From this bed I gathered 12 lb. of Mushrooms on December 25. The bed is 9 feet long and 4 feet wide, and up to the present time (January 28) 200 lb. have been picked from it, some much larger than those sent. In sample No. 2 the produce is very much smaller, the bed having been spawned at 80° Fahr. three days later than the bed above-mentioned. From this bed up to the present only 20 lb. have been gathered, the spawn being quite similar, and the bed equal in size to the other, and in the same Mushroom-house. *Stephen Davis, Enderby Hall, Leicester.*

**Amateur Dealers.**—I am glad to see this subject coming to the front, and I hope it will be thoroughly discussed, and if "discussion" will be of any service to the market garden trade, I for one will throw in my mite towards suppressing the now existing practice of selling surplus produce from private gardens. In many cases I believe it is not the gardener's fault that the produce is sold. I have myself politely objected to my employers on several occasions to sell surplus produce, but have been very quickly told if I did not choose to do so plenty of others would. Now, what are gardeners to do? [Carry out the instructions of their masters.] Most gardeners condemn the practice, yet it is not worth their while to throw themselves out of employment because they object to sell their master's goods. What I should like to see is a law made to compel every nobleman or gentleman keeping gardens as a luxury to take out a £10 license before they could sell any surplus produce, for I believe if they were taxed as market gardeners are they would require us to sell more than we do. Most gardeners, where help is not over-abundant, will say that they have quite enough to do without preparing things for sale, and in large gardens there are generally labourers who would be glad of a few vegetables if to spare, and in some instances their distribution would cause a better feeling between master and man. *A Young Head Gardener.*

**New Potatoes.**—Mr. W. Barrett, of the firm of Messrs. J. & A. Barrett, market gardeners, Leckhampton, Cheltenham, writes as follows:—"It has surprised me that no one has written, either to the *Gardeners' Chronicle* or *Gardeners' Magazine*, a line or two in favour of Midsummer Kidney Potato. With us it was ripe fully a fortnight earlier than Myatt's Ashleaf, with a much heavier crop of sound and handsome tubers. Chancellor has done well with us, handsome, sound, and a very heavy crop: from 1½ lb. we got 5 stones. This fine variety appears to resist the disease well; White Prime Minister, planted alongside of it, and both without manure, were almost all diseased, though it gave an enormous crop. The Dean is a picture to behold, and as to its table quality, on our gravelly soil it is perfection indeed." *R. D.*

**Marguerites as Bedding Plants.**—These plants were grown in the past season with various other plants intermixed, and I found the following combination to give the most satisfactory results, viz., yellow *Marguerite Etoile d'Or*, planted 2 feet apart in a large bed, alternated with *Salvia patens*, and edged with pink *Pelargonium Master Christine*. The Daisy was pegged down till the *Salvia* got well ahead, then all were allowed to grow into a mass, the result being a most charming bed, which remained until very late in the autumn. White *Marguerite*, *Coronaria frutescens*, planted farther apart than the yellow, was mixed with *Lobelia fulgens* Queen Victoria, and edged with *Ageratum Lady Jane*, was a very effective combination. The above can be planted out about the middle of May. The *Salvias* are best propagated from cuttings taken from old roots. Started in a gentle heat early in April they grow very fast, and if struck earlier they are liable to get drawn. Seed is very uncertain in germinating, but cuttings strike easily, and at that time the *Marguerites* may also be struck. The *Lobelia* is hardy, and only needs transplanting; a stock of it is readily raised from seed. *W.*

**Broccoli.**—Those who have to provide a daily supply of vegetables all the year will find Veitch's Self-protecting Broccoli one of the best (if not the best). From the beginning of December up until now we have been cutting fine white heads, and being so well protected it takes a sharp frost to touch them. By making two sowings at intervals of a fortnight, we intend another year to try and prolong the

season of cutting. Being a rather strong growing one it should not be planted too close, the individual heads are not so fine, and if sharp weather should set in, the plants do not stand the frost so well as those that have had plenty of air and light all through the season. *A. H.*

**Sulphur Fumes as an Insecticide.**—The merits of sulphur as an insecticide have been long known, as it has been in use for many years as a remedy against red-spider; but till I applied it for destroying scale and moss on fruit trees, I had never heard of its being burnt for such a purpose, which it may be, with the greatest safety, any time through the winter before the buds break, and it will save all the time and labour many expend in painting over the branches, as sulphur fumes will kill every parasite, and make the bark look bright and clean after. So pleased am I with its effect that we now make a practice of going round the walls and giving the trees a dose, when the air is still, as soon as we have pruned, and not only does the sulphur clear the bark, but it kills the mossy growth on the face of the bricks, and makes them look as if they had been scrubbed, so powerful is the influence of the fumes where they pass up. Having scale on some of our Peach trees in the house we fumigated them, and it is gratifying, now that the shoots are being tied, to find every scale losing its hold, thus showing how satisfactorily the sulphur has done work, which would have taken a man days, or even weeks to accomplish; and even if the trees had been painted the chances are that some portions would have been missed, whereas the sulphur fumes penetrate every crevice, and allow one to start after with a clean bill of health. It is not much sulphur that is required, as a pound will suffice for a large house. The way to use it is to have a little lighted charcoal or red-hot cinders placed in three or four small flower-pots, distributed along the pathways of the house, when equal portions of the sulphur should be thrown in each, and an exit made as quickly as possible, leaving the lights and ventilators all closed till the following morning. I need hardly say that there must not be any plants in the house, except hard-wooded deciduous ones, while the fumigating is going on, or they will present a sorry figure after, as every leaf will shrivel up immediately, for their tissues will perish. *J. Sheppard.*

**Eucharis amazonica.**—When I took charge of these gardens six and a-half years ago I found among other things a few pots of Eucharis; they were in the stove, stood on inverted pots in a bed of cocoa-nut fibre. The latter was not very fresh, and had become very wet, I suppose through the constant use of the syringe. The leaves were small, yellow-looking, and of poor substance. Having had to do with plants in a few good establishments, I thought I was clever enough to get these Eucharis into good condition in six months, and accordingly set to work, and had them carefully cleaned and repotted into well-drained pots of suitable size, putting the flowering bulbs (or rather those I expected to flower) by themselves, and the little ones the same. The soil used was of the best description, and the plants were plunged in a bed of leaves in the Cucumber-house. In course of time I examined the roots, fully expecting to find them running towards the side of the pot, but to my surprise I found they had not made a start, so I left them a little longer, and on looking some days after I found no progress had been made. My next trial was to shake out one of the best-looking pots of bulbs, and thoroughly wash them in clean rain soft water, carefully preserving what few roots there were, and potting singly in soil of various sorts, thinking perhaps some at least would grow. They had every attention in the way of temperature, moisture, ventilation, and shading, indeed every thing that the foreman could do was done to try and save them. I had no fear but they would come right in time, but on again looking at them I found that the lower part of the bulbs was going rotten, the leaves (what few there were) began to get a lot of yellow spots about, and I began to wonder where my Eucharis flowers were coming from for Christmas decoration. As time went on Christmas came, but no Eucharis. I was not pleased with the failure, and thought I would try again. I did try, and failed, tried and failed, till I hadn't a live bulb to try to make livelier; the whole lot died in about two years—never having given us a single

flower for all our labour. Thanks to one of your most able correspondents (who if he reads this will accept my hearty thanks), who is not only a grower and writer, but a giver of good things, we have the best stock of Eucharis it has been my fortune to see for many years, all raised from a pot of clean bulbs carried by Mr. Brown, of the Model Farm, Mill Hill, Hendon, six miles from the station to this place about four years ago. I may add that it is my opinion that too hard forcing has ruined a good many Eucharis. *G. Merritt, The Hoo Gardens, Welwyn.*

— I would recommend all who have plants of the above affected with the so-called disease, to give them a chance to recover. On taking charge of these gardens last April I found about thirty 9 and 8-inch pots of Eucharis in a very unhealthy state, and in reply to my inquiries my predecessor assured me they had produced no flowers for some considerable time. On shaking them out I found the pots full of bulbs, but all more or less covered with the red spot I have heard so much about. I had them thoroughly cleaned, cutting the roots well back, saving every bulb—large and small—selecting three sizes and making in all one hundred 9, 8, and 7-inch pots, thoroughly drained, placing a few crushed bones on the top of crocks, which were covered with good tough fibrous loam. I took special care in preparing the soil, warming and making it moderately dry before using. The compost consisted of two parts good loam, one part peat, a good share of well decomposed cow manure, a little leaf-soil, a plentiful supply of coarse silver-sand, finely broken crocks, with a dash of soot. All was well mixed together, and the bulbs were potted moderately firm, and, with the exception of syringing, I withheld water entirely for a month, placing them on the front stage of a large lean-to house, directly under a Stephanotis trained to the roof, using no plunging material (the temperature ranged from 65°—75° by day and 55°—60° by night). For the first month they made but little progress, only a few sickly-looking leaves covered with the dreaded red spot were seen; but on examination I found they were making some healthy roots. I then thoroughly soaked them, after which they gradually began to improve. I used plentiful supplies of manure-water every third watering. This was made from cow-manure and soot, and occasionally a small quantity of guano was added. Each leaf they made appeared more healthy, and my hopes began to revive. About the middle of August I again withheld the water for a month, after which I saw no reason why they should not produce some flower. I again commenced to water, using plenty of stimulants, and my hopes were not in vain, for I soon observed now and then a spike pushing through, but with slight traces of the spot, and as the flowers expanded were more or less deformed. I have kept them at work since, and each week they have improved, giving a good supply of bloom of good quality. I enclose for your inspection specimens of foliage and bloom from plants that a few months ago were badly diseased. *Edwin Beckett, The Gardens, Aldenham Park, Elstree, Herts.* [Very fine blooms and foliage. *ED.*]

— Notwithstanding all that has appeared in the *Gardeners' Chronicle* for the last few weeks respecting the Eucharis, not one correspondent has given his opinion, or what he thinks might be the cause of its failure. All give their experience and treatment of the plant, and some conclude that it is subject to a disease unknown to gardeners. As my plants for two years previous to 1884 failed in a similar manner as described by several correspondents, I am induced to give what I think is the chief cause. Both years in question I examined the plants in the autumn, which was the time they began to look sickly, and both times I found most of the roots and the soil in a saturated condition. The thought at once struck me that it was owing to too much water. The beginning of last March I turned the whole of the plants out of the pots, at the same time shaking every particle of soil from the few remaining roots. I then sized the bulbs and potted in pots of different sizes, the number of bulbs in a pot according to its size—the compost being two parts fibry loam, one part peat, a small quantity of decayed cowdung, with a sprinkling of charcoal and sand. The plants were then placed in a day temperature of 70° to 75°, according to the weather, and 10° lower at night. Strict injunctions were given to use the watering-pot sparingly—in fact, to err rather on the side of dryness than otherwise. The plants soon

commenced to make fresh roots in the new soil, and, pushing up a new growth, soon began to put on a healthy appearance. I narrowly watched my plants, likewise the watering, throughout the year, and now, instead of the miserable-looking plants of the previous two winters, they are in a healthy condition, with large leaves, and giving me a good supply of fine flowers. The treatment of the plants being precisely the same, with the exception of watering, as other years, I feel fully convinced that too much water was the cause of the failure. Again, "W. B." says in both of his communications, "that his plants were in a healthy condition until removed to a house, and under a Stephanotis, where they were saturated from the syringe, and watered too." To me this is further proof that too much water is the cause of the so-called disease. *H. F.*

**Cucumber Growing.**—According to Mr. Bishop's wish, p. 123, I have again consulted the article of Mr. Longshaw, p. 726, where (according to my understanding) his primary object is to know if any one has proved himself equally successful, or more so, as a grower. Secondly, and very much secondly, the return per plant. Surely Mr. B. does not for one moment seriously contend that the return per plant will be accepted by your readers, as valuable information, unless gauged by space occupied. Mr. L. gives the measurement with number of plants and returns. If his object was to know only the return per plant, without space occupied, then why so exact as to figures? And in looking at Mr. B.'s reply, p. 759, I cannot help thinking it was given to show his success as a grower, based on measurements. He says Mr. L.'s "enormous quantity" of Cucumbers and "plants" must be taken into consideration with "the quantity of glass," and then gives your readers the length and span of his little house with return of his twenty-four plants, overlooking, no doubt, result of figures worked out. Cucumber growing in a vinery is quite outside the present issue, and only adopted to utilise space until demanded for the Vines altogether. There may be two classes of successful growers, but first and foremost would be those for *£ s. d.*, as Mr. L. undoubtedly is, and class 2 may be termed growers for exhibition. Cucumber plants, like Grape Vines, can be grown to cover areas according to fancy, but I still contend the question most affecting growers is the return per square yard. Mr. Smith, at p. 791, gives a return per plant in a house 9 feet by 11. If his figures are correct I imagine it is the greatest success that ever was or that ever will be. But perhaps his accuracy in figures was lost in the anxiety to bring under notice his pet variety. While on this topic I would call the attention of your readers to the article (p. 79) "Culture of Cucumbers." Mr. Ward recommends a house running east and west, whereby I think he catches the full force of the sun when not so much wanted, and loses its good effect morning and evening. Light and heat are equally needed, and the great variations of the sun's action would be reduced by running houses (about) north and south. *F. B. T.*

**Celeriac.**—Having seen a paragraph in the *Gardeners' Chronicle* (p. 154) with reference to Celeriac, its cultivation and its uses, "M. W." in his remarks seems to infer that this vegetable is confined chiefly to the Continent, and is there used in soups, salads, &c. I beg to inform "M. W." that this vegetable is not confined altogether to the countries he names, as I have grown it here many years as a vegetable. It is prized here as being one of the best winter vegetables, and is sent to the dinner-table served up in white sauce, and in other ways. *W. Gallop.* [It is greatly to be regretted that it is not more used in this country, as it is very easily grown, can be readily stored away in large quantities, and is available for use for the greater part of the year. *ED.*]

**Filberts in Flower.**—The somewhat sharp frosts followed by rain experienced during the last days of the month of January just passed, accompanied with a great change of temperature, have shown how exceptionally precocious are the buds upon trees generally. One short week ago the catkins upon Filberts were short, hard-rolled, and colourless, albeit very abundant; to-day (January 31) they have all enlarged, are a beautiful golden colour, diffusing their pollen abroad; and the female flowers, bright, shining scarlet, though so minute, are also abundantly displayed. *William Earley, Ilford.*

## Florists' Flowers.

### SEASONABLE NOTES ON HARDY FLORISTS' FLOWERS: THE AURICULA.

ABOUT the first week in February the whole collection should be carefully looked over. It is the time for surface-dressing the plants. This used to be considered an important part of their culture, and a large portion of the soil was removed, its place being taken by some very rich compost. I have often observed when potting the plants as late as May or June that very few roots have grown into this top-dressing; indeed, at the time they are in flower no new roots have worked into it. Acting on the assumption that surface-dressing is unnecessary, I have scarcely done it at all, and the plants have progressed quite as well as those surface-dressed. This is perhaps the best time for removing off-sets. If they are carefully potted, one off-set in the centre of a small thumb-pot, in fine sandy soil, they speedily form roots, and soon grow into nice little plants, which will, under good culture, form flowering specimens for next year. This is also a very good opportunity to remove greenfly by brushing it off, as each plant requires to be handled and examined at any rate. Those who intend to exhibit should remove the early flowering varieties, such as Pizarro, Acme, Glory, &c., to a frame behind a north wall. The late kinds, such as Silvia, John Simonite, Richard Headley, &c., must be placed in the warmest position in the Auricula-house. After this time it is better not to allow the plants to get frozen. The hot-water pipes will keep out the frost in the Auricula-house, and the frames in severe weather must be double matted.

### THE CARNATION AND PICOTEE.

In a month the show varieties should be repotted. They are now in large and small 60-sized pots; from these they are transferred into 7, 8, or 9-inch pots. Two plants should be placed in the 8 and 9-inch pots, and one in the 7-inch ones. The potting soil ought to be prepared at least a month before using it. If it can be prepared two or three months previously it is all the better, as the manure mixed with the soil becomes so much more thoroughly incorporated. In potting press the compost in rather firmly, but I do not care, as some do, to ram it in with a stick. When the plants are potted I take them back, and place them in frames until well established. A fourth part leaf-mould and as much decayed stable-manure is an excellent potting soil when mixed with twice its bulk of good turfy loam. The plants suffer from the attacks of greenfly, but no other insect pests seem to trouble them at this season. It is now quite time to see to the propagation of the perpetual flowering kinds by cuttings taken off and rooted in a little bottom-heat; they succeed in frames, or, better still, in a propagating-house. If they are put into a hot-bed the moist heat will keep them fresh until roots are formed. If they are to be rooted in a forcing-house it is a good plan to lay a square of glass over them—it is readily supported by the labels in the pots; the object of this is to keep the moisture about the cuttings; if they are allowed to dry up much injury is caused to them, and many will die. They will form roots in two or three weeks, and should at once be potted separately in small pots. The old plants are still producing a few flowers where they are stimulated by a little heat. The seedlings planted out in beds do not seem to require any attention, except to keep the ground quite free from weeds.

### THE GLADIOLUS.

If the weather is fine plant out the first batch of bulbs to flower early. The seedling bulbs (corms) may all be planted out at this time. If they are the produce of seed sown about the end of March or early in April, the corms will vary in size from a Pea to a Hazel-nut. By planting them out early, they have a better opportunity to form strong flowering plants by the flowering season in August. A seedling corm, not larger than a Marrow Pea, will produce, by the end of August a flowering plant 3 or 4 feet high. Draw drills for them about the same depth as would be required for Peas; place some sand in the bottom of the drill. Plant the seedlings 6 inches apart, drop some sand over each, and fill up the drill

with good light sandy loam. Some of the corms of large size, named kinds, that may be starting to grow, may be potted singly in 4 and 5-inch pots, the pots to be plunged in frames up to the rims. These should be planted out in the open ground in April, unless it is intended to flower them in pots; if the latter, they must be shifted into 6 and 7-inch pots. Ground on which Gladioli have to be grown should be well worked, fork it over frequently when the surface is rather dry. *J. Douglas, Great Gearies.*

## Notices of Books.

**Ye Narcissus or Daffodil Flowere**, containing hys Historie and Culture, &c.; with a Complete Liste of all the Species and Varieties known to Englyshe Amateurs; Illustrated with Wood Engravings, and to be sold by Barre & Sonne over in King Street, Nos. 12 and 13, in the Parish of Saint Paul, in ye Convent Garden, nigh to ye Strande, Westminster.

Under this somewhat affected imitation of antique mode of speech, betraying at once its unreality by the mention of species and varieties, and its use of words of the nineteenth century, we have a reprint of Mr. Burbidge's lecture on the Narcissus, with additions. This forms a preface to Mr. Barr's "Supplementary Catalogue," itself an expansion of the catalogue published under the auspices of the Daffodil Conference. The varieties are grouped under the sections Corbularia, Ajax, Ganymedes, Queltia, Eu-Narcissus, Aurelia. The names adopted are those sanctioned by the Daffodil Conference, which did good work, and would have done better still by expunging all Latin names except those representing the original wild types. Numerous small woodcuts illustrate the principal types.

Thanks in no stinted measure to the efforts and devotion of Mr. Barr the public taste for these elegant flowers is likely to increase, and the consequent utility of this catalogue will increase. In the coming spring we are sure to have abundant displays of these charming flowers, and the success of the last Daffodil Conference was such that a second is proposed. "Ye Narcissus" is coming to the fore, and those who would keep pace with his march must be posted in the information contained in this little treatise, which, we must add, is not a trade list.

### The Gardeners' Year Book. (171, Fleet Street.)

This very useful annual enters upon the second quarter century of its existence with every sign of healthy maturity. In addition to the usual calendar matter, tables, &c., we find a detailed catalogue of the new plants of the year, articles on various diseases of plants, lists of select fruits, flowers, and vegetables. The woodcut illustrations add but little to the value of the book.

### Student's Elements of Geology. By Sir Charles Lyell, Bart. 4th edition. By P. Martin Duncan. (Murray.)

This admirable little handbook to practical geology has been revised and edited by Professor Martin Duncan in such a manner that while the old has been respected much has been added to bring the work up to date. In an appendix is a descriptive list of the principal minerals, the character of which, however, it is impossible to learn from books; and there is a table of all the families of animals and plants found in a fossil state in Britain, with indications of their relative abundance in the various strata. No better treatise for students' use has been published.

## Obituary.

### PROF. BENJAMIN SILLIMAN.

PROF. BENJAMIN SILLIMAN, of Yale College, died on January 14. Prof. Silliman was the son of Prof. Benjamin Silliman, whom Edward Everett styled the "Nestor of American science." Born on December 4, 1816, at New Haven, where his father then resided as Professor of Chemistry in Yale College—a chair afterwards filled by the son—he graduated at Yale College at the age of twenty-one. Prof. Silliman was for many years Secretary of the American Association for the Advancement of Science, and, as such, edited the annual report of its proceedings. He contributed many papers to scientific associations, and was a most acceptable lecturer in his special line. He has passed away in his sixty-ninth year.

## The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, FEBRUARY 4, 1885.

MONTH AND DAY.	BAROMETER.		TEMPERATURE OF THE AIR.				HYGROMETRICAL DEDUCTIONS FROM GLAISHER'S TABLES 6th Edition.		WIND.	RAINFALL.

Jan. 29.—Dull day and night, rain in evening.

30.—Rain falling at 9 A.M., dull day and night.

31.—Heavy rain falling at times, dull day and night, thunder and lightning at 7 P.M.

Feb. 1.—Dull morning, rain till 11 A.M. Fine afternoon, rain from 8 P.M.

2.—Fine morning, dull afternoon and night.

3.—Fine morning, sun shining, dull day and night, rain falling at 5 P.M.

4.—Very fine morning, dull afternoon and night, rain in evening.

LONDON: Atmospheric Pressure.—During the week ending January 31, the reading of the barometer at the level of the sea decreased from 30.17 inches at the beginning of the week to 29.83 inches by 1 P.M. on the 27th, increased to 29.88 inches by 9 A.M. on the 28th, decreased to 29.25 inches by 5 P.M. on the 30th, increased to 29.32 inches by 9 A.M. on the 31st, and was 29.07 inches by the end of the week.

The mean reading of the barometer for the week was 29.68 inches, being 0.42 inch lower than last week, and 0.26 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 52°, on the 29th; the highest on the 25th was 40°. The mean of the seven high day temperatures was 47° 3.

The lowest temperature was 25° 9, on January 25; on the 30th the lowest was 43° 5. The mean of the seven low night temperatures was 35° 1.

The greatest range of temperature in one day was 16°, on the 26th; the smallest was 6° 5, on the 30th. The mean of the seven daily ranges was 12° 2.

The mean temperatures were—on the 25th, 32° 9; on the 26th, 36° 7; on the 27th, 44° 3; on the 28th, 43° 6; on the 29th, 46° 2; on the 30th, 47° 1; on the 31st, 42° 3; of these the 25th and 26th were below their averages by 4° 9 and 1° 2, the rest were above by 6° 2, 5° 4, 7° 9, 8° 7, and 3° 8 respectively.

The mean temperature of the week was 41° 9, being 10° 1 higher than last week, and 3° 6 below the average of the week.

The highest reading of a thermometer with black-

ened bulb in vacuo placed in the full rays of the sun was 89°. The mean of the seven readings was 69.9.

The lowest reading of a minimum thermometer with its bulb placed on grass was 19°, on the 26th. The mean of the seven readings was 28°.1.

**Rain.**—Rain fell on five days, to the amount of 0.44 inch, of which 0.29 inch fell on the 31st.

**ENGLAND: Temperature.**—During the week ending January 31 the highest temperatures were 56°, at Leeds, 55° at Cambridge, 54° at Liverpool; the highest at Brighton was 48°, at Wolverhampton 51°.2, at Bolton 51°.3. The general mean was 52°.9.

The lowest temperatures were 23°.2, at Cambridge, 25°.9 at Blackheath, at Wolverhampton 26°.2; the lowest at Truro, 44°, at Plymouth 42°.5, at Bristol 34°. The general mean was 30°.9.

The greatest ranges were 31°.8, at Cambridge, 28° at Leeds, 26°.1 at Blackheath; the smallest ranges were 9°.5, at Plymouth, 10° at Truro; 16°.1 at Brighton. The general mean was 22°.

The mean of the seven high day temperatures was highest at Truro, 52°, at Plymouth 50°.4; and was lowest at Wolverhampton, 45°.5, at Brighton and Sunderland 46°. The general mean was 47°.8.

The mean of the seven low night temperatures was highest at Truro, 46°.6, at Plymouth 45°.7, at Bristol 42°.2; and was lowest at Blackheath, 35°.1, at Wolverhampton 36°.6, at Bolton 36°.8. The general mean was 39°.3.

The mean daily range was greatest at Blackheath, 12°.2, at Cambridge 11°.3, at Bolton 10°; and was least at Plymouth, 4°.7, at Truro 5°.4, at Brighton 6°.2. The general mean was 8°.5.

The mean temperature was highest at Truro, 49°, at Plymouth 47°.8, at Bristol 45°.8; and was lowest at Wolverhampton, 40°.7, at Sunderland 41°.1, and at Bolton 41°.5. The general mean was 43°.3.

**Rain.**—The largest falls were 1.64 inch at Bolton, 1.50 inch at Bolton, 1.42 inch at Truro; the smallest falls were 0.39 inch at Sunderland, 0.44 inch at Blackheath, 0.49 inch at Cambridge. The general mean fall was 0.91 inch.

**SCOTLAND: Temperature.**—During the week ending January 31, the highest temperature was 52°.3, at Leith; at Perth the highest was 45°.8. The general mean was 49°.1.

The lowest temperature in the week was 30°, at Perth; at Aberdeen the lowest temperature was 34°.2. The general mean was 31°.9.

The mean temperature was highest at Leith and Paisley, 42°.2; and lowest at Dundee, 38°.9. The general mean was 41°.

**Rain.**—The largest fall was 3.85 inches, at Greenock; the smallest fall was 0.46 inch, at Aberdeen. The general mean was 1.21 inch.

JAMES GLAISHER, F.R.S.

**SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE** in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, February 2, 1885; issued by the Meteorological Office, 116, Victoria Street, London, S.W.:—The weather has been in a very unsettled and rainy condition over the whole kingdom. Densely clouded skies have been reported generally, but in most places—especially in the west and south-west—there have been a few brief intervals of warm sunshine. Thunder and lightning were experienced over our southern counties late on January 31, and again at some of our western stations during the evening of February 2.

The temperature has been much higher than for many weeks past. Over eastern, southern, and central England it has exceeded the normal value by 7°, in Ireland 3°, and in Scotland from 2° to 4°. The maxima, which were recorded either on January 29 or February 2, varied from 54° to 56° over Ireland and the greater part of England to 51° in "Scotland, W.," and 47° in "Scotland, N." The minima, which were recorded at most stations on the first day of the period, ranged from 31° in "Scotland, E." and "England, E.," to 37° in "England, S.," and "England, S.W.," and to 40° in the "Channel Islands."

The rainfall has been a little less than the mean in the north and east of Scotland, but more elsewhere, the excess over central and southern England being very considerable.

Bright sunshine values show a great deficiency in

nearly all districts, the percentages of the possible duration varying from between 4 and 11 over Great Britain to 22 in "Ireland, S.," and 28 in "Ireland, N."

**Depressions observed.**—During the whole of this period the distribution of pressure over north-western Europe has been cyclonic, the barometer being highest over France, with depressions travelling northwards or north-north-eastwards along our western and north-western coasts. Some of these disturbances were unusually deep, the barometer in the centre of that of January 31 showing a reading of about 28.3 inches. Strong southerly to south-westerly winds consequently prevailed over our islands, and on several occasions, especially in the west, they reached the force of a moderate to strong gale.

### Answers to Correspondents.

**BOOK.**—*Wilmet's Most Delightful Voyage in the World*; published by Richards, Glanville & Co., 114, Fenchurch Street, E.C.

**CHIMNEY.**—*J. S. B.* The most simple and efficacious method you could adopt to do away with the nuisance you complain of would be to reverse the pipes and have the joints filled with good cement (Roman, if possible), or red-lead and spun-yarn tightly caulked; there would then be no possibility of the nuisance continuing.

**CHRYSANTHEMUM.**—*A. J. B.* *Chrysanthemum frutescens* Comtesse de Chambord; colour yellow.

**GUMMING OF CUCUMBERS.**—*B. D. E.* Various remedies are advocated for arresting the progress of "gumming," the following have proved the most successful, viz.:—Carefully scrape away the affected part, being careful to injure the woody part of the stem as little as possible, then place some clean, sharp sand round the part scraped, and over that some nice fresh turf; and if the disease is not gone too far, the plant will emit fresh roots, and "callus" over. Dusting with powdered charcoal, or flowers of sulphur, has also been tried with varied success.

**EDELWEISS.**—*J. U.* This was figured in our columns, and has repeatedly been noticed in our pages by M. Corveon and others.

**GARDEN PLANS.**—*A Subscriber.* Any good landscape gardener would furnish you with designs for a garden. If you require merely a design for flower-beds, a nurseryman in your own locality would supply them.

**GRAPES.**—*W. T.* It is Mrs. Pince's Black Muscat, not so highly coloured nor so large as it should be under culture. There is no better late Grape grown. Shanking is due to a variety of causes; either the foliage has been injured, or in some way prevented from performing its proper functions, or the roots have got into a bad condition.

**INTRODUCTION OF NEW PLANTS.**—*A. V. G.* *Amasonia punicea*, J. Veitch & Sons; *Aphelandra Margaritacea*, M. Linden, Ghent; *Clerodendron illustre*, J. Veitch & Sons.

**MALFORMED CINERARIAS.**—*W. B. S.* A frequent occurrence, and not confined to Cinerarias alone; the flowers that are produced later on will no doubt come more perfect; it seems to be caused in most instances by excessive vigour.

**NAMES OF PLANTS.**—*F. L.* *Cœlogyne cristata*.—*G. H.* Berries of common Juniper.—*J. H. H.* 1, a Gesnera, not recognised; 2, *Franciscæa laurifolia*; 3, *Amaryllis reticulata*; 4, *Xylophylla latifolia*; 5, *Reidia glaucescens*.—*A. J.* *Cypripedium Spiciferum* magnificent, but not a good sample of the variety.—*A. F. G.* The *Odontoglossum cirrosus* was a good specimen of the species, with a broad distinctive labellum. The other flower is *Epidendrum ciliolare*.

**NEWSPAPER, "PLANTERS' GAZETTE."**—*G. S.* 6, Little Tower Street, E.C.

**OCHEA.**—*M. H.* This name belongs to a species of *Hibiscus* (*H. esculentus*), or *Abelmoschus esculentus*, growing in Egypt, and many parts of India, and the tropics generally. The long pods, or seed-vessels, contain an abundance of mucilage, whence the pods are used to thicken soups and in curries, &c.

**PEACH-BUDS FALLING OFF.**—*Constant Reader.* The shoots show a generally diseased condition of the tree, but whether it can be traced to old age, or to persistent gumming, or to something being wrong with the roots we cannot say. As young trees are growing close by in a healthy state we should think the tree is unhealthy, and would be better destroyed.

**POPULUS TREMULA.**—*G. A. R.* Yes, it is indigenous to Britain. See our answer in Notices to Correspondents last week.

**SEEDLING APPLES.**—*J. L. B. J.* A very fine looking fruit, and of good quality.

**STRAWBERRY LEAVES.**—*B.* The brown spots are due to the presence of a minute fungus (*Sigmæa fragariae*). No remedy is known, but sometimes a change of soil will cause the disappearance of the malady.

**TUFA.**—*F. H.* We cannot give the name of any Tufa quarry. See our advertising columns.

**WOODLICE.**—*S. B. T.* Going suddenly with a strong light into the dark places frequented by them, and

pouring boiling water over them from a long-spouted can, is a remedy as good as any. Carbolic acid and chloride of lime are very obnoxious to some insects that possess acute olfactory powers. Perhaps these might answer if sprinkled about.

## SEEDS.

LONDON: Feb. 4.—There was but little business doing on the seed market to-day, the attendance being small. The demand for field seeds, usual at this season of the year, still hangs fire; meantime holders, considering the extremely moderate rates current, remain firm. All descriptions of seeds are consequently this week without variation in value. Spring Tares, being in short supply, more money is asked for same. There is a very dragging sale for bird seeds, at Monday's currencies. Feeding Linseed continues steady. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

## CORN.

At Mark Lane on Monday prices were lower all round. The sales of both English and foreign Wheat showed 1s. to 2s. decline for the week, and at this reduction transactions were of merely retail extent. Flour was quoted 1s. per sack lower, and equally difficult to sell. Malting Barley remained quoted nominally the same as on the preceding Monday, grinding sorts 3d. to 6d. lower. Flat Maize was 7d. down, Oats on the week receded 3d. to 6d., Beans and Peas went down 6d. per quarter.—On Wednesday there was very little enquiry for either English or foreign Wheat. Flour continued dull. Barley, Beans, and Peas were unaltered in value, but there was only a retail trade passing. Rather easier rates were accepted for flat Maize ex ship, whilst Oats were nominally unaltered.—Average prices of corn for the week ending Jan. 31:—Wheat, 34s. 6d.; Barley, 32s. 1d.; Oats, 20s. 6d. For the corresponding period last year:—Wheat, 37s. 9d.; Barley, 32s. 6d.; Oats, 19s. 6d.

## CATTLE.

At Copenhagen Fields on Monday increased depression was experienced in every department. On prime cattle prices gave way 4d. per 8 lb., and then sales were difficult to close. Sheep met an equally dull and irregular sale at 2d., in some case 4d. reduction. Quotations:—Beasts, 3s. 8d. to 4s. 6d., and 4s. 10d. to 5s. 4d.; calves, 3s. 8d. to 5s. 8d.; sheep, 4s. 4d. to 5s., and 5s. 2d. to 5s. 6d.; pigs, 3s. 8d. to 4s. 4d.—Thursday's cattle trade was a shade better than on Monday. Both beasts and sheep were held for more money; calves were quiet and pigs dull.

## HAY.

Tuesday's Whitechapel Market report states that there was a very dull trade, with smaller supplies. Quotations:—Clover, prime, 85s. to 102s. 6d.; inferior, 46s. to 73s.; prime second cut, 85s. to 105s.; hay, prime, 76s. to 90s.; inferior, 30s. to 65s.; and straw, 22s. to 35s. per load.—On Thursday there was a short supply and trade very quiet with prices unaltered.—Cumberland Market quotations:—Clover, best, 90s. to 105s.; inferior, 60s. to 84s.; meadow hay, best, 84s. to 88s.; inferior, 60s. to 80s.; and straw, 29s. to 34s. per load.

## POTATOS.

The Borough and Spitalfields Markets reports state that there was a good supply and steady trade for best samples. Quotations:—Scotch Regents, 90s. to 100s.; Kent ditto, 70s. to 80s.; Champions, 50s. to 60s.; Magnum Bonums, 60s. to 80s.; and Victorias, 70s. to 90s. per ton.

## COALS.

The following are the prices current at market during the week:—Broomhill West Hartley, 14s. 6d.; Ravensworth West Hartley, 14s. 9d.; East Wylam, 15s. 6d.; Walls End—Tyne (unscreened), 11s. 3d.; Hetton, 17s.; Hetton Lyons, 15s.; Lambton, 16s. 6d.; Wear, 15s.; Caradoc, 17s.; Hartlepool, 16s.; East Hartlepool, 16s. 3d.; South Hartlepool, 15s. 3d.; Tees, 17s.; Harton, 15s.

**Government Stock.**—Consols closed on Monday at 100 to 100½ for delivery, and 100½ to 100¾ for the account. On Tuesday prices for delivery were as on the preceding day, and 100½ to 100¾ for the account. Wednesday's closing figures were 100½ to 100¾ for delivery, and 100½ to 100¾ for the account. The final figures of Thursday were, 99½ to 100 for delivery, and 100 to 100½ for the account.

## HIGH-CLASS VEGETABLES.

## WEBBS' WOODFIELD MELON.

THE BEST GREEN-FLESHED MELON  
1s. 6d. and 2s. 6d. per packet, Post free.

From Mr. JOHN McKINLAY, *Gardener to the Right Hon. Lord Foley*.—"Your Woodfield Melon is a free setter, thin-skinned, beautifully netted, and of delicious flavour."

From Mr. E. SIMPSON, *Gardener to the Right Hon. Lord Wrottesley*.—"Webbs' Woodfield Melon is an excellent sort; thick flesh, of first-rate flavour, and good setter; very desirable."

## WEBBS' EMPEROR CABBAGE.

The BEST CABBAGE in CULTIVATION  
6d. and 1s. per packet, Post-free.

Extract from the "*Journal of Horticulture*," of May 24.—"Our largest piece of Spring Cabbage measures 70 feet x 50 feet, and here we have many sorts growing—the best of all these at the present time is Webbs' Emperor. J. MUIR."

## SAVE 20 PER CENT.

Our exceptional position as the largest Seed Growers in the Kingdom enables us to offer Pure Vegetable and Flower Seeds at very moderate prices, which, on comparison, will be found some twenty per cent. lower than those of other leading Houses.

## WEBBS' SPRING CATALOGUE.

Circulars, with full particulars, on application to

THE LIVERPOOL HORTICULTURAL CO.

(JOHN COWAN), LIMITED,

THE VINEYARD, GARSTON.

## SHARPE'S EARLY PARAGON PEA.

THE EARLIEST WRINKLED MARROW.

SEALED PACKETS.

One Pint 2s. 6d.; Half-pint 1s. 6d. each.

SEALED PACKETS.

THE EARLIEST WRINKLED MARROW.

First-class Certificate Royal Horticultural Society, 1884.

PARAGON shows in many respects a great improvement upon any variety at present in the trade. It is a Blue Wrinkled Marrow of fine flavour; height from 3 to 4 feet. The pods are produced two and three together in such abundance as to almost conceal the foliage. They are of an unusual size, broad and thick backed, containing from twelve to fourteen immense Peas packed in a double row as shown in the illustration.

Paragon is the earliest of the large Wrinkled Marrows, being ready before Prize-taker. It is very hardy, and will stand earlier sowing than any Pea of its class. It is most valuable for succession crops as it is not liable to mildew, and a constant supply of Peas for four months can be obtained from this one variety.

TRADE PRICE PER BUSHEL ON APPLICATION.

CHARLES SHARPE &amp; CO., SEED MERCHANTS, SLEAFORD.

CONTRACTORS TO HER MAJESTY'S WAR DEPARTMENT.

## IMPROVED VINE ROD FASTENER.

PATENT.  
Vine Rods are now attached to the wire or lowered to be pruned, in a few moments. The fastener is always ready, and being made of strong material will last several years. Many experienced Vine growers have already adopted it, and expressed their entire approval of the result. Box containing 6 dozen, price 5s.

Sold by R. H. and J. PEARSON, 141 and 143 High Street, Notting Hill, W.; and J. W. DART, St. Aubin's, Jersey.

## THE LOUGHBOROUGH GREENHOUSE HOT-WATER APPARATUS.

Price, as engraving, with Boiler, open feed syphon, 12 ft. of 4-inch hot-water pipe, and patent joints, complete, £4 4s. Delivered free to any Station. Discount for Cash.

This is the simplest, cheapest, and most powerful apparatus made. It requires no brick setting, no stovehole, and no hot-water filter for fixing. The Boiler stands in the Greenhouse, the front only being outside and flush with the outer wall, so that the whole of the heat from the boiler itself is utilised.

It burns over 12 hours without attention, at a nominal cost. "Loughborough" Boilers to heat up to 650 ft. of 4-in. pipe, with hot-water pipe, joints, &c., always in stock.

COST OF APPARATUS FOR HOUSES OF ANY SIZE ON APPLICATION.

The measurement of Greenhouse being given, every apparatus is delivered with pipes cut and fitted ready for fixing.

Illustrated LIST with full particulars, post-free.

NOTE.—All genuine Boilers have "The Loughborough Boiler" cast on.

**HILL AND SMITH'S BLACK VARNISH,**  
for Preserving Ironwork, Wood, or Stone.  
(Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

#### UNSOLICITED TESTIMONIAL.

"Pierrefield Park, June 21, 1876.—Sirs.—I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chepstow.—I am, Sirs, yours respectfully, WM. COX."

**CAUTION.**—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the Kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large illustrated CATALOGUE of Fencing Hurdles, Field and Entrance Gates, &c., sent free on application to

HILL AND SMITH, Brierley Hill Ironworks, Staffordshire; 118, Queen Victoria Street, London, E.C.; and 196, St. Vincent Street, Glasgow.

Take Notice of

**WOOD**

& MILTONS

PATENT.

The Future Boiler for Nurseries and Gardeners,  
and Heating any amount of 4-inch Pipe up to 15,000 feet.

Advantages over all other Inventions.—The greatest amount of heat from less fuel. As seen by diagrams, some tubes are in the very centre of the fire and others surrounded by fire. This Boiler is a combination of tubes, to meet the requirements of the times.

## TO BE DISPOSED OF, A WHOLESALE

and RETAIL SEED BUSINESS. A splendid going concern. One of the finest in existence, doing a large and profitable trade. An unusual opportunity.

Apply (by letter only) to Messrs. PROTHEROE AND MORRIS, 67 and 68, Cheapside, London, E.C.

**WANTED, a PARTNER, or to PURCHASE** one of the best concerns in the Trade, enjoying a fine and rapidly-increasing business. An altogether exceptional opportunity for a capitalist. Amount required from an Income, not less than £5000.

Arrangements could probably be made to retain the services of the Managers and Foremen.—Apply to Messrs. PROTHEROE AND MORRIS, Auctioneers, 67 and 68, Cheapside, City, E.C.

**WANTED, as HEAD WORKING** GARDENER, an active man, not under 35. Must thoroughly understand Kitchen Gardening, Vines, and Greenhouses. No Early Forcing. Three men kept. Wages £1 1s. per week, with house, coals, and gas. Family must be small.—Sir W. PARKER, Long Melford, Suffolk.

**WANTED, a married man, as GARDENER.**—Able to milk and look after Cows, Poultry, &c., and be generally useful. No glass. One accustomed to Market Gardening and Foremen who could undertake Dairy preferred.—Address: with full particulars as to age, wages, &c., Mr. CLARKE, South Wales Colliery Co., Old Dock, Newport, Monmouthshire.

**WANTED, GARDENER AND PLAIN COOK,** Man and Wife, as Indoor Servants. Must have had Vines and Orchard-house Trees under his care, understanding Cultivation of Fruits, Flowers and Vegetables. Character with ability indispensable.—State wages required, with particulars of last situation, to HORTUS, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**WANTED, a FOREMAN and PROPAGATOR,** used to growing Soft-Wooded Plants for Market preferred.—J. SWAFFIELD, Exotic Nurseries, Bournemouth.

**WANTED, IMMEDIATELY, a steady** respectable young man, as FOREMAN—one who understands Stove and Greenhouse Plants, Vines, Peaches, Cucumbers, Melons, and Bedding Plants.—Apply by letter to THOS. HEDLEY, The Gardens, Putteridge Park, Luton, Beds.

**WANTED, a PROPAGATOR and GROWER** of Roses and Dahlias for Market and Exhibition, with knowledge of Herbaceous Plants. Wages, 20s. weekly, with cottage.—R. H. VERTEGANS, Chad Valley Nurseries, Edgbaston.

**WANTED, a GROWER** for Heaths, Genistas, Solanums, &c.—Good references required. State wages.—FRANCIS R. KINGHORN, Nurseryman, Richmond, S.W.

**WANTED, a Gentleman** to take the entire CHARGE of the COUNTING-HOUSE of a leading Nursery establishment, with a view to PARTNERSHIP or PURCHASE. Must be able to invest in the business a considerable amount of cash. Apply to Messrs. PROTHEROE AND MORRIS, 67 and 68, Cheapside, E.C.

## WANT PLACES.

**POSTAL ORDERS.**—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

**R. B. LAIRD AND SONS** (successors to the late Firm of DOWNIE & LAIRD) can at present recommend with every confidence several first-rate SCOTCH GARDENERS, whose character and abilities may be thoroughly depended upon, either for Large Establishments or Single-handed Situations; also FOREMEN, UNDER GARDENERS, and FARM BAILIFFS.—17, Frederick Street, Edinburgh.

**B. S. WILLIAMS** begs to intimate that he has at present in the Nursery and upon his Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Holloway, N.

**SCOTCH GARDENERS.**—JOHN DOWNIE, Seedsman, 144, Princes Street, Edinburgh, has at present on his list a number of SCOTCH GARDENERS, waiting re-engagements, at wages ranging from £50 to £100 per annum, and he will be pleased to supply full particulars to any Nobleman or Gentleman requiring a trustworthy and competent Gardener.

**RICHARD SMITH AND CO.** beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

**Journeyman and Foreman, Scotch.** JOHN DOWNIE, SEEDSMAN, 144, Princes Street, Edinburgh, has at present on his Books a number of first-rate Young Men who wish to go to England.—Particulars on application.

**THE LIVERPOOL HORTICULTURAL CO.** (John Cowan), Limited, The Vineyard and Nurseries, Garston, can recommend a first-class GARDENER to any Nobleman or Gentleman requiring the services of such.

**TO LANDED PROPRIETORS, &c.—A. MCINTYRE** (late of Victoria Park) is now at liberty to undertake Formation and Planting of New Garden and Park Grounds, and Remodelling existing Gardens. Plans prepared. 115, Listeria Park, Stamford Hill, N.

**GARDENER (HEAD),** where more are kept.—One child, age 13. Five and a half years' character. Employer's lease expired.—Edstone Hall, Henley-in-Arden.

**GARDENER (HEAD),** where one or two hands are kept.—Four years in last situation. Good character.—GARDENER, M. Hartley, Esq., Larkfield, Chesham, Monmouthshire.

**GARDENER (HEAD).**—Age 32, married; experienced in Stove and Greenhouse Plants, Forcing, Fruits, Flowers, and Vegetables, Kitchen and Flower Gardening.—JAS. HOWELL, Lodge, Thurcroft Hall, Rotherham.

**GARDENER (HEAD).**—Age 39, married; abstainer. Twenty years' thorough practical experience in all branches including the Cultivation of Orchids.—H. NUNN, 33, Noyra Road, Upper Tooting, S.W.

**GARDENER (HEAD).**—Age 28; thirteen years' practical experience in Early and Late Forcing, Stove and Greenhouse Plants, Orchids, House Decorations, and Flower and Kitchen Gardening. Can be well recommended.—J. SMITH, 20, Stanford Road, King's Road, Chelsea, S.W.

#### GRATEFUL-COMFORTING.

### EPPS'S COCOA.

#### BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." *Civil Servant's Gazette*.

Made simply with boiling water or milk. Sold only in Packets, labelled thus—  
**JAMES EPPS & CO., Homoeopathic Chemists, London.**

#### HOLLOWAY'S OINTMENT and PILLS.

All diseases springing from bad blood, malarious districts, or infected atmosphere, can be cured by these noble remedies. Fever, ague, influenza, bronchitis, quinsy, stomach complaints, and bilious disorders are easily met and readily conquered by these unrivalled medicaments. Both act harmoniously in preserving the pure and best materials of the body and in expelling all that is redundant, effete, or corrupt. Thus the cure is not slight and ephemeral, but complete and permanent, as thousands who have personally tested their power have gratefully testified. Invalids in all quarters of the globe, whose listlessness of mind and sallowness of complexion warned them and their friends of some undermining disease, have been thoroughly renovated by Holloway's remedies.

NORFOLK

ESTABLISHMENT

## NEW EARLY PEAS for 1885.

The Earliest and Best in Cultivation.

DANIELS' GEM OF THE SEASON  
SHOULD BE SOWN NOW.

From Mr. A. ARTHUR, Orwell Gardens, Cambridge.

"I sowed your Gem of the Season Pea March 29, and gathered them June 13, and sowed Laxton's Earliest of All March 15, and did not gather till June 29. This new Pea has proved what its name implies for earliness, productiveness, and flavour."

From Mr. T. NOTLEY, The Gardens, Stoke Hall, Stoke Holy Cross.

"The Gem of the Season, has proved itself a good one. I planted it at the same time and by the side of Day's Early Sunrise. I gathered from Gem of the Season ten days earlier, the pods were also full, averaging from seven to nine good sized Peas in each."

Height 2 feet, and very prolific.

Price, 3s. 6d. per quart, 2s. per pint, 1s. 3d. per half-pint.

Free by Parcels Post to any address.

## DANIELS' MIDSUMMER MARROW PEA.

The Earliest Blue Wrinkled Marrow in Cultivation.

Height 1½ to 2 feet. Splendid cropper and quality.

Should be sown now.

Price, 3s. 6d. per quart, 2s. per pint, 1s. 3d. per half-pint.

Free per Parcels Post to any address.

Seedsmen to H.R.H. the Prince of Wales,  
NORWICH.

## Come and See.

Our Seedlings, Just Raised.

GOLD MEDAL.

## CANNELL'S BEGONIA SEED.

We simply mention the following to show that we  
exhibited the finest seedling last year:—  
FIRST-CLASS CERTIFICATE for the best WINTER-  
FLOWERING ever exhibited.  
FIRST-CLASS CERTIFICATE for the best BEDDING  
ever exhibited.  
FIRST-CLASS CERTIFICATE for the best DOUBLE  
ever exhibited.  
FIRST-CLASS CERTIFICATE for the best and largest  
most distinct SINGLE-FLOWERING, and many  
others, ever exhibited.

Seed, 2s. 6d. and 5s. per packet.

Send for the Best Illustrated Catalogue.

## DAHLIA ROOTS.

For years we have been awarded the highest honours by the  
Royal Horticultural Society for the best and most complete  
Collection, and to show the satisfaction that our Pot Roots give  
we simply append the following.

100 Roots, in splendid varieties, for £1 5s., our  
selection.

Mr. F. W. EVERETT, The Gardens, Penrhos, Holyhead,  
February 4, 1885:—"Many thanks for the beautiful Dahlia  
bulbs I received quite safely. I shall not forget where to send  
when I want any more."

H. CANNELL & SONS,  
THE HOME of FLOWERS, SWANLEY, KENT.

## NOVELTIES in SEEDLING POTATOS.

FIDLER'S ENTERPRISE.—Cross between American  
Purple and Royal Ashleaf. Raised by Mr. Elliott, and  
offered for the first time this season. Was awarded Two  
First-class Certificates. *Gardener's Magazine* says:—"A  
distinct and beautifully coloured kidney, making few chas,  
and incapable of coarseness, heavy cropper, and of excellent  
table quality." Price, per pound, 1s. 6d.; 7 lb., 10s.

FIDLER'S SUCCESS.—White fleshed, cross between  
Beauty of Hebron and Myatt's Prolific. Two First-class  
Certificates. Early as the Ashleaf, but much superior in  
quality and of more handsome appearance. Price, per  
pound, 6d.; 7 lb., 3s.

FIDLER'S PROLIFIC.—Sent out last season, is an  
excellent table variety, has given the best satisfaction  
wherever tried. Tubers are flatish and rounded like those  
of Snowflake. Price, 6d. per pound; 7 lb. for 3s.

FIDLER'S VICTORY.—Late variety, of excellent  
quality, perfectly free from disease. Price, 1s. 6d. per peck;  
4s. per bushel.

Full description CATALOGUE of all kinds gratis and  
post-free on application to  
C. FIDLER, Potato Grower, READING.

PROTHEROE AND MORRIS** will **SELL** by **AUCTION**, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on **TUESDAY NEXT**, February 17, at half-past 12 o'clock precisely, by order of Messrs. **HUGH LOW & CO.**, 2000 **ODONTOGLOSSUM ALEXANDRÆ**, imported some months since, and all starting into growth, from localities whence come the finest varieties.

Also fine imported plants of the large-flowered variety of **ODONTOGLOSSUM VEXILLARIUM**, **ODONTOGLOSSUM LUTEO-PURPUREUM** VARIETY from **ANTIOQUEA**, **CATTLEYA GIGAS**, &c.

*On view morning of Sale, and Catalogues had.*

## TUESDAY NEXT.

**ODONTOGLOSSUM ALEXANDRÆ.**  
**HUGH LOW & CO.,**

Referring to the Advertisement inserted above, beg to notify that for a considerable time past they have had a very careful and experienced Collector, Mr. **GEORGE T. WHITE**, engaged in visiting the localities whence come the finest varieties of **ODONTOGLOSSUM ALEXANDRÆ**.

Large quantities have been received from time to time, which have been retained until the plants started into growth, so that buyers will not run the least risk. The 2000 offered have already made fine young growths, they are all in pots, and are, in every respect, a most promising lot of plants.

**CLAPTON NURSERY, LONDON, E.**

## FRIDAY NEXT.

**WHITE LÆLIA ANCEPS.**

**MESSRS. PROTHEROE AND MORRIS** have received instructions from Messrs. **SHUTTLEWORTH, CARDER & CO.**, to **SELL** by **AUCTION**, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on **FRIDAY NEXT**, February 20, at half-past 12 o'clock precisely, a grand importation of **WHITE LÆLIA ANCEPS**, including many magnificent masses, with 200, 300, and 400 Bulbs.

**WATKINS & SIMPSON,**

SEED AND BULB MERCHANTS,

**EXETER STREET, STRAND, W.C.**

## GENUINE SEEDS

**JAMES VEITCH & SONS,**  
ROYAL EXOTIC NURSERY,  
CHELSEA, S.W.

**AQUILEGIA,  
VEITCH'S NEW HYBRIDS.**

Comprising many new, beautiful, distinct, and pretty sorts of various shades, of which a coloured plate appeared in *The Garden*, October 18, 1884.

Per packet, 1s. 6d.

**NEW CAMPANULA,  
CALYCANTHEMA ROSEA.**

A new bright rose-pink variety; a most attractive and desirable addition to our hardy border plants, owing to its pretty colour and free blooming habit, the flowers literally hiding the plant.

Per packet, 1s. 6d.

**IMPATIENS SULTANI.**

*First-class Certificate, Royal Horticultural and Royal Botanic Societies.*

Remarkable for its profuse and continuous flowering and the gorgeousness of its flowers, which are of a brilliant rosy-scarlet colour. Decorative alike for the Stove, Greenhouse, Conservatory, or for Summer Bedding.

Per packet, 1s. 6d.

**MIGNONETTE, CRIMSON KING.**

A new, distinct, and most desirable variety for pot culture, throwing up numerous stout flower-stalks, terminated by extremely broad spikes of delightfully scented bright red flowers.

Per packet, 1s. 6d.

**BRUSSELS SPROUTS,  
VEITCH'S EXHIBITION.**

Unequaled for exhibition or for general use. The stems are entirely covered from top to bottom with large, firm, solid sprouts, which are of remarkably fine quality.

Per packet, 1s. 6d.

**NEW CAULIFLOWER,  
VEITCH'S PEARL.**

The best main crop variety for general use, pure white heads of fine texture, medium size, and finest quality; perfectly distinct, and very desirable.

Price per packet, 2s. 6d.

**CABBAGE LETTUCE,  
VEITCH'S PERFECT GEM.**

*First-class Certificate, Royal Horticultural Society.*

A most distinct, compact-growing variety, of a rich deep green colour, forming very early a close solid heart, beautifully crisp, juicy, and tender, and of excellent flavour.

Per packet, 1s. 6d.

**NEW TOMATO,  
HACKWOOD PARK PROLIFIC.**

*Two First-class Certificates, Royal Horticultural Society.*

The finest Tomato in cultivation for exhibition or main crop, enormously prolific, handsome large smooth fruit of bright scarlet colour; flesh firm and solid, of finest quality, excellent flavour.

Per packet 1s. 6d.

**NEW VEGETABLE MARROW,  
PEN-Y-BYD (the best in the world).**

*First-class Certificate Royal Horticultural Society and First-class Certificate International Exhibition, Dunce.*

This new, most distinct, and exceedingly prolific variety is by far the best of Mr. Muir's hybrids, and superior to any yet in commerce; the fruit, averaging about 6 inches in diameter, is of handsome globular form, creamy-white in colour, of finest table quality, and particularly delicate flavour.

Per packet, 1s. 6d.

**VEITCH'S NEW POTATOS FOR 1885.  
M.P. and MISS FOWLER.**

Each awarded First-class Certificate International Potato Exhibition, October, 1884; and also received the Highest Awards for cropping and table quality, from the Royal Horticultural Society, 1884.

**M.P.**

A grand round white variety, of dwarf, stout growth; an enormous cropper and thorough disease-resister; tubers all of most useful table size, and the quality is all that can be desired.

Per lb., 1s. 3d.; per 4 lb., 4s. 6d.; per 7 lb., 7s. 6d.

**MISS FOWLER.**

A handsome late white kidney, very heavy cropper; tubers of moderate size, very even, and of finest table quality.

Per lb., 1s. 6d.; per 4 lb., 5s. 6d.; per 7 lb., 8s. 6d.

For full particulars of the above and other Choice Vegetable and Flower Seeds and Potatoes, see CATALOGUE, forwarded Gratis and Post-free on application.

**ROYAL EXOTIC NURSERY,**  
KING'S ROAD, CHELSEA,  
LONDON, S.W.

**DREADNAUGHT.**—The best paying Cucumber for Market, and finest Black Prickly Cucumber grown. We have grown mostly of the Telegraph type, and find Dreadnaught make 30 per cent. more in the market. 1s. per packet.

POPE AND SONS, Seedsmen, 120, Market Hall, Birmingham Nurseries, King's Norton.

**NEW WHITE PLUME CELERY** (Henderson's).—Seed direct from New York, 6d. per packet, free by post.

CATALOGUES free on application.  
POPE AND SONS, Seedsmen, 120, Market Hall, Birmingham Nurseries, King's Norton.

**ELLAM'S DWARF and EARLY MARKET CABBAGE.**—The two best Cabbages for Autumn or Spring. 6d. per packet, free by post.

CATALOGUES on application.  
POPE AND SONS, Seedsmen, 120, Market Hall, Birmingham Nurseries, King's Norton.

**TOMATO.**—The best flavour and finest for private use, Vick's Criterion. True selected seed, imported from America, free by post, 6d. per packet.

POPE AND SONS, Seedsmen, 120, Market Hall, Birmingham Nurseries, Birmingham.

**SHALLOTS.**—Price per Cwt. or Ton on application to  
WATKINS AND SIMPSON, Seed and Bulb Merchants, Exeter Street, Strand, W.C.

**Wholesale List of Vegetable Seeds.**

**H. AND F. SHARPE** will be pleased to forward their WHOLESALE LIST of Home Grown VEGETABLE SEEDS to those who have not yet received it. It comprises all the best varieties in cultivation, and the quality of the seeds is exceptionally good.  
Seed Growing Establishment, Wisbech.

**G. STEVENS, F.R.H.S., St. John's Nursery, Putney,** is now Booking Orders for his New CHRYSANTHEMUMS, which will be sent out in April next:—

**WHITE PERFECTION**, beautiful single, very free and compact grower, acknowledged to be the finest of this class of Chrysanthemums. First-class Certificate, National Chrysanthemum Society, 1884. 2s. 6d. each.

**TERRA-COTIA**, single, beautiful bright colour, very free and compact grower, fine for Conservatory decoration. First-class Certificate, National Chrysanthemum Society, 1884. 2s. 6d. each.

**MAGENTA KING**, a beautiful sweet-scented Anemone pompon, with a very high centre, and of a very bright colour, a very great acquisition to this class of Chrysanthemums. First-class Certificate, National Chrysanthemum Society, 1884. 2s. 6d. each.

**G. STEVENS**, a charming reflexed variety, of a bright crimson-chocolate colour, showing gold under-surface. Quite distinct from any other variety. First-class Certificate, Royal Horticultural Society, 1883, and National Chrysanthemum Society, 1884. 1s. each, 1s. 3d. post-free.

Cash with order.

CHRYSANTHEMUM CATALOGUE two stamps.

**ANTHONY WATERER** has to offer:—

ASH, 4 to 6 feet.

BIRCH, 3, 4 and 5 feet.

SPRUCE, 2½, 3, 4, and 5 feet.

SPANISH CHESTNUT, 3, 4, and 5 feet.

LARCH, 4 to 6 feet.

All stout and well rooted.

ANTHONY WATERER, Knap Hill Nursery, Woking, Surrey.

**GRAPES THIS YEAR.**  
FRUITING CANES, 7s. 6d. and 10s. 6d. each.  
PLANTING CANES, 3s. 6d. to 7s. 6d. each.

Leading kings, perfectly ripened without bottom-heat.

DUKE OF BUCCLEUCH, grafted, 15s. each.

JAMES DICKSON & SONS, "Newton" Nurseries, Chester.

**ASPARAGUS.**—True Giant, 2, 3, and 4-yr. Fine sample 100 or 2000, with price, on application.  
JAMES BIRD, Nurseryman, Dowham.

To the Trade.

MANGEL WURZEL and TURNIP SEEDS.

**H. AND F. SHARPE'S Wholesale Price** LIST of the above-named Seeds is now ready, and may be had on application. It comprises all the very finest varieties of 1884 growth.

Seed Growing Establishment, Wisbech.

**New Kidney Potato**

**BIRD'S DOCTOR BOB.**—This is the earliest Kidney variety in existence; a very heavy cropper, as many as sixty tubers of all sizes have been counted at a root. It is a seedling from Early King. After a trial of several years it has never taken disease. Eyes very shallow; a good cooker, and fine flavour. 5s. per stone.

JAMES BIRD, American Nurseries, Downham Market.

**DAHLIA TUBERS.**—A large quantity of pot Roots in fine condition, in all the leading varieties, including Shows, Fancies, Cactus, Pompons, and Singles.

DESCRIPTIVE PRICE LIST on application to

THOMAS S. WARE, Hale Farm Nurseries, Tottenham, Middlesex.

**HOUSE'S PERFECT MARROW PEA.** Pronounced by competent judges to be the finest Pea ever eaten. Prizes 301. and 20s. per Forty Pods will be given at the Royal Horticultural Society's Show in July. Sold in packets, post-free for fifteen penny stamps.

JOHN HOUSE, Eastgate Nurseries, Peterborough.

To Noblemen and Others Planting, &c.

**FOR IMMEDIATE SALE**, 10 magnificent Specimen WELLINGTONIA GIGANTEA, over 6 feet high, in perfect health, shape and foliage—such handsome trees seldom seen; to good Silver Variegated Japanese MAPLES, from 4 to 8 feet high (grafted), and about 20 fine shaped Purple BEECH—all moved within the last year. Also 5 immense Specimens of ADIANTUM CUNEATUM, over 30 inches through—these are fit for high competition.

The above, the property of a Lady, are for Immediate Disposal. Price, &c., address by letter only to R. GARDNER, care of T. Smith, 15, Wine Office Court, Fleet Street, London, E.C.

**MR. LAXTON'S  
SPECIALTIES FOR 1885.**

For particulars with Prices of—

**NEW PEAS—**

EVOLUTION, LORD BACON, and EARLIEST OF ALL;

**NEW RUNNER BEANS—**

THE CZAR and GIRTORD GIANT

**NEW LONGPOD BEAN—**

JOHN HARRISON;

**NEW POTATO—**

WHITE-SKINNED BEAUTY OF HEBRON;

**BEST ONION—**

SANDY PRIZE WHITE SPANISH;

SEED MERCHANTS and NURSERYMEN,  
WORCESTER.

# B. S. WILLIAMS'

PRIZE STRAINS OF  
**FLORISTS' FLOWERS.**  
POST-FREE.

Sold only in Sealed Packets bearing my Trade Mark. The quality of all is alike; the difference in price applies to the quantity of seed put into the packets.

## WILLIAMS'

Prize Strain of  
**BEGONIA HYBRIDA**, finest mxd.,  
per packet, 1s. 6d.  
**BEGONIA HYBRIDA**, Tuberous  
rooted, for bedding, per packet  
1s. and 2s. 6d.

Saved from Strains which have  
taken First Prizes wherever ex-  
hibited.

## WILLIAMS'

Prize Strain of  
**CALCEOLARIA**  
(Herbaceous, finest mixed),  
Per packet, 1s. 6d. and 2s. 6d.  
This fine strain has been selected  
from the dwarfest and most distinct  
types, and will be found unequalled  
for size of flowers and brilliancy of  
colours.

## WILLIAMS'

Prize Strain of  
**CINERARIA**  
(extra choice, mixed),  
Per packet, 1s. 6d. and 2s. 6d.

A superb strain of very dwarf branch-  
ing habit and strong constitution, con-  
taining a great variety of colours.

## WILLIAMS'

**PRIZE COCKSCOMB.**  
The finest in cultivation.  
HAS GAINED NUMEROUS FIRST  
PRIZES.  
Per packet, 2s. 6d.

## WILLIAMS'

**CYCLAMEN CIGANTEUM** (mxd.)  
containing four varieties.  
per packet, 2s. 6d.,  
**CYCLAMEN PERSICUM** (mxd.)  
per packet, 1s. 6d. and 2s. 6d.

The finest strain in cultivation. For  
varieties of Cyclamen in separate col-  
ours see Illustrated Seed Catalogue.

## WILLIAMS'

Prize Strain of  
**GLOXINIA**,  
CHOICE MIXED.  
Per packet, 1s. 6d.

This produces immense flowers, of  
the most brilliant and varied colours,  
both of the erect and drooping  
varieties.

## WILLIAMS'

**PRIMULA SINENSIS PIM-  
BRIATA**, mixed packets,  
containing six varieties. s. d.  
Per packet, 1s. 6d. and 2s. 6d.  
This superb strain has stood the  
test for thirty years, and never fails to  
take 1st Prizes wherever exhibited.  
For new Primulas and superb  
strain of Primulas, see Illustrated  
Seed Catalogue.

**LUCULIA GRATISSIMA.** Per packet, 2s. 6d.

Illustrated Seed Catalogue for 1885,  
Gratis and Post-free on application.

UPPER HOLLOWAY, LONDON. N.  
NURSERIES.

SEEDSMEN BY ROYAL WARRANT

# SUTTON'S

CHOICE  
**NOVELTIES.**

## NEW MARROW PEA, SUTTON'S "SATISFACTION."

By far the most robust medium-cropping Pea in  
cultivation, and in productiveness is unsurpassed. The  
pods are produced in pairs, and are thickly set on the  
haulm. The Peas are remarkably large, and some-  
times as many as two are contained in a pod. When  
brought to table they are of a beautiful green colour, and  
even when quite old they retain their sweet and delicate  
flavour. The haulm is very stout, resists drought and mil-  
dew, and is easily distinguished from that of all other Peas.  
Height 3 feet. Per quart, 3s. 6d.

OBSERVE  
THIS TRADE MARK  
ON  
EVERY PACKET.

For full particulars of Sutton's choice varieties of  
Vegetables, Flowers, and Potatoes, see

## MEMBLAND.

THE fine country residence of E. C. Baring, Esq., is situated on the confines of the South Devon coast, about midway between Salcombe and Plymouth, and eleven miles from the stations of Ivybridge and Plymton. The route chosen to reach it was from Ivybridge, a pretty little town, a fine view of which is obtained from the skeleton bridge spanning a deep valley, and over which runs the Great Western Railway. This valley, through which flows the River Erme, is followed for some miles; it is bounded by bold and grand slopes thickly planted with Oak, equalling many of those for which the River Dart is so famous. Passing on through the well-wooded park of Flete, the route taken now being through private property, another estate, called Pamphlete, is passed through, where one cannot help being struck by the way in which Pinus insignis stands out conspicuously in the plantations, evidently confirming the opinion of those who advocate its planting for the seacoast, for here at a considerable height and in exposed situations it tops the Larch and Austrian Pine.

Here the River Erme has assumed wide dimensions, being within a short distance of the sea. Along its course delightful views are continually presenting themselves, many of which have been selected by some of our eminent landscape artists. As we near the coast a good stretch of open country is traversed. Being now on the property of Mr. Baring, and being several hundred feet above the sea, occasional glimpses of the ocean and of a portion of the rocky coast are obtained. A lodge recently erected—substantial, elaborate, and original in design—indicates the entrance to the park; a circuitous drive, with a gradual descent, leading from the sea coast, brings one to the house. Benefiting by the experience of adjoining estate proprietors, Pinus insignis has been extensively planted, and on the right side of the drive now mentioned it has been planted at a distance of 40 feet apart the whole length. Picea Nordmanniana and other Pinuses are planted between; these are eventually to be cut away as the P. insignis increases in growth.

Membland may be said to be only in its infancy, judging from the preparations for planting, the cutting and laying out of new drives, &c., although much work has already been accomplished within the last few years. It has only of late years passed into the hands of the present proprietor, who seems to be quite alive to the manner by which the natural surroundings may be made still more interesting and enjoyable by judicious planting.

Before entering upon an account of the garden, which concerns us most, I will refer to one very grand feature of Membland—this is a drive 8 miles in length, commencing from the lodge referred to, and which leads immediately on to the summit of the high cliffs at a height of from 400 to 600 feet above the sea. The drive is

continued on the sides of the cliffs for the whole distance mentioned, winding in and out, following the course of the rugged coast. It had frequently to be cut through solid rock to attain the necessary gradations. Almost immediately upon entering the drive are the ruins of Revelstone Church, roofless and covered with Ivy, and without any sign of cultivation or habitation saving a small plot of land half an acre in extent, which is in the occupation of some distant fisherman probably. It was stocked with Cabbage, which, perhaps, would be the only vegetable in a cottager's point of view that could be grown there. Possibly at some remote period a village existed here, but now not a vestige remains other than the ruins of the church. As the course of the drive winds in and out, often abruptly, a faint outline of its course is visible for miles, either rounding some high and prominent point or round the huge recess formed by the connection of two large promontories. In many places the rocks are very precipitous, and dangerous for horses not well under command. The charm experienced in being able to traverse the sides of the cliffs with ease is greatly enhanced by the seething and foaming of the waves beneath, unceasing in their battle with the projecting rocks, the water assuming a beautiful malachite hue. Among the distant views to be obtained during its course, as we are in Bigbury Bay, on the left, at starting, is seen Bolt Head and Bolt Tail off Salcombe. Burt Island—a huge rock in the foreground—stands about halfway. Away to the south are seen the woods on the summit of Mount Edgcombe, and a long stretch of the rocky coast of Cornwall. In the offing is visible the new Eddystone Lighthouse—a mere speck on the horizon. During the progress of the formation of this drive, it was rendered necessary on many occasions during severe gales of wind to withdraw all hands, it being impossible to withstand the gales that visit this coast.

On the termination of the coast drive, the return journey is made along the course of the River Yealm, a short river, but with bits of scenery as beautiful and picturesque as can be found on any of our rivers. The land slopes very abruptly to its waters, having the village of Norse on the eastern and Newton on the western side, each with its village church standing out prominently half way up the steep slope. The drive is continued on through this valley, at the termination of which, on very elevated ground, is situate Membrand House, from which we started.

Large additions have been made by the present owner to the old building, the improvements and additions being in the same style of architecture as the old portions (see fig. 40, p. 213). From the west end a very extensive view is obtained of the valley just mentioned, the bold slopes on either side being well wooded, with the tower of Newton Church conspicuous in the landscape, having for a background the distant hills in Cornwall. Although the house is situate so near the sea yet no glimpse of it can be seen from it. The ground gradually declines from the coast inwards, the house being situate on this decline, with a thick belt of Oak and other trees, entirely blocking out the ocean view, and affording protection from the southern and south-easterly gales. The north and east sides are now thickly planted with trees, as it lies exposed to the cold winds from Dartmoor, the hills of which are distinctly seen from this point. The pleasure grounds around the house are not extensive, neither are they required to be, the natural surroundings being themselves of sufficient attraction for those who love and enjoy rural scenery. The lawn in front is one bold slope of grass only bounded by a ha-ha fence: trees and shrubs are nearly dispensed

with in this instance, and wisely so, the bold scenery of hill and valley near and far requiring no aid from dressed grounds and small Coniferae to enhance its grandeur. The walls, pillars, and porticos are covered with Ivy intermingled with *Ampelopsis Veitchii*, *Lonicera fragrantissima*, and other climbers, and beneath the terrace walls large plants of *Fuchsia Riccartoni* were flowering splendidly. From the west end the ground declines rapidly into the valley, and here are situate the kitchen garden and the numerous glass structures. Between this garden and the house a small plantation of trees has been made, and though the views from the windows of the mansion are carried directly over the garden, yet it is effectually hidden by the trees and partly by the sudden declination of the ground. The gardener's house is one of a block of buildings at the back of these trees, thus commanding a view of the entire garden and a lovely valley beneath. *D. C. Powell.*

(To be continued.)

## New Garden Plants.

*CATTELEYA BICOLOR WRIGLEYANA*, nov. var.

I PROPOSE this name for a lovely variety with grey-green sepals and petals and a dark purple lip. The flower at hand has its apex white. It is well known that the typical *Cattleya bicolor*, Lindl., first described from a sketch prepared by Baron Descourtil, has tawny sepals and petals. I would not look to the number of flowers for marks of distinction, as the quantity depends upon the strength of the growth. *Cattleya bicolor* is very often two or three-flowered. My herbarium contains inflorescences with as many as six flowers. I never saw peduncles with eight or ten flowers. I have this fine variety several times. Never was it so bright green as in the last instance, when it came from Mr. Edwin G. Wrigley, Howick House, Preston, Lancashire. It is a great satisfaction to dedicate it to this gentleman, *H. G. Rehb. f.*

*LÆLIA ANCEPS (Lindl.) LEUCOSTICTA*, nov. var.

This has long white or whitish-rosy markings on the darker rosy sepals and petals. They are usually either broad linear, or triangular, or short elliptical. I had something near the flower at hand a long while ago from Mr. Burbidge, Trinity College Garden, Dublin. What is now at hand was sent by Mr. F. Sander. It is from Mr. Greenfield, Beechwood Park, Dunstable. *H. G. Rehb. f.*

*LÆLIA ANCEPS BLANDA*, nov. var.

It becomes alarming to note how many varieties appear of this old species, which from 1835 till 1868, when the glowing Dawsonia appeared on the scene, offered only the var. *Barkeriana* (1837). Now we suffer from *embarras de richesse*. This variety has sepals and petals white with a rose hue. The median nerves of the sepals are lightest green. The anterior lacinia of the lip is emarginate, blunt, wholly coloured with the warmest purple. The angles of the side lacinia are rosy, with rows of purple dots. Mid area sulphur coloured, with numerous very dark shining elevated brownish-purple stripes. It would be *Lælia anceps Calvertiana* were it not for this rich mid area and those curious rows of dark streaks of single spots on the side lacinia, which make one think of var. *Veitchii*. *Lælia anceps Percivaliana* has only the apex of the lip purple, and the side lacinia have no such lines of spots on their angular parts. It came from Mr. F. Sander, who received it from W. Cobb, Esq., Silverdale, Sydenham. *H. G. Rehb. f.*

*AGAVE WIESENBERGENSIS*.—In this newly-described species the tuft of leaves measures 55 cm. across, the individual leaves 20 cm. long by 6 cm. broad, and 1½ cm. thick, oblong-lanceolate mucronate, remotely spine-toothed at the margin. The flowers are in clusters along the side of a long flower-stalk, the individual flowers are erect, tubular, 6-parted, 30 mm. long. The plant is figured by Dr. Wittmack in the *Garten Zeitung* for January 15.

## ASPLENIUM GERMANICUM.

VARIOUS views have been put forward with respect to the origin of *Asplenium germanicum* by those who have disputed its claim to rank as a species. Thus it has been considered by some to be a hybrid, and by others to be a mere variety, and each party is split into two subdivisions. Of those who suppose it to be a hybrid one division has attributed its derivation to *Asplenium Ruta-muraria* and *A. septentrionale*, and the other to *A. septentrionale* and *A. trichomanes*. Of those who regard it as only a variety some have considered it as the offspring of *A. Ruta-muraria*, and are able to bring the authority of Linnaeus, and to point to the "cuneatum" variety of *Ruta-muraria* as supplying a connecting link, in support of this view; whilst by the remainder it has been set down as a variety of *A. septentrionale*. The latter is the opinion held by Dr. Lowe, but his reasons for coming to this conclusion seem to me, so far as they are set forth on p. 80, scarcely sufficient.

These appear to be based primarily upon the fact that veritable fronds both of *septentrionale* and of *germanicum* were produced by one plant, and secondarily upon the fact that there were also intermediate forms. Now if it were indubitable that this was only one individual plant I do not see how the argument could be resisted, but from the circumstances of the case it would be well nigh impossible to shut out the chance of error in determining this point. In most places where *germanicum* occurs it will be found associated with *septentrionale*. Growing, as they do, side by side, it is only to be expected that instances such as those mentioned by Dr. Lowe would not be very unusual in which the two Ferns would be so intimately united, and their fronds so intermingled, that it would be almost impracticable to separate or distinguish between the two plants, both of which send up their fronds in the same densely-growing and thickly-tufted fashion. Consequently extreme caution would be necessary in drawing any conclusion merely from the circumstance that the two distinct kinds of fronds sprang from what appeared to be but one root. "Intermediate forms proving their common origin" would then be required to decide the question as to whether in such case there were really two plants or only one. And here, I think, Dr. Lowe's evidence falls short.

The specimens illustrated (fig. 15, p. 80) seem to me not to be intermediate forms, but to belong—the right-hand one to *Asplenium germanicum*, and the left-hand one to *A. septentrionale*. From a figure one can judge only of the form of the frond, and there may perhaps be some intermediate characteristics of colour and texture evinced by the fronds which a figure cannot indicate. Any one who has observed the two species growing wild must have noticed the light green colour and thin texture of the *A. germanicum* fronds, and been struck with the marked difference in these two points between the two *Aspleniums*. As the roots which Dr. Lowe brought home are doing well, perhaps next season he will kindly give further information as to the growth and development, whether normal or otherwise, of the fronds.

It has been alleged, as one of the strongest arguments against *A. germanicum* being entitled to take rank as a distinct species, that it is never to be found growing in any considerable quantity together, but only in few or solitary plants associated generally with *A. septentrionale*. As Newman says, "No botanist has ever recorded the discovery of a colony of *germanicum*." If any one should be fortunate enough to discover such a colony it might not be desirable, in the interests of the Fern, to point out its locality too definitely, but it would be very desirable to have some record of the discovery. Mr. Britten, in *European Ferns*, states that *A. germanicum* is found abundantly in many localities in the Tyrol, and in Silesia, where neither *A. trichomanes*, *A. septentrionale*, nor *A. Ruta-muraria* occur. If any of your readers could supply any additional testimony on this point it would be very welcome. There is an interesting note in the number of the *Journal of Botany* for July, 1883, p. 209, on the occurrence of *A. germanicum* in Hong Kong, completely out of the reach, so far as is known, of *A. septentrionale*, the nearest habitat for which Fern appears to be in Northern India or Afghanistan.

There is a good deal of variation in the forking and size of the fronds of *A. septentrionale*, but I am not aware whether any distinct variety has been raised or

found. Of *A. germanicum* two varieties are recorded—one, named "acutidentatum," was raised by the late Mr. R. Sim, of Foot's Cray, and a figure of the same is given in *Nature-Printed British Ferns*. The other is mentioned in Messrs. Stansfield's *General Fern List*, No. 8, p. 23, and thus described:—"Variety with remarkably broad pinnules, from St. Goar, in Germany." Some sixteen years ago I found, near Argeles, in the Pyrenees, a plant of this Fern, fronds of which were identified with Messrs. Stansfield's variety by Mr. Sim. Here is an instance, from two places wide apart, of a form of *A. germanicum* characterised by a larger and more vigorous growth, and showing the species in perhaps its most perfect development, and the tendency of its divergence from the ordinary type is not in the direction of any approximation to *A. septentrionale*, but rather otherwise. I have the plant still in cultivation, and enclose a few fronds herewith.

I have found the common form of *A. germanicum* in several places in the Pyrenees and in Switzerland, and also in the district about Gastein, in Austria, and in all these cases the neighbourhood abounded with *A. septentrionale*. Pretty much the same position and conditions are necessary to both, but *A. septentrionale* is the harder and more vigorous of the two. It is capable of adapting itself to a much greater range of elevation, its habit of growth is more spreading and extending, and wherever it is at all plentiful fine plants in large tufts can usually be found.

From my observation of both Ferns in their wild state I should be inclined to think that where the two happen to grow together, and become crowded in a limited space, the strong probability is that *A. germanicum* will be overgrown and choked by its sturdier companion. If this supposition be correct it may serve to afford some explanation of the scarcity and solitariness of *A. germanicum* as generally found. Can it be that in former times it was more abundant than now; that gradually the weaker was to some extent ousted by the stronger; and that therefore the present representatives of its race are to be regarded as survivors of that struggle for existence which is ever going on in vegetable as well as in animal life? *W. O'Brien, Merriem, co. Dublin.*

## UNFRUITFUL TREES.

How often one sees and hears of trees that are unfruitful, and Apples and Pears especially so. Now this should not and need not be if proper means were employed to remedy it. Nothing is more disappointing than year after year to expect fruit and get none, or of such poor quality as hardly to be fit for use. Some trees are no doubt too old, and would be better replaced by young ones, but others, both standard and trained, can be brought into a fruitful state, and the treatment will often entirely cure canker, which no doubt is caused by poverty in a great many instances. Very generally this unfruitfulness is caused by the roots getting down into the subsoil for moisture in dry seasons, and when there, as they do not find any of the elements that are necessary for building healthy growths, the tree gets into an unhealthy or an unfruitful state, often making wood at the expense of the fruit-buds. This must not be taken to be always the case because some trees seem to run all to fruit-buds and yet do not ripen their fruit.

Young trees can be lifted and brought into a fruitful state by bringing the roots nearer the surface, but trees that have stood in one position, for twenty years or more, cannot be lifted entirely, or if they were lifted they would hardly recover from such severe treatment. What is necessary to do in such cases is this. Cut away the roots that have a tendency downwards. The way to proceed with this operation (and I have practised it myself on a great number of trees and found it bring about the desired result) is to open a trench on both sides of the tree (if a standard), 6 feet from the stem, 3 feet wide and about 6 feet long, parallel to each other, removing the soil from the trenches to the depth of 3 feet, taking care not to injure the roots that lie horizontally; then work towards the stem with steel forks and remove the soil as the work proceeds until within 18 inches of the stem, tunnel the remainder, and sever the tap or perpendicular roots about 2 feet from the surface, cutting the upper portion of the roots smoothly with a knife and removing as much of the remaining part as possible: then proceed to fill in the trench,

making it firm beneath the ball of earth. If some manure can be worked into the upper 18 inches of soil it will encourage fresh roots and greatly assist in stimulating the energies of the tree. This pruning will check rank growth and consequently direct the energies of the tree to the formation of fruit-buds.

Trees on walls must be done from one side only, removing all downward-stretching roots quite back to the wall. Trees that produce nothing but bloom are easier dealt with: Pear trees especially are liable to get into that state; they make no wood, nor in my opinion do they perfect their fruit-buds. The best way to operate upon them is to thin out the head of the tree about a third of its branches if a standard, and to give it a dressing of rich manure. Trees treated in this way, and which have not had any fruit for years previously, fruited well the next year. A great deal of good can be done to trained trees by the removal of spurs, thereby causing fresh ones to push. In the case of some sorts it is necessary to cut them all back to the main shoot, and the trees of some kinds refuse to bear fruit on old spurs or limbs; pertinaciously obstinate is Gansel's Bergamot Pear, and some others that fruit best on a system of moderate extension. This is work that can be carried on at almost any time from the beginning of September until the end of February, frosty weather excepted. *A. Waterman, Preston Hall Gardens.*

## A FEAST OF CHINESE PRIMROSES.

No heading could be more appropriately placed at the commencement of this paper than the one I have employed. In the Portland nursery of Messrs. Sutton & Sons, at Reading, there can be seen at the present time a collection of Chinese Primroses of a singularly varied and interesting character, representing varieties raised and put in circulation during the past few years, and also novelties, the result of careful crosses—some of them specially striking and instructive as showing how much can be accomplished by intelligent, patient, and persistent cross-breeding. The visitor sees house after house of Primulas, finely grown, and flowering in the best manner; but unless he can avail himself of a pleasant chat with Mr. James Martin (Messrs. Sutton & Sons' clever foreman) he quite fails to understand how and by what means many of the charming novelties he sees have come about. Much thought and years of patient work have been employed, not a cross has been attempted but it has been fully recorded; the pedigrees of all the most useful varieties are kept, nothing appears to be left to mere chance, though something of this appears in the results which must be attributed to that natural sportiveness which is characteristic of not a few popular flowers.

Messrs. Sutton & Sons have from time to time put several new varieties of Primulas into commerce, such as Reading Scarlet, rich bright red; flowers of good size, handsomely fringed, and thrown well above the foliage. Pearl, white, the flowers large and beautifully fringed; habit very good, the flowers very numerous, and standing in the form of a pyramid above the leaves. Ruby King, of a rich deep ruby-crimson hue; flowers of fine form, well fringed, and numerous produced; they are pale in colour when they first open, but become more intense and richer in tint with age. Reading Blue, a type so improved here that it has developed into the darkest blue we have yet seen; the flowers large, finely fringed; clear lemon eye, very free, and the blossoms thrown well above the foliage. It is probable that, for some few years to come, blue Primulas will be found sportive in character, but it is a strain that will become definitely fixed in course of time. The foregoing have palmate, or the old type of foliage. In addition to these selected varieties, there are Superb White, Superb Red, Princess Beatrice, delicate rosy-lilac, bordered with white; Marginata, lilac, bordered with white and grey; Florence, bright brick-red, &c., but they fall behind those named for distinctness and novelty of character, though all very good. Of Fern-leaved types there are the old white and red forms—in excellent character it must be admitted; and the following, obtained from distinct crosses:—Snowdrift, a pure white variety that preserves its purity until the end; it is remarkably free and successional, and when in the height of bloom charming in the extreme; it is

also very early, and by means of a later sowing can be had in flower for a considerable time. Gipsy Queen is quite new; the flowers come nearly pure white, but as they age become suffused and spotted with deep rose; they are large and finely fringed. One singular peculiarity possessed by this type is the deep russety brown or dark Beet-like foliage, which is in striking contrast to the flowers. It is a very desirable novelty. Rosy Queen is older in point of time, and, like all Messrs. Sutton & Sons' new types, it has a close and compact pyramidal habit, and is very early; the colour of the flowers delicate salmon-rose; large and well formed. It will be remembered that the older types of Fern-leaved Primulas had long leaves, foot-stalks and leaves both being so long that they hid the flowers from view. The blade of the leaf in Messrs. Sutton & Sons' varieties is only half the length formerly seen, and the foot-stalks are correspondingly short.

It is held by Mr. Martin that there are four essential points necessary to a good Primula, viz., habit of growth, size of flower, substance, and colour. Those who remember the strains of Chinese Primulas of twenty years ago will acknowledge what an advance has been made with these qualities in Primulas. It is worthy of note that in all cases the darkest palmate foliage makes an excellent habit. It has also been observed that in the case of pink and carmine-coloured flowers the eye is clearest, and the purer the clear lemon colour the better is the effect. What is the origin of the Fern-leaved character in Chinese Primulas? Mr. Martin claims it as a result of high culture; he remarks that one seldom sees sickly Fern-leaf types, and affirms that impoverished Fern-leaf plants will degenerate into palmate foliage. Broadly put, the Fern-leaf character has been evolved out of the palmate or old type of foliage, and among the progeny which represents Messrs. Sutton & Sons' latest crosses some can be seen in which the character of the foliage is intermediate between the two. One cross was exhibited in which the dark coloured Rosy Queen had been carried over to the delicate coloured Gipsy Queen, with its peculiarly dark foliage, and the dark flowers had resulted without the slightest change of foliage. In seeking certain definite results the fertiliser finds that the more opposite in character the two subjects he operates upon the longer is the time required to produce them.

The following novelties so obtained were seen in the best condition:—A beautiful and distinct double crimson variety, large and full, very fine, and having dark palmate foliage; a double carmine of similar colour and character of foliage, much paler in tint, very bright and effective; a double variety with Fern-leaf foliage of the Prince Arthur type; a charming double white Fern-leaf, of the purest white, and specially attractive; a variety provisionally named *oculata lutea*, with an unusually large clear lemon eye, and a margin of pale rose, which may, perhaps, be made the progenitor of a distinct section; another, with a large white star-like centre, having a broad margin of pleasing deep rosy-pink, and dark foliage, which must be regarded as a new departure; a variety with a clear Picotee edge, white, distinctly margined with delicate pink; and it is remarkable that the best form of this came from a Reading Blue and another; new type, the deep pink flowers blotched with white; a large lemon centre, and dark Fern-leaved foliage. From a clear single white has come a semi-double deep red, very rich in colour, and admirable in habit. A semi-double lilac-coloured variety is being crossed on to a good blue in the hope of attaining a double blue variety.

In looking over these new breaks, the eye is attracted by two types of a singularly eccentric appearance. One is a mossy or Parsley-leaved Primula, of Continental origin, at first with flowers of the poorest character, but considerably improved by patient fertilisation; and another Continental type with dark foliage and entire cordate leaves at the termination of long dark stems. This, too, has been much improved in flower and habit, and one has this season produced rich ruby-crimson coloured flowers, large, stout, and well fringed. Whether these curious freaks will ever have a commercial value remains to be seen, but among the crosses so carefully made at Reading nothing is overlooked, the one aim being to obtain as much variety as possible both in flower and foliage, the latter always in association with blossoms characterised as much as possible by the four points mentioned as essential to a comparatively perfect Primula. *R. D.*

## INDIAN NOTES.

MILLINGTONIA hortensis belongs to the Bigoniaceae, and is one of the finest trees of India. Even when comparatively young, with a stem about 12 or 14 inches in diameter, it grows to 40 or 50 feet high, and as straight as an arrow, while at its widest part it is not often more than 8 or 10 feet across. Like the Lombardy Poplar and Cypress in Europe, it is one of those trees which Nature has placed in the hands of the landscape gardener to enable him to vary the monotony of trees with a round head. The head of this Millingtonia is cylindrical, with foliage of the deepest green. The leaves are upwards of 18 inches long, imparipinnate, with a tendency to become decompound; the leaflets at the base and extremity of the pinnæ being larger than the intermediate ones. The inflorescence is terminal, and in loose compound panicles, with drooping, long, and narrow-tubed white flowers, which become subsequently slightly tinged internally with purple. The corolla is divided into five parts, and has a Jessamine scent. It has the rudiment of a fifth stamen, I suppose to indicate its relationship to the five-stamen section of plants. This beautiful tree flowers in November, when many other trees are turning of a yellowish green, and are beginning to shed their leaves. It rarely seeds. I have been in India since 1857, and although in Lucknow there are many "Neem Chameli" trees, as natives call the Millingtonia, I have only seen one tree bearing seed, and that sparingly, and only on its eastern aspect. The seed is contained in a Siliqua-like pod, about a foot long.

The Millingtonia is one of those trees expressly made by Nature for avenues, and as a matter of course it is rarely or never used for such a purpose! An avenue with three rows of Millingtonia trees on each side would be worth going a long distance to look at. It would thus have space not only for a carriage-road, but also side-ways for horses and pedestrians. As it grows straight upwards to a great height it would not spread over the road, nevertheless it would give plenty of shade on either one or other side, except perhaps for half-an-hour at mid-day, and that if the avenue were due north and south. Its not giving branches which would cover the road, as in a tunnel, is, I think, a great advantage in India—and, indeed, in all hot countries. The shade over a road during sunshine is grateful enough, but in the hot weather after sundown, when the open country has become comparatively cool, all roads overshadowed by trees remain for hours suffocatingly hot, owing to the trees obstructing the radiation of the heat absorbed by the road during the day. It is enough to pass from the open ground to that under trees to feel at once a great rise in the temperature. During the hot weather at night no one thinks of sleeping under a tree. On the open "maidan" it is cool, and sleep is possible, while under trees the air remains as hot as an oven.

The wood of the Millingtonia hortensis is soft and loose-textured, and almost worthless excepting as an inferior firewood. I was thinking that a combination avenue of tall trees, such as the Millingtonia, and some pretty round-headed tree, such as the Erythrina tuberosa, planted alternately, or three of one kind and one of the other, or *vice versa*, would make a novel and most charming thing. This tree is propagated either by cuttings or root-buds which are thrown up in the surrounding ground, especially of older trees. These root-buds serve, instead of seed-buds, to save it from extinction. E. Bonavia, M.D., Etawah.

## SATYRIUM NEPALENSE.

THE genus Satyrium had always been considered to be confined strictly to Africa, until from material obtained from the collection of Buchanan Hamilton in 1824, D. Don, in *Prodr. Fl. Nep.*, p. 26, published this curious and handsome species, giving the habitat as Sikkim, 7000—12,000 feet. In 1838 two other well-defined Indian species, *S. Wightianum* and *S. ciliatum* appeared, and three years later Achille Richard named three others, which he received from the Nilgherry collection of Perrottet, viz., *S. Perrottetianum*, *S. albiflorum*, and *S. pallidum*, but these Dr. Lindley considered were not botanically distinct from the varieties previously named. *S. nepalense* is easily recognised by its large coloured bracts and purple flowers. Our illustration

(fig. 38) gives—a, front view of flower; b, side view; c, back view; d, column; e, side view of the same; f, pollen masses; d, e, f, being enlarged.

The Satyriums, both African and Indian, grow well together if properly treated; and some day or other, when some of our clever Orchidists, who seem only to have to turn their attention to any genus in order to bring out its full beauty, can find time to arrange a low house of the same temperature as the Odontoglossum-house, but somewhat drier, for the reception of terrestrial Orchids, we shall see the golden, crimson, yellow, purple, and white spikes, with their numerous flowers, which travellers often tell us of, and our stray specimens exhibit, and then their beauty and fragrance will be appreciated. The Satyriums are all terrestrial Orchids, with tuberous or Orchis-like roots, the flower-spikes proceeding from the centre of the crown of leaves, which cap the last-made tubers.

After flowering they want a restricted supply of water for a month or so, but should not be allowed to get too dry, as the formation of the next season's root-growth soon begins; it is, therefore,

FIG. 38.—FLOWER OF SATYRIUM NEPALENSE.

A, Front view of flower; B, Side view; C, Back view; D, Column; E, Side view of same; F, Pollen-masses.

the best time to repot them soon after flowering, the material used being all sandy peat, or two-thirds sandy peat and one-third loam. James O'Brien.

## NOTES ON THE CULTIVATED ASTERS.—IX.

(Continued from p. 142.)

SUBGENUS V. CALIMERIS.—Bracts of the involucre subequal, uniform in texture throughout. Ray-flowers fertile, spreading. Pappus shorter than the achene, of few rigid bristles. Connects Aster with Boltonia.

47. *A. Thomsoni*, Clarke; Hook. fil., Fl. Ind., iii., 253. *Calimeris flexuosa*, Royle.—Stems hairy, erect, simple or branched, 1—3 feet long. Leaves large, thin, sessile, broadly ovate, acuminate, hairy, coarsely toothed, the lower 3—4 inches long, 1½—2 inches broad. Heads few, arranged in a lax corymb, sometimes solitary. Involucre broadly campanulate, ½ inch in diameter; bracts sub-

equal, lanceolate, acute, greenish. Expanded heads 1½ inch in diameter; ligules 30—40, whitish, ½ inch long. Achene clavate, hairy, ½ inch long; pappus white, shorter than the achene, composed of a few rigid unequal bristles.

Temperate region of the Western Himalayas. Our Kew plant was given us lately by the Rev. C. Wolley Dod. A very distinct and interesting species. *Calimeris incisa*, DC., which is common in gardens, and was classified by Fischer in Aster, is now placed by Benth in Boltonia. It has a very small paleaceous pappus.

SUBGENUS VI. GALATELLA.—Bracts of the involucre without any leafy tips. Ray-flowers sterile and reflexing irregularly. Leaves narrow and rigid, usually distinctly gland-dotted. Achene and pappus as in Orthomeris. This subgenus is confined entirely to the temperate regions of Europe and Asia. All the species are very closely allied to one another, and authorities differ widely as to their number and limitation. In a garden they catch the eye by the untidy irregular way in which the ligules reflex. Galatella has been usually kept up as a genus, but is merged in Aster by Benth and Hooker.

48. *A. acris*, Linn. *A. linifolius* and *hyssopifolius*, Linn. *A. punctatus*, W. and K. *A. dracunculoides*, Besser. *Galatella linifolia*, *hyssopifolia*, punctata, insculpta, pauciflora and biflora, Nees. *G. dracunculoides*, DC.—Stems firm in texture, terete, scabrous, stiffly erect, 1½—2 feet long. Leaves crowded, sessile, ascending, lanceolate, entire, acute, firm in texture, densely gland-dotted, the lower 1½—2 inches long, ¾—1 inch broad, obscurely 3-nerved. Heads very numerous, arranged in a dense panicle with corymbose branches. Involucre campanulate, ½ inch in diameter; bracts pauciserial, lanceolate, firm in texture. Ligules 8—10, bright lilac, ¼—½ inch long, reflexing irregularly. Achene densely persistently silky, slightly flattened; pappus copious, flexuose, whitish, nearly ¼ inch long.

The form as above described is the *Galatella punctata* as understood by Nyman, which he limits geographically to France and Italy. From this *G. insculpta*, Nees, of Hungary and Russia, differs mainly in its broader, more distinctly 3-nerved leaves, and the Siberian and East European *G. dracunculoides*, DC. (*G. pauciflora*, Nees), by its smaller heads and fewer ligules. *Aster linifolius* and *hyssopifolius* of Linnaeus, were both described by him under some misapprehension as American species. The former is a variety of the present species, with very narrow one-nerved leaves, and few very short ligules.

49. *A. canus*, Waldst. and Kit., Pl. Hung., t. 30. *Galatella cana*, Nees. *G. canescens*, Cass.—Stems erect, 2—3 feet long. Leaves sessile, lanceolate, entire, coated on both sides with persistent silvery tomentum, beneath which the glandular dots are hidden, entire, distinctly 3-nerved from base to apex, the lower 1½—2 inches long. Heads numerous, arranged in a dense panicle with corymbose branches. Involucre campanulate, under ½ inch diameter; bracts lanceolate, green, firm in texture. Ligules 8—10, bright lilac, ½ inch long. Achene densely silky, rather flattened; pappus copious, dirty white, ½ inch long.

Hungary, Moravia, Slavonia, and Servia. A very distinct species, well represented in the Kew herbaraceous ground.

50. *A. dahuricus*, Benth. *Galatella dahurica*, DC.—Stems stiffly erect, 2—3 feet long; leaves lanceolate, sessile, acuminate, copiously gland-dotted, the lower 1½—2 inches long, distinctly three-nerved. Heads numerous, arranged in an ample panicle with corymbose branches. Involucre campanulate, ½ inch diameter, well imbricated; bracts green, multiserial, lanceolate. Ligules twenty or more, pale lilac, ¼—½ inch long. Achene densely pilose, little flattened; pappus ½ inch long, white, flexuose.

Central Siberia eastward to Amurland. A near ally of *acris*, from which it mainly differs by its larger heads and more numerous ligules.

51. *A. trinervis*, Desf. *A. acris*, Willd. *Galatella acris*, Nees. *G. rigida*, Cass.—Stems scabrous, 1½—2 feet long. Leaves lanceolate, very firm in texture, very obscurely if at all gland-dotted, distinctly three-nerved, the lower 1½—2 inches long. Heads in a dense corymbose panicle. Involucre ½ inch diameter; bracts lanceolate, rigid in texture. Ligules 8—10, lilac. Achene and pappus as in *A. acris*.

South of France. Differs mainly from *acris* by its almost undotted leaves. The Siberian *G. Hauptii*, Lindl., of which *G. fastigiata*, tenuifolia, and squarrosa are scarcely more than mere forms, differs mainly

from the narrow-leaved forms of *acris* by its undotted leaves.

Subgenus VII. *LINOSYRIS*.—Differs only from *Gala-tella* by the ray-flowers being entirely absent.

52. *A. Linosyris*, Bernh. *Chrysocoma Linosyris*, Linn. *Linosyris vulgaris*, Cass.—Stems scabrous, stiffly erect. Leaves crowded, ascending, linear, 1-nerved. Heads many, in a dense corymbose panicle. Involucre campanulate,  $\frac{1}{4}$  inch in diameter; bracts pauciserial, lanceolate, acute. Ligules entirely absent. Achenes hairy, rather flattened; pappus  $\frac{1}{8}$  inch long, of copious white ciliated bristles.

Spread all through Europe from Britain to the Caucasus. There are about half a dozen other species

elsewhere; on all occasions staging specimens of a high order of merit; but the plants appearing in our illustration were universally regarded as the best he had ever placed in an exhibition tent. So much were the committee of the Bath show pleased with the specimens that they engaged the services of a photographer to make a picture of them on the spot; but after being two hours making the attempt, no satisfactory result occurred. After the plants were taken back to Clyffe Hall, they were photographed as seen in the illustration. Some idea of their height and dimensions can be realised by a comparison with the stature of Mr. Lye, who is standing by his plants and who is of average height. It should be mentioned, that previous to being photographed they

duced. Four of these are dark varieties, viz., Bountiful, Charming, Elegance, and the Hon. Mrs. Hay—the latter one of the oldest, but one of the freest, and scarcely without an equal for its great freedom of bloom. The remaining five are light varieties, viz., Lye's Favourite, Harriet Lye, Star of Wilts, Pink Perfection, and Beauty of the West.

The specimens figured average from two to five years of age. It is really marvellous what Mr. Lye can do with a *Fuchsia* in two years, and lest it might be supposed that he has plenty of glass accommodation and can keep his plants under glass continuously, it is due to him it should be stated that he is very deficient in house accommodation, having but two small houses, in one of which (a cold house) he winters his

FIG. 39.—MR. LYE'S FUCHSIAS.

of this subgenus in Siberia. It will be noted that the three subgenera dealt with in this instalment of my paper all belong exclusively to the Old World. *J. C. Baker.*

(To be continued.)

### LYE'S FUCHSIAS.

THE group of *Fuchsias*, an engraving of which appears at fig. 39, represents a collection of nine specimens raised and exhibited by that well-known cultivator, Mr. James Lye, of Clyffe Hall Gardens, Market Lavington, at an exhibition held in Bath in September last, and which received the 1st prize in the premier class for that number of plants. For many years past Mr. Lye has exhibited *Fuchsias* at exhibitions held at Bath, Trowbridge, Devizes, Calne, Chippenham, and

had travelled by road from Market Lavington to Bath and back, a distance of 52 miles, in addition to having been exhibited two days. They returned to their home apparently little the worse for wear, which immunity from harm is no doubt owing to the admirable system of tying adopted by Mr. Lye. It is sometimes said that the act of tying-in the flowering shoots in this manner gives the plants a somewhat severely formal appearance, but there is an abundance of healthy foliage and a wonderful profusion of finely developed flowers, showing the most careful and painstaking cultivation. It is only those who are privileged to see these unrivalled plants who can appreciate them at their proper worth.

It has been stated already that the varieties figured are all of Mr. Lye's own raising, which fact attests to the value of his seedlings, many of which he has pro-

plants and brings them on until he can place them with safety in the open air in early summer. His method of treating the specimens as set forth in his own words may prove helpful to some of our readers:—"After the plants have done flowering, say about the third week in October, I cut them back into the shape best fitted to form symmetrical specimens, and keep them dry for a week or ten days, to check the bleeding of sap which follows; after that I give a little water just to start them into growth so as to make shoots about three-quarters of an inch in length, in order to keep the old wood active and living. I keep them in a cold house, and give but very little water until the first or second week in February, when I shake the old soil from the roots, and repot them into a fresh compost made up of three parts good loam, one part well decomposed manure, and one

part leaf-mould and peat, with a good bit of silver or sea-sand to keep it open. In order to make large specimens they are shifted as soon as the pots are filled with roots. About the first week in June I place them out-of-doors on a border somewhat sheltered, and syringe the plants freely every day during hot weather to keep the foliage clean and healthy. I top them back till about seven or eight weeks before I want to show them, according to the requirements of the variety, as some of them require it to be done more freely than others. I give them liquid manure, using what I get from the cows, which with some soot is put into a tub, and allowed to stand a week or ten days before using, and I give them a good dose once a week as they show signs of flowering." In order to preserve his plants from the effects of hail and very heavy rains, a rough framework is erected, and over this is stretched some floral shading, which can be readily removed when required; it also serves the purpose of shading the plants from the sun in very hot and scorching weather.

During his career as an exhibitor of Fuchsias Mr. Lye has taken nearly one hundred 1st prizes—a measure of success which fully justifies the bestowal of the title of being the Champion Fuchsia Grower of his day. R. D.

### EUCHARIS AMAZONICA.

As this subject seems to have approached a crisis in which it bids fair to be thoroughly threshed out, may I, by your kind permission, trespass on your valuable space just to offer a few remarks on this long agitated question? We have a house devoted to *Eucharis* and *Gardenias*, with climbers growing on the roof; it is a span-roofed structure, running east and west. In the centre of this house there is a bed 45 feet long by 8 feet wide, enclosed by a brick wall 3 feet high; around this bed, outside the brickwork, we have two rows of 4-inch pipes. This bed is filled with pebbles to within 6 inches of the top, to hold moisture, and on the top of this bed we have a stage 6 feet high, with five shelves, one on the top and four on either side and ends, and on this stage we stand our *Eucharis*. On either side of this novel stage we have beds with *Gardenias* planted out, and *Allamandas* to cover the south side of the roof, and *Stephanotis* to cover the north side; these are also planted out, and, I may add, the whole structure is heated by ten rows of 4-inch pipes. The *Eucharis* were shifted in April last from 24's and 16's into 12's and 8's size pots, while some of the more vigorous were put into 6's into a compost consisting of three parts turfy loam, one part fibrous peat, and one part old hotbed manure and silver-sand. After potting they were stood on the stage and received but little water at the roots until they began to push through, but were syringed overhead five and six times a day during bright weather, and the paths and every other surface being kept sprinkled a very moist atmosphere was maintained, the temperature being kept at 70° at night, 85° by day, 90° with sun-heat, and during this time the *Allamandas* formed a dense shade overhead. As soon as the *Eucharis* roots had reached the sides of the pots they were supplied liberally with soft water, and with this treatment they had by the end of June filled their pots with large white fleshy roots, and made foliage 3 feet long and 8 inches wide, of a beautiful dark green colour, without a spot or blemish of any description. At this period they were kept somewhat drier at the roots, and were syringed overhead less often; the temperature also was allowed to drop a few degrees, during which time they seemed to enjoy a comparative rest, and the first week in August the first flower-spikes appeared, about 106 in the whole batch; and since that date, by a systematic course of treatment, they have flowered five consecutive times, giving us from 100 to 250 spikes at each flowering, and from four to seven flowers on each spike, the individual flowers measuring from 4 to 6 inches across, and this same batch are again coming into flower for the sixth time in six months, and I may mention all this has been accomplished in the same house without dividing the plants into batches, dried off, or rested, as I often see recommended, and I expect another crop from the same plants at Easter, after which time they will be again dealt with as last year. The fact of the matter is this. To cultivate *Eucharis* successfully three great essentials must be observed, viz., heat, shade, and moisture. Each of these must

be given them in correct proportions, which under the varying circumstances of different gardens can only be indicated generally. They cannot withstand the direct piercing rays of the sun or a dry hot atmosphere, and they are equally unhappy in a wet and cold atmosphere. Each of the above will cause the healthiest of plants to become weak when the miserable state of things termed disease follows. I may add when our *Eucharis* were potted no respect was paid to size of bulbs; small and large were potted together in the same pot, and by way of variety some were potted covering the bulb about half way, others were buried entirely, and others were put almost hard on the crocks, and the results in each case were precisely the same. Our treatment during the past five months has been to syringe overhead three and four times a-day, weather permitting. The paths, which are of cement, are always sprinkled with water, and the atmosphere is at all times heavily charged with moisture. By these means, when carrying a crop of flowers, they are supplied at every alternate watering with weak liquid manure made of the drainings of the horse stable. The temperature is 65° at night, 70° by day, 75° with sun-heat, unless in frosty weather, when the thermometer falls below the above readings. H. H., West Brighton Nurseries.

## Orchid Notes and gleanings.

### LÆLIA ANCEPS.

THE large importations of this species being sold in London and elsewhere comprise specimens of great size, and some of them quite remarkable as to variety. Evidently the white forms are very plentiful, as a sheaf of spikes on which were the dried flowers was exhibited in Stevens' rooms last week. All of them that have yet flowered follow the original *L. anceps* Dawsoni in having coloured lines or other markings on the lip, the sepals and petals being white. Orchid fanciers will look forward to the flowering of these recent importations of the white form with great interest, as they will not only vary in the colour of the lip, but the sepals and petals will be purer, broader, longer, and differently suffused with blush, in some forms more than in others. The bulbs which some of these recently introduced *Lælias* have made in their native haunts are of uncommon size and substance. They are just right to start into growth at once with the established plants, which will also do so as soon as they have done flowering. This is a good time to repot any plants that may require it. The characteristic habit of this species is to form elongated pseudobulbs with a woody stem of some length; these stems have a tendency to push the bulbs over the sides of the pots, or upwards, amongst other old bulbs. The roots will then form outside of the compost in which the plants are potted. It is the nature of the plant to do this, and it is bad management to place peat or any other matter in contact with them. The roots have great attractions for slugs, &c., but these pests must not be allowed to interfere with them. *Lælia anceps* is not like *L. majalis*, *L. autumnalis*, and some others that will flower for a year or two and speedily degenerate. I have grown the same plants, and flowered them successfully for twenty years. A plant of this kind becomes an old and valued friend, which we look to welcome us with its lovely flowers during each recurring winter. It does best in a light position in the *Cattleya*-house, and the plants should be potted in the first place, just as *L. purpurata* or *Cattleya Mossie* is potted, with the pots filled two-thirds full with clean drainage, the remainder with good fibrous peat, sphagnum, and broken pottery with it. The newly imported plants must have a good hold of the compost, it must be pressed in firmly around the old bulbs; if the plants can be readily moved in the pots they will not be likely to do well. J. Douglas.

### CYRTOPIDIUM CARDIOCHILUM.

This interesting species is well figured in the *Orchid Album*, but the Editor states that it has gone out of fashion. It is a small genus of Orchids well worth cultivating, as the flowers are not only showy, but they are well set off by the noble growth of the plants. The flowers are also sweet-scented. The species alluded to was introduced so long ago as

1846. *C. punctatum*, introduced from Brazil in 1823, is also a very handsome plant. These Orchids should find a place in all large collection. The Editor states that the plants require plenty of pot-room, to be potted in fibrous loam and decayed manure, and to have free exposure to light, shading only when the sun is very powerful. J.

### DENDROBIUM HASELTI.

A native of Java, with erect slender stems and sheathing lanceolate leaves, from whose axils emerge short racemes of small rosy-lilac flowers with a well-marked triangular spur. The species was originally described by Blume, and is figured in the *Illustration Horticole* for January, tab. 545.

### ORCHIDS AT MESSRS. J. VEITCH & SONS.

*Saccolabium bellinum* is quaint and interesting, the ground colour of its flowers is yellow, with heavy deep maroon spots, and a fringed labellum. The advance guard of *Cattleya Trianae* is in flower, and with them are to be seen some of the later blooms of *C. Percivaliana*. The contrast between the two species is very great, especially when the pale forms of *C. Trianae* are compared with the brilliant coloured labellum and deeply tinted sepals and petals of *C. Percivaliana*. G. G.

## FORESTRY.

### WORK FOR FEBRUARY: HEDGING.

FINISH as early as possible the trimming of Thorn and other fences. Plant young hedges in ground previously well prepared by trenching. Such work would have been much better performed during autumn, as the Hawthorn is one of our first plants to start into growth. Repair old fences by planting strong bushy plants of Privet, Beech, or Thorn in the gaps. Hedges seldom receive the attention they deserve, and are too often entrusted to those who are practically unacquainted with their management. Cleaning the sides of live fences is, although usually considered of minor importance, one of the greatest aids in the promotion of a healthy useful fence, and should be annually attended to. The various railway companies are certainly to be commended for the very efficient manner in which their hedges are usually managed.

### DRAINING.

Plantation and other drains should now receive attention, and all accumulations of branches and debris should be removed from their course. Scour out, widen, and deepen woodland ditches, and, where necessary, cut new drains for the removal of stagnant water. It will be found a good plan to have the mouths of closed drains examined weekly, more especially during winter, and all obstructions removed therefrom.

### ROADS AND WALKS.

Keep these in a good, sound, passable condition at all times, avoiding ruts and surface irregularities which are anything but pleasant to foot or other passengers. Take advantage of dry, frosty weather for the cartage of stones, gravel or screenings required in their repairs. Now is a good time to construct new roads and walks, or metal such as have by heavy traffic become worn down and irregular on the surface. After applying the metalling give a slight covering of gravel or screenings—the latter is preferable, and press all firmly down with a heavy roller. The gratings of roadside drains will also require attention to prevent their becoming choked with small twigs and sediment.

### GENERAL WORK.

Prepare and stack faggots for home consumption, and when perfectly dry have them carted under cover for use as required. In the pleasure ground fork shrubby beds, peg down evergreens where their extension is desired, and replace any dead plants by others of a different kind from the nursery border. Where *Rhododendrons* are planted on poor clay soils a dressing of cow-dung and leaf-mould will not only promote rapid growth but add a decided lustre to the foliage. Levelling and ground-work improvements may also, during favourable weather, be carried on, and Furze, Briers, and other objectionable vegetation may be grubbed up and removed from the greensward. Manures previously carted should now be turned and all nursery compost heaps well mixed up before

being applied to the breadths and borders. Arboreal vegetation looks remarkably well, and has every appearance of producing strong shoots and being unusually floriferous during the coming season. Where old trees are considered worthy of preservation all dead branches should be removed therefrom, hollows or decayed places filled up or covered over to prevent the ingress of water, and a trench formed all around them and refilled with some rich loose compost. The soil close to the stem should also be thoroughly loosened and mixed with leaf-mould, or well decayed farmyard manure. Saw-mill work should be well forwarded during the present month, and a stock of charred and tarred gate and paling posts got ready for spring fencing. The latter is well worthy of attention, and may be engaged in during winter, when the inclemency of the weather prevents the workmen from pursuing their usual occupations. Collect all prunings, more especially those of the Yew, Laurel, and Box, and have them either safely disposed of or burned on the ground. Yew and Box are deadly poison to many animals when in a half withered state, as the numerous recorded cases only too plainly show. Continue to collect the refuse and debris of plantations, which, although it may not be saleable, or even pay the cost of collecting, still, to insure healthy crops of trees free from the attacks of insect pests, it is really of the utmost importance that woods be gone over annually to clear them of all fallen timber and decaying refuse.

This season, for the first time, I have seen the Corsican Pine (*Pinus Laricio*) infested by the Pine Beetle (*Hylurgus piniperda*), but it is but right to say that the trees, which had been planted the previous summer, were in a very unhealthy state at the time they were attacked. The origin of the beetle was clearly traced to decayed Pine branches that had been left about when removing blown-down timber during the previous season.

#### THINNING.

Excellent opportunities have been afforded by the open weather of the past month for the general felling of underwood, and bringing up of all planting arrears. Hardwood plantations, Oak excepted, should, as far as possible, be finished this month, before the buds begin to expand, after which they are liable to damage and disbudding by the falling thinnings. Where practicable dispose at once of all thinnings, and take advantage of dry frosty weather for the removal of timber into lots or convenient stations for loading, always bearing in mind that good roads considerably enhance the value of timber generally. The thinning of plantations should be executed gradually, and with great caution, and always proportionately to the exposure, if the remaining trees are to retain their health and vigour. Avoid over-thinning the outer lines of trees, more especially on the exposed or windward side, and look more to the benefit of the remaining timber than to the value of the produce cleared out.

#### ROOTS.

Wherever trees have been blown over, but more particularly within the policy grounds, all other work should be suspended until they are removed, as few things have a more neglected or untidy appearance than fallen trees with upturned roots, especially where visible from drives and walks. The cheapest and most effectual way of disposing of tree roots is to dig a large pit immediately behind them, and into which they will fall when severed from the trunk. Not less than 2 feet of soil should cover such roots.

#### PRUNING.

Prune branches that have become broken or twisted by the late gales, and paint the wound caused by amputation with tar or composition specially prepared for the purpose. The wound should be carefully dressed with an adze or sharp pruning-knife and made perfectly smooth previous to applying the tar or composition.

#### NURSERY.

The nursery will now claim the almost undivided attention of the forester who has had much planting on hand. By the end of the month all seedlings should, if possible, be planted and the work of the home nursery should be well advanced. In planting seedlings give plenty of room, not only between the individual plants, but the lines as well, so as to admit of plenty of room for weeding and keeping these in a proper healthy condition. For hardwoods generally 5 inches

between the plants and 18 inches from row to row will be sufficient; Larch, Scotch Fir, and Spruce may, however, be planted closer, say 12 to 15 inches between the rows, and 3 or 4 inches from plant to plant. During fine weather sow seeds of Ash, Sycamore, Beech, Elm, and Thorn in ground previously well prepared and broken up. The beds may be 3 feet in width and 18 inches apart. Plant cuttings of Elder and Poplar, the former with one eye below-ground and two above; and the latter, selected from the thick end of the last year's shoots, 6 inches below-ground and 2 inches above. In nursery management it should always be remembered that deep planting is highly injurious to trees of all sizes. Overcrowding should also be sedulously avoided, a fact that is at once apparent by the number of ill-grown, weakly plants sent out by some of our nursery firms.

#### FENCING.

Pay attention to all woodland fences, gates, tree guards, and rabbit-proof wire nettings, and where these have become damaged or broken repairs should at once be executed. At this season many of the rarer coniferous and other trees are apt to be injured by ground game; this can only be avoided by surrounding them with wire-netting, or where bare stems occur by frequent applications of Davidson's composition. Tar is also useful, but becomes a tiresome application from the frequency with which it requires renewing. The latter should never be applied wholesale, but with the utmost caution, especially to the stems of the Holly and kindred plants. The moorings of ornamental park trees, one of the fencer's duties, should, especially during stormy weather, receive careful attention at least once each week. *A. D. Webster.*

## THE PROPAGATOR.

### THE PROPAGATION AND CULTURE OF ANTHURIUMS.

(Continued from p. 83.)

ANTHURIUM ANDREANUM is a splendid plant, and for brilliant colour almost surpasses the well-known *A. Scherzerianum*, and, therefore, well deserves special attention from the gardener. From seed it can be raised in large quantities, and as success will very much depend upon its quality the seed should not be purchased, but should be raised by personal fertilisation. In fertilising a small camel's-hair brush should be brushed along the spadix from end to end and around it. This should be done three or four times at intervals of two or three days. The plants fertilised should be separated from the others, and placed together in a part of the house where they will be out of the reach of the syringe. If they throw up any leaf-growth it should immediately be pinched out, so that seed-ripening alone may be encouraged. As soon as the seed is ripe it should be gathered and cleaned. There is a glutinous substance surrounding the seeds from which they should be freed. To do this it is a good plan to take the ripe fruits between the finger and thumb, squeeze the seeds out, and thinly spread them over a sheet of paper upon which a little finely sifted dry sand should have previously been shaken. After a few hours the seeds will have become somewhat dry, and can be brushed into a small pan ready for sowing. The most convenient pans for the seeds are those of large, deep, 48-size, and well drained. These should be filled with soil composed of one-half peat, one-quarter loam, and one-quarter silver-sand, to which should be added small quantities of finely broken potsherds and well-chopped sphagnum moss, besides a little charcoal, the whole to be well mixed together, and rubbed through a  $\frac{1}{4}$ -inch sieve. The soil in the pans should be made  $1\frac{1}{2}$  inch higher in the centre than the rim of the pot, to which it should be made to slope gradually, and after the pans have been well watered the seeds can be sown lightly on the surface of the soil, but they must not be covered with it. The pans should now be placed in a cutting-case or frame upon a gentle bottom-heat; if the case be a deep one they should be placed upon inverted pots, so as to bring the seed-pans as near the light as possible. Here they must be watered with a fine rose-pot as soon as they become dry, and shaded from the strong rays of the sun, and besides this they should be ventilated for

one hour both night and morning. When the seedlings have grown an inch in height the pans should be taken from the case and stood upon the open bottom-heat. At the expiration of a few days they can be potted each into a small thumb-pot, and must again be put in the cutting-frame near the glass; they must now receive a good watering, and every night and morning sprinkled with a fine rose-pot, shading them lightly, and for ventilation the lights of the cases must be raised an inch both in front and behind, and the air should not be taken off either during the day or for the night. The plants should be treated in this manner until they are strong enough to be potted into larger pots. For a few days before the plants are taken out of the case for this purpose more and more air should gradually be given them, and before potting them they must be allowed to stand a few days upon the open bottom-heat. They can at the end of that time be potted into small 60's, and must be replaced upon open bottom-heat, and sprinkled night and morning with a fine rose-pot. When they have rooted through the soil, and have gained sufficient strength, they should be potted into large 60's, and then moved to a front platform in a good growing house. Here they must be well watered at the roots, and slightly syringed or sprinkled as before, besides being shaded from the sun, and upon every fine day liberally supplied with air. When they again require larger pots they should be potted into large 48's, and again into a larger size if necessary.

#### SOIL.

With regard to soil, at and from the time the plants are potted into small 60's the following mixture should be used:—One-half good turfy loam, one-quarter fibrous peat, and one-quarter river sand, to which should be added small quantities of chopped sphagnum moss, ballast, or finely broken potsherds, and charcoal broken into pieces of Walnut size. It should be kept in mind that, in potting, the crowns of the plants must be kept about an inch above the level of the rim of the pot. The seeding of Anthuriums is well worth doing, as the seedlings give a quantity of compact plants which often thrive better than those from cuttings. This variety can also be increased by division. To do this what is called the crown of the plant should be taken out with a sharp knife, *i.e.*, a piece of the main stem or top shoot, which should have two or three roots attached to it. Each of these pieces should be firmly potted into small 60's, placing to each pot three sticks, forming a triangle, and tying to each of the sticks one of the three principal leaves on the cutting in order to keep them firmly in the pots. A little sand should be put at the base of each piece in potting, and when they have been potted they must be well watered and placed in a cutting case or frame. To the case they must be kept well watered and shaded from the sun, and air should be given them for an hour at night and in the morning, but as soon as they have well rooted through the light of the frame should be raised an inch, and kept so both day and night for a few days before they are turned out upon the open bottom-heat. Here they should remain until they are a little hardened, when they should be potted into large 48's and put in a good growing house to be treated in the same way as the seedlings.

#### STOCK PLANTS.

The plants that have been cut down will be very valuable as stock plants, and should therefore be taken great care of. A stick should be placed in each, and the leaves looped up to it as erect as possible, and in order to prevent the exudation of sap a little dry sand should be put upon the surface of the cut for three or four days. When this has been done they should be replaced upon the bottom-heat, and if care be taken they will continue for years to throw up young growths, and as soon as these are strong enough they can be taken off and put in as cuttings.

The treatment above given can be applied to all Anthuriums of like growth, such as *A. crystallinum*, *A. magnificum*, *A. Dechardii*, *A. floribundum*, *A. hybridum*, *A. ornatum*, *A. regale*, *A. tenuissimum*, *A. Veitchii*, *A. Warocqueanum*; besides these there are a few climbing or trailing varieties which propagate very freely. The cuttings should only have one leaf and one eye, and should be put in in the ordinary way. They root freely, and will soon form good plants. *T. O.*

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Feb. 16	Sale of 5000 <i>Lilium auratum</i> , at Stevens' Rooms.
TUESDAY, Feb. 17	Sale of Valuable Imported Orchids, at Protheroe & Morris' Rooms. Clearance Sale of Nursery Stock, at Newing's Nursery, Deal, by Protheroe & Morris.
WEDNESDAY, Feb. 18	Sale of Lilies, Roses, and Plants from Belgium, at Protheroe & Morris' Rooms. Sale of Roses, Fruit Trees, Hardy Plants, and Flowering Orchids, at Stevens' Rooms.
THURSDAY, Feb. 19	Meeting of the Linnean Society. Sale of Imported Orchids from Mr. Sander, at Stevens' Rooms.
FRIDAY, Feb. 20	Sale of Valuable Imported Orchids, at Protheroe & Morris' Rooms.
SATURDAY, Feb. 21	Sale of Hardy Plants and Bulbs, at Stevens' Rooms.

THE annual general meeting of the ROYAL HORTICULTURAL SOCIETY was held on Tuesday last, in the conservatory, under the presidency of Sir TREVOR LAWRENCE. The report, which will be given next week, was taken as read and the financial account—which, *mirabile dictu*, shows a balance in favour of the Society to the extent of £28—was also passed without material comment. The manner in which the books are kept, we may add parenthetically, reflects the utmost credit on the accuracy and neatness of Mr. DOUGLAS DICK, the Financial Secretary. The most serious item in the report is the large number of resignations and of defaulters. While we regret the loss of cash that this involves, it is abundantly evident that the Society can get on very well without such less than lukewarm support, and that a smaller body of Fellows who are really interested in horticulture, and an earnest Council devoted to carrying out the legitimate objects of the Society, are much more likely to manage the Society's affairs usefully and creditably than a larger number of adherents caring nothing for horticulture proper. While, on the one hand, there has been, as every one expected there would be, a large falling off in the South Kensington element, on the other the Society has been freed from debt and freed from the incubus of keeping up the Kensington Garden. Indeed, so far from that garden, or what remains of it, being a drag on the Society, it was paid for maintaining it in order by the Health Exhibition Committee last year, and similar arrangements, satisfactory to all parties, have been entered into for the present year. So far, then, things are going on smoothly. There is an excellent Council, and the additions made on Tuesday will strengthen it materially. The improved spirit as compared with that which was evinced during the years of terror, is manifest, even in the tone and wording of the report. It is evident that the present Council appreciates the legitimate work of the Society, and endeavours, so far as circumstances permit, to carry it out. And here it is fitting and just that cordial acknowledgment should be made of the services of Lord ABERDARE, the retiring President. His Lordship claims no special merit as a horticulturist, but his rule has been eminently judicious. Elected at a time when the Society was at the very lowest ebb—in debt and difficulty, despised outside and torn by faction inside—Lord ABERDARE undertook no enviable office. Nevertheless by his courtesy, tact, and business management, he conciliated opposing parties, saw the Society through its disastrous law suits (undertaken, it will be remembered, in vindication of the honour and good faith of the Society), and now, finding the Society's affairs in a satisfactory condition and general harmony prevailing, he retires, simply because he is overburdened by the weight of other public and official duties. The Fellows at large will cordially join in the vote of thanks proposed by Sir TREVOR LAWRENCE, and seconded by Mr. GUEDALLA, in the following terms:—

"The Royal Horticultural Society desire to express to the Right Hon. Lord ABERDARE their grateful acknowledgment of the eminent services he has rendered to

them during the ten years he has been their President—services which largely contributed to the extrication of the Society from a position of serious embarrassment and difficulty. The Royal Horticultural Society greatly regret his Lordship's resignation, owing to the pressure of other engagements, of a post which he has occupied to their signal advantage."

And now, having sped the parting guest, it is a pleasure indeed to welcome the incoming President. Sir TREVOR LAWRENCE, as President of the Royal Horticultural Society, is, to all intents and purposes, the right man in the right place at the present time; and with the strong Council to back him, we may look on the prospect as encouraging. The proposed exhibition of Orchids and the Conference thereupon, will be looked forward to with the greatest interest.

We trust that speedy steps may be taken to secure adequate accommodation for the Fellows, who now have no place even to sit down in. A meeting-room is sorely wanted, and if this could be obtained temporarily, and provisionally, we could wait a little longer for the much needed offices and accommodation for the library. Surely it would be possible to find some corner in which a temporary reading room for the general use of the Fellows could be erected pending the acquisition of that more ample permanent accommodation which is so urgently needed. Reverting to the proceedings at the general meeting, it may be added, that Mr. LIGGINS and others made some comments on the Society's proceedings, and that Mr. SHIRLEY HIBBERD urged the Council to take steps to secure a larger number of exhibitors among amateurs and others unconnected with trade interests.

— THE PARKES MUSEUM.—The large and valuable collection of books in the Health Section of the library of the International Health Exhibition—consisting of about 1500 volumes—has been presented to the library of the Parkes Museum. Special arrangements have been made for the admission of students to the library and reading room.

— ROSE W. F. BENNETT.—We understand that Mr. EVANS, of Rolandsville, Philadelphia, has purchased the whole stock of this Rose, and that it will be sent out this spring by Messrs. W. PAUL & SON, of Waltham Cross. Mr. EVANS has also purchased "Her Majesty," the price for the two Roses, we believe, having been not less than £1600.

— PALERMO BOTANIC GARDEN.—We have received the catalogue of seeds offered in exchange by the Palermo Botanic Garden.

