to other causes for his Peas rotting in the ground. Last season I had all my early Peas here eaten by slugs under ground, but this season, acting upon a suggestion made by the *Gardener's Chronicle* to try sowing the seeds in paraffin, I have tried it on several varieties with perfect success, as the slugs have touched none underground. I also sowed some Broad Beans and some Radish seeds, which the birds did not touch. Paraffin is used with perfect safety, and it is the best safeguard against mice and slugs that I have ever tried. *J. W. Sealey, The Gardener, Manor House, Lyndhurst, Hants.*

Peach Setting.—It is no part of my duty to look over the back files of the *Gardener's Chronicle*, to put "Vitis" right in this matter. He has got himself into an amusing dilemma by rushing into print on a matter which has been so fully explained as regards the subject upon which he is so eloquent. Let me, however, just inform him that he is not "quite correct," but entirely wrong, concerning "Mr. Miller's theory and practice" on the subject of setting Peaches. Here are Mr. Miller's own words:—"The *Gardener's Chronicle* of February 19, 1876, p. 235—"As to

setting the fruit, I have not used any artificial means for a considerable time, but simply the common grafting and, and this year, as in other seasons, I have applied the usual soft water as it stands in the house to the trees while in full flower," and, adds Mr. Miller, "our set this year appears to be as thick as hail;" and he goes on to continue, "It is over twenty years since I first tried my hand at setting early Peaches with the syringe, and found it successful." I think these declarations of Mr. Miller will convince "Vitis" himself that he has made "one big mistake" in citing Mr. Miller's practice—in fact, the most amusing case of convicting a man out of his own mind is seldom witnessed. In answer to "Vitis" question as to what advantages the advocates of the syringe claim for it, I again refer him to the back pages of the *Gardener's Chronicle* where these matters are fully set forth. Clearly he needs to read rather than to write on such subjects, but at the same time the "advocates of the syringe" are by no means anxious to convert him (or any one else) to their views, against his will. *J. Simpson.*

Lilium Washingtonianum.—On looking over some back numbers of a well-known garden periodical I saw that there had been some dispute respecting the above Lily, and recollected that a friend of mine, who was out in California some twenty-five years ago, gave me on his return to England notes and a coloured portrait of this exquisite flower, which he had seen growing on the Sierra Nevada mountains. I send you the description, and shall feel pleasure in forwarding the figured bloom if you would like to see it.

"The flowers of the *Lilium Washingtonianum*," says *Lilium Washingtonianum*, "are like when they first appear, and gradually become a brilliant blue. The bush deepens with age (her ladyship is unlike other ladies in this respect—it is the young ones who blush, and even with them the habit seems going out of fashion). The buds become almost a lilac-purple before it fades. A few delicately shaded spots form the throat. The blossom looks forward or upward, does not droop, and has the fragrance of the *Tabeena*, but the scent is more delicate than that of the latter flower. The leaves are small (about 2 inches long and 1 to 1½ wide), approximate, verticillate (in whorls of six to twelve), somewhat scattered above and below, oblanceolate, waved, three to six nerved, nerves inconspicuous, very slightly scabrous on all stems except the midrib, which is smooth and shining. Petals erect, glaucous, 3 to 4 inches long, or more. Flowers patent, open, tubular, funnel form; petals recurved from the upper third of the somewhat narrow and slightly becoming broadly ovate, deeply unguiculate (slender claw, about ½ inch long), deeply channelled, the three outer divisions of the perianth quite distinct, neither ridged nor crested; lamina plain, parallel or slightly incurved.

