The stove at the end contains some fine Orchids, and among them a very superior variety of *Oncidium Kramerii* in full flower, and two distinct kinds of *Cattleya Trianae*, the one being pale, and the other nearly as highly coloured as *C. labiata*. Abutting on this range, and leading from it, is one of Sir J. Paxton's patent houses—a span-roofed structure, the centre bed being filled by large *Camellias* in tubs, and the rest of the floor-space around them being occupied by mixed greenhouse plants, the side stages were filled with *Pelargoniums*, *Cyclamens*, *Primulas*, *Cinerarias*, and other soft-wooded subjects in flower. The chief collection of Orchids is grown in a light low span-roofed house, parallel to the one just mentioned, and has a pathway down the centre, with 4-foot beds on each side, made up of chalk, covered with a thick layer of loose shingle, from which cool bottom plenty of moisture is constantly

rising. The first plants to attract notice on entering were the *Cœlogyne cristata*, owing to their fulness of flower, one in a 48-sized pot having no less than seven spikes, and others were equally fine in proportion. Among the *Odontoglossum Alexandræ* one variety stood out most conspicuously as being exceptionally fine, and in this Mr. Ransome has a gem, as it is very rare indeed such are met with at sales, at one of which I was told this one was bought. The *Dendrobies*, of which there are some ten or twelve kinds, were remarkable for the hard short-jointed growth they have made, which is owing to Mr. Munday's treatment in giving so much light and air, and keeping a low temperature, for in the middle of February, the time of my visit, the thermometer stood below 60°, and air was coming in freely through the roof ventilators, as could be seen, as well as felt, by the movement of the spikes of bloom on the Orchids, which were waving about. At the end of the Orchid-house is a small stove, in which was a fine pot of *Eucharis* which had had twenty spikes of flower on it, and looked equal to produce that number again. Plenty of drainage, with good loam, peat and sand, and not much water during the winter, are the secrets of Mr. Munday's success with this, one of the most useful of all hot-house plants. The Rose-house is a low lean-to structure, and stands by itself, the floor and staging at the back being occupied with Roses in pots, and a *Maréchal Niel* in the border, showing hundreds of blooms, under the roof. *J. Sheppard.*

## ORCHIDS FOR AMATEURS.

(Continued from p. 247)

**SHADING.**—Shading by means of blinds is very necessary during the summer, indeed blinds are needed from the end of April, or even earlier, until the end of September. Many growers, to save trouble, paint the glass over on the outside with a mixture of starch, plaster of Paris, and water—plaster of Paris, 1 lb.; starch, 6 oz.; make a milk with water and add water until the mixture measures half a gallon. This may be painted on to the glass, and forms a good shade. There is, however, this great objection to its use—it cannot be removed after the sun ceases to shine on the house nor in dull weather. I use this mixture for the windows at the south end of my house, but prefer thin blinds of tiffany, which are easily removed as a shade for the roof. The tiffany should be stretched on light wooden frames provided with hooks to fix them to the upper part of the roof, as tiffany does not roll well and canvas keeps out far too much light.

### LIGHT.

Although few Orchids bear the strong sun when they are growing or flowering all want as much light as it is possible to give them, and many fail to flower from an insufficiency of light. There can be no doubt that the distance of the glass from the plants seriously affects their growth. The nearer they are placed to it the better they grow and the more likely they are to produce flowers. This has been a puzzle to me for years, for it does not seem easy to understand why the light should be more powerful near the glass than at a distance from it, unless the loss is due to the shade of the rafters, and if these are properly constructed they should not diminish the light very much. I have often thought that the better growth near the glass is due to a freer circulation of air, and to the fact that the heat is more intense there in the day, and less at night than in other parts of the house. Whatever the explanation may be, there is no doubt of the fact, that proximity to the glass favours the growth of all flowering plants, but with Orchids it is necessary to remember that many plants suffer from cold at night if they are too near the glass; we must, therefore, put them as near as possible, always remembering that those species to which cold is fatal should not be too near it, especially in the cold nights of winter and spring.

### COVERING THE GLASS.

I have seen flower-buds destroyed by cold when they have been allowed to remain within an inch or two of the glass. Some Orchids, especially *Odontoglossums* and *Oncidiums*, never flower if too far removed from the glass. In very cold weather, when the Orchids are resting, light is of far less importance, and I am in the habit of protecting mine by covering the whole roof, or even the side lights, with straw and matting. Sometimes they have been covered in this way for

three weeks without injury, but under such circumstances they must not grow; too high a temperature and too much moisture would then very much damage the plants. I believe that such protection is a far better means of keeping up a suitable temperature than driving the fires, for, as I have already remarked, very hot pipes in cold weather are very liable to dry the plants and scorch the more delicate leaves, as well as to favour the development of thrips and red-spider.

The best kind of protective covering is made of frames like light sashes, with straw fixed over them instead of glass. The straw can be readily kept in its place by nailing battens of wood over its ends and in the middle of each layer. The straw must be placed like thatch, and the lower ends of the straws above must overlap the upper ends of those below. No covering should rest immediately upon the glass, as when it becomes wet it will do little to protect the plants below, for the drying of the covering will rob the house of heat very rapidly.

Bast mats are not nearly so effective as straw, if the latter is properly arranged on frames—and this is especially the case when the mats are allowed to rest upon the glass. They are also far more difficult to manage. The same frames which are used for blinds in summer may be readily used for straw in winter if the stowage of two sets of frames is inconvenient. A few shillings expended in such frames will amply repay the amateur by saving both fuel and labour as well as by relieving him of all the anxiety attendant on a severe frost. *B. T. L.*

(To be continued.)

## THE PROPAGATOR.

### THE PROPAGATION AND CULTURE OF ALOCASIAS.

WE intend for the present to restrict ourselves to a description of the various ways of multiplying the following varieties, viz., *A. Chelsoni*, *A. gigantea*, *A. hybrida*, *A. intermedia*, *A. Lowii*, *A. metallica*, *A. Sedeni*, *A. Thibautiana*, *A. Veitchii*, *A. zebrina*, and *A. longiloba*.

### CUTTINGS.

One of the methods of propagating these varieties is by cutting out what is called the crown of the plant, and putting it in as a cutting. In making the cutting care should be taken to cut  $1\frac{1}{2}$  inch of the main stem with it. They can be potted into small 48-sized pots, but the soil should be pressed firmly around the cutting, at the base of which a little sand should be placed. Further on we have a few special remarks to offer as to potting, so it will not be necessary to give any directions here. A stick should be placed to each cutting, which should be securely tied to it, and after having been watered with a fine-rose pot they can be put into a cutting case upon a brisk bottom-heat. If the case is not deep enough to stand the cuttings upright they can be laid down upon their sides or tilted, provided they are moved to a different position every two or three days, otherwise they will grow crooked and deformed. The lights of the cases should be taken off for an hour both in the morning and at night, but an inch of air should be left on all night, at the same time the cuttings should be sprinkled with a fine-rose pot. They should also be shaded from the sun's rays. When the cuttings have rooted more and more air should gradually be given them during the few days before they are taken out of the case. When this has been done it will be necessary to keep them upon the open bottom-heat until they have become well rooted and established with hard (*i.e.*, not tender) foliage. They can then be potted into 32-sized pots, watered, and replaced upon the bottom-heat. When the plants have established themselves in this sized pot they can, if large plants are required, be potted into a larger-sized pot; but if this is not the case, they can be removed to any warm house where they may be required.

### THE OLD PLANTS.

The tops or crowns of these from which have just been taken out should have a little dry sand sprinkled over the fresh cut for two or three days in succession, in order to prevent the exudation of sap. They must be replaced and kept upon the bottom-heat, and should be given a moderate supply of water. They form a kind of stock plant, and should therefore be taken care of. As soon as the fresh growths which they

will put forth are strong enough they should be taken off, and potted up as cuttings, and treated in the same way as the crowns of the plants.

By BULBILS.

It is a habit of the *Alocasias* to produce young plants beneath the soil. In shape and size they mostly resemble a hazel-nut, and are generally found at the end of a thin stem that grows beneath the soil, although they are sometimes found near the main stem. The gardener must be exceedingly careful in his search for these bulb-like offsets, because, being of the same colour as the soil, and often found in the centre of a piece of fibrous peat or loam, or even amongst the cracks at the bottom of the pot, they often escape notice.

The offsets should be firmly potted into small thumb-pots, putting a little sand around each offset, and making its pointed centre level with the surface of the soil. After receiving a good watering they should be placed in a shallow cutting-case upon a brick bottom-heat. Here they should be watered when they become dry, and also shaded from the sun's rays. For ventilation the light should be raised for an hour at night and in the morning, but when the offsets have grown 2 inches in height, more and more air should gradually be given them for the purpose of making them hardy enough to be stood out upon the open bottom-heat: after they have been ten days upon this they will be strong enough for potting. They should then be potted into large 60-sized pots, and after having been well watered they must be replaced upon the bottom-heat. They can again be potted when the size and strength of the plant demand it.

#### POTTING AND CULTURE.

As the *Alocasias* require a large quantity of water, it is of great importance that the surplus water should pass off freely, and in order that this may be done, each pot must be well drained. A large piece of crock should be placed over the hole in the bottom of the pot, not so as to stop the passage of the water, but with the hollow of it towards, or arching over, the hole. The pot should then be filled to one-quarter of its depth with smaller crocks. The soil—which can be used for potting alike the plants, cuttings, and offsets—should be made up as follows:—Half good turfy peat, broken up into pieces about the size of a small thumb-pot; a quarter good turfy loam, and a quarter river sand, and to this should be added small quantities of charcoal broken up into pieces of Walnut size, chopped sphagnum, moss, and ballast, or broken potsherds. This mixture should be well mixed together, and moistened before it is used for potting purposes. In planting *Alocasias*, whether in the plant, cutting, or other states, it is necessary to make the soil high in the centre of the pot, and to make it slope gradually down towards the rim.

*Alocasias* should receive a liberal supply of both heat and moisture during the growing seasons, although for many weeks during the dull months of the year they require very little if any water. Excepting during the dull months they should be syringed twice a day, lightly shaded from the hot rays of the sun, and ventilated upon all warm days. T. O.

(To be continued.)

#### FRUIT NOTES.

**THE MARGIL APPLE.**—This excellent old English dessert Apple deserves to be more extensively planted than in general it is. The fruit is of excellent flavour, but is rather small. The tree is rather a slow grower, but it is an abundant bearer. It forms numerous spurs, which should be thinned every season; and the fruit will in consequence be all the finer. It forms a nice specimen as a pyramid, and does well as a bush, and being a slow grower is well suited for small gardens.

#### AROMATIC Russet.

This is an excellent and highly flavoured dessert Apple, which bears well. It is a free grower, and one of the most delicious and tender of Apples when in season. I have kept till May, and had the fruit fine during the spring months.

#### KING OF THE PIPPINS.

I cannot understand how this has got to be ranked among the leading kinds of dessert Apples. I have grown it for nearly forty years, and, no matter what

the season may have been, the quality of the fruit was always inferior, but when ripe it is always very showy, and a few fine fruits tastefully dished up make a nice show. The fruit is in season from January till April. The tree is an upright grower, and bears abundantly. If the fruit were a little larger it would make an excellent variety for market, its appearance being in its favour. M. Saul, York.

## Orchid Notes and Cleanings.

#### ORCHIDS AT OLDFIELD, BICKLEY.

I HAD often paid a friendly visit to Mr. Heims when he had charge of Mr. Philbrick's garden in the Regent's Park, and he had always something good in the way of Orchids to show me, and, what is ever pleasing and instructive to gardeners or practical amateurs, the plants were always clean and healthy—the *Phalenopsis* especially were excellent examples of good culture. When Mr. Philbrick removed to Bickley, many of the Orchids were sold, an entire clearance being made of the East Indian species. On my visit to Bickley the other day I found many of the old Regent's Park Orchids were still in the collection, with the addition of many choice new ones, all alike testifying by their cleanliness and general good condition that they were well managed. The *Cattleya*-house was the most attractive feature, and it is needless to say that the centre of attraction was the varieties of *Cattleya Trianae*. In this collection some of the varieties had been introduced years ago, and they held their own bravely against the recent importations. The variety *Penelope* was sold when Mr. Marshall's collection was dispersed from Enfield; the flowers are of a rosy-lilac colour, with a yellow blotch. Perhaps the best form in a large group was one purchased from Mr. Turner's collection about seven years ago; it is very lovely, and has broad well formed pure white sepals and petals, with a rich crimson-coloured labellum. Amongst the recently imported ones are some with very rich colours on the lip, and the beauty of some is enhanced by the sparkling effect of the deep yellow and orange throat. The delicately tinted group of which some are almost white was well represented; these are neither more nor less than forms of *C. Trianae*, although they have been grouped in another species as *C. Warszewiczii* *delicata*. Indeed there is no dividing line that I can see between these two species. *C. Warszewiczii* was introduced first in 1862. The name of *C. Trianae* was given four years later. *Laelia anceps Dawsoni* was very fine; a plant bearing two spikes was in splendid health. *L. anceps rubra* I noted as a richly coloured and distinct form. Mr. Philbrick has purchased a number of fine plants of the recently imported white forms, and all of which Mr. Heims has potted in the usual way. The plants are not so much trouble when they are grown in pots as when fixed to blocks or rafts, and my long experience has convinced me that, all things considered, pot culture is best. In passing round the houses many interesting plants in flower were noted. Here, for instance, was a little group of *Cypripedium insigne* and the variety *Maulei*. *C. insigne* itself is a valuable species, and some of the varieties are much finer than others. Large masses of *Coleogyne cristata* are well grown, the variety with lemon blotched labellum being very fine. *Laelia flava*, of a clear golden-yellow colour, was in full beauty—a cluster of ten flowers together rivetted the attention. *L. harpophylla* was also very fine. *Dendrobifolium glumaceum* was in flower, and filled the house with perfume. No collection of Orchids should be without this sweet plant. The drooping spikes are very beautiful in a mass, although the individual flowers are insignificant indeed. *Epidendrum Wallisii* was just opening its flowers, and there was a gorgeous plant of *Dendrobium Wardianum* splendidum in full flower.

#### THE COOL HOUSE

contained some choice varieties of various species, the *Masdevallias* being especially rich in variety. The golden-yellow *M. Davisii* was very fine. One flower that I measured was  $1\frac{1}{4}$  inch across by 2 inches long. *M. amabilis lineata* is a distinct form of this species. *M. Harryana rosea violacea* is a rosy-violet colour, and very distinct. In the *M. ignea* group there are some charming varieties; *M. ignea superba* is the most attractive; *M. ignea aurantiaca* has very large flowers with a yellow suffusion; *M. ignea Bodartii* is rosy-red with deeper lines. The most interest-

ing plant of the whole group was a fine hybrid form, raised, I believe, in Scotland, between *M. Lindenii* and *M. ignea*. It has the form of leaf and habit of plant of the first-named, while the flowers are nearer the latter. Their colour is a brilliant rosy-red with deep crimson lines. *M. polysticta* is in its way very quaint and very pretty: a well-flowered plant would be a feature in any collection. The flowers are very numerous, of a creamy-ground colour, thickly spotted with deep purple, each of the three segments of the flowers being adorned with yellow tails. *M. Crossii* is a complete failure. A healthy, well-grown plant was in flower, a small rosy-tinted little thing, which might be dealt with as a novelty by the Scientific Committee. I must say, however, that the dried flowers gave one an idea that this might be a good garden plant; the flowers at the best are not large, but six or eight may be found open at one time on a spike. The most interesting of the *Odontoglossums* was the fine yellow form of *crispum*; it has been named and certificated as *O. crispum aureum*, while the varieties of *O. Andersonianum* are as numerous as the plants. *O. Erstedii* major is decidedly a good thing. I have seen it in several gardens, and can say that it is quite distinct from the normal form, and far superior. A small collection of *Phalenopsis* has been formed, and they are grown remarkably well in a low span-roofed house. On the stage underneath there was an exuberant growth of *Fittonia argyoneura* and *Cyrtodeira fulgida* mingled together, producing a fine effect. There was an excellent example of *Phalenopsis Stuartiana nobilis*; *P. amabilis*, *P. Schilleriana*, and others are in fine flower and capital condition. J. D.

#### ORCHIDS AT SILVERDALE LODGE, SYDENHAM.

The collection of Orchids here is very choice, and contains some fine specimens. At present, being in a state of great luxuriance and having a grand lot of bloom, they are a sight well worth seeing. In a large house of *Vandas*, *Cattleyas*, &c., amongst the first plants we noticed was a splendid specimen of *Cymbidium Lowii*, we should think one of the largest in the country; it has seven strong spikes of bloom, each carrying twenty-seven or twenty-eight blooms, and will be a splendid sight when all are fully expanded. Amongst the *Vandas*, *saavis* and others were in bloom, and a fine lot of spikes was coming up. The *Cattleya Trianae* were just getting past their best, but we were luckily in time to see one of the finest we have ever seen in full bloom, named *C. T. Alexandrae*, the outer petals being of a most delicate tinge, somewhat approaching puce; the labellum has a blotch of the deepest purple, which gradually shades off to the white, and the throat is a deep orange, also fading into the white of the labellum; the flower is of medium size, but of fine proportions and substance. In other houses several fine forms of *Odontoglossum crispum* were to be seen, *O. Hierbstii majus*, *O. gloriosum*, *O. hystrix* var., fine; *O. Pescatorei*, *O. Rossii*, and *O. coronarium*, a fine plant, well flowered, something like *O. Insleyi*, only larger. *Dendrobiums* were very well grown, and had large and numerous spikes of bloom, and included the following varieties:—*D. Farmeri alba*, fine plant; *D. Wardianum*, *D. nobile elegans*, *D. japonicum*, very sweet scented; *D. crassinode*, *D. moniliforme*, and *D. splendidissimum*, one of Veitch's hybrids, very fine. *Sophranites grandiflora* was showing its conspicuous blooms; *Phaius grandifolius*, too, was fine. *Cypripediums* were looking well; *C. villosum*, *C. Maulei*, *C. concolor*, *C. Harrisianum*, with two flowers on a spike; *C. Argus*, and *C. Lowii*, had all fine blooms. *Masdevallias* were throwing up large quantities of spikes; *M. ignea* and *M. Massangeana* were in bloom. *Oncidium fuscum* was in flower, and *O. bicolor* had a very strong spike. This is a very useful Orchid, as it usually blooms in August and September when Orchid bloom is, comparatively speaking, scarce. Several fine plants of *Coleogyne cristata* were in bloom, a fine plant of *Cymbidium eburneum Dayii*, and *Laelia harpophylla* were also blooming freely. All the Orchids continue to be well managed by Mr. Catt, but if it were possible to instance any particular class, we should certainly pronounce in favour of the *Phalenopsis*, which are very luxuriant, not only as regards the great, thick, board-like leaves, which some growers sigh for, but the flowers also, which for quantity, substance, and size, are, we should think, very seldom excelled. The collection comprises the finest known varieties.

**DENDROBIUM WARDIANUM.**—In the issue of the *Gardeners' Chronicle* for March 15, 1884, is an account of a plant having thirty-two blooms on one growth. We have one just opening with thirty-eight blooms. Can any of your readers give a case where this number has been surpassed, or state the highest number produced by one growth, all open at one time? If ours is unusually good, and a note of its culture interesting to any of your readers, I shall be willing to give it. N. Blandford. [Anything touching on Orchid culture would be welcome. ED.]

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Mar. 23	Sale of Liliun auratum, Roses, and Plants, at Protheroe & Morris' Rooms. Royal Horticultural Society: Meeting of Fruit, Floral, and Scientific Committees, and Promenade Show.
TUESDAY,	Mar. 24	Unreserved Sale of the Suggall Hall Collection of Established Orchids, at Protheroe & Morris' Rooms (two days). Sale of Camellias, Azaleas, Roses, &c., at the City Auction Rooms, by Protheroe & Morris. Bath Bulb Show (two days).
WEDNESDAY,	Mar. 25	Sale of Hardy Plants and Bulbs, at Stevens' Rooms. Glasgow and West of Scotland Horticultural Society's Show, St. Andrew's Hall, Glasgow.
THURSDAY,	Mar. 26	Sale of Imported Orchids, from Mr. F. Sander, at Stevens' Rooms. Crystal Palace Spring Exhibition of Plants and Flowers (two days).
FRIDAY,	Mar. 27	Sale of Imported Orchids, at Protheroe & Morris' Rooms.
SATURDAY,	Mar. 28	Sale of Hardy Plants and Bulbs, at Stevens' Rooms.

AS no operation will be more frequent in our gardens for the next month than seed sowing, it may not be inopportune to offer a few observations on SEED BUYING, for there are some very unsound ideas far too prevalent, which often lead to injudicious purchases. In the opinion of a large number of persons seeds are a purchasable commodity of like value from whomsoever obtained. No more delusive idea exists. If one thing is more certain than another it is this: that there is as much difference in seeds as in men and women, and consequently it behoves every one to get the best obtainable. There may be some trifling difference in price; the good will undoubtedly cost rather more money, but what is that circumstance compared with paying a trifle less and getting an inferior article? Satisfactory crops cannot be grown from inferior seeds, however good the cultivation. Good seeds must be secured, then, whatever the cost and trouble in selecting them.

The sage advice in one of our famous cookery books which commenced with the admonition to "first catch your hare," may be paraphrased on the present occasion by the advice to "first select your seeds." Any one who has paid a moderate amount of attention to matters horticultural must know that during the last few years great improvements have been made in most of our vegetables, and in many flowering plants raised from seed. For example, compare the Cabbages of to-day with those of ten years ago, or the Peas, Broccoli, or Cauliflowers. These marked improvements—small from year to year, but important over longer intervals—we owe chiefly to our leading seedsmen, who have spent great pains in the creation and improvement of so many plants of everyday use. In numbers of instances they have done the work in their own grounds; in others they have bought up at large premiums the results of other men's labours; but in one way or other it is to the enterprise of our leading seedsmen that we are indebted for the improved characters of so many universally grown plants.

Then, it must be remembered, that these enterprising members of the craft, however enthusiastic they may be—and we believe that many of them are enthusiastic to a degree not common among business men in other trades—have to regard the distribution of their seeds, however good they may be, as a commercial transaction, and if they are to thrive they must contrive to gather a little profit by the way, or they will fail in their object. In what way, it may be asked, does this consideration affect the seed buyer? The answer to this will appear a little later on.

It must be conceded that every real improvement effected in any plant of general use is a national gain. It is equally a personal gain to the individual cultivator. Each gardener has thus, it would seem, not only a personal but a collective interest in these improvements. And again, if the seedsmen and the other raisers of improved seeds are repaid for their past

labours, they are encouraged to undertake others, which in turn will benefit the general community. This result can only be secured by a very large number of persons buying the novelties which are offered from year to year. There is a frequent notion among gardeners that it is hazardous to buy novelties. Perhaps it was so when ill-advised people offered untried things for sale; but now-a-days, what with criticism in the gardening Press and the care which good business men take to prevent disappointment, the risk is reduced to a minimum. It is rare that any strongly recommended novelty will now prove absolutely delusive. We may then, without indiscretion, urge our gardeners to be trustful as well as careful; only suggesting that, in selecting novelties for trial, they should do so judiciously by choosing those only which are sent forth by well-tried and trustworthy firms.

We think in preparing seed lists a mistake is often made which can be easily remedied. If a man buys all his seeds from one firm he is limited to those kinds which they offer for sale. But almost every house has its own specialties. These are things on which they have expended their strength. Obviously it is better to buy the specialties from those who are the original distributors of them than from any one else, and it is fairer to do so. Our advice, then, would be to buy the specialties from the original distributors, and the ordinary seeds from the house most usually dealt with.

We cannot too forcibly impress on our readers this fact, that the pedigree of seeds is as important as the pedigree of stock. If a celebrated breeder of Shorthorns by his skill and perseverance through long years has obtained a strain of animals superior in some respect to all others, and so commands a higher price for his produce, why should not our seedsmen who have taken equal pains equally reap the reward of their labours and enterprise?

It is the more necessary to put these points forcibly, inasmuch as nowadays the desire for the utmost money value and necessary economy have induced many people to go to Co-operative Stores for their seeds. It may answer to buy many things there, because they are cheaper than in ordinary shops, but seeds are different to tinned meats and patent medicines. Seeds are a variable quantity, and as those sold at the stores can in the usual course of things be only such as any one can obtain from any of the wholesale houses, and the special strains of seeds which embody the results of years of labour are special things, only to be bought of those who possess them, we feel we are doing a service by urging the purchase of the best seeds only, even though they cost a little more money.

— NOISSETTE ROSE LAMARCK. — Amongst the Roses which have suffered a partial eclipse from the rush for novelties is the old and beautiful climbing Noisette, which the facile pencil of Mr. FITCH has so well portrayed (fig. 70), and yet it is not, after all, a very old Rose. It was raised by MARÉCHAL, a French grower, about the year 1830, and was at one time very generally cultivated by such Rose growers as could give space to it, for being a rampant growing climbing Rose it requires considerable room on a south wall; and where this is to be had, most Rose lovers prefer (such is the taste for yellow Roses amongst us) to give it to either a Gloire de Dijon, Madame Bérard, Belle Lyonnaise, or Maréchal Niel. There is another reason which has tended to limit the number of its admirers—it is not perfectly hardy, and it will not stand severe winters as well as Roses of the Gloire de Dijon class; moreover, it is hardly ever fit for an exhibition stand, and that in these days is a serious drawback. And yet it surely deserves a better fate than this; its numerous clusters of white flowers, with oftentimes the faintest *souffron* of yellow in the centre, are very chaste and charming, and there is no Rose that looks better when cut with a good long footstalk and placed

loosely in a tall vase, especially if the vase be of ruby-coloured glass, when the contrast of the pure white flowers is very marked; it is less formal in its growth than many of the exhibition kinds, and is thoroughly a lady's flower.

— A NEW FORESTERS' AND GARDENERS' BENEVOLENT INSTITUTION.—It is proposed to form an Institution with the above title for Scotland, and with a view to ascertain the feeling of those most concerned in the matter the opinion of gardeners and foresters is solicited, either in its favour or otherwise.

— ROYAL BOTANIC SOCIETY.—At a meeting of this Society, held on Saturday last, Sir WALTER STIRLING, Vice-President, in the chair, the following candidates were balloted for and elected Fellows:—Mrs. BLUETT, Mrs. HARRISON, Lady KNIGHT, and Captain DOUGLAS WHITMORE. The Secretary, Mr. SOWERBY, who lately returned from a trip to the South of Europe, exhibited some interesting botanical curiosities he had collected.

— SULPHIDE OF POTASSIUM.—In support of his previous testimony with regard to the efficacy of the substance in checking the ravages of mildew and allied forms of fungus growth on plants Mr. TONKS, of Knowle, Warwickshire, recently sent to our office a fine healthy specimen of a zonal Pelargonium which a month ago was rapidly perishing from the disease. This plant had been totally immersed, soil and all, in the solution, to the complete cure of the malady.

— "STUDIES IN MICROSCOPICAL SCIENCE."—This publication, edited by Mr. ARTHUR COLE, is excellent. The text deals with the mode of preparation of the objects, explains what there is to be seen in them, and is further illustrated by chromolithographs, and, better still, by appropriate microscopical preparations. The botanical portion of the work can be had separately. It may be had from Messrs. BAILLIÈRE, TINDALL & COX.

— VENETIAN HOUSES.—We are informed that these houses, illustrated on p. 282, February 28, which at first seemed to be even too well supplied with ventilation, at least for some kinds of plants, and at certain times, are now so constructed that the lights can be easily disconnected, and half or one-third of the house may be ventilated, the other portion remaining closed if desired.

— GHENT FLORAL COMMITTEE.—At a meeting held on Monday, the 9th inst., the following awards were made:—

*Certificates of Merit.*—Clivea, Mr. Ambrose Verschaffelt, exhibited by Mr. F. J. Spaë; Begonia sceptum, exhibited by Mr. E. Pynaert; Korthalsia robusta, exhibited by Mr. Aug. Van Geert; Cattleya Trianae, var. from Popayan, exhibited by Mr. James Bray; Odontoglossum Edwardi, exhibited by the Compagnie Continentale d'Horticulture; Phalenopsis Stuartiana, exhibited by the Compagnie Continentale d'Horticulture; Camellia, General Stewart, exhibited by Mr. J. Moentjens.

*Cultural Commendations.*—Cypripedium Boxalli, exhibited by Messrs. Vervae & Co.; Anthurium ferrierense, exhibited by Mr. L. Van Houtte; Sparmannia africana flore-pleno, exhibited by Mr. Van Driessche-Leys; Clivea miniata, exhibited by Mr. de Ghellinck de Walle; Cypripedium Boxalli, exhibited by Mr. James Bray.

*Votes of Thanks.*—Phaius Blumei, exhibited by Mr. Aug. Van Geert; Dendrobium Findleyanum, exhibited by Messrs. Vervae & Co.; Odontoglossum Alexandrae, exhibited by Messrs. Vervae & Co.; O. hystrix magnificum, exhibited by Messrs. Vervae & Co.; Laelia superbiens, exhibited by Mr. Van Geert; Clivea Chevalier Heyndrick, exhibited by Messrs. Blancquaert & Vermeire; Clivea (seedling), exhibited by Mr. Louis Desmet; Phalenopsis Schilleriana, exhibited by Messrs. Vervae & Co.

— MUSHROOMS.—These esculents seem to be particularly fine and abundant during the present winter, more especially where the cultivation in beds in the open is well understood. This is the most profitable method of growing them, but the time required is much longer than with beds in warmed houses. Mr. N. FULLER, gardener to Sir J. C. JERVOISE, Bart., Idsworth, Hants, sent us lately for our inspection some extraordinarily fine samples, firm, solid, and large, the produce of beds in a Mushroom-house.

FIG. 70.—ROSE "LAMARCK." (SEE P. 378.)

— GARDENERS' ROYAL BENEVOLENT INSTITUTION.—A special meeting, very largely attended, was held on the 13th inst., at the "Bedford" Hotel, Covent Garden, and over fifty gentlemen were present, many of them gardeners. Mr. E. TIDSWELL, the Treasurer, being in the chair. Mr. J. LEE, the Chairman of the committee, explained the working of the various additions and alterations made to the rules, which were unanimously agreed to; and the alteration in Rule 8, for increasing the pensions of recipients of the charity by £4 per annum was carried by acclamation. The first increase of the pensions will take place on the next payment of them, *i.e.*, this quarter. A vote of thanks was accorded to Mr. JOHN LEE in consideration of his successful management of the Augmentation Fund, and the affairs of the evening were brought to a pleasing conclusion by a dinner given to commemorate the occasion. The forty-second anniversary dinner is appointed for Friday, July 3, when E. J. TIDSWELL, Esq., will preside, and we have reason to hope he will be most substantially supported.

— MIKANIA APIHOLIA.—This is a little known evergreen climber, adapted for cultivation on the pillars or walls of a stove. The palmately divided leaves are borne on long stalks, each of the five leaflets being lanceolate and irregularly lobed at the margin. It is figured in the *Illustration Horticole*, t. 549.

— "DICTIONNAIRE DE BOTANIQUE."—We are glad to announce the publication of another part of this useful work, which comprises articles from "Dual" to "Eubi." We may suggest to the Editor, Mr. BAILLON, to give in all cases references to the latest or best esteemed monograph, and not merely references to general works, like the *Genera Plantarum* or the *Histoire des Plantes*. These latter works are the first that would be consulted by the student, who, however, might not have the means of knowing of the more elaborately detailed monographs, while, on the other hand, those who are familiar with the works in question are just those to whom the *Dictionnaire* is least useful. "Edgeworth" is a slip of the pen for "Edgeworth," which occurs twice in the same paragraph. The work is beautifully got up, typography and illustrations alike being good, but some scale of proportionis needed in the latter case.

— THE PARCEL POST.—A correspondent says:—"Useful as the Parcel Post undoubtedly is, the uncertainty as to the time parcels will arrive is a serious drawback, especially with such perishable things as flowers. The Parcel Post is useless where it is requisite that parcels should arrive at a given time, as there is no certainty that they may not be delayed one or two days longer than a letter going the same distance. If an extra charge were made for such parcels as require to be sent without delay, and for which the time of arrival could be as accurately reckoned on as that of a letter, it would add much to the number of parcels sent through the post, as well as to the convenience of the senders."

— ZAMIA TONQUINENSIS.—A handsome Cycad, probably a Cycas and not a Zamia, the species of which latter genus are American, and with slender erect stem covered with woolly hairs. The leaves are oblong pinnate, bright green; the leaf-stalks are downy and provided with small spines. The leaflets are narrow lanceolate, wavy at the margins, each about 6 inches long. It is said to come from Tonquin, and is highly spoken of by the editor of the *Illustration Horticole*, in which journal it is figured, t. 547.

— YEAR BOOK OF THE BERLIN BOTANIC GARDEN.—The third volume of this publication has been recently issued. It contains a report on the work of the museum and garden from April 1, 1881, to September 30, 1884, besides numerous papers relating to work done in the laboratory and herbarium. Mr. VOLKENS treats of the relation between the structure of plants and the nature of the locality in which they grow. Mr. LOEW deals with the relation between flowers and insects. Mr. SCHUMANN on the etymology and history of the Gewürznelke (Clove). Dr. SCHUMANN describes certain malformations of *Gagea pratensis*. Dr. FUNKESTÜCK treats of

the development of Lichens. Mr. WENZIG contributes a monograph of the American species of Oak. Mr. SCHWACKE discusses the arrow poison (*pfelgift*) of the Tecuna Indians, the most important ingredient in which appears to be *Strychnos Castelnaei*. Lastly, Mr. PRANTL furnishes a systematic review of the genus *Ophioglossum*.

— CERREUS C. M. HOVEY.—This is a variety of *C. speciosissimus*, of dwarfer habit, with smaller but with more numerous and more brightly coloured flowers. It is figured in the *Illustration Horticole*, t. 548.

— MESSRS. CARTER AND CO.'S PRIMULAS.—Although past their best, the blooms of this well-known strain are still very fine, and one can judge by the amount of seed-cases how fine they have been; many of them have thrown three tiers of bloom on one spike. Messrs. CARTER & CO. have several types, which are pretty well known; all shades of the favourite colours are to be seen, and they have from 300 to 400 so-called "blues," or rather violet, but the blues will no doubt intensify in time, and then it will be an acquisition; at present even it is decidedly interesting. The other varieties are all good in their class; Holborn Carmine and H. Salmon are both good varieties, as also are Rosy Morn, Alba Magnifica, Holborn Elaine, fine Fern-leaved white, and another white, called H. Pearl; H. Magenta, H. Mauve, H. Vermilion, very fine; H. Blush, Venus, flaked like a Carnation with magenta and scarlet; Tomkin's Queen, a fine Fern-leaved white, was very fine; and we must not forget to mention two semi-doubles, Prince of Wales, and Snowflake, the former a fine salmon, and the latter white.

— AGAPETES BUXIFOLIA.—Judging from the beauty and floriferous character of this plant, it is to be regretted that three or four species are all that have been introduced to British gardens, and that these are seldom seen in cultivation. Twenty-five species are known to science, and all are stated to be of a showy and decorative character. They are natives of the mountains of India and the Malayan peninsula, with an outlying member in Fijii. *A. buxifolia* is a native of the Bootan Himalayas, and consequently amenable to greenhouse or conservatory treatment. In its native habitat it grows to the height of 5 feet, but under cultivation at least, growth is slow and bushy, so that as to house-room it is as easily accommodated as a Heath or an Epacris. The tubular scarlet flowers are about an inch long, and produced in clusters at the end of the short branches. Specimens may always be seen in flower at this season in the temperate-house at Kew.

— PHAIUS GRANDIFOLIUS.—Botanically the characters of this species exhibit a close relationship with *P. Wallichii*. For garden purposes, however, they are easily separable. The former is a robust and vigorous grower, with ample foliage, and flower-stems attaining a height of 3 feet. The sepals and petals are whitish externally, and brownish or buff internally. The lip has a pale tube, with a deep dull purple limb, while the tube internally is striped with darker veins. *P. Wallichii*, on the other hand, has shorter flower-stems and narrower segments to the perianth, while the lip is distinctly yellow, with a white limb and purple mouth. The two species have been confused by some authorities in books. There are a number of strong healthy plants of the Orchid under notice stood about in various positions in the Orchid-house at Kew, and present a bold appearance with their tall many-flowered stems and parti-coloured flowers amongst the numerous subjects now flowering there.

— ILLUSTRATIONS IN NURSERYMEN'S CATALOGUES.—How much of ingenuity is displayed annually in the production of drawings of most impossible plants, flowers, and vegetables those that receive catalogues best know. Our American cousins are not at all behind in this matter. All who receive catalogues are familiar with the wonderful Fuchsias, Carnations, Cinerarias, &c.; the "prolific Cucumber," so long, even, and straight, with no "neck" to speak of, and hanging so thick on the vine that from all appearances one would require to cut those hanging in front before it would be pos-

sible to get at those behind. Illustrations of Peas, showing their habit of growth, are, to put it mildly, somewhat startling, for if we take the length of pod and compare it with the height of the "bine," we find that the pods measure a little over 14 inches, so that reckoning eight Peas in a pod, we get the gigantic size of at least 1½ inch!

— ST. NEOT'S HORTICULTURAL SOCIETY.—The annual show of this Society will be held on Monday, August 3.

— BROWNEA GRANDICEPS.—With the exception of *Brownea Ariza*, this is one of the grandest flowering species in the genus. The long pinnately compound leaves assume an elegantly drooping habit; and, although presenting a somewhat tufted appearance, owing to their being crowded together towards the summits of the stems and branches, their graceful character more than redeems this fault. Some plants in the Palm-house at Kew never fail to flower during the winter or spring, when they are a source of great attraction to visitors. The plant belongs to a sub-order of the great Pea family with regular flowers. These are collected together in a large dense head, and appear like a huge Rose, the central unopened flowers representing petals still in bud. This species is a native of several parts of Venezuela on the mountains, and is known there by the native name of Rosa del Moote. The flowers are rose-coloured, but produced in more imposing heads than either *B. coccinea* or *B. Ariza*. There is a figure of the plant in the *Botanical Magazine*, t. 4839, and in these pages, 1841, p. 436.

— BERRIED AUCUBAS.—Lovers of plants who have a cold house, and but little in the way of hardy plants of a decorative character to fill it in early spring, should make use of *Aucuba japonica* in pots, growing also a male plant or two for the supply of pollen with which to fertilise those of the opposite sex. Plants of this free growing hardy evergreen shrub can be kept in due bounds as regards size by means of judicious cutting back, and also in good shape, and the leaves are always handsome and do not readily turn brown even when the plants are kept dry. The male plant should be kept out-of-doors in order to retard its flowering, as in this respect it is earlier than the female; but it is not difficult to gather the pollen and keep it for a long period for the purpose of artificial impregnation. The berries are formed in summer, and they keep green until about Christmas, when they change colour rapidly, and are highly ornamental in early spring.

— THE BRIGHTON AND HOVE CHRYSANTHEMUM SOCIETY'S EXHIBITION will be held on Tuesday and Wednesday, November 10 and 11.

— HYACINTH SHOW AT MESSRS. LUCOMBE, PINE & CO.'S NURSERY, EXETER.—On Friday, the 13th inst., the annual Hyacinth exhibition was held as usual in the show-house belonging to the firm. More competitors than usual entered the lists, the flowers exhibited being of the average merit. First honours were given to Mr. VINEY, gardener to Mrs. NORRIS, Pinhoe, Exeter. The principal kinds in his collection of first-class flowers were *Ida*, yellow; *Queen of Hyacinths*, red; *Lord Macaulay*, General Havelock, and *King of the Blues*. Mr. SPARKS, gardener to A. BARNETT, Esq., Tiverton, was 2d; his collection included good spikes of *General Havelock*; *La Tour d'Auvergne*, *Fabiola*, and *Baron Van Tuyl*. The Rev. T. GARDE, Chudleigh, came in 3d, with a very nice even collection. Other exhibitors from Taunton, Torquay, Exmouth, and Exeter staged very creditable collections. Considering that Hyacinth bulbs have not been of first-class quality this season, the productions staged reflected much credit on the growers. As usual, the whole of the houses and nursery grounds were open to the public, and the weather being all that could be desired the exhibition proved very attractive.

— GARDENING APPOINTMENTS.—Mr. GEORGE CLARKE, formerly Gardener to W. N. MARCY, Esq., The Manor House, Bewdley, has been appointed Gardener to the Rev. GEORGE LAMBE, The Highlands, Ivy Bridge, Plymouth.—Mr. L. BARNES as Head Gardener to H. BENTLY, Esq., Westacre High Hall, Swaffham, Norfolk.

## NITRATE OF SODA AS MANURE.

THE committee of the Saltpetre Producers' Association on the West Coast of South America (Comité Salitrero, at Iquique, Chili) offers £1000 in prizes for essays on the use of nitrate of soda as manure. Of this amount—

I. A prize of £500 will be awarded for the best popular essay, showing the importance of nitrate of soda as a manure, and the best mode of its employment.

The essay, in its theoretical part, is to treat of the effect of nitrate of soda on vegetation, as compared with other manures containing nitrogen, and should exhibit the present state of knowledge on this point. In its practical part the essay is to give directions for the use of nitrate of soda in the various conditions of plant culture. References and quotations and purely scientific explanations, if necessary, are to appear as notes. The essay may be written in English, German (italic characters), or French. The writing must be distinct, and on one side of the paper only. It is desired that the length of the essay may not exceed six sheets of printed octavo. Each manuscript is to be signed with a motto; the name and address of the author is to be given in a sealed envelope bearing the motto outside. The essays are to be sent on or before October 1, 1885, to any of the undermentioned judges.

II. A prize of £500 will be awarded for the best essay treating of the same subjects on the basis of new experimental researches made by the author himself. The essays must fulfil the conditions already mentioned. They may be sent to any of the judges on or before January 1, 1877. The committee of judges consists of the following agricultural chemists:—

Germany.—Professor Paul Wagner, Director of the Agricultural Station at Darmstadt.

England.—R. Warrington, Esq., Agricultural Laboratory, Rothamstead, St. Albans, Herts.

United States of America.—Vacant.

France.—Professor L. Grandeau, Director of the Agricultural Station, and Dean of the Faculty of Natural Philosophy at Nancy.

Belgium.—Professor Petermann, Director of the Royal Agricultural Station at Gembloux.

Holland.—Professor Adolf Mayer, Director of the Agricultural Station of the State at Wageningen.

Russia.—Professor L. Thoms, Director of the Agricultural Station at the Polytechnical Institution at Riga.

If none of the essays received should thoroughly satisfy the committee of judges, they are authorised to award inferior prizes of not less than £150 each. Any essay for which a prize is awarded becomes the absolute property of the Saltpetre Producers' Association at Iquique, which also reserves to itself the right of translation into other languages. (Signed) *Professor Paul Wagner, Darmstadt, for the Comité Salitrero, at Iquique.*

## Plants and their Culture.

### GREENHOUSE HARD-WOODED PLANTS.

THIS section of cool-house plants will now become attractive; the earlier flowering genera should soon yield a good display. Although many of these are not grown to any extent for supplying cut flowers, we do not see any reason why such should not be the case. They would furnish material whereby a pleasing change might be made from the ordinary run of greenhouse flowers. Several of the Cape Heaths would not be in the least injured by moderate cutting, neither would the Boronias, Polygalas, Chorozemas, Eriostemons, Pimeleas, or Darwinias; each of these genera, too, possess flowers of such persistency as should recommend them to favourable notice. Closer attention will be needed to their requirements, as they advance into flower. When the flower-buds are being developed the plants will require a gradual increase in the supply of water, and they must not be exposed to sudden currents of cold air, especially when the house is so situated as to take the full force of an easterly wind. It must not be inferred from this that the house is to be kept close, as ventilation judiciously given is quite necessary to the

perfect development of the flowers; these will then be possessed of more lasting qualities. Attention to these details will have a beneficial effect, bearing in mind that most of the Cape and New Holland plants last in flower for a longer period when under favourable conditions; this should therefore be a sufficient inducement to study their needs, if not from any other point of view. Where two or three plants of *Dracophyllum gracile* or *Pimelea mirabilis* are grown, it will be a good plan to pinch out the points of the shoots in order to obtain a later flowering. We have practised this for some years, and always found it to answer well; the flower trusses are not quite so large, but there will be at least two to one where the pinching is not performed at all. No shading will be required for some time to come. These plants invariably delight in the maximum amount of sunshine that this climate affords them, except when in the height of their flowering season. The past summer and autumn should have been most favourable to floriferousness in all the species this year, resembling closely as it did the climate of their native countries. Autumn flowering plants such as *Pleroma elegans*, *Crocea saligna*, and other species with the late blooming Heaths may require a shift; should this be the case we advise it being seen to at once. When their flowering period is passed the autumn will be rather far advanced for this work to be done safely. Young stock of *Pleroma elegans* should be kept pinched at every second joint that is made, in order to keep the plants dwarf and bushy. *James Hudson, Gunnersbury, Acton, W.*

## FRUITS UNDER GLASS.

### FIG TREES IN POTS.

WITH the aid of suitable and well heated glass structures, and proper treatment combined, we certainly ought never to fail in securing two crops of Figs every year, the first from the well developed and matured growths made the preceding season, and the last crop from those of the current year. Trees which were placed under the influence of forcing operations in the early part of last December will now have both crops of fruit advancing simultaneously, and the fruit of the former crop will be completing the formation of its seeds, when for a time progress appears to be suspended, which state continues until the seed is perfect, after which the increase of size will be rapid, and the ripening process speedily follow.

### THINNING THE FRUITS.

Before this time, however, the second crop of Figs will be ready to be thinned. This should be done as soon as they are about the size of a full grown Grape, and should not be done too lavishly at this advanced season; two or three fruits on each vigorous shoot, and one on the weaker ones will be ample for a crop.

### STOPPING AND THINNING SHOOTS.

Any lateral growths which are made after this period should be kept pinched at the first or second leaf, and any weakly ones, or those which are at all crowded together, should be removed altogether. Strict attention should at all times be given to details in management, but at no season should it be more rigorously enforced than at this time and onwards until the fruit is perfected, as the crop will mainly depend on the kind of treatment given during this interval.

### FEEDING.

The Fig tree is naturally a gross feeder when in a healthy state, and will absorb water very freely, which as occasion demands should therefore be plentifully supplied in a tepid state, and on every alternate occasion guano-water should be substituted for it if the surface-soil be full of roots, and they should also be still more encouraged to grow by an addition of fibrous loam and manure in a lumpy state being put on the pots, and if the roots have run over the top of the pots into the fermenting bed their wants in the way of water should be supplied.

### GENERAL TREATMENT.

The temperature in this compartment now should

range from 60° to 65° at night, 70° to 75° in the day time, with a rise of 10° or 15° more by solar heat. Moisture should be abundantly supplied, and syringing carried out twice every day. Open the ventilators at top at 75°, and gradually increase or diminish the supply of air according to external influences, and close the house early in the afternoon with sunheat at 85°. This condition of treatment will need modifying when the fruit shows signs of ripening, or it will be insipid and devoid of colour. To avoid this, syringing and moisture about the house must be somewhat abated, and the temperature, as indicated, should be well supported by fire-heat, so as to be able to keep a little air on the house constantly until such time as the fruit is gathered, when the former treatment should be resumed again and continued until more air is required to harden and mature the growth for another season. *G. T. Miles, Wycombe Abbey.*

## The Kitchen Garden.

### SEED SOWING.

AUTUMN and early winter varieties of Broccoli should now be sown; let the seed-beds be made thoroughly firm before sowing the seed, and also afterwards. Sow successions of Mustard and Cress, Radish, Spinach, and Turnips. Firm soil produces the best shaped roots of the latter. In the beginning of April sow Salsify, Scorzonera, Seakale, Asparagus, and Rhubarb. Do not sow Savoys or Borecole yet. No one would care to eat them, when choicer vegetables could be had, and in most gardens ground would not be available for planting out such early sowings. *G. W. Richards, Somerley Gardens, Ringwood, Hants.*

### FORCING DEPARTMENT.

IN FRAMES WITHOUT HOT WATER.—Diminish the labour by drawing the lights clean off during rainy weather, unless it should be rain from a cold quarter, which would be better not admitted to the young plants on hotbeds. Thin the young plants early where necessary, and before they get into a weakly state through standing too thickly in the beds.

### CARROTS.

Florn varieties will stand a moderate amount of forcing by sun-heat, and where there is none left out-of-doors from last August's sowing, earliness will be a great consideration. Air freely during mild, sunny weather in the morning, and close in the afternoon early enough to catch a little sun-heat. The strength of the young plants will indicate when the frame may be kept a little warmer, or when more air is required as the case may be. Quite a fortnight may be gained by careful management and attention in this respect.

### TURNIPS.

Will bear but little forcing, and all that is necessary is to expel frost and ward off cold, biting winds.

### POTATOS.

Earth-up succession crops as the haulm becomes 5 or 6 inches high, and do not make the mouldings narrow at the top, but as broad as is consistent with the quantity of soil at command. Broad mouldings admit the water freely to the place where it is most wanted. The haulm will be getting somewhat firm in the earliest frame, and here sun-heat may be indulged in with advantage, where earliness takes the precedence of size. If no lukewarm water can be obtained for watering, choose mild weather and water that has been exposed to the air for a day or two, for the operation. A cold frame, say closed in March at 3 o'clock, and well covered at dusk, will be 5° warmer throughout the night, than one closed later and not covered. It is well worth the extra trouble to those who rely on these for their first crop.

### TOMATOS.

If not already done, the seed should now be sown for rearing plants for outdoor planting in May. There is a great advantage in having good sized and established plants with some firm shoots at planting-out time. Afterwards they do not grow away so rank, but produce and ripen fruit earlier. In growing on the young plants keep them as near the glass as possible. *G. W. Richards, Somerley Gardens, Ringwood, Hants.*

## The Rosery.

### TEAS OR NOISSETTES.

"Under which king, Bezonian?" *Il. King Henry IV.*, sc. 3.

A FRIEND, the diligent secretary of one of our provincial Rose societies, writes to me:—"I am preparing our schedule, and am anxious to confine our Tea classes to those which are pure Teas, and to exclude Noisettes. In which class is *Maréchal Niel* to be included?" At first sight this seems not difficult, but on looking into the matter I have come to the conclusion that it is neither one nor the other, and that its real position is as a Tea-scented Noisette. The National Rose Society places it amongst the Noisettes, while such an accomplished rosarian as Mr. George Paul classes it amongst the Teas. A few remarks, then, on the origin of these two classes and their subsequent development may not be uninteresting.

The Noisette Rose has a curious history, and, although so thoroughly French in its name, owes its origin to America, for there lived about the time when the great European wars of Napoleon had come to a close a French nurseryman of the name of Philippe Noisette, at Charlestown, in South Carolina, who had hybridised the old Musk Rose with a Rose called *Champneys' Pink Cluster*, which he sent to his brother, Louis Noisette, a nurseryman at Paris. *Pink Cluster* was the product of the white Musk fertilised with the blush *China*; and John *Champneys*, its raiser, ought to have some credit in the matter although he was put on one side; and while Noisette is known, *Champneys'*, except in America, is unknown. When Louis Noisette introduced the Rose it created quite a *furor* in Paris. Its habit was so remarkable, and its perfume so pleasant that everybody was desirous of possessing it. Mr. Rivers, in his *Rose Amateurs' Guide*, makes the natural mistake of supposing that the cross was (as in *Champneys'* case) between the Musk Rose and the *China*, whereas, as it has been shown, another generation had come into use, as much entitled to the term "*Pedigree Rose*" as many which are now so called. The tendency of the Noisette to bloom in clusters which it derived from one of its parents has been considerably lessened by the efforts of the hybridiser, who while producing large flowers has diminished their floriferous character. However much may have been thought at one time of what we may call the pure Noisette Roses, we hardly now ever see *Aimée Vibert*, *Fellenberg*, *Lamarck*, or *Jeanne d'Arc*; whether this is right or not I do not pretend to say, but they are certainly not exhibition Roses, and hence, probably, the neglect into which they have fallen. Probably the oldest of these Tea-scented Roses is *Jaune*, although often called *Jean Desprez* or *Jaune Desprez* from the name of the raiser; it was introduced in the year 1838. The best known, and, taking it all in all, when seen in perfection, the finest yellow Rose, *Cloth of Gold* or *Chromatelle*, was brought out by *Coquereau* in the year 1843; it was in this year that Mr. Rivers saw it at Angers, and describes the buds as hanging down and being like golden balls. This is much more like a description of *Maréchal Niel* than *Cloth of Gold*, for its superiority to *Maréchal Niel* consists, I think, in the bold manner in which it holds itself erect. Mr. Alex. Hill Gray has described in the *Rosarians' Year Book* for the present year what it is in the Azores, and it is unquestionably better suited for a warmer climate than ours—although on a wall close by me there was a magnificent tree of it, on which I had veritable clusters of grand flowers until the ruthless hand of an improving (?) gardener cut it hard back, and it has not yet recovered the treatment.

Mr. Rivers is inclined to place that favourite Rose, *Gloire de Dijon*, amongst the Teas. Mr. Elwanger calls it a climbing Tea, and in the National Rose Society's *Catalogue* it is placed amongst the Teas and called the parent of a hardy race of Tea Roses; yet it bears a very striking analogy to the Noisettes: it is like them impatient of the knife, and has the long rambling habit of the older type of Noisette Roses. Unfortunately we cannot determine its parentage; it came up, as *Jacotot* himself told me, as a chance seedling in his garden at Dijon. He pointed out to me the very spot. And what a success it has been! In all places and under all circumstances old "*Glory of John*" comes to the fore; nor do I think that any of

its progeny have eclipsed it. Madame *Trifle*, Madame *Bérard*, *Belle Lyonnaise*, *Bouquet d'Or*, *Jeanne d'Arc*, are all good Roses, but the comely mother of them all is still unsurpassed. *Maréchal Niel* is the next claimant for a place; its place is, however, pretty well defined: as far as quality and popularity are concerned it is *facile princeps* of all Roses; it must, however, be considered, I think, as either a Tea-scented Noisette or a climbing Tea; the former would probably be its proper position, the young foliage is so unmistakably Teay, and the perfume is so exactly that of the Tea that it would seem to be difficult to disassociate it from that class. Its origin is unknown. It was raised by *Prüdel*, and is said to be a seedling from *Isabella Gray*, itself a seedling from *Cloth of Gold*. It may be, perhaps, said that its habit is very improper for a Tea, that there is "*rampageousness*" about it, which shows that it is not fit company for such modest maidens as *Catherine Mermet*, *Comtesse de Nadaillac*, *Marie Van Houtte*, &c.; but this will hardly hold. There cannot be a finer Tea than *Devoniensis*, the only one of its class (until very recently) raised in England, and we can all testify to what a lovely Rose it is; although amongst the tenderer varieties of a popular class, yet see what it has come to be in climbing *Devoniensis*. This, as we know, Mr. Pavitt observed in his garden as a stray shoot; it has been fixed, and while the normal plant will grow its couple of feet in the year, shoots of the climbing variety 16 to 20 feet long in one season are not uncommon.

There is one point in which all these Roses—*Gloire de Dijon*, Madame *Bérard*, *Maréchal Niel*, *Cloth of Gold*, &c.—have a complete accord with the Noisettes, they do not like the knife; pruning leads to growth, but not to flowering, and all who wish to grow *Maréchal Niel* out-of-doors are advised to spare, not the root, but the knife; and yet there are plants of it not far from me which are cut about with as little ceremony as a *Gooseberry* bush, and yet they bloom profusely. Why this should be I know not, but it is an exception to the general rule, and to the advice of all rosarians. I must, therefore, regard *Maréchal Niel*, not as a true Noisette, nor a true Tea, but as a combination of both—and in truth, whether by chance or artificial cross-fertilisation, the classes of Roses have got irretrievably mixed. Tea influence is to be traced in many of our hybrid perpetuals, in such Roses as *La France*, *Captain Christy*, *Jules Finger*, and others; while the influence of the Noisette is seen in such Roses as *Coquette des Alpes*, *Coquette des Blanches*, *Baronne de Maynard*, and others, mostly due to the well-known raiser *Lacharme*; and that in *Duchess of Edinburgh* (*Veitch*) we have unquestionably a large share of the *China* blood, if, indeed, there be any genuine Tea blood in it; in fact, in the large class of hybrid perpetuals it is hard to say which blood has not been introduced.

I have said but little of the hybrid Tea Roses, as they hardly come within the scope of my notes. I do not think that they have as yet established a very strong claim on the attention and love of Rose growers. There are one or two, such as *Reine Marie Henriette* and *Cheshunt Hybrid*, which are, especially the latter, very largely grown, and as climbing or pillar Roses they are unsurpassed at present; but like many other varieties which have been brought forward have no special merit, they lack the delicate beauty of the Tea, and the brilliancy of colour of the hybrid perpetual. We may get something of value amongst them by-and-by; but at present, both in the garden and in the exhibition room, they are at a discount. *Wild Rose*.

### FILMY FERNS.

As the name of our firm is mentioned in connection with this class of plants in your issue of March 7, perhaps we may be permitted to say that we think the terms "*cool*" and "*warm*" are likely to be misleading, unless very distinct information is given as to the range of temperature intended to be indicated by these terms.

When we speak of "*Cool Filmies*" we mean those which grow and thrive in the same temperature (not necessarily same degree of moisture) that suits the *Killarney Fern* (*Trichomanes radicans*). We have not found that *T. Luschnatianum*, *T. maximum*, *T. ariculatum*, and other *Filmies* from the West Indies, *Java*, &c., have flourished in such an atmosphere. Though they have existed with us under such conditions they were not what we call healthy or satisfactory.

If—as we now understand—Mr. Cooper-Foster has

succeeded in getting fine healthy development in such a climate as we call "*cool*" most certainly he is entitled to the credit of the discovery, and not us. At one time or other we have cultivated eighty or ninety species of *Trichomanes* and *Hymenophyllums*.

Many tropical species occur on high mountain ranges, in shaded ravines, which explains, no doubt, why some species will bear more cold than has usually been supposed; and Mr. Cooper-Foster's discovery of this fact only says, virtually:—This charming class of Ferns is manageable where there is little or no artificial heat, to an extent that cultivators generally have not been aware of. The thanks of Fern cultivators are certainly due to him, and his grand collection will "*speak for itself*." *Jas. Backhouse & Son, York*.

### THE TROPICAL HOUSE, CHERKLEY COURT.

THE illustration on p. 383 (fig. 71) gives a view of the splendid plant-house erected by A. Dixon, Esq., at Cherkley Court, for the home of the *Victoria Lily* mentioned at p. 19 of the *Gardeners' Chronicle* for January 3, and numerous species of tropical flowering plants, and others having striking foliage. The curved roof house is 62 feet long by 30 feet wide, having one bay in front 30 feet 9 inches wide by 24 feet high to the ridges. Ventilation is secured by openings along the ridge and in the brickwork in front. The whole is glazed on Helliwell's system, with patent zinc bars and caps of the same metal, the glass used being British sheet of 32 oz. to the square foot. The heating of the house is provided for by means of six rows of 4-inch pipes running underground the whole length of the house, and by sixteen rows of 4-inch pipes which go all round the house, while in the centre is a tank 20 feet by 15 feet for the *Victoria regia*. The water in the tank is heated by two wrought-iron pipes laid round the bottom of the tank, and which maintains the water at an average temperature of 75°. In all there are about 2600 feet of 4-inch pipe in the house, worked by a powerful saddle-boiler capable of maintaining the temperature at 75° in the coldest weather. Another boiler is fixed and connected with the first, in case of a break-down.

### HOME CORRESPONDENCE.

**Carter's Ashtop Fluke Potato.**—In reference to Mr. Murphy's last note on this Potato I may say I have referred to Messrs. Carter & Co.'s catalogue, and find it described as Mr. M. has stated; this is the first time I have seen it described as early. Turning to the same work for 1884, p. 31, it is described as second early, the same in 1883; and in 1879, p. 34, where Potatoes are arranged in their order of earliness, it stands sixth on the list. I do not understand why there should be this difference, but perhaps Messrs. Carter can explain it. With me it has been a late second always, and so it remains, as Potatoes do not change from late to early or *vice versa*. The soil is a rich light loam, rather sharp, and slopes due south; but in spite of early planting and these advantages, the crop is not fit for storing till about the end of August. We have them in use now, and they will remain good as late as any variety I am acquainted with (and I have grown a great many kinds on trial), and my object in doing so was to discover which was the best earliest variety, and thus avoid disappointment. *W. Divers, Wierton*.

**The First Brood of Aphides.**—There are some things so often repeated that they receive almost general acceptance, and yet they are only partially correct. Amongst these is the saying that hard winters leave few insects alive. It may be supposed that intense frost causes some discomfort to them, and may kill some; but instinct comes to the aid of the smallest and least significant of the animal king-

dom, as well as those that are larger, and they generally manage to keep out of harm's way in sufficient numbers to make their presence felt after there is sun-heat enough to bring them forth from their hiding places. With spring weather come the aphides, and such things as Roses on walls are usually amongst the first to get infested, and if left undisturbed they soon spoil the flowers. If timely means are taken to destroy the first brood much after-trouble will be saved, and as soon as their presence is observed the plants are well syringed with tobacco-water and soap-suds in equal quantities on a dry day and letting the liquid dry on, few will escape; a second application will usually effect a complete clearance. The soapy water added makes the dressing much more effectual than tobacco-water alone, through its adhesiveness causing it to stick better. *T. Baines.*

**Gardeners at the Present Time.**—I might suggest that there should be a register kept open at the Gardeners' Royal Benevolent Institution for gentlemen and gardeners to get mutually suited, at

fore I do not think the mites, if there were mites on them, cause a mite of difference, if they get the proper treatment, which so many abler correspondents than I am have already explained and recommended in your pages. *A. Macdonald, The Gardens, Cheadle Royal Asylum, Manchester.*

**Melons.**—In reference to Mr. Miles' remarks (p. 277) on Melon canker and his experimental zinc collar—which I hope he may soon be able to fully recommend as a preventative to the above perplexing disease—I have used a very simple glass collar for the past two years, more especially for wood-lice, whose immediate prevention is imperative, which I have found, together with the aid of the common toad, to complete the eradication of that pest. I have never seen the slightest signs of canker, but I do not wish to attribute its non-appearance to the aid of such a contrivance, and only give it for what it is worth, as it may be useful to many gardeners. I use common transparent three-gill bottles, and cut them at about 2 inches from the neck, and again  $2\frac{1}{2}$  inches from where the neck enlarges, that is, at the greatest

destructive, and the application of them cannot be safely entrusted to the ordinary gardener, who cannot conceive that a sprinkling on the soil of anything in about the same proportion as he peppers his boiled Cabbage could have any effect, consequently, in spite of the strictest injunctions as to quantity, he persists in giving a very visible dressing; and when in due course the resulting mischief becomes apparent, he abuses all chemical manures. An inch of rain covering the surface of an acre weighs 101 tons; 10 cwt. of artificial manure is a very heavy dressing. Assuming the weight of the manure to be the same as that of water, this dressing evenly spread over the surface would be only  $\frac{1}{30}$  inch in thickness. *Edmund Tonks, Knowle.*

**Lilium Bulbs.**—It is extremely interesting to me to find so good an authority as Mr. W. H. Rogers maintaining that the cause of disease, fungus, or whatever it may be, in *Lilium auratum* bulbs imported from Japan is found in the bruising or damage sustained by them in packing and transit. This is just what I urged a week or two since, and it is without

FIG. 71.—TROPICAL HOUSE, CHERKLEY COURT. (SEE P. 382.)

10s., say, for a gardener, and £1 for a gentleman on engagement, the money [after payment of expenses?] to go to the funds of the Gardeners' Royal Benevolent Institution. It would help to make both parties more independent of the nurserymen. It might be made a rule that a gardener, on wishing to be placed on the register, should send copies of testimonials from his last two situations, and that none but those of good character should be placed on the register. *S. W., Derby.*

**Eucharis Disease.**—A short time ago I found some that had done flowering were losing their foliage. On examining them I found the base full of the red rust to which "W. B." referred in one of your former issues. Can it be, after all, I said to myself, that there is a disease among them? However, I at once turned them out of their pots and found the roots all quite rotten, the bulbs were also covered with the same rust already mentioned, worms had got into the drainage and completely blocked it with soil, consequently water stagnated at the roots, and thus aided the destruction. I potted them immediately in fresh soil, put them in heat, and when I examined them recently I found they were making both roots and leaves, and I have no doubt they will soon be all right. There-

circumference of the bottle, placing them neck downwards when the plants are very young. I cut the glass with a hot iron. *Alexander Methven.*

**Artificial Manure for Bulbs.**—Mr. C. Wolley Dod's experience of the effect of his application of artificial manure to bulbs is not surprising, seeing that he applied nearly five times the proper quantity. Long experience has conclusively proved, not only the beneficial effect, but the necessity of artificial manure in profitable agriculture; if so, it cannot, when properly used, be injurious in horticulture. Ville, in his treatise on artificial manure, gives a formula for a stimulating manure of the same ingredients as those used by Mr. Dod, but in very different proportions:—Calcic superphosphate, 352; potassic nitrate, 264; calcic sulphate, 176; sodic nitrate, 88: total, 880; and specifies the number of pounds as the proper dressing for an acre. Mr. Dod applied a tablespoonful of his composition to a cubic foot of soil. I found on trial this quantity to weigh  $1\frac{1}{2}$  oz. To dress an acre in the same proportion, assuming the soil to be a foot deep, would require 4084 lb., or nearly five times the quantity recommended by Ville. Overdoses of strong chemical manures are most

doubt true. Perhaps, as Mr. Rogers suggests, the bulbs are lifted before they are matured; but still that would hardly account for the decay found in so many very fine roots. When these bulbs are imported in such vast numbers it is evident that they are cheap where grown; hence it is probable that about the same care is taken in lifting and packing as we here give ordinarily to market Potatoes. *Lilium* bulbs are essentially soft and succulent, and if bruised much sap is extravasated; this would soon breed mildew and rot. The fungus found is, without doubt, a product of decay, not a cause of it. It would be worth while for importers to try some better modes of packing, even if the price of the bulbs was raised. Certainly a consignment of bulbs absolutely sound and uninjured would be worth a score of badly packed consignments. Is it not possible to obtain bulbs in a very small stage of growth and then grow them into size in this country? Certainly such roots might well command a greatly enhanced price. *A. D.*

—If permitted to put my experience beside that of Mr. E. Jenkins, my advice to all who purchase *Lilium auratum* is—delay not an hour in potting the bulbs in a compost of fibry loam and good peat, with a fair proportion of sand. Pot the bulbs firmly, and let the top of the

bulb be at least 2 inches under the surface. This done, plunge the pots in ashes out-of-doors on the north side of a wall or hedge, and there let them remain until they spear through the ashes, or, still better, until the flower-buds are colouring. At this stage remove to the conservatory or corridor, first dropping the pots into others a little larger. If the plan suggested is followed there will be very few failures. Lilies dearly like fresh air and sweet soil; they detest frames, and all glass structures, in the first stages of growth. *Argus*.

**Camellia Blooms Losing their Centres.**—Your correspondent, D. T. Fish, in a recent number of the *Gardeners' Chronicle*, brings to the notice of readers that in some large white Camellia plants two-thirds of the blooms have shot their centre petals. It may reassure him to know that his are not the only ones so affected. We have a large plant of *C. fimbriata* which yearly sheds some of the centre petals in the same way as described by Mr. Fish. Some of the buds open in such a way as to represent three flowers in one; in fact, out of 200 or 300 buds we seldom get one to open quite perfect. I sent flowers to your office last year, and asked for advice. The advice you gave was to lift and replant, but I was afraid to do so, the plant being large and in robust health. Can any of your readers kindly inform me if it is the nature of this particular sort to act so? *H. Louth*.

**King of the Pippins Apple.**—I am surprised to find that at the Apple Congress there was such a large majority of votes in favour of King of the Pippins over Ribston Pippin and Cox's Orange Pippin for first place as dessert Apples. The King of the Pippins when grown in this part of Yorkshire is never worth calling a dessert Apple. With me it is classed as a third-rate kitchen fruit. No doubt soil and climate make all this difference in the flavour of the fruit. In reading your article, before coming to the place where you name the two favourites, one for dessert the other for kitchen use, I had in my own mind fixed upon either Ribston Pippin or Cox's Orange Pippin as first for dessert, and Lord Suffield first for kitchen use. The King of the Pippins may be the Apple of Apples in the South of England, but I think the Ribston Apple is the King of all the Pippins north of the Trent. *Thomas Jones, Ribston Hall, Wetherby*.

**The Education of Gardeners.**—In reference to the education of gardeners, the following remarks may not be inopportune. The profession of horticulture plays as important a part in the economy of civilisation as many other professions; in itself it is essentially a scientific calling, and requires also the aid of several collateral sciences, such as botany, geology, meteorology, &c. Why, then, should its members not have the advantage of some systematic course of special training? Why should they not participate in the same system of competitive examinations as students in biology, physical science, classics, or mathematics? I think the time has arrived when these advantages should be secured to them. In regard to instruction in the theory of horticulture, nothing is more discouraging and perplexing to an intelligent beginner than to be required to remember innumerable details of practice without having sufficient knowledge of the principles on which that practice is based. Not being able to understand the "reason why" of these details of culture, practical gardening presents to his mind a hopeless chaos of processes with apparently no capabilities of classification; whereas had he possessed a knowledge of the principles of horticulture he would be able to satisfactorily relegate these details to their proper place, as in botany one who has a previous acquaintance with its classification can readily determine the proper position of any species. *P. Ingram*.

**Clematis indivisa lobata.**—This lovely Clematis is to be seen just now in grand condition in the gardens at Stoneleigh Abbey, Kenilworth. It is planted in the border of the Camellia-house, where it grows luxuriantly, and appears quite at home. The plant is trained up one of the pillars in the centre of the bed, on a single stem; when it gets within 10 inches of the glass it is trained horizontally to wires, and covers the greater portion of the roof on the south side of the house. At present it is simply a grand sight, it being literally covered with snowy-white flowers, some of them measuring upwards of

3 inches in diameter. Mr. Beddard told me he had been cutting daily from it for some time past, and should do for some time to come. *R. Greenfield, Priory Gardens*.

**Narcissus becoming Double.**—Having the misfortune to live just 200 miles from London, I regret that I was unable to attend the Narcissus Committee: but the subject discussed is one to which I have given much attention during the past twelve months. I have collected a great amount of evidence about it from different parts of the country, which has quite convinced me that the popular belief amongst gardeners about single wild Daffodils being liable to turn by cultivation into the common garden form of double is no delusion. Some of my correspondents have most patiently and kindly submitted to be cross-questioned about it, but I hardly feel justified in mentioning their names, so as to render them liable to further inquiries: but I may be allowed to tell the parish in which they live, in case any member of the Narcissus Committee should have access to that part of the country. The change from single to double, which is common in *N. Pseudonarcissus*, in *N. poeticus*, and in *N. incomparabilis*, is evidently due to some property of soil, coupled perhaps with certain conditions of atmosphere and subsoil. The following are amongst the places which have soils causing Daffodils to become double:—

Alton, in Hampshire.  
Steventon, near Micheldever, in Hampshire.  
Frome, in Somersetshire.  
Brackley, in Northamptonshire.  
Knowle, in Warwickshire.  
Wyde Green, near Erdington, in Warwickshire.  
Brynkalnall, near Chirk, in Denbighshire.  
Lytham, in Lancashire.  
Warkworth, in Northumberland.  
Hawick, Co. Roxburgh.  
Alloa, Co. Clackmannan.

*C. Wolley Dod, Edge Hall, March 4.*

**Pruning Dendrobiums.**—When I described Mr. Simpson's Dendrobium Wardianum I made no appeal to Orchid growers to at once commence wholesale pruning; I merely stated plainly what I saw. Your correspondents may still remain convinced that the practice is bad—as I was a year ago; now I should have no hesitation in trying the pruning system. If the old bulbs are not wanted, why keep them? They only increase the weight of the plants, and are an eyesore when they are in flower. Let those who have never tried the system prune one or two plants—the poorest varieties will do—and grow them side by side with others which are at present about the same strength, and then honestly form their opinions from results. They may try it with other species of Dendrobiums, and no doubt will find some do just as well as formerly; others may become weaker. The result will be an increase of knowledge learned by experience. *W. Baxter*. [This has been stated before, and found wanting. Ed.]

**Mushroom Growing at Lythe Hill.**—Having lately paid a visit to Mr. Evans, gardener to S. Hodson, Esq., Lythe Hill, Haslemere, Surrey, I was so struck with the enormous quantity of Mushrooms that I trust you will allow space for a few remarks thereon; for, to say the least, the sight was something surprising, and it is a convincing proof of Mr. Evans' skill as a Mushroom grower. We know that success in Mushroom culture depends to a great extent upon the quality of spawn used, and undoubtedly Mr. Evans used some of the best, and he informed me that he purchased it from two different firms. Which of the two kinds is producing the best crop it would be difficult to say, for there are two beds in the Mushroom cellar, each 20 feet by 6, in full bearing, each bed being spawned with a different kind. There are also two others of the same size, from which several dishes could now be gathered; these have been in bearing from two to three months. In the Mushroom-house, which is on the rack system, there are two beds 16 feet by 4, in full bearing, with others coming on for succession. Outside, in a shubbery, with only just a covering of Fern on galvanised sheeting formed to a gable, is a bed 22 feet long by 6 feet wide, on which are some monster Mushrooms 8 inches in diameter. This bed is completely covered with clusters in various stages of growth. Mr. Evans remarked, that although he has

always had good crops he has not had them come in such large clusters on the whole season's crop as they are doing now, there being in many instances from twelve to eighteen Mushrooms fit for use. *J. W.* [We ourselves well know Mr. Evans' skill in Mushroom growing, as well as in all other departments of horticulture. Ed.]

**Melon Canker.**—I congratulate your correspondent "C. II." on his good fortune in having grown Melons nine years consecutively in freedom from this pest. I should like to hear if his other crops, and late ones especially, "if not grown in pots," have the same immunity from it. Although I am obliged for his advice about the collars in question, I nevertheless cannot accept it until such time as I have tried them and found them to be useless, or otherwise, because an experienced Melon grower introduced them to my notice whose opinion I esteem. *Geo. Thos. Miles, Wycombe Abbey*.

**New Kinds of Potatoes.**—In a note on "New Potatoes" at p. 186 reference is made to some varieties which I had the honour to raise. Chancellor is spoken of as resisting the disease well, and Prime Minister as being much diseased. I should like to say that in my efforts to produce kinds that had disease-resisting qualities I employed several parents, and notably the famous Magnum Bonum. That kind was the seed-parent to both the varieties above-named, but whilst the first had for its pollen parent the old and once popular King of Potatoes—a sort I always found fairly disease-resisting—the second one had for pollen parents Woodstock Kidney, a grand Potato when sound, but in disease very bad indeed. It may be that both kinds thus partake of the properties of their pollen or male parents in the matter of disease-resistance or otherwise. Both kinds possess the robust health of Magnum Bonum, both are great croppers, yet there exists the dissimilarity mentioned, although my experience here has been to find very little disease indeed in Prime Minister. I may point out, and it is a matter that needs attention with some other good kinds also, that whilst Chancellor seems to bury its tubers well in the soil, Prime Minister, which throws large flattish tubers, pushes them to the surface; hence it is needful with that kind to mould higher than with the former. Again, being a producer of big tubers it should never be grown in rich soil. Perhaps, if the Jensonian experiments are continued at Chiswick this year, Prime Minister may be one of the kinds selected for planting and protective earthing. *A. Dean*.

**Pearson's New Zonal Pelargoniums.**—For years past Messrs. J. R. Pearson & Sons, of the Chilwell Nurseries, Notts, have taken the undoubted lead in raising and introducing new varieties, and this spring they announce a list of ten new ones as follows:—Othello, dark scarlet with white eye, large, stout, well formed pip; Nerissa, salmon-scarlet, a pleasing shade of colour, extra fine; Lucy Mason, salmon, suffused with orange, large and stout; Miranda, scarlet suffused with magenta, extra fine; Ruby, rosy-scarlet, with white eye; C. II. Swin-stead, rich vermilion, fine and striking; Mary Caswell, white, flushed with pink, delicate and pleasing; Viola, magenta, blotched with red upon the petals, white eye, distinct and novel; Raphael, scarlet, shaded with magenta and flushed also with rose; and Zeno, scarlet suffused with magenta, which deepens to a pleasing shade of purple. Those who cultivate Messrs. Pearson & Sons' new varieties of zonals know that they are characterised by three important characteristics:—a good habit of growth, freedom of bloom, and bold and striking trusses of flowers. That some of these varieties make excellent exhibition specimens is not to be wondered at; they are also useful for bedding purposes and decorative work. But it is curious to note how slowly new and greatly improved varieties find their way into some parts of the country. In some exhibitions can be seen specimens fifteen and twenty years old that should have been long since thrown away. It is perhaps not to be wondered at that exhibitions where such ancient varieties are seen appear to exist in a dull stage of mediocrity, and there is but little change in their aspects. The same tents are seen in the same field; the staging is as it was years ago; the exhibits appear the same also, and they occupy a certain portion in the tents just as if they had not been removed from one year's end to the

other. Exhibitions should—and many undoubtedly do—exhibit in smaller or larger degree the progressive aspects of horticulture, and this should be one of their leading functions. It may be said with much truth that those which display this in the greatest degree are among the most successful financially, as well as from an educational point of view. *R. D.*

**Vegetable Culture.**—Your correspondent, "S. W. R.," at p. 275, has ably defended the fraternity of gardeners against what he evidently thinks was an attack made by me upon their practices in a recent paper on "Market Gardening." I felt the difficulty I had to face at the time I wrote those remarks, viz., how to speak out without injuring many susceptibilities, and am glad to encounter such an able spokesman. I do not blame gardeners, but hope to show that much in market garden practice might be copied advantageously by many of them; and am convinced a year or two spent by young gardeners in a well managed market garden farm would prove of much benefit to them in carrying on vegetable growing sometimes under the difficulties of various kinds, which "S. W. R." refers to, &c. I am versed in vegetable culture on both systems, and if I regret one thing more than another, it is that I did not know sooner—and when the knowledge would have been of much use to me—the various methods market growers employ to secure the fine results they do. "S. W. R." is wrong when he imagines I am opposed to trenching as such. What I do object to is trenching, and too minute manipulation of soils, too late in the season, or so soon before the seeds are sown and plants set out as not to allow time for the soil to become again somewhat solidified—a state of tilth in which roots delight. As regards Carrots and Parsnips, where do we see, bulk for bulk, such examples as our markets are overloaded with? I cannot accept occasional exhibition examples as any criterion of universal goodness. Assuredly selected soils have much to do with this, but not all. In conclusion, I may say that long roots are not so tender as such as have the greater bulk near to the surface, and market Parsnips are of this latter form. Why do not gardeners endeavour to do more justice to artificial manures? *William Earley.*

**Herbaceous Phloxes.**—Having last autumn saved a quantity of seed from several good kinds of herbaceous Phloxes, and having from previous experience some doubts as to its germinating powers, I took the liberty in these pages to ask information as to the best method of raising plants from it, as previous sowings had failed. No such information was afforded, but in the meantime I learned incidentally that it was a good plan to sow the seed as soon as saved, and that I did in a frame, but still not giving it any shelter. I think I must have sowed the seed early in December. In any case in the open frame it quickly germinated, and I anticipated that a large number of seedlings will bloom next autumn, and the opening of which will surely afford very much interest, although little new or varied may result. Perhaps if Phloxes were thus more commonly raised from seed they would be much more largely grown than they are now, but it is to be regretted that there are many gardens in which respectable kinds are not seen. The roots are just now sending up young shoots, and these, if taken off carefully with a bit of heel, and put in under glass, as ordinary cuttings, will soon make root and develop into robust plants. Such plants always produce the finest heads of bloom; and if well grown in pots make fine decorative plants. In all our autumn shows classes should be formed to encourage the culture of this fine hardy border flower. The plants turned out of pots into borders the second year would make a brave show, whilst others could be soon produced for the annual pot supply. Very many who have gardens little know what beautiful things are now to be had under the designation of herbaceous Phloxes. *A. D.*

**Narcissus calathinus.**—Referring to my note on this subject on p. 347 I ask to be allowed, first to apologise to Mr. Baker for having said that we might "follow him in dropping the name calathinus," for on turning again to his "Review of the Genus Narcissus" I find I was mistaken in thinking that he proposed to do so. In the second place I send *verbatim* an extract from a letter received from Portugal since writing my former note:—"I have succeeded

in collecting roots of the *N. triandrus*, which are being dried in sand and loam, and I suppose they will be ready to send to you about May. In collecting these I have noticed that they vary in the most remarkable manner in size, shape of cup and perianth, colour, &c. Some are very large: by to-day's post I send a plant of triandrus which measures 26 inches in length of leaf, and 19 inches of flower-stalk. Surely this is very large? Of these I found a considerable quantity—may not this be the calathinus of some authors? In some the cup is crenulated, in others quite smooth-edged: the perianth in some is twice the length of the cup, in others it is shorter than the cup; and yet all these are found near each other. No wonder that there seems to be so much confusion and uncertainty as to the classification of this family." *C. Wolley Dod, Edge Hall, March 16.*

**Spirea rotundifolia alba.**—In reference to your excellent plate of the above (p. 283), allow me to say that the plant referred to is a most useful one either for vase decoration or for florists' work in wreaths, &c., the blue-green foliage being very elegant when forced. I first met with it in a private garden, and the gardener said, "Our lady brought it from the mountains of Austria." I could not find the proper name, and bought a host of Spireas to try for this kind, but at last I found it under the name of Van Houttei, and we now annually force a batch or two. This same plant was also shown at Kensington under the name "confusa" by Messrs. Stuart & Mein, of Kelso, in 1884. It is, as you suggest, most easily forced. The plants are merely lifted, well watered, and brought on as required. Its graceful pendent habit and Hawthorn-like flowers render it an attractive plant for the conservatory. After forcing the plants are quartered in some rich soil and cut to the ground, when they throw out a quantity of shoots, and may again be forced the next year. The foliage has the glaucous appearance of that carried by *Dielytra spectabilis*, and is thus a useful foil for other subjects. *George Bunyard, Maidstone.*

**Brugmansia sanguinea.**—We are quite losing sight of this species and others of the genus. It used to be much more common, especially as a big half tree in a tub that was wintered in some half light place, as an orangery, and stood out in the garden during the whole summer. The leaves are sinuately lobed, and the branches somewhat tomentose. The flowers are pendulous, 7 inches long, and trumpet-shaped, the colours being orange-yellow with a rich orange-red. The base of the tube is greenish. *B. suaveolens* has trumpet-shaped flowers of the purest white, whilst the foliage is oblong, entire, smooth, and dark green in colour. It will flower through the summer and autumn months. *M. W.*

**White Lily.**—Gavin Douglas, a Scotch poet, a son of the fifth Earl of Angus, who died 1475, mentions the Lily in one of his poems, but I imagine he alluded, not to the white Water Lily, about which your correspondent inquires, but to the *Lilium candidum*, for he says:—

"Queen of the field, in milk-white mantle drest,  
The lovely Lily waved her curling crest."

*Helen Watney.*

## Reports of Societies.

### EDINBURGH BOTANICAL: March 12.

THE Society met at 5, St. Andrew's Square, Mr. Alex. Buchan, F.R.S.E., in the chair.

#### A TRAVELLING CAMP.

A report was submitted suggesting that the Society should have this year a botanical travelling camp. The idea was cordially taken up by the members, and the matter was remitted to the Council to elaborate details. It was mentioned that if the camp was formed in spring they might associate with the Geological Survey, and that if they delayed till after the first week in August there might be some difficulty in getting access to the deer forests. We understand that the idea of having such a camp originated with Mr. Symington Grieve, and that it will be the first of the kind in this country. The camp will probably be formed for a whole month, members joining and leaving at different periods to suit their own convenience.

#### NORTH AMERICAN FLORA.

Mr. W. Caldwell Crawford gave notes of a visit as the Society's delegate to the British Association meeting

at Montreal and to the meeting of the American Association at Philadelphia. In the course of his tour he passed through Arizona and New Mexico, where he was in a partial desert amongst Yuccas which skirted the railway as Gorse frequently did in Scotland. Then the country became mere desert, and there were Cacti for a hundred miles or more—enormous plants, frequently 20 and now and again 40 or 50 feet high. Americans were always devising means of developing the natural resources of their great country, and the last notion he heard was to turn these enormous Cacti to some useful dollar-producing purpose. Nothing else would grow in Arizona, so it was proposed to graft Vines on these great succulent masses.

#### MISCELLANEOUS.

Mr. John Rattray, Marine Station, Granton, gave some interesting notes on new cases of epiphytism among algae, and exhibited forty-seven specimens, some of which had been dredged in 5 to 7 fathoms of water south of Inchkeith, and others in 30 to 35 fathoms of water off St. Abb's Head. He promised further communications on the same subject. Dr. Macfarlane exhibited curious specimens of Nephentes, and explained exhibits of rare British mosses from Mr. E. M. Holmes, and varieties of *Ling* (*Calluna vulgaris*) forwarded by Professor Dickson.

**The Royal Botanic Garden.**—Mr. Robert Lindsay, Curator, submitted his report on the progress of vegetation at the Royal Botanic Garden for February.

During February the thermometer was at or below the freezing-point on sixteen occasions, indicating collectively 67° of frost, as against 24° for the corresponding month last year. The lowest readings were registered on the 15th, 25°; 18th, 24°; 19th, 24°; 20th, 23°; 21st, 19°. The highest morning readings were on the 8th, 44°; 12th, 48°; 22d, 44°; 24th, 49°; 27th, 47°. The lowest day temperature was 35°, which occurred on the 16th and 17th, and the highest day temperature was 57° on the 24th. A good deal of rain fell throughout the month, but hardly any snow. Vegetation is making slow progress. Ribes, Thorns, Lilacs, Roses, and other deciduous trees and shrubs, are late in developing leaf and flower-buds. They are from three weeks to a month later than last season; the buds, however, are remarkably strong and vigorous, and with more genial weather will make rapid progress. The Hazel, Alder, Rhododendron atrovirens, and *Daphne mezereum* came into flower and were well covered with bloom during the month. Early flowering hybrid Rhododendrons are well set with flower-buds, and, along with most other hardy plants which are used for forcing purposes, are much more readily induced to flower when put into heat than is usual, mainly owing to their having been so well ripened during the fine dry summer last year. Spring flowers are also late in coming into bloom, but they promise to be very fine ere long—those that have already flowered are strong and richly coloured. On the rock garden twenty-four species and varieties of hardy plants came into flower during the month, while at the same date last year forty-one were recorded as having flowered. At the end of February, 1881, no less than ninety different species were counted in flower. At the end of the past month only thirty-eight could be found.

Mr. Taylor submitted Mr. Robert Bullen's report on *The Temperature and Vegetation at the Botanic Institution, Glasgow.*—The thermometer during February has been at or below the freezing-point fifteen times during the month, the lowest reading being 22° during the night of the 18th. Total frost, 73°. The highest day temperature was 53° on the 27th; the lowest 31°, on the 20th. Sharp frosty nights were continuous from the 13th to the 21st, both inclusive, after which mild weather prevailed until the night of the 28th, when 24°, or 8° of frost, were registered. The frosty nights were succeeded by fine days, but the snow which fell during the night of the 17th gave the country a wintry look. A severe gale of wind was experienced during the night of the 21st, but no serious damage resulted. Although showers were frequent during the early and latter part of the month, the rainfall was not heavy. Vegetation is still dormant, the only plants in bloom in the open ground being *Daphne mezereum* and *D. m. album*, *Crocus vernus* and *biflorus*, and *Petasites vulgaris* and *lobata*.

### MASSACHUSETTS HORTICULTURAL.

BOSTON: February 28.—Vice-President Moore in the chair. Dr. G. Austin Bowen, of Woodstock, Connecticut, read a paper on "Leaf as a Study."

The exhibition of flowers, fruit, and vegetables, was much the finest of the season. There were sixteen magnificent *Maréchal Niel* Roses from E. M. Wood & Co., for which a gratuity was awarded, and, in addition, a Bronze Medal for skill in cultivation. John B. Moore & Son sent splendid hybrid perpetual Roses, William H. Spooner, hybrid perpetual Roses, including a plant in flower of the new Queen of Queens; and Delay & Meade a variety of tender Roses. E. L. Beard brought two plants of *Primula obconica*. Edwin Sheppard showed the odoratissima Violet, a new single variety, very large, deep-coloured, and fragrant. Mrs. Francis B. Hayes sent the beautiful and fragrant *Rhododendron Veitchianum*, and a large collection of *Camellias*. C. M. Hovey exhibited a plant of *Clivia Van Houttei*, a large collection of *Camellias*, and other flowers. W. K. Wood had two vases of Roses and one of other flowers. Stillman S. Hovey showed a stand of Pansies and a variety of other flowers, and Miss S. W. Story a collection of cut flowers. A First-class Certificate of Merit was awarded to Mr. Beard for his new *Primula*, and one to Mr. Spooner for his new Rose, and a gratuity to the latter for other Roses. Gratuities were awarded to all the other contributors of flowers.

The Maine Pomological Society sent a collection of forty-three varieties of Apples grown in that State, some of which were fine specimens. H. Brackett exhibited fine Mushrooms and Cucumbers; G. F. Stone, fine Tennisball Lettuce; Josiah Crosby, Tennisball Lettuce; Mrs. Francis B. Hayes, three varieties of seedling Rhubarb; and C. M. Hovey, Mushrooms.

## Variorum.

JARRAH WOOD.—The Jarrah wood (*Eucalyptus marginata*), of Western Australia, is acknowledged by those who know its qualities to be about the next thing to everlasting. Almost everything in Western Australia is made of this timber—work-boxes, pianofortes, buildings, wharves, and jetties. It seems to defy all known forms of decay, and is untouched by white ants and all other insects, so that ships built of it do not require to be coppered. It has been used above-ground and below, in almost every situation in which timber could be placed, and was durable in all. On the table was a specimen from a tree cut thirty-two years ago, which had lain on the surface nearly all that time. It had been exposed to bush-fires every two or three years; to the sun during the summer; to wind and rain during the wet season; and was as sound now as the day it was felled. Another piece had been cut from a small sapling used in a bridge at Banbury, and so certified by the Government Resident, which had been thirty-six years in use, and this piece had been taken just between wind and water. There were about fifteen varieties of the timber, and it could be obtained of any reasonable length up to 60 or 80 feet, the trunk of the tree having no branches whatever. Another advantage is that it does not burn freely, but only charred, which made it additionally valuable for building. It is poisonous to all insects, and when put into a white ants' nest they will not touch it. If a sheet of glass and a piece of this timber are put into such a nest, the ants will bore through the glass rather than touch the Jarrah. The fresh sawdust put at the roots of a fruit tree would kill it, and it is stated by Baron von Mueller to contain, not only tannic acid, but also sulphate of copper. Some of the wood was put into the Suez Canal seven years ago, and when examined lately was found as perfect as on the day it was laid. *Journal of the Society of Arts.*

## A DISASTROUS STORM AT TOOWOOMBA, QUEENSLAND.

The old year closed disastrously for Toowoomba. After a close sultry morning a heavy storm burst over the town at half-past 3 in the afternoon, preceded by vivid lightning and heavy thunder. Rain fell in torrents, and was followed by a fall of hail unprecedented in severity in the memory of the oldest inhabitant. For the space of twenty minutes the hail fell, the stones at first being small, then increasing in size until lumps of ice larger than hens' eggs fell, and the whole town presented a mantle of white, while the Main Range looked as if covered with snow. The destruction of property is very great. Vineyards have been cut down and completely stripped of fruit and leaves; and hundreds of fruit trees have been denuded of fruit. The gardens of Messrs. Taylor and Groom, and other private gentlemen, have been terribly injured; but the Botanical Gardens, which were more exposed, have become a complete wreck; the large conservatory is completely smashed, and the valuable plants and Ferns destroyed. In the vicinity of the Main Range the Maize and Potato crops were cut to pieces.

## Obituary.

WE regret to announce the death of Mr. ANDREW SINCLAIR, of the firm of Messrs. W. P. Laird & Sinclair, nurserymen and seedsmen, Dundee, which took place recently at his residence, Fountainbrae, Monifieth. The deceased gentleman, who was a native of Edinburgh, learned his business with Messrs. Dickson & Co., Waterloo Place, and thereafter held an important position with Messrs. Lawson & Son, Edinburgh. He subsequently joined Mr. W. P. Laird in the business which that gentleman established in Dundee fifty-one years ago, and he had been connected with the firm for upwards of a quarter of a century. He was an active, energetic man, thoroughly acquainted with all the branches of his business, and

he bestowed great care and attention to the nursery at Monifieth, which had been under his personal superintendence since the death of Mr. W. P. Laird in 1872. Mr. Sinclair had been suffering from heart disease for several years, and it is somewhat singular that only the day preceding his death he completed the arrangements for retiring from the firm and transferring the business to Mr. R. B. Laird (of Messrs. R. B. Laird & Sons, Edinburgh), brother of the founder of the firm. The death of Mr. Sinclair will be felt as a serious loss to his numerous friends in all parts of the country. He was in his 51st year, and unmarried.

LONDON: *Atmospheric Pressure.*—During the week ending March 14, the reading of the barometer at the level of the sea decreased from 30.04 inches at the beginning of the week to 29.86 inches by 1 P.M. on the 8th, increased to 30.52 inches by 9 A.M. on the 11th, decreased to 30.46 inches by 9 A.M. increased to 30.49 inches by 1 P.M., decreased to 30.45 inches by 5 P.M. on the 12th, increased to 30.50 inches by 9 A.M. on the 13th, decreased to 30.46 inches by 1 P.M. on the same day, increased to 30.64 inches by 1 P.M. on the 14th, and was 30.54 inches by the end of the week.

The mean reading of the barometer for the week was 30.33 inches, being 0.59 inch higher than last week, and 0.24 inch above the average of the week.

*Temperature.*—The highest temperature was 48° 5, on the 12th; the highest on the 8th was 38° 2. The mean of the seven high day temperatures was 44° 5.

The lowest temperature was 26° 5, on the 8th; on the 14th the lowest temperature was 36° 3. The mean of the seven low night temperatures was 31° 5.

The greatest range of temperature in one day was 19° 2, on the 12th; the smallest was 9° 5, on the 9th. The mean of the seven daily ranges was 13°.

The mean temperatures were—on the 8th, 32°; on the 9th, 36° 9; on the 10th, 35° 2; on the 11th, 36° 7; on the 12th, 39; on the 13th, 40° 6; on the 14th, 40° 9; and these were all below their averages by 8° 5, 3° 6, 5° 4, 4°, 1° 8, 0° 4, and 0° 3 respectively.

The mean temperature of the week was 37° 3, being 2° 3 lower than last week, and 3° 4 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 107°, on the 14th. The mean of the seven readings was 87° 5.

The lowest reading of a minimum thermometer placed on grass was 20° 5, on the 8th. The mean of the seven readings was 25° 3.

No rain fell during the week.

ENGLAND: *Temperature.*—During the week ending March 14, the highest temperatures were 56° at Truro, 52° 8 at Plymouth, 51° 8 at Bristol; the highest at Wolverhampton was 48°, at Blackheath 48° 5, at Brighton 48° 6. The general mean was 50° 1.

The lowest temperatures were 26° 2 at Cambridge and Wolverhampton, 26° 5 at Blackheath; the lowest at Plymouth 33°, at Leeds 32°, at Liverpool 31° 7. The general mean was 29° 6.

The greatest ranges were 26° at Truro, 24° 8 at Bristol, 24° 7 at Cambridge; the smallest ranges were Liverpool 17° 3, at Brighton and Leeds 18°. The general mean was 20° 5.

The mean of the seven high day temperatures was highest at Truro, 51°, at Plymouth 47° 7, at Cambridge 47° 2; and was lowest at Bradford, 43° 8, at Wolverhampton 44°, at Liverpool 44° 1. The general mean was 45° 7.

The mean of the seven low night temperatures was highest at Plymouth, 35° 7; at Nottingham and Newcastle 34° 6; and was lowest at Wolverhampton, 30° 3, at Hull 31° 1, at Bolton 31° 3. The general mean was 33°.

The mean daily range was greatest at Truro, 18°, at Cambridge 15° 4, at Bristol 15°; and was least at Liverpool, 9° 1, at Brighton 10° 5, at Nottingham 10° 7. The general mean was 12° 7.

The mean temperature was highest at Truro, 41° 1, at Plymouth 40° 8, at Newcastle 39° 7; and was lowest at Wolverhampton, 36° 2, at Bolton 36° 9, at Bradford 37° 1. The general mean was 38° 5.

*Rain.*—The largest falls were 0.27 inch at Sheffield, 0.21 inch at Hull, 0.18 inch at Nottingham; the smallest fall was 0.01 inch at Newcastle, 0.04 inch at Bristol and Wolverhampton. No rain fell at Truro, Plymouth, or Blackheath. The general mean fall was 0.09 inch.

SCOTLAND: *Temperature.*—During the week ending March 14, the highest temperature was 53° 8, at Aberdeen; at Greenock the highest temperature was 49°. The general mean was 51° 4.

The lowest temperature in the week was 27°, at Glasgow; at Aberdeen the lowest temperature was 30° 8. The general mean was 28° 7.

The mean temperature was highest at Paisley, 41° 8; and lowest at Glasgow, 38° 9. The general mean was 40° 4.

*Rain.*—The largest fall was 0.04 inch, at Aberdeen; the smallest fall was 0.01 inch, at Edinburgh. No rain fell at Glasgow, Dundee, Leith, or Paisley. The general mean fall was 0.01 inch.

JAMES GLAISHER, F.R.S.

## Enquiries.

"He that questioneth much shall learn much."—BACON.

"FLORAL CALENDAR," OR "REGISTER."—Your correspondent, Mr. Andrew Taylor, Edinburgh (*Gardeners' Chronicle*, vol. xxi., 553), informs us that the *Transactions of the Botanical Society of Edinburgh*, vol. xiv., part 3, gives the Calendar for the fourteen years preceding 1883. My bookseller, having made inquiry of his London correspondent, informs me that they cannot find the price in London of this part. Can any of your correspondents oblige me? *Diss.*

## Answers to Correspondents.

ADVERTISEMENT: E. T. No; it did not appear.

ANTHURIUM SCHERZERIANUM: Mrs. Brightwen. It is a very fine bloom.

APPLE: C. B. Son. Not known.

ARISTOLOCHIA SIPHO: C. W. S. The colour of the flower is purplish-green, and they are sometimes found measuring 2 inches in depth of pitcher. The leaves are cordate, and have a width of 7 or 8 inches.

BEEES.—Apply to Mr. Fox Kenworthy, 55, Coleman Street, E.C., Secretary of the Middlesex Beekeepers' Association.

BEGONIAS: E. W. T. Dreggi is a winter blooming white, small, but very free. B. manicata is also of the same colour, but more graceful—both are easily grown.

BOOK ON LAYING OUT: A Young Gardener. Kemp's *Practical Gardener* will give you all the information you require.

BOOKS: B. Vinc. *Vines and Vine Culture* (by Barron). Published at 171, Fleet Street, E.C.

**CATTLEYA BLOOM:** *P. Hillat*. Fine in form and substance, but in no respect better than many others.

**CORRIGENDUM.**—In our report of the last meeting of the Royal Horticultural Society Messrs. W. Paul & Sons' address was given at Waltham Cross, instead of the "Old" Nurseries, Cheshunt.

**CROWEA SALIGNA AND OTHER FINE NEW HOLLAND PLANTS:** *B.* These are still to be obtained at the leading nurseries, although but few make a specialty of them at the present time. We believe Messrs. Cutbush, of Highgate, are paying some attention to this class of plants.

**DRESSING FOR PEAT LAND:** *H. H., Bournemouth.* Use stone lime, but not slacked.

**FRENCH BEAN:** *J. S.* You should send Beans and haulm, when in season, to our office, and ripe seed, if you have any.

**INSECTS:** *B.* The small beetles are Aphodius scybalarius; a common dung-feeding insect. *H.*

**INSECTS ON GOOSEBERRY SHOOT:** *C. W. D.* The extremely minute mites infesting the base of the buds are in a very juvenile condition, with only six legs, and are consequently not accurately determinable. They appear to belong to a species of Tetranychus, like *T. Salicis*, Koch, *Cont. Panzer, F. I. G. H., 155, No. 18. I. O. W.*

**NAMES OF PLANTS:** *R. P. 1.* Cupressus Lawsoniana aurea; 2, Juniperus tamiscifolia; 3, Biota orientalis aurea; 4, Cephalotaxus pedunculata; 5, Retinospora lycopodioides; 6, Juniperus chinensis aurea.—*W. J. Mitchison.* Polygala Dalmaniana and Doronicum deotatum.—*Charles Sharpe & Co.* Trifolium ochroleucum (but not an Egyptian species).—*H. T. S.* Populus tremula, the Aspen.—*J. O. B. 1.* Dendrobium transparens, approaching Dendrobium litiflorum; 2, D. fimbriatum.—*C. C. E.* Dendrobium Pierardi.—*H. Woodmansey.* 1, Pachyphyllum bracteosum; 2, Echeveria acutifolia; 3, Bryophyllum calycinum; 4, Onychium lucidum; 5, Gaultheria Shalloon.

**SULPHIDE OF POTASSIUM.**—See our advertisement columns in this number.

**POTATOS.**—Magnum Bonums, 40s. to 70s.; Regents, 70s. to 90s. Champions, 45s. to 60s. per ton. Markets have a downward tendency.

### SEEDS.

**LONDON:** March 18.—The seed markets are now characterised by a moderate amount of activity, and all varieties are offered somewhat less freely, without, however, any notable advance in values, extreme cheapness all round being still the order of the day. Some further fresh shipments of American Clover seed have been made to New York. Alsike, White, and Trefoil all keep steady; more money is asked for imported Italian. Spring Tares meet a fair inquiry. There is not much passing in either Canary or Hemp seed. In Linseed the tendency is downwards. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

### CORN.

At Mark Lane on Monday English Wheat showed an advance of 1s. per quarter, mainly attributable to the improved condition of the samples offered. Foreign Wheats in most cases lost the advance obtained in the course of last week, and went back to the rates of Monday's night. Flour rates were quite up to those of the previous Monday. Barley, Beans, and Peas were without notable change. Maize upheld an advance of 3d., and Oats 3d. to 6d. advance on the week.—On Wednesday the Wheat trade was almost at a standstill, and quotations nominal. No notable change occurred in Maize, and Barley, Beans, Peas, and Oats also remained at Monday's rates.—Average prices of corn for the week ending March 14:—Wheat, 31s. 4d.; Barley, 31s. 8d.; Oats, 20s. 9d. For the corresponding period last year:—Wheat, 37s. 7d.; Barley, 31s. 3d.; Oats, 19s. 8d.

### CATTLE.

At Copenhagen Fields on Monday supplies of beasts were not so heavy as on the previous Monday, but trade was no better. With a heavy supply, sheep declined 2d. per 8 lb., and sales moved slowly. The assortment of calves was not very good, and the trade was slack. Quotations:—Beasts, 3s. 6d. to 4s. 6d., and 4s. 8d. to 5s. 2d.; calves, 3s. 8d. to 5s. 10d.; sheep, 4s. 6d. to 5s., and 5s. 2d. to 5s. 8d.; pigs, 3s. 8d. to 4s. 4d.—On Thursday there was no trade either for beef or sheep, and prices tend in favour of buyers. Calves were steady, and Pigs sold at late prices.

### HAY.

Tuesday's Whitechapel market report states that trade was fairly brisk for prime sorts of Clover and hay, some of the top qualities of which, specially picked, were worth 2s. per load more, at 107s. and 94s. respectively. Supplies short. Quotations:—Clover, prime, 85s. to 107s.; prime second cut, 85s. to 105s.; inferior, 48s. to 75s.; hay, prime, 76s. to 94s.; inferior, 25s. to 60s.; and straw, 22s. to 35s. per load.—On Thursday there was a short supply, and trade steady.—Cumberland Market quotations:—Clover, best, 90s. to 105s.; inferior, 60s. to 84s.; meadow hay, best, 80s. to 90s.; inferior, 60s. to 14s.; and straw, 29s. to 34s. per load.

### POTATOS.

The Borough and Spitalfields Markets reports state that the demand continues limited, but prices are supported. Quotations:—Scotch Regents, 40s. to 95s.; Kent ditto, 75s. to 85s.; Champions, 40s. to 60s.; Magnum Bonums, 60s. to 80s.; Victorias, 70s. to 90s. per ton.—The imports into London last week consisted of 755 bags from Hamburg, 3 Rotterdam, 126 Malta, and 20 from Harlingen.

**Government Stock.**—Consols closed on Monday at 97½ to 97½ for delivery, and 97½ to 97½ for the account. Tuesday's prices were 98 to 98½ for delivery, and 98½ to 98½ for the account. The closing figures for Wednesday were 98½ to 98½ for delivery, and 98½ to 98½ for the account.—Thursday's final quotations were 98 to 98½ for both delivery and the account.