— STRELITZIA REGINA.—There is a fine plant of this species carrying the unusual number of seventeen spikes, at Cac Gwyn, the residence of T. F. MADDOCKS, Esq. This is a subject of easy culture that should be more commonly grown, the handsome bird-like flower of gorgeous colours being always striking.

— LINNEAN SOCIETY OF LONDON.—A meeting will be held on February 19, at 8 P.M., when papers will be read:—"Recent Ephemerideæ or May Flies" (Part III.), by Rev. A. E. EATON; on "Mosses of the genus *Fissidens*," by W. MITTEN, Esq.; and on the "Structure of Ambulacra of living *Diadematidæ*," by Professor DUNCAN.

— THE COMING FORESTRY EXHIBITION.—The prospectus for this Exhibition is now before the public, and those who take an interest in such matters may judge of what the promoters propose. An exhibition of this kind might be made to cover an immense field; in fact, to include virtually everything of importance wherein wood enters into the construction. After looking over the prospectus that which will most strike the reader is the improbability of there being anything approaching a complete exhibition of useful and ornamental trees and shrubs, combining the immense number of species and varieties of deciduous and evergreen kinds that will thrive in this country, and of which not a few of the deciduous sort—although they may have been long

enough in the country—are not so well known as they deserve to be. A representative group, such as a good many of the leading nurserymen in the kingdom could exhibit, would cover a good deal of ground, and at the price the executive require (18s. per yard super), would amount to a sum that, if we are not mistaken, few, if any, will be found willing to pay. The cost of exhibiting groups really representative, such as we have indicated, would be no trifling matter in itself, leaving out of account having to pay heavily for being permitted to do it.

— A NEW SEEDLING DENDROBIUM.—There is a very pretty hybrid *Dendrobium* now in flower at Messrs. VEITCH'S; it is interesting as being raised from the hybrid *D. endocharis*, which was the pollen parent, the seed bearer being *D. nobile*. The flower is best described as a pale nobile, but it retains the sweet perfume of the original parent *D. aureum* (*heterocarpum*). *Trichoglottis cochlearis* in flower is also very pretty; it has small clusters of white flowers heavily barred with crimson.

— ORCHID CONFERENCE, 1885.—The Council of the Royal Horticultural Society invite the attention of the Fellows, and of the cultivators of Orchids generally, to the Conference on Orchids, which it is proposed to hold in the Conservatory, on May 12 and 13, and at which the President, Sir TREVOR LAWRENCE, Bart., M.P., will preside. The "invitation" proceeds:—

"The cultivation and popularity of Orchids have extended rapidly of late years, owing to the singular beauty and variety of their flowers, the large and frequent importations, and the introduction, or the raising by hybridisation, of rare and beautiful novelties. The Council hope to assemble at the proposed Conference a thoroughly representative exhibition of Orchids, embracing plants in flower and in seed, and cut flowers, and illustrating the results obtained by hybridisation, the modes of growth, the methods of cultivation, and the appliances and soil used. Several of the chief growers, amateur and professional, have already promised their support. Fellows of the Society, and cultivators of Orchids generally, are invited to contribute to the Conference, so that the exhibition may be as varied and interesting as possible. In all cases, where practicable, the following information should be given, viz.—(1) Name; (2) Native country, if imported; (3) Parentage, if a hybrid. The plants will be staged in the conservatory, where the atmosphere will be especially attended to, so as to ensure in all respects the well-being of the plants. Staging must be completed by 11 o'clock A.M., and all exhibits may be removed after 6 o'clock P.M. on the second day, Tuesday, the 12th, the ordinary meeting day of the committees, will be devoted to a general examination of the various subjects presented. The doors will be open at 12 noon. On Wednesday, the 13th, the Conference will meet in the conservatory for the reading of papers and discussion, the chair being taken by the President at 10.30 A.M. precisely. Notice of intention to exhibit, with amount of space required, must be sent to Mr. BARRON, Royal Horticultural Society, South Kensington, on or before Friday, the 8th of May."

— MR. B. S. WILLIAMS has received a warrant appointing him Nurseryman to H.R.H. the Prince of WALES.

— POLITICAL FLORICULTURE.—Sir STAFFORD NORTHCOTE, speaking at Exeter recently, remarked that the present age seemed the age of the language of flowers. They knew that one flower was associated with the reputation of a statesman whose name would ever be remembered with esteem. He alluded to the Primrose and Lord BEACONSFIELD. It would be difficult to give Mr. GLADSTONE's flower, because he was more at home among trees. Mr. CHAMBERLAIN admired the Orchid, a strange imported flower which had to be nursed with tender care, could not be exposed to the climate of England, and had to be maintained by hothouse shelter. On the other hand, the Conservatives had chosen the Primrose as their flower, found everywhere, and which was a type of fresh hope, fresh determination, and fresh interest to man. The flowers were faithful to the stems, the stems to the root, the root to the rock to which the plant adhered (!), and this indicated the true spirit of the Conservatives of England. Sir STAFFORD apparently understands more about the flowers of rhetoric than he does about the flowers of the field or the garden. We deplore the association of flowers with party politics of any denomination, but if orators will use metaphor, they should take some pains to

use it correctly. We are afraid Sir STAFFORD would stand little chance of election if it depended on a jury of physiologists, florists and gardeners. But, perhaps, the worst offenders in this line are the clergy, which is the more remarkable as many of the cloth are devoted gardeners.

— NATIONAL AURICULA, AND NATIONAL CARNATION AND PICOTEE SOCIETIES (SOUTHERN SECTION). — The schedules of the above societies have been issued to all subscribers, as far as their addresses could be ascertained. There may be members who subscribed for the first time in 1884 who have not yet received them. The New Treasurer (Mr. ROLT, of 170, Hartfield Road,

have large corymbs, and are good growers. There are some new Fuchsias, both single and double, in Fleuve Rouge, Formosa, General Lewal, Indo-Chine, and La France. Some fine zonal Pelargoniums, as Capitaine Krebs, Capitaine Renard, G. Bentham, Henri Martin, J. B. Dumas; and double-flowered varieties in Bastian-Lepage, Friant, Petitjean, Prouve, Abutilon Thompsoni flore-pleno, Begonia manicata aureo-maculata. M. BRUANT, Poitiers, Vienne, France, offers a fine-habited subtropical in Verbesina Mameana, an elegant Bromeliaceous plant in Caraguata Andreana, Pitcairnia Maroni, a hybrid between P. Altensteinii (the pollen bearer) and P. corallina (the seed bearer), the colour a scarlet-crimson; Dahlia reduplicata, very distinct; Hedera helix

*Botanical Magazine*, t. 6184, and a large specimen is in cone amongst the Cycad collection in the Palm-house at Kew. Cones have also been produced there on former occasions. The large seeds are ground by the natives of Mexico and used as Arrowroot; hence the specific name.

— ALOCASIA REGINÆ is a remarkable novelty, which differs completely from the other species of the genus known in cultivation. There are so few of the Aroids which are pubescent, that if the pubescence exists in one of them that constitutes at first a very distinct character, and one of the most easy to recognise. The existence of hair on the petiole and on the lower face of the medial nerve, and of the

FIG. 40.—MEMBLAND HALL. (SEE P. 205.)

Wimbledon) has, it is asserted, applied twice to Mr. DODWELL for an account of the funds and a list of subscribers for last year, but has not yet received any reply. Under those circumstances the Treasurer would be glad to receive promises of support. This can be given in various ways. The first and best is for each subscriber to obtain a new schedule. The second would be for those interested in the success of the societies to double their subscriptions; or thirdly, to give a donation for this year, and so place the societies again on a sound financial basis. Members who have not yet received copies of schedules and a subscription form can do so by applying to Mr. ROLT.

— SOME CONTINENTAL NOVELTIES. — M. LEMOINE'S novelties in flowers: — Three Bouvardias: Triomphe de Nancy, Sang Lorraine, V. Lemoine; all of them—some shade of scarlet—pretty, and having double flowers. They are abundant bloomers,

aurantiaca, fruit orange-red; Monina obtusifolia, a shrub having persistent leaves, belonging to the Polygala family; Vriesia fenestralis, an introduction from Brazil; Philodendron Mamei, a strong-growing Aroid from Ecuador, by M. ED. ANDRÉ.

— DIOON EDULE. — To the uninitiated the huge cone of the female plant appears like an immense flower-bud about to burst open. It is ovoid in shape, and consists of a densely imbricated, erect mass of scales, closely enveloped with hairs, that give to the cone as well as the leaf-stalks a hoary appearance. The elegantly pinnatifid and spiny-pointed foliage is erect when fully developed and young, but gradually assumes a reclining, or even pendent position, when the plant is about to throw up a fresh tier of leaves. A large well-furnished plant in this condition has a very graceful appearance, despite the rigidity of all parts of the leaves. The plant is figured in the

secondary veins, at once characterises the new species, and distinguishes it from all the other Alocasias introduced into the conservatories, as also from all the species described up to this day, with the exception of *Alocasia pubera*, SCHOTT. This last, however, is easily distinguished from the new one in many points—among others is that the peduncles are pubescent, whilst those of *Alocasia reginæ* are glabrous. *Alocasia reginæ* is a striking plant with foliage of a marked character. The petioles are round, pubescent, of a dark green colour set off with purple-brown. The leaves are fleshy, deeply cordated, deep green, glossy on the upper face, purple underneath, with the veins of the lower face green and pubescent. The peduncles are glabrous, slightly compressed, pale green, marked with points of brown purple. The spathe is white, with the tube prettily spotted with purple. They produce a striking contrast with the dark green colour of the leaves. This plant will be

sought after without doubt to produce charming effects with other brilliantly coloured foliage plants. It has been introduced from Borneo by the Compagnie Continentale d'Horticulture of Ghent, and will demand the same care in culture, easy in other respects, as the other species of the genus. It is figured in the last number of the *Illustration Horticole*.

— **ROYAL GARDENS, KEW.**—Young gardeners of ability and ambition to rise in their calling should not overlook the great advantages which a sojourn at Kew offers to them. In addition to the routine duties of management, excellently carried out at Kew, gardeners have the opportunity of seeing and learning more of plants and their culture (excepting, of course, fruit and vegetable culture) than is to be had anywhere else in the kingdom, and the same may be said as to the facilities for acquiring a knowledge of the principles upon which all good culture is based. If our young men do not wish to find themselves supplanted by the Germans—who as a rule are much better educated for their work than our men are—they will avail themselves of every opportunity of increasing their knowledge and not content themselves with mere routine work. The following circular has just been issued showing the mode of admission to the Royal Gardens, Kew:—

"ROYAL GARDENS, KEW.

"Applicants for admission as gardeners into the Royal Gardens are furnished with a copy of this paper, which, when filled in, must be signed by their present or last employer, and returned to the Curator, accompanied by a letter in applicant's own handwriting. The wages are 18s. per week, with extra pay for Sunday duty.

"Applicants must be at least twenty, and not more than twenty-five years of age, and have been employed not less than five years in good private gardens or nurseries. Preference will be given to men who have had most experience in the cultivation of plants under glass, and no application will be entertained from men who have not had some such experience. Where obtainable, testimonials from known practical gardeners should accompany the application.

"The applicant will be informed if his name has been entered for admission, and, on a vacancy occurring, he will receive notice to that effect. Should there be no vacancy within three months from date of application, it must be renewed if employment at Kew is still desired. If not renewed, the applicant's name will be removed from the book.

"Gardeners who remain at Kew a year, and whose conduct is satisfactory, will be eligible, as vacancies arise, for the positions of sub-foremen, and will be recommended, according to the capacity they display, for employment in other first-class gardens either at home, in India, or in the Colonies.

"J. D. HOOKER, *Director*.

"J. SMITH, *Curator*."

— **NOVELTIES IN CONTINENTAL VEGETABLES.**—We take the following notes from the *Garten Zeitung*.—Lettuces—Cabbage kinds:—Pelletier, an excellent one, ranging from large to very large, firm, tender, and of a pretty golden colour, the leaves finely toothed and fringed, resembling Endive. Does not readily run to seed. Golden Trout, a large kind, and very firm, also stands hot weather well. The outer leaves are golden-yellow, spotted and flecked over with reddish-brown. The flavour is tender and fine, and as an ornament to the table it is one of the best varieties of Lettuce. A Chicory, strong growing kind, with crimson leaves, which in blanching become of a lively carmine colour, is one of the most handsome of the Chicories, and very decorative for the table. Much to be recommended. Onions:—White Giant Garganus, a new Italian variety of extraordinary dimensions. It is early; in form flattish, and with a fine mild flavour, much to be recommended for exhibitions. Pale Red Etna, also an Italian introduction, for which, with the other kind, we have to thank M.

DAMMAN & CO., Naples. Silver-white Etna is like No. 2, an excellent kind, that in quantity and firmness exceeds it. The *Bullettino della Società Toscana di Orticultura* notes a Pea, Bliss's Abundance, introduced from America by M. GODEFROY-LEBEUF, horticulturist, Argenteuil, very dwarf, and a great bearer.

— **THE ROYAL BOTANICAL GARDENS, MANCHESTER.**—MR. BRUCE FINDLAY writes:—

"About four years ago we found that the old range of glass-houses which had been standing for fifty years was worn out, and its removal became imperative, consequently it was taken down and a new range was built, not so imposing as the old one, but far better adapted for cultural purposes. Two years later it was found that the exhibition-house was not safe; this also had to be demolished, and the present fine house was built. These improvements have been effected at a cost of £6000. This amount has been raised partly by the creation of life members, partly by the successful Whitsuntide exhibitions, and partly by donations from friends of the Society. When the present magnificent exhibition-house was finished many gentlemen who had plants which had grown too large for their houses, and who had also a desire to embellish the building, presented some fine specimens of various kinds. These, with some of the old plants saved from the old houses in the garden, numbering together 200 fine plants, are at the present time in the exhibition-house, and form a magnificent spectacle. Now, inasmuch as the whole of these plants will have to be removed to make room for the great annual display at Whitsuntide, and inasmuch as we have no house to protect them, are they to perish? This must be the case to a certain extent unless a suitable home be provided. Our only sources of income are derived from annual subscriptions, life membership, and receipts from exhibitions. The exhibitions of horticultural produce, which for so many years have taken place here, have been among the most attractive events in Lancashire; liberal awards have produced keen competition, and gardeners know that to be the gainer of a prize at Manchester is to stand at the head of their class. It is very generally admitted that the Manchester Botanical Society has been for many years doing important public work. At the annual meeting of the Society two years ago the President of the Institution said:—'In merely a utilitarian and material point of view, he had no doubt it had a great deal more than repaid any expenditure which it had caused, but far above and beyond that he was quite certain that in a place like Manchester, and a county such as Lancashire, it furnished a civilising and humanising agency with which they could not afford to dispense;' and it is earnestly hoped that the sum of £2000 will be raised by an extension of membership and donations from ladies and gentlemen who have the means to assist so worthy an object."

— **ROYAL METEOROLOGICAL SOCIETY.**—At the ordinary meeting of the Society, to be held at 25, Great George Street, Westminster, on Wednesday, the 18th inst., at 7 P.M., the following papers will be read:—"How to Detect the Anomalies in the Annual Range of Temperature;" by Dr. C. H. D. BUYS BALLOT, Hon. Mem. R. Met. Soc. "Cloud Observing;" by D. WILSON BARKER, F.R. Met. Soc. "A Suggestion for the Improvement of Solar Radiation Thermometers;" by WILLIAM F. STANLEY, F.R. Met. Soc., F.G.S.

— **THE UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.**—The annual meeting of this Society took place in the Caledonian Hotel on Monday evening last, Mr. RICHARD DEAN, one of the honorary members, presiding, and there was a numerous attendance of members, some of them having come twenty and thirty miles in order to take part in the proceedings. The balance-sheet, read by the Secretary, Mr. J. McELROY, showed the position of the Society to be highly satisfactory. The amount received in members' subscriptions during the past year amounted to just over £236, the payments from the sick fund amounted to £232s. 6d., which was the largest amount that had ever been paid in any previous year. During the past year the sum of £301 17s. 6d. had been invested in Consols, and the Society has now the sum of £3000 so invested. There are three distinct funds, viz., the benefit fund, the benevolent fund, and the management fund; a certain amount of the members' subscriptions is paid to each. The management fund is very small, and in this respect the Society is most economically worked, and it is the practice for the members at the annual general meeting to present to the Secretary, as a honorarium, though a very inadequate one, the balance remaining over from the fund, which

this year amounted to only £3 18s. 7d. This is the only payment made to the Secretary for his services, and these are truly a labour of love, for Mr. McELROY is not even a member of the Society and cannot derive any benefit from it, having passed the allotted age when appointed to the office of Secretary in 1872. The number of members is now 163, exclusive of three life and ten honorary members, the latter subscribing one guinea per annum. There has been a steady increase of members during the past two years, forty-seven having joined in 1883, and thirty-five in 1884. The treasurer reported that during his last three years of office the sum of £700 had been invested in Consols, and were the assets of the Society realised they would average nearly £19 for each member. The Society has now been in existence nearly twenty years, and it is a matter for regret the advantages it offers to young gardeners are not so widely known, as they deserve to be. The address of the Secretary is The Gardens, Moray Lodge, Campden Hill, Kensington, who will furnish any information. Hearty votes of thanks were passed to the Treasurer, Secretary, Trustees, Auditors, and others for their services during the past year, and it must be admitted they were well deserved.

— **RAILWAY CHARGES FOR THE CARRIAGE OF FRUIT AND VEGETABLES.**—That what is everybody's business often becomes no one's is a trite old saying, and usually a true one. The rates charged by the railway companies in this country for the conveyance of fruit and vegetables are so disproportionately heavy compared with those of the Continental lines as to occasionally cause low murmurings being heard from the home growers, the manifest injustice to whom becomes more apparent by a glance at what the companies exact from them for the carriage of their produce from any one place to another within the kingdom, as compared with the small amount the said companies get for the conveyance over their portion of line of the same kinds of produce of foreign growth. JOHN BULL is proverbial for the patience with which he submits to have the money extracted from his pockets by his own countrymen, as well as by others; and in such pursuits as the cultivation of garden produce, in which comparatively few are engaged, their want of numbers, and the absence of concerted action, leave them a prey to the rapacity of any strong-backed monopoly that is in a position to put the screw on them; they may grumble more or less loudly, but, the grumbling usually avails nothing. The railway companies have shown that they are wise in their generation; it is a significant movement on their part now—when the times are such that they could not avoid seeing that it was likely there would be some pressure brought to bear on them to reduce their charges for the carriage of home produce of all kinds—to give out their intention, as some of them are doing, of raising their rates higher than they already are, hoping no doubt that, by foregoing their threatened rise as a sort of sop to those who were likely to push for a reduction, they might be able to keep matters as they are. For the farmers and fruit and vegetable growers of this country to look for any patriotic sacrifice at the hands of the representatives of a carrying monopoly would be as useless a proceeding as to look for blood in a stone. But there is one thing tolerably certain, which is, that the agricultural interest through the country will ere long bring a pressure to bear on the companies that they will find it difficult to resist; and if those engaged in the cultivation of fruit and vegetables do not join in the movement, so as to make themselves heard, they will not be true to their own interests.

— **SCOTTISH HORTICULTURAL ASSOCIATION.**—The eleventh ordinary meeting of the Association was held in the Society's rooms, 5, St. Andrew's Square, Edinburgh, on Tuesday evening, February 3, Mr. JOHN METHVEN, the President, in the chair. The Secretary, Mr. ROBERTSON MUNRO, Abercorn Nursery, Piershill, read a paper on "Flowers and the Lessons they Teach." After referring to the rudimentary culture of various plants in the lake districts of Switzerland—plants which have become extinct in some instances, while others were improved—he said that during the Bronze age some improvement was effected; but it was to the Romans that the credit of anything like high culture was due, which clearly showed that as civilisation and good government advanced, so also did the cultivation

of flowers, which never failed to give the greatest pleasure to those who grew them. The city of Edinburgh of late years has made a great improvement in embellishing its parks and gardens with gay flowers, and the hope was expressed that while this good work would continue the city gardener would be provided with the necessary appliances, and have the additional duties imposed on him of providing every elementary rate-paid school with fresh flowers for public instruction. Not only should our children be taught to transfer their images to paper, but their beautiful structure and adaptation should be systematically taught. Such early training could not fail to have an elevating tendency, so that in after years, in whatever situation or relation in life they might be placed, they would make better men and women. In the after discussion Mr. DOWNTON, Mr. DUNN, the President, and others, enforced the sentiments expressed, and gave instances in which the culture of a few plants brightened the cottager's dwelling. The thanks of the meeting were conveyed by the President to Mr. MUNRO for his paper. The meeting then concluded with a very hearty vote of thanks to the President.

— **BEGONIA, GLOIRE DE SCEAUX.**—This, according to a figure in a recent number of the *Revue Horticole*, is a very free-flowering form with oblique smooth leaves, deep green above, claret-red beneath, and with erect panicles of rose-pink flowers, each flower about  $1\frac{1}{2}$  inch long. It is a hybrid out of *B. socotrana* by *B. subpeltata*.

— **EDINBURGH SCHOOL OF FORESTRY.**—A meeting of the committee in charge of the arrangements for the formation of a School of Forestry and Forest Museum, at Edinburgh, was held on the 29th ult., when there were present the Marquis of LOTHIAN, who presided; Lord Provost Sir GEORGE HARRISON, Sir ALEXANDER CHRISTISON, Bart., Dr. CLEGHORN, Dr. CROMBIE BROWN, Messrs. NEILL FRASER, BELFRAGE, and DUNN, and the Secretary, Colonel DODS. After reading a considerable amount of correspondence highly favourable to the proposed scheme a preliminary list of subscriptions was announced, the sums varying from £1 to £100, which was considered a very satisfactory beginning. It was resolved that the subject be brought directly under the notice of the landowners in the country, and others specially interested in a School of Forestry, from whom it is anticipated a liberal support will be received by the committee in the execution of the scheme. The necessary arrangements are expected to be completed in the course of the next week or two, when the committee will be in a position to appeal to the general public for their favourable consideration and generous aid in carrying out the objects in view. At a meeting of the Council of the Scottish Arboricultural Society, held in Edinburgh on the 4th inst., it was resolved to recommend to a general meeting of the Society that a grant of £50 be made towards the formation of a School of Forestry at Edinburgh.

— **THE HARPENDEN HORTICULTURAL SOCIETY.**—The seventh annual show of this Society has been fixed for Wednesday, August 26.

— **ANTHURIUM LINDIGI.**—Judging from the success that has attended the hybridising of some members of this extensive genus, it would probably repay the trouble in other cases to use this plant either as the seed or pollen parent, when a fresh class of seedlings would certainly be obtained. The whole plant is moderate in dimensions, with heart-shaped leaves and flowers in a comparatively small state. The spathe is oblong, erect, waxy-white, or slightly shaded with pink, of great substance, and lasting for weeks in perfection. The cylindrical spadix is stout, blunt, and of a strange pinkish chocolate colour, and fragrant during the dispersion of the pollen. Some plants of it may be seen in No. 1 house at Kew. It is synonymous with *A. Lindenianum*, under which name it is sometimes grown.

— **PUBLICATIONS RECEIVED.**—*Proceedings of a Meeting of the Committees of the Agri-Horticultural Society of Madras.*—*Permanent Pastures* (SUTTON & SONS, Reading).—*Report of London Water Supply for December, 1884.*

— **GARDENING APPOINTMENTS.**—Mr. FREDERICK JENNINGS, Foreman at Eridge Castle, as Gardener to JAMES COX, Esq., Thirlestean Hall, Cheltenham.—Mr. THOS. CROSWELL, late Foreman at Hollanden, has been appointed Head Gardener to Lady FORSTER, Meaford, Stone.—Mr. P. BOGIE, late Head Gardener at the C  tel, Guernsey, as Head Gardener to F. J. CLARKE, Esq., Bracebridge Hall, near Lincoln.

## The Flower Garden.

### HARDY AMERICAN PLANTS.

HYBRID Rhododendrons and hardy Azaleas will sometimes require to be rearranged and replanted as the strong-growing varieties will overgrow those of weaker growth. Beds and borders require fresh mould. I mix one-third peat, one-third turfy loam and leaf-mould, with sharp sand, which I find suits them admirably. Many of the grafted and choice Rhododendrons put up many suckers from their stock, and which soon kill the plants if not checked; all such should be removed, and they are easily distinguished by their leaf, it being the common ponticum on which all the good kinds are worked. In replanting, select all the tallest and the free-growing kinds for the centre of the beds and the backs of the borders, giving plenty of space between them, then plant the dwarf kinds in front of those, and mix the hardy Azaleas with them, and if judiciously selected kinds, the colours will arrange themselves nicely and have a good effect. For the front near the margin, plant such things as hardy Heaths and Sedums of sorts, Kalmias of sorts, with *Gentiana acaulis*, planted quite near the edges. Many persons object to the use of Rhododendrons and Azaleas in large masses, as they flower at a season when the family is absent from home—i.e., during the London season. To obviate that I plant between the Rhododendrons, *Tritoma nvaria*, *T. glaucescens*, *Anemone japonica alba*, *A. rosea*, and *Canna indica*, *Gladiolus* of many varieties, Begonias, and *Digitalis*—an arrangement that gives a most pleasing effect throughout the summer months.

The spring garden has much improved since the favourable change of the weather. Many of the bulbs and early spring flowering plants are showing bloom, and if the weather should keep mild for a time the garden will soon present a gay appearance. Let cleaning operations be well attended to. If frost sets in again protect all tender plants and flowering bulbs. The most convenient way to protect flower beds is to hoop them over with sticks and cover over with mats, leaves, or any other material suitable, which should be moved as soon as the weather moderates sufficiently. All climbers on the walls should be pruned and trained. Clematis and early Roses are frequently damaged by the spring frosts, consequently they require protecting with mats or any other light convenient covering in frosty weather. The propagation of all the summer plants should now receive every attention, and all deficiencies made up as quickly as possible so as to enable the plants to get well-established by bedding-out time; such things as *Heliotropes*, *Ageratum*, *Salvias*, *Lobelias*, *Pelargoniums*, *Dahlias*, *Iresine*, *Coleus*, *Alternantheras*, *Tropæolums*, will strike easily and quickly if placed in bottom-heat. After they are struck they should be carefully hardened off by degrees to prevent too sudden a check. When hardened sufficiently they can be potted off into 60-size pots, and planted into boxes or frames where they can be protected from frost till required for bedding purposes. *Pelargoniums* and all the autumn struck cuttings will want potting off into 60-size pots and kept close for a week or two till they have made fresh roots. All this work should be done as soon as possible. *W. Smythe, Basing Park, Alton.*

## Plants and their Culture.

### STOVES, SOILS, AND POTTING OPERATIONS.

It will be advisable to proceed with this work as soon as convenient, as at the latest all the stove plants should be overhauled by the end of the month. The lengthening days will soon have a perceptible influence on vegetation, particularly in the stove and intermediate houses, and all the more so, should we be favoured with a few sunny days to advance the temperature. Prior to making a start it will be necessary to collect a good quantity of crocks for drainage. These should be placed in a tub and then worked about with a broom to cleanse them. The requisite stock of flower-pots should also be washed, whilst new ones will be all the better for being soaked

in water for some hours previous to using. Each kind of soil will also need attention in its preparation, particularly in the case of that used for the choicer kinds of plants. Good peat with an abundance of fibre in it is indispensable in the cultivation of the majority of stove plants. Cast aside any that is devoid of this essential quality, to be used for plants of a season, i.e., those that are thrown away at the end of the same, or, if required, it can be used for the peat-loving plants in the open air. On the undersides of the sods of peat there is frequently a layer of varying thickness that should be carefully separated from the good; this is generally of a darker colour and deficient in fibre, which if used for plants that require watering freely would soon be rendered unfit for healthy root-action. Sound turfy loam of good quality from an old pasture should also be secured; that taken from low-lying districts is not so good as a rule. This should have been got together and stacked some months ago, and I have no doubt many cultivators will congratulate themselves upon possessing an excellent stack of loam secured in the autumn months. After such a season as the last the loam should be of excellent quality for potting purposes. By reason of the short rainfall it will have been got together in first-rate condition for keeping.

When a good heap of leaves has been got together from such as the Oak and the Beech, it will be found a valuable aid in plant culture when well decomposed. It is necessary to be cautious, however, in the case of the leaves from our evergreen trees and shrubs, such as the Laurel and the Holly, for instance. Rather than use leaf soil that has been made from an indiscriminate collection of leaves, I would prefer to use peat and loam with the addition of charcoal in small pieces, if the loam is of a retentive character. If the charcoal is not at hand, some crocks broken small could be used. When the soil is considered to be somewhat poor, the use of half-inch bones or bone-meal may be recommended in the case of gross-feeding subjects, for which also some dried cow-manure, or that from an old Mushroom-bed will be a capital addition. Silver-sand should always be used freely when it is at command, being favourable to root action by aiding to keep the soil in a porous condition. The soil thus prepared should be placed where it will become warmed; this will be all the more necessary if any of it is of a heavy nature from excess of moisture, or otherwise. If the potting-shed is not in close proximity to the plant-houses it will be well to do the repotting in the houses. The mixing of the soils can be made as the work advances, so as to suit the requirements of the particular plants. *James Hudson, Gunnersbury House, Acton.*

## FRUITS UNDER GLASS.

### PINES.

A PART of the early batch of those fruiting plants to which I adverted in my last paper upon this subject have already thrown up fruit, and the rest of the plants unmistakably appear to have started. The earliest of these fruits will be ripe towards the end of May next, and the others in June—a most opportune time, because the supply of foreign Pine-apples will be almost over or of inferior quality; under any circumstances they will not be at all comparable to the English-grown Queen Pine, which for use from the middle of May until the end of September is unsurpassable in point of quality.

Give these plants every attention, and as to watering especially: use this in a tepid state, and add a little stimulant in the way of guano. Keep the temperatures steady at about 80° at the roots, and at 70° to 75° at night and 80° by day air temperature. Give air at 80°, and close up the place whenever sun-heat prevails at 90°. Well moisten the house and syringe the plants overhead when they need it, which can be ascertained by the moisture resting in the axils of the leaves. When the fruit is flowering it should not be syringed, as sometimes it leads to mischief. The next batch of successional plants to which reference was made in my last paper should now be brought into the place where they are to remain until the fruit is cut. It may not be amiss here to call attention to the fact that much damage may arise from the want of proper care in moving such plants as these, and I, as far as possible, avoid having to do it by having my fruiting plants in those places where the necessary

amount of heat required for the beds is supplied by means of hot-water pipes beneath.

These plants will require similar treatment to the former in all respects, excepting in fire-heat for the house, which should be 5° less. The house in which the young stock of plants are placed should still be kept at a temperature of from 55° to 65° during sunny days; these plants should be freely ventilated, as growth in these is not wanted until after they have been reported. Suitable occasions—as wet days—will afford opportunities to prepare crocks, pots, &c., in readiness for use. Soil may likewise be got ready: this is best done by hand; only the fibrous part should be used, and this should be in good sized pieces and not too much decayed. A compost comprising good fibrous loam, a little sharp sand, and a few half-inch bones, will be found suitable for these plants. *G. T. Miles.*

## The Kitchen Garden.

### FORCING DEPARTMENT.

*Asparagus.*—In a few gardens pigeon-holed brick beds have been constructed, and permanently planted with roots for forcing. This is accomplished by providing intervening spaces between the beds for the reception of heating material. The beds are covered by light spao-roofed glass structures that can be taken on and off at will. Although this system entails considerable labour, beds thus formed are very useful for starting into growth about this time of year to succeed produce forced from lifted roots. When abundance of litter from stables is not at command, it would be useless making such beds, for, of course, they could not be heated by hot water: beds constructed and planted on the above system, and without hot water can now safely be started. Remove the now decayed material which was placed between the beds to force on growth last year, and replace at once with well mixed stuff that will generate a good brisk heat, then place on the glass coverings. If the beds have been well watered throughout the past dry summer, well mulched, and plenty of roots were found penetrating the pigeon-holes, and feeding on the rotten material between the beds, many fine heads may reasonably be expected. Of course, the roots must be cut off.

### IN HOT-WATER FRAMES.

*French Beans.*—As the season advances ply the syringe freely among the plants, which are often assigned positions close to hot-water pipes, which is favourable to the development of red-spider. Somewhat exhausted plants in frames will derive much benefit from a good top-dressing of good short manure with a little soot added. Surface-dressings should be placed between the plants (after pricking up the soil) about the time they require a watering, with which stimulating properties will be carried down to the roots and evaporation will also be arrested.

*Potatos.*—The tubers will now be developing rapidly on the first early lot, either planted out or in pots or boxes. A nice watering should be given occasionally at 65°. When watering in frames use a rose on the pot, or some soil may get washed down from the mouldings and expose the young tubers.

### IN FRAMES WITHOUT HOT WATER.

*Turnips.*—A spare frame may be usefully devoted to the above. Early Milan is a good early variety, and one which will produce useful bulbs when grown thickly in a limited space for development. If labour and material are not plentiful, these will succeed without a slight hotbed, but better with it.

*Carrots.*—Keep the frame close until the young plants are well above-ground. Carrot seed requires moist ground in which to germinate freely, therefore give a watering if the surface of the bed is somewhat dry.

*French Beans.*—A frame with hotbed should now be planted; if the frame is constructed of bricks no outside lining will be necessary. The soil should be light, 1 foot deep.

*Potatos.*—Providing the soil at planting time was fairly moist, no water will yet be required in these frames. The bed and atmosphere being somewhat dry will materially assist in keeping out frost, and a sturdy growth will be made. Place plenty of covering over the mats (where the growths are above-ground) at night. *G. H. Richards, Somerley Gardens, Ringwood, Hants*

## The Hardy Fruit Garden.

### NAILING AND TRAINING.

THE low temperature which generally prevailed throughout last month has kept all kinds of fruit trees back, so that the buds are still dormant; but should mild weather continue during the present month the sap will begin to rise rapidly, so that pruning and nailing of wall trees should be pushed forward with all possible expedition. First finish Apricots and Peaches, then Apples, Pears, and Plums. In nailing use as few nails as possible; the shreds should be of different widths; for small shoots very narrow shreds should be used—broad ones look unsightly, and harbour insects during the summer. Many of the small shoots on wall trees may be tied with raffia-grass, which will last one season, and has a neat appearance on the trees, when used in a workman-like manner.

### PROTECTING THE TREES.

Protection should be got ready in case of sharp weather taking place, but I prefer not covering up

will grow early and rapidly, and will produce fruit in the autumn.

### ORCHARD TREES

should be carefully looked over, and when crowded, thinned out moderately. Any strong shoots that are taking the lead, and so robbing other parts of the tree, should be shortened back, and in some cases removed entirely. Any trees that have become shaken by high winds should be staked anew and placed upright, by digging out a portion of soil on the opposite side of the ball, so as to place the tree upright without destroying many of the roots. Small weak shoots near the ground are best removed, for they seldom bear any fruit. *J. Smith, Mentmore, Bucks.*

## Florists' Flowers.

### THE HOLLYHOCK.

As soon as cuttings can be obtained they may be carefully taken off with a portion of the old stem

FIG. 41.—ULLUCUS TUBEROSA. (SEE P. 217.)

until there is every appearance of frosty weather. There are so many different plans recommended and adopted for protecting the blossom of fruit trees, but we all have the same object in view—namely, trying to secure a crop of fruit. I will merely name a few which I have adopted with more or less success, according to the season. Tiffany is a good material for protection, also thick nettings of various makes. Poles placed against the wall, and hay-bands placed on these, have been found to answer well. Dry Fern placed lightly amongst the branches, straw placed among the shoots in the same manner where dry Fern cannot be procured. Where the wall coping is defective, place boards a foot wide above the trees and remove when all danger of frost is over. These are all inexpensive means of protecting the blossoms, and when applied with care and judgment will in most seasons answer moderately well. The most perfect means is by having tiffany or other thick material placed on rollers, so that it can be rolled up during the day; but all cannot command such expensive means of protecting their trees, hence the above suggestions.

### SMALL FRUIT.

*Raspberries.*—Should a very late supply be desired, cut down the shoots in a row or two to within an inch or so of the ground. By this means the shoots

attached to their base. Each cutting should be firmly potted in a small pot, using for the purpose fine sandy soil. They will form roots under the same conditions as described for the perpetual-flowering Carnations, only note this—the Carnations may be watered as soon as they are inserted in the pots, but the Hollyhock cuttings should not be watered for at least a week; the object of the cultivator is to be careful not to cause the Hollyhock cuttings to damp off; they are certainly very liable to do so if water is too freely applied to them.

### THE DAHLIA.

There is nothing like the difficulty attending the propagation of the Dahlia that there is with the Hollyhock. Our whole collection has been stored in a dry place with some cocoa-nut fibre refuse over the roots. In a week or ten days they will be taken out, and planted closely together in boxes, in any fine refuse from the potting bench. They will soon start into growth, and when the shoots are 2 inches long they can be taken off; they will root readily in an ordinary hotbed.

### THE RANUNCULUS.

There are few people who do not admire a bed of choice Ranunculi when in full bloom, but there are very few gardens now where they are to be seen.

Tubers can be purchased from any of the large seedsmen at a cheap rate. We grow both the French and Scotch strains. Some persons prefer the French; the flowers are larger and more brilliant in colour; the plants are also more vigorous. The Scotch type! Why Scotch? I cannot answer, as most of the best varieties were raised years ago by Mr. Tyso and his son. They have been, and are now, cultivated near Manchester. I had a collection which were termed by the dealer Scotch Ranunculi, but all the varieties, fifty in number, had foreign names, mostly Dutch. At any rate, this small-flowered type is most valued by the trained florists. The dainty little flowers, perfectly formed, are poised on slender stems from 4 to 6 inches high, while the rich and varied colours have a charming effect. The ground ought to be well prepared for them. They like a rich deep loam, and if it is heavy mix some fine sandy peat into the six inches nearest the surface. I tried peat a few years ago, and found they grew and flowered well in it. Mr. Simoonite, of Sheffield, also told me that the finest bed he ever saw was planted in peat soil. The crowns of the tubers should be about an inch below the surface. *J. Douglas.*

### POTATO IMPROVEMENTS.

MR. LAXTON has been making some experiments on hybridising different *Solanums* with a view to procuring a substitute for the Potato. He has tried to mingle the blood of the English woody Nightshade with that of the edible Potato. As one of his subjects for operation he used an early Potato, the Hammersmith Kidney, and in order to get a good supply of blossoms all tubers were removed as they formed. The result was very satisfactory, the more so as twenty-five years ago the experiment with the Ashleaf Kidney had been a failure.

Mr. Laxton commenced operations on June 12 by using the pollen of the earliest Potato he then had flowering on *S. Dulcamara*; between then and July 1 he made sixteen attempts, three of which were successful. He has also obtained one ripe berry containing two seeds by crossing *S. Dulcamara* with *S. Commersonii*. Between June 18 and July 1 attempts were made to fertilise thirty-four blossoms of various Potatoes with *S. Dulcamara*, and again obtained three berries containing seed. Nothing was obtained from an attempt to fertilise *S. Dulcamara* with *S. Maglia*. Nipe attempts were made to cross *S. Commersonii* with various Potatoes, but were a failure. Out of forty-two attempts to cross *S. Maglia* with various Potatoes the result was *nil*; but out of three attempts to cross the Hammersmith Kidney Potato with *S. Maglia*, one berry having twenty seeds was obtained. Altogether Mr. Laxton has only been able to procure eight satisfactory results out of 107 attempts at intercrossing, as the subjoined table shows:—

	Attempts at fertilisation.	Berries obtained.

*Journal of Horticulture.*

### THE MELLOCO.

ULLUCUS TUBEROSA.—Early last year two tubers of this plant were received at Kew from Caracas, and from them a batch of young plants was obtained and planted out-of-doors in a prepared bed in June. The result of this experiment, together with a few particulars as to the esculent properties of the tubers, may be worth recording, as I believe several gardeners, amongst them being the Messrs. Sutton, have obtained tubers of the *Ullucus* from Kew with a view to giving it a trial. The two Caracas tubers mentioned above were as large as hen's eggs, rather longer, and somewhat flattened; the skin was red, as in some Potatoes. These, when placed in heat, rapidly developed shoots,

which were removed as soon as they were strong enough to form cuttings; in this way about a hundred sturdy young plants were obtained and made ready for planting out-of-doors in June. They were planted in a light, sandy, well manured soil in a position exposed to full sunshine. Here they grew quickly, forming by the middle of August tufts of shoots and leaves 1 foot across. They were earthed up as for Potatoes, and the strongest shoots were pegged down and partly covered with soil, though the latter proved unnecessary. At this time there were no tubers nor any signs of them. On again examining the plants in September (about the middle) we were surprised to find no tubers had yet been formed. The plants were now very strong, and it was therefore concluded that instead of forming tubers the strength of the plants had "run to leaves." We gave them up, no further notice being taken of them till the frost came, when on perceiving that a frost of four or five degrees did not injure the foliage, we again examined the plants and found an abundant crop of tubers just below the surface of the soil, and varying in size from that of Peas to pigeon's eggs. The plants were left till the haulms had been destroyed by cold, after which the tubers were gathered. On cooking some of the larger ones by boiling for half an hour we found them still rather hard, and with a flavour of Potatoes, almost concealed under a strong earthy taste, quite disagreeable and soap-like. Considering how short a time these tubers had had to grow in it is not improbable that their hardness and disagreeable taste were owing to their being unripe: no doubt young green Potatoes (these *Ullucus* tubers were partly green) would be quite as nauseous as these were.

We are told that the *Ullucus* is extensively cultivated in Peru and Bolivia, in the elevated regions

FIG. 42.—MELLOCO TUBERS.

where the common Potato also thrives, and with which the *Ullucus* is equally popular as a tuber-yielding plant. In the *Gardeners' Chronicle* for 1848, p. 862, Mr. J. B. Pentland stated that the *Ullucus* "is planted in July or August, the seed employed being generally the smaller tubers unfit for food, and is gathered in during the last week of April. These two periods of the year are the spring and autumn in the southern hemisphere. The mode of cultivation is in drills, into which the root is dropped, with a little manure. The climate, even during the summer season, is severe, scarcely a night passing over without the streams being frozen over, the sky being in general cloudless at all periods of the year except during the rainy season (December to March). Mean temperature about 49°." This information seems to support the view formed of this plant from its behaviour at Kew last year, namely, that the tubers are formed on the approach of cold weather, and that so long as the weather is warm and bright leaves only are developed. Plants grown in houses where the temperature has not been allowed to fall below 50° in winter did not form any tubers, although they were in good health. We found no tubers on the plants grown out-of-doors till some time after the return of cold wet weather. It seems likely that this plant does not develop tubers unless its existence is threatened by cold; at all events, such a conclusion seems reasonable from the above statements.

Possibly a wet and rather cold autumn would be favourable to this plant and the production of its tubers—such a season, for instance, as would be most unfavourable for the common Potato. It would be worth while testing the *Ullucus* for low and cold situations where the Potato would not thrive. There is not much probability of the former ever proving a substitute for, or even a rival to the Potato, at least in this country; but there is room for another good esculent, and the *Ullucus* is prolific enough, hardy enough, and, we suppose, when properly grown,

palatable enough to be worthy a trial. In the *Gardeners' Chronicle* for 1848, p. 828, will be found a most interesting detailed account of experiments made with this plant in France by M. Louis Vilmorin. *W. Watson, Kew.*

### HOME CORRESPONDENCE.

Plants and the Recent Severe Weather.—There can be little doubt that the hardness of plants is greatly influenced by their conditions as to growth or comparative dormancy, as well as to the attendant conditions and severity of the weather. Owing to the mildness of autumn and winter, up till lately vegetation of many kinds was in a more or less active state, consequently it was but ill-prepared to withstand the sudden lowering of the temperature. The thermometer in the neighbourhood of London ranged from 2° or 3° to 10° of frost, attended with dense fog on some days, when the temperature was by no means the lowest. This additional evil, with the alternate freezing and thawing which it implies, cannot but be prejudicial to vegetation in proportion as it saturates the foliage. Most of the undermentioned greenhouse or half-hardy plants, although enjoying the protection of a south wall, are now more or less severely injured. *Abutilon vexillarium*, in full growth, flowered up till lately, but now shares the fate of *Calceolaria luchsiaefolia* and *Physalis edulis*—all from some part of South America. The freely growing tips of *Ceanothus puniceus* are somewhat blackened where they project from the wall, but the Australian *Hardenbergia monophylla* has been severely crippled, contrasting greatly with *Sollya heterophylla*, from the same country, and altogether uninjured. *Cercocarpus parviflorus*, a Rosewort from California, also retains its healthy green appearance. *Buddleia crispa*, a half-hardy shrub from the Western Himalayas, has lost its leaves both on a wall and in the open shrubbery. *Escallonia montevidensis* and *Coprosma Cunninghamii* on a wall are partly denuded; while the scathing effects of the frost is also shown on the shoots of *Benthamia fragifera* and *Myrtus mucronata*, having no such protection. *J. F.*

The Name Veronica.—I have been much interested in your correspondent, Mr. C. Wolley Dod's letter on this subject, and think it very probable that he is correct as to the real origin of the name of Veronica. It has always been up to the present time a very doubtful question whether the word Veronica, though applied to the Speedwell, did not come from "Betonica," the name of the Wood Betony; whilst others, Pliny amongst them, say that Betonica is only an alteration from Vetonica. It seems that the Vetones, a people who lived at the base of the Pyrenees, were the first to bring the Wood Betony into notice. *Helen Watney.*

Gas-Lime for Old Gardens.—Until I saw Mr. Corbett's remarks last week concerning gas-lime I had overlooked what Mr. Divers had to say about its use in the way I recommended it. Let me assure Mr. Divers that in advising the application of this, or anything else for garden use, I always first satisfy myself of its being safe for the purpose named. From a long residence in the manufacturing districts, where the article in question is plentiful, and where its properties are well understood, I was in a position to prove its merits. I have had an old garden to deal with, where the whole Cabbage family clubbed to such an extent that half the crops used to fail until I used it exactly in the way I described, after which, by a thin dressing, put on in the manner named once every two or three years, clubbing was unknown, as well as reducing slugs and other vermin to within manageable numbers. A dressing laid on in the way I mentioned, and allowed to remain the time stated before digging in, will not do the least harm to any crop that may be put in the ground. Mr. Corbett says he wonders if I practise what I advise, in using the lime to kill weeds in the manner I mentioned. I have frequently done so, and oftener seen others use it for the like purpose. Last spring I saw it thus applied to an extent that I had not previously seen, in the quiet old-fashioned town of Richmond, in Yorkshire, where, as known to those who are acquainted with it, some of the wide outlying streets are paved with cobble-stones, and have not enough traffic on them to keep the grass from growing. These were spread

over with the lime, and no one seemed to be inconvenienced by its presence; and there is no mistake about its answering the purpose. Mr. Corbett admits that he has not tried the lime for weeds, neither will he, fearing the smell. I venture to suggest that it is safer to satisfy oneself by actual practice, with this or anything else, than to condemn its use on supposition. *T. B.*

**The Growth of Carrot and Onion Seeds.**—A recommendation is being sent forth from the wholesale seed houses advising that, as the growth of last year's crops of Carrot and Onion seeds is not so strong as expected, it is desirable that they should be sown thicker. It is due to the wholesale seed trade that it should be stated that the utmost care is taken to test the growth of all garden and other seeds as soon as they are received from the growers. In all the large warehouses there is a testing room, properly arranged and heated, and well adapted for the purpose. A certain percentage of the seeds is carefully counted out and sown, and, should any prove tardy in germination or thio, another sowing is immediately made as a further test. Outsiders unacquainted with the internal economy of a seed warehouse have little idea of the labour bestowed on securing accurate tests, and the care with which it is done. It is more than probable that other seeds besides those named above will show a lack of germinating power. The summer of 1884 was indeed what has been very appropriately termed "a rushing season," meaning thereby that owing to the heat and drought things matured with unusual and undue rapidity, and it might be said of some seeds that their juices appeared to be almost dried up in the process. Undoubtedly many seeds are small and thio as compared with a season in which they can be brought to a less hurried maturity. Gardeners of all kinds should not therefore be in too great a hurry to sow. The later in the season seeds of weak vital power are sown, the greater are the chances of a satisfactory crop. There is one thing favourable to the germination of the seeds in the season just commencing—the soil is unusually dry and workable; and heavy soils can be pulverised and rendered more manageable than when wet and tenacious. Given, then, a balmy spring-time, and the work of sowing should be done in comfort and with expedition, under conditions favourable to the fullest germination of the seeds. To this end, all ground intended to be sown should be thoroughly well worked previously, so that advantage can be taken of a favourable time for placing the seeds in the ground. The spring-time is a period of the year when there is a great pressure of work in the kitchen garden, and it is not to be wondered at that gardeners are desirous of expediting the work, and getting in their crops early. Much depends, as a matter of course, upon the nature of the soil and its present condition. In early warm soils sowing can be performed earlier than in soils that are cold and tenacious. There is no doubt that the body of the earth, owing to its unusual dryness at this season, is much warmer than is customary at this season of the year. A warm spring rain will bring into active play the latent heat, and assist the growth of seeds not so strong as could be desired. *R. D.*

**Inarching Vines.**—There is no question but that good results will follow the practical treatment (described at p. 152) Mr. Ward has given his Vines, and that an advantage of considerable worth may be gained by "patching" young canes that break irregularly is manifest. It was a good thought of Mr. Ward's to inarch the lateral growths to the rods, inasmuch as by so doing the neatest work possible can be made, but it is doubtful if any other advantage will thereby be derived. In this respect alone Mr. Ward's mode of "stopping gaps" differs from that I saw practised when I was an apprentice at Crimonmogate, in Aberdeenshire, and which we have carried into effect here in a limited degree upon Vines which broke imperfectly in our Lady Downe's house. Instead of inarching, we merely tied the laterals to the rods, and it is almost superfluous to say the growths emanating from these produced fruit in quality similar to those springing immediately from the main rods. A like method of treating old Vines that have been kept closely spurred for years, and have consequently become weak and unfruitful, is of comparative importance; for example a case of our own experience may be mentioned. Previous to uprooting all our Vines in order to exterminate the

Phylloxera, one of the houses contained, with other varieties, an old Buckland Sweetwater which yielded unsatisfactory crops during the first two seasons we had its management. By laying in young shoots of about 3 feet or 4 feet in length up the entire rod, however, and cutting out useless spurs, this Vine was caused to produce the largest and best bunches of the kind I ever saw. The roots, which were entirely outside, were found, when the Vine was destroyed, to be exempt from Phylloxera, although those belonging to young Vines occupying a part of the same house, having their roots inside, were infested with it. Much is doubtless sacrificed for appearance sake, and want of digression from a beaten track, and probably there are in existence many old, almost barren Vines, taking up valuable space, which want only an infusion of young sap to make them fruitful. This is the argument in favour of extension. *Thos. Coomber.*

**Protection of Plants.**—Although last winter and this up to the present have been exceedingly mild, it is a great chance if we get off much longer without severe frost, and if it does come, most plants after such a time will feel it severely. The best protection that can be given to such things as Pampas-grass, Tritomas, and other half-hardy subjects, is fresh-fallen leaves, which lie light and loose, and are non-conductors, as they keep frost out, by keeping warmth in, and it must be severe weather indeed if the ground is made hard under them, even though only a thin layer be used. The difficulty with them is to keep them where they are wanted, but this may be done by pushing them around the stems and in among the leaves of the plants, and directly after this is effected a layer of Bracken will hold them snug and close. Roses in beds, where they are close together, are very easily dealt with, as loose straw or Bracken scattered amongst them will prevent all harm being done, but standards are best preserved by pieces of hayband being twisted round the part where they are worked, and besides this the ground should be mulched, as it is surprising what a help that is. For Belladonna Lilies, Alströmarias, and other herbaceous subjects partly decayed leaves are suitable, and these may, with great advantage, be spread over the entire bed or border and left there till spring, when they should be picked in. Isolated plants may be protected by using the same kind of material, and to keep the birds from pulling it about it is a good plan to stick a few pieces of Holly or Whin around them, which are very deterrent. Leaf-soil is also capital for young Cauliflowers that are standing in beds, or pricked out under walls, or planted in handlights, and if the ground under them is covered with about an inch or so of it, sifted fine, the plants will stand a great deal of frost. The handiest material for the protection of Celery is clean straw, which should be in readiness, as when the leaves of the Celery get frozen they soon rot together with the stalks. Fruit trees of all descriptions that have been transplanted need mulching as a protection to the roots, which, under it, then get no check in their formation or progress, but soon take fresh hold of the soil. For Vine borders, where the Vines are to be forced, a covering of dry leaves with straw over them is best, and when these come off in the spring a layer of half rotten dung should succeed them. *J. S.*

**Fungus in Imported Japanese Lilies.**—It is singular there should be any doubt about the cause of the fungus found on imported bulbs of *Lilium auratum*, which is simply occasioned by damage to the succulent roots in packing, and by removing them from the ground in an immature state. If English-grown bulbs were subjected to the same treatment, the same fungus and the same effects would probably be produced. There is no remedy when the disease has extended to the centre of the bulbs, but when it is only partial it may be counteracted by judicious treatment. An enormous number of newly-imported bulbs are doubtless lost for want of this. The principal cause of failure is perhaps occasioned by an excess of moisture at first. The best plan is, as soon as the bulbs are received, to plant them singly in pots according to their size, in a mixture of loam, heath-mould and friable manure from an old hotbed, a trifle below the surface. The pots should then be placed in a cold frame, and covered with cocoa-nut fibre to the depth of about 3 inches, and no water given until the flower-shoots appear, when they may be considered safe, and water given in moderation, and

continued more bountifully according to the weather and state of growth. *W. H. Rogers, Southampton.*

**Pruning Dendrobiums.**—I have no wish to revive the old controversy about pruning Dendrobiums, but a few days ago I saw at Wortley Hall a plant of *D. Wardianum*, which Mr. Simpson, the gardener, assured me had been pruned soon after flowering for four years in succession. The growths made by this plant last year were quite as good as are usually met with, and better than I have frequently seen on what may be termed well grown plants of this Dendrobium. The flower buds were well advanced from each node for more than half way down to the bulbs. The plant has commenced to break again freely, and at present shows no inclination to weakness during the coming year. Mr. Simpson pointed out several other plants which had been treated in the same manner, and in each case of *D. Wardianum* the result was the same. One plant of *D. formosum*, which was cut down when first imported, had made a few growths, but not of such a character as would induce any one to follow the plan with that species. *W. Baxter.*

## Reports of Societies.

### ROYAL HORTICULTURAL: Feb. 10.

THIS, the second meeting of the year, was held in the conservatory at the Society's garden, South Kensington, when an interesting number of objects was shown, including even, although it is still winter, a few beautiful Orchids in flower.

#### Scientific Committee.

Present: Sir J. D. Hooker, in the chair; and Messrs. Grote, Beddome, A. S. Michael, Pascoe, Smee, Murray, Ridley, Masters, Llewellyn, Loide, and Wilsoo.

#### SCLEROTIIDS IN POTATOS.

The following communication was received from Professor Trail, who had used various re-agents in testing the nature of these bodies, as suggested by Professor Foster at the last meeting:—

"Since I wrote in the month of January in regard to the result of my experiments on the sclerotoids in the leaves of diseased Potatos, using for these experiments material given me by Mr. A. Stephen Wilson, I have continued and extended my observations. I have made use of several additional tests, and have found the results yielded by them confirm the conclusion that the bodies in question are masses of protoplasm coated with a deposit of oxalate of lime. As the subject is of much practical interest in its bearing on the propagation of disease in the Potato plants I subjoin a description of the results of the tests employed by me in addition to those previously mentioned. The former tests were also repeated, and gave quite the same results as they had done previously.

"In every case, except where specified, the bodies were teased from among the tissues in which they lay imbedded, so as to allow of certainty that the same body remained under observation during the whole course of operations to which it was subjected; nitric acid was then added in sufficient amount to dissolve the oxalate of lime, and the excess of acid was carefully washed away before any other reagent was added. In every case where the body was so isolated, and where care was taken to prevent its escape from the field of the microscope, there remained a nearly transparent finely granular body, as described in my former communication. Nor was it difficult after the situation of the body had been carefully noted with relation to the surrounding objects to detect it again after the slide had been moved and the body was again brought into the field of vision; but where such care had not been taken it was frequently very difficult to rediscover it, and it is easy to understand how one might suppose that nothing remained after the action of nitric acid.

"The residuum, as I shall call what remains after the removal of the oxalate, retains nearly the size and form of the entire sclerotoid; but no true cell-wall can be detected even with the most careful examination, i.e., no cell-wall separable from the rest of the mass. Yet, as the mass retains its form in water and in other fluids, and resumes its form after moderate pressure has been made on the cover glass, the outer surface, like a primordial utricle, must serve as a wall.

"The residuum is faintly yellowish, and on running in dilute solution of ammonia this colour becomes slightly deepened; dilute ammonia did not dissolve the mass.

"Dilute potassic hydrate did not markedly alter the appearance of entire sclerotoids, but it dissolved the residuum more or less.

"Acetic acid, osmic acid, and chromic acid all rendered the residuum in some degree more visible, diminishing its transparency. Osmic acid changed the colour slightly; and chromic acid rendered it yellower.

"On running in a solution of iodine and potassic iodide the residuum became pale brown or yellowish-brown,

being rendered very much more easily detected, though not so dark as the contents of the Potato leaf cells,

"Solutions of saffranine and of aniline blue stained the residuum, though less dark than the cell contents of the leaf tissues.

"Picrocarminae had little effect on either the residuum or the leaf cells, but it is not of general use in vegetable histology. *James W. H. Traill.*"

Mr. G. Murray, having independently examined these bodies, reported as follows:—

"I have to report to the committee that in compliance with its reference to me on the subject, I have renewed my enquiry into the nature of the bodies which Mr. Stephen Wilson calls 'sclerotia' of the Potato disease. It will be remembered that the result of my previous examination of these bodies was the discovery that they consist of oxalate of lime, and my opinion was (and, it may be said, still is) that they are intrinsic products of the Potato plant. Since that was announced Mr. Wilson has again addressed the committee on the subject. He accepts the oxalate of lime, but states that in addition to it there is present a substance which he asserts is protoplasm; and this he regards as establishing again his views as to the connection of the bodies in question with *Phytophthora infestans*. Professor Traill has also sent you a report in which he states that, after dissolving the oxalate of lime, a substance is left which may be stained with magenta. He also judges this to be protoplasm.

"Mr. Worthington Smith, working independently, has made the same observation, and has furnished figures illustrating this aspect of the objects. His contention is, that we have here a central mass of protoplasm encrusted with oxalate of lime. In this view I shall join with him Mr. Wilson, and also Professor Traill, who has 'no doubt that the sclerotia are masses of protoplasm coated with calcium oxalate, probably in the form of minute raphides.'

"But for this unanimous statement that the substance in question was contained in the oxalate of lime, the appearance might have been explained without further investigation. However, I proceeded to carefully repeat these experiments with the bodies strictly isolated from the tissues, and giving a clear, definite outline, precisely as described by the above observers. After treatment with dilute nitric acid there was no difficulty in finding the substance referred to, and none in repeating the staining process, but I failed entirely and absolutely to find the smallest evidence that this substance was contained in the body. The statement that it is so contained is the merest assertion. Obviously if it were the case it would suit Mr. Wilson's theory. If the protoplasm were outside it is equally obvious it would bear out my interpretation. I can prove that it is so. In order to demonstrate the presence of this substance, it is not necessary to remove the oxalate of lime with nitric acid. The observer has only to isolate as well as he can one of these bodies, and apply iodine, for example, to obtain the desired stain. This will appear as a delicate colouring, and not with the intensity that would result were the whole mass to take up the stain. This shows (and I have repeated the test over and over again) that the stained substance is outside the oxalate of lime, and the natural interpretation is, that it is but the remains of the original cell contents of the Potato leaf-cell in which the oxalate of lime body was formed—adhering to it over the surface. A deal of trouble might, therefore, have been saved, but for the assertion that the oxalate of lime contained a central mass of protoplasm.

"In addition to this part of the enquiry, I have looked into the matter from another point of view, and evidence has been obtained which, I venture to think, will prove to be of interest. A week or two ago Mr. Carruthers placed in my hands a letter from Dean Buckland (dated July 19, 1847) to Robert Brown, enclosing leaves, &c., of a Potato plant, and asking, 'Is the enclosed the same affection of the Potato leaves as that of the two last years?'—meaning the Potato disease. I examined the leaves, and found no sign of Potato disease, but, abundantly present, Mr. Wilson's sclerotia. Thus we see that Mr. Wilson was anticipated even in his mistake.

"Mr. Carruthers then suggested to me that I should examine Potato plants preserved in Sir Hans Sloane's herbarium. We found four plants which had evidently been healthy and vigorous when collected. From each I removed a very minute fragment for examination. The first one was from the King's garden at Montpellier, collected by Dr. Charleton (Charleton was born 1619, and died 1707). It contains Mr. Wilson's 'sclerotia' as abundantly as Mr. Wilson's own specimens. The next was a plant collected by Boerhaave (Boerhaave was born 1668, and died 1738), and it also proved as fertile in the matter of 'sclerotia.' The next was one of Plukenet's plants (Plukenet was born in 1642, and died 1706?); it contains them too, but the fragment selected shows only a few. Finally a fragment was taken from a plant 'collected about 1660,' as labelled in Sir Hans Sloane's handwriting; and it, like the last named, contained these bodies which Mr. Wilson wishes to connect with the Potato disease. The four fragments of antiquity could all be placed under an ordinary cover-glass—they were selected from the plants at random, and none of them disappointed me. Unfortunately, I cannot remove the slides from the Museum, but the specimens have been examined by Mr. Carruthers, Mr. Bower, Mr. Ridley, Mr. Geddes, and Dr. Masters. Mr. Carruthers and Mr. Bower have also kindly witnessed the tests described above, and I need not add I shall be happy to exhibit the whole matter to Mr. Wilson, or to any one whom he may appoint. *George Murray.*"

#### BUDS ON ORCHID ROOTS.

Major Lendy exhibited a plant of *Phalenopsis* bearing small buds on the aerial roots; a very unusual phenomenon, though not unknown. They, however, are too minute to be of use as a practical source of propagation. The plant was figured in the *Gardening World*, vol. i., p. 364.

#### PINUS MASSONIANA.

Sir J. D. Hooker exhibited a branch bearing a large cluster of cones. He remarked that they were usually borne singly on the young trees, but the normal character appeared to be in clusters when they grew older, as figured by the Japanese.

#### MASDEVALLIA LEONTOGLOSSA.

This Orchid was exhibited by Sir Trevor Lawrence, and the committee awarded it a Botanical Certificate.

#### DECAY OF CEDRUS DEODARA.

Mr. Murray reported upon the mycelial growth found under the bark of the trees which had died, and which were exhibited at the last meeting. He found it to be in all probability a species of *Polyporus*, and which was parasitic upon the cambium layers. It was his opinion that the fungus was quite competent to cause the destruction of the trees.

#### NARCISSUS PACHYBULBOS.

Mr. Loder exhibited a truss of this Algerian plant, of which we hope shortly to give a figure. The flowers are white and fragrant.

#### CHINESE WAX.

Mr. MacLachlan exhibited specimens of *Fraxinus chinensis* and *Ligustrum lucidum* (?) attacked by *Coccus Pela* (*Gardeners' Chronicle*, 1853, p. 533).

FIG. 43.—CHINESE WAX INSECT.

He remarked that it appeared to be an agglomeration of male insects, and not a secretion from the female scale, as is usual. The wax was an important commercial product, and Sir J. D. Hooker observed that our information on this subject was derived through the great facilities offered by the Foreign Office in inquiring into the sources of various native productions of foreign countries. Mr. MacLachlan observed that there was another source of a similar wax from a female cocoon from South India.

#### MORNODES DISEASED.

Mr. Smee exhibited specimens of leaves apparently attacked by some insect. They were referred to Mr. Michael for examination and report.

#### CASTOR-OIL FRUITS.

He also exhibited some fruits and seeds which had ripened in the open air. The latter were rather small, but apparently quite sound.

#### ROOTS OF RHODODENDRON DISEASED.

Hon. and Rev. Mr. Boscawen sent some roots, which appeared to have decayed through wet; no fungoid growths could be detected in it.

#### Floral Committee.

Present: G. F. Wilson, Esq., in the chair; and Messrs. M. T. Masters, J. Llewellyn, H. Turner, W. Bealby, J. Walker, A. Perry, H. Herbert, G. Hemeloa, J. James, C. Noble, J. Fraser, J. Hudson, H. M. Pollett, H. Ballantine, J. Dornay, H. Cannell, G. Duffield, J. O'Brien, E. Hill, J. Douglas,

W. B. Kellock, H. Williams, T. Baines, H. Bennett, J. Laing, J. Child, and T. B. Kinghorne.

From Sir T. Lawrence's garden came a small plant of *Dendrobium heterocarpum* album with a splendid spike of its charming white flowers. *Cattleya Massangeana*, a richly-coloured species with striped segments, and *Laelia anceps* Hillii, a magnificent plant, growing on a raft. It would measure 2 feet and 3 feet superficially, the spikes of white blooms being both strong and abundant, the faint lilac lip adding much to the attractiveness of the flower. *Acineta chrysanthra*, also from the same treasure-house of Orchids, was showing one spike of its massive orange flowers, spotted with minute red dots. The singular position of the bloom, as in Stanhopea, and its rare colour and unwonted form, made it very attractive. An immense flower of *Anthurium Ferriense*, with a spathe 8 inches in length, came from Sir T. Lawrence's gardener. This was in no way a monstrosity, but a well developed bloom. Mr. Ballantine, gr. to Baron Schröder, The Dell, Egham, showed *Odontoglossum Chestertonii*, with the beautiful brown-spotted lemon-coloured flowers, and the very pretty cream-coloured free-flowering *Coelegyne flaccida*. The plant was not large, but it was completely hung round with the drooping flower-spikes. From W. Lee, Esq. (Mr. Woolford, gr.), Downside, Leatherhead, came the handsome *Odontoglossum Hrubyanum* (cirrosium album), with flowers of the purest white on long robust spikes, the plant carrying about twenty open flowers. *Saccolabium belinum*, having flowers small, with narrow oblong green segments, spotted with brown; the basal part of the lip is a pure white cup, the front portion convex, white, and covered with a fringe of white hairs. Messrs. Veitch & Sons, Chelsea, showed a reddish-crimson greenhouse *Rhododendron militare*, the flower being borne on a flatish corymb. From the same nurseries came the well known *Linnm trigynum*, shown as a mass in a large pan, to indicate its value as a decorative plant in the winter months; likewise a large plant of *Nepenthes cincta*, well furnished with its large brownish-crimson pitchers. This variety is said to have been raised from seeds accidentally imported with those of *N. Northiana* (*Gardeners' Chronicle*, May 3, 1884, fig. 110). This firm staged a bright group of *Cyclamen persicum* of great variety of colour and general excellence, for which a Bronze Banksian Medal was awarded. A. H. Smee, Esq. (gr., G. W. Cummins), The Grange, Wallington, showed a healthy small specimen of *Odontoglossum membranaceum*, which it was stated had been grown for three months in 1884 in the open air. Mr. B. S. Williams, The Nurseries, Upper Holloway, showed a specimen of *Odontoglossum hystrix* magnifica, carrying a spike of flowers, the segments of which are rich chocolate-colour with yellow tips. Mr. W. Bull, The Nurseries, King's Road, Chelsea, had a group of considerable size, consisting mainly of Orchids and Palms, among the former being a *Dendrobium Wardianum* album, a good white form of *Wardianum*, with a yellow labellum and throat, with two purple blotches at the side. Several forms of *Cattleya Trianae*, as *tyrianthina*, *Imperialis*, *picta*, and *Empress* have varying degrees of dissimilarity in colour, size of bloom, &c. *Odontoglossum Pescatorei* aurantiaca, with sepals and petals of a pure white, the crest a bright orange, the former being faintly suffused with rose colour, was a variety to admire, as is also *O. Pescatorei melanoleuca*, with a brown crest, tipped with gold. There was in this collection a good form of *O. Halli leucoglossum*, exceedingly dark in its tints. The finest plant was undoubtedly *Vriesia jaceiriense* variegata, a bold-habited Bromeliaceous plant, well foliaged from top to bottom. The leaves were in tufts, dark green, 3 inches wide, and bearing a broad central band in the young ones, and several in the older leaves of a creamy-white. *Oreodoxa plumosa*, a graceful pinnate-leaved Palm, with narrow recurved segments, was a noticeable species, as was also *Deckenia furfuracea*, a handsome spiny-stemmed Palm, with pinnate leaves and wedge-shaped segments, irregularly notched at the edges. Mr. Heims, gr. to F. A. Phillbrick, Esq., Oldfield, Bickley, showed the New Granada *Odontoglossum blandum*, a small plant of this fine species, the yellowish-white flowers sprinkled with crimson, like *O. nevium* as to the lip, but rather broader than in that species. *O. Erstedii* came from the same gardens. Mr. Simcox, gr. to G. N. Wyatt, Esq., Lake House, Cheltenham, showed a large piece of *Odontoglossum ramosissimum*, a straggling long-spiked variety of no particular beauty, and *Cattleya choconensis*, with five blooms. Mr. James, Farnham Royal, showed a box of wonderfully large and symmetrical blooms of *Cinerarias*. Mr. Baylor Hartland, 24, Patrick Street, Cork, showed the much sought for *Narcissus Rip Vao* Winkle, a dwarf yellow double variety; and N. General Gordon, a hybrid double, N. Ajax x N. Incomparabilis. Messrs. H. Cannell & Sons, Swanley Nurseries, Kent, showed a well grown group of *Primula sinensis*, Swanley Blue, a fair lilac in colour, but not blue, it is, however, the nearest approach to a blue that we have, and moreover, the plants had been well done. They showed besides, a collection of *Cyclamen* of good quality, and another, of the old double white *Primula*, receiving a Bronze Banksian Medal. Messrs. T. Todman & Son, Upper Footing, showed seedling *Azalea indica*. Mr. Clarke, Nurseries, Twickenham, had a fine group of very varied *Cyclamen persicum*, the bright and deep colours of great richness being pre-eminent, as were likewise those with pure white flowers for size and substance. *Monarch*, white with a rosy eye, and *Sunset*, a deep pink, with a scarlet eye, were considered the best of the named kinds. He was awarded a Silver Banksian Medal for the collection. Mr. H. B. Smith, St. George's Nursery, Hanwell, had also a collection of *Cyclamens*, in which were many flowers of great substance and beautiful tints, as *C. persicum*, *Rose Perfect*.

tion, a fine robust kind, and *C. giganteum album*, an equally good flower; showing also *C. Mont Blanc* and *C. H. B. Smith* in good form, two kinds certificated in former years. A Silver Banksian Medal was awarded for the collection. A Bronze Banksian Medal was awarded to Mr. J. Wiggins, gr. to W. Clay, Esq., Kingston-on-Thames, for a collection of Cyclamen (160 plants), in which the flowers of a pure white took the lead, the best of the named kinds being *C. giganteum*, Ingomar, a pale flesh, with purple eye; *C. persicum*, Dawn of Day, rose, with a similar eye; and *C. p. Ariel*, a white, with rose eye. Mr. M. Crowe, of The Nursery, Upton, Essex, showed *Begonia semperflorens gigantea rosea*, a useful winter variety. Mr. J. Potts, gr. to R. Phillips, Esq., Welcombe, Stratford-on-Avon, showed seedlings of double Primulas; and Mr. King, Rousham, Aylesbury, some handsome Chinese Primulas, the best being *The King*, a symmetrically formed crimson of good substance.

#### FIRST-CLASS CERTIFICATES.

To W. Lee, Esq., for *Odontoglossum Hrubyanum* and *Saccolabium belinum*.

To Mr. W. Bull, for *Vriesia janirensis*.

To Messrs. J. Veitch & Sons, for *Nepenthes cincta* and *Rhododendron militare*.

To Sir Trevor Lawrence, for *Acinetia chrysanthra*, *Dendrobium heterocarpum album*, *Cattleya Massangeana*, and *Laelia anceps Hillii*.

To Mr. B. S. Williams, for *Odontoglossum hystrix magnifica*.

To Mr. J. King, for *Primula The King*.

To Mr. H. B. Smith, for *Cyclamen giganteum album*.

To Messrs. Cannell & Sons, for *Primula White Perfection*.

#### VOTES OF THANKS.

To Mr. N. Wyatt, for *Odontoglossum ramosissimum*.

To Mr. Heims, for *Odontoglossum blandum*.

To Messrs. Todman & Son, for seedling *Azalea indica*.

To Sir Trevor Lawrence, for *Anthurium Ferriense*.

To Baron Schröder, for *Odontoglossum Chestertonii*.

To Messrs. Veitch & Sons, for *Linum trigynum*.

To Mr. G. W. Cummins, for *Odontoglossum membranaceum*.

To Mr. James, for *Cineraria* blooms.

#### Fruit Committee.

Present: F. D. Godman, Esq., in the chair; and Messrs. J. Lee, A. Sutton, H. J. Veitch, J. Woodbridge, G. T. Miles, W. Paul, A. Howcroft, C. Ross, G. Goldsmith, J. Willard, Harrison Weir, F. Rivers, F. Rutland, G. Paul, W. Denning, G. Bunyard, and R. D. Blackmore.

Early Cabbages were shown by Mr. Gilbert, gr., Burghley, Stamford, the sorts being his Selected Imperial and Ellam's Dwarf. Mr. Inglis, gr. to Earl Grey, Howick, Northumberland, showed four varieties of early kinds, all of them being superior to the Burghley varieties, the best being the Reading All Heart, and the next Cooke's Early, these two having really firm hearts—the Early Rainham and Heartwell Marrow standing in that order as regards merit. Mr. Bibby, nurseryman, Colchester, showed some solid sticks of white Celery named Bibby's Defiance. In fruit, Messrs. G. Bunyard & Co., and Messrs. H. Lane & Sons, came out strongly, each putting up fifty dishes of Apples, consisting of the leading kinds; many early kinds appearing, that ordinarily are long since over-ripe. Messrs. Bunyard showed a new Pear, Duchess de Bordeaux, a sort resembling the Eyewood somewhat in form and markings. Messrs. Rivers & Son, Sawbridgeworth, exhibited a collection of fifteen varieties of the Orange, of home growth, two of Lemons, a Lime, and a Shaddock. These fruits were handsome to look on, and not wanting in juiciness, but they had no flavour. Only one, named O. Sustane, was considered to be worthy of notice. Mr. J. Day, gr., Galloway House, Garlistown, N.B., showed the Galloway Pippin, which will keep in usable condition from November to May.

#### FIRST-CLASS CERTIFICATES.

To Messrs. Rivers & Son, for Orange Sustane.

To Messrs. G. Bunyard & Co., for Pear Duchess de Bordeaux.

#### VOTE OF THANKS.

To Mr. D. Inglis, for an assortment of Cabbages.

AUSTRALIAN TIMBER.—Of the 10,000 forest trees which probably represent the timber-producing capabilities of the globe 7000 or 8000 would flourish in New South Wales. Already there is an export trade in cut and sawn timber of considerable value. The export in 1881 was valued at £23,816, in 1882 at £42,040, and in 1883 at £67,150. It was well observed by the jurors on wood at the Victoria Exhibition of 1872 that the disfavour which attaches to Australian timber is in a large measure owing to the fact that the timber is so frequently felled at improper seasons, whilst the sap-vessels are full; and it is a matter for regret that this is never considered by the Government in calling for tenders, the completion of the work being often stipulated for at a time which leaves the contractor no alternative but to fell his timber after the sap has risen. Another cause of the disfavour is owing to the fact that due care is not exercised in sending the best sorts, besides which there is a general want of care in withdrawing faulty pieces from shipment. P. L. Simmonds, in "Journal of the Society of Arts."

## The Weather.

Feb. 5.—Fine day, sun shining occasionally. Fine and clear at 5 P.M.

6.—Fine, dull day and night.

7.—Fine bright day and night.

8.—Dull day throughout; rather windy at night.

9.—Fine bright morning; dull afternoon; fine evening.

10.—Dull morning; very fine afternoon; fine night.

11.—Fine day and night, clear and cloudy alternately.

LONDON: Atmospheric Pressure.—During the week ending February 7, the reading of the barometer at the level of the sea increased from 29.07 inches at the beginning of the week to 29.31 inches by 5 P.M. on the 1st, decreased to 29.05 inches by 1 P.M. on the 2d, increased to 29.41 inches by 9 A.M., decreased to 29.31 inches by 5 P.M. on the 4th, increased to 29.37 inches by 9 A.M. on the 5th, decreased to 29.34 inches by 1 P.M. on the same day, increased to 29.82 inches by 9 A.M. on the 6th, decreased to 29.64 inches by 9 A.M. on the 7th, and was 29.74 inches by the end of the week.

The mean reading of the barometer for the week was 29.43 inches, being 0.25 inch lower than last week, and 0.51 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 53°, on the 2d; the highest on the 1st was 46°.3. The mean of the seven high day temperatures was 49°.3.

The lowest temperature was 31°, on 5th; on the 7th the lowest temperature was 40°. The mean of the seven low night temperatures was 36°.5.

The greatest range of temperature in one day was 17°, on the 2d and 5th; the smallest was 6°.8, on the 1st. The mean of the seven daily ranges was 12°.8.

The mean temperatures were—on the 1st, 42°.7; on the 2d, 45°.9; on the 3d, 44°.2; on the 4th, 40°.9; on the 5th, 39°.5; on the 6th, 42°.3; on the 7th, 45°.9; and these were all above their averages by 4°.1, 7°.2, 5°.2, 2°.0, 0°.5, 3°.2, and 6°.8 respectively.

The mean temperature of the week was 43°, being 1°.1 higher than last week, and 4°.1 above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 93°.5, on the 7th. The mean of the seven readings was 83°.7.

The lowest reading of a minimum thermometer with its bulb placed on grass was 23°.5, on the 5th. The mean of the seven readings was 29°.2.

Rain.—Rain fell on every day in the week, to the amount of 0.59 inch, of which 0.28 inch fell on the 4th.

ENGLAND: Temperature.—During the week ending February 7, the highest temperatures were 56°.1, at Cambridge, 53°.6 at Nottingham and Bradford; the highest at Sunderland was 49°, at Bolton 49°.1, at Wolverhampton and Newcastle 50°. The general mean was 51°.8.

The lowest temperatures were 28°.8, at Bolton, 29°.1 at Wolverhampton, 30° at Cambridge and Sunderland; the lowest at Plymouth, 33°.5, at Brighton and Liverpool 33°.4. The general mean was 31°.4.

The greatest ranges were 26°.1, at Cambridge,

22°.6 at Bradford, 22° at Blackheath and Hull; the smallest ranges were 16°.8, at Brighton, 17°.4 at Liverpool, 18° at Newcastle. The general mean was 20°.4.

The mean of the seven high day temperatures was highest at Truro, 50°.9, at Plymouth 49°.9, at Cambridge 49°.6; and was lowest at Bolton, 44°.3, at Newcastle 45°, at Sunderland 45°.1. The general mean was 47°.4.

The mean of the seven low night temperatures was highest at Plymouth, 41°, at Truro 39°.3, at Bristol 39°.1; and was lowest at Wolverhampton, 33°.1, at Bolton and Hull 34°.1. The general mean was 36°.5.

The mean daily range was greatest at Cambridge, 15°.1, at Blackheath and Wolverhampton 12°.8; and was least at Plymouth, 8°.9, at Bristol 9°.2, at Liverpool 9°.5. The general mean was 10°.9.

The mean temperature was highest at Plymouth, 45°.2, at Truro 44°.7, at Bristol 43°.4; and was lowest at Bolton, 38°.9, at Wolverhampton 39°.2, at Sunderland 39°.6. The general mean was 41°.6.

Rain.—The largest falls were 2.11 inches at Truro, 1.51 inch at Bolton, 1.26 inch at Plymouth; the smallest falls were 0.12 inch at Sunderland, 0.14 inch at Newcastle, 0.46 inch at Cambridge. The general mean fall was 0.85 inch.

SCOTLAND: Temperature.—During the week ending February 7, the highest temperature was 50°, at Glasgow; at Dundee the highest was 44°.2. The general mean was 47°.4.

The lowest temperature in the week was 30°.2, at Perth; at Edinburgh, Greenock, and Paisley, 34°. The general mean was 32°.7.

The mean temperature was highest at Leith, 40°.7; and lowest at Dundee, 38°. The general mean was 39°.7.

Rain.—The largest fall was 2.05 inches, at Greenock, and 0.31 inch, at Aberdeen. The general mean was 0.86 inch.

JAMES GLAISHER, F.R.S.

#### Answers to Correspondents.

\* \* Notice.—Owing to want of space this week, many communications are unavoidably held over.

ADDRESS: Chev. d. M., Botanic Garden, Hamburg.

ADDRESS OF INTRODUCER OF JAPAN PLUM: A Constant Reader. The address you inquire for is Messrs. Hammon & Co., Oakland, Michigan, U.S.A. Apply also to Mr. W. Bull, King's Road, Chelsea.

FARADAYA PAPUANA: W. M. It is a tropical Australian climbing shrub, the treatment of which might accord with that given to the warm-house Ipomæas.

GROS COLMAR: Barr & Son. A bunch of from 4 lb. to 5 lb., well finished, is considered a very "fine" bunch.

HYACINTH SPIKE ROTTING: W. & S. The malady is common, but the reason is unknown, and there is no remedy that we know of.

INSECT IN LEAVES OF MARGUERITES: [G. R. Gude. The Celery leaf miner (Tephritis onopordinis). Carefully pick off all affected leaves and burn them; do not throw them away, as the maggots go into the soil and change into the pupæ state, and so are reproduced.

MOSSY TENNIS-COURT: R. G. D. The best remedy for you to adopt will be to thoroughly drain the court, and give it a good top-dressing of sifted wood-ashes and good soil. This generally succeeds in eradicating the moss.

MUSHROOMS FOR THE MARKET: Fungus. Mushrooms for the Million, by J. Wright, published at 171, Fleet Street, E.C. (Journal of Horticulture Office).

NAMES OF PLANTS: J. Forsyth Johnson. Schinus Molle.—F. N. B. Celogyne flaccida.—F. D. Peristrophe speciosa, Nees.—W. M. Excoecaria bicolor; a tropical plant.—A. Goulding. Garrya elliptica.

ODONTOGLOSSUM CRISPUM: J. Earl. A pale variety of no great merit.

ROSE OF JERICO: J. C. The plant you allude to is Anastacia hieracanthina. We believe the phenomenon is purely physical, though it has not yet been explained why this plant, Selaginella involvens, and a few others, should have greater absorbent properties than others. Doubtless there is some structural or molecular reason, but it has not been proved. Of course, the appearance is quite independent of vitality.

STATUS OF UNDER GARDENERS, APPRENTICES, AND GARDEN LABOURERS: W. R. G. Garden labourers are not under-gardeners. Apprentices, improvers, and under-gardeners all come under the Act, and have to be paid for.

\* \* All communications intended for publication should be addressed to the "Editor," and not to the Publisher, or to any member of the staff personally. The Editor

would also be obliged by such communications being written on one side only of the paper and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

INTELLIGENT READERS, PLEASE NOTE. — Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and NOT to the Editor.

DIED, on the 5th inst., at Denham Road Nursery, Uxbridge, the residence of his son-in-law, ANDREW DICK, aged seventy-six, after many years of patient suffering. Deeply regretted by his family and friends.

## Markets.

### COVENT GARDEN, February 12.

The subjoined reports are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list weekly, and are responsible for the quotations. It must be remembered that these quotations are averages for the week preceding the date of our report. The prices fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the price at any particular date, still less can they be taken as guides to the price in the coming week. Eo.]

MARKET very quiet; supplies falling off. Prices remain the same. *James Webber, Wholesale Apple Market.*

### SEEDS.

LONDON: Feb. 11.—Messrs. John Shaw & Sons, of 37, Mark Lane, E.C., report that no new feature of interest or importance in connection with the trade for farm seeds was exhibited on the market to-day. Speaking generally, values remain without alteration; the demand for all varieties, for the time of year, continues small. There is a ready sale for spring Tares at the late advance; good parcels of winter Vetches also quickly find buyers. Blue boiling Peas and Haricot Beans are, for the present, neglected. Canary and Hemp seed sell slowly on former terms; there is, however, rather a better feeling for the former. Feeding Linseed keeps firm.

### CORN.

At Mark Lane on Monday English Wheat sold slowly at the rates of Monday week; foreign also remained without quotable change, but there was hardly sufficient doing to test quotations. The prices of flour had a drooping tendency. Barley, Beans, and Peas met only a retail demand, and remained at late rates. American mixed Maize was 6d. lower on the week at 22s. 6d., the little improvement noticed on Friday last being lost. Russian Oats were rather firmer than on last market, and ruled up to Monday last.—On Wednesday transactions in Wheat were upon an extremely limited scale, but sales were not pressed at any tangible decline. Flour was a weak market. No change occurred in the value of Barley, Beans, or Peas. American mixed Maize was easier. Oats were held for steady value, but were very dull of sale.—Average prices of corn for the week ending February 7:—Wheat, 33s. 9d.; Barley, 32s. 5d.; Oats, 20s. 11d. For the corresponding period last year:—Wheat, 37s. 3d.; Barley, 32s. 4d.; Oats, 19s. 6d.

### CATTLE.

At Copenhagen Fields on Monday finer weather, lighter supplies, and rather better markets for dead meat gave help to the trade, and 2d. per 8 lb. advance was obtained on all but undesirable qualities of cattle and sheep. Quotations:—Beasts, 4s. to 5s., and 5s. 2d. to 6s. 4d.; calves, 3s. 8d. to 5s. 8d.; sheep, 4s. 2d. to 5s., and 5s. 4d. to 5s. 8d.; pigs, 4s. to 4s. 6d.—On Thursday there was a very quiet business doing. Supplies were quite equal to the demand. Beasts changed hands quietly at late rates, and a clearance was not effected. Sheep were dull and drooping. Calves and pigs were in demand at late prices.

### HAY.

Tuesday's Whitechapel Market report states that trade was very quiet, at the following quotations:—Clover, prime, 85s. to 102s. 6d.; prime second cut, 85s. to 102s. 6d.; inferior, 45s. to 75s.; hay, prime, 76s. to 90s.; inferior, 30s. to 65s.; and straw, 22s. to 38s. per load.—On Thursday there was a fair supply offered, and the trade was steady at previous prices.—Cumberland Market quotations:—Clover, best, 90s. to 105s.; inferior, 60s. to 84s.; meadow hay, best, 80s. to 88s.; inferior, 60s. to 75s.; and straw, 25s. to 35s. per load.

### POTATOS.

The Borough Market report states that the demand was only very moderate, and supplies fully adequate. Quotations:—Scotch Regents, 90s. to 100s.; Kent, 70s. to 80s.; Champions, 50s. to 60s.; Magnum Bonums, 60s. to 80s.; Victorias, 70s. to 90s. per ton.—The imports into London last week consisted of 80 bags from Boulogne, and 18 from Hamburg.

### COALS.

The following are the prices current at market during the week:—Broomhill West Hartley, 14s. 9d.; East Wylam, 15s. 6d.; Ravensworth West Hartley, 14s. 9d.; Walls End—Harton, 15s.; Tyne (unscreened), 11s. 3d.; Hetton, 17s.; Hetton Lypoos, 15s.; Lambton, 16s. 6d.; Wear, 15s.; Hulam, 15s. 3d.; East Hartlepool, 16s. 3d.; South Hartlepool, 15s. 3d.

Government Stock.—On Monday and Tuesday Consols closed at 99½ to 99½ for delivery, and 99½ to 99½ for the account. Wednesday's prices were as on the preceding days for delivery, and 99½ to 99½ for the account. Thursday's final quotations were 99½ to 99½ for delivery, and 99½ to 99½ for the account.

**SPECIAL TRADE OFFER.**—Three Acres of Conover's COLOSSAL ASPARAGUS PLANTS, on land that must be cleared; 2-yrs., 9s. per 1000; 3-yrs., 11s. per 1000; 4-yrs., 15s. per 1000. The very best money can buy. Cash with orders. Packing free.  
R. LOCKE, Redhill, Surrey.

BLACK FIBROUS PEAT, 5s. per sack, 5 sacks 22s.; sacks, 4d. each.

COARSE SILVER SAND, 1s. 9d. per bushel; 15s. per half ton, 26s. per ton, in 2-bushel bags, 4d. each.

YELLOW FIBROUS LOAM, PEAT-MOULD, and LEAF-MOULD, 1s. per bushel.

SPHAGNUM MOSS, 8s. 6d. per sack.

MANURES, GARDEN STICKS, VIRGIN CORK, 10-BACCO CLOTH, RUSSIA MATS, &c. Write for Free Price LIST.—H. G. SMYTH, 21, Goldsmith's Street, Drury Lane (late called 174, Coal Yard), W.C.

## STANDEN'S MANURE.

ESTABLISHED 20 YEARS.

This old-established Manure is acknowledged by most of the leading practical Gardeners in the United Kingdom and the Colonies to exceed all others in general fertilising properties and staying powers. It promotes a rapid, healthy, and robust growth to plants generally. For Vines it cannot be too highly recommended, and this fact is fully sustained from the result obtained by its use in the hands of some of the most successful Grape growers. It is a clean and dry powder, with very little smell, which renders it particularly adaptable for ladies interested in plant culture.

The highly fertilising properties of this Manure render its money value, in comparison with other manures, at least double, and users will find that very small quantities will produce favourable results.

Sold in TINS, 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each; and in BAGS or KEGS, at reduced prices, 28 lb., 12s. 6d.; 56 lb., 23s.; 112 lb., 42s. each.

May be obtained from most known Seedsmen in the United Kingdom and the Colonies.

### SOLE MANUFACTURERS,

CORRY, SOPER, FOWLER & CO.

(LIMITED).

Offices and Show Rooms—FINSBURY STREET, E.C.

Manufactory and Bonded Tobacco Stores—

SHAD THAMES, S.E.

### THOMSON'S VINE AND PLANT MANURE.

—We are daily getting letters asking us how to apply this manure, from persons who have purchased it from nurserymen who have had none from us. We beg to intimate that we have no responsibility for the quality of the article they have purchased, which may have little in common with ours, though advertised as the same.

WM. THOMSON AND SONS, Clovenfords.

### COCOA-NUT FIBRE REFUSE.

Reduced price. The same as supplied to the Royal Horticultural Society of England. Truck-load, loose, of 2 tons, 20s. 4 tons, 35s. Larger quantity contracted for. In sacks:—Ten, 8s.; twenty, 15s.; forty, 25s.; bags included. All free on to the following Railways:—Great Western, Great Northern, London and North-Western, Great Eastern, Midland; other lines, 5s. extra per truck. Cash with all orders. Established 1872.

J. STEVENS AND CO., Cocoa-nut Fibre Merchants," Grey-bound Yard," and 153, High Street, Battersea, S.W.

BUY ONLY ENGLISH THREE-QUARTER PLATE  
WATCHES.

**BENSON'S NEW PATENT (No. 4658)**  
"LUDGATE" WATCH,

SILVER,

£5 5s.

GOLD,

£12 12s.

Is a "Special Strength" Silver English Lever, my best London make, with Three-quarter Plate Movement.

Jewelled throughout.

Chronometer balance, with damp and dust-proof

Patent ring-band, and extended barrel, in

Massive sterling silver dome cases

With crystal glass front.

Winds, set hands and opens at back.

The superiority in value, accuracy, and durability of the "Ludgate" Watch over the Swiss and American Keyless and Non-Keyless Watches, made in imitation of and sold as English work, and the ordinary Full-plate English Watch is enormous. The "Ludgate" Watch is compact, strong, handsome, and durable. Being Three-quarter Plate, it is superior in value and appearance to any £10 Watch sold, and being compensated, it keeps perfect time; fitted with crystal front, it combines the strength of the Hunter, and convenience of the open face. Of my best London make, it will last a lifetime, stand rough usage of all and every kind without damage, and, being made in three sizes, it is for the above reasons suited for Home, Indian, and Colonial use by

Gardeners, Workmen, and Gentlemen.

The "Ludgate" Watch is far superior

To any Watch at the price yet made, and

Will be sent free and safe at our risk

To all parts of the world for £5 5s.,

Cash or P.O.O.; or in hunting cases, £6 6s.

Price in 18-carat gold, crystal glass cases,

Twelve Guineas

**SPECIAL NOTE** that J. W. BENSON is the only Maker of a Three-quarter Plate English Watch for £5 5s. in Silver, or £7 7s. in Gold, and that our Patent "Ludgate" Watch cannot be had through or of any Watchmaker in the Kingdom. Any infringement of the Patent Rights will be proceeded against. A Book explaining the advantages of this Watch over the Full-plate English Watches sold by all other makers, will be sent Post-free on application to

4 and 5, Wormwood Street, London, E.C.

Oil Paint no Longer Necessary.  
**HILL AND SMITH'S BLACK VARNISH**, for Preserving Ironwork, Wood, or Stone.  
(Registered Trade Mark.)

This **VARNISH** is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

### UNSOLICITED TESTIMONIAL.

"Pierrefield Park, June 21, 1876.—Sirs.—I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chepstow.—I am, Sirs, yours respectfully, Wm. Cox."

**CAUTION.**—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large illustrated **CATALOGUE** of Fencing Hurdles, Field and Entrance Gates, &c., sent free on application to **HILL AND SMITH**, Brerley Hill Ironworks, Staffordshire; 118, Queen Victoria Street, London, E.C.; and 196, St. Vincent Street, Glasgow.

## PATENT WROUGHT-IRON TUBULAR HOT-WATER BOILERS,

And others with SHELVES, and Hollow or Ordinary Cast-iron GRATE BARS;

### SADDLE BOILERS.

With WATERWAY BACKS, and WELDED BOILERS, which are Specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c.

They are the neatest, cheapest, most effective, and durable of any extant.

The Tubular ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention. This pattern

Had the First and Highest Prize, a Silver Medal, Awarded to it at the Royal Horticultural Society's Exhibition, South Kensington, London, on June 3 1881.

The Journal of Horticulture of June 9 says:—

"HEATING APPARATUS—A great number of boilers, valves, &c., were exhibited by eight competitors, and considerable interest was manifested in the verdict of the judges, and much discussion was brought to bear on the merits and shortcomings of the different boilers. The apparatus for which the Silver Medal was awarded was a wrought-iron saddle boiler, with a series of intersecting tubes, somewhat in the form of a letter X, but the tubes in ogee form, in the crown of the boiler. Most gardeners who examined the boiler expressed a favourable opinion of it. It is no doubt a quick and powerful boiler without being complex, the latter condition having, no doubt, had weight with the judges."

The Garden of June 11 says:—

"The premier prize, a Silver Medal, was taken by Messrs. Green & Son for their new patent tubular saddle boiler. It is a modification of their original patent, the boiler being longer and not so high. It is found to be a powerful and efficient boiler, and heats a large quantity of water quickly with a small consumption of fuel."

Descriptive Illustrated Price List may be had free on application. Estimates given for all kinds of Heating Apparatus, and Hot-water Fittings of every variety supplied on the shortest notice. Galvanised Iron Cisterns, from 4d. to 1s. 6d. per gallon.

**GRATEFUL-COMFORTING.**  
**EPPS'S COCOA.**  
**BREAKFAST.**

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." *Civil Service Gazette*.

Made simply with boiling water or milk. Sold only in Packets, labelled thus:—  
**JAMES EPPS & CO., Homeopathic Chemists, London.**

**HOLLOWAY'S OINTMENT and PILLS.**  
—Old Wounds, Sores, and Ulcers.—Daily experience confirms the fact which has triumphed over opposition for nearly half a century,—viz., that no means are known equal to Holloway's remedies, for curing bad legs, sores, wounds, diseases of the skin, erysipelas, abscesses, burns, scalds, and, in truth, all cases where the skin is broken. To cure these infirmities quickly is of primary importance, as the compulsory confinement indoors weakens the general health. The ready means of cure are found in Holloway's Ointment and Pills, which heal the sores and expel their cause. In the very worst cases the Ointment has succeeded in effecting a perfect cure, after every other means has failed of giving any relief. Desperate cases best display its virtues.

# WEBB AND SONS' HOME-GROWN VEGETABLE SEEDS.

THE BEST CUCUMBER.

## WEBBS' PERPETUAL BEARER.

1s. 6d. and 2s. 6d. per packet, Post-free.

From Mr. EDWARD EVITT, Gardener to J. Atkins, Esq., *Hinckley*.—"Your Perpetual Bearer Cucumber is the best sort I ever grew. I cut some Cucumbers 2 feet 7 inches long, and of splendid quality; they were greatly admired by all who saw them."

## WEBBS' WOODFIELD MELON.

1s. 6d. and 2s. 6d. per packet, Post-free.

From Mr. JOHN McKINLAY, Gardener to the Right Hon. Lord Foley.—"Your Woodfield Melon is a free setter, thin-skinned, beautifully netted, and of delicious flavour."

From Mr. E. SIMPSON, Gardener to the Right Hon. Lord Wrottesley.—"Webbs' Woodfield Melon is an excellent sort; thick flesh, of first-rate flavour, and good setter; very desirable."

## SAVE 20 PER CENT.

Our exceptional position as the largest Seed Growers in the Kingdom enables us to offer Pure Vegetable and Flower Seeds at very moderate prices, which, on comparison, will be found some twenty per cent. lower than those of other leading Houses.

## WEBBS'

## EARLY MAMMOTH CAULIFLOWER.

1s. 6d. and 2s. 6d. per packet, Post free.

From Mr. GEO. BRIGHTON, Gardener to Right Hon. the Earl of Mount Edgcumbe.—"Your Early Mammoth Cauliflower, being well protected with foliage, I am now cutting (November 1) fine white heads, very compact, and of first-rate quality."

## WEBBS' IMPROVED BANBURY ONION.

6d. per packet, 1s. per ounce, Post-free.

From E. J. LOWE, Esq., F.R.S., *Shirenewton Hall*.—"Enough cannot be said in praise of this (Webbs' Improved Banbury) Onion, or of your strain of Queen Onion."

From Mr. W. S. HOLMES, *Wellington*.—"I took 1st prize with (Webbs' Improved Banbury) Onion at our show."

## WEBBS' SPRING CATALOGUE

Beautifully Illustrated. Post-free 1s.—Gratis to Customers.

## WEBBS' SELECT SEED LIST,

GRATIS and POST-FREE.

All Vegetables and Flower Seeds Free by Post or Rail. 5 per Cent. Dis. for Cash.

*W. & A. Webb & Sons*

## WEBBS' NEW PEA, THE WORDSLEY WONDER.

THE BEST BLUE WRINKLED MARROW.

2s. 6d. per pint—in sealed packets only.

Mr. W. Iggulden says:—

"It is the best novelty in the way of Peas."

Mr. R. Gilbert says:—

"It is calculated to suit the million."

Mr. W. Ingram says:—

"The Wordsley Wonder is altogether a very good Pea."

The "Gardeners' Chronicle" says:—

"One of the best Peas of modern introduction."

Mr. William Crump says:—

"I am well pleased with Webbs' Wordsley Wonder."

## WEBBS' SUMMERHILL LETTUCE.

6d. and 1s. per Packet, Post-free.

From W. ELSTON, Esq., *Clifton*.—"I had some very fine Summerhill Lettuce from your seed. They were the size of small Cabbage, and the best I ever grew. I took 1st prize with them at our Horticultural Show."

From Mr. W. DAVIES, Gardener to E. J. WILLIAMS, Esq., *Rochford House*.—"Webbs' New Summerhill Lettuce is undoubtedly the finest Cabbage Lettuce grown."

THE QUEEN'S SEEDSMEN, WORDSLEY, STOURBRIDGE.

**Warminster, Wilts.**  
Re J. Wheeler.—In Liquidation.—IMPORTANT SALE of VALUABLE FREEHOLD PROPERTIES.  
To Nurserymen, Builders, and Others.

**MESSRS. PROTHEROE and MORRIS** (in conjunction with Messrs. Harding & Sons) are instructed to **SELL** by AUCTION, at the "Bath Arms" Hotel, Warminster, on **TUESDAY**, March 3, at 3 o'clock precisely, by order of the Trustees, the valuable FREEHOLD NURSERY GROUNDS, with comfortable DWELLING-HOUSES, OUTBUILDINGS and OFFICES, extensive HOTHOUSE and GREENHOUSE ERECTIONS, Brick PITS, &c., and the GOODWILL of the Old-established BUSINESS; also several productive GARDENS, possessing choice FREEHOLD BUILDING SITES, the whole conveniently situate in the Town of Warminster, near the Railway Station, and only three hours' journey from London. Offering an excellent opportunity to Nurserymen requiring a thoroughly genuine Old-established Business and others desirous of securing Land in the best part of the Town for Building Purposes. The purchaser or purchasers of these Properties will have the great advantage of securing, at unreserved Auction prices, any of the Trees and Shrubs growing in the Grounds at the extensive SALE of NURSERY STOCK, commencing **WEDNESDAY**, March 4. Particulars and Conditions of Sale may be had on the Premises, at the place of Sale, of Messrs. SPARKES and POPE, Solicitors, Exeter and Crediton; of Messrs. CHILTON and GREEN-ARMYtage, Solicitors, Bristol; of Messrs. WAKEMAN and BLACK, Solicitors, Warminster; of Messrs. HARDING and SONS, Auctioneers, Frome and Warminster; and of Messrs. PROTHEROE and MORRIS, Auctioneers and Valuers, 67 and 68, Cheapside, London, E.C.

**Warminster, Wilts.**  
In Bankruptcy.—Re James Wheeler, Nersyman.  
GREAT CLEARANCE SALE of about 40 ACRES of NURSERY STOCK.

**MESSRS. PROTHEROE and MORRIS** (in conjunction with Messrs. Harding & Sons) will **SELL** by AUCTION, on the Premises, the various Nurseries situate at or near Warminster, on **WEDNESDAY**, March 4, and following days, at 12 o'clock precisely each day, without reserve, by order of the Trustee, with concurrence of the Mortgagees, the whole of the valuable NURSERY STOCK, extending over 40 Acres, including an enormous number of Trees and Shrubs of young growth, and an extraordinary stock of large Conifers, Evergreen and Deciduous Shrubs, invaluable to Planters, Gentlemen, and others largely engaged in planting. The Stock includes 5000 Green Hollies, 1 to 2 feet; 3500 English Yews, 2½ feet; 30,000 Common and Caucasian Laurels, 9 inches to 3 feet; 7000 Portugal Laurels, 14,000 Firs and Pines, 10,000 hybrid and named Rhododendrons, 1 to 5 feet; 50,000 Larch, 2 to 5 feet; 7000 Privet, 15,000 Thorns, 1½ to 2 feet; 20,000 Hazel, 1½ to 4 feet; 35,000 Ornamental and Forest trees, such as Limes, Beech, Poplars, Oaks, Chestnuts, &c.; 8000 Standard and Pyramid Apples and Pears, 2000 Standard and Dwarf Roses, GREENHOUSE PLANTS, and other Stock too numerous to mention.

May now be viewed. Catalogues may be had at the Warminster Nurseries; or of Messrs. PROTHEROE and MORRIS, Auctioneers, 67 and 68, Cheapside, London, E.C.; Messrs. HARDING and SONS, Auctioneers, 26, King Street, Frome; Mr. W. H. PHILLIPS, Chartered Accountant, 1, Small Street, Bristol; Messrs. WAKEMAN and BLECK, Solicitors, Warminster; Messrs. SPARKES and POPE, Solicitors, Exeter and Crediton; and of Messrs. CHILTON and GREEN-ARMYtage, Solicitors, Bristol.

**N.B.**—The Four FREEHOLD NURSERIES will be OFFERED by Public AUCTION, in Lots at the "Bath Arms" Hotel, Warminster, on **TUESDAY**, March 3 (the day preceding the Sale of the Stock), by Messrs. PROTHEROE and MORRIS, in conjunction with Messrs. HARDING and SONS. Full Particulars and Plans may be had on application. (See preceding Advertisement.)

**Extraordinary Form of White Lælia anceps.**  
**MESSRS. PROTHEROE and MORRIS** are favoured with instructions from Mr. F. Sander to **SELL** by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., at an early date, great masses in extra condition of a most superb WHITE LÆLIA ANCEPS, undoubtedly the finest pure white species ever offered. The whole flower is pure white, and very large, the throat striped crimson and the lips over an inch across. Mr. Edward Klaboch, who has collected these masses, states that the flowers are of great substance. (We consider this the finest White Lælia anceps ever introduced. Dried flowers will be on view.  
Further particulars will appear.

**WM. CUTBUSH AND SON** (Limited), Nurserymen and Seed Merchants, Hightgate Nurseries, N.

### For Present Sowing.

The earliest in cultivation, dwarf and compact in habit, head firm and pure white, and well protected by the foliage. It stands dry weather better than any other variety.

Mr. GILBERT says it turned out the best of all he grew last season.

Mr. E. STEPHANSON, Thorogaby Hall, says:—"Your 'President' Cauliflower is not only the earliest but the most useful I have ever grown; we can plant it 3 or 4 inches closer than any other variety. The heads are very white and compact. I have grown it ever since it came out: I recommend it to all my friends."

Post-free on receipt of postal order or stamps for 1s. 6d.

WILLIAM E. MARTIN, Seed Merchant, Hull.

# THE FRUIT OF THE FUTURE.

## NEW MAGNIFICENT BLACKBERRY,

### "THE WILSON JUNR."

In spite of the fact that Blackberries will grow "anywhere" in reason, and everybody likes them, it is yet a puzzling reality that it is only with great difficulty and at a high figure that we can purchase them in our markets.

Surely, then, it must be apparent to all farseeing "fruit growers" that instead of glutting the markets with Gooseberries, Currants, &c., they have here a fruit which, if planted upon any given area of land, will prove **far more** profitable than any other hardy fruit that could be grown. And why?

Simply because for half-a-dozen years ahead, at least, the stock throughout the country will not have time to become so great as to exceed the demand.

Landowners, Stewards, and Gardeners, who have each year to show a balance-sheet "of profits," have here a very simple, safe method of for some years obtaining highly profitable results. Planted 3 feet by 8 feet requires at the rate of 1815 plants to an acre.

Gardeners also who grow for house consumption will find this fruit a valuable assistant. It will stand any treatment, and do well where other fruits would fail.

Whilst, however, we have the matter under consideration, do not let us fall into the mistake of planting **any** variety so long as it is a "Blackberry." Why not, for the sake of a slightly additional first expense, obtain the very "cream" of the family; or, in other words, procure stocks of the hardiest, largest, most delicious, and most productive?

By pursuing this procedure the result repays the grower tenfold for the slightly additional first expense incurred.

It was this reasoning that caused us to give the subject our most careful study; the result of which is, we offer a variety, the grandest of the group, producing enormous berries, measuring on an average  $3\frac{1}{4}$  inches around, lengthwise, and the same dimensions crosswise. (This will give an idea of the profit to be derived from its culture as a market commodity.) The berries are also glossy black, very early, of exquisite flavour, and enormously productive—the heavy load of fruit often bending the canes to the very ground.

We can offer strong plants at 1s. 3d. each,  
12s. per dozen, 85s. per 100.

We can offer other varieties as follows:—"LAWTON," "KITATINNY," "PARSLEY-LEAVED" (*Rubus fruticosus laciniatus*), "WILSON'S EARLY," at 9d. each, 8s. 6d. per dozen, 63s. per 100.

## A DELICIOUS AND LITTLE KNOWN VEGETABLE.

### "THE CHINESE YAM or POTATO" (*Dioscorea Batatas*).

We can with every confidence offer this novel esculent as being bound (when once fairly known) to create a sensation in the vegetable world. If planted in ridges, as you would Potatoes, it grows without trouble, and when boiled for a few minutes presents a most tempting mealy white appearance, whilst in flavour it is most delicious, having a gratifying and somewhat nutty taste.

Gardeners, &c., who "move with the times," will in this novelty find their enterprise well repaid, whether as words of praise from their employer for providing a new table delicacy; or, if supposed to turn same to a profitable account, as a highly beneficial pecuniary result.

Price, per dozen tubers, 4s. 6d.; per 100, 32s. 6d.

# B. S. WILLIAMS'

Specialties in Vegetable Seeds  
for 1885.

## WILLIAMS'

Holloway Rival Pea.  
Per Quart, 2s. 6d.  
Very Prolific; the best Second  
Early Pea yet introduced.

Emperor of the Marrow Pea  
Per Quart, 2s. 6d.  
Very superior and well-known variety.

## WILLIAMS'

Basing Park Hybrid Melon  
(New). Per Packet, 2s. 6d.  
Deep flesh, scarlet, and of fine flavour.

Nowton Court Melon  
(New). Per Packet, 2s. 6d.

Semper Fidelis Melon  
(New). Per Packet, 1s. 6d.

## WILLIAMS'

Early Prolific Dwarf French  
Bean.

Per Quart, 2s. 6d.

Acknowledged by every one to be  
the earliest and best French Bean in  
commerce.

## WILLIAMS'

Magnum Bonum Onion.  
Per Packet, 1s. 6d.  
The largest and best keeping Onion  
ever sent out.

## WILLIAMS'

Matchless Red Celery.  
Per Packet, 1s.  
The finest flavoured variety and longest  
keeper, largely grown for market.

Matchless White Celery.  
Per Packet, 1s.  
The earliest and best White Celery.

## WILLIAMS'

Improved Dwarf Brussels  
Sprouts.

Per Packet, 1s.

Very prolific, compact, and of splendid  
flavour.

## WILLIAMS'

TELEGRAPH CUCUMBER.  
(Woolley's variety.)

Per Packet, 1s. 6d.  
Specially selected stock, best for  
general purposes.

TELEGRAPH CUCUMBER.  
(Kollisson's variety.)

Per Packet, 1s. 6d.

THE

# Gardeners' Chronicle.

SATURDAY, FEBRUARY 21, 1885.

## LEAVES.

IN his discourse at the Royal Institution last Friday night Sir John Lubbock (to whom we are indebted for the following summary) said that, greatly as we all appreciated the exquisite loveliness of flowers, it must be admitted that the beauty of our woods and fields was even more due to the marvellous grace and infinite variety of foliage. How is this inexhaustible richness of forms to be accounted for? Does it result from an innate tendency of the leaves in each species to assume some particular shape? Has it been intentionally designed to delight the eyes of man? Or has it reference to the structure and organisation—the wants and requirements of the plant itself?

## SIZE.

Now, if we consider firstly the size of the leaf we shall find that it is regulated mainly with reference to the thickness of the stem, and that when strict proportion is departed from the difference can generally be accounted for. This was shown, for instance, by a table giving the leaf area and the diameter of stem of the Hornbeam, Beech, Elm, Lime, Spanish Chestnut, Ash, Walnut, and Horse Chestnut.

The size, once determined, exercises much influence on the form. For instance, in the Beech the leaf has an area of about 3 square inches. The distance between the buds is about 1½ inch, and the leaves lie in the general plane of the branch, which bends slightly at each internode. The basal half of the leaf fits the swell of the twig, while the upper half follows the edge of the leaf above; and the form of the inner edge, being thus determined, decides that of the outer one also. In the Lime the internodes are longer, and the leaf consequently broader. In the Spanish Chestnut the stem is nearly three times as stout as that of the Beech, and consequently can carry a larger leaf-surface. But the distances between the buds are often little greater than those in the Beech. This determines, then, the width, and, by compelling the leaf to lengthen itself, leads to the peculiar form which it assumes.

## ARRANGEMENT.

Moreover, not only do the leaves on a single twig admirably fit one another, but they are also adapted to the ramification of the twigs themselves, and thus avail themselves of the light and air, as we can see by the shade they cast without large interspaces or much overlapping. In the Sycamores, Maples, and Horse Chestnuts, the arrangement is altogether different. The shoots are stiff and upright, with leaves placed at right angles to the plane of the branch, instead of being parallel to it. The leaves are in pairs, and decussate with one another, while the lower ones have long petioles, which bring them almost to the level of the upper pairs, the whole thus forming a beautiful dome.

For leaves arranged as in the Beech, the

gentle swell at the base is admirably suited, but in a crown of leaves, such as those of the Sycamore, space would be thereby wasted, and it is better that they should expand at once, as soon as their stalks have carried them free from the upper and inner leaves; hence we see how beautifully the whole form of these leaves is adapted to the mode of growth and arrangement of the buds in the plants themselves.

In the Black Poplar the arrangement of the leaves is again quite different. The leaf-stalk is flattened from side to side, so that the leaves hang vertically. In connection with this it will be observed that while in most leaves the upper and under surfaces are quite unlike, in the Black Poplar, on the contrary, they are very similar. The stomata, or breathing holes, moreover, which in the leaves of most trees are confined to the under-surface, are in this species nearly equally numerous on both. The "Compass Plant" of the American prairies, a yellow Composite not unlike a small Sunflower, is another plant with upright leaves, which, growing in the wide open prairies, tend to point north and south, thus exposing both surfaces equally to the light and heat. It was shown by diagrams that this position also affected the internal structure of the leaf.

In the Yew the leaves are inserted close to one another, and are long and linear; while in the Box they are further apart and broader. In the Scotch Fir the leaves are linear, and  $1\frac{1}{2}$  inch long, while in other Pines, as, for instance, the Weymouth, the stem is thicker and the leaves longer.

In the plants hitherto mentioned, one main consideration appears to be the securing of as much light as possible; but in tropical countries the sun is often too powerful, and the leaves, far from courting, avoid the light. The typical Acacias have pinnate leaves, but in most Australian species the true leaves are replaced by a vertically flattened leaf-stalk. It will be found, however, that the seedlings have leaves of the form typical in the genus. Gradually, however, the leaf becomes smaller and smaller, until nothing is left but the flattened leaf-stalk or phyllode. In one species the plant throughout life produces both leaves and phyllodes, which give it a very curious and interesting appearance. In Eucalyptus, again, the young plant has horizontal leaves, which in older ones are replaced by scimitar-shaped phyllodes. Hence the different appearance of the young and old trees which must have struck every visitor to Algiers or the Riviera.

#### EVERGREENS.

We have hitherto been considering mainly deciduous trees. In evergreens the conditions are in many respects different. It is generally said that leaves drop off in the autumn because they die. This, however, is not strictly correct. The fall of the leaf is a vital process, connected with a change in the cellular tissue at the base of the leaf-stalk. If the leaves are killed too soon they do not drop off. Sir John illustrated this by some twigs which he had purposely broken in the summer; below the fracture the leaves had been thrown off, above they still adhered, and so tightly that they could support a considerable weight. In evergreen trees the conditions are in many respects very different. It is generally supposed that the leaves last one complete year. Many of them, however, attain a much greater age; for instance, in the Scotch Fir, three or four years; in the Spruce and Silver, six or seven; in the Yew even longer. It appears from this that they require a tougher and more leathery texture. When we have an early fall of snow our deciduous trees are often much broken down; glossy trees have a tendency to throw it off, and thus escape; hence evergreen leaves are very generally smooth and glossy. Again, evergreen leaves often have special protection, either in an astringent or aromatic

taste, which renders them more or less inedible; or by thorns and spines. Of this the Holly is a familiar illustration; and it was pointed out that in old plants, above the range of browsing quadrupeds, the leaves tend to lose their spines, and become unarmed. The hairs on leaves are another form of protection; on herbs the presence of hairs is often associated with that of honey, as they protect the plants from the visits of creeping insects; hence perhaps the tendency of water species to become glabrous, *Polygonum amphibium* being a very interesting case, since it is hairy when growing on land, and smooth when in water. Sir John then dealt with cases in which one species mimics another, and exhibited a striking photograph of a group of Stinging Nettles and Dead Nettles, which were so much alike as to be hardly distinguishable. No one can doubt that the Stinging Nettle is protected by its poisonous hairs, and it is equally clear that the innocuous Dead Nettle must profit by its similarity to its dangerous neighbour. Other similar cases were cited.

He had already suggested one consideration which in certain cases determined the width of leaves, but there were others in which it was due to other causes, one being the attitude of the leaf itself. In many genera with broad and narrow leaved species, *Drosera* and *Plantago*, for instance, the broad leaves formed a horizontal rosette, while the narrow ones were raised upwards. Fleshy leaves were principally found in hot and dry countries, where this peculiarity had the advantage of offering a smaller surface, and therefore exposing the plant less to the loss of water by evaporation.

#### WATER PLANTS.

Sir John then passed to aquatic plants, many of which have two kinds of leaves—one more or less rounded, which floats on the surface, and others cut up into narrow filaments, which remain below; the latter thus present a greater extent of surface. In air, however, such leaves would be unable to support even their own weight, much less to resist any force such as that of the wind. In perfectly still air, however, for the same reason, finely divided leaves may be an advantage, while in comparatively exposed situations more compact leaves may be more suitable. It was pointed out that finely cut leaves are common among low herbs, and that some families which among the low and herb-like species have such leaves, in shrubby or ligneous ones have leaves more or less like those of the Laurel or Beech.

An interesting part of the subject is connected with the light thrown by the leaves of seedlings. Thus the Furze has at first trifoliate leaves, which gradually pass into spines. This shows that the Furze is descended from ancestors which had trifoliate leaves, as so many of its congeners have now. Similarly in some species, which when mature have palmate leaves, those of the seedling are heart-shaped. He thought that perhaps in all cases the palmate form was derived from the heart-shaped, and that when in any genus we find heart-shaped and lobed leaves, the former may represent the earlier or ancestral condition. He then pointed out that if there was some definite form told off for each species then surely a similar rule ought to hold good for each genus. The species of a genus might well differ more from one another than the varieties of any particular species; the generic type might be, so to say, less closely limited; but still there ought to be some type characteristic of the genus. He took then one genus, that of *Senecio* (the Groundsel). Now, in addition to *Senecios* more or less resembling the common Groundsel, there were species with leaves like the Daisy, bushy species with leaves like the Privet and the Box, small trees with leaves like the Laurel and the

Poplar, climbing species like the Tamus and Bryony. In fact, the list is a very long one, and showed that there is no definite type of leaf, but that the form in the various species depends on the condition of the species. From these and other considerations he concluded that the form of leaves did not depend on any inherent tendency, but on the structure and organisation, the habits and requirements of the plant. Of course it might be that the present form had reference to former and not to present conditions. This rendered the problem all the more complex and difficult. The lecture was illustrated by numerous diagrams and specimens, and Sir John concluded by saying, the subject presented a very wide and interesting field of study, for if he were correct in his contention every one of the almost infinite forms of leaves must have some cause and explanation.

#### MEMBLAND.

(Concluded from p. 206.)

THE kitchen garden is the exact termination of the valley which runs up its centre. It is from 5 to 6 acres in extent, bounded by a wall 14 feet high, and as a consequence ranges on both sides of the valley. The greater portion is on the right or north side, where a kind of terrace is occupied by the various fruit and plant houses, the whole length of the wall on this side being covered with glass.

#### THE GLASS HOUSES.

For greater convenience in directing the operations in the numerous houses, Mr. Baker has numbered each one—a capital plan in large establishments—and for the purpose of describing them we cannot do better than adopt the same. Nos. 1 to 4 are lean-to vineries, 18 feet wide, thus affording a good length of rafters. The Vines all through are in first-class condition, being about eight years old, trained on the span system. Borders are made inside and out.

No. 1 is the early vinery, for which purpose Black Hamburgs and Foster's Seedling are the only kinds grown.

No. 2 is a late house, where were growing fine well-shaped and coloured bunches of Gros Colmar, also splendid examples of Alicante and Barbarossa, well coloured. A Vine of Pearson's Golden Queen was carrying a good crop, and perfectly ripened; these appeared as if they would surpass the Muscat of Alexandria for keeping qualities, the skin being thick and the berries plump. Some Vines also of Madresfield Court, though the fruit had all been cut, showed evident signs of good culture. The back wall of this house was covered half with that fine old Pelargonium, Rollisson's Unique; the other with Heliotrope, which produces abundance of cut bloom during the winter months.

No. 3 contained Vines of Lady Downe's, carrying some remarkably fine bunches for this variety, well coloured and monstrous berries. Black Prince, Muscat Hamburg, and Madresfield Court also are grown in this house, and from the latter variety in this house were grown those handsome bunches with which Mr. Baker carried off the first prizes at the western shows.

No. 4. Principally Muscat of Alexandria are here grown. A few Vines of Frontignan are being inarched with rods carried from the Muscats, in order to fill the house entirely with the latter variety. The back wall was covered with double Pelargoniums and Abutilon Boule de Neige. A fine batch of Chrysanthemums, for cut flowers, occupied the centre at the time of my visit.

No. 5, a Peach-house; back walls 16 feet, the border 6 feet wide, with upright sashes in front, 12 feet wide, 65 feet long. It may here be remarked that this kind of fruit cannot be

grown on the open walls, owing to the salt impregnating the atmosphere as it comes off the sea; hence there is a considerable amount of glass devoted to the Peach and Nectarine. In the house No. 5 the principal varieties are Lord Napier, Violette Hâtive, and Rivers' Early Orange Nectarines; Royal George, Dymond, and Magdala Peaches; the two latter Mr. Baker thinks much of for early work.

No. 6. Peach-house, wherein Walburton Admirable, Barrington, Lord Palmerston, and Princess of Wales Peaches; Humboldt, Victoria, and Pittmaston Orange Nectarines, are the kinds grown.

No. 7 is a small square house, connecting the two Peach-houses, Nos. 6 and 8. A very fine plant of *Luculia gratissima* occupied the back wall, and a standard of the same in front, well set with flower-buds. A large and healthy-looking plant of *Lapageria rosea* was trained up and covered the roof; a collection of Palms, *Dracaena indivisa*, and *Dracaenas* with hardy green-house Ferns occupied the centre.

No. 8, another Peach-house of the same dimensions as the other; Noblesse, Dymond, and Princess of Wales Peaches, and Pine-apple Nectarines occupied the trellis. The trees throughout were strong and healthy-looking, with plenty of good bearing wood, but not so well ripened as one could wish. It seems a pity that these ranges of Peach-cases were not widened sufficiently at first, so as to enable a large trellis to be used in front; an angle would thus have been made in the roof which would have caught the direct rays of the sun and would have conducted to a better ripening of the wood, besides the large quantity of fruit extra, and all this at a little more cost than the present erections, which, like all other glass structures in this establishment, are very substantial, elaborate, and well-built.

Nos. 9 and 10 are low span-roofed houses in front of the vineries, each about 50 feet long, and 12 feet wide, admirably adapted for plant culture for decorative purposes. Large specimen plants are not grown, only those that are useful for cut blooms and home work, of which there are large quantities.

No. 9 is classed an intermediate-house. Here were growing a fine batch of *Odontoglossum Alexandræ* and *vexillarium*; a fine specimen of *Lælia Dayana* was in flower at the time, and several large plants of *Cypripedium Maulei*. A capital lot of *Cyclamen* for early use were coming on; large batches of *Adiantum cuneatum* and *White Lady Heliotrope* were all in a very healthy condition. The shelves were filled with *Primulas* and *Cyclamens*, every available space being utilised to advantage.

No. 10. A stove temperature is here maintained. Some remarkably fine pans of *Cologne cristata*, which Mr. Baker had under his care for many years previous to taking charge of Membland, were very noticeable. *Calanthes* in variety were largely grown. Batches of *Euphorbia jacquiniæflora*, small *Crotons*, *Dipladenias*, *Adiantums cuneatums* and *Farleyense*, were all showing signs of good management. A fine lot of plants of *Jasminum gracillimum*, well set with flower-buds, and just coming into flower, are much esteemed here for their fragrance and pure whiteness. It does not drop its flowers so readily as most *Jasmines*. In a line with these houses stands a range of pits, 70 feet long, used for forcing French Beans, &c.

We now leave the walled garden and pass out to the back of the vineries on ground still higher, where exist two long ranges of span-roofed-houses, each range about 100 feet long, and each in six divisions, well adapted for the cultivation of Cucumbers, Melons, Tomatos, &c.

No. 11 in these ranges is used as a propagating-house.

No. 12. Anthuriums, Gardenias, and Bouvardias occupy this house at the present time, conspicuous being *A. Andreanum*, with a very

fine and handsome spathe. This house at forcing time is devoted to the forcing of Roses, Lilacs, &c.

No. 13. Filled with double white *Primulas*, flowering well, together with several of Gilbert's new varieties—Princess of Wales being the best of them.

No. 14. Double *Pelargoniums*, of Wonderful and Raspail varieties—the latter being a splendid thing, a very deep scarlet; and *Carnations* W. P. Milner, best of Whites; and Miss Jolliffe, were all showing abundance of flower-buds.

No. 15 was filled with French Beans in pots, Fulmer's Forcing still being a favourite here.

No. 16. Devoted exclusively to Tomatos, Trentham Fillbasket being considered the best—Hathaway's Stamfordian Excelsior and Stamfordian being the other varieties grown. Large crops had been taken from this house, and there yet remained a quantity of fair sized fruit.

No. 17. A Cucumber-house just coming into bearing. Mr. Baker sticks to a cross between Sion House and Telegraph raised by himself, and which he considers the best that he knows, being specially adapted for winter culture. By the appearance of the fruit at that time I thought it a very distinct and desirable variety, and one that should be brought under public notice.

No. 18 was just being filled with pot Vines. This completes the list of houses, and here I may say that cleanliness and good management existed everywhere, as might be anticipated, as the gardener is one of our best men.

#### THE KITCHEN GARDEN

exhibited the same care bestowed upon it in the selection of varieties of vegetables suitable, and arrangement for a continuous supply throughout the season. Good specimens of Apple and Pear trees line the different walks intersecting the garden. The principal varieties of Pears that succeed here as pyramids are *Fondante d'Automne*, *Gratioli* of Jersey, *Urbanist*, *Alexandre Lambre*, *Williams' Bon Chrétien*, and *Louise Bonne* of Jersey, this last doing exceptionally well. Pruning is not carried out so rigidly as in many places, no doubt conducing to fruitfulness in earlier stages of the tree. The north wall is covered with Morello Cherries, and the border with late autumn bearing Raspberries. At the head of the kitchen garden are borders for herbaceous plants in great variety. Beds of Lilies of the Valley were noticed as producing wonderfully fine crowns, and which are said to do so annually, the soil and position being such that they luxuriate in. Various additions and alterations are in contemplation to improve the gardens, and so long as Mr. Baring has a gardener like Mr. Baker, who has so long served and enjoyed the confidence of his employer both here and at Coombe to advise him in any fresh undertakings, there is no doubt but that Membland will retain its rank with the finest and best managed establishments in the kingdom. *D. C. Powell.*

## New Garden Plants.

### ODONTOGLOSSUM PESCATOREI MELANOCENTRUM, n. var.

A VERY fine variety, which looks as if it had a black centre. The top of the column and the whole of its front side have this colour. The lamellæ of the base of the lip, and the bilamellate disc between them, are likewise blackish-purple, while the small anterior lamellæ are orange, with a black-purple margin at the base. Sepals with a light purple wash on the middle line. Excepting the places mentioned the whole flower is white. Kindly forwarded from Mr.

W. Bull, together with the fine variety *aurantiacum* *H. G. Rehb. f.* (These varieties were shown at the last meeting of the Floral Committee.)

#### MAXILLARIA KALBREYERI (*Rehb. f.*), n. sp.\*

This is a New Grenadan discovery of Mr. W. Kalbreyer, whose name it may bear. It comes near to *Maxillaria venusta* and its allies, but the flower is so much shorter that I was reminded at first sight of *Maxillaria candida*, Lindl. This, however, has a distinctly three-lobed lip, and the callus stands far more towards the apex of the lip. I have only seen *M. candida* in Dr. Lindley's Herbarium. The bulb of our plant is oblong-uncipitous, one-leaved, and about 2 inches in length and 1 in breadth. The leaf is oblong-ligulate, a span high, a good inch broad. Peduncles with some strong sheaths as in allied species. Bracts oblong cucullate acute, surpassing a little the ovary, which is one inch in length. Mentum angulate. Upper sepal and petals ligulate, acute, side sepals triangular acute, not much surpassing an inch, lightest greenish-white. Lip oblong-ligulate, blunt, tooth-letted on the anterior margins, a little broader towards the base, lightest greenish-white, with some sordid mauve-purple outside on the superior margins, covered with meal from broken hairs in the usual manner. The callus itself is partly mealy, but its triangular, naked, orange apex peeps out distinctly from the meal in the middle of the disc. I had excellent materials from Mr. Harry Veitch. *H. G. Rehb. f.*

#### CHARLES DOWNING.

THE death of Mr. Charles Downing, of Newburgh, New York, took place on January 18, in the eighty-third year of his age, after a lingering illness, caused by a severe injury received in New York city two years ago, when he was knocked down by a horse car. In early life he was engaged with his brother, A. J. Downing, in the nursery business near Newburgh, New York. Many years after he retired from active business life, and took up his abode in the city of Newburgh, having a small garden attached to his house, where he devoted all his time to the study of fruits, living a very retired and quiet life. Being a man of great experience and in direct communication with all the leading horticulturists, pomologists, and nurserymen, he received large quantities of fruits from all parts of the country, thus enabling him to become one of the greatest pomologists the world has ever known.

