"Report on the Progress of Vegetation at the Royal Botanic Garden, Edinburgh, for April, 1885." By Robert Lindsay, Curator:—

During the month of April vegetation generally made good progress. The weather during the latter half of the month was mild and genial, frequent light showers of rain and bright sunshine alternated, and these conditions, combined with southerly winds, caused vegetation to make rapid progress. Many deciduous trees had their leaves well developed at the end of the month. Pear, Cherry, and Currant were in full flower and well laden, Apple blossom being also well advanced. Although a good deal of frost occurred little or no damage was done, owing chiefly to the lateness of the season. The thermometer was at the freezing-point on ten occasions, indicating 27° of frost collectively, as against 37° for the corresponding month last year. The lowest readings were on the 2d, 29°, 4th, 25°, 9th, 28°, 14th, 28°, 15th, 27°. The highest morning readings were on the 19th, 61°; 20th, 53°; 21st, 55°; 27th, 54°;

30th, 55°. The lowest day temperature was 42°, which occurred on the 8th, and the highest 68°, on the 19th.

The aggregate amount of frost registered this season up till the end of April is 466°, while for the same period last season 163° only were registered. The lowest point reached this season was 18° Fabr., or 14° of frost, which occurred on January 23. The following are the amounts of frost registered for each month, viz.:—October, 7°; November, 64°; December, 86°; January, 70°; February, 67°; March, 82°; April, 27°.

The rock garden was very gay during the month; 182 species and varieties of alpine plants came into bloom, making a total of 280 since January 1, as compared with 225 for the same period last year. Amongst the most conspicuous plants which flowered were:—

<i>Adonis vernalis</i>	<i>Narcissus rupicola</i>
<i>Androsace carnea</i>	<i>Lithospermum prostratum</i>
" <i>coronopifolia</i>	<i>Petrocallis eyreana</i>
" <i>Laggeri</i>	<i>Primula ciliata purpurata</i>
" <i>foliosa</i>	" <i>longiflora</i>
<i>Aubrietia Hendersoni</i>	" <i>Clusiana</i>
<i>Anemone fulgens</i>	" <i>cashmiriana</i>
" <i>Robinsoniana</i>	" <i>rosea</i>
" <i>pulsatilla</i>	" <i>Sieboldi</i>
<i>Draba Maweana</i>	" <i>viscosa</i>
<i>Deutaria eueaphylla</i>	<i>Polyga chamæbuxus</i>
<i>Corbularia Graelsi</i>	" <i>purpurea</i>
<i>Epigaea repens</i>	<i>Menziesia corulea</i>
<i>Gentiana verna</i>	" <i>empetriformis</i>
<i>Helonias bullata</i>	<i>Rhododendron ciliatum</i>
<i>Iberis petraea</i>	<i>Soldanella montana</i>
<i>Narcissus bulbocodium minor</i>	<i>Podophyllum Emodi</i>
" <i>Emperor</i>	<i>Tulipa pulchella</i>
" <i>Empress, &amp;c.</i>	<i>Ranunculus amplexicaulis</i>
" <i>incomparabilis</i>	<i>Trifolium uniflorum</i>
" <i>Watkin</i> "	<i>Muscari Arzai</i>

A large number of interesting plants in flower was laid on the table for exhibition, among which was a pure white variety of *Gentiana verna*, found by Professor Dickson, at Teesdale, while with the Scottish Alpine Botanical Club's excursion to that district last autumn.

Mr. Lindsay drew attention to a fine large specimen of *Morehella esculenta*, which was sent to the meeting by Mr. Dunn, Dalkeith Palace Gardens, who found it growing under a Gooseberry bush in the kitchen garden there.

VI. "Report on Temperature, Vegetation, &c., in the Botanic Garden, Glasgow, April 1885." By Robert Bullen, Curator.—The thermometer has been at or below the freezing point nine times, the lowest reading being 26° during the night of the 8th. No frost has been registered since the morning of the 18th. During the latter part of the month the temperature has been higher than is usual, weather often sunless, and showers frequent, but generally light; this has had a marked effect on vegetation, the growth developed in a few days being wonderful. Like the corresponding month last year, the rainfall has been light, and favourable for seed sowing, which important operation had in many instances to be deferred owing to the frequent slight frosts.

#### MANCHESTER BOTANICAL AND HORTICULTURAL.

The Whitsun show of this Society closed in a manner highly satisfactory to the Council and Mr. B. Findlay, for it left them with a gain of something like £700. Whit Monday, which was so wet about London, was gloriously fine at Manchester, and the largest numbers with but one exception, which had attended this show on a Whit Monday was present, and over £800 were taken at the gates. Though only the Tulips were on view on Saturday last, and there was the counter attraction of a high-class county cricket-match close by, a large number of persons were at the Botanical Gardens, and the sum of over £67 was taken in sixteen admissions. The gardens are now being seen to the best advantage; the spring tints are on the trees, the green-sward is in the best condition, and many shrubs and plants are in bloom. Everywhere the admirable care bestowed in keeping the grounds is apparent. The entrance walk is greatly improved by the addition on the left-hand of a fringe of rockwork, planted with many choice hardy subjects. The houses are attractive with flowering plants, and such specimens of *Schizanthus* as one seldom sees in the show-house. Manchester has once more come to the fore in a decided and successful manner. A spirited policy on the part of the Council commands and receives a generous public support.

KLUGIA NOTONIANA. — This is an old introduction from the East Indies, probably lost, and re-introduced last year to Kew, where it is now flowering in the Begonia-house. The flowers are small, but of a beautiful intense blue, and singularly interesting on account of the curious conformation of the corolla. The upper lip is small, the lower one large and pouched, but much flattened vertically, and completely enclosing the organs of the flower. At first sight one would imagine the flower was self-fertilising, but its deep colour and singular development preclude this idea. A more plausible theory is that the flower is specialised for certain large insects which are able to open the lip and effect an entrance, to the exclusion of small ones. The plant is figured in the *Botanical Magazine*, t. 4620, and rejoices in several synonyms, such as *Wullenia Notoniaea*, *Glossanthus Notoniaea*, and *G. malabarica*.

#### LEUCOIUM HERNANDEZII.

*LEUCOIUM Hernandezii* of Cambessides has for many years been one of our botanical puzzles. Nobody could tell you, with any degree of certainty, which of the summer Snowflakes it was. In my notes on the *Leucoiums*, published last year in your columns (*Gardeners' Chronicle*, March 15, 1884, p. 341), I stated that I had not been able to find any illustration of this flower, and I do not believe that any has ever been published. I afterwards searched through the specimens in the Kew herbarium, with the kind assistance of Mr. Baker, but it was not to be found there. Mr. Baker was anxious to have the matter cleared up, believing it would be found to be the same as *L. pulchellum*, and there appeared to be no other way open than that of obtaining bulbs from its native habitat. Dean Herbert made it the third of the *Leucoiums*, and described it carefully; so I suppose he had seen it under that name. Oddly enough, he describes *pulchellum* from the plate in Salisbury's *Paradisus*, and he adds: "I have never seen the plants." He states that *L. Hernandezianum* differs from *æstivum* in having flowers about half the size, and a more oblong germen, which is quite correct; and he states that it was found by Dr. Hernandez in Majorca, on the mountains near Lluch. I, therefore, sent a sketch of the plant as I expected to find it to Señor M. Juan Rodriguez, of Malion, Minorca, an excellent botanist, for whose name I was indebted to Mr. Baker, and I stated the case as above, and asked if he would be so good as to endeavour to procure bulbs of the plants in the locality indicated by Dean Herbert. M. Rodriguez very kindly did so, and succeeded in procuring twenty bulbs, which in due time reached me in England. Several of these have flowered and are now in flower, and they have been seen by many botanists, and carefully compared with the other *Leucoiums*—*æstivum* and *pulchellum*. The conclusion arrived at has been that *L. Hernandezii* is the same as *pulchellum*.

Salisbury appears to have named *L. pulchellum* in his note of 1807, whereas Cambessides' paper, in which it was afresh introduced and named after its finder, Dr. Hernandez, was published in 1827, so that the name *pulchellum* has priority over *Hernandezii*, or *Hernandezianum*, as Dean Herbert has it, by twenty years. The latter names will, therefore, have to be dropped for the future, except as synonyms, and the name *pulchellum* will stand. There are thus but two summer Snowflakes—*æstivum* and *pulchellum*. I have been surprised to find how rare the true form of *L. æstivum* is in the North of England, whereas *L. pulchellum* abounds. I had but one clump of it in my garden, whereas we have at least fifty of *pulchellum*, and, oddly enough, that single clump of *æstivum* was marked *Hernandezii* by a very leading authority, and the various clumps of *pulchellum* were divided by fancied differences into *æstivum* and *pulchellum*. There are slight differences just as there are in the spring Snowflakes—some have yellower green spots, but beyond this there is no real difference. The best plate of the true form of *L. æstivum* is to be found in Jacquin's *Flora Austriaca*, vol. iii., pl. 263, and the only two I know of for *L. pulchellum* are in Salisbury's *Paradisus*, pl. 74, and Loddiges' *Cabinet*, 1478. *W. Brockbank, Brockhurst, Didsbury, May 29.*

#### THE CABBAGE APHIS.

MOST persons are familiar with the swarms of blueish aphides that in some seasons affect the common Shepherd's Purse. It occurs commonly on the Turnip, Radish, field Cress (*Isatis tinctoria*), Shepherd's Purse (*Capsella bursa-pastoris*), and Charlock (*Brassica arvensis*), in addition to Cabbage, and upon this last plant, according to Buckton, "It often crowds both the upper and under sides of the foliage in such numbers that the leaves become hidden by the living mass. Indeed, sometimes, weight for weight, there is more animal than vegetable substance present. The leaves then become putrid, offensive in odour, and quite disgusting to the eye. Frequently whole fields of Cabbage are rendered unfit for the market by the work of this species."

"The remedy of fumigation with tobacco smoke, as recommended by Fitch, Curtis, Thomas, and others, is," says Prof. Riley in his report of the State Entomologist, "impracticable on a large scale, and applications of soot, ashes, lime, and washes of tobacco-

water and other materials seem ineffectual. Strong whale-oil soap solution, indeed, seems to be the only remedy so far tried which affords any satisfaction. This is highly recommended by Prof. W. R. Lazenby, formerly of the Horticultural Department of Cornell University. Saschenberg recommends sprinkling with soap-suds treated with quassia, and also the use of a decoction of fresh Walnut leaves. The Pyrethrum infusion will destroy a large number of the insects, which work in such exposed situations that they can be easily reached by a spray, while the waxy material which they excrete is not sufficiently abundant to perfectly shield a watery solution, as is the case with many allied species. But the kerosene emulsion will prove more satisfactory than any of the insecticides mentioned." (See vol. xxii., 1884, p. 304.)

— 3.—Very fine day and night.

LONDON: Atmospheric Pressure.—During the week ending May 30, the reading of the barometer at the level of the sea increased from 29.79 inches at the beginning of the week to 30.07 inches by 9 A.M. on the 25th, decreased to 29.96 inches by 9 A.M. on the 26th, increased to 29.99 inches by 1 P.M. on the same day, increased to 30.02 inches by 9 A.M. on the 27th, decreased to 29.91 inches by 9 A.M. on the 28th, increased to 29.99 inches by 1 P.M. on the 29th, decreased to 29.96 inches by 5 P.M. on the same day, increased to 30.10 inches by 9 A.M. on the 30th, and was 30.04 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.99 inches, being 0.34 inch higher than last week, and 0.04 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 75.8 on the 28th; the highest on the 25th was 62.5. The mean of the seven high day temperatures was 68.2.

The lowest temperature in the shade in the week was 42°, on the 25th; on the 28th the lowest temperature was 54.5. The mean of the seven low night temperatures was 47.8.

The greatest range of temperature in one day was 21.9, on the 30th; the smallest was 17.3°, on the 29th. The mean of the seven daily ranges was 20.4.

The mean temperatures were—on the 24th, 51°; on the 25th, 48.3°; on the 26th, 54.7°; on the 27th, 50°; on the 28th, 63.4°; on the 29th, 58.2°; and on the 30th, 55.7°; of these the 24th, 25th, 26th, and 30th were below their averages by 3° 6', 6° 7', 0° 5', and 0° 3' respectively; the 27th, 28th, and 29th being above by 3° 6', 7° 8', and 2° 4', respectively.

The mean temperature of the week was 55.8, being 6.8 higher than last week, and 0.4 higher than the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 131.5, on the 28th. The mean of the seven readings was 111.8.

The lowest reading of a minimum thermometer placed on grass was 34.2, on the 25th. The mean of the seven readings was 42.7.

Rain.—Rain fell on two days, to the amount of 0.46 inch.

ENGLAND: Temperature.—During the week ending May 30, the highest temperatures were 75.8 at Blackheath, 74.6 at Cambridge, 72° at Sheffield; the highest at Plymouth was 60.6, at Truro 62°, at Bolton 63.7. The general mean was 67.9.

The lowest temperatures were 35° at Hull, 37° at Leeds, 37.2 at Wolverhampton; the lowest at Truro was 47°, at Plymouth 46.5, at Brighton 46°. The general mean was 41.2.

The greatest ranges were 34.8, at Cambridge, 34° at Hull and Leeds, 33.8 at Blackheath. The smallest ranges were 14.1 at Plymouth, 15° at Truro, 20.5 at Bristol and Liverpool. The general mean was 26.7.

The mean of the seven high day temperatures was highest at Blackheath, 68.2, at Cambridge 66.8, at Brighton 63.8, and was lowest at Plymouth 57.4, at Bolton 58.5, at Sunderland 59.5. The general mean was 61.7.

The mean of the seven low night temperatures was highest at Brighton, 49.3, at Truro 49.1, at Plymouth 48.9; and was lowest at Bolton, 43°, at Wolverhampton 43.4, at Hull 44.1. The general mean was 46.4.

The mean daily range was greatest at Cambridge, 20.6, at Blackheath 20.4, at Hull 19.6; and was least at Plymouth, 8.5, at Liverpool 12.7, at Bristol 12.9. The general mean was 15.3.

The mean temperature was highest at Liverpool, 57.5, at Blackheath 55.8, at Brighton and Cambridge 54.8; and was lowest at Bolton, 49°, at Wolverhampton 50.2, at Sunderland 50.3. The general mean was 52.6.

Rain.—The largest falls were 1.54 inch at Sunderland, 0.57 inch at Plymouth, 0.55 inch at Cambridge; the smallest falls were 0.06 inch at Liverpool, 0.07 inch at Hull, 0.09 inch at Bradford. The general mean fall was 0.37 inch.

SCOTLAND: Temperature.—During the week ending May 30, the highest temperature was 64.9, at Leith, at Aberdeen the highest temperature was 61.5. The general mean was 63°.

The lowest temperature in the week was 28°, at Glasgow; at Leith the lowest temperature was 43.4. The general mean was 39.2.

The mean temperature was highest at Leith, 53.7; and lowest at Glasgow, 50.1. The general mean was 52.2.

Rain.—The largest fall was 0.62 inch at Aberdeen; the smallest fall was 0.24 inch, at Glasgow. The general mean fall was 0.41 inch.

JAMES GLAISHER F.R.S.

AN AUSTRALIAN FERN PARADISE.—The Blue Mountain Range, in New South Wales, is much frequented by Fern-hunters, especially in the vicinity of Mount Wilson, where the summit of the ridge is largely covered with a dense growth of Eucalypti, the mere trunks of which almost obscure the horizon, and in the undergrowth it is no exaggeration to say that thousands of Tree Ferns, ranging up to 30 feet in height, are visible in every direction. It is on the southern slopes that the Sassafras jungle is found, in which mosses and Orchids luxuriate, and festoons of lianes hang from the topmost branches. There are two peculiarities in this vegetation which are worthy of notice; first, that the Tree Ferns (*Alsophila australis*) frequently bifurcate at a short distance from the ground, and in many cases divide into three or four, and sometimes into five and six stems, from one root; second, that Tree Ferns (which must be of very ancient date) are frequently almost entirely absorbed by the growth of forest trees (*Quintetia Sieberii*), which, germinating in the axils of their fronds, send down suckers to the ground, and enclose within their solid timber the Fern-stems from which they derived their first support. In some cases are seen Ferns which, having attained a growth of 20 feet in height, have been laid low by the wind, and where some portions of their heads have touched the ground a second growth of equal altitude has succeeded, which in its turn has been subsequently enclosed by a *Quintetia* of large diameter, while the roots of the original Tree Fern still retain their vitality. *Sydney Paper.*

## Answers to Correspondents.

ASPECT FOR GREENHOUSE: W. W. We think span-houses, with low-pitched roofs, standing north and south, would suit such plants as you mention, and would render unnecessary the turning round of the plants, an operation often required in houses with a southerly aspect only.

DAISY: A. S. W. The Hen-and-chicken Daisy, owing its appearance to a formation of secondary flower-stalks in the axils of the bracts (axillary proliferation).

JUDGING AT RECENT SHOWS: J. C. & Co. We forwarded your letter to our reporter, and having received his reply, cannot admit that you have any just cause for complaint.

NAMES OF PLANTS: D. H. 1. *Limnanthes Douglasii*; 2. *Coronilla Emerus*.—D. W. H. 1. *Leucocium vernum*; 2. *Narcissus poeticus*; 3. *Primula Sieboldi*.—F. J. H. 1. a *Casuarina*; 2. *Escallonia macrantha*; 3. *Epimedium alpinum*; 4. *Ribes aureum*.—R. J. H. *Ulmus montana*.—F. T. *Epipendrum rhizophorum*.—C. W. *Cochlearia officinalis*.—R. G. I. *Polygala vulgaris*.

ORCHIDS: T. D. The variety you send is a fine one as regards size, form, and substance, but the colour is not so rich as in some we have seen. The *Amaryliss* is *Sprekella formosissima*.—A. J. We do not quite gather whether you allude to the photographs or the plants.

SULPHATE OF AMMONIA: A Reader. 1 cwt. per acre, mixed with some fine ashes or sand.

FOREIGN SUBSCRIBERS sending Post-Office Orders are requested to send them to the Publisher of this journal, 41, Wellington Street, Covent Garden, and to make them payable to William Richards, at the Post-Office, Drury Lane, London, W.C.

## SEEDS.

LONDON: June 3.—There is scarcely any business now doing in farm seeds. The prospects for red Clover seed for next season are not considered good, either in this country or America. Meantime, however, there is but little speculative inquiry for the small stocks left over. The prices asked for new French Trifolium are apparently too high for buyers on this side. For Mustard and Rape seed there is a good sowing demand; values keep steady. Other articles at this quiet season offer no subject for remark. *John Shru & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

## CORN.

At Mark Lane on Monday the reduction on both English and foreign Wheat was quoted 1s. to 2s. The latter shows good quality. Flour was even more unsaleable than Wheat, and fully 1s. per sack lower. Grinding Barley was dull of sale, at 6d. reduction. Beans and Peas were down 6d. to 1s. and Oats 3d. to 6d. per quarter. On Wednesday the fine weather and the Epsom races tended to check the already very limited business passing in the grain trade, and the tendency was adverse for both Wheat and flour. Maize engaged little attention. Barley remained unchanged, and Beans, Peas, and Oats were nominally the same as on Monday.—Average prices of corn for the week ending May 30:—Wheat, 34s. 11d.; Barley, 28s. 8d.; Oats, 22s. 9d. For the corresponding period last year:—Wheat, 37s. 7d.; Barley, 28s. 9d.; Oats, 21s. 2d.

## CATTLE.

At Copenhagen Fields on Monday the good finish up in the beef trade at the Central Market on Saturday induced hopes of a better demand for cattle here; but the result was disappointing, and although the previous Monday's extreme rates were obtained in exceptional instances, the current trade was against the seller. Sheep sold fairly well, and quite up to late value, but the lamb trade was decidedly worse, and prices much lower. Calves sold badly, though supply was lighter. No pigs were on offer, and quotations are nominal.—Quotations:—Beasts, 4s. to 4s. 8d., and 4s. 10d. to 5s. 4d.; calves, 4s. to 5s. 4d.; sheep, 4s. 8d. to 5s., and 5s. 4d. to 6s.; lambs, 6s. 4d. to 7s.; pigs, 4s. to 4s. 6d.—On Thursday trade was quiet. Supplies were ample for the demand. Beasts moved off very slowly, and were lower to sell. Sheep were in quiet request, and were weak in value. Lambs were a shade steadier, but no higher; calves lower to sell, pigs dull.

## HAY.

Tuesday's Whitechapel Market report states that trade was fair and supplies moderate. Quotations:—Clover, prime, 85s. to 108s.; prime second cut, 85s. to 100s.; inferior, 60s. to 75s.; hay, prime, 70s. to 98s.; inferior, 40s. to 60s.; and straw 26s. to 36s. per load.—On Thursday there was a moderate supply. Trade was quiet, except for best Clover, which was again dearer. Cumberland Market quotations:—Clover, best, 85s. to 105s.; other qualities, 60s. to 80s.; hay, best, 84s. to 95s.; other qualities, 40s. to 70s.; and straw, 28s. to 35s. per load.

## POTATOS.

The Borough and Spitalfields Markets reports state that of old Potatoes there is a short supply, dearer for good qualities. New Potatoes from abroad are coming in, fairly good. Quotations:—Scotch Regents, 8s. to 11s.; Kent ditto, 70s. to 100s.; Champions, 50s. to 60s.; Magnum Bonums, 70s. to 110s.; Victorias, 80s. to 110s. per ton; Jersey Kidneys, 18s. to 20s.; Lisbon and Malta Rounds, 8s. to 10s. per cwt.—The imports into London last week consisted of 288 boxes 2992 packages 5 cases from Malta, 5004 packages 4117 half-boxes Lisbon, 15 boxes Lyttelton, 157 cases 26 half-cases Salonica, and 390 baskets from St. Nazaire.

**Government Stock.**—Consols closed on Monday at 101½ for delivery, and 99½ to 100, x.d., for the account. The figures of Tuesday and Wednesday were 99½ to 99½, x.d., for both delivery and the account. Thursday's closing quotations were 99½ to 99½, x.d., for both the account and delivery.

Oil Paint no Longer Necessary.  
**HILL AND SMITH'S BLACK VARNISH,**  
for Preserving Ironwork, Wood, or Stone.  
(Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on  
all outdoor work, while it is fully two-thirds cheaper. It was  
introduced upwards of thirty years ago by the Advertiser, and  
its genuine good quality, notwithstanding a host of unprincipled  
imitators, is fully attested by its constantly increasing sale. It  
may be applied by an ordinary labourer, requires no mixing  
or thinning, and is used cold. It is used in the grounds at  
Windsor Castle, Kew Gardens, and at the seats of many  
hundreds of the Nobility and Gentry, from whom the most  
flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon,  
at the Manufactory, or 1s. 8d. per gallon carriage paid to any  
Station in the Kingdom.

UNSOLICITED TESTIMONIAL.

"Pierrefield Park, June 21, 1876—Sir, I have this day  
forwarded from Chepstow to your address a black varnish cask,  
to be filled and returned with as good Varnish as the last we  
had, which I candidly admit was the best we ever had. Address  
Varnish to Pierrefield Park, Chepstow.—I am, Sirs, yours re-  
spectfully, Wm. Cox."

CAUTION.—HILL & SMITH would particularly warn their  
Customers against the various cheap Varnishes now so much  
advertised.

H. & S.'s Varnish has been an article of common use on most  
of the large estates in the kingdom for upwards of thirty years;  
and their constantly increasing trade in it, and the numerous  
Testimonials they receive stamp it as a truly genuine article.  
Every cask is legibly marked with their name and Registered  
Trade Mark as above, without which none is genuine.

Large Illustrated CATALOGUE of Fencing Hurdles, Field  
and Entrance Gates &c., sent free on application to

**GARDENER (HEAD WORKING).**—Married, no family; thoroughly understands the Forcing of Fruits, Flowers, and Vegetables; also Flower and Kitchen Garden and Grounds. Wife as Cook or Dairywoman. Four years' good character from present situation, sixteen years' previous.—PETER STODDART, Hall Street, Long Melford, Suffolk.

**GARDENER (HEAD WORKING),** where a good practical and energetic man is required.—Age 38, married; twenty years' experience in good establishments. Thoroughly competent in all branches. Ten years' excellent references.—GARDENER, 18, Queen's Road, Crown Hill, Norwood, S.E.

**GARDENER (HEAD WORKING, or good SINGLE-HANDED).**—Married, one child; thoroughly experienced in the profession, particularly Grapes, Melons, Cucumbers, and Mushrooms. Two years' good character.—C. E., 8, Hereward Road, Upper Tooting, S.W.

**GARDENER (HEAD, or good SINGLE-HANDED).**—Age 26, married; understands Vines, Cucumbers, Melons, Flower and Kitchen Gardening. Eleven years' experience, four years in last situation.—G. LONG, 15, Denmark Road, Gloucester.

**GARDENER (HEAD), GROWER for Market, or SALESMAN (Fruit, Plant, and Cut).**—Age 38; thoroughly practical in all the above, also Kitchen Garden and Pleasure Grounds. Wages £2 per week. Disengaged when suited. A thorough Florist's connection in London at the present time, and a steady sale for good stuff.—HEAD GARDENER, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**GARDENER (HEAD), or good FOREMAN.**—Eleven years' experience in Early and Late Forcing, Stove, and Greenhouse Plants, Kitchen and Flower Garden Work. Highest testimonials.—H. GILBERT, 3, Victoria Villas, Lower Mortlake Road, Richmond.

**GARDENER (HEAD, or SINGLE-HANDED).**—Age 32, married, one child; understands Vines, Peaches, Melons, Cucumbers, Stove and Greenhouse Plants, and Flower and Kitchen Gardening.—J. HORN, 45, Flask Walk, Hampstead, N.W.

**GARDENER (SINGLE-HANDED, or where help is given).**—Age 26; can be highly recommended from present and previous situations.—J. HIGGS, Burghfield, Reading.

**GARDENER (SINGLE-HANDED), or otherwise.**—Married, one child; five years' good character.—Reply to Rev. E. D. GALLOWAY, Papworth Everard, St. Ives, Hunts.

**GARDENER (SINGLE-HANDED), or where help is given.**—Age 38, married; seventeen years' experience. Thoroughly practical in every branch of Gardening. Good character. Total abstinence.—B. C., Mr. Allen, Collee Tavern, Waltham Cross, Herts.

**GARDENER (SECOND),** where two or three are kept.—Age 21; highest character. Strongly recommended by Rev. J. T. WESIROP, Witham Priory Vicarage, Bath.

**GARDENER (SECOND).**—Age 22; well up in the Growing of Pines, Vines, Peaches, Melons, Cucumbers, Stove and Greenhouse Plants, Flower and Kitchen Garden Work. Well recommended by previous and present employers.—W. JOHNSON, Park Hall, Hayfield, Derbyshire.

**GARDENER (SECOND),** in a good establishment.—An active young man; thoroughly understands the work; or good Market Place. First-class testimonials for honesty, sobriety, civility, and industry.—A. FOWLIS, Coffee Tavern, Droitwich.

**GARDENER (SECOND),** in a Gentleman's establishment.—Age 21; good knowledge of Plant Growing and Propagating, and the general routine of Gardening, In and Outdoors. Good experience.—G. ART, Mrs. Bay, Post Office, Chipstead, Red Hill, Surrey.

**GARDENER (SECOND), or FIRST JOURNEYMAN.**—Age 24; ten years' experience in all branches. Three years' good character from present situation.—T. H., Field Heath, Hillingdon, Uxbridge, Middlesex.

**GARDENER (SECOND), or JOURNEYMAN,** in a good establishment.—Age 23; seven and a half years' experience. Good references.—E. TICHNER, 14, Auckland Road, Tunbridge Wells, Kent.

**GARDENER (UNDER).**—Age 26, married, no family. Total abstinence. Good reference.—A., 2, Church Terrace, Ravenscroft Road, Beckenham, Kent.

**GARDENER (UNDER), or otherwise.**—Age 21; seven years' experience, chiefly under Glass. A fair knowledge of Outdoor Gardening. Good character.—A. CROWSLEY, 40, Castle Hill, Becontree.

**GARDENER (UNDER).**—A Gardener's son (age 17), requires a situation in a Gentleman's Garden or Nursery. Three years' experience inside and out. Good character.—E. HARRISON, Southampton Street, Ringwood, Hants.

#### To Nurseriesmen.

**MANAGER, FOREMAN, and PROPAGATOR.**—Can be highly recommended by London and Provincial Firms, as to ability, sobriety, &c.—A. B., Ivy Terrace, Green Lanes, Stockport.

**FOREMAN, in the Houses.**—Age 24; well up in Stove and Greenhouse Plants, Fruit, and Orchids.—W. KITTLE, Hill Farm, Layer de la Haye, Colchester, Essex.

**FOREMAN, in a good establishment.**—Age 27, single; thirteen years' practical experience in all branches.—State wages and particulars to FOREMAN, The Gardens, Benham Park, Newbury, Berks.

**FOREMAN, in the Houses.**—Age 26; eleven and a half years' experience in all branches of the profession—two years in last situation. Well recommended from last and previous places.—M. F., 25, Barrow Hill Road, Regent's Park, London, N.W.

**FOREMAN, in the Houses, or HEAD where another is kept.**—Age 25. Can be highly recommended from present employer, and nine years' good character.—H. B., 2, Bawles Place, High Road, Whetstone, N.

#### To Nurseriesmen.

**FOREMAN (GENERAL) under Glass.**—One of the most successful Propagators and Plantsmen in the Trade. Thirty years' extensive practice. Twenty years as General Foreman with leading Firms.—W. E., 7, Mill Street, Altrincham, Cheshire.

**FOREMAN GROWER and PROPAGATOR.**—Single. Twenty years' practice with Grapes, Tomatoes, Cucumbers; also Roses, Ferns, and Plants, for Cut Blooms and market. Eleven years' character.—K. W. P., Mr. Richard Windsor, Florist, Child's Hill, London, N.W.

**PROPAGATOR and GROWER for Market.**—Age 29, single; sixteen years' experience. Good character.—State wages to E. R. B., 3, Stephens' Cottages, Myrtle Road, Sutton, Surrey.

#### To Nurseriesmen.

**PROPAGATOR (SOFT-WOODED).**—Low wages where there would be opportunities for Improvement. Good character.—Full particulars from X., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**JOURNEYMAN,** where three or more are kept.—Age 22; six and a half years' good character.—E. REFFOLD, The Gardens, Peperharow, Godalming, Surrey.

**JOURNEYMAN, in the Houses, in a good establishment.**—Age 21; both preferred. Five years' experience. Good character.—J. DEAN, Lower Eaton, Hereford.

**JOURNEYMAN, in a good establishment.**—Age 22; well recommended from last and previous situations. Total abstinence.—F. WALKER, Hingham, Attleborough, Norfolk.

**JOURNEYMAN, in the Houses, or to help Indoors or Out in the Garden, in a good establishment.**—Bothy preferred. State Wages, &c.—J. B., 64, Mount Street, Spring Gardens, Reading, Berks.

**JOURNEYMAN (INDOOR), in a large establishment; age 21.**—Mr. LONGFOOT, The Gardens, Pull Court, Tewkesbury, Gloucestershire, can with confidence recommend a young man, as above, with excellent testimonials.

**JOURNEYMAN, or IMPROVER, in a Gentleman's Garden.**—Age 17; four years' good experience under Glass. Can be highly recommended. Bothy preferred.—A. B., W. Cole, Vineyard, Feltham, Middlesex.

**IMPROVER, in the Houses.**—Age 18; willing to make himself useful. Good reference.—F. GEORGE, Mrs. Bray, Post office, Chipstead, Surrey.

**IMPROVER, in the Houses.**—Good character and references. Bothy preferred.—J. H., 29A, Western Road, Bath Road, Reading, Berks.

**IMPROVER, in a garden; age 18.**—The Rev. D. T. MOORE, Ivy Bank, Reading, can highly recommend a lad as above. Has knowledge of General Work.

**IMPROVER, a Nobleman's garden preferred; age 20.**—A Gardener's son, an orphan, wants a situation as above. Total abstinence from infancy. Present place eleven years.—Rev. GEORGE DART, Elvington, York.

**IMPROVER, in a Gentleman's or Nobleman's Estate.**—Age 18; five years' practical experience. Can be well recommended.—W. J., 1, Hauover Terrace, London Road, Isleworth, Middlesex.

**IMPROVER; age 17.**—Wanted, a situation, as above, in a good establishment. £2 Bonus. Four years in present situation; leaving through place being broken up.—W. MAXFIELD, Camden House, Landaff, Glamorganshire.

**TO GARDENERS.**—Wanted by a young man (age 23) a situation in a Gentleman's or Nurseryman's Garden. Five years' experience in the same.—GEORGE LITCH, Dudbrook Cottage, near Brentwood, Essex.

**TO HEAD GARDENERS.**—The Advertiser can confidently recommend a reliable Second Man (age 25) in a moderate sized establishment.—G. H., The Gardens, Athelstan Road, Harold Wood, Romford.

**TO NURSERYMEN and MARKET GARDENERS.**—A youth (age 16), with some knowledge of Plant Rearing, requires a situation as Helper and to Learn the Trade.—C. BRADLEY, Stixwold, Hornsea.

**TO NURSERYMEN.**—Advertiser would take a place of trust, at low wages, where he could improve himself in the general business. Small nursery preferred.—Particulars from T. Y., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**TO HEAD GARDENERS.**—Situation wanted, in the Houses, under a Foreman; age 18; well recommended. Bothy preferred.—G. W. BULL, Earl's Croome, Worcestershire.

#### To the Seed Trade.

**SHOPMAN (HEAD), MANAGER or TRAVELLER.**—Advertiser will shortly be disengaged; is thoroughly practical in the different branches of the Trade, and has had considerable experience of late amongst Farmers and Agriculturists in the Provincial Markets. Good references.—A. E., Messrs. Hurst & Son, 152, Houndsditch, London, E.

**SHOPMAN, or otherwise.**—Age 30; good knowledge of the Seed and Florist's Business. Willing to be useful.—J. G., 14, Hertford Road, Kingsland, N.

**TO FLORISTS, &c.**—Re-engagement wanted in office, or otherwise; good knowledge of General Trade and Orchids. A good Florist. Unexceptionable references.—H. A., Thos. Runyard, Asford.

### GRATEFUL-COMFORTING. EPPS' S COCOA-BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." *Civil Service Gazette*.

Made simply with boiling water or milk. Sold only in Packets, labelled thus—  
**JAMES EPPS & CO., Homoeopathic Chemists, London.**

**HOLLOWAY'S OINTMENT and PILLS.**—Colds, Coughs, Shortness of Breath.—These maladies require early and unremitting attention, for if neglected they often end in asthma, bronchitis, or consumption. The Ointment well rubbed upon the chest and back, penetrating the skin, is absorbed and carried directly to the lungs, whence it expels all impurities. All the blood in the body is perpetually passing through the lungs, and there all noxious particles tending to disease can be quickly, thoroughly, and permanently neutralised, rendered harmless or ejected from the system. Holloway's Ointment and Pills perfectly accomplish this purification; and, through the blood thus cleansed, the influence of these wonderful medicaments reaches the remotest parts of the human body, and thus cures all diseased action, whether internal or external.

## AUTUMN DELIVERY.—THE FRUIT OF THE FUTURE.

NEW MAGNIFICENT BLACKBERRY  
"THE WILSON JUNR."

Delicious—Marvellous—Tempting—Luscious—Handsome.

*Perfectly hardy—will do well under any treatment—grow in any soil (waterlogged excepted)—and extraordinarily productive.*

THE FRUIT FOR THE MANSION.  
THE FRUIT FOR THE COTTAGE.  
THE FRUIT FOR THE MARKET.

*To the gentry requiring a delicious dessert,  
To gardeners wanting a new luscious fruit,  
To market gardeners desirous of large profits,* } Try this.

As we are daily receiving Orders for this magnificent variety from patrons desirous of ensuring early delivery next autumn, we must impress upon all would-be purchasers of this splendid fruit the necessity of favouring us with their commands as speedily as possible, as all Orders will—as in the spring—be executed in strict rotation as received.

The following Testimonial is one from amongst many others received from well-known fruit judges who have tested the merits of "Wilson Junr.":—"Editors often have to comment on the difference between a drawing of a new fruit and the fruit itself when it comes before them. Before me just now is a drawing of the Wilson Junr. Blackberry, and the real fruit of the same, and it is pleasant to record that the immense size is not the least exaggerated. They were  $1\frac{1}{2}$  inch long,  $4\frac{1}{2}$  inches around lengthwise, and  $3\frac{3}{4}$  inches around crosswise. Five of them weighed 2 ounces."—Mr. THOMAS MEEHAN, of *American Gardeners' Monthly*.

Price, 1s. 3d. each, 12s. per dozen, 85s. per 100, delivered free.

Other varieties—KITTATINNY, LAWTON, PARKLEY-LEAVED (*Rubus fruticosus laciniatus*), WILSON'S EARLY, &c., at 9d. each, 8s. 6d. per dozen, 63s. per 100, delivered free.

## VICCARS COLLYER &amp; CO.,

Importers of New and Rare Plants, Seeds, &c.,  
Seedsmen, Nursermen, &c.,

CENTRAL HALL, LEICESTER (where all Letters are to be addressed), and

CENTRAL NURSERIES, GLENFIELD, near LEICESTER.

A. W. CREWS, Manager.

# WM. PAUL & SON'S

## NEW HARDY CRIMSON AUTUMN-FLOWERING CLIMBING ROSES.

Waltham Climber No. 1.  
Waltham Climber No. 2.  
Waltham Climber No. 3.

These Roses are seedlings from Gloire de Dijon, possessing all the good qualities of that well-known variety: they are all red Roses, but of different shapes and distinct shades of colour — No. 1 being the lightest, and No. 3 the darkest. They flower abundantly and until late in the autumn, and are recommended as supplying a long-felt want in the garden, namely, good hardy Crimson Autumn-flowering Climbing Roses, with fine foliage.

Strong Plants, in 5-inch pots, now ready, 10s 6d. each; the set of three varieties for 21s.

WM. PAUL & SON also desire to call attention to Mr. Bennett's New Crimson Hybrid Tea Rose, "W. F. BENNETT," the finest red Rose yet introduced for forcing and cut bloom, and for the sale of which in Europe they are the Sole Agents. For full description and price of this and other NEW ROSES (including Wm. Paul & Son's New Varieties of 1884, the Yellow H.P. "GLOIRE LYONNAISE," the new American variety "SUNSET," H.P. "QUEEN of QUEENS," &c.), see WM. PAUL & SON'S

To cut 8 in. .. 1 15

It is simple in construction, easily adjusted, is well adapted  
for mowing small plats, cutting borders, verges, round flower  
beds, the edges of walks, &c. It is a most handy, serviceable  
machine, and very easy to work.

### GREEN'S PATENT GRASS EDGE CLIPPER.

With Chain and Wheel Motion.

A most useful Machine.

Price, £1 16s.

Packing Case, 2s.

SIZE,  
8 inches wide by  
7 inches diameter.

### GREEN'S PATENT (No. 2412) LAWN TENNIS COURT MARKER.

Price 20s.

Small Bag of Marking Compo-  
sition, Mat, and Packing, 1s. 6d.

Price List free on application.

The above Machines can be had of all respectable Iron-  
mongers and Seedsmen in the United Kingdom, or direct from  
the Manufacturers,

THOMAS GREEN & SON  
(LIMITED).

SMITHFIELD IRONWORKS, LEEDS; and  
SURREY WORKS, BLACKPRIARS ROAD, LONDON, S.E.  
Carriage paid to all the Principal Railway Stations in  
the United Kingdom.

THE

## Gardeners' Chronicle.

SATURDAY, JUNE 13, 1885.

### CHERKLEY COURT.

ABOUT two miles from Leatherhead, the approach being over the undulating and gradually rising ground towards Mickleham, stands Cherkley Court, the residence of Abraham Dixon, Esq. Not much more than ten years have elapsed since the mansion has been completed and the gardens formed, but during that time a great number of interesting matters connected with the growth and fruiting of tropical fruits and other things not usually met with in gardens, but which Mr. Dixon's intimate knowledge of tropical climates and vegetation have enabled him to manage successfully, have there been worked out. Unfortunately, as in other places where there is a master mind to suggest original ideas and direct their carrying out to a successful issue, too many of the triumphs about which we should have been glad to hear have passed unnoticed except by the friends and visitors who may have been present at the time. The mansion being situated on the further brow of the hill, the carriage drive from the Leatherhead entrance, in order to make it convenient, had to be made through a cutting in the chalk which with a thin surface of soil runs throughout the whole district. The banks on either hand are planted with shrubs, and an avenue of alternate Cedrus atlantica and Lime trees borders the road which leads up to the carriage entrance. On this side, the house is comfortably sheltered by the rising ground, that in close proximity being prettily clad with Cotoneaster microphylla, aglow with its bright berries in winter. In summer the brow of this hill is said to be conspicuous from a considerable distance with the bright-looking flowers of Silene pendula, which grows there luxuriantly.

From the drawing-room runs the long ornamental conservatory (fig. 169), about 25 feet in height, and containing many fine examples of tropical vegetation, Palms, Musas, Ferns, &c., brightened by a good display of flowering plants. So sturdily does the Musa ensata grow here that the force of the growing young leaves smashes the glass of the roof just over them every year. This at first sight, and considering the tender nature of the leaves, seems incredible, but nevertheless it is a fact, the pressure being exerted in the same manner as that which enables a Mushroom to lift a paving-stone. The right-hand wall of the conservatory is cased with lattice-work filled in with soil and planted with Maidenhair and other Ferns, Begonias, mosses, &c. This arrangement is an excellent one, as it gives that side of the house a charming appearance, clothing it from bottom to top with lovely foliage without encroaching on the walk beneath, as would be the case if the screening of the wall were ever so imperfectly done by plants in pots, or planted at its foot. On the sunny side of the house are interesting collections of Bromeliads and succulents, and a grand specimen of Agave mexicana, which produced a flower-spike over 20 feet in height in the open

air last year. The pillars and roof are furnished with a suitable selection of climbers and some models of Alhambra arches, near which the Bougainvillea profusely blooms, make a novel and pleasing change in this well arranged floral promenade.

Just the passage through a doorway here suffices to bring us into the tropics. Here we enter the Victoria-house, which produced such a grand specimen of that plant last year, and views of which we gave at p. 19, January 3 of this year. Notwithstanding the wonderful effort made by the plant last season it is in the most vigorous condition, and growing on so strongly as to lead to the supposition that it will be even better this year than last. The seedlings, too, which it produced of its own accord and without the artificial fertilisation supposed to be necessary, are in the most thriving condition. In this house the different varieties of Bananas and Plantains fruit well, the variety known here as *Musa dacca* being by far the most ornamental in foliage, and the best in the flavour of its fruits. *M. paradisiaca* is also highly spoken of for the good quality of its fruit, and *M. coccinea*, in flower, speaks for itself as showy plant. The *Monstera deliciosa* and many other tropical fruits are here in the greatest vigour; the *Nelumbiums* in the side tank, with their large umbrella-like leaves on stalks 7 feet in height, the other water and ornamental plants, and the profusion of arched and festooned climbers, rendering the house exceedingly beautiful, and very interesting by reason of its being quite out of the usual run of plant-houses now met with. *Passiflora laurifolia* (the Water Lemon), with its golden fruits, and the monster *Passiflora macrocarpa*, with its Gourd-like fruits, are very handsome, and also good for dessert. In the lean-to houses leading out from the Victoria-house is a fine collection of Water Lilies of all the varieties in cultivation, and an interesting lot of Citrons and other plants, the fine specimen of *Citrus medica* against the wall having a great quantity of its large fruits on it.

Conveniently away from the house is the compact and neatly walled-in kitchen garden, with ranges of fruit and plant-houses. All about them is so neat and orderly, and every detail seems to be attended to with such precision, that too great praise cannot be given to Mr. John Page, the energetic gardener who presides over the Cherkley Court gardens. In the houses almost every branch of plant and fruit growing is carried out, and with a never-failing good result. The long range divided into many compartments is devoted to Camellias, Oranges, and plants generally; three of the houses are vineries, one of them is devoted to pot Vines, and others to Peaches, Nectarines, Figs, Strawberries, &c., the whole of them being in the most perfect trim. At the end of the range is the Orchid-house, with its plants in such good condition that the collection may safely be enlarged. In bloom now or recently are many *Cypripediums*, including the rare *C. insigne* violaceo-punctatum, *Zygopetalum Mackayi*, *Lælia anceps*, *L. autumnalis*, some well bloomed *Calanthes* and *Cælogynes*, and a bright display of the scarlet spathes of the *Anthurium Scherzerianum*. In the stoves beyond are good, clean, useful, specimens of *Dracænas*, *Crotons*, *Marantas*, *Palms*, &c., which are so serviceable when needed for indoor decoration. The smaller ranges of houses have good batches of *Pelargoniums*, *Cinerarias*, *Cyclamens*, *Primulas*, pot *Mignonettes*, *Eucharis*, &c., besides the large lot of soft stuff necessary for bedding-out. The late Peach-house under the wall is also well arranged to bear a crop of Figs as well as Peaches.

Returning to the house through the shrubberies and rocky herbaceous garden, and past the geometrical garden, enclosed by straight cut banks of *Thuja Lobbi*, 8 or 10 feet in height, we come to the terraces, looking over the

Mickleham Downs (fig. 167). The lowest level is planted with fine specimens of *Cupressus Lawsoniana*, which together with most of the other coniferous plants thrive so well here. *Wellingtonia gigantea* is an exception to the rule, as it does not grow well here, no matter how carefully planted.

Tunnels and grottoes formed in the Yews that abound here make delightful retreats—cool in summer and warm in winter. The care bestowed upon the noble old trees therefore does not go unrewarded. They should be carefully guarded, for they greatly assist in making delightful views. Stored as Mr. Dixon's residence is with works of art, among which are many fine pictures of vegetation and scenery in the Tyrol, it is doubtful if he could find one which represents so lovely a scene with so few drawbacks as that which greets the eye from his own dwelling. His own efforts, too, have done much to improve the scenery on the estate which comprises some 350 acres, for in all his alterations he has had the general effect in mind, and introduced just art enough and not too much art, and thus avoided the marring effect of the artificial; indeed, the whole place is in such perfect keeping that it should be a great source of pleasure to him who has so well planned and carried out that great work which was begun in order to give occupation and pleasure to an active mind, which refused to be idle even when rest might fairly have been claimed for it.

The carriage drive leading to Mickleham is planted on either side with *Picea Pinsapo*, which will form a telling feature when the specimens get up, and the whole of the neighbourhood gives varied and pleasant drives and walks, the health-giving properties of which are well known.

## New Garden Plants.

NARCISSUS JONQUILLA, L., var. BURBIDGEI, Baker.

BESIDES the three varieties of the Jonquil described and named by Haworth (major, media, and minor), there is a fourth, well worthy of notice, characterised by having the corona divided down nearly to the base into six segments. In the character of the corona it resembles closely *Narcissus rupicola*, Dufour, figured in *Bot. Mag.*, tab. 6473, fig. 3, but that is a variety of *N. juncifolius*, and the present plant is a Jonquil. It was first brought to my notice several years ago by Mr. Burbidge, who sent me a drawing, which, with his letter, was laid into the Kew herbarium. I intended to have noticed it at the time, but omitted to do so, and now this year it has been sent to me in a living state by Mr. Barr, with a request that I should furnish him with a name for it. Where its original home is I do not know, as all the specimens I have seen are of garden origin.

General habit of leaf as in ordinary typical *Narcissus Jonquilla*. Flowers 2—3 to an umbel; pedicels 1—1½ inch long. Perianth with a greenish cylindrical tube an inch long, and an expanded bright yellow limb ½—1 inch in diameter, with oblong yellow segments. Corona a third or a quarter of the length of the perianth segments, cut into six segments nearly down to the base. *J. G. Baker.*

ONCIDIUM LUDENS, n. sp.\*

At first sight you might suppose this to be *Oncidium annulatum*, but the difference of the callus of the lip, the sharp angles at the base of (his, the lamellæ under the stigmatic hollow, as well as other features, soon show that it is not. The growth may be that of *Oncidium serratum* as Mr. H. Veitch compares it to that species, stating at once the curious circumstance,

\* *Oncidium ludens*, n. sp.—(Cytocilla appendiculata label; linguiformi); sepalis impari unguiculato transverse, elliptico; sepalis lateralibus longius unguiculatis oblongis acutis; tepalibus breviter unguiculatis hastato; oblongis crispis annulato convolutis, nunc liberis (?), nunc coalitis, labello basi utrinque angulato linguiformi-acuto apicem versus recurvo, callo basos cuneato quadrato, parte cuneata angulo parvulo utrinque supra partem quadratam obtusangulo quadrilobum, carina utrinque basi bicurvi de callo in apicem auriculæ excurrente; columnæ alis semihombes, lamellis apice libero acutis de margine foveæ in medium tabulam infrastigmaticam excurrentibus. *H. G. Rehb. f.*

that the annular petals occur both closed and open, whence I named it "ludens." The colours are rather fine. Sepals of a rich brown verging into a mixture of cinnamon with yellowish-brown, rather than to mere cinnamon. The upper sepal has a narrow yellow border. Petals finest yellow with cinnamon-brown lobed marbling. Lip very pale, yellowish-ochre coloured with brown. It has some mauve at the base of the callus. Column greenish with brown small stripes. Lamellæ under fovea orange with purple margin. Wings of column dark purple. As already stated, it was kindly sent by Mr. Harry Veitch. *H. G. Rehb. f.*

AERIDES BURBIDGEI SPLENDENS, n. var.

A very stately broad-leaved *Aerides*, with large flowers of a rich purple. The side-lacinia of the lip are ochre, spotted with brown, the apex of the spur ochre, mid-lacinia of lip fine dark purple, stalked ovary light purple. It has the inner characters of Mr. Burbidge's *Aerides*, but it is far superior to it, rivaling *Aerides Læcanum* in colour—at least, as so far as I retain its colours in memory. I have to thank Messrs. J. Veitch & Sons for it. *H. G. Rehb. f.*

CATTLEYA (LABIATA MOSSIE) NALDERIANA.

An astonishing beauty, a dangerous rival of *Cattleya Massangeana* herself, which I lately had in finest state from Sir Trevor Lawrence. Its general colour is a peculiar rose-purple, with what I would call a slightish grey hue. You may easily copy this colour by adding strong mineral white to lightish carmine. The sepals and petals have a much darker purple linear hus. In the sepals it is a border; in the petals the marking is quite distinct. There are two similar dark bands converging before the apex, leaving a purple-rosy disc and a similar margin at nearly equal distances. It came in my reach—a two-flowered inflorescence—from Mr. W. Bull. It is stated to belong to its name-bearer, Mr. H. F. Nalder, of Wrencote, Croydon. *H. G. Rehb. f.*

CYRTOPODIUM SAINTLEGERIANUM, n. sp.\*

"Bulbs 18 inches on the average." Inflorescence about 2 inches long. Sepals lightest yellow, with fine brown blotches. Petals of same colour, with a very few spots at the very base. Lip rather short, low. Side lacinia broad, oblong; mid lacinia small, obtriangular, retuse, very short, with the callose border as in the affinity. Central callus oblong, having some small lobes, but no mucronate surface. Colour sulphur, with a few brown spots, and the margins of side lacinia deep brown. Column yellow. Anther greenish, with some smallest spots. Its apiculus now retuse. All the other characters are as in *Cyrtopodium punctatum*. I hope, however, to have fresh materials next season to control my statements.

I learn it was sent from Central Paraguay by the same M. Saint Leger, whom I finally understood to have discovered *Ocoidium Jonesianum*. I feel much pleased to be able to render justice to the excellent French traveller. Messrs. J. Veitch & Sons kindly sent me the materials. *H. G. Rehb. f.*

## TULIPS.

MR. WARE sent us recently specimens of:—

*Tulipa Celseiana*, an elegant Tulip, with solitary erect flowers of medium size and orange-yellow colour; the flower segments are lanceolate, the outer ones narrower, finely marked with purplish-brown, and flushed with a tinge of red at the margins and tips. The base of the inner segments and of the filaments is hairy.

*Tulipa fulgens* is sent in two forms, one a self-crimson, the other crimson, with a yellow feather. Inner perianth segments and filaments alike glabrous.

*Tulipa retroflexa*.—A graceful Tulip, about 5 inches across, with oblong lanceolate acuminate lemon-yellow segments, the outer of which are more or less reflexed. The segments and filaments are alike glabrous.

*Tulipa Didieri*.—Flowers 4 inches across, glowing crimson with a yellow eye, segments oblong acute, like the stamens destitute of hairs.

\* *Cyrtopodium Saintlegerianum*, n. sp.—Omnia *Cyrtopodii punctati*, Lindl.; bracteis parvulis hene undulatis; labello transverso lacinis lateralibus ellipticis transversis, lacinia antica obtriangulara retusa, callosa marginata; callo disci ligulato obscure lobulato, non mucronato; sepalis tepalisque valde obtusis. *H. G. Rehb. f.*

*Tulipa elegans*.—Flowers solitary, 6 inches across, orange-crimson with a yellow eye. Segments oblong-lanceolate, acuminate, glabrous at the base, like the stamens. Anthers black, apiculate. The leaves are oblong-lanceolate, acuminate.

*Tulipa Haageri*.—Flowers solitary, 3 inches across, dull red, with a brownish eye margined with yellow. Segments oblong, and slightly acuminate. Anthers dark green.

*Tulipa florentina*.—An elegant yellow-flowered Tulip, like *T. silvestris*, but with erect flowers. The bases of the inner perianth-segments and of the filaments are provided with fine hairs. As these parts are in close opposition, the hairs form a close *chevaux-de-frise*, the purport of which is presumably to exclude marauding insects. The outer segments

description (p. 159), accompanied by a coloured figure (tab. 18, fig. 2). This is a very rare and little-known type, which, from its being confused by Duby in his Monograph of the Primulaceæ in De Candolle's *Prodromus* with the rare *Primula villosa* of Jacquin, and the widely spread *P. viscosa* and *P. hirsuta*, has been very much overlooked and misunderstood. It seems to have been first gathered in the Tyrol by Clusius, and by him to have been introduced into cultivation. It was gathered wild by Wulfen at the end of last century and was by him sent to Jacquin. But for something like seventy years no one seems to have found it in a wild state. It is kept up as a species and carefully characterised in Von Haussmann's *Flora of the Tyrol* (1852, vol. ii., p. 716), and is said to have been gathered by Wulfen

any Auricula show, with this *Primula pubescens* in memory, without feeling that Professor Kerner's paper is very far from having exhausted the whole subject. My own view is, that a very large proportion of our garden Auriculas are nearer to *Primula Auricula* than they are to *Primula pubescens*, and that the garden Auricula of the present day is the product of a complicated series of intercrossings of which *Primula Auricula* has been the main groundwork, and into which *P. Balbisii*, *P. venusta*, and *P. pubescens* have also entered. If we have a great Primula Conference and exhibition next year it will furnish an excellent opportunity for the comparison of the wild with the cultivated types. *Primula Auricula* is one of the most universally diffused plants of the alps of Central

FIG. 167.—VIEW FROM THE TERRACE AT CHERKLEY. (SEE P. 756)

are smaller than the inner, and destitute of hairs at the edge.

## ON THE ORIGIN OF THE GARDEN AURICULA.

IN your columns for 1875 (vol. iv. of the new series, p. 806) there is printed an abstract made by my friend Mr. Alfred Bennett of a paper by Professor Kerner (then of Innsbruck, but now Professor at the University and Director of the Botanic Garden at Vienna, whom we all honour as one of the highest living authorities on critical alpine plants) on the subject of the origin of the garden Auricula. Professor Kerner attributes its parentage to the *Primula pubescens* of Jacquin. This is a plant which received that name in the first volume of the *Miscellanea Austriaca*, a work published at Vienna in 1778, a brief

and Rauschenfels, and it was refound by Kerner on the hills near Innsbruck in 1867. Of late years it has been distributed by Huter in his excellent sets of specimens of the dried plants of Tyrol. We have ten Tyrolese specimens of it in the Kew herbarium, two gathered in 1865 by Gander near Windisch Matrey, and eight dried by Huter himself in May, 1876, labelled "Tirolia merid., Pusteria med., Innichen, colitur in hortis, sol. schist., 1050 metres." From the widely-spread and well known *Primula Auricula* of Lionæus this *Primula pubescens* differs by having leaves shortly pubescent all over the surface, and especially on the margin, conspicuously inciso-crenate in the upper half, pubescent bracts, calyx, and pedicels, calyx-teeth more acute and as long as the calyx-tube, dark lilac flowers, and the whole plant, leaves, bracts, pedicels, and calyx, almost entirely destitute of fine white meal. It seems to me quite impossible to take a walk through

Europe. It is spread all over the mountain region from Dauphiné to Servia and Transylvania, and from the Jura through Switzerland to Savoy. *P. venusta* and *P. Balbisii* are both rare. Good coloured figures of Primulas are much wanted, and as none of these four have yet appeared in the *Botanical Magazine* I have no doubt that Sir Joseph Hooker would be willing to figure them if he were furnished with suitable material. All that I wish to do at present is to lay before your readers the view which I have just expressed, and to ask them to take it into consideration. I add brief descriptions of the four types to which I have made reference, drawn up from wild specimens, and mere names of a few other types to which Latin names have been given, which are probably hybrids with the parentage of which *Primula Auricula* has had something to do.

1. *P. Auricula*, Linn.—Leaves obovate-cuneate, 2—3 inches long, entire or obscurely crenate towards the

margin, nearly glabrous, furnished with a distinct white mealy margin. Peduncle glabrous, 3—6 inches long. Flowers 6—12 in an umbel; pedicels glabrous,  $\frac{1}{4}$ —1 inch long; bracts minute, ovate. Calyx  $\frac{1}{2}$ — $\frac{3}{4}$  inch long, mealy, as are the pedicels and upper part of the scape; teeth ovate, obtuse, shorter than the campanulate tube. Corolla a uniform primrose-yellow; tube cylindrical,  $\frac{3}{4}$ —1 inch long; limb  $\frac{3}{4}$  inch in diameter; segments  $\frac{1}{2}$  inch broad, conspicuously emarginate. Jacq., Fl. Austr., t. 415; Reich., Ic. Fl. Germ., t. 1093, figs. 1, 2.

Spread everywhere through the Alps of Central Europe from Dauphiné to Transylvania, and from the Jura to Savoy. The typical wild *Primula Auricula* has been drawn for the *Botanical Magazine*, from a plant in the Kew rockery.

2. *P. Balbisii*, Lehm.—Leaves obovate-cuneate, faintly crenate in the upper half, pubescent all over the surface, furnished with a distinct white mealy margin. Peduncle pubescent upwards. Calyx just like that of *P. Auricula* in shape, size, and cutting, but pubescent; segments obtuse, shorter than the tube. Corolla a uniform primrose-yellow, with a tube  $\frac{3}{4}$ —1 inch long, and a limb and segments as in *P. Auricula*. *P. ciliata*, Moretti, non Schrank; *P. Auricula*, vars. *mollis* and *ciliata*, Reich., Ic. Fl. Germ., t. 1093.

Alps of Lombardy and Tyrol. In my view, not more than a mere variety of *P. Auricula*. It is not identical with the plant figured as *P. ciliata* by Sweet, Brit. Flower Gard., series ii., t. 123. This is the *Primula ciliata* of Schrank, and is a form nearly allied to *P. pubescens*.

3. *P. venusta*, Host.—Leaves obovate-cuneate, distinctly crenate in the upper half, glabrous on the surface, furnished with a distinct white mealy edge. Peduncle glabrous, 3—6 inches long. Flowers 6—12 in an umbel; pedicels glabrous,  $\frac{1}{4}$ — $\frac{1}{2}$  inch long. Bracts small, ovate. Calyx campanulate, mealy, glabrous,  $\frac{1}{2}$  inch long and broad; teeth ovate, obtuse, rather shorter than the tube. Corolla dark lilac, with a tube  $\frac{1}{2}$ — $\frac{3}{4}$  inch long, and a limb  $\frac{3}{4}$  inch in diameter, with deeply emarginate segments  $\frac{1}{2}$  inch broad.—Bot. Reg., t. 1083; Reich., Ic. Fl. Germ., t. 1094, fig. 1.

Alps of Carniola and Tyrol. Differs mainly from *P. Auricula* in the colour of its flowers.

4. *P. pubescens*, Jacq.—Leaves obovate-cuneate, 2—3 inches long, pubescent all over the surface and especially on the narrow pale margin, distinctly incise-crenate in the upper half, not mealy on the edge. Peduncle 3—6 inches long, obscurely pubescent upwards. Flowers six to twenty in an umbel; pedicels pubescent,  $\frac{1}{4}$ — $\frac{1}{2}$  inch long, obscurely mealy, as are the small ovate bracts and the calyx. Calyx  $\frac{1}{2}$  inch long, pubescent; teeth ovate, subacute, rather shorter than the tube. Corolla dark lilac (figured by Jacquin with a yellow eye); tube  $\frac{3}{4}$ —1 inch long; limb  $\frac{3}{4}$  inch in diameter; segments  $\frac{1}{2}$  inch long and broad, deeply notched.—Misc. Austr., t. 18, fig. 2; Reich., Ic. Germ., t. 1102.

Mountains of the Tyrol, very rare.

The following forms are probably hybrids, with the parentage of which *Primula Auricula* has something to do, viz.:—*P. discolor*, Leybold; *P. rhoetica*, Gaud.; *P. helvetica*, Don; *P. Peyritschii*, Stein; *P. Portae*, Huter; *P. aretosis*, Kerner; *P. Goblilii*, Kerner; *P. Kernerii*, Gobl. and Stein; *P. alpina*, Schleicher; but here, as in *Narcissus*, we shall soon get bewildered if we go on giving Latin names to every slight variation in a series of complicated hybrid types. The wild European species of the *Auricula* group are not more than a dozen in number, but it is evident that these dozen cross naturally in all directions. *J. G. Baker*.

## NOMENCLATURE OF BRITISH FERNS.

THAT there should, in some cases, be two or three names for precisely the same plant is hardly to be wondered at; indeed such a thing is inevitable, and almost unavoidable under such a system of naming as has existed hitherto; but now that days of Conferences have set in, with something approaching to earnestness, it is not unreasonable to expect that what has been done for the Apple, the Daffodil, the Orchid, in the immediate future, may be done for Ferns, both British and exotic. I would suggest such a meeting being held in the month of August, at which time most of the Filices would be in their true character. As an instance of the existing confusion I give the following case:—A private communication is received from a botanist of high standing, asking for a plant or two of *Grammitis*

ceterach for herbarium purposes, the next time I may happen to meet with it. The answer returned is, that that plant is unknown to me at present, and the further remark is added, that in Bentham's *British Flora* there is only one species of *Grammitis* mentioned, viz., *G. leptophylla*. A second note from the same source is duly received, saying, that *G. ceterach* is sometimes called *Ceterach officinarum*. Under this name the plant is easily recognised, forwarded in due course, and is an old favourite we had known for years; but certainly never with the generic name used in specific order. It would be interesting to learn which of these two names at the present time is considered the right one; there can be no question as to which of the two the plant is most widely known by, viz., *C. officinarum*. My correspondent further states that the plant referred to as *G. leptophylla* is not a *Grammitis* but a *Gymnogramma*, so that we have here again a little uncertainty. This last name is frequently used by many English botanists, but it is rather misleading, for I believe it has been shown on the highest authority that the generic name, *Grammitis*, adopted by Continental botanists, has an incontestable claim and right of priority over that of *Gymnogramma*. It would be too much to expect that we shall at any time have complete unanimity regarding the nomenclature of Ferns—or, for the matter of that, any other class of plants; still, I would venture to say that many doubtful points might be cleared up for the time being, at least, and would be greatly to the advantage of all interested. *J. H.* [So long as men take different views of things, so long will there be synonyms. It is worthy of consideration whether it might not be possible to frame a conventional nomenclature, based on Bentham and Hooker's *Genera*, for garden purposes only, and leave the botanists to deal as they pleased with the synonyms. *ED.*]

## NOTES FROM FRENCH NURSERIES.

(Concluded from p. 737.)

MM. CHANTRIÈRE FRÈRES' NURSERY, MORTFONTAINE.—This nursery is eminently a place for the raising of Crotons, Anthuriums, Philodendrons, and Dracenas. Many other things are to be found, but these are its specialties, and are consequently grown in great quantities. The usual stuffy little houses crammed full of plants, are found. So thickly placed together are the plants that were it not for the bright sunshine of France they would be irretrievably spoilt by etiolation and damp. Of Dracenas, *Chamierii* is a distinct novelty, the leaves 1 foot in length and 3 inches in breadth, bronzy tints, changing to reddish ones as the foliage ages. *D. Eugène Chancier* has a bronze leaf with crimson mottling and veins; the habit is robust, and the foliage above the usual size. *D. Madame Bergman* has the tinting of *D. terminalis rosea*, but of much greater width of leaf than that old variety, and possesses a very leathery texture; *D. Verlaetti* has dark crimson foliage, with a broad margin of rose; it is very compact in growth, and is one of the best of its colour.

In Crotons were many fine things, of which we select a few of the more striking novelties, viz., *C. Alexander*, with broad entire leaves, the upper surface of which is dark green, marbled with red in the mature stage, and with yellow when young; the underside is of a cerise tinge. *C. Dallieri* has recurved foliage of a lively green, with yellow nerves and midrib, and bold blotches of the same colour; *C. Mortfontainense* has the form of leaf of *Disraeli*, but of a bright red colour.

In new Anthuriums were *A. carneum* with smooth surfaced spathes, large, and of a bright cerise colour, the growth being stronger than in *A. Andreanum*; *A. Souteiri* is another variety of robust growth, in which the flower-spathe is white, and the spadix brown; *A. Mooreanum* × *signatum* and *magnificum* has a large cordate leaf of leathery texture, and will make an imposing looking plant; *A. Oulettianum* has a cherry-red spathe, is longer than, and an improvement on, *A. magnificum*. Several other Anthuriums were observed, at present unnamed, some of which have white flowers and distinct foliage.

*Phyllanthus Chancieri*, with tiny flowers of a red colour depending from the small leaflets of what looks like a composite leaf, is a very noticeable plant. It is likely to prove a useful subject for table decoration and elegant arrangements indoors. The yellow spiked *Til-*

*landsia Zahni* is another remarkable plant. *Santozolinia bullata*, a stove shrub, with leaves having a bronzy-green surface, much roughened, and the habit of *Cyanophyllum magnificum*, was equally noteworthy. In *Peperomia prostrata* there is a pretty carpet plant for baskets and hanging pots; the minute round leaves are dark green marbled with white.

Many Palms, Ferns, and Begonias, together with a general collection of warm-house plants, are grown for sale; and the outdoors department is rich in species and varieties of coniferous plants, which do remarkable well in the deep warm soil overlying rock.

## Orchid Notes and gleanings.

### ONCIDIUM TRICUSPIDATUM.

THIS tiny *Oncidium* was described in the *Gardeners' Chronicle* last year (vol. xxii., p. 70) by Professor Reichenbach, and a plant of it may now be seen in flower in the Orchid-house at Kew. The whole plant, flowers and all, is not more than enough to make a meal for a cockroach, which bears out the remark of the Professor, that this species is botanically interesting only, for certainly it would not fetch a high figure at an auction sale. The leaves are  $1\frac{1}{2}$  inch long, in shape and texture very like leaves of a small *Masdevallia Harryana*, but a little stiffer, a pair of leaves being borne by each of the small thin pseudobulbs. The racemose inflorescence is 4 inches long, erect, branching, and bears about a dozen flowers, which are not more than half an inch in diameter, their colours being pale yellow lined and spotted with reddish brown. *O. tricuspidatum* is a native of Costa Rica, where, according to Professor Reichenbach, it was first discovered by Herr Wendland. It has recently been introduced alive by Messrs. Sander & Co., to whom Kew is indebted for the specimen now in flower. *W.*

### A REMARKABLE CATTLEYA.

In the gardens of G. Hardy, Esq., Pickering Lodge, Timperley, Cheshire, a *Cattleya Sanderiana*, imported two years ago, has lately been in flower, and has produced perhaps the largest blooms ever seen under cultivation. What may have been the size in a state of Nature we cannot say, probably not larger than these under notice. A flower was shown at the Whit-week exhibition at Old Trafford, which was measured by several Orchid growers, every one expressing astonishment at its immense size. It was just worth observing the look of surprise that came over many a countenance as the rule was placed on every part, eclipsing everything that had hitherto been seen or even anticipated. The diameter of the bloom was 11 inches, each petal covering  $5\frac{1}{2}$  inches, these in their widest part being just 3 inches across. The sepals were, perhaps, rather narrow, but in length were equal to the petals. The broad, flattened lip extended well below the throat to  $2\frac{1}{2}$  inches, whilst across this part of the labellum 3 inches were measured. The colours of the bloom were of the best and richest hue, and every division of the bloom was perfect. *W. S., June 1.*

### CYPRIPEDIUM CONCOLOR.

The little group of *Cypripedium* to which *C. concolor* belongs, and which includes the beautiful new introduction, *C. Godefroye*, and the no less beautiful but better known *C. niveum*, is perhaps the most charming of the Indian *Cypripeds*, many of which are remarkable more from their curious forms than for the possession of true floral beauty. The three species above named will probably come to be considered merely forms of one variable species; such, at least, seems to be a likely conclusion from what is now taking place at Kew, where an interesting set of these three *Siamese Cypripediums* are in a flowering condition. The history of *C. Godefroye* has yet to be told, and we believe by the Kew authorities, as these *Siamese plants* are said to contain among them the true *C. Godefroye*, and other kinds, which differ slightly from both this and *C. concolor* and *C. niveum*, and which may, therefore, be the links which are to connect these three so-called species into one. A plant of *C. concolor* has recently been in flower at Kew, and a few weeks ago a distinct form of it bore flowers in the same establishment. Apart from questions of nomenclature the large white or

yellow thickly spotted flowers of the above-named plants are so chastely beautiful that they ought to be included in the smallest collection of tropical Orchids, though at present the high price asked for *C. Godefroye* will prevent its becoming widely cultivated. *H.*

#### CYMBIDIUM PENDULUM VAR. ATROPURPUREUM.

The species of *Cymbidium* which have coloured flowers appear to show much variety of colour—at least, such is the case with *C. Lowianum*, some of the forms of which are not more beautiful than the old *C. giganteum*, whilst others are exceedingly beautiful. The same remark applies to *C. pendulum*, the type of which bears long pendent racemes of green and brown flowers, with a reddish-brown and cream-coloured labellum, but forms of which are also found with flowers of the greatest beauty. Such a form is that named as above, and which is now in flower at Kew—a large plant, bearing two long racemes of truly noble appearance. The sepals and petals are over an inch long, one-third of an inch wide, thick and leathery in substance, yellow-green on the back, and a dark maroon-purple on the inside. The column is of the same colour, and the labellum is creamy-white, with several large dark red spots on its recurved portion, and a tinge of rosy-red on the sides. This noble flowered variety first flowered in the Tooting Nurseries (Messrs. Rolisson) in 1868, and a drawing of it was published in the *Botanical Magazine* the same year. It is supposed to be a native of Java, where, as well as in Singapore and the Philippines, the type is found. In our opinion this is one of the most beautiful of a genus which contains some very fine garden Orchids.

#### DENDROBIUM DRACONIS.

Under this name there are several plants in flower at Kew of what in gardens is known as *D. eburneum* of Bateman. It is one of the handsomest of the Moulmein Dendrobies, and was first introduced to England by the Rev. Mr. Parish, whose zeal as a collector and introducer of Indian Orchids has recently been most fittingly acknowledged by the Royal Horticultural Society. *D. draconis* has plump pseudobulbs a foot long, which, when mature, are covered with the persistent sheathing bases of the leaves. The flowers are produced on the leafy growth of the current year, and are arranged on a two to six-flowered raceme, having a stalk an inch long, which curves downwards so as to display the large ivory-white petals and sepals, and the rather long, pointed lip, the margins of which are conspicuously crenulated. Except for a few lines and a dash of orange-red on the base of the lip the flower is wholly white. *D. draconis* flowers and grows freely under cultivation for a year or two, but like many other Dendrobies it seldom remains in thriving condition for any time. It likes a warm, moist stove, and plenty of water when growing.

#### AMORPHOPHALLUS VIROSUS.

In the spring of last year I received from Mr. Henley Grose Smith a specimen of an *Amorphophallus*, which although somewhat resembling *A. campanulatus*, seemed to me distinct in its much smaller inflorescence and somewhat globose irregular appendix, in these characters approaching *A. dubius*, but is larger than that species, and so is intermediate between the two. Mr. Smith informs me that it was brought by Mr. Bock from Siam. The following is a description of the plant, which is an ornamental and striking Aroid:—

Petiole tall, terete, rough, from being thickly covered with small tubercles, dark green, marked with numerous, more or less confluent, round or elliptic, whitish-green blotches. Lamina three-branched, branches two to three times forked, pinatisect, leaflets oblong or narrowly elliptic-oblong, variable in size, rather abruptly and shortly acuminate at apex, the lower side at the base decurrent on the branch of the petiole as a wing, entirely bright green without variegation. Peduncle asperate, and blotched like the petiole. Spathe funnel-shaped, slightly contracted at the middle, 9 inches long, 6 inches in diameter at the top; outside smooth, pale green, with a broad purple margin, everywhere marked with round white spots; inside rugose, and purple at the base, the rest smooth, having the middle part of a rich cream colour, and

the upper part purple. Spadix shorter than the spathe, about 7 inches long, stout, the female part occupying one-third of its length, the male part rather more than a third, and the rest forming an irregular, somewhat globose, rugulose, brownish or purplish appendix, the part just above the anthers being broken up into rugulose crowded tubercles. Ovaries globose, greenish, with a purplish apex; style 4 lines long, purple; stigma bifid, or rarely trifid, light brown, with a darker dorsal line. Anthers dirty yellowish, 3 lines long, compressed, dehiscing by two terminal pores. When cut through the inside of the spadix is of a soft salmon-pink colour. *N. E. Brown.*

#### COOMBE WOOD.

A RAMBLE through this extensive and well kept nursery, so rich in new and rare shrubs, most of which have been introduced by Messrs. Veitch, suggests bright visions of improvements in our general garden scenes in the future by means of the introduction of those lovely things from Japan and other regions which are constantly exhibiting their marvellous beauty and their worth as hardy plants in this country in the grounds at the Coombe Wood Nursery.

The introduction of these handsome new shrubs, their nursing over their journey, their subsequent propagation and years of culture in the open air necessary to prove their quality and hardiness in this country, is no light matter; and as those which pass successfully through the necessary probation play such an important part in beautifying our gardens and landscapes too great praise cannot be awarded to Messrs. Veitch and others for their enterprise in introducing so many lovely things which, while giving us their strange beauty, make themselves as much at home as though they were natives of these isles. But it takes many years to get even the most beautiful new shrubs generally planted, and even now at Coombe Wood a selection could be made of warranted hardy plants, which would make gardens full of beauty and pleasure, and unlike anything else in the country, if but the planters could be found willing to take up such an interesting and useful hobby. The visitor has but to glance at the noble avenue of alternate *Arancaria imbricata* and *Wellingtonia gigantea*, 20 feet to 25 feet high at Messrs. Veitch's, if he needs encouragement to plant. Any nobleman in the land would be proud of such an avenue on his estate, and some would have had such if, years ago, they could have imagined their beauty and vigour when planted in suitable districts. The *Rhododendrons* everywhere command attention just now by their gorgeous flowers and those at Coombe Wood are well known for their excellence. Viewed from the higher ground the large expanse of neat round-headed plants in the quarters backed by the masses of specimen bush and standard with their variously tinted blooms, they seem to light up the whole scene, the standards, like huge standard Rose trees, being especially effective.

On closer inspection bewildering details of beauty come forth, rendering it difficult to make a selection and say they are the best; but as many may be glad of the names of the most striking and distinct, we noted the following as being of the highest order of merit:—Duke of Teck, magenta tinged with lilac and fringed; Mrs. Cameron, bright pink, lighter in the centre, upper petal spotted orange; Baron Schröder, rich plum colour; James Bateman, rosy-scarlet; Duchess of Edinburgh, crimson; Mrs. Holford, rich salmon; Mrs. John Clutton, white; Old Port, rich violet-crimson; Sir Arthur Guinness, rose; Sigismund Rucker, magenta; Robert Marnock, bright crimson; Mrs. Shuttleworth, scarlet, spotted; Mrs. Milner, rich crimson; Michael Waterer, bright rosy-scarlet; Lord Eversley, dark crimson-scarlet; Lady Tankerville, pale rose; Madame Miolan Carvalho, pure white; Alarm, white, edged with scarlet; *Atro-sanguineum*, blood-red; Frederick Waterer, fiery crimson; Lady Armstrong, pale rose, spotted; Lady Annette de Trafford, cream-coloured, with chocolate blotch; H. H. Hunnewell, rich crimson; Blandyanum, reddish-crimson; Charles Bagley, cherry-red; Helen Waterer, purest white, edged with crimson; Vauban, mauve, with yellow blotch; and Brayanum, vivid rosy-scarlet. These form a very fine and distinct selection, but all who can possibly inspect Messrs. Veitch's fine stock should

not fail to do so whilst the countless specimens are in bloom.

The handsome Japanese Maples, which are among the specialties at Coombe Wood, and which were introduced through Mr. John Gould Veitch and Mr. Maries, seem quite at home there as hardy trees, some of the earliest arrivals having assumed large proportions in very exposed situations, one of them, the first imported plant of *Acer polymorphum*, having a head some 18 feet across, and densely clad with its beautiful finely-cut Fern-like foliage. The crimson and yellow leaved forms, too, of this numerous and diverse species are equally robust, and seem to point to the fact that they are by no means delicate; the sooner, therefore, that idea is done away with the better, as they are invaluable for their distinct foliage and neat growth. A nook could be found in most gardens which might well be devoted to them.

The Coniferous ground contains large quantities of all those well-known things which every one about to plant has first in his thoughts, but there are also a great many new and rare things not generally known, which might well occupy some of the space allotted in private gardens, and thus give variety, and prevent the too frequent repetition of the same species which we too often see. A visit to Coombe Wood Nursery would disclose a great variety of fine Conifers and other hardy plants unknown even to the general run of plantmen, and hence the importance of a personal inspection from all those who are undertaking the very important duty of planting trees, which if well done are perhaps to stand as memorials of them in times to come. Among the prettiest of the Coniferae may be noted *Abies brachyphylla* with young cones of a bright violet colour; *Abies Veitchii*, a variety with foliage like *A. Nordmanniana*, but more elegant; *A. sachalinensis*, a very handsome kind; *A. polita*, with dark green foliage, lighter beneath, and having a yellowish bark to the stem; *A. Mariessii*, very compact and bushy; *Biota japonica filiformis*, a common form of *Arbor-vitæ*, with long whip-like appendages to the branches; and innumerable fine golden and glaucous forms of *Yews*, *Cypresses*, and *Arbor-vitæ*.

Along the borders of the main walk a very rich and varied display of flowering shrubs appears—all the best and newest forms of *Weigela*, *Crataegus*, *Syringa*, *Viburnum*, &c., and one of them may be selected, first and foremost, as being one of the finest of flowering shrubs—*Chionanthus retusus*. This lovely plant grows into a compact neat bush, its leaves resembling those of the Lilac, whilst its bunches of pure white Jasmine-like flowers, which are produced in the most luxuriant manner, constitute it an object of great beauty, and unlike any other shrub in general appearance; it should make its way into every garden, large or small. *Philadelphus microphyllus*, with its neat twiggy habit and pretty simple white flowers, so fragrant of ripe Quince, with a suspicion of Tea Rose, is another good thing; and *Olearia Gunnii*, with Daisy-like flowers, a real gem; *O. Haastii*, which is now getting much used, and *O. dentata*, also appear very handsome. Also in great beauty are *Viburnum plicatum*, literally covered with white bosses, *Staphylea Bumalda*, and *S. colchica*, covered with flowers; *Styrax japonica*, white and very fragrant; *Magnolia Soulangeana nigra*, the darkest of *Magnolias*; *Philadelphus tomentosus*, very showy; *Escalopia sanguinea*, and *E. Philippiana*, the neatest of the *Escallonias*; *Andromeda japonica*, with drooping flowers like Lily of the Valley; and many fine improvements in Hawthorns, *Cytisus*, *Lilacs*, and other hardy flowering shrubs, among the last named being in great beauty the new white Lilac, *Marie Lagrange*. Conspicuous for their distinct and tropical looking foliage are *Pavia macrostachya*, with handsome *Aralia*-like leaves; *Eucalyptus coccifera* (true), which has here attained a good size, and is quite hardy here; *Styrax obassia*, with *Paullonia*-like foliage and handsome flowers; *Daphniphyllum glaucescens*, with very handsome large entire leaves; *Aralia Maximowiczii*, and several fine forms of *Quercus*.