## DANIELS BROS.'

### LIST of CHOICE

## FLORISTS' FLOWERS

SPRING 1885.

We have much pleasure in offering the following choice Florists' Flowers in strong healthy young plants, mostly from single pots, and guaranteed true to name.

# THE FRUIT OF THE FUTURE.

## NEW MAGNIFICENT BLACKBERRY, "THE WILSON JUNR."

In spite of the fact that Blackberries will grow "anywhere" in reason, and everybody likes them, it is yet a puzzling reality that it is only with great difficulty and at a high figure that we can purchase them in our markets.

Surely, then, it must be apparent to all farseeing "fruit growers" that instead of glutting the markets with Gooseberries, Currants, &c., they have here a fruit which, if planted upon any given area of land, will prove far more profitable than any other hardy fruit that could be grown. And why? Simply because for half-a-dozen years ahead, at least, the stock throughout the country will not have time to become so great as to exceed the demand.

Landowners, Stewards, and Gardeners, who have each year to show a balance-sheet "of profits," have here a very simple, safe method of for some years obtaining highly profitable results. Planted 3 feet by 8 feet requires at the rate of 18½ plants to an acre.

Gardeners also who grow for house consumption will find this fruit a valuable assistant. It will stand any treatment, and do well where other fruits would fail.

Whilst, however, we have the matter under consideration, do not let us fall into the mistake of planting any variety so long as it is a "Blackberry." Why not, for the sake of a slightly additional first expense, obtain the very "cream" of the family; or in other words, procure stocks of the hardiest, largest, most delicious, and most productive?

By pursuing this procedure the result repays the grower tenfold for the slightly additional first expense incurred.

It was this reasoning that caused us to give the subject our most careful study; the result of which is, we offer a variety, the grandest of the group, producing enormous berries, measuring on an average 3¼ inches around, lengthwise, and the same dimensions crosswise. (This will give an idea of the profit to be derived from its culture as a market commodity.) The berries are also glossy black, very early, of exquisite flavour, and enormously productive—the heavy load of fruit often bending the canes to the very ground.

We can offer plants of this grand variety at 1s. 3d. each, 12s. per dozen, 85s. per 100, carriage paid.

We can offer other varieties as follows:—"LAWTON," "KITTA-TINNY," "PARSLEY-LEAVED" (*Rubus fruticosus laciniatus*), "WILSON'S EARLY," at 9d. each, 8s. 6d. per dozen, 63s. per 100.

After this date (March 12) we advise our numerous Patrons for the "Wilson Junior Blackberry" to give us the option of Autumn Delivery. We have, however, every reason to believe that there is a certainty of delivery in time this spring.

## EUREKA!! INSECTICIDE.

Prepared by

**WILLIAM SMITH, Chemist, Stockbridge, Edinburgh.**

Highest Award, Forestry Exhibition, Edinburgh.

"Clovenfords, by Galashiels, N.B., July 25, 1883.  
"MR. SMITH.—Dear Sir,—We have now tried your Insecticide on all the Insects we can find on any of our Plants, including Orchids, and used as directed by you we find it instant destruction to them all, while it neither stains nor injures the tenderest leaf. We shall in future use no Fire-tree Oil, or other Insecticide but yours.—We are, yours truly,  
"WILLIAM THOMSON AND SONS."

Newcastle, Staffordshire.

## RANSOMES' NEW PATENT EDGE CUTTER.

Any Gardener can use it with ease.

The only really practical Edge Cutter yet brought out.

THIS Machine is a light, simple, strong, and useful substitute for Hand Shears, for trimming the edges of Lawns.

It can be guided with the greatest ease either in a straight line or round the edges of flower beds, &c. The depth of cut can be varied to suit the depth of the edge by simply tilting the conical roller more or less. The knives can be adjusted to the fixed blade as they wear, and can be readily removed for sharpening.

Of course, in the first instance, the edges should be prepared for the Edge Cutter, as no machine can work when the edges are filled up with dirt, gravel, and leaves. After it has been used a few times and the edges get into form, the saving effected by the use of the implement will be marvellous; in fact, after a little practice, a man can trim the edges as fast as he can walk, thus doing from five to ten times as much work as with the ordinary shears. Price .. 35s.

Carriage Paid to any Railway Station

RANSOMES, SIMS & JEFFERIES (Limited), Ipswich.

**HILL AND SMITH'S BLACK VARNISH**,  
for Preserving Ironwork, Wood, or Stone.  
(Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used to the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 15. 6d. per gallon, at the Manufactory, or 15. 8d. per gallon carriage paid to any Station in the Kingdom.

**UNSOLICITED TESTIMONIAL.**

"Piercefield Park, June 21, 1876. Sirs.—I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Piercefield Park, Chepstow.—I am, Sirs, yours respectfully, Wm. Cox."

**CAUTION.**—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large illustrated CATALOGUE of Fencing Hurdles, Field and Entrance Gates, &c. sent free on application to

## WANT PLACES.

**POSTAL ORDERS.**—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

**B. S. WILLIAMS** begs to intimate that he has at present in the Nursery and upon his Register some excellent Men, competent either to fill the situation of HEAD GARDENER, EAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Holloway, N.

**SCOTCH GARDENERS.**—JOHN DOWNIE, Seedsman, 144, Princes Street, Edinburgh, has at present on his list a number of SCOTCH GARDENERS, waiting re-engagements, at wages ranging from £50 to £100 per annum, and he will be pleased to supply full particulars to any Nobleman or Gentleman requiring a trustworthy and competent Gardener.

**RICHARD SMITH AND CO.** beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

Journymen and Foremen, Scotch.

**GRATEFUL—COMFORTING. EPPS'S COCOA. BREAKFAST.**

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." *Civil Service Gazette*.

Made simply with boiling water or milk. Sold only in Packets, labelled thus:—**JAMES EPPS & CO., Homoeopathic Chemists, London.**

**HOLLOWAY'S PILLS.**—In general debility, mental depression, and nervous irritability, there is no medicine which operates so like a charm as these famous Pills. A disordered stomach and a torpid liver are fertile sources of gloomy thoughts and dismal forebodings. These Pills elevate the spirits, and, in fact, make the patient sensible of a most delightful revolution in his whole system. They may be commended most unreservedly as the very best family medicine in existence. Though so powerfully efficacious, they are singularly mild in their operation, and may be given with perfect confidence to delicate women and young children. They contain no mercury, or any other noxious substance, and cannot do harm. Delicate females and all persons of sedentary habits will find these Pills a blessing.

# BOULTON & PAUL, Horticultural Builders, and Heating Engineers, NORWICH.

Plants, purchaser's selection, 2s. 6d. per dozen, 16s. per 100; cuttings, 1s. 6d. per dozen, 10s. per 100; W. E.'s selection, cheaper. For the new English and Cotoontal varieties see CATALOGUE, with Essay on Cultivation, one stamp.  
W. ETHERINGTON, The Manor House, Swanscombe, Kent.

#### New Kidney Potato.

**BIRD'S DOCTOR BOB.**—This is the earliest Kidney variety in existence; a very heavy cropper, as many as sixty tubers of all sizes have been counted at a root. It is a seedling from Early King. After a trial of several years it has never taken disease. Eyes very shallow; a good cooker, and fine flavour. 5s. per stone.  
JAMES BIRD, American Nurseries, Downham Market.

#### Forcing Asparagus.

**R. AND G. NEAL** beg to offer the above by the hundred or thousand (own growth, and transplanted last spring). Samples with Price on application. Also beg to call the attention of Nurserymen, Builders, and others to their exceptionally fine stock of **FRUIT, FOREST, and ORNAMENTAL TREES and SHRUBS.**  
The Nurseries, Wandsworth Common, S.W.

#### CARNATIONS, PICOTEES, and PINKS.

—Having a large stock of strong, finely rooted plants of the above, we beg to offer them at the following low prices:—Choice Show **CARNATIONS** and **PICOTEES**, in name, our selection, 12s. per dozen pairs; purchaser's selection, 15s. to 18s. ditto. **PINKS**, Show varieties, our selection, 4s. 6d. to 6s. per dozen pairs. Old Crimson **CLOVES** (True), 3s. per dozen. Mixed **CARNATIONS**, for borders, 3s. per dozen. **PYRETHRUMS**, choice Double varieties, 3s. per dozen. Carriage and package free for cash with order.  
ISAAC BRUNNING AND CO., Great Yarmouth Nurseries.

**SAMUEL SHEPPERSON, FLORIST and SEEDSMAN**, Prospect House, Belper, Derbyshire, begs to inform the readers of the *Gardeners' Chronicle* that he is prepared to execute orders for the following plants, all of which have been grown on the Derbyshire hills, and are very hardy and strong stocky plants, and sure to succeed well. They are of the very finest strains that money can buy. They are carriage free for cash with order.  
Descriptive CATALOGUE of Florists' Flowers free.  
Established 26 years.

**PANSIES a SPECIALTY.**—Probably the best collection in England. The cream only of the most noted raisers. The latest new sorts, and the winners at all the great shows. Good plants, correctly named, Show or Fancy, 12 for 3s.; 25 for 5s. 6d.; 100 varieties for 25s. Postal Orders.

**CELERY, FISHER'S No. 1.**—New Pink. Warranted the largest, earliest, and best-flavoured Celery grown. Seed Packets, 1s.  
**SAMUEL SHEPPERSON, Florist and Seedsman**, Prospect House, Belper.

## EXTRACTS

from our Seed Catalogue of

# FLORAL GEMS

#### ANARRHINUM BELLIDIFOLIUM.

A rare and beautiful Biennial, which though allied to the Antirrhinum, differs nevertheless in its formation of bloom from that family. Grows 1½ foot high, and produces, June to August, most lovely blue flowers. . . . It is perfectly hardy, and may thus be sown in the open border, greatly delighting in a sandy loam. Price 6d. and 1s. per packet.

#### ANGELONIA GRANDIFLORA.

A most lovely and sweet-scented Greenhouse Annual, producing fine spikes of beautiful blue flowers. Can highly recommend this to any amateur wanting an uncommon, pretty, and easily grown pot plant. Price per packet, 3d. and 6d.

#### ANTIRRHINUM ("SNAPDRAGON").

##### Magnificent Strain.

The mixture we offer has been procured from three of the finest strains in the world, and which we have thoroughly mixed; our patrons may therefore depend upon receiving a strain such as cannot be equalled. Price per packet, 1s. 6d. and 2s. 6d.

#### ASTER TENELLUS.

This is a beautiful Biennial, and blooms in August, when it presents one dense mass of lovely blue flowers; is a splendid pot plant for greenhouse, or may be planted outdoors on a warm sunny border. Price per packet, 6d. or 1s.

#### CHRYSANTHEMUM, POMPONE.

We can now offer seed at 1s. and 2s. 6d. per packet.

#### CLEMATIS GRAVEOLENS.

A half-hardy Clematis, bearing yellow flowers, and thus contrasting most effectively with other well-known varieties. Price per packet, 1s. and 2s. 6d.

#### CONVOLVULUS MINOR, "ROSE QUEEN"

This is unquestionably a most valuable acquisition to the Annual family, being of a most enchanting soft rosy-blush, whilst each plant is smothered with bloom. Certain to create a grand impression. Price, per packet, 6d. and 1s.

#### CONVALLARIA MAJALIS,

##### "LILY OF THE VALLEY."

We can offer seed of the well-known "Lily of the Valley," Price, per packet, 3d. and 6d.

#### FORGET-ME-NOT, "PIGMY BEDDER."

If any one requires a cheap, effective, and uncommon blue edging, obtain a packet of this plant out with other bedding plants, when we can vouch that, if well grown, all visitors will say that it puts all other Myosotis or Lobelia completely into the shade. Unlike the other known varieties this new species now offered presents no straggling appearance but one line of unbroken blue. Supply limited. Price, per packet, 1s. 6d. and 2s. 6d.

#### IPOMOPSIS ELEGANS.

As the name implies (*Ipo* to strike forcibly, and *opsis* sight) this splendid biennial is extremely effective when well grown. If grown in pots, well crooked, watered carefully, and kept in any airy situation next the glass the amateur will find his labours amply repaid by an uncommon effective flower. Our collection comprises an assortment of various colours, and will produce hues of from rose, canary, yellow to dazzling scarlet. Price, per packet, 6d. and 1s.

#### MISTLETO.

It is not generally known that Mistletoe may be easily grown by rubbing the viscous seed upon the young wood of any Apple, Thorn, &c., tree, when the wood is not too hard. Many growers where the wood is hard cut off a little of the outer bark. Dust a little fine earth over to keep from view of birds. Price, per packet, 6d. and 1s.

#### PALIURUS ACULEATUS SYN. P.

##### AUSTRALIS (CHRIST'S THORN).

This, without question, is the plant from which "the Crown of Thorns, which was put upon the head of Jesus Christ was composed" (*London, Encyc. of Plants*, p. 178). Many in sheer ignorance imagine the Crown in question to have been formed of our common Hawthorn (*Crataegus oxyacantha*). Besides its biblical interest the plant possesses such curious and ornamental qualities as should alone make it a resident in every English garden. It is a perfectly hardy ornamental deciduous shrub, and delights in any common garden soil. It attains a height of about 4 feet, and produces during June and July greenish-yellow flowers, which are succeeded by curiously-formed fruit, "appearing something like a bead with a broad-brimmed hat on" (*Paxton*). Grows readily from seed. Price per packet, 6d.

#### STEPHANOPHYLLUM LONGIFOLIUM.

This is a most beautiful Greenhouse Annual, producing during autumn numerous graceful branches with enchanting scarlet blossoms, which open for a long period. Price per packet, 1s. 6d. and 2s. 6d.

#### VIRGINIAN STOCK, "White Cluster."

This is a great improvement on the White variety at present known, being larger in the blooms, more compact, and altogether more effective as a border plant. Stock this year limited. Price per packet, 1s. and 2s. 6d.

N.B.—All Seeds forwarded, post-free, upon same day as orders are received.

**VICCARS COLLYER & CO.,**  
Importers of New & Rare Plants, Seeds, &c.,

#### To the Trade.

#### MANGEL WURZEL and TURNIP SEEDS.

**H. AND F. SHARPE'S Wholesale Priced LIST** of the above-named Seeds is now ready, and may be had on application. It comprises all the very finest varieties of 1884 growth.  
Seed Growing Establishment, Wisbech.

#### FIVE THOUSAND PELARGONIUMS.

Must be sold. Clean, large bushy stuff, to flower early. Established in 48-pots, including all the best named varieties, as Dr. Masters, Duchess of Bedford, Bridal Bouquet, King-ston Beauty, &c., 7s. 6d. per dozen for cash. Also ditto in 6s. ready for 48-pots, at 4s. per dozen for cash.  
Address, MANAGER, The Hill Nurseries, Sandiacre, Notts.

#### HENDER'S BALSAMS.—We save only

from finest double Camellia-like flowers, and we are confident our strain is far superior to any other offered. Colours rich, beautifully mottled and striped. Eight varieties, separate, 2s. 6d. HENDER'S PETUNIA GRANDIFLORA, well known to be the finest strain; flowers beautifully mottled and striped. Single, 2s. per packet.  
HENDER AND SONS, Nursery, Plymouth.

#### New and Choice Chrysanthemums.

**R. OWEN** begs to call attention to his choice collection, which comprises only the best new and old varieties. Strong rooted cuttings, twelve varieties for 1885, 7s. 6d.; ditto for 1884, 3s. 6d.; best old varieties, 2s. 6d. per dozen — cuttings, 6d. per dozen less, post-free for cash. CATALOGUE one stamp. **Mr. BOWERMAN, Hackwood Park Gardens, says:—"They are the best cuttings I ever had sent me."** The Floral Nursery, Maidenhead.

#### TWELVE CAMELLIAS or AZALEA

INDICA, full of buds, 21s., large perfect plants of either, in 5½-inch pots, all different named sorts; or 1 dozen of each sent carriage paid on receipt of 42s.  
E. YANDER MEERSCH, Queen's Nursery, Selhurst, S.E.

**SEAKALE.**—Thousands of strong Crowns. GRAPE VINES, Fruiting and Planting Canes. Special low quotations to large buyers.  
WILL TAYLER, Osborn Nursery, Hampton, Middlesex.

#### SPRING CLEARANCE SALE,

to avoid planting.  
LILIU AURATUM, SINGLE OAHLIAS, IRIS, GLADIOLI, BEGONIAS, and many other Bulbs, with some choice Seeds, at greatly reduced rates. Send for our Special Clearance LIST, No. 73.

## BIDDLES & CO.,

THE PENNY PACKET SEED COMPANY,

LOUGHBOROUGH, LEICESTERSHIRE,

Supply 3000 varieties of FLOWER SEEDS, in Packets, at One Penny each, including the choicest sorts, viz. :—Asters, Balsams, Calceolarias, Cyclamens, Pansies, Petunias, Phlox Drummondii, Primulas, Salvias, Stocks, Verbenas, &c. All seeds being of the best quality in small quantities, the packets must be regarded as economical, not cheap. We recommend our various collections of twelve varieties for 1s.

All kinds of VEGETABLE SEEDS, of best quality, by weight, and also in Penny Packets.

Send for CATALOGUE, gratis (500 Illustrations). Save expense and buy a large selection in small packets.

50,000 GLADIOLUS BRENCHEYENSIS to be sold off at 5s. per 100—grand bulbs.

### For Present Sowing.

The earliest in cultivation, dwarf and compact in habit, head firm and pure white, and well protected by the foliage. It stands dry weather better than any other variety.

Mr. GILBERT says it turned out the best of all he grew last season.

Mr. E. STEPHENSON, Thorganby Hall, says:—"Your 'President' Cauliflower is not only the earliest but the most useful I have ever grown; we can plant it 2 or 4 inches closer than any other variety. The heads are very white and compact. I have grown it ever since it came out: I recommend it to all my friends."

Post-free on receipt of postal order or stamps for 1s. 6d.

WILLIAM E. MARTIN, Seed Merchant, Hull.

**DANIELS BROS.,**  
NURSERYMEN AND FLORISTS,  
NORWICH.

## AMARYLLIS (SPREKELIA) GLAUCA.

## E. H. KRELAGE & SON,

NURSERYMEN, SEEDSMEN, AND FLORISTS,  
HAARLEM, HOLLAND,

Have an extra large stock of this splendid bulbous plant, in very large bulbs, ready for sale just now. It is a parent of the well-known Jacobean Lily (Amaryllis formosissima), and has a similar brilliant red flower, which, however, is larger and less dark. It flowers easily and early, and the foliage usually is developed at the same time as the flowers. It can be cultivated in pots in the greenhouse or room, or in glasses, like Hyacinths. When planted in the open ground, in spring, it must be taken up before winter and kept dry and warm during its rest. In more temperate climates it can remain in the open ground during winter.

We offer large flowering bulbs, delivered free to all the principal towns of Great Britain and Ireland, no charge for package:

25 bulbs, 7s. 6d.; 50 bulbs, 12s. 6d.; 100 bulbs, 20s.; 250 bulbs, 45s.,  
500 bulbs, 80s.; 1000 bulbs, 150s.

Discount to the Trade. Please send with Orders remittance in Post-bills or Cheques.

## NEW CATALOGUE FOR 1885.

Beautiful Flowers for Indoors, selected from an immense stock. Our Glasshouses cover nearly 2 acres.

## Wm. Clibran &amp; Son's New List

(90 Pages Double Column)

Of the newest and finest varieties of all classes of Plants for Greenhouses, Stoves, &c., may now be had for two stamps. It includes only the best varieties of their respective classes. Every season new sorts are added. Comparisons of the varieties when in bloom carefully made, and the inferior kinds discarded. Intending purchasers may rely when selections are ordered as under on being supplied with varieties of merit only.

The following cheap Collections of finest named kinds consist entirely of our selection. Purchasers may select from the Lists at Prices as per CATALOGUE, which please see before ordering elsewhere.

Wholesale, J. W. COOKE, Market Place, Wincor; and A. LAING, Rawcliffe, Selby, Yorks.; also Messrs. OSMAN AND CO., 15, Windsor Street, Bishopsgate, London; and W. FRASER, 124, High Street, Perth.

## THOMSON'S VINE AND PLANT MANURE.—

We are daily getting letters asking us how to apply this manure, from persons who have purchased it from nurserymen who have had none from us. We beg to intimate that we have no responsibility for the quality of the article they have purchased, which may have little in common with ours, though advertised as the same.

WM. THOMSON AND SONS, Clonfertford.

## 12-oz. Sample Packets, free by post, 12 stamps.

FIBROUS PEAT FOR ORCHIDS, &c.—BROWN FIBROUS PEAT, best quality for Orchids, Stove Plants, &c., 66s. per truck. LIST free. Special prices to the Trade for cash. W. HERBERT AND CO., Hop Exchange Warehouses, Southwark Street, S.E. (near London Bridge).

## STANDEN'S MANURE.

ESTABLISHED 20 YEARS.

This old-established Manure is acknowledged by most of the leading practical Gardeners in the United Kingdom and the Colonies to exceed all others in general fertilising properties and staying powers. It promotes a rapid, healthy, and robust growth in plants generally. It is a clean and dry powder, with very little smell, which renders it particularly adaptable for ladies interested in plant culture.

The highly fertilising properties of this Manure render it money value, in comparison with other manures, at least double, as users will find that very small quantities will produce favourable results.

Sold in TINS, 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each; and in BAGS or KEGS at reduced prices, 28 lb., 12s. 6d.; 56 lb., 23s.; 112 lb., 42s. each.

May be obtained from all Nurserymen and Seedsmen in the United Kingdom and the Colonies.

SOLE MANUFACTURERS,

## THE MOST SUITABLE FOR

SHADING ORCHIDS, FERNS,

Palms and Stove and

GREENHOUSE PLANTS.

It is a strong, durable Cotton

Netting, woven in squares so

close as to exclude the

direct rays of the sun,

but admitting the

greatest amount

of light attain-

able through

shading.

It with-

stands the

weather better

than any other

class of Shading,

and may be benefi-

cially used on account

of the thickness of its texture,

during cold weather, to keep

the frost out. R. WARNER, Esq.,

Broomfield, Chelmsford, has em-

ployed this material for some years,

and speaks very highly of it, pronouncing

it to be the very best material for Orchids

he has ever used.

Blinds made up and fixed complete.

Sold in pieces, 30 yards long by 1½ yard wide.

Price 45s. each. Sample submitted.

## BADMINTON.

BADMINTON is best known, perhaps, from its sporting associations, and comparatively few of your readers will know it as having a long and famous horticultural history. Bradley, in his quaint treatise, published in 1721, says, talking of "curious gardens of particulars," that "the chief in England are those at Badminton." This was in the days of the third Duchess, who was known and respected throughout the realm for her love of gardening and botany. Originally the grounds were laid out in the style fashionable in the days of William III. From the remnants left, a tolerably accurate picture can be formed of the manner in which the house was surrounded with labyrinths, mazes, hedges, and other forms in Yew and Box.

The kitchen garden was then at a considerable distance from the house, on the eastern side, and the site is known to this day as the "old fruit garden." Between the two was a long chain of flower garden and lawn, conceived in the ancient Dutch mode. The fifth Duke, with an animosity worthy of a Jacobite, changed the site of the kitchen garden to one nearer the house on the west side, and gradually swept away the intervening pleasure ground. About 1829 Capability Brown appeared on the scene. But, *grace à Dieu*, Badminton was a place he could only partially mar, not spoil. For the vast old timbered park around can boast the same motto as its ducal owner, *Mutare vel timere sperno*. Query—Was the first greenhouse in this country erected at Badminton?

Badminton has not been the home of the Beauforts since the Conquest, for they only came here after the levelling to the ground of the greater part of their massive castle of Raglan. Erudite John Timbs has a very interesting account of their "fair and pleasant castel, yn middle Venseland," and of its siege by Fairfax. It was beleaguered in 1646. The Marquis of Worcester, a hoary warrior of eighty-five, when bid to surrender, "made choice (if it soe pleased God) rather to die nobly than to live with infamy." However, after a siege of seventy-seven days, he capitulated on very favourable terms, which terms were kept by the Roundheads with Punic faith, for he was arrested and put into prison. In confinement his health gave way. Just before his death—only a year after the gallant defence of Raglan Castle—he was informed that permission would be given for his body to be interred in Windsor Castle, whereat the brave old man exclaimed, "Why—God bless us all!—why then I shall have a better castle when I am dead than they took from me whilst I was alive." His descendants have certainly lost nothing by the exchange, for the truly ducal mansion, which they now inhabit, has so few equals. that an exchange would be almost out of the question. The Earl of Worcester is a famous title, for besides the inventor of the steam-engine, there is Caxton's pattern for humanity, John Tiptoft.

The house is situated 9 miles from any railway station in the very south of Gloucestershire. The nearest town is Chipping Sodbury, a cleanly old market town, but sleepy. The walk from it to Badminton is across some outlying undulations of the Cotswolds, where the memory of bygone days is renewed by the sight of oxen between the shafts. This route brings the visitor to the foot of a long avenue pointing towards Bath, 14 miles away. At first it is but an avenue of comparatively young and bushy Elms and Hollies, with fields beyond. After passing the lodge it is a drive through Beech woods, rustling with a murmur like unto that of the sea. The road is good, but has no formal, carefully-brushed everyday appearance. Here and there are open spaces, and wherever practicable there is an undergrowth of Box, Laurel, Yew, and Barberry. The approaches on the other sides are through avenues of older trees, and then through park land, the one leading to the Worcester Lodge being 3 miles long.

The kitchen garden has a good aspect, and occupies a walled-in space of 11 acres. The walls are far higher than is usually the case, and a transverse one of the same stature arches over the broad central path. On both sides of this path is a well garnished herbaceous border, and over the arch is trained a flourishing Wistaria. Thus, the beautiful has a place as well as the useful. Every plot is as neat as a new pin, and the wall trees evidence the closest attention. The Apricots are fine healthy trees, and although thirty years' old look far younger than the trees in most gardens. The way these trees repay the constant and loving care bestowed upon them must be very satisfactory to Mr. Nash, the gardener. The soil in the garden is a rich and easily worked loam resting on an oolitic brash. When the trees do not succeed in cold clayey soils, as is usually the case, surely this delicious fruit is worth the trouble of having a special border formed for its roots. Constant feeding is injurious, and the mulchings should be spare. There is no reason why Apricots should not grown well in nearly every garden. And yet how many, with a spirit of *laissez-faire*, are content every year to saw out the cankered branches, and blame climate, soil, and position. Healthy trees with rational treatment, are within the bounds of possibility nearly everywhere. A west wall is devoted almost entirely to dessert Apples. By this means large yields of fine and handsome fruit have been obtained in years of scarcity. The Nonpareils, especially the old Scarlet, are admirably adapted for wall culture. The Orange Pippin, not Cox's, is a great favourite. The north walls are planted with Morellos, red and white Currants, Gooseberries, and the Diamond Plum. This latter, one of the best kitchen Plums in cultivation, has never failed to bear abundantly. Other sorts, suitable for a north aspect, are Deoniston's Superb, Guthrie's Late Green, Belle de Septembre, Gisborne's, Orleans, both the late and early, and Victoria. Although oftener met with in the older gardens, the public, thanks to the efforts of many of your correspondents, are quite awake to the advantages of growing Gooseberries and Currants on walls facing to the north. Among the Pears, Hacon's Incomparable, a Norfolk variety, which was raised near Downham Market, is planted to a large extent. It is not good in all soils, but where it is there are few, if any, varieties of better quality. November is the month of ripening, but it is a fairly good keeper. The fruit, moreover, ripens gradually without rotting at the core, and can be obtained till near the end of December.

All vegetable produce is well grown here. The whole *tout ensemble*, with its 18 feet walls and spic-and-span appearance, conveys to the senses the delight experienced at the sight of thorough and substantial work. The herbaceous border was mentioned above. The flowers in it are chiefly the old garden favourites, including the cherished Lilies. The variegated Comfrey is by no means to be despised by its neighbours, and contrasts well with the spiny Eryngiums.

The glasshouses are nearly all old structures, and the Vines from which Mr. Nash has cut so many prize bunches are forty-five years old. One vinery, with a height of 12 feet, has the disproportionate breadth of 24. The Vines have been planted close

together so that the laterals are short, but the long reach of rod counterbalances. The late varieties are very well grown, and although this year, owing to their having had their roots lifted, they are not up to their usual standard, yet Badminton Grapes are too well known in the "west country" to need any bush.

On the west and north sides of the garden is a drive called "the Verge," through alternate lawn and woodland; by its side, too, are numerous specimen Conifers. The intervening space between the house and the garden is turned to practical purposes. Near the kennels, which are situated in this part, are some huge Elms, one 30 feet round 3 feet up the bole. Lower down, nearer the public road, are some tall Yews, relics of the old order of things.

Notwithstanding its great size and its pilasters with Corinthian capitals, the mansion looks homely. The south front is very pretty; close up to the windows is an old Cedar of Lebanon, with a tall Tulip tree for neighbour, standing on the broad walk: facing it, you have the village church and its Ivy-grown tower, which is contiguous to the mansion. Hard by is the comely village of Badminton, with the old hostelry so well known to hunting men.

The west front faces a pleasure-ground of 16 acres, where are some fine old Chestnuts, and between them in the distance glistens Alderton spire. There is a flower garden on this side of the house, terminated on one side by a stone conservatory of the same architecture as the house, and on the other, the north end, by an octagon library.

The north front looks towards a goodly park, which is apparently boundless. In front of the entrance-hall is a large gravel space, large enough for two or three packs of hounds to meet on. It is surrounded by stone posts, through which are passed chains. Some little distance up the park is a small lake, and the broad Worcester avenue of Beeches and Elms.

A cosy part of the pleasure-grounds is the "Old Orange Garden." It is of the Italian pattern. The orangery, not used now for its original purpose, for the trees have been done away with, is covered with Wistarias, Magnolias, and Jasmines. In the centre of the garden is a fine marble vase, supported by exquisitely carved lion claws. The inscription is as below:—

Franciscus.  
Zam Paleo N.V.S.  
Corigien  
MDLXXXV.

There is also a quaintly-shaped fountain. Around are some clipped Boxes, and near the centre two tall Salisburias, which harmonise very well with the scene. Strolling about this old-fashioned place was very pleasant, and I liked the gardener all the better for saying "New-fangled notions couldn't sit well here." C. A. M. Carmichael. [The reader may be reminded of an interesting catalogue of variegated plants drawn up in the 17th century, and presumably grown at Badminton. The paper is by Mr. Berkeley, and is contained in the *Journal of the Royal Horticultural Society*, 1866, p. 22. Ed.]

## New Garden Plants.

VANDA STANGEANA, Rehb. f.

I WAS much puzzled when I read of "a new Vanda" of Mr. Freeman's in one of Messrs. Stevens' catalogues of a Sanderian sale. At length the new Vanda is at hand. A fine inflorescence was kindly given me by Sir Trevor Lawrence, Bart., M.P., Pres. R.H.S., and a single flower and a leaf were sent to me by Mr. F. Sander.

The plant was published by me in Von Schlechtendal and Von Mohl's *Botanische Zeitung* as early as 1858, p. 351, and dedicated to Mr. Stange, now the well-known grower of *Disa grandiflora*, *Sarracenias*, *Darlingtonias*, *Cattleyas*, Ferns, &c., at Hamburg, at one time Consul Schiller's enthusiastic gardener. I gave, in 1862, in *Xenia*, ii., plate 102, and p. 8,

\* *Vanda Stangeana*, Rehb. f.—Affinis *Vandae* Roxburghii, R. Br., et *fuscorividi*, Lindl. Labelli auriculis semiovatis divergentibus, lamina a basi lata utrinque semicordata sensim attenuata apice leviter bilobula, callis geminis parvis ante calcaris ostium; sepalis dorsalibus tepalibus subaequalibus cuneato ovatis; sepalis lateralibus majoribus.—*Vanda Stangeana*, Rehb. f., in Schlecht., and Von Mohl's *Botanische Zeitung*, '88, p. 356; *Xenia Orchidacea*, ii., tab. 102, p. 8.

both a representation and a description. I feel now a little struck at the rather narrow leaves, which were taken from a sketch prepared by Mr. Stange, as is distinctly stated in the last line of p. 8.

The leaf actually at hand is broad (m. 0.03), rather thin for a Vanda, compared by some with the leaf of *Vanda coerulea*. The leaves in the late Consul Schiller's collection were unequally bilobed at the apex; the leaf now at hand has no apex. The lax inflorescence of four to five flowers is comparable to that of the blue *Vanda Roxburghii*. Sepals and petals inside at first greenish, afterwards ochre coloured, tessellate with dark purple-brown. Auricles of lip blunt, white with yellow and some mauve-blue spots. Mid-lacinia cordate, triangular, emarginate at the apex, white with mauve-blue, or wholly mauve-blue. Two gibbosities project at the entrance in the hairless compresso-conical spurs. If one considers the destructive razzias of Mr. Freeman in Assam, an idea of the rarity of this species may be gained, since I have reason to believe there never were more than ten plants imported into England. H. G. Rehb. f.

EPIDENDRUM PSEUDEPIDENDRUM AURATUM,  
nov. var.

A fine variety, having only the disc of the semi-quadrifid lip crimson, the broad borders deep orange. Leaves as usual. There is mauve on the midline underneath, and some mauve on base above. It was kindly forwarded by Mr. W. Bull. H. G. Rehb. f.

## FILMY FERNS.

REFERRING to the article on this subject which appeared in your columns at p. 310, I must acknowledge that the benefit derived by these lovely plants through the very different and more rational treatment to which, for nearly twelve months, they have been subjected, is certainly a matter upon which all lovers of that most interesting class will join in bestowing high praise upon the Kew authorities. Every one interested in their culture will agree with "W. W." that the change has been marvellous, and certainly the greatest credit is due to the man who, during that time, has had them under his special care, for until lately, with the exception of the *Todeas*, which always were flourishing, the cultivation of nearly all kinds of New Zealand Filmy was a failure in our great national institution. In our opinion no better results could have been anticipated, unless it be, indeed, that the same alterations which have taken place in regard to their improved condition should have been arrived at under a perfectly cool treatment; for is it not somewhat misleading to apply that term to a culture where the winter temperature is kept at about 50°? "W. W." says that "some anxiety was felt for the success of the experiment;" but he need not have been so astonished at the results brought on the condition of the Kew plants through the great change in their culture, which alteration was, if I surmise aright, mainly due to the repeated advice of Mr. Cooper Forster, our best authority on the subject, who himself thinks it as unreasonable to expect those plants to thrive when subjected to great heat as it would be to see in a flourishing condition any shrub or flowering plant native from comparatively cold latitudes; for on the report of many conscientious travellers and plant collectors we know now that although some Filmy Ferns come from warm countries, they are, almost every one, found wild at high elevations, and the difficulty of introducing them alive into this country is principally owing to the certain amount of warm climate through which they have to pass before reaching our shores.

As Mr. Backhouse rightly says:—"The terms 'warm' and 'cool' treatment are too ambiguous unless the thermometric range is distinctly indicated, for one person calls 'cool' what another calls 'warm,' and *vice versa*." What is really meant by cool treatment is a temperature, keeping during the winter a little above freezing point, and as Mr. Cooper Forster's name has been prominently brought to notice in connection with this case, I may safely state that in his idea such treatment should be one in which the plants are kept quiet during the winter, and allowed to start of their own accord the following summer. It is the way in which for many years these plants have been treated in Upper Grosvenor Street, for it has often been my privilege to see in his unique Filmy Palace the thermometer as low as 34°. Yet all the species

which it contains enjoy luxuriant health, as may be attested by any visitor having a taste for, and possessing a certain knowledge of the subject, making a call at the above address. This extreme choice, and I may venture to say, matchless collection comprises fifty-nine species and varieties, so that it is not limited to New Zealand kinds alone. Far from it, for in company with the *Trichomanes radicans* and varieties, the *Hymenophyllum tunbridgense* and *H. Wilsoni*, all native from the British Isles, the numerous New Zealanders, one sees such reputed warm kinds as *Trichomanes maximum*, *auriculatum*, and *Lusch-nathiaum* in the most perfect condition; the latter not only thriving well but actually producing numberless fronds which in point of size greatly surpass even those previously grown in a warmer place. Now, that fernery is undoubtedly cool, as there are no means whatever of giving it any artificial heat, and it is situated at the back of the dwelling-house where there is no protection, and yet Tree Fern stems covered with a luxuriant vegetation of the lovely and most transparent Javanese *Trichomanes auriculatum* are there seen standing side by side with pieces of stone and pottery over which the numerous rhizomes of the Brazilian *T. Luschnathianum* form a most intricate network, and produce an abundance of beautiful fronds, some of which measure over 1 foot in length.

The extremely pretty *Hymenophyllum cruentum* and *H. pectinatum*, both of Chilian origin; the equally attractive little Japanese *Trichomanes parvulum*, the grand Brazilian *H. Forsterianum*, undoubtedly the finest of all the known *Hymenophyllums* in cultivation; the hairy *H. hirtellum* and *hirsutum*, both from the West Indies; the delicate *Trichomanes trichodeum*, also from the same habitat; the almost unique *T. Bauerianum*, from Norfolk Island; the equally rare *H. valvatum*, and several other rare kinds, are in Mr. Cooper Forster's collection as so many vegetable gems, delighting in the companionship of the New Zealand sorts, such specimens of which do not exist anywhere in cultivation. Take, for instance, the rare and beautiful *Hymenophyllum pulcherrimum*, which is there represented by several plants growing in hanging baskets and brackets (an entirely novel way of making use of Filmy Ferns, and one which originated with the fortunate possessor of this splendid collection), some of their lovely, delicate, and gracefully pendulous fronds measuring over 23 inches in length; the enormous specimen of *Trichomanes reniforme*, with its fronds counted by hundreds, and all in the grandest possible health. Besides the above enumerated we also notice masses of *Hymenophyllum æruginosum*, *caudiculatum*, *crispatum*, *dilatatum*, and *scabrum*; *Trichomanes angustatum*, *bilobiatum*, *mei-folium*, which, although still very scarce in private collections and conspicuous by their absence even in the Kew establishment, are all subjected to one common treatment and deprived of all artificial heat.

Thus we have the "cool" treatment system originating at Upper Grosvenor Street, and not as erroneously, though no doubt unintentionally stated by "W. W." at the York Nurseries. "Render unto Caesar the things which are Caesar's" is a maxim most appropriate to this particular case, and while we are all so much indebted to Mr. Backhouse for first bringing Filmy Ferns into notice, and attempting to render them popular, it is only fair to acknowledge the right of priority belonging to Mr. Cooper Forster for advising others and himself practising the "cool" or unheated treatment of these pet plants. S.

## ORCHIDS AT ROSEFIELD, SEVENOAKS.

THE collection of Orchids here is of recent formation, and consists chiefly of such kinds as thrive in cool and intermediate temperatures. In the selection of kinds Mr. De Barry Crawshaw seems to have steered clear of the mistake that so many beginners in the cultivation of these plants fall into of buying all plants that are met with—a course which soon crowds the houses with plants of little beauty horticulturally, and entails a process of weeding out which is neither agreeable nor profitable. The Cattleyas and their near allies, the *Lælias*, are the leading feature in the collection; they occupy a roomy curvilinear-roofed house standing east and west, the internal arrangements being conducive to the plants getting as much as possible of light and sun-heat. Their robust condition gives ample evidence of the

suitability of the treatment, in the unusually thick broad leaves, borne on stout bulbs, which have the appearance of having been formed in their native habitats, rather than under cultivation. All the leading Cattleyas are represented, the plants consisting of the finest forms of favourite species, and of imported plants, affording, as these last never fail to do, the pleasures of anticipation in a high degree, in marking the progress made till the open flower discloses a prize or a blank as the case may be. A number of the finest varieties of *Cattleya Trianae* were in flower, conspicuous amongst them being the variety *C. Trianae Rosæ*, a fine large flower with a splendid highly coloured lip; another, *C. Trianae Crawshayi*, a beautiful form of this favourite Cattleya, with broad petals and sepals, the soft tint of which affords a striking contrast to the intensely deep rich crimson lip and orange throat; *C. Trianae Dawsoni*, the true variety, was also in nice condition. Several other forms of this variable Cattleya, little inferior to those named, were likewise in bloom. These flowers were very different to the thin, washy coloured examples of this species that one used to meet when the over-heated, over-moist atmosphere it was generally subjected to obtained for it the character of being difficult to manage. A grand form of the fine Cattleya *Warszewiczii superbissima* was in bloom; it is the finest variety representing this species I have met with; the flowers are unusually large—8 inches across—with an immense broad open lip, the colour of which is of the most lovely shade of lilac. Of *C. Dowiana* there are a large number, some of which have been recently imported, and are making good progress. *C. gigas* in quantity flowers here as freely as *C. Mossiæ*; out of a dozen imported pieces four bloomed on the first growth they made. Of *C. Gaskelliana* one specimen was making a dozen strong growths, and numbers of other examples of this fine kind, somewhat smaller, but in equally satisfactory condition. Some of those imported last autumn have made growths as large as are often seen only in the second season. The fine dark variety of *C. Gaskelliana*, and the beautiful form of this species with white sepals and petals, both of which received Certificates from the Royal Horticultural Society last summer, are doing well—the last-named has now seven leads. *C. speciosissima Dawsoni*, with three leads, is very strong. *C. Eldorado* is in fine order, as likewise *C. Mendellii* and *C. Mossiæ*, both of which are still held in the estimation which their beautiful flowers and freedom of growth entitle them to. A grand lot of *C. Warneri* is in the best possible condition, the leaves which they bear are such as to give a forecast of the bloom that may be looked for after awhile. Most of these were imported in 1881. Some of the living roots which the plants had attached to them when they come over are still alive, showing for what a length of time they retain their vitality when the culture accords with their needs. One plant of *C. lobata* had nine strong leads. Amongst many other fine kinds was noticed *C. Mossiæ Marianæ*, a rare form, with pure white sepals and petals, in the way of *C. Reineckiana*, but paler in the lip.

In *Lælias* the collection is strong. Of *L. purpurata*, besides numerous large old established specimens, there are several that were imported last autumn and which deserve notice; one mass of 120 bulbs is coming away with twenty-eight leads; *L. Russeliana*, with six leads; of *L. elegans* in its different forms there are several specimens in vigorous condition.

A good many other Orchids are grown along with the Cattleyas, including the specimen of *Vanda suavis* from which the illustration that appeared in the March number for the present year of the *Orchid Album* was taken. The variety as there represented speaks for itself. *V. tricolor insignis* was in flower; *Trichopilia suavis* was coming on, with nine flower-spikes; *Epidendrum prismatocarpum*, with fourteen leads; *Saccolabium giganteum* illustre was nicely in flower. The treatment given to the Cattleyas does well for various *Dendrobiums*, including *D. suavisimum*, *D. chrysotoxum*, *D. Wardianum*, &c.

In another span-roofed house there is a nice collection of cool *Odontoglossums* and other plants that thrive with like treatment. Of these several fine varieties of *O. crispum* were in bloom with many others with their flowers in different stages, some with flowers heavily spotted, others devoid of marking. *O. Halli*, *O. triumphantis*, bearing a long four-branched spike; *O. hebraicum*, *O. grande*, which makes

sound fair-sized bulbs under the moderately cool temperature maintained; *Cattleya citrina* is quite at home, making good growth; also several *Oncidiums*, including *O. oriothorrhynchum*, *O. concolor*, and *O. leucochilum*, which, with many others, do much better in cool quarters than when subjected to a higher temperature. Mr. Crawshaw and his gardener both seem really fond of Orchids, and where this unison of feeling exists and their cultivation is intelligently carried out the result is generally seen in the progress which the plants make. *A Correspondent.*

## THE HARDINESS OF PLANTS.

THE accounts given in late issues of the advantages accruing from unheated Tea Rose houses, and also of the success attending the culture of Filmy Ferns at Kew under cooler treatment, is most significant, and touches closely upon a subject which has been a source of very great experimental interest to the writer during the last fifteen years, viz., the amount of success to be attained in glass structures which are practically unheated. By an unheated greenhouse is meant one in which there is no fixed apparatus of hot-water pipes, or flues or furnaces of any kind, but which may be so far heated by temporary devices as to exclude frost in severe weather. The subject is obviously one of great importance to the amateur, who, with limited means, both of money and labour, at his disposal, is yet desirous of keeping his greenhouse gay and in good order during the entire year. But, altogether apart from this aspect of the question, I venture to think that it also possesses some points of scientific interest. In the course of years instances of curious changes of habit and adaptation to circumstances have from time to time come under my notice, and it is certain that when a plant can thoroughly acclimatise itself to a lower temperature than is natural to it, it not uneldom gains in vigour and heartiness. Converse instances are also not unfrequent of thoroughly hardy plants luxuriating in the shelter afforded by glass and assuming a distinct character therefrom.

Ferns seem to be specially capable of such adaptation to cool treatment, as shown in the case of the Filmy at Kew. I have myself a plant of *Adiantum gracillimum* which bore two or three winters ago 6° of frost without injury. *A. cuneatum*, though apparently less hardy in constitution, will, under proper care, grow into fine specimens in a greenhouse from which frost is only just excluded, under which conditions it also attains the advantage of lasting much longer when cut for bouquets.

One of the most interesting of such cases, however, I met with last year in a species of *Æschynanthus* (probably *grandiflorus*, but of this I cannot at present speak positively), which bloomed throughout the summer in an unheated greenhouse, after having been wintered in a cold vinery, where a slow combustion stove—a most undesirable and clumsy mode of heating, by the way—was only occasionally lighted to keep out actual frost. On comparing the flower of this with that of *Æ. grandiflorus* grown in a hothouse, I could discover no structural distinction, though the apparent difference was great, but it was of a character quite compatible with difference of treatment. The individual flowers were the third of an inch shorter and slightly more slender, but the glowing scarlet of their colouring more than atoned for the reduction in size, and the healthiness of the dark green foliage left nothing to be desired. The plant was cut-in after flowering and has broken well, but as the temperature of the house in which it has wintered has several times fallen as low as 37°, I am curious to see whether it will bloom as abundantly this season. I believe the genus has hitherto been treated as tropical. Meanwhile, my plant seems to be in perfectly good condition. *Lasiandra macrantha* is another beautiful plant which I have found to be amenable to cool treatment requiring open-air quarters during June and July to ripen it for strong autumn blooming.

The whole system of hardy gardening under glass is distinct from ordinary warm greenhouse management, and runs parallel, as it were with hardy herbaceous gardening out-of-doors. It is especially suited to the amateur who does not disdain to give personal care and work to his plants; and to those who like to make a fair trial of this system of culture, I am persuaded that it will give a greater return of healthful interest and enjoyment than can possibly be attained in the enervating temperature of heated structures,

It will also be found that the flowering plants at command for the purpose are practically inexhaustible. *K. L. D.*

### THE EASTER LILY.

THIS, which appears to be only a form of *Lilium longiflorum*, has been cultivated in the Bermudas for a long while, though the date of its introduction to those islands is not known. Professor Sargent, to whom we are indebted for the photograph whence our illustration (fig. 72) was taken, tells us that it is grown in Bermuda in immense quantities for the New York Easter market. The buds are cut three or four days before their period of opening, packed in cotton wool,

### PINE-APPLE CULTURE IN MOSS AT FERRIÈRES.

PINE-APPLE culture has always been costly, and that has prevented its being as general as might have been hoped, considering the beauty and goodness of the fruit. The culture of this fruit has been necessarily confined to royal gardens such as Windsor, or to those of wealthy amateurs. Pine-apples require a great deal of top and bottom heat, hence an expenditure of a quantity of coke or coals; they require houses, manure, and a lot of peat, rather a long time is necessary to bring the fruit to perfection, but when once cut the plant is of no further use. For the last few years we have managed to replace peat to a cer-

tain extent by fermentation, hence it is necessary when planting with a thickness of 16 inches of moss not to put the whole of it on at once, as it might burn the roots; moss even without artificial heat attaining a temperature as high as 115° Fahr., while for the good of the Pines from 75° to 78° Fahr., at the greatest, is all that is wanted. It is absolutely necessary always to have in the moss or beds several thermometers, and to look at them often to make sure that the temperature is neither too high nor too low. We take our suckers in January, and let them dry for a fortnight before potting off, for if they were potted off at once the juice escaping from the wound might make them rot. Suckers are better for propagation than the crowns,

FIG. 72.—LILY CULTURE IN BERMUDA.

and sent by steamer to New York, where they are sold in the shops at a low price. The soil and climate of Bermuda seem admirably suited to this kind of Lily farming, and the crop is a valuable source of revenue to the islands. We would suggest to Mr. Dorrien Smith that it would be worth trying, as an experiment, in the Scilly Islands, though near London it is asserted not to do well out-of-doors.

¶ We first heard of this Lily in 1882 (see *Gardeners' Chronicle*, July 29, 1882); and later on Messrs. Watkins & Simpson favoured us with specimens of the flower, which showed it to be a very distinct form of *L. longiflorum*.

NEWCASTLE-ON-TYNE.—We hear that the Spring Show at this town will be held on April 15 and 16, and should be a good one if there are many exhibitors there of Mr. Watson's calibre.

tain extent by moss, thereby reducing the cost of planting out. The process of Pine-apple growing in moss consists in using that instead of peat whenever practicable. The best moss is that gathered on lawns with an iron rake. The remainder of the culture differs but little from that generally followed. With our culture in moss we have always succeeded well, our Pines varying in weight from 8 to 12 lb. Moss has the great advantage over peat of letting the heat through, which spreads evenly through all the mass of moss, up to the roots, which was not always the case with peat; this latter after being heated and watered for some time became a solid body and did not allow the heat to ascend through it. The moss can be roughly gathered and if some leaves, pieces of wood, or soil, are left in it, they do not interfere in the least with the result. Moss deve-

these last should only be employed for varieties giving few suckers, of which a number is wanted. The suckers when dry are potted into pots according to their various sizes with peat, they are then put into pits on a warm bed made of manure, and the pots are surrounded by a layer of moss instead of peat. After a short time the suckers will be well rooted. They are then planted out at the end of April, and left till October, when they are taken out, well shaken, and the roots cut back within an inch of the stock. They are then potted into what are called, in France, Belgian pots of 6 to 8 inches diameter. They are again put into a hotbed in moss till April of the following year. This is the time to plant in the house where they are to fruit. The cultivation of Pines planted out is only possible in houses with rows of hot-water pipes running under the stage, which latter is

made of tiles on T iron. These tiles are better than wood, as they do not rot; and if an inch is left between each tile the heat rises readily. A layer of crocks is then put on and peat on the top, so as to

where we formerly used six cartloads of peat, one is now quite sufficient, and the fruits are finer. After a certain time a new layer of moss of about 6 to 7 inches is added. Plenty of water is wanted during

about June or July, and ripen in December or January, that is to say, at a time when fruits in general are scarce, and, therefore, much in request. When once the fruit is cut, we think it best to keep

FIG. 73.—CONE OF *PINUS COULTERI* GROWN IN HERTFORDSHIRE. (SEE P. 415.)

form good drainage; then a layer of moss of 10 inches in thickness. The Pines are then planted with two shovelfuls of peat to each plant, and the moss is made firm round them. To give an idea of the saving of expenditure I may say that in one of our houses

the growing season, but when flowering or the fruit is ripening, syringing the crowns of the plants must be avoided, and moisture kept up in the houses only by watering the moss and on the pathways. Pines planted at the time mentioned above will flower

the plant which has suckers round it, and to shift it only when it is in the way of replanting the house; the suckers grow rapidly, and become strong much sooner after the fruit has been cut.

If Pines are wanted all the year round, and if only

one house is devoted to their culture, the planting can be done at three different times; one-third of the house is planted in February, another in March, and the last in June: in that way fruits can be gathered at all times. If Pines are wanted to bloom, so to speak, artificially, a great deal of heat must be given to them, and watering and syringing left off for fifteen or thirty days then start anew, it is almost certain that they will bloom.

The varieties we grow most successfully in moss are Smooth-leaved Cayenne and Charlotte Rothschild. We have grown many others amongst the old and newer kinds, but we always find these two the best. Amongst the varieties we keep in our collection, and which do well in pots, we may note the following:—Moscow Queen, medium size, very good; Ripley Queen, small, very sweet; Comte de Paris, big and good; Montserrat, medium, good; Providence, very big, not good in quality; Bracamorensis, enormous, not particularly good quality (see *Revue Horticole*, p. 336, 1880, where the description and culture of it is given); Lord Carrington, medium, very good, It is well to have in every collection, not for its fruits, but for the beauty of its foliage, *Anaëssa sativa variegata*, which looks remarkably well amongst the others, and the plant is useful for house and table decoration.

One of the essentials of Pine culture is to have the plants and fruits clean and healthy, so that a great deal of attention has to be paid to see that the plants do not get infested by insects. It is safest not to put any other plants into the Pine-houses, especially plants liable to have thrips, scale, and mealy-bug on them. *Ernest Bergman*.

## GARDEN PALMS.

(Continued from p. 338.)

*Chamaëdorea*, Willd.—About sixty species are included in this genus, of which the small genera *Nunnezharia* and *Morenia* now form a part. They are mostly erect slender-stemmed Palms, a few species, such as *C. Martiana*, being dwarf and more or less procumbent. The genus may be separated into three distinct groups by means of the foliar and stem characters. (1.) Stems erect, varying in height from 6 feet to 20 feet; annulated, crowned with a tuft of leaves, which are regularly pinnate, arching, the segments lanceolate and pointed, and varying in width from half an inch (*C. elegantissima*) to 4 inches (*C. Arenbergiana*). (2.) Stems erect, very tall and slender, and bearing a tuft of leaves at the top which are pinnate and plumose, as in *Cocos plumosa*. One of the finest of this group is *C. glaucifolia*, of which there is a specimen at Kew 20 feet high, the stem being no thicker than a walking stick. (3.) Stems erect and slender, and varying in height from 2 feet (*C. tenella* and *C. stolonifera*) to 12 feet or more (*C. Ernesti-Augusti*); leaves tufted near the top, from 9 inches to 3 feet long, the blade more or less cuneate, with a deep sinus dividing the blade into two pointed lobes, the margins of which are sometimes dentate. The stems of some members of this group usually develop roots several feet above the ground. A distinct species from any of the above, in that its stems sometimes grow to a length of about 60 feet (see plant at Kew) is *C. scandens*. In this the leaves hang downwards from the stem and are pinnate, the pinnae being broad and widely separated from each other.

All the cultivated *Chamaëdoreas* are remarkable for their free-flowering character, and in fact owing to their flowering at a very early stage some of them have been described as much dwarfer and smaller than they ultimately become. The spadices are graceful and ornamental, being either simple and erect, or freely branched and pendent. The flowers are generally very fragrant. Flowering as they do when quite young, and producing flowers which are both graceful and fragrant, the *Chamaëdoreas* may be recommended as flowering plants, a character very rare amongst Palms. *C. stolonifera* is remarkable for its habit of producing lateral stems or stolons from its lower joints, which stems grow down to and along the ground, where they emit roots, and the point then assumes an erect position, and forms a distinct plant. In this way a Bamboo-like tuft of stems is formed; *C. stolonifera* is the only known species with this habit. All the introduced *Chamaëdoreas* thrive best when grown in a very moist and shaded stove; in fact, they prefer more shade than almost any other

class of Palms. Their seeds germinate readily in a warm house; they are globose or oblong, pea or nut-like, and are smooth and shining. Seedling leaves bipartite. The genus is limited in its distribution to the tropical forest lands of Mexico and Central and South America.

*Chamaerops*, Linn.—There are no less than six distinct genera represented in the dozen or so Palms which are popularly known in gardens as *Chamaerops*, viz.:—*Sabal* (*C. Palmetto*, Mich.); *Nannorhops* (*C. Ritchieana*, Griff.); *Raphidophyllum* (*C. hystrix*, Fraser); *Acanthorhiza* (*C. stauracantha*, Hort.; *C. Mocini*, Kth.); *Trachycarpus* (*C. excelsa*, Thunb.; *C. Fortunei*, Hook.; *C. Khasyana*, Griff.; *C. Martiana*, Wall.); and the two species now retained in *Chamaerops*, and enumerated here. *C. humilis* is particularly interesting as being the only Palm indigenous to Europe. It is found in abundance in some parts of Sicily and Spain, "where it spreads over the uncultivated sandy tracts just as the common Brake Fern does with us." It is also met with in Western Asia and Northern Africa. There are several distinct forms of it in cultivation in English gardens, namely, what is considered the type, and characterised by a dwarf habit, seldom exceeding 6 feet in height, and forming a dense tuft of short leafy stems with stiff erect leaves, the petioles of which are about a foot long, the edges clothed with stiff spines, and the leaf blade from 9 inches to a foot in length. A variety known as *elegans* is distinguished by its graceful petioles, 3–4 feet long, the spines on which are scattered and rather small; it forms a tuft of stems, and grows to a height of about 5 feet. The arborescent variety is represented at Kew by a specimen with a stem 15 feet high and 6 inches in diameter, naked half way up, the upper half being clothed with the persistent bases of the old foliage, and a head of numerous leaves; the petioles are about 4 feet long, very spiny, and the blade is a stiff fan composed of about twenty-four segments, each of which is split from the point downwards some 6 inches. A mass of roots encircles the stem at the base, and through and beneath it numerous sucker-like stems are developing. This species is easily distinguished from all other *Chamaerops* (so-called) by its stout spines and its habit of producing numerous lateral growths about the base of the main stem. The seeds are in size and form like the berries of a Black Hamburgh Grape, brown, smooth, and hard. Seedling leaves ensiform and entire. As a greenhouse Palm this species proves very serviceable.

*C. humilis*, Lion. (*C. elegans*, arborescens, lomen-

tosa, &c., Hort.).—South Europe and North Africa. Of the variety *tomentosa* a good illustration will be found at p. 601, vol. xix., May 12, 1883.

*C. macrocarpa*, Tenore (kept up as a species by Sir Joseph Hooker; but as represented at Kew, apparently only a form of *C. humilis*.)

(To be continued.)

## The Flower Garden.

### PROPAGATION.

THE stock required for filling the summer flower garden should now be complete, and the plants placed in frames or cold pits, to be hardened off preparatory to planting into the flower beds in May. However, such plants as *Lobelias*, *Salvias*, *Coleus*, *Iresines*, and *Alternanthera*, can still be propagated and kept growing, as they will not be required till the first week in June, when the carpet bedding is commenced generally. See that abundance of *Pyrethrum aureum*, *P. laciniatum*, and *P. selaginoides*, are sown. These plants will be found indispensable with some for lying out all the principal designs. Those I sow in boxes, and place them in cold frames till they come up; then remove them to a spot under a south wall, and as soon as the plants are large enough they are transplanted into the flower beds. They are easily managed, and form most distinct yellow lines, and are most effective when used in conjunction with the great varieties of tints seen in *Alternantheras*, *Iresines*, *Coleus*, *Kleina repens*, *Echeveria glauca*, *Hieraria glabra* and *Mesembryanthemum cordifolium variegatum*. The *Alternantheras* may be classed as the carpet bedding plants *par excellence*, and as they require to be planted very closely together, should be propagated in large quantities, the simplest and quickest way to increase them being to make up a slight hotbed, and place a frame on it, and about 4 inches of light sandy mould, making it firm, and then put in the cuttings 3 inches apart each way. They strike in about fourteen days, and make good plants by the first week in June. *W. Smythe, Basing Park, Alton*.

## FRUITS UNDER GLASS.

### FIGS: SUCCESSION-HOUSES.

IN these the trees established in borders which were started at the beginning of the current year will be in rapid growth now. Attend to disbudding and pinching in the shoots and removing all that are not wanted whilst they are in a young state—the terminal shoots be let run unchecked, the side shoots be stopped at about the fifth leaf, and not be left too thickly together. Guard against the attacks of the red-spider by means of vigorously syringing the trees twice every day. The course of ventilating and heating will be identical to that advised for the trees in pots, and watering must not be omitted whenever it is requisite. Fig trees in later houses, if not cleaned and prepared for starting, should have the necessary attention at once, or the young Figs will be liable to injury by this operation at an advanced period, as is now the case. Give regular attention to trees in pots in the way of watering, and be not hasty in putting them out-of-doors if they are expected to produce Figs this year.

### PINES: YOUNG STOCK.

The month of March is the customary time to go through the plants which have been matured in small pots, and to prepare them for starting into growth again. Presuming that preliminary operations in the preparation of the soil, pots, &c., have been attended to and a bed made up for their reception, they should at once—if the heat in the bed is of the right degree—be dealt with in the following way:—Take them out of the pots and remove all the soil from them, cut the roots off close to the stem, and strip off from it a few of the lower leaves, so that the new roots which will be formed may push forth freely into the new soil; for this purpose that part of the stem must necessarily be kept beneath the surface-soil when potting takes place. In this process use 5 and 6-inch pots, drain them properly, and cast some soot or wood-ashes

among the corks to prevent the ingress of worms, and for the sake of checking their progress afterwards should any enter. The soil used in potting should be the fibrous part of good calcareous loam only in a moderately moist state, which must be rammed down firmly and close to the stem of the plants. A bed to be in a proper state for starting these plants should have not less than from 80° to 90° of heat in it at about 9 inches beneath its surface, and I have found none is equal to those composed of fermenting materials, as they afford heat most congenial to the requirements of such plants under these conditions.

#### TREATMENT AFTER POTTING.

After the plants are potted up they should at once be plunged into the bed prepared for them. No water, excepting that afforded in the course of syringing, should be applied until such time as they have made new roots, which will occupy about ten days. Syringing should be lightly done twice every day, and other available surfaces in the house be well moistened, in order to keep up a genial and invigorating state of the air constantly about the plants—a temperature of 60° at night and 70° in the daytime, with 5° or 10° more by the aid of sunshine, with shading over the plants during the time it prevails. A close atmosphere is most suitable. No air should therefore be given except when the heat runs above 80°, and then as little as is possibly required, until the plants have made new roots and growth has commenced, when more liberal treatment as regards heat and air should be supplemented.

#### SHIFTING INTO LARGER POTS.

An occasional examination by turning a plant out will be requisite to find out its condition; and before the roots become too much matted together the plants should be shifted again into 7 or 8-inch pots. Formerly I shifted those plants from the sucker-pots into the fruiting ones, but now I find it expedient to defer the final potting into the fruiting-pots until the last-named pots are filled with roots. When this is so, they are at once put into pots, varying in size according to the variety, of from 11 to 14 inches in diameter, in the same kind of soil, only using it in larger lumps, with an addition of a few ½-inch bones and a little decomposed manure from a Mushroom-bed being intermixed. In all cases in potting Pine plants it is very essential to ram the soil into the pots very firmly. As these plants in general are partly grown in fermenting beds, these will want attention sometimes; opportunities, such as when potting is going on, should be embraced for turning them over and refreshing them with some new stuff, which should always be ready at hand. Very little addition to the beds will be necessary during the summer months, or too much heat will be generated; for Queen plants 80° or 85°, and for coarser growing kinds 5° or 10° less will be a safe range; with proper attention to airing, watering, and syringing. These plants will form the stock from which fruiting plants will be selected that will yield a supply of ripe fruit the subsequent year from the end of May until September—a period which above all others nowadays is when English-grown Pine-apples are most required. *G. T. Miles, Wycombe Abbey.*

## The Hardy Fruit Garden.

#### STUNTED TREES.

ORCHARD trees recently planted should be looked over and the soil pressed down firm round the roots. It will often happen that Prunes and Damsons will grow moderately well for a few years after being planted, then stop growing, and the leaves and shoots become smaller every year. The best remedy for this is to cut the whole of the shoots well back to within a few inches of the stem, then slightly fork over the surface of the ground round the stems of the trees and place on the surface a good dressing of rotten manure. A number of trees treated in this manner made shoots from 2 to 3 feet the first season: the season previous they did not grow so many inches. These trees have continued to grow in a most satisfactory manner, with every prospect of making fine healthy specimens, whereas a few left uncut for experiment are still mere stunted bushes, which must now be well cut back.

#### FIGS.

Fig trees that have been covered up during the winter should now be partially uncovered; it is not advisable to entirely uncover during the present cold weather, but if left covered up too long the small embryo Figs are sure to grow, and if exposed at once are as sure to drop off. It is very important to try and preserve them, as when they can be saved they will ripen early, and so lengthen the succession of fruit.

#### PEAR TREES.

Such trees as were root-pruned during the autumn and winter should have a mulching of rotten dung placed over the roots, and when this cannot be spared, a good coating of long stable-dung may be used. Attention to this early in the season will save much watering later on.

#### GRAFTING.

Grafting of Apples and Pears should now be pushed on as fast as possible. This should always be done before the trees begin to grow. Old worthless trees of Pears and Apples should be headed back, and a number of grafts put on according to the size of the trees. I think it might be possible to effect an improvement on some varieties of Apple by grafting a weak-growing variety on the strong-growing stock or old tree; as, for instance, by grafting Cox's Orange Pippin on a young healthy tree of Blenheim Orange, with many other sorts that could be named. *J. Smith, Mentmore, Bucks.*

## Plants and their Culture.

#### GREENHOUSE HARD-WOODED PLANTS.

THE winter flowering Heaths, such as *E. hyemalis*, *E. melanthera*, and others, should now be pruned back to preserve them in a compact and bushy shape. The first named will need somewhat hard pruning, being free growers under good cultivation, whilst the more slender growth of the latter will not require more than a few shoots removed, such for instance as those that are disposed to be too vigorous. This work may have been done in some cases ere this, but we do not consider that any appreciable gain will result therefrom. Now that the daylight is longer the growth that is made will be sturdier and compact, aided as it will be by the free admission of air into the house.

The greater portion of the winter and early spring blooming Epacris will now be getting past their best. Where any clean and fresh spikes of bloom still remain, I would advise such to be cut for using at the first opportunity. They last in a cut state for a long period of time, but should be cut early in the morning before the sun's rays have much warmth, as they will then be found to keep fresh much longer. When these spikes are removed the stock should be gone over without delay, and all stray shoots cut back to make the plants as uniform as possible. The tendency of the plants is invariably towards an erect growth, and that of a good length too; if these shoots are not therefore well shortened every spring, the plants will soon become more remarkable for their height than for anything else. I do not advise the bending of these shoots into a horizontal or downward direction for the formation of a trained specimen, as they are not at all adapted for this mode of culture. The varieties of *E. miniata*, generally represented by that, the best of its type, viz., *E. Eclipse*, are the most amenable for training into specimens. This process should not, however, be carried to such an extreme degree as some cultivators are disposed to do, the very character and habit of the plant being lost in the distortion of its shoots and branches in order to bring them under this severe rule-of-thumb practice.

I departed somewhat from my usual course last autumn in the culture of the Epacris. They were not potted in the spring, which is the customary time for the work, for it was thought that they would stand over for another season. In the autumn, however, their appearance was not satisfactory, especially on the surface of the soil. After the hot weather was passed they were carefully gone over and repotted, and soon afterwards housed, and I am well satisfied with the result. The soil had undoubtedly become

deprived of a great portion of its nutriment, by reason of the extra amount of water that had to be given them during the dry weather. In late autumn potting it is absolutely necessary to exercise greater care in the watering, the failures will then be reduced to a minimum. *J. Hudson, Gunnersbury House, Acton.*

## The Kitchen Garden.

#### CELERY.

IN most gardens this is considered an important crop, which indeed it is, when we consider the length of time the heads will keep in a sound and eatable condition after arriving at maturity, and how useful the heads are, not only for salad, but for other purposes, and it is well worth every attention. To obtain good crops considerable labour must be bestowed upon it, more especially on heavy land, but the best results are gained in well worked moderately light soil of a somewhat sandy character: the produce then is crisp and clean: and if plenty of good rich manure, properly prepared, be placed in the trenches the plants will always grow to a good size. In soil of this nature it will also keep sound for the longest period possible after it is fully developed. Where the soil is very heavy and clayey it is found necessary, in order to ensure the best results, to place light soil immediately around the plants when carrying out the operation of earthing-up. This will not only blanch the plants better than the natural stiff soil, but will also prevent the heads from rotting during wet and mild winters. Where this system has by necessity to be adopted the best drained piece of ground should be selected, and set apart always for this crop. By the annual addition of light soil for the earthing the plot would annually be improving, and would ultimately become light enough in itself to grow a crop to perfection. Good blanched heads may be had from September to April.

#### SEED SOWING AND PRICKING OUT.

From the February sowing the young plants will soon be large enough for pricking out on a bed near the glass in a cold frame, the young seedlings being placed 3 or 4 inches apart. When preparing beds in frames or out-of-doors for pricking out the young seedlings, some material should be worked amongst the soil, such as old Mushroom-dung, leaf-soil, or well decayed manure, well broken into small pieces. To this the roots of the plants will cling well when lifted, and each plant can be removed to the trenches with a good ball of soil full of active roots. Keep the frame a little close and steady for a few days, until the young plants make a fresh start, after which time the lights should be drawn off in the daytime and replaced on frosty nights. Frames or handlights not being at command, they can be pricked out-of-doors and protected with hoops and mats during frosty weather.

The second or main sowing should be made from the middle to the end of April. This sowing will supply heads for the winter months. In each case it is best to sow under glass either in pans or boxes, or on a raised bed in a frame. In the early stages of growth the young plants generally succeed best in a house which is syringed and damped several times a day, and the boxes or pans should be kept near the glass. The young plants from this sowing should be pricked out-of-doors when large enough in an open position. They will require shading and sprinkling overhead for some days after being removed from the boxes or pans, and during dry sunny weather successive waterings will be required; the young plants will make no headway in dry soil, in fact, throughout the whole season of growth they should not receive a check for want of water at the root.

The third and last sowing to produce heads for the spring months should be made from the first to the third week in May. I am in favour of making this sowing on a raised bed in a cold frame, keeping the latter quite shaded until the seed germinates. By this method a sufficient space of soil may be sown over to allow the seedlings to be thinned out, so that they will stand in the seed-bed until large enough to plant direct into the trenches: thus they only receive one check by removal, and this is a decided advantage should the weather be hot and dry at the time of transplanting. *G. W. Richards, Somerley Gardens, Ringwood.*

## APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, Mar. 31	Special Sale of Orchids in Flower, at Protheroe & Morris' Rooms.
WEDNESDAY, April 1	Sale of Liliun auratum, Roses, and Plants, at Protheroe & Morris' Rooms.
THURSDAY, April 2	Sale of Established Orchids, at Stevens' Rooms.
	Meeting of the Linnean Society, at 8 P.M.
	Sale of Imported Orchids, and Liliun auratum, &c., at Stevens' Rooms.

AN important epoch in the history of the ROTHAMSTED EXPERIMENTS was reached in 1883. In that year the fortieth crop of Wheat grown year after year on the same land was harvested, and in the current number of the Royal Agricultural Society's *Journal*, Sir J. B. LAWES and Professor GILBERT record the results obtained during the last twenty years of this period—the first twenty years' investigations having been given in the same *Journal* in 1864.

Since the former publication much has been learnt respecting the action of manures on different classes of soil and upon different descriptions of plants, which knowledge, our authors say, enables them to forecast with some degree of certainty—subject to the influence of climate—what will be the relative yield by the various manures applied to their experimental crops for some considerable period in advance.

Coincident with the increase of knowledge a completely new branch of inquiry has sprung up—the sources of inherent plant-food, and the channel of unexhausted manure ingredients. These subjects are ably dealt with in the report before us, and the investigations clearly show, that the soil itself, without external aid from manures, is capable of producing much more growth than it was formerly credited with; it in fact not only contains more inherent fertility derived from the *debris* of pre-existing vegetation, but holds it with a firm grasp, and gives it up very slowly unless stimulated by an additional supply of nitrogen in an easily assimilable form.

Every year a certain proportion of the organic nitrogen of the soil becomes nitrified by the agency of organisms existing in the land, resulting in an annual unmanured Wheat crop of from 100 to 120 lb. per acre. Of the more important constituents of plant-food, there have been removed from the soil 17 lb. of potash, 10 lb. of phosphoric acid, and 20 lb. of nitrogen each year.

A fact of considerable importance to gardeners comes out in the report regarding the influence of weeds. When weeds are allowed to decay upon the soil which produces them, no loss of fertility takes place. But as weeds take up available nitric acid which should go towards the support of useful garden products, an immediate loss is the result. The nitrates taken up by the weeds revert again to the form of organic nitrogen, and do not become again available as plant-food until they have undergone decay. If large crops of weeds are removed from the land, then a serious loss of plant constituents may be the consequence.

Mineral manures alone, although requisite to build up the fabric of plant growth, gave but a small excess of Wheat over the unmanured land, amounting to an increased yield of not more than  $1\frac{1}{2}$  bushel of grain per acre per annum, demonstrating the fact that the Wheat plant, at all events, obtains but little of its nitrogen from atmospheric sources. Potash and phosphoric acid, two important elements in mineral manures, appear to enter into very fixed combinations with the soil, and in this respect differ much from compounds of ammonia and nitric acid, which are extremely liable to be washed away by heavy rains unless taken up by means of growing vegetation.

When large crops of Wheat have been grown by the application of nitrate soda or ammonium salts in combination with mineral manure, the Rothamsted soil does not seem to have either

gained or lost fertility, the loss of plant-constituents being, in fact, made good by the amount of nitrogen stored up in the stubble, decaying leaves, and under-ground roots of the large crops produced. This may serve to explain the value of certain luxuriant plants as restorative crops.

When farmyard dung is applied to land much less growth is obtained from a given amount of nitrogen than from an equivalent in ammonium salts or nitrate soda. In dung the nitrogen which constitutes the stimulating ingredient is always in combination with carbon. In this form it is both insoluble and inactive, and for more crops only becomes available during the slow process of decay or nitrification.

Carbon may be separated much more easily from the nitrogen of the urine and other animal secretions, which must form a large proportion of all good and well made dung, while it may take many years to nitrify portions of the nitrogenous organic matter of straw, especially in heavy land.

The Rothamsted Wheat experiments further teach us that the soil of a well cultivated and properly manured garden should go on increasing in fertility, however much it may be cropped.

— THE DAFFODIL CONGRESS.—It is proposed to make a great display of Daffodils and Narcissi at the next meeting of the Royal Horticultural Society, on April 14, at 3 P.M., in the conservatory, so as to enable the Nomenclature Committee, appointed at the Conference held last year, to consider what additions or changes in the Daffodil report are made desirable by the experience of the present season, with the view to the publication of the report at an early date. Messrs. BARR & SON, Mr. WALKER, and others, have intimated their intention of exhibiting largely, and it is hoped that the small amateur cultivators of these popular flowers may be well represented.

— ROYAL HORTICULTURAL SOCIETY.—The President has nominated the following gentlemen Vice-Presidents for the ensuing year, viz., Sir P. CONLIFFE OWEN, K.C.M.G., C.B., C.I.E.; ROBERT HOGG, LL.D., F.L.S.; Professor M. FOSTER, F.R.S.; and G. F. WILSON, F.R.S.

— "LINDENIA."—The publication of the first number of this new journal is deferred till May 15.

— MONSTERA DELICIOSA.—A plant of this Mexican variety of Monstera, at Messrs. CARTER & Co.'s nursery, Forest Hill, is bearing at present two fine fruits. It is rather uncommon, as it is rarely grown in England. The fruit is very luscious, with a Pine-apple flavour, but objectionable from the abundance of needle-like crystals.

— PITCAIRNIA MARONI ×.—A hybrid Bromeliad, of which a coloured figure is given in the *Revue Horticole* for March 1. It has a tuft of bold lanceolate spineless leaves, silvery-white on the under-surface, and surrounding an erect stalked spike of densely packed crimson flowers. It was raised between *Pitcairnia Altensteinii* and *P. corallina*.

— THE METROPOLITAN BOULEVARD AND PLAYGROUND ASSOCIATION.—This praiseworthy Association, founded for the purpose of giving play and recreation spaces in the denser populated parts of the metropolis, and whose objects have often been advocated and noticed in these columns, has now commenced operations in Wilmington Square, Clerkenwell. This oasis of slovenly keeping will be planned out anew, new gravel walks made, new turf laid, shrubs rearranged, and the whole area generally made presentable. Employment is given, by preference to the local unemployed labourers, thus helping much to relieve temporary distress, and to lessen the burden on the local rates. Miss WILKINSON, of 15, Bloomsbury, W.C., has given £1000 towards the undertaking, and much interest is shown in the different parishes, which expresses itself in various ways.

— PALM LEAF LABELS.—We are indebted to Mr. HOLMES for specimens of plant-labels constructed from the dried leaf of *Corypha umbraculifera*. They are not easy to write on with ordinary ink, but this difficulty might be got over by the use

of Brunswick black. The durability of such labels would of course be very great. It has occurred to us, that if the name were scratched on the leaf, and then Brunswick black, or other staining fluid, allowed to penetrate the incised marks, a label would be produced which for convenience and durability could hardly be surpassed. The labels were sent by Dr. ONDAATJE from Ceylon, and could be supplied wholesale with brass eyes at about 3s. 6d. per 1000.

— LINNEAN SOCIETY OF LONDON.—A meeting of this Society will be held on April 2, at 8 P.M., when the following papers will be read:—1, "On the Coast Flora of Gapygia (Otranto), South Italy," by HENRY GROVES. 2, "Studies in Vegetable Biology: Observations on the Continuity of Protoplasm and on ROSANOFF'S Crystals in the Endosperm-cells of *Manihot Glaziovii*," by SPENCER MOORE.

— THE "FARMER'S YEAR BOOK."—This useful publication, by Messrs. SUTTON & SONS, Reading, which combines cultural directions with excellent descriptions of farm produce, as grasses, Clovers, Carrots, Mangel Wurzel, Cabbage, &c., is quite apart, as an example of trade advertising; the figures, profusely given, showing the habit of growth of the various plants, and the accurate appearance of many varieties of grass seeds used in permanent pastures and alternate husbandry, being especially interesting and instructive. Gardeners and amateurs who are frequently required to lay down lawns and cricket-grounds afresh, will find much assistance in determining the quality of the seeds used by means of the figures of the sorts usually employed for this purpose, viz., *Cynosurus cristatus*, *Dactylis glomerata* (useful in shady places, and standing drought well), *Festuca duriuscula*, *F. tenuifolia*, *F. ovina*, *Poa trivialis*, *P. nemoralis*. The cultural directions appended to each kind of crop are perfectly trustworthy, and are the results of wide experience; but knowing the pertinacity of the farmer in keeping to old safe if not over-intelligent practice, one may be inclined to ask what use these finger-posts in practice serve.

— PESCATOREA KLABOCHORUM.—It is remarkable what frail characters are sometimes made to serve the purpose of distinguishing genera, and Orchids are no exception to this finely dividing hair-splitting rule. The plant under notice is an apt illustration of this, and the *Genera Plantarum* has done good service in reducing many superfluous genera. The species of *Pescatorea* are reduced to *Zygopetalum* under the group *Warszewiczella*. The distinguishing features are one-flowered peduncles, and broad incurved sepals and petals, which give the flower a somewhat globular appearance. These, in the present instance, are white, minutely tipped with green, while the curiously shaped alternately concave and convex lip is of a reddish-purple colour. The flower is of a thick and fleshy texture, emitting a powerful but agreeable perfume. A specimen is flowering, or was recently, in the warm division of the Orchid-house at Kew.

— LILIES AT MESSRS. BECKWITH'S.—Forced Lilies have for some years been one of the features of Messrs. BECKWITH'S Tottenham Nursery, where they are grown in thousands. This season they promise to make a magnificent display. The comparatively little known *L. Harrisii* is the first to come into bloom; this kind occupies a house 125 feet long, and begins to open its flowers before the middle of March. *L. eximium* fills three houses from 120 to 140 feet long; the plants are as even as possible, just showing flower, although not more than 10 or 12 inches high. The great masses of *Hyacinths* in one house just coming into full bloom showed a picture in varied colours such as few kinds of plants afford. The even character of the large massive spikes standing well above the foliage of just the right length, would astonish ordinary growers of these bulbs. In addition to obtaining bulbs that are right in the matters of age and strength, there is a good deal in knowing the kinds that will come into flower together early or late in the season.

— COVENT GARDEN LIFE BOAT.—A grand evening concert was held in aid of the support of the above boat on Tuesday evening last at St. James's Hall, passing off brilliantly, and judging by the numbers present we should say with great profit

FIG. 74.—*PINUS COULTERI*, GROWN IN HERTFORDSHIRE. (SEE P. 415.)

to the cause. The station, which is the most important of all the stations belonging to the Royal National Lifeboat Institution, is at Caister, in Norfolk, and was founded in 1858, since which time its boats have been instrumental in rescuing over 1000 lives from a watery grave, of which *The Covent Garden*, although it has only been stationed there seven years, claims the credit of more than half, viz., 567, or an average of eighty-one per annum; thus gaining for itself the exalted position of having saved more lives in that time than any other boat in the fleet. The Ramsgate boat, we believe, comes next, her numbers being 767 in twenty years. The gratifying intelligence reached the committee a few days before the concert that their boat had again performed two good services, having been away fully twenty-four hours in making two journeys to ships in distress, their efforts being rewarded by landing the crews of two vessels, numbering thirty souls in all, at Harwich. Nearly £1200 has been paid into the Institution by the Covent Garden Lifeboat Fund.

— PLANTS IN FLOWER AT THE BOTANIC GARDENS, EDINBURGH.—We learn from the report of the Edinburgh Botanical Society that of the forty selected plants whose dates of flowering have been annually recorded by the Society for the last thirty-five years the following fourteen came into flower during the past month, all of which, with one exception, flowered in January last year:—

First Flowers Opened.	1885.	1884.
<i>Corylus Avellana</i> .. .. .	Feb. 4	Jan. 14
<i>Tussilago alba</i> .. .. .	" 10	" 18
<i>Galanthus nivalis</i> .. .. .	" 6	" 19
" <i>plicatus</i> .. .. .	" 8	" 26
<i>Daphne Mezereum</i> .. .. .	" 11	" 20
<i>Leucojum vernum</i> .. .. .	" 12	" 26
<i>Rhododendron atrovirens</i> .. .. .	" 13	" 10
<i>Eranthis hyemalis</i> .. .. .	" 14	" 22
<i>Crocus susianus</i> .. .. .	" 18	" 19
<i>Symplocarpus foetidus</i> .. .. .	" 20	Feb. 4
<i>Bulbocodium vernum</i> .. .. .	" 23	Jan. 16
<i>Crocus vernus</i> .. .. .	" 23	" 28
<i>Scilla præcox</i> .. .. .	" 26	" 20
<i>Arabis albidia</i> .. .. .	" 28	" 23

The weather experienced has been very favourable for transplanting operations and outdoor work generally.

— EUPATORIUM ATRORUBENS.—Like its congener *E. lanthum*, this is also a native of Mexico, and requires rather warm treatment to grow it to perfection. When in flower or nearly in that condition, it may be removed to a conservatory, where, although a Composite, its unusual appearance cannot fail to be attractive. The flowers are of the same pale blue or violet colour as those of the better known species, but the leaves are several times larger and far more handsome. The habit is more robust and less compact in the manner of branching; but the most important and striking feature of the plant is to be found in the long reddish-purple hairs that invest the stems, petioles, and midribs of the leaves, giving them a shaggy appearance and suggesting the specific name. It is synonymous with *Hebeclinium atrovirens*. Both the above mentioned species are well represented in the greenhouse No. 4, at Kew.

— THE QUINQUENNIAL EXHIBITION AT HAARLEM.—We learn that this exhibition, which was held at Haarlem, from March 20—24, was not only very large, but very successful. Hyacinths formed the staple of the exhibition, there being six exhibitors in the class for 100 Hyacinths in pots, eight in that for forty varieties, and corresponding numbers in other classes—twenty-eight in all. Messrs. KRELAGE obtained a Silver-gilt Medal for a new single Hyacinth, not in trade (Sophie Charlotte, red), Messrs. KERSTEN, a Silver Medal for single white Corregio, and the same gentlemen for City of Haarlem, single yellow. Messrs. G. C. VAN MEUWEN, of Haarlem, gained a Silver Medal for a new double blue variety, Duke of Norfolk. There were twenty classes for Tulips, five for Narcissus, three for Crocus, three for Fritillaria, and others for Galanthus, Scilla, Anemone, Ranunculus, Chionodoxa, Pæonies, Amaryllis, and Clivia, Eucharis, table decorations, and miscellaneous objects. The principal prize-takers were Messrs. J. II. KERSTEN & CO., of Haarlem, for a collection of one hun-

dred Hyacinths in pots (eighty single, twenty double-flowered varieties). In the same class Messrs. BIJVOET, KRELAGE, ZOCHER, and VOORHELM. In the principal class, for a hundred Tulips, eighty single, twenty double, Messrs. L. WEVEREN & CO., of Hillegom, took first honours, Messrs. POLMAN MOOY and KRELAGE being also honoured. For Narcissus (Tazetta) Messrs. J. D. ZOCHER obtained first honours. Other prizes were taken by Messrs. KRELAGE, POLMAN MOOY, and VAN VELSEN. Messrs. G. II. VAN WEVEREN obtained a Silver-gilt Medal for forced Fritillaria imperialis in pots, and which we learn were very effective. The white Scilla sibirica also attracted attention. The show was almost exclusively made up of bulbous plants, for although a few classes were allotted to other plants, they were not well filled, and "niet ingezonden"—equivalent to our "no entry"—had to be written against them.

— PHYLLANTHUS MIMOSOIDES.—The characters of the flowers of this species from a garden point of view are normal, that is, of the usual diminutive and inconspicuous type. Notwithstanding the enormous number of species belonging to the order, the absence of showy flowers is notable; and although a considerable number are cultivated in hothouses, it is their coloured bracts, or the beauty of their foliage, that gains them admission. The lateral branches of the present species, even upon close inspection, bear a remarkable resemblance to compound and twice pinnate leaves. They also mimic in no ordinary degree the leaves of some species of Acacia, such as *A. lophantha*, but of thicker and more leathery consistency. The presence of minute stipules, however, and the clusters of flowers in the axils of the ultimate divisions, show the latter to be the true leaves. The whole branch with its leaves are of a bright green colour, constituting the plant no mean object for decorative purposes. A specimen has been flowering for some time in the stove at Kew, and a figure may be seen in the *Botanical Cabinet*, 721.

— NEW EARLY TULIPS AT SOUTH KENSINGTON.—There was so much of an attractive character at South Kensington on Tuesday last that in all probability the group of new varieties of early single and double Tulips shown by Messrs. JAMES VEITCH & SONS did not receive the attention they merited. Of the single varieties one of the best is Ophir d'Or, a deep coloured Chrysolora, of a bright deep canary-yellow—large, showy, of good form, and dwarf in growth; Rose of Holland is one of the most distinct, and charmingly feathered with rosy-pink on a white ground—the flowers of good build and very pleasing; Adeline is of a soft satiny-rose, in the way of Proserpine, and, being of dwarf sturdy growth, is admirably adapted for pot culture; Prince of Austria is somewhat difficult to describe. It is something in the way of Thomas Moore, but darker and differently marked: the petals are a kind of brownish orange-red, feathered with bright deep orange—very bright and effective. It is still more difficult to accurately describe American Lac, one of the most distinct of the new varieties. The principal colour is a kind of tawny-orange, feathered with delicate lavender and white—certainly very pretty and distinct; Queen of the Netherlands is almost white: it has a white ground, very delicately suffused and flushed with pink—also pretty and distinct. Of flowers of crimson and scarlet shades there were Messcher, maroon-crimson, rich in colour, flowers large and well formed; Moucheron—this may be described as something in the way of Couleur Cardinal, the dark shaded red petals are distinctly feathered with vermilion, dwarf and very showy; La Grandesse has bright crimson flowers, feathered with scarlet, large and striking; Queen Emma is of a semi-double character, the colour bright rosy-cerise, striking and showy, but the flowers small and wanting in form; White Hawk is probably the purest white single Tulip in cultivation, large flowers, but as shown inclining to roughness; Dandy is the last of the new single varieties—it has a pale rosy-purple ground, feathered with white; the flowers small, and somewhat dull looking. The new double varieties certainly fall behind the single types for quality and attractiveness; the best are Emmeline, deep rose, flushed with crimson—very bright and striking; Vuurbaak, bright orange-crimson, distinctly feathered with orange, but with the green tips common to Rex Rubrorum; and Raphael, white, suffused with pink, and flaked with rose—pretty and distinct. All the new varieties appeared to

be of a dwarf yet vigorous growth, but this was, perhaps, mainly owing to the fact that they were so admirably grown.

— FRITILLARIA SEWERZOVII.—It is rather a comfort that Mr. BAKER has reduced REBEL's genus Korolkowia to Fritillaria. The combination of such a generic and such a specific name, however acceptable in Russia, is not very euphonious to English ears, and gardeners certainly will prefer the better known name Fritillaria to the less familiar Korolkowia. Technically it differs from most Fritillarias in the absence of a circular pit at the base of the perianth segments. In place of the pit is a rather long, very shallow furrow, from the centre of which projects a yellowish ridge. As figured in the *Gartenflora*, tab. 760, it forms a tall glabrous bulbous herb with sessile broadly lanceolate leaves and a leafy raceme of numerous pendulous green bell-shaped flowers, each rather more than an inch long with six recurved segments, dark, oblong obovate, and rather longer than the six stamens. Mr. BURBIDGE kindly forwards from the Trinity College Botanic Garden a specimen which he describes as flowering out-of-doors. In Mr. BURBIDGE's specimen there is but a single flower, considerably larger than those figured by Dr. VON REBEL, and greenish-yellow in colour, with the basal furrow bordered by a blotch of chestnut-brown. The six stamens are dull red in colour, and the filaments studded with numerous small purplish conical excrescences. The anthers are of a dull purple, not green as described by VON REBEL and BAKER. In the specimen before us the ovary and style are completely absent, so that although there is little doubt that we have to do with the same species, yet we must as usual admit a considerable range of variation in it. Perhaps, as the plants get stronger, the peculiarities we have noticed will disappear. The plant is a native of the mountains of Turkestan, where it was collected by SEWERZOW. A greenish-yellow flower is not an attractive description, nevertheless the present flower, from the elegance of its form, is worthy of cultivation, and the peculiar tint would assort or contrast well with other colours in a group. In the February number of the *Gartenflora*, t. 1181, is given a coloured figure of a variety (8 bicolor) with more robust habit and greenish-yellow flowers. Mr. BURBIDGE's specimen seems nearer to this variety than to the original species.

— APHELANDRA CRISTATA.—When this plant was introduced more than 150 years ago British gardeners knew nothing of the highly decorative and valuable species of more recent introduction, important alike for their handsome foliage and large brilliantly coloured flowers. The flowers in this instance are of the same type as those of *A. fulgens*, but greatly enlarged, and altogether more ornamental, from their deep scarlet colour and much longer tube, with a ringent mouth. The most notable feature of the species, however, is its manner of throwing out lateral branches all round the termination of the central axis. These branches are four-sided, owing to the arrangement of their bracts in alternating opposite pairs. The flowers are consequently arranged in four rows on each branch, and the whole inflorescence gives the plant a crested appearance, suggestive of the specific name. It flowers in a small state from cuttings, as may be seen in the Begonia-house at Kew. There is a coloured plate of the plant in the *Botanical Magazine*, t. 1578.

— PUBLICATIONS RECEIVED.—*Épître of the Art of Laying Down Land to Permanent Temporary Pastures.—One Hundred Years Ago*. A paper read before the Philadelphia Society for Promoting Agriculture at the Centennial Meeting, February 4, 1885. By GEORGE BLIGHT.—*Electric Meteorology. What is Gas? How the Theory was Worked Up*. By G. A. ROWELL, Assistant in the Oxford University Museum.

— GARDENING APPOINTMENTS.—Mr. B. ASHTON, late Head Gardener at Kirkham Abbey, York, has been appointed Head Gardener to Lord HOWARD OF GLOSSOP.—Mr. A. STEVENS, formerly Gardener to Mrs. FLETCHER, Hollywell Park, near Sevenoaks, Kent, as Head Gardener to J. BATMAN, Esq., Moor Park, Farnham, Surrey.—Mr. S. WHITE has been engaged as Gardener to G. B. WOODRUFF, Esq., High Hatch, Hurstpierpoint, Sussex.

## PINUS COULTERI.

THIS magnificent Pine is a native of the mountains of California (36° N.), where it grows at an altitude of 3000—4000 feet. The specimen of which, through the courtesy of Mr. Rashleigh, we give a figure (fig. 74), produced its cones in the pinetum of W. R. Baker, Esq., of Bayfordbury. The history and botanical features of the tree are well known, and may be found in readily accessible sources. We may, however, supplement the accounts by the following extract from Ravenscroft's *Pinetum Britannicum*, and from our own note-book. In the *Pinetum* this tree (of which *P. macrocarpa* is a synonym) is described as—

"A tree very nearly allied to *P. Sabiniana*, growing to the height of 80 or 100 feet, with large spreading branches, and a trunk 3 or 4 feet in diameter. It is perhaps of a straighter habit and of a less glaucous hue. It produces the largest, heaviest, and most beautiful cone of any known species. The cone is like that of *P. Sabiniana*, with the scales terminating in large recurved hooks, but it is larger, longer, and the hooks of the cones more produced. Good specimens are rarely to be seen, the projecting hooks of the scales being usually broken and injured before it reaches this country. Mr. W. Murray mentions that two magnificent specimens for long ornamented his drawing-room chimney-piece in San Francisco, and notwithstanding the occasional use of fires when these were needed, they never showed the slightest indication of opening, but seemed as if carved out of one solid block of wood—indeed, the common observation made by non-botanical visitors was what an exquisite piece of carving it was, the light colour like box-wood, and the sharply defined edges contributing to mislead those who had never heard or dreamed of Pine tree cones larger than a man's head. [In Mr. Rashleigh's specimens the scales show a tendency to separate.] The cone of *P. Sabiniana* is on the other hand easily opened, the scales separating of their own accord. The seeds of the two species are the converse of what one would expect, the species with the smaller cone (*P. Sabiniana*) having the largest seed. The cone takes about twenty months to come to maturity. In 1852 a tree in the Jardin des Plantes, at Paris, produced two cones in its eighteenth year. They grew at the top of the leading shoot: one dropped off, but the other remained; at the end of the first season it measured about 3 inches in length and three-quarters of an inch in diameter. At the end of the second season it had reached its full development, and was about 16 inches in length, by about 9 inches in diameter."

At Kew there is a fine specimen of this tree, of which the regularly pyramidal habit is very striking. The old bark flakes off in thin irregular smoky-brown plates. The branches are long and lithe, with the bud-scales markedly reflexed and rough. The buds are large, oblong-ovate acute, cinnamon-brown, expanding early in April (relatively late). The young shoots are glaucous-green, flushed with pink, and clothed to the base, or nearly so, with leaves. The leaf section is triangular, with thick wedge-shaped masses of hypoderm, resin canals surrounded by strengthening cells, and a central ovoid fibro-vascular bundle surrounded by endoderm. In germination two cotyledons only are produced, then a pair of primordial leaves, followed after an interval by two decussating pairs. We have Mr. George Paul's authority for the statement that this Pine is one of the few that will thrive on London clay. Mr. Rashleigh, on the other hand, informs us that on his deep loamy soil this Pine does not do well. At Pampesford it grows on the chalk drift.

## PROTECTION OF FRUIT TREE BLOSSOMS.

THE present is an anxious period for the cultivator of the various varieties of fruit trees, which expand their blooms earlier than our fickle climate renders quite safe. So much is this the case that an abundant promise of fruit is not unfrequently blasted by one of those sudden and sometimes unexpected depressions of temperature which are frequently experienced when the season is considerably advanced. To prevent as far as is possible injury to the fruit crop, various appliances are resorted to by way of protection, more particularly in the case of such useful fruits as the Apricot and the Peach; and for such there can be no doubt that glass in some form is one of the more effectual materials, but as this is not always available, the use of more rough and ready materials is frequently resorted to, such as hay or straw bands stretched upon poles placed at a short

distance from the face of the walls on which the trees are trained; or curtains formed of "Frigi Domo," or some similar material, suspended from temporary wood coping; or the trees are sometimes thinly covered with twigs or small branches of the Spruce Fir or the common Yew; and these, although not always effectual, are nevertheless found in a majority of instances to be so.

The petals of flowers, including the blooms of the Apricot and the Peach, &c., are possessed of considerable protective power, and effectually protect the more tender parts of the blooms from injury during even very considerable depressions of temperature, but the moment the petals are unfolded the most tender as well the most important parts of the blooms are exposed, and bereft of all defence against the frost.

It is obvious that it would tend very much to the safety of the blossoms of such trees as the Apricot and the Peach could their expansion be retarded to a somewhat later period; and it is quite possible that more than is generally attempted in this direction might easily be done. Such trees as the Apricot and the Peach are generally trained upon the south or south-east side of a garden wall, and they are consequently, at intervals, subjected to a comparatively high temperature by the bright gleams of sunshine which occur during frosty weather in the month of February and the early part of March, and this circumstance has necessarily the effect of prematurely exciting the flower-buds, and inducing an earlier expansion than would otherwise be the case. Indeed, it may generally be found that in early spring, trees trained to south walls in the open air are in a more forward condition than the same kinds occupying an unheated orchard-house, or similar glass structure, as in the latter case the cultivator may manage to keep the trees longer in a condition of rest by the free admission of external air, by night as well as by day, when the state of the weather will permit this to be done, and thus to a considerable extent retarding the blooming period, in order to secure a condition of weather more favourable to the fertilisation of the blooms, and when sudden and severe depressions of temperature are less likely to occur, as in early spring it has been found that a covering of glass is hardly a sufficient protection for Peach and Apricot trees in full bloom.

In the case of trees trained to walls much might be accomplished by carefully shading the trees during those bursts of winter sunshine which tend to excite the blossom-buds and to induce them to unfold at an earlier period than is desirable or consistent with safety. This might no doubt be effected by the use of a curtain formed of "Frigi Domo," or canvas, and which should only be applied during sunshine, and will also be in readiness to protect the expanded blooms from frost and cold winds at a later period of the spring. And such curtains, with proper care, will be found to last for many years.

It has often been asserted that the bloom of fruit trees, and tender plants in general, suffer more in the process of thawing than they do in freezing; that is, a belief that if plants when more or less frozen can be gradually thawed, the injury to them will be very much less than would otherwise be the case. It is possible that this assertion may be somewhat misleading. It may be asked, In what way does frost act injuriously upon tender vegetation? I may be wrong, but I have always considered it to be its power of expanding fluids, and the consequent rupture of the tissues of tender plants, and the tender parts of the blossoms of fruit trees, &c. [It is the fluid between the cells which freezes, not that in the cells themselves: the practical result is the same. Ed.]

If a bottle or other glass vessel be filled with water and exposed to the influence of intense frost during a winter night, it will in the morning be found to be fractured, and whether thawed gradually or otherwise, will when fairly thawed fall in pieces all the same. As another case in point, I have a distinct remembrance of having a collection of seedling *Cinerarias*, a plant known to be impatient of frost. They were intended for winter flowering, but they still occupied a cold pit, and were placed close to the glass. One night, however, an early and unexpected frost occurred, and on the following morning it was evident that the plants were more or less frozen. The pit was in two divisions, and the plants in one division were at once well syringed with cold rain-water, and kept shaded with mats during the entire day. The plants in the other division were also shaded, but by way of experiment they were not syringed. On un-

covering the pit on the following day the portion of plants which had been syringed certainly appeared to have suffered less than those which had not been so treated; but before the end of a week there was no perceptible difference in the two sets of plants as regarded the injury they had sustained. P. G.

## Florists' Flowers.

## SEASONABLE NOTES ON HARDY FLORISTS' FLOWERS: THE AURICULA.

AT p. 188 it was stated that the offsets should be taken off and potted in small pots. My own were done at that time. They were placed in a shady position in a cold frame, and have not yet been watered. At this season of the year water should be applied very cautiously to such delicate subjects. Last year we sowed the seed of the show Auriculas in January, plunging the pots in a gentle hotbed, but the seeds vegetated very irregularly, and the largest proportion of the plants appeared after the seed-pans were removed from the hotbed, and placed in a cold frame. This year the seed-pots were placed in the Auricula-house at once, and I have now a fine lot of young plants regularly placed over the surface of the soil in which the seeds were sown. I fancy the seeds of all these hardy and other alpine plants vegetate most freely when sown in cold houses or frames. The flowering of the specimen plants is much later this year than it was last. At this date last year I had many choice named varieties and seedlings in flower, while this year there is practically no bloom at all. Unless the weather changes soon the season will be a late one. As the trusses are now pushing up freely from the centre and sides of the plants, with the pips in course of expansion and formation, we are careful not to allow the cold east winds to blow directly on the plants, at the same time they must have a free supply of fresh air admitted daily. In frames the lights are tilted against the wind, and at night double mats are required to keep the plants from being frozen. Three nights ago the thermometer fell 9° below the freezing point. The plants, which up to this time have been placed very closely together, now require more room to prevent the leaves and flower-stems from being drawn.

## THE CARNATION AND PICOTEE.

ALTHOUGH the weather has been so cold the whole collections of plants have made signs of growth, and if they have not been repotted or planted out, no delay should take place now. The whole of mine have been potted into their blooming pots, they being protected in the meantime by glass lights. At one time I used to turn the plants out-of-doors as they were potted, but some of the more delicate varieties used to suffer if cold east winds or perhaps a fall of snow caught them before they became established. They do not receive any water at the roots for ten days at least after they are potted. I am planting out some named varieties, and two or three hundreds of seedlings in the open ground. It would have been much better to have planted out the seedlings in the summer, but I was unable to do this with the whole of them. Some that were planted out have made very strong flowering plants. Within a month the seeds should be sown over a gentle hotbed to produce plants to flower in 1886. Those who intend to raise seedlings with the object of producing new and distinct varieties should save their own seeds; the flowers should be intercrossed with each other, and it is better not to mix the classes. The best varieties only should be selected for seed bearing.

The young plants of the perpetual flowering type raised from cuttings in January have been potted off into large and small 60-sized pots. They require to be grown on in a frame over a spent hotbed, where there is yet a slight heat in the plunging material beneath. The plants very speedily fill the small pots with roots, and before they are root-bound in the least should be potted again into larger pots. They must be kept steadily growing under glass until the weather is favourable, about bedding-out time, when they should be placed out-of-doors.

## THE GLADIOLUS.

The main collection should be planted out now without any delay, except waiting until the ground is in good condition. Instructions were given as to

planting them at p. 188. The early flowering species and varieties that are hardy enough to be established in the borders may now be lifted in the mass, and be divided and replanted. Some of them, such as *G. Colvilleus* and the variety *alba*, have made very considerable growth, but even now, if they are lifted with a mass of roots and carefully planted, they will grow on again without any apparent check. It is better not to part each root out separately, but rather part them into smaller clumps of from six to a dozen roots in each. Some roots that were purchased in the winter were potted, and as soon as they have grown sufficiently they will be planted out where they are to remain permanently. *J. Douglas.*

#### SELECTIONS OF EXHIBITION DAHLIAS.

**Show Varieties.**—Undoubtedly the best twenty-four show Dahlias for exhibition purposes will be found to include Mrs. Gladstone, Lord Chelmsford, Miss Cannell, Prince Bismarck, Joseph Ashby, Henry Walton, William Rawlings, Henry Bond, the Hon. Mrs. Percy Wyndham, Joseph Green, Prince Arthur, Georgiana, Canary, Constancy, Emily Edwards, James Cocker, Herbert Turner, Condor, Mr. Stancomb, Mr. William Dods, Prince of Denmark, Vice-President, Earl Radnor, and Walter H. Williams. But in case a smaller selection of twelve of the best varieties might be required, the following can be named with confidence:—Mrs. Gladstone, Lord Chelmsford, Miss Cannell, Prince Bismarck, Joseph Ashby, Henry Walton, William Rawlings, Henry Bond, the Hon. Mrs. Percy Wyndham, Joseph Green, Prince Arthur, and Georgiana. The following are the very pick of the self coloured show Dahlias:—Imperial, Canary, Earl Radnor, Emily Edwards, Georgiana, Henry Bond, James Cocker, Joseph Ashby, Joseph Green, Lord Chelmsford, Prince Arthur, Prince Bismarck, Cardinal, Thomas Goodwin, Walter H. Williams, William Rawlings, Herbert Turner, and Vice-President. The self flowers are a rather more numerous section than the edged or tipped varieties, and so a selection of the best twelve of the latter will be found in Henry Walton, Lady Gladys Herbert, Harriet Tetterell, the Hon. Mrs. Wyndham, Miss Cannell, Mrs. Harris, H. W. Ward, Mrs. Hodgson, Mrs. John Downie. **Picotees:**—Royal Queen and Cremorne.