The *Fruits and Fruit Trees of America*, in its present form, was really more the results of the labours of Mr. Charles Downing than of his brother, A. J. Downing. He added much new matter, the results of his own observation and experiments, finally completing a work which is considered of the highest authority on this subject, both in England and America.

Darwin, in his work on *The Origin of Species*, constantly quotes from this work of Charles Downing in support of his own theories of "natural selection," and "evolution," and makes due acknowledgment of the aid and assistance he had received from his opportune discoveries. His conscientiousness was one of his most noticeable traits, and no nurseryman could ever induce him to over-praise any new fruits introduced, and it has been said of him that "there can be no other Charles Downing, as no other man can do for the fruits of America what he did." Mr. Downing never had any children. His wife died a few years ago. The Massachusetts Horticultural Society appointed a committee at its last meeting (January 24) to take action on his death. Ex-President Wilder, chairman of the committee appointed to take action on his death, spoke at the meeting of January 31 in tender and touching words on the life and worth of the deceased. He recalled the fact that it was his sad duty to pronounce the eulogy of his brother, Mr. A. J. Downing, since which time the work in pomology had been conducted by Mr. Charles Downing. As a pomologist Mr. Downing was renowned for his knowledge and accuracy. His object was to make others happy in the enjoyment of the bounties of Nature. In closing he said, with deep emotion, that he expected soon to follow and rejoin him in another world.

At the request of Mr. Wilder, the Secretary read a series of resolutions expressing the sense of loss in the death of the eminent pomologist. Mr. Downing had a large collection of works on pomology, which he

\* *Maxillaria Kalbreyeri*.—Aff. *Maxillaria candida*, Lindl. Folio angustiori; labello integerrimo oblongo-ligulato superius furfuraceo; callo in disco superiori apice triangulo. N. Grenada. *H. G. Rehb. f.*

intended to give to a Western agricultural college at his death. A portrait of Mr. Downing will be found at p. 143 of our vol. i. for 1875.

## THE NEW DAHLIAS OF 1885.

RESPECTING these it may be stated that while the list of new varieties to be sent out by Mr. Turner is, if anything, considerably larger than usual, that of Messrs. Keynes & Co. is a little less; but both lists include flowers that will not lessen the reputations of these firms for putting into cultivation varieties generally acceptable to cultivators, and likely to maintain the interest in this favourite summer flower. That there is no lack of interest in the Dahlia as an exhibition flower was abundantly shown at the meeting of the National Dahlia Society at the Crystal Palace in September last. A very large number of flowers were staged, and it is with something like surprise we hear the rumour that this annual exhibition is in danger of being discontinued through want of funds, and especially as just now special societies appear to be more flourishing than those which encourage plants in general.

It will be remembered that at the October meeting of the Royal Horticultural Society Messrs. Rawlings Brothers, of Romford, exhibited a number of seedlings of their own raising, not in the best condition because the fateness of the season had induced a certain amount of roughness, but yet showing evidence of promise in another trial. These passed into the hands of Mr. Turner, and he has decided to send out the following from this batch in May next, viz.:—Mrs. Douglas, vivid scarlet, perfect in petal and form, good high centre, and an extra fine exhibition variety; Mrs. Glasscock, a pure white self, of full size, good form and centre; Mrs. Kendall, white ground, heavily tipped and edged with purple, a novel flower of full size and good form; Harry Turner, rich black-maroon, extra fine form, and very constant; T. J. Saltmarsh, yellow, deeply edged with red, finely cupped petals, and of decidedly novel character; and William Dodds, orange-buff, petals broad, stout and circular, full size, and quite constant.

In addition, Mr. Turner has the following new varieties raised by the Rev. C. Fellowes, Shottesham, for sending out in May, viz.:—Bugleman, dark maroon, shaded with bright crimson, fine petal and outline, very beautiful and novel; Clarionet, a bright scarlet self, showy and constant; Sybil, a buff self flower of good form, and constant; and Pandora, French white, of good size, excellent form, and very constant.

Messrs. Keynes & Co.'s new show varieties are Falcon, fawn colour, novel, pretty, a very neat and well-formed flower; James Huntley, a fine bright rosy-purple self, novel in colour, very pleasing, large in size, and of fine form; and Mrs. Langtry, cream colour, heavily edged with cherry, charming in colour, form all that can well be desired, and has received several First-class Certificates of Merit. The three foregoing are all of their own raising.

Mr. Turner will send out the following new fancy varieties, viz.:—Charles Turner, pale buff ground striped with maroon, of great depth of substance, very constant, good centre, and a fine show variety; Henry Eckford, yellow or light buff ground, striped with scarlet, very constant; and Mrs. Carter, a finely-shaped dark fancy, the ground colour dark maroon tipped with white, and extra fine.

Messrs. Keynes & Co. will also send out three new fancy varieties, viz.:—General Gordon, a variety that will take the same high rank among fancy flowers this year that Mrs. Gladstone did among the show varieties in 1884. The ground colour is yellow, and it is very handsomely striped with scarlet of a bright shade, which, with the brilliancy of the yellow, imparts a very effective appearance to the flower: it is of exquisite form, and very constant. It was Certificated wherever shown last year, and it obtained the premier prize for the finest bloomer of the whole exhibition of the National Dahlia Society in 1884. Neptune is an orange-ground flower striped with crimson, and likely to prove very useful as an exhibition variety. Romeo is a somewhat distinct variety, the ground colour buff, striped and speckled with crimson. This trio was raised by Messrs. Keynes & Co.

Of new bouquet and single Dahlias there will no doubt be many—of the latter especially, and of these no information is obtainable at this early period of the year. R. D.

## VARIETIES OF NARCISSUS.

DAFFODIL RIP VAN WINKLE.—This Daffodil was shown by Mr. Hartland, of Cork, before the Royal Horticultural Society at the last meeting, but as the specimens were grown under glass it was considered better to wait till flowers were produced in the open air before adjudicating on their merits.

By some this is considered to be the true double Daffodil; but a reference to our figure (fig. 44) shows such considerable differences that there can be no doubt as to its distinctness from that variety. It is very like the big double Daffodil, *N. telamonius* plenus, but is considerably smaller, and the segments are slightly toothed and whitish at the tips. Mr. Hartland himself considers it to be the Irish nanus, basing his opinion upon the comparison of the bulbs of the two. "The colour of the flowers he describes as pale lemon-yellow, petals very double, and frilled." It is of very dwarf habit.

Mr. Barr, in a "Stop Press Notice," inserted as an appendix to his *Ye Narcissus or Daffodil*, says of Rip Van Winkle that "the colour of the flower is a very light canary-yellow, habit of the plant dwarf, early to bloom, and very dapper in its way among small rare Daffodils." Mr. Barr, moreover, promises "not to spare Master Rip Van Winkle if he has been posing himself as new when we strongly suspect he

FIG. 44.—NARCISSUS RIP VAN WINKLE: FLOWERS CANARY-YELLOW.

is our English pseudo-Daffodil, or Lent Lily, gone to sleep in his double form in the island of saints." Now is Mr. Barr's opportunity, but we do not think his suspicion is justified, but as the Narcissophiles are apt to make very fine distinctions we are conscious that we are skating on thin ice. Botanically we stand on firm ground when we say that both are forms of *Narcissus Pseudo-Narcissus*! A melancholy significance attaches to another Daffodil exhibited by Mr. Hartland, and called General Gordon, a cross between Ajax and *Incomparabilis*!

### NARCISSUS PACHYBULBOS.

We are indebted to Mr. Loder for the opportunity of figuring this interesting species (fig. 45), which he exhibited at the last meeting of the Scientific Committee of the Royal Horticultural Society. It is an Algerian species, with a large thick bulb covered with brown lacerate scales, and trusses of white fragrant flowers. The plant is figured in Mr. Burbridge's work on the *Narcissus*, t. 39, apparently from dried specimens. In the fresh specimen, the flowers are all turned to one side. It was originally introduced by the late Mr. Giles Munby. Mr. Baker in our columns inclined to the view that it is but an African form of *N. tazetta*, having a more sturdy habit of growth and very glaucous foliage, but as shown the other day it appeared sufficiently distinct.

## THE INFLUENCE OF DIRECT SUNLIGHT ON VEGETATION.

THE influence of direct sunlight on vegetation is generally known, but surely deserves to be a subject of special study. In the following paper we shall only endeavour to describe some facts with relation to this influence. In the first place, the effect of the sun's rays in the tropical regions will be traced, and afterwards in the temperate and arctic zones. The constant high temperature within the tropics is the cause of the plants being less dependent on the direct solar heat than is the case in the greater part of the temperate and cold zones, but, notwithstanding this, there are plants even in the tropical regions requiring for a luxuriant growth the direct rays of the sun.

Of the tropical monocotyledonous plants, the Palms are doubtless the most important, and of these the Date Palm of the Sahara Desert (*Phoenix dactylifera*, L.) furnishes daily food to the inhabitants of this part of Africa.

It is known that the subterranean wells are the only cause of vegetation in this desert. When a well is discovered, in a short time an oasis arises, and the Date Palm appears.

Considering that the first condition for the growth of Palms is a humid soil wherein the roots may vegetate there seems to be at first something strange in the fact of the Great Desert producing species of this family; but the Arabs say that this "Queen of the Oasis" puts her feet in water and her head in the fire of heaven; and this is the cause of the rapid growth of the plant (Grisebach, *Die Vegetation der Erde*, theil ii., p. 87); the water ascends by the roots into the tissue of the tree, and communicates its temperature to the inner parts, so that the influence of the sun's heat is tempered; the evaporation of the plant also causes a lower temperature; thus it withstands the difference of 98° (from 126° to 28°), as occurs in the desert (Martins, "Le Sahara," *Revue des Deux Mondes*, 1864, vol. lii., p. 613).

Though, as we have said above, these plants require, in the first place, water for their roots, the fact of the stems growing in their wild state at a considerable distance one from the other, and never forming dense forests, proves that they require also the light.

But the Date Palm is indigenous to the Great Desert; nowhere else does this plant vegetate so rapidly. When cultivated with success it is also in a desert climate, as, for instance, in that of Murcia in Spain (the Date forest of Elche), the highlands of Afghanistan, &c. The cause of its being without fruits in the Mediterranean is the dry summer, there being no subterranean wells, as is the case in the Sahara.

The Sugar-cane (*Saccharum officinarum*, L.) is also a plant requiring direct solar light; moist climates are disadvantageous to its cultivation. Thus the climate of China, with its heavy rains in May and June (Dove, *Klimatologische Beiträge*, vol. i., p. 102), but less precipitation in autumn, when the fruits [cane?] ripen, is suited for the culture of this plant. It is known that the quantity of sugar depends on the quantity of sunshine.

Turning to the warm temperate zone we see the species of Citrus cultivated in the sunny climate of Southern Italy, and even by cultivation produce the delicious fruits generally known, because they are in summer under the almost constant influence of the sun's rays in open localities. In the Malayan peninsula the supposed native country of these plants, they also grow in open spaces and not in the jungles, requiring a moist soil, but also the solar light, to ripen their fruits; this explains why the finest and largest Oranges are obtained when the trees are trained against walls, as is the case in some parts of Southern England.

The Vine (*Vitis vinifera*, L.) is also a plant requiring heat in the after summer to ripen its fruits; the climate of Southern France and Italy is therefore well adapted for its cultivation. In the continental climate of Bokhara in Turkestan (40° N. lat.), with its hot summers (in the sandy desert on the Oxus River the soil was found to have a temperature of 144°—Basiner, *Reise durch die Kirgisiensteppe nach Chiwa*, the plant is cultivated in the open fields; its winter covering is not taken off before the end of March, but in April the temperature is already very high, and in July it becomes insupportable; \* the fruit of the

\* Mean temperature at Samarkand, lat. 39° 39', in 1881:—April, 61°; May, 70°; June, 77°; July, 84°; August, 77°; September, 68°; and December, 28°. Mean temperature at 1 P.M. in June, 86°; in July, 93°; in August, 92°; in September, 81°.

Vine is ripe by the end of June or the beginning of July. The soil is moistened here by artificial irrigation. A climate with sudden changes of temperature, as, for instance, in the United States, does not suit this plant. On the banks of the Ohio River the fruits are rotten, or fall down, before they are ripe, notwithstanding that the mean temperature of all the months at Cincinnati is higher than at Pesth in Austria; but the American species are cultivated with success.

In California, with its equal temperature, the Vine is cultivated, though the mean temperature at San Francisco is much lower than in Europe in the same latitude; but the dry Californian summer is not to be found throughout the United States, where heavy rains occur at this season.

Everywhere, in the warm as well as in the temperate regions, corn is cultivated with success where there is in summer direct sunlight enough to ripen its grains; on the highlands of Afghanistan, in China, on the plains of Southern Russia, on the highlands of Mexico, &c.—for these plants require also the direct solar warmth.

On highlands, the influence of insolation is very much increased. At Leh, in Tibet, altitude about 12,000 feet, the thermometer rose in July, in the sun, to 144°, and in mid-winter to 84°, though the mean summer temperature is only 61°, and that of the winter 16°.\* Barley is sown about May 18, and harvested on September 12; but in the valley of Pituk (altitude about 11,000 feet) Barley was sown and harvested in two months. *Nature.*

(To be continued.)

## KILIMANJARO.

At a meeting of the Royal Geographical Society, held recently, Mr. H. H. Johnston gave a description of his visit to Kilimanjaro, on the slopes of which he spent more than five months in the summer and autumn of last year. Kilimanjaro is a snow-clad mountain in Eastern tropical Africa, and the investigation of whose flora may be expected to yield results of great interest to science and to horticulture.

Mr. Johnston told how, after some difficulties, he began the ascent of the mountain. He and his porters crossed the cultivated zone, which ended at about 5500 feet in that part, entered a healthy district with pleasant grassy knolls and many streams of running water, and encamped beside a lovely fern-choked brook at 6500 feet, the whole ascent being very gradual. The following day they passed through stunted forest, not unlike an English woodland, where the trees, however, were hung with unfamiliar ferns and creepers, and where deliciously-scented parasitic Begonias trailed their pink flower-bells from branch to branch. The *Dracæna*, which is cultivated by the Wa-Chagga to form hedges, here grow wild. Tree Ferns were abundant and handsome. Above 7000 feet the Orchilla moss draped the forest trees in long gay festoons. At 9000 feet they encamped for the night by a small spring of water in the midst of a grand bit of forest, not of that stunted character which marked the lower woods. The next day they walked several miles eastward to find a good place for settlement close to water, and not too high up, so that his shivering followers might not suffer unreasonably from cold. He selected an admirable spot on a grassy knoll rising above the river of Kilema, which takes its source near the base of Kimawenzi. The altitude of this spot was nearly 10,000 feet. Having seen every one carefully installed and protected from the—to them—severe cold (for the thermometer descended every night to 1° or 2° below freezing point), he transferred his own quarters to a higher elevation, and began industriously to collect. His first excursion was to the base of Kimawenzi. The terrible hurricane of wind, however, that raged round this jagged series of lava peaks, prevented him from continuing the ascent, although he doubted if it were possible for any one to reach the summit, owing to the want of foothold. The snow varied very much in quantity on Kimawenzi. Sometimes the whole peak would be covered down to the parent ridge, with only the precipitous rocks peeping blackly through the mantle of white. At other periods the snow would be reduced to an insignificant patch, and the reddish sand which filled the crevices and glissades between the lava rocks would be left exposed to view. This change from an

almost complete snow-cap to nearly no snow at all might be effected in twelve hours. His great object, however, was to reach the snows, and, if possible, the summit of Kibô. Starting at 9, he walked upwards with few stoppages until 130. At first they crossed grassy undulating hillocks, the road being fairly easy. Then they entered a heathy tract, scorched and burnt with recent bush-fires; but higher up, where the blaze had not reached, the vegetation was fairly abundant and green. Small pink *Gladioli* studded the ground in numbers. At an altitude of nearly 13,000 feet bees and wasps were still to be seen, and bright little sun-birds darted from bush to bush, gleaning their repast of honey. Mounting high above the rivulet the scenery became much harsher. Vegetation only grew

FIG. 45.—*NARCISUS PACHYBULBOS*; FLOWERS WHITE, FRAGRANT.

FIG. 45.—THE TRUE WILD DOUBLE DAFFODIL, FOR COMPARISON WITH FIG. 44.

in dwarfed patches as they passed the altitude of 13,000 feet, and the ground was covered with boulders more or less big, apparently lying in utter confusion, and without any definite direction. They were not very difficult to climb over, and even seemed to act as irregular stone steps upwards. In their interstices Heathens of the size of large shrubs grew with a certain luxuriance. About 13,700 feet he saw the last resident bird, a kind of stonechat apparently. It went in little cheery flocks, and showed such absence of fear that he had to walk away from it before shooting to avoid shattering his specimen. After this, with the exception of an occasional great high-soaring kite or great-billed raven, he saw no other bird.

Throughout this ascent, which was easy to climb, he suffered absolutely nothing from want of breath or mountain sickness, although his three Zanzibari fol-

lowers lagged behind, panting and exhausted, and complained much of their lungs and head. "Mounting up a few hundred feet higher than the last stopping-place," Mr. Johnston said, "and rounding an unsuspected and deep ravine, I arrived close to the base of a small peak which had been a continual and useful point to aim at during the whole journey from my station. I was now on the central connecting ridge of Kilimanjaro, and could see a little on both sides, though the misty state of the atmosphere prevented my getting any good view of the country. The highest point I attained on Kilimanjaro was 16,315 feet. I thus came within a little more than 2000 feet of the summit, which is usually estimated to reach an altitude of 18,800 feet." He made other ascents during the month he was in high altitudes. The footprints and other traces of buffaloes were seen up to 14,000 feet, but he never caught sight of one of the creatures, nor did he see any of the big antelopes, which also wander up to the snow line. At a height of 13,000 feet he saw three elephants, and at night the shrill trumpeting of these animals could be heard round the station. On October 18 he found himself, most unwillingly, obliged to leave the elevated settlement and return to Taveita. The relatively great cold they had experienced had acted very unfavourably on his men's health, and he feared that a longer delay might render them quite unfitted to carry burdens. Their downward journey, part of the way through trackless bush and dense dank forest, was not without adventure and some reward in scenery of great beauty. The average elevation of this country was between 8000 and 7000 feet, and the temperature consequently almost cool, ranging from 43° at night to 70° in the mid-day warmth. After some four hours' walking from their camp they crossed the long ridge that marked the southern flank of Kimawenzi, and began to descend the eastern slope of the mountain. Soon they emerged on a kind of heath-like country, and then looked forth on a splendid view, stretching from Mvika to the mountains of Bura and Ukambani (the Kiulu range), with Jipe on one hand and the River Tzavo on the other. After some enjoyable excursions from his settlement at Taveita, he made a rapid journey to the coast by way of Pare, Usambara, and the Rufu River to Pangani. At Zanzibar, finding there were no fresh funds to enable him to return to Kilimanjaro, he paid off the last of his faithful followers and took his passage on the British India steamer to Suez in quite a sulky frame of mind, as sorry to leave his beautiful mountain as many people are to quit Eogland. Travelling overland from Suez he arrived in London not much more than six weeks after he had caught his last glimpse of the snows of Kilimanjaro.

## DISEASE OF RHODODENDRON ROOTS.

THE Scientific Committee (see p. 219 *ante*) must have arrived at an erroneous conclusion in regard to the roots infested with fungi, sent for examination by the Rev. J. T. Boscawen. The material described by the committee as "roots, which appeared to have decayed through wet," and amongst which "no fungoid growths could be detected," included the hybernating mycelium, in profuse quantities, of the fungus known to mycologists as *Xylaria vaporaria*, B. This mycelium, which is really in a sclerotoid or compact and hybernating condition, entwines amongst the roots, and exactly (on a superficial examination) resembles entwined root masses. It is always more or less "wet," and exudes drops of water on being broken. Some persons would consider the root-like growth of this curious mycelium to be an example of "mimicry" or "protective resemblance;" the latter quality, perhaps, last week, saved the fungus from desiccation and incarceration in one of the national herbaria.

These "wet roots" have often been sent to the *Gardeners' Chronicle* office for a name. They have been artificially grown in damp sand, first by the late Mr. Frederick Currey, and afterwards by Mr. C. E. Broome and myself. The perfect *Xylaria* appears after the mycelium has rested for about three months.

The only way to get rid of this fungus is to pull out all the "roots" and burn them. In some instances I have known this sclerotoid mycelium to be so profuse and destructive in gardens that the gardeners have pulled out the cords of mycelium by yards, and carted them away in barrows for destruction by fire, W. G. Smith.

\* Frost is observed in September, and lasts till the end of May. See Moorcroft, *Travels in the Himalayan Provinces*.

## FORESTRY.

### REMARKABLE TREES ON THE PENRHYN ESTATE.

In our Forest papers it has frequently been asserted that the Larch is not suited for bog planting; but this is a mistake, and certainly not borne out by the testimony of the tree itself, as apart from the specimens in question the finest Larch I have ever seen are growing in deep peat bog, on an estate in the North of Ireland. In such soil the Larch is also remarkably free from the various diseases to which, more especially of late years, it seems particularly susceptible, and which have lowered it in the estimation of landed proprietors and planters in general, and so caused the now well-known outcry of "a substitute for the Larch." Remarkable not so much for individual size, but as being planted by Royalty and other distinguished personages, are a number of trees near the lawn-tennis ground between the Castle and flower garden. The first of these is a well furnished and very symmetrical specimen of the Mammoth tree (*Sequoia gigantea*), planted on October 17, 1859, by Her Majesty the Queen, and which has now attained a height of over 40 feet, the stem girthing 6 feet 9 inches at 3 feet, and 6 feet 1 inch at 5 feet. A Turkey Oak, also planted by Her Majesty on the same date, is 33 feet in height, with a stem girthing at 3 and 5 feet 33 inches and 31 inches respectively. Another Oak (English), planted on the same day by H.R.H. Prince Arthur, girths 18 inches at 3 feet up, and 16 inches at 5 feet. Close to the latter is a Nordmann's Fir (*Abies Nordmanniana*), planted in 1857 by Sir James McGarel Hogg, the girths at 3 and 5 feet being 4 feet 2 inches and 3 feet 11 inches respectively, and the height 50 feet. A *Sequoia* planted by the Lady Hogg in 1857 has, however, far outgrown any of the others, being now rather more than double the girth of the Nordmann Fir planted by Sir James Hogg in the same year. This tree is also the tallest of its kind on the estate, although as regards girth of stem it is inferior to one or two others. The total height is now fully 60 feet, and the bole girths 8 feet 8 inches at 3 feet, and 7 feet 8 inches at 5 feet.

Here also is a well-branched specimen of the Redwood (*Sequoia sempervirens*) planted in 1857 by the Lady Penrhyn, and which has attained the height of 47 feet, and a girth of stem at 3 feet of 6 feet 9 inches, and at 5 feet of 6 feet. A fine group of the upright Cypress (*Cupressus sempervirens*, var. *fastigiata*), eight in number, and with stems girthing from 3 to 4 feet at a yard up, next attracts attention, these trees being amongst evergreen shrubs what the Lombardy Poplar is amongst timber trees—a fine contrast to the more spreading and round-headed forms. Although of rather formal growth, and imparting a somewhat gloomy air to the situation which it occupies, yet the deep evergreen branches and leaves, laden as they usually are with clusters of large round cones, render this Cypress a favourite with most planters, more especially for using alongside buildings where the prevailing lines are horizontal. Not far from these, at the bottom of the lawn, are a number of Lebanon Cedars, some of which were raised from seed sent from the Lebanon forest in 1859. Strange to say, these latter approach in structure and general appearance so nearly to the Atlantic Cedar (*Cedrus atlantica*) that they would readily pass for that species; indeed it is difficult to find distinctive characters for these trees, the main difference lying in the foliage of the latter, which is shorter and of a more glaucous green or silvery hue than that of the Lebanon Cedar. The Atlantic Cedar is of a more erect pyramidal habit than that usually assumed by the Lebanon species—this being very noticeable in the specimens under consideration.

A few trees growing in front of the kitchen garden must not be omitted, notably fine specimens of the Aleppo or Jerusalem Pine (*Pinus halepensis*), the Cephalonian Fir (*Abies cephalonica*), and the Golden Larch (*Pseudo-Larix Kämpferi*).

Amongst these the Jerusalem Pine is the most remarkable, not only as being a tree that is rarely seen in Britain but one that has been falsely represented as being of too tender a constitution for our climate generally. The tree in question is 45 feet in height, with a stem girthing, at 3 and 5 feet, 4 feet 5 inches and 4 feet respectively; and although growing in a somewhat breezy situation has kept pace with the

Austrian and other trees in its close vicinity. *Abies cephalonica* and *A. Pissapo*, growing nearly side by side, are very distinct and ornamental Firs, the former especially having been quite enlivened during the past summer with its numerous purple, resin-streaked cones.

The Golden Larch is a very ornamental Conifer, the leaves being of a beautiful pale green when young, but before falling off in the autumn they assume a fine golden-yellow hue. This is the only deciduous species among golden Conifers, and, at the same time, one of the largest in growth. Not far from these, and growing in poor shingly soil, is a well proportioned specimen of Lambert's Cypress (*Cupressus Lambertiana*), the horizontal branches of which, well laden with glossy cones, are at all times attractive. It is fully 50 feet in height, with a stem girthing 4 feet 4 inches at 3 feet, and 4 feet 2 inches at 5 feet up.

A short distance from the entrance gate at Port Penrhyn are several of the newer Coniferæ with goodly proportions, amongst which is a well-furnished plant of the Japan Cedar (*Cryptomeria japonica*), 52 feet in height, and girthing 4 feet 6 inches at 3 feet, and 4 feet 2 inches at 5 feet up. Growing nearly opposite this is a densely branched and well proportioned *Araucaria imbricata*, that shows well the gracefully drooping branches with up-curved tips, which is so striking a peculiarity of some of these trees. The Bhotan Pine (*Pinus excelsa*) also does well, as a specimen but a few yards from the latter tree clearly shows. At a yard up it is 5 feet 6 inches, and at 5 feet 5 feet 3 inches in circumference of stem, and has a height of 61 feet. Many old Thoro trees, real relics of the past, are scattered throughout the park, and which during early summer display a wealth of bloom that is both ornamental and conspicuous. Several of these, notably such as are the remnants of demolished fences, are of unusual dimensions; one in particular, growing on the southern side of the Ogwen River, and within a short distance of the park wall, has a girth of stem at 3 feet up of 9 feet 6 inches, and a height of over 30 feet. Close to this tree are several others of the same kind and of nearly the same dimensions, some in full vigour, others gauged and half decayed, while not a few are, as it were, amalgamated with other trees, notably the Oak, Ash, and Elm. *A. D. Webster.*

(To be continued.)

### VEGETABLE MARROW CULTURE UNDER GLASS.

THIS very popular edible can be had fit for use during the months of May and June in this way, but will its cultivation prove to be remunerative in a commercial point of view? I predict that it can be made so, although my practical experience in the matter is not sufficient to confirm it, as my requirements have been only of a private and limited nature; but this is a matter well worth the attention of our enterprising market growers, and which they could readily solve by devoting a house to this particular subject. It is not very many years since the Tomato, now a most popular edible, was but rarely cultivated under these conditions, and I am inclined to believe, from my personal experience with this subject, the Vegetable Marrow, that it would be as remunerative as a house of Cucumbers is during the same season; and for this reason I submit the problem to the consideration of those whom it may be more likely to concern, and with this view give my experience, which now extends over four seasons, as to its cultivation in this manner.

We sow seeds in the early part of February, and rear the plants in the same way as Cucumber plants until they become of a good size, when they are partially hardened in a more temperate house, and subsequently planted out in hillocks of moderately enriched soil, containing about 2 bushels in each. In private establishments they have to be accommodated in those houses where space and trellis room—as they require a good run—can be found for them. Any house, or the back wall of it, can be employed, providing sun and light can get to them, wherein a temperature of 50° to 55° at night, and of 60° or 65° in the daytime is maintained. I have had them both in mid-summer vineries and intermediate Peach-houses, where they succeeded to my satisfaction in every way, giving them the same treatment with regard to stopping, training, and setting the fruit, as is applied in the case of Cucumber plants. As an addition to the

vegetable list for private demands they are highly esteemed; and doubtless, if introduced into the markets, they would be in demand; at least, I have found it to be so when I had a superabundance and a surplus quantity beyond what I required. *G. T. Miles.*

## Orchid Notes and Gleanings.

### LÆLIA ACUMINATA.

THIS species is now being imported, and sold at a cheap rate, but it is not greatly valued by the fanciers, and although not a showy plant by any means, it is of a neat, compact habit, does not take up much room, and flowering as it does in December and January, we value it greatly for producing cut flowers; I grow it in pots in the Cattleya-house. The flowers are of small size, produced in clusters; the sepals and petals, as well as the lip, are white, with the exception of a dark blotch on the base of the lip.

### LÆLIA AUTUMNALIS AND L. MAJALIS

are both being imported and sold at cheap rates. I have potted a number of them; their treatment is rather different from the ordinary run of *Lælias*. I place them in a house 5° cooler than the Cattleya-house, and they are also placed in a position where they get plenty of light; they are scarcely shaded from the sun even in summer. While growing they receive plentiful supplies of water; at other times they are kept comparatively dry. Plants like these, that are frequently exposed to the direct rays of the sun in summer, are apt to suffer, if they happen to be neglected when they require water for a few hours. If they could get the right treatment, there is no reason why they should not flower as well here as they do in their own wild home. *L. majalis* seems to do well on blocks. *L. autumnalis* should be potted in the usual way. The plants alluded to were sold as the *atro-rubens* variety. This is brighter in colour than the ordinary form, but both are handsome. The flowers are produced earlier than those of *L. anceps*. *J. Douglas.*

### DENDROBIUM SPECIOSUM.

In a note in the *Gardeners' Chronicle* of Feb. 7, p. 180, mention is made of a fine *Dendrobium speciosum*, bearing three spikes of bloom, and it is also mentioned as being a shy bloomer; this is a rock Orchid, and if properly treated it should not be shy to bloom. A plant here has been in the vineries for many years, and it flowers every year. We never think of a miss year, and we are all anxious to count the number of spikes it is showing as soon as the new year arrives. The plant measures nearly a yard in diameter. It has just gone out of bloom after carrying seventeen spikes, this being regarded as a minimum quantity, as three years since it bore thirty fine spikes. But to obtain this I put the plant in the warmest place in the vinery, and as soon as it shows signs of growth it is given plenty of water; and when the growth is completed—which is some time in July—the plant remains in the warm place, in the full sun; and never gets any water until it begins to show signs of flowering in the new year. This it will do readily, many of the stems throwing two spikes each—on one occasion one stem threw three spikes. In one of the years I spent in the Horticultural Gardens at Chiswick—I think it was the year 1847—a large plant flowered there after such treatment by a Mr. Harris, now gardener to Lord Halifax, in a stove in the experimental ground. Dr. Lindley was delighted with this plant, and ordered it to be exhibited at the Horticultural Rooms, 21, Regent Street. The superintendent said this was impossible, it could not be got out of the house, the doors not being big enough. Dr. Lindley then said "Take the roof off," and part of it was taken off, and the plant exhibited at the Regent Street rooms. What has become of that plant now? It deserved a home at Kew. *William Culverwell, Thorpe Perrow.*

### CATLEYA CHOCOENSIS.

In your notice of *Cattleya chocoensis* you do not mention the chief reason for which I prize it, which is for its exquisitely delicate perfume. It also has the merit of flowering in mid-winter. Another very

favourite plant of mine, now in flower, is *Epidendrum ciliare*. I cannot say much for its beauty. At night its rich but not oppressive scent cannot be surpassed, and I have it in the drawing-room for five or six weeks every winter when in flower. Another very sweet-scented winter-flowering Orchid is *Epidendrum varicosum*. *C. W. Strickland.*

#### CYRTOPODIUM CARDIOCHILUM.

A very curious Orchid, with elongated pseudobulbs 3 feet high, bearing linear lanceolate recurved leaves, and erect branching many-flowered racemes proceeding from the base of the pseudobulbs. The flowers are yellow, each about  $1\frac{1}{2}$  inch long, with three rounded yellow sepals; lateral petals of the same size and colour, but shortly stalked; lip 3-lobed, side lobes erect roundish, central lobe spoon-shaped. The native country is unknown. It requires to be grown in fibrous loam, with a little rotten dung, and to be kept in the East India house.

#### DENDROBIUM CRUENTUM.

A species with slender erect pseudobulbs, from the joints of which, near the upper part, arise flowers each about 2 inches long by  $1\frac{1}{2}$  broad, with broadly ovate lanceolate green sepals, the lateral petals very narrow, green; the lip 3-lobed, the side lobes short, erect, crimson, central lobe ovate acute, with a green centre, crimson edges with a central red callus. Native of the Malay peninsula. *Orchid Album*, t. 174. It requires a hot and dry rest from October till April.

#### CIRROPETALUM PICTURATUM.

A singular Orchid, with small ovoid pseudobulbs, solitary leaves, and erect scape, bearing an umbel of long greenish flowers, the median sepal and small petals red spotted, the two lateral sepals united and prolonged into a long sleeve-like tube. Native of Moulmein. *Bot. Mag.*, t. 6802.

#### LÆLIA PEDUNCULARIS.

Pseudobulbs small, sub-globose, with a solitary oblong leaf and a terminal erect raceme of flattish star-shaped flowers, each about  $2\frac{1}{2}$ —3 inches across, with narrow sepals and rather broader petals of a rosy-lilac colour. The lilac lip is 3-lobed, the two side lobes short, erect, the central lobe oblong, throat magenta coloured. Mexico. Mr. Williams, in the *Orchid Album*, t. 173, recommends this to be grown in the Cattleya-house in a basket near the glass.

#### DENDROBIUM SPECIOSUM.

A notice is made in your impression of February 7, p. 180, of the flowering of this species at The Mount, Sevenoaks. We have a plant in bloom here (Park Place, Henley-on-Thames), with eleven spikes, producing collectively 638 flowers. There are two other spikes not yet developed. *George Stanton, Park Place Gardens.*

## The Arboretum.

#### THE CEDARS OF REELICK.

IN reference to the paragraph on these trees that appeared a short time since, I beg to say that "W. C." is quite correct about the Indian Cedar (*Cedrus Deodara*). The large one in the centre of the grounds referred to by Mr. Cruthers was planted by McCallum, as he says; and Miss Fraser, of Rebeg, tells me they were brought from India by her uncle, J. B. Fraser, Esq., last male heir of Reelick. This tree Miss Fraser says was grown a number of years in a pot before planting it, and when planted the ball was left entire, and consequently the roots never got away right into the soil. But we have four better specimens in front of the house; they seem to have been better planted; they are in good health, and better furnished with branches. But the *Cedrus Libani*—I am sure there is a mistake about them. So far as Miss Fraser can remember they were planted by her grandfather, Edward S. Fraser, of Reelick, father of the late J. B. Fraser. As near as we can go, some of them had been planted about the year 1749—50; that makes some of them 130 years old. We have this year on some of them a fine lot of cones, and I shall be very glad if any person will give me a hint when to harvest them. They are still sticking on the trees, and I am very anxious to try the seed.

Can you furnish me with any information regarding the cones? I shall be much obliged if you can. *Andrew Ewart, Monlack Gardens, Beaulieu.*

### RORAIMA.

A TELEGRAM has been received at Kew giving the welcome news that Mr. Everard F. im Thurn has at last ascended Roraima. This has been the cherished object of botanical exploration in South America for the last quarter of a century. The expenses of Mr. im Thurn's expedition have been borne in equal shares by the Government grant of the Royal Society and the Royal Geographical Society.

The latest news from Mr. im Thurn was in a letter dated December 6, from the south side of the mountain, and the following passage, cited from *Nature*, describes the position immediately before the final attack:—

"Before we came to Roraima itself we had four days walking through a purely savannah, but most glorious country, and over splendid mountain passes, guided by an Aricoona who said, villain that he is, that he knew the way to Roraima. But at a village marked on the map as Tpelemonta on the Aroopa River, and with a considerable mountain pass still between us and Roraima, our villain guide at last admitted that the road for some distance had been quite new to him, and that he now knew not how to proceed further. However, at last we procured a guide and came, in some four hours, out of our difficulties at Tpelemonta (its real name, by the way, is Toorarking), into this inconceivably magnificent valley, and are installed in a village on the actual southern slopes of Roraima itself.

"Yesterday Perkins and I ascended the slope of Roraima to a height of 5600 feet to a most beautiful spot—a very garden of Orchids and most beautiful and strange plants. To-morrow after despatching the bearer of this scrawl, we go up to the same place with a lot of Aricoonas, who are to build us a house, in which we intend to stop for a week or as much longer as we may find desirable. I may mention that we have already seen, close to where our house is to be, a place where the mountain seems accessible; but it looks so easy that I am convinced that it is impossible at that point."

## THE PROPAGATOR.

#### BERTOLONIAS.

THE Bertolonias form a small but most effective and beautiful group of variegated plants. Their leaves are delicately and beautifully veined or spotted with silvery-white, or pink, or purple, and are shown to great advantage, especially in small choice collections, because of the plant's diminutive growth, while in larger collections it is much prized as an ornamental plant. The stock can always be kept healthy and beautiful if propagation is attended to, and any old and unsightly plants can be thrown away. Bertolonias can be propagated from cuttings and from leaves, but can also be raised from seed.

If the plants are to be raised from seed it will be necessary to fertilise two or three flowers on each plant for three or four days in succession, to ensure good seed. They should then be removed to a part of the house beyond the range of the syringe, but as near the light as possible. Directly the seeds are ripe they should be cleaned from the pod and sown, for which purpose well drained 48-size pans should be prepared. The soil should be composed of equal parts of yellow loam, peat, leaf-mould, and river-sand, to which should be added small quantities of chopped sphagnum moss, charcoal broken into pieces of hazelnut size, and ballast or finely broken potsherds. This mixture should be passed through a fine sieve, and in filling the pans the soil should be raised 2 inches above the top, and made to slope gradually to the rim. After the seed has been thinly sown upon the surface the pans should be placed in a cutting case upon a gentle bottom-heat, and as near the light as possible. They should be watered as soon as they become dry, and a little air must be left on the case both night and day; they should, however, be shaded from the sun. When the seedlings have put forth three or four small leaves they should be pricked off into thimble-pots. They must then be replaced in the cutting case, where they must be sprinkled with a fine-rose pot both night and morning, and shaded from the sun, and if the case be a very close one the light should

be raised an inch and never shut down. The seedlings will again be treated in this manner after they have been potted into thumb-pots, which will be done as soon as they are strong enough, but after they have been potted into 60's the quantity of air should be increased from 1 to 2 inches. As soon as the plants have become established in this size pot they should be taken out of the case and placed upon a front platform, which should be covered with a layer of sifted ashes. They can be potted again when necessary, although as a rule they do not require much pot room, a large 48 being the size they generally develop in. They should always be well supplied with water at the roots, but should not in any case be syringed overhead during sunshine.

#### FROM CUTTINGS.

Top shoots make the best cuttings, although the plants can be propagated from single eyes. The plants selected for cutting purposes should have the top shoots taken off, each one having two well developed leaves upon it, and should be potted into long thumb pots. Each cutting should be firmly pressed into the soil and a little silver sand should be placed at the base of each one. For single eyes, pieces between half an inch and an inch, having two leaves attached, can be taken off the old plants. Each piece must be made into two cuttings, and this is done by splitting the main stem down the centre so as to have one leaf and eye upon each piece. The cuttings should now be put in and pressed firmly into the soil up to the eye, and to each one a stick should be placed, to which the leaf should be tied in as erect a position as possible. They must be well watered before putting in the frame, but when they have been placed there they must be watered with a fine-rose pot night and morning, at which times they should also be given a little ventilation. They must be shaded from the sun. When the plants have well rooted through, more ventilation should be given them, in fact the light of the case should be raised 1 inch in front and behind, and left so night and day until the plants are thoroughly established, and then they should be potted into small 60's. They must be watered and placed back in the frame as near the light as possible, and there they should remain until they are strong enough to be potted into large 48's. They must again be placed in the case, but more air should be given them until at length they are hardy enough to be stood out upon the open platform of the house. The plants should at all times be carefully watered at the roots, but they should never be syringed overhead during sunshine; air should be given them upon all mild days, and they should be lightly shaded from the sun.

#### FROM LEAVES.

The oldest leaves upon the plant should be selected for this purpose, because none but well developed leaves are likely to lead to a good result. The leaf-stalk should be cut off close to the leaf, which should now be turned over, and the midrib and the side ribs of it must be notched with a sharp knife about every half inch; the ribs must not, however, be cut right through. Well drained pans should have been previously prepared for the leaves. The soil, similar to that previously named, should be pressed very firmly into the pans, and well watered before they are used. The under-side of the leaf should touch the soil, to which it should be loosely pegged. A little dry silver-sand should be lightly sprinkled over the upper surface of the leaves before they are put in the cutting-case. Here they must be placed upon a gentle bottom-heat, and air given them for an hour at night and in the morning. They should also be shaded from the sun, and watered as they become dry.

When the young plants which will be formed upon the leaves have grown half an inch high they should be taken off and potted into thimble-pots. They can then be treated in the same manner as the seedlings. The old leaves will continue to produce young plants for some time, they should therefore be taken care of.

Bertolonia Van Houttei is one of the most distinct and beautiful of these plants, and can be freely propagated from leaves. The following varieties must not by any means be overlooked, viz., *B. Mirandei*, *B. guttata*, *B. margaritacea splendens*, *B. marmorata*, and *B. superbissima*. They all make lovely table plants, and when propagated freely can well be spared for such work. *T. O.*

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Feb. 23	Sale of 500 <i>Lilium auratum</i> , at Stevens' Rooms.
TUESDAY, Feb. 24	Special Sale of Flowering Orchids, and a Sale of <i>Camellias</i> , <i>Azaleas</i> , and <i>Roses</i> , at Protheroe & Morris' City Auction Rooms.
WEDNESDAY, Feb. 25	Sale of Hardy Plants and Bulbs, at Stevens' Rooms. Sale of <i>Lilium auratum</i> , <i>Roses</i> , and <i>Bulbs</i> , at Protheroe & Morris' Rooms. Clearance Sale of Nursery Stock at the Mount Pleasant Nursery, by Protheroe & Morris.
THURSDAY, Feb. 26	Sale of Imported Orchids, at Stevens' Rooms. Sale of Imported and Established Orchids, at Protheroe & Morris' Rooms.
FRIDAY, Feb. 27	Sale of the Lease and Stock, at the Lordship Nursery, Wood Green, by Protheroe & Morris. General Meeting of the Royal Botanic Society.
SATURDAY, Feb. 28	Sale of Hardy Plants and Bulbs, at Stevens' Rooms.

THE TILLAGE OF THE SOIL constitutes one of the most essential elements in the successful germination and cultivation of young plants, and the gardener who sows his small seeds in an imperfectly pulverised soil is only throwing away time and money.

The influence of soil upon the quantity of seed necessary to be sown is accounted for by the fact that in rich garden mould more or stronger stems will be thrown up from each plant-root than if the soil be poor. To make up for this deficiency, and also to enable the crop more thoroughly to search for food, a greater number of plants is necessary, and a larger allowance of seed is the consequence.

The depth most desirable for the germination of seed depends to a very great extent upon the closeness and adhesive character of the soil; the seed should be planted in that position which will secure to it such a supply of moisture, warmth, and air as will most rapidly promote healthy germination. It is clear that these conditions cannot be secured in soils of different texture at one uniform depth, and that this can only be safely decided by local experience.

The lighter and more loamy the soil the gardener has to deal with, the more important he will find it to sow his seeds at a considerable depth, as this not only favours the stability of the plant, but enables the small root-fibrils to obtain their necessary supply of moisture; the stronger and more clayey the soil, the greater the necessity for keeping near the surface.

In clay soils seed should be sown as a rule whilst the land is as dry as possible; it will be sure to receive moisture from the fall of rain; but wetness in adhesive soils causes the particles to bind together to the prejudice of the crop. As the soils we have to cultivate assume a lighter texture there is less objection to working them when wet; in some cases, indeed, this even becomes essential in order to give the soil the required firmness, and the seed a sufficiency of moisture.

When a proper degree of tilth has been obtained and the seed sown, the introduction of atmospheric air beneath the surface of the soil by means of the hand-hoe and similar implements cannot be too frequent. For as the majority of garden outdoor seeds are sown in early spring their growth takes place at a time of year which is not only very favourable for active nitrification of the soil, but the soil is also less exposed to the loss of the soluble nitric acid by excess of rain.

Seeds sown in the spring and early summer have still one other advantage: nitric acid contains an immense amount of oxygen, and as it is only those particles of carbon which are close to the surface of the soil that can have access to oxygen, the constant stirring which a soil should receive during the early growth of plants is doubtless the means of continually exposing fresh surfaces to the action of atmospheric air, and so providing the young plants with food easily to be assimilated. Sir J. B. LAWES says, in an article on the "Action of Manures," he has more faith in these several causes being sufficient to explain the reason why mineral manure, or even phosphate of

lime alone, is able to grow large crops of roots without a direct supply of nitrogen in manure—than he has in the explanation sometimes put forward, that plants with large leaves take their nitrogen from the atmosphere.

— DR. REGEL.—This indefatigable botanist has been nominated by the Emperor of BRAZIL a member of the Order of the Rose.

— CHANGES IN THE BOTANICAL DEPARTMENT, JAMAICA.—Mr. GEORGE SYME, formerly Superintendent at the Castleton Botanic Gardens, has resigned his appointment, and returned to England.—Mr. HART, Superintendent, King's House Gardens, &c., has been appointed to the charge of Castleton Botanic Gardens.—Mr. ELLIOTT, late Superintendent at the Parade Garden, has been appointed to King's House.

— POLITICAL FLORICULTURE.—Our, as we thought, wholly impartial and innocent allusion to this subject, has brought down upon us explosions from Canons, thunders from Exeter Hall, protests from Radicals, growls from Tories, explanations from M.P.'s—a pretty good proof, we imagine, that there cannot be much to complain of in reality. We deprecated, and still do, the practice of making flowers of any kind the badges of party politics or religious sects, and for saying this we have apparently got as much into hot water as when the great boiler question bubbles over. The *English Churchman* for February 12, 1885, has an amusing article on the subject, but which, from fear of the consequences, we prudently refrain from reprinting.

— NEW CHRYSANTHEMUMS.—We are informed by Messrs. CANNELL & SONS, Swanley, Kent, that they have at last succeeded in importing two large consignments direct from the native home of the Chrysanthemum, and have every reason to hope that they will be unusually attractive, and give us an entirely new feature in the Chrysanthemum. Some of them have the commencement of a blue tinge, others are white and green, and some are peculiar broad-petalled kinds, single, after the fashion of a single Dahlia.

— GHENT FLORAL COMMITTEE.—At the last meeting the following Certificates were awarded:—

*Certificates of Merit.*—To *Brunswigia magnifica*, from the Compagnie Continentale d'Horticulture, of Ghent; to *Hæmanthus Kalbreyeri maximus*, from the Compagnie Continentale d'Horticulture; to *Odontoglossum guttatum*, from Vervæet & Co., of Ghent; to *Imantophyllum miniatum* var. *Président C. Bernard*, from M. Peeters, of Brussels; to *Cypripedium Haynaldianum* roseum, from the Compagnie Continentale d'Horticulture; to *Begonia hyb. nova*, from Desbois & Co., of Ghent.

*Cultural Certificates.*—To *Cœlogyne cristata*, from M. James Bray; to *Lycaste Skinneri*, from M. James Bray; to *Cypripedium villosum*, from Vervæet & Co.; to *Anæctochilus Dawsonianus*, from M. E. Pynaert van Geert, of Ghent; to *Hemitelia Cunninghami*, from Vervæet & Co.

*Honourable Mention.*—To *Phalænopsis amabilis*, from Vervæet & Co.; to *Odontoglossum Wilckeanum*, from Vervæet & Co.; to *Imantophyllum miniatum* var. *M. Snoeck*, of Gendbrugge; to *Imantophyllum miniatum* var. *Madame Wallaert*, from M. Peeters; to *Columnnea Kalbreyeriana*, from M. Desmet-Duvivier; to *Cattleya Trianae* sp. from Popayan, from Vervæet & Co.

*For Good Cultivation.*—To *Bertolonia Van Houttei*, from M. D'Haene; to *Phalænopsis Schilleriana*, from Vervæet & Co.

— BROMELIADS.—We have received the fourth part of M. ANTOINE's superb publication on the Bromeliaceæ entitled *Phyto-iconographie der Bromeliaceæ*, and containing plates xvi.—xx., and pp. 20—30 of text. The size of the plates is large folio. The plants figured are—

*Bromelia antiacantha*, tab. xx., with strong-spined leaves, and dense erect spikes of purple flowers.

*Vriesea scalaris* has spineless leaves, dilated at the base, pointed at the blunt end, and a long pendulous spike, with scanty yellow flowers, each about 2 inches long, disposed at wide intervals in two rows, so that they give the impression of a ladder or flight of steps.

*Vriesea inflata*, tab. xviii., has similar foliage, but dense erect broad spikes; the bracts boat-shaped, orange-red, nearly concealing the yellow flowers.

*Vriesea Jonghei*, tab. xvi., has long, recurved, spineless leaves, and slender erect spike of yellow tubular flowers, each about 2 inches long, and arranged rather loosely in erect spikes.

*Vriesea corallina*, tab. xvii., has rather broad obtuse pointed spineless leaves, and a two-ranked spike of flowers horizontally disposed; each flower is nearly 2 inches long, and yellow.

— ABERDEEN ROYAL HORTICULTURAL SOCIETY.—This well-supported Society intend to hold two shows at Aberdeen in the ensuing season, the first one beginning on July 29, and extending over three days; the other taking place early in the month of September, the exact date of which will be made known later. A Silver Cup is given with the premier prize in each of the great divisions, plants, cut flowers, fruit and vegetables, besides special prizes of various descriptions, medals, and a goodly sum of money in prizes.

— VITIS AMURENSIS.—This is a species wild in the mountains of Mongolia, producing fruit abundantly, and of which the Grapes are agreeable to the palate. It is cultivated by the Chinese, according to the Abbé DAVID.

— "LOCO" WEED.—The *Journal of Forestry* has an article on a weed growing in Texas and New Mexico which causes symptoms of intoxication in horses which graze on it. One company is said to have lost 400 animals through its effects. The most common "Loco" plant is said to be *Astragalus mollissimus*; other leguminous plants have a like evil reputation.

— THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The augmentation fund finally closes on February 28, and we are also informed that the sum of £500, promised by the unknown donor, has been paid into the Institution's bankers. This will enable the committee to make up the funded reserve to £21,000, from which an income of £630 per annum will be derived. A special general meeting of the subscribers will be held on Friday, March 13, at the Bedford Hotel, Covent Garden, London, W.C., to consider a recommendation from the committee as to certain modifications of the rules of the Institution; but more particularly to obtain the sanction of the subscribers to altering Rule No. 8, so as to increase the pensions by £4 per annum each.

— THE VEITCH MEMORIAL FUND.—The trustees have decided to offer the following Medals and Prizes during the present year, namely, one Medal and Prize of £5 to the Botanical and Horticultural Society of Durham, Northumberland, and Newcastle-on-Tyne; one Medal and Prize to the National Rose Society, and one Medal and Prize to the National Chrysanthemum Society. The Medals and Prizes are to be offered for subjects to be selected by the committees of the respective societies. The Trustees have also determined to place three Medals and £5 Prizes at the disposal of the committee which is to have charge of the Orchid Conference, to take place at South Kensington in May next. In all cases the awards are to be made in favour of *bonâ fide* gentlemen's gardeners and amateurs only.

— IRON PLATE STAGING.—This material in the form of ordinary corrugated-iron sheet has been put to a useful purpose by Messrs. LAING & CO., nurserymen, Forest Hill, S.E., for tables and side benches in the Orchid-house now being erected there. It is used in 10 feet lengths, and is supported by light T-iron rods, of 1½ inch in depth, and 1 inch square iron standards. A kerb of T-iron 1 inch in depth runs round the benches, &c., to prevent the shingle, spar, &c., from falling off. The supports are about 5 feet apart, at which distance the sheet-iron will support 2 cwt. on any part without "sagging."

— THE PLASTICITY OF PLANT STRUCTURE.—The internal structure of leaves of the same species often varies according to the situation and nature of the surroundings. If exposed to the light and air its palisade cells will be developed, its fibrous tissue will be well marked. If growing in water the inter-cellular and aerial passages will be large in proportion, and the fibrous framework will be thin and weak, inasmuch as the water supports the leaf, and obviates the necessity for a stiff framework. Some plants are much more plastic in relation to light and

to moisture than others, the plasticity being an hereditary endowment. Those plants possessing it in largest measure are naturally those best adapted to maintain themselves under different conditions, so that the possibility of cultivation depends much on the anatomical construction. STAHL was the first to indicate the relation of the palisade tissue to light, and his observations have been followed up by VESQUE in France and by VOLKENS in Berlin. The relation between the motility of the leaves of certain Conifers, and the presence of palisade cells, was pointed out by Dr. MASTERS.

— TOMATOS AND INSECTS.—A curious statement, deserving the examination of botanists at home,

like that of the Cape, that its peculiar powers are brought into play. Much the same power was once attributed, we believe, to the common Broad Bean, but we are afraid this plant does not "live up" to its character.

— CALLIPSYCHE AURANTIACA.—Of the three known species of this genus, the present one may well claim attention as a highly ornamental plant with striking and attractive flowers. The generic name, signifying beautiful butterfly, is not inappropriate, owing to the spreading oblique flowers and long protruding stamens, in this instance about 3 inches longer than the perianth. The flowers are laterally compressed and produced several together in a horizontal

— BRITISH BEE-KEEPERS' ASSOCIATION.—The annual general meeting of the British Bee-keepers' Association was held recently at 105, Jermyn Street. The report for 1884, which was taken as read, said that eighty-seven new members had joined the Association. The committee referred with great regret to the decease of two of the oldest members, namely, the Baroness DE ROTHSCHILD, of Gunnersbury Park, and the Rev. G. HARRIS, of Norwich. Fifteen members had withdrawn and twenty-three had been struck off the books. New county associations in connection with this central body had been formed in Cumberland, Carnarvonshire, Denbighshire, Flintshire, Monmouthshire, Nottinghamshire, Gloucestershire, and Pembroke-

FIG. 47.—VIEW IN THE GROUNDS AT NEMBLAND. (SEE P. 238.)

says the *Colonies and India*, comes from Cape Colony, where it is alleged that insects are observed to shun land on which Tomatos are grown, and the culture of this *Lycopersicon esculentum* is accordingly recommended in all cases where it is possible to grow it, under fruit trees for instance, since the Tomato will thrive in the shade of other trees, which few other plants will do, for the sake of the virtues attributed to it as a prophylactic against the inroads of insect pests. The popularity of the Tomato as an esculent is sufficiently great to repay the trouble of planting on a large scale even if its supposed virtues proved to be a myth, and any surplus supplies might easily be preserved in tins, and shipped to this country. It will be interesting to know whether this Tomato has been observed to exercise any such effect on insects elsewhere—in Canada, for instance, where the fruit is so popular—or whether it is only in warmer climates,

umbel, and of a deep green when first expanded, but this in a remarkably short time gives place to a golden yellow colour with somewhat paler margins. The greatest fault of the plant is in flowering at a time when the leaves are absent. This however is no serious drawback when associated with other plants. A flowering specimen may be seen in the Begonia house at Kew, and a figure in SAUNDERS' *Refugium Botanicum*, 167.

— ROYAL AGRICULTURAL BENEVOLENT INSTITUTION.—At the monthly meeting of the Council of this Society, held at their offices, 26, Charles Street, St. James', on Tuesday, the 3d inst., it was resolved that the annual election of pensioners should take place on Wednesday, June 24; and that fifty-four additional recipients should be elected, viz., ten males, twelve married couples, and twenty females.

shire, and others were in course of formation. During the year thirty-two candidates had undergone examinations for third-class certificates at ten centres, twenty-eight of them being successful. For second-class certificates there were eleven competitors at six centres, and seven were successful. The holding of a first-class examination had been deferred for want of candidates. The committee proposed at some future date again to bring the subject of practical bee-keeping before the Education Department, with the object of having it included in the education code. The Department had already declined that proposal. The committee referred with satisfaction to the part taken by the Association in the International Health Exhibition, and noted with pleasure the formation of honey companies on a commercial basis. The Association was in urgent need of more funds to enable it to meet the ever-growing demands for assistance made

by those counties where bee-keeping upon advanced and humane principles had made little progress. The report and balance-sheet were adopted, the usual votes of thanks passed, and the officers for the ensuing year appointed, the Baroness BURDETT-COUTTS being re-elected President.

— *ODONTOGLOSSUM NEBULOSUM*. — It is interesting to trace the close connection between this species and those belonging to the *O. Rossii* group. This is seen not only in the relatively small size of the plant and its habit, but most particularly in the form and construction of the lip. The limb is short and broadly ovate, and the claw is proportionately much longer than in *O. Rossii*, and produced into the same cuplike process answering to the crest in the latter, and striped with orange internally. The sepals and petals are ample and white, beautifully blotched or spotted with brown for more than half their basal length. A flowering specimen may be seen in the cool section of the Orchid-house at Kew. A fine variety also to be seen there has only a few spots at the base of the sepals and petals, and a large brownish-yellow blotch on the lip, instead of the numerous brown ones of the type. Several varieties are in cultivation, and this one is the same or similar to that named *O. n. candidulum*.

— MASSACHUSETTS HORTICULTURAL SOCIETY. — At a meeting of this Society at Boston, U.S., on the 24th ult., a very beautiful display of Orchids was made by SAMUEL R. PAYSON. *Cattleya Trianae* was shown in six varieties of different shades, and *C. labiata Percivaliana* in two varieties. *Phalenopsis amabilis* and the new and rare *P. Schilleriana* were also exhibited. The flower committee awarded a silver medal to Mr. PAYSON. C. M. ATKINSON, gardener to JOHN L. GARDNER, exhibited six pots of *Lily of the Valley*, for which a gratuity was awarded. HOVEY & Co. exhibited a collection of Camellias. CEPHAS H. BRACKETT showed fine Mushrooms and Brighton and White Spine Cucumbers, and a gratuity was awarded therefor.

— SMUTS AND CLUSTER-CUPS. — In the *Quarterly Journal of Microscopical Science* Mr. PLOWRIGHT gives the results of his examination of the life history of five species of Uredo (smut), as revealed by experimental cultivation. The experiments have been repeated in some cases twenty or thirty times. Altogether between 400 and 500 experiments are recorded. The experiments were made by infecting various plants with the spores of fungi. Thus the smut spores of *Poa trivialis* and *pratensis* (*Uromyces Poa*) produce characteristic *Æcidia* or cluster-cups on *Ranunculus repens* and *Ficaria*. Those of *Uromyces dactylidis* on *Dactylis glomerata* produce cluster-cups on *Ranunculus bulbosus*. Spores of *Puccinia Magnusiana* on the common Reed yield cluster-cups on *Ranunculus bulbosus* and *repens*. The spores of *Puccinia perplexans* on *Avena elatior* and *Alopecurus pratensis* form the *Æcidium* of *Ranunculus acris*. *Puccinia phragmitis* on the common Reed yields *Æcidia* on *Rumex obtusifolius* *hydrilapathum*, *Crispus conglomeratus*, and *Rheum officinale*. *Puccinia Scholeriana* growing on *Carex arenaria* produces by artificial inoculation the *Æcidia* of *Senecio jacobaea*. The specific identity of forms of very different appearance growing on plants of widely different character is thus proved.

— PANAX MURRAYI. — A splendid tree, 50 to 60 feet high, and then trichotomously branched. The leaves measure 3 to 4 feet in length, and are reflexed and pinnate, with ten to twelve pairs of ovate leanceolate green lobes. The flowers like those of the Ivy, but arranged in long erect panicles. It is a native of Queensland, and possibly of the South Sea Islands, and is a very handsome decorative plant for the stove or conservatory. It is figured in the *Botanical Magazine*, t. 6798.

— CYTISUS PROLIFERUS. — More than a hundred years have elapsed since this plant was originally introduced from the Canary Islands to our greenhouses, yet it is rare compared with such species as *C. canariensis* and *C. racemosus*, especially the latter. This is a white-flowered species, making its rarity all the more surprising, considering the prevalence of yellow in the genus. The flowers are rather freely produced in short axillary aggregated racemes or umbels along the gracefully arching branches. Some

old books describe the flowers as yellow—probably by mistake. The trifoliate leaves are silky on the underside as well as at the margins, and being above the average size for the species of this group, give the plant a distinct appearance. A good-sized specimen has been flowering for some time in a cool compartment of the T range at Kew. A figure of the plant was given many years ago in the *Botanical Register*, t. 121.

— NATIONAL CHRYSANTHEMUM SOCIETY. — At a meeting of the General Committee of this Society, held at the "Four Swans," Bishopsgate Street, E.C., on Monday evening, the 16th inst., E. SANDERSON, Esq., President, in the chair; it was reported that the trustees of the Veitch Memorial Fund had offered the Veitch Medal and a prize of £5 for competition at the annual exhibition to take place at the Royal Aquarium in November next, the conditions of the class to be thirty-six incurved blooms of Chrysanthemums, in eighteen distinct varieties. In addition, Mr. JAMES CRUTE offers special prizes in two classes, one for twelve plants of Chrysanthemums, incurved varieties, grown for specimen blooms, not less than two blooms on a plant; and the other for the same number of plants of Japanese varieties, under the same conditions, to be grown in CRUTE's patent concave flower-pots. The sum of £10 is offered as prizes in these two classes. The Secretary, Mr. WILLIAM HOLMES, announced that applications for affiliation under the recently issued regulations had been received from the Bristol, Yeovil, and Chelmsford and Essex Chrysanthemum Societies, the Canterbury Gardeners' Mutual Improvement Society, and the Ancient Society of York Florists; while several others had applied for the rules, with a view of applying for affiliation.

— RHODODENDRON CAVRONI ×. — This is a cross between *R. Gibsoni* and another species unnamed, raised by M. CAVRON, of Cherbourg. It is a shrub with oblong lanceolate glabrous bullate leaves, and trusses of broadly trumpet-shaped white flowers, flushed with rose, 3–4 inches in diameter, and very fragrant. It is figured in the number of the *Revue Horticole* for February 1.

— GREENHOUSE CLIMBERS FOR AMATEURS. — One is frequently asked by persons who have a small greenhouse and are not very well up in knowing the right class of plants to procure for it what could they get for a climber. Well there are any number of plants suitable for a house with or without heat that can be raised from seed in the spring, and form beautiful festoons and masses with only ordinary care. We refer to such plants as *Maurandias*, *Ecce-mocarpus*, the former lilac and white, the latter rich orange; *Thunbergias*, yellow and white, *Tropæolums*, various, and many others which may all be raised from seed sown now, and will soon form handsome climbers. Of course for a good house we would not recommend these, but *Habrothamnus*, *Fuchsias*, *Plumbago*, *Lapageria*, *Clematis*, *Hoya*, &c. These may all be successfully grown in a cool greenhouse.

— YORK GALA. — The annual exhibition of this Society takes place on June 17, 18, and 19. The prizes are on the same liberal scale as they have now been for some years. The schedule contains ninety-six classes for plants, flowers, fruits, and vegetables. Amongst them are prizes of £20, £14, and £8 for collections of sixteen stove and greenhouse plants, ten in bloom and six fine-leaved (open); £10, £8, £6, and £4 are offered in the principal class (open) for miscellaneous groups arranged for effect; £46 are given for Roses in pots; some £38 for cut Roses, and £56 for fruit—in all, nearly £600. We see the committee have introduced on additional regulation, to the effect that where exhibitors fail to name their productions the judges are empowered to pass them over. The growing practice shown by exhibitors to leave their exhibits unnamed is such that a rule of this kind is wanted. For gardeners, and those who know the plants, flowers, fruits, &c., competing, the naming is not necessary, but it is for the information of the public, who usually are wanting in such knowledge, yet having paid their money to see the display have a right to be able to make themselves so far acquainted with what they come to see.

— GARDENING APPOINTMENTS. — A. MCKINNON, late Head Gardener, to Major FINLAY, Burley Lodge, Newbury, Berks, as Head Gardener to Baron WILLIAM V. SCHRÖDER, The Rookery, Nantwich, Cheshire.

## FRUIT NOTES.

APPLES AND PEARS. — From the Apple Congress onwards all that has been since written in the *Gardeners' Chronicle* respecting Apples has been most interesting. I often think that in planting an orchard too great a proportion of early kinds are planted, so that when the new year comes Apples are much in request for dessert and culinary purposes; then there is a deficiency, which is a great pity, seeing that a little forethought would have obviated it. If the Royal Horticultural Society were to invite the gardeners of this country to send up a collection in the first week in February there are plenty of us who would respond; then we should have a true test of the keeping kinds, the names of which are readily selected from any good nurseryman's list now, and some of which will keep till next May. I quite agree with Mr. Barron about what he says of Cox's Orange Pippin. We had 6 bushels of it here this year, and during the day the fruit-room is pretty frequently visited by fruit eaters, but not an Apple was looked at till these were finished, and many preferred it to the Pears, of which we have a good selection. I would especially mention two valuable kinds just now in season, viz., the Sturmer Pippin and Dumelow's Seedling, generally known as Wellington; it is a very fine culinary sort, while the former is an excellent dessert kind; and although Golden Knob is not a first-class fruit, we cannot dispense with it, keeping, as it does, till so late in the year. I cannot agree with the Apple Congress, which scratched Golden Harvey. It is certainly a shy bearer, but very delicious, plump, and juicy.

### PEARS.

Any one looking over a fruit tree catalogue will see any number of Pears given as ripening in January and the two following months. With us, alas! it is not so; we have now only Catillac, Ne plus Meuris, Knight's Monarch, Vicar of Winkfield, and Olivier des Serres. The Vicar I shall do away with, but the last-named Pear is a superb kind—handsome, hardy, and well flavoured; where it requires a wall, as in the Midland and Northern Counties, it should always have one. A bishop once told me never to dish up together the two fruits I have now written about, and the reason given that it was an Apple which ruined the first Pair. *J. Rust, Eridge Castle, Sussex.*

### PEAR MADAME HUTIN.

In the *Bulletin d'Arboriculture* for December we find a coloured plate of this Pear, an excellent variety. The fruit is of medium size, broadly oblong-ovoid, with a long stalk set in a shallow basin, the skin yellowish, speckled with brown spots, especially near the stalk. Flesh yellow, juicy, fragrant. Season December to January. It was raised by M. Leclerc, of Laval, in 1841.

### MELON GLORY OF BRISTOL.

This is figured in the October number of the *Bulletin d'Arboriculture*, and is a small netted variety with red flesh and excellent flavour.

## Notices of Books.

Christy's Guide to Poultry Rearing. By T. Christy, F.L.S. London: Fenchurch Street, E.C. Price 6d.

This little brochure on hatching poultry by artificial means, and rearing them so as to be fit for the table as early as possible, may be of much service to those who are desirous of adding to their income by this remunerative small industry. Much useful information is given on the rearing of all kinds of domestic food birds and game birds. The methods given are suited either to the cottager with small means, or to the person of ample means.

Bulletin de la Fédération des Sociétés d'Horticulture de Belgique, 1882.

Somewhat late in the day comes the report of the Federation of the Horticultural Societies of Belgium for 1882. Great part of the volume is devoted to the transactions of the several constituent societies, which are of no great interest to outsiders. Then follows a translation of Mr. [Fawke's] *Hot-water Heating*, and the useful directory known as the *Correspondance Botanique* for 1884, which we have previously had occasion to notice.

## The Flower Garden.

### BULBS AND TUBERS.

THESE should now be examined, and the first batch of *Gladiolus* planted for early flowering at once. Choose a fine dry day for the work, and if the soil in which they are to grow is stiff put a little rough sand round the bulbs which will greatly assist them in coming away with clean growths. *Ranunculus*, *Anemones*, *Tigridias*, *Lilies*, *Tritonias*, and all similar bulbs should now be planted when the weather is mild and dry. The soil most suitable for the above-mentioned bulbs and tuberous rooted plants is a good light sandy loam, well trenched, with rotten dung thoroughly mixed with the staple, and then made quite firm before planting the bulbs. I always cover with leaf-mould after planting, to protect them from frost. The *Ranunculus* should be planted either in small masses, which then afford pretty patches of colour in the borders or mixed beds, or in small beds by themselves. But in whatever way is chosen, the ground needs good preparation. In beds it is a good plan to throw out the soil over the area of the bed to be planted, making the sunken part about 3 inches deep, level and firm. Place the roots about 5 inches apart each way, and then carefully put back the soil. Some persons plant in drills, but the roots do best when planted as above described.

The *Anemones* may also be so treated, allowing rather more depth and distance apart. *Tritonias* should have a warm sheltered quarter, and sloping well worked soil that will not get waterlogged. These and *Ixias*, *Babianas*, are well worthy attention in the warmer parts of the country.

The *Lilies* and *Tigridia pavonia* and *T. alba* are less susceptible to injury, and will grow, provided the ground is good, without any great amount of attention, both being, however, much benefited by having some well-rotted cow-manure and peat within reach of the roots.

### HERBACEOUS PLANTS.

Large masses of these may now be divided and vacant places filled up, rearranging the borders and beds, giving great care and attention to the effective and artistic in planning, so as to get pretty contrasts in colour of flower and form of leaf, taking care not to plant diminutive species in the rear of tall growing ones, although it is by no means satisfactory when all the plants are placed so as to make a smooth-faced bank. *W. Smythe, The Gardens, Basing Park.*

## FRUITS UNDER GLASS.

### PEACH-HOUSES: DISBUDDING.

*Early Division.*—As soon as the growths on the trees are forward enough for disbudding it should be attended to at once. This operation involves the removal of all superfluous shoots that will not be required to furnish the trees with fruit-bearing wood for the subsequent season, and it should be done gradually, as otherwise, when done in a wholesale manner, it must in some degree be detrimental. From personal observation, I have come to the conclusion that the best way to manage these shoots is to leave part of them untouched until they have made about four leaves, and then, whilst in a very young state, to nip out the top. This method tends to produce a supply of fruit-bearing spurs all over the trees, which in the case of very vigorous trees oftentimes are more fruitful than even the ordinary bearing shoots. As soon as the growths that are left are fit they should be tied in at the base; this, if properly done, is a material aid towards keeping the trees in a good form.

### RED-SPIDER.

In houses where the red-spider is likely to abound a strict search for them should be made without delay. If present they will be detected on the earliest developed foliage, and most probably near the heating apparatus. Any leaves which may be infested with this pest should, as far as possible without damage to the trees, be removed altogether, and be destroyed.

### TEMPERATURE.

This compartment should now be kept at about 55° at night and 65° during the day, with a range of from 75° to 85° by sun-heat. Under these conditions give air freely, and at other times a diminished quantity will suffice. Keep the trees well syringed every day both at morning and at shutting-up time in the afternoon likewise.

*Second Division.*—The trees here will be in blossom at about this time. See to the setting of the fruit occasionally, and proceed to disbud the trees as soon as they are ready in manner as before described: 50° at night, 10° more in the daytime, and from 70° to 80° from natural means, may rule here for the present month. Attend to airing, &c., as before advised.

*Late Division.*—The crops in these can be advanced or retarded according to requirements, where a regular supply of ripe Peaches and Nectarines is required from the beginning of May until the time those out-of-doors are fit for use. The first division should be started at the beginning of December, the second division about the middle of January, and the third towards the end of February. The latter only need to be encouraged by husbanding sun-heat, and giving the trees a little heat whenever conditions out-of-doors are such that they require it. *G. T. Miles, Wycombe Abbey.*

## Plants and their Culture.

### POTTING STOVE PLANTS.

MANY of the stove plants will thrive in a mixture of peat and loam in about equal proportions, as *Allamandas*, *Clerodendrons*, *Bougainvilleas*, *Stephanotis*, and *Vincas*, among the flowering kinds; and *Crotons*, *Dracenas*, *Pandanus*, and most of the *Palms* that are grown in a high temperature, among the foliage plants. *Palms* that are possessed of roots somewhat fine and wiry, will do better in a peat compost; on the other hand, those that have stout, fleshy roots should have more of loam given them. *Ixoras* will thrive best in good fibrous peat alone, potting firmly as with a Cape Heath. By this means the growth that is made will be sturdy and compact, and the plant found to remain in good condition at the root for a longer time. *Dipladenias* and *Hoyas* will succeed well under the same course of treatment. *Marantas* and *Cissus discolor* do best when potted lightly without any ramming of the soil.

We have always found *Alocasia Lowii* and *A. metallica* to thrive best in rough peat, sphagnum moss, and charcoal, with the pot filled up half-way with small pots and large crocks in order to provide an abundant drainage. It is also a good plan to elevate the centre of the plant some few inches above the rim of the pot. In repotting the *Alocasias* I like to carefully remove the greater part of the soil or even all of it if the same has become sour and exhausted, washing the roots if necessary. The foliage *Anthuriums* will also come under the same course of culture. If any potting is needed among the flowering section of *Anthuriums*, it had better be seen to at once, do not reduce these too severely or smaller spathes will result.

The South African *Asparagus plumosus nanus*, and *A. tenuissimus* are well worthy of the attention of the cultivator. For using in a cut state they are invaluable at any season of the year. I find they thrive best in loam, and that of a heavy character, as the plants advance in size. A temperate-house suits the first-named admirably, it never appearing to need any rest from active growth. *Gardenias* that are now showing their flower-buds had better be potted after flowering is over, then if the plants are straggling in growth they may be cut back rather hard, afterwards potted and placed in a brisk heat to induce them to make vigorous breaks again. The *Achimenes* had better be left for a few weeks longer before being started into growth, there will then be quite time enough to get them into flower at a season when they will be of the most service. *Gesperas*, too, will be all

the better if kept dormant for the present; this can easily be done by keeping the stock in a cool house. *James Hudson, Gunnersbury House Gardens, Acton.*

## The Kitchen Garden.

### SEED SOWING.

A GENTLE hotbed should now be prepared for making early sowings of the following seeds:—*Brussels Sprouts*, *Cauliflower*, *Cabbage*, and *Lettuce*. The beds for these should be raised to within 3 or 4 inches of the glass, as the soil will sink lower as the heating material beneath subsides. Frame room being a great consideration in most gardens, only a very limited space can be devoted to sowing and raising young plants for the kitchen garden. For the above sowings not much need be occupied, as a large number of young plants can be raised to the rough leaf stage under glass and afterwards pricked out in the open on a well prepared piece of ground that can be covered with mats on hoops, whence they can be transferred to their allotted quarters to come to maturity. *Brussels Sprouts* sown in February will be large enough to prick out in the open about the first week in April, and ready to plant out into their permanent position about the end of May. If earlier sowings of *Cauliflower* and *Lettuce* were made in boxes in January, and the number of plants derived therefrom are considered large enough for the early batch, the sowing as above recommended will not be necessary for these two kinds, but frame space will be wanted to prick them out under glass. Frames not being at command the *Cauliflowers* can be potted off in large 60's and placed in a cool house near the glass, and the *Lettuces* pricked out on a south border and protected on cold nights for a time. Where *Capsicums* are required in autumn some seed should now be sown in heat.

### CURLED CHERVIL AND RADISH.

On a narrow border, well sheltered, and in a sunny position, a bed of each of the above may now be sown. When sown place a piece of net over the *Radish* bed to ward off birds, and watch for those little depredators, the mice, which soon rummage over the beds in search of the seed. Should frost set in a little light covering placed on at night and removed after the frost has passed off in the morning will be of great advantage.

### PARSLEY

is generally sown in rows, and in the position in which it is to stand; but in all instances this method is not the most satisfactory. It can be sown in a prepared seed-bed similar to other seed, as it will stand transplanting (carefully) for forming edges, &c., with the greatest impunity. Of course it must receive a watering after being removed if the soil is dry.

### TURNIPS.

About March 1, soil being in good condition, a sowing of the above should be made out-of-doors in the lightest and most favourable soil for early development—*Early Milan* or a similar variety.

### NEW PLANTATIONS OF GLOBE ARTICHOKE.

Do not sow seed. It would be going a roundabout way of getting good varieties. The *Green Globe* is the best. Procure offsets from a well known stock that has been carefully looked over, and had varieties discarded. Pot the offsets into small 32-pots, place them in a gentle bottom-heat to start, and afterwards in a cool house prior to planting out, after sharp frosts may no longer be feared.

### BROAD AND LONGPOD BEANS.

Any sown in boxes in January, and that have been well exposed, should now be planted out.

### PEAS.

If the pot, or turf method has been chosen for raising the first earlies, they should now be ready to plant out. The necessary distance between the rows will depend on the variety. Pots with from eight to ten *Peas* in each should be planted 6 inches apart in the rows, afterwards press a little light soil into the centre of each lot; in order to divide the plants a little and induce them to grow outwards, draw a little soil up to them with the hoe. If a little light brushwood

can be put to them, it will be a great assistance, and the longer stakes (if required) can be placed later on. Some protection should be provided in readiness should sharp frosts prevail.

#### POTATOS.

Plant under south walls. *G. H. Richards, Somerley Gardens, Ringwood, Hants.*

## Florists' Flowers.

### LATE CHRYSANTHEMUMS.

THE special prizes offered by Mr. William Cullingford, through the medium of the National Chrysanthemum Society, to be competed for in July next, will operate to turn attention to a consideration of what are the sorts likely to be serviceable at this season of the year, and how the plants should be treated. As to the late flowering sorts, Mr. George Stevens of Putney furnishes the following as a select list:—*Iocurved varieties*: Angelina, golden-amber; Barbara, bronzy-yellow; Cherub, golden-amber; Eve, pale primrose; Lady Slade, pinkish lilac; Mr. Halliburton, ivory-white; Mabel Ward, golden-yellow; Princess Teck, bluish white; Venus, pink; White Venus, and Yellow Perfection. *Japanese varieties*:—Boule d'Or, golden-yellow; Ceres, delicate flesh colour; Jackson's Duchess of Albany, orange-buff; Ethel, white; Meg Merrilies, sulphur-white; Thunberg, golden-yellow; and Yellow Dragon. *Large Anemone-flowered varieties*:—Fleur de Marie, white; and pompon Anemone-flowered *Virginalis*. *Pompon varieties*:—Mdlle. Marthe, white; Golden Mdlle. Marthe, Rosinante, bluish-rose; Souvenir de Jersey, yellow; and Snowdrop, white. The foregoing are all well known varieties, and therefore easily procurable.

As a matter of course, in having good flowers in January, much depends upon the way in which they are grown. Mr. Stevens recommends that the sorts selected be potted about the second week in July into their flowering pots, and be grown on in the open air as long as it is considered safe to do so and frost holds off. Instead of taking the crown buds, that is, the one bud on each stem, the terminal ones, *i.e.*, those that appear on the side branches, should be taken, and the cooler the plants can be kept after they are housed the better, as this would assist the late production of flowers, provided, of course, that frost is not allowed to injure them. Under this treatment the varieties named might be expected to flower from the beginning of December until the middle of January.

The National Chrysanthemum Society do not require that any particular varieties, generally denominated late-flowering, be shown for Mr. Cullingford's prizes. All flowers in good condition in January will be accepted in competition. If any one can produce Mrs. George Rundle and its allies, or any other early flowering forms, in good condition at the beginning of 1886, all the more credit would be due to them. That it will be an interesting exhibit there is no doubt, and if one result should be the development of a race of what might be termed winter flowering Chrysanthemums, or introduce a system of culture that will greatly retard the usual season of blooming, then some substantial gain will flow from Mr. Cullingford's generous offer. *R. D.*

## THE TRUFFLE BEETLE.

NOWHERE in the whole range of Nature does there exist a greater need for the presence of the numerous tribes of Rypophagous insects, cleansers or scavengers, than in connection with fungi of various kinds, both above and below ground. Left to themselves to rot and decay these vegetable productions, from their soft structure, would soon become nuisances, but, as for example, every grower of Mushrooms is well aware, they are soon attacked by numbers of cylindrical white maggots or larvæ of different kinds of two-winged flies, which reduce them to a state of wet putrefaction which soon ends in their reduction to the parent earth from which they sprang. The Mushroom grub and fly are represented in our article in the *Gardeners' Chronicle*, p. 581, 1853.

In like manner the much-prized Truffle is attacked

by numbers, not only of the maggots of different dipterous insects, but also by the Truffle beetle and its larvæ represented (with an uninjured Truffle) in the accompanying illustration (fig. 48).

Many years ago we received, through the kind intervention of the late Professor Henslow, from Lady Braybrooke, a number of dipterous larvæ, chiefly of minute Tipulidæ found in the Truffles which occurred plentifully in the grounds of Lord Braybrooke's seat at Audley End, in Essex, together with specimens of the Truffle beetle and its larvæ, of which latter Mr. C. E. Broome also supplied us with specimens. These were of small size, and when dried they assumed the bent form represented in our cut, with the head of large size and convex, with strong jaws, much dilated at the base, a deep semi-oval incision in the middle of the inner margin, and terminated obliquely in two or three sharp teeth. The maxillæ are armed along the inner margin with a row of curved flattened spines. The upper lip is large, flat and porrected. The antennæ have the basal joint very short, the second and third joints longer and slightly thickened at the tips, the fourth joint small, terminated by a minute triangular appendage. The six legs are strong, and the body is terminated by a pair of short two-jointed appendages, each ending in a short seta.

FIG. 48.—THE TRUFFLE BEETLE.

The perfect beetle (*Anisotoma cinnamomea*, Panzer) is the type of Latreille's genus, *Leiodes* (of which it is the largest species), measuring from 2 lines to 3½ lines in length; the larger specimens being males, distinguished by their large thickened hind legs, of which the femora are toothed on the under-side, and the tibiae are curved. The general colour of the insect is shining orange, or ferruginous ochre, oval in shape, convex, and highly polished, the club of the antennæ and tips of mandibles alone being black; the upper surface of the head and thorax is thickly punctured, and each of the elytra is faintly marked with eight rows of small punctures.

The females are smaller than the males, and the hind legs are neither thickened, toothed, nor curved. The antennæ have the seventh, ninth, and two terminal joints thickened, the eighth joint being smaller than the preceding and following joints. The four anterior tarsi are 5-jointed, but the hind pair has them more slender, and only four-jointed. Owing to its subterranean habits, infesting Truffles, it is not often found. It has occurred in Devonshire and Cornwall, and was found by the late Mr. Kirby and Professor Henslow at Lord Braybrooke's, at Audley End, in Essex, in some numbers. *I. O. W.*

BUMBLE-BEES. — Naturalists urge that bumblebees' nests should be carefully preserved, the insect being the most valuable we have in the fertilisation of fruit and other crops, their tongues being longer than those of honey-bees, and therefore better adapted to securing pollen and depositing it on other blossoms.

## ROYAL HORTICULTURAL SOCIETY.

THE following is the annual report of the Council for 1884, presented to the Fellows at the annual meeting, but which we were unable, owing to the pressure on our space, to give previously:—

"The usual accounts and balance-sheet are submitted to the Fellows.

"The Council have the satisfaction of being able to report that they have obtained from the Council of the International Inventions' Exhibition, 1885, for the Fellows and the former debenture-holders of the Society, privileges in connection with that Exhibition, of the same nature as those which gave so much satisfaction last year. They have arranged for a series of shows—the programme of which has been circulated among Fellows—which they hope will, for beauty and utility, fully maintain the reputation of the Society.

"The death of Mr. Mangles, whose abilities were unceasingly employed in the service of the Society, has deprived the Council of a colleague whose energy and assistance they highly valued; and they regret to have to announce the retirement of their President, Lord Aberdare, whose other engagements render his attendance at their meetings impossible. Lord Aberdare joined the Society when it was torn by dissension, in debt, and discredited; he retires from its Presidency when it is united, solvent, and advancing in a career of usefulness. The Council recommend Sir Trevor Lawrence, Bart., M.P., who has long been a member of their body, and whose name is well known to all lovers of horticulture, as his successor.

"The Council have under consideration the propriety of filling up the vacancy in the office of Assistant-Secretary.

"A report of the committee of the National Apple Congress, held last year, uniform with the Society's *Journal*, prepared by Mr. Barron, and edited by Professor Henslow, has been published by the Society, and may be obtained by Fellows on application to the Secretary.

"A Conference on Daffodils, under the presidency of Professor M. Foster, F.R.S., was held in the conservatory in April last, when most of the amateurs and leading cultivators of these interesting flowers contributed specimens; and papers were read on the classification and nomenclature of the genus, which elicited an unusual amount of interest on the part of those who were present.

"The Council propose to hold an Orchid Conference on May 12 and 13. The great interest taken in Orchids, the rapidity with which their cultivation is spreading, their singular structure and manner of growth, and their beautiful flowers, lead the Council to believe that such a Conference will be welcomed by horticulturists and botanists alike. A circular on this subject is issued with this report, for which the Council earnestly bespeak the consideration of all cultivators of Orchids.

"The gardens at Chiswick have been maintained in their usual high state of efficiency, and the practical work of the Society carried on as in former years.

"The trials by the several committees have been conducted in a thoroughly satisfactory manner. Those of the Fruit and Vegetable Committee comprised Peas, of which a large collection was grown, the newer varieties of Potatoes, Tomatoes, and Broccoli; and those of the Floral Committee, Caladiums, fine-folaged Begonias, Adiantums, and Pelargoniums.

"Some interesting experiments on the prevention of the Potato disease by what is termed the 'Jensenian method,' were conducted under the direction of the Scientific Committee, but owing to the exceptional dryness of the year they have not yielded sufficient materials for a trustworthy report.

"Facilities were again afforded to the committee of the International Potato Exhibition for testing new varieties of Potatoes sent to that body. It is satisfactory to learn that the accommodation thus afforded is much appreciated.

"Endeavours are being made to secure, for subsequent distribution amongst the Fellows, a supply of the tuberous-rooted species of *Solanum* which are now being introduced, and which are attracting considerable attention, as likely to lead to the improvement of the cultivated Potato.

"It is proposed that trials should be made by the Fruit Committee, during the present year, of the newer varieties of Peas, Beans, Cauliflowers, and Potatoes, and by the Floral Committee of Fuchsias, Caladiums, Carnations, Picotees, and Pinks, Phloxes, and the various sorts of Ivies. Fellows or others who may be cultivators of these plants, are invited to contribute for the purpose.

"The crop of Grapes in the great vinery and other houses was unusually good, but that of outdoor fruit, Apples and Pears in particular, proved a total failure, owing to the prevalence of spring frosts.

"During the past season 999 Fellows have availed themselves of the privilege of obtaining plants, &c., from

the gardens, the number of plants distributed amounting to 18,468, with 35,000 packets of seeds and 1977 packets of cuttings of vines and fruit trees.

"The Council are much indebted to many exhibitors for the assistance rendered by them in maintaining special displays of flowers, &c., in the conservatory during the season, which greatly added to its interest and attraction. Special mention may be made of the magnificent hardy herbaceous plants by Mr. T. S. Ware, of Tottenham; of the Gladioli from Messrs. Kelway; and of the Dahlias from Mr. C. Turner, of Slough. The Council will be pleased to make similar arrangements for the present year.

"A Fellow, a contributor during the past season, has suggested that many other Fellows would be pleased to lend from time to time interesting house plants which they can spare in small numbers, to add to the attraction of the conservatory and the enjoyment of the large numbers of people who will visit it during the Inventions Exhibition. The Council are willing to give effect to this suggestion, and will be happy to receive plants suitable for such purpose, which will be treated with the same care that is bestowed on the plants of the Society; but they cannot on behalf of the Society undertake any special responsibility in respect of them.

"The very successful shows of fruits and vegetable produce held in the conservatory during the past season cannot fail to have beneficial results. Special interest was taken in these by the many thousands of visitors who thronged the conservatory on the days when they were held. The wonderful exhibition of cottagers' produce may be specially mentioned.

## COLONIAL NOTES.

CHRISTCHURCH BOTANIC GARDEN.—Mr. J. B. Armstrong sends us a categorical denial of the charges brought against the garden by Mr. Mudd, and points out that it was visited by more than 20,000 persons last year, the population of Christchurch being only 35,000. Since the establishment of the garden more than a million of timber trees and other useful plants have been distributed free to various public bodies, such as Road Boards, School Boards, County Councils, &c., besides large numbers of ornamental, economic, and valuable plants of other classes; and it would not be difficult to prove that the value of these distributions has nearly, if not quite, equalled the whole cost of the garden during the whole period of its existence.

The following brief description of the park and garden, from the *Southern Provinces Almanac*, will help to show what has been done:—"The domain was originally reserved for a Government House, but it is now to all intents and purposes a Botanical Garden, although that name has never been officially applied to it. The whole extent of the ground comprising the domain (about 79 acres) is laid out as a public garden in the picturesque style; and, although only nineteen years old, many parts of the garden have already become very beautiful. We have here such a triumph of Art over Nature as is not often observable, seeing that a few years ago the site was a miserable wilderness of sand and shingle, the only shrubby vegetation being the Wild Irishman (*Discaria toumatou*) and the common Koromiko (*Veronica stricta*). Even when the present curator took charge of the garden there were not 200 kinds of plants in it, whilst now there are over 3000, and additions are constantly being made, although the great want of funds militates against the rapid increase of new and rare plants.

"Special attention is devoted to conifers, for which about 15 acres have been set apart as a pinetum. About 179 kinds of conifers have already been planted, and when they attain sufficient size the public will be able to inspect them and form an opinion as to their adaptability to the climate of the province. Another large piece of ground is devoted to native plants, of which there are an immense number of sorts, and where it is intended that specimens of all our native plants shall be preserved to show future generations of New Zealand what the original vegetation of the country was like. Another interesting department is that devoted to British plants, and containing about 500 species; this is perhaps the most interesting part of the garden to the old colonist, as he can see the old familiar plants of the English hedge-rows and mountain slopes. Unfortunately, the soil of the garden is rather too dry for British plants, and many of them are only preserved by constant attention. A similar collection of New Holland plants has lately been formed, and promises to be successful. Considerable attention has also been given to medicinal and economic plants

—of which there are large numbers in the gardens—and no doubt many of them will ultimately become sources of income to the colony. Of late years attention has been principally directed to the introduction of the class of plants known as hardy herbaceous perennials which are now so much sought after in England. The efforts in this direction have been fairly successful, many hundreds of beautiful flowers having been introduced through the agency of the garden, but much still remains to be done, as some of the finest plants of this class are still absent from the collection."

## BUDS OUT OF PLACE.

THE formation of buds in out-of-the-way situations has an interest for the gardener beyond that of

FIG. 49.—BUDS ON THE ENDS OF THE LEAVES IN CURCULIGO.

botanical curiosity, as it often affords a means of propagation which would otherwise be difficult, and sometimes unattainable. Our illustration (fig. 49), for the materials for which we are indebted to Mr. Watson, shows some buds on the tips of the leaves

FIG. 50.—FLOWER BUDS ON THE ROOTS OF PYRUS JAPONICA.

of *Curculigo orchoides*. The frequency with which buds of similar character are formed on the fronds of Ferns is matter of common observation, and Mr. Dreury's recent discovery of reproductive organs on such buds, while still on the frond and without the intervention of a spore, opens up new clues towards the unravelling of the course of descent of these plants, and shows that the prothallium is, after all, only a form of bud. Another very interesting case of bud formation was that exhibited by Major Lendy before the Scientific Committee, recently, and which was figured in a late number of the *Gardening World*. This consisted in the production of leaf-buds from the surface of the aerial roots of *Phalenopsis Schilleriana*. Our young contemporary has earned the credit of having been the first, so far as we know, to note and figure the production of buds on the aerial roots of Orchids.

## HOME CORRESPONDENCE.

Mushrooms.—In recent numbers of the *Gardeners' Chronicle* mention has been made of a bunch of prolific Mushrooms. I have sent a bunch for your inspection, which, unless you count the very small buttons, does not come up in point of numbers to the one supplied by Mr. Breese, but which are of a useful size. They are grown in an unheated shed, and the bed was spawned at about 90°, soiled and beaten down, on November 29 left a day or two to test the heat, then covered with about 6 inches of long straw. I commenced to gather about a fortnight ago. In a heated Mushroom-house I never get such bunches. They grow away quicker, but the beds do not last so long in bearing as those grown in a cold place. The spawn I procure from Mr. George, of Putney, and use it in pieces about 1½ inch square. I am of opinion that the newer the spawn used the better, and the beds come into bearing quicker. *Newman F. Fuller, The Gardens, Idsworth, Horndean.*

Gladioli Planting.—Marquis of Lothian.—I am pleased to see Mr. Douglas (p. 188) recommending an immediate commencement of planting the corms, as hitherto it was not considered orthodox to do so so early. My stock are becoming so numerous that a number escaped my notice in the ground last November. Judge my surprise this morning to see several 4 and 6 inches grown over the ground; not the early kinds alone, but hybrids of *gandaveensis*. These will flower some weeks before those I am planting now, though if anything like severe frost comes they are sure to be seriously checked. Allow me to recommend Marquis of Lothian, a magnificent and robust flower, raised by Mr. Coddling, and sent out by Mr. A. G. Campbell, Gourrock. It is, I believe, as yet hardly known south of the Border. *W. J. M., Clonmel.*

Grape Mrs. Pince.—Many have been the adverse criticisms pronounced upon Mrs. Pince Grape, but where it succeeds well it has much to recommend it. It produces bunches freely, of large size and of very even proportion, and it is a variety which will bear cropping heavily; its colour is not always first-class, sometimes the berries are rather "foxy," more particularly in a wet season, when there is an absence of sunlight during the time it is colouring; it keeps well, and does not shrivel nearly so much as it is sometimes said to do, if attention be given to watering the border several times after it is ripe. It is of good flavour—which is that of a brisk Muscat—and which it retains as long as it is in good condition, which is usually to the end of January or early in February. *E. M. Molyneux.*

Violets Swanley White and New York.—It would hardly be possible to speak too highly of the lovely double white Violet, which with a little warmth will bloom all the winter, and yield a large quantity of blossom, very sweet and of a large size, and which have long foot-stalks, enabling one to gather and bunch it very readily. It has a hardy constitution, for we have it here in a cold pit, where the severe frost in the first week of January injured other sorts, but not this. Sometimes it is known under the name of Count de Brazza and White Neapolitan. New York is a double mauve coloured Violet, but little known, in the way of Marie Louise, but its superior as regards earlier blooming, larger, and very fragrant flower. There is not the least doubt that in the multitude of other things we do not pay sufficient attention to our Violets in summer. A light rich soil, a shady situation, occasional waterings, and constant removal of runners, are the four principal things to attend to. *J. Rust, Eridge Castle.*

Gas Lime in Gardens.—In answer to "T. B.'s" last communication on this subject (p. 217) I do not object altogether to the use of gas lime, but I differ with him as to the quantity he recommends to be applied. I know it is a useful agent if used in moderation, but I have seen land rendered useless for a time by a smaller dose than "T. B." recommends. What "T. B." has said on the subject simply amounts to this. On p. 58 "Gas lime should be applied to land half an inch thick to destroy slugs, &c., and allowed to remain three or four weeks before digging it in." On p. 217 he says:—"This will not do the least harm to any crop that may be put in afterwards."

On p. 86 he recommends it to be "applied to walks scattered on the surface in the way salt is applied, and allowed to remain three weeks, when it not only kills all the weeds, but also their seeds, and prevents anything growing for two years." Salt is not generally applied half an inch or even a quarter of an inch thick, and if the weeds will not grow for two years how does "T. B." prove that it will not do the least harm to vegetables? Moreover, a dressing of gas lime half an inch in thickness is equal, at a rough calculation, to 1414 bushels per acre, or a bushel to a piece of land less than 6 feet each way. *W. H. Divers, Ketton Hall.*

The Orchid Conference.—Narcissi had a Congress, but even a Conference is better than nothing to us poor bewildered growers. How the varieties multiply in those species which will not be in bloom when the much welcomed Conference will be held. Look at *Lælia anceps* now—one or two a week are sold, and now two are described as new varieties. These will not be seen at the show, and so those who are blooming them now have only the papers to read, and these are puzzling enough when we get shades of colour described. There are fewer really sanctioned named varieties of *Cattleya Mossiae*, *Mendelii*, *gigas*, *Warnerii*—which four will be at the show—than are now circulating and named in *Lælia anceps*. My drift is evident to any one (I hope it is, at any rate), that this Conference on Orchids wants to be kept going all round the year to get a really comprehensive system of naming and adjudicating on the varieties, growth, &c. Take again the myriads of forms of *Odontoglossum crispum*. They cannot be all there at once in two days of one month of the year. I am aware that what I point at would be a very arduous undertaking to expect of any one, but I do hope that the success of the May Conference will enable the Royal Horticultural Society, with so good an orchidist as its President, to have other meetings of this Conference at times when the bulk of midsummer, autumn, winter, and early spring Orchids are in full glory. The result to be attained will depend on the exertion and energy of the growers all over the kingdom. Including the collections in France and Belgium, the show has command of immense resources. The Narcissus growers worked in a body, and produced a result of their Congress beyond an outsider's expectation—I would say beyond their own. Let not us cultivators of this the highest and most lovely race of flowers be behind in our efforts, and let us show that the lead given us by a "meek Daffodil" can be taken up as it should be. Let there be no prudishness on the part of any one who has a good plant, well grown, though it be a bad variety, but let him show it; it may put the fine variety which may chance to stand near it into obscurity as to cultivation. Cultivation cannot be purchased at once, as a good variety can be. It would be a good thing, too, were there to arise from this Conference a reliable man who could name a new variety as well as Professor Reichenbach can. It is not always convenient to cut a whole spike and post it off. Moreover, the whole plant could be seen (which is a guide in naming hybrids of no mean calibre) were the Professor in England, and not in Hamburg. I am aware that I have here stepped on dangerous ground, but I do so fearlessly, and will say, for any one's satisfaction, and for that of Professor Reichenbach himself, that I have no wish for any one to supplant him [a rather difficult matter!], but rather that some one should take off his shoulders the onus of naming a plant which he only sees by its bloom, and this he well knows does not show its true colours when badly packed or dried, as he frequently must get them. To conclude, let me exhort all Orchid growers—the ones most unknown are those whom I would wish to see exhibiting, those who are well known will be there for a certainty (or ought to be)—to send what they have, be it a bad or good variety, old or new species, grown any way, large or small, if it is healthy, to send it to be seen, and let the Conference on Orchids be a flower show such as was never seen before. *Dr B. Crawshay.* [Prof. Reichenbach's labours are the outcome of a life of steady devotion and univalued opportunities. He would be the first to welcome an assistant, but such a one must be the product of many years' evolution. Who will pay for the services of such a man, first to educate him, and then to maintain him? Prof. Reichenbach's services are made for the benefit of science, and are all but gratuitously rendered. *Ed.*]

—The numerous varieties and forms, and the confusing hosts of names which belong to many

of the most popular of our cultivated Orchids, might be put into something like understandable order—many of the names discarded, and erratic names corrected—by the adoption of some such plan as was acted upon at the Daffodil Conference. But if the Daffodils were a difficult problem to solve, what will the Orchids be should they be as fully and completely represented as we expect they will? To help those who will not have an opportunity of comparing along with the committee the different forms of each species, would not it be a good plan to arrange the whole of the plants of each species in one group, so that the variations in form, &c., might be easily perceived? The genera might be similarly grouped; a geographical arrangement might also be adopted, or at least the New World plants might be placed on one side of the exhibition-room and the Old World plants on the other. As no prizes are to be awarded, surely exhibitors would not object to the arrangement here proposed. For the sake of accuracy in spelling, native country, parentage, and such-like information, which it is proposed to attach to each plant, it would be well if the Society requested intending exhibitors to forward a list of the plants they intended to contribute a few days before the opening of the exhibition. These lists could then be submitted to a good authority for correction, and then labels of uniform size, printed in something like the following manner, might be issued:—

# ODONTOGLOSSUM

CRISPUM.

*Var. Trianae.*

NEW GRENADA, 1868.

Exhibitor—SIR TREVOR LAWRENCE.

The cost of printing such labels would be small, the names and countries for each plant would be vouched for, though the Society would not, of course, be held responsible for the fitness of the name when affixed to any particular plant. We all know how difficult it is to read the labels supplied by some exhibitors, and errors in spelling are not always absent, whilst it is not always possible for some exhibitors to obtain information as to country and date of introduction for their plants. Bearing in mind that exhibitors are asked to contribute plants with nothing but thanks for their pains, it is not too much to expect the Society to willingly undertake to provide suitable, neat, and uniform labels for all the plants exhibited. At the Daffodil Conference, some of us that went to glean as much information as possible found it no easy matter in some cases to read the labels, whilst in not a few cases the labels could not be got at. As the first object of this proposed Conference is that of affording information to those interested in Orchids, and not merely to provide a pretty picture for loungers to stare at and admire, there are good reasons for the adoption of some such suggestions as those offered here. *W. W.*

Brussels Sprouts.—By far the finest batch of Brussels Sprouts I have seen for many years was at Hutton Hall, Guisborough; every plant was as equal as possible—in fact, I did not see a single plant which varied in any way from the main batch; the whole breadth was as if cast in a mould. The variety, Mr. McIndoe informed me, was Veitch's Exhibition, and which is without doubt a very fine Brussels Sprout. *R. Greenfield, Warwick.*

Preparation of Large Trees for Moving.—The span of human life in the present era of the world's existence, even in the case of those who live to be old, is of short duration compared with that of trees, the progress of which to a state of maturity is proportionately so much slower than that of man, that those who plant small trees do not live long enough to see much of the effect they produce. In the case of that favourite fruit the Pear, it used to be said that those who plant them plant for their heirs, and with the ordinary kind of trees planted to give effect or shelter there is still longer to wait. To shorten time in waiting is the manifest object of those who go to the trouble of planting large trees instead of little ones in the grounds about their dwellings or other conspicuous places, where the presence of such are required. Where work of this kind has to be done it often happens that enough forethought is not brought to bear on the

proceedings. In place of taking the precaution to previously prepare the trees by trenching round them, and severing the roots to within a movable compass, so as to admit of a season's growth before they are taken up, they are at once transferred from where they have been growing for perhaps a score of years or more with their roots unchecked in any way; the result of which is, that the progress made for a year or two afterwards is not near so much as it would be if the roots had been previously shortened back to the way named. The omission of this timely preparation of trees that are to be transplanted when much above the ordinary planting size is the less excusable when it is remembered how little labour cutting in the roots as described involves. To the too frequent absence of judgment and reasonable care in moving trees that have attained considerable size, is attributable the failures that occur and that have led many to the conclusion that it is better to plant small trees and wait for them to grow up, even in positions where it is desirable to have such as would give effect at once. In the case of deciduous kinds of a size such as under notice and that are intended for removal next autumn or winter, the sooner the root-shortening preparation is now completed the better, before there is any appreciable movement in the buds. With evergreens it is better to defer this work until the time that the drying March winds are over, especially in cases where the trees are large and in vigorous condition, as with such the root severance necessary is proportionately more felt than with smaller examples. *T. Baines.*

Pruning Dendrobiums.—When we have examples held up before us we are expected to give greater credence to them than any amount of theorising that might be indulged in; and when your correspondent mentions the fine plant of *D. Wardianum* at Wortley Hall, that has been regularly pruned after flowering, and then tacks on to this one others that have been treated in a similar manner, we are, no doubt, expected to believe that this course of treatment, more especially for this species, is the best that can be adopted. Now, I am not about to find fault with your correspondent for his statements, nor with the cultivator for his practice; but if we are advised to adopt the same plan and method, because of the success attending the practice at Wortley, I must certainly be allowed to use my own judgment, refer to the experience of most Orchid growers, and also feel myself compelled to utter a word of warning against the barbarous practice. It may happen that "J. S. W." has succeeded to his own satisfaction, and that year after year when he finds the growths sufficiently advanced and well-rooted he may cut away the old bulbs and imagines the new shoots are stronger for the operation. But that is not sufficient evidence. One clever *artiste* may walk across the circus on a slack wire, but should the audience leave in consequence, what would be the result? So I say to those, "You are now cultivating Orchids, and Dendrobiums especially. Don't cut the old bulbs away whilst they are green, and acting as storehouses of sap to the young and tender growths." *W. Swan, Fallowfield.*

Cucumber Growing.—Your correspondent, "F. B. T.," p. 187, makes reference to my inaccuracy of figures in giving the dimensions of the Cucumber-house which I wrote about some time since. When giving the height, 9 feet, and the width, 11 feet, I am sorry I omitted to give the length, which is 250 feet. I do not see how your correspondent can justly accuse me of any anxiety to bring my "pet variety under notice;" when he invited a successful grower to state the name of the sort he grew, &c., surely he will in all fairness grant the same privilege to me—if he thinks there is anything in a variety. *A. Smith.*

Centropogon Lucyanus.—Few stove plants are more useful than this, coming in as it does at a dead time of year, and lasting in flower for a considerable period, as after those at the end die away or are cut, the shoots break again and send out a further supply of bloom at the joints. In habit the *Centropogon Lucyanus* is shrubby, and branches up freely from the crown, the shoots reaching a height of from 1 foot to 2 feet in a season. The flowers are bright red, and in form and size much like those of the *Aschmannanthus*, which is likewise a valuable thing, now seldom seen

in hothouses. To have nice little plants of the Centropogon for furnishing, cuttings should be put in as soon as the plants have done blooming, and if kept in a brisk heat in a propagating box they soon strike, when they should be potted, and after being kept close for a few days, to give them a start, stood on a light shelf in a stove, or other situation where they can get the same temperature. During summer, the best place for them is a pit where they can be plunged and grown with similar soft-wooded subjects, as there they are more under control, and can be syringed freely and shut up early, so as to give a brisk heat with plenty of moisture. *J. S.*

**Wall Fruit Tree Protection.**—I note an article (see p. 146) on wall copings, which the writer recommends glass as the best and only safe means of ensuring a crop of fruit on walls. Too much has been spoken and written in favour of glass copings, which alone are all but useless, and the only persons benefited by them to any great or even appreciable extent have been the manufacturers and builders. For every hundred pounds spent throughout the country I believe the value of the fruit gathered over and above what would have been taken had a simple and intelligent system been followed would probably not amount to £5. As I said before, a 3-feet coping of itself is of little or no use during severe weather. There must be some protecting material suspended in front of the trees, and this will be found as useful if hanging from a 6-inch permanent slate coping as the same material would be attached to glass and secured 3 feet from the wall. Except in a very few cases the system of planting fruit trees in holes is totally wrong. In planting, place the roots above the ground line, and keep them there; we shall then hear less of spring frosts and bad crops. *A. L. H.*

## Reports of Societies.

### EDINBURGH BOTANICAL: Feb. 12.

THIS Society met at 5, St. Andrew Square, Professor Dickson in the chair.

The following communications were read:—

I. "The Geographical Distribution of Algae of the Firth of Forth," with exhibition of specimens. By John Rattray, M.A., B.Sc., Botanist to the Granton Station of Marine Observation.

II. "On the Development of Bifoliar Spurs into Ordinary Buds in *Pinus sylvestris*." By Professor Dickson, M.D., LL.D., F.R.S.E.

III. "Note on the Occurrence of *Carex salina* var. *kattagatensis*, F." By A. Bennet, F.L.S., Croydon, Surrey.

IV. "Report on the Excursion of the Alpine Botanical Club." By William Craig, M.D., F.R.S.E., F.R.C.S.E.

V. "Report on Temperatures for December and January, at the Royal Botanic Institution of Glasgow." By Robert Bullen, Curator.

**December, 1884.**—Frost was registered on eighteen mornings during the month, the lowest reading being 21°, or 11° of frost, during the nights of the 21st and 22d respectively. Total for the eighteen readings, 93°. The mean temperature was generally high during the day, the lowest readings being 32° on the 1st, 17th, and 23d, and 30° on the 22d and 28th. The highest readings were 48° on the 13th, and 50° on the 14th. Dull, showery, and often stormy weather prevailed during the first half of the month, accompanied by an occasional heavy downfall of rain and hail. Since the 19th the weather has been generally fine; vegetation is in a dormant state, and in striking contrast from the same month last year, when so many hardy plants were blooming prematurely.

**January, 1885.**—Frost was registered on nineteen mornings during the month, the lowest reading being 20°, or 12° of frost, during the night of the 21st. Total of the nineteen readings, 95°. Although the total record of frost is nearly the same as last month, the low temperature at night was continuous from the 11th to the 25th, and being assisted by the cold dry weather which prevailed at the time made its effects felt to a much greater degree. The highest day temperature was 47° on the 5th, the lowest 31° on the 23d, but on several other days the thermometer was at, or very little above, freezing point. The frequent frosts have had the effect of keeping vegetation in check. The rainfall has been light, and weather all that could be desired for the season.

VI. "Report on the Progress of Vegetation at the Royal Botanic Garden, Edinburgh, for January, 1885." By Robert Lindsay, Curator.

The weather of January was very favourable in regard to open-air vegetation. The temperature was uniformly cold throughout the month, but at no time excessively so. No extremes either of heat or cold having occurred vegetation has suffered very little in consequence—comparatively tender plants are

still uninjured in the open ground. Frost was registered on no less than eighteen occasions, amounting collectively to 72° as compared with 20° for the corresponding month last year. The lowest readings of the thermometer occurred on the 2d, 26°; 20th, 26°; 22d, 25°; 23d, 18°; and 24th, 22°. The highest morning reading was 40°, which was repeated on six mornings. The lowest day temperature was 32°, which occurred on the 23d of the month, and the highest 55°, on the 29th. West and south-west winds were frequent, and there were sixteen perfectly dry days.

The continuance of moderately cold dull weather during the month has had the effect of retarding the flowering of spring plants considerably. Of the forty selected plants whose dates of flowering are annually recorded, only two came into flower by the end of the month, viz., *Tussilago fragrans*, on the 7th; *Diondia epipactis*, on the 20th; while at the same date last year no less than sixteen were in flower. *Rhododendron atrovirens*, which opened its first flowers on January 10 last year, is not yet out. *Hazel* was in flower on January 14 last year, and February 4 this; *Snowdrop*, January 19 last year, February 5 this; *Tussilago alba*, January 18 last year, February 10 this.

On the rock garden eight species and varieties came into flower during the month, viz., single and double Primroses, Cowslip, *Diondia epipactis*, *Hepatica angulosa*, and three species of *Helleborus*. Last January eighteen were noted. Throughout the garden the most conspicuous plants in flower were the various species of *Helleborus*, *Jasminum nudiflorum*, *Erica herbacea alba*, *Garrya elliptica*, and *Andromeda floribunda*.

The following plants in pots were exhibited in full flower from cold frames in the garden:—*Cyclamen Coum vernum*, *Iris reticulata Krelagei*, *Muscari linguatum*, *Narcissus Bulbocodium monophyllum*, *Saxifraga Burseriana*, *S. B. var. major*.

## NOTTS HORTICULTURAL AND BOTANICAL: Feb. 11.

AT the monthly evening meeting, which was held at the Mechanics' Institute, the chair was taken by Mr. J. Radford. The attendance of members and friends for the first meeting of the season was most satisfactory, inasmuch as a hundred new members have been enrolled. The tables presented a lively appearance, being covered with plants, cut flowers, and vegetables. Mr. German, Malvern House, exhibited some nice pieces of Orchids, including *Odontoglossum crispum*, *O. c. guttatum*, *O. Inseayi*, *O. Pescatorei*, *O. P. nivale*, *Phalaenopsis amabilis*, also fine cut spikes of *Zygopetalum Mackayi*, which had been in flower in the conservatory since November. Mr. Edmonds, Bestwood Lodge, brought fine Camellias, also immense flowers of *Dendrobium Wardianum*. The same exhibitor showed fine specimens of May's Northway Prize Brussels Sprouts, the stems having a fine pyramidal form, studded with solid medium Sprouts. Mr. Thacker showed *Dendrobium Wardianum* in a large 60-pot, with one good growth carrying twenty-one fully expanded flowers. Mr. Edington, Woodthorpe Grange, exhibited *Dendrobium nobile* in small pots, well flowered; also good examples of *Mignonette*, with cut flowers of Camellias, Azaleas, Primulas, and Cinerarias; Mr. Walker, Hardwick House, fine sprays of *Passiflora quadrangularis*, completely covered with large expanded flowers. The same exhibitor read a paper on the cultivation of the Camellia, which was followed with a discussion by Messrs. Edmonds, Edington, Thacker, Graham, Thompson. A vote of thanks to the lecturer and the Chairman brought the proceedings to a close. (*A Correspondent.*)

## The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON,  
FOR THE WEEK ENDING WEDNESDAY, FEBRUARY 18, 1885.

MONTH AND DAY.	BAROMETER.		TEMPERATURE OF THE AIR.				HYGROMETRIC DEDUCTIONS FROM GLAISHER'S TABLES 6th Edition.		WIND.	RAINFALL.

Feb. 12.—Fine day; sun shining brightly at times. Fine night.

— 13.—Dull day and night. Fine.

Feb. 14.—Dull day and night.

— 15.—Rain from early morning till 9 A.M. Dull day and night.

— 16.—Rain all day and night.

— 17.—Rain in early morning; darkness from 11 A.M. till 12.45 P.M. Dull day and night.

— 18.—Very fine day and night.

**LONDON: Atmospheric Pressure.**—During the week ending February 14, the reading of the barometer at the level of the sea increased from 29.74 inches at the beginning of the week to 29.79 inches by 9 A.M., decreased to 29.47 inches by 5 P.M. on the 8th, increased to 30.04 inches by 5 P.M. on the 10th, decreased to 29.90 inches by 9 A.M. on the 11th, increased to 30.17 inches by 9 A.M. on the 12th, and was 29.72 inches by the end of the week.

The mean reading of the barometer for the week was 29.90 inches, being 0.47 inch higher than last week, and 0.07 inch below the average of the week.

**Temperature.**—The highest temperature in the shade in the week was 57°, on the 12th; the highest on the 10th and 14th was 48°. The mean of the seven high day temperatures was 51°.6.

The lowest temperature was 33°.5, on the 10th; on the 14th the lowest temperature was 45°. The general mean was 40°.3.

The greatest range of temperature in one day was 15°.5, on the 12th; the smallest was 3°, on the 14th. The mean of the seven daily ranges was 11°.3.

The mean temperatures were—on the 8th, 45°.9; on the 9th, 41°.1; on the 10th, 41°.2; on the 11th, 49°; on the 12th, 49°.3; on the 13th, 47°.4; on the 14th, 46°.5; and these were all above their averages by 6°.8, 2°, 2°.2, 10°, 10°.4, 8°.5, and 7°.7 respectively.

The mean temperature of the week was 45°.8, being 2°.8 higher than last week, and 6°.8 above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 97°, on the 12th. The mean of the seven readings was 78°.9.

The lowest reading of a minimum thermometer with its bulb placed on grass was 21°, on the 10th. The mean of the seven readings was 31°.4.

**Rain.**—Rain fell on the 8th and 9th to the amount of 0.18 inch.

**ENGLAND: Temperature.**—During the week ending February 14, the highest temperatures were 58°, at Cambridge, 57° at Blackheath, 55° at Nottingham; the highest at Brighton was 50°.6, at Bolton 50°.9, at Preston 51°.5. The general mean was 53°.5.

The lowest temperatures were 30°.2, at Wolverhampton, 31°.2 at Cambridge, 31°.4 at Bradford; the lowest at Truro and Leeds 39°, at Preston 37°.5. The general mean was 34°.9.

The greatest ranges were 26°.8 at Cambridge, 22°.1 at Wolverhampton, 22° at Hull; the smallest ranges were 13°.5 at Blackheath, 14° at Preston, 15° at Truro and Leeds. The general mean was 17°.6.

The mean of the seven high day temperatures was highest at Truro, 52°.7, at Cambridge 52°.4, at Blackheath 51°.6; and was lowest at Bolton, 47°.1, at Sunderland 48°.2, at Preston 48°.4. The general mean was 50°.2.

The mean of the seven low night temperatures was highest at Truro 45°.3, at Plymouth 42°.7, at Leeds 41°.9; and was lowest at Wolverhampton, 36°.4, at Hull 37°.1, at Sunderland 38°.4. The general mean was 40°.2.

The mean daily range was greatest at Cambridge and Hull, 13°.9, at Wolverhampton 13°; and was least at Preston, 7°.2, at Truro 7°.4, at Plymouth 8°.3. The general mean was 10°.

The mean temperature was highest at Truro, 48°.6, at Plymouth 46°.5, at Leeds 46°.1; and was lowest at Bolton, 42°.4, at Wolverhampton 42°.5, at Sunderland 42°.9. The general mean was 44°.8.

**Rain.**—The largest falls were 0.93 inch at Truro, 0.72 inch at Bolton, 0.63 inch at Preston; the smallest falls were 0.18 inch at Blackheath, 0.20 inch at Cambridge, and 0.30 inch at Hull. The general mean fall was 0.49 inch.

**SCOTLAND: Temperature.**—During the week ending February 14, the highest temperature was 53°.6, at Aberdeen; at Dundee the highest was 49°.9. The general mean was 51°.7.

The lowest temperature in the week was 32°, at Aberdeen; at Paisley the lowest temperature was 34°.2. The general mean was 33°.1.

The mean temperature was highest at Glasgow,

44°.6; and lowest at Dundee, 40°.S. The general mean was 42°.6.

**Rain.**—The largest fall was 3.18 inches, at Greenock; the smallest fall was 1.24 inch, at Glasgow. The general mean fall was 1.60 inch.

JAMES GLAISHER, F.R.S.

## Enquiries.

"He that questioneth much shall learn much."—BACON.

**LUX-COLOR GAS AND OIL STOVES.**—A correspondent writes:—"Having a small lean-to greenhouse (24 x 8 feet), where a small greenhouse boiler cannot be fixed, I am desirous of finding some other mode of warming the house. Gas I have close by, which can be utilised readily, therefore I am anxious for reliable information respecting the effect of the Lux-Color stoves—if, from practical experience, they are found to entirely dispose of the deleterious products of combustion from gas, consequently not to be injurious to plant life."

## Answers to Correspondents.

**ADDRESS OF S. OWENS & CO.: D. Mason.** The address you inquire for is S. Owens & Co., Hydraulic and General Engineers, Whitefriars Street, London, E.C.

**BOOKS: Pomona. Botany for Beginners, and Plant Life** (Messrs. Bradbury, Agnew, & Co., Boulevard Street, E.C.).—P. Ingram. *Holt Castle; or, The Threefold Interest in the Land*, by Prof. Tanner (Chapman & Hall, 11, Henrietta Street, Covent Garden, W.C.).

**CAMELLIAS: Amateur.** The plants are badly infected with honeydew. Probably overhead washing with an insecticide containing a portion of sulphur, such as Gisburst's soap, would rid you of it.

**CATTLEYA PERCIVALIANA: W. J.** A very good example of this variety, but some superior ones are to be seen. The colour of the variety and prettily fringed lip are well seen in your flower. It will most likely improve in size under cultivation.

**EUCALYPTUS: J. S. E. Gunnii**, the hardiest of the genus.

**HOLLY PLANTING: W. Adams.** The best time to plant Hollies is the month of April, or early in May. Take advantage of wet weather.

**ICE-HOUSE AIR-INLETS: J. P.** If there is a drain at the bottom, properly trapped and furnished with a grating, enough air will get into the place for all purposes. A pipe in the roof, and air-bricks, are worse than useless.

**KEW: W. G.** The Temperate-house was built by Messrs. Cubitt, from the designs of Decimus Burton, in 1861. We cannot tell you the cost, but it was not defrayed from the proceeds of any legacy, but from a Parliamentary grant in the ordinary manner.

**NAMES OF PLANTS: F. L.** The Dendrobes were we regret to say, overlooked. 1, *Nephrodium molle*; 2, *Asplenium Adiantum nigrum*; 3, *Acacia cinerascens*; 4, not certain—there are about 500 varieties.—*Alfred Walker*. *Correa alba*.—U. 1, *Metrosideros stricta*; 2, *Sansiviera zebrina*; 3, *Polypodium ensifolium*.—*E. Kruyff*. *Senecio Ghiesbreghtii*.

**ROOTING BRAMBLE: A. D. W.** It may not be common, but yet it is the way to propagate the plants artificially.

**SCRUBBING BRUSHES: J. P.** Try Treloar & Co., Cocoa matting manufacturers, London.

**SHRUBS, &c., REMOVED: K. L.** If you planted the things you can remove them, or do what you like with them, during your tenancy, if all dues, such as rent, and value of repairs, owing to the landlord, are paid. But nothing may be removed of the nature of a fixture after the expiration of the tenancy without the permission of the landlord.

## SEEDS.

LONDON: Feb. 18.—A quiet feeling continues to characterize the trade for farm seeds. As regards values there is no important alteration to be noted. The supply of every description is more than equal to the demand, and, as a natural consequence, extreme cheapness still prevails all round. Spring Tares sell freely at the advanced rates previously noted. Canary and Hemp seed are still a very dragging trade. Some good white Mustard is now offering at very moderate figures. Feeding Linseed is steady. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

## CORN.

At Mark Lane on Monday Wheat sales were difficult to effect. For good dry samples, however, offers of lower rates were not entertained. Though the imports of foreign Wheat into London are very moderate, and, under ordinary circumstances, should be firmer, still the stagnation of the trade is such as to prevent any perceptible effect. The market for flour was checked. Peas were rather firmer, and tended against buyers. Beans were quiet and unchanged. Oats were firm. The rates for Maize were steady. Barley was dull.—On Wednesday no revival of demand was noticeable for any kind of grain. Wheat and flour were more especially dull, and whilst prices were nominal from absence of business the tendencies were adverse. Barley, Beans, and Peas remained at late value. Oats were firm, but trade slow. Maize was quoted steady.—Average prices of corn for the week ending February 14.—Wheat, 32s. 10d.; Barley, 31s. 9d.; Oats, 20s. 11d. For the corresponding period last year:—Wheat, 37s. 3d.; Barley, 31s. 11d.; Oats, 19s. 10d.

## CONIFERS—CONIFERS.

**ABIES DOUGLASII**, 2-yr. seedling, 15s. per 1000; 2-yr. 1-yr. transplanted, 25s. per 1000; 12 to 18 inches, 8s. per 1000.

„ **GLAUCOA**, 2 to 3 feet, 12s. per dozen; 3 to 4 feet, 18s. per dozen.

The glauca variety is a grand ornamental tree, of dense compact habit, with different shades of colour.

„ **ENGELMANNI**, 6 to 9 inches, 4s. per dozen.

„ **MENZIESII**, 9 to 12 inches, 8s. per 100; 2 to 3 feet, 16s. per 100.

**SHARPE'S EARLY PARAGON PEA.**

THE EARLIEST  
WRINKLED MARROW.

SEALED PACKETS.

One Pint 2s. 6d.; Half-pint 1s. 6d. each.

SEALED PACKETS.

THE EARLIEST  
WRINKLED MARROW.

First-class Certificate Royal Horticultural Society, 1884.

PARAGON shows in many respects a great improvement upon any variety at present in the trade. It is a Blue Wrinkled Marrow of fine flavour; height from 3 to 4 feet. The pods are produced two and three together in such abundance as to almost conceal the foliage. They are of an unusual size, broad and thick backed, containing from twelve to fourteen immense Peas packed in a double row as shown in the illustration.

Paragon is the earliest of the large Wrinkled Marrows, being ready before Pizetaker. It is very bardy, and will stand earlier sowing than any Pea of its class. It is most valuable for succession crops as it is not liable to mildew, and a constant supply of Peas for four months can be obtained from this one variety.

TRADE PRICE PER BUSHEL ON APPLICATION.

**CHARLES SHARPE & CO., SEED MERCHANTS, SLEAFORD.**

*Price 1s. stitched.*

**HOW TO GROW ASPARAGUS.**

A POPULAR EXPLANATION OF THE BEST METHOD OF CULTURE.

By WILLIAM EARLEY.

**THE PINETUM BRITANNICUM** : a Descriptive Account of Hardy Coniferous Trees cultivated in Great Britain. Illustrated with Facsimiles of the original Water-colour Drawings, made expressly for the work, Maps, Photographs, and 643 Engravings on Wood. The work is complete in fifty-two parts, making three large folio volumes. Price, in parts, 25 guineas. As only 100 have been printed in excess of those originally subscribed for, orders should be sent without delay. The work may also be obtained in various styles of binding, at prices ranging from 18s. extra per volume. Subscribers who require back parts to complete their copies are requested to make application without delay, as very few odd parts remain on hand, and perfect sets cannot be broken.

Also Makers of all other kinds of Boilers for Heating.

**HOT-WATER PIPES AND FITTINGS**  
of every description for Heating Apparatus.  
**THE LARGEST STOCK IN THE KINGDOM.**

HIGH and LOW PRESSURE and HOT-AIR HEATING APPARATUS ERECTED and GUARANTEED.

**FRED. SILVESTER,** Castle Hill Foundry, Newcastle, Staffordshire.

**THE LOUGHBOROUGH GREENHOUSE**  
**HOT-WATER APPARATUS.**

Price, as engraving, with Boiler, open feed syphon, 12 ft. of 4-inch hot-water pipe, and patent joints, complete, £4 4s. Delivered free to any Station. Discount for Cash.

This is the simplest, cheapest, and most powerful apparatus made. It requires no brick setting, no stovehole, and no hot-water fitter for fixing. The Boiler stands in the Greenhouse, the front only being outside and flush with the outer wall, so that the whole of the heat from the boiler itself is utilised. It burns over 12 hours without attention, at a nominal cost. "Loughborough" Boilers to heat up to 650 ft. of 4-in. pipe, with hot-water pipe, joints, &c., always in stock.

**COST OF APPARATUS FOR HOUSES OF ANY SIZE ON APPLICATION.**

The measurement of Greenhouse being given, every apparatus is delivered with pipes cut and fitted ready for fixing.

Illustrated LIST with full particulars, post-free.

NOTE.—All genuine Boilers have "The Loughborough Boiler" cast on.

4-in. Expansion Joint Hot-water Pipes, 9 feet long, 4s. 3d. each  
4-in. Socket Hot-water Pipes, 9 feet long, 4s. 6d. each.  
Price List on application.

**IMPROVED VINE ROD FASTENER.**  
PATENT.

Vine Rods are now attached to the wire, or lowered to be pruned, in a few moments. The fastener is always ready, and being made of strong material will last several years. Many experienced Vine growers have already adopted it, and expressed their entire approval of the result. Box containing 6 dozen, price 5s.

Sold by R. H. AND J. PEARSON, 141 and 143, High Street, Notting Hill, W.; and J. W. DART, St. Aubin's, Jersey.

**JOHN CORBETT, HOT-WATER ENGINEER,**  
CORPORATION ROAD, CARLISLE,  
Inventor and Sole Manufacturer of the  
**RIGMADEN WROUGHT-IRON WATERWAY FIRE-BAR BOILERS.**

The best and most economical Boilers ever introduced. An additional heating power of fully one-third is obtained by the use of these Wrought-iron Waterway Bars. Churches, Schools, and all Horticultural Buildings Heated on the most approved principles by Hot Water. PLANS AND ESTIMATES FREE.

Oil Paint no Longer Necessary.

**HILL AND SMITH'S BLACK VARNISH,**  
for Preserving Ironwork, Wood, or Stone.  
(Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used to the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.

"Pierrefield Park, June 21, 1876.—Sirs,—I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chepstow.—I am, Sirs, yours respectfully, Wm. Cox."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large illustrated CATALOGUE of Fencing Hurdles, Field and Entrance Gates, &c. sent free on application to  
HILL AND SMITH, Brierley Hill Ironworks, Staffordshire; 118, Queen Victoria Street, London, E.C.; and 196, St. Vincent Street, Glasgow.

**WANTED**, an energetic and trustworthy man as **FOREMAN** in the Houses. Wages, 18s. and Bothy.—Apply by letter only to **FOREMAN**, Mr. Pickering, Bookseller, High Ousegate, York.

**WANTED**, a good **PROPAGATOR**, who can undertake the Propagation of Roses, Rhododendrons, Clematis, Coniferæ, and Soft-wooded Plants.—Apply, with reference, to **HALSTEAD AND SHAND**, Nurserymen and Seedsmen, Lancaster.

**WANTED**, **IMMEDIATELY**, a **NURSERY PROPAGATOR** and **GROWER**. Must be competent, steady, and obliging.—**FREDERICK FOREMAN**, Eskbank Nursery, Dalkeith, N.B.

**WANTED**, a steady young **JOURNEYMAN**, who understands Cucumber, Grape, and Tomato Growing.—R. PIPER, Jun., Ladydell Nurseries, Worthing.