Besides the growth of shrubs for planting, Messrs. Veitch make a special culture of such things as *Lilacs*, *Viburnums*, *Azaleas*, &c., for forcing in pots, and so well have they succeeded that they have disabused the minds of all who have tried their growths for this purpose that it is necessary to get such things from the Continent, for bushier plants of better blooming quality can be got at Coombe Wood. The *Roses* are in fine order, both in pots and in the open ground,

and the different varieties of hardy Azalea now in bloom well worth seeing.

Hardy marsh and aquatic plants, ornamental grasses and Bamboos, climbing plants, and all other things for planting in the open air, are well grown at Coombe Wood, as well for the neat specimens for sending away as for the large examples of them to show the character of each; and we note that a happy idea of displaying the beauties of such things as *Wistaria sinensis*, blue, white, double, and golden variegated and other strong growing climbers, is there carried out, the plants being trained up stout stakes, and made to form bushes; so grown they are easily kept within bounds, flower all the freer for the necessary pruning, and are available for beautifying the garden where more extensive accommodation for climbing could not be given them. The climbing *Hydrangea* (*Schizophragma hydrangeoides*) looks well so grown, and the lovely scarlet *Clematis coccinea*, which is so well grown at Coombe Wood, will no doubt adapt itself to this mode of culture.

Of Messrs. James Veitch & Sons' nursery at Coombe Wood it may be said that it is always in the most trim condition, and as it is so close to London a run out there for a couple of hours makes a pleasant relaxation for the business man, for one of those unfortunates on whose hands time hangs heavily, or for the lover of plants either from a botanical or a cultural point of view.

### NOTES ON THE CATTLEYAS OF THE AMAZON.

DURING a residence of some eight years in Para and on the Amazon we have received many letters asking information as to Amazonian Orchids. The notes given in Orchid manuals that a certain Orchid comes from Brazil, lead many to suppose that it comes from the Amazon, whereas the Amazonian region, vast in extent as it is, comprises only a small portion of the immense empire of Brazil. The two genera of Orchids concerning which there is the most inquiry (and well do they merit the attention) are *Cattleya* and *Lælia*. Now there is not a *Lælia* of any kind in the Amazonian valley, nor, as far as our knowledge extends, have any ever been found on any of the Amazonian tributaries. To the north *Lælias* are found in Mexico and Guatemala, but the Brazilian *Lælias* are natives of the southern provinces, generally in the region of Bahia or Rio de Janeiro, and thence toward central Brazil. The large genus of *Cattleya* is also sparingly represented in the Amazon valley, the great proportion of the Brazilian *Cattleyas* being natives of the same regions as the *Lælias*. But as compensation for the lack of number the Amazonian *Cattleyas* are pre-eminent for their beauty.

To one who now has only to wire them on to the trees, or on to blocks which hang on the fences, to have them establish themselves at once and bloom profusely, the general complaint that they do not thrive in cultivation would argue want of proper care, did not his experience in times past in their culture in the Orchid-house lead him to believe that they are not easily grown. A few notes as to the conditions under which they naturally grow may furnish some suggestions as to their culture.

The *Cattleyas* of the Amazon are *Cattleya superba* and its varieties, *El Dorado* and its varieties, *luteola Wallisii*, and the almost unknown species—if species they be called—*Schroederi* and *Leeana*.

None of these are found on the Amazon this side of Manaós, which city is situated on the river Negro just above its junction with the Amazon, about 1000 miles from Para, and, as far as our knowledge goes, no *Cattleyas* have been found above Tabatinga, the frontier fortress on the Amazon between Brazil and Peru. They are also, except *Cattleya luteola* (and perhaps *superba*), confined wholly to the northern bank of the Amazon.

The *Cattleya* region thus seems to comprise a tract of about 800 miles on the northerly bank of the Amazon, extending northerly to Guiana, Venezuela, and Colombia. The whole of this region for many miles north of the Amazon is of the same general character—*varzea*, or land overflowed in the annual rise of the rivers, with stretches or isolated portions of higher land known as *terra preta*. There are innumerable lakes, many of great size, countless *igaripes* and *parana-meris*, or water-courses which connect the various rivers, but never any high hills or

great elevations until far north near the boundaries of Brazil. The greater part of the soil is alluvial, though there are sandy plains and rocky formations. No road or path of any kind exists in the whole of this immense extent of territory, and the only communication is by way of the water.

The evaporation is very great, and in the woods the air is generally surcharged with moisture. The rainy season begins in December and continues until June, the rain at times falling continuously in a deluge. During the remainder of the year there is but little rain, but the air at night is always damp from the great condensation. The days are hot, the mercury often rising to 80° or 90° in the shade, and the nights cool, often cold, the thermometer sometimes falling to 55°. The annual rise of the rivers, as shown by marks on the trees, is from 20 to 30 feet.

It is under these conditions of temperature that the Amazonian *Cattleyas* grow. It must be remembered that *Cattleyas* are never found in the close dark woods, and never in pestilential localities. Orchids like a free circulation of pure air, and the *Cattleyas* often grow on the topmost branches of the immense trees in the full sunlight. They also never seek to cover or bury their roots, which run up and down the branches often to the length of 15 feet, but always on the surface clinging close to the bark, but in large clumps the roots often wind round and round the dead roots and pseudobulbs of past years, and make large masses, but these inner roots are all dead, and these masses become the habitation of fire-ants—a fact which does not add to the pleasures of Orchid collecting.

The *Cattleyas* thus experience a season of six months of constant moisture followed by six months of intense heat by day, during which they become very dry, but are every night refreshed by the copious condensation; the maximum and minimum of temperature in the shade being about 80°, rising to 120° in the sun, and about 55° at night. The nearer we approach these conditions in cultivation the nearer we shall be to success. *The American Gardener*.

### PLANTS AND CUT FLOWERS.

WITH regard to the economical use of cut flowers there is undoubtedly much need of reform, and that in more ways than one. A needless amount of material is wasted more frequently than not, by overcrowding in the arrangements. One-third at least of the cut flowers supplied by most private establishments could with advantage be dispensed with in each design. This surplus could be used advantageously in other parts of the household or reserved for future occasions. By using too many flowers another evil presents itself in the rapid absorption of the water in the vases, or of those constituents in it that are of the greatest value as sustenance for the flowers. This waste in flowers generally happens when what may be termed special efforts are being made, the object aimed at, viz., more than ordinary good effect, being defeated by the excessive quantities that are used. This point should always be borne in mind—not to rely on quantity so much as on judicious arrangement. A great waste of flowers also takes place when designs for dinner-tables are carried out by arranging the flowers on the cloth without any means of keeping them fresh, not to mention the amount of Fern fronds and other foliage that is so sacrificed. A good deal of economy can likewise be practised in rearranging the cut flowers; when the vases require it, it will often happen that some of the flowers are capable of being used over again: such as these ought not to be discarded. It will be found far better in every way for the gardener to have entire charge of the floral arrangements, provided the employers themselves do not personally undertake this work. It is never so satisfactory when this responsibility is left in the hands of the household servants. There are, we are well aware, some instances where this is perhaps unavoidable, as in the case of families residing in town whilst the source of supply is far removed. In such cases matters must be arranged in the best way possible to suit each instance. This mention of flowers when sent a distance either to town or elsewhere brings up another point, that is, that no longer time should be allowed to elapse between the receipt of the flowers and their arrangement than is at all preventible. For instance, on their receipt the box lids are opened and the flowers very probably exposed to the air for some con-

siderable time before being placed in water, or if they come to hand late at night are most likely left in the boxes till morning instead of being taken out and placed in convenient receptacles and in a cool place free from currents of air till the next morning. When flowers have to be sent a distance the selection should be made from such as are only just about to expand, as these will be found to last much longer; this is also an excellent system in home use. That there is a great waste in the consumption of cut flowers in many private establishments will, I feel, be confirmed by those who have had any experience of the subject, and it is this which ought to be prevented as much as possible, especially in these days when reduction in the garden expenditure is the frequent complaint that is heard of amongst the fraternity. No doubt the extra quantity required has caused less value to be put upon their use, but this ought not to be. *J. Hutson, Gunnersbury House, Acton.*

### DRIMYS WINTERI.

MR. TYERMAN was so good as to send us some time since flowers of this species produced on a plant against a south wall in his garden in Cornwall. We are not aware whether this species has been previously recorded as flowering in the open air. The plant is of interest as allied to *Illicium*, one of the *Magnoliaceæ*, and as the source of the bitter aromatic bark known as Winter's Bark. The tree is a native of Chili, and the bark was first introduced in 1579, by one of Drake's captains, from Magalhães's Straits. (See fig. 168.)

### CHÂTEAU DE FERRIÈRES.

THIS charming place is seen at its best in spring garb, as we saw it recently, the abundance of the flowering trees, shrubs, and hybrid *Rhododendrons* giving a beauty at that time seldom enjoyed in gardens in which Conifers and evergreens form the major part of the furnishing. The blending of the many tints of green here and there contrasted with that of copper Beeches and dark Pines and Spruces, and the lively effect of the broad lake, occupying the middle distance in looking from the terrace to the rising ground beyond, made up a picture of great beauty. The great mass of *Rhododendrons* at the foot of the terrace was in full flower, most of them being familiar varieties from the Bagshot and Ascot nurseries.

Summer bedding out had hardly been commenced, perhaps because the great masses of red and white Daisies, the Pansies, and *Saponaria calabrica* were yet so full of flower that they were loth to disturb them, and, moreover, late frosts are quite as prevalent there as in England. The quantities of bedding plants used may be reckoned by several hundreds of thousands, many ranges of low pits being filled with them.

The Pine-apples now being cultivated by Mr. Bergman in moss, as described by him in the *Gardeners' Chronicle*, March 28, 1885, p. 408, were stout and vigorous to a degree seldom seen; but we think much of the success seeming to attend this method of growing the Pine-apple is due to the sunny bright skies of France, which allow of the plants being grown without the aid of so much artificial heat as with us, and without depriving the plants of the great advantage of an abundant ventilation during the summer months. The sorts *Charlotte de Rothschild* and *Smooth Cayenne* are those mostly grown, of which many fruits were seen of 6—7 lb. in weight. Another kind, named *Bracamorensis*, is grown, but it is not very good in quality.

The Orchid collection, which becomes more extensive year by year, is generally well managed, and contains a great number of good things. The big plant of *Vanda Lowii* which last year had eleven has this year sixteen spikes of bloom just showing. *V. Batemani* was a strong plant, very healthy; and several *V. suavis*, good examples, were observed. A very fine piece of *Acrides odoratum*, with eleven spikes, and a great many plants of this *Acrides* of different dimensions were likewise found in one of the Orchid-houses. A good piece of *Dendrobium calceolus* was bearing an abundance of its golden blooms. *D. Bensonæ* was in fine bloom, as was *D. Dearei*.

Of *Cypripediums* there are many species and varieties, but few of them were in bloom, or they had been shorn of it for house adornment, the fate of most

of the best flowers at Ferrières. A fine plant of *C. caudatum* bore several of its curious blooms. An *Oncidium*, somewhat like *O. cucullatum*, named *Wiltouense*, was burdened with many long sprays of bloom.

One of the houses is the home of *Vanda teres*, which being planted out in a raised border, gives annually several hundred blossoms; this year it had as many as 600. In the same house *Anthurium Scherzerianum* is planted in elevated side beds, giving by this method of culture a large crop of blooms for cutting purposes. Peat and sand alone are used to form the border, and the plants are surfaced annually with fresh compost.

*Cattleya Mossii* is largely grown, and many varieties were still flowering. *Cattleya Sanderiana*

mouths. A house is set apart for them, light, roomy, and capable of being well ventilated when needed. Under this method of treatment the foliage is large, and furnishes the plants from top to bottom.

The Palm-house was pleasantly warm, roomy, and in no way crammed with plants. Palms, *Araucaria elegans*, a fine example; *Theophrasta imperialis*, Cycads, and a few others were planted widely apart, and between them stretched a carpet of *Selaginella denticulata* and nothing else—no frittering away of effect by multiplying objects of interest, such a common error, made in conservatories everywhere. A very long span-roofed greenhouse was filled with fine symmetrical plants of *Azalea indica*; many were over for the season, but a great number had yet to fully open their flowers. We remarked Jules van

## Florists' Flowers.

### THE DAHLIA.

THE exhibitions of the National Dahlia Society held at the Crystal Palace have done much to popularise this gorgeous autumn flower. The addition of bunches of single forms, and the small flowered type also exhibited in bunches, make the exhibitions much more attractive to the public who visit flower shows. The season being so late this year the plants were sent out later from the nurseries, and those propagated at home are only now ready to be planted out. It is not desirable to plant them out very early. If the plants are potted about the third week in May into 6-inch pots, and grown on in cold frames until the middle of June, they will grow on at once and will not be checked by cold nights. It is very desirable to have the ground well worked by exposure to the atmosphere. It should be lightly forked over two or three times during dry weather in April and May. The operation of planting should be carefully performed. Our plan is to mark out the places for the Dahlias; if ground can be spared they ought to be 4 feet apart at the least. The centre stick is then driven into its place, and a spadeful of soil is taken out in front of the sticks, to be replaced with some good rich loam, in which the young plants can root away at once. If the natural soil of the garden should not be well adapted for the culture of the Dahlia, and at the same time wet and cold, the plants will not take kindly to it at first, but if some suitable soil is put in the holes for them to root into they will start into growth at once. The plants should be tied to the sticks to prevent their being injured by the wind. The plants ought to be quite free from insect pests, and they must also be well inured to stand in the open air. The plants are best kept in cold frames, and the lights removed entirely a few days before planting them out.

### THE CARNATION AND PICOTEE.

These plants, even the choicest varieties of them, do not seem to be injured in the least by cold weather, as both out-of-doors and in pots they are remarkably strong, but rather late—quite two weeks later than last year. It is a good plan to place a handful or two of rich compost on the surface of the soil round the base of the plants. It is necessary to place sticks to all the stems at this time, and if there is any greenfly about the flower-buds dust them with snuff or tobacco-powder. The young seedling plants raised from seeds sown early in April may now be planted permanently where they are to bloom. We have to-day (June 2) surface-dressed the beds with rich manure, where the seedlings are planted that have to flower this year. The plants are also sufficiently advanced to have sticks placed to them. This has also been done, and they will have no more attention until they burst into flower about the end of July or the first week in August.

### PINKS.

The florists' type ought to be in flower by the third week in this month; they look as if they would be at their best ten days later. Having been carefully attended to with sticks, the cultivator has only to watch the development of the bloom; and if the plants were put out in the autumn, and are now good-sized specimens, they will be sure to come well laced. The plants for next season's bloom should be propagated about the end of June or early in July. I used to be much more successful in the propagation of Pinks in Scotland than I have ever been in the South. We always took off the pipings in wet weather, and they were dibbled into the open ground in rows, a shady place being preferred. The pipings were watered daily until they were rooted, and I did not lose more than five in a hundred. They do not root so well in the open air in the South, and as there are plenty of frames convenient, I generally make up a gentle hotbed for them in a shady place. As soon as they have formed roots, ventilation must be freely applied to prevent their becoming drawn. The forcing Pinks should now be ready to plant out in the open ground. It is best to propagate them some time in April, and as soon as they are strong enough to be planted out there is no better way to deal with

FIG. 168.—*DRIMYS WINTERI*. (SEE P. 760)

was seen in several examples, most of them carrying many spikes, and all evidently doing well under the treatment given.

Of *Odontoglossum Alexandræ* there is a very charming lot of varieties, all of course grown that they may supply cut bloom, so that no great quantity of bloom was visible. *O. niveum*, *O. Rossi major*, and *O. triumphans*, were amongst the species in flower.

In the stove we noticed some beautiful *Crotons*, mostly with very large, entire foliage, and several seedling, *Anthurium* × *A. Lindleyanum* and *Andeanum*, some possessing cherry-red spathes, and others of a deep crimson colour, all being plants of robust habit.

It is found that, when planted out, the *Crotons*, *Dracenas*, &c., make much finer growth than the same would do if kept in pots during the summer

Loo, a brilliant pink, having double flowers, a splendid variety; *Souvenir de François Vervaeke*, also a double sort, white, with rose stripes on the petals; and *Théodore Prosser*, a deep crimson, of excellent quality, in bloom.

Much more of interest horticulturally was noticed, which Mr. Bergman, the kindhearted, courteous head gardener, pointed out to us, but which space now prevents our noticing.

**PAVIA FLAVA.**—This yellow-flowered Chestnut, of North American origin, is now beautifully in flower about London, in the public parks and elsewhere. The tree is round-headed and symmetrical, like most of the *Pavias*, and the pale yellow flower-heads make a good contrast with *P. rubicunda*, and are, moreover, sweetly scented.

them. They ought to stand a foot apart, and in good soil they will quite cover the ground by the end of September, when they must be lifted and potted, not using very large pots, if they are 6 inches in diameter that will be large enough. If they are removed with a mass of fibrous roots, and the plants are placed in frames for a few days, they will not receive any check.

#### THE RANUNCULUS.

The growers of this choice old-fashioned flower are very few. I feel sometimes when writing a line or two of seasonable notes on these and the late flowering Tulips, that valuable space is taken up that might be filled with more useful matter. The late Mr. Turner, when he sent me the last roots of his choicest strain of Tulips, made the remark, "that he could not have thought it possible such lovely flowers could have gone so completely out of cultivation." The Tulip exhibition at Manchester serves to keep alive the embers of the fires that burned so brightly forty years ago. The extravagant prices paid for Tulips would give some idea of the estimation in which they were held. The Ranunculus succeeds the Tulip, and will be in flower this season by the end of the month. The roots have started remarkably well this year, and up to this time have required no attention except to keep the ground free from weeds. The beds were watered for the first time on June 3. If they get too dry the leaves of the plants become yellow, and the flowers do not develop.

#### THE TULIP.

The bloom is now quite over; not ten flowers out of hundreds are fresh. They will be lifted, and the roots will be stored away for the season in two or three weeks. As soon as the time of flowering is over the stems rapidly decay. The Northern florists say the roots may be lifted when the flower-stems can be bent double without breaking. The ground may be planted with Stocks and Asters. *J. Douglas.*

### INDIAN NOTES.

THE LUCKNOW HORTICULTURAL GARDENS (continued from p. 736).—In my report for 1865 I find the following:—"Cantonments and stations generally might be with little care turned into gorgeous gardens, in course of time, if some one were forthcoming to think of and look after these things, which to the ordinary mind appear trifles. Very few people have yet grasped the idea of the immense influence of these little pleasures on the health of the men. If people would only try to abandon their foregone conclusions about the nature of mind, and learn its relation to the other forces of the universe, they would not fail to see at once what influence beautiful trees, beautiful flowers, and the delight ensuing from the mere impression of such objects on the brain have on health."

#### EXPERIMENTS ON ACCLIMATISATION.

About this time I proposed to myself the laborious task of endeavouring to acclimatise European vegetables and flowers (annuals), and to obtain by selection some kinds that would suit the soil and climate, and thus perpetuate their good qualities by seed raised in Lucknow. This I thought would be a great gain, as the importation of European seeds in large quantities was expensive, and they could therefore never reach the native cultivator. Up to this time there was a theory in India that acclimatised seeds were worthless. Experience of native gardeners, however, soon gave me a notion of the cause of this theory. A native will sow seed in the most careless, "anyhow" fashion. In collecting seeds he mixes varieties, and sows the mixture again next year, and so on, regardless of proper soil to invigorate the plants from which seed is to be raised. Of course, after a certain number of years of this treatment there will be a lot of plants which might truly be called degenerated, or as the enlightened gardener would call them, "rubbish." I determined to undermine this theory by proper cultivation and selection every year of the best specimens only for seed, eradicating all plants which did not come up to my standard. By this, of course, was meant that I had to do the selection and eradication for many years with my own hands, as natives could not be trusted to do it. I thought that if a plant germinates, grows well, and seeds, there was no sensible reason why it should not be improved in India as well as anywhere else, provided the conditions of healthy and luxuriant growth were invariably given. In course of some years by this means I obtained a large variety of annuals, which now have a name in India, and are appreciated in many places as better than those from imported

seed, being more certain to germinate and more suited to the climate. In Calcutta, at the Royal Botanic Garden, as a rule, nothing but my Lucknow acclimatised seed was sown, as the climate there did not admit of the plants from imported seeds of annuals coming to flower, owing to the shortness of the winter. Every year I was asked to send a large quantity of these acclimatised seeds to the Agricultural Society of India, for distribution to its members, so that the success of my exertions in this direction was undoubted.

As regards vegetables, I succeeded in acclimatising several seeds, many of which are still to be had in quantity, with an acclimatised pedigree of more than fifteen years. Celery grown from acclimatised seed several times got the 1st prize at horticultural shows, in preference to that from imported seed. Cos Lettuce, by always selecting the best and most perfect specimens for seed, has held its own for upwards of seventeen years. A trial made at the Saharunpore Botanic Garden with the Lucknow Cos Lettuce seed resulted in the following report:—"A splendid variety. Three sowings were made, and all made good heads, superior to any imported variety we had. Inquiries were made by parties who received it in 'dallies,' where the seeds were obtained from." In 1883 I sowed some of this Lettuce seed in Etawah, and sent some heads to friends. They said they never saw anything like it for size, whiteness, crispness, and sweetness. Tomatos from acclimatised seed have been introduced among natives successfully. They develop earlier, and fruit earlier than plants from freshly imported seed. I used to send a large quantity of acclimatised Cauliflower seed every year to Bombay and Calcutta. The plants flowered early, and produced good heads; while the imported seed, I was told, rarely came to anything in those climates. They have at present in the Lucknow garden one of the best kinds of white Onion in India, with a long and perfect pedigree; also a fine dwarf Pea, imported many years ago as the Tom Thumb Pea. The demand for the Lucknow acclimatised seeds rose steadily. In 1873-4 the sale of this seed was only 172 rupees, in 1874-5 it was 642 rupees, in 1878-9 it rose to 1291 rupees, and in 1882-3 to 1367 rupees, and all this on account of its real worth. Never that I remember was it advertised.

I introduced also the Cyprus Carob by means of seed. It answered so far as to grow flower and fruit. But the latter, ripening during the hot winds, produced shrivelled pods. I distributed large quantities of the seed to all parts of India, but I have never heard that they have anywhere come to anything.

From one plant of the *Bougainvillea glabra* which I obtained literally thousands were made and distributed all over Oudh and the North-Western Provinces. They are to be seen at almost all the railway stations.

Sugar-Beet and Mangel Wurzel were grown experimentally with success. Of the former some specimens of medium size with the leaves on weighed from 7 to 8 lb., and of the latter 9 lb. each. On other occasions individual specimens weighed from 15 to 20 lb.

Some Mahogany plants sent by the Director of the Royal Botanic Garden, Calcutta, thrived, and are now as good as some I saw at the latter place, and of about the same age.

#### DATE PALMS.

About the year 1868 I read Gifford Palgrave's book on his interesting journey through Arabia. In that he says that at "Djouf" he found excellent Dates, and added, that there "it is the bread of the land, the staff of life, and the staple of commerce." He also states that Kaseem has the best Dates known anywhere. "Those who, like most Europeans at home, only know the Date from dried specimens in shop windows, can hardly imagine how delicious it is when eaten fresh, and in Central Arabia." He and his companion bought a large handkerchief full for three farthings, and "hung it up from the roof-beam of our apartment to preserve the luscious fruit from the ants, and it continued to drip molten sweetness into a sugary pool, on the floor below, for three days together, before we had demolished the contents, though it figured at every dinner and supper during that period." In another part of the book, having tried many kinds, Palgrave says, "The 'Khalias' Date is the *facile princeps* of its kind, and bears to ordinary Dates the same relation that the Bombay Mango bears to the 'Jungli' (Mango)." It is grown in "Hadhoo" on the east coast of Arabia. Another fine kind in the same place is "Rekab." Having

read the above, it struck me that it would be a great triumph if I could introduce into India some of these fine kinds of Date Palms. I suggested the matter to Government, who got me, through the Resident in the Persian Gulf, between 1869 and 1873, seeds and offsets of a number of the best varieties of Date Palms. Till then I did not know that the Date Palm could be propagated by offsets. The latter are given off at the base of the stem on a level with the ground. They had a woody stump without any roots. Most of them struck, and all the seeds germinated. A portion of the seed had been distributed to every district in Oudh. At present, in the Lucknow Horticultural Garden there is a large number of the best kinds of Arabian Date Palms raised from offsets, besides a large number raised from seed (upwards of 252 seedlings between thirteen and sixteen years old, and 112 Palms from imported offsets twelve or thirteen years old). I remember at that time a Deputy Commissioner of one of the districts of Oudh persisting in the idea that my experiment would prove a failure. He said pilgrims coming from Arabia have often brought Date seeds with them, and no instance is known of their having ever succeeded. It does not require much acumen to see the reason of failure in introducing the Date Palm in this way. At best the seeds must have been few, and when young the goats must have eaten much of the plants. One here and there may have struggled through all the surrounding difficulties, and when it flowered it may have been either a male or a female, and therefore no result was obtained. Even had there been many, probably none would be spontaneously fertilised. The Arabs, in cultivating the Date Palm, universally practise artificial fertilisation, as they say they cannot rely on either wind or insects for performing this office, and in propagating they rely on offsets to propagate any desired kinds, as seeds vary.

Mr. Ridley, the present Superintendent of this garden, in his report to Government for 1881-82 (that is, about eight or ten years after the Palms were introduced), writes:—"This year a greater number of the Arabian Date Palms fruited than in any preceding year. Some of the bunches were of good size, and yielded very good fruit; the size, shape, and colour of these prove the trees in the garden to be a collection of several different varieties. The colours are mostly shades of dark red and yellow, while the shapes ranged between oblong and oval, of different sizes." Here, then, is a garden into which the true Arabian Date Palm has been transplanted bodily from regions where it is indigenous, and which should serve as a centre for disseminating this important and useful tree over the province of Oudh, the North-west, and other parts of India. They have there not only many of the true varieties of Arabia, but also an infinity of other probable varieties, raised from seed of different kinds. It has always been a wonder to me why these fine kinds of Arabian Date Palms have not been systematically introduced into the South of Europe. This Palm grows well there, as well as all about the Mediterranean. One never hears of it in Cyprus for instance. These delicious varieties ought to suit that island well, now that locusts are warred against with success.

#### EUCALYPTI.

In 1866 I commenced a series of experiments with the Eucalypti. The first dealt with was the famous *E. globulus*. Most of the plants grew amazingly till the rains commenced, when all damped off except three. These survived for about three years, and grew to the height of 20 or 30 feet, when one unusually rainy season killed them all. Why this *E. globulus* has been considered suited to swampy regions I do not know. In the plains of India, as soon as it feels the rains it dies off. It appears it cannot in the least withstand moisture and heat combined. The Nilgiri Hills is the only place in India where I have seen this *Eucalyptus* thrive. There it does so beyond conception. In those hills it has both moisture and drainage, and the temperature is not high. The *Eucalyptus rostrata* succeeded well in Lucknow, and there are now specimens of it 40 and 50 feet high. It does not mind the alternations of temperature, and extremes of dryness and moisture; but unfortunately it does not seed in that climate. Another kind, *E. resinifera*, also succeeds well and seeds, but it forms a spreading tree, unsuited to timber. I tried a large number of other kinds, and they all proved to be unsuited to the climate of Oudh. In 1877-78, however,

shortly before I left Lucknow, I tried the *E. citriodora*. It has a rough leaf, and is deliciously scented, like Verbena. It has thriven better than any kind previously tried. It has a clean white stem, with deciduous bark, and without a branch, excepting at the very top. The trees are now 30 and 40 feet high, and as straight as an arrow. They are not bothered either by heat, cold, dryness, or moisture. They flower and seed, and, best of all, the seed germinates. In 1883 Mr. Ridley had under his care thousands of young seedlings raised from the acclimatised seed of the trees I had planted. It is not improbable that the *E. citriodora* may yet do for Oudh and the North-west of India what the *E. globulus* is doing for the Nilgiri Hills. Of course its constitution has yet to be studied, as well as the best mode of raising seedlings. A little care may be required in sowing the seed and nursing the young plants, owing to the extreme dampness at one season and the extreme dryness at another, but I think when once they start, the plants will require little care, and will form fine trees in a comparatively short time. *E. Bonavia, M.D., Etawah, February 10.*

(To be continued.)

## The Arboretum.

### GOLDEN YEW AT TRING PARK.

THE extensive use of these made in the recent alterations in the grounds at Sir Nathaniel de Rothschild's affords excellent examples of their invaluable aid in lighting up the views where heavy green foliaged trees and extensive lawns already exist. At a distance their effect is equal to that of flowers, while they have the advantage of being bright summer and winter alike. The manner in which they are arranged in massive belts and groups near the mansion at Tring Park affords a study which any landscape gardener might do well to imitate. The manner in which the now gorgeous Rhododendron clumps and the beds of red Roses and other flowering shrubs are arranged to show up the golden foliage of the Yews, demonstrates that the whole has been arranged with consummate skill and taste.

### GENISTA PRÆCOX.

This is an early flowering graceful habited Broom. In the York Nurseries it forms a most attractive and pleasing object, especially so where the plants are planted in elevated positions on the rookwork—the blossoms being then raised above the line of the eye, enhances the beauty of the shrub. There appear to be several varieties of it; varying both in habit of growth and in the colour of the flowers: some are stiff and compact, while others have pendent branches, which hang gracefully like whiplash, and when the plant is in flower the shoots are clothed almost their entire length with bright yellow, or cream-yellow, or pure white, according to the variety. Another feature which makes this beautiful Broom doubly welcome in our gardens is its perfect hardiness. *R. P.*

### PHOTINIA SERRULATA.

In your remarks on the above at p. 728 you speak of the tree at Shaldon as one of the largest. We have a tree here growing in the open, but in a sheltered position, which exceeds the height of the Shaldon tree by 3 feet. It has a clean stem of 6 feet, and is 2½ feet in height. This tree has flowered profusely this spring, but the flowers appear to last but a short time after being quite open, and the perfume is not very pleasant. (See *Gardeners' Chronicle*, No. 568, vol. xxii., p. 616.) *P. Conway.*

### CERCIS SILIQUASTRUM (JUDAS TREE)

is one mass of flower this year; one of our trees, which exceeds 30 feet in height, and about 25 feet through, is quite a picture at the present time. One of your contemporaries in writing of the tree at Dulwich states that it rarely flowers in this country. Surely this must be a mistake; trees here, both small and great, never fail to flower each year. [Such is our experience also near London. *ED.*] *P. Conway, Muntkam Gardens, Worthing.*

### HALESIA TETRAPTERA.

This tree, popularly known as the Snowdrop tree, is probably the best of the five or six known

species, taking into account the abundance and purity of the pure white flowers, together with the relative hardiness of the trees in this country. Asiatic representatives from China and Japan produce their flowers in terminal panicles, but those from America produce them in lateral clusters from last year's wood, consequently the flowering branches are surmounted by a tuft of leaves of the present season's growth. The flowers are pendent, bell-shaped and produced in such great abundance as to constitute the tree a conspicuous object for a park or shrubbery, where it comes into flower as the double Cherry fades and forms a succession to it. There is a well flowered tree in the pleasure grounds, Kew, and a figure is given in an early number of the *Botanical Magazine*, t. 910. *F. F.*

## Plants and their Culture.

### RICHARDIA ÆTHIOPICA, ETC.

THE turning-out system is a very good one to follow with the Richardias (*Callas*), especially where labour is at the minimum, and a maximum return looked for. These plants will thrive best in a rather stiff soil, as we observed last year in the case of some pot-grown plants, that were the sturdiest lot we ever saw. In planting-out it will be well to look after keeping up the stock by division of the stronger clumps; secure also a level piece of ground for them, so that they can receive the copious waterings in which they delight without the same running away from them. Forced clumps of Lilies of the Valley and Hoteia (*Spiraea*) japonica should also be turned out after having been divided, having regard, however, to the selection of a spot where they can remain for at least one season before being again potted up. Young stock of *Deutzia gracilis* and dwarf plants of Lilacs will also be benefited by being turned out of their pots for a season or two.

### THE CONSERVATORY.

The gayest displays in this structure will now be waning; the Azaleas in their brilliant colours and other plants now being past their best, and the Calceolarias (herbaceous) that will soon be over; there will be a lack of variety and colour that will not compare favourably with the early bloom. The show and fancy varieties of the Pelargonium will, it is true, prove of much value during the next few weeks; a conservatory, however, unless it be kept well ventilated by night and day, is not a good house wherein to keep them in perfection. Should this building join the mansion, there is oftentimes a difficulty in leaving a good supply of fresh air on during the night-time, by reason of having to guard against the intrusion of those who view the valuables in the mansion with an envious eye. Unless this obstacle can be surmounted by the provision of proper fastenings to the doors giving admittance to the house itself or by means of ventilation through which it would be impossible for any person to gain admittance, the cool greenhouse plants on the whole will not remain in perfection as long as they ought to do. Pelargoniums and Fuchsias will drop their flowers prematurely, and the growth of all the plants will become unduly drawn. In such instances I advise a greater quantity of Ferns, Palms, and ornamental foliage plants generally to be used, in fact I prefer the use of such plants during the summer months in any case. They impart a cool, refreshing appearance, especially when used in association with an ornamental fountain, bringing much relief to the eye when wearied with the brilliant display in the flower beds and borders outside. The richly coloured forms of the improved types of the Coleus can in such cases be used with good effect in combination with plants possessing white and green variegation (*Aspidistra lurida* variegata and *Eurya latifolia* variegata are two good examples). These, with the best of the hardier Palms, Dracenas, Cordylines, and Ferns, can all be turned to good account. If a good number of stove plants are grown this will be a source from which many excellent subjects can be chosen;

well established plants of Crotons, the same of the brightest of the Dracenas, with *Pandanus Veitchii*, will, with proper attention, endure a good time without any serious injury—in fact it affords a means of these excellent foliage plants being viewed with comfort by those who cannot conveniently endure the temperature of the stove proper, and this is a point not to be lost sight of. The chief points to be aimed at are the avoidance of chill to the roots, caused by the use of cold instead of tepid water and sharp currents of air; the plants can at times receive a syringing, as opportunity may occur. Their removal will be a means of easing the stove during the warmer months. Camellias that are now making their growths will need watching against attacks of aphids, more particularly in the case of plants that are retained in the conservatory after their flowering season is over. It is not always convenient to fumigate in such a structure, but no means should be neglected to keep down these insects at such times. The *Lapagerias* will probably be attacked by the same pest, and some few other climbers as well; in order, therefore, to thoroughly extirpate them endeavours should be made to give at least two fumigations before much harm be done. Any climbers that are making a too luxuriant growth may require careful thinning, and this had better be done before they become too dense. *James Hudson, Gunnersbury House, Acton, W.*

## The Kitchen Garden.

### CELERY.

PREPARING AND PLANTING THE TRENCHES.—The finest Celery is grown in trenches containing but one row of plants; but two, three, or four may be grown together in the same trench. Whichever be the plan adopted the broad rules of cultivation remain the same. I much prefer the single row with trenches 4 feet between. The depth to which the trenches should be excavated will depend entirely on the nature of the soil, not only with due regard to the depth of the latter, but the extent to which it is drained. On land with two spits deep of good soil, and well-drained, the soil may be dug out to the depth of 8 inches to 1 foot. The first-mentioned depth is quite sufficient providing the trenches are 4 feet apart, as this distance will allow space enough to collect sufficient soil to blanch, and also to lie thick enough around the plants to turn severe frosts. The more shallow the soil the wider they must be apart. After the soil is removed from the trench to the required depth, dig the bottom a good spit deep, or as deep as the soil allows. After this is done add 4 inches thick of prepared manure, then dig this in half a spit deep, and the trench is ready to receive the plants, which should stand about 9 inches apart, irrespective of the number of rows of plants placed in each trench. Trenches to receive one row of plants should be 14 inches wide; two rows, 2 feet, and so on.

### PREPARING THE MANURE FOR THE TRENCHES.

To each cartload of good rich manure add two bushels of soot, half a bushel of freshly slacked lime, and a peck of agricultural salt. Prior to adding the latter three things, the manure should be well worked about in order to well separate all the flakes. The whole should then be thoroughly mixed together and thrown up into a heap, quite one month before it is required for the trenches.

### EARTHING-UP THE PLANTS.

With the first early and main crop this should not be done until the plants are nearly full grown. Prior to earthing-up remove all the under-sized leaves and stalks from the base of the plant, then tie up the remainder with broad pieces of matting, being careful to place each stalk into its proper place, so that the sticks, when dug for use, will come up quite straight. When the plants have been earthed-up as far as possible, consistent with not allowing any earth to drop in the heart of the plants, remove the matting. Before any sharp autumn frosts occur, a second and last earthing-up will most likely be required. The last batch, which was placed in the trenches late in the year, will require earthing-up at intervals, as a protection from frost, and the trenches for this lot need not be deep, as the plants rarely attain a large size, but although small they will stand frost well and come in at a time when salading is at a low ebb. *G. H. Richards, Somerley Gardens, Ringwood, Hants.*

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, June 15	Sale of Valuable Mexican and Brazilian Orchids, at Stevens' Rooms.
TUESDAY, June 16	Sale of Natural History Specimens, at Stevens' Rooms. Sale of Imported Orchids, at Protheroe & Morris' Rooms. Summer Show at the Royal Botanic Society, London. Grand Floral Fete at York.
WEDNESDAY, June 17	Sale of Imported Orchids from the New Plant and Bulb Company and Mons. Leon Humbolt, at Stevens' Rooms. Sale of Carnations, Picotees, and Plants, at Protheroe & Morris' Rooms. Sale of Imported Orchids from Mr. Sander, at Stevens' Rooms.
THURSDAY, June 18	Meeting of the Linnean Society.
FRIDAY, June 19	Sale of Imported Orchids, at Protheroe & Morris' Rooms.

THE fitting sequel to the public ceremonial in Westminster Abbey on the occasion of the burial of CHARLES DARWIN was enacted on Tuesday last. On that day Professor HUXLEY, as President of the Royal Society and of the DARWIN Memorial Committee, presented to the Prince of WALES, as the representative of the Trustees of the British Museum, a marble statue of the late philosopher. The memorial is placed on the landing of the staircase in the great hall of the new Natural History Museum at South Kensington, than which no more fitting place could have been found. The naturalist is represented seated with the head slightly inclined to one side, wrapped in thought, like that marvellous statue of MICHAEL ANGELO'S in Florence. The pose is easy, the likeness good, so that the artist, Mr. BOEHM, may well be congratulated on his success. The statue has been erected with funds raised from all countries and all classes of people. Germany, of course, was too much in sympathy with intellectual advancement to be behind in the matter, but the large share taken by Sweden in the matter is remarkable. In that country, we are told, all classes, from the seamstress to the bishop, contributed according to their means to the erection of this tribute, which is thus, as the Prince of WALES aptly stated, more cosmopolitan than national; nevertheless we Englishmen especially do well to be proud of DARWIN. There is no reason in these columns to say why—the tale has been so often told, and each day confirms it.

Evolution and its methods have been applied with signal success to almost all departments of human knowledge—all have benefited. The fright experienced by some folk merely served to show their own inconsistency, for true religion remains as before, unaffected, while truth has had much of its concealing veil stripped off. From those who from lack of training in scientific method and scientific objects, evolution is still but an empty name, the man's method of work, essentially practical, taking nothing on trust that could be verified, and the grand simplicity of his character, have compelled respect and homage. Unaffected by passion, unswayed by insult and contumely, returning no ill, he simply worked, not merely theorised, but worked incessantly, and ultimately by his singleheartedness, his amazing candour and still more amazing modesty, disarmed all opposition. He lived to see his opinions all but universally accepted, he lived to witness the enormous generating power of his theories in all departments of knowledge, he lived to be a witness to the vast and varied erudition which he was the direct cause of bringing to light; he lived till the reckless clamour of ignorant or thoughtless opponents had died away, but never a word of triumph or self-complacency escaped his lips. And why? The great philosopher, like another NEWTON, realised more fully than any one the sense of his own limitations and imperfections on the one hand, and the boundless scope of Infinity on the other. And thus it happens that while in a neighbouring country religious feeling is violated, and political disturbance apprehended when a great man is carried to the grave, here in England men of all creeds

and of all parties stand round the tomb, and from prince and archbishop downwards combine to render homage to the memory of the greatest man the century has produced.

The following is the text of Professor HUXLEY's Address:—

"It is now three years since the announcement of the death of our famous countryman, CHARLES DARWIN, gave rise to a manifestation of public feeling, not only in these realms, but throughout the civilised world, which, if I mistake not, is without precedent in the modest annals of scientific biography.

"The causes of this deep and wide outburst of emotion are not far to seek. We had lost one of those rare ministers and interpreters of Nature whose names mark epochs in the advance of natural knowledge. For, whatever be the ultimate verdict of posterity upon this or that opinion which Mr. DARWIN has propounded, whatever adumbrations or anticipations of his doctrines may be found in the writings of his predecessors, the broad fact remains that since the publication, and by reason of the publication, of the *Origin of Species*, the fundamental conceptions and the aims of the students of living Nature have been completely changed. From that work has sprung a great renewal, a true *instauratio magna* of the zoological and botanical sciences.

"But the impulse thus given to scientific thought rapidly spread beyond the ordinarily recognised limits of biology. Psychology, ethics, cosmology, were stirred to their foundations, and the *Origin of Species* proved itself to be the fixed point which the general doctrine of evolution needed in order to move the world. 'Darwinism,' in one form or another, sometimes strangely distorted and mutilated, became an everyday topic of men's speech, the object of an abundance both of vituperation and of praise, more often than of serious study.

"It is curious now to remember how largely, at first, the objectors predominated; but, considering the usual fate of new views, it is still more curious to consider for how short a time the phase of vehement opposition lasted. Before twenty years had passed, not only had the importance of Mr. DARWIN'S work been fully recognised, but the world had discerned the simple, earnest, generous character of the man that shone through every page of his writings.

"I imagine that reflections such as these swept through the minds alike of loving friends and of honourable antagonists when Mr. DARWIN died; and that they were at one in the desire to honour the memory of the man who, without fear and without reproach, had successfully fought the hardest intellectual battle of these days.

"It was in satisfaction of these just and generous impulses that our great naturalist's remains were deposited in Westminster Abbey; and that immediately afterwards a public meeting, presided over by my lamented predecessor, Mr. SPOTTISWOODE, was held in the rooms of the Royal Society, for the purpose of considering what further steps should be taken towards the same end.

"It was resolved to invite subscriptions, with the view of erecting a statue of Mr. DARWIN in some suitable locality; and to devote any surplus to the advancement of the biological sciences.

"Contributions at once flowed in from Austria, Belgium, Brazil, Denmark, France, Germany, Holland, Italy, Norway, Portugal, Russia, Spain, Sweden, Switzerland, the United States, and the British Colonies, no less than from all parts of the three kingdoms; and they came from all classes of the community. To mention one interesting case, Sweden sent in 2296 subscriptions 'from all sorts of people,' as the distinguished man of science who transmitted them wrote, 'from the bishop to the seamstress, and in sums from £5 to 2d.'

"The Executive Committee has thus been enabled to carry out the objects proposed. A 'Darwin Fund' has been created, which is to be held in trust by the Royal Society, and is to be employed in the promotion of biological research.

"The execution of the statue was entrusted to Mr. BOEHM; and I think that those who had the good fortune to know Mr. DARWIN personally will admire the power of artistic divination which has enabled the sculptor to place before us so very characteristic a likeness of one whom he had not seen.

"It appeared to the committee that, whether they regarded Mr. DARWIN'S career or the requirements of a work of art, no site could be so appropriate as this great hall, and they applied to the Trustees of the British Museum for permission to erect it in its present position.

"That permission was most cordially granted, and I am desired to tender the best thanks of the committee to the Trustees for their willingness to accede to our wishes.

"I also beg leave to offer the expression of our gratitude to your ROYAL HIGHNESS for kindly consenting to represent the Trustees to-day.

"It only remains for me, your ROYAL HIGHNESS, my Lords and Gentlemen, Trustees of the British Museum,

in the name of the DARWIN Memorial Committee, to request you to accept this statue of CHARLES DARWIN.

"We do not make this request for the mere sake of perpetuating a memory, for so long as men occupy themselves with the pursuit of truth, the name of DARWIN runs no more risk of oblivion than does that of COPERNICUS or that of HARVEY.

"Nor, most assuredly, do we ask you to preserve the statue in its cynosural position in this entrance-hall of our National Museum of Natural History as evidence that Mr. DARWIN'S views have received your official sanction, for science does not recognise such sanctions, and commits suicide when it adopts a creed.

"No; we beg you to cherish this memorial as a symbol by which, as generation after generation of students of Nature enter yonder door, they shall be reminded of the ideal according to which they must shape their lives, if they would turn to the best account the opportunities offered by the great institution under your charge."

— A PEAR CONGRESS.—The success of the Apple Congress has probably been the parent of the desire for the establishment of a similar exhibition of Pears in October next. We shall heartily support such a proposal, but we have not got our Pears yet. A Potato Conference has also been proposed, and has precedence; but some say Potatoes, like the poor, are always with us; had ones sometimes, but seasons still give force to the adage, "He who plants Pears plants for his heirs." Let us have the Pears by all means, if we can get them, but that is no reason why we should not have the Potatoes too. The fruit that grows on the tree, and the fruit that grows at the root, are so different, that we cannot suppose the authorities of the Royal Horticultural Society feel incompetent to undertake both "congresses," if season permit.

— ROYAL BOTANIC SOCIETY.—The great summer show of this Society will take place on Wednesday, June 17, when a fine display of plants, flowers, and fruits may be expected.

— COL. TREVOR CLARKE.—The sympathy of very many horticulturists and Fellows of the Royal Horticultural Society will be manifested towards Col. CLARKE, so long one of the most enthusiastic and intelligent supporters of horticulture, and the recent death of his wife. Mrs. CLARKE had been in ill-health for a long period.

— PRIZES FOR MARGUERITES.—Mr. OLLERHEAD, the head gardener at Wimbledon House, informs us that Sir HENRY W. PEEK, Bart., desires it to be made known that he intends to place in the hands of the Royal Horticultural Society the sum of £20, to be divided at their discretion into prizes for the well known section of Chrysanthemums called Marguerites, or French Daisies. Full particulars will shortly be advertised.

— "WALKS IN EPPING FOREST" is the title of a little book published at 123, Fleet Street, and which is intended to make known to Londoners and others, not only the beauties and attractions of the Forest, but the readiest method of getting there, and the easiest and most pleasant ways of exploring its bye-ways. The book is agreeably written, the information is correct, the illustrations pretty, and the map serviceable. We have said enough to show that the few pence the book costs will be well expended, even if the reader has no idea of visiting the Forest himself.

— A NEW DAISY CUTTER.—An implement for the collecting of the flowers of the common Daisy on lawns has been brought out by Mr. ROWLAND, of Cranleigh, Surrey, which differs from the old form in that it is made to be pushed before the workman instead of being pulled towards him as with the older implement, and that it is to be, provisionally, made of iron instead of steel, thus making it cheaper at the cost of lesser durability. We had thought the close-cutting lawn-mower had rendered the Daisy cutter unnecessary on all well kept lawns.

— HACKWOOD PARK TOMATO.—This is an exceedingly prolific variety, its merits being well tested in a Tomato-house at Stoodleigh Court, Tiverton, where Acme, Fildon, Hathaway's Excelsior, and others are growing side by side, and in a fruiting state. Mr. BARNES thinks well of it, and gives it the preference to any other he knows.

FIG. 169.—INTERIOR OF THE CONSERVATORY AT CHERKLEY COURT. (SEE P. 755)

— **HARDY ORCHIDS.** — Messrs. BACKHOUSE send us flowers of *Orchis militaris* with grand spikes of lilac flowers. The four-lobed lip is marked with small projecting purplish hairs. *O. fusca* is represented by a magnificent spike, the hooded sepals are richly spotted with brown, and the broad lip deeply notched in front is white, flushed with lilac and dotted with small spots of a similar colour. This is the finest spike we have seen of this species. Messrs. BACKHOUSE find these two species thrive best in calcareous loam. *O. latifolia*, var. *lagotis*, has a leafy

spike of richly coloured dark violet flowers, heavily marked with darker spots. A heavy loam mixed with good fibrous peat suits this best.

— **THE EFFECT OF PRUNING VINES.** — In our issue for March 7, p. 314, we quoted some observations of MM. CASOCIA and SAVASTANO to the effect that unpruned Vines produced berries with the greatest amount of sugar and the least proportion of acid. The paragraph attracted the attention of Professor CORNU, the Director of the Jardin des Plantes,

who at once called attention to the universal practice of pruning in the Vine growing districts, and to the alcoholic strength of the wine produced from them. In the *Vigne Américaine* M. PLANCHON records the opinions of certain members of the Central Society of Agriculture of the Herault, comprising many well known cultivators whose reputation has become established even on this side of the Channel. The conclusions come to are:—1. The larger the number of berries on a given Vine, the smaller the proportion of sugar and consequently of

alcohol. The proof of this is afforded by those Vines which, being intended to be removed next year, are not pruned at all or only slightly. The numerous berries produced on such Vines ripen with difficulty, and often remain sour as verjuice. 2. Vines cultivated in "hautains" and slightly pruned or not at all: the Vine trellises which yield large crops always produce a wine of less alcoholic strength than the same varieties do when pruned severely, and whose berries are near enough to the soil to profit by the radiation of heat from its surface. Numerous illustrations are given in proof of these assertions and in support of the usual practice in the vineyard of hard pruning.

— GHENT BOTANIC SOCIETY.—At a recent meeting of the Royal Agricultural and Botanic Society of Ghent, First-class Certificates were awarded to Mr. J. Van der Swaelmen, for *Oncidium pulchellum*; to Mr. A. Van Geert, jun., for *Lastræa* sp. nova; to Messrs. Vervæet & Co., for *Calamus* species; to Mr. L. Desmet-Duvivier, for *Odontoglossum vexillarium purpureum*. Commendations were awarded to Mr. Aug. Van Geert, jun., for *Masdevallia Backhousiana*; to Madame J. Baumann, for *Anthurium Scherzerianum* var. *atropurpureum*; to Mr. De Smet-Duvivier, for *Ixora Cheloni*; to Mr. Aug. Van Geert, sen., for *Phalaenopsis Stuartiana*; to Mr. F. J. Spæe, for *Medinilla Curtisii*; to Mr. Aug. Van Geert, sen., for *Cattleya Mossiæ splendens*; and Mr. James Bray received a Cultural Commendation for *Cypripedium Lowii*.

— GRAS CAULIFLORA.—The handsome foliage of this plant is sufficient to command attention at all times, whether in flower or not. Of the several plants at Kew, that one in the south end of the Palm-house engages the attention of thousands of visitors. The huge leaves are collected umbrella-fashion at the apex of a naked trunk, and attain a length of from 3 to 5 feet. These hang down in a very characteristic manner, and their beauty is greatly supplemented when a tier of young leaves crowns the summit. This same plant has commenced flowering, the first time at least for a number of years, and as the clusters of creamy-white flowers occupy the greater part of the naked trunk, a succession of open flowers will be kept up for a long time. The plant is a member of the great Myrtle family, and is figured in the *Botanical Magazine*, t. 5622. Only two or three species are known to science, natives of the tropical parts of America, where they form tall trees. They require accordingly a tall house with stove temperature, in order to attain flowering dimensions.

— MESSRS. SUTTON & SONS, READING.—This well known firm of nurserymen and seed merchants has received an additional partner, in the person of Mr. LEONARD GOODHART SUTTON, a son of the senior partner, who, from the thorough business and scientific training which he has enjoyed, should prove one of its most useful members.

— HORTICULTURAL CLUB.—The usual monthly dinner took place on Tuesday last, when there was a large attendance of members, including Mr. JOHN LEE, Messrs. LODER, GIRDLESTONE, G. PAUL, WHEATSTONE, GALT, DRURY, COUSENS, &c. In the evening a discussion took place on alpine plants, the subject being introduced by the Secretary, who in his address took up the practical side of the question, and adverted to some considerations which ought to be borne in mind by those who wish to grow these plants, the difficulty connected with them being considered being exaggerated. The discussion was continued by Mr. E. G. LODER, who especially detailed the manner in which he had overcome the difficulties connected with growing *Gentiana bavarica* and *Phyteuma comosum*; and Mr. GEORGE PAUL also spoke of the manner in which he grew *Silene acaulis* in drain-pipes sunk in the ground. Mr. GIRDLESTONE spoke also of the manner in which he conquered some difficulties connected with them. Some interesting blooms were exhibited. Mr. GIRDLESTONE exhibited a box containing, amongst other things, *Iris susiana*, *Thalictrum adiantifolium*, *Rosa rugosa corsicans*, *Anemone sulphurea*, *Pentstemon glabrum*, *Edelweiss*, &c. Mr. GEORGE PAUL had *Onosmatauricum*, *Saxifraga Waldensteini superba*, *Heuchera sanguinea*, &c. Mr. DRURY brought a fine plant of *Saxifraga pyramidalis*. Mr. PERKINS, of Leamington, sent a plant and some blooms of his fine new *Pelargonium Volonté Nationale alba*, which was

greatly admired. Mr. F. ARTHUR DICKSON, of Chester, sent up for the dinner some splendid *Asparagus*, grown on the coast of North Wales. Altogether a most pleasant and profitable evening was spent.

— POLYSTACHYA OTTONIANA.—A plant of this distinct and pretty little Cape Orchid is now flowering at Kew. The genus *Polystachya* comprises four or five species from South Africa, and about the same number from India, the largest flowered species being *P. grandiflora*, figured in the *Botanical Magazine*, and which is in cultivation at Kew along with *P. pubescens*, *P. rufula*, and the above-named. This last has small oval-shaped pseudobulbs which grow closely together, and are covered with silvery sheath-scales. The leaves are 5 inches long by a quarter inch wide, channelled, with numerous brown spots on the under-side. The flowers are produced from the young growths, singly or in pairs, on a slender peduncle nearly as long as the leaves. As in all *Polystachyas* the flowers of *P. Ottoniana* have the lip uppermost, which makes them appear upside down. They are three-quarter inch across, ivory-white, with a rose coloured keel to the sepals, and a yellowish line down the centre of the recurved labellum. In form they are very similar to the flowers of *Cymbidium eburneum*, but about one-sixth less in size. They are very fragrant. *P. Ottoniana* has been introduced from the Cape to Kew, where it is cultivated in a cool-house, and is fastened to a bit of soft Fern-stem with a little sphagnum about the roots of the plant.

— SHOW FIXTURES.—The Grand Floral Fête at York will be held on Wednesday, June 17, and two following days. The seventh annual show of the Bagshot and Windlesham Horticultural Society will take place in Bagshot Park on June 30 and July 1. The Croydon Horticultural Society's summer show of Roses and other flowers, plants, fruits, and vegetables, on July 1, in the grounds of Wellesley House. The Bath Rose Show on July 2. Tunbridge Wells Horticultural Society will hold the annual Rose, Flower and Fruit Show on Friday, July 3. A grand exhibition of Roses at the Crystal Palace on July 4. Ealing, Acton, and Hanwell Horticultural Society will hold its summer show in the grounds of Gunnersbury House on July 7 and 8. The directors of the Royal Caledonian Society will hold their show of plants, fruit, cut flowers, and vegetables, in the Waverley Market, Edinburgh, on July 8 and 9. A Rose Show, Cottage Hospital, and Children's-work Exhibition, will be held by the Horticultural Society of Moreton-in-the-Marsh on July 15. The annual Bedford and Bedfordshire Horticultural Society's shows will take place at Bedford on July 15. The Royal Botanic Society's show of plants, fruit, and cut flowers, will be held on June 17. The Newcastle-on-Tyne Botanical and Horticultural Society will hold a three days' show, on July 22, 23, and 24, when prize money to the amount of £302 will be awarded. Darlington Rose show, affiliated with the National Rose Society, will hold its show on July 23. Saffron Walden and North Essex Horticultural Society hold their show on July 15, when six open prizes will be offered for collections of fruit and vegetables. Wirral Rose Society will hold their annual meeting on July 18, when £112 will be offered in prizes. The twenty-first annual exhibition of the Calne Horticultural Society will be held in the grounds of Bowood Park, Calne, on July 28, when good prizes will be offered in the plant and Rose classes.

— CINCHONA IN JAMAICA.—The areas of land planted in Cinchona all over the world, according to the latest report of the Botanic Gardens of Jamaica, are comparatively small, and unless a very greatly increased area is brought into cultivation the day is not far off when, instead of quinine being too cheap for the Cinchona planters' benefit it will be too high for the consumers' pockets. In India there are only 18,300 acres; in Java 15,000 acres; Straits Settlements, Borneo, &c., 500 acres; Jamaica, say 500 acres; in Ceylon there were last year 64,000 acres. The area, then, of Cinchona which is likely to be a source of permanent supply is therefore only about 35,000 acres—a little more than half the area of the Ceylon fields, which have been the source of the recent enormous supplies of bark, 7,000,000 lb. in 1882-83 10,000,000 lb. in 1883-84. Unless all the accounts which show that Cinchona cultivation in Ceylon is a thing of the past, and that the Cinchona tree will not survive there for more than three or four years, are

grossly untrue, the yield of bark next year must fall off heavily and the price of the article must rise rapidly and considerably. The soil of Jamaica is so evidently suitable to Cinchona, and the growth and vitality of the plant is so satisfactory there, as compared with Ceylon and India, that there is little doubt that Cinchona cultivation will pay as well, if not better, in Jamaica than in the East or anywhere.

— LINNEAN SOCIETY.—Something like a sensation was experienced at the last meeting of this usually impassive and decorous Society. Some one espied a lady seated on the back benches, a hurried search for precedents was instituted, charters and by-laws were rapidly consulted, the business of the meeting, usually so punctually commenced, was delayed, and ultimately the Fellow under whose protection the lady was introduced, was requested to intimate to her that those documents mentioned Fellows and visitors of the male sex only. The lady accordingly withdrew. As in any case the lady could only have been present as a matter of courtesy, it seems a pity that an unnecessary act of discourtesy should have been committed by the authorities.—At a meeting of the Society, to be held on Thursday, June 18, at 8 P.M., papers will be read on—1. "Goldfingia MacIntoshii, a new Sipunculid from the coast of Scotland," by Prof. E. RAY LANKESTER. 2. "On the Occurrence of Articulated Laticiferous Vessels in *Ilex*," by D. H. SCOTT.

— RHODODENDRONS IN LONDON.—A fine display of these plants is now on view, and will continue for several weeks, in a large marquee erected in the garden of Cadogan Square, Sloane Street. The show is due to the enterprise of Mr. ANTHONY WATERER, of the Knap Hill Nurseries, Woking.

— ARBORICULTURE IN PRINTING HOUSE SQUARE.—We regret to hear that the old specimen of *Ptelea trifoliata*, which has grown for so many years in Printing House Square beneath the shade of the *Times* Printing Office, has at last fallen to the ground. We hear that it was a flourishing tree in 1841, and it has a special interest as furnishing an illustration of what shrubs will thrive even in such unlikely localities as that in which this tree has grown for so many years. The seed-vessels of this plant have large membranous wings, which give them a striking appearance, while in autumn the three-parted leaves assume a deep golden colour. From the bitter aromatic principle they contain, the seed-vessels have been used in some places as a substitute for Hops. Its native country is the Northern United States, and it owns kinship with the Rues (*Rutaceæ*).

— ROYAL METEOROLOGICAL SOCIETY.—At the ordinary meeting of the Society, at 25, Great George Street, Westminster, on Wednesday, the 17th inst., at 7 P.M., the following papers will be read:—"Meteorological Observations made on a Trip up the Nile, February and March, 1885," by WILLIAM MARCET, M.D., F.R.S., F.R. Met. Soc. "The Mean Direction of Cirrus Clouds over Europe," by Dr. H. H. HILDEBRANDSON, Hon. Mem. R. Met. Soc. "On the Influence of Accumulations of Snow on Climate," by Dr. A. WOELKOFF, Hon. Mem. R. Met. Soc. "Note on the Weather of January, 1881," by CHARLES HARDING, F.R. Met. Soc. "Results of Meteorological Observations made in the Solomon Group, 1882-84," by Lieut. ALEXANDER LEPPER, R.N. "Graphic Hygrometrical Table," by DAVID CUNNINGHAM, M.Inst.C.E., F.R. Met. Soc.

— ANTHOCERCIS VISCOSA.—A specimen of this old introduction has been flowering for some considerable time in the south octagon of the Temperate-house at Kew. There is no question about the showy character of the large white flowers blotched with purple in the tube; but the viscid nature of the leaves might be objectionable to some if the plant was grown for cut flowers. The leaves, however, are agreeably fragrant, which compensates for the bad properties experienced in handling them. Eighteen species are known to science, all Australian shrubs, of which few have been introduced, and fewer still are known to cultivators in general. The present species is figured in the *Botanical Magazine*, t. 2961. The genus is included in the Solanaceæ by the *Genera Plantarum* in a tribe represented typically by the well known garden annual *Salpiglossis*. Other authorities include both the above-mentioned genera in the Scrophularia family, doubtless on account of the four perfect and one rudimentary stamen.

## ALPINE PLANTS.

**ARNERIA ECHIOIDES.**—This interesting and singularly pretty plant, with its clear yellow flowers and dark velvety spots, is now in full bloom, and well merits attention as being one of our most showy Borage-worts. Not long ago, like many other alpine, this plant was almost coddled into existence, but now it may be seen growing strongly in an ordinary border and where but a minimum of attention has been bestowed on its cultivation. As regards soil it is by no means fastidious, flourishing well in either light or stiff. It is certainly a decided gain to know that such an ornamental plant requires but the attention that is usually bestowed on one of our commonest garden occupants.

**GENTIANA VERNA,**

long supposed to be a miffy plant, is really not so, and flowers in our lowland gardens just as well as on the alpine peaks where it is now protected by a blanket of snow until revived by the mid-summer sun. A peaty loam, pressed firmly, suits it well. In the pink Wood Sorrel (*Acetosella purpurea*) the colour is distinct and good. It is a delicate and precious little plant which well deserves to be increased and grown as a garden flower. Is this what Ray calls "*Biophytum trifolium acetosum flore pleno*"?

**RANUNCULUS ALPESTRIS.**

It is delightful to see this high alpine plant growing and flowering really well at less than 100 feet above sea-level. The numerous slender stalks a little more than 2 inches in height, surmounted by large solitary snow-white flowers, are in my opinion not even surpassed by *R. anemonoides*, which is now just out of bloom. Peat, loam, and lime, with a fair supply of moisture, seems to suit it best.

**R. AMPLEXICAULE,**

with its graceful greyish leaves and pretty white blossoms with yellow centres, is always welcome, and well worthy of extensive culture as one of our most showy Crowfoots. On rockwork amongst leaf-soil it does remarkably well, seeding up flower-stems nearly 1 foot in height, which are also furnished with entire stem-clasping leaves—whence its name.

**THE BLOOD ROOT (SANGUINARIA CANADENSIS)**

is a distinct and curious North American plant, not only from its great fulness of sap, but because of the shape, colour, and method of development of the leaves. Grown in a cool shady position among rich vegetable soil this handsome plant produces an abundance of large pure white flowers which, although of good substance, usually fall to pieces in about a week. It will be found of great benefit both for the plant's beauty and welfare to have the place in which it is grown carpeted with some low creeping plant such as the *Arenaria*, *Linaria alpina*, or *Campanula hederacea*.

**PRIMULAS.**

Few alpine are more effective just now than the various species of *Primula*. *P. cashmeriana* and its near relative, *P. purpurea*, both well in bloom at present, are very effective, the boldness of growth being a marked characteristic. The flowers, though individually small, are arranged in globular trusses of large size, and placed on stems of from 9 to 12 inches in height. *P. verticillata*, although of a somewhat tender nature, has stood our past three winters with impunity. The flowers are distinct and beautiful, of good substance, and borne in quantity.

**DAPHNE CNEORUM**

is one of the sweetest and most showy hardy plants now in bloom, and which, on account of its procumbent spreading habit should have a place on every rockwork, large or small. In light sandy soil it grows freely, and by layering the branches they root rapidly and soon produce a good bold mass of rich green foliage, which during the spring months is studded with a multitude of rosy-lilac very fragrant flowers.

**MYOSOTIS ELEGANTISSIMA.**

The variegated Forget-me-Not is a pretty and desirable plant, its blue flowers contrasting charmingly with the silvery variegated foliage. In a shady, damp position it does well, and soon forms a very ornamental tuft. Two other species of *Myosotis* are also worthy of attention—our native *M. alpestris* and *M. azorica*. The latter is, unfortunately, rather

tender, although in many shady, sheltered gardens it seems quite at home, and during early May produces a wealth of indigo-blue flowers, for which it would be almost impossible to find an equal.

**HYOP PETTICOAT NARCISSUS.**

Just now one of the most charming flowers of the open air garden, as well as valuable addition to the later Narciss, is *N. Bulbocodium*, or the Hoop Petticoat Narcissus. The rich golden-yellow cup, regularly widening from the base to the margin, is both distinct and beautiful. In many gardens it will not thrive, the chief requirements—a light sandy loam, and warm, rather dry situation—being rarely found. Placed on low warm banks or the more sheltered positions of the rockwork it is much improved, and thrives infinitely better than in the ordinary border.

**ERODIUM MACRADENIUM.**

Neat in habit and of exquisite beauty is the little Stork's-bill (*Erodium macradenium*), and which, although introduced to this country more than a century ago, is still comparatively rare. From the exceptional length and peculiar formation of its roots, it requires a deep well drained soil and sunny situation. *Emergo.*

THE DOUBLE NARCISSUS  
POETICUS.

MR. PETER BARR, in a note to the *Gardeners' Chronicle* last year, expressed an opinion that the double form of *Narcissus poeticus*, so common in market gardens near London and elsewhere, is the double of the variety "patellaris," a form not often found single, and distinguished by its broad and regular crown. I disputed Mr. Barr's assertion last year, but this year, having had a better opportunity of comparing the single "patellaris" both with the single *N. p. recurvus* and with the double form, which is abundant in my garden, I believe Mr. Barr to be right. I find that all the characters of the single patellaris, the form and carriage of the leaves, the shape of the limb, and the angle to the tube at which it is carried, correspond to those of the double *N. poeticus*, whilst the peculiar recurved leaves, which give the name "recurvus" to the more common variety, as well as its English name, "the drooping-leaved Narcissus," do not mark the double form. Assertions about the doubling of the single Poet's Narcissus by cultivation in certain soils are even more common than those about the wild Daffodil, and both alike require careful and continuous observations to confirm or refute them.

To endeavour to obtain these observations I last year distributed several hundred bulbs of "recurvus" of proved singleness amongst gardens said to have this doubling power in the soil. If they double it will be interesting to note whether they also change the character of their leaves, which I think it not improbable that they may do, the drooping being effaced by the greater vigour of growth generally present in double forms. *C. Wolley Dod, Edge Hall, Malpas.*

FRUIT-GROWING AT MR.  
LADDS.

In times past the price which the best fruit made was very different to what it is now; it was no unusual occurrence for the earliest Grapes that came to hand in Covent Garden Market to sell for 15s. or 20s. per pound, the first Strawberries half-a-crown an ounce, and Peaches £3 or £4 a dozen. Higher figures than these were sometimes realised, whilst late Grapes, kept until the first of the new crop were about to appear, were worth nearly as much as the new ones. But it goes without saying that at such prices the demand was confined to the few who are ever ready to pay any price for anything providing only that it is rare enough to make its use all but prohibitory even amongst well-to-do people. In like manner choice flowers through the winter and early spring were only obtainable at a figure proportionate to that of the fruits named. But the time for such prices is gone, and not likely to return. At the present day, during the season, when most difficult to produce, the best fruits and flowers do not fetch more than a third of what they used to; but with the drop in price has come the increased demand, which rarely fails to spring up when any commodity that comes under the cate-

gory of luxuries gets cheap. As a natural consequence, to meet this altered state of matters the leading market growers, convinced that the demand will still further increase, are largely increasing their means of production.

In addition to the large extent of glass which Mr. Ladds put up at Swanley in the winter of 1883-4, which was planted with Vines and filled with Tomatos last summer, there has been this winter an immense addition made there—forty houses, each 200 feet long by 12½ feet wide, and seven each 200 feet long by 17 feet wide, having been completed. They are constructed in the same plain but substantial way that Mr. Ladds is now doing the whole of his work of this kind. The houses are erected in blocks, with well-built 9-inch walls enclosing each block. They are thoroughly stayed with stout iron ties, so as to stand the immense pressure which the wind has on such enormous surfaces of glass in an elevated exposed position, such as that in which these houses stand, where there is nothing in the shape of a tree or a building to break the force of the gale. All the wood used is Pitch Pine, selected so as to be perfectly free from knots. All the houses stand ends north and south, excepting the 680 feet vinery, and some half-dozen others, which run in the opposite direction. The new houses were begun in the autumn about September, and the last of them were all but finished and ready for use when I saw them, the last week in March. At that time twenty were filled with pot Strawberries, consisting of a fine lot of even plants, promising well for a crop. In addition to these Mr. Ladds has at his Dartford Heath establishment twenty-five houses, similar in width, and each 135 feet long, filled with Strawberries, something like 100,000 plants in all. Early forcing is not attempted, the crop being timed to come in so as to give a succession from early in May until they are ripe out-of-doors. Nearly the whole are Sir Joseph Paxton, but several others are being tried to come in about the time mentioned. As the Strawberries are cleared out the whole of the houses that have been occupied by them are to be filled with Tomatos, hundreds of thousands of plants of which are prepared wherewith to stock them.

In ten of the new houses at Swanley a row of *Maréchal Niel* Roses has been planted at each side, and ten others with similar rows of *Gloire de Dijon*. Tomatos will also form the principal crop here until the Roses get up.

No time is lost in long waiting for a crop of Grapes; five of the twenty houses planted with Vines last March twelvemonth are being fruited this year, the Vines being allowed to carry five or six bunches each. They are planted on each side of the houses at a distance sufficiently far apart to allow of each Vine running right across the span from eave to eave. The remaining fifteen houses, as well as the very big one, which were planted late with very small Vines, will not be allowed to bear anything until next year. These are to be filled with Tomatos this year.

The whole of these Swanley houses are now heated by twelve of Rochford's boilers, which Mr. Ladds is adopting in place of the boiler of his own design which he has hitherto used. There is this difference in those he is putting in from the ordinary Rochford, which is composed of 4-inch pipes, that Mr. Ladds is using 3-inch. The boilers are placed in pairs, side by side, in each stokehole. In the big vinery, where the flow and return is continuous from end to end, the water from leaving the boiler before it gets back into it has to travel over a quarter of a mile. The four long houses at the Dartford Heath place—now filled with 100 Royal George Peaches, occupying each side of the houses—are now a feature such as I feel satisfied has never been seen in Peach growing under glass before. When I saw them nothing could promise better for a crop, the fruit from end to end, without the exception of a single tree, were as even as if they had been put on the branches by hand. By the way the thinnings lay on the ground there had evidently been as many taken off as would have sufficed for eight or ten crops. The cultivation of this fruit is about to be much extended here. At the Bexley Heath establishment a new house, double span, 300 feet long by 35 feet wide, has this winter been finished, and is now filled with a beautiful lot of flowering plants of *Gardenia*. They are all in pots; Mr. Ladds has tried planting out *Gardenias* on a large scale; the plants were kept until they formed bushes 8 or 10 feet through, by 6 or 7 feet in height; but henceforth their cultivation is to be confined to pots. *T. B.*

## FRUIT NOTES.

WASHINGTON PLUM.—A coloured figure of this excellent Plum is given in a recent number of the *Bulletin d'Arboriculture*. It is a Plum of large size, oblong obtuse form, yellow colour, and good flavour. The history of this Plum is curious. A Plum tree (variety not stated) was overthrown by a hurricane, but from the stock proceeded some suckers, one of which was removed and grown on, ultimately producing a fruit, deemed worthy to be named after Washington himself.

## FRUIT PROSPECTS.

There is every prospect now of abundance of all kinds of fruit. Generally we have to make some kind or other an exception, but, notwithstanding the cold spring, we have come out of very little the worse. Peaches and Nectarines are good, and with the exception of a little blister, the foliage is clean and healthy. Apricots are a full crop, but there are great losses of branches, not one variety escaping, though the Hemskirke is said to be less subject than any other. Pears on walls of most are good. Plums, though not a full crop, are above the average, and very free from aphids. Apples have set a good crop, not so thickly as anticipated, still sufficient to require thinning—the larger varieties, some of them, already thinned. Orchards are later, can scarcely tell yet what will swell, but I don't think there is any doubt about there being full crops. Early Cherries are good; the Elton now colouring, Morellos very abundant—far too many to mature on the trees. Gooseberries and Currants are excellent. Raspberries have broken well, and promising to be a good crop. Strawberries every prospect of being heavy crops; next week will find plenty of ripe fruit in the market. It is very cheering to be able to write thus of our fruit crops, excessive drought, birds, and wasps being the only difficulties lying in our way to securing a good fruit harvest. Wasps have been unusually abundant this spring, nests having been taken here this season as early as May 13. D. C. Powell.

## DISEASE AND NON-GERMINATION OF PEAS.

EVERY one acquainted with garden literature must have observed numerous reports regarding the non-germination of Peas. The failure is often attributed to the weather, to the state of the soil, or to destruction wrought by birds. In not a few instances seed merchants are seriously blamed for sending out old and dead, instead of new seeds. The growers seldom report further than the total failure of the crop; they say they have planted seeds with no result, and a new sowing has been compulsory.

I have several times reported that parasitic and other fungi frequently grow inside the pods of Peas, and often upon the seeds themselves whilst still in the pod.\* The fungi I have noticed include the destructive *Peronospora viciae*, B.; *Erysiphe Martii*, Lk.; *E. communis*, Schl.; with *Penicillium crustaceum*, Fr., and other moulds. These fungi, one and all, not only invade the exterior of the seeds, but by their germ-tubes gain an entrance to the interior, and destroy the embryo and life of the Pea.

The accompanying illustration will show younger readers of the *Gardeners' Chronicle* more clearly than words how the germ of the Pea is attacked and destroyed by fungi from the outside.

The outline on the left-hand top of fig. 170 represents at A a Pea, enlarged four diameters; the dotted line shows a fragment of one of the valves of the pod. B is the little stalk of the Pea, and the black dot at C is a natural opening in the skin of the Pea leading direct to the germ within. In the properly fertilised and ripe Pea this little opening, or gate, is termed the micropyle (little gate). When the Pea is very young—a mere unimpregnated ovule in the ovary—this minute orifice is known as the foramen (hole), and through this minute hole the ovule is acted on and fertilised by the pollen with its pollen tubes. It will be seen then that every Pea has a weak point, or gate, by which its interior may be reached by both friendly and hostile "tubes."

In the next figure, on the right, D shows a Pea removed from the pod as well as from its little stalk. The scar left by the latter is seen at E;

this scar is termed the hilum, or umbilicus: it is the point of attachment of the Pea to its mother. The little gate, or micropyle, is seen at C; the shading represents the threads of microscopic fungi and the injured outer membrane of the Pea.

The third figure shows a section through a healthy Pea; F, is the surface of one of the cotyledons, or young seed leaves within the Pea; G the testa, skin, or coat (of two thin membranes); H is the young rootlet or radicle within the Pea, ready to emerge on germination through the little gate, or micropyle, at C; J is the plumule or rudimentary bud with young leaves of the embryo Pea. The fourth figure at K shows in section the interior parts diseased by fungi, the disease being clearly traced to the microscopic opening, or micropyle, at C. The micropyle of a Pea is so small that it requires a lens to see it; from a microscopist's point of view, however, it is an opening of very large size.

At L a micropyle of the Pea is engraved direct from a camera-lucida reflexion from a microscope, enlarged

FIG. 170.—DISEASE OF PEAS.

200 diameters; the little straight line at the bottom is the commencement of the umbilical scar (seed at E). To show how large the opening of the micropyle is in comparison with the spores and threads of the dangerous parasite of Peas, named *Peronospora viciae*, I have engraved to the same scale a spore and mycelial tube of this fungus at M. The parasitic fungus of Peas, named *Erysiphe Martii*, Lk., bears its transparent spores in little colourless bags, asci, as seen also to the same scale at N. It will be noted that many of these bags of spores could easily sail into the micropyle. At P are shown the minute spores and a single thread of one of the blue-mould fungi, *Penicillium crustaceum*, Fr. The difference in size between these microscopic spores and the minute micropyle of the Pea is remarkable.

The micropyle in seeds commonly becomes closed or obliterated, but in Peas and Beans it frequently remains open; in some varieties and samples of Peas it appears to be always open.

Good seed merchants never send out Peas or any other seeds without first testing and often guaranteeing their power of germination; when, therefore, a crop is very bad or a total failure, it is hard to see

how the seed merchant can be free from blame, if the seeds have not been eaten by birds. I have at times received large samples of seeds for examination from good firms, and in cutting sections of the Peas have found in some instances nearly every example dead, through the destruction of the embryo by parasitic fungi, through the micropyle.

It is obvious that in slight attacks the germinating Peas grow up from the seed with the elements of disease already in their tissues. All diseased Peas should, of course, be destroyed, and no seed Peas should be kept in places where the slightest moisture prevails; damp air not only starts fungi into renewed growth, but it causes the micropyle (which may possibly be closed) to gape open, and so offers a point of ingress to a death-dealing invader or invaders. W. G. Smith.

## HOME CORRESPONDENCE.

Rhubarb.—Amongst the subjects thought just then to be perhaps of trifling importance, staged at the recent South Kensington exhibition, was a couple of samples of Rhubarb from the Society's gardens at Chiswick—Stott's Monarch and Victoria. Chiswick soil seems to be favourable to Rhubarb, for the growth in this case was remarkable, the Victoria stalks being some 4 feet in length and straight as a rod, very large, and remarkably handsome; whilst Stott's Monarch, which is of pale green hue, quite lacking colour, had stems 7 inches round and nearly 3 feet in length. Gigantic as these stalks were, and effective in attracting the attention of visitors, it is very doubtful indeed whether either sort would be favoured in any kitchen or cottage home for domestic consumption. Probably a large amount of Rhubarb is employed in the manufacture of those sparkling hocks and champagnes which deluded Britons pay for so liberally and drink so freely, under the impression that it is genuine juice of the Grape. Mr. Robert Fenn has often manufactured from Rhubarb and Gooseberries home-made champagne which would puzzle some *connaisseurs* to tell from a Continental brand, and at a cost of about 1s. per bottle. Why English enterprise has never yet set to work to manufacture its own champagne, with such a wealth of Rhubarb and Gooseberries at our doors as we have, is, indeed, marvellous, and shows that for some things we prefer to pay through the nose for any kind of manufacture if it has a Continental brand. Whilst we have these gigantic Rhubarbs we happily have in Red Champagne and Early Albert other kinds of great value for domestic purposes, and Victoria is seldom seen so large as it was in this particular instance. Kinds that are very early and produce stalks of medium size, rich colour, and of good flavour, are most desirable. It is worthy of notice that new distinct Rhubarbs are singular rarities. A. D.

Seedling Dendrobiums.—Thinking it might interest some of your readers, I have sent you two seedling Dendrobium devonianum raised from seed sown in June, 1882. No. 2 shows the first bulb. Some plants from the same batch flowered a month ago, being only two years and ten months from the time of sowing the seed. Edmund Ayling, Forty Hill, Enfield, Middlesex.

Wistaria sinensis at Home.—Presuming its home to have been on the trees of its native forests, I had long wished to rescue poor Wistaria from its unnatural position on the garden wall, and several years ago wrote to this effect in the *Gardeners' Chronicle*. Much time, however, elapsed before I succeeded in carrying out my desire of establishing it on a group of large Laburnums growing at the entrance of the rock garden at Bayfordbury, chiefly from falling into the common error of planting it too near the base of the trees. But having obtained a strong plant with a single stem some 10 feet long, I prepared the soil at that distance from the nearest Laburnum, to which I led the stem underground, and soon induced it to grow well; and at the present time it is spreading more or less over the tops of three adjoining trees with a profusion of blossom on both the Laburnum and Wistaria; so that, from their time of flowering being identical, just now it is a sight worth seeing. [Visitors to Mr. A. Waterer's nursery at Woking will remember a similar case. Ed.] A *Tropeolum speciosum* planted near the same spot bids fair to succeed them with its flowering later in the year, after wandering over some low Box trees beneath the Laburnums. Immediately adjoining on

the grass is a very fine specimen of *Gunnera manicata*, with several heads of flower coming on, and in the corner of some rockwork an old-established plant of *Plumbago Larpentæ* has obtained an undisturbed possession, producing every autumn a great profusion of fine flowers. A little further on, upon some sunny sloping rocks, the hardy varieties of *Cactus Opuntia*, of considerable size, promise abundance of flower, retaining some of the fruit of last year, which seem inclined to ripen. The alpine in general are flowering, well favoured by the late winter, as also a fine specimen of *Chamærops Fortunei*. On leaving the rock garden, in an angle of a portion of the wall of the house facing east a *Lapageria rosea* was planted some years back, which is growing most vigorously, far exceeding some plants in the conservatory. It has not yet flowered, but from the size which it has attained I fully expect it to do so this year. It has been sheltered with dry Fern in the winter, and is affected more by sun than cold weather, although it only gets the former in the early morning. *W. R. B.*

*Ornithogalum gracile*.—About "*Ornithogalum gracile*" (see p. 480) exported by an eastern province nurseryman, the story is much this way. Given a white *Ornithogalum*, apparently useful for forcing and other horticultural purposes, given also a collecting nurseryman out here without knowledge of the plant's name—any fancy adjective which seems likely to take a purchaser's eye is attached to the exported lot. The consignee, simple soul, supposes his collector to know all about the name and takes it on trust. And thus *synonyma hortulana* get their misbegotten birth. *Ornithogalum gracile* is founded on a very tiny span-high species distributed some years ago from my herbarium collection in the *Van Stadensberg*, No. 1939, and described by Mr. Baker in *Journal of Botany*, 1874. *O. gracile*, so called, is probably merely *O. thyrsoides*, or *O. lacteum*, both of which have been exported by the thousand from the Cape Town peninsula ever since the time of Villette and Bowie, or earlier. *Cape Town*.