**Fancy Dahlias.**—The best twenty-four fancy Dahlias should include George Barnes, Professor Fawcett, Flora Wyatt, Jessie McIntosh, Rebecca, Rev. J. B. M. Camm, Fanny Sturt, John Forbes, Mrs. Saunders, Henry Glasscock, Gaiety, Frederick Smith, Charles Wyatt, Chorister, Parrot, Hercules, James O'Brien, Maid of Athens, Miss Annie Milsome, John Saunders, Madame Soubeyre, Mandarin, Mrs. N. Halls, and Monsieur Chauviere. What varieties should be selected from this list to form the best twelve? Clearly, George Barnes, Professor Fawcett, Flora Wyatt, Jessie McIntosh, Rebecca, Rev. J. B. M. Camm, Fanny Sturt, John Forbes, Mrs. Saunders, Henry Glasscock, Gaiety, and Frederick Smith. The fancy Dahlias are dividable into two classes—the tipped flowers and the striped and flaked flowers. The best twelve of the former are Fanny Sturt, Jessie McIntosh, Maid of Athens, Miss Browning, Miss Rodwell, Mrs. N. Halls, Mrs. Saunders, Miss Annie Milsome, Peacock, Polly Sandell, Lady Antrobus, and Queen Mab. The best twelve striped and flaked fancies are Flora Wyatt, George Barnes, Chorister, Frederick Smith, Gaiety, Henry Glasscock, Hercules, John Forbes, Monsieur Chauviere, Rebecca, Rev. J. B. M. Camm, and Professor Fawcett. *R. D.*

#### THE PARCEL POST.

I OBSERVE the remarks of a correspondent with regard to the delay which is occasioned by the parcel post system to perishable things such as cut flowers, &c., and can see with him the great inconvenience it is to senders and receivers, as in some cases the delay would prove fatal to the contents of such parcels. But I fail to see that his suggestion for an extra charge for a more prompt delivery would be accepted as an improvement on the present state of things. Such packages are supposed to be securely packed in stout material, which makes the present charge sufficient. If an extra charge were made I fear it would be equal (in some cases) to the value of the flowers sent. Some more economical suggestion must be made to become general. *Another Correspondent.*

## HOME CORRESPONDENCE.

**Large Masses of Imported Orchids.**—Orchids are noted for their slow rate of increase, especially when the plants are small to begin with. Not the least remarkable fact is the way in which large masses bear division. For many years after they began to reach this country in great numbers the importers, before offering them for sale, divided almost all they obtained into small pieces, often carrying this so far that it took years before the little bits, so divided and subdivided, were able to recover in a way that enabled them to produce bulbs and flower-spikes of their normal size. In recent years there has been a departure from this practice, and now large masses are offered which have such an amount of strength and vigour in them that in a year or two they produce bulbs and flower-spikes equal in size to those made in their native wilds, and showing little sign of the rough treatment they have been subjected to. Notwithstanding the extra price which large plants such as described realise as compared with the fragments that used to be almost all that were obtainable, still it is a great saving in the matter of time, as specimens can at once be secured, such as used to take ten or twenty years to grow up. *T. Baines.*

**Excrescence on the Stem of *Cryptomeria japonica*.**—The accompanying sketch (fig. 75) represents an example of several excrescences growing out

FIG. 75.—EXCRESCENCE FROM *CRYPTOMERIA*.

of the stem of a fine tree of *Cryptomeria japonica* growing here. They are found, here and there, all up the stem to 25 feet. Some are not forked as the one represented, but most of them are so. They are covered with a scaly bark, and are not connected very strongly to the inner bark of the tree, as shown by the figure. Those near the base look like an attempt at root making. *Henry Mills, Enys, Penryn.* [Please send a specimen. *ED.*]

***Clianthus puniceus*.**—How seldom it is one sees a plant of this now, and yet it is one of the most showy things any one can grow, especially when planted out and trained up a pillar in a conservatory—a purpose for which it is specially adapted, and where it shows to the greatest advantage, as its racemes of large pea-shaped and bright-coloured flowers show up boldly. Not only is this *Clianthus* suited for the position referred to, but it is equally good run up under the rafter of a greenhouse, or grown and tied out to cover the panel of a wall, the thing with it being to get plenty of young shoots annually on which the blossoms are formed. This may be done by pruning hard in every spring or summer after it has done blooming, and encouraging the plant to break again by frequent syringing, and this wetting of the stems and foliage should be continued during hot weather to keep down red-spider, an insect to which the plants are very subject. The soil the *Clianthus puniceus* does best in is a fibry loam, and in making the border this ought to be cut fresh, as then it lasts open much longer, and keeps the plants in good health. As they take a good deal of water when growing and blooming, it is necessary to have plenty of drainage. If it is desired to increase the stock

of plants, propagation may be effected by seeds or cuttings—the best time to take off and strike the latter being just after fresh growth commences, and when the shoots are about 4 inches long, at which stage, if taken off with a heel, they root readily; but to enable them to do this, they must be kept close under a glass, and placed where they can get a little heat. Seeds may either be sown as soon as ripe, or kept till spring, the latter being the best time, as then the plants go right on growing without any check. As the seeds are somewhat hard, their germination may be expedited by soaking them a few hours in warm water, after which they should be just buried in sandy soil and stood where they can have a brisk temperature to prevent them from rotting. *J. S.*

**Proposed Foresters' and Gardeners' Benevolent Institution for Scotland.**—I see in your paper that it is proposed to start a society under the above heading for Scotland, and opinions are solicited. I give mine freely and frankly, and am decidedly against it. We have an excellent society in London, managed in a most efficient manner, every year more prosperous, and conducted without the least partiality by members of committee without fee or favour. The pensions are to be increased. The Society has a nice sum carefully invested, and it will be far better for the gardeners of Scotland to assist this society, which is now in a prosperous condition; and let them take this carefully into consideration that if ever "Age and Want—oh! ill-matched pair"—should be their lot, the society of which I speak, or rather the gardeners who belong to it, will not forsake them in their hour of need. I know Mr. Methven well, and believe he is actuated by the purest of motives—the welfare of gardeners, but it will be better to stir up gardeners in the North to join the established society existing in London. *J. Rust, Eridge Castle.*

—I am in favour of the above Institution. I trust that no time will be lost in getting it started. I am confident that gardeners and foresters in Scotland will become members in numbers. I would suggest that a meeting be held in all the principal towns in Scotland, and in this way the number could be taken who are in favour of an Institution for Scotland for the benefit of gardeners and foresters. *J. MacL., Ayrshire.*

**Mushroom Growing.**—We often hear of Mushrooms being grown to a high state of perfection, but seldom do we see them in such fine condition as at the Ranelagh Gardens, Leamington. This establishment has for some months past been producing hundredweights of Mushrooms, grown in the simplest way imaginable. The Mushroom-house is a sight in itself, but nothing to compare with the immense beds which are made on the paths in some of the late vine-ries, and in the body of the house where the Vine borders are outside. Mr. Crump told me he had gathered as many at one time as seventy-two fully expanded Mushrooms from one stool, and left remaining as many more small buttons; also that many of the individual clumps measured from 1½ to 2 feet in diameter. I feel sure it would be very interesting and instructive to the readers of the *Gardeners' Chronicle* if Mr. Crump would give a detailed account of his method of growing the Mushroom to such perfection. *R. Greenfield, Priory Gardens, Warwick.*

**The Doubling of Daffodils.**—I cannot claim to be what the scoffers term a "Daft-down-dillyite," but still have enough preference for the *Narcissus* to think it a very beautiful and interesting genus. I would therefore like to suggest to the committee which has been appointed to consider the question of doubling or assumed doubling of single Daffodils, that it should also endeavour to ascertain whether there are to be found any cases of reversion from the duplex to the single form also, for if the latter can be found the former may be equally existent. The doubling of Daffodils stands on a diverse footing from the doubling of other flowers, because in the *Narcissi* the doubling is not assumed to result from evolution through progeny obtained from seed, but from change of soil or cultivation. Doubling is so common on the part of flowers raised from seed that we regard it as no novelty. At the same time it is by no means inexplicable, because selection of flowers showing the slightest tendency to increase their normal number of petals as seed or pollen parent is pretty sure to produce in the end a race of double flowers. The peculiarity to which the single Daffodil

is said to be addicted, is that not through seeds but from the bulbs double flowers are created. That such a freak of nature is possible none can dispute, and it is not improbable, yet it seems unlikely. It is true bulbous roots are queer things, and as they are created afresh, practically from year to year, there is no telling what sort of change may take place in them that may not be productive of the same results as flow from seed progeny. If the committee should really find single Daffodils to double, it is hoped that the reason for such evolution will also be shown at the same time. *A. D.*

**The Lyon Leek.**—A few years ago a gentleman in Scotland was good enough to send me a few seeds of this splendid variety of Leek, and since that time I have grown a breadth of it every year, and I may safely venture to say, considering its size and quality, and its merit of not running to seed so readily as some other kinds which are more commonly cultivated, that it is the best kind of Leek with which I am acquainted, either for general use or for the exhibition table. I am glad to see this subject has met with recognition by the Royal Horticultural Society, as liberal prizes are offered for Leeks at the exhibition at South Kensington on October 27 and 28 next. This incentive will undoubtedly be the means of bringing together a good collection of different kinds, and of affording an opportunity of finding out practically some of the merits pertaining to them. I, for one, shall certainly be somewhat astonished if this excellent variety does not rank well amongst them on that occasion. *Geo. Thos. Miles, Wycombe Abbey.*

**The Potato "Sclerotet."**—Mr. Murray now contends (see *Gardeners' Chronicle*, March 14, p. 350) that "satisfactory evidence can readily be obtained" as to whether the plasmodium is inside the lime or outside, "by cutting through the so-called 'sclerotet,' and demonstrating the contents, if any." Supposing that this ball of the two-thousandth of an inch in diameter could, by some happy accident, be cut in two, it would be impossible to tell that it was cut. If the flat face of one hemisphere were next the eye, then, upon the assumption that the plasm forms the interior, its transparency would allow the lime crystals on the convex surface below to be seen through, so that the appearance would be an opaque ball, as before cutting. Then, upon the assumption that the lime is in the interior, the face of the section, all round the circumference, would remain unaltered. And, as the interior would appear opaque whether the lime is in the interior or below a translucent plasm, no information would be got from the section. The expedient of focussing would not apply to an opaque field. What next? *A. Stephen Wilson.*

**Two Good Varieties of Melon.**—Were I debarred from growing more than two varieties of the Melon—and I do not think that I should be a loser as regards quality and supply if such were the case—the two chosen would be Cox's Golden Gem (green-flesh), and Blenheim Orange (scarlet-flesh). These two, when well grown, possess, in my opinion, everything that could be desired in a first-class Melon. They are good growers, free setters, and the fruits are handsome in appearance and rich in flavour. But unfortunately seeds of these excellent Melons cannot always be obtained true to name from the trade, by reason of the seed having been saved from fruits grown in the same house side by side with other varieties. At Madresfield Court, where Golden Gem was raised by the late Mr. W. Cox, who superintended the gardens there for a great number of years, and was succeeded in their management by the raiser of Blenheim Orange (Mr. W. Crump), only these two varieties of Melon, I believe, are grown, each in a house to itself, and the crop in one house forming a succession to the other; in which case both varieties are never in flower at the same time, even in separate houses, and the possibility of their getting crossed is in consequence prevented. *H. W. Ward.*

**Peas.**—It is a fact patent to us all that good Peas may justly be termed the prince of all vegetables. They are alike the favourite with the rich and the poor, so that they are universally liked. For me to suggest to hold a Congress of Peas this season would not be well received—Congresses being like many other things, good no doubt, still may be overdone.

I am well aware of the great amount of work a Congress brings to both the worthy Superintendent and his subordinates at the Royal Horticultural Society, still I should like something to be done even in a small way, and I feel sure the Society will help us in any way which lies in its power. I therefore suggest we invite the four large firms, Messrs. James Veitch, Sutton, Carter, and Webb, also the three Pea-makers, Messrs. Laxton, Culverwell, and Burberry, and five noblemen's or gentlemen's gardeners—but the selection of these, I shall leave to the Editor—each one to send one dish, both cooked and uncooked, to one of the meetings of the Fruit Committee to be hereafter named: one dozen varieties of Peas being enough to spare for the committee to adjudicate upon in one day. This would be a beginning to get at the great fact as to which is the best Pea, as I feel sure by having one dozen shown we should have the cream of the collection, and so that we may have Peas in perfection mid-season varieties should have the preference. These few crude lines I look upon as a text, and invite discussion on the subject. *R. Gilbert.*

**A Friendly Lift.**—The accompanying sketch (fig. 76) was taken from an Elder bush growing in proximity to a pollard Oak. Most of the

FIG. 76.—AN AMBITIOUS ELDER.

branches of the Elder were their usual size, but one, which grew against the trunk, seems to have profited by the support, for it not only hooked itself over the branch of the Oak at a height of 10–12 feet from the ground, but developed in thickness amazingly in proportion to the other branches which had no such friendly aid. Generally when a branch is thus supported, although its length is increased, the thickness is not enhanced; thus we may often see the fronds of the common Brake attaining a height of 12–15 feet when supported by the bushes in a hedgerow, but the stalk is not proportionately thickened, as it was in the Elder. A second branch of Elder was observed pressed up against the trunk of another pollard near to the one first mentioned. In the latter instance the shoot had not yet reached the branches of the Oak, and so could not support itself by hooking over them, but it was firmly pressed against the Oak trunk, and at least twice as tall and twice as thick as the other branches of the Elder not so supported. We lighted upon these interesting specimens in the course of a Sunday afternoon ramble, and mentally decided to revisit the spot, with pencil and note-book, at the first opportunity. A week elapsed ere this occurred, and then we experienced a shock to find that some enterprising builder of the tribe of the Philistines had felled the Oak and grubbed up the Elder. Another week and they would have disappeared utterly. Wretched Philistine! As it

was, we were enabled to make a rough sketch, and give it in memoriam. *M. T. M.*

**Fertilising and Raising Seedling Fuchsias.**—When does Mr. Lye fertilise his Fuchsia blooms if he finds it necessary to do so? is a question to which some of your readers would no doubt like a reply. It may be said to arise out of the remarks relating to his mode of culture given in the *Gardeners' Chronicle* a few weeks ago. The month of September is that when the work of fertilisation is done by the famous grower. He prefers for the purpose flowers that have been expanded three or four days. It is also necessary that the weather be fine, and the pollen in good condition and dry. A feather or the tail of a rabbit is used in the process. The pollen is taken from one set of flowers and placed on the stigma of others, and the plants so operated upon are placed within a covering of tiffany to prevent bees and other insects visiting the flowers. When the berries are ripe, i.e., of a black, or nearly black colour, they are gathered and laid by on a piece of slate or board and placed on a warm shelf in the greenhouse for a few days to dry somewhat and shrivel. The seeds are removed from the pods by means of a small pen-knife, taking them from the pulp and placing them on a sheet of brown paper to dry. The seeds are sown in March in a temperature of some 60° to 70° during the month of March. The soil used is one composed of three quarters of rich yellow loam, and of leaf-mould one quarter, with the addition of a good sprinkling of silver-sand. The seeds are sown in pots or pans, and slightly covered, and then placed in a Cucumber-house or Melon-frame, where they germinate in a comparatively short time. As soon as they have grown large enough to handle they are potted singly into small pots and returned to the Cucumber-house to get them established. They are then placed in a cold frame, where they remain during the summer months, throwing the lights open at night to keep them from drawing. Many of the plants flower in the month of September. It is a bad plan to over-pot seedlings, as they grow too much to wood in consequence, and require a longer time in which to flower. *R. D.*

**Pruning Orchids.**—Orchids were never held in so much estimation as at the present time. There are continually numbers of people commencing their cultivation who have comparatively little knowledge of their management, but who are ever ready to adopt any new treatment they see held up as advantageous, such as this cutting out the living bulbs, which has now for several years been persistently held up by the advocates of the practice as the right course to follow. Yet the inexperienced cannot be too often cautioned as to the condition their plants will be reduced to if they follow the mischievous practice. It is not every one who has been beguiled into this erroneous mutilation of their plants who has the courage to proclaim the result like Mr. David Walker. Several cases have come under my notice, one in particular where the bulb-cutting was not confined to two or three plants, like the instance so fully described, but ten or twelve fine specimens were operated on with the result that the owner was so disgusted with the plight they were reduced to that at the end of the season they were put into the fire as being beyond recovery. When the subject was first mooted the advantages claimed for it were not confined to Dendrobiums, but extended to other species. *Coelogyne cristata* was represented to be much benefited by cutting out the back bulbs, which it was alleged did not allow enough room for the young growths. It now appears there is a retreat from the ground first taken up, and the operation advised is to be confined to the removal of the bulbs that are three, four, or five years' old, with the damaging admission that a plant that had all its back bulbs cut away for several years in succession continues to live. If nothing better than negative results like this had at first been claimed for the pruning it is not likely any one would have been foolish enough to have adopted it. Mr. De B. Crawshaw rightly suggests that the pruned plants should be shown at the Orchid Conference. I and others have repeatedly urged that they should be shown at one of the leading exhibitions, or at a meeting of the Royal Horticultural Society. After February there is a meeting every fortnight, consequently they cannot be withheld on the plea of not being in bloom at a time when there is an opportunity of showing them. Neither would it matter whether the plants were in bloom or not; the result

of the practice would be as easily seen without flowers as with them. Why cannot the other correspondent mentioned show his pruned *Dendrobium nobile* with bulbs said to be 3 feet long at one of these meetings? A sight of the plants would do more than all the assertions that have been made to remove the scepticism of Orchid growers. *T. B.*

**Sclerotoids in Potatoes.**—On p. 663, Professor Trail suggests that these bodies should be sought for in Tomatos attacked by *Peronospora*. I have recorded their occurrence with *Peronospora* in Parsley, and with *Peronospora* in Onions, in the *Gardeners' Chronicle*, Nov. 22, 1884, p. 662. *W. G. Smith.*

## Reports of Societies.

### ROYAL HORTICULTURAL: March 24.

THE last meeting of this Society was the occasion for an interesting exhibition by nurserymen and other growers of Hyacinths, Tulips, Cyclamen, Tazetta Narcissus, Daffodils, together with some uncommon forms of Orchids and specimens of various rock plants and Primulas.

#### Scientific Committee.

Sir J. D. Hooker in the chair. Present: Messrs. Michael, Pascoe, Masters, Godman, Houston, Grote, Lowe, McLachlan, Murray, Ridley, and Henslow.

#### CYPRIPEDIUM, SEMI-DOUBLE.

Dr. M. T. Masters exhibited a very curious blossom of *C. Hookeri*, on the part of T. B. Haywood, Esq., which he was requested to examine and report upon.

#### LAPAGERIA ROSEA, DOUBLE.

He also showed [a specimen received from Mr. C. J. Bowring, of Forest Farm, Windsor, on which he will report.

#### ARUM ITALICUM.

He also showed specimens of this plant gathered at Folkestone. The foliage is much larger than that of *A. maculatum*, and also appears earlier.

#### INDIAN PRIMULAS AND THE COLD.

Mr. Wilson exhibited some trusses which had withstood severe rain, snow, and a temperature of 24° without injury.

#### IRIS RETICULATA BULBS ATTACKED BY MILLIPEDES.

Mr. McLachlan mentioned that bulbs received from Professor M. Foster and others were often attacked by these enemies after a year or two of cultivation, though Mr. Wilson and Colonel Clarke had not experienced it.

#### DAFFODIL BULBS DISEASED.

Mr. Plowright sent bulbs received from Dr. M. Foster attacked by some species of *Pleospora* (*Sphaeria*) with sketch of fungus. It was given to Mr. G. Murray for further examination and report.

#### SWEET WILLIAM LEAVES ATTACKED BY PUCCINIA DIANTHI.

Mr. Plowright sent specimens, and observed:—"This is one of the *Leptopucciniae*, the spores of which germinate as soon as they are ripe. Like *P. malvacearum* the mycelium is confined to limited circular areas, where after a time it kills the tissues of the leaf—in some cases quite through, so as to cut out or punch out a circular hole."

#### WILLOW ATTACKED BY CEDIDONYA SP.

Mr. Plowright also sent branches of Willow with the "Cabbage gall," the tufts of leaves still adhering to the ends of the branches.

#### PODISOMA SARINÆ.

He also forwarded a branch of Juniper, exhibiting this fungus just commencing to appear.

#### PLANTS EXHIBITED: IIBISCUS HUGELII.

Colonel Clarke showed this beautiful flower from Australia.

#### HYBRID (?) BETWEEN BEGONIA SOCOTRANA AND B. SUBPULVATA ROSEA (?).

A plant was sent by MM. Thibaut & Keteleer with rosy-pink blossoms and cordate, not petate leaves. The question was raised whether it was a hybrid, as it appeared to show no trace of *B. socotrana*, while the figure of *B. subpeltata* (Wight's *Zeon*) was hirsute and not smooth, and of quite a different habit, as was the specimen sent.

#### RICHARDIA ÆTHIOPICA WITH TWO SPATHES.

A specimen of this not uncommon peculiarity was sent by Mr. Axford, of Twyford Moors, Winchester.

#### Floral Committee.

Present: G. F. Wilson, Esq., in the chair; and Messrs. Masters, Henslow, W. Wilks, H. Bennett, W. Bealby, J. Walker, G. Duffield, H. Ballantine, H. M. Pollett, J. Doiny, W. B. Kellock, A. Perry, J. Smith, H. Herbst, Shirley Hibberd, J. Fraser, C. Noble, H. Williams, J. O'Brien, T. Baines, H. Cannell, H. Turner.—A letter was read from Mr. R. Cookson relating to the variety of *Dendrobium nobile* shown at the previous meeting, and which he alleged to be constant.

Some small trained plants of Roses from Messrs. Paul & Son, The Old Nurseries, Cheshunt, consisting of the following of the *Rosa polyantha* section, found many admirers:—*Pacquerette*, pure white, with a habit of flowering in large bunches; *Anna Montravel*, also white, very double and sweet, with the habit of the first-named; *Mignonette*, *Perle d'Or*, and *Rivers* and Musk Rose. From the same nurseries came *Scilla sibirica*, *Erythronium purpureum majus*, a fine large rose-coloured variety; *Sempervivum fimbriatum*, of bronzy-red as to the leaf; *Saxifraga longifolia*, with silvery-white foliage, distinct; and various other alpine in *Saxifraga aretioides*; a minute yellow-bloomed *Primula*; *Primula Wulfeniana*, a rare and rosy-lilac flower, opening boldly; *Androsace Laggeri*, *Saxifraga retusa*, *S. oppositifolia*, &c. Messrs. Paul & Son were awarded a Bronze Banksian Medal for their collection of plants.

Messrs. J. Veitch & Son, Chelsea, staged numerous exhibits, including a fine collection of Narcissi, Anemones, Iris, &c.; *Rhododendron Emblem*, pale brick-red, and a good truss; and R. Teymanni, with pale buff-yellow trumpet-shaped flowers, with ten declinate stamens. Several of their seedling *Amaryllis*, of which the best were *Niobe*, a scarlet with a white stripe and green centre; *Queen*, white ground flaked with claret; and *Paragon*, a deep scarlet with a broad white star, the eye being green; other varieties were also shown by them of much beauty. Their exhibits included a fine collection of Hyacinths and Tulips, for which the Silver-gilt Banksian Medal was awarded; *Heliniopsis umbellata*, a Japanese plant, with a leafy spike arising from a tuft of lance-shaped leaves, and bearing at the top an umbel of pink six-parted flowers, like those of *Helenias bullata*; and some fine plants of *Pieris japonica* and *Spiraea confusa* were likewise shown by them. Messrs. Cutbush & Son, Highgate, London, also staged a fine collection of 150 Hyacinths and sixty Tulips, similar in name, &c., to the previous collections, also receiving the Silver-gilt Banksian Medal; and two fine plants of *Viburnum Laurustinus lucida*, well bloomed, which is a fine thing for decorative purposes. Mr. R. Dean, Ealing, exhibited a collection of hardy *Polyanthus*, consisting of *P. White Queen*, *P. Purple Cushion*, *P. spectabilis*, *P. marginata*, *P. latifolia*, *P. nivea*, *P. pedemontana*, and *Anemone ranunculoides*. R. Newbury, Esq., Manor Lodge, Feltham, staged three fine blooms of *Camellia Mathottiana*. H. Cannell & Sons, Swanley, Kent, showed a basket of a fine Primrose called *Harbinger*.

Mr. B. S. Williams, Holloway, staged a select lot of plants, consisting of *Clivia Lindenii*, a very fine variety, scarlet and orange; and General Gordon, of a more intense colour; *Amaryllis Masterpiece*, fiery crimson; *Calanthe Sanderiana*, a strong grower, with a peduncle 3 feet in height, and a large strong bulb—the flowers are of a deep rose colour; *Camellia Commendatore Betti*, a fine large-flowered bright rose-coloured variety, with smooth petals and very massive form; *Sarracenia atro-sanguinea*, *Atkinsoniana*, *Tolliana*, and *Chelsonii*, all in flower; a nice pan of *Boronia megastigma*, a collection of very well flowered *Azalea mollis*, in considerable variety; a few pots of very dwarf floriferous *Primula sinensis*, six splendid pots of *Lily of the Valley*, a small collection of well grown *Polyanthus*, *Narcissus* in pots, and a splendid lot of Hyacinths and Tulips—180 of the former and sixty of the latter. Amongst the Tulips Kaiser Kroon, *Proserpine*, *Van der Neer*, *Fabiola*, *Joost van Vondel*, *Ophir d'Or*, *Canary Bird*, &c. Amongst the Hyacinths, *Czar Peter*, *Lord Macaulay*, *La Grandesse*, *Koh-i-noor*, *Challenger*, *Odalisque*, *Ida*, *Mont Blanc*, *Sultan*, *Lord Derby*, *Princess Amalia*, *Prince Albert Victor*, and many others. Mr. B. S. Williams was awarded the Silver-gilt Banksian Medal.

Mr. W. Bull, King's Road, Chelsea, had a small group of *Palms*, *Ferns*, *Asparagus*, and other small foliage plants, as a background to a few flowering plants. We noticed a pretty piece of *Dendrobium Farmeri*, *D. nobile* insignis, a high coloured variety with much purple tints on the tips of sepals and petals; *Cymbidium eburneum*, with three blooms; *Coleogyne Massangeana*, with a stout spike of its lemon and brown-coloured blooms; *Odontoglossum Wilckeanum album*, with a creamy ground colour, crest and throat yellow, and brown spots on petals and sepals and labellum. *Azalea Illuminator*, a bright coloured improved form of *A. amona*, formed an attractive plant in this group, as did also *Epacris onosmaeflora flore-pleno* and *Hæmanthus Kalbreyeriana maxima*. *Anthurium Rothschildianum*, with a spathe of small size, white, suffused with minute red spots, was a curious thing, which might be showy as a large plant. *Bentinkia condapanina* is a fine Palm, of bold habit, with three-sided stems and glabrous pinnate foliage. A Silver Banksian Medal was awarded for the group.

Mr. Anthony Waterer, Knaphill Nursery, Woking, had a pretty collection of Primrose *Polyanthus* in pots,

also hardy Heaths, and some fine plants in pots of *Pieris japonica*, well bloomed; *Andromeda floribunda* being placed beside them to show the superiority of the former plant. Mr. Waterer received a Bronze Banksian Medal for the collection.

Mr. Henry Bennett, Shepperton, Middlesex, showed the pedigree hybrid Tea Rose, Lady Mary Fitzwilliam, Tea Rose William Francis Bennett, and pedigree seedling Tea Rose "Ye Primrose Dame," a very delicately tinted yellow; and General Gordon, almost a white, very fine, but of less substance than the first-named. Mr. J. Aldous, florist, Gloucester Road, South Kensington, staged a collection of decorative plants, consisting of *Palms*, *Dracenas*, *Adiantum farleyense*, *Funkias*, and *Lycopodiums*, also a few nice plants of *Chrysanthemum frutescens*, being awarded a Bronze Banksian Medal. Messrs. Collins Bros. & Gabriel staged a choice collection of English grown Victoria Giant Anemones, very fine; also a nice lot of Narcissi, *Muscari*, *Scilla*, *Chionodoxa*, &c., and were awarded a Bronze Banksian Medal. Mr. R. Clark, florist, Twickenham, staged about 400 splendid Cyclamens, in various sized pots, but all of fine form, substance, and colour, obtaining a Silver-gilt Banksian Medal. Messrs. Barr & Son, Covent Garden, had an excellent collection of Narcissi, *Pseudo-Narcissi*, and *Polyanthus Narcissi*, &c., obtaining a Silver Banksian Medal. In this collection was *Chionodoxa sardensis* with smaller flowers than the type, and of a deep purple colour, the white eye being very small. Mr. T. S. Ware, Tottenham, was awarded a Silver Banksian Medal for a fine collection of hardy herbaceous plants and bulbs, consisting of fine examples of *Lachenalias*, *Iris*, *Freesia*, *Scillas*, *Chionodoxa*, *Anemones*, and *Megasea Milesii*, a white variety of much promise. Mr. W. B. Hardland, of 24, Patrick Street, Cork, staged a collection of Narcissi grown in Ireland, consisting of the following sorts amongst others that were unnamed, viz., tall Albicans, *Commodore Nutt*, *Silver and Gold*, tall *Tortuosus*, with pale sulphur perianth and crown; early flowering *Cloth of Gold*, a stellate double form of pale yellow; double *Cernuus*, a primrose coloured double flower. Mr. J. Walker showed a fine basket of cut blooms of *Clematis indivisa lobata*. A very finely bloomed plant of *Trichopilia suavis* was exhibited by Mr. J. N. Davis, gr. to W. Soper, Esq., 307, Clapham Road, S.W. Mr. W. Parkes, gr. to H. M. Pollett, Esq., showed a well-grown plant of *Odontoglossum Wilckeanum*, carrying fifty-one flowers and buds. J. Batten, Esq., Highfield, Bickley, showed a plant of *Odontoglossum gloriosum majus*, a fine variety, nicely spotted, of a pale yellow ground, the spots, which are brown near the apex of the petals, approach to a crimson colour at the base.

#### FIRST-CLASS CERTIFICATES.

To Messrs. J. Veitch & Sons, for *Amaryllis Niobe*.  
To Messrs. J. Veitch & Sons, for *Amaryllis Paragon*.  
To Messrs. J. Veitch & Sons, for *Amaryllis The Queen*.  
To R. H. Measures, Esq., for *Odontoglossum Wilckeanum*.  
To Messrs. Barr & Son, for *Chionodoxa sardensis*.  
To Mr. H. Bennett, for *Rose General Gordon*.  
To Mr. H. Bennett, for *Rose Ye Primrose Dame*.  
To Messrs. Paul & Sons, The Old Nurseries, Cheshunt, for *Primula Wulfeniana*.  
To Mr. B. S. Williams, for *Calanthe Sanderiana*.  
To Mr. B. S. Williams, for *Camellia Commendatore Betti*.

#### VOTES OF THANKS.

To J. Walker, Esq., for *Clematis indivisa lobata*.  
To L. Paighton, Esq., for *Odontoglossum Alexandræ*.  
To H. M. Pollett, Esq., for *Odontoglossum Wilckeanum*.  
To I. Batten, Esq., for *Odontoglossum gloriosum majus*.  
To W. Soper, Esq., for *Trichopilia suavis*.  
To R. Newbury, Esq., for *Camellia Mathottiana*.  
To R. Dean, Esq., for hardy Primulas.  
To J. C. Bowring, Esq., for *Orchid bloom*.  
To H. Bennett, Esq., for cut Rose blooms.  
To H. Cannell & Sons, for cut blooms of Primulas, &c.

#### Fruit Committee.

Present: F. D. Godman, Esq., in the chair; and Messrs. J. Lee, A. W. Sutton, H. J. Veitch, J. Bennett, G. Bunyard, J. Lane, G. Paul, T. F. Rivers, J. Roberts, F. Rutland, R. D. Blackmore, J. Woodbridge, H. Ivarson Weir, Dr. Hogg, T. B. Heywood, G. Goldsmith, and J. Willard.

Dr. Bull, Hereford, showed a dish of Herefordshire Beefing. Mr. S. Ford, gr. to W. E. Hubbard, Esq., Leonardslee, Horsham, showed dishes of Bessom, a large handsome conical Apple; Mincing Pippin, and Minchal Crab. He also sent the first two cooked. C. Ross, Welford Park, Newbury, sent Apple Peck's Pleasant; and Isaac Harrison, Esq., Leicester, sent an unnamed seedling.

#### ROYAL BOTANIC: March 25.

This Society held its first show this year on Wednesday last in the corridor and conservatory of Regent's Park.

Six greenhouse Azaleas, amateurs.—Mr. H. Eason, gr. to B. Noakes, Esq., Hope Cottage, Highgate, was 1st, with six nicely trained and flowered specimens of *Apollon*, *Françoise*, *Vervaine*, *Model*, &c.; 2d, Mr. G. Wheeler, gr. to Lady Louisa Goldsmith, St. John's Lodge, Regent's Park, with six nice examples; 3d, Mr. F. G. Hill, gr. to H. Little, Esq., Hillingdon Place,

In the class for nurserymen, Mr. H. James, Castle Nursery, Norwood, was 1st, with Flag of Truce, Exquisite, Apollon, Roi Leopold, Ceres, and Sigismund Rucker; Messrs. T. Todman & Son, Rose Park Nursery, Upper Tooting, was 2d. For six Chinese Primulas, open, Mr. F. G. Hill, who, amongst other varieties, had Tomkins Queen especially fine, was 1st; Messrs. Carter & Co., High Holborn, were 2d, with six of their well-known varieties; 3d, Messrs. H. Williams, Finchley. For nine hardy Primulas, open, Mr. J. Douglas, gr. to F. Whitbourn, Esq., Great Gearies, Ilford, Essex, was 1st, with P. nivalis, P. nivca, P. obconica, P. marginata corulea, P. Nelsoni hybrida, and P. John Bright. For nine hardy herbaceous plants, Mr. J. Douglas was also 1st, with Narcissus bicolor Horsfieldii, white and blue Muscari, Sanguinaria canadensis, Anemone ranunculoides, Hellebores, Fritillarias, &c. For six forced Roses (nurserymen) Messrs. Paul & Son, the "Old" Nurseries, Cheshunt, were 1st, with Souvenir d'un Ami, Marquise de Castellane, Perfection de Montplaisir, Alba rosea, Duke of Teck, Catherine Soupert, all well grown handsome specimens. This firm also staged forty other pot Roses, all in the very best condition, for which they received a Large Bronze Medal. Six Deutzias (open).—Mr. J. Douglas was a long way 1st here, with six splendid specimens, literally "smothered" with bloom; Mr. H. Eason was 2d, with six well bloomed but considerably smaller specimens than Mr. Douglas; 3d, Mr. G. Wheeler. The classes for twelve pots of Cyclamen brought forth a grand display. In the open class Mr. H. B. Smith, nurseryman, Ealing Dean, was 1st, with twelve even, dwarf, well bloomed plants; Mr. F. Hill, gr. to H. Little, Esq., Hillingdon Place, was 2d, with twelve good plants, but not quite so dwarf as Mr. Smith's.

In the amateurs' class, Mr. F. Hill was 1st, with a nice even lot; and Mr. J. Wiggins, gr. to W. Clay, Esq., Grove Road, Kingston, was 2d with twelve plants very little behind Mr. Hill's. Six pots Lily of the Valley, in 9-inch pots (open), brought out some grand examples, which were much admired. Mr. W. J. Watson, nurseryman, Newcastle-on-Tyne, was 1st with six splendid fresh examples, especially when the distance they travelled is taken into consideration; Messrs. H. Williams & Sons, Fortis Green, Finchley, were 2d; and Mr. H. R. Wright, florist, Lee, Kent, 3d. For twelve Hyacinths, single spikes, amateurs, Mr. H. Eason was 1st, with magnificent examples of Koh-i-noor, Lady Derby, General Havelock, Grand Master, Baroness von Tuyl, Macaulay, Marie, Marchioness of Lorne, King of the Blues, and Von Schiller; Mr. J. Douglas was 2d with fine examples of La Grandesse, Bird of Paradise, Ida, Von Schiller, Souvenir de J. H. Veen, and others. The class for twelve Hyacinths, distinct, nurserymen, brought out a fine lot. Messrs. H. Williams & Sons were 1st, with magnificent examples of Czar Peter, Koh-i-noor, Grandesse, King of the Blues, Lord Macaulay, Marie, Morena, Lord Derby, Von Schiller, Grandeur à Merveille, and King of the Yellows. Mr. H. R. Wright was 2d, with fine examples of Grand Maitre, Rubra, and Maxima. Messrs. W. Cutbush & Son, Highgate, were 3d, with twelve fine spikes, mostly of the newer varieties, fine in colour, but deficient in size. Twelve pots of Tulips, three in a pot, amateurs.—Mr. J. Douglas was 1st, with fine dwarf, highly coloured examples of Kaiser Kroon; white Joost van Vondel; purple Joost van Vondel, Ophir d'Or, and Prosperpine; 2d, Mr. H. Eason, with rather taller plants of the same varieties. Twelve pots of Tulips, distinct, Nurserymen.—Messrs. W. Cutbush & Son were 1st, with excellent examples of Hector, Prosperpine, Kaiser Kroon, Fabiola, Van der Neer, Rose Gris de Lin, Ophir d'Or, Cottage Maid, Vermilion Brilliant, and Joost van Vondel. Messrs. H. Williams & Son were 2d, having, amongst others, several very well-grown plants, good examples of Hector, Nelly, Mercurius, Spaendonk, &c.; Mr. H. R. Wright was 3d. Twelve pots of Polyanthus Narcissus, three in a pot, not less than four varieties (open).—1st, Messrs. H. Williams & Son, with a fine even lot of Grand Monarque, Bazelman Major, Newton, Gloriosa, Her Majesty, Bathurst, &c.; 2d, Mr. J. Douglas, with similar varieties; 3d, Mr. H. Eason. Twelve pots of Crocus (open).—1st, Mr. J. Douglas; 2d, Messrs. Cutbush & Son. Twelve Amaryllis (open).—1st, Mr. J. Douglas, with twelve seedlings of Empress of India, all of them, more or less, showing the character of the parent. Two of them were especially noticeable—an unnamed one with a fine white star, and very deep claret edging; and Sir Garnet Wolseley, fine lively scarlet.

Special prizes for Amaryllis.—For the best seedling, 1st, Mr. J. Douglas, with Helen Lodge, a fine bold flower, rich carmine, with small white distinct star; 2d, Mr. F. J. Hill, with Mrs. H. Little, a good flower, deep crimson, white-tipped, small green star. For the best six named, Mr. J. Douglas was 1st, with Great Gearies, light crimson, white distinct star; Empress of India, J. Douglas (Veitch), Marcus Aurelius, fine bright crimson, green star; John Heal, bold flower, white, flaked claret, green eye; 2d, Madonna, white, flaked crimson, green eye; 2d, Mr. R. Butler, gr. to H. H. Gibbs, Esq., St. Dunstan's, Regent's Park, with six of the Empress of India type. For the best dark variety, Mr. J. Douglas was 1st and 2d, with Great Gearies and Empress of India respectively. For the best light variety, Mr. J. Douglas was again 1st and 2d, with J. Heal and Madonna. There were numerous miscellaneous exhibits of exceptional quantity and merit, which in no small degree contributed to the success of the exhibition. Mr. Bull, Chelsea, had a choice collection of plants, neatly arranged, several of which received Certificates. Messrs. Paul & Son, the "Old" Nurseries, Cheshunt, had a fine collection of hardy plants and alpine, for which they received a

Certificate, while some of their specimens received a special Certificate. Messrs. H. Cannell & Sons, Swanley, staged a fine stand of twenty bunches of Pelargoniums and a basket of Primrose Harbinger. Mr. Anthony Waterer, Knap Hill, received a Bronze Medal for a fine collection of hardy Primroses, &c. Messrs. B. S. Williams, Holloway, had a large stand of miscellaneous plants, which had a telling effect, and for which they received a Large Silver Medal. Mr. R. Clark, Twickenham, had a fine lot of Cyclamens. Mr. H. W. Price, gr. to P. M. Muntz, Esq., Malvern Lodge, Surbiton, showed a collection of Cinerarias, with very large heads of bloom, for which he received a Certificate. Mr. H. B. Smith, Ealing Dean, received a Large Bronze Medal for a magnificent group of Cyclamens. Mr. James, Farnham Royal, Slough, received a Bronze Medal for a collection of Cinerarias of remarkably dwarf habit and striking colours. Mr. H. R. Wright, Lee, had a Large Bronze Medal awarded him for a collection of Tulips. Mr. J. Wiggins, gr. to W. Clay, Esq., Kingston-on-Thames, received a Certificate for a collection of Cyclamens. Messrs. J. Veitch & Sons, Chelsea, had a fine collection of miscellaneous plants, including some of their famous Amaryllis, many of which received a Certificate. Mr. F. J. Hill received a Certificate for a quantity of Lycopodium in variety, and a fine example of Dendrobium crassinode, with very large blooms and well coloured. Mr. H. Eason also received a Certificate for a collection of flowering bulbs—Hyacinths, Tulips, &c. Messrs. Hooper & Co. exhibited a fine basket of Carnations. Messrs. Carter & Co., High Holborn, had a fine basket of Valotta purpurea, and pans of Primula spectabilis and Soldanella montana. Messrs. Collins Bros. & Gabriel had a showy collection of Narcissi, Anemones, &c., for which they were awarded a Large Bronze Medal. Mr. T. S. Ware, Tottenham, with a fine collection of hardy flowers, for which he received a Certificate. Messrs. Barr & Son, Covent Garden, were awarded a Bronze Medal for a fine collection of Narcissi, &c. Messrs. W. Cutbush & Son were awarded a Small Silver Medal for groups of Hyacinths, &c.

Certificates were awarded as follows:—To Mr. W. Bull, Chelsea, for Hemanthus Kalbreyeri maximus, Bentinckiana condapanna, Oreodoxa plumosa, Saracenica Adkinsiana, Masdevallia Wagneriana, Lycopodium Skinneri alba, Dendrobium crassinode var. alba, D. nobile var. insignis, D. Ainsworthii, Odontoglossum Rossii concinnum, Selaginella amocna, and Lomaria heterophylla. To Mr. Hill, for Dendrobium crassinode var. gigantea. To Messrs. Paul & Son, Cheshunt, for Anemone pulsatilla patens. To Mr. E. S. Williams, for Calanthe Sanderiana, Dendrobium nobile nobilis, and Camellia Commendatore Betti. To Messrs. Barr & Son, for Chionodoxa sardensis. To Messrs. Keteleer, nurserymen, Soeaux, for Begonia Gloire de Soeaux. To Mr. J. Douglas, for Amaryllis Helen Lodge, and A. Great Gearies. To Mr. Hill, for Lycopodium Skinneri magnifica. To Mr. James, for single-flowered Cinerarias, Mrs. A. Sutton, Viceroy, Paragon, Mary Anderson, General Gordon, Dante, and Rob Roy. To Mr. Hill, for Azalea Madame J. N. Verschaffel and Primula Tomkin's Queen. To Messrs. J. Veitch, for Amaryllis Basilisk, Ne Plus Ultra, Perfection, and Rhododendron Teysmanni.

### CLIFTON SPRING SHOW.

THE fifteenth spring show was held in the Victoria Rooms on the 18th inst., and was in every respect an excellent one. The chief features were the spring flowering plants, but in addition there were also some choice collections of stove and greenhouse plants, Orchids, Ferns, and some capital dishes of late fruit, consisting of Grapes, Pears, and Apples, all of which were in an excellent state of preservation. One of the most interesting exhibits in the non-competitive class was a very large and choice collection of Narcissi, sent from Tresco Abbey, Isles of Scilly, by T. A. S. Dorrien Smith, Esq.

Prize offered by the Treasurer, Walter Derham, Esq., for the best eighteen Hyacinths, distinct varieties; twelve pots of Tulips, six single and six double.—Mr. G. Marsh, gr. to M. Dunlop, Esq., was 1st, with a very choice collection, comprising the following varieties:—Queen of Blues, General Havelock, Von Schiller, Fabiola, L'Innocence, King of Blues, Odalisque, Haydn, Lord Shaftesbury, Queen of Hyacinths, Mont Blanc, Pinerman, Lord Macaulay, De Candolle, Paix de l'Europe, Grand Maitre, General Pellissier, Lothair, Tulips:—White Pottebakker, Vermilion Brilliant, Murillo, Prosperpine, Fabiola, Joost van Vondel, Tournesol, Kaiser Kroon, Imperator Rubrorum, Tournesol yellow. 2d, W. N. Lintern, gr. to Wm. Butler, Esq., with some good examples of Queen of Hyacinths, General Havelock, Mont Blanc, King of Blues; also some well grown Tulips. 3d, Mr. W. C. Taggett.

Twelve Hyacinths, distinct varieties.—1st, Mr. Gastrell, gr. to A. Jones, Esq.; 2d, Mr. H. Lintern, gr. to Wm. Butler, Esq.; 3d, Mr. Wm. Fox, gr. to Mrs. Harle.

Six Hyacinths, distinct varieties.—1st, Mr. Josh. Gastrell, gr. to A. Jones, Esq.; 2d, Mr. W. Fox.

Four pots, single Tulips.—1st, Mr. W. Fox; 2d, Mr. Lintern.

Four pots double Tulips.—1st, Mr. Fox; 2d, Mr. Lintern.

Four pots Vermilion Brilliant.—1st, Mr. Lintern; 2d, Mr. Fox.

Banks of plants arranged for effect on a space 12 feet by 7 feet.—These were composed of Orchids, stove and greenhouse plants, interspersed with fine-foliated plants and Ferns, and although somewhat flat and formal, had a very gay effect (open). 1st, H. C. Miles, Esq. (gr. Mr. F. Perry) (Silver Cup); 2d, James Derham, Esq. (gr.

Mr. W. Rye), 4 guineas; 3d, Messrs. Maule & Son. Three pots Amaryllis.—1st, Mr. C. Taggett.

For the best bunch of Grapes, Mr. F. Nichol, gr. to Mrs. Miller, was placed 1st, with a good bunch of Lady Downe's; and Mr. Loosenore, gr. to W. Cooper, Esq., 2d, with the same variety, better in colour than the former, but somewhat shrivelled. For the best dish of Pears, Mr. J. Marshall, gr. to Mark Whitwell, Esq., was 1st, with an excellent dish of Easter Beurré; Mr. J. Stapleton, gr. to H. Mardow, Esq., 2d; and Mr. W. Rye, 3d. For the best dish of Apples the 1st prize was awarded to Mr. E. T. Hill for a highly coloured plump dish of Blenheim Orange; the 2d to Mr. H. Bannister, gr. to H. St. Vincent Ames, Esq.; 3d, Mr. J. Marshall.

For the best arranged vase of flowers there was a keen competition, as also for buttonhole bouquets. In the former class Mr. E. T. Miller was 1st, with a well arranged stand, although the flowers were somewhat too crowded at the base. Mr. E. S. Cole was 2d, and Mr. Mark Hutchings, 3d; and for the buttonhole bouquets, Mr. E. S. Cole, gr. to W. Pethwick, Esq., was 1st.

For the best specimen Orchid, for which a Banksian Silver Medal from the Royal Horticultural Society was awarded to Mr. E. Miller, for a nicely flowered Phalaenopsis Schilleriana with over sixty expanded flowers; Mr. Rye being a good 2d with a nice pan of Cologney cristata, 3 feet in diameter; Mr. Nichol being 3d with the same species. The ornamental foliated plants were represented by some grand specimens of Crotons—Weismanni, interruptus, Youngii and variegatus; Latania borbonica, Areca sapida, Cycas revoluta, Alocasia metallica, Dracena Morreana, and others.—Mr. Rye being placed 1st; Mr. R. Morse, gr. to S. Budgett, Esq., 2d; and Mr. T. Edwards, gr. to J. Lysaght, Esq., 3d. For the best collection of stove and greenhouse plants, there were some neat plants staged, consisting of Clerodendron Balfourianum, Clivia polygala.—Mr. F. Perry being 1st, Mr. H. Hancock, gr. to A. W. Summers, Esq., 2d; and Mr. Fox, 3d. The Azaleas were not largely represented, although some neat and well flowered specimens were staged, the chief prizes being awarded to Messrs. F. Perry, H. C. Taggett, A. Hancock, H. Spry, gr. to J. Gibson, Esq., H. Lintern, and R. Morse, gr. to S. Budgett, Esq. For hand bouquets, Messrs. E. S. Cole, M. Hookings, and E. Miller, were awarded prizes for some very choice and tastefully arranged examples. Messrs. Parker & Sons also exhibited (not for competition), some elaborate specimens of bridal and ballroom bouquets. Pots of Lily of the Valley, as well as Cyclamens, were exceedingly well done, as were also Mignonette and Primula. A few good stands of cut Roses were also well shown, especially those exhibited by Mr. Wm. Taylor, gr. to Alderman Chaffin, Esq., of Bath. I must not omit to mention the splendid display of Hyacinths contributed by Messrs. Garaway of the Durdham Down Nursery, which comprised some magnificent examples of all the leading kinds. A treble-spated Anem was also shown by the same firm. In this instance two of the spathes were large and equally developed, while a third could just be distinguished between these.

Advantage was taken at this large gathering of the lovers of horticulture to present to Mr. George Webley, who has just resigned the post of Hon. Secretary to the Society after sixteen years' hard and most successful work, an illuminated address, accompanied by a silver cake-basket, fruit-spoons, and album, as a mark of their sincere regard for him, and as a small acknowledgment of his valuable services. T. S. C.

March 19.—Fine bright day and night.

20.—Dull, but fine.

21.—Dull and windy.

22.—Snow fell from early morning till 10 A.M., to the depth of 4 inches. Fine afternoon; sun shining at times.

23.—Fine bright morning, dull afterwards.

24.—Fine and bright mostly.

25.—Very fine bright morning; dull afternoon.

LONDON: *Atmospheric Pressure.*—During the week ending March 21, the reading of the barometer at the level of the sea decreased from 30.54 inches at the beginning of the week to 30.44 inches by 5 P.M. on the 15th, increased to 30.59 inches by 9 A.M. on the 16th, decreased to 29.60 inches by 1 P.M. on the 18th, increased to 30.09 inches by 9 A.M. on the 19th, decreased to 30.08 inches by 1 P.M. and increased to 30.13 inches by 5 P.M. on the same day, decreased to 29.72 inches by 5 P.M. on the 20th, increased to 29.90 inches by 9 A.M. on the 21st, and was 29.87 inches by the end of the week.

The mean reading of the barometer for the week was 30.05 inches, being 0.28 inch lower than last week, and 0.15 inch above the average of the week.

*Temperature.*—The highest temperature in the shade in the week was 58° on the 20th; the highest temperature on the 19th was 44°.7. The mean of the seven high day temperatures was 50°.

The lowest temperature was 26° on the 15th; on the 21st the lowest temperature was 40°.5. The mean of the seven low night temperatures was 32°.2.

The greatest range of temperature in one day was 26°.5, on the 20th; the smallest was 5°.5, on the 21st. The mean of the seven daily ranges was 17°.8.

The mean temperatures were—on the 15th, 37°.3; on the 16th, 39°.4; on the 17th, 42°.3; on the 18th, 41°.5; on the 19th, 36°.5; on the 20th, 45°.7; on the 21st, 41°.7; and these were all below their averages (excepting the 17th and 20th, which were 0°.7 and 4° above) by 4°.1, 2°.1, 0°.2, 5°.2, and 0°.1 respectively.

The mean temperature of the week was 40°.6, being 3°.3 higher than last week, and 1° below the average.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 112°, on the 15th and 17th. The mean of the seven readings was 96°.3.

The lowest reading of a minimum thermometer with its bulb placed on grass was 21°, on the 15th. The mean of the seven readings was 26°.3.

*Rain.* 0.05 inch fell on the 18th.

ENGLAND: *Temperature.*—During the week ending March 21, the highest temperatures were 59°.2 at Cambridge, 58° at Blackheath, 57° at Plymouth; the highest at Preston was 49°, at Liverpool 49°.3, at Bolton 49°.8. The general mean was 53°.8.

The lowest temperatures were 24°.5 at Cambridge, 25°.6 at Wolverhampton, 26° at Blackheath; the lowest at Liverpool was 32°.4, at Brighton 31°.3, at Bristol 30°.5. The general mean was 29°.

The greatest ranges were 34°.7 at Cambridge, 32° at Blackheath, 29° 9 at Wolverhampton; the smallest ranges were 16°.9 at Liverpool, 18° at Preston, 19°.4 at Brighton. The general mean was 24°.8.

The mean of the seven high day temperatures was highest at Sheffield, 53°.3, at Cambridge 52°.9, at Truro 51°.6; and was lowest at Bolton and Sunderland, 45°.8, at Liverpool 46°. The general mean was 49°.3.

The mean of the seven low night temperatures was highest at Liverpool and Preston, 36°.1, at Truro 36°; and was lowest at Cambridge, 30°.5, at Wolverhampton 31°, at Hull 31°.6. The general mean was 33°.9.

The mean daily range was greatest at Cambridge, 22°.4, at Wolverhampton 19°.3, at Sheffield 19°.2; and was least at Hull, 9°, at Liverpool 9°.9, at Preston 10°.5. The general mean was 15°.4.

The mean temperature was highest at Truro and Sheffield, 42°.7, at Preston 42°.2; and was lowest at Bolton, 37°.8, at Wolverhampton 39°, at Sunderland 39°.3. The general mean was 40°.6.

*Rain.*—The largest falls were 0.90 inch at Bolton, 0.81 inch at Brighton, 0.58 inch at Preston; the smallest falls were 0.01 inch at Plymouth and Bristol, 0.05 inch at Blackheath. The general mean fall was 0.26 inch.

SCOTLAND: *Temperature.*—During the week ending March 21, the highest temperature was 59°, at Glasgow; at Paisley the highest was 51°.3. The general mean was 53°.6.

The lowest temperature in the week was 20°, at Greenock; at Leith the lowest temperature was 31°.7. The general mean was 27°.9.

The mean temperature was highest at Edinburgh and Aberdeen, 42°.1; and lowest at Greenock, 40°.1. The general mean was 41°.5.

*Rain.*—The largest fall was 0.65 inch, at Greenock; and the smallest fall was 0.15 inch, at Dundee. The general mean fall was 0.30 inch.

JAMES GLAISHER, F.R.S.

## Obituary.

WE regret to hear of the death of Mr. F. W. WILSON, at the comparatively early age of fifty-one. He was for many years superintendent of the shows at the Crystal Palace, and all who knew him at that time will remember how indefatigable he was, and the wonderful good temper he displayed in moments of worry and anxiety.

## Answers to Correspondents.

\*\* Correspondents are informed that, owing to the arrangements for Easter week all communications intended for publication must be sent not later than March 31.

CAMELLIA LEAVES DISEASED: *Waterside.* We are unable to offer any satisfactory explanation of the numerous brown spots on the Camellia leaves. We have seen like spots caused by a fungus named *Pestalozzia Guepini*. In your case, however, we cannot detect any fungus spores. For a description of a very similar disease in Palms, with illustrations of species of *Pestalozzia*, see the *Gardeners' Chronicle* for October 4, 1884. In default of a full knowledge of the ailment, we can only recommend the removal and burning of the leaves as soon as the disease-patches begin to show. *W. G. Smith.*

DISEASED PEACH TREE. *Arbre.* Apparently a case of gumming, but from what cause is not evident.

LAWN TENNIS COURT: *H.* There is no harm done by the ground having been much trodden, rather good if the land be light and well-drained. It can be best laid with turf from an old pasture, as free as it can be got from weeds. Lawn Sand applied after the turf has begun to grow will encourage the grasses, thereby choking the other vegetation, which will then gradually die out. For the mixture of grass seeds suited to your soil and requirements, apply to a respectable nurseryman, but do not purchase the Rye-grass with the other seeds, as this is best sown by itself first and hoed in lightly; the other seed can then be sown and lightly raked in, and the ground rolled evenly afterwards. The Rye will cover the ground and shade the weaker grasses for the first year, after which it will die out, leaving the perennial grasses to form the sward.

NAMES OF PLANTS: *F. C. T.* Camellia paeoniflora rosea.—*G. K. Gude.* Eucalyptus globulus; Cytisus racemosus; Carex, next week.—*A. Chapman.* 1. Scilla sibirica; 2. S. bifolia; 3. not recognised.—*W. M. B.* Gaultheria Shallon.—*W. Leighton.* Aeschynanthus splendens.—*W. Collett.* Grevillea Manglesi; Rhododendron, perhaps Countess of Haddington.—*J. Willis.* Dendrobium chrysotomum, Epidendrum Stamfordianum. The seed-pod of your Odontoglossum grande will be engraved, and figured in our columns shortly.

PRIZE SCHEDULE, &c.: *G. C. I.* Unless the schedule states that no hardy plant may be shown as a greenhouse plant, you should be able to put up Clematis Miss Bateman. 2. Not later than six weeks in advance of the date.

QUOTATIONS FROM BOOKS, &c.: *C. Ford.* If you fully acknowledge the source from which the quotations are taken, that is all that is required, unless you quote in a wholesale manner, when, unless you have obtained permission, your acts would become unlawful. The rule to follow is "Do unto others," &c.

"TRANSACTIONS OF THE BOTANICAL SOCIETY OF EDINBURGH" (vol. xiv., part 3): *Dis.* This can be obtained through the Treasurer, Mr. P. Neil Fraser, Old Fishmarket Close, Edinburgh.

WINDOW-BOX PLANTS TO BLOOM FROM APRIL TO JUNE: *John M. G.* Pansies, fancy and self; Lobelia erinus in variety; Regal Pelargoniums; zonal ditto; shrubby varieties of Calceolarias; Azaleas, Indian, Ghent, and mollis species; early-flowering Pinks; Wallflowers in variety, single and double; Ivy-leaf, sweet-scented, and tricolor Pelargoniums; Mignonette; the old single yellow Auricula, and alpine varieties; Cinerarias; Dactylis procumbens; Lysimachia nummularia; Saxifraga sarmentosa. All of these are best obtained from a florist's, in a forward state, just about to bloom. Dwarf coniferous and evergreen plants, to mix up with the flowering plants, if desired, can be obtained in great variety from the same source.

## SEEDS.

LONDON: March 26.—Messrs. John Shaw & Sons, of 37, Mark-Lane, report that an active sowing demand now prevails for field seeds, but the business passing this season is not so large as usual. Prices all round show no improvement, however, every description continuing exceedingly cheap; available supplies are meantime feeling the inroads made upon them, and values generally, it is thought, have seen their lowest point. Clover seed maintains the firm tone previously noted. Ther eis an improved inquiry for Italian and perennial Rye grasses. Canary and Hemp seed are without variation, the business passing being small. Spring tares offer more freely. Good black Rape seed is in short supply.

## POTATOS.

The Borough Market report states that supplies are more than adequate to demand, which is dull. Quotations—Scotch Regents, 85s. to 95s.; Kent ditto, 75s. to 90s.; Champions, 45s. to 60s.; Magnum Bonums, 60s. to 80s.; and Victorias, 70s. to 90s. per ton.—The imports into London last week consisted of 27 bags from Boulogne, 755 from Hamburg, and 55 from Rotterdam.

Government Stock.—Consols closed on Monday at 97½ to 97½ for delivery, and 97½ to 97½ for the account. Tuesday's figures were 97½ to 97½ for delivery and the account. The closing quotations on Wednesday were 97 to 97½ for both account and delivery, Thursday's final figures were 96½ to 97 for the double quotation.

# NATIVE GUANO.

Extracts from the Ninth Annual Collection of Testimonials from persons who have used this  
Manure for Farm and Garden Crops:—

## ROOTS, GRAIN, GRASS, &c.

GEORGE STONE, *Cashio Bridge Farm, Watford.*

February 19, 1885.

"Used for Swedes on plants at the rate of about 6 cwt. per acre. Results: I was very well satisfied, considering the long time we were without rain; the Swedes were quite as good or better than some in the same field with more expensive manures. I have used your Native Guano for Swedes and white Turnips, and have a very good crop for the season. Kindly send me 3 toos at your earliest convenience, and oblige."

JAMES KITLEY, *Farm Steward to the Right Hon. Lord Derby, Witley Park, Haslemere.*

January 24, 1885.

"Used for Tares, at the rate of 4 cwt. per acre. Results: Very good."

ROBERT CRAWLEY, *Chelveston, near Higham Ferrers.*

January 20, 1885.

"Used for Wheat, Oats, Barley, Clover, and grass, at the rate of from 2½ to 5 cwt. per acre (according to the condition of the land, which was cold clay), with good results; had quite 5 cwt. of hay more per acre. Your manure, if as good as last year's, is the best I have ever used, except guano. All other manures are land damagers—they doctor the land for a time, afterwards they require a physician."

WM. GEO. ELLIOTT, *Aston Abbots, Aylesbury.*

February 1, 1885.

"Used for Oats grown after seed Tares at the rate of 7 cwt. per acre. Results: Very good; about 12½ qr. per acre. Being grown against the road, it was generally remarked what a fine piece of corn it was, and I have no doubt will be the cause of several of my neighbours using it this season."

JAMES SOMES, *Bailiff, Yelden Estate, Higham Ferrers.*

February 3, 1885.

"Used for Oats and roots, at the rate of 4 cwt. per acre for roots, and 2 cwt. for Oats, with farmyard manure. Results: Exceedingly good for crops. I was very pleased with your manure, and we intend using it largely this year."

JOSEPH FRANKLIN, *Scotsgrave, Thame.*

February 18, 1885.

"Used for grass and Mangel Wurzel, at the rate of 6 to 8 cwt. per acre. Results: Very good."

A. C. HILLS, *Marston, Oxford.*

February 7, 1885.

"Used for Mangel Wurzel, at the rate of 5 cwt. per acre, with plenty of ash. Results: A splendid crop. I think a lot of ash with the Guano does a deal of good."

J. SHRIMPTON, *Great Hasely, Tetworth, Oxford.*

February 5, 1885.

"Used for Swedes and Turnips, without farmyard manure, at the rate of 4 cwt. mixed with ashes. Results: Gave good satisfaction, the Turnips being a very good crop indeed. The Swedes were a good plant, but owing to the dryness of the season and severe attacks of blight did not finish up so well. I shall be a customer again this season."

C. BFESON, *Glory Farm, Amersham.*

February 9, 1885.

"Used for Mangel at the rate of 6 cwt. per acre. Results: Very good. I have given my opinions on your manure previously."

JOHN A. WILLIAMS, *Alderminster Lodge, Stratford-on-Avon.*

January 26, 1885.

"My first experience with your manure has been confirmed during the past year. It seems especially valuable and economical when used for roots."

## POTATOS and KITCHEN GARDEN CROPS.

G. WHEELER, *Bourne End.*

February 2, 1885.

"Used for Potatoes at the rate of 16 cwt. per acre. Results: Tubers much finer and quantity considerably larger than any other manures I ever tried. I consider your manure the best possible, as it supplies the tubers when most needed, without a tendency to rot them."

JACOB ROBINSON, *Beyton Green, Bury St. Edmunds.*

February 9, 1885.

"Used for Potatoes at the rate of 10 cwt. per acre. Results: Most satisfactory: no other manure whatever used. My method of applying is to sow broadcast immediately in front of the hands engaged in moulding up."

J. SMITH, *Head Gardener to the Right Hon. Lord Rosebery,*

*Mentmore, Bucks.*

January 28, 1885.

"Used for Peas, Onions, Lettuce, Cabbages, Potatoes, Turnips, and fruit trees. Results: Onions, a splendid crop; other crops, where used, most satisfactory. As a surface-dressing I consider your Native Guano most useful. Peas seemed to derive much benefit from the dressing."

JAMES DART, *Gardener to the Right Hon. Lord Carlingford, K.P., The Priory, Chewton Mendip, Bath.*

February 9, 1885.

"The Native Guano I received from your firm in 1884; instead of using it dry I used it as liquid in large tubs to plants of many sorts: in pots; also Roses, Cucumbers, Marrows, and many other things, and I was quite satisfied with it."

THOMAS HAMILTON, *Gardener to the Right Hon. Viscount Hood, Lynwood, Sunningdale, Ascot.*

January 28, 1885.

"Used for Tomatoes, Cucumbers, and soft-wooded plants in general. Results: Very good. As we had only a cwt. bag, can-generally purposes is very good."

THOMAS HENRY HILL, *The Gardens, Durward, Witham.*

January 24, 1885.

"Used for Potatoes, Onions, Beet, and Carrots, at the rate of 8 cwt. per acre. Results: Very good indeed. I can report again on the excellency of your Native Guano. I use no other artificial manure. All I used it for did very well, considering the dry season we had."

H. CAKEBREAD, *Head Gardener to Sir Philip Rose, Bart.,*

*Reyners, Bucks.*

January 28, 1885.

"Used for Potatoes, Peas, Beans, and all kinds of winter Greens, Vines, Peaches, and Pot Plants. Results: Satisfactory in all cases. Without doubt your Native Guano is a very stimulating manure, and especially for all green crops. I am of opinion, to thoroughly prove any kind of artificial manure on the same piece of ground, one row should be manured and the next left, i.e., every alternate row only done."

JAMES SAYERS, *Gardener to Frank Snod, Esq., The Firs,*

*Old Charlton, Kent.*

January 26, 1885.

"Used for Peas, Beans, Potatoes, Cabbage, Cauliflowers, Celery, Lettuce, Radish, Endive, Cucumbers, Tomatoes, &c., and Fruit Trees, also Stove, Greenhouse, and Conservatory. Results: Very satisfactory. I consider it a first-rate manure for all these purposes. I think the Native Guano only requires to be better known to be much more largely used."

E. S. WILES, *The Gardens, Edgercote, Banbury.*

January 26, 1885.

"Used for Melons, Cucumbers, Peas, Onions, and Pot Plants. Results: Good on all—Melons, Cucumbers, Peas, and Pot Plants in particular. The Native Guano supplied to me last year was very good, and as a cheap manure I highly recommend it."

## VINES, STRAWBERRIES, LAWNS, FRUIT TREES and FLOWERS.

ISABELLA MECHI, *The Limes, Earls Colne, Essex.*

February, 1885.

"Used for all kinds of vegetables, and young fruit trees, with satisfactory results. On pot plants the effects are very marked, producing a brilliant green foliage, and enabling them to resist greenfly. I have no doubt whatever of the fertilising qualities of Native Guano."

Dr. CHAS. A. BURGHARDT, *Delamere, Alderley Edge,*

*Cheshire.*

February 9, 1885.

"Used for Peas, Cauliflowers, Strawberries, Cabbages, and grass. Quantity used: well dusted over surface for grass; well dusted over surface and forked in for other crops. Results: The Strawberries were excellent in quality and larger in size than usual, the Peas and other vegetables were much improved by this manure, in fact the Brussels Sprouts were earlier and finer than I have seen them for some years. No other manure used on grass, ordinary farmyard manure on Strawberries, as I always have used it. I consider the manure you sent me most excellent for grass, lawns are much improved by the use of it, the grass growing much quicker and having a much better colour than before."

Col. the Hon. W. P. TALBOT, *Glenhurst, Esher.*

January 27, 1885.

"Used for all sorts of flowers, fruit, and vegetables, in and out of houses. I have used it principally on small patches of ground and in the houses in pots, but my gardener tells me he supposes about 2 cwt. to the acre. Results: Very good; won a great number of prizes at South Kensington, Richmond, and other shows with fruit, flowers, and vegetables grown with it."

General BOILEAU, *Bognor.*

January 24, 1885.

"Used for almost all garden crops, Peas, Beans, Lettuce, Asparagus, Tomatoes, Carrots, Turnips, Salsify, &c., Strawberries. Results: Very good, with all vegetables, fruit, &c."

WILLIAM APPLETON, *Sipton, Slough.*

Feb. 5, 1885.

"Used for Strawberries at the rate of half a ton per acre. Results: Season very dry; not a fair trial; where used the Strawberries were more free from mildew."

J. E. HAINSWORTH, *Dewsbury.*

January 29, 1885.

"Used for Vines. Results: Great improvement. I think the manure good for many kinds of things—Roses, Geraniums. I have used it for Camellias that have not bloomed for a long time without retreating. Crops this year good: Peaches, Figs, Nectarines. It must be used with reason."

W. PATERSON, *Beech Grove, Sydenham Hill.*

February 9, 1885.

"Used for lawns, vegetables, Vines, flowers; grass thickly covered with the Guano (probably at half a ton per acre). Results: Very satisfactory. Having used your Guano for twelve years, I have no hesitation in saying that it has always answered well, and that my gardeners say they could not do without it, more especially for my grass slopes and lawns."

C. L. NICHOLSON, *Thatched House Club, St. James's,*

*London.*

January 24, 1885.

"Used for lawn. Results: Excellent. Marking out the area over which I used the manure, the crop of fine new grass compared most favourably with that portion of the lawn over which ordinary manure was applied. Our gardener desires a larger supply this season."

A. MARGETSON, *Victor Road, Teddington.*

January 31, 1885.

"Used for Beet, Onions, Lettuce, Celery, Turnips, Endive, Roses, Pelargoniums, Primulas, Cinerarias, Tomatoes. The results have been greatly to my satisfaction, especially in cases of Roses, Beet, and Celery. I have tried all other manures, but, considering the price you charge, I shall recommend it to all my friends."

At the Birmingham Show, 1884, Nineteen Prizes were taken by Exhibitors who used Native Guano.

PRICE £3 10s. PER TON, in Bags, at the RAILWAY STATION, AYLESBURY.

Pamphlets of Testimonials and all other particulars may be obtained on application to the Secretary of the

NATIVE GUANO COMPANY, LIMITED,  
29, NEW BRIDGE STREET, BLACKFRIARS, LONDON, E.C.

MESSINGER & CO.'S GREENHOUSES are constructed so as to obtain, with the least obstruction to light and sun, the greatest Strength and Rigidity. The best Materials and Workmanship, at prices which, owing to their facilities, defy competition.

## RANSOMES' LAWN MOWERS.

### THE "WORLD" LAWN MOWERS

are the best for cutting long grass, and are constructed on the  
American system with the special advantages of English  
materials and workmanship.

They are made in nine sizes, 8 to 24 inches.

Prices from 45s. to £10.

### THE "REVERSIBLE" LAWN MOWERS

are suitable for small gardens and borders. They roll the  
grass as well as cut it, and can be used either side upwards.

They are made in three sizes, 6 to 10 inches.

Prices from 27s. to 45s.

### THE "AUTOMATON" LAWN MOWERS

are the best machines for general purposes and gardeners' use.  
They leave no ribs in the grass but produce a perfect surface.

They are made in eight sizes, 8 to 22 inches.

Prices from 55s. to £3 10s.

### THE HORSE-POWER MOWERS

are the best for Large Lawns, Cricket and Lawn Tennis Clubs.  
They are used on the Cricket Grounds of the Oxford and Edin-  
burgh Universities and numerous Colleges and Public Schools.  
They are made in six sizes, 26 to 48 inches.

Prices from £14 10s. to £32.

Complete Price *LISTS* may be obtained from any respectable Ironmonger, or

**RANSOMES, SIMS & JEFFERIES (Ld.), IPSWICH.**

**WROUGHT-IRON TUBULAR**  
**HOT-WATER BOILERS,**  
And others with SHELVES, and Ho'w or Ordinary Cast-iron  
GRATE BARS;  
**SADDLE BOILERS.**  
With WATERWAY BACKS, and WELDED BOILERS,  
which are Specially adapted for Heating Greenhouses, Conser-  
vatories, Churches, Chapels, Schools, Public Buildings, Entrance  
Halls, Warehouses, Workshops, &c.  
They are the neatest, cheapest, most effective, and durable  
of any extant.  
The Tubular ones are remarkable for their great heating  
power, slow combustion, and the length of time the fire will  
burn without requiring attention. This pattern  
Had the First and Highest Prize, a Silver Medal,  
Awarded to it at the Royal Horticultural Society's Exhibition,  
South Kensington, London, on June 3 1884.

The Journal of Horticulture of June 9 says:—  
"HEATING APPARATUS—A great number of boilers, valves,  
&c., were exhibited by eight competitors, and considerable in-  
terest was manifested to the verdict of the judges, and much  
discussion was brought to bear on the merits and shortcomings  
of the different boilers. The apparatus for which the Silver  
Medal was awarded was a wrought-iron saddle boiler, with a  
series of intersecting tubes, somewhat in the form of a letter X,  
but the tubes in ogee form, in the crown of the boiler. Most  
gardeners who examined the boiler expressed a favourable  
opinion of it. It is no doubt a quick and powerful boiler with-  
out being complex, the latter condition having, no doubt, had  
weight with the judges."

The Garden of June 11 says:—  
"The premier prize, a Silver Medal, was taken by Messrs.  
Green & Son for their new patent tubular saddle boiler. It is a  
modification of their original patent, the boiler being longer and  
not so high. It is found to be a powerful and efficient boiler, and  
heats a large quantity of water quickly with a small consumption  
of fuel."  
Descriptive Illustrated Price List may be had free on application.  
Estimates given for all kinds of Heating Apparatus, and Hot-  
water Fittings of every variety supplied on the shortest notice.

FOLLOWS AND BATE (Limited), beg to direct attention to the variety of LAWN MOWERS they manufacture, all of which are made of the best materials, and with due regard to those essential points necessary to ensure durability as well as PERFECTION IN WORKING. The large demand that has existed for several years for their Machines (which are sold by all respectable Ironmongers), together with the highest distinctions gained by them in various International Exhibitions and Public Contests—including Paris, Vienna, Brussels, London, Birmingham, Manchester, Liverpool, Wigan, &c.—sufficiently attest their merits.

Complete Illustrated Horticultural List now ready—Post-free.  
**FOLLOWS & BATE (Limited), Dutton Street Works, Manchester.**

## BUY ONLY ENGLISH THREE-QUARTER PLATE WATCHES.

**BENSON'S NEW PATENT (No. 4658)  
 "LUDGATE" WATCH.**

SILVER, £5 5s. GOLD, £12 12s.

Is a "Special Strength" Silver English Lever, my best London make, with Three-quarter Plate Movement.

*Twee led throughout.  
 Chronometer balance, with damp and dust proof  
 Patent ring band, and extended barrel, in  
 Massive sterling silver dome cases  
 With crystal glass front.  
 Winding, set hands and opens at back.*

The superiority in value, accuracy, and durability of the "Ludgate" Watch over the Swiss and American Keyless and Non-keyless Watches, made in imitation of and sold as English work, and the ordinary Full-plate English Watch is enormous. The "Ludgate" Watch is compact, strong, handsome, and durable. Being Three Quarter Plate, it is superior in value and appearance to any £10 Watch sold, and, being compensated, it keeps perfect time; fitted with crystal front, it combines the strength of the Hunter, and convenience of the open face. Of my best London make, it will last a lifetime, stand rough usage of all and every kind without damage, and, being made in three sizes, it is for the above reasons suited for Home, Indian, and Colonial use by

Gardeners, Workmen, and Gentlemen.

*The "Ludgate" Watch is far superior  
 To any Watch at the price yet made, and  
 Will be sent free and safe at our risk.  
 To all parts of the world for £5 5s.,  
 Cash or P.O.O.; or in hunting cases, £6 6s.  
 Price in 18-carat gold, crystal glass cases,  
 Twelve Guineas*

**SPECIAL NOTE** that J. W. BENSON is the only Maker of a Three Quarter Plate English Watch for £5 5s in Silver, or £12 12s. in Gold, and that our Patent "Ludgate" Watch cannot be had through or of any Watchmaker in the Kingdom. Any infringement of the Patent Rights will be proceeded against. A Book explaining the advantages of this Watch over the Full-plate English Watches sold by all other makers, will be sent Post-free on application to

**J. W. BENSON**

Watchmaker to Her Majesty the Queen. The Steam Factory,  
 62 and 64, Ludgate Hill, E.C.  
 Illustrated Pamphlets of Watches from £2 to £500, Gold and Silver Jewellery, Clocks (House, Chime, and Turlet), and Musical Boxes, free on application.

Oil Paint no Longer Necessary.

**HILL AND SMITH'S BLACK VARNISH,**  
 for Preserving Ironwork, Wood, or Stone.  
 (Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received. Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.

"Pierrefield Park, June 21, 1876.—Sirs.—I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chepstow.—I am, Sirs, yours respectfully, Wm. Cox."

**CAUTION.**—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large illustrated CATALOGUE of Fencing Hurdles, Field and Entrance Gates, &c., sent free on application to

**TO FLORISTS, &c.**—Situation wanted by a young Lady; thoroughly experienced, and able to take Management. Undeniable references.—T., 10, Saunderson's Terrace, Kensal Green, W.

**PAINTER and GLAZIER, in a Nursery or Nobleman's Garden.**—Married; practical; understands Hot-water Work. Can fill up time in Houses, having had practical experience in the profession.—STEADWALL, Worthen, Shrewsbury.

**GRATEFUL-COMFORTING.**  
**EPPS'S COCOA.**  
**BREAKFAST.**

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." *Civil Service Gazette*.

Made simply with boiling water or milk. Sold only in Packets, labelled thus:—  
**JAMES EPPS & CO., Homoeopathic Chemists, London.**

**Further proof (this week) that Consumption and Asthma are always relieved by**

**DR. LOCOCK'S PULMONIC WAFERS.**  
Mr. PEARCE, M.P.S., 217, Athol Street, Liverpool, writes:—A lady stated to me that Dr. Locock's Pulmonic Wafers were the only thing that gave ease to her daughter, suffering from Consumption. This is only one case of many I could mention. Dr. Locock's Wafers instantly relieve and rapidly cure Asthma, Consumption, Bronchitis, Coughs, Colds, Shortness of Breath, Phlegm, Pains in the Chest, Rheumatism, and taste pleasantly. Sold at 1s. 1/2d., 2s. 9d., 4s. 6d., and 11s. per box by all Druggists.

**HOLLOWAY'S PILLS.**—These admirable Pills cannot be too highly appreciated for the wholesome power they exert over all disorders of the stomach, liver, bowels, and kidneys. They instantaneously remove impurities and steadily work out a thorough cure, and in its course dispel headache, biliousness, flatulence, and depression of spirits. It is wonderful to watch the daily improvement of the complexion as Holloway's Pills purify the blood and restore plumpness to the face which had lost both flesh and colour. These Pills combine every excellence desirable in a domestic remedy. The most certain and beneficial results flow from the occasional use of this medicine; even persons in health, or when following sedentary occupations, will find it an invaluable agent.

# EXTRACTS.

From the "Daily Telegraph" of  
March 20, 1885.

FOLKESTONE WINTER GARDEN.—The South-Eastern Railway Company's Hotel at Folkestone has been greatly improved by the construction of a well-appointed winter garden, which will be open for the use of visitors on the 1st of next month. With a frontage of 168 feet, a width of 51 feet, and constructed on the "ridge and furrow" principle, the building consists of seven spans, the centre one being surmounted by an octagonal lantern rising to a height of 43 feet. Along the ridge of each roof an iron cresting is placed, finished at the ends with an ornamental finial. The front and one end consist of moulded pilasters with ornamental transom and cornice, the former being relieved at each pilaster, while shaped consoles are placed on the mullions between the cornice and the transom. The bottom portion is filled with sashes sliding on brass rollers, and the top with fan-lights. There are three entrances, each with a vestibule. One of these is directly connected with the hotel by a glass corridor, thus enabling visitors to enter the winter garden without exposure to the weather. A bed for plants, with moulded edging, runs all round the building, and the heating apparatus is so regulated and arranged that an even temperature can be always maintained.

From the "Standard" of  
March 19, 1885.

WINTER GARDEN AT FOLKESTONE.—A spacious "Winter Garden" has just been erected for the South-Eastern Railway Company at their Royal Pavilion Hotel, Folkestone. The building, which is now completed, has a frontage of about 168 feet, and a width of 51 feet. It has three entrances, each of which has a vestibule, one being connected to the hotel by a glass corridor, enabling visitors to enter the Winter Garden from the Hotel without exposure to the weather. A bed for plants, with moulded edging, runs all round the building. In front of the bed and through the centre of the building are hot-water pipes, laid in four brick chambers, covered with ornamental gratings. In each of these chambers there are six 4-inch pipes, running the whole length of the building and across the two ends, the apparatus being so arranged that the heat can be regulated at pleasure, thus enabling an even temperature to be maintained in any weather. The Garden will be open for the use of residents in the Hotel on Wednesday, the 1st of April.

March 20, 1885.

A WINTER GARDEN AT FOLKESTONE.—A spacious Winter Garden has just been erected for the South-Eastern Railway Company at their Royal Pavilion Hotel, Folkestone. The building, which is now completed, is a spacious one, having a frontage of about 168 feet and a width of 51 feet. It is built on the "ridge-and-furrow" principle, and consists of seven spans, two of 16 feet each, four of 22 feet each, and a centre span of 31 feet, surmounted by an octagonal lantern, running to a height of 43 feet. All the roofs are hipped back at each end, and an iron cresting runs along the ridges, finished at the ends with an ornamental finial. The whole of the work has been carried out by Messrs. Weeks & Co., Horticultural Builders and Hot-water Engineers, of Chelsea, about 110 tons of prepared wood, glass, and ironwork having been sent from their works for its construction. The gardens will be open for the use of residents in the hotel on Wednesday, April 1.

This Winter Garden was designed and has been erected by  
**J. WEEKS & CO., Horticultural Engineers, King's Road, Chelsea, S.W.,**  
and will be opened on April 1, 1885.

## THE FRUIT OF THE FUTURE.

### NEW MAGNIFICENT BLACKBERRY, "THE WILSON JUNR."

In spite of the fact that Blackberries will grow "anywhere" in reason, and everybody likes them, it is yet a puzzling reality that it is only with great difficulty and at a high figure that we can purchase them in our markets.

Surely, then, it must be apparent to all farseeing "fruit growers" that instead of glutting the markets with Gooseberries, Currants, &c., they have here a fruit which, if planted upon any given area of land, will prove far more profitable than any other hardy fruit that could be grown. And why? Simply because for half-a-dozen years ahead, at least, the stock throughout the country will not have time to become so great as to exceed the demand.

Landowners, Stewards, and Gardeners, who have each year to show a balance-sheet "of profits," have here a very simple, safe method of for some years obtaining highly profitable results. Planted 3 feet by 8 feet requires at the rate of 18½ plants to an acre.

Gardeners also who grow for house consumption will find this fruit a valuable assistant. It will stand any treatment, and do well where other fruits would fail.

Whilst, however, we have the matter under consideration, do not let us fall into the mistake of planting any variety so long as it is a "Blackberry." Why not, for the sake of a slightly additional first expense, obtain the very "cream" of the family; or in other words, procure stocks of the hardiest, largest, most delicious, and most productive?

By pursuing this procedure the result repays the grower tenfold for the slightly additional first expense incurred.

It was this reasoning that caused us to give the subject our most careful study; the result of which is, we offer a variety, the grandest of the group, producing enormous berries, measuring on an average 3¼ inches around, lengthwise, and the same dimensions crosswise. (This will give an idea of the profit to be derived from its culture as a market commodity.) The berries are also glossy black, very early, of exquisite flavour, and enormously productive—the heavy load of fruit often bending the canes to the very ground.

We can offer plants of this grand variety at 1s. 3d. each, 12s. per dozen, 85s. per 100, carriage paid.

We can offer other varieties as follows:—"LAWTON," "KITTA-TINNY," "PARSLEY-LEAVED" (*Rubus fruticosus laciniosus*), WILSON'S EARLY, at 9d. each, 8s. 6d. per dozen, 63s. per 100.

After this date (March 12) we advise our numerous Patrons for the "Wilson Junior Blackberry" to give us the option of Autumn Delivery. We have, however, every reason to believe that there is a certainty of delivery in time this spring.

Not less than 500 at 1000 price.

HOWCROFT & WATKINS, COVENT GARDEN, LONDON, W.C.

TO show how well pleased even the East Indians are with what we send them, the Indian Gardener of March 3, in a long article, written by "Paharee," alludes to us thus:—

"Many people are under the impression that it is not only difficult to raise plants from seed, and these raised they are scarcely worth having; such, however, is not my experience. Last spring a friend of mine sent me out a packet of CANNELL'S GIANT BEGONIAS—sown in May—and I have now 150 plants from it, most of which are in flower. They are the most even lot of seedlings I have seen. Blooms measure over 5½ inches in diameter, and there is scarcely one below 4½ inches. The flowers are not only very diverse in colour, but of good shape and substance. I know that many do fail in their endeavours to raise what are termed florists' flowers, and for two good reasons—first, they do not procure seeds from a reliable source, or, if they do, they study cheapness before quality; and secondly, when the seeds are obtained they bestow no more care on them than they would on the commonest annual. We continually hear grumblings of the deterioration of plants and seeds in this country, but my opinion is that, provided we really get good seeds, and grow them as we ought to grow them, we in India can, to use an Americanism, have them better than the old country."

H. CANNELL &amp; SONS,

THE HOME FOR FLOWERS

Half the above, 11s.  
**ISAAC BRUNNING AND CO.**, Great Yarmouth Nurseries.

# EXTRACTS

from our Seed Catalogue of

## FLORAL GEMS

**ANARRHINUM BELLIDIFOLIUM.**  
 A rare and beautiful Biennial, which though allied to the Antirrhinum, differs nevertheless in its formation of bloom from that family. Grows 1½ foot high, and produces, June to August, most lovely blue flowers. It is perfectly hardy, and may thus be sown in the open border, greatly delighting in a sandy loam. Price 6d. and 1s. per packet.

**ANGELONIA GRANDIFLORA.**  
 A most lovely and sweet-scented Greenhouse Annual, producing fine spikes of beautiful blue flowers. Can highly recommend this to any amateur wanting an uncommon, pretty, and easily grown pot plant. Price per packet, 3d. and 6d.

**ANTIRRHINUM ("SNAPDRAGON").**  
 Magnificent Strain.  
 The mixture we offer has been procured from three of the finest strains in the world, and which we have thoroughly mixed; our patrons may therefore depend upon receiving a strain such as cannot be equalled. Price per packet, 1s. 6d. and 2s. 6d.

**ASTER TENELLUS.**  
 This is a beautiful Biennial, and blooms in August, when it presents one dense mass of lovely blue flowers; is a splendid pot plant for greenhouse, or may be planted outdoors on a warm sunny border. Price per packet, 6d. or 1s.

**CHRYSAETHUM, POMPONE.**  
 We can now offer seed at 1s. and 2s. 6d. per packet.  
**CLEMATIS GRAVEOLENS.**  
 A half-hardy Clematis, bearing yellow flowers, and thus contrasting most effectively with other well-known varieties. Price per packet, 1s. and 2s. 6d.

**CONVOLVULUS MINOR, "ROSE QUEEN"**  
 This is unquestionably a most valuable acquisition to the Annual family, being of a most enchanting soft rosy-blush, whilst each plant is smothered with bloom. Certain to create a grand impression. Price, per packet, 6d. and 1s.

**CONVALLARIA MAJALIS, "LILY OF THE VALLEY."**  
 We can offer seed of the well-known "Lily of the Valley," Price, per packet, 3d. and 6d.

**FORGET-ME-NOT, "PIGMY BEDDER."**  
 If any one requires a cheap, effective, and uncommon blue edging, obtain a packet of this and plant out with other bedding plants, when we can vouch that, if well grown, all visitors will say that it puts all other Myosotis or Lobelia completely into the shade. Unlike the other known varieties this new species now offered presents no straggling appearance but one line of unbroken blue. Supply limited. Price, per packet, 1s. 6d. and 2s. 6d.

**IPOMOPSIS ELEGANS.**  
 As the name implies (*Ipo* to strike forcibly, and *opsis* sight) this splendid Biennial is extremely effective when well grown. It grows in pots, well crocked, watered carefully, and kept in any airy situation next the glass the amateur will find his labours amply repaid by an uncommon effective flower. Our collection comprises an assortment of various colours, and will produce hues of from rose, calvary, yellow to dazzling scarlet. Price, per packet, 6d. and 1s.

**MISTLETO.**  
 It is not generally known that Mistletoe may be easily grown by rubbing the viscous seed upon the young wood of any Apple, Thorn, &c., tree, when the wood is not too hard. Many growers where the wood is hard cut off a little of the outer bark. Dust a little fine earth over to keep from view of birds. Price, per packet, 6d. and 1s.

**PALIURUS ACULEATUS SYN. P. AUSTRALIS (CHRIST'S THORN).**  
 This, without question, is the plant from which "the Crown of Thorns" which was put upon the head of Jesus Christ was composed (*Loudon, Encyc. of Plants*, p. 178). Many is sheer ignorance imagine the Crown in question to have been formed of our common Hawthorn (*Crataegus oxyacantha*). Besides its biblical interest the plant possesses such curious and ornamental qualities as should alone make it a resident in every English garden. It is a perfectly hardy ornamental deciduous shrub, and delights in any common garden soil. It attains a height of about 4 feet, and produces during June and July greenish-yellow flowers, which are succeeded by curiously-formed fruit, "appearing something like a head with a broad-brimmed hat" (*Paxton*). Grows readily from seed. Price per packet, 6d.

**STEPHANOPHYLLUM LONGIFOLIUM.**  
 This is a most beautiful Greenhouse Annual, producing during autumn numerous graceful branches with enchanting scarlet blossoms, which open for a long period. Price per packet, 1s. 6d. and 2s. 6d.

**VIRGINIAN STOCK, "White Cluster."**  
 This is a great improvement on the White variety at present known, being larger in the blooms, more compact, and altogether more effective as a border plant. Stock this year limited. Price per packet, 1s. and 2s. 6d.

**N.B.**—All Seeds forwarded, post-free, upon same day as orders are received.

**VICARS COLLYER & CO.,**  
 Importers of New & Rare Plants, Seeds, &c.,  
 SEEDSMEN, NURSERYMEN, &c.,

## HORTICULTURAL SHOWS.

## HARRISON &amp; SONS

Have purchased the entire stock of a grand new Pea, a selection from the Ne Plus Ultra, and a great improvement, having larger and better filled pods, containing Peas of an immense size, it having taken the 1st Prize at every Show where it has been exhibited. We have named it

HARRISON'S EXHIBITION MARROW,

and highly recommend it for

AUGUST and SEPTEMBER SHOWS.

Pint Packets post-free for 2s.

HARRISON & SONS,  
SEED GROWERS, LEICESTER.

NOTE.—Seedsmen likely to require a few bushels next season can have a trial packet free on receipt of 3d. for postage.

## THE FRUIT OF THE FUTURE.

NEW MAGNIFICENT BLACKBERRY,  
"THE WILSON JUNR."

In spite of the fact that Blackberries will grow "anywhere" in reason, and everybody likes them, it is yet a puzzling reality that it is only with great difficulty and at a high figure that we can purchase them in our markets.

Surely, then, it must be apparent to all farseeing "fruit growers" that instead of glutting the markets with Gooseberries, Currants, &c., they have here a fruit which, if planted upon any given area of land, will prove far more profitable than any other hardy fruit that could be grown. And why? Simply because for half-a-dozen years ahead, at least, the stock throughout the country will not have time to become so great as to exceed the demand.

Landowners, Stewards, and Gardeners, who have each year to show a balance-sheet "of profits," have here a very simple, safe method of for some years obtaining highly profitable results. Planted 3 feet by 8 feet requires at the rate of 1815 plants to an acre.

Gardeners also who grow for house consumption will find this fruit a valuable assistant. It will stand any treatment, and do well where other fruits would fail.

Whilst, however, we have the matter under consideration, do not let us fall into the mistake of planting any variety so long as it is a "Blackberry." Why not, for the sake of a slightly additional first expense, obtain the very "cream" of the family; or in other words, procure stocks of the hardiest, largest, most delicious, and most productive?

By pursuing this procedure the result repays the grower tenfold for the slightly additional first expense incurred.

It was this reasoning that caused us to give the subject our most careful study; the result of which is, we offer a variety, the grandest of the group, producing enormous berries, measuring on an average  $3\frac{1}{4}$  inches around, leathery, and the same dimensions crosswise. (This will give so idea of the profit to be derived from its culture as a market commodity.) The berries are also glossy black, very early of exquisite flavour, and enormously productive—the heavy load of fruit often bending the canes to the very ground.

We can offer plants of this grand variety at 1s. 3d. each, 12s. per dozen, 85s. per 100, carriage paid.

We can offer other varieties as follows:—"LAWTON," "KITTA-TINNY," "PARSLEY-LEAVED" (*Rubus fruticosus laciniatus*), "WILSON'S EARLY," at 9d. each, 8s. 6d. per dozen, 63s. per 100.

After this date (March 12) we advise our numerous Patrons for the "Wilson Junior Blackberry" to give us the option of Autumn Delivery. We have, however, every reason to believe that there is a certainty of delivery in time this spring.

## NEW CATALOGUE FOR 1885.

Beautiful Flowers for indoors, selected from an immense stock. Our Glasshouses cover nearly 2 acres.

### Wm. Clibran & Son's New List

(90 Pages Double Column)

Of the newest and finest varieties of all classes of Plants for Greenhouses, Stoves, &c., may now be had for two stamps. It includes only the best varieties of their respective classes. Every season new sorts are added. Comparisons of the varieties when in bloom carefully made, and the inferior kinds discarded. Intending purchasers may rely when selections are ordered as under on being supplied with varieties of merit only.

The following cheap Collections of finest named kinds consist entirely of our selection. Purchasers may select from the Lists at Prices as per CATALOGUE, which please see before ordering elsewhere.

- |                                                                                                       |                                                                                                |
|-------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| 12 <i>Attilons</i> , 12 sorts, 3s.                                                                    | 12 <i>Geraniums</i> of any or all classes, Zonal for pots or beds, Ivy-leaf, Doubles, &c., 3s. |
| 12 <i>Achimenes</i> , 12 sorts, 2s. 6d.                                                               | 50 " all classes, a lovely selection, 12s. 6d.                                                 |
| 12 <i>Begonias</i> , Tuberosus, 12 sorts, 6s.                                                         | 12 <i>Gloxinias</i> , 12 sorts, 6s.                                                            |
| 12 " Ornamental, 12 sorts, 4s.                                                                        | 12 <i>Greenhouse Plants</i> , 12 sorts, 9s.                                                    |
| 6 " Evergreen, 6 sorts, 2s.                                                                           | 12 <i>Heliotrope</i> , 12 sorts, 2s. 6d.                                                       |
| 12 <i>Bouvardias</i> , 12 sorts, 4s.                                                                  | 12 <i>Lantanas</i> , 12 sorts, 2s. 6d.                                                         |
| 12 <i>Caladiums</i> , 12 sorts, 6s.                                                                   | 12 <i>Liliums</i> , 6 sorts, 12s.                                                              |
| 12 <i>Camellias</i> , 12 sorts, 2s.                                                                   | 12 <i>Palms</i> , 6 sorts, 18s.                                                                |
| 12 <i>Chrysanthemums</i> of any or all classes, Large Flowered, Pompon, Anemone, or Japanese, 2s. 6d. | 12 <i>Pelargoniums</i> , Show, French, Fancy, &c., 9s.                                         |
| 50 " " 10s.                                                                                           | 12 <i>Roses</i> , 12s.                                                                         |
| 100 " " 18s.                                                                                          | 12 <i>Salvias</i> , 2s. 6d.                                                                    |
| 12 <i>Coleus</i> , 12 sorts, 3s.                                                                      | 12 <i>Stove Plants</i> , Flowering, 9s.                                                        |
| 12 <i>Ferns</i> , 12 sorts, 9s.                                                                       | 12 " " Foliage, 9s.                                                                            |
| 12 <i>Fuchsias</i> , 12 sorts, 3s.                                                                    | 12 <i>Tropaeolums</i> , 2s. 6d.                                                                |
| 25 " 2s. 6d.                                                                                          | 12 <i>Tree Carnations</i> , 9s.                                                                |
| 50 " 50 sorts, 12s. 6d.                                                                               | 12 <i>Verbenas</i> , 2s. 6d.                                                                   |
| 100 " 18s.                                                                                            |                                                                                                |

Liverpool, 1872—Manchester & Liverpool Agricultural Society—1st Prize Medal.

FOLLOWS AND BATE (Limited), beg to direct attention to the variety of LAWN MOWERS they manufacture, all of which are made of the best materials, and with due regard to those essential points necessary to ensure durability as well as PERFECTION IN WORKING. The large demand that has existed for several years for their Machines (which are sold by all respectable Ironmongers), together with the highest distinctions gained by them in various International Exhibitions and Public Contests—including Paris, Vienna, Brussels, London, Birmingham, Manchester, Liverpool, Wigan, &c.—sufficiently attest their merits.

Complete Illustrated Horticultural List now ready—Post-free.

FOLLOWS & BATE (Limited), Dutton Street Works, Manchester.

## WORKS FOR THE POSSESSORS OF GARDENS.

**HIGH CLASS KITCHEN GARDENING.** A Handy Manual for the Improved Cultivation of all Vegetables. By WILLIAM EARLEY, Author of "How to Grow Mushrooms," "How to Grow Asparagus," &c., &c. Crown 8vo, with Coloured Frontispiece, price 4s. 6d.

**MRS. LOUDON'S LADIES' COMPANION TO THE FLOWER GARDEN.** A complete Guide to the Management and Adornment of Gardens of every size. A New Edition. Fcap. cloth, price 7s.

**THE ART OF GROWING ROSES OUT-OF-DOORS.** By Rev. O. FISHER. Fourth Edition, revised and enlarged. Price 1s.

**HOW TO GROW MUSHROOMS.** By WILLIAM EARLEY. Price 1s. stitched.

**HOW TO GROW ASPARAGUS.** A popular Explanation of the best Method of Culture. By WILLIAM EARLEY. Price 1s. stitched.

London: BRADBURY, AGNEW, & CO., Bouverie Street, E.C.

**CHOICE NEW and GENUINE FLOWER SEEDS.** One Farthing a Packet! Parcel containing 48 packets, 1s. post-free, 1s. 2½d., comprising new Giant MIGNONETTE, Black Sweet FEA, new GODETIA (Princess of Wales), Giant SUNFLOWER, and forty-four other packets all different.

Address The GARDENER, Hillside, Loudwater, High Wycombe.

### Special Offer to the Trade.

**ARALIAS; AZALEAS INDICA, MOLLIS, and PONTICA; CITRUS, CLIVEA, DRACENAS, FERNS, FICUS, PALMS, and RHODODENDRONS.**  
JULES DE COCK, Ornamental Plant Nurseries, Ghent, Belgium.

**CABBAGE PLANTS.**—Early Rainham and Enfield Market, 2s. 6d. per 1000; Red Dutch, 3s. per 1000. ASPARAGUS ROOTS, 3-yr. old, 14s. per 1000. Forcing SEAKALE, splendid crowns, 9s. per 100; planting out, 3s. per 100. Cash with orders.

RICHARD WALKER, Market Gardens, Biggleswade, Beds.

**LOVEL'S STRAWBERRY PLANTS.**

Price 2s. 6d. per 100, 10s. per 500, 17s. 6d. per 1000.

Sample and Pamphlet, post-free, 4d.

W. LOVEL AND SON, Strawberry Growers, Driffield.

**PALMS.**—Specially hardy grown, for Cool Greenhouses and Dwelling-houses. Latania borbonica and Seaforthia elegans, splendidly foliaged, 20 inches high, 12s. per dozen; sample plants, 1s. 3d. Same kinds, 12 inches high, 2s. 6d. per 100; sample twelve for 4s. All packages and parcels post-free. Postal Orders to

GARDENER, Holly Lodge, Stamford Hill, London, N.

## GARDEN REQUISITES.

### COCOA-NUT FIBRE REFUSE,

4d. per bushel; 100 for 25s.; truck (loose, about 2 tons), 40s.; 4-bushel bags, 4d. each.

**LIGHT BROWN FIBROUS PEAT,** 5s. 6d. per sack

5 sacks, 25s.; sacks, 4d. each.

**BLACK FIBROUS PEAT,** 5s. per sack, 5 sacks 25s.; sacks, 4d. each.

**COARSE SILVER SAND,** 1s. 9d. per bushel; 15s. per half ton, 26s. per ton, in 2-bushel bags, 4d. each.

**YELLOW FIBROUS LOAM, PEAT-MOULD, and LEAF-MOULD,** 1s. per bushel.

**SPHAGNUM MOSS,** 8s. 6d. per sack.

**MANURES, GARDEN STICKS, VIRGIN CORK, TOBACCO CLOTH, RUSSIA MATS, &c.** Write for

Price LIST.—H. G. SMYTH, 21, Goldsmith's Street, Drury Lane (late called 17A, Coal Yard), W.C.

## MEREDITH'S

## VINE AND GENERAL PLANT MANURE.

Manufactured by Joseph Meredith, late of The Vineyard, Garston.

**GREAT INTERNATIONAL HORTICULTURAL EXHIBITION,** held at Hamburg.—The MASSIVE SILVER CUP given by Her Majesty QUEEN VICTORIA for the Best Specimen of Grapes was awarded to JOSEPH MEREDITH.

This and other famous successes largely attributable to the use of this celebrated Manure.

Used regularly in most of the leading establishments in the United Kingdom.

CIRCULARS, with price and full directions for use, free on application to

JAMES MEREDITH, Seedman, &c., 125, BRIDGE STREET, WARRINGTON.

## GARDEN REQUISITES.

TWO PRIZE MEDALS.

Quality, THE BEST in the Market. (All sacks included.)

PEAT, best brown fibrous .. 4s. 6d. per sack; 5 sacks for 20s.

PEAT, best black fibrous .. 3s. 6d. " 5 sacks for 15s.

PEAT, extra selected Orchid .. 5s. 6d. " " 5 sacks for 25s.

LOAM, best yellow fibrous .. " " " " " " " "

PREPARED COMPOST, best .. " " " " " " " "

LEAF MOULD, best only .. " " " " " " " "

PEAT MOULD .. " " " " " " " "

SILVER SAND, coarse, 1s. 3d. per bush., 12s. half-ton, 22s. ton

RAFFIA FIBRE, best only .. " " " " " " " "

TOBACCO CLOTH, finest imported .. 8d. lb., 28 lb. 18s.

TOBACCO PAPER (Speciality) .. 8d. lb., 28 lb. 18s.

MUSHROOM SPAWN, finest Milltrack .. 5s. per bushel.

SPHAGNUM MOSS, all selected .. 2s. per bush., 6s. per sack.

COCOA-NUT FIBRE REFUSE (by Chubb's special process),

sacks, 1s. each; 10 sacks, 9s.; 15 sacks, 13s.; 20 sacks, 17s.;

30 sacks, 25s.; 40 sacks, 30s. Truck-load, loose, free on rail,

25s. Limited quantities of G. special quality, granulated, in

sacks only, 2s. each. Terms, strictly Cash with order.

**CHUBB, ROUND & CO.,**

WEST FERRY ROAD, MILWALL, LONDON, E.

**COCOA NUT FIBRE REFUSE.**—Best

and fresh only, 1s. per bag; 15 bags, 12s.; 30 bags,

22s. sent to all parts; trucks, 23s. free to Rail. PEAT and

LOAM.—A. FOULON, 32, St. Mary Axe, London, E.C.

**GENUINE GARDEN REQUISITES,** as

supplied to the Royal Gardens.—Fresh Cocoa-Nut Fibre

Refuse, 4 bushel bags, 1s. each; 30 for 25s.—bags included.

Two Ton Truck, free on Rail, 25s. Best Brown Fibrous Kent

Peat, 5s. per sack; 5 for 22s. 6d.; 20 for 35s.; 20 for 60s. Best

Black Fibrous Peat, 4s. 6d. per sack; 5 for 20s.; 10 for 30s.

Coarse Bedford Sand, 1s. 6d. per bushel, 14s. per ½-ton; 25s.

per ton. SPECIALITY TOBACCO PAPER, 8d. lb.; 28 lb. 18s.

# NATIVE GUANO.

Extracts from the Ninth Annual Collection of Testimonials from persons who have used this  
Manure for Farm and Garden Crops:—

## ROOTS, GRAIN, GRASS, &c.

GEORGE STONE, *Cashio Bridge Farm, Watford.*

February 19, 1885.  
"Used for Swedes on plants at the rate of about 6 cwt. per acre. Results: I was very well satisfied, considering the long time we were without rain; the Swedes were quite as good or better than some in the same field with more expensive manures. I have used your Native Guano for Swedes and white Turnips, and have a very good crop for the season. Kindly send me 3 tons at your earliest convenience, and oblige."

JAMES KITLEY, *Farm Steward to the Right Hon. Lord Derby, Witly Park, Haslemere.* January 24, 1885.  
"Used for Tares, at the rate of 4 cwt. per acre. Results: Very good."

ROBERT CRAWLEY, *Chelveston, near Higham Ferrers.* January 29, 1885.  
"Used for Wheat, Oats, Barley, Clover, and grass, at the rate of from 2½ to 5 cwt. per acre (according to the condition of the land, which was cold clay), with good results; had quite 5 cwt. of hay more per acre. Your manure, if as good as last year's, is the best I have ever used, except guano. All other manures are land-damagers—they doctor the land for a time, afterwards they require a physician."

WM. GEO. ELLIOTT, *Aston Abbots, Aylesbury.* February 5, 1885.  
"Used for Oats grown after seed Tares at the rate of 7 cwt. per acre. Results: Very good; about 12½ qr. per acre. Being grown against the road, it was generally remarked what a fine piece of corn it was, and I have no doubt will be the cause of several of my neighbours using it this season."

JAMES SOMES, *Bailiff, Yelden Estate, Higham Ferrers.* February 3, 1885.  
"Used for Oats and roots, at the rate of 4 cwt. per acre for roots, and 2 cwt. for Oats, with farmyard manure. Results: Exceedingly good for crops. I was very pleased with your manure, and we intend using it largely this year."