**WANTED**, a married **MAN**.—Must be used to General Greenhouse Work.—T. W. DASHWOOD, Queen's Road Nursery, Peckham, S.E.

**WANTED**, a thoroughly competent **SECOND HAND**, for the Gardens. Must be a total abstainer.—Apply, personally, to Mr. GREEN, Bishopwood House, Hampstead Lane, Highgate, N.

## Wanted.

**H. CANNELL AND SONS** are now **RE-QUIRING** a good, practical, and energetic young **MAN** as **Second in the Hardy Plant Department**.—Apply, first instance, in own handwriting, Swanley, Kent.

**WANTED**, **AT ONCE**, a middle-aged **MAN**, to work (with help) an Outdoor Branch Nursery. Must have had good experience.—**WALSHAW AND SON**, Scarborough.

**WANTED**, a Gentleman to take the entire **CHARGE** of the **COUNTING-HOUSE** of a leading Nursery establishment, with a view to **PARTNERSHIP** or **PURCHASE**. Must be able to invest in the business a considerable amount of cash.  
Apply to **MESSRS. PROTHEROE AND MORRIS**, 67 and 68, Cheapside, E.C.

**WANTED**, an **ASSISTANT** with a good knowledge of Seeds, Plants, and Flowers. Must be a good Salesman. State salary required with references, or copy of character. To a good man it would prove a good and permanent situation.—**POPE AND SONS**, Central Avenue, Market Hall, Birmingham.

## Seed Trade.

**WANTED**, a young **MAN**, about 20, as Assistant for Shop in Manchester. State wages, &c. Also **FOREMAN** for Packing Department, an energetic man with a good general knowledge, able to check orders and manage a number of men. State wages, &c.—**W. CLIBRAN AND SON**, Oldfield Nursery, Altrincham.

**WANTED**, a strong active **GARDEN LABOURER** or **OUTSIDE MAN** who can do all kinds of Kitchen Garden work. Wages 15s. per week, with lodgings and vegetables.—Mr. TURNER, Mostyn Hall Gardens, Mostyn, Flintshire.

**WANTED**, a steady, honest, industrious **MAN**, as experienced **COWMAN**, his wife to do the Dairy and Poultry. The place will be made comfortable to suitable persons. For particulars apply to H. HEPBURN, Estate Badiff, Scarisbrick Hall, Ormskirk.

## WANT PLACES.

**B. S. WILLIAMS** begs to intimate that he has at present in the Nursery and upon his Register some excellent Men, competent either to fill the situation of **HEAD GARDENER**, **BAILIFF**, **FOREMAN**, or **JOURNEYMAN**. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Holloway, N.

**SCOTCH GARDENERS**.—**JOHN DOWDIE**, Seedsman, 144, Princes Street, Edinburgh, has at present on his list a number of **SCOTCH GARDENERS**, waiting re-engagements, at wages ranging from £50 to £100 per annum, and he will be pleased to supply full particulars to any Nobleman or Gentleman requiring a trustworthy and competent Gardener.

**RICHARD SMITH AND CO.** beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

## Journeyman and Foreman, Scotch.

**JOHN DOWDIE, SEEDSMAN**, 144, Princes Street, Edinburgh, has at present on his Books a number of first-rate Young Men who wish to go to England.—Particulars on application.

**TO LANDED PROPRIETORS, &c.**—**A. MCINTYRE** (late of Victoria Park) is now at liberty to undertake Formation and Planting of New Garden and Park Grounds, and Remodelling existing Gardens. Plans prepared. 115, Listria Park, Stamford Hill, N.

**GARDENER (HEAD)**.—Age 37, married; has thorough practical knowledge of the Cultivation of all kinds of Fruit, Flowers (including Orchids), and Vegetables. Good reference.—G., 51, Lansdowne Road, Croydon.

**GARDENER (HEAD)**; age 33, married.—£5 Bonus will be given to any one who will be the means of securing the Advertiser a situation as above. Sixteen years' practical experience in all branches. Five years' good character from last place.—L. W. P., Copleston Road, Peckham, S.E.

**GARDENER (HEAD)**; age 28.—**J. BAYLISS**, Foreman to Earl Sydney, requires a situation as above in a good establishment. Thirteen years' practical experience in all branches. Can be thoroughly recommended.—The Gardens, Fognal, Fooks Cray, Kent.

**GARDENER (HEAD)**, to any Lady or Gentleman.—**MR. HENDERSON**, Gardener to J. Deacon, Esq., Mableton Park, Tonbridge, can with confidence recommend his Foreman (Wm. Couzens), who has had good practical experience in all branches of the profession. Total abstainer.

**GARDENER (HEAD)**.—**NIEL SINCLAIR**, Gardener to the Marchioness of Downshire, Easthamstead Park, Wokingham, Berks, can with confidence recommend his Foreman (H. Howell) to any Lady or Gentleman requiring the services of a thorough practical man in all branches of the profession. Total abstainer.

**GARDENER (HEAD)**.—**JAMES CYPHER** can with every confidence recommend an exceptionally good man as above. Thoroughly understands Vines, Peaches, Pines, Early and Late Forcing, Orchids, Stove and Greenhouse Plants, Table Decorations, &c.—Apply, stating full particulars, to F. CHARLES, James Cypher & Son, Exotic Nursery, Cheltenham.

**GARDENER (HEAD)**.—Age 30; thoroughly practical in all branches of the profession. Can manage Land and Stock if required. First-class testimonials.—A. B., 9, High Street, Sevenoaks.

**GARDENER (HEAD)**; age 30.—**MR. F. THOMSON**, Gardener, Norman Court, Dean, Salisbury, will be pleased to recommend his Foreman, Wm. Sheehan, to any Lady or Gentleman requiring the services of a good practical Gardener. Two years in present situation. Good recommendations from former employers.

**GARDENER (HEAD)**; age 30.—**MR. W. FOX**, Head Gardener to His Grace the Duke of Devonshire, Holker Hall, Cark-in-Cartmel, Carnforth, can with confidence recommend his General Foreman, C. Martin, to any Lady or Gentleman as a competent, trustworthy man. Three years in present situation. Good references to previous employers.

**GARDENER (HEAD)**; age 32, married, two children.—**WILLIAM MAYBURY**, for the last four years' Head Gardener to G. A. Fuller, Esq., The Rookery, Dorking, will be pleased to engage with any Lady or Gentleman requiring a practical man. Eighteen years experience in Plant and Fruit Growing, Table Decorations, &c., in leading Noblemen's and Gentlemen's places. Highly recommended. No small place accepted.

**GARDENER (HEAD)**.—Age 30, married, one child (five years). A thoroughly practical, sober, and industrious Scotchman is desirous of re-engaging as above. A situation required where at least three are kept, and where orderliness and good gardening would be appreciated. Good wages expected. Highest references and testimonials as to character and abilities; copies can be sent.—P. KNIGHT, The Oaks, Epsom.

**GARDENER (HEAD)**, where three or four are kept, or **FOREMAN** in a Gentleman's establishment.—Age 28; understands Vines, Cucumbers, Melons, Stove and Greenhouse Plants, Pines, and General Routine of Gardening. Good characters from situations.—**W. GREASLEY**, The Gardens, Nostell Priory, Wakefield.

**GARDENER (HEAD)**, or **GARDENER** and **BAILIFF**.—Age 32, married; character and experience, which will bear the strictest inquiry, from the Rt. Hon. Sir W. B. Brett.—**W. KENDALL**, Heath Farm, Watford, Herts.

## To Noblemen and Gentlemen.

**HOUSE CARPENTER, in Gentleman's mansion.**—Age 28, married; good Mechanic; town and country experience. Good references. — A. F., 66, Crowndale Road, Oakley Square, N.W.

## GRATEFUL-COMFORTING. EPPS'S COCOA. BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." *Civil Service Gazette.*

Made simply with boiling water or milk. Sold only in Packets, labelled thus—  
**JAMES EPPS & CO., Homœopathic Chemists, London.**

**Cure of an Old and Distressing Cough by DR. LOCOCK'S PULMONIC WAFERS.**  
—From Mr. SOARS, *Loughborough*.—"It gives me great pleasure to bear testimony as to the efficiency of Dr. Locock's Wafers. A gentleman troubled for a long time with a constitutional cough tried one box of the Wafers, and was entirely cured by them." Dr. Locock's Wafers give instant relief and a rapid cure to Asthma, Consumption, Coughs, Bronchitis, Colds, all disorders of the Breath and Lungs, and taste pleasantly. Price 1s. 1/2d. per box.

**HOLLOWAY'S PILLS. — NERVOUS DEBILITY.**—No part of the human machine requires more watching than the nervous system—upon it hangs health and life itself. These Pills are the best regulators and strengtheners of the nerves, and the safest general purifiers. Nausea, headache, giddiness, numbness, and mental apathy yield to them. They dispatch in a summary manner those distressing dyspeptic symptoms, stomachic pains, fulness at the pit of the stomach, abdominal distension, and overcome both capricious appetites and confined bowels—the commonly accompanying signs of defective or deranged nervous power. Holloway's Pills are particularly recommended to persons of studious and sedentary habits, who gradually sink into a nervous and debilitated state, unless some such restorative be occasionally taken.

Mr. JOHN EWING, Curator, at the Gardens.

**THE GARDENERS' ROYAL**  
BENEVOLENT INSTITUTION.  
A SPECIAL GENERAL MEETING of the Subscribers to this Institution will be held on FRIDAY, March 13 next, at the BEDFORD HOTEL, COVENT GARDEN, London, to consider a recommendation from the Committee as to certain modifications of the Rules of the Institution, but more particularly to obtain the sanction of the Subscribers to "ALTERING RULE No. 8, so as to INCREASE the PENSIONS of the Society by £4 per annum each." The Chair will be taken at 5 o'clock precisely. By order,  
EDWARD ROGER CUTLER, Secretary,  
14, Tavistock Row, Covent Garden, W.C., Feb. 18, 1885.

**CINERARIA PIP SHOW.**—We simply insert the following to show even when our individual flowers are put in competition how they distance others:—  
Mr. S. GREEN, 275, Barkend Road, Bradford, Feb. 23, 1885.  
"I am glad to inform you that the Cineraria blooms not only gained the first prize, but were a mile in advance of all others; in fact, they caused quite a sensation, and were the talk of the show."  
H. CANNELL and SONS, The Home of Flowers, Swanley, Kent.

**CEDRUS DEODARA.**—To arrive in a few days, guaranteed perfectly fresh seed. Price according to quantity, application to  
HY. CLARKE and SONS, Wholesale Seed Merchants, 39, King Street, Covent Garden, W.C.

On view morning of Sale, and Catalogues had.

**Wednesday Next and Following Days.—Warminster.**

In Bankruptcy.—Re James Wheeler, Nurseryman.

HIGHLY IMPORTANT TO THE TRADE AND OTHERS extensively engaged in Planting.

GREAT CLEARANCE SALE of about 40 ACRES of NURSERY STOCK.

**MESSRS. PROTHEROE AND MORRIS** (in conjunction with Messrs. Harding & Sons) will SELL BY AUCTION on the Premises, the several Nurseries at or near Warminster, Wilts, on WEDNESDAY NEXT, March 4, and four following days, at 12 o'clock precisely each day, without reserve, by order of the Trustee, with concurrence of the Mortgagees, the whole of the valuable NURSERY STOCK, extending over 40 Acres, including an enormous number of Trees of young growth, and an extraordinary stock of large Conifers, Evergreen and Deciduous Shrubs, invaluable to the Trade, Noblemen, Gentlemen, and others largely engaged in planting. The Stock is too extensive to mention in an Advertisement, but the following may be noted:—40,000 Laurels of sorts, 4000 Yews, 5000 Green Hollies, 10,000 Rhododendrons, 50,000 Larch, 35,000 Ornamental and Forest Trees, 7000 Privet, 14,000 Firs, 20,000 Hazel, 15,000 Thorns, 8000 Fruit Trees, &c.

May now be viewed. Catalogues had on the Premises; of Messrs. PROTHEROE and MORRIS, Auctioneers, 67 and 68, Cheapside, London, E.C.; Messrs. HARDING and SONS, Auctioneers, Frome; Messrs. WAKEMAN and BLECH, Solicitors, Warminster; Messrs. SPARKES and POPE, Solicitors, Exeter; Mr. W. H. PHILLIPS, Accountant, 1, Small Street, Bristol; and of Messrs. CHILTON and GREEN-ARMYtage, Solicitors, Bristol.

## Friday Next.—Very Valuable Importations.

**MESSRS. PROTHEROE AND MORRIS** are instructed by Mr. F. Sander to SELL BY AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on FRIDAY NEXT, March 6, at half-past 12 o'clock precisely, very large and fine importations of ORCHIDS from Mexico, consisting of the rare and valuable Odontoglossum Inseleyi leopardinum and splendens; large masses of Oncidium tigrinum (and Odontoglossum nebulosum); also a specially fine large-bulbed Odontoglossum, from Mexico, Cervantesii. Mormodes luxatum cernuum, Odontoglossum Philatopsis, Cypripedium Schlimii, Odontoglossum Pescatorei, Cattleya choconensis, white Lælia anceps, Peristeria, a great lot of Odontoglossum citrosomum album and roseum, and many other ORCHIDS; also a grand specimen with twelve flower-spikes of Lælia elegans Russelliana or species, the finest plant of elegans in existence.

On view morning of Sale, and Catalogues had.

## Tuesday, March 10.

LÆLIA ANCEPS SCHROEDERIANA, new pure white LÆLIA ANCEPS.

**MESSRS. PROTHEROE AND MORRIS** are favoured with instructions from Mr. F. Sander to SELL BY AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on TUESDAY, March 10, at half-past 12 o'clock precisely, a small but especially fine importation of LÆLIA ANCEPS SCHROEDERIANA, Rehb. f., several great masses being amongst them.

This is undoubtedly the finest white variety ever offered. The whole flower is very large and pure white, and entirely distinct from any of the white forms; the throat striped crimson, and the lip extra broad and square, and an inch across or even more. Mr. Edward Klaboch, who has collected every plant in flower, states that this variety is particularly rare and that the flowers are of great substance, far surpassing anything he has seen. He considers it the finest white Lælia anceps ever introduced. Every plant received will be included in this Sale, and there are no more coming. Lælia anceps Schroederiana is described by Prof. Reichenbach as follows:—

"There are before me twenty-seven brilliant dried lips, and a dried flower. The colours are purest white, the disc between lateral lacinie is orange, and the projecting keels running in the base of mid-lacinia are even deeper orange; there are three to five crimson-purple longitudinal, and several forked lines radiating outwards. So much for the colour. The complete flower would appear to surpass the dimensions of Lælia anceps Dawsonii. The petals seen are remarkably broad. The great merit of the plant consists in the lip, which is broad, with short nearly rectangular blunt side-lacinia. The mid-lacinia is very broad, blunt, emarginate, and this lip is quite novel to me." "The result of the description would be that the value of this remarkable white flower is admirably enhanced by the beauty of the great square and flat lip. This very ornamental Orchid bears fully the name of one of our most excellent orchidists, Baron Schröder, and it gives me great pleasure to attach the Baron's name to such a glorious Lælia."

It is one of the most recent and most brilliant introductions of Mr. F. Sander.

On view morning of Sale, and Catalogues had.

## Chelmsford, Essex.

HIGHLY IMPORTANT SALE of valuable Specimen STOVE and GREENHOUSE PLANTS, &c., by order of Mr. Thomas Harris (that well-known Plant Grower), who is giving up exhibiting.

**MR. BURLEY** will SELL BY PUBLIC AUCTION, and without reserve, on the Premises, Baddow Road, Chelmsford (about fifteen minutes' walk from the Chelmsford Railway Station, Great Eastern Railway), on THURSDAY, March 5, at 12 half-past 12 o'clock precisely, the whole of the valuable COLLECTION of STOVE and GREENHOUSE PLANTS, including grand specimens which have been exhibited at all the principal shows in the Eastern Counties with marked success. The whole of them are in the best possible health, and ready for exhibiting this season. Among these will be found native examples of Anthurium Scherzerianum (the best variety) with over 300 leaves, Dracæna Cooperii and D. amabilis, Maranta zebrina and M. Veitchii, Aralia elegantissima, 5 feet by 3 feet 6 inches; Allamanda Hendersonii and A. grandiflora, 4 feet 6 inches by 3 feet; Croton majesticus, 5 feet 6 inches by 5 feet; C. Andréanus, 6 feet by 4 feet; C. undulatus, 4 feet by 3 feet 6 inches; C. Queen Victoria, 3 feet by 3 feet; fine specimens of Bougainvillea glabra, 4 feet 6 inches by 4 feet; Stephanotis, Elvaston Castle variety, 4 feet 6 inches by 4 feet; Areca Verschaffeltii and A. Whitei, 7 feet by 6 feet; Chamaecyparis humilis, 5 feet by 5 feet; Aphelandra purpurea, Dracophyllum gracile, Phoradendron prolixa, 3 feet 6 inches by 6 inches by 3 feet 6 inches; Statice profusa, 3 feet by 4 feet; S. brassifolia, Tremandra verticillata, 4 feet 6 inches by 4 feet 6 inches; Rhynchospermum jasmoides, 4 feet 6 inches by 4 feet; Cycas revoluta, 5 feet by 6 feet; Yucca variegata, 5 feet 6 inches; Kalosanthus coccinea, 3 feet by 3 feet; grand specimen Erica, and choice Davallias and other Ferns, large well-shaped Fuchsias, a quantity of fine specimen white Camellias and Roses, best exhibition kinds, and many other fine specimens too numerous to mention. Also a large well-made EXHIBITION PLANT VAN, on Springs and Patent Axle.

On view the day prior and morning of Sale. Catalogues may be had on the Premises; of Mr. THOS. HARRIS, as above; and of the Auctioneer and Valuer, High Street, Brentwood, Essex.

The First Portion of the Valuable Collection of Specimen STOVE and GREENHOUSE PLANTS, the property of

STEVENS** has received instructions to SELL BY AUCTION, on the Premises, as above, without the least reserve, on MONDAY and TUESDAY, March 16 and 17, at half-past 12 o'clock precisely each day, the COLLECTION of STOVE and GREENHOUSE PLANTS formed by E. J. Coleman, Esq., comprising fine Standard, Half-Standard, and Pyramid Azaleas, Camellias, Orange Trees, Eucharis, Crotons, Dracænas, Greenhouse Rhododendrons, &c.; also the ORCHIDS, including many specimen plants of Dendrobium nobile, Cattleyas, Lælias, Odontoglossums, Phalaenopsis, Cælogyones, and other species; a quantity of Callas, Fuchsias, Primulas, Pelargoniums, Bouvardias, Strawberry Plants, &c.

On view Saturday prior and mornings of Sale, and Catalogues had on the Premises, or Mr. J. C. STEVENS, 38, King Street, Covent Garden, W.C.

## Heaton Park, Lancashire.

IMPORTANT SALE of RARE and CHOICE ORCHIDS, PALMS, TREE FERNS, and VALUABLE STOVE and GREENHOUSE PLANTS, GARDEN IMPLEMENTS, TOOLS, and OUTSIDE EFFECTS.

**MESSRS. ARTINGSTALL and HIND** beg to notify that they are favoured with instructions from the Executors of the late Earl of Wilton, to SELL BY AUCTION, in the Gardens of Heaton Hall, near Manchester, on MONDAY and TUESDAY, March 2 and 3, commencing at 12 o'clock each morning, the whole of the choice HORTICULTURAL PRODUCTIONS, IMPLEMENTS, TOOLS, and MISCELLANEOUS EFFECTS.

May be inspected on the Saturday prior to Sale. Descriptive Catalogue will be prepared, and may be obtained on application to Mr. BAILLIE, Head Gardener; or from the Auctioneers, 45, Princess Street, Manchester.

To Nurserymen, Florists, Gardeners, and Others. FLORIST'S BUSINESS.

**FOR SALE**, by Private Treaty, as a going concern, all that well known and remunerative FREEHOLD BUSINESS PREMISES, called Guildford Street Nurseries, within two minutes' walk of the Barton Railway Station, Hereford, the property of Uriah Hain, Florist, who is relinquishing business on account of declining years. The Property comprises a modern and substantially brick-built Residence, called Blenheim House, with several Perches of Freehold Garden Ground, a number of Span-roof and Lean-to Glass Houses, with Hot-water and other Heating Apparatus, Hot and Cold Pits, and Potting Sheds; together with the Stock-in-Trade, consisting of a well-grown and healthy lot of Bedding, miscellaneous assortment of useful Greenhouse and Hardy Outdoor Plants, in popular demand; small collection of useful Nursery Stock, Horticultural Requisites, Tools, and absolute Goodwill. A splendid opportunity for an enterprising young man or gentleman's gardener with small capital desirous of retiring from service. One-half or so of purchase money can remain on mortgage, if required. For further particulars, apply to GEO. H. BARLOW, Estate and Property Agent, Hereford.

## Seedsman, Florists, &amp;c.

**TO BE DISPOSED OF**, the oldest established SEED BUSINESS in Coventry, centrally situated. Apply to WEST and DOWNES, 45, Cross Cheaping, Coventry.

**FOR SALE**, by Private Contract, the STOCK and GOODWILL of a NURSERYMAN and LANDSCAPE GARDENER, which has been carried on successfully for the past 35 years by the late Mr. Cowdrey and his Father, the late Barton Road and St. James' Nurseries, Edgbaston. The Nurseries, which are well stocked, are situated in the most fashionable suburb of Birmingham, and command a large and good trade. Price exceedingly low. For full particulars and Cards to View apply to FLEETWOOD and GOODEVE, Auctioneers, 42, Cherry Street, Birmingham.

**THE PARKS, & C., COMMITTEE** of the METROPOLITAN BOARD OF WORKS meet at the Office of the Board, Spring Gardens, S.W., on WEDNESDAY, the 11th day of March, 1885, at 12 o'clock at noon precisely, and will then be prepared to OPEN TENDERS by persons who may be willing to CONTRACT for the CONSTRUCTION and ERECTION of a PLANT-HOUSE and OTHER WORKS in connection therewith in Southwark Park, Bermondsey. Persons desirous to submit Tenders may inspect the Drawings and Specification, and obtain Form of Tender and other particulars, on application to the Architect of the Board, at the Office, Spring Gardens, between the hours of 9 A.M. and 4 P.M. (or on Saturdays, between the hours of 9 A.M. and 2 P.M.), until Tuesday, the 10th day of March, 1885. The Tenders, which must be on the form supplied from this Office, and be addressed to the Clerk of the Board, are to be delivered at the Office before 4 o'clock on the last-mentioned day, and no Tender will be received after that hour. Any Tender which is not fully filled up in every particular will be rejected.

The Committee do not bind themselves to accept the lowest or any Tender.

J. E. WAKEFIELD, Clerk of the Board,  
Spring Gardens, S.W., February 25, 1885.

E. J. JARMAN,

The People's Seedsman,

CHARD, SOMERSETSHIRE.

## For Present Sowing.

The earliest in cultivation, dwarf and compact in habit, head firm and pure white, and well protected by the foliage. It stands dry weather better than any other variety.

Mr. GILBERT says it turned out the best of all he grew last season.

Mr. E. STEPHENSON, Thorganby Hall, says:—"Your 'President' Cauliflower is not only the earliest but the most useful I have ever grown; we can plant it 3 or 4 inches closer than any other variety. The heads are very white and compact. I have grown it ever since it came out: I recommend it to all my friends."

Post-free on receipt of postal order or stamps for 1s. 6d.

WILLIAM E. MARTIN, Seed Merchant, Hull.

## CUTBUSH'S MILL- TRACK MUSHROOM

SPAWN.—Too well known to require description. Price 6s. per bushel (12 extra per bushel for package), or 6d. per cake; free by Parcels Post, 1s.

None genuine unless in sealed packages and printed cultural directions enclosed, with our signature attached.

WM. CUTBUSH AND SON  
(Limited), Nurserymen and Seed  
Merchants, Highgate Nurseries, N.

- " PLUMOSA AUREA, 3 to 5 feet.

Knap Hill Nursery, Woking Station, Surrey.

TUESDAY, March 10.

# LÆLIA ANCEPS SCHRÖDERIANA.

## NEW PURE WHITE LÆLIA ANCEPS.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions from Mr. F. Sander, to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on TUESDAY, March 10, at half-past 12 o'clock precisely, a small but especially fine importation of LÆLIA ANCEPS SCHRÖDERIANA, Rchb. f., several great masses being among them.

This is undoubtedly the finest white variety ever offered. The whole flower is very large and pure white, and entirely distinct from any of the white forms; the throat is striped crimson, and the lip extra broad and square, and an inch across or even more. Mr. Edward Klaboch, who has collected every plant in flower, states that this variety is particularly rare, and that the flowers are of great substance, far surpassing anything he has seen. We consider it the finest white Lælia anceps ever introduced. Every plant received will be included in this Sale, and there are no more coming. Lælia anceps Schröderiana is described by Professor Reichenbach as follows:—

"There are before me twenty-seven brilliant dried lips and a dried flower. The colours are purest white, the disc between lateral laciniae is orange, and the projecting keels running in the base of mid-laciniae are even deeper orange; there are three to five crimson-purple longitudinal, and several forked lines radiating outwards. So much for the colour. The complete flower would appear to surpass the dimensions of Lælia anceps Dawsoni; the petals seen are remarkably broad. The great merit of the plant consists in the lip, which is broad, with short, nearly rectangular, blunt, side laciniae. The mid-lacinia is very broad, blunt, emarginate, and the lip is quite novel to me."

"The result of the description would be that the value of this remarkable white flower is admirably enhanced by the beauty of the great square and flat lip. This very ornamental Orchid bears fitly the name of one of our most excellent orchidists, Baron Schröder, and it gives me great pleasure to attach the Baron's name to such a glorious Lælia."

It is one of the most recent and most brilliant introductions of Mr. F. Sander.

*On view morning of Sale, and Catalogues had.*

# THE FRUIT OF THE FUTURE.

## NEW MAGNIFICENT BLACKBERRY, "THE WILSON JUNR."

In spite of the fact that Blackberries will grow "anywhere" in reason, and everybody likes them, it is yet a puzzling reality that it is only with great difficulty and at a high figure that we can purchase them in our markets.

Surely, then, it must be apparent to all farseeing "fruit growers" that instead of glutting the markets with Gooseberries, Currants, &c., they have here a fruit which, if planted upon any given area of land, will prove far more profitable than any other hardy fruit that could be grown. And why?

Simply because for half-a-dozen years ahead, at least, the stock throughout the country will not have time to become so great as to exceed the demand.

Landowners, Stewards, and Gardeners, who have each year to show a balance-sheet "of profits," have here a very simple, safe method of for some years obtaining highly profitable results. Planted 3 feet by 8 feet requires at the rate of 18½ plants to an acre.

Gardeners also who grow for house consumption will find this fruit a valuable assistant. It will stand any treatment, and do well where other fruits would fail.

Whilst, however, we have the matter under consideration, do not let us fall into the mistake of planting any variety so long as it is a "Blackberry." Why not, for the sake of a slightly additional first expense, obtain the very "cream" of the family; or in other words, procure stocks of the hardiest, largest, most delicious, and most productive?

By pursuing this procedure the result repays the grower tenfold for the slightly additional first expense incurred.

It was this reasoning that caused us to give the subject our most careful study; the result of which is, we offer a variety, the grandest of the group, producing enormous berries, measuring on an average ¾ inches around, lengthwise, and the same dimensions crosswise. (This will give an idea of the profit to be derived from its culture as a market commodity.) The berries are also glossy black, very early, of exquisite flavour, and enormously productive—the heavy load of fruit often bending the canes to the very ground.

We can offer strong plants at 1s. 3d. each, 12s. per dozen, 85s. per 100, carriage paid.

We can offer other varieties as follows:—"LAWTON," "KITTA-TINNY," "PARSLEY-LEAVED" (*Rubus fruticosus laciniatus*), WILSON'S EARLY," at 9d. each, 8s. 6d. per dozen, 63s. per 100.

## SEASON 1885.

Is now offered to the Public for the tenth year, and the Manufacturers have again much pleasure in stating that it is still increasing in popularity.

They are, however, sorry to find that it is still necessary to CAUTION the Public against, under any circumstances, accepting it, unless in their PACKETS or SEALED BAGS, as they will not be responsible for its genuineness under any other conditions.

Where no Agent resides in the neighbourhood they will forward a Sample Bag, carriage paid, on receipt of Cheque or Post-office Order.

Sold in Packets, ONE SHILLING each, and in

**ASPARAGUS**, grand Roots for Forcing, 2s. per dozen, 12s. 6d. per 100; strong, for planting, 2s. 6d. per 100. SEAKALE, forcing, 2s. 6d. per dozen, 16s. per 100; planting, 2s. per dozen, 12s. 6d. per 100. RICHARD SMITH AND CO., Nurserymen and Seed Merchants, Worcester.

## CHARLES SHARPE & CO.'S SPECIALTIES, 1884-5.

**SHARPE'S  
PEA.**

2s. 6d. per pkt.

**TRIUMPH.**

Finest Dwarf Blue Wrinkled Marrow. Best flavoured and heaviest cropper—sixty-nine pods, with nine to eleven Peas in each, gathered from one plant.

**SHARPE'S  
PEA.**

2s. 6d. per p'nt.

**PARAGON.**

Hardest and earliest large Wrinkled Marrow. Successive crops can be had for four months. First-class Certificate, R.H.S., 1884.

**SHARPE'S  
PEA.**

1s. per quart.

**PROLIFIC WHITE  
MARROW.**

An excellent, large-podded, prolific White Wrinkled Marrow.

**SHARPE'S  
PEA.**

1s. per quart.

**INVINCIBLE.**

Fine, long-podded, Blue Marrow. Peas deep green. A fine Market Garden Pea.

**SHARPE'S  
BEAN.**

1s. per pint.

**CONQUEROR.**

The longest-podded variety known. Pods often 16 to 18 inches long. Fine for Exhibition.

**SHARPE'S  
CUCUMBER**

2s. 6d. per pkt.

**EPICUREAN.**

The most prolific, earliest, deepest in colour, and finest in flavour of any variety grown. Fruit long and very handsome. It is simply perfection.

**SHARPE'S  
POTATO.**

8d. per pound.

**VICTOR.**

The earliest, quickest, and most productive kind for forcing or early planting—ready for table in from six to eight weeks.

**SHARPE'S  
POTATO.**

4s. per stone.

**DUKE OF ALBANY.**

Most valuable main crop variety—good to use from July to March.

**SHARPE'S  
TOMATO.**

1s. 6d. per pkt.

**POMEGRANATE.**

Fruit large, round, smooth, deep pink suffused with violet. Flesh solid, very deep in colour, and of the finest flavour.

**SHARPE'S  
New Tomato.**

2s. 6d. per pkt.

**ECLIPSE.**

A remarkably prolific variety. Fruit globular, smooth, growing in large clusters at every joint, exquisite flavour, colour bright cherry-red.

**SHARPE'S  
PARSLEY.**

6d. per packet.

**LINCOLN GREEN.**

The perfection of garnishing Parsley.

**SHARPE'S  
ONION.**

1s. per packet.

**PRIZE WHITE  
SPANISH.**

The best type of the Banbury section of Onions.

**SHARPE'S  
MELON.**

1s. per packet.

**RAUCEBY HALL.**

Finest flavoured green-flesh Melon in cultivation.

For full description see Advertisements in the Horticultural Papers; or,

## Gardeners' Chronicle.

SATURDAY, FEBRUARY 28, 1885.

### TEA-HOUSES.

NOT coffee-palaces, nor those abodes of virtue which Sherard Osborne thought he had found in Japan, but which he found out afterwards to be very much the other way; but houses in which Tea Roses are and may be grown, and which are rapidly increasing all over the country. They range from the tiny house of the suburban lover of Roses to the grand unequalled house of the Cranston Company at Hereford, the finest of its kind in the kingdom; and as glass is so cheap, and the return for all labour and care expended so full and generous, the wonder is that more persons do not "put up" glass-houses for them.

In advocating this I do not mean the forcing of Teas; I would, had I my choice (which, alas! I have not), prefer to have an unheated to a heated house, so as to bring the Roses on in the spring, and not in the winter, and to have them more like those which we can get out-of-doors in a favourable season. But why, it may be asked, advocate Teas alone, and not include other classes of Roses as well? There are many reasons for this. Owing to their greater substance and absence of bright colours they are able to bear better the glare of light to which they are exposed. I never see a hybrid perpetual growing in a house but what I think of a poor lark in a cage—how out-of-place it is, and how much happier it would be in the open. The Tea Rose is like the canary. You feel that it is quite in its place, that it does not care for the sweets of liberty, nay, that it rejoices in protection from the cold and wet which it would inevitably have to endure were it free; and although in some of the more favoured parts of our island Tea Roses may be safely trusted out-of-doors, yet in other parts they have but a miserable existence, something like the poor canary would have if it ever escaped from its cage. Then, again, their habit of constantly blooming is an immense advantage, for, cut them as you may, you may always reckon on a succession of flowers, while the delicacy of the colour entitles them to that care which a house can best offer them. It is true that a great deal which was formerly held to be truth concerning them has had to be abandoned. The supposed difficulty of growing has been considerably lessened, this having been greatly helped by the introduction of more robust varieties. There is a tendency when people write about Tea Roses to indulge in very "highfalutin" writing, and to go off in sentimental raptures over their beauties. I would like to avoid this, but one cannot help saying something as to their refined delicacy of tints, their pleasing perfume, and great substance. This latter is very remarkable, so much so that I have known a bloom of Souvenir d'Elise do duty at two shows some days apart, and there is no hybrid perpetual that will do this. This same property makes them so valuable as cut Roses for vases or stands. You put a fine bloom of Charles Lefebvre or Duke of Edinburgh into a vase, in a few hours it begins to

show symptoms of loss of colour, and by the evening it has become dull and slaty looking. A bloom of *Souvenir d'Elise* or *Catherine Mermet* will in the same time have not only not deteriorated but improved in size and appearance.

I have seen many of these unheated Tea Rose-houses—and there are a few things which, I think, ought to be observed by all who make or use such structures, whether they be large or small, because there are a few things to be provided against which often mar the success of indoor cultivation—the chief of these being mildew. It is painful to have the beautiful foliage of the Tea Rose destroyed as to both its appearance and vitality by this unsightliness, and although it is almost impossible entirely to guard against it, yet something may be done to prevent it—one of these is thoroughly ripened wood. I do not pretend to any scientific knowledge on the subject, but I do most strongly think that one of the best means to prevent it is to have thoroughly ripened wood, and for this reason I would advise all who may desire to build such houses to arrange so that the top lights may be removable, so as towards the end of summer, and before the autumn rains set in, to leave the house fully exposed, and to allow the wood a chance of being hardened and autumn growth checked. Another point is to secure good ventilation when the lights are all on. So much has been said and written on the subject of ventilation from a scientific point of view, that one is almost afraid to mention it, but one thing to be borne in mind is that ventilation does not mean a through draught: to the delicate foliage of many of the Teas this is injurious, and it should therefore be avoided. Again, there ought to be, as every one tells us, top ventilation; so that the heated air as it ascends may escape. I think this is especially needful for the prevention of mildew. There seems to be some connection between its appearance and great changes of temperature; when this can be avoided so much the better, and if in very sunny weather the house gets uncomfortably warm, and cold nights supervene, it would tend to this. I do not think that many people experience how cold a night may be after a bright sunny day, even in July or August. The coldest ride I ever recollect was some—ah, well! I will not say how many years ago. I was, as a boy, travelling up from Bristol to London outside the "Highflyer;" the day had been very hot indeed; and, as boys, we thought the nights would be equally warm, and so we had nothing extra but thin camelot cloaks (the fashion of those days) to put on. Ah! to write of it makes one feel cold. Heavy dews and thick mists covered the ground, and the cold was piercing. Now, I suppose that the sensitive leaves of the Tea Rose would feel such a change as much as our skins did; and so, while providing for the most thorough ventilation, take care to avoid exposing your plants to draughts.

I think that there can be no question as to the manner in which the plants should be treated: pots should be avoided, and they should all be planted out. The best arrangement that I have seen is one where there is a central bed, a walk round it, and borders round the house. In the central bed standards are used, and all growers know how well this class of Roses does on the standard Brier; half-standards may form the second row on each side, and dwarfs the outside row. These dwarfs should be on the seedling Brier—by far the most suitable stock for the Tea Rose. Dwarfs should be planted in the borders also, while here and there a strong growing Tea or Noisette should be planted to run up the rafters, giving a rich harvest of bloom and also a certain amount of shade, which is by no means an injury to the plants growing underneath. In the matter of soil and pruning there is little to be said, there being but little difference, if any, between what is suitable for outdoor cultivation and the house. It must be remembered that when it is sometimes said you require lighter soil for Teas than for other classes, that it is not the Rose but the stock which has to be thought of, and that as in most cases this is the Brier, and the Brier is a gross feeder, and delights in strong loamy soil, so whether it forms the stock for Teas or hybrid perennials, this suits it best. Watering is of course a matter to be well thought of, and where good supplies of rain-water are to be had, this is best for the plants. Frequent syringing is also needed to keep down attacks of red-spider and aphides, the former being an especial pest in

dry weather. When mildew does make its appearance, the dusting of the plant with sulphur is perhaps the best remedy, although some have professed to find Fir-tree oil as effectual, and not so unsightly. It is well, if large flowers are desired, to apply liquid manure occasionally—but let all avoid the house for a day or two after its application, for you do not get the "perfumes of Araby the blest" if you venture in. In the same way fumigating must be resorted to whenever green-fly makes its appearance; indeed, it is better, on the system that prevention is better than cure, to be beforehand, and to fumigate occasionally to prevent its appearance.

With regard to choice of sorts, I think that the following would be a good one:—Take for the rafters *Maréchal Niel*, *Belle Lyonnaise*, *Bouquet d'Or*; and if you want a charming Rose for a button-hole, *Allen K. Richardson*, a very strong grower, although giving a small flower, but for this purpose unapproachable, and from the manner in which I have seen ladies flutter round a stand when it has been shown, I am sure it would be always acceptable in a bouquet. *Celine Forestier* might also be added; then there are such lovely Roses as *Alba rosea*, the best of the creamy white Teas; *Aona Ollivier*, *Catherine Mermet*, *Caroline Kuster*, *Comtesse de Nadaillac*, *Devoniensis*, *Etoile de Lyon*, *Innocenta Pirola*, *Jean Ducher*, *Madame Charles*, *Madame Cusin*, *Madame Lambard*, a light red, very vigorous, and most varied in its colouring, becoming darker in autumn; *Madame Margottin*, *Madame Welche*, *Madame Villermoz*, *Marie van Houtte*, a most vigorous growing Rose and most lovely in colour, especially when the pale primrose petals are edged with pink; *Niphetos*, the most popular and best of all the white Teas, *Perle des Jardins*, a very beautiful dwarf yellow Rose; *Rubens*, *Souvenir d'Elise Vardon*, a most lovely Rose but not quite so vigorous in habit as might be desired; *Souvenir de Paul Néron*, and *Souvenir d'un Ami*. These I think are the *crème de la crème* of the Tea Roses, and a house planted with these would be a source of constant enjoyment. I have seen such houses, and while they may lack the brilliancy of colour which houses of other flowers may give, I am quite sure that for every true lover of what is chaste, refined, and beautiful in the demesne of Flora, there is nothing which would so well repay the loving care that would be bestowed upon it. *Wild Rose*.

## New Garden Plants.

CYPRIPEDIUM LEUCORRHODUM, n. hyb. art.

A fine fresh English Orchid, raised at the Royal Exotic Nursery of Messrs. Veitch & Sons. The seed-bearing plant was *Cypripedium Roelzii*, the pollen parent *C. Schlumii* album. Its leaves are very broad and firm. The strong peduncle at hand has short, stiff hairs. Bracts triangular, acute, convolute, not equalling the dark purple ovary, that has exceedingly short scarce hairs. The flower is nearly that of *Cypripedium Roelzii* in shape, the tail-like petals being of medium length. Their ground colour is pure white. Petals beautifully margined with purple, and with very stiff purple hairs at the base inside. The upper sepal has some purple wash while the conchoid connate sepal ("inferior") is pure white. Lip with purple sac, the projecting square edges at the base of the sides deep purple outside, while the remaining part of the involved lateral laciniae is sulphur-coloured. There are brown spots inside at the bottom of the lip. Stamens irregularly square, being broader in front with numerous black-purple hairs on each side. The plant would appear to have good *avenir*. *H. G. Rehb. f.*

MASDEVALLIA WALLISII STUPENDA, n. var.

I FEEL persuaded this is the grandest *Masdevallia* sight I ever enjoyed. It is not so much for the length of the tails, but for the immense development of the triangles of the sepals, that the plant rivals most probably anything seen in Europe, not excepting the grand *Masdevallia Winniana*. Looking to the average flowers of *Wallisii*, our neophyte may claim to beat them by 2½ to 2½ inches. The tails are fine chocolate-coloured on the outside of the sepals, the same colour is seen at the apex of the triangular parts, mostly on the upper sepal. The ground colour is a light sulphur, and the internal disc around the internal

organs is orange. At each side of the petals stands a small cushion-like white place covered with numerous small scarlet spots. Some large chocolate-coloured spots are spread over the triangles on both sides, and the inside shows a splendid *richesse* in hairs; petals and lips normal. When looking over my collection I found the same thing kindly given me by Mr. Shuttleworth, who may have been the lucky discoverer of this phenomenal creature. I have to thank for the flower Sir Trevor Lawrence, Bart., M.P., P.R.H.S., who sent it to me on December 18 last. Having asked as to the peduncle, I got a highly interesting answer, coincident with observations of mine made in other genera (e.g., *Cœlogyne*). I hope Sir Trevor will favour our readers with those observations. *H. G. Rehb. f.*

CYPRIPEDIUM CARDINALE, Rehb. f.

A very fine branched peduncle with several flowers and buds is at hand, proving once more how many discrepancies arise amidst those mules. The petals stand at a right angle, and are not deflexed, and the purple of the lip is much darker than it was in the original flower of September, 1883. *H. G. Rehb. f.*

## THE VICTORIA REGIA.

A SHORT time since we were enabled, through the courtesy of Abraham Dixon, Esq., to give an illustration (fig. 6, p. 19) of the finely grown specimen of *Victoria regia* in his stove aquarium at Cherkley Court. In that illustration the great sustaining power of the leaf was exemplified by the fact, that on one leaf a young lady was seen comfortably seated in a chair placed on the leaf, while on the other, a young lad in sailor's costume appropriately illustrated the powers of floatation. The distribution of the weight over the immense surface of the leaf affords an obvious explanation of its supporting power. The view of the under-surface of the leaf which we now give (fig. 51), shows the arrangement of the ribs of the leaf radiating from the top of the leaf-stalk and connected by smaller transverse ribs, which thus form a series of separate pockets or compartments, adding enormously to the strength and powers of resistance of the leaf and suggestive to the engineer of methods of obtaining great strength and amount of surface with relatively small outlay of material.

## AN INVITATION TO JAVA.

THE study of vegetable anatomy and of the physiology of tropical plants cannot be carried out on an extensive or satisfactory scale at home, where the specimens are few, and grown under glass. In order to thoroughly investigate the growth and progress of these plants, it is necessary to have abundance of material at hand in all stages of growth. This want is to be supplied by the spirited enterprise of Dr. Treub, the Director of the famous Botanic Garden of Buitenzorg, Java. Dr. Treub invites European botanists to spend a few months in Buitenzorg, where literary and every other facility is afforded for their investigations.

Dr. Treub has, with the consent of the Dutch Government, established a physiological laboratory. The usual reagents, small bottles necessities for work, are placed at the disposal of the botanists. Alcohol, bottles, and herbarium-paper, which the visitor may wish to use for his collections, will be furnished at the expense of the visitor. Dr. Treub will assist the investigations by procuring materials for investigation, and by furnishing any information desired.

The botanic garden proper, founded in 1817 by Professor Reinwardt, consists of 91½ acres, and contains more than 9000 species; each species is represented by two plants. The directorate consists of a director and a sub-director; the garden work is carried on by a head gardener and an assistant gardener and by several native workmen.

The agricultural garden is 6 miles from Buitenzorg. This garden contains 172 acres, and was founded in 1876. Another botanic garden is situated on the slopes of the volcano of Gede, at an elevation of about 4500 feet.

The botanical museum, in the centre of Buitenzorg, near the garden, contains the herbarium and a collection of vegetable productions preserved dry and in alcohol. The same building contains the library and the garden offices. A small place in the museum ground is reserved for drawing and photography.

Buitenzorg is situated in one of the most beautiful parts of Western Java, and about 36 miles from Batavia, at the base of a great mountain, Salak.

There is an idea that people visiting the tropics are necessarily subject to serious maladies, but this is erroneous, especially with regard to Java. The chances of illness are less than those entailed during a winter in Europe. Dr. Treub does not pretend that a stranger

very frequent, for a continual drought, as in the east of Java, is unknown in Buitenzorg. The temperature is not so high as represented; the maximum at mid-day is between 28° and 29° Cent. (83° to 85° Fahr.) in the shade. In the dry season the thermometer reaches 31° Cent. (88° Fahr.) The evenings, nights, and mornings are fresh, temperature varying between 22° and 25° Cent. (72° to 77° Fahr.) The cost of

## ORCHIDS FOR AMATEURS.

(Continued from p. 176.)

**WATERING THE PLANTS.**—The greatest difficulty with the novice is the watering of his plants, and even the most experienced growers are often doubtful when water should be given and when it should be withheld. Too liberal a supply is

FIG. 51.—UNDER-SURFACE OF LEAF OF VICTORIA REGIA. (SEE P. 270.)

going to dwell there for four or five months cannot fall ill, but he asserts that the chances of taking a serious illness are not greater than if he stayed at home or travelled in Europe during the winter.

The best time for a botanist to visit Buitenzorg is from October to April. It is the wet season, and the heavy and frequent rains are sometimes troublesome, but it is the coolest and the healthiest season, and the one in which vegetation is most luxuriant. Moreover, even in the rainy season, it seldom rains before mid-day, and as for the so-called dry season rain is

living in Buitenzorg would not exceed 450 francs per month (£18). This includes hotel and excursion expenses, but if it is intended to travel in the interior of Java the expenses will be increased considerably. But there is no need to go far from Buitenzorg to get a good idea of tropical vegetation. Six months would be long enough to spend in the Garden of Buitenzorg, and it should not cost more than 5000 francs (£200). Dr. Treub suggests that scientific societies and like associations should assist the botanists of their countries to pass a few months in Buitenzorg.

often fatal to their welfare and too little water produces starved growths and gives rise to disease; some plants only flourish with abundant supplies, and others resent the slightest excess. When the plants are growing rapidly, if they are well drained and have plenty of air it is hardly possible to give too much water, but great care must always be taken lest water should lodge in the young shoots or about the stems or bulbs close to the compost. The compost should always be allowed to get dry before a second watering. Nothing is so deleterious as giving a little

water at a time and repeating the watering frequently. The surface of the compost is always kept wet and the deeper portion dry by this means, the bulbs and young shoots are destroyed, and the ends of the roots (which are the absorbent organs), remain dry.

As a rule dipping the pots, when it can be done, up to the rim, and afterwards syringing the sphagnum on the surface with a fine rose, is the best treatment. In summer the pots need dipping twice or three times a week, or even oftener if they become dry, but this only applies to plants which are growing. *Masdevallias* and *Odontoglossums* need more water than *Cattleyas* and *Lælias*; *Cypripediums* also need liberal supplies. Dendrobies in the growing season must not be allowed to suffer for want of water. *Oncidium*s must not get dry, but no plants are more liable to lose their young shoots if these are wetted.

Syringing the leaves of *Orchids* needs great judgment, but I am certain no plants will succeed unless the leaves are frequently wetted. It is usual with many growers to syringe the plants just before closing the house for the night, and I believe there can be no greater mistake. Syringe them in the early morning and no harm will occur, unless the ventilation of the house is neglected in the day.

#### ATTACKS OF BACTERIA.

One of the most dreaded diseases in *Orchids* is "spot." A small speck of decay appears on a leaf and rapidly spreads. This condition is often attributed to over-watering, but I am very doubtful about this. The decay is due to the development of a vegetable parasite (bacterium), and unless the decayed part is at once cut out the disease spreads to the whole plant. It generally occurs in very warm close weather, and I am sure want of ventilation is the cause of its prevalence.

Plants draw up moisture by the roots and give it off from the leaves. Water is taken in by the healthy roots of an *Orchid* very rapidly. Last autumn a plant of mine of *Dendrobium Wardianum* was forgotten; its bulbs were found hanging over the rim of the pot, limp and flaccid. I thought it was quite done for; however, I dipped the pot to the rim, and then put it back into its place. Two hours later I went into the house, and to my surprise the plant was looking as well as ever; I could scarcely believe my own eyes.

#### EVAPORATION.

With such power of imbibing water by the roots it is evident that *Orchids* must give off water very rapidly by the leaves and the surfaces of the bulbs, which appear to act as leaves. The water taken from the soil contains ammonia and salts in solution, and these are needed for the nourishment of the plants, the water is given off, and the salts and ammonia are elaborated by the plant; if the air is saturated with moisture the plants are starved and soon die. A moist atmosphere is necessary, but it should never be so saturated that the plants cannot dry, or healthy circulation of fluid from the roots to the leaves and of sap from the leaves to the roots is stopped, and I believe that such stagnation favours the development of bacterium. The leaves often absorb instead of giving off water, but this occurs when the roots are inactive or dry.

A *Cattleya Leopoldi* of mine made a bulb 30 inches long in six weeks last summer with three huge fleshy leaves. To do this it must have taken in many gallons of water, otherwise it could not have obtained the needful supply of salts and ammonia, the whole of this water must have evaporated from the leaves, and no sooner was the bulb finished than it threw up a spike of twenty fine flowers. Such a result could never have been obtained without evaporation, and to ensure this a plentiful supply of air is necessary. Water without a free circulation of air is death to the plants in summer.

When a plant is flowering it needs far less water than when growing, and when it rests only enough water must be given to keep the bulbs from shrivelling. After resting most *Orchids* start making roots; during this they need a little water, but not too much or the root-growth will be checked—merely a slightly moist compost, and the water should be supplied from below by dipping the pot. Nothing is more likely to destroy the young roots than keeping their soft pith-like surface wet. *Conerva* grows upon them: they turn green and perish.

#### SYRINGING.

In winter syringing is quite out of the question, so it is with all *Orchids* which have no healthy roots; the

leaves must then be sponged frequently, or the plants inverted and their leaves dipped into water and allowed to drain well before they are again placed upright. I have established *Cattleyas*, *Lælias*, and *Oncidium*s in this way which would certainly have died under any other treatment.

Rain-water must be used, and it must be as warm as the air in the house, and it should be even 5° or 10° warmer except in very hot weather. There is a great prejudice against watering plants in the sun, but I never find any harm accrue from this if the water is warm; although cold water would be very deleterious. The leaves should not be syringed in the hot sun, as drops of water act as burning lenses and destroy the leaves, and the rapid evaporation tends to cool the plants and check their development. The evaporation from the leaves of *Orchids* is very rapid, and that is why they need a damp atmosphere, as they lose water too rapidly in a dry one. But again they cannot stand a saturated atmosphere.

Plants with thick fleshy leaves require less frequent waterings than those with thin paper-like leaves; the latter especially suffer from drought, and as the leaves are too delicate to sponge, such plants must be dipped or syringed; those which are leafless, as *Vanda teres* and *Hooker* require perhaps less water to the roots than any, but need frequent syringing, and as there are no cups to collect water, no injury can occur. The flowers of all *Orchids* are at once destroyed by water, and must on no account be wetted, but the unopened buds are not injured; indeed, they are generally improved by being wetted. For two years I have always dipped *Oncidium fuscum* into the tank, immersing the flowering-buds two or three times a week, and they have been greatly benefited by the process. All the American *Orchids* have their flower-buds plentifully watered in a state of Nature, and open their magnificent blossoms as soon as the sun dispels the clouds. I believe many flowers are greatly damaged by the drying of the flower-buds. Those of *Cattleyas* and *Lælias* are protected by sheaths from the rains until they pierce them, and it is then that they seem to suffer from drought in our hothouses. Moth *Orchids* especially should have their leaves wetted every day, and in summer mine often have water lying upon them half the day. B. T. L.

(To be continued.)

### LATHYRUS SILVESTRIS.

As a decorative garden plant this will never rival the widely-grown *L. latifolius*, popularly known as the Everlasting Pea. The flowers, as well as the leaves, are smaller than those of the latter, but in other respects it is no mean competitor for a reasonable share of the cultivator's attention; and, considered in the light of a British plant, it acquires more interest for, and a stronger claim upon, every lover of our native wildings. It varies considerably in a state of Nature, both with regard to the breadth of the leaves and the colour of the flowers. Broad leaved forms occur, by which the plant has been mistaken for *L. latifolius*, thereby causing some of the older botanists to assume that the latter, if not indigenous, was at least naturalised, from the frequency of its occurrence. A more important variation, however, is seen in the colour of the flowers. A figure of the plant in Smith's *English Botany*, t. 1004, may represent the type with washy-green or greenish-yellow flowers, suffused and veined with purple, but it gives a very poor idea of the attractiveness displayed in some wild varieties. On the North Downs, in the neighbourhood of Bletchingly, spreading about in the wildest luxuriance over the rubble of a chalk pit, is a form with a bright rose-coloured standard and purple wings. In summer, when in full flower, it forms a veritable wild garden, the attractiveness of which, and its enjoyable character, is greatly augmented by the undulating and ever-changing aspect of the ground, together with such choice natives as *Clematis vitalba* and *Echium vulgare*.

Now, in addition to the growing of this species in the ordinary mixed collection of herbaceous plants, advantage might be taken of its habit in clothing rocky or stony places, whereby a new and desirable feature could be introduced in many an uninteresting corner or wayside on the private demesne. Once established, no further trouble with it is necessary, as it is able to compete with most kinds of vegetation, and the long climbing stems may be allowed to ramble over the ground, or cling to whatever support comes in the way. A. F.

### FROM A BUCKINGHAMSHIRE GARDEN.

FEBRUARY 1.—"Gloomy winter's now awa!" Suddenly, without any warning as it were, winter is away. There's a new sound in the air, "a new face at the door." And the sound is the rooks' consultation in the tops of the great Elms (they always arrange matters on a Sunday); while in the garden, the air seems full of the voice of birds. Through the budding branches and the thickness of the winter greens is woven a network of melody, where a thousand little finches twitter, and blackbirds and thrushes just lightly touch their long silent notes. And there's a vision of the sweetest face in all the world—the first pale glimpse of spring with her Snowdrop crown. It was but yesterday the Snowdrops had scarce begun to show in silvery points above the earth—to-day the slender stalks have risen 2 inches high! There are pure white double Primroses and a few coloured, in every part of the garden, where so late as yesterday there seemed to be none. Even the yellow of a Winter Aconite, or the azure of Squills, begin to show here and there. I do not know if the sap does actually rise at the touch of spring, but there has come a fresher green in the broad blue green Iris leaves, and the ends of the long Rose sprays are flushed with emerald, and a warmer green glows through the prickly Junipers. This first awakening comes rather later than usual. Though the season has been so mild, it was unusually dark, and in my garden diary for December I find fifteen days marked "very dark." In January there were indeed days when we beheld the sun, but it has been mostly a reign of darkness, and earth's stars, which are the flowers, are few.

These Snowdrops! year after year they come again to test our appreciation of form and simplicity, and every year their triumph is assured. I challenge you to show me the grandest bell-flower born of tropic suns that can compare in its attributes of perfect grace with our English Snowdrop. I mean the large old single Snowdrop.—I will have nothing to do with the double, as a Snowdrop. The Snowdrop is in itself a lesson of form and colour—from the straight, long oval of the tube, out of which spring three sweet oval lobes, to the delicate pencilling in Nature's loveliest green of the threefold inner cup. And you will observe there is no over-luxuriant fulness, all is severely, tenderly restrained, as are the lines of a Greek statue. And then the colour! it is pure as fresh-fallen snow upon an alpine peak. The hanging of the bell, too, is a wonder of firm lightness; so light that with a breath it swings, so strong it will upheave the snow-drift. One lovely detail must not be forgotten: it is the folding inwards of the lobes along each outer edge, giving a peculiar grace which hard lines here could never have. But an attempt to describe the Snowdrop must fail; I know of no words simple enough, nor any language rich enough to give its perfect beauty. Dear innocent of home! There are exiles under skies of eastern drouth whose brave hearts faint with longing if they do but for a moment dwell upon the thought of your cold loveliness.

February 14.—The happy birds are keeping St. Valentine's Day, and I have found an Echo! There is ever a weird charm in the mysterious presence which makes such arbitrary choice of some special spot, building or rock, and lives there for ever silent and unknown until awoken by chance, and then is so warily on the watch, ever ready to start up and mock the passer-by with a hollow imitation of his voice or foot-step. Doubtless there is some scientific explanation, but it does really seem that Echo is a capricious being, and will come and go much as she pleases; else why is it that, after haunting a place for years, she will sometimes disappear one day without rhyme or reason, and never come back? I have not thought of it for many a year; but at this moment I remember like yesterday a lovely Echo, or group of echoes, somewhere in Switzerland; I think it was on the Grindelwald, within view of the Great Scheideck. A man played a little tune on an immense shepherd's horn. The travellers listened, and after a pause Echo gave back the air note for note with clear and sweet precision; and then from hill to hill her hermit sisters took up the music over and over again till the sounds became small and far, dying away in a fairy-like *diminuendo*. That is how memory recalls to me the beautiful Fairy of the Scheideck Pass. But our new-comer dwells somewhere near the end of a brick wall

partly covered with Ivy. She, too, is a fairy, but of coarser mould, and she can only repeat once. I was startled by the sudden mockery early one morning as I called my dog, and I can solemnly affirm that this Echo has only just arrived and settled in the wall, for close by it is an almost daily occurrence to turn and call the dog in before shutting the garden gate, and we have never before heard her voice. Echoes are rare here on the flat. We had one in a gable of the house, but she went away or was lost when the Vew hedges were planted. In some counties they say the bulls in the fields are made savage by hearing their own cries re-echoing from the woods and hills around.

We have had busy days of late trimming the creepers all round the house. Long prunings of Honeysuckles and Jasmine with leafy splendours of Magnolia, lay in lavish waste upon the gravel, and the air was full of the curious pungency of Ivy leaves. Pruning days are my delight, when the Laurel and Box are trimmed, and the aroma of them scents the whole place, and clipped sprigs fall and are spread about, strewing the ground as if for some garden triumph. Once last spring (it was on May 12) I thought to try a little pruning on my own account, and severed a long healthy branch of Vine which when in leaf would smother a young Pomegranate growing on the south wall. I shall never forget what followed the rash act. The Vine began to bleed; pure crystal sap welled up, and drop after drop fell fast; it flowed and flowed and poured from the wound, and never ceased till seven days and nights were past. In the first dismay at seeing this wine of life pour forth I tried to staunch it by binding a handkerchief tightly round. But that availed nothing; the cambric was drenched in a moment, while down the stem the stream ran on as the poor Vine wasted her blood upon the earth. I felt it was murder, and the Vine seemed to me like some hapless human creature bleeding to death! Through the day I returned again and again, and guiltily crept to the place at night, when the moon was shining—and still the wound bled, and the stem of the Vine grew black with moisture, and the wood Strawberry leaves underneath were full of big drops. At last, one happy morning the tree was dry. I believe it is only in spring that a Vine will behave like this—and no harm was done! But for me henceforth the Vine may go unpruned for evermore. The amateur knife does, however, still work usefully on young Limes and such-like, keeping their stems smooth and free from buddings out of leaves and twigs, and the gardener is lenient with my amusements in this line.

In the Wilderness (so we name a rather wild unkept grassy place outside the gates of old Italian ironwork that enclose a broad opening between Vew hedges) we have planted climbing Roses, and Clematis Jackmanni and montana at the foot of some useless Apple and Plum trees. Many old Roses are at their best only when thus grown wild, as it were, without the least restraint. Only in this way do they attain their fulness of grace and beauty. And by this kind of growth only can one imagine the sleeping Titania, quite over-canopied with Musk Roses. A white Noisette left to itself to grow up the stem of our Stone Pine has grown so immensely in the few years since it was planted as to take complete possession of the tree; climbing in the richest luxuriance up to the top, and thence hanging down in long rosy wreaths of exquisite lightness. Yet, although in its season of flowering none would deny this Rose's loveliness, we have hardened our hearts, and have been cutting away the half of it, so as to entirely free the foliage of the Pine. There is many a handsome tree we could easier spare from the garden than that old Stone Pine. The interests belonging to it are endless. There are the great green cones that reign secure in the widespread umbrella top, and the brown ones that come down with a thump on the grass when the wind blows a gale, and that are good to fill the empty grates in summer and to smell of Italy in winter; and the titmice and wrens and robins and all manner of small birds that lodge in its branches, whose ways are so pleasant and past finding out; and the curiosity that is never satisfied as to the enormous white fleshy grubs we sometimes see them dig out of holes and crannies in the bark, and carry off in their beaks. And the long double Pine needles which drop and lie flat all day where they fell, and bristle upright in the turf next morning after the worms have been pulling them under all night. All these and

countless small matters besides make up a little world of interest in our great Pine. The seeds are collected yearly, and they always grow when sown, and thrive up to a certain age; yet we have not been able to rear any young trees.

In the Bocage there are now two living proofs of the mild weather we have had. The unconscious obstinacy of one of them sometimes makes me smile: it is a Tritoma. December came too soon, and caught the central flower-stalk with its usual pyramid of buds still incomplete. The plant remained in the same position quite unconcerned, and has managed ever since to keep life in the buds, holding itself doggedly upright, and in perfect health, with a sheaf of fresh green leaves about it, and actually to surround itself with a family of shorter flower-stalks, and after sometimes looking pale in snow-time or frost, the whole group takes heart again vigorously. With a little sunshine we should see it in nearly as fine bloom as in September! Near the grass walk, glowing in bright pink against the grey of a shadowy Elm-tree background, there has been for three weeks or more a large round half-opened Rose: it blooms at the end of a long summer Rose-shoot. In the wintry winds it has swung to and fro undismayed. Once or twice I have seen it crested with frost. The white crystals fell away and left it bright as ever when warmer days brought to it a new warmth of colour. Now it begins to flag; the pink petals have gradually hardened, and some of the green leaves are withered; but yet the half-opened Rose endures bravely, and sometimes shines like a rosy star. The Violet leaves, in sheltered places under the walls, are just beginning to be strewn with amethysts; and the double lilac Marie Louise Violets, which we turned out in the borders, have borne flowers as large and fragrant as those in the frames all through the winter. I wonder where is the old dark purple double Violet of former days! If the old gardening books may be believed, it is quite easy to double the single purple wild Violet.

### PROTECTING THE BLOSSOMS OF FRUIT TREES ON WALLS.

THE season will soon be upon us when the wall trees will demand the anxious care of the gardener, who is often at his wits' end to save the delicate blossoms from the injurious effects of spring frosts. These are almost sure to come, but there is uncertainty as to the precise time they are coming. Last year, for instance, the weather was very favourable up to the time the Apricot blossoms were set, and the fruit had begun to swell. In some places after that time the crop was destroyed by the frost. All other kinds of blossoms open at that time were also killed, and Apple trees, that usually flower the latest, had their blossoms cut off in some localities. I was much interested in observing the value of a very slight shelter, as a screen from frosty winds in a well known garden. In one part were some tall old standard Apple trees open on all sides to the weather, in another part was a large quarter of bush trees, the direction from which the winds blew being east and north, and on both sides was a moderately tall Privet hedge; it did not seem to afford much protection, but it was evidently sufficient: there were some 150 or 200 trees well furnished with fruits, while on the tall trees there were scarcely any. In reference to the protection or no protection of wall trees there always has been much difference of opinion, but it has been practised in one form or another from antique times; and at the beginning of the present century, when glass-houses were confined to the gardens of the nobility, gardeners were much more interested in saving the blossoms of their fruit trees. The oldest method is to cover the trees before the blossoms open with fronds of Ferns, Spruce, or branches of some other evergreen trees. These are fixed amongst the branches, but it is a dangerous practice, unless securely fixed, as high winds blow them about and do much injury. In country places a system of using hay or straw bands has been adopted, and with considerable success. This method was recommended in the *Transactions of the Horticultural Society* more than half a century ago, and later the system was

recommended in the *Horticultural Register*. The writer says, "Only two seasons' trial of this simple protection has convinced me, together with some of my neighbours, that it is as effectual as the netting commonly used for the purpose. The system is this:—Before any of the blossoms open, poles are placed against the wall, about 2 feet from its base; the thick end of the pole is fixed in the ground, the small end being fixed under the coping at the top: the poles should be 5 or 6 feet apart. Well twisted hay or straw bands should be stretched across the poles from one end to the other. Some persons recommend nailing them on to the poles at 10 inches apart; others leave a space of 18 inches. The bands may be secured to the poles by nailing, or they may be fastened by taking a turn round each pole." I have never tried this system, but it is one that can be tried in any country place at no expense except the labour. The saving of even a few pounds for shading is of some importance to a great number of gardeners. The bands should be taken off about the second week in May. Every alternate band should be removed first; three days after the remainder may be removed; if they are stored away in a dry state they will last three seasons. Personally I have not been convinced that there is any better protecting material for wall trees than the old hexagon garden netting. It was expensive material, but lasted in good condition for many years with care. The meshes were small, but large enough to admit light and a circulation of air, at the same time. It is better not to have them down over the trees an hour longer than they are really required. They are fixed and used in the following manner:—On every well-constructed garden wall there ought to be a projecting stone coping; on the top of this should be fixed deal boards. A good arrangement is to have two 1½ inch deal boards fixed together with hinges. One board is fixed firmly to the coping, the loose one being made to project over the coping about 6 inches. They can be fixed in their places with buttons, either while they are in use, or folded back for the summer. Poles must be used as already described. The protecting material should be bound round with strong webbing, one side of it to be nailed to the tops of the poles under the coping, and half a yard of string fastened to each nail. The string is to tie the material when it is rolled up. When it is down for protection it has to be tightly strained, and nailed to each pole at the base. If this canvas screen or netting is used only when really needed it is an excellent protection from frost. I do not know of any better except glass. *J. Douglas.*

### FORESTS AND CLIMATE.

At a meeting of the Meteorological Society of Berlin, held on January 6, and reported in *Nature*, Professor Müttrich gave a short historical review of the arrangements in connection with forest meteorological stations in Prussia, seventeen of which were in operation. They were established on as uniform a system as possible over regions of very wide varieties of climate, on plains and at different levels above the sea, in districts having a more continental, and in districts having a more oceanic climate, and in leaf and Pine forests. In all these places, moreover, observations were made according to precisely the same regulations. Each station was twofold, having one equipment in the wood, another in the open field, both as a rule at the distance of 200 metres from the edge of the wood. The observations comprised the atmospheric pressure, the temperature of the air and of the ground, the wind, moisture, cloudiness, atmospheric precipitation, and the evaporation of an open mass of water. These observations were made twice a day—at 8 A.M. and 2 P.M. The observations thus obtained were collected at the station of Eberswalde, and published regularly in monthly and yearly reports.

As a result of his investigation, Professor Müttrich had arrived at certain definite conclusions respecting the influence of the forest on temperature, which may be stated as follows:—(1) The forest exercised a positive influence on the temperature of the air; (2) the daily variations of temperature were lessened by the forest, and in summer more than in winter; (3) the influence of the leafy forest was in summer greater than that of the Pine forest, while in winter the tempering influence of the Pine forest preponderated over that of the disfoliated forest. An attempt to determine the influence of the forest on the mean annual temperature led to no sure results.

### "LA PETITE CULTURE."

YOUR observant correspondent "A. D." has done well to draw attention to that portion of my remarks on this interesting topic, to use a politician's term "small holdings," or as "A. D." puts it "La petite culture." I am the more anxious not to be misunderstood at this particular time, owing to the fact that a great outcry has been raised by probably perfectly justifiable agitators, regarding the undue absorption of the land by a small number of landlords, and indeed, for the matter of that, of tenant holders. Though party politics have no place in a technical paper such as the *Gardeners' Chronicle*, nevertheless, in the face of the many superficial assertions advanced regarding this particular phase of the land question, it is time that the principles and real facts of the case were set forth and explained, on the basis of the realities of practice, rather than to let the heated theories of the public platform orators assume the form of truth.

I am pleased to see that I am not really at issue with your correspondent; on the contrary, when the apparent divergence is explained, it would appear that "A. D." has arrived at precisely the same opinion as myself. Herein lies the difference: "A. D." assumes "La petite culture" to mean hiring and working "six to ten acres" of land for market garden purposes; whilst I, on the contrary, assume "La petite culture" to be the possession of one, two, and it may be, three acres of land, and its application to precisely the same, or similar purposes. In the latter case I cannot perceive a germ of success, whether from the point of view of outlay on labour or in actual profit and benefit from a national point of view. Many may ask, "Why?" The answer is simple enough. The most economical labour is of paramount importance, both to the individual and to the nation. As is the saving of labour through the medium of machinery all-important in connection with dry goods manufacture, so also are all modern appliances indispensable in connection with the manufacture of vegetable crops; and beyond all it is necessary in connection with such implements, &c., that horse labour be employed.

Now my argument has all along been based on these simple facts, consequently I opine that my position is proved. As to the exact number of cultivated acres which will keep one horse and its driver in full work all the year round, that is difficult to estimate, so very much depending on the nearness or otherwise of a market for the produce the convenience of obtaining manure, &c.; for the farther removed any grower is from either by so much per cent. per mile is the grower handicapped. This is not devoid of compensation, however, as purer air, cheaper rent, and a decided reduction in the amount of taxes to be paid, fall on the profit side of the accounts. These latter do not, however, entirely compensate for the waste of power consequent on having to traverse many miles of road to secure a market.

To return to the important subject of spade v. plough labour. How can a grower using spade culture compete with the owner or tenant using horses, whose Potatoes sell at 50s. per ton, with the carting from 5 to 12 miles by road into market included, and less commission—with Spinach but a shilling a sieve (whilst it costs 3d. to gather) besides carting to market, wear of sieves, &c.? The same remarks apply to Broccoli, winter Greens, &c., to say nothing about the Pea and the Runner Bean crops, all of which are produced, as if by magic, by the 50 and 100 acres together, and the larger the field so much the greater the economy displayed—headlands, plough turnings, limited gatherings in kind, all being utilised so as to bring the proprietor quick returns on his outlay.

It may be said "Near a town a grower with 2 or 3 acres may cultivate things which pay better than those above named, such as Celery, Seakale, Asparagus, flowers, and the much-talked-of fruit crop. Certainly, but it would be extremely laborious even for an individual fitted out with all necessary knowledge. How about the results, then, with present rents, rates, and taxes? Whilst considering these matters it is desirable to remember that in any and every case where an individual hires land for this, or any purpose, he must possess capital: without it he cannot hope to succeed. There is always an outlay to be made, on going into possession, and an inevitable outlay to be continued constantly afterwards. The smaller the area the more limited the returns during the long winter months, and the more

must the holder draw on the money made in the summer.

I am constrained, therefore, to maintain the position I took up. Very small "holdings," such as I have described, will not benefit the country. Any man will be better in regular employment as the servant of another than in becoming tenant or proprietor of a too limited acreage, however industrious he may be. And the *petite* culturist of "A. D.'s" "4 to 10 acres" can only succeed by having such an account at his banker's as will meet adverse contingencies and constant outlay. But with this assured, and with energy and perseverance, he may succeed. *William Earley, Ilford.*

### DEFORMED FIR BRANCH.

IN a recent number of the *Bulletin* of the Botanical Society of France, M. Van Tieghem describes a malformation in the branches of *Pinus Pinaster* observed in the park at Segrez, the property of the late M. Lavallée. The young shoot

FIG. 52.—DEFORMED FIR BRANCH.

in spring divides in the middle by a longitudinal cleft which extends for a considerable distance and is closed at the top by the curving inwards and confluence of the two divisions of the shoot. The phenomenon occurs in various degrees: sometimes several such openings exist on one branch, but separated one from another by one or more years growth, or it may occur year after year, forming a series of links, like those of a chain. The two concave surfaces bounding the cleft are covered with resin. It is supposed that the original cause of the deformity is due to the puncture of some resin-eating insect. M. Van Tieghem gives some interesting details of the anatomical structure and of the way in which the wound is healed by the formation of new cells from the surface of all the tissues of the section, so that a rounded swelling is formed on each side of the cleft. This forms outside a layer of cork cells, while inside a generating layer is formed, which unites with its fellow of the opposite side, and so the aperture is eventually closed. M. Kny produced similar phenomena by dividing young shoots of various plants longitudinally by a thrust of the scalpel without injuring the bud at the end. The illustration we give (fig. 53, from a previous volume) shows a branch of Spruce Fir whose appearance, no doubt, is due to the same cause as that mentioned by M. Van Tieghem.

### KALAMAZOO CELERY.

MIDWAY between Detroit and Chicago lies the beautiful city of Kalamazoo, sometimes appropriately called Celeryville. Fifty tons of the esculent are "expressed" from Kalamazoo daily now during the height of the shipping season. Kalamazoo Celery is famed from ocean to ocean, and is the brand called for everywhere. Shipping begins about July, increasing till the holidays, then gradually decreasing until the crop is disposed of in the spring. More growers are annually holding their crop until the firmer markets of spring. Three thousand tons were shipped from this point alone during 1883, and the shipment for 1884 is estimated at 5000 tons. From 1500 to 2000 acres are devoted to the industry in this vicinity, and the production of a superior article has never exceeded the demand. Twenty thousand stalks are easily raised during the season on an acre, and the wholesale price ranges from 15 to 25 cents per dozen.

Marsh land has become the home of this luxury, and Hollanders are the main producers. Driving north from Kalamazoo through the country, one passes great 100-acre farms devoted to the sweet-scented Celery, reminding one of that Methodist hymn:—

"Sweet fields beyond . . .  
Stand dressed in living green,"

One would never forget a drive through the Celery gardens in any direction from Kalamazoo; the long rows keeping their bright green till November, as crop follows crop; and the fields being unmarred by fences or anything except the cozy cottages of the thrifty Hollanders. The irrepressible Yankee has, of course, bought large tracts and gone into its culture, but the mass of growers cultivate from 3 to 10 acres, raise the choicest article, and make the most money. Too much expensive hand-labour is required to justify going into the business on a large scale.

The Celery business is of more value to a town than can be shown by figures. The drainage necessary to Celery growing is worth everything to the health of towns. Celery can be raised on any marsh properly drained, and it is not necessary that the marsh lie along the mystic waters of the Kalamazoo. Yet it is a recognised fact that specialities hover together. Celery growers and shippers have here an association to protect their interests, and disseminate information useful to the industry.

Practical Celery growers can teach most men who write books on the subject their A B C's, and the jolly Dutchman could wake up in the night any time and laugh at some of the advice given.

Celery growing resembles farming wonderfully about one thing. The campaign opens about January 1, and, save an occasional holiday, it is "hurrah, boys," till about December 31.

Celery growers are beginning to raise their own seed, which heretofore has been a serious item of expense. There are about fifty principal varieties; most popular among them are the White Walnut and Crawford.

The objective points for perfect Celery are soundness, brittleness, and keeping qualities. The seed is sown in narrow rows in hotbeds, and this produces plants for the early crops. As soon as the weather will permit seed is sown outdoors in beds of about a square rod of plants for a square acre of land. Plants are set in May, or as soon as the size of the plants and the geniality of the climate will permit.

Some marshes may be ploughed with a team by using wooden shoes on the horses. These shoes are made of 2-inch Pine, cut round, and two curved pieces of iron, moving freely in the shoe and bolted together over the hoof. If this method is reckoned unsafe, a windlass may be placed on the upland across the centre of the marsh to be ploughed. A whiskey barrel makes a good windlass. A miniature marsh railroad is handy on land where horses cannot be safely driven, to carry manure, tools, plants, &c. It consists of a light car, and as much track as is required in sections of about one rod long each, and movable, so they can be laid to any part of the marsh.

Open ditches for draining are common, cutting the land into quarter acre sections; but if tile drain is used two rows of Celery can be raised in the space taken by the open ditch. The better marsh is drained the handsomer crops look in time of drouth, and the soil can be worked immediately after a rain.

Two and three crops are raised off this soil in one season. Table Onions are put in for the early market; early Celery is set in June and harvested the last of August; and winter Celery is set in September and secured in November. Each crop must be fertilised, as the soil is so porous the manurial properties wash down out of reach of plant roots. Celery is set 6 feet apart between the rows, and about a finger's length apart in the row. Table Onions, or some early crop, is raised between the rows, and harvested before the Celery is ready to hill. Hilling this Celery crop leaves a trench between the rows, along which manure is spread, and another row of Celery plants set, and by the time the first Celery crop is marketed the latter crop is grown, and needs the soil for hilling. If the season is favourable another row of plants is set in place of the first Celery crop harvested. Many growers have quite a trade in Celery plants, shipping the plants for setting far and wide.

The first and last crops are bleached with soil hilled closely to the leaves, but the intermediate crop is bleached with boards held closely to the roots by beat iron hooks. Boards bleach the Celery higher to the leaves and in quicker time.

Shippers have adopted a uniform box sawed into proper lengths for different orders, as twenty, fifty, or 100 dozens, the ends of the boxes being inch stuff, and the sides half-inch. Celery is trimmed, washed, and tied into bunches of a dozen stalks each. This work in summer is done in a shed built over a stream, in winter in Celery cellars.

These cellars are made by digging 2 feet below the surface, and boarding up 2 feet above; then, on a centre frame 6 feet high, 12 feet boards meet and slant to the ground with windows. The cellar is then banked and covered with manure. They are built 24 feet wide and 50, 100 or 200 feet long, according as they are required to hold 50,000, 100,000, or 200,000 dozen Celery. These are built on upland, as marsh is too damp and cold. When the Celery is first put into the cellar it is green, but bleaches in a few weeks. It is packed closely, standing boards every few feet to prevent heating. The object is to keep it growing. The roof-boards of these cellars are used in summer for bleaching the second crop.

Another method of storing and bleaching for winter is in trenches 2 feet deep and wide, packing as closely as the crop will stand.

A hilling plough has been invented, on which there is no patent. It resembles an ordinary shovel-plough, except that the sides of the steel plough are straighter, to which sides are attached steel wings hinged to the plough. On the top of each wing is fastened an iron rod meeting on the centre of the beam of the plough, by which the cut may be regulated to any desired width.

The first growers of Celery in this place never dreamed of using the meadow land, but sought for soft, warm, sandy loam. It was some eighteen years ago that a Hollander named Leendert de Brayn, a gardener, made the experiment. He owned a piece of hard land on South Burdeck Street, which ran down into the marsh. Owing to the drouth he could not successfully raise Celery, so he made the trial of the marsh land, draining it well to begin with. Success crowned his efforts, and a sure crop came with every season, no matter what the weather. So with Onions. Others watched him and followed his example. But beyond supplying the home demand there was no sale for the toothsome esculent.

In the early fall of 1878 Messrs. Buckhout Bros., grocers and shippers, were selling much of this plant at home, when one day one of the firm, in talking with an Omaha man, asked him if there would be a market for Celery. The reply was that small quantities were raised in Omaha, but it was high-priced and not very good. He estimated that Omaha would be a good market for Kalamazoo Celery, which was so superior, and gave the Buckhout Bros. the card of Payker & Co. Shipments were made in small quantities at first, and rapidly increased in size and frequency. Other points east and west were also supplied, and almost at once a trade grew up. John Seale, Ben Haften, Den Adel, Vandimeder, de Brayn, and others, furnished all that was called for. Express messengers on the various roads, seeing so much Celery going from this village, sharpened their trading proclivities, and sought markets where they could themselves make a commission, and thus the sale of the esculent was greatly spread. The Messrs.

Buckhout's success, which they took no pains to conceal, induced others here to take a hand, and Mr. J. W. Taylor, of the American Express Company, soon became a large shipper, and has ever since remained in the business.

So the business grew, each season doubling upon the sales of the former one, and ever as the demand increased the supply was equal to the call. Land which had hitherto been valued only for marsh hay or cow pastures, and a good deal not fit for that, was now eagerly sought for and brought undreamed of prices, till now there is not a piece of meadow land in the city or vicinity but has been drained and made into a garden spot, immensely enhanced in price.

The principal firms engaged in producing and shipping their own products here are Messrs. J. W. Wilson, Holtenhouse & Co., O. M. Allen & Son, Den Adel & Sons, Van Haffen & Sons, Loughborough & Allen, P. C. Davis, J. W. Taylor, and others.

The number of those now engaged in the Celery trade is estimated at 1500 to 2000, and is an immense bonanza to the express companies. On one train alone a carload is shipped daily, and sometimes two. The gathering of the Celery daily from the different shippers occupies much of the time of the express companies. A Correspondent, in the "Gardeners' Monthly and Horticulturist."

### CRYPTOSTYLIS LONGIFOLIA.

THIS most curious and pretty Australian terrestrial Orchid is admirably figured in Sir J. D. Hooker's

FIG. 53—CRYPTOSTYLIS LONGIFOLIA.

*Flora of Tasmania*, vol. ii., in which many fine things are so well depicted in colouring and every other detail. It is described as one of the three Australian Cryptostylis which appear to approach in their botanical characteristic near to the much larger Malayan and East Indian genus *Zosterostylis*, Bl. *C. longifolia* grows from 1 to 2 feet in height, the single lanceolate leaves on long stalks springing from the fleshy root-crown. Flowers, 3 to 8, rather distant, upwards of an inch broad. Sepals narrow, yellowish-green; petals shorter and the same colour as the sepals; lip pointing upwards, red, with reddish-brown markings. The most curious feature in the flower, and that which gained for the genus the name, is the manner in which the short column is hidden in the cucullate base of the lip. Our illustration (fig. 53) will serve to give a good idea of this interesting peculiarity. James O'Brien.

### A GARDEN VISIT.

A FEW weeks since, when visiting Clarendon Park Gardens, I found Mr. Chas. Warden, the gardener, busily engaged propagating stock for the current year. I there had a peep into a hothed in the frame ground, which contained seedlings of Tomatoes, Celery, &c., nearly ready for potting off and pricking out, as well as cuttings. Of the latter there was a good batch of perpetual flowering Carnations, which had been put in a few days prior to my visit in well-drained 6-inch pots, the latter having a 3-inch pot resting on the drainage in the centre of each, and the space between the two filled with suitable soil—three-parts of light loam and one of leaf-mould with

a surfacing of sand—in which one row of cuttings is inserted 1 inch apart all round, and the pots plunged to the rim, and covered with squares of glass supported by the labels attached to the individual varieties, so that the cuttings did not come in contact with it. The squares of glass thus placed, in addition to producing a more equable temperature about the cuttings, and preventing a too rapid evaporation taking place, preserves the cuttings from the condensed moisture dropping on them. The empty 3-inch pot in the centre of the 6-inch one results in the body of soil in the latter being kept warm, so that the cuttings strike quicker, and by taking out the 3-inch pot their rooting can easily be observed without disturbing either roots or soil, potting taking place as soon as they are well rooted, 3-inch pots being used for each plant. They are then put again into the frame, and watered through a rose to settle the soil about the roots, and afterwards shading from bright sunshine for a few days until the roots have taken to the soil, and the plants afforded more room at the roots as they require it.

The cutting-pots having been placed in proper position in the hothed, and the sashes drawn over them, I turned my eyes in another direction close by, and in reply to my query as to what the ridge contained, I was invited to come and see. The gardener proceeded to remove the long brown paper frame protectors, which protected the long and slightly fermenting stable litter, which to the depth of 9 or 12 inches covered the bed from rain. "See here!" said he, disclosing cluster after cluster of huge Mushrooms, 6 inches in diameter, and of first-rate quality. In addition to this excellent out-of-door Mushroom bed Mr. Warden is equally successful with flat beds, 12 to 15 inches deep, made on the flagged floor in a lean-to greenhouse, underneath a step-stage, completely hidden from view, being covered with hay and "brown paper shutters" to throw off the drip from the plants above, consisting of flowered Pelargoniums and perpetual flowering Carnations. Mr. Warden has read Wright's *Mushrooms for the Million* attentively, and, as results testify, profitably. Visitor.

### VEGETABLE CULTURE.

AT p. 115 Mr. Earley, in his article on Market Gardening, seems to overlook the fact that private gardeners and market gardeners respectively grow produce for quite a different purpose, and that the knowledge gained by experience in market gardens—at least, a considerable portion of it—would not be of much service to gardeners growing for private consumption. A continual daily supply of every kind of vegetable in season should be the aim of a private gardener. He does not require to grow large quantities of any one kind to come in all together; he has not to study the requirements of the market, but the wishes of his private employers, and of course he has to grow vegetables to suit their tastes, whether they are of a high commercial value or not, or whether the crop occupies the ground for a long or short period of time. Every gardener knows the difficulty which sometimes occurs in order to keep up a continual supply of some kinds of vegetables, and always endeavours to have his crops arriving at maturity in succession. The market gardener, on the other hand, requires his crops to turn in quickly, so that plenty of saleable produce is ready when the prices are most remunerative, and the quicker a given plot is cleared and replaced by a successional one the better. It is evident that the private grower cannot benefit much by following many of the market garden practices.

Part of Mr. Earley's article runs as follows:—"Far too general an old rule-of-thumb practice is adopted whereby certain limited quarters in private gardens are devoted year by year to their familiar thinly clad crops, consisting mainly of not more than two during the twelve months, much time being lost not only as regards space, but also in connection with a possible rapidity of succession." Well! these remarks in some instances apply to the letter, but this is not always through the inability of the gardener, who in private places has much to call for his attention besides vegetable growing. Often the ground has arrived at such a poor and hungry condition that it is unable to bring one crop to perfection, not to speak of two; or, perhaps, if the manure is at hand, other pressing work elsewhere in the garden prevents it being applied in time for the benefit of the following crop. The market gardener,

of course, has his drawbacks and many anxieties of which the private gardener knows but little; he has to consider what will most likely be in greatest demand, and meet with the readiest sale at a given time of year, and time his crops accordingly, the earliest and latest crops paying best.

Under the heading of "Plough and Spade," Mr. Earley writes:—"Why should the best vegetables result from plough culture?" The very best of land is generally selected for market gardening purposes, but this does not apply in many instances in private establishments, where the kitchen garden is often made in a certain position for convenience, and the natural fertility of the land is not always considered as it should be. Market garden land, although it has to support in many instances double the crops of land in private establishments, receives four times the manure, and of a composition worthy of the name, where many private gardens have had not much else besides rotten straw for years, quite devoid of the fertilising properties for promoting rank feeding crops. This extra application of manure to market garden plants makes up for the shallow plough cultivation, as the surface soil in a few years becomes very rich, and brings crops to maturity quickly. But I do not consider Carrots or Parsnips perfect such straight and clean roots on ploughed land as on trenched and well pulverised land, neither do Potatoes. I am not drawing any comparison between the weight of crops which could be grown under either culture. Many private gardens would produce but scanty crops indeed, if trenching in some form were not resorted to, as the want of good applications of genuine manure renders the surface soil poor, hence the necessity. As a rule, the stable manure is all that is allowed for the gardens: the best of this (the droppings) has to be extracted for Mushroom growing, making hotbeds, &c., and when it has served these purposes, as Mr. Earley truly remarks, its best fertilising properties have departed, and it is found wanting in nutriment to support the rapid and succulent growth of vegetables. Mr. Earley seems to have arrived at the conclusion that vegetables growing on well trenched land do not obtain a firm roothold, especially if the soil is broken up into small particles. I have not noted any practical results to support this theory, on the contrary, in soil thus prepared the roots penetrate very deep, and this surely means protection and strong support against wind-rocking. On land constantly under plough cultivation, especially on heavy soil, a pan soon forms immediately beneath the depth to which the plough penetrates, and the roots pass through it but little, and the plants are much more likely to be disturbed by high winds. Another advantage on ground not full of hard clods, is that rapid planting is facilitated with the dibber, and the soil more easily pressed into the holes made thereby, and the plants made secure. *S. W. R.*

## THE INFLUENCE OF DIRECT SUNLIGHT ON VEGETATION.

(Continued from p. 241.)

BUT, in the first place, the solar warmth of the after summer is necessary to ripen the fruits of the most important plants; for the Vine a September temperature of at least 59° is thought to be necessary (Grisebach, *Die Vegetation der Erde*, theil i., p. 126). Now, if we compare the means of this month of certain places in Southern England (Greenwich, 57°; Penzance, 57°; Chiswick, 57°; Isle of Wight, 58°) with others on the Continent (Liège, 61°; Mannheim, 62°), we see it is clear that the cloudy sky and rain, and not the mean temperature, are the causes of the Vine being cultivated without success in England.

The limit of corn cultivation ascends on the Continent generally farther to the north than on the shores—Fort Norman (N.W. Territories of Canada), 65°; Jakutsk, 62°.

The fact of its reaching 70° N. lat. in Norway (Alten), and the impossibility of agriculture in Greenland, even under 60°, and in Iceland (Reikiavik), notwithstanding the mean summer temperature of Alten and Reikiavik being about equal,\* can only be explained by the continual clear sky in summer at Alten, and by the powerful insolation here, which is not the case in Iceland. The continual wet climate and absence of sunlight make the grains rot on the stalks before they are ripe (Martins, *Essai sur la*

*Végétation de l'Archipel des Féroé*, pp. 388, 392). The period of vegetation at Alten is the same as that in Siberia (Jakutsk), though the mean summer temperature is 9° lower.

But a climate such as that of northern Norway, where the shores are free from ice even in mid-winter, caused by the north-east branch of the Gulf Stream, is nowhere to be found on the globe under such a high latitude. On the north-east shores of Asia corn cannot be cultivated even under 50° N. lat. The same latitude is its limit on the eastern shores of America; on the western it reaches about 57°. On the north-east shores of Asia the cause is the ice in the sea of Ochotsk, the wind in summer being mostly south-east or south,\* thus coming from the sea or along the shores, and causing much lower summer temperatures than in the interior,† and cloudy sky. On the north-east shores of North America the corn limit reaches 50° N. lat., the cause being here the ice in Hudson's Bay and along the shores of Labrador and Newfoundland.‡ But again, it is not alone the low mean temperature which causes the corn limit to descend so far southerly, but want of sunlight.§

In the vicinity of the arctic zone the influence of insolation is, in the first place, observed on the continent. At Turuchansk, lat. 65° 55', Gourds are cultivated, though of a small size (Middendorf, *Sibirische Reise*, band iv., theil i., p. 701). The mean temperature in 1881 was:—Of June, 48°; of July, 59°; and of August, 55°—the two last months being about equal in temperature to the means of Valentia in Ireland, lat. 51° 55' (July, 59°; August, 59°); but at Turuchansk there were, in June, seven days with the temperature, at 1 P.M., ranging between 68° and 73°; in July, fifteen days ranging between 68° and 82°; and in August, sixteen days ranging between 62° and 75°. Number of days completely clouded:—June, 6; July, 9; August 3. Snow did not occur till June 15, and was observed again on August 29 (*Annalen der Physikalischen Central Observatoriums*, St. Petersburg). In Norway the cultivation of Gourds (*Cucurbita Pepo*, L.) reaches 59° 55'.

In North America, at Cumberland House, lat. 53° 57', a sugar harvest is collected from *Negundo fraxinifolium*, Nutt. (*Acer Negundo*, L.), by means of cuttings in the trees, but the flow of the sap is greatly influenced by the action of the sun's rays, and is greatest after a smart night's frost (Richardson, *Search Expedition through Rupert's Land*, vol. ii., p. 236).

In summer the influence of the direct sunlight causes the tropical mid-day temperature so common in the interior of both continents in the temperate zone; but in America the days' differences are much greater than in Asia;|| even near the eastern shores (Montreal, Quebec, &c.) daily differences of 20° are of common occurrence in midsummer.

The Asiatic continent, reaching to the Arctic Sea, without interruption presents to the sun's rays a much greater surface than is the case with America, where the melting ice in Hudson's Bay and the Arctic archipelago consumes the greatest part of the solar warmth, being at the same time the cause of the sudden low temperatures occurring when the wind turns to the north or north-west.

Notwithstanding this, the European vegetables and corn are cultivated with success in the United States and the interior of Canada, but some of them cannot stand the sudden changes of temperature, as, for instance, the Vine, and also the Orange tree (*Citrus aurantium*, L., et var.); the general cultivation of the latter does not reach beyond 30° N. lat. (Florida).

(To be continued.)

\* On account of the barometric summer minimum over the Asiatic continent.

† Temperature of Ochotsk, lat. 59° 21':—June, 46°; July, 55°; August, 56°; September, 47°. Temperature of Nicolajefsk, lat. 53° 8':—June, 54°; July, 57°; August, 61°; September, 50°. See Schrenck, *Reise im Amur Lande*, bd. iv., p. 405.

‡ Mean temperature in 1876 at York factory, lat. 57°:—June, 49°; July, 57°; August, 55°. Mean temperature in 1880 at Moose Fort, Ontario, lat. 51° 16':—June, 55°; July, 59°; August, 55°; September, 52°. See Report of the Meteorological Service in Canada.

§ Percentage of sky clouded, Nikolajefsk on the Amur:—June, 58°; July, 59°; August, 63°. See Schrenck, *Reise im Amur Lande*, bd. iv., p. 476. Percentage of sky clouded in 1880 at Moose Fort:—June, 66°; July, 62°; August, 62°. Number of rainy days:—June, 15; July, 15; August, 20. See Report of the Meteorological Service in Canada.

|| Greatest difference at Winnipeg, lat. 49° 55', on July 2, 1881:—Maximum, 98°; minimum, 45°: difference 53°. At Poplar Heights, Manitoba, lat. 50° 5':—Maximum on May 20, 85°, minimum, 27°: difference, 58°. At Blagoweschtschensk, Siberia, lat. 50° 15', on May 25, 1881:—Maximum, 79°; minimum, 48°: difference, 31°. At Akmolinsk, lat. 52° 12', on May 25, maximum 68°; minimum, 50°: difference, 18°.

## THE DOUBLING OF SPANISH DAFFODILS.

IT is not generally known that these self-yellow or concolorous Daffodils can be doubled by cultivation in suitable soils, though this fact has for long been recognised by gardeners in the case of the common wild English Daffodil, or Lent Lily. Having lately obtained an introduction to a gentleman living in the North of Portugal, I asked him if he could obtain me some of the wild Daffodils of the country, and he replied that a small single Daffodil, which he took to be the common form of *N. Pseudo-Narcissus*, was common a few miles away. He added that a few years ago he dug up 200 or 300 to stock his garden, and that in two years all of them were producing large double flowers, except under a Palm tree, which had exhausted the soil with its roots. I then begged for flowers of both double and single forms, which were already out on February 10. Some arrived by post yesterday. The double flowers are hideous deformities, with green centres, and very double; the single certainly belong to one of the much-incised concolorous forms—I should say *N. minor* of the Daffodil Conference; but after their overland journey of 1500 miles they are not in first-rate condition, and I am not sure that they might not belong to the closely allied form cultivated by the name of *lobularis*; but, as I am promised bulbs of both single and double, I hope next year to study them at home, together with a great many others doubled by cultivation. *Wolley Dod, Edge Hall, Malpas, February 20.*

## SULPHIDE OF POTASSIUM AS A REMEDY FOR PLANT DISEASE.

VARIOUS applications of sulphur have been used from time immemorial for the destruction of mildew and red-spider, generally in the form of flowers of sulphur—an imperfect remedy, the application of which is both inconvenient and unsightly. Some old gardeners recommend quicklime and sulphur to be boiled together, in water; this makes a solution of bisulphide of calcium, which is probably a very efficient form of applying sulphur to plants, but as yet I have not tried it.

The mixture of sulphur and carbon, or bisulphide of carbon, is known to be the best remedy against Phylloxera, but unfortunately it is very sparingly soluble in water (some treatises on chemistry describe it as insoluble); moreover, its odour is most offensive. The odour of the compound of sulphur and potassium (bisulphide, or sulphuret of potassium, the "liver of sulphur" of the old books), which is here recommended, is not agreeable being that of Harrogate water, but it is sweet compared with the carbon compound; however, I gratefully tolerate the smell, in recognition of the multifarious cures it effects in man, beast, and plant. A strong solution (half an ounce to a pint of water) applied to the surface affected, by means of lint or rag wetted in it, is a perfect remedy for many kinds of poisoned wounds, skin diseases caused by vegetable and animal parasites, whitlows, and many forms of inflammation involving the formation of pus. I have had thirty years' experience of its valuable qualities in such cases, and I never found it do any mischief in the few where no benefit could be traced to its use. On two occasions gardeners in my employ came to me with poisoned wounds, each with his hand and fingers swollen, and both perfectly stiff, with a red line up the arm, showing extension of the inflammation to the axilla; in each case I applied to the hand a bandage wet with a strong solution, and in each case on the next day the inflammation had disappeared, and the hand and fingers could be moved freely. I make no excuse for referring to this medical phase of the subject, for independently of the liability of gardeners to the accident referred to, the action of the potassium compound of sulphur on animals is of the same character as its action on plants, and what is very important, to neither, even when no direct benefit can be traced to its application, it does any harm, even to the most delicate plant, when plunged overhead. Plunge soil and pot in a solution of a quarter of an ounce to the gallon (I have frequently used half an ounce to the gallon without mischief, but a quarter of an ounce is sufficient); I have saturated every Orchid, filling two houses, without a trace of injury to foliage, pseudobulb, or root; in fact, the growing points of the roots appear more active after the dose. As to the benefit to plants

\* Summer temperature at Alten, 53°; at Reikiavik, 54°. See Dove, *Temperaturtafeln*.

to be derived from its use, it arrests at once all forms of fungoid growth—even the hard fungus which grows on dead wood; it is a perfect remedy for mildew on Roses, &c. I have found it efficient against red-spider; it is probably equally so against microbes, various forms of which are doubtless as injurious to plants as other forms are supposed to be to animals. It will probably relieve us from those diseases which are so destructive to the bulbs of Lilies, Eucharis, &c. My limited experience has already proved that it has arrested disease in many varieties of plants. I was driven to the necessity of taking some active steps to counteract a form of disease, which had become endemic with me, the marked symptom of which is rotten roots. As this has increased so much of late, and had begun to attack every plant in my houses (a great variety), I began experimenting at the beginning of this winter very carefully with the sulphuret of potassium, and growing bolder as I traced no injury to its use, I ultimately applied it to nearly all my plants. I should have postponed writing until after an extended experience during the growing period of the year; but I thought that some benefit might arise from others joining in the experiment, even if they limited themselves to testing its effect upon that very troublesome disease, mildew on Roses, which so frequently puts in its appearance at this season of the year. The compound is cheap—I pay 8d. per pound for it; it is very soluble in water, and is easy of application. *Edmund Tonks, Knowle, Warwickshire.*

## THE CULTIVATION OF EARLY MELONS.

OUR modern improvements in the way of glass erections, combined with the perfect means we possess nowadays for heating them, has considerably diminished the labour, and made the cultivation of this kind of fruit much less difficult than it formerly was under the old system; but with these advantages care, with skill combined, is as essential as ever it was in order to produce a good crop of first-rate Melons early in the month of May. For this purpose different means are employed; some growers prefer cultivation in pots, whilst others resort to planting out in beds.

### POT CULTURE.

For very early work I am in favour of the former method, and still adhere to the practice of employing a fermenting bed in the house, not merely for the sake of the heat it affords to the roots, but likewise for the stimulating effects it produces on the plants. I arrange to have a well-heated and light pit in which there is room enough above the bottom-heat pipes to have a good fermenting bed composed of equal proportions of Beech leaves and stable manure, "which ought to be sweetened by fermentation before it is introduced;" this is made up to within 18 inches of the glass, thus it brings the plants within the range of every ray of light and sunshine—very indispensable elements for this work and especially so at this particular period of the year.

### POTTING AND TRAINING.

The pots are 12 or 14 inches in diameter, are plugged in the bed in a row 2 feet apart, then are filled with moderately rough calcareous loam, with about a sixth of sandy soil or road scrapings added. When the plants are ready and the soil has become warm put a single plant into each pot; plant it carefully, otherwise the roots, "which at this season are not over-numerous or strong," may be injured. Water the plants with tepid water, and tie them up carefully, to prevent any damage arising from the use of the syringe, which will be necessary at least twice every day. Let the terminal shoot run about 2 feet, when it should be pinched, and the side shoots from it should be stopped as early as possible at the first point above that where the Melon is to be set—a process which by no means should be neglected at the proper time, as the object in view is to have ripe Melons as soon as possible. Not more than two fruits on each plant should be left to finish off.

### GENERAL DIRECTIONS.

The chief points in the management consist in keeping the heat at the roots regular at about 80°. In the event of the heat arising from fermentation being inadequate, use the bottom-heat pipes at once to supplement it. Water very carefully at first and on-

wards until the plants have taken well hold of the soil, when they will need it abundantly and in an improved form by means of adding a little liquid manure or diluted guano-water. When the roots have permeated the surface-soil encourage them upwards by means of adding some moderate sized pieces of fresh loam and lumps of manure intermixed, which should be laid over the surface roughly, and, if expedient, a collar made of zinc is sometimes placed round the rim of the pot for such additions. During the early stage of growth the house should be kept rather close and the air moist, with a temperature of from 70° to 80° constantly, and from 80° to 90° by solar heat. Close the house early in the afternoon with plenty of sun-heat, and syringe the plants thoroughly at the same time. As the foliage becomes hardened give more air whenever favourable, but still maintain the heat as described.

### SOWINGS.

Under careful management, seeds which were sown about the middle of last January will now be fit for planting out. A supplementary sowing should be made now, when, if desirable, more varieties may be included of both green and scarlet-fleshed kinds.

### DISEASES.

The most troublesome disease to contend with in Melon culture is canker, which attacks the plants when in a bearing state, and oftentimes is most vexatious as well as disappointing; and although many remedies are propounded and applied to check the disease, yet none with which I am acquainted are altogether effectual. I am testing the effect of placing a funnel-shaped zinc collar round the neck of the plants; but at the present time my experience in the matter does not justify a recommendation of the method. I am, nevertheless, inclined to think it will have a beneficial effect. *G. T. Miles, Wycombe Abbey.*

## Orchid Notes and Cleanings.

### ORCHIDS AT MR. B. S. WILLIAMS'.

A VERY choice assortment of Orchids is in bloom at present at this nursery, many of them being fine types of their respective varieties. The lovely *Cœlogyne cristata* and *C. cristata Lemoniana* are well represented. *Dendrobium*, too, are in strong healthy bloom, amongst them being *D. Farmeri aureum*, *D. Ainsworthii*, *D. superbiens*, *D. luteolum*, *D. Boxalli*, *D. Wardianum*, *D. crassinode*, *D. nobile*, &c. The *Odontoglossums* are well represented, *O. odoratum striatum* quite filling the house with its delicious scent; *O. maculatum superbum*, *O. hystrix magnifica*, a decided advance on *O. hystrix*; *O. facetum*, *O. Horsmanni*, *O. nebulosum*, *O. Cervantesii*, were also in bloom, some of the spikes being large and fine. *Cattleya Trianae Williamsii*, *C. Trianae formosa*, and *Rodgersii*, *C. Percivalliana* and *C. Warszewiczii* delicate, were all in bloom, and the rest of the *Cattleyas* were in grand health, and showing fine strong "sheaths" in profusion. *Cypripediums* were well represented by *C. Harrisianum*, *C. villosum*, *C. Warnerii*, *C. Maulei*, *C. Haynaldianum*, *C. Dayanum*, *C. Ashburtoniae*. *Masdevallias*, too, looked very well, the beautifully scented *Dendrochilum glumaceum* and the less favoured variety, *D. uncatum*, had good spikes. *Vandas* were throwing up a grand lot of spikes. *Zygopetalum crinitum roseum* is a good Orchid in its class, and has a fine dwarf habit of flowering, so that the flowers have the advantage of being "set off" by the foliage. *Sophranites grandiflora* caught the eye with its brilliant coloured blooms. Amongst *Lælias* were *L. harpophylla* and *L. anceps grandiflora*. Three varieties of *Lycaste Skinnerii*, viz., *amabilis*, *picta*, and *purpurata*, were distinct. The brilliant *Ada aurantiaca* was in good form, and many others not mentioned form a fine display for the season of the year.

### FREAKS OF ORCHIDS.

Seeing that Major Lendy exhibited a plant of *Phalaenopsis Schilleriana* with adventitious buds before the Scientific Committee, possibly the following may be of interest:—On one of our plants of *Phalaenopsis Stuartiana* a piece of the root, about 2 inches long, by some means got detached from the plant, though still adhering to the Teak rod of the

basket, and strangely enough from the end of the root a small plant has formed. It has made a root from itself, and seems to have infused new vigour into the old piece of root, and at the present time the little plant is growing nicely. It would be interesting to know if any more of your correspondents have noticed any such freaks among their plants, or if any one has succeeded in propagating *Phalaenopsis* from the root. After seeing it seems possible that it might be done. *C. J. Salter, Selborne, Streatham.*

### ORCHIDS AT MESSRS. J. VEITCH & SONS, CHLSEA.

The fine large *Cattleya*-house is now wonderfully full of great healthy plants of *Cattleya Trianae*, there being fully 1000 handsome blooms now open, and with a promise of a long continuance of the blooming season, to be followed by that of *Cattleya Mossiae*, of which one side bench of this very long house mainly consists. The *C. Trianae* give a pretty wide range of difference in colour, from the palest flesh colour in sepals, petals, and labellum, to the deepest purplish-rose, and dark purple lip in others. The frillings of the lip and its amount of expansion are quite as varied as we found the colouring. The exhibition is quite remarkable, and would delight any one, either orchidist or not. A few fine plants of *Vanda suavis* placed at intervals, and just showing on some what the colours of their flower-buds were, breaks up the otherwise flat appearance of the mass of *Cattleyas* when out of bloom. A few of the richer coloured *C. Percivalliana* interrupted the show of rose and purple, and the eye rested thankfully on little masses of the pretty white *Cœlogyne*, the *Trentham* variety. Coming on among the *C. Trianae* were many specimens of *C. purpurata* and *C. Mendelii*. In a *Cypripedium*-house were a few plants of *C. Haynaldi*, *C. villosum*, *C. Sedeni*, and the fine old masses of the *Chatsworth* variety of *Cœlogyne*. Near by *Zygopetalum maxillaria* was found covered with its richly tinted blooms, the colours of which are so well set off by the fine blue labellum. This is probably the biggest specimen extant, as it certainly is one of the finest bloomed. The yet more scarce *Dendrobium crassinode alba* had thrown up a fairly strong spike, as had likewise the novel *Aerides Lawrencei*, which has only bloomed in two previous years. The loosely arranged panicle resembles *A. odorata*, but has a faint green tinge, that is deepest at the bottom of the tube. Many plants of *Angraecum sesquipedale* were abundantly covered with flowers, and *Vanda cœrulescens* was pushing many spikes, that must be considered strong for this variety. *Dendrobium speciosum*, about which so much has been written as to its treatment both now and formerly, was doing well here, one plant of no great size carrying three good spikes of bloom.

Of *Odontoglossums*, which never seem to be quite out of bloom, there were many of *O. Rossi*, and a beautiful form, richly coloured beyond precedent, of *O. triumphans*, the petals being remarkable for thickness. Of *O. Pescatorei*, *O. Wilckeanum*, and *O. crispum* were numerous specimens of great beauty, although several stood out as being much better than others. A little bit of the golden *O. concolor* contributed a welcome morsel of colour to the house, and the *O. uguiculatum* was noticeable by its green lip.

The new hybrid *Lælia bella*, described in the pages of the *Gardeners' Chronicle*, February 9, 1884, p. 175, was carrying two large blooms. This is the second year of its flowering. The character of *Lælia purpurata*—the seed-bearing parent of this hybrid—is more evident in the colour, while *Cattleya labiata* gives the form and size.

A pretty hybrid *Dendrobium* named *splendidissimum* came under notice, which had particularly pleasing tints and form, the parents being *D. nobile* and *D. heterocarpum*, the flower possessing the delicious perfume of the latter species. A few other new *Dendrobiums* were seen in *D. micans*, a hybrid between *Low's* variety of *D. Wardianum* and *D. lithuanicum*, with a deep purple blotch in the throat, and rosy petals and sepals.

Of *Cypripediums* there were amongst the newest *C. tessellatum porphyreum*, *C. Sedeni candidissimum*, a beautiful improvement on *C. Sedeni*, the light tints being purer, and the rosy ones fainter; *C. calurum*, *C. cananthum superbum*, the varnished look of the whole bloom, together with the dark-spotted, white-margined dorsal petal, and rich port-wine-coloured sac, making this a very fine noticeable variety.

The fine *C. Leeannum superbum* was also flowering on several specimens, not two of which were exactly alike.

## APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY,	Mar. 3	Sale of Freehold Nurseries and other Properties, <i>re</i> James Wheeler, at Warminster, by Protheroe & Morris.
		Sale of Established Orchids, at Protheroe & Morris' Rooms.
WEDNESDAY,	Mar. 4	Sale of Camellias, Azaleas, Roses, &c., City Auction Rooms, by Protheroe & Morris.
		Sale of Greenhouse and Hardy Plants and Bulls, at Stevens' Rooms.
THURSDAY,	Mar. 5	Great Clearance Sale of 4 acres of Nursery Stock, at the Warminster Nurseries, by Protheroe & Morris (five days).
		Sale of Liliun auratum, Plants, &c., at Protheroe & Morris' Rooms.
FRIDAY,	Mar. 6	Meeting of the Linnean Society.
		Sale of Established and Imported Orchids, at Stevens' Rooms.
SATURDAY,	Mar. 7	Sale of Imported Orchids, at Protheroe & Morris' Rooms.
		Sale of Roses, Fruit Trees, and Border Plants, at Stevens' Rooms.

THOSE who have travelled much in England and seen the fruit trees and Apple orchards of its cottages and homesteads, need not be told that APPLES are grown in this country in all kinds of soils, and even in districts as inclement as the extremes of North Britain. If cultivated Apples are not indigenous in the high latitudes of the United Kingdom, they must have been of very ancient introduction, for the Romans found them producing acid fruit, with a tough green skin, as far north as Ultima Thule, the most distant of the Shetland Isles; and there we have seen them green and tough as ever. Apples will grow anywhere within our confines, and, with due allowance for exceptions and extremes, their quality will depend generally on varieties and cultivation rather than locality.

Great Apple trees, with tall and spreading heads, bearing scores of bushels of fruit, can hardly be expected except on the most congenial soils; and as the development of the roots bears close relation to the height of the tree and the extent of its branches, the subsoil beneath these great orchard trees must necessarily be congenial. In different parts of the country we find trees varying in size according to the soil, trees of the largest size affecting deep soils with favourable subsoils. Mr. T. B. WOODWARD, who opened the discussion on "Fruit Farming" last year at the London Farmers' Club, and whose father planted orchards largely between Tewkesbury and the Avon, expressed his belief that large parts of the Midland and East Midland Counties were adapted to successful Apple growing. This means that the soil of these districts is capable of bearing Apples naturally and without a large expenditure in manuring the trees, and defending their roots from an uncongenial subsoil. The best sorts of Apples can hardly be produced either in uncongenial climates or on indifferent soils, though there may be few soils that refuse to bear this accommodating fruit when they are properly cultivated and enriched. You may, in fact, grow your own Apples for your own use almost anywhere, but in some situations you would grow them for market under great disadvantages.

A typical soil for Apples is one that is sound and dry, deep and friable, and an Apple crop can be produced on such land in favourable seasons with the same economy that Maize or Wheat can be produced on the unexhausted soil of the Western States. The earliest planters of our Apple orchards for saleable fruit, or for cider, wisely selected for their operations the wholesome loams of Worcestershire and Herefordshire, chiefly on the Old Red Sandstone, or the deep and well drained land of Devonshire and Somersetshire, with the Ragstone loams of the Medway valley. In these districts the largest orchard trees have long been grown with the biggest crops of Apples. Still the growth of Apple orchards has not been confined to the typical soils, and although this kind of husbandry has fallen into neglect, the remnants of old orchards, cankered and moss-grown, are quite a feature of the rural landscape both on the light soils of Surrey and on the stiff loams and clays of the weald of Sussex. A large

farmer of heavy land, near Horsham, informs us that in 1870, before the rain-floods of more recent years, his Apple orchards yielded 1000 gallons of cider. The trees, he states, were planted at a period when farm servants were boarded in their employers' houses, and when cider was largely consumed in hay-time and harvest; but habits have altered, and beer is now regarded as a better beverage than cider, and it is easily obtained. Hence the decay of the farmhouse orchards.

A vast amount of useful information on our subject is contained in the report on *British Apples* by the committee of the National Apple Congress, compiled by Mr. A. F. BARRON, and published by MACMILLAN & CO., to which we have frequently referred. The number of different names applied by the exhibitors to the Apples shown at the Congress was 2020, but many of these were synonymous, and the number of distinct varieties probably did not exceed 1544—a sufficiently large list for any Apple grower to select from! The forms filled up by the exhibitors supplied the compiler and, through him, the reader of his admirable report, with unbiassed and exhaustive information on the situations where the trees were grown, whether they were sheltered, or otherwise, the character of the soil and subsoil, the stocks on which the trees were grafted, their form, whether standards or bushes, and the best sorts. Mr. BARRON, it will be remembered, has grouped the selections of sorts geographically, so that the different districts and the sorts suitable for them may be examined separately. Examining the returns from the Garden of England, we find, as might be expected, that the Apple is grown on standards grafted on the Crab, the tree being often fifty or sixty years old, as for example at Mereworth, Maidstone, in the orchard of Mr. G. BEATON, who exhibited eighty sorts, naming and describing the favourites of his district, such as Cox's Orange Pippin, Margil, Cornish Gilliflower, Dumelow's Seedling, Winter Non-such, and other sorts recommended for market use. Mr. L. A. KILLICK of Langley, Maidstone, exhibited 126 sorts, and his concise remarks convey his opinion on the respective economy of growing Apples for market on large or small trees. Most of his trees are standards grafted on the Apple stock. "The Paradise stock," he says, "does not produce a tree large enough for market purposes." Large trees are usually grown on turf, and are then manured, year by year, by means of cattle or sheep fed on the grass with oilcake, the best orchards being thus produced on deep loam resting on Kentish Rag or gravel. On the other hand exhibitors from the chalk districts of Kent invariably describe their Apples as growing on bushes, pyramids, and cordons, so that the roots may be kept under control. Mr. CHARLES LANGLEY, of Dover, who sent a fine lot of fruit, including thirty-six sorts, grows pyramids on the chalk artificially. Finding that his Apple trees used to suffer in hot summers, producing only small fruit, he dug large holes down to the chalk and replanted the trees in good turfy loam, in which they grow well and ripen their wood. "The great secret is," he remarks, "to mulch well with good manure; the better manure I use the better the fruit." In dry weather he waters the trees.

With the aid of a little reading between the lines Mr. BARRON's report, statistical as it needs must be, forms a very valuable essay on Apple growing both for sale and for home use. We hope to recur to this subject on a future occasion.

—WOODWARDIA RADICANS.—We are accustomed to see this bold looking Fern in cool ferneries and conservatories, where its sturdy habit and elegantly arching fronds produce an excellent effect

both of lightness and strength. Occasionally, too we have met with it nestling in some sheltered nook out-of-doors, but never in such beauty as is shown in the accompanying engraving (fig. 54), taken from a photograph kindly placed at our disposal, and representing a plant growing in the open air in the garden of T. S. BOLITHO, Esq., Trengwainton, Pembroze. The plant measures 18 feet by 13 feet, the average length of the fronds being 5 feet 6 inches. Woodwardia radicans has, like many Ferns, a very wide range of distribution, in this case in temperate and subtropical regions, as southern Europe, Madeira, the Himalayas, California, &c. A marked peculiarity of the species resides in the production of adventitious buds on the axis or rachis of the frond, by means of which the plant can be propagated. Crested varieties are also in cultivation.

—BOTANIC GARDEN, KLAUSENBERG.—We have received a copy of the seed catalogue of the botanic garden of this Hungarian University, which labours under a plethora of synonyms, being known as Claudiopolis officially, and vernacularly as Kolozsvár and Klausenberg.

—FINGER AND TOE.—An amusing illustration of the perplexity occasioned by vernacular names is before us. A German gentleman in Russia found in an English book on plant life the expression "finger and toe" as applied to roots. Perplexed to know what this might mean he applied to the University librarian, a man of erudition. He looked on it as the title of a book, although no such book was in the library. An anatomist naturally thought it had reference to some surgical deformity. One botanist rightly divined its meaning, while another thought all the suggested explanations very unsatisfactory.

—BAMBOO.—Mr. THISELTON DYER, at the last meeting of the Linnean Society (February 19) exhibited and made remarks on specimens of the peculiar "Square Bamboo" (*Bambusa quadrangularis*, FENZL)—see *Gardeners' Chronicle*, January 29, 1876, p. 147, fig., and on articles (screens, &c.) made from the so-called "Hairy Bamboo" (probably *Dendrocalamus latifolius*, MUNRO), sent from Wenchow to the Kew Museum by Dr. MACGOWAN.

—LINNEAN SOCIETY.—At the next meeting of this Society, which will be held on March 5, at 8 P.M., papers will be read on:—1. "New Genera and Species of Hydroids from H. GATTY's collection," by Professor ALLMAN. 2. "Recently Discovered Flowering Plants from the Interior of New Zealand," by Rev. W. COLENSO. 3. "Rearing, Growth, and Breeding of Salmon in Fresh-water in Great Britain," by Dr. F. DAY.

—VRIESEA WARMINGII.—A handsome Bromeliad, 3–5 feet, with tufted leaves, dilated at the base, and extending with long linear oblong acuminate leaves, each nearly a yard long. The flower-spike is about 5 feet in height, rising above the tuft of leaves, and bearing above a close two-ranked spike of flowers of a yellow colour, scarcely exceeding the boat-shaped bracts, which are yellow, with green tips. The plant is a native of Brazil, where it was discovered by M. WARMING. It is figured in tab. 11 of the *Belgique Horticole* for September, 1884.

—PITCHER OF DISCHIDIA.—According to TREUB, who has studied the living plant in the garden of Buitenzorg, the pitcher in this plant is a modification of the blade of the leaf, its inner surface corresponding to the lower surface of the leaf and *vice versa*. The pitcher-like form is due to an increased relative growth in the central portion of the leaf. When the pitcher is complete, adventitious roots are produced from the petiole, some of which enter the pitcher. It does not appear that the pitchers of this climbing Asclepiad have any digestive properties. Insects enter them, but there is no provision for retaining or dissolving them, and the roots in the pitcher afford an easy means of escape. The real object seems to be the supply of water to the plant, which forms its own water-pot.

—PARIS INTERNATIONAL HORTICULTURAL EXHIBITION.—This Exhibition will be held in Paris, in the Champs Elysées, from May 20 to May 31. Exhibitors of all nations are invited to send their productions for competition for medals and other awards. Notice of intention to exhibit should be given to the President, 84, Rue de Grenelle, Paris, before April 25 next. British exhibitors should apply for schedules

to M. ERNEST BERGMANN at the above address. There are eleven classes for new plants in each of the following groups—stove, greenhouse, or hardy. Six classes on the same conditions for plants of fine cultivation, and three for market plants. For stove and greenhouse plants of various characters there are 109 classes; for hardy plants, Roses, Clematises, &c., 109 classes; for cut flowers six classes, besides various other classes.

— FILL-DITCH MONTH.—February has in the South justified its old reputation of the fill-ditch month, and has done so in a manner that is satisfying the most ardent demands for more rain. A heavy and continuous rainfall at this season of the year brings its inconveniences and hindrances, but if followed by a dry March

as much rain as may, because of the lack of moisture during the past year. Fruit growers who see their trees full of promise for the season are heartily rejoicing that the rain is reaching their roots and affording them that sustenance without which the greatest promise might have been unfulfilled. Those over-anxious to sow and plant may perhaps wish they had not been quite so hasty, or may now be deterred from such acts until the season has become both more advanced and more favourable. There can be little doubt but that next summer we shall have ample reason to be thankful to February for its contribution of rain.

— MR. JAMES THOMSON, who has acted as manager of the house plant department in Messrs. DICKSONS & Co.'s nurseries, Edinburgh, for the last

after flowering. It 1833, after introducing a swarm of Ligurian bees from England, a cross-fertilisation was effected. The Hybrid *Echium* possesses the leaves of the giant plant, and the stem merely branches sparingly. The flowers are tinged light blue, and the perennial habit of *E. fastuosum* is expressed by the continual growth of the flower racemes, which, after flowering for two years, measure 26 inches, and are still unfolding. The seeds of this hybrid have not germinated. Why these magnificent plants are not more frequently seen in our gardens is a puzzle.

— SCHOOL OF FORESTRY, EDINBURGH.—At a meeting of the Edinburgh Town Council, held on the 24th inst., it was unanimously agreed, on the recom-

FIG. 54.—WOODWARDIA RADICANS. (SEE P. 278.)

no harm will be done; but, on the other hand, the satisfying of the thirsty soil will be productive of much good. We have found the soil universally working so well, and so tempting for sowing and planting, that it seems a pity such good tilth should be damaged. This pleasant condition of the soil arose from the exceeding dryness of the subsoil and the facility with which the surface moisture percolated through. Now that this lower stratum of the soil, with its constant drain from roots of trees and shrubs is being satisfied, the earth will presently assume a pasty form unless we get considerable relaxing of the rainfall, so as to enable the surface moisture to get well away. As long as there is free percolation from the surface the soil suffers little, but when it is flooded day after day, and finally the water lies for a time on or in the soil, very bad results follow. All this it is to be hoped may be avoided this season at least, come

eleven years, has been appointed Head Gardener to JAMES HOPE, Esq., of Belmont, Mid-Lothian. Mr. THOMSON was recently presented with a handsome album, along with a purse of sovereigns, by a number of his friends, which included all the leading nursery and seed firms in the city and their managers, as well as most of the head gardeners in the district.

— HYBRID ECHIUM.—Dr. GRABHAM, of Madeira, describes in *Nature* a hybrid between *E. fastuosum* and *E. simplex*. The former is a perennial shrub, 3 to 4 feet high, with hairy light green leaves, and branching stems, crowded with scorpioid racemes of light blue flowers with white stamens. The latter has large, smooth, silvery leaves, and terminates its growth in one unbranched stem, densely packed with folded flower-stalks bearing pure white blossoms, and forming a pyramid sometimes 14 feet high; it dies

after flowering. It 1833, after introducing a swarm of Ligurian bees from England, a cross-fertilisation was effected. The Hybrid *Echium* possesses the leaves of the giant plant, and the stem merely branches sparingly. The flowers are tinged light blue, and the perennial habit of *E. fastuosum* is expressed by the continual growth of the flower racemes, which, after flowering for two years, measure 26 inches, and are still unfolding. The seeds of this hybrid have not germinated. Why these magnificent plants are not more frequently seen in our gardens is a puzzle.

— RARE ORCHIDS.—At Messrs. PROTHEROE & MORRIS' Sale Rooms, Cheapside, on Tuesday, a plant of *Celogyne crista alba* was, after a keen competition, knocked down to Mr. WILLIAM BULL, of Chelsea, for £131. The plant had seven flower-spikes, the blooms being snowy-white without the least shade or tint. Several other high prices were also obtained.

— VRIESEA RETROFLEXA ×.—This is a hybrid out of *V. scalaris* by *V. psittacina* var. *Morreniana*, raised by Professor MORREN, at Liège, and combining the characteristics of both parents. The leaves are

like those of the seed parent, the flower-spike at first curves downwards, as in the seed parent, but subsequently becomes erect, like that of the pollen parent. The bracts are scarlet, the flowers loosely arranged in two rows, and yellow in colour. Professor MORREN hung up some of the plants in an inverted position when the flower-spike was appearing in order to see what effect would be produced. Under these circumstances the spike remained straight. Replacing the plants in their normal position the spikes were, of course, erect, but after some days they became bent downwards, the tips showing a tendency to curve upwards. The plant, moreover, has a tendency to produce flowers at a very early period from the suckers. The flowers remain in beauty for a long period, and the plant is very suitable for cultivation in a basket suspended from the roof. *Belgique Horticole*, 1884, t. 10.

— THE PRICE OF WHEAT.—According to the useful tabular summary published by Mr. ALLNUTT, the fluctuation in the weekly average price of Wheat has been greater during the past year (1884) than in 1883, but not so much as in 1882. The price in 1882 was 12s. 1d.; in 1883, 4s. 10d.; and in 1884, 8s. 7d. per quarter. The annual average price of 1884 was considerably lower than that of 1883, being 5s. 11d. per quarter less; and taking the two years 1883 and 1884 the average price has fallen 9s. 5d. under 1882. The annual average price of corn per bushel was—Wheat, 4s. 5½d.; Barley, 3s. 10d.; Oats, 2s. 6½d. The average price of Barley from November 15 to December 13 exceeded that of Wheat, Barley is generally about 12s. per quarter below Wheat, and for the last twenty-five years Barley has averaged 13s. 6d. per quarter below Wheat. On January 3 the price of Wheat was 31s. 11d., and on January 10 32s. 7d.; this is a rise of 2s. 2d. a quarter over November 29 last. As Wheat generally rises and falls every four years, this may be the commencement of an upward movement. On looking over the price of Wheat from 1641 we see Wheat has not been so low for a century. In 1780 the annual average was the same as 1884, viz., 35s. 8d. Previous to 1780 Wheat was fifty-two years under this average, and eighty-seven years above it.

— COWAN'S PATENT ORCHID POTTERY.—A new description of receptacle in which cultivators may grow Orchids is being put on the market by Mr. JOHN COWAN, of the Vineyard Nurseries, Garston, which admirably fulfils the requirements of this class of plants. The pots and pans have longitudinal slits, are of great variety in size, simple in form, and are made in three different qualities, viz., of the same material as ordinary flower-pots, also with finer material and finish, and lastly, as partly glazed ware. The pans, &c., fulfil all the conditions of Orchid growth, not confining the roots in any degree, allowing them freedom to run about outside, and affording the perfect drainage that the epiphytial species require. They must be made cheap, so that growers would not hesitate to smash them up for the purpose of releasing the roots that will cling to them, whenever repotting is done.

— CHINESE CONIFERS.—In M. FRANCHET'S account of the plants collected in various parts of the Chinese empire, several new Conifers are described, which may here be mentioned as probably some of them would prove hardy in this country. *Pinus Armandi* is one of the *Cembra* group with cones like those of *P. Koraiensis*, but not reflexed at the tips of the scales. It is described as a beautiful Pine with smooth green bark. *Abies Davidiana* is said to combine the characteristics of the *Piceas* (Spruces) and the *Tsugas* (Hemlock Firs), in both of which the cone-scales are persistent. The tree is lofty, with both foliage and the erect cone much larger than in most *Tsugas*, the cone, according to the figure, measuring nearly 6 inches in length by 2 in breadth. *Abies sacra* is considered to be very like *A. Davidiana*, and perhaps merely a variety of it with smaller leaves and cones, and with glabrous not hairy shoots. This tree is planted around the temples: hence the name given to it. These species were collected in the province of Chem-si, on the slopes of the Tsen-ling Mountains. Several other species are mentioned, of some, however, the specimens are too imperfect to admit of satisfactory determination. Those named are *Pinus Thunbergii*, *Larix Kämpferi*, *L. sibirica*, *Abies Tsuga*, *Cunninghamia sinensis*, *Cryptomeria*

*japonica*, *Juniperus chinensis*, *J. rigida*, *J. recurva*, *Cephalotaxus Fortunei*, *C. pedunculata*, *Torreya grandis*, *Taxus baccata*.

— NARCISSUS COMMITTEE.—Dr. LOWE, of Woodcote, Inner Park Road, Wimbledon, has issued the following circular:—

"A sub-committee, which for brevity we will call the 'Narcissus Committee,' has been formed under the auspices of the Scientific Committee of the Royal Horticultural Society, having for its object to ascertain the conditions under which the single flowers become double, or, if it be the case, the reverse, viz., how double flowers of the Narcissus tribe become single. As Honorary Secretary of the said committee, I am desired to express a hope that you will become a member.

"I may mention that the committee is a large one, comprising most of the lovers of the Daffodil, in order to secure a wide field of observation; but that while any member will be cordially welcome at its meetings, it is not expected that those living at a distance, or otherwise engaged, should attend, provided we may secure their intelligent and accurate memoranda on the subject.

"From the nature of the inquiry the same committee will probably exist for several successive years, as it must be obvious no reliable information could be obtained in one or two seasons. The nature of the soil, whether light or friable, or stiff and heavy, the aspect to which the plant under observation has been exposed, elevation of the land, &c., whether the phenomenon of changing from single to double, or the reverse, has taken place in its native or natural condition, or under artificial treatment, and if so, what? These, and every circumstance noted by the observer, it will be the business of the committee, in the first instance, to collect, and then to sift, in order to ascertain if possible the conditions under which these changes take place; in other words, the cause of single plants becoming double.