Is Cotton an American Plant?—Mr. Bourke, in the *Snake Dance of the Moquis of Arizona*, p. 244, says:—"The Tunis weave the same kind of cotton mantle, but do not grow the fibre, preferring to buy this from their neighbours, the Moquis, whose fields, exposed to warmer suns, have yielded the precious bolls from generations long prior to the advent of the Spaniards." He also (p. 241) refers to Davis' *Conquest of New Mexico*, p. 100, which speaks of the inhabitants possessing "blankets of cotton." I always understood that Cotton was an Old World plant used on this side of the Atlantic centuries before America was discovered, and that the first Cotton ever sent from America to England was a little lot the fill of a woman's apron; as that was approved of the next shipment was one bale from, I think, Savannah. But if Cotton was an Old World plant how could it be used in the New World "centuries before the advent of the Spaniards"? *J. R. Hay.*

The Snake's Head.—The local name in this part of Hampshire for the common Fritillary is "The Snake's Head." *Helen Watney.*

Proliferous Roots of Orchids.—In the *Gardeners' Chronicle* of May 16 last Professor Reichenbach (p. 627) writes as follows regarding the proliferous roots of the Bird's-nest Orchid (*Neottia Nidus-avis*):—"I saw this as long ago as 1849, when I observed the fact at Tharant. I learned very lately that it had been observed before by Vaucher in 1841. After Vaucher and myself it was seen by Irmisch, Prillieux, Hofmeister, who got it from me; then it was formally denied by Drude, but reobserved and neatly described by Warming, the excellent Scandinavian botanist." Now, although it is not distinctly stated in the above that Vaucher first observed the proliferous roots of the Bird's-nest Orchid, still such will naturally be inferred from the text. This is, however, not the case, as previous to its being noticed by Vaucher in 1841, it was observed and formed the subject of a most interesting communication to the *Magazine of Botany and Gardening* in 1833, by the Hon. and Rev. W. Herbert. He thus knew of it more than eight years before Vaucher, as in writing his notes he says that "many years ago," &c., that was previous to 1833. My own observations (communicated some time ago to the Royal Horticultural Society, regarding the proliferous roots

of the *Neottia*, but more particularly that the young eye or bud is produced at the extremity of one of the fibres, and not, as your correspondent says, from the axils of certain sheaths or the very top of a root-fibre), are certainly more in accordance with those of Herbert than Reichenbach. The whole matter is most interesting, and well worthy of more careful observation than it has hitherto received. *A. D. Webster.*

Rosemary.—This maritime plant (*Rosmarinus—sea dew*) has probably been associated with pure love and pure, lasting, loving remembrance on account of the old fable that, like the earlier veiled Aphrodite, or Venus, the goddess and symbol of pure, unearthly love, it arose from foam caused by the fashing of the sea waves. The later, coarser, generally nude and non-seaborn Aphrodite, daughter of Zeus and mother of Eros (Cupid), was (as opposed to the first-mentioned) the goddess and symbol of earthly and sensual love. *W. G. S.*

Pine Needles.—Every one knows how the adult leaves of Pines grow in groups of two, three, or five,

FIG. 171.—TERMINAL SHOOTS OF PINUS.

according to the species, and how, as a rule, the stem or branch which bears them does not elongate but remains abortive. We have lately met with an instance in the Scotch Pine wherein the stem has continued its growth between the two needles, so that a new leaf-shoot was produced in that situation: see fig. 171. Generally such shoots proceed from the axils of scales or of primordial leaves, as may be seen very well in seedling Pines; but in this case the shoot forms the direct continuation of the axis. *M.*

Australian Grapes.—The London correspondent of one of the Manchester papers of last week notices the arrival of two consignments of Australian Grapes, which were offered for sale, and went off well. The writer says:—"I heard the other day from a friend who has just arrived from Adelaide, that Grapes are selling there at a penny per pound, so that if the exporters can send them over here and command a sale at from fourpence to sixpence per pound, it will pay them to do so. Some people are professing to pooh-pooh the idea of an Australian fruit trade; but, judging from what we have now seen, there seems every prospect that, like the wool and frozen meat trades, it will ultimately develop into a remunerative line of business." There can be little doubt if these Grapes arrive

here in good condition and in a fairly well usable state, they will seriously depreciate the value of English hothouse Grapes. When Jersey Grapes arrive in good condition, the value of hothouse Grapes falls at once, some people preferring to use these to paying a higher price for good hothouse Grapes. If Australian Grapes come in as competitors, they will cause a greater depreciation in hothouse Grapes. *M. S.*

Cabbage Early Warwick.—Amongst the recent introductions of early Cabbages there is none can approach this grand old variety; in every respect it is a perfect Cabbage, fit for any gentleman's table, and a grand market variety, and is without doubt the earliest Cabbage in cultivation. I have grown it side by side (all sown on the same day) with Ellam's Dwarf, Offenham, and Carter's Heartwell Early, and the Early Warwick is fit to cut quite ten days to a fortnight before any of the aforesaid. The Early Warwick Cabbage was raised and sent out by Mr. Butcher, of Stratford-on-Avon, some thirty-five years ago. This firm still hold stock of the original variety, having each year carefully saved seed from selected plants. I can strongly recommend the Early Warwick Cabbage to all who have to supply the table with early Cabbages as a first-class variety. *R. Greenfield, Priory Gardens, Warwick.*

Tacsonias Dying.—After reading Mr. Earley's letter on Vines dying, I am induced to send a few notes about the mysterious way the Tacsonias are dying on the roof of our conservatory. Three years ago some fine plants were bought from a well known English firm. The varieties were Van Volxemii; they were planted in a border 2 feet wide and 18 inches deep, well drained. These were trained up the columns and across the arches. Up till last November nothing could be more satisfactory than their growth, when one showed signs of decay, then the one next to it went away; and now I see another quite gone, although it had shoots 3 and 4 feet long covered over with healthy foliage. The disease seems to be working to each end of the house. The border is well looked after for water. In the same border there are Camellias, Rhynchospermums, and Pelargoniums trained up the wall, and nothing can be more satisfactory than their growth. I will be much obliged if some of your able correspondents will be so kind as to give their opinion, as it is very annoying to see those immense arches covered with dead creepers. *H. K.*

Hydrangeas.—It is a long time since I have seen such a display of these highly ornamental plants as came under my notice a few days ago at Mr. R. Bayley's, Tor Grove, Plymouth, in one of the conservatories there. The gardener, Mr. Gould, is certainly clever in producing dwarf compact plants, each carrying three and four very powerful-looking cymes or corymbs of their elegant flowers. *Hortensis* is the principal, but its pure white variety, "Thomas Hogg," comes in for a good share of attention. Mr. Gould secures autumn-struck plants early in February, which he hurries on into 5 and 6-inch pots, in which they bloom. Hydrangeas ought to command extensive cultivation, as they are so well adapted for a variety of purposes, and they make excellent table plants when in flower. *W. Napper, June 8.*

Fairy Rings and Moles.—Every one who is acquainted with the literature of fairy rings knows that there was once a prevalent belief that the green circles in pastures were caused by the burrowing of moles. When it was pointed out that fungi were almost invariably present at one season of the year on the margin of the rings, the reply was made that the disturbed ground formed a pabulum suitable for the growth of fungi. The theory has, however, long been thoroughly demolished, so that it is now unnecessary to bring forward any arguments against the idea. The one fact that fairy rings are often common where moles do not, and never have, existed, is sufficiently fatal to arguments in its favour. Still the fact remains undoubted that there is often a kind of "consortium" or fellowship between fairy rings and the burrowings of moles; but the truth is, moles do not incite the growth of fairy rings, but, on the contrary, fairy rings attract moles, as the following note will show. "I have long been acquainted with some enormous fairy rings on Dunstable Downs, caused by the growth of the edible and delicious *Agaric* of spring, *Agaricus gambosus*. During the last week or two I have visited the rings and secured several repasts. Mole-hills were in the

neighbourhood of the rings, but there were at first no runs or heaps on or very near the fungus circles. On visiting the rings again, last Sunday, I was surprised to see an abundance of mole-hills on the exact circles of the fairy rings, and many examples of *Agaricus gambosus* overthrown by the burrowings of moles beneath the rings. It appears then that moles are attracted by the rings. It may be that either the underground strong-scented nitrogenous mycelium of the fungi is the source of the attraction, or it may be due to the presence of a greater abundance of worms (possibly attracted by the same cause) on the line of the rings than elsewhere. It is quite possible that worms may be attracted to the line of the circles by the decaying roots of the dead grass and fungi of the previous year, and so the moles in turn discover an unusual number of worms. Whatever the explanation may be, it would seem certain that moles are really attracted to the rings." *W. G. S.*

**Saxifraga Macnabiana.**—Mr. G. C. Churchill, p. 738, is right in regarding *Saxifraga Macnabiana* as a garden variety. It was raised in the Royal Botanic Garden, Edinburgh, in 1875, from seeds obtained from *Saxifraga nepalensis*, a misleading name for a form of *S. pyramidalis*. Of the seeds sown only two plants came to maturity, one, *S. Macnabiana*, having very dark spotted flowers and leaves like *S. lingulata* (which I take to be the male parent), the other having broader leaves and larger, less coloured flowers, but also a handsome plant. *S. Macnabiana* seeds freely, but does not come true from seed, the seedlings being generally like *S. pyramidalis*. *Robert Lindsay, Curator, Royal Botanic Gardens, Edinburgh.*

**Melon Canker.**—In answer to Mr. Ward, who, at the commencement of his remarks on p. 703, accuses me—unfairly as I think—of misquoting from his previous note, I was certainly under the impression, after reading it, that his intention was to convey the meaning that deep planting was the only cause of canker, for on the page mentioned he says, "In reference to this subject I beg briefly to say, that if due allowance is made in forming the hillocks after the plants have been set therein at the same depth in the soil as they were in the pots, and soil has been added afterwards to cover the roots as they push through the sides of the hillocks, and 3 inches higher than the soil surrounding them, to prevent water lodging about the stems, 'canker' will be prevented from attacking them;" and further down he concludes thus: "In short, I opine that canker is caused by the plants being set out too deeply, and the mould becoming too wet round the stems, gainsay it who can." Now it is clear that Mr. Ward, when writing this, did infer that canker was the sole result of deep planting. I am still of opinion that Melons may be planted and earthed-up as is usual with Cucumbers, without any fear of canker, provided no injury be caused to the stems. In reply to the query, Why the temperature of the house should affect the buried stem? I may say, as far as I have seen, canker usually occurs where the stems come in contact with the soil, and not the buried portion, consequently the temperature of the house would affect it; and as the sudden fall in the atmosphere would in most cases be accompanied also by a similar fall in the bottom-heat through the heat from the hot-water pipes not affording enough heat, the entire plant would feel the check. The last instance of canker or damping off that came under my notice (twelve years since) was, I believe, occasioned in this way: During hot weather the fires were withheld for a few days—a cold night succeeded a hot bright day, the house being heavily charged with moisture; this sudden check produced, in my opinion, the canker which followed, although the plants were on raised mounds of soil, and not deeply planted. Too much water will certainly cause the sudden collapse of Melon plants just the same as it would a *Calceolaria* or *Cineraria*, quite independently of what depth the stem is buried in the soil. I am careful that our plants shall not get "too wet," and to this, combined with small beds of firm soil, with ample drainage and careful attention always, attribute our immunity from disease. Mr. Ward furnishes his name and address as a guarantee of his cultural statements. I may inform him that my employers have recently passed high encomiums on our Melons, both as regards culture and flavour. We also have gardening friends who frequently give us a call, and several of them members of the Royal Horticultural

Society's committee; one, a member for many years past, when he saw our Melon-house recently remarked that he had "never seen a better crop or a prettier lot of Melons." As far as quality is concerned I presume Mr. Ward will allow that the exhibition table is a fair test, and I may mention that during the past year or two out of seven times exhibiting we have obtained six 1st prizes, and on one, if not more occasion he was himself amongst the competitors. *C. H.*

**Snowberries.**—I have always understood that these white berries were poisonous. I cannot call to mind any instance, but I well remember having been, when quite a child, cautioned by a good botanist, "not to eat these berries, because they would make me very ill." I believed the old gentleman, and never doubted his words as regarded both Snowberries and Laburnum seeds, whilst he, at the same time, rebuked my mother for allowing me to put them in my mouth when trying to thread them. The Snowberry of Brazil (*Chiococca*) is very hurtful, violently emetic, and some writers say that when its cuds are given as a remedy for snake bites, "the remedy is worse than the wound." *Helen Watney.*

**Clover Sickness.**—In adverting to this subject Mr. Plowright says (p. 704) that the structure of the internal mass enclosed in the small nodules on the roots of diseased Clover reminds him of *Plasmodiophora*. *Plasmodiophora*, as all readers of the *Gardeners' Chronicle* no doubt know, is the fungus which is believed to cause "club root" or "finger-and-toe" in Turnips, Swedes, and other cruciferous plants. It does not seem probable that *Plasmodiophora* would spread from Clover to Turnips. There may, too, be two or more species of *Plasmodiophora*. It is, however, a fact that there exists a very strong and wide-spread belief amongst farmers that "finger-and-toe" commonly shows itself in bad form when Turnips are grown after a crop of Clover, especially after Clover grown on "Clover-sick" land. This belief of "experienced agriculturists" when linked with the resemblance which is said to exist when the diseased tissues of Clover and Turnips are examined under the microscope, will no doubt be sufficient for some minds to conclude that the resemblance means nothing more or less than the positive identity of the two diseases. It is possible that some one will now be ready to "prove" the existence of a genetic connection between "Clover-sickness" and "finger-and-toe." The connection, though not probable, is possible; it is hard to say that anything is impossible. "Faith healing," instead of lime dressings, clean farming, and a proper alternation of crops, may now perhaps be tried with success in bad cases of "Clover-sickness" and "finger-and-toe." *W. G. Smith.*

**Cattleya Mossiæ.**—I send a bloom of *Cattleya Mossiæ* which was produced on a plant here that has been grown in England several years. You will notice the double lip and abnormal development, one so peculiar that I have never seen its counterpart, and therefore send it you as a matter of interest botanically. I know *C. MacMorlandiæ*, which has no lip at all, and so flowers persistently, as I have remarked at Messrs. Veitch's. This seems the complement, having two lips, but, unlike *C. MacMorlandiæ*, this has not the sepals and petals. *Cattleyas* have been great here this season. One flower of *Mossiæ* has measured 10½ to 10¾ inches in breadth across—the largest I remember. *Fred. A. Philbrick.* [In the flower sent the parts were in twos instead of threes—two sepals, two lip-like petals, and an erect column without anthers. This dimorphic condition is not uncommon in Orchids. *Ed.*]

**Mimulus Seed.**—Were Mr. Murphy's experience of the laggard germinating powers of *Mimulus* seed that of all others, I fear few would care to grow what must rank amongst the most beautiful of garden flowers. I can say for strains of very beautiful *Mimuluses* that have not such pretentious designations as "Queen's Prize," that seed germinates in a week or two most freely, even when sown in an ordinary greenhouse in the dull month of November; for I always sow at that time of the year in shallow pans, and thus get myriads of seedlings to dibble out into shallow boxes, or else into a frame in February, and from thence into the open ground in April. Perhaps so treated the seed organs are more perfectly fertilised than is the case with plants grown in pots under

glass. It would be a misfortune were it to be assumed that *Mimuluses* of the finest and most beautiful strains are difficult to raise from seed. *D.*

## Reports of Societies.

ROYAL HORTICULTURAL: June 9.

THE varied beauties and other charms of the floral display on Tuesday at South Kensington abundantly illustrated the fact that the attractiveness of different groups of flowers differs in kind as well as in degree. Delights of colour, of perfume, and of form, whether united, as in a *Maréchal Niel* Rose, or separated, as in the night-scented Stock, in many Tulips, Pansies, and other groups, are perfectly intelligible objects of desire; but the cultivation of such plants as *Arum crinitum*, many of the *Arisemas*, and, it must be added, not a few Orchids, must be explained by some totally different motive. Besides the great number of plants that are shelved at South Kensington and elsewhere as "of merely botanical interest," there are whole groups of others which, though enjoying the utmost popularity, can lay no claim to beauty of colour, of perfume, or even of form. "Bizarerie" seems to be the only term that explains the attractiveness of many plants in Tuesday's show. The attempt to get flowers as nearly black as possible is an instance in point. This shows itself in the hyperbolic application of names signifying black to dark purple Pansies, and to the reddish-brown labellum and lines on *Cypripedium barbatum*, as well as in the streaks on popular Tulips and in such oddities as *Iris susiana*, which might be described in the language of "the ring" as "white with black specks." The reptilian mottling of some of the *Stapelia*-like *Epidendrums*, &c., the metallic hues of some *Ixias*, and the glaring aniline hues achieved in some *Begonias* and *Pelargoniums*, and in the majority of *Masdevallias* and *Pyrethrums*, are also to a great extent "acquired" tastes (?). Looking, however, at the show as a whole, one can well see the charm of the Orchids as a class, and admire the success which has attended the artificial selection of *Begonias* for size and colour of flower. Though fewer in number and deficient in some types many of the individual Orchids shown were finer than those at the Conference. New sorts did not seem to endanger the pre-eminence of well-grown old favourites, such as *Lælia purpurata*, *Dendrobium thyrsiflorum*, *Cattleya Mossiæ*, *C. Mendellii*, and *C. Warnerii*; though among the *Cypripediums*, which were well represented, *superbum* and *nigrum* are names indicating undoubtedly fine strains of our old friend, *C. barbatum*, and the red-lined cup of *Anguloa Ruckerii sanguinea* is a welcome comparison to the clear-hued *A. Clowesii*. *Odontoglossum cordatum aureum* is "a thing of beauty" in lemon-yellow and green, and one can never tire in admiring the curiously long "tails" of *Cypripedium caudatum* and the fresh complexion and fine foliage of the hardy *C. spectabile*. The increase in the taste for simpler and more hardy plants is seen each year at Kensington in the care bestowed upon such plants as *Hemerocallis flava* or *Chrysanthemum frutescens* (of which magnificent specimens were shown from Mr. Brasse's garden at Preston Hall, near Maidstone), and so well repaid in colour by *Pæonies* and *Geum coccineum*. This last species affords rich hues not perhaps as yet obtained in any other flower, certainly not among the varied beauties of the *Begonias*. Several useful *Ajugas* and *Centaureas* were shown, and florists have done well to seize upon the rich purple of our native *Campanula glomerata*; but perhaps the greatest treat in simple colour was to see the magnificent *Papaver orientale* surpassed by *P. bracteatum*, and it in its turn yield a well contested triumph to *P. ioviolacratum*—certainly a king of Poppies. The delicately tinted Japanese *Pæonies* lack the fine contrast of the glossy black centre.

A medal was well earned by the diameter of 7½ inches reached in a *Begonia*, the varied hues, lemon, red, pink, orange, and white of this group being one of the most rapid achievements of modern floriculture, reminding us of Darwin's saying with regard to the possibilities in pigeons' feathers. It may, however, be doubted whether doubling has effected much gain in this group, or among *Pelargoniums* or *Violas*. Irises are unhappy plants to show in a cut state, as often also are growing *Adiantums*; but *A. Victoria*, *A. Raperi*, and *A. umbellum* made a pleasing show of the latter, while some large plants of *A. cucutatum*, grouped with *Pelargoniums* and club-moss were a tasteful contrast to the collection of slicks and Fuchsias sent from Chiswick.

## Scientific Committee.

E. S. Loder, Esq., in the chair.

## DENDROBIUMS, MALFORMED.

Dr. Masters reported upon the specimens sent to the last meeting. They had two supernumerary labella in place of the two extra usually suppressed stamens of the outer row. He also showed various malformed flowers of *Cattleya Mossiae* and *Lælia purpurata* from Mr. Douglas, with more or less regular flowers, some being binary in arrangement.

## LYCOPERDON, SP.

Mr. Murray pronounced the species sent to the last meeting to be *L. cæclatum*.

## CUCUMBER GUMMING.

He also reported on the Cucumbers sent to the last meeting. No trace of fungus or other cause could be detected.

## LILY OF THE VALLEY DISEASED.

He also reported on these, but the fungus was in too immature a state to pronounce upon it. He proposed cultivating it, and would report later.

## COCCI ON APPLE BARK.

Mr. McLachlan showed specimens, and raised the question as to how these insects, normally sap-loving, could live on dead bark. Mr. Pascoe remarked on the long periods many would exist and thrive though deprived of food.

## SCILLA, MONSTROUS.

Mr. Boulger exhibited a specimen of *Scilla* having flower-buds in the axils of the perianth leaves.

## MERCURIALIS, MONŒCIOUS.

Mr. Boulger showed specimens in which female flowers grew on the lower part and male peduncles on the upper.

## FLOWERS EXHIBITED.

Dr. Lowe showed a fine spray of *Melanthus major*, *Libertia grandiflora*, *Caccinia glauca*, *Grevillea sulphurea*, *Lynchnis alpestris*, *Achillea rupestris*, *Xerophyllum asphodeloides*. Mr. Loder exhibited five species of *Allium*, white and green-flowered. They were referred to Kew for names; also *A. Murrayanum*.

## AQUILEGIA CROSS.

Mr. A. Dean sent a flowering branch of a seedling raised from *A. chrysanth* crossed by a white garden variety. It was pink in colour and quite spurless.

## TULIP: PISTILLODY OF PERIANTH.

Rev. G. Henslow showed a specimen in which all the leaves of the perianth had coalesced, forming a thick green pistillate structure open on one side, the free margins alone being petaloid. The proper pistil and stamens were included, but more or less degenerate in character, the former being open down one side with abortive ovules. This monstrosity is described by Dr. Masters (*Teratology*, p. 302).

## MORCHELLA SP.

Mr. Smith sent drawings of two species. The one was from Blaydon, near Bristol, and was an enormous specimen of *M. Smitthiana*; the other was a small example of *M. gigas* from West Deeping, near Market Deeping. He adds that the species has only once before been found in Britain, and that it sometimes attains dimensions almost equal to *M. Smitthiana*—viz., a foot or more high.

## Floral Committee.

Present: Shirley Hibberd, Esq., in the chair, and Messrs. Kinghorne, Cannell, Laing, Herbst, Walker, Wilks, Fraser, Noble, Duffield, Pollett, H. Williams, J. O'Brien, E. Hill, H. Turner, Ballantine, Amos Perry, Hudson, and Baines.

The central stage was devoted on one of its sides to the rather numerous groups of Orchids of the amateurs and nurserymen, whose display equalled almost that seen at the late Orchid Congress, and in some things exceeded it in the size and beauty of the specimens shown—a result which may be attributed to the stimulus afforded by the monetary value of the different awards. Taking the groups noteworthy for their size and superiority from a cultural point of view, first we must name that of Messrs. F. Sander & Co., St. Albans, which was awarded a Silver-gilt Banksian Medal, and was also recommended for some special award in addition. The plants were arranged with Maidenhair Ferns and *Panicum variegatum*, in a succession of lines extending to a length of ten yards. Odontoglossums were largely represented—*O. citrosum*, *O. citrosum roseum*, both of which were seen in many beautiful specimens, as were *O. Alexandre*, *O. niveum*, *O. Pescatorei*, *O. Wilckeanum*, &c. *Cypripedium niveum* was a very charming panful of many plants, *C. Laurenceum* was likewise good. The *Cattleyas* formed the other striking feature, fine specimens of *C. Mossiae*, *C. purpurata*, *C. Mendelii* in several varieties, and *C. Acklan-*

*dia*. *Masdevallias* included *Harryana Arnoldiana*, a splendid crimson; *M. Harryana*, in varieties; *M. Schlimii*, and *M. Lindeni*. Other plants were *Zygopetalum Macleanii*, *Sobralia macrantha*, *Acrides* in varieties, and a *Dendrobium*. Messrs. F. Sander & Co. showed a group of the pretty *Aërides Ballantini*, which received from the judges special recognition.

Messrs. Heath & Son, Cheltenham, received a Silver Medal for a collection of Orchids, in which were noticed a fair-sized, well-flowered *Cattleya Skinneri Mossiae*, of good quality of bloom; *Acrides Fieldingi*, and *A. odoratum*.

The next largest group consisted of twenty-five Orchids, distinct, shown for competition in the open classes by Mr. H. James, the Castle Nursery, Lower Norwood, who obtained the 2d prize. His best plants were a good form of *Cattleya Mossiae* with pale flowers, a nice piece of *C. Mendelii*, the seldom-seen *Saccabium retusum*, with small flowers of white and lilac; *Cypripedium Veitchii* with five blooms; *Oncidium Harrisonii*, a slender growing species with yellow and brown flowers; *Dendrobium Bensonae*, a nicely bloomed dwarf piece; several *Masdevallias*, as *M. Lindeni* and *M. Harryana*, and the dwarf growing *Acrides japonica*, having white flowers spotted with rose-lilac. Mr. James was the only competitor in this class. For the competition with twelve distinct species of Orchids, open to men—1st, Mr. J. Cypher, Cheltenham, who had a capital lot of plants, consisting of an *Odontoglossum vexillarium*, a compactly grown specimen with highly tinted blooms; *Odontoglossum Alexandræ*, in variety of forms; a fine plant of *Oncidium sphacelatum*, with several large spikes; a *Lælia purpurata*, with thirty blooms; *Cattleya Mendelii*; a very superior *Cypripedium Hookeri*, bearing eighteen blooms; *Dendrobium thyrsiflorum*, with eight fine spikes, a nice panful of *Masdevallia Harryana*, *Cattleya Mossiae*, &c. The 2d prize was taken by Mr. H. James, Lower Norwood, who had fine *Cattleya Mendelii*, with twelve blooms; *C. Mossiae*, with twenty-four; *Anguloa Clowesii*, with eleven blooms, a capital plant; *Brassia verrucosa*, with fifteen spikes, and several others. Six Orchids, distinct, ourserymen.—1st, Mr. J. Cypher, who had *Masdevallia Harryana* of a brighter tint than usually seen; a strong plant of *Anguloa Clowesii*, with six blooms; *Cattleya Mendelii*, having thirteen large and beautiful blooms; *Dendrobium thyrsiflorum*, a fresh looking plant of four large spikes of bloom. 2d, Mr. H. James, whose exhibit was richer than the other in *Cattleyas*; and an *Epidendrum vitellinum majus*, well bloomed. For fifteen species of *Odontoglossum*—1st, Mr. H. James, with *O. cordatum* with four spikes; a fine piece of *O. citrosum*, another of *O. polyanthum*, the neat growing *O. Lehmanni*, *O. Alexandre*, with a spike of particularly massive blossoms; and another of *O. Pescatorei*. For the best six *Cattleyas*, or *Lælias*, nurserymen—1st, Mr. Cypher, who had *Cattleya Sanderiana*, with a spike of three immense blossoms; *C. Mossiae*, of fine form; *C. Mendelii* and *Lælia purpurea*. 2d, Mr. H. James, whose *Cattleya Mossiae* lilacina was a delicately tinted flower; others were *C. Warneri*, *C. Mendelii*, and *C. intermedia*. Cut blooms were exhibited to the number of twelve by Dr. Paterson, Fernfield, Bridge of Allan, 1st; 2d, Mr. H. James, in the open class.

## ORCHIDS—AMATEUR CLASSES.

Twelve distinct.—1st, H. Little, Esq., Hillingdon Place (gr., Mr. F. J. Hill). In this collection *Odontoglossum Roezlii* had fifteen blooms, and was a beautiful mass; *Aërides crispum* had four medium spikes; a *Lælia purpurata*, with three large blooms; *Cattleya Mossiae*, with fifteen blooms of a rich colour; a well flowered *Dendrobium Dalhousianum*, and *Cypripedium barbatum superbum*. De B. Crawshaw, Esq., Rosehill, Sevenoaks (Mr. S. Cooke, gr.), was 2d, with *Cattleya Mendelii*, a good piece with eight blooms—an extra fine variety; *Vanda suavis*, with two stout flower-stalks, well furnished; the rare *Cattleya intricata*, a striking flower, said to be a hybrid between *C. amethystina* and *Lælia elegans*; a fine *C. Warneri*, of splendid colour; *Epidendrum vitellinum majus*, and other good things.

For the six best Orchids, distinct.—1st, F. A. Philbrick, Esq., Oldfield, Bickley (gr., Mr. H. Heims), in whose exhibit the *Odontoglossum vexillarium*, with nine sprays of bright hued blooms; *Phalenopsis grandiflora*, *Cattleya Mendelii*, of good form; *Cypripedium barbatum superbum*, with twenty-two blossoms; *Lælia purpurata*, bearing twelve blooms; and the beautiful *Masdevallia Harryana sanguinea* were of the finest quality. H. Little, Esq., was 2d; his *Cypripedium Laurenceum*, *Cattleya Mossiae*, a good dark variety of *Lælia purpurata*, were noteworthy specimens. The 3d prize was won by R. R. Hyatt, Esq., Leigham Court Road, Streatham (gr., Mr. A. Luff).

The best six *Cattleyas* were shown by De B. Crawshaw, Esq., whose plant of *Cattleya Warneri* was so good that it was awarded a Vote of Thanks; the others were forms of *C. Mendelii*, *C. Mossiae*, and *C. gigas*, 2d, H. Little, Esq.

The prize of a Silver Banksian Medal for the finest specimen Orchid was taken by Mr. Evans, gr. to J. S. Hodgson, Esq., Lythe Hill, Haslemere, with a very fine *Odontoglossum vexillarium*.

F. A. Philbrick, Esq., was 1st for six cut blooms of Orchids; Mr. Evans was 2d, and Dr. Paterson 3d.

Mr. John Day, Tottenham, showed *Odontoglossum hybridum Dayanum*, a flower possessing a light pink ground colour, the segments having white margins and chocolate spots. Dr. Wallace, Chelmsford, showed a very fine deep rose-tinted *Odontoglossum vexillarium* var. *purpureum*.

From Sir N. M. de Rothschild's gardens, Tring Park, came *Cattleya Wagneri*, a white variety with deep yellow stain in throat, lower half of lip white, with petals and sepals as well as lip prettily frilled. *C. gigas imperialis*,

imported September, 1884, had a very large richly coloured lip, sepals and petals rosy-crimson—a large showy bloom. A Vote of Thanks was accorded for these two plants.

Messrs. J. Laing & Co., Forest Hill, had a very fine group of tuberous *Begonias*, including the best of the older varieties and their finest novelties. *Princess Victoria* is a bright scarlet, changing at the centre to white—a single flower; *Globosa* is a beautiful salmon-coloured duplex flower, very full; *Marquis* of Stafford is another good double, of a scarlet colour; *Lillie* is light flesh colour, that becomes white in the middle—a very pretty full flower; *Amy Adeock* is another scarlet, having the centre petals white. A Silver-gilt Medal was awarded for the above group of these now popular flowers.

A few cut blooms of single and double-flowered *Begonias* were shown by Mr. Cannell, Slough.

From the nurseries of Mr. C. Turner, Slough, came some stands of capital *Maréchal Niel* Roses, and three stands of cut blooms of *Pyrethrums*. Messrs. J. Veitch & Sons, Chelsea, had a very pretty *Gloxinia* named *Marchioness of Abergavenny*, a white ground erect variety, densely spotted with crimson; *Lælia Canhamii* *Cattleya Mossiae*, and *Lælia purpurata*, a flower having white sepals and petals and a deep purple lip, which has the peculiar attraction of a thin white margin; *Rhododendron Manglesii*, mentioned in the *Gardeners' Chronicle*, p. 730, June 6, 1885; *Chionanthus retusa*, a white-flowered hardy shrub, the flowers in panicles, growing out of the old wood. Miss Jekyll, Mumstead Place, showed a *Saxifraga* plant, *Carpenteria californica*, with flat white blooms 2 inches in diameter, and yellow anthers, to which a Vote of Thanks was accorded. Mr. Cummins, gr. to H. Snee, Esq., The Grange, Wallington, showed *Galeandra nivea*; and Mr. W. Bull, Chelsea, had *Bilbergia nobilis*, a grand habited plant, with broad grey-spotted recurved leaves and rosy-pink bracts on a drooping spike; the flowers were not open.

From Mr. Waterman, who grows these plants uncommonly well, came six *Chrysanthemum frutescens* of a large size, and white with bloom. A Silver Medal was awarded.

## LANCASHIRE SHOW TULIPS.

The collection of florists' Tulips sent by Mr. S. Barlow from Manchester was one of the best seen in London for many years past. The flowers were very young, so much so, indeed, that when the wooden crinolines placed within the flowers to assist them to expand were removed, a number of them closed up directly. The great hindrance to the collection being so effective as Mr. Barlow could have desired is that the flowers were fully a week too young; they were buds, not flowers; the bases of them were cloudy or creamy for want of a few more days of growth and bleaching; the green in the outer petals had not grown out, while the outer petals were also shorter than the inner ones; and these defects constituted all the difference between a perfectly developed flower and the same flower five or seven days earlier in point of time. In a communication from Mr. Barlow which accompanied the Tulips he states:—"In reference to this want of full development in the outer petals being the main cause of inferior effect, I will mention a remarkable case in point. Nearly thirty years ago I won the premier prize for the best flower selected from the whole exhibition at the Great South Lancashire Tulip Show with that old Dutch sort, 'La Vandikken.' When this flower opened for the first time, the inner petals expanded, finely developed, and grandly flamed, the marking being perfect, while the outer ones looked ridiculous by contrast, being only half the height of the inner ones. I thought the outer petals had been half-killed by the frost, but to my astonishment they grew slowly day by day until in about a week they were of equal height, and almost of equal quality to the inner petals, and the flower won the premier prize as the best flowered in any class. If that flower had been exhibited in its early stage of growth, as most of my collection is, it would have disqualified any stand. I mention this as an illustration."

The collection staged by Mr. Barlow included about sixty flowers; the most striking were:—Flamed bizzars: Masterpiece, Nonpareil (Ashmole), Lord Stanley, Dr. Hardy (Storer), Prince of Wales, Sir J. Paxton, Ajax, Storer's Orion, and a fine seedling by Parker. The best feathered bizzars were:—General Grant (Hepworth), Masterpiece, William Wilson, Albert (Ashmole), and Sir Joseph Paxton. Flamed roses: Sarah Heady, Mrs. Bright (Hepworth), brilliant in colour; Mabel (Martin), and Old Aglaia. Feathered roses: Modesty, very fine in colour; Lady Wilton, (Martin), and Charmer (Martin). Flamed byblomems: Samuel Barlow (Hepworth), William Parkinson (Hepworth), Friar Tuck (Storer), Duchess of Sutherland, and Talisman. Feathered byblomems: Bessie (Hepworth), William Bentley (Groom), Mrs. Jackson (Jackson), Seedling 101 (Martin), Maid of Orleans (Gibbons), and Violet Aimable. The breeder varieties formed nearly one-third of the whole, and they were much admired for their striking colours. Of bizarre breeders there were Seedling 27 A. (Hepworth), Excelsior (Hardy), and Horatio (Hardy). Rose breeders: Annie McGregor, Mrs. Barlow, Lucretia (Martin), and Seedling 16 (Hepworth). Byblomen breeders: Samuel Barlow (Hepworth), Alice Grey (Walker), Nimbus (Hardy), Glory of Stakehill (Ashmole), and Delicata (Eardman). First-class Certificates of Merit were awarded to flamed bizzars Prince of Wales and Orion, feathered bizarre William Wilson, flamed rose Mrs. Bright (Hepworth), feathered rose Modesty, and flamed byblomen Samuel Barlow. The stand was also awarded a Silver Medal.

Another important matter was referred to by Mr. Barlow, namely, his finding in many usually fine flowers "that the pollen from the anthers has liquefied (?) and run upon the stamens, thereby tinging them more

or less. This is notably seen in Hardy's Excelsior, both in the breeder and in the rectified state; out of some forty blooms I have scarcely one in a pure state, although I have won with the breeder, perfectly pure, at least a score of times in stands and classes. This, I think, is owing to the slow growth or development of the flower during the long cold May. The anthers being protected have developed more rapidly than the petals, with the result that in very many cases the pollen from the anthers is ripe when the flower first opens, and has disfigured the stamens. A very notable illustration of this is shown in feathered bybleimen Mrs. Jackson, which I send to show its wonderful colour—black as the raven's wing, darker and more glossy than the once famed Louis XVI. The flower from this bulb was perfectly pure two years ago (I did not through severe illness see my bloom last year); but it is now stained all down the anthers. This flower, raised by Mr. David Jackson, of Middleton, has never been in the breeder state; unlike 999 out of every 1000, its first bloom was a grand black feathered one, so pure, so fascinating in colour, as to be a perfect surprise.

"In judging of my exhibition of Tulips these things should be duly considered, and allowance made for them. Should there be any spark of the old Tulip love of yore lingering among my Southern brother florists, I shall be glad to assist in kindling it into flame, by helping them to form a collection which in quality shall far exceed the flowers which gave so much delight to growers in the palmy days of Groom, Goldham, Lawrence, Dr. Sanders, and other renowned Tulip fanciers."

#### HARDY FLOWERS.

Hardy flowers were decidedly in the ascendant on Tuesday at South Kensington. Foremost was Messrs. Kelway & Son's collection of cut Pyrethrums from their Langport nurseries—four boxes of double flowers, and five of single varieties, set up in little groups of one variety, and displayed to the best advantage. It is not to be wondered at that many of the visitors to the "Inventions" took them for Chrysanthemums. A few of the best double varieties will be found in J. N. Tweedy, floribundum plenum, Rubens, Marquis of Salisbury, Herman Stenger, Princesse de Metternich, Progress, Lady Godiva, Emile Lemoine, and Fulgens plenissimum. The leading single varieties—and some of them are very richly coloured—were Bajanda, Banquo, Cerinthus, Gedboisi, Druis, Chios, Vestalis, Abnaozor, Eurybates, Bactius, &c. Double Pyrethrum Melton, a large, full, and rich-coloured variety, of a bright carmine-crimson hue, is a good acquisition to this popular class of flowers. In addition, this firm had very fine blooms of Papever bracteatum, Trollius europæus, various Irises, Pæonies, &c.

Messrs. James Veitch & Sons, of Chelsea, had a collection of cut flowers, of hardy Rhododendrons, an admirable lot, comprising Sir Joseph Whitworth, Madame Carvalho, Kate Waterer, Lord Wolsley, Mrs. John Clutton, James McIntosh, Concessum, Meurice, and Nero.

From Messrs. Cross & Steer, nurserymen, Salisbury, came a basket of Pink Tea Fairy, a small-flowered pure white variety, the blossoms much frimbriated, very free, and likely to be very useful for cutting from. A yellow-flowered Carnation named Pride of Penshurst came from Mr. Jennings, gr. to Leopold de Rothschild, Esq., Ascott, Leighton Buzzard, a good grower and very free, the flowers pale yellow. Messrs. Heath & Son, nurserymen, Cheltenham, had a yellow-flowered variety also, named Daisy Gastrell, with well formed, rather small pale blossoms.

From the Royal Nursery, Slough, came boxes of cut blooms of double Pyrethrums, set up in bunches of eight or nine flowers, backed by their foliage, in the way in which Mr. Turner sets up single Dahlias. It was a useful practical lesson in the art of staging flowers of this character. The leading varieties were Marchioness of Lorne, Prince Teck, very fine; Versailles Defiance, Boule de Neige, Princess Alexandra, J. N. Tweedy, La Vestale, Charles Baltet, and Flora.

Messrs. Paul & Son brought from their Broxbourne Nurseries a large group of hardy plants, as well as cut flowers, including Aquilegias, Pyrethrums, and other things of a similar character, admirably illustrative of the wealth of hardy flowers in bloom at this season of the year. Messrs. Hooper & Co., Covent Garden Market, had a similar group, including cut specimens of Irises, Poppies, Pyrethrums (single and double), Ixias, and Sparaxis, &c. Mr. J. Vander Rees, Exotic Nursery, Tottenham, had a similar collection of an equally interesting character. Mr. T. S. Ware, nurseryman, Tottenham, had a very large and representative collection, occupying a large space of slating, all hardy plants, including Pyrethrums, Aquilegias, Irises, including the singular I. Susiana, I. germanica, I. Gracchus, with yellow upper segments, rest of flower white, striped purple; Campanulas, Poppies, &c. Messrs. Barr & Son, King Street, Covent Garden, had a smaller but useful collection, including fine collections of Ixias and Sparaxis of the leading varieties.

The collection of cut Verbenas which Mr. W. H. Stacey brought from Dunmow, was greatly admired, for the bunches of trusses of bloom were wonderfully fine. Fairy Queen, French-white, with a slight white centre, and round it a broad irregular band of satiny-rose, pip large, well formed, and stout; and Distinction, a very fine striped variety, were considered to be the best. The following varieties were in the finest condition:—Hamlet, crimson, very fine; Othello, shaded crimson: Purity, pure white, the *beau idéal* of what a white Verbena should be; Lilacina, pale lilac, very fine; and Ruby, rich ruby-crimson. If such fine trusses of flower can be produced on plants of Verbenas under glass, then their more extended culture in this way should be enforced. One thing is certain, Mr. Stacey is determined that the

Verbena shall not suffer for lack of some one to present it in a very attractive form.

#### MISCELLANEOUS GROUPS.

A charming bank of plants was arranged by Messrs. Hawkins & Bennett, Lily Nursery, Twickenham, and commanded general admiration. At the back was a line of tall-growing pink Ivy-leaved Pelargoniums; some very fine plants of Adiantum cuneatum were embedded in white and scarlet zonal Pelargoniums, and edged with a line of the common Selaginella; at each end of the bank was a diamond, composed of bunches of scarlet, white, pink, and salmon zonal Pelargoniums. Mr. J. Wiggins, gr. to W. Clay, Esq., Kingston-on-Thames, had a collection of seedling show and decorative Pelargoniums—a very good lot, the best being Vanity, white, with slight carmine spots, large, and free; Titania, white, dark top, petals margined with deep lilac and white; Ruby, bright salmon-carmine, a good showy variety; and Rose Queen, rich rose-pink lower petals, dark top petals, margined with fiery carmine—a good form. From the gardens of the Royal Horticultural Society came a large collection of Fuchsias, of which the Floral Committee will have to take account during the summer.

#### FIRST-CLASS CERTIFICATES.

To Messrs. J. Veitch & Sons, for Lælia Canhami, Rhododendron Manglessii, and Gloxinia Marquis of Abergavenny.

To Mr. W. Bull, for Bilbergia nobilis.

To Messrs. Paul & Son, The Old Nurseries, Cheshunt, for Saxifraga latifolia superba.

To Messrs. F. Sander & Co., for Aërides Ballantynei.

To Messrs. J. Laing & Co., for Begonia Marquis of Stafford, Globosa, Princess Victoria, and Lillie.

To Mr. J. Wiggins, for Pelargonium Variety.

To Mr. T. Ware, for Iris germanica, Gracchus.

To Mr. Gordon, for Tree Pæony Snowball.

To Mr. Stacey, for Verbenas Fairy Queen and Distinction.

To Messrs. Kelway & Son, for Pyrethrum Melton.

To Mr. S. Barlow, for Tulips Modest, Samuel Barlow, Mr. J. Bright, Princess of Wales, Orion, and W. Wilson.

#### Fruit Committee.

Present: Harry Veitch, Esq., in the chair; and Messrs. Lyon, Willard, Lane, J. Lee, A. Sutton, W. Paul, Woodbridge, Blackmore, Haywood, G. Paul, G. Bunyard, Webb, and Miles.

Mr. Herrin, gr., Chalfont Park, showed La Favorite Melon; and Mr. Jas. Corbett, Fawley Park, Melon Royal Regatta. Mr. Gilbert showed Broccoli Gilbert's Queen, large and firm, and seemingly well protected from the weather.

#### FIRST-CLASS FRUIT AND VEGETABLE CERTIFICATES.

To Mr. Gilbert, for Gilbert's Queen Broccoli.

To Mr. Herrin, for La Favorite Melon.

#### WALTHAM ABBEY HORTICULTURAL: June 4 and 5.

THE show, which was held on the above days at this quaint old Essex town, was a decided success, both as regarded the extent of the display and the great merit of the productions forthcoming. In the plant classes this was very noticeable, some of the specimens being unsurpassed by any that have been exhibited in or about London for some time.

#### OPEN CLASSES.

For twelve stove and greenhouse plants in bloom Mr. Donald, gr. to — Barclay, Esq., Leyton, took a decided lead, with large and beautifully flowered examples, the best of which were Darwinia tulipifera, profusely bloomed, the flowers much finer coloured than usual; D. Hooker, equally well done; Statiche profusa, Aphelexis macrantha purpurea, Ixora Fraseri, and Borenia pinnata, all in fine order and quite fresh. Mr. James, Castle Nursery, Norwood, who was 2d, also had a well-managed group.

With twelve fine-foliage plants Mr. Donald and Mr. Rann, gr. to J. Warren, Esq., Handcross Park, Crawley, had a close run. Mr. Donald taking 1st, with a big well-grown collection, the most noticeable amongst which were Croton angustifolius, C. pictus, Cycas revoluta, Latania borbonica, and Chamaerops humilis, which, in the size and condition it was here brought out, is one of the most desirable Palms in cultivation. Mr. Rann's best plants were Kentia Belmoreana, Croton Queen Victoria, C. multicolor, and Cycas circinalis.

With ten Ferns Mr. Rann was well in front, staging, along with others, good examples of Gleichenia repens, G. Mendelii, Davallia Mooreana, some 8 feet in diameter, and Lomaria Vroomii. Mr. Donald, who was 2d, also had a clean fresh group.

For six Crotons the 1st prize went to Mr. Rann, who staged medium-sized examples; the same exhibitor being likewise 1st for six Azaleas.

In the nurserymen's class for the best group of new or rare plants Mr. B. S. Williams, Victoria Nursery, had 1st honours for a beautiful collection; 2d, Mr. James.

#### GROUPS OF PLANTS.

For the best and finest group of plants Messrs. Paul & Son, Cheshunt, were 1st, with a large and varied collection, consisting of Rhododendrons, bushes and standards; hardy Azaleas, Roses in pots, in the form of bushes and standards, flowered in the way usual with

the Cheshunt plants; associated with these were hardy herbaceous and alpine plants, making altogether an imposing display. Messrs. J. & J. Hayes, Edmonton, were 2d, with a large and beautifully flowered group, comprising Pelargoniums, most of the leading market kinds; Cinerarias and herbaceous Calceolarias, for both of which showy species of plants Messrs. Hayes have done so much to bring them up to the present high standard, alike remarkable for distinct colours and profuse habit of bloom. Mr. B. S. Williams was 3d, having flowering and fine-leaved plants, Orchids, Nepenthes, and Sarracenias. Mr. Rumsey, Waltham Cross, had an extra prize in the same class for a varied and well selected group—hardy shrubs, flowering and others; greenhouse plants, Ferns, and a beautiful lot of cut Roses. Messrs. Cutbush, Highgate, likewise received an extra prize in this class for a miscellaneous collection of stove and greenhouse flowering and fine-leaved plants.

#### HERBACEOUS PLANTS.

Twenty-five herbaceous plants.—1st, Messrs. Paul & Son, who had a beautiful lot; 2d, Mr. Gilks.

Six Pelargoniums.—1st, Messrs. Hayes, showing medium-sized, beautifully flowered examples.

For the best group of market plants grown in 6-inch pots Mr. J. Rochford, Cheshunt, took 1st.

#### AMATEURS' CLASSES.

In the amateurs' division, with five stove and greenhouse plants, Mr. Keers, gr. to F. Carter, Esq., had 1st, his best plants being a beautifully flowered specimen of Clerodendron Balfourianum and Trachelospermum jasminoides.

For five ornamental plants.—1st, Mr. Turk, gr. to W. Melles, Esq., who, in a nicely managed group, had good specimens of Phoenix pumila and Cocos Weddelliana.

With ten Orchids Mr. Gilks, gr. to A. Borthwick, Esq., Walthamstow, was 1st, staging a meritorious group, the best of which were a very handsome form of Lycaste Skinneri bearing a score of flowers; it is one of the most distinct varieties we have seen, the lip is milk-white, with a narrow well-defined border of deep crimson; Cymbidium Lowii with very long spikes, C. eburneum, Lælia purpurata, Oncidium macranthum, and a fine Odontoglossum Hallii. Five Orchids.—1st, Mr. Gilks, with nicely flowered plants, the most noteworthy being a well-bloomed Masdevallia Lindenii and Lælia purpurata.

For ten Caladiums.—Here Mr. Turk had 1st honours, staging a good selection of these effective plants thoroughly well grown, the best being Mons. A. Hardy; Candidum, Luddemannii, Pyrrhus, Mithridate, Comtesse de Maille, Artémise and Herold; 2d, Mr. Riding, gr. to R. Edwards, Esq.

For twelve Roses in pots.—1st, Mr. Rann.

#### SCOTTISH HORTICULTURAL ASSOCIATION.

THE monthly meeting of this Association was held on Tuesday, June 2, at 5, St. Andrew Square, Edinburgh. One of the Vice-Presidents, Mr. R. Lindsay, Curator of the Royal Botanic Garden, occupied the chair. Between forty and fifty gentlemen were present. A number of rare and beautiful flowers and plants were exhibited by various members of the Association. There was a very beautiful show of Pansies from Messrs. Dicksons & Co., one of which, named Mrs. J. Fleming, received the award of a First-class Certificate from the Flower Committee.

A paper was read by Mr. Alexander Hutton, F.L.S., Arbroath, on "The Lily and its Allies," in which the characteristics of the botanical order Liliaceæ were fully explained. The Amaryllis family was afterwards referred to as one of the nearest allies. The history, geographical distribution, and economic uses of many of the Lilies were given, special reference being made to the florists of Palestine and Japan, which are so rich in that family of plants. The part played by insects in the fertilisation of the Lily family was referred to, several curious instances being mentioned, among which the Yucca was named as being associated with a small moth (Protonuba yuccasella), the existence of the one being entirely dependent on the other. Concerning the Hyacinth and Tulip, reference was made to their commercial importance, and to the extensive trade carried on between Holland and Great Britain in these bulbs.

In connection with the Amaryllis group, the history of the American Aloe was sketched, and it was pointed out that this has no connection with the Aloe of the Cape of Good Hope, as the latter belongs to the Lily family, the former being an Amaryllid. In dealing with the Narcissus, an account of that interesting plant was given, dating its history back from the classic days of Greece and Rome. The arrangement and nomenclature of that popular flower had been much simplified by Mr. Baker, of Kew Gardens, and also by the Daffodil Conference of last year.

Dr. Sidney, 20, Heriot Row, exhibited a seedling Chestnut, grown in a glass vessel, and a number of ornamental vases, in which were growing Beet and Carrot from shed tops; these were placed in water and covered with moss, and were highly ornamental, and as they were grown in a room they could be grown by any one. It was explained by Mr. Lindsay that some of them were grown by patients of Dr. Sidney.

From Messrs. T. Methven & Son came a spike of Dra cœna indivisa; Mr. Howie, Inch House Garden, a collection of beautiful seedling Begonias; Mr. Air, 3, Wilfred Terrace, Narcissus poeticus with twin flowers; Mr. Chapman, Easter Duddingston Lodge, a collection of hardy flowers; Mr. Pealing, florist, Logie Green, two bunches of Lily of the Valley—one of the ordinary form, the other with the interior of the flower beautifully spotted with pink.

## MASSACHUSETTS HORTICULTURAL.

BOSTON : May 9.—At the free weekly exhibition, held in the Society's large hall, there was a large and good display of Pelargoniums, Azaleas, Orchids, wild flowers, &c. David Allan, gr. to R. M. Pratt, staged the following Orchids, viz., Cattleya Mossie, C. gigas imperialis, Oncidium sphecelatum, and Dendrobium japonicum var. robustum, and cut flowers of Lælia purpurata, L. majalis, Cattleya Mendellii, C. labiata Gaskelliana, Dendrobium devonianum, and Cypripedium niveum. From the above contributor came a large collection of Auriculas. E. Sheppard exhibited Lælia purpurata and a fine plant of Dendrobium thysiflorum, also a large collection of Pelargoniums. Mrs. P. D. Richards, West Medford, Mass., showed an interesting collection of wild flowers. C. M. Hovey showed some very fine Azaleas, and was awarded 1st and 2d prizes for single plants with Madame Miellet and Cheloni. Several contributors showed large displays of cut flowers. In the vegetable department there was a good display of forced Cucumbers, Mushrooms, Tomatoes, &c. From Geo. Hill came a large dish of well-grown Sharpless Strawberries.

May 16.—At the exhibition to-day B. Moore exhibited three vases of Roses and large plants of H.P. Roses, and another plant in bloom at four months from seed. Edwin Fewkes showed Bougainvillea glabra and hybrid Primulas. Miss A. Kenrick contributed Magnolia Lenne, M. Soulangeana, and M. speciosa.

May 25.—Among the most interesting exhibits made to-day was a collection of flowers of various species of Apples from Northern Asia, exhibited by Jackson Dawson, gr., Arnold Arboretum, namely, *Pinus communis*, fl.-pl.; *P. toring*, and var. *P. baccata*, and the varieties *rosæ*, *præcox*, *cerasifera*, and two others; *P. malus spectabilis*, *P. prunifolia*, *P. floribunda*, and *P. coronaria*, fl.-pl. Mrs. P. D. Richards again made an excellent display of wild flowers not shown before this season; Mrs. F. B. Hayes, Rhododendron Madeni, R. nobile, R. Countess of Haddington, R. roseum, and R. Hookeri; also *Malus floribunda*, and a variety of *Violas*. *F. A. De Mar*.

## BATH AND WEST OF ENGLAND AGRICULTURAL : BRIGHTON MEETING.

THE classes open for competition in the horticultural department of the above Society's show were fairly attended, and the exhibits were good in quality. The prizes for a group of Orchids did not bring so many competitors as one might have expected, owing most probably to the Orchid show at South Kensington being held at the same time. The 1st prize, £15, was taken by Mr. Meachin, gr. to Captain Armstrong, Withead, Sussex, with some very nice well-grown plants, the best of which were *Aërides Fieldingii*, with three spikes; very good *Vanda tricolor*, *Vanda suavis*, good; two pretty *Cypripediums*, and several meritorious *Odontoglossums*; Mr. Martin, of Hurst, being 2d, with a very creditable lot, though smaller.

A cup or money, value £5, for the best collection of fruit, was taken by Mr. A. Waterman, gr. to H. A. Brassey, Esq., M.P., Preston Hall, Kent, with a very good collection; Messrs. T. Rivers & Son, Sawbridge-worth, Herts, being 2d, with a fine even lot.

In the class for the best two baskets of Strawberries, the 1st prize, £3, was taken by Mr. Vert, gr. to Lord Braybrooke, Audley End House, Saffron Walden; 2d, Mr. Waterman, gr. to H. A. Brassey, Esq., M.P.

Messrs. Smith & Son, Worcester, showed a fine collection of specimen Clematises, in which we noticed two new varieties, very fine, viz., Countess of Lovelace, and Venus Victrix; Enchantress was also good, the whole being remarkably well grown.

Messrs. J. Cheal & Sons, Lowfield Nurseries, Crawley, Sussex, had a fine group of hardy Rhododendrons, the best of which were Lord Wolsley, The Bride (pure white, new), Charles Noble, Ellen Waterer, Purity, John Waterer, and Mrs. W. Agnew.

The same firm showed a good group of hardy Azaleas; also a collection of cut blooms of hardy perennials, and a collection of cordon fruit trees, for which this firm has long been famous, consisting of Apples, Pears, Plums, and Cherries. Mr. Joseph Cheal gave a short and interesting lecture on their growth and treatment.

Mr. Balchin, nurseryman, of Brighton and Hassock's Gate, showed a very fine miscellaneous group, arranged with great taste, the most prominent plants of which were Yuccas, Palms, Dracænas, Ferns, Ericas, Orchids, a large plant of *Statice imbricata*, well flowered, and a grand plant of *Platynerium alcinore*, also the pretty blue *Leschenaultia biloba major*, which should be grown by every lover of plants.

S. Warren, Esq., of Handcross Park, Crawley, showed a fine collection of stove and greenhouse plants, consisting of Crotons, Palms, Azæas, Roses, and other plants, all well grown and perfect.

Messrs. Laing & Co., Forest Hill, sent a collection of Begonias (double and single), shown in their usual form.

Mr. Miller, of Worthing, exhibited two boxes of double and single Pyrethrums, which were very much admired.

CORYDALIS BIGELOWI.—Mr. Burbidge sends us flowers of this *Corydalis*, one of the finest of its class, some 18 to 24 inches high with much cut foliage, and leafy racemes of purplish violet-spurred flowers, each about 1 inch long.

## CLOSE-FERTILISATION OF ORCHIDS.

APROPOS to the subject of the Fertilisation of Orchids, perhaps it would not be amiss to allude to some discoveries which tend to show that intercrossing is not so advantageous as has been supposed, and that cleistogamy (close-fertilisation) sometimes occurs in this "stronghold" of cross-fertilisation.

A paper read at the Linnæan Society last December on "Contrivances for Insuring Self-fertilisation in some Tropical Orchids," by Mr. H. O. Forbes, seems worthy of some more general notice. As the order Orchidaceæ is looked upon by some as a sort of stronghold of the theory that adaptations to insect agency are for the purpose of securing some sort of advantage to the species by intercrossing. The author, however, after calling attention to the general fact, as observed by himself in Portugal and in the tropics, that Orchids especially adapted for insect agency are to an enormous extent utterly barren (not 2 per cent. of the flowers in one case being fertilised), described several species which exhibit remarkable adaptations for securing close-fertilisation, and in so doing more or less prevent intercrossing, and yet produce abundance of seed.

The appearance of his paper would seem to afford an opportunity for reopening this subject, and I propose making some observations upon it.

Mr. Darwin was "much surprised" at the close-fertilisation of the Bee Ophrys, and remarks in his work, *The Fertilisation of Orchids*, that "Nature, if I may use the expression, seeing that the Fly and Spider Ophrys were imperfectly fertilised and produced few seed-capsules . . . changed her place and effected complete and perpetual self-fertilisation in order that more seeds might be produced." He observed that the contrivances are still present which are utilised in other species, e.g., viscid disc, depression of caudicle, &c., and thereby inferred that they are "assuredly adapted to give an occasional cross with another individual; and the safest conclusion, as it seems to me, is, that under certain unknown circumstances, and perhaps at very long intervals of time, one individual of the Bee Ophrys is crossed by another."

This sentence and another—that "Nature abhors self-fertilisation"—I believe to have given rise to nearly as widespread erroneous an apprehension as that "Nature abhors a vacuum." I know nothing in the nature of plants, at least, to justify this *à priori* assumption, and the large number of cleistogamous flowers now known to exist, including one described by Mr. Forbes in *Orchids*, as a silent protest against the notion. Mr. Darwin repeatedly spoke of the injuriousness of self-fertilisation in his work on *Cross and Self-fertilisation of Plants*, but as far as I know, he gave no experimental grounds for its justification. On the contrary, his own experiments with *Mimulus*, e.g., *Hero*, *Dianthus*, &c., went a long way to refute it. I combated this view in 1877, and have seen no reason to change my opinion since then; and the fresh discoveries of Mr. Forbes is a corroboration, as he was good enough to observe of my conclusions. As the latter, however, have been misstated, and I think misunderstood, I should like to restate them, as they have now received a remarkable confirmation where, perhaps, many would have least expected to find it.

When we speak of a "benefit" or "injuriousness" accruing to plants, we ought to attach very definite meanings to those words. Now, as far as I can make out from Mr. Darwin's use of the latter term, he meant that close-fertilisation brought about some sort of physical weakness, so that plants perpetually so fertilised would die out unless re-crossed from time to time. I repeat, this is an *à priori* assumption, which has never been verified experimentally. On the other hand, as to the word "benefit," I do not see how we can recognise more than two "ends" in plant life, viz., self-preservation, and the production of numerous healthy offspring; and the question is, Which answers best—intercrossing or self-fertilisation? I must refer any one interested in this question to the details given in my paper on "Self-Fertilisation" (*Trans. Linn. Soc.*, vol. i., p. 17, 1879), where it is shown—keeping these two ends solely in view—that self-fertilising plants are incomparably the better off. What "good," then, does intercrossing? Avoiding the word "good," we may get a more satisfactory answer to what are the effects or results of intercrossing. Comparing plants with flowers adapted for intercrossing with allied species adapted for self-fertilisation, it will be found that the

former are (speaking generally) larger plants, are more often perennials, and have "finer" foliage, and more "handsome" flowers; but "finer" and "handsome" are merely subjective impressions, and are of no account to the plant itself, hence, to the horticulturist, the value of intercrossing is untold; but to aid in the struggle for life, the dependence upon insects is as much a source of embarrassment as a want of self-reliance is to a man who desires to get on in his struggle for life. Of two plants, both structurally adapted to insects, but one more favoured by them than the other, as a coloured variety over a white one, then, of course, the latter, if it cannot propagate vegetatively, stands a fair chance of dying out; but if it can acquire self-fertilising properties, as so many have done—and I have shown that cleistogamous flowers are adaptations from ancestral insect-visited flowers—then they, so far from being injured thereby, acquire an ascendancy over their still visited allies which is perfectly astounding—as Mr. Darwin proved in the case of *Hero Mimulus* and *Dianthus*. Thus it is, as Mr. Forbes has now shown, with Orchids. He examined them in many situations—dense forests and in open ground, in sun and in deep shade, and "invariably found that a very small proportion produced fruit."

The first self-fertilising form which he described is one of *Phaius Blumei*, of 150 flowers, of which there was not one that was not self-fertilised. There are two forms—one in which the rostellum is well developed, but the pollinia, bathed in a profuse amount of fluid secreted by the stigma, "avalanches down," obliterates the intervening rostellum, and emits the pollen tubes over its edges. In a second form the rostellum is rudimentary, the anther is at first terminal and erect; it then rotates forward through 90°, when it occupies the normal position, as in the previous form. It then continues to rotate through 70° more till it reaches the fluid emitted by the stigma. This takes place in the bud, so that before the flower opens the pollinia are immovable. Similarly *Spathoglottis plicata* is completely fertilised while in bud, yet the flower opens afterwards. Here, then, we have two cases where cleistogamy is not yet reached, though the processes approximate that condition. In *Arundina speciosa* the rotation of the pollinia continues till they are actually thrust down the throat-like stigma, which, as the author says, "swallows them." Occasionally they fail to rotate, and then the flowers remain unfertilised. *Eria* (?) *flavescens* behaves very much like *Ophrys apifera*, only the labellum and sepals close over the stigma and shut in the pollinia fixed to the latter. A very nearly related species is not self-fertilised, and rarely sets seed. Lastly, *Plocoglottis* (?) is absolutely cleistogamous.

In these cases of Orchids, as in many other plants that could be added, all degrees of transition may be found between flowers apparently well adapted for intercrossing, yet quite as well able to fertilise themselves, and cleistogamous flowers, many exhibiting adaptations for both purposes. If, however, self-fertilisation be specially resorted to, then the adaptations for intercrossing may or may not be retained as well. Mr. Darwin's inference from their presence (as mentioned above in the case of the Bee Ophrys) is, therefore, a false assumption, at once negated by cases where the adaptations for intercrossing are entirely lost, as is the case of a plant bearing nothing but cleistogamous flowers.

I would here add that I find our British *Neottia Nidus-avis* is self-fertilised by the powdery pollinia falling on the edges of the stigma into which the pollen tubes penetrate. Also *Chysis aurea*, which was noticed by Orchid growers to fade within a few hours after expansion, and therefore rejected by them, is self-fertilising also, the pollinia readily falling into the stigma. *Geo. Henslow*.

## CACTACEÆ AT NEW ORLEANS.

POSSIBLY the display is the most extensive ever gotten together at one exhibition. One exhibitor, Mr. J. H. Erkener, of San Antonio, Texas, claims to have on exhibition 20,000 specimens, obtained from Mexico at great personal labour and expense. The entire collection taken together is extremely interesting and instructing. The greater portion of the exhibit is made by Mexico. There are specimens from the size of an Acorn to plants of *Cereus giganteus*, 21 feet in height and 3½ feet in circumference.

*Cereus*, about twenty-four varieties, some of which are as follows:—

<i>C. longisetis</i>	<i>C. dubius</i>	<i>C. procumbens</i>
<i>C. chloranthus</i>	<i>C. ctenoides</i>	<i>C. polyacanthus</i> , &c.
<i>C. schottii</i>		

## Echinocactus, about eighteen varieties :—

E. Emoryi E. brevihamatus E. Le Contei  
E. longehamatus E. texensis E. Wislizeni  
E. heliophorus, 4 feet high and 9 feet in circumference, &c.

## Mamillaria, about thirty varieties :—

M. echinus M. dasyacantha M. fissurata  
M. Grahamii M. gummifera M. applanata

## Opuntia, about twenty varieties :—

O. Bigelovii O. Engelmanni O. arborescens  
O. frutescens O. rufida O. Schottii, &c.  
O. Wrightii

Agave mexicana, specimens 12 feet across; the variety that produces the Mexican beverage :—

A. geminiflora A. revoluta A. densiflora

J. E. W., in "Gardeners' Monthly."

## MAHWA FLOWERS.

THE succulent corollas of *Bassia latifolia*, and of *B. longifolia* and *B. butyracea*, Sapotaceous trees, preserved by drying, have long been used as an article of food of the poorer classes, especially of the wild tribes, inhabiting the forests of Central India. The tree is not unlike our Oak in form, size, and colouring of the foliage; it grows from 30 to 40 feet high, and flowers in the months of March and April. The flowers are sweet, containing the remarkable amount of 63 per cent. of sugar, but, owing to a very strong smell, they are not relished except by those accustomed to their use. A first-class tree often yields more than 20 cwt. of flowers. An ardent spirit (3 galls. from 1 cwt.) is manufactured from them, which is largely consumed by those classes of the people who have no caste objection to the use of spirituous liquors. Colonel Drury, in his *Useful Plants of India*, states that the Mahwa spirit, if carefully distilled, resembles good Irish whiskey in taste. The flowers of an allied species, *B. longifolia*, growing in Southern India, are also eaten as food after being roasted, as well as the skins of the fruit boiled to the consistence of jelly.

But these flowers have recently developed into a considerable article of commerce, their saccharine value being appreciated in Europe. The exports from India in the year ending March, 1884, reached 269,329 cwt., valued at £67,066. A sample of the flowers as imported shows a soft sticky mass, having much the appearance of Raisins of a poor quality, such as are packed in casks. When soaked in water the individual corollas swell out and assume a flattened globular shape, about as large as an average Cranberry, and are found to consist of a very fleshy cup, within which are a great number of anthers. From a scientific point of view the Mahwa is a most interesting product, for it is rarely that we find the flower, the corolla of a plant, serving any other purpose than as a temporary protection for the reproductive organs within. For it to secrete more than half its weight of sugar, and thus become an article of economic value, and even of commerce, is most remarkable. The flowers are also good for feeding cattle; they will keep for a long time. P. L. S.

## The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON,  
FOR THE WEEK ENDING WEDNESDAY, JUNE 10, 1885.

MONTH AND DAY.	BAROMETER.		TEMPERATURE OF THE AIR.					HYGROMETRICAL DEDUCTIONS FROM GLAISHER'S TABLES 6th Edition.	WIND.	RAINFALL.

June 4.—Very fine day and night, lightning about 11 P.M.  
— 5.—Very fine day and night.  
— 6.—Rain from early morning till noon, showery afterwards.  
— 7.—Fine day and night.  
— 8.—Rain from early morning, and nearly all day.  
— 9.—Rain from early morning till noon, finer afterwards, sun shining slightly about 5 P.M.  
— 10.—Fine day and night.

LONDON : Atmospheric Pressure.—During the week ending June 6, the reading of the barometer at the level of the sea increased from 30.04 inches at the beginning of the week to 30.27 inches by 9 A.M., decreased to 30.26 inches by 1 P.M. on the 1st, increased to 30.31 inches by 9 A.M. on the 2d, decreased to 29.82 inches by 9 A.M. on the 5th, increased to 30.02 inches by 1 P.M. on the 6th, and was 30 inches by the end of the week.

The highest reading of the barometer for the week was 30.06 inches, being 0.07 inch higher than last week, and 0.08 inch higher than the average of the week.

Temperature.—The highest temperature in the shade in the week was 86°.8 on June 4; the highest on May 31 was 67°.3. The mean of the seven high day temperatures was 76°.9.

The lowest temperature was 45°.8, on June 2; on the 6th the lowest temperature was 57°.5. The mean of the seven low night temperatures was 51°.4.

The greatest range of temperature in one day was 33°, on June 2; the smallest was 14°.8, on the 6th. The mean of the seven daily ranges was 25°.5.

The mean temperatures were—on May 31, 56°.7; on June 1, 56°; on the 2d, 61°; on the 3d, 64°.1; on the 4th, 69°.8; on the 5th, 66°.2, and on the 6th, 57°.9; and these were all above their averages (excepting the 1st, which was 0°.5 below) by 0°.4, 5°.3, 7°.2, 12°.7, 8°.9, and 0°.4 respectively.

The mean temperature of the week was 61°.7, being 5°.9 higher than last week, and 4°.9 above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 147°, on the 3d. The mean of the seven readings was 132°.3.

Rain.—Rain fell on the 6th, to the amount of 0.22 inch.

ENGLAND : Temperature.—During the week ending June 6, the highest temperatures were 86°.8 at Blackheath, 86°.7 at Cambridge, 84° at Leeds; the highest at Plymouth was 69°.8, at Truro 70°, at Brighton 70°.5. The general mean was 78°.8.

The lowest temperatures were 39°.2 at Bolton, 40° at Hull, 40°.7 at Wolverhampton; the lowest at Newcastle was 48°, at Brighton 47°, at Liverpool 46°.4. The general mean was 43°.8.

The greatest ranges were 44°.1, at Cambridge, 41°.4 at Wolverhampton, 41° at Blackheath and Hull. The smallest ranges were 23°.5 at Brighton, 23°.8 at Plymouth, 27° at Newcastle. The general mean was 35°.

The mean of the seven high day temperatures was highest at Blackheath, 76°.9, at Cambridge 73°.3, at Sheffield 72°.6; and was lowest at Plymouth, 64°.4, at Liverpool 65°.5, at Truro and Brighton 67°. The general mean was 69°.4.

The mean of the seven low night temperatures was highest at Brighton, 52°, at Blackheath 51°.4, at Plymouth 51°.1; and was lowest at Bolton, 45°.1, at Wolverhampton 46°.6, and at Hull 47°.3. The general mean was 49°.4.

The mean daily range was greatest at Blackheath, 25°.5, at Cambridge 25°.3, at Wolverhampton 23°.3; and was least at Plymouth, 13°.3, at Brighton and Liverpool 15°. The general mean was 20°.

The mean temperature was greatest at Blackheath, 61°.7, at Leeds 59°.8, at Sheffield 59°.6; and was lowest at Bolton, 54°.2, at Liverpool 56°.2, at Bristol 56°.6. The general mean was 57°.7.

Rain.—The largest falls were 1.19 inch at Brighton, 0.69 inch at Wolverhampton, 0.68 inch at Bolton; the smallest falls were 0.14 inch at Plymouth, 0.17 inch at Nottingham, 0.19 inch at Bristol. The general mean fall was 0.39 inch.

SCOTLAND : Temperature.—During the week ending June 6, the highest temperature was 68°.6, at Aberdeen; at Greenock the highest temperature was 64°.2. The general mean was 66°.8.

The lowest temperature in the week was 43°.3, at Dundee; at Leith the lowest temperature was 45°.6. The general mean was 44°.4.

The mean temperature was highest at Dundee,

56°.8; and lowest at Greenock, 54°.3. The general mean was 55°.5.

Rain.—The largest fall was 0.78 inch, at Greenock; the smallest fall was 0.02 inch, at Edinburgh and Paisley. The general mean fall was 0.21 inch. No rain fell at Dundee.

JAMES GLAISHER F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, June 8, 1885, issued by the Meteorological Office, 116, Victoria Street, London, S.W. :—The weather was at first fine in England, and unsettled in Ireland and Scotland. After the 5th, however, these conditions were entirely reversed, heavy rain falling at some of the English stations on the 6th, and still heavier amounts over our midland and south-eastern counties on the 8th. During the latter half of the week fog was general in the Channel, and thunderstorms occurred in many parts of England.

The temperature was a little below the mean in "Scotland, N.," "Scotland, W.," and "Ireland, S.," and about equal to it in "England, N.W.," and "Ireland, W.," but above the normal elsewhere, the excess in "England, E.," and "England, S.," being as much as 4°. The highest maxima were observed as a rule on the 4th, when the thermometer exceeded 80° in many parts of England. The lowest minima were observed over England on the 2d, but over Ireland and Scotland they occurred mostly on the 6th, when the thermometer fell to 33° at Mackree Castle. The range of temperature for the week was unusually large; in "England, E.," it amounted to 45°, and in the Midland Counties to 48°.

The Rainfall was less than the mean in "Scotland, E.," "Scotland, W.," "Ireland, N.," and the Channel Islands, but considerably in excess over the eastern, southern, and central parts of England.

Bright Sunshine was more prevalent than during the preceding week, the percentages ranging from 24 in "Scotland, W.," to 50 in "England, E.," and 56 in the Channel Islands.

Depressions observed.—At the commencement of the period an anti-cyclone lay over the south of England, while large depressions skirted our extreme north-west coasts in a north-easterly direction; the wind was therefore light from west in the east and south, but fresh from south-west and south in the west and north. On the 3d the anti-cyclone moved away to Central Europe, the depressions advanced nearer to our islands, and the wind backed to south-west and south generally during the night of the 5th; however, an area of relatively high pressure was formed over our more central districts, while a small hollow was developed over the south of England. The new high-pressure system eventually moved away to the eastward, and on the 7th a low-pressure area with two minima advanced over our southern districts, causing the wind to shift to the eastward in the North. One of the minima broke up, while the other passed over the south-east of England on the 8th, and in its rear the wind shifted to north-east generally.

## Answers to Correspondents.

ABUTILON : W. R. Curious, but of no value at present. If you persevere you may get something worth having.

BOOKS : A. R. Your note has been handed to our reviewer, who, in reply, sends a large number of additional errors and oversights. Whether they occur in the original we cannot say.

CORRIGENDA : MANCHESTER WHITSUN SHOW.—In our report of this meeting Mr. Broome is credited with obtaining the 1st prize for six specimen pot Roses, and 2d prize for twelve Tea Roses, when it should have been Mr. James Brown, the similarity of the names being accountable for the error.

CUCUMBER : TO PRESERVE A VARIETY OF CUCUMBER : C. G. B. Make layers of some young shoots by inserting them in pots, or in the bed, and then when they are rooted cut them off from the parent plant, and grow them on; or take cuttings 7 or 8 inches long, and treat as you would any other cutting requiring warmth to strike it.

DOUBLE BEGONIA BLOOM : Elcombe & Sons. Quite as good, as regards the bloom itself, as any of the colour which we have seen at late exhibitions.

HYACINTH : E. J. Farman. The curiosity has been engraved, and will appear in the *Gardeners' Chronicle* shortly.

INJURED SHOW CHRYSANTHEMUMS : H. H. Bourne-mouth. Under the circumstances, and at this date,

you cannot do better than to encourage a new leader, and try by disbudbing, later on, to throw the whole strength of the plant into the best-looking terminal bloom.

**MALFORMED FOXGLOVE: A. G. B.** A common occurrence in this plant, and one often figured in these columns, and due to the union of several of the terminal flowers into one large cup-shaped bloom.

**MARKET GARDENING: Jas. Burnett, Kitchen and Market Garden,** published at the Garden office, 37, Southampton Street, Strand; and *Profitable Fruit Farming*, by Chas. Whitehead, F.L.S., F.G.S. (Longman, Green & Co., London).

**MUSHROOMS: Daniels Brothers.** The species appears, from the putrid specimens that arrived, to be the edible one, but which have become very light from the bed having become exhausted—by cropping heavily, or from other cause—of the food of the Mushroom, aided probably by too high a temperature in the place where they grew.

**NAME OF SECRETARY OF SUTTON ROSE SOCIETY: A. J. S.** Mr. Ernest Wilkins, Lyndhurst, Sutton, Surrey.

**NAMES OF PLANTS: C. & S. K.** *Pyrus arbutifolia*.—*H. M. H.* 1, *Orchis bifolia*; 2, *O. mascula*; 3, *O. maculata*; 4, *O. ustulata*.—*A. P.* *Jasminum fruticosum*; *Hesperis matronalis*.—*G. A.* *Callistemon rigidus*.—*Alex. Forbes.* *Kerria (Corchorus) japonica*.—*J. May.* *Ceanothus azureus* var.—*E. V. B.* *Pan-cratiun maritimum*.—*J. O. C.* 1, *Ceanothus azureus*; 2, *Syringa Emodi*; 3, *Spirea*, unknown; 4, *Asphodelus luteus*; 5, *Ranunculus acemifolius*; 6, *Anthericum liliago*.—*C. D. & Sons.* *Pyrus crenata*.—*Hortus.* *Brassia verrucosa*; *Cattleya Mossiae*, a bad variety; the mottling is perhaps caused by damp.—*J. W.* *Paulownia imperialis*.—*T. D.* *Hyoscyamus niger* (large leaf), *Anemone rivularis*, *Oxalis rosea*.—*E. Jenkins.* *Leptospermum scoparium*.—*W. Kettlewell.* *Ribes lacustre*, *Primula cortusoides* var. *alba*.—*S. W. W.* *Lipidium Smithii*.

**NOTICE TO QUIT: J. J. M.** In cases of the kind you name, there are exceptions made to allow the nurseryman to clear his stock, but you had better consult a solicitor.

**POGONIA BARKLYANA.**—At p. 726, col. 4, an error, for which we are responsible, was committed in the last lines of the description of *Pogonia Barklyana*. Mayotte is the name of one of the Comoro Isles, and not of a collector, as would appear from the sentence as it stands.

**SPOTTED GOOSEBERRY LEAF: J. P. A.** See *Gardeners' Chronicle*, p. 77, vol. ii. for 1881, where an account of the disease is given, accompanied by figures.

**FOREIGN SUBSCRIBERS** sending Post-Office Orders are requested to send them to the Publisher of this journal, 41, Wellington Street, Covent Garden, and to make them payable to William Richards, at the Post-Office, Drury Lane, London, W.C.

**COMMUNICATIONS RECEIVED.**—*B. T. L.*—*H.*—*W. Wright.*—*H. M.*—*J. F.*—*E. S. D.*—*A. R.*—*S. H.*—*N. E. B.*—*W. H. B.*—*A. N.*—*A. D.*—*J. D.*—*F. v. M.*—*H. G. Rchb.*—*f. E. J.*—*A. J.*—*B. T. blooms	1 6-2 0	Woodruffe, 12 bun.	3 0-6 0

#### SEEDS.

**LONDON: June 10.**—As usual at this period, an exceedingly quiet feeling now characterises the trade for farm seeds. Hardly any variety is for the moment actually wanted, and all speculation being dead, there is consequently just now nothing moving. A few small sowing orders for Mustard, Rape seed, and Tares come to hand, which are executed on former terms. The demand for bird seeds is very languid. Feeding Linsced is rather dearer. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

#### CORN.

At Mark Lane on Monday trade flagged, English Wheat being 1s. lower on the week, but good dry samples were not much pressed for sale. Foreign Wheats 6d. to 1s. lower, but there was rather more doing in Indian and Russian. Flour was dull, and 6d. per sack lower on the week; Barley was quoted 6d. down for the same term. Maize was 6d. easier. Oats were rather more saleable, but the common grades of Russian showed 3d. to 6d. decline from Monday se'night. Beans were unaltered, and white Peas 1s. cheaper.—On Wednesday there was but little inquiry for either Wheat or flour. Quotations remained nominally unaltered, but the tone was weak. For Oats steady rates were required. Maize was dull; Beans and Peas were without alteration; and Barley in only limited demand.—Average prices of corn for the week ending June 6:—Wheat, 34s. 6d.; Barley, 27s. 6d.; Oats, 22s. 3d. For the corresponding period last year:—Wheat, 37s.; Barley, 27s. 1d.; Oats, 21s. 4d.