JOSEPH FRANKLIN, *Scottgrove, Thame.* February 13, 1885.  
"Used for grass and Mangel Wurzel, at the rate of 6 to 8 cwt. per acre. Results: Very good."

A. C. HILLS, *Marston, Oxford.* February 7, 1885.  
"Used for Mangel Wurzel, at the rate of 5 cwt. per acre, with plenty of ash. Results: A splendid crop. I think a lot of ash with the Guano does a deal of good."

J. SHRIMPTON, *Great Hasely, Tetworth Oxford.* February 5, 1885.  
"Used for Swedes and Turnips, without farmyard manure, at the rate of 4 cwt. mixed with ashes. Results: Gave good satisfaction, the Turnips being a very good crop indeed. The Swedes were a good plant, but owing to the dryness of the season and severe attacks of blight did not finish up so well. I shall be a customer again this season."

C. BEESON, *Glory Farm, Amersham.* February 9, 1885.  
"Used for Mangel at the rate of 6 cwt. per acre. Results: Very good. I have given my opinions on your manure previously."

JOHN A. WILLIAMS, *Alderminster Lodge, Stratford-on-Avon.* January 25, 1885.  
"My first experience with your manure has been confirmed during the past year. It seems especially valuable and economical when used for roots."

## POTATOS and KITCHEN GARDEN CROPS.

G. WHEELER, *Bourne End.* February 2, 1885.  
"Used for Potatoes at the rate of 16 cwt. per acre. Results: Tubers much finer and quantity considerably larger than any other manures I ever tried. I consider your manure the best possible, as it supplies the tubers when most needed, without a tendency to rot them."

JACOB ROBINSON, *Bejon Green, Bury St. Edmunds.* February 9, 1885.  
"Used for Potatoes at the rate of 10 cwt. per acre. Results: Most satisfactory; no other manure whatever used. My method of applying is to sow broadcast immediately in front of the hands engaged in moulding up."

J. SMITH, *Head Gardener to the Right Hon. Lord Rosebery, Mentmore, Bucks.* January 28, 1885.  
"Used for Peas, Onions, Lettuce, Cabbages, Potatoes, Turnips, and fruit trees. Results: Onions, a splendid crop; other crops, where used, most satisfactory. As a surface-dressing I consider your Native Guano most useful. Peas seemed to derive much benefit from the dressing."

JAMES DART, *Gardener to the Right Hon. Lord Carlingford, K.P., The Priory, Chewton Mendip, Bath.* February 9, 1885.  
"The Native Guano I received from your firm in 1884; instead of using it dry I used it as liquid in large tubs to plants of many sorts in pots; also Roses, Cucumbers, Marrows, and many other things, and I was quite satisfied with it."

THOMAS HAMILTON, *Gardener to the Right Hon. Viscount Hood, Lynwood, Sunningdale, Ascot.* January 28, 1885.  
"Used for Tomatoes, Cucumbers, and soft-wooded plants in general. Results: Very good. As we had only a 2 cwt. bag, cannot bear testimony on a large scale; but have no doubt for general purposes is very good."

THOMAS HENRY HILL, *The Gardens, Durwards, Witham.* January 24, 1885.  
"Used for Potatoes, Onions, Beet, and Carrots, at the rate of 8 cwt. per acre. Results: Very good indeed. I can report again on the excellency of your Native Guano. I use no other artificial manure. All I used it for did very well, considering the dry season we had."

H. CAKEBREAD, *Head Gardener to Sir Philip Rose, Bart., Rayners, Bucks.* January 28, 1885.  
"Used for Potatoes, Peas, Beans, and all kinds of winter Greens, Vines, Peaches, and Pot Plants. Results: Satisfactory in all cases. Without doubt your Native Guano is a very stimulating manure, and especially for all green crops. I am of opinion, to thoroughly prove any kind of artificial manure on the same piece of ground, one row should be manured and the next left, i.e., every alternate row only done."

JAMES SAYERS, *Gardener to Frank Snood, Esq., The Firs, Old Charlton, Kent.* January 26, 1885.  
"Used for Peas, Beans, Potatoes, Cabbage, Cauliflowers, Celery, Lettuce, Radish, Endive, Cucumbers, Tomatoes, &c., and Fruit Trees, also Stove, Greenhouse, and Conservatory. Results: Very satisfactory. I consider it a first-rate manure for all these purposes. I think the Native Guano only requires to be better known to be much more largely used."

E. S. WILES, *The Gardens, Edgemoor, Banbury.* January 26, 1885.  
"Used for Melons, Cucumbers, Peas, Onions, and Pot Plants. Results: Good on all—Melons, Cucumbers, Peas, and Pot Plants in particular. The Native Guano supplied to me last year was very good, and as a cheap manure I highly recommend it."

## VINES, STRAWBERRIES, LAWNS, FRUIT TREES and FLOWERS.

ISABELLA MECCHI, *The Limes, Earls Colne, Essex.* February, 1885.  
"Used for all kinds of vegetables, and young fruit trees, with satisfactory results. On pot plants the effects are very marked, producing a brilliant green foliage, and enabling them to resist gently. I have no doubt whatever of the fertilising qualities of Native Guano."

Dr. CHAS. A. BURGHARDT, *Delamere, Alderley Edge, Cheshire.* February 9, 1885.  
"Used for Peas, Cauliflowers, Strawberries, Cabbages, and grass. Quantity used: well dusted over surface for grass; well dusted over surface and forked in for other crops. Results: The Strawberries were excellent in quality and larger in size than usual, the Peas and other vegetables were much improved by this manure, in fact the Brussels Sprouts were earlier and finer than I have seen them for some years. No other manure used on grass, ordinary farmyard manure on Strawberries, as I always have used it. I consider the manure you sent me most excellent for grass, lawns are much improved by the use of it, the grass growing much quicker and having a much better colour than before."

Col. the Hon. W. P. TALBOT, *Glenhurst, Esher.* January 27, 1885.  
"Used for all sorts of flowers, fruit, and vegetables in and out of houses. I have used it principally on small patches of ground and in the houses in pots, but my gardener tells me he supposes about 10 cwt. to the acre. Results: Very good; won a great number of prizes at South Kensington, Richmond, and other shows with fruit, flowers, and vegetables grown with it."

General BOILEAU, *Bognor.* January 24, 1885.  
"Used for almost all garden crops, Peas, Beans, Lettuce, Asparagus, Tomatoes, Carrots, Turnips, Salsify, &c., Strawberries. Results: Very good, with all vegetable, fruit, &c."

WILLIAM APPLETON, *Sipton, Slough.* Feb. 5, 1885.  
"Used for Strawberries at the rate of half a ton per acre. Results: Season very dry; not a fair trial; where used the Strawberries were more free from mildew."

J. E. HAINSWORTH, *Devisbury.* January 19, 1885.  
"Used for Vines. Results: Great improvement. I think the manure good for many kinds of things—Roses, Geraniums. I have used it for Camellias that have not bloomed for a long time without retopping. Crops this year good: Peaches, Figs Nectarines. It must be used with reason."

W. PATERSON, *Beech Grove, Sydenham Hill.* February 9, 1885.  
"Used for lawns, vegetables, Vines, flowers; grass thickly covered with the Guano (probably at half a ton per acre). Results: Very satisfactory. Having used your Guano for twelve years, I have no hesitation in saying that it has always answered well, and that my gardeners say they could not do without it, more especially for my grass slopes and lawns."

C. L. NICHOLSON, *Thatched House Club, St. James's, London.* January 24, 1885.  
"Used for lawn. Results: Excellent. Making out the area over which I used the manure, the crop of fine new grass compared most favourably with that portion of the lawn over which ordinary manure was applied. Our gardener desires a larger supply this season."

A. MARGETSON, *Victor Road, Teddington.* January 31, 1885.  
"Used for Beet, Onions, Lettuce, Celery, Turnips, Endive, Roses, Pelargoniums, Primulas, Cinerarias, Tomatoes. The results have been greatly to my satisfaction, especially in cases of Roses, Beet, and Celery. I have tried all other manures, but, considering the price you charge, I shall recommend it to all my friends."

At the Birmingham Show, 1884, Nineteen Prizes were taken by Exhibitors who used Native Guano.

PRICE £3 10s. PER TON, in Bags, at the RAILWAY STATION, AYLESBURY.

Pamphlets of Testimonials and all other particulars may be obtained on application to the Secretary of the

school standing then on the present site of the famous college which the grateful Bishop himself founded. Those were days of great ecclesiastical splendour, and the immense possessions of the see of Winchester supported several palaces and manor-houses which William of Wykeham repaired and restored, such as Wolvesey, Farnham, Southwark, and Bishop's Waltham—all palaces; with the manor-houses of Merewell, Sutton, High Clere, Esher, Wargrave, and Taunton.

The first stone of William of Wykeham's famous school, known as St. Mary's College, was laid in Otterbourne Mede in 1387; New College, Oxford, having been commenced earlier. The cathedral was restored and the high road to London repaired after long neglect by the same improver, a man of great actions, admirable as bishop, statesman, and Christian. He died at the palace of Bishop's Waltham, and men still look with reverence on his recumbent effigy and noble features, knowing how great he was who lies in dust below.

We must pass on to later times with some abruptness. Several kings connected with Winchester have been already mentioned. In later times Charles II. was a frequent visitor here. He brought Nell Gwynne to Winchester, and when Thomas Ken, of this cathedral, refused to lodge the lady in his house, Charles had one built for her, which stood as lately as 1878 in Colebrook Street, near the cathedral. And afterwards, when the See of Bath and Wells fell vacant, Charles inquired, "Where is the good little man who refused poor Nell his lodging?" and Ken became a bishop. He was brother-in-law to Isaac Walton, and, like him, takes rank among the worthies. The verses inscribed on a tablet near Isaac Walton's grave in the north transept of the cathedral were written by him. The noted angler lived some time here at Wolvesey Palace with his friend Bishop Morley, and then moved to the house of his son-in-law, Prebendary Hawkins, in the Close, where he died, old and honoured, after a life devoted to innocent pursuits, and to such sweet retirement as all men love to dream of. Gilbert White, of Selborne, led just such a life, unnoticed, but well employed, and therefore happy. In spite of Byron's gibe, the excellent angler of the Itchen and the Dove was kind to all created things except worms and fishes! He died in extreme old age, beloved by numerous friends. "His well spent life did last," we read in his epitaph, "full ninety years and past."

Returning to Charles II., that chief saunterer among our kings, besides the house already noticed another was built for another of his female friends, the Duchess of Portsmouth, partly remaining in Peter Street. Charles himself was entertained on several occasions by one or another of the greater clergy, by Ken more than once. He liked the place, he enjoyed the healthful downs in the neighbourhood where he rambled, and the fishing in the Itchen; ships amused him too, and he was always partial to Portsmouth, both the town and Duchess, and Southampton was another place where he enjoyed himself, and both were easily reached from Winchester. Charles therefore purchased the ruins of the old castle and eight acres of land, and on this site Sir Christopher Wren was commissioned to erect a palace, and he had commenced the building when Charles died and the project was abandoned.

I cannot refrain from mentioning among many interesting recollections of Winchester that Bishop Patteson, who nobly met his death at the hands of the savage men for whom he had given up country, friends and home, says in his *Life*, "I know no such associations as those of Winchester Cathedral." As a little boy he had stopped at the Deanery, where he loved to play in the Dean's garden, known as "Paradise," within the buttresses of the old grey choir; and here he sometimes paused in his play and listened with awe and wonder to the solemn chant within.

These memorials may not be unfitted to a column where we have often maintained that the *genius loci* forms a heritable feature of every place of interest. Among the notabilities who were buried here, and whose tombs or memorials may be seen in the cathedral, are Cardinal Beaufort, whose capped effigy is in the presbytery with Norman nose and high, proud face, son of John of Gaunt, grandson of Edward III., brother of Henry IV., who died in Winchester at Wolvesey Castle, in 1447. At the im-

pressive deathbed scene of the ambitious prelate, a reference to his bad life drew from the king, according to Shakespeare's *Henry VI.*, a well known rebuke and just reflection. "So bad a death argues a monstrous life," says Warwick. The king replies, "Forbear to judge, for we are sinners all. Close up his eyes and draw the curtains close; and let us all to meditation." Others among the eminent that lie here are William Waynflete, Bishop of Winchester, Lord Chancellor of England, founder of St. Mary Magdalen's College, Oxford; who died at the same palace at Bishop's Waltham where William of Wykeham expired; Stephen Gardener, Bishop, Henry VIII.'s Chancellor in the period of his trusting youth, died 1555; Miss Mitford of Alresford, authoress of *Our Village*, and her still more eminent contemporary, Jane Austen, died in 1817, aged 41, having, at that early age delighted tens of thousands, including Sir Walter Scott, and merited her epitaph, which is as follows:—"She openeth her mouth with wisdom, and in her tongue is the law of kindness." Having omitted Hardicanute he must come in here among the ladies. His grave is at the extreme east end of the cathedral.

It might be said of the relentless Cardinal Beaufort, who made no sign when the king implored—"Make signal of thy hope"—that if he had been a gardener and had read the lesson of the spring when the vegetable world resumes its life, he might have felt such faith as shone undimmed in the last moments of John Knox, who as he lay dying, was asked, "Hast thou hope?" He was past utterance, but he raised his finger, pointed upwards, and so died. *H. E.*

## New Garden Plants.

IRIS VARTANI.\*

I HAD intended to leave the description of this plant to my friend, Mr. J. G. Baker, who has done so much to extend and correct our knowledge of this as of many other genera. But the flower which I purposed to send to him unfortunately failed; and as blooms may also fail next season I have thought it best, with his approval, to describe the plant myself, while the image of it is still fresh on my mind.

The bulbs have reticulate coats, like those of *I. reticulata* and *I. histrio*, but are in shape a longer, more pointed oval, and those bulbs which proved flowering bulbs were smaller than flowering bulbs of *I. reticulata*. In colour they seemed to be not so silvery-white, but more distinctly of a brownish hue.

A flowering bulb produces two leaves, each guarded at its base by two vaginal sheaths, the lower of which is colourless, the upper marked with faint green parallel veins. The leaf itself is about 1 foot or more long at full growth, 8 or 9 inches or less at flowering time, dark green, tetragonal, with concave sides and sharp angles, the inner side being the smallest, and the outer the largest; it is twisted once on itself in a long spiral, and ends in an opaque-white sharp point. One of the two leaves is at flowering time 2 or 3 inches shorter than the other.

The bud appears between the above two leaves, guarded by a vaginal sheath, which is pointed and colourless, or marked near its apex with a few faint green lines only.

The spathe valves, about 1½–2 inches long, are pointed and colourless, except for a few green veins in their upper part; one (the lower) is shorter than the other.

Tube about 2½ inches, colourless, or faint yellowish-green, slightly constricted below the short perianth funnel.

Whole flower about 3 inches across, not fragrant.

Fall, with narrow claw, suddenly enlarging into an ovate-lanceolate blade. In the middle line of the hinder part of the lamina is the crest, which, begin-

ning as an even ridge, is continued along the whole length of the claw as a ridge thrown into transverse folds like a frill. The crest is yellow, except at the extreme point, which in some cases is white; over the frilled or folded part are numerous black or dark brown minute spots or dots. The claw is on its upper surface yellow, with a tinge of green, becoming a deeper yellow at the edges, but not so deep as that of the crest, and is marked with diverging lilac in colour; i.e., pale blue, with a slight tinge of red. The yellow colour of the claw spreads on to the lamina on either side of the crest, and then dies gradually away into a white or cream-coloured ground marked with lilac or lavender veins, which, diverging from the claw and crest, become broader and confluent at the edge of the lamina, so that the whole lamina seen at a little distance seems lavender or slaty blue in colour, and indeed might be described as lavender or lilac broken by diverging bands of creamy-white. The under-surface of both claw and lamina is a greenish-yellow, marked by the veins shining through. The claw, which has a slight flange at its base, is placed at an angle of about 45° with the prolonged axis of the tube, so that the flower is turbinate; the lamina is bent at about right angles to the claw.

The standards are small, erect, not connivent, with a small narrow, almost linear, lanceolate, lavender-coloured blade, and a very slender completely canaliculate claw, yellow in colour, with a tinge of brown, and marked with brownish-lavender lines. On the lamina a few faint diffuse veins of deeper hue are seen.

The style, shorter and broader than the claw of the fall, which it overlaps, is very concave from side to side, lavender-coloured in the median portions, but becoming lighter on each side, and nearly white at the edge on both surfaces. It bears two pointed triangular crests one-and-a-half times or even twice as long as the style itself, divergent, with obscurely dentate or serrate edges, one crest overlapping the other at the base behind, the inner edge being continued as a ridge some way down the back of the style. Each crest is of a pale lavender colour, marked by conspicuous divergent veins of a deeper hue. The stigmatic surface is blind, and presents the form of two teeth of nearly white colour. The anthers, with blueish light lavender pollen, are longer than their filaments, which are white and short, and are expanded and flattened at their base. The concave style and the concave claw of the fall present a narrow tunnel, in which, however, owing to the style being shorter than the fall, the anther cannot be seen unless the fall be pulled down.

The perianth segments unite into a short (two or three lines) perianth funnel, which is by a slight constriction continued into the thin cylindrical tube.

The ovary being completely buried underground was not seen at flowering time, but after fructification was in due time thrust up, and then appeared to be rounded-trigonal, with shallow grooves in the middle of each side, and at each angle.

The dimensions are as follows:—Fall: claw, 1 inch by ½ inch; lamina, 1½ inch by ¾ inch. Standard: lamina, ¾ inch by ½ inch; claw, 1 inch by ½ inch; style, ¾ inch by ½ inch; crests, 1 inch or more by ½ inch; spathe valves, 2½ to 3 inches long; tube, 2½ inches long, or more, by ½ inch or more; leaves, 15 inches long by ½ inch or more broad.

The bulbs were kindly sent to me by Dr. Vartan, of the Medical Mission, Nazareth, under the idea that they were bulbs of *I. histrio*. The plant, however, differs from *I. histrio*, (1), in the bulbs being more pointed and of a longer, more slender oval form; (2), in the falls having a very narrow claw and a lanceolate lamina, whereas in *I. histrio* the claw is almost as broad as the lamina; (3), in the claw of the fall possessing an obvious crest, whereas in *I. histrio* the orange ridge or "signal" on the lamina of the fall sinks away on the claw into an inconspicuous bar, hardly visible without the help of a lens; (4), in the very long triangular pointed crests of the style, these in *I. histrio* being shorter and more obtuse; (5), in colour.

Indeed, this plant, as I will explain in a subsequent note, seems much more distinct from both *I. histrio* and *I. reticulata* than either of these from the other. It, like *I. histrio*, is a native of Palestine, but Dr. Vartan has not yet been able to tell me its exact habitat.

The plant flowered with me in October, as did also

\* *Iris Vartani*, sp. nov.—Bulbi ovato-acuti, tunicis fibroso-reticulatis; foliis 1–2, flore longioribus, tetragonis, faciebus concavis inequalibus; spathæ unifloræ valvulis linearis acutis; floribus sessilibus, tubo exserto, limbo pallide lilacino; perigonii segmenti externi lamina ovato-lanceolata lactea, venis pallidis lilacinis crebris, ungue linearis, cristâ flava, sparse nigro-punctata obsita; segmenti interni, lamina linearis linearis-lanceolata, ungue linearis, cauculata, brunneo-flava; stylis cristatis, longis triangularibus acutis, margine serrata, venisque lilacinis conspicuis instructis; anthera filamentis longioribus, polline pallide lilacino. Ovario (2); capsula cylindrico-trigonalis.—Habitat, Palestina. (See *Gard. Chron.*, p. 524, vol. xxii., 1884.)

one of the bulbs which I sent to Mr. Max Leichtlin; but I am inclined to think that its real time of flowering in this country has yet to be ascertained.

This new Iris will not, I think, prove a very valuable addition to our gardens. The form is commendable, but the colour is poor, the whole flower presenting at a distance a slaty-blue hue. If it always flowers in October, at a time when the eye is rather weary of Composites, and other flowers are rare, and if it proves easy of cultivation, it may be useful. But I fear it will be difficult to grow if it persists in flowering in October, for then its leaves will, in their very prime, have to bear all the "slings and arrows of an outrageous" English winter. How can we expect them under such circumstances to manufacture plump, sound, bloom-hearted bulbs? I confess I feel a pang of conscience, as if I had done a cruel deed, when I worry my far-off friends to send me bulbs and roots, and having received some thing of beauty from a happy sunny clime, kill it by exposing it to the muddle of frost, rain, darkness, thaw, wind, mist, and mugginess, which we call winter. *M. Foster.*

#### ERIA ELWESII, n. sp.\*

This tiny little dwarf is a great curiosity, well deserving to rank under the genus. Its almost lenticular depressed pseudobulbs are covered with fibrous sheaths without prominences. The small light brown flower has the ovary surpassed by a wide cucullate bract. The outer perigone is connate and three-toothed. Petals rhomboid, with exceedingly minute denticulations at the upper part. Lip oblong, retuse, with two rounded lobes at the base, nearly three lines in length. The leaves are nearly an inch long. They are stalked, oblong acute, nearly membranous. It is a discovery of the King of the Lilies, Mr. Elwes, and I have received it several times since February, 1883, from Sir C. W. Strickland, Hildenley, Malton. *H. G. Rehb. f.*

### GARDEN PALMS.

(Continued from p. 410.)

*Cocos*, L.—About thirty species are included in this genus, two-thirds of which are cultivated at Kew. In the characters of the foliage and of the fruit, and also in the size and habit of the different species, there is a much wider range of variation than is found in any other genus of Palms. Thus we have the graceful plumose type of foliage with the segments aggregated and arranged irregularly along the rachis, and which is represented by *C. plumosa*, *C. flexuosa*, &c.; the Areoid type with the leaf-segments somewhat rigid and lanceolate and arranged in regular series on each side of the rachis, as seen in the Cocoa-nut (*C. nucifera*); the stiff glaucous plumes of *C. campestris*, the graceful Fernlike foliage of *C. Weddelliana*, and the spire-clothed rachises of *C. schizophylla*. The stems vary in like manner, from the tall columnar trunks of the Cocoa-nut to the thin walking-stick-like stems of *C. Weddelliana*, or the flattened decumbent Sabal-like stem of *C. perambucana*. Some of the trunks are almost smooth, and marked with the scars of the fallen leaves, whilst others are clothed with the stout persistent bases of the old foliage, as in *C. capitata*, *C. schizophylla*, *C. coronata*, &c. The fruit varies in size from that of the well-known Cocoa-nut to the small Pea-like drupes of *C. campestris* and *C. Weddelliana*; wide differences in shape are shown by the spherical form of some, the peg-top shape of others, and the long-pointed barley-shaped drupes of a third group, represented by *C. Procopiana*. The pericarp of all the species is brown and fibrous as in the Cocoa-nut, the seed itself being generally smooth, hard, dark brown, and marked at the base with three scars or punctures, as in *Bactris*, *Astrocaryum*, &c. The fancied resemblance of the seed thus marked to the head of a monkey is said to have suggested the generic name *Cocos*, from *Cocos*, or Coquin, monkey. The seedling leaf is simple and erect, and whilst some of the species, such as *Weddelliana*, develop pinnate foliage immediately after the first leaf, others, such as *C. flexuosa* and *C. australis*, continue to produce only ensiform leaves for several years after germination.

\* *Eria Elwesii*, n. sp.—Aff. *Eria* (*Cryptochilo*) *reticulata*, Parishii, Wightii et (C.) Mellicr. Pseudobulbo leontocari minute costato, vaginato; foliis petiolatis oblongis acutis, floribus bractea cucullata acuta, ovarium pedicellatum superante; sepalis in tubum tridentatum connatis; tepalibus rhombis acutis obtusangulis supra minutissime denticulatis, labelli lobis lateralibus semioblongis, lobo antico ligulato retuso; columba brevissima. *H. G. Rehb. f.*

It is hardly necessary here to do more than refer to the many and varied uses to which the Coco-nut Palm is applied. Cultivated, or growing wild, in every part of the Tropics in the vicinity of the sea, there is probably no plant, except perhaps the Bamboo, which supplies man with so many important necessities of life. Every part of the fruit and its envelopes is put to some good use; the leaves and stems are employed in numerous ways, and the sap affords the beverage known as "Toddy." Geographically this Palm is interesting from its being plentiful in both the Old and the New Worlds. If we except the genus *Eleis*, which is a near ally of the *Cocos*, and which is represented in Africa and also in Central America, there is no genus of Palms, as now classified, the species of which are not confined to either the one or the other world, except the *Cocos*. The range of *C. nucifera* is the more remarkable when it is remembered that the remainder of the *Cocoses* are confined to tropical America. The tribe *Cocoinae*, which includes the genera *Bactris*, *Desmoncus*, *Astrocaryum*, *Acrocomia*, *Eleis*, *Diplorhynchium*, *Cocos*, *Maximiliana*, *Scheelia*, *Attalea*, *Jubaea*, and *Orbignya*, is exclusively American, except only *Cocos nucifera* and the *Eleis*.

For garden purposes the majority of the species of *Cocos* are of known value, the most popular in this respect being *C. Weddelliana*, which is too well known to require describing here. Next in importance come *C. plumosa*, *C. flexuosa*, and *C. botryophora*, which are tall, slender growing Palms, with very long, erect, and graceful dark green foliage, most effective in groups of foliage plants, and suchlike. *C. insignis* is very like *C. Weddelliana*, but owing to its being rather difficult to cultivate as compared with the easily managed nature of the latter, the recent introduction does not appear to be much sought after. A tropical moist temperature suits all the *Cocoses*; their seeds germinate readily if sown in a heated bed, and kept very moist. *C. nucifera* is not easily cultivated in glass-houses. It was successfully managed at Syon House about twenty-five years ago, where it flowered, but the extraordinary high temperature both at the root and overhead which was applied to this plant before such a result could be obtained was such as does not fall within the means of any ordinary garden (see *Gardeners' Chronicle*, 1862, p. 189, with fig. At Kew there are two rather large plants of the Cocoa-nut, and it is hoped that the high temperature now kept in the Palm-house will prove sufficient for them. According to Seemann it was not unusual years ago for this Palm to thrive under cultivation in plant-stoves until it attained the age of eight or ten years, when it invariably sickened and died. There may be a useful hint in the saying of the Cingalese, that "Cocoa-nut trees do not thrive unless you walk and talk amongst them," indicating that the trees require constant and careful attention. Possibly the aid of sea-water, with which the roots of these trees are frequently watered in tropical countries, is needed for their successful management here.

### LYCOPODIACEÆ.

PTERIDOLOGISTS will be pleased to learn that two very interesting Lycopods have recently been added to the collection of living Ferns at Kew; they are *Phylloglossum Drummondii*, a truly remarkable little plant, not much more than 1 inch high when fully developed. The root is composed of two ovoid tubers, each of which will produce a plant, and develop a pair of tubers the year following; these tubers are as small as a pin-head, and are white and fleshy. The leaves, which are deciduous, are terete and subulate, half an inch long, and are arranged in a little rosette, from the centre of which an erect cone-bearing peduncle is developed. This cone is composed of imbricating scales, in the axils of which are the capsules containing the spores. It is stated that nothing is known of the process of fertilisation or reproduction in this plant, and it is for the purpose of obtaining knowledge on these points that these plants have been procured by the Kew authorities. The second plant is *Tmesipteris Forsteri*, which has a habit somewhat similar to the allied Lycopodiums, but differs in having the leaves arranged in threes and in their being large, falcate, and bilobed, with the capsule seated in the base of the fork. This capsule is large (quarter of an inch long), and contains the spores; altogether a very singular plant, as may be seen by the Kew specimen of it, which is placed in a case along with Filmy Ferns. Some spores of this plant have been sown at Kew, and as these appeared good—having been ripened on the plant before it was imported—there is some hope of their vegetating. It would be worth the while of any one possessing any plants of Lycopodium or Psilotum to sow their spores under various conditions, as it does not appear that any one has ever yet succeeded in raising plants from spores of any of the genera belonging to Lycopodiaceæ, except *Selaginella*. It seems not improbable, however, that the spores produced under artificial cultivation are not perfect; I have tried such spores in various ways, but have never had any success. There is great scientific interest attached to the reproductive process in the plants of this order. *W. A.*

### THE CULTURE OF THE POTATO.

FIELD CULTURE.—The field crop is the one of the greatest interest to the nation, and as matters stand at present that crop can only be reckoned as a paying one when it is up to or over the average as regards quality and free from disease; on the other hand, when there is a general good crop the prices rule very low. At the end of the season last year I purchased Potatoes of the best quality (that designated "ware" by the growers near London) at 3s. per hundredweight. Later they were sold as low as 2s. 6d. The next quality, "middlings," were 6d. less, and "chats" were 1s. less. At the highest price this would give an average of £2 10s. per ton, and, say, the average of the crop over a large farm was 7 tons per acre, it would give £17 10s. per acre, and this allows nothing for waste. Now I am in a position to state that the cost of producing an acre of Potatoes in the district where the above crop was grown averages £20 per acre; that, of course, includes rent, rates and taxes, manure, labour for cultivating the ground, &c., as well as delivering to the consumer. The cost of manure is usually a heavy item, and the land is expected to grow the following crop without manure, but the Potatoes take the largest share of it, especially if the crop happens to be of the "Champion" variety.

The farmers are very careless in the way they treat the Potato plant, especially towards the end of the season. The latest sets are perhaps "snibbed" twice, and shovelled from one place to another during the process. The operation of planting is generally done at so much per acre, and the men hurry over the work. They use as a dibber an implement shod with a round iron head, which, driven into heavy wet soil, makes a hole that will almost hold water; a boy follows, dropping a Potato into each hole. The result of careless cropping, combined with bad management of the tubers, is often seen in an irregular crop. Some of the farmers have a belief in certain dates to begin planting. The 14th of February is a popular date, and on large farms the planting period extends over six weeks or more. It behoves farmers, market

gardeners, and those in charge of private gardens, to make the most of the Potato crop. The sets ought to be put in the ground in such a way that no water will lodge around them before they sprout, and the soil should be well and deeply cultivated to permit of the roots growing away freely at first, and the tubers to form without any check to their growth. A former President of the Royal Horticultural Society (Mr. Thomas Andrew Knight) experimented very much with the Potato, both as a field and garden crop. He was very careful to be exact in his experiments, else one would be inclined to doubt the correctness of some of his statements. He planted some Ashleaf Kidney Potatoes in his garden, and the produce calculated per statute acre was 670 bushels of 80 lb. each, that is at the rate of 24 tons per acre, and in his letter he says:—"To obtain these vast crops of the Ashleaf Kidney I always plant whole Potatoes, selecting the largest I can raise, and for a very early crop those ripened early in the preceding summer and kept dry. I usually plant them on their ends, to stand with the crown end upward, and place them at 4 inches distant, from centre to centre, in the rows—the rows 2 feet apart, and always pointing north and south." He says further:—"I plant my large Potatoes much in the same way, but with wider intervals, according to the height which the stems attain; thus, one which grows a yard high, at 6 inches distance from centre to centre, and 3 feet 6 inches or 4 feet between the rows, never cutting any Potato, or planting one of less weight than a quarter, but generally half a pound. By using such large sets, I get very strong and large plants, with widely extended roots, very early in the summer." Mr. Knight further adds, "The blossoms take away a good deal of sap, which may be better employed in forming tubers; and whenever a Potato produces seeds I think it almost an insuperable objection to it." The time of planting is of great importance, but it is at the same time very difficult to decide when to do it. Before the disease came in 1845 late planting was more the rule than it is at present. By late planting we escape the spring frosts, but we are more likely to catch the disease. Frosts of considerable intensity are not uncommon in the first and second week of May, and I read in the *Horticultural Register* for 1831 that they were prevalent at that time. The Editor of the *Domestic Gardeners' Manual* says that the fatally destructive frost of May 6, 1831, destroyed every Potato leaf that had emerged from the ground. In 1860 we had 8° of frost on May 8. In 1867 a severe frost killed the Potatoes on May 8, after the thermometer the week previous had been 85° in the shade. Taking these chances into account the farmers think it is better to plant early and risk the frost rather than to plant late and risk a probable loss by disease.

#### GARDEN CULTURE.

To obtain the best results the preparation of the ground is of very great importance. The ground should be well dug up as soon as the previous crop has been removed, in order that it may be well pulverised by the winter frosts. Our earliest crop is planted in two ways: one set of tubers is placed in single layers in boxes, and the boxes, in which have been placed 2 inches deep of fine soil, are placed in a cool greenhouse, vinery, or Peach-house; they are not covered with the mould, but merely pressed into it. When sprouted an inch or two they are carefully planted out without injuring the growths. The other portion is planted out on the first favourable opportunity after February 1 on an early border. The ground having been deeply dug and manured in the autumn, we begin at one end and lightly fork it over, planting the Potatoes as the work proceeds; this system does away with the necessity of treading on the ground afterwards. Another plan is to draw drills, as for Peas; place the sets in the drills and then draw the earth over them, forming a ridge. I am planting for the earliest crop this year the old Ashleaf, Uxbridge Kidney, and Veitch's Improved Ashleaf. The two round varieties are Sutton's Early Regent and Lady Truscott. They gave great satisfaction last year. Victoria is still a great favourite with us, and for the latest of all Champion. I do not cut the tubers of any kidney Potatoes, nor of Victoria. I ventured to cut some very large tubers of this last-named variety one season to make them plant more ground, but a large number of the cut sets did not grow at all, and there were many blanks. I would urge the importance of waiting if necessary until the ground is dry before planting Potatoes on it. The plants are not likely to do so well when planted on wet ground; this remark applies more particularly to heavy soils. J. Douglas.

### THE EUCHARIS MITE.

[WE are now enabled to publish illustrations of this mite, taken from Mr. Michael's paper in the *Journal of the Royal Microscopical Society*, and have added a copy of the figures given by Claparède, making the necessary correction.]

There is another member of the family of Tyroglyphidae (*Rhizoglyphus Robini*) which has been making itself unpleasantly conspicuous in this country in 1884. It was first described by Claparède\* in 1868; he found it upon Hyacinth, Potato, and Dahlia roots; he describes it, names it, and figures both the male and female with his accustomed skill and exactitude, but, by some strange error, he has misplaced the

FIG. 77.—THE BULB MITR: GREATLY MAGNIFIED; ♂ MALE, ♀ FEMALE, AFTER CLAPARÈDE.

FIG. 78.—HYPOPIAL FORM OF THE BULB MITR: DORSAL AND VENTRAL SURFACES.

The detached sucker-plate magn. 300 diam. After Michael.

sexes, calling the male the female, and *vice versa*. I have not even noticed the species in England until 1884, but it may probably have existed, for I have not ever searched for it. In the latter half of 1884 I have been receiving it from numerous quarters, always accompanied by complaints of the damage it was doing. The first instance came from the Duke of Sutherland's famous hothouses at Trentham. Mr. Stevens, the skilful and energetic head of that establishment, found the Eucharis bulbs in their hothouses attacked, and sent some to Mr. E. Bostock, of Stone, for microscopical examination. That gentleman detected a *Rhizoglyphus*, and despatched the bulb to me in order that I might identify the species. Mr. Bostock also sent me about the same time a Hyacinth bulb for examination for other purposes, which I found to be swarming with the same *Acarus*. About the same time I received it from Exeter, from Mr. Parfitt, and from numerous other sources. The mite not merely attacks the exterior of the bulb, but also forces itself in between the scales, and thus devours the fleshy parts of the interior, the wounds thus caused becoming coated in the case of the Eucharis bulbs with a hard brown gummy matter. The Hyacinth bulbs were utterly destroyed. It would seem wise therefore that at present importations of Dutch or other European bulbs should be submitted to some examination before being mixed with other bulbs of value; and that, if they be infected, sulphur, carbolic acid, or some other insecticide should be tried.

In keeping the present species, I soon began to breed Hypopi from the nymphs. The Hypopus is very different from that of *T. corticis*, not only from its greater size, but also from its shorter and broader form, different sucker-plate, the entire absence of the eye-like organs, and many other particulars. In this instance again I found what seems to me strong confirmation of my view as to the circumstances under which Hypopi are produced. The *Rhizoglyphus* was swarming on the Hyacinth bulbs; both sexes were thriving; breeding was going on very much more freely than the owners of bulbs would approve of; the creatures were all only too healthy, and were not in any way dried up or subject to any adverse circumstances; and yet Hypopi kept on appearing in large numbers, and, at the moment of writing this, they are swarming in my cells, accompanied, both there and on the bulbs, by numerous smaller Hypopi, being those of some species of the genus called *Serrator* by Ménézin (his original *T. rostro-serratus*), *Philostoma* by Kramer, and *Histiostoma* by Canestrini and Berlese. A. D. Michael.

### CHRYSANTHEMUM LA NYPHE.

THE illustration on p. 441 (fig. 79) represents a fine specimen of an imbricated white variety flowered last autumn by Mr. E. Wills, gardener to Mrs. Pearce, Bassett, Southampton. It is stated that the variety lends itself capably to the culture imposed by specimen growing, the habit being profuse as regards lateral shoots, which in the plant figured were much less stiffly trained than is usually witnessed in the imbricated section of the Chrysanthemum. The flowers are white, and the plant speaks itself for its abundant blooming habit.

### PEACH TREES UNDER GLASS.

As Peach tree forcing is sometimes disappointing to the inexperienced, it may be well to point out the chief causes of failure, as well as suggest the best and readiest means of overcoming them.

#### THE HOUSE.

Supposing a Peach-house intended for very early forcing is about to be erected, I would recommend that it should be either a lean-to or a hip-roofed house, supported by a back wall. The house should be from 13 to 15 feet wide inside; the front wall should be about 3 feet high, and the front sashes about 2 feet 6 inches or 2 feet 9 inches deep; the front roof springing from these should be placed at an angle of about 35° or 37°. This elevation of roof may be greater than the general run of those for early Peach-houses, and may be objected to by some practitioners as being calculated to produce too arid an atmosphere, but I would here remark that early Peaches succeed admirably under such a roof because the sharp pitch catches every ray of sunshine at mid-winter and early spring, which is of far greater importance to them at this season than a stiller and moister atmosphere would be. For the same reason the position selected for the house should either face due south or incline a little towards the south-east, and it should be in an elevated position where neither trees, buildings, nor other objects can possibly intercept a single ray of sunshine. Whether the house be constructed of wood or iron—and I must admit, for this special purpose, I would give the preference to the former—it should be constructed so as to admit as much light as possible. With the present improved method of glazing there is no necessity for thick bulky rafters, provided they are

\* "Studien an Acariden," *Zetschr. f. Wiss. Zool.*, xviii. (1868), p. 506, pl. 38, figs. 7-11.

sufficiently strong, with the assistance of the internal truss-rods or supports, to give stability and security against all weathers; that is all that is required.

#### GLAZING.

As to the methods of glazing there are now so many systems in force that it is rather difficult to determine which is the best, but my own experience leads me to recommend that system which is now termed the dry method, where the upright edges are simply butted against each other, and where a lap of at least  $1\frac{1}{4}$  inch is allowed at the bottom of each square, where the purlins to which each square is secured by two or more clips of well prepared wire,

houses as being both chilly and drippy, and therefore quite unsuitable for the purpose of early forcing. I cannot help thinking that such persons have either not proved them personally, or else they have had experience only of such as have been badly constructed; be that as it may, I can only assert that they have as early peacheries far exceeded my most sanguine expectations. For the last six years I have found no difficulty in ripening Peaches in them by the end of April without an unusual amount of fire-heat which fact speaks for itself. As to the charges of coldness and drip they are simply incorrect. If the angle of the roof is what I have recommended, the glass good, carefully chosen, and

at the base of the house, at the back as well as at the front; the top ventilators should open about 2 feet wide the full length of the house: these lights may be all on one side of the ridge or in alternate lengths of about 4 feet on either side, as may be thought advisable. The ventilators at the base should be made of sliding shutters about 2 feet long, with similar intervals between them; they should be arranged in the front and back wall, immediately below the hot-water pipes, so as to ensure the air in cold weather being warmed as it enters the house; the front sashes should also open, although it will not be necessary to use them except in the hottest weather. Four 4-inch pipes will be required

FIG. 79.—CHRYSANTHEMUM LA NYMPHE. (SEE P. 440.)

or other similar material, should be fixed to the rafters, and which should be the exact thickness of the lap, *i.e.*,  $1\frac{1}{2}$  inch. The weight of glass should be fully 21 oz. to the foot, and if the position be a particularly breezy one, 26 oz. to the foot will not be any too stout. In purchasing the squares, which should be exactly 24 inches long by 18 inches wide, care should be exercised to select those only whose edges are perfectly straight and even, and in arranging them on the roof the convex side of the squares should always be placed uppermost, nor should the junction of any two squares be in an exact line with that of the two immediately below them. The wire or other metal clips are usually secured to the purlins by  $\frac{3}{4}$  inch screws, but for many reasons I would recommend flat-headed copper tacks of the same length, as being equally secure and more preferable. I am well aware that many good authorities condemn these dry glazed

properly fixed, there need not be any doubt about them answering perfectly. They possess a few important advantages over sashed houses or such as are glazed on to the rafters, inasmuch as there is a gentle stream of air passing through the roof at all times, which effectually prevents the possibility of a stagnant atmosphere, even when the ventilators are closed; this in Peach forcing is most beneficial. Much less wood is required in forming the roof, the light is consequently greatly increased. Repairs are almost *nil*, and as there is but little wood exposed to the weather, painting is reduced to a minimum.

#### VENTILATION.

The internal arrangements have now to be considered. In the first place ventilation should be ample, not only at the apex of the roof, but also

along the front of the house, and two 4-inch along the back and ends, so as to ensure a sufficiency of heat in the severest weather without the necessity of having the pipes too hot.

#### TRELLISES.

The form and method of arranging the trellises will also have to be considered; longitudinal ones, describing an arc from the front to the back path and immediately below the glass, are generally preferred, and doubtless when heavy rafters and small squares were in use this was the only arrangement calculated to ensure sufficient light for their successful growth. Since this objection need no longer exist, there is no reason why this form of trellis should be used, as in these modern built houses there is more light admitted at their base than there was in the former ones immediately under the roof.

This being the case, transverse trellises placed under each rafter at intervals of about 5 feet 6 inches, extending from the front to the back wall, leaving an arch over the back path, not only give an increased surface for training, but by this arrangement another great advantage is gained, as the light on the back wall is in no way obstructed, while experience has proved that the fruit at the base of the trees not only swells, but colours and ripens to perfection. Double trellises under each rafter placed about 6 inches apart, and where the trees are placed back to back, have also been tried with the best results, and without any ill effects being perceptible. This of course gives double the amount of training space, a greater number of varieties can be planted, thus ensuring a greater variety, and a much longer succession of fruit. Two shelves can be arranged to the full length of the house along the front, one at the base of the sashes and one immediately under the rafters, while two more can be arranged over the back path near the ventilators, and one on the back wall. These five shelves will be exceedingly useful for forcing Strawberries, or for the growth of any other plants needing an intermediate temperature. The preparation of the borders next demands attention, and as this is perhaps the most difficult work to perform, at least to amateurs and young gardeners with but little experience, I must take another opportunity to describe the method of preparing them. T. J. C.

## Orchid Notes and Gleanings.

### ORCHIDS AT LAKE HOUSE, CHELTENHAM.

G. NEVILLE WYATT, Esq., has a model collection here, which, while containing no failures, can boast of having obtained a great number of victories over subjects which are generally wont to be troublesome, and several of which are now in bloom. Among these may be noted well-flowered plants of the beautiful *Oncidium Phalaenopsis*, with flowers 2 inches in length and snow-white labellum over  $1\frac{1}{2}$  inch across—lovely and marvellous sprays of flowers for such tiny plants to bear. One of them has flowers with the petals and base of the labellum heavily blotched with violet, and another is simply dotted over with the same colour. It, as well as all the other of the *O. cucullatum* section, is a fine plant for a cold house. *O. cucullatum giganteum*, with its large rose-coloured lip, and other fine forms of it, are in bloom and doing equally well. *Lælia harpophylla*, too, is a blaze of orange-scarlet, some of the flowers being 3 inches across, and nine on a spike; they arrange very effectively with the beautiful *Dendrobium Jamesianum* and the magnificent varieties of the snowy waxlike *Odontoglossum pulchellum majus*. *L. harpophylla* receives special treatment at Lake House, and as under it weak plants grow into strong ones it may be well to note it. The plants are grown in a still shady corner of the north side of the intermediate-house, where they are liberally watered when growing, and not allowed to get dry when at rest. Want of water and too much sunlight is here supposed to be the commonest causes of failure with this plant. *Odontoglossum Edwardii*, which is supposed to be a difficult plant to grow, is producing its heavy sprays of violet-coloured sweet-scented flowers under similar treatment to that given to *L. harpophylla*, but in a cold house.

The principal range is divided into four compartments, the first being for East Indian plants, the second for those requiring intermediate temperature, such as some *Cypripediums*, *Bolles*, *Pescatoreas*, *Odontoglossum vexillarium*, *O. Roelzii*, *O. Phalaenopsis*, *Cymbidiums*, &c.; and the third and fourth to cool Orchids, of which a very sound and clean lot are there established. Among the warm-house plants *Aërides Lecanum*, *Phalaenopsis violacea*, *P. grandiflora*, *P. Schilleriana*, and *Angraecum sesquipedale* are fine. In the next division the massive white blooms of *Cymbidium eburneum*, 5 inches across, are superb, and tell well in the contrast with *Lælia harpophylla*, *Odontoglossum pulchellum majus*, *Cypripedium villosum aureum*, *C. Boxallii*, *C. Lowii*, *C. Sedeni*, *C. concolor*, *C. lævigatum*, and *C. insigne* and barbatum varieties. The cool-houses have fine spikes of *Odontoglossum Alexandræ* varieties, *O. Andersonianum*, *O. bictoniense*, *O. cirrosum*, *O. gloriosum*, *O.*

*Halli* (one a grand yellow-lipped variety, with eighteen flowers on a spike), *O. Hallii*, *leucoglossum*, *O. Insleayi*, *O. roseum*, *G. Rossi majus* and *rubescens*, *O. Oerstedii*, *O. Pescatorei*, and the beautiful *O. Sanderianum*, with its fine branched spike of sweet-scented flowers, which are like a good odoratum, with blandum lip. The *Oncidium cucullatum* varieties, *O. dasytle*, many scarlet *Sophronitis*, *Masdevallia ignea*, *M. igoea rubescens*, *M. chimæra*, and well-flowered *Lycastes* are also in excellent form.

Another span-roofed range, 43 feet by 13 feet, in two compartments, contains the *Dendrobes*; in the warmer half among them, well in bloom, being many good *D. Wardianum*, *D. nobile*, *D. Fytchianum*, fine forms of *D. infundibulum*, and *D. Jamesianum*, *D. cretaceum*, *D. Findlayanum*, *D. fimbriatum*, *D. crassinode*, *D. luteolum*, and *D. chrysotoxum*. In the cooler division, *Vandas*, *Lælias*, &c., are grown. In it *Cymbidium Lowianum* has four fine spikes of eighteen to twenty flowers each, and the *Cœlogyne cristata*, *Trentham* and *Chatsworth* vars., are very fine, some of the flower-spikes of the latter bearing seven flowers. The *Cattleya*-house, 35 feet long, has some fine forms of *C. Trianae*, *C. Percivaliana*, and *C. Walkeriana* in flower and a good show of buds, sheaths, and clean healthy foliage. The plant-houses and vineries at Lake House also contain various Orchids, including *Dendrobium bigibbum* and *D. Bensoniæ*, and at one end of the Melon and Cucumber-house, over a tank of water, *Dendrobium Dathousianum* thrives wonderfully well, having growths on it about 6 feet high. *Peristeria elata* (the Dove Orchid) also grows and flowers well in the same. The *Azalea*-house is used for resting *Dendrobes*, &c. Everything which comes into Mr. T. Simcoe's (the gardener) hands seems to be so sensibly and skillfully treated that it at once settles comfortably down, and in due time gives its flowers in more than usual profusion as a reward for the care bestowed on it—as witness the grand specimen of *Dendrobium Falconeri* growing on a tree Fern stump which sometimes bears nearly 300 of its large showy flowers; the superbly bloomed *D. superbiens*, *D. bigibbum*, *D. Fytchianum*, *D. Jamesianum*, *Epidendrum bicoloratum*, and many other things which certainly want good culture to grow and flower well.

### ORCHIDS IN FLOWER AT THE YORK NURSERIES.

When walking through the houses at the Messrs. Backhouse's lately, I was particularly struck by the fine display of flowers of *Cattleya Trianae* in the large *Cattleya*-house, which has been described in your columns on several occasions. The plants are grown, as has been aforesaid, on the non-shading system. I am informed the percentage of bloom-sheaths is larger than usual this year, thus proving that the late hot summer has not in any way injured the plants, as was feared by some orchidists who visit these nurseries in the summer season. It is perhaps only right to mention that the plants are much further from the glass than is general in smaller houses that do not let in such a flood of light and that an abundance of air is given when the weather is at all favourable. There were about 800 flowers open when I was in, amongst them were some very fine varieties, one named "magnifica" being especially so. It is a fine bold flower, with pinkish-rose petals and sepals, and a splendid magenta-purplish coloured lip with a handsomely frilled white margin, the flowers were fully 8 inches across, and the plant had nine flowers open in an 8-inch pot. Amongst other *Cattleyas* there were fine varieties of *venosa*, *aureum*, and *citrina*, the latter growing on small blocks hung up near the glass in an intermediate-house, and here *Lælias* of sorts were in good health. In the same house were also a fine batch of *Cymbidium eburneum* in bloom. In the *Odontoglossum*-house I noticed some very fine varieties of *O. crispum* and *Pescatorea*, and the plants generally were in a good healthy state. H. J. C.

### ORCHIDS IN FLOWER AT KINGSBURY HOUSE, SHORTLANDS: E. HARRISON, ESQ.

A grand display of *Cattleyas* is now in flower in the houses here—between 200 and 300 expanded flowers in one house—the greater part of which are of the *Trianae* section. The innumerable varieties vary considerably, some having the fine form of *C. chocoensis*, one particularly noticeable being a white form, very fine; *C. Warszewiczii* also is open, some *C. Mossiæ* also; amongst others, several fine forms of *Cattleya citrina*, *Lycaste Skinneri*, *Trichopilia suavis*, *Odontoglossum Roelzii* and *pulchellum*,

*Bletia hyacintha* and *Cœlogyne cristata*. In the cool house some fine varieties in great number of *Odontoglossum Alexandræ*, *O. Rossi majus*, some very good, deep, well-marked varieties; good *O. gloriosum* and *O. triumphans*, and a fine form of *O. Andersonianum*. There are a great many spikes showing, and a good display will be kept up for some time. This collection is doing remarkably well, and of late years has been very much increased. Great credit is due to Mr. King, the head gardener, for the practical manner he handles this collection. A. O.

## FORESTRY.

### NURSERY WORK FOR APRIL.

THE present month may be considered that in which the annual routine of forest work should be wound up for the year, but as, in all probability, there will be arrears in various departments, no effort should be spared to get these attended to before commencing the important operation of bark stripping. Nursery work will still demand great attention to finish the sowing of seeds, the transplanting of seedlings, and grafting of ornamental trees. As a guide to seed sowing we may state that about 1000 seedling plants to the square yard is considered ample nursery space; also that a sample of coniferous seeds of average quality under favourable circumstances produces about two-thirds of good germinating seeds. The number of seeds contained in 1 lb. each of the different kinds is about as follows:—Larch, 64,000; Scotch Fir, 69,000; *Pinus austriaca*, 24,000; *P. Strobus*, 31,000; *P. Pinaster*, 11,000.

### PRUNING.

The pruning of all evergreens should be completed as soon as possible, and as has been before stated under this heading, every precaution ought to be taken to prevent cattle, horses, or sheep, getting access to the prunings. Yew and Laurel or *Rhododendron* trimmings are especially dangerous, more particularly when in a half-withered state, and should be burned as the work of pruning proceeds. Remove Ivy from trees, walls, and other objectionable places, and where an annual trimming or pruning is given, the present will be found the best time to proceed with the work. Prune off dead and twisted branches, and paint the wound, after being carefully dressed with an adze or sharp knife, with tar or one of the several compositions specially prepared for the purpose. All rival leaders on coniferous and other trees should now be removed, as well as straggling side branches, so as to produce a well balanced head. In the nursery management of trees pruning is too often neglected, but this should not be so either as regards branch or (in the case of several hardwoods, notably the Oak) root.

### FENCING.

The duties of the fencers will now be many and varied, such as the guarding of newly planted trees and shrubs against the attacks of hares and rabbits, staking or wiring of recent transplants, reparation of tree-guards, and attending to plantation fences generally. Rabbits and hares have a particular relish for trees when newly transplanted from the nursery border, and it requires the utmost vigilance on many estates to guard against their depredations. Surrounding the clumps or single trees with wire netting is certainly the most effectual preventive against injury by game, but where extensive planting is engaged in from year to year this method is both troublesome and expensive. In the case of shrubs, we find it a good plan to stick a few branches amongst them, which are painted with tar every week, the smell being a powerful agent in keeping these pests at bay. Tarring the stems of trees and shrubs is highly objectionable, not only as regards the injurious effect on the plant's system, but from a point of appearance as well.

### HEDGING.

Hedges of various kinds may still be formed, but the Hawthorn, being of early growth, should not now be disturbed. Holly, where care is taken in the removal, may now be planted with success, as well as Yew, Box, Privet, *Berberis* of various kinds, the *Ma-honia*, *Laurusticus*, and *American Arbor-vitæ*. For lawn or nursery purposes we find the Yew and *Arbor-vitæ* of great value, but the former should never be

planted within access of farm stock. Neglected or overgrown fences may now be cut over with advantage, but the sooner the better. Clean by hoeing or slightly forking over the sides of existing fences, which will materially assist in the producing of strong useful hedges. *A. D. Webster, Penrhyn Castle, North Wales.*

## The Flower Garden.

### ANNUALS.

This is the best time to sow seeds of all the many kinds of hardy and half-hardy annuals. Many of these are so beautiful, especially the many improved and new varieties, but far too numerous to mention in this notice; nor is it necessary, as they can be readily ascertained in seedsmen's catalogues. Of such things the tenderer kinds should be sown in pans or boxes, and placed in gentle heat, and when large enough they should be pricked off into other boxes or frames. The border kinds may be sown thinly in cold frames, and afterwards singled out, or they may also be pricked out. Many hardy kinds may be sown in the open flower-beds or borders at once.

### SOME VARIETIES OF ANNUALS.

Amongst the most beautiful of the hardy annuals are the *Clarkias*, *C. pulchella*, *C. integrifolia*, and *C. marginata*. These either sown now and carefully pricked off, or sown where they are to stand, make fine telling plants. Thus grown they look far better than when dotted all over the herbaceous and shrubby borders in little patches, where the effect is frittered away by endless and unmeaning repetition. *Salpiglossis variabilis*, in many fine varieties, is well worth growing. They are rather tall, and the markings of the trumpet-shaped blooms make them very beautiful additions to any garden. *Scabiosa* in many varieties should not be forgotten; these are good also for late autumn and winter in pots in the greenhouse. *Verbena hybrida* make pretty small beds, where masses of one colour are not required, the plants being very floriferous, possessing a more robust constitution than those from cuttings. *Acroclinium album*, *Alonzoa Warscewiczii*, the several varieties of *Anagallis*, of charming blue, lilac, and scarlet, are useful for rock-work and small beds; *Browallia elata*, either for pots or groups; *Eucharidium grandiflorum*, a miniature *Clarkia*, growing about 9 inches high, dark red, useful for margins and small beds; *Cosmidium Burridgeanum*, like brown velvet, with a golden edge; *Eschscholtzia*, in white, yellow, and rose, are useful things for beds and borders; *Tagetes patula nana*, *T. lucida*, *T. signata pumila*, the latter very floriferous, and well adapted for margins and small beds.

### GENERAL WORK.

The weather has been most favourable for completing all necessary work in this department; if any still remains to be done no time should be lost in completing it. Shrub pruning, turf laying, the sowing of grass seeds, edging and gravelling the walks, should now be finished, mowing being now at hand, which will leave but little time for the execution of such without neglecting the usual routine work. Nothing tends to enhance the beauty of a garden more than well kept lawns and walks. All recently planted trees and shrubs should be carefully looked to, and if loosened by the late gales they should be securely staked and fastened, and if not already mulched this should be done at once. *W. Smythe, The Gardens, Basing Park, Alton.*

## Plants and their Culture.

*BORONIA megastigma* will now be opening its deliciously scented flowers. Do not let this plant be exposed, particularly at this period, to currents of cold air. As soon as it is past its flowering stage and has been slightly rested it should be pruned similarly to *Epacris*. A little later on *Aotus gracilimus* will need the like treatment. As soon as all of these plants that we have advised to be cut back are fairly broken into fresh growth the potting of such as need it should be seen to at once. Sound fibrous peat and silver sand should form the chief materials in the mixture used for them, and firm potting must always be practised. I always keep the plants

at this season of the year in a late vinery, which will now soon be closed, the treatment given to the Vines suiting these plants for the next few weeks. Later on, when the temperature has become higher, they must be removed, to prevent weak growth.

### RETARDING GREENHOUSE PLANTS.

It will often happen about this season of the year that a large quantity of flowering plants will advance more rapidly than is desirable, causing for a while an over-abundance of flower. In order to obviate this, some of the hardier plants should be retarded by as cool a course of culture as is safe in each respective case. Indian Azaleas will be secure in any place where the frost can be just excluded. A late batch of these is always welcome at the end of May and the early part of June. A north house or cold pits having the same aspect are useful for such purposes. In the latter a late batch of *Cinerarias* could be kept back, along with various other things. Having an extra good number of *Lachenalia tricolor* this season I have transferred a portion to a cold frame, finding this beautiful bulbous plant very durable as well as being suitable for our conservatory. The latest of the Dutch bulbs, *Spirea (Hoteia) japonica*, *Dielytra spectabilis*, and other early spring blooming plants should likewise be kept in check as much as possible, as a late batch is frequently the most useful. It is not safe, however, to retard *Deutzia gracilis*, as this useful early shrub does not develop such fine spikes of flower if kept too cool. *Azalea mollis*, and the late flowering *Rhododendrons* can always be kept in check with safety, and a few pot Roses are also useful when allowed to bloom just before those of outdoors.

### SOFT-WOODED GREENHOUSE PLANTS.

Many of these will now need extra attention, the *Pelargoniums* in various stages particularly so. These should have all the light possible and be kept near the glass, but this cannot always be done, and in such cases it is therefore best to keep them on the shelves as long as they do not touch the glass. When they are seen to be knotting for flower a liberal amount of manure water will be of much service. *Fuchsias*, if not already started into growth and repotted, should be seen to at once. Aphides will now become more troublesome among the greenhouse stock; a sharp watch need be kept against their increase. It will be found far better for the plants to give occasional doses than to leave this work till the enormous increase of the pests compels strong fumigation, &c., to be resorted to for their destruction. *James Hudson, Gunnersbury House Gardens.*

## THE VINERY.

### THE BORDERS IN THE EARLY HOUSES.

THE Grapes in early started vineries will now be near the time when they will take the final growth; before this proceeds it is very important to be well assured that the inside borders are in a proper state, and especially as regards moisture; therefore without unnecessarily disturbing many roots this should be ascertained. As Vines at this period need even more nourishment and support than at almost any other time, unless this matter is duly attended to it cannot reasonably be expected that they will perfect the fruit in the way desired—in fact, it is a customary practice to give liberal supplies of much diluted guano or other stimulants in water in a tepid state at this period every year, and no harm can possibly ensue if the drainage of the border is perfect and permits the excess to pass away freely. By this time the surface-dressing of manure ought to be well permeated with the feeding roots; if this is so, the material should be moderately watered as often as necessary, to prevent it becoming at all dry.

### VENTILATION.

The state of the weather will, at this season, often render a considerable amount of fire-heat indispensable—so much so that at certain times the heat at night would be excessively high, which should be avoided as far as possible during the time the Grapes are colouring, and counteracted by means of a chink of air being left on throughout the night when the

thermometer will not fall below 60° at daybreak, when the ventilators should be closed until such time as the temperature regains 70°; at this point it should be put on again, and be gradually increased as the temperature rises to 85° or 90°. At this point a little air should be admitted at the front ventilators; as the heat declines the quantity of air should be reduced in like manner, and the house be closed at 80°, when all suitable surfaces in it should be sprinkled over, but not in a way to overcharge the atmosphere with moisture.

### SUCCESSION-HOUSES.

In these the Vines, aided by solar heat carefully economised, will push forth leaves and make growth rapidly. In order to secure a sturdy habit with compact branches the houses should be freely ventilated. We strive to keep a little air on constantly at the apex of these houses, and do so unless the thermometer goes below 55°, when it is better to close for a time, and at 65° have all the ventilators opened. These consist of openings in front and at the top of about 18 inches square, which are gradually shut as the day declines, and the front ones entirely closed in the evening at about 6 o'clock. As soon as the Vines come into flower we keep the houses considerably warmer, and later apply the same treatment as recommended for early vineries, only giving more air considerably at all times when it can be done without ill effects. Attend regularly to stopping the shoots before they become strong. We pinch these at the second leaf above the lowest bunch, and remove the laterals entirely below it, and stop those above at the first or second leaf according to the vigour of the foliage, and to fill up any vacant space over the trellis. These, as well as the terminal shoots, are allowed to extend further where space admits. Give timely attention to thinning, which should be begun at the earliest moment possible in order to keep the matter well in hand, and to promote a sturdy growth in the foot-stalks of the berries. Moderately sprinkle over the borders about twice every day, and see that those inside borders do not want for water. *G. T. Miles, Wycombe Abbey.*

## The Kitchen Garden.

### ASPARAGUS PLANTING.

THE roots will soon be commencing growth, which should determine the time of transplanting and forming new beds. When moving them spread the roots out well in their new position before placing on them any soil, which should be well worked amongst them with the hand, making it quite firm immediately around each plant as it is placed in its new position, then cover the roots to a depth of 3 or 4 inches. A good mulch of rotten manure should be given before the shoots come through the soil. Finely crushed bones is a capital manuring, and should always be applied above the roots as a top-dressing.

### BEETROOT.

A few rows may now be sown for early autumn use, but the main crop to supply roots for use throughout the ensuing winter and spring should not be sown till the first or second week in May. To obtain properly sized roots for salad purposes a somewhat poor piece of ground is best, which should receive a dressing of soot and salt, applied a short time before the seed is sown. It is difficult during rainy seasons, even after late sowing, to prevent the roots getting too large. Large coarse roots, usually the result of early sowing, are generally light in colour and stringy.

### FRENCH BEANS.

A sowing should be made about the middle of this month, in a sunny position. Allow plenty of space between the rows, to secure room for moving between them when fully grown to gather the crop. One yard is none too much for varieties such as *Canadian Wonder*. A larger sowing should be made at the end of the month. *G. H. Richards, Somerley Gardens, Kingwood.*

THE TRUMPET OF JUDGMENT. — According to the *Moniteur d'Horticulture*, *Datura arborea* is called in France, "*Trompette du jugement dernier*," in allusion to its large white flowers. Of the two, we prefer the Latin name.

## APPOINTMENTS FOR THE ENSUING WEEK.

WEDNESDAY, April 8	Royal Caledonian Horticultural Society's Spring Show (two days). Sale of Hardy Plants and Bulbs, at Stevens' Rooms.
THURSDAY, April 9	Sale of Carnations, Pinks, Roses, &c., at the City Auction Rooms 38 and 40, Gracechurch Street, E.C., by Protheroe & Morris. Sale of Imported Orchids, at Stevens' Rooms.
FRIDAY, April 10	Sale of Valuable Imported Orchids, at Protheroe & Morris' Rooms.
SATURDAY, April 11	General Meeting of the Royal Botanic Society, at 3.45 P.M.

THE schedules of prizes offered by the ROYAL HORTICULTURAL SOCIETY at the series of exhibitions of plants, flowers, fruits, and vegetables, arranged to be held in the great conservatory at South Kensington during the present year, have been distributed, and doubtless have been scanned with no inconsiderable interest in many a gardener's home. That many other societies hold much larger exhibitions is indisputable, but no other society holds at least so many shows in the season, nor do any other shows create so much national interest, or secure higher average quality in the exhibits.

Apart from the fact that these shows are held in connection with the Royal Horticultural Society, they derive special interest and prestige from the place in which they are held, and their association with those remarkable and truly international exhibitions now being held annually at South Kensington, and which are visited by such numbers of the people. Thus it happens that the garden produce exhibited in competition or otherwise at South Kensington during the summer months is seen by such myriads of visitors that even in that respect alone horticulture should derive stimulus and benefit from the Royal Horticultural Society's exhibitions.

Last year, without doubt, the series of exhibitions held in the conservatory under the control of the Council, but really through the liberality of the Healthieries' Committee—of which that excellent amateur gardener, the Duke of BUCKINGHAM, was chairman—presented on the part of South Kensington, a new departure, the which, it is satisfactory to find, is this year to be well maintained. In some respects the shows of the present year will prove to the gardener more interesting, because they are not so entirely as last year laid in familiar lines. Then, to be *en rapport* with the Healthieries, it was largely essential that the horticultural products should be in the form of food; hence, many of the shows displayed monotony in the exhibits.

This year more variety is introduced, as, for instance, one show—that of June 9, is entirely devoted to those aristocratic exotic flowers, Orchids; and no doubt the liberal prizes offered will be instrumental in bringing together some beautiful collections. Some of our readers, perchance, will remark with surprise that the anticipated Orchid Conference of two days' duration is to be held a month earlier, and not on the date of the Orchid show, but there may be good reasons for such an arrangement—amongst others, perhaps, the instructive fact that the Conference will doubtless create an attractive exhibition without much pecuniary aid.

The shows of the Auricula and Carnation Societies come in as in previous years, and to the latter is added a number of attractive prizes for Begonias and other allied plants, so that these now exceedingly popular summer flowers may then be looked for in fine form. We have yet to see what Begonias can produce in the way of specimen plants, and hope then to have the desire to some extent gratified. The National Rose Society also holds its London show again at South Kensington this year, so that the queen of flowers will reign supreme in the conservatory for one day at least. A cottagers' show is also fixed for August 25, and

remembering the remarkable success which attended last year's display of such garden produce, can but rejoice the cottagers of the country are to have another chance. Probably some who saw last year's show thought that if this is the product of cottage gardens our professional growers must look to their laurels. It is to be hoped that in all cases the exhibitors really were what they professed to be, and that their produce was genuinely home-grown.

To gardeners generally, however, there can be little doubt that chief interest will centre round the three last shows of the schedule, and specially to the one of September 8 and 9, which is devoted to Grapes and Dahlias. Curiously enough—and the departure is one to rejoice over in this case—there are no collections of Grapes, therefore there are no special gifts for the few big growers. There are no less than twenty-six classes for named kinds of Grapes, and one other for "any other variety" after the twenty-six kinds have been staged. Well, some other kind may be produced, it is true, but we fancy the compilers of the schedule were, in arranging this latter class, indulging in a quiet chuckle anticipatory of the "other varieties" proving to be one or other of those previously scheduled. Perhaps exception will be taken to thus giving, as it were, tacit encouragement to so many kinds of Grapes, not a few of which are of no great merit. It is obvious, however, that the classes are intended to have an educational result, and it is hoped may lead to much needful revision in Grape nomenclature. In some classes, no doubt, the competition will be large, in others indifferent. According to the list of prizes good classes and bad ones are to fare alike, but it is hoped that, should some fail to fill well, the savings will be bestowed in the form of extra prizes where the competition is large and good.

The show of October 13 and 14 is devoted to Apples and Pears, and, having regard to the present fruit prospects, a really grand display of these serviceable fruits may be looked for. That there are fifteen single dish classes in each section of fruits shows that the competition will be varied, and produced from a wide area. The other October show, devoted chiefly to vegetables, is to be associated with a Potato Conference, of which more perhaps is expected than will be realised. In any case this show of edible garden produce will fitly close the season, and will doubtless not be the least popular one.

— THE ROYAL HORTICULTURAL SOCIETY has issued the following programme of the Orchid Conference, to be held [in the Conservatory] at South Kensington on Tuesday and Wednesday, May 12 and 13, 1885:—

## THE EXHIBITION.

Programme of the Exhibition (open to Fellows at noon on May 12, and at 10 A.M. on May 13)—

## Class I.

Collections of Orchids in flower. With a view to economy of space, exhibitors are requested to show duplicates as little as possible.

## Class II.

1. Species and varieties of the genera *Cattleya* and *Lælia*.
2. " " genus *Odontoglossum*.
3. " " " *Masdevallia*.
5. " " " *Cypripedium*.

## Class III.

1. Species and varieties of the genus *Oncidium*.
2. " " " *Epidendrum*.
3. " " " *Dendrobium*.
4. " " " *Vanda*, *Saccolabium*, *Aërides*, and *Stanhopea*.

## Class IV.—Single plants of any Orchid.

## Class V.

Hybrid Orchids—i.e., those raised by cross fertilisation. It is hoped that the parents will be shown, if possible, with the hybrid.

## Class VI.—Orchids in fruit.

## Class VII.

1. Orchids indigenous to Great Britain.
2. Hardy Orchids from any other countries.
3. Cut flowers of Orchids.

In order to ensure uniformity and accuracy, it is requested that the plants exhibited bear the labels which have been specially prepared for this Conference, and with which, through the kindness of Mr. Pollett, the Society is prepared to provide the exhibitors. Exhibitors are requested to apply for these at the Society's office on or before May 1, giving the exact name of the plants which they intend to exhibit [on a form to be had on application to the Secretary].

## CLASS VIII.

Materials, such as sphagnum and other mosses, peat and other soils, baskets, rafts, pots, pans, labels, &c., used in the cultivation of Orchids.

## THE CONFERENCE.

Programme of the Conference, Wednesday, May 13, at 10.30 A.M.:—

- Introductory remarks by the President.
  - 1. Communication from Professor Reichenbach.
  - 2. Discussion on the Hybridisation of Orchids. Opening paper by Mr. Harry Veitch, F.L.S.
  - 3. Discussion on the Cultivation of Orchids. Opening paper by J. O'Brien.
  - 4. Discussion on the Nomenclature of Orchids.
- N.B.—Two Veitch Memorial Medals will be awarded at the Conference on the recommendation of the committee.

The following gentlemen are members of the Orchid Conference committee:—

Colonel Biddome, Hon. and Rev. J. T. Boscawen, J. C. Bowring, W. E. Brymer, M.P., The Right Hon. J. Chamberlain, M.P., John Day, W. T. Threlton Dyer, F.R.S., Sir Nathaniel De Rothschild, Bart., M.P., Professor Michael Foster, F.R.S., Hulbrook Gaskell, George Hardy, E. Harvey, J. S. Hirst, Sir Trevor Lawrence, Bart., M.P., William Lee (of Downside), Major F. Mason, Rev. John B. Norman, Alexander Paterson, M.D., Frederick A. Philbrick, Q.C., Baron Schröder, W. Thompson.

## THE DINNER.

The Conference Committee have arranged for a dinner in connection with the Conference, to take place at the "Albion," Aldersgate Street, on Tuesday, May 12, at 6.30 for 7 o'clock precisely. Gentlemen wishing to be present are requested to send their names to W. LEE, Esq., Downside, Leatherhead, on or before Friday, May 8.

— THE DAFFODIL COMMITTEE.—In order that the Daffodil Committee, at its meeting at the Royal Horticultural Society, on Tuesday, April 14, may have an opportunity of examining as many new forms of Daffodil as possible, it is hoped that amateurs and others will not be frightened by the larger collections of the growers, but will send up any forms which they think to be new, even if they are able to send one form only. Mr. BARRON will take care that all such sendings are duly attended to.

— THE HAARLEM BULB SHOW.—We have received the following letter from Messrs. BYVOET:—

"We felt much surprised at reading the report of the Quinquennial Exhibition at Haarlem, in No. 587 of the *Gardeners' Chronicle*, p. 414, and fully trusting to your impartiality in such matters, we take the liberty of requesting you to insert the following rectification in the next number of your paper.

"Not Messrs. J. H. KERSTEN & Co. were the principal prize-takers, but Messrs. GEBROEDERS BYVOET.

"The highest prize was not awarded for class No. 1 of the schedule, but for class No. 9, being a Gold Medal and 50 fl.; and the Hyacinths wherewith GEBROEDERS BYVOET got the 1st prize in this class were universally pronounced the best of the entire exhibition.

"Excepting one class, in which Messrs. KERSTEN were 1st, Messrs. BYVOET secured the 1st prizes (seven Gold Medals) in all the principal classes for Hyacinths, and obtained the Gold Champion Medal given by the 'Gartenbau-Verein,' at Hietzing, near Vienna, to the highest prize-taker for Hyacinths at this exhibition.

"GEBROEDERS BYVOET."

We regret the occurrence of the errors in question, which are attributable to our scanty knowledge of the Dutch language. We trust that on another occasion an abstract of the schedule and prize list be given in French or English.

— PEARS FROM THE CAPE.—This fruit is being consigned to our markets now, some of it in fairly good condition, so that the seasons for Pears will probably overlap each other, or nearly so. We are indebted to Mr. WEBBER, of Covent Garden, for this information, that gentleman having brought for our inspection fruits of *Beurré Superfin* and *Glou Mor*.

FIG. 80.—*IMPATIENS HOOKERIANA*: FLOWERS WHITE, WITH CRIMSON SPOTS. (SEE P. 446.)

ceau. The former had been sent in rather too ripe a state, and, being unskillfully packed, had suffered in consequence. The latter, not nearly ripe, was almost unhurt by the long journey, and both were of fair size, with clear healthy rind.

— **CINERARIAS AT WOODSIDE, FARNHAM ROYAL.**—It is not too much to say that in the work of improving the Cineraria, extending over the last twelve or fifteen years, Mr. J. JAMES has made a mark beyond all contemporary florists. As a leading and successful exhibitor of Cinerarias some years ago Mr. JAMES found the tall growing types then in cultivation somewhat inconvenient for the purpose, as there was a necessity for so much tying down and out in order to secure a symmetrical shape. It is true we were then getting from the Continent a dwarf strain of Cinerarias, but they were not suited for exhibition purposes, as the flowers were by no means up to the standard of form then prevailing among our home strains. Mr. JAMES had already made some headway in the direction of procuring better formed and stouter flowers, and it occurred to him that if he could add somewhat to the dwarf and then almost pigmy growth of the Continental strains, but keeping it reasonably short and at the same time vigorous, and also develop in plants of this character flowers of the finest form, texture, and brilliant colours, he would attain to something of a highly valuable nature. That he has succeeded even beyond his most sanguine expectations was shown at the last meeting of the Royal Horticultural Society by the presence of a large batch from Woodside. Nothing was wanting in point of habit; the flowers were very large, remarkably stout, brilliantly coloured, and produced in what must be considered wonderful heads of bloom. For market and decorative purposes the strain can scarcely be improved upon; but the florist—that somewhat troublesome person who may be old-fashioned and far behind in the march of progress in a certain direction—could not look upon this strain with satisfaction, for with size had come coarseness and roughness, the presence of which is apparent to no one in such a pointed manner as it is to Mr. JAMES himself. He deserves great credit for what he has done, but he regards it only as an earnest of what he hopes to do in the future. A recent visit to Woodside enabled us to see not a few of the seedlings both of last and present year. No spot could be more appropriate for the culture of this valuable spring-flowering greenhouse plant. There is a pure air pregnant with breezy influences drawn from the woods and open fields, with not a taint of smoke to rob it of an atom of fitness; and high up near to the verge of the famous Burnham Beeches, from which one may be said to look down upon Windsor Castle lying some 8 miles southwards, no fog or damp can scarcely come. There is an abundance of turf from the gravelled country road sides, so gritty as not to need any admixture of sand; there is the best of leaf-mould from the beechen woods, and from the domain of Dropmore, lying a short distance off.

— **TEA ROSES AT HAREFIELD GROVE.**—How largely these are grown by Mr. J. GOUGH for cutting purposes is evidenced by the fact that at the present time there may be seen in two houses some 3000 plants in pots in 24 and 32-sizes, and all in the very best condition. About 1000 of this number consists of the following varieties:—Isabella Sprunt, Niphetos, Madame Falcot, Perle des Jardins, and Safrano. In addition there are all the leading varieties of Tea Roses. Etoile de Lyon, beautiful as it is, is of little value for indoor culture. Cutting commences early in January, and it is continued for about eight months in the year. In March the plants are top-dressed with some rich soil, and later on liquid manure is occasionally given. These Rose-houses appear admirably adapted for the culture of Tea Roses, and the plants are well attended to at all stages. On the back walls Maréchal Niel is planted out, where it grows and flowers with great freedom.

— **SHOREHAM PLACE, SEVENOAKS.**—The houses in the above gardens are now looking remarkably well. The Orchid-house contains many good plants in flower, notably some good Cattleya Trianae var., Coelogyne cristata, various Calanthes, a grand well-flowered piece of Dendrochilum glumaceum, suspended from the roof; Dendrobium nobile, Wardianum, and heterocarpum; Lycaste Skinneri, Lælia albida, Odontoglossums in variety; these, with some well-

flowered Anthurium Scherzerianum, and various foliage plants mixed with Ferns, beautifully arranged, produce a nice effect. At this time of year the green-houses are very gay with Cinerarias, Azalea indica and mollis, Ericas, Epacris, Primulas, and some well-flowered Cliveas, and other plants, well arranged, and looking remarkably well. The Rose-house is showing a fine crop of flowers, the other various departments being likewise well done. Peaches, Vines, &c., promise to repay Mr. BURT, the Head Gardener, for his pains in a very satisfactory manner.

— **GARDENERS' AND AMATEURS' MUTUAL IMPROVEMENT SOCIETY, WESTERHAM.**—The spring show of the above Society was held at the King's Arms Hotel, Westerham, on Thursday, March 26, the various plants and flowers exhibited reflecting great credit upon the exhibitors. It is a great pity the Society could not find a more convenient place, as the exhibits were far too much crowded—in fact, the show is well worthy of being held in a much better place. Hyacinths, Narcissus, and Tulips, were shown well, and a keen competition took place. The Cinerarias were very fine, as were also the Deutzias and Cyclamen; cut flowers were also well represented—in fact, the only drawback was the want of space to show things off better.

— **EUONYMUS JAPONICUS.**—We have frequently had occasion to note this shrub as one of the best, probably the best evergreen shrub for the sea coast, but till this year we had no idea of the extreme brilliancy of a particular variety, the young shoots and leaves of which are at this season of a brilliant golden-yellow colour, but which later on assume the deep rich green colour characteristic of the species. The gardens and plantations at Folkestone are at this moment resplendent with the golden radiance of this variety, which, when mixed judiciously with the ordinary kind, produces a splendid effect. Another fine golden shrub which will thrive in similar situations is *Spirea opulifolia aurea*.

— **MR. B. S. WILLIAMS' NURSERY.**—There is a capital show of Hyacinths, Tulips, Narcissi, and Cyclamen to be seen at this nursery. The plants are arranged on the side benches in the big show-house, and consist mainly of tried old kinds, with a few new ones intermingled. Amongst the Polyanthus varieties of Narcissi, Jaune Suprême was specially good. The Amaryllis at this nursery are coming into bloom in great numbers, exhibiting much variety in tint and form, and the display of Orchid bloom will be very abundant, judged by the great numbers of spikes appearing on Cattleyas, Vandas, &c.

— **HAREFIELD GROVE, UXBRIDGE: DINNER TO EMPLOYEES.**—A large number of workmen being employed in adding materially to the already extensive glass erections of this place, these, together with the gardeners of all degrees engaged on the place, were entertained at dinner by GEORGE WEBSTER, Esq., on the 25th ult., about 140 persons sitting down to an admirable dinner provided in the grounds. Mr. E. Bennett, of Potters Bar, was in the chair, Mr. J. Gough, the Head Gardener at the Grove, being Vice-Chairman. The company included some visitors, among them being Mr. B. S. Williams, Holford; Mr. W. Dean, Walsall; Mr. J. C. Mundell, Moor Park; Mr. G. J. Brush, High Grove; Mr. R. Dean, Ealing; and others. Testimony was borne to the liberality of Mr. Webster, and also to the admirable manner in which the gardens are managed by Mr. Gough. During the past year considerable additions have been made to the glass erections, and further additions are contemplated. It is already one of the most extensive places of the kind in the county of Middlesex.

— **FROST IN THE NORTH.**—A correspondent informs us that on the morning of March 31, the thermometer registered 9° of frost at Ulverstone.

— **GARDENING APPOINTMENTS.**—Mr. JOHN LANE, of the Loughborough Old Nurseries, as Gardener at The Brand, near Loughborough. — Mr. HAMSHIER, late of The Brand, Loughborough, as Gardener at Beau Manor Park, succeeding Mr. MACLEAN, who is resigning after forty years' service, and is liberally provided for by the family he so faithfully served.

## IMPATIENS HOOKERIANA.

THE flowering of this very handsome species—perhaps the largest flowered of all—is so rare, that a note of the culture of the plant in the Cambridge Botanic Garden, which produced the specimen here illustrated (fig. 80), may be of interest. It has lately flowered at Kew, but from the fact that it may grow and flourish in leafage for years without flowering, it has probably been the subject there of special culture. From Cambridge experience I find that it is by no means easily flowered, for last year we had a fine plant which produced buds only, that failed to reach any considerable size, and it, like our specimen of this year, was the recipient of every care and attention. We have now a plant 4 feet across and 2 feet high which has produced about forty flowers, during a period of about three weeks—sixteen flowers being the largest number open at one time. The cutting was struck in February and the plant was grown on till May, it was then rested in a greenhouse and kept fairly dry until September, when it was started, without repotting, on a shelf near the glass in the warm Orchid-house. When shifted the last time it was potted rather low down, so that the lower branches might root into the soil, which they had shown inclination to do; and now from this lowering in the soil the specimen presents the appearance of being made up of several plants. The main features of successful culture appear to consist in a period of thorough rest, and the giving of that liberal treatment which all Balsams love, during the season of growth. The reason why the buds of our plant did not mature last year is probably that culture in the spring was not commenced early enough. The result above described has been attained by the special care and attention devoted by Mr. A. Cowan, the foreman of these gardens. *Impatiens Hookeriana* was introduced to Kew by seeds from Ceylon, sent by the late Dr. Thwaites. It was flowered at Kew in 1823, and a figure was published in the *Botanical Magazine*, t. 4704. The umbels are described as producing from four to six flowers, but in no case had we more than five. The flowers are chiefly white, but spotted and clouded with blood-red on the lower part of the flower towards the orifice leading to the spur. Including the spur the flowers are 3 inches in vertical diameter; without that addition they measure 2 inches, and they are 1½ inch across. Our illustration shows their fine character. *R. Irwin Lynch.*

## FRUIT NOTES.

**KING OF THE PIPPINS APPLE.**—I, like your correspondent Thos. Joos, was surprised that the Apple Congress should decide by such a large majority in favour of the above Apple. I take great interest in Apple culture, and have had great opportunity of testing the quality of Apples grown in the Midland Counties, and am of opinion that King of the Pippins as a dessert Apple is quite third-rate; its principal point is appearance, but even in that it is distanced by many, among others Wyken Pippin, which is superior in appearance, aroma, sugar, and market value. Cox's Orange Pippin is certainly one of the very best dessert Apples all round in this locality for crop, shape of fruit, and flavour. *John Pope.*

### FRONTIGNAN GRAPES.

How seldom one sees our old friends, Grizzly Frontignan, Chasselas Musqué, and Purple Constantia, at horticultural shows; and yet in flavour they are simply exquisite. Many country gentlemen will not allow any other Grapes to appear at dessert whilst the Frontignans are in season, as they prefer perfume and flavour to mere size. The new Grape, Dr. Hogg, and Purple Constantia, are like all the Frontignans, well adapted for pot culture, and do not crack, but they are little known in the country. The Frontignans are very fruitful, come into bearing early, and some of them will thrive in any sunny corner of greenhouse or viney. Purple Constantia is worthy of the Muscat-house. The writer has backed his opinion by offering special prizes for the best collections of Frontignan and Round Muscat Grapes. See schedule of the Royal Horticultural Society, South Kensington, for 1885. *W. R.*

### PEAR, BEURRÉ FLON.

On p. 308 we figured this Pear, which, according to all we can learn about it, appears to be a synonym of Bonne Antoine. The description of this latter in *Leroy's Dictionary* differs from that of the former but slightly, and these variations are such as might be induced by climate or season.

## THE PHILIPPINE ISLANDS.

THE Philippine Islands are well known as the home of several beautiful species of *Phalenopsis* and *Cypripedium*, of the superb *Vanda Sanderiana*, and of several other handsome Orchids which ornament our gardens; and also some of those marvels of the vegetable kingdom—the *Rafflesias*. Consequently we should anticipate that an outline of the vegetation of the islands generally would reveal some interesting particulars. Until recently very little reliable information on this point has been available, beyond that contained in Blanco's *Flora de Filipinas*, and in various scattered publications. The late Mr. Benthham wrote, in the *Flora of Hong-Kong*:—"Looking to the Philippine Islands, it is very difficult to obtain any definite notion of their vegetation. We have no serviceable general Flora of the Philippines, for Blanco's species require re-identification." A new edition of Blanco's work has recently been published, with a Latin translation, and 468 chromo-lithographed plates, both of which materially enhance the value of the work. An appendix to this work contains an enumeration of the plants believed to grow in the islands, with an attempt to re-identify Blanco's plants. The work is well conceived, but unfortunately it falls far short of the ideal; for the species are identified from book descriptions only, without comparison of specimens, and the result is that a large number of plants are included which there is good reason to believe do not grow in the islands at all. In a recent number of the *Journal of the Linnean Society* is a paper by Mr. R. A. Rolfe, of the Kew Herbarium, "On the Flora of the Philippine Islands, and its probable Derivation," from which we condense the following:—

The Philippines form a large group of volcanic islands, situated between Formosa and Borneo, and extending over 9° of latitude and 14° of longitude; or, if the Sulu Archipelago be included, which now, in common with the rest of the group, belongs to Spain, they extend over 16° of longitude. They are for the most part surrounded by deep sea, though with several submerged banks, which indicate former connections with neighbouring islands. One of these banks stretches northward in the direction of Formosa, a second from near Manila by a long chain of islands to the northern point of Borneo; a third by way of the Sulu Archipelago from the southern point of Mindanao to north-east Borneo; and a fourth from the south-eastern point of Mindanao to the remarkable island of Celebes. The two largest islands, Luzon and Mindanao, are each of about the same extent as Ireland, and each contains a number of high volcanic peaks, where a few *Rhododendrons*, *Vacciniums*, and other tropical mountain plants are found; while the lower elevations are clothed with dense forests of tall vegetation. The fauna has been pretty well worked out. The terrestrial mammalia are very limited—twenty-one species, but of these nine-tenths are peculiar to the islands. Of land birds two-thirds are peculiar to the islands, and of water birds one-tenth; a larger proportion of peculiar species than is found on any of the Malayan islands. This would lead us to infer that a study of the vegetation would reveal some equally interesting facts. A set of about a thousand plants was brought to Kew by Don Sebastian Vidal, conservator of forests in the islands, and it fell to Mr. Rolfe to assist this gentleman in the elaboration of the plants, the outcome of which is the aforementioned paper. After an outline of the various works dealing with Philippine plants we find a census of genera and species, with a column showing the endemic element in the flora. This table shows the number of flowering plants to be 3466 species, belonging to 1002 genera, of which six genera and 915 species are peculiar to the islands, or a proportion of over one-fourth endemic. The number of Ferns growing in the islands appears to be 467, of which fifty-two are endemic—a fact which stamps the islands with a marked individuality, as Ferns generally have a wider range than most plants. The Orchids are estimated at 460 species, of which 110 are endemic. The small number of endemic genera, as compared with some of the neighbouring islands and with the large number of species, is pointed out as a remarkable feature.

The affinities of the flora with neighbouring countries is next pointed out. The general features are decidedly Malayan, many of the genera having a wide range in the Indo-Malayan region, while some

have a more limited range. On the other hand, a very large number of typical Malayan genera do not appear to reach the Philippines. The same thing holds good with respect to the Philippine animals—a fact which is attributed by Mr. Wallace to extinction by submersion, of which there is abundant evidence in the presence of raised coral reefs in various directions.

One of the most striking features in the flora is the presence of a few plants of decidedly Australian type, as *Osbornia octodonta*, a remarkable monotypic genus of Myrtaceæ, hitherto only known from Australia; *Xanthostemon Verdugonianus*, a new species of a genus formerly thought to be confined to Australia and New Caledonia; *Stachhouisia muricata*, a representative of an order otherwise limited to Australia and New Zealand, besides others of less importance. A slight connection with New Guinea and with some of the smaller Pacific islands is also traced.

Next to the Australian the northern element in the flora is, perhaps, the most interesting. We find a *Lilium*, a *Pinus*, a *Viburnum*, a *Scutellaria*, and a *Privet*; all endemic species, outliers of these typical northern genera which are well represented in the opposite Chinese region. Three endemic species of *Carex* are also mentioned. There is a second *Pinus*, *P. Merkusii*; but this occurs also in Sumatra. In comparing the plants with those of surrounding islands it is pointed out that a few Philippine plants occur also in Borneo, a few others in Celebes, and others in Java, Sumatra, and the Moluccas, respectively, though not yet known from elsewhere—a condition of things pointing to connections with these islands in the past. Between the different islands of the Philippine group themselves there seems to be a certain amount of individuality, owing to long isolation, for no less than six of the smaller islands are mentioned as having endemic species growing upon them. Future research will, no doubt, extend the area of some of these supposed endemic plants, but while so many new species keep turning up it is quite likely that some will ultimately prove to be extremely local, as is the case elsewhere. A new genus and several new species are described; the former, belonging to the Rubiaceæ, is illustrated with a plate, and is named *Villaria*, in commemoration of the labours of Father Fernandez Villar in the production of the third and much improved edition of Blanco's *Flora*.

The one remaining point to be noticed is the probable derivation of the existing flora. The conclusions of Mr. Wallace respecting the Philippines, and which were largely based on a study of their fauna, were, that they are truly insular, while the Malay islands are really continental in the essential features of their natural history. This opinion was afterwards somewhat modified, for in his *Island Life* he says:—"It is evident that the Philippines once formed part of the great Malayan extension of Asia, but that they were separated considerably earlier than Java. The reason of their comparative poverty in genera and species of the higher animals is that they have been subjected to a great amount of submersion in recent times."

It is the former of these two conclusions which Mr. Rolfe considers best supported by a study of the flora, for it is suggested that submersion sufficient to have caused such wholesale extinction of the animals would have probably destroyed many of the plants which still survive. His contention is, that as the Philippines are almost entirely volcanic, and as nearly all the genera have their headquarters elsewhere, that the flora has reached its present location by migration. He also attempts to trace the lines of migration, the principal one, comprising the bulk of the flora, from the Malayan region; a second from the Australian region, through the Moluccas—a few of the plants extending even to China; and a third from the Chinese region, southward; which latter may have taken place during the cold of the glacial period. The large number of endemic species is held to indicate that the migration took place at a sufficiently remote period for the species to have become differentiated under changed conditions. However this may be it is certain that some interesting facts of distribution are coming to light, and more yet remains to be done. The future may have something to say on this point; indeed, we believe that an additional collection of Philippine plants has recently been received at Kew, which, when worked up, may yield additional information.

## The Rosery.

WORK IN THE ROSE GARDEN IN MARCH OR APRIL.

THIS is an important month to the Rose grower, whether he be an exhibitor or simply a lover and grower of the flower for his own special delectation and that of those who come to visit him in his garden, and a good deal of the work to be done will depend as to the manner of doing it—as to whether the person who operates be an exhibitor or not. Take now, for example, the dressing and arranging of the beds. A person who intends to exhibit will not consider whether his beds look very tidy or not, and will at this season give them a good mulching of stable manure or cow-dung, as it may be at the owner's disposal. A Rose garden thus treated is not an æsthetic object, however good it may be for the plants, and when blackbirds have their "wicked way" over it and scratch it all about to find worms and grubs it requires a little extra care to keep it in anything like condition; yet the Rose exhibitor will feel that above all things he must feed his pets, and everything else must give way to this. He will rake off all the mulching which has served for a winter covering (the longer, part of it will do excellently for putting under Strawberries), will fork the beds lightly over, and then put on his supply of fresh manure for the spring and summer feeding; but the non-exhibitor feels he shall get good, nay, beautiful Roses—some of them, indeed, fit for an exhibition stand—without this; and so he, too, rakes off the longer portion of the litter, and then forks them over, but in so doing goes a little deeper and forks the manure in, adding nothing more for the summer supply. The beds are then marked out afresh, the walks looked over, and all then looks neat and tidy, requiring only to be carefully watched and weeded as the summer goes on. This is the way my own are treated, and I am very well satisfied with the blooms that I obtain.

But there is more important work than dressing the beds to be considered, and that is pruning, about which there is so much difference of opinion that we may apply to it the Latin saying, "*Tot homines, totidem sententie*." The great bugbear, the terror, the Old Man of the Mountain to the Rose-grower, is the treacherous spring frost; if we could fix his coming—if, as in America, we could know to a day when the change would come—it would be all right; but it is its uncertainty that makes it so dangerous. For some years we had a cold wave about May 20, and most disastrous it was. Last year we had one about April 24, and sad havoc it made; those who had pruned early found that all the young shoots of their Roses which had freely pushed and were some inches in length were completely blackened, and the pruning had in many cases to be done over again—those who pruned late escaped completely free. If the frost comes at the end of May the earlier pruned trees have more stamina in their shoots, and are better able to resist frost than those which were pruned late and would be in the same condition as the earlier pruned ones would be with an April frost. Here then one must say "Let every man be fully persuaded in his own mind," let him study his climate, his situation, and soil, and then act according to what he thinks best; no hard and fast line can be laid down, but I suppose, taking Rose growers in general, nineteen out of twenty prune in the month of March.

And now as to pruning. There are some who advocate what is called hard-pruning and some more gentle treatment. Here I think a good deal will depend on whether a person is an exhibitor or not: in the former case he is looking simply for the quality of the bloom totally irrespective of the quantity—if each plant will give him three or four show blooms he is satisfied, and as he believes this is effected better by hard pruning he adheres to that. The non-exhibitor has

more thought for the blaze of beauty and colour in his garden than for super-excellent blooms, although he is glad to get these when he can, and so he leaves his shoots longer, looks to a greater number of heads on them and consequently to a larger number of Roses. There is one thing which each class of grower may do with advantage, that is, cut out all the weak and spindly wood. Last year's wood may, in the case of Roses that have grown well, be safely cut away. Two or three good healthy shoots have come away from the bottom, and on these dependence must be placed for this year's blooms; and in this way it is that dwarf Roses are so valuable. Attention must be, of course, paid to the individual habit of each plant, and, however tedious it may be, it is justified in principle, and amply repaid in the end; the pruning that would be suitable for Marie Baumann would be utterly unsuitable to Etienne Levet. It may be taken for granted that when a Rose is of a delicate habit it will require more pruning than a vigorous growing variety.

As a rule a good pruning knife is the best implement to employ, it makes a clean cut and does not hurt the bark; but the *scateur* is useful in getting at the interior of the bush and cutting out the more weakly shoots. Some people are very much afraid of bleeding and of the injury it does to the plant; I cannot say that I have seen any bad effects from it, and certainly the dread of it would not prevent my putting off pruning if I thought all other circumstances were favourable to so doing. *Wild Rose*.

### THE EARLIEST AMERICAN BOTANIC GARDENS.

To the series of descriptions and illustrations of botanic gardens in various countries which we have been enabled to give from time to time we are now enabled, thanks to the courtesy of Prof. Sargent, to add illustrations of the two earliest gardens of this kind in the States (figs. 80, 81.) The interest attaching to them is mainly historic, and in the memorials of J. S. Bartram, and Humphry Marshall, published by the late Dr. Darlington, in 1849, and dedicated to the Pennsylvania Horticultural Society, we find many interesting details respecting these pioneers, from which we condense the following particulars.

About 1730 John Bartram began to make collections of American plants for his friend, Peter Collinson. He probably detected more undescribed plants than any of his contemporaries. "He was perhaps the first Anglo-American who conceived the idea of establishing a botanic garden for the reception and cultivation of the various vegetables, natives of the country as well as exotics, and of travelling for the discovery and acquisition of them. The Bartram Botanic Garden, established in or about the year 1730, is most eligibly and beautifully situated on the right bank of the river Schuylkill, a short distance below the city of Philadelphia."

Bartram's travels in search of plants were extensive, and in those days dangerous. Bartram was appointed Botanist and Naturalist to the King, at the instigation of Peter Collinson, in 1765, with a salary of £50 per annum. From Bartram's correspondence with Collinson we learn that Bartram had proved by experiment the nature and office of the pollen in a species of *Lychnis*. In reference to this matter Collinson writes as follows (1740), giving the history of the mule Pink:—

#### THE MULE PINK.

"My experiment of the usefulness of the farina is very curious and entertaining. Where plants of a class are growing near together they will mix and produce a mingled species. An instance we have in our garden, raised by the late Thomas Fairchild, who had a plant from seed that was compounded of the Carnation and Sweet William. It has the leaves of the first, and its flowers are double like the Carnation, the size of a Pink, but in clusters like the Sweet William. It is named a mule—per analogy to the mule produced from the horse and the ass."

Bartram, in 1763, anticipated the scarcity of timber, which Darlington, writing eighty years after, repudiated, but which the experience of the present day tends to justify.

#### DAFFODILS.

Referring to the white double Daffodils, Collinson writes with enthusiasm to Bartram, "I waited almost all my lifetime to get this rare flower. I read of it

and saw it figured in books, but despaired of ever possessing it. But about seven years ago my botanic genius carried me into a garden where I expected to find nothing; on a sudden my eyes were ravished with the sight of this flower, and my heart leaped for joy that I should find it at last."

To this Bartram replies, October, 1763, "If I had known the white double Daffodil had been such a rarity with thee, I could have sent thee large quantities thirty years ago. Our first settlers brought them with them, and they multiply so that thousands are thrown away."

In 1773 the second botanic garden within the British provinces of North America was established by Humphry Marshall, a cousin of Bartram's, in the township of West Bradford, Chester County, Pennsylvania, he having previously collected and cultivated useful and ornamental plants.

In 1785, Humphry Marshall published his *Arbustum Americanum*, a description of the forest trees and shrubs, natives of the American United States. This is believed to be the first strictly American botanical work, that is to say, the first treatise on American plants, written by a native American.

Marshall's house and garden have remained in the family until last year, when they were sold, and will doubtless be destroyed. Bartram's garden is now pretty well surrounded by the city of Philadelphia, and must soon go, unless arrangements can be made for its preservation. In Marshall's garden there still remains, or did till recently, a noble specimen of *Magnolia acuminata*, while the great feature of Bartram's garden is a grand *Taxodium distichum*, and which Bartram brought with him from the lower counties of Delaware in his saddle-bag.

### HOME CORRESPONDENCE.

**The Doubling of Daffodils.**—There is I think some misconception respecting the doubling of Daffodils from roots that have incontestably proved to have previously produced single flowers. I have no belief that such an occurrence has ever happened, or is likely to happen under any process of cultivation: of course I leave out the probability of a double variety being obtained from seed, as that is not the question. About two miles from here is a well known wood containing a grove of magnificent Beech trees, in which from time immemorial have grown large tracts of Lily of the Valley, but unfortunately from continued depredations the roots have become so weakened as to produce very few or no flowers. Near the same wood is an old grass field which for the same long period has been equally prolific in producing single Daffodils in such abundance, that just now dozens of people may be seen in the road between there and Southampton carrying large bunches of the gay yellow flowers, but notwithstanding the length of time the Daffodils have grown and propagated in that field they have never, that I am aware of, changed their nature from single to double. *W. N. Rogers, Southampton.*

**Eucharis Disease.**—My observations on this quite coincide with A. Macdonald's experience, viz., that decay is the cause of the mites, not the mites the origin of the decay. About Christmas, 1882, my *Eucharis*, after flowering heavily during the year, began to show signs of exhaustion, and before the days were long enough to commence repotting they were in very bad condition, having what few leaves remained more or less marked with the red spots. I repotted in the usual way, and had the satisfaction of seeing them soon come round to their usual health and vigour. They have remained in the same pots until quite recently, when they again showed signs of the red mites on several plants, which had borne a heavy crop of flowers about Christmas. On close examination of bulbs, I have come to the conclusion that it is the decay of the flower-stalk taking place in winter, in old bulbs, which are naturally weak through having flowered two or three times during the season, that is the primary cause of the attack of the mites and so-called disease. Consequently those plants which have all the young bulbs taken from them yearly, and subjected to extremes of temperature to induce them to flower at given periods, soon exhaust themselves, decay sets in, and is little less in its effects than a disease. If a *Eucharis* grower must, in this grasping age, take three crops of flowers off

the same plants yearly, it would be well if he prepares himself with a stock of young plants, as he will certainly need them at least every two years, if not oftener. But if grown and allowed to flower and form young bulbs naturally, and subjected to the usual routine of other plants as to change of soil, &c., we should soon hear nothing of the *Eucharis* disease—at least that is the impression I have come to. *J. Wilkes.*

**Dendrobium Wardianum.**—In answer to N. Blandford I write to say I have one growth 4 feet 6 inches long bearing forty flowers—two flowers more than your correspondent (p. 377, March 21). The plant is growing in a pot. *J. Child, Garbrand Hall.*

**Melon Culture: Canker.**—In reply to Mr. Miles I may state we have grown Melons, and late ones, in and out of pots with equal success; also on hotbeds in frames, adopting the same system of earthing-up. Last year I utilised a 4-light pit, 16 ft. x 8 ft., for a late batch of Melons that had been used earlier in the season for Cucumbers, and in which I was unable to use pots. The plants were planted out on July 26, in a very narrow ridge of soil, with a division of loose bricks between each plant, and the earthing up carried out as the plants progressed similarly to those grown in pots, a little Clay's Fertiliser being used in preference to liquid manure. Out of this pit we cut thirty-eight good Melons, the last being used on or about November 20. In our Melon house proper we adhere to the pot system, both for early and late batches, keeping plants ready for planting as soon as others have done fruiting. I should like Mr. Miles to try one or two plants earthed up in the way previously described, in comparison with those wearing the zinc collars, and give the results. Does Mr. Methven (p. 383) mean that previous to using the glass collars for woodlice he was troubled with canker, and after their use it disappeared? *C. H.*

**Orchids from Rosefield at the Royal Horticultural Society's Show, March 10.**—I beg to send you a correction which I hope you will insert relating to my exhibits at a late show of the Royal Horticultural Society. *Cattleya Trianae* Crawshayana bore four flowers of very large size and an exceedingly deep purple lip of very large size and very long in the expanded portion. The above specimen is described as "a *Warszewiczii* carrying four flowers;" and then "another with three of a paler colour," relates to *Cattleya Warszewiczii* superbissima carrying a three-flowered spike of blooms 8 inches across, with a lip 4 inches long and 2½ inches wide in the expanded portion, the side lobes being square and not rounded as usual, the whole flower one soft pink-mauve. The above plant was considered the most extraordinary variety that any one had seen. *De B. Crawshay.*

**Azalea indica, Deutsche Perle.**—I don't know how long this variety has been grown—I only noticed it last year for the first time—but find that this season it is offered for sale much more extensively. It is the best variety I have seen for bouquets or buttonholes. It is semi-double, pure white, and, when three parts open, much resembles a Rose-bud. It is a good grower and free bloomer, and cannot fail to find its way into every garden. It is one of those acquisitions which will find favour with every admirer of flowers, and hold its own. *D. C. Powell.*

**Methoda of Starting Japan Lilies when Received.**—I am sure it must have often amused, if not surprised, you as to how opinions and methods differ on almost every conceivable subject. The discussion which you have permitted in your columns in reference to the treatment of the *Eucharis* is an illustration, and if another were wanting your readers have had it in the above. Some months since in the *Gardeners' Chronicle*, I believe for the first time, I drew attention to what I considered a fungus in newly imported bulbs. Whether cause or effect I was not prepared to say, nor am I yet, though Mr. Rogers, of Southampton, confidently asserts bruising in packing and transit is the cause, and the fungus or rot merely an effect. This opinion Mr. Dean seems to agree with in your last issue. Dr. Wallace, of the New Plant and Bulb Company, thinks the contrary, and clinches the discussion by announcing that he and his Company have found a remedy, which they apply before serving their customers. I certainly cannot think "bruising" the explanation, for then some would escape, or the bulb merchants and Japanese

growers would long since have found a remedy. But the methods of treatment, which is alter all the most important, differ most of all. One would pot immediately when received, but this is no remedy. Another uses peat-mould to plunge in temporarily, and with more reason. A third would treat much like Hyacinths and Tulips, and after potting cover with coal-ashes for months until flowers appear. All these methods mean to allow the fungus and rot to do their worst. Mr. Shepherd's proposal (p. 370), to scrape away decayed parts and dress with charcoal and lime is far better, but I submit your advice to me more than a year ago—to plunge in cocoa-fibre and examine at short intervals until roots appear—with our present information—is the best of all. *W. F. Murphy, Clonmel.*

**Sprekelia glauca.**—On reading the advertisement in a recent number respecting the dozens, hundreds, thousands, of bulbs of this plant which Messrs. Krelage & Son had for sale, I was a little puzzled when I came to the words, "It (*S. glauca*) is a parent of the well known Jacobean Lily (*S. formosissima*)."  
Some errors we set down to the errors of the press, in other cases we see the right meaning peeping from behind, whilst a few, occurring now and again, are allowed to pass un-

in 1593, figured by Parkinson in 1629, and placed by him among the Daffodils. According to Curtis this plant is not kept in good health unless cultivated under glass. He says, "Stoves and greenhouses were then unknown; no wonder, therefore, it did not thrive long." Yet in these days of acres of glass the Jacobean Lily is cultivated satisfactorily in a sheltered border out-of-doors, such as, for instance, the *Belladonna Lily* thrives in. Planted about 6 inches below the surface in a warm sunny border against a greenhouse or stove, if possible, the Jacobean Lily will be quite at home, growing all the summer and flowering after its winter's rest in about the month of May. The curiously contracted arrangement of the lower flower segments of this plant distinguish it from all its relations. *S. glauca* was considered a good species by Lindley from its having smaller flowers and distinctly glaucous foliage, which characters, however, Bentham thought insufficient to justify its being retained as a species. A note by Dean Herbert on the treatment that he found this and the type thrive under is worth quoting. He says:—"The bulbs are perfectly hardy, and appear to like a low temperature, but they will not flower willingly unless they have a season of drought. They succeed well against the wall of a stove in the open ground, flowering in the spring and sometimes

sensational podders to the neglect of some prolific, well-flavoured, trustworthy kinds. ED.]