"In order not to prolong this introductory letter, I beg to subjoin certain suggestions which have been made for the guidance of the committee, and which will probably be adopted at the next meeting with such modifications or additions as those present may determine.

"1. Collect and sift the evidence offered by various observers as to the 'doubling' or 'going single' in their gardens.

"2. If any cases seem to afford *prima facie* evidence of 'doubling' or 'singling' in this or that garden, take these as 'experimental stations.'

"3. Draw up a list of regulations for carrying out an experiment, such as—(a) Bulbs in flower this spring to be marked for experiment this summer as single, double, &c.; (b) the ground experimented on must be assured to be free from Daffodil bulbs; (c) precautions for securing that the labels do not get separate from bulbs, &c.

"4. It will be as well that the character of the bulbs experimented on, and the result should be attested by more than one member of committee. Possibly it will be desirable that some of the committee should go down and plant the bulbs in the experimental stations.

"5. Besides the operations carried on at experimental stations in localities said to have the power of doubling, &c., some sets of marked bulbs should be planted at Chiswick, under experimental conditions, and possibly in other places, where they can be watched by the committee.

"With regard to the proposed meeting, I beg to state that it will take place in the LINDLEY Library, Royal Horticultural Society, South Kensington, on March 10 next, at eleven o'clock."

— SALE OF THE LATE I. ANDERSON-HENRY'S BOTANICAL LIBRARY.—The sale of this valuable collection of botanical and other works on natural history took place at Messrs. CHAPMAN & SON'S Great Sale Rooms, Hanover Street, Edinburgh, on the 10th inst., and the two following days. The celebrity of the late Mr. ANDERSON-HENRY as a naturalist, and especially as a hybridiser of plants, attracted considerable attention to the sale, as the books were known to have been selected with great skill and taste during a long lifetime, and included most of the best works on botany and natural science which have appeared during the present century, as well as a choice selection of the works of an earlier period. The competition for some of the rarest and best works was at times very keen, and the sale, under the skilful management of Messrs. CHAPMAN, realised a handsome sum, many of the books being secured at high prices, for public institutions, and by Mr. HENRY'S numerous friends as a *souvenir* of a genial acquaintance and an eminent man of his day. The following are the prices realised for a few of the botanical books:—Sowerby's English Botany, 11 vols., 1877, £14 5s.; Hooker's Botany of the Antarctic Voyage of the *Erebus* and *Terror*, 4 vols., 1847–60, £15 4s. 6d.; The Botanical Register,

33 vols., 1815–47, £13 13s.; Hooker's Journal of Botany, &c., 1834–57, £5 5s.; Hooker's Icones Plantarum, 6 vols., 1837–81, £3 12s. 6d.; Paxton's Magazine of Botany, 16 vols., 1834–49, £4 10s.; Curtis' Botanical Magazine, complete from 1793 to 1883, £52; Elwes' Monograph of Lilies, 7 parts, 1880, £5 5s.; De Candolle's Prodrromus Regni Vegetabilis, 19 vols., 1824–69, £5 5s.; Royle's Botany of the Himalayan Mountains, £2 14s.; Loddiges' Botanical Cabinet, 12 vols., 1817–25, £5 4s.; Hooker's Exotic Flora, 3 vols., 1823, £2 14s.; Sweet's British Flower Garden, £2 4s.; Seboth's Alpine Plants, 4 vols., £2 6s.; Lowe's British and Exotic Ferns, 8 vols., 1867, £3 17s.; Bentham and Mueller's Flora Australiensis, 7 vols., 1863–68, £4; Lindley's Pomologia Britannica, 3 vols., 1841, £2 11s.; Gerard's Herball, 1663, £2 10s.; Parkinson's Theatrum Botanicum, 1640, £2 2s.; Flore des Serres, 6 vols., 1865–82, £3 12s. 6d.; Journal of the Royal Geographical Society, 40 vols., 1830–70, £6; Transactions of the Edinburgh Botanical Society, 8 vols., £2 9s.; Hooker's Flora of British India, 3 vols., 1875–79, £2 2s.; Wight's Indian Botany, 1840, £1 18s.; Sowerby and Johnson's British Wild Flowers, 1863, £1 15s.; Harvey's Flora Capensis, 3 vols., 1859–65, £1 9s.; Bentham's Handbook of British Flora, £1 15s.; Loudon's Arboretum Britannicum, 8 vols., 1838, £2 5s.; Hooker's New Zealand Flora, 1867, £1 4s.; Torrey and Gray's Flora of North America, 2 vols., 1834–42, £1 12s.; Griffith's Plants of India, 3 vols., 1847, £1 3s.; Wooster's Alpine Plants, 2 vols., 1872, £1 2s.; Atlas der Alpenflora, 3 vols., 1881–84, £1 12s.; The Floral Cabinet, 3 vols., 1838–40, £2 6s.; Transactions of the Horticultural Society, 10 vols., 1820–48, £3 6s.

— MUSCARI BOTRYOIDES, OR GRATE HYACINTH.—How strange it is that this beautiful little flower is not more largely grown for button-hole bouquets, &c., as it is one of the prettiest things imaginable for such work, and especially as it comes in at this season of the year, when it is nearly the only small flower of a delicate blue; it is not expensive, as the bulbs are only 1s. per dozen, and are easily grown.

— THE OXFORD UNION CARNATION AND PICOTEE SOCIETY.—Mr. DODWELL proposes to establish an annual meeting of the cultivators of the Carnation and Picotee, and an exhibition of the products of their skill in the city of Oxford. To prevent any misunderstanding, it is proposed to give to this meeting a distinctive appellation—"The Oxford Union Carnation and Picotee Society;" and to state that, resting wholly on popular support, its affairs will be subject to popular government. Every subscriber will be entitled to a voice in its management. To provide for needful preliminary expenses, and a nucleus for the prize fund, Mr. DODWELL proposes to place certain surplus growth of his stock now on hand at the disposal of the management, and to forward to all subscribers full value for their subscriptions.

— TREVESIA SUNDACA.—None of the eight or nine species known to science are recorded in gardening books as having been introduced to this country. The subject of this note is not only conspicuous for its large ornamental leaves, but their curious construction as well. These are divided into seven or nine large finger-like segments that are more or less contracted and narrowed towards their base, and seated on the dilated, truncate base of the blade, that more or less resembles the foot of a web-footed bird. The inflorescence consists of horizontal or pendulous panicle umbels of flowers, with fleshy creamy-white petals, and a yellow disc. They smell rather disagreeably when fully expanded, but are extremely interesting, and followed by globular berries about the size of Peas, and reminding one very much of Ivy-berries. The plant is figured in REGER'S *Gartenflora*, 1864, t. 438, and a plant in the Palm-house at Kew flowers annually about this time.

— GARDENING APPOINTMENTS.—Mr. W. FLOOD has been engaged as Head Gardener to Colonel T. J. LEVET, M.P., Wychnor Hall, Lichfield.—Mr. ALFRED GRANT has been appointed Head Gardener to J. HARRIS SANDERS, Esq., Porter's Park.

## The Flower Garden.

### SPRING GARDEN.

THE mildness of the weather has already given the spring garden a promise of very early effect, many plants and bulbs being now in bloom, and all we want is a continuance of fine sunny weather, and this is hardly to be looked for at present. When the soil has got dry enough it will be advisable to loosen the surface of the flower-beds with digging forks, but in doing so be very careful. All dead leaves and rubbish should be removed, great attention should be given to examine all plants, and make firm all those that are loosened by frost, for this purpose using the hand only. The gravel walks should now be turned, and, if requiring it, surfaced with fine gravel, and well rolled down while wet, so as to make the gravel bind well together. If the walks between the beds are grass, it should be swept and well rolled, and the edges sheared so as to produce a neat appearance. Every attention should be given to tying up the bloom stalks, and protecting the bulbs from frost and bad weather generally.

### ROSES.

All climbers should have every attention, and the tender ones should be protected. Such as Clematis and early Roses should be pruned at once, as they are unusually forward this year. Many have made shoots 2 or 3 inches long and much young foliage, great care therefore should be taken in pruning the Tea and Noisettes not to cut back too hard in case severe frosts should set in and destroy them. These tender Roses must be planted only in warm and sheltered situations, so that they are protected from the north-east winds, which so frequently occur in the spring months. The sooner all Roses are planted the better, so that the roots may take hold of the soil as soon as growth commences; they will then withstand the trying weather of March and April.

### CHRYSANTHEMUMS

may be planted in a well prepared border or in beds, using always plenty of manure, and thoroughly trenching the beds. I always plant my old plants out; I find they are much stronger and flower earlier, and have finer blooms than young ones. After I have planted them I put a little leaf-mould round each, to protect it from the effects of frost and winds.

### CARNATIONS AND PICOTEEES

can now be planted out in well prepared borders or beds. After the bed is planted out it should have a mulch of leaf-mould. *W. Smythe, Basing Park Gardens, Alton.*

## Plants and their Culture.

### STOVES AND INTERMEDIATE HOUSES: CLEANSING OPERATIONS.

WHILE these houses are being overhauled for potting operations it is necessary that each should be well cleansed, as this work can be easier performed now than if left till the plants are in growth, and it may then have to be deferred to a still later period. Let the glass be carefully cleaned, and any loose inside putty made good; the woodwork should be washed with a weak mixture of soft-soap and soda, and the walls scrubbed down hard with the same where it is not convenient or possible to cover them with Feros and other suitable subjects. If crickets or cockroaches abound attack them in their haunts with boiling water or some kind of poison; then, should a few escape, it will be possible to destroy them by laying beetle-halls or vermin-paste in the places where they are most to be found at night-time. The plants themselves, too, will need close scrutiny for insects, using means as previously advised for their destruction. If allowed to escape notice at this season they will soon prove very troublesome when the temperature is increased, and give endless annoyance where cleanliness and good culture are aimed at.

### WATERING.

This is a most important item in plant culture, and one in which errors are most frequently made. Great injury is frequently caused to those plants that are the most susceptible to an excess of water at the roots. One good watering to settle the new soil around the roots is always advisable, and after that the water-pot must be used with due discrimination as to the needs of each plant for some weeks to come. In the case of large plants, to avoid washing up the soil, lay a piece of slate on the surface. The use of the syringe will aid in a great measure to keep the plants moist at the root, and allowance should be made for this when watering.

### PLUNGING MATERIAL.

I have not advocated this means of accelerating the growth of stove plants in general, neither do I see any reason for its use in a general way, as the plants under these conditions do not prove so productive of bloom in the case of flowering varieties, nor is it so favourable to lasting qualities in foliar growth in the case of ornamental-leaved plants, compared with that of plants grown without bottom-heat. We have, however, seen its application put to a most successful test by Mr. Roberts, of Gunnersbury Park, with his collection of *Ixoras*, than which nothing in their way could possibly be finer. These plants are evidently quite at home under his treatment, flowering profusely; *Ixora coccinea* being especially fine. I have, therefore, adopted the same means with mine, and hope soon to have the satisfaction of seeing a free growth and a good return in flower trusses. I am partial to their splendid heads of bloom for floral decorations, to which they impart a rich effect when used with judgment. Kept free from mealy-bug there is no finer stove plant of its colour in cultivation than *Ixora coccinea*. This genus is worth growing well, although of late we have not given them that attention which they deserve. A bed of manure and leaves has been made up, and the same covered with cocoa-fibre for plunging in and for appearance sake. With only a thin layer there is not much likelihood of its becoming charged with water to the injury of the plants, as the material beneath is absorbent, and also by reason of the bottom-heat pipes. *J. Hudson, Gunnersbury House, Acton.*

## The Hardy Fruit Garden.

### PEARS.

THESE, when planted in good rich soil, often grow too vigorous for a few years, so that fruit is rarely formed. Where such is the case it is a good plan to prune the roots as well as the branches. The condition of the roots is of more importance than that of the branches, for if the former are in an unhealthy state no attention bestowed on the trees will be of any use. It is not wood that is our object in growing fruit trees, at the same time I consider it a bad plan to starve trees into bearing; but get strong healthy trees, then prune them into a bearing state. This is that which I would inculcate, that young trees which have been planted five or six years, and are growing too strong, should now be root pruned as follows. This year I am taking the south side half of every tree, and digging down 18 inches from the centre of the trees right under each tree, and making sure that there are no roots left striking downward, pruning all the roots carefully, and then replacing the part of the soil again which is of good quality. Next year the north side half of each tree will be served in the same manner. Where the trees are large we begin, say, 3 feet all round. Where the soil is of a poor texture I should recommend turfy loam being placed round the roots, not chopped up, but packed firmly round the roots. I think it would be a great boon for fruit growers if we could only get a Pear Congress, the same as the Apple Congress of last year. There must be a great many varieties of Pears grown which one never hears of, for in looking over an old Pear list grown in a private garden I see the list extended to 130 varieties of Pears and 110 of Apples.

Gooseberries should be planted on north and east walls for a late crop; they may also be planted on

borders where Morello Cherries are on the walls, so that they may both be protected at the same time. The two best varieties I know for this purpose are Warrington and Ilenson's Prolific. *J. Smith, Montmore, Bucks.*

## The Kitchen Garden.

### FORCING DEPARTMENT: CUCUMBERS.

WITH lengthening days and increasing solar heat, these should now be making good progress. Allow young plants to run up the trellis a good distance before stopping the leader. Keep some suitable soil in a warm place, for the purpose of adding a little to the hillocks occasionally. It is not necessary to add much at a time until the plants commence bearing, when a greater bulk of soil will be an advantage. A little shading may be required until the plants get well established, at which time it is advisable to discontinue it. I know good Cucumbers are grown under the shading system, at the same time keeping an extra high temperature, but by drawing a comparison of the longevity of plants grown under both conditions, viz., shaded and full exposure to sun, the balance is in favour of the latter. On bright sunny days a little air must be given for a few hours during the morning (and cautiously when cold winds prevail) when the thermometer reaches 75° or 78°, and close intine to run up with sun-heat to 85° or 90° with plenty of atmospheric moisture. Spray the plants well with the syringe twice daily, taking care to thoroughly wet the foliage on both sides. This should be done early in the morning and again at closing time with lukewarm water. Maintain a night temperature of 68° to 70°. They will succeed with a lower one, but not so satisfactorily. If a second house is to be planted, some more seed should now be sown.

### PREPARATION OF GROUND AND SEED SOWING.

The time for many important operations in this department is now close upon us, and the undertaking of them will entirely depend upon the weather and the nature of the soil with which we have to deal; but no opportunity should be neglected to proceed when the soil is found to be in a desirable condition and can be reduced on the surface to a fine tilth for the reception of seeds; but do not be in any particular hurry if the soil is found to be in a wet adhesive state, rather defer the sowing of Parsnips, Onions, and Carrots (the latter two being very important crops in large establishments) until the soil can be caught in a good workable condition even until the latter part of the month.

### PARSNIPS.

Deeply cultivated ground is necessary for the production of fine straight roots. If a special piece of ground has not been prepared for them last year's Celery piece will answer well.

### ONIONS.

To obtain a fine heavy crop the ground should have been well prepared and enriched in autumn. Before drawing the drills, which should be about 1 inch deep and 1 foot apart, make the ground thoroughly firm, and well tread or roll the drills after sowing. Or the bed system will produce equally as fine bulbs; in this case the seed can be sown broadcast, and the beds hand-weeded throughout the season.

### CARROTS.

Three outdoor sowings of these are advisable as follows:—First, beginning of March (a Short Horn variety); second, and main crop (Intermediate and a long variety), about the first week in April; lastly, another sowing of Short Horn, beginning of August. Short Horn varieties are always desirable in the kitchen. Select light soil if possible for these crops.

### CELERY.

Make a sowing soon, to supply the earliest blanched heads for salad.

### ANNUAL HERBS,

such as Basil, Borage, Sweet Marjoram, and Summer Savory, should soon be sown in boxes in a gentle heat. These would be ready for planting out into summer beds about the end of May. Any perennial

herb beds getting exhausted may be renewed in a similar way with seedlings.

#### SEED BEDS.

Commence levelling down part of the ground which has been set aside and prepared for seed-beds, and strike out alleys to allow of conveniently moving between them, and between this and the latter part of the month the following should be sown, which in many gardens will be the first sowing of the year:—Brussels Sprouts, Cabbage, Cauliflower, Leek, and Lettuce. By giving every attention to the seed-beds, and raising sturdy young plants, we lay the foundation for good crops. We always prepare a large heap of light soil long before it is required, for the purpose of covering the beds after the seeds are sown, and do not take soil from the alleys, and the operation is completed quite as quickly. This should always be done on heavy soil.

#### EARLY POTATOS.

Some good varieties should now be planted out in the open borders, or the tubers (if not much sprouted) may be placed in boxes and covered with light soil, and allowed to remain in a cool house or frame until grown out a couple of inches, and planted out at a later date. The advantages of the latter mode is that at planting time the crown eyes can be easily seen and the weaker ones removed; less haulm will be made throughout the growing season, and a much finer sample of tubers obtained, and for garden culture this is well worth consideration. *G. H. Richards, Somerley Gardens, Ringwood, Hants.*

## Florists' Flowers.

#### GREENHOUSE FLORISTS' FLOWERS: THE AMARYLLIS.

REFERRING to p. 22, "Instructions as to Potting," &c., were given, and also for starting them into growth. Since that time they have made much progress, and some of the earliest varieties are just opening their flowers. Some varieties have a tendency to flower late, and grow away much more slowly than others from the first. This must be taken into account in respect of the time they are expected to flower. From the time that the flower-spike is seen until the flowers open a period of from six to eight weeks elapses; that is, if the spikes show about the first or second week in February. If they show a month later than this, the flowers will open sooner. All through the period of flowering the plants require careful attention as to watering; they do not require it oftener than once a week, and some varieties will take much more water than others: in this respect the grower of the plants must use his own discretion as to the treatment each individual bulb requires. The offsets in small and large 60's will form leaves more rapidly than the flowering specimens, and require rather more water at the roots. An over-moist atmosphere does not agree with them, as it causes some of the bulbs to decay. The temperature of the house ought to be about 55° at night, with a rise by day of from 5° to 10°. A few hours sunshine is very welcome, and if it raises the temperature to 70° all the better. Seedlings ought to be grown on well, as the whole of them ought to flower the third season. If they do not get good culture they may require a year longer, which, of course, adds to the expense of proving them.

#### THE CHRYSANTHEMUM.

If all the cuttings have not yet been put in no time should be lost in doing so. Put each cutting in the centre of a thumb-pot or small 60, using fine sandy soil; by doing this they do not receive any serious check, as they are sure to do if several cuttings are put in one pot, so that it is necessary to shake them out after they are rooted. I put as many cuttings as we found ready singly into small pots in December, these have been in a cold frame since that time, most of them have formed roots, and a few have failed to do so; these have been taken from amongst the others and placed in a hotbed, where they will soon root. Any of them that are well rooted should be shifted into pots a size larger. The Chrysanthemum does not suffer so much from bad man-

agement as some other classes of plants, but in order to do them well they must not be checked in the early stages of their growth either from being allowed to become pot-bound or by being exposed to cold east winds at this early season. We grow them in frames, in order that the lights may be removed entirely when the weather is fine, or to benefit from gentle rain in mild weather. The potting soil was mixed up at least six weeks ago, and it is always convenient to have it ready for use as often as the plants require repotting. They like a generous diet from the first.

#### THE CINERARIA.

The flowers are opening very nicely now, and it is very interesting to see the seedling flowers open for the first time when you are sure the strain is a good one. On the other hand, it is very disappointing to

#### LATE CHRYSANTHEMUMS.

Among unlooked for flowers, though by no means unwelcome at this late date (February 16) is a comparatively good flower of Chrysanthemum, Mrs. Mahood, a variety figuring among the new Japanese kinds of 1884, and which also received a First-class Certificate. The colour is creamy-white, changing to pure white, florets long and thread-like, in all a flower of great promise; and seeing that it is capable of perfecting its blossoms at this season, it is only natural to assume that by special culture it will take a leading place among late whites in the future. A fading flower of Mrs. Charles Carey, an indispensable late white, was also cut to-day with the first-named from a shoot made in early autumn. A good flower has been produced on a plant of Roseum superbum, which lacked, however, some of its original colour; and last on the list is Duchess of Connaught, which, according to its progress of late, will not expaod for some weeks to come. Not only are they slow in expanding their blossoms at this season, but their longevity after development is important and interesting also. *E. Jenkins, Floral Nurseries, Maidenhead.*

#### VENETIAN SASHES FOR GLASS-HOUSES.

THE idea of admitting the greatest possible amount of air, tantamount, indeed, to taking off the roof, has

FIG. 55.—VENETIAN HOUSE: OPEN.

take the greatest pains to grow the plants well and then find it is only a common strain after all. How important it is that the very best seeds should be obtained when the difference in price between the good and bad article may be only a shilling, while the expense of growing the plants may be reckoned at a very large sum indeed. Even the latest-flowering plants should be in their flowering pots before this time; indeed I never have any to pot after the new year comes in. The plants are very impatient of want of attention to the watering of them; many of the pots become quite full of active roots, and in that state they require considerable supplies. As the sun becomes powerful the plants must be looked over daily. Weak liquid-manure water applied twice a week adds a darker tint to the leaves and more brilliant colour to the flowers. If the plants are well fumigated with tobacco-smoke up to the time the first flowers open the plants will be free from insect pests. *J. Douglas.*

been carried into practice by Messrs. Skinner & Board, horticultural builders, of Bristol. Such houses are, perhaps, best adapted for Peach-houses, for Strawberries, and Melons, Tomatos, Capsicums, Cape Gooseberries, and for hardy fruit cultivation in bad climates. The amount of opening can be regulated by a simple endless screw and hinged arms fixed on a movable iron rod. Such a house would also be well adapted for hardy and half-hardy Ferns, and the Himalayan varieties of Rhododendrons and Camellias; but Grapes grown with such ventilation would be most likely to suffer from rust and mildew, although the construction is well suited to give the Vines the fullest exposure during their period of rest. For Vineries during the growing period of the Vines the four lights in the middle of the roof should be made to disconnect, so that ventilation could be given only at the top and bottom of the house. Like all the labour-saving methods of ventilating, there remains the disadvantage of being obliged to give air to all

parts of a house at the same time—a most undesirable thing, especially for amateurs, and those who are constrained to carry on plant growing, raising plants from seeds, repotting, and pricking off young stock in one or two houses.

## SPIRÆA MEDIA

Var. ROTUNDIFOLIA (*S. rotundifolia alba*, Hort.)\*

THE accompanying illustration (fig. 56) represents a well-marked and very desirable form of the variable and widely distributed *Spiræa media*, a species which appears to occur from Austria and Southern Russia to Amurland and Japan. Both botanically and horticulturally *S. media* comes very near *S. chamædrifolia*, with which it is very frequently confused. The distinguishing characters relied on by Regel are the

Gumbleton, who obtained his plant from Lemoine, of Nancy, who bought his stock at the Leyden nursery above referred to. In any case the plant is a very welcome addition to British shrubberies, it is a dwarf compact grower, produces an abundance of its corymbs of pure white scented flowers, and would probably force well. *S. oblongifolia* is a taller growing form, with ovate acute leaves, entire or toothed only near the apex. *George Nicholson, Royal Gardens, Kew.*

## THE PROPAGATOR.

### THE PROPAGATION AND CULTURE OF MARANTAS.

THE Marantas form a group of highly ornamental plants; their prettily coloured and variegated foliage

the surface, putting them a quarter of an inch apart, and then covering them with a quarter of an inch layer of soil, which should be lightly pressed down, and its surface levelled. After having been watered the pans should be plunged in cocoa-nut fibre or other material in a cutting case over a brisk bottom-heat. Here they should not be allowed to become dry, and they must be shaded from all sun as well as being ventilated for one hour at night and in the morning. When the seedlings have grown 1 inch in height they should be taken out of the case and placed upon the open bottom-heat for a few days to harden them a little, and so fit them for potting.

### POTTING THE PLANTS.

Each of the seedlings should be potted into a small thumb-pot, and when they have been watered they should again be placed in the cutting-case, plunging them in the cocoa-nut fibre as before. They should be as near the light as possible, and for ventilation the light of the frame should be raised 1 inch both day and night; in the morning and at evening they should be watered with a fine rose pot, and should always be shaded from the sun. The plants should be treated in this way until they are strong enough for, and require repotting, and then they can be taken from the frame to the open bottom-heat for a few days. At the end of that time they can be potted into small 60's, and after having been watered they should be plunged into a bed in a good growing house, and as near the glass as possible. They should be kept well syringed and shaded from the sun, and on every mild day a little ventilation should be given. The Maranta grows best in a warm moist atmosphere, but they cannot stand much sun; they should, therefore, be placed at the north side of the house, if possible. When the plants have become strong enough to be shifted, the stronger ones should be potted into large 48's, and the remainder into small 48's. Well water them and replace upon the open bottom-heat, but it is not necessary to plunge them in the bed. When they have rooted through the soil and become well established plants they can either be potted on or removed to any other warm house where they may be required. In potting plants into 60 and larger-sized pots, soil composed as follows should be used:—half good turfy loam, quarter peat, and quarter river-sand, to which should be added a small quantity of charcoal.

### 2. FROM CUTTINGS.

Some varieties, such as *M. Lietzei*, *M. Warscewiczii*, *M. bicolor*, and *M. sanguinea*, form young plants upon the tops of the old flower-shoots, and these when taken off as cuttings soon develop into nice plants. The young plant or growth should not be taken off the old flower-spike until it has put forth three or four leaves, and in making the cuttings about an inch of the old flower-stem should be left to each cutting.

### POTTING THE CUTTINGS.

In potting them small thumb-pots should be used, and each cutting should be firmly pressed into the soil, which should be similar to that used for the seeds. After watering them they should be placed in a cutting-case over a gentle bottom-heat. The case should be shaded during sunshine and ventilated for half an hour at night and in the morning, while the plants should never be allowed to become dry. When the cuttings have well rooted the light of the case should be raised an inch and kept so day and night for a few days, but at the end of that time they should be turned out upon the open bottom-heat. They will soon have gained enough strength to necessitate potting into large 60's. The plants must now be plunged in the bed of a good growing house, and over a brisk bottom-heat. Here they must be kept well watered and syringed twice a day, lightly shading them from the sun, and ventilating them a little upon every mild day. When they require repotting they should be shifted into large 48's. After this has been done they should be watered and placed upon the bottom-heat, there to remain until they have well rooted through the soil, and become well-established plants. They can again be potted if necessary, or removed to any other warm house.

### 3. BY DIVISION.

Having knocked the plant out of the pot, and shaken the soil from the roots, the first thing to be done is with a sharp knife to divide the plants into as many pieces as plants required; although

FIG. 56.—SPIRÆA ROTUNDIFOLIA ALBA.

angled branches and erect styles of *S. chamædrifolia*, and the cylindric branches and curved or horizontally-spreading styles of *S. media*. After examining a series of specimens of both species the last-named seems to me to have habitually stamens with shorter filaments than those of *S. chamædrifolia*.

*S. media* var. *rotundifolia* was introduced from Japan some years ago by Von Siebold, of Leyden, and the first mention of it appears in the *List of Novelties for 1882*, published by the establishment in question; I am unable to state whether it was discovered in a wild state, or is only one of the numerous plants cultivated in Japanese gardens. The specimen herewith figured was sent by Mr. W. E.

and compact habit are shown to good effect when tastefully arranged with Ferns or mosses, and some of the varieties are admirably suited for the front rows in decoration. With regard to their multiplication there are three ways by which these plants may be increased, viz.:—1, from seed; 2, from cuttings; and, 3, by division.

### 1. FROM SEED.

Purchased seed should not be relied upon, but the gardener should save his own seed. Marantas will come true from seed, but to obtain the latter it will be necessary to fertilise the flowers as soon as they open day by day, because the flower soon fades. Directly the seed is ripe it should be gathered and sown. Well-drained 48-sized pans should be filled with soil composed of equal quantities of peat, leaf-mould, loam, and sand, after it has been well mixed together and sifted through a ¼-inch sieve. The pans should be filled within a quarter of an inch of the rim, and the soil should be firmly pressed in with the bottom of another pot. The seeds can then be sown upon

\* *SPIRÆA MEDIA*, Schmidt, (Estr. Baumz., i., 53, t. 54; Körnicke, in *Gartenflora*, 1863; Maximowicz, adnot. de *Spiræaceis*, p. 187 (1870).  
*S. chamædrifolia*, Camb. Mon. Spir. in *Ann. Sc. Nat.*, i., 362; non L. nec Led. Fl. Ross., ii., 14.  
*S. oblongifolia*, W. and K. Pl. rar. Hung., iii., 234, p. 261; Led. Fl. Ross., ii., 13.  
*S. confusa*, Regel and Körnicke, Ind. Sem. Hort. Petrop. 1859, 58; *Gartenflora*, 1858, 48.

each piece should not have less than two leaves upon it. In potting a little sand should be placed at the base of each piece, and small or large 60-pots should be used according to the size of the piece, and in every case the soil should be firmly pressed into the pots. After they have been watered they should be placed in a close house upon open bottom-heat, and plunged in the bed. To shade them a few newspapers can be laid over them during sunshine. It will also be necessary to sprinkle them with a fine-rose pot five or six times a day until they have well rooted, and then it can be withheld. The pieces that have rooted can be potted into large 48's, and after watering them replaced upon the gentle bottom-heat in a good growing place on the north side of the house. Upon every fine day the house should be ventilated a little, and during sunshine should be shaded. The plants must be kept well watered at the roots, and thoroughly syringed twice a day. They should be treated in this way until they have well rooted through the soil, and become strong plants. If large plants are required they must be again potted; but if not, they can be removed from the bottom-heat, and placed in any warm house.

The above methods of propagation are applicable to all varieties of the Maranta.

In conclusion we should point out that, as some of the strong-growing kinds, such as *M. Veitchii*, do not produce young plants freely from the base of the plant, it is a good plan in such cases to pull out the centre leaf growth, and continue to do so until the plant is so reduced that it will send up suckers more freely from the base. *T. O.*

## HOME CORRESPONDENCE.

**Gardeners at the Present Time.**—The competition amongst nurserymen anxious to supply "noblemea and gentlemen" with that respectable commodity called gardeners is evidently getting very keen, but how far this anxiety to do business may be of advantage to the fraternity those of us who are in it are able to see by a reference to your advertising columns. "Scotch gardeners" in wholesale quantities, "trustworthy and competent," to be had "at £50 to £100 a year," and this in the year of our Lord 1885. I fancy some of my old "chums," Scotch friends, must feel highly flattered by this announcement. After spending from eight to fifteen years in acquiring a knowledge of the art—sufficient to enable one to conduct the affairs of a small or a large garden successfully and economically—it is somewhat discouraging to see "gardeners," "competent and trustworthy," put up Dutch auction fashion at £50 per annum. If I might be allowed to make a suggestion to such gentlemen, who display so much kindly interest in gardeners, it would be that they should offer at rates per hour instead of per annum, and they would then wake up to a knowledge of how "competency" and "trustworthiness" were being rewarded. "Save me from my friends" is an old proverb, never more true than when applied by gardeners to those gentlemen in the trade who compete with each other in keeping down a just remuneration to qualified gardeners. *Z. Stevens, Trentham.*

**Lælia anceps.**—Mr. Douglas recommends immediate potting for newly imported plants of this popular Lælia, but without disparaging his advice it might be said that there are good reasons for the adoption of block or raft treatment for these plants for at least the first year. As Mr. Douglas suggests, there is danger in surrounding the living roots of this Lælia with compost, and the love of snails for the young roots is a second source of danger. It is still a disputed question whether newly imported epiphytal Orchids should in any case be potted as soon as received—many eminent growers prefer to block them for a time. Of course, where blocks are used, atmospheric moisture is of greater importance to the plants than when their roots are in contact with compost or shaded by the pots. Blocked plants are generally hung near the glass, so that the plants' roots are exposed to light and air on every side. As an instance of what this Lælia when grown upon a trellis or block will do, the superb specimen of *L. anceps* Illini shown by Sir Trevor Lawrence at the last meeting of the Royal Horticultural Society may be pointed to. This plant bore two dozen flower-

scapes, and was much admired. An excellent substitute for the flat piece of board or portion of tree trunk sometimes used for block-loving Orchids is the teak raft, which is formed by narrow strips of wood fastened to transverse pieces so as to leave a little space between each strip. These rafts are largely employed both by nurserymen and amateurs. Instead of suspending the rafts so as to hang perpendicularly, they should be hung obliquely, so that the top or growing ends of the plants may point in a slightly upward direction. The advantage of this plan is seen in the plant being turned wholly to the light, and the bottom of the raft, instead of hanging so that it often gets the full force of the sun upon it, is turned towards the ground. Other advantages, which this method possesses over that of hanging the plants upright will readily suggest themselves. We must remember that although the epiphytal Orchids grow against the upright trunks of trees, light reaches them, not from behind nor from exactly overhead, but in front of them. Orchids which grow on the tops of trees or shrubs always turn their full face to the sun, or at least in an upward direction. *W.*

**Dendrobium speciosum.**—I see in the *Gardeners' Chronicle* of February 7 a few lines describing *Dendrobium speciosum* as a shy blooming species. My experience points to the contrary; it blooms with me yearly, once excepted, and that was on account of excessive moisture which caused decay. A plant now in my charge carries eight racemes, each one bearing forty-five to fifty-five blooms each. *William Batchelor, Gardener to Alex. Drueg, Esq., Dulwich Common, S.E.*

**Violets Swanley White and New York.**—I can fully endorse all that your correspondent, Mr. Rust, says in favour of the above (p. 249). They are, I fully believe, a pretty acquisition to this lovely tribe, in particular as being autumn and winter-flowering varieties. I have grown both kinds in pots this season, much to the satisfaction of all who have seen them. Quantities of good bloom have been, and are now being, regularly gathered. I advocate the planting of young stuff every season, and the present month is a good one for the purpose. Insert them into light compost a few inches apart, and when fairly established plant into cold pits near the light, finally planting them out on a shady border at 1 foot each way. Remove runners occasionally, and give plenty of rain-water in dry weather. *Thos. Garnett, Cavendish Gardens, S.W.*

**Camellias.**—A few days ago I saw a houseful of what had been a short time since a very nice healthy collection of Camellias, but at the time of my late visit they were in a yellow sickly condition, chiefly without flower-buds, and the worst of them almost without foliage. They were occupying a house facing west, and as well as I could judge there was nothing either in the position or construction of the house detrimental to the plants. The only probable cause of their present condition is that two years ago they were potted into a compost consisting of loam two parts, peat one part, leaf-mould one part, with a slight addition of sharp sand; and to the introduction of the leaf-mould was attributed their present state. Supposing the leaf-mould to have been well decayed and perfectly free from fungus, is it probable that it could have been the cause of the mischief? I make this inquiry because a few years ago a very similar case came under my observation, but on this occasion the misfortune was at first attributed to the use of water containing a good deal of lime. Soft water was then used, but with little or no improvement; the soil was then shook from their roots, and they were again potted into a compost in which the leaf-mould was omitted, when they soon began to improve and regain their former healthy condition. Camellias succeed well in good sandy peat, and so they will in light turfy sandy loam, but when leaf-mould is introduced they do sometimes fail, but not always. Why is this? *T. S. C.* [On the Continent leaf-mould that has laid long in the forest is used for Camellias without any admixture. Leaf-mould varies much according to the trees from which it is collected and the length of time it has lain. *Ed.*]

**Imantophyllum miniatum.**—I can recommend this plant to those who, having but a limited amount of glass, are expected to grow an unlimited amount of flowers; extravagance in these is now, indeed, the

order of the day, and gardeners with limited means must use their skill to keep up the supply. The above is of easy cultivation, and by having a dozen or two, and bringing a few at a time into heat, blooms may be had all the year round. I am also confident that the same plants have bloomed twice at least with me in one year. They may be easily multiplied by dividing, and should be repotted every second year, in a similar compost to what is used for *Eucharis*. Their blooms also contrast well with the blooms of the *Eucharis*, in fact I find both invaluable for winter decoration. I have had some with scapes bearing eighteen of their bright vermilion flowers. *A. MacDonald, Cheadle, Manchester.*

**The Ullucus** (see *Gardeners Chronicle*, p. 216, Feb. 14).—As far as I recollect, the Ulluco was imported and tried at Chiswick in Lindley's time, and with the same negative results. We are apt to forget the vast amount of good work done by the Society; work that has been going on like a quiet stream from the beginning, and aye is flowing still. I cannot concede that our Society was ever despised; certainly not by respectable people. Perhaps it was by the noble army of defaulters who took their tickets, enjoyed their privileges, and bolted without paying. Or was it confined to the little man who desired to look down with contempt upon us, but was obliged to get up in a chair to do it? The real friends of our dear old Society may rest assured, that after having taught horticulture in its highest sense to the whole civilised world, it can afford to be despised by those whose contempt is a compliment. *R. Trevor Clarke, Welton Place.* [The feeling was confined to certain bondholders, who had no sympathy except for their ducats, and which the Society financially ruined itself to provide without help from those who had the chief and permanent advantage of the afore-said ducats. *Ed.*]

**Brussels Sprouts: May's Northaw Prize.**—The above-named variety I consider to be the best I have ever grown, having stems 3 feet long entirely covered from top to bottom with medium-sized, firm, solid green sprouts. When cooked they are of excellent quality. For exhibition purposes it has no equal, this variety having taken 1st prize at South Kensington and Westminster Aquarium shows last autumn. *J. Edmonds.*

**Narcissus monophyllus** (Clusii and albus).—These beautiful snow-white flowers have been blooming with us from the middle of January, and will continue so for some weeks, under one of Boulton & Paul's frames. Early in autumn we planted the bulbs in a mixture of sand and loam, the bed raised a few inches above the general level, and covered with the frame, the lights raised sufficiently to admit air but to protect from the cold autumn rains. When the leaves had advanced an inch or two the sides of the frame were alternately raised, thus fully exposing the plants, except when there was a severe frost or heavy rains, then air only was admitted, and this will be followed till the weather becomes dry and warm, when the glass will be kept constantly down, only admitting air. *P. Barr.*

**The Earliest Narcissus.**—*Narcissus pallidus præcox* is now expanding its beautiful sulphur-coloured blossoms in the open, and will, as happened last year, be nearly a fortnight in advance of all others. In our bulb grounds, Tooting, the first flower opened about the 15th inst. *Barr & Son, Feb. 24.* [The flowers sent to us by Mr. Barr were well developed and perfect examples of these harbingers of spring. The pretty Hoop Petticoat is worth all the trouble of growing it as Mr. Barr does—in a frame. *Ed.*]

**Wall-fruit Tree Protection.**—Your correspondent, "A. L. 11." (p. 251) has done well in drawing attention to the question, as to whether glass copings for walls, as a means for protection against spring frosts, are really as useful and beneficial as some would have us imagine; and a discussion, giving us the opinion of practical men upon this important matter cannot fail to be both useful and interesting to your readers, more especially at this season of the year when the protection of fruit trees against frosts and cold winds is uppermost in our minds. My own experience—more especially considered from an economical point of view—is decidedly against the practice. In the first place, to cover a wall with glass coping 3 feet wide is rather

an expensive matter; and again, the subsequent cost of labour necessarily entailed through adopting this system would be considerable. Glass copings are permanent on the walls, and would obstruct the rains and dews throughout the year, thereby requiring a great amount of extra labour in order to keep the trees clear of the dirt and insects which would accumulate in such sheltered positions. The question of cost may not always be considered when good results are obtainable, but is it so in this instance? It is at least questionable. To my mind there are other methods of protection more simple, more economical, and more easily obtained, and I point to one in particular, which is also recommended by your correspondent "M. W.," p. 153, namely, that of tying Spruce Fir branches over the trees, which I have also adopted with excellent results. These or something similar can easily be obtained in most places, and it has this one great advantage over other methods, that as the season advances and the frosts and winds become less and less severe, the Fir branches become more and more destitute of foliage from constant dropping, so the trees become gradually hardened off, and when all danger of frosts is over the naked Fir branches can be taken off without injury to the trees. There are also several other simple methods, but to my mind none so good as this; and if we consider the difference of the cost of labour between Fir branches and glass copings the verdict must be given in favour of the former, and I do not hesitate to say, that trees protected by Fir branches in spring will produce at least quite as good, if not better, crops than those protected by glass coping. *Alfred Gant, The Gardens, Porter's Park.*

**Carter's Ashtop Fluke Potato.**—I missed noticing before Mr. Divers' allusion to this Potato (p. 90), in which he takes exception to my reference to it in a previous issue of the *Gardeners' Chronicle*. At that time I quoted a nobleman's head gardener as saying he was using it for frame culture, to succeed Myatt's Ashleaf, and that I had myself found it one of the earliest on a south border. That is quite accurate. Mr. Divers may at the same time have found it "a second early," by comparison, but he is mistaken in saying "it has always been classed as such in the catalogues." If he will turn to p. 31 of Carter's *Vade Mecum*, where it is fully referred to, he will see there is not a word as to its being a second early; on the contrary, that firm describes it as "the most perfect type of an early kidney," and I had mine from them direct. I understand there are several spurious sorts sold for this. *W. J. Murphy, Clonmel.*

**Some Permanent Beds for the Flower Garden: Bedding Out.**—How to diminish the quantity of bedding plants required to embellish the flower garden and pleasure ground during the summer season, that require the protection of glass during seven months of the year, is a problem that most gardeners would like to have solved in a satisfactory manner, for most are agreed that the room taken up and the time employed in attending to the ordinary class of bedding plants could oftentimes be used, when employers desire it, in a way that would give more varied and consequently pleasing results. My object is to show how some combinations can be produced with plants that are perfectly hardy, and at the same time be of no more trouble to the gardener than the usual bedding plants in summer and much less in winter. The Clematis stands foremost in the list of hardy bedding plants, for what can surpass a bed of Jackmanii edged with *Lonicera aurea reticulata*? I find one of the best-ways to manage the above is to plant the Clematis about a yard apart each way, and in two seasons they will have filled the bed. Then if it is desired some of the plants can be transplanted to form other beds. In after years I find the best way to manage them is soon after the foliage is dead to cut three-fourths of each plant down to the ground, the remaining portion can be layered by simply burying the shoots, leaving some of the eyes out of the ground, which method of treating them will soon fill the bed with a mass of roots, and plants can be procured in quantity for planting elsewhere; at the same time fork in plenty of good rotten manure. The *Lonicera* is best left all the winter; it forms a cheerful edging during the dull winter months, but about the end of March cut it down quite close to the ground; it will soon break strong, making a thick edging of golden foliage, and it is much better kept in order by this

treatment. Another good combination is a large circle, say 15 feet in diameter, centre planted with *Rudbeckia Neumannii*, a plant that requires transplanting every two years to make strong growth; next to that *Clematis Jackmannii*, edged with *Santolina iacana* or *Dactylis elegantissima*. Many effective beds can be formed of varieties of Clematis, but there is none to beat those of the Jackmannii type for the purpose, as they are strong growers, with great floriferousness. A large circle planted with Pampas-grass, edged with *Tritoma uvaria glaucescens*, forms a noble and attractive bed. During the past season a bed here was quite gay up to Christmas. *Tritomas* can be easily increased by cutting them up or by seed: some I sowed last January, and a few seedlings bloomed in autumn. Blue Delphiniums, mixed with dwarf plants of *Acer Negundo variegata*, the *Acer* being well cut back every year; dig in plenty of rotten manure in winter, which will cause the *Acer* and Delphinium to make strong growth, and a charming bed will result during summer. Yellow Spanish Broom, mixed with the copper-leaved Filbert, forms a very gay bed until the Filbert loses its leaves. *N.*

**Artificial Manure for Bulbs: Caution.**—Observing last year some remarkably fine Daffodils in flower in pots, I asked the secret of growing them, and received the following directions for a manure:—Superphosphate of lime, 34; nitrate of potash, 16; sulphate of lime, 25; nitrate of soda, 25—total, 100; quantity for a 32-sized pot, as much as would lie on a shilling. In autumn I began to experiment with it, and for a patch of Daffodils or Anemones in the open ground I mixed well with the soil above, below, and round the bulbs, at most a table-spoonful. This quantity was about equally spread in a cubic foot of soil. The bulbs so treated were carefully labelled. On going round and comparing them with those which had no manure, I find that the result of the chemicals has been deplorable. Some of the Daffodils have rotted in the ground without attempting to grow, while others are growing weakly. But the difference between manure and no manure is still more conspicuous in the Anemones. Those which were planted in the dressed soil are putting up a few threadlike stalks, and on examination many of the tubers seem dead, whilst those by their side in plain soil are healthy and vigorous and in forward bud. This experiment has been a warning to me not to play with artificial manures in gardening. *C. Wolley Dod, Edge Hall, Malpas.*

**The Mooncock Island.**—Has any one heard of the Cranberry (*Vaccinium oxycoccus*) being known by the name of Mooncock? In Anagarriff Lake, situated about 3 miles from Lough Neagh, in the North of Ireland, there are several small islands, one of which, from being almost covered with the Cranberry, is known by the above name. A pleasure party used annually, for a number of years, to visit the island in summer to indulge in the delicious cooling berries, which were extremely large and palatable. Jam was also made of the fruit, which was considered a great delicacy by the gentry in the district. Adjoining this, was another island, which for many years floated about from one end of the lake to the other. It was well clothed with small trees and Heath (the latter indigenous). I can well remember how on one occasion, during a series of storms, it moved almost the full length of the lake (about 1 mile) in less than a week, the movement being regulated by the prevailing wind at the particular time. Unfortunately, some years ago, this island got into shallow water, and has ever since remained permanent, the roots of the trees being now perhaps the most powerful agents in putting a stop to its wandering career. The advisability of again detaching it was seriously considered, but afterwards wisely abandoned. *A. D. Webster.*

**Mandevilla suaveolens.**—Old favourites disappear to make way for new, and this seems to have been the case with *Mandevilla suaveolens*, a plant that is now rarely seen, but which is one of the finest things in existence, as it has lovely pure white, sweet-scented, trumpet-shaped blossoms, as large as those of some of the *Dipladenias*, with which, in a cut state, those of the *Mandevilla* dress and associate well, forming a most pleasing contrast in their two distinct colours. Where plants appear at their best is when they are growing almost naturally, or with-

out much restraint, in the roof of a lofty conservatory, under which conditions I had the pleasure of seeing one last autumn at Hazelwood, near Watford, under the able management of Mr. Stannard, which had innumerable racemes of flowers that quite scented the house. So full and free of growth is this *Mandevilla* that it covers an immense space, and I remember meeting with one many years ago, in a span-roofed structure, that had found its way out through the openings where the lights were down, the long shoots of which plant were lying on the glass and blooming in the greatest profusion. The secret of success with it seems to be to keep it cool during the summer, and if possible, or convenient, syringed with plenty of clear water, as otherwise the leaves are sure to become infested with red-spider, for which reason we had to abandon its culture in our iron-roofed conservatory, where we could not keep it clear from that troublesome parasite; as the temperature in the summer runs very high, and the leaves always become very brown and shabby long before the summer was over. As the *Mandevilla suaveolens* flowers on the young growths, which run out yards in length, the way to treat it is to train the main shoots under the girders or rafters, and every year when spring comes round shorten the others back, soon after which all the back buds will break and reclothe the house. The most suitable soil to grow the plants in is a mixture of equal parts peat and loam, which should be used in a rough state on plenty of drainage, that the water, of which *Mandevilla suaveolens*, when growing and blooming, cannot well have too much, may pass away without souring the border and making it close. *J. Sheppard.*

**Pruning Dendrobiums.**—The tumbling acrobats who frequent country fairs are ever attempting to do things different to the rest of mankind. Were it not for this they would pass through the world unnoticed; they walk on their hands instead of their heels, yet the method of locomotion is so manifestly wrong that they get few imitators. Of a like character is the mischievous practice of cutting away the fresh living bulbs of Orchids. There is probably not an experienced Orchid grower in the country who has not tried it, and proved the mutilation to be as far wrong as it is opposed to common sense. The matter has been discussed and threshed out in a way to satisfy reasonable people, yet the upholders of the barbarous practice appear determined, directly or indirectly, to proclaim that it is right. The subject would not deserve notice were it not that when such teaching gains currency there are always some incautious enough to adopt it, in the way that there was when the practice was first mooted, the result of which was that the plants so treated, from being in a healthy thriving state, were so injured that they never recovered. *T. B.*

## The Herbaceous Border.

### EXCELLENT HARDY BORDER PLANTS.

**LYCHNIS VESPERTINA FL.-PL.**—A plant not half as much known as it should be, so showy and useful is it during the late summer months; planted in good soil it branches most copiously, forming a good mass of white flowers not unlike those of large double Chinese Primroses, and almost as useful in a cut state as these. The difficulty with which it is propagated has perhaps a great deal to do with its comparative scarcity in our gardens. Dividing is out of the question, and no seed is produced, while the striking of cuttings is a tedious and often perplexing business, unless one particular method is adopted, when with patience a stock may be had. The best way to manage this is to place a stock plant in gentle warmth at once, so as to excite growth; allow the young shoots to become drawn and get soft at the base; select the smallest of these, taking them off with a heel, insert in sand, stand in the same house, keep moist and covered with a bell-glass, when in due time, 90 per cent. will root; some, however, may be six months. I have known them to be longer than this, but although a trying business the game is well worth the powder, as the plant is such a good one.

### DORONICUM PLANTAGINEUM EXCELSUM

is of quite a different character, but equally desirable. In my opinion no herbaceous border

should be short of good masses of this, and these can soon be had in rich soil, for it grows most luxuriantly, especially if it is frequently split up, indeed if allowed to stand long in one position it deteriorates, the best plan is to divide it freely, selecting the strongest crowns each time. It flowers from early spring until cut down by frost. If thus handled, and if plants are lifted, potted, and placed in a cool greenhouse, its charming large yellow capitula may be enjoyed all through the winter. The Rev. Wolley Dod flowers it this way, and when well known it should be a conspicuous feature in such houses during the dull winter season. I recently saw a clump which was lifted at the end of December and placed in a very cool house, and it is now pushing up its flower-heads (January 27). I noticed in a contemporary lately Mr. Wolley Dod proposed the name of Harpur Crewe for this plant, which is, I think, a pity, for writing from memory I am under the impression the same gentleman named it *excelsum*, while it emanates from another source under the name of *Draytoniensis*; hence this beautiful plant, so far, has been christened not less than three times. I think the one here adopted, first registered in the *Gardeners' Chronicle*, should be considered first and best, however much one may desire to perpetuate the name of the enthusiast in whose garden it originated.

#### CHRYSANthemum atratum,

a name I cannot say is to be generally accepted. The first plants I ever saw of it were received from Mr. J. Whittaker, of Morley, who informed me he obtained it from the Liverpool Botanic Gardens. It is distinct from any of the other kinds I know, being much dwarfer than *Leucanthemum*, and one known as *maximum*; the leaves are also different, and the flower-heads are much larger, the ray-florets not so thickly set, but longer and narrower in proportion to their length, and certainly purer white. It is selected as the best by the merest tyro, and is likely to become a popular plant. It increases pretty freely by division, which, as far as I know, is the only way to augment the stock, as so far I have not seen seed produced.

#### GERANIUM ARMENIUM.

To get this beautiful Crane's Bill in the best condition it should be planted in a deep rich tilth, and then be allowed to remain for some years, the only attention needful afterwards being an annual top-dressing of manure; it will produce large branching heads 3 feet across, crowded with the large purplish-crimson flowers; and sometimes it seeds freely, by which means it may be readily increased, sowing the seed in pots in spring, and placing them in a cool-house or cold frame. By taking pieces of the root it may also be increased.

#### ACHILLEA PTARMICA FL.-PL.

An old and well known plant, nevertheless one of the best; no border should be without it, but plenty of room must be assigned, as it grows very freely, spreading beneath the surface at a great rate, quickly forming dense masses which, when crowded in the summer months with the white flower-heads, can scarcely be surpassed in effect, while it proves most valuable to cut flowers from. Wherever there is a large demand for cut flowers this should be freely planted, and when once a stock is secured there will be no difficulty to keep it, as it can be so freely divided.

#### SPIRÆA VENUSTA.

Some are inclined to throw cold water upon this plant, the reason I fail to discern, as it is certainly very beautiful when in flower. It grows from 3 to 4 feet high when happy, producing large cymes of deepish rose-coloured flowers, quite unlike any of the other "Meadow Sweets," and it grows very freely if planted in the right position. Herein lies the cause of much dissatisfaction I imagine; as it revels in a damp situation, partially shaded and well manured: thus treated it blossoms and increases freely, and the roots may be divided *ad lib.* after flowering, or as soon as the leaves show signs of decay.

#### ANTHERICUM LILIASTRUM, OR ST. BRUNO'S LILY

as it is popularly known, is also a very handsome and chaste plant when in flower, producing its tufts of grass-like foliage, and spikes of pure white flowers, with a sweet fragrance, supposed to be known by everybody ere this, but not represented in one-half of the principal gardens in the kingdom, as it should be. As it is such a sweet plant, large tufts of it should

adorn all borders; it thrives best in a rich holding soil, and the more it is divided, say yearly, the finer crowns are produced, and the larger and more floriferous will be the flower-spikes. Mr. Wood, of Kirkstall, recommends that it should be grown similarly to Lily of the Valley crowns, and when sufficient strength is secured pot them in the autumn, and when semi-established they may be gently forced and used for the conservatory or the individual flowers for cutting, &c.

## Reports of Societies.

### EDINBURGH BOTANICAL.

THE BUDS OF *PINUS SILVESTRIS*.—A paper on this subject was read by Professor Alexander Dickson at a recent meeting of the Edinburgh Botanical Society. He said:—

Many Coniferæ exhibit remarkable specialisation as regards branch development. In some, as in *Larix* and *Cedrus*, there is a marked tendency to a contracted development, or shortening of many of the shoots which appear as "spurs," with numerous leaves crowded together to form a fascicle. Here it is only certain of the shoots which are developed in this way, and of these it may happen that a spur of one season may next season become produced at its extremity in the ordinary elongated form with scattered foliage leaves. A further step in specialisation occurs in *Pinus*, where, in the adult condition, the leaves on the elongated shoots are reduced to chaffy scales, from whose axils buds are produced, which, after developing from 2–5 foliage-leaves, abort at the growing point. In this genus we had then the remarkable condition of the foliage leaves in the adult plant being developed exclusively in 2–5-membered fascicles on shortened and abortive branches, and as these are perfectly comparable to the spurs in the *Larch* and *Cedar*, they may likewise be described as spurs developing 2–5-membered leaf-fascicles. In *Pinus sylvestris*, and a number of other species, there are only two foliage-leaves in the fascicle, and hence it seems convenient to designate such spurs as bifoliar. These "spurs" in *Pinus* fall off bodily after a certain period—from two to five years according to the species—and, in this, as pointed out by Dr. James Stark\*, we have an approximation to this condition in many *Cupressineæ*, where the individual leaves are not shed, but where there is from year to year a shedding of leafy twigs, a phenomenon to which the term *cladotaxis* has been applied. The highest specialisation in branch-development occurring in the order is to be noted in the genera *Sciadopitys* and *Phyllocladus*, where in the adult state there are no foliage-leaves at all, the leaves being all reduced to the form of scales, and where the "leaf-function" is performed by green cladodes which are slender and needle-like in *Sciadopitys* and in the form of flat expansions in *Phyllocladus*. It is to be noted that in *Pinus*, with development of foliage-leaves exclusively on abortive spurs in the adult condition, the ordinary or unspecialised condition is exhibited in the seedling plant, where we have a development of foliage-leaves scattered on an elongated shoot—a condition which persists throughout life in such genera as *Abies* and *Picea*; and, similarly, we have in the seedling *Sciadopitys* a few genuine foliage-leaves immediately succeeding the cotyledons, although in later life we have the very highly specialised condition above described, where the foliage-leaves entirely disappear.

The specimen I now exhibit is one which I found in the neighbourhood of Biggar this winter. It is a small branch of *Pinus sylvestris*, the extremity of which has been destroyed—probably broken off. In consequence of this accident a large number of the "bifoliar spurs"—about twenty within a space of 3 inches below the injury—have been stimulated to further development, resulting in the production of a well-marked scaly bud placed between the basis of the two foliage-leaves of the original fascicle. It is further to be noted that the development of these buds is stronger the nearer their position to the seat of injury. In the more feebly stimulated spurs of this kind there is simply a closed scaly bud springing from between the bases of the two leaves of the fascicle; but in the stronger ones, near the seat of injury, the condition is somewhat different. In these the extremity of the spur produced beyond the bases of the two leaves of the fascicle does not immediately produce a closed bud, but before doing so develops a variable number of short but well marked foliage-leaves, and, in the very strongest ones, these foliage-leaves have secondary bifoliar spurs developed in their axils.

Such a specimen is interesting in two ways:—1st, as a well marked case of the development, in consequence of the removal of the extremity of the branch, of lateral buds, which would otherwise have remained more or less dormant—a phenomenon sufficiently familiar to the cultivator in his operations of pruning or "cutting back," 2d, as exhibiting, in the stronger buds above-mentioned, a reversion to the early or unspecialised condition in the development of foliage-leaves on the prolonged axis of the stimulated spur.

Abnormal development of this kind in *Pinus* is probably not very uncommon. Many years ago I observed very much the same condition in a branch of Scotch

\* On the Shedding of Branches and Leaves in Coniferæ. By Dr. James Stark (with notes by Professor Alex. Dickson). *Transact. Roy. Soc. Edin.*, vol. xxvii., pp. 651–9, plate xlv.

Fir, where the end of the shoot had been destroyed; and Dr. Masters, in his *Vegetable Teratology*, gives a figure where he represents the "ordinary arrangement of the leaves in fascicles of three" in *Pinus Pinea*, as contrasted with an "unusual arrangement of leaves of the same plant in spires."\* From his figure I should imagine that the abnormality represented was a spur stimulated to further growth, as in my specimen, from which the leaves of the original fascicle had fallen off; and it is further to be noted that the spirally-arranged foliage-leaves are of the same character—comparatively short—as in my case.

### ROYAL MICROSCOPICAL.

At a recent meeting of this Society Mr. A. D. Michael read a paper on the life-histories of some of the little known Tyroglyphidæ. In 1873 Riley published a report on the ravages of the Apple bark louse (*Aspidiotus conchiformis*), and described an *Acarus* which was supposed to destroy that pest, and which he thought might be the *Acarus malus* of Shimer. Riley only describes the female. Mr. Michael has found the *Acarus* in England under the bark of Reeds, destroying the Reeds, not feeding on any insect, and concludes that it is probably a feeder on various kinds of bark, not on animal life; he has traced the whole life-history. The male (previously unknown) presents the exceptional features possessed by Tyroglyphus carpi, discovered by Kramer in 1881, and the hypopial nymph has been figured by Canestrini and Fanzago in 1877, under the name of "parasite of an Oribata," but without explanation. Mr. Michael finds in the life-history of this *Hypopus* a confirmation of his views that the hypopial stage is not caused by exceptional adverse circumstances, as M'ginn supposes, but is an ordinary provision of Nature to insure the distribution of the species, which it is intended to call *T. corticalis*. Mr. Michael also called attention to the prevalence of *Rhizoglyphus Robini* on Dutch bulbs imported into England in 1884, and to the destructive nature of that species and the damages it did to Hyacinth, Dahlia, and *Eucharis* bulbs, &c., and recommended that imported bulbs should be carefully examined.

Feb. 19.—Dense fog from 11 A.M. to noon; very fine day and night.

- 20.—Dull throughout.
- 21.—Very fine, bright day and night.
- 22.—Dull day; drizzling rain all afternoon. Fine clear night; lunar halo.
- 23.—Very fine day and night; lunar halo.
- 24.—Very fine day and night.
- 25.—Rain falling all morning; fine afternoon, no rain from 2.30 P.M., very fine clear night.

LONDON: Atmospheric Pressure.—During the week ending February 21, the reading of the barometer at the level of the sea decreased from 29.72 inches at the beginning of the week to 29.20 inches by 5 P.M. on the 16th, increased to 29.83 inches by 9 A.M., decreased to 29.78 inches by 1 P.M., increased to 29.79 inches by 5 P.M. on the 19th, decreased to 29.67 inches by 9 A.M. on the 20th, increased to 30.21 inches by 9 A.M. on the 21st, and was 30.17 inches by the end of the week.

The mean reading of the barometer for the week was 29.64 inches, being 0.26 inch lower than last week, and 0.35 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 56°, on the 16th; the highest on the 20th was 39°.5. The mean of the seven high day temperatures was 46°.1.

\* *Vegetable Teratology*, p. 89, fig. 41.

The lowest temperature was 26°, on the 21st; on the 16th the lowest temperature was 46°.5. The mean of the seven low night temperatures was 35°.4.

The greatest range of temperature in one day was 15°, on the 21st; the smallest was 5°, on the 15th. The mean of the seven daily ranges was 10°.7.

The mean temperatures were—on the 15th, 47°.7; on the 16th, 49°.8; on the 17th, 41°.3; on the 18th, 38°.1; on the 19th, 35°.1; on the 20th, 35°.2; on the 21st, 33°.1; of these the first three were above their averages by 9°, 11°.1, and 2°.6, the rest were 0°.7, 3°.7, 2°.7, and 5°.9 respectively below their average.

The mean temperature of the week was 40°, being 5°.8 lower than last week, and 1°.4 above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 102°, on the 21st. The mean of the seven readings was 67°.6.

The lowest reading of a minimum thermometer with its bulb placed on grass was 19°, on the 21st. The mean of the seven readings was 27°.8.

**Rain.**—Rain fell on three days to the amount of 0.94 inch, of which 0.61 inch fell on the 16th.

**ENGLAND: Temperature.**—During the week ending February 21, the highest temperatures were 56°, at Blackheath, 55° at Truro, 53°.2 at Cambridge; the highest at Sunderland was 41°, at Sheffield and Hull 43°. The general mean was 48°.

The lowest temperatures were 20°, at Cambridge, 21°.8 at Wolverhampton, 22° at Sheffield; the lowest at Plymouth, Brighton, and Sunderland, 29°. The general mean was 24°.9.

The greatest ranges were 33°.2 at Cambridge, 30°.1 at Bristol, 30° at Truro and Blackheath; the smallest ranges were 12° at Sunderland, 16°.2 at Liverpool, 17°.5 at Preston. The general mean was 23°.1.

The mean of the seven high day temperatures was highest at Truro, 49°.3, at Plymouth 48°.5, at Blackheath 46°.1; and was lowest at Bolton, 37°.4, at Sunderland 39°.7, at Liverpool and Bradford 40°.3. The general mean was 42°.9.

The mean of the seven low night temperatures was highest at Plymouth, 38°, at Truro and Brighton 37°; and was lowest at Hull, 28°.3, at Bolton 28°.8, at Wolverhampton 29°.1. The general mean was 32°.4.

The mean daily range was greatest at Leeds, 14°, at Hull 12°.4, at Truro and Wolverhampton 12°.3; and was least at Brighton, 7°.2, at Liverpool 8°.3, at Bolton 8°.6. The general mean was 10°.5.

The mean temperature was highest at Plymouth, 42°.8, at Truro 42°.7, at Brighton 40°.2; and was lowest at Bolton, 32°.8, at Hull 34°.1, at Bradford 34°.6. The general mean was 37°.2.

**Rain.**—The largest falls were 1.24 inch at Brighton, 1.21 inch at Sheffield, 1.16 inch at Bristol; the smallest fall was 0.19 inch at Sunderland, 0.59 inch at Cambridge, 0.70 inch at Liverpool. The general mean fall was 0.88 inch.

**SCOTLAND: Temperature.**—During the week ending February 21, the highest temperature was 47°.2, at Edinburgh; at Leith the highest was 40°. The general mean was 44°.

The lowest temperature in the week was 20°.3, at Aberdeen; at Paisley the lowest temperature was 27°. The general mean was 24°.2.

The mean temperature was highest at Paisley, 35°.1; and was lowest at Dundee, 32°.5. The general mean was 33°.7.

**Rain.**—The largest fall was 0.76 inch, at Greenock; the smallest fall was 0.02 inch, at Edinburgh. The general mean fall was 0.21 inch. No rain fell at Aberdeen.

JAMES GLAISHER, F.R.S.

**SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, February 23, 1885; issued by the Meteorological Office, 116, Victoria Street, London, S.W.:**—*Weather* was cold and generally fair during the greater part of this period, but towards its close it became milder and rough, with rain in the S. and S.W. and much snow, sleet, or rain in the N. and N.W. A thunderstorm was experienced in the S.W. of Ireland on the 21st and another in the Hebrides on the 22d.

*Temperature* has been below the mean in all districts, the deficit ranging from 1° in the "Channel Islands" to between 3° and 5° in most other districts and 6° in "Scotland, N." The highest of the maxima were registered on the 22d or 23d, and varied from 49° in "Scotland, N." to 55° in "England, S.W." and "Ireland, S." The minima, which were recorded either on the 20th or 21st, were lower than for many weeks past; in "Scotland, N." the thermometer fell to 9° and in "Scotland, E." to 15°, while in nearly all other districts it sank to between 18° and 23°. In the "Channel Islands," however, the lowest reading was 35°.

*Rainfall* has been rather more than the mean in "Scotland, N.," "England, N.W.," over Ireland, and in the "Channel Islands," but a little less elsewhere.

*Bright sunshine* shows a decided increase, the percentages of the possible duration varying from 17 in "England, N.E.," to 38 over Ireland and to 46 in "Scotland, E."

*Depressions observed.*—The distribution of pressure has been subject to considerable changes. At the commencement of the week the barometer was highest over the south of France, while shallow depressions were shown over Denmark and off the west of Norway, and other small shallow disturbances over southern England. On the 19th and 20th pressure was comparatively high in all the more northern parts of our area, while a depression moved eastward over the Bay of Biscay and France. By the 21st a large anticyclone had been formed over England, the North Sea, and the north of France, while a large and deep depression, whose centre subsequently travelled north-eastwards outside our western and north-western coasts, was approaching our western stations. During the first two days of the period the wind was generally moderate, between west and north-west, and on the 19th and 20th moderate to fresh from the eastward, but on the appearance of the depression in the west it shifted to the south-eastward and southward, and increased to a gale on all our coasts. In Scotland and the north-west of Ireland the gale was of unusual violence, and was accompanied by heavy snow, sleet, or rain.

## Obituary.

WE greatly regret to hear of the sudden death from heart disease of Mr. WILSON, who for the last twenty-nine years had been gardener to the Duke of Norfolk at Arundel Castle. Mr. Wilson was in the sixty-fifth year of his age, and up to the time of his death was engaged in carrying out the extensive improvements in the Castle gardens, which we noted only a few months since. Mr. Wilson was an excellent example of the good old school of "all round" gardeners, who aimed at general excellence in all departments committed to his charge. The demands upon his talents and ability were exceptional in some particulars, but were fulfilled in the most satisfactory manner.

## Enquiries.

"He that questioneth much shall learn much."—BACON.

**DAUBENTONIAS.**—Can any reader tell me how to grow and flower the different species of this genus? *Foreign Subscriber.*

**THUIA GIGANTEA (LOBBI).**—At Wiston Park, Sussex, is a tree of this species, planted in 1856, the girth of the stem at 3 feet from the ground being 5 feet 2½ inches. Is there any larger than this in the country? B.

## Answers to Correspondents.

**CAMELLIA: B.** The plant was named by Linnæus in honour of Father Camelli, and hence should be spelt *Camellia*. Camelli was a Jesuit missionary, who made large botanical collections in the Philippine Islands.

**COLOURED PLATE OF HOLLYHOCK: F. Dawber.** No; there has been no such plate issued by us.

**CORRIGENDA.**—In our report of "Membrand," p. 238, line 20, read *spur* for *span*, and p. 239, line 18, read Hathaway's Excelsior and Stamfordford, instead of Hathaway's Stamfordford Excelsior.

**DEFORMED SEQUOIA: F. W.** Yes; but inadvertently omitted in our Communications Received.

**EXUDATION ON CAMELLIA LEAVES: Amateur.** As there are no creepers that would account for the appearance on the leaves, we are constrained to believe it to be an exudation from the leaves themselves; and

that such does occur there is no doubt, although in other cases the effects witnessed are due to aphides. The subject is still an obscure one, and no satisfactory explanations have been given for these states of the foliage of Camellias and other plants under glass and outside. The change to black may be occasioned by smut, dust, and exposure to the air.

**GRANT ALLEN'S COLOURS OF FLOWERS: P.** Except on the topsy-turvy principle, we cannot see how the theory can be true. Asa Gray, moreover, points out that it is not the stamens that are yellow, but the pollen.

**HYACINTH BELLS: P. H.** We cannot undertake to name flowers from such scraps.

**KEW: Pilgrim and Others.** The matter is under consideration. We strongly sympathise. The difficulty would lie in the carrying out your proposals, which in themselves are excellent.

**NAMES OF FRUITS: Brown & Tweedie. Apple:** Blenheim Orange, a small example.

**NAMES OF PLANTS: Thomas Hughes.** Lagerstroemia indica; of course, introduced into Buenos Ayres.—*A. E. Smith.* *Cologyne breviscapa*, probably; but please send particulars as to the form of the bulbs, foliage, &c.—*H. M. H.* A form of *Lælia anceps*; *Dendrobium heterocarpum*.—*R. A.* 1, *Maxillaria punctata*; 2, *Maddevalia polysticta*; 3, *Odontoglossum odoratum*; 4, *Eletia hyacinthina*, as far as we can tell from withered scraps.

**SEEDLING ORCHID: C.** The first notice we have of raising Orchids from seed dates from 1832, when the seeds of *Prescottia plantaginea* were raised in the garden of the Horticultural Society at Chiswick.

**TWO-WHEELED CART FOR SHIFTING LARGE PLANTS: W. Catterwell.** The address of the maker at Hackney is not known to us.

**WIRED GARDEN WALLS: E. Warner.** There is no harm in wiring garden walls provided the wire be of a fine description, and the trees are fastened to it with care. The worst wire is the thick galvanised fencing wire, and it is worst in its effects when it is at such a distance away from the wall, that there is a space of several inches between the two. When a tree lies close to the wall—as it would if the wire stud-holes were flush with the wall—there would be no motion whatever from wind, and consequently no friction to cause canker and gumming. The wire should be placed vertically, and fastened at top and bottom; this gives great rigidity, and, being close to the wall, shoots cannot get behind it.

POTATOES.—Magnum Bonums, 40s. to 70s.; Regents, 70s. to 90s.; Champions, 45s. to 60s. per 100. Markets have a downward tendency.

## SEEDS.

LONDON: Feb. 25.—There was very little business done on the seed market to-day, the attendance being small. Buyers generally seem this season determined to defer their operations until the latest moment. Red Clover seed can now be bought at rather less money, the tendency of values being adverse to holders. Imported Italian Rye-grass remains firm. Winter Vetches are scarce. Spring Tares sell at last week's rates. Feeding Linseed keeps steady. Canary, Hemp seed, and Millet are without quotable variation. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

## CORN.

At Mark Lane on Monday English white Wheats were quoted 6d. under the value on that day week. No change was quoted in red. Foreign Wheat met only a retail inquiry, and to effect sales in quantity lower rates must have been taken. Flour was a very slack sale, with prices in buyers' favour. Barley met a very dull sale; grinding qualities were 3d. to 6d., and malting are 3d. to 6d. lower. Beans and Peas were quiet and unchanged. Maize was in steady demand, and rather firmer. Oats were 3d. to 6d. higher on the week, and in steady demand.—On Wednesday both Wheat and flour were dull of sale, and quotations nominally unchanged. Barley, Beans, and Peas met only a limited inquiry. Maize was firm, and Oats, with small importations, were the turn dealer.—Average prices of corn for the week ending February 21:—Wheat, 32s. 4d.; Barley, 31s. 10d.; Oats, 20s. 8d. For the corresponding period last year:—Wheat, 36s. 11d.; Barley, 31s. 10d.; Oats, 19s. 5d.

## HAY.

Tuesday's Whitechapel Market report states that there was a good inquiry, with a brisk trade. Quotations:—Clover, prime, 85s. to 102s. 6d.; prime second cut, 85s. to 102s. 6d.; inferior, 46s. to 73s.; hay, prime, 76s. to 90s.; inferior, 30s. to 65s.; and straw, 22s. to 34s. per load.—On Thursday there was a fair supply, and trade moderately active.—Cumberland Market quotations:—Clover, best, 90s. to 105s.; inferior, 60s. to 84s.; meadow hay, best, 80s. to 88s.; inferior, 60s. to 75s.; and straw, 29s. to 34s. per load.

## POTATOS.

The Borough Market report states that there were fair supplies, and trade steady at the following quotations:—Scotch Regents, 90s. to 100s.; Kent ditto, 70s. to 85s.; Champions, 50s. to 60s.; Magnum Bonums, 60s. to 80s.; and Victorias, 70s. to 90s. per ton.—The imports into London last week consisted of 48 bags from Hamburg, 1 Rotterdam, 2221 Harlingen, 178 Boulogne, and 112 bags 63 cases from Malta.

## COALS.

The prices current at market during the week were as follows:—Betside West Hartley, 14s. 9d.; Ravensworth West Hartley, 14s. 9d.; Walls End—Tyne (unscreened), 11s. 3d.; Hetton, 16s.; Hetton Lyons, 14s.; Lambton, 15s. 6d.; Wear, 14s.; East Hartlepool, 15s. 3d.; South Hartlepool, 14s. 3d.; Tees, 16s. 6d. and 16s.

## PURCHASERS OF GARDEN SEEDS

ARE REMINDED THAT THE ONLY GOLD MEDAL AT THE HEALTHERIES WAS AWARDED TO

MANURES, GARDEN STICKS, VIRGIN CORK, 10-BACCO CLOTH, RUSSIA MATS, &c. Write for Free Price List.—H. G. SMYTH, 21, Goldsmith's Street, Drury Lane (lately called 17A, Coal Yard), W.C.

THOMSON'S VINE AND PLANT MANURE.—We are daily getting letters asking us how to apply this manure, from persons who have purchased it from nurserymen who have had none from us. We beg to intimate that we have no responsibility for the quality of the article they have purchased, which may have little in common with ours, though advertised as the same. WM. THOMSON AND SONS, Clonfert.

TOBACCO CLOTH and PAPER, finest and most effective, 14 lb. for 9s.; 28 lb., 18s.; cwt. 70s. Special quotations for the Trade. J. DENVN, Manufacturer, 73, Rendlsham Road, Clapton, E.

# THOMSON'S VINE AND PLANT MANURE.

This Manure is now solely manufactured by us, on our Premises here, and can be had through all Nurserymen and Seedsman, or direct from us.

We will be happy to forward Descriptive CIRCULARS, in reply to applications, containing terms, &c.

*Intending Purchasers are requested to see that they obtain the Manure manufactured by us.*

WM. THOMSON & SONS,  
TWEED VINEYARD, CLOVENFORDS, GALASHIELS, N.B.  
February 11, 1885.

GRATE BARS;

**SADDLE BOILERS.**

With WATERWAY BACKS, and WELDED BOILERS,  
which are Specially adapted for Heating Greenhouses, Conserva-  
tories, Churches, Chapels, Schools, Public Buildings, Entrance  
Halls, Warehouses, Workshops, &c.

They are the neatest, cheapest, most effective, and durable  
of any extant.

The Tubular ones are remarkable for their great heating  
power, slow combustion, and the length of time the fire will  
burn without requiring attention. This pattern

Had the First and Highest Prize, a Silver Medal,  
Awarded to it at the Royal Horticultural Society's Exhibition,  
South Kensington, London, on June 3, 1884.

The Journal of Horticulture of June 9 says:—

"HEATING APPARATUS.—A great number of boilers, valves,  
&c., were exhibited by eight competitors, and considerable  
interest was manifested in the verdict of the judges, and much  
discussion was brought to bear on the merits and shortcomings  
of the different boilers. The apparatus for which the Silver  
Medal was awarded was a wrought-iron saddle boiler, with a  
series of intersecting tubes, somewhat in the form of a letter X,  
but the tubes in ogee form, in the crown of the boiler. Most  
gardeners who examined the boiler expressed a favourable  
opinion of it. It is no doubt a quick and powerful boiler with-  
out being complex, the latter condition having, no doubt, had  
weight with the judges."

The Garden of June 11 says:—

"The premier prize, a Silver Medal, was taken by Messrs.  
Green & Son for their new patent tubular saddle boiler. It is a  
modification of their original patent, the boiler being longer and  
not so high. It is found to be a powerful and efficient boiler, and  
heats a large quantity of water quickly with a small consumption  
of fuel."

Descriptive Illustrated Price List may be had free on application.  
Estimates given for all kinds of Heating Apparatus, and Hot-  
water Fittings of every variety supplied on the shortest notice.  
Galvanised Iron Cisterns, from 4d. to 1s. 6d. per gallon.

**IMPROVED VINE ROD FASTENER,**  
PATENT.

Vine Rods are now attached to the wire, or lowered to be  
pruned, in a few moments. The fastener is always ready, and  
being made of strong material will last several years. Many ex-  
perienced Vine growers have already adopted it, and expressed  
their entire approval of the result. Box containing 6 dozen,  
price 5s.

Sold by R. H. AND J. PEARSON, 141 and 143, High Street,  
Notting Hill, W.; and J. W. DART, St. Aubin's, Jersey.

HIRST, BROOKE, AND HIRST, Manufacturers, Leeds,  
Yorkshire.

Oil Paint no Longer Necessary.  
**HILL AND SMITH'S BLACK VARNISH,**  
for Preserving Ironwork, Wood, or Stone.  
(Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertiser, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 15. 6d. per gallon, at the Manufactory, or 15. 8d. per gallon carriage paid to any Station in the Kingdom.

## UNSOLICITED TESTIMONIAL.

"Pierrefield Park, June 21, 1876.—Sirs,—I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chepstow.—I am, Sirs, yours respectfully, Wm Cox."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large illustrated CATALOGUE of Fencing Hurdles, Field and Entrance Gates, &c., sent free on application to  
HILL AND SMITH, Brierley Hill Ironworks, Staffordshire;

## Roshier's Garden Edging Tiles.

**THE ABOVE** and many other PATTERNS are made in materials of great durability. The plainest sorts are specially suited for KITCHEN GARDENS, as they barbour no Slugs or Insects, take up little room, and, once put down, incur no further labour or expense.

as do "grown" Edgings, consequently being much cheaper. GARDEN VASES, FOUNTAINS, &c., in Artificial Stone, very durable and of superior finish, and in great variety of design.

**BUY ONLY ENGLISH THREE-QUARTER PLATE  
WATCHES.**

**BENSON'S NEW PATENT (No. 4658)  
"LUDGATE" WATCH,**

SILVER,

£5 5s.

GOLD,

£12 12s.

Is a "Special Strength" Silver English Lever, my best London make, with Three-quarter Plate Movement.

Jewelled throughout.

Chronometer balance, with damp and dust proof Patent ring band, and extended barrel, in Massive sterling silver dome cases.

With crystal glass front.

Winds, set hands and opens at back.

The superiority in value, accuracy, and durability of the "Ludgate" Watch over the Swiss and Americo Keyless and Non-Keyless Watches, made in imitation of and sold as English work, and the ordinary Full-plate English Watch is enormous. The "Ludgate" Watch is compact, strong, handsome, and durable. Being Three Quarter Plate, it is superior in value and appearance to any £10 Watch sold, and, being compensated, it keeps perfect time; fitted with crystal front, it combines the strength of the Hunter, and convenience of the open face. Of my best London make, it will last a lifetime, stand rough usage of all and every kind without damage, and, being made in three sizes, it is for the above reasons suited for Home, Indian, and Colonial use by

Gardeners, Workmen and Gentlemen.

The "Ludgate" Watch is far superior

To any Watch at the price yet made, and

Will be sent free and safe at our risk

To all parts of the world for £5 ss.

Cash or P.O.O.; or in hunting cases, £6 6s.

Price in 18-carat gold, crystal glass cases,

Twelve Guineas

**SPECIAL NOTE** that J. W. BENSON is the only Maker of a Three-Quarter Plate English Watch for £5 ss. in Silver, or £12 12s. in Gold, and that our Patent "Ludgate" Watch cannot be had through or of any Watchmaker in the Kingdom. Any infringement of the Patent Rights will be proceeded against. A Book explaining the advantages of this Watch over the Full-plate English Watches sold by all other makers, will be sent Post-free on application to

**TO GARDENERS, &c.**—Wanted, a situation under a Gardener for a lad of 15. Premium given.—H. C., Latimer Cottage, Church Road, Teddington, Middlesex.

## GRATEFUL—COMFORTING. EPPS'S COCOA. BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." *Civil Service Gazette.*

Made simply with boiling water or milk. Sold only in Packets, labelled thus:—  
**JAMES EPPS & CO., Homœopathic Chemists, London.**

**HOLLOWAY'S PILLS.**—No Mystery.—Whenever the blood is impure or the general health is impaired, the human body is predisposed to attacks of any prevailing epidemic. The first indications of faulty action, the first sensations of deranged or diminished power, should be rectified by these purifying Pills, which will cleanse all corrupt and reduce all erring functions to order. These Pills counteract the subtle poisons in decaying animal or vegetable matter, and remove all tendency to bowel complaints, biliousness, and the host of annoying symptoms arising from foul stomachs. The fruit season is especially prone to produce irritation of the bowels and disorders of the digestive organ; both of which dangerous conditions can be completely removed by Holloway's corrective medicines.

# GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING and COLLECTING MACHINES for 1885.

THE WINNERS OF EVERY PRIZE IN ALL CASES OF COMPETITION.

Patronised by Her most Gracious Majesty the Queen on many occasions, His Royal Highness the Prince of Wales, the King of the Belgians, the late Emperor of the French, the Emperor of Russia, and most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. The "Journal of Horticulture," of June 9, says:—"MOWING MACHINES.—After a critical examination the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. Green & Son, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 125,000 of these Machines have been sold since they were first introduced in the year 1856,

And thousands of unsolicited Testimonials have been received testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every prize that has been given.

The following are their advantages over all others:—

- 1st. Simplicity of Construction—every part being easily accessible. 2d. They are worked with much greater ease than any other. 3d. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

## SINGLE-HANDED LAWN MOWER.

To cut 6 inches, can be worked by a Lady	Price £1 15 0
To cut 8 inches, do. do.	2 10 0
To cut 10 inches, do. by a strong youth	3 10 0
To cut 12 inches, do. by a man	4 10 0
To cut 14 inches, do. do.	5 10 0

## DOUBLE-HANDED LAWN MOWER.

To cut 16 inches, do. one man on even lawn	£6 10 0
To cut 18 inches, do. man and boy	7 10 0
To cut 20 inches, do. do.	8 0 0
To cut 22 inches, do. two men	8 10 0
To cut 24 inches, do. do.	9 0 0

\* If made stronger, suitable for Donkey, 30s. ext a

Prices of Donkey, Pony, and Horse Machines, including Patent Self Delivery Box, or Side Delivery, with Cross-stay complete, suitable for attaching to Ordinary Chaise Traces or Gig Harness:—

### DONKEY and PONY MACHINES.

To cut 26 inches	£14 0 0
To cut 28 inches	16 0 0
To cut 30 inches	18 0 0
Leather Boots for Donkey	1 0 0
Leather Boots for Pony	1 4 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machine makes little noise in working, the most spirited animal can be employed without fear of it running away, or in any way damaging the machine.

Packing Cases as per List.

### HORSE MACHINES.

To cut 30 inches	£22 0 0
To cut 32 inches	26 0 0
To cut 34 inches	30 0 0

STOVE and GREENHOUSE PLANTS, ORCHIDS, &amp;c.

MR. J. C. STEVENS has received instructions to sell by AUCTION, on the Premises, as above, without the least reserve, on MONDAY and TUESDAY, March 16 and 17, at half-past 12 o'clock precisely each day, the COLLECTION of STOVE and GREENHOUSE PLANTS formed by E. J. Coleman, Esq., comprising fine Standard, Half-Standard, and Pyramid Azaleas, Camellias, Orange Trees, Eucharis, Crotons, Dracænas, Greenhouse Rhododendrons, &c.; also the ORCHIDS, including many specimen plants of *Dendrobium nobile*, *Cattleyas*, *Lælias*, *Odontoglossums*, *Phalænopsis*, *Cælogynis*, and other species; a quantity of *Callas*, *Fuchsias*, *Primulas*, *Pelargoniums*, *Bouvardias*, *Strawberry Plants*, &c.

On view Saturday prior and mornings of Sale, and Catalogues had on the Premises, &c. of Mr. J. C. STEVENS, 38, King Street, Covent Garden, W.C.

Flowering Orchids.

MR. J. C. STEVENS begs to announce that his next SALE of FLOWERING ORCHIDS will take place at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY, March 18. Gentlemen desirous of entering Plants for this Sale will please send particulars not later than THURSDAY NEXT, March 12.

Caversham Park, Reading.

MR. J. C. STEVENS has received instructions from the Executors of the late Mrs. Crawshaw, to sell by AUCTION, on the Premises, as above, EARLY IN MAY, without reserve, the collection of STOVE and GREENHOUSE PLANTS, consisting of Crotons, Dracænas, Marantas, Palms, Allocasias, Camellias, and Azaleas, Ferns, &c.; also 12,000 BEDDING PLANTS, of all the best varieties; a small collection of ORCHIDS, including several nice plants of *Dendrobium nobile*, *Cypripedium isopseum*, *C. venustum*, *C. barbatum*, *Cattleyas* of sorts, *Arthurius*, *Scherzerianum*, and other species; a quantity of IMPLEMENTS, comprising 3 Rollers, Water-barrows, Cans, Tanks, Mowing Machines, Farm and Spring Carts, together with a Cart-horse, Cob, &c. Date of Sale will shortly be announced.

A Most Magnificent New Cattleya.

MR. J. C. STEVENS will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., by order of Mr. F. Sander, at an EARLY DATE, a grand importation of a most magnificent new CATTLEYA, and one of the very finest novelties we have introduced for years. It has just been brought home by Mr. E. Seidl from the Roraima Mountains; it is as rare as it is beautiful, and the importation is in superb order. Full particulars in next week's *Gardeners' Chronicle*.

Orchids from the Roraima Mountains.

MR. J. C. STEVENS will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., by order of Mr. F. Sander, at an EARLY DATE, a superb Collection of ORCHIDS, from the Roraima Mountains, just brought home by his collector, Mr. E. Seidl. Full particulars in next week's *Gardeners' Chronicle*.

Tuesday Next.

LÆLIA ANCEPS SCHRODERIANA, new pure white LÆLIA ANCEPS.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions from Mr. F. Sander to sell by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on TUESDAY, March 10, at half-past 12 o'clock precisely, a small but especially fine importation of LÆLIA ANCEPS SCHRODERIANA, Rchb. f., several great masses being amongst them.

This is undoubtedly the finest white variety ever offered. The whole flower is very large and pure white, and entirely distinct from any of the white forms; the throat striped crimson, and the lip extra broad and square, and an inch across or even more. Mr. Edward Klaboch, who has collected every plant in flower, states that this variety is particularly rare, and that the flowers are of great substance, far surpassing anything he has seen. He considers it the finest white *Lælia anceps* ever introduced. Every plant received will be included in this sale, and there are no more coming. *Lælia anceps Schroderiana* is described by Prof. Reichebach as follows:—

"There are before me twenty-seven brilliant dried lips, and a dried flower. The colours are purest white, the disc between lateral lacinia is orange, and the projecting keels running in the base of mid-lacinia are even deeper orange; there are three to five crimson-purple longitudinal and several forked lines radiating outwards. So much for the colour. The complete flower would appear to surpass the dimensions of *Lælia anceps Dawsoni*. The petals seem to be remarkably broad. The great merit of the plant consists in the lip, which is broad with short nearly rectangular blunt lacinia. The mid-lacinia is very broad, blunt, emarginate, and this lip is quite novel to me."

"The result of the description would be that the value of this remarkable white flower is admirably enhanced by the beauty of the great square and flat lip. This very ornamental Orchid bears fully the name of one of our most excellent orchidists, Baron Schroder, and it gives me great pleasure to attach the Baron's name to such a glorious *Lælia*."

It is one of the most recent and most brilliant introductions of Mr. F. Sander.

On view morning of Sale, and Catalogues had.

Tuesday Next.

LÆLIA ANCEPS STELLA, new White Anceps.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. F. Sander to sell by AUCTION at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on TUESDAY NEXT, March 10, at half-past 12 o'clock precisely, an importation of LÆLIA ANCEPS STELLA (new White Anceps). Prof. Reichebach writes:—"The flowers are of the greatest of the tribe, secrete, pure white. The lip's side lacinia are remarkably curved and broad in front, the long mid-lacinia is narrow at base, dilate and marginate in front; disc of lip and base of mid-lacinia orange, very numerous nerves both radiating outside as longitudinal ones with a deep point of rich scarlet-purple that nearly forms a dark blotch each side in front. This is the great mark of distinction of *Lælia anceps stellata*; it might be called *Dawsoni* or *Sanderiana*, but the anterior lacinia is half yellow and white in front. It is decidedly a very brilliant flower, and the importation is in Mr. Sander's hands." The importation is in grand order, and enormous masses are among them.

At the same time will be sold a fine lot of *ODONTOGLOSSUM ALEXANDRÆ* and many other *ODONTOGLOSSUMS*, and other ORCHIDS.

On view morning of Sale, and Catalogues had.

Important Sale of English-grown Camellias, beautifully set with bloom-buds, AZALEA INDICA and other GREENHOUSE PLANTS, 400 fine Standard and other ROSES, selected FRUIT TREES, Hardy CONIFERÆ, SHRUBS, AMERICAN PLANTS, DAHLIAS, LILIUUM AURATUM, &c.

MESSRS. PROTHEROE AND MORRIS will sell by AUCTION the above, at the City Auction Rooms, 38 and 39, Gracechurch Street, E.C., on TUESDAY, March 10, at 12 o'clock precisely. On view the morning of Sale. Catalogues had at the Rooms, and of the Auctioneers, 67 and 68, Cheapside, E.C.

Wednesday Next.

LILIUUM AURATUM, ROSES, PLANTS, &amp;c.

MESSRS. PROTHEROE AND MORRIS will sell by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on WEDNESDAY NEXT, March 12, at half-past 12 o'clock precisely, 6000 unusually fine and sound bulbs of LILIUUM AURATUM and IRIS KEMP-FERTI varieties from Japan, in fine condition; 1000 Standard, Half-Standard, and Dwarf ROSES of the best sorts, from English nurseries; CAMELLIAS, AZALEAS, AZALEA MOLLIS, PALMS, &c., from Belgium; African TUBEROSES, 3000 crowns LILY of the VALLEY, an assortment of hardy English grown LILIES and BULBS, GLADIOLI, DAHLIAS, BEGONIAS, GLOXINIAS, &c.

On view morning of Sale, and Catalogues had.

Wednesday Next.—To the Trade.

6000 LILIUUM AURATUM.

MESSRS. PROTHEROE AND MORRIS will sell by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on WEDNESDAY NEXT, 6000 exceedingly fine bulbs, just received from Japan.

On view morning of Sale, and Catalogues had.

Friday Next.—Mexican Orchids.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. G. Marriott to sell by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on FRIDAY NEXT, March 13, at half-past 12 o'clock precisely, the finest importation of MEXICAN ORCHIDS that has ever reached this country, consisting of a grand lot of *Epidendrum vitellinum majus*, *E. Parkinsonianum*, *E. nemorale majus*; *Cattleya citrina*, fine masses and extra large bulbs; *Odontoglossum maculatum*, *O. Rossi majus*, *O. cordatum*; *Oncidium suave*; *Lælia anceps*, *L. albida*, *L. majalis*, &c.; also a few ESTABLISHED ORCHIDS, including *Cattleya Skinneri alba*, *Cypripedium vexillarium*, *Odontoglossum polyanthum*, *Dendrobium Huttoni*, together with a large quantity of Orchids in flower.

On view morning of Sale, and Catalogues had.

Clapham Common, S.W.

ORCHIDS and GREENHOUSE PLANTS.

MESSRS. PROTHEROE AND MORRIS will sell by AUCTION, on the Premises, the Woodlands, Nightingale Lane, Clapham Common, S.W., five minutes' walk from Wandsworth Common Station, London, Brighton, and South Coast Railway, on WEDNESDAY, March 18, at 12 o'clock precisely, by order of F. Williams, Esq. (the freehold estate having been sold for building), a small but well-grown collection of ESTABLISHED ORCHIDS, including the whole of the choice STOVE and GREENHOUSE PLANTS—Crotons, Eucharis, Orange Trees, Camellias and Azaleas, including several extra fine plants; Palms, Ferns, &c. Also the GARDEN UTENSILS, MOWING-MACHINE, GARDEN FRAMES, VASES, GARDEN SEATS, 100 Iron HURDLES, and numerous effects.

On view day prior and morning of Sale. Catalogues had of the Gardener, on the Premises; or of the Auctioneers and Valuers, 67 and 68, Cheapside, E.C.

Important Unreserved Sale of the Signal Hall COLLECTION OF ORCHIDS.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions from Walter Williams, Esq., to sell by AUCTION, at their Central Auction Rooms, 67 and 68, Cheapside, London, E.C., on TUESDAY and WEDNESDAY, March 10 and 11, at half-past 12 o'clock precisely each day, this VALUABLE COLLECTION, which has been got together with great care during the last dozen years from the oldest established collections in the country, including types not lately imported, embracing a large number of specimen *Cattleyas*, the whole in robust health, including:—

<i>Cattleya Mossie</i> , beautiful old type; six grad specimens	<i>Cattleya Trianae alba</i> "Wallisi" "gigas" "Mendellii" "Eldorado" "Skinneri"
"Warneri"	"Warczewiczii delicata" (log)
"superba"	"labata" (autumn-flower)

Also *Trichocentrum albo-purpureum*, *Angraecum eburneum*, *Sobralia monantha*, *Epidendrum prismatocarpum*, *Oncidium myanthes barbatum*, *Oncidium ampliatum majus*, several *Odontoglossums*, *Dendrobiums*, *Oncidiums*, &c.

The whole of the Collection will be sold, and no plants will be disposed of prior to the Auction.

On view mornings of Sale, and Catalogues had.

Orchids in flower.—Special Sale.

MESSRS. PROTHEROE AND MORRIS beg to announce that their next SPECIAL SALE of ORCHIDS, in flower and in bud, will take place on TUESDAY, March 10, and they will be glad to receive notice of entries as early as possible.

**WM. CUTBUSH AND SON**  
 (Limited), Nurserymen and Seed Merchants, Highgate Nurseries, N.

### For Present Sowing.

The earliest in cultivation, dwarf and compact in habit, head firm and pure white, and well protected by the foliage. It stands dry weather better than any other variety.

Mr. GILBERT says it turned out the best of all he grew last season.

Mr. E. STEPHENSON, Thorngaby Hall, says:—"Your 'President' Cauliflower is not only the earliest but the most useful I have ever grown; we can plant it 3 or 4 inches closer than any other variety. The heads are very white and compact. I have grown it ever since it came out: I recommend it to all my friends."

Post-free on receipt of postal order or stamps for 1s. 6d.

**WILLIAM E. MARTIN**, Seed Merchant, Hull.

**Martin's President Cauliflower**  
 1s. 6d. per packet.

These splendid Decorative Plants become more and more general favourites, and cannot be recommended too much. Special offers will be sent on application.

## TUESDAY NEXT.

# LÆLIA ANCEPS SCHRODERIANA.

## NEW PURE WHITE LÆLIA ANCEPS.

**MESSRS. PROTHEROE AND MORRIS** are favoured with instructions from Mr. F. Sander to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on TUESDAY, March 10, at half-past 12 o'clock precisely, a small but especially fine importation of LÆLIA ANCEPS SCHRODERIANA, Rchb f, several great masses being among them.

This is undoubtedly the finest white variety ever offered. The whole flower is very large and pure white, and entirely distinct from any of the white forms; the throat is striped crimson, and the lip extra broad and square, and an inch across or even more. Mr. Edward Klaboch, who has collected every plant in flower, states that this variety is particularly rare, and that the flowers are of great substance, far surpassing anything he has seen. We consider it the finest white Lælia anceps ever introduced. Every plant received will be included in this Sale, and there are no more coming. Lælia anceps Schroderiana is described by Professor Reichenbach as follows:—

"There are before me twenty-seven brilliant dried lips and a dried flower. The colours are purest white, the disc between lateral laciniae is orange, and the projecting keels running in the base of mid-lacinia are even deeper orange; there are three to five crimson-purple longitudinal and several forked lines radiating outwards. So much for the colour. The complete flower would appear to surpass the dimensions of Lælia anceps Dawsoni; the petals seen are remarkably broad. The great merit of the plant consists in the lip, which is broad, with short, nearly rectangular, blunt side laciniae. The mid-lacinia is very broad, blunt, emarginate, and the lip is quite novel to me."

"The result of the description would be that the value of this remarkable white flower is admirably enhanced by the beauty of the great square and flat lip. This very ornamental Orchid bears fitly the name of one of our most excellent orchidists, Baron Schroder, and it gives me great pleasure to attach the Baron's name to such a glorious Lælia."

It is one of the most recent and most brilliant introductions of Mr. F. Sander.

On view morning of Sale, and Catalogues had.

## TUESDAY NEXT.

# LÆLIA ANCEPS STELLA.

## NEW WHITE ANCEPS.

**MESSRS. PROTHEROE AND MORRIS** are instructed by Mr. F. Sander to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on TUESDAY NEXT, March 10, at half-past 12 o'clock precisely, an importation of LÆLIA ANCEPS STELLA (new white Anceps). Prof. Reichenbach writes:—"The flowers are of the greatest of the tribe, stellate, pure white. The lip's side-laciniae are remarkably curved and broad in front, the long mid-laciniae is narrow at base, dilatate and marginate in front, disc of lip and base of mid-laciniae orange; very numerous nerves both radiating outside as longitudinal ones, with a deep point of rich scarlet-purple that nearly forms a dark blotch each side in front. This is the great mark of distinction of Lælia anceps vestalis—it might be called Dawsoni or Sanderiana—but the anterior laciniae is half yellow and white in front; it is decidedly a very brilliant flower, and the importation is in Mr. Sander's hands." The importation is in grand order, and enormous masses are among them.

At the same time will be Sold a fine lot of ODONTOGLOSSUM ALEXANDRÆ and many other ODONTOGLOTS, and other ORCHIDS.

On view morning of Sale, and Catalogues had.

**NEW MAGNIFICENT BLACKBERRY,**  
**"THE WILSON JUNR."**

In spite of the fact that Blackberries will grow "anywhere" in reason, and everybody likes them, it is yet a puzzling reality that it is only with great difficulty and at a high figure that we can purchase them in our markets.

Surely, then, it must be apparent to all farseeing "fruit growers" that instead of glutting the markets with Gooseberries, Currants, &c., they have here a fruit which, if planted upon any given area of land, will prove far more profitable than any other hardy fruit that could be grown.

And why?

Simply because for half-a-dozen years ahead, at least, the stock throughout the country will not have time to become so great as to exceed the demand.

Landowners, Stewards, and Gardeners, who have each year to show a balance-sheet "of profits," have here a very simple, safe method of for some years obtaining highly profitable results. Planted 3 feet by 8 feet requires at the rate of 18½ plants to an acre.

Gardeners also who grow for house consumption will find this fruit a valuable assistant. It will stand any treatment, and do well where other fruits would fail.

Whilst, however, we have the matter under consideration, do not let us fall into the mistake of planting any variety so long as it is a "Blackberry." Why not, for the sake of a slightly additional first expense, obtain the very "cream" of the family; or in other words, procure stocks of the hardiest, largest, most delicious, and most productive?

By pursuing this procedure the result repays the grower tenfold for the slightly additional first expense incurred.

It was this reasoning that caused us to give the subject our most careful study; the result of which is, we offer a variety, the grandest of the group, producing enormous berries, measuring on an average ¾ inches around, lengthwise, and the same dimensions crosswise. (This will give an idea of the profit to be derived from its culture as a market commodity.) The berries are also glesvy black, very early of exquisite flavour, and enormously productive—the heavy load of fruit often bending the canes to the very ground.

We can offer plants of this grand variety at 1s. 3d. each, 12s. per dozen, 85s. per 100, carriage paid.

We can offer other varieties as follows:—"LAWTON," "KITTA-TINNY," "PARSLEY-LEAVED" (*Rubus fruticosus lacinatus*), WILSON'S EARLY," at 9d. each, 8s. 6d. per dozen, 63s. per 100.

**HOW TO GROW ASPARAGUS.**

A POPULAR EXPLANATION OF THE BEST METHOD OF CULTURE.

By WILLIAM EARLEY.

London: BRADBURY, AGNEW, & CO., Bouverie Street, E.C.

# B. S. WILLIAMS'

## PRIZE STRAINS OF FLORISTS' FLOWERS, POST-FREE.

Sold only in Sealed Packets, bearing my Trade Mark. The quality of all is alike: the difference in price applies to the quantity of seed put into the packets.

### WILLIAMS'

Prize Strain of  
**BEGONIA HYBRIDA**, finest mxd.,  
per packet, 1s. 6d.

**BEGONIA HYBRIDA**, Tuberous  
rooted, for bedding, per packet  
1s. and 2s. 6d.

Saved from Strains which have  
taken First Prizes wherever ex-  
hibited.

### WILLIAMS'

Prize Strain of  
**CALCEOLARIA**  
(Herbaceous, finest mixed),  
Per packet, 1s. 6d. and 2s. 6d.

This fine strain has been selected  
from the dwarfest and most distinct  
types, and will be found unequalled  
for size of flowers and brilliancy of  
colours.

### WILLIAMS'

Prize Strain of  
**CINERARIA**  
(extra choice, mixed),  
Per packet, 1s. 6d. and 2s. 6d.

A superb strain of very dwarf branch-  
ing habit and strong constitution, con-  
taining a great variety of colours.

### WILLIAMS'

**PRIZE COCKSCOMB.**

The finest in cultivation.  
HAS GAINED NUMEROUS FIRST  
PRIZES.

Per packet, 2s. 6d.

### WILLIAMS'

**CYCLAMEN GIGANTEUM** (mxd.)  
containing four varieties.

Per packet 2s. 6d.,

**CYCLAMEN PERSICUM** (mxd.)  
Per packet, 1s. 6d. and 2s. 6d.  
The finest strain in cultivation. For  
varieties of Cyclamen in separate col-  
ours see Illustrated Seed Catalogue.

### WILLIAMS'

Prize Strain of  
**GLOXINIA,**  
**CHOICE MIXED.**

Per packet, 1s. 6d.

This produces immense flowers, of  
the most brilliant and varied colours  
both of the erect and drooping  
varieties.

### WILLIAMS'

**PRIMULA SINENSIS FIM-  
BRIATA**, mixed packets,  
containing six varieties, 1s. d.

Per packet, 1s. 6d. and 2s. 6d.  
This superb strain has stood the  
test for thirty years, and never fails to  
take 1st Prizes wherever exhibited.  
For new Primulas and superb  
strain of Primulas, see Illustrated  
Seed Catalogue.

**LUCULIA GRATISSIMA.** Per packet, 2s. 6d.

Illustrated Seed Catalogue for 1885,  
Gratis and Post-free on application.

The Diplomed'Honneur, Amsterdam, 1883

The Special Gold Medal, Melbourne, 1880

# SUTTON'S

## EVERGREEN MIXTURES,

SPECIALLY PREPARED FOR

Garden Lawns,  
Tennis Lawns,  
Cricket Grounds.

### PRICES:—

Sutton's Mixture for Garden	Per bushel, 25s. 0d.
Lawns and Croquet Grounds	„ gallon, 3s. 3d.
Sutton's Mixture for Tennis	Per bushel, 22s. 6d.
Lawns and Bowling Greens	„ gallon, 3s. 0d.
Sutton's Mixture for Cricket	Per bushel, 22s. 6d.
Grounds .. .. .	„ gallon, 3s. 0d.

Sow 3 bushels per acre to form New Lawns, or 1 bushel  
per acre to improve an existing sward.

"Your new plot of Grass is perfection itself. I don't think  
I have ever seen better."—J. C. Fox, Esq., Royal Horti-  
cultural Society, South Kensington.

"The new Lawn made with Messrs. Sutton's Grass Seeds  
has been a wonderful success. Every one who sees it is  
astonished to find that it was only sown last May."—Mrs.  
CRESSWELL, Morney Cross.

"Your Grass Seeds have quite surpassed anything ever  
seen about here before. My employer desired me to ex-  
press his pleasure in playing on such a close sward of sown  
grass."—Mr. J. McIntosh, Gardener to W. Lowson, Esq.,  
Taymouth.

"I have a wonderfully good Tennis Lawn from the seed  
supplied by you last season. Although only sown the second  
week in May, the lawn was actually played upon the first  
week in August."—T. W. FORSHEW, Esq., Witney.

## APPLES AND SOILS.

APPLE lovers throughout the country who  
have not seen or so closely studied, as it  
deserves, the official report prepared by Mr.  
Barron since the Congress, will be glad perhaps  
if we repeat some of the lessons of the show,  
stripped of their uninviting aspect when buried  
in necessary statistics. Useful information,  
such as cultural details relating to favourite  
fruits or flowers, can hardly be too frequently  
repeated. It is possible that some person even  
now, in spite of repeated publication, may not  
be aware of the name of the Apple of Apples.  
There are, in fact, a dessert and a culinary  
Apple which excel all others, each in its depart-  
ment, and every one should know their names,  
and plant them if possible.

The United Kingdom was divided into dis-  
tricts at the Congress, and from these came 10,150  
dishes of Apples from 236 exhibitors, as duly  
reported at the time. Kent sent one-eleventh  
of the total number, Middlesex almost as many,  
while Ireland was represented by two exhibitors  
only; Surrey boasts of twelve exhibitors at  
the Congress, or just half as many as Kent,  
so that Surrey, with an area of less than half a  
million acres, contributed more in proportion  
than Kent, which contains rather more than a  
million acres of orchards. But statistics require  
careful reading; and when we turn to the  
western group of counties—England being  
divided into six groups—and find from Devon-  
shire only three exhibitors, from Gloucestershire  
seven, Herefordshire four, Somersetshire two,  
and Worcestershire eight, the truth becomes  
apparent that the Apple growers of the cider  
districts were less strongly represented than the  
private growers of the Home Counties. Gentle-  
men and their gardeners and nurserymen  
formed, in fact, the bulk of the exhibitors, and  
as nurserymen are naturally good instructors  
in their several horticultural departments, while  
the orchards of the hall are certainly superior  
to those of the farmhouse or cottage, as a rule,  
Mr. Barron's report, with its numerous "exhi-  
bitor's remarks" and abundant cultural details,  
forms a volume by competent authors, and is,  
in fact, so much the most useful book on Apple  
growing that has yet been published that we  
are not surprised that a second edition is in  
preparation.

Fifteen hundred and forty-five distinct varie-  
ties of Apples were exhibited, two of them being  
better than all the rest. In each group each  
exhibitor was invited to name the best Apples  
of his district, so that the whole of Great Britain  
was polled, and the Apple selected the greatest  
number of times by these experienced judges  
was placed at the head of the poll.

Among sixty dessert Apples King of the  
Pippins headed the list, with 98 votes; Cox's  
Orange Pippin followed, with 89 votes; then  
Ribston Pippin, 78; Kerry Pippin, 56; and  
Blenheim Orange, 52.

For culinary merit Lord Suffield polled 101  
votes; Dumelow's Seedling, 93; Keswick Cod-  
lin, 84; Warner's King, 70; and Blenheim

Orange, 65. These are closely followed by New or Winter Hawthornden, Cellini, Mank's Codlin, Alfriston, &c. The best in each class are too numerous to mention. All this has been told before more than once, and it will be told fifty times again, for the results of a most important and interesting Apple congress cannot be dismissed like the commonplaces of a news column which will not bear repeating.

The best Apple of Kent is Cox's Orange Pippin, the King of the Pippins following—Dumelow's Seedling and Lord Suffield standing first and second in the list of culinary Apples. Margil is not very generally known in Kent, though it bears a high character with all who have grown it, and Cornish Gilliflower is even a greater favourite as a late dessert Apple.

With regard to sites and soils a situation well uplifted above the fogs and frosts of low levels and yet well sheltered by forest trees or other means is best for orchards, and to this it may be added happy are the gardeners with deep soils and wholesome subsoils. Like George III., when his arbitrary gardener, the headstrong Mr. Brown, died, they can do as they like then. Mr. J. Roberts, gardener to the Baroness de Rothschild, Gunnersbury Park, has a friable loam on a light clay, and can grow Apples on either standards or pyramids, and on Crab or Paradise stocks. He prefers the latter for the early kitchen Apples, the former for late keepers, and he thinks that dessert kinds should be on standard trees on the Crab stock, since the fruit is improved by exposure to the sun. Compare this with Messrs. Veitch & Son's report of their light poor soil and poorer subsoil at the nursery at Fulham, where their "remarkably well-grown, very varied and interesting collection, very correctly labelled," as the official report says, was gathered from trees two, three, and five years old only, and trained as dwarf pyramids grafted on the Paradise stock. A very fine collection, consisting of 100 varieties, came from Chester, from the nursery of Messrs. F. & A. Dickson, gathered from bush and pyramid trees, only from three to six years old, which the exhibitors observe are best suited for small gardens and for the production of fine fruit. Specially noticeable in this "remarkably fine collection," says the report, were Braddick's Nonpareil, Ribston Pippin, Northern Spy, the Old Hawthornden (very large), Peasgood's Nonsuch, Warner's King, Wareham Russet, a large and fine Apple, only noticed in the Chester collections, and a variety named Windsor Castle.

The Royal Horticultural Society exhibited 328 varieties from a garden of loam bordering on clay, with a gravel subsoil. The "exhibitor's remarks" are of special interest. The Apples were all grown on bush and pyramid trees, some on the Crab and some young trees on French Paradise and Doucin stocks, and the finest fruit was from the latter. Pruning is confined to shortening the straggling shoots and thinning out moderately. One of the best collections of Apples we have seen on a soil not of the best, was within the boundaries of a large garden, where small trees, or big bushes, grew alongside the paths, and partook of the liberal dressings applied to the vegetables. The culture was entirely artificial, as compared with that of orchards on deep and favourable soils, where large standards are grown on the Crab, and the surface is in permanent pasture, manured by corn-fed live stock. These are the opposite systems, each adapted to a particular site, which Mr. Woodbridge, gardener at Sion House, had in view when he remarked of his fine specimens of Royal Russet, Old Winter Pearmain, Gloria Mundi, and Ribston Pippin, that they were "grown on bush and standard trees of various ages, grafted on the Crab and

Paradise stocks. Situation sheltered, in walled garden. Soil light and sandy on gravel. We find that trees grown in a bush form, on the Paradise or dwarfing stock, are very suitable for the borders of kitchen gardens. They bear better fruit, require less pruning, and can be allowed to grow in a more natural way. Trees on the Crab, or tree stock, I consider more suitable for orchards." As a case in point, we may mention those excellent orchards at Deepdene, Dorking, from which Mr. Burnett sent 110 varieties, including many of the old sorts not now common. Some of the best collections of Apples in the country may be found on the deep loam of the Greensand in that sheltered valley between Reigate, Dorking, and Guildford. Ribston Pippin scarcely ripens satisfactorily at its native home in Mr. Dent's garden at Ribston Hall, Yorkshire; but in Surrey, sheltered by the "backbone" of the country, the North Downs, and by the groves and plantations of that pictorial district, it finds the climate and the warm soil that bring it to perfection. The same remark applies to other superior dessert Apples which abound in the gardens. Deepdene, under a former owner, was the site of a vineyard, and produced good wine in hot seasons. Mr. Burnett remarks that he gathered his fine fruit mostly from large orchard trees, many of them being old; and he mentions as the most certain bearers Keswick Codlin, Lord Suffield, Cellini, Stirling Castle, Ecklinville Seedling, and Cox's Orange Pippin. He mentions, too, the Blenheim Orange, Pearmain, and Ribstons of the district. But even in this favoured district Apple growing by farmers is much neglected; the trees being starved, the fruit dwindles to half its natural size, and no market can be found for such fruit. "Small and inferior," is the comment on a collection of thirteen varieties which the exhibitor observes were grown on old orchard standards on a heavy undrained loam with stiff clay subsoil, the trees being covered by lichen, eaten up by caterpillars, and the blossoms injured by spring frosts. "We find it a good plan," says an exhibitor, with a subsoil of wet inferior gravel, "to lift as many trees as possible every year, and to put a quantity of old brick rubbish under them, and maiden loam round the roots. When the roots reach the wet gravel they seldom fruit satisfactorily."

Trees planted on prepared soil of road-scrappings and loam and mulched annually with stable manure are apt to canker, but they bear well nevertheless; whereas in some moist subsoils they grow vigorously without a spot of canker, but they yield no fruit, producing wood instead. Large trees on such soils should be extirpated. Mr. Taylor, gardener at Dunevan, Weybridge, with a light soil and wet sandy subsoil, cuts round his pyramids every second year 2 feet 6 inches from the stem, raises the roots and adds fresh soil, treads firm, mulches on the surface, and thereby produces fine fruit.

It is evident, from these examples, that Apples can, by skilful cultivation, be grown in all districts and upon soils naturally unsuited to them. As a rule, the finest fruit is grown on bushes and cordons (see remarks by Mr. Miles, of the Wycombe Abbey gardens, and by Mr. Smith, of Mentmore). In the case of large orchard trees you can only manure the surface, and you cannot control the roots, nor raise the temperature of the soil, except so far as drainage may do so. In growing Apples for market, however, they must be produced at the lowest possible price and of the best possible quality, that is to say, in well treated orchards, where the soil is naturally suited to this particular crop. The report indicates that certain districts possess advantages conferred on them by Nature. Even such skilled growers as Messrs. T. Rivers & Son, of Sawbridgeworth, who exhibited 183 varieties, recognise the superiority of the climate of Kent to that of Herts. Whether

the drift clay and calcareous gravel of Sawbridgeworth, which produces for Mr. Prout such incomparable Wheat crops, equals loams of the Kentish Rag as a soil for Apples, we cannot say, but Messrs. Rivers remark of their climate that it is "too keen to secure the size and colour of the Kentish Apple orchards." In Surrey, as we have seen, there is a sheltered and sunny district where climate and soil are both pre-eminently favourable for Apples; and although we find the superior sorts of Apples heading the lists in the various reports from the north of England and from Scotland, these reports, it should be remembered, refer to gardens sheltered generally by walls as well as plantations. The area from which the best Apples can be produced under orchard cultivation will probably be found far more limited than some over-sanguine writers have imagined.

This point must be left to the sound sense, based on careful observation, of those who propose entering upon this kind of fruit farming. They should also consider, not merely the climate of their own locality, but of England generally; for unless we are favoured by warmer and drier seasons than the average of the last eight years, home-grown Apples—whatever enthusiasts may say of our obligations as patriots—will hardly be found profitable. Something has been said of a small duty on foreign Apples to protect the English grower. In bad seasons he may need it—but he is not likely to obtain it!

In an essay on orchard cultivation, as it now exists, the improvement of the sorts of Apples in the cider districts, as well as of the beverage itself, would have to be treated. We can only add, however, in regard to sorts generally, that the Committee at the Congress considered many of the dessert Apples as too small, and they added, in reference to culinary Apples, that all varieties under the standard of 3 inches in diameter might with advantage be discarded, "excepting always a few sorts that are specially adapted to certain localities." Large Apples, for example, are not desirable in windy situations.

Messrs. James Dickson & Sons, Newton Nurseries, Chester, exhibited, as we read, "a very interesting and instructive" collection of 110 varieties, one half from trees worked on the Crab, the rest from those on the French Paradise, and the latter bearing much larger fruit than the former, would scarcely suit the coast of Norfolk, except in the most sheltered gardens, since large fruit is liable to be blown down by gales or bruised on the trees. These general hints, we hope, may prove useful.

## NOTES ON THE CULTIVATED ASTERS.—X.

(Continued from p. 209.)

THE subgenera noticed in the present paper form a well marked group, from a horticultural point of view, being all dwarf alpiques, suitable for rockery growth.

SUBGENUS VIII. ERIGERASTRUM.—Bracts of the involucre nearly equal in length, leafy from base to apex. Pappus not distinctly biserial. Stem leafy. Ligules numerous.

53. *A. alpinus*, Linn.—Stems 1-headed, hairy, erect, varying from a few inches to a foot in length. Basal leaves numerous, oblanceolate, obtuse, entire, narrowed gradually into a petiole. Stem-leaves few, distant, growing gradually smaller towards the head. Expanded heads about 1½ inch in diameter. Involucre broadly campanulate, ½ inch in diameter; bracts 2—3 serial, subequal, oblanceolate, foliaceous, pilose. Ligules thirty or more, pale lilac, ½ inch long. Achene oblanceolate, compressed, pilose, ¼ inch long; pappus ¼ inch long, copious, flexuose, white or pale red, moderately firm in texture.

Mountains through Europe and Siberia to Arctic America, and southward along the Rocky Mountains to the forty-ninth parallel of latitude. *A. hirsutus*,

Hort.; *A. cylleneus*, Orphan.; *A. Garibaldi*, Brugger, and *A. Wolfii*, Favrat, are varieties, and *A. chrysocomoides*, Turcz., is said to be a discoid form of this species. There are three closely allied species in the Himalayas—*A. himalaicus* and *tricephalus* of C. B. Clarke, and *A. Stracheyi*, Hook. fil., none of which are in cultivation so far as I am aware. To this subgenus also belong the Siberian *A. silenifolius*, Turcz., the North American *A. peregrinus*, Pursh, and *A. pygmaeus*, Lindl., and the Natal *A. natalensis*, Harv., all four of which are well-marked species. *Aster salsuginosus*, Richardson, *Bot. Mag.*, 4942, is now placed by Dr. Gray in *Erigeron*.

54. *A. pyreneus*, Desf.—Stems stout, hairy, erect, 1½–2 feet long. Leaves numerous, sessile, lanceolate, amplexicaul, thin in texture, acute, slightly serrated, the lower ones 3–4 inches long. Heads few, corymbose, sometimes solitary. Expanded heads 2 inches in diameter. Involucre broadly campanulate; bracts subequal, lanceolate, foliaceous, hairy. Ligules 30–50, linear, lilac, above ½ inch long. Achene oblanceolate, compressed, hairy; pappus reddish-white, firm in texture, ½ inch long.

Spanish and French Pyrenees. A most distinct and striking species, well worthy of garden cultivation.

The Andioe and South American subgenus *Heteraster*, of Benthams, contains about three species which differ mainly from *Erigerastrum* by their very short, very numerous narrow ligules.

**SUBGENUS IX. BELLIDIASTRUM.**—Differs from the last by its scapose habit, which is just like that of a Daisy (*Bellis*); represented by a single species. Restricted to Europe.

55. *A. Bellidiastrum*, Scop. *Doronicum Bellidiastrum*, Linn. *Bellidiastrum Michelii*, Cass.—Perennial, with a small rosette of obovate, obtuse, crenate, petioled radical leaves, ½–1 inch broad. Peduncle naked, varying in length from 2 or 3 inches to a foot. Head always solitary, an inch in diameter when expanded. Involucre campanulate, ½ inch in diameter; bracts lanceolate, equal, foliaceous. Ligules 30–40, white, ½ inch long. Achenes glabrous, flattened on the faces; pappus rather longer than the achene, of copious flexuous, pale red bristles.

Widely spread amongst the mountains of Central Europe, but not extending to the Pyrenees nor Scandinavia.

**SUBGENUS X. HETEROCHÆTA.**—Habit and involucre of *Erigerastrum*, from which it differs by the short outer bristles of the pappus, forming a more or less distinct row as contrasted with the long inner ones. Of this section there are about three species in the Himalayas, one in Siberia, and three at the Cape. I give descriptions of the only two I have seen alive.

56. *A. diplostephioides*, Benth.; Hook. f., in *Bot. Mag.*, t. 6718.—Stems erect, hairy, 6–18 inches long. Stem-leaves large, oblanceolate, spatulate, sessile; radical petioled, 2–4 inches long. Heads solitary, about 2 inches across when fully expanded. Involucre campanulate, above ½ inch diameter; bracts equal, foliaceous, lanceolate, acute. Ligules very numerous, bright lilac, ¾ inch long. Pappus biserial, the outer row of bristles short.

Alpine region of the Himalayas from Kashmir eastward to Sikkim. It was introduced lately into cultivation by Mr. Elwes, and is, as may be seen from the figure that was given recently in the *Botanical Magazine*, a very effective species for garden purposes. According to Dr. Aitchison, the roots are used for washing in Kashmir. The two other Himalayan species of this subgenus are *A. heterochaeta*, Benth., which resembles *A. alpinus* very closely, and *A. tibeticus*, Hook. f. The Siberian *A. flaccidus*, Bunge (*A. intermedius*, Turcz.), also resembles *alpinus* very closely.

57. *A. hispidus*, Baker, in *Sturt. Ref. Bot.*, t. 342. *Calendula hispida*, Thunb. *Diplopappus asper*, Lessing, in *DC. Prod.*, v., 276.—Stems a foot long, erect, roughly hairy from the base, usually one-headed. Leaves distant, lanceolate, sessile, hispid, the lower toothed, the upper entire, three-nerved from base to apex, ½–¾ inch broad. Involucre campanulate, ½ inch diameter; bracts subequal, lanceolate, acute, hispid, leavy; expanded heads 1½–2 inches in diameter. Ligules about thirty, linear, bright lilac, ½ inch long. Receptacle conspicuously alveolate. Achene flattened, pilose; pappus white or pale red, firm in texture, nearly ½ inch long.

Mountains of Cape Colony and Natal. Cultivated by Mr. Wilson Saunders from seeds given him by the

late Daniel Hanbury, who received them from Bishop Callaway. There are at the Cape two other allied species (*D. levigatus* and *serrulatus*) not in cultivation. *J. G. Baker*.

(To be continued.)

## ANTWERP EXHIBITION.

IN connection with the Universal Exhibition to be held in Antwerp in the coming summer, an International Exhibition of Horticulture, Pomology, and Market Gardening will be held. The Royal Horticultural and Agricultural Society of Antwerp is charged by the Government with the organisation of these shows, which will take place at intervals from May 2 to October 31, 1885. A part of the gardens and a large open space within the precincts of the Universal Exhibition are specially set apart for this purpose.

The horticultural exhibition comprises the five following series:—I. Permanent exhibition, for the whole period of the exhibition, the gardens of ornamental plants, trees, shrubs, and flowers. II. From May 10 to 12 exhibition of Azaleas, Orchids, Rhododendrons, &c. III. From June 28 to 29 exhibition of cut Roses. IV. From August 2 to 6 general horticultural exhibition. V. From September 27 to 29 exhibition of fruit and vegetables.

I. The programme of the permanent exhibition from May 2 to October 31, 1885, comprises for outdoor trees and ornamental shrubs in groups and clumps, twenty-two classes: for single specimens, five classes; A, for plants suitable for forming beds, edges, and groups:—(1), Outdoor perennials, twelve classes; (2), Stove herbaceous and under shrubs, nine classes; (3), Bulbous and tuberous plants, eleven classes; (4), Annual plants, two classes; (5), Ornamental plants, two classes; (6), Lawns and grass plots, one class; (7), Carpet bedding, three classes.

B. Greenhouse and conservatory plants which can be placed in the open air from May 1 to October 15, twelve classes.

II. Inaugural exhibition from May 10 to 12. Foliage plants, six classes; flowering plants, twenty-eight classes.

III. Exhibition, of cut Roses, June 28 and 29. (1), Amateurs, nine classes; (2), nurserymen, ten classes.

IV. Exhibition, August 2 to 6. New plants. (1), Introductions. Class 1.—Collection of twenty-five plants, flowering or non-flowering, introduced into Belgium since 1882. Class 2.—Collection of six plants, flowering or non-flowering, introduced into Belgium by the exhibitor, but not in commerce. Class 3.—Collection of three plants not yet in commerce. Class 4.—A new plant in flower. Class 5.—A new plant not in flower.

(2), Seedlings, six classes; good cultivation, nine classes; general collections, eleven classes; special collections (1), Ferns and Lycopods, twelve classes; (2), Cycads and Conifers, four classes; (3), Palms, Pandanads, and Musas, eleven classes; (4), Aroids, eight classes; (5), Marantaceae and Liliaceae, eight classes; (6), Bromeliaceae, three classes; (7), Orchids, six classes; (8), carnivorous plants, five classes; (9), Euphorbiaceae, Proteaceae, and Araliaceae, six classes; (10), Begoniaceae, five classes; (11), Gamopetalous plants, Coleus, Bouvardias, Gloxinias, Gesneraceae, and Calceolarias, six classes; (12), Polypetalous plants, Cacti, Echeverias, Bertolonias, Sonerillas, Pinks, Pelargoniums, Fuchsias, and Roses, eighteen classes; (13), room decorations, two classes; (14), bouquets, &c., seven classes.

V. Exhibition September 27 to 29.

Section 1, Pomology, twenty-six classes.

Section 2, Kitchen and market garden produce, twenty classes.

Section 3, Bouquets, &c., three classes.

Section 4, Dahlias, cut flowers, four classes.

Medals of gold, silver-gilt, and silver, accompanied by a diploma, are to be awarded to the exhibitors named by the jury. The value of the gold medal may be had in money.

Competitors who have obtained from the horticultural exhibition a gold medal of the value of 200 francs (£8) will receive in addition the same diploma as that which accompanies the gold medal of the Universal Exhibition, as well as large-size bronze medal from the Universal Exhibition.

Competitors who have obtained three gold medals, as well as those who have most contributed to the success of the exhibition, will get a Diploma of Honour.

Besides the medals mentioned in the schedule, the jury have the power of awarding three diplomas, corresponding to the gold medal, six to that of silver-gilt, and twelve to that of silver, to deserving exhibitors.

The Secretary of the International Commission is M. L. Lubbers, Botanic Gardens, Brussels.

## MARKET GARDENING.

(Continued from p. 115.)

My former remarks, taken in connection with the general display of vegetables at the various leading metropolitan markets devoted to these and similar subjects, show that, whatever system of crop culture market gardeners generally follow, it is a highly successful one, both as to quantity and quality. In connection with this, I have endeavoured to show that liberality in the matter of manuring, the use of highly fertilising manures, properly prepared by periodical turning, timely ploughing, are the chief items which secure these results. An intimate knowledge of both spade and plough labour teaches many lessons, beyond what a study of either, alone, can give.

### A FIRM BASE FOR ROOT GROWTH.

I am far from advocating what is known as shallow culture. Nevertheless, compared with spade labour, trenching, &c., ploughing must be placed in that category—albeit four-horse ploughing is occasionally practised, which gives a moderate depth, though shallow compared with bastard-trenching. Add to this the facts that, below the point of the plough-share the land retains its primitive hardness, and that even such paris as are turned over are not, so to speak, decicated to their utmost depth, and we have, at the best, what gardeners would perform call half-worked land. Yet it is by this means alone that the fine vegetables we see marketed are grown. Before we study the processes in connection with variety in crops, the seed-beds, seed sowing, planting, &c., it may be well to extract all the practical lessons possible from the contrasts shown above. Does the professional horticulturist give anything like sufficient weight to this need of a firm foothold for seedling plants and the crops resulting from them? An old-school doctrine seems to have a better hold on many minds than have the roots of the plants of some culturists on the soil.

If we compare established much-worked garden soils with those in fields generally we shall find them deeply manipulated and manured, so much so that such natural cohesiveness as is possessed by virgin soils is destroyed in very great part. Annually such soils are turned over, and, in the case of such parts as are trenched, tossed up lightly into very porous ridges. This is often done as late in the season as the months of February and March. What does the cultivator do to cause this light mould to become sufficiently firm for good root-hold? Generally nothing. Occasionally, in connection with the Onion and Carrot crop, he trends or rolls the surface. This shallow practice proves, however, of very little use, and the result is that the roots go down into anything but a suitable subsoil. If the same cultivator had to use some of this same soil for potting purposes he would press, ram, jerk, and otherwise make it very firm within the pot, knowing that, unless he did so, the plants would not thrive. A contrast in practice, which it seems hard to believe possible. For a contrast to this method turn to field cropping. Generally, after land is ploughed up it is harrowed, then well rolled with heavy iron rollers, and trodden, as of necessity it must be, by the feet of heavy horses. Not only is the land thus rolled to receive the plants or seed crops, but it is rolled so soon as they get well hold of the ground subsequently, both in connection with planted plants and seedling crops the result of seed sowing. Nor is this confined to one given kind, almost all are treated alike. Lisbon Onions when 6 or 8 inches high, Turnips when with four or five leaves, "plants," Tares, cori, one and all are subject to pressure from heavy iron rollers, and as a result they thrive and give crops of superior quality. To ensure good crops in the garden, more especially upon light soils and such as have been under spade culture for a decade or more, all trenching should be done as long as possible before cropping. Many crops of what would have been good were lost last summer owing to the simple and easily avoided practice of working the soil late in the month of February and during March. Owing to the drought which prevailed, the lands were dried in process of digging or trenching, and they continued to dry subsequently, so much so that seeds sown absolutely failed to germinate, owing to want of moisture, latent or otherwise, in the soil, and to the fact that after being turned up it was permitted to remain unpressed or otherwise made firm, and sown in so light a state as to permit of all the moisture

contained in it being lost by evaporation. Market garden farmers suffered far less by this evaporation, and secured their customary good crops by such rolling as I have suggested.