#### CATTLE.

At Copenhagen Fields on Monday a good assortment of cattle met a dragging sale, at easier rates for buyers. Sheep were not a quick sale, but they upheld late value. Lambs cleared a little more readily, but not at better prices. Calves were very unsaleable, and hardly quotable, the few that sold being at wide and lower prices. Pigs were without material change in values. Quotations:—Beasts, 3s. 8d. to 4s. 6d., and 4s. 8d. to 5s.; calves, 3s. to 5s. 2d.; sheep, 4s. 4d. to 5s., and 5s. 4d. to 6s.; lambs, 6s. 4d. to 7s.; pigs, 4s. to 4s. 6d.—On Thursday quietness prevailed. Beasts met a moderate demand, but the tone was steady. Sheep and lambs, with a fair inquiry, realised full prices, the latter being a shade dearer than on Monday. Calves were neglected, and pigs quiet.

#### HAY.

Tuesday's Whitechapel Market report states that trade was very dull, with moderate supplies in consequence of the wet weather. Quotations:—Clover, prime, 80s. to 110s.; prime second cut, 85s. to 110s.; inferior, 60s. to 75s.; hay, prime, 70s. to 98s.; inferior, 40s. to 60s.; and straw 26s. to 36s. per load.—On Thursday there was a moderate supply, and trade was very dull at late rates.

#### POTATOS.

The Borough and Spitalfields Markets reports state that new Potatoes are coming in more freely. For old the trade is in a very narrow compass. Scotch Regents, 85s. to 110s.; Kent ditto, 80s. to 110s.; Magnum Bonums, 80s. to 110s. per ton; new Malta and Lisbon, 7s. to 9s.; Jersey Kidneys, 12s. to 14s. per cwt.—The imports into London last week consisted of 206 bags from Hamburg; 40 tons, 81 casks, 10 cases, 315 packages from Malta; 121 packages from Faro; and 3946 packages and 3419 half-boxes Lisbon.

"Gather Honey from Your Flowers."  
**NEIGHBOUR'S Celebrated BEEHIVES.**  
 Silver and Bronze Medals awarded at the International  
 Health Exhibition, 1884, to Geo. Neighbour & Sons.

### NEIGHBOUR'S

**IMPROVED  
 COTTAGE BEEHIVE,**  
 as originally introduced by them,  
 working three bell glasses or a tray  
 of sectional supers, is neatly and  
 strongly made of straw; it has  
 three windways in the lower Hive.

This Hive will be found to pos-  
 sess many practical advantages,  
 and is more easy of management  
 than any other that has been  
 introduced.

Price .. .. £1 15 0  
 Stand for ditto 0 10 6

### NEIGHBOUR'S FIFTEEN SHILLING FRAME-HIVE.

This hive has been designed to  
 supply a want long felt by those  
 who desire a Hive at once tasteful  
 in appearance and moderate in  
 price. The walls are built of straw  
 neatly bound with cane. Ample  
 means for ventilation to summer,  
 and sufficient warmth in winter are  
 enclosed therein, a double quilt to place over the Frames, a case  
 of American one-piece sections for supering, and a substantial

thus secured. Nine Frames, of the standard size, fitted  
 with metal ends, and a dummy for reducing the Hive, are en-  
 closed therein, a double quilt to place over the Frames, a case  
 of American one-piece sections for supering, and a substantial

cover of wood, to protect from the weather, are also included.  
 Price, complete, 15s.

Also **BAR-FRAME HIVES**, from 7s. 6d. to 42s. each.  
**"THE APIARY,"** by **ALFRED NEIGHBOUR**  
 Price 5s., post-free.

**CATALOGUE** of Improved Beehives and Appliances may  
 be had on application to

**GEO. NEIGHBOUR & SONS,**  
 127, HIGH HOLBORN, LONDON, W.C.,  
 and 149, REGENT STREET, LONDON, W.

**HILL AND SMITH'S BLACK VARNISH,**  
 for Preserving Ironwork, Wood, or Stone.  
 (Registered Trade Mark)

This **VARNISH** is an excellent substitute for oil paint on  
 all outdoor work, while it is fully two-thirds cheaper. It was  
 introduced upwards of thirty years ago by the Advertiser, and  
 its genuine good quality, notwithstanding a host of unprincipled  
 imitators, is fully attested by its constantly increasing sale. It  
 may be applied by an ordinary labourer, requires no mixing  
 or thinning, and is used cold. It is used in the grounds at  
 Windsor Castle, Kew Gardens, and at the seats of many  
 hundreds of the Nobility and Gentry, from whom the most  
 flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon,  
 at the Manufactory, or 1s. 8d. per gallon carriage paid to any  
 Station in the Kingdom.

**UNSOLICITED TESTIMONIAL.**  
*"Pierrefield Park, June 21, 1876.—Sir, I have this day  
 forwarded from Chepstow to your address a black varnish cask,  
 to be filled and returned with as good Varnish as the last we  
 had, which I candidly admit was the best we ever had. Address  
 Varnish to Pierrefield Park, Chepstow.—I am, Sirs, yours re-  
 spectfully, Wm. Cox"*

**CAUTION.**—HILL & SMITH would particularly warn their  
 Customers against the various cheap Varnishes now so much  
 advertised.

H. & S.'s Varnish has been an article of common use on most  
 of the large estates in the kingdom for upwards of thirty years;  
 and their constantly increasing trade in it, and the numerous  
 Testimonials they receive stamp it as a truly genuine article.  
 Every cask is legibly marked with their name and Registered  
 Trade Mark as above, without which none is genuine.

Large Illustrated **CATALOGUE** of Fencing Hurdles, Field  
 and Entrance Gates &c., sent free on application to

**HILL AND SMITH,** Brierley Hill Ironworks, Staffordshire;  
 118, Queen Victoria Street, London, E.C.; and 196, St. Vincent  
 Street, Glasgow.

**WANTED,** a thoroughly experienced man, as HEAD GARDENER.—Must understand Forcing of every description, and have had long practical experience in the growing of Orchids, Stove and Greenhouse Plants, Ferns, &c., besides the general routine of Gardening, Inside and Out, in all its branches. Undeniable references as to character, &c., indispensable.—T. F. G. BANNATYNE, Summerville, Limerick.

**WANTED,** a middle-aged experienced GARDENER. Wages 25s. per week, and 6-roomed house.—SILBURY, Crediton.

**WANTED, GARDENER and WIFE,** near London. Wife as Plain Cook. Must be thoroughly trustworthy, and without children. Good personal characters required.—Liberal ages given.—Apply by letter, stating ages and full particulars, to L. F., Messrs. Street & Co., 30, Cornhill, London, E.C.

**WANTED, an experienced WORKING GARDENER and WIFE,** between 30 and 40, with no children, to take Charge of a House and Garden in South Devon. The woman must thoroughly understand Housework, and be able to keep House in Order, where they will live, in absence of family. Garden small; no glass.—G. W., Messrs. E. Street & Co., News Agents, 30, Cornhill, London, E.C.

**WANTED, a man and wife in small family,** S.W. suburb—man as GARDENER and to make himself generally useful; wife as good PLAIN COOK. Comfortable home to those who have been similarly occupied, and whose characters will bear strict investigation.—Address, stating ages, references, wages, &c., BETA, 2, York Street, Covent Garden, W.C.

**Botanical Gardens, Cambridge.**

**WANTED, as FOREMAN,** a good Cultivator of Orchids, Hardwooded Plants, Bulbs, Ferns, and Stove and Greenhouse Plants in general. Must be quite fit for responsibility. No bedding out. Wages 26s. per week with rooms.—Apply, at once, by own letter, to CURATOR, and send Certificate of experience or recommendation, with special reference to first two classes. Good character and address indispensable.

**WANTED, a WORKING FOREMAN** in a Market Nursery. Must be steady and energetic, and well up in Grapes, Strawberries, Cucumbers, Cut Flowers, &c., also in growing best Pot Stuff.—X., Messrs. Black & Co., Covent Garden Market, W.C.

**WANTED, a young man, as PROPAGATOR.** Must have had a fair amount of experience and been under a thoroughly good man. Vacancies also for ONE or TWO young MEN, for General Work under Glass.—Please state wages required, and give references, to W. M. CROWE, Boleyn Nursery, Upton, Essex.

**WANTED, an energetic young MAN,** experienced in Propagating and Growing Bedding Plants, Roses, Clematis, &c., and Cut Flowers, also in Making up Wreaths, &c. One who has been under a Foreman in a good Nursery preferred.—Apply, by letter, stating wages required, age, &c., to WM. CROWDER and SONS, Thimbleby Nurseries, Horncastle.

**WANTED, a married MAN and WIFE** (without children)—Man for the General Outdoor Work of a Gentleman's Garden, and to Make the Gas; Wife would have to attend to the Rooms of men in the Garden and Stables. Wages, for both, 18s. per week with house, firing, milk, and spare vegetables.—SYDNEY WHITE (Head Gardener), Oaklands Park, Hurstpierpoint, Sussex.

**WANTED, a FORESTER,** for a large Highland Estate in the Central Highlands of Scotland, on which it is intended largely to increase the Plantations. None but trained and skilled Foresters need apply.—No. 453, Robertson & Scott, Advertising Agents, Edinburgh.

**WANTED, a good OUTDOOR MAN.**—Good Budder: wages £1 per week. Permanent place for good man.—Warwick Road and Park Nurseries, Coventry.

**WANTED, a KNIFESMAN** for permanent situation. Must be good hand, well up in general Nursery Stock.—Apply, stating wages to commence at, and particulars of age and experience, to RALPH CROSSING, Penarth Nurseries, South Wales.

**WANTED, IMMEDIATELY, a MAN,** accustomed to Packing, Tying, and Watering, in a Market Nursery.—Apply, stating wages and full particulars, to HEWITT and CO., Solihull, near Birmingham.

**WANTED, a CLERK and BOOK-KEEPER,** with a good knowledge of the Seed Trade. Must be quick and correct at Figures and Addresses.—State age, salary required, and references, in own handwriting, to HARRISON and SONS, Seed Merchants, Leicester.

**WANTED, for the Counter, a smart, active young MAN,** of good address, and general knowledge of the Seed Trade.—Apply, stating wages expected, age, and references, to Messrs. JAMES DICKSON and SONS, 108, Eastgate Street, Chester.

## WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

**TO NOBLEMEN, GENTLEMEN, &c.,** requiring smart, sound, and thoroughly competent STEWARDS, GARDENERS, &c.—We have on hand Applications from several Men of tested ability, and shall be pleased to Assist any Nobleman, &c., in Obtaining Men specially suitable for their requirements.—VICCAR COLLYER and CO., Leicester; A. W. CREWS, Manager.

#### GRATEFUL—COMFORTING.

**EPPS'S COCOA.**  
**BREAKFAST.**

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." *Civil Service Gazette.*

Made simply with boiling water or milk. Sold only in Packets, labelled thus:—  
**JAMES EPPS & CO.,** Homœopathic Chemists, London.

**HOLLOWAY'S PILLS. —**Nervous Debility.  
—No part of the human machine requires more watching than the nervous system—upon it hangs health and life itself. These Pills are the best regulators and strengtheners of the nerves, and the safest general purifiers. Nausea, headache, giddiness, numbness, and mental apathy yield to them. They dispatch in a summary manner those distressing dyspeptic symptoms, stomachic pains, fullness of the pit of the stomach, abdominal distension, and overcome both capricious appetites and confined bowels—the commonly accompanying signs of defective or deranged nervous power. Holloway's Pills are particularly recommended to persons of studious and sedentary habits, who gradually sink into a nervous and debilitated state, unless some such restorative be occasionally taken.

# SEND FOR A PRICE LIST OF JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS,

For Raising Water for the Supply of Towns, Villages, Irrigation, Railway Stations,  
Mansions, Fountains, Farms, &c.

*No Cost for Motive-Power, which is obtained from a Stream of Water passing through the Rams.*

NO OILING OR PACKING REQUIRED.

Made in Sizes to Raise from 300 to 500,000 Gallons per day.

Will Force to a Height of 1500 feet.

SPECIAL RAMS for HIGH FALLS to send up Two Gallons out of every Five Gallons passing through them.

Blake's Special Ram, to work under small falls.  
These patterns vary with the different sizes.

This Ram will force a part of the same water that works it, or will force clean water from a well or spring whilst worked by a stream of impure water. Rams on this principle can be supplied to force to a height of 1500 feet.

This Ram, for deep working falls, is capable of sending up two gallons out of every five gallons passing through it.

## SALES BY AUCTION.

## Tuesday Next—Choice Orchids.

**MESSRS. PROTHEROE AND MORRIS** will sell by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on **TUESDAY NEXT**, June 23, at half-past 12 o'clock precisely, by order of Messrs. Hugh Low & Co., a large quantity of ORCHIDS, in the best condition, comprising Cattleya Sanderiana, Cattleyas from Columbia, in all probability Cattleya Roezlii, C. Dowiana, C. gigas, C. amethystoglossa; Cypripedium ciliolare, Dendrobium Dacot, D. crystallinum, D. thysiflorum, D. Dalhousiana, Masdevallia Haryana, Lælia elegans, Phalaenopsis amabilis, P. grandiflora, the fine Java variety, Vanda corulea, and other CHOICE ORCHIDS.

On view morning of Sale, and Catalogues had.

**Tuesday Next.**  
**ONCIDIUM JONESIANUM.**  
**ESTABLISHED ORCHIDS.**

**MESSRS. PROTHEROE AND MORRIS** will include in their SALE, at the Central Auction Rooms, on **TUESDAY NEXT**, **ESTABLISHED ORCHIDS**, from two well known private collections, including Vanda caryocaulis Boxallii, Angraecum sesquipedale, two fine plants; Lælia, Cattleyas, and others; also from Messrs. F. Horsman & Co. a fine lot of the beautiful **ONCIDIUM JONESIANUM**, guaranteed true, and other fine ORCHIDS, in lots to suit the Trade and private buyers, and 500 **EUCARIS ANAZONICA** BULBS.

On view morning of Sale, and Catalogues had.

## Friday Next—Very Valuable Importations.

**MESSRS. PROTHEROE AND MORRIS** are instructed by Mr. F. Sander to **SELL** by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on **FRIDAY NEXT**, June 26, at half-past 12 o'clock precisely, a fine lot of the rare and superb **BOLLEA CÆLESTIS**; grand importation of **CATTLEYA SPECIOSISSIMA**, **ONCIDIUM CAVENDISHIANUM**, **EPIDENDRUM NEMORALE**, **ODONTOGLOSSUM ROEZLII** and **VEXILLARIUM RUBELLUM**, **SOBRALIA VIRGINALIS**, **ONCIDIUM AMPLIATUM MAJUS**, **LÆLIA PEDUNCULARIS**, many **CATTLEYAS** and **ODONTOGLOSSUMS**, &c.

On view morning of Sale, and Catalogues had.

## Flowering Orchids.

**MESSRS. PROTHEROE AND MORRIS** beg to announce that their NEXT SPECIAL SALE of **FLOWERING ORCHIDS** will take place on **TUESDAY**, June 30, for which they will be glad to receive entries as early as possible.

## New Orchids.

**ANGRÆCUM LEONI**, a magnificent novelty, for the Cattleya-house.

**ANGRÆCUM SCOTTIANUM**, rare and striking.

**ANGRÆCUM FUSCATTUM**, long spikes, covered with flowers.

**ANGRÆCUM rostellare**, Pogonia Barklyana, Eulophia megistophylla, E. pulchra, Lissocylus stylus, L. julax, &c.

**ANGRÆCUM LEONI**.—This is a most wonderful novelty, and, next to Yanda Sanderiana, we consider it the finest Orchid we have had the pleasure to offer. It was discovered and collected by Mr. Leon Humboldt in the Comoro Islands, growing at an altitude of 3000 feet. It should be grown in the Cattleya or the Dendrobium house, and it will be a plant of very easy culture; the plants, although only just imported, are beginning to grow.

**Angræcum Leoni** is a serious rival to A. sesquipedale, surpassing it, we consider, not only in its extraordinary and very beautiful form, but in its adaptability to the Cattleya-house, its cool habit, and great floriferousness, some of the plants actually showing up to fifteen flower-spikes, and each bearing six to ten of the large pure white flowers.

Our Woodcut gives the exact size of the plant. The leaves are fleshy, and are quite a remarkable feature, standing boldly sideways, and are so arranged as to form a perfect half circle, in front of which the flower-spikes arrange themselves; altogether it is a remarkable and grand thing, and nothing like it is in cultivation.

Professor Dr. REICHENBACH says in his description:—"The flowers may be well compared to Angraecum sesquipedale—a very stately thing, taking little space, bearing great flowers. Is not this sufficient to make beat a collector's heart with satisfaction?"

The importation is simply grand, and every plant in extra condition. See Flowers and Woodcut.

**MESSRS. PROTHEROE AND MORRIS** have received instructions from Mr. F. Sander to **SELL** the above and other very valuable ORCHIDS on **TUESDAY**, July 7, at half-past 12 o'clock precisely.

On view morning of Sale, and Catalogues had.

## Wednesday Next.—(Sale No. 6931.)

## IMPORTED ORCHIDS.

**MR. J. C. STEVENS** will **SELL** by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on **WEDNESDAY NEXT**, June 24, at half-past 12 o'clock precisely, fine masses of **ODONTOGLOSSUM CRISPUM** (ALEXANDRÆ), the very best type; **O. CITROSUM**, **O. MADRENSE**, **O. INSLEAVI LEOPARDINUM**, **O. CERVANTESI**, **ONCIDIUM TIGRINUM**, and the beautiful **BARKERIA LINDLEYANA CENTERÆ**, from Messrs. Shuttleworth, Carder & Co.; also splendid importations of Mexican and other ORCHIDS, from Messrs. F. Horsman & Co.

On view morning of Sale, and Catalogues had.

## Thursday Next.—(Sale No. 6932.)

## ONCIDIUM CUCULLATUM GIGANTEUM.

**MR. J. C. STEVENS** will **SELL** by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., by order of Mr. F. Sander, on **THURSDAY NEXT**, June 25, at half-past 12 o'clock precisely, a fine lot of the gigantic variety of **ONCIDIUM CUCULLATUM**, in fine order. This is one of the most lovely of Orchids. Also many fine importations, among others large masses of **ONCIDIUM SUPERBIENS**, **BARKERIA BARKERIOLA**, **PESCATORIA WALLISII MAJOR**, **ODONTOGLOSSUM INSLEAVI LEOPARDINUM**, **EPIDENDRUM TOVARENSE**, **ONCIDIUM WELTONI**, **KRAMERI**, and **PAPILIO**; the rare **ODONTOGLOSSUM KRAMERI**, **EPIDENDRUM STAMFORDIANUM**, **URO-PEDUM LINDENI**; also several plants of **PAPHINIA SANDERIANA**, a most beautiful Orchid, &c.

On view morning of Sale, and Catalogues had.

Malda Vale, W.—(5758.)

Must be Sold, owing to ill health,

**HALF AN ACRE OF LAND**, with frontage of 125 feet to road, eight-roomed DWELLING-HOUSE, and SEED SHOP, eleven GREENHOUSES, and three PITS. Nominal rent, only £25. Lease 24 years unexpired. **R. HALLIDAY & CO.,**  
HOTHOUSE BUILDERS AND HOT-WATER ENGINEERS,  
ROYAL HORTICULTURAL WORKS, MIDDLETON, MANCHESTER.

Vineries, Stoves, Greenhouses, Peach Houses, Forcing Houses, &c., constructed on our improved plan, are the  
perfection of growing houses, and for practical utility, economy, and durability cannot be equalled. We only do one class of work,  
and that THE VERY BEST.

Conservatories and Winter Gardens designed architecturally correct without the assistance of any one out of our firm,  
from the smallest to the large-t. Hot-water Heating Apparatus, with really reliable Boilers, erected, and success guaranteed  
in all cases. Melon Frames, Sashes, Hotbed Boxes, &c., always in stock.

Plans, Estimates and Catalogues free. Customers waited on in any part of the Kingdom.

Our Maxim is and always has been—

## GREEN'S PATENT "MULTUM IN PARVO" MOWER.

Suitable for Small Grass Plots.

A most useful Machine.

Prices, with Grass Box:

£1 5 0
1 13 0
2 0 0

Prices,  
Without Grass Box

To cut 6 in. .. £1 1
To cut 7 in. .. 1 8
To cut 8 in. .. 1 15

It is simple in construction, easily adjusted, is well adapted for mowing small plots, cutting borders, verges, round flower beds, the edges of walks, &c. It is a most handy, serviceable machine, and very easy to work.

## GREEN'S PATENT GRASS EDGE CLIPPER.

With Chain and Wheel Motion.

A most useful Machine.

Price, £1 16s.

Packing Case, 2s.

SIZE,  
8 inches wide by  
7 inches diameter.

## GREEN'S PATENT (No. 2412) LAWN TENNIS COURT MARKER.

Price 20s.

Small Bag of Marking Composition, Mat, and Packing, 1s. 6d.

Price List free on application.

The above Machines can be had of all respectable Iron-mongers and Seedsmen in the United Kingdom, or direct from the Manufacturers,

THOMAS GREEN & SON (LIMITED).

SMITHFIELD IRONWORKS, LEEDS; and SURREY WORKS, BLACKFRIARS ROAD, LONDON, S.E. Carriage paid to all the Principal Railway Stations in the United Kingdom.

## Gardeners' Chronicle.

SATURDAY, JUNE 20, 1885.

## INSECTS.

INSECTS play a most important part in the economy of Nature. The average townsman, whose knowledge of them is confined to certain lectural and household pests, can scarcely appreciate the fact, or have any other feeling than repugnance and contempt for the annoying hexapods of his acquaintance. Yet, as scavengers, as pollenisers of our flowers and fruits, or as food for other animals, they not only vitally concern man, but, philosophically considered, are seen to be essential to his very existence.

We receive, also, some direct benefits from insects. They supply us with the sweetest of sweets, our very best inks and dyes, and our finest robes and tapers, to say nothing of various acids, lacs, and waxes; while few, who have not studied the subject, have any just idea of the importance of insects and their products as articles of human diet. But the benefits, whether direct or indirect, which man derives from insects, must always appear trifling compared to the injury they inflict on our agriculture.

In the primitive condition of the country, as the white man found it, insects, doubtless, took their proper place in Nature's economy, and rarely preponderated in any direction to the injury of the wild plants, scattered, for the most part, sparsely throughout their range. Harmony between organisms, in the sense of the widest inter-relation and inter-dependence, had resulted in the long course of ages. But civilised man violated this primitive harmony. His agriculture, which is essentially the encouragement and cultivation, in large tracts of one species of plant to the exclusion of others which he denominates weeds, gave exceptional facilities for the multiplication of such insects as naturally fed on such plants. In addition to this inevitable increase of species thus encouraged, many others have been unwittingly imported from other countries, chiefly through the instrumentality of commerce with those countries; for it is a most significant fact that the worst weeds and the worst insect pests of American agriculture are importations from Europe. Thus, in addition to the undue increase in our native species, as above noted, we have to contend with these introduced foreigners, and it is no wonder that Dr. Fitch declared America to be the land of insects, for, as compared to Europe, we are truly bug-ridden.

As I have stated (*Encyclopædia Americana*, "Agricultural Entomology"):—"The losses occasioned by insects injurious to agriculture in the United States are, in the aggregate, enormous, and have been variously estimated at from 300,000,000 dols. to 400,000,000 dols. annually. It will never be possible to fully protect our crops from the ravages of the many species that injuriously affect them: but it is the aim of the economic entomologist to prevent as much of the loss as possible and at the very least expense. To do so effectually the chief

knowledge required is of an entomological nature, *i.e.*, the full life-history and habits of the different species; and this implies a great deal of close and accurate work in field and laboratory. By means of it we learn which species are beneficial, and which injurious; and the ability to distinguish between friend and foe is of the first importance in coping with the latter, for it is a notorious fact that the farmer often does more harm than good by destroying the former in his blind efforts to save his crops.

... The economic entomologist, to do effectual work, must possess, not merely a knowledge of the particular injurious species and its habits with which he wishes to deal, but must study its relations to wild plants as well as to the particular cultivated crops it affects. He must also study it in its relations to other animals. Indeed, its whole environment must be considered, especially in connection with the farmer's wants, the natural checks which surround it, and the methods of culture that most affect it. The habits of birds, the nature and development of minute parasitic organisms, such as fungi, the bearing of meteorology, must all be considered, and yet, with the knowledge that a study of all these bearings implies, he will frequently fail of practical results, without experiment and mechanical ingenuity." ... Mere study of [insects], however, while essential, is not often productive of those important practical results which follow when it is combined with field work and experiment by competent persons and upon scientific principles. Many of the remedies proposed and recommended in the agricultural Press are either ridiculous or else based on misleading empiricism; and economic entomology, as a science, is of comparatively recent date.

The time limit of this paper will permit but the briefest reference, by way of illustration, to some of the means alluded to. I have already indicated the prime importance of a knowledge of the life-history of the species to be dealt with—a knowledge that can come only by direct and careful inductive research carried on sometimes during many years; for every insect exists, in the course of its development, in four different states, three of them more or less abruptly marked by metamorphosis and each with habit and environment peculiar to it. Thus the same species may inhabit earth, air, and water at one or the other period of life, and yet be quite incapable of a change of environment at any one period. It took me five years, with a number of observers at command, to definitely settle some points in the life-history of the Cotton-worm (*Aletia xyliana*, Say), and with all the resources of the French Government—its liberal premium, its superior and sub-commissions appointed for the purpose and at work for the past fifteen years—there is much that is yet mooted in reference to the Grape Phylloxera. You have all heard of this insect, and perhaps a brief statement of its habits will serve to illustrate the complicated problems with which the economic entomologist often has to deal. I quote in substance from one of my reports:—

"The full life-history of the species exhibits to us no less than five different kinds of eggs. 1. The regularly ovoid egg, 3.25 mm. long and half that in diameter, of the normal, agamic, and apterous female, as it is found upon the roots. 2. The similar but somewhat smaller egg of the gall-inhabiting mother. 3. The female egg from the winged mother, rather more elliptical and 0.4 mm. long when matured. 4. The male egg from same, quarter less in length, and rather stouter. 5. The impregnated egg 0.32 mm. long, still more ellipsoidal and with peculiar sculpture and anal point. We have also the peculiar spectacle of an egg from the winged mother increasing from 0.34 mm. (its size when laid) to 0.4 mm. (its size just before hatching), giving birth to a perfect insect 0.4 mm. long, and this, without any nourishment, laying an egg 0.32 mm. long. A being thus born, and without food whatsoever, lays an egg very nearly as large as that from which she came.

"We have, further, the spectacle of an underground insect possessing the power of existence even when confined to its subterranean retreats. It spreads in the wingless state from Vine to Vine, and from vineyard to vineyard, when these are adjacent, either

through passages in the ground itself, or over the surface; at the same time it is able in the winged condition to migrate to much more distant points."

The recent advance in our knowledge of the life-history and habits of species has been great, but leaves yet an immense field for future research.

Insects probably outnumber in species all other animals combined, some 350,000 having already been described, and fully as many more remaining yet to be characterised. The proper and conscientious characterisation of a genus or species of some microscopic creature involves as much labour as that of one of the higher animals. Of the above number a goodly proportion are injurious to cultivated crops. Lintner recently records no less than 176 affecting the Apple.

#### INSECTICIDES.

Of insecticides any number of substances have been recommended, and many of them tried with more or less satisfaction. Of these may be mentioned lime, sulphur, soot, salt, wood-ashes, corrosive sublimate, naphtha, naphthaline, turpentine, alum, carbolic acid, phenyle, cyanide of potassium, blue vitriol, ammonia, alkalis, benzine, vinegar, sulphuric acid, quassia, vitriol (the sulphate of copper), hot water, &c. Most of these may be safely used for specific purposes, either dry, in liquid, or in vapour; but the three most useful insecticides of general application in use during the early days of economic entomology in this country and up to within a few years, were undoubtedly tobacco, white Hellebore, and soap. Tobacco-water and tobacco-smoke have long been employed against aphides and other delicate insects, and are most useful. A quite recent advance in its use is by vapourising. The vapour of nicotine is most effectual in destroying insects wherever it can be confined, as in greenhouses. Thus the boiling of tobacco in such a greenhouse is as effectual as, and less injurious to the plants than, the older methods of syringing with a decoction, or of fumigating by burning; while experience by Mr. William Saunders at the Department of Agriculture during the past two summers shows that the vapour gradually arising from tobacco-stems strewn on the ground and regularly moistened is likewise effectual.

White Hellebore, either dry or in liquid, has long been one of the most satisfactory insecticides against Tenthredinid larvæ, otherwise known as false-caterpillars, of which the imported Currant-worm (*Nematus ventricosus*) is a familiar type; while soap, syringed in strong suds, will kill some soft-bodied plant-destroyers, and when used as a paint on the trunks of trees is an excellent repellent against the parents of different borers.

Transcending in importance, however, any of these older insecticides are the three now most commonly used because most satisfactory. They are:—(1) arsenical compounds, (2) petroleum, and (3) Pyrethrum. The first act through the stomach, and are effectual chiefly against mandibular insects; the second and third act by contact, and are, therefore, of more general application, affecting both mandibular and haustellate species.

#### ARSENIC.

The use of arsenic as an insecticide in the field dates from the year 1871. At the rate of 50 grains of arseniate of soda and 200 grains of dextrine dissolved in a gallon of water, and this diluted at the rate of about 1 oz. to 10 gallons of water, it furnishes one of the cheapest of insecticides at command, and various patented combinations of it have been extensively sold and used. Again, 1 lb. of arsenic and 1 lb. of sal-soda boiled in 1 gallon of water till the arsenic is dissolved, and diluted at the rate of 1 quart to 40 gallons of water, is also a good formula. The chief merits of arsenic are cheapness and solubility. Its demerits are its white colour, which makes it liable to be mistaken for harmless substances of the same colour, and its tendency to burn the plant. Paris green, or Scheele's green, has been more extensively used than any other arsenical compound, and is, on the whole, one of the most satisfactory insecticides. I first used this poison against the Colorado Potato-beetle (*Doryphora 10-lineata*) in the summer of 1868, but owing, doubtless, to the use of an inferior article, reported adversely upon it ("First Report on Insects of Missouri for 1868," p. 116). George Liddle, jun., of Fairplay, Wis., experimented with it the same summer, and with one part of the green to two of flour found it eminently satisfactory (*American Entomologist*, i., p. 219); and from the time he

announced his experience—May 25, 1869—in the *Galena, Ill., Gazette*, the green became rapidly popular against the *Doryphora*. I first recommended it in 1872 for the Cotton-worm, and its use gradually extended to other leaf-eating insects, until hundreds of tons have been sold for insecticide purposes in a single year. It is used dry with various diluents, as ashes, plaster, flour, &c., at the rate of one part of the green (if pure) to twenty-five up to one hundred parts of the diluent. Flour as a diluent has the great advantage of causing greater adhesiveness and permanence. In liquid suspension Paris green can be used at the rate of 1 lb. to from 40 up to 100 gallons of water. The liquid should be kept constantly stirred, and a little dextrine or other substance added to give adhesiveness is an advantage.

A refuse obtained in the manufacture of aniline dyes, and known as "London purple," is the third important arsenical compound that I will mention in this connection. It consists of lime, arsenious acid, and carbonaceous matter, and was first used by me against the Cotton-worm and other insects in 1878, and more fully and thoroughly in 1879. It is used with diluents, either wet or dry, in the same manner as Paris green; while for some insects experience has shown it to be less satisfactory than Paris green, for many others it is equally effective, and has the great advantage over Paris green of being vastly cheaper (costing on an average but five cents against sixty cents per pound); of covering twice the ground, weight for weight; of being more soluble, less poisonous, more adhesive and permanent in its effects, and of decided colour, so that when intelligently used it is in all ways preferable. C. V. Riley, in "*American Entomologist*."

(To be continued.)

## New Garden Plants.

LISSOCHILUS STYLITES, *Rehb. f.*

IN the way of *Lissochilus arearius*, Lindl. Sepals triangular acuminate reflexed; petals oblong, wide; lip grand, nearly square, blunt-edged, with a very short conical angled spur, and two styliform processes in the mouth. There are numerous dark spots on the base of the lip inside. Flower equal to that of a good *Zygopetalum intermedium*, rose coloured.

It would be a great triumph for English gardeners to grow well these *Lissochilus*, which form the pride of so many places in the Black Continent. An immense supply of water in the time of growth, and nearly absolute dryness in the state of rest, with an exceptional shower of water just to prevent death, are the conditions under which they grow, as several African travellers have told me. Mons. Léon Humblot brought home living plants, as well as some of *Lissochilus fallax*. Our plant is comparable to *Lissochilus roseus*, Lindl. (see *Bot. Reg.*, xxx., 12). This flowered at Mr. Rucker's in February, 1843. *H. G. Rehb. f.*

*LÆLIA PURPUREA* (Lindl.) VAR. *SCHROEDERI* AND VAR. *PALLIDA*, *Rehb. f. (Xenia, ii., p. 53).*

I have two fine varieties of *Lælia purpurea* before me, both recognised by Mr. Edward Low, who kindly forwarded me these freshest beauties of the old firm, of Hugh Low & Co.—1, Schœderi; 2, pallida. As to the second I can fully vouch for it, having named it myself. It has the anterior part of the lip of the lightest purple colour. As to Schœderi, I do not feel quite so certain, but I am sure Mr. Edward Low is right in his opinion. It might have been the original of the flower represented on the left hand in the *Orchid Album*, vol. i., pl. 2. The two other flowers want the two large light purple spots standing near each angle of the lip. Whether this deficiency is accidental, or the result of an oversight, I cannot say, the more since, to my great regret, I never had an authentic flower of the plant which bears so highly regarded a name. The lip is white, with a horseshoe-like, lightest orange-coloured blotch, locked in front on the median and basilar parts of the disc. The veins of the disc are of a fine dark purple colour, and similarly tinted veins traverse the disc in the sinus in front of the lateral angles, and there they have a purple hue. Of course all the margin is white. The base of the column is lightest yellow, with some

dark purple spots on the sides of the top of the androclonium in its interior and under the fovea.

Speaking of *Lælia purpurata* I may mention that I saw a specimen in the Hamburg Botanic Garden, with open well formed flowers, lasting for two days, during clear weather, of light green colour (so-called Schweinfurt's green) and then suddenly turning to white. *H. G. Rehb. f.*

*ANGRÆCUM FLORULENTUM, n. sp.\**

A discovery of M. Léon Humblot. It has the fine flowers of *Angræcum Ellisi* in numerous racemes of one to three flowers. In one specimen I saw five such racemes in full flower at once, which must look very effective in a living state. The zigzag stem is strong, and the sheaths wrinkled. The leaves are very leathery, lanceolate, unequally blunt, bilobed at the apex. You might compare the growth to that of *Aëranthus gladiifolius*; but all the parts are stronger, of an extraordinary solidity, as if made of metal. The flowers are much larger than could be expected from a plant the leaves of which reach 3 inches in length. *H. G. Rehb. f.*

*EULOPHIA MEGISTOPHYLLA, n. sp.†*

This is very near *Eulophia pulchra*, Lindl., yet its enormous leaves, panicle inflorescence, lip and spur separate it very distinctly. It has, probably, the largest leaves in the whole affinity if you consider both the breadth and length at once. It is a discovery of Mons. Léon Humblot. *H. G. Rehb. f.*

*ODONTOGLOSSUM CORADINEI KINLESIDIANUM, n. var.*

This was imported with *Odontoglossum Pescatorei* by Mr. F. Sander, who sent it to me. It is, however, now in the possession of the Rev. Mr. Kinleside, Sunbury House, Tunbridge Wells, who is stated to be one of the most ardent orchidists of Kent so that his name is appended to the plant. The large anterior calli are retuse and emarginate. This is peculiar, but it was just so in an *Odontoglossum Coradinei*, kindly forwarded by Mr. W. Bull in April, 1882. The lovely quality is that it has sepals and petals white, bordered only with yellow, which produces a fine effect. *H. G. Rehb. f.*

*ODONTOGLOSSUM CORADINEI ALBIDULUM, n. var.*

A new variety of this well known plant, having the flowers with a certain yellowish-white ground colour, far more white and only light sulphur at the base of the lip.

It is a very bad plant, inasmuch as it might almost as well be regarded as a form of *Andersonianum*, although the shanks of the calli are so elongated that I thought it more nearly allied to *Coradinei*. This is, however, nearly a matter of opinion. All these—let me say "things," to avoid any exact statement—run one into another. It is very easy to name the first. "*Sed post equitem (viz., autorem) sedet atra cura.*" When the connecting links arrive in a long series then the naming ceases to be easy. On the other hand it is no wonder if rich amateurs pay extravagant sums for extra fine specimens with extraordinary colours. As to these the investment of money is perhaps much safer than in the case of well defined species. You need not expect such importations of masses of *Odontoglossum Schroederianum*, *Pescatorei*, *Veitchianum*, *crispum*, *Sanderianum*, *Percivalianum*, as of good species (remember *Cypripedium Spicerianum*).

This flowered with Mr. Smith, of Stirling Park. I had at first only a single flower from Mr. F. Sander, sent by Mr. Smith. This gentleman luckily reconsidered the matter, and sent me a rich supply of flowers. If one is condemned to name such "things" one should have at least good materials. How agreeable it is to get a great cigar-box full of twenty

flowers, one of each, and the labels loose. Shocking! *H. G. Rehb. f.*

*ANTHURIUM INCONSPICUUM (N. E. Brown), n. sp.*

Stem probably elongating. Scale-leaves 1—2 inches long, deltoid, oblong, or lanceolate oblong, obtuse, with a short mucro, with one or two keels down the back, at first pallid and somewhat transparent, membranous, soon becoming brown and fibrous. Petioles 6—9 inches long,  $1\frac{1}{4}$  line thick, nearly terete, with a slight flattening down the face, green; geniculus  $\frac{1}{2}$  inch long, often incurved; lamina 9—12 inches long,  $1\frac{1}{2}$ —3 inches broad, narrowly elongate-elliptic, gradually and equally narrowed from the middle in a slightly curved line to an acutish apex and base, green on both sides, but a little paler beneath, scarcely shining; midrib equally prominent and rounded on both sides, primary lateral veins 11—13 on each side of the midrib, not prominent either above or beneath, about level with the general surface, and but little stouter than the secondary veins, straight, making an angle of about 40°—45° with the midrib, uniting in a continuous intramarginal vein at a distance of 3—4 lines from the margin. Scape as long as the petioles, scarcely 1 line thick, terete, green. Spathe  $\frac{1}{2}$ —1 inch long, 3—3 $\frac{1}{4}$  lines broad, reflexed, oblong, with a convolute-acute apex, bright green. Spadix  $\frac{1}{2}$ —1 inch long, 2 lines thick, dark brown-violet, the individual flowers about  $\frac{1}{4}$  line in diameter. This species was sent to Kew by Mr. Glaziov from Rio Janeiro, but whether it is a native of that place or of some other part of Brazil I do not know, as although his plants are all labelled Rio Janeiro it is quite certain that some of them come originally from other parts of Brazil. From a horticultural point of view this plant is neither better nor worse as a foliage plant than many others in cultivation. *N. E. Brown.*

## LUTON HOO PARK, LUTON.

THIS extensive demesne takes a high place among the "ancestral homes of England." For many years past it has been the residence of Mrs. Gerard Leigh, now, by reason of her recent marriage with His Excellency the Danish Minister, Madame de Falbe. The Manor of Hoo is very ancient, and was possessed by the family of that name long before the Norman Conquest, mention being made of the fact in old records so far back as the time of King Canute. The estate seems to have remained in the possession of this family for many years after, although the residents took an active part in the stirring events of the period. Many of the old knights are buried in Luton Church, and their tombs still remain objects of interest to the archaeologist. In the days of Henry VI. one of the family so distinguished himself by his services in France and Normandy that he was created a baron of the realm by the title of Lord Hoo and Hastings, and was also elected a Knight of the Garter. After the year 1523 the manor passed through several hands, but in 1611 the seat and park were purchased by Lord Napier, who was knighted by James I., and a year later advanced to the dignity of a baronet. From the family of Napier the estate passed to a Mr. Herne, who sold it to John, Earl of Bute. It is recorded in the *Gentleman's Magazine* of 1763 that this nobleman gave £111,000 for the house and grounds. It was held by the Bute family until 1844, and then sold to Mr. Ward, who disposed of it immediately after to Mr. John Shaw Leigh, the father of Mrs. Gerard Leigh's late husband. During all these years, and under successive owners, the house and grounds have been enlarged and improved, until there are now so many features of interest that an adequate description is almost impossible.

The Park contained about 300 acres when Sir Robert Napier was the possessor; it was enlarged to 1200 acres by the Earl of Bute, the succeeding Marquis of the same name added 300 acres more, and it is now, therefore, a very extensive desmesne. Great improvements have been made since the estate became the property of the Leigh family. Many small adjacent and intermingled properties were bought and thrown into the Park, or exchanged for outlying portions; the roads were relaid and remade, and the general arrangement of the grounds has been considerably improved.

There are several entrances to the Park, one of the principal being situated only a short distance from Luton. The distance to the house from this spot is

only a mile and a half, and along the carriage drive a very fine view of the property may be obtained. The river Lea, which leaves Luton in the form of a dirty stream, is temporarily transformed into a broad current, running through the valley along the whole length of the grounds, and widening into a beautiful lake at the foot of the eminance on which the house stands. The lake is rich in fish, and many waterfowl resort to it. There are also entrances at New Mile End and on the St. Alban's Road.

The mansion itself is situated on an elevated spot, and has a very imposing appearance from the front. Years ago it was comparatively small. In 1762 considerable additions were made to it by the Earl of Bute, and the last Marquis of that name who lived there rebuilt the greater part of the edifice. A considerable portion of it was destroyed by fire in 1843, but since then it has been thoroughly renovated at an enormous cost and the grounds laid out with excellent judgment. The Park is finely undulated as well as of very large extent, the drives wind through in graceful curves, and the Beech, which abounds here, and of which there are many very fine specimens, is fine. The Oaks are small, a great deal of the fine Oak timber having been felled many years ago. Elm is well represented, but does not compare in size and vigour with the Beech. In proximity to the house are fine specimens of the copper and scarlet Beeches, for they are decidedly distinct in colour and stand out prominently against the tints of green. In a shrubbery of considerable extent near to the mansion may be seen one or two remarkably fine specimens of Copper Beech. Very pleasant walks wind about this shrubbery, a great deal of the undergrowth of which is Laurel, with a fringe of Rhododendrons, and at intervals there are bays of Rhododendrons and hardy Azaleas, &c., that supply charming patches of colour in spring. It is scarcely necessary to say this part of the grounds is admirably kept.

The pleasure grounds and flower garden are at the south side of the mansion, and they fall away down a gentle declivity towards a valley, and rise again towards the house-level beyond. There is a large extent of greensward, which is admirably kept. Dotted about the garden and on the terrace may be seen a number of standard Bays in tubs, in perfect condition, with large and solid heads of foliage of great size. On either side of a winding gravel walk is a long border of hardy plants and which contain something of interest all the year round. The flower gardens and pleasure grounds comprise in all about 8 acres, a considerable addition having been made during the past autumn and winter. At a point farther east there is to be seen a good and varied collection of specimen Conifers, Wellingtonia gigantea, Abies Douglasii, Abies Nordmanniana, A. Pinsapo, Cedrus Deodara, Cupressus Lawsoniana, Thuia orientalis, and others. The situation is somewhat open, and fierce north-westerly winds leave marks of their effects on the trees. Close by is a charming sunken roseroy with climbing Roses trained over arches and in festoons—a lovely spot when the Roses bloom, all the plants breaking into a fine growth, as if soil and situation alike suited them. Then a descending path leads to a half wild fernery forming a charming dell within a block of shrubbery—a deliciously cool and inviting spot in hot summer weather; and leaving this, an ascending path leads to another roseroy enclosed within a belt of shrubbery, planted mainly with Gloire de Dijon Roses for cutting.

Then passing on to the south-east front, the visitor is attracted by the number of specimen trees, some fifty in all, planted by distinguished persons and members of the family to commemorate their visit to Luton Hoo.

Further south, on the high ground, lies the extensive walled-in kitchen gardens and fruit and plant-houses. A rapid run through the latter shows the Vines to be in the best condition—a luxuriant clean growth, and highly promising crops of fruit. The early vinery has Black Hamburg as the first crop. In the second vineries Black Hamburg, Muscat of Alexandria, and Buckland Sweetwater. The third have Black Hamburg, Gros Colmar, Frankenthal, Madresfield Court, Ferdinand de Lesseps, and Alnwick Seedling. Pot-Vines are in several houses, admirably grown, and carrying excellent crops; the sorts Foster's Seedling, Hamburg, and Gros Colmar. Strawberries abound, about 2500 pots being grown for forcing, and they are seen to be carrying fine crops of fruit; the forced varieties are Keen's Seedling and Vicomtesse Hericart de Thury for the

\* *Angræcum florulentum* (No. 4).—Caulis elato fractiflexo; vaginis rugosis; laminis lanceolatis apice inæqualiter bilobis; racemis uni-trifloris basi vaginatis; bracteis ovatis minutis; sepalis lanceis; tepalibus latioribus, labello oblongo-lanceolato apiculato; calcaris filiformi ovarium pedicellatum prope iter excedente, nunc curvula; columna pollinariorum exacte Angreæci. *H. G. Rehb. f.*

† *Eulophia megistophylla*, n. sp.—Folio membranaceo petiolato cuneato oblongo acuto nervis ternis validissimis, reliquis tenuissimis, ultra pedali, spithamam lato; panicula succedanea, ramis inferioribus distantibus serius floridis; vaginis amplis ochreatis oblongis acutis; bracteis lanceis acuminatis deflexis deciduis; sepalis lanceis; tepalibus latioribus; labello quadrilobis, lobis obtusis, sinu antico magno profundo; calcaris brevissimo cylindricato didymo crasso callis angulatis geminis in basi. *H. G. Rehb. f.*

earliest; the main pickings from forced plants being taken from President and Sir Joseph Paxton.

In the Fig-house the trees are in splendid condition, and have been fruiting freely since the third week in April; the principal sort is Brown Turkey. In this house is raised the earliest crop of Tomatos, the plants being in pots trained up the roof near the glass. Excellent crops have been gathered for some time. Tomatos are largely grown, and are seen to abound in other houses, trained up the back walls and other places, and thus a good succession is maintained. The Peach and Nectarine-houses show the trees in rare condition, and carrying good crops of fruit. In a range of three Melon-pits can be seen admirable crops of fruit; the leading sorts are Scarlet Perfection, Hero of Lackinge, Blenheim Orange, Dickson's Best of All, one of the best varieties grown. Here was also growing an Egyptian Melon; last year one fruit of this kind weighed 22 lb. The Cucumber-houses were in full bearing, remarkable crops being produced; the sorts being Rollisson's Improved Telegraph, and Carter's Model; but it is difficult to perceive any difference between them.

The plant-houses are numerous, and well filled with subjects in good condition. Tree Carnations are a special feature, these being in so much demand for cut purposes. Such an extensive and fine lot of Souvenir de Malmaison is rarely seen; there is the old form, another with pale pinkish flowers, and Lady Middleton, flaked and suffused with rose, but all bearing the unmistakable habit of the old type. Another house was filled with a collection of Tree Carnations in pots, from which flowers are obtained all the year round. Earl of Beaconsfield, a very fine rose flake; Mary Morris and Sir Beauchamp Seymour were particularly attractive. In the Camellia-house was a good selection of varieties, and flowers can be cut from September until February. A large quantity of Liliun candidum—single roots in pots—is grown for cutting, and found to be very acceptable. There is then a range of three houses—viz., a stove, a Palm, and an Azalea-house. The first has Gardenias planted out, and Mr. Butters claims to have been one of the first to have adopted the practice of planting-out Gardenias. The roof is covered with Stephanotis floribunda. Some good specimens of Palms are to be seen—*Areca lutescens*, *Kentia Baueri*, *Seaforthia elegans*, &c. The Azalea-house has some useful specimen Azaleas that are forced into flower, and on the roof are white and red *Lapagerias*. Then comes a house containing a rare collection of *Eucharis* and *Pancratiums* in the best condition. Here, too, is a good lot of small handy plants of *Cypripedium insigne*, grown for table decoration. Next to this is a small Gardenia-house, the plants bearing large quantities of fine blooms, and a few Orchids also are here. Overhead is *Stephanotis floribunda* planted in the Gardenia bed, and which is reverely pruned back to spurs, when it comes laden with flowers.

The commodious Rose-house, with ridge-and-furrow roof, is a fine structure, 50 by 35 feet; the Roses are planted in beds and side borders with gravelled walks between, and there are about sixty varieties in it. Some are dwarfs, others standards; some are grown as pillar Roses, reaching up to the roof, and some climb over the archways. Here, as in the open air, the vigorous cleanly growth of the foliage was most noticeable. Large quantities of flowers are cut at this season of the year. The fernery is another striking feature: of large size, with huge Tree Ferns in the centre, and raised rocky banks round on which Ferns are growing, and with ledges for standing pots upon. There is a magnificent *Cyathus princeps* over 20 feet in height, with nine large fronds; and two more of the same species rising from the centre, a very fine *Alsophila australis*, a grand *Cibotium regale*, *C. Schiedei*, *Alsophila Williamsii*, good specimens of *Adiantum gracillimum*, and other *Adiantums*, &c. The back wall is heavily draped with *Ficus repens*, from among which rises the leaves of foliaged *Begonias*. In order to keep the massive fronds of the Tree Ferns from touching the glass roof they have to be brought down by means of weights suspended from their points.

At the back of one of the vineries *Passiflora edulis* grows against the wall. It is found very useful when large desserts are required. It is cut back very hard before being allowed to break into growth.

The kitchen garden is spacious, and well planted with fruit trees on the walls, all of which appear to do well with the exception of Apricots; apparently there is something in the subsoil which does

not suit them, and the trees decline. This has been going on for years, and many attempts to prevent it have failed. There are spacious orchards filled with fruit trees in good bearing condition. The vegetable garden is fully cropped, and from beginning to end it is in admirable order.

During the ten years that Mr. C. Butters has had charge of the gardens at Luton Hoo he has carried out many important improvements. Owing to circumstances he is now leaving Luton Hoo, amid general regret. It must be said of him that he has left his impress on the place as that of an able, painstaking, and intelligent gardener.

## BENTLEY PRIORY.

It is doubtful, if within the radius of a dozen miles from St. Paul's, an estate could be named combining so many and varied attractions as "Bentley," or, as it is sometimes called, "Stanmore" Priory. Nearly all the accessories of picturesque landscape are present, from the richly hued parterre in front of the stately residence to the huge thickets of *Rhododendrons*, the sloping lawns, the magnificent Cedars, the belts of varied woodland, the lake, the picturesque hill, on which stands the church, and the distant downs and Surrey hills.

The estate, which comprises an area of about 460 acres, is situated on the southern slope of a hill near to the village of Stanmore. It is sheltered from the north by thick belts of woodland, among which the Scotch Fir is conspicuous. The high road from Harrow to Bushey forms its western boundary, and the Edgware and Watford broad highway lies on the north of it; picturesque commons covered with gorse and bracken stretch away beyond these.

Bentley Priory was purchased by the first Marquis of Abercorn in 1788. In 1848 it was leased by the Dowager Queen Adelaide, widow of William IV. After the death of the Queen Dowager, which took place within a year and a half, the mansion remained unoccupied until 1852, when the estate was purchased by Mr. (now Sir John) Kelk, the great railway contractor and engineer. Sir John enlarged and beautified the mansion, adding thereto a lofty clock tower, covered skating rink, and spacious and elegant conservatory—the subject of our illustration (fig. 172, p. 789). The structure forms a western wing to the house, and is connected by glazed corridors with the various orchard-houses, vineries, and cool-houses of the adjacent gardens. The corridors just referred to are furnished with enormous Camellias, loaded in winter and early spring with hundreds of blooms. The conservatory is 126 feet long by 24 feet wide, with a hipped roof and transept. In the centre is the circular marble fountain and statuary shown in the accompanying woodcut. The path is of white marble inlaid with purple and orange encaustic tiles. The dark masses of foliage consist of branches of the graceful *Araucaria excelsis*. The Orange trees, which are splendid specimens, are now loaded with swelling fruit and opening blossoms. On either side of the principal entrance there is a fine Tree Fern (*Dicksonia antarctica*). Camellias, *Agapanthus*, foliage plants and Ferns fill up the borders. The roof girders are wreathed and festooned with the variegated *Cobaea scandens*, one of the most free growing, elegant, and effective climbers for the roof of a large house. The leaves of this plant are now used at the flower-shops for decorating epergnes, &c. The back of the transept, facing the fountain and doors, forms an apse, decorated with mural paintings of birds and flowers. From a seat here, when the doors are open, the magnificent panorama can be surveyed at leisure, with the accompaniment of dripping fountains and groves full of singing birds.

In the spacious grounds, which are studded with picturesque groups and single specimens of coniferous trees, there are cricket and tennis grounds, a roserie, a cleverly constructed fernery, and several rustic arbours and summer-houses. In one of the latter, on the margin of the lake, Scott is said to have corrected the proofs of "Marmion," and Rogers to have written his "Pleasures of Memory." There are some splendid standard *Rhododendrons* by the walk beneath the terrace: these are now in their glory. The mansion has only recently been opened as a first-class hotel, in connection with the "Avenue" and "Metropole," and under the directorship of Mr. Frederic Gordon, the proprietor of the famous Holborn Restaurant. T. W. Harrow.

## THE NEW ZEALAND CORDYLINES.

In New Zealand the Cabbage trees (*Cordylines*) form a conspicuous feature in the flora. The common Cabbage tree, *C. australis*, abounds in all open lands below 2000 feet altitude, above which it is rarely found. Groups of these give a peculiarly semi-tropical aspect to the country, but they are rapidly being cleared from the lowest grounds as cultivation extends. However, unlike most native plants, they are favourites with gardeners, and considerable numbers are grown in villa gardens throughout the colony. The tree forms a stout trunk with rough scaly bark, more or less covered with the fibrous remains of old leaf-sheaths. The trunk is frequently 20 feet high, and sometimes more than twice that. Young trees have simple stems, but old ones are always branched, sometimes as many as forty or fifty branches being produced. This branching is caused by the inflorescence being terminal, and all the trees grown here produce a branch for each panicle of flowers. They will branch, however, if wounded or if the crown is cut out. The leaves are collected together at the tips of the branches, where they form dense crowns composed of 100 to 200 leaves, the lower ones dead for several series. The leaves are from 2 to 4 feet long and 2 inches wide, light green in colour, ensiform or lanceolate in form, quite entire, leathery but not rigid in texture, and very finely striated. In some varieties the midrib is very evident, and of a fine red colour, but usually it is absent. The flowers are produced in a long broad panicle, which appears in early summer from the centre of the crown, and grows with great rapidity to a length of 4 to 6 feet (less in young plants). The flowers are very small, are very strongly perfumed, dull white or pale blue in colour (according to variety), and are succeeded by large masses of whitish berries, which are 3-celled, and contain several small black angular seeds.

The cultivation of this *Cordylina* is simple enough in its native country. Seedlings can be raised by the thousand out-of-doors; indeed, they often germinate freely under the parent trees, and are fast in growth—some young trees in the public gardens here having reached a height of 18 feet in ten years. The root-stock and larger roots soon make plants if cut up into small pieces and placed in pots in a frame, and plants so produced bloom earlier than those raised from seeds. Besides the common Cabbage tree we have three other species accepted by authors, and two of doubtful validity.

*C. indivisa* is the grandest looking of the New Zealand species, but is scarcely so generally useful as the common species. It is found in mountain woods in both islands at 1000–3000 feet altitude, most commonly at about 2000 feet. Owing to its natural habitat it stands drought badly, and hence is unsuited for cultivation on our dry plains, a peaty or humid soil being, moreover, essential. But this sort is probably less susceptible to cold than any other *Cordylina*, and therefore more useful in England. Its appearance generally assimilates to that of *C. australis*, but the trunk is shorter, more leafy, and less inclined to branch, and the leaves are very much broader, thicker, and are glaucous below. On young plants they are not infrequently 5 feet long and about 6 inches broad. The nerves are numerous, yellowish or reddish, and give the plant a variegated appearance. The panicle is lateral, smaller than in *C. australis*, but the individual flowers are more than twice as large. This is the *Ti Palm*, or great *Ti* of the settlers, *Ti* being a Maori name for the genus. The leaves of this species yield a fine elastic fibre of great strength, which was formerly used by the Maories for making mats, called *Toiis*.

*C. Banksii* is the most graceful New Zealand species, and is found in moist woods, especially near watercourses. In this species the trunk is slender, about 10 or 12 feet high, and surmounted by a large head of leaves, arranged in numerous fan-like crowns, the whole not a little resembling a bush of *Phormium tenax* elevated on a stalk. The leaves differ from the other species in being petioled, and are frequently 6 feet long and 2 to 4 inches broad. They are striated, as in *C. indivisa*, but the striations are whitish or pink. The panicle is lateral (terminal in the var. *Gouldiana*), sub-erect, and 4 to 6 feet long, with small scattered flowers, followed by blue berries. Like *C. indivisa* this species does not thrive in Christchurch out-of-doors, requiring to be grown in a moist

sheltered position. It does not reach a great elevation, and is tender as regards frost.

*C. Pumilio* is a miniature of *C. Banksii*, and does not appear to be known in England. It is a small grass-like plant, with the stem only a few inches in length, much branched, and bearing leaves about 18 inches long and about  $\frac{1}{4}$  inch wide. The panicle is about 2 feet high, erect, and carrying a number of

forms a mass of crowns, as in *Yucca filamentosa*. A plant in cultivation in this garden for over 12 years has never flowered, and is not yet 1 yard high; I think this will eventually turn out to be a form of *C. australis*.

Another Cabbage tree has lately been sent out by a North Island nurseryman under the name of *C. Sturmii*, and described as a fine new species from the

## THE ORCHID CONFERENCE.

THE great success of the Orchid Conference held last month under the auspices of the Royal Horticultural Society, tempts Orchidologists to hope that the Society will institute regular meetings of the same kind. I hear with regret that it is the intention of the Society to postpone a second Orchid Conference *sine*

FIG. 172.—THE CONSERVATORY AT BENTLEY PRIORY. (SEE P. 788.)

small scattered dirty-white flowers. Though curious, it has not much to recommend it as an ornamental plant. It is an inhabitant of shady woods.

Besides these four species there are many varieties of *C. australis* and *C. Banksii* which may repay the researches of future collectors, and also two so-called species which are imperfectly known. *C. edulis* is a name given by Colenso to a plant cultivated by the Maories, and known as the Sugar Ti. In foliage it resembles *C. australis*, except that the leaves are rather shorter. The trunk, however, branches below the ground, or just at the ground level, and the plant

Waikato. A plant procured for this garden bears a suspicious resemblance to the Australian *C. nutans*, but is at present too young to be determined with any certainty. *J. B. Armstrong, Christchurch, New Zealand.*

**WACHENDORFIA THYRSIFLORA.**—An Iris-like plant, with erect green sword-shaped leaves, and tall erect racemes of yellow flowers, reminding one of those of *Gentiana lutea*, but arranged in long clusters, not in whorls. It is now in flower on the rockwork at Kew.

*die.* There are so many important points in which the experiences of Orchid growers need comparison, and the number of those who are now interested in Orchids is so great, that there is a distinct need for regular and periodical meetings. I am surprised that no society exists where those who are specially interested in Orchids can compare their experiences. I should be sorry to see a society of orchidologists formed which would have interests separate from those of the Royal Horticultural Society, for assuredly, now the experiment has been once tried, such a society will speedily spring into existence, unless the Royal

Horticultural Society takes the initiative by instituting a permanent section devoted to the interests of orchidologists having regular meetings say three or four times in each year.

The nomenclature and cultivation of Orchids alone need open discussion. Synonyms of the most misleading nature daily come to light, and the most simple questions of culture are questions which are not definitely settled. Nothing but the actual comparison of results can set such matters at rest.

I am sure that both amateur and professional growers would gladly take part in such meetings, as they could not fail to afford mutual benefits. The grand show of Orchids on the 9th inst., following closely as it did on the Conference, shows that such meetings would not fail to draw large numbers of exhibits; and I believe if the scope and nature of the last Conference had been fairly understood by the large number of amateurs, so many papers would have been forthcoming that the postponement of a second meeting *sine die* would have been an impossibility.

I trust that you will use your large influence to induce the Royal Horticultural Society to meet the views of a considerable section of the Fellows, and institute a committee for the purpose of arranging matters of detail. *Benjamin T. Lowe, F.R.H.S.*

[We hope the Society will see its way to establish another Conference, next year, as we know it to be the desire of a large number of Orchid growers. We deprecate the formation of a special society. Breadth of view is apt to be lost in special societies. ED.]

## INDIAN NOTES.

THE LUCKNOW HORTICULTURAL GARDENS (*continued from p. 763*).—MANGOS.—I also undertook experiments with Mango seedlings of good strains. I always considered the fine cultivated varieties as descendants of the indigenous and wild *Mangifera indica*. Natives have no fancy for sowing Mango seeds (excepting for stock to be grafted on), simply because they have already fine kinds, which can be propagated by inarching. But in the same way that new Roses, new Camellias, new Vines, Apples, &c., are created, so can new Mangos be originated. To get new sorts seeds must be sown and those of good sorts are as likely, or more so, to produce good varieties, as "wildlings." The mistake people make is that they think by sowing one or a few seeds of Malda or Bombay Mangos, they will get a similar fruit. It is like taking one ticket in a lottery of 10,000 tickets. You may get the prize, but much more likely you will not. To be of use, Mango seeds must be grown by the thousand, of the best sorts, which have been grown together in the same orchard, so that these seeds would have had a chance of being crossed by other good kinds; and this has to be continued for years or generations, giving the young plants favourable conditions of growth, selecting those which are worth keeping and destroying or rejecting the remainder. Of course this process is at first expensive, and can only be done either by Government, by a society, or some wealthy native with a fancy for such a pursuit. When I quitted Lucknow I left some seedling Mango trees which had arrived at a fruiting age. Mr. Ridley, in one of his reports, stated that out of four of my seedlings that fruited, one was good and worth keeping. To get one worth keeping out of four is very good luck, and means a proportion of twenty-five per hundred. Many raisers of new plants would, I daresay, be glad to get one "trump" in a hundred chances. The great advantage of new kinds of Mangos is this: the soils and climates of India are infinite, and it would be to the advantage of every one to have one or another kind that will suit any soil or climate of India, and so grow this choice fruit as extensively as possible.

### CHICK-HOUSES.

About the year 1873 I constructed the first "chick-house" for growing Ferns and other delicate plants which cannot live in the open air during the hot winds. It made quite an era. The advantage of such a structure and its success were undoubted. It was afterwards adopted in many places, both private and public, and now one can scarcely visit any Indian station without seeing a "chick-house." The above house had "chicks" on the top and on all sides, so that by keeping the soil moist during hot winds an artificial atmosphere was produced. A

modification of this—having only the roof covered with reeds, and the sides left open—was also made, which was found of immense value for germinating seeds, for raising and nursing seedlings of all sorts, and other semi-tropical plants. The reed-roof shaded the young plants in the hot weather, and screened them from the frost in winter, while the open sides allowed an unlimited amount of air.

The Maréchal Niel Rose especially can be grown here as well as in England. The name Lucknow acquired for Roses was due to one of my assistants, Mr. Hodges, who died in March, 1873. Mr. Ridley joined in March, 1874, and in 1877-78 my connection with this garden ceased. Owing to the amalgamation of Oudh with the North-Western Provinces the appointment I then held was abolished. The above-named gentlemen were only my assistants in a small way, as their principal charge was always the Wingfield Park—a totally different institution. Mr. Ridley had been my assistant for about four years. When I left, at my recommendation, he got sole charge of the Horticultural Garden in addition to his former charge. Under his judicious care its usefulness has increased, and I am sure will continue to do so. He is now undertaking the uphill task of improving native fruit trees. If Government do not expect wonders in too short a time, there is no reason why he should not succeed if he live long enough.

My charge of this garden lasted for about seventeen years from the turning of the first sod. As I said, this garden belonged first to a Society, which after a time ceased to exist for want of support. Then it continued to be kept up by the local Government, and by the income derived from the sale of seeds, plants, fruit, and other produce. Eventually it was recognised by Government as a very useful institution; as a centre from which seeds and plants could be disseminated, and as an experimental and acclimatising garden.

The original soil of this garden was all but barren. By manure and water I got things to grow, and as soon as I had trees and shrubs about the place my constant care was to prevent the fallen leaves from being swept away from under the trees and shrubs. I thus allowed their own decayed leaves to become their manure, and whenever I had an opportunity I brought more dried leaves from the outside, and strewed them under the plants. In this way, in the course of some years, a layer of leaf-mould covered the soil, which, while it added to the nourishment of the plants, was yearly added to by the fall of leaves. By the time I left some persons were accustomed to describe the garden as a "tangle," so luxuriantly did things grow. Without interfering much with the picturesqueness of the vegetation, my object was to allow plants to grow naturally without clipping or chopping, but only trimming where necessary. By the moisture and shade of the trees, and by screening off the hot wind, which scorches everything in May and June, I succeeded in producing there an artificial climate, by which many plants that years ago refused to exist in this garden, now thrive with luxuriance. In addition to this it is one of the few gardens in India which pays a large portion of its expenses. In no part of India before, was the uphill task of raising good acclimatised seed seriously tried. *E. Bonavia, M.D., Etawah, February 10.*

## KEROSENE EMULSIONS.

It cannot be too strongly impressed upon all who use kerosene as an insecticide that it can be considered a safe remedy only when properly emulsified. The formula for the kerosene and soap emulsion, as found most satisfactory by Mr. Hubbard, is as follows:—

Kerosene .. .. .	2 gals. = 67 per cent.
Common soap or whale-oil soap .. .. .	$\frac{1}{2}$ lb. }
Water .. .. .	1 gal. } = 33 per cent.

Heat the solution of soap and add it boiling hot to the kerosene. Churn the mixture by means of a force-pump and spray-nozzle for five or ten minutes. The emulsion, if perfect, forms a cream, which thickens on cooling, and should adhere without oiliness to the surface of glass. Dilute, before using, one part of the emulsion with nine parts of cold water. The above formula gives 3 gals. of emulsions, and makes, when diluted, 30 gals. of wash.

The kerosene and soap mixture, especially when the latter is warmed, forms upon very moderate agitation, an apparent union; but the mixture is not stable, and separates on standing, or when cooled or diluted by the addition of water. A proper emulsion

of kerosene is obtained only upon violent agitation. It is formed not gradually, but suddenly; in short, to use a familiar phrase, "it comes" like butter. The time required in churning depends somewhat upon the violence of the agitation, but still more upon the temperature, which, however, need not be much above blood-heat.

When obtained, an emulsion of kerosene and soap is known by the perfect union of the ingredients and the absence of oiliness, so that the liquid clings to the surface of glass or metal. It resembles a rich cream, more or less thickened, according to the proportion of soap used in the mixture. *Mr. Hubbard, in "American Entomologist."*

## ORCHIDS AT COL. GASCOIGNE'S, PARLINGTON HALL, LEEDS.

DURING the past few years Col. Gascoigne has got together a very select collection of Orchids at Parlington Hall, Leeds. The collection includes good varieties of most of the leading genera of Orchids, viz., East Indian, Brazilian, and what are termed cool varieties; they are growing in three small sunken span-roof houses about 10 feet in width, the path being down the centre and the plants arranged on the side stages, well up to the glass. There are no side lights, and the plants stand about on a level with the ground outside. The houses in question were originally erected for Melon and Cucumber culture, and with some simple additions to the side ventilation which Mr. Dunn, the gardener, has himself carried out, they appear to be exceedingly well adapted to the purpose for which they are now used. In the compartment used for Cattleyas, I noticed the other day some very nice plants and good varieties of *C. Mossiae*; one small plant had nine flowers on two spikes, the flowers measuring fully 8 inches across; a small plant of a fine variety of *C. Skinneri* had 8 flowers open on one of its spikes; of *C. Mendelii*, too, there were some nice varieties, one in particular, which had a dash of magenta running along the centre of its broad pale lilac petals, was very handsome, reminding one of *C. Trianae* Backhouseiana. Of *Trianae* there were some nice plants, but the flowers were past. I noticed one plant had seven breaks coming away; this, Mr. Dunn informed me, was only a 7s. 6d. plant two years ago. There was a very fine variety of *Laelia purpurata* amongst several others of this excellent Orchid. It had a deep port-wine coloured lip with a patch of white on its front and pure white uncurled sepals and petals. The cool varieties are grown in an adjoining compartment of the same house. There were some twenty spikes of *O. Pescatorei* in flower, several of them being very beautiful varieties with purple spots on the lip. They averaged about fourteen flowers on a spike, and the plants were growing in 4-inch pots. *O. cordatum maculatum* and *Uro-Skioneri* were showing nice spikes, but not fully open. In the East Indian-house there were nice healthy plants in flower of *Sobralia macrantha*, *Cypripedium laevigatum*, *C. Dominianum*, *C. barbatum*, and *C. caudatum*; *Pescatorea Klavochiana*, *Bollea celestis*, and *Angraecum sesquipedale*. At the end of this house there was placed against the brick wall a large rustic mass of wood, around which was growing a fine plant of *Anthurium Andreanum* with several spathes open. The plant in question seemed quite at home, and had a striking appearance. *H. J. C.*

## FORMATION OF STARCH IN VINE LEAVES.

PROFESSOR G. CARBONI has recently been conducting a series of experiments to determine the formation of starch in Vine leaves. It is known that the decomposition of carbonic acid takes place only by day and under the influence of sunlight, and that the carbonic acid thus acquired is absorbed within the chlorophyll cells of the plant-leaves, and that starch composed of carbon and the elements of water is undoubtedly among the earliest products. Professor Carboni found that none of the Vine leaves examined contained starch before April 28, but by May 12, when the growth was most vigorous, the formation of starch was very general, and it continued until November. It was further discovered that the starch formed in the Vine leaves during the sunshine of the day disappeared again in the night. At 4 o'clock on the morning of June 25, 1884, half of a leaf was removed, the other half being left attached to the midrib. The

half removed contained no starch whatever, but two hours afterwards the half which remained was found fully charged with starch, which, however, disappeared again with the return of sunshine the next morning. The youngest leaves of the Vine do not produce starch, and the older leaves cease to form it after a certain period.

From these exceedingly interesting experiments Professor Carboni reasons the justification of pinching out the young Vine shoots which are formed too late to be of any permanent use to the fruit-bearing plant, and also the propriety of removing the old leaves which are produced below the Grape clusters. *J. J. W.* [This is interesting in connection with Sach's experiments on starch formation in leaves, previously recorded in our columns. ED.]

## JAMAICA PRODUCE.

THE following table, published in Mr. Morris' last Report of the Botanic Gardens of Jamaica, will show the great strides taken in the export of fruit from Jamaica to the United States during the last ten years:—

FRUIT EXPORTED IN 1884 AS COMPARED WITH 1875.

Article.	Quantity.		Value.	
	1875.	1884.	1875.	1884.
Cocoa nuts (number) .. .. .	2,007,893	5,439,730	£ 599 7 3	£ 20,670 19 4
Bananas (bushels) .. .. .	58,411	1,842,934	5,590 0 0	191,972 5 10
Limes (barrels) .. .. .	635	670	254 0 0	268 0 0
Mangos (number) .. .. .	57,820	126,968	43 7 4	180 6 3
Oranges (number) .. .. .	4,673,820	41,639,500	3,271 13 5	58,295 6 0
Pine-apples (dozen) .. .. .	389½	14,070½	116 16 0	2,110 11 6
Plantains (number) .. .. .	14,250	?	35 10 0	31 3 0
Shaddocks (barrels) .. .. .	6	11	0 17 6	5 5 0
			£14,911 11 6	£273,533 16 11

If the New Orleans market (within four days by steamer) were open to Jamaica there is no doubt the exports under this head might be considerably increased. New Orleans could very conveniently take all the Jamaica fruit during the winter months when the trade with the northern ports is comparatively low. The chief elements which have contributed more than any other to the small trade now existing between this island and New Orleans are the very irksome and unnecessary quarantine restrictions imposed during six months of every year upon all vessels arriving at the latter port from this island.

### ORANGES.

The export of Oranges is increasing by rapid strides, as will be seen from the table. The demand for Orange plants is in excess of all other plants from the public gardens, and this would indicate that the regular cultivation of the Orange tree is being taken up with spirit and energy.

### BANANAS.

The rapid growth of the export of this essentially tropical fruit is most remarkable and suggestive. Nearly the whole of the Bananas at present are shipped to the Northern parts of the United States, viz., New York, Philadelphia, and Baltimore. The trade with New Orleans is small and irregular. If, however, this important market could be fairly opened to Jamaica there is no reason to doubt the trade might assume still larger proportions. As noted below, the export of Bananas (which is our chief fruit industry) last year, viz., 1884, was 1,842,934 bunches, of the value of £191,972. Ten years ago the exports were only 85,083 bunches of the value of £6381. The development of this industry has brought into cultivation large tracts of lands formerly lying useless or poorly cultivated; and it has also been the means of circulating nearly £200,000 per annum in ready money amongst all classes of the community. The particular kind of Banana chiefly cultivated is the yellow kind, sometimes known as the Martinique, but now known in the United States as the Jamaica Banana, to distinguish it from the large red Banana formerly exported in large quantities from Cuba. The Cuba Banana has now been almost entirely replaced by the brighter and more attractive as well as the more luscious fruit from Jamaica.

### COCOA-NUTS (COCOS NUCIFERA).

The largest export of Cocoa-nuts from Jamaica ever recorded was in 1880, when over 6,000,000 green nuts, of the value of £20,500, were shipped to England and America.

The hurricane of August 18, 1880, so severely damaged the trees, especially in the eastern and northern districts of the island, and so injured the blossom and crop of young nuts that were then showing, that the exports of the year 1881 fell to two and a half millions, or nearly one-third of that of 1880.

The severe droughts of the last three years have also contributed their quota to reduce crop on Cocoa-nut plantations, but happily now there are indications that these adverse influences are beginning to be less felt, and the Cocoa-nut crops are assuming almost their former proportions.

### VANILLA (VANILLA PLANIFOLIA).

The cultivation of this economic Orchid, which produces the valuable Vanilla beans or pods of commerce, is being taken up very widely. To encourage it as much as possible cuttings are distributed by post, with plain hints as to their treatment.

### BLACK PEPPER (PIPER NIGRUM).

The Pepper vine is indigenous to the forests of Malabar and Travancore (Southern India), and although black Pepper is exported from many countries, that which comes from Malabar is acknowledged the best. By the valuable aid of the Royal Gardens, Kew, some black Pepper plants have been obtained direct from Southern India, which are now being established and propagated at the Castleton Gardens. The three varieties received are:—Piper nigrum, "Ballam cotta"; Piper nigrum, "Culla vully"; and Piper nigrum, "Kew variety." These new sorts, in addition to those already in the island, will enable interesting experiments to be carried out as to the value of each and the conditions under which they may best be cultivated. In 1882 Mr. Syme reported that "the black Pepper vine was perfectly naturalised, run wild, and fruiting profusely on the Her Boreale estate, near Annotta Bay.

## The Rosery.

### PEGGED-DOWN ROSES.

A GREAT many years ago I paid a visit to that ardent and successful florist, the late Mr. C. J. Perry, at his residence near Birmingham, where many things were grown in a style that one rarely sees, Roses and Verbenas being especially well managed. Amongst other methods of growing Roses was that of pegging them down instead of growing them upright. Dwarfs, whether on their own roots, Manetti or seedling Briers, are apt to throw up long vigorous shoots. At one time these were called robbers, and were considered rather damaging to the plant than otherwise, and they were cut away. Now, on the other hand, these are regarded as the flower-bearers of the following year, being at pruning time cut back to three or four eyes, while the old bearing wood is cut out. Mr. Perry's plan was different. The old wood was cut out, but these long shoots were left, and were then turned down and pegged

to the ground; every eye then started, and the result was such a profusion of bloom as could be obtained in no other way, and it was certainly a grand sight to see these beds in full bloom. In the *Rosarians' Year Book* for 1885 Mr. George Paul has reverted to the subject, and has given directions much in the same direction as the system pursued by Mr. Perry, only, if I recollect aright, he used merely to top the long shoots, and not to cut them back, as Mr. Paul recommends; nor should I be inclined to do as he recommends—allow the strong vigorous shoots to flower; indeed, in my limited experience, they rarely attempt to do so, but when they do I should nip out the flower-buds, so as to throw as much strength as possible into the growth of the plant.

A system which I have lately seen, and which is analogous to this, with Mr. Foster, silversmith, at Asbford, the inventor of the tube and support for showing Roses in, which has obtained so much favour amongst exhibitors, and deserves, I think, a notice. It is in its main features the same, the treatment of the plant is exactly similar, but instead of the shoots being pegged down to the ground, they are tied out about 1 foot from it, the shoot being secured to a short support just high enough to hold the shoots, and then when the foliage grows these supports are hidden. I saw the other day in his garden a number of Roses thus treated, having shoots 5 feet long, and a profusion of buds showing all the way along them. The advantage of this plan over the pegged-down system seemed to me to lie in the fact that, not being so near the ground, the flowers are not so likely to be splashed by the heavy rains, and they are, moreover, nearer to see and to handle, which to some of us is not a matter of slight importance.

All Roses are not amenable to this treatment; some are too delicate—in fact, rarely throw up those strong shoots which are the foundation of the whole system, while others are almost too vigorous. The following list, given by Mr. George Paul, is perhaps as trustworthy a one as can be had of those which fall under the category of vigorous but not rampant growers:—Camille de Roban, Charles Darwin, Charles Lefevbre, A. K. Williams, Beauty of Waltham, Duke of Teck, Duc de Rohan, Camille Bernardin, Dr. Audrey, Elie Morel, Fisher Holmes, Etienne Levet, Général Jacqueminot, Henri Ledechaux, La France, Maurice Bernardin, Marie Baumann, Mdlle. Eugénie Verdier, Abel Grand, Comtesse d'Oxford, Comte Rambaud, Duchess of Bedford, Countess of Rosebery, Duke of Connaught, Egeria, Madame Lacharme, Madame Victor Verdier, Mdlle. Thérèse Levet, Marie Rady, Mons. E. Y. Teas, Pride of Waltham, Victor Verdier. I have left out a few which I do not think suitable or good enough for the purpose.

I would take this opportunity for replying to a question of my friend Mr. G. F. Wilson, with regard to the use of *Rosa rugosa* as a stock for Roses—a question which I do not think that any one has answered. I cannot answer it either as to reporting on its capabilities from experience, but I have had a letter from a correspondent in Boston, Mass., U.S.A., who says that "they are going in for it largely as a stock in America." *Wild Rose.*

## HARDY FRUIT TREES IN THEIR ORNAMENTAL ASPECT.

THE face of Nature presents fewer more beautiful and interesting features during the months of April and May than that offered by hardy fruit trees. This has been exemplified in an unusual degree during the present season, although the weather during the greater part of the month of May was very ungenial. It is to the ornamental aspect of our hardy fruit trees when in bloom that I should wish to call attention, and to suggest the desirability of rendering the orchard more attractive and more enjoyable during the flowering season and throughout the entire year than is usually found to be the case, and this I am inclined to think could be easily accomplished. The beauty of the Apple, the Pear, and the Cherry tree, &c., when in flower seldom fail to command admiration, but the orchard is seldom laid out and kept in such condition as to render it attractive as a promenade, or enjoyable as a garden.

Standard fruit trees, such as the Apple and the Plum, &c., are not infrequently found in the kitchen or vegetable garden, where they are often out of place, unless it be in the form of cordons or espaliers; while in orchards such trees are

generally found in the form of standards, planted in lines or irregularly, and often little cared for further than as regards the gathering of their fruit. But when the beauty of the trees is taken into consideration it suggests the advisability of giving more consideration to their disposal, or the planting, laying out, and the keeping of the orchard, which, instead of being placed in some out-of-the-way place, might readily be rendered an interesting, attractive, as well as a valuable adjunct. Let an orchard be supposed to be formed, or laid down on grass, with gravel paths intersecting or surrounding it, and instead of planting the trees in lines, let clumps or groups be formed, which might be made to assume any desired form, and be of any desired dimensions; and in these clumps or beds the trees may be planted at proper distances from each other. In the case of the Apple, tall or standard trees might occupy the central portion of the plots, while pyramidal or dwarf-trained trees might be planted between them and the margin, which could be formed by single or double cordon trees. Similar, or if desired smaller beds might be formed of the various other kinds of fruit trees, such as the Cherry, the Plum, and the Pear, &c.; while single specimens or standards might be made to occupy suitable positions upon the greensward: and, to still further increase the beauty and attractiveness of the orchard, beds or clumps of spring flowering plants, and bulbs might readily be introduced, so as to render it a pleasing combination of the spring flower garden and orchard, which could hardly fail to be interesting throughout the spring and early summer months. As regards such fruits as the Apple and the Pear it is too generally considered that further assistance after the planting of the trees is unnecessary, or indeed injurious rather than otherwise. It need hardly be said, however, that this is far from being the case, as the desired form and healthy development of such trees can be materially assisted by the careful application of timely pruning, and the thinning out of the branches. And it should be borne in mind that such trees are planted for the production of fruit rather than of timber.