—Mr. Gilbert's suggestion as to a Congress of Peas is, like most of the thoughts which emanate from Burghley, original, but which, I fear in this case, is scarcely practicable. In this particular case it is so very unlikely that the suggestion will be acted upon, and even if it were who would accept as conclusive any results arrived at? The best practical Congress of Peas is a trial in growth side by side, for there are other important features in Peas to be tested than mere flavour, size of Pea, or number in a pod. We want to know more about synonyms first, then of classification into sections, and the best of those sections; then of height and average cropping qualities, and finally of flavour. It is very doubtful whether even the most exhaustive trial of this kind in any one place would suffice. We want half-a-dozen in diverse parts of the kingdom, all impartially and intelligently conducted; and then the results, tabulated and compared, might be productive of valuable and reliable information. *A. D.*

**Pruning Orchids.**—Without waiting for the already pruned plants to be shown at South Kensington, as suggested by "T. B.," could not every

FIG. 81.—EARTRAM'S HOUSE. (SEE P. 443.)

FIG. 82.—MARSHALL'S HOUSE. (SEE P. 443.)

corrected because they are of little consequence. But when M. Krelage, one of the chief bulb growers in Holland, or in the world, which amounts to the same thing, writes that the old Jacobean Lily owed its origin to the skilful manipulation of a hybridist who practised before the time of Parkinson, we pause to wonder how it comes that we never heard of this before we see it in an advertising column. The mystery was beyond my power to unravel, so I went for an explanation to Mr. Baker at Kew. On stating my case he at once blamed the printer [too bad], but when he read the advertisement he at once saw where the flaw was. "It's Krelage's English: he has used the word 'parent' in its French signification, which is simply that of relation, and of course he is in that sense quite right, though in any other totally wrong." No doubt Mr. Krelage will pardon me for presuming to set him right, seeing how much is involved in the meaning I gave his advertisement; and at the same time English bulb growers will be glad to learn what Mr. Krelage means when he calls *Sprekelia glauca* a parent of *S. formosissima*. Mr. Bentham considered these two plants so closely related that he makes only one species of them, to which the genus *Sprekelia* is now limited. We find three plants figured under the name *Sprekelia*, viz., *S. formosissima*, Heist., *Bot. Mag.*, t. 47; *S. glauca*, Lal., *Bot. Reg.*, 1841, t. 16; and *S. cybister*, Herb., *Bot. Mag.*, t. 3872. The first of these is a native of Mexico, according to Linnæus, first known in Europe

again in the autumn, if the summer has been very dry. They rarely blossom if watered through the winter in a greenhouse; but if kept dry and warm for a few months, they will flower as soon as they are watered in the spring." The third *Sprekelia*, so called by Herbert, is now referred to the genus *Hippeastrum*, although so far as I can see this plant has many characters in common with the recently introduced *Callipsyche aurantiaca*, lately figured for the *Botanical Magazine*. *W. W.*

**Peas.**—I for one shall be pleased to assist in getting at "the fact as to which is the best Pea." Here Peas are highly valued, and I may say I have grown some hundreds of bushels of fine pods. It would be strange if I did not, seeing that I serve one of those noblemen who cares not what Pea is grown, or what its name is, so long as it is a good one, neither am I expected to go to the Stores, but can pay a good price for a good article; therefore I should be glad to know if I am growing the best or not. It often puzzles me to understand why people do not pay more attention to varieties, and also to culture, for to my mind there is nothing looks worse than a miserable lot of Pea-rows, and there is decidedly nothing that gives better results in all quarters than well-grown good Peas. *G. M. W.* [Our correspondent really assumes too much; for we believe gardeners pay much attention to the sorts of Peas they purchase, but there is perhaps too much running after

Orchid grower who has a score or two of plants or upwards put the matter to a practical test for himself, and thus obtain actual and not *ex parte* evidence one way or the other? The pruning treatment naturally infers that certain Orchids are purely herbaceous, and that the old bulbs are but stems that, having performed their required functions, may be cut away as useless. Non-pruners, on the other hand, hold that these old and perhaps decaying bulbs do serve some not merely useful, but important purpose, in Orchid plant life, but in what way or form nothing clear is shown. Do these old and exhausted bulbs in decaying give back to the plant something which they have abstracted, and thus furnish nutriment and strength to newly forming bulbs? If that be the case, then the position of the non-pruners is proved up to the hilt. If it be not so, then wherein lies the use or value of old bulbs? *A. D.*

—In reply to "T. B." on p. 417, asking why the correspondent who has *Dendrobium nobile* with growths 3 feet long cannot send them to the Royal Horticultural Society's meeting at South Kensington, I beg to inform him I shall have great pleasure in doing so provided my employer does not object, and if "T. B." will undertake to pay all expenses connected with the same, and make good any damage to the plants in transit. To show that what I say is correct, I send herewith a growth for you to see, which has twenty-eight flowers on it. Though this is by no means one

of the finest growths I have, I think it will be quite sufficient to convince any one (even "T. B.") that *D. nobile* can be grown with the old growths—the pseudo-bulbs—cut away far better than by leaving them on the plants. The plant from which I cut this one has more than 300 expanded blooms on it, and some of the growths I have measured exceed 2 feet 10 inches in length. On some of these I counted as many as forty-two flowers. My plants have not "been pruned for the occasion," but all the growths have been cut away annually exactly as the one I send you. A large quantity of my *D. nobile* have to be cut for Easter decorations; they will have to travel about 150 miles by rail; so by the time this reaches you the best of them will have been cut off the plants. However, I shall still have some plants uncut, and if "T. B." would really like to see them, I shall have great pleasure in showing them on the conditions named. *D. M.* [A beautiful spike, more than 2 feet 3 inches long, leafy for a fourth of its length, and with thirteen racemes, with two to three flowers in each, twenty-nine in all, each flower about 3 inches across. Ed.]

## Reports of Societies.

### CRYSTAL PALACE SPRING SHOW.

AN exhibition of spring flowers was held at the Crystal Palace on Friday, March 27, in the north transept. A large marquee was erected, or, rather, suspended, and in this an excellent array of flowering and foliage plants was very tastefully arranged; the colours of the flowers showed to better advantage in the soft light of the marquee than they would have done if exposed to the full light of day. Sloping benches were provided, and on these the exhibits were staged to great advantage, besides dispensing with the "fearful and wonderful" contrivances exhibitors in other instances have to resort to in order to "show off" their specimens satisfactorily. The general arrangement was, as usual, all that could be desired, and reflected great credit on Mr. Head, the able Superintendent, and his staff. The classes were for the most part closely contested, and the exhibitors generally of a high order of merit. The awards were as follows:—

In the open class, for thirty-six Hyacinths Messrs. H. Williams & Son, Fortis Green, Finchley, were 1st, with a well grown lot, good in size of pip and truss; Grandesse, Lord Macaulay, Ida, Grand Maltre, Voltaire, Rubra Maxima, Mont Blanc, Moreau, King of the Blues, Czar Peter, Baroness von Tuyl, Lord Derby, Grandeur & Merveille, Marie, Vuurbak, L'Innocence, Von Schiller, Gigantea, and King of the Yellows being his principal varieties. Mr. H. R. Wright, Lee, Kent, was 2d, very little behind, with good Grand Maltre, Rubra Maxima, Von Schiller, Mont Blanc, and others. Messrs. W. Cutbush & Son, Highbate, were 3d.

For thirty-six Tulips Messrs. W. Cutbush & Son were 1st, with a splendid lot, including Van der Neer, white Pottebakker, white and purple Joost van Vondel, rose Gris de Lin, Or d'Ophir, Proseperie, Globe de Rigaud, Kaiser Kroon, Vermilion Brilliant, Cottage Maid, Hector, Fabiola, &c. Messrs. H. Williams & Son were 2d, with a good collection of similar sorts. Mr. H. R. Wright, Lee, Kent, was 3d.

For twenty-four Narcissus, Messrs. H. R. Williams & Son were 1st, with a dwarf, compact, well-flowered lot of the usual show varieties; Mr. H. R. Wright a close 2d, and Mr. W. J. Watson, Newcastle-on-Tyne, 3d. The class for thirty-six Cyclamens made a fine display, Mr. H. B. Smith, Ealing, carrying off 1st honours with a fine telling lot, including some very distinct types; Mr. R. Clark, Twickenham, was 2d, with slightly smaller but very bright coloured examples; Mr. F. J. Hill, gr. to H. Little, Esq., Hillingdon Place, Uxbridge, was 3d. For twelve Amaryllis, Messrs. Paul & Son, The "Old" Nurseries, Cheshunt, Herts, were 1st, with Venus, very bright claret, flaked white; Roderigo, flaked deep crimson, green star; Albion, small bright crimson flower, white star; Pallas, deep claret, white star; Minima, good flower, white, flaked with claret; Cupid, bright scarlet; Bendigo, a flower of good substance, velvety dark crimson, green star; Vulcan, scarlet; Robert Browning, a starry flower, deep claret, white tipped, distinct, green eye; President Grevy, very bright scarlet; and Merry Maid, small, white, flaked with claret and green eye; 2d, Mr. F. J. Hill, with a small lot, Mrs. H. Little being the best. For twelve Cinerarias, Mr. J. Ford, gr. to J. C. Lanyon, Esq., Birdhurst, South Croydon, with twelve fine plants, having large heads of bloom and fine dark green foliage; Messrs. T. Todman & Son, Rose Park Nursery, Upper Tooting, were 2d, and Mr. F. J. Hill was 3d. For twelve 8-inch pots of Lily of the Valley, Mr. H. R. Wright was 1st, with a fine lot; Messrs. H. Williams & Son, were 2d; Mr. W. J. Watson, Newcastle-on-Tyne, was 3d. For twenty-four Anemones.—Mr. C. Turner only staged a collection which was worthy the 1st prize allotted to it—Royal Purple, Dr. Horner (Read), Lord Beaconsfield, Privateer (Grimes), Eliza Sarah (Turner), Thetis, The Prince, Mrs. Llewellyn, Charles Perry (Turner), and the rest fine seedlings. Messrs. H. Lane & Son, Berkhamstead, were the only competitors in the class for twenty-four Rhododendrons, the collection being also considered worthy the premier award; the varieties were Mrs. Russell Sturgis, Marchioness of Lansdowne, Cynthia,

The Queen, The Maroon, Mr. John Penn, Wm. Milton, Earl of Shannon, Mr. G. Brown, Bianchi, Baroness Rothschild, The Star, Snowflake, Geo. Peabody, Mrs. W. Hankey, James Bateman, Mr. T. Longman, Roseum Pictum, Mrs. Home, and Lord Eversley. For twenty-four greenhouse Azaleas, Mr. C. Turner, Slough, was 1st with an excellent lot of well flowered specimens, including Jean Vervaine, Apollo, Borsig, Comtesse de Flandres, Lady F. Hastings, Charles Enke, Duchesse de Nassau, Roi d'Holland, Mademoiselle Marie Leleuvre, Madame Van der Cruyssen, Sigismund Rucker, Mrs. Turner, Stella, Jules Verne, Cordon Bleu, Ceres, and Fürstin Bariatinski; 2d, Mr. H. James, Lower Norwood, who had amongst others, Vittata crispiflora, Comte de Flandres, Charles Enke, Ceres, John Gould Veitch, &c. For eighteen pots of Mignonette, grown in the usual market style, Mr. H. B. Smith, Ealing, was 1st with a fine dwarf lot with very large heads of bloom; Mr. J. Wiggins, gr. to W. Clay, Esq., Kingston-on-Thames, was 2d, and Miss Clay, Kingston-on-Thames, was 3d. For nine plants of Tree Mignonette, Mr. J. R. Bird, Lodge more, Alleyn Park, West Dulwich. Two fine groups of stove and greenhouse foliage and flowering plants were staged by Messrs. J. Laing & Co., Forest Hill, and Mr. H. James, Lower Norwood, the former receiving the premier award, and the latter 2d; both groups were very tastefully arranged, and the same class of plants for the most part were used by each, and consisted principally of Palms, Crotons, Azaleas, Dracaenas, Caladiums, Ericas, Orchids in variety, and Cyclamens, &c.

In the amateurs' class for twelve Hyacinths, Mr. John Horsley, 6, Selwood Place, South Kensington, staged the only collection, and was a 3d prize. For six Lily of the Valley Mr. W. Monk, gr. to W. N. Cheeseman, Esq., The Hall, North Dulwich, was 1st. For twelve Cyclamens, Mr. J. Wiggins was 1st with a nice lot; 2d, Mr. F. J. Hill. For twelve Cinerarias Mr. F. J. Hill was 2d, no 1st being awarded.

Extra prizes were awarded to Messrs. Paul & Sons, The "Old" Nurseries, Cheshunt, for a magnificent bank of pot Roses, conspicuous amongst them being Souvenir d'un Ami, Duke of Teck, Marquise de Castellane, Catherine Soupert, La France, and others; and also for a fine group of alpine. Mr. H. P. Wright, Lee, for a fine collection of Tulips. Mr. H. B. Smith, for a large collection of Cyclamens. Messrs. J. Laing & Co., Forest Hill, for a nice collection of decorative plants. Messrs. Barr & Son, Covent Garden, for a large collection of Narcissus, &c. Mr. R. Clark, Twickenham, for a collection of Cyclamens. Mr. C. Turner, Slough, for a stand of four dozen Carnations. Mr. J. R. Bird, Lodge more, West Dulwich, for a collection of Tree Mignonette; and to W. J. Watson, Newcastle-on-Tyne, for thirty-six Hyacinths and thirty-six Tulips respectively.

Miscellaneous exhibits were staged by Messrs. Hooper & Co., Covent Garden—hamper of Carnations; Mr. J. James, Farnham Royal, Slough—two boxes of fine blooms of Cinerarias; Messrs. J. Carter & Co., Holborn—Valotta purpurea, Sempervivum, &c.; and Mr. C. Turner, Slough—Violet Welliana.

Certificates were awarded to Mr. H. B. Smith, for Cyclamen The Major, a fine bold flower, creamy-white, deep purple tip; and Miss Nightingale, rosy-purple; Messrs. Barr & Son, for Chionodoxa sardensis, Narcissus pallidus præcox, and N. Barri conspicuus.

### THE ROYAL CALEDONIAN HORTICULTURAL.

THIS old-established Society has recently issued its prize list for the present year, which contains some features of improvement, and a more ambitious programme than anything it has yet attempted in the way of a season's ordinary work. The Royal Caledonian Horticultural Society was instituted in 1809, and Incorporated by Royal Charter on August 18, 1824, and consists of ordinary, honorary, corresponding, and foreign members. The affairs of the Society are managed by an Executive of nineteen members, consisting of President, four Vice-Presidents, twelve Councillors, Secretary, and Treasurer. Two of the Councillors and all the other members of the Executive are elected annually at a general meeting of the Society held on the first Thursday of December. Every person interested in horticulture is eligible for election as an ordinary member on payment of a 10-guinea life subscription, or 1 guinea annually, which secures to the members certain extra privileges in connection with admission to the shows—a payment of half a guinea annually entitling a member to half those privileges. Pass tickets, admitting to all the shows of the season, are issued to professional gardeners on payment of 2s. 6d.—a valuable privilege considering that four shows are now held in the season, and each open for two days. Such liberality to the profession might be followed with advantage by more of our horticultural societies. The prizes offered by the Society are open free to all, British or foreign, who choose to compete, and who comply with the regulations of the Society. For new productions of special merit the Council awards the Society's Certificate at all the shows.

The foregoing particulars are gathered from the second page of the Society's prize list for 1885, now before us, and are followed by an excellent code of regulations for competitors and exhibitors—new features in the schedule which will be much appreciated by the members of the Society as well as by the horticultural public in general. The arrangement or regulation which has been in vogue with the Society for some years, by which the prizes won by competitors are paid the same day, is one of special advantage to exhibitors, and where it can be carried out is worthy of general adoption. The Society is under the special patronage of the Queen; with the Marquis of Lothian, K.T., President; John Stewart, Esq.,

Secretary; and P. Neil Fraser, Esq., Treasurer. For the first time we believe for many years, the Society has decided upon holding four regular exhibitions in the course of the season, each of two days' duration. They are to be held, as usual, in the Waverley Market, Edinburgh—a spacious covered area of nearly 2 acres, adjoining the Waverley Railway Station, and affording unrivalled facilities for the holding of horticultural exhibitions. On ordinary occasions this capacious hall is used as a vegetable market—the Covent Garden of Edinburgh—and attended by all the market gardeners of the district with their vanloads of produce. On the occasion of a flower show the exhibitors drive their plant vans alongside of the stages, both when setting down and removing their plants, which entirely saves the laborious work of lifting, and the long carry of heavy plants by men, so prevalent at most flower shows.

At the ensuing spring show in April, £339 is offered in prizes for 141 different articles, distributed as follows:—98 for plants, 18 for cut flowers, 9 for fruit, and 16 for vegetables. The summer show in July has £256 offered in prizes for 142 articles—Plants, 62; cut flowers, 49; fruit, 14; and vegetables, 17. At the autumn show in September, £283 is offered for 175 articles—Fruit, which leads at the autumn show, 54; plants, 53; cut flowers, 33; vegetables, 23; and bees and honey, 12. At the new winter show, in November, £232 is offered for 198 articles—Plants, 95; cut flowers, 31; fruit, 42; and vegetables, 30. Two prizes are offered for all articles, and for most of the leading exhibits three prizes are allotted. In all there is offered £1110 in prizes in 1885 for 656 articles, as follows:—Plants, 308; cut flowers, 131; fruit, 119; vegetables, 86; and bees and honey, 12—a programme extensive enough to satisfy the appetite of the keenest exhibitor. Ten years ago, in 1874, the prizes offered at the three shows amounted to £259 14s. 6d. for 200 articles.

The finances of the Society are apparently in a prosperous condition, and the funds at the disposal of the Council are quite equal to carrying out the programme set before it. Previous to 1878 the Society held its exhibitions in the Music Hall, and the "abstract of accounts of the Society" for the year 1877—the last year in which all the shows were held in the Music Hall—shows the state of its funds in that year to have been—Receipts, £713 14s. 1d.; payments, £697 6s. 10½d.; and the total reserve funds of the Society £534 11s. 9d. For the year 1884 we observe that the receipts are £1551 11s. 9d.; the payments, £1540 2s. 9½d.; and the Society's reserve funds, £1249 0s. 5d.—a state of affairs in these times reflecting credit on the management of the Executive, and which, for the sake of horticulture, we hope will continue.

### LIVERPOOL HORTICULTURAL ASSOCIATION: March 24, 25.

THE spring show of this Society was held on the above dates in the St. George's Hall, and all the circumstances connected therewith were of a most pleasing and gratifying character. The weather was favourable and the company attending on both days was numerous, and so far the committee are to be congratulated. To the show as a whole, and of the details in their varied parts, we must award unstinted praise and commendation to all concerned in the magnificent collection of plants and flowers gathered together under the roof of this fine hall. It would perhaps be difficult to get in one hall a finer lot of colour than was here presented. The large specimen Azaleas, Orchids, forced Rhododendrons, masses of Azalea Mollis, Ghent varieties, with bulbs (of which there was a fine display), contributed to make this show as it was generally admitted, the finest floral display ever got together in Liverpool in early spring.

The schedule was divided into fifty-one classes, and in almost every instance there was strong competition. In some of the classes six and even eight competitors entered for the prizes offered; added to this were many extra groups and subjects not stated in the schedule. We will take the classes somewhat in order as they appear in the official list.

#### OPEN CLASSES.

For a group of miscellaneous plants, arranged for effect, to occupy a space of 50 feet, the 1st prize was awarded to W. H. Walls, Esq., Wavertree (gr., Mr. A. R. Cox); 2d, C. W. Neumann, Esq. (gr., Mr. W. Mease); and 3d, F. H. Gossage, Esq., Woolton (gr., Mr. J. Jellicoe); these each in their way made up their groups with flowering plants nicely contrasted with Palms, Crotons, and Ferns. For ten hardy herbaceous and bulbous plants the collections staged were each admitted to have been deserving of a 1st prize; after considerable care and attention had been bestowed upon them the prizes were awarded, 1st, to J. Dickson & Sons, nurserymen, Chester; 2d, to W. B. Bowring, Esq. (gr., J. Hurst); 3d, C. W. Neumann, Esq. In the 1st prize group were splendid plants of Narcissus Sir Watkin, with thirty-six flowers; N. Emperor, with twenty-five; Tulipa retroflexa, with nine of its bright yellow blossoms; a large Delytra spectabilis, well bloomed; Narcissus moschatum, and good pans of Primula rosea and Aubrietia—a very showy and effective group. In Mr. Bowring's group were fine plants of Iris germanicus, Telemachus, and The Beauty; Muscari botryoides, with fifty spikes; Primula cortusoides lilacina marginata, and Narcissus bulbocodium, with thirty flowers. Mr. Neumann's group also contained N. Sir Watkin, N. Horsfieldi, Primrose Harbinger (very fine), and Iris reticulata with several blooms. For six Azaleas, C. W. Neumann, Esq., was 1st, having good plants of Grandis, Iveryana, Flower of the Day, Souvenir de Prince Albert, Dieudonne, Spa, and Madame Vervaine; 2d, Mrs. Lockett (gr., Mr. W. Evans); 3d, J. Lewis, Esq. (gr., Mr. W. Bustard). For one bouquet, T. Robinson, Mossley Hill, was 1st;

G. Downes, Lodge Lane, 2d; and B. Hall, Wavertree, (gr., A. Crosbie), 3d. The excellence of the Liverpool bouquets is well known, these and also others in the amateur classes were exceedingly well done. Passing now to the amateur classes, the 1st and only prize for twenty-four Hyacinths was awarded to R. Singlehurst, Esq., Aigburth (gr., Mr. J. Kelly). This was the only bulb class where only one exhibitor put in an appearance, and the remarks here applied may be taken as referring to the bulbs as a whole—they were well done, spikes standing well up, not drawn out and so detracting from the beauty, but just nicely up above the erect foliage, which in the majority of cases was of a stout and vigorous character. In this group, Lord Derby, Grandiflora, Koh-i-noor, La Grandesse, Mimosa, Baroness Von Tuyl, Van Speyk, La Franchise, 11a, Prince of Wales, Blondin, Von Schiller, Mrs. B. Stowe, and Queen of the Blues, were prominent. For eighteen Hyacinths the 1st prize was taken by R. Singlehurst, Esq.; 2d, R. Cornelius, Esq. (gr., Mr. T. Stephenson); 3d, W. B. Bowring, Esq. Twelve Hyacinths.—1st, W. H. Watts, Esq.; 2d, Mrs. Aitken (gr., Mr. C. Waring); 3d, J. Woolright, Esq. (gr., Mr. E. Green). For six Hyacinths, W. P. Sinclair, Esq., was awarded 1st. For six pots of Hyacinths, three in a pot, —a very effective way of showing them—the 1st prize was taken by Mrs. Barnsley (gr., Mr. P. Barber); 2d, Mrs. Lockett. Narcissus were well shown, the 1st prize being awarded to Mr. W. P. Sinclair; 2d, Mr. S. S. Parker; 3d, Mr. R. Cornelius. The Tulips, both single and double, were numerous and good: Mr. R. Cornelius was 1st for twelve pots of single, among which we noticed Chrysolora, Vermilion Brilliant, Proserpine, white and yellow Pottebakker as very effective; the 2d, prize went to H. Nash, Esq.; 3d, J. Woolright, Esq. For six pots, single Tulips, the 1st prize fell to S. S. Parker, Esq., who had La Precieuse, Kaiser Kroon, and Canary Bird, in fine form. Ten pots, double Tulips.—1st, T. S. Rogerson, Esq.; 2d, S. S. Parker, Esq. Here we met Tournesol, Imperator, and Rex Rubrorum, Raphael, Duke of York, very good; Princess Beatrice, and Purple Crown. Six pots of Crocus were shown by Messrs. C. W. Neumann, J. Woolright, and H. Nash, and prizes awarded in the order named. For six stove and greenhouse plants, C. W. Neumann, Esq., was 1st: here we noticed *Chorozema cordata splendens*, *Clivia miniata maxima*, *Croton Disraeli*, *Arcalutenscens*, and a fine *Azalea*; 2d, F. H. Gossage, Esq.; 3d, W. H. Watts, Esq.

## ORCHIDS.

The Orchids staged were remarkably fine. Such plants are not often seen at a spring show, and associated here with so much that was good, they were much admired and deservedly so. For four Orchids, C. W. Neumann, Esq., was 1st, with *Phalenopsis Schilleriana*, with two branching spikes; *Dendrobium Wardianum*, with twelve flowering bulbs; *Coelegyne cristata*, a yard across, a mass of flower; and *Dendrobium crassinode*, with four good flowering bulbs; 2d, Dr. Walker Rodney (gr., Mr. J. Edwards); in this group was a plant of *Dendrobium Wardianum*, with twenty-four flowering bulbs well covered with bloom; *Vanda suavis*, with three spikes; *D. thysiflorum*, and *Cattleya Trianae*. W. Holland, Esq., Mossley Hill (gr., Mr. W. Moss), was 3d, having *Phalenopsis Stuartiana*, with a fine branching spike; *Angraecum sesquipedale*, with two spikes; *Vanda tricolor* and a *Cattleya Trianae*. For one Orchid, E. Harvey, Esq., Aigburth (gr., Mr. T. Worth), was 1st, with *Dendrobium Aiosworthii* with nine flowering bulbs; 2d, C. W. Neumann, Esq., with *Phalenopsis Schilleriana*, a spike 3 feet long, with five laterals and several sub-laterals—flowers of good size, form, and colour; 3d, Dr. Walker, with a nice piece of *Dendrobium Aiosworthii*. A Cultural Certificate was awarded for a *Dendrobium fimbriatum giganteum* to Sir J. A. Pictou (gr., Mr. G. Blackmore). This was a fine piece, with growths 5 and 6 feet long, with about thirty-six spikes of its bright orange coloured blossoms.

Ferns were shown by Mrs. Horsfall (gr., Mr. G. Rhodes), who staged *Dicksonia squarrosa* and *D. antarctica*, *Cyathea medullaris*, and a large *Gymnogramma*, to which the 1st prize was awarded. The 2d went to F. W. Medley, Esq. (gr., Mr. C. Jooles), who had *Adiantum Cardiolobum*, a very fine; *Davallia dissecta*, *Nephrolepis exaltata*, and *Alsophylla australis*. For one Fern Mrs. Lockett was 1st, with *Goniophlebium subauriculatum*, with about sixty fronds 5 feet long; Mrs. Horsfall 2d, Mr. T. S. Rogerson 3d.

Three Azaleas were shown by S. S. Parker, Esq., who was 1st; C. W. Neumann, Esq., 2d; and H. Cunoingham, Esq., 3d. For one greenhouse Rhododendron H. Cunoingham, Esq., was 1st, with Countess of Haddington, a plant only 3 feet high, but with fifty trusses of bloom; 2d, A. Tate, Esq. (gr., Mr. R. G. Waterman), with a nice plant of R. Taylori; 3d, Mr. W. Holland. Forced Rhododendrons were numerous and well flowered, whilst of *Azalea mollis* and its varieties many good plants were shown. For four plants Messrs. C. W. Neumann, S. S. Parker, and J. Lewis competed, and prizes were awarded in the order named. The six forced hardy plants again brought C. W. Neumann, Esq., to the front; 2d, W. B. Bowring, Esq.; 3d, B. Hall, Esq. Primulas, Cinerarias, Lily of the Valley, Migonette, Cyclamen, and table plants were numerous, and generally good. The stands of cut flowers, in which class five competitors entered, were very good for the season. C. W. Neumann, Esq., was 1st, in whose stand we noticed good bunches of *Dendrobium Wardianum* and noble, *Cattleya Trianae*, *Anthurium Andreanum* and *ferriense*, *Rhododendron Gibsoni*, *Amaryllis*, *Cliveas*, *Clematis indivisa lobata*, *Camellia Lavinia Magi*, &c.; the 2d prize fell to S. Smith, Esq., M.P.; 3d, Mr. W. H. Watts.

Bouquets were shown by Mr. T. Robinson, Mr. B. Hall and Mrs. Walls, and were awarded prizes in order as the names appear.

## CERTIFICATES OF MERIT.

These were awarded to Messrs. T. Davis & Co., for a collection of plants and bulbs; to R. P. Ker & Son, for *Azalea James Veitch*, *A. Phobus*, *Mathilde*, *Madame Herman Seidel*, and also for a collection of miscellaneous plants, bulbs, &c. Cultural Certificates were also given to Messrs. J. Dickson & Sons for some grand pots of *Narcissus Sir Watkin*; to Messrs. R. P. Ker & Son, for *Choisya ternata*; Mr. G. Blackmore, for *Dendrobium fimbriatum oculatum giganteum*; also to Mr. Elsworth, for splendid bunches of *Black Alicante Grape*; to Mr. J. Jellicoe, for Mushrooms; and C. W. Neumann, Esq., for *Amaryllis*, in which were included *Junius*, *Achilles*, and *Empress of India*. The Liverpool Horticultural Company showed a fine lot of useful plants, including *Cinerarias*, *Hyacinths*, *Azaleas*, and *Orchids*.

## GLASGOW AND WEST OF SCOTLAND HORTICULTURAL.

The spring show of this Society, which took place in the St. Andrew's Hall on March 25, was a great success. Of late years the Society has been playing the game of the rolling stone, but now a well meant effort is being made to re-establish and popularise it, the number of plants sent both for exhibition and competition being a decided advance upon those of recent years. The tables of plants furnished by Messrs. Austin & MacLean and Messrs. Smith & Simons were effective arrangements of spring blooming plants. The latter firm had some good Palms, and the former a great variety of Japanese Acers, these elegant foliaged plants being deservedly admired at this season. A large table of plants was also sent by Mr. Peter McKenzie, nurseryman, Paisley, but this exhibit was almost confined to bulbous plants, for the cultivation and exhibition of which Mr. McKenzie has been celebrated for years, also a few Orchids, and eight enormous bouquets, which collectively brought out all the hues of the rainbow, but individually were made up of two or three colours only. Fern fronds being sparingly used in each case, and were much admired by the ladies. His *Cypripedium* and *Coelegyne cristata* were shown in large, round, very shallow, teak-wood tubs, with a neat wooden handle on each side: the plants were well elevated above the surface, and although about 3 feet across could be easily carried by one man. They are very durable, and well suited to plants of that nature. From Lady Campbell, of Garscube (Mr. R. Fleming, gr.), came one of the finest and best bloomed plants of *Dendrobium speciosum* seen in Glasgow for many years, most of the twenty-two spikes having perfectly developed flowers. Two bridal bouquets exhibited along with other floral decorations by Messrs. J. & R. Thyne, were especially noteworthy. Hybrid seedling Azaleas of the *amœna* type were extensively shown by J. B. Miles, Esq. (Mr. G. Russell, gr.); the best of those in commerce being shown alongside of Mr. Russell's seedlings, proved the general superiority of the latter, one large hose-in-hose, a cross between *A. amœna* and *A. Victoria*, named General Gordon, being of special merit.

For the collection of stove and greenhouse plants to fill a table 12 feet by 6 there were only two competitors. The 1st prize was awarded to Messrs. J. & R. Thyne, nurserymen, Glasgow, who arranged a very effective group, conspicuous amongst which were some splendidly coloured *Crotons* of the leading varieties, and for which this firm is justly celebrated. Their *Dracænas* were also equally well grown. Their best flowering plants were some fine forms of *Cattleya Trianae*, *Cypripedium Boxalli* and *C. Lawrenceanum*, the latter a grand variety with a large and deeply coloured dorsal sepal. John L. Henderson, Esq., West Bank, Partick (Mr. John Mathison, gr.), was a good 2d, with much larger plants, which were shown to disadvantage owing to the restricted width of the table; some of the Azaleas were also a little coarse; but the collection contained the best managed Palms and Cycads in the hall; his plants of *Dracæna indivisa* (the true broad-leaved form) and *D. Massangeana* were much admired. The 1st prize for six stove and greenhouse plants, distinct varieties, was easily won by John Gordon, Esq., of Aikenhead (Mr. Thos. Hogg, gr.), with fine plants of *Gleichenia spenceana*, *Rhododendron Countess of Haddington*, *Cypripedium Boxalli* and *C. villorum*, and two good Azaleas. The 2d prize was awarded to a much smaller collection from R. Ramsay, Esq., Langside House (Mr. James Clatworthy, gr.); this latter exhibitor, however, carried 1st honours for three stove or greenhouse plants, with fine plants of *Tremandra ericoides*, *Eriostemon pulchellum*, and *Azalea Ceres*—*Morris Carswell*, Esq., Murcia House, Pollokshields, being 2d: in this collection there was a large and highly coloured variety of *Clivia miniata*. R. B. White, Esq., of Ardarroch (Mr. Thomas Leslie, gr.), was 1st for three Orchids, exhibiting *Dendrobium nobile*, *D. thysiflorum*, and *D. Wardianum*—the latter species being particularly well bloomed. In the classes for Azaleas and Rhododendrons there was nothing worthy of special notice except a well grown and splendidly bloomed plant of *Azalea amœna*; and the 1st prize collection of Azaleas, restricted to pots not exceeding 8 inches; these came from the Aikenhead Gardens, and reflected great credit on Mr. Hogg, the gardener. Plants for table decoration were a great feature of the show, the entries being numerous, and the collections all good. Mr. John Sutherland, Victoria Nursery, Lenzie, was 1st with twelve plants (distinct varieties) in 6-inch pots, and which for beauty and symmetry of the individual plants could not be excelled; Alexander Raeside,

Esq., Vorkhill, was 2d. The gardeners' and amateurs' classes were equally well contested. Ferns were good, but the numerous other plant and cut flower classes contained nothing of special merit, except those confined to bulbs, and certainly these were in great numbers, and very good. The leading prize in the open class for eighteen Hyacinths (distinct varieties) was awarded to Mr. John Sutherland, nurseryman, Lenzie. In the gardeners' classes 1st honours were awarded to J. Young, Esq. (Mr. J. Buchanan, gr.), his spikes of bloom being of great size, very uniform, and of fine colour; this exhibitor also staged *Polyanthus Narcissus*, splendidly bloomed. The Tulips shown by Mr. James Heron, Pollockshaws Gardens, were also very meritorious. Prizes are offered by this Society in many classes of one, two, or three plants, cut flowers, bouquets, &c., to encourage small amateur growers, and it is pleasing to note that many of the prizes were well contested, but I am aware that your space is too valuable to admit of any attempt at further enumeration. R. B.

## BATH EARLY SPRING SHOW.

On the 25th ult., at the Assembly Rooms, the Floral Fête and Band Committee made their first venture in holding an early spring show, and judging from the number of exhibits, as well as their exceptionally fine quality generally, the enterprising gentlemen who form this committee, as well as the exhibitors, have abundant cause to be satisfied with the result, as it was in every respect a splendid exhibition. It is to be hoped such a signal success to commence with will be an inducement to them to continue these early spring shows, which are so deservedly appreciated by every one.

T. A. S. Dorrien Smith, Esq., of Tresco Abbey, Isles of Scilly, exhibited a magnificent collection of *Narcissus* (not for competition), which, although not quite so numerous in variety as that exhibited on the 18th at Clifton, was in much better condition and proved most attractive to the visitors. Messrs. Cooling & Son, also Mr. James Cypher, of Cheltenham, contributed some choice miscellaneous plants, consisting of early spring flowering plants, Roses, and other plants; the latter firm contributing some good Orchids, for which it is becoming justly noted.

The whole of the exhibits was pleasingly arranged in two large rooms. For eighteen Hyacinths.—1st, Mr. Wm. Taylor, gr. to S. P. Budd, Esq.; 2d, Mr. G. Marsh, gr. to M. Dunlop, Esq.; Certificate of Merit, Mr. W. Dobson. For twelve Hyacinths, Mr. Taylor was again 1st; 2d, Mr. W. Thomas. Six Hyacinths.—Mr. Taylor again carried the 1st prize; 2d, Mr. Dobson; Certificate of Merit, Mr. W. Thomas. For six Hyacinths, grown in glasses.—1st, Mr. Taylor; 2d, Mr. G. Garaway. For twelve pots of Tulips.—1st, Mr. Marsh; 2d, Mr. D. Dobson. Four pots of Tulips, single.—1st, Mr. Taylor; 2d, Mr. W. Thomas. Four pots of Tulips, double.—1st, Mr. Thomas; 2d, Mr. Dobson. For six pots of *Polyanthus Narcissus*.—1st, Mr. Thomas; 2d, Messrs. Geo. Cooling & Son. Six pots of Crocus.—1st, Mr. Dobson; 2d, Mr. Drummond. Three sorts of Lily of the Valley.—1st, Messrs. Cooling & Son; 2d, Mr. W. K. Wait; Certificate of Merit, Mr. Drummond. For three pots of *Ameryllis*.—1st, Mr. F. J. Walker; 2d, Mr. T. Jolly. For four hardy Rhododendrons.—1st, Messrs. Cooling & Son; 2d, Mr. Drummond. For three Azaleas.—1st, Mr. E. Bryant; 2d, Col. London. Six Azalea mollis, or Ghent vars.—Equal, Messrs. Cooling and W. C. Drummond. For a specimen Azalea.—1st, Mr. T. Jolly; 2d, Mr. Drummond. For three Orchids.—1st, Mr. James Cypher; 2d, Col. London. Specimen Orchid.—1st, Mr. Cypher; 2d, Col. London. Six Roses in pots.—1st, Gen. Doherty; 2d, Mr. Taylor. Six Cinerarias.—1st, Mr. Jolly; 2d, Mr. H. Pictou. For twelve Cyclamens.—1st, Mr. Taylor; 2d, Miss Charles. Collection of plants arranged for effect.—1st, Mr. Geo. Cooling; 2d, Mr. Drummond. Collection ditto by amateurs.—1st, Mr. E. Bryant; 2d, Gen. Doherty. For six ornamental foliaged plants.—1st, Mr. E. Bryant; 2d, Mr. Drummond. For four ornamental foliaged plants.—1st, Mr. R. B. Cator. For four stove and greenhouse plants in flower.—1st, Mr. Bryant; 2d, Gen. Doherty. Six exotic Ferns or mosses.—1st, Mr. Bryant; 2d, Gen. Doherty. For six plants for table decoration.—Mr. W. K. Wait; 2d, Messrs. Cooling & Son. For six Primulas.—1st, Mrs. Counsell; 2d, Col. Grant. For twenty hardy herbaceous plants.—1st, Messrs. Cooling & Son. For six pots of Violets.—1st, Mr. Jolly; 2d, Mr. Drummond; extra, Mr. S. Tredwell. Bouquet for the hand.—1st, Mr. W. H. Mould; 2d, Mr. W. Pethwick. Three buttonhole bouquets.—1st, Mr. H. Cooper; 2d, Mr. W. K. Wait. Spray for a lady's dress.—1st, Mr. Pethwick; 2d, Mr. Bryant. Vase of flowers for table decoration.—1st, Mr. Pethwick; 2d, Mr. W. Mardon; Certificate of Merit, Mr. Cypher. Twelve cut Roses.—1st, Mr. J. Mattock; 2d, Mr. W. Taylor, gr. to Alderman Chaffin, Esq.; Certificate of Merit, Messrs. Cooling & Co.

## FRUIT.

Best bunch of Grapes.—1st, Mr. W. Cooper. Best dish of Apples.—1st, Mr. F. J. Walker; 2d, Mr. S. Butler. Best dish of Pears.—1st, Mr. R. Hooper-Taylor; 2d, Mrs. W. J. Smith; Certificate of Merit, Mr. S. Butler. Best dish of Strawberries, Mr. Cator.

## VEGETABLES.

Brace of Cucumbers.—1st, Mr. G. Garaway; 2d, Mr. F. J. Walker. Dish of Mushrooms.—1st, Mr. James Stucky; 2d, Mr. G. Garaway. Dish of Seakale.—1st, Mr. Garaway; 2d, Mr. Landsdown Daubeny. Dish of Asparagus, fifty heads.—2d, Mr. H. Mardon. Basket of Salad.—1st, Mr. Garaway; 2d, Mr. Mould. Dish of Beans.—Certificate of Merit, Mr. S. P. Budd, T. S. C.

MASSACHUSETTS HORTICULTURAL :  
March 7.

The exhibition of flowers, &c., was excellent. John B. Moore & Son again showed some fine hybrid perpetual Roses, Jackson Dawson and William H. Spooner also brought hybrid perpetual Roses, and Delay & Meade a collection of Tea Roses. Mrs. Francis B. Hayes contributed a collection of Camellias, Azaleas, Rhododendron Veitchianum, and R. Veitchii laevigatum, Dendrobium nobile, &c. C. M. Hovey had a large Azalea plant in flower, also a collection of cut Azaleas and Camellias. Miss S. W. Storey exhibited a variety of cut flowers. Gratuities were awarded by the flower committee for all the above. James Cartwright showed a specimen of the Bourbon Rose Mme. Isaac Pereire. *A Correspondent.*

## MANURES.

The following, for which we are indebted to our correspondent, Mr. De Mar, is a paper which was read at a meeting of the Massachusetts Horticultural Society, and will be of interest to many of our readers resident near the great fishing stations and fish markets of this country.

The Hon. James J. H. Gregory was introduced to the meeting, and read a paper on "Nitrogen." After an introduction, showing the very small quantity of mineral matter in plants—a cord of wood, that might require two yoke of oxen to draw it and would be of the bulk of 100 bushels, yielding but a bushel of ashes, which the driver might carry on his shoulder—and the sources of this matter, he passed to the consideration of nitrogen, which makes up about four-fifths of the air mass that surrounds the earth for a depth of about 50 miles, the other fifth being oxygen. This gives unnumbered thousands of tons of nitrogen, right at hand, but never available, for human knowledge has not yet discovered a way by which nitrogen can be economically got from it for plant food. We have to depend for our supply wholly on what plants and animals have incorporated into their structure, using their waste in the form of manure, dead remains, either from land or sea, for our supply. The ammoniated liquor from the gasworks is but the waste produced from the remains of ancient forests which we burn as coal.

When nitrogen is combined with hydrogen in the proportion of three parts of hydrogen to fourteen parts of nitrogen, we have ammonia, one of the most common forms in which, from the waste of both animals and plants, nitrogen is fed to our crops.

The other most important source of nitrogen is nitric acid. This is a combination of nitrogen with oxygen; and nitrates, of which we see frequent mention in all works on manures, are a combination of nitric acid with soda, potash, and other materials called bases. It is well to fix in the mind that, in changing nitrogen to ammonia in any manure analysis, we must add about one-fifth to the quantity given. It appears to be the settled conviction among men of science, as the result of many experiments, that plants cannot take up pure nitrogen directly from the air. The theory is that they are able, in a greater or less degree, to get their supply through the water that carries it in some form in solution into the soil, and also from the air indirectly by the soil first separating it from the air that permeates it. Still another source of natural supply for plant growth is nitrogen in a latent condition, that has accumulated in the soil, set free by the action of such substances as lime and plaster. There is a general belief among agriculturists that plants have ways of collecting still but little known, while some extremists have gone so far as to declare that there is no necessity of feeding nitrogen to our crops, for they can of themselves collect from natural sources all they require. There is a growing belief that their power to supply their wants from natural sources is greater than has hitherto been credited to them. It is found also that different kinds of plants have different capacities for taking up nitrogen. Clover is an example, for though nitrogen enters largely into its composition, it has such a capacity to help itself to the good things which surround it, that it needs but very little artificial help from the manure pile, while Wheat, though it needs but little nitrogen, is so dainty a feeder that it insists on a large artificial supply from which it may pick out that little.

In regard to the sources from which the practical gardener can obtain nitrogen, Mr. Gregory first considered hen manure, which has by some been compared in value to guano, but he regarded this as an overestimate. He laid down a grand principle, that no

more nitrogen, phosphoric acid, or potash can be obtained from the manure of any animal than is contained in its food. An ordinary hen will eat about 2 bushels of maize a-year, and the larger breeds about one-half more. From this they must take the material for about 125 eggs annually, a change of feathers, keep up the animal heat, and make up the growth of the body, besides performing the various functions on which life depends. Now, subtracting what is required for these purposes, the waste element in our 2 bushels of maize shrinks to very small proportions. We must also take into account the fact that the droppings which we save are confined almost wholly to those made during half of the twenty-four hours. By analysis 2 bushels of maize contain, in nitrogen, potash, and phosphates, 46 cents in value. From this standpoint it will be seen that the droppings of a hen for a year cannot contain nearly the value sometimes claimed for them. For many years the essayist collected hen manure at a cost of 1 dol. per barrel, but afterwards reduced the price to 75 cents, and thought it at the latter price a cheap manure until he tested it side by side with an equal value of guano. Moreover, it is a sticky mass, difficult to handle, and it is worth any one's while to experiment, if it were only to realise the advantage in the handling of any commercial fertiliser over hen manure even in its finest state. It is generally composted with muck or dryish soil—three parts of muck to one of manure—and the compost should be made as fine as possible. A rake is the best tool to do this with, if it is sticky, and it should be turned over in three or four days, and a six-tined fork is a good implement for this purpose.

Sulphate of ammonia, a by-product where coal is used for the manufacture of gas, is one of the principal sources of nitrogen. It looks like rather coarse salt, and is often sold in huge casks weighing 1000 lb. or 1500 lb. It is readily soluble in water, but does not waste in the air. Nitrate of potash (saltpetre) is usually too costly a source of nitrogen to make it available. Nitrate of soda is a remarkably stimulating fertiliser, but if there is much rain it will waste before plants can take it up. In dry seasons, however, it is better and cheaper than sulphate of ammonia, as the latter needs a degree of moisture to make plant food; yet, on the whole, the latter is considered the better investment, for, first, it is not likely to be lost in the atmosphere; second, it is not too soluble; and, third, it has the power of clinging to the ingredients of the soil. Clay will hold it persistently, and even pure sand, when washed with water, will retain a large portion of it. Its ammonia is easily changed into nitric acid by ingredients in the soil. Nitrate of soda is very liable to be adulterated with white sand or broken quartz, and with common salt or the cheap potash salts. The purchaser should see that it dissolves entirely in water and does not taste distinctly of salt. Castor oil pomace affords a supply of nitrogen, but it must be kept from animals, as it is poisonous, and in spreading it care must be taken to go with the wind, as it is very disagreeable to the eyes or mouth. Cotton seed meal is better fed to stock, and the manure used, which will be nearly as rich as the meal before feeding. Occasionally spoiled meal can be found in the market, and this is as good for manure as the best, and is a very cheap source of nitrogen and phosphoric acid. Wood and horn shavings and leather are very rich in nitrogen, but it are not readily available, and therefore they have a low value as market articles. The last is excellent for mulching, and in time will decay and fertilise the ground, but if worked into tillage land it becomes a nuisance.

The waste of the fisheries is one of the principal sources from which manufacturers obtain the ammonia in their fertilisers. The largest portion is from the fish called menhaden, hardheads, moss bunks or fat backs. They are caught in immense quantities in nets, and boiled to secure the oil, in which they are rich. After pressing, the pomace or chum is packed in barrels or dried and ground. When a surplus of fish is caught they are sold to farmers, who put them directly on the grassland, where the effect is very stimulating for a few years, but the final result is that the soil becomes hard and the fish have less and less effect, and finally the crop is almost nothing. The fish are deficient in potash, and the result is what always comes from continuous manuring with any substance that is deficient in any one of the three essentials of plant food. The land can be restored by using potash. Other fish wastes are found in

the form of spoiled fish, and the heads, sound bones, and entrails of fish which accumulate at fishing ports. So immense was the waste of heads, bones, &c., of fish at the Isles of Shoals that the harbour had to be cleared twice by dredging them out. The essayist left a standing offer with a fisherman, a few years ago, of 25 cents per 100 lb. for all surplus pollock; the result was that 20,000 lb. of fine large fish, weighing from 8 lb. to 15 lb. each, just out of the water, was hauled to his manure heaps. All these substances are, however, very disagreeable and difficult to handle, requiring a vast quantity of soil to compost them. Where bay fishing is carried on on a large scale, liver or blubber chum can sometimes be found, and furnishes a very cheap source of nitrogen. It should be cut with sharp sand before composting, to make it fairly fine. Halibut chum is the refuse from the heads of halibut, which are cooked under high pressure to extract the oil, and the bones are left in such a state that they can easily be crumbled. It is especially rich in phosphoric acid. The skin, bones, and fins of salted fish, stripped and sold free of bone, are another form of fish waste, and the waste of herring and mackerel at the fishing stations is sometimes made up into chum. Dogfish, a small species of shark, are caught in immense quantities, and are very rich as manure, their muscles being very firm. The shells and other refuse of lobsters at canning factories are ground up and sold as plant food, and are especially rich in nitrogen.

All fish waste must be composted with a large quantity of soil, or the crops will be burned; and the compost, owing to its great richness, should be spread broadcast rather than used in the hill. Fish chum may be used broadcast or composted with poor manure to enrich it, or with soil, muck, or sawdust. It is surprising how penetrating is the ammonia from fish compost, and, therefore, in making a heap, the bottom layer of soil should be a foot or more in thickness. Cases have been seen when the fish was mixed liberally where the soil was full of ammonia for several feet below the surface. The layer of fish should be thick enough to just hide the soil, and the next layer of soil about 3 inches, and so on, scattering raw ground plaster over each layer of fish before covering with soil, at the rate of 50 lb. of plaster to 300 lb. of fish. The heap should be on level ground, with a little embankment around to catch the liquid that sometimes runs from it when the fish begin to decompose, or may be washed out by heavy rains, and it will be handy to fill up the holes that are apt to show on the top as decomposition progresses, letting out bad odours unless closed. Fish containing much oil are better composted with stable manure, and plaster should be scattered as before directed. If decomposition is slow to start, unleached ashes or lime may be mixed with the mass; but be sure to cover the heap with several inches of soil.

## Florists' Flowers.

## SELECTIONS OF BOUQUET DAHLIAS.

THE best twenty-four bouquet or pompon Dahlias will be found in Lady Blanche, white; E. F. Jungker, amber; Fanny Weimar, yellow, with slight edge of crimson; Isabel, bright orange-scarlet; Nemesis, dark maroon, occasionally tipped with white; Rosetta, purplish-magenta; Golden Gem, pure yellow; Little Prince, deep crimson, distinctly tipped with white; Mabel, lilac; Favourite, dark maroon, edged with crimson; Gem, intense rich scarlet; Little Duchess, white, edged with crimson; Guiding Star, white; Hedwig Pollwiz, red, distinctly tipped with white; Little Bobby, rich crimson; Pure Love, bright lilac; Rougier et Chauvière, bright blush, dashed with white; Sappho, dark crimson; Mdle. Valentine Falconet, white, striped with purple; The Khedive, deep crimson, suffused with white at the base of the petals; Wilhelm Nitschi, red, tipped with white; Brunette, shaded red, blotched and tipped with white; and Dora, pale primrose and white. The best twelve varieties would be Lady Blanche, E. F. Jungker, Fanny Weimar, Isabel, Nemesis, Rosetta, Golden Gem, Little Prince, Favourite, Gem, Little Duchess, and Mabel. Little Prince must not be confounded with Little Princess, they are quite distinct.

## SELECTIONS OF SINGLE DAHLIAS.

There is some difficulty in dealing with these because there are now so many raisers of new varieties, and such an enormous number of the latter, that in sketching

a representative group of select varieties some raiser or the other will be likely to feel aggrieved on the ground that certain of his flowers are left out. I cannot do better than fall back upon a selection of twenty-four varieties made at the Dahlia Exhibition held last year at the Crystal Palace, viz., *Admiral*, dark maroon, edged with lake, medium sized, distinct and striking; *Alba*, or *White Queen*, pure white; *Aurata*, pure yellow; *Coccinea*, bright orange-scarlet; *Dorothy*, white, suffused with rosy-peach; *Duchess of Westminster*, white; *Ellen Terry*, pale peach; *Evening Star*, bright crimson; *Falcon*, deep crimson, edged with bright purple; *George Clarke*, light purple, banded with deep crimson; *Harlequin*, deep rose, with purple stripe down each petal; *Juno*, rosy-lake, margined with silvery-rose; *Harold*, dark velvety-maroon; *Lucy Ireland*, rich magenta, suffused with crimson; *Magnificence*, pale silvery-pink; *Mauve Queen*, pale lilac; *Mrs. Goldring*, rosy-pink, rich and very pleasing; *Mrs. Bowman*, bright purplish-magenta; *Negress*, dark maroon; *Nora*, bright pink; *Paragon*, rich maroon, with purple edge; *Rob Roy*, bright scarlet; *Sunbeam*, deep yellow, very fine; and *Terra Cotta*, creamy-yellow, suffused with pale brown. A select twelve would comprise *Alba*, *Coccinea*, *Ellen Terry*, *Falcon*, *Harlequin*, *Juno*, *Lucy Ireland*, *Mauve Queen*, *Negress*, *Paragon*, *Magnificence*, and *Sunbeam*. R. D.

## The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON,  
FOR THE WEEK ENDING WEDNESDAY, MARCH 31, 1885.

March 25.—Very fine day; dull night.  
— 26.—Fine morning; dull afternoon.  
— 27.—Dull morning; fine afternoon.  
— 28.—Very fine day.  
— 29.—Fine day; very fine night.  
— 30.—Very fine day and night.  
— 31.—Very fine day; deep blue sky.

LONDON: *Atmospheric Pressure*.—During the week ending March 28, the reading of the barometer at the level of the sea was—decreased from 29.87 inches at the beginning of the week to 29.82 inches by 9 A.M. on the 22d, increased to 30.33 inches by 9 A.M., decreased to 30.30 inches by 1 P.M., increased to 30.32 inches by 5 P.M. on the 23d, decreased to 30.28 inches by 9 A.M., increased to 30.47 inches by 1 P.M., and decreased to 30.13 inches by 5 P.M. on the 24th, increased to 30.31 inches by 9 A.M. on the 25th, decreased to 29.93 inches by 9 A.M. on the 27th, increased to 30.30 inches by 1 P.M. on the 28th, and was 30.28 inches by the end of the week.

The mean reading of the barometer for the week was 29.86 inches, being 0.19 inch lower than last week, and 0.20 inch above the average of the week.

*Temperature*.—The highest temperature in the shade in the week was 50° 9, on the 26th; the highest on the 23d was 42°. The mean of the seven high day temperatures was 46° 8.

The lowest temperature was 25°, on the 23d; on the 27th the lowest temperature was 38° 9. The mean of the seven low night temperatures was 31° 6.

The greatest range of temperature in one day was 18° 7, on the 24th; the smallest was 9° 6, on the 27th. The mean of the seven daily ranges was 15° 2.

The mean temperatures were—on the 22d, 35° 6; on the 23d, 33° 7; on the 24th, 35° 7; on the 25th, 38° 2; on the 26th, 41° 2; on the 27th, 42° 7; on the 28th, 39° 8; and these were all below (excepting the 27th, which was the same as its average) by 6° 3, 8° 3, 6° 4, 4° 1, 1° 3, and 3° 2 respectively.

The mean temperature of the week was 38° 1, being 2° 5 lower than last week, and 4° 2 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 105° 6, on the 28th. The mean of the seven readings was 99° 7.

Rain fell on two days to the amount of 0.74 inch, of which 0.67 inch fell on the 22d, and 0.07 inch on the 27th.

ENGLAND: *Temperature*.—During the week ending March 28, the highest temperatures were 55° at Truro and Plymouth, 54° 5 at Cambridge; the highest at Wolverhampton was 48° 1, at Preston 48° 5, at Nottingham and Bolton 49° 7. The general mean was 51° 2.

The lowest temperatures were 25° at Blackheath, 25° 3 at Cambridge, 26° 2 at Wolverhampton; the lowest temperature at Plymouth was 33° 5, at Liverpool 33° 4, at Nottingham 31° 7. The general mean was 29° 7.

The greatest ranges were 29° 2 at Cambridge, 26° at Hull, 25° 9 at Blackheath; the smallest ranges were 17° 2 at Liverpool, 17° 5 at Preston, 18° at Nottingham. The general mean was 21° 5.

The mean of the seven high day temperatures was highest at Truro, 51°, at Cambridge 50° 2, at Plymouth 50° 1; and was lowest at Sunderland, 44° 7, at Wolverhampton 45° 2, at Bolton and Bradford 45° 5. The general mean was 47° 1.

The mean of the seven low night temperatures was highest at Plymouth, 38° 3, at Liverpool 37° 6, at Truro 37° 3; and was lowest at Hull, 30° 3, at Cambridge and Wolverhampton 31° 3. The general mean was 34° 3.

The mean daily range was greatest at Cambridge, 18° 9, at Hull 16° 8, at Blackheath 15° 2; and was least at Liverpool, 9° 4, at Sunderland 9° 8, at Newcastle 10° 8. The general mean was 12° 8.

The mean temperature was highest at Plymouth, 43°, at Truro 42° 9, at Liverpool 41° 1; and was lowest at Wolverhampton, 37°, at Hull 37° 5, at Brighton 37° 9. The general mean was 39° 5.

Rain.—The largest falls were 0.74 inch at Blackheath, 0.53 inch at Bristol, 0.52 inch at Bolton; the smallest fall was 0.07 inch at Cambridge, 0.10 inch at Nottingham. The general mean fall was 0.25 inch.

JAMES GLAISHER, F.R.S.

## Obituary.

WE have to announce the death, on March 30, of Mr. EDWARD ROWE, at the age of forty-six years. He was formerly gardener to the Viscountess Clifden, was a man of undoubted energy, a successful exhibitor of the Chrysanthemum and many other horticultural productions. His death occurred from consumption, at Northampton, in which town he had established himself as a florist.

## Enquiries.

"He that questioneth much shall learn much."—BACON.

NOTICE TO QUIT.—I took a few acres of land and a cottage on April 6, 1881. I have no written agreement, only a verbal arrangement that I was to use it as a nursery. I planted a portion of it with Quicks, Sycamores, and other trees. In April last year my landlord gave me twelve months' notice to quit. I paid a small amount on entry for ploughing, digging, and for Peas and Beans, to my landlord, who now refuses to pay me for anything except for ploughing. Am I entitled to compensation for trees, &c.? *Ernest*. [Consult a solicitor. Ed.]

## Answers to Correspondents.

BLIGHTED LAUREL: *G. Buchanan*. The plants are evidently affected by a disease common to Rosaceæ. There is no known cure for this mysterious malady, in which the skin is, as it were, lifted from the leaf. No fungus or insect has as yet been discovered to account for it; but by cutting back the wood severely, and by so doing getting a new growth entirely, the vigour of the tree or bush can be renovated.

BOULEVARD AND PLAYGROUND ASSOCIATION.—We are requested by Miss Wilkinson to correct a mis-

statement which appeared in our last issue, in reference to her having given £1000 to the Association. The lady states that, although she is desirous of helping that body in any way she can, the sum above named came from an anonymous donor, and not from herself.

"CHEMISTRY OF MANURES." *R. B. Dr. Voelcker* (not Faulkner) did not publish such a book; his papers are contained in the *Journal of the Royal Agricultural Society*.

CLIMBING PLANT: *W. Mount*. *Ipomoea purpurea* in many colours; *I. grandiflora*; *I. Nile*, corerulea blue; *I. violacea vera* (rubro corulea); *I. violacea vera* flore albo.

GLASS-HOUSE SHADING: *Jules Withergh, St. Nicolas*. Dissolve plasterers' size in water; sufficient of the former to be used so as to make the liquid slightly adhesive. Then mix into it as much Brunswick Green as will give the amount of shading you may desire, and if it should prove of too dark a tint on trial, put in a little powdered whitening.

MUSHROOMS: *E. C.* The sample was that of very superior Mushrooms, the flesh being close, fine-grained, and juicy, and without that thick and coarse appearance of the skin often seen in large examples.

MUSHROOM, DOUBLED: *A. R. L.* This occurrence is by no means rare.

NAMES OF FRUIT: *E. Thomas*. *Beurré Rance*.—*T. Taylor*. *Jean de Witte*.

NAMES OF PLANTS: *G. N. Gude*. *Carex*, probably the Japanese *C. Mounowii*; would be easier determined if in fruit.—*T. S. Thomasia solanacea*, *Fritillaria sewerzowii*. Thanks for the *Narcissus*, of which we shall give a figure.—*W. S. C. Sinuill*. *Saxifraga decipiens*, *Veltheimia viridifolia*, *Muscari conicum*, *Fuchsia fulgens*.—*C. E. J.* 1. *Acacia obliqua*; 2. *A. armata*; 3. *Aristotelia racemosa*.—*J. J. W.* This *Cirrhopteralum* we cannot venture to name specifically from the material. It is near *C. Wightianum*, &c.—*A. Brookes*. *Cornus mas*.

"ON THE CULTIVATION, HARVESTING, PRESERVATION AND DURATION OF THE VITALITY OF SEEDS." *F. C. Heinemann*. There is no such book in English, but you have several in German.

PEACHES NOT SWELLING: *W. O.* You must wait with patience till the stone is formed.

POTATO THE THORBURN: *J. M. Thornburn & Co., New York*. Potato received. We will get it tried here, and report in due season.

VINES AND ROSES: *F. O. S.* The Vine leaves were much eaten by thrips; with the roots there seemed but little the matter. The tissues of the Rose leaves were very thin—evidently the result of hard forcing and bad ventilation; a breath of cold air would cause the appearances noticed.

\* All communications intended for publication should be addressed to the "Editor," and not to the Publisher, or to any member of the staff personally. The Editor would also be obliged by such communications being written on one side only of the paper and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

COMMUNICATIONS RECEIVED.—"West Wilts."—*J. N. Thornburn*.—*J. R.*—*J. M.*—*T. S.*—*Sir T. L.*—*W. E. G.*—*W. J. S.*—*C. K.*—*F. W. B.*—*C. S.*—*H. Corveon*, Geneva.—*H. Copenhaen*.—*J. D.*—*The Secretary of the Interior*, Washington.—*E. Crump*.—*R. D.*—*G. Malcolm*.—*Hon. Mr. Boyle*.—*H. S.*—*A. J.*—*F. I. J. W.*—*Valisea Flower Show*.—*W. C. P.*—*M. Sullivan*.—*J. D.*—*R. H. Evans*.—*J. Hughes*.

MARRIED, on Saturday, March 28, PIETRO TACAGNI to EDITH, only daughter of Worthington G. Smith.

## Markets.

COVENT GARDEN, April 1.

No alteration to quote, the holidays checking London trade. *James Webber, Wholesale Apple Market*.

## SEEDS.

LONDON: April 1.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, report a strong growing demand for the leading varieties of farm seeds. All descriptions are now getting into narrow compass, and where values change the movement is upward. Grasses are in improved request. Sainfoin continues somewhat scarce. Of spring Tares there is now a better supply. Bird seeds sell slowly. Feeding Linseed keeps steady. Rape seed continues firm.

## CORN.

At Mark Lane on Monday, with the more pacific tenor of the political news, the animation of the previous Friday disappeared, and the advance then quoted was to a great extent lost. For English Wheat holders stood to the advance of 1s. on the week. Foreign Wheats were not quite so firmly held, but generally 6d. over the rates of Monday se'nnight was required, and on flour 6d. of the previous advance nominally remained. Maize and Oats were but just the turn dearer on the week; and Barley, Beans, and Peas unchanged.—Average prices of corn for the week ending March 28:—Wheat, 32s. 7d.; Barley, 31s. 4d.; Oats, 20s. 10d. For the corresponding period last year:—Wheat, 38s. 1d.; Barley, 31s. 3d.; Oats, 19s. 10d.—On Wednesday scarcely anything was done. Wheat, both English and foreign, was in quiet request, and prices had a weak tendency. Flour was quiet, at previous quotations. For Barley the demand was inactive, at late currencies. Oats were in fair demand, at late rates. Maize sold slowly, on former terms. Beans and Peas were quiet, at late prices.

## HAY.

Tuesday's Whitechapel market report states that trade was dull for everything except best hay, which continues in demand. Supplies were fair. Quotations:—Clover, prime, 85s. to 107s.; prime second cut, 85s. to 105s.; inferior, 46s. to 75s.; hay, prime, 76s. to 95s.; inferior, 25s. to 60s.; and straw, 22s. to 35s. per load.—The Cumberland Market report states that there was a moderate supply, and no demand for inferior quality. Quotations:—Clover, best, 90s. to 105s.; inferior, 60s. to 84s.; meadow hay, best, 80s. to 90s.; inferior, 60s. to 75s.; and straw, 29s. to 34s. per load.

## POTATOS.

The Borough and Spitalfields Market report states that there has been a slow trade, at the following quotations:—Scotch Regents, 80s. to 95s.; Kent ditto, 70s. to 90s.; Champions, 40s. to 50s.; Magnum Bonums, 55s. to 80s.; and Victorias, 60s. to 90s. per ton.

## COALS.

The following are the prices current at market during the week:—Debside West Hartley, 14s. 9d.; East Wylam, 15s.; Walls End—Type (unscreened), 11s. 3d.; Hetton, 16s. 6d.; Hetton Lyons, 15s.; Lambton, 16s.; Wear, 15s.; East Hartlepool, 15s. 9d.; South ditto, 15s. 3d.; Ravensworth West Hartley, 14s. 9d.

Appointed by Royal Warrant Makers to  
Her Majesty the Queen and His Royal Highness the  
Prince of Wales.

## GREEN'S PATENT

### "Silens Messor" and "Multum in Parvo" LAWN MOWERS

Have been proved to be the best, and they have carried off every Prize in all cases of competition.  
Every Lawn Mower is guaranteed to give entire satisfaction, otherwise they may be returned AT ONCE, free of cost to the Purchaser.

#### HAND MACHINES, "Silens Messor" Pattern.

To cut 8 in. wide .. £2 10 0	To cut 16 in. wide .. £6 10 0
To cut 10 in. wide .. 3 10 0	To cut 18 in. wide .. 7 10 0
To cut 12 in. wide .. 4 10 0	To cut 20 in. wide .. 8 0 0
To cut 14 in. wide .. 5 10 0	To cut 22 in. wide .. 8 10 0
To cut 24 in. wide .. £9 0 0	

For Donkey, Pony and Horse Machines, see Price List.

#### GREEN'S PATENT "MULTUM IN PARVO" MOWER.

Suitable for Small Grass Plots.

A most useful Machine.

Prices, with Grass Box:

£1 15 0
1 12 0
2 0 0

Prices,  
Without Grass Box:

To cut 6 in. .. £1 1 0
To cut 7 in. .. 1 8 0
To cut 8 in. .. 1 15 0

It is simple in construction, easily adjusted, is well adapted for mowing small plots, cutting borders, verges, round flower beds, the edges of walks, &c. It is a most handy, serviceable machine, and very easy to work.

#### GREEN'S PATENT GRASS EDGE CLIPPER.

With Chain and Wheel Motion.

A most useful Machine.

Price, £1 16s.

Packing Case, 2s.

SIZE,  
8 inches wide by  
7 inches diameter.

#### GREEN'S PATENT (No. 2412) LAWN TENNIS COURT MARKER.

Price 20s.

Small Bag of Marking Composition,  
Mat, and Packing, 1s. 6d.

Price List free on application.

The above Machines can be had of all respectable Ironmongers and Seedsmen in the United Kingdom, or direct from the Manufacturers.

LEMON OIL INSECTICIDE (Registered).

—Soluble in water. The cheapest, safest, and most effectual Insecticide extant. Harmless to flower and foliage, instant death to Mealy Bug, Scale, Thrips, Red Spider, Green and Black Fly, American Blight, Mildew, Ants, &c. As a winter dressing unequalled. See circulars, with testimonials, from many of the leading Gardeners on its behalf. Sold by most of the leading Nurserymen, Seedsmen, and Garden Maoure Manufacturers, in tins—per pint, 1s. 6d.; quart, 1s. 9d.; half gallon, 5s.; gallon, 9s. Directions for use with each tin. Wholesale, J. W. COOKE, Market Place, Winstford; and A. LAING, Rawcliffe, Selby, Yorks; also Messrs. OSMAN AND CO., 15, Windsor Street, Bishopsgate, London; and W. FRASER, 124, High Street, Perth.

Mildew and Other Hurtful Fungi, Red Spider, &c., Extirpated by

PHILIP HARRIS AND CO.'S specially prepared SULPHIDE OF POTASSIUM, which is very soluble. See article by E. TONKS, Esq., B.C.L., in *Gardeners' Chronicle*, February 23, p. 276, describing the great efficacy of this preparation, with which his successful experiments were made. Sold in Bottles, ONE SHILLING EACH (post-free), containing sufficient to make 32 gallons of solution, by the Sole Manufacturers PHILIP HARRIS AND CO., Wholesale Chemists, 9, Bull Ring, Birmingham.

Special quotations for large quantities.

PEAT.—Superior Black or Brown Fibrous PEAT, for Rhododendrons, Azaleas, &c., as supplied to Messrs. J. Waterer and other noted growers. Six tons, loaded on trucks at Camberley Station, S.W.R., £4 4s. Mr. W. TARRY, "Golden Farmer," Farnborough Station.

# "ARCHIMEDEAN" AMERICAN LAWN MOWERS.

AWARDED  
HIGHEST PRIZE

AT THE  
Paris Exhibition, 1878;  
and the JURY, in their REPORT,  
say:—

"The 'ARCHIMEDEAN' did the  
BEST WORK of any Lawn  
Mower exhibited."

ALSO AT  
Sydney Exhibition, 1879-80

AND AT  
Melbourne Exhibition, '80-1

Opinions of the Press:  
"Far superior to any of ours."—  
Vide *The Field*.

"Remarkably easy to work."—Vide  
*Gardeners' Magazine*.

"The quickest, most simple, and  
most efficient mower ever used."—Vide  
*Gardeners' Chronicle*.

"We feel bound to recommend it to  
our readers as one of the best mowers  
we have as yet made acquaintance  
with."—Vide *Floral World*.

HARNESS ROOMS, DRYING ROOMS, HOTHOUSES and BUILDINGS of EVERY DESCRIPTION.

## HORTICULTURAL PREPARATIONS.

The best and most effectual yet introduced.

**FOWLER'S LAWN SAND**, for destroying  
Daisies, Dandelions, Plantains, Ribbed Grass, Thistles,  
and other weeds on Lawns, Croquet Grounds, Bowling Greens,  
Parks, &c.: at the same time acting as a fertilizer, and improving  
the growth and colour of the grass. Price in tins, 1s., 2s., 6d.,  
and 5s.; kegs, 20 lb. 10s.; 56 lb. 10s.; 112 lb. 36s.

**GARDENER'S INSECTICIDE**, for destroy-  
ing all the various Insects infesting plants and trees. It  
is easily applied either by dipping, syringing, or sponging; will  
not injure the most delicate flower, fruit, foliage, or root. In jars,  
1s., 6d., 3s., 5s., 6d., and 10s. each; and in kegs, 28 lb., 21s.,  
56 lb., 42s.; 112 lb., 84s. each.

**FOWLER'S MEALY-BUG DESTROYER**,  
for the special eradication of this most troublesome of  
stovehouse plant pests. It is easily applied, is instantaneous destruc-  
tion to both insect and ova, and does not injure the foliage. In  
bottles, 1s., 2s., 6d., 5s. and 10s.; half-gallon, 21s.; one gallon,  
42s. each.

**POOLEY'S WORM DESTROYER**, for  
eradicating every kind of Worm from pots, lawns,  
&c. It is easily and cheaply applied, and will not harm the most  
delicate plant. In bottles, 1s., 2s., 6d., 7s., and 12s. 6d. each.

**EWING'S MILDEW COMPOSITION**, for  
the prevention or destruction of Mildew on all plants. In  
bottles, 1s., 6d. and 3s. each.

**ELLIOTT'S IMPROVED "SUMMER  
CLOUD"** Shading for Greenhouses, &c. For efficacy,  
economy and lasting effects this article remains unrivalled.  
In Packets, 1s.; 14 lb., 28s.; 28 lb., 50s.

**CORRY, SOPER, FOWLER & CO., Limited,**  
SOLE MANUFACTURERS, LONDON.

**EPPS'S SELECTED PEAT**.—Forty sacks,  
2s. 6d. per sack; 30 ditto, 2s. 9d.; 20 ditto, 3s. 6d.;  
10 ditto, 4s. 6d.; sacks, 6d. each. In trucks of 14 cubic yards,  
11s. per yard. For Rhododendrons and common purposes,  
14s. per ton, not less than four tons; sample sack, 2s. 6d.  
**LOAM, SAND, LEAF-MOULD, SPAGNUM, &c.**  
See Special List, also for the Trade. Kingwood, Hants.

**GISHURST COMPOUND**, used by leading  
Gardeners since 1859 against Red Spider, Mildew,  
Thrips, Green Fly, and other Blight. 1 to 2 ounces to the  
gallon of soft water; 4 to 16 ounces as winter dressing for Vines  
and Orchard-house Trees; and in lather from the cake against  
American Blight. Has outlived many preparations intended to  
supersede it. Boxes, 1s., 3s., and 10s. 6d.

**GISHURSTINE keeps Boots dry and soft on  
wet ground.** Boxes, 6d. and 1s., from the Trade.  
Wholesale from PRICE'S PATENT CANDLE COMPANY  
(Limited), London.

**SILVER SAND**, excellent, coarse, 7s. and  
8s. per ton. **PEAT**, excellent, 6s., 8s. and 10s. per cubic  
yard. **LOAM**, excellent, 10s. and 12s. per cubic yard. Free on  
rail by truckloads. In sacks at moderate prices.  
W. SHORT, Horticultural Company, Midhurst, Sussex.

**JAMES T. ANDERSON,**

149, Commercial Street, Shoreditch, London, E.

Rosher's Garden Edging Tiles.

**THE ABOVE** and many other PATTERNS are made in materials of great durability. The plainest sorts are specially suited for KITCHEN GARDENS, as they harbour no Slugs or Insects, take up little room, and, once put down, incur no further labour or expense, as do "grown" Edgings, consequently being much cheaper.

GARDEN VASES, FOUNTAINS, &c., in Artificial Stone, very durable and of superior finish, and in great variety of design. F. ROSHER AND CO., Manufacturers, Upper Ground Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.-Kingsland Road, E.

Agents for LOOKER'S PATENT "ACME" FRAMES, PLANT COVERS, and PROPAGATING BOXES; also for FOXLEY'S PATENT BEADED GARDEN WALL BRICKS.

Illustrated Price LISTS Free by Post. The Trade supplied.

**ORNAMENTAL PAVING TILES,** for Conservatories, Halls, Corridors, Balconies, &c., from 3s. per square yard upwards. Pattern Sheet of Plain or more elaborate Designs, with Prices, sent for selection.

WHITE GLAZED TILES, for Lining Walls of Dairies, Larders, Kitchen Ranges, Baths, &c. Grooved and other Stable Paving of great durability. Wall Copings, Drain Pipes and Tiles of all kinds. Roofing Tiles in great variety, Slates, Cement, &c.

F. ROSHER AND CO., Brick and Tile Merchants, See Addresses above.

**SILVER SAND,** fine or coarse grain as desired. Price, by post, per Ton or Truckload, on Wharf in London, or delivered direct from Pits to any Railway Station. Samples of Sand free by post. PLANTS and BRICK BURNERS for Rockeries or Ferneries, KENT PEATS or LOAM supplied at lowest rates in any quantities.

F. ROSHER AND CO.—Addresses see above.

N.B.—Orders promptly executed by Rail or to Wharves. A liberal Discount to the Trade.

**FRED. SILVESTER, Castle Hill Foundry,** Newcastle, Staffordshire.

Oil Paint no Longer Necessary.  
**HILL AND SMITH'S BLACK VARNISH,** for Preserving Ironwork, Wood, or Stone. (Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

### UNSOLICITED TESTIMONIAL.

"Pierrefield Park, June 21, 1876.—Sirs,—I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chepstow,—I am, Sirs, yours respectfully, Wm Cox."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large illustrated CATALOGUE of Fencing Hurdles, Field and Entrance Gates, &c., sent free on application to HILL AND SMITH, Brierley Hill Ironworks, Staffordshire: 118, Queen Victoria Street, London, E.C.; and 196, St. Vincent Street, Glasgow.

ROYAL HORTICULTURAL WORKS, MIDDLETON MANCHESTER.

THE WORLD.

THE AUTOMATON.

## RANSOMES' LAWN MOWERS.

### THE "WORLD" LAWN MOWERS

are the best for cutting long grass, and are constructed on the American system with the special advantages of English materials and workmanship.

They are made in nine sizes, 8 to 24 inches.

Prices from 45s. to £10.

### THE "REVERSIBLE" LAWN MOWERS

are suitable for small gardens and borders. They roll the grass as well as cut it, and can be used either side upwards.

They are made in three sizes, 6 to 10 inches.

Prices from 27s. to 45s.

### THE "AUTOMATON" LAWN MOWERS

are the best machines for general purposes and gardeners' use. They leave no ribs in the grass but produce a perfect surface.

They are made in eight sizes, 8 to 22 inches.

Prices from 55s. to £8 10s.

### THE HORSE-POWER MOWERS

are the best for Large Lawns, Cricket and Lawn Tennis Clubs. They are used on the Cricket Grounds of the Oxford and Edinburgh Universities and numerous Colleges and Public Schools.

They are made in six sizes, 26 to 48 inches.

Prices from £14 10s. to £32.

Complete Price *LISTS* may be obtained from any respectable Ironmonger, or

**RANSOMES, SIMS & JEFFERIES (Ld.), IPSWICH.**

THE MOST SUITABLE FOR  
SHADING ORCHIDS, FERNS,  
Palms and Stove and  
GREENHOUSE PLANTS.  
It is a strong, durable Cotton  
Netting, woven in squares so  
close as to exclude the  
direct rays of the sun,  
but admitting the  
greatest amount  
of light attain-  
able through  
shading.

It with-  
stands the  
weather better  
than any other  
class of Shading,  
and may be beneficia-  
lly used on account of  
the thickness of its texture,  
during cold weather, to keep  
the frost out. R. WARNER, Esq.,  
Broomfield, Chelmsford, has em-  
ployed this material for some years,  
and speaks very highly of it, pronouncing  
it to be the very best material for Orchids  
he has ever used.  
Blinds made up and fixed complete.  
Sold in pieces, 30 yards long by 1½ yard wide.  
Price 45s. each. Sample submitted.

No. 392. IMPROVED HOSE REELS for Coiling up Long Lengths of Hose for Garden use.

An engraving of the exterior of the Old Rectory, a large, long, two-story building with a gabled roof and a central entrance. The building is surrounded by a lawn and trees, with a path leading to the entrance.

A detailed black and white illustration of a portable cold storage box. The box is rectangular and shown from a three-quarter perspective. Its lid is hinged at the back and is propped open by a long, thin support rod. The interior of the box is divided into several compartments by vertical and horizontal dividers. The front panel of the box is made of a wire mesh or grate. The box sits on a flat surface, and the lid is open, revealing the internal structure.

A detailed illustration of a wooden building with a large, hinged hatch open, revealing a complex internal mechanism of gears and shafts, likely a pump or engine. The mechanism is mounted on a wooden frame within the building's interior. The hatch is supported by a long pole. The building's exterior is made of dark, textured wood. The illustration is in a classic, engraved style.

Apply to Messrs. PROTHEROE AND MORRIS, 67 and 68

**WANTED**, a young MAN, used to Potting and Tying Plants for Market.—Mr. W. ORPWOOD, Boll Bridge Road, South Acton, Middlesex.

#### Traveller.

**WANTED**, one well acquainted with the North-West and North Country Trade, to Represent an Old-established London Seed House.—Communications by letter only, which will be strictly confidential, to A. B., W. Neely, 1, George Street, Mansion House, London, E.C.

**WANTED**, a capable MAN, to take charge of the Packing Department.—Apply, giving reference and stating salary, to THE LIVERPOOL HORTICULTURAL CO. (John Cowan), Limited, Garston, near Liverpool.

**WANTED**, a young WOMAN, for a Florists' Business. Must be thoroughly competent to Make-up Bouquets, &c., and Arrange Flowers.—Address, with references, FLORIST, W. Porteous & Co., Glasgow.

### WANT PLACES.

**POSTAL ORDERS.**—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

**R. B. LAIRD AND SONS** (successors to the late Firm of DOWNIE & LAIRD) can at present recommend with every confidence several first-rate SCOTCH GARDENERS, whose character and abilities may be thoroughly depended upon, either for Large Establishments or Single-handed Situations; also FOREMEN, UNDER GARDENERS, and FARM BAILIFFS.—17, Frederick Street, Edinburgh.

**B. S. WILLIAMS** begs to intimate that he has at present in the Nursery and upon his Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Holloway, N.

**RICHARD SMITH AND CO.** beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

**SCOTCH GARDENERS.**—JOHN DOWNIE, Seedsman, 144, Princes Street, Edinburgh, has at present on his list a number of SCOTCH GARDENERS, waiting re-engagements, at wages ranging from £50 to £100 per annum, and he will be pleased to supply full particulars to any Nobleman or Gentleman requiring a trustworthy and competent Gardener.

#### Journeyman and Foreman, Scotch.

**JOHN DOWNIE, SEEDSMAN**, 144, Princes Street, Edinburgh, has at present on his Books a number of first-rate Young Men who wish to go to England.—Particulars on application.

**TO LANDED PROPRIETORS, &c.**—A. MCINTYRE (late of Victoria Park) is now at liberty to undertake Formation and Planting of New Garden and Park Grounds, and Remodelling existing Gardens. Plans prepared. 115, Listra Park, Stamford Hill, N.

**GARDENER (HEAD).**—Understands Early and Late Forcing of Flowers, Fruits, and Vegetables. Fourteen years' character from late employer.—L. JANSOON, Foxley, Hereford.

**GARDENER (HEAD).**—Age 35; twelve years' character. Leaving through reduction in establishment. Thoroughly understands Gardening in all branches, Carpet Bedding, &c.—GEORGE FISHER, Rowtown, Chertsey, Surrey.

**GARDENER (HEAD)**; age 36, married.—Mr. TILLYARD, Gardener to Earl Varborough, Brocklesby Park, Ulceby, Lincolnshire, can with every confidence recommend a thoroughly practical man; high-class Fruit and Vegetable Grower, &c., and one fully competent to manage a large establishment. In last situation five years as Head Gardener. Good references.

**GARDENER (HEAD WORKING).**—Age 40, three children (youngest, five years old). Twenty years' experience.—Wm. CLARKE, (late) P. Cazenove, Esq., Clapham Common, S.W.

**PLUMBER, ZINC-WORKER, and GAS-FITTER.**—On Estate preferred.—H. MANKIN, 11, White Conduit Street, Islington, N.

#### GRATEFUL-COMFORTING.

### EPPS'S COCOA.

#### BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." *Civil Service Gazette*.

Made simply with boiling water or milk. Sold only in

Packets, labelled thus:—

**JAMES EPPS & CO., Homoeopathic Chemists, London.**

**HOLLOWAY'S PILLS.**—Dismiss your doubts; let no one be any longer oppressed with the notion that his or her malady is incurable till these purifying Pills have had a fair trial. Where ordinary preparations fail these Pills produce the best results. A course of this admirable medicine cleanses the blood from all impurities, and improves its quality. The whole system is thus benefited through the usual channels without reduction of strength, shock to the nerves, or any other inconvenience; in fact, health is renewed by natural means. For curing diseases of the throat, windpipe, and chest, these Pills have pre-eminently established a worldwide fame, and in complaints of the stomach, liver, and kidneys, they are equally efficacious. They are composed of rare balsams, without a single grain of mercury or any other deleterious substance.

# SEND FOR A PRICE LIST OF JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS,

For Raising Water for the Supply of Towns, Villages, Irrigation, Railway Stations, Mansions, Fountains, Farms, &c.

*No Cost for Motive-Power, which is obtained from a Stream of Water passing through the Rams.*

NO OILING OR PACKING REQUIRED.

Made in Sizes to Raise from 300 to 500,000 Gallons per day. Will Force to a Height of 1500 feet.

SPECIAL RAMS for HIGH FALLS to send up Two Gallons out of every Five Gallons passing through them.

Blake's Special Ram, to work under small falls. The patterns vary with the different sizes.

This Ram will force a part of the same water that works it, or will force clean water from a well or spring whilst worked by a stream of impure water. Rams on this principle can be supplied to force to a height of 1500 feet.

This Ram, for deep working falls, is capable of sending up two gallons out of every five gallons passing through it.

 SILVER SAND, Coarse or Fine, 52s. per Truck of 4 tons.  
 WALKER AND CO., Farnborough Station, Hants.

## STANDEN'S MANURE.

ESTABLISHED 20 YEARS.

This old-established Manure is acknowledged by most of the  
 leading practical Gardeners in the United Kingdom and the  
 Colonies to exceed all others in general fertilising properties and  
 staying powers. It promotes a rapid, healthy, and robust  
 growth in plants generally. It is a clean and dry powder,  
 with very little smell, which renders it particularly adaptable  
 for ladies interested in plant culture.

The highly fertilising properties of this Manure render its  
 money value, in comparison with other manures, at least double,  
 as users will find that very small quantities will produce  
 favourable results.

Sold in TINS, 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each;  
 and in BAGS or KEGS, at reduced prices, 28 lb., 12s. 6d.;  
 56 lb., 23s.; 112 lb., 42s. each.

May be obtained from all Nurserymen and Seedsmen in the  
 United Kingdom and the Colonies.

SHADINGS, &c.  
 Before buying send for Samples and Prices to  
 RIGBY, WAINWRIGHT AND CO.  
 Manufacturers, Neptune Works, Manchester.

# THE MOST SUITABLE FOR SHADING ORCHIDS, FERNS, Palms and Stove and GREENHOUSE PLANTS.

It is a strong, durable Cotton Netting, woven in squares so close as to exclude the direct rays of the sun, but admitting the greatest amount of light attainable through shading.

It withstands the weather better than any other class of Shading, and may be beneficially used on account of the thickness of its texture, during cold weather, to keep the frost out. R. WARNER, Esq., Bromfield, Chelmsford, has employed this material for some years, and speaks very highly of it, pronouncing it to be the very best material for Orchids he has ever used.

Blinds made up and fixed complete.

Sold in pieces, 30 yards long by 1½ yard wide. Price 45s. each. Sample submitted.

**B. S. WILLIAMS,**  
VICTORIA and PARADISE NURSERIES,  
UPPER HOLLOWAY, LONDON, N.

Oil Paint no Longer Necessary.  
**HILL AND SMITH'S BLACK VARNISH,**  
for Preserving Ironwork, Wood, or Stone.  
(Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 15. 6d. per gallon, at the Manufactory, or 15. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.

"Pierrefield Park, June 21, 1876.—Sirs,—I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned to me in as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chepstow.—I am, Sirs, yours respectfully, Wm. Cox."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which one is genuine.

Large illustrated CATALOGUE of Fencing Hurdles, Field and Entrance Gates, &c., sent free on application to

HILL AND SMITH, Brierley Hill Ironworks, Staffordshire;

118, Queen Victoria Street, London, E.C.; and 195, St. Vincent Street, Glasgow.

BUY ONLY ENGLISH THREE-QUARTER PLATE

WATCHES.

BENSON'S NEW PATENT (No. 4658)

"LUDGATE" WATCH,

SILVER, GOLD,

£5 5s. £12 12s.

Is a "Special Strength" Silver English Lever, my best London make, with Three-quarter Plate Movement.

Twelvefold throughout.

Chronometer balance, with damp and dust-proof Patent ring-band, and extended barrel, in Massive sterling silver dome cases

With crystal glass front.

Winds, set hands and opens at back.

The superiority in value, accuracy, and durability of the "Ludgate" Watch over the Swiss and American Keyless and Non-Keyless Watches, made in imitation of and sold as English work, and the ordinary Full-plate English Watch is enormous.

The "Ludgate" Watch is compact, strong, handsome, and durable. Being Three-quarter Plate, it is superior in value and appearance to any £10 Watch sold, and, being compensated, it keeps perfect time; fitted with crystal front, it combines the strength of the Hunter, and convenience of the open face. Of my best London make, it will last a lifetime, stand rough usage of all and every kind without damage, and, being made in three sizes, it is for the above reasons suited for Home, Indian, and Colonial use by

Gardeners, Workmen, and Gentlemen.

The "Ludgate" Watch is far superior

To any Watch at the price yet made, and

Will be sent free and safe at our risk

To all parts of the world for £5 5s.

Cash or P.O.O.; or in hunting cases, £6 6s.

Price in 18-carat gold, crystal glass cases,

Twelve Guineas

SPECIALLY NOTE that J. W. BENSON is the only Maker of a Three-quarter Plate English Watch for £5 5s. in Silver, or £12 12s. in Gold, and that our Patent "Ludgate" Watch cannot be had through or of any Watchmaker in the Kingdom. Any infringement of the Patent Rights will be proceeded against. A Book explaining the advantages of this Watch over the Full-plate English Watches sold by all other makers, will be sent Post-free on application to

J. W. BENSON,

Watchmaker to Her Majesty the Queen, The Steam Factory,

62 and 64, Ludgate Hill, E.C.

Illustrated Pamphlets of Watches from £2 to £500, Gold and Silver Jewellery, Clocks (House, Chime, and Turret), and Musical Boxes, free on application.

# THE GARDENERS' CHRONICLE

(Established 1841)

CONTAINS ARTICLES ON ALL DEPARTMENTS OF

GARDENING, PRACTICAL AND SCIENTIFIC,

REPORTS OF EXHIBITIONS,

REVIEWS of BOOKS, and NOTICES of all HORTICULTURAL MATTERS of  
CURRENT INTEREST,

HOME, COLONIAL, and FOREIGN CORRESPONDENCE.

Special attention is given to the following subjects:—

ALPINE PLANTS.  
ARBORETUM—The.  
BEDDING PLANTS.  
BEES.  
BOTANY.  
BULBOUS PLANTS.  
CHEMISTRY OF PLANTS.  
CONIFERS.  
DISEASES OF PLANTS.  
EVERGREENS.  
EXHIBITIONS.—FERNS.  
FLORISTS' FLOWERS.  
FLOWER GARDENS.

FORCING.  
FORESTRY.  
FRUIT CULTURE.  
GREENHOUSE PLANTS.  
HERBACEOUS PLANTS.  
IMPLEMENTS.—INSECTS.  
KITCHEN GARDENING.  
LANDSCAPE GARDENING.  
LAWNS.—LILIES.  
MACHINES.  
MANURES—Analyses of.  
MARKET GARDENING.  
NEPENTHES.

ORCHIDS—including a com-  
plete List of those in culti-  
vation.  
PALMS.  
PLANTING.  
PLEASURE GROUNDS.  
POMOLOGY.  
POTATOS.—POULTRY.  
RHODODENDRONS.  
ROCKERIES.  
ROSES.  
SHRUBS and SHRUBBERIES.  
STOVE PLANTS.—SOILS.

SUCCULENT PLANTS.  
TOWN GARDENING.  
TRAINING.  
TRAVEL—Notes of.  
TREES—Deciduous and Ever-  
green.  
VEGETABLE CULTURE.  
VEGETABLE PHYSIOLOGY  
VINES.  
WALKS.—WALLS.  
WEATHER.—WEEDS.  
WINDOW GARDENING.  
WOODS, &c., &c., &c.

# Gardeners' Chronicle.

SATURDAY, APRIL 11, 1885.

## COWPER'S COUNTRY.

**A**MONG the numerous homes and haunts of English poets none have attracted so many visitors as Cowper's red brick house in the High Street at Olney, and "The Lodge" at Weston Underwood. At one or other of the dwellings, surrounded by friends and neighbours, he wrote *The Task* and *Table Talk*, described his garden and greenhouse, "Warm and snug, while the winds whistle and the snows descend." And here he described the fireside pleasures of a winter evening in this simple verse:—

"Now stir the fire, and close the shutters fast,  
Let fall the curtains, wheel the sofa round,  
And while the bubbling and loud-hissing urn  
Throws up a steamy column, and the cups,  
That cheer but not inebriate, wait on each,  
So let us welcome peaceful evening in."

The Americans, having but a short history and few shrines at home, are particularly fond of coming on pilgrimage to England, and especially to the home of Cowper, the poet of Nature and of rural life. They come by rail in haste, spring-heeled travellers as they are, doing England in a few jumps. I entered Olney after slow tramping through the meadows, the spire long in sight, reaching it by the bridge of many arches,

"That with its wearisome but needful length,  
Bestrides the wintry flood."

Here in Olney and its lanes

"Of grassy swarth, close cropp'd by nibbling sheep,"

pilgrims to the spot discover the "local habitation" of the muse. Here stands the Apple tree planted by the poet; here grew the

"Rose just washed in a shower;"

and here the most truthful of observers sketched

"Yon cottager that weaves at her own door,  
Pillow and bobbies all her little store."

In Cowper's summer-house, at the end of his garden, he spent a large part of his leisure, wrote most of his letters, and several of his popular poems, and thus he sang of it—

"Oh, bless'd seclusion from a jarring world,

Had I a choice of sublunary good,  
What could I wish that I possess not here?  
Health, leisure, means to improve it, friendship, peace!"

In this same summer-house Cowper and Mr. Newton wrote those exquisite and simple verses of the "Olney Hymns."

On entering the village, after passing through a level tract of country on the banks of the oft-flooded Ouse, the native home of ague and "rheumatics," one naturally recalls that old rhyme which Cowper introduces in one of his minor poems—

"Sle slay, slud, stuck in the mud,  
Oh, it is pretty to wade through a flood."

Cowper's cellar, in the winter, we are told, was often filled with water—poor liquor for a cellar—and in the same season of the year a damp and fishy fume pervaded the locality, breathing of marsh miasma. The "trunk drainage" was defective, and the river flowed down the meadows slowly with many windings. The distance from Olney to St. Neots as the crow flies is 20 miles, but the "far wandering" stream, as Drayton called it, that

"In labyrinth-like turns and twinings intricate  
Through these rich fields doth run,"

measures 70 miles in its tortuous course.

"A good view of the Ouse and its meadows is obtained from the 'cliff,' a short distance from Olney on the road to Weston Underwood. The poet and Mrs. Unwin walked to this spot almost daily, during many years, before they removed to Weston, and it was here that their companion and favourite, the spaniel "Beau," earned such immortality as a poem may confer, when he plunged into the river and brought a Water Lily ashore and laid at his master's feet. A mile further on we reach Weston and "the Lodge," where Cowper spent many happy days and wrote his pleasantest poems, nearly the whole of "The Task" and "Table Talk," and many of the short poems.

Many persons must have experienced disappointment in visiting the sites of interesting events or the homes of great men. The battle of Hastings was an event of no small interest in English history; you visit the spot, refresh yourself—weather being hot—with ginger or other ale at an ordinary inn, and stroll out to the rear of the houses in the street of Battle.

It would be useless asking, "Please where was the Battle of Hastings fought?" so you consult Mr. Freeman's map, and then look around. And this is all you see—pastures, a Hop gardeo, and the backs of the houses with clothes hanging out to dry. But poets are greater than conjurers, and they leave deeper marks. These you will find where Cowper rambled, and where we, following his footsteps with *The Task* as our guide, feel our affections and our sympathies moved as his were, and by the same incidents and scenes. "The sheep fold here," he says, "pours out its fleecy tenants o'er the glebe." How simple and how apt! We stand at the field gate and behold this same hurried movement of the "silly sheep" just as the poet did sixty years ago, and we feel that such inimitable descriptions must remain for all time. At the end of a rural lane that he tells of, we may meet the "boorish driver" and his "loaded wain," as in these verses:—

"There from the sunburnt hayfield homeward creeps  
The loaded wain; while lightened of its charge,  
The wain that meets it passes swiftly by,  
The boorish driver leaning on his team."

Not less attractive is the minutely drawn picture of a woodland scene diversified with trees, "alike, yet various," I believe the closest observer will find the following description accurate:—

"No tree in all the grove but has its charms,  
Though each its hue peculiar; paler some,  
And of a warmish grey; the Willow such  
And Poplar, that with silver lines his leaf,  
And Ash far stretching his umbrageous arms;  
Of deeper green the Elm; and deeper still  
Lord of the woods, the long-surviving Oak.  
Some glossy-leaved, and shining in the sun,  
The Maple, and the Beech, of oily nuts  
Prolific; and the Lime, at dewy eve  
Diffusing odours; nor unnoted pass  
The Sycamore, capricious in attire,  
Now green, now tawny, and ere autumn yet  
Have changed the woods, in scarlet honours bright."

I shall not venture to supplant a poet who has so minutely described the scene of his daily walks, in sketches like these. The guide-book to Weston is "The Task," where the scenes around his home are all described, from the humble dwelling which Cowper named the "peasant's nest" (now a farmhouse) to his favourite resort, the park and shrubbery of Sir John Throckmorton (known as "Benevolus" in "The Task"), who provided the poet with a key of his grounds. The Manor House, which was then attached to the small estate of the old family of Throckmorton, was pulled down half a century ago, but the outbuildings, park, and "pleasance" remain, awaiting the restoration of the hall.

In this "wilderness" you will find a bust of Homer out in the cold among the evergreens, with an inscription in Greek, "done into English" by Hayley, thus:—

"The sculptor, nameless, though once dear to fame;  
But this man bears an everlasting name."

In this same "wilderness," close to the Baronet's roof-tree, on the very spot where the hounds broke in and killed the fox in the presence of the family and of Cowper and Mrs. Unwin, who were walking there, a couple of uros, green with moss, and inscribed with Cowper's playful verses were placed by Sir John over the graves of "Neptune," his favourite pointer, and "Fop," his lady's spaniel. Two representative institutions in the village, of course, remain—the church, and "Cooper's Oak"—

"Time made thee what thou wast—King of the Woods,  
And time has made these what thou art—a cave  
For owls to roost in!"

These verses, however, refer to Yardley Oak, a tree known in the country by the name of "Judith," a niece of William the Conqueror, and elsewhere known as "Yardley Oak," from the name of the Chase in which it stands. The "Oak" in the village, now called "Cowper's Oak," is the inn in which, with its successors, will probably stand as long as thirst remains in the land, and "accommodation for man and horse" shall be required at Weston—longer, we may hope, than the pyramids of Egypt.

"The Lodge," which was the gift of Cowper's cousin, Lady Hesketh, is a cheerful looking house, having the aspect of a country vicarage. It looks like the residence of people who are happy, and here amid cheerful scenes, among dear friends, in the constant society of his old friend, Mrs. Unwin, well employed and well amused, with his books, and his pets, and his best thoughts, the heavy clouds that beset him elsewhere cleared away. But we are told that "coming events cast their shadows before," and on a shutter in Cowper's bedroom we mark the shadow of impending evils. In July, 1795, he left Weston for ever, and on the shutter we read this couplet, written by himself, in pencil—

"Farewell, dear scenes, for ever closed to me!  
Oh! for what sorrows must I now exchange you!"

The prophesy fell true. At East Dereham, where he spent his last days and was buried, small joy awaited him. *H. E.*

## New Garden Plants.

### IRIS RETICULATA VAR. SOPHENENSIS.

IN October last Mrs. Barnum, of the Mission, Kharput, Asia Minor, kindly sent me bulbs, gathered from the sides of the hills near Kharput. The bulbs themselves did not seem to me to be in any essential respect different from those of ordinary *I. reticulata*, but their flowers, which appeared on February 14, proved that I had obtained a new and distinct variety of the species.

The form is not very different from that of the type, but the claw of the fall is distinctly narrower than the lamina, instead of being nearly as wide, and the lamina is elliptical, ending broadly and obtusely instead of being pointed. The standards are relatively to their length broader than the type in the lamina, which also ends obtusely, and the claw is more distinctly canaliculate. The style is more decidedly triangular, with crests more divergent than in the type. The falls are more spreading than in the type, making an angle of a few degrees only with the horizontal, whereas in both the type and the Krelagei variety this angle is one of nearly 45°. The standards instead of being vertically erect diverge somewhat outwards; and the whole flower is small, and especially dwarf, reaching only about 2½ or 3 inches from the ground, the tube and spathe-valves together being about 1½ inch long.

In colour the plant is very distinct both from the blue-purple type and the red-purple Krelagei. The lamina of the fall is of a light reddish-purple, marked in the median line by a low ridge of an orange-yellow hue, not so bright or full as in the type. Along the claw this ridge or signal is continued as a

low wavy yellow crest, marked by dark spots. On each side of this crest is a yellow band marked with dark purple spots, and from this band veins diverge, bluish-purple at first, but becoming redder near the edge where they are confluent into a reddish-purple ground. The standards are of a reddish-lilac, with hardly visible veins.

The styles have a very peculiar colour. The upper surface for about the median half is a blue with a peculiar metallic sheen; this on each side gradually changes into a light reddish-purple. Veins of a similar blue are seen on the median side of the upper surface of the crests, which are otherwise of a reddish-purple. The under-surface of the styles is similarly blue in the middle and reddish-purple at the edges. The anthers and pollen are of a dead white.

The leaves are tetragonal, quite similar to those of *reticulata*; but these either do not appear until after the flower, which thus arises naked from the ground, guarded by the spathe valves and sheath only, or acquire at most the height of an inch or so at flowering time, whereas both in the type and in Krelagei the leaves are several inches high at flowering time, generally overtopping the flowers, and in *I. histrio* they are higher still.

The differences of form mentioned above do not seem to be very great, yet they—especially with the differences of colour, the short stature and the absence of leaves—suffice to give the plant so distinct an appearance that every one on seeing it would say it was something new. Still, for reasons which I will give in a subsequent note on the whole *reticulata* group, I conclude that the plant ought not to be considered as a new species, but as a new and distinct variety, or at most a subspecies; and I propose accordingly to call it *I. reticulata* var. *sophenensis*, from Sophene, the old name of the district around Kharput.

As a garden plant viewed with regard to its beauty, it is distinctly inferior to the type, and inferior even to the better forms of the Krelagei variety. And it is not at all fragrant. Still its peculiar colouring, its dwarf habit, and even the absence of foliage at flowering time, give it a charm of its own.

ODONTOGLOSSUM ANDERSONIANUM, *Rehb. f.*,  
AND HEBRAICUM, *Rehb. f.*

I have before me a rich inflorescence kindly sent by Mr. W. Lee. Among the numerous flowers of the first is one of the second, and this gives a fair idea of the value of these differences we have to consider, and which would have been multiplied *ad infinitum* if the wishes of certain correspondents had been fulfilled. It is after all as great a satisfaction to obtain such fine specimens as this was, as it is shocking to get a single crushed flower where well preserved flowers should be the basis of operations. It is just impossible to name with certainty miserable scraps, whatever may be their origin. I could not help refusing the other day to receive a Continental box, as I knew beforehand that it would contain once more single flowers in miserable condition. *H. G. Rehb. f.*

### DAFFODILS.

N. OBVALLARIS, FL.-PL.—I send herewith a flower of the double Tenby Daffodil, the first example I have seen, although many spurious double Tenbys have been offered in florists' catalogues. I send three examples, which will, I hope, be examined, with reference to the report on the doubling of Daffodils, for the Conference Committee. The first is a wild Tenby Daffodil, having the usual six perianth segments, six stamens, and one three-lobed pistil. The second is what I take to be the first stage of doubling. It has eight perianth segments, eight stamens, and the stigma is four-lobed. The crown also has eight notches. It is a remarkably sturdy flower, and the ovary is very full, so that it would evidently have produced a very strong crop of seedlings, of which some might possibly have been doubles. The third is a full double Tenby Daffodil, an exact double, there being evidently a double set of perianth segments, and a double set of crowns, broken up into a rose Daffodil. All these occurred wild in the neighbourhood of Tenby, and are, I consider, a very interesting set of examples of the passage from the single to the double in a wild state. The full double occurred on the site of an old garden, where a college stood some twenty years ago; but the whole place is now a field.