Such is the technical description given me, and I am not a mistake, first introduced this Lily to the notice of the California Academy of Natural Sciences. *Helen E. Watson, Berry Grove, List, P.S.* "This Lily will not bear the glare of the sun, and it is low, like *Traveller's* Lily, but the treatment; too much heat and light dwarfs it." Thus write my friend, but his remarks may only be applicable to its culture in California. *H. E. W.*

Lady Ann Grimston's Tomb at Tewin.—As far as I recollect, the trees growing out of this tomb were Sycamores, and not Ashes. The tomb of the Sycamore is well adapted for insinuation in the crevices of stone when cracked by the weather or accident, and there is of course nothing marvellous in the fact. It is not impossible that the man's name, who is supposed to have been buried there after the Sycamores had intruded upon the privacy of her resting-place—not the last, if the trees are to be taken as evidence. *T. F. R.*

Wild Trees.—Will the writer of the notice on the nutrition of fruit trees be good enough to give his reasons for the statement that the root apparatus of a cultivated tree differs from that of a wild tree, and also the meaning of the term "wild tree?" In connection with this, I should like to hear heartily (if possible) to Dr. Goepfert for the discovery of a less cumbersome "nutrition" than farmyard manure, which alone at present answers the wants of a fruit tree. *T. Francis Rivers.* (Try Pasture's solution, or some other solution such as the German chemist employ such as their "water culture" experiments, only we can't they will pay commercially.) Eds.]

Carnation Souvenir de la Malmaison.—In answer to "Vitis" B.'s inquiry respecting the *Souvenir de la Malmaison* with the above plant, I must say it is very simple, yet successful. First, I find that cuttings taken about the end of July, after being well ripened out-of-doors, make the best plants. These cuttings I take and insert them in a good soil, and keep them in a cool, but sufficient road-dirt, or river-sand, to keep the whole open, and afterwards placed in a cold

frame, to be allowed to root at pleasure, will make fine, sturdy stock, capable of producing large flowers the following April and succeeding months. Secondly, having a stock of plants to perform upon, the requirements of the establishment is the next consideration; but, as "W. E. B." has said, "the dull season" of the year I must confine myself to that period. For this object I take in March the points from plants that have been standing in a cool house all the winter, and strike them in heat. When rooted, I pot them on, and gradually increase the heat until they are established. About May they are placed in a cold frame, and grown on there throughout the summer. These, not being allowed to stand still, will flower from November onwards. The secret, if such it can be called, is to gradually increase the heat, and to do so when the buds of the plants are developed, say, the size of a common Walnut, to apply fire-heat. A dry corner of an intermediate-house, or the like, will answer very well. It is useless to attempt to force this plant until its buds are developed, as above stated; it is likewise quite as absurd to think that this fine *Carnation* can unfold its many petals in a greenhouse in any other than the "warm seasons" of the year. *Walter Johnston, Gr. to the Marchioness Camden.*

Lessons to Young Gardeners at Kew.—I am very glad to learn that the lessons on scientific subjects connected with gardening, which Dr. Hooker proposed to give to the young gardeners, will be appreciated by them. But I still think that the fact that in the first instances the majority of them were not willing to attend them, shows that the Horticultural Society can hardly undertake work of this kind until they see a way very clearly marked out for its failure. The experiment was made at Kew with the help of money from Government, and amongst a considerable number of young men who were learning gardening as their profession. At the same time, I am very glad to see that the Horticultural Society undertake this kind of work; it is doubtless work that it is perfectly legitimate for it to undertake, and if Dr. Allbutt will tell us the number of gardeners who might be expected to attend a class of the kind, I think that they would pay for instruction in scientific horticulture, I shall be very glad to promote the taking it up by the Horticultural Society. And I must again say that I think that if country horticulturists wish the Society to undertake such work for them, that they ought to become members of the Society to enable it to do so. I suppose when Dr. Allbutt says that this strikes him differently, he means that the Society would have more support if they did such work; but I think that this is not the way to do it. I think that they should make the railway before asking any one to subscribe to it. *C. W. Strickland, Hildesley, Walton.*

Vine Leaf.—A neighbour started a house of Vines at the end of July, and very early the Black Hamburgs is a leaf measuring 14½ by 14 inches, on a stalk 8½ inches long. Is not this unusually large? *W. T. T.* [Yes. Eds.]