Not a few of our most useful varieties of the Apple and the Pear are found, irrespective of the character of the season, to bear only in alternate years, *i.e.*, if a tree produces a heavy crop of fruit in one season it will be in vain to expect the same to furnish a large crop the succeeding one—a result, doubtless, to be ascribed to exhaustion, a condition that might in some measure be counteracted by thinning out the fruit as soon as it is fairly set, on all trees inclined to crop heavily in alternate years. All the varieties of Apple are, when in full bloom, very beautiful objects; some of them are, however, on account of the large size of their flowers, even more so than others, as for instance the New Hawthornden, some varieties of the Codlin, such as Nelson's Codlin; while the profusion of bloom generally borne by standard trees of the Morello Cherry, combined with the purity of its colour, renders such trees objects of the greatest beauty. *P. G.* [We think that the decorative treatment of orchards deserves some more attention than is usually given it, but the paying part of the question must not be lost sight of in these economising days. *ED.*]

### ADIANTUM NOVÆ CALEDONIÆ.

OUR illustration (fig. 173) gives a good idea of the habit of growth of this new species of Adiantum, which was shown by Messrs. Birkenhead, of Sale, Manchester, at the Whitsuntide show of the Royal Manchester Botanical and Horticultural Society in 1883. Adiantums in their endless diversity of form, and from their elegant habit and generally enduring character, have become quite indispensable to the gardener of the present day, who has much indoor decoration to carry out, and this variety will be very useful by reason of its succeeding in the temperature of a greenhouse. A full descriptive account of this Fern, by Mr. T. Moore, will be found in the *Gardeners' Chronicle* for June 9, 1883, p. 720.

**CODONOPSIS OVATA.**—A dwarf hoary Campanulad, with small entire ovate leaves and erect thread-like flower-stalk, bearing a solitary nodding flower about 1 inch long, bell-shaped, pale lilac, with darker spots at the base of the tube. Very graceful and pretty.

## Orchid Notes and gleanings.

### THE CULTIVATION OF ORCHIDS.

TWENTY-FIVE years ago I had six or seven Orchids in a collection of stove plants under my charge, and few as these were, they awoke in me a deep and lasting interest in their culture. As opportunities occurred I visited places in the neighbourhood where Orchids were grown, and always and everywhere I saw a large number of old leafless back growths, more especially on the larger specimens of Cattleyas and Dendrobiums. Sometimes I ventured a question as to the use of these old dry things, and was very seriously informed that Orchids were very curious things, and that these old bulbs added strength as well as value to the specimen. Ah! I now regard many of them

largest blooms and strongest spikes are from the smallest plant.

Having mastered the art of management with this species my next special effort was with the Dove Orchid (*Peristeria elata*). I attended to what I considered its requirements with unflagging attention, and watched its growth with the deepest interest, aiming to get as large bulbs as possible. But by slow degrees I discovered my mistake, for though I got good bulbs they did not all produce blooming spikes. And I found that the conditions suitable to bringing Phaius to perfection failed in this case. One secret in Orchid life, however, I learned from this species, and that was that every new growth soon produced roots, and thus became an independent plant. And acting upon this fact I felt sure that I ought to discard the worn-out bulbs. This was about sixteen years ago, when the *Dendrobium nobile*, which has been already described, came in for special treatment, I was not so confident on the point with

FIG. 173.—ADIANTUM NOVÆ CALEDONIÆ.

as ruins of former glory, or as evidences of Nature inviting the assistance of the cultivator, and at the same time showing the skill of past handling; but some I regard as monuments of the truth uttered by these veteran Orchid growers, and will therefore hold their names in reverence. But these answers set me thinking and searching out some of the secrets of Orchid nature and life. My opportunities were few and the material scanty; as a consequence, my progress was slow.

My first step was taken with a small specimen of *Phaius grandifolius*, then generally called *Bletia Tankervilleæ*. I aimed to get the finest foliage and strongest flowering spikes possible, and I got rewarded by two spikes from one bulb. At potting time I cut away all the old bulbs which had lost their leaves, and I have continued to do so till the present time. We have now two plants, one of two bulbs bearing three spikes; another of five bulbs, which carried seven spikes. The tallest spike is 5 feet high; it commenced to bloom the last week in January, and had still ten good blooms on it on May 16. The

the *Dendrobium* at first, for habit, growth, and production of bloom were altogether different in the two plants. With *Phaius* the pruning had been mere guesswork up to this time, and with the *Dendrobium* I was somewhat doubtful for the first year or two after trying it, but my doubts have vanished now for some years. But to follow *Peristeria*. At every potting time I cut away all the back bulbs which had lost their leaves, leaving only the last newly formed one, and that which had produced it. These were, as a rule, potted on in 24-size pots.

The old bulbs were thrown away, when not required for increasing stock. Here, however, I would say that this Orchid is very obliging to the propagator, for every old bulb will soon become a parent again if well handled. This practice was continued, then, every year, and I began to find out more secrets as time passed. One other was to get two spikes of bloom from one bulb. This leads me up to the date July, 1879, when we exhibited a specimen at the Bittern show having five spikes of bloom; four of these were the production of two bulbs. The three

new bulbs had produced five spikes. This plant was mentioned in the report of the show in the *Gardeners' Chronicle* of July 12 of that year. Two blooming spikes is now the rule with me when special efforts are made. I once had a bulb with three, and by relating its history I will bring my present note to a close. The specimen just mentioned was treated as I have already described, as to pruning and potting. In the spring of 1881 a very promising looking bulb was cut clean away, from the one which produced it, and potted up singly. In August of the same year this bulb was taken to Southampton show and worked into a group of plants for "effect." No one seemed to notice it except Mr. E. Tudgey. His keen eye saw something more than a Dove

besides many in bud, and the other had fourteen open, besides many in the bud. I have just potted this plant, but not pruned away any of the old growths, for I want to have a large specimen (*bonâ fide*), and I want also to get each growth to produce two spikes of bloom, that from the five growths now rising I may get ten spikes next year. I can do this with single bulbs, as I have before said, but with larger plants unpruned I have not yet obtained the two spikes to every bulb. But this may be attained by the non-pruning growers; perhaps it has, only I have never heard of it. We have this year but three specimens, besides the one I have been describing, and two of them are pushing up two spikes, and a growth from each bulb; the other a plant of four

sort this bulb anticipated in one year the growth of twelve! As may be gleaned from what was said about the growth of bulbs in general in the article on "Double Daffodils," in the "indefinite" type of bulbs such a condition is possible, but in the definite type, such as that of the Tulip, it is difficult to imagine such a state of things.

## Foreign Correspondence.

### THE FRUITS OF THE ARGENTINE REPUBLIC.

THE United States Consul at Buenos Ayres has recently furnished to his Government a very full report on the climate, soil, and fruits of the Argentine Republic. In the matter of fruits he points out that with such a soil and such a diversity of climate nearly all the fruits of the world may be grown. Many grow so abundantly in a natural state that it is not necessary to cultivate them. Others are cultivated in the sense that they are planted in orchards or belts and are then left to take care of themselves, while others still have some degree of attention devoted to them.

The Orange, for instance, was originally imported into the basin of the River Plate, but it soon multiplied to a great extent, and now, in certain localities, grows wild, sometimes forming veritable forests. The lower Parana and the islands which form its delta are covered with these trees. They are also found more or less numerous on the islands of the upper Parana, on those of the Uruguay, and sometimes even on the borders of those rivers. Farther up those rivers the Orange becomes more frequent, in the forest of the Misiones as well as those of Paraguay.

On the lower islands of the Parana and Uruguay the fruit which the tree yields is somewhat bitter, sour, and acid, but farther north, and especially in the province of Corrientes, in the Misiones, and in Paraguay, they are deliciously sweet and of very large size. The Orange is produced perfectly from the seeds and these being scattered everywhere by the parrots, which are exceedingly fond of the fruit, explains the fact of its general dissemination. In the Misiones and Paraguay many of the inhabitants content themselves with gathering their supply of Oranges from the wild trees of the forests rather than trouble to plant their own orchards. The tree commences to bear fruit at the age of six years, and is in full bearing at eight years. It is of very robust habit and is perfectly proof against drought and locusts, the two worst plagues of agriculture in the Argentine Republic. The shipments to market from the upper rivers begin in April and May and run through July and August. The steamers which ply between Buenos Ayres and Asencion, all return laden with the delicious fruit, a half a million of Oranges sometimes being piled up on their hurricane-decks and are free during the voyage to all passengers who choose to partake.

Some little movement toward the utilisation of the surplus Orange crop in the preparation of preserves and sweetmeats has been made, but the industry is yet very insignificant. The Lemon is grown all over the Republic, and is very prolific, not merely producing two crops per annum, but maturing a continual succession of crops. The Sweet Lemon is also grown in the northern provinces. It is eaten like an Orange, and is most deliciously refreshing.

The Olive (*Olea europæa*) is also thoroughly at home in the Argentine Republic, where it grows to an immense tree. The trees are planted in orchards from 10 to 20 feet apart, and are kept down by pruning and heading-in, but they require no further care. They come into bearing in about five years after planting, and they continue to bear almost for an indefinite period. At present the home-grown trees only in part supply the local consumption, pickled Olives and olive oil being imported into the country from Europe. It is calculated that if the Olive cultivation were prosecuted with energy it would become in a comparatively short space of time a very important branch of commerce.

The Fig is described as a favourite and generally distributed fruit of the country, which grows indigenous. It thrives everywhere, and gives the best results, especially in the regions bordering the Parana River. The tree often grows to a height of

FIG. 174.—A PROLIFEROUS HYACINTH.

flower, and he questioned me to ascertain whether it was an imported or a home-grown bulb; he said he had never seen anything like it before. It was carrying three spikes of blooms, and was also making three young growths. These bulbs were small at the end of the season, but were about equal in size and strength. My object has been to make as good a specimen as possible from this plant. In 1882 it was repotted and grown on; the same also the following year. And last year (1884) it was exhibited at Southampton as a single specimen, and took the honours, though two others competed for the prize, and, moreover, it drew forth a special mark of commendation from Mr. Williams of the Holloway Nurseries, who visited the show. It had five new, or flowering bulbs, with six spikes of bloom, five of which had twelve open,

bulbs, one spike, and a growth from each. Now, with my knowledge of these facts, I think I am justified in defending the pruning system. If pruning away the old back-growth weakens the plants, how is it that ours are still so strong, and so free to bloom? *Lælias*, *Cattleyas*, and *Ansellias*, will be the subject of next note. *N. Blandford*.

### PROLIFEROUS HYACINTH.

MR. JARMAN, nurseryman, of Chard, sent us some time since the Hyacinth from which our illustration (fig. 174) is taken. It will be seen that no fewer than twelve flower-spikes were produced from one bulb. This was brought about by the development of lateral spikes in the axils of the bulb-scales, so that in some

40 feet, forming a massive trunk. In the provinces of San Juan, Rioja, and Catamarca, the crop attains to large proportions, and considerable quantities are dried for commerce and find a ready sale all through the interior of the country. While in the provinces bordering on Parana the fruits are produced abundantly, no movement has ever been made to dry them, the people being content to consume the Figs while fresh; though it is an industry that will sooner or later become developed. Two kinds of Figs are grown—the white, which are properly called figs, and the violet or purple-coloured, which are called *brevas*.

The Date Palm (*Phoenix dactylifera*) has been introduced, and is cultivated slightly, but the Dates are of a very inferior quality. The Banana, Chirimoyer (*Annona cherimolia*), Papaw (*Carica papaya*), Nispero (*Psidium guajava*, var. *pomiferum*), Cherries, Pears, Apples, Peaches, Almonds, and Plums are all more or less cultivated, also the Pomegranate (*Punica granatum*) which is stated to become quite a large and robust tree, growing to a height of 20 to 30 feet. The Pistachio nut (*Pistacia vera*) is sometimes seen in private gardens, and appears to thrive well, also the Mulberry (*Morus alba*) which is stated to bear fruit very abundantly. *F. R. ?*

## HARDY SHRUBS.

**ASTER ARGOPHYLLUS.**—A specimen of this old-fashioned greenhouse shrub has been sent us from Cornwall, where it has produced its flowers in the open air. Its large lanceolate sharply toothed leaves are white on the under-surface, and have a delicious perfume of Musk. The flower-heads are small, whitish, and arranged in loose branching panicles. The shrub is a native of Tasmania.

### CHOISYA TERNATA,

popularly known as the Mexican Orange, is one of the most ornamental shrubs now in bloom. The silvery stars, which are singularly like Orange-blossom and on the Continent commonly grown as a substitute for that popular bridal flower, are deliciously sweet-scented, and produced in rich profusion at the apices of the last year's growth. It is perfectly hardy, and is never injured even by the severest winters, although occasionally we have seen it damaged by late spring frosts. As an ornamental wall plant it is particularly deserving of notice, not only on account of its flowers, but fresh evergreen foliage as well. It is readily propagated by inserting in sandy soil cuttings of the last year's growth as soon as the new growth is completed, and before it becomes hard and woody. They should be placed indoors, and on no account allowed to flag, as if that happens the greater number will refuse to root.

### THE DUTCHMAN'S PIPE (*ARISTOLOCHIA SIPHO*)

is in many respects a distinct form of climber. The large glabrescent leaves render this plant one of the most conspicuous coverings for a wall that can be imagined. The flowers, which are small and inconspicuous, resemble a siphon, and are usually hidden beneath the foliage, thus rendering the plant well suited for occupying a place over a path, as nowhere else are these remarkable flowers seen to better advantage. Being a native of North America, it is perfectly hardy and well suited for our climate, the only drawback being that, as a wall plant where sufficient space is given for its ramifications, one sees it far too seldom. It is rather difficult to propagate, but cuttings of it inserted in loam and sand and placed under glass generally do well.

### PIPTANTHUS NEPALENSIS, OR THE EVERGREEN LABURNUM.

In this will be found at present a very desirable flowering shrub. It has trifoliate leaves and large yellow flowers in terminal bracteate racemes. Being somewhat tender, hailing from the Himalayas, this handsome plant should be placed in a rather warm sheltered situation, indeed it is perhaps seen to best advantage when trained to a wall, as not only is it there somewhat sheltered during severe weather, but late spring frosts, to which this country is very susceptible, are not so likely to cut off the flowers. Being earlier in flower than the Laburnum it is very desirable, and is a valuable addition to our early flowering shrubs. Here, at Penrhyn Castle, it is perfectly hardy in all situations, but I am informed that in the neighbourhood of London, as well as many

other parts, it is not unfrequently cut down to the ground. It is readily propagated from seed, which it bears in great abundance.

### CEANOTHUSES.

Beautiful as are many of the *Ceanothuses*, their liability to be killed during severe winters has doubtless caused them to be much neglected. As wall plants they, however, usually stand uncathed, more especially *C. dentatus* and its variety *grandiflora*. The latter is a distinct and lovely plant, indeed one of the most profuse bloomers with which I am acquainted, which, coupled with the peculiar evergreen foliage, renders the plant when in bloom a most conspicuous object. In a compost of good rich loam, with an addition of peat or leaf-mould, this plant grows freely, and if suitably situated the young wood becomes well matured during summer and passes through the winter unharmed. Pruning back is very advantageous to this plant, and will cause it to bloom more freely than if left alone. *A. D. Webster.*

### CERCIS SILIQUASTRUM (JUDAS TREE).

This is one of the most beautiful of ornamental trees, and is a most striking object when in flower. It has been many years in English gardens, but is, nevertheless, singularly scarce. It grows freely in ordinary garden soil, and in almost any situation. It is perfectly hardy, grows well as a specimen on the lawn or trained to a wall or trellis, and deserves to be more generally cultivated. The specimen, 30 feet in height and about 25 feet through, grown at Muntham Gardens, Worthing, must be a very striking object when in flower. It is strange that a tree of such striking beauty should be so little grown. If nurserymen were to introduce it more to the notice of planters they might extend its cultivation, as it only needs to be seen to be appreciated. *M. S.*

## Notices of Books.

**Introduction à la Botanique.** Par J. L. de Lanesan. Paris: Felix Alcan, 1885.

This work is intended to furnish the educated reader some knowledge of the general principles of botanical science, without the necessity of wading through numberless details. The author chooses the Spruce Fir as a text, and describes pretty fully its organisation and histological structure, with constant reference to other types and with frequent allusion to the physiological office of the several structures. M. de Lanesan contrives in this way to give a great deal of general information respecting the organisation of plants in general. In a popular work of this character, however, he might well have been more didactic, and not puzzled his readers with controverted points about the nature of the inferior ovary, or the seed of Conifers. A discussion of the different views held by various botanists is out of place in such a treatise.

### Yarrell's British Birds.

The fourth edition of this invaluable treatise is now completed with the publication of the thirtieth part (Van Voorst). The first two volumes were revised by Prof. Newton, the two latter ones by Mr. Howard Saunders. Copious indices are attached.

### Clematis.

Dr. Otto Kunze has published in Germany a monograph of the genus *Clematis*, in which he admits sixty species. The main subdivisions are founded on the erect or climbing habit, and the presence or absence of bud-scales. Of our common *Clematis Vitalba*, some twenty subspecies or varieties or forms are enumerated, which will serve to show the method upon which the author has worked. *C. Jackmanni*, hort., is considered as a hybrid between *C. florida* and *C. viticella*. A good index is appended.

**Where to Find Ferns.** By F. G. Heath. Society for Promoting Christian Knowledge.

A pretty little book, giving not only indications where to find Ferns, but also illustrations and brief descriptions of the Ferns themselves. We could almost wish the author had confined to a chosen few only the localities for certain Ferns. Extinction

is the certain and not remote fate of some species. Needless to say that those who are indirectly responsible for this are those Fern lovers, whose love is on the surface, and whose requirements at any rate would be much better supplied by the nurseryman. Some future Chancellor of the Exchequer will have to put a tax on wild plants brought to market; many of them stand in greater need of a "close time" than do the birds. Meanwhile it is, we admit, selfish to wish to keep such innocent delights to ourselves. With the author we would fain see the appreciation of Nature become universal, and we have not the heart to quarrel with an author who gives us such a pretty book, and one which awakens such pleasant associations.

### The Forest Flora of South Australia.

The last part of Mr. J. S. Brown's useful publication contains folio coloured plates and botanical descriptions of *Eucalyptus gracilis*, one of the "Mallee" trees of the colonists, the word being applied to those species which branch from the base, like a shrub, rather than those which have one distinct trunk; *Myoporum insulare*, or Blue Berry, a tree with a very rough bark, obovate leaves, inconspicuous flowers, succeeded by numerous purple berries each the size of a Pea, which are more attractive to the eye than to the palate. The tree is mentioned as suitable for planting in the vicinity of the sea. *Melaleuca squarrosa* is one of the so-called Bottle-brush trees, so called from the aggregation of numerous yellow flowers in cylindrical masses round the ends of the branches. It is one of the so-called Tea Trees of the colonists. *Pittosporum phylliræoides* is a shrub with slender pendulous branches, narrow green leaves, small yellow flowers in loose clusters, and succeeded by ovate, pointed, yellowish, capsular fruit. It grows in exposed sterile parts of the country, and is of elegant habit. The foliage is eaten by stock.

## THE COLOURING MATTERS OF FLOWERS AND FRUITS.

A VERY interesting communication has recently appeared in the *Verhandlungen der Physik. Med. Gesellschaft zu Würzburg* on the subject of the colouring matter in flowers and fruits, contributed by Dr. A. Hansen. It appears that a relatively small number of pigments serves for the production of the seemingly endless variety of colour in flowers and fruits. The white and black shades which we encounter there are not due to any special colouring matter. White is due merely to the reflection of light through colourless tissues containing air. Blacks owe their origin merely to the dense concentration of violet pigments. If we set aside chlorophyll-green, which is rarely met with in flowers, we may recognise the three following groups of colours:—(1) Yellows, (2) reds, (3) blues and violets. Hildebrand has previously demonstrated that the yellows are mostly in combination with the plasmic substance, whilst the colours of the second and third group are generally found existing in the cell-sap. The yellow of flowers forms an insoluble compound with fatty matters, as was demonstrated by Krukenberg in the animal kingdom under the name of lipochrome (this may go far to account for the general comparative permanence of the yellow colours both of plants and animals). The yellow pigment, obtained by Hansen in a pure crystalline state by saponification with soda and extraction with petroleum ether, agrees in its behaviour with lipochromes. The spectra of the pigments of different yellow flowers agree with each other so closely as to lead to the conclusion of their mutual identity. Between the F and G lines there occur two absorption bands, which do not, however, always occupy exactly the same position. The solutions are not fluorescent. Orange is formed by a denser deposit of the yellow pigment. Thus the colour of the rind of an Orange is due to the same pigment as is found in the yellow flowers of *Ranunculus repens* (Buttercup, Kingcup). The colour of yellow Dahlias and of Lemon-rind is not a lipochrome. It is soluble in water, and behaves differently both chemically and spectroscopically, displaying, for instance, no absorption bands. It is very similar to the pigment of *Æthelium septicum* (the yellow fungus or mould on rotten wood) examined by Krukenberg. The reds of flowers may be reduced to a single pigment—the rose-dye of Roses, Carnations, Pæonies, &c. It is soluble in water, and is decolourised in

alcohol, probably in consequence of dehydration. On the addition of an acid the colour is restored. The spectrum displays a broad absorption-band between D and F. The varying intensity of the colours of Roses, Carnations, and Pæonies depends probably on the presence of acids. The scarlets and brick-reds of Poppies, scarlet Lilies, the berries of the Dog-Rose, &c., are produced by the simultaneous presence of lipochrome.

The blue violet pigments turn pale also in alcohol. The solution is reddened by the addition of an acid, as was noticed by Fremy and Marquardt. They assumed, therefore, that the red colours were merely the pigments modified by acids. Hansen, on the other hand, holds that the blue and violet colours are derivatives of the red. In favour of this view is the fact that certain blue and violet flowers (Boraginæ) are at first red. The flowers *Erica cinerea* (Pine-leaved Heath) are on opening red, but turn more to a violet on fading. On the contrary, the corolla of many *Fuchsias* passes from a bluish violet to a red. Salts of iron turn the red of Pæony flowers to a violet. It is well known that gardeners can produce blue *Hydrangeas* by adding iron to the soil. Pæony-red is turned to a violet by the addition of sodium phosphate, and larger quantities of the same reagent render it blue. The spectrum of the blue and violet pigments has two absorption bands between D and  $\delta$ . These pigments also may be combined with lipochrome-yellow, they producing the colour of the berries of *Ampelopsis* (Virginia creeper). Hansen does not refer to the red, blue, and violet colour granules which occur here and there in flowers and fruits. He assumes, therefore, only four fundamental pigments—soluble yellow, lipochrome-yellow, flower-red, and chlorophyll-green. He opposes the view that all colours are derived from chlorophyll-green, since their spectra do not agree. The change of colours of green fruits and green leaves in autumn he accounts for by the destruction of the chlorophyll, and either the simultaneous formation of new pigments, or the unmasking of lipochrome which existed previously, but which was concealed by the chlorophyll. Brown decomposition products co-operate in the production of the autumnal colours. *English Mechanic*.

thoroughly rotten manure is given over the surface, *Calceolarias* and similar plants will derive much benefit therefrom, and much labour otherwise spent in watering will be saved.

#### EDGING AND WALKS.

Box edging should now be trimmed as neatly as possible. Gravel-walks should receive a sprinkling of new gravel over the surface, and be then well rolled. Cleanliness and order should be maintained throughout, so as to make the garden as pleasing as possible.

#### TREE OR PERPETUAL CARNATIONS.

These should be carefully attended to, and well supplied with manure water, and if already mulched with decayed manure will be much benefited by its application, which assists them to develop their blooms and prolongs their flowering season. I find the Tree Carnations far the best for bedding out, as they last so much longer in bloom than the ordinary border kinds, and are so much freer flowerers than those; and as there are so many splendid new varieties to select from, they are most useful for cut flowers. They should be exclusively grown, as they are favourites with every one. *W. Smythe, Basing Park, Alton*.

## The Hardy Fruit Garden.

APPLE trees on hot gravelly soil will require attention as to watering, otherwise they will suffer, and in many cases mildew will appear with the hot weather. This should by no means be allowed to become established. Sulphur dusted over the affected parts is a good remedy.

#### SMALL FRUITS.

Gooseberries, Red Currants, and Black Currants would be all the better for the young shoots being thinned out, leaving only sufficient to form good bushes, the best and largest fruit being always borne on the young shoots or spurs of the current year's growth; hence the importance of having these vigorous and well ripened, and this cannot be expected if all the young shoots are allowed to grow until winter pruning. All kinds of fruit trees are better for the summer shoots being well thinned out; it not only allows the sun to ripen the wood for next year's crop, but allows the sun and air to colour and ripen the fruit. This is an important point where fruit has to be kept any length of time, more especially with Apples and Pears. It is well known that a thoroughly ripened Apple or Pear will keep much better than a green or half-ripened one.

#### WALL TREES.

These now require constant care and attention: the most important points are keeping the trees free from insects, the most effectual means of which we know, are careful syringing with clear rain-water, pinching in any misplaced shoots that may have been overlooked when disbudding the trees, nailing up the strongest to the wall. Any weakly shoots that it is desirable to encourage are better left unnailed for a time—they will grow stronger if left at liberty. Morello Cherries should be gone over again, and all wood not required should be pinched-back or cut away. When the shoots are thio, a certain number of them might be pinched back to form fruit spurs for next year's fruiting. Pinch back to one eye above the fruit all Vines on walls, and stop the laterals; water with manure water when dry. Fig trees on walls should have all the young bearing shoots stopped at five or six joints, and all weakly shoots cut clean away.

#### STRAWBERRIES.

Where the fruit is now ripening fast the beds will require netting from birds. Very light nets laid on the beds will as a rule keep them away; but where the fruit is used for dessert, and has to be gathered two or three times a day, I prefer having the nets placed a sufficient distance above the beds so as to allow of the fruit being gathered without having to remove the nets. For this purpose I use light poles placed all round the beds, driven sufficiently firm into the ground to bear cross pieces to be placed on the top of them, so as to carry the nets about 3 feet clear of the ground. The first variety to ripen here is King of the Earlies, on the 12th inst. *J. Smith, Mentmore, Bucks*.

## Plants and their Culture.

#### FERNS: ADIANTUM CUNEATUM.

THE stock of this most indispensable Fern that is relied upon for decorative uses both on the plant and in a cut state should receive every attention during the next few weeks, in order to have plants of compact habit and hard durable fronds by the autumn. This cannot be achieved if the plants are kept in a moist stove temperature with comparatively little ventilation, and more likely than not a somewhat dense shade; these results may produce fronds of a dark verdant green, but not such as will be found of lasting properties, and consequently of the greatest value in a cut state. If we could select our own idea of a good house for them it would be one of such as are used by the trade growers for Cyclamen and other dwarf plants; here they would be near the glass, and provision could be made for abundant ventilation. Shading should only be applied during very bright sunshine, but an abundant supply of water would be needed at the roots. Failing such suitable houses we are compelled to use the best means we possess to obtain the best possible results. Our own plants are now standing thinly arranged on the staging of a lateinery, which, so far, seems to suit them very well, and gives a pleasing effect to the interior of the house likewise. Rather than allow them to be in the stove at this season we would prefer to keep them in cold pits or frames, and if they could there stand on a bed of coal-ashes a good quantity of seedlings might be had by the autumn. Any stock that has of late been severely drawn upon for cut fronds should be kept moderately dry at the root for a while; then after a rest the old fronds may all be cut away, the plants re-potted if needful, and started into fresh growth again, but not in a high moist temperature, for reasons already given. Two or three batches in different stages of growth would be found the most useful for a constant supply in the case of a large demand. These remarks will also apply to many other decorative Ferns, several other *Adiantums*, and *Pteris* in particular, likewise those that are most useful from among the *Davallias*, which for durability can hardly be surpassed. *James Hudson, Gunnersbury House, Acton*.

## The Flower Garden.

#### HERBACEOUS BORDERS.

THESE are now very gay, and to keep them in perfect order no labour should be spared in regard to staking and tying; the hoe should be used freely in dry weather, so that the weeds make no progress. A good supply of liquid manure will be very beneficial to most of the plants in these borders. Bulbous plants which have matured their growth may now be taken up and gradually dried and stored away in cool dry quarters till the autumn. The Persian Ranunculuses which are now showing bloom should be freely watered should the weather prove dry. Lawns will now require constant and regular attention in mowing, sweeping, and rolling, for if neglected at this period the effects will be visible throughout the summer. All large and broad-leaved weeds should be taken out as soon as seen; I find hand-weeding is the best method and safest, after having tried all others. The shrubberies much crowded with shrubs, and all recently planted subjects should, if the weather be dry, be freely watered, and afterwards mulched with short litter, &c. Care should be taken that they cannot be swayed about by the wind, till they become thoroughly established.

#### THE FLOWER BEDS.

The fine weather and bountiful rains have proved beneficial to the many newly-planted subjects in the flower garden. Even the tenderest kinds have already made satisfactory progress, and will soon fill their allotted spaces, and bedding plants are looking well and very promising, and many of the beds are already full. Every attention will be required in pegging, tying, and training into the proper form, and in pinching and stopping exuberant growths and such shoots as have already filled their spaces. Constant attention should be paid to watering if the weather continue hot and dry; and if a good mulching of

## The Kitchen Garden.

#### PLANTING OUT.

THIS work is out of the question so long as the present dry weather continues. The first early Broccoli will have now been in permanent quarters for some time. As soon as a favourable change takes place in the weather for planting, the second sown lot of Broccoli plants should be got out. There is no better system than drawing drills in which to place the plants, as during the time they remain open they offer a good receptacle for water, and after being filled in when the plants are further advanced. The additional soil about the roots and stems will steady the plants and protect them against wind-rocking, and another earthing-up later on should again take place. The main plantation of Brussels Sprouts, if not already put out, should be attended to on the first favourable change in the weather. A good plantation of purple sprouting Broccoli would be found most useful during March and April of next year, especially if the winter prove severe; and it will be wise to make a provision for a supply of this hardy variety. It should be allowed more space (when planting out) than other varieties, say to the extent of 6 or 9 inches. The same remarks apply to Cottagers' and Asparagus Kale, both of the greatest utility during severe weather, when the supply of Broccoli and Spinach is taxed to the utmost. One yard each way is not too much for Cottagers' on good land, 2 feet 6 inches or 2 feet on poorer land. Should these not be required for the dining-room they will be certain to come in useful, for the many other demands which the gardener has to meet. They will succeed well on north borders or under the partial shade of trees. A good plantation of Leeks should soon be planted out either in trenches or in deeply drawn drills on well manured soil. The young plants should be planted as deeply as the leaves will allow, the object being to obtain a long blanched stem, which will ultimately be secured by earthing-up, as for Celery. Spinach must be sown frequently (in various positions) until the time arrives for making the main winter sowing. A semi-shady place is best for it during hot dry weather. *G. H. Richards, Somerley Gardens, Ringwood, Hants*.

## POINTMENTS FOR THE ENSUING WEEK.

TUESDAY, June 23	Meeting of the Royal Horticultural Society's Committee; Show of Roses, Pelargoniums, and other Plants.
WEDNESDAY, June 24	Sale of Imported and Established Orchids, at Protheroe & Morris' Rooms. Richmond Horticultural Show.
THURSDAY, June 25	Sale of Imported Orchids from Messrs. Shuttleworth, Carder & Co., at Stevens' Rooms.
FRIDAY, June 26	Sale of Orchids from Messrs. Horsman & Co., at Stevens' Rooms.
SATURDAY, June 27	Sale of Imported Orchids from Mr. F. Sander, at Albans, at Stevens' Rooms.
	Sale of Imported Orchids, at Protheroe & Morris' Rooms.
	Canterbury Rose Show.
	General Meeting of the Royal Botanic Society, at 3.45 P.M.

IT is probable that one of the reasons why natural or home-made manures are considered so valuable by the gardener, and so much more useful for general purposes than any ARTIFICIAL MANURES, is that the effects of the latter are not fully understood.

Purely chemical manures are usually classed by those who know but little of the subject as stimulants, but a stimulant is something which causes temporary excitement, but does not produce any permanent good.

To the human race alcohol is called a stimulant. We hear of old people being sometimes kept alive by the aid of stimulants, but never of young people growing and thriving on them. Sir J. B. LAWES says: "Light and heat are the only stimulants to vegetation, all other things must be classed as foods." Therefore chemical fertilisers are not stimulants, but real plant-foods.

Let us examine the matter a little more fully. The food of plants consists of certain ingredients. Some of these are derived from atmospheric sources, the rest are furnished in solution in water from the soil. No plant can attain full development without a sufficient supply from the soil through its roots of potash, phosphoric acid, and some compound of nitrogen. Besides these lime, magnesia, sulphuric acid, chlorine, and perhaps silica, are sometimes, if not always, indispensable, though in some cases in fractionally proportions, to produce perfect growth.

The largest constituent of plants in the fresh state is water, which makes up from nearly three-fourths to over nine-tenths of the weight of most of our common garden plants. The next largest is the organic matter, which constitutes from 7 to 25 per cent.; and finally we have the ash constituents, which remain after the plant is burnt, forming from 1 to 6 per cent. of the plant in its natural condition.

The roots of a plant are the organs by which it absorbs water from the soil, and with this water a variety of food elements is introduced into the structure of the plant. The feeding power of roots and their fibrils is not, however, confined to the taking up of ready formed solutions, they are also capable of attacking some of the solid ingredients of the soil, which they render soluble, and then appropriate for their nutrition. This important function of roots is carried on in different degrees in different plants, and takes place only at the point of contact between the rootlets and the particles of the soil, and is brought about by the exudation of an acid juice which the roots contain. This action of roots plays an important part in the supply of phosphoric acid, potash, lime, and nitrogen to the plant; the latter being nearly always taken up in the form of nitrates. When we remove the crop we necessarily take away the materials the plants have gathered from the soil. Soil exhaustion is, in other words, therefore, the removal of plant food.

A worn-out soil is generally one from which the available supply of soluble plant-food has been reduced so low that it can no longer produce good and paying crops. We find, however, from data furnished by the invaluable experiments of Sir J. B. LAWES at Rothamsted, that even a worn-out soil may do some-

thing towards supporting vegetation. It does this by virtue of what Sir JOHN has very aptly termed its "natural strength." This quality is what the soil has to fall back upon after it has been reduced by cropping, and is practically constant, because it depends, not upon stimulants, but upon the chemical and physical processes that, with the aid of air and moisture, warmth and frost, and the agency of minute "bacteria" which render the nitrogen in the soil available for plant-food, and which are, some or all, more or less, continually going on in every soil.

Now these actions go on whether the soil is cultivated or not; at the same time proper tillage aids the work wonderfully. But even without it the stock of food accumulates so long as less is removed than is supplied. It is in this way that fallow ground recuperates, and that virgin soils have acquired their richness. And what the soil will thus do for itself slowly the gardener may do for it more quickly by manuring.

For this purpose we have at command—(1) stable-dung, and various animal manures, house, farm, and garden refuse generally; (2) rubbish of all kinds, ashes, marl, lime, and other cheap materials; and (3) commercial fertilisers.

The natural or home-made manures, stable and yard dung, night-soil, and the like, contain all the soil-ingredients of plant-food. They are, however, usually slow in their action, although lasting in their effects, and besides supplying plant-food directly, they have an indirect action of improving the texture of the soil.

Marls and lime supply less plant-food than dung, but their property of improving the texture of the soil, and changing the stores of inert and dormant constituents into assimilable forms, is far greater.

Commercial fertilisers, like potash salts, phosphates, bones, guano, ammonium salts, and nitrate of soda, contain plant-food in very concentrated and readily available conditions. Their principal ingredients are phosphoric acid, potash, lime, and nitrogen.

The rule in purchasing such manures should be to select those which supply most economically the materials that garden plants need, and which the soil fails to furnish in sufficient amount.

Of the very numerous artificial manures so freely advertised few seem, so far as the analyses which were undertaken for us some few years ago, testify to be absolutely bad, many are excellent, but nearly all are preposterously high-priced—a matter of little moment when used on a small scale in the garden, but which would become serious if they were used on a large scale, as they would be by a farmer or market grower. A necessary caution in all cases is to use the manure at the right season, and always in a very dilute state.

— ANTWERP EXHIBITION. — Great efforts are being made to secure a first-class exhibition in August next. In conjunction with the exhibition an International Congress of Botanists and Horticulturists will be held under the auspices of the Botanical Society of Belgium, the Cercle Floral of Antwerp, the Chambre Syndicale of Ghent, and other public bodies. Various botanists and horticulturists have been requested to send in reports on the various subjects mentioned in the programme before alluded to by us. The International Association of the Congo has promised its concurrence, and there is every probability that both Exhibition and Congress will prove successful. Four hundred visitors from various nations have announced their intention to be present, and it is hoped that Great Britain will be well represented on the occasion. M. CHARLES DE BOSSCHÈRE, Liège, near Antwerp, is the President of the committee, to whom communications should be sent.

— "BOTANICAL MAGAZINE." — The plants figured in the June number of this magazine are:—

*Bauhinia variegata*, t. 6818.—A stove tree, with roundish bifid leaves, the lobes obtuse. The flowers are in short clusters, each about 4 inches in diameter, with fine spreading, stalked, obovate pink petals, one rather larger than the rest, and of a darker colour, like the lip of an Orchid.

*Cytisus hirsutus*, t. 6820.—A low spineless bush, softly hirsute, with ternate leaves, leaflets obovate, and dense axillary clusters of yellow Pea-shaped flowers. It is a hardy shrub, native of Southern and Eastern Europe.

*Odontoglossum Oerstedii*, t. 6821.—See *Gardeners' Chronicle*, vii., 1877, pp. 302 and 811.

*Costus igneus*, t. 6821.—A brilliant Brazilian Ginger-wort, recently figured in the *Illustration Horticole*.

*Hyacinthus azureus*, t. 6822.—This plant has the habit of Muscari, but the perianth-segments are not incurved, so that it forms a link between the two genera.

— ORCHID PRICES. — At Messrs. STEVENS' sale of Mr. EDWARD WALLACE'S Orchids on the 17th, one plant of *Cattleya Reineckiana* was sold for 76 guineas, a fine plant of *C. Wagneri* for 90 guineas, and two smaller pieces for 19 and 12 guineas.

— FROST. — On Wednesday night, June 10, there was a sharp frost in the Dunstable district, with all the water derived from the rain of the previous Monday covered with ice, the foliage of Bean and some Potatoes being in consequence much blackened.

— SOUTH KENSINGTON SHOWS. — Owing to the almost or quite invisible dividing lines between the groups of exhibitors' plants, &c., at these meetings, frequent mistakes occur in reports, as in our own of the show on the 9th ult., where Mr. DE B. CRAWSHAY was asserted to be the possessor of Mr. LITTLE'S two plants, *Cattleya Mendelii* and *C. imbricata*. Something more is wanted than a faint and frequently fast vanishing line made with chalk on the green baize. Coloured rods that would not be mistaken for flower-sticks, and which would not run a risk of being used as such by exhibitors' employees, would be the best kind of thing to mark the extent of the groups, together with fixed conspicuous tickets placed in suitable positions.

— BROCCOLI LATE QUEEN. — This fine variety, sent out by Mr. GILBERT, of Bughley Gardens, Stamford, is well worthy of all praise as a kind which well fills up the gap frequently observed just before the coming in of the Cauliflower in May and early June. It is large, close, creamy-white, tender, and almost devoid of the strong aroma peculiar to other Broccoli.

— YUCCA WHIPPLEI. — Of the pure white original form of this very interesting species a fine plant was in flower the first fortnight of June in the nursery of Messrs. E. H. KRELAGE & SON, Haarlem, Holland. It will be remembered that this Yucca flowered for the first time in Europe in the summer of 1876 at the above mentioned nursery of Messrs. KRELAGE, and almost at the same time with Mr. PEACOCK, of Hammersmith. A description and a sketch of that plant was then given by Mr. J. G. BAKER in the *Gardeners' Chronicle* (August 12, 1876, pp. 196, 197). Recently a variegated variety of this plant has been figured and described in the *Revue Horticole* (1884, pp. 324, 325), from a plant flowered in the Jardins d'Acclimatation of Hyères.

— CHISWICK HORTICULTURAL SOCIETY. — The exhibition of this Society will take place on July 16, in the historical grounds of the Royal Horticultural Society, thanks to the kindness of the Council. Numerous prizes are offered, varying in value from a 1st prize of £5 for the best group of plants to the 6th prize of 1s. offered to the Board-school children for a bouquet of wild flowers. Chiswick is such a good centre, and the gardens are so well adapted for an exhibition of this kind, that it is to be hoped success will crown the endeavours of

the committee. Mr. JOHN BARRY, whose experience at the Royal Horticultural Society should render his services specially valuable, is the Assistant Secretary to the Chiswick Society, which has the support countenance of the Duke of DEVONSHIRE and the officers of the Royal Horticultural Society.

— THE KEW ROCKERY is now very charming—so many plants of beauty and interest being now in bloom. The object of the designer is being more completely fulfilled as time advances, and the success which was recognised when it was first planted has become more decided. The little nooks wherein are clumps of Ferns, or of hardy Bamboos, or terrestrial Orchids, or what not, are very interesting, though some of them are on too small a scale; perhaps this might be remedied, in appearance at least, by re-arrangement of the rock-masses at particular places, so as to prevent the whole nook being seen at one time. The geological sections, now covered with pendent sprays

their expansion. Not unfrequently a second crop of bloom is produced in the autumn; but in this case it is produced on the ends of the long slender shoots formed in spring. This year a tree of some age has been an object of interest, as while it has produced very few clusters in the ordinary way, from spurs, it has borne numerous racemes from the shoots of the year (like a Rose). Generally speaking, when this mode of blooming occurs in the Laburnum it does so in early autumn, but in this particular case the blooms were expanded at the same time as those of the ordinary character on spurs.

— HARDY SHRUBS.—Mr. KETTLEWELL, The Gardens, Balrath Bury, Co. Meath, sends us flowering sprays of *Spiræa Houttei*, with slender branches, small oblong leaves, toothed near the apex, and dense corymbs of pure white flowers, each nearly half an inch in diameter. *S. trilobata* is similar, but has roundish 3-lobed leaves and smaller flowers. *Ceano-*

illustration of what can be secured in the direction of early flowering by means of careful and persistent selection, and Mr. DAVIES' new early flowering varieties must prove a distinct gain in the North.

— BRUNONIA AUSTRALIS.—Although introduced as long ago as 1834, we seldom see this interesting little plant in cultivation. Furthermore, the natural order Goodenovia, to which it belongs, is seldom represented in gardens, notwithstanding the fact of its containing over 200 known species. Seeds of the *Brunonia* were sent to Kew in 1883, and the plants (some of which have been developing their flower-scapes for months) are now in their most attractive condition in the Heath-house. The flowers are small, bright blue, and collected in heads at the end of naked flower-stalks, resembling superficially those of a *Jasione* or a *Phyteuma* belonging to the Campanula order. The silky hairy spatulate leaves are arranged in a rosette, and remind one of a *Myosotis*.

FIG. 175.—BEARWOOD. (SEE P. 798.)

of *Saxifraga pyramidalis*, &c., are very beautiful, but here also as time goes on and the plants become more luxuriant, there is a lack of "breadth," which was not so apparent at first. *Kniphofia caulescens* is at present one of the most striking plants in bloom. It resembles one of the tree Aloes, having a short, stout erect stem, and strap-shaped acute leaves, glaucous, and somewhat reflexed, and terminal stalked spikes of red flowers, as in most of the other species of the genus. Altogether the rockery is more beautiful and attractive than ever to our thinking, though that was not the opinion of two ladies—one of whom we overheard complaining that so much space should be given up to weeds and wild flowers! There is no pleasing every one. A Regent Street milliner's window would doubtless have proved more attractive to the visitors in question.

— INFLORESCENCE OF THE LABURNUM.—This tree, as is well known, usually produces its flowers on short spurs corresponding to those of the Apple or Pear, and which are formed in the autumn preceding

thus *Veitchii* has numerous dense oblong racemes of slaty-blue flowers. From the massiveness of the inflorescence and the size of the individual blooms this constitutes one of the best of its class.

— EARLY-FLOWERING HARDY RHODODENDRONS.—For some years past Mr. ISAAC DAYLES, nurseryman, of Ormskirk, has been labouring to produce a section of hardy Rhododendrons that shall bloom much earlier than the majority of the fine hybrid varieties familiar to visitors to the Bagshot and Knap-hill Nurseries. Ormskirk is a very late district—probably three weeks later than the London district; and the late period at which the hardy Rhododendrons flowered induced Mr. DAVIES to set about the production of varieties showing greater precocity in regard to the time of flowering. Fully a month ago a box of flowers of seedlings was sent to us, taken from plants growing in the open air that had bloomed much in advance of the ordinary hybrids. They were very bright and pretty, and of excellent quality. This affords another

But the most curious character about this plant, as well as the whole order, is a cup-like indusium or covering surrounding the apex of the style. The plants named after great botanists are frequently small and insignificant, and this one is no exception to the rule with regard to size; but the flowers are not only interesting but attractive. A figure of this, the only species, is given in the *Botanical Register*, t. 1833.

— LUISIA PSYCHE.—Few of the ten known species of this genus have been introduced to cultivation, probably on account of the not very conspicuous character of the flowers. In habit they somewhat resemble *Vanda teres*, with similar foliage, but much dwarfer stems. The present species, flowering in the warm division of the Orchid-house at Kew, has medium-sized flowers of a fleshy consistency and creamy-white colour, with a blackish-purple blotch at the base of the labellum. The latter is flattened and  $\frac{1}{8}$  inch long, and  $\frac{1}{2}$  inch broad. The flowers possess a faint but agreeable fragrance, and are interesting on account of the manner they are seated in

clusters on the stems at the base of the leaves. The species are variously described under the names of Vanda, Cymbidium, and Epidendrum.

— EALING, ACTON, AND HANWELL HORTICULTURAL SOCIETY.—It is announced that a special great anniversary exhibition in celebration of the above Society having attained to the twenty-first year of its existence, will take place in the grounds of Gunnersbury Park, Ealing, on Tuesday, July 7 and Wednesday, July 8. In addition to granting the use of these beautiful grounds for the purposes of the show, Sir N. M. DE ROTHSCHILD, Bart., M.P., and his brothers have given the sum of fifty guineas towards the Special Prize Fund, the classes being open to all England; and Lady DE ROTHSCHILD will present the prizes to the successful cottagers and allotment holders on the afternoon of July 8.

— HARDY ORCHIDS.—Mr. WARE sends us fine blooms of the lovely *Cypripedium spectabile*, the white segments and rosy-lilac lip of which render it a formidable rival of the most beautiful of its stove congeners. In the same consignment are various specimens of *Orchis foliosa*, showing a range of colour from pale rose-lilac to deep lilac.

— SENEIO CONCOLOR.—This is a very pretty species, with the habit and foliage of *Lychnis flos cuculi*. The flower-heads are  $\frac{3}{4}$ –1 inch across, the rays lilac, the disc whitish. It is now in flower on the rockwork at Kew.

— ROYAL BOTANICAL AND HORTICULTURAL SOCIETY OF MANCHESTER.—A Chrysanthemum and fruit show, on a large scale, will be held, under the auspices of the above Society, in St. James' Hall, Manchester, on November 17, 18, and 19.

— CALOTROPIS GIGANTEA.—Two out of the three known species of this genus are flowering for the first time at Kew. They are natives of the hotter parts of Asia, Arabia, and Africa, and dislike a superabundance of moisture which would rot and destroy them. They occupy the warm end of the Succulent-house, which seems to be according to their liking. The foliage of both species presents a whitish or hoary appearance, contrasting well with other kinds of vegetation. The flowers are produced in extra-axillary umbels on the same level as the leaves, but half way round the stem. Those of *C. procera* are white with a purple blotch on the corolla segments, and the plant is figured in the *Botanical Register*, 1792. The flowers of *C. gigantea* are much larger than those of its congener just mentioned. The segments of the corolla are reflexed and twisted, suffused purple and white, and less attractive than those of the others. The spur-like appendages of the corona of *C. grandiflora*, however, are violet-purple, very largely developed and more conspicuous than all the rest of the flower. This species is figured in the *Botanical Register*, i., 58. The flowers of both on the whole are attractive for the order Asclepiadaceæ, and rarely seen in gardens.

— PRICKLY PEAR IN AMERICA.—In some recently published Consular reports of the United States the following interesting paragraph on the Nopal, or Prickly Pear (*Opuntia cochinillifera*) occurs:—"The plant abounds in the whole territory of Mexico, Texas, New Mexico, Arizona, and California, and extends much farther north. It has flat oval leaves, about 6 inches long and nearly half an inch thick, covered by long sharp thorns, and bears a fruit of a purple colour resembling a Pear, filled with numerous small seeds. The plant grows from 3 to 6 feet high. Its fruit is eaten freely by cattle, and the leaves, after having been burnt in a fire to get rid of the thorns, are thrown by the cartmen in place of fodder to their oxen by means of a long sharp-pointed stick, especially when on the road where there is no grass. It also makes an excellent hedge, and once planted will last for ever. There is another species of Nopal called Nopal de Castilla, which has no thorns, and which is cultivated for the sake of its fruit. This Nopal has much larger leaves than the wild species, and grows to the height of 10 and 20 feet, and the fruit is much larger. Of this species there are a great many different kinds, each having its distinct name. They are of different colours—green, red, yellow, white, and purple. The fruit is delicious, and in the interior of Mexico forms one of the principal means of sustenance for the inhabitants. From the purple

Tuna a liquor is made called *colonche*, and a sort of sweet cheese (*queso de Tuna*). There is a small red Tuna growing wild in the mountains near to Zacatecas, called Cardona, which is highly prized on account of its fine flavour and digestible qualities, and several cartloads of which are sold daily in Zacatecas. They are sold at 6 cents for four dozen. Besides serving as food for men and beasts, its leaves form the food of the cochineal insect."

— MR. CUTLER.—We are informed that it is the intention of the members of the Committee of the Royal Gardeners' Benevolent Institution to present Mr. CUTLER with a testimonial, in recognition of the great efforts that he put forth to secure the sum necessary to augment the pensions. The subscription list will close on Tuesday, June 30. It is believed that the testimonial will be presented on the occasion of the annual dinner, on July 3.

— COMING SHOWS.—At South Kensington, in the Royal Horticultural Society's Garden, June 23, there will be a great show, comprising Roses, Pelargoniums, and other flowers. The grand Bath Rose Show is fixed for Thursday, July 2. Some good prizes are offered in the best classes to both nurserymen and amateurs. At Grantham a show will be held on August 13, at which the now favourite method of arranging groups of plants for effect will form a leading feature. The Rose Show at the Crystal Palace will take place on Saturday, July 4, at which a large special exhibition of Roses will be made by Messrs. W. PAUL & SONS, of Waltham Cross, and which will be on view from that date till July 11.

— GARDENING APPOINTMENTS, &c.—Mr. H. C. WILSON, formerly of Heveningham Hall Gardens, Suffolk, goes with H. V. HAIG, Esq., from Cameron Bridge, Fife, to his newly purchased estate, Ramoonie, Ladybank, Fife.—W. CLARKE, formerly with the late P. CAZENOVE, Esq., Clapham Common, has been appointed Head Gardener to the Earl of Bessborough, Bessborough Park, Piltown, Ireland.—Mr. JOHN DOWLEY, for over forty years connected with the Royal Parks and Gardens, and for the past four years chief Foreman in Kensington Gardens, has retired on a pension from the Commissioners of Her Majesty's Works. As a mark of respect, his colleagues and the *employés* in Kensington Gardens, St. James', the Green and Hyde Parks, have presented him with a purse of money on his retirement.—Mr. GEORGE WARD, for the past ten years principal Foreman in the gardens of the Marquis of NORTHAMPTON, at Castle Ashby, succeeds to the post vacated by Mr. DOWLEY.

## PLANT PORTRAITS.

CAMELLIA CATERINA REDOLPHE, *Bulletino della Società Toscana di Orticultura*, May.—A rose-coloured self, with well formed imbricating petals.

CHERRY GRIOTTE DE SCHAARBEK, *Bulletin d'Arboriculture*, April.

CYPRIPEDIUM CARDINALE, *Garden*, June 6.—A cross between *C. Sedeni* and *C. Schlumii* album.

ECHINOCACTUS CYLINDRATUS, *Garten Zeitung*, May 28.

ECHINOCACTUS LECONTEI, *Garten Zeitung*, May 28.

IPOMEEA RUBRO CÆRULEA, *Garden*, May 23.

MAPANIA LUCIDA, *Illustration Horticole*, t. 557.—A remarkable *Carex*, with sheathing leaves in three ranks, long petioles, and broad acuminate leaves, dark green above, pink beneath. It is a native of Borneo.

MASDEVALLIA CHIMERA, *Revue de l'Horticulture Belge*, May.

MICROSTYLIS METALLICA LOWII, *Belgique Horticole*, t. xiv., 1884.

PIERIS (ANDROMEDA) JAPONICA, *Revue de l'Horticulture Belge*, May.

ROSE COQUETTE DES BLANCHES, *Journal des Roses*, June.

THOMASIA GLUTINOSA (Lindley) var. LATIFOLIA. — *Gartenflora*, t. 1186.

VRIESEA METHYSTINA, E. Morren.—This is a new Bromeliad, with tufted leaves dilated at the base and prolonged into a long narrow blade pointed at the end, and of reddish colour beneath. The long yellow flowers are loosely disposed in two ranks on an erect raceme. The plant is a native of Brazil, and is figured in the *Belgique Horticole*, t. xv.—xvi.

## BEARWOOD, WOKINGHAM.

TRAVELLERS by the railway or road which runs from Wokingham to Reading can hardly fail to note, projecting above the noble mass of woodland which crowns the rising ground some three miles from the former town, the chimneys of what is undoubtedly a fine mansion, and inquiry elicits the fact that it is Bearwood, and that the palatial residence thus embossed in trees is Mr. John Walter's residence, erected by him within the past twenty years, and practically by himself, for all the work was performed on the estate, and carried out in a way that would have done honour to any of our largest building firms. The approach to the grounds from Wokingham is by a delightful roadway, a large portion of which runs through the estate, and affords in passing delightful views of a beautiful country in the distance, with much that is high-class in agriculture in the foreground. Alighting near to the fine church, which stands in finely planted ornamental grounds, a private entrance conducts to the splendid grounds and the mansion close at hand. This latter has its chief front looking on to a bold broad south terrace, and is built of red brick with stone facings, which being new has a fresh look, not at present happily consorting with the dense masses of greenery surrounding. Time will, however, tone down the garishness of the brickwork. There is also a handsome bold western front, which, looking down a broad and singularly beautiful glade of lawn and tree, overlooks in the distance the town of Reading and much beautiful country beyond. On the north side of the house is a vast quadrangle with bold entrance-way, opening on to the broad road bordered by masses of *Cupressus Lawsoniana* first, and farther on of noble *Wellingtonias*, of which (having been transplanted after this portion of the park was rescued from chaos) Mr. Tegg has good reason to be proud. The grassy glade to which we have made reference—a beautiful expanse of turf of several acres, without tree or shrub to mar its vista—is on each side bounded by marvellous masses of *Rhododendrons*, *Azaleas*, *Kalmias*, &c., that for the past few weeks have been grandly blooming, and to see which Mr. Walter most kindly admits those who may obtain tickets during the month of June. Fronting the southern side, however, is a clump of superb *Deodars* which form a beautiful item in the picture, and shows that, pleasing as this elegant *Pine* may be singly, it is far more effective when growing in groups as in this instance. Opposite to these *Deodars* may be seen the entrance to the rockery, marked by an imitation rocking stone. Here out of a bed of clay, or rather what was once a huge ugly hole, has been formed, at no inconsiderable cost, certainly a very charming arrangement of rock, cascade and rivulet, and associated with which is seen some decorative gardening as well as much that is rugged and natural. This rockery is one of Pulham's efforts, and presents a most interesting feature, showing in what way even the ugliest holes may be converted into artistic and pleasing objects. The rockwork is planted with an interesting variety of suitable plants, rock Roses especially prominent. At the extreme end of the grassy glade there are prominent fine plants of the *Rhododendrons* Mr. and Mrs. John Walter, both rich deep colours, but the latter has the most robust habit; these are very striking objects: between them stands the late John Standish's charming white variety *ascotensis*, still one of the best of its class.

The south, or principal front of the mansion, looks out upon a grand lake of some 90 acres in extent, presenting a water view of the most picturesque kind. Immediately fronting the broad terrace the lawn slopes down irregularly to the edge of the lake, which is surrounded by noble masses of trees and shrubs, broken here and there by peaceful grassy glades, whilst in the distance a charmingly wooded island dots the lake, and far beyond rise woods and verdure, the whole forming an exquisitely beautiful picture.

It is one of the special charms of Bearwood that its planting has enabled diverse views of this fine expanse of water to crop up continually, yet in every case bringing into prominence some new and interesting feature or object. If to the right of the lake we see wondrous masses of flowering shrubs, backed by the most gigantic growth of *Hollies*, and towering above all noble trees, closely set; to the left are found, if still dense shrub growth, more open spaces of verdure,

and constantly may be seen singularly perfect specimens of *Conifera*, *Cryptomerias*, *Deodars*, *Wellingtonias*, *Araucarias*, &c., in almost endless variety—all noble trees. It is due to these to say that though there may be larger ones in the kingdom there are few more beautiful or more perfectly formed. This portion of the pleasure-grounds is a perfect maze, in the intricacies of which a stranger might easily be lost, but under Mr. Tegg's guidance we feel secure, and are taken here and led there to see now a grand Birch, a huge Stone Pine, a lovely Purple Beech, or some delightful vista, in rapid succession, until even the most devoted admirer of beauty becomes satisfied.

The kitchen garden department is remote from the mansion, and forms a complete block adjoining the gardeners' residence. Here are glasshouses devoted to the growth of plants in quantity for the house decoration and for the production of cut bloom, for the demands on this department are heavy. *Lapageria rosea* and *alba* growing overhead in one house and intermixed bloom superbly, and produce a very pleasing combination. Pines in the pits are first-rate: we have seldom seen so many fruiting at once in any private garden, but Mr. Tegg has always done Pines well. These houses and pits, with myriads of frames, stand in a large but admirably sheltered space, and in all respects are as neatly supervised as their contents are excellent. The long range of fruit-houses which look down the large walled-in kitchen garden is being employed to the utmost in the production of fine crops of Grapes, now cutting and for latest keeping, and also of stone fruit, Figs, and other special products. A very fine range of buildings, Mushroom, Potato, fruit-packing, and gardeners' houses back the glass-houses, and affords excellent accommodation.

The kitchen garden has a very stiff clay soil, and, being situate rather below the level of the lake, is sometimes difficult to cultivate, but still it produces splendid crops of vegetables, and Apple and Pear bush trees do well, and are carrying wonderful crops of fruit. On the walls Peach trees, usually so fine here, have somewhat suffered from the late frosts, but still have fair crops of fruit, and are now coming round. Plums on walls are a grand crop, and the outer Pear wall is a fine feature, of which any gardener may well be proud. It is not possible to note other features in detail, suffice it to say that in every part Bearwood presents a princely aspect; it is a truly noble domain, a grandly kept garden, and an honour to British horticulture.

## MARKET GARDENING.

(Continued from p. 694.)

**HARDY GREENS.**—The early and successional planting of these from beds of 1 to 2 or 3 acres in extent, is an important matter with market garden farmers. The seedlings when hoed between with the hand-hoe rapidly attain a very stiff, sturdy form, and gradually cover the soil in process of time, making "stocky" material for the purpose. The operator is in a stooping position day after day at the work, as the handles of the hoes are little over 12 inches in length.

However forward the seedlings may be, the grower generally awaits an opportunity for transplanting them, which seldom occurs until some early summer crop matures and is marketed. Yet, though the plants, even after they are large enough for the process, have to wait until a space is vacant whereon to plant them, they do not seem to suffer in any marked degree. The reason for this is doubtless to be found in the fact that they enjoy full exposure and abundant light and air. For this reason I have always advised such seeds to be sown on open, exposed sites in all gardens. Unfortunately, however, odd corners, &c., upon walled-in, or around, and tree-shaded gardens, are all but invariably chosen. It would seem, in fact, to be considered that any kind of place will do to sow seeds and rear such seedling plants upon, provided only rich, deep soil, and a more open space be given them to grow upon anon.

I need not point out how fallacious such reasoning is. Whoever would grow fine produce ultimately must do so with strong, sturdy young plants. Such as are drawn up, leggy, attenuated, and enervated, cannot possibly give such desirable results subsequently.

Furthermore, these remarks apply very forcibly to

the matter of the hardiness of these and other plants. Such seeds as are sown in the open fields in the latter end of summer yield seedling plants infinitely more hardy and enduring than is possible to rear on the "odd corner" system. It is greatly owing to this that field Cabbages and Greens are both an abundant and trustworthy crop.

Immediately a few acres of land become vacant, whether following Tares, early Peas, autumn-sown Onions, or other crops, manure is carted on and ploughed in, and the transplanting follows on continuously until completed. The work is performed thus rapidly for several reasons, the primary ones being the necessary thinning out of the seedling plants in the seed-bed, rapidly planting whilst the newly turned-up ground is moist.

In practice the strongest plants are pulled up and placed in baskets, then carted to the allotted ground, where a child drops them in rows, and a planter follows with a dibble, so quickly that the "dropper" with difficulty keeps in advance. Some weeks afterwards the hoe is "run" between them. When it is known these so-called "foot" crops (which means that the plants are set at that distance apart) are planted at less than 20s. per acre, it will be readily understood that deep planting, or careful planting, are not possible, yet the result of such simple land ploughing and planting is well known, as seen in the level, uniformly good and abundant crops which result.

Ultimately hoeing follows, and it is interesting to watch piece hoers at work. They simply stride over the fields, along the rows, at all but a walk, throwing first the right hand forward, then the left, changing the implement from left side to right with great freedom and rapidly, by which means they are enabled to cover much ground in the forward movement, and to hoe closely up to or between the rows without shifting the position of the body.

As I have said, the spring seed-bed furnishes plants for successional plantings, as long as any remain to plant; besides which, other sowings of great extent are made during the succeeding months, more especially during July. As a rule, showery weather is chosen for these sowings, and "spent Hops" are generally employed as a preventive of Turnip-fly ravages. Occasionally a few rows of Broad Beans are planted at 3 or 4 feet distances apart, with a like intention; but whether this is really beneficial has not yet been ascertained.

As I write (June 8) acres of such beds exist around here of all varieties of the Brassica genus, sufficiently large for transplanting. There is not yet, however, vacant land for the purpose. Tares and Rye crops are being rapidly cleared off by being placed into sixpenny bundles for metropolitan horse-keepers, and shortly the wide breadths devoted to these will be transposed, as if by magic, into breadths of greens, Veitch's Autumn Giant Cauliflowers, &c. No delay is permitted. Time well employed often means securing an additional crop, especially at this season of the year, when a season of drought so rapidly follows June rains, and when it is not possible to do these, or any other crops full justice. Besides, those who have to rely on their judgment and industry to secure the wherewithal to pay high rents required for the land—some of which is still rented at £5 an acre—must also find means to maintain the required manual labour, horses, and the heavy outlay of rates and taxes, and cannot, therefore, permit land to lie idle. If these facts are considered, ample reasons are seen to exist for rapidity in cropping. But there are other and extremely important considerations which cannot be lost sight of, though they are seldom taken into account by private growers, namely, that all properly cultivated land contains a certain percentage of manures of a highly volatile nature, as all observant growers well know.

Again, whenever crops have attained to their best, there is little if any profit accruing by their continuance upon the ground. It is not too much to say, that the practice of permitting greens to stand through the summer impoverishes the piece of ground so occupied exclusively, and the returns are but poor. Those who follow this practice may justly ask what I advise in lieu. The answer is simple. When planting out the bed of autumn Cabbages, have ready batches of seedling Cabbages, of two ages, secured from two successional sowings, one made earlier than is customary. If twenty rows be planted, only plant the half, or ten rows (and those on the most exposed part of the bed), with the earliest and largest plants, using

the smaller plants from the later sowing for the other half. In the early spring, so use the produce that the earliest planted be cut and wholly removed before the second half are commenced. Meantime, if you have not other space ready or convenient, fork up the first portion, and plant thickly upon it hardy greens, 1 foot apart all ways. To do this, obtain from your seedsman a good stock of "Hardy Greens," and sow about the fourth week in the month of March.

The second half should also be treated in the same way if the consumption be great. Generally, however, the heavy crop produced from such thickly planted, compact, and useful produce will amply suffice, being four to one in real bulk against all the stump greens. Subsequently the other half of the spring Cabbage bed may be used, and the space be devoted to other crops.

But the gardener may say, and justly, "I deal with a leading nurseryman, and he does not catalogue Hardy Green Cabbage. Where is it obtainable?" The query is, no doubt, justifiable. If, however, he insist upon having it, wholesale houses dealing with market garden farmers will soon supply such upon demand to all retail sellers. Whether German or other varieties catalogued are identical with the above I am unable to say. The Rosette Colewort is a summer variety of these, otherwise called Hardy Green Collards, *William Earley, Ilford*.

(To be continued.)

## ORCHIDS FOR AMATEURS.

(Continued from p. 602.)

THE genera *Cattleya* and *Lælia* are deservedly great favourites with most amateurs; both genera contain many species of easy cultivation, and others which are comparatively difficult or even very difficult to flower satisfactorily. Botanically the two genera are very closely allied, and many species are placed in one or other genus by different writers.

### THE GENUS *CATTLEYA*

is a very natural group, and is distinguished from *Lælia* by having only four pollen masses in each flower instead of eight. The cultivator is, however, more interested in the fact that the great majority of *Lælias* need far more air and less heat than the *Cattleyas*. The great number of varieties of *Cattleya* are very puzzling to the beginner and need considerable experience for their recognition. The plan usually adopted of giving them in alphabetical order renders the task of identifying them and bearing them in mind extremely difficult.

There are only five well marked groups of *Cattleya* and a very little observation will enable any one to learn the appearance of each, as they are remarkably distinct from each other. The numerous varieties, hybrids, and species recognised by horticulturists all group themselves under one or other of these five principal types—exemplified by (1) *C. labiata*, (2) *C. chocoensis*, (3) *C. Forbesii*, (4) *C. Aclandiae*, and (5) *C. citrina*. I shall confine my remarks in the present article to the first of these groups, reserving the rest for a future communication.

It is a little unfortunate that orchidologists have given quasi-specific names, not only to mere varieties, but also to known hybrids. No one has fallen into the same error with such plants as *Fuchsias*, *Pelargoniums*, or *Roses*; but although a renaming of Orchids would be subject to great inconveniences, it is a pity that a thorough revision of the nomenclature is not undertaken, and whenever this is done the type or specific name should be prefixed to the varietal name.

### *CATTLEYA LABIATA* SECTION.

The most showy and gorgeous examples of the genus *Cattleya* belong to this type, of which *Cattleya labiata* is the highly developed form. This group is distinguished by the large fringed labellum or lower petal. One of the most beautiful plants in the group is easily grown, and seldom disappoints the cultivator either in the beauty of its flowers or their appearance. This is

*Cattleya Mossie*.—Its varieties are very numerous, and they are all "good." The principal points of excellence are a good texture in the flower; some plants have thick flowers, with a beautiful gloss upon them, in others the flowers are thin and poor. I believe this is due to the manner in which they have been grown rather than to the inherent qualities of the plant.

The lip should be broad, open, and well fringed; plants with narrow, contracted, and badly fringed lips do not improve. The petals should be broad, and filled at their edges; and the sepals should stand well forward, not curling back. The colour of the flower is either pale or dark; very pale or very dark varieties are esteemed more than those with an intermediate tint. The labellum should be brilliantly mottled, and streaked with carmine and orange.

The colour of the flowers depends greatly on the mode of cultivation, like their texture and size; but the form of the flower is inherent to the variety of the plant, and cannot be improved. I have already described the treatment which will ensure success in the growth of the beautiful plant, but would add here my belief that nothing conduces so much to the full development of its flowers as plenty of sunlight; plants which are overshadowed do not produce brightly coloured blossoms, and are by no means so healthy or likely to flower as those which have had a full allowance of sun. *Cattleya Mossiæ* flowers in the early part of the summer, and after the new leads have made their appearance—a condition which it is important to bear in mind, as many *Cattleyas* never flower after the lead begins to grow. It is very fragrant. A fine figure of *C. Mossiæ* was given in *Gard. Chron.*, p. 533, vol. xx., 1883.

*Cattleya Trianae*.—Closely allied to *Cattleya Mossiæ* is *Cattleya Trianae*, which blooms earlier, and has a less expanded lip, the lower part of which is of a deep crimson colour. White varieties are in much request, and generally reach a high price.

*Cattleya Mendelii* also resembles *C. Trianae*, but has a much more open lip, and its petals stand forward; both these forms differ from *C. Mossiæ* in not having a streaked and spotted labellum. The points of excellence are much the same as those of *C. Mossiæ*. All three forms will do well with moderate heat and moisture, and may be grown much as *Camellias* are grown, except that they need a greenhouse in the summer and autumn, when the *Camellias* are out in the open air. They must be kept dry in winter with plenty of air and an even temperature—not falling below 45°, or rising much above 60°. *C. Trianae* needs to be started earlier than *C. Mossiæ*, as it flowers earlier in the spring, or even late in winter.

*Cattleya labiata* is a magnificent plant, with enormous flowers, often 8 inches in diameter, with a large widely expanded labellum having a large deep violet spot on its expanded portion, which sends rays back into the bright orange throat of the labellum. It flowers late in the year—October or November. A variety with a double sheath (spathe) and especially magnificent flowers is known as the autumn-flowering *Cattleya labiata*. It is exceedingly valuable, and very few examples exist.

A vast number of inferior varieties, all good in their way, are known under various names. *C. Gaskelliana* is closely allied to *C. labiata*, but often produces very poor flowers when compared with the better forms of *labiata*. It also flowers in the autumn months.

This group of *Cattleyas* differ from the *C. Mossiæ* group in their large lip, which is not spotted, but of one colour on the limb, and streaked or rayed in the throat; in their autumn flowers, which are produced before the new leads start, and in requiring more heat and moisture for their satisfactory cultivation. They are natives of the hottest forests of South America.

*Cattleya Dowiana*.—Another subsection of the labiate form of *Cattleya* is exemplified by *C. Dowiana*. The lip is of an intense purple approaching to blackness rayed with golden-yellow streaks. Unfortunately it is a difficult plant to grow and flower. It has a habit of making its young shoot as soon as, or even before the old bulb is matured, and then it never flowers, and if its young growth is checked the lead is lost and the plant ruined for years, or even destroyed. To get it to flower it is necessary to bring it into a condition of rest before the bud at the base of the bulb breaks, and as this is often in June, July, or August, it is a little difficult to perform satisfactorily. It flowers in August, September, or later. It is not at all a satisfactory plant for a beginner.

*Cattleya Eldorado* and *C. Skinneri*.—Another subsection of the labiate group is *C. Eldorado*, resembling *C. Mossiæ* in its flowers, but being nearer the group typified by *C. Forbesii* in the form of its long narrow bulbs. It flowers in summer or autumn, and

is, like *C. Mossiæ*, very fragrant. The new *C. Lawrenceana* is probably closely allied to *C. Eldorado*.

*C. Skinneri* comes from the mountains of Guatemala, and needs cooler treatment than any others, especially in the hot months of summer, when it may be placed with *Odontoglossums*; it flowers in early summer, and is a free-blooming plant. I have not had this species, but believe it would be a very desirable one for those who have not the means of maintaining a high temperature. *B. T. L.*

(To be continued.)

## A MOTH INJURING DRIED COCOA BEANS.

IN the month of October last I received from the proprietors of a warehouse at the East-end of London a box containing a quantity of Cocoa beans, which had been found to have been extensively gnawed all over the outer surface by the larvæ of a small moth, together with some of the grubs, some cocoons all matted together, and some of the moths produced from them; and again, at the beginning of December last, Miss E. Ormerod sent me a quantity of these Cocoa beans similarly infested, which she had received from Guyaquil.

The appearance of the sound Cocoa bean is shown

FIG. 176.—COCOA MOTH.

in the upper right-hand figure in the accompanying engraving (fig. 176), whilst one much gnawed by the larvæ is represented in the left-hand upper figure, which shows a quantity of the pellets of the excrement of the larvæ partially detached from the bean.

The caterpillar, of the natural size and magnified, is represented in the middle of the woodcut; it is long, slender, and very active, wriggling about and running quickly either forwards or backwards; it has six anterior, eight ventral, and two anal claspers; it is of a dirty flesh-coloured grey, with the head darker and fibrous brown, with a patch of the same colour on the first segment behind the head, in which patch the hind portion forms two darker spots; all down the back are two rows of minute black dots, each segment bearing two on each side of the middle dorsal line, and a third more lateral dot forming a triangle with the two dorsal ones. These dots are setigerous; the penultimate segment of the body has one large central and two smaller lateral black spots, and the terminal segment has a transverse black spot (the antennæ in front of the head of the larvæ are represented too long and prominent in the accompanying engraving, and the caterpillar itself is too robust). The chrysalis is of a chestnut shining colour, and is enclosed in a loose silken web, forming with the other cocoons attached to the Cocoa beans a matted mass.

The moth measures about two-thirds of an inch in the expanse of the fore-wings, which are of a pale grey colour, with a faint ochreous tinge, especially

towards the inner margin, and with very indistinct but darker greyish markings, forming irregular bars across the fore-wings. The first towards the base of the wings is preceded by a pale band, and the second beyond the middle is grey, followed by a pale band; between these bars are two small ones in the middle towards the costa.

On submitting the moths to Mr. H. T. Stainton, our great authority on the tiny or *Tinea* moths, he informs me that they belong to the family of the Knot-horns (*Phycides*), and are the *Ephestia elutella* (*Phycita elutella*, Curtis and Stephens), or the cinereous Knot-horn of Haworth. He believes that the whole of the species of the genus *Ephestia* have similar habits, and devour all sorts of dried fruits, the larvæ being often found in Raisins and Figs, and they are extremely partial to all preparations of chocolate, flying by scores in warehouses where such things are stored. Mr. Stainton, moreover, believes that in a wild state they feed upon Ivy berries and nuts. In an economical point of view they are noxious insects, and they cannot certainly be called beautiful.

One of our correspondents suggests that the eggs are laid in the Cocoa in the West Indies or South America, and that they hatch out and damage the Cocoa here in hot dry weather like last summer. He also asks whether the moths lay their eggs and the young ones are hatched in this country, or whether the eggs are only laid in the green Cocoa bean? He further notices that as soon as cold weather commences the moths and larvæ seem to be killed, doubting, however, whether the eggs and chrysalids are also killed.

In answer to these inquiries, we believe that in warehouses where the Cocoa beans are stored, and which are infested by these moths, the propagation of the insect is continuous—very similar, in fact, to that of some of our small domestic moths, such as *Tinea sarcitella*, and the little corn moth, *Tinea granella*.

It may be questioned whether repeated fumigations with sulphur would not be injurious to the Cocoa beans; it would certainly, however, kill the insects. Benzine, or, better still, naphthaline, would also be equally efficacious in destroying the insects.

The subject of these Cocoa destroying moths was brought under the notice of the Entomological Society by Mr. W. F. Kirby, on November 5 last, when Mr. McLachlan suggested heat as the only remedy for getting rid of these pests, but Messrs. Weir and Fitch pointed out the impracticability of its application in large bonded and other warehouses. In the case before the Society the stock affected exceeded 20,000 bags. A case was also reported in which a stock of ship's biscuits was attacked, and when the biscuits were removed the moths came out in thousands.

A memoir on another injurious species of this genus, *Ephestia Kuhnii*, Zeller, from North America, which has become naturalised in the Rhine district (where it is known as the meal-moth), forms the subject of several communications in the *Entomologische Nachrichten* of 1884 and the present year. *L. O. W.*

## WELL-FED VINES.

ONE of the most noticeable things connected with vegetable life is the readiness with which plants adapt themselves to circumstances. This, to a greater or less extent, may be seen in most all the kinds of plants now cultivated either for their flowers or fruit. In few things is it so apparent as in the Vine. In some of the most noted wine-producing countries of the world little is given in the shape of manure, except the vegetable matter contained in the prunings of the Vines, which are thus used to nourish the plants that have produced them. In this country, where the cultivation of Grapes is undertaken with a view to their being eaten, the course followed is widely different, but is as far from being uniform as it well could be. Take, for instance, the preparation of an ordinary Vine border, leaving out the carrion or other crude animal matter, now by common consent condemned, the ingredients in the shape of manure are as different in character as they are in quantity. Some growers contend that nothing should be added to the soil, except perhaps the orthodox broken bones, about the use of which there is something like unanimity. Others act on the principle that the Vine, making as it does annually a very large amount of growth, requires a proportionate quantity

of food given in a form that can at once be taken up by the roots. Such opposite practices as these could not have adherents, were it not that Vines in plenty are to be seen thriving and bearing, so as at all events to satisfy those who grow them under these different kinds of treatment. Those who take the no manure side of the question maintain that it is better to have young Vines when they come into bearing of medium strength than to put all the size and vigour into them that is possible; the opposite contention is that at this stage they cannot be too strong, and that the less time occupied in getting a maximum of strength into them the greater the return of fruit within a given time after planting will be—a proposition that, admitting that the wood is ripened as it should and can be, is so far reasonable and borne out in practice as not to admit of dispute. The Grape growers' motto at the present day is "Onwards." In this, as in other matters, there is little disposition to wait; the sooner that young Vines can be got strong enough to carry full crops the quicker the return.

Possibly the adherents of the slow course treatment may urge that young Vines allowed to bear heavy crops will soon be exhausted, but the high feeders take means from the first to prevent this happening, for their practice not only consists in giving manures that from the time of planting act quickly and powerfully on the young roots as these are formed, but they keep on giving stimulants from the time the Vines begin to bear; the result of which is, that they are able to carry a weight of fruit that, in the absence of the regular feeding given, would have the effect of over-cropping with its well-known ruinous results. That young Vines grown on in this way, so as to get as much vigour as possible into them, and afterwards fed in the manner described, can finish up crops without being weakened or distressed, is proved by what is done in some private gardens, as well as by some who grow for market. The Vine is a gross feeder, and naturally makes an immense amount of growth in little time, to bring out and support which it requires food without stint, but further to have the food within its reach in a form that can quickly be taken up and assimilated—a very different state of things to that available where bones in the ordinary condition, or slow in decomposing, are alone used. It is also evident that stable manure, even with the aid of bones, does not contain all that is needful to bring out all of which the Vine is capable, or to an extent that has usually been supposed manure of the nature would. The astonishing weight of finely finished Grapes which a cultivator such as Mr. Thomson, of Clovenfords, is enabled to grow year after year by the aid of annual applications of his mixed manure—or Mr. Ladds, with the help of successional heavy dressings of fish manure, sulphate of ammonia, nitrate of soda, and guano, each applied separately once during the season of active growth—and all this in addition to borders which, in the first instance, were made rich with stable manure and the usual half-inch bones—affords proof, if it were wanting, of the immense amount of food which strong Vines can not only take, but are benefited by, if the most is to be got out of them. A rank-feeding plant like the Vine, that makes so much growth annually, needs not only to have the soil wherein its roots are placed fully stored with food, but, further, to have the food in a state that admits of its being quickest taken up and converted into wood, leaves, and fruit.

As already said, this is opposed to the preconceived ideas entertained by many Grape growers. But the results of the practice of the growers mentioned, and others who treat the Vine similarly, carry more weight than any amount of theory. *T. B.*

**BANANA CULTURE IN HONDURAS.**—Honduras is rapidly assuming importance among the larger countries in Central America. According to the *Commercial Advertiser*, it has increased 50 per cent. in population in the last ten years. The lands outside of the main towns are being bought from the Government by citizens of the United States and by Germans. The object of these new settlers is to establish Banana plantations. The soil of Central America is peculiarly adapted to the growth of this fruit, which can be raised at what would seem to be a ridiculous expense. The market for Bananas in New York is good, and the sale of them pays a profit of about 20 per cent. The purchase of these lands has netted the Government about 1,500,000 dollars during the last year, and as it owns about 1,000,000 acres, there is a fair prospect of its enriching itself within the ensuing five years.

## HOME CORRESPONDENCE.

**Myosotis Turning Red.**—In one of your late numbers I observe an inquiry about the turning of the Myosotis red. Here all say it is over-manuring. A curious thing happened to ours. We took from Inverary the matchless Irish Forget-me-Not, planted it in new highly-manured soil; more than one half turned red, the rest became white. The latter has remained so, and has degenerated in size; the other, since our removal from Westwood, has come back to its own lovely blue, and has increased in size. *I. S.*

**Saxifraga media.**—For the opportunity of illustrating this pretty but uncommon species (fig. 177) we are indebted to Messrs. Backhouse. The species is a native of the Pyrenees, and of the mountains of Greece. From a persistent root-stock are produced compact tufts of leaves about  $1\frac{1}{4}$  inch across, the

FIG. 177.—SAXIFRAGA MEDIA: FLOWERS DEEP CRIMSON.

leaves themselves obovate-acute, green, with white tubercles at the margin. From the centre of a tuft uprises a flower-stalk, 6 to 8 inches high, with numerous scattered leaves covered with viscid, hairy pubescence. Each flower springs from the axil of a solitary bract, which, like the five-parted, bell-shaped calyx, is of a deep crimson colour. The petals are enclosed within the sepals, and are of a similar hue. The plant is also known under the name of *S. calyciflora*. It has lately been in flower at Kew, and is now ripening seed.