Perhaps the good soil of the old garden had something to do with the doubling, but the specimens show that the single Tenby produces a double Tenby of the same character. From my point of view I see herein also a further confirmation of my theory that doubling is produced by seeding, although I am quite open to admit that doubling may also come by other favourable circumstances.

In the *Gardeners' Chronicle* for May 10, 1884, p. 606, I gave an account of the doubling of the white *N. moschatulus* in the gardens of Mr. Elwes and Mr. Dillwyn Llewellyn, in both of which cases the single wild form and the double occurred in close proximity, and I advanced reasons for thinking that the doubling came by seeding.

Dr. Browne, of Hull, gives a very interesting account in the *Garden* (p. 265) of the raising of his double *N. nanus*. He says that he grows some hundreds of *N. nanus*, and every year collects seeds, which he sows in spare beds. The seedlings are left to take care of themselves until they are large enough to transplant, and that the flowers sent by him to the Conference last year were the produce of one of these bulbs, and that he has two or three more bulbs which he expects will turn out to be doubles. Here we have direct proof that doubles come as seedling varieties.

#### DOUBLE DAFFODIL SEEDING.

Your columns for 1884 contained many notes upon this subject, after I had raised it, at the Conference, and on reading them afresh it is interesting to note the progress which has been made in proof of it since that time. Mr. Barr challenged me to show ripe seeds of the double *Telamonius*, and this was in due time accomplished. We have now a nice little crop of seedlings grown from seeds of this double Daffodil. Mr. Wolley Dod (*Garden*, March 21, p. 232) reports that Mr. Tyerman finds that his double *Telamonius* produce seed freely, and he finds that they produce doubles like themselves by seeding. I think therefore we may consider this part of the question settled, so there only remains the further one, which may be said to be Mr. Wolley Dod's query—Does our wild *Pseudo-Narcissus*, by cultivation, become *Telamonius plenus*? For the solution of this we must wait the result of the labours of the committee. *Wm. Brockbank, Brockhurst, Didsbury, March 28.*

#### NOTES FROM A BUCKINGHAMSHIRE GARDEN.

MARCH 12.—I waste my time just now in observing from the window a pair of little blue titmice. They mean to build in the Ivy and Roses that cluster round the old Stone Pine; not, I think, in the rustic back mansion placed ready for them in a Yew tree hard by. These titmice are the gracefulest little things imaginable: flitting about like airy living leaves, their colour a lovely grey-green flashed with blue. One never tires of following with the eye their pretty graceful movements while they are on the hunt in and out of the branches. Nothing can exceed their animation and grace as they turn and twist upon a small square of bacon-fat made fast to the end of a long string. This dainty hangs all the winter from the tree for the tomtits' especial benefit. They are tame also, and, like all very little birds, are seemingly not able to take in the idea of a large human being. Quite unlike this small fearlessness of titmice is the impudent effrontery of our little ne'er-do-weels—the sparrows. Their familiarity seems to have no touch of kindness in it. I do not blame them. It is the shape of their blunt coarse beaks that affects their whole nature! The sparrows' perverseness increases, and the friendlier we are to them the worse they behave. They tear up into shreds our beautiful yellow Crocuses, but mainly the yellow. The white and the lilac are left comparatively unmolested, and they seem to attack only the beds in full sunshine. Crocuses, I feel sure, never before suffered from sparrows as they do this season. The Sea Purslane also, which luxuriates in our warm soil, has been persecuted all the winter, and is now stripped nearly bare of leaves. I believe this ferocity (for it is nothing less) of our sparrows is to be attributed to the unusual dryness of the weather following the extreme dryness of last summer. Want of food it cannot be, for all our beloved birds have been fed throughout the winter. Moisture is sought by them in the honey-drop within the Crocus flower, and in the rather fleshy foliage of the Sea Purslane. In the

spring the sparrows will amply pay for the sorrows they cause us now, and the more sparrows' nests the fewer grubs there will be to plague us. The sparrow's eye for colour (one would guess that flaunting yellow would be their chosen colour) is not the same as the hive-bee's. Bees seem to avoid the yellow Crocus, while they love the white, the purple, and the striped. I have watched them of late when the sun has been warm and bright. I do not know if hive-bees carry on into the summer their objection to yellow; it is certain, however, that in Sunflower time the yellow Sunflowers are visited by humble-bees only. One division of our Crocus enemies has been partly checkmated by the simple plan of putting in the bulbs very deep; the mice do not quite so easily get at them. Numbers have also been successfully trapped. Hares, on the other hand, have annoyed us more than usual. A long row of fine young Wallflowers have been devoured by them, besides scores of Carnations in the Boccage—the hares and I agreeing in our love for Wallflowers, only their fancy is for the leaves, not the flowers. (Poor hares! It is little consolation for our loss to remember that they were all shot and roasted for dinner, after they had done the mischief!)

Charming as masses and lines of Crocus are in the borders and parterres, to enjoy them thoroughly they must be growing in the green grass, and they must be spreading themselves wide open to the sunshine at mid-day. The orchard is gay with broad patches of yellow Crocus—remnants torn from the field of the Cloth of Gold; and the banks of our tiny watercourse is a long green cloth laid out with services of amethyst and silver cups. Within the garden pure white and golden Crocus sprinkle the turf round trees and elsewhere, where their leaves need not be mown off too soon.

All this should be in the past tense, for the Crocus has already seen its prime, and the remaining few look pinched under the East Wind's bane. How strangely vivid, with how great tenacity, will some very little unimportant scene or feeling sometimes cling to the memory through all the years. Thus, with February's first purple Crocus for me unfailingly arises in a far-off tender light the vision of some forgotten garden wilderness, enclosed with trees, beyond the town, where my mother and I once walked together. There, as we rested under the trees, appeared before us a solitary purple Crocus, shining on the grassy lawn! After years, whose number one scarcely cares to count, that moment's joy is in sober truth recalled as the most exquisite of a whole long life-time. On the old brick south wall of the kitchen garden our only plant of *Pyrus japonica* is arrayed in finer bloom than usual. Hardly an inch of brown wood shows between the clustering red of a thousand rich and brilliant blossoms. Last autumn the fruit ripened—or, to be truer, hardened—upon it in large green apples of a Pippin shape. What an old-fashioned shrub it is! and how seldom seen but in old gardens; and how, in these days, one never thinks of planting a new one. About the roots of the *Pyrus japonica*, and along the narrow border at the foot of the wall, is a delicious tangle of Iris, Violets, and Rosemary, *Narcissus* of the less common kinds, with many a sweet South-loving plant that has got there one knows not when nor how. Amongst them is a Star of Bethlehem, and in the wall itself grow bunches of yellow *Fumitory* (*Corydalis lutea*) just coming into flower; and there is a seedling Holly, and a little starved Yew niched in a cranny near the top, and there are patterns in grey lichen scrawled upon the red brick. The *Polyanthus* *Narcissus* under the wall—roots that have been turned out of the greenhouse after flowering in days gone by—are luxuriantly beautiful this season. Their petals are the clearest yellow, and the cups deep orange, most richly scented. The orange centres seem to gather in and hoard all the sunshine that has ever shone upon them, giving it out again in living sun-gold even in dull weather. The delicate lilac flowers of *Iris cristata*, sheltered among the thick-growing bushes of dark green leaves, are blooming abundantly. There have been hundreds of blossoms, and we have never been without them since December, for we had them under glass all January till February, when we began to perceive a lilac glow among the leaves in the open air. These Irises bloom here at precisely the same time with those of the same kind in their own warm sun-steeped land. They could not flower here so early but for the sheafs of sheltering leaves which almost hide them from sight. Few things look more charming for the table than the transiently perfumed *Iris ensata*! One evening we had them

arranged in knots, with *Mignonette* and sprays of lemon-scented *Pelargonium*, toned with the brown of *Cryptomeria elegans*. One often hears a gardener's arrangement of flowers reviled as stiff, or garish; yet this lovely contrast of lilac, green, and brown was only a gardener's nosegay! As a decoration it might have been deemed pallid, but for the presence of glasses filled with deep coloured *Primroses*, *Dog's-tooth Violets*, and *Glory of the Snow*—all resting against the brown. The tips of *Cryptomeria* used in this way are neither stiff nor heavy, but full of the lightest grace.

MARCH 22.—Before six this morning the tame robin sang such a brilliant brief fantasia in the *Magnolia* just outside my window, that when the shutters were opened it was a surprise to see heavy snow falling. Snow is as good as change of scene to us home-keeping folk. Our view from the windows is transformed. The large *Ilex* Oak drooping under its load of snow looks more like a Yew, or some kind of Fir tree. The outline and character of the Stone Pine is entirely changed. "Deborah" and the sundial stand out boldly sculptured in black and white, as every day they certainly are not. The parterre with its Crocuses is gone; the grass and the walks are nowhere. Branching Elms in the background are almost as much increased in size by the snow crystallising over every slender twig, as in summer by their leafy millions. But all this proved only a dissolving view: by noon the grass appeared again, green as an emerald, and the thrushes were loudly rejoicing. The Yews will smoke no more after such heavy snow! On bright afternoons, chiefly during the earlier part of the month, it was exactly as if smouldering fires burnt within some of them; so hidden were they in clouds of smoke. There must have been always a light breeze stirring at the time; but the air would mostly seem unusually still when this smoke arose. And then, when it cleared off, the Yews were like "dusty millers," powdered over with pollen. One or two of the younger Yews (they never flower profusely until they are many years older), give "the idea" of bursting into fresh green buds of spring all over them, at the points of almost every twig. Buds, however, they are not, only mischievous imitations; or a sort of gall made by insects [mites]. Nothing can be discovered by pulling these buds to pieces; at least, after minute examinations, we have never been able to find the insect inside. When the days are warm and dry I have often worked for an hour or so at one time pulling off the growths as high as I can reach all round the trees, but the result is small; they soon come again as thick as ever. My favourite, *Garrya elliptica* is in beauty now, growing against the east wall of the entrance court. A soft veil of catkins enshrouds the tree from its top downwards; each long catkin, just tinged with a rosy bloom, is delicately outlined against the dark round-leaved foliage. I can fancy the *Garrya* standing alone, thus softly veiled, upon the open sward—how beautiful it would be! But if this ever happens I do not know, for in our climate it seems to need the support or shelter of a wall. I have been going round the garden in the bleak windy sunshine; and I think our flowers of March are nearly many enough and varied enough to satisfy even our immoderate desires.

The straight walk in the kitchen garden never looks fairer, with all its Roses, than now in the simple green and gold of Daffodil clumps all the way on both sides. All sorts of Daffodils are everywhere, from the large heavy-headed double ones to the diminutive brilliant little *Hoop Petticoat* only 3 inches high. There is *Pulmonaria*, *Triteleia*, and white Violets and patches of white Arabis, and *Primroses* just becoming plentiful. There is a long blue-rimmed border of *Grape Hyacinth*, and another of metallic-shining *Scillas*. Blue prevails indeed—blue *Scilla* and *Chionodoxa*, blue *Hepatica*, blue *Omphalodes*. Soon there will be deep blue *Gentian*, beside which all other blues will pale. Dear little cheerful-eyed *Omphalodes*! The old plants have worn themselves out, but young roots are spreading over some stones near the Roman Walk, and flowering with enthusiastic vigour. A charming Hungarian lady the other day embraced it (so to speak) with delight. She said *Omphalodes verna* grew wild in her native woods. Amongst the rarer gems must be counted *Sisyrinchium grandiflorum*, or, better named, *Satin-flower*, with its exquisitely shaped purple bells, like hanging Crocus flowers; and on the rounded south side of *Glorietta* is a group of magnificently fiery-scarlet star *Anemones*. *E. F. B.*

## ORCHID FRUITS.

It so happens that few of the seed-vessels of Orchids are described in books. Relatively speaking, few are imported, and it is not very often out of the great Orchid emporiums that one sees them on cultivated plants. Nevertheless, they are important as aids to discrimination between one species and another, and now that the practice of artificial fertilisation and hybridisation is increasing, we may expect to meet more of them. The illustrations we now figure (figs. 83, 84) were all taken from plants in the collection of Sir Trevor Lawrence. The seed-pods of Orchids (botanically fruits) are usually more or less leathery, pods ultimately dividing into three or six pieces or valves, and revealing a very large number of very fine dust-like seeds of very simple structure. These seeds are attached to the centres of three of the valves; the other three valves bear no seeds and are in truth the midribs of the carpels which separate from the rest of the fruit as it ripens. The Vanilla pods of commerce are the leathery fruits of *Vanilla aromatica*, which either do not open or are gathered before they have done so. In the present number we figure the pods of *Dendrobium heterocarpum*, which has an ovoid pod, scarcely so long as its stalk, and pointed at both ends. *D. formosum giganteum* has, as will be seen, a larger pod than the preceding, and Pear-shaped. In *D. rhodostoma* the pod is thick, club-shaped, with prominent ribs.

*Cypripedium caudatum* has very long glabrous but furrowed pods, thicker in the middle and curved at the apex. *Cypripedium Druryi* has much shorter, somewhat club-shaped, furrowed pods, covered with hairs, and with a short terminal projection. *Cypripedium hirsutissimum* has oblong, ribbed pods, with a long terminal curved beak, the whole densely covered with hairs. Allowance must be made for individual variations, and of course for stage of growth.

## ROSEMARY.

I WAS very much interested in the article on "Mortuary Flowers" at p. 173, especially in the paragraphs relating to the Rosemary, and feel a strong desire to know whether there is any part of the British islands where the practice of using it at funerals yet prevails [yes.] It is over half a century ago that my father, failing to establish himself in business in London, fell back on his profession, engaged himself as gardener, and with his wife, a babe in arms, and myself, a three-year-old boy, took a three days' journey (!) to the Isle of Wight. Ryde had then but a few hundred houses, and the island, though but 7 miles from Portsmouth, was as fully cut off from intercourse with what we may term the progressive portion—the mainland of the country—as land 700 miles distant would be to-day. I suppose few of us can remember events clearly back to between their third and fourth year, and I suppose I am indebted to the sudden change from a spot like London to the "backwoods" of what the island was then for the vivid impressions that everything made on me. Where we were settled, about midway between the three triangular points, St. Helen's, Brading, and Ryde, there was no one to associate with but the families of the farm labourers who had lived on these spots through many generations, except the younger of the family of my father's employer, as a playmate for whom I was often invited to the "big house." The native children could not understand my London talk, and their language was as bad as Greek to me. Words that I found as I grew into knowledge had long been obsolete in other parts of England were in common use there. A switch was a "vice," and to get a good vicing I heard threatened to many an unlucky mother's son. To be an imbecile was to be a "zawney;" and if stupid, you would be a "zoat." I remember Old Hadley, a tall six-footer, who used to go through the village of Ryde with his bell, and with "Oh, yes!"—"Oh, yes!"—"Oh, yes!"—"Lost!"—and so on—"God save the King!"—let us know the news of the day. And I remember well when Thomas Radden started a little school and a printing-press together, and by his handbills eventually got the village crier out of his job. This press and school was in a stable-yard. There he taught me by getting eight pebbles to find out how many were left by taking four away, as I remember well on that day from his dog having subtracted

FIG. 83.—SEED-PODS OF CYPRIPEDIUM.

A, *Cypripedium hirsutissimum*; B, *C. Druryi*; C, *C. caudatum*.

my whole dinner while the stony lesson was being given to me. You see it was a very primitive spot in those days. How often have I since wished that I could have foreseen the tremendous march of civilisation that has left those old times behind. What a wealth of old lore could now be imparted if copious notes had been kept of these old people in those old times.

Well, about the Rosemary. They used it then at funerals. It was prepared by the one who had charge of the funeral. A trayful was ready in the room of sorrow, and each was handed a sprig as he went out of the house to follow the corpse to the grave. When there each took his turn, and with the last look, threw the sprig on the coffin. I am almost sure there was no dipping in water, as described by "H. E.;" my impression is that its use was in some way connected with an old belief that Rosemary was good to preserve the dead from being troubled by evil spirits, but I cannot now remember how I got that impression. Although possibly in no part of England were the religious views that preceded the Reformation so thoroughly crushed out as in the Isle of Wight, the belief in elves and fairies, and spirits good, bad, and indifferent interfering continually and everywhere with human affairs, was apparently universally entertained; and I could, even after these many years, put together a good sized volume of the blood-curdling tales which were beliefs all too real in those days. I feel the more satisfied that the use of Rosemary had something to do with some of these tales. I am also inclined to think that the statement of Dr. Prior and others before him, that Rosemary is derived from *rosmarinus*, sea spray, can scarcely be correct, as I fancy the old English people called the plant Rosemary long before they could know of its Latin name. *Thos. Meehan, Germantown, Philadelphia, U.S.*

## POTATO DISEASE: WILSON'S SCLEROTIOIDS.

THERE can be no doubt that these bodies are found accompanying the spawn-threads of *Phytophthora infestans* when it occurs upon the leaves of the Potato, but, as Professor Trail pointed out, their presence has yet to be demonstrated when this parasite attacks the Tomato. During the present discussion I have re-examined these bodies in Potato leaves, but I cannot trace any hyphae (spawn-threads) arising from them. Neither to my mind does Mr. Smith's figure (p. 348) prove this to be the case. No doubt the base of the conidiiferous hypha which he figures is in contact with one of these bodies, but whether it has *bona fide* arisen from it is very doubtful indeed. One often sees in microscopic slides the end of a mycelial tube accidentally in contact with a particle of vegetable tissue, and adhering to it with sufficient firmness to sway to and fro when the cover-glass is pressed, but in this case no question of direct continuity arises. In the numerous instances in which I have examined these sclerotoids, it is surprising that I should never once have seen a mycelial tube arising from them. Another equivocal point in Mr. Smith's figure is the peculiar manner in which the conidiophore becomes attenuated towards its lower extremity. As far as I have observed the mycelium of *Phytophthora*, although it may be somewhat irregular in outline as it meanders between the cells of its host plant, yet its calibre is pretty uniform throughout its length, and not very different in size from the time it emerges from the spore as a germ-tube to the time it gives off its conidia-bearing branches. Certainly, the end of a mycelial hypha may collapse when dry, as when its extremity escapes beyond the cover-glass. It is easily to be observed that these sclerotoids are rendered transparent by the action of strong nitric acid, but, although they are not thereby otherwise altered in shape, yet it has been assumed that they consist of oxalate of lime. Of course, it may be true that they are covered with a coating of this salt, but even this has not as yet been absolutely demonstrated, for so many other substances are dissolved by nitric acid. Mr. Murray's original experiment of treating them with nitric acid, allowing the fluid to evaporate spontaneously, and finding oxalate crystals on the slide next morning, does not prove that the oxalate was derived from the sclerotoids only, for it is obvious to any one who has examined them that they cannot be so perfectly isolated from the tissues of the leaf in which they are imbedded as to allow of this being done with sufficient accuracy to ensure that the oxalate was not derived from the other tissues of the Potato plant, especially when one

FIG. 85.—MASDEVALLIA WALLISII VAR. STUPENDA.

remembers how constantly oxalate of lime occurs as a waste product in the vegetable kingdom generally.

While these bodies constantly accompany the *Phytophthora* upon the leaves, are they found as abundantly, or at all, in the tubers when the latter are affected? I have not been very successful in finding them here; have Mr. Wilson or Mr. Smith had better success? This is an important point to have cleared up. I certainly at first thought they were the bodies figured by Martius, but his figures are of such a nature that one cannot be at all sure what he really meant in many cases in which the more minute structures are delineated.

As for the relationship which these bodies bear to the Potato disease it is to me doubtful whether they are anything more than the metamorphosed tissues of the host plant. If they had any anatomical connection with *Phytophthora* I think the keen eye of De Bary would have detected it, even if it had escaped the observation of Berkeley and Tulasne, to say nothing of the hundreds of other observers who have examined the life-history of this fungus. Charles B. Plowright, King's Lynn, March 15.

### MASDEVALLIA WALLISII

#### VAR. STUPENDA.

A FEW weeks ago (p. 271) Professor Reichenbach wrote in these columns in enthusiastic terms concerning this *Masdevallia*. We are now enabled to lay before our readers an illustration of the flower (fig. 85) taken from a plant in the collection of Sir Trevor Lawrence. The ground is light sulphur colour, the apex of the sepals and the long tails proceeding from them being of a rich chocolate, orange haloes, scarlet spots, brown hairs; a white shell-like lip completes the decoration of this phenomenal *Masdevallia*, for the description of which we must refer to the account already given at p. 270.

### CARBERRY TOWER,

THE seat of the Right Honourable Lord Elphinstone, is situated in Midlothian, 2 miles from the thriving town of Musselburgh, and 7 miles south-east of Edinburgh. Carberry Tower is a noble mansion, and stands on the western slope of Carberry Hill (fig. 86). It was here that Queen Mary surrendered herself to the Confederate Lords on June 15, 1567, prior to her imprisonment in Lochleven Castle. The hill flanks the east side of the vale of the river Esk, and forms part of a very beautiful landscape. In the neighbourhood there are many ancient relics, two miles off the place is still pointed out where Cromwell pitched his tent, and where he remained two months; and here was fought the battle of Piokie which arose out of an invasion of Scotland in 1547 by the English and ended so disastrously for the Scotch. About 2 miles further east the battle of Prestonpans was fought on September 24, 1745, between the rebel forces under Prince Charles Edward, and the Royal forces under Sir John Cope, which ended in the complete overthrow of the English army. Returning to Carberry, from the east the policies are entered by a very neat lodge and gateway, and on entering, the approach turns sharply to the right and a good distance on turns to the left, and then runs on in a straight line till it turns again sharply to the right and runs on in gentle curves through a plantation of grand old trees till the Tower is reached. From the front of the Tower the views are very extensive and varied, looking north across the Firth of Forth, here about 5 miles broad; the eye takes in a large portion of the west of the county of Fife, and the mountains on the border of the Highlands are distinctly seen. North-west parts of Edinburgh are seen with its fine surroundings, and west over the grand Oak forest of Dalkeith Palace the whole range of the Pentland Hills is seen from 12 to 20 miles off.

The main avenue from the Tower runs in a straight line out to the main road, running east and west, and here a very handsome lodge and gateway was erected some years ago.

The glass erections at Carberry are very extensive, and at the time of my visit contained the following inmates, viz. :—A Rose-house, 30 feet by 9 feet, containing fine plants of Céline Forestier, Comte de Paris, Duchess of Edinburgh, Gloire de Dijon, Madame Berard, Madame Levet, Maréchal Niel, Catherine Mermet, Souvenir de Paul Néron, &c. An early vineyard, 62 feet by 9 feet,

Vines all in pots, principally Black Hamburgh, and bearing a very nice equal crop. In this house 1500 Strawberry plants are forced annually, the sorts being Keens' Seedling and Garibaldi, and to utilise space the back wall is used for the growth of Tomatos, which at the time of my visit were carrying an excellent crop. A Peach-house, span-roofed, 12 feet by 9 feet, was planted with Stirling Castle, and bearing a very fine crop of large-sized fruit. Another early vinery, 50 feet by 12 feet, planted with Black Hamburgh and Duke of Buccleuch, the latter bearing a fine crop with large berries. A vinery, 30 feet by 16 feet, planted with Muscat of Alexandria and Bowood Muscat, both sorts carrying a grand crop. Peach-house, span-roof, 24 feet by 20 feet, planted with Early Alfred, Royal George, Stirling Castle, and the Elrue Nectarine. Along the roof are trained *Lapageria rosea* and *Maréchal Niel* Roses, the former very full of bloom. On the end walls were plants of the old favourite Fig, Brown Turkey, bearing fine crops. A Camellia-house, span-roof, 20 feet by 20 feet, planted with such fine old sorts as *Alba plena*, Countess of Orkney, *Imbricata*, Lady Hume's Blush, &c., all fine specimens in vigorous health. A mixed vinery, 30 feet by 16 feet, the following bearing fine crops:—Mrs. Pince, Lady Downes', and a young plant of John Downie, making grand wood. A Peach-house, 50 feet by 12 feet, planted with Royal George, Barrington, Walburton Admirable, and Red Roman Nectarine, the whole bearing a grand crop indeed. On a low staging was a very fine lot of young Azaleas of the finest sorts, in the best of health. A conservatory and fernery combined forms a magnificent house, 72 feet by 24 feet, span-roofed, well furnished with large plants of all the leading varieties, conspicuous among which was a splendid specimen of *Erica Cavendishii*, which usually flowers well. The Ferns, judging by their luxuriant appearance, were evidently at home, whilst trained to pillars and rafters were *Tacsonia Volkemii*, *Cobaea scandens* var., *Rhodochiton volubile*, *Lapageria alba*, &c., giving to this grand house a finish which cannot but be much admired. A greenhouse, 33 feet by 14 feet, is principally used for preparing plants for conservatory decoration. A stove, span-roofed, 33 feet by 24 feet, containing large plants of *Anthurium crystallinum*, *Croton Weissmanni*, a grand plant that took 1st prize for the best *Croton* at the International Show at Edinburgh, in 1882. There are also several fine specimens of other *Crotons*, beautifully coloured, as well as of *Pandanus*, *Dracenas*, &c. I also noticed in this house some fine specimen Orchids consisting of *Cattleya Mossiae*, *Cypripedium longifolium*, *Dendrobium giganteum*, *D. nobile*, &c., and climbers were well represented by *Clerodendron splendens*, *Dipladenia boliviensis*, *D. Williamsii*, *Stephanotis*, &c. A warm greenhouse, with a span-roof, 33 feet by 20 feet, contained large plants of *Aralia Kerchoviana*, *A. Veitchii*, and *A. gracillima*, *Asparagus plumosus nanus*, *Bougainvillea glabra*, *Phormium tenax variegatum*, &c., and the roof was covered with *Passiflora edulis*. A Melon-house, 36 feet by 9; a Heath-house, 36 feet by 9 feet, in which I found very fine healthy specimens of *E. Bothwelliana*, *E. vestita alba*, *E. coccinea*, *E. Austriana*, &c.; a house for the culture of sweet-scented *Pelargoniums*, contained a very interesting collection, the perfume from which upon entering the house was delightful. Melon-pits and a Mushroom-house completed the garden structures. These houses are heated by two twin saddle-boilers  $4\frac{1}{2}$  feet long, to which are attached 4000 feet of 4-inch piping, and have all been erected within the last few years by Mr. Lowe.

The kitchen garden, over 2 acres in extent, lies to the south-east of the houses, and is enclosed by substantial walls, partly brick and partly stone, and covered by well managed fruit trees of the ordinary sorts, which as a rule bear remarkably well here. In the front of the conservatory there is a very pretty flower garden, half an acre in extent, from the top of which a walk 10 feet broad and 300 yards long runs nearly straight west to a beautiful sheet of water, and on either side of this walk, 20 feet back, there are two rows of *Sequoia gigantea*, averaging from 16 to 20 feet in height, fifty in number, and 18 feet apart, in a most thriving condition. To the south and west of the Tower there are also many specimens of *Conifers* of various sizes. Bedding-out is carried on here to a large extent, and is well managed.

His lordship, being an ardent horticulturist, takes great interest in everything connected with gardening, and Mr. Scott, the head gardener, may be complimented on the high state of cultivation in which the garden under his care stands at the present time. D.

## Orchid Notes and Cleanings.

### ORCHIDS AT WESTBROOK.

THE Orchid-house at Westbrook, Sheffield, devoted to blooming plants, is at the present time very attractive, on account of the display of bloom. It contains some fine varieties in excellent health, bearing many spikes of very fine flowers. The graceful spikes of the *Phalenopsis* and the *Odontogloss*, loaded with blossoms, arching over the *Cattleyas*, *Lycastes*, and other erect kinds, give a beauty and grace to the whole that is afforded by few other kinds of plants; the rich and delicate markings and colours being particularly chaste and pleasing, and the effect is heightened by the bright orange colour of the flowers of *Ada aurantiaca* (a good specimen with numerous spikes), and the star-shaped blossoms of *Lælia harpophylla*. All are good specimens, but amongst the best may be mentioned *Phalenopsis amabilis aurea*, with flowers  $3\frac{1}{2}$  inches across, the petals strong, and about  $1\frac{1}{2}$  inch broad, the base of the lip tinged with deep yellow, and striped with carmine; the inner portion of the lower petals are tinged with green, and lightly spotted. Another plant bears flowers with petals a little broader, and without the spots, and the yellow on the lip of a paler shade. *P. Stuartiana* has a good spike of flowers heavily spotted on the lower sepals; *P. Sanderiana* is also good, the flowers being of a deeper colour; *P. Schilleriana* is represented by three good varieties. *Odontoglossum Roezli alba*, pure white, with the exception of the lip, which is suffused with yellow, is very effective. *O. cordatum* carries three spikes of good flowers, harred and striped with deep chocolate-brown. *Cattleya Trianae* has flowers 7 inches across, the petals white,  $2\frac{1}{2}$  inches broad; lip  $1\frac{1}{2}$  inch across, tinged pink; the throat a deep yellow, and is a good specimen. *Cypripedium Laurenceanum* is very good, its large dorsal sepal, finely striped on a white ground, renders it both distinct and attractive. *Angraecum sesquipedale* is represented by a small plant with four flowers arranged in the form of an arc, which are well relieved by the dark green foliage of the plant. This variety, although not a showy one, is always interesting, particularly to the botanist, on account of the curious spurs attached to each flower; on this plant the flowers are 5 inches across, and the spurs 12 inches long. Many other varieties are equally good, and are represented by *Dendrobiums nobile*, *crassinode*, *Barberianum*, and *lituiflorum*; *Masdevallias ignea*, *Shuttleworthii*, and *triangularis*; *Odontoglossums Rossi*, *maculatum*, *superbum*, *Cervantesii*, *triumphans*, *tripudians*, *nebulosum* (three varieties), *Alexandrae* (many varieties), *Pescatorei*, *gloriosum*, *Uro-Skinneri* (which has been in bloom six months), *Lindleyanum*, *Halli*, *Andersoni*, and *cirosum*; *Phalenopsis Ludemanniana* and *grandiflora*; *Cypripedium Boxalli*, *villosum*, *Roezli*, and *Haynaldianum*. *Lycastes* and *Vandas* are also represented by *Skinneri* and *tricolor* respectively. In addition to the above-mentioned plants now in bloom there is a reserve of plants in various stages of development in sufficient quantity to produce bloom all the year round. The whole collection is in a clean, healthy, and vigorous condition. One plant, an *Odontogloss*, of the *Andersoni* type, has thrown up from one bulb three spikes bearing fifty-nine flower-buds, an evidence of the care and skill of Mr. Pidsley, the head gardener, who spares no pains to bring the plants under his charge to a high state of cultivation. New and valuable varieties are being added to the collection which is increasing in numbers, variety, and importance. J. H. S.

### ORCHIDS AT THE WOODLANDS.

At the Woodlands, Streatham Hill, the residence of R. H. Measures, Esq., a plant of the pure white form of *Lycaste Skinneri alba* has been in flower for upwards of three months, the individual blossoms lasting over eight weeks. In the centre of the new range of Orchid-houses lately erected in these gardens there is a bijou structure for plants in flower, admirable in every way, and there is abundant proof that the flowers last much longer here than when left in the houses in which they have been grown. Many lovely species and novelties were in flower at the time of my visit, elegantly arranged with *Palms*, *Aralias*, *Ferns*, &c., and all scrupulously clean, in fact I have never seen a garden in which absolute cleanliness in

every part is so well carried out as is the case here; even the walks in the kitchen garden are regularly washed, and not a weed is to be seen anywhere. There is now a fine show of *Phalenopsis* in flower, upwards of fifty spikes, including a fine example of *P. Stuartiana nobilis* and *P. Sanderiana*. In this house I noticed fine plants of *Cypripedium Druryi* and *C. vexillarium* in bloom, as also a fine plant of the new *C. Godefroyae* doing splendidly. The gardener, Mr. Howes, informed me that he watered these plants overhead every day copiously, and there is no doubt but that the treatment suits them, as I have never before seen *C. Godefroyae* and *C. niveum* growing so vigorously. *Saccolabium Hendersoni* is also growing freely and well in the same house, certainly better than I have ever seen it elsewhere. In the flowering house there is a plant of *Cattleya Trianae grandis* with twenty-six of its lovely large blossoms in perfect condition, as also many other handsome varieties, but the palm must be given to the numerous beautiful hybrid *Odontoglossums*, some of them quite unique. There are also many magnificent varieties of *Odontoglossum Rossi majus*, including the very beautiful *O. Rossi gemma*, *O. sceptrum*, a grand plant with two spikes, several splendid examples of *Cymbidium Lowianum*, some of the spikes having as many as twenty-two well developed flowers. *Dendrobium Jamesianum* is also particularly fine, and the same may be said of *D. Wardianum* and *D. Ainsworthii*, and many other things too numerous to mention in a short notice like the present; there is abundant evidence, however, that the owner is a very enthusiastic lover of these beautiful plants. J. G.

## The Flower Garden.

THE fernery should be carefully looked over, and all the old fronds and weeds removed, but great care must be taken not to injure the young growing fronds, these being very easily damaged, the effect of which would be visible all through the summer. After all the rubbish is cleared away surface the soil all round the Ferns and under all movable stones with finely sifted leaf-mould or peat, or in lieu of these any light soil that is available.

### THE ROCKERY.

Where alpine plants are grown these should have similar attention given them, removing any dead plants, filling up the vacancies with young subjects, and care should be taken in planting to so arrange the plants that the weaker and delicate may not be overshadowed or crowded by the strong-growing ones.

THE SPRING AND SUMMER FLOWER GARDENING, as now practised in most gardens, cause much labour and a considerable amount of forethought to manage the two creditably, and more particularly if the spring should be a backward one, as then the opening of the spring flowers is much retarded, as I find is the case this season, the prevalent cold winds acting as a check on growth, which renders the preparation of the bed for the summer bedding-out plants a difficult matter. Where spring gardening is not carried out the beds and borders may now be prepared and made ready for bedding-out time by marking out the design and settling the arrangement of the colours and planting such hardy plants as are intended to be used.

### PLANTING AND SOWING.

*Echeverias*, *Sedums*, *Saxifrages*, *Pansies*, *Violas*, and *Hollyhocks* may now be planted out. *Wallflowers*, *Antirrhinums*, *Sweet Williams*, *Pansies*, *Sweet Peas*, and *Mignonette* should now be sown. To have an abundant supply of *Viola*s throughout the winter and spring, young plants should now be planted out on a well prepared and a slightly manured warm border, planting the strongest runners, by preference those with roots, as they will make the greatest progress. The best kind for winter blooming is *Marie Louise*. With us this variety has been in bloom ever since last October, and blossoms were to be had in great abundance. I grow twelve other kinds, new and old, but none of them equal the one mentioned. The sub-tropical plants may now be placed in a cool-house. *Calceolarias* and *Verbenas*, *Ageratums* and *Petunias*, and other similar plants may also be placed out under a cradle or some other protection, and be covered at night with mats. Wm. Smythe, *The Gardens, Basing Park, Alton*.

## FRUITS UNDER GLASS.

### PEACHES: THINNING THE FRUIT, ETC. THE EARLY-HOUSE.

At this season a series of peacheries will occupy a considerable amount of time to keep everything connected with them in proper order. In the early division the fruit will be advanced sufficiently in growth to be reliable; the final thinning of the fruit should, therefore, take place—an operation best determined by the state and condition of the trees; however, a safe rule may be enforced in the case of trees planted out and trained on trellises, by leaving not more than one Peach for every square foot of trellis covered by the trees. Nectarines can be left somewhat nearer to each other than this. Assuming the growths are now evenly regulated and tied out, the laterals pinched in as they appear, the chief object is to keep the foliage as healthy and vigorous as possible, as under no other conditions can the fruit be expected to attain size, colour, and perfection in flavour.

#### INSECT ENEMIES.

The most dangerous enemy amongst these trees is the red-spider, which will quickly establish itself, if it is present at all, unless it is forcibly kept in check by the syringe as the fruit approaches maturity. If possible avoid using water that is highly impregnated with lime, or any other substance that will leave a deposit on the foliage or fruit, considerably marring its appearance when ripe. Rain-water is unquestionably the best of all for this purpose.

#### BORDERS.

Water the inside borders liberally with weak manure-water at about 60° prior to the final swelling of the fruit; maintain a regular temperature of about 60° at night and 70° in the day-time, with 10° or 15° more by sun-heat, and shut the house up with this aid at 80°.

#### SUCCESSION HOUSES.

In the next house the growth of the trees will be more natural, and, as a rule, the fruit will set more abundantly than in earlier started houses. Before the fruit gets large remove any superabundant supply of them, at the same time reserve enough to meet contingencies that may arise. As far as practicable those from the underside of the shoots and others not well placed should be taken off. Keep the tying-in and stopping of the shoots well in hand, and the foliage clean and healthy by means of a vigorous use of the syringe or by fumigation if it is necessary. The temperatures here should in each instance range 5° less than in the earlier department. In late divisions, if the fruit is expected to give a successional supply to the foregoing crops, a little artificial aid should continue to be given; on the other hand, if the trees are to come in almost naturally, fire-heat will only be necessary as a protection when frost threatens. After the trees are disbudded the growth required to furnish the trees should be tied in close to the base. This method is a great advantage in symmetrical training. All gross shoots except the terminal ones should be stopped at about the sixth leaf. This will in some degree counteract an exuberant growth, and tend to cause a more even distribution of the sap over every part of the tree.

#### THE VINERY: LATE HOUSES.

In late houses where late keeping Grapes are chiefly grown, the Vines should now be moving; in fact, if this is not the case they should be encouraged to do so with the aid of a little fire-heat at night, and on dull sunless and cold days, under more favoured conditions, growth may be accelerated by means of early closing. With sun-heat I am quite convinced that in order to rest Grapes perfectly and to avoid having mildew amongst them, they should be fully ripe by the end of September. My experience with a half-span house which runs due north and south, where naturally the Grapes are considerably later than in those houses having southern aspects, has proved beyond all possible doubt the truth of this assertion. As soon as the shoots on these Vines attain a size for the best to be detected, all excepting one on each spur should be rubbed off entirely and the stopping of these when fit for the purpose should be done in the same way as previously advised. For the preceeding crop, in all cases where Vines are in robust

growth, the shoot should not be tied down only for the purpose of keeping them from touching the glass until such time as they become more inured and pliable for the purpose.

#### THE GRAPE-ROOM.

If the shoots with the bunches of Grapes on them are in bottles it will be necessary to look over them once a week, and replenish the water which is exhausted, so that the stems may be kept well submerged. Keep the place cool, and avoid dust as much as possible. The Grapes of last season's growth have kept well here, and our supply is sufficient for the demands until the new ones are ripe, which will be the case early in May. *G. T. Miles, Wycombe Abbey.*

## The Hardy Fruit Garden.

#### WALL TREES.

ALL pruning, nailing, staking, and planting of trees should be finished at once. The cold dry weather of late has been most favourable for retarding the flowering season, so that there is at present every prospect of a fruitful year; but the protection of the blossom which has appeared will require great care and attention for some time to come. Whatever means has been adopted for this purpose should only be continued as long as the cold weather lasts. All attempts at coddling should be dispensed with, for I am sure there is often much harm done by this mistaken notion of continuing to protect the trees whilst not making them more liable to injury. *J. Smith, Mentmore.*

## Plants and their Culture.

#### PITS AND FRAMES.

IN the majority of cases the houses will now be filled to their utmost capacity; we must therefore look to the cold pits and movable frames for the necessary room required for succession stock of general furnishing plants. In our case we find the most inconvenience to occur just about this time of the year when the latest vinery is closed, thus driving us to seek other quarters for its recent occupants that succeed best under cold treatment. Gladioli and Lilics in pots have been turned out into the open in a sheltered spot, thus leaving room for more tender plants to take their place. The Chrysanthemums will soon have to follow, and by the removal to the conservatory of the latest of the bulbs we shall have room to devote to spring-sown Ten-week Stocks, scarlet and other Pelargoniums, Harrison's Musk, and various useful early summer-flowering plants, which will in their turn do good service in the conservatory. Autumn-sown Stock of the intermediate type have been shifted into their blooming pots, and stood on a bed of coal-ashes out-of-doors. The spring-sown Ten-weeks will soon be fit for pricking off, placing three plants into a 4-inch pot (in which they will be allowed to flower), being kept under glass till well established. A selection should be made from amongst the bedding Pelargoniums and shrubby Calceolarias, securing some of the best of each for pot work, and shifting them on, at the same time keeping any flower-spikes pinched off till likely to be required. This will occur after the latest of the Indian Azaleas and herbaceous Calceolarias are past their best. They will then stand in good stead for intermixing with the latest Spiræas (*Hortia japonica*) and Fuchsia. For later use still in the conservatory, some few pots of *Lobelia speciosa* will be found extremely useful as an edging, particularly so when intermixed with Harrison's Musk. Both the double and the single varieties of Petunias should also be grown on without a check, not allowing them to become pot-bound till the desired size of pot is occupied. Young stock of Fuchsias will thrive well; better even, from this time onward in commodious pits than in houses that are lofty.

#### TUBEROUS BEGONIAS.

The now deservedly popular class of tuberous Begonias can also be started into growth in a close pit or frame. We do not mean by this one that is artificially heated, but one that can be conveniently

damped down and closed up early in the afternoon, so that the sun's rays warm the interior during the latter part of the day. At night a mat or two may be thrown on the glass to prevent any morning frost from unduly lowering the temperature. When fairly started into growth, gradually inure them to a harder course of culture; they cannot bear a coddling kind of treatment throughout their growth; and where such is followed the results will soon be apparent in their flacid leaves and elongated shoots that will eventually bear but a poor crop of flowers. A well grown tuberous Begonia should require but little support with sticks; the latest that have been raised by our well known trade growers have been remarkable both in the habit as well as in the floriferous character and finely formed flowers among this section of Begonias. Seedlings raised this spring will bear a little more heat, but this must not be continued too long. The earlier batches will have been pricked off before this, but the seed-pan will yield another lot or two of useful plants for succession. This pricking-off process should be repeated the second time to prevent them becoming too crowded; afterwards they can be safely transferred to small pots with every success. These will make most useful plants for the conservatory in the late summer and autumn.

## The Kitchen Garden.

#### SEED SOWING, ETC.

ANOTHER good sowing of Broccoli should be made in the middle of the month, again including one or two autumn varieties, such as Veitch's Autumn Protecting. The latest sowing of Broccoli may be made in the beginning of May. The following varieties are best for this:—Lauder's Gosheo, Ledsham's Latest of All, and Model. This last sowing is of great importance, as the produce therefrom comes in when other vegetables are usually very scarce, and before the earliest of out-of-doors Cauliflowers are ready for use the following year. About the middle of the month a sowing of Scarlet Runner Beans may be made, and a larger sowing at the end. The soil to grow this crop should receive a liberal addition of manure. It is a good plan, and it economises the manure to grow them in prepared trenches. Place some of the manure at the bottom of the trench, and when filled in, the top part of the trench should be a little lower than the surrounding ground, which will allow for easy watering during very dry weather. Make the main sowing of Brussels Sprouts; also sow successions of Cabbage, Cauliflower, and Lettuce. The latter and other salading must be sown often and in small quantities throughout the summer. Make the main sowing of Leeks and Vegetable Marrow, the latter for planting out next month. If no protection can be given to the Marrows at planting-out time, the middle of the month will be early enough to sow the main crop. When planting out, add but little manure, unless the soil should be very poor; even then it would be preferable to make holes, and add some good soil, than to use much manure.

#### PEAS.

Make main sowings according to the supply required during July and August. After the above sowing, to keep up a continuous supply of fresh Peas it will be necessary to sow several rows at regular intervals according to circumstances, for instance, on good holding soil Peas continue bearing for a much longer period than they do on poorer ground, hence the necessity for sowing more frequently on soil of the latter description. Caroons may now be sown.

#### SEAKALE.

The cuttings will be ready for planting out now. Allow the shoots to grow out from the callus from  $\frac{1}{2}$  to 1 inch before removing them from the cutting-bed. When planting remove all the shoots but the two strongest. After the shoots are well above-ground in May remove one of these, thus the plants will form but one good bold crown by autumn. Planting with the intention of lifting to force should be done by placing the cuttings in rows 1 foot apart, and 14 to 16 inches between the rows. Permanent plantations to be blanched on the ground where grown must be planted according to the means employed to attain this. If pots are used, four or five cuttings may be planted in a suitable form, or boards 1 foot wide may be made into a kind of box cover, which answers quite as well as pots if kept thoroughly dark. If the latter are used, the cuttings may be planted in a double row 6 inches apart; between these double rows a space of 1 yard should be allowed for conveniently placing on the blanching materials. Planting should be done with the dibbler, placing the cuttings from  $\frac{1}{2}$  to 1 inch below the surface, and care will be required not to break off the young shoots. *G. H. Richards, Somerley Gardens, Ringwood, Hants.*

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, April 13	Sale of Natural History Specimens, at Stevens' Rooms.
	Sale of Imported and Established Orchids, at Protheroe & Morris' Rooms.
TUESDAY, April 14	Royal Horticultural Society: Meeting of Fruit and Floral Committees, at 11 A.M.; Scientific Committee, at 1 P.M.
	National Rose Society: Meeting of Executive Committee, at 3 P.M.
	Sale of Carnations, Lilies, &c., at Protheroe & Morris' Rooms.
WEDNESDAY, April 15	Sale of Flowering Orchids, at Stevens' Rooms.
THURSDAY, April 16	Sale of Imported Orchids, at Stevens' Rooms.
FRIDAY, April 17	Sale of Imported Orchids, at Protheroe & Morris' Rooms.
SATURDAY, April 18	Sale of Hardy Plants and Bulbs, at Stevens' Rooms.

THE Tenth Census of the UNITED STATES comprised an enquiry into many matters besides a mere enumeration of the population. For one thing, it included an investigation of the nature and extent of the FORESTS of that vast country; and the results of that enquiry are now before us, in the shape of a thick quarto volume of over 600 pages, and an atlas of sixteen coloured folio maps. This elaborate publication has been compiled and edited by Professor CHARLES SARGENT, the Professor of Arboriculture in Harvard College—a sufficient guarantee for the carefulness with which the work is done.

Vast as are the resources of the United States in the matter of timber, yet reckless felling and the want of anything like conservancy have at length produced their inevitable results. A warning note has been sounded by those best qualified to judge; it has been echoed by others, not without effect; and we cannot doubt that the present publication will most materially serve to preserve to our American cousins their heritage of Nature's great gift.

Imperial Britain is as much concerned in this matter as the United States. Much that applies to the North-east Atlantic and to the North-west Pacific States applies equally well to the great Dominion of Canada, stretching as it does from ocean to ocean, and comprising areas of forest once considered inexhaustible. It is needless to say how vastly the interests of the home country are concerned in the adequate and continuous supply of timber from the American continent. So vast are the forests—so much vaster were they once—that it is no matter for surprise that at first the idea of a failure of supplies was disregarded if not ridiculed. Even so good a botanist as DARLINGTON treated lightly the warnings of BARTRAM made eighty years previously, and based on personal travel and experience in States far less denuded of timber than they are now—States, indeed, which were in his time largely covered with virgin forest, but which are now stripped of their timber. These matters are better understood now, and the most convincing proof of it is offered by this portly volume, containing what is doubtless the fullest and most elaborate report on the forests and forest trees of any country.

An attempt is made to estimate the value of the forest crop for the Census year—1879-80. Such attempts must necessarily be loose approximations only, but estimating the amount required for construction, fuel, railroads, telegraphs, charcoal, dyeing purposes, and the myriad demands of modern civilisation, the value cannot be estimated at less than 700,000,000 dollars! In the present volume we have a series of tables showing the statistics of the timber trade in all the States and Territories of the Union, accompanied by numerous coloured maps so tinted as to show at a glance the nature and extent of the supply. From inquiries made in every town of the Union it is estimated that in the Census year 140,537,439 cords of wood of the value of 306,950,000 dols. were used for domestic purposes alone by 32,375,074 persons.

In spite of this vast amount, which will, of course, increase largely each year, in spite of reckless management, or no management at all—in spite of the utter destruction of forests in certain of the States of the Union, which were once considered inexhaustible, and of the certain exhaustion of others within no long period, yet on the whole the report is hopeful. In many places the inroads have not yet materially or dangerously affected the prospects of the future. This is particularly the case in the Pacific States of Washington and Oregon, the western slopes of the Rocky Mountains, and the Californian sierras, though the famous Redwood, *Sequoia sempervirens*, has seriously diminished in amount, and is likely to do so still more, as it furnishes the best substitute for white Pine (*Pinus Strobus*). "The forest wealth of the country is still undoubtedly enormous. Great as it is, however, it is not inexhaustible, and the forests of the United States, in spite of their extent, variety, and richness, in spite of the fact that the climatic conditions of a large portion of the country are peculiarly favourable to the development of forest growth, cannot always continue productive if the simplest laws of Nature governing the growth are totally disregarded. The judicious cutting of a forest in a climate like that of the Atlantic or Pacific coast regions entails no serious or permanent loss. A crop ready for the harvest is gathered for the benefit of the community; trees which have reached their prime are cut instead of being allowed to perish naturally, and others take their place. The permanence of the forest in regions better suited for the growth of trees than for general agriculture may thus be insured. Two causes, however, are constantly at work destroying the permanence of the forests of the country, and threatening their total extermination as sources of national prosperity—fire and browsing animals inflict greater permanent injury upon the forests of the country than the axe, recklessly and wastefully as it is generally used against them."

The elaborate details concerning the nature and extent of the timber supply in every county of every State and territory in the Union have, of course, a specially local interest. We mention them to show the exhaustive nature of the report, and the wide basis which has thus been obtained for statisticians and economists to base their deductions upon.

Another and most important section of the work is devoted to the determination of the value of the woods for special purposes. This department was entrusted to the supervision of Mr. SHARPLES, who has recorded the results of experiments made with a view to determine the fuel value of the woods of the United States, and their value for constructional purposes. The specific gravity, and the amount of ash from dry wood, supplemented by a chemical analysis of the wood furnish data for the first part of these inquiries, while for constructional purposes properly prepared specimens of definite size were tested as to their resistance to pressure, their elasticity, &c. A large amount of useful information is thus comprised within statistical tables, useful for reference, but not suitable for citation; some general results may, however, be here given as to the specific gravity:—

"It will be noticed that all species in which the wood is heavier than water belong to the semi-tropical region of Florida, or to the arid Mexican and interior Pacific regions. There seems to be a certain, but by no means constant relation, as shown in this table, between aridity of climate and the weight of the wood produced by closely allied species or by individuals of the same species. The wood of the form of *Quercus rubra* peculiar to Western Texas is nearly 39 per cent. heavier than the average of all the specimens of the typical species grown in the Northern States. Among the white Oaks the wood of species belonging to regions of little rainfall, *Quercus grisea*, *Q. oblongifolia*, *Q. Durandii*, and *Q. Douglasii*, is heavier than that of allied species peculiar to regions

more favourable for the growth of trees. The average of two specimens of *Quercus prinoides* grown in Western Texas is 19 per cent. heavier than the average of all the other specimens of this species grown in other parts of the country. In *Fraxinus* the wood of *F. Greggii* of the Rio Grande Valley, is heavier than that of any other species; it only just surpasses in weight, however, the wood of the Western Texas form of *F. americana*, which is 20 per cent. heavier than the average of all specimens of the typical species grown north of Texas. On the other hand, the wood of Texas forms of *Fraxinus viridis* is constantly lighter than that of northern specimens, and the wood of *Celtis* grown in Arizona is lighter than that of the average of all the other specimens of this species. In *Juglans*, the heaviest wood is that of *J. rupestris*, a species belonging to a region of little rainfall, and specimen of *J. nigra* from Western Texas is 33 per cent. heavier than the average of all specimens grown in the Mississippi basin. In the case of *Platanus*, the heaviest wood is that of the Atlantic species, but wood of the species peculiar to the comparatively moist climate of south-western Arizona is, however, considerably lighter than that of the drier climate of southern California."

The relative fuel value of each was obtained by deducting the percentage of ash from the specific gravity. This is based on the hypothesis that the real value of the combustible material in all woods is the same. But this hypothesis will hardly commend itself unsupported to those who know how greatly the nature of woods of each species differs at different times and according to different circumstances, and indeed, we find from Mr. SHARPLES' experiments that resinous woods give out more than twelve per cent. more heat than do equal weights of non-resinous woods; the heat produced by burning a kilogram of dry non-resinous wood being about 4000 units, while the heat produced by burning a kilogram of dry resinous wood is about 4500 units—a unit being taken to be the quantity of heat required to raise one kilogram of water one degree Centigrade.

So far as the relative strength of woods is concerned we may extract the following summary bearing on the relation of the minute microscopic anatomy of the wood to its breaking strength.

"An examination of the results obtained from the various tests made upon the woods of North America indicate at least the important fact that within the limits of any species the weight and strength of any specimen of wood depend upon the actual proportion of the space occupied, in the layers of annual growth, with open ducts, to the space occupied with compact, woody tissue, and to the size of these ducts; or in the case of the wood of *Coniferae*, the proportion of space occupied with cells formed early in the season to that occupied with the smaller cells of the summer growth. The proportion between these two kinds of growth varies not only in every individual tree, but in different parts of the same tree. The causes which thus affect the growth of wood are not very apparent. It is not soil, nor age, nor general climatic conditions, it appears, which produces the different proportion between the solid and the light portions of the annual growth in any species, because in the same individual this proportion is found to vary from year to year. It varies very irregularly; nor does the rapidity of growth, as has been supposed, greatly affect the strength of wood, because the proportion of open to compact growth is little affected by rapid or slow increase of the tree's diameter.

"How far annual climatic variations affect the nature of the annual layers of growth has not been demonstrated, although it is not impossible that in years in which conditions favourable to rapid growth are extended late into the season, the proportion of the annual layer occupied by open, weak growth to the growth of the whole year would be greater than that formed in a year during which the season favourable to rapid growth was less extended.

"It follows that while such experiments as those conducted by Mr. SHARPLES are necessary to establish maximum and relative values for any species, these being established, actual values of any given specimen of wood may be determined by microscopic examination of its structure; that is, two specimens of the wood of any species to which the Census tests have been applied being given, their relative value can be determined by an examination of their structure as well as, or better than by any elaborate experiments."

Then follows some tables showing the amount of tannin in the bark of various trees, the per-

centage proportion varying from 4 per cent. in *Prosopis juliflora* to 31 per cent. in the Mangrove, *Rhizophora Mangle*. Curiously as it seems, the proportionate amount of tannin in the bark of the several species of Oak is small, and almost invariably largely exceeded by that in the bark of the Conifers. Tables are also given showing the specific gravity, ash, and weight per cubic foot of each of the 412 species of timber-yielding trees, and in many cases in several specimens of each tree. Similar tables are given of the fuel value and chemical composition of a select number, as well as of their strength, as tested in various ways. The mass

who proposed it, and then very full bibliographical reference to the works of subsequent authors in which the particular tree is mentioned. The synonyms and varieties are treated in a similar manner. No descriptions are given, the references to the literature obviating the necessity of these, but a popular description of the tree, indications of the districts in and conditions under which it grows, of the nature of its wood, and the purposes for which it is or might be employed. Here again, then, we have a vast mass of authentic information which will be of the utmost service not only to those interested in timber supplies, but

the forests of North America in relation to the locality, climatic condition, distribution, &c. The forests are arranged in districts, thus:—

(1). The Atlantic region, including the northern forest, the northern Pine belt, the south maritime Pine belt, the deciduous forests of the Mississippi basin and the Atlantic plain, the semi-tropical forest of Florida, and the Mexican forest of Southern Texas.

(2). The Pacific forests are subdivided into a northern forest, a coast forest, an interior forest, and a Mexican forest.

This is a most interesting and readable account, but as it formed the subject of a report by Dr.

FIG. 86.—CARBERRY TOWERS. (SEE P. 473.)

of information thus tabulated is indeed enormous, and the Government of the United States merits the gratitude of the civilised world for accumulating and rendering available so vast an amount of information, useful, not to one nation, but to all humanity.

The part of this volume which comes first in order, though it has suited our convenience to allude to it last, comprises a full catalogue of the 412 species admitted under the general head of forest trees. These are arranged under their natural orders, beginning with *Magnolias* in the order of that name, and ending with the fibre-producing *Yuccas* of Texas and Arizona. The information given under each species comprises first the adopted name, with that of the author

to planters in this country, who will find this the most carefully compiled and authentic catalogue of American trees ever published, and one which should do much to abate the nuisance of conflicting synonymy and to fill up gaps in our knowledge. A full index of specific and varietal names is given, as well as of synonyms and local names—the latter particularly valuable, for who would dream, for instance, that by the "Slippery Elm" was meant *Fremontia californica*?—which has not much more relation to an Elm than a cow to a Cucumber; or who, without this guide, would know which white Pine out of the some half-a-dozen trees so-called was meant?

This list is preceded by a general account of

ASA GRAY and Sir JOSEPH HOOKER, and also of a lecture by the latter botanist (*Gardeners' Chronicle*, August 3, 1878, p. 140), we need not lengthen this article by inserting the present report. We may be excused for repeating our statement as to the great value of the enormous body of information here got together, and our admiration of the manner in which it has been done.

— HORTICULTURAL EXHIBITION IN BERLIN. —With reference to the above show, which will be held from September 5 to 15 this year in the Royal Exhibition Buildings (formerly Hygienic Exhibition), we are informed that it promises to exceed in extent and completeness anything of the kind ever held in

Germany. In all probability the horticultural productions from beyond the sea, and from the new German colonies, will be of such considerable extent and variety that a separate section will have to be made for them. The management of the Exhibition is in the hands of Herr SPÄTH and Herr SAINT PAUL as assistant.

— ROYAL METEOROLOGICAL SOCIETY. — At the ordinary meeting of the Society, to be held at 25, Great George Street, Westminster, on Wednesday, the 15th instant, at 7 P.M., the following Papers will be read:—"Report of Committee on Decrease of Water Supply," "Report of Committee on the Helm Wind of Cross Fell, Cumberland," "Results of Meteorological Observations made at Asuncion, Paraguay;" by RICHARD STRACHAN, F.R.Met.Soc.

— PINUS COULTERI.—The seed of the tree which produced the cones figured at pp. 409 and 413 was, we learn, sown in 1845. The tree now measures 39 feet in height, with a girth of 6 feet 6 inches at 3 feet from the ground. Another tree, also at Bayfordbury, Herts, measures 47 feet in height, with a girth of 7 feet 3 inches, but this has never borne cones.

— MESSRS. JAMES DICKSON & SONS.—This firm has been honoured with a special warrant appointing them nurserymen to His Royal Highness, the Prince of Wales.

— LINNEAN SOCIETY OF LONDON.—A meeting will be held on Thursday, April 16, at 8 P.M., when papers will be read on the following subjects:—"On Forms of Leaves," by Sir JOHN LUBBOCK, Bart.; "On New Species of Australian Minyad," by Professor F. JEFFERY BELL; "Germination of Seeds after Long Submersion in Salt Water," by JAS. J. WHITE.

— EXHIBITION FIXTURES.—The Reading Chrysanthemum Society will hold its second annual exhibition in the Town Hall on November 13. The schedule of prizes has undergone revision, and the prizes in some of the leading classes augmented. The Devizes Chrysanthemum Show will take place as usual, in the Corn Exchange, on November 17.

— "THE DEW FROM THE ROSES IN THE GARDENS OF THE POETS."—This is the literal translation of the title of a little book recently published by the authoress of "Notes from a Buckinghamshire Garden"—"Ros Rosarum ex horto Poetarum,"—dew of the ever living Rose gathered from the poets' gardens of many lands, by "E. V. B." To lavish commonplace eulogies on a book like this would be to play the part of DOGBERRY. It consists, indeed, of buds and blossoms plucked by loving hands "from a garland of eternal Roses." Graceful imaginings, fanciful conceits, inspired imagery—this is what "E. V. B." gives us in plentiful measure. She will have her reward in the knowledge that she places a source of exquisite delight within the reach of her fellows. In these days, when even Roses are vulgarised by flower shows, starched and stiffened by gum and wire, when their value is appraised in terms of filthy lucre, it is renovating and pleasant to be brought back to the Rose gardens of the poets, where nothing sordid may enter. In fact, we have in this volume a selection of the choicest allusions, analogies, and epithets that have been bestowed on Roses from all ages and in many languages. Such is the profusion of books on the Rose that when first we heard of this we almost lamented that another should have been added to the list, but that was before we were privileged to dip into its pages. Many who, like ourselves, were becoming weary with hearing what SAPPHO said about Roses, the cries of the red Rose, the tears of the white, and the rest of the hackneyed catalogue, will find in this little volume exquisite allusions and delicate imagery which will be as delightful as they are fresh and un worn. The book is well printed, and got up in that quaint antique style which in some cases savours of affectation, but which in this case seems appropriate. ELLIOT STOCK is the publisher.

— NITRATES.—Messrs. BERTHOLOT & ANDRÉ have recently published in the *Comptes Rendus* the

results of a series of analyses, from which it appears that the nitrates are found in abundance in the stems of most plants, less copiously in the roots and leaves, and that the quantity formed when the plant begins to produce flowers is less than the quantity of nitrates used up. It is clear, then, that the nitrates are decomposed in the green matter of the leaves, and the nitrogen used up in the formation of albuminoid matter.

— THE FLORA OF OXFORDSHIRE.—Over half a century ago WALKER's *Flora of Oxfordshire* was published, but the changes in nomenclature, the subdivision of species, &c., demand a new work on the subject. Long ago Mr. ALFRED FRENCH began one, but he died in 1879, and the MSS. fell into the possession of Mr. CLARIDGE DRUCE, F.L.S., who has undertaken its completion. Botanical authors from 1500 A.D. downwards and the herbaria of Oxford, British Museum, &c., will be fully quoted. About 400 species and varieties additional to those of WALKER and SIBTHORP will be enumerated, and something like 20,000 records have been made in visiting the parishes of the county. The flora of the Berkshire border will be given. The comparative plant occurrences in the counties of Berks, Bucks, Warwick, Northampton, and Gloucestershire will be shown.

— NEW HYACINTHS AT MESSRS. VEITCH & SONS', CHELSEA.—The house at this nursery that is set apart for spring flowering bulbous plants is, as may be expected, very brilliant just now. Amongst Hyacinths and Tulips some desirable acquisitions have been made of late years, and which will, on account of their striking colours, impart more variety into these favourite flowers. It is noticeable, however, that the newer varieties are decidedly inferior to the older ones as regards size of bells and spike, but no doubt they will improve in time. Amongst the finest Hyacinths are—Distinction, very dark crimson; Marchioness of Lorne, nankeen-white; La Franchise, very large bells, of a most delicate blush; Masterpiece, nearly black; Harlequin, light puce, very attractive and others. Two new Tulips, viz., American Lac and Empress of Austria, are very attractive and distinct—the former cerise, the latter orange-scarlet in colour, both of good shape and substance.

— THE PHYLLOXERA.—According to some statistics published by M. TISSERAND relating to the spread of the Vine louse in France and the means taken to combat it, it appears that in spite of the methods adopted the insect still extends its range of operations. In 1883 upwards of 17,000 hectares of vineyards were treated by submersion—a plan which was adopted in 1884 in upwards of 23,000 hectares. Of vineyards in which insecticides were used there were in 1883, 26,000, and in 1884, 39,000 hectares. American Vines were used as stocks whereon to graft French Vines in 28,000 hectares in 1883, and in 52,000 hectares in 1884. In each case we cite the figures in round numbers, but they show that while there has been a large increase in each of the methods of treatment the use of American Vine stocks has increased by nearly one half. In spite of the ravages of the insect it is estimated that 35,000,000 hectolitres of wine were produced last year in France. The falling off was greatest in the Burgundy district of Côte d'Or.

— PROPAGATING CASE FOR AMATEURS.—Messrs. DEANE & Co., London Bridge, have provided an article under the above designation which should be of value to persons not having a suitable place for striking cuttings, raising seeds, starting bulbs, &c. It requires little attention to keep up a regular supply of heat, as the boiler or kettle by which it is heated only requires to be heated once every twenty-four hours.

— NARCISSI.—From Mr. BURBIDGE we have received flowers of *Narcissus princeps*, a bold and handsome flower, 3 inches and more in length, with oblong lanceolate flower-segments, pale sulphur-coloured, twisted like the moustaches of an exquisite, and with a broad trumpet-shaped crown, clear gamboge-yellow, wavy, and slightly notched at the edge.

*Narcissus maximus*, true, a very showy variety, with flowers 3 inches and more in length, with ovate-oblong segments of a rich gamboge-yellow, the

trumpet of equal length, broadly tubular, with a reflexed top, the edge of which is boldly lobed, and of a deep golden-yellow. The Dutch form of the same variety is very similar, but smaller.

*Narcissus Sir Watkin*.—A grand flower with star-shaped perianth, broad ovate canary-yellow segments, slightly longer than the deep golden-yellow trumpet, the edge of which is wavy and slightly notched, but scarcely turned back. See *Gardeners' Chronicle*, April 26, 1884, fig. 109, p. 553.

*Narcissus spurius*.—Flowers  $2\frac{1}{2}$  inches long, segments oblong ovate, canary-yellow, rather shorter than the rich golden trumpet, whose border is slightly notched and lobed, but little turned back. The double form is very handsome. Its peculiarities will be mentioned later on.

— NATIONAL CHRYSANTHEMUM SOCIETY.—The scheme for affiliating suburban and provincial Chrysanthemum societies, or such societies as make Chrysanthemums a special feature at their autumn shows, is bearing good fruit, as already sixteen applications have been received and accepted from the following societies, viz., Bristol Chrysanthemum, Yeovil Chrysanthemum, Ancient Society of York Florists, Chelmsford and Essex Horticultural, Canterbury Gardeners' Mutual Improvement, Dorset Chrysanthemum, Lincoln Chrysanthemum, Sheffield and West Riding Chrysanthemum, Brighton and Hove Chrysanthemum, Weald of Kent Gardeners' and Cottagers' Mutual Improvement; Highgate, Finchley, and Hornsey Chrysanthemum; Scarborough Floral and Horticultural; Ascot, Sunninghill and District Horticultural; Bath Floral Fête, Lincoln Chrysanthemum, and Ealing, Acton, and Hanwell Horticultural. One excellent idea in connection with the affiliation scheme is found to be working well—namely, that of a representative of each affiliated society having a seat on the General Committee of the National Chrysanthemum Society for the season; it serves to bring it into more intimate touch with country societies, and suggestions often of a useful and practical character are made and discussed. At a meeting of the General Committee held on Monday evening last twelve new members were elected, bringing the total up to 271. It may be said that the National Chrysanthemum Society is one of the most successful horticultural ventures of recent days.

— THE BOTANICAL SOCIETY OF BELGIUM.—The twenty-third volume (1884) has just reached us, and is noteworthy for an interesting paper on the division of the nucleus in *Tradescantia*, by Dr. BERNI-MOULIN, of Liège, in which, however, the author does not state the magnifying power that he made use of. Methyl-green was used as the staining material. Mycologists will welcome the excellent classified list of the fungi found in the neighbourhood of Brussels, and drawn up by two ladies, Mesdames BONMER and ROUSSEAU. A series of analytical tables serve for the ready determination of the genera. The literary references are ample, and show that the authoresses have availed themselves of the most highly reputed authorities, while their personal observations, carried on for many years, give ample warranty of the excellence of this list. We regret that the compilers have adopted the diffuse method of characterising the orders and sub-orders. It would greatly tend to facility of reference if cryptogamic botanists would adopt the concise technical description as practised by LINNÆUS and carried out by most botanists who deal with flowering plants. The diagnoses of Chytridiceæ, for example, occupies fourteen lines, but which, if treated in the same manner as the descriptions of the genera, need not fill more than one half of the space. In the case of such genera as *Puccinia*, the *Uredineæ* and *Aecidial* forms are given where known, with the plants on which they respectively occur. We commend this valuable list to the notice of our readers.

— MANGIFERA INDICA.—In spite of its close connection with a large number of poisonous trees or shrubs belonging to the same natural order the fruit of the Mango is not only harmless, but esteemed highly delicious. Besides growing naturally, and cultivated in various parts of India, it has also found its way into many warm or tropical countries. In hothouses it succeeds under a considerable range of temperature, and is worthy of a place in large stoves for the beauty of its long, lanceolate, deep green, shining leaves. A large specimen grown in a pot may be seen flowering in the Palm-house at Kew. The

inflorescence is terminal, consisting of a panicle of small pale or white and yellow flowers resembling in the aggregate those of some species of *Rhus*, but differing in colour. The leaves, however, are simple in this instance, and the flowers are remarkable for the reduced condition of the stamens: seldom more than one is perfect, while the rudiments of other four are more or less discernible. The species is figured in the *Botanical Repository*, 425.

— **ROSES IN THE SOUTH OF FRANCE.**—It is stated that a Rose grower at Hyères obtained for his Rose buds of Safrano, this season, 30,000 fr. In the first week of January (including New Year's Day) he sold flower-buds to the amount of 5000 fr., and the receipts for one day amounted to 1400 fr., and all this from 2 hectares of ground.

— **CAMELLIAS AND AZALEAS AT MESSRS. J. VETCH & SONS, CHELSEA.**—The large conservatory planted out with Camellias is just now one mass of bloom, all the plants, large and small, being extremely full of flower. C. Storyi, a beautiful rosy-pink; Comte Nesselrode, large flowers, rose tipped and edged with white; Mathotiana rosea and alba, and Tricolor, Comtesse Mastiana, blush-white; Princess Bacchiocchi, Countess of Orkney, Gerardine Santarelli, crimson, blotched white, fine flower; Mad. Cachet, pure white, striped with crimson, as in Countess of Orkney, but with more substance; and Duchesse d'Orleans, white, striped with crimson, were amongst the most noticeable. Some of the new Azaleas were very striking, particularly Hermosa, a very fine rose-coloured variety; Baron Nathaniel de Rothschild, deep crimson, large flowers; Czar Alexander, very deep reddish-scarlet; Empereur du Brésil, deep rose, bordered with white; and Theodore Reimers, nearly purple.

— **CLIVEA MINIATA.**—As an illustration of good cultivation and of the magnificent effect that can be produced by relatively inexpensive plants, we may mention that in the gardens of J. STEWART HODGSON, Esq., of Haslemere, are two specimen Cliveas, one with twenty-two spikes, and some of the spikes with twenty-three flowers on each. Both are good varieties, and, needless to say, they are well cultivated by Mr. EVANS, the gardener.

— **SPARMANNIA AFRICANA.**—Some standard plants of this fine old Cape of Good Hope greenhouse shrub are now to be seen in fine condition in the conservatory at Gunnersbury House, Ealing. Mr. HUDSON manages these with exceptional success. They are on 4 to 5 feet stems, and have put forth branches bearing main and side spikes of blossom in great plenty. There is much to be said in favour of growing the Sparmannia in this way—the delicate Schizanthus-like spikes of bloom are above the level of the line of sight, and the eye can take in all their beauty, especially that of the pencilled golden stamens. There are several specimens at Gunnersbury House; they have remained for sometime undisturbed in their pots; when they have done flowering the plants are placed out-of-doors, and in the autumn, before being housed, the flowering wood is pruned back hard. Then they break into strong growth, and bloom in early spring freely and finely.

— **PÆONIA ARBOREA IN POTS.**—Mr. ROBERTS has made a most successful experiment with these at Gunnersbury Park. In the large vinery can be seen two very fine specimens in pots that have borne a number of flowers, and they have been found very useful for cutting purposes. The experiment has been made for the purpose of showing the adaptability of the Tree Pæony for a winter garden. Mr. LEOPOLD DE ROTHSCHILD is forming; and that these Pæonies can be grown in pots in the most successful manner is amply demonstrated. The early flowering character of *P. arborea* lays it open to damage from early frosts when grown in the open ground.

— **GARDENING APPOINTMENT.**—Mr. J. PETRIE, Indoor Foreman in the Gardens, Broxmouth Park, Dunbar, has been appointed Head Gardener to the Marquis of TWEEDDALE, Yester House, Haddington, N.B. — Mr. G. DUNCAN, late Foreman at Dupplin Castle, N.B., as Gardener to C. W. Wilson, Esq., M.P., Warter Priory, Pocklington, York.

## THE PROPAGATOR.

THE PROPAGATION AND CULTURE OF ALOCASIAS.

(Continued from p. 377.)

A. JENNINGSII.—This is a very distinct and pretty variety, and is distinguished from other plants by the peculiar markings of its foliage. Its pea-green leaves and black markings, with occasional round black spots, renders it attractive and conspicuous. It is not evergreen, like *A. Veitchii*, but loses its foliage upon the approach of winter. It is an excellent plant, and well deserving of a place in every collection.

During the winter months the plants can be placed under the stage of a warm house where there is not much drip from overhead. The supply of water should now be almost withheld, giving them only just enough to prevent the roots from shrivelling; but when the plants are in full growth they should be well supplied with water. For this purpose the pots should be stood in pans of water. These saucers should be emptied and washed out once a week, and should not be filled for a day or two in order that there may be a free circulation of air to the roots and soil.

In the active growing state the plants should be kept in a good temperature, constantly syringed, and ventilated upon every fine day, but they should also be shaded from the hot sun. They will grow in almost any soil, but in some cases, when potted into strong soil, the plants do not attain their proper size in the first season, and in the second often disappear altogether. In the summer the plants do not feel the want of a warm soil, but it is during the winter months that a cold heavy soil has such a dangerous effect. The following compound is best suited to the plant:—Equal quantities of yellow loam, leaf-mould, peat and river-sand, and small quantities of chopped sphagnum moss and charcoal broken up into pieces of hazel-nut size. This soil should be well mixed together before it is used. In order that good drainage may be secured the pots used for the plants should be filled to a quarter of their depth with broken potsherds.

### PROPAGATION.

After the soil has been shaken from the roots of the plant all its thick knotted root-growth should be cut off to within an inch of the crown or centre of the plant. Both the pieces of root and the remainder of the old plant are to be used, and should therefore be taken care of. Taking the old plants first they should be potted into large 60's, and care should be taken to keep the crowns or centres level with the surface of the soil. A little sand should be placed at the base of the plant—that is, between the plant and the ordinary soil. They must be put in a cutting-case upon a gentle bottom-heat, and after three or four days have elapsed they should receive a good watering, but not before. From that time they should be sprinkled with a fine rose pot, as well as ventilated for an hour every night and morning; and when the sun shines, shading is also necessary. When the plants have well rooted and thrown up growths to the height of 3 or 4 inches the amount of ventilation should be increased.

If the light of the case is raised an inch, and is not shut down during the day or night, the plants will soon have become strong enough to be stood out upon the open bottom-heat, and here they should remain until established in their present pots. They should then be potted into large 48's, and as they are small growing plants they seldom require larger pots, but if large masses are required they can be further potted as occasion demands. Now attention must be turned to the root growths. The necessary pans should be well drained, and the soil must be firmly pressed in, the surface being made quite level, and after being well watered they are ready for use. The root-growth must be cut into pieces half-an-inch in length, and these can be placed upon the surface of the soil, not burying them, (but sprinkling them first with dry sand and then with the ordinary soil, but only so as to barely cover them. The pans must be placed upon a brisk bottom-heat in a cutting case, and they should be well watered after

they have been there four days, but not sooner. They must be sprinkled with a fine-rose pot night and morning, at which times they should also be ventilated for an hour, and when necessary they should be shaded from the sun. When they have grown into plants, 1½ inch in height, each one should be potted into thumb-pots, and if more plants are required the pieces of old root-growth can be taken off each young plant and placed back in the pan, where they will form fresh plants. After the root-plants have been well watered they must be placed in a close cutting-case or frame, and treated in the same way as the old plants until they have been turned out upon the bottom-heat. Here they should remain for four or five days to harden them for potting into large 60's. Well water and replace them upon the open bottom-heat. They can be potted again into larger pots if large plants are required. *A. Marshalli* is a companion plant to *A. Jenningsii* and can be propagated in the same way, as also *A. Gibsoni*, with the exception of the soil, which should be composed of one-half good turfy loam, one-third peat, and one-quarter river sand.

### ALOCASIA MACRORHIZA VARIEGATA: ITS PROPAGATION.

The top growth of the plant should be cut down, and care taken to cut an inch of the main stem with it. In potting a little sand should be placed between the bottom of the cuttings and the ordinary soil, which should be firmly pressed into the pots. The cuttings must be secured to small sticks, and after being well watered placed in a cutting frame. The case should be shaded from the sun and ventilated for an hour night and morning, and the cuttings should be watered as soon as they become dry. When the plants have well rooted they can be removed to the open bottom-heat, and after they have been here for six or seven days they will have gained strength enough to be repotted into 24-sized pots. They should be watered and replaced upon the bottom-heat, and when they have grown to the required size they can be taken from the bottom-heat to an ash bottom in a warm house, although if more than ordinary size plants are required they must again be potted as they gain strength.

The old plants from which the cuttings have been taken should now be stood or plunged upon bottom-heat. They will soon produce a quantity of young plants, and when two or three leaves have appeared upon each of these the old plant should be shaken out of the soil and all the young plants taken off. They must be potted into small 60's, and after being well watered they must be replaced upon the bottom-heat. Here they should be well supplied with water, besides being lightly syringed three or four times a day, and as they grow in strength and size they must be potted into larger pots when necessary.

The old plants should again be potted and stood out upon the bottom-heat, where they will continue to produce growth for cuttings. The soil suited to this plant is composed of one-half good turfy loam, one-third leaf-mould or good rotted cow-manure, and one-quarter river-sand. The pots used should also be well drained. T. O.

## The Herbaceous Border.

### ALSTRÖMERIAS.

THIS beautiful tribe of plants does not receive the attention it so well merits. In these days of floral decoration, when flowering plants of all descriptions are being sought for, it is surprising that such useful and beautiful plants as the *Alströméria* should be so little grown; they are quite hardy and of easy culture, they like a deep, rich, sandy soil and a warm situation. They are increased either by dividing the roots or by seed, which may be sown when ripe or kept until spring, the latter being the best season. When the seed is sown it should be put into heat and kept moderately moist until it commences to grow. When the young plants are fit they should be potted off and put back into some heat, and kept growing gently. When they begin to fill the pots with roots they should have a shift; they should then be put into a cold frame or pit and gradually hardened off. Towards the end of May they may be planted out; they will do well grown against a south wall. I have grown them well against the end of a vinery having

an east aspect. They should be planted in a border well prepared with nice soil, and should be placed a foot or more apart. A few only of the strongest will flower the first season, but the following season the flowers will be all that is desired. They will grow and flower in the same situation for several years, but when the clumps get large it is best to divide them, and renew at the same time the soil in the border. *M. Saul, York.*

#### ORNITHOGALUM "GRACILE."

I have had several letters of inquiry as to the identity of the *Ornithogalum* which has been widely advertised lately under the above name. Mr. T. S. Ware has now sent me perfect specimens, and it proves to be *Ornithogalum lacteum* of Jacquin, of which figures will be found in the *Botanical Magazine*, t. 1134, and in Andrews' *Botanical Repository*, t. 274. The plant which I described under the name of *O. gracile* in Trimen's *Journal*, 1874, p. 366, belongs to the same subgenus (*Cathissa*), but is perfectly distinct specifically. We have a handbook of all the Cape bulbs, with full synonymy and references to all published figures, in a forward state of preparation. *J. G. Baker.*

#### RANUNCULUS LYALLI.

At p. 186 Mr. James McIndoe asks if any of the attempts to cultivate this plant in Britain have yet proved successful. So far nothing very satisfactory has been done; the plants introduced a few years ago by Messrs. Veitch all perished, and as no second attempt to bring living plants of it to England appears to have been made, the only other means, that of seeds, has perforce to be looked to for the introduction of this remarkable and beautiful plant to gardens on this side of the world. The late Mr. Anderson-Henry succeeded in raising plants of it from imported seeds, which, if still alive, it is to be hoped have passed into careful hands. Mr. Max Leichtlin, of Baden Baden, possesses, or did recently possess, a young plant of it; and in the Royal Gardens, Kew, there are two young plants which were raised from seeds obtained through Major Tesker-naker, Sydenham. These two plants are at present growing in a cool Orchid-house, where they are shaded from direct sunlight, and are kept in a temperature of 45° to 50° in winter. The seeds were sown about two years ago in a loamy soil, and placed in a warm house, where two of them germinated ten months after date of sowing. The character of the seed-leaves was so remarkably like that of the common field *Ranunculus* that it was feared they were not the right thing. They were, however, saved and grown on, and in time began to show that they were something unfamiliar, as the leaves thickened and assumed a rugose appearance. Till recently all the leaves developed by these two plants were semi-rotundate, with a wide sinus at the base extending to the leaf-stalk; now, however, the leaves are almost orbicular in outline, and the sinus is comparatively short and narrow, so that in appearance the leaves are distinctly peltate. This character of the seed-leaves, differing so markedly from the mature ones, is somewhat singular, and I have not met with a similar instance amongst the numerous and various seedling plants which have come under my observation.

If Mr. McIndoe or some other New Zealand friend could supply us with particulars as to the conditions under which this *Ranunculus* grows, both naturally and when in cultivation, he would afford valuable assistance to those of us who are trying to succeed with this plant. What we want to know is whether the position most favourable for it is one exposed to sunlight or shade, and if the plant is semi-aquatic, as stated by some, or genuinely terrestrial, as I am inclined to believe it is from information recently received.

The description of this *Ranunculus* in Hooker's *New Zealand Flora*, together with the interesting observations from Mr. McIndoe, are sufficient to make us here long to succeed in its cultivation. A plant with thick fleshy concave peltate leaves, 4 feet high, and bearing tall scapes, each with about a dozen dazzling white flowers 4 inches in diameter, and which, moreover, is likely to prove perfectly hardy in England, would be a most welcome addition to gardens. We have the beginnings of the plant; what we still want is some reliable information on the conditions most suitable for their full development. *W. W.*

## DISEASE OF SPINACH.

PERONOSPORA EFFUSA, Grev.

In the *Gardeners' Chronicle* for February 7 last, p. 176, a description and illustration was given of a parasite of *Hebe* named *Peronospora Hyoscyami*, P. In the description it was pointed out that *P. Hyoscyami*, P., might possibly spread to other solanaceous plants, as the Potato, Tomato, &c. We also stated that *P. Hyoscyami*, P., so closely resembled in habit and form another species of *Peronospora*, named *P. effusa*, Grev., a parasite of Spinach, that Dr. Rabenhorst had considered the two fungi to be identical with each other.

Since that article was published several correspondents have asked for an illustration of the Spinach parasite, *P. effusa*, Grev., so that the figure might be compared with that of *P. Hyoscyami*, P., on p. 176. As we are not acquainted with any illustration of *P. effusa*, Grev., in any English book, we here give one in fig. 87, enlarged from Nature to the same scale as

tains its existence from year to year. The fungus differs from the Potato fungus, *P. infestans*, Mont., in growing on the attacked plants for several months together, instead of for a few weeks only, or perhaps days.

If the readers of this paper will compare the illustration of *P. Hyoscyami*, P., with that of *P. effusa*, Grev., now given, they will see how very close is the resemblance in form and size between the two parasites. The colour of the conidia is also the same.

To prevent attacks from this pest, Spinach should not be resown a second year in beds where the disease has once appeared. The yellow leaves, such as have the pale mauve disease patches beneath, should be removed, and if possible burnt as soon as seen. As diseased stems and foliage contain the resting spores, all such material should be gathered together and burnt or deeply buried. The old material should on no account be thrown on to refuse heaps. *W. G. Smith.*

## Florists' Flowers.

### SEASONABLE NOTES: THE HOLLYHOCK.

THE plants that have been propagated by cuttings or root grafting since January 1 may not yet be ready to be planted out. It is not well to plant them out too hurriedly. When the small plants are fairly rooted they should be repotted into 5 or 6-inch pots, and be gradually inured to the outside atmosphere. I place them in a cold frame, from which the lights can be removed, and the plants are ready to plant out, when they have rooted well into the pots, and the lights have been removed night and day for a week at least. The autumn propagated plants may be put out any time early in April, and it must be borne in mind that the main essential to success is a deep well worked soil, with plenty of rich manure incorporated with it. They are not very particular about the quality of the soil, but the young plants turned out of pots do not take kindly to a heavy clay. It is a good plan in such soils to dig out a spit or two, and fill up the hole with some refuse from the potting-bench, a much more kindly start will be made in this material. The old plants stand well in the ground all the winter if the frost is not severe. All our plants have been left out this season, and not one has short stable manure, and digging it in. When dry been injured. I am now giving them a dressing of weather sets in, I mulch round the roots, and water freely. If any traces of the *Puccinia* appear on the back of the leaves, let the plants be dipped in a strong solution of soft-soapy water and flowers of sulphur, after the diseased leaves have been picked off and burned. The sulphur and soapy mixture has the effect of destroying the fungus in its very earliest stages of development. Any red-spider that may be on the leaves is also destroyed. This is a troublesome pest in hot seasons, and quite destroys the leaves if it is not checked by frequent syringing.

### THE DAHLIA.

One of the easiest of plants to propagate, and grow on to a size for planting out, and yet I have had almost as many letters asking for information about the culture of it as about the *Auricula*. The single Dahlias having gained so much popular favour during the last few years, has been the cause of the double varieties being also sought after. The single type is best treated as an annual. A pinch of seeds sown in a hot-bed about the end of February will produce plenty of vigorous plants about the end of May. The propagated plants are rooted in a hot-bed during March and April. As soon as rooted they are removed to a house where the frost can be kept out; and when they are sufficiently inured to the cooler atmosphere, they may by the end of April be placed in a cold frame, and early in May be potted into 5 and 6-inch pots. In fine weather remove the lights from the frames; the object is to encourage a dwarf bushy form of plant.

### THE TULIP.

We do not in any way protect our plants, and yet it would scarcely be possible to see a finer growth than we have this year—the leaves are so clean and brittle: the last a sure sign of vigorous health. They are later than usual owing to the cold nights, but the

FIG. 87.—DISEASE OF SPINACH: PERONOSPORA EFFUSA.

*P. Hyoscyami*, viz., to 400 diameters. The spores or conidia of *P. effusa*, Grev., are ovate, very large, and of a very pale grey, or pale mauve colour, a bundle of four supporting threads or conidiophores are seen in the illustration emerging from the underside of the Spinach leaf through an organ of transpiration; three of these supporting threads are cut off in the illustration to prevent confusion. The ultimate little branchlets which carry the spores are curiously and abruptly recurved or bent down as if by the weight of the large spores or conidia.

To the unaided eye this mildew of Spinach appears as greyish effused patches on the under-side of Spinach leaves. It causes the leaves to become yellow and putrid, and Spinach is frequently invaded by the parasite all through the spring, summer, and autumn. The fungus is a common one and very destructive to the host plant. It is not confined to Spinach, but attacks several members of the *Chenopodiaceæ* (to which natural order Spinach belongs) and the *Polygonaceæ*. The parasite produces resting spores or oospores within the decaying tissues of the host-plant, and by means of these oospores the equivalent of seeds, which fall to the ground and hibernate, the pest main-

ground around the plants is quite dry, hence a few degrees of frost does not injure them in the least. By far the best protecting agent would be some glass lights placed over them to protect the blooms from frost and wet, as well as to prevent water from collecting in the axils of the leaves after rains, which freezes there, and does considerable injury to the plants. If the soil becomes too dry water with a small rose water-pot between the rows, and mulch the ground afterwards with decayed manure. *J. Douglas.*

## ORCHARDS ON FRUIT-SICK SOILS.

AN article which appeared under the above heading stated that there can be no doubt that the plan of going on from generation to generation planting the same kind of fruit trees on the same spot where others have stood is wrong, to which few will demur; but why plant the same sorts as those in favour a century back when there are so many improved varieties, and why on the same spots, when they might be placed a few feet farther either one way or the other?

As to fruit-sick soil, I do not think there is such a thing, as the roots of trees do not take possession of all the ground about them, or it would be useless planting woods more than once; but as it is, they are no sooner felled than other plants are put in to take the place of those cut down, or seedlings come up, and the same process goes on for hundreds of years, and the trees succeed simply because they have Nature's top-dressing, fallen leaves, and debris of other kinds, that rots and enriches the soil.

When orchards fail it is generally through the land being unsuitable, or because it has become impoverished through the grass being continually cut and not grazed, in which case the soil gets no manure, and it is not to be wondered at, under such circumstances, that the growth of the trees is unsatisfactory, or that they dwindle and die. Lichen is a frequent cause of ill-health in Apples, and this is brought on as frequently through poverty as from want of draining, proofs of which I have seen again and again, as in several places where I have seen them in that state there was not a drop of water near the surface for miles round. [Is not the lichen an indication of unfavourable conditions? Of itself it is, we believe, quite harmless to the tree, unless as a refuge for insects. *ED.*]

It seems a general idea that trees will not grow where trees have been before, as I remember quite well that when I came here, near thirty years ago, I was told the same thing; but I did not heed it, and as the Apples were all very old and cankered I destroyed the greater part by grubbing them up, and replanted. Before this was done, however, the soil was trenched as deep as it would admit of, and at the same time manured, and it would be difficult now to find any better or more healthy trees anywhere in the district, for they are clean in bole and branch, and carry fine crops of fruit.

To just dig a hole and stick in a tree where another has died out is a great mistake; if the young one is to do any good, the soil must be thoroughly broken up, and every old root picked out, for if these are left in they generate fungos, and nothing is more fatal to plant life than this. If a little fresh soil can be got to start the tree in so much the better; and if not, the turfy part, or that at the top, should be used, and after the roots are properly spread out on some of it they should be covered with the rest, and when the soil filling up is completed, the next thing is to mulch. To this I attach the greatest importance, as the plant is then placed in the most favourable condition it can be, for the manual mulching keeps out the frost, and renders the soil about the roots uniform by preventing the escape of moisture and heat.

If those who think they have fruit-sick orchards will treat the trees after this fashion, and give the trees enough light and room above, I do not think they will have reason to complain of any failing to grow and flourish in the way young Apples ought. *J. Sheppard.*

**BANANAS AT HAREFIELD GROVE.**—A light and airy span-roofed house, not over tall, and measuring some 25 by 18 feet, is devoted to the culture of *Musa Cavendishii* at Harefield Grove. The Musas were planted out on March 28, 1884, before the house was finished, there are four fine plants on either side, and they are now fruiting in the finest condition, some of the bunches being of a very large size.

## NARCISSUS TAZETTA, VAR. TREWIANA.

THE Tazetta group of *Narcissus* is very large and varied, and it would puzzle the ingenuity of the botanist to classify the several forms in such a way as to satisfy anybody but himself. In truth, the forms run so much one into the other, that accurate definition becomes impossible. The form we now figure from the collection of E. G. Loder, Esq., is one of the finest and best of the group, and is the

FIG. 88.—TREW'S NARCISSUS.

variety Trewiana, the *Hermione Trewiana* of Sweet, the *Narcissus Trewianus* of Gawler, *Bot. Mag.*, tab. 940 (sub. *N. orientale*), *Bot. Mag.* (sub. tab., 1298, description only). It is also the *N. grandiflorus* of Haworth. It is closely allied to the ordinary Bazelman major of the shops, but has larger flowers, fragrant, white, with a yellow cup.

## MATTHEWS' COMBINED STRAWBERRY TILE AND SNAIL TRAP.

WHEN the enterprising proprietor of the Royal Pottery at Weston-super-Mare turns his attention to the designing and manufacture of an article, be it an ordinary vase, a perforated Orchid pot, or a highly decorated work of art, he does not rest until he has completed his task, and is in a position to offer another boon to the horticultural world. The article which he now has to offer is not expensive, although

FIG. 89.—STRAWBERRY TILE AND SLUG TRAP.

it is ingeniously contrived, and is well calculated to answer the purpose for which it is intended. It is what Mr. Matthews terms a Strawberry Protector and Snail Trap, and is composed of two semicircular pieces of well turned clay, which, when fitted together, form a convex support for the foliage and fruit, while a bead underneath keeps the outside edges clear of the soil, and forms a cool secluded retreat for snails and like marauders. Now Strawberry tiles have been for some years before the public, but they are small and heavy, being neither more nor less than two solid blocks of burnt clay, with a semicircular piece cut out of the side of each to form,

when placed together, a square block, with a circular opening in the centre large enough for the collar of the plant. The tile manufactured by Mr. Matthews, as will be gathered from the accompanying illustration (fig. 89), is much higher and larger, and falls off from the centre at an angle which secures a comparatively dry surface for the fruit to rest upon in wet weather; moreover, being supported clear of the soil by the inner and outer beads, it attracts sun-heat, which produce an underlying stratum of warm moisture, at all times acceptable to the roots of the Strawberry. Being made in two halves the protectors can easily be raised from the ground whenever it is thought necessary to search for the depredators. Some two years ago, when on a visit to Weston, this newly designed tile was amongst other interesting articles placed before some horticulturists who happened to be present, and it struck some of them as being too flat, and lying close to the ground to answer the double purpose for which it was intended. This defect has been corrected, and at my request two were sent to Eastnor to undergo the test of a fair trial, where they have been in use up to the present time, and I am prepared to say they answer admirably.

So much for snails and Strawberries, so frequently found occupying the same bed, especially in cool, calcareous districts, for much as the silent depredator objects to lime in a caustic state, he evidently enjoys it in its primitive form. The use of the Strawberry tile does not, however, end here; on warm light soils subject to burning, and the sudden collapse of established plants, notably the *British Queen*, it is equally valuable in the prevention of splashing with gritty matter during heavy rain, and in keeping the surface roots moist and active during a continuance of hot dry weather. If in such a light and difficult Strawberry garden there are neither snails nor slugs to eat the finest fruit, the proprietor may indeed think himself fortunate.

From fruit we turn to plants and flowers. Every one knows a snail will travel a long way for a Christmas Rose, a Dahlia, or the dainty point of a Lapageria shoot; persevering indeed must the attendant be who succeeds in keeping his treasure safe; but aided by Matthews' tile the feat may be accomplished, as the enemy, foiled in his attempt, settles down under its shelter until the attendant can find time to despatch him.

There are other uses to which this neat article can be turned, such as protecting newly planted trees or choice plants in the flower garden or on the open lawn, where a ground covering of some kind is required, and ordinary mulching may be objectionable. But sufficient has been said to show that the improved Strawberry tile may be turned to many uses in every garden beyond the purpose for which it was originally designed. *W. Coleman.*

## FRUIT NOTES.

**THE INFLUENCE OF SOIL AND SITUATION.**—I think the Apple Congress was justified in placing King of the Pippins at the top of the list. I will name one or two facts that have come under my own observation in reference to this variety. In the gardens here there is a tree that has been planted from fifteen to twenty years. The soil is a strong loam resting on chalky clay. Now the fruit from this tree never colour well, and as a rule is only of third-rate quality. In another part of the garden, some 55 or 60 feet higher, there are a number of younger trees, planted in a lighter loam, which overlies gravel. The fruits from these trees attain a high colour, and are of excellent quality. When living near Hounslow I had, in a grass field adjoining the gardens, a grand old tree of this variety which as a rule bore fine crops of a beautiful colour, but they were never of good quality, and after being gathered for a short time they always turned mealy, and became cracked in the rind. The soil was a deep rich loam. One more instance and I have done with this variety at present. In January of the present year I was offered an Apple or two by a stranger. He said I would find them good ones, and they were King Pippins. I brought two home, and found they were really true King Pippins, to all appearance from an old tree, being small, but very bright, clear, firm, crisp, and of rich flavour. To prove how much soil and situation has to do with other varieties I will instance another case or two. When living in Rutland, in the village of Exton there was a grand old tree of Golden Noble

which every year produced fine crops of large handsome fruit. They were so large and fine that the owner used to bring me some fruits every year, and taunt me by saying I could not grow any equal to him. The soil was a strong rich loam, with ragstone below. Here was an instance of Golden Noble being a very free bearing variety. In the gardens here we have fine healthy trees which only bear a very few—in fact, are anything but free bearers; while side by side are fine crops yearly of Cox's Pomona and other varieties. When living in Kent we could always depend on fine crops of Purple Gage Plums, grown as standards; as a rule they produced fine fruit of excellent quality—soil very strong loam, almost clay, resting on chalk. In these gardens we have a number of fine healthy trees of this variety, which blossom well, but for ten years we have had no fruit worth naming. We have much to learn on this subject, and my opinion is that hardy fruit cultivation in this country is only in its infancy, and that there is a grand future for this industry. We must study soil, aspect, and the most suitable varieties for each locality. I hope to return to this subject: in the meantime I am sure your readers would be glad to have the opinion of hardy fruit growers on this, to me, most interesting subject—namely, on the soil, aspect, and varieties of hardy fruits most suitable for their locality. *J. Smith, Mentmore, Bucks.*

## Notices of Books.

**Cactaceae Plants: their History and Culture.**  
By Lewis Castle. *Journal of Horticulture*  
Office.

WE have already noticed the publication of this little volume, but the opportunity of speaking of it at greater length according to its merits has hitherto been wanting. Now we may express both our surprise and our gratification at Mr. Castle's venture. Our surprise is to find that there are still among us enough amateurs to appreciate a much neglected class of plants—our gratification results from the fact that their wants are so well met in the present publication. For interest they yield the palm to no class of plants; for gorgeousness of bloom they have no superiors; for general facility of culture few can equal them, and yet they are certainly not fashionable, and young ladies who gush over Daffodils, enthusiasts who approach the confines of madness when they talk of Roses, or empty the purse of Crocus into the coffers of the Orchid merchants, pass with almost a shudder the quaint and grotesque form of the Cactuses, and apparently find little to admire in the glowing colours of the flowers. Professional gardeners hardly like them better: they are nasty things to handle, of no use for cutting, and not of much use for bedding out. Nevertheless, for the purposes of table or house decoration what is there more beautiful than well grown plants of Epiphyllum? For the most part their culture is simple, and some of the finest collections we have ever seen have been in smoky towns, or in cottage windows, where the facilities for successful cultivation were of the smallest. Mr. Castle's book opens with a brief—too brief—account of the structure, economy, and geographical distribution of the order. Although principally found, as Mr. Castle tells us, in hot dry countries, yet, from their conformation and inward structure, there are few plants better able to adapt themselves, within certain limits, to climatal variations. A wet, waterlogged soil is probably the condition they are least able to resist, and they dislike an over-moist condition of the atmosphere; and this is one reason why they often do better in cottage windows and dwelling-rooms than in greenhouses, where they are grown with other plants. As to temperature, it is certain that if they are kept dry they can bear a much lower temperature than is usually supposed. Mr. Loder's experience on this point is specially valuable. The by no means mild climate of Northamptonshire does not prevent many species from being cultivated in the open air, or with the protection of a cold frame. Mr. Castle, appropriately enough, alludes to the miniature Cactus-houses which are so attractive even to children of larger growth, and which may be seen in Covent Garden Market; but we could have wished he had condemned rather than have praised the bright red pots, which, diminutive as they are, are surely a great disfigurement.

After several remarks on cultivation, Mr. Castle

proceeds to give an account of the principal genera of the order, with a brief notice of those species most interesting to the cultivator. In so doing Mr. Castle has, very wisely as we think, followed the arrangement adopted in the standard book on the classification of plants—Bentham and Hooker's *Genera Plantarum*; but the author should have remembered that in so doing an alphabetical index became an absolute necessity. This necessity is not supplied. This omission is the greatest fault we can find with the book, but it is not one that need weigh very heavily on the author's conscience, for the number of genera is but small. We should gladly have heard more from the author regarding the movements of the stamens and the process of fertilisation, and further proof of his allegation that the pollen and stigmas are mature at the same time in the majority of the species. If this be really so, and not, as we suspect, merely apparently so, we are at a loss to conceive the use of the glorious coloured petals or the fragrance of the night-flowering Cereus. The movements of the stamens in the latter plant are very marked, without the aid of any external aid, such as a touch. In olden days it was naturally supposed that this motion of the stamens was a provision to secure the deposit of pollen on the stigma of the same flower, and so possibly it may be, but if so, of what use is the fragrance? So far as we know, no one has recorded the condition of the stamens and stigma in these plants since the publications of Darwin have shown the vast importance of cross-fertilisation. We commend the subject to the attention of Mr. Castle, and of those gentlemen who practise hybridisation in these plants.

Mr. Castle gives a list of illustrations of Cactaceae from the principal illustrated periodicals, but he has omitted to mention the original illustrations of these plants given in these columns from the collections at Kew, of Messrs. Thuret, Wilson Saunders, Peacock, and others, as well as from native sources. Mr. Castle's book is very well done, is published at a very low price, and should therefore commend itself to a large circle of readers.

## HOME CORRESPONDENCE.

**A Curious Hyacinth.**—I have in my possession a Hyacinth which has bloomed in water, but not thrown a strong spike. From the base and sides of bulb have sprung smaller bulbs, and in two cases the flowers are distinct from the main spike (which is rosy-red), while one of the side offsets has flowers of a pale creamy-white striped with rosy-pink, and the other has flowers of a pale salmon-pink. Perhaps some of your readers can offer some explanation of this freak, and give their own experience also, which would be very interesting. I would further ask whether it is possible to fix the sports from the offsets and propagate thereby distinct colours from the old bulb? [Yes, certainly, many varieties are so raised. *Ed.] E. Wilson Serpell, Plymouth.*

**The Narcissus Doubling Committee.**—The doubling committee are, I believe, obtaining sacks of soil from several of the gardens in which conversion from typical single N. Pseudo-Narcissus to double N. Telamonius is alleged to have taken place: these are to be used in the garden of Chiswick for making pockets of soil in which single wild Daffodils are to be planted. But the case is not exactly analogous to that of the fable of *The Leap at Rhodes*. Soil may be only one factor in effecting the change in which atmosphere and subsoil and other obscure agents may play an important part. As an illustration of this, I may mention that I have from time to time, in the last few years, received double wild Daffodils from Devonshire, sent by Mr. Archer Hind. These after a year or two in my soil became quite single. I have tried sending them back in this state to Devonshire,

where they flowered the next spring with quite double flowers. Last year Mr. Archer Hind sent me some of these redoubled bulbs back again, with a bag of the soil in which they had been redoubled. I carefully made a pocket of this soil, in which I planted six of the bulbs. They are now in flower, and the flowers are nearly single, and next year will probably be quite single. It is true that the change from typical Pseudo-Narcissus to Telamonius is a more remarkable transformation than this, but why do not the committee send a deputation to three or four of these gardens, which I have obtained leave for them to do, and investigate the circumstances for themselves? I have at present in flower in my garden here four sets of double Telamonius, all of which were, I am quite certain, from the good evidence given me, produced in four different gardens from typical wild single Pseudo-Narcissus, specimens of which were sent to me. I have only to-day heard of another instance, and have been told the name of a lady who convinced the late Mr. Harpur-Crewe that this change takes place. In a letter written not long before his death that gentleman told me that he had always thought the statement of single wild Daffodils becoming by cultivation large double garden Daffodils to be founded on error, but that lately he had been told by a lady that she frequently had effected the change in her own garden; and as he knew the lady to be an accurate observer, this information had induced him to change his mind. *C. Wolley Dod, Edge Hall, Malpas, April 4.*

**Rhododendron argenteum.**—There is at present in the conservatory here a good specimen of this plant in flower carrying three grand spikes of twenty-four flowers each. The flowers are pink in bud, gradually whitening as they expand, and the base of the tube inside is adorned by a rich dark purple blotch. Without flowers the noble foliage renders it a conspicuous object at all times. *M. Sullivan, The Gardens, Garden Reach, Champion Hill.*

**Red Cedar.**—In the article on Junipers, p. 370, *Gardeners' Chronicle*, for March 21, it is stated that the Red Cedar (*Juniperus virginiana*) is used in the manufacture of cigar-boxes. It seems to me that the writer has fallen into an error in this statement. I am not aware that cigar-boxes are ever made of Juniper wood; the so-called Cedar-wood from which they are made is the Cedrela odorata, known as the West Indian Cedar. This wood is imported in some quantities from Cuba to Hamburgh, for making cigar-boxes. The use of Juniper wood would certainly be objectionable, as the scent would impregnate the cigars contained in the boxes. *J. R. Jackson, Museum, Kew.*

**The Eucharis Mite.**—I have not any intention of occupying your space by a correspondence on the subject of the mites on the Eucharis, but perhaps I may as well say a few words to endeavour to prevent a confusion which is apparently arising. Any acarologist reading Mr. Wilkes' letter in a recent issue would understand immediately that the mites which that gentleman speaks of belong, not only to a different species, but also to a different family from the Rhizoglyphus found on the Trentham bulbs; but this probably would not be by any means so apparent to a botanist or gardener, and probably the disease of his plants and Mr. Macdonald's was equally distinct from that affecting the Trentham bulbs. It often happens that apparent differences of opinion arise from the fact that the various writers who suppose that they are treating of the same disease are really dealing with two or more. I do not profess to be an authority on Eucharis growing, but I certainly should not deny, and I imagine that no one would deny, the extreme probability that if they or other bulbs be too abundantly supplied with moisture, over-forced, or otherwise weakened or injudiciously treated, decay might set in, followed by the advent of such mites or other scavengers as perform the function of clearing away decaying vegetable matter; and, for all I know, this may be a more frequent cause of Eucharis disease than the Rhizoglyphus; but it certainly was not the cause in the cases of the Trentham and other bulbs submitted to me for examination. I cut the Trentham bulbs right through in various directions, and they were perfectly sound, not showing the slightest sign of decay or hypertrophy; but the Rhizoglyphi were actively engaged on their work of destruction in the interior of the bulbs, between the scales; this, indeed, is

what might have been expected, as they are not usually consumers of decayed matter, but have the good taste to prefer their vegetables fresh, although, doubtless, they would rather have stale food than none at all. *Albert D. Michael.*

**Badminton.**—In the account of Badminton the writer asks if the first greenhouses in England were put up at Badminton. I think I can show that almost the first were. In Faulkner's *History of Chelsea*, describing the Apothecary's Garden, *Evelyn's Journal* is quoted, and a passage occurs about going in 1683 to see the new mode of keeping plants through the winter by means of an ingenious arrangement of hot air and glass. I only speak from memory, "but I know," he adds, "that the foreman or overseer is likely soon to lose his place." The connection of the Beauforts with Chelsea was that their house stood in the middle of where Beaufort street now runs. This Beaufort House was the house Sir Thomas More lived at, probably Holbein also; and this was at one time called Buckingham House, from its connection with the Dukes of Buckingham. Now somewhere, perhaps in the same work, I have found quoted a list of plants given by the Chelsea Garden to the Duchess of Beaufort. Amongst these is specially mentioned a *Crinum*. When I was at Badminton some few years ago, I saw the hugest *Crinum* I ever set eyes on in all my life. The present Duke tells me it has been in his family for generations, and at some time they had connection with the West Indies; I think it is amiable, but it was not in flower. From the vast size of this plant I conceive it may have been part of a descendant of, or the very bulb given by or shared with the Apothecaries' Garden in about 1685, when the Beaufort family had a horticultural Duchess and lived at Sir Thomas More's house in Chelsea. Should this meet the eye of his Grace, I daresay he will kindly throw some light on the subject. As the *Crinum* could not have been grown without a greenhouse, it certainly points to 1685 or thereabouts being the date of the erection of greenhouses at Badminton, a year or so after the first experiments at Chelsea. *Frank Miles.* [Ray, in 1684, mentions the house in the garden at Chelsea as being heated by hot embers put in the floor.—ED.]