#### HARDINESS OF VEGETABLES.

Gardeners and their *confères* of the farm hold very different views as to the real hardness of the more hardy kinds of vegetables. This is particularly observable in connection with the whole of the Brassica family. Market garden farmers prepare their huge seed-beds, consisting of acres in extent in kind, and sow the seeds broadcast generally during the latter part of the month of February or very early in March. These comprise hardy Greens, Veitch's Autumn Giant Cauliflowers, Brussels Sprouts, Broccoli, Curled Kale, Savoys, &c. All are sown together upon an open and exposed field—all germinate, grow, and form the most dense beds of sturdy young plants.

In gardens warm, sheltered corners are chosen for such things, and dates are chosen with nervous exactitude, these latter being generally later than those of the farmers. By these means late, weakly plants are secured. In preference to this the above dates should be substituted, and the most open, exposed, and sunny situation in any garden chosen whereon to sow and form a sturdy nucleus for many future important crops. *William Earley, Ilford.*

(To be continued.)

### THE NATURE OF LICHENS.

SYSTEMATIC students of Lichens seem very unwilling to accept the views of anatomists and physiologists, who regard Lichens as really composite beings, consisting of the threads of a predatory fungus, which establish themselves between and upon the green globules, or "gonidia," formerly considered a special attribute of the Lichen, but which are now considered to be, in reality, forms of *Algæ* embedded in the web of fungus thread. The theory, when first started, seemed startling enough, but gradually it has come to be accepted by the one class of botanists and rejected by the other. Recently Mr. Crombie, an expert lichenologist, has strongly combated the modern notion, arguing *inter alia* that whereas parasitic plants usually exhaust their prey, and bring about its death, here we have a parasite many hundred times bigger than its host, and yet, so far from the latter being exhausted, it continues to thrive, and the two plants, fungus and *Alga*, jog on comfortably together in that condition of happy cohabitation which botanists call "symbiosis." Mr. Hartog, in *Nature*, shows how this may be. A fungus requires for its food a supply of mineral or earthy constituents, nitrogen in the form of nitrates or ammonia, and carbo-hydrates (combinations of hydrogen and carbon). An *Alga* does not require a ready-made supply of the latter ingredients, because it supplies its own wants from the carbonic acid of the atmosphere and water under the influence of solar light. The spawn-threads (hyphæ) of the Lichens, aided by carbonic acid, can dissolve the earthy matters, nitrates are furnished by rain, while the carbo-hydrates, as above stated, can only be obtained from the atmosphere by the green Lichen-gonidia.

But Mr. Hartog points out that there is no necessity for the fungal threads (hyphæ) to penetrate the green tissue (gonidia) of the Lichen in order to obtain the carbo-hydrates they require. The green matter of the *Algæ* is contained within membranous bags, or walls, of cellulose (a carbo-hydrate), and these cellulose layers undergo constant transformation into gummy or gelatinous matter, which is continually repaired by new formation. It is on this layer of jelly, and not on the enclosed nitrogenous protoplasm, that the fungal threads feed, and as it is constantly formed there is no excessive strain on the resources of the green algal matter so long as it is duly nourished and exposed to light. It is interesting to see that in this case, as in most plants, the nitrogen required is not derived from what would seem to be the most readily accessible supply (in the case of the gonidia the protoplasm, in the case of other plants the atmosphere), but from nitrates furnished by the rain, &c.

**THE ICE PLANT.**—M. Hervé Mangon finds that the juice of this plant, *Mesembryanthemum crystallinum*, the leaves of which are studded with translucent vesicles of fluid, contain 33 per cent. of sea-salt. It is considered that the culture of the plant in the salt-laden soil of some parts of France would be beneficial, by abstracting much of the salt and thus rendering them fertile.

### PEAR, BEURRÉ FLON.

#### DESCRIPTION OF THE TREE.

WOOD, of average strength; branches, rather numerous, spreading, rather weak and short, slightly bent, hairy, yellowish-brown, with fine and close lenticells, and prominent cushion-like swellings on the bark; buds, small, ovoid, downy, closely applied to the bark, having the scales convex and loosely united; leaves, small, abundant, generally elliptical irregularly dentate, slightly reflexed at the margins, provided with a strong and very short petiole; fertility average.

#### CULTURE.

Grafted on the Quince this Pear does not succeed well, it is then feeble and very late. On the free stock it is more vigorous, but its pyramids still leave much to be desired.

FIG. 57.—PEAR BEURRÉ FLON.

#### DESCRIPTION OF FRUIT.

Size, rather large; form, turbinate, very obtuse, knobbed, usually having one side larger than the other. Peduncles short, stout, straight, swollen at the summit, inserted into a shallow cavity bordered by a very decided prominence. Eye small, open, placed in a deep, funnel-shaped basin. Skin harsh to the touch, thick, citron-yellow, entirely covered with red-grey spots, largely marbled and spotted on the side exposed to the sun. Flesh white, rather delicate, tender, juicy, slightly gritty. Juice abundant, sweet, aromatic, endowed with an agreeable and delicate acid flavour. Season from the middle of September to the middle of October. Quality, first.

#### HISTORY.

It was obtained at Angers by M. Flon, nurseryman, Bas-Chemins du Mail. The tree fruited for the first time in 1852.

These particulars, taken from Leroy's *Dictionary*, constitute all we know of this Pear, respecting which enquiry has been made. Perhaps some of our readers may recognise the Pear from the description and outline we now give.

### THE CHERKLEY YEWS.

ONE of the most interesting features in the grounds at Cherkley Court, near Leatherhead, the seat of A. Dixon, Esq., consists in the noble clumps of Yew along the hill-side (fig. 58). How old they are no one can tell. It is more than probable that, long before Brown Bess and her more deadly successors drove the bowmen from the field their branches furnished goodly material for the weapon of the day. Much time might pleasantly be spent in ranging among the Cherkley Yews alone, as they in various ways supply ample material for thought and speculation. For example, a wonderful difference exists in their habit of growth, and in the arrangement of their branches, some of them being dense and compact like an *Erica Cavendishii*, while others are loose and straggling; some are broad and flat, and others narrow and erect; one gigantic specimen, with straggling branches (illustration, p. 309), measures 25 feet round the trunk 6 feet above the ground. Can it be that the differences come from their variation as seedlings,

or have they been acquired by the roots getting into different strata and different soils? [Seedlings.] Be it as it may, the Yews at Cherkley are wonderful, and form a study in themselves. It is pleasant to see that they are treated with the greatest respect, and rather than remove them from the line of the road, tunnels have been formed through them, such tunnels and avenues forming delicious retreats in summer. B.

### ORCHIDS IN FLOWER AT DOWNSIDE, LEATHERHEAD.

THE spring review of Orchids has well commenced at Downside, and Mr. Lee's pleasant Saturday "at homes," as usual, call thither the *élite* of the Orchid world to enjoy the privilege of seeing at their best, comparing and discussing the relative merits of the rare things there to be found. In the case of such things as *Cattleya Trianae*, of which there can scarcely be found two exactly alike, and with the numerous varieties of *Odontoglossum*, the benefit and pleasure to be derived from an inspection of them in flower in such an establishment is hardly to be overrated, as it is only by actual comparison side by side that the merits and the differences of the varieties can be deter-

mined. It is very difficult to remember a flower sufficiently well to be able to compare it with another which is present, and hence it is that many who flower among their imported *Trianae* varieties, which they vaunt as being better than *Dodgsoni*, *Osmani*, &c., would in most cases have the conceit taken out of them if they were to bring flowers of their *protégés*, and place them side by side with those they are supposed to eclipse.

The great *Cattleya*-house is, of course, at present the centre of attraction, and although it is even better than it was last year a reference to our illustration at p. 677 (May 24) will give an idea of the extent of the display and to that of the plan of the structure (which is one of the most perfect in the country),

able in the features which caused them to be originally selected. With respect to any variety which Mr. Lee may sanction the naming of the utmost confidence may be felt, for with the Saturday gatherings if there be any virtue in trial by jury the plant will have been severely tested before the honour was accorded.

The best variety of *C. Trianae* now in flower at Downside are *C. T. Leeana*. This must be judged the giant among them all, and now that culture has improved it its flowers are marvellously massive. Some of them measure  $8\frac{1}{2}$  inches in width, and have petals  $3\frac{1}{2}$  inches broad. Altogether the variety is a phenomenal one, and the price (250 guineas) was not so extravagant as some would suppose.

*C. T. Emiliae*.—As *C. T. Lecana* represents mascu-

*C. T. Backhousiana*, with its dark velvety maroon lip and crimson feather in the petals also stands by itself.

*C. T. Normani* resembles *Backhousiana*, but has plain rosy-lilac petals.

*C. T. delicata*.—This is in flower in several grand masses, the flower being pale lilac all over except the throat, which has yellow marking.

*C. T. Victoria Reginae* is a perfectly formed variety, with pale lilac sepals and petals, bright ruby-crimson lip, and orange throat.

Besides the above beautiful kinds, *C. T. Russeliana*, *C. T. Dodgsoni*, and other rare varieties are in bud.

Also in bloom in great beauty throughout the

FIG. 58.—GLOBOSE YEW AT CHERKLEY COURT. (SEE P. 308.)

given by us March 10, 1883, p. 308, will furnish interesting details which will be useful to many, the more particularly that the venture having now stood the test of time proves even more satisfactory than it was anticipated, and leaves nothing in the building to be regretted.

The Downside *Cattleya*-house is a most enchanting sight just now, with its banks of flowers on either hand. Of *Cattleya Trianae* undistinguished by special varietal title there are great numbers of fine specimens in full bloom, the variation among them, and the consequent interest by comparing them, being very great; many of them are of the first merit and still they are to remain untitled, in fact, a review of all the named forms of *C. Trianae* shows that distinguishing names have not been thoughtlessly given—the old *Dodgsoni* with its peculiar shape and tubular lip, *Osmani* with its broad velvety crimped edged labellum, and all the other old favourites, are each unapproach-

able in grandeur, so does Mrs. Lee's *Trianae* personate feminine grace. Its lovely pearly-white petals and mauve lip (which is even brighter than that of *Osmani*), edged with pale lilac and tinged with light yellow in the throat, constitutes it a lovely variety. The plant has about twenty-five blooms.

*C. T. magnifica* runs *Leeana* hard for size. Its petals, which are very massive, are pale lilac, lip crimson, tinged in the throat with sulphur-yellow.

*C. T. alba*.—Of this there are two fine snow-white varieties, the one without colour of any kind, and the other with lemon-coloured tinge in the throat.

*C. T. Emperor* is a variety of fine form, with rosy-lilac veined petals and dark mauve lip, with orange-coloured throat.

*C. T. Osmani*.—This variety is very handsome, and is unique in the fine flat expansion of its fringed labellum, which in its glowing crimson resembles the lustre on the breasts of some humming-birds.

*Cattleya*-house, which is 100 feet in length, are some good varieties of *C. Percivaliana* and *C. Walkeriana*, some grand specimens of the different varieties of *Cœlogyne cristata*, including *C. c. Lemoniana*, and two well-flowered specimens of *C. c. alba*; many fine forms of *Lælia anceps*, among which the pure white *L. a. Williamsii*, which has no rose tint anywhere about it, and the beautiful white *L. a. Veitchii*, with its bluish-lilac lip and wings to the labellum, are very prominent; *L. a. Hillii* is also good; some *Vandas*, grand plants of *Epidendrum Wallisii* (one with thirteen sprays of its large yellow flowers on a stem), *Lælia harpophylla*, *L. flammea*, *L. Turneri*, the white *Brassavola glauca*, the pretty dwarf *Cœlogyne*, *C. sparsa* and *C. conferta*, and many other odd beauties, lend attraction and variety to the whole arrangement, and stamp it as one of the finest sights of the kind the season has produced. In the lobby at the entrance of the *Cattleya*-house, on the left-hand

side, the *Odontoglossum Roezii*, which thrives so well here, are, as always, in bloom; *Phaius tuberosus* strongly in bud, and *Colax jugosus* and the rare *C. j. rufinus* in flower, on the right being some rare *Cypripediums*, among which *C. Dayanum*, *C. Swainianum*, *C. barbatum* Warneri, *C. b. biflorum*, *C. vexillarium*, and other notabilities, are in bloom; while overhead the *Vanda Sanderiana*, *Nepenthes*, and *Oncidium Marshallianum*, give good examples of the effects of good culture. The *O. Marshallianum* are grown in a cold house, but brought in here to perfect their flowers, but during and after flowering they are still kept in the cold house.

The long lean-to Masdevallia-house, which protects the end of the Cattleya-house, contains vigorous plants, with healthy foliage and bristling spikes, giving promise of even better things in their season than in former years. Many plants of *Sphronitis grandiflora*, with their scarlet flowers, brighten it, and one of *S. g. rosea* gives its soft rose bloom to help the bright orange-scarlet of the *Masdevallia ignea*, *M. Chelsoni*, *Aca aurantiaca*, and other odd varieties.

The continuation of the lean-to range gives the chimneroid *Masdevallia*-house, in which the strikingly handsome *M. Roezii rubra*, *M. chimera*, *M. bella*, and *M. radiosa* are in bloom; and the long cold-house, in which the *Oncidium macranthum* and some hybrid *Odontoglossums* are grown on the back, and the lesser *Masdevallias* on the front. Here blooming are *Odontoglossum macrospilum* (the only plant), with flowers like those of *O. crispum guttatum*, with a suspicion of *O. Andersonianum*, *O. Jenningsianum*, *O. species* like *Chestertonii* with *O. Andersonianum* marking, *O. triumphans*, *O. Ruckerianum*, *O. hebraicum*, true *O. Cervantesii decorum*, with lovely large flowers; *O. Uro-Skinneri* and many of the small *Masdevallias*, such as *M. Shuttleworthii*, *M. Arminii*, &c.

The 100 feet long span *Odontoglossum*-house—like all the rest of the establishment, bright, clean and fresh, with unspotted foliage and profusion of flower—is sprinkled throughout with good spikes of *O. crispum*, *O. Pescatorei*, *O. luteopurpureum*, in all grades; *O. Wilckeanum*, *O. mirandum* (which is just intermediate between *O. polyxanthum* and *O. Lindleyanum*), and many forms of *O. odoratum*, which, as well as giving variety to the display, diffuse a grateful Hawthorn scent through the houses. The span range, in three divisions, has well-bloomed plants of *Odontoglossum blandum*, *O. pulchellum majus*, *O. Sanderianum*, *O. aspersum*, *Maxillaria venusta*, *M. grandiflora*, *Laelia harpophylla*, and many *Cypripediums*, both species and hybrids.

In the old block of houses something like the splendour of the Cattleya-house is given by the great show in the *Lycaste*, *Dendrobe*, and *Phalenopsis*-houses. The forms of *Lycaste Skinneri*, like those of *C. Trianae*, are scarcely two alike, but all hands will go up to give the award of first merit to the beautiful, massive, snow-white *L. S. alba*, of which there are several plants in bloom with six or seven flowers each. Other handsome kinds are *L. S. labella alba*, *L. S. delicatissima*, *L. S. rubella*, and *L. S. atrorubens*. In the same house are fine specimens in bloom of *Cymbidium eburneum*, *Oncidium cheiroporum*, *O. unguiculatum*, the rare *O. cucullatum macrochilum*, *Odontoglossum Oerstedii*, &c.; and here in this cool house the *Dendrobium Falconeri* and *D. F. giganteum* grow and flower well.

Of the *Dendrobium*-house the lovely violet-crimson *D. nobile nobiliss* is the king. It is a lovely variety, with a richly glowing colour. *D. splendidissimum*, best variety, is also very striking, with its wax-like rosy petals and orange stained lip, and a fine specimen of the pure white *D. Wardenianum album*—a chaste and substantial beauty. The show is made up of many grand specimens of *D. Wardenianum*, *D. Ainsworthii*, *D. heterocarpum*, *D. Findleyanum*, *D. Kingianum*, *D. fimbriatum*, Day's variety, *Barkeria Skinneri*, *Epidendrum arachnoglossum*, and many other pretty *Epidendrums* and *Dendrobes*. The *Phalenopsis*-house is a beautiful sight, with the numbers of arching spikes of the sweet-scented, rose-coloured *P. Schilleriana*, the massive white *P. grandiflora* and *P. amabilis*, and the curiously varied but always lovely *P. Stuartiana*, aided by the long graceful spikes of the profusely flowered *Angraecum citratum* falling over them from the shelf above in the manner which has been often admired and noted at Downside. The East *Iodia*-houses are the least showy just now, but a specimen of *Dendrochilum glumaceum*, with fifty spikes; *Saccolabium bellinum*, and some other *Saccolabiums* and *Aërides* are already in bloom. Mr.

Lee appears to be more enthusiastic than ever with his Orchids, for building is again about to commence. Neither Mr. Lee nor his able assistant, Mr. Woolford, need praise to encourage them. They seem to get pleasure enough out of the work as it goes on.

## FILMY FERNS.

THE removal of a large proportion of the collection of *Filmy Ferns* grown at Kew into a house with a lower temperature than has hitherto been considered necessary for these plants has been followed by results as satisfactory as to be worthy the attention of Fern growers. Messrs. Backhouse, of York, were perhaps the first to discover that the majority of *Filmy Ferns*, including even those from distinctly tropical regions, could be much better grown under artificial management when placed in a comparatively low temperature than when treated as stove plants. Mr. Cooper Forster also has demonstrated by his success in the cultivation of a collection of these plants in a house where little or no artificial heat is employed that a high temperature was not only unnecessary, but very often harmful to most *Filmy Ferns*. Any one who remembers what miserable objects these plants were when grown in a tropical house, and who has seen the beautiful and healthy collection of them now grown in the York nurseries, or the equally healthy though smaller collection possessed by Mr. Forster, will find no difficulty in admitting that in most cases tropical treatment for *Filmy Ferns* was a mistake. Equally strong evidence in favour of cool treatment is shown by the condition of that part of the Kew collection which has been subjected to it, as compared with the health of the plants before they were removed from the tropical-house into the cool fernery in April last. Some anxiety was felt for the success of the experiment, because it seemed not unlikely that plants which had for a long time grown in a stove temperature all the year round would suffer from the change to a temperature which in winter, owing to the heating arrangements, could not be kept above 50°, and in very severe weather would fall as low as 45°. Instead, however, of harm resulting from this change, the effect has proved beneficial to almost every one of the plants which all through the winter have been growing vigorously, and apparently enjoyed the lowness of the temperature. Many of the *Filmies* grow freely in winter time, but we were not prepared to see these "pampered" specimens take advantage of the change in so short a time.

The cool fernery at Kew is a low T-shaped structure in which *Gleichenias*, *Nothochlænas*, *Aspleniums*, some *Adiantums*, &c., are grown. In the "big" division of the T there is a wide central stage, and a narrow one on each side. The stage on the east side of this part of the house has been made into a case for *Filmy Ferns*, by fixing sliding sashes along the front from the stage to the roof, and erecting slate slabs along the back, leaving a little space between the slate and the side of the house to allow the warm air to pass all round the case. Over the top, and spanning from the slate to the sashes, panes of glass are placed, so that the case is practically doubly roofed, a current of warm air passing between the roof of the house and the panes of glass. In this way a temperature as warm as that of the house itself is secured in the case without allowing the heated air to come in contact with the *Filmy Ferns*. Inside the case a layer of crocks is placed upon the stage, then a layer of moss, and upon this the stones (sandstone) and soil are arranged, so as to form a sort of rackery. Very little soil was used—peat fibre, charcoal, and broken sandstone being principally employed—as *Filmy Ferns* generally do not care for a close soil. Some of the plants are growing upon portions of Tree Fern stems. The spaces between these and the stones are planted with various species of *Filmies* or covered with moss (*Hypnum*). Water is frequently poured over the stones and moss and upon the slate slabs at the back, and in this way it is found easy to keep the atmosphere in the case at saturation point, so that the *Ferns* seldom or never require watering directly. Watering overhead is always carefully avoided, as very few of these plants care to be wetted with ordinary water.

The temperature of the case varies from 60° to 65° in summer, and, except in very severe weather, from 50° to 55° in winter; for although a little lower temperature does not appear to do much if any harm, it would not be wise to allow it to fall below these figures. Sunlight direct must never be allowed to

reach *Filmy Ferns*, nor should hot dry air ever be permitted to pass over them.

It is much easier to supply the conditions required for the management of a large number of these plants than at first sight appears. The most important points to be observed are a sweet fibrous substance for the roots to grow in, an atmosphere constantly saturated, subdued light, and an equable temperature, to be procured, if possible, by means of cases or bell-glasses, so as to prevent the currents of air, quick changes in temperature, and the dry air from hot pipes from affecting these delicate, easily injured plants. The only amateur known to us whose taste for horticulture has turned to the cultivation of *Filmy Ferns* is Mr. Cooper Forster, and without disparaging the tastes of others, it may be said that in the variety, the grace, and the delicacy of their forms, in their rarity, and in the interest that attaches to them at different stages of their development, Mr. Forster finds, as he tells us, sources of the highest pleasure and most enjoyable study in his management of a choice collection of *Filmy Ferns*, which he has gathered together in that little "drawing room greenhouse" of his, since he first commenced to grow them, now many years ago—in Grosvenor-street!

The following list comprises all the species which have succeeded in a cool fernery at Kew. It will be seen that several are included that are almost hardy, viz., *Todeas*, *Trichomanes radicans*, *Hymenophyllum tunbridgense*, &c.; they are not omitted because the list aims at showing the whole of the *Filmy Ferns* which may be grown under cool treatment:—

<i>Hymenophyllum asplenoides</i>	<i>Trichomanes apifolium</i>
" <i>chloense</i>	" <i>auriculatum</i>
" <i>ciliatum</i>	" <i>attenuatum</i>
" <i>cruentum</i>	" <i>crispum</i>
" <i>demissum</i>	" <i>ex-ectum</i>
" <i>flabellatum</i>	" <i>humile</i>
" <i>fuciforme</i>	" <i>macilentum</i>
" <i>hirsutum</i>	" <i>maximum</i>
" <i>javanicum</i>	" <i>membranaceum</i>
" <i>var. flexuosum</i>	" <i>parvulum</i>
" <i>polyanthos</i>	" <i>Petersii</i>
" <i>pectinatum</i>	" <i>pyxidiferum</i>
" <i>pulcherrimum</i>	" <i>var. olivaceum</i>
" <i>toruosum</i>	" <i>radicans</i>
" <i>tamaricifolium</i>	" <i>var. alabamense</i>
" <i>tunbridgense</i>	" <i>Bochianum</i>
<i>Todea Fraseri</i>	" <i>frondosum</i>
" <i>hymenophylloides</i>	" <i>Luschthianum</i>
" <i>intermedia</i>	" <i>reniforme</i>
" <i>pellucida</i>	" <i>trichodeum</i>
" <i>superba</i>	" <i>venosum</i>
<i>Trichomanes alatum</i>	

H. H.

## FORESTRY.

### WORK IN THE NURSERY: TRANSPLANTING.

MARCH is the busiest month in the nursery, the work of which, more so than perhaps any other operation in connection with forestry, requires to be not only carefully but energetically conducted. The manuring and trenching or digging of all vacant borders, the transplanting of young trees, the preparation of seed-beds, and the sowing of many kinds of tree seeds, are all duties which, during favourable weather, require prompt attention, and will tax to the utmost the energies of all employed. Hard woods of all kinds, as well as *Thorn*s, should be transplanted early, after which the various *Pines* and all such plants as are late in budding may be taken in hand, in every instance proportioning the distance in the rows to the size of plants, as well as length of time they are intended to remain in the nursery. For seedlings of *Oak*, *Ash*, *Elm*, *Beech*, &c., 18 inches between the rows, and 4 inches from plant to plant, will be ample, but in the case of 2 year seedlings nearly double the latter distance between individual plants may be required. Overcrowding should at all times be sedulously avoided, this being generally the bane of nursery stock, and one of the most fertile causes of failure or of weak, straggling, and slow growing trees in many of our woodlands. In transplanting great care is also necessary to avoid cramping or in any way displacing the roots, which should be spread evenly around the base of the stem, and not, as is usually the case, all on one side.

### METHOD OF SETTING OUT PLANTS.

Under the present system of home management, which I may also say is the method adopted in the majority of our public nurseries, a garden line is stretched along the surface of the ground where the plants are to be inserted, and a notch taken out along one side of and close to the line. The plants are

then placed against the perpendicular cut, all the roots being directed towards the planter, after which they are covered with soil and the line removed further on. Now under this treatment it is quite evident that the roots will all grow to one side and produce trees ill-adapted for planting in any but the most sheltered situations. A much better method, although one requiring a little longer time, is to take out a sloping notch on both sides of the line and into which the roots can be spread to their full extent. By this method the roots are in a measure trained from their infancy in the position which they should occupy as forest trees, and as they will thus form a complete whorl round the base of the stem they are not only enabled to withstand the fiercest storm but to collect food from all quarters.

#### WOODLAND PLANTING.

In nursery management it is also now well to remember that as the month advances the risk from continuous dry weather after planting increases, so that quick and careful removals can alone insure success and safety in the operation. With favourable weather all woodland planting and "beating up" should be prosecuted and quickly brought to a close. Thinning or extending game coverts may still be carried on, indeed the present time is one of the best for layering such underwood as the Privet, Laurel, Rhododendron, &c. Osiers, for the cooper and basket maker, may now be cut and left standing in pools of water until required for use.

#### RESOWING AND MENDING GRASS VELGES.

Woodland drives and all bare patches occasioned by the removal of timber should be prepared by a slight digging or forking and laid down in grass. For such purposes we find the following a good mixture:—

Timothy grass, Tall Fescue, Hard Fescue, and Meadow	
Footail, 2 lb. of each	8 lb.
Rough Cocksfoot, and smooth-stalked Meadow, 4 lb. each	8 lb.
Sweet-scented Vernal, and rough-stalked Meadow, 4 lb. each	8 lb.
Wood Meadow-grass	8 lb.

32 lb.

A. D. Webster.

### CHINESE VEGETATION.

[THE following extracts are taken from a letter of the Abbé David prefixed to M. Franchet's enumeration of the plants collected by that adventurous traveller, recently published in the *Nouvelles Archives du Muséum*]:—

From a naturalist's point of view I divide the Chinese empire into three large regions—1st, Northern China, extending from the Yellow River, or Hoang-ho, to the confines of Mantchouria; 2d, all Eastern Mongolia, which adjoins the Great Wall; 3d, all that region, generally mountainous, which forms the South of China, including the immense basin of the Blue River or Yangtsekiang.

#### NORTHERN AND EASTERN CHINA.

The two first regions resemble each other greatly in vegetable and animal productions and in climate. The last is characterised—1st, by great dryness, interrupted in summer by occasional storms; the rare showers of rain or snow which take place in the rest of the year are for the most part insignificant, and dews are not seen until about the commencement of July after the first rains; 2d, by an unusually clear sky, with north winds, as disagreeable as they are frequent; 3d, by the regularity of the seasons—the cold of winter and the heat of summer being rarely broken by abrupt alterations of temperature; 4th, by a long very hot summer, and by a rigorous winter. At Peking the severe cold commences suddenly in November, but the waters of the rivers and sea are not frozen over until December, to thaw in March. Each summer the thermometer attains, and sometimes exceeds, 40° C. (104° Fahr.) in the shade, while the severest cold of winter varies between -8° C. (17° Fahr.) and -12° C. (10° F.), descending exceptionally to -20° C. (-4° Fahr.); but in Mongolia a cold of -30° C. (22° below zero Fahr.) is not rare.

This peculiarity which Northern China shows of being subject to regular alternations of hot summers and rigorous winters makes it impossible for a perennial or ligneous plant from a cold country to live there,

although species of tropical annuals prosper there, and are cultivated far north. For the same reason Bamboos are not found in a wild state higher than the Hoang-ho, although they abound in all the mountains of the South beyond Tsing-ling. On the other hand, Rice, Sesamum, Cotton, Sweet Potato, and a number of the Cucurbitaceae, are cultivated with success as far as the confines of Mantchouria. Again, although China has many species of wild Vines, the two or three varieties which are cultivated in the neighbourhood of Peking (introduced, no doubt) only live there because the people are careful in winter to cover them entirely with earth.

It appears that several centuries ago the Chinese destroyed all the forests, perhaps to satisfy their agricultural and industrial requirements—perhaps, as I believe, to destroy the haunts of the great and formidable animals (tiger and leopard) near which man could not live in security, especially if he kept but few cattle, as is the case here. It is among the reputedly inaccessible mountains that remnants of the ancient forests are found, and generally the country is without spontaneous shrubby vegetation, even on the hills. As to the plains, almost every part is so devoted to agriculture, that the indigenous plants have almost completely disappeared: especially so, as the Chinese have no meadows, and as they are careful in winter to hoe up all the wild plants with their roots to supply their kitchen fires!

The vegetation of the northern region is poor and little varied, especially on the Mongolian plateaux, where the meagre plots of grasses, widely scattered, alternate with immense plots formed by *Artemisia*, *Iris*, *Glycyrrhiza*, studded here and there with bushes of *Caragana*, *Ephedra*, *Clematis*, and *Roses*. Inside the Great Wall the ligneous wild vegetation which has best resisted the vandalism of the Chinese, and which gives to the flora of the country its peculiar appearance, belong to the genera *Zizyphus*, *Vitex*, *Lycium*, *Lepedeza*, *Rhamnus*, *Clematis*, *Eunonymus*, *Celastrus*, *Ailantus*, *Morus*, *Ulmus*, *Planera*, *Salix*, *Populus*, *Biota*, *Juniperus*, and *Pinus*. Besides, on the mountains, there are the *Quercus*, *Carpinus*, *Betula*, *Tilia*, *Juglans*, *Corylus*, *Corylopsis*, *Xanthoceras*, *Koeleria*, *Larix*, *Abies*, *Vitis*, *Loisera*, *Fraxinus*, *Syringa*, *Ligustrum*, *Philadelphus*, many *Spiræas* and *Roses*, *Cratægus*, *Sorbus*, *Sambucus*, &c. There is no *Hedera* (Ivy) in the north, but *Cornus* and *Aralia* are found there.

The trees which are commonly planted to shade the habitations are the Willow, Poplar, and *Ailantus*—often the *Sophora* and *Cedrela*, and as a luxury the *Salisburia*, but these last are imported species, like the *Kaki*, which is cultivated on a large scale on the hills. However, it is only in the mountains of Peking that I have seen in a wild state the black fruited *Diospyros*, while it is only in the South that I have found the *D. Kaki* with little yellow fruits growing spontaneously. As to the beautiful Pious Bungeana, which ornaments the courts of the temple of Peking, I have not been able to discover where it exists in a spontaneous state. Of the three or four *Poplars* of China the most remarkable is that which I have pointed out before under the native name of *Ta-yang*. To its height and elegant appearance it joins the advantage of furnishing one of the most esteemed woods of the country. The Chinese cultivate fruit trees but little, and that badly; however, they possess nearly all those genera that we have in the West. On this subject note that we find in the Chinese mountains, growing in their primitive and spontaneous state, the Chestnut, Walnut, Apricot, Peach, and Cherry, but not the true Plum. Can this old land of the extreme East be the principal, or even the only cradle of these useful plants now spread through all the countries of temperate climate?

The little taste of the Chinese for fruits offers an explanation why they have neglected to domesticate the Strawberries, as also numerous species of Gooseberries and Raspberries, the existence of which I have proved in all their large western mountains. In the region of the Tsing-ling the productions of the North mix with those of the South. There, *Paulownia*, *Catalpa*, *Sierculia*, *Cedrela*, *Melia*, *Rhododendrons*, &c., begin to grow spontaneously; but the greater part of the flora is Northern rather than Southern, and it seems to me to contain a good proportion of species peculiar to the country.

The southern provinces, situate to the south of the Yangtse, have a sub-tropical climate, rain is frequent there all the year, less, however, in winter than in

summer. The vegetation, also, is much more abundant than in the North, without being at all varied. By Kiangsi the country is verdant and the hills are covered with large herbs, with a number of bushes interspersed, and with some trees or shrubs peculiar to the South: *Vitex*, *Pachyrhizus trilobus*, *Smilax*, *Liquidambar*, *Fortunia*, *Cunninghamia*, the small *Castanea chinensis*, *Rhus semialata*, *Chamærops Fortunei*, &c. It seems that the flora of this region contrasts greatly with that of Japan.

### MALT.

MALT-MAKING will eventually gain largely by the repeal of the Malt-tax; but, as I pointed out, both before the repeal and after, at the meeting of the British Association, at York, in 1881, farmers must lose largely. The arguments then adduced by me have never been refuted, and experience shows their correctness. English Barley can never again attain to such prices as it might had the tax continued, and the benefits to farmers of securing malt for feeding purposes and brewing beer are so small, that they do not—and never can—compensate for a reduction in the price of Barley of 1s. per quarter. The tax created a monopoly in English Barley, which practically kept the price at the fictitious level of at least 4s. per quarter above its intrinsic value. Farmers would not believe it, but it is proved by stern, incontrovertible fact.

Wheat malt would doubtless be much more largely made and used, especially at the present price of Wheat, were it not for the difficulty of growing it with the acrospire outside the husk. Further, its excess of gluten, and other nitrogenous constituents, give brewers much trouble in their existing state of knowledge.

Oats, when malted, also labour under the latter disadvantage to a very large extent, and in comparison with Wheat and Barley they are, ordinarily, dear. Otherwise they malt freely, and if brewed properly make delicious beer.

Combes are the rootlets of the Barley. They remove from the kernel a large proportion of the ash and nitrogenous matters, as they consist of 30 per cent. or more of nitrogen compounds, with 6 to 8 per cent. of ash. They also contain a great diversity of acids and other substances. Lermier detected upwards of twenty distinct compounds in the samples he examined. They form good food for cattle and sheep, far better than any common food, and are much cheaper. Few farmers seem to be aware of their true position in this respect.

Kiln dust is a very minor product of malting, but is of use to farmers as manure. It consists of the combs or rootlets which fall through the wire or perforated floors of kilns, mixed with the dust and ashes carried by the ascending column of air from the fires and then deposited.

The uses of malt are becoming more numerous, as it is found to be of considerable value for a variety of purposes. Of its use by brewers, distillers, and vinegar-makers every one knows, and its value to these traders is great. Its value to the agriculturist is, however, problematical. For bread and biscuit making, for various extractive condiments and medicines, we are still, as regards malt, in the experimental stage, and much remains to be discovered.

Malt bread is very palatable. It possesses the advantage of remaining moist and soft when several days old. It makes delicious toast, and altogether is of considerable advantage to sufferers from weak digestion, as it is practically partly digested food. To toothless infants who are fed upon starchy food; malt is a great boon, as, until the teeth are formed, children assimilate starch with great difficulty if at all, but if the starch is converted by the diastase of the malt prior to feeding, the infant can derive nourishment and strength from it. *Journal of the Society of Arts.*

### Notices of Books.

#### The Cultivation of Vegetables and Flowers.

Messrs. Sutton have published a second edition of their useful treatise on the management of the flower and kitchen gardens. The several articles are arranged alphabetically. A year's work in the vegetable garden is a very serviceable reminder of what to do and how to do it, and the several articles on the pests of the garden, and the chemistry of vegetation, though somewhat meagre, will be found of much service in calling attention to these matters.

## APPOINTMENTS FOR THE ENSUING WEEK.

		Royal Horticultural Society: Meeting of Fruit and Floral Committees
		National Rose Society: Meeting of Executive Committee, at 3 P.M.
TUESDAY, Mar. 10		Sale of New and Valuable Orchids, at Protheroe & Morris' Rooms; and of Azaleas, Roses, &c., at their City Auction Rooms.
WEDNESDAY, Mar. 11		Sale of Imported and Established Orchids, Hardy Plants, and Bulbs, at Stevens' Rooms.
		Sale of Lilies, Roses, and other Plants, at Protheroe & Morris' Rooms.
THURSDAY, Mar. 12		Sale of Imported Orchids, at Stevens' Rooms.
FRIDAY, Mar. 13		Sale of Imported Orchids, at Protheroe & Morris' Rooms.
		Sale of Hardy Plants and Bulbs, at Stevens' Rooms.
SATURDAY, Mar. 14		General Meeting of the Royal Botanic Society, at 3.45 P.M.

THE articles that have appeared in our columns relating to the admission of GARDENERS TO KEW, to the mode of obtaining gardeners for service in private establishments, and to the wages paid them, have brought us, as such subjects usually do, a number of communications, too large for us to insert even if we deemed it desirable to do so. The education question, we are pleased to see, has hitherto attracted the most attention, judging from the letters we have received; and communications from the West Indies, from Australia, from New Zealand, and from India, relating to the same subject, have come to hand at a very opportune season. On some of these letters, and the deductions to be made from them, we propose to make some comment. Adverting, in the first instance, to the new regulations for the admission of young gardeners to Kew, lately published (see p. 214), we believe they are the outcome of a feeling that youths of a higher class, and with a more earnest purpose, were needed in the Royal gardens, and that it was desirable to secure them, if possible, by making the advantages of Kew more widely known amongst young gardeners, by offering a higher rate of remuneration, and by holding out other inducements. Under the old regulations, any lad of approved character, and not less than two years' experience, could be entered and admitted as soon as a vacancy occurred. Inexperienced lads, who knew not how to crock a pot or water a plant, whose garden experience had been confined to walk-weeding or pot-washing, had no difficulty in getting into Kew as "royal gardeners." It is not asserted that all the candidates were of this nature, but many were. The consequence of this was bad, both for the plants which such men had to take charge of, and for the credit of the gardens. It was equally bad for the men themselves, their ignorance of elementary gardening standing in the way of their progress, and often the last state of such men was worse than the first. The new form of application fixes a higher standard, and offers a higher rate of wages. Kew ought to stand higher in the estimation of gardeners, who should look upon it as a "high school" through which they should pass, and instead of being considered, as by some it has been—with what justice we need not stop to enquire—a refuge for the inefficient the gardens should become the first school of horticulture in the world. The exceptional advantages for the practice of first-rate horticulture, for instructing "rising hopes" in the more scientific branches of the profession, and in other ways rendering high service to gardening, might be turned to the best account. The services rendered by Kew to the colonies and India, and to scientific botany, are the theme of universal admiration. Something more might now be done for practical horticulture. Kew has her opportunities, and she ought to avail herself of them by taking horticulture by the hand, thus effecting a great good, and, by doing it, benefit herself. At present we believe most of the gardeners (journeymen) are employed indoors. If trees, shrubs, borders, and herbaceous plants could also be taken in hand and properly worked it is easy to see how both Kew and horticulture might be benefited.

At present the outdoor collections, except on the rockeries, are mostly kept in natural orders, regardless of the requirements of different species—a plan well suited for botanical students, but not adapted for horticultural requirements. Both these conditions, as well as the demands of visitors who come to see and enjoy rather than to study, have to be met at Kew, and enormously add to the expense and difficulty of management.

First and foremost come the requirements of scientific botany, which can nowhere else be so well met as at Kew. The students' department should be extended, and, as now, be kept separate, and arranged purely on scientific methods. As a general principle to be acted on, as far as circumstances allow, everything should be grown and tested at Kew. Its nomenclature should be verified, its habit of growth recorded, its peculiarities of structure noted, its flowers analysed and drawn, and specimens preserved for the herbarium. Only a very small proportion would need to be kept in cultivation—only those which have some special value as typical of structure, or as ornamental plants, but what is grown should be grown as well as possible. This brings us to the second point of importance, the requirements of scientific and experimental horticulture, which are intimately associated with the preceding, and of which good cultivation is the natural outcome. Much more may be learnt, even by the botanist, from a well cultivated specimen than from one that is indifferently grown. Last of all in importance, so far as Kew is concerned, are such matters as summer flower-beds, and other purely decorative objects of no special horticultural or botanical interest, but to which a certain amount of attention must be paid in order to please the tax-paying public and provide something for all tastes.

Reverting to the question of the work of the garden, young gardeners have, we are informed, each a separate charge, which they manage under directions from foremen. In addition, the work in each department is shared by all men employed in it. Thus a man in the ferneries has a portion of the collection to water and clean, &c., and also to assist in potting the whole collection, and in all bulky work. Instead of cutting the work up into bits for each man, watering and cleaning only are thus treated; all important work is, we believe, done by gangs under foremen. The men are changed, as often as consistent, from one department as they desire it. On three mornings a week the whole of the men are, we believe, allowed half or three-quarters of an hour to visit other departments, and see all that is going on. Under the old *régime* the men were not allowed to do anything but clean plants during public hours; now they go on with usual work all day.

So far as educational requirements are concerned, lectures on chemistry, structural and geographical botany, are already given, and are well attended; and it might be well if the men were subjected to an examination at the end of each course, and prizes or some other inducement to steady work offered. Lectures on practical horticultural subjects—such, for instance, as soils, manures, the structure and physiology of plants, with special reference to the requirements of cultivation—the most important operations in gardening, such as propagation, grafting, &c., might be given. At present there is, we are informed, a reading society, which meets every Thursday evening in the library. The garden library is open every night till 10 o'clock, and is much appreciated. There is a good collection of books, and most of the garden periodicals are taken.

Good as the present modicum of theoretical instruction may be to the fortunate few who can get it, it is obviously inadequate, and we have only to point to what is done in

Belgium, in Germany, and France, to see how far behind we are in this country in the matter of the higher education of gardeners. We have so often alluded to this subject that it becomes stale iteration to revert to it; nevertheless, we cannot avoid substantiating our statements by again calling attention to the exhibition made in the "Healtheries" last year, of the means adopted in Belgium and France to promote this object. Perhaps the following letter from an old Kew *employé* may have more force than anything we can say on the matter. In any case it is a valuable contribution to the discussion:—

"As a gardener, who has worked at Kew, while recognising the unique advantages it offers to young men for botanical study, I think it ought to afford them more than this; for though Kew gives matchless advantages and opportunities to young men for becoming acquainted with the appearance and nomenclature of an immense number and variety of plants, yet it provides no course of instruction as to their cultivation. I think Kew ought to provide this knowledge also, by giving to the young men a systematic course of instruction in the principles and theory of horticulture, which should make Kew a national training school of horticulture, and which, owing to its vast resources and advantages, it is better qualified to be than any other place. But at present no such adequate national school exists. I believe that the best authorities will agree with me, that young English gardeners require more systematic instruction in horticulture, to enable them to successfully compete with their better trained Continental brethren, and I think they ought to be able to obtain this instruction at Kew. That the present system at Kew is inadequate to do anything of this sort no one who is acquainted with the routine there will dispute. As no fruit or vegetables are grown at Kew, the knowledge and experience gained there is necessarily to that extent imperfect, and a young man who possessed no other knowledge than that which Kew at present gives would be quite incompetent to undertake the management of a garden as an all-round gardener—a cultivator of fruits and vegetables as well as flowers. What is required is a system of instruction which would thoroughly demonstrate to the students the theory of horticulture, and make the practical cultivation of plants more a matter of practice based on inductive reasoning than a 'rule of thumb,' which it too often is at present. In my opinion the best way to attain this most desirable end would be to establish a course of lectures on horticulture, accompanied by periodical competitive examinations in order to test the progress of the students in their subject. Though under the new regulations young men will be expected to be pretty well up in practical gardening before they come to Kew, yet though they may have a certain amount of 'rule of thumb' knowledge, yet from lack of opportunities and advantages they are not likely to possess a sound knowledge of the principles and theory of horticulture, on which all scientific practice depends, and I think the best means of affording the young men this information would be by the establishment of a comprehensive course of lectures [and demonstrations, especially demonstrations]—a course of lectures worthy of that central station that Kew should be, namely, a national training school of horticulture, and the head-quarters of scientific gardening, as well as the head-quarters of the science of botany."

We look on the above communication as specially important as coming from one who has passed through the ordinary routine at Kew, and one who is evidently impressed with the need of a fuller system of education than gardeners, as a rule, can now get. It has often been suggested that the Horticultural Society should undertake this work, and, indeed, fitful efforts have been made in past years, and even now, perhaps, Chiswick might co-operate with Kew and supply in a measure what Kew cannot undertake; but to look to the Royal Horticultural Society to become the School of Horticulture is to look at a mirage.

Another letter, received from a correspondent in one of our colonies, and who, if we mistake not, also spent some time at Kew, may be here inserted as giving the views of one who has risen in his calling and has a correct appreciation of some at least of the reasons why he has done so. Our correspondent says:—

"Some years ago test examinations of young gardeners were undertaken by the Society of Arts and also by the Royal Horticultural Society. Lately, however,

I have seen nothing showing their continuance, which is much to be regretted. I was one of those examined nearly twenty years ago, and feel the great benefit derived from the study requisite before going up for the examination, not only for the purpose in hand, but chiefly as an incentive to further study. The certificates I obtained have so far proved of little direct value to me; but that has been more than compensated for by the knowledge derived during the preparation to obtain them, and the love of study by this means inculcated. If I may suggest such a thing, it would appear to me, that if possessors of large private gardens, Curators of Botanic Gardens, and of the Colonial and Indian botanical establishments, were requested to throw open appointments to each of their respective establishments to men who passed in the first, second, or third grades respectively, and such appointments were published by the Examining Committee after each examination,

aminations, as a rule, should be progressive, *i.e.*, the first grade should first be passed, but this need not be absolutely adhered to, but in such a case the educational test of the three R's should be first passed before going into the other subjects in the higher grades. Each grade should carry its own remuneration. If the first is put at £100 to £70 per annum the second would follow at £70 to £50, and the third, who would probably be but beginners, at £50 to £30 per annum. I might easily point to examples selected from the list of those who have passed the old examination, which enable me to speak with confidence of the success of such a scheme. I am sure myself that I could never have held my present position (worth £200 per annum) had I not in the first place undertaken the study so necessary to be undertaken by a candidate for such an examination."

We have now selected evidence, from among those best qualified to give it, of the necessity for that higher education of gardeners which we

beauty of its foliage (fig. 59). As a single specimen on a lawn during the summer months it is unequalled, and for so-called sub-tropical work it is unapproached by hosts of more tender things which require no little care and attention. Even in the smoke-laden atmosphere of large towns it thrives apace, and produces leaves of large size. A few years ago these columns contained an account of a plant which had grown to be the most conspicuous object in a small square in the heart of London itself. It is almost indifferent to soil; we have seen it thriving in deep alluvial loam, in a heavy clay, and in dry gravelly soils. In the latter, however, it does not grow so fast as under more favourable conditions. Not unfrequently the leaves attain a length of more than 3 feet, the breadth at the base equalling the length. By some authorities *A. mandschurica* is considered to

FIG. 59.—*ARALIA CHINENSIS* VAR. *MANDSCHURICA*.

sufficient inducement would be afforded, and would undoubtedly result in numbers coming up for examination. The appointments might be arranged for by the Examining Committee (which should consist of men eminent as well for their scientific as for their cultural qualifications) entering into correspondence with the various proprietors, curators, &c., some time beforehand, ascertaining the nature of the appointment, the rate of remuneration, and the facilities for acquirement of knowledge afforded by the appointment, bad personal character alone being a bar to the appointment of any approved candidate. The grades respectively should carry an equivalent remuneration, though it might be allowed to vary in each individual grade, in accordance with circumstances. The first grade should be examined in botany—elementary, descriptive; elementary, vegetable physiology; chemistry, light and heat, horticulture, floriculture, arboriculture, &c. The second should be examined in botany, elementary; horticulture, fruit and vegetables; arboriculture, floriculture, &c. The third should be examined in horticulture, culture of fruit and vegetables, floriculture. The ex-

have, in season and out of season, advocated from our knowledge of the superiority of our Continental neighbours in these particulars. Now that those who are or who have been in the ranks begin to feel the same necessity, we may have hopes of better things, and of some remedy being found for other evils—such as a low rate of wages—touched on by other correspondents, and alluded to in the onset of this note, but the discussion of which we must leave to a future occasion.

— *ARALIA CHINENSIS* VAR. *MANDSCHURICA*.  
—No tree or shrub, hardy in the climate of Great Britain, surpasses the subject of this note in the

\* *DIMORPHANTHUS ELATUS*, Miq.; *D. mandschuricus*, Max.; *Aralia mandschuricus*, Max.; *A. japonica*, Hort.

be specifically identical with *A. spinosa*, the Angelica tree, or Hercules Club of North America. They are certainly nearly allied, but for garden purposes they are abundantly distinct. *A. mandschurica* has much larger and handsomer leaves, and a nearly naked—not more or less densely prickly—generally unbranched stem, which attains a height of 8 feet (are there any taller specimens in this country?), and forms a magnificent horizontal crown of foliage, from the centre of which emerges much branched panicles of creamy-white flowers, followed—in favoured spots in hot summers—by black Ivy-like berries. There is a form with golden variegated leaves in cultivation on the Continent. We recently saw a description of it in a German periodical, but are unable to state whether or not it has yet found its way to this country. *A. canescens* of SIEBOLD and ZUCCARINI has leaves decidedly hoary beneath,

but otherwise does not seem to differ from *A. chinensis*; therefore, like *A. mandshurica*, it must be placed under that species as a variety. Our illustration is taken from a plant in the nursery of Messrs. BUNYARD, of Maidstone, who kindly sent us specimens of the fruit ripened during the last summer. For subtropical work Messrs. BUNYARD recommend it to be cut down in the autumn when it will spring up again in great beauty in the following season.

— ROYAL PURVEYORS. — Messrs. WILLS & SEGAR, Oslow Crescent, South Kensington, have received the Royal Warrant appointing them Florists to Her Majesty the QUEEN.

— MESSRS. WILLIAM PAUL & SON, Waltham Cross, will make a special exhibition of *Camellias* in pots in flower at the next meeting of the Floral and Fruit Committees at South Kensington on March 10.

— HULL AND EAST RIDING CHRYSANTHEMUM SOCIETY. — We learn from the first annual report of this Society that its last season's exhibition was a great success—a fact surprising when the very late formation of the Society is borne in mind, as it was on September 15, 1884, that it was resolved, at a meeting held in Hull to form a society with the above designation. Starting the present year with a balance of more than £77 actually in hand gives good promise of a successful gathering in due season.

— EFFECT OF PRUNING. — MM. CASOCIA and SAVASTANO have recently compared the analysis of the juice of pruned and unpruned Vines respectively. The Vines, belonging to nine distinct varieties, occupied 1 hectare of space (2½ acres); half were pruned, the other half were left intact. On analysing the juice it was found that that produced from the unpruned Vines was the richest in sugar and the least acid. It would be well if similar experiments could be made on Vines grown on the extension system and otherwise.

— EFFECT OF POLARISED LIGHT. — A correspondent of *Nature* attributes the absence of trees in the extreme north of Scotland, the Shetland Isles, &c., in part to the fact that the light in those high latitudes is polarised, and polarised light is well known to be much less intense in its chemical action than ordinary white light.

— EXETER APPLE AND PEAR SHOW. — We are informed, through a circular sent by the Hon. Secretary, Mr. J. I. PENGELLY, that the great success attending the show in 1884 has induced the committee to make arrangements for another exhibition this year, to be held on Thursday and Friday, October 22 and 23; and, in compliance with a generally expressed wish, the classifications will be based upon a scheme securing a fairer mode of competition to all exhibitors. The prizes have been considerably increased, and the schedule contains fifty-three classes, among which will be the following:—Four for trade growers exclusively, two for tenant-farmers, four for private growers having gardeners, two for private growers not having gardeners, and one for Devonshire cottagers. The full schedule of prizes and rules for the year 1885 will be ready for distribution early in August.

— CEARA RUBBER IN CEYLON. — In a communication to the Agricultural Society of Madras, Messrs. WILLIAM BROS., of Heneratgoda, Ceylon, say:—"We have tapped a Ceara rubber tree of six years of age. Three days successive tapping by an ordinary knife gave 8½ oz. dried rubber. Ceylon Ceara rubber has already been valued in London at 3s. to 4s. per pound, and the operation can be performed twice a year. Three hundred Ceara rubber trees to the acre, at 12 feet apart, at 1 lb. of rubber per tree, gives 300 lb. per annum; at 1 rupee per pound this would realise 300 rupees. The cost for tapping is estimated as follows:—Coolies pay, superintendence, and other expenses, per acre, per annum, 100 rupees; giving a profit of 200 rupees per acre per annum. This is stated to be very encouraging, considering the little outlay required. The quantity of rubber increases yearly with the age of the tree, but experience shows that it is not advisable to tap Ceara trees under the age of five years. Ceara rubber seeds," it is said, can be grown without filing, as follows:—Keep the seeds in cold water for six days, put in the nursery, and covered about half an inch

with soil, about 2 or 3 inches apart, and water twice a day in dry weather. The nursery should not be shaded, or the seeds will perish. Seeds will begin to germinate one month after planting, and will take from two to four months to complete the germination."

— PRIMULA SINENSIS. — This pretty class of winter flowers seems to get additional attractions each succeeding year, as was well observed in a fine collection brought for our inspection from Messrs. CARTER & CO., High Holborn. There were all the well-known Holborn blues, magentas, and crimsons, and some slightly doubled forms in Village Maid, a pale lilac; Snowflake, a very pale flesh tint, and a cerise-coloured kind. The blooms were of medium size, firm of substance, and possessed eyes of greenish-yellow, of much variety of form and dimensions.

— ORCHIDS IN AUSTRALIA. — The great island continent of the South is not devoid of Orchids, as the splendid publication of FITZGERALD shows. It is not improbable that this work, which has from time to time been noticed in our columns, may have done something to stimulate the curiosity of the inhabitants. At any rate it is certain that the taste for Orchid culture is extending in regions that within the memory of man was untrodden wilderness. The *Bendigo Advertiser* has a whole column devoted to the account of an importation of Orchids made by Messrs. KNIGHT BROTHERS, of Sandhurst (some hundred miles from Melbourne). Messrs. KNIGHT received their first consignment direct from Mr. BULL on Christmas eve, after a journey of two months, when they were necessarily exposed to great fluctuations of temperature. Nevertheless the fifty-one well chosen varieties arrived in excellent condition, and form an acceptable addition to a consignment which the same enterprising firm imported direct from the Himalayas. Fifteen years ago, says the *Bendigo Advertiser*, no one would have thought of such a thing as importing Orchids from England, even to Melbourne. Messrs. KNIGHT, in a letter before us, attribute the success of their present venture to the care and skill exercised by the packer, and give practical proof of their appreciation in a way that is not commonly experience, but which must be very gratifying to the recipient.

— THYRSACANTHUS RUTILANS AT GUNNERSBURY HOUSE. — Mr. HUDSON, who has the gardens at Gunnersbury House under his charge, and who deservedly ranks high as a floral decorator, is giving admirable effect to a happy thought, in which he uses this charming winter blooming plant for house decoration. He has a number of plants in 32-sized pots; these were grown on until they attained a suitable height, then stood in a line on the front of the back stage of his stove-house, the heads fastened to lines of stout wire running lengthwise along the rafters; the result being that there is a most effective line of long pendulous racemes laden with tubular shaped bright scarlet flowers hanging down by the side of the pathway along the house. The effect is excellent, and one sees at a glance how great is the decorative value of such a plant. This method of employing it also shows the flowers off to the very best advantage, and they appear all the more effective because hanging below a charming drapery of green.

— NOTTINGHAM LAMBS! — Some 200 men engaged at the relief works of the Nottingham Corporation becoming dissatisfied with the conduct of the holders of the allotment gardens near the works, the other day proceeded with picks and shovels and completely demolished the fences and other property in over 100 gardens. The police were powerless to interfere.

— THE IMPORTS OF CAOUTCHOUC. — Messrs. HOCHT, LEVIS & KAHN, in their caoutchouc report for 1884, state that the year was "one of, if not the most remarkable in the annals of the indiarubber trade." The price of the leading sort, fine Para, furnished by *Hevea brasiliensis*, gradually declined, with few temporary reactions, from 4s. on January 5 to 2s. in July, thus showing a fall of 50 per cent. in a little over six months. The reason of the decline is said to be due to accumulated large stocks, at times pressing on the market; to a decrease of consumption in the United States of America, one of the largest consumers of rubber; and to the "inevitable reaction from the artificially high and unwarranted

rates at which a reckless and desperate speculation had succeeded in keeping them for some years." The total exports from Para to all ports are estimated at 10,600 tons, against 10,130 tons in 1883. The exports into London and Liverpool during the year were 4610 tons against 4637 tons in 1883, showing a decrease of 27 tons. Of the total exports from Para the United States have taken about 5900 tons direct from Para, besides which they have also taken moderate quantities from Europe. The imports into Liverpool of Ceara scrap rubber from *Manihot Glaziovii* amounted to 80 tons—a slight increase on the imports of the previous year. Of Central American rubber (*Castilleja elastica*) the imports were 35 tons, and of the African kinds, from species of *Landolphia*, the imports were 1650 tons. The imports into London were as follows:—Assam and Rangoon, 250 tons; Borneo, 390 tons; Penang and Java, 90 tons; Mozambique, 860 tons; Madagascar, 135 tons; and of Central American, West Indian, Columbian, Carthagena and Guayaquil, 235 tons collectively.

## SPRING CROCUSES.

FROM the time of Linnæus, who regarded all the Crocuses, both autumnal and vernal, as variations of one species, down to the present day, an immense stride has been made towards a full and accurate knowledge of these popular garden flowers. Although this popularity is confined to comparatively few species, and many are satisfied in cultivating the large-flowered garden forms of *Crocus vernus*, together with the common or Dutch yellow, a wide field of ever varying forms and colours is open to any one possessed of a bit of garden ground and the requisite taste for flowers.

It is needless to refer to the almost universally grown *C. vernus* in the following enumeration; but that figured in the *Botanical Magazine*, t. 45, as a variety of it is the Dutch yellow, *C. luteus* of Lamarck, and merely a garden form of *C. aureus*. The latter is the parent of numerous garden forms, the origin of which is obscure or altogether unknown. *C. mæsiacus*, *Botanical Magazine*, t. 1111, *C. lagenæflorus*, *Botanical Magazine*, t. 2655, *C. lagenæflorus lacteus lutescens*, *Botanical Magazine*, t. 3869, and several other varieties, such as *striatus* and *sulphureus*, are all referable to *C. aureus*, *Botanical Magazine*, t. 2986. They flower considerably in advance of the varieties of *C. vernus*, and are all extremely interesting and choice garden plants, diverging from the golden-yellow type with paler flowers, or variously striped and feathered on the external face of the outer segments with bronzy lines. *C. stellaris*, of unknown origin, closely resembles some of the striped forms of *C. aureus* when unexpanded, but during direct sunshine the segments of the former spread out in a stellate manner, while the flowers of the latter are always cup-shaped. By attending to such simple facts of ordinary observation the Crocuses can so be individualised as to be recognisable at sight. The old Cloth of Gold, *C. Susianus*, *Botanical Magazine*, t. 652, is an extremely hardy and early-flowering species, and was known to Parkinson, who, like others of the same school, regarded it as a variety of *C. vernus*. It is closely allied to *C. stellaris*, but the markings are darker in colour, and the three outer segments are reflexed, never closing up again when once expanded—a character that is unique in the genus.

*C. Olivieri*, a hardy free flowering species with fragrant orange-coloured flowers, must not be omitted here. It was formerly considered a variety of *C. lagenæflorus*, but is assigned its true value as a species in the *Botanical Magazine*, t. 6031. Its smaller flowers and much divided stigmas distinguish it.

Another group of species, with striped or feathered markings, that associate well for garden purposes, would include the early-flowering *C. Imperati*, followed by *C. versicolor*, *C. biflorus*, and their varieties. The first is well known by the buff ground colour of its outer segments, and is a robust vigorous grower. The second typically is darker and more nearly uniformly feathered on all its segments, but is also recognisable by a delicious fragrance resembling Primroses (some say Violets). By this means it is easily distinguished from some of the large garden forms of *C. biflorus*, such as *Cloth of Silver*, the smell of which is rather disagreeable than otherwise. The wild forms, variable as they are, present no difficulty to an ordinary observer. The interior of the flower

is white, with scarlet stigmas. Botanically the two species in question are widely separated.

Besides *C. vernus*, there are several other highly ornamental species with blue, lilac, or purple flowers. Amongst these *C. Sieberi*, *Botanical Magazine*, t. 6036, is an early flowering blue species, or deep lilac verging on purple, with an orange throat. It is synonymous with *C. nivalis*, which name would refer to its flowering as soon as uncovered by the snow. *C. banaticus*, a deep bluish-purple, and *C. varius*, with bright blue flowers blotched with purple on the base of the segments, are very choice. This by no means exhausts the list of seasonable and decorative kinds worth cultivating. They may all be seen, with the exception of some varieties mentioned, in the Kew collection, lately greatly enriched by Mr. G. Maw.

Crocuses should not be grown in herbaceous borders subject to much digging, as the corms soon get buried too deeply. They are amenable to endless variety of arrangement, but never look so natural as when growing in scattered irregular clumps or patches on the grass. Four or five species have been figured in *English Botany* as naturalised. *J. F.*

## The Flower Garden.

### THE SHRUBBERY AND PLEASURE GROUND.

IF not already done, no time must be lost in planting young trees wherever required, and cutting out all dead wood. Before planting the young trees the old soil should be removed, and a quantity of loam sufficient for the trees for some years to come put in its place to plant them in. It is quite a waste of time and money to plant young trees without this precaution being taken, as it is seldom that satisfactory results are gained by sticking in trees and shrubs in soil that is much exhausted.

### PROPAGATION OF THE SUMMER BEDDING PLANTS.

This should now have every attention, so as to get the plants well established by the time they are required. Look over your stock to ascertain if you have got a sufficient quantity of each kind, and if not lose no time in making up the number by putting in every cutting available. If put in bottom-heat they will soon and easily strike, and soon make good plants—such plants as Dahlias, Begonias, Lobelias, Pelargoniums, Ageratums, Iresines, Colons, Alternantheras, Calceolarias, and all those kinds that are required for bedding out. If the number of available cuttings are few, sow seeds of such of the kinds as are wanting. Sow seeds in strong heat of the following kinds of sub-tropical plants:—Wigandia, Solanums, Ferdinandas, Acacia Lophantha, and Cannas of sorts; Ricinus, Eucalyptus globulus, Nicotiana of various kinds, Chilian Beet. These will give a beautiful effect if planted in sheltered places about the gardens, giving great relief to the general aspect of the gardens and pleasure ground. *Wm. Smythe, The Gardens, Basing Park, Acton.*

## FRUITS UNDER GLASS.

### CHERRIES.

Few things are, perhaps, more interesting and attractive at this season than a Cherry-house when the trees are full of blossom. In the house which is devoted solely to Cherries here, this is the case at the present time, namely March 2. Amongst the kinds we cultivate for size in the flower and purity of its whiteness none is so remarkable and transparent in appearance as the Elton variety.

### FERTILISATION.

At this time the most important matter to be done is the fertilisation of the flowers. As yet we have not had any assistance from the bees—a circumstance which naturally makes the artificial operation of fertilising the flowers demand more attention than usual, and it should therefore be persistently followed up as the blooms open until a crop of fruit is secured.

### TEMPERATURE.

By no means endeavour to promote growth in the trees hastily; 45° at night and 50° in the daytime by fire-heat is ample for the present, and 60° should still remain the standard point of opening and shutting up the house. If warm weather prevails out-of-doors, so as to raise the temperature inside much beyond this point, open the house entirely.

### GENERAL MANAGEMENT.

Syringe the trees at closing-up time in the afternoon every day, and repeat it next morning if the foliage has become dry, otherwise merely sprinkle the border and paths, &c. When the shoots have made about five leaves pinch out the points of all, excepting those required for first supplies of wood. If fumigation was resorted to as advised before the trees came into flower neither green nor black fly are likely to abound now, but if this was not done it is quite probable that these insects are already present; if so, fumigation should be resorted to immediately the fruit is properly set, or else the trees should be syringed over with strong quassia water; and in order that this may pass easily through the syringe it is necessary to enclose the chips in a bag, which should be submerged in the water a day or two before it is wanted for use. The next pest to which Cherry trees are particularly liable when grown under glass is a small maggot, which will be found rolled up in the leaves, from whence they travel to the fruit, and, boring into it, so destroy it; the only sure remedy to eradicate the pest is to examine the leaves minutely and destroy the grubs by hand. *G. T. Miles, Wycombe Abbey.*

## Plants and their Culture.

### TEMPERATURES, &c.

AFTER the rearrangement of the houses is completed the temperatures by day and by night should be gradually increased. For a warm stove 65° to 68° by night would induce an active growth, with a rise by day of 10° to 15°, or even 20°, rather than give too much top air during keen cutting winds, with sunshine to run up the temperature. An extra amount of top air should be carefully avoided during the early spring months, as it allows of too rapid an escape of atmospheric moisture, which is trying to the plants for the time being. Rather than this should occur I prefer to use a slight shading for an hour or two during the middle of the day, and an additional application of the syringe upon the plants. Early closing should likewise be practised, to box up, as it were, as much heat from the sun as can be done with safety. In the case of a stove with a mixed collection of plants, consisting of those genera that are best grown somewhat cooler, a few degrees less than the above quotations should be the rule. In this case the amount of moisture in the air must be slightly reduced, to avoid injury from damp. The night temperatures are given for mild genial weather, but a reduction of about 5° should rule if frosty weather or easterly winds prevail. If the blinds are already fixed we should advise their use during the night at such times as these rather than drive the fires too severely.

### EXOTIC FERNS.

POTTING.—These will now, in most cases, be showing signs of starting into active growth. This will give us intimation that they are in need of extra attention. Potting in every needful case ought to be seen to without delay, and among the first to receive attention should be *Adiantum cuneatum*. Young growing stock of this indispensable Fern, if pot bound, should receive a shift. Larger clumps that may have lost some of their vigour and become still weaker in the centre, could with advantage be divided for small stock. Large plants are not desirable when grown for cut purposes, neither are the most durable fronds to be obtained from large plants either. Six and 8-inch pots are ample for all such, and if a great run is

made upon the stock it will take some time to get them much beyond these limits in a vigorous condition. In order to obtain such fronds as will prove to be the most lasting when cut, full exposure to the light, with a free circulation of air and a moderate temperature only, will attain these results. If the old fronds are shabby, we would prefer to cut them clean away, rather than they should in any way impede the young growth which will soon take their place. A liberal use of loam in the soil will tend to produce good lasting fronds; these thus grown will be paler in colour than usual—this is the shade that is now most sought after. During the potting of the stove plants some seedlings may have been obtainable, these should be looked after to supply fresh stock. Next to *A. cuneatum* perhaps *A. gracillimum* is one of the most useful of the genus, and for these purposes should be grown under the same conditions. *James Hudson, Gunnersbury House Gardens, Acton, W.*

## The Kitchen Garden.

### MUSHROOMS.

DISPENSE with fire-heat in houses so long as the temperature does not fall below 55° or even 50°, if a plentiful supply is coming on. Fire-heat is prejudicial to the production of good fleshy Mushrooms, and it also shortens the period of bearing. The quantity of water which is necessary for the surface of the beds, and to sprinkle about the floor and walls to keep the proper atmospheric condition, will depend on the way and position in which the house is formed. Houses built with the walls partly under or wholly under ground will require but little attention in this respect, and here the finest produce will be found. Not so in many of the houses built above the natural surrounding ground, with thin walls and slate roofs, and heated with hot-water pipes, which are obliged to be heated during severe weather to an injurious degree, in order to maintain a growing temperature. In such the surface of beds must be frequently syringed with tepid water, and all available surfaces kept damped, or dried up, miserable produce will be the result. In such houses it is as well to cover the beds lightly, to arrest evaporation. Beds from which good Mushrooms may be expected can be made up now in cool moist sheds facing north, behind shady walls, or in the open, where the beds will receive some shade later on.

If a warm frame can be devoted to Vegetable Marrows, a few seeds may now be sown, and they will succeed perfectly well if planted on a gentle hotbed in a frame without hot-water at the beginning of April, making full use of sun-heat in the afternoon, and covering up to expel frosts. *G. H. Richards.*

## The Herbaceous Border.

### TRANSPLANTING FLORISTS' FLOWERS.

FROM this time forward plants and rooted cuttings of the hardy and half-hardy florists' flowers that add beauty to the flower garden may fitly be transplanted to the positions they are to bloom in, and as the last ten days here were more like fine days in April than mid-February, I took advantage thereof to do so. In ordinary seasons and ordinary soils there would as yet be "no growth in the ground," that is, the temperature would be so reduced by the winter's cold as to be less than that of the open air, and therefore not favourable to growth. This winter, so far, only once did my thermometer register 7° of frost, or 25° Fahr., and that passed away before the sun peeped out the following day, so that I have Pelargoniums planted against a wall uninjured in the open air, that have had no protection; *Veronica rosea grandiflora* never ceased to bloom; and this morning I observed a forward bud on that best of all outdoor Tea Roses, *Gloire de Dijon*. So much for our winter in the south of Ireland. Though hardy bulbs are undoubtedly late, for some reason I have not yet seen satisfactorily explained—I could understand the reverse happening, remembering the splendid ripening autumn—for this season and the aforesaid mild winter, the soil should contain an unusual amount of stored-up heat. It certainly

has not been abstracted by a severe winter. For these reasons, then, I think planting, or transplanting, should not be delayed, for the customary reasons. Permit me then to refer briefly to a few matters of present interest, commencing with

#### OUTDOOR CARNATIONS AND PICOTEEES.

I am not sure, after the Roses, if those should not come next. Mr. Douglas very properly says, "the largest proportion of them may be successfully grown in beds or borders and propagated by layers." To the first I agree, but I have never seen the necessity of layering when nine-tenths of all the cuttings I put in root in the open air without care and without trouble. It was those rooted cuttings (pipings) I had been transferring a few days since, each with its ball of earth, from the cutting boxes. Success depends on having the cuttings fairly ripened or hardened, and put in early so as to give them a chance of rooting before winter. I have often tried rooting on a hot-bed, but have long since given it up. For the first time I noticed that the Carnation buds that remained unopened when the temperature fell last November, are now commencing to expand and promise us much beauty and brilliancy for the next nine months. Of what other flower can as much be said?

#### THE ANTIRRHINUM.

When you get a good variety of this which pleases you—tastes differ in the matter of colours—try and keep it by propagating cuttings. You can have no guarantee that even carefully preserved and selected seed will not become hybridised by bees or otherwise, or they may sport. I limit myself to three kinds—the striped and barred, pure white, and a deep velvety blood-red. If cuttings are taken off just as they become firm at the base, and put into a box of sandy loam, they root in a fortnight in August or September. Transfer to beds or borders any time from this forward.

#### PANSIES.

These have now formidable competitors for public favour in the Violas. Both are quite hardy, but I occasionally meet people disposed to "coddle" them in frames or greenhouses. Even in the smoky manufacturing districts of Lancashire and Yorkshire I have invariably found they did best fully exposed. No better time for transferring to a new bed, or filling up blanks, than the present. Left with a ball of earth and the Pansy or Viola continues on its course without check. I so like all three—fancy, show and Viola—that I would say, "grow some of each." It is so hard to define the difference between a Pansy and Viola, especially the recent introductions of the latter, that I take them together.

#### THE POLYANTHUS.

The gold-laced are very beautiful, but require extra attention to keep them. Those I kept during the winter in a cold frame are now transferred to the open border. The fancy kinds take care of themselves, and are very robust. Between the hot sun and consequent red-spider, mine lost every leaf last autumn, but are now again commencing to bloom. There are many other florists' flowers that will now require attention, such as tuberous Begonias, Dahlias, Hollyhocks, Gladioli, Phloxes, Pentstemons, and Pyrethrums. *W. J. M., Clonmel.*

#### RANUNCULUS LYALLI.

This grand New Zealand species proves difficult of cultivation in this country. This is not to be wondered at when its native habitat in the damp gullies of the high alpine regions is taken into account. The finest plants I ever saw were situated at the foot of a waterfall, where they were dashed with the fine spray. The two finest plants I have seen in this country were in the collection of the late Mr. I. Anderson-Henry, of Edinburgh, but the situation chosen did not suit them. These had been raised from seed, which had lain dormant for four years before vegetating. Those who have sown seeds of this plant should not disturb them till three years have elapsed. I know of several plants in this country, but their owners do not appear to know their wants, consequently they only exist. *Aberia.*

#### HELLEBORUS CORSICUS.

In looking over the herbaceous border some time since in the York Nurseries, I was much pleased with the beauty of this truly noble Hellebore, especially at

the dull season of the year. It forms a large handsome bush, about 2 feet high, and as much in diameter. The leaves are thrice divided into large deeply serrated dark green divisions of a thick leathery texture. Each growth or stem was about to burst into flower; the blossoms are very numerous, and are of a light yellowish-green. I have frequently seen this plant in the London nurseries, when it presented a starved gaunt appearance, which may possibly arise from it objecting to the London clay, which made it all the more welcome to see it in such splendid vigour, and so highly ornamental. I also noticed a considerable number of young plants, which seemed equally at home. *R. Potter.*

#### NEW DELPHINIUMS.

It is worthy of notice that new Delphiniums are in course of much more numerous production in the United Kingdom than they were a few years ago. Then we used to look almost exclusively to the Continent to supply new varieties; now our home productions are both numerous and fine. Messrs. R. B. Laird & Sons, florists, Edinburgh, appear to have taken a most decided lead in this work. This year they announce nine new varieties, selected from a very fine batch of seedlings of their own raising, fine in colour and perfect in habit, as follows:—Desdemona, indigo-blue, with white eye, magnificent spike, and extra fine. Favourite, very fine pale blue, grey eye; distinct and very fine. Glitter, bright blue, with white eye; very dwarf habit. Her Majesty, dark blue, with white eye; a semi-double of dwarf compact habit. Maid of Athens, cobalt-blue, with white eye, and tinged with delicate lilac; semi-double. Mrs. Gamp, azure-blue, with rich lilac centre; very large semi-double flowers; extra fine. Rob Roy, dark blue, with white eye; fine branching spike. Theodore, rosy-purple, with grey eye; semi-double, very fine, dwarf habit. And The Prince, brilliant blue, the centre of the petals lilac, grey eye; fine compact spike. The value of the Delphinium as an effective border plant cannot be too highly estimated. The varieties yield blue shades of a desirable character. The plants do well in a rich deep loam, and they are thoroughly perennial in character. *R. D.*

## Orchid Notes and Gleanings.

#### HUGH LOW & CO'S NURSERY, UPPER CLAPTON.

A VISIT to the above nursery will convince any one what a wholesale trade is carried on with Orchids, and the rapid strides they have taken of late years in public favour. Ten or fifteen years ago you could not have found as many Orchids of certain species in Great Britain as the Messrs. Low now have at their nurseries. Whole ranges of houses are devoted to one variety only, and these just simply "packed" together. One can judge, too, of the rapidity with which the plants circulate, as you can see but few established plants, at least large home-grown specimens. This is here comparatively speaking rather a dull season for Orchids as regards bloom, but still there was a nice "sprinkling" in the different ranges. It is, of course, unnecessary to say that Orchids are done well at Clapton, but if we make an exception it would be the Phalæopsis, which simply luxuriates. There is a good collection of them, too, and we were fortunate enough to see most of them in bloom. It would occupy too much space to enumerate all the varieties we saw in bloom, we must confine ourselves to the principal "batches." There is a large house, or rather there are large houses, full of Cattleyas in grand health, and showing fine sheaths, including large consignments of the somewhat rare *C. amethystoglossa*, *C. Acklandii*, *C. Largesii*, *C. speciosissima*, *C. Schilleriana*, *C. Warscewiczii* delicata, and *C. praestans*, the true variety; this latter is not to be confounded, when once seen, with the one usually known under that name, as it is a finer bloomer altogether than the variety that sometimes bears that name. The labelium is more open, of a brighter colour, and the flower generally is not so deflexed and cramped looking. Cypripediums are largely represented both as regards number and variety; the following were in bloom:—*C. Boxalli*, *C. Haynaldianum*, *C. Robellini*,

*C. Stonei*, *C. Lawrenceana*, *C. Spicerianum*, *C. laevigatum*, *C. Harrisianum*, *C. barbatum*, *C. niveum*, and others. Vandas, Aërides, Saccoboliums, &c., were in large batches; a lot of *V. coerulescens* was showing bloom abundantly; as were also *V. Denisoniana*, *Parishii*, *Cathcartii*, and *Sanderiana*. *Oncidium Kramerii*, varicosum, and pudes were looking well. Large masses of *Masdevallias* of most of the well-known kinds, and *Cœlogyne cristata*, and a host of the different varieties of *Dendrobiums*. Amongst the numerous *Odontoglossums* we noticed a new one—*O. tentaculatum*—a good thing, after the way of *O. gloriosum*. A large batch of *Dendrochilum glumaceum* scented a house finer than any perfumer's shop. The pretty *Angraecum citratum* was a mass of bloom, and looked very pretty. We could enumerate many others, but the above will be sufficient to show the extent of the collection, and we may add that any Orchid fancier will be well repaid by a visit to this famed nursery, and will no doubt come away as well pleased as was a Visitor.

#### CÆLOGYNE CRISTATA VAR. LEMONIANA.

We have this lovely form of *C. cristata* in splendid bloom just now. Two large pans, each measuring a yard across, have respectively 251 and 237 blooms. These, with other plants of various sizes, have at the present time an aggregate of 1630 expanded flowers. Besides being one of the most charming of Orchids, we find it one of the most useful and one of the most appreciated. It rarely fails to flower well, and its cultivation is easy. *George Stanton, Park Place Gardens, Henley-on-Thames.*

#### NOTES FROM REDLEAF, PENSHURST, KENT.

A large number of fine Orchids is now in flower at this garden, a new house having been recently erected for them when in flower, in which we found *Laelias*, *Lycastes*, *Odontoglossums*, *Phalæopsis*, *Cœlogyne*, *Cattleyas*, *Dendrobiums*, in great variety, beautifully arranged, as well as many fine and distinct varieties, in the conservatory, which now is very gay. Some grand specimen *Calla æthiopica*, with six to eight flowers on a plant—fine flowers they are, indeed. Such old plants as *Coronilla glauca*, *Echeveria retusa*, *Allium neapolitanum*, are grown in quantities. These, mixed with well-grown *Cinerarias*, *Primulas*, *Epacris*, *Ericas*, *Camellias*, &c., form a very pleasing effect. Great credit is due to Mr. Holah for the practical manner in which he manages the various departments of this fine place. *A. O.*

#### ODONTOGLOSSUM CÆRSTEDII.

As in the case of many species of *Odontoglossum* that are well represented in English collections, this pretty little Orchid, recently imported in quantity, shows some variety both in the form, size, and colour of its flowers, and in the shape of the pseudobulbs. The largest-flowered form was shown at the last meeting of the Horticultural Society, where, owing to the general opinion that the true *O. Cærstedii* has but one flower on each scape, and that a small one, this exhibited plant was allowed to pass as a major variety. It will be seen, however, by a reference to Dr. Reichenbach's description, and the figure in the *Gardeners' Chronicle*, vol. vii., p. 811 that the typical *O. Cærstedii* has two-flowered scapes, and flowers as large in size as what is now called the variety *majus*. Instead, therefore, of dubbing the larger form with a varietal name, it would be more accurate to distinguish it from the smaller-flowered variety by calling the latter minor. It is not easy to convince dealers that such is the proper thing to do. Whoever thinks of calling *O. Rossii*, however small and inferior it may be, by any other name than *O. Rossii majus*? Names which denote superiority are always preferred. Apart from the question of the names, this jewel-like Orchid is one of the most charming among the smaller kinds of *Odontoglossum*. It is easy to cultivate, as it thrives in the coolest house, is not injured by heavy watering, and always looks neat and healthy even when not in flower. We are told that in its native habitat *O. Cærstedii* is exposed to a low temperature all the year. The dense heavy fogs keep the atmosphere about it thoroughly saturated, and as it grows upon the moss-clothed tree trunks the moisture gathers about its roots, so that it is constantly wet. Under cultivation *O. Cærstedii* flowers freely. A few months ago there was a fine batch of it in the Clapton Nurseries, and we are informed that Mr. Shuttleworth has now flowering in his nursery several plants of the true form of this plant. A specimen of the minor variety is now in flower at Kew. *W. A.*

## ERISKA.

WE give (fig. 60) a view of a number of glasshouses and other garden buildings, lately erected by Mr. Stuart at Eriska, an island some 350 acres in extent, which is being drained and reclaimed at a large expense, and which is not far distant from the little town of Appin, in Argyleshire. The mansion and other buildings, gardens, and everything besides are entirely new, the site chosen being farming land. The island enjoys a mild but damp climate. The plan of the flower garden is of irregular hexagonal form, one acre being enclosed. The north wall is 150 feet long and about 18 feet high; against this wall, and lacing due south, is a range of lean-to vineries 17 feet wide, divided into an early and a late by a covered passage leading to the stable court behind. The early vinery is heated by eight rows of 4 inch pipes, and the late vinery by six rows. Behind the vineries on the north side of the wall is a two-storey range of offices, stables, coach-houses, byre, &c., with stores and a couple of dwelling-houses on the upper flat. The south-east angle of the garden is taken up with the Peach-houses, 125 feet long; they are semi-span, and are divided by a covered passage into an early house heated by six rows, and a late house heated by three rows of 4-inch pipes. The north-west angle is covered by the forcing-houses, 125 feet long, divided into four houses, with forcing beds to

house, which stands some distance to the south of the garden, are heated from two powerful terminal boilers placed at the north end of the stokehole.

The pathways of all the houses are of iron gratings, and these, as well as all the other ironwork, are all galvanised.

In addition to the offices already mentioned there are extensive hen-houses and runs to the north of the stable range, the hen-houses being heated with hot water.

The whole of the walls, pillars, &c., are built of Portland cement concrete, made of gravel and crushed granite, a stone-crusher, concrete-mixer, and steam engine being in constant use for many months. It is calculated that no fewer than 7000 tons of concrete were used, as the foundations at some parts are 10 feet deep, in consequence of the nature of the soil.

The whole of the work was planned by Messrs. Mackenzie & Moncur, horticultural builders, Edinburgh and Glasgow (the plans being revised by Mr. Thomson, of Tweed Vineyards), and the work is being executed by them, under the superintendence of Mr. Mackenzie, manager on the island for Mr. Stuart.

## FRUIT NOTES.

GRAPE CHASSELAS SAINT BERNARD.—This is described as a very early Grape, ripening a fortnight earlier than the ordinary Chasselas, the berries being superior in colour, and while the

## ASTON TOWN PEAR.

This is a very hardy little Pear, from the village of Aston, in Cheshire. It is of excellent flavour, and the tree when in bearing is characterised by its long slender branches, which have a half-twisted dangling appearance. It bears freely and regularly, but the fruit is rather small, which is greatly to its disadvantage. The flesh is buttery, moderately sweet, with an agreeable flavour. The tree bears well as a standard—better than on a wall. I have tried them both ways, and found them do best grown as standards. Season September and October. I can confidently recommend these Pears to the notice of planters, and especially for growing for market. *M. Saul, York.*

## PLANT PORTRAITS.

ÆCHMEA CORNUI.—A small Bromeliad with strap-shaped, obtuse, mucronate, coarsely toothed, green leaves spotted with brown, and a terminal spike of crimson flowers subtended by large boat-shaped bracts of the same colour. It is a native of Brazil, and is figured in the *Revue Horticole* for January 16.

CARYOPTERIS MASTACHANTHUS, *Bot. Mag.*, February, t. 6799; *Gard. Chron.*, vol. xxi., p. 48, f. 30.

FIG. 60.—PLAN OF THE GARDENS AT ERISKA.

the front and Welsh slate stages against the back wall. Each house is heated by eight rows of 4-inch pipes. Behind the forcing-houses are the gardener's offices, Mushroom-house, fruit-room, seed-room, office, and potting-house. As there is sometimes a scarcity of water on the island, the overflow from all the cisterns in the various houses is gathered into a large tank below the offices: this tank is about 100 feet long, 10 feet wide and 10 feet deep; it is covered over with cement concrete on iron beams, forming floor of offices. Provision is made by which the water from this reservoir may be pumped up and flow back by gravity to all the cisterns in the various houses.

The roof of the offices as well as that of the stable range is flat, made of strong cement concrete on iron beams. At the east and west angles of the garden are built two cottages, the one at the west for the head gardener, consisting of five rooms and kitchen with some outbuildings. The other cottage is intended for the foreman and single gardeners and is divided accordingly, while four additional rooms are added to it to increase the accommodation. Forming the south side of the garden and enclosing it is a range of orchard-houses, 350 feet long and 18 feet wide, span-roofed, and divided into two sections by means of a covered passage forming the principal entrance to the garden. Between the head gardener's house and the potting-house is placed the boiler-house and stokehole. The latter will contain from 50 to 60 tons of coals.

The whole of the hothouses and also the mansion-

berries set well they do not require thinning. It is figured in the *Revue Horticole* for February 16.

## PEAR JOSEPHINE DE MALINES.

A good figure of this excellent Pear is given in the *Bulletin d'Arboriculture* of January. The flesh is of a pale rose colour and exquisite flavour. It originated with Major Espereu at Malines as a seedling. The fertility of the tree, says our contemporary, depends very much on the management during the first few years. At first the tree is hard pruned, but when flower-buds begin to show the shoots are not pruned so severely, and only the strong branches are pinched, the weak ones being broken across in part in August.

## DUNMORE PEAR.

There are so many kinds of Pears now in cultivation that considerable experience is necessary to enable any one to select the choicest and most reliable sorts. The Dunmore is of medium size, and a fine Pear, raised by Mr. Knight, which was distributed over the country from the gardens of the Royal Horticultural Society. It is a strong growing tree, bears exceedingly well, and should become better known. Its blossoms stand well the severe spring frosts. The fruit is of medium size; skin greenish, dotted and speckled with smooth brownish-red russet. The flesh is yellowish, buttery, very melting, with a rich high flavour, and is deserving a place in every garden. Bears freely as a standard. Season end of September and early part of October.

## Florists' Flowers.

## GREENHOUSE FLORISTS' FLOWERS: THE PELARGONIUM.

DURING the recent mild weather these have made rapid and very vigorous growth. The large specimen plants must be trained out, to give the flowering shoots more room to develop themselves, in some cases the weaker growths may be removed to give the others more vigour. The attention the large plants require

may be summed up in a few words. Ample ventilation, without exposing the plants to a direct current of cold air. Particular attention to watering! each time water is applied sufficient must be given to thoroughly moisten the whole of the soil and roots. Keep the plants quite free from greenfly: this is easily done, easier than to destroy the troublesome pests after they have once made a home upon the young growths. The most useful of plants to make a good display in the conservatory or show house are young plants propagated in early summer, and flowered in 5-inch pots. In order to provide a rapid growth for them, I plant cuttings singly in small pots; they are arranged on a shelf near the glass, where they soon form roots, and when well established are potted on. We pinch them back once only, and generally each plant will produce on an average a dozen good trusses. The varieties classed as the decorative type are the best to cultivate in small pots, they give a greater profusion of bloom than the others.

A few of the fancy or small-flowered type ought to be grown in every garden, they give even a greater quantity of bloom than the decorative type, and they are also so very distinct in character, but they seem to be out of the fashion at present. Perhaps the reason of this is that they are not quite so easily grown as the others. They merely require a lighter compost and a warmer atmosphere in winter.

By the end of January the whole of the winter-flowering zonals have ceased to bloom satisfactorily, and have been removed from the house to make room for spring-flowering plants and bulbs. These zonals make a splendid display if planted out in the flower borders during the summer. It will be time enough to take the cuttings for next season about the end of April. *J. Douglas.*

#### POLYANTHUS.

These are a *specialité* at Brockhurst, and nowhere perhaps does a finer collection exist; this is saying a great deal, but I have no doubt this is so. Strong healthy plants abound on every hand in the choicest variety; old varieties with many most meritorious new ones find a most congenial home under varying conditions, while others require naming, and many more are carefully tended as seedlings having the best of pedigrees. They are a very fine lot in the frame, when we saw them in their resting condition, it is true, but there was vigour beneath the exterior, which in due time will undoubtedly acquit itself with honours upon the exhibition table. Mr. Brockbank thinks he has at last secured the true Pearson's Alexander. There appears to be a great similarity between it and Maud's Beauty of England, and plants in this collection which were up to last year grown under the latter name have been recognised by those most competent to judge as Alexander. This is most desirable, as several counterfeits have been circulated at a high figure, only to afford vexation in the end. In the best condition are George IV., Blackbird, Exile, Cheshire Favourite, Black Diamond, Lord Beaconsfield, and many others; a rarity, under the name of Stafford Favourite, concerning which little is known, and apparently less recorded, here finds a home; indeed, I suppose it would be difficult to name the variety, hitherto distributed or in existence, which is not represented. What strikes one most is the freedom with which they grow, and the abundance in which they exist; beds and lines here, clumps there, in, I should think, a dozen places; and one was prompted to ask if there were any secrets in their cultivation—Lancashire dodges one had suspicions of; but no, nothing more than ordinary mortals can easily bestow is lavished upon them—moderately good loam, with some rotten manure and sand, exhausts the number of soil items, while the positions assigned them are sheltered and usually semi-shaded. Many of the plants are quite exposed now, but will be covered when coming into bloom.

#### THE ALPINE FRAMES.

These contain a multitude of choice gems, which were dormant or only showing signs of renewed activity; some of the Cyclamen will soon be in flower, the curious and pretty *Synthyris reniformis* is also sending up its spikes. *Gentiana bavarica* is established and happy, while *G. verna* has scarcely been out of flower all the year; such a little cushion of *Androsace belvetica* one does not often see. The *Megaseas* are happily accommodated and strong, and in due time will no doubt be most attractive. I was much struck with a span-roofed frame invented at

Brockhurst; iron troughs form the ridge and wall plates, upon which the lights rest, so that all water drops in them and is carried away. Close by the sides are stout posts at convenient distances, and when it is necessary to remove the lights entirely they are stood on their ends and supported between the side of the frame and the posts, thus affording nice shelter without any fear of them being blown over, and all the plants can be examined over them; indeed, they are more convenient than otherwise.

#### THE DAFFODIL.

The season for these has commenced, for Barr's *Pallidus præcox* has opened, and a dwarf double variety which came from Italy as a duplex form of *N. Pseudo-Narcissus* is swelling rapidly; it looks like what I have seen from other Continental sources as *N. nanus plenus*, which is said to be one of the double varieties of *N. lobularis*, but we shall see. The *Narcissus* season must be a treat indeed when at its prime, for they are planted everywhere; I will not anticipate them, but hope to see them in their showiest dress, when a few more jottings may be made upon what is now one of the finest collections of hardy plants in the country. *R.*

## HOME CORRESPONDENCE.

**Pruning Dendrobiums.**—When danger is near, it is well that there are those who will give timely warning; this has been done on many occasions before, but I disregarded the warning, or rather being desirous to excel—I had more than a dozen of *D. nobile*—I thought I would try "J. S. W.'s" method of pruning, and selected two of the best plants so as to give it a fair trial. The result was as I expected—a complete failure; the plants are condemned to the rubbish-heap: as they are not taken there yet, any gardener wishing to see them can do so—two monuments of the folly of acting contrary to the advice of so many experienced Orchid growers. *D. Wardianum*, also pruned, is in the same miserable condition. It would be a grand opportunity for "J. S. W." to convince the gainsayers by taking a plant or two to the Orchid Conference—not just pruned for the occasion, but at the time he recommends; then we might see or hear what others say about them. *David Walker.*

— This subject can be set at rest once for all, as follows. Let "J. S. W." bring his plants to the Orchid Conference in May, they are invited as all illustrations of growth, &c., and methods of growth, are particularly invited. If these much praised plants are not there we who do not approve of and do not practise the system, shall at once conclude that they are not in a condition to be presented for public inspection, and that the upholder in chief of the plan does not think his plants will bear the exceedingly close scrutiny that will be sure to be exercised by the judges there. If they are so remarkably fine as has often been said, there might be a Veitch Memorial Prize awaiting their triumphant victory over all the other poor unpruned *Dendrobiums* present. *De B. Crawshaw.*

**Camellia Blooms Losing their Centres.**—Some large plants of white Camellias have taken it into their heads and shot all the centres out of fully two-thirds of their blooms. The Camellias are planted out and have a very large crop of bloom. The flower-stalks, with a few rows of petals at the base remain firm, the great bulk of the flower being shot out with considerable force. I have never seen this freak of Nature before, and would be glad of an editorial opinion, and also that of your Camellia-growing readers, who must be legion, on this freak of Nature, or of our other eccentricities among our white Camellias. The plants are in robust health,

and show no other abnormal symptom, but that of throwing out their centres. Others have only come out free within the last week. *D. T. Fish.*

**Vegetable Garden, Market and Private.**—I believe that as fine vegetables are grown in private places as any that are sent into the market, and as a rule much superior as regards flavour, as the market growers' land is driven to excessive production by means of strong manures, solid and liquid, so that many of the vegetables have a distinctly disagreeable and nauseous flavour imparted to them. In many gardens, if the close rotation of crops were followed, more would be grown than could be consumed, with the danger that the surplus would find its way to the open market, to the further detriment of the man who lives by his occupation. That that is at the present time the case in many gardens is proved by the great quantity of such produce in all open markets, more being grown than is wanted at home, and rather than crop less, or throw the surplus to the rubbish-heap, it is often disposed of. *M. W.*

**Gardeners at the Present Time.**—Mr. Stevens, under the above heading, at p. 284, has done well to call attention "to the competition to supply noblemen and gentlemen with gardeners, and the low remuneration to competent men" as a consequence, and no wonder when the services of the wife amongst the poultry are sometimes offered along with the gardener, all for the magnificent sum of £50 per annum. I consider the system of nurserymen supplying gardeners bad for all parties concerned, except the nurserymen—as well have butchers supplying cooks, and brewers butlers. A gardener's ability is sometimes only a secondary consideration; this is damaging to the art, and must keep the standard of gardening low. The bad effects of this system are strongly noticeable in young men, 80 per cent. of whom never seek to learn their profession efficiently. Only let them get into a place with a name—Lord Somebody's, it possible—and it little matters how things are managed in it, the fact of their having been in such a place will some day do duty as a recommendation of ability. Genuine ability ought to be the aim of every young man, and this should be rewarded by being made the first consideration in filling a gardener's place. Gardeners would then know what to work for, employers would be better served, and their places more economically managed. I believe "noblemen and gentlemen" will recognise this sooner or later, and take their gardeners from the open market. Another question gardeners themselves ought to face is the filling of foremen's and journey-men's places by nurserymen, and the system of exchange in force in Scotland, by which the nurserymen keep a monopoly of supplying men, gardeners being left almost without any means of making a choice; in fact, on a November term day they are practically powerless; the particulars of the men you require get little or no consideration, neither can they, for the ordeal a nurseryman has to face in disposing of a shopful of gardeners and men, not to mention those standing in the street, all in about three hours, to the satisfaction of all parties concerned, is a practical impossibility, but if seriously undertaken is enough to drive any one mad. Now, do the gardeners of Scotland think this a satisfactory arrangement for themselves or the young men? *A Scotch Gardener.*

**Spring Flowering Plants.**—There is a great charm about the spring flowers opening to the chill January and February winds out-of-doors, that does not appertain to those grown in pots under glass. *Heleborus niger altifolius* is nearly over, the pearly white of the early opened blooms has given place to a dirty white tinted with rose, but we find still the full beauty and perfect development in the very beautiful variety *angustifolius*: while scattered about the borders we have a very plentiful supply of *H. guttatus*: they are still spotted freely, as the name implies, but some have the spotting on a white ground, others have the spots thickly arranged on a purplish-red ground, the shade of colour varying in each. One of the plants that pleases us best is a group of *Cyclamen Coum*; the blossoms seemed to develop even during the rather severe frost in January, and two days after the frost was gone many flowers were fully developed. About the middle of January *Saxifraga Burseriana* major was fully open on the rockwork. The ordinary form flowers a month later with us. Is this usual? Both

forms came from York. *Leontice altaica* is no great beauty, but it has pushed rapidly through the ground, and its small clusters of pale yellow flowers were fully developed before the Snowdrops were fully open. It flowers with the Winter Aconites. The first flowers of *Iris reticulata* opened on St. Valentine's Day. We tried to grow this year after year in pots, but they seemed to degenerate; planted out in a sunny position on the rockwork they gained strength and are flowering well. *Anemone blanda* is the earliest of the genus to open its flowers; they are now nearly developed. It is much superior to *A. apennina*, which will not be in flower for a month yet. *Leucorum vernum* is also in flower, and *L. carpaticum* is pushing rapidly after it. Different species and varieties of Snowdrops are also charming on grass and in borders. *J. Douglas.*

**A Large Leek.**—Bury Port, South Wales, really seems to be a favoured spot as regards soil and climate. An enormous Leek, 14 inches in circumference, is growing in a garden belonging to Mr. John Lewis, at the present period. It would have been appropriate had it been sent to His Royal Highness, our much loved Prince of Wales, to be cooked, *à la Seakale*, on St. David's Day. *Helen Watney.*

**Exudation and Smut on Camellia Leaves.**—This exudation is of insect origin, and the change of colour to black is caused by a fungus named *Capnodium footii*, which grows upon the excretion. It is the habit of the fungus to so grow. A lichen named *Strigula Babingtonii* sometimes accompanies the fungus and the insect excretions. The fungus (*Capnodium*) grows over this lichen (*Strigula*) and destroys it. The black fungus invades both the insect and lichen nuisances, but when necessary it is able to grow on *Camellia* leaves without either insect excretion or lichen. *W. G. S.*

**Rose Cuttings Turning Black.**—I may inform "J. L." that Rose cuttings will become rotten from excess of moisture at their base, owing to the surrounding material not being sufficiently porous, and drained below. Beds in cool frames, for striking Roses in the early autumn months from ripe wood, fulfil the purpose the best, if given a rounded form, and then much of the water that is supplied finds its way to the lowest points, leaving the soil in which the cuttings stand in a healthy condition. Cuttings will go black from exciting them to grow by means of heat before any callus or roots are formed. The best time for making the cuttings of H.P. and the hardest Tea hybrids is the month of September, or even the month of August in warm localities. These may also be put in precisely as Gooseberry cuttings are treated, but without removing the wood-buds, unless you require half or quarter standard forms, when the buds below may be cut off; but that is not often practised on "own root Roses," notwithstanding its being quite as eligible a method as using Brier stocks. There are usually fewer losses from cuttings in open-air beds made in a sheltered but open site, than when put into cold frames; but in the latter shorter lengths of wood may be used, whereas open-air cuttings must not be less than 1 foot long, and may be much more, although not more than 4 or 5 inches should range above the surface. China Roses in all their varieties strike well in a shallow frame on a mild hotbed of leaves, in the month of July. The young side-shoots of 4 to 6 inches in length must be chosen when getting slightly firm and woody, and they must be made with a thin heel of the yet older wood of the shoot from which they sprang. The foliage may be entirely removed, but I have found the best results follow its retention, merely shortening the leaves by one-half their length. The site for such a bed should be full south; the cuttings must be kept close and shaded till rooted, when air must be admitted gradually for a week, and then full exposure without lights. The frame will require syringing or dewing over with a fine rose pot if the foliage shows signs of dryness, and surface watering may be needed once before the cuttings form roots. *M.*

**Late Grapes.**—The present is a good time to note the keeping qualities of the different varieties of late Grapes. Of these the following are represented in our Grape room by specimens of Gros Colmar, Trebbiano, Muscat of Alexandria, Abbercainry Seedling, Black Alicante, Gros Guillaume, Mrs. Pince,

and Lady Downe's. Also a small bunch of Gros Maroc which has been cut since August last, and its condition under the circumstances warrants us in pronouncing this variety to be a first-rate late Grape, and it should undoubtedly be grown as such. Gros Colmar and Trebbiano have suffered from damp, though the room is dry, while all the other varieties named (including the Muscat of Alexandria) are in fine condition. Mrs. Pince and Lady Downe's are likely to keep nice and plump for a couple of months hence. The chief cause of Mrs. Pince—and many other Grapes for that matter—not colouring satisfactorily, is over-cropping and insufficiency of dry air from the time the fruit begins to colour until ripe. *H. W. Ward.*

**The Eucharis Disease.**—In some cases the mite may be the cause of the *Eucharis* becoming unhealthy, but I am quite sure that in many of the cases lately quoted the cause is simply that the soil has got into such a condition as to cause the roots to rot. I find just the same difficulty in cultivating many other stove Amaryllids, many of which are much more difficult to manage in this respect than is the *Eucharis*, such as some of the *Griffinias* and *Hemanthi*. I have had pots of *Eucharis* healthy and vigorous for years, when suddenly the leaves would be seen to flag, and the roots would be found to be all rotten; and they have become healthy again when planted in fresh soil and not over-watered. No doubt if the mite were to attack them when in a weak condition they would hardly recover, and possibly in some cases it might attack and destroy healthy bulbs, but I believe that in most cases the roots failing would be the prime cause of the mischief. *C. W. S.*

**Dendrobium speciosum.**—I observe, on p. 180, *Gardeners' Chronicle*, a note of the above-named *Dendrobium* in flower at the residence of J. Moore, Esq., The Mount, Sevenoaks, having three spikes of flowers on. I may add, there is now to be seen (February 7) a large plant of this fine old *Dendrobe*, having forty-two spikes, averaging 2 feet in length each, at the Welsh residence of Thomas F. Maddock, Esq., Cae-Gwyn, Carnarvon. Mr. J. Cromwell (the gardener) has flowered this fine old plant successfully for a number of years, and kept in a vinery the whole year round.

—In the recent numbers of the *Gardeners' Chronicle* there appears to be so much interest centred in the *Dendrobium speciosum*, that a plant of the same under my care may be worthy of record. It is growing in a tub a yard square, and this year has borne forty-two blooms; some of the bulbs are 2 feet long, and have in some instances four blooms on one stem. *James Cornwell, The Gardens, Cwllwyn, Carnarvon.*

**Early French Short Horn Carrots in Winter.**—Really there appears to be little difficulty in having a supply of these delicious little Carrots all the year round, or nearly so, and grown in the open air. In August every year Mr. Hudson sows this useful Carrot in lines on a south-west border under a fruit tree wall, where the soil is light and early. Now, and for a long time past, he has been pulling Carrots, and is able to keep up a good supply for the table. The seeds are sown thinly, and it is not necessary to pull out many, if any, in a young state; some are certain to come on earlier than the others, and the act of thinning out by pulling for use does all that is required. A sowing might be made in a cold frame in October or November to follow these; but the bed appears almost inexhaustible, as the late plants all grow into useful Carrots. *R. Dean.*

**Thinning of Fruit Buds on Pear Trees.**—Notwithstanding the thinning of spurs, it often happens there are too many fruit-buds left, and if these are all allowed to remain to flower it will exhaust the trees so much that it often causes a stunted growth, and in favourable seasons much more fruit sets on a tree than it is able to mature in the usual run of seasons, but if favoured by a good season it does bring a heavy crop to tolerable perfection. It then generally rests from bearing for a season, thus producing in one year a surplus, which is not much valued and which can never compensate for the subsequent deficiency of supply. A full supply in every season should be aimed at, and every means tending to ensure it ought to be adopted. The principal of these is thinning. The fruit-buds on trained trees, such as wall and pyramids, also espaliers and bush fruit buds, are abundant on some of our trained trees

this season. I intend to have a great many removed at once, as they are plumping up very fast thus early. I have practised this for two or three years past on old and young Pear trees, trained and pyramids, with good results. In some cases I have had removed a half, and a few instances three-fourths of the fruit-buds. It is well known that the largest, best formed, and finest flavoured Pears are produced from the strongest buds and blossoms; these should be left, or part. This practice may appear to some unnecessary, but my humble opinion is, it is not practised enough by many gardeners. The buds are easily removed with the finger and thumb at this time of year. *Robert Smith, Kenward.*

**Cockscombs in Winter.**—These decorative subjects are generally grown for summer and autumn display, but a few well-grown plants with their bright crimson combs go far to light up a warm greenhouse or stove at the dull season. I have grown a late batch for the last two winters, and they have been much admired. Red-spider sometimes attacks them, and which must be checked at first sight, or their beauty will very soon fade. *H. Louth.*

**Free Growing Apple Trees.**—There seems to be some virtue in planting Apple trees for posterity after all, as but for numerous old trees in diverse parts of the kingdom, and especially in the West, we might have had but few Apples this season, and specially of that valuable kind Blenheim Pippin. It is not so long since that "planting for posterity" was made a constant sneer against those who planted or purposed planting free growing Apple trees. The present generation have very largely to thank those of their progenitors who were not so selfish as to refrain from planting for posterity. If we were all to ask the somewhat hackneyed joke "What has posterity done for us?" and be influenced by the obvious reply, only that would be planted that would endure for a few years. Happily such policy does not guide our labours, and yet if we had taken the advice so freely tendered a few years ago we should have planted Apple trees for to-day only and not for the future. If in the previous year the dwarfed or temporary trees had a good season, they certainly failed us last season, whilst generally the old and once condemned trees have proved to be our best friends. If we want fruit immediately we can have it, at least subject to seasons, if we will plant dwarf trees; but wisdom should guide us to plant also standard trees, rising above the dwarfs, that either our later years or those of our children may be blessed with after-abundance. After all it is no wonder that Blenheims are in great demand, for the splendid crops seen in many districts last year when other kinds have been so bare, show that it is an Apple that will prove a friend when it is most needed, and, taken all round, it is one of the very best kinds we have. It is therefore satisfactory to learn that the demand for trees is so great, and that Blenheims promise to be abundant still, some fifty years hence. *A. D.*

**Adiantum Farleyense as a Basket Fern.**—This Fern is grown very extensively in small pots and as specimen plants, but not so much as might be expected as a basket Fern, therefore it will not be out of place to consider its graceful form, delicacy of tint and pinnules deeply fringed, a beautiful Fern for that purpose. We have grown it here as such for several years past, and it has been greatly admired. Our treatment is as follows: I procure nice free-growing plants in February or early in March, which have just begun to make new fronds. Having the basket ready and some nice green moss, I first place some moss over the bottom of the basket and also for a short distance up the sides so as to hold a portion of the soil, which I use a trifle lighter than most people do for this Fern; two parts loam, one part peat, leaf-mould one part, and enough sand to keep it porous. Some growers use all loam, but I have found the above mixture of soils answer very well. Beginning with the first circle of plants about 6 inches from the bottom of the basket, draw the fronds carefully through the meshes and place the plants about 8 inches apart, then fill round the plants with some of the compost firmly and regularly; then proceed with another circle of plants in the same way. Two circles of plants will in most cases be sufficient round the sides of the baskets, but when very large ones are used three circles will not be too many. After the sides are completed one good plant or three small ones will

be required for the top, which should be firmly filled in with soil. When the baskets are finished they are suspended over the walk in the fernery where a genial atmosphere is maintained. Great care is now exercised in watering: and two or three days after the baskets are finished they receive a good watering through a fine rose. It is obvious that the plants should have a good watering before they were turned out of their pots, which will enable them to stand a few days without water. By no means are the plants supplied with much water till the roots permeate the whole of the soil, when a liberal supply is given. By June the baskets will form a complete globe of healthy fronds, which are very attractive, and lovers of Ferns are so greatly charmed with them that they have been borrowed to do duty at some of our public places on occasion. Any amount of trouble will be amply repaid by growing a basket or two of this beautiful Fern. *C. Penford, Leigh Park, Havant.*

## Reports of Societies.

### SCOTTISH HORTICULTURAL.

THE annual general meeting of this Society was held in the rooms, 5, St. Andrew's Square, Edinburgh, on Tuesday evening, March 3, Mr. A. D. McKenzie, one of the Vice-Presidents, in the chair. The Secretary, Mr. Robertson Munro, Abercorn Nursery, Midlothian, read the eighth annual report, which showed that the work undertaken by the Association is being steadily pursued. Eighteen new members were added to the roll during the session, which has now a membership of 431. The exhibits continue to be one of the principal objects of the Association, and forty-four collections of plants, fruits, flowers, and vegetables have been placed before members during the session, and these came from widely separate parts of England, Ireland, and Scotland. The Treasurer's (Mr. McKenzie, Warriston Nursery, Edinburgh) report showed an income of £33 7s. 6d., while the expenditure had been £24, leaving a balance in hand of £9 7s. 6d. Both reports were approved of. The office-bearers for next session were then elected. Honorary President: Alexander Dickson, M.D., Professor of Botany, University of Edinburgh, and Regius Keeper of the Royal Botanic Gardens. President: Mr. William Thomson, Clovenfords, Galashiels. Vice-Presidents: Mr. John Methven, Nurseryman and Seed Merchant, Edinburgh; Mr. R. Lindsay, Curator, Royal Botanic Gardens, Edinburgh. Secretary: Mr. Robertson Munro, Abercorn Nursery, Midlothian. Treasurer: Mr. Alexander McKenzie, Warriston Nursery, Edinburgh. The following gentlemen were elected members of the Council in place of the first five, who retire by rotation:—Mr. M. Dunn, Dalkeith Palace Gardens, Dalkeith; Mr. Hugh Fraser, Leith Walk Nurseries, Edinburgh; Mr. George McKinnon, Melville Castle Gardens, Lasswade; Mr. R. Morrison, National Bank, Edinburgh; Mr. George Simpson, Superintendent Rose Bank Cemetery, Edinburgh. On the motion of Mr. Dunn the retiring President, Mr. John Methven, was awarded a hearty vote of thanks. Eight gentlemen were nominated for admission to the Association as new members.

Mr. Chapman, Easter Duddingston Lodge, exhibited the following bunches of early spring flowers:—*Helianthus niger*, *H. n. angustifolius*, *H. olympicus*, *H. o. albus*, *H. altifolius major*, *Hepaticas* of sorts, *Galanthus nivalis* and *plicatus*, *Leucocodium vernum*, *Bulbocodium vernum*, *Crocuses* of sorts, *Erica carnea*, *MacNab's Primrose*, *Cheiranthus alpinus*, *Primula purpurea*, *Sisyrinchium grandiflorum*, *Rhododendron Nobileanum*, *R. atrovirens*, *R. præcox*, *Daphne Mezereum*, *Jasminum nudiflorum*, *Orobis vernus*, *Garrya elliptica*, *Poplar* and *Willow*. Messrs. Methven & Sons, Edinburgh, showed a white *Polyanthus*; Mr. Begg, Wardie Lodge, Edinburgh, showed *Draba Maweanae*, *Saxifraga Burseriana*; Mr. McMillan, Edge Hill, dwarf *Cinerarias*. The exhibitors received a vote of thanks.

Four Certificates have been awarded during the session to new and meritorious productions.

The meeting concluded with a hearty vote of thanks to the Chairman.

### MASSACHUSETTS HORTICULTURAL.

WE learn from the *Boston Evening Transcript* that at the close of a recent business meeting of this Society Mr. Joseph H. Bourn, of Providence (ex-President of the Rhode Island Horticultural Society), read the following paper:—

#### OLD AND NEW ROSES.

The most popular, because the most useful Roses are the hybrid perpetuals, whose special beauty consists in the [shell] form of the large petals, softly recurring in their glistening freshness of colour. For decorative purposes the varieties should be the free-flowering kinds, noted for elegance *en masse* and brilliance, in preference to those possessed of great symmetry of form. The essayist traced the development of these Roses from the

time when rosarians were delighted with *Baronne Prevost* and *La Reine*, introduced in 1842 and 1843. In 1846 the Giant of Battles was introduced, in 1852 the *Général Jacqueminot* and *Victor Verdier* appeared, and the *Prince Camille* in 1861. Each of these is now the type of a group of Roses, the most valuable being the *Général Jacqueminot* family, leading members of which are *Marie Rady*, *Pierre Notting*, and *Marie Baumann*, though the *Victor Verdier* family is best for forcing, good illustrations being *Mlle. Eugénie Verdier*, *Etienne Levet*, *Comtesse d'Oxford*, and *Captain Christy*. But there is a type recently introduced more valuable than any of the preceding, called "*Hybrid Tea*," of which *La France* was the original in 1869. Roses of this family that give promise of usefulness are the *Duke and Duchess of Connaught*, *Cheshnut Hybrid*, *Viscountess Falmouth*, *Madame Alexandre Bernaix*, *Madame Etienne Levet*, *Jules Finger*, *William Francis Bennett*, and *Lady Mary Fitzwilliam*.

Roses of the past have been the product of Nature, unaided by human art, while those of the present chiefly came from sowing the seeds of varieties which have not been crossed. Roses of the future should be principally the result of artificial fecundation and hybridisation. Our aim should be to control and assist Nature as far as possible in her tendency towards variation, and in order to obtain new sorts of marked individuality we should avoid crossing varieties so much alike. To obtain new varieties by the mixture of those already existing is one of the most fascinating occupations of the floricultural artist, who is moving continually amid ideal scenes, knowing what forms he wishes, but not what he will obtain.

#### CULTIVATION.

In regard to cultivation, the "rosery" should be both exposed and sheltered—a place of sunshine and shade—the centre clear and open, with a protecting screen around. The soil is more a matter of experience than of cultivation. The plants should be so arranged that the sun will shine upon them from its rise to meridian, and then leave them in shade. The hardy kinds may be planted in the autumn, and the tender ones in the spring. Set plants of one or two years' growth, and prune before planting, for the shortening of the shoots reduces the number of buds which draw upon the sap, and a more vigorous increase follows. Choose a day when the earth is friable and easily worked. Place the roots from 3 to 6 inches under the surface, and set deeper in light, dry soils, than in strong, moist ones. They should be transplanted once in five or six years. Budded or grafted plants more frequently become impaired; the wood, annually weaker, does not attain that maturity and size necessary to the production of fine flowers. If we carefully remove a plant in this condition we shall find large sucker-like roots, almost destitute of fibres, which have been burying themselves deeper in the earth each succeeding year. Removed farther from the reach of nourishment, the bush dwindles and becomes debilitated, which is remedied by replanting in the autumn, cutting off the suckers, and pruning the roots.

The ground for Roses should be thoroughly drained and rendered as porous as possible, and fertilised. In clay soils the use of sand, lime, soot, burnt earth and loose, light vegetable matter, such as leaf-mould, will alter the texture and improve the quality. At the time of planting strong fertilisers are not required, and should not be given until the bushes have become established; they then like rich soil, which should be made light for the delicate rooting kinds, and more tenacious for the robust and hardy, and it would be reasonable that the classes and varieties differing in their nature should have more than one soil, if all are to receive that which is most suitable. A renewal of the surface soil with old pasture loam every two or three years will supply important elements unattainable by any other method. We should avoid the application of more fertilisers in a soluble state than the plants can consume. It is well that the earth should be filled with stimulants in different stages of decomposition, that the plant may in all conditions of growth have plenty of food. When the plant is growing, and especially when flowering, weak liquid manure may be applied. Bone and potash act favourably early in the spring. A frequent sprinkling of water adds health to the foliage and prevents injury by insects. The earth should be wet only when dry, and then thoroughly.

#### ARRANGEMENT.

The arrangement of cut Roses is a matter of taste, in regard to which there does not exist a unanimity of sentiment, else we should be wearied with a continual sameness. But there are certain fixed laws that regulate the decorative art in flowers. Too many blooms are used for single baskets and bouquets, where they are crowded together promiscuously, exhibiting a mass of petals, the form and colour of each separate flower being indistinct, with little of its own foliage to render the proper effect. The more nearly Roses are shown as they naturally grow the handsomer they are. The stiff artificial stem, without the leaf of the flower, propped up by *Smilax*, *Ferns*, and other green things than its own, is not like Nature. Hand bouquets of Roses and buds are more beautiful when made of one variety with its own foliage, stems long and loosely bunched, having a small number, well chosen, of sweet odour. A collection in basket form or for parlour decoration had better lack a flower than have one too many, the object being to form a graceful, refreshing, and suggestive picture, preserving an "easy negligence mixed with art." Show each bloom separately, reposing in its own green, and a few colours have a better effect than many. A combination is thought to be desirable red, white, and buff form a pleasing one. The beauty of Roses is much enhanced when displayed in masses. As a rule, if there are to be many flowers, use the delicate shades; if few

the deeper tones. Large and choice Roses are always more effective when displayed in proper standards for their reception as single specimens.

## The Weather.

Feb. 26.—Fine morning; dull afternoon and night.

— 27.—Drizzling rain nearly all day.

— 28.—Dull day and night.

March 1.—Very fine day and night.

— 2.—Very fine day and night.

— 3.—Rain nearly all day and night.

— 4.—Very fine day and night.

LONDON: "Atmospheric Pressure."—During the week ending February 28, the reading of the barometer at the level of the sea decreased from 30.17 inches at the beginning of the week to 29.80 inches by 5 P.M. on the 22d, increased to 30.09 inches by 9 A.M. on the 23d, decreased to 29.75 inches by 5 P.M. on the 24th, increased to 30.13 inches by 9 A.M. on the 26th, decreased to 29.83 inches by 5 P.M. on the 27th, and was 30.04 inches by the end of the week.

The mean reading of the barometer for the week was 29.92 inches, being 0.28 inch higher than last week, and 0.07 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 57° 5, on the 24th; the highest on the 22d was 45° 2. The mean of the seven high day temperatures was 51° 5.

The lowest temperature was 30°, on the 22d; on the 27th the lowest temperature was 45°. The mean of the seven high day temperatures was 39° 5.

The greatest range of temperature in one day was 16° 5, on the 23d and 24th; the smallest was 6° 5, on the 27th. The mean of the seven daily ranges was 12°.

The mean temperatures were—on the 22d, 38° 4; on the 23d, 43° 9; on the 24th, 49° 6; on the 25th, 46° 8; on the 26th, 45° 7; on the 27th, 47° 7; and on the 28th, 45° 9; and these were all above their averages (excepting the 22d, which was 0° 7 below) by 4° 7, 10° 3, 7° 3, 6°, 7° 8, and 5° 8 respectively.

The mean temperature of the week was 45° 4, being 5° 4 higher than last week, and 5° 9 above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 104°, on the 24th. The mean of the seven readings was 82° 2.

The lowest reading of a minimum thermometer with its bulb placed on grass was 31° 7, on the 22d. The mean of the seven readings was 37°.

Rain.—Rain fell on five days, to the amount of 0.47 inch.

ENGLAND: Temperature.—During the week ending February 28, the highest temperatures were 59°, at Leeds, 58° 9 at Liverpool, 58° 8 at Cambridge; the highest at Brighton was 54°, at Plymouth 55°, at Bolton 55° 8. The general mean was 57°.

The lowest temperatures were 27°, at Leeds, 29° 1 at Wolverhampton, 29° 5 at Plymouth; the lowest temperature at Brighton was 35°, at Bristol 34°, at Preston 33° 5. The general mean was 30° 5.

The greatest ranges were 33° at Sheffield, 32° at Leeds, 28° at Bradford; the smallest ranges were 19° at Brighton, 22° at Preston, 24° at Bristol. The general mean was 26°·5.

The mean of the seven high day temperatures was highest at Truro, 53°·7, at Bristol 53°·5, at Sheffield 53°·3, and was lowest at Bolton, 49°·8, at Brighton 50°·1, and at Preston 50°·6. The general mean was 51°·7.

The mean of the seven low night temperatures was highest at Plymouth, 43°·8, at Truro 42°·9, at Bristol 42°·3, and was lowest at Wolverhampton, 37°·1, at Bolton 37°·5, at Sheffield 37°·7. The general mean was 40°.

The mean daily range was greatest at Sheffield, 15°·6, at Cambridge 14°·7, at Wolverhampton 13°·6; and was least at Plymouth, 8°·7, at Brighton 9°·2, at Preston 9°·5. The general mean was 11°·7.

The mean temperature was highest at Truro, 47°·8, at Plymouth 47°·6, at Bristol 47°·4; and was lowest at Bolton, 43°·1, at Wolverhampton 43°·4, at Sunderland 44°·5. The general mean was 45°·3.

**Rain.**—The largest falls were 1·30 inch at Bolton, 1·12 inch at Preston, 0·89 inch at Truro and Plymouth; the smallest fall was 0·02 inch at Sunderland, 0·17 inch at Wolverhampton, 0·32 inch at Cambridge. The general mean fall was 0·58 inch.

**SCOTLAND: Temperature.**—During the week ending February 28, the highest temperature was 54°·8, at Leith; at Perth the highest was 51°·5. The general mean was 53°·5.

The lowest temperature in the week was 26°, at Greenock; at Perth the lowest temperature was 34°·8. The general mean was 30°·6.

The mean temperature was highest at Leith, 46°·2; and was lowest at Perth, 43°. The general mean was 44°·4.

**Rain.**—The largest fall was 1·44 inch, at Greenock; the smallest fall was 0·36 inch, at Perth. The general mean fall was 0·75 inch.

JAMES GLAISHER, F.R.S.

## Obituary.

MR. ALEXANDER MEIKLEJOHN, the Auricula grower, died at the Raploch, Stirling, on the 18th ult. He was one of the old school of florists, and was contemporary with Mr. George Lightbody and Mr. Robert Trail. His specialty was Auriculas, and after his retirement from business he gave his whole time to his plants. His collection was the largest in Scotland; nor had he any idea of growing them in heated houses—they were all cultivated in frames of a span-roofed form, the lights at an angle of 45°. His frames were raised above the surface of the ground, in order to admit of the air circulating freely around the plants. He did not raise many seedlings. The variety Alexander Meiklejohn, sent out by him, was raised by a neighbouring farmer named Kay. He raised the fine shaded edged alpine Auricula, Mrs. Meiklejohn. I visited him eleven years ago, when he told me that he had been growing Auriculas for fifty years. Few people can say that they have cultivated and made a specialty of one species of flower only for sixty-one years. His age is not stated, but he must have been about eighty-seven. *J. D.*

—The death is also announced of Professor T. C. ARCHER. Originally connected with the Custom House at Liverpool, he became familiar with the varied vegetable products that are imported into that port, and published a popular handbook of *Economic Botany*. His technical knowledge led to his nomination as juror or commissioner to several of the exhibitions, and ultimately to his appointment as Director of the Edinburgh Museum of Science and Art. Professor Archer died quite suddenly on the 19th ult.

## Answers to Correspondents.

**APPOINTMENT IN A TEA GARDEN:** *D. M. K.* An application at the India Office, Whitehall, London, for the information you desire would probably meet with a response.

**BLOCKS OF FERNS:** *J. H. H.* The blocks you mention could only be obtained by purchase from the publishers, who might, or might not, be disposed to sell you electros of them. They are not to be had in the open market. We trust, if you secure any, you will not adopt the disreputable practice of not acknowledging the source whence they are derived.

**BOOK ON THE VINE:** *H. H. Barron* on *The Vine*, published by Macmillan & Co., 2s. 6d.

**BOOKS:** *Pomologist.* 1, Hogg's *Fruit Manual* is published at 171, Fleet Street, London, E.C. (*Journal of Horticulture* Office), price 15s. 2, *British Apples*,

published by Macmillan & Co., London, price 2s. 6d. 3, *Manual of Conifers*, published by J. Veitch & Sons, Nurseries, King's Road, Chelsea, London, S.W.

**CORRIGENDA.**—In article "Hybrid Echium," p. 279, February 28, in top line, right-hand column, read "In 1883," instead of "1t 1833."

**CUCUMBERS:** *Thoms.* The disease is the result of the attacks of microscopic worms, often described and figured in these columns. You will do well to burn all the plants, turn out the soil, and start entirely afresh.

**"GARDEN PALMS."**—We beg to inform our Russian correspondent of the reappearance of the "Notes on Garden Palms" in our columns next week.

**FOUL LAWN-TENNIS LAWN:** *J. C.* Spudding out the roots, or cutting them off just below the ground-level, and dropping vitriol on the top of the root, are remedies, but they will take up much time if the weeds are many. It is often more economical to dig up the lawn, throwing out all roots of injurious plants, and after well levelling, sow down with a good assortment of the cleanest sample you can get of lawn grasses.

**JUNIPERUS VIRGINIANA:** *H. W.* The tree will stand the sea-breezes very well—it is very hardy anywhere—but its growth is not rapid in very windy sites, and it gets brown from much exposure to the sea-breezes, unless protected by something deciduous, like Sloe, Tamarisk, Norway Maple, or Sea Buckthorn, as a protecting screen from the first onslaught of the wind. Trees that renew their foliage entirely annually should always be in the majority in seaside planting in the front lines.

**NAMES OF PLANTS:** *R. Dondram.* 1, Rhododendron Falconeri; 2, sp. not identified; 3, Falconeri var. Is not No. 2 a hybrid between R. Falconeri and some other species?—*W. Stachhouse.* 1, Trachelospermum jasminiflorum. The small Trumpet Narcissus is Ajax minor, the other Tazetta orientalis. 4, Cheiranthus longitollis; 5, Tritoma uvaria; 6, Megasia crassifolia var. *O. O.* Dendrobium fimbriatum oculatum, so far as we can judge without knowing the kind of bulb it has.—*J. H. S.* 1, Maxillaria discolor. We cannot undertake to name Camellia hybrids; send them to some nurseryman who grows them.

**NEW YORK VIOLET:** *Mrs. Porteous.* You can obtain this variety, quite true to name, from Messrs. Cannell & Sons, Swanley, Kent.

**PEAT AT AGRICULTURAL HALL:** *S. Pope.* Messrs. Gateril & Sons, Bistern, Ringwood.

**PLANTS FOR FERNERY:** *A Subscriber.* The situation is certainly not favourable for growing anything, but such things as Aspidistra lurida and A. I. variegata, Scolopendrium, Picea repens, and some of the varieties of Selaginella, such as Martensii, umbrosa, denticulata, ought to do fairly well; also Tradescantia discolor, T. d. lineata, T. zebrina, &c. Most likely Grisselinia littoralis, Aucubas, Veronicas, would thrive, and as they are not expensive we would advise you to try them. Nothing will endure for any great length of time, and most things will want replanting yearly. Club mosses perhaps twice in a year. For soil use fibry peat and sound loam, with an admixture of coarse sand, and keep the glass both outside and inside as clean as possible.

**REMOVING THE FIBRY ENVELOPE FROM GLADIOLUS WATSONIA AND OTHER IRIDS' CORMS:** *W. W.* It is quite immaterial, if not done severely; but our opinion is that it is better not done at all.

**TUBEROUS BEGONIAS:** *L.* The tuber is formed by a swelling of the caudex, or portion of the stem intervening between the root and the seed leaves.

**VINES, CISTERNS, &c.:** *W. D.* Some of our best Grape growers pinch off the fruit-bearing shoots at the second joint from the bunch. You may remove the buds then left on such shoots beyond the bunch, except the leading one, if you like to do so. It is immaterial whether you do so or not. All laterals must be kept in check by pinching them back to one leaf, thus letting them increase a joint at a time; or you may remove them entirely till the crop is finished, when they may be allowed almost unrestricted growth, as undue checking of the Vines all through the growing season results in checking likewise the natural and healthy extension of the roots; a thing to avoid. Stoves, forcing-houses, and the like structures, should be fitted with covered cisterns for holding soft water, if possible, for watering and syringing uses. Evaporating troughs and pans are not essential, as the air of a house can be made sufficiently moist by sprinkling floors, walls, &c. In a forcing-house a heap of fermenting manure is useful during the winter and spring months for the same purpose.

**YELLOW FLOWERED RHODODENDRON:** *W. Messrs.* J. Veitch & Sons.

## CATALOGUES RECEIVED.

**THOMAS S. WAKE,** Hale Farm Nurseries, Tottenham, London.—Chrysanthemums, Hardy Florists' Flowers, Hardy Climbing, Creeping, and Trailing Plants; Choice Hardy Perennials.

**DICKSON, BROWN & TAIT,** 43 and 45, Corporation Street, Manchester.—Farm Seeds.

**ELLWANGER & BARRY,** Mount Hope Nurseries, Rochester, N.Y.—Fruits.

**H. ELLIOTT,** St. Helier's, Jersey.—Chrysanthemums.

**A. LIETZE,** Caixa 644, Rio Janeiro.—Orchids and Caladiums.

**LITTLE & BALLANTYNE,** Carlisle.—Farm Seeds.

**W. TOOGOOD,** Southampton.—Farm Seeds.

## SEEDS.

LONDON: March 4.—Messrs. John Shaw & Sons, of 37, Mark Lane, report that for the time of the year unusual quietude continues to characterise the trade for farm seeds. Values for all descriptions are now so low that they may be regarded at about a holding over level. Italian and perennial Rye grass keep steady. For spring Tares there is a fair sale at full prices. Winter Vetches are scarce. The trade for Canary and Hemp is very slack. Rapeseed holds its own, and has a good demand. Feeding Linseed is depressed.