**Devon Notes.**—Those of your readers who have not visited Mount Edgumbe, at Devonport, cannot fully realise the intense delight a horticulturist experiences when viewing the splendid gardens there, particularly if favoured with the company of the veteran and able gardener, Mr. Brighton. He directs a staff of some twenty to thirty under-gardeners. Passing over what Nature has done in forming the beautiful and undulating grounds, which are surrounded on nearly all sides by the sea, and passing over the aged and gigantic park trees, including perhaps the finest Cedars of Lebanon in Britain,

I came into a series of gardens—the English garden, the Italian garden, the rock garden, and last, but not least, the orangery. Near here I noticed four remarkable specimens of the *Chamærops excelsa*, from 20 to 25 feet in height, in the open ground; the one I measured has a straight trunk about 3 feet in circumference at 3 feet from the ground—this one was blooming, and its neighbour was fruiting. (There is a great plant of this noble Palm at Messrs. Lucombe, Pince & Co.'s nurseries, at Exeter, and in a tub.) Within sight is a quaint tree of the red Cedar, certain to attract any one's attention. It must be of great age, as many of its limbs appear dead, and hang down in a peculiar way. There is also a perfect pyramid of the variegated *Thuopsis* quite 20 feet high. In this garden are likewise unique specimens of the Japanese Medlar, the variegated *Osmanthus*, *Magnolias*, *Photinia serrulata*, &c., and the forty or fifty Orange trees in the adjoining garden, 20 feet or more in height, are blooming and fruiting prodigiously. *W. N.*

**Position of Certain Forms of Stems.**—Has it been noticed that, in this country, plants with angular or flat stems invariably present their acute sides to the south and south-west, as if to preserve their flat sides from direct exposure to the sun? *A. D. W.* [Will our correspondent obligingly specify some instances? *ED.*]

**Eucalypti in South Portugal.**—There has been no note in your columns, as far as I know, of the *Eucalyptus* plantations in Southern Portugal. In the vicinity of Cintra Gum trees have been planted to a large extent with the most successful results. The rapid growth they make, even to one who comes prepared, is little short of miraculous. Lord Byron calls Cintra a "glorious Eden." Some, but chiefly *les glorieux*, would doubtless call the palace of the Pena a Moorish mansion in which one of the loftiest peaks of the Serra culminates—its chiefest ornament; but to the great majority Montserrat, as it now is, will linger longest in the memory. The Visconde de Montserrat, as Mr. Francis Cook is entitled, is one of the largest, as he is one of the first, experimenters with these trees. He has planted an extensive wood of them; the average height of the trees in which is 60 feet. This growth is a matter of fifteen years. Two specimens on the lawn before the portico of the house are probably the finest in Europe. They are *vimenifolia* and *falcata*. The former, whose age a tyro would compute at over a hundred years, has barely seen twenty summers. It is a magnificent wide-spreading tree, and well suited for a lawn. The girth at 1 foot and 4 feet is 15 feet 8 inches and 13 feet 6 inches. The other is 12 feet 7 inches and 12 feet 2 inches at the same altitudes. Although it bifurcates it is 120 odd feet high. Below trickles a brook, and the lawn is regularly irrigated throughout the burning summer heat. Mr. Cook has also promised young plants of *E. amygdalina* and *citriodora*. The tallest *Eucalyptus* in the district is in the garden of the Conde de Bella Vista, which at a very careful estimate must be close upon 150 feet high. A very fine row of specimens girts the high road through Collares; one which I measured girthed 9 feet 6 inches at 4 feet up. One can easily imagine how the landscape has been changed by the introduction of the *Eucalypti*. They seem impervious to the violent winds, which often enough assault the coast line of Portugal. They sway recklessly, but seldom snap. Indeed, it is a bad plan to stake the saplings at all; Mr. Cook lost a lot of trees by so doing. *C. A. M. Carmichael.*

**Mildew on Roses.**—May I draw attention to an experience of mine as to mildew on Roses? I put on a very thick layer of sulphur on every leaf, letting a good quantity fall on the ground intentionally. The result so far is complete cure, as before this time last year we were tormented by it, and the change of locality does not appear to be the cause, the Roses left behind being also free. *I. S.*

**Rhododendrons.**—These, like all other shrubs and trees that bear flowers have been unusually full of bloom this season, and are quite a sight, as every truss seems perfect, the rain having come just in time to help the blossoms to open, and the fine weather since has been quite in their favour. When they go off, which they very soon will, there will be a multitude of seed pods, and these, if the plants are to have a fair chance [to

grow must be removed, as allowing them to stay and ripen is very exhausting and distresses the plants more than it does to carry the flowers. The way to get rid of the seed-pods quickly is to start at them before the young shoots form, when they may be broken off rapidly by just taking them between the thumb and finger and bending them on one side, when they will snap off at once; but if left till later the stem part gets hard and woody, and not only that, but the shoots impede the work, and are liable to injury from being broken or bruised. As next season's display depends in a great measure on the growth the plants make now, they should have every encouragement by being mulched, which will keep the ground moist and thus favour the roots, as these run at a shallow level and soon feel the effect of a continuou: drought. Although Rhododendrons do not like a manured or cultivated soil, mild dung does them good on the top, as the juices are carried down by the rains, and therefore the mulching may consist of long stiff straw from the stable-yard, with horse-droppings in, which suits the plants as well, or better than anything that can be given them to keep the drought out. Liquid manure, such as drains from a farmyard, is also of much benefit to Rhododendrons; and those who value their plants, and can get a supply, should give them a good soaking now and then during the season, but the time when it will be of most value is while the plants are making their growth and setting their buds, as then they stand more in need of a stimulant. *J. Sheppard.*

*Nicotiana affinis*.—This sweetly scented annual is of very easy culture—so easy, indeed, that one cannot help wondering that a plant so agreeably scented is not more extensively grown, not only for planting in the flower garden, but also for conservatory embellishment. For the latter purpose three sowings should be made in the year, the first in February, second in April, and the third the first or second week in June: plants from the first sowing for flowering at the present time; from the second, in August, September, and October; and those from the third supplying flowers in winter and early spring. The seed should be sown in well drained pans or pots, filled to the brim with light sandy soil, and be covered lightly with a sprinkling of the same, and afterwards watered through a fine rose. The pots can be placed in a Melon or Cucumber pit, where, if the seed be good, it will appear in the course of a week or ten days, when, as soon as the seedlings are large enough to handle, they should be pricked out 2 inches apart in a box or pans, subsequently potting them singly into 3-inch pots before they become crowded to the box or pans, shifting them into 6-inch pots as soon as they have established themselves in the 3-inch ones. In this size (3's) the plants will send up branching flower-spikes from 2 to 2½ feet high above their large pale green leaves, which are somewhat different in shape from those of the ordinary Tobacco (*Nicotiana glauca*), which latter plant it resembles very much in habit, except that it (*Nicotiana affinis*) is dwarfier and the flowers Phlox-like in shape. They are borne on stems 2 to 3 inches long, are of a French-white tint, and their fragrance is most distinguishable from half-past five in the afternoon until six o'clock the following morning, when they partly close until late in the afternoon, at which time they reopen with all their sweetness and freshness. *H. W. Ward.*

*Cantua dependens*.—This plant, sometimes called *buxifolia*, is one of the most graceful conservatory plants we are acquainted with, and when trained on wire supports, forms a happy combination and companion to the *Acacia Riceana*. Mr. George Rundle, of Devonport, is a great admirer of the *Cantua*, and succeeds well with it. He has two specimens at his place which have just given him abundance of their elegant funnel-shaped red flowers. It is not a difficult plant to grow—on the contrary. It delights in a compost of turfy loam and sand with leaf-mould, having due regard to ample drainage. It flowers in corymbs at the ends of the branches. There is also a fine example of this charming plant at Powderham Castle, where Mr. Powell is the chief gardener. *W. N.*

Gilbert's Late Queen Broccoli.—I was not at all surprised to read in your last issue that this has been honoured with a First-class Certificate by the Royal Horticultural Society. Through the kindness of the raiser I was enabled to plant a score of it last season by the side of Cattell's Eclipse, a well-known

late variety. The first one of Cattell's was ready to cut on May 12; the first one of the Late Queen on May 28, and the last of the latter variety June 13. I have this day tested the cooking qualities of a specimen weighing 7½ lb., and find it white, tender, and very sweet in flavour—especially so in the branches of the head, which are remarkably good in comparison with some varieties. Its growth is robust, of medium height, heads large, white, compact, and beautifully protected by the leaves, which fold over it very closely, and although it has grown larger than any variety we have had this season, it is by no means coarse in texture. The varieties we have tried this season are Early Penzance, Veitch's Self Protecting, Snow's Winter, Adams' Early, Carter's Champion, Hill's June, and Cattell's Eclipse, and for flavour and tenderness I prefer the Late Queen to any of them. Its merits were well summed up by my man who serves the kitchen a few days since, when he said, "Them is the best Broccoli we have had!" That is also the opinion of *W. H. Divers, Ketton Hall.*

*Narcissus Becoming Single*.—Our Narcissus have shown a tendency to become single again, and so do our Daisies, in spite of all care. *I. S.*

*Autumn-sown Annuals*.—What a gorgeous effect may be easily had by a judicious selection of the kinds most suited to stand the winter. In the new pleasure ground here we have a bank (east) 100 yards by 6 yards, planted with Mollis and Ghent Azaleas at 5 feet apart. In autumn last we determined to sow annuals for late spring and early summer display; the bank was divided into equal parts, each 2 yards wide, the bottom was sown with the new dwarf *Silene pendula compacta* (pink), thinned out to 6 inches apart in early spring; the middle sown with *Nemophila insignis* (sky-blue), thinned out to 1 foot; the top with *Limnanthes Douglasii* (creamy-white), thinned out to 15 inches. The effect has been all that could be desired for the past six weeks, and by its appearance it will continue for another six. It was thought at the time of sowing the Azaleas would mar the effect, but we find they rather add to it, as they emboss it equally the whole length, and take off the flat appearance, as well as add their various tints of foliage and flower. Due regard is taken that the Azaleas are not encroached upon by being overgrown. *W. Kettlewell, The Gardens, Balrath Barry, Kells, Co. Meath.*

*Cordylone australis*.—We have here two large plants of *Cordylone australis* in tubs. They are 15 feet in height, and about nineteen years old, having been in a large old conservatory until May, 1884, when we put them out-of-doors, where they have since remained without the slightest protection. Not only have they flourished, but each has now put forth large masses of bloom-buds, the bracts (of which there are many) being nearly a foot in length. *Cordylone australis* has often bloomed here in the conservatory, but I wish to know if it is on record that it has stood the winter and bloomed before in this country in the open air. It would appear that the plant is hardier than it was supposed to be. *J. Borlase Tibbits, Kettering.*

*The Primula Conference*.—Should this proposed Conference take actual form, it may be well worth consideration whether it should not assume two divisions, one devoted to the consideration of the *Primula* family in all its botanical relationships, and the other a florists' section, in which all that concerns the florists' forms of *Primulaceæ* may come under consideration. Botanists think there is still a good deal in relation to the nomenclature of *Primulas* that needs revising. The subject is hardly so fraught with difficulties as is the nomenclature of *Daffodils* perhaps, and may prove not only more interesting but also more profitable. In any case, if the holding of the Conference could also be instrumental in producing a representative exhibition of *Primula* species and varieties, the result would be in the highest degree gratifying. The florists may well turn their attention to such matters relating to florists' *Primula* varieties as the origin of the florists' *Auricula* and *Polyanthus*, the desirability of expanding the various sections into which these flowers are divided, so as to render them more popular and more widely cultivated. The Conference may well inquire whether, in the case of *Auriculas*, it is possible to attain further advance, and, if so, how that advance may be secured; also to ascertain whether the new laced forms are not so

meritorious as to entitle them to be classed as a separate florists' section, and presenting features more worthy than are those seen in those vagaries termed fancy *Auriculas*. With reference to the gold-laced *Polyanthus*, it may well be asked also whether that can be made to assume any new forms of interest, or whether it is desirable to create a section for the fine self and fancy border kinds, which, though so beautiful, yet by florists are treated with indifference. The last *Auricula* show fully established the need of some Conference or other means of creating public interest in these spring flowers. *A. D.*

*Flowers at Chepstow*.—In a sheltered spot in a garden near Chepstow there is now (June 15) in flower, and has been for some time, a *Ciceraria*, the same plant that bloomed last spring, and which circumstance you kindly inserted in your journal. There has been gathered also a *Butterfly Orchis* 22 inches in height near the same place—of course, wild. It seems to me of unusual height. *J. P., Chepstow.*

*A Natural Flower Garden*.—Visiting the gardens at The Rookery, near Carlisle, late the residence of the Venerable Dean Close, Mr. Leslie, the head gardener, allowed me an opportunity of feasting my eyes upon a floral scene worth miles of travel to inspect. Picture on a lawn a large purple Beech, now in full foliage of a rich coppery hue, whose pendulous branches sweep the grass over an area of 48 yards in circumference. On lifting a branch you naturally expect to find this area, as is generally the case under the thick leafy shade of trees, an uninteresting blank. Not so, however, here, for the whole ground is thickly covered with a most beautiful pure white double flower, the *Saxifraga granulata*, fl.-pl., whose stalks, about 6 inches high, rise out of the ground relieved by the grass, which is also growing fresh and green. The green carpet, the snow-white flowers, and the rich coppery canopy, under the rays of a summer sun, is really a grand and most enchanting sight, and the lesson is beautifully impressed, that a plant is only seen when "at home." Immediately adjoining the same plant is flowering freely in a plantation associated with a very pretty pink *Oxalis*, both of which seem to be valuable early flowering plants for a shady situation. *W. C.*

*Pea Sangster's No. 1*.—I again send you an account of our early Pea, Sangster's No. 1. Sown on a south border, at the front of the kitchen garden wall, on December 15, 1884, from which we picked our first dish on June 13, 1885. *Geo. Lambert, Oakwood.*

*Papaver umbrosum*.—A large bed of this superb hardy annual attracts universal admiration. More than excelling in richness of hue Gesner's grand Tulip, the flowers are of perfect form, cup-shaped, and large. Each of the four petals composing the flower has upon it, marked boldly, a heavy black blotch, which is as defined within the flower as without. Here and there some blooms show a whitish margin to these blotches, but that is hardly an improvement. In this particular case the seed was grown in the open ground in August, and the plants from the seed-bed dibbled out in November to where they are now blooming. Thus the plants are very strong, are blooming early, and with wonderful profuseness. *A. D.*

*Curious Spike of Orchis mascula*.—On the 3d of the present month I met in with a very remarkable specimen of *Orchis mascula*. The stem, which was a foot in height, bore eight flowers (two had been broken or eaten off), but, instead of the usual number, sixteen, contained no less than forty pollinia. Six individual flowers contained six pollinia each, and the remaining two the usual number, viz., two each. One of the flowers had two lips, both almost perfectly formed, and, strange to say, the remaining sepals and petals were normal. The rostellum was, however, much enlarged, almost closing up the entrance to the nectary, and contained the rudimentary traces of a pistil. This latter was observable in two of the flowers, and issued from between the stigmatic surfaces. The pollinia were, as usual, enclosed in the anther cells, but only in the two centre ones were the viscid discs protected by the rostellum. We might here be permitted to ask, Is this a case of reversion to the original form, or one in which the flower is gra-

dually working its way up to the present structure of an Orchis flower? There is one fact in connection with this flower which seems more in favour of Dr. Crüger's opinion than that of either Brown, Lindley, or Darwin. These three observers have stated that the two lower stamens are invariably petaloid and form part of the labellum. Now in support of Dr. Crüger, who will not admit that the labellum is thus formed, it may be argued that here is a flower with not only the original number of stamens but the lip also, and in one case two, perfectly developed, which we could hardly expect if that organ is, as Darwin and the others state, composed partly of the two lower stamens. *A. D. Webster*. [In the flowers sent by Mr. Webster there were three stamens present. Rarely we have seen all six. ED.]

*Yucca filamentosa variegata*.—A specimen of this handsome variegated plant was exhibited at a recent meeting of the Royal Horticultural Society at South Kensington, in bloom, a condition in which it is not frequently met with. The flowers were borne on an erect branching spike, some 7 or 8 feet high. In colour they are quite white, and collectively handsome and effective in appearance. The cause of this plant not often being seen in a blooming state is no doubt owing to the demand for it being such as to induce growers to keep on propagating to an extent that does not admit of its getting strong enough to flower. It is a variegated form of *Y. filamentosa*, a Virginian species long cultivated in British gardens. Some years since, when plants with variegated leaves came more into fashion, the plant naturally received more notice than it previously had had, although it is by no means yet so generally grown as its merits entitle it to, for when properly treated it is one of the most elegant and effective plants in cultivation. I repeat, properly treated, for it can be grown so as to keep it in a healthy condition in ways widely different. It is hardy in many parts of England, still it so far differs from most things that will succeed altogether out-of-doors that so grown it has a dumpy, inelegant appearance as compared with the character it assumes grown under glass, especially when subjected to a stove or intermediate temperature, as so treated the leaves reach two or three times the size they ever grow to in the open air, curving beautifully, whereas outside they are always short and comparatively erect. In fact, when kept warm the whole plant attains a size and character such as to make it scarcely recognisable. Not the least remarkable thing connected with it is that when kept continuously in heat it shows no disposition to weakness or debility, as most things that will live out-of-doors generally are affected with when kept constantly in a much higher temperature than they naturally require. This *Yucca* is never likely to become so common as the generality of plants, on account of its being so much slower to increase than things that admit of being struck from shoot cuttings. The method of increasing it is by cuttings made of bits of the roots. These are obtainable from any plant that has attained sufficient strength and size by turning it out of the pot and shaking away most of the soil, so as to admit of the strongest roots being taken off from the root-stock, interfering no more than cannot be avoided with the smaller roots, which plants so treated are necessarily for some time afterwards dependent on to get re-established. Root deprivation of the kind stated is always a severe ordeal, and although this *Yucca* bears being so treated without worse effect than suffering a check, which for a time causes it to make smaller leaves and less progress, yet if a sufficient amount of roots be not left entire, severe injury will follow. The roots so obtained should be cut into bits of from half an inch to an inch long, and be put 2 inches apart in pots half filled with peat and sand, or loam and sand, the remainder all sand, leaving the upper end of the cuttings about level with the surface. They must be put in heat and kept moderately close and moist; they will soon break into growth, when more air must be given them. After two or three leaves have been formed they should be moved singly into small pots and grown on in the stove, keeping them well up to the glass in a light position, without which latter the growth made will be weak and the progress unsatisfactory. All that the young plants require afterwards is more pot-room as it is needed, and ordinary stove treatment for two or three years, after which, if desired, they may be transferred to a conservatory or greenhouse, where they are always effective.

live. The white variegation, which adds so much to the appearance of the plant, comes out much more distinctly from the green ground-colour when grown under glass, than when out-of-doors. The best time for taking cuttings is either early in spring before much growth has begun, or about midsummer, after the first new leaves produced in the season have attained something like their full size. On no account should a plant have its roots removed so late in autumn as not to admit of its getting established again before winter. Plants that have been partially disrooted should at once, as soon as repotted, be placed in a brisk growing temperature, as, if this is neglected, their leaves are all but certain to suffer. This *Yucca*, up to a certain size, is an excellent subject for room decoration if well attended to and stood in a light window; if too far from the light it gets drawn and weak. A well managed specimen that has been kept in heat long enough for it to attain the full size of which the plant admits being grown to, will be near on 3 feet across by about as much in height, whilst still retaining its bottom leaves, so as to all but cover the pot. *T. B.*

## Reports of Societies.

### ROYAL BOTANIC: June 17.

THE second summer exhibition of the Society was held in the gardens, Regent's Park, on Wednesday, June 17. The large tent was completely filled with specimen stove and greenhouse flowering and foliage plants. Of Orchids there was also an exceedingly good display. The usual bank was well filled, and seven collections were staged on another bank, where they had a good effect, with a green baize and Box hedge for a background. The groups of plants were, as usual, an excellent feature.

Messrs. Laing, of Stanstead Park, Forest Hill, arranged their choice Begonias with capital taste, and showed how well adapted they are for decorative purposes when mixed with Crotons, Orchids, Caladiums, and other bright flowers and foliage against a background of Palms.

Mr. B. S. Williams, of Holloway, had a most effective group, containing the usual run of stove and greenhouse plants, conspicuous amongst them being *Crimum rubicundum*.

Messrs. Henderson, of Maida Vale, arranged the third group with admirable taste; it contained distinct and good Caladiums, with a number of plants in flower of *Blandfordia flammea*.

#### STOVE AND GREENHOUSE PLANTS IN FLOWER.

Although it is now getting late for these plants to be shown in first-rate condition the group of twelve in the open class from Mr. James Cypher, of Cheltenham, were in capital condition; *Erica Cavendishiana* was in splendid order, and of immense size; *Erica ventricosa*, very fine; as also were *Pimelea decussata* and *Allamanda Hendersonii*. Mr. H. James, of Norwood, was a good 2d; Mr. J. F. Mould, Pewsey, 3d. For six plants Mr. D. Donald, gr. to J. G. Barclay, Esq., Leyton, was a good 1st, with *Statice profusa*, very fine; *Ixora Fraseri* and *Darwinia tulipifera*, equally good; *G. fuchsoides*, very profusely bloomed; *Erica tricolor* Kingscotti was well bloomed. Mr. C. Rann, gr. to J. Warren, Esq., Handcross, Crawley, was 2d; Mr. J. Young, gr. to E. C. Coope, Esq., Rochetts, Brentwood, 3d. In the corresponding class for trade growers Mr. Cypher was well 1st; Mr. Tudgely, Waltham Cross, 2d; and Mr. James 3d.

#### ORCHIDS.

Exotic Orchids were well shown by Mr. Douglas, gr. to F. Whitbourn, Esq., Great Gearies, Ilford. This exhibitor was 1st in the class where one or more plants might be shown in a pot. *Odontoglossum vexillarium* from one rootstock had thirty-four spikes and nearly 200 flowers, a fine *Oncidium macranthum hastiferum*, *Masdevallia Harryana*, and two fine plants of *Odontoglossum Roezlii album*. Mr. C. J. Salter, gr. to J. Southgate, Esq., Streatham, was a very good 2d—*Aerides Fieldingii*, *Odontoglossum vexillarium*, and *Cattleya Warneri* being very fine. Mr. F. J. Hill, gr. to H. Little, Esq., Hillingdon Place, was 3d. In the corresponding class for the trade Mr. Cypher was 1st, with immense specimens, mostly made up; a fine variety of *Cattleya gigas* (Sanderiana) was conspicuous. Mr. James was an excellent 2d—a made up mass of *Cattleya Mendelii* being very fine. Mr. Douglas was 1st in the class for single plants, showing really good *Odontoglossum vexillarium*. Mr. S. Cooke, gr. to De B. Crawshaw, Esq., Sevenoaks, was 2d; he had two splendid *Vandas*, but the blooms were sadly bruised; *Cattleya Warneri*, with seven flowers was very fine. Mr. Salter, of Selborne, Streatham, was 3d. In the trade class Messrs. Jackson, Kingston, were 1st, with a well arranged group of *Aerides Lindleyanum* with a branched spike, very fine; *Laelia purpurata*, with six blooms, &c.; Mr. Cypher was 2d; and Mr. James 3d.

#### NEPENTHES, SARRACENIAS.

Mr. James gained the 1st prize for a group of *Nepenthes*, and also for a small group of *Sarracenias*, N. Mastersiana being very fine. Messrs. Laing, of Forest Hill, were 2d.

#### FUCHSIAS.

Fuchsias were well shown by Mr. G. Wheeler, gr. to Lady Goldsmid, St. John's Lodge, Regent's Park; Mrs. Marshall and Earl of Brimsfield were the best. Mr. J. Weston, gr. to S. Martineau, Esq., Clapham Park, was 2d, the plants being smaller but well grown.

#### PELARGONIUMS.

In the trade class for six show *Pelargoniums*, Mr. C. Turner was easily 1st, the varieties were very fine—*Amethyst*, *Joe*, *Despot*, *Prince of Prussia*, *Ritualist*, and *Comtesse de Choiseul*, being the varieties. The same exhibitor was 1st for fancies. In the amateurs' class for six fancies, Mr. J. Wiggins, gr. to W. Clay, Esq., Kingston, Mr. D. Phillips, gr. to R. W. Mann, Esq., Langley Broom, Slough, and Mr. F. J. Hill, exhibited, taking the prizes in the order of their names. In the class for show varieties, Mr. Hill was 1st; Mr. Wiggins 2d, and Mr. Phillips 3d. The best zonal *Pelargoniums* were from Mr. Weston, and the 2d best from Mr. H. Eason, gr. to B. Noakes, Esq., Hope Cottage, Highgate, the plants in both cases being tied down too closely.

#### FINE-FOLIAGE PLANTS, FERNS, AND BEGONIAS.

Mr. Rann, gr. to J. Warren, Esq., Handcross, Crawley, exhibited magnificent *Crotons*, a splendid *Cycas revoluta*, *Bonaparteia stricta*, and large Palms, with which he easily won the 1st prize for foliage plants in the amateurs' class; while Mr. Cypher won that in the trade class. Mr. Rann also received a 1st prize for six handsome *Crotons*: *C. Warrenii* and *C. Prince of Wales* were superb specimens; Mr. Warren was also well 1st for a group of exotic Ferns, *Davallia Mooreana*, *Gleichenia rupestris*, and *G. Mendelii* being well grown.

Messrs. Laing were the only exhibitors of *Begonias* in the trade class, but the specimens to which the 1st prize were awarded were in their best style—*Her Majesty*, *Bridesmaid*, *General Roberts*, *White Perfection*, and *Piebald* being the best of them.

#### FRUIT.

There was a good display of fruit, but it was not quite up to the standard of what we usually see at the Botanic in June. The 1st prize for a collection was awarded to Mr. W. Robins, gr. to E. D. Lee, Esq., Hartwell House, Aylesbury; *Alexandra* Peaches, Melons, Buckland Sweetwater, *Foster's Seedling*, and Black Hamburgh Grapes were good.

Pines were very fine, but only Queens were exhibited. Mr. H. Morris, gr. to A. P. Vivian, Esq., M.P., Taibach, South Wales, was 1st, with a handsome, well-ripened fruit; Mr. G. T. Miles, gr. to Lord Carrington, Wycombe Abbey, was 2d; and Mr. T. Coombes, gr. to J. A. Rolis, Esq., M.P., The Hendre, Monmouth, was 3d. All were superb fruits.

For two Melons, Mr. Douglas was 1st; Mr. H. W. Ward, gr. to the Earl of Radnor, Longford Castle, Salisbury, 2d; and Mr. George Halliday, gr. to J. Norris, Esq., Castle Hill, Bletchingly, 3d.

The baskets of Black Grapes were all one variety—Black Hamburgs; that from Mr. W. Bates, gr. to Mrs. Meek, Poulett Lodge, Twickenham, which gained 1st prize, was very fine, the fruit black and well finished. The best basket of white was from Mr. P. Feist, gr. to R. J. Ashton, Esq., Bishopsgate House, Staines—very good Muscat of Alexandria, the others being Buckland Sweetwater. The best three bunches of Black Hamburg Grapes were from Mr. F. Smith, gr. to W. H. Sewell, Esq., Warren Hill, Troughton; they were well finished, with beautiful bloom. Mr. G. Aslett, gr. to C. Butler, Esq., Warren House, Hatfield, was a good 2d. The best black Grapes of any other kind were three bunches of Black Prince, from Mr. W. Mowbray, gr. to the Earl of Leven and Melville, Fulmer, Slough. Muscats, for the season, were very fine indeed. Mr. H. Cakebread was easily 1st, with three capital bunches; Mr. P. Feist being a good 2d. For white Grapes of any other kind Mr. Cakebread gained the 1st prize, with three fine bunches of *Foster's White Seedling*; Mr. Mowbray was 2d, with Buckland Sweetwater; and Mr. Robins 3d, with *Foster's White Seedling*.

Mr. Mowbray had the best Peaches and Nectarines; Royal George and Noblesse in the former, Elrue and Pirmaston Orange in the latter.

Mr. T. Hare, Wellington Gardens, Grantham, exhibited two varieties of Cherries, *Elack Circassian* and *Elton*, very fine.

Mr. T. Laxton, of Bedford, also exhibited Strawberry Noble and The Captain, grown entirely in the open air; they are both remarkably good-looking fruit, of the largest size, and very well formed. Strawberry Pauline, from Messrs. Paul & Son, Cheshunt, also exhibited from out-of-doors, is a very early and good kind.

#### CUT FLOWERS.

These comprised Roses, which were fairly well exhibited in the amateurs' class by Mr. A. Gibson, gr. to T. F. Burnaby Atkins, Esq., Halstead Place, Sevenoaks; T. W. Girdstone, Esq., Sunningdale; and Mr. J. Hollingworth, Maidstone.

Messrs. Paul, of Cheshunt, and Mr. B. R. Cant, of Colchester, exhibited in the trade classes, the former being 1st for forty-eight trebles, with clean blooms of large size and good quality. Mr. B. R. Cant exhibited a box of superb blooms of *Souvenir d'Elise* Tea Rose, and was awarded the 1st prize.

Mr. Rumsey, of Waltham Cross, was awarded 1st prize for a collection of climbing Roses.

Mr. B. R. Cant, Colchester, was awarded a 1st prize for a fine stand of twelve *Maréchal Niel* Roses.

Mr. David Laird's Pansies were very rich in colour, and comprised the finest varieties in the fancy section.

Mr. Salter was 1st for cut Orchids, showing a capital collection, which were very pretty, arranged with small pots of *Adiantum*.

Several other good collections were shown.

Collections of cut flowers of herbaceous plants were well exhibited by Mr. T. S. Ware, of Tottenham; Messrs. Paul, and Messrs. Kelway, of Langport; greenhouse cut flowers by Mr. James. Mr. Turner obtained the 1st prize for cut show Pelargoniums, and Mr. Eason for zonals. A splendid collection of wild flowers (cut) was exhibited by Mr. Dixon, gr. to Sir. T. M. Wilson, Searles, Uckfield, and well deserved the 1st prize. It contained 180 species collected in the neighbourhood. The same exhibitor was awarded the 1st prize for a collection of medicinal and economic plants. Baskets of cut Roses were an interesting and pretty feature. The 1st prize was awarded to Messrs. Paul & Son.

#### AWARDS.

The following were awarded the Large Silver Medal of the Society:—Messrs. E. G. Henderson & Son, for group of plants; Messrs. Laing, for group of plants; Mr. B. S. Williams, for group of plants.

The Silver Medal was given to Messrs. Hooper, of Covent Garden, for cut flowers and Tree Carnations in pots.

The following had the award of a Small Silver Medal:—Messrs. Barr & Son, Covent Garden, collection of hardy cut flowers. Messrs. Paul & Son, Cheshunt, for group of herbaceous plants; and one for cut hardy flowers.

The Large Bronze, to Mr. H. James, for collection of *Dracaenas*.

The Bronze, to Messrs. Low, of Clapton, for collection of Orchids; and to Messrs. Sander, of St. Albans, for group of *Odontoglossums*.

Certificates were awarded to the following:—Mr. Salter, for group of Hydrangeas; Mr. Wiggins, for collection of seedling Pelargoniums; Mr. J. Vander Rees, Tooting, for collection of hardy cut flowers; Messrs. H. Cannell & Sons, for cut flowers.

#### NEW PLANTS.

The following Botanical Certificates were awarded:—To Messrs. Veitch, for *Lælia Canhamii*, a splendid variety, white sepals and petals, crimson-purple lip, with narrow white margin; *Thunia Veitchii* (also exhibited by Mr. B. S. Williams under the name of T. Wrigleyana), a cross between T. Marshalli and T. Bensoniae, purple bluish sepals and petals, pale lilac labellum; *Masdevallia Gairiana*, a cross between M. Veitchiana and M. Davisii, bright yellow, with a slight trace of the bright colour of M. Veitchiana on the top petal; *Cypripedium Sedeni candidum*, a pretty form of this handsome and popular hybrid; *Cypripedium macropterum*, between C. Lowii and C. superbiens; the lateral sepals have the distinct spotting of C. superbiens, the dorsal sepal is like C. Lowii; *Spirea palmata alba*, a very pretty white form of this species; *Eunonymus japonicus Silver Gem* has very beautiful white variegation; *Fagus sylvatica tricolor*, the leaves margined with rosy-red; *Cyathia divergens*, a remarkably handsome basket Fern, very distinct in character; *Phyllanthus Chantrieri*, a distinct and well-marked species.

Messrs. E. G. Henderson & Son, for *Alcacia Hendersoni*, very distinct in the form of its deep green leaves and dark green midrib.

Messrs. Lee & Son, for *Cupressus Lawsoniana erecta viridis alba variegata*.

Mr. James Cypher, for *Dendrobium Falconeri* delicatum, very pale form, with pale purplish instead of the usual maroon blotch; *D. crystallinum album*, white, with yellow blotch.

Messrs. Laing, for *Caladium Raymond Lemonier*, greenish-white leaf, with red centre; *C. albo luteum maculatum*, cream, with dark red blotches; *C. Comte de Germiny*, with reddish-crimson midribs, with greenish-white blotches.

Messrs. Barr & Son, for *Brodiaea stellaris*, a pretty species with bluish-purple flowers, the centre white.

Messrs. Sander & Co., St. Albans, *Odontoglossum Alexandrea rosea punctata*, with well formed flowers, fringed petals, thickly spotted brown; *O. Alexandrea Johnsoni*, bluish sepals, and petals very heavily blotched, and spotted brown; *O. Alexandrea Phalaenopsis* takes its name from the form of the flower, which is well formed, pinky bluish with a few brown spots.

Mr. B. S. Williams for *Agapanthus umbellatus variegatus*, the leaves striped with yellow.

#### NEW FLORISTS' FLOWERS.

Floral Certificates were awarded to the following plants:—

To Mr. J. Wiggins, for show Pelargonium *Portia*, a dwarf plant with rosy tint and maroon blotch; *Vesper Bell*, pinky-white, maroon blotch, with pretty marks on the lower petals.

To E. B. Foster, Esq., Clewer Manor, Windsor, for Pelargonium *Pluto*, a large handsome variety, rosy-red, white centre, maroon blotch.

To Mr. C. Turner, for fancy Pelargonium *Mrs. Langtry*, very free, pinky-white, bright rose blotch.

To Messrs. Chas. Lee & Sons, Isleworth, for *Statie floribunda*.

To Messrs. Veitch, of Chelsea, for Carnation *Pride of Penshurst*, a beautiful bright yellow variety, very free flowering.

To Messrs. Laing, for Tuberous Begonias.

To Mr. Brissenden, for a large double variety of Begonia, with crimson-scarlet flowers; *B. Salomonea*, double rosy-salmon, a neat plant.

To Messrs. H. Cannell & Sons, Swanley, for *Verbena Purity*, large heads of white flowers; and *V. Dr. Feyerlin*, rich plum-purple; *Begonia Louis Bouchet*, a decorative variety thickly beset with drooping scarlet flowers.

#### THE YORK GALA: June 17-19.

THE York show is this year of a character such as to keep up the reputation which the old City has so long held for its horticultural displays, in the several departments of plants, flowers, and fruits, there is a keen competition in stove and greenhouse plants—both flowering and fine-foliated being exhibited in very large numbers and fine condition.

Of Pelargoniums, as usual, there is an immense display. Pot Roses are nicely shown, filling the greater part of a large tent.

Fruit is well represented, especially Grapes, Melons, Nectarines, and Figs.

In the class for sixteen stove and greenhouse plants, flowering and fine leaved, Mr. Letts, gr. to Lord Zetland, holds the 1st place, showing a fine group; and Mr. Cypher 2d. Mr. Eastwood, gr. to Mrs. Tatley, of Leeds, takes most of the leading prizes for Pelargoniums in both the show and zonal classes.

The groups of plants were arranged for effect, and filled a large circular tent. Mr. McIntyre takes 1st in the class for large groups; in the class for smaller groups Mr. Noble is 1st. Mr. Miles, gr. to Lord Carrington, is 1st for eight dishes of fruit.

With the continuance of fine weather the gathering cannot fail to be a decided success. (By Telegraph.)

#### MASSACHUSETTS HORTICULTURAL.

MANURES.—At a recent meeting of this Society Professor G. C. Caldwell, of Cornell University, read a paper on "A Comparison of Manures for the Orchard and Garden." How to manure the garden or the orchard for the most profitable results is one of the difficult questions that the horticulturist has to meet. Of the biggest and most solid Cabbages, the earliest Peas, the largest Squashes, the sweetest and most prolific berries, the handsomest and most delicately flavoured Grapes, the most luscious Peaches or Pears, the earliest or the best late-keeping Apples, he has an unlimited variety offered him by all the seedsmen or nurserymen in the land; and he need find no difficulty whatever in laying out to good advantage all the money he has to spare in this direction. Of the most suitable land on which to plant all these crops there is enough and to spare somewhere in all this wide country. Of tools and labour-saving machines of every kind, and of men and animals to use them, there is no scarcity. In respect to all these supplies there is only embarrassment of riches, and no crops need fail of producing good fruit abundantly from any want of liberal provision for its highest requirements on any of these lines.

But is there such a superabundance of supply when we come to the matter of the highest requirements as to the food of these crops? Is there a sufficiency of a supply of such kinds of food as will, in the long run of garden and fruit culture, give the surest results? Is not the gardener's call always for more stable manure? and is the call of the fruit grower any less loud? One naturally asks, why is this so when there are elsewhere at least immense, if not inexhaustible, quantities of the nitrogen, phosphoric acid and potash that are reckoned as so important plant nutrients, all to be had for the purchasing, and under so great a competition that they ought to be had for as low rates as they can be sold for and pay fair profits? They can be had also in every form of combination and every degree of assimilability, and in any desired mixture; and, further, to save the farmer or the gardener the trouble of studying out for himself the kind of combination that his crop needs, mixtures are offered to him ready made up for each crop.

Abundant as these commercial supplies are, they do not seem to fully answer the purpose. It is doubtful whether the demand for animal manures is any less urgent now than it was before the commercial manures became the important articles of trade that they now are. Yet in agricultural operations superphosphates, bone meal, nitrate of soda and the like, have in some few cases been made to take the place entirely of stable manure, with profit. As an instance of this kind, Professor Caldwell gave an account of Mr. Prout's farm in England, which was bought in 1861. It comprised 450 acres, and therefore its cultivation was no small plot experiment. When bought it was in a low condition of fertility, and the owner asked the advice of the late Dr. Voelcker, the eminent agricultural chemist, as to the best way to bring it into good condition again. The advice was to dress it well with stable manure. After doing this with unsatisfactory results for two years, application was again made to the chemist, who advised the owner to use more stable manure. He said he could not afford it; and the chemist visited the farm again and suggested the use of commercial fertilisers after a certain plan. The plan was followed, and bone-dust, superphosphate, dissolved guano, and nitrate of soda were the only manures used from that time on. The crops of Clover, hay, grain, straw, and everything were all sold standing; only an insignificant quantity of manure was made, the cultivation being almost entirely by steam. This system has been carried on for more than twenty years. The farm cost in the beginning 74,500 dol., and enough more was spent upon it in improvements to make

the total cost about 100,000 dol. The annual clear profits have been on an average about 4500 dol., and it was estimated that the farm could be sold, eight years after it was taken, for twice what it had cost.

These facts show that commercial fertilisers do contain all the food required by crops, and that, with their assistance only, a farm can be brought up from a low condition to a higher one, and held there for a series of years. And no one can show that what is true of farm crops should not be true of garden and fruit crops as well—if not to the same extent, yet to a large extent. They feed on the same kind of soil, and in the same manner, and require the same nutrients in general, and the same particular nutrients that are specially important for farm crops are, so far as we know, specially important for garden and fruit crops; the proportions required may be different, but perhaps not more so than for different farm crops. The same mixture of nitrogen compounds, phosphate and potash salts, will not answer equally well for Wheat and Potatoes, nor even for Wheat and corn, which are more nearly alike than Wheat and Potatoes.

What are the obstacles in the way of the more extensive use of commercial fertilisers in the garden and orchard, and of less dependence on the city and village stables? In answering this question we naturally ask, first, What does stable manure contain that is not supplied in commercial fertilisers?

The valuation of a commercial fertiliser is based on the quantities of nitrogen, phosphoric acid, and potash that it contains, and there is no doubt that in respect to just these ingredients we can meet the wants of any crop better by supplying commercial fertilisers than we can by stable manure, if indeed there is any difference between the two as to efficiency. But besides these the crop must find in the soil, supplied from some source, lime, magnesia, sulphuric acid, in the form of sulphates, of which plaster is one, a very little iron, possibly chlorides, of which common salt is one, and perhaps silica. These substances are all found in all good soils, or supplied in fertilisers; hence we are justified in charging all the cost of a commercial manure to, and in expecting to get our money back from, its nitrogen, phosphoric acid, and potash; the rest of the ingredients must be thrown in gratis, as of no value generally, although there may be cases where one or another of them may be of service. All of these matters the stable manure contains also in abundance.

So far no one can claim anything for the stable manure that is not supplied by the commercial fertiliser. The only respect in which the two materials are distinctly unlike is this: the stable manure is composed largely of dead vegetable and animal matter in process of decay; the product of this decay is the humus, or vegetable mould of the soil. About one-fifth of ordinary stable manure is made up of this vegetable and animal matter, while not over six to eight one-thousandths is potash, five or six one-thousandths nitrogen, and three one-thousandths phosphoric acid. Of nitrate of soda, so much mentioned for its nitrogen, one-sixth is this nitrogen; of a good superphosphate, as this fertiliser averages in this country, about one-eighth is phosphoric acid, and of a German muriate of potash from a third to a half may be potash. But in all their materials there is no vegetable matter, and little or no animal matter.

Here, then, is a clear distinction between the two kinds of manure, the stable and the artificial. The stable manure has its few thousandths of nitrogen, of phosphoric acid, and of potash, and its one-fifth of decaying vegetable and animal matter; the commercial manure only its few thousandths or even less of animal matter, and its proportion of nitrogen, phosphoric acid, and potash, counted by eighths to thirds. About three-fourths of the stable manure is only water, however; expel this, and we get a manure as dry as commercial manures ordinarily are, and the comparison between the two will be more just and no less striking. We shall then see that four-fifths of this dry manure is decaying vegetable and animal matter, about one-fortieth is potash, one-eighth phosphoric acid, and one-fiftieth nitrogen.

Can any way now be shown in which this striking difference between the two kinds of manure may account for the greater measure of success that is attained in general use with stable manure? As already said, decaying vegetable or animal matter in the soil makes humus or vegetable mould. This common ingredient of all arable soils is not necessary for plant growth, for, on a small scale in pot culture, good crops have been obtained in a soil as white as snow, and therefore quite free from any humus, but containing all the real plant nutrients that have been mentioned. But that this humus is an important ingredient of a fertile soil no one can doubt. Given two soils, equally rich in nitrogen, potash, phosphoric acid, lime, and all matters of such sort, but of which one is poor in humus and the other rich in it, but yet not so excessively rich as a bog or muck bed, there is not a farmer or gardener who knows soils who would not give more for the soil rich in humus than for the other. In the course of the decay of these vegetable matters several acid substances are formed, chiefly carbonic acid; these acids act on the large quantities of difficultly soluble plant food of fair quality, and aid in bringing it into solution, and thus within easy reach of the plant. That the carbonic acid, which is one of the main products of the decay of humus, does in some way favour vegetable growth is illustrated by an experiment performed many years ago by Stockhardt, of which an account was given by Professor Caldwell, but which we have not room to quote. It is also shown by other experiments and by analysis of the air in the pores of the soil.

One of the most interesting properties of soils is that remarkable power they have of absorbing certain valuable plant nutrients, and holding them in a difficultly

soluble condition near the surface, so that however much rain may reach through the ground, they will only very slowly be carried down deeper, or washed out altogether. Thus the soil behaves with phosphoric acid, with potash and with the ammonia that is so valuable for its nitrogen. For these three substances dry, arable soil, that is not too sandy, is a most trustworthy savings-bank. Therefore, although we should make much account, in buying a fertiliser, of the proportion of soluble phosphoric acid or potash or nitrogen compounds in it, yet in all probability, to say the least, our crops take up but a little of these nutrients before they are changed by this fixing power of the soil into a difficultly soluble condition. This, which might at first appear a disadvantage, assists in the more equal distribution of the fertiliser through the soil, and at the same time prevents it from straying far off. Commercial fertilisers, it is often observed, do their best when used with stable manure, and this is because the abundance of carbonic acid generated by the fresh application of such manure assists in the resolution of the "insolubilised" phosphoric acid and potash of the commercial manure, as well as of the difficultly soluble native food of the soil.

The essayist gave a comparison of the values of certain kinds of manures. Cow-manure at 1.16 dol. per 1000 lb. is not a cheap way of getting plant food; it would be more costly than commercial fertilisers were it not for the large amount of humus-forming material that it contains, which may offset the high cost of the plant nutrients in it. But we have just as much of this humus-forming material in horse-manure, and the important plant nutrients in that at 1.54 dol. per 1000 lb. are cheaper than in the commercial fertilisers. Night soil at 43 cents per 1000 lb. (the cost of hauling) affords plant food at a remarkably cheap rate—much more so than commercial manures. Rock-weed at 1.21 dol. per 1000 lb. is an expensive manure. Fish chum at 6.50 dol. per 1000 lb. provides nitrogen and phosphoric acid at a very cheap rate. Hen manure at 4 dol. per 1000 lb. is an expensive fertiliser. Farmers' waste at 78 cents per 1000 lb. affords nitrogen and phosphoric acid at a cheap rate.

Professor Caldwell advised the purchase and mixing by farmers of the raw materials of fertilisers, and gave an instance of a farmer in Connecticut who had done this successfully, the mixture being cheaper, and he has also the great advantage of knowing just what it was made of; its nitrogen, for example, being in the form of sulphate of ammonia, the most costly and valuable form of nitrogenous plant food, and not of roasted and ground leather waste, an utterly worthless form of nitrogenous plant food.

Professor Caldwell closed with the following summary:—

1. That if enough of the needed elements of food of the gardener's or horticulturist's crops cannot be obtained in stable manure or other animal waste, it can be procured in the trade in unlimited quantity and in every degree of availability depending on different grades of solubility and in the greatest variety of mixtures to suit any whim or fancy of crop or crop growers.

2. That profitable crop growing can be carried on for at least many years with these commercial fertilisers alone.

3. That the most evident distinction between stable manure and commercial fertilisers, and the distinction upon which we should, therefore, base an explanation of the greater reliability of the former, is its large proportion of vegetable matter or humus-forming material, of which commercial fertilisers contain practically none.

4. That soils contain in a difficultly soluble condition, and, therefore, not easily fed upon by the crop, all the needed elements of plant food.

5. That humus, by the decay it suffers in the soil, furnishes carbonic acid and other solvent agents, and this carbonic acid appears to play an important part in the nourishment of crops by bringing this native insoluble stock of plant food within their easy reach.

6. That even if we add water-soluble plant food to the soil it becomes largely insoluble before the crop can feed upon it or needs it; therefore soluble plant food added to the soil in commercial fertilisers also needs the help of the humus finally for its solution.

7. That plant food in most animal and vegetable residues used as manures, costs much less than in commercial manure.

8. That in spite of the disadvantages that under some conditions attend the use of commercial fertilisers, they are nevertheless a very important and necessary help in crop-growing.

9. That in using these fertilisers the wisest course appears to be to make one's own mixtures of the raw material, as well for securing a better manure as for economy in the first cost.

## The Weather.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, June 15, 1885, issued by the Meteorological Office, 116, Victoria Street, London, S.W. :—The weather has been rather showery in the extreme north of Scotland, but in all other parts of the kingdom the conditions have been dry and very fine.

The temperature has been slightly above the mean in "Scotland, E." and "England, N.E.," and about equal to it in the "Midland Counties," "England, S.," and "England, S.W.," but from 1° to 3° below in all other districts. The maxima, which were

recorded either on the 12th, 13th, or 14th, varied from 62° in "Scotland, N.," and 70° in "Scotland, W.," to between 80° and 84° over the greater part of England. The minima were registered at most stations either on the 9th or 10th, when the thermometer fell to between 34° and 37° in almost all parts of the country, and to 48° in the Channel Islands. At the inland stations the range of temperature during the week has again been unusually large, that at Llandovery being 45°.

The rainfall has been less than the mean in all districts; over the greater part of the kingdom the fall has been scarcely appreciable.

Bright sunshine shows a further increase in duration, the percentages ranging from 39 in "Scotland, E.," to between 53 and 66 in most other districts, and to 68 in the Channel Islands.

Depressions observed.—The only depression observed in our neighbourhood was that noticed as passing over the south-east of England at the close of last week. By 8 A.M. on the 9th it had reached Denmark, and on the following day, after growing much deeper, it disappeared over the Gulf of Bothnia. The distribution of pressure over our islands now became anticyclonic, and the winds, which had blown freshly or strongly from the northward or north-eastward, decreased in force and shifted to the westward on our northern coasts, and to the eastward in the south.

### STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, JUNE 17, 1885.

June 11.—Very fine day and night.

12.—Very fine day and night.

13.—Very fine day and night.

14.—Very fine day and night.

15.—Fine day; dull at times.

16.—Fine day; very windy throughout.

17.—Fine day; dull mostly; occasional gleams of sunshine.

LONDON: Atmospheric Pressure.—During the week ending June 13, the reading of the barometer at the level of the sea decreased from 30 inches at the beginning of the week to 29.85 inches by 9 A.M., and increased to 29.88 inches by 5 P.M. on the 7th, decreased to 29.69 inches by 5 P.M. on the 8th, increased to 30.09 inches by 9 A.M., and decreased to 29.98 inches by 5 P.M. on the 9th, increased to 30.36 inches by 9 A.M., and decreased to 30.30 inches by 5 P.M. on the 10th, increased to 30.42 inches by 9 A.M. on the 11th, decreased to 30.37 inches by 1 P.M. on the same day, increased to 30.38 inches by 9 A.M. on the 12th, and was 30.15 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 30.16 inches, being 0.10 inch higher than last week, and 0.15 inch higher than the average of the week.

Temperature.—The highest temperature in the shade in the week was 78° 5, on the 13th; the highest on the 9th was 64° 3. The mean of the seven high day temperatures was 70° 9.

The lowest temperature was 41° 4, on the 11th; on the 8th the lowest temperature was 57°. The mean of the seven low night temperatures was 49° 2.

The greatest range of temperature in one day was 31° 5, on the 13th; the smallest was 11° 5, on the 8th. The mean of the seven daily ranges was 21° 7. The mean temperatures were—on the 7th, 60° 5;

on the 8th, 59° 5; on the 9th, 53° 3; on the 10th 52° 4; on the 11th, 52°; on the 12th, 59° 6, and on the 13th, 61° 6; of these the 7th, 8th, 12th, and 13th were above their averages by 2° 9, 1° 8, 1° 1, and 2° 9 respectively; and the 9th, 10th, and 11th were below by 4° 6, 5° 7, and 6° 3 respectively.

The mean temperature of the week was 57°, being 4° 7 lower than last week, and 1° 1 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 139° 5, on the 11th. The mean of the seven readings was 121° 3.

Rain.—Rain fell on two days, to the amount of 0.98 inch.

ENGLAND: Temperature.—During the week ending June 13, the highest temperatures were 80° 1, at Cambridge, 78° 5 at Blackheath, 78° at Truro; the highest at Liverpool was 70°, at Preston 71°, at Bolton 72° 6. The general mean was 74° 6.

The lowest temperatures were 35° 3 at Cambridge, 37° at Hull, 38° 5 at Wolverhampton; the lowest at Plymouth 45° 6, at Liverpool 44° 4, at Truro and Newcastle 44°. The general mean was 41° 2.

The greatest ranges were 44° 8, at Cambridge, 38° at Sheffield and Hull; the smallest ranges were 22° 6 at Plymouth, 25° 6 at Liverpool, 28° at Preston. The general mean was 33° 4.

The mean of the seven high day temperatures was highest at Blackheath, 70° 9, at Cambridge 70° 7, at Truro 68° 4; and was lowest at Preston, 62° 9, at Bolton 63° 1, at Hull 63° 3. The general mean was 65° 5.

The mean of the seven low night temperatures was highest at Plymouth, 50° 2, at Brighton 50° 1, at Liverpool 49° 9; and was lowest at Sunderland, 44° 7, at Hull 45°, at Bolton 45° 7. The general mean was 47° 6.

The mean daily range was greatest at Cambridge, 24° 1, at Blackheath 21° 7, at Sheffield 20°; and was least at Plymouth, 13° 2, at Liverpool 13° 8, at Preston 14° 3. The general mean was 17° 9.

The mean temperature was greatest at Blackheath, 57°, at Truro and Cambridge 56° 9, at Brighton and Bristol 55° 9; and was lowest at Hull, 52° 4, at Bolton 52° 5, and at Sunderland 52° 7. The general mean was 54° 6.

Rain.—The largest falls were 1.69 inch at Nottingham, 1.58 inch at Cambridge and Bolton; the smallest falls were 0.01 inch at Brighton, 0.18 inch at Truro, 0.48 inch at Sunderland. The general mean fall was 0.88 inch.

SCOTLAND: Temperature.—During the week ending June 13, the highest temperature was 76° 5, at Aberdeen; at Edinburgh the highest temperature was 64° 8. The general mean was 70° 7.

The lowest temperature in the week was 34° 5, at Glasgow and Perth; at Greenock the lowest temperature was 41°. The general mean was 37° 9.

The mean temperature was highest at Paisley, 54° 8; and lowest at Perth, 52° 2. The general mean was 53° 9.

Rain.—The largest fall was 0.09 inch, at Edinburgh; the smallest fall was 0.02 inch, at Perth. The general mean fall was 0.04 inch.

JAMES GLAISHER F.R.S.

### Answers to Correspondents.

CUCUMBER PLANTS DYING: J. F. As you have planted tender varieties on an old Potato bed it is just possible the plants die off for want of heat, or from cold and over-much moisture together. Can you not give the bed more heat by means of linings; or, clear out the lot, mix fresh dung with the old materials of the bed, and when the rank heat is over plant the frames with young plants.

DISEASED BRANCHES: R. P. F. The leaf is affected with the silver-leaf disease, the exact nature of which has hitherto baffled all inquiry. Cut the diseased branches away, and burn. The Plants are affected with a fungus (*Exoascus pruni*) often figured in the *Gardeners' Chronicle*. Cut away all the affected branches and burn them.

ERRATA.—In our notice of the show of Rhododendrons now being held in Cadogan Place, Sloane Street, S.W., Mr. Anthony Waterer's name got substituted for that of Mr. John Waterer, American Nursery, Bagshot, Surrey, who is the proprietor of the show in question.—In "Cabbage Early Warwick," p. 769, for "thirty-five years," read twenty-five years.

GALLS ON MAPLE: Camjee. The crimson pimples are said to be caused by a mite named *Phytoptus myriadenium* (see the *Gardeners' Chronicle* for July 1, 1882, p. 12).

**HOLLY: G.** The small grub which knits together the leaves of your Hollies is the larva of a minute moth (*Graptolitha nevana*). The sparrows are reputed to be fond of them.

**INSECTS: C. D.** Your young shoot of Pine was covered with a brood of newly-hatched caterpillars of one of the species of the feather-horned sawflies. Hand-picking, or syringing the shoots with soapsuds and quassia, or Pyrethrum infusion, are the best remedies. **I. O. W.—G. P.** Your Peach shoots are infested with the too common black Peach aphid (*Aphis persicae*). The remedies proposed against the Cabbage aphid in our issue of June 6 are applicable to this insect. Your Vines are infested with an exceedingly minute mite closely allied to the red-spider, against which some of the remedies proposed against the Cabbage aphid are also available. **I. O. W.**

**NAMES OF PLANTS: G. W. R.** 1, *Staphylea pinnata*; 2, *Daphne cneorum*; 3, *Ornithogalum pyrenaicum*.—**C. S. & Co.** *Papaver bracteatum*.—**C. W.** 1, *Helianthemum vulgare*; 2 and 4, *Polygala vulgaris*; 3, *Ranunculus arvensis*.—**E. F.** 1, *Carex ovals*; 2, *C. hirta*.—**W. S. C. P.** All varieties of *Eremurus spectabilis*.—**L. E. C.** 1, *Echites picta*; 2, *Choisya ternata*; 3, *Calycanthus floridus*.—**A. F. Fot.** *Polygonum cuspidatum*.—**T. J.** *Viburnum Opulus*, the wild Gueldres Rose.—**A. B.** The Austrian Brier.—**W. S.** 1, *Symphitum asperum*; 2, *Veronica gentianoides*; 3, *Centaurea montana*; 4, *Orobuchus*.—**Cattle and Green.** Rose *Moutan*.—**H. Reynolds.** *Begonia*—Marga is the green and white one; Louise Chretien the rose and bronze.

**NAME AND ADDRESS OF THE SECRETARY OF THE ROYAL HORTICULTURAL SOCIETY: J. H. P.** Mr. Dick, Royal Horticultural Society's Gardens, South Kensington, S.W.

**POLYPODIUM FRAGRANS: T. P. Collings & Co.** We do not see that the so-called "Polypodium fragrans," Collings, differs at all from the old and well-known *Pleopeltis nuda*, of Hooker's *Exotic Flora*, which has several other aliases, as *Drynaria Fortunei*, *Polypodium lineare*, *P. Wightianum*, and some others not quite so free from doubt. This plant has the same rich scent of coumarin in the drying fronds as those now sent. The name *P. fragrans*, Collings cannot be recognised.

**INTELLIGENT READERS, PLEASE NOTE.**—*Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and NOT to the Editor.*

**COMMUNICATIONS RECEIVED.**—**R. D.**—**R. L.**—**F. S.**—**W. H. C.**—**F. T. D.**—**W. W. W.** (no plants enclosed).—**C. W. Dod.**—**W. G. S.**

## Markets.

COVENT GARDEN, June 18.

THE subjoined reports are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list weekly, and are responsible for the quotations. It must be remembered that these quotations are averages for the week preceding the date of our report. The prices fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the price at any particular date, still less can they be taken as guides to the price in the coming week. **E. O.**

A GENERAL fall has taken place in all best goods, the market being now heavily supplied. Outdoor Strawberries have commenced this week. *James Webber, Wholesale Apple Market.*

**POTATOS.**—Jersey, 7s. to 8s.; St. Malo and Cherbourg, 6s. 6d. per cwt. Old, £2 to £3 per ton.

### SEEDS.

**LONDON: June 17.**—The seed trade, as usual at this season of the year, is now quite stagnant, and is consequently devoid of interest. Nothing for the moment is, of course, actually wanted, and business in seeds is, therefore, for the time being at a standstill. Offers of new French Italian are coming to hand. *Trifolium* is neglected. There is no change in bird seeds. Mustard and Rape seed keep steady. In blue Peas more inquiry has sprung up *John Shriv & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

### CORN.

At Mark Lane on Monday trade was dull and depressed. The foreign imports of Wheat being large exercised an adverse influence on the value of both English and foreign, but the transactions were so limited and irregular that it was difficult to give quotations. Flour was cheaper to buy. Grinding Barley was 6d. lower. Beans and Peas were again 6d. to 1s. cheaper. There was only a limited demand for Oats, but on the week prices show very little change. In Maize, for round corn lower rates were taken. On Wednesday business was nearly at a standstill, and prices were nominally unaltered, but the tendency was unfavourable for holders of grain generally. Average prices of corn for the week ending June 13:—Wheat, 33s. 8d.; Barley, 30s. 2d.; Oats, 22s. 1d. For the corresponding period last year:—Wheat, 37s. 4d.; Barley, 28s. 3d.; Oats, 21s. 6d.

### CATTLE.

At Copenhagen Fields on Monday a good assortment of cattle came on offer. The trade ruled firm, at 2d. to 4d. per 8 lb. in advance in many cases. Sheep and lambs met a fairly steady sale at the previous Monday's extreme rates. The calf trade was firmer, and no change was reported in the pig markets. Quotations:—Beasts, 3s. 10d. to 4s. 8d., and 4s. 10d. to 5s. 4d.; calves, 3s. 4d. to 5s. 4d.; sheep, 4s. 4d. to 5s., and 5s. to 6s.; lambs, 6s. 4d. to 7s.; pigs, 4s. to 4s. 6d. Thursday's trade was in an inanimate state. Supplies were ample for requirements. Beasts sold slowly and rather favoured buyers. Sheep and lambs also were inactive and weak. Calves and pigs dull.

### HAY.

Tuesday's Whitechapel Market report states that trade was dull, with a poor inquiry for everything, and supplies moderate. Quotations:—Clover, prime, 80s. to 110s.; prime second cut, 85s. to 110s.; inferior, 60s. to 75s.; hay, prime, 70s. to 98s.; inferior, 40s. to 60s.; and straw 26s. to 36s. per load. On Thursday there was a moderate supply on sale, with trade dull at Monday's rates. Cumberland Market quotations:—Clover, best, 85s. to 105s.; other qualities, 60s. to 80s.; hay, best, 85s. to 95s.; other qualities, 45s. to 90s.; and straw, 28s. to 35s. per load.

### POTATOS.

The Borough Market report states that new Potatoes are coming in freely from Guernsey and Jersey, and a few are still arriving from Lisbon. Prices are lower. Quotations:—Lisbon, 7s. to 8s.; Cherbourg, 7s. to 8s.; Jersey Kidneys, 9s. to 11s. per cwt. Old Potatoes are getting out of demand, and are much lower. Magnum Bonum, Regents, and Victorias, all from 50s. to 60s. per ton. The imports into London last week consisted of 383 half-boxes from Lisbon, 1385 baskets from St. Nazaire, and 313 cases from Malta.

**Government Stock.**—Consols closed on Monday at 99½ for delivery, and 99½ to 99½ for the account. Tuesday's figures were 99½ to 99½ for delivery, and as on the preceding day for the account. The final quotations of Wednesday were 99½ to 99½ for delivery, and 99½ to 99½ for the account. Thursday's closing prices were 99½ to 99½ for both transactions.

# FIR TREE OIL

## INSECTICIDE (SOLUBLE IN WATER)

SCALE.

MEALY BUG.

THRIP.

WIRE WORM.

RED SPIDER.

Destroys all Insects and Parasites without injury to Flowers, Fruit, Roots or Foliage.

Useful alike in Greenhouse, Vinery, Fernery, Orchard, Vegetable, Flower and Hop Gardens. Cures Mildew and Blight. Kills all Grubs, Aphids, Lice, Red Spider, Thrip, Mealy Bug, Caterpillars, &c. Applied by means of the Fir-Tree Oil Spray Pump, the Aphicide (hand spray producer), or by dipping. The trouble will be amply repaid by the healthy appearance of the foliage and the abundance of Fruit and Flowers. Always effectual, economical, and safe. Quickly removes all Insects from the coats of animals. It will cure Ringworm and all Parasitic Skin Diseases, and is perfectly harmless to the Hands and Skin.

Sold by Seedsman and Chemists, 1s. 6d., 2s. 6d., and 4s. 6d. a Bottle. Per Post 3d. extra. Tins— $\frac{1}{2}$ -gallon 7s. 6d., 1 gallon 12s. 6d.; Drums—5 & 10 gallon 11s. per gallon, Carriage Paid. A Treatise on FIR TREE OIL, as an Insecticide, its application to Plants and Animals sent Post Free on receipt of address, by the Manufacturer,

# THOMAS GREEN & SON (LIMITED),

Smithfield Ironworks, Leeds.  
And Surrey Works, Blackfriars Road, London, S.E.  
Horticultural Engineers to Her Majesty the Queen,  
CALL SPECIAL ATTENTION TO THEIR

## PATENT WROUGHT-IRON TUBULAR HOT-WATER BOILERS,

And others with SHELVES, and Ho'w or Ordinary Cast-iron  
GRATE BARS;  
SADDLE BOILERS.

With WATERWAY BACKS, and WELDED BOILERS,  
which are Specially adapted for Heating Greenhouses, Conserva-  
tories, Churches, Chapels, Schools, Public Buildings, Entrance  
Halls, Warehouses, Workshops, &c.

They are the nearest, cheapest, most effective, and durable  
of any extant.

The Tubular ones are remarkable for their great heating  
power, slow combustion, and the length of time the fire will  
burn without requiring attention. This pattern

Had the First and Highest Prize, a Silver Medal,  
Awarded to it at the Royal Horticultural Society's Exhibition,  
South Kensington, London, on June 3, 1881.

The *Journal of Horticulture* of June 9 says:—  
"HEATING APPARATUS.—A great number of boilers, valves,  
&c., were exhibited by eight competitors, and considerable in-  
terest was manifested in the verdict of the judges, and much  
discussion was brought to bear on the merits and shortcomings  
of the different boilers. The apparatus for which the Silver  
Medal was awarded was a wrought-iron saddle boiler, with a  
series of intersecting tubes, somewhat in the form of a letter X,  
but the tubes in ogee form, in the crown of the boiler. Most  
gardeners who examined the boiler expressed a favourable  
opinion of it. It is no doubt a quick and powerful boiler with-  
out being complex, the latter condition having, no doubt, had  
weight with the judges."

The *Garden* of June 11 says:—  
"The premier prize, a Silver Medal, was taken by Messrs.  
Green & Son for their new patent tubular saddle boiler. It is a  
modification of their original patent, the boiler being longer and  
not so high. It is found to be a powerful and efficient boiler, and  
heats a large quantity of water quickly with a small consumption  
of fuel."

Descriptive Illustrated Price List may be had free on application.  
Estimates given for all kinds of Heating Apparatus, and Hot-  
water Fittings of every variety supplied on the shortest notice.  
Galvanised Iron Cisterns, from 4s. to 12s. 6d. per gallon.

Oil Paint no Longer Necessary.

HILL AND SMITH'S BLACK VARNISH,  
for Preserving Ironwork, Wood, or Stone.  
(Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on  
all outdoor work, while it is fully two-thirds cheaper. It was  
introduced upwards of thirty years ago by the Advertisers, and  
its genuine good quality, notwithstanding a host of unprincipled  
imitators, is fully attested by its constantly increasing sale. It  
may be applied by an ordinary labourer, requires no mixing  
or thinning, and is used cold. It is used in the grounds at  
Windsor Castle, Kew Gardens, and at the seats of many  
hundreds of the Nobility and Gentry, from whom the most  
flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 12s. 6d. per gallon,  
at the Manufactory, or 15s. 8d. per gallon carriage paid to any  
Station in the Kingdom.

### UNSOLICITED TESTIMONIAL.

"*Pierrefield Park, June 21, 1876*.—Sir, I have this day  
forwarded from Chepstow to your address a black varnish cask,  
to be filled and returned with as good Varnish as the last we  
had, which I candidly admit was the best we ever had. Address  
Varnish to Pierrefield Park, Chepstow.—I am, Sirs, yours respec-  
tfully, WM. COX."

CAUTION.—HILL & SMITH particularly warn their  
Customers against the various cheap Varnishes now so much  
advertised.

H. & S.'s Varnish has been an article of common use on most  
of the large estates in the kingdom for upwards of thirty years;  
and their constantly increasing trade in it, and the numerous  
Testimonials they receive stamp it as a truly genuine article.  
Every cask is legibly marked with their name and Registered  
Trade Mark as above, without which none is genuine.

Large Illustrated CATALOGUE of Fencing Hurdles, Field  
and Entrance Gates, &c., sent free on application to

41, Wellington Street, Strand, London, W.C.BUY ONLY ENGLISH THREE-QUARTER PLATE  
WATCHES.BENSON'S NEW PATENT (No. 4658)  
"LUDGATE" WATCH,

SILVER,

GOLD,

£5 5s.

£12 12s.

Is a "Special Strength" Silver English Lever, my best  
London make, with Three-Quarter Plate Movement.

Jewelled throughout.

Chronometer balance, with damp and dust-proof  
Patent ring-band, and extended barrel, in  
Massive sterling silver dome cases

With crystal glass front.

Winds, set hands and opens at back.

The superiority in value, accuracy, and durability of the  
"Ludgate" Watch over the Swiss and American Keyless and  
Non-Keyless Watches, made in imitation of and sold as  
English work, and the ordinary Full-plate English Watch is  
enormous. The "Ludgate" Watch is compact, strong, hand-  
some, and durable. Being Three-Quarter Plate, it is superior  
in value and appearance to any £10 Watch sold, and, being  
compensated, it keeps perfect time; fitted with crystal front, it  
combines the strength of the Hunter, and convenience of the  
open face. Of my best London make, it will last a lifetime,  
stand rough usage of all and every kind without damage, and,  
being made in three sizes, it is for the above reasons suited for  
Home, Indian, and Colonial use by

Gardeners, Workmen, and Gentlemen.

The "Ludgate" Watch is far superior  
To any Watch at the price yet made, and  
Will be sent, free and safe at our risk

To all parts of the world for £5 5s.

Cash or P.O.O.; or in hunting cases, £6 6s.

Price in 18-carat gold, crystal glass cases,

Twelve Guineas.

SPECIALLY NOTE that J. W. BENSON is the only Maker  
of a Three-Quarter Plate English Watch for £5 5s. in Silver,  
or £12 12s. in Gold, and that our Patent "Ludgate" Watch  
cannot be had through or of any Watchmaker in the King-  
dom. Any infringement of the Patent Rights will be

**GARDENER (SECOND),** where three or four are kept, or SINGLE HANDED where help is given.—Age 24; can be highly recommended from present and previous employers.—E. HIATT, Powis Castle Gardens, Welshpool.

**GARDENER (UNDER),** to assist Inside or Out.—Age 21; nearly three years' good character from last place.—P. H., Havering Green, Romford, Essex.

**GARDENER (UNDER),** in a Gentleman's place.—Age 23; good character.—J. H., 17, Regent Street, Briton Ferry, Glamorganshire.

**GARDENER (UNDER),** Indoors or Out.—Age 23; first-class references. Please state particulars.—T. E., 131A, High Street, Wandsworth, S.W.

**GARDENER (UNDER),** in the Houses, or to assist with In and Outdoor work.—Six years' experience. Good character.—G. PROSSER, Porthkerry, Cowbridge, Glamorganshire.

**GARDENER (UNDER),** in a Gentleman's establishment, partly In and partly Outdoors preferred.—Age 24; five years' good character.—A. LELLIOTT, St. Martin's Square, Chichester.

**FOREMAN, in the Houses.**—Thoroughly competent in all branches.—DELTA, 11, Midfield Street, Rochester, Surrey.

**FOREMAN, in the Houses.**—Age 24; well up in Stove and Greenhouse Plants, Fruit, and Orchids.—W. KETTLE, Hill Farm, Laver-de-la-Haye, Colchester, Essex.

**FOREMAN, in the Houses.**—Age 25; ten years' practical experience in all branches. State wages and particulars to G. FARRINGTON, The Gardens, Colston Bassett, Bingham, Notts.

**FOREMAN, in the Houses.**—Young; good Plant Grower. Five years' good character. Bothy preferred.—E. E., J. Taylor, Yew Tree Cottage, Hermitage, Emsworth, Hants.

**FOREMAN.**—Ten years' experience in Stove and Greenhouse Specimens for exhibition. Well up in Ferns, Vines, Peaches and General Gardening.—A. STOTE, Pikes Hill, Lyndhurst, Hants.

**FOREMAN, in a good establishment.**—Age 27, single; thirteen years' practical experience in all branches. Excellent recommendations.—State wages and particulars to FOREMAN, The Gardens, Benham Park, Newbury, Berks.

**FOREMAN, in a good establishment.**—Age 25; eight years' experience in all branches of the profession. Two years in present situation. Well recommended from present and previous places.—G. HART, The Gardens, High Firs, Harpenden, Herts.

**FOREMAN (GENERAL), in a Market Nursery.**—Experienced and practical. Please state terms.—A. A., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**FOREMAN (GENERAL), in a Gentleman's place, or Nursery.**—Age 28, single; has a thorough knowledge of the profession in all its branches. Would take a job at Grape Thinning. Good references.—F. B., Mr. Tapsall, South Street, Westerham Hill, Kent.

## To Nurserymen.

**FOREMAN (GENERAL).**—One of the most successful Propagators and Plantmen in the Trade. Thirty years' extensive practice—twenty years as Foreman and Salesman with leading firms.—W. E., 7, Mill Street, Altrincham, Cheshire.

**FOREMAN, or SECOND, in a good establishment.**—Age 25; thorough good general knowledge of the profession. Highly recommended.—W. RICHARDSON, Verandah Cottage, Malvern Wells.

## To Nurserymen and Growers.

**FOREMAN and PROPAGATOR (INDOOR), or General Management of Small Nursery.**—Age 27, married; twelve years' practical experience in Leading Firms in the Growing of H.P. and Tea Roses, Clematis, Rhododendrons, Bouvardias, Solanums, &c. First-rate at Wreaths, Bouquets, and Crosses. Excellent characters.—E. G. W., Morebroad, Peasmarsh, via Hawkhurst, Sussex.

## To Nurserymen.

**FRUIT GROWER, or Fruits and Roses (Outdoor).**—The Advertiser (age 40, single) seeks a permanent situation as above; twenty years in the St. John's Nurseries; good Knifeman; accustomed to Execute Orders, also Management of Men; has a fair Knowledge of General Outdoor Work; could Manage a Small Nursery, or work under a General Foreman.—POMONA, East Terrace, Malvern Road, Worcester.

## To Nurserymen.

**PROPAGATOR and GROWER (SOFT-WOODS),** under Glass, where there would be opportunities for improvement.—Wages no object. Steady and trustworthy.—Particulars from C., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**ROSE-GROWER (Indoor).**—Age 26; good Budder and Grafter. Six years' experience, and six years in other branches. Good character.—J. E. FERNSIDE, 5, Daffod Street, Larkhall, Bath.

**JOURNEYMAN (FIRST), in a good establishment.**—Nine years' good character. Can be highly recommended.—G., Mr. S. Gurney, Bridens Camp, Hemel Hempstead, Herts.

**JOURNEYMAN, where three or more are kept.**—Age 22; six and a half years' good character.—E. KEFFOLD, The Gardens, Pepperharow, Godalming, Surrey.

**JOURNEYMAN, Inside and Out.**—Age 20; six years' experience. Good character.—A. F., Park Cottage, Acre Road, Kingston-on-Thames.

**JOURNEYMAN, Inside or Out, in a good Garden.**—Age 22; good character.—A. B., 7, Gwalior Road, Gardener's Lane, Putney, S.W.

**JOURNEYMAN, in a Gentleman's establishment.**—Age 23; nine years' experience. Good character. Please state wages, &c.—JOSEPH HORNER, Harmby, near Bedale, Yorks.

**JOURNEYMAN, Inside or Out, in a good establishment.**—Age 22; has good experience and character. Bothy preferred.—H., Mr. Shefford, The Grove, Long Ditton, Surrey.

**JOURNEYMAN, in the Houses, in a good establishment.**—Age 21; bothy preferred. Five years' experience. Good character.—J. DEAN, Lower Eaton, Hereford.

**JOURNEYMAN, partly Inside and Out.**—Age 22; well recommended from last and previous situations. Total abstainer.—F. WALKER, Hingham, Attleboro', Norfolk.

**TO GENTLEMEN, NURSERYMEN, &c.**  
—Situation wanted. Understands Vines, Peaches, Cucumbers, Melons, Tomatoes, &c. References. Job not objected to. Disengaged.—J. G., 86, Packington Street, Islington, N.

**TO NURSERYMEN.**—Wanted, for the commencement of October, a situation, in a Nursery, for a young man (Swiss) who has passed a three years' apprenticeship at a Nurseryman's, and one year's study at a School of Horticulture.—C. R., Orell, Füssli & Co., St. Gallen, Switzerland.

**TRAVELLER, in the Nursery or Seed Trade.**  
—The Advertiser is requiring a situation as above. Has had good experience in both branches. Thoroughly understands his business, and can produce first-class testimonials from previous employers.—N. O., Mr. F. Webber, Florist and Seedsman, Tonbridge, Kent.

## To Nurserymen.

**TRAVELLER, or SALESMAN, in a first-class Nursery.**—Thoroughly conversant with all branches of the Trade. Seventeen years with Messrs. R. Smith & Co., Worcester. Excellent references.—W. W. LAING, Bransford Road, Worcester.

## To the Seed Trade.

**SHOPMAN (HEAD), MANAGER, or TRAVELLER.**—Advertiser will shortly be disengaged. Is thoroughly practical in the different branches of the Trade, and has had considerable experience of late amongst Farmers and Agriculturists on the Provincial Markets. Good references.—A. B., Messrs. Hurst & Son, 152, Hounsditch, London, E.

## Seed Trade.

**SHOPMAN (ASSISTANT), or MANAGER.**—Age 27; thirteen years' practical experience in Seeds, Plants, and Decorating, or Sole Management.—J. H., 19, Birley Street, Wandsworth, S.W.

**CLERK (JUNIOR), or ASSISTANT.**—Age 18; good Florist and Decorator, also knowledge of General Trade and Orchids. Good references.—ALPHA, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

## To the Nursery and Seed Trade.

**BOOK-KEEPER and CASHIER.**—Advertiser will shortly be disengaged. Eighteen years in present situation.—J. H., Messrs. Dickson & Turnbull, Perth, N.B.

## To Seedsmen and Florists.

**COUNTER HAND, or to take charge of Small Business.**—Seven years' experience both in London and provinces. Well up in Wreath and Flower Work. General knowledge of the Seed Trade. Good references.—H. S., Nursery Cottage, Ashford, Kent.

**HORTICULTURAL BUILDER and HOT-WATER ENGINEER.**—A thorough practical man in all branches, with over fourteen years' experience, seeks employment.—A. DYSON, 19, Augustus Street, Regent's Park, London, N.W.

**COACHMAN.**—Age 38, married, no family; Pair or Single. Three years in last situation. Good character. Country.—BURGESS, Warnford Park, Bishop's Waltham, Hants.

**HOLLOWAY'S PILLS and OINTMENT.**  
—Dyspepsia, Jaundice. These complaints are the result of a disordered liver, which secretes bile in quality or quantity unsuitable for digestion, which requires a free flow of healthy bile, to insure which Holloway's Pills and Ointment have long been famous, far eclipsing all other remedies. Unsuitable food, irregularity of living, unhealthy climates, and other causes are constantly throwing the liver into disorder, but that important organ can, under all circumstances, soon be regulated and healthily adjusted by Holloway's Pills and Ointment, which act directly upon its secreting cells. The Ointment rubbed on the skin penetrates immediately to the liver, whose tissues it rectifies. One trial is all that is needed; a cure will soon follow.

CATTLEYA REINECKIANA SUPERBISSIMA.

CATTLEYA WAGNERIANA.

TREE FERNS.

**MESSRS. PROTHEROE AND MORRIS** will sell by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on **FRIDAY NEXT**, July 3, at half-past 12 o'clock precisely, by order of Messrs. Hugh Low & Co., CHOICE IMPORTED ORCHIDS, in the best possible condition, comprising fine plants of the lovely and rare Phalanopsis Marie, figured in *Orchid Album*, plate 60; Phalanopsis Stuartiana, P. amabilis, P. Sanderiana; Cattleya Arnoldiana, C. Downiana, C. Reineckiana superbissima, C. Wagneriana, C. Mossiae, C. Schofieldiana, C. Skinnerii, C. speciosissima; Cypripedium Roezlii, Dendrobium Dearii, Laelia purpurata, fine masses; L. elegans, fine masses; Odontoglossum Alexandriae, very fine; O. elandum, O. Roezlii, O. luteo-purpureum, Antiquia varieties; O. vexillarium, O. v. rubellum; Paphinia Sanderiana, and other choice ORCHIDS; also a consignment of fine TREE FERNS from New Zealand.

On view morning of Sale, and Catalogues had.

New Orchids.

**ANGRÆCUM LEONI**, a magnificent novelty, for the Cattleya-house.

**ANGRÆCUM SCOTTIANUM**, rare and striking.

**ANGRÆCUM FUSCUM**, long spikes, covered with flowers.

**ANGRÆCUM rostellare**, Pogonia Barklyana, Eulophia megistophylla, E. pulchra, Lisochilus stylisus, L. Julax, &c.

**ANGRÆCUM LEONI**.—This is a most wonderful novelty, and next to Vanda Sanderiana, we consider it the finest Orchid we have had the pleasure to offer. It was discovered and collected by Mr. Leon Humbolt in the Comoro Islands, growing at an altitude of 5000 feet. It should be grown in the Cattleya or the Dendrobium house, and it will be a plant of very easy culture; the plants, although only just imported, are beginning to grow.