**Herbaceous Phloxes.**—*Apropos* of these Phloxes and your correspondent "A. D.'s" remarks at p. 385 respecting them, it is obvious that my note at p. 55 of the issue for January 10 has escaped notice, to which I now refer him, where he will probably find something of service in my concluding remarks of the note in question. I am under a partial promise of making some observations as to the various means of employing them, and which I will now do as briefly as possible:—From the rootstock of the great majority of the varieties of this section numerous strong shoots will now be issuing, and to ensure fine heads of bloom in comparatively small pots, these may be secured without further delay; cuttings, such as are strong and robust, of about 4 inches in length are the best; these may either be severed with a knife, or stripped off by the heel, in either case if subjected to slight warmth such as may be had in an ordinary dung frame, they will soon and freely emit roots not only from the base, but the sides of the cuttings also. Any ordinary vegetable soil made rather sandy will suit them, and according to the number required may be inserted in single pots, or several in a 5-inch pot. Whatever course is adopted now, it will be well to observe that if required for conservatory decoration the plants should only be placed singly in their flowering pots, for, like the *Chrysanthemum*, it is almost impossible to over-feed them when well in growth. By rooting them in a dung frame good vigorous plants are the result; indeed, they thrive to a remarkable extent thus treated, evidently feeding upon the humid atmosphere of the frame and the ammonia arising from the manure. When well rooted pot into 4-inch pots, keeping them close till fresh roots are formed, when air may be admitted to them; by the end of April these pots should be full of roots, when they may receive their final shift into 6-inch pots; when giving this shift use well enriched loam, not over sandy; plunging the pots out-of-doors in short stable litter, coal ashes, or any similar material. Keep well supplied with water, for these Phloxes are rare lovers of moisture during their growing and flowering season, and by doing this the foliage, which otherwise would be lost, will be retained, and which forms an important part. After

flowering they should be planted out, for if kept a second year, no matter how treated, they are sure to shed their lower leaves and look unsightly. By inserting successional batches of cuttings from the present time till the end of April a good display will be guaranteed for the embellishment of the conservatory till *Chrysanthemums* make their appearance, and even then their large and massive panicles form a pleasing contrast with them, to say nothing of the greater variety of bloom. Unlike the *Chrysanthemum*, however, they must not be stopped, for although you may get two breaks instead of one, you will most certainly sacrifice the finest head of bloom, as there are a great number of varieties it may be not out of place to cite some of the finest sorts; and as there are plenty of good kinds of dwarf growth, I will confine myself to them. The best whites of this group are Queen of Whites, 2 feet 6 inches, with monster panicles of the purest white, the individual flowers being large too; Thomas Chisholm, 2 feet, a very good variety; Independence, 2 feet, very fine heads of bloom—this variety is occasionally streaked with pink; and *Virgo Marie*, pure white, trusses large and compact, and about 3 feet high—this height, however, is rarely attained the first season in pots. Of crimsons and shades near akin may be mentioned *Coccinea*, 2 feet high, colour rich vermilion-crimson, the most conspicuous among dark Phloxes; and *Madame A. Verschaefelt*, 2 feet 6 inches, colour rich crimson, suffused with purple. Among whites with conspicuous centres are *Edith*, 2 feet; *La Candeur*, 2½ feet; *Mdlle. Marie Lacroix*, 2½ feet; and *Virgie Marie*, 2½ feet. Of rose shades *Roi des Roses*, 2½ feet, is very fine—an excellent variety for masses or lines; *Mons. Joseph Heine*, 2½ feet, bright salmon-rose; *Moos. Taillard*, 2½ feet, salmon-red, trusses very large and freely branched; *Rêve d'Or*, bright salmon, 2½ feet; *Liervalli*, 2½ feet, salmon-red, centre crimson; *Lothair*, bright glowing scarlet, a most beautiful variety, 2½ feet; *Amabilis*, rosy-salmon, 3 feet; and *Aurore Boreale*, 2½ feet, rich salmon vermillion. *Menotti* is perhaps one of the most pleasing and distinct of all: it is a free and continuous bloomer, 2 feet high, and very large trusses, colour pleasing delicate rosy-lilac distinctly lined white. *Gloire de Poiteau*, 3 feet, has rosy-lilac flowers; *Mons. Malet*, 2 feet, has clear lilac flowers with lilac-purple centre, and large well formed trusses. These are, among the best dwarf kinds, some of the most conspicuous, all well adapted for pot culture, and grown as such form excellent decorative plants. Not the least feature in connection with these handsome flowers is that they are fragrant, and in some cases remarkably so—a not overpowering fragrance, however, still it is sufficient to arrest the attention of the would-be passer-by, and when planted *en masse* are among the most attractive of garden plants. *E. Jenkins.*

**Frost.**—At Ulverstone 9° of frost (see p. 446) would seem to be somewhat out of the way; here we have only had six nights without frost from March 1 up to present date, April 7, from 6° to 16° up till the last three mornings, when we had only 3°. April was ushered in with 12°. Everything in the shape of spring flowers has been killed, even the common *Crocus* could not stand it. *F. Bedford, Straffan House, Co. Kildare.*

**Proposed Foresters' and Gardeners' Benevolent Institution for Scotland.**—I feel inclined to indorse all that has been said by Mr. Rust on this subject at p. 416. The Gardeners' Royal Benevolent Institution already exists, and is also prosperous, and is moreover sufficiently cosmopolitan in its character to embrace the whole of the United Kingdom, *i.e.*, Scotland and Ireland, as well as England. The pensions are now raised to £20 and £16 per annum, and although most of the present pensioners appear to reside in England a perusal of their names suggests a northern origin for a large portion of them. The Institution has the patronage of the Queen; its affairs are efficiently managed by a committee of some twenty-four members elected from the subscribers, one-third of them being practical horticulturists. It has long been a matter of merited reproach to practical gardeners that they have not rendered that support to the Institution which they were reasonably expected to do, and which they might doubtless have done, knowing, as they do, that it exists exclusively for their benefit. The line which separates the forester from the gardener can hardly be a hard and fast one, or if it exists at all it

will doubtless be willingly obliterated. So instead of introducing a new and rival institution which will require considerable time, trouble, and expense to fairly develop, let foresters and gardeners in all parts of the country cordially unite in rendering support to the old and existing institution, which is a "going concern," with an ample capital safely invested, and from which they may expect to derive benefit, should they ever happen unfortunately to require it, or if not so much the better for them, and they will nevertheless secure that which is of more value than pecuniary assistance, *viz.*, a knowledge that by their means some less fortunate man or woman have had their most pressing needs supplied, and the too often rough and downhill path made more endurable. *P. Grive, Bury St. Edmunds.*

**Philesia buxifolia.**—Years ago, when this now somewhat scarce Chilean evergreen was first introduced, it was treated as a greenhouse plant, succeeding in the temperature of a cool-house when potted in well drained fibrous peat. At the same time it was demonstrated by the late Mr. James Veitch that having lived in the open borders at the Exeter Nursery for three winters there was every probability of its proving thoroughly hardy, though some contended that the climate of Devonshire could not be taken as indicating what would exist in the open air in colder parts. Messrs. Backhouse & Son, at their York Nurseries, have treated it as a hardy plant, and with marked success, planting it in well drained and partially sheltered positions, using a compost made up of deep peat, chopped sphagnum, and an abundance of white sand, and in this it is found to run freely. What a lovely neglected plant it is, with its neat shrub-like growth, the habit being close and erect, the flowers large, solitary, and of a delicate waxy-rose colour, resembling those of *Lapageria rosea*. Small plants only a few inches high will produce flowers. It is time it was rescued from the comparative oblivion to which it is now consigned. *R. D.*

**Lily Growing in Scilly.**—The suggestion made on p. 408 to Mr. Dorrien Smith, that he should devote a portion of his insular domain to Lily culture, has already been taken up by him to some degree. Although at present his main object is *Narcissus* growing, large patches of ground are planted with *Amaryllis Belladonna*, the *Guersey Lily*, and *Lilium candidum*. Last August, and during the first ten days of September, I had the pleasure of seeing the *Belladonnas* in flower. The number of flowers on the scape was a proof that the soil is specially fitted by the will of the gods for bulbous plants; and not only in truss, but also in individual size, were these Lilies superior to any I had ever seen elsewhere. In this opinion two well known and experienced horticulturists, who were visiting the island home of the *Narcissus* at the same time, concurred. *Calla æthiopica*, again, may *en vérité* be described as growing wild in a marshy portion of the Treco Abbey grounds; and in Mr. Trevillick's garden on St. Mary's Isle it increases in a wonderful manner. This grower last year lifted and sent away to England hundreds of roots in the beginning of September at an extremely low price. Mr. Dorrien Smith could well be pardoned if his affections were alone centred in Daffodils, but it is a great pleasure to be able to report that he is cultivating *Ixias*, *Irises*, and Lilies. *C. A. M. Carmichael.*

**Imported Orchids.**—I have just read the remarks of Mr. Baines on p. 416 on the importation of large masses of Orchids. I fancy growers are much indebted to collectors and importers alike for the extreme care taken to send over the plants at all seasons in such capital condition. The recent importations of the white forms of *Lælia anceps alba* were very fine indeed. The best way of treating them has been fully discussed, but whether we have arrived at a definite conclusion I am not prepared to say. Two things must be considered; first, the state of the plants when they are placed in the hands of the cultivator, and, second, the season of the year at which they arrive. I have usually potted all *Lælias* and *Cattleyas* in pots filled to the rim with clean potsherds, and as soon as they started to grow, and formed roots, they were repotted in the usual compost of peat, sphagnum, &c. We tried a lot last year potted in the usual way as soon as they were received, the compost being kept rather dry. I fancy this dryness was carried to excess, as the plants did not start

strongly. This year we potted the white *Lælia* anceps in the usual way, and watered the compost freely from the first, and never did imported *Lælias* look better. The plants were received early in February, with green leaves; these they lost mostly, but the bulbs kept very plump; now they are breaking freely, and making plenty of strong young roots, as well as promising to make strong and probably flowering growths. Many plants of these *Lælias* were sent to different parts of the country. It would be interesting to know how they have succeeded under the different treatment they have been subjected to. I have seen such plants left in the houses with the roots exposed for days before potting them. Sometimes they are tied to blocks, and occasionally they pass through the form of being hung up by the heels for a time. It is highly important that we should ascertain the best method of procedure, and having done so, no delays should take place in potting the plants and getting them into the desired temperature. *J. Douglas.*

**Hoya globulosa.**—This charming and distinct species of the Honey-plant, or Wax-flower, is now to be seen in good condition in one of the stove-houses at Gunnersbury Park. It is a vigorous grower, and appears to flower freely. Mr. Roberts has his plant trained in a globular shape, and it promises to be an object of beauty for some time to come. The flowers are of a bright straw colour, the corol protruberances white, the interstices of a shining brownish-pink. It appears to have been discovered by Sir Joseph Hooker as far back as 1849, though it did not come prominently before the plant-loving public until it was exhibited at one of the meetings of the Royal Horticultural Society in 1880 by the Cranston Seed and Nursery Company, and awarded a First-class Certificate of Merit. It is a little unpleasantly fragrant, but that is not perceptible unless an effort is made to discover it. *R. D.* (See fig. 115, *Gardeners' Chronicle*, June 3, 1882.)

**Brussels Sprouts.**—I have seen a good number of so-called strains of Brussels Sprouts from time to time, and whilst most ready to admit that some thoroughly careful selections have been more true to character than others, yet I have never found any material divergence between the best plants of any number of strains. Nothing is more easy than to secure a good strain if any one will but seed from only one or two of the very best plants to start with, but it is of the first importance that no other kind of Brassica should be blooming near. If, the second time of growing for seed-stock, the plants are well rogued it may be taken for granted that the strain will prove to be equal to the best, and the man who has taken so much pains to obtain that strain true may be justified in calling it after his name, but it will be a grave error if he assumes that it is superior to or differs materially from the strains obtained by half-a-dozen or even a score of others who have taken equal pains to secure the same results. I have seen splendid breadths of Brussels Sprouts out in the market fields, all true as could be and of first-rate quality, quite equal to the best found in private gardens, yet not classed as any one's strain, but simply the product of good imported seed. I have found, too, that a good plant of these Sprouts is more often the result of careful planting and cultivation than anything else. Two very large breadths, put out in two fields here, but from the same sowing, would by the majority of gardeners have been classed as of distinct strains if they had been seen by them, so diverse in appearance were they. Yet in the one case the soil had been subsoiled, and the plants were several inches taller and altogether more even and productive than in the other field, where the soil had been ploughed only and the bottom had not been broken. To quote the words of the grower, "that subsoiling in a dry season was worth far more than a dressing of manure." But there seems to be an assumption abroad that certain strains of Brussels Sprouts are marked by the production of exceptionally fine side heads. Is that really the case, or are these large Sprouts the product of gross cultivation? All the members of the Brassica family are gross feeders, and the Brussels Sprouts peculiarly so; but then the question is, whether for the production of nice firm moderate-sized side Sprouts very gross cultivation is desirable? When seed is sown in rows 3 feet apart, and the seedling plants thinned out to stand in the rows some 2 feet apart, the soil having been previously trenched deeply and

heavily manured, how can the plants be otherwise than coarse and the side Sprouts very large? But if the thinnings were planted out in fairly good field soil there would be no reason to complain then that the Sprouts were unduly big. No doubt big Brussels Sprouts are undesirable; we might almost as well have small Cabbages at once. Better have the plants to produce a pretty sample than Sprouts as big as cricket-balls. *A. D.*

**Pruning Orchids.**—"D. N." (p. 449) offers to show plants of pruned *Dendrobies* at a meeting of the Royal Horticultural Society, providing I will pay all the expenses connected with their being shown, and make good any damage sustained in transit. This is about as cool a piece of assurance as anything that has come under my notice. "D. N." altogether mistakes the position that the two or three associates who advocate Orchid pruning stand in. The burthen of proving that the representations they have made are correct rests on their shoulders, not on mine, and the collective body of Orchid growers who have tried and know the results of the practice, and disbelieve in it. The originator of the pruning doctrine gave it out to the gardening world as a new idea, whereas it is nothing more than an old practice abandoned for the proved injury that it effects. The exponent of the principle persistently refused to exhibit his plants, and now "D. N." comes down with an offer that he could not avoid seeing would not be accepted. Hitherto, when any one has made a real or supposed discovery in the cultivation of any plant or plants, they have been only too glad to substantiate the truth of their statements by bringing out examples of their practice anywhere or everywhere where they might be seen by those interested. Does "D. N." suppose that the one or two advocates of Orchid pruning are to be let off as exceptions from the general rule? Those conversant with and interested in Orchid cultivation, who have watched the tortuous proceedings that have been resorted to in advocating the system have good reason for disbelieving what has been said by the Orchid pruners, and "D. N.'s" offer does nothing to remove this. If "D. N." supposes that the flowering bulb of *Dendrobium* nobile sent to the *Gardeners' Chronicle* Office does anything to satisfy those who are sceptical about what has been said, he is very much mistaken. It simply proves that he has had in his possession the bulb in question, without giving a spark of supporting evidence to show whether the plant was pruned or unpruned when the said bulb was produced. According to the editorial description of the bulb, it is the growth of last season but one—1883—the lead from which it was cut will consequently now consist of nothing but the single bulb of last summer's growth, and the bud or young shoot that is now about to break or has broken from its base. What is required from the Orchid pruners is to at once exhibit some plants denuded of all their bulbs, excepting those produced last summer, like the lead from which the bulb noticed was taken; to have the plants marked so as to admit of unmistakeable identification, to take them back and grow them to the end of the season, and any time next autumn or winter, when it suits their convenience, to bring these plants forward again so as to show the character of growth they have made. Old hands at Orchid growing, like myself, who were cultivating these plants when their value in many cases was ten times that which it is now, tried the bulb cutting practice on all species that seemed likely to admit of propagation by pieces of the bulbs, with the obvious intention of increasing them that way, not with a view to benefit the plants in the way the Orchid pruners have been striving to make people believe in; but, in my own case, and that of every Orchid grower I have met with who ever tried the removal of the bulbs for propagation, the result was the same—a weakening of the plants so treated proportionately to the extent to which the bulb cutting was carried. *T. B.*

**GREVILLEA ROSMARINIFOLIA.**—There is a danger of this elegant plant, and once old favourite, falling away into the long roll of neglected plants. It can be seen in one of the frames in the Royal Horticultural Society's Gardens at Chiswick, producing at the points of shoots, thickly studded with simple leaves, tufts of bright crimson coloured flowers. A well grown specimen of this must be a charming sight, and were it now introduced for the first time it could scarcely fail of obtaining a First-class Certificate of Merit, for it is an excellent decorative subject. This and other species of *Grevillea* not less handsome will bear the hardest greenhouse treatment. (See *Gardeners' Chronicle*, fig. 24, April 22, 1876, p. 529).

## Reports of Societies.

### TORQUAY HORTICULTURAL: March 26.

THE spring exhibition of this Society was held on the above date in the Bath Saloon, occupying the large hall and a large ante-room. The numerous classes were well contested, and the quality of the exhibits showed a marked improvement on former years. Several of the nobility and gentry in the neighbourhood and the nurserymen sent good collections, not for competition—a fact that indicates an increased interest in the Society, which we trust will be lasting, especially as the committee have worked hard to bring together good floral displays for the benefit of the Torquay residents and visitors.

For nine stove and greenhouse plants, Mr. H. Yelland, gr. to Colonel Campbell, Villa Como, Torquay, was 1st. He had a splendidly flowered specimen, of *Rhododendron* Gibsoni, *Azalea* Reine des Doubles and Prince Albert, also very fine specimens and well flowered; and a gigantic plant of *Phormium tenax* var. *variegata*, a plant that would thrive well outside in this neighbourhood. 2d, Mr. Cole, gr. to W. B. Fortescue.

Six stove and greenhouse plants.—Lady Macgregor was awarded 1st prize (H. Damerel, gr.); 2d, Mr. J. Tucker, gr. to G. Price, Esq., Barcombe, Paignton.

Six *Azalea indica*.—1st, Mr. Yelland, who had three remarkably well-flowered specimen and healthy Model Bride and Duc de Nassau, and three lesser ones—Duchesse de Nassau, Flag of Truce, and Lady Poltemore, a splendid white; 2d, Mr. J. Tucker, who also staged some very fine plants.

Twelve Hyacinths.—These formed one of the features of the exhibition; better Hyacinths have never been staged than those put up this year. The 1st prize was awarded to Mr. B. Richards, with a very superb and even collection; 2d, Mr. F. Ferris; 3d, Mr. J. Sloman, all with excellent spikes of bloom.

Messrs. Veitch & Son, of Exeter, staged a very choice collection of flowering plants, including many varieties of Orchids, *Dendrobium Wardianum*, crassinode, nobile, and Pierardi; *Phalaenopsis Schillerianum*, *Cypripedium* Boxall, and many seasonable stove and greenhouse flowering plants. Their Hyacinths were quite an especial feature, being fine compact spikes and beautiful colours, the foliage being dwarf and healthy. *Czar Peter*, a lovely pale blue; *Duke of Connaught*, dark blue; *Marchioness of Lorne*, a splendid yellow; *Lord Derby*, blue; *Garibaldi*, dark red; *King of the Blues*, always good, were a few of the best, and most certainly the best in the exhibition.

Mr. Smaile, Philips, Curtis, Sandford & Co., Horn & Sons, Burridge, of Paynton, nurserymen of the neighbourhood, all contributed fine collections of decorative plants, which greatly enhanced the attraction of the show. The Earl of Kinnoul (gr., Mr. A. Browning) staged a splendid group of miscellaneous plants, not for competition, including many fine specimens of Orchids, *Phaius grandiflorus*, with twenty grand spikes on *Phaius maculata*, with its beautifully mottled foliage and yellow flowers; *Dendrobium Wardianum*, nobile, *cerulescens*—fine specimens of each, and well grown crassinode *Barberianum*, one or two fine specimens of *Anthurium Scherzerianum* majus, and stove and greenhouse foliage and flowering plants together made a very nice display. An extra prize was granted this collection, and highly deserved the notice taken of it. *W. C. P.*

### PAISLEY FLOWER SHOW: March 26 and 27.

In the George Clark Town Hall one of the most striking exhibitions of plants and flowers took place lately which for quality and style of exhibition put the greater show in St. Andrew's Hall, Glasgow, completely in the shade. Horticultural activity seems to be moving in the direction of Paisley if we look to the character and quality of the exhibits displayed. Unfortunately there does not seem to be the patronage displayed in the West of Scotland for flower shows. The hat, vulgarly speaking, has to be sent round to keep most of them alive, but this show deserves more than a cursory notice. In the magnificent hall fronting the orchestra the exhibition of Mr. Archibald Coats, put up by his gardener, Mr. Beveridge, deserved unqualified praise. The plants, if they had room enough, would have covered a rod of ground, and as they were they commanded universal admiration. The chief plants consisted of Fan Palms, Cycads, and other Australian and New World plants of the greenhouse, and were intermixed with finely bloomed *Azaleas*, *Rhododendrons*, and miscellaneous flowering plants, giving a blaze of colour, but toned down with the elegant foliage of those cool arching *Kentias*, the upright-fronded *Dasylirions*, with their chaffy-looking points, and the edges of the leaves bristling with spines; then a goodly assortment of choice Orchids, mostly small plants, but such as in time must render this collection notable; then a fringe of the feathery-like *Spiraea*, with the silver and green *Isolepis* drooping down the front of the raised platform.

Flanking this exhibit at right angles was a table from Mr. Stewart Clarke, M.P., whose gardener, Mr. Henderson, certainly put up as fine a collection of specimen plants as we have seen at any exhibition in the three kingdoms. His large Palms—as large individually as would fill a good-sized greenhouse—gave a tone to the whole, and his immense specimen *Azaleas*, crowded with flowers, set under the shade of these Palms, were simply superb. His Orchids, which formed quite a feature in the exhibit, were not small bits, as one I

accustomed to see, but masses of pseudobulb and bloom. No finer *Coclogyns* could be put upon the table, and they were smothered with their white bloom. This appears to be one of the best commercial Orchids in commerce, and supposing there are lots of them in the country, the demand for fine specimens has not even in these times ceased. Ward's Dendrobe, with its soft-tinted sepals and petals and glorious orange-blotched labellum suspended amongst the group, elicited general admiration.

Mrs. Coats sent an excellent assortment of plants, which her gardener (Mr. McDonald) put up to the best advantage. Chief among the lot were specimen *Camellias*, *Palms*, *Rhododendrons*, *Azaleas*, and such-like plants, fringed with a grand lot of Lily of the Valley, and fringed at the edge with a decoration of evergreens; altogether the exhibit was impressive, and with the others helped to make the hall such a sight as those who saw it cannot easily forget. Messrs. Ireland & Thomson, Edinburgh, sent a small lot of choice Orchids, chief among them being the flamed *Lælia elegans*, several good *Odontogloss* and *Cattleyas*; and Mr. Peter Mackenzie had a very attractive table of bulbs.

The miscellaneous exhibits were much above the average, and the show as a whole would bear comparison with any one in the kingdom.

## ROYAL CALEDONIAN HORTICULTURAL.

THE annual spring show of the Royal Caledonian Horticultural Society was held in the Waverley Market, Edinburgh, in splendid weather, on Wednesday and Thursday last, and was in every respect the most successful that the Society has yet held at this season of the year. The spring shows of the Society were begun in 1855, when the prize-money amounted to only £22, but this year premiums to the value of £339 were offered, the total for the four shows held during the year being £1110—a sum which is not exceeded by any other Society. The entries showed a great increase on those of former spring shows, numbering 640, as compared with 497 in 1884, 471 in 1883, 519 in 1882, and 373 in 1881. No better place for a horticultural exhibition can be found than the Waverley Market, which allows a full display of the different exhibits, affords a pleasant promenade for visitors, and is in the centre of the fashionable thoroughfare of the Scottish metropolis. Full opportunity was taken of its resources by the committee of management, and Messrs. Angus McLend, David Mitchell, and David Thomson, who had charge of the arrangements, deserve great praise for the effective manner in which the various tables were displayed. The effect when seen from the gallery was very pleasing, the colours of the numerous plants being blended in an artistic manner.

A novelty in the show was the illumination of a dining-table by the incandescent electric light, shown by Messrs. John Mitchell & Son, cabinet-makers, Edinburgh. In the pavilion in which the electric light was shown, Messrs. Todd & Co. exhibited about twenty-five different varieties of the now fashionable *Daffodil*. All the plants shown were forced, and they could not, taken as a whole, have been desired to be seen in better bloom. In the centre of the commodious market the bandstand was decorated by Messrs. R. B. Laird & Sons with a magnificent collection of greenhouse *Rhododendrons* in bloom, from 3 to 12 feet in height, and at rich colours. Exotic *Palms* were also displayed round the stand, the groundwork being made up of small flowers in pots—the whole forming a very attractive centrepiece to an unusually fine display of floriculture.

A striking feature of the show was the splendid display of Orchids, *Azaleas*, *Roses*, and *Rhododendrons*, which were shown in great force. The number of Orchids in competition was, indeed, about quadruple that which has been seen for many years. The prize for the best table of plants was gained, as last year, by Mr. Buchanan, Oswald Road, Edinburgh, with a beautifully arranged table of mixed exotics, including a fine lot of Orchids in bloom, *Crotons*, *Ferns*, &c. His collection comprised some excellent specimens of *Dendrobium Wardianum*, *Odontoglossum Halli*, *O. triumphans*, and *Cattleya Trianae*. The prize hardy spring flowering plants were also a very neat collection. *Azaleas* formed a magnificent display, and their brilliant colours and great profusion of blooms did much to enhance the value of the show. Mr. Paterson, Milbank, who has been 1st in this class for several years, was again well to the front with a group that was far in advance of his other exhibits, both for richness and density of bloom. His lot included the white striped *Iveryana*, *Model*, *Duchesse de Nassau*, and *Roi Leopold*. Mr. Paterson was also 1st for six stove or greenhouse plants with some finely bloomed specimens, his lot being made up of two *Azaleas*, two *Ericas*, an *Acacia*, and an *Anthurium Schotterianum*. The *Azalea mollis* formed an interesting feature of the show, their light delicate colouring being much admired. (Mr. Buchanan's 1st prize six Orchids comprised a very fine *Cymbidium eburneum*, with about twenty spikes; *C. Lowi*, *Dendrobium thyrsiflorum*, with ten spikes; *D. nobile*, *Vanda tricolor*, and *Ada aurantiaca*. Mr. Curry's 2d prize group included a well-flowered *Trichopilia tortilis*, *Dendrobium speciosum*, and *D. nobile*. Mr. Cockburn's 1st prize three Orchids were composed of a *Phalenopsis Stuartiana*, *P. Schilleriana*, and *Angraecum citratum*, with five spikes of bloom.

There was a good display of *Ferns*, and the graceful beauty and delicate texture of the fronds were much admired. The 1st prize four exotics included very fine pieces of *Davallia Mooreana* and *Leucostegia immersa*. The *Adiantums* comprised some very pretty specimens, the 1st prize lot consisting of *A. gracillimum*, *farleyense*,

and *cuneatum*. The foliage plants were a clean and tidy lot, and included some excellent specimens.

Hardy spring flowers made an imposing display. *Cinerarias* were both numerous and good; and *Cyclamens* were shown in the best of bloom. Some nice flowering *Deutzias* were among the prize-takers, and *Camellias* also made a good display. Tree *Mignonette* was shown very tall and well cultivated; and *Pelargoniums*, though not numerous, were of great excellence. *Hyacinths* made one of the best exhibitions of this flowering bulb that has been seen in Edinburgh, and the 1st prize lots were characterised by great depth of flower, uniformity in bloom, and regular colour. *Tulips* and *Narcissus*, particularly the former, were a superior lot, being very even and well bloomed.

Of cut flowers there was a very fine display for the season of the year. *Roses* were especially fine, the *Maréchal Niel* still holding its place in popular favour, and some very handsome blooms of this variety were shown. *Camellias* and *Primulas* were an interesting feature of the show, though they did not bulk so largely as some other classes, and there were some very prettily arranged bouquets.

There was not a large display of Fruit, but what was shown was of good quality. There was a remarkably good show of *Strawberries*, both in dishes and pots, for this early period of the season, and the fruit was ripe and luscious. *Grapes*, though few in number, were of fine bloom and well coloured; and *Apples* and *Pears* formed a very creditable exhibit. The 1st prize baking *Apples*, from Maidstone, were of great size and beauty, and included among them *Elenheim Orange*, *Lord Derby*, and *Beauty of Kent*.

As might be expected, *Vegetables* were not a large show, but they were of very high quality. The local nurserymen made a capital turn-out, and their exhibits were of a very high class. There were only two competitors this year for the table of plants, and Messrs. Ireland & Thomson were deservedly 1st, as they have now been for eight years in succession. Their victory this year was most complete, as they were first in every class in which they had entered, numbering half-a-dozen. The special feature of their stand was the rich and rare display of Orchids in bloom, over 200 in number, with *Azaleas* and flowering plants in general, the whole making up a fine collection of valuable plants, with a beautiful mixture of colour. Their exhibit included about four dozen fine varieties of *Cattleya Trianae*, *Lælia elegans*, many large-flowering varieties of *Odontoglossum Alexandrae*, *Azalea mollis*, in splendid colour; and *Amaryllis*, in magnificent bloom. This firm was also 1st for *Rhododendrons*, with twelve of the finest specimens that have been seen in pots, there being over forty blooms on some. The 2d prize table was owned by Messrs. R. B. Laird & Sons, and was very tastefully laid out. The exhibits comprised *Cyclamens* with large sized blooms, a number of half-specimen *Azaleas* in full flower, including a standard *Azalea mollis*, two plants of the Countess of Haddington *Rhododendron*, a fine lot of *Hyacinths*, and the new *Asparagus tenuifolius*. The edging of the table was composed of *Scilla sibirica*, and the hardy white *Primula nivialis* intermixed with *Maidenhair Fern*. Messrs. Methven & Sons did not enter in the table competition this year, but they had a very fine stand on exhibition. Their collection comprised *Rhododendrons*, *Azaleas*, *Gauldre Roses*, *Dendrobiums*, and a fine lot of Japanese *Acer*s. The stand, which was laid out to display to advantage the great variety of flowering plants, was flanked at both ends with an excellent lot of variegated *Ivies*. Messrs. Dickson & Co., Waterloo Place, had also a good collection, including specimens of the variegated New Zealand *Flax*, Orchids of different kinds, a new seedling *Amaryllis*, *Cinerarias* of a good strain, and a fine collection of *Dendrobiums* and *Cypripediums*. The east end of the market was occupied by a large stand shown by Messrs. Gordon & Sons, Haymarket, whose specialities were *Roses*, *Azaleas*, *Palms*, *Mignonette*, *Lily of the Valley*, and *Richardia æthiopica*. They also exhibited a very superior pot of *Miles' Spiral Mignonette*, with beautiful spikes, some very good *Cinerarias* grown in pots, a number of hybrid *Primulas*, the Japanese *Primrose*, *Auriculas*, *Amaryllis Mendeli*, the scarce bulbous plant, *Lachenalia luteola* in nice flower, and some very pretty *Roses*.

## SWANSEA SPRING SHOW.

THE first show of spring flowers, held by an enterprising Society in Swansea on Thursday, March 26, was an entire success, both in the quantity of exhibits brought together, and from the way in which it was patronised by the public. The exhibition was held in the Drill Hall, which is a lofty and commodious structure well suited for such a purpose, and in the small hall attached; both places being decorated by the committee for the occasion, and much credit is due to the indefatigable Hon. Sec., Mr. Manaton. The most interesting feature of the show was the arrangement of circular groups of flowering and foliage plants on the floor of the Drill Hall, still giving sufficient space for promenading, while the sides of the hall were furnished with semi-circular groups from trade and other growers; and altogether the effect was thoroughly pleasing, and was well observed from the gallery at the end of the building, whence a bird's-eye view of the whole was obtainable.

For the best group of plants Mrs. Vivian, Singleton (gr., Mr. Harris), was awarded the 1st place, for a choice assortment of profusely flowered plants. This exhibit, which had a diameter of 15 feet, occupied the centre of the hall. Its groundwork was formed of *Hyacinths*, *Lily of the Valley*, *Spiræas*, *Deutzias* (species), *Adiantums*, &c. A good specimen *Cyrtaea dealbata* formed the centre of the group, and was supported by *Azaleas*, *Chorozemas*, small *Palms*, and Orchids, amongst which

were noticed *Phaius grandiflora*, *Odontoglossum Alexandrae*, and *Cattleya Trianae*, the flowers being relieved by graceful plants of *Cocos Weddelliana*.

Very tasteful groups, also in circular form on the floor of the hall, were exhibited by Sir H. H. Vivian, Bart., M.P., Park Wern (gr., Mr. Buckmaster); J. T. D. Llewellyn, Esq., Penllergare (gr., Mr. Warmington); and T. Cory, Esq. (gr., Mr. Lodge), who took the prizes in the above order. The collection of J. T. D. Llewellyn, Esq., contained some nice examples of *Primula sinensis* and a large plant of *Dendrobium nobile*, over 3 feet high and densely flowered, which attracted much attention. Plainly, lack of time to complete the arrangement of the many good things in this collection prevented its taking a higher place in the awards, which the individual specimens quite merited.

The trade groups do not require special note, being of the usual spring market plants, in fairly good form, tastefully disposed. In the smaller hall the exhibits that most call for notice were the 1st prize lot of cut flowers exhibited by Mrs. Vivian, a miscellaneous collection of fruit and vegetables by the same exhibitor, and the groups of *Auriculas*, species of *Primulas*, and *Polyanthus*, by Mr. Llewellyn. Amongst the cut flowers from Singleton were noted *Cypripedium Pearcei*, *C. barbatum*, *Dendrobium macrophyllum giganteum*, *D. nobile*, *Lycaste Skinneri*, *Odontoglossum Rossi majus*, *Vanda tricolor*, *Camellia odoratissima* (deliciously sweet-scented), *Rhododendron Edgworthii*, &c. In the fine collection of fruit and vegetables from Singleton were fine *Ne Plus Ultra Beans*, *Veitch's Spring Broccoli*, *Ivery's Celery*, *Exhibition Brussel Sprouts*, *Mushrooms*, *Parsnips*, good *Potatoes*, *Asparagus*, and *Seakale*; twenty pots of *Keens' Seeding Strawberry*, heavily fruited, and four bunches of *Lady Downes' Grape*, perfect in colour and finish.

The very interesting collections of insects sent by J. T. D. Llewellyn, Esq., and which were explained to those interested, deserved and attracted much notice. Choice *Camellias* and Indian *Rhododendrons*, included in a collection of cut flowers from the open, sent by Mrs. Vivian, were an unwonted feature, even in South Wales, at an exhibition. There were classes for all the ordinary spring flowers, such as *Hyacinths*, *Cinerarias*, *Deutzias*, *Spiræas*, *Azaleas*, *Primulas*, &c., and the exhibits of some of the cottagers were of considerable merit.

The show, which was open for two days, resulted in a financial success—a balance of £25 remaining after all expenses had been paid. This sum will form the nucleus of a fund with which it is hoped to re-establish a horticultural society in Swansea, and assuredly the good beginning made by the managing committee augurs well for still greater success in the future.

## KING GEORGE III.'S DESSERT FRUIT.

WHEN George III. was king, and made Weymouth a fashionable resort, he always had his table furnished with fruit from town. The head gardener had boxes made in two sizes of 1-inch deal, the largest box 2 feet long and 14 inches broad, the same in depth; the smaller 1 foot 9 inches long, 1 foot broad, and the same deep. These boxes were made secure by three iron clamps at each corner, and had a small iron handle at each end by which they were fastened to the top of the coach or waggon. These boxes were for *Melons* (which, by the way, could not have been very large), *Pears*, *Peaches*, *Nectarines*, *Plums*, and *Grapes*; for *Cherries* and *Currants* there were flat tin boxes to fit into the deal ones. A layer of long dry moss was placed in the bottom of the tin box, and then a layer of *Currants* or *Cherries*, next another layer of moss, and so on until the box was quite full; moss, of course, lay at the top, and when the lid was hasped down it shut so closely that there was not the slightest friction during the journey. Soft short dry grass was mixed with the moss at the bottom of the deal boxes, and the *Melons* being the most weighty fruit, were placed in a row on it, with some moss packed very tightly in between each *Melon*. The selected fruit was as nearly as possible of the same size, and every interstice was filled with grass and moss. Then came another layer of moss, and after that the *Pears* with more moss between and over them; next *Peaches* or *Plums*, but the *Grapes* always were put at the very top of all the other fruit, being well guarded from touching the lid of the box by moss.

The boxes were locked, and each box had two keys, one kept by the chief gardener, the other by the receiver, possibly by His Majesty himself. What a shame, I have always thought, that "Peter Pindar" should have so ridiculed the homely Farmer King. When I first knew Weymouth there was an old woman there, whom my cousin took an interest in; she had lived when quite a girl in the king's household, and used to relate many curious little traits of King George and Queen Charlotte to amuse the children: not that there would have been anything singular, in my opinion, in His Majesty's superintending the unpacking of his

own fruit, for a housemaid I had in Wales assured me that when she was in service at Mr. Ingram's her present Majesty often came down to that gentleman's house to see the fruit he had ordered in, and selected what she wished sent to the Royal table. Garforth said that Her Majesty, then a young wife, took the very greatest interest in the gardens and their produce. But what amused me most about the fruit packing for Weymouth was that the empty boxes were always most carefully returned, and the packing materials, moss and grass, taken out, well shaken out, dried, and used again and again. *Helen Watney.*

## ORCHIDS FOR AMATEURS.

(Concluded from p. 376.)

**THE FOOD OF THE PLANTS.**—I have already shown that plants derive a supply of carbon from the carbonic acid in the air; this, with water and nitrogen, forms the main food of plants, but some kind of salt is also needed. The horticulturist must supply the needs of his plants or he cannot succeed. It is true that four-fifths of the atmosphere is nitrogen, but this free nitrogen is incapable of being combined by living plants with any other substance. Ammonia or its salts are the chief if not the only sources of nitrogen with most plants, although some, as Mr. Darwin first showed, are capable of feeding upon animal matter, and are even supplied with special arrangements for capturing and digesting insects: such are Venus' Fly-trap (*Dionæa*), the Pinguiculas, the Pitcher-plants, and our own Sundews (*Droseras*). I have seen the *Droseras* in Australia black with dead insects. There are, however, exceptions to the general rule, and I know no Orchid which feeds in this way, although some may in their native country derive nourishment from dead insects lying amongst their roots, or from the manure the insects produce. Practically ammonia salts are the main source of nitrogen to the great majority of plants as well as to all Orchids.

### MANURES.

Every gallon of rain-water contains about half a grain of ammonia salts, and the great agricultural chemist, Liebig, calculated that this quantity per gallon is sufficient to nourish a forest of Oaks, or any other forest trees; but then it must be remembered that these shed their leaves, and the leaf-mould so produced supplies an abundance of ammoniacal salts to the roots. No doubt Orchids watered with pure rain-water would grow and flourish for years, but I doubt whether the supply of ammonia is sufficient for the full development of their powers of growth.

### ARTIFICIAL AIDS TO CULTURE.

Every cultivator knows the advantage of giving potted plants some form or other of artificial manure, and many growers of Orchids advise the addition of dry cow-dung to the compost in which *Cypripediums* are planted, but with the epiphytes much difference of opinion with regard to the use of manure prevails. Of course where the sweetness and openness of the compost is of the first consideration, the addition of manure or decomposing material in any form is entirely out of the question, so that all epiphytes must have a very meagre diet; except the carbon derived from the air and the ammonia from the water, they get no special food to stimulate their growth.

I have given great attention to this subject, which at once appears the most important to every one who looks at it from a scientific point of view. It is clear that manure must not be recklessly supplied, as these plants are very delicate feeders, still, in the tropics, vast numbers of insects exist, and many die on the decaying wood on which the Orchids grow. The wood itself supplies ammonia during its decomposition, and birds leave their droppings about the plants, yet it doubtless happens that many Orchids grow for years without producing flowers. We all know how much flowering exhausts the plants, and the production of fine flowers is the main object of the horticulturist. There are two methods by which Orchids may be stimulated to growth and flowering by artificial manures, and the longer I grow these plants the more convinced I become that a due supply of manure is essential to their well-being.

There is danger in giving too gross a diet. You may easily destroy the plants by an excess of manure in any form, but the plants will certainly deteriorate, and ultimately die with too little. How can nitrogen, the essential element of all manures, be supplied safely and supplied in sufficient quantities to get the most vigorous growth? That is the question to be answered.

### AERIAL MANURES.

I believe all the most successful growers know this necessity; many have their secrets, which they do not publish to the world; others tell all they know, and their advice is disregarded.

### THE FRENCHMAN'S SECRET.

I remember many years ago a French Orchid grower boasted that he had a secret which enabled him to excel his brother horticulturists. This boast made him very unpopular, and deservedly, but he never divulged his secret. I do not, of course, know what it was, but, like most secrets, I suspect it was something well known but disregarded. I can even guess what it was, and I shall now explain the method which he most probably believed to be known only to himself; although in reality it is well known, only very few practise it or recognise its utility. It consists simply in placing a few pieces of carbonate of ammonia on the piers supporting the pipes, not on the hot-water pipes themselves, but near them.

The carbonate of ammonia slowly evaporates, and is absorbed by the moisture in the pots or on the leaves of the plants. I use about a pound of carbonate of ammonia in a year, in this way, and I believe if I used twice as much in my small house, 20 feet by 12 feet, I should not exceed the requirements of the plants. I am quite convinced of its utility, not only on scientific grounds, but from observation. Whenever I have neglected it the flowers are less developed, poorer in colour and size, and the plants are less vigorous. The manner in which the roots of the plants cling to charcoal, which has an especial tendency to absorb the vapour of ammonia, suggests the advantage of feeding the plants in this manner. The quantity of ammonia I use—generally one or two fragments the size of a walnut or somewhat larger—does not produce a perceptible odour of ammonia, but is enough to give the plants the extra stimulus they require to grow them vigorously.

### SALT.

Another substance very important to the plants or at least to those which naturally grow near the sea, is common salt. This may also be applied safely as an aerial manure. Salt, in the presence of moisture, evaporates rapidly. The encrustations of salt on the windows of house near salt-works, and the perceptible taste of salt near the sea, is evidence of this. Salt in the air can be detected with a spectroscope. All the gas flames in my dwelling-house became fringed with yellow light one evening; I immediately took out my spectroscope and found a large quantity of salt in the air. I learned that the cook had spilt a quantity of brine on the hot plate in the kitchen. This gave me the idea of placing salt near the pipes in the Orchid house, and the result was that the air became quite like that at the sea-side. Working in the house makes your hands and face feel as they do at the sea-side, and I believe it is a great advantage to many of the plants, at any rate it is worth a more extended trial. I am convinced it is a most useful method of supplying salt, which is absolutely necessary to the plants.

No doubt many Orchids flourish far from the sea, and it may be objected that the use of salt in this way is not needed by them, but I have found no harm from its use, and soda salts are known to replace potash salts with many plants, and a deficiency of potash salts is very liable to arise under cultivation.

I attribute much of my success—and I feel that with the limited means at my disposal I have had considerable success—to the use of these methods. My friends often say to me that my Orchids seem to flower so much more freely than theirs do; no doubt continual attention has something to do with this, but the fact remains that all their attention often produces no flowers. Year after year I look for flowers on the same plants, and after once flowering them I feel almost certain that I shall not be disappointed; and I look for even greater success by a continuance of these methods. I am even getting bolder in the use of manures, and am adopting a method recommended by the Comte du Buysson, so far with success, the details of which I will give in my next article. *B. T. L.*

## ORCHARD HOUSE TREES IN FLOWER.

IF reference be made to p. 88 instructions will be found there for the general condition of the trees, fertilising the blooms, &c. In both the late and early houses the fruit has set well, the branches being quite crowded with it. This will necessitate a good deal of thinning out, but we can place the fruit regularly over the trees, and an even crop of fruit gladdens the eyes all through the season. It is mortifying to have to attend to a house full of Peach and Nectarine trees with half a crop, or perhaps no crop at all upon them, and to feel all the time that the trees might have been laden with fruit but for a slight inattention at the time they were in bloom. Another and quite avoidable occurrence is that of shy setting varieties with scarcely any fruit on them amongst other trees bearing a good crop. These shy setting varieties can be made to bear freely if the stigma of the flower is dusted over with the pollen of a free setting variety by means of a camel-hair brush. Another occasional source of failure with orchard-houses is caused by the want of any heating apparatus. As a rule the glass protection is sufficient to shelter the blossoms from any injury that may be caused by frost, but some seasons dull frosty weather is continued all through the flowering season, and there is not a chance for the pollen to develop sufficiently, owing to the dampness of the atmosphere, combined with a low temperature. If we could always depend upon bright weather to follow frosty nights the case would be different. The heating apparatus insures a crop, whatever may be the state of the atmosphere. Now that the fruit is well set it is quite necessary to fumigate the house with tobacco smoke, as a preventive of the Peach aphid, or to destroy it, if it is on the trees. The fresh compost in the pots is now thoroughly permeated with roots, the trees therefore require a large supply of water at the roots, and they may also be well syringed once or even twice a day in fine weather. The syringing maintains a healthy condition in the atmosphere, and prevents the advent of red-spider on the leaves. *J. Douglas.*

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, APRIL 8, 1885.

MONTH AND DAY.	BAROMETER.		TEMPERATURE OF THE AIR.					HYGROMETRIC DEVIATIONS FROM GLAISHER'S TABLE 6th Edition		WIND.	RAINFALL.

April 2.—Dull in early morning. Fine bright day.  
 3.—Fine day and night.  
 4.—Very fine day.  
 5.—Very fine day and night.  
 6.—Dull day and night.  
 7.—Dense fog in early morning. Very fine morning, dull afternoon.  
 8.—Fine day, overcast throughout, cold wind.

LONDON: Atmospheric Pressure.—During the week ending April 4, the reading of the barometer at the level of the sea was—decreased from 30.28 inches at the beginning of the week to 30.09 inches

by 5 P.M. on the 29th, increased to 30.36 inches by 5 P.M. on the 30th, decreased to 29.68 inches by 1 P.M. on the 1st, increased to 30.25 inches by 9 A.M. on the 3d, and was 29.91 inches by the end of the week.

The mean reading of the barometer for the week was 30.07 inches, being 0.21 inch higher than last week, and 0.15 inch above the average of the week.

**Temperature.**—The highest temperature in the shade in the week was 57°.8, on April 1; the highest on the 4th was 48°.5. The mean of the seven high day temperatures was 52°.4.

The lowest temperature was 28°.5 on the 4th; on March 30 the lowest temperature was 39°.3. The mean of the seven low night temperatures was 32°.7.

The greatest range of temperature in one day was 24°, on March 31; the smallest was 15°.2, on April 2. The mean of the seven daily ranges was 19°.7.

The mean temperatures were—on March 29, 41°.9; on the 30th, 47°.2; on March 31, 43°.4; on April 1, 47°.5; on the 2d, 42°.1; on the 3d, 39°.3; on the 4th, 37°.9; of these March 30 and April 1 were above their averages by 3°.5 and 3°.3, the rest were below by 1°.4, 0°.6, 2°.3, 5°.3, and 6°.9 respectively.

The mean temperature of the week was 42°.8, being 4°.7 higher than last week, and 1°.4 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 127°, on April 4. The mean of the seven readings was 119°.

No rain fell during the week.

**ENGLAND: Temperature.**—During the week ending April 4, the highest temperatures were 60° at Cambridge, 57°.8 at Blackheath, 57° at Truro; the highest at Sunderland and Newcastle was 48°, at Preston 49°. The general mean was 52°.5.

The lowest temperatures were 22°.7 at Cambridge, 22°.7 at Wolverhampton, 24° at Hull; the lowest at Plymouth was 34°, at Newcastle 32°, at Brighton 31°.5. The general mean was 28°.2.

The greatest ranges were 37°.3 at Cambridge, 29°.3 at Blackheath, 29° at Truro; the smallest ranges were 16° at Newcastle, 18° at Preston, 19° at Plymouth and Sunderland. The general mean was 24°.3.

The mean of the seven high day temperatures was highest at Cambridge, 54°.9, at Blackheath 52°.4, at Truro 52°.3; and was lowest at Newcastle, 45°.6, at Sunderland 45°.7, at Bolton 45°.8. The general mean was 48°.8.

The mean of the seven low night temperatures was highest at Plymouth, 37°.5, at Truro 36°.6, at Liverpool 36°.3; and was lowest at Cambridge, 29°.7, at Hull 31°.6, at Wolverhampton 32°.6. The general mean was 34°.5.

The mean daily range was greatest at Cambridge, 25°.2, at Blackheath 19°.7, at Hull 17°.7; and was least at Sunderland, 9°.9, at Liverpool 10°.3, at Newcastle 11°. The general mean was 14°.3.

The mean temperature was highest at Truro, 43°.1, at Plymouth 42°.9, at Blackheath 42°.8; and was lowest at Bolton, 37°.6, at Wolverhampton 38°.5, at Newcastle 38°.8. The general mean was 40°.4.

**Rain.**—The largest falls were 1.49 inch at Preston, 1.25 inch at Bolton, 0.97 inch at Plymouth; the smallest fall was 0.01 inch at Brighton, 0.10 inch at Cambridge. No rain fell at Blackheath. The general mean fall was 0.66 inch.

**SCOTLAND: Temperature.**—During the week ending April 4, the highest temperature was 54°.8, at Aberdeen; at Greenock the highest was 50°.2. The general mean was 52°.4.

The lowest temperature in the week was 29°.2, at Dundee; at Leith the lowest temperature was 32°.9. The general mean was 31°.1.

The mean temperature was highest at Edinburgh, 41°.8; and lowest at Dundee, 39°.6. The general mean was 40°.9.

**Rain.**—The largest fall was 1.45 inch, at Greenock; the smallest fall was 0.60 inch, at Paisley. The general mean fall was 1.05 inch.

JAMES GLAISHER, F.R.S.

**ROSE CECILE BRUNNER.**—A very beautiful Rose for decorative purposes, combining the foliage of the Tea Roses with the inflorescence of the R. polyantha, but with the inner petals rose coloured. It is said to be a seedling out of R. polyantha by the Tea Rose Madame Tartas, and is figured in the *Journal des Roses*, February, 1885.

## Enquiries.

"He that questioneth much shall learn much."—BACON.

**GRAPE BUNCHES DEFORMED.**—I should be glad if your correspondents could give me any information respecting the cause of deformed bunches in Muscat Grapes. Most of the bunches upon each rod are, like those I send you, deformed at the points, with a few exceptions, which are on very vigorous shoots and are showing good bunches. For the last year or two the Vines have not been entirely gathered until within a month of starting them again. I have wondered whether this has had anything to do with the deformed bunches. I am not sure if the spurs that are showing good bunches this year had any on them last or not. These Muscat Vines are growing in the early house, along with Black Hamburghs, the latter being very healthy and robust, but the Grapes are cut off them as soon as they are ripe. *J. F.* [The development of the flowers seems to have been checked. We find no insects in them nor any sign of disease. *ED.*]

## Answers to Correspondents.

**BOOK: F. B.** The *Flora of Hampshire*, published by L. Reeve & Co., 5, Henrietta Street, Covent Garden, W.C.

**BOOK ON GREENHOUSE MANAGEMENT: L. J. Jennings.** There is no one book that treats of the so-called "greenhouse plants" as such; but Thompson's *Gardeners' Assistant*, or B. S. Williams' *Stove and Greenhouse Plants*, will give you the information you require.

**COVERING FOR SEEDS ON A LAWN: J. V. B.** Peat is about the worst material you can use; employ rather heavy loam, finely sifted, and roll it down when dry enough.

**GREENHOUSE SHADING: H. H.** See our Notices to Correspondents last week. This mixture will wear well, only coming off as autumn approaches.

**GUMS: Josiah Elcombe.** Kauri gum, from *Dammara australis*; Red gum, from *Nanthorrhoea arborea*; Thus gum (frankincense), from *Abies excelsa*; Kino gum (African), from *Pterocarpus erinaceus*; Aboyana and India gum, from *P. marsupium*; Botany Bay gum, from *Eucalyptus resinifera*. Mira gum is unknown to us.

**INJURED LEAVES: E. S.** The leaves look as if they had been burnt by the sun when wet. The bleeding of the Willow will do no appreciable harm; the fluid is little but water.

**INSECTS: J. M.** One of the very numerous and most destructive family of the weevils. Trap them with pieces of Carrot or Potato, and destroy them.

**LILY OF THE VALLEY FAILING: A North-country Nurseryman.** You should communicate with the German Consul at the port of arrival, who will probably, be able to put matters right.

**NAMES OF PLANTS: IV. C. Stobart.** 1. A variety of *Odontoglossum gloriosum*; 2. *O. Halli tripudians*.—*W. Robinson.* *Oncidium ciliatum*.—*J. Trinder.* *Dondia epipactis*, an old-fashioned umbelliferous herbaceous plant.—*S. Cooke.* *Conoclinium lanthimum*.

**ODONTOGLOSSUM CERVANTESII: A. P. C.** A spike bearing ten blooms is an unusual occurrence, showing extra vigour and suitable culture.

**ROSE MARÉCHAL NIEL: Constant Subscriber.** This variety frequently dies off in part, or wholly, without any apparent cause, but possibly from some inherent weakness—"own root" plants and worked ones suffering alike. Layering strong shoots in small numbers annually will maintain the vigour of a plant for an indefinite time if combined with the application of fresh loam, crushed bones, and manure every year or two.

**SPOTTING ON LEAVES OF KENTIA: Kurt Wolff.** Will be answered shortly.

**TUBEROUS TROPÆOLUMS: W. H. W.** If these are to be planted now, stations should be prepared for them in a sunny spot, near a wall or fence. The ground, if good, should be deeply moved, and enriched with rotten farmyard manure. Do not turn the infertile subsoil to the surface in digging, or bad results will follow. Where the soil is not naturally good, a hole can be dug out 2 or 3 feet square, and be filled in with good loam and some manure, adding coarse sand if it appears too adhesive. The tubers can be planted after the soil has become consolidated by treading. T. pentaphyllum and T. tuberosum amongst the tuberous species, and T. polyphyllum and T. speciosum amongst those with fleshy creeping roots, like warm situations. All live out during our winters with hardly any protection over the roots. If pot-bound roots are received from a nursery, slightly disentangle the outside roots on planting.

**VINE BORDER: W. T.** Now that your Vines are removed from the border dig out all the old soil, inside and out, and make a new one with turfy loam, coarsely broken bones, and charcoal, the two last forming about an eighth part of the whole. Throw all together into a heap, and turn it several times to get the materials mixed together. Do not make it fine, but rather lumpy. Reform the bottom of the border with firmly packed brickbats, stone, chalk, &c., making a good

outlet drain, and over all a layer of coal-ashes rammed firm. Then after making up a border of sufficient width to hold the Vine roots and 2 feet deep, half inside and half outside the vinery, and treading it thoroughly, carefully lay out the Vine roots their full length, after pruning off badly wounded portions. The roots ought to be placed at various levels, from 1 foot to 4 inches from the surface. Then, after making the border level, water all thoroughly, and, before the surface gets very dry put on a mulch of partly decayed strawy manure to prevent loss of moisture during hot weather. Do not add to this mulch as it decays, for Vine roots are more benefited by the hot sun than they are by having the moisture retained in the soil, as that can always be given from time to time as it is found to be wanted.

\*. \* All communications intended for publication should be addressed to the "Editor," and not to the Publisher, or to any member of the staff personally. The Editor would also be obliged by such communications being written on one side only of the paper and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

FOREIGN SUBSCRIBERS sending Post-Office Orders are requested to send them to the Publisher of this journal, 41, Wellington Street, Covent Garden, and to make them payable to William Richards, at the Post-Office, Drury Lane, London, W.C.

## Markets.

### COVENT GARDEN, April 9.

The subjoined reports are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list weekly, and are responsible for the quotations. It must be remembered that these quotations are averages for the week preceding the date of our report. The prices fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the price at any particular date, still less can they be taken as guides to the price in the coming week. *EO.*

TRADE keeps very quiet; and with fair supplies, prices remain unaltered. *James Webber, Wholesale Apple Market.*

(POTATOS.—All markets 5s. to 10s. per ton lower, with a bad trade.

## SEEDS.

LONDON: April 8.—There is now a brisk consumptive demand for all the various seeds required for present sowing. Stocks generally are in consequence getting much reduced, and the tendency of values all round is against the buyer; prices, nevertheless, are still most moderate, no great advance this season being expected. Spring Tares exhibit no quotable change. White Mustard is firm. Rape seed continues scarce. Hemp and Canary seed move off at late rates. The trade for feeding Linseed is inactive. *John Shew & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

## CORN.

At Mark Lane on Wednesday trade showed a hardening tendency, but without any tangible revival of demand. For English red Wheats, of which there is but little offering, 1s. advance on the rates current this day week has been obtained, and on some descriptions of foreign 6d. advance has been realised, but the extent of the business is so small that the change is in a great measure nominal. Flour was steadier in sympathy with Wheat, but there was no appreciable change in value. There was no change in the value of Barley, Beans, or Peas. Maize was held for 3d. advance, but very little business done.—Average prices of corn for the week ending March 28:—Wheat, 32s. 6d.; Barley, 31s. 6d.; Oats, 20s. 9d. For the corresponding period last year:—Wheat, 37s. 7d.; Barley, 31s. 3d.; Oats, 19s. 6d.

## CATTLE.

At Copenhagen Fields on Monday trade was rather disappointing. Scotch cattle were short, but better prices were not currently obtainable. English cattle were a very good suitable collection, but met a very dull dragging sale; foreign beasts were more saleable. Sheep met a moderate demand, at about the rates of Monday se'nnight, and lambs sold slowly at the reduced quotations of that day. Calves hardly quotable, and no pigs on offer.—Thursday's trade was steady. There was more doing, at an advance of 2d. per 8 lb. Sheep sold slowly, and were without alteration in value. Lambs were scarce and dear. Calves sold at full prices. Pigs were without change.

## HAY.

The Whitechapel market report states that trade is very dull, with short supplies, and no change in prices. Quotations:—Clover, prime, 85s. to 107s.; prime second cut, 85s. to 105s.; inferior, 46s. to 75s.; hay, prime, 76s. to 95s.; inferior, 25s. to 60s.; and straw, 22s. to 35s. per load.—On Thursday there was a moderate supply on sale. The trade was fair for best qualities.—Cumberland Market quotations:—Clover, best, 90s. to 105s.; inferior, 60s. to 84s.; hay, best, 84s. to 92s.; inferior, 45s. to 75s.; and straw, 30s. to 34s. per load.

## POTATOS.

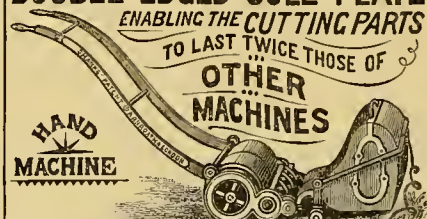

The Borough Market report states that very little is doing, and prices are unchanged. Quotations:—Scotch Regents, 85s. to 95s.; Kent ditto, 76s. to 90s.; Champions, 40s. to 60s.; Magnum Bonums, 55s. to 80s.; and Victorias, 70s. to 90s. per ton.

## COALS.

The following are the prices current in this week's market:—East Wylam, 15s.; Walls End—Tyne (unscreened), 11s. 3d.; Hetton, 17s. 6d.; Hetton Lyons, 16s.; Lambton, 17s.; Wear, 16s.; East Hartlepool, 16s. 9d.

**Government Stock.**—Consols closed on Tuesday at 97½ to 97½ for delivery, and 97½ to 97½ for the account. Wednesday's figures were 97½ to 97½ for delivery, and 97½ to 97½ for the account. Thursday's closing prices were 94½ to 95.

THE WORLD.

THE AUTOMATON.

## RANSOMES' LAWN MOWERS.

### THE "WORLD" LAWN MOWERS

are the best for cutting long grass, and are constructed on the American system with the special advantages of English materials and workmanship.

They are made in nine sizes, 8 to 24 inches.

Prices from 45s. to £10.

### THE "REVERSIBLE" LAWN MOWERS

are suitable for small gardens and borders. They roll the grass as well as cut it, and can be used either side upwards.

They are made in three sizes, 6 to 10 inches.

Prices from 27s. to 45s.

### THE "AUTOMATON" LAWN MOWERS

are the best machines for general purposes and gardeners' use. They leave no rib in the grass but produce a perfect surface.

They are made in eight sizes, 8 to 22 inches.

Prices from 55s. to £8 10s.

### THE HORSE-POWER MOWERS

are the best for Large Lawns, Cricket and Lawn Tennis Clubs. They are used on the Cricket Grounds of the Oxford and Edinburgh Universities and numerous Colleges and Public Schools.

They are made in six sizes, 26 to 48 inches.

Prices from £14 10s. to £32.

Complete Price *LISTS* may be obtained from any respectable Ironmonger, or

**PATENT**  
**WROUGHT-IRON TUBULAR**  
**HOT-WATER BOILERS,**

And others with SHELVES, and Hollow or Ordinary Cast-iron GRATE BARS;

**SADDLE BOILERS.**

With WATERWAY BACKS, and WELDED BOILERS, which are Specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c.

They are the neatest, cheapest, most effective, and durable of any extant.

The Tubular ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention. This pattern

Had the First and Highest Prize, a Silver Medal, Awarded to it at the Royal Horticultural Society's Exhibition, South Kensington, London, on June 3 1881.

The *Journal of Horticulture* of June 9 says:—

"HEATING APPARATUS.—A great number of boilers, valves, &c., were exhibited by eight competitors, and considerable interest was manifested in the verdict of the judges, and much discussion was brought to bear on the merits and shortcomings of the different boilers. The apparatus for which the Silver Medal was awarded was a wrought-iron saddle boiler, with a series of intersecting tubes, somewhat in the form of a letter X, but the tubes in ogee form, in the crown of the boiler. Most gardeners who examined the boiler expressed a favourable opinion of it. It is no doubt a quick and powerful boiler without being complex, the latter condition having, no doubt, had weight with the judges."

The *Garden* of June 11 says:—

"The premier prize, a Silver Medal, was taken by Messrs. Green & Son for their new patent tubular saddle boiler. It is a modification of their original patent, the boiler being longer and not so high. It is found to be a powerful and efficient boiler, and heats a large quantity of water quickly with a small consumption of fuel."

Descriptive Illustrated Price List may be had free on application.

Estimates given for all kinds of Heating Apparatus, and Hot-water Fittings of every variety supplied on the shortest notice. Galvanised Iron Cisterns, from 4d. to 1s. 6d. per gallon.

**JOURNEYMAN** in the Houses, in a good establishment. Two years' good character from last place.—WILLIAM THOMPSON, Long Street, Atherstone.

**JOURNEYMAN**, in the Houses.—Six years' experience; well recommended.—F. H., The Gardens, Kendall Hall, Elstree, Herts.

**JOURNEYMAN**, in a Nursery or good Garden.—Age 18; two years' experience under Glass.—C. J. R., 6, Laidler's Cottages, New Street, Hampton.

**JOURNEYMAN**.—Mr. J. McNair, Illam Hall, Ashbourne, Derbyshire, will be glad to recommend a young man as above. Very pushing and energetic.—E. W. JONES, "Salisbury Arms," Tremuchon, St. Asaph.

**JOURNEYMAN**, in the Houses, in a large establishment.—Age 21; eight years' experience. Five years' good character. Bothy preferred.—A. C., Hatch, Northlands, Salisbury.

**JOURNEYMAN**, in the Houses, in a good establishment.—Age 21; bothy preferred. Five years' experience. Good character.—J. DEAN, Lower Eaton, Hereford.

**JOURNEYMAN**, in the Houses, in a good establishment.—Age 21; strong and active. Good recommendation from last and previous employer.—W. H., Higher Lytchett, Poole, Dorset.

**JOURNEYMAN**, in the Houses, in a good establishment.—Age 23; seven years' experience. Can be well recommended.—J. WELLER, Denne Park Gardens, Horsham, Sussex.

**JOURNEYMAN**, in the Houses.—Age 21; ten years' experience in Indoor and Outdoor. Six years' good character from present situation. Bothy preferred.—R. C., The Gardens, Sheen House, Mortlake, Surrey.

**JOURNEYMAN**, in Houses, in good establishment, or where Fruit and Flowers are Grown for Market.—Age 21; good experience. Good character. Abstainer.—J. FLETCHER, Harleyford Garden, Great Marlow, Bucks.

**JOURNEYMAN**, in the Houses, in a Nobleman's or Gentleman's establishment.—Age 21; nine years in present place. Good reference from present place.—State particulars to A. GROVER, Northbrook Cottage, Farham, Surrey.

**JOURNEYMAN**.—Age 20; seven years' experience Inside and Out. Nineteen months' good character.—B. DOWSON, The Gardens, Wood Eod, Chichester.

#### To Nurserymen.

**KNIFESMAN**.—Thoroughly efficient in Budding and Grafting and General Outdoor Nursery Work. Good references.—W. JONES, Bowling Green, Powick, Worcester.

**IMPROVER** in Gardens.—Age 18; no objection to a small Premium. Good character from last situation.—W. BRIMBLE, Nunney, near Frome, Somerset.

**IMPROVER**, in a good establishment, in the Houses.—Age 18; two and a half years' experience. Good character. Total abstainer.—W. BREWER, Penton Gardens, Andover, Hants.

**IMPROVER**, in private establishment.—Age 19; nearly five years' good character. Twelve months' experience. Well recommended.—W. E. JONES, The Gardens, The Mount, Shrewsbury.

**TO NURSERYMEN**.—Situation wanted in a Nursery. Used to Growing for Market.—Age 31; good references.—S. DENSON, 1, Trent Villas, Chase Road, Southgate, N.

**TO MARKET NURSERYMEN**.—A young man (aged 20), desires a situation in a large Nursery near London preferred. Three years' experience in Potting, Watering, and General Routine of Nursery Work.—Please state particulars and wages, to R. Mrs. Dodd, Cross Street, Ashton-on-Mersey.

**TO MARKET GARDENERS**.—Wanted, by an experienced young man, a situation in the market or otherwise, where flowers, &c., are grown with great spirit.—G. M., 4, Newgate Road, Bohemia, Hastings.

**TO NURSERYMEN**.—An active young man desires a situation in the Jobbing Trade. Experienced. Can fill up time in Nursery. Total abstainer. Good wages.—J. D. RICHARDS, 86, Midway Park, N.

**TO NURSERYMEN**.—Wanted, by a young man, a situation in a good Nursery where he would thoroughly learn the profession. Is a good scholar and can be highly recommended.—R. SMITH, Buccleuch Nurseries, Hawick, N.B.

**TO HEAD GARDENERS**.—H. AMBERTIN, Bulwick Park, Wootton, would be pleased to recommend a young man, aged 19—with four years' experience—last two in the Houses. Abstainer.—Address as above.

**TO MARKET GARDENERS and NURSERYMEN**.—Youth (age 16), wants situation as Helper, and to learn the Trade.—M. G., Mr. Watford Hooke, Stationer, 19, Friary Street, Guildford.

**TO SEEDSMEN and FLORISTS**.—Youth (age 15) requires situation as Assistant. Writes well, and good bookkeeper.—FLORIST, Mr. Watford Hooke, Printer, 19, Friary Street, Guildford.

**TO GARDENERS**.—A respectable youth (aged 17); wishes a situation in a Nobleman's or Gentleman's Garden, in the country, near the coast preferred.—W. GRAY, 3, Camden Villas, Kennington, S.E.

**TO GARDENERS, &c.**—Wanted, by a Gardener's son, a situation in the Garden. Has been in Garden before. Good character. Age 20.—H. M., T. Martio, The Gardens, Escher Place, Escher, Surrey.

**TO GARDENERS**.—Required by a youth (age 18) a place as Gardener's Help. Not used to gardening so would take low wages in order to thoroughly learn the work. Two and a half years' good character.—W. WILSON, 107, Cliden Road, Clapton Park, Essex.

**ESTATE MANAGER, or FORESTER**.—Thoroughly qualified. Life experience in Estate Management, Planting, Thinning, Fencing, Sawmill and Nursery Work, Draining, Road Making, Farming, &c. References.—Apply SCOTSMAN, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**CLERK**, in a Nursery, or Seed Warehouse.—Young; could Draw Plans for the Flower Garden. Character if required.—H. H., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**CLERK, WAREHOUSEMAN, or SHOPMAN**.—Considerable experience. First-class reference. A. B., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

#### GRATEFUL—COMFORTING.

### EPPS'S COCOA.

#### BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." *Civil Service Gazette*.

Made simply with boiling water or milk. Sold only in

Packets, labelled thus:—

**JAMES EPPS & CO., Homoeopathic Chemists,**

London.

### HOLLOWAY'S PILLS and OINTMENT.

"Vicissitudes of climate, exposure and hardships, tell heavily on soldiers and sailors, sowing the seeds of diseases, which may ultimately break up the constitution. Naturally careless of their health, a word in season may avert many evils, and may cause them to resort to timely measures without any difficulty or publicity. Holloway's effectual remedies are so suitable, and are so easily adapted for the varied complaints to which our soldiers and sailors are liable, that a supply should always be obtained before proceeding abroad. It may with confidence be stated that many a valuable life might have been saved or confirmed cripple prevented from begging in the streets of Holloway's remedies had been used in time."

# GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING and COLLECTING MACHINES for 1885.

THE WINNERS OF EVERY PRIZE IN ALL CASES OF COMPETITION.

Patronised by Her most Gracious Majesty the Queen on many occasions, His Royal Highness the Prince of Wales, the King of the Belgians, the late Emperor of the French, the Emperor of Russia, and most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. The "Journal of Horticulture," of June 9, says:—"MOWING MACHINES.—After a critical examination the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. Green & Son, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 125,000 of these Machines have been sold since they were first introduced in the year 1856,

And thousands of unsolicited Testimonials have been received testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every prize that has been given.

The following are their advantages over all others:—

- 1st. Simplicity of Construction—every part being easily accessible. 2d. They are worked with much greater ease than any other. 3d. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

## SINGLE-HANDED LAWN MOWER.

To cut 6 inches, can be worked by a Lady	Price £1 15 0
To cut 8 inches, do. do.	2 10 0
To cut 10 inches, do. by a strong youth	3 10 0
To cut 12 inches, do. by a man	4 10 0
To cut 14 inches, do. do.	5 10 0

## DOUBLE-HANDED LAWN MOWER.

To cut 16 inches, do. one man on even lawn	£6 10 0
To cut 18 inches, do. man and boy	7 10 0
To cut 20 inches, do. do.	8 0 0
To cut 22 inches, do. two men	8 10 0
To cut 24 inches, do. do.	9 0 0

\* If made stronger, suitable for Donkey, 30s. extra.

Prices of Donkey, Pony, and Horse Machines, including Patent Self Delivery Box, or Side Delivery, with Cross-stay complete, suitable for attaching to Ordinary Chaise Traces or Gig Harness:—

### DONKEY and PONY MACHINES.

To cut 26 inches	£14 0 0
To cut 28 inches	16 0 0
To cut 30 inches	18 0 0
Leather Boots for Donkey	1 0 0
Leather Boots for Pony	1 4 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machine makes little noise in working, the most spirited animal can be employed without fear of it running away, or in any way damaging the machine.

### HORSE MACHINES.

To cut 30 inches	£22 0 0
To cut 36 inches	26 0 0
To cut 42 inches	30 0 0
To cut 48 inches	34 0 0
Leather Boots for Horse	1 9 0

Packing Cases as per List.

Essay on Cultivation, one stamp.

W. ETHERINGTON, The Manor House, Swanscombe,  
Kent.

**Prize Florists' Flowers.**  
JOHN DOWNIE begs to intimate that his  
CATALOGUE of the above is now ready and will be sent  
post-free on application. It comprises the finest varieties of  
Pansies, Violas, Pentstemons, Phloxes, Antirrhinums, Dahlias,  
double and single, &c.

As I am now in business solely on my own account, and from  
a long and varied experience in the cultivation of Florists'  
Flowers, purchasers may rely on nothing being sent them but  
what is really first-rate. Selection and not collection is my  
style of doing business.

Beechhill Nursery, Murrayfield, Edinburgh.

**New Kidney Potato.**  
**BIRD'S DOCTOR BOB**.—This is the  
earliest Kidney variety in existence; a very heavy  
cropper, as many as sixty tubers of all sizes have been counted  
at a root. It is a seedling from Early King. After a trial of  
several years it has never taken disease. Eyes very shallow; a  
good cooker, and fine flavour. 5s. per stone.

JAMES BIRD, American Nurseries, Downham Market.

THE WORLD.

THE AUTOMATON.

# RANSOMES' LAWN MOWERS.

**THE "WORLD" LAWN MOWERS**  
are the best for cutting long grass, and are constructed on the  
American system with the special advantages of English  
materials and workmanship.

They are made in nine sizes, 8 to 24 inches.

Prices from 45s. to £10.

**THE "REVERSIBLE" LAWN MOWERS**  
are suitable for small gardens and borders. They roll the  
grass as well as cut it, and can be used either side upwards.

They are made in three sizes, 6 to 10 inches.

Prices from 27s. to 45s.

**THE "AUTOMATON" LAWN MOWERS**  
are the best machines for general purposes and gardeners' use.  
They leave no ribs in the grass but produce a perfect surface.  
They are made in eight sizes, 8 to 22 inches.

Prices from 55s. to £8 10s.

### THE HORSE-POWER MOWERS

are the best for Large Lawns, Cricket and Lawn Tennis Clubs.  
They are used on the Cricket Grounds of the Oxford and Edin-  
burgh Universities and numerous Colleges and Public Schools.  
They are made in six sizes, 26 to 48 inches.

Prices from £14 10s. to £32.

Complete Price LISTS may be obtained from any respectable Ironmonger, or

### EUCALYPTUS CULTURE.

THE following communication, forwarded to  
Mr. A. H. Smee by a correspondent in  
Chili, will be found of value, especially to our  
numerous Indian and colonial readers :—

It is not necessary to enter with great  
minuteness into those matters on which all  
are agreed, but rather to accentuate the points  
regarding which my personal experience par-  
tially diverges from, or is found in open con-  
flict with, the current instructions supplied by  
accepted authorities. These points are :—

1. The preparation of the seed-bed.
2. The advisability of rooting the seedlings  
in pots previously to planting them out de-  
finitively.
3. The use of stakes for propping the re-  
cently planted trees.
4. The space to be allotted to each tree.
5. The suitability of marsh land for large  
plantations.

#### 1. THE SEED-BED.

The plants are raised from a small and ex-  
ceedingly hard black seed, which should be  
thoroughly soaked before being sown. As the  
seed germinates with great difficulty, and seems  
unable to overcome the resistance of a soil even  
slightly compact or tenacious, it is usually re-  
commended to form the bed of coarse sand or  
other very light earth; this plan is, however,  
attended with the disadvantages consequent on  
the general poorness of such soils, and the still  
greater one of the difficulty of removing the  
seedlings from the bed without detaching the  
sand adherent to their roots, which is  
fatal to their life if immediately transported  
to the plantation, and causes loss even if  
potted at the edge of the bed. After  
experiencing these evils I ultimately prepared  
seed-beds some six months before sowing, com-  
posed of some garden earth and a large propor-  
tion of leaves (those of the Fig and of the  
Eucalyptus itself are very good) and of sheep's  
dung, which I had continually watered and dug  
over until completely incorporated and rotted.  
The decayed leaves impart to the composition  
a peculiar mellowness, and, while the bed is  
kept damp, that softness so necessary to the  
successful germination of this delicate seed, as  
well as a fertility far superior to that of the  
sand usually recommended; while by leaving the  
bed completely dry and exposed to the sun for  
a few days previously to transplanting the  
seedlings the dung causes it to become hard  
and tenacious, so that each separate plant  
may be cut out with a knife, remain firmly  
embedded in its surrounding earth, and, being  
as easily transported on trays or in carts as  
little bricks, thus rendering unnecessary the use  
of the often costly and always pernicious pot.  
All depends in this plan on the proper propor-  
tions of the ingredients. Should the leaves be  
deficient or clay be present in the earth, the  
surface of the bed will be sticky and the seed  
will not come up; while, should there not be

dung enough (it must be sheep's) the bed when dry will not be sufficiently compact to cling to the roots of the little trees when removed for transplantation. Above all, both leaves and dung must be thoroughly rotten, or larvæ may appear from the latter, and all operations may have to be postponed for a year by the complete ruin of the young plants.

I quite agree with the received opinions that the seed should be sown very light, and rather thin, that the bed should be kept damp by frequent though not too copious waterings, that the young plants should be continually guarded against the small birds which pursue with passion the young plants in their early stage, that they should be protected by mats from the chance of a frosty night and from excessive sunshine. As they may all be lost by the slightest accident a fresh lot of seed should be sown every fourteen days during the season (which lasts, I should imagine, everywhere more or less from midwinter till the end of spring), which plan also ensures a succession of suitable plants as the work of plantation on a large scale progresses.

#### 2. SEED PANS.

Should the sand-bed plan be adopted pots are necessary as a means of transportation to the plantation of the young plants, since the attempt to carry them loose would entail the detachment of their adherent soil and their consequent certain loss. They should, however, be left only a few days in the pots under the penalty of incurring a misfortune gravely compromising to the whole future of the plantation. The roots, rapidly developing, fill up the entire pot with a conorted and interlaced mass, and the tap-root, twisting round like a corkscrew, often assumes an upward direction, which usually causes lingering death, the roots being unable to disentangle themselves and assume their natural direction and relative position; the surviving plants obtain merely a rachitical existence, and very rarely become healthy, and never really fine trees. In large operations any unforeseen delay in carrying on the planting with sufficient rapidity may compel the use of "pot-bound" plants, with all the explained disadvantages, and I therefore declare myself hostile to the pots, and in favour of the direct removal of the seedlings to their plantation from a series of beds prepared as related in the first section, so as to secure by their softness the certain germination of the seed, while assuming, when thoroughly dried, the tenacity of sun-dried brick, thus facilitating the removal of the seedlings without disturbance of their roots. In cutting out the seedlings from the beds the severance of many ends of roots is unavoidable, but occasions no injury whatever, since their general relative disposition and direction (especially important in the tap-root) are preserved, and they have to undergo no struggle to rectify distortions such as they suffer in the pots. Many large plans have failed completely, from the plants having been pot-bound, and the failure is attributed to every cause but the true one. I know, for instance, of a municipality having expended a large sum on the formation of miles of avenues of Eucalyptus, all of which have turned out small, unhealthy, and distorted trees, and which will never be any better. The people themselves blame the trees, and denounce them as unsuitable to the climate and ugly in themselves; but an expert can see evidently that the cause lies in their having been grown in sand and pots, according to the instructions of the local sages.

#### 3. STAKING THE TREES.

It is generally recommended that seedlings should on transplantation be tied to a stake, to prevent their being overthrown by the wind. I think this practice generally mischievous.

The Gum tree, when healthy—*i.e.*, in favourable soil, and starting with sound and uncontorted roots—is quite as able to resist wind as any other tree, in spite of its slender superficial roots, since, armed with the wiles of Nature, they immediately build up a mass of filamentous roots, extending like a net in every direction, and throw out numerous boughs, heavily loaded with foliage of graduated length, from the ground upwards; thus presenting the aspect of a broad-based cone with its centre of gravity in the lower third of its height, so that when agitated by wind they not only hold on by their reticulated surface-

roots but are also sustained by the actual contact of their lower boughs with the soil. Relieved by the props of the necessity of these precautions, they develop fewer roots and lower boughs, and running too soon to height, and shifting upwards their centre of weight, become top-heavy, and can only be saved by substituting longer and longer props, from friction with which they often sustain damage, and rarely turn out quite satisfactory, in spite of the trouble they cause. At the same time it is doubtless necessary to continually examine the young trees, and to prop those partially uprooted, or which, having failed to protect themselves by proper boughs and foliage, have a spindly growth. I may mention that in plantations the trees greatly protect one another by intercepting the wind.

#### 4. DISTANCE AT WHICH THE TREES SHOULD BE PLANTED.

Influenced by the analogy of European plantations many persons have wasted large sums in planting these trees in thick clumps, thinking that as their growth progresses they may be thinned out advantageously, and that those spared will attain the same development as if originally planted at suitable distances, only suffering the usual retardation. Convinced of the necessity of testing this before undertaking an industrial plantation, I planted half an acre favourably situated at distances of 2 metres apart (that often recommended), and a part even closer together, with the bad result which immediately became apparent. Unable to obtain sufficient air and sun, they entered into a frantic struggle to overtop one another; those which were distanced in the race were completely deprived of leaves and eventually died, the remainder could only maintain a scanty foliage at the top, and when already 60 feet high (their growth was rapid enough in height) were not more than 8 inches in diameter, and their wood was nearly worthless. By thinning they were not restored to prosperity; as they had formed no matted surface roots they were most of them blown down, and those which escaped this fate showed no sign, when I last saw them, of any serious increase of girth.

The planter should never lose sight of the main peculiarity of the Blue Gum, *viz.*, that its whole future is irrevocably fixed in early youth, *i.e.*, before it exchanges (at from two to three years old) its abundant boughs, loaded with luxuriant dark blue foliage, for the sparse ramifications, and dark, narrow, and almost shadeless leaf, of its second stage of vegetation. Should its early roots have been unhealthy; if on transplantation it has failed to develop a large crop of inferior boughs and of healthy leaves; if these inferior boughs have been stripped of foliage,\* or have been only clothed at their extremities with leaves; or should the leaves, instead of presenting their healthy tint of glossy dark blue, become clouded with greyish bloom, be red or yellowish, a perfect development will rarely be realised, and I should recommend removal and replacement as a saving of time. I may remark in this connection that a premature change of leaf is a sure indication of ill-health.

I ultimately made the large plantation at the distance of 5 metres, or with 25 square metres to each tree, but on their arriving at four years old, I was convinced that even this distance was not sufficient; as, however, they would not have incommoded one another till long after the change of leaf they might perhaps have been thinned at about ten years old without damage, *i.e.*, obtaining useful timber from those alternately cut down before any appreciable injury would have been incurred by those remaining. I think, however, that the best plan is to plant them at 7 metres apart (if not a little more), utilising the enclosures after a few years where possible for pasturage, since the matured Gum at this distance with its comparatively scanty crown and obliquely set foliage would not prevent the growth of coarse herbage, if soil and moisture were suitable.

The whole beauty and much of the success of the plantation depends on the exact collocation of each tree in its place, so as to form to the eye avenues in every direction; the ground should, therefore, be previously laid out with a theodolite, or it may even be done by a skillful and careful operator with a large compass by the well-known methods employed in such cases. When the ines-

timable advantage of artificial irrigation exists, the gutters should be equidistant and parallel, and the trees placed in them, or at their edge. I must not forget to mention that the young trees at the moment of planting must be watered, as they are always quite dry when planted, whether from pots, or, according to my plan, in little bricks, in order to avoid detachment of the soil from their roots; when there is no irrigation, and rain should be inconveniently delayed, they would doubtless again shortly require to be watered by hand, which is a costly and troublesome proceeding on a large scale. When once rooted they can exist an almost indefinite time without rain, though they will not thrive until they get access to subsoil moisture.

#### 5. PLANTING IN MARSH LAND.

The strangest peculiarity of the Gum is its combination of the greatest avidity for water, which it contains in the form of sap, and throws off from its leaves in almost incredible quantities, with the capacity of surviving prolonged drought, and of thriving fairly in very dry places when once developed to a certain point by a sufficient supply of moisture. It is, however, my opinion that the customary statement, that the Gum tree will grow in rank marshes, *i.e.*, in land completely saturated to the surface with stagnant water, is very extravagant; and I may holdly state that this tree will not grow in waterlogged soil, although it feels much less aversion to running than to stagnant water; enduring, for instance, for a long time complete immersion of its roots in the flood water of a river, while dying rapidly under the influence of the casual elevation of the level of stagnant subsoil water. It will, however, thrive admirably in the ordinary marshy ground, where it enjoys a space of free soil of from 2 to 4 feet deep before reaching the level of the subsoil water, the amount of free soil required apparently depending chiefly on the aëration of the water; if this should be absolutely motionless and charged with salt the Gums are much less tolerant of its proximity than when pure and moved by a slight drainage current.

I think the truth to be that this tree will not endure that its surface roots should be permanently immersed in stagnant water, whatever statements may have been made to the contrary, but that it thrives admirably, although its tap-root (which is virtually a continuation downwards of the trunk) should descend vertically into the same; in other words, it can and will imbibe enormous quantities of water voluntarily, but dies if the water be administered by force. I feel no doubt that marshes fulfilling this condition of the existence of a certain depth of unsaturated superficial soil may be completely drained and sanitarized by extensive plantations, provided the subsoil-water should arise from the imperfect removal by drainage filtration of the merely local accumulation of rainfall; but I utterly refuse to believe that huge spongy plains completely saturated, not only with their own rainfall, but, further absorbing whole rivers discharged from neighbouring hills, can be restored to human habitation and commerce by any such insufficient device. It requires no argument to show that while each tree can pump and discharge into the atmosphere a quantity of water far exceeding the rainfall of the space it occupies, the trees cannot deal with an unlimited quantity of extraneous moisture, and the less so that only the more elevated spots in such plains are at all suitable for their cultivation.

I find I have omitted to mention in its place an interesting experience illustrating the bad effect of superficial stagnant water on Gum trees. I had a flourishing row of large trees growing on the very edge of a permanently flowing irrigation ditch; there occurring a scarcity of water, the ditch was left dry for six days out of seven, and when dry there remained a pool behind a sluice at the foot of one of the trees, which suddenly died. On repeating the experiment with another tree it also died.

#### SEASONING.

The recently felled timber is so charged with sap that in drying it becomes much warped and cracked, and there is no doubt that seasoning it is most difficult and troublesome. I am assured that the Australians immediately strip the trunks, and then keep them for a long time in water—sea-water by preference. On a large scale this difficulty, as well as that of preparing the wood for market, could be easily dealt with by making the requisite pools and constructing saw-mills.

When we consider that the Blue Gum averages a growth of 10 feet a year, that it possesses a bark

\* I need only mention the madness of those persons who recommend the removal of the lower branches to strengthen the growth.

admirable for tanning purposes, that the cast bark serves for firewood, and that its timber endures a crushing or longitudinal strain greater than Oak, and is unsurpassed by any for ship-building and for timbering mines, and is capable of developing heat fierce enough to smelt sulphurets of copper in a reverberatory furnace, and that this wood can be grown in soils often useless for any other purpose, we can find no difficulty in believing that a large business might be made by industrial plantations in selected localities, of which there must exist many in all the subtropical countries, either in dry sandy plains accessible to irrigation, or on the sort of marshlands above described. I need not, however, insist on the necessity of careful study and experiment before embarking definitively in such a venture, both as regards the chance of the tree itself thriving, as well as of the economical conditions relating to expense and final disposal of the timber. My own experience is limited to Chili, in the north of which country I made the plantations alluded to, but they may perhaps be of some use to your friends.

## New Garden Plants.

### ODONTOGLOSSUM BRASSIA, *n. hyb. nat.*

THIS has the straight shape of the sepals, petals, and lip of a Brassia. The lateral sepals are very stiff, linear lanceolate as also is the upper sepal. The lip is deltoid, cuspidate, and has at the base five keels with two anterior projecting ones. The wings of the column are rather poor, lacerate, the whole flower sulphur-coloured. Upper sepal with one, lateral sepals with several, lip with one horse-shoe-like purple spot. It might be regarded as extended *Odontoglossum deltoglossum*. It is by no means one of those starved abortions of which one gets often enough a single crushed flower, but it is decidedly in brilliant health. I had a fine raceme of thirteen large flowers from Mr. F. Sander, and the plant is in Mr. Lee's collection. *H. G. Rehb. f.*

### ÆRIDES ORTGIESIANUM, *n. sp.\**

This looks like a smaller *Ærides quinquevulnerum*, Lindl., though its growth is said to be more slender and its leaves are narrower. The sepals and petals have the usual purple blotch towards the apex, some small ones being scattered on the surface, and some light purple warts also. The side lacinia of the lip are sulphur-coloured, the mid-lacinia white, the spur green—all with small red dots and bars. The mid-lacinia is blunt, bilobe, not serrate at all. In the front part of the spur there stands one horn-like process at the back, there is a triangular callus, and this induced me to regard this recent introduction of Mr. F. Sander as a novelty. It is dedicated to Mr. Ortgies, of Zurich, whose wonderful zeal and activity for garden botany in general, and for Orchids in particular, can only be well appreciated by those who have the advantage of personal acquaintance with the inspector of the Zurich Botanic Garden. *H. G. Rehb. f.*

**USEFUL PLANTS IN THE ISLAND OF ST. THOMAS.**—In a recently issued report on the Island of St. Thomas, Danish West Indies, it is stated that attention has recently been drawn to the possibility of utilising the soil of the island and making it productive. An attempt was made some two years since to revive the cultivation of the Sugar-cane, but it has resulted in heavy losses, and now that the price of sugar is so ruinously low this branch of industry will probably be entirely abandoned. The cultivation of Aloes [*Agaves*] and other fibre-producing plants is now being tried. The climate and soil seem well adapted to such plants, the hills are thickly strewn with them, and if the leaves were collected many hundred tons of fibre could be annually exported without an acre of land being planted. Actual trial, it is said, has, however, demonstrated that 6s. a ton for the crude leaves is the highest price that can be paid, but as this price does not appear to offer any inducement to the peasants to collect the wild leaves, which are so numerous, they remain untouched. It remains to be seen whether cultivation will reduce the cost of collection by localising plants, and thus rendering the gathering of the useful portions easy, rapid, and economical.

\* *Ærides Ortgiesianum*, *n. sp.*—Affine *A. quinquevulnerum*, Lindl., gracilis folio angustius; racemis brevioribus; labelli lamina mediana integerrima apice biloba calcaris antorsor, callo corniformi in pariete antico, callo triangulo in pariete postico. Cl. Ortgies, Zuricensi dicatum. *H. G. Rehb. f.*

## ORCHID FRUITS.

IN continuation of the illustrations of the seed-pods of Orchids we now give representations of those of *Cattleya Dowiciana* (fig. 90), which, as will be seen, are of large size, elliptical, and marked with six prominent ridges. In marked contrast are the long pods of *Brassavola stricta* (fig. 92), and the short 3-valved pods of *Odontoglossum*

FIG. 90.—CATTLEYA DOWICIANA.

grande (fig. 93), which seem not to break away from the ridges or midribs, as is the case in most Orchids.

**RHODODENDRONS AT MESSRS. J. VEITCH & SONS, CHELSEA.**—A new greenhouse *Rhododendron* named *Forsterii* ×, a cross between *R. Veitchianum* and *R. Edgeworthii*, is very striking, having large fimbriated white flowers, cinnamon-coloured throat, with faint blush on the petals and very sweetly-scented; Lady Alice Fitzwilliam, with its abundant pure white flowers, is very telling; *R. Brookianum*, a species from Borneo, with deep reddish-orange-yellow flowers, is also a good variety.

## NOTES ON THE CULTIVATED ASTERS.—XI.

(Continued from p. 307.)

THIS paper includes the tall perennial species with a biserial pappus, and the few monocarpic types which have found their way into cultivation.

Subgenus XI. DOELLINGERIA. — Bracts of the pauciserial involucre destitute of foliaceous tips. Ray flowers short, white. Achenes flattened, many-nerved; pappus distinctly biserial. Stem long. Leaves broad.

58. *A. umbellatus*, Miller. *Diplopappus umbellatus* and *amygdalinus*, Torrey and Gray. *Diplostegium umbellatum* and *amygdalinum*, Cass. — Stems stout, erect, glabrous, 2–6 feet long. Stem-leaves sessile, oblong-lanceolate or lanceolate, acuminate, entire, the lower ones 3–4 inches long,  $\frac{1}{2}$ – $\frac{3}{4}$  inch broad at the middle. Heads very numerous, middle sized, arranged in an ample panicle with corymbose branches. Involucre campanulate, pauciserial,  $\frac{1}{2}$  inch diameter; bracts lanceolate, pale green, closely imbricated, uniform in texture throughout. Ligules 10–12, white, linear,  $\frac{1}{2}$  inch long. Achene nearly glabrous; pappus copious, pale red, longer than the achene, moderately firm in texture, with a distinct regular row of short bristles on the outside.

Spread from Labrador, Newfoundland, and Saskatchewan, through Canada and the Northern United States, to Arkansas and Georgia. *D. amygdalinus* of Torrey and Gray is a well marked variety, with shorter ovate-lanceolate or ovate leaves, which extends further south than the type, reaching Texas and Florida. *A. infirmus*, Michx., has fewer heads, fewer obovate or oblong leaves, and a multiserial involucre, with thicker more obtuse bracts.

59. *A. reticulatus*, Pursh. *Aster obovatus* and *dichotomus*, Elliott. *Diplostegium obovatum* and *dichotomum*, DC. *D. boreale*, Spreng. — Stems firm, slender, erect, 2–3 feet long, hairy all the way down. Leaves numerous, sessile, obovate-oblong, coriaceous, entire, deltoid at the base, the lower 2–3 inches long; veinlets of the under-surface raised. Heads moderately numerous, middle-sized, arranged in a flat-topped panicle. Involucre campanulate,  $\frac{1}{2}$ – $\frac{1}{3}$  inch diameter; bracts pauciserial, lanceolate, pubescent. Ligules 10–12, white,  $\frac{1}{2}$ – $\frac{3}{4}$  inch long. Achene clavate, very pubescent; pappus pale red,  $\frac{1}{2}$  inch long, with a distinct outer row of short bristles.

South Carolina to Florida. A very distinct species.

Subgenus XII. IANTHE. — Involucre multiserial; bracts rigid, without leafy tips. Ligules bright lilac. Leaves linear, 1-nerved. Pappus with an outer row of very short bristles.

60. *A. linariifolius*, Linn. *A. rigidus*, Linn. *A. pulcherrimus*, Lodd., Bot. Cab., t. 6. *Diplopappus linariifolius*, Hook.; *D. rigidus*, Lindl. — Stems 1–1½ foot long, erect, scabrous. Leaves numerous, linear, rigid, sessile, spreading, 1-nerved, entire, 1–1½ inch long. Heads few or many, corymbose. Involucre campanulate, multiserial,  $\frac{1}{2}$  inch in diameter; bracts lanceolate, firm in texture, with erect tips. Ligules about a dozen, bright lilac,  $\frac{1}{2}$  inch long. Achene ob-lanceolate, very silky; pappus pale red, with an outer row of short bristles.

Dry sandy and gravelly soil, Newfoundland to Wisconsin and Texas. A very distinct and handsome species, most resembling a *Calliastrium*, except for its pappus and involucre. There are three other species of this subgenus—*A. scopulorum* and *A. stenomeris* of A. Gray, and *A. ericefolius*, Rothrock; all inhabitants of the Rocky Mountains and Western States.

Subgenus XIII. TRIPOLIUM. — Stems annual or biennial. Involucral bracts few, lanceolate, without leafy tips. Inner flowers of the disc sterile. Achene flattened; pappus of fine slender bristles.

61. *A. Tripolium*, Linn. *Tripolium vulgare*, Nees. — Stems 2–3 feet long, stout, erect. Leaves few, lanceolate or linear, entire. Heads many, corymbose, middle-sized. Involucre campanulate,  $\frac{1}{2}$  inch diameter; bracts pauciserial, linear-oblong, adpressed, obtuse. Ligules 10–12, lilac,  $\frac{1}{2}$  inch long, sometimes fewer or absent. Achene linear, glabrescent; pappus fine, copious, slender, white,  $\frac{1}{4}$  inch long.

Shores throughout Europe, extending to North Africa and Siberia.

There are two allied sub-genera in America confined to maritime and subsaline situations, viz., *Oxytripolium*, with a multiserial involucre, with

acute bracts, with two species, extending as far south as Chili and Buenos Ayres; and Conyzopsis, which extends also to Siberia, and connects Aster and Conysa. Neither of the two contain aught of gardening value. *J. G. Baker.*

(To be continued.)

## CULTIVATION OF LETTUCE UNDER GLASS.

COMMERCIALLY speaking this proceeding may not be necessary, because most of our markets are abundantly supplied from foreign places; but otherwise such an estimable edible, almost universally esteemed, and quite indispensable for the salad, is surely deserving of some extra labour and attention in order to have it ready for use before those grown outside in a natural way are available. For instance, the conditions in a cool orchard-house are so well suited to the purpose that where one exists accommodation might be found to grow enough Lettuces for the requirements of a private establishment for at least three weeks before those outside come into use; or otherwise, if such a place is not available, by means of those simple contrivances, cold frames, a crop can be ensured a fortnight earlier; either way it is a significant advantage, and worth the time and trouble it involves.

I set apart two four-light frames for this subject, which together enclose an area of 32 feet by 4 feet. One half is applied to Cos, and the other to Cabbage Lettuces. The frames are placed in a convenient and sheltered position facing the south; the soil within them is well enriched, and made moderately firm, its surface inclining slightly to the south. The seed is sown in the last week in August, and the frames are filled with the plants in lines 8 inches apart all ways. The chief point in management is to get the plants as hardy as possible, only using a slight covering when absolutely necessary, and keeping them dry during the winter months. In early spring, when growth begins, it should be encouraged, and more protection afforded, in order to get them fit for use as early as possible, which is usually by the first week in April. From my experience in this way I find Hicks' Hardy White Cos, and Stanstead Winter Cabbage Lettuce, the two best kinds for the purpose, which under these conditions we are now (April 1) able to draw for use. *G. T. Miles, Wycombe Abbey.*

## DAFFODILS.

THE GREAT SIR WATKIN DAFFODIL.—At the request of a correspondent, Mr. F. J. Broome, I gave an account last year in the *Manchester City News*, August 8, of the origin of this grand Daffodil, which was brought out by our townsman, Mr. William Pickstone, after having been cultivated at his estate, Maesmynan, near Caerwys, for many years, until he became possessed of a very large stock of it. No Daffodil has ever before produced such a sensation amongst florists, and its early promise is now being amply fulfilled, as it stands pre-eminently the finest of all the incomparable section—a peerless Daffodil.

In the *Manchester City News*, October 18, 1884, a letter appeared, signed by William George, Brook Street, Chester, stating that it was an old type of the Giant or Mountain Daffodil, improved in colour and substance under cultivation, and that the same type could be found in many old gardens throughout North Wales, and also in its wild state in at least two counties, and that it had been known to exist there over forty years, and that this Sir Watkin was an old founding under a new name.

Very soon after this letter appeared two of our leading seedsmen offered me bulbs of this wild form, which were expected to turn out to be the real Sir Watkin, and they were prepared to supply these bulbs by the thousand at a very moderate price. Similar offers were abroad, so that the opportunity was pretty widely known, and no doubt many took the risk and ventured to order. A few bulbs were presented to me as samples, and for trial, but as I had a good stock of the true Sir Watkin I found on comparing the bulbs that they were much smaller, and I therefore declined to purchase a quantity. The name of the person who was thus offering bulbs was then given to me, and I lost no time in communicating with him. He had the subject well mastered, and gave a very plausible account of the Daffodil as he knew it to occur in wild Wales, and he was quite

ready to supply bulbs in any quantity. I took down his narrative, and made a bargain by which he undertook to accompany me to the spot this spring, and I undertook to respect his secret and to see that he benefited if he could really prove the truth of his statement.

The time of blooming is here, Sir Watkin is in his glory, but his rivals prove to be mere common Pseudo-Narcissus, as it occurs wild in North Wales. The man himself is not to be found. It may be true for all this, but at present the whole affair looks like a cleverly laid scheme for trading profitably upon the fame of the grand new Daffodil, if buyers could be found willing to take the risk.

There is, however, a very solid foundation for the statement that Sir Watkin was descended from the Great Mountain or Giant Daffodil, well known in Wales more than forty years ago. In that fine old and very rare book, *Hales' Eden*, published in 1757, is to be found an account of the Nonpareil Daffodil, and a full-sized engraving of it is given in plate 41. This is indisputably like the Sir Watkin Daffodil as figured by the Rev. C. Wolley Dod, of Malpas, in the *Gardeners' Chronicle* for April 26, 1884, p. 553, and which is the best illustration we yet possess of Mr. Pickstone's Daffodil. The *Gardening World* of Saturday last contains an excellent plate of several of our best Daffodils, Sir Watkin being at the head; and this illustration by Mr. F. W. Burbidge, the best authority on the Narcissus, is again exactly like the plate in *Hales' Eden*, if we make allowance for the difference (here but slight) between a wild flower and a cultivated garden flower, the latter probably grown under glass.

Mr. Pickstone lays no claim to having raised the Sir Watkin Daffodil from seed. He states that he found it growing in a garden he became possessed of in a mining district in Merionethshire about seventeen years ago. How it got there he does not know. He found it there, recognised its beauty, and kept it to himself until he had a very large stock, and he deserved the profit he gained by its sale. It is thus clear that we really know nothing of its origin, and it is likely enough that it may be found elsewhere if search is made for it. *Wm. Brockbank, in "Manchester City News."*

### DOUBLE DAFFODILS.

In many places all the Daffodils are doubles over pretty large areas where they have been allowed to increase unmolested for a long period. It occurred to me that if seedlings could be found in such places they would afford conclusive evidence that double Daffodils spread by seeding. I therefore wrote to several friends who had favourable opportunities for observing this point, and have received the confirmatory information from three quarters.

Your well-known correspondent, Mr. A. D. Webster, of Llandegai, writes me as follows:—"I send you a few genuine seedlings of *N. Telamonius plenus* from a wood where they grow in plenty. They were found at too great a distance from any clump for it to be supposed they are offshoots, and no single Daffodils grow within miles. I have sent a few of the seedlings to several others of the Narcissus Committee in corroboration of your statement that *N. Telamonius pl.* produces seed. Some sceptics cannot be convinced, but the thing is a fact nevertheless. There are hundreds of these seedlings growing under Conifers, where it is very improbable they could have been placed." Another correspondent points out that if doubles increased only from the roots they would form only dense clumps, whereas they are in reality found dotted over the orchards and fields where they occur, each clump separated from its neighbour, and this could only occur by seeding.

I think, therefore, we may now consider the proof of the seeding of double Daffodil, and their spreading thereby, as complete.

In a clump of single Tenbys, which has been planted here two years, one plant has come double this season. I should have thought it probable that this had happened by culture but for the fact that I have received flowers of the true double Tenby from the same place this season. I therefore prefer to conclude that there was a bulb which had not yet flowered, and which was a double when it came to me. If any of our single Tenbys should hereafter become doubles I might alter this opinion, but up to this time, out of some 20,000 singles grown here, I have not yet seen the evidence of one which has turned to a double.