## SHARPE'S EARLY PARAGON PEA.

*The Earliest Large Wrinkled Marrow.*

First-class Certificate, Royal Horticultural Soc., 1884

PARAGON shows in many respects a great improvement upon any variety at present in the trade. It is a Blue Wrinkled Marrow of fine flavour; height from 3 to 4 feet. The pods are produced two and three together in such abundance as to almost conceal the foliage. They are of an unusual size, broad and thick backed, containing from twelve to fourteen immense Peas packed in a double row.

Paragon is the earliest of the large Wrinkled Marrows, being ready before Prizetaker. It is very hardy, and will stand earlier sowing than any Pea of its class. It is most valuable for succession crops, as it is not liable to mildew, and a constant supply of Peas for four months can be obtained from this one variety.

Paragon will prove a most invaluable Market Gardeners' Pea, its earliness, hardness, and immense cropping quality surpass anything yet sent out—it also stands long railway carriage without injury.

*The following Testimonial is from the largest dealers in the kingdom in Peas for Market Garden Purposes:—*

"December 6, 1884.—In reply to yours respecting your Paragon Pea. We grew it last season and were favourably impressed with its qualities. We consider it a great improvement on Telephone, the pods being a much better colour and the Peas in it being much finer. We consider it is the finest Pea in our trials last season, and we grew every Pea we thought of merit and nearly every novelty."

CHARLES SHARPE & CO., SLEAFORD.

### Special Cheap Offer.

R. AND A. MORRISON, The Nurseries, Elgin, beg to offer:—  
ABIES DOUGLASII, 2-yr., 15s.; 3-yr., 1-yr., 35s.; 6 to 9 inches, 60s.; 9 to 15 inches, 75s. per 1000.

RANSOMES'  
LAWN MOWERS.

## THE "WORLD" LAWN MOWERS

are the best for cutting long grass, and are constructed on the  
American system with the special advantages of English  
materials and workmanship.

They are made in nine sizes, 8 to 24 inches.

Prices from 45s. to £5.

## THE "REVERSIBLE" LAWN MOWERS

are suitable for small gardens and borders. They roll the  
grass as well as cut it, and can be used either side upwards.

They are made in three sizes, 6 to 10 inches.

Prices from 27s. to 45s.

## THE "AUTOMATON" LAWN MOWERS

are the best machines for general purposes and gardeners' use.  
They leave no ribs in the grass but produce a perfect surface.

They are made in eight sizes, 8 to 22 inches.

Prices from 55s. to £8 10s.

## THE HORSE-POWER MOWERS

are the best for Large Lawns, Cricket and Lawn Tennis Clubs.  
They are used on the Cricket Grounds of the Oxford and Edin-  
burgh Universities and numerous Colleges and Public Schools.

They are made in six sizes, 26 to 48 inches.

Prices from £14 10s. to £32.

Complete Price LISTS may be obtained from any respectable Ironmonger, or

## RANSOMES, SIMS &amp; JEFFERIES (Ld.), IPSWICH.

IMPROVED VINE ROD FASTENER.  
PATENT.

Vine Rods are now attached to the wire, or lowered to be  
pruned, in a few moments. The fastener is always ready, and  
being made of strong material will last several years. Many ex-  
perienced Vine growers have already adopted it, and expressed  
their entire approval of the result. Box containing 6 dozen,  
price 4s.

Sold by R. H. AND J. PEARSON, 141 and 143, High Street,  
Notting Hill, W.; and J. W. DART, St. Aubin's, Jersey.

CHELSEA, S.W.

IRON HURDLES, GATES, TREE GUARDS,  
Iron and Wire Espalier, &c.

CATALOGUE Free. Please name this paper.

BAYLISS, JONES & BAYLISS,  
VICTORIA WORKS, WOLVERHAMPTON;  
And 3, Crooked Lane, King William Street, London, E.C.HILL AND SMITH'S BLACK VARNISH,  
for Preserving Ironwork, Wood, or Stone.  
(Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on  
all outdoor work, while it is fully two-thirds cheaper. It was  
introduced upwards of thirty years ago by the Advertisers, and  
its genuine good quality, notwithstanding a host of unprincipled  
imitators, is fully attested by its constantly increasing sale. It  
may be applied by an ordinary labourer, requires no mixing  
or thinning, and is used cold. It is used in the grounds at  
Windsor Castle, Kew Gardens, and at the seats of many  
hundreds of the Nobility and Gentry, from whom the most  
flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon,  
at the Manufactory, or 1s. 8d. per gallon carriage paid to any  
Station in the Kingdom.

## UNSOLICITED TESTIMONIAL.

"Pierrefield Park, June 21, 1876.—Sirs.—I have this day  
forwarded from Chepstow to your address a black varnish cask,  
to be filled and returned with as good Varnish as the last we  
had, which I candidly admit was the best we ever had. Address  
Varnish to Pierrefield Park, Chepstow.—I am, Sirs, yours re-  
spectfully, Wm. Cox."

CAUTION.—HILL & SMITH would particularly warn their  
Customers against the various cheap Varnishes now so much  
advertised.

H. & S.'s Varnish has been an article of common use on most  
of the large estates in the kingdom for upwards of thirty years;  
and their constantly increasing trade in it, and the numerous  
Testimonials they receive, stamp it as a truly genuine article.  
Every cask is legibly marked with their name and Registered  
Trade Mark as above, without which none is genuine.

Large illustrated CATALOGUE of Fencing, Hurdles, Field  
and Entrance Gates, &c. sent free on application to  
HILL AND SMITH, Brierley Hill Ironworks, Staffordshire;

## Rosher's Garden Edging Tiles.

THE ABOVE and many other PATTERNS are made in materials of great durability. The plainest sorts are specially suited for KITCHEN GARDENS, as they harbour no Slugs or Insects, take up little room, and, once put down, incur no further labour or expense, as do "grown" Edgings, consequently being much cheaper.

GARDEN VASES, FOUNTAINS, &c., in Artificial Stone, very durable and of superior finish, and in great variety of design. F. ROSHER AND CO., Manufacturers, Upper Ground Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.; Kingsland Road, E.

Agents for LOCKER'S PATENT "ACME" FRAMES, PLANT COVERS, and PROPAGATING BOXES; also for FOXLEY'S PATENT BEADED GARDEN WALL BRICKS.

Illustrated Price LISTS Free by Post. The Trade supplied.

**ORNAMENTAL PAVING TILES,** for Conservatories, Halls, Corridors, Balconies, &c., from 3s. per square yard upwards. Pattern Sheet of Plain or more elaborate Designs, with Prices, sent for selection.

**WHITE GLAZED TILES,** for Lining Walls of Dairies, Larders, Kitchen Ranges, Baths, &c. Grooved and other Stable Paving of great durability. Wall Copings, Drain Pipes and Tiles of all kinds. Roofing Tiles in great variety, Slates, Cement, &c.

F. ROSHER AND CO., Brick and Tile Merchants. See Addresses above.

**SILVER SAND,** fine or coarse grain as desired. Price, by post, per Ton or Truckload, on Wharf in London, or delivered direct from Pits to any Railway Station. Samples of Sand free by post.

**PLANTS and BRICK BURNERS** for Rockeries or Ferretories. KENT PEATS or LOAM supplied at lowest rates in any quantities.

F. ROSHER AND CO.—Addresses see above. N.B.—Orders promptly executed by Rail or to Wharves. A liberal Discount to the Trade.

## THE MOST SUITABLE FOR SHADING ORCHIDS, FERNS, Palms and Stove and GREENHOUSE PLANTS.

It is a strong, durable Cotton Netting, woven in squares so close as to exclude the direct rays of the sun, but admitting the greatest amount of light attainable through shading. It with-stands the weather better than any other class of shading, and may be beneficially used on account of the thickness of its texture, during cold weather, to keep the frost out. R. WARNER, Esq., Broomfield, Chesham, has employed this material for some years, and speaks very highly of it, pronouncing it to be the very best material for Orchids he has ever used.

Blinds made up and fixed complete. Sold in pieces, 30 yds long by 1 1/2 yard wide. Price 4s. each. Sample submitted.

**B. S. WILLIAMS,** VICTORIA and PARADISE NURSERIES, UPPER HOLLOWAY, LONDON, N.

## RUSSIA MATS.

TO BE DISPOSED OF, A WHOLESALE  
and RETAIL SEED BUSINESS. A splendid going  
concern. One of the finest in existence, doing a large and  
profitable trade. An unusual opportunity.  
Apply (by letter only) to Messrs PROTHEROE AND  
MORRIS, 67 and 68, Cheapside, London, E.C.

WANTED, a PARTNER, or to PUR-  
CHASE one of the best concerns in the Trade, enjoying  
a fine and rapidly increasing business. An altogether excep-  
tional opportunity for a capitalist. Amount required from an  
loc mer, not less than £5000.

Arrangements could probably be made to retain the services of  
the Managers and Foremen.—Apply to Messrs. PROTHEROE  
AND MORRIS, Auctioneers, 67 and 68, Cheapside, City, E.C.

WANTED, an active single young man, a  
WORKING PARTNER, with £200 capital, in an  
established Florist, seed, and Fruiter's business capable of  
considerable extension.—Z. Y. X., *Gardeners' Chronicle* Office,  
41, Wellington Street, Strand, W.C.

WANTED, a WORKING PARTNER,  
with about £150, in a well-established Seedsman and  
Florist Business, 5 miles from P.O. A good opportunity. Large  
increasing neighbourhood. Partner must be a good gardener.—  
Address, state particulars, to W. E. S., *Gardeners' Chronicle*  
Office, 41, Wellington Street, Strand, W.C.

WANTED, an experienced WORKING  
MANAGER, for 6 acres of Market Garden and Glass  
for Cut Flowers, Tomatoes, &c.—H. M. MARTYN, Conniss  
Weir, Exeter.

WANTED, for a large Nursery, a very first-  
class man, as HEAD FOREMAN or MANAGER.  
No one unless thoroughly efficient and capable in every way  
need apply.—Address in own handwriting, with all particu-  
lars as to age, experience, references, salary expected, and when  
disengaged, to C. W. C., *Gardeners' Chronicle* Office, 41,  
Wellington Street, Strand, W.C.

WANTED, a GARDENER, one who  
understands the care of a Small Herd of Jersey Cattle.  
—Address by letter to the MIRABLES, Unclecliff, Isle of  
Wight.

WANTED, a Man and his Wife as  
SINGLE-HANDED GARDENER and good  
LAUNDRESS for a small family. Not over 40 years of age,  
and without family. The man must be a really good Kitchen  
Gardener (very little glass), and make himself useful. Cottage,  
coal, gas, and vegetables when available. Address by letter,  
in first instance to M. M., The Larches, Orpington, Kent.

WANTED, a thorough practical FORE-  
MAN.—Well up in Propagating. Must be a good  
Plantsman, and competent to Manage Men. Married man  
preferred—no children. Also a man for the Houses. Must  
understand Early and Late Forcing, &c., for a Gentleman's  
large Garden. None but good men need apply.—Apply by  
letter, with copies of testimonials, stating wages required, with  
lodgings, &c., to J. BROADBEAR, the Gardens, The Chest-  
nuts, Denmark Hill, S.E.

WANTED, IMMEDIATELY, a steady,  
respectable young man, as FOREMAN.—One who  
thoroughly understands Stove and Greenhouse Plants, Orchids,  
Vines, Cucumbers, and Melons, Bedding, and Decorative  
Plants.—Apply by letter to JOHN LEMAN, Gardener, The  
Lawns, Eaton, Norwich.

WANTED, a FRUIT TREE FOREMAN  
in large Nursery. Must be thoroughly efficient in  
every respect.—Apply, with all particulars as to salary expected,  
age, and references, to A. B. C., Messrs. Nutting & Sons,  
106, Southwark Street, London, S.E.

WANTED, a WORKING NURSERY  
FOREMAN, well up in Grafting and Budding—one  
who has had some experience under Glass. A good cottage in  
the nursery.—CATTELL AND GREEN, Bourne Nursery,  
Haddow, Kent.

WANTED, an experienced MUSHROOM  
GROWER.—C. Z., Crediton.

WANTED, a steady and industrious MAN,  
who has been bred up to the Nursery Business, to  
Grow Plants for Market and Cut Bloom. Wages 22s. per week.  
Also a YOUTH who is used to the business.—HY. GODFREY,  
Nurseryman, Stourbridge.

WANTED, a young MAN, for a Rose  
Nursery, who is a good Budder, and can take charge  
of Greenhouses. Terms to begin with, 15s. a week and board.  
—Address, with reference, to GEORGE TEMPLETON,  
Rose Merchant, Prestwick, N.B.

WANTED IMMEDIATELY, a good  
GENERAL NURSERY HAND, who can Bud and  
Graft. Married preferred. Good character indispensable.—  
Apply, stating wages required, with references, to CHARLES  
AND J. W. TOWNSEND, Nurserymen, Fordham, near Soham.

WANTED, IMMEDIATELY, TWO young  
MEN, in the Houses, quick at Potting and Tying.  
None need apply that have not been accustomed to Nursery  
Work. State wages.—E. J. BATCHELOR, Harlow Heath  
Nursery, Harrogate.

Eastern Counties' Asylum for Idiots, Colchester.  
WANTED, a single man or widower, as  
GARDENER ATTENDANT, with a practical know-  
ledge of Kitchen and Flower Gardening, a small Greenhouse for  
bedding out plants. Salary £25 per annum, with Board, Lodg-  
ing and Washing.—Apply to the SUPERINTENDENT,  
stating age, reference, &c.

WANTED, a Gentleman, to take the entire  
CHARGE of the COUNTING-HOUSE of a leading  
Nursery establishment, with a view to PARTNERSHIP or  
PURCHASE. Must be able to invest in the business a con-  
siderable amount of cash.  
Apply to Messrs. PROTHEROE AND MORRIS, 67 and 68,  
Cheapside, E.C.

WANTED, an Assistant with a knowledge  
of the Seed and Nursery Business, to Assist in Office  
and Shop, and occasionally as Salesman.—R. H. VERTE-  
GANS, 114 Valley Nurseries, Edgbaston, Birmingham.

## WANT PLACES.

thoroughly experienced in Early and Late Forcing of  
Fruit, Flowers and Vegetables, Orchids, Stove and Greenhouse  
Plants, Ferns, Flower and Kitchen Garden. Excellent character.  
G. F., 2, Elm Terrace, Elm Road, Kingston-on-Thames.

GARDENER (HEAD).—A. GENTLEMAN  
wishes to recommend his Head Gardener to any one  
requiring a thoroughly trustworthy man. Well up in all  
branches. Leaving for no fault.—CHARLES LISTER, Esq.,  
Agden Hall, Lymm, Cheshire.

GARDENER (HEAD).—Age 42, married;  
thoroughly practical in all branches of Gardening. Ten  
years' good character from last place—an extensive one; and  
four years' from a previous large place as Head Gardener.—  
S. C., 23, George Street, Leamington.

GARDENER (HEAD).—Age 27; can be  
well recommended; fourteen years' experience in Nur-  
sery and private places: two and a half years in present  
situation.—GEO. BRADY, Buckhurst Park, Sunninghill,  
Berks.

GARDENER (HEAD); age 28.—C. SAND-  
FORD, Walcombe Park, Torquay, can with confidence  
recommend his Foreman, Henry Wood, to any Lady or Gentle-  
man requiring a thoroughly practical and competent man in all  
branches, having been under him four and a half years.—Address  
as above.

GARDENER (HEAD); age 35, married.—  
£5 Bonus will be given to any person being the means of  
securing Advertiser a desirable appointment as above. Highest  
reference to present employer, and excellent testimonials from  
former employers.—T. W. P., Jasmine Cottage, Abbots Langley,  
Watford, Herts.

GARDENER (HEAD); age 31.—E. SIMP-  
SON, Head Gardener to Lord Wrotlesley, Wrotlesley,  
Wolverhampton, can with confidence recommend his General  
Foreman, W. Holdcroft, to any Lady, Nobleman, or Gentleman,  
as a competent, trustworthy man in the general routine of gar-  
dening. Three years in present situation.

GARDENER (HEAD).—Age 35, married;  
thoroughly practical in all branches of the profession.  
Fifteen years Head Gardener in large establishments; six and  
a half years in present situation. Highly recommended by  
present and previous employers.—W. T. PALMER, Kiolet  
Hall, Bewdley, Salop.

GARDENER (HEAD).—Age 30, single;  
thoroughly competent to undertake the charge of any  
Lady's or Gentleman's Garden in all its requirements. Over four  
years Head Gardener at Hazkwood Castle, and leaving through  
a reduction in the establishment. Has had considerable expe-  
rience at some of the leading places in England. Also has a  
fair knowledge of Forestry.—A. B. Bramham Park, Tadcaster,  
Yorkshire.

GARDENER (HEAD WORKING).—Age 37,  
married, no family; thoroughly practical in every branch.  
Leaving through death. Excellent character.—GEO.  
MORRIS, Elmwood, Bridgewater.

GARDENER (HEAD WORKING).—Age 40,  
three children (youngest, five years old). Twenty years'  
experience.—WM. CLARKE, (late) P. Cazenove, Esq., Clapham  
Common, S.W.

GARDENER (HEAD WORKING).—Age 36,  
married; successful Cultivator of Orchids, Stove and  
Greenhouse Plants, choice Fruit, Vegetables, &c. Well  
recommended.—GARDENER, War Copple, Whitehill,  
Bletchingley, Surrey.

GARDENER (HEAD WORKING).—Age 48,  
married, one daughter (age 13); well up in the cultiva-  
tion of Flowers and Fruit under Glass, also Kitchen Gardening,  
&c. Five and a half years' character. Employer leaving.—  
Edstone Hall, Henley in Arden.

GARDENER (HEAD WORKING).—Age 29;  
fourteen years' practical experience in all branches, in-  
cluding Orchids. Can be well recommended by present  
employer. Total abstainer.—C. SHORT, West Tarring,

**CARPENTER**, with Painting, Glazing, Plumber, and all kinds of Repairs, on Gentleman's estate or Institution. Abstainer. Good reference from present employer.—E. CLUTTERBUCK, Brownsea Island, Poole, Dorset.

### GRATEFUL-COMFORTING. EPPS'S COCOA. BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." *Civil Service Gazette*.

Made simply with boiling water or milk. Sold only in Packets, labelled thus:—  
**JAMES EPPS & CO., Homoeopathic Chemists, London.**

**HOLLOWAY'S OINTMENT and PILLS**.—Shortness of Breath, Wheezing Coughs, and Colds.—Numbers of testimonials can be produced to prove the power possessed by these corrective remedies in cases of asthma, incipient consumption, and all disorders of the chest, lungs, and air passages. The Ointment well rubbed upon the chest and back, penetrates the pores of the skin, is absorbed and carried directly to the lungs, where, in immediate contact with the whole mass of circulating blood, it neutralises or expels those impurities which are the foundation of consumption, asthma, bronchitis, pneumonia, and similar complaints. On the appearance of the first threatening symptoms the back and chest of the patient should be fomented with warm brine, dried with a coarse cloth, and Holloway's Ointment then well rubbed in. Its absorption will check and subdue them.

# SUPERB STRAINS OF FLOWER SEEDS.

## WEBBS' SUPERB CALCEOLARIA.

1s. 6d., 2s. 6d., and 5s. per packet.

Ainsworthii**, **D. nobile**, with over 700 flowers; **Odontoglossum Alexandree**, many fine lo-ns; **O. Pescatorei**, including a grand spotted variety; **O. Edwardsi**, **O. Andersonianum**, several hybrid **Odontoglossums**, **Phalænopsis Stuartiana**, and **P. Sanderiana**, **Masdevallia Roezlii** and **M. Chimera**, **Cymbidium eburneum** **Dayii**, **Cœlogyne cristata**, with 45 spikes; 24 fine plants of **Calanthe Regineri**, and a great variety of other good things; also about 100 lots of **ESTABLISHED ORCHIDS** from a well-known private collection.  
On view morning of Sale, and Catalogues had.

## Wednesday Next.—(Sale No. 6874.)

**MR. J. C. STEVENS** will **SELL BY AUCTION**, at his Great Rooms, 38, King Street, Covent Garden, W.C., on **WEDNESDAY NEXT**, March 18, at half-past 12 o'clock precisely, a consignment of choice named **INDIAN AZALEAS**, Hybrid **RHODODENDRONS**, **PALMS**, **AZALEA MOLLIS**, and other **PLANTS** from Ghent; 1000 first-class Standard and Dwarf **ROSES**, from well-known French and English growers; **FRUIT TREES**, **PLANTS** and **BULBS** from Germany, **CARNATIONS** and other **BORDER PLANTS**, a choice collection of Home-grown **LILIES**, together with many other **HARDY BULBS** and **ROOTS**.  
On view morning of Sale, and Catalogues had.

## Thursday Next.—(Sale No. 6876.)

5000 **LILIIUM AURATUM** from Japan.

**MR. J. C. STEVENS** will include in his **SALE BY AUCTION**, at his Great Rooms, 38, King Street, Covent Garden, W.C., on **THURSDAY NEXT**, March 19, an importation of 5000 **LILIIUM AURATUM**, just received from Japan in the finest possible condition.  
On view morning of Sale, and Catalogues had.

## Thursday Next.—(Sale No. 6876.)

**LÆLIA ANCEPS SCHRODERIANA**, new pure white **LÆLIA ANCEPS**.

**MR. J. C. STEVENS** will **SELL BY AUCTION**, at his Great Rooms, 38, King Street, Covent Garden, W.C., by order of Mr. F. Sander, on **THURSDAY NEXT**, March 19, at half-past 12 o'clock precisely, a small but especially fine importation of **LÆLIA ANCEPS SCHRODERIANA**, **Rchb. f.**, several great masses being amongst them. This is undoubtedly the finest white variety ever offered. The whole flower is very large and pure white, and entirely distinct from any of the white forms; the throat striped crimson, and the lip extra broad and square, and an inch across or even more. Mr. Edward Klaboch who has collected every plant in flower, states that this variety is particularly rare, and that the flowers are of great substance, far surpassing anything he has seen. He considers it the finest white **Lælia anceps** ever introduced.

**Lælia anceps Schroderiana** is described by Prof. Reichenbach as follows:—"There are before me twenty-seven brilliant dried lips, and a dried flower. The colours are pure white, the disc between lateral lacinia is orange, and the projecting keels running in the base of mid-lacinia are even deeper orange; there are three to five crimson-purple longitudinal and several forked lines radiating outwards. So much for the colour. The complete flower would appear to surpass the dimensions of **Lælia anceps Dawsoni**. The petals are remarkably broad. The great merit of this plant consists in the lip, which is broad, with short, nearly rectangular, blunt side-lacinia. The mid-lacinia is very broad, blunt, emarginate, and this lip is quite novel to me. The result of the description would be that the value of this remarkable white flower is admirably enhanced by the beauty of the great square and flat lip. This very ornamental Orchid bears fully the name of one of our most excellent orchidists, Baron Schroder, and it gives me great pleasure to attach the Baron's name to such a glorious **Lælia**.  
It is one of the most recent and most brilliant introductions of Mr. F. Sander.

On view morning of Sale, and Catalogues had.

## Thursday Next.—(Sale No. 6876.)

**LÆLIA ANCEPS STELLA**—new White **ANCEPS**.

**MR. J. C. STEVENS** will **SELL BY AUCTION** at his Great Rooms, 38, Kings Street, Covent Garden, W.C., by order of Mr. F. Sander, on **THURSDAY NEXT**, March 19, at half-past 12 o'clock precisely, an importation of **LÆLIA ANCEPS STELLA** (new White **ANCEPS**). Prof. Reichenbach writes:—"The flowers are of the greatest of the tribe, stellate, pure white. The lip's side-lacinia is remarkably curved and broad in front, the long mid-lacinia is narrow at the base, dilate, and marginate in front, disc of lip and base of mid-lacinia orange, very numerous nerves, both radiating outside as longitudinal ones, with a deep point of rich scarlet-purple that nearly forms a dark blotch each side in front. This is the great mark of distinction of **Lælia anceps stellata**, it might be called **Dawsoni** or **Sanderiana**, but the anterior lacinia is half yellow, and white in front. It is decidedly a very brilliant flower, and the importation is in Mr. F. Sander's hands." The importation is in grand order, and enormous masses are among them.

At the same time will be sold a fine lot of **ODONTOGLOSSUM ALEXANDRE**, and many other **ODONTOGLOTS** and **ORCHIDS**.

On view morning of Sale, and Catalogues had.

**Cattleya Lawrenceana**, **Rchb. f.**, new species.

A distinct and beautiful new **CATTLEYA** from the Roraima.  
**MR. J. C. STEVENS** will **SELL BY AUCTION**, at his Great Rooms, 38, King Street, Covent Garden, W.C., by order of Mr. F. Sander, on **THURSDAY**, March 19, at half-past 12 o'clock precisely, the entire importation of this most superb **CATTLEYA**. The consignment, brought home under the personal care of the Collector, is in exceptional order, and it has not been our fortune before to offer a finer, more compact, and altogether satisfactory lot of plants; and we do not hesitate to say that we have never seen such splendid sound pieces—they are well shaped, leaves fresh and green, and eyes perfectly dormant, and are the result of two years' diligent search. **Cattleya Lawrenceana** belongs to the very finest of the genus, the colour of the large flower is deep, rich, and warm; the lip is flat and large, the lower half intensely dark and brilliant, throat yellow and often finely spotted red. There are no pure or light coloured varieties among them, and although this **Cattleya** varies in the markings of the inner lip, all are superb. It is a free-growing, free flowering species, the flower-spikes on plants show up to fifteen flowers; habit of plant is most compact, bulbs thick and varying in size from 6 to 15 inches. The leaves are in some varieties reddish in colour, in others green, and from 6 to 9 inches long.  
On view morning of Sale, and Catalogues had.

## Thursday Next.—(Sale No. 6876.)

**ORCHIDS** from the Roraima.

**MR. J. C. STEVENS** will **SELL BY AUCTION**, at his Great Rooms, 38, King Street, Covent Garden, W.C., by order of Mr. F. Sander, on **THURSDAY NEXT**, March 19, at half-past 12 o'clock precisely, a fine importation of Roraima **ORCHIDS**, just brought home in superb condition by Mr. E. Seidl, and consisting of a fine batch of the lovely white and black **Oncidium nigratum**; also **Cypripedium Lindleyanum**, and the beautiful **Zygopetalum Burkei** (First-class Certificate, November, 1883); a fine **Scuticaria**, and a **Zygopetalum** like **rostratum** in growth, &c.; also a splendid batch of **Cattleya Mossiae**, early flowering variety—this species is of upright stiff growth, and a plant of it will be sold in flower; the specimens are very superb, thoroughly well grown, and with plenty of sheaths and buds; also many other **ORCHIDS**.  
On view morning of Sale, and Catalogues had.

## Wood Green.

**FOR IMMEDIATE SALE**, at a low price, the **LEASE** of the **LORDSHIP NURSERY**, which comprises about an Acre of Land, Brick-built Residence and Stables, eleven Greenhouses, all heated by hot water and in capital working order.

## AMARYLLIS (SPREKELIA) GLAUCA.

**E. H. KRELAGE & SON,**  
**NURSERYMEN, SEEDSMEN, AND FLORISTS,**  
**HAARLEM, HOLLAND,**

Have an extra large stock of this splendid bulbous plant, in very large bulbs, ready for sale just now. It is a parent of the well-known Jacobean Lily (*Amaryllis formosissima*), and has a similar brilliant red flower, which, however, is larger and less dark. It flowers easily and early, and the foliage usually is developed at the same time as the flowers. It can be cultivated in pots in the greenhouse or room, or in glasses, like Hyacinths. When planted in the open ground, in spring, it must be taken up before winter and kept dry and warm during its rest. In more temperate climates it can remain in the open ground during winter.

We offer large flowering bulbs, delivered free to all the principal towns of Great Britain and Ireland, no charge for package:

25 bulbs, 7s. 6d.; 50 bulbs, 12s. 6d.; 100 bulbs, 20s.; 250 bulbs, 45s.,  
500 bulbs, 80s.; 1000 bulbs, 150s.

Discount to the Trade. Please send with Orders remittance in Post-bills or Cheques.

## CATTLEYA LAWRENCEANA (Rehb. f. New Species.)

A DISTINCT and BEAUTIFUL NEW CATTLEYA, from THE RORAIMA.

**MR. J. C. STEVENS** will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., by order of Mr. F. SANDER, on THURSDAY, March 26, at half-past 12 o'clock precisely,

The entire Importation of this most superb *Cattleya*.

The consignment, brought home under the personal care of the Collector, is in exceptional order, and it has not been our fortune before to offer a finer, more compact, and altogether satisfactory lot of plants, and we do not hesitate to say that we have never seen such splendid sound pieces. They are well shaped, leaves fresh and green, and eyes perfectly dormant, and are the result of two years' diligent search. *Cattleya Lawrenceana* belongs to the very finest of the genus; the colour of the large flower is deep, rich, and warm; the lip is flat and large, the lower half intensely dark and brilliant; throat yellow, and often finely veined red. There are no poor or light-coloured varieties among them, and although this *Cattleya* varies in the markings of the inner lip, all are superb. It is a free-growing, free-flowering species, the flower-spikes on plants show up to fifteen flowers. Habit of plant is most compact, bulbs thick and varying in size from 6 to 15 inches. The leaves are in some varieties reddish in colour, in others green, and from 6 to 9 inches long.

On view morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET COVENT GARDEN,  
LONDON, W.C.

### Orchids a Specialty.

The stock at the Clapton Nursery is of such magnitude that, without seeing it, it is not easy to form an adequate conception of its unprecedented extent.

### HUGH LOW & CO.

very cordially and respectfully solicit an inspection by all lovers of this interesting and beautiful class of plants, whether purchasers or not.

CLAPTON NURSERY, LONDON, E.

## New Pea.—SHARPE'S TRIUMPH.

Triumph is the very last of Mr. Culverwell's Peas, and is the best of the many fine varieties he has given to the Public.

It is a Blue Wrinkled Marrow Pea, of exquisite flavour; the pods are large, very much curved, and are well filled with large Peas closely packed in the pod.

The habit is good, being dense and bushy, attaining a height of 2 to 3 feet.

The plant is covered with pods from the ground to the extreme top of the haulm.

On one plant no less than sixty-nine pods have been counted, containing from nine to eleven Peas in a pod.

The pods are of a bright green, in clusters of two or three; and are not easily affected by drought, remaining green for a long time.

In constitution it is robust and hardy; and, without hesitation, we can say that it is the perfection of Peas for either the Market Gardener or the Private Grower, for exhibition, or for ordinary use.

Price, 2s. 6d. per 1-pint Sealed Packet.  
Trade price on application.

**CHARLES SHARPE & CO.,**  
**SLEAFORD.**

### SPECIAL CULTURE OF FRUIT TREES AND ROSES.

## WILD FLOWERS OF NORTH AMERICA.

Our Most Destructible PERENNIAL PLANTS for Cultivation—SEEDS, &c.

Orchids, Ferns, Lilies, Aquatics, Alpine and Sub-Alpine Plants.

Botanical and Common names given. Send for CATALOGUE. **EDWARD GILLET**, Southwick, Mass., U.S.A.

## CANNELL'S CHRYSANTHEMUMS.

At the present moment we have unquestionably much the finest and largest lot of cold-frame properly struck plants in 4-inch pots ever seen. These, together with the cultural and other instructions in our Catalogue, even the novice could hardly fail to experience great results; certainly the plants we now offer are as near perfection as they can well be, and ready to go straight away for the first prize. 6s. per dozen.

Our new and most correct book of the whole family is now ready, and sent free to customers. No previous work or Catalogue bears any comparison. It is replete with every information, and every class defined and illustrated. A perfect specimen plant, and the new and proper mode of setting-up the cut flowers for exhibition fully explained and illustrated. How to grow and dwarf plants. How to arrange petals in blooms, showing clearly the varieties sent out under false names, and the correct with synonyms. All the best new varieties direct from Japan. The new Scarlet Crimson, best for all purposes. The two Champions. The new Incurred, and others. The first Show, and the kinds exhibited. How to strike Cuttings. A wonderful Exhibition. How Chrysanthemum Books and Catalogues are made. How to reduce the number of varieties. A Chrysanthemum Show and Garden Party in the Imperial Palace Gardens, Japan; some of the specimens displaying 430 fully developed blooms. Our country-grown Plants and Cuttings; and a vast amount of invaluable information—in fact, every particular required to bring them to perfection.

### REMARKABLE PLANT.

**LEONOTIS LEONURUS (LION'S TAIL).**  
—This lovely flowering plant, if treated exactly like a Chrysanthemum, produces abundance of orange-coloured flowers all the autumn; a striking resemblance to a lion's tail. Post-free, 8d. each.

### CANNELL'S MARIGOLDS.

It is well known that we have for years grown and shown the best in the South, and it appears that they are equally as good in the North. 1s. per packet.  
**MR. JOHN ANDERSON**, Sheephouse Hill, Fouldhouse, N.B.  
"Sir—I have grown Marigolds for the last twenty-five years, and I got more prizes from your seed than during the whole of that time."

NEW PLANT and BULB COMPANY, Colchester.

## SHARPE'S

### EARLY PARAGON PEA.

The Earliest Large Wrinkled Marrow.

First-class Certificate, Royal Horticultural Soc., 1884

PARAGON shows in many respects a great improvement upon any variety at present in the trade. It is a Blue Wrinkled Marrow of fine flavour; height from 3 to 4 feet. The pods are produced two and three together in such abundance as to almost conceal the foliage. They are of an unusual size, broad and thick backed, containing from twelve to fourteen immense Peas packed in a double row.

Paragon is the earliest of the large Wrinkled Marrows, being ready before Prize-taker. It is very hardy, and will stand earlier sowing than any Pea of its class. It is most valuable for succession crops, as it is not liable to mildew, and a constant supply of Peas for four months can be obtained from this one variety.

Paragon will prove a most invaluable Market Gardener's Pea, its earliness, hardiness, and immense cropping quality surpass anything yet sent out—it also stands long railway carriage without injury.

The following Testimonial is from the largest dealers in the kingdom in Peas for Market Garden Purposes:—

"December 6, 1884.—In reply to yours respecting your Paragon Pea. We grew it last season and were favourably impressed with its qualities. We consider it a great improvement on Telephone, the pods being a much better colour and the Peas in it being much finer. We consider it is the finest Pea in our trials last season, and we grew every Pea we thought of merit and nearly every novelty."

Price, 2s. 6d. per Pint, 1s. 6d. per Half-pint  
Trade Price on application.

# THE FRUIT OF THE FUTURE.

## NEW MAGNIFICENT BLACKBERRY, "THE WILSON JUNR."

In spite of the fact that Blackberries will grow "anywhere" in reason, and everybody likes them, it is yet a puzzling reality that it is only with great difficulty and at a high figure that we can purchase them in our markets.

Surely, then, it must be apparent to all farseeing "fruit growers" that instead of glutting the markets with Gooseberries, Currants, &c., they have here a fruit which, if planted upon any given area of land, will prove far more profitable than any other hardy fruit that could be grown. And why? Simply because for half-a-dozen years ahead, at least, the stock throughout the country will not have time to become so great as to exceed the demand.

Landowners, Stewards, and Gardeners, who have each year to show a balance-sheet "of profits," have here a very simple, safe method of for some years obtaining highly profitable results. Planted 3 feet by 8 feet requires at the rate of 1815 plants to an acre.

Gardeners also who grow for house consumption will find this fruit a valuable assistant. It will stand any treatment, and do well where other fruits would fail.

Whilst, however, we have the matter under consideration, do not let us fall into the mistake of planting any variety so long as it is a "Blackberry." Why not, for the sake of a slightly additional first expense, obtain the very "cream" of the family; or in other words, procure stocks of the hardiest, largest, most delicious, and most productive?

By pursuing this procedure the result repays the grower tenfold for the slightly additional first expense incurred.

It was this reasoning that caused us to give the subject our most careful study; the result of which is, we offer a variety, the grandest of the group, producing enormous berries, measuring on an average  $3\frac{1}{4}$  inches around, lengthwise, and the same dimensions crosswise. (This will give an idea of the profit to be derived from its culture as a market commodity.) The berries are also glossy black, very early, of exquisite flavour, and enormously productive—the heavy load of fruit often bending the canes to the very ground.

We can offer plants of this grand variety at 1s. 3d. each, 12s. per dozen, 85s. per 100, carriage paid.

We can offer other varieties as follows:—"LAWTON," "KITTATINNY," "PARSLEY-LEAVED" (*Rubus fruticosus laciniatus*), "WILSON'S EARLY," at 9d. each, 8s. 6d. per dozen, 63s. per 100.

After this date (March 12) we advise our numerous Patrons for the "Wilson Junior Blackberry" to give us the option of Autumn Delivery. We have, however, every reason to believe that there is a certainty of delivery in time this spring.

THE

# Gardeners' Chronicle.

SATURDAY, MARCH 14, 1885.

SHERIFFMUIR.

MR. STIRLING, of Kippenross, is the owner of Sheriffmuir, the scene of the only battle of the Rebellion of 1715. In Mr. Hunter's book on Perthshire, he mentions Sheriffmuir in writing of Kippendavie, a much older property than the one just named, which is a comparatively recent acquisition, dating from the last century. But the present mansion house of the Stirlings stands on the land last acquired, and the Stirlings of this place are known now as of Kippenross.

They are a branch of the Stirlings of Keir, a place which once attracted public notice when Sir William Stirling-Maxwell received a visit from Lord Beaconsfield, who planted a tree in the grounds. A curious collection of appropriate mottoes is displayed at Keir, where you may read such legends as "Gang forward," the family motto; and on the clock tower, "Tak tent of time ere time be tint," "It is later with the wise than he's aware," "Hours are Time's darts, and one comes winged with death."

Sheriffmuir is still a bleak, black, and extensive waste, though its area has been diminished, a former laird of Kippendavie having planted part of it with mixed Fir, Scotch, Spruce, and Larch, now sixty years old—the trees on the best land having reached the size of 50 feet or 60 feet high and 3 feet in girth at 5 feet from the ground. In this part of the plantation the ground is thickly covered with a layer of decayed Fir leaves, in which the usual grasses of such sites grow freely, the soil below being very much ameliorated by the increase of the vegetable matter which is now accumulating, and is destined to enrich the land for any crop that may be sown in it after the removal of the trees. Where the soil happens to be poorer the trees are small and stunted and covered with lichens, and the fall of the leaf has not proved sufficient to crowd out the natural growth of Heather and coarse grass that still covers the surface in this part of the wood, as it does that of the moor outside.

It is satisfactory to find trees growing on the former battlefields of Scotland, and to know that the very sites of battles, such as Sheriffmuir and Culloden, have been covered with profitable and ornamental timber.

Sheriffmuir Wood suffered much from the storms of a few years since, that of December, 1879, having overturned 80,000 of its trees. I had almost omitted to mention the "Gathering Stone of the Clans," which lies within the wood on the highest ground of what was once the moor. A stout iron grating surrounds the stones, of which there are now three, the one original stone having been broken into three pieces. An inscription on the grating runs:—"The gathering stone of the Highland army on the day of the memorable battle of Sheriffmuir, fought in November, 1715. This grating has been created to preserve the stone, by John Stirling, Esq., of Kippendavie, principal heritor of the parish of Dunblane: November, 1840."

I must not conclude this short notice of Sheriffmuir, and the property to which it is attached, without describing the "Big Tree of Kippenross," a Sycamore 440 years old, which at its prime contained 875 cubic feet of timber, and which measured 100 feet in height and 19 feet in the circumference of the trunk. It has now become a wreck from old age. If space permitted the measurements of many other noble trees might be given. I walked 3 miles from the ancient town of Dunblane to pay a visit to the well-known moor without being aware of the near neighbourhood of so many fine trees, of such a venerable Sycamore, and of that delightful walk by the river side known in song as the "Banks of Allan Water." H. E.

## GARDEN PALMS.

(Continued from p. 743, vol. xxii.)

*Catoblastus*, Wendland.—The two or three species of which this genus is composed were originally included in *Iriarteia*, now limited to about five species, the remainder being now separated under *Socratea* and the above. *C. premorsus* is included by Seemann among the cultivated Palms of 1856, but it does not appear to have become established in any English garden, though there is a fine specimen of it in the Botanical gardens at Berlin. No other species has yet been introduced, though seeds of *C. pubescens* were sent to Kew by Messrs. H. Low & Co. in 1881, none of which germinated. *C. premorsus* is represented at Kew by only small specimens. There is a close resemblance between this genus and *Iriarteia* in characters of habit and foliage, so that it is difficult to distinguish them when young. *Catoblastus* has a tall, erect, columnar stem, unarmed, remotely annulated, and the base surrounded with, sometimes raised upon, stout roots. The leaves are arranged in a somewhat close head and are unequally pinnate, the segments being trapeziform, cuneate at the base, and divided at the apex into numerous teeth or lobes. The shining deep green of the foliage, and the cylindrical, rather stout, petiole, give these plants a fresh and distinct appearance. They are found in the humid forests of Tropical South America. Young plants are ornamental, and are easily kept in good health by growing them in a moist shaded stove, bright sunlight being somewhat harmful to them. They require an abundance of water always. The seeds are almost round, as large as a Chestnut (*C. pubescens*), and are less firm and bony in texture than most Palms, being more like that of the Catechu-nut; they are covered with a crisp papery pericarp. I have not seen the seedling characters of this genus.

*C. premorsus*, Wendl.—Venezuela.

*Ceratolobus*, Blume.—A small genus of Calameæ, represented in gardens by only one species, always, however, in a small state. Like their allies the Calami, this cultivated species and the only other one are climbing in habit, with spiny stems and leafstalks, but with no spines upon the leaf-segments. The slender stems grow to a height of about 30 feet, are covered with broad spines an inch long, and bear all along their upper portions rather long (7 feet) pinnate leaves, the segments of which are alternate or opposite in pairs, are smooth and green above and glaucous below; they are about 9 inches long by 3 inches broad, tapering to each end, the upper end being interrupted and jagged (crenate-erose). The rachis is triangular, green, and is clothed on the underside with stout hooked spines. The fruit is a Plum-shaped berry,  $1\frac{1}{2}$  inch long, and is covered with ciliated brown scales enclosing the seed, which is smooth, and of the size and shape of a robin's egg. Young plants of the cultivated species are handsome stove plants, quite different in appearance from other Palms. The genus is limited to the islands of Java and Sumatra.

*C. glaucescens*, Bl.—Java.

*Cattleya Lawrenceana*, n. sp.  
At last we have a *Cattleya*, bearing Sir Trevor's excellent name. Of course it ought to be an extra good plant, and so it is. My knowledge of the novelty is based on the flowers, which have been dried with extraordinary skill, even the colours being neatly preserved. Then I have before me two plants and several cut bulbs, which illustrate once more the variability of these organs. One before me is a little, plump, short thing, m. 0.1 high to 0.025, with a short broad leaf scarcely much longer, 0.06 broad. The longest bulb before me is m. 2 high by 0.025 in diameter. The plants may have been grown exposed to the sun, as they have a reddish hue on the bulbs and on some leaves, the longest of which is 0.22 long by 0.05 wide. The trans-section of the bulbs is nearly tetragonal, and there are four furrows each side. Those bulbs remind one a little of *Cattleya Mossiae*. The rhizome is of extraordinary strength. The sheath of the flower-stalk is singularly long, 0.16 long by 0.015 wide—measured in the withered state.

Now come the flowers, the grand things. The peduncle is very strong, 0.23 long, of purple colour. I have the scars of seven flowers on one, and I learn there is evidence of the possession of fourteen flowers, which is very promising. The flowers are as large as those of a very good *Trianae*. Sepals uncommonly broad. Petals much broader, usually blunt. There are some flowers with broader petals, and those will, no doubt, be received with uncommon favour.

The lip is quite novel in its shape for the labiate group. It is panderate emarginate, rather broader in front than at the base. If you like to see its outline well represented, take *Botanical Register*, 1847, plate 42, *Cattleya bulbosa*. This outline makes me record it as a new species, not one of the endless varieties of *Cattleya labiata sensu amplissimo*. The column is singularly small, but it may have lost a good deal by being dried.

And now the colours. The flower is of a fine purple-lilac. The whole anterior part of the lip is of the darkest, warmest purple. You might nearly compare this part to the end of the tail of a heath-cock. The side wings of the superior part are purple, the centre light yellow. I think dried flowers and plants will give evidence of the accuracy of my description. It would be superfluous to lose many words in recommendation of this unexpected novelty. I will only say that I regard it a very good fortune to inscribe such a plant to such an orchidist as is Sir Trevor, and that I think the *Cattleya Lawrenceana* will rank, when established, under the finest Orchids imported by Mr. F. Sander. H. G. Rehb. f. [This, as we believe, quite new *Cattleya* was discovered on Roraima, the mountain in British Guiana recently ascended for the first time by our correspondent, Mr. Im Thurn, and sent home by Mr. Seidl. The flower is so well dried, and the bulbs are so healthy, that good materials exist for a woodcut, which we hope to issue very shortly. ED.]

tallow, for making candles. "To obtain the wax the tree must be felled, each tree yielding about 25 lb." (Purdie). Specimens of the wax, candles, &c., with portions of the trunk bearing wax are exhibited in the museums at Kew. As a garden Palm this species is most suitable, as it is a free grower and soon assumes an ornamental character, whilst when large the specimen at Kew shows how strikingly beautiful this Palm becomes. Seeds of it are frequently imported, and germinate freely in a warm moist house, a similar house being required for the plants.

*C. andicola*, H. and B. (*Iriarteia aodicola*, Sp.; *I. Klopstockia*, Hort.; *Klopstockia cerifera*, Karst.; *Beethovenia cerifera*, Engel.), *Illustr. Hort.*, 3 ser., t. 157.—New Grenada and Venezuela.

(To be continued.)

## THE DISCOVERY OF APOSPORY IN FERNS.

As sundry paragraphs relating to the above have recently appeared which are not altogether correct in their details it may perhaps be of interest to your readers to have the facts at first hand. In your issue of December 22, 1883, under the heading of "Proliferous *Athyria*," I gave an account of the discovery of proliferation upon several varieties of *Athyria* in the shape of bulbils upon the upper surface of the fronds of precisely similar nature to those produced upon *Asplenium* and other families, and bulbils of a different character which were developed upon the backs of the fronds in the place of sori, a form of proliferation which has not been remarked in connection with any other Fern than four forms of *Athyria*, all natives of Britain and all of the plumose character. In the same article and in conjunction with the above-cited discoveries, I mentioned some exceedingly curious growths which had been remarked by Mr. G. B. Wollaston upon an *Athyrium* in his possession (*A. f. clarissima*), and which were thought to be bulbils also. Upon examination, however, I came to the conclusion that they were of a different nature, since no definite axis of growth was apparent, and instead of the scales common to bulbils proper, there was in all cases an indusium, which led me to the belief that they were abnormal sporod bodies and not bulbils capable of producing plants by direct bud growth.

To test this point I laid down, in November, 1883, sundry pinnæ of the plant in question and carefully observed and recorded their development through the winter, with the result that in 1884 I reported to the Linnæan Society that plants had been raised from the said excrescences through prothalli into which they had developed while still attached to the pinnæ, the said prothalli being formed by the dilatation, bifurcation and extension of the tips of the pseudobulbils and bearing in the normal manner archegonia and antheridia, by the inter-action of which the plants had been formed.

The fact being altogether new and so far unconfirmed I was requested to continue my investigations, and if possible bring forward more evidence in the following autumn. Accordingly, in November, 1884, I laid before the Linnæan Society a number of plants, and, what was more to the point, pinnæ of the parents, showing such a manifestly abnormal state of the pseudo-sori that my report was accepted as correct.

Professor Thiselton Dyer thereupon was provided with material for that deeper microscopic research which the subject merited, and Mr. F. O. Bower of the Jodrell Laboratory, Kew, was deputed to pursue the investigation *au fond*. The result was that on December 18 he confirmed the discovery in every respect, and gave the term apospory to the absolutely new phenomenon of reproduction, the existence of which was thus established, viz., the production of a Fern from prothalli, which were not developed through the mediation of a spore, but by direct growth from the parent Fern. It will thus be seen that *Athyrium Filix-femina clarissima* has the proud privilege of being the first of the Filices to bear, if not flowers, at any rate their homologues, the alternation of generation being superseded.

This discovery led to another very shortly afterwards, for Mr. G. B. Wollaston found the same phenomenon of apospory upon a *Polystichum* (*P. ang. var. pulcherrimum* Padley) in his possession, but developed in a still more extraordinary and unparalleled fashion, viz., by the production of prothalli by the direct uninterrupted extension of the points of the

pinnules, such prothalli being provided with antheridia and archegonia. This case, as I have indicated, is so much stranger than that of *A. F.-f. clarissima* as to eclipse it quite, the prothalli not even being connected locally with the sorus. An interesting fact in connection with these two Ferns is, that both are wild finds, discovered in North Devon, and both were given to Mr. Wollaston by Colonel Jones, of Clifton.

I may add, that Mr. Bower's investigations showed that the prothalli in *A. F.-f. clarissima* were developed from the stalks of the sporangia, that portion containing the archesporium, which by fusion would form the spores, being previously aborted. *Chas. T. Drury.*

## MUSTARD.

PROBABLY but few are aware of the extent to which Mustard is cultivated in this country for economic purposes. The great Mustard growing districts of England are Cambridgeshire, Lincolnshire, Yorkshire, Essex, and Keot, on account of the adaptability of the soil. It is computed that the average growth of Mustard in Lincolnshire is from 5000 to 6000 acres annually. Some persons grow from 50 to 150 acres each of the white and brown Mustard, many grow less. Taking the average of the acreage of Mustard in the counties named above, the quantities of white and brown are pretty nearly equal. The black-brown or red Mustard, as it is variously termed, is *Sisaps nigra*, and grows wild in many parts of the country in cornfields and waysides. The white Mustard, of which large quantities are grown in gardens for salad purposes, is *S. alba*, a native of the South of Europe, but now naturalised in this country. There are decided specific differences between the two. The Charlock or wild Mustard (*S. arvensis*) is well known as a great plague in cornfields, with its numerous large and brilliant yellow flowers. The seed of Charlock is a limited article of commerce in this country; when it is reaped with Wheat the seeds are separated in the process of preparation.

The best soil to grow good crops of Mustard is a deep rich one, resting on a clay subsoil; a soil impregnated with saline substances appears to produce good crops. A new soil formed out of reclaimed marshland suits the brown Mustard well, and brings a bolder, fatter meal than does the old soil. The richest feeding bullock land, that is, land that will fatten bullocks without resorting to artificial food, will grow more seed, a crop freer from weeds, and of better quality than land frequently cultivated. A crop of Mustard may be grown on such land three and four years in succession, and it generally proves very remunerative, returning from £20 to £30 per acre. An average crop of Mustard in a favourable season is from 12 to 20 bushels per acre. Mr. A. Johnson, of Messrs. W. W. Johnson & Sons, seed merchants, Boston, who deal largely in Mustard, informs me he has known such a very exceptional crop as 40 bushels to an acre. The produce of white Mustard per acre is said to be a little larger than that of the brown: 20 bushels per acre is said to be a very good average crop.

Brown Mustard seed is generally sown in March and April, according to the weather and the nature of the season; some sow later—in May, and even in June. The balance of advantage is in favour of early sowing. Two dangers beset the Mustard plant, viz., late spring frost, and the fly in early summer. The latter is called the Mustard-fly beetle. It is akin to the Turnip-fly, but larger and most destructive to the Mustard plants. There is more danger of attack from fly through the seed being sown late, than from frost in being sown early; but the plant is tender enough to be completely destroyed from sharp late spring frosts. The seed of the white Mustard is sown late because the plant is of a more succulent nature, and therefore more keenly susceptible of frost, but it will mature the crop quicker than the brown.

In sowing the brown Mustard about 4 lb. to 6 lb. of seed per acre is used, about 4 lb. is the average sowing; if the ground is not in good condition, a larger quantity of seed is used. It is drilled in by means of an ordinary Turnip seed drill, and the distance the drills are apart is regulated by the strength and richness of the land, the better the condition of the soil the wider apart are the drills. The distance varies from 14 to 20 inches. Many growers of Mustard prefer to cross-hoe the crop; some will even go to the expense of singling out the plants, as is

done in the case of Turnips, doing this when they are from 2 to 3 inches in height. The advantage of thinning is considerable in the event of a wet season, the plants being subject to attacks of mildew, and especially when growing on good land. The mildew appears to affect the stalks of the plants especially; hence the advantage of thinning. In sowing white Mustard more seed per acre is required than in the case of the brown, because it is larger. The drills are also nearer, averaging from 6 to 10 inches or 12 inches according to the quality of the ground.

As the Mustard plant approaches maturity, and after escaping the ravages of the Mustard-fly, it is subject to the attacks of a larger fly or beetle, commonly called the Mustard-beetle, which will sometimes appear in such quantities as to completely destroy the crop. They attack the leaves and flower both. Their larvæ appears to infest the soil to such an extent that in some districts it is found impossible to grow Mustard at all, hence hundreds of acres which a few years ago produced good crops of Mustard are totally unfitted for the purpose. Perhaps this is one reason why Lincolnshire has come to take the leading position in the growth of Mustard; Cambridgeshire formerly could boast the greatest breadth of crops, now it is Lincolnshire.

The Mustard crop is gathered about the end of July, when the seed-pod—which in the case of the brown is smaller and not so fleshy as in the case of the white—turns to a light brown colour. It is a good plan to allow the plants to stand until the seeds get tolerably matured, as they become bolder in character in consequence, and the haulm can be placed in the stack much more quickly than when cut with too much sap in it. The crop is cut with an ordinary reaping-hook or sickle, and bundles of it are made and tied with its own straw in a peculiar manner, at which the workmen are great adepts, and the haulm sooner dries when tied in this way, should it become wet through rain. The bundles are put into sheaves, the stalks upwards, and the seeds near the ground; if stood upright, as in the case of Wheat, the wind would affect and burst the pods, threshing out and scattering a good portion of the seed. In fine dry weather the crop is soon ready for carting and stacking; it is of great importance that the bundles be perfectly dry before they are stacked; the least moisture from dew or rain causes the seed to coat or turn mouldy in the stack, consequently the market value of the crop is reduced. If the crop be dry, and the stalks in good condition, containing a fair quantity of sap, and judiciously stacked, a small amount of heat will be given forth which assists in improving the colour of the seed. A Mustard stack should never exceed 3 yards in width; it does not matter how long it is. By building a stack narrow the wind blows right through it and regulates any superfluous heat, so that no harm comes from it.

The seed usually remains in the stack until October, then it is threshed out by means of a Wheat threshing machine. One precaution is necessary: so to regulate the "riddles," by means of perforated zinc, when it comes from the machine, to suit the size of the seeds. The seed is then put twice through an ordinary dressing machine, and then it is ready for market. When brown Mustard seed is in good condition and of the best quality it should average something like 16 stones of 14 lb. to the sack of 4 bushels, nett; white seed in good condition gives about 15 stones to the sack. The brown Mustard is almost wholly used for manufacturing purposes, only a small quantity being sown for garden purposes. A mixture of brown and white makes the best Mustard; the brown imparts pungency, the white colour, to the flour.

The "Healtheries" Exhibition of last year afforded opportunity to many persons to become acquainted with the manufacture of Mustard for culinary purposes. The seed is put into stampers and stamped, the object being to break the shell of the seed as little as possible; then it is put through the finest wire and silk sieves. The husks of the seeds are compressed, and oil having the appearance of olive oil is extracted from them, known as oil of Mustard. It is rather heavier than water, of an exceedingly pungent odour, and has sulphur among its essential constituents. After the oil is extracted the refuse is made into a kind of cake, similar to Linseed cake, and which makes a capital fertiliser for Potato and Turnip crops.

The Mustard industry is a very extensive one, and the annual produce of seed is something enormous.

That it is a remunerative crop is undoubted, and perhaps has something to do in keeping some farmers in a state of solvency at a time when agricultural depression is being severely felt. *R. D.*

## SMALL APPLES FOR DESSERT AFTER CHRISTMAS.

SEEING your note as to the condemnation by the Apple Congress Committee of the little dessert Apples in cultivation—with which I thoroughly agree—I send you a list of many which I think growers should discard, not by ruthlessly cutting down established trees, but by grafting better kinds upon them, which in two years' time would begin to fruit, and as this present month is the time to graft now is the season to make a start. I admit that many of these small sorts possess peculiar flavour, and are dear from old association, &c., but sentiment should not stand in the way of progress, and crop and quality should be placed before a "thin sprinkle" and flavour.

### Little Apples Considered too Small for Growers.

Beachamwell	Keddleston Pippin
Court of Wick	Lamb Abbey Pearmain
Coe's Golden Drop	Pearson's Plate
Downton Pippin	Redleaf Russet
Guernsey Pippin	Sam Young
Golden Harvey	Twining's Pippin
Gogar Pippin	Wanstall
Holbert's Victoria	

I am ready to admit that many of this black list can be grown on cordons, &c., to a fair size, and that amateurs may like to grow a few historical sorts, but I venture to say that equal quality can be found in the

### List of Medium-sized Apples which I would commend to the notice of Amateurs and Market Growers.

Adam's Pearmain	Melon
Allen's Everlasting	New Rock Pippin
Brownlee's Russet	Pearmain Claygate
Caraway Russet	"Hubbard's
Court Pendu Plat	Reinette de Bordeaux
Clark's Pippin	"du Canada
Duke of Devonshire	Sturmer Pippin
D'Arcy Spice	Scarlet Nonpareil
Lord Burghley	Wyken Pippin

I purposely omit those kinds with which I am not thoroughly acquainted. Experience teaches me that small fruit is of no value for market sale, as in a cold or wet season they are little better than "scrumpings," as the fruiterers designate them. *George Bunyard, Maidstone.*

## The Rosery.

### TEA ROSE HOUSES.

As one perhaps more fortunate than "Wild Rose," being in the possession of a Tea Rose house, I would like to say that I hardly agree with his assumption that Tea Roses need such special exposure to the air and weather in the summer or autumn as he insists upon for the purpose of ripening the wood. As my house is a span-roof, some 30 feet by 20 feet, and the roof admits of no top air or ventilation of any kind being given, I have had ample experience of the effects of such closeness upon the growth for the past ten years, and have no reason to complain of the results. My Roses are all Teas, the favourite *Maréchal Niel* predominating in extent. All are worked on standard Brier stocks, and planted in outside borders. I have had no reason to complain of mildew, and if there has been evidence of this fungus I have generally found it to arise from fierce easterly or other cold winds playing upon the house and causing piercing currents of air through the laps or any other openings that the wind could find. No doubt chills promote mildew, but ventilation is rather likely to promote draughts than to alleviate them.

Gardeners are now getting wiser with regard to ventilation, and do not so largely favour the ancient notion that so much air must be given at the sides, and so much at the top, simultaneously. That method is a capital promoter of draughts, or cold currents of air, but it has little else to recommend it. "Wild Rose" would perhaps be surprised were he to visit one of our market plant growing establishments to see almost miles of long, low span-houses, without any provision for side-ventilation, and of top-ventilation only very moderate means.

The notion that plants want to live in an eternal condition of atmospheric circulation is an exploded one. In most cases the laps of the glass will give all the needful air, and if the house needs drying then a dry day with the doors open, or a sash or two, will soon put matters right. The recommendation to fumigate Rose-houses early and often is a good one, for it is peculiarly a case in which the old adage as to "A stitch in time saves nine" comes as a forcible illustration.

Just now, for instance, in unheated Rose-houses, and such an one as mine, the buds have started some two or three inches of young shoots, and these present happy hunting grounds for the devastating aphids. A little tobacco-smoke whilst they are yet weakly will tumble them over, and may check the reproduction of myriads. Mildew is a nuisance when it gets into a Rose-house, but greenfly is a horrible pest, spoiling and defiling all the leaves and flowers. Happily the worst visitant may be sooner exterminated than the lesser one, but the latter needs tackling at the outset, if possible, by checking the cold draughts which have given it birth.

As to the subject of wood ripening, I have always found that under glass, where the wood is not exposed to frost and winds, as it is outdoors, that even fresh unripe growth will, if shortened back a little, break and bloom finely. Again, it is a fact that on all the Roses the buds nearest the extremities—and, of course, where the wood is softest—always break the strongest, and produce the finest blooms. It is, of course, a common rule with gardeners to strip vioeries, Peach-houses, &c., late in the summer, and to expose the Vines and Peach trees beneath to the full effects of the weather, but this is more done to secure resting than to promote ripening, which is usually accomplished before the lights are removed. Roses less need this resting, as they are almost perpetual growers, especially under glass. *A. D.*

#### THE ROSE IN THE SOUTH OF IRELAND.

I cannot remember any date when Roses were so forward. I have a few hundreds on a southern aspect, and the shoots are from half an inch to an inch and a half long. If I prune now, the lower-buds I am to depend on will be unduly excited and get damaged by March frosts and withering winds; if I do not prune I see all the sap sucked up to form shoots that are useless, and which will be cut away by-and-bye. But I suppose this is no new dilemma. But my reference to the queen of flowers was more for the purpose of repeating what I said to a friend recently, that owing to the forward state of the growth it is now too late, except in peculiar cases, to transfer Roses this year with any prospect of success in outside beds, &c. *W. F. M.*

#### NEW WINTER GARDEN AT STANCLIFFE.

IN the last week of last year we had the pleasure to give our readers some particulars and a double-page illustration of Sir J. Whitworth's beautiful estate, Stancliffe, near Matlock. In the course of our remarks we spoke of the new winter garden then being erected by Messrs. J. Weeks & Co., of Chelsea; through the kindness of these gentlemen we are now enabled to give a view of this elegant structure (fig. 61). The existence of stone on the estate accounts for the very substantial nature of the building, which would astonish a London builder of the Jerry type.

#### LEUCOIUM VERNUM VAR. CARPATICUM.

MR. BROCKBANK sends us flowers of this variety which correspond with the plate in the *Botanical Magazine*, tab. 1993. The chief distinguishing feature from the common form resides in the yellow tips to the flower segments, the two-flowered scapes being of less consequence as distinguishing marks inasmuch as they occur in the common form figured at p. 341, and repeated from our columns, March 29, 1879, where will be found a brief monograph of the genus by Mr. Baker. The Carpathian variety is a more robust plant with larger flowers than the ordinary form and with a slightly different capsule, but the differences are, in our opinion, not sufficiently important to constitute more than a variety.

#### IRIS STYLOSA (UNGUICULARIS), VAR. ALBA.

A YEAR or more ago, M. Durando, of Algiers (to

known blue Algerian Iris. The gentleman in whose garden near Algiers the plant was growing, very kindly answered my appeal by sending me some roots. These, though doing well, have not as yet

FIG. 61.—SIR J. WHITWORTH'S WINTER GARDEN, STANCLIFFE, NEAR MATLOCK.

whom so many of us are indebted for supplies of Algerian plants, and who by the way sent over the *Narcissus pachybolbos*, which has flowered this spring for the first time in this country for several years), told me of the existence of a white variety of the well

flowered. But a small piece of rhizome which Mr. Frank Miles was so good as to send me towards the end of last year, and which probably came from the source mentioned above, has, to my great surprise, thrown up a bloom, and thus enabled me to state that the

white variety is a welcome addition to our list of winter flowering Irises. The plant has been grown in a pot in a greenhouse, and, as I have just said, was a few months ago a small dry brown morsel, hence the bloom is naturally small and poor, but, except in colour, does not differ from the type. All the blue—or rather blue and red colour (for the hue of the typical plant is that kind of purple often spoken of as lavender or lilac—that is, a purple with an excess of blue over the red, largely diluted or mixed with white)

I am not one of those who think that white is the best of all colours, and, therefore, do not believe that flowers are necessarily improved by losing all their colour; but I must confess that this white Iris is charming in itself, over and above its affording a variety to the type, and one of my friends is very enthusiastic in its praise. Whiteness in this, as in the case of many other white varieties, means defect of or disturbed nutrition, *i.e.*, in a broad sense, sickness. Hence this white variety will probably not be

be put in too dry a place, and the more it is scorched by the summer's sun the more stuff will be drawn into the root, to reappear in winter as purple and fine petals. I mean this coming summer to dry my pot plants right off, as if they were Cape bulbs, and I believe that I shall thereby secure a larger bloom than I do now, though even with moderate resting one plant in a largish pot has given me more than a hundred blooms I think between November and now.

M. Foster.

FIG. 62.—LEUCOIMUM VERNUM. (SEE P. 340.)

—has disappeared, leaving the falls, standards, and styles, a pure white, save for the medium yellow bar or "signal" at the junction of the claw and blade of the fall, and a greenish-yellow tinge over the claws of both the falls and standards. This preservation of the yellow marks, in the total absence of the blue, is interesting, seeing that, in regard to the uses of colour for purposes of fertilisation, the yellow "signal" or "guide" to the insect, is of more importance than the general hue of the flower. Probably the yellow is a solid pigment, and the blue or purple merely coloured cell-fluid.

so vigorous as the type; but this does not necessarily follow, and experience will soon settle the question.

I hear many complaints about *Iris stylosa* not flowering. These arise, I believe, because many people, drawing a hasty broad, false generalisation, from the fact that our common yellow Flag (*I. pseudacorus*) is a water plant, think that all Irises should be grown in swamps. As a matter of fact about 70 or 80 per cent. of the known species of the genus thrive best in dry hot situations. *I. stylosa* is one of these, and it will not bloom as it ought unless it gets a good resting period of drought in the summer. It cannot

## The Arboretum.

### NUTTALLIA CERASIFORMIS.

THIS early spring flowering shrub is a near ally of the genus *Prunus*, but differs conspicuously by having five drupes instead of one to a flower. The flowers are also male, female, or hermaphrodite on different plants, and are also remarkable amongst Roseworts for the regularity in the number of their parts. Each

set of organs consists of five, except the stamens, which are fifteen in three series. The name *Nuttallia* has been applied to two other distinct genera, namely *Callirhoe*, belonging to the Mallow family; and *Nemopanthes*, belonging to the Holly order—all consisting of North American plants. There is only one species of *Nuttallia* as now recognised, and its great value horticulturally lies in its early blooming habit, when few or none other shrubs of the same character enliven the shrubberies. The white flowers are borne in pendulous racemes, and the leaves, being produced at the same time, give the plant a handsome appearance. It is liable to suffer from spring frosts. A large plant near the main entrance to the gardens at Kew is annually very conspicuous about this time. A figure was given in our columns for March 10, 1883, p. 309.

#### ARACARIAS.

Having read with much interest the articles on large *Araucarias* in your paper, I would like to bring to your notice some fine specimens there are at Mr. G. W. Piper's, Piltown Nurseries, Sussex (for many years carried on by Messrs. J. Mitchell & Son). In a short avenue of this noble Chili Pine there is one which in 1854 measured—height, 50 feet; circumference of branches, 80 feet; circumference of trunk, 9½ feet, and perfect in every respect. Of course there is a proportionate increase in the measurements now. There are many more splendid plants from 35 to 40 feet high now, and most beautifully feathered, in the same avenue. I believe the reason that one is a much finer plant than the rest is that some years ago there were several cartloads of soil taken from its roots and replaced with maiden loam; it was intended to do the same with all. There are a fine lot of catkins and cones on them now, some cones being about 8 inches in diameter. They have matured many cones, which have produced a good healthy stock of plants. I have never heard of any other instance of seedlings from home-grown cones, and would be pleased to learn if any of your correspondents have noticed such cases. There are a few specimens that, like "R. McK.'s," are about equal in height and diameter. A. P.

## FORESTRY.

#### GENERAL WORK.

THE weather of the past month, although favourable for the general work of the estate, has been of a very stormy character, particularly the latter part of it. Numbers of trees have been uprooted, branches twisted and torn, and recent transplants half blown over. Attention should at once be directed to the setting of matters right, trees cut up and removed, branches neatly trimmed, and stakes or other supports placed to heeled-over plants.

Hurdles and other guards round park trees will also require attention, care being taken to keep them both high enough and wide enough in order to secure their safety, more especially where young horses are allowed to roam at will. The planting of hedges, although usually left over till spring, should be finished at once, and all gaps in old fences made up without delay. Keep woodland drains clean and in good working order, also attend to those alongside drives and roads, as, during the present unsettled weather, they are apt to get choked up.

Repair roads, drives, and walks; attend to shrubberies, and push forward all work likely to interrupt "bark stripping," which, we presume, will be early in hand this season. A. D. Webster.

## Orchid Notes and Gleanings.

#### ORCHIDS AT FERNSIDE, BICKLEY.

THE collection of Orchids here, the property of H. M. Pullett, Esq., is not a large one, but very select, and for its extent the quantity of flowers to be seen is very surprising. The cream of the collection is contained in a span-roofed house in two divisions. One half of it is set apart for those requiring a Cattleya-house temperature, and the other portion is for cool Orchids. For winter and the early spring months there are few more showy subjects than

*Lycaste Skinneri*. They are grown here in the Cattleya-house, and the very rare as well as chaste white variety was in flower, besides some other well marked forms. This Orchid is usually classed as a cool-house species, but I must say that as far as my own experience goes it makes the best growth in the Cattleya-house; and also flowers earlier, which is a consideration. This species is most interesting, from the fact that it was one of the first subjected to quite cool-house treatment, and led the way for one of the greatest revolutions in plant culture ever made, and yet it is one not specially adapted for the cool-house. The flowers are easily injured by a close moist atmosphere—it causes them to spot. Here is also a handsome plant of *Ceologyne cristata alba*, with three spikes; on one of them there are five flowers. This is a very rare plant, doubtless, and consequently very valuable; but if I were to make my choice of the three varieties without any regard to their commercial value I should choose the one with a lemon blotch on the lip, although it must be admitted that the pure white variety would be more valuable for cut flowers in some instances. The *Treotham* variety, with the orange blotch on the lip, is a well-marked form of the type, not only in the greater length of its flower-spikes, but also in the form of the pseudobulbs. *Cattleya Percivaliana* is yet in flower, and in two good forms; it is never of large size, but always conspicuous in the rich crimson and gold of the labellum. *Calanthe Regnerii* was also in flower, and is very useful to flower later than the ordinary forms of *C. vestita*. It is tinged with red in the centre, and a useful companion to *C. nivalis*, flowering at the same time. In the cool-house there are many rare, beautiful, and valuable specimens. The attention is arrested by a charming little specimen in flower of the Peruvian *Oncidium Phalanopsis*; the flowers are large, white, with rich purplish spots and blotches in the centre. Here also is the finest form of *Odontoglossum blandum* I have yet seen. It had two spikes of large flowers for this variety, densely marked with maroon-crimson spots. The flowers have also a very delicate perfume. *O. Sanderianum* is also in flower, but it is not one that will ever be popular: even the best forms of it are not superior to the best of *O. constrictum*. *Oncidium dasytle* is always conspicuous by the dark bee-like form in the centre of the flower; in other respects it is allied to *O. concolor*, although the flowers are different in form and colour. There is a splendid plant of *Odontoglossum elegans*, a very rare plant, but the flowers are not likely to be seen (although it showed two strong spikes), owing to the fondness of slugs for the succulent growths. Slugs are great pests in a collection of choice Orchids, and when they are present the utmost vigilance on the part of the cultivator is required, and even then the mischief may be done in a night. There are also two good plants of *O. Hallii magnificum*, certainly the finest form of this species yet seen. They are both showing spikes. *O. Wilckeanum* is showing three spikes; the best forms of this are very expensive, because of their rarity, but they are also very handsome and distinct, with the clear yellow ground and brownish markings. *O. crispum* is showing numerous strong and good spikes. In the moderate-sized house 280 spikes of *Odontoglossums* in flower, or in course of development, could be counted. There is not much bloom in the warmest house, but a good spike of *Vanda Cathcartii* is opening its flowers; and amongst *Phalanopsis* there is a handsome branched spike of *P. Stuartiana*, and *P. speciosa* is also in full flower. F. Douglas.

#### LÆLIA ANCEPS SCHRODERIANA, n. var.

Although we shrink at the multitude of fresh varieties of *Lælia anceps*, it is a great satisfaction to see what would appear to be a quite distinct race. To begin with the plant, it has colossal dimensions, a very strong stem, rather tetraginous, deeply furrowed bulbs, 0.17 m. in length, 0.1 m. in circumference. The upper joint is half way up the stem. The leaves have the average dimensions, in length, of 0.24 to 0.06 in breadth in the middle, and are exceedingly stiff. I write this from a magnificent living plant. Further there are before me twenty-seven brilliant dried lips and a dried flower, whose column has been cut out with great cruelty. The colours are purest white; the disc between the lateral laciniae is orange, and the projecting keels running in the base of mid-lacinia are even deeper orange. There are 3—5 crimson-purple longitudinal and several forked lines

radiating outwards. So much for the colours. The complete flower would appear to surpass the dimensions of *Lælia anceps Dawsoni*. The petals seen are remarkably broad. The great merit of the plant consists in the lip, which is broad, with short, blunt, nearly rectangular, side-laciniae. The mid-lacinia is very broad, blunt, emarginate, and the lip is quite novel to me. The beauty of the remarkable white flower is admirably enhanced by that of the large square and flat lip. This very ornamental Orchid bears the name of one of our most excellent Orchidists, Baron Schroder, and it gives me great pleasure to attach the Baron's name to such a glorious *Lælia*. It is one of the most recent and most brilliant introductions of Mr. F. Sander. H. G. Rehb. f.

## The Flower Garden.

THE shrubberies should have every attention at this period of the year, and will require the utmost skill and discrimination in removing all useless and unsightly subjects, and afterwards carefully pruning into form the remaining plants. This kind of work should be undertaken at once, and should be performed only by the most careful workmen. All straight lines, unless there is an object in having them, should be avoided, and in pruning off shoots the best tools for this purpose are a strong knife or branch-pruning shears, with a sharp saw for removing the larger branches; but care should be taken to avoid the use of the shears in a way that would give the appearance of a clipped hedge to plants in a shrubbery. Where shrubberies have been long neglected it is impossible that they can be made as perfect as if they had been carefully attended to from the first, but much may be done to improve them. All permanent trees and shrubs should be planted at a distance from the walks, and this distance should be according to the size the trees or shrubs are likely to attain. As nurse plants, or to fill up the groups and borders, any common free-grown plants that could be cut away when no longer needed may be planted, avoiding the crowding of the trees and shrubs that are intended to be permanent. Attention should be paid to the proper staking and tying of all newly planted subjects. The shrubbery should be thoroughly cleaned of weeds and rubbish, and afterwards the ground should be carefully forked between.

The grass lawns and tennis-ground should be carefully looked to. Where moss exists in any bulk in the turf find the best treatment is to give a mixture of equal parts of lime and wood-ashes, with 10 lb. of phospho-guano to the bushel, well mixed and sown over the lawn, and if used with a good mixture of grass seed will greatly improve it; this should be done at once, and the turf well rolled every week previous to mowing, and at other times if found requisite. Wm. Smythe, *The Gardens, Basing Park, Alton*.

## Plants and their Culture.

#### FERNS IN HANGING BASKETS.

THIS is an excellent way in which to grow many kinds both in the stove and warm greenhouse. The appearance of plant-houses that are lofty is greatly enhanced by the use of Ferns grown in baskets. Medium-sized baskets of about 1 foot in diameter will be found very useful, and the planter these are made, so much the better for their future occupants. A narrow margin, turned over at the top, is an improvement, but no ornamental work is needed at the bottom part. The latter will be found more of an impediment than otherwise, especially so when the Fern in question is turned out of one basket to be placed into another. Ferns under this mode of culture will continue in good health for several years if a little fresh soil is added at intervals, and by careful attention to watering. Several of the *Adiantums* are well adapted for basket culture, particularly those whose rhizomes ramble through the soil and cover the sides of the basket. *A. amabile* is one of the best of

this type, it will quickly cover the sides, producing a dense mass of pale green fronds. When it is necessary to renovate such as these, the central portion of the soil, with that part of the plant on the top of the basket can be removed entirely, scooping it out, as it were, and filling in with fresh soil, and afterwards replanting a sufficient amount of Fern to cover the surface fairly well. That part of the Fern which was left at the sides will soon take to the new soil that is placed within its reach. A. cuneatum also makes an excellent basket Fern, developing fronds of more than usual size and beauty. These, too, are excellent for using in a cut state by reason of their greater durability, owing, no doubt, to the extra amount of air in circulation around them. The smaller growing forms of Davallias are most useful for basket culture, such, for instance, as D. bullata, D. dissecta, D. elegans, and D. Mariessii, D. canariensis is also an excellent species both in this way and for culture in rustic pottery, or on pieces of virgin cork in the way of a raft. Cheilanthes elegans is also very tractable when suspended in a basket, and grown in a moderately dry atmosphere. Platycerium alcicorne is also strongly to be recommended for use in this way, being most accommodating to its surroundings. P. grande had, however, better not be tried in this fashion, but rather give it a position against a wall in a warm house. Of the Ferns with long fronds preference should be given to the Goniophlebiums, particularly G. subauriculatum, which is one of the handsomest Ferns in its way that can be grown. It will succeed very well in a house that is kept at about 50° by night, or even occasionally dropping as low as 45° will not injure it. Under these conditions the fronds will not be of such a deep green colour, neither will they extend themselves to such a length as when grown in a warmer house, but nevertheless it makes a beautiful object in a lofty structure. For a large basket in a suitable position Woodwardia radicans is a noble Fern, whilst on the other hand for a small basket, with sufficient suspending room whereby its long narrow fronds with a young plant generally to be found at the extremity of each is Asplenium longissimum, which is not easily surpassed. All Ferns in baskets should receive attention without delay, renovating the soil in each case even if but a little. The Davallias will require their rhizomes to be regulated and pegged to the sides of the baskets; this will be a capital opportunity to work in a little fibrous peat and sphagnum moss, to which they will quickly root when brought in contact. As growth proceeds the supply of water must be increased in each case, having due regard to the genera that is being treated upon. The Adiantums and also the Cheilanthes will require a greater quantity than the Davallias. Ferns in baskets last in good condition for a greater length of time than when in pots, caused, no doubt, by the larger amount of plant food within their reach, and their perfect drainage. *J. Hudson, Gunnersbury House.*

## FRUITS UNDER GLASS.

### STRAWBERRIES.

At this season it is not possible to provide more suitable places for forcing Strawberry plants in pots than can be had on shelves which are placed near the roof and ventilators of vineries or peacheries and similar houses now at work, but, alas! at many places unfortunately, prudence forbids the practice, by reason of the imminent peril of introducing with the plants that terrible pest the red-spider. Nevertheless, wherever it can safely be done, it is an immense advantage to be able to utilise places which for the purpose required cannot be surpassed.

### SUCCESSIONAL PLANTS

will at this period be coming into flower almost every day, and will, with a moderate supply of fresh air, set very freely. As soon as the process is complete the fruit should be thinned, and here it may not be amiss to remark how universally fine fruit is esteemed to that of medium character, therefore in this matter quality should be considered as being preferable to quantity. Early varieties, as Vicomtesse Héricart de Thury, Keens' Seedling, or Black Prince, will carry a dozen each well; President, Sir Joseph Paxton, or Sir Charles Napier about eight or nine on each plant; and for larger and later kinds, including James Veitch

and others, six fruits will be enough for every plant. If necessary the ripening of the fruit can be accelerated considerably by putting the plants after the fruit is set into Pine pits or others having a high temperature, where they should be placed in close proximity to the ventilators, which should be kept open a little way constantly, otherwise the lack of air will make the fruit very insipid and worthless in point of quality. From the flowering period until the fruit is ripe is a time when of all others the plants demand more attention. Any lack of water occurring now is more or less detrimental to excellence.

To provide against contingencies in this way it is a good plan to have sides 2 inches high fixed on the shelves, so as to form troughs to be filled with rich materials, which will induce root-action and sustain the plants if they should ever become at all dry. Gross feeding plants like these, especially when grown with such a restricted quantity of nutriment, will want stimulating by manures, which should be regularly applied in a much diluted form. It generally happens that these plants are not provided with a house to themselves, consequently they have to be accommodated where there is room and the conditions most suited to their requirements for the time being, and treated as favourably as the circumstances will admit of. In any case the plants must be well syrioged overhead twice daily, and be put where they can get all the air possible. Where a Strawberry-house exists the treatment most suitable to the subject only should be enforced which consists in keeping up a night temperature of 55° and 65° in the daytime, allowing 10° or 15° higher under sunshine, and at all times a genial and invigorating atmospheric state. *G. T. Miles, Wycombe Abbey.*

## The Hardy Fruit Garden.

### DWARF APPLE TREES

MAY be planted any time during the present month with every prospect of success. Last March I planted a number of trees on the Paradise stock, and many of them bore from ten to twelve fruit the same season, of good average size. I think the most profitable way of growing Apple trees is to plant small bush trees grafted on the Paradise stock two or three years grafted. These may be planted 6 feet apart each way. This would allow 1210 trees per acre, which is ample space for them to grow; and while the trees are young salads and other small growing vegetables might be grown between the rows. I should strongly advise every one who has the means to grow a few hundreds of these pretty bush trees; they occupy no more space than an ordinary Currant or Gooseberry bush, and the produce will be most satisfactory with only ordinary care and attention. In planting these bush trees my practice is to keep the roots as near the surface as possible, and the first season to heavily mulch with rotten manure; if this is attended to very little watering will be required even should the season prove dry. Our trees, although planted the end of March, were never watered, and yet last season was remarkably dry. Every tree planted is now full of blossom-buds, and should the season prove favourable we may hope for a grand crop. The best situation for forming a plantation is an open exposure, facing south if possible, and sheltered from the north and east winds. Our largest and best coloured fruit was grown on trees of this description for some years. I would strongly advise those who have not tried this style of growing Apples to begin at once, and others who have already got quarters of this description of trees I am sure will endorse my recommendation. I am fully convinced that when the soil and situation are suitable this plan of growing Apple trees could be adopted with a fair margin of profit. For private gardens they make a fine feature when planted altogether in one quarter, the same as Currants and Gooseberries. One great advantage of this style of growing Apples is that the high winds are not so liable to blow the best and finest fruit down before it is ripe, as is often the case with large orchard trees. Another great benefit is their coming into bearing immediately they are planted. Such varieties as Blenheim Pippin, which as a rule takes years to come into bearing, will, when grafted on the Paradise stock, fruit the first year after planting, and produce fine bright handsome fruit of good size.

### SORTS TO PLANT.

I have planted a great number of varieties of Apples on the Paradise stock, but the following are the freest bearing here, and they are again covered with bloom-buds:—Irish Peach, Cobham, Oslin, Jefferson's Ringer, Worcester Pearmain, Mr. Gladstone, Court of Wick, Kerry Pippin, Emperor Napoleon, Stamford Pippin, Besspool, Lord Burghley, Hoary Morning, Thorne Pippin, Summer Golden Pippin, Rymer, Ribston Pippin, Washington, Margaret, Lemon Pippin, Annie Elizabeth, Scarlet Nonpareil, Yellow Ingestre, Cellini, Blenheim Pippin, Cockle Pippin, Dumelow's Seedling, Rhode Island Greening, Lady Henniker, Early Harvest, Cox's Orange Pippin, Lane's Prince Albert, Paradise Pippin, Galloway Pippin, Old Nonpareil, Lamb Abbey Pearmain, Peasgood's Nonsuch. We grow many more varieties, but the above are all on the Paradise stock, and are showing abundance of fruit-buds this season. Were I confined to a limited space of ground I should only grow a very few varieties, and of them I should grow a number of trees of each. The following I consider the best six:—Dessert: Cox's Orange Pippin, Ribston Pippin, and Mr. Gladstone; very early—cooking: Dumelow's Seedling, Lane's Prince Albert, and Blenheim Orange.

### STRAWBERRY BEDS.

Beds of Strawberries may still be planted, although I much prefer early autumn planting. The first batch of early forced plants should be saved for planting out for autumn fruiting. They should be placed in a cold frame as soon as the fruit has been gathered, and gradually hardened off, then planted out on a warm south border. Very early varieties are the best for this purpose, such as the old Black Prince, Keens' Seedling, and Vicomtesse Héricart de Thury, which is perhaps the best of all for this purpose. If planted in a warm position and well watered in dry weather they will produce an excellent crop of fruit, after the regular beds are finished. Permanent beds should now be mulched with long manure, by doing so early the rains will wash it clean for the fruit and so save using straw. It also saves time in the busy season by giving attention to such work thus early. *J. Smith, Mentmore, Bucks.*

## The Kitchen Garden.

### PEAS, ARTICHOKEs, RHUBARB, ONIONS.

A STOCK of pea-sticks should be held in readiness to plant to tall-growing varieties. Draw ridges of soil to any Peas well above-ground; they afford a little shelter from biting cold winds, which injure Peas much more than frost. In some places it will be found difficult to keep small birds, mice, rats, &c., from doing much mischief. Guards made of fine wire-netting are most useful preventives against small birds, which attack the Peas the moment they are above-ground. The guards can be moved from crop to crop as required. Protecting material may now be removed from Globe Artichokes; also remove any weeds growing between them, and prick over the ground, but not deeper than a few inches. Any manure to spare may be usefully employed as a mulching between the plants. Keep a succession of Rhubarb and Seakale covered, so that a break in the regular supply does not occur. Any transplanting of autumn-sown Onions should be done this month. Before planting make the soil thoroughly firm with the roller; loose soil produces ill-shaped bulbs.

### GENERAL WORK.

Use the hoe occasionally between all growing crops when the soil works freely, and during sunny weather. The importance of a free use of the hoe during spring months cannot be over-estimated; numbers of weeds soon spring up, and should be prevented from shedding seed if possible. Through other pressing matters this work is often neglected until later on in the early summer it almost becomes unmanageable, especially if showery weather should be frequent, and ultimately resulting in the kitchen garden presenting an unsightly appearance throughout the whole of the summer, while the crops suffer in consequence. [Any Parsnip roots still remaining in the soil should be lifted, shoots removed, and stored in a cellar or cool shed. Beet-root will require looking over frequently to remove any growths, which, if allowed to remain, will render the roots deficient in colour when cooked. Proceed with the planting of second early Potatoes. There are various methods of doing this. For small garden plots we take out a separate hole for each set with a small spade, and consider it as expeditious as drawing drills. The system which is most to be avoided is dibble planting. *G. W. Richards, Somerley Gardens Ringwood, Hants.*

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Mar. 16	Sale of the Collection of Orchids and other Plants formed by J. Coleman, Esq., Stoke Park, Slough, by Mr. Stevens (two days).
TUESDAY,	Mar. 17	Royal Botanic Society of Manchester Horticultural Show (two days). Sale of Imported Orchids, at Protheroe & Morris' Rooms. Sale of Flowering Orchids, at Stevens' Rooms; also of Hardy Plants and Bulbs.
WEDNESDAY,	Mar. 18	Sale of <i>Lilium auratum</i> , Plants, and Shrubs, at Protheroe & Morris' Rooms. Clearance Sale of Orchids, Plants, and Utensils, at the Woodlands, Clapham, by Protheroe & Morris.
THURSDAY,	Mar. 19	Linnean Society meeting. Sale of Imported Orchids, at Stevens' Rooms.
FRIDAY,	Mar. 20	Sale of Imported Orchids, at Protheroe & Morris' Rooms.
SATURDAY,	Mar. 21	Sale of Hardy Plants and Bulbs, at Stevens' Rooms.

THE outburst of interest in all that concerns the DAFFODIL and its allies, which formed so remarkable a feature of the horticultural proceedings of last year, has not subsided, as some thought it would do—on the contrary, the interest seems to intensify. There is an earnestness of purpose about the worshippers of the new cult, and a desire to get to the bottom of things, which are gratifying to those who know how much intellectual enjoyment is lost by those who content themselves simply with the sensuous delights which these lovely flowers furnish so abundantly. Well meaning people are sometimes apt to quote WORDSWORTH'S disparaging remarks on those who peep and botanise on hallowed spots, quite forgetting that no objection could be raised, even if it were conducted in a proper spirit. Such people quote as much or as little as they like—wrench it from the context to serve their shallow purpose for the moment, and hug themselves complacently at the notion of their superior sensibility. Let them! Other people have read WORDSWORTH too, and remember a certain PETER BELL, whose understanding was not of a high order. At any rate, that the interest in the Daffodil did not evaporate in last year's Congress was shown by the large representative gathering that took place on Tuesday last in the Lindley Library of the Royal Horticultural Society. Members appeared from Somersetshire, Lancashire, and Cornwall; Holland sent its representative, the Home Counties contributed their quota; the monographer of the Daffodils, Mr. BAKER, skilful cultivators, travellers familiar with Mexican highlands and Arabian deserts, met to discuss the humble Daffodil. A lady graced the room by her presence. All this is gratifying, as showing the spread of an intelligent love of plants for their own sakes, and not merely for their beauty, which in this case is particularly skin-deep. It is satisfactory also as bringing around the Horticultural Society a class of amateurs who have too long kept aloof from the Society, fearful perhaps that their own special hobby would not be looked on indulgently by the parent Society. Again, it is gratifying to find the Society showing a disposition to become more catholic and cosmopolitan, inclined to advance the interests of all branches of horticulture, and all classes of horticulturists. The Apple Congress and the Daffodil Congress were both great successes, and we have no doubt have done more to win favourable opinions from the amateurs than any number of "fashionable flower shows." This year, we doubt not, the Orchid Conference will appeal forcibly to a large constituency of whom only a few at present take interest in the work of the Society. If some people look upon Orchids and their cultivators as aristocrats, beyond the pale of humbler folk, we doubt not the Conference will undeceive them; and even if their fears were well founded, which they are not, Daffodils and Primroses (which latter we believe are to be taken in hand next year) are surely flowers that the humblest cottager may grow. As to any aristocracy in flowers, we protest against the

assumption. We may have our preferences for this or for that, but the flowers are perfect after their kind, as marvellously adapted to the conditions under which they live as any other of GOD'S creatures.

To revert to the Daffodil meeting, what could there be found to do? Well, the Conference of last year settled that question—this year's work is but the continuation of the last. Our readers are familiar with the controversy that has arisen as to the alleged mutation under cultivation of single into double Daffodils. Some say Yes—others No: like the rest of the Narcissophiles we have our own opinion. But opinions are not facts, and the object of the meeting in question was to appoint a sub-committee to collect evidence and sift it—the latter perhaps the more important matter, as evidence of a kind is already plentiful. A certain number of bulbs carefully verified and attested as having borne single flowers, are to be planted at Chiswick and at Kew under various conditions and varying circumstances, and the results are to be noted. Similar experiments will be made by growers in various parts of the country, but the impossibility of supervising these latter, and of eliminating all occasion for cavil, will render these experiments less decisive than those which can be supervised by the sub-committee.

The object is not only to test the correctness of the assertion, about which there is little reason for doubt, but to ascertain the why and wherefore of the process. If the committee can come to any definite result on this point a very important question will, in so far, be solved—the cause of the production of double flowers generally—a matter of no little moment from the point of view of science and of practice.

Meanwhile, as was pointed out at the meeting, there are half a dozen or more modes of doubling in the case of Daffodils, which it is necessary to distinguish, because the causes likely to produce some of them are likely to be antagonistic to others, while hereditary tendencies may be stronger than either. To simplify matters from this point of view, and to arrive at some conclusion as to what we really mean when we talk of double Daffodils, Dr. MASTERS was requested to draw up a brief account of the various ways in which Daffodil flowers become double, and this will shortly be done. Gentlemen having a specially ugly Daffodil are requested to send a specimen to the Editor at this office for *post mortem* examination and report, for, strange to say, the interest of these flowers is sometimes inversely proportionate to their beauty. But here personal opinion creeps in. Some people prefer the doubles to the singles—the true botanist, for different reasons, enjoys both.

— PINUS THUNBERGII.—The specimen we figure was obtained from the Royal Gardens, Kew, through the courtesy of Sir JOSEPH HOOKER. It is the *P. Massoniana* of some collections, but not of LAMBERT. It is one of the commonest of all the Japanese Pines, and is used by that ingenious people in a variety of ways. Usually the cones are solitary, or in pairs; but occasionally, as in the instance before us (fig. 63), they are in clusters. The tree is sufficiently known botanically, and its description (under the name *Massoniana*) is given in the ordinary text-books, or under its proper name, by PARLATORE, in *DE CANDOLLES' Prodromus*, xvi., fasc. 2, p. 388. All that we need add are a few notes taken from the living trees at Pampisford and Kew. The bark of the old trunk is cinnamon-brown, the young shoots thick, cylindrical, grayish-green, devoid of foliage for some distance above the base. The buds are oblong, conic, covered with silky white lacerated scales. The male catkins are clustered, oblong, cylindric, orange in colour, about half-an-inch long, and with the anther-crests sub-orbicular, nearly entire. The cross-section of the leaf reveals a boat-shaped outline with a layer of hypoderm cells, and two or more resin canals immersed in the cellular tissue of the leaf, each surrounded by strengthening

cells. An interesting account of this Pine is given in VEITCH'S *Manual of the Conifera*, p. 149, wherein are contained numerous details as to the tricks of cultivation practised by the Japanese. The wood is largely used for constructional purposes. In this country no observations, so far as we know, have been made as to the quality of the timber, but the tree has one advantage in not expanding its buds till late in the spring—at least it is so at Kew.

— GLASGOW.—The Chair of Botany in the University of Glasgow is at last declared vacant by the resignation of Dr. BAYLEY-BALFOUR. The circumstances which have caused the delay in this announcement are well known in the scientific world, and we express the hope that, now the vacancy is officially intimated, there will be no lack of candidates and that a really good appointment will be made.

— PROFESSOR RODIGAS OF GHENT.—The French Government have recently recognised the merits of Prof. RODIGAS, in consideration of the services he has rendered, not alone to Belgian horticulture, but to horticulture generally. We understand that a public *fête* will be given in his honour in May next, at which time he will have completed the twenty-fifth year of his career as Professor in the School of Horticulture and Botany. We are happy to offer our congratulations, not only for being thus honoured in France, but also on his being made a Chevalier de l'Ordre de Leopold.

— LINNEAN SOCIETY OF LONDON.—At the meeting on March 19, at 8 P.M., papers will be read on the following subjects:—1. "New Genera and Species of Hydroids from H. GATTY'S collection;" Professor ALLMAN (postponed from March 5). 2. "Plants of Moresby, Basilisk, O'Neill, and Margaret Islands, South-east New Guinea;" by WM. E. ARMIT.

— THE LANGUAGE OF ROSES.—M. A. MYARD proposes, in the *Journal des Roses*, to make the garden varieties of Rose the symbols of various sentiments and attributes. Aimée Vibert is a symbol of Virginity; Alphonse Karr, of Sympathy; Captain Christy, of Triumph; Géant des Batailles, of Glory; Gloire de Dijon, of Pleasure; Maréchal Niel, of Patriotism, and so on. We think we have said enough. Sentiment is very nice sometimes, but—

— THE "BOTANICAL MAGAZINE."—The number for the present month contains coloured figures of:—

*Vitis pterophora*, t. 6803, the singular and very handsome tropical Vine better known as *V. gonyolodes*, and figured as such in our columns, vol. xix., p. 52, fig. 8.

*Dioscorea crinita*, t. 6804, is a very elegant climber, with delicate pale green translucent foliage, and copious snow-white pendulous racemes. The leaves are stalked palmately, five-foliolate; the leaflets oblanceolate, stalked, softly pubescent. Sir JOSEPH HOOKER, who describes it, speaks of it as one of the most elegant conceivable pot-plants. It is a native of Natal.

*Solidago Drummondii*, t. 6805, is a rather weedy-looking herbaceous perennial, which has the advantage of flowering late in the autumn.

*Neviusia alabamensis*, t. 6806.—A handsome deciduous shrub, with ovate-stalked puberulous leaves, and panicles of snow-white feathery blossoms, allied to those of *Rubus*, but differing in several particulars, especially in the absence of petals, the feathery look before mentioned being due to the numerous white stamens. It flowered at Kew against a wall in 1883, but Sir JOSEPH HOOKER doubts its being hardy.

*Citrus medica* var. *Riversi*, t. 6807.—This is the pretty little fruit figured in our columns, vol. v., p. 690, f. 123, under the name of *Rivers' Bijou Lemon*, but which Sir JOSEPH HOOKER considers to be a Lime—a variety of *C. medica*. Those interested in this question should consult the very interesting notice of the Limes given in a former volume of the *Magazine*, t. 6745.

— ROYAL METEOROLOGICAL SOCIETY.—At the ordinary meeting of this Society, to be held by kind permission of the Council of the Institution of Civil Engineers at 25, Great George Street, Westminster, on Wednesday, the 18th inst., at 7 P.M., the following papers will be read:—"Notes on Sunshine Records," by ROBERT H. SCOTT, M.A., F.R.S.,

FIG. 63.—*PINUS THUNBERGII*: FORM WITH NUMEROUS CONES. (SEE P. 344.)

President. "Results of Meteorological Observations made at San Paulo, Brazil, 1879-1883," by the late HENRY B. JOYNER, M. Inst. C.E., F.R. Met. Soc. After the reading of these papers the meeting will be adjourned, in order to afford the Fellows and their friends an opportunity of inspecting the exhibition of sunshine recorders and radiation instruments, and of such new instruments as have been invented and first constructed since the last exhibition. The exhibition will remain open till Thursday evening the 19th inst.

— *BIGNONIA VENUSTA*.—With few exceptions this is the most beautiful climber grown, and should always find a place in every warm greenhouse. The flowers are trumpet-shaped, and deep crimson in colour, the leaflets being oblong-ovate and acuminate. It is an extremely abundant bloomer, lasting many weeks in perfection.

— *BEHNIA RETICULATA*.—There is a figure of this plant in the *Botanical Magazine*, t. 5638, under the name of *Dictyopsis Thunbergii*, of HARVEY. It is quite distinct from and by no means to be confounded with *Myrsiphyllum asparagoides* of gardens, a slender climber frequently grown for the beauty of its long graceful sprays. It is encumbered with a perplexing synonymy, and is moreover a true species of *Asparagus* with flattened leaf-like branches. *Behnia*, on the other hand, has large ovate deep green shining leaves, beautifully veined and reticulated, forcibly reminding one of the cladodes of *Ruscus androgynus* on a reduced scale. The stems are very much ramified upwards, bearing numerous oblong or shortly cylindrical flowers in somewhat cymose racemes. These flowers are small, greenish-yellow, and not particularly attractive, but taking into consideration their agreeable fragrance and the beautiful background of shining foliage, the plant becomes a desirable addition to a well kept garden. It is a native of S. Africa, and may be seen trained to the rafters in the Succulent-house at Kew.

— "FAIR DAFFODILS."—We refrain from quoting the rest for fear so delicate verse should become too hackneyed. Few people seem to realise how often HERRICK mentions Daffodils, and how fond he was of them. He laments in one place that they did not form part of the cradle of the "Kingly Stranger" that appeared on earth on Christmas Day.

"Fragrant posies  
Of Daffodils and Roses,"

would, he intimates, have formed a better resting-place than the "homely manger." In another place he takes it as the emblem of his own career:—

"When a Daffodil I see  
Hanging down his head t'wards me  
Guess I may what I must be:  
First, I shall decline my head;  
Secondly, I shall be dead;  
Lastly, safely buried."

— THE PHYLLOXERA LAWS.—For the guidance of nurserymen and seedsmen we append the following paragraphs of these regulations, kindly forwarded to us by Messrs. PUTZ & ROES, of Erfurt. They are those which are specially directed against plants imported from those countries that have not signed the Phylloxera Convention—England, the United States of America, and Australia. Rooted plants only are mentioned—dry roots are not interfered with.

(Extract Copy.)—"BERLIN, June 26, 1884.—In reply to your letter of the 2d inst. concerning the import of rooted plants from territories not included in the International Phylloxera Treaty of November 3, 1881, I beg to say that I am not competent to effect an alteration of section 2 of the imperial decree of July 4, 1883, nor do I recognise the necessity for any such alteration, as section 5 of the same decree authorises the Imperial Chancellor to allow exceptions from the said section 2.

"In the majority of the numerous cases of applications for permission of the import of plants from the territories in question, and especially from the Tropics, the exception has been granted, observing particular care, and after examination of the plants on the imperial frontier. This course will be followed as far as possible also in future. The exception, however, cannot be granted with reference to plants from countries where the Phylloxera is known to exist, but where measures have not been instituted to prevent the insect spreading in the interior of the respective countries, or by international traffic. This holds good particularly for the

United States of America—the home of the Phylloxera, for England, and for Australia."

The paragraphs which are applicable are:—

"Section 2.—The import of rooted plants from territories not included in the International Phylloxera Treaty over the imperial frontier is prohibited."

"Section 5(a).—The Reichskanzler is authorised to allow exceptions to the contents of section 2."

— *LIVISTONA CHINENSIS*.—This, one of the most commonly grown Palms, is popularly known as *Latania borbonica*, and is figured as such in JACQUIN'S *Fragmenta Botanica*, t. 11, f. 1. Although not attaining the stately dimensions of its congener, *L. australis*, it is a bolder and even more handsome tree than the latter when both are of equal size. A noble specimen, that bids fair in a few years to outgrow the space at command, is now ripening an enormous crop of fruit in the Palm-house at Kew. It is taller than *Sabal umbraculifera*, so frequently mentioned as being in fruit there, but has proportionately smaller leaves and diameter of stem. The fruit-bearing spadices are erect during the flowering period, and for some time afterwards, but as the fruit swells and progresses towards maturity they become pendulous, and, being long, slender, and much branched, they present an imposing appearance, while the black berry-like fruits are very tempting. Very little of their tissue, however, is succulent, the greater part consisting of a seed of bony hardness.

— COMMON RIGHTS IN EPPING FOREST.—Complaints have been made to the Corporation in consequence of instructions issued to the reeves of Epping Forest not to mark the cattle of persons not entitled to common of pasture. The Epping Forest Committee have now given instruction to the superintendent, as a temporary measure, to inquire into the circumstances of each case, and to authorise the reeves to continue to mark for those persons whose cattle have been marked for some years although not legally commoners. They have also given instructions to the City Solicitor to afford every facility for determining the question by a legal decision.

— *CINERARIAS*.—We have received from J. P. KENDALL, gardener to H. L. HOLLAND, Esq., Templeton Gardens, Roehampton, a box of *Cineraria* blooms which were very fine, some of the blooms being over 3 inches across, of fine form and substance. The colours were very vivid and distinct, and consisted of the following:—puce, magenta, crimson, violet, mauve, rose, pink, cerise, &c. From the specimens Mr. KENDALL'S strain must be a very fine one.

— THE "ORCHID ALBUM."—The March number of this periodical contains figures of—

*Cypripedium Godefroye*, t. 177, lately figured by us.  
*Cattleya Mendelii* var. *Jamesiana*, t. 178.—A grand variety, with very broad rosy-lilac petals, and a frilled lip, with a bright magenta blotch, and a yellow throat, with radiating streaks of magenta.

*Angrecum Kotschyi*, t. 179, has racemes of numerous white flowers, each about 1½ inch across, and with very long pink spurs.

*Vanda suavis*, t. 180.—A good figure of a noble species.

— *PRIMULA POCULIFORMIS*.—The most important character of this *Primula*, leaving its botanical distinctness out of the question, is its perpetual flowering habit. When first described it was regarded as an autumn-flowering species; but, unlike its near allies, *P. cortusoides* and *P. Sieboldii*, whose flowering time is distinctly confined to a certain season of the year, this species, with ordinary greenhouse temperature and abundance of light, will flower continuously, as might be seen from a specimen in the Cape-house at Kew. The temperature there is kept as uniformly cool as possible without creating a draught, which seems perfectly to the liking of the plant in question. A number of scapes carry open flowers, while many more keep up a succession in all stages of development. It will keep perfectly well in a cold frame, and although not quite deciduous, like its allies, it does not flower in winter with this treatment. The plant is figured in the *Botanical Magazine*, t. 6582, and in these pages, January 27, 1883, and comes from the interior of China.

— GARDENING APPOINTMENTS.—Mr. C. SMITH, as Gardener to T. G. MASON, Esq., Ufford

Hall, Stamford.—Mr. W. KENDALL as Head Gardener to C. M. PALMER, Esq., M.P., Grinkle Park, Saltburn-by-the Sea, Yorkshire.—Mr. R. HENDERSON, late Foreman in the gardens, Alowick Castle, as Head Gardener to the Earl of TANKERVILLE, Chillingham Castle, Northumberland.

## NARCISSI FROM THE SCILLY ISLES.

WITH this I send you a collection of varieties from the Scilly Islands, which, with particulars enclosed, were intended for the inspection of the Floral Committee at the Royal Horticultural Society's meeting on March 10. Public interest will, I hope, be a sufficient apology for my troubling you on the subject.

Thanks for this collection is due to Mr. W. Trevelthick, Rocky Hill, St. Mary's, who is the largest grower on the islands, excepting only A. DORIEN-SMITH, Esq., Tresco Abbey, who writes:—"I have close on 300 varieties, all of which, with very few exceptions, seem thoroughly at home here. The soil is mostly light. I find the *Polyanthus* varieties do best in the lighter, the *Ajax* and *Poeticus* in the heavier. The only manure used is seaweed, of which, when the beds are made, I dig in a considerable quantity, well decomposed. The bulbs are covered with seaweed in the growing time: this keeps the ground moist and keeps down the weeds.

"The best beds are only a few feet above the level of the sea. I never noticed any peculiarity as to doubling or otherwise. The bulk of the varieties have been imported within the last eight years, but these have been longer than any of us can recollect *Narcissi* (I suppose) naturalised here—the principal varieties being *Scilly White* (*N. Polyanthus* named by Baker), *Grand Soleil d'Or*, a small variety of the *Grand Monarque*, *Biflorus*, &c. The blooming of imported bulbs is always earlier the second year than the first."

Mr. Trevelthick writes, "I send you a collection as per list of all the *Narcissus* varieties now in bloom (nearly forty) on St. Mary's Island. *Soleil d'Or* takes the lead here in cultivation, followed by two kinds of native, *White* and the *Grand Monarque*. All these kinds are supposed to have been on the island 200 or 300 years, and not very long since, before the rage set in for collecting these bulbs, could be found all over the island in hedges and ditches from the sea level to 150 feet above it. The soil is light and sandy; manure I never use, seaweed is used by many growers principally on the higher ground. In addition to the very high value set on our early naturalised sorts for market purposes in bloom, we anticipate a higher commercial value for our native bulbs, as no kind yet imported, including the *Pallidus precox*, blooms so early by more than a month. I may add that the market trade for the 'natives' commenced before Christmas, and the weekly supply to Covent Garden gradually increased to about 35,000 bunches of twelve blooms, which represent about half of the island's export, showing a total export of nearly one million blooms.

Account of Various Kinds of *Narcissus* sent herewith, and Grown in St. Mary's, Islands of Scilly.

Name.	When Imported, or how long known on Island.	Blooming.
<i>Soleil d'Or</i> .. ..	Probably 200 or 300 years ago, found growing about hedges, and thriving well.	From November onwards.
<i>Scilly Whites</i> ..		
<i>Early Scilly Whites</i>		

Imported Recently.—Blooming from January Onwards.

<i>Glorious</i>	Queen of the Netherlands
" minor	Paper-White
<i>Pallidus precox</i>	Silver <i>Soleil d'Or</i>
<i>Triquet</i>	<i>Narcissus Jonquilla</i>
<i>Orange Phoenix</i>	Staten-General
<i>Odorus</i>	<i>Flora onatus</i>
<i>Bazelman major</i>	<i>Incomparabilis sulphureus</i> ,
" minor	if opened out-of-
<i>Gladstone</i>	doors?
<i>Mozart</i>	( <i>Poly.</i> ) italicus, perhaps,
<i>Prince of Wales</i>	of <i>Bot. Mag.</i> , or
<i>Themistocles</i>	sub-albidus of
<i>Thomas Beccles</i>	Dutch catalogues
<i>La Belle de Normandie</i>	" <i>Laura</i> ? (in the way
<i>Marquis de Westrode</i>	of, not sure)
<i>Incomparabilis</i>	" <i>Laura</i>
<i>Daffodils</i> (various)	" <i>Mecurius</i>
<i>Grand Monarque</i>	" <i>Gloriosa</i>
<i>Imperator</i>	" <i>Newton</i>
<i>Isabel</i>	<i>Tweeta papiacius</i>
<i>Silver Phoenix</i>	<i>precox</i>
<i>Jaune Suprême</i>	<i>Pseudo-Narcissus</i> .

J. B. Thomas, Covent Garden.

## ORCHIDS FOR AMATEURS.

(Continued from p. 271.)

**VENTILATION.**—The necessity for ventilation has already been insisted upon, but the manner of ventilating an Orchid-house is of the first importance. The two objects to be effected should be kept in mind—the circulation and renewal of the air in the house and the regulation of its temperature.

Stagnant air is fatal to the well-being and, indeed, to the life of the plants, but the admission of cold air in winter would be equally fatal. Ventilators should be supplied close to the pipes, so that the air is well warmed in passing into the house. An abundance of warm vapour should be also supplied close to the entrance; the cold air condenses this vapour and is warmed thoroughly by the heat given off during the condensation. A tank of warm water, heated by the pipes, is by far the best means of warming the air as it passes into the house.

The admission of fresh air to the lower part of the house drives the warm air out between the laps of the glass, so that in cold weather ventilation from above may be well dispensed with; this is not the case, however, in warm weather—then overhead, and good overhead, ventilation is indispensable. One principal ingredient in the food of plants is the carbonic acid gas in the atmosphere; this exists in normal air to the extent of two parts in 10,000 of air, so that a house containing 2500 cubic feet contains just half a cubic foot of carbonic acid gas. Half a cubic foot of carbonic acid gas contains in round numbers 120 grains of carbon, and would make twice or three times that weight of wood, or about 240 grains of starch; but 400 or 500 plants would soon extract this from the air, if in healthy growth, so that the air must be renewed, or the plants will be underfed. In point of fact, fresh air is the only means of supplying the plant with its proper food.

I have already insisted on the necessity of air to enable the plants to give off moisture, so that it is clear that a proper circulation of air must be maintained both night and day. As plants only absorb carbon in the daylight, they need it then to supply them with food, and it is equally necessary at night to carry off surplus moisture.

In a hot moist stove in cold weather the cooling due to the glass maintains a circulation, but, as I have already observed, this is not the case in warm, close weather. For the purpose of lowering the temperature if the house becomes too warm, air must be admitted freely, but in cold weather this air must be warmed and rendered moist before it reaches the plants, or irretrievable harm will be done.

## NOVEL METHOD OF VENTILATING.

One of the most successful growers of Orchids in France, the Count du Buysson, has invented a specially ingenious method of admitting air in large quantities for the purpose of lowering the temperature of his houses, by means of which, he states in his work, *L'Orchidophile*, he is enabled to dispense entirely with watering his plants for months in the winter. I have not tried the plan, but it appears to be founded on sound scientific principles. The air from his ventilators is admitted through an enclosed tank kept three-parts full of water, which is warmed by the pipes. Under ordinary circumstances, when the external and internal ventilators in these tanks are open, only a moderate current of air, warm and moist, enters the house, but when he wishes to lower the temperature he attaches a short pipe about 18 inches long, bent at a right angle to the internal ventilator; the moist air rises in this tube as it would in a chimney, and so strong a draught is created that by opening a small ventilator in the roof the steam escapes, "as if a steam engine were at work within." Of course the steam is not hot—only warm, and it appears as vapour owing to the condensation due to the cold air outside. The plan seems so excellent that it is worthy of a fair trial in this country; as he observes, the plants are moistened with fine dew, and the air is set into rapid circulation and entirely renewed. This very afternoon my houses rose in temperature nearly 10° above the proper heat. I soon reduced the temperature by opening the ventilators, but could not help regretting that I could not apply the Count's method of ventilation, which would have rendered the air moist and refreshed the plants after their unexpected subjection to an atmosphere which was certainly far too warm, although, as it was not dry, I do not expect any harm, especially as the excessive temperature was due to the sun, and not to artificial heat. B. T. L.

(To be continued.)

## HOME CORRESPONDENCE.

**Melon Culture in Pots: Canker.**—I should advise Mr. Miles to discard his funnel-shaped zinc collars from the neck of his Melon plants, and pack good fibrous loam round instead, into which he will find the plants will root freely. I have fruited all our Melons in No. 2-sized pots for the past nine years, and never had the slightest trace of canker on a plant yet. I practise the earthing-up system from the first by sowing the seeds singly in 5-inch pots rather less than half filled with light loam, and as the plants progress add soil until the pots are quite full, packing lumps of loam well up round the stem of the plant. When they have filled these pots with roots, which they usually do by the time they are from 12 to 15 inches high, I plant them into their fruiting-pots, the latter two-thirds full of soil, and make it thoroughly firm. As soon as fairly rooted, and the roots show freely on the surface, I commence earthing-up, and add in small quantities until the pots are quite full and the fruits have finished swelling. The soil I use is a moderately heavy turfy loam without any admixture. In the earthing-up soil I sprinkle a little Clay's Fertiliser, which I find admirably suited for Melons, and never water with liquid-manure, but use warm clear water. I am always careful to keep the fibre of the loam packed well round the stems of the plants, and find roots are emitted almost as freely as is the case with the Cucumber plant. For bottom-heat we use fermenting leaves and dung, the pots standing firmly on low brick piers, which allows the heating material to be turned and renewed as the heat declines, or as often as necessary. We grow them equally well standing on shelves without bottom-heat, but the fruits are longer in coming to maturity. Through having a limited quantity of hot-water piping we are unable to keep up the high temperature usually considered necessary for Melons—60° to 65° at night being the highest we can command through the early stages, but make the most of sun-heat, especially when the fruits have commenced swelling, by shutting up early, raising the temperature to 70° or higher, with abundance of atmospheric moisture. We admit air only in small quantity, sufficient to prevent scorching until the fruits commence to ripen. We usually cut our first Melon not later than May 20 from seed sown the last week in January. C. H.

**Tritoma Flowers in Spring.**—From many parts of the country, and from Ireland, I hear of Tritoma having at present (in March) many spikes of flower. This seems due not only to the mild winter, but to the fact that Tritomas last summer flowered too early to be satisfied to go to rest, and at once started for a second crop of flowers. The mild winter has allowed these to come to a kind of morbid maturity, for they are poor and colourless, as well as unseasonable; still, there they are in abundance, many clumps here having as many as ten or twelve heads of flower. C. Wolley Dod, Edge Hall, March 3.

**Protecting the Blossoms of Fruit Trees on Walls.**—I do not wish to gainsay anything which your correspondent Mr. Douglas has advanced regarding this, at this season, interesting subject. I have had a system of protecting wall trees in practice, which I nevertheless consider has no equal for simplicity—certainly none for safety—and by the constant use of which I for many years never failed to secure large crops. The material I employed was Frigi Domo. This is a well known material, made of hair and wool, is blanket-like as a protector, yet comparatively light, not too pervious, and very durable. The system I followed in putting it into use was to fasten up iron rods as near under the existing copings of the walls as was possible—such rods being placed in strong eyed supports let into the wall, the rods being removable after danger was past. To the Frigi Domo, which is purchasable of any reasonable width, rings were attached and the pieces were then hung upon the rods, precisely as curtains are hung upon poles. For the larger trees I found two curtains necessary, as the trees averaged 12 to 15 feet wide, and the rods would not admit of the whole weight for the drawing of the rings. Thus, each morning the curtains were drawn-to, twisted together and tied to posts inserted upright in the borders, about 3 feet

from the base of each tree. Each evening they were replaced over the trees: the work was done in a few moments, light and air only being intercepted by a roll at every 12 or 15 feet, and the most severe wind or other frosts could not possibly enter to chill, without saying anything about freezing flowers or leaves. William Earley.

**Effect of Pruning: Pruned and Unpruned Vines.**—The facts announced by MM. Cassocia and Savastano, and reported at p. 314, are absolutely contrary to those observed in the south of France. There experience extends over an immense district, grafted Vines being there grown by the million. Long ago the produce of the grafted, as compared with that of the ungrafted Vine, was ascertained. No difference was perceptible. This is now received in France as an incontestable fact. The quantity of alcohol in the juice is in proportion to the sugar in the Grapes, and very often the wine is sold according to the alcoholic strength; that is to say, that a hectolitre of wine is sold for 2.50 or 3 fr. and more (according to circumstances), according to the alcoholic strength; wine having 10 per cent. alcohol selling, for example, at 30 fr., while if it contains 12 per cent. it brings 36 fr., and so on. Considering that the great merchants sell often 1000, 2000, or 3000 hectolitres, it is seen that the question of alcoholic strength (that is to say, the amount of sugar) is one of the greatest importance for them. The strength is estimated with care by well-known practical methods. In many southern Departments the French Vines are now grafted on to divers American Vines, to protect them against the Phylloxera. The American Vines are varieties of *Vitis aestivalis*, *V. cordifolia*, and *V. riparia*, or of hybrids between them. The grafts succeed well; there are even schools of grafting, with hundreds of students, and grafting competitions are established in many Departments. No doubt if the stock is badly chosen the graft does not develop well, and the produce is bad; but it is a fact that, in the South of France, grafted plants give quite as good results as those growing on their own roots. The results obtained on fruit trees, which immemorial practice indicates and recommends, are in fact of the same nature. Maxime Cornu, *Jardin des Plantes, Paris*.

**Gas-Lime for Gardens.**—Mr. Divers' communication (p. 249) shows that he is only partially acquainted with the nature of gas-lime, or with the fact that its effects are dependent on the way it is applied. Mr. Divers seems to think that because this lime spread on a road (the surface of which is not afterwards disturbed) kills weeds that are present and prevents others from growing, that the dressing I named will have a like effect on plants to be grown in land that has been so treated, but with this difference, that the lime and the surface with which it has been in contact have been mixed by digging with the body of the soil underneath. It appears strange that Mr. Divers could not see that the two cases are as far different as they well can be. Some who have used gas-lime in gardens have made mistakes through not being acquainted with the chemical change that takes place in it when spread out thinly, so as to be fully exposed to the air for a time—the necessity for which I was careful to mention. If in place of letting it lie thus the material is at once dug in it will injure any plant or seed that comes in contact with it. I have seen this mistake made by both farmers and gardeners, who, in some cases, were afterwards deterred from using it; whereas if treated in the way I described it will do all I said, and a good deal more, as it is one of the best materials that can be applied to the soil, especially where there is much humus present. In his first communication Mr. Divers cautioned amateurs against using it, saying that practical gardeners will know how to deal with it; yet it appears that all do not, or Mr. Divers would not have committed himself to an opinion that will provoke a smile from some of the many amateurs who I know use it, and know by experience the benefit their gardens derive from it. T. B.

**Narcissus calathinus.**—One name less in the terrible crowd of Narcissus names will be a crumb of comfort, however small, to bewildered gardeners, and perhaps we might do without this name "calathinus." Its use has been very vague and confusing. In the first index of the *Botanical Magazine* we are referred to three plates for it. Two of these belong undoubt-

edly to *N. odoratus*, which is said to have been the *N. calathinus* of Linnaeus; but the third, which is t. 1262, represents the short-cupped variety of *N. triandrus*. The description of it says that this is the *N. calathinus* of Redouté. I do not know Redouté's original figure, but it is reproduced in Burbidge's *Monograph of the Genus Narcissus* (p. 34), and corresponds, not with t. 1262 of the *Botanical Magazine*, but with t. 48, which is named *N. triandrus*. I have recently had some flowers sent to me which were gathered wild in Portugal; they are of a pale sulphur colour, and have the cup nearly as long as the reflexed segments of the perianth, as in t. 48 above mentioned. The forms of *N. triandrus* more common in cultivation have the cup shorter; but I observe that Mr. Baker, in his "Review of the Genus *Narcissus*," does not think this distinction important, so we may safely follow him in dropping the name *calathinus* altogether and using only *triandrus*. In fact the length of the cup in this species seems to be variable, being greatest in a form said to be found exclusively in the Isle of Drénec, not far from Brest. This form is rare in cultivation. Mr. W. Thomson, of Ipswich, some years ago, received seed of it from Brest, and has succeeded in rearing a few bulbs of it to flowering size; one of these he has presented to me, and it is soon going to flower in my greenhouse. It will be interesting to compare it with the flowers received from Portugal. Still, we must remember that the length of the crown or cup is the characteristic from which the different sections of the genus *Narcissus* receive their distinctive names, and it therefore may seem inconsistent to hold that any variations in length are in this species of but little importance. *C. Wolley Dod, Edge Hall, Malpas.*

**Early Flowering Alpine Plants.**—A good sized tuft of that charming and rare little alpine, *Ranunculus anemonoides*, is now in full blow, and well does it deserve the Windflower appellation, for the flowers both in size and form forcibly remind one of *Anemone palmata*. It is a plant of the easiest culture, succeeding well here in gritty loam, with a small admixture of peat. The flowers, which are borne in rich profusion, are white, suffused with violet internally, while externally they are rosy-pink. *Soldanella montana* is a little beauty. The deep almost sky-blue, bell-shaped flowers, surmounted on stems 3 or 4 inches long, are now very attractive, and from the finely divided petals they have a remarkably light feathery appearance, which still further adds to their beauty. No collection of alpine is complete without this gem, which is readily enough managed in a somewhat shady situation, amongst gritty leaf-mould. *Ethionema cordifolium* is flowering freely on the rockwork, and is one of the most attractive plants there at the present time. It evidently prefers a rather light, free soil, and good drainage—at any rate, these are the conditions under which it luxuriates here. It is a rare but pretty rock-plant from Mount Lebanon, with bunches of flowers resembling those of a small rose-coloured *Iberis*. Amongst the Saxifrages *S. Burseriana* was the first to open its pretty creamy-white flowers, these appearing ere the bleak dull weather of mid-winter had passed away. Some prefer the plant in the bud state, when the little pink rosettes borne on their ruddy flower-stems are certainly very attractive. The continuity of bloom in this plant is something remarkable, the flowers, which open slowly, remaining in good character for nearly a couple of months. The purple mountain Saxifrage (*S. oppositifolia*), a plant dear to all lovers of our native flora, is now becoming studded with its large and conspicuous pinky-purple flowers, these being shown off to the best advantage by the dark green, mossy-like foliage. Gritty rock and large stones amongst which the tender rootlets can roam at will is the secret, if there be any, of its successful cultivation. Another Saxifrage under the name of *S. orbicularis* is both showy and attractive the rosy or rosy-purple flowers, borne on stems of half a foot in height, being now in their glory. It belongs to the Megasea section, much resembling in foliage *S. purpurascens* and *S. cordifolia*. Three or four dozen clumps of the common Snow-drop, irregular in size, rising from amongst the now half-withered Fern fronds on a piece of undulating rockwork, are a treat not soon to be forgotten. The Daffodil season promises to be unusually early and of long duration, the Italian variety of *Polyanthus Narcissus* as well as our native *N. Telamonius plenius* being already in flower. Between *N. Pseudo-Narcissus* and

its near relative, the Tenby Daffodil, there is quite a race, both of which will be in flower in a week, the former probably first, soon to be followed by their pigmy brethren, *N. minor* and *N. nanus*. Hellebores of various kinds, notably *Antiquorum*, *Albin Otto*, *Olympicus*, *Willie Schmidt*, *guttatus sub-punctatus*, and the great Christmas Rose, *niger maximus*, have been very attractive. The latter especially has few equals, both for quantity and quality of flowers. Other plants worthy of notice at present are *Erica carnea*, *Arabis* of sorts, *Aubrietia Eyrei*, and *A. Campbellæ*, the latter from its procumbent habit and neat close growth being most desirable; *Scillas* of sorts, *Crocuses*, and the Winter Aconite. *Emergo.*

**Starting Imported *Lilium auratum*.**—Notwithstanding the large quantities of bulbs of *Lilium auratum* which find their way to this country, it still remains uncertain which is the best method of starting newly imported bulbs into growth. That it has been a puzzle to many in the past there is no doubt, and

only a dangerous practice, but is quite contrary to Nature; even though they may be placed in frames the fact cannot be overlooked that they are subjected to a variety of changes atmospherically, which may be beneficial to them, especially when we consider that few plants have a briefer resting period. In some cases they may be regarded as evergreen, for no sooner has the old flower-stems shown signs of decay than new roots are being formed below. But presuming everything to be in readiness when the bulbs arrive the safest means will be to place them in the soil without delay; before potting them, however, a careful examination of the bulbs is of the utmost importance, removing any bruised portions of scales, for if these are allowed to remain the bulb itself is in danger of decaying entirely. The bulbs are like Apples—they do not at once exhibit the injury inflicted in harvesting, sorting, and packing. Those whose experience extends over a few years will call to mind their aptness to rot at the base of the bulbs, and for which there is probably no cure. All that can be done is to cut away the bruised por-

FIG. 64.—SPAWN-THREADS OF THE POTATO FUNGUS ARISING (*ut videtur*) FROM A SCLEROTOID. (SEE F. 350.)

the many enquiries which have been made to myself personally on the subject of late leave no doubt but that that difficulty still exists. In my present note, I do not lay down any hard and fast rules as to how they should be started into growth, nor do I wish those who have been successful hitherto to depart from what they have found to suit their own case, but I wish to draw attention to some of the means which are employed and to which I am sure many of the losses and failures in the starting of imported bulbs of this Lily may be traced. Of the means employed the following are some which have come under my notice. After the bulbs are received some prefer to stand them on damp peat, and covered with leaves, others to cover them with damp moss, others I have seen in a mixture of silver sand and sphagnum moss, others place them in pots half-filled with soil, with the bulbs fully exposed, while others prefer to place them in boxes of cocoa-nut fibre till the new roots have made their appearance. For all ordinary purposes consistent with the safety of the bulbs the latter will be found not only the most simple but the most economical. To place a *Lilium* of any description on the surface of the soil with the bulb exposed seems to me not

tions, and dust with powdered charcoal. I do not recommend their being left in the boxes of cocoa-fibre till many new roots are formed, as these are so brittle as to get mostly broken in the potting. Perhaps one of the greatest difficulties to be met in starting this Lily into growth is that of watering. I have no hesitation in saying that water should never be given them till they have made from 4 to 5 inches of new growth, and this is the system I have found to give every satisfaction. In potting the most suitable soil to use is sandy peat, placing a little dry sand about the base of each bulb, the size of which will regulate that of the pots. Pot in the ordinary way, *i.e.*, to within half an inch or so of the rim of the pot. When completed they may be placed in cold frames in any cool quarters away from drip; they should then be covered with at least 4 inches of either coal-ashes, tan, cocoa-nut fibre refuse, or failing these short straw litter will answer the same purpose. Water in no case should be given them till the new growth is well above this covering, by which time all danger will be at an end, and the pots will invariably be found to contain a goodly number of roots, and the stem roots will at this stage be just protruding. *E. Jenkins.*

## Reports of Societies.

ROYAL HORTICULTURAL: March 10.

THE advancing springtide was manifested in the abundance of flowering plants furnished by horticulturists at this meeting, for besides some choice cut blooms and plants of Orchids, alpine plants, Narcissi, Cyclamen, and Camellias were in considerable numbers to be seen on the tables.

Scientific Committee.

Hon. and Rev. J. T. Boscawen in the chair. Present: Messrs. Grote, Michael, McLachlan, Pascoe,

Canestrini and Fanzago, of Padua, in 1876, under the generic name of *Chizonemus* (*Atti. Soc. Veneto-Trentina di Sci. Nat.*, vol. v., fasc. 1). The authors subsequently discovered that the name had been used by Cuvier for a genus of fishes, and accordingly changed the name to *Tarsonemus* (*ibid.*). Dr. Kramer, of Schlensingen, subsequently found the same creature, and described it independently under the name of *Dendroptus* (*Archiv. für Naturgesch.*, 1876, p. 197).

"The species appears to be identical with *Tarsonemus buxi*, which Professor Canestrini found in 1884 in great quantities on the Box trees at Venice and Padua, and which he says nearly destroyed the foliage of the trees of *Buxus sempervirens* in the Botanic Gardens at Padua. Professor Canestrini states that the mite burrows in between the upper and lower cuticles of the leaf, and eats out the whole of the parenchyma.

"In the instances of the *Mormodes* leaves the injury appears to have been chiefly affected from the exterior,

is printed in another column. Mr. Pim says that he has seen nothing to confirm Mr. Murray's contention that the protoplasm is outside the bodies. The "plasm" seems to correspond exactly with the original body in size and shape. Mr. Pim, however, doubts whether the bodies have any connection with the disease.