**ANGRÆCUM LEONI** is a serious rival to A. sesquipedale, surpassing it, we consider, not only in its extraordinary and very beautiful form, but in its adaptability to the Cattleya-house, its cool habit, and great floriferousness, some of the plants actually showing up to fifteen flower-spikes, and each bearing six to ten of the large pure white flowers.

Our Woodcut gives the exact size of the plant. The leaves are fleshy, and are quite a remarkable feature, standing boldly sideways, and are so arranged as to form a perfect half circle, in front of which the flower-spikes arrange themselves; altogether it is a remarkable and grand thing, and nothing like it is in cultivation.

Professor Dr. REICHENBACH says in his description:—"The flowers may be well compared to *Angræcum sesquipedale*—a very stately thing, taking little space, bearing great flowers. It is not this sufficient to make beat a collector's heart with satisfaction?"

The importation is simply grand, and every plant in extra condition. See Flowers and Woodcut.

**MESSRS. PROTHEROE AND MORRIS** have received instructions from Mr. F. Sander to sell the above and other very valuable ORCHIDS on **TUESDAY**, July 7, at half-past 12 o'clock precisely.

On view morning of Sale, and Catalogues had.

Whetstone, Middlesex.—Preliminary Notice.

The well-known Freehold Property distinguished as the Whetstone Nurseries, or New Lodge, Whetstone, carried on so successfully for upwards of thirty years by the present proprietors, comprising about 5 Acres of LAND, thirty-four superiorly erected GREENHOUSES, with nearly 4 miles run of HOT-WATER PIPING, a substantially built, twelve-roomed, detached RESIDENCE, and numerous other TRADE BUILDINGS; also 13 Acres of valuable FREEHOLD BUILDING LAND adjoining, opposite Oakleigh Park and ten minutes' walk from Tutteridge Station.

**MESSRS. PROTHEROE AND MORRIS** are favoured with instructions to sell by AUCTION, at the Mart, London, E.C., at an EARLY DATE, the above very valuable property, in Three Lots, by order of Messrs. Davis & Son, in consequence of falling health of Mr. Davis, Jun. Particulars and plans will be ready in due course, and can be obtained at the Auctioneers' Offices.

Eltham Park, Eltham, Kent.

IMPORTANT UNRESERVED SALE of a valuable COLLECTION OF STOVE and GREENHOUSE PLANTS, ORCHIDS, &c.

**MESSRS. PROTHEROE AND MORRIS** are favoured with instructions from the Executors of the late Thomas Jackson, Esq., to sell by AUCTION, on the Premises, Eltham Park (fifteen minutes' walk from Eltham Railway Station), on **THURSDAY**, July 16, at 12 o'clock precisely, a valuable Collection of well-grown STOVE and GREENHOUSE PLANTS, including many fine specimens, consisting of several fine Camellias and Azaleas, Greenhouse Rhododendrons, splendid examples of Eucharis, Dracenas, Crotons, Cycas revoluta, Anthuriums, Palms, Ferns; an assortment of ESTABLISHED ORCHIDS, amongst which are several large examples including *Peristeria elata*, *Dendrochilum filiforme*, *Arides*, and *Dendrobium* in variety, *Cattleya Skinneri* and *C. speciosissima*, *Vanda tricolor* and *V. insignis*, &c. May be viewed day prior to Sale. Catalogues may be had of Mr. WAKELIN, the Head Gardener, on the Premises, and of the Auctioneers and Estate Agents, 67 and 68, Cheapside, London, E.C.

WANTED TO RENT, about an ACRE of GARDEN GROUND, with Glass; also COTTAGE. Within 12 miles of Covent Garden.

A. Gardener's Chronicle Office, 41, Wellington Street, Strand, W.C.

ESTATE BADHOEVE in HAARLEMMEER, HOLLAND.

FOR SALE, on WEDNESDAY, July 15, at 10 A.M., in the riding-house on the said estate, and in the presence of the Notary Mr. J. L. VAN DER MOER. This Estate is to be Publicly Sold. It consists of Residence, carefully and comfortably constructed and strongly stone-built, large Coach-house, Riding-school, Ice-house, several Lodges and Houses for keepers and workmen, Dairy, Forge, Carpenters and Painters' Workshops, Baking-shop, Stores, Warehouses, Stables for Horses and Horned Cattle, Sheep-folds, Bars, Granaries, Hay-ricks, further Structures and Buildings, Yards, Grounds, Walking Grounds, Kitchen Gardens, Orchards planted with fine Shrubs and other Plants and Fruit Trees, Roads, Alleys, Canals, Woodland and Moor Grounds, fertile and well drained Meadows and arable Lands, altogether situated side by side and near one another, in the community and polder of Haarlemmeer section Rijk, and limited by the north-east side partly by the land-road, partly by the Ringdijk of the Ringvaart, opposite the village of Sloten, near Amsterdam, by the south-west side by the Spaarwaterweg, at the north-west side by the Sloterweg, and at the south-east side by the Doorweg. This Estate, measuring about

TWO HUNDRED HECTARES,

is to be sold in Sixteen Lots, and in several combinations of these lots, and in mass.

The situation and extension of these lots has been described in printed notices about the sale. These notices, containing the principal conditions of sale and a chart of the whole estate, are to be had, price 6d. each, at Messrs. J. H. AND G. VAN HETEREN, Booksellers, 21, Hartenstraat, Amsterdam.

The lots may be seen from June 15 every week-day between 10 A.M. and 4 P.M., upon application at the Surveyor's house on the Estate.

To Nurserymen, Landscape Gardeners, Florists, and SEEDSMEN.

FOR SALE, an OLD ESTABLISHED BUSINESS, in one of the best suburbs of Birmingham, owing to a very serious accident to the present proprietor. The Nursery contains about 2½ Acres, and is well stocked with Shrubs, Trees, and Herbaceous Plants, and Four Glass Houses, Seed Warehouse, Frames, &c., together with a Stall in Market Hall. The above is thoroughly genuine, and will be sold as a going concern. Possession can be had at once.

Full particulars from FLEETWOOD AND GOODEVE, Auctioneers and Valuers, 42, Chesser Street, Birmingham.

Farnborough. (Sale No. 6212)

Five minutes from Aldershot Camp Railway Station.

Re Edward Smith, deceased.

TO BE SOLD, with Possession, the NORTH CAMP NURSERY, nearly 17 Acres, with Dwelling-house, Stable, Cart-shed, and Greenhouse standing thereon. May be carried on as a Nursery or a Market Garden; but the Estate having 300 feet available frontage will ultimately be valuable for building. Price £3400.

Apply to Messrs. PROTHEROE AND MORRIS, 67 and 68, Cheapside, E.C.

Maida Vale, W.—(5758.)

Must be sold, owing to ill health.

HALF AN ACRE of LAND, with frontage of 125 feet to road, eight-roomed DWELLING-HOUSE, and SEED SHOP, eleven GREENHOUSES, and three PITS. Nominal rent, only £25. Lease 24 years unexpired. Price for Lease and Goodwill on application. A capital opening.

Apply to Messrs. PROTHEROE AND MORRIS, 67 and 68, Cheapside, E.C.

FOR SALE, an Old-established NURSERY BUSINESS, in Kilburn, with Greenhouses, Stock, and Goodwill. Owner retiring.

Full particulars of Mrs. TOWNSEND, Rosemount, West End Lane, Kilburn, London, N.W.

SEED TRADE, NURSERY and FLORIST BUSINESS. Established 36 years. Good locality in Cornwall. 5 Acres fertile Land, large Shop, Washhouse, and Residence in the main thoroughfare; Cottage, and 5 Glass Houses in centre of the grounds; Seed Stall, best position in the City Market House. Staff, five young men, active, willing workers. Stock at valuation. Possession in September.

T. M., Nutting & Sons, Southwark Street, London, S.E.

Southampton. (6209.)

About a mile from this important town.—To Market Gardeners and Others,

TO BE LET on LEASE, 25 Acres of Land, in a high state of cultivation. Rent, £160 per annum. Open to offer. Crops and Tillages at valuation, under £400. Full particulars and orders to view of Messrs. PROTHEROE AND MORRIS, Market Garden Valuers, 67 and 68, Cheapside, E.C. Personally inspected.

To Florists,

TO LET, a commanding NURSERY, situated in the main road, West End position, fitted up with all the necessary plant. Now doing an extensive trade. Long lease.

For particulars apply to Mr. J. ODELL, Coulds Green, Hillingdon.

To Landed Proprietors, &c.

**A. MCINTYRE** (late of Victoria Park) is now at liberty to undertake the FORMATION and PLANTING of NEW GARDEN and PARK GROUNDS and REMODELLING existing GARDENS. Plans prepared, 115, Listeria Park, Stamford Hill, N.

To the Trade only.

**E. H. KRELAGE and SON, NURSEYMEN** SEEDSMEN, and FLORISTS, Haarlem, Holland. The Wholesale Catalogue (No. 379A) of Dutch Flower Roots and Miscellaneous Bulbous and Tuberous-rooted Plants for 1885-86 is now ready, and may be had free on prepaid application by Nurserymen, Seedsmen, and Florists. The Catalogue, although giving only an extract of the collections, forms a pamphlet of 48 pages 8vo, in two columns, and is doubtless one of the most complete sent out of this speciality. The prices of Hyacinths in general are considerably lower than before. Prices of Tulips and other Bulbs, too, are in many instances inferior to former quotations. German and French editions as well as a separate English edition for America, are published.

By Special Warrant.

## Gardeners' Chronicle.

SATURDAY, JUNE 27, 1885.

### SITES AND SOILS, AND THEIR SUITABLE TREES.

FEW districts in England offer within narrow limits more interesting and useful lessons on the sites and soils adapted to different kinds of trees than Sylva Evelyn's own district, the Homedale of Surrey. From Mr. Cubitt's residence at Denbies, overlooking Dorking, or from the downs above Wotton, Evelyn's residence, a great variety of soils, seen at the same time over a wide landscape, occasion a great variety of trees; while from the same chalk ridge, known as the backbone of Surrey, extending the whole distance from Dorking to Guildford, the same varied landscape with the same diversity of timber is seen. A skilful forester will not fail to notice the appropriateness of the planting in this district, and he may well suspect that this must in some degree be due to the influence of Evelyn himself. It will be remembered that the great planter lived just 200 years ago, and the forester looking around him in this delightful paradise of Surrey, known as the Homedale, will observe that many of the most notable specimens of the planter's art with several of the woods, and the salient features of some of the chief parks and gardens, are about 200 years old. He will notice Norbury in the valley of the Mole, a beautiful park sloping down the hillside to the river below, and the history of the place will inform him, what the age of the trees would indicate, that Evelyn himself directed the planting at Norbury. He had a hand, too, in the gardens at Albury, then belonging to the ducal Howards, now to the ducal Percies. The famous Yew tree hedge at Albury was all his own work; Wotton was his own property, and its noble woods of Beech, as might be guessed by their age, were created by his taste and judgment.

Our native Beech woods are found on chalks and sands and hard soils in the south and west, as on the Chilterns of Bucks, and the oolite rubble of Oxfordshire and Blenheim, and in the valley of the Severn, but not on the slate rocks of Wales, or any other part of the Principality except as an introduced tree. Along the Surrey backbone, in many a wood, and on the hard sand of Wotton—lower greensand, an outcrop from below the chalk—the Beech finds its place on its appropriate sites. Great Yew trees grow, too, on the chalk, and are scattered here and there on the better sand loams of the Homedale, Surrey being one of its native habitats, the site of some of the largest Yews in the country, as in the case of those grand old Yews of the "Pilgrim's Way" on the Albury Downs. The Holly is another native tree growing abundantly in this district, both on the patches of tertiary sand that cover the chalk in many wild secluded spots where the indigenous wood or waste of Gorse and Heather has not been disturbed, or at Wotton, where Evelyn's Hollies were enthusiastically described by himself as forming an "exquisite viretum."

Such lesser subjects as the native Cornel and Euonymus, Aspen, Travellers' Joy, Butchers'

Broom, and Hazel, or imported Box crowning Box Hill, or pyramidal Juniper, frequent on sand and chalk, need not detain us. We desire to notice the more important timber trees which seem to present an unusual variety in this district, and to occupy generally the soils and sites best adapted for them. In the few remaining patches of primeval forest the Oak is always found even on the poor and proverbial Surrey sands, where it covers the ground in the form of scrub, proving that Nature's list of timber trees at her disposal was far more limited than the profitable cultivation of the ground with this kind of crop required. She had probably the Scotch Fir, but that is a tree of very short duration, and all the lineal descendants of the original plantations of Fir in the sand district appear to have become extinct although the enduring Oak scrub remains, as well as several native shrubberies, both of White Thorn and Black Thorn, such as that near Newland's Corner and another where Thorns are mixed with Hollies at Holmwood, near Dorking. But Nature, pure and simple, cannot long reign even over the most limited spaces, nor is her rule desirable, in proximity to the highly cultured properties of those fortunate wealthy gentlefolk who, having settled thick in Homedale in recent times, and who must all have been, as we maintain, more or less influenced in matters of taste and propriety in regard to planting and landscape gardening by the example of Evelyn. Mr. Gladstone remarked in the House of Commons on the general absence of a good "custom" in the management of woods, and spoke of the "superstition" of ignorance, which, unfortunately, is too prevalent. Some such custom, handed down through 200 years by the influence of the greatest English teacher of forestry, we claim for this part of Surrey.

To confirm this contention, look at the Scotch Fir plantations clinging to the steep sides and brows of the sandhills, where no other tree would yield so much profit, or lend so much beauty to the landscape. Look at the old English Elm, an introduced tree constantly found in its favourite sites in the watered valleys, growing by the streamlets, feeders of the Mole and Wey, or near the villages, to a great size, with the Ash on a stiffer soil generally, both trees yielding timber much sought after by country wheelwrights and carpenters now as in past times.

Are not the trees and shrubs at Deepdene—from the great Spanish Chestnuts on the richer loams to the modern Conifers and Rhododendrons near the house, planted respectively by the Howards and their successors, the Hopes—are not they appropriately placed?

Several Lime avenues of noble size might be named as growing on the same warm loam, especially when the roots are not very distant from water. But those who know the Homedale are aware that while its poorest lands will yield only the Birch, the better loams produce every kind of forest tree, giving to the neighbourhood exquisite variety both in the hues and the forms of the leaves.

Other characteristic trees of this district consist of ponderous Oaks and occasional Walnuts, growing in a narrow belting beneath the chalk ridge. We spoke of the lower greensand and its timber, but between it and the chalk is a strip of strong soil formed by the outcrop of the upper greensand, and commingling with it is another and much poorer clay belonging to the cretaceous series, and known as the gault. These, too, have their appropriate timber trees—the Oak, Ash, and Walnut—both in planted woods and isolated specimens. In naming the Willows and Alders that affect the waterside, the latter supplying the charcoal of the Albury powder-mills, we shall have completed our list of the trees appropriate to the various soils of this well-known district, though no doubt many kinds have been omitted. *H. E.*

## New Garden Plants.

### ODONTOGLOSSUM CRISPUM (Lindl.), VAR.

MR. F. SANDER sends me a three-flowered twig of a probably larger inflorescence. It is a highly curious thing, but no information is given about it, as both information and packing are getting inferior from year to year, although exceptionally rich information comes when one grower has been deprived of his priority by another. The flowers have white and light mauve sepals, a cucullate convex short lip, exceedingly far from being fine, and looking rather teratologic, and petals of a deep purple-mauve hue, nearly as lobed as in *Cattleya Massangeana* and *Nalderiana*. There are, however, on the petals numerous cartilaginous teeth (!!) on surface. That looks rather trilabellous. Now there is the question whether it will come next year as it is now. It was grown by the Rev. Mr. Kinaleside, Sunbury House, Tunbridge Wells. *H. G. Rehb. f.*

### ODONTOGLOSSUM VEXILLARIUM KIERNASTIANUM, n. var.

A magnificent variety. The sepals and petals have broad white margins and a rose coloured disc. The lip is of a light yellow colour at the very base, the usual three central purple lines and fine radiating rose lines run all over the grand lip except along the pure white margin. It is uncommonly large. I had this variety from Herr Consul Kleinst Zölly, who is inferior to no one in his ardent zeal for Orchids. *H. G. Rehb. f.*

### EPIDENDRUM POLYANTHUM (Lindl.) ASPERUM, n. var.

Messrs. J. Veitch & Sons have kindly forwarded me a plant I had known before in English garden, as I had had it from the late Mr. Wilson Saunders. It would be fully the well-known *Epidendrum polyanthum*, Lindl., were it not that the ovaries, and even the rhachis, are covered with numerous dense small warts.

I remember well I saw such a case before, forty years ago in an *Epidendrum patens*. It is a very interesting fact, that I have specimens of *Epidendrum polyanthum*, doubtless, coming from the same source, some with even and some with rough ovaries. My specimens of Galeotti, 5125, purchased in 1847, have smooth ovaries, while the same number of Galeotti's private herbarium, purchased in 1856, had them with warts. *H. G. Rehb. f.*

### THUNIA VEITCHIANA, n. hyb. Angl.

A fresh "English Orchid," of much elegance, lending the charms of both its cross parents, *Thunia Marshalliana*, Rehb. f., and *T. Bensonæ*, Hook. f., and standing quite between both. The flower is not so broad and so short as in the first-named, nor so long as in Sir Joseph Hooker's plant. The spur is rather that of the first. The white sepals and petals have a very light mauve wash at their tops, which looks remarkably elegant—at least "t. m. t." The lips' median keels are broken up in the anterior disc into numerous fringed processes of a certain colour between orange and mauve-purple. The whole anterior broad border of the lip is of the finest mauve-purple, and the superior part of the lip is white, with some mauve-purple veins. There are some very small mauve spots on the top of the column. The plant is a fresh proof of Mr. Sedo's perseverance, zeal, and skill, and it is destined at once to be, in its chaste elegance, one of those numerous memorials both science and horticulture will ever keep in honour of that illustrious Veitchian firm. *H. G. Rehb. f.* [The plant received a Certificate at the last meeting of the Floral Committee.]

**INDESTRUCTIBLE FENCE POSTS.**—A farmer writes that twenty-five years ago he set split white Oak posts for his garden fence, putting about a peck of air-slaked lime about each, and they are all good yet. He attributes their good condition to the effect of the lime, in which he is doubtless correct. A board that has been used in a mortar bed, and thoroughly saturated with lime, is almost indestructible from decay. *Florida Dispatch.*

## INSECTS.

(Concluded from p. 786.)

PETROLEUM, in its various forms, has long been recognised as one of the most effective insecticides in our possession, all oily substances being particularly deadly to insects. Unfortunately they are also injurious to plants, and one of the problems the solution of which I have had in mind for many years has been their use in such dilution as to kill the insect without injury to the plant. Refined kerosene has been used to a limited degree by forcible attenuation in water and spray, while some plants withstand doses of the pure oil. But the safe and general use of kerosene for the purpose under consideration dates from the year 1880. Of the various substances used in attempts to emulsify and mix kerosene with water none are more satisfactory than soap and milk, both being everywhere accessible and cheap. Milk was first suggested in 1880 by Dr. W. S. Barnard, while carrying on experiments for me against the Cotton-worm, and subsequent experiment, especially by another of my assistants, Mr. H. G. Hubbard, has given us the simplest and most satisfactory method of making the emulsion quickly and permanently. An emulsion resembling butter can be produced in a few minutes by churning with a force pump two parts of kerosene and one part of sour milk in a pail. The liquids should be at about blood-heat. This emulsion may be diluted with twelve or more parts of water to one part of emulsion, thoroughly mixed, and may be applied with the force-pump, a spray nozzle, or with a strong garden syringe. The strength of the dilution must vary according to the nature of the insect to be dealt with, as well as to the nature of the plant; but finely sprayed in twelve parts of the water to one of the emulsion it will kill most insects without injury to the plant. An equally good emulsion may be made as follows:—

Kerosene, 2 gal.; common soap,  $\frac{1}{2}$  lb.; water, 1 gal. Heat the mixture of soap and water, and add it boiling hot to the kerosene. Churn the mixture by means of a force pump and spray nozzle for five or ten minutes. The emulsion, if perfect, forms a cream, which thickens on cooling, and adheres without oiliness to the surface of glass. Dilute with cold water before using, to the extent to which experience will indicate is best.

The simplest discoveries are often the most valuable, and this discovery of so simple and available a means of diluting, *ad libitum*, oil with water is important and far-reaching in its practical application.

### PYRETHRUM.

Pyrethrum roseum, a plant native to the Asiatic countries south of the Caucasus Mountains, and *Pyrethrum cinerariaefolium*, a native of Dalmatia, have long been known to possess insecticide properties, especially in the powder from the dried and pulverised flowers. The powder, sold under various names by druggists, was chiefly used against household pests, however; and though Mr. C. Willemet, as early as 1857, in France, and Mr. William Saunders, in 1879, in Canada, tried it in powder form on some that are injurious to plants, its importance as a field insecticide did not appear till 1880, when, in prosecuting the work of the United States Entomological Commission, we discovered that it could be used in liquid solution. Both species proved to be hardy throughout the greater portion of our country, and Mr. G. N. Milco, of Stockton, Cal., has for some years cultivated *cinerariaefolium* quite extensively at great profit, the product being sold under the name of "Buhach." The insecticide property dwells in a volatile oil. It acts only by contact and its action on many larvæ is marvellous, the smallest quantity in time paralysing and ultimately killing. Its influence in the open air is evanescent, in which respect it is far inferior to the arsenical products; but being perfectly harmless to plants it can frequently be used on vegetables where the more poisonous substances would be dangerous.

Pyrethrum is supposed to have no effect on the higher animals, but that is a mistake, as my own recent experience is that the fumes in a closed room have a toxic influence, intensifying sleep and inducing stupor; while the experience of Professor A. Graham Bell with the powder copiously rubbed on a dog showed that the animal was made sick and was affected in the locomotive organs very much as insects are. The wonderful influence of this powder on insects has led me to believe that it might prove

useful as a disinfectant against fevers and various contagious diseases by destroying the microzoa and other micro-organisms, or germs, which are believed to produce such diseases. It should be tried for that purpose. It is remarkable that these two plants of all the many known species of the genus should alone possess the insecticide property.

### BISULPHIDE OF CARBON.

Of all insecticides to be used against root-feeding or hypogean insects, naphthaline, sulpho-carbonate of potassium, and bisulphide of carbon are the chief. Dr. Ernst Fischer, in a recent work, has shown that naphthaline in crystal may be satisfactorily used under-ground, destroying by slow evaporation. But bisulphide of carbon still holds the first place in France against *Phylloxera vastatrix*. It is conveyed beneath the ground at the rate of one-half to one kilogram per Vine by special injectors, or by more complicated machinery, drawn by horses. I believe that petroleum emulsions will supersede it as an underground insecticide, and prove to be the best we have, cheapness, safety, and efficiency considered. After the discovery of a satisfactory insecticide, however, various important problems must be solved, and particularly how to apply it to greatest advantage, having safety to man and stock, harmlessness to plant, and economy in mind. The solution of these points, and others that the peculiar habits of the insect to be controlled involve, brings us to the question of mechanical contrivances and appliances; for while much ingenuity has been exhibited in devising mechanical means of directly destroying noxious insects without insecticides, it is chiefly in the proper application of these last that the greatest mechanical advances have been made both in this country and in Europe. Here, again, the subject is so vast that I cannot enter into details.

It will already have been gathered, from what has preceded, that the chief insecticides are applicable in liquid form, and as liquids have an advantage over powders in field use, instruments for atomising and distributing liquids constitute the most important part of insecticide machinery. The desiderata in a spray-nozzle are, ready regulation of the volume to be thrown; greatest atomising power, with least tendency to clog; facility of cleansing or ready separation of its component parts; cheapness, simplicity, and adjustability to any angle.

I will content myself with exhibiting one which meets, perhaps, more of these requirements than any other in use, and which works on a new principle applicable to many other purposes than that for which it was designed. It is what has been described and illustrated in my late official reports as the eddy or cyclone nozzle, and consists of a small circular chamber with two flat sides, one of them screwed on so as to be readily removed. Its principal feature consists in the inlet through which the liquid is forced being bored tangentially through its wall, so as to cause a rapid whirling or centrifugal motion of the liquid which issues in a funnel-shaped spray through a central outlet in the adjustable cap. *Prof. Riley in "American Entomologist."*

## NEW PLANTS CERTIFICATED

BY THE ROYAL BOTANIC SOCIETY DURING THE FIRST HALF-YEAR, 1885.

\* B.C., Botanical Certificate; F.C., Floral Certificate; either being equal to a First-class Certificate.

<i>Agapanthus umbellatus</i> variegata .. .. .	Williams, June 17—B.C.
<i>Allium karataviense</i> .. .. .	Veitch & Sons, May 20—B.C.
<i>Alocasia Hendersoni</i> .. .. .	E. G. Henderson & Son, June 17—B.C.
<i>Sanderiana</i> .. .. .	W. Bull, April 22—B.C.
<i>Amaryllis Basilisk</i> .. .. .	Veitch & Sons, March 25—F.C.
<i>Great Gearies</i> .. .. .	J. Douglas, March 25—F.C.
<i>Helen Lodge</i> .. .. .	Veitch & Sons, March 25—F.C.
<i>Ne Plus Ultra</i> .. .. .	Veitch & Sons, March 25—F.C.
<i>Perfection</i> .. .. .	Veitch & Sons, April 22—F.C.
<i>Prince George of Wales</i> .. .. .	Veitch & Sons, May 20—B.C.
<i>Amasonia pumila</i> .. .. .	Paul & Son, March 25—F.C.
<i>Anemone pulsatilla patens</i> .. .. .	C. Turner, April 22—F.C.
<i>Auricula Chastity</i> .. .. .	C. Turner, April 22—F.C.
<i>Rosalind</i> .. .. .	C. Turner, April 22—F.C.
<i>Sunrise</i> .. .. .	C. Turner, April 22—F.C.
<i>Azalea Madame J. N. Verschaffelt</i> .. .. .	Hill, March 25—F.C.
<i>Princess of Wales</i> .. .. .	Laing & Co., May 20—F.C.
<i>Begonia Formosa</i> .. .. .	Keteleer, March 25—F.C.
<i>Gloire de Seaux</i> .. .. .	Laing & Co., May 20—F.C.
<i>Lady Hulse</i> .. .. .	Cannell & Sons, June 17—F.C.
<i>Louis Bouchet</i> .. .. .	Laing & Co., June 17—F.C.
<i>Salmonia</i> .. .. .	Laing & Co., June 17—F.C.
<i>Mr. Brissenden</i> .. .. .	Laing & Co., May 20—F.C.
<i>Sir P. Lumsden</i> .. .. .	Laing & Co., June 17—F.C.
<i>tuberosus</i> .. .. .	W. Bull, March 25—F.C.
<i>Bentickia condapanna</i> .. .. .	Barr & Son, June 17—B.C.
<i>Brodiaea stellata</i> .. .. .	B. S. Williams, March 25—F.C.
<i>Calanthe Sanderiana</i> .. .. .	B. S. Williams, March 25—F.C.
<i>Caladium albo-luteum maculatum</i> .. .. .	Laing & Co., June 17—B.C.
<i>Comte de Germiny</i> .. .. .	Laing & Co., June 17—B.C.
<i>De Condeux</i> .. .. .	Laing & Co., May 20—F.C.
<i>Raymond Lemonier</i> .. .. .	Laing & Co., June 17—B.C.
<i>Camellia Commendatore Betti</i> .. .. .	B. S. Williams, March 25—F.C.

<i>Carnation Colonel Cox</i> .. .. .	C. Turner, May 20—F.C.
<i>F. W. Girdlestone</i> .. .. .	C. Turner, May 20—F.C.
<i>Goliath</i> .. .. .	C. Turner, May 20—F.C.
<i>Fride of Penhurst</i> .. .. .	Veitch & Sons, May 20—F.C.
<i>Cattleya Mendelii carminata</i> .. .. .	Little, May 20—B.C.
<i>striata</i> .. .. .	Low & Co., May 20—B.C.
<i>Schofieldi</i> .. .. .	Low & Co., May 20—B.C.
<i>Chionodoxa sardensis</i> .. .. .	Barr & Son, March 25—F.C.
<i>Cineraria Amy Robsart</i> .. .. .	James, April 22—F.C.
<i>Countess</i> .. .. .	James, April 22—F.C.
<i>Dante</i> .. .. .	James, March 25—F.C.
<i>General Gordon</i> .. .. .	James, March 25—F.C.
<i>Mary Anderson</i> .. .. .	James, March 25—F.C.
<i>Mrs. A. Sutton</i> .. .. .	James, March 25—F.C.
<i>Paragon</i> .. .. .	James, March 25—F.C.
<i>Rob Roy</i> .. .. .	James, March 25—F.C.
<i>The Bride</i> .. .. .	James, April 22—F.C.
<i>Viceroy</i> .. .. .	James, March 25—F.C.
<i>Cupressus Lawsoniana erecta</i> .. .. .	Lee & Son, June 17—B.C.
<i>viridis albo variegata</i> .. .. .	Veitch & Sons, June 17—B.C.
<i>Cyathea divergens</i> .. .. .	Veitch & Sons, June 17—B.C.
<i>Cypripedium macropterum</i> .. .. .	Veitch & Sons, May 20—B.C.
<i>Davallia retusa</i> .. .. .	W. Bull, March 25—F.C.
<i>Dendrobium Ainsworthi</i> .. .. .	W. Bull, March 25—F.C.
<i>crassinode var. alba</i> .. .. .	Hill, March 25—F.C.
<i>crassinode var. gigantea</i> .. .. .	Cypher, June 17—B.C.
<i>crystallinum album</i> .. .. .	Cypher, June 17—B.C.
<i>Falconeri delicatum</i> .. .. .	W. Bull, March 25—F.C.
<i>nobile var. insignis</i> .. .. .	B. S. Williams, March 25—F.C.

## THE AMHERSTIA.

"WHILE at Beling, on the way," writes the Rev. C. Parish, in the new edition of Mason's *Burmah*, "I rode out in company with Col. Fytche and Capt. Harrison to a place called Kothanaiong, about 7 miles off, to see the Amherstia trees there. This place had often been mentioned as one where the Amherstia was to be seen in great perfection, and where indeed it might perhaps be wild. I was well rewarded, for a prettier little spot I never visited. The Amherstias, growing in a well-shaded place and watered by a perennial stream, which tumbles down a steep granite hill, and is ingeniously directed hither and thither in large Bamboo troughs, were indeed to be seen in the wildest luxuriance of growth. But Kothanaiong is a sacred spot. Here are pagodas, pongyee-houses, zayats all around. A flight of steps leads from the bottom to the top of the overhanging hill, which is about 600 feet high, and on which are more sacred buildings. The Amherstias, seen only round the principal pagoda, were undoubtedly planted, although

they are now left to take care of themselves and have a wild appearance. Evidently this is not a native habitat of the tree."

Dropping down the Yuzaleen, however, by boat from Pahpoon, on the second day, Mr. Parish found a fine *Amherstia* in full flower, which he regarded without hesitation as a wild tree. Mr. Parish cogently remarks:—"Now my reasons for saying that this was a *bona fide* wild tree are these: in all this district, the valley of the Yuzaleen, there are no pagodas or pongyee-houses, or spots sacred to the Burmese, where they erect buildings. The inhabitants of this district, in fact, are Karens, and not Burmese, and these Karens are exceedingly few and scattered. After leaving Pahpoon we did not see a single village on the banks all the way until we came to the junction of the Yuzaleen with the Salween. There are, indeed, no doubt, a few villages a little way from the bank, here and there hidden among the trees, but these generally consist of but two or three houses; neither are they settled villages, for the custom of the Karens is to change the site of their houses continually. Besides, the regular Karens, not being Buddhists, do not build pagodas, nor do they ever trouble themselves to plant ornamental trees, as the Burmese always do, in their sacred places. Again, the spot where this *Amherstia* was seen was not at all a likely spot for an *Amherstia* to have been planted by any one, but one of the wildest places imaginable. Had it been on a rising ground, or on a high bank alone, or on any prominent point on the river, I should have suspected that a hand had placed it; but it was on a low and sloping part of the bank, struggling for life with *Calamus*, *Bauhinia*, and tall grasses, and such other tangled stuff as forms the common vegetation of our river banks in the wildest places; and behind, again, was a dense jungle of the tallest trees. However, notwithstanding all this, had it been seen in a fairly peopled district I should have doubted, but in such a wild, uninhabited country as the Yuzaleen is, I see no reason for suspecting that it was not a genuine native. Had Wallich's first tree been here I am satisfied that the idea of its not being wild would never for a moment have occurred to him. I am perfectly satisfied that the tree seen by me was a wild one. That the *Amherstia* in a wild state may be very scarce is not improbable, but that it should not exist any longer in that state, though possible, is, to say the least, very unlikely."

## PEAS IN COLD FRAMES.

THE necessity for growing Peas in this way is not so clearly demonstrated in gardens that are situated on elevated ground, where the air is naturally dry, as it is in those which are in low positions, with atmospheric moisture always in some degree abounding, and producing a condition which exposes tender subjects to much more danger from the baneful effects of frost than where conditions are otherwise; more especially is this the case with frosts that happen after the middle of May. These are very destructive, and cause more damage among early Pea crops than antecedent ones, because at this late period the vines are well furnished with pods; these being very tender, the least touch of frost arrests growth in them at once, and renders them useless, and thus defers the gathering a week or ten days beyond the ordinary time.

A delay of this kind in the supply of an esteemed edible is vexatious and disappointing, and should not be tolerated when it can easily be avoided by this method of cultivation, and by utilising for the purpose some of those excellent kinds of dwarf Peas we now possess that are so well adapted for this purpose, as well as for other early requirements, any of the following sorts may be depended on as very good growers and bearers also:—Chelsea Green, Veitch's American Wonder, Linton's Unique, and Little Gem. I grew the two first-named kinds this season, both coming into bearing at the same time; the first dish of Peas being gathered May 14, and the last dish from them on June 3. A crop of this description enables one with certainty to have a fair supply of green Peas at least a fortnight, in a favourable season, before the early crop out-of-doors is fit for use; and by supplementing these with a good row of the same kinds (which should be sown at the same time) at the base of a south or east wall, the supply may be continued until the ordinary early crop outside comes into use; with us, this is at about the end of the first week in June, but this year the crop will be a week or two days later.

My frame for Peas is a roughly constructed one, 50 feet x 10 feet wide, 3 feet high at back, and 18

inches in front. Strong Larch stakes are made from trees about 5 inches in diameter, which are cut down the middle and crossways, so as to make stakes 4 feet 6 inches long for the back, and 3 feet 6 inches for the front, which are pointed and driven into the ground firmly about 4 feet apart, the rough side being turned inwards and outwards alternately; some 1 inch, or 1½ inch deal boards are nailed to these, and form the frame; cross pieces are dovetailed into the top of the frame, which form the rafters for the lights, placed at proper distances apart to meet the requirements of the lights on hand. The lights I used formerly belonged to a vinery, and instead of discarding them I applied them to this purpose, and since then have found the place most useful, not merely for this object, but likewise for other crops, as Cauliflowers, French Beans, Lettuce, Endive, late Radishes, &c., which form the subsequent crops, and which for late use need protecting from autumn and early winter frosts. Frames can be formed by means of fresh cut sods being stacked closely together, that will answer the same purpose in every respect.

The cultivation requires good rich soil, properly tilled. The Peas should be sown in drills about 15 inches apart about December 1. At this time the lights should be put on, and kept so until the Peas are visible, after which they should be freely aired in favourable weather; and when they come into flower, in order to protect them from frost and to accelerate the crop, they should be covered up at night with mats, or an equivalent to them. *G. T. Miles, Wycombe Abbey.*

## CHIONANTHUS RETUSUS.

THIS is one of our most beautiful spring-flowering hardy deciduous shrubs, the deep shining green of its leaves setting off the snow-white flowers to advantage. Our illustration (fig. 178), taken from a specimen grown in Messrs. Veitch's nursery at Coombe Wood, serves to show better than words the general character of the shrub. The shrub is of medium stature, variable as to foliage, closely allied to the Olives and Osmanthus, and native to Japan and China. It is one of Fortune's introductions.

## WADDESDON.

SITUATED on an eminence 6 miles to the N.W. from the town of Aylesbury, overlooking one of the richest parts of the country—the vale of Aylesbury—is the new mansion of Baron Ferdinand de Rothschild. The site has been well chosen, if regard be had only to pure air, perfect sanitary conditions, and extensive views from almost every point over the surrounding beautiful landscape. The modern house-builder often selects a site for his mansion that would not have recommended itself to the builders of former days. We often, therefore, see houses built on spots whence the country around is spread as in a map, but which are cold and bleak, and thus rarely so enjoyable as were the snug manor-houses and well-chosen dwellings of the monks of the middle ages that we find in the plains, and generally in the neighbourhood of running water. In sites, high-lying, the one important point that no one studying the comforts of life can afford to pass over, is that conveyed in the word "shelter." This may consist of plantations of forest trees chosen for their ability to abide the fierce winds of such places, or of groups of trees, some of an exotic origin, and others native to the soil. And in Waddesdon we find this has been met by extensive planting of the largest trees and shrubs in great profusion. Some magnificent attempts have been made during the ten years the work of forming the gardens and pleasure grounds has taken, to move great numbers of Oaks, Horse Chestnuts, Limes, Elms, and many species of Conifers, which in most instances have succeeded to a wonderful extent. The one tree, the endeavour to remove which has proved a partial failure so far, is the *Quercus pedunculata*. Many trees of other species are seen making this year good growth, such as Horse Chestnut of more than 2 feet in diameter of stem at 4 feet from the ground, and from 30–40 feet in height. The common Lime, purchased of proprietors in the neighbourhood, of nearly as large proportions, have also recovered from the effects of removal in a remarkable degree. In these operations the utmost care and the most powerful tree transplanters have been employed, and the whole of the soil having been thoroughly

trenched and manured where thought requisite for the species of tree planted. Mr. Sims, who has conducted the operations from the first, has seen his reward in the growth which almost all of the subjects have made in recent years, and which has converted what was a bare hill-top into a really well sheltered enjoyable place. The one fact which appears so striking to those who are used to see new grounds planted with ordinary nursery stock, is the size of each group of shrubs, which in place of being composed of three or five specimens are here found in numbers of from thirty to forty, and even more, when the plant is a dwarf, or a small growing one. One of the most beautiful groups that can be imagined is at the end of the wide carriage drive near the house, where a cutting was made through rising ground. Here the bank, in places 100 yards in width, has been planted with double blossoming Furze that has grown to the height of 7 feet, the lower edge of the bank near the road being occasionally bordered with the dwarf-growing Spanish variety of a shade lighter than the other, while higher up and flanking the upper border of the bank great masses of white and yellow Broom give a touch of lightness and elegance to the picture. This group, cut into two parts by the road, is at least 400 yards in length, so that some idea may be had of this fine feature in the flowering season.

The mansion, which is built of fine grained white stone, and of a very pleasing and elegant exterior, was erected by a French architect, and stands slightly back from the edge of the plateau, which was made at the top of the hill by carrying away bodily a mass of soil of an average depth of 9 feet over an area of 10½ acres.

In the front, overlooking the Vale of Aylesbury, there is a broad expanse of gravel and turf; then a descent is made a few feet to a large oval basin of water, 30 yards in its longest diameter, which has flanking parterres for flowers at either end. Below this fountain terrace is yet another, of a smaller size, having a water basin and fountain of proportionate size; and beyond all is the rapidly falling ground of the park, in extent about 1800 acres.

At the opposite side of the mansion is a level plateau of about 4 acres, cut into half by a broad path, which runs direct for about 450 yards to its termination at a large water-basin of an oval form, 32 yards in diameter. This basin, standing in the middle point of an extensive rondeau of gravel and greensward, backed up with fine shrubs in massive groups and trees, is the spot from which radiate the principal walks in the place.

On either side of the beforementioned level plateau has been planted a row of Oaks, of about forty years old, the question of whose ultimate success is being anxiously debated. Some are certain to become at no distant day fine specimens, whilst others do not seem likely to recover from their removal. If all do not recover, there will be nothing for it but to remove all of them, and to plant the avenue with some other kind of tree of a large size, more amenable to such a difficult operation. It was a fortunate circumstance that a great quantity of rock was met with in escarping the hill-top, as by transporting this a short distance to the left-hand side of the Oak avenue, as seen coming from the house, it has been possible to make a natural looking rock scene, and that with materials of quite Titanic proportions; and much of the over-lying excavated earth was thrown up on one side of the rockery to give the appearance of a natural hill. This hill is now planted with *Pinus austriaca*, growing capitally, and being about an acre in extent it is one of the finest features in that part of the garden. The rockwork being tunnelled at one point, forms a store for large garden implements and machines. Returning to the house, we observe that its outline is not marred by the usual incongruous conservatory stuck on one end of it, but the place for the plants arranged is an ante-room to the dining-room, with a few well flowered Indian Azaleas, and a group of the pretty hybrids of Ivy-leaved Pelargoniums trained in elongated dome shapes, surrounded by *Selaginella* and Ferns.

Around the walls of the mansion a slightly serpentine border of flowering Rhododendrons was planted, in no place exceeding 3 yards in width, and not more than 2 feet in height of plant. These were just coming into flower at the time of our visit, and as the colours were mostly crimson, scarlet, and the like bright tints, they just gave the requisite line of colour to divide the walls from the turf, and showed up their hues well against the white stone. It was charming; but

they should never grow higher. Perhaps it is intended to have always only these dwarf plants in that place. Looking from the garden front down the Oak avenue a few beds of Ghent Azaleas were seen on either hand, but far enough removed from the central wide lawn to form no impediment to the spacious vista down to the fountain. Further removed from the house, and

base and the point coming alternately to the front, and as they are now touching each other, and generally each plant in a group is fully developed, they will never look better than at present. The species and varieties are—*Spiræa Thunbergii*, *Laurustinus*, which last flowers profusely, and does not get cut by frost, possibly because of its making no late growth ;

although some of the double pink kinds meet with great approval. A bed of these Thorns standing right and left of a landing-place on the steep walk leading to the kitchen garden has been a wonder of colour and floriferousness, perhaps both being the effect of something contained in the soil. The effect is heightened by an undergrowth of closely planted *Gynierum*. *Pyrus*, *Cerasus*, *Laburnum*, *Rhododendrons*, *Azaleas*, *New Zealand Veronicas*, *Kalmias*, and others too numerous to mention, form those great masses before spoken of as lining the shrubberies on all the main walks. A plant seldom met with in great clumps is *Hippophaë rhamnoides*, but which is at Waddesdon planted in quantity : one great bank of it will in winter exhibit great masses of its heavily-berried branches of orange-scarlet—grown thus it is a very conspicuous object at that time of the year. The bank had an edging of Spanish Furze.

The grass verges are of considerable width everywhere, as are also the walks, thus giving an air of magnificence to the grounds rarely seen. Much advantage has been taken of the natural contour of the ground around the house, but not reckoning the levelling operations on the area immediately surrounding the house, very heavy earth-moving work was involved in getting easy curves and gradients. The carriage drive to the lodge on the Aylesbury Road is 2½ miles long, and is carried through park-like scenery and bold groups of planting, but which a few years ago was a congeries of small fields and tall hedgerows of Thorn, but which has been so dealt with that little of its former use is now seen, except in masses of the Thorns allowed to grow wild, and which indicate here and there the lines of the old hedges.

Leaving the pleasure-grounds by a rather steep path, rendered easy in places by landings and flights of stairs, the kitchen garden and ranges of glass-houses are reached. These, with divisions, exceed forty in number. Taking the more important of these, we find a fruit range of lean-to houses 380 feet in length. Cherries, Figs, and Peaches occupy three compartments ; and after those come four vineries, containing leading kinds of Grapes, showing generally good crops of fruit. Foster's Seedling, Lady Downe's, Muscat of Alexandria, are much used, the first named being especially fine.

The fruit houses have not long been planted and are not as yet at their best, but the subjects therein, under Mr. Bradshaw's capable management, cannot fail to become very productive, as every appliance and assistance to successful cultivation are found here. The kitchen gardens are also in course of completion, and, being made on previously unworked soil, will require some years of thorough cultivation before the soil is what it should be. Its texture would indicate its complete adaptability to fruit culture, and even now the trees already there show that it suits them admirably.

The popular Carnation, *Souvenir de la Malmaison*, is here so much appreciated that a house in two compartments is filled with it. The plants, which are eighteen months old, are being brought on successionally, are capital stocky specimens with great bulky buds that promise well. Adjoining is a span-house filled with *Camellias*, planted next the central path with *Carnations*, *Roses*, and *Ferns*, and next the path is a margin of rockwork. This house had side annexes of 80 feet in length, one being filled with a healthy vigorous lot of *Gloxinias*, *Caladiums*, &c., and the other with *Pelargoniums*, of show size, and also smaller. Two other adjoining divisions held *Cucumbers* and *Tomatoes* planted in side beds. Orchid growing is being taken up with spirit by Baron de Rothschild, and although only a beginning can be said to be made as yet, there are five houses filled with choice species and choice varieties. The *Odontoglossum crispum* collection contains as many beautiful varieties as it has been possible to gather together, and the many examples of *O. citrosimum* and *O. c. roseum* were finer than the writer has seen collected together in any private garden ; and the healthy look of the plants, and the large amount of flower on these and others, leaves nothing to be desired. *O. Rossi* was blooming finely, as was *O. astrolabium*, a fine spike of bloom, with lemon sepals and petals, barred purple and white. *Cattleyas* are much grown, and many superb varieties were observed, notably *C. imperialis*, a plant of which had three blooms ; many of *C. Mendelii*, with four blooms each ; *C. Sanderiana* was a very fine plant, and had two strong shoots ; a *C. Dowiana*, with eight breaks, will be a

FIG. 178.—*CHIONANTHUS RETUSUS* : HARDY SHRUB : FLOWERS WHITE. (SEE P. 820.)

lying back from the path, are isolated beds for flowering plants, and independent groups of beds filled with bedding plants of the usual sorts. In the newer parts of the grounds, at the outskirts, plantations of ordinary nursery forest trees and shrubs have been made, through which narrow paths meander in all directions. The older and main drives and walks are of great width, and are planted on either side with great masses of shrubs, disposed in groups of a sort, the form of the groups being triangular, the

Golden Yew, a capital variety, backed up with *Viburnum opulus* ; *Thuja sinensis aurea*, *Acer Negundo variegata*, many kinds of *Berberis*, as *dulcis*, *steno-phylla*, *Hookeri*, *atropurpurea* ; purple *Corylus*, *Copper Beech* in several tints of foliage, *Mahonia aquifolia*. *Lilacs* in profusion, and of the best coloured varieties, grow and flower beautifully, the Persian being much used for groups. Double Thorns of several shades of colour, amongst them Paul's scarlet, standing pre-eminent for vivid colour,

grand sight when in flower; *C. aurea*, *C. purpurata*, with fifteen blooms; *Dendrobium Wardianum* and *D. infundibulum* were seen in fine examples, and *Lælia elegans* (Reich.), rare, a splendid flower with dark purple throat and pure white sepals and petals, was a fine object. Of *Phalaenopsis* there are many plants of *amabilis* and several of *P. Lawrenceana*, which is not yet at all common, and is difficult to grow; one plant had two spikes. The other Orchids conspicuous for their flower were *Oncidium Kramerii* and *O. Papilio*, and a number of choice kinds of *Cattleya Mossiae*, the latter quite at home, as indeed most of the plants are.

In one of the houses an extraordinary fernery has been constructed with great ingenuity below the level of the floor. There are cavernous and natural looking tunnels of stalactite rock, and a rocky floor over which water runs in channels; beds and bays are filled with great masses of one species of Fern; a rustic bridge spans two separate portions, from which the visitor looks down on a scene quite fairy-like in its character; and, what is of perhaps as great moment to the gardener, is that the place is so well constructed that the Ferns really do well, and do not require that constant replacing which is so troublesome in some ferneries.

Outside the kitchen garden, and masking the buildings and adjuncts, a mass of rockwork has been constructed quite recently by Mr. Pulham, in front of which is a large pool for water-fowl. The rockwork is boldly designed, and is planted with herbaceous plants, creeping Junipers, a weeping variety of the Chinese Juniper, &c. The margins of the lake are decorated with large masses of *Elymus glauca*, Pampas-grass, weeping trees, clumps of Irises, *Hemerocallis*, and *Bambusa*.

Close by are the buildings of a dairy farm built of red brick, and enclosing a considerable quadrangular area for the use of the animals. These buildings are cool, lofty, and have every convenience for dairy use, the milk-room being a building apart, partially underground, and lined with white glazed bricks.

It is almost superfluous to state that the quarters for the young gardeners were designed for their comfort and convenience, with an amount of forethought and a complete knowledge of their requirements seldom seen even now, when these things are not so much lost sight of as was formerly the case. For ten young men there are four bedrooms, a large living-room, a study or reading-room, a separate kitchen, and quarters for an elderly woman, who attends to the place.

The supervision of Waddesdon devolves on Mr. Sims, who has been there since the gardens were began, and who now fills the onerous post of land-bailiff, together with that of superintending the removal and planting of large trees and all heavy operations, whilst all decorations and cultural work in the gardens fall to Mr. Bradshaw the head gardener.

## CHELSEA.

THIS old suburb is favoured in its gardens. Cheyne Walk, though mutilated, retains something of its Dutch quaintness; the Embankment Gardens furnish a delightful substitute for the mudbanks we remember in former years. Hard by is the "physic" garden of the Society of Apothecaries, once the care of Philip Miller, of Anderson, of Fortune, and now of Thomas Moore. The old garden still fulfils its useful purpose, still includes a number of plants of singular interest, is still the scene of botanical lectures and demonstrations. But what would the solemn apothecaries of olden time have thought of their gardens being invaded by hands of girls, not on pleasure but on study bent? What would they have thought of subjecting students in petticoats to the ordeal of competitive examination in science? Yet that is what is done now by their successors, and with good result. Not far from the Physic Garden are the grounds of the Royal Hospital, partly formal as befits the style of the building to which they are attached and where ribbon borders are still preserved to roast the eyes—partly pictorial, as in the Ranelagh Gardens attached to the Hospital grounds, the home of the "Chelsea pensioners." Here, raised mounds, undulating banks, sinuous paths, well arranged clumps of shrubs and trees constitute a most satisfactory bit of landscape gardening, all but unknown, save to the dwellers in the vicinity, and not even mentioned in Dickens' *Dictionary of London*. A delicious avenue of pollarded Limes leads to the river, and in another direction is a series of allotment gardens, each tilled by a military veteran, and exhibiting, as such gardens

do, a most amusing and instructive study, as showing the extraordinary diversity of men's tastes and knowledge in matters horticultural. How pleasant it is to witness the care bestowed on these little plots, and to feel that such a resource is still open to those who have done such good service in bygone years.

## PANSIES AT THE ROYAL BOTANIC EXHIBITION.

IN a somewhat condensed report many objects of considerable beauty and interest have necessarily to be left unnoticed by the reporter. A stand of fancy Pansies exhibited by Mr. D. Laird was very bright, and in the form of the very finest varieties; their modest beauty was perhaps over-shaded by magnificent examples of flowering and foliage plants under which they were placed, or the adjoining bank of richly coloured Orchids in proximity to them. Some years ago prizes were offered for Pansies at these summer exhibitions, at a time when the fancy section was far inferior to what they have become during the last few years. In our own garden they have flowered remarkably well this year, owing doubtless to the cool weather and frequent showers of rain. The Pansy does not succeed so well in the South as it does in the northern districts, but much can be done to ensure success by trenching deeply the ground where they are to be planted, enriching it with cow-manure, and mulching amongst the plants afterwards. Where large quantities are required the best plan is to purchase a dozen plants of the best varieties and to save seed from them. Seed sown in August produces grand flowering plants for next spring. If the reproduction of named varieties is desired, take the small slender shoots that spring from the base of the stem. They are drawn out with the fingers, having some roots attached. Insert them out-of-doors, shade from bright sunshine, and they speedily form plants. The stout flowering stems are hollow, and do not make good cuttings. Frequent propagation of young plants is necessary to maintain a succession of good flowers. *J. Douglas.*

## NOMENCLATURE OF ALPINE PINKS.

ON p. 758 there is an editorial suggestion, the adoption of which would be most welcome to gardeners if it were but practicable: on this latter point, however, I feel various doubts. The suggestion is that gardeners might agree to adopt conventional names for plants; regard being paid to the limits of genera laid down by Bentham and Hooker, but not to the ever-disputed specific and still more vexed varietal distinctions of more minute botanists. Besides the flowers commonly known as "florists' s" there is many a species which includes some forms very good, and others comparatively worthless for garden decoration, between which botanists assure us that they are unable to draw any botanical distinction; and if gardeners are importunate and insist upon having a varietal name, the name given is rarely as acceptable to them as a conventional name of their own choice. For instance I shall never be persuaded to prefer and adopt such a name as *Doronicum plantagineum varietas excelsa*, instead of the more homely and convenient *D. Harpur-Crewe*. But the difficulty of a system of merely conventional names consists in the fact, that in many classes of plants varieties multiply rapidly and indefinitely in proportion to the numbers of them which are cultivated together; and even if distinctive names can be found for them all, these names themselves cease to be applicable as soon as the variety is grown from seed, as it is sure to depart from its previous characters. As illustrations of this I may mention three genera, all of which are cultivated largely by me—*Aquilegia*, *Primula*, and *Dianthus*. As for the first, the natural species divide themselves into two, short-spurred or Old World, and long-spurred or New World; and these two are tolerably distinct. When one tries to subdivide them farther the natural lines become hopelessly perplexing. But let all the so-called species be cultivated in the same garden, and I defy the wisest gardener to pre-

dict with any certainty what kind of a flower will be produced by the seed of any plant amongst them. Then, as for *Primula*: I have ceased to be startled by the seed of a brilliantly pink *Primula rosea* producing a large hemispherical truss of flowers of a dull muddy-purple colour. The first time this happened I thought I must have made a mistake, and sown the seed of some variety of *P. denticulata* instead, but now I find these nondescripts of ordinary occurrence. I intended, however, to speak more particularly to-day of alpine Pinks. One of these was figured last year in the *Gardeners' Chronicle* under the name of *Dianthus glacialis*. It is a most elegant and choice rock plant, inferior to none of its class, and the earliest of them in flower. A firm in York has long sold it as *D. glacialis*, and many cultivators of alpine accept the name. I obtained it several years ago from Mr. R. Parker, of Tooting, who had a fine stock of it named *D. neglectus*, and I have at least twice sent it to Kew for identification. They say there that it is neither *glacialis* nor *neglectus*, but an early form of *D. alpinus*, and I feel no doubt that they are right. Three or four years ago I was staying at Floore, the owner of which is not only a successful alpine gardener, but an experienced collector, and he possesses herbaria formed by himself in different districts where he has visited. He has many specimens of *D. glacialis*, collected by himself in the Alps, different from anything I had at that time seen in cultivation, but answering exactly to the figures and description given by Reichenbach. Having made up my mind, then, what *D. glacialis* was I prevailed upon Mr. Loder, of Floore, to send me a live plant from the Alps in the following summer. This he dug up on the edge of a glacier, and sent it wrapped in wax-paper in an ordinary letter—by far the best way of sending home alpine plants. A little care not only made it grow, but also ripen about a dozen seeds the same autumn; from these I raised nearly as many plants, which are now in flower on my rockeries. As ornaments they are far inferior to the misnamed variety from York. They differ entirely from it, forming dense tussocks of long reflexed leaves, in which the very few flowers are nearly hidden. These plants are not likely to be long-lived. What English conditions could satisfy a plant which ought to sleep for eight months in the year, and be frozen on most nights during the other four? In Cheshire it finds neither regular summer nor regular winter, but for most of the year an unseasonable mixture of both; so such plants are soon worn out. Seedlings from it are sure in a generation or two to depart from the character of the parent, at least such is my experience of similar plants. I might go on telling much the same story about some dozen or more forms of alpine Pink which have been raised by me from seed, or picked up in nurseries, or sent from the Alps. Some appear to be garden forms, some perhaps natural hybrids, but hardly any fit exactly to the characters of *D. alpinus* or *D. neglectus*, which several of them, different from one another, profess to be. I am informed from Kew that they "may perhaps pass as *D. neglectus* or as *D. alpinus*," but no other name is suggested. One very floriferous plant has never had a botanical name assigned to it, except *D. deltoideus*, for which the flower might possibly pass, though the leaf and habit are nearer to *D. neglectus*. It was dug up wild in the Alps by the lady of Coed-Coch. If I insisted on botanists finding a name for it, that name might be *D. neglecto-deltoidoideus*, but I prefer to continue my name of *D. Coed-Coch*, by which I have sent it to several choice gardens; it is, however, very difficult to increase, and never ripens a seed. It most resembles Reichenbach's *D. nitidus*. *D. cæsius* is another kind of Pink of which it is difficult to fix the standard type. I have always thought that its recognised home was the Cheddar Rocks; but I have been asked more than once lately whether I possess the "Oxford" *cæsius*—"very superior to the type;" and other specimens from the Jura are again very distinct. When we get into the single alpine forms of *D. petraeus*, *D. fragrans*, *D. caucasicum*, &c., and raise them from seed, the hybrid varieties become endless and different, that it is useless to call them by any name at all.

The moral I draw from all this is, that the more horticulture advances the more difficult it will become to distinguish garden varieties by consistent names, unless the plan of florists' names is adopted. Even this plan is impossible with such flowers as the Columbine, the individual forms of which cannot be

repeated from seed, and of which no botanist could declare the specific parentage. *C. Wolley Dod, Edge Hall, Malpas, June 13.*

## Orchid Notes and Gleanings.

### ORCHIDS AT THE ROYAL BOTANIC SHOW.

THE new hybrids raised and exhibited by Messrs. Veitch were of great interest. *Thunia Veitchii* is in its way a very pretty variety. It exhibited better culture than the smaller specimen sent by Mr. B. S. Williams, and by a rule in the schedule the best cultivated plant received the award. Mr. Williams' specimen was shown under the name of *T. Wrigleyana*. It did not transpire which plant had been named first, else in the order of priority the person who first flowered and named the plant should take precedence. One of the two names will have to be withdrawn. The *Laelia Canhamii* is one that will take precedence in this class. It is in its way extremely beautiful, and combines in a remarkable manner the characteristics of its parents *L. purpurata* and *Cattleya Mossiae*. Amongst established species and varieties of Orchids, the greatest amount of attention was bestowed upon the large specimen of *Odontoglossum vexillarium* exhibited from Great Gearies. It was fully a yard across, and in rude health. I may say that the plant was purchased with the others exhibited at the same time at the emporium in King Street, Covent Garden, and cost five shillings. It with the others has been several times attacked with thrips, but this pest is not allowed to establish itself; it is destroyed by dipping in tobacco-water. The plants are all grown in the *Cattleya*-house, except for a few months in summer, they are placed in the coolest house. Some of the growers seemed to consider the specimens of *C. Roezlii* and *C. Roezlii album* as being more remarkable as examples of good culture. The plants exhibited had been in flower for nearly six weeks, and were just going off, else the best specimens had a hundred flowers open upon them at one time. This species is grown in the warmest house all the year round, and, like the other species, it can only be kept in good health by keeping it quite free from thrips. The specimen of *Epidendrum vitellinum majus* was *bond fide*, not made up for the occasion. It has been grown on during a period of ten years, and the size of the spikes has never been so remarkable as this year. They were of large size, well branched, and had many flowers on them. Mr. Southgate's specimen of *Aërides Fieldingii*, with four spikes, long and well branched, was a remarkable one, being much admired. This is one of the most useful of the whole genus for exhibition, and does not require great heat to grow it well. *Cattleya Warneri*, by the same exhibitor, was a good variety of this handsome species, the flowers bright in colour, and the plant well grown. The quality of the flowers was, however, over-matched by one smaller specimen in the collection of De Barry Crawshaw, Esq., which were also bright in colour, and larger. *C. gigas*, exhibited in more than one collection, is a noble species, distinct in its large flowers and richly-coloured labellum. *Cattleya Mendelii* was exhibited in capital condition. The "made-up" specimens exhibited by Mr. James was very fine indeed, but it seems almost barbarous to turn the plants out of their pots, in which the have been established, breaking and bruising the active rootlets, and doing the plants much harm. It will be done always when the competitors strive one with another who can make the largest specimens until the limit is reached when no larger pots can be obtained. The old *Aërides Lindleyana* was shown with a very fine branched spike, in the collection of Messrs. Jackson, of Kingston. This form of *A. crispum* is not surpassed in massive beauty by any of the new species recently introduced, and it is a good exhibition plant. The rather new *Dendrobium Dearei* was in capital condition in the 3d prize collection from Mr. Little's garden; it promises to be a very useful species indeed. *Cattleya Gaskelliana alba* is a beautiful variety of the species, and seems to be akin to *C. Wagnerii*, but the flowers were not sufficiently developed to show its true character. This fine form was sent by Mr. Crawshaw, and formed part of an altogether meritorious group, which would probably have been first, except that the flowers of the *Vandas* were much bruised. *J. Douglas.*

### NOTES FROM FERNIEHURST.

Two strong plants of *Odontoglossum polyanthum* may be seen at Ferniehurst, near Shipley, the residence of E. Salt, Esq., one with eleven fully expanded flowers, the other with fifteen. These far surpass all varieties of this grand *Odontoglossum* I have seen, the flowers being very large, of fine substance, deep yellow, with heavy blotches and spots. The *O. crispum* are all in very robust health, some of the newest types carrying flowers of great substance, very round and beautifully spotted. *Oncidium macranthum* is grown here to perfection, the younger plants bear about twenty flowers, and some of the older and stronger ones from thirty-five to forty each. Nowhere have I seen so fine a lot of plants as these. Mr. Salt is also the fortunate possessor of some magnificent varieties of this glorious *Oncidium*. *A. J.*

### AERIDES ODORATUM PURPURASCENS.

There is an excellent plant of this sweet-smelling Orchid in the garden of Mr. J. T. D. Llewellyn at Penllergare, near Swansea. It occupies a large basket, about 3 feet square. It has many strong upright growths, the tallest of which measures a little over 6 feet in height. Lately it produced eighty-three massive spikes, and although these are beginning to decay it is still very effective. *J. Muir, Margam.*

## The Flower Garden.

### THE HARDY FERNERY.

THE plants here should be carefully looked to, and the surface and pockets should be kept free from weeds and well supplied with weak manure-water, which greatly assists the various Ferns when the weather becomes hot and parching.

### MISCELLANEOUS.

*Chrysanthemums* should also be kept well supplied with weak manure-water, and the shoots thinned out to four or five, and be carefully staked and tied; they will make a pretty display in the borders and beds during the autumn months.

Climbers on the walls and elsewhere should now have every attention, and be persistently trained, and thinned out.

Many of the early flowering kinds of *Clematis* should now be in full bloom; they look exceedingly well this season with us.

### ROSES.

These are looking well this season, better, in fact, than I have seen them for many years past; they are likewise very free from blight and mildew; still the careful examination of the leaf for the roller grub and for fly must not be discontinued, and mulching and watering with liquid manure must be attended to.

### ANNUALS AND PERENNIALS

may still be planted to fill up all blank spaces left by early flowering bulbs in the herbaceous and spring borders. An extra sowing of quicker growing kinds may still be made, to be ready when required for filling up any vacant places. *Wm. Smythe, The Gardens, Basing Park, Alton.*

## Plants and their Culture.

### CLIMBING FERNS.

THIS is a most useful section for decorative work, particularly for using in dinner-table arrangements, by entwining the fronds around the stems of epergoes, &c.; the fertile portion of the fronds is the most effective for using in this way. These plants can be stood at the base of pillars or columns, and trained up them to their full length. But by far the best mode of growing *Lygodium scandens*, which is about the best of this section, is that practised by Mr. Allen, at Normanhurst (Sir Thos. Brassey's), near Hastings. The back walls of the vineries are there wired perpendicularly, and strong plants of this *Lygodium* are placed at the base, one good frond in most instances being allowed a wire to itself. In this manner a beautiful effect is made, each frond developing itself to its fullest extent and being likewise of easy access when needed to be cut from the plant. Grown in this way with plenty of room for development, portions of each frond can be taken as may be required, the fertile parts, as previously noted, being

very striking and distinct, also of good lasting properties.

### BASKET FERNS.

At this season of the year well established clumps of these Ferns will need vigilance in regard to the supply of water. *Adiantums* will soon tell their own tale if neglected, by the perfume emitted from the withering fronds. *Davallias* and *Nephrolepis*, though not so quickly injured by under-watering, will eventually show the effects of neglect by the fronds assuming a yellow hue, the sign of premature decay. *James Hudson, Gunnersbury House, Acton.*

## FRUITS UNDER GLASS.

### PEACHES AND NECTARINES.

SUCCESS or non-success in the cultivation of these subjects in glasshouses depends very much on the nature of the treatment the trees receive after the crop of fruit is gathered. To open a house and expose trees which have been subject to careful treatment is surely not the best way to secure those results which are indispensable to ensure success the following year, for this reason avoid doing this, and continue for some time onwards the course of treatment which has been pursued. Still continue to ventilate the house according to outside circumstances, airing it abundantly during arid and sunny weather. Syringe the trees once or twice daily, and if insect pests abound eradicate them at once by means of fumigation or tobacco-water. Keep all gross shoots in check by stopping them repeatedly; if growth continues, and if the shoots are too thickly crowded together a part of them should be removed so that the rest remaining can have the full benefit of light, sunshine, and air. The watering likewise must not be omitted; give it plentifully when necessary, and in the case of trees weakened through heavy cropping, manure water should be used as a medium to reinvigorate them. If these conditions are enforced until about the end of July, the growths will by this time have developed properly, and the maturation will follow accordingly in due course. At about this time also the trees may be fully exposed to the elements, for this purpose remove the lights off them altogether if it can be done.

In houses where the fruit is colouring, use the syringe sparingly, and use water free from all impurities—rain-water is the best for the purpose if it can be had. Pinch all exuberant growths in as they advance, and stop lateral shoots above the first leaf. The weight of large fruits naturally incline them to fall beneath the trellis, these should be raised and be supported in order to colour them perfectly. I use for this purpose thin pliable laths, which are placed beneath the fruit and above the trellis. The time of gathering Peaches and Nectarines is a matter that depends on the purpose for which they are required; for market purpose as a rule they are pulled off the trees before they are fully ripe, while, for home consumption they are allowed to hang considerably longer, in fact until they are quite ripe; and this practice unquestionably is to be recommended when quality of the highest degree is required. No process of ripening is equal to the natural one. *G. T. Miles, Wycombe Abbey.*

## The Kitchen Garden.

### GENERAL WORK

will mainly comprise the earthing-up advancing crops and sticking Peas, Beans, &c. The advancing crops in the seed beds above all things must be well supplied with water. Celery in trenches and successional main crops in nursery beds must also be well attended to in this respect. Pick and train out the shoots of Marrow, Cucumber and Tomatos, as required. Give the main crop of Onions, Parsnips, and Carrots a thorough good hoeing and surface stirring before the tops of the plants close over the intervening spaces between the rows. Thin out the main crop of Beet-root to 6 inches apart, this being the distance to produce the best salad roots. *Scorzonera* and *Salsify* should stand 9 inches from plant to plant.

### SEED SOWING.

The last week in June make the first sowing of Coleworts. An autumn supply of Cabbage being required, make a sowing at the same time. As mentioned in a previous Calendar, make the main sowing of Savoy the last week of the month, and a later one the middle of July, also the latter part of the month or beginning of July make the latest outdoor sowing of Peas—choosing any round variety, such as, *William the First*. *G. H. Richards, Somerley Gardens, Ringwood, Hants.*

## APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, June 30	Bagshot and Windlesham Show (two days). Maidstone Rose Show. Special Sale of Orchids, Flowers, &c., at Protheroe & Morris' Rooms. Farnham Show.
WEDNESDAY, July 1	Farnham Rose Show. Cardiff Rose Show. Croydon Rose Show. Bath Rose Show. Reigate Rose Show.
THURSDAY, July 2	Helstone, Norwich, and Tunbridge Wells Shows. Sale of Imported Orchids, at Stevens' Rooms.
FRIDAY, July 3	Sale of Imported Orchids, at Protheroe & Morris' Rooms.
SATURDAY, July 4	Crystal Palace Rose Show. Eltham Rose Show.

THE fire which recently destroyed a large portion of the roof of the India Museum and caused the destruction of a considerable proportion of its contents, happily spared the loft in which the Royal Horticultural Society's offices are at present located. We say happily, because its destruction would in all probability have entailed the loss of the LINDLEY LIBRARY also; otherwise the annihilation of the wretchedly inadequate premises which have served for so many years as the offices of the Society would not in itself be a matter of regret, but rather the reverse. The imminent danger to which the library was then exposed—we are sorry to add, is hourly exposed—will stimulate the efforts which, we believe, are being made by the Council of the Society to procure adequate accommodation in the way of offices, meeting-rooms, and library. A comparatively small number of the Fellows have any idea where the library is, much less of its value. It will be news to many that the only access to this library—by far the best horticultural library in London, containing much that no money could replace—is by means of a narrow and most inconvenient passage beneath the roof of the building—a passage one would have supposed left during the construction of the building for the convenience of workmen only, but never intended, surely, as the entrance to the Council chamber and library. Nevertheless, for many years there has been no other room available as a meeting place for the Council, no other apartment in which the library could be stored. It is needless to say that, excepting to members of the Council and of the Scientific Committee—whose meetings also take place in this room—the library is practically inaccessible. The Trustees of the Library have been hoping year after year for better times, expending a portion of their small means in cataloguing and arranging their property, in the purchase of books and periodicals, in binding, and so forth, and they have looked forward to a time when a suitable room and a competent librarian would be forthcoming. Always apprehensive of fire, from the frail nature of the building and the highly combustible character of the premises by which it is surrounded, the fate of the library has been a matter of anxiety to those concerned in its preservation. Recent events have but intensified this apprehension, and lead us to wonder how much longer the Fellows of the Society will consent to have what is virtually their property exposed to such risk—how much longer they will tolerate such a state of things as that exemplified by the fact that the Society does not so much as furnish its Fellows with a room to sit down in.

By the courtesy, we believe, of the Albert Hall authorities, the recent Orchid Conference was held in one of the rooms of that building, and though far from affording satisfactory accommodation, it at least answered the purpose, and induced the hope that a meeting-room might be found there as well as accommodation for the library.

As we have said, we have reason to believe that the Council of the Society is engaged in negotiation on the subject, and we earnestly hope that the recent danger to which the Society's property has been exposed will

quicken the progress of affairs, which have only been tolerated because they were known to be temporary and provisional; but so slow has been any progress visible to outsiders, that the temporary character might well be called "secular," the term "provisional" he supplanted by that of "permanent."

PROFESSOR HORWITZ, Superintendent of Forest Conservatory in Copenhagen, and for twelve years Superintendent of Forests in Australia, gave evidence on the subject of TREE PLANTING IN IRELAND lately before the Select Committee of the House of Commons on Irish Industries. Ireland, he said, was so situated that it would grow almost all necessary timbers; and as the supply of Pines in the United States would be worked out in twenty years, every country would soon have to look to itself for its own supplies of timber. Even Sweden and Norway imported timber, though of course they exported much more. In Ireland trees should be planted on the northern coast from Giant's Causeway, and along the western and southern coasts, and on the eastern wherever required for protection. Slip planting would cost £4 or £5 per acre; hole planting £6 to £7 per acre. In from thirty-four to forty-eight years the produce would be worth from £33 to £78 per acre, or from £1 to £2 per acre per annum. By the abundant remains of Oak in Ireland, Nature had given a hint that Oak should be raised in that country. One or two per cent. of the land, or from 20,000 to 40,000 acres of land, would be suitable for Oak. Ireland now, in regard to forests, was a land of nakedness. There was a great deal of land by the rivers suitable for Osiers. These would be ready for market in three years. Basket-making was easily learnt, and might become a considerable industry—in France whole towns had sprung up on it. Basket-makers in Ireland did not know there were Osiers in the country, although there were some. Tree planting in Ireland would have to be carried out by a department of the State. One acre in every four or five in a country should be forest, so that out of 20,000,000 acres in Ireland 5,000,000 should be planted. In France, in a district of the Garonne, the population had increased by immigration in one generation from 25,000 to 5,000,000, in consequence of the planting of Pines on large sandy regions, and the industries that had arisen in firewood, charcoal, tar, resin, bark, &c. The population was rich. Scotch Firs or Larches could be planted on mountain sides at from £3 to £8 per acre, and would be marketable for pit props and telegraph poles in twenty years. Asked as to trespass, witness said he would take advantage of natural boundaries such as rocks and water-courses for fencing. The planting of 5,000,000 acres in Ireland would cost about £20,000,000, but he believed it would pay. Parts of the bog could be planted with trees without removing the bog. A Forest Department should be established for Ireland as soon as possible.

— THE FRUIT AND POTATO CROPS OF THE YEAR.—We shall shortly present our readers with the usual annual report on the condition and prospects of the various fruit crops in all parts of the British Isles, the circulars issued for the purpose having already been distributed. That on the Potato crop will be issued at a later period of the year.

— "THE ENGLISH FLOWER GARDEN."—An index of this work has now been prepared. The arrangement of the book is, for the greater part, alphabetical, but it was found that a thorough index would be useful in showing, at a glance, the kinds mentioned, and their number, in giving a ready reference to all parts of the book, and indicating the illustrations by the use of italics. Between 8000 and 9000 names are enumerated in this index, which will

be bound up with all future copies of the book, the value of which is much enhanced by the addition.

— THE ASSISTANT-SECRETARYSHIP OF THE ROYAL HORTICULTURAL SOCIETY.—This revived office has been conferred on Mr. NEWPORT.

— THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The Forty-second Anniversary Festival of this Institution will be held on Friday, July 3, at 6 o'clock precisely, at the "Albion" Hotel, Aldersgate Street. The chair will be taken by E. TIDSWELL, Esq., of West Hatch, Chigwell.

— MR. DOUGLAS' ODONTOGLOSSUM VEXILLARIUM.—The plant shown at the last Royal Botanic Show with 200 expanded blooms was purchased, as we are informed by Mr. DOUGLAS, in the year 1878, it being at that time in a small sixty, so that its progress, under his care, has been very rapid.

— ORANGES AT NEW ORLEANS.—On p. 606 of May 9 an impression is given that California was awarded the first position with the Citrus family. The following statement by the Assistant-Superintendent of Horticulture will show that Florida was really first:—

"Florida gets two Gold Medals and eleven Silver Medals on tropical fruit. Florida also gets the sweepstake premium of Gold Medal and 250 dols.

(Signed) "E. F. NELSON, Assist.-Superintendent."

A letter from Mr. SANDFORD, a large fruit grower in the neighbourhood of Florida, states that Florida was a long way ahead with Oranges, and also that the score of judging was as follows:—Florida, 5400 points; California, 3321 points. The mistake was due to one of the San Francisco papers publishing an editorial to the effect that California had won the Orange premium, the mis-statement being quickly copied into other papers and forwarded to us among others.

— FUCHSIA TRIALS AT CHISWICK.—At a meeting of the Floral Committee of the Royal Horticultural Society, held at Chiswick, June 18—present, SHIRLEY HIBBERD, Esq., in the chair, Messrs. FRASER, HUDSON, POLLETT, DOMINY, and BARRON, Secretary—the committee examined the collection of Fuchsias being grown on trial, when the following were selected as the best in their various classes:—*Single Dark*: Spitfire, Crimson Globe, Charmiog, President, Minerva, Dr. Sankey. *Double Dark*: Avalanche. *Striped Dark*: Lord Wolseley. *Light Single*: Lady Heytesbury, Prince Alfred, Miss Bright, Ellen Lye, Erica, var. Novelty (very distinct), Alba coccinea. *Double White Corolla*: Artaban, Berliner Kind. *Single White Corolla*: Flocon de Neige.

— VANILLA.—Some pods of this are ripening in the Botanic Garden, Chelsea, having been artificially fertilised.

— PENTSTEMON DIGITALIS.—This is a very beautiful species, sometimes grown as P. Wrightii, with sessile lanceolate leaves and upright, loose panicles of tubular white flowers. It is flowering well, in one of the houses, at the Garden of the Society of Apothecaries, at Chelsea. Outdoors Ferula tingitana forms a stately pyramid of elegantly cut recurved foliage surrounding a candelabrum-like inflorescence of umbels of yellow flowers.

— INULA GLANDULOSA.—This is a very bold and showy herbaceous perennial, scarcely so much grown as it deserves to be. It is a Sunflower-like plant, producing at the end of the main shoots large solitary flowers having an orange disc as a centre, and rich golden-yellow thread-like florets. It is a plant that does well in an ordinary border. A good specimen of it can be seen blooming finely in the Portland Nursery of Messrs. SUTTON & SONS, at Reading.

— A GOOD SEED TIME.—It is some years since, in all probability, that annuals and biennials sown in the open air came so well. Stocks, Asters, Acroclimium, Phlox Drummondii, Petunias, and many other things of like character sown in the open ground in good early light soils have come away numerous and strong, and there is every prospect of a good summer plant, provided the rows and patches be carefully thinned. This is an excellent

requiring to be done with some care, and, if possible, during moist weather. If done during dry weather the soil about those which are left will certainly become loosened, and, when the operation is completed, the soil should be pressed firmly about them, some fresh compost added, and a watering given. A little care at this stage will be found of great service to the future crop.

— *ÆCHMEA BARLEEI*.—Amongst the many things that claim the attention of the gardener hundreds are apt to be neglected, and probably, considering the number of really showy species in it, no order of the same extent and attractive variety is so neglected as the Bromeliads. The *Æchmea* under

for the benefit of farmers and gardeners in the south-western districts of England, served by the London and South-Western and London, Brighton, and South Coast Railway Companies. But if it prove successful it is capable of application to other districts. . . The object aimed at is to bring the producer in the country into more direct communication with the consumer in the metropolis by means of an agency controlled and managed by a combination of producers and consumers, with a view to the advantage and the profit of both." The Association will be formed as a limited company, somewhat on the principles of the Co-operative Supply Associations. The commodities most in request, as butter, cheese, fruit, vegetables, fodder, roots, poultry, game, rabbits—and

growth of this favourite flower. There were some 250 entries, comprising exhibits from the principal growers in Scotland and the North of England. For twenty-four show and twenty-four fancy Pansies Mr. JOHN SUTHERLAND, of Lenzie, took 1st honours, for a magnificent lot. The practical gardeners' classes were well to the fore, the competition being very keen. The amateurs also deserve great credit. Some good stands and grand flowers both in fancies and show varieties were exhibited, and were features of great interest. An interesting feature of the show is the competition on the part of ladies for Violas and Pansies arranged for effect in epergnes and glasses, the principal honours here falling to Mrs. D. P. LAIRD and Miss LAIRD, of the Pink Hill Nurseries, Edinburgh.

FIG. 179.—THE PINETUM AT CHITHURST. (SEE P. 826.)

notice may be grown for the robust and bold character of its foliage, and especially so in a collection where the order is fairly well represented. The individual flowers of the panicle are small and pale yellow, but the most striking character of the inflorescence lies in a few long lance-shaped bracts of a deep red, almost crimson colour at its base. These are scarious in their nature, and last for six or eight weeks in good condition. The plant is quite a recent introduction, belonging to the sub-genus *Platyæchmea*. It is flowering in the stove at Kew, and was described in the *Gardeners' Chronicle*, vol. xx., p. 102.

— THE FARMERS' AND GARDENERS' MUTUAL AID ASSOCIATION.—The above is the rather unwieldy title of a Society that is being formed for the supply of fruits and vegetables to the dwellers in London and other large towns. The circular which it has sent out states that "It is intended primarily

possibly meat, milk, hay, corn, and flowers may later be advantageously dealt with—will be those with which the Association mainly mean to deal. The difference between the prices paid by consumers and those received by the growers and raisers in the country under the present mode of supply is well known, so that if the latter can be brought into direct communication with the former much more of this will find its way into their pockets, and must make a substantial, and in the present state of agriculture an acceptable, difference to their income. The secretary *pro tem.* is A. D. CRIPP, 50, Parliament Street, S.W.

— SCOTTISH PANSY SOCIETY.—The forty-first annual show of this Society was held on June 19 in the Waverley Market, and was in every way a decided success, although the cold winds of May and the drought of June have been very unfavourable for the

Some grand seedlings, both show and fancies, were exhibited, several of which were certificated, and will be sure to find way in stands at future exhibitions.

— *POLYGONUM AFFINE BRUNONIS*.—On the new rockery at Kew a plant under the above name appears in every way a decided acquisition. In some books, both the type and the variety are recorded as distinct species, while other books seem altogether to ignore *P. affine*, or reckon the two names as synonymous. There is a figure of *P. Brunonis* in Dr. ROYLE's *Illustrations of the Flora of Cashmere*, but if the illustrations in some other books have been taken from that, the plant would appear to be *P. affine*. The latter has slender cylindrical, somewhat interrupted spikes of pink flowers, while the above-mentioned specimen of BROWN's variety has short, stout, almost ovate, spikes of intense rosy-red flowers. The foliage and habit of the two seem identical, and

although *P. affioe* is somewhat inferior to *P. vacciniifolium* as a rock plant, the variety *P. a. Brunonis* is no unworthy competitor for a place amongst choice rock plants. It was obtained for Kew through the medium of the Edinburgh Botanic Garden.

— GARDENING APPOINTMENT.—Mr. H. G. JONES has been appointed Head Gardener to Madame A. PATTI, Craig-y-nos Castle, Swansea.

## THE WILDERNESS, CHITHURST.

THE great upheaval, the denudation of which has exposed the Wealden formation, appears to have caused transverse rents in the ridges of chalk and greensand which run east and west; the consequence has been that the rivers and streams which rise in the Weald, instead of flowing down the valley, follow a north or south course through these gullies. The West Sussex Rother never really touches the Weald, and is, therefore, no exception to the rule.

It may be supposed that these steep ravines in the Hythe beds of greensand would form admirable situations for the growth of Conifers, and the subject of our illustration (fig. 197) is just such a locality. The pinetum is situated about a mile from Captain King's house at Chithurst, which is upon the northern slope of the valley of the Rother, and its chief interest, apart from the beauty of the situation, lies in the perfect shelter from south-west winds, which it receives from a hill of about 200 feet in height, so that specimens of the Douglas Fir, instead of, as in ordinary cases, losing their heads so soon as they overtop the other trees, may here obtain their full height, and will probably some eighty years hence assume the proportions of their brethren in British Columbia.

The pinetum was commenced about the year 1866 by the planting of a few Douglas Firs, which are about 50 feet in height, and it has been continued to the present day, such treasures as seedling *Abies bracteata* and *amabilis* being only recently procurable. The heights vary accordingly from *Pinus monticola*, about 40 feet high, and in some years making 3 feet of growth, to *Cunninghamia lanceolata*, which is not so many inches, and which increases in height very slowly, but which is growing steadily upwards, although upon the north side of the hill. None have produced cones excepting the Douglas Firs, which bear in profusion. *Pinus insignis* alone has proved a failure, but the only chance of securing a hardy specimen appears to be to purchase a dozen, and trust to there being a survivor; such at least has been the experience at Chithurst, where a side branch has turned into a remarkably handsome tree. *Libocedrus decurrens* enjoys the sheltered situation; but it is far surpassed by the true *Thuja gigantea*, whose name it so unfortunately usurped for a time.

The collection consists of about a hundred species, and all appear to be in vigorous growth notwithstanding their exposure to the north. *Rhododendrons* and *Azaleas*, of course, are flourishing, and but for that mischievous little beast, the rabbit, the ground might be clothed with Swiss *Rhododendrons*, but although eschewing the larger species, he plays havoc with these. Heaths are also abundant and last year did not see a single month without some in bloom, *E. ciliaris* in December overtaking *E. codonodes* in January, the latter giving place to *E. carnea* in February; these last, however, are not able to hold their own against the Bracken.

There are groups of fine Hollies upon the ground, which was formerly a common, and from out of these have sprung some good specimens of Oak, which could only by that means escape the browsing of the cattle previous to enclosure. The succession of knolls marks the northern escarpment of the Hythe beds of sand rock, while the distant line of hills to the left forms the corresponding ridge on the northern side of the curious neck of the Weald which touches the boundary of Hampshire, Sir John Hawkshaw's picturesque place of Hillycombe being situated in a corresponding gully upon that side, near the border of Surrey.

A SCALE REMEDY.—An orchardist down at Santa Anna reports that he uses the following mixture with success to kill the scale on Orange trees:—Take 20 lb. of lime and mix it thoroughly with 1 gal. of petroleum; then add 100 gals. of water. Spray the trees. One application used in the dry season will remove all scale. *California Press*.

## Foreign Correspondence.

LISBON PARKS AND GARDENS.—Spring-time in Portugal can hardly be less beautiful than the same season in the more easterly peninsula. My personal knowledge only extends to the environs of Lisbon and Cintra, but Algarve, with its 70 miles of Fig trees and its *Cistus*-covered slopes and meadows, must be delightful, and, according to all accounts, there is no river valley in Europe that equals the Minho, when its length is taken into consideration. The gardens of the Lisbon squares are particularly bright and attractive with bedding plants in the month of April. *Cinerarias* are sown in the open borders in very much the same way as we treat *Mignonette* or *Nemophilas*. And really when one is so sickened with regular lines or concentric circles of the same colour in beds, like some striped confection, it was exhilarating to see the changeful shades of colouring in the profuse flowering *Cinerarias*, not two exactly alike. These beds of *Cinerarias* have generally a *Cycas* or some other Palm or *Dracena* in their midst. *Petunias* are grown in a similar way. One of the larger *pracas*, opening out into the broad way by the side of the Tagus, had a motley but most effective garden of flowering plants. Besides *Cinerarias* and *Petunias* there were beds of resolute *Ranunculi*, *Marigolds*, *Wallflowers*, and *Roses*. In many cases the different flowers were beautifully blended together without any conspicuous or glaring arrangement. It is not a necessity to the Portuguese gardener that there should be an artificial edging. Around the *Roses*, and in their midst, were mauve *Sedums* and varied *Mesembryanthemums*. April is a famous month for *Roses* in Portugal, and the display of bloom on little-cared-for bushes makes one envious. To see a *Chromatella* throwing itself from branch to branch of a Cork tree, and producing, with no apparent effort, numberless blossoms, or climbing over the portico balconies and tapping at the windows, or garlanding the pillars, is one of the prettiest designs Flora ever thought of. Another square in the centre of the city has, instead of these gay flowers, beds of prickly *Opuntias* protecting large *Cycads*. Two other very varied gardens, that also flank public thoroughfares, both near the Botanic Gardens, redeem the Lisbon streets from the monotony inevitable from the architecture of the houses. The *Estrella Gardens* are on a larger scale. The trees in them are somewhat dust-ridden, and will be more so as the season advances. They also could be kept much better, and a great improvement would be to take away or modify the numerous puny basins and fountains. Notwithstanding there is much that is interesting, if little that is beautiful. A tall Norfolk Island Pine, with the ground under and around the branches completely carpeted with *Erigeron mucronatus* and a *Corphyra australis* rising in the same way from out the *Myosotis*, were very pretty. Large *Brugmansias*, *Wigandias*, and *Fourcroyas*, all in flower, enlivened the shrubberies greatly. Adjoining is the English cemetery, in which the *Irises* bloom multitudinously. They seem particularly fond of Fielding's tomb, whereon is written, *Luget Britannia gremio non fovere natum*. Whatever his country may do, Fielding has certainly as "snug lying" as if he were buried in his favoured city of Bath. *C. A. M. Carmichael*.

## HARDY TREES AND PLANTS.

TREES AND THE SEASON.—To not a few it may be of more than general interest to know both the present state and prospective condition of the woodlands; and it is only after having passed the period when frosts and hard east winds usually do their blasting and blighting work that anything can be recorded with common certainty. It has seldom been our privilege to record such a combined profusion of foliage and flower all over. With the exception of young Silver Firs, whether in or out of the nursery, and a slight touch to some of the new and more tender Coniferæ, there has been no injury done to the forest this season worthy of notice—at least, in all our surroundings here. The foliage, both of deciduous and evergreens, is exceedingly rich and profuse, and neither have there been abortive buds, nor the newly expanded leaf blasted or blighted. The crop of Scotch Fir cones is this season a very scarce one indeed—probably not over one-third that of last year; but the prospects for next year's crop are exceedingly good. The young shoots are every-

where bountifully crested with the beautiful little purple embryo cones. All other fruits and seeds are very abundant. The Beech-mast, or nut, has not been anything like such an abundant crop since 1869—the season succeeding the memorably dry one of 1868. The branches are already quite pendulous with their weighty treasure, and before they are fully expanded it is to be feared no small damage may occur from the limbs breaking off, especially under a soft rain or heavy dews. The ornamental and flowering trees and shrubs are vying with each other in their grand display. The Horse Chestnut is in splendid condition, and the Mountain Ash, Sweet Service, Laburnum, Hawthorn, Azalea, *Rhododendron*, Lilac, &c., are each so rich in bloom that it is scarcely possible anything can surpass it. Combined with the splendour of blossom is the no less profuse and grand display of foliage, which together make the woodland at the present day such a subject of rare attraction, and such a magnificent sight as none should lose the opportunity of witnessing, for in the brief space of human life it is not the lot of any one to repeat often to themselves such a treat. *C. Y. Michie, Cullen House, June 22.*

## HARDY PLANTS AT THE BOTANIC.

The large group tastefully arranged by Messrs. Paul, of Cheshunt, at the entrance to the large tent, of hardy herbaceous and alpine plants formed an interesting feature, and deserved high commendation. It was the best group that Messrs. Paul have yet exhibited, and showed what an infinite variety of form and colour is now available for the decoration of our gardens during the early summer months. The cut flowers sent by Mr. Ware, of Tottenham, Messrs. Paul, and Messrs. Kelway, have never been seen of such excellent quality, nor have they been so well arranged. Messrs. Hooper, of Covent Garden, had to arrange their group at the furthest end of the long corridor, and perhaps some people missed seeing it, but the cut *Irises* were wonderfully fine in their rich and almost glowing colours. Messrs. Barr had also a splendid assortment of cut flowers of herbaceous plants, which were also arranged in the corridor at the entrance, where they could be inspected by the visitors before they came to the Orchids, although Mr. Peter Barr will have it that his wonderful *Irises* are more than a match, both in interest and beauty, for the finest Orchids. *J. Douglas*.

## ADOXA MOSCHATELLINA.

THIS very early flowering, extremely hardy, beautiful, scented, and highly curious wild plant, deserves to be better known in gardens. It is a local or somewhat rare wild plant, and, as far as my experience goes, is seldom seen in much abundance anywhere. On the top of the downs to the east of Dunstable it was in full flower in the middle of last March; it grows there in a dwarf hedgerow, which is swept by all the winds of winter. On Good Friday last, and on the previous Thursday and following Saturday, the frost was most severe in the position named; all the fields and roads were frozen as hard as stone, and the water was frozen. Notwithstanding the severe frost, which greatly injured some wild plants and killed certain garden plants, the *Adoxa* remained perfectly uninjured—not a blossom suffered. This was the more curious as it is a somewhat succulent and tender-looking plant. It is easily distinguished, even at a distance, from the early foliage of other spring plants by its beautiful glaucous green colour, more or less like the colour of Rue or *Corydalis*. It is said (as its specific name indicates) to have the odour of Musk. It certainly has a peculiar and possibly agreeable scent, which, however, it must be confessed, has a dash of that "felix" about it so familiar in *Orchis mascula*. I have never been able to detect the true Musk odour. The soil in which *Adoxa* grows near Dunstable is a glacial loam full of subangular flints, mixed with the chalk rubble on which the thin glacial stratum is placed.

The plant is so well known that any full description is unnecessary. It produces subterranean runners from which new plants arise. It bears radical leaves of beautiful form, each flower-stem carries a pair of elegant little leaves half-way up, and the greenish flowers are borne in fives in curious globular heads; the terminal flower usually bears a four-cleft corolla, whilst the four lateral flowers usually have five-cleft

corollas. In watching the growth of this plant, in many hundreds of examples the terminal four-cleft flower invariably opened first, whilst the four lateral ones were still in bud.

The genus *Adoxa* contains but the one species here illustrated. It grows wild in Europe, Asia, North America, and the Arctic regions.

This genus of one species has long been a puzzle to botanists, and it has been placed in various different natural orders, according as different botanists have estimated its relationship to other plants. The reasons for placing it first amongst one set of plants and then another have been various, and *Adoxa* seems to have true allies in several directions.

I am not aware that the pollen of the supposed allies has hitherto been examined with a view to testing its relationships, if not, the outlines of pollen, drawn from Nature to an uniform scale, 160 diameters, at the base of fig. 180 may be useful:—A is the pollen of *Adoxa*. B is the pollen of the Ivy, a member of the Araliaceæ, in which natural order Professor Babington and other botanists have placed our plant. C is the pollen of *Weigela bicolor*, a member of the Caprifoliaceæ, an alliance, as far as the natural order is concerned, advocated by Sir Joseph Hooker, Mr. Bentham, and others. D is one of the Honeysuckles, *Lonicera Periclymenum*. E is a second Honeysuckle, *L. Standishii*. F the Snowberry, *Symphoricarpos parviflora*; and G the Elder, *Sambucus nigra*. C, D, E, F, G, are all members of the Caprifoliaceæ.

The resemblance between the pollen of the Elder and the *Adoxa* is striking, and it is remarkable that Payer placed *Adoxa* (probably not on account of the pollen) with the *Sambucaceæ*.

Sometimes parasitic fungi attack closely allied plants, and there is a parasite of *Saxifragas* named *Puccinia saxifragarum*, Schl., which spreads, or is said to spread, from *Saxifragas* to *Adoxa*. It is, therefore, at least interesting to note that Linneus and Jussieu placed *Adoxa* with the *Saxifragaceæ*. W. G. S.

## HOME CORRESPONDENCE.

**Gloxinias.**—One remarkable feature of plant cultivation of the present day is the rapidity with which plants can be brought on into a flowering state as compared with what was done a few years ago. When at Messrs. Sutton & Sons, Portland Nursery, at Reading, a few days ago, I was shown a number of *Gloxinias* in 32-sized pots, with four and six finely-developed leaves—and such leaves, too!—broad, and of a dark olive-green colour, hanging down over the sides of the pots, and hiding them from view. This is one of the peculiarities of the strain of *Gloxinias* grown by Messrs. Sutton & Sons; they have aimed at a pendent habit of growth, and have succeeded to a remarkable degree. From this cushion of leaves rise the flower-stems, surmounted with lovely flowers. Grown in this way, the *Gloxinia* makes an excellent table-plant, and can be utilised with the best decorative effects. The seeds which produced these plants were sown in January, pricked off the last week in February, potted in March singly into quite small pots, potted into 60's in May, and are now in course of being shifted into 32's to flower, and many of them will be in bloom by the second week in July. This is indeed rapid development, but in no case are the plants drawn or prematurely forced. Time was when it was thought necessary to grow the *Gloxinia* as a biennial; now it is successfully treated as an annual, and in an incredibly short time. Among the seedlings which bloomed last year for the first time and are now in full flower, there are some astonishingly fine varieties, the flower so large, stout, and richly coloured that it seems as if perfection was reached. Plants from seed sown in January, 1884, are now at the second time of flowering, of large size, and perfect spreading leaves, with many flowers of the finest quality. But all attempts to get rich carmine and crimson flowers on to this type of foliage have failed as yet. It will be noticed that the richly coloured varieties, such as *Boule de Feu*, have small upright-growing leaves, and unequal and irregular heads of flower. But improvement in the habit of growth of these has commenced, and will be perfected in time. Some very fine pure white varieties have this massive foliage, and it is worthy of remark that the experience at Reading is that seed from white varieties reproduce flowers of the same colour

without any mixture of coloured ones. The flowers may differ in size and texture, but they are white. There is just now a grand display of *Gloxinias* at Reading, and any lover of this flower will find they will repay a visit. R. D.

**Broccoli and Cauliflower.**—With Veitch's Model Broccoli and Early Forcing Cauliflower, there is no difficulty, to use an old saying, not only to make these vegetables "shake hands," but they may be easily had in use together, for a time, indeed we have this season finished cutting our first batch of this Cauliflower, and commenced Early London while there still remained many heads of the Broccoli to gather, the last of which were cut in good condition on the 18th of the present month. Too much cannot be said in praise of both of the above varieties. Model is well named, for it is a model indeed—perfect in form and purely white; and the Cauliflower is equally perfect. A good way of growing early Cauliflowers where the means is at command, and

FIG. 180.—*ADOXA MOSCHATELLINA*, WITH ITS UNDERGROUND RUNNERS AND POLLEN, AND WITH POLLEN OF SUPPOSED ALLIES. (SEE TEXT.)

which we adopt, is to pot the plants in 60-sized pots as soon as they are fit, and plant them in cold frames early in January about 15 inches apart into richly manured soil. When the plants make a start mulch with short manure, and soak the soil with liquid manure whenever it becomes dry. By carrying out this method we produce excellent heads early, and by growing Veitch's Early Forcing and Early London, procure a lengthened supply until successive crops in the open come into use. To plant 15 inches asunder may appear close to those who have not tried, nevertheless it is all the room that is necessary, and space in frames is precious. Thomas Coomber.

**Richardia æthiopica** (see p. 763).—The Rev. F. Tymons called here two years ago, at Auricula time, the end of April, and in the course of conversation he told me the best way to grow this plant was to plant it out in Celery trenches. I have tried the plan for two years, and now recommend it as strongly to others as Mr. Tymons did to me. We manure the trenches as for Celery, and plant out in May. I sug-

gest this plan after reading Mr. Hudson's advice to plant them out on level ground, to prevent the water running away. The roots can be kept moist in the trenches with half the labour, and the water cannot run away. J. Douglas.

**A Novelty in Window-plant Culture.**—A few days ago I had a special request to go and call upon two lady friends of mine who reside a short distance off. Their principal object was to show me a very neat and handsome tuft of Horse Chestnuts growing in a shallow dish, and placed on the top of a small vase in the window. On the first glance over them they presented by their spreading palmated foliage the appearance of some new introduction of this class of plants; the leaves were of a dark healthy green, most of them consisting of five leaflets, on stems of 7 to 8 inches high, with about the same number of plants. The specimen when viewed as a whole was quite unique, and worthy of imitation. The method of management is so simple and easily performed that it brings it within the reach of every one, and adds to it a greater interest. The plan is, first to procure a shallow galvanised dish, such as are sold in the shops at 1d. or 1½d. each, or a large saucer, into which place seven or eight of the nuts. Cover them with moss, and moisten the whole occasionally with water: when showing signs of vegetation give an increased supply. When they attain the season's growth, such as when I saw them, the dish under the moss was a mass of strong, healthy roots. The progress of early growth is similar to that of Hyacinths in glasses; and, although no flowers are produced, they are much more effective as a window plant. J. Webster, Gordon Castle.

**Fabiana imbricata.**—A plant of *Fabiana imbricata*, planted out against a south wall last summer, has lived through the winter without any protection, and is now in full flower. Mary Freeman. [The plant is bardy on the south coast. ED.]

**Rhubarb.**—"A. D." in your issue of June 13, when speaking about various kinds of Rhubarb, says, in reference to Victoria and Stott's Monarch Rhubarb, that "it is very doubtful, indeed, whether either sort would be favoured in any kitchen or cottage home for domestic consumption." I know nothing of the kind named Victoria, but after an experience of many years I can say of Stott's Monarch that it is as good as it is gigantic; the flavour is exquisite, and, in my opinion, there is nothing to compete with it. Messrs. Stuart & Mein, of Kelso, introduced this Rhubarb, and my supply came from them. Once grown it must please all by its size, and delight all with the deliciousness of its flavour. W. H. Cullingford.

**Hackwood Park Prolific Tomato.**—This is by far the best Tomato we have ever attempted to grow. Not only is it the most prolific, but the fruit is large in size and excellent in quality. The market growers find it most profitable to grow the old red Tomato, because it bears the heaviest crop, and is an old favourite in Covent Garden Market. It would be worth while to try the Hackwood Park variety. I fancy it would take in the market for its large size and good form. J. Douglas.

**Morello Cherries.**—About twenty-five years ago a severe electric storm occurred in the district in which I was then living; on the following day I noticed that a young Morello Cherry, trained against a wall in my garden, previously, as I believed, in perfect health, was dead; and in my father's garden, distant about half a mile from my own, a standard Morello Cherry also dead; both evidently having perished about the same time. I could find no better explanation for the extraordinary coincidence than that the mischief had been caused by electric agency. I noticed no other variety of tree in their neighbourhood injured in any way. Possibly the Morello Cherry is peculiarly susceptible of electric influence, and those referred to in your paper of the 6th as having been more or less injured, may have been exposed to this influence. In evidence of the unsuspected currents of electricity constantly passing and repassing through trees, &c., I may mention that a very observant friend this morning informed me that he had been much interested in watching yesterday a light twiggish shoot of an Oak regularly oscillating between two boughs while all the rest of the tree was motionless. This movement, after five minutes, gradually ceased. It is curious that two boughs in close proximity and full connection with the trunk, should vary in electric status. Edmund Tonks, Knowle.

## Reports of Societies.

### ROYAL HORTICULTURAL: June 23.

THIS meeting was distinctively a show of Pelargoniums, Roses, Pyrethrums, and Pæonies. Still the enterprising nurserymen, who are seldom absent from these gatherings, brought huge lots of miscellaneous subjects, and those chiefly from the open ground, and therefore within the scope of any plant lover to cultivate. The Pæonies vied with the Pelargoniums in bright colours, nor were the Pyrethrums and Iris of all sections far behind them in gorgeous effect. The Rose was fairly well represented if quality be regarded, but the quantity was wanting; exhibitors of this flower reserving their strength for the Rose shows proper, which begin in a few days from the present. Messrs. Sutton & Sons, of Reading, offered prizes for Melons and Lettuces and were the means of affording additional items of attractiveness to the show.

#### Scientific Committee.

Sir J. D. Hooker in the chair.

#### DAVID DOUGLAS.

Sir Joseph Hooker showed a portrait of the famous botanical explorer, to whom our gardens are indebted for so many fine hardy plants.

#### HONEY GLANDS IN CATTLEYA.

Dr. Masters read a communication from Mr. Burbridge relating to the presence of honey glands on the sepals of *Cattleya Mendelii*—a circumstance not commonly known.

#### ATHROTAXIS SELAGINOIDES.

Dr. Masters showed, on the part of Mr. Noble, branches of this plant provided with cones.

#### TEA FROM JAMAICA.

Sir J. D. Hooker alluded to a consignment of Tea which he had received from Jamaica, the first received from that island, and the produce of seed sent from Kew to Jamaica some twenty years since. The quality was reported as very good.

#### ACTION OF FROST.

Specimens of espalier Apples from Rev. H. H. D'Ombrian were shown, in which the young growths were browned and withered. Dr. Masters stated that he had recently received numerous specimens of various trees similarly affected in different parts of the country. In the absence of other visible cause, he attributed the effect to the action of frost on the young growing shoots.

#### ÆRANTHUS LEONIS.

Mr. W. G. Smith sent a sketch of the flower of the new *Æranthus* (*Angræcum*) *leonis*, and called attention to the long and remarkable spur, 5 inches long, and which is abruptly twisted and the end upturned. "In *Angræcum sesquipedale* a moth was found with a proboscis long enough to reach the nectar at the bottom of the straight or only slightly curved spur. How could a moth get its proboscis to the base of a spur like the one of which I send a sketch? It could only be done with inconvenience to the moth, and might lead to a damage of the delicate proboscis. If I may be allowed to say so, the flower appears to me to be twisting its spur at the moth in a most defiant and irritating manner. All the spurs are curved in the same style."

It was pointed out that the twisted state of the spur might be advantageous rather than otherwise, as affording leverage to the moth.

#### CORN MILDEW.

Mr. Smith sent a drawing of the fungus of corn mildew, *Puccinia graminis*, Pers., growing in company with the fungus of smut, *Ustilago carbo*, Tulasne, within the membranes of the fruit or grain of Oats. The fungus was detected as drawn in the very young fruit, and the fungus did not gain access to the fruit from the exterior, but from the interior of the host (plant in company with the smut fungus. Mr. Smith has the original materials and a microscopic slide with the fungi *in situ*.

The meaning will be quite obvious to all botanists, and proves that corn mildew can be (and in Mr. Smith's opinion it is) hereditary in corn. By hereditary, it is meant, that the germs of the disease can be transmitted in the fruits or grains.

"The district in which I write (Dunstable) is purely agricultural. Corn is one of the chief products, and cornfields are spread over thousands of acres. The corn is now much rusted. This rust, or Uredo, the early state of Puccinia, appeared on the first leaves of this corn in spring and early summer. The amount of Uredo is perfectly inconceivable.

"As for Barberry bushes and Barberry blight,

although I have known this district well all my life, and studied its botany, I have never once seen a wild Barberry bush in the whole county. Abbot only gives two localities in the county of Beds, and Saunders only one. Mildew is always in its worst form near hedges and trees, and bad patches are always seen where the ground has been manured with mildewed straw from stables.

"One of the reasons why mildew is so bad here is found in the fact that all the best unmildewed straw is very carefully selected for the manufacture of hats and bonnets, and all the mildewed material finds its way to the fields, where it reproduces the disease.

"I do not say, and never have said, that it is impossible for the fungus of Barberry blight to infect corn with Uredo; all I say is that nothing like proof has yet been adduced of a genetic connection between *Æcidium berberidis* and *Puccinia graminis*.

"The cornfields in this district conclusively show that Barberry bushes are unnecessary for the production of Uredo and Puccinia, as such bushes are virtually unknown here."

#### POLLEN PELLETS.

From Dr. Wallace, of Colchester, came numerous pellets of yellow, friable character, found in the casing of a disused window. They were evidently masses of pollen collected by a humble bee.

#### Floral Committee.

Present: John Fraser, Esq., in the chair; and Messrs. J. Douglas, J. O'Brien, H. M. Pollett, H. Turner, J. Dornay, C. Noble, T. Baines, R. W. Wilks, H. Herbst, W. Bealby, H. Bennett, H. Cannell, M. T. Masters, H. Ballantine, W. B. Kellock, J. Child, J. Walker, A. Perry, H. Kinghorn, and J. James.

Taking the plants in the order of the schedule, Pelargoniums, show, decorative, or fancy, come first, and here Mr. F. Hill, gr. to Henry Little, Esq., Hillingdon, was placed 1st for eighteen, with neat, medium-sized plants, some nice things in fancies being Turner's Seedling, Ellen Beck, Miss E. Little, and Madame Thibaut, Zulu Belle and Sultana were good dark varieties. Mr. C. Turner, Slough, was awarded 2d prize for a neat collection. As these plants were shown in 6-inch pots they must be considered good examples of small pot culture, if poor exhibition objects. For zonals (open class) in the same sized pots Mr. Hill was awarded the 3d prize, no other awards being made.

Zonal Pelargoniums (amateurs).—The 3d prize was awarded to Mr. C. J. Waite, gr. to Colonel Talbot, Glenhurst, Esher.

In the class for Gloxinias in pots (amateurs), Mr. E. Chadwick, gr. to E. M. Nelson, Esq., Hanger Hill House, Ealing, obtained 1st prize, for a mixed lot of nine, consisting of erect and semi-erect varieties; a 2d prize was awarded to the same gardener for twelve exotic Ferns in 8-inch pots, mostly varieties of *Adiantum*, *Lomaria gibba*, *Davallia*, &c.—neat and well furnished; and for eight small Palms in 8-inch pots Mr. Chadwick was awarded a 1st prize.

The pot Roses, in groups of thirty, and grown in pots not exceeding 8 inches in diameter, were the prettiest feature of the show, and exhibited a system of growing these plants that ought to recommend itself to the amateur and gardener alike. The specimens had from three to six blooms open, and as many unopened buds to keep up the succession. Messrs. Paul & Son, Old Nurseries, Cheshunt, were 1st; and Mr. Rumsey, Joyning's Nursery, Waltham Cross, 2d.

#### CUT FLOWERS.

PELARGONIUMS.—In the class for twelve bunches of large-flowered or show Pelargoniums Mr. C. Turner was well to the front, his stand of blooms not only showing very fine quality, but also efficiently displayed. Mr. Cannell, Swanley, was 2d in the class; and Mr. H. Little, Hillingdon, 3d. The most striking flowers shown were *Volouté Nationale* alba, *Venus de Milo*, *Nellie Hayes*, *Comtesse de Choiseul*, *Mandarin*, *The Czar*, *Magnate*, *Purpurea*, *Madame Thibaut*, *E. Perkins*, and *Captain Bernard*.

In the zonal class Messrs. H. Cannell & Sons were in fine form, their big bunches of blooms being set up with great effect, and included C. A. Swinstead, *Keotish Fire*, W. E. Gumbleton, *Lord Chesterfield*, *Ajax*, *Jealousy Improved*, *Nerissa*, *Queen of the Belgians* (pure white), *Constance*, &c. The other collections were less effectively disposed. Messrs. Cannell also staged grand lots of such beautiful doubles as *Madame Thibaut*, pink; *La Cygne*, white; *Belle Nancienne*, rosy-salmon, very novel; and *Madame Thuenin*, rosy-pink, *Madame Cochin*, delicate lilac; *Louis Thibaut*, vivid red; *Congo*, rosy-lake, of double Ivy-leaf forms—all very effective.

PINKS.—These made a poor show, Mr. C. Turner having the only respectably put up dozen bunches, three blooms each, and even these, being all of the laced forms, lacked variety. The best appeared to be *Morare*, *Eurydice*, *Gaiety*, and *Victory*. Mr. Hooper, of Bath, who was 2d, had not less than four bunches of Mrs. Jenkins, white self; also the red *Lord Lyons*, and *Derby Day*; but the blooms were roughly shown. Mr. J. Douglas, Great Gearies, Ilford, had the only six kinds, rather small blooms. Judging by the results, it would seem as if Pinks were not widely grown, and yet self forms are found in every good garden.

PYRETHRUMS.—Messrs. Kelway & Sons, of Langport,

had the finest lot of twenty-four kinds, in bunches of fine blooms, making, for rather dull-coloured and formal flowers, a fine show. Messrs. Paul & Sons also had a fine collection, though their blooms lacked the size seen in the Messrs. Kelway's stands. Very fine in form, and striking in colour, were *Godiva*, *Mont Blanc*, *White Aster*, and *Sam Vanbrugh*, whites; *Ajax* and *J. N. Tiverty*, rich deep reds; *Uzzie*, creamy-pink; *Aphrodite*, quilled; *Gloire de Stella*, *Flora*, and *Progress*. Mr. F. Hooper, Widcombe, Bath, took the 3d prize.

ROSES were much admired, the fine fresh flowers indicating that the coming Rose season will be, barring accidents, one of exceptional high quality. Seven lots of twenty-four single blooms competed in the chief class, Messrs. Paul & Sons, Old Nurseries, Cheshunt, taking 1st place with some superb flowers. Mr. T. House, of Peterborough, was 2d, and Mr. Charles Turner, Slough, 3d. Exceptionally good flowers of Ulrich Brunner, Victor Verdier, Madame Prosper Langier, Etienne Levet, François Michelon, Abel Carrière, Sir Garnet Wolseley, La France, Lady Mary Fitzwilliam, Sultan of Zanzibar, Marguerite St. Amand, Maréchal Niel, Merveille de Lyon, Madame Gabriel Luizet, Catherine Mermet, Beauty of Waltham, and Duke of Edinburgh were in these stands, and many other popular flowers were hardly less finely represented. The class for twelve single blooms of Tea Roses brought out many very beautiful flowers, Mr. G. Prince, of Oxford, coming 1st with a fine stand, Mr. House taking 2d place again. Such fine kinds as Adam, Catherine Mermet, Madame Lambert, Comtesse de Nadaillac, Mons. Furtado, Maréchal Niel, Jean Ducher, Marie Van Houtte, Niphotos, Belle de Bordeaux, delicate pale mauve, very striking; Madame de Watteville, new, white, heavily edged with rose; and Sunset, also new, rich creamy-yellow. Many of the flowers displayed singularly refined colouring. Mr. Prince showed a box of twenty-four blooms of Comtesse de Nadaillac, a lovely rose-tinted variety; Mr. House had a pale pink globular Rose, Mrs. House, rather needing substance; and in quantity, Mr. Allan Richardson, Noisette, a very rich orange-buff coloured flower, nice in bud stage, small and specially adapted for buttonholes, and a free bloomer; and the singularly pure white Miss Blanche Moreau, which should be in great request for market purposes. Only two lots of twelve trebles were entered in the amateurs' class, but these were of moderate quality and call for no comment.

#### THE MISCELLANEOUS EXHIBITS.

Mr. T. S. Ware, Hale Farm, Tottenham, staged an immense quantity of hardy perennial and bulbous flowers, rich in Delphiniums, Plox, Gladiolus, Iris, Campanulas, Lilium, Pyrethrum, Gaillardias, Ixias, Sparaxis, very fine Cypripedium spectabile, and *Orchis foliosa*. A Silver-gilt Medal was fittingly awarded.

From Messrs. Kelway & Sons came a very numerous assortment of Chinese (herbaceous) Pæonies of a large size generally and of striking colours, there being several new varieties, viz., Beatrice, white and pink, elegant and full; and Lady Carrington, white suffused with rose. Some cut blooms of choice *Amaryllis*, of middling size, but clear, bright, and distinct tints were amongst their exhibits: *Sileas*, a scarlet Jappa, deep crimson; *St. Gatie* (Certificated, 1884); and *Hogarth*, a smooth scarlet with a white band on each segment, may be noticed as being the more pleasing forms. A variety of herbaceous plants were likewise shown. A Silver-gilt Flora Medal was awarded for this fine group.

A Silver-gilt Banksian Medal was awarded to Messrs. Barr & Son, who showed a grand group that was flanked at either end by a group of Tree Carnations. There were the pretty *Mumstead Poppy* (*Papaver nudicaule* var.); a great many varieties of Iris, especially good being *I. squaleus* varieties, and varieties of *I. Anglica*, *I. variegata*, *I. pallida*, *I. virginiana*. Pyrethrums were numerous and of fair size. The pretty *Allium triquetrum*, good pieces of *Tropæolum polyphyllum*, and a number of Pæonies of the Chinese section. This last exhibit included more named varieties than we recollect having seen at any other exhibition.

A Silver Banksian Medal was awarded to Mr. J. Wiggins, gr. to W. Clay, Esq., Kingston, for a collection of seedling show and fancy Pelargoniums.

A Bronze Banksian Medal was awarded to the New Plant and Bulb Company, Colchester, for a collection of Japan Maples, most of them being far too small to judge of their merits. Some pretty foliage was observed in *Acer trilobum roseum*, *A. pictum marmoratum*, and *A. septemlobum rubro marginatum*. It is to be anticipated that planters will not take to the plants kindly while such fearful Latin names are retained, and the sorts should be shown as trees with 6 feet stems, at least worked at that height.

A Bronze Banksian Medal was awarded to Mr. House, Peterborough, for Roses.

Messrs. H. Cannell & Co. received a Bronze Banksian Medal for Pelargoniums shown as cut blooms, *Verbenas*, and Pæonies.

Messrs. Paul & Son, The "Old" Nurseries, Cheshunt, showed a large group of herbaceous Pæonies, fine in bloom being *Fretria maxima*, *Le Fraeschur*, *Belle Chatelaine*, both these being similarly creamy-white, with centre petals of crimson, and guard petals of purplish-rose. *Grandiflora nivea plena*, a very large double white, is a fine bloom, white, occasionally splashed with crimson. English annual Poppies in varieties, single, double, and semi-double, in several shades, were worthy of notice; these had been sown in September, 1884. Many kinds of rock and border flowers came from the Cheshunt nursery, wherewith a charming display was made. A Bronze Banksian Medal was awarded for the collection.

*Cattleya Mendelii rosea superba*, a nice variety with a well coloured lip, was sent by Mr. Hill, Hillingdon.

Mr. Chadwick showed *Stanhopea tigrina* bearing two blooms. Mr. Wiggins exhibited *Cattleya Mendellii* superba, a pale-coloured form, having a much-frilled pale purple lip. The New Plant and Bulb Company showed *Cattleya delicatissima*, with white lip and throat, with sepals and petals of faint rose. *Euonymus japonicus* Silver Gem, a white and green striking variegated shrub was amongst the items from Messrs. J. Veitch & Sons, Chelsea. Messrs. F. Sander & Co. showed a capitally-grown group of *Odontoglossum*.

#### CERTIFICATED PLANTS.

Mr. H. Bennett's Rose Princess Beatrice is a flower of a creamy colour, having the centre petals of a slightly deeper tint. It is close, of medium size, fibret-shaped, and faintly perfumed. Messrs. Kelway & Sons' *Pæony Leonora* Bramwell is a deep rose-coloured flower—fine and full. *Candytuft Empress*, exhibited by Mr. R. Dean, is a massive spike of bloom of great length, the colour dead white—a useful variety. *Cymbidium Parishii*, from Sir Trevor Lawrence, has sepals and petals of pure white, the throat being yellow, with spots of crimson. *Anguloa Ruckeri*, a beautifully flowered specimen of this old well-known Orchid from the same treasure-house of good things. It carried twelve blooms. From Messrs. Veitch & Sons, Chelsea, there were *Olearia macrodonta*, a Holly-like dwarf shrub with Aster-like white blooms disposed in corymbs; *Styrax japonica*, an elegant shrub with numerous pendulous white blooms of an inch in diameter—a beautiful thing; *Thunia Veitchii*, a plant as shown of one pseudobulb surmounted with three white blooms striped faintly with purple on the lip; and *Masdevallia Gairiana*, a flower of  $\frac{1}{2}$  inch in width by  $\frac{1}{2}$  inches in perpendicular length—the colour orange, with two suffused bands of a crimson tint traversing it. Messrs. F. Sander & Co.'s *Odontoglossum Johnsonianum* and *O. mulus Germynianum* are somewhat alike in their markings, except that the first-named has a white ground colour and the latter a light yellow one, the blotching being brown in each instance; *O. Alexandræ Brymerianum* is a flower regular in its form and of good substance, the ground colour faintish rose, the edge of the various limbs being silvery-white, the spots are of a light brown and are of various dimensions, crest yellow—a distinct flower. The New Plant & Bulb Co. had the handsome *Eremurus aurantiacus*, carrying a long spike of translucent primrose-coloured flowers.

#### LIST OF CERTIFICATES.

To Mr. H. Bennett, for Rose Princess Beatrice.  
To Messrs. Kelway & Sons, for *Pæony Leonora* Bramwell.  
To Mr. R. Dean, for *Candytuft Empress*.  
To Sir Trevor Lawrence, for *Cymbidium Parishii*.  
To Sir Trevor Lawrence, for *Anguloa Ruckeri*.  
To Messrs. J. Veitch & Sons, for *Olearia macrodonta*.  
To Messrs. J. Veitch & Sons, for *Styrax japonicus*.  
To Messrs. J. Veitch & Sons, for *Thunia Veitchii*.  
To Messrs. J. Veitch & Sons, for *Masdevallia Gairiana*.  
To Mr. W. Clay, for *Pelargonium Thisby*.  
To Messrs. F. Sander & Co., for *Odontoglossum Johnsonianum*.  
To Messrs. F. Sander & Co., for *O. galiceæ*.  
To Messrs. F. Sander & Co., for *O. mulus Germynianum*.  
To Messrs. F. Sander & Co., for *O. Brymerianum*.  
To The New Plant and Bulb Company, for *Eremurus aurantiacus*.  
To Mr. G. Paul, for Strawberry Pauline.

#### Fruit Committee.

Present: Harry Veitch, Esq., in the chair; and Messrs. J. Lee, T. F. Rivers, T. S. Lyon, J. Ellam, G. Goldsmith, J. Burnett, H. Weir, G. Paul, H. Webb, Robt. Hogg, J. B. Heywood, R. D. Blackmore, G. Bunyard, F. D. Godman.

Mr. G. Paul showed the earliest of all Strawberries in Pauline; the fruit is conical, bluntly ribbed, and of a deep red colour. It will be valuable for its earliness.

Several Melons were shown for Messrs. Sutton & Sons' prizes. The sorts were to include Sutton's Invincible, Masterpiece, and Hero of Lockinge. The 1st prize was taken by Mr. J. Douglas, Great Garies; the 2d by Mr. Eldridge, Chesterford Park Gardens, Saffron Walden; and the 3d by Mr. J. Fry, gr., Haydon Hall, Eastcote.

The prizes for the best six distinct varieties of Lettuces were awarded—1st, Mr. C. J. Waite; 2d, Mr. W. Meads, gr., Beckett Park, Shrinvenham; and the 3d, Mr. G. H. Richards, Somerley Park, Ringwood.

From the Society's garden, Chiswick, there came a collection of Cauliflowers that were sown on January 19, and planted out April 17. The sorts had all turned in earlier than any other variety sown in the autumn, and, in fact, are only adapted for this winter sowing, as when sown in the autumn they generally "button." The sort had many synonyms, but are all sprung from, or are varieties of, the Early Erfurt.

#### YORK GALA: June 17, 18 and 19.

This year's gathering in the well known Boutham Field (of which a telegraphic summary appeared in our last) has added one more to the long course of successful exhibitions which York has witnessed—successful alike from a gardening point of view from the meritorious character of the various productions that were forthcoming, as from the unflinching appreciation of the public, who showed by their presence in the crowded tents that the liking for plants and flowers increases as time goes on. In each department—if we except cut

Roses, which owing to the backward season were not so numerous, or collectively so fine as they have before been, and the principal class for large stove and greenhouse plants, in which there was some falling off—the exhibition was one of the best which the Society has had.

#### STOVE AND GREENHOUSE PLANTS.

In the open class for sixteen stove and greenhouse plants, flowering and fine-leaved, Mr. Letts, gr. to the Earl of Zetland, Aske Hall, Richmond, stood well in front, staging a fine group as regards both the flowering and the fine-foliage examples. Amongst the former were large and beautifully bloomed specimens of *Ixora coccinea*, bearing some seventy heads of its bright scarlet flowers; *I. Williamsii*, similarly well done; *Anthurium Scherzerianum*, with near on a hundred flowers; *Erica Cavendishii*, *Stephanotis floribunda*, *Dracophyllum gracile*, and *Azalea Duc de Nassau*. The best foliage plants were *Croton Queen Victoria*, not less than 8 feet in diameter; *Kentia Fosteriana*, and *Cycas revoluta*. Mr. Cypher, Cheltenham, was 2d, having smaller plants, the most noteworthy of which were the now seldom seen *Ixora salicifolia*, *Clerodendron Balloourianum*, nicely flowered; and the showy *Azalea Souvenir de Prince Albert*. Mr. Berry, gr. to W. Dove, Esq., York, was 3d.

With six stove and greenhouse plants Mr. Letts was also easily 1st, having a profusely flowered half dozen, *Ixora Prince of Orange*, *I. Dixiana*, and *Pimelea mirabilis* being the best; 2d, Mr. Noble, gr. to T. Fry, Esq., Darlington, who, in a nicely flowered group, had *Erica tricolor* Wilsoni and *E. ventricosa coccinea minor*.

Three stove and greenhouse plants.—1st, Mr. Lumley, gr. to W. N. Champion, Esq., Halifax, with medium-sized but well-flowered examples, comprising *Reticularia montana*, a mass of flowers  $\frac{1}{2}$  feet in diameter; *Anthurium Scherzerianum*, and *Imantophyllum miniatum*; Mr. Berry 2d.

For three Cape Heaths the competition was very close between Mr. Letts and Mr. Cypher, the former, whose plants were a little fresher in the bloom, taking 1st; Mr. Cypher 2d. Mr. Letts was likewise 1st with a single greenhouse plant, *Darwinia tulipifera*, in good condition, the flowers numerous and well coloured; 2d, Mr. McIntyre, gr. to Mrs. Gurney Pease, Darlington.

Single Azaleas.—1st, Mr. Letts; 2d, Mr. McIntyre.

#### FINE-FOLIAGE PLANTS.

These were well shown, large, and in fine condition. For six, Mr. McIntyre had 1st honours, with, amongst others, *Cordylina indivisa*,  $\frac{1}{2}$  feet in diameter; *Cycas revoluta* and *C. circinalis*, both fine; 2d, Mr. Noble, who also had a good collection, the best of which were *Kentia Fosteriana* and *Dasyliroton acrotrichum*, one of the straight-leaved forms of this singular plant.

Three fine-foliage plants.—1st, Mr. Methven, gr. to T. Lange, Esq., Gateshead; Mr. Letts, a close 2d. *Crotons* were well done, the plants being large, dense, and finely coloured; Mr. Letts was well in front with four, having, amongst others, *C. majesticus* and *C. Warneri* clothed with large leaves of high colour; 2d, Mr. McIntyre.

#### FERNS.

Of stove and greenhouse Ferns there was a fine display, the plants being well grown, with more variety in the competing collections than now often seen, composed, as they not unfrequently are, of too many tree species. For six the 1st prize was won by Mr. Berry, who staged a well managed lot of plants; 2d, Mr. Nash, gr. to Captain Starkey, York. In the class for three, Mr. Noble was 1st, his exhibit containing one of the best examples we have seen of the beautiful drooping *Goniophlebium subauriculatum*, its pendent fronds running from 8 to 9 feet in length; Mr. McIntyre 2d, also showing a clean grown group.

Hardy Ferns are usually forthcoming at York as we seldom meet with them elsewhere; this year they were even better than ordinary—their size and condition being alike remarkable, in addition to which the competing groups were fairly representative in the number of genera they were composed of—a matter of importance, which exhibitors often appear to lose sight of. In the class for ten, Mr. W. R. Robinson, York, took 1st honours with enormous plants in the best condition in every respect, the most meritorious being *Polystichum plumosum*, *Adiantum pedatum*, *Lastrea filix-mas cristata*, *Osmunda regalis cristata*, *Struthiopteris pensylvanica*, over 6 feet high; and *Trichomanes radicans*. Mr. J. Rodwell, York, 2d, having smaller, but nicely managed examples.

Six hardy Ferns.—1st, Mr. Robinson; 2d, Mr. J. Rodwell.

#### GROUPS OF PLANTS ARRANGED FOR EFFECT.

For several years these have been one of the principal features of the show. On the present occasion they filled the greater part of a large circular tent, and being in most cases well arranged and composed of suitable materials the effect collectively was very good. In the class confined to 250 feet super, Mr. McIntyre had 1st, his group consisting of elegant Palms, Ferns, and other fine-leaved plants, combined with suitable flowering subjects—colour and form alike well balanced; Mr. R. Simpson, Selby, a close 2d; Mr. Berry, 3d.

In the competition for groups occupying 150 feet, Mr. Noble came in 1st; his exhibit also was well arranged and very effective, having, as in such arrangements there ever should be, a good background of fine-leaved plants not too light in character; 2d, Mr. McIntyre, who here also had a well matched group.

#### PELARGONIUMS.

As usual at York these were in great force—large and profusely flowered, added to which the comparatively

cool weather enabled the plants to carry their flowers so differently to that which occurs with *Pelargoniums* when it is hot and parching. With twelve show varieties Mr. Eastwood, gr. to Mrs. Tetley, Leeds, added one more to the long list of victories which he has achieved with *Pelargoniums*, taking 1st with plants alike remarkable for the dense sheet of bloom they bore, and the healthy development of their foliage. Mr. McIntosh, gr. to J. T. Hingston, Esq., who was 2d, also staged a very good lot, Messrs. Kyalence, Ormskirk, being 3d.

Six show kinds.—1st, Mr. Bridge, Liverpool, whose plants were in splendid bloom; 2d, Mr. Eastwood.

In the class for six fancies, and also for three, Mr. Eastwood was again in front with plants equally well managed to those he exhibited in the classes for large-flowered kinds.

Zonal varieties, as they ever are here, were remarkable for the amount of bloom they bore. There was likewise a comparative absence of the stiff formal training which too often is noticeable in these showy plants. With these Mr. Eastwood was very successful, taking 1st in the class for twelve with a group combining a nice selection of colours and smothered with bloom. Messrs. Pybus & Son, Ripon, who were 2d, also had a fine lot of plants.

With six zonals Mr. Eastwood was again in front, staging specimens that were even finer than those in the large class; 2d, Mr. McIntosh.

The 1st prize for six Fuchsias went to Mr. McIntosh—Mr. Clark, gr. to Miss Wharton, York, being 1st with three.

#### POT ROSES.

These were shown in large numbers, the plants collectively nicely grown and bearing well developed flowers, although there was an absence of the large specimens that the eyes of visitors to the metropolitan exhibitions are accustomed to.

In the class for nine in 8-inch pots, Messrs. Jackson & Co. took the lead, with an even fresh group; Messrs. Pybus, who were 2d, likewise put up an attractive collection.

With fifteen, confined to 8-inch pots, Messrs. Pybus led the van, having here again an effective group, bearing even full-sized flowers. 2d, Messrs. Jackson & Co., who had well matched, nicely flowered plants.

In the amateur's class for six, Mr. Veary, gr. to Miss Steward, had 1st; Mr. Sunley, gr. to B. Hemsworth, Esq., 2d, both exhibiting well managed plants.

In the amateurs' class for six in 8-inch pots Mr. Veary was also in front, staging nice examples; 2d, Mr. Eastwood.

#### ORCHIDS.

were not quite so numerous on this as on some previous occasions. With eight Mr. Mitchell, gr. to Dr. Ainsworth, Manchester, had 1st, for medium-sized, nicely flowered examples, the most noteworthy of which were *Phalaenopsis amabilis*, carrying a number of spikes full of fresh clean flowers; *Vanda suavis*, *Saccolabium guttatum*, and *Thunia Marshallii*. The 2d prize went to Mr. Cypher, who, along with others, had the lovely *Aërides crassifolium* and *Dendrobium Dalhousianum*, one of the best of the long-bulbed kinds.

Four Orchids.—1st, Mr. Mitchell, whose best plants were *Phalaenopsis grandiflora* and *Saccolabium præmorsum*; 2d, Mr. Rollinson, gr. to W. Bateman, Esq., Harrogate.

In a close competition with a single Orchid Mr. Letts had 1st for a large and finely bloomed *Aërides odoratum* purpurascens, bearing some twenty good spikes of deeply purple-tinted flowers; Mr. McDoe, gr. to Sir J. W. Pease, Hutton Hall, Guisborough, was 2d, with a good plant of *Odontoglossum vexillarium*.

#### GLOXINIAS.

were unusually well represented, both as regards numbers and condition. Nothing in their way could be finer than the plants shown by Mr. Lumley in the classes for twelve and six, in both of which he took 1st with plants remarkable alike for the size, number, and fine colouring of their flowers, backed as they were by stout, robust leaves; Mr. Lumley was a good 2d in both classes, with plants well shown in every way.

#### NEPENTHES.

For Mr. B. S. Williams' special prizes for six *Nepenthes*, Mr. A. Cole, gr. to J. Broome, Esq., Didsbury, Manchester, took 1st, with well-grown plants bearing handsome pitchers, amongst them being the hybrid of *N. Mastersiana* in beautiful order, its large highly-coloured pitchers contrasting well with the others; 2d, Mr. McIntyre.

#### CUT FLOWERS.

Many of the Roses shown were only indifferent. For forty-eight varieties (open) Mr. House, Peterborough, was easily 1st, with a handsome lot of blooms, having a good proportion of fine Tea varieties amongst them; 2d, Mr. May. Thirty-six varieties (open).—1st, Mr. House here also showing a meritorious collection; 2d, Mr. May.

Twenty-four varieties.—1st honours in this class likewise fell to Mr. House; 2d, Messrs. Jackson & Co., Bedale.

Twelve white and yellow Roses (amateurs), not less than six varieties.—1st, Mrs. Maynard Proud, Darlington; 2d, Mr. Milne, gr. to R. Bell, Esq., Thirsk.

Twelve Tea Roses (amateurs).—1st, Mr. Milne; 2d, Mrs. Maynard Proud.

Twelve hybrid perpetuals, one variety (amateurs).—1st, Mr. Veary; 2d, Mr. Sunley.

Eighteen distinct varieties (amateurs).—1st, Mr. Trees; 2d, Mr. Eastwood.

Twelve varieties (amateurs).—1st, Mr. Eastwood; 2d, Mr. Sunley.

Cut flowers shown in bunches are always a feature at York, tender exotics and hardy outdoor kinds being alike forthcoming in quantity and in faultless condition. With twelve bunches of stove and greenhouse sorts Mr. McIndoe was easily 1st, showing a grand lot, consisting of Orchids of various kinds, *Ixoras*, *Anthuriums*, *Dipladenias*, *Stephanotis*, and the singular *Callistemon rigidus*; 2d, Mr. Black, gr. to the Misses Pease, Darlington.

Six varieties.—With these also Mr. McIndoe had 1st, and Mr. Black 2d.

Twelve bunches hardy flowers.—Here again Mr. McIndoe had 1st with a fine collection; 2d, Mr. Craig, gr. to T. Hutchinson, Esq.

#### FRUIT

was present in large quantities, with less of an inferior character than is often to be seen where much is brought together at this time of the year. In the class for three bunches of black Hamburg Grapes there were some nine competitors, several of whom ran a close race.—Muscats, as might be supposed, taking the time of year into account, were deficient in colour. The collections of fruit shown in the different classes were with few exceptions in good condition. For eight dishes Mr. Miles, gr. to Lord Carington, Wycombe Abbey, took 1st, with an even collection consisting of Black Hamburg and Forster's Seedling Grapes, a good Queen Pine, Elruge Nectarines, Hale's Early Peaches, Negro Largo Figs, Hero of Locking Melon, and Black Circassian Cherries; 2d, Mr. McIndoe, whose best dishes were Black Hamburg Grapes, a Queen Pine, Bellegarde Peaches and Pitmaston Orange Nectarines; 3d, Mr. Westcott, gr. to the Duke of Cleveland, Raby. Six dishes.—1st, Mr. McIndoe, with a good collection, the best examples being Black Hamburg and Foster's Seedling Grapes, Best of All Melon, and a Queen Pine. Mr. Dawes, gr. to the Hon. Mrs. Meynell-Ingram, Temple-Newsome, was a close 2d, having, amongst others, Muscat of Alexandria and Madresfield Court Grapes, the latter very large in berry; Royal George Peaches, and Lord Napier Nectarines. 3d, Mr. Westcott. In the class for four dishes of fruit Mr. Clayton, gr. to J. Fielden, Esq., Grimston Park, took the lead, with Black Hamburg Grapes, Abec Peaches, Elruge Nectarines, and a Melon—all in excellent condition; 2d, Mr. Leadbetter, gr. to A. Wilson, Esq., Hull. Three bunches of Black Hamburg Grapes.—Mr. Allsop, gr. to Lord Hotham, Dalton Hall, Hull, was 1st, with medium-sized bunches, even in berry, quite black, and covered with thick bloom; 2d, Mr. Wallis, gr. to Sir H. Meysey-Thompson, Kirkby Hall, York, showing nicely finished bunches; 3d, Mr. H. Gill. Three bunches of Muscats.—1st, Mr. Sleightholme, gr. to T. W. Dymond, Esq., Barnsley. Three bunches any other varieties of white Grapes.—With these Mr. Allsop was easily 1st, staging Buckland Sweetwater in beautiful condition; Mr. Miles, who was 2d, had the same variety.

Six Peaches.—1st, Mr. Dawes; 2d, Mr. Black. Six Nectarines.—1st, Mr. Muller, gr. to W. H. Long, Esq., Trowbridge, with an excellent dish of Elruge; 2d, Mr. Sunley.

Scarlet-flesh Melon.—1st, Mr. Hare, gr. to R. H. C. Neville, Esq., Grantham; Mr. Clayton, 2d. Green-flesh Melon.—1st, Mr. McIndoe; 2d, Mr. Short, gr. to A. Pease, Esq., Darlington. Dish of Figs.—1st, Mr. McIndoe, with good Brown Turkey; 2d, Mr. Short.

Messrs. Harkness & Sons, Bedale, exhibited a good collection of show and fancy Pansies, for which they received a Certificate of Merit.

Mr. House had a First-class Certificate for a new hybrid perpetual Rose named Miss House. It is delicate flesh in colour, very full, and promising in appearance.

## Obituary.

MR. JAMES WELSH, of Messrs. James Dickson & Son, nurserymen, Edinborough, died somewhat unexpectedly at Erickstave, near Moffat, on the 18th inst., whither he had gone to recruit his health. The third son of the late Mr. James Welsh, of Earlshagha, the deceased came of an old agricultural family, several members of which were among the best known sheep farmers of the Western Border country. Mr. Welsh, however, after a liberal education at the Moffat Academy, chose a mercantile career, and as a partner in the well-known firm of nurserymen and seedsmen with which he has for many years been identified, found scope there for his admirable business habits and ability. He was well known to many farmers and foresters, horticulturists and landed proprietors, in every county in Scotland; and his death, in the prime of his powers, will be regretted by a wide circle of friends, who greatly appreciated his many business and social virtues.

MR. J. W. CROSS.

It is with much regret that we record the untimely death of Mr. J. W. Cross (of the firm of Cross & Steer, nurserymen, seedsmen, and florists, at Ford and at Salisbury), which took place under painful circumstances on Monday last. When driving into Salisbury, accompanied by two of his children, the deceased was suddenly taken with a fit, fell from the trap on to the road and expired. The painful occurrence has cast a gloom over the residents of Salisbury

and surrounding districts, by whom the late Mr. Cross was well known and respected, and great sympathy is felt on all sides for his widow and young family. Those of our readers to whom the deceased was personally known will read this notice of his death with sorrow, as they will recognise in it the loss of a well-trained, courteous, and unassuming gardener of high ability. The deceased was for many years gardener to Louise Lady Ashburton, at Melchet Court, Romsey, where, as is well known to readers of the *Gardener's Chronicle*, he established a good collection of Orchids, some of which found their way to Stevens' Rooms, and thence to the now famous collection at Burford Lodge. *Cypripedium Ashburtonæ* and *C. Crossianum* were, as the names imply, raised by the late Mr. Cross while in the service of Lady Ashburton for the second time as head gardener. Though plant-culture was our lamented friend's forte, he was also a good fruit grower, and good all-round gardener. When he left Melchet Court the second time it was to embark in business as a nurseryman, &c., at Ford, a couple of miles from Salisbury, where, at 8, The Canal, he carried on the seed and cut flower business, taking Mr. Steer into partnership a few years since. It will be remembered that within the last few years The Governor and Louise Ashburton Carnations were brought into commerce by the deceased, who, through straightforward business-like habits and practical industry had at the time of his death succeeded in establishing a good sound business connection.

## The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON,  
FOR THE WEEK ENDING WEDNESDAY, JUNE 24, 1885.

June 18.—Very fine.

19.—Fine, dull, rain in morning.

20.—Fine and bright at times, strong wind, rain in evening.

21.—Fine day, strong wind.

22.—Fine day, strong wind.

23.—Fine day and night.

24.—Very fine day, overcast at night.

LONDON: *Atmospheric Pressure*.—During the week ending June 20, the reading of the barometer at the level of the sea decreased from 30.15 inches at the beginning of the week to 30.05 inches by 5 P.M. on the 14th, increased to 30.11 inches by 9 A.M., and decreased to 30.04 inches by 5 P.M. on the 15th, decreased to 29.84 inches by 9 A.M. on the 17th, increased to 30 inches by 9 A.M. on the 18th, decreased to 29.53 inches by 1 P.M. on the 20th, and was 29.56 inches by the end of the week.

The mean reading of the barometer for the week was 29.91 inches, being 0.25 inch lower than last week, and 0.05 inch below the average of the week.

*Temperature*.—The highest temperature in the shade in the week was 84°, on the 14th; on the 17th the highest temperature was 64°. The mean of the seven high day temperatures was 71°.9.

The lowest temperature was 43°.2, on the 18th; on the 20th the lowest temperature was 56°. The mean of the seven low night temperatures was 50°.9.

The greatest range of temperature in one day was 33°.6, on the 14th; on the 20th the smallest was 12°. The mean of the seven daily ranges was 21°.

The mean temperatures were—on the 14th, 65°.1; on the 15th, 58°.5; on the 16th, 55°.2; on the 17th, 54°.9; on the 18th, 58°.3; on the 19th, 60°.1, and on the 20th, 58°.6; of these the 14th and 19th were above their averages by 6°.2 and 0°.4; the rest were below by 0°.5, 3°.9, 4°.4, 1°.2, and 1°.3 respectively.

The mean temperature of the week was 58°.7, being 1°.7 higher than last week, and 0°.7 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 152°, on the 14th. The mean of the seven readings was 122°.2.

*Rain*.—Rain fell on three days, to the amount of 0.27 inch.

ENGLAND: *Temperature*.—During the week ending June 20, the highest temperatures were 84°, at Blackheath, 82° at Cambridge, 79° at Truro; the highest at Liverpool and Newcastle was 65°, at Hull and Sunderland 68°. The general mean was 73°.7.

The lowest temperatures were 37° at Cambridge, 40° at Hull, 43°.2 at Blackheath; the lowest at Preston and Newcastle was 50°, at Liverpool 49°.7. The general mean was 45°.7.

The greatest ranges were 45°, at Cambridge, 40°.8 at Blackheath, 34° at Truro; the smallest ranges were 15°, at Newcastle, 15°.3 at Liverpool, 22° at Sunderland and Preston. The general mean was 28°.

The mean of the seven high day temperatures was highest at Blackheath, 71°.9, at Cambridge 69°.4, at Plymouth 68°.2; and was lowest at Liverpool, 61°.3, at Sunderland 61°.7, at Bolton 62°.5. The general mean was 65°.9.

The mean of the seven low night temperatures was highest at Plymouth, 53°.5, at Preston 52°.9, at Brighton 52°.7; and was lowest at Hull, 47°, at Cambridge 48°.6, at Wolverhampton 49°.6. The general mean was 51°.

The mean daily range was greatest at Blackheath, 21°, at Cambridge 20°.8, at Wolverhampton 16°.6; and was least at Liverpool, 10°, at Newcastle 11°, at Sunderland 12°. The general mean was 14°.9.

The mean temperature was highest at Plymouth, 59°.1, at Blackheath 58°.7, at Brighton 58°.2; and was lowest at Hull, 53°.2, at Sunderland 53°.9, and at Bolton 54°.3. The general mean was 56°.5.

*Rain*.—The largest falls were 1.30 inch at Bolton, 0.53 inch at Preston, 0.38 inch at Plymouth; the smallest falls were 0.08 inch at Hull, 0.10 inch at Newcastle, 0.11 inch at Nottingham. The general mean was 0.31 inch.

SCOTLAND: *Temperature*.—During the week ending June 20, the highest temperature was 71°, at Perth; at Aberdeen the highest was 64°.7. The general mean was 67°.2.

The lowest temperature in the week was 40°, at Glasgow and Leith; the lowest temperature was 48°.5. The general mean was 45°.2.

The mean temperature was highest at Perth, 55°.9; and lowest at Greenock, 54°.2. The general mean was 55°.2.

*Rain*.—The largest fall was 0.87 inch, at Greenock; the smallest fall was 0.09 inch, at Edinburgh. The general mean fall was 0.40 inch.

JAMES GLAISHER F.R.S.

PLANTING IN CENTRAL ASIA. — Here (Kitalé) was one of the plantations mentioned by General Korolkoff, which the Russians place in the mountains to keep the soil from washing down. The surplus trees raised for this purpose are given to the natives, who readily undertake their culture. The year I was in Samarkand they had distributed 1,000,000, and in the following spring expected thus to give from 2,000,000 to 3,000,000 of saplings. Of the various trees and shrubs cultivated by the Russians the General mentioned to me a variety of Poplar (*P. alba pyramidalis*, also called *P. Bolleana*), almost unknown in Europe, but common in Central Asia, where it attains, in from fifteen to twenty years, proportions fit for building, and is sold from 10s. to 16s. the tree. Elm is used for making *arbas*, as also sometimes is Almond wood, but not often that of the wild Nut. They have introduced also several kinds of Conifers, among them *Thuia orientalis*, which does not grow so large as in Europe, though it attains to 70 feet. To these may be added the white and black Mulberry (*M. alba* and *nigra*), especially the former for silk culture, and many attain only moderate perfection as cultivated by the Sarts, and Raspberries, which I understood the natives do not cultivate at all. More than 12,000 fruit trees were grafted the year of my visit, and were to be given to the natives. "*Russian Central Asia*," by Henry Lansdell, D.D.

## Enquiries.

"He that questioneth much shall learn much."—BACON.

**PATENT VENETIAN FRUIT-HOUSES.**—Will any of your readers who have had experience with the Patent Venetian Fruit-houses give me their opinion and experience with them? I noticed them advertised in your paper recently. J. H.

## Answers to Correspondents.

**BOOKS: Reader.** See Hentfrey's *Elementary Course*, 4th edition, and *Bower and Vines*, for practical instruction.

**GLOXINIA: R. H. P.** A common occurrence, resulting from an outgrowth of the natural corolla. Some nurserymen have now a strain of such flowers.

**GRAPES DISEASED: V. W.** The berries sent for our opinion were attacked by mildew and were also rusted. The first is difficult to rid the Vines of without some damage being done to the berries, but in any case it must be attempted—using the mildew remedies sold by the nurserymen. You can, in the future, prevent its ingress by keeping up warm, moist temperatures during the period previous to the crop ripening, and by a drier, buoyant one afterwards. Keep a mixture of lime and sulphur, in pans, about the vinery, at all times, and smear the same on pipes and walls. To avoid rust you must regulate the time and method of the ventilation, so that cold draughts of outside air are not admitted, certainly not when the berries are covered with moisture, this being oftentimes a fruitful source of rusting.

**HAIRWORM: W. S.** Gordius aquatics. In spite of your friend's assertion that they are derived from horse-hairs, and that he has "done it himself" by pulling hairs out of a horse's tail, you may rest assured that they have as much to do with horsehair as the moon has to do with cream-cheese. It is not likely, however, that you will be able to convince such an observer!

**INSECTS: T. H.** Your Grapes are gnawed by the green caterpillars of a small moth, Tortrix (Ditula) angustiorana. You will find a description in our last year's volume. W.—G. P. Your Gooseberries are attacked by the berry-borer, or caterpillar of the moth Geometra vauaria. Sweep up, and burn the fallen fruit as soon as possible. W.

**IXORA HYBRID: H.** Good in colour, form, and substance, but the trusses loose and small.

**JUDAS TREE: H.** Cercis siliquastrum, a native of Judæa. By some *hocus focus* Judæa has become converted in Judas.

**NAMES OF PLANTS: Southampton.** Syringa [osikea. —R. G. B. 1, Send again when in seed; 2, Avena elatior; 3, Festuca pratensis. —A. B. C. 1, Linaria cymbalaria; 2, Geranium molle; 3, Orchis maculata; 4, Lychnis vespertina; 5, Anagallis arvensis. —G. P. 1, Polygonum bistorta; 2, Melampyrum pratense; 3, Orchis maculata and the white variety. —W. S. Escallonia macrantha. —F. C. S. Maréchal Niel. —C. W. and W. T. T. Geum rivale, with the calyx leafy, and the central part of the flower prolonged by median proliferation into a long flowering shoot. —G. Paul, Leeds. Alopecurus bulbosus. —E. H. Sanicula europæa. —W. A. Euphorbia splendens, Mitraria coccinea. Your Peach leaves have the "blister," caused by the attack of a parasitic fungus. —C. E. B. Primula kasimiriana. (See *Gardener's Chronicle*, July 24, 1880, p. 107, and *Botanical Magazine*, t. 6493). —A. H. Calceanthus floridus. —W. Leighton. 1, Saxifraga sponhemica; 2, S. umbrosa; 3, S. Andrewsii; 4, S. trifurcata; 5, S. hypnoides. —C. E. F. Veronica dentata.

**PEA ROOTS: W. G.** These excrescences are common to all Leguminous plants, and are not injurious. The Orchis is Habenaria bifolia.

**PERPETUAL FLOWERING CREAM-COLOURED STOCK: A. Mitchell.** It is a pretty variety. We have seen nothing like it before among biennial Stocks—which, by the way, it is—and we think no nurseryman has it.

**PITCHER ON CABBAGE LEAF: C. W. D.** Not very uncommon; often figured in the *Gardener's Chronicle*. It results from the partial branching of the leaf in a vertical as well as in a horizontal plane, but what is the exciting cause we do not know.

**POLYGONUM CUSPIDATUM: A. F. Pot.** Fortune said that the Polygons were eaten by the Chinese, the young shoots being cut like Asparagus, just as it shows above-ground. The liking for it must be an acquired one, as the flavour is bitter and disagreeable; but then what is there a Chinaman will not eat! As regards its feeding properties for poultry we have no experience.

**POSTAL BOXES: E. Helliwell.** The best sorts are those made with dovetailed or nailed sides of thin wood; or those made of stout tin plate. The collapsible boxes reach us very generally quite smashed up, and the contents often unrecognisable.

**ROYAL BOTANIC SHOW: CORRECTION.**—Floral certificates were awarded to Messrs. Laing for Tuberosa Begonias Mr. Brissenden and Salmonea. They are described at p. 804, but Mr. Brissenden is stated to be the exhibitor.

**SOFTENING PUTTY: C. Noble.** Soak the putty with a

strong solution of pearlash—or, failing that, of washing soda—mixed with wood-ash lye.

**VINE LEAVES: H. S.** There is no disease, but constitutional weakness (perhaps hereditary). We cannot tell the cause if the other Vines are healthy. Try a very weak solution of sulphate of iron, and carefully applied doses of weak liquid manure.

**WIREWORMS: W. G.** The grub of various beetles is so called. If you can let your land, or any portion of it, remain fallow for a time, a dressing of gas-lime will kill the grubs; but, as it will kill the plants too, some months must elapse before you plant. Any stimulating manure will cause the plants to grow more vigorously, and in a measure compensate for the injury done by the insect. Great quantities may be caught by burying pieces of Potato, Turnip, &c., to a depth of a few inches, and examining them every few days.

**GOOSEBERRY DISEASE: W. P.** Your plants are covered with the Gooseberry fungus, which seems unusually prevalent this year, especially in Ireland. As many gardeners may not have seen it, we reproduce

FIG 181.—GOOSEBERRY FUNGUS.

the woodcut from an earlier volume (fig. 181). Nothing but destruction by fire of the affected parts will do any good.

## CATALOGUE RECEIVED.

E. H. KRELAGE & SON, Haarlem—Wholesale Catalogue.

**COMMUNICATIONS RECEIVED.**—W. Fricker, shortly. —R., next week. —A. B.—C. W. S.—J. F.—Constant Reader. —I. O. W.—W. N.—Jas. P.—A. W.—J. H.—C. W. D.—R. D.—W. J. M.—H. E.—J. R. Robinson.—J. L. S.—S. POTATOS.—Jersey kidneys, 7s. to 9s.; Belgian, 5s. to 7s. per cwt. Old, 60s. per ton.

## SEEDS.

LONDON: June 24. —There was a very poor attendance on the seed market to-day, and the small business transacted was without any new feature either of interest or importance. The higher prices demanded for new French Trifolium hinder operations, as buyers hold off. In Mustard and Rape seed there is no quotable change. Canary seed is somewhat firmer. Hemp seed is now exceedingly cheap. Feeding Linseed is inactive; in other articles are without alteration. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

## CORN.

Monday's trade at Mark Lane was hardly on the whole so good as on the previous Friday, and the market at the close appeared to have lost tone a little as regards Wheat and Maize, but on the week Wheat prices in some instances showed a small advance, and firmness. Flour was quiet, without material change, but firmer. Barley did not engage much attention. Light arrivals were, however, in favour of prices. A good business was done in Beans and Peas at steady prices, Maize was somewhat irregular, flat corn rather firmer, and round slightly easier. Oats were dull of sale, but no change was made in quotations.—On Wednesday the Wheat trade was quiet, the tendency of prices for English Wheat being downward. Altogether, however, there was no quotable change in the values of English or foreign. Flour was quiet, but steady in value; Barley was unaltered, Beans and Peas very firm, Maize steady, and Oats quiet and unchanged.—Average prices of corn for the week ending June 20:—Wheat, 33s. 2d.; Barley, 28s. 2d.; Oats, 22s. 4d. For the corresponding period last year:—Wheat, 37s.; Barley, 27s. 11d.; Oats, 22s. 4d.

## HAY.

Tuesday's Whitechapel Market report states that trade was very dull, especially for Clover, which had a decidedly drooping tendency. Supplies were large. Quotations:—Clover, prime, 80s. to 110s.; prime second cut, 85s. to 110s.; inferior, 60s. to 75s.; hay, prime, 70s. to 95s.; inferior, 40s. to 60s.; and straw 25s. to 35s. per load.—On Thursday there was a moderate supply. Trade was very dull at late prices.—Cumberland Market quotations:—Clover, best, 85s. to 105s.; inferior, 60s. to 80s.; hay, best, 84s. to 95s.; inferior, 40s. to 70s.; and straw, 25s. to 35s. per load.

## POTATOS.

The Borough Market report states that fair supplies are to hand, with a steady trade. Quotations:—Lisbon Rounds, 7s. to 8s.; Cherbourg, 7s. to 8s.; Guernsey Rounds, 7s. to 8s.; Jersey Kidneys, 9s. to 11s. per cwt. Old Magnum Bonums, Regents, and Victorias, 50s. to 55s. per ton.—The imports into London last week consisted of 30 baskets 872 packages 273 baskets from St. Nazaire, 1403 cases from Cherbourg, 68 packages from St. Michael's, and 50 boxes 23 cases from Malta.

Weeds. How to Destroy them.—Use  
SMITH'S Celebrated WEED KILLER, the  
cheapest and most effectual preparation ever invented.  
For testimonials and prices address  
MARK SMITH, Manufacturing Chemist, Louth, Lincolnshire.

**EPPS'S SELECTED PEAT.**—Forty sacks,  
25. 6d. per sack; 30 ditto, 25. 9d.; 20 ditto, 35. 6d.  
10 ditto, 45. 6d.; sacks, 6d. each. In trucks of 14 cubic yards,  
115. per yard. For Rhododendrons and common purposes,  
155. per ton, not less than four tons; sample sack, 22. 6d.  
LOAM, SAND, LEAF-MOULD, SPHAGNUM, &c.  
See Special List, also for the Trade. Ringwood, Hants.

### A GREAT SUCCESS.

## "JEYES' GARDENER'S FRIEND."

One Gallon of this Fluid, diluted with water according to  
directions, and applied with an ordinary watering-can,  
Effectually Removes all Weeds, Moss, Worms, and  
Insects on Gravel Walks, Lawns, &c.

Price, 3s. 6d. per Gallon, including drum; 40-gallon Casks,  
£4 10s. Carriage paid.

JEYES' SANITARY COMPOUNDS CO. (Limited),  
43, Cannon Street, London, E.C.

YOU CAN IMMEDIATELY

## Destroy all Insects

And PARASITES that infest Trees and Plants  
(whether at the roots or on the foliage) by using

# FIR TREE OIL INSECTICIDE (SOLUBLE IN WATER)

Green Fly From Garden, Greenhouse, Mealy Bug  
Black Fly Orchard, or Vine; these and Thrip  
Woolly Aphis all insect pests are speedily cleared by the use of Fir Tree  
Grubs Oil. Effectual, Economical, Caterpillars  
Ants and Safe. It does not injure and Mildew  
Worms Flowers, Foliage, or the bloom on Grapes, Stone Fruit, &c. Scale, &c.

**FIR TREE OIL** destroys Lice and Fleas on Animals; it  
will cure Ringworm and all Skin Diseases produced by  
Parasites, and is perfectly harmless to the Hands & Skin.  
Sold by Seedsmen and Chemists, 1/6, 2/6, and 4/6 a Bottle.  
Per post 3d. extra. Per gallon 12/6, or less in larger quantities.  
A Treatise on FIR TREE OIL, as an INSECTICIDE, its  
application to Plants and Animals, sent Post Free, on  
receipt of address, by the Manufacturer,

**E. GRIFFITHS HUGHES, Manchester.**  
Wholesale:—HOOPER & CO.; CORRY, SOPER, FOWLER  
AND CO.; C. E. OSMAN & CO.; and from all the London  
Seed Merchants and Wholesale Patent Medicine Houses.  
New York:—ROLKER & SONS.

**GISHURST COMPOUND**, used by leading  
Gardeners since 1850 against Red Spider, Mildew,  
Thrips, Green Fly, and other Blight, 1 to 2 ounces to the  
gallon of soft water; 4 to 16 ounces as winter dressing for Vines  
and Orchard-house Trees; and in lather from the cake against  
American Blight. Has outlived many preparations intended to  
supercede it. Boxes, 12s., 3s., and 10s. 6d.

**GISHURSTINE** keeps Boots dry and soft on  
wet ground. Boxes, 6d. and 1s., from the Trade.  
Wholesale from PRICE'S PATENT CANDLE COMPANY  
(Limited), London.

## ROLL TOBACCO PAPER, Cloth, and Fibre for Fumigating.

The best and strongest it is possible to obtain. 6 lb. 45. 6d.;  
14 lb. 10s.; 28 lb. 20s. Good strong TOBACCO PAPER or  
CLOTH, 6 lb., 2s. 6d.; 14 lb., 5s.; 28 lb. 10s. Carriage paid to  
London or any Railway Station in Kent. All our articles contain  
the pure essence of Tobacco only. Used in Royal Nurseries, the  
Gardens of the Nobility, by Leading Men of the Profession, &c.

### PARCEL POST.

Our celebrated Best ROLL TOBACCO PAPER, CLOTH,  
and FIBRE, guaranteed same quality as above, delivered free to  
any address in the United Kingdom, at the following rates:—  
2½ lb., 2s. 6d.; 4½ lb., 4s.; 6 lb., 5s.; 6½ lb., 5s. 6d.

### Rosher's Garden Edging Tiles.

THE ABOVE and many other PATTERNS  
are made in materials of great durability. The  
plainer sorts are specially  
suited for KITCHEN  
GARDENS, as they har-  
bour no Slugs or Insects,  
take up little room, and,  
once put down, incur no  
further labour or expense,  
as do "grown" Edgings, consequently being much cheaper.

GARDEN VASES, FOUNTAINS, &c., in Artificial Stone,  
very durable and of superior finish, and in great variety of design.  
F. ROSHER AND CO., Manufacturers, Upper Ground  
Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.;  
Kingsland Road, E.  
Agents for LOOKER'S PATENT "ACME" FRAMES,  
PLANT COVERS, and PROPAGATING BOXES; also  
for FOXLEY'S PATENT BEADED GARDEN WALL  
BRICKS.

DEANE & CO.'S  
RANGE OF HOUSES.

No. 9.—A very useful range of three-quarter-span houses, divided into three parts, the centre part projecting a ft. more than the ends. It can be varied in form to almost any extent. Designs and estimates for ranges of Houses, including Conservatories, Peach-houses, Vineries, &c., prepared and furnished free.

ESTIMATES.—The prices given are for ERECTING COMPLETE, by our own men, within 15 miles of London Bridge, including building dwarf wall, 2 ft. high, in 9 in. brickwork, at front and ends, two divisions on 4 1/2-in. brickwork, and erecting, painting, and glazing in the best style.

HEATING APPARATUS.—No reliable price can be given for this off-hand, as the heat required in the different divisions varies so much, but estimates will be forwarded when information is obtained as to the purpose for which the various divisions are to be used.

"Gather Honey from Your Flowers."  
NEIGHBOUR'S Celebrated BEEHIVES.  
Silver and Bronze Medals awarded at the International Health Exhibition, 1884, to Geo. Neighbour & Sons.

### NEIGHBOUR'S IMPROVED COTTAGE BEEHIVE,

as originally introduced by them, working three bell-glasses or a tray of sectional supers, is neatly and strongly made of straw; it has three windows in the lower Hive. This Hive will be found to possess many practical advantages, and is more easy of management than any other that has been introduced.

Price .. .. £1 15 0  
Stand for ditto 0 10 6

### NEIGHBOUR'S FIFTEEN SHILLING FRAME-HIVE.

This hive has been designed to supply a want long felt by those who desire a Hive at once tasteful in appearance and moderate in price. The walls are built of straw neatly bound with cane. Ample means for ventilation in summer, and sufficient warmth in winter are thus secured. Nine Frames, of the standard size, fitted with metal ends, and a dummy for reducing the Hive, are enclosed therein, a double quilt to place over the Frames, a case of American one-piece sections for supering, and a substantial

cover of wood, to protect from the weather, are also included. Price, complete, 15s.

Also BAR-FRAME HIVES, from 7s. 6d. to 42s. each.  
"THE APIARY," by ALFRED NEIGHBOUR.  
Price 5s., post-free.

and 149, REGENT STREET, LONDON, W.

Oil Paint no Longer Necessary.  
HILL AND SMITH'S BLACK VARNISH,  
for Preserving Ironwork, Wood, or Stone.  
(Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

#### UNSOLICITED TESTIMONIAL.

"Pierrefield Park, June 21, 1885.—Sir, I have this day forwarded from Chestow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chestow.—I am, Sirs, yours respectfully, WM. COX."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the Kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

### Seed Trade

**TRAVELLER, or to ASSIST in Warehouse,** or at the Desk.—Good references.—Z., J. W. Vickers, 5, Nicholas Lane, E.C.

**HOLLOWAY'S OINTMENT and PILLS.**—Diseases of the Bowels.—A remedy, which has been tested and proved in a thousand different ways, capable of eradicating poisonous taints from Ulcers and healing them up, merits a trial of its capacity for extracting the internal Corruption from the Bowels. On rubbing HOLLOWAY'S OINTMENT repeatedly on the abdomen, a rash appears, and as it thickens the alvine irritability subsides. Acting as a derivative, this Ointment draws to the surface, releases the tender intestines from all acid matters, and prevents Inflammation, Dysentery, and Piles, for which blistering was the old-fashioned, though successful treatment, now from its painfulness fallen into disuse, the discovery of this Ointment having proclaimed a remedy possessing equally derivative, yet perfectly painless, powers.