Professor Trail writes:—

"It is satisfactory to find that Mr. Murray no longer adheres, as in the report published in the *Journal of Botany* in December, 1883, to the view that no trace of a plasmodium was left after the action of nitric acid; but that, on the contrary, the protoplasmic substance found by others to remain after isolated 'sclerotets' were treated with nitric acid was found by him without difficulty and stained easily. But he continues:—'I failed entirely and absolutely to find the smallest evidence that the substance was contained in the body. The statement that it is so contained is the merest assertion. Obviously, if it were the case, it would suit Mr. Wilson's theory. If the protoplasm were outside it is equally obvious it would bear out my interpretation. I can prove that this is so.'

"As I had no theory either to defend or to combat, I sought simply to determine the nature of the bodies by independent and reliable tests, and these have led me to the conclusion formerly stated by me, that the protoplasm forms a mass within the oxalate of lime, though probably the latter is partially embedded in, and not merely adherent to, the surface of the protoplasm. This conclusion is based upon the following reasons:—The protoplasmic residuum is so considerable after removal of the oxalate, that if it formed a coat outside the latter, as Mr. Murray supposes it does, it would be visible along the edges of the body without requiring the use of iodine. Again, were it merely part of the contents of the Potato-leaf cell, accidentally adhering to the mineral mass, we could scarcely suppose that the outline of such protoplasm would continue so definite, not showing any tendency to dissolve in the surrounding fluid; and, were the protoplasm such a mere coat, it would surely be possible, after solution of the oxalate, to detect the cavity in which the latter lay; but in the numerous bodies that I have examined carefully under varied conditions no such appearance has ever presented itself. The changes produced by nitric acid, and the appearance of the body after it has ceased to act, are admirably exhibited in Mr. W. G. Smith's figures published last year in the *Gardeners' Chronicle*, Dec. 13, 1884.

"In reference to Mr. Murray's experiment of using iodine to demonstrate the external protoplasm on a 'sclerotet' which has been isolated merely, without solution of the oxalate, it is only what might be expected, that a 'delicate colouring' should be observed, due in part probably to the protoplasm imbedding the inner ends of the particles of the oxalate, and in part, it may be, to a little of the contents of leaf-cells (of which many are necessarily torn in dissecting out the bodies) adhering to the surface.

"As to the internal structure of the uninjured 'sclerotet' and its behaviour with iodine internally I am ignorant, simply because the bodies are absolutely opaque while uninjured, except along the extremely narrow margin. I cannot see that Mr. Murray's test in any way throws light in the direction indicated by him. There seems no cause for regret that the nature of the 'sclerotets' is being fully discussed, even were it the case that 'a deal of trouble might have been saved, but for the assertion that the oxalate of lime contained a central mass of protoplasm.' In regard to what may be called the historical side of Mr. Murray's report it is undoubtedly of interest to those even who do not find themselves able to accept it as decisive. Before it could be held that 'sclerotets' are 'intrinsic products of the Potato plant' it must surely be proved that they are of still greater constancy than any evidence yet warrants us to assume. Systematic and extended inquiries by Mr. Murray and others, so situated as to be able like him to pursue them, cannot fail to be of much value. Another line of investigation worth working, would be the examination of Tomatoes and any other plants attacked by *Phytophthora infestans*, to learn whether 'sclerotets' are found in them also, and the conditions under which they occur."

Mr. Stephen Wilson writes:—

"I have critically examined nearly a hundred of these bodies, and have seen nothing to suggest the inference that the lime is in the interior of the ball. I have run in iodine, as Mr. Murray has done, and its contact with the body reveals nothing whatever which is not equally well seen without it. But the lime being in the condition of crystals, necessarily presents a rugged outline. Where the crystals are not seen superposed, they are partly translucent, and this translucency, along with the rugged outlines, presents a border which is optically clearer than the more opaque interior of the field, and this clearer border has somewhat the appearance of plasm. But when the process of solution is watched closely, the points of the crystals and the outer crystals themselves, are seen dissolving, before the 'clear definite outline' of the plasmodial body emerges from the eclipse. The lime is seen beyond the 'clear definite outline,' but the 'clear definite outline' is not seen beyond the lime. The definite outline is seen without any reagent after solution of the lime; and if it is outside the lime it should be equally seen before solution, without iodine or any other reagent, which it certainly is not.

"The measures given in my first paper show that the lime ball is larger than the plasmodial ball.

"By focussing with a high power, while the crystals are dissolving, it is seen that the vanishing fragments in the centre of the field are nearer to the eye than the

FIG. 65.—GNAUR IN TAXODIUM SEMPERVIRENS.

Smee, Murray, Ridley, Beddome, Lowe, Wilson, and Masters.

### DISEASED LEAVES OF MORMODES.

Mr. Michael reported as follows on the leaves of *Mormodes* submitted by Mr. Smee at the previous meeting:—

"I have to report that I have examined the injured leaves of *Mormodes* received from Mr. Smee. I was not able to detect any creature within the gall-like swellings, but I found on the under-surface of each affected leaf a number of extremely minute Acari, in all stages of development, except adult males. The Acari were usually in the affected parts; they all belonged to the same species, and are very difficult to discover, being minute, colourless creatures, about  $\frac{1}{100}$  inch long, and narrow in proportion to their length. In spite of their small size, I believe them to be the cause of the injury. They belong to the genus *Tarsonemus*, which was originally described by Professors

and the leaf to have swollen after the wound, so as to form a gall-like body. The Italian Professor states that the Acari most readily attack leaves which have already been injured by insects. I did not find any trace of this with the *Mormodes* leaves. It appears to me that the original injury to these plants had probably been effected while the leaves were quite young, but showed more as they grew older.

"I found a species of the same genus in the Midland Counties of England last year, in considerable numbers, burrowing under the cuticle of the common Burdock."

### SCLEROTICIDS OF POTATO DISEASE.

Communications on this subject were read from Mr. Greenwood-Pim, Prof. Trail, and Mr. Wilson. A further communication, with sketch, was sent by Mr. Worthington Smith, but by some mishap did not arrive till after the close of the meeting; but to make the record complete, Mr. Smith's communication, of which a copy was also forwarded to us with the woodcut,

optical edges of the definite outline, and therefore upon the outside of the ball. Mr. Smith and I have given independent drawings exactly corresponding (*Gardeners' Chronicle*, December 13, 1884, p. 757). Has Mr. Murray given any?

"Mr. Murray makes the inference that the plasmodial ball is 'the remains of the original cell-contents of the Potato leaf in which the oxalate of lime body was formed, adhering to it over the surface.'

"These bodies are not formed in the cells of the Potato leaf, but lie in the intercellular passages, through which their mycelium runs on germination. Others have called these bodies protoplasm, but my own observations seem to me to justify the inference that they consist of fungoid plasma and short lines of mycelium. I have seen some of these lines extending nearly a fourth part across the ball. Then Mr. Murray wants to take the conceit out of me as to priority of discovery. He quotes Dean Buckland, as asking Robert Brown regarding certain Potato leaves, whether the 'affection' they showed was that of the Potato disease. I have always contended that these parasitic balls were to be found in the undiseased tissues, where they lie in a state of incubation. Along with the host plant they furnish a good example of symbiosis. Now, if Robert Brown referred to these bodies at all, he suspected that they were foreign to the real tissues of the plant, and in some way connected with the Potato disease. And if he did not refer to them, where is the relevancy of this reference? That Mr. Murray has found these bodies in ancient Potato plants from the herbarium of Sir Haos Sloane was what I should have predicted. Mr. Thielton Dyer is of opinion that the disease has always been 'hanging about' the Potato. Mr. Baker, a member of this Committee, is of opinion that 'Any plant brought to the tuber-bearing state is in a diseased unhealthy condition.' But perhaps it may be found that this is simply putting the cart before the horse; and that in the case of the Potato plant we should have no tubers at all except for the inroad into its tissues of the *Peronospora infestans*. I annex illustrations."

Mr. Worthington Smith's communication (which was not read at the meeting, for reasons before stated), is as follows:—

"When Mr. A. S. Wilson published his paper in the *Gardener's Chronicle* for October 7, 1872, I wrote at once (October 28) to say that the bodies he had described 'had been familiar to me for many years.' At that time I thought I had myself seen *Peronospora infestans* arising from bodies similar to Mr. Wilson's in autumn.

"The chief point of interest does not centre in the presence of oxalate of lime, which is not invariably present. The question is, 'Does the Potato fungus ever really and truly arise from the bodies described by Mr. Wilson?' Mr. Wilson has stated in the most detailed and emphatic manner that it does, and I acknowledge that Mr. Wilson's view has support from what I have myself seen.

"The accompanying drawing (fig. 64) is from a mounted microscopic preparation given to me in 1882 by Mr. Wilson. It shows, enlarged 100 diameters, one of the plasmodium-like bodies, A, naturally divested of its oxalate of lime. Springing from this body is an excessively attenuated mycelial thread, which rapidly increases in diameter at H to ten times its first diameter as seen near the ball of protoplasm. This basal part of the preparation is further enlarged to 400 diameters at B, to show the extreme tenuity of the mycelial thread and a fold in the feeble cell wall of the ball of protoplasm. The nature of this first mycelial growth, A, H, C, may be compared with the familiar pro-mycelium, and from it at D, E, F, G, numerous conidiophores of *Peronospora infestans* arise.

"The example is in fluid, and the whole basal part moves freely too and fro from the elbow at H, but constant movement has had no effect in detaching the ball.

"The explanation of this growth may be that in the autumn the tubers belonging to diseased Potato plants contain the plasma of *Peronospora infestans* in a free state, or in the state so familiar to us in zoospores. It is there resting, and in this resting condition it is carried up into the stems and leaves of the Potato plant in the process of the Potato plant's growth. The presence of the fungus plasma excites the production of oxalate of lime in the cells of the Potato plant. When the next autumn arrives the plasma, which till then had been resting, renews its vitality, bursts through the coating of oxalate of lime (when there is one) and reproduces the *Peronospora*.

"Martius in his *Die Kartoffel Epidemie*, 1842, pl. iii., figs. 19, 23, and 24, has illustrated a peculiar growth in Potatoes similar as I think with Mr. Wilson's so-called encrusted plasmodia. Martius has shown these bodies in a germinating state. I have said in the *Gardeners' Chronicle* that Martius' spurious Protomyces may be similar with Mr. Wilson's bodies. Mr. Plowright has expressed the same opinion. I regret therefore to notice that Mr. Murray has stated in the current number of the *Journal of Botany*, that I originally determined Mr. Wilson's bodies to belong to Protomyces. I did nothing of the sort.

"As *Peronospora infestans* is known to be a South American fungus which preys upon the Potato plant in Chili, the home of the Potato, no one need feel surprised in finding evidence of its presence in old herbarium examples of Potato foliage."

Mr. Murray expressed his gratification that Prof. Traill accepted his observations. Prof. Traill tenders no direct evidence, however, as to the existence of a protoplasmic body within the oxalate of lime. Mr. Murray respectfully pointed out that the onus of proving this lies with him as the author of the statement, and

that satisfactory evidence can readily be obtained by cutting through the so-called "sclerotet" and demonstrating the contents, if any.

#### MISCELLANEOUS EXHIBITS.

Mr. G. F. Wilson showed a cut spike of the lovely *Phaius tuberosus* which he had grown in a close house, kept at a temperature of 65°–70°. Mr. Webster, The Gardens, Gordon Castle, sent a fine example of a gnar in *Taxodium sempervirens*, like that figured at fig. 65, being the largest example of the kind we have seen. It is impossible to state the cause with certainty, but probably it arises from injury to the radicle at a very early stage of growth. Mr. Vaaner showed two Orchids with supplementary lips, showing that the flowers were on the way to become double. Mr. Greenwood-Pim sent a branch of Privet with short stout spiny branches (see fig. 66). Mr. Boscawen showed flowers of the true *Anemone fulgens*, and flowers of *Rhododendron fulgens* and *Iris stylosa*. Mr. G. F. Wilson showed flowers of *Tulipa biflora* with numerous flowers on the scape. Dr. Masters showed drawings of a double flower of *Dianella coerules*, in which the ovules were petaloid—the first instance, it is believed, of a similar malformation occurring in Monocotyledons. The plant is the *Dianella congesta* of Robert Brown, and was forwarded by Baron Sir Ferdinand von Mueller.

#### Floral Committee.

Present:—Shirley Hibberd, Esq., in the chair; and Messrs. G. F. Wilson, J. Walker, H. Bennett, J. Douglas, J. Fraser, H. Herbst, J. Hudson, T. Hill, J. Child, W. Wilks, J. Laing, H. Turner, W. Bealby, J. Dominy, H. M. Pollett, T. Baines, W. Kellock, H. Cannell, J. Smith, J. O'Brien, J. James, H. Ballantine.

Mr. Ballantyne, gr. The Dell, Egham, showed a fine form of *Clivia* named *Schroderia*, in which the petals were of much substance, nicely rounded, and of sufficient breadth to make a regular close bloom; the colour a fine brilliant scarlet, and base of flower yellow, with anthers of the same colour. Two other seedling forms were shown by him of inferior merit, but that would have been thought good flowers a short time ago. From the same gardens came *Odontoglossum gloriosum*, an exceptionally fine massive spike, with closely set blossoms; an *Odontoglossum* apparently identical with *O. multus*, having an orange ground dotted over with brown spots of a great size, and a labellum of which the lower half was yellow, and the upper of a brown colour. In the same group was noticed *O. Wilkeanum* Godefroye, a handsome flower of yellow ground colour densely spotted irregularly with crimson-brown.

Messrs. J. Veitch & Sons, Chelsea, showed a fine panful of the sweet-scented *Boronia megastigma*, *Rhododendron delicatum*, a beautiful rose-coloured greenhouse variety; *R. cardinale*, of the same section, of a bright crimson colour, with a good quantity of bloom; *Azalea* Paul Schryver, a single purplish-rose; *Cypripedium Sedeni* candidum, a fine variation on *C. Sedeni*, one of its parents, the colours being paler and purer, and the caudal wings much longer; *Carnation* Sir C. Wilson, a dark crimson, full bloom, with acutely serrate petals; *Cydonia japonica nivea*, and *Crocus* King of Blues, a regularly formed flower of robust habit and fine new hue. C. John Bright, that was also shown, was very similar in colour and general aspect.

Mr. W. Bull, The New Plant Nursery, King's Road, Chelsea, had a rather extensive collection of plants, including several Palms, &c., several *Odontoglossums*, as *triumphans*, *O. crispum* Lehmanni, of good form and substance, with two brown spots on the labellum; *O. Wilkeanum*, *O. decorum*, *O. sceptrum*, in which the intense and thickly placed brown blotches almost hid the yellow ground colour; a good plant of *Cypripedium Warneri*, a beautiful panful of the seldom seen *Griffinia hyacinthina* of coerulean-blue in largish corymbs, a great pan of the gorgeous *Hæmanthus Kalbreyeri*, a specimen of *Clematis indivisa lobata*, nicely bloomed; a large and a small plant of *Dendrochilum glumaceum*, receiving a Vote of Thanks for these two last-named; and several *Calanthes*, a *Camellia*, *Madame Cachet*, a prettily formed white flower, occasionally striped with rose; and *Dendrobium nobilissimum*, or *nobilium*, a handsome flower, with much purple colour in the sepals and petals; a small plant of *D. crassinode alba* and *Saccolabium ciliolare*. A Silver-gilt Banksian Medal was awarded Mr. Bull for this group.

Mr. H. Adams, gr. to R. B. Lemon, Esq., Moatbridge, Beckenham, showed *Oncidium Brunleesianum*, a plant bearing primrose-coloured blooms, having a velvety-chocolate lip, the sepals and petals semi-translucent, and projecting forwards into a tube instead of spreading, as in most *Oncidia*—both curious and striking. H. M. Pollett, Esq., Farnside, Bickley, showed two forms of *Miltonia cuneata*, one having much larger flowers than the other, and a trifle more pale purple in the tube; *Odontoglossum Sanderianum* and *blandum*; and the curious *Epidendrum xanthinum*, so rarely seen, and, at first glance, more like a Composite than an Orchid.

From Messrs. Shuttleworth, Carder & Co., 191, Park Road, Clapham, came *Odontoglossum asperum* and *O. Humeanum*, a variety evidently of *O. Rossi* major. M. Godefroy-Lebeuf, Argenteuil, France, showed *Cypripedium Salieri* x *C. insignis*, and *C. villosum*, and was awarded a Vote of Thanks for the same; *Dendrobium*

*endocharis* x *D. japonicum*, and *D. heterocarpum*, white, with rose-coloured throat, the specimens being well bloomed and dwarf in habit. He likewise sent *Pleurothallis Roezlii*, and the minute white-flowering *Epidendrum macranthum*. Mr. G. Gaiger, gr. to T. Whitehead, Esq., Burton Close, Bakewell, showed a fine *Lycaste Skinneri* of good size and colour, and bearing a score of blooms fully open, for which he was awarded a Cultural Commendation and a Vote of Thanks. D. B. Crawshaw, Esq., Rose field, Sevenoaks, had several fine-bloomed *Cattleyas*, a *Warszewiczii* carrying four flowers, another with three of a paler colour, and a pretty *C. Trianae* rosea with a labellum of medium size, and a deep yellow throat, for which he obtained a Vote of Thanks. From the nursery of Mr. H. James, Lower Norwood, came *Cattleya Trianae*, var. *Jamesiana*, very large lilac sepals and petals, the rich purple lip having a thin line of white on its much crimped edge; it was well perfumed, and had been bought for C. Gaskelliana. He had also an *Odontoglossum cirrosum*, in which the spottings were brown instead of black.

Messrs. Barr & Sons, Covent Garden, exhibited a fine collection of *Narcissus* and other spring-flowering bulbs, and was awarded a Bronze Banksian Medal. Messrs. T. S. Ware, Tottenham, and W. Paul & Sons, of Waltham Cross, each staged a choice collection of hardy herbaceous and alpine flowers, and were respectively awarded Bronze Banksian Medals, the latter nurserymen putting up twelve boxes of cut blooms of *Camellias*, among which were a few new ones and the best of our old varieties. They contributed a group of nicely flowered *Camellias* in pots, ranging from 2 feet to 5 feet in height. For the *Camellia* blooms a Silver Banksian Medal, and a Silver-gilt Medal for the group of *Camellias*, were awarded.

Two groups of *Cyclamens* were staged by H. B. Smith, Hanwell and Ealing, and B. S. Williams, Holloway, respectively. Mr. Smith's collection consisted of between 300 and 400 plants, and had a telling effect; some of the colours were very brilliant, and the size and quality of the blooms all that could be desired. Mr. Smith was awarded a Silver-gilt Banksian Medal by the Society. Mr. Williams' collection was hardly so large, but the strain was equally good, and, if anything, more floriferous. He was awarded the Bronze Banksian Medal. A splendid group of *Cinerarias*, consisting of between seventy and eighty fine dwarf grown plants, was staged by J. James, Farnham Royal, Slough; the colours were rich and vivid, while the form of the flower and the habit of the plants left nothing to be desired. He was awarded the Silver-gilt Banksian Medal and a Commendation for the strain.

Messrs. Carter & Son, High Holborn, staged a showy basket of *Amaryllis* (*Valotta*) *purpurea*, and a *Chrysanthemum*, *Ceres*. J. King, Rousham, Aylesbury, showed a box of seedling *Primulas*, and was awarded a Vote of Thanks. B. Clark, Esq., F.L.S., &c., showed one-year old roots of Gobo plants, a Japanese form of the common Burdock, with a sheet of remarks about them. The roots, when cooked, proved to be not unlike Salsify, but require further improvement.

From the Society's Garden, Chiswick, Mr. Barron brought a few early-flowering rock plants, as *Saxifraga sancta* and *oppositifolia pyrenica*, *Soldanella alpina*, *Cyclamen Atkinsii*, and the useful greenhouse plant *Hebecladium laetianum*. Mr. Charles Turner, Slough, showed a quantity of *Violet Welliana*, strong, finely-flowered plants. Dr. Acton, Kilmacurragh, Co. Wicklow, had some single and double *Camellias*, grown in the open air, wonderfully full of buds and bloom. Mr. J. Crawford, gr. to Colonel Thorpe, Coddington Hall, Newark, sent *Comte de Brazza* and the old Neapolitan *Violets* for comparison, the latter carrying off the palm for scent. Messrs. Cannell & Sons, Swanley, received a Vote of Thanks for some capital heads of zonal *Pelargonium* blooms; showing also well done home-grown *Spirea japonica*, and fine *Cineraria* blooms.

#### FIRST-CLASS CERTIFICATES.

To Mr. Pollett, for *Miltonia cuneata*.

To Messrs. J. Veitch & Son, for *Cypripedium Sedeni* candidum.

To Messrs. J. Veitch & Son, for *Rhododendron cardinale*.

To Messrs. J. Veitch & Son, for *Crocus*, King of the Blues.

To Mr. Ballantyne, for *Odontoglossum Wilkeanum*.

To Mr. Ballantyne, for *Clivia Schroderi*.

To Messrs. Barr & Son, for *Lachenalia*, Aldborough Beauty.

To Mr. Adams, for *Oncidium Brunleesianum*.

#### Fruit Committee.

Present:—Harry Veitch, Esq., in the chair; and Messrs. J. Lee, Harrison Weir, J. Woodbridge, W. Deany, S. Ford, T. F. Rivers, G. T. Myles, J. Willard, W. Paul, J. Burnett, A. Sutton, J. Roberts, Dr. Hogg, G. Goldsmith, G. Paul, T. B. Haywood, J. Ellam, G. Bunyard, C. Silverlock, R. D. Blackmore.

#### APPLES.

There were three collections of Apples staged, viz., from Mr. S. Ford, gr., Leonardale, Horsham, which was decidedly superior to the others, and contained some superb examples, many of them as plump and firm as the day they were gathered; prominent in this collection were several varieties that one seldom can keep in good condition after Christmas, such as *Mère de Ménéage*, *Hoary Morning*, *Wadhurst Pippin*, *Cox's Orange Pippin*, and several others. Bess Pool, Alfriston, Emperor Alexander, Golden Noble were also very fine.

Mr. Ford contributed between forty and fifty dishes, and received a Silver Banksian Medal. T. Rivers & Sons, Sawbridgeworth, staged between eighty and ninety dishes of fine fruits, but they had not kept so well as those in the Leonardslee collection; King of Tomkins County, Lord Burghley, Blenheim Orange, Dumelow's Seedling, Kentish Gilliflower, Baxter's Pearmain, Sutton's Beauty, Wagener, Bailey's Sweet, and others were amongst the finest. Mr. P. Middleton, gr., Wynstay, Ruabon, staged a small collection, but the fruits were for the most part in rather a shrivelled condition. Mr. Thrower, High Canons, Burnet, exhibited a dish of Apple High Canons. Single dishes were also exhibited by A. Outram, 7, Moor Park Road, Fulham, and S. Ford. A good dish of Catillac Pears was exhibited by G. Lambert, Oakwood Gardens, Chichester.

## The Weather.

- March 5.—Dull day; very fine night.  
6.—Dull day; rain falling from 3.30 P.M.  
7.—Dull morning; very fine afternoon and night.  
8.—Fine day; darkness from 11 A.M. to noon; brighter afterwards.  
9.—Very fine day; dull night.  
10.—Fine dull day and night.  
11.—Fine dull morning; fine bright afternoon.

LONDON: Atmospheric Pressure.—During the week ending March 7, the reading of the barometer at the level of the sea increased from 30.04 inches at the beginning of the week to 30.18 inches by 9 A.M. on the 1st, decreased to 29.44 inches by 9 A.M. on the 4th, increased to 29.57 inches by 9 A.M. on the 5th, decreased to 29.27 inches by 9 A.M. on the 6th, increased to 30.04 inches by 9 A.M. on the 7th, decreased to 29.97 inches by 1 P.M. on the same day, and was 30.04 inches by the end of the week.

The mean reading of the barometer for the week was 29.74 inches, being 0.18 inch lower than last week, and 0.33 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 53° 2, on the 4th; the highest on the 7th was 41° 3. The mean of the seven high day temperatures was 48° 3.

The lowest temperature was 27° 9, on the 7th; on the 4th the lowest temperature was 39°. The mean of the seven low night temperatures was 33° 3.

The greatest range of temperature in one day was 19° 5, on the 2d; the smallest was 10° 3, on the 3d. The mean of the seven daily ranges was 15°.

The mean temperatures were—on the 1st, 39°; on the 2d, 38° 1; on the 3d, 39° 5; on the 4th, 45° 4; on the 5th, 43° 7; on the 6th, 38°; on the 7th, 33° 6; of these the 4th and 5th were above their averages by 4° 9 and 3° 2; the rest were below by 1° 3, 2° 3, 1°, 2° 5, and 6° 9 respectively.

The mean temperature of the week was 39° 6, being 5° 8 lower than last week, and 0° 8 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 113°, on the 1st. The mean of the seven readings was 94° 8.

The lowest reading of a minimum thermometer with its bulb placed on grass was 22° 6, on the 7th. The mean of the seven readings was 29° 6.

Rain.—Rain fell on three days, to the amount of 0.67 inch, of which 0.40 inch fell on the 3d, 0.21 inch on the 6th, and 0.06 inch on the 1st.

ENGLAND: Temperature.—During the week ending March 7, the highest temperatures were 56° at Truro, 55° at Cambridge, 53° 5 at Plymouth; the highest at Sunderland was 46°, at Preston 48°, and at Bradford 48° 6. The general mean was 51° 2.

The lowest temperatures were 23°, at Cambridge, 26° at Hull, and 26° 2 at Wolverhampton; the lowest at Plymouth was 35° 5, at Truro and Brighton 33°. The general mean was 29° 6.

The greatest ranges were 32° at Cambridge, 26° 9 at Wolverhampton, 25° 3 at Blackheath; the smallest ranges were 16° at Sunderland, 17° 3 at Liverpool, and 18° at Plymouth, Leeds, and Preston. The general mean was 21° 6.

The mean of the seven high day temperatures was highest at Truro, 51° 8, at Plymouth 49° 8, at Blackheath 48° 3; and was lowest at Bolton and Sunderland, 42° 8, at Bradford 43° 3. The general mean was 45° 6.

The mean of the seven low night temperatures was highest at Plymouth, 40° 5, at Truro 38° 1, at Brighton 37° 2; and was lowest at Hull, 31°, at Wolverhampton 31° 4, at Cambridge 31° 5. The general mean was 34° 1.

FIG. 66.—SPINY BRANCHES OF PRIVET.

The mean daily range was greatest at Cambridge, 16° 1, at Blackheath 15°, at Truro 13° 7; and was lowest at Liverpool, 8° 7, at Preston 9° 2, at Plymouth 9° 3. The general mean was 11° 5.

The mean temperature was highest at Plymouth, 44° 4, at Truro 44° 3, at Brighton 41° 4; and was lowest at Hull, 36° 5, at Bolton 36° 7, at Sunderland 36° 8. The general mean was 39° 1.

Rain.—The largest falls were 1.18 inch at Hull, 1.04 inch at Bolton, 1.02 inch at Brighton; the smallest falls were 0.24 inch at Wolverhampton, 0.30 inch at Nottingham, 0.51 inch at Bristol. The general mean fall was 0.71 inch. Rain fell on every day in the week at Nottingham.

SCOTLAND: Temperature.—During the week ending March 7, the highest temperature was 47° 9, at Paisley; at Greenock the highest was 44° 5. The general mean was 46° 6.

The lowest temperature in the week was 26°, at Glasgow; at Aberdeen the lowest temperature was 31°. The general mean was 29° 2.

The mean temperature was highest at Glasgow, 38° 2; and lowest at Greenock, 37° 1. The general mean was 37° 7.

Rain.—The largest fall was 0.69 inch, at Perth; the smallest fall was 0.04 inch, at Glasgow and Paisley. The general mean fall was 0.34 inch.

JAMES GLAISHER, F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, March 9, 1885; issued by the Meteorological Office, 116, Victoria Street, London, S.W.:—The weather has varied considerably in different parts of the kingdom. Over northern England a good deal of rain has fallen, and at many of the Scotch stations some snow showers, while over Ireland, the south-west of England, and the west of Scotland it has been comparatively dry.

Temperature has been equal to its normal value in the "Channel Islands," but from 1° to 3° below elsewhere. The maxima, which were registered in most places on the 4th, varied from 48° in the north and east of Scotland and the north-east of England, to 57° in the Midland Counties. The minima were generally recorded on the 7th or 8th, and ranged from 23° in the Midland Counties to 29° in "Scotland, E.," "England, N.E.," and to 37° in the "Channel Islands." On the grass the minima were, of course, much lower, that in London during the early morning of the 8th being 15°.

The rainfall has been about equal to, or rather less than the mean over Scotland, Ireland, the south-west of England, and the "Channel Islands," but more elsewhere. In "England, N.E.," and "England, N.W.," the excess was large.

Bright sunshine has been rather more prevalent than it was last week in most districts, the percentages varying from 14 in "England, N.E.," to 36 in "England, S.W.," and 41 in "Ireland, S."

Depressions observed.—The changes in the distribution of pressure have been frequent and irregular. At the commencement of the period readings were highest on the Continent, while a depression was approaching Ireland from the Atlantic. On the 4th this disturbance, in conjunction with a small subsidiary depression which had formed over the Channel, resolved itself into a band, or trough, of low pressure stretching from Ireland to North Germany. By the 6th these conditions had disappeared, and an area of low pressure, having two distinct minima, was moving eastwards over the North of France. As this disturbance travelled away the barometer rose quickly and an area of comparatively high readings lay over Ireland, England, and the north of France, while a depression was moving eastwards over the north of Scandinavia. As the week drew towards its close the highest pressure was becoming established off our north-west coasts, while depressions had begun to appear over the Bay of Biscay and France. Under these conditions the winds have varied considerably. At first they were fresh or strong between south-east and south, and on the 4th easterly in the North and south-westerly in the South, while during the remainder of the period they were generally from points between north-west and north-east.

## Answers to Correspondents.

\*\*\* Numerous communications are unavoidably postponed.

DOUBLE-SPATHED CALLA ÆTHIOPICA: S. Grassing. It is not at all uncommon in these plants, and so far the doubling has not been fixed by seed, and only occasionally by dividing the plants throwing double spathes.

GRAPES: W. T. The sorts you name will succeed in the same house; all late keepers are profitable kinds to keep the longest. Black Hamburg will sometimes keep good till the New Year with care, but it is not to be relied on as a long keeping variety.

INSECT: Camjee. Dytiscus marginalis, common English water-beetle; the larva is destructive to plant roots.

MUSHROOMS FAILING TO GROW: J. W. M. Your shed ought to grow any quantity of Mushrooms, and there has been improper treatment somewhere, or the spawn was untrustworthy. Get Wright's Mushrooms for the Million, and adhere to the plain directions there given, and you will succeed. The book is to be had at the Journal of Horticulture Office, 171, Fleet Street, London.

MUSHROOMS: W. H. The kind is quite right, and the produce you forwarded is very heavy and well grown. From a check at a particular stage of growth, the gills are distorted into wavy lines.

NAMES OF PLANTS: G. Slater. Lycaste Skinnerii, pale coloured, large-sized var.—R. S. Newell. Acacia cultriformis; Poinciana regia.—Wexham. Myrsiphyllum asparagoides.

ODONTOGLOSSUM CRISPUM: J. Bayliss. It is a very fine flower, of unusual size, with handsome markings, giving it a distinct character as a variety of crispum.

**PAY IN MARKET GARDENS, &c.:** *Adscriptus gleba.*  
The pay will depend on knowledge of the business and capability, a beginner not getting more than 8s. or 9s. per week, unless he be strong and a good spadesman, when he might at piecework earn from 30s. to 40s. per week. To get a situation, make a personal application to a market gardener doing a good business, or advertise in a gardening paper—or, still better, in the local paper that has a circulation in a gardening district. Book, *London Market Gardens*, by C. W. Shaw, published at 37, Southampton Street, Strand.

**PRIMULA BLOOMS:** *D. C. P.* The blooms are very unusual as to form, and with regard to the eye very distinct. The crimped form of petal, and its serrated margin, convey the idea at first sight of the blooms being double. It is worthy of perpetuation should the habit prove a good one.

**PRUNING DENDROBIUMS.**—"J. S. W." protests against "T. B.'s" misrepresentations, and states that it is "a safe and proper practice to remove three, four, or five year old back bulbs of certain species." "J. S. W." also says that from experiment he has found that plants continue to grow for several years in succession with the whole of the back bulbs removed, but he does not make it a general practice to do so, nor advise others to do it without experiment. A correspondent, whose address we are at liberty to give on application, writes to say that he will be unable to exhibit at South Kensington, but that he has some three dozen plants of *Dendrobium nobile*, some of which have as many as four dozen growths, some 3 feet long, blooming at from twelve to fourteen nodes at the base of as many green leaves. Our correspondent does not assert that the system suits all *Dendrobiums*, but judging from his own statement he had great success with *D. nobile*.

**SULPHIDE OF POTASSIUM.**—In reference to Mr. Tonks' letter (p. 276), advocating the use of this chemical as an extirpator of mildew and other hurtful fungoid growths, red-spider, &c., we find some of our correspondents have tried to obtain this chemical and have been unable to get it. We, therefore, direct attention to the advertisement in another column, giving the address of the makers of the sample of sulphide of potassium which Mr. Tonks found so effectual. It will be seen that a supply of the chemical sufficient to make 32 gallons of solution of the proper strength for use on plants can be obtained, post-free, for 1s. Should an extended use of this inexpensive substance prove it to be as effectual as Mr. Tonks has found it, its value to gardeners cannot be over-estimated. A chemical friend informs us that its value in all probability depends on the extreme solubility of the sulphur in it; if this be so, it is important to know that the common form of sulphide of potassium, mostly of foreign manufacture, is much less soluble than the specially prepared form used by Mr. Tonks.

### SEEDS.

**LONDON:** March 11.—The inquiry for Clover and other farm seeds now increases daily. The late weather, however, has not been favourable for sowing operations. Alsike has advanced 2s. per cwt. White Clovers remain steady. The duller article is still red Clover seed, the supply of which continues most abundant. There is an improved sale for Italian Rye-grass. French Sainfoin is this season rather scarce. Bird seeds are slow. Feeding Linseed shows no change. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

### CORN.

At Mark Lane on Monday trade was very quiet. As compared with the previous Monday, English and foreign Wheats were unaltered, except, perhaps, that Australian and old Russian were rather firmer. Flour was dull; Maize was quiet, and flat corn quoted 22s. 3d. to 22s. 6d.; Barley continued steady in value, but without much doing; Beans and Peas met a very slow sale at unaltered rates, and Oats were firm, at 3d. to 6d. advance for the week.—On Wednesday holders of Wheat required extreme rates, but there was very little done to establish quotations, buyers being slow to operate on political contingencies in the face of statistical facts. Flour was steadier, in sympathy with Wheat, and on diminished shipments from America. There was no change in the value of Barley, Beans, or Peas; Maize was steady in value, without much doing; and Oats were again rather dearer.—Average prices of corn for the week ending March 7:—Wheat, 31s. 8d.; Barley, 31s. 3d.; Oats, 20s. 8d. For the corresponding period last year:—Wheat, 37s. 7d.; Barley, 31s. 5d.; Oats, 19s. 11d.

### HAY.

Tuesday's Whitechapel report states that there was a dull trade, with considerable supplies of inferior stuffs, which were difficult to sell. A better inquiry prevailed for very prime qualities of Clover, hay, and straw, with an advance of 2s. on the top price of Clover and hay, and 1s. on straw. Quotations:—Clover, prime, 85s. to 104s.; prime second cut, 85s. to 100s.; inferior, 48s. to 73s.; hay, prime, 76s. to 92s.; inferior, 25s. to 60s.; and straw, 22s. to 35s. per load.—Cumberland Market quotations:—Clover, best, 90s. to 105s.; interior, 60s. to 84s.; meadow hay, best, 80s. to 90s.; inferior, 60s. to 75s.; and straw, 29s. to 34s. per load.

### POTATOS.

The Borough and Spitalfields Market report states that the trade continues slow, but prices remain without further alteration. Quotations:—Scotch Regents, 85s. to 95s.; Kent ditto, 65s. to 85s.; Champions, 40s. to 60s.; Magnum Bonums, 60s. to 80s.; Victorias, 70s. to 90s. per ton.—The imports into London last week consisted of 256 bags from Boulogne, 1718 Harlingen, 283 Hamburg, 269 sacks Rouen, 9 packages St. Michael's, 4 baskets Amsterdam, 14 bags, 112 cases, 188 boxes, and 14 packages from Malta.

### COALS.

The prices current at market during the week were as follows:—East Wylam, 15s. 6d.; Walls End—Hetton, 16s.; Hetton Lyons, 14s.; Lambton, 15s. 6d.; Wear, 14s.; Caradoc, 16s.; Tees, 16s.; Tync (unscreened), 11s. 3d.; East Hartlepool, 15s. 3d.; Eldon West Hartley, 14s. 9d.

## CONIFERS—CONIFERS.

**ABIES DOUGLASII**, 2-yr. seedling, 15s. per 1000; 2-yr., 1-yr. transplanted, 25s. per 1000; 12 to 18 inches, 8s. per 1000.

„ „ **GLAUCOA**, 2 to 3 feet, 12s. per dozen; 3 to 4 feet, 18s. per dozen.

The glauca variety is a grand ornamental tree, of dense compact habit, with different shades of colour.

„ **ENGELMANNI**, 6 to 9 inches, 4s. per dozen.

„ **MENZIESII**, 9 to 12 inches, 8s. per 100; 2 to 3 feet, 16s. per 100.

WEST FERRY ROAD, MILWALL, LONDON E.

## STANDEN'S MANURE.

ESTABLISHED 20 YEARS.

This old-established Manure is acknowledged by most of the  
leading practical Gardeners in the United Kingdom and the  
Colonies to exceed all others in general fertilising properties and  
staying powers. It promotes a rapid, healthy, and robust  
growth in plants generally. It is a clean and dry powder,  
with very little smell, which renders it particularly adaptable  
for ladies interested in plant culture.

The highly fertilising properties of this Manure render its  
money value, in comparison with other manures, at least double,  
as users will find that very small quantities will produce  
favourable results.

Sold in TINS, 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each;  
and in BAGS or KEGS. at reduced prices, 28 lb., 12s. 6d.;  
56 lb., 23s.; 112 lb., 42s. each.

May be obtained from all Nurserymen and Seedsmen in the  
United Kingdom and the Colonies.

SOLE MANUFACTURERS,

**CORRY, SOPER, FOWLER & CO.**  
(LIMITED),  
18, FINSBURY STREET, LONDON, E.C.

**THOMSON'S VINE and PLANT**  
**MANURE.**—We are daily getting letters asking us how  
to apply this manure, from persons who have purchased it from  
nurserymen who have had none from us. We beg to intimate  
that we have no responsibility for the quality of the article they  
have purchased, which may have little in common with ours,  
though advertised as the same.  
**WM. THOMSON AND SONS, Clovenfords.**

## EUREKA!! INSECTICIDE.

Prepared by  
**WILLIAM SMITH, Chemist, Stockbridge, Edinburgh.**

Highest Award, Forestry Exhibition, Edinburgh.

"Clovenfords, by Galashiels, N.B., July 25, 1883.  
"Mr. SMITH,—Dear Sir,—We have now tried your Insecti-  
cide on all the insects we can find on any of our Plants, includ-  
ing Orchids, and used as directed by you we find it instant  
destruction to them all, while it neither stains nor injures the  
tenderest leaf. We shall in future use no Fir-tree Oil, or other  
insecticide but yours.—We are, yours truly,  
"WILLIAM THOMSON AND SONS."

Oil Paint no Longer Necessary.

HILL AND SMITH'S BLACK VARNISH,  
for Preserving Ironwork, Wood, or Stone.  
(Registered Trade Mark.)This VARNISH is an excellent substitute for oil paint on  
all outdoor work, while it is fully two-thirds cheaper. It was  
introduced upwards of thirty years ago by the Advertisers, and  
its genuine good quality, notwithstanding a host of unprincipled  
imitators, is fully attested by its constantly increasing sale. It  
may be applied by an ordinary labourer, requires no mixing  
or thinning, and is used cold. It is used in the grounds at  
Windsor Castle, Kew Gardens, and at the seats of many  
hundreds of the Nobility and Gentry, from whom the most  
flattering testimonials have been received.Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon,  
at the Manufactory, or 1s. 8d. per gallon carriage paid to any  
Station in the Kingdom.

UNSOLICITED TESTIMONIAL.

"Piercedfield Park, June 21, 1876.—Sirs,—I have this day  
forwarded from Chepstow to your address a black varnish cask,  
to be filled and returned with as good Varnish as the last we  
had, which I candidly admit was the best we ever had. Address  
Varnish to Piercedfield Park, Chepstow.—I am, Sirs, yours re-  
spectfully, Wm. Cox."CAUTION.—HILL & SMITH would particularly warn their  
Customers against the various cheap Varnishes now so much  
advertised.H. & S.'s Varnish has been an article of common use on most  
of the large estates in the kingdom for upwards of thirty years;  
and their constantly increasing trade in it, and the numerous  
Testimonials they receive, stamp it as a truly genuine article.  
Every cask is legibly marked with their name and Registered  
Trade Mark as above, without which none is genuine.Large illustrated CATALOGUE of Fencing Hurdles, Field  
and Entrance Gates, &c., sent free on application toHILL AND SMITH, Brierley Hill Ironworks, Staffordshire;  
118, Queen Victoria Street, London, E.C.; and 196, St. Vincent  
Street, Glasgow.

*A Discount for Cash to the Trade.*

**THE MOST SUITABLE FOR SHADING ORCHIDS, FERNS, Palms and Stove and GREENHOUSE PLANTS.**

It is a strong, durable Cotton Netting, woven in squares so close as to exclude the direct rays of the sun, but admitting the greatest amount of light attainable through shading.

It withstands the weather better than any other class of shading, and may be beneficially used on account of the thickness of its texture, during cold weather, to keep the frost out. R. WARNER, Esq., Broomfield, Chelmsford, has employed this material for some years, and speaks very highly of it, pronouncing it to be the very best material for Orchids he has ever used.

*Blinds made up and fixed complete.*  
Sold in pieces, 30 yards long by 1½ yard wide.  
Price 45s. each. Sample submitted.

## PATENT WROUGHT-IRON TUBULAR HOT-WATER BOILERS,

And others with SHELVES, and Hollow or Ordinary Cast-iron  
GRATE BARS;  
SADDLE BOILERS.

With WATERWAY BACKS, and WELDED BOILERS,  
which are Specially adapted for Heating Greenhouses, Conser-  
vatories, Churches, Chapels, Schools, Public Buildings, Entrance  
Halls, Warehouses, Workshops, &c.

They are the neatest, cheapest, most effective, and durable  
of any kind.

The Tubular ones are remarkable for their great heating  
power, slow combustion, and the length of time the fire will  
burn without requiring attention. This pattern

Had the First and Highest Prize, a Silver Medal,  
Awarded to it at the Royal Horticultural Society's Exhibition,  
South Kensington, London, on June 3 1881.

The Journal of Horticulture of June 9 says:—

"HEATING APPARATUS—A great number of boilers, valves,  
&c., were exhibited by eight competitors, and considerable in-  
terest was manifested in the verdict of the judges, and much  
discussion was brought to bear on the merits and shortcomings  
of the different boilers. The apparatus for which the Silver  
Medal was awarded was a wrought-iron saddle boiler, with a  
series of intersecting tubes, somewhat in the form of a letter X,  
but the tubes in ogree form, in the crown of the boiler. Most  
gardeners who examined the boiler expressed a favourable  
opinion of it. It is no doubt a quick and powerful boiler with-  
out being complex, the latter condition having, no doubt, had  
weight with the judges."

The Garden of June 11 says:—

"The premier prize, a Silver Medal, was taken by Messrs.  
Green & Son for their new patent tubular saddle boiler. It is a  
modification of their original patent, the boiler being longer and  
not so high. It is found to be a powerful and efficient boiler, and  
heats a large quantity of water quickly with a small consumption  
of fuel."

Descriptive Illustrated Price List may be had free on application.  
Estimates given for all kinds of Heating Apparatus, and Hot-  
water Fittings of every variety supplied on the shortest notice.  
Galvanised Iron Cisterns, from 4d. to 1s. 6d. per gallon.

## IMPROVED VINE ROD FASTENER. PATENT.

Vine Rods are now attached to the wire, or lowered to be  
pruned, in a few moments. The fastener is always ready, and  
being made of strong material will last several years. Many ex-  
perienced Vine growers have already adopted it, and expressed  
their entire approval of the result. Box containing 6 dozen,  
price 4s.

Sold by R. H. AND J. PEARSON, 141 and 143, High Street,  
Notting Hill, W.; and J. W. DART, St. Aubin's, Jersey.

THE WORLD.

THE AUTOMATON.

## RANSOMES' LAWN MOWERS.

### THE "WORLD" LAWN MOWERS

are the best for cutting long grass, and are constructed on the American system with the special advantages of English materials and workmanship.

They are made in nine sizes, 8 to 24 inches.

Prices from 45s. to £10.

### THE "REVERSIBLE" LAWN MOWERS

are suitable for small gardens and borders. They roll the grass as well as cut it, and can be used either side upwards.

They are made in three sizes, 6 to 10 inches.

Prices from 27s. to 43s.

### THE "AUTOMATON" LAWN MOWERS

are the best machines for general purposes and gardeners' use. They leave no ribs in the grass but produce a perfect surface.

They are made in eight sizes, 8 to 22 inches.

Prices from 55s. to £8 10s.

### THE HORSE-POWER MOWERS

are the best for Large Lawns, Cricket and Lawn Tennis Clubs.

They are used on the Cricket Grounds of the Oxford and Edinburgh Universities and numerous Colleges and Public Schools.

They are made in six sizes, 26 to 48 inches.

Prices from £14 10s. to £32.

## THE COTTAGER'S CALENDAR OF GARDEN OPERATIONS.

ORIGINALLY COMPILED BY THE LATE SIR JOSEPH PAXTON, M.P.

Price 3d., Post Free 3½d.

**W. RICHARDS, 41, WELLINGTON STREET, STRAND, LONDON, W.C.**

BUY ONLY ENGLISH THREE-QUARTER PLATE WATCHES.

**BENSON'S NEW PATENT (No. 4658) "LUDGATE" WATCH,**

SILVER,

£5 5s.

GOLD,

£12 12s.

Is a "Special Strength" Silver English Lever, my best London make, with Three-quarter Plate Movement.

*Jewelled throughout.*

*Chronometer balance, with damp and dust proof*

*Patent ring-band, and extended barrel, in*

*Massive sterling silver dome cases*

*With crystal glass front.*

*Winds, set hands and opens at back.*

The superiority in value, accuracy, and durability of the "Ludgate" Watch over the Swiss and American Keyless and Non-Keyless Watches, made in imitation of and sold as English work, and the ordinary Full-plate English Watch is enormous. The "Ludgate" Watch is compact, strong, handsome, and durable. Being Three Quarter Plate, it is superior in value and appearance to any £10 Watch sold, and, being compensated, it keeps perfect time; fitted with crystal front, it combines the strength of the Hunter, and convenience of the open face. Of my best London make, it will last a lifetime, stand rough usage of all and every kind without damage, and, being made in three sizes, it is for the above reasons suited for Home, Indian, and Colonial use by

Gardeners, Workmen, and Gentlemen.

*The "Ludgate" Watch is far superior*

*To any Watch at the price yet made, and*

*Will be sent free and safe at our risk*

*To all parts of the world for £5 5s.*

*Cash or P.O.O.; or in hunting cases, £6 6s.*

*Price in 18-carat gold, crystal glass cases,*

*Twelve guineas*

**SPECIALLY NOTE** that J. W. BENSON is the only Maker of a Three Quarter Plate English Watch for £5 5s. in Silver, or £12 12s. in Gold, and that our Patent "Ludgate" Watch cannot be had through or of any Watchmaker in the Kingdom. Any infringement of the Patent Rights will be proceeded against. ## WANT PLACES.

**POSTAL ORDERS.—To Advertisers,**  
*Subscribers, and Others.—It is very important*  
*in Remitting by Postal Order that it should be*  
*filled in payable at DRURY LANE, to W.*  
*RICHARDS, as, unless the Number of a Postal*  
*Order is known, and it has been made payable*  
*at a particular office, and to a particular person,*  
*it is impossible to prevent any person into whose*  
*hands it may fall from negotiating it.*

*N.B.—The best and safest means of Remitting*  
*is by POST-OFFICE ORDER.*

#### GRATEFUL-COMFORTING.

### EPPS'S COCOA.

#### BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." *Civil Service Gazette*.

Made simply with boiling water or milk. Sold only in

Packets, labelled thus:—

JAMES EPPS & CO., Homeopathic Chemists, London.

**HOLLOWAY'S PILLS.**—The Great Need. —The blood is the life, and on its purity our health as well as our existence depends. These Pills thoroughly cleanse the vital fluid from all contaminations, and by that means strengthen and invigorate the whole system, healthily stimulate sluggish organs, repress over-excited action, and establish order of circulation and secretion throughout every part of the body. The balsamic nature of Holloway's Pills exercises marvellous power in giving tone to debilitated and nervous constitutions. These Pills dislodge all obstructions, both in the bowels and elsewhere, and are, on that account, much sought after for promoting regularity of action in young females and delicate persons who are naturally weak, or have from some cause become so.

# GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING and COLLECTING MACHINES for 1885.

THE WINNERS OF EVERY PRIZE IN ALL CASES OF COMPETITION.

Patronised by Her most Gracious Majesty the Queen on many occasions, His Royal Highness the Prince of Wales, the King of the Belgians, the late Emperor of the French, the Emperor of Russia, and most of the Nobility, Clergy, and Gentry of the United Kingdom,

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. The "Journal of Horticulture," of June 9, says:—

"MOWING MACHINES.—After a critical examination the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. Green & Son, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 125,000 of these Machines have been sold since they were first introduced in the year 1856,

And thousands of unsolicited Testimonials have been received testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every prize that has been given.

The following are their advantages over all others:—

- 1st. Simplicity of Construction—every part being easily accessible. 2d. They are worked with much greater ease than any other. 3d. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

## SINGLE-HANDED LAWN MOWER.

To cut 6 inches, can be worked by a Lady	Price	£1 15 0
To cut 8 inches, do. do.		2 10 0
To cut 10 inches, do. by a strong youth		3 10 0
To cut 12 inches, do. by a man		4 10 0
To cut 14 inches, do. do.		5 10 0

## DOUBLE-HANDED LAWN MOWER.

To cut 16 inches, do. one man on even lawn	£6 10 0
To cut 18 inches, do. man and boy	7 10 0
To cut 20 inches, do. do.	8 0 0
To cut 22 inches, do. two men	8 10 0
To cut 24 inches, do. do.	9 0 0

\* If made stronger, suitable for Donkey, 30s. extra.

Prices of Donkey, Pony, and Horse Machines, including Patent Self Delivery Box, or Side Delivery, with Cross-stay complete, suitable for attaching to Ordinary Chaise Traces or Gig Harness:—

### DONKEY and PONY MACHINES.

To cut 26 inches	£14 0 0
To cut 28 inches	16 0 0
To cut 30 inches	18 0 0
Leather Boots for Donkey	1 0 0
Leather Boots for Pony	1 4 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machine makes little noise in working, the most spirited animal can be employed without fear of it running away, or in any way damaging the machine.

Packing Cases as per List.

### HORSE MACHINES.

To cut 30 inches	£22 0 0
To cut 36 inches	26 0 0
To cut 42 inches	30 0 0

STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY NEXT, March 25, at half-past 12 o'clock precisely, First-class Standard, Half-Standard, and Dwarf ROSES, comprising most of the leading varieties; a consignment of RHODODENDRONS, THUIAS, KALMIAS, HYDRANGEAS, ILEX, and other SHRUBS and PLANTS from Holland; BORDER PLANTS in quantity to name, LILIUMS, GLADIOLI, and other hardy BULBS and ROOTS, &c.

On view morning of Sale, and Catalogues had.

Thursday Next.—(Sale No. 688b.)

CATTLEYA LAWRECEANA, Rehb. f., new species. A distinct and beautiful NEW CATTLEYA from the Roraima.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., by order of Mr. F. Sander, on THURSDAY, March 26, at half-past 12 o'clock precisely, the entire importation of this most superb CATTLEYA. The consignment, brought home under the personal care of the Collector, is in exceptional order, and it has not been our fortune before to offer a finer, more compact, and altogether satisfactory lot of plants; and we do not hesitate to say that we have never seen such splendid sound pieces—they are well shaped, leaves fresh and green, and eyes perfectly dormant, and are the result of two years' diligent search. Cattleys Lawrenceana belongs to the very finest of the genus, the colour of the large flower is deep, rich, and warm; the lip is flat and large, the lower half intensely dark and brilliant, throat yellow and often finely veined red. There are no poor or light coloured varieties among them, and although this Cattleys varies in the markings of the inner lip, all are superb. It is a free-growing, free flowering species, the flower-spikes on plants show up to fifteen flowers; habit of plant is most compact, bulbs thick and varying in size from 6 to 15 inches. The leaves are in some varieties reddish in colour, in others green, and from 6 to 9 inches long.

On view morning of Sale, and Catalogues had.

Thursday Next.—(Sale No. 688c.)

**CUTBUSH'S MILL-TRACK MUSHROOM SPAWN.**—Too well known to require description. Price 6s. per bushel (1s. extra per bushel for package), or 6d. per cake; free by Parcels Post, 1s.

None genuine unless in sealed packages and printed cultural directions enclosed, with our signature attached. WM. CUTBUSH AND SON (Limited), Nurserymen and Seed Merchants, Highgate Nurseries, N.

### For Present Sowing.

The earliest in cultivation, dwarf and compact in habit, head firm and pure white, and well protected by the foliage. It stands dry weather better than any other variety.

Mr. GILBERT says it turned out the best of all he grew last season. Mr. E. STEPHENSON, Thorngay Hall, says:—"Your 'President' Cauliflower is not only the earliest but the most useful I have ever grown; we can plant it 3 or 4 inches closer than any other variety. The heads are very white and compact. I have grown it ever since it came out: I recommend it to all my friends."

Post-free on receipt of postal order or stamps for 1s. 6d.

WILLIAM E. MARTIN, Seed Merchant, Hull.

## New Pea.—SHARPE'S TRIUMPH.

Triumph is the very last of Mr. Culverwell's Peas, and is the best of the many fine varieties he has given to the Public.

It is a Blue Wrinkled Marrow Pea, of exquisite flavour; the pods are large, very much curved, and are well filled with large Peas closely packed in the pod.

The habit is good, being dense and bushy, attaining a height of 2 to 3 feet.

The plant is covered with pods from the ground to the extreme top of the haulm.

On one plant no less than sixty-nine pods have been counted, containing from nine to eleven Peas in a pod.

The pods are of a bright green, in clusters of two or three; and are not easily affected by drought, remaining green for a long time.

In constitution it is robust and hardy; and, without hesitation, we can say that it is the perfection of Peas for either the Market Gardener or the Private Grower, for exhibition, or for ordinary use.

Price, 2s. 6d. per 4-pint Sealed Packet.  
 Trade price on application.

CHARLES SHARPE & CO.,  
 SLEAFORD.

## BIDDLES & CO., THE PENNY PACKET SEED COMPANY,

LOUGHBOROUGH, LEICESTERSHIRE,

## AMARYLLIS (SPREKELIA) GLAUCA.

E. H. KRELAGE &amp; SON,

NURSEYMEN, SEEDSMEN, AND FLORISTS,  
HAARLEM, HOLLAND,

Have an extra large stock of this splendid bulbous plant, in very large bulbs, ready for sale just now. It is a parent of the well-known Jacobean Lily (*Amaryllis formosissima*), and has a similar brilliant red flower, which, however, is larger and less dark. It flowers easily and early, and the foliage usually is developed at the same time as the flowers. It can be cultivated in pots in the greenhouse or room, or in glasses, like Hyacinths. When planted in the open ground, in spring, it must be taken up before winter and kept dry and warm during its rest. In more temperate climates it can remain in the open ground during winter.

We offer large flowering bulbs, delivered free to all the principal towns of Great Britain and Ireland, no charge for package:

25 bulbs, 7s. 6d.; 50 bulbs, 12s. 6d.; 100 bulbs, 20s.; 250 bulbs, 45s.,  
500 bulbs, 80s.; 1000 bulbs, 150s.

Discount to the Trade. Please send with Orders remittance in Post-bills or Cheques.

**THOMAS S. WARE,**

HALE FARM NURSERIES, TOTTENHAM, LONDON.

Strawberry Growers should Note that LAXTON'S NEW STRAWBERRIES, "KING OF THE EARLIES," and "THE CAPTAIN," are the most remarkable since the days of "British Queen" and Keens' Seedling. Upwards of 100 Trade Firms supplied—5000 to one Market Grower. Particulars of T. LAXTON, Bedford.

**NEW CATALOGUE FOR 1885.**

*Beautiful Flowers for Indoors, selected from an immense stock. Our Glasshouses cover nearly 2 acres.*

**Wm. Clibran & Son's New List**  
(90 Pages Double Column)

Of the newest and finest varieties of all classes of Plants for Greenhouses, Stoves, &c., may now be had for two stamps. It includes only the best varieties of their respective classes. Every season new sorts are added. Comparisons of the varieties when in bloom carefully made, and the inferior kinds discarded. Intending purchasers may rely when selections are ordered as under on being supplied with varieties of merit only.

The following cheap Collections of finest named kinds consist entirely of our selection. Purchasers may select from the Lists at Prices as per CATALOGUE, which please see before ordering elsewhere.

**MORRISON BROTHERS, NURSERIES, ABERDEEN.**

## ORCHIDS, HYACINTHS, AND AMARYLLIS.

MESSRS. JAMES VEITCH &amp; SONS

BEG TO

INVITE INSPECTION of their MAGNIFICENT COLLECTIONS

WHICH ARE NOW IN FULL BLOOM.

THE ROYAL EXOTIC NURSERY, KING'S ROAD, CHELSEA, S.W.

THURSDAY NEXT.—(Sale No. 6881.)

CATTLEYA LAWRENCEANA (RCHB. F.), NEW SPECIES.

A DISTINCT and BEAUTIFUL NEW CATTLEYA, from the RORAIMA.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., by order of Mr. F. SANDER, on THURSDAY, March 26, at half-past 12 o'clock precisely,

The entire Importation of this most superb Cattleya.

The consignment, brought home under the personal care of the Collector, is in exceptional order, and it has not been our fortune before to offer a finer, more compact, and altogether satisfactory lot of plants, and we do not hesitate to say that we have never seen such splendid sound pieces. They are well shaped, leaves fresh and green, and eyes perfectly dormant, and are the result of two years' diligent search. Cattleya Lawrenceana belongs to the very finest of the genus; the colour of the large flower is deep, rich, and warm; the lip is flat, and large, the lower half intensely dark and brilliant; throat yellow, and often finely veined red. There are no poor or light-coloured varieties among them, and although this Cattleya varies in the markings of the inner lip, all are superb. It is a free-growing, free-flowering species, the flower-spikes on plants show up to fifteen flowers. Habit of plant most compact, bulbs thick and varying in size from 6 to 15 inches. The leaves are in some varieties reddish in colour, in others green, and from 6 to 9 inches long.

*On view morning of Sale, and Catalogues had.*

AUCTION ROOMS AND OFFICES, 38, KING STREET COVENT GARDEN, LONDON, W.C.

FRIDAY NEXT.

IMPORTED BURMESE ORCHIDS.

MESSRS. PROTHEROE AND MORRIS are instructed by Messrs. HUGH LOW & Co. to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on FRIDAY NEXT, March 27, at half-past 12 o'clock precisely, a large quantity of choice BURMESE ORCHIDS, collected by Mr. Curnow, comprising DENDROBIUMS in variety, specially a grand lot of the rare and lovely D. LUTEOLUM; AERIDES LOBBI, VANDA CÆRULEA, also CATTLEYA DOWIANA, C. GIGAS, C. MAXIMA, ODONTOGLOSSUM LUTEO-PURPUREUM, variety from Antioquia; O. VEXILLARIUM, large flowered variety; O. ALEXANDRÆ, fine imported pieces from the localities whence come the best varieties.

*On view morning of Sale, and Catalogues had.*SHARPE'S  
EARLY PARAGON PEA.*The Earliest Large Wrinkled Marrow.*

First-class Certificate, Royal Horticultural Soc., 1884

PARAGON shows in many respects a great improvement upon any variety at present in the trade. It is a Blue Wrinkled Marrow of fine flavour; height from 3 to 4 feet. The pods are produced two and three together in such abundance as to almost conceal the foliage. They are of an unusual size, broad and thick backed, containing from twelve to fourteen immense Peas packed in a double row.

Paragon is the earliest of the large Wrinkled Marrows, being ready before Prizetaker. It is very hardy, and will stand earlier sowing than any Pea of its class. It is most valuable for succession crops, as it is not liable to mildew, and a constant supply of Peas for four months can be obtained from this one variety.

Paragon will prove a most invaluable Market Gardeners' Pea, its earliness, hardness, and immense cropping quality surpass anything yet sent out—it also stands long railway carriage without injury.

The following Testimonial is from the largest dealers in the kingdom in Peas for Market Garden Purposes:—

"December 6, 1884.—In reply to yours respecting your Paragon Pea. We grew it last season and were favourably impressed with its qualities. We consider it a great improvement on Telephone, the pods being a much better colour and the Peas in it being much finer. We consider it is the finest Pea in our trials last season, and we grew every Pea we thought of merit and nearly every novelty.

Price, 2s. 6d. per Pint, 1s. 6d. per Half-pint

*Trade Price on application.*

CHARLES SHARPE &amp; CO., SLEAFORD.

THE MOST SUITABLE FOR  
SHADING ORCHIDS, FERNS,  
Palms and Stove and  
GREENHOUSE PLANTS.

It is a strong, durable Cotton Netting, woven in squares so close as to exclude the direct rays of the sun, but admitting the greatest amount of light attainable through shading.

It withstands the weather better than any other class of Shading, and may be beneficially used on account of the thickness of its texture, during cold weather, to keep the frost out. R. WARNER, Esq., Broomfield, Cbeilmsford, has employed this material for some years, and speaks very highly of it, pronouncing it to be the very best material for Orchids he has ever used.

Blinds made up and fixed complete. Sold in pieces, 30 yards long by 1½ yard wide. Price 45s. each. Sample submitted.

B. S. WILLIAMS,  
VICTORIA AND PARADISE NURSERIES,  
UPPER HOLLOWAY, LONDON, N.

Plants for the Season.  
CHARLES TURNER'S Descriptive CATALOGUE, containing some fine novelties as well as the choicest selections of established kinds, is now ready. The present is the best time to procure plants of Carnations, Picotees, Cloves, &c., to ensure a good bloom. Plants are unusually fine this season. The Royal Nurseries, Slough.

SPRING CLEARANCE SALE,  
to avoid planting.  
LILIUM AURATUM, SINGLE DAHLIAS, IRIS, GLADIOLI, BEGONIAS, and many other Bulbs, with some choice Seeds, at greatly reduced rates. Send for our Special Clearance LIST, No. 73.  
NEW PLANT AND BULB COMPANY,  
Lion Walk, Colchester.

# NATIVE GUANO.

Extracts from the Ninth Annual Collection of Testimonials from persons who have used this  
Manure for Farm and Garden Crops:—

## ROOTS, GRAIN, GRASS, &c.

GEORGE STONE, *Cashio Bridge Farm, Watford.*

February 19, 1885.  
"Used for Swedes on plants at the rate of about 6 cwt. per acre. Results: I was very well satisfied, considering the long time we were without rain; the Swedes were quite as good or better than some in the same field with more expensive manures. I have used your Native Guano for Swedes and white Turnips, and have a very good crop for the season. Kindly send me 3 tons at your earliest convenience, and oblige."

JAMES KITLEY, *Farm Steward to the Right Hon. Lord Derby, Witley Park, Haslemere.* January 24, 1885.  
"Used for Tares, at the rate of 4 cwt. per acre. Results: Very good."

ROBERT CRAWLEY, *Chelveston, near Higham Ferrers.* January 29, 1885.

"Used for Wheat, Oats, Barley, Clover, and grass, at the rate of from 2½ to 5 cwt. per acre (according to the condition of the land, which was cold clay), with good results; had quite 5 cwt. of hay more per acre. Your manure, if as good as last year's, is the best I have ever used, except guano. All other manures are land-damagers—they doctor the land for a time, afterwards they require a physician."

WM. GEO. ELLIOTT, *Aston Abbotts, Aylesbury.*

February 5, 1885.  
"Used for Oats grown after seed Tares at the rate of 7 cwt. per acre. Results: Very good; about 12½ qr. per acre. Being grown against the road, it was generally remarked what a fine piece of corn it was, and I have no doubt will be the cause of several of my neighbours using it this season."

JAMES SOMES, *Bashiff, Yelden Estate, Higham Ferrers.* February 3, 1885.

"Used for Oats and roots, at the rate of 4 cwt. per acre for roots, and 2 cwt. for Oats, with farmyard manure. Results: Exceedingly good for crops. I was very pleased with your manure, and we intend using it largely this year."

JOSEPH FRANKLIN, *Scots Grove, Thame.*

February 18, 1885.  
"Used for grass and Mangel Wurzel, at the rate of 6 to 8 cwt. per acre. Results: Very good."

A. C. HILLS, *Marston, Oxford.* February 7, 1885.

"Used for Mangel Wurzel, at the rate of 5 cwt. per acre, with plenty of ash. Results: A splendid crop. I think a lot of ash with the Guano does a deal of good."

J. SHRIMPTON, *Great Hasely, Tetworth, Oxford.*

February 5, 1885.  
"Used for Swedes and Turnips, without farmyard manure, at the rate of 4 cwt. mixed with ashes. Results: Gave good satisfaction, the Turnips being a very good crop indeed. The Swedes were a good plant, but owing to the dryness of the season and severe attacks of blight did not finish up so well. I shall be a customer again this season."

C. BESON, *Glory Farm, Amersham.* February 9, 1885.

"Used for Mangel at the rate of 6 cwt. per acre. Results: Very good. I have given my opinions on your manure previously."

JOHN A. WILLIAMS, *Alderminster Lodge, Stratford-on-Avon.* January 26, 1885.

"My first experience with your manure has been confirmed during the past year. It seems especially valuable and economical when used for roots."

## POTATOS and KITCHEN GARDEN CROPS.

G. WHEELER, *Bourne End.*

February 2, 1885.  
"Used for Potatoes at the rate of 16 cwt. per acre. Results: Tubers much finer and quantity considerably larger than any other manures I ever tried. I consider your manure the best possible, as it supplies the tubers when most needed, without a tendency to rot them."

JACOB ROBINSON, *Beyton Green, Bury St. Edmunds.*

February 9, 1885.  
"Used for Potatoes at the rate of 10 cwt. per acre. Results: Most satisfactory: no other manure whatever used. My method of applying is to sow broadcast immediately in front of the hands engaged in moulding up."

J. SMITH, *Head Gardener to the Right Hon. Lord Rosebery, Mentmore, Bucks.* January 28, 1885.

"Used for Peas, Onions, Lettuce, Cabbages, Potatoes, Turnips, and fruit trees. Results: Onions, a splendid crop; other crops, where used, most satisfactory. As a surface-dressing I consider your Native Guano most useful. Peas seemed to derive much benefit from the dressing."

JAMES DART, *Gardener to the Right Hon. Lord Carlingford, K.P., The Priory, Cheyton Mendip, Bath.*

February 9, 1885.  
"The Native Guano I received from your firm in 1884; instead of using it dry I used it as liquid in large tubs to plants of many sorts in pots; also Roses, Cucumbers, Marrows, and many other things, and I was quite satisfied with it."

THOMAS HAMILTON, *Gardener to the Right Hon. Viscount Hood, Lynwood, Sunningdale, Ascot.*

January 28, 1885.  
"Used for Tomatoes, Cucumbers, and soft-wooded plants in general. Results: Very good. As we had only a 2 cwt. bag, cannot bear testimony on a large scale; but have no doubt for general purposes is very good."

THOMAS HENRY HILL, *The Gardens, Durward's, Witham.*

January 24, 1885.  
"Used for Potatoes, Onions, Beet, and Carrots, at the rate of 8 cwt. per acre. Results: Very good indeed. I can report again on the excellency of your Native Guano. I use no other artificial manure. All I used it for did very well, considering the dry season we had."

H. CAKEBREAD, *Head Gardener to Sir Philip Rose, Bart., Rayners, Bucks.*

January 28, 1885.  
"Used for Potatoes, Peas, Beans, and all kinds of winter Greens, Vines, Peaches, and Pot Plants. Results: Satisfactory in all cases. Without doubt your Native Guano is a very stimulating manure, and especially for all green crops. I am of opinion, to thoroughly prove any kind of artificial manure on the same piece of ground, one row should be manured and the next left, i.e., every alternate row only done."

JAMES SAYERS, *Gardener to Frank Snood, Esq., The Firs, Old Charlton, Kent.*

January 26, 1885.  
"Used for Peas, Beans, Potatoes, Cabbages, Cauliflowers, Celery, Lettuce, Radish, Endive, Cucumbers, Tomatoes, &c., and Fruit Trees, also Stove, Greenhouse, and Conservatory. Results: Very satisfactory. I consider it a first-rate manure for all these purposes. I think the Native Guano only requires to be better known to be much more largely used."

E. S. WILES, *The Gardens, Edgerote, Banbury.*

January 26, 1885.  
"Used for Melons, Cucumbers, Peas, Onions, and Pot Plants. Results: Good on all—Melons, Cucumbers, Peas, and Pot Plants in particular. The Native Guano supplied to me last year was very good, and as a cheap manure I highly recommend it."

## VINES, STRAWBERRIES, LAWNS, FRUIT TREES and FLOWERS.

ISABELLA MECCHI, *The Limes, Earls Colne, Essex.*

February, 1885.  
"Used for all kinds of vegetables, and young fruit trees, with satisfactory results. On pot plants the effects are very marked, producing a brilliant green foliage, and enabling them to resist greenfly. I have no doubt whatever of the fertilising qualities of Native Guano."

Dr. CHAS. A. BURGHARDT, *Delamere, Alderley Edge, Cheshire.* February 9, 1885.

"Used for Peas, Cauliflowers, Strawberries, Cabbages, and grass. Quantity used: well dusted over surface for grass; well dusted over surface and forked in for other crops. Results: The Strawberries were excellent in quality and larger in size than usual, the Peas and other vegetables were much improved by this manure, in fact the Brussels Sprouts were earlier and finer than I have seen them for some years. No other manure used on grass, ordinary farmyard manure on Strawberries, as I always have used it. I consider the manure you sent me most excellent for grass, lawns are much improved by the use of it, the grass growing much quicker and having a much better colour than before."

Col. the Hon. W. P. TALBOT, *Glenhurst, Esher.*

January 27, 1885.  
"Used for all sorts of flowers, fruit, and vegetables, in and out of houses. I have used it principally on small patches of ground and in the houses in pots, but my gardener tells me he supposes about 10 cwt. to the acre. Results: Very good; won a great number of prizes at South Kensington, Richmond, and other shows with fruit, flowers, and vegetables grown with it."

General BOILEAU, *Bognor.*

January 24, 1885.  
"Used for almost all garden crops, Peas, Beans, Lettuce, Asparagus, Tomatoes, Carrots, Turnips, Salsify, &c., Strawberries. Results: Very good, with all vegetables, fruit, &c."

WILLIAM APPLETON, *Sifton, Slough.*

Feb. 5, 1885.  
"Used for Strawberries at the rate of half a ton per acre. Results: Season very dry; not a fair trial; where used the Strawberries were more free from mildew."

J. E. HAINSWORTH, *Deusbury.*

January 29, 1885.  
"Used for Vines. Results: Great improvement. I think the manure good for many kinds of things—Roses, Geraniums. I have used it for Camellias that have not bloomed for a long time without retopping. Crops this year good: Peaches, Figs, Nectarines. It must be used with reason."

W. PATERSON, *Beech Grove, Sydenham Hill.*

February 9, 1885.  
"Used for lawns, vegetables, Vines, flowers; grass thinly covered with the Guano (probably at half a ton per acre). Results: Very satisfactory. Having used your Guano for twelve years, I have no hesitation in saying that it has always answered well, and that my gardeners say they could not do without it, more especially for my grass slopes and lawns."

C. L. NICHOLSON, *Thatched House Club, St. James's, London.* January 24, 1885.

"Used for lawn. Results: Excellent. Marking out the area over which I used the manure, the crop of fine new grass compared most favourably with that portion of the lawn over which ordinary manure was applied. Our gardener desires a larger supply this season."

A. MARGETSON, *Victor Road, Teddington.*

January 31, 1885.  
"Used for Beet, Onions, Lettuce, Celery, Turnips, Endive, Roses, Pelargoniums, Primulas, Cinerarias, Tomatoes. The results have been greatly to my satisfaction, especially in cases of Roses, Beet, and Celery. I have tried all other manures, but, considering the price you charge, I shall recommend it to all my friends."

At the Birmingham Show, 1884, Nineteen Prizes were taken by Exhibitors who used Native Guano.

PRICE £3 10s. PER TON, in Bags, at the RAILWAY STATION, AYLESBURY.

# Gardeners' Chronicle.

SATURDAY, MARCH 21, 1885.

JUNIPERS.

AMONG the widespread family of Junipers the Juniperus oxycedrus has an interesting history in connection with the destruction of forests in Madeira. I received lately a bit of this species which had lain in the ground probably without life, but still undecayed, and which retained its peculiar perfume during 400 years. The specimen in question was unearthed at an altitude of 6000 feet above the sea by Mr. C. H. Sharman, of the firm of Messrs. Carter, of Holborn, who took a well-earned holiday in Madeira last year. Madeira was discovered by the Portuguese in 1419, and received its name from the word *Materia*, wood, the dense woods which covered the island consisting mainly of *J. oxycedrus*. This elegant drooping Juniper—a European species—reaching a height of 40 or 50 feet, was formerly in great demand among cabinet-makers, and the red and "scented Cedar-wood," which forms the lining and the material of the drawers of many old cabinets and costly coffers, frequently consists of the Juniper of Madeira. This useful tree, however, has shared the fate of some of the other indigenous trees and shrubs which abounded in the island previous to their reckless destruction by its modern owners, and by the traders and merchants of Europe. A list of all the native trees and plants, and of the abounding flowers and Ferns and seaweeds of Madeira, may be found in Lowe's *Manual Flora of Madeira*, but all the choice and useful kinds of trees which were once plentiful, such as *Dracæna Draco*, the Dragon tree; *Persea indica*, the Madeira Mahogany; *Rhamnus glandulosa*, *Taxus baccata*, with its fragrant wood, used for torches; and *Juniperus oxycedrus*, have become scarce through the "plundering and blundering" of modern times.

Loudon describes *J. oxycedrus*, the Sharp Cedar or Brown-berried Cedar (*Arboretum Britannicum*), as a native of Spain, Portugal, and the south of France, feathered to the ground, and reaching to the height of 10 or 12 feet. In the delightful climate of Madeira it grows four or five times taller, resembling in this respect the closely allied shrub, *J. communis*, our common Juniper, which is a native of Europe, Asia, and America, a familiar shrub of our downs and wastes, growing usually from 3 to 5 feet, but attaining a much greater height in favourable situations. Both on the chalk and sand of Surrey the common Juniper, in sheltered sites, reaches large proportions. One of its favourite localities is the exposed slope of the Albury Downs, between Guildford and Dorking, but on one particular part of the hill there is a beautiful shrubbery of Junipers of Nature's planting which have reached 12 and 15 feet or more. The soil is thin, as elsewhere on the Downs, and the chalk rock is immediately below the surface.

*Juniperus virginiana*, commonly called the Red Cedar, and a native of North America, is described as growing at Whitton, 60 feet high and

2 feet in diameter; while the trees at Syon House, Pain's Hill, and many other places, are also famous. It is not a tree of much utility in this country, though in North America its timber, when obtainable, is largely used by rural carpenters, as Ash and Elm are here. Lumbering, however, has made it scarce and dear. The best timber is produced in the southern maritime States, where this Western Cedar is still used for coffins, as the Cedar of Lebanon was in the East, and where, as the favourite fuel for the river steamboats, its combustion perfumes the air for miles. It is largely used in England as an imported wood in the manufacture of black-lead pencils; and as it grows rapidly here on light soil, and attains a large size, it seems not improbable that it might be cultivated with advantage in the warmer parts of our island. There are thousands of acres of sandy wastes in the sunny county of Surrey which afford no return in their present neglected condition, and which might perhaps enrich their owners if they were planted with Red Cedar.

The best pencils were undoubtedly made from the wood of *Juniperus bermudiana*, the Bermuda Cedar; but this has now become so scarce that the Red Cedar has taken its place both in the manufacture of "cedar pencils," as they are sometimes called, as well as of cigar boxes; and in Lady Brassey's graphic picture in *The Trades, the Tropics, and the Roaring Forties*, of the productions and industries of the Bermudas, the accomplished authoress does not notice the once famous Cedar of these islands.

The destruction of the forests in Madeira is mentioned in Dr. Fructuoso's account of the landing of Captain Zargo in 1419. The work is in Portuguese, and I am indebted to Mr. Sharman for extracts relating to the forests. Zargo sailed under the patronage of Prince Henry, a grandson of our John of Gaunt, whose daughter married the King of Portugal. It was at his suggestion, on his return to Portugal previous to his long residence in Madeira as Governor, that the forests were set on fire, as the woods of the Western States of America have been, for the sake of making clearances for cultivation—once on fire they continued burning for a period of seven years. Translated literally, Fructuoso's account of the calamity is that Zargo "awoke to the fact that it was not possible, with labour of men, to undo so much forest as there was in the island from the beginning of the world;" so the forest in the Valley of Funchal was fired, and "on account of the great quantity of wood and its great antiquity, much of it was lying on the ground, some was dry and standing up," and "the fire took such hold, that it walked seven years among the trees, and trunks, and the roots, under the earth, so that it could not be put out." An informant writes from Madeira that the spot where the Cedar root was found is about 6000 feet above sea level, and that the root was pulled out of the earth by the side of a rivulet. He adds that the Cedar (*J. oxycedrus*) was found growing, on the discovery of the island, from the summits of the mountains to the sea shore, and that it is now only found in the remotest ravines and nearly inaccessible places. It is used principally as the material of the torches by the light of which coalings is carried on at night. Governor Zargo, who ruled in Madeira forty years, and was buried in the island, cut down a Cedar which contained a sufficient quantity of timber for the construction of a small church! The statement is vague, and we may see in North Britain specimens of the architecture of an ancient people, forts and watch towers, which were built without the use of a stick of wood, or an ounce of mortar. One would like to know the actual size which these trees have attained. *H. E.*

## New Garden Plants.

ODONTOGLOSSUM CIRROSUM HRUBYANUM,  
*n. var.*

THIS grand variety has large snow-white flowers, with only a blotch of orange at the base of the lip, and with some red lines. It has just flowered a second time with Mr. W. Lee, who has kindly forwarded a second excellent specimen. There has been much search and much doubt about this introduction of Mr. F. Sander, but it is only requisite to make a pilgrimage to Mr. Lee to see it. It is dedicated to Baron Hruby of Peckar (say Petchkar if you can!) in Bohemia, one of our most enthusiastic and intelligent collectors on the Continent, who is so famous for his *Renanthera Loweii* and his enormous stock of Masdevallias. *H. G. Rehb. f.*

## RANUNCULUS LYALLI.

ONE of the finest plants of New Zealand is the mountain Lily of the settlers, *Ranunculus Lyalli*, Hook. fil. As I have succeeded very well in its cultivation, I purpose to give a few particulars regarding it, trusting to show how it may be grown in England with more success than hitherto. This fine plant was first collected by Dr. Lyall, in 1848 or 1849, in Milford Sound, on the west coast of Otago, but was not described botanically until the publication of the *Handbook of the New Zealand Flora*, by Sir J. D. Hooker, in 1864. Prior to this it had been raised from Dr. Lyall's seeds by the late Mr. Anderson-Henry, but whether the plants were preserved I am unable to say. However, Mr. Henry informed me some years ago that the plant was in flower on his rockery. Since that time a considerable number of plants have been sent home from here, but with the exception of two at Kew and some in the possession of Messrs. Backhouse, I believe all have been lost. This is to be regretted, as there are few finer hardy plants in cultivation, and there is really no difficulty in growing it once the necessary conditions are understood and intelligently followed up. In the wild state the plant is confined to the mountains of the middle island, being found chiefly in Canterbury and Otago; in the former province at 2000 to 4000 feet altitude, and in Otago at 1000 to 3500 feet. It grows on mountain slopes below the snow fields, where the ground is usually moist during summer from the trickling downwards of the melting snow. I have seen it described as an aquatic, but that is entirely a mistake, as the drainage of the slopes is rendered perfect by the large masses of rock debris which have been worn away by the frosts of ages, and these are generally nearly or quite covered up with peat, formed by the decay of the countless plants which have grown upon them. It is on this natural rockery that the mountain Lily flourishes best, though it is sometimes found in sand or even in shingle, with scarcely any peat. It is also usually found in situations shaded from the mid-day sun—such, for instance as the southern face of a defile or gorge. On mountains facing the south I have seen it covering the ground for hundreds of acres with one huge sheet of white, but more usually it grows in patches of a score or thirty plants nestling among straggling plants of *Olearias*, *Veronicas*, or other shrubs. The necessary conditions for success in its cultivation are therefore—shade, by which I do not mean the shade of trees, but that produced by a wall or high bank; a peaty soil, with a fair proportion of sand; a constant supply of moisture both in the soil and atmosphere, and perfect drainage. The latter point is of great importance, as the *Ranunculus* soon suffers from stagnant moisture. You will see by the photograph (fig. 67) that the plant has done fairly well here, and it must be remembered that our climate is unfitted for alpinos owing to the severe droughts of early autumn. It is therefore only reasonable to suppose that the plant will do better in England than in the New Zealand lowlands. The leaves shown in the photograph vary from 6 to 12 inches across, and the flowers from 1½ to 3½ inches. The plants, about 100 in number, are growing on the south (the cool aspect here) side of a wooden fence at about 6 feet high, and have only been there about eighteen months, the bed being

prepared with peaty loam: the tubers were simply laid on the surface, and 2 or 3 inches of fine peat and leaf-mould placed over them. All the attention they have had since planting has been watering during dry weather, and yet they have grown most luxuriantly. I have tried to grow the plant in pots, but with indifferent success; it flowers well the first year, but makes very poor leaves, and eventually gets very weak. I should, therefore, advise any English grower who gets hold of a plant of this *Ranunculus* to plant it out in a suitable place as above described, or if that should be thought too risky, in a cold frame specially prepared. But there is not the slightest reason to doubt its hardiness in England, as there is no part of Britain so cold as our mountains, where this and many other fine alpinos flourish, although buried during the winter in snow and ice. To those who have never seen this fine plant a short description may be interesting. It is a deciduous herb, attaining a height of 2 or 3 feet when in flower. The rootstock is a thick fleshy tuber, as thick as the thumb, and very much resembling that of the common *Aemonea*, except in size. These rootstocks are frequently branched in old plants. The radical leaves are peltate and much concave in form, resembling huge saucers or rather funnels; indeed they are sometimes used as substitutes for the latter. They frequently hold as much as three-quarters of a pint of water and sometimes after a shower a very refreshing draught is obtainable from a big leaf of "the Lily" as the settlers call it. The petiole is stout and generally more or less hairy, about a foot or 18 inches long, broadly sheathing at the base, and more or less marked with purple spots. On old and flourishing plants the leaves are often a foot across, and I have measured some as much as 16 inches. They are very leathery in texture, and have coarsely crenated margins. The flower-stems are stout, 2 or 3 feet high, paniculately branched, bearing from four to thirty flowers and a few sessile deeply toothed and lobed cauline leaves, which in some varieties have bright red edges, adding to the beauty of the plant. The flowers are from 1 to 4 inches across, the central one being the largest. They are on stout peduncles, each with a coarsely lobed oblong bract at its base. Each flower has five broad hairy sepals and from eight to sixteen petals each, with an oblong gland at its base. The petals are snow-white in colour in all the varieties I have seen; but a pink one is reported by the shepherds to exist on the upper Rakaia, and Sir J. D. Hooker describes the variety, *R. Traversii*, as cream-coloured. This variety *Traversii* is a small form found in the Hurunui and Waiau districts, but it has very few claims to specific rank, more especially as *R. Lyalli* turns out to vary much in foliage, &c. When sown by Mr. Henry the seeds laid for four or five years, but some which I sowed as a test, when sending seeds to England, germinated in exactly eight months from the date of sowing, and this is doubtless the natural period when self sown. In the localities where the plant grows seedlings of all sizes are abundant; but we have at present no knowledge of the period required to bring them into a blooming condition, and consequently it is better to collect old plants of blooming size, than to raise it from seed. The plant blooms during the earlier part of summer in cultivation here, but in the mountains it blooms during late summer and early autumn. Soon after the seed is ripe the plant begins to look sere, and before winter disappears almost entirely. Its position must therefore be well marked when grown in the garden. *J. B. Armstrong, Christchurch, New Zealand.*

## JAPAN LILIES.

It would be well if we could know more about the conditions under which the bulbs grow and increase so fast in Japan, which they must do, or the nurserymen there could not export them in such quantities year after year. A good way to treat those fresh imported is carefully to scrape away any decayed part, and then dust the bulbs over with charcoal and lime mixed, which arrests further growth of mould, when the Lilies should at once be potted, in rather small well drained pots, using fresh turfy soil, sprinkling a little dry sand over the bulbs at the time, and giving no water till they start, and then only just sufficient to keep the ball moist till the plants get well into growth.

If they are to be planted out the places ought to be prepared for them by being dug out and the holes filled in with chopped turf that is rather sharp and

sandy, or with peat, which many seem to prefer, but I have always seen them do best in loam, such as that mentioned above. Although the plants seem rather to enjoy the sun on their stems and foliage I do not think they like it to shine strongly on the roots, where the ground, in my opinion, should be kept shaded, moist, and cool, at least during summer, by having a mulching of light material over it, or by growing some dwarf annuals around them. The lancifolium section are not half so difficult to grow, and with very little trouble may be grown very satisfactorily in pots, when they flower freely and increase quickly. Lilies of the kind referred to should be potted early, the best season being when the tops die down, as then there is no fear of injuring the roots, which are not formed till later on, when the bulbs begin to make a fresh start.

Although this is so, it is as well not to disturb them any more than can be avoided in removing the crocks and old loose soil, but I always like to clear away the stumps from the stems above, which pull out, with the dead root-fibres clinging around, and leave the crowns of the bulbs free and clear. If these

## THE VEGETATION OF THIBET.

THE mountainous regions of Eastern Thibet are wet, as I have said, and plunged in almost continual fogs, hence they offer singularly favourable conditions for the growth of certain plants, such as Ferns, Conifers, and Rhododendrons. These last plants, among which I have distinguished in Moupine some fifteen to twenty different species, form fairly large trees with persistent foliage, and with their magnificent flowers of red, rose, white, and yellow, lend to the landscape a beautiful appearance from April to July. One species, of little size, but with large red flowers only, grows on the trunks of old Fir trees as an epiphyte; another with round leaves is only found in woods about 9900 feet elevation. Here the Rhododendrons and Willows are the only hard-wooded plants which are found in the highest mountains forming the highest limit of the forests. It is a great pity that the ripe seeds of most of these Rhododendrons as well as those of three large Magnolias with white flowers and caducous leaves (huge in one case), which I collected with care, and sent to the Jardin des Plantes were

large and sweet fruits on those parts that are hidden beneath sand or stones.

Lower down towards the torrents, together with the Salix with large leaves, may be seen growing a splendid Alnus, a Pterocarya (which extends from this latitude down to the Eastern Sea along nearly all the watercourses), Liquidambar formosana, Rhus vernicifera, Mimosa julibrizin, &c. The beautiful Fir which I have distinguished by the name of Abies sacra only grows wild in the region of the massive mountain range which forms the frontier between Setchuen and Chensi. It is also in this western region that I have found the Poplar pyramidalis, planted commonly near houses. This tree is unknown in the rest of China. The Weeping Willow, moreover, exhibits here the most beautiful specimens, both male and female, that I have ever seen. It is among these lower hills that the Camphor is usually grown, often to a colossal size, whilst another Cinnamomum, called Nan-moi by the Chinese, and which forms one of the most elegant and largest trees that can be seen, is only found in the alluvial plains of Setchuen at an elevation of about 1700 feet. A single Rose, with rose-coloured flowers

FIG. 67.—*RANUNCULUS LYALLI*. (SEE P. 370.)

should appear crowded and to want more room they should be pulled apart *en masse*, and so divided, without further separation, when they may be potted in pots according to the room they require. After being potted, the most suitable situation for Japan Lilies is a cold pit or frame, where they should be plunged in coal-ashes, which will prevent the soil drying and keep them in a more natural uniform condition than they would be if the outside of the pots was exposed. By managing thus there is no occasion to water till the plants move, and that is a great point gained, as however cautiously it is given they are apt to get more than is good for them, as they cannot take it up and make use of it. J. S.

**CRANBERRIES.**—Although much of this fruit is imported into this country, notably from America, its culture might be profitably undertaken in naturally suitable places at home. Much swampy land still exists that might be turned to such a use. Where the soil is naturally damp and rests on a bed of porous material and there is free circulation of air, the American Cranberry (*Oxycoccus macrocarpa*) grows quite luxuriantly.

lost, for they arrived in France during the unfortunate Franco-Prussian war.

The chief constituents of the high forest region are three or four species of Abies mixed with Birch trees, Cunninghamia, two Pines, a Cephalotaxus. They hardly ever extend beyond 6600 feet in elevation; the same applies to the Quercus, numerous Laurels, Pavias, and tall Cornus. There is a quantity of trees of all shapes, which I do not know for the most part, and which seem new to science; and with which Rhododendron, Buxus, Aralia, and Bamboo, form impenetrable thickets, tenanted by the beautiful Amherst pheasant. Near the ravines Mahonias and Berberis abound, as well as numerous species of Ribes, Rubus, Spiraea, Hydrangea, Hedera, Aralia, &c. The curious tree which Mr. Baillon has kindly named after me Davidia tibetana, grows also about 6600 metres in elevation in company with a great Cerasus, with small red fruits; a gigantic Corylus, a Quercus, with a corky bark; various Laurels, numerous Ficus, differing greatly from one another in height and appearance, some forming large trees of majestic appearance, others climbing as parasites on the bark and on rocks; one species creeps over the ground, and only produces its very

of a sweet scent, grows in the woods of Moupine; but the white flowering species with long shoots abounds there, as it does through all Central China.

Among the numerous climbing shrubs I ought to mention one which is remarkable for having largely developed floral bracts, like our Bougainvillea, but white; also the Glycine, so common on the hills of the eastern provinces, but which is absent from the west. I have not seen here either the wild Camellia, with white flowers of moderate size, which is so abundant in the district of Kiangsi, where the best table oil to be had in the country is made from the fruits [seeds?]. As to the Chamærops, it may be seen prospering in Setchuen and Moupine up to an elevation of 3400 feet, supporting with impunity the colds and snows of winter. This tree, the only representative of Palms in Central China, does not grow spontaneously farther north than the basin of the Yantze. In this region is found in a wild state and in abundance the Loquat of Japan and a Ligustrum. The Chinese make use of a Privet with persistent foliage, and of the Fraxinus sinensis, to raise their wax insect (*Coccus pela*). Pistacia sinensis and Elæagnus edulis, as well as Citrus triptera, the only wild form of the genus, are found here. I ought not

to forget to mention an Arundo, very near to our A. Donax, if not identical, which I have never seen but in Setchuen, whilst the Phragmites abounds near all freshwater courses.

The trees cultivated in the province of Setchuen (which is considered to be the most beautiful and richest of the empire) and which need man's care to propagate them, are the same as those found in all Southern China: Mandarin Pear, Peach, Plum with red flesh, Dryandra Stillingia, immense Ficus lucida (near the pagodas), and above all, a numerous assortment of splendid Bamboos, which the inhabitants make use of in a vast number of ways. Besides the ordinary Tea, spread throughout one half of China, in the mountains of Moupine and Setchuen, a second species, called "White Tea," is cultivated; it is a shrub much grown, with slightly hairy leaves and of an elongated form.

The herbaceous flora of Moupine, and of the large mountains of Western China is proportionately less rich than the arborescent vegetation, but it is always more interesting there than in the north of the empire, where monotony is the striking characteristic of the vegetable kingdom. And if the northern flora comprehends a certain number of European genera and species it is not so in Eastern Thibet, where these last are only represented by accidental introductions. I should say that it is only a few years ago that the culture of Maize, Potatoes, and European Cabbages was introduced into these mountains, and without which it would only be possible for a small number of hunters to live. Another observation of interest is that when the old forests are destroyed by fire for the purposes of agriculture, the denuded land gives spontaneous birth to other vegetation, to a great quantity of Sinapis with oily seeds, from which the natives obtain two or three good harvests without any labour. As this species of Sinapis (which is largely cultivated by the Chinese throughout the empire) is not seen growing in the woods, one asks with astonishment, Whence and how has it originated?

I should lengthen my letter without measure if I undertook to review the herbaceous plants of Moupine—those, more easy to prepare than the woody plants, are consequently better represented in my herbarium. I conclude by adding that in the valleys of Eastern Thibet I have counted fifty species of Ferns, and that in the high prairies of that region I have commonly found a large Rhubarb with palmate leaves, whilst the species with entire leaves is the only one that grows on the hills of Northern China and of Mongolia. The roots of these two medicinal plants are hunted after with avidity by the mountaineers, and constitutes an object of active commerce all over the empire. *Armand David, in Franchet's "Plante Davidiane."*

### TELEGRAPH POLES.

THE 900 miles of additional telegraph lines required outside of London for the cheaper service in August next have robbed the Norwegian Pine forests of some 20,000 trees. English Larches used to be employed for telegraph posts, but they proved to be sadly wanting in durability. The wood was of too close a grain to permit of its being impregnated with creosote, but yet incapable of resisting the effect of moisture for any great length of time. Larch, therefore, has been discarded, and all our telegraph poles are now imported from Norway.

In America they appear to have given the closest attention to this subject, for it has been found that dividends are very largely dependent on the durability of poles. They use various kinds of wood, Cedar by preference, and it is said that the durability of a pole depends to some extent on the time of year in which it is cut down. A sound Cedar post felled in winter, when the sap is low, will last for sixteen years. A Spruce pole will last seven years only under the best of circumstances. The soil in which they grow is said also to have considerable influence on the lasting powers of telegraph poles, and no doubt also much depends on the soil and situation in which they are planted for service. In America it has been found that the whole of their lines want completely renewing every two or fifteen years at the utmost. The importance of the supports of a telegraph line becomes particularly obvious when it is remembered that the breaking of a post involves not merely the necessity of renewing it, but also broken wires and interrupted service by throwing the various wires one across the other.

It seems probable that by-and-by Norwegian

Pines in this country will give place to iron posts, which of course may be made somewhat more ornamental than bare Pine poles, and possibly would prove sufficiently durable to more than counterbalance the extra cost. This is a point, however, which at present seems to be doubtful. An iron post will cost four times as much as a wooden one, and how many times longer it will last there is at present no sufficient evidence to show. A fourfold initial outlay is a matter that is not to be altogether overlooked. *Daily News.*

### THE INFLUENCE OF DIRECT SUNLIGHT ON VEGETATION.

(Concluded from p. 275.)

NOWHERE else is the influence of insolation more distinctly observed than in the Arctic regions. It is known that in high latitudes the heat of the sun's rays in summer is often very great. Richardson remarks that (being under about 60° N. lat. near the Slave River) he had never felt the heat within the tropics so oppressive as he experienced it on some occasions in these Arctic regions (Richardson, *Search Expedition*, vol. i., p. 144), though the sun's rays are here always horizontal instead of vertical, as is the case in the tropical countries. The enormous multitude of mosquitos suddenly appearing in spring, when the ice is thawing, and in places where there is water for their larvæ (swamps, pools, &c.), is also much greater than in India.

The following observations may give some idea of the difference between the temperature in the shade and that in the sun's rays.

At Fort Franklin, Great Bear Lake, North America, in 65° 12', the mean temperature in the last part of March or the beginning of April is about 0° F.; the effect of the sun's rays on the blackened bulb of a thermometer, however, is sufficient to raise the mercury to 90° (Richardson, *Search Expedition*, vol. ii., p. 254).

Comparing these observations with those within the tropics we see that the difference between the maximum temperature in the sun in these regions and the northern is relatively small. Maximum temperature in the sun, 1882:—Calcutta, 162°; Bombay, 151°; Colombo (Ceylon), 157°; Barbados, 156°. But in dry climates the difference is greater:—Melbourne, 169°; Adelaide, 180°. The mean humidity at Adelaide was only 58 per cent.; highest temperature in shade, 112°.

Even in the North American Arctic archipelago, in Smith Sound, lat. 78° 30', where the mean summer temperature is only 33° (June, 30°; July, 38°; August, 31½°), Kane's observations with the black bulb thermometer gave the following results:—From May 16 till September 4 the temperature in the sun's rays was constantly above the freezing point (with the exception of May 22, when this was not the case); on June 15 it reached 48°, on the 26th 54°, on July 5, 70°, and on August 11, 66°.

Observations at Pavlovsk, Russia, Lat. 59° 43'.

It is clear that the influence of the sun's rays increases with higher latitude, because the sun in summer rests above the horizon.

\* *Annalen des Physikalischen Central Observatoriums, St. Petersburg, 1881.*

Now we come to the main point, viz., the effect of the direct solar heat on vegetation in the northern regions.

In Novaya Zemlya the vegetation (consisting chiefly of herbaceous plants) is, in places exposed to the sun's rays (at the foot of the mountains), like an arctic flower-garden, the surface of the soil not being covered with grass, as is the case in the temperate regions. The flowers are here of a much greater size than the leaves. In this island, and even in Spitzbergen, the snow disappears in summer by the action of the sun from hills exposed to its light; but on Ben Nevis in Scotland, being a difference in latitude of more than 20°, the snow rests sometimes the whole year.

In the Tundra of Siberia, on the declivities of hills sheltered from the winds and exposed vertically to the sun's rays, the same herbaceous vegetation, with its large, splendid-coloured flowers, is observed (Middendorff, *Sibirische Reise*, bd. iv., th. i., p. 733), but this is not the case in plains where the sunlight in its horizontal direction cannot have so much influence on the vegetation of the frozen ground; therefore these plains are in general really deserts, only covered with moss.

Insolation is also the cause of the rich vegetation in some parts of the mountains in the temperate zone (Alps, &c.).

Even in the most northern regions there may be a rich vegetation where the plants in sheltered localities are exposed to the sun. Parry (*Attempt to Reach the North Pole*) found the Scurvy-grass (*Cochlearia*) on Walden Island under 80° 30' N. lat. in such a luxuriant growth as he had never seen it before.

Middendorff observed, under 74° 30' N. lat., on the borders of Lake Taimyr, in Siberia, on August 2, a temperature of 52° in the shade, but a heliothermometer under glass placed in the sun's rays stood at 104°; an uncovered one marked, in the sun, 70°. The pitch on his boat was not only melted by this temperature, but flowed (Middendorff, *Sib. Reise*, p. 657).

But, as is the case also in lower latitudes, the greatest difference between the temperature in the shade and in the sun occurs in early spring. In June Middendorff was travelling in the Stanowoi Mountains, and saw a Rhododendron in full flower; when he was about to gather some flowers of this plant he found not only the roots, but even the stem, frozen hard in the soil. The temperature of the air was between 54° and 43°, but at night it was some degrees below freezing-point.

The assertion of some botanists that the contents of the cells, as soon as they are frozen, make the latter burst, thus causing the death of the plants, has been already refuted by Nägel; but the important observations of Middendorff have showed clearly that the severest frosts of the Asiatic arctic region, by which the innermost parts of the trees are frozen as hard as iron, have little influence on the tissue when the cold becomes gradually more intense; only when the temperature sinks suddenly below the freezing-point of the mercury the wood splits with a thundering noise. These crevices have a disadvantageous influence on the vegetation of the tree in summer, because in these places the plant often begins to rot.

The trees rest in a frozen state till, in spring, the sun's rays reach the upper parts, and here vegetation is raised, though the roots and lower parts of the stem are still in a frozen state.

But the most interesting discovery on this subject was made by Middendorff under 69° 30' N. lat., on April 14, near the village of Dudino; notwithstanding the clear sky and incessant brilliant light of the sun, the temperature at mid-day ranged from -4° to -13°, yet before and after this time from -24° to -35°. While going over the glittering snow he was suddenly stopped by the sight of a Willow catkin peeping about an inch out of it. The catkin was wholly developed, yet the branch on which it was observed was, 1 or 2 inches down, solidly frozen; this was also the case with the other parts of the plant hidden under the snow (Middendorff p. 653). Thus this little part of a branch was called to life, for some hours only, by the direct solar rays, in which it was thawed.

In the beginning of August, under lat. 74° 30', Middendorff found the soil exposed to the sun's rays heated to 86°, though the temperature about 4 inches below the surface was only 39°, and at the depth of about 1 foot the ground was constantly frozen (Middendorff, p. 666).

It is clear that plants in the high northern regions,

when they vegetate, receive more warmth by insolation than is often supposed—1° by the direct solar light itself, and 2° by the heated surface of the ground. The snow and ice being melted by the sun, the necessary water and humid atmosphere never fail; even this is the cause of the luxuriant growth of grass on some places in the Tundra. The flowing water gradually communicates its warmth to the soil, and prevents also the nightly radiation.

All this is proof enough that, when the mean temperature in the shade is known, this is not at all sufficient for a knowledge of the real temperature by which the vegetation of several plants is raised. What might have been the temperature in the tissue of the little branch, and also in that of the Willow catkin, of which we have spoken? and this when the temperature in the shade was so many degrees below freezing-point.

In the temperate regions vegetation commences in spring, when the difference of temperature between night and day is greatest; in the high north this difference is often insignificant, because the sun rests above the horizon; but the temperature of the soil being at this time very much lower than that of the objects exposed to the sun's rays, even this great difference is the cause of the very rapid vegetation in sheltered localities and under the influence of the solar light.\*

In conclusion we must remark that the facts thus briefly mentioned show how much a new system of bio-meteorological observations is wanted to ascertain the real quantity of warmth and sunlight necessary for the growth of plants, many of which are of the utmost importance in the life of man. *M. Buysman.*

## THE NOMENCLATURE OF ORCHIDS.

WE are now within a short period of time from the Orchid Conference, and one point that certainly deserves the attention of experts is the very important subject of naming. I have given a good deal of my time during the last ten or fifteen years to the study and the culture of Orchids; and I have no hesitation in saying, that the most difficult part of the subject to grasp is the principle on which they are named. I have protested again and again, at meetings and elsewhere, against the practice of attaching specific names to what are undoubtedly merely the varieties of a species. To illustrate my meaning, let us take one of the most popular of all Orchids—*Odontoglossum crispum*. This was introduced in 1844, and named by Dr. Lindley, and the name well describes the character of the flowers. Some fifteen or twenty years subsequently it was renamed in this way: the white ground varieties, with scarcely any spotting, took the cognomen of *O. Alexandræ*, and the blush spotted form *O. Bluntii*. For several years these specific names were used indiscriminately, until Messrs. Veitch, of Chelsea, exhibited the plant under the name of *O. crispum*, not without some loudly expressed protests against the alleged irregularity of their proceedings. When the irregularity is traced to its source it must be placed on the shoulders of those who in ignorance gave the specific names of *Bluntii* and *Alexandræ* to an Orchid which had already received its specific name, and that one descriptive of the character of the flower. Keeping to the same genus, it is well known that there is considerable variety in the ground colour and also in the spotting of *O. Rossii*. A year or two ago one with quite a pale yellow ground was sold at Stevens' rooms. The same form has flowered in other places. I saw it very fine at Messrs. Shuttleworth and Carder's, Clapham Road, lately, under the specific name of *O. asperum*. No one, I take it, has any doubt of it being merely a form of *O. Rossii*, why then make another species of it? Again, who is responsible for the specific name, *O. Hrubyanum*? It is not a distinct species, but a white form of *O. cirrosum*. A correct and descriptive name for it would be *O. cirrosum* var. *alba*. We have also been told during the last few years that the scarce plant, *O. nævium majus* is not correctly named, and that the true *O. nævium majus* is a plant of the gloriosum type, of no great beauty, and of very little value

commercially. So greatly have even our best cultivators been led astray over the *Odontoglossum* nomenclature, that the name of *O. crispum* is not used at all in the last edition of the *Orchid Growers Manual*! *O. Bluntii* is given as probably a variety of *O. Alexandræ*. Let the specific name of any Orchid be decided once for all [if possible]: the rule ought then to be that no merely varietal form of it should be called by a specific name. [Our correspondent overlooks that these are matters of degree, differently appreciated by different people. ED.]

I am not sure whether there is not greater confusion in the *Dendrobium* genus. Referring to my notes of the last committee meeting at South Kensington, I find *D. heterocarpum album* received a First-class Certificate. The first name given to this plant was *D. aureum*, and yet some authors give it as a synonym of *D. heterocarpum*. Paxton's *Botanical Dictionary* says that *D. aureum* was introduced from Ceylon in 1836, and *D. heterocarpum* from Khoosea in 1837. This sets the matter at rest as far as the original name is concerned. *D. heterocarpum album* would do very well, but if, as it ought to be, the original name is *D. aureum*, then some other name than *album* should be given to the white form. *D. moniliforme*, *D. macrophyllum*, and even the very recent *D. philippinense*, will require to be correctly named. The last is sometimes given as a species, and at other times as a variety of *heterocarpum*, which is itself nothing more than a synonym of *D. aureum*.

I quite agree with Mr. De B. Crawshaw, that the Orchid Conference should be "kept going all the year round." It is impossible to do any real good unless this plan is adopted. Most of us remember the interesting lectures given by Mr. Bateman on Orchids at the bi-monthly meetings of the Royal Horticultural Society. Such lectures might have very easily been developed into conferences. When the Orchid Conference announced for May 12 and 13 has been held, the lack of material for illustration will be painfully felt. The winter, early spring, late summer, and autumn flowering Orchids will not be seen at it. It will certainly be an arduous undertaking to hold a Conference twice a month on Orchids, but it will have to be done, and "Where there's a will there's a way." The season for Daffodils is practically a short one, and the Conference at the height of the season brought in nearly the whole of the genus. In the case of Orchids there is not one genus, but many, and not a third of them could possibly be brought in on any given date. *J. Douglas.*

## AMARYLLIS AT J. VEITCH AND SONS', CHELSEA.

THE Amaryllis-house at Messrs. Veitch's nursery is just now literally illuminated with bloom, there being over 1400 flower-spikes, and these will give a magnificent succession of bloom for some time. This number does not nearly represent all that are to flower, as there are over 2000 flowering bulbs to bloom this season. A great many bulbs are in flower for the first time just now, and from amongst the most noticeable of these we have selected the following:—

The Climax, a very fine large flower, from 8 to 9 inches across, with petals of fine substance, of a very deep crimson-scarlet; Navarino, fine form, scarlet, with green eye; Jason, white, flower of good substance, deeply feathered with scarlet; Correggio, very floriferous, vivid crimson-scarlet; Glencarn, finely formed, deep scarlet flower, streaked green and white; Lord of the Isles, vivid scarlet, without any eye, distinct; Charmer, claret, streaked with white; Duoholme, bright scarlet, greenish-white star, large flower; Euripides, finely shaped white flower, with reddish-purple markings; Valida, a very brilliant scarlet; Oiranto, claret, with white central bands and deep central spot; Mark Tapley, greenish-white star, tipped with bright red; Picotee, creamy-white, with a narrow distinct crimson edging, very distinct; Roderigo, brilliant scarlet, with a white band in petals; and Helvetia, crimson-lake, with pure white flakes, very distinct and pretty. Other choice varieties conspicuous amongst the forest of spikes are Royal Standard, Princess Ida, Sir Redvers Buller, James Douglas, Clarinda, Ceres, Empress of India, Chelsoni, and Lady of the Lake, fine flowers that have been seen at various times and duly noticed in these columns. The display is none the less pleasing on account of the health and vigour of the plants,

## FUCHSIAS.

THE illustration at p. 209 of Mr. Lye's magnificent Fuchsias may well prove instrumental in inspiring some other gardeners—younger ones especially—to strive to imitate the champion of the West in the cultivation of one of the most elegant and beautiful of all greenhouse plants. Though it is not all who can grow such big plants—at least very many may produce handsome specimens of medium size and exceeding beauty—plants that would prove of the greatest value for house decoration, if unable to display their charms at flower shows. We find in many gardens (and flower shows give ample evidence of the same) that easily grown foliage plants, especially Ferns and Palms, are preferred to those beautiful flowering plants which need some patience and skill to produce really good specimens. Almost any one may have these elements of greenery for the asking, they grow so freely and with so much ease. For those reasons it should be the aim of framers of flower show schedules to repress such effusive tastes for ordinary forms of foliage, by making the prizes of moderate amounts, whilst those for classes of flowering plants—Fuchsias especially—should receive more than ordinary encouragement. There are many so-called first-class shows about the country, at which one plant, much less a dozen of such Fuchsias as Mr. Lye grows, is seldom, or perhaps never, seen. Now that those grand plants have been so widely illustrated, perchance show committees may make an effort to promote and encourage high-class Fuchsia culture.

In describing the excellent travelling capacities of Mr. Lye's plants, stress is laid upon the careful tying which they receive. That is, of course, one important element in successful culture for exhibition, but still something is due to varieties that by reason of habit travel well; indeed, some kinds retain their bloom much better than others; hence are always better travellers. But very much is due also to the short-jointed, hard, and very floriferous growth promoted in the plants by exposure to the full light of the sun and free circulation of the air. It was most fortunate circumstance, after all, that the grand specimen plants illustrated were not photographed at the exhibition as originally intended, as then some admirers would, perhaps, refuse to admit that such splendid fellows could have been grown in the open air. That the picture presents them really in their outdoor summer quarters is proof positive that the sun and air have been potent agents in their production.

I remember many years since going into a garden in the New Forest, and seeing there plunged into a big bed of leaves a number of fine young pyramidal Fuchsias, which, in 2 inch pots, were developing into noble plants. The position was full south, with a belt of trees behind breaking the force of strong winds. The plants were occasionally turned, that the sun might play upon each side and thus produce what is so essential in a good pyramid, evenness and symmetry. That was an idea in Fuchsia culture which I found later to be of good service, although I could not command beds of leaves, I managed to find ashes, for in those days that useful article cocoa-fibre refuse had not been introduced to gardens. It is so long since that I have almost forgotten the names of the kinds then in vogue, but certainly none equalled in excellence those fine sorts which Mr. Lye has sent out. Not a few of the old Fuchsias were obstinately indifferent to form and symmetry, and only with exceeding difficulty could be made shapely; therefore any sorts that were specially amenable to training through the mere act of pinching were held in the highest esteem—they are so still, and such kinds are always the most free to bloom.

Cuttings put into sandy soil and in pots in the autumn soon made roots, and at the beginning of the winter were shifted into 60's singly, though not materially assisted with heat. At the commencement of the next spring, shifted into 48's, and given a temperature of 50°, the plants soon made strong growth, and the moment bloom displayed itself at the points the shoots were pinched, and new shoots promoted. The next shift was into 24's, using good loam mixed with old Cucurbit-bed manure and leaf soil. By this time the plants were some 2 feet in height, supported with one stake for the main stem, and from the base well furnished with growth, but not a bloom-bud was permitted to develop. The plants were now large enough to be plunged in a bed of ashes in a somewhat sheltered place outdoors, and here encouraged to make renewed

\* In 50° N. lat., on the banks of the Amur River, where the situation with regard to the ground-ice in spring is the same as in the Taimyr country, *Nasturtium* and *Calamagrostis* plants were observed to grow about half a foot every day (see *Beiträge zur Kenntniss der Russischen Reiches*, band xxiii., pp. 547, 617).

growth and fill the pots with roots, the plants being turned occasionally and kept well pinched. It is of the very first importance in the building up of a good pyramid plant that the leader shall never become bare of side shoots, hence the moment bloom-buds appear the leader must be pinched or stopped below these bloom-buds, and a fresh leader formed from the next leading shoot. Presently the plants needed a shift into 9-inch or 10-inch pots, according to size; and thus, with constant attention in the matter of pinching for a few more weeks, very perfect specimens, ranging from 4 to 5 feet in height, were formed, which became through the autumn months pyramids of bloom. As the pots filled with roots weak manure-water was applied, but when stopping ceased and bloom was encouraged the soakings of liquid-manure, obtained from horse-droppings, were given twice a week. These plants, kept henceforth in a cool position, would bloom superbly for some two months. Stored in winter, just as Mr. Lye keeps bis, and so cut back in the spring, and either shaken out and repotted or liberally top-dressed, these specimens would increase in height and breadth and make very fine plants for show during the following summer. If Art will build up the frame of a specimen, Nature will soon do the rest. A. D.

### ALPINE PLANTS.

*DRYAS OCTOPETALA*, L.—This is one of the most graceful of the plants of the Alps. It is called "Swiss Tea," because the population of the alpine cantons make a drink from it which with them takes the place of tea. It occurs everywhere in the region of the Alps, but it seems to prefer more particularly calcareous soils. It is hardly to be found above 7200 feet in elevation, and its inferior limit appears to be about 4900 feet.

Some horticultural books, on account of its generic name, say that this species grows in the woods, but this is a complete error. It is never found in the shade, but always exposed to the rays of the sun, and on a stony soil, frequently limestone. Often it is found on rocks most exposed to the sun, and where the rays penetrate into the fissures. It continues in bloom a long time in the Alps, and its clusters, which extend so as to form a carpet on which one may lie down, have flowers nearly all the summer. The shining green of its foliage, white and tomentose underneath, the graceful form of the crenate and dentate leaves, produce a pleasing impression on the traveller who visits the Alps; but when the immense tufts of dwarf procumbent verdure are covered with flowers, each like a small wild Rose without its thorns, the effect is very striking. One cannot help plucking some of them, and what traveller is there who has not wished to lay himself down to rest on these inviting tufts?

Unfortunately these plants throw out suckers, and extend so much over the ground that it is impossible to take them away; they are too large, and will not root again. If success is desired in the transplantation, the young runners in the dry beds of torrents, on stones, or in the fissures of the rocks, must be chosen. It is difficult to obtain all their roots, but if they are taken in autumn they generally succeed, and flower the following summer.

When they are collected in summer it is preferable to take them from a fertile soil, and surrounded with green turf or other plants, so that the soil may be kept round their roots. It is too dry here (Geneva) just now to permit transport and transplantation of runners taken from a sandy soil, loosened by the roots, on account of its want of consistence. In autumn this inconvenience does not exist, and, moreover, there is the advantage of being able to transplant the *Dryas* with all their roots, which are much easier obtained in a sandy soil than in any other.

The *Dryas* should be placed in a calcareous rock-work, in the sun, and in large and deep pockets, of which the bottoms should be filled with limestone, so as to secure perfect drainage. The soil should be peaty, rich in humus, but not heavy. Use one-third loam, one-third leaf-mould, and one-third peat and sand.

The plant in the Botanic Garden of Geneva measures nearly a metre in diameter, and has only been on the rocks about six years. Under cultivation the *Dryas* flower as freely as in the Alps, but they do not produce the same effect, because their flowers do

not appear all at once, but succeed each other all over the tuft from May 1 to the end of November.

The seeds I collected in the Botanic Garden were not fertile, and I have never been able to raise seedlings from them. Last September I sowed a pot with seeds of *Dryas* collected some days before on the Jura, and they germinated in about eighteen days. I believe that the seed is the best means to employ to raise the plants. *H. Correvon, Jardin d'Acclimatation, Geneva.*

### CATTLEYA LAWRENCEANA.

WE give in fig. 68 as accurate an appearance of the bulbs and leaves, and in fig. 69 the actual size and form, and such indications of the superb colouring as is possible in a woodcut, of this fine introduction from the hitherto unexplored region, Roraima, in British Guiana, the full description of the flower, foliage, and bulbs having been given in our last number, p. 338. A large consignment of this splen-

FIG. 68.—CATTLEYA LAWRENCEANA.

did new species will be sold on the 26th inst., by order of Mr. F. Sander, the enterprising importer, by Mr. Stevens, at his rooms in King Street, Covent Garden, W.C.

### THE ELECTRIC LIGHT AND THE GROWTH OF PLANTS.

IN conversation with Mr. Isaac Buchanan, one of the best known florists of New York, this subject came up, and he stated that his observation inclined him to believe that when plants were used for decorative purposes in rooms where the electric light was used instead of gas, they seemed to have all the health and vigour as if growing under the light of a conservatory. He furthermore said that he had long ago observed that on moonlight nights there was always a better development of the flowers of Camellias and Roses during the winter months than when there was no moonlight. Hence he inferred that light, no matter how obtained, was beneficial to the growth of plants. This opinion from such an authority as Mr. Buchanan, who is well known to have had nearly half a century's experience, and who

has always been a close observer, is certainly worthy of great attention.

It is well known to all cultivators that the greater the amount of sunlight the greater will be the development of the flowers. We all know that in the dark days of December and January the growth development of Rose buds, Carnations, &c., is less than half of what it is in the months of March and April, when the days have lengthened, and the increased sunlight gives nearly twice the amount of light. Few commercial florists have the means or time for such expensive experiments as would be necessary to determine whether the use of the electric light in forcing flowers and fruit in greenhouses during winter could be profitably employed. It is a matter of sufficient importance, it would seem, for the Agricultural Department at Washington to take hold of. For be it known that the gardening industry now in the forcing of vegetables, fruits, and particularly flowers, has millions [of dollars] of capital invested in it throughout the land, and gives employment to tens of thousands of men; and if Nature can be aided by this wonderful electric light it will be a leap forward that the discoverer might well be proud of. *Peter Henderson, in the "Scientific American."*

### COLONIAL NOTES.

A DAY'S RIDE IN NATAL.—It is an old saying, that "What can be done at any time is seldom attempted," and so I have deferred till now to say a few words about the plant-life of Natal—a tempting topic, for we have a rich and varied flora, and about which one rarely reads aught in the pages of gardening journals.

It is midsummer with us, and work in the nursery—always pressing—is very urgent just now. Often I have wished to ride up to Howick and see the Umgeni Falls—for they are a fine sight, and such a contrast to the everyday routine of work. At last, one fine summer morning, I started on horseback, and alone, just as the rising sun peered over Table Mountain, which lies about 15 miles east of Pietermaritzburg. It had rained heavily the night before, and as I cantered slowly down the long street the Syringa trees—*Melia azedarach*—laden with their purple flowers, shook out their heavy perfume. Taking the Town Bush Valley road, and passing field upon field of Tuberoses, each pushing up its snow-white spike, the town was left behind, and after an hour's uphill ride I reached the dense bush—the object of my visit. Dismounting here, and turning the horse loose to graze, I, prone on the grass, tried to take a little rest.

But what are these handsome large orange-coloured flowers peeping out of the thicket beside that spring?—*Clivia* (*Imantophyllum*) *miniata*, no less; and now I see many more, varying a good deal in colour and choice of site, often growing on rocks, stones, and mossy trees. *Selaginella denticulata* forms a green carpet under the shade of a handsome Tree Fern, some 8 feet high—*Cyathea Dregii*; and here, too, is *Begonia Dregii*, *B. geranoides*, a very handsome dwarf white-flowering species; and another *Begonia*, undescribed in Harvey and Sonder's *Flora*, with orange-red flowers and reddish stems and leaf-stalks, said to make a good preserve. Lower down, by the edge of the stream, grows *Osbeckia Umhliasiana*, not unlike a *Lasiandra*, with its rich purple flowers and golden stamens. Alongside is a thicket of *Thunbergia natalensis*, with flowers dull purple in colour. A few trees in bloom take one's attention. *Syzygium cordatum*, resembling a *Eucalyptus*, covered with heads of white blossom; *Kigelia pinnata*, which looks strange from the pale red flowers springing direct from the old trunk; a *Cussonia*, with its handsome palmate leaves and stiff, candelabrum-like spikes of greenish flowers; a few bushes of *Ochna atro-purpurea*, with its black and crimson fruit; and a *Pavetta*, with its handsome white flowers and exserted style.

Wandering a little higher up I chanced on *Lissochilus speciosus*, a very handsome terrestrial Orchid, with a flower-spike about 2 feet in height, sepals brown, petals bright yellow,  $1\frac{1}{2}$ —2 inches across, pseudobulbs 3 inches long. Many other terrestrial Orchids were growing near. A *Disa*, like a fiery jet, some 3 feet high, crowded with small orange-yellow flowers; another species has white petals, rose-tipped; a beautiful *Eulophia*, orange, with rich brown lip; and another, with golden-yellow

flowers in a dense head. We have many Orchids besides these, but unluckily there is no work describing them, or, in fact, any endogenous flowering plants native to this country. Here is running water, springs gushing out all over the hillside, and overhanging the water *Montbretia Pottsi* grows abundantly, its handsome red-yellow spikes rising and falling with every breath of wind. Here, too, are *Streptocarpus parviflorus*, and another species with small light purple flowers and one leaf, which often grows to a huge size—2 feet across.

But the sun is climbing higher—high time we were on our way. So onward and upward; for Howick is 1000 feet higher than Maritzburg, which again is 2600 feet above the sea. Passing along on the outskirts of the bush, I notice *Littonia modesta*, so like a *Gloriosa* in habit, with its six-parted yellow perianth.

grassy plains on either side; more flowers peep out of the grass—*Hypoxis latifolia*, with bold funnel-shaped flowers; *H. elata*, with long narrow leaves, flower large, handsome, bright yellow; *Diets Huttoni* is in seed, for it is our earliest spring flower, flowering in October when the summer rains begin, followed by a beautiful scarlet *Cyrtanthus*, called the Flame Lily. Dotted over hill and dale like Mushrooms is a flower resembling a single white *Petunia*, a species of *Cycnium*: many *Asclepiadæ* grow here, some resembling a *Hoya*, one in particular, with huge clusters of green flowers might be a *Lagaristhus*, another with a huge Turnip-like root and small purple flowers of peculiar structure is a *Raphionema* (*Thesaurus Capensis*, t. 66). *Gladioli* are plentiful and many other Irids.

After a long climb I gain the hill-top, and am

but until lately was unable to determine it. To give an idea of how little is known about our native plants a man—I should say a nurseryman—whom I asked regarding the last-named plant, he, having seen it, referred it to *Gaultheria*!—though how he came to this conclusion it would puzzle any one to say.

In the valley beneath the Zwartkop a *Crinum* is plentiful, like *C. Forbesianum*, but the anthers are black. On the Umlass River I have seen the river valley a mass of colour, caused by the vast quantities of *Crinums* growing there—some pure white, some pink flushed, and others banded with red; they are superb flowers. Now we are nearing Howick: in one spot the ground is pink with the flowers of a large bulb, perhaps a *Brunsvigia*; here and there grows *Pentanisia variabilis*, one of the *Rubiaceæ*, with deep blue heads of flowers. *Richardia macu-*

FIG. 69.—CATTLEYA LAWRENCEANA. (SEE P. 374.)

*Sandersonia aurantiaca* is also seen with its campanulate yellow flower. Conspicuous amongst the green leafage is *Sparmannia africana*, a snow-white mass; also *Polygala variegata*, erect with spikes of purple bloom. Here, too, is *Leonotis leonurus*, with dense whorls of bright orange flowers; *Burchellia capensis* in full bloom. Underneath these bushes is a very elegant thing which looks like *Adiantum æthiopicum*, but turns out to be a *Thalictrum*, perhaps *T. rhynocarpum* (see *Gardeners' Chronicle*, January 22, 1884, p. 22), remarkable when in seed, each single fruit hanging by a long hair-like thread. The flowers are very small and inconspicuous. A huge bulb grows plentifully here with a long spike of flowers and pink stamens—*Drimys altissima*; and scrambling over the bushes is a *Clematis*, *C. bracteata*, I think; also a singular bulbous-rooted leafless climber, *Bowia volubilis*.

At last I gain the high road, with boundless rolling

nearly level with my destination. About 4 miles to the left is Zwartkop, a flat topped hill towering some 2000 feet. Many fine plants grow on the top—*Greyia Sutherlandi*, with trunks 3 feet through and 15–20 feet high; other things handsome and unknown to me. On the eastern slope I once found *Cyrtanthus lutescens* and another plant, of which I wish to say a few words. It is one of the *Compositæ*, subtribe *Mutisiaceæ*, a stemless perennial, radiate-flowered herb, with the habit of a *Gazania*; leaves oblong-lanceolate: flowers 1½–2 inches across, of a rich bright scarlet colour. I take it to be *Gerbera aurantiaca* (*Fl. Capensis*, vol. iii., p. 523). Dr. Harvey describes it as “a very handsome species,” but dried specimens, which probably he had before him when describing the plant, give a poor idea of the living thing. Growing amongst grass on dry fully exposed hill-sides it might be treated in cultivation as a *Gazania*. I have known this plant for a long time,

*lata* is common, and more rarely a beautiful little golden Sedge. At last Howick comes in sight, a straggling village interspersed with plantations of trees consisting of *Eucalypti* and *Acacias*. Putting up my horse at the inn I make for the Falls, a few yards distant. The Umgeni River here makes one leap from the table land above down a huge cleft in the rocks some 360 feet perpendicular. Scrambling down a rough path strewn with boulders I reached the water edge below. Truly it is a fine sight, the white rill of ever-falling water with its everlasting roar, the vapour mists curl up, and are lost in the blue sky. Near the bank grows a fine yellow Irid, much like *Diets Huttoni*, and at the base of the cliff are vast quantities of *Richardia africana*, their snow-white spathes delighting in the cool moist air. Near by *Hæmanthus natalensis* is very plentiful, with its huge head of yellow stamens and red-brown spathes. High overhead, struggling for life in the seamy rock,

is *Agapanthus umbellatus*, together with what looks like a small yellow-flowered *Aloe*. Many other plants are seen, but not being in flower I could not name them. But the sun is getting lower, and will soon sink behind the far-distant Drakensberg, so I scramble up to the top again, noticing many *Zamias*, from one-leaved seedlings to ancient standing 6-8 feet high, with a vast crowd of spreading fronds atop 10-12 feet across; each leaflet has but one spine. It is a long climb up, laden as I am with sundry roots and bulbs. The mist is coming up from the sea, and the evening shadows fall thick and fast. Now for a 12 mile ride home. Nearing town I hear the cricket's shrill cry, the frogs croak loud and incessantly, the fire-flies dance and gleam, and the night air is heavy with Orange and Tuberose perfume: the holiday is over. *R. W. Adlam, Pieter-Maritzburg, Natal.*

## ORWELL LODGE, IPSWICH.

THIS, the residence of R. C. Ransome, Esq., of the famous engineering firm of Ransome, Sims & Jefferies, is pleasantly situated on the Stoke hills, the pleasure ground in front of the house opening out in a deep gorge, well broken up to the right and left, where on high knolls there are bold clumps of trees, and running sharp down into the park-like meadows below, over which a splendid view of the picturesque river Orwell, with its well wooded banks, is obtained. The kitchen garden and plant and fruit houses lie in a hollow, open to the south-east, and are, therefore, well sheltered on the northern side, but though this is so it is found, as is usually the case in low-lying places, that the late frosts in spring often cut off the fruit blossoms. The Pears and Apples, which are planted along the sides of the walks, are mostly trained in the pyramid or bush forms, the whole of the trees being very clean and well set with bud. The main range of houses is in four divisions, three being devoted to the growing of Grapes, and the other is used as a stove, and has in it a mixed collection of Orchids and other plants. In two of these houses the Vines are quite young, and are planted near the back wall, up which they are led with clear stems 8 or 10 feet high, and then under the hipped roof, and on down the front, which is steep. The Vines were breaking very strong at the ends, and were showing fine bunches of fruit. The sorts in the middle division are Mrs. Pince and Muscat of Alexandria, the former of which Mr. Munday, the gardener, colours well by keeping the foliage healthy, and giving plenty of air. In the end house the sorts grown are Raisin de Calabre and White Tokay, with the latter of which Mr. Munday was first at the Ipswich and East of England Autumn Show, the bunches being large and compact, with fine berries of a rich amber tint; and as this sort has done so well, and is so superior in flavour to the Raisin de Calabre, it is intended to work the one on the other.

The object in making the border inside, and planting and training the Vines in the way referred to, was to give them as wide a root-run as possible, as they can go out under the front wall, where the ground is on the same level, but soon recedes rapidly, and the wisdom of the arrangement so far is shown in the success attending it, and the great strength of the rods. In the Hamburg-house the Vines are old, but still very healthy, one of Wilmot's, with a large stem, filling a good deal of space, the canes being carried up to the top and down again according to convenience, and to have them where wanted for covering the roof.