After careful observation of our singles and doubles, I have come to the conclusion that each single variety produces its own double, and we frequently find these coming from the same garden whence singles and doubles are sent to us. I could certainly show singles and doubles of the following varieties now in bloom here:—*N. Pseudo-Narcissus Telamonius*, *N. major*, *N. maximus*, *N. obvallaris*, *N. princeps*, and *N. cernuus*.

The shades of difference in the wild forms of single *N. Pseudo-Narcissus* all the way up to *N. Telamonius* and its Irish representative, *N. princeps*, are so gradual that it is almost impossible to draw a line, and to say where *N. Telamonius* begins and ends. How impossible, then, to solve the question whether single *N. Pseudo-Narcissus* turns to *N. telamonius plenus*! For my own part I think this portion of the work undertaken by the Narcissus Conference will be labour thrown away. I maintain for the present that each single has its own double.

A correspondent has this week sent me a single Tenby Daffodil with seven perianth segments, and he states that it was from a bulb planted 8 inches deep. Another flower from the same clump had eight segments. Can it be that this extra size in the flower was due to the stored-up vital power in the bulb, owing to the time it would take to grow to the surface and mature its flowers? I notice frequently that deeply planted bulbs produce finer flowers and taller plants than shallow planted bulbs. At any rate here is a stage towards doubling apparently due to this peculiar circumstance. *Wm. Brockbank, Brockhurst, Didsbury, April 11.*

## SPREKELIA GLAUCA.

I AM much obliged to "W. W." for drawing the attention of the readers of the *Gardeners' Chronicle* to the above fine-flowering plant, in consequence of an advertisement of my firm in the columns of this paper. "W. W." is quite right when he supposes that the word "parent" in the advertisement meant the wider signification of relative. But as for the plant itself it is not my task to make out if it is a species or a variety, and this is indeed not of great consequence from a horticulturist's point of view; if both are considered to belong to the same species the question of parentage, however, may be put. *Sprekelia formosissima* and *S. glauca* are both original Mexican plants. The dark flowering *S. formosissima* was introduced as long ago as 1593—the lighter coloured *S. glauca* was only figured and described in 1840. Now from this difference in time of introduction there cannot be any criterion as to the one form or the other being the original. In most of the descriptions of *S. glauca* it is stated that the plant has smaller flowers and smaller bulbs than *S. formosissima*; this, however, is not according to my experience. I have cultivated both *S. formosissima* and *S. glauca* in the same way with great success, and find the flowers as well as the bulbs of *S. glauca* are larger. Probably, as was often the case in former times with different bulbs, the specimens of *S. glauca* examined for the descriptions were of inferior growth. When we see *S. glauca* producing larger flowers than *S. formosissima* the hypothesis does not seem absurd to me that it has as good right to be considered as the parent of *S. formosissima*, as that I should be obliged to consider *formosissima* to be the parent of *S. glauca*.

In many instances with monocotyledonous plants the dark varieties come after the paler ones, the most usual primitive form is a neutral pale unicolor, in this instance red; by variation the colour may become darker, and thus the size of the flower often decreases, or there comes variation with white, &c., and the colour becomes in the coloured parts the more bright in the same proportion, the white parts become larger and purer white. Nobody, I suppose, will be able to say if *S. formosissima* originated from *S. glauca*, but I suppose that possibly, it may be *S. glauca* from seed gives forms of the same colour, but of different size and good quality as an ornamental plant. Only the best forms are recommendable for cultivation. Probably, among the introduced *S. glauca* there, too, are different forms; sometimes *S. glauca* has been introduced under the erroneous name of *S. formosissima*. Lately, a coloured plate and description was given of *S. glauca* in the *Garten Zeitung*, edited by Dr. Wittmack, vol. i. (Berlin, 1882), p. 513–514, where the numerous species given by Lindley are maintained. In the

*Gartenflora*, vol. ii. (1883), p. 45, some remarks were given to complete the former article.

I cultivate both *Sprekelias* here with much success: in summer in the open ground, the bulbs are flowering; late in autumn, before frost comes, they are cleaned and dried in the air, and then stored during winter in a dry and warm place. They are replanted in the open ground in the late spring, when no frost is now to be feared. *J. H. Krelage, Haarlem, April 8.*

## POTATO CROPS AND METHODS OF PLANTING.

I HAD before read of the wonderful crops of Potatoes said to have been obtained by Mr. Andrew Knight, especially of Ashleaf Kidney, as mentioned by Mr. Douglas at p. 440, but had not learnt of the method of planting which he adopted to obtain these crops. I have to thank Mr. Douglas for now giving the information, and, if I may so put it, bursting "the bubble reputation" which had hitherto thrown such glamour over Mr. Knight's efforts. That such a moderate cropping kind as the Ashleaf Kidney should ever have produced such an enormous crop as twenty-four tons per acre was to me always a staggerer, and therefore, not wishing to hold Mr. Knight's word in doubt, I am all the more glad to have the matter explained. We very commonly plant Ashleaf Kidney Potatoes in rows 2 feet apart because the tops are of moderate height, and that distance under fair culture usually suffices. But then we seldom plant our sets in the rows at less than 12 inches apart, usually rather wider, but 12 inches will suffice for comparison. We also should plant for Ashleaf's sets about ten to the pound, and find these excellent. That gives in round numbers about a peck of 14 lb. to the rod, or 40 bushels (one ton) of seed per acre. On good ground the produce would be about 2 bushels per rod, or 8 tons of produce per acre. Now Mr. Knight admits that he planted the largest tubers, and taking these at five to the pound—not so very large either—he would at our rate of planting employ two tons of seed per acre. But then he tells us that instead of planting at 12 inches apart, he put the sets in at 4 inches apart, which means three times that quantity—really 6 tons of seed per acre, and, after all, his produce is only 24 tons, or an increase in bulk by four times only: really nothing to boast of after all. When we regard the weight of seed per acre that must have been planted by Mr. Knight, it is evident that the plan could only have been tried on a small scale. For instance, at the rate of planting shown by Mr. Knight, he must have used 384 sets per rod. Taking five to the pound as a fair size for good seed, I find the result in weight to be 76 lb. Where, then, is there anything to boast of? Why, even when planting strong growing kinds in rows 4 feet apart, and the sets 6 inches apart in the rows, 128 tubers must have been planted per rod, or, at half a pound each, 64 lb.—an inordinate quantity of seed. We now-a-days plant about 20 lb. per rod of fine seed, and get in good ground 180 lb. in return. Could Mr. Knight show better results? We may take it for granted that results in the way of Potato crops have been obtained in these degenerate days that would have astonished even Mr. Knight.

Mr. Douglas deprecates the use of the dibber in Potato planting. Against his opinion may be placed that of hundreds of large growers, who plant with this implement many acres every year, and seem to prefer that method of planting to any other. I use it largely myself every year, and, because expedition in planting is needful, find it to be the most acceptable way. The experience I have here of a stiffish soil prevents me from agreeing to the dictum that the ground for Potatoes should be well dug as soon as the previous crop has been removed, that the winter frosts may pulverise it. My advice rather in the case of such soils is to leave it alone till the spring, as the winter rains will otherwise pound it into the consistency of clay. There is no greater fallacy than is found in the eternal iteration of the advice—turn up your soil in the autumn that it may get the benefit of the winter frost. The soil which has been left untouched all the winter and is full of worm-holes, through which both moisture and air can pass freely, will be always found in the spring more thoroughly aerated and friable than is the soil which has been dug or ridged. It is about time the elementary twaddle found in garden school-books were revised

in accordance with the experience of practical men. We dibble our Potato sets in here as fast as the soil is dug, always planting the strong growing late kinds first, hence we don't get them up to catch the late spring frosts, for really the tubers lie dormant longer in the soil than out of it. Thus, if digging begins as this year in the month of February we can follow with the dibber at once, and so we go on, and as the soil, when fresh dug, lies light the little pressure given in dibbling and planting helps to consolidate it. The large growers dibble immediately after the plough, taking, as a rule, every third furrow for their line. Hence, they dibble in just where the soil lies loosest, and the supposition that the dibble in making the cavity for holding the sets necessarily makes a basin to hold water is incorrect. Really, the soil gets no more pressure than would be the case were it seeded and well rolled. If any one will but watch the planters following the plough they will not fail to observe that the ease and rapidity with which holes are made shows that the pressure on or in the soil is of the most trifling kind. Again, in covering up dibbled sets with a hoe—the invariable rule—it is seen that only light loose soil is drawn in, that the sets are evenly covered, and later results show that over vast breadths the tops come through wonderfully even and regular.

The planting of sets which need cutting is by no means a common rule—at least, in this district; the rule is to save or purchase for planting good seed size, and plant whole, therefore homilies about the evil of cutting sets are lost this way. I may, however, say that when I am sometimes obliged to cut sets sent me that are rather large I rarely find, if properly cut—and there is something in that—that failure results. Of my own seed, however, I always prefer to select samples of even size, that give all I hope for with a minimum of waste and of risk. *A. D.*

## BRITISH APPLES.

SOMETHING like surprise has, I believe, been expressed at the variety known as the King of the Pippins displacing the old and well known Ribston Pippin; this, however, it appears to have done, as it has received the greatest number of

such varieties as the Oslin Pippin, Court of Wick, Worcester Pearmain, &c.; while the Ribston Pippin is placed at the top of the lists, followed by King of the Pippins, Kerry Pippin, &c.; while as regards Ireland the two finest dessert varieties are shown to be Irish Peach and Summer Strawberry.

Where the poll was taken for the whole of Great Britain, King of the Pippins was placed first as a dessert variety, followed by Cox's Orange Pippin, then Ribston Pippin, and Kerry Pippin, &c. And as regards culinary varieties, Lord Suffield is placed first, followed by Dumelow's Seedling, Keswick Codlin, Warner's King, &c.

Several of our deservedly esteemed dessert Apples are found to occupy a lower position in the various lists than might have been expected to be the case, such as Golden Harvey, or the Brandy Apple, Court of Wick, Scarlet Nonpareil, Lamb Abbey Pearmain, and several others. This appears to be on account of their comparatively small size. Many growers, however, may consider size as of less importance than quality in the case of the dessert varieties of the Apple. *P. Grieve, Bury St. Edmunds.*

## NOTES FROM SYON.

A WALK round this admirably managed place cannot fail to leave a pleasant impression on the visitor. Things are generally so well done, that it is a difficult matter to decide as to which shall be noticed when space will not admit all. The forced Strawberries (*La Grosse Sucrée*) were carrying an abundant crop of very fine fruit; Keens' Seedling, too, was giving promise of an excellent crop. There do not appear to have been so many complaints this season of Strawberries and other forced fruits not setting, which may, no doubt, be traced to the fine season of last year for ripening the crowns, wood, &c. The early Peaches and Nectarines were simply "smothered" with fruit, nearly every bloom having set. In the Bananahouses is growing the *Vanilla planifolia*, most vigorously, and carrying any amount of flower. Before pods are formed the flowers have to undergo a careful manipulation or mutilation before they can be impregnated; here they are very successful, securing annually a fine crop of pods.

votes of any dessert variety of Apple. But in the lists of varieties selected by the various exhibitors as best suited for cultivation in their respective districts, Cox's Orange Pippin would appear to be an equally universal favourite, as in the six groups into which the counties of England are divided this variety is in each instance placed first upon the list, or as having been the greatest number of times selected. The accompanying tabular form will, however, show the names of a dozen of the first-named varieties in each group, placed in juxtaposition with each other, and it will be observed that considerable uniformity exists in regard to the estimation in which the varieties are held. As has already been stated, Cox's Orange Pippin is in each instance placed first, while in four cases out of the six King of the Pippins has been placed second, and in four instances out of the six the Ribston Pippin has been placed third. In Scotland Cox's Orange Pippin may as yet be little known, or it is possible that this variety may not succeed so well in the North as it does in the southern portion of the island—at all events, it is placed somewhat low in the lists, in some instances falling under

In one of the stoves, *Gardenias* planted out in a shallow box were carrying immense quantities of bloom; also *Eucharis amazonica*, very healthy: we were told this batch of *Eucharis* flowered six or seven times a year, and were never thoroughly dried off. There is also a fine batch of the lovely *Pancratium*-looking *Hymenocallis macrostephana*, from which they are enabled to gather flowers nearly all the year round. A fine terrestrial Orchid from Tropical America, *Cyrtopodium punctatum*, was throwing up a fine strong spike; it was flowered here six years ago, and was exhibited at South Kensington: the flowers are yellow and brown.

Pleiones are growing very strongly, and seem to appreciate the manure-water supplied to them. There are some fine pieces of *Anthurium Scherzerianum* and *A. Woodbridgei*, an excellent deep coloured variety with large spathe, broad and long, and lying close in to the stem; a lot of seedlings of the above variety were looking well. Some plants of *Odontoglossum vexillarium* were in most luxuriant health, many of them throwing three spikes. A collection of Cape bulbs which had a house devoted to them

were doing well, and contained some beautiful things. A pretty little *Primula* is *P. amoena*, with its bright rosy-pink flowers; a *Rose*, Chesnut Hybrid, had an extraordinary amount of buds on it. For a neat table decorative plant few things could equal *Gymnogramma schizophyllum* as it is done at Syon. Two grand *Acacias* for conservatory decoration are *A. longifolia* and *A. verticillata*; a bulb of *Crinum Macowanii* was carrying a fine truss of its lovely flowers.

In the fruit-houses the Vines, Figs, Melons, &c., were all giving promise of excellent crops, and some young fourteen months old Vines were growing very vigorously.

## Orchid Notes and Gleanings.

### ORCHIDS AT BIRCHFIELD, FALLOWFIELD, MANCHESTER.

THE pleasant blooms of the winter season have almost all bidden us adieu. The *Calanthes* are past, and started on again for the preparation of another season's growth and development of bulbs for future blooming; the *Coelogynes* are almost bare, though a few of their useful flowers still remain; *Lælia anceps* and *L. autumnalis* are over and gone; but what a host are trooping up. It cannot be said that any new methods are adopted here, or that any original ideas are carried out in the culture of these plants; but it can be affirmed that the principles of Orchid culture are thoroughly understood, and that every detail is carried out in a practical manner—Mr. J. Craggs being quite an enthusiast, and his success imparts a fresh zest to the pursuit; and liberal assistance and encouragement are rendered by an employer who is passionately fond of his plants, and whose success in so short a time is certainly unusual. The *Dendrobiums* just now claim attention, and *D. Wardianum* is the most prominent. Very wisely Mr. Craggs has managed these, so that they will flower in separate batches; the first lot is now just in excellent condition. The plants are almost all two years imported plants, and during the past summer made very fine and stout bulbs; this is shown by the blooming—500 flowers on seven plants; the best bulb has thirty-nine perfect blooms, many other bulbs producing from twenty to thirty. This number of flowers of this most beautiful *Dendrobe*, intermixed with several fine plants of *D. nobile*, and with a variety of *D. nobile* of an unusual depth of colour, almost the colour of *D. Freemanii*, *D. crassinode* *Barberianum*, *D. Findleyanum*, and *D. prmlulinum*, make an effective display in one of the houses. In other divisions *Cattleya Trianae*, *C. speciosissima*, and *C. amethystoglossa*, the latter being a variety of very good colour and spotting. Of *Odontoglossums* a very strong plant of *O. Alexandræ* has sent up two spikes, which have branched, one spike measuring 4 feet, the other 4 feet 2 inches. The flowers on each spike are nineteen and twenty-one respectively, a very stellate form, perfectly flat, but very narrow in each division; this is somewhat disappointing, but is one of the experiences that all Orchidist have to pass through. A later batch of this beautiful Orchid gives promise of finer forms and of stouter substance. *O. Pescatorei*, *O. nebulosum*, *O. triumphans*, *O. Sanderianum*, with a variety that is much like *O. Chestertonii*; but it will be better to wait another season, as the spotting in recent imported plants is not always constant. *Cypripedium Boxalli*, *C. niveum*, *C. Lawrenceanum* are nicely in flower, also the scarce *Oncidium trilingue* has produced a lengthy spike and blossoms of a rich chocolate-brown edged with pale yellow, with its singular lip, are conspicuous amongst and above the other plants. *Cattleya Mossiæ*, *C. Warneri*, and *Mendelii*, are now pushing up in their sheaths, and by-and-bye the blooms will be counted by the hundreds. *W. Swan, Fallowfield.*

#### EPIDENDRUM ENDRESII.

This charming Orchid has flowered with Sir Trevor Lawrence, Bart., M.P., this spring, in his rich collection at Burford Lodge, and to him we are indebted for the means of giving an illustration of it (fig. 91). The plant was originally discovered by Endres in Costa Rica, and afterwards found there by Mr. Lehmann in 1878, who endeavoured to send it over alive, but not with success, until after repeated attempts,

and then only a plant or so survived the journey. Messrs. F. Sander & Co. have frequently tried to get plants of it to England, but, owing to its being a very bad traveller, they also have met with but a poor reward for their trouble, only succeeding in getting three or four plants to survive. In March, 1883, however, it flowered at St. Albans, and in the issue of the *Gardeners' Chronicle*, April 7, 1883, Professor H. G. Reichenbach—naming it after poor Endres, who had sent him the original specimen—described it. The same plant which supplied the description is now in bloom with Messrs. F. Sander & Co., and, therefore, we may conclude that its proper time of flowering here will be March and April, the same time that Mr. Lehmann found it blooming in Costa Rica, although Endres gathered it in flower in December. When strong, however, its period of flowering will no doubt be very protracted, and let us hope that such a pretty and modest-looking beauty will not long be with-

FIG. 91.—EPIDENDRUM ENDRESII: FLOWERS WHITE.

holden from us, although its very unpopular name, *Epidendrum*, gives but little hope to the importer that it will ever attain a commercial value commensurate with the trouble and expense of importing. *E. Endresii* is of compact growth, having rather hard stems and leaves, which Professor Reichenbach happily terms "like those of *Box*"—a term which well marks their difference from the usually fleshy leaves of others of like habit of growth. The flowers are of the purest white, waxlike in texture, the only colour being some prettily arranged violet spots on the centre of the lip and its wings enclosing the column, and two raised orange-coloured marks in the middle of the lip, and immediately beneath the cap of the column. The difficulty lies in getting the plant alive, for once obtained it seems to grow well in a rather shady part of the intermediate-house. Some day, when good specimens of it are to be found covered with its charming blooms, *E. Endresii* will do much to right the wrongs of slighted genus. *James O'Brien.*

#### ODONTOGLOSSUM MARRIOTTIANUM.

This rare plant has again flowered with Mr. Geo. Marriott, at Upper Edmonton, and, as was expected, it has improved by culture. It is evidently a cross between *O. crispum* and *O. cirrosum*. In size the flowers are as large as a good *O. crispum*, the segments being formed as in *O. cirrosum*, the tail-like points being the same as in that species; the lip, too, is elongated, and has a twisted point, as in *O. cirrosum*. The flowers are of the purest white, delicately frosted over, and sparsely marked with spots of the *O. cirrosum* character. It is a charming plant, and Mr. Marriott sets great store by it. Some good *Cattleyas* and *Dendrobies* are also in flower with Mr. Marriott, and a fine lot of *Oncidium Marshallianum*, and a grand lot of Mexican Orchids coming on in fine order.

#### ODONTOGLOSSUM TRIUMPHANS.

A superb variety of this noble cool-house Orchid is now in flower with Messrs. John Laing & Co., at Forest Hill, who are making good progress with Orchid culture. The blooms of the plant in question are 3½ inches across. The sepals and petals, which are very broad, are all equal, the ground colour bright yellow, barred and blotched with shining chestnut-brown. The straight projecting column is over an inch in length, pure white, with crimson cup and wings; lip 1½ inch long, pure white at the base, reddish-brown in front, the margin being bright yellow. *O. triumphans* is always good, and Messrs. Laing's variety exceptionally so.

#### VANDA CŒRULESCENS.

Blue Orchids are so rare that we can afford to overlook any deficiency or weak point affecting their value as decorative subjects, or that ideal excellence rather too frequently dwelt upon, namely size. The species under notice is inferior in point of size to the old *V. cœrulea*; but the plate in the *Botanical Magazine*, t. 5834, scarcely conveys a true idea of its beautiful colour. At all events a specimen flowering in the East-Indian section of the Orchid-house at Kew has the sepals and petals of a clear sky-blue, while the lip although rather small is deep blue. The species is also described as having the flowers in a pendulous raceme, but the peduncle of the above mentioned specimen is erect from a spreading or decumbent base. These are characters of minor importance, but certainly they are sufficiently noticeable to command attention. The unusual colour in this great natural order is a sufficient guarantee for the admission of this plant in a collection whose value would be greatly enhanced thereby. There is another figure of the plant in question in the *Gardeners' Chronicle*, 1870, p. 529, fig. 97. *J. G.*

#### CŒLOGYNE CRISTATA AS A COMMERCIAL PLANT.

Peter McKenzie in his suburban greenhouses, &c., in the neighbourhood of Paisley has a superb collection of *Cœlogyne cristata*. I counted some fifty specimens, and it seems to be such a favourite with his customers who do business with him in his Glasgow shop, that it pays him over and over again. The varieties among the lot comprise about three distinct forms, the earliest one being the typical plant, which is distinguished for its longer sheaths than the other forms. There the lemon form which is as easily distinguished as an old white *Camellia* among its competitors by having a much shorter sheath, and when in bud is only faintly discoloured, so different from the typical variety. Some of these lemon forms almost disappear into the concoloured form which seem to command a fancy price in these times. The crest which is more or less tinged with from a faint lemon to a showy yellow, is much larger and longer on the one than the other. Probably the most useful of the three is the latest flowering one which has been seen in Chatsworth and in Veitch's collection, but is much scarcer than the other two forms. Any of them for cut flowers individually command more than even a *Maréchal Niel* Rose or the finest of *Camellias*, and is well worthy the attention of all those who can command a market in varied cut flowers. *A.*

#### ODONTOGLOSSUM POLLETTIANUM.

This beautiful hybrid *Odontoglossum* is now in flower at Messrs. F. Sander & Co.'s Orchid nursery, St. Albans, where, seen as it is, among a large and interesting group of hybrids, a good opportunity is given of judging of its merits. No one who sees it will say that the First-class Certificate which was

awarded to it when Mr. H. M. Pollett, of Fernside, Bickley, exhibited the original plant at the Royal Horticultural Society was not well deserved, as its flowers have size, form, substance, colour, and durability in a degree not combined in any other of its class. The flowers may be described as being like those of a medium-sized *O. crispum*, but decidedly of the wax-like substance of *O. Ruckerianum*. They are heavily blotched and spotted with rich claret-crimson. *O. Pollettianum* may be regarded with relation to *O. Ruckerianum* to hold the same place as *O. crispum* *Veitchianum* does in the *O. crispum* section. *J. O'Brien*.

#### DENDROBIUM NOBILE VARIETIES.

The handsome and fragrant old *D. nobile* seems again to be coming to the front, and its good varieties taking rank as plants of high commercial value. Recently Mr. J. C. Stevens sold a large plant in bloom for 10 guineas, and a smaller one of a better variety fetched 18½ guineas. Recent importations show that this Orchid varies very much in specimens from different localities, whilst in certain localities the forms are superb. Messrs. F. Sander & Co., of St. Albans, have now a large batch in bloom which they received from their collector with advice that they should be flowered. They are a superb strain, the colour of the flowers varying from white to bluish-crimson, and the labellums from crimson to nearly black, many of them, too, are prettily tinged with primrose-yellow. The plants were found growing with *D. lituiflorum*, and those varieties which approach the rich bluish-crimson of *D. n. nobiliss* show traces of that species, their lips being somewhat of the trumpet-shape, and having the brightly tinted sharp pointed lower half as in *D. lituiflorum*. It may well be that the two species have intercrossed. On the other hand, many of Mr. Sander's *D. nobile* have round flat lips, tinged with yellow, and shaped something like those of *D. primulinum*. In their growth and in the odour of the flowers there is so much variation that it seems to point conclusively to the fact that the lovely family are of mixed parentage. *J. O'Brien*.

## The Rosery.

#### TEA ROSES IN APRIL AND MAY.

In the notes given at p. 382, reference was made simply to the class of hybrid perpetuals, and the general condition of the Rose garden at this season; the class of Tea Roses cultivated in the open air require a separate notice, as they require (or even if they do not require they receive) a separate treatment; indeed the treatment varies to a considerable extent with the part of the country in which they are grown. In the South of England and in the South-west of Scotland, and other parts where the magical influence of the Gulf Stream is felt, they are grown in the open, and slight protection given to them in severe weather. In the Midlands and more northern parts of our islands it is necessary either to give them very substantial shelter, or else to lay them in until all fear of frost is over, and then plant. The use of raised beds where the soil is heavy, or the situation unfavourable, has led to many being cultivated in the open air where the attempt had not been previously made, while there are no doubt many who, like myself, having raised some in the autumn, have thought it wiser to lay them in, and are now preparing to plant; indeed this question of autumn or spring planting has been much mooted with regard even to hybrid perpetuals, when the question has reference mainly to transferring from one portion of the rosery to another, or the planting of trees obtained from a nurseryman near at hand. Where one can select his own plants, and bring them away with him, there cannot, I think, be a question as to the preference to be given to autumn planting; but when they have to be obtained from a distance, when you do not know how long they may have been in the packing shed before they are sent off, and when in some cases probably a week has elapsed from the time of lifting until the time of planting, then I say by all means, when they are received, lay them in, and wait for spring planting; but whatever may be the case as to hybrid perpetuals, I am quite convinced that for Teas it is best, however obtained, to lay them in during the winter months and have a mat or some covering close at hand to put over them when severe weather

comes. I live in the south-east of England, and we are not as some people imagine thereby protected from cold; nowhere, except perhaps in East Anglia, are the effects of the vile north-easter more felt—things will not live out-of-doors here which flourish in the Isle of

FIG. 52.—BRASSAVOLA STRICTA.

FIG. 53.—OOENTOGLOSSUM GRANDE.

Wight, or in South Wales, or Devonshire. The great advantage which I think we possess is the dryness of our atmosphere; we are not exempt from spring frosts, and in three years out of four our Cherry crop is thereby destroyed, so that my own method of procedure may be a guide to a good many places if they choose to follow it. I have a considerable number of Teas on the seedling Briers, which have been laid

in under a south wall, and which I am now preparing to plant: of course all fear of frost is not gone, but none that will hurt the plants themselves, although some of the shoots may be cut off. The bed into which they are to be planted was prepared in the autumn and has been lying roughly turned up all the winter; the plants I find have been throwing out rootlets, but as they will be taken immediately from the place where they have been laid on to the bed these will not have time to dry, and will not, I hope, suffer by the removal: at any rate, as the seedling Brier is such a famous stock for bearing many roots, I do not from my experience of former years anticipate that they will be much checked. Previous to planting each plant is pruned, and as this is the first year of their planting, they will be pruned quite hard, that is, back to three or four eyes. I have found that when this is done strong shoots are thrown up from the bottom, which give an abundance of bloom, and quite late too in the autumn. A certain amount of retarding is caused by thus removing, and therefore they are not likely to be so forward as those which have been in their position for some years; this will help towards having a continuous bloom.

The old-established beds which have existed now for some years look very well, and the question now comes how they shall be pruned. Last year one of my beds was pruned very hard, and as a consequence I had a very large quantity of strong growth, so that the plants are now almost touching one another. If I do the same this year I suppose that the same result will ensue, and I therefore shall not cut them hard. It is strange how opinions vary on this subject. Mr. Prince, who is one of our greatest authorities on Teas, says "Hardly prune at all," while others say "Shorten growth about one half," and others "Only take off the end of the shoots." My own experience leads me to believe that if you require to get vigorous growth and a well furnished plant that it is best to prune hard. You will also get good blooms somewhat later, but borne in profusion. If you require early and choice blooms for exhibition a more tender use of the knife will be advisable. In some seasons after a severe winter there is no choice about pruning, for, unless the heads have been protected by bracken or some other material, the shoots will have been severely hit, and it will be necessary to cut below any part which has been affected by the frost, but this year there has not been—with us at any rate—any frost sufficient to injure them, and as I have said they are fuller of young shoots than the hybrid perpetuals. The beds which I did not prune so hard last year have not made as much growth, and I shall give them this year a turn of hard pruning, so as to get, I hope, more growth with them. *Wild Rose*.

(To be continued.)

#### TEA ROSE HOUSES.

THIS subject, and the best mode of cultivating Tea Roses under glass, has been most ably put forward by "Wild Rose," and, being myself well acquainted with the propagating and growing of Tea Roses, I cannot agree with the mode of growing described by "A. D." in the *Gardeners' Chronicle* of the 14th ult. I may mention that I have worked in the large Tea-house at Messrs. Cranston & Co., of Hereford, previously spoken of by "Wild Rose," and a finer lot of well grown Tea Roses cannot be seen. This house has both top and side ventilators, and upon all favourable occasions in the blooming and growing season air is given freely. Of course care is always taken that no strong draught can play through the house, as the air is always given on the proper side. The growth on these trees is particularly strong, and the blooms are of extra size and quality. By the end of autumn the wood is always well matured and ripened, and in the following February it receives a careful pruning. I have myself a small house of newly grafted dwarf and climbing Tea Roses in pots which I well ventilate on all bright and warm days, closing the house early in the afternoon, at the same time syringing the plants. These have made under this treatment some fine strong short-jointed growth. I also would remark in reference to the statement made by "A. D." as to the large market plant growing establishments where plants are grown in low span-roofed houses being sparingly ventilated—I think every gardener is perhaps acquainted with the fact that these growers cultivate for quantity, and for producing their stuff economically and quickly to meet the demand; but the question is this—Will Tea

Roses retain their fine quality in such ill ventilated houses and under such treatment? My experience is that the growth becomes miserably weak, the plants soon get exhausted, and have frequently to be replaced by new ones. It may not be the case with "A. D.'s" climbing Roses, still I cannot think but that the growth is thin, and the blooms not very first-class. I shall, however, continue to grow my Tea Roses as I have always done, with air carefully given, and shall have much pleasure in reading and studying the practical hints given by "Wild Rose" on growing Tea Roses. *Edmund Williams, Pearmarsh Place Gardens.*

#### JAPANESE ROSE HEDGE.

*Rosa rugosa* should make a good and ornamental hedge. I have used seedlings for the experiment, suckers would save time, and where this Rose is grown in good soil and thrives it throws up suckers in abundance; the advantages which strike me are, the large sharp clear thorns, the pretty foliage which comes out early, and which stands frost; that the fruit is almost as beautiful as the flowers, that the growth is quick and the wood stands close pruning when required. Large plants give much seed, and this comes up well in the seed bed. If the hedge comes much into use the hawfinches will have a good time. I recommend nurserymen to consider the subject of this new hedge. *G. F. Wilson.*

#### A REMARKABLE ROSE TREE.

At the new gardens, Whitby, there is growing a remarkable Rose tree of the *Maréchal Niel* variety. It was planted, or rather budded, on Victoria stock by the late Mr. Willison in the year 1865, so that it is nearly, if not quite, twenty years old. For many years it produced regularly large quantities of Roses of perfect beauty and rare perfume; but it was not till the year 1882 that the full number of blooms was accurately counted, when no fewer than 2500 single Roses were recorded. This is believed to be the largest number ever grown on the tree during one season. In 1883 there was a falling off in the number of Roses grown of about 1000, the actual number plucked being a few less than 1500. Last year (1884) there was a further diminution in the number, as only 850 blooms were plucked. It was then thought that the tree had seen its best days, and that, considering its age, its vitality was on the wane, and that its powers of production would lessen every year. There is, however, more than sufficient reason to believe that there is abundant life in the old tree yet. Since last season Messrs. Brown & Co., who are the proprietors of the gardens, have devoted considerable care and attention to the tree, and there is now the best evidence of the probability of their industry being amply rewarded, for at the present time, early though it is, there are many hundreds of buds in various stages of forwardness—some on the point of opening, and others just visible at the ends of its long and vigorous lateral growths. There is every reason to believe that the tree this year will be more prolific than ever, the proprietors estimating the number of probable blooms at not less than 3000. Cuttings and blooms from this remarkable Rose tree are sent all over the kingdom during the season. It is believed to be the largest and most prolific tree of its kind in England.

#### THE PROPAGATION AND CULTURE OF DIEFFENBACHIAS.

ONE way of propagating these plants is by cutting off the top growths with about  $1\frac{1}{2}$  inch of the main stem, and putting them in as cuttings. In potting well drained 60-sized pots should be used, and a little sand should be placed around the bottom of each cutting. A stick should also be placed to each pot to support the cutting; they can then be placed in a cutting case or frame upon a brisk bottom-heat, where they must not be watered at all for the first four days, but at the end of that time they should receive a good watering with a fine spout pot. It would not be loss of time if the cuttings were taken out of the case on this occasion and afterwards replaced in the case to be watered as they become dry.

During the whole time the cuttings are in the case great care should be taken not to water them overhead, because the plants, being of a succulent nature, are apt to rot if too much moisture hangs about them. They should be shaded from the sun, and for ventilating purposes the lights or glasses of the frame should be removed for an hour both at night and in

the morning, but when the cuttings have well rooted an inch of air should be allowed to remain on both night and day. After three or four days they will have gained strength enough to permit of their being turned out upon the open bottom-heat: here the plants should be allowed to remain for a week, and then should be potted into 32-size pots. It will be necessary to replace the plants upon the open bottom-heat, and to keep them there until they have become thoroughly established. They can again be potted if necessary or removed to any other warm house where they may be required.

#### THE OLD PLANTS,

the heads of which have been taken out for the cuttings, can be further cut down to within an inch of the soil, and the piece of main stem thus cut off can be divided into lengths of  $1\frac{1}{2}$  inch. Each piece should possess an eye, and a little sand should be placed at both ends to prevent the sap exuding. In potting, small 60-sized pots should be used, and a little sand should be placed at the bottom and around each piece, the top of which should be level with the surface of the soil. When they have been a week in the cutting-case they should receive a good watering, but not till then, and from that time it is only necessary to water them as they become dry. The case should be shaded from the sun and ventilated for an hour in the evening and morning of every day. As soon as the growths or shoots, the pieces of stem will send up, have attained the length of 6 inches they should be cut off and put into small pots as cuttings. The old pieces of stem should be replaced in the frame until the fresh growth they will form has grown to the length of 2 or 3 inches, and then if roots have been formed they can be turned out upon the open bottom-heat to be potted on as they grow in size and strength.

#### THE CUTTINGS.

The shoots which have been put in as cuttings must be placed in the frame and hardened off in the usual way. When they have rooted they can be potted into large 60-size pots, but they must be replaced upon the open bottom-heat, and can be treated in a similar way to the other cuttings.

The soil for potting the cuttings should be composed of one-half peat, one-fourth good yellow loam, and one-fourth river-sand, and a small quantity of finely broken potsherds. Before it is used it should be well mixed together, and both sifted and rubbed through a quarter-inch sieve.

For the old plants the following should be used:—Half good yellow turfy loam, one-third peat, and a quarter river-sand, to which should be added small quantities of leaf-mould and finely broken potsherds. The old plants should be grown in a brisk temperature, and during the growing season should be well supplied with water at the roots and syringed twice daily, besides being lightly shaded from the sun and ventilated upon all fine days.

#### VARIETIES.

Of those which deserve the attention of the propagator are—*D. Barquiniana*, *D. brasiliensis*, *D. picta*, *D. Bausei*, *D. Bowmani*, *D. Imperator*, *D. insignis*, *D. Leopoldi*, *D. marmorata*, *D. Pearcei*, *D. sequina picta*, *D. Shuttleworthi*, *D. splendens*, *D. Weiri superba*, *D. Carderi*, and *D. eburnea*. *T. O. B.*

#### FRUIT NOTES.

FRUIT PROSPECTS.—It may seem early to write of these, but the swelling buds enable us to say that there has seldom been better promise of huge fruit-baskets of all sorts of fruit than that presented to the open-eyed pomologist this April. Of course there may be many a slip between this cup and our lips—these fair promises and the blighted performances of several months hence. Yet can nothing rob us of the promise, as already stated, is all that can be desired, barring the birds. The latter are ever with us, and are far less problematic evils than the first. The latter may come and blight all, but the former are already carrying wreck and ruin at a fearful rate among the fruit-buds. No one who has not seen a few tomtits or bullfinches at work among the Pears and the Plums can have any idea of their enormous powers of destruction. We are often told, "A few buds to feed such tiny birds, what are they among so many?" What indeed, if they only took sufficient to fill them; but that is not their mode of proceeding. It cannot

be too often repeated that the birds chew, not eat the buds. They simply smack them down at the rate of a score or more a minute. Whether they retain a morsel for themselves in the process is doubtful; but down they go before them as snow melts under the fierce sunheat, and whereas the tree was yesterday all bloom, to-day it is bloomless. But that is hardly a truthful way of putting it, for the birds do not wait for the trees to be in bloom before they attack them. It is not a new edition of the nursery rhyme that when the pie was opened the birds began to sing. Before the buds are opening the birds began to dash them all to the ground. Pomologists are told that this is the punishment of insects and that the birds are their best friends, &c.: what when all are scattered? Better a good many worms in the bud, than all the latter scattered like a shower of hail on to the cold earth. And any one who has seen the birds at work will then relinquish the insect-hunting theory on the instant; the birds exercise no discrimination, they are simply wholesale plunderers, reckless destructionists, stripping the whole tree, bough by bough, branch by branch, just as a huge snail will browse off a bed of young Cabbage or Lettuce plants, so far as it can feed at one meal—but with this difference, that as the birds do not seem to feed on the buds, they will strip on for hours at the rate of twenty or more a minute, and the entire stripping of fruit trees or Gooseberry bushes, leaving our fairest prospects of plenty on the ground instead of on the plants. But apart from the ravages of birds, so far the season has dealt kindly with the fruit crops; though the frosts have been sharp, neither Pears nor Plums, nor Peaches, Apricots, nor Nectarines, in the open, have suffered much, if at all; and with ordinary skill in protection, and the rigid suppression of insects so soon as they appear, there is every prospect of a splendid fruit harvest. Pears are specially promising, and will be specially welcome after the scant harvest of the last two or three years. *D. T. Fish.*

#### RIBSTON, COX'S ORANGE, AND KING OF THE PIPPINS APPLES.

Although the note on p. 384 is doubtless quite right as regards the place mentioned, it is scarcely applicable to the whole district north of the Trent. Here, nearly 20 miles north of York, we had fine fruit of each last year, and of the three Cox's Orange was, without doubt, far the best, the King coming second, and the Ribston behind both. *Thomas Trollope.*

## Florists' Flowers.

#### THE HYACINTH.

I HAVE been recently turning over the pages of Hogg's book on florists' flowers, which includes the culture, &c., of the Hyacinth. It does not seem that we have learned a great deal in the method of culture. Perhaps in those days out-of-doors culture was better understood than it is now, and hardy plants like the Hyacinth were always much valued for the embellishment of the flower garden in spring. Hogg writes as if protecting the flowers from the sun were of much importance. Doubtless it is, and our forefathers thought nothing of putting up some arrangement of framework, which was covered with canvas, to shelter choice flowers from sun, rain, and wind; indeed, an old florist's garden used to be a very untidy place, as all his choice flowers required to be covered up in some way or other.

After the Hyacinth the late Tulips came in, to be succeeded by the Ranunculus beds in June and the Carnations in July. It is much better to let the whole of them take their chance in the open ground, as even if the litter could be tolerated the plants do not mature their growth under canvas or shading of any kind so well as they do in the open air, even in our cold and changeable climate. It is stated in Hogg's book that the best customers to the Dutch growers were the English, and the demand for bulbs was regular and progressive. It seemed to be the custom to destroy the bulbs that had been forced, and import a fresh supply annually. Against this Hogg protested, and made a suggestion that no doubt had been made before, and has frequently been made since, that we should compete with the Dutch in

growing our own Hyacinths. A list of the best cultivated varieties is given, and comprises 125 double varieties and only thirty-one single.

Since 1839, when the book was published, there has been quite a revolution in the popular estimate of what constitutes a good Hyacinth. The proportion of single to double varieties has been reversed, and scarcely any of the Hyacinths popular then are grown now. Even during the last quarter of a century the improvement has been very great indeed. In all the classes there have been improvements very recently in the colour of the flowers and the form of the spikes. The dark purple-blue *Souvenir de I. St. Veen* has flowered well this year, and promises to be a very fine exhibition kind; *King of the Blacks* has been well shown: *Sultan*, a rich purple-blue, forms a massive spike of well formed bells, and is highly thought of by Mr. James Cutbush, of Highgate.

In the pale blue class *Princess Mary of Cambridge* is the most attractive of the new varieties. It forms a tall spike quite different from the broad massive one of *Lord Derby*, the best of the older varieties. *Grand Maître* is very distinct, the bells are very large and of good form, but not very thickly placed on the spikes.

We have now some distinct and good new varieties in the class for single reds. The latest and best is the *Queen of Reds*, exhibited by Messrs. Veitch at South Kensington and Regent's Park. It did not receive a Certificate, probably the plant was not strong enough; but as it is a sport from the *King of the Blues*, it will rise to the highest position in its class: the colour is a bright red. *Garibaldi* is not very common as yet, but it is the best of the brilliant red kinds, and has been well shown this year. This and *Vuurbaak* are the best dark red varieties. *Morena* promises well; it is a distinct and very fine variety, the colour a peculiar salmon-buff.

In the white varieties *Anna* is likely to hold a foremost place; it is not white but bluish, and caused quite a sensation when exhibited by Messrs. Veitch, of Chelsea, some years ago: no such massive spikes were ever before seen. It has not subsequently been so well developed. *Galatea*, exhibited by Messrs. Cutbush, of Highgate, is a very distinct variety with large flowers of a bluish-white, and forms a good spike. None of the new pure white varieties are yet to be compared with the splendid kind *La Grandesse*. Amongst the yellow varieties the recent improvements have been very marked. *Admiration*, exhibited by Messrs. Veitch as a new kind, is very promising; the spike is large and very symmetrically formed. It may take its place as about equal to *King of the Yellows* and *Bird of Paradise*, but it will not surpass those fine varieties. The names of many new varieties are creeping into the catalogues at reasonable prices, and some of them are destined to take a permanent place there; but their characters cannot be ascertained by merely seeing them in single specimens at a flower show; there are some varieties that will produce a splendid spike occasionally, but it may be necessary to grow twenty bulbs to obtain it, whereas such a variety as *King of the Blues* will produce all its spikes fit for exhibition, but this is one of the most constant of Hyacinths. Still there are some others that may be depended upon to produce good exhibition spikes every year if three or four bulbs are grown. Many, of course, grow for the rich and distinct colours of the individual specimens, and do not care to sacrifice individuality for mere size of spike, and in that case bright and decided colours have the best effect arranged with other flowers.

In cultivating the Hyacinth it is important to take into account the rapid development of the plants after they are removed into the houses. Whether the pots are well filled with roots or not, the development is very rapid; if there are few roots the spikes will be weakly, and they will be strong just in proportion to the character of the roots. September and October are the best months in which to pot the bulbs. Five and 6-inch pots should be used, and a single bulb ought to be potted in each, using rich sandy loam, with a liberal proportion of sand, leaf-mould, and decayed manure. The pots ought to be placed closely together on a hard dry bottom, and be covered with about 3 inches of cocoa-nut fibre refuse over the crowns of the bulbs. Here they ought to remain for three months, and by that time plenty of roots will have formed, and the spikes will be pushing strongly from the centre of the crowns; after this time they may be removed into a cool house for a few days until the leaves become green; they may then be

forced in a warm house or grown on to flower in the greenhouse, according to the will of the cultivator. What they require in order to have the leaves erect and of good substance is to be placed near to the glass as soon as the leaves are green; what I mean by this is that the plants should be within a foot or 18 inches of the glass roof. This closeness to the glass gives richness of colour and good substance to the flowers and the spikes are better developed. When the flowers have faded we do not throw our bulbs away. The pots containing them are placed in a sheltered place out-of-doors, and they are supplied with water until the leaves naturally decay. The bulbs are then cleaned and stored away for potting next season. We pot three in a 6-inch pot of these home-saved bulbs, and very useful they are for furnishing the greenhouse and conservatory early in the season. Sometimes we have planted them in the open borders, and here also they make a very rich display the following and successive seasons. *J. Douglas.*

## Plants and their Culture.

### BULBOUS PLANTS.

OF Lilliums I purpose giving a trial to *L. auratum* for late autumn blooming by potting up some sound bulbs that are still to be obtained in the dormant state. I think they will prove valuable after the other established Lillies are over. When potted they will be kept moderately dry at the root till the young growths are well above the soil; this will consist of peat and loam in about equal proportions, with a liberal addition of silver-sand; a small handful of the latter will be used around the bulb itself. Pots of moderate size will be used, but such bulbs as thrive the most satisfactorily will again receive attention after the flower-spikes have died down, and larger pots be given them. I do not believe in the dry course of treatment that Lilliums in pots sometimes receive, as an examination of this course would convince any one of the mistake they are making, and which can be easily seen by inspecting the roots after the flower-spikes have died down. These will generally be found in a growing state proportionate to the vigour of the bulb itself.

### SCHIZOSTYLIS COCCINEA

which have done duty during the winter might now be shaken out of their pots, and planted into good soil in the open ground. The stock can be easily increased by division, and should there be a goodly quantity at disposal I advise a portion to be planted in a sheltered nook, or where they could have a movable frame placed over them when the spikes appear in the autumn, as a safeguard against injury from frost. In this way a quantity of spikes will be obtainable for cutting at a needful time.

### HELLEBORUS NIGER

(Christmas Rose) and its varieties, if still in pots, after having done service in that manner, should be treated the same as recommended for the *Schizostylis*. This treatment will be found far better than allowing such valuable material to stand about for a few weeks longer before getting attention; the probability is they would frequently become dry at the root and thereby considerably weakened if this work is postponed.

### FORCED PLANTS.

Through want of room and time, and sometimes from thoughtlessness, plants that have been forced get but scant attention afterwards. Any place is considered good enough for them, but it would be better to throw them to the rubbish-heap at once than to let them thus become spoiled for future use. Of all forced shrubs there is perhaps none pays better for kind attention than *Dentzia gracilis*. On previous occasions I have advised a due regard being paid to this plant, and I am more convinced than ever that the system followed here is a good one by the abundant crops of bloom that the plants are bearing this season. We treat them in the same manner as *Indian Azaleas* after flowering, removing the flower-spikes and placing the plants in a vinery where they will receive frequent syringing and a plentiful supply of water at the roots. When the growths are completed the plants are gradually inured to the open air and a sunny position, the pots being plunged in a bed of coal-ashes. Our

stock has not received a shift for the past nine years, yet they do not show the least signs of exhaustion. Top-dressing has at times been given them and liquid-manure at intervals during the season. *Rhododendrons*, *Kalmias*, and *Andromedas* after being forced and gradually hardened off can be turned to good account in making up any vacancies among the American plants in the open air. *James Hudson, The Gardens, Gunnersbury House, Acton, W.*

## FRUITS UNDER GLASS.

### ORANGES.

THE Taogierie variety, and, indeed, the other varieties also, have now passed through the period of fruit setting, and should be grown on in quite a tropical temperature and atmosphere, if the best results are to be obtained. They succeed all the better if they are well syringed twice a day from now until the fruit begins to colour. The water that is applied to the roots and also that used for syringing should be at least as warm as the atmosphere; but it may even be warmer if warmed over the hot-water pipes. We keep a number of water-pots constantly filled with rain water in all our hothouses over the hot-water pipes, and it is always ready either for watering or syringing. Instead of using manure-water we take a handful of rich prepared compost and spread over the soil in pots. The best material for Orange trees is equal parts of loam and decayed manure reduced to powder; added to this some bone manure reduced to powder, and some powdered charcoal. The trees require repotting at uncertain intervals, and if they require it now it is a good time to do it. The Orange trees may live in the poor, black peaty mould in which they are some times potted, but they will not carry full-sized good flavoured fruit unless they are potted in substantial loam, crushed bones, and some good stable manure added. Charcoal is a good mechanical agent to mix with it. *J. Douglas.*

## The Kitchen Garden.

### FORCING DEPARTMENT: CUCUMBERS.

THE young plants from the January sowing, if they have been well treated, will now be fruiting freely, and the old plants which have occupied space through the winter may now be safely removed, and, if necessary, replaced with another lot. Large seedling plants not being available for this purpose, some excellent cuttings may now be taken from the young fruiters of this year's sowing. Remove the growths to form cuttings at the base of the third or fourth partly developed leaf. It is best to have two leaves at least, after removing the one to form the base of the cutting. Place the cuttings singly into small pots, such as 60's, in light soil, with a good addition of sand. They must then be placed beneath a bell-glass, or in a propagating-frame, where a somewhat brisk and regular bottom-heat can be maintained, shade from bright sunshine, and after they have been in for several days, should the closeness produce too much moisture about the foliage, care must be taken that the points of the cuttings do not damp off. A little air may be left continually on the frame or bell-glass, or the glass inside may be wiped over with a sponge occasionally to prevent drip. As root-action commences admit a little air, and gradually expose them to full sunshine and the air of an ordinary Cucumber-house or pit. Cuttings or seedlings may be planted out in frames on hotbeds now with every chance of success, keeping good linings round the frame in order to ensure a good top-heat as well as bottom. When planting on newly-formed hotbeds leave a chink of air on the lights continually to let out the steam, and cover the glass at nights with mats when necessary.

### TOMATOS

in pots and planted out will now be growing rapidly. Do not allow the shoots to become too thick. The shoots of plants in pots should be regularly pinched after each successive show of bloom, to induce fruit to set evenly all over the plants. Those planted out, of course, will be treated in this respect according to space and other circumstances. Apply no stimulants until a good number of fruits are set and swelling.

Pot off early sown Capsicums, also prick off any herbs requiring it. *G. H. Richards, Somerley Gardens, Ringwood.*

## APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, April 21	Royal Horticultural Society: Meeting of Fruit and Floral Committees, at 11 A.M.; Scientific Committee, at 1 P.M.
	National Auricula, Carnation, and Picotee Society's Show of Auriculas, at South Kensington.
WEDNESDAY, April 22	Sale of Imported Orchids, at Protheroe & Morris' Rooms.
	Show at the Royal Botanic Society's Gardens.
THURSDAY, April 23	Sale of Carnations, Picotees, Plants, &c., at Protheroe & Morris' Rooms.
	Sale of the celebrated Collection of Stove and Greenhouse Plants and Orchids, at Garbrand Hall, Ewell, by Protheroe & Morris.
FRIDAY, April 24	Sale of Valuable Imported Orchids, from Mr. Sander, St. Albans, at Stevens' Rooms.
	Sale of Imported Orchids, at Protheroe & Morris' Rooms.

It is a disappointing thing when one is looking for a satisfactory explanation of any particular phenomenon to be told that it is due to some internal force which cannot be defined except by its results. When the candidate for a medical degree was asked why opium acted as a soporific, he is reported to have answered, "*Quia est in eo virtus dormitiva.*" Unfortunately we have in many cases no better answer to give about the commonest phenomena. We talk glibly enough about gravitation, we assign particular effects to it as a cause, but we are as entirely ignorant of what gravitation is as we are of what constitutes heat or what is the nature of electricity. We allude to the subject because a Swiss Professor has lately been investigating the upward growth of the stem and the downward growth of the root, but after all his experiments all he can tell us is that it is due to "polarity," and this polarity manifests itself in the fact that branches tend to produce new branches near their summit, while in roots the tendency is to produce branches near the base.

M. VÖCHTING is at great pains to show that this polarity manifests itself in detached portions of the plant, as when a branch of a Willow is suspended in a dark room in a reversed position. After a while, buds will be formed at the organic upper end and roots at the upper extremity in spite of their reversed position. We need not specify M. VÖCHTING'S experiments, because they are just what experience has taught us to expect, and what many of us have frequently witnessed.

It is, however, important to remark that M. VÖCHTING proves that gravitation has nothing to do with the phenomena, for on so repeating the experiments (by the use of a clinostat) that the action of gravity is nullified, the results remain the same. Alluding to the different kinds of branches that one meets with in fruit trees, M. VÖCHTING shows how each variety of branch, leader, shoot, lateral, fruit-spur, spine, may proceed from buds of identically the same character and that the character of the shoot may be determined by the experimenter. It is obvious here that we are dealing with the physiological basis of pruning. The facts specified by M. VÖCHTING have been known and acted on for centuries, and various explanations have been given of them. In gardening books, even many of the best modern books, we find the sap credited with this, that, and the other, according to its nature, and the supposed directions and concentration of its currents.

The teaching of modern physiology takes a very long time filtering through horticultural books, and so we find even now the best gardeners among us still hugging the belief in the mysterious and diversified powers of the sap, long after such powers have been shown to be purely visionary. We need not now stop to point out what the accepted doctrine is, as we have so frequently done so in these columns, and it is given in all the modern botanical text-books. That no attribute of the sap, so far as we know at present, suffices to explain polarity in M. VÖCHTING'S sense, is made by him abundantly obvious, but unluckily, while like his pre-

decessors among vegetable physiologists he takes away our sap as a motive force, he does not provide us with any more tangible substitute than an "internal force" called polarity. It is something—it is a great deal, however, to have errors eliminated—destructive criticism at least paves the way for constructive action; and so we may in passing allude to some peculiarities pointed out by M. VÖCHTING which are not generally known. Thus, if a detached branch be suspended in a horizontal or sloping position buds will, under suitable conditions, be formed all round the summit and on the under-surface near the summit, while the roots will spring at the base from the circumference of the branch and from the lower surface of the branch for a certain distance from the base. In the branch still attached to the tree the buds at the apex of the shoot forming the crown are always developed, the other buds on the upper side of the shoot are developed in a degree corresponding with the more or less horizontal position of the branch. In the case of the pendulous branches (as of the Weeping Ash for example) when severed from the tree, the crown of buds at the end is produced as usual, while the other buds are equally developed on all sides. As to the subsequent growth of these buds the author shows that the force of growth is greater in proportion as the shoots have a vertical direction and the force of growth is universally proportionate to the angle which the branches make with the trunk.

In the case of branches, which are directed more or less horizontally, the force and direction of growth depend upon the distance of the bud from the apex of the shoot, the degree of development already obtained, the degree of inclination of the shoot, and its position on the upper or lower surface of the branch, as the case may be. In the Pear and the Apple the diminished intensity of growth on the lower surface of the shoots naturally favours the development of flowers.

The author sums up the general results of his experiments thus:—"In considering the mode and direction of branching two factors have to be considered—an internal force—'polarity'—and gravitation. Polarity tends to the production of shoots from the tip or free end of the branch; gravitation, on the other hand, induces the development of branches in the highest parts. According to inclination to the horizon, these factors may act together or in opposition one to the other. In other words gravitation joins with polarity when the position of the branch is between horizontal and vertical (less than 90°), and it hinders polarity when the inclination is more than 90°, and it directly opposes it when the direction of the branch is vertically downwards."

As to the relation between roots and branches M. VÖCHTING relies upon such facts as these:—An Apple tree growing on the border between turf on the one side and a kitchen garden on the other will develop itself more fully on the side towards the tilled ground. If a strong root of a fruit tree be severed one of the branches suffers an arrest of growth; and other considerations are adduced to show the relation between roots and leaf-bearing branches.

Beginning with circumstances of this character M. VÖCHTING next directs his attention to practical matters, such as the culture of fruit trees in pots, root-pruning, and ringing. In the case of pot fruit trees, where the roots are confined in a restricted space, the whole of the vegetative system is checked; each branch produces but a single shoot, and cultivators are sometimes under the necessity of "heading back" to secure a sufficiency of branches. On the other hand the production of flowers is favoured to a great degree. The life of the tree is, however, shortened by these procedures. Root-pruning rests on a similar basis: if the strong roots are severed occasionally the tree

produces a mass of fibrous roots; the production of wood is much restricted, that of flowers is promoted. Lifting and transplanting have the same effect.

Ringing has the same effect as a total severance of the branch, and is equivalent to the formation of a new individual, which grows independently of the mother plant, receiving from it merely water. The portion of the plant above the wound then behaves like a plant whose roots have been cut. The production of wood is checked, but that of fruit is favoured. Above the wound from the base of the new individual plant, if it may be so called, roots are produced, while from the upper end of the parent branch below the wound spring branches, and thus the "polarity" above alluded to is once more called into play. These facts are familiar enough to all gardeners, so much so, that they will be as much surprised to see them treated at such length in a physiological treatise as the physiologists are astonished at the wonderful theories invented by the gardeners to explain their procedure. But after all, the reference of the phenomena to intangible forces, external or internal, is not much more satisfactory than the allegations as to the ebb and flow of the sap, except to those to whom a sounding phrase, like "that blessed word, Mesopotamia," conveys ample satisfaction.

— ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Fruit and Floral Committees of this Society will take place jointly with the National Auricula Society's show, in the conservatory; and the Scientific Committee in the Library; on Tuesday, the 21st inst., instead of on April 28, when no meeting will be held.

— ROSE TUNNEL IN THE LUCKNOW HORTICULTURAL GARDENS.—This remarkable feature of these gardens, shown in fig. 94, consists mainly of Maréchal Niel Roses, that grow and flower as well in that tropical land as in England. The Roses were planted by our correspondent, Dr. E. BONAVIA, of Etawah, who formerly held the appointment of Director of the gardens till the year 1877, when his connection with them ceased, owing to the amalgamation of Oudh with the North-west Provinces, when the appointment was abolished. We hope shortly to give a full account of these useful horticultural gardens, accompanied by a figure of a group of Palms standing therein.

— SOCIÉTÉ NATIONALE D'HORTICULTURE OF FRANCE.—We are requested to state that arrangements for the show are progressing satisfactorily. Over £400 has been received for extra prizes. Application for schedules should be made at once as well as application for space to exhibit, as large numbers of applicants have already applied. Applications must be made on or before April 25. The show opens on May 20, and the jury meets on the day before, viz., the 19th.

— INTERNATIONAL BOTANICAL AND HORTICULTURAL CONGRESS IN PARIS, MAY, 1885.—In connection with the International Flower Show, the Société Nationale d'Horticulture of France has decided to hold a Congress in May. Further particulars as to date, &c., will be published next week, but nurserymen and amateurs wishing to become members should send their names at once to the President of the Society, 84, Rue de Grenelle, Paris. The committee for the organisation of the Congress is composed of Messrs. DUCHARTRE, Membre de l'Institut; CHAS. VERDIER, nurseryman; JAMAIN, FERD. TRUFFAUT FILS, BERGMAN FILS.

— THE PHYLLOXERA.—The Government of Russia has issued the following notices relating to the introduction of plants, &c., into Russia:—The importation into Russia of manure, garden soil, Vine layers, or Vine cuttings, with or without roots, and in general all parts of this plant, with the exception of the fruits and seeds, is forbidden throughout the empire. The importation into Russia of other living plants, or parts of them, as well as Grapes, is only authorised at certain custom-houses, and after the application of certain measures. These measures will be taken by the

Minister of Domaios, and by the Minister of Finance. Further, the Minister of Domaios and of Finance may prohibit the importation of vegetables in cases where they might contribute to the spread of the *Phylloxera*. All attempts to evade the measures against the *Phylloxera* will be punished by a fine of not more than 300 roubles, or imprisonment for not more than three months.

— **ROYAL HORTICULTURAL SOCIETY.**—At a general meeting held on April 14, Sir JAMES TYLER in the chair, the following candidates were unanimously elected Fellows, viz.:—C. Bloodworth, W. Boutcher, Mrs. Bramwell, John Brill, William Brockbank, F.L.S., F.G.S.; George Browiog, George T. Chambers, Walter Christmas, William

be valuable for reference, but serve as a pleasant narrative for perusal. So many novelties from foreign countries now make their appearance in the markets, that a book giving exact information respecting them will meet a want often felt.

— **"CHRYSANTHEMUMS AND THEIR CULTURE"** is the title of a small *brochure* written by Mr. JOHN BARDNER, of the Arley Hill Nursery, Bristol, a well known West-Country grower, and successful exhibitor of these much-admired flowers. Such being the qualifications of the writer we may naturally look for trustworthy directions as to the cultivation of the *Chrysanthemum*, and which we find in the concise, easily understood language of this literary venture. We find propagating, potting, soils, disbudding,

are given in which the path of the destroying *suogus* is traced through the Pine woods of Russia.

— **"UNBEATEN TRACKS IN JAPAN."**—We are pleased to announce the publication of a new and abridged edition of Miss BIRD's work on Japan (MURRAY), and which is sure to be acceptable to the public, especially at a time when Japan and its wonderful people are exciting special attention and interest. It is a novel feature to read a book upon a far distant land and then with little trouble or fatigue be able to compare the description of the inhabitants and their industries (as described in the book) with the people themselves. This may be done in the present instance, and a visit to the Japanese Village at Hyde Park will enable us to verify, in numerous cases, the

FIG. 94.—THE ROSE TUNNEL IN THE LUCKNOW BOTANIC GARDEN. (SEE P. 508.)

Bedford Dyson, John Edwards, Charles J. Gapp, J. T. Gideon, Hugh Roumieu Gough, F.R.I.B.A.; Richard Grice, Mrs. Hatch, Thomas Every Innous, N. Kempthorne, Benjamin Thompson Lowne, W. H. Mann, M. L. Massouee, Frederick McTier, W. D'Arcy Godolphin Osborne, W. J. Plaister, Newton Pratt, T. A. Rolls, M.P.; A. O. Saunders, Thomas Simpson, J. Surrey, Charles Todd, Frederick Tyler, and Wm. Layton Vincent.

— **"FRUITS AND FRUIT TREES, HOME AND FOREIGN."**—This is the title of a new work by Mr. LEO H. GRINDON, with descriptions, histories, and other particulars, and will contain details respecting every kind of fruit esteemed in Britain, whether ripened in our own islands or imported from abroad. The history, the particular merits, and a great variety of curious and interesting information of a miscellaneous character will be introduced, so that the book will not only

stopping, formation of exhibition plants, are all treated in a practical manner; and the value is enhanced by a select list given of the best of each section.

— **THE WEATHER IN MIDLOTHIAN.**—A correspondent writes:—"Within the last few days the weather has taken a favourable change, and with the heavy rain of the 10th and 11th, and the mild genial weather since, vegetation is pushing away vigorously, and appearances are all in favour now of heavy crops. Fruit of all kinds never looked more promising."

— **TREE FUNGUS IN RUSSIA.**—According to the *Bulletin* of the Society of Naturalists of Moscow, the hitherto unaccountable destruction of Pine forests is caused by the ravages of a species of Mushroom which takes growth on the surface of the wood, and afterwards penetrates and destroys the tree. Maps

accuracy and skill with which Miss BIRD has depicted the manners and customs of the Japanese at home, and has, moreover, made solid contributions to our knowledge by giving the results of her travels in regions scarcely known to European travellers—regions, moreover, of special interest to horticulturists. The book is nicely printed and bound, and will be useful for reading aloud to classes of young people, and very acceptable to them as a gift-book or school prize in its present form. It will make an agreeable change from the "Moral Tales," "Lives of Celebrated Men," and "Selections from the Poets," usually chosen for presentation on such occasions.

— **EALING, ACTON, AND HANWELL HORTICULTURAL SOCIETY.**—This flourishing suburban Society, which was established in 1863, will this summer hold its twenty-first exhibition, and in order to do justice to this important event a special two

lands could be rendered more remunerative. The proper treatment of forest lands, he said, was of the greatest importance ; and the forest interests of India and the colonies demanded such an institution as a School of Forestry in this country. There were many other considerations that might be urged in its favour, and it was very desirable that our young men should be able to get instruction on the subject at home, instead of being obliged to go to France and Germany to find it, as had hitherto been the practice. The Convention unanimously agreed to the Lord Provost's motion to petition Parliament on the subject.

— THE HEREFORD AND WEST OF ENGLAND ROSE SOCIETY'S nineteenth annual show will be held in Hereford on July 9 next.

— PRESENTATION TO MR. HENDERSON.—On Thursday, the 2d inst., the "Golden Lion," 11 High Street, Fulham, was the scene of a very pleasant gathering of the members of the Fulham Palace Cricket Club, the occasion being the presentation of a handsome marble timepiece to Mr. ROBERT HENDERSON, who was for over thirty years the Head Gardener to the late Bishop JACKSON, and from whom the club has received for several years much assistance in endeavouring to provide a good ground in the pretty field known as the "Bishop" Warren."

— BATH AND WEST OF ENGLAND SOCIETY AND SOUTHERN COUNTIES ASSOCIATION.—We are requested to state that a Cup, or money, value 10 guineas, will be given at the Brighton exhibition for the best group of Orchids; also a Cup, value 5 guineas, for the best collection of fruits; also a first prize of £2, and second prize of £1, for the best six dishes of Strawberries. The Hon. and Rev. J. TOWNSHEND BOSCAWEN, Lamorna, Probus, Cornwall, is steward of department.

— PUBLICATION RECEIVED.—*Report of the Public Gardens and Plantations of Jamaica*, for the year ended September 30, 1884: by D. MORRIS, M.A., F.L.S., Director.

THE CULTIVATION OF PLANTS.

Suffolk.—H. E. GRIBBLE, late of Canon Hill, Maidenhead, as Head Gardener to the Marquis of LONDONDERRY, Wynyard Park, Stockton-on-Tees.—J. NICOL, late Gardener at Alderbrook, Surrey, as Head Gardener to His Grace, the Duke of LEEDS, Bedale.—RICHARD ELLERKER, late Foreman to Mr. JAMES GIBSON, Chevet Park, Wakefield, as Head Gardener to A. J. CHOLMLEY, Esq., Newton Hall, Rillington, Yorkshire.—JOHN SNOW, as Head Gardener to —BRUCE, Esq., Southwell Park, Wadhurst, Sussex.

— **SCHOOL OF FORESTRY.**—At a meeting of the Convention of Royal and Parliamentary Burghs of Scotland, held in Edinburgh on April 8, the President, Sir GEORGE HARRISON, Lord Provost of Edinburgh, called attention to the state of forestry in this country, and moved the Convention to petition Parliament for a committee to consider whether, by the establishment of a forest school or otherwise, wood-

days' show will take place in the grounds of Gunnersbury Park, the residence of the ROTHSCCHILD family, on Tuesday, July 7, and Wednesday, July 8. The sum of £75 is offered in prizes, open to all England, and an additional £200 is offered for competition among subscribers. This is the first time these well known grounds have been available for such a purpose, and as they are situated in the centre of a rapidly increasing district, numbering its population by thousands, a great success may be predicted, judging from the desire so freely expressed to see what the gardens are like.

— BUSINESS ANNOUNCEMENT. — We are informed that Mr. J. CLARKE, who was formerly Head Gardener to Lord HASTINGS, at Melton Coastable, and previously at Farnham Castle, has commenced business as a florist and seedsman at the Albion Nursery, Farnham.

— WHITE CINERARIA SNOWFLAKE.—This fine pure glistening white variety has been sent to us by Messrs. J. CARTER & CO. for inspection. The flowers are  $1\frac{1}{2}$  inch in diameter, with sufficient smooth petals to make a regular form, the eye being dark purple. The variety is a long way ahead of any other that we are acquainted with.

— EPIPHYLLUM RUSSELLIANUM VAR. GÆRTNERI.—This curious plant, which was exhibited at the Royal Horticultural Society on Tuesday last, has the general habit of an Epiphyllum, but its fleshy jointed branches are less flattened than in most Epiphyllums, and more like those of Cereus except in the jointed character. The flowers are borne either singly or in groups of three from the ends of the joints as in Epiphyllum (not from the axils of the notches as in Cereus), and have the regular funnel-shaped form of Cereus with the orange-red colour of that genus, as distinguished from the irregular flattened pink flowers of Epiphyllum. In spite, however, of these intermediate characters, Dr. VON REGEL in the *Gartenflora*, November, 1884, tab. 1173, describes it as a variety of E. Russellianum, which, he says, resembles, in the form of the branch joint, E. truncatum, but the flower is regular in outline, and with regular spreading petals. HOOKER (fig. 3717, *Bot. Mac.*), describes this species, which has lilac-rose flowers, from specimens collected in the Organ Mountains, near Rio Janeiro. The variety figured (E. Russellianum Gærtneri) was sent to HAAGE & SCHMIDT from Blumenau, near Rio Janeiro, by H. GÆRTNER, and differs in having scarlet-red flowers. There are numerous intermediate forms of these three species, the produce of a variety of crossings, the flowers of which vary according to the sort from dark violet to purple and scarlet, but mostly partaking of the characteristics of E. Altensteini. From E. Russellianum, so far as is known, no (hybrid) varieties have been produced with the exception of this one, in the possession of HAAGE & SCHMIDT. The specimen exhibited came from Messrs. HINRICH of Altona. A list of cultivated Epiphyllums is given in our number for April 2, 1864, p. 318.

— SCOTTISH HORTICULTURAL ASSOCIATION. —  
 The first ordinary meeting of the above Association was held at 5, St. Andrew's Square, Edinburgh, on Tuesday evening, the 7th inst. Mr. JOHN METHVEN, the retiring President, occupied the chair, and in a few appropriate remarks introduced Mr. W. THOMSON, Clovenfords, the new President, who delivered his inaugural address, taking for his subject "The National Importance of Horticulture." Mr. DUNN, Dalkeith Palace Gardens, brought under the notice of the meeting the proposed formation of a Gardeners' Benevolent Society for Scotland. After some remarks from Mr. DOWNIE, Mr. METHVEN, and the President, the matter was ultimately remitted to the Council of the Association. The President intimated that Mr. GEORGE McLURE, Trinity Grove, would read a paper at next meeting on "Alpine Auriculas," and Mr. A. N. McALPINE, B.Sc., Minto House, Edinburgh, on "The Functions of the Root."

— COYENT GARDEN MARKET REGULATIONS. —  
Mr. HOWARD, of Southgate, has published a lengthy correspondence detailing certain grievances alleged to be experienced by those who frequent the flower market. The Duke of BEDFORD's agent, in reply, says that those who use the market must conform to the regulations, and that, if just cause for complaint arises, that representations should be made to the Superintendent of the Market, on the spot. It is

## HOME CORRESPONDENCE.

**Pæonia arborea in Pots.**—The cultivation of Tree Pæonies in pots for winter gardens, conservatories, and other purposes cannot be too much recommended. If treated well, flowering specimens of this fine class of plants may be had as fine, if not finer in winter than is possible in the open ground. An important point is to have good established plants which have been in pots undisturbed for at least one year before forcing them. Forcing Tree Pæonies has been a custom in Holland for a long time. My father, as long ago as 1833, obtained a Silver Medal (the highest award) at a flower show of the Society of Industry, held at Haarlem on February 23 of that year. It was a splendid specimen of the old sort of Tree Pæony, with several open flowers as large and fine as they had ever been seen. The forcing of the plant at so early a period was then considered an extraordinary fact, on account of the inferior arrangements then obtainable as compared with those of the present time. Some fine Tree Pæonies in bloom were exhibited by my firm at several late shows, beginning at Amsterdam April, 1856, and lately a dozen varieties were shown at the Grand Haarlem Exhibition. *E. H. Krelage, Haarlem.*

**Daffodils Doubling.**—Holding rather strong opinions on the subject, and being eager to join the fray, I should like very much to relate what has happened under my own eye in this garden. Thirteen years ago we received in a parcel of 109 species of "herbaceous" plants from Aberdeenshire two bulbs of *Narcissus incomparabilis* (in the list accompanying them *Narcissus Pseudo-Narcissus bicolor*—evidently a misnomer). There is no doubt that it is the incomparabilis of Daffodilists of the present day, although the incomparabilis, which I have myself found wild in the South of France, is long-tubed, and this has a short cup. For eight years this beautiful flower, whose roots until last year have never been disturbed (and have increased to a good sized clump), was a joy through all the too fleeting Daffodil-tide. It was perfect in its starry singleness. Five years ago, however, "a change came o'er the spirit of its dream," and it began to double. Once begun, the doubling has progressed in double quick time, till last spring only two blooms came single, and I became seriously alarmed, fearing I should eventually lose my lovely incomparabilis in its perfect form. So the two remaining single flowers were marked, and at the proper season the bulbs belonging to them were taken up and replanted separately at a little distance from the group, though in the same border. I have been anxiously on the watch, and now, oh horror! (with just a little triumph mixed), two flowers have opened from the transplanted single-flowered bulbs, and they are both double!—that is, in the ugliest stage of half doubling. Thus in thirteen years one bulb of incomparabilis, with all its increase, has entirely changed its character and become a double Daffodil. The same thing has happened with another group of single short-cupped Daffodils, at some little distance from incomparabilis, growing, not in a border, but on a pit of poor land under some Elms. I now believe that long-tubed Daffodils will never double, and that, therefore, the wild Lent Lilies may be transplanted for ever from fields into the garden without any change occurring in the character of their flowers; but that, on the other hand, the short-cupped Daffodils are never safe. It will be a happy disappointment to me if I find half a dozen single flowers on any of our short-cupped varieties this season! I find, on the other hand, that *Narcissus poeticus flore-pleno* has a tendency to "undouble" under certain conditions. *E. V. E.*

—It is curious that, having lately inquired whether cases of reversion on the part of double Daffodils to single were known, I should have found here to-day what seems to me to be a clear case of reversion. I have a quantity of the common double Daffodil which has been growing here for the past ten years, and in the same spot, having been lifted, divided, and replanted, in the same place once some three years since. I have never before seen a single flower amongst them, all being true double Daffodils. I have now found a perfect single flower—one only—and one of a small clump which has produced no other flower this season. I find also a few flowers the tubes of which are perfect, not being at all split

or broken up, and enclosing others just as we see in the double Canterbury Bells. If desirable, I can mark and lift the bulbs. I think I shall have a green double flower open in a few days. Would that be a novelty? *A. Dean.*

—In the *Gardeners' Chronicle* of last week, I understand, from a letter of Mr. Wolley Dod (p. 482) on the subject of Daffodil doubling, that he tried some bulbs received from Mr. Archer Hind of a double Daffodil at Edge Hall, which became after a year or two quite single. Mr. Dod then returned the bulbs in this state to Devonshire, where they flowered the next spring with quite double flowers. Last year Mr. Archer Hind sent back again some of these redoubled flowers to Mr. Wolley Dod; these were carefully planted (I presume last autumn), and are now in blossom, the flowers being nearly single. Surely Mr. Wolley Dod is aware that bulbs form their flower-buds the previous year, and whether planted in good or bad soil, or even in water, would blossom the subsequent year as formed in the bulbs the previous year, single or double. If Mr. Dod had cut the bulbs open last autumn he would have found the blossoms formed in the bulbs. *A Member of the Daffodil Committee.* [The framework of the flower is so formed, but it is possible that a change might be effected during subsequent growth. This has to be tested. *Ed.*]

**Eucharis amazonica.**—The large number of letters which have lately appeared respecting this plant sufficiently attest the lively interest which the subject commands. Every ill-conditioned bulb is filled with insects, but the real cause of the disease, in my opinion, precedes their appearance, and they have no more to do with the disease than the desert eagle has with the death of the camel he devours. [But it is well ascertained that one particular kind of mite, figured in a recent issue, murders as well as eats—others only eat. *Ed.*] The decay may not always proceed from the same cause any more than the ill-condition of any other plant under bad artificial conditions, but I think one correspondent struck the common key-note of danger when he stated his conviction that the prevalent custom of trying to make the plant flower three or four times in the year was one of the chief causes of mischief. This practice may succeed for a time, but failure will assuredly follow such forced treatment, as it would in the case of the most enduring plant. Again, some cultivators keep it plunged in a strong bottom-heat during its period of growth, and then, with the intention of resting it, place it either on the hot-water pipes or on the stage in an airy house, where it is exposed to the full sun, allowed to become perfectly dry and shrivelled for weeks together. One person I know planted a whole houseful; the borders were well prepared, and the plants made such progress and flowered so profusely for years as to be the admiration of all who saw them. Eventually the soil and drainage, from frequent deluges with liquid-manure, became clogged and sour, and before remedial measures were thought of the plants became sickly. Eighteen years ago I had a large quantity, and caused them to flower so freely that they were thought too common, and I received instructions to discard them; instead of carrying this out to the letter, a number of them were placed under the stage, where they received much water and little light, a few others were placed on the top shelf out of the way, where they received but little water and were extremely dry. Under these opposite and unfavourable conditions they remained with scarcely any attention for three years, with the result that very little foliage remained upon them, and the few leaves which they had retained, were sickly and shrivelled, while the old bulbs were in an advanced stage of decay and literally covered with the red or orange spots, and the small insects already referred to. Their real value was at this time felt by their absence from the drawing-room, and I was instructed to replace them. They were turned out of the pots, the soil was removed, and the old bulbs were thrown away, as it was thought safer to depend on the youngbulbs only; these as well as the roots were carefully washed, after which they were repotted into 7 and 8-inch pots, placing eight to twelve bulbs in a pot according to size. The drainage was abundant, and the soil was composed of sandy loam to which was added one-fourth of hard sandy peat such as would be used in the cultivation of hard-wooded plants. In this compost they were potted

firmly, after which they were placed in a moderate stove temperature, shaded from bright sunshine, and syringed lightly overhead in the after-part of the day, giving them but little water at the root. Under these conditions they made slow but very satisfactory growth; the old leaves did not regain their proper colour, but the young ones were free from defect, and in twelve months I had the satisfaction of seeing a perfectly healthy and vigorous stock, with plenty of bloom during the winter season, and I am happy to say they still continue free from spot, and give me a profusion of bloom every winter. After flowering they receive three months' rest in an intermediate-house, during which period they are neither shrivelled by dryness, scorched by sun, nor chilled by cold: they receive regular supplies of clear water, and the foliage is kept clean. Afterwards they are transferred to a warmer and moister atmosphere, and when growth commences they receive an occasional watering with weak liquid manure made from soot and deer's dung. By altering their period of rest I find no difficulty in having them in bloom from November to March. They never have bottom-heat, nor do they require it, as their foliage and flowers are of great substance, and endure longer than when so treated. If we only consider that they do not naturally grow in an extremely hot climate, we may feel assured that the varied treatment they too often receive must result in injury. The climate of New Grenada varies considerably, but in no part is it particularly hot, and most certainly not extremely dry, even in the dry season, and in the neighbourhood of Choco, from whence *Eucharis grandiflora* is said to have been introduced, the climate is at all times moderate in respect to heat, nor is it, even in the dry seasons, by any means parching, as may be inferred from its great elevation, and from the reports of those travellers who have described its climate. The *Eucharis* is said to grow chiefly on the sandy, firm, and moist river banks, in which position it must always receive abundance of water at the root, and at such an elevation the atmospheric moisture is undoubtedly considerable, especially in the vicinity of the rivers. Looking at these natural conditions, and comparing them with our methods of treatment, it seems only reasonable to conclude that failures arise chiefly from the following causes—extreme temperatures, strong bottom-heat, imperfect drainage, and loose, soft, spongy soil. *T. S. C.*

—I note what Mr. McDonald says in your issue of March 21 about *Eucharis* disease, but I consider he is wrong, and that he is not troubled with the real thing. Evidently his plants suffered from bad drainage, and not from the mites. I send you a bulb herewith; if you examine it under a microscope you will see there are active little insects and thousands of eggs. My plants had good drainage and proper treatment in every way, but the leaves died down and would not grow. The bulbs rotted off, and I then discovered these pests. They will attack a healthy bulb on the side, bottom, or top, make a wound, when, after due time, it will rot away altogether. The smell is abominable. I turned all the bulbs out of the pots, and have washed and cleaned them in soft-soap water, removing the outside skin of the bulb, behind which there are thousands of eggs, and completely dried them off. I am told this disease is common, and that the cure is to put the bulbs in soot and lime, which will kill these pests, and nothing else will, but will not the soot and lime injure the bulbs? Could you or any of your correspondents tell me what to do, and the cause of these pests? [See the article and figure at p. 440 *Gardeners' Chronicle* for April 4, 1885. *Ed.*] I bought a fresh lot of plants the other day, and I find these have the same disease. It is most disheartening. *W. R. Lees.*

**National Auricula Society.**—Allow me to remind your readers who are interested in this Society that an exhibition will be held on April 21, in the conservatory of the Royal Horticultural Society. Entries should be sent at once to Mr. A. F. Barron, South Kensington. Those exhibitors who bring their plants out of the pots will have pots provided to place them in, and green moss to place over the surface. It is absolutely necessary that all exhibits be placed ready for the judges at 11 A.M. Those who have been accustomed to exhibit seedlings will kindly take note of Rule X. in the schedule—that all plants submitted for certificates must be staged separately from the collections.

It may not be generally known that there is a separate fund for seedlings, the subscribers to it, according to the last published balance-sheet, being six persons interested in seedling raising, the balance in hand being £7 4s. It may also be well to state that it is proposed to hold a Primula Conference in 1886, and the preliminary arrangements will be made on the 21st. The luncheon will take place at 2 o'clock P.M., when John T. D. Llewellyn, Esq., will preside, the subject of discussion after luncheon being the proposed conference. The Council of the Royal Horticultural Society have appointed Colonels Clarke and Beddome, The Hon. and Rev. J. T. Boscawen, Messrs. Loder, G. F. Wilson, Llewellyn, and Godman to confer with the Society. Tickets for luncheon are 3s. 6d. each, and may be obtained on application to Mr. Rolt, Hartfield Road, New Wimbledon. *J. Douglas.*

**Peas.**—If your correspondent, "G. M. W.," wants a real good Pea I would advise him to try Huntingdonian, if he has not already done so; it is the best Pea that I am acquainted with. I have grown several sorts side by side with it at different times, and have invited people to taste them all, and one and all have given the palm to Huntingdonian for flavour. It is a good grower, and an excellent cropper. I have grown it for several years, but it is one that I think is not very much known, as I have met with a good many people who have not known it, and I seldom see it in catalogues except Wood & Ingram's, of Huntingdon, where I think it was raised some years ago. It is a main crop Pea, and when once it is fit to pick and my employer has a dish of it he wants no other. Our garden being small, I have no opportunity to try novelties—I leave that to those with more room; but if any one has found a Pea to beat it I shall feel grateful if he will give its name, as my employer knows and appreciates a real good Pea. *H. L., Sherwood, Beckenham.*

**Melon Canker.**—At p. 448, "C. H." asks me if my Melons were ever cankered previous to using the glass collar. I have had individual plants so bad as to render the functions of the plants useless before ripening started. I do not wish to mislead any one. They must understand I recommend it only in protecting the collars against the ravages of woodlice, having here and at other places seen the damages done to the necks of Melon plants by them, weakening the capacities of the plants; with the results of badly finished fruits or no finish at all. The soiling system he recommends, a gardener of my acquaintance adopts to the letter as described in "C. H.'s" note, and I can assure him I have seen canker rampant. *Alexander Methuen.*

**Gathering and Pickling Samphire.**—The following information may have an interest for, even if it does not prove of use, to many of your readers. It is supplied by Mr. Sidney Ford, of Leonardslee, Hortham, to enable me to answer the question of a correspondent as to when was the best time to gather Samphire, and how to pickle it. Mr. Ford began by informing me that Samphire is not to be found on the coast below the district where he resides; "but I was staying at Worthing, and had some given to me from the coast of Ilfracombe, where it grows freely, and we have it in pickle now. For pickling purposes it may be gathered green and growing. It should be soaked for two days in brine, then placed in a stone jar with peppercorns and allspice, covered with vinegar, then placed in an oven, where it should be allowed to boil only till quite crisp, and when cold, corked up securely." *R. Dean.* [It is abundant on the chalk cliffs near Dover, as it was in Shakspeare's time, and occurs also on the beach at Littlehampton. *Ed.*]

**Mushroom Growing.**—In a late issue I am asked to give a detailed account of our system of Mushroom growing, which I think would be superfluous, seeing that your Leicester correspondent (Mr. Davies) has already promised your readers a greater treat on the subject (p. 186). His method is certainly in advance of anything practised here, when he tells us a bed (9 feet long and 4 feet wide) spawned on December 6 produced on the 25th (or in nineteen days) 12 lb. of Mushrooms, and in forty-seven days 200 lb., or something over 4 lb. daily of 36 superficial feet. This must be the system to adopt in future. For my own part I do not like these precocious beds; I often find if they are early to come they are also early to go.

Our beds have yielded a continuous supply since the middle of December, and the cry is still they come, and in quantity too, while for size, form, and colour such as are seldom seen indoors or out. I may mention that a gentleman staying in this town, and seeing a daily supply of the above in our own and other shop windows, made it his business to find out where they were grown, and was so pleased with the rough-and-ready way in which they were produced that on his return he sent his gardener all the way from Manchester (expenses paid) to see the same thing, which I consider as being the best test of interest taken in gardening matters by employers. I sincerely wish there were more gentlemen possessing an equal interest; gardening would become a still pleasanter occupation than it is at present, it would also prove a greater stimulus to good cultivation. *E. Crump, Ranelagh Gardens, Leamington.*

**The Waddesdon Plant Truck.**—Which of us in our young days does not remember how tired we were when night came after a long day at the hand-barrow in the bedding-out season, and how often my heart has ached to see perhaps an intelligent youth with perhaps not an over-robust frame staggering under a load of plants on the hand-barrow, much too heavy for him to carry. I was rejoiced to see the above truck advertised by Holliday, The Pheasantry, Beaufort Street, Chelsea, and at once sent for one, and I cannot tell what a boon it is for carrying plants. It is mounted on springs, and has two wheels, and holds about a third more than a common hand-barrow, and is so easily pushed that a mere youth can move it along quite smartly. I really cannot say what a benefit it will be, and the saving of labour in about a month's time, when bedding-out commences. Perhaps its size will be better understood when I say that it carries a hundred large 60-sized pots. The thing is well made, and the price is £5. *J. Rust, Eridge Castle.*

**Lilium auratum.**—If you do not think the *Lilium auratum* question sufficiently exhausted, I would like to add a few words of my own experience about the too-well-known disease. I once grew a single bulb of this *Lilium* with fifty-six well developed blooms. I do not want to be laughed at for mentioning it, as I am well aware that plants have been exhibited with over 100 blooms, although I have never seen one. But when at one of the Bath summer shows I observed that everybody admired a plant with from fifteen to twenty blooms on it, it struck me that I had not half appreciated my own fifty-sixer. That plant has, however, long since gone the way of a good many more, and since then I have never had its equal. Although I have purchased many bulbs, and taken great pains to grow them to a large size, unfortunately with the same results as scores of others, they became a prey to the disease, or bruise-rot, which I call it. It is of course a difficult matter to determine the cause of this, as well as many other diseases, which that most responsible man—the gardener—is called upon to explain, which, considering that oftentimes the only lens he can bring to bear upon it is his own unaided sight, which he generally contrives to do to his own satisfaction, but frequently to the discredit of the firm that supplied the bulb. This by no means settles the question, as it neither restores the plant to life, nor yields any return for money spent. There are several causes from which I think this fungus or rottenness is likely to spring—one is, lifting and packing the bulbs before they are thoroughly matured, in order to be first in the market; another is, that they are so packed as to ferment more or less on their passage hitherward. I have this year started with a dozen bulbs obtained from Messrs. Cooling & Son; it was towards the end of January. After carefully removing all the decayed portion they were immediately potted in the usual way in pots, according to size of bulb, but rather small than otherwise; drainage was abundant; the compost, as usual, rough, fibry loam and peat with plenty of sand, and a small heap of sand under and surrounding the bulbs. They were gently pressed into the soil, and filled up till just hidden from view, and as the soil happened to be drier than I usually like to pot with, I gave them just sufficient water through a fine-rose watering-pot to moisten without soddening the mass; they were then taken to a frame which I had just put on a moderate hotbed, and on which I had placed soil for a few small seeds. I plunged them in a row at the back of the frame up to the rim of the pots in the soil, and covered them with about 4 inches of

leaf-mould; the temperature at no time exceeded 80°, and the bed being largely composed of leaves, did not vary much for the next month; they had plenty of top air, and the result is that every one is alive and looking well. Some have shoots 6 inches long, and only one is what we term just beginning to smile; but on examination I find that it has made, if anything, stronger roots than those that have made long shoots; all of them, however, have plenty of roots, and I have now removed them to the shady side of a low house, outside, where they are sheltered from heavy rain and strong sun, which they do not like at any time. They have still a covering of leaf-mould, pots and all, into which they are beginning to emit roots from the base of the shoots, and which the plunging material accelerates, and will I hope contribute to the building up of plants constitutionally free from disease. *H. Gay, Shockerwick House, near Bath.*

**Sixpenny Telegrams.**—The discussion upon sixpenny telegrams, and the desirability or otherwise of abbreviated addresses, brings out some curious statistics in the history of the seed trade. We find upon scrutinising that amongst our customers we can only muster 851 Smiths, against Messrs. Sutton's 1060, but when we come to the Browns we are brought to the front with a total of 503 against Messrs. Sutton's 450, and we can throw in 205 Robinsons. We must leave some wiser head than ours to account for the peculiarities of these statistics. *James Carter & Co.*

**Abnormal Tints in *Odontoglossum Alexandræ*.**—Regarding a very curious novelty in a plant of *Odontoglossum Alexandræ*, you kindly published a letter from Professor Reichenbach in your issue of June 16, 1883; the inflorescence there spoken of consisted of two white flowers and one yellow one. The plant is again in flower, and, strange to say, this extraordinary peculiarity appears to it a fixed characteristic, as it now bears upon a stem six flowers, three of which are yellow and three white, lightly blotched, as described by Professor Reichenbach two years since. *W. J. Cross, Salisbury.*

**Improvement in Vegetables?**—I think that the majority of practical gardeners will—notwithstanding the editorial notes in your issue of March 21—agree with me, that there has been very little real improvement in vegetables for the last ten or fifteen years, certainly not in proportion to the yearly flourish of trumpets made by our leading retail seed houses. Taking the kinds enumerated last week first—Cabbages—is there any real advance on Enfield Market? Peas—is there any more reliable sort than the old Champion of England, which I have never known to give dissatisfaction, either in the kitchen or dining-room? I certainly cannot say the same of the large show kinds that are now so popular with a great many people, especially amateurs. Broccoli and Cauliflowers, with the exception of Veitch's Autumn Giant Cauliflower, which is, I might almost say, "a pearl above price," both to the gardening fraternity and the market growers, I think we may safely say we have made no advance on the kinds cultivated fifteen years ago. Again, Beet-root, what a host of kinds have been sent out, and still one of the best is Whyte's Black. In Onions we still have nothing better than White Spanish and James' Keeping. Another important vegetable—Celery—has not a better or more distinct variety than Williams' Matchless Red, and I have known this for about eighteen years. I speak from memory. Once more, before I cease comparisons, after all the Melons that have been sent out the last fifteen years, is there anything to equal Golden Perfection or Beechwood? I think I may venture to say that if novelties were not more eagerly sought after by amateurs than they are by professional gardeners we should both see and hear less of so-called improvements, or rather selections of good old varieties, which most of them are. With regard to the advice given as to selection of specialties from different sources there are one or two grave objections, viz., a multiplication of accounts, both troublesome to the gardener and very objectionable to most employers. Again, at the present time all the large retail houses have special varieties of every kind of vegetable seeds which they extol as the very best in its class, and so keen is the competition in garden seeds that I believe that if the varieties recommended by any substantial house are purchased no better can be procured even if selected from a dozen different catalogues. *John Wilkes, The Hayes, Stone, Staffordshire.* [Our correspondent is evidently no believer in novelties, even when incontrovertible evidence can be adduced that some of them are really earlier, more prolific, and better flavoured than the old kinds. *Ed.*]

## CULTURE OF PLANTS IN SMALL POTS.

IN supplying cultivated plants with the manurial food they require over and above that which the soil to which their roots have access naturally contains, two courses are usually followed—either to fill the storehouse, namely, the soil, at the commencement of operations with as much as is supposed to be required, or to put in less at the beginning, and to make additions from time to time as occasion requires afterwards. Each course has its advantages; the former plan, where all is given at once, leaves the roots to help themselves as they choose, and is the simplest, entailing no further trouble with after-applications. The latter method, whilst giving the roots as much as they need continuously, does not admit of over-gorging at any one time, as may occur where enough to suffice for a lengthened period is placed within their reach at once. The ill effects of this practice becomes most apparent where the roots are confined within a limited space, and the manure is consequently placed before them in a manner that makes over-feeding all but a matter of certainty. To this cause may be attributed the disparity between the gross leaves and the small amount of flowers sometimes noticeable in pot-grown plants, where as much manure has been mixed with the soil they were potted in as was supposed to suffice for the season. When the highest results attainable in the cultivation of plants in very small pots is aimed at—the root space often being restricted to the lowest possible point—the system of frequent manurial feeding becomes a necessity, which must be met by applications in liquid form or in a dry concentrated condition to the surface of the soil, to be washed down when water is given. By either of these means the supply can be regulated in accordance with the demand, giving least in the early stages when growth is less active, and more when the rate of progress is such as enables the plants to feed more freely.

It may be said that the fullest exemplification of what it is possible to accomplish with pot-grown plants is to be seen in the two extremes where very large or very small pots are used. Of the former there is no lack of examples at the various horticultural exhibitions that annually occur throughout the country. The latter are comparatively little seen at these gatherings, being more in the hands of those who cultivate for sale, especially the market growers, whose plants in little pots are at the present day nothing less than marvellous. At one time it would have been thought impossible to have produced them with their roots confined in so little material. The growers of this kind of stock have evidently studied the requirements of each of the different kinds of plants they cultivate, and have also got the exact gauge of the amount of feeding they will bear, for there can be little doubt that if stimulation were carried further than this the result would be failure. With plants, as with animals, if more food is taken than can be assimilated the constitution gives way; yet there is this difference that animals usually leave off eating when they have had enough, whereas plants have not the same power of rejecting an excess of food. Water, when within reach of their roots they will take up, and if it is too strongly impregnated with even such elements as needful to support growth, plethora follows. The immense increase in the demand for plants in small pots necessitates their being grown in private gardens in numbers greatly exceeding what were once required, and some who have them to provide find a difficulty in getting them equal to such as are forthcoming from the market growers, who have made this little-pot culture their especial study, and have learnt exactly at each stage of growth, in the respective kinds of plants they take in hand, what amount of stimulants they will bear. Needless to say this is a matter that can only be got at by practice; as a rule, the freer and quicker the growth of the plant is naturally the more stimulating food it is capable of taking, giving in all cases weaker applications during the earlier stages of the plant's existence, whilst root and top-growth are alike progressing slower than later on. The old theory about not giving anything in the way of stimulants until the flowers are visible requires to be got rid of, so far as the flowering section of the class of plants under notice is concerned, for if nothing of an invigorating

character is applied until then, they will not be likely to attain more than half the size they should do. The little-pot system of culture means regular feeding from the time there is enough root and top growth present to take it. Another matter of importance where high feeding of this kind is followed, is that the plants must from the first have all the light it is possible to give them by being stood close to the roof in light houses; and with the same object of encouraging sturdy, robust growth there must never be anything approaching crowding. If in the early stages there is the least approach to a drawn condition, nothing that can be done afterwards will remedy the evil. A point that needs to be also considered with stock of all kinds grown in little pots is that from the time the soil gets full of roots the plants will be more injured should they ever be allowed to suffer for want of water, than if their heads had not been disproportionately large to that of the root-space. The higher the cultivation resulting from liberal feeding, the less able are the plants to bear short-comings. From the same cause there requires to be no falling off in the liberal feeding when once begun with. *T. Baines.*

## NARCISSUS MINNIE WARREN.

NARCISSUS Minnie Warren (fig. 95), which is in all probability a derivative from *N. moschatus*, is a very pretty novelty, flowers of which were sent us by

FIG. 95.—NARCISSUS MOSCHATUS ("MINNIE WARREN"): FLOWERS PALE CREAM COLOUR.

Mr. F. W. Burbidge. The flowers measure about  $1\frac{1}{2}$  inch in length, with a funnel-shaped flower-tube, yellowish at the base, and with six lanceolate, slightly twisted, creamy-white segments, which are about the same length as the cream-coloured, trumpet-shaped corona, whose erect edge divides into shallow lobes and notches.

## Reports of Societies.

### ROYAL HORTICULTURAL: April 14.

THIS promenade show was the means of bringing together one of the prettiest of spring flower shows; and the promised Daffodils exhibited by several of the largest growers of these now much admired flowers gave in their abundance just that amount of bright colour that is required in that dingy place, the South Kensington conservatory. One side of the middle area was set apart for Daffodils, and well filled were the portions allotted to Mr. Walker, Messrs. Veitch & Sons, Messrs. P. Barr & Son, and Messrs. Collins Brothers & Gabriel; the palm for perfection of flower being given to the first-named exhibitor. Some fine Amaryllis were shown by Messrs. J. Veitch & Sons, and by Mr. B. S. Williams; these, and a few Orchids, Cyclamen from Mr. Clarke, hardy flowers from Messrs. Paul & Son, and Azalea indica and Laurustinus from Messrs. Cutbush & Son, gave the

requisite amount of varied colour to the display. Of new plants or new varieties there were not many, and certificates were fortunately sparingly bestowed.

### Scientific Committee.

F. Pascoe, Esq., in the chair. Present: Messrs. MacLachlan, Michael, Boulger, Murray, Ridley, Smea, Loder, Beddome, Col. Clarke, Drs. Lowe and Masters.

### CYRIPEDIUM HOOKERÆ.

Dr. Masters reported on this flower, referred to him at a former meeting. The sepals, petals, and lip were normal, but the column was represented by five petaloid segments, which from their relative position appeared to represent the stamen opposite to the lip (absent in normal *Cypripedium* or represented only by a shield-like rudiment, a 1 of the recognised diagrams, the other two stamens of the outer row A 2, being unrepresented. Two of the inner stamens, a 1, a 2, were present, as is usually the case in *Cypripedium*, but were here petaloid, while a 3, generally absent, was here present in the form of a secondary lip. In addition, one of the styles, G 1, was present as a petal, so that the flower may be described as a partially double *Cypripedium* in which some of the stamens and one of the styles were present in a petaloid guise.

### FUNGUS ON NARCISSUS.

Mr. Murray agreed with Mr. Plowright, and suggested that the fungus affecting *Narcissus* and *Hyacinth* bulbs was *Pleospora Hyacinthi*, and suggested that diseased bulbs should be sent for cultivation.

### WEEVILS IN LENTILS.

Mr. MacLachlan showed specimens of Lentils attacked by weevils (*Bruchus* sp.) in the manner so common in Peas and Beans. The insect perforates the cotyledons, leaving the plumule generally intact, so that Beans of this character are not affected as to their germinating power. When the beetle cannot perforate the hard rind, it perishes with the seed.

### CHINESE WAX.

Mr. MacLachlan read extracts from a communication of Mr. Alexander Hosie.

During the present year, in the months of May and June respectively, I had the opportunity of examining these galls (female insects of *Coccus* sp.) and their contents with some minuteness in the neighbourhood of Ch'ung'king, and within the jurisdiction of Cheating Fu, the chief wax-producing country in the province. In the former case I should state that the insect has reached Ch'ung'king and its neighbourhood from Chia-ting by short annual stages, being propagated on the insect tree in the country lying between these two cities. Thirty li to the east of Ch'ung'king I plucked the galls [the female scale-like insect] from the trees [*Ligustrum lucidum*], and on opening them they were very brittle. I found a swarm of brown creatures like minute lice crawling about [young scale insects]. The great majority of the scales also contained either a small white bag or cocoon containing a chrysalis, whose movements again were visible through the thin covering, or a small black beetle. The beetle is called by the Chinese in Chia-ting the "Nui-erk," or "buffalo." If left undisturbed in the broken scale the "buffalo" will, heedless of the wax insects which begin to crawl inside and outside the scale, continue to burrow with his proboscis and pincers in the inner lining of the scale, which is apparently his food. The Chinese declare that the beetle eats his minute companions in the scale, or at least injures them by the pressure of his comparatively heavy body; and it is a fact that the scales from Chien-ch'ang in which the beetles are numerous, are sold cheaper than those in which they are absent. A careful examination, however, has forced me to the conclusion that the beetle is there for a far more useful purpose. When a gall [scale] is plucked from the insect tree an orifice is disclosed where it was attached to the bark; how can the wax insects escape from their imprisonment? I carried back with me a bough with a number of insect scale clinging to it, and watched day by day for signs of life. At last my patience was rewarded by seeing the pincers of the beetle gradually boring a hole through the scale. This scale, when completed, was circular, and of sufficient size to allow him to escape from his imprisonment. Although he did not issue when he had broken his prison wall, but continued to burrow in the inner lining, the wax insects began to crawl out and in, and I am persuaded that the beetle is a wise provision of Nature to afford an outlet for the wax insects. That the beetle devours the insects may well be doubted, for I endeavoured, but without success, to feed him with the daintiest morsels; he always turned away and recommenced burrowing. When I removed the beetles from the scales some of them made efforts of fly, but at that time their elytra were not sufficiently developed, and they had to content themselves with crawling—a movement which, owing to the long proboscis, they performed very clumsily.

The Beetle in question, said Mr. MacLachlan, who altogether doubts the explanation given by Mr. Hosie, is a parasitic beetle of the genus *Brachytarsus*. He observed that the subject was important in two ways; that the wax is excreted (or secreted) by the male

insect only, and that the female has a parasitic beetle of the genus *Brachytarsus* attached to it, as is the case in some European species of *Coccidae*.

#### TEASELS.

Col. Clarke showed specimens of the cultivated Teasel, grown in Northamptonshire, with a smaller form, probably introduced with foreign seed, and referred to Mr. Ridley for identification.

#### CYCLAMEN.

From Mr. Clarke, of Twickenham, came a specimen of *Cyclamen*, showing curious outgrowths from the upper surface of the leaves, as well as from the petals, to which we shall hereafter refer more at length.

#### CANKER ON HAWTHORN.

Mr. Plowright sent specimens illustrative of the peculiar appearance left on Hawthorn twigs after the death of the spawn of *Rostelia lacerata*, as determined after actual experiment.

#### CHIMONANTHUS GRANDIFLORUS.

Fruits and a seedling plant from Mr. Noble were shown. The two seed-leaves are very large, like those of the Beech, but much thicker, and dark green in colour.

#### PRIMULAS.

Mr. Henslow showed illustrations of flowers gradually losing their brilliancy of colour and becoming at the same time uniform as regards the length of their stamens and pistil. As the attraction for insects is less, and the length of the stamens and style adapted for close fertilisation, cross fertilisation did not occur, and the number of seedlings was proportionately increased.

#### EUCALYPTUS.

Mr. Smee communicated a paper on the culture of these plants in Chili. (See p. 499.)

#### PLANTS EXHIBITED.

In addition to the *Epiphyllum* and *Cyclamen* above-mentioned, flowers of *Calceolaria Burbridgei*, *Ranunculus cortusifolius*, *Villarsia parnassifolia*, and *Spiranthes convallarioides* were shown by Mr. Loder; and Dr. Masters showed specimens of the curious excrescences found on the stems of *Cryptomeria* by Mr. Mills. (See p. 416, March 28, 1885.)

#### Floral Committee.

Present:—Shirley Hibberd, Esq., in the chair; and Messrs. G. Henslow, W. Wilks, H. Bennett, W. Bealby, J. Child, H. Herbst, J. Walker, J. James, C. Noble, J. Fraser, G. Duffield, Dr. Masters, H. M. Pollett, J. O'Brien, H. Ballantine, H. Turner, E. Hill, W. B. Kellock, J. Douglas.

Messrs. J. Veitch & Sons exhibited several new forms in *Amaryllis*, as *Lady Howard de Walden*, a well formed white flower of medium size, but of more than usual substance in the petals; *Archimedes*, a crimson self; *Rosslyn*, bright scarlet, with a white band on the petals and a white star; *Duchess of Edinburgh*, with a crimson coloured suffusion over a white ground, and several others of handsome colours. *Gladolus blandus* *Rosy Gem*, pale pink, with bright cerise circles on the segments of the flower; *Tree Carnation* *Sir Charles Wilson*, of deep crimson, a good bloom, full, compact, and smooth; and *Tree Carnation* *Niobe*, a fine crimson.

Mr. B. S. Williams, Holloway Nurseries, showed a collection of *Amaryllis* hybrids, containing distinct and pleasing colours, but of which none obtained recognition. *Guiding Star*, a crimson, having a white band on the petals; *Magnifica*, a scarlet of excellent build; and Dr. Masters *Improved*, were among the most striking. He exhibited *Clivia* *Madame Reimers*, now pretty well known as one of the finest hybrids of this beautiful genus, *C. miniata* being shown to mark the advance in this flower of late years; *C. Madame Van Houtte* was also a fine form, but would be taken to rank second only; *Odontoglossum Andersonianum* *grandiflorum*, a fine variety, with crimson spots, sepals and petals spotted alike, the blooms being of great size—the plant carried two flower-spikes of fifteen blooms; *O. radiatum*, a curious form, with many hairs on the labellum, which is likewise much dentated at the edges, the prevailing colours of the flowers being brown and gold; *Begonia gogoensis*, a prostrate plant, with bronzy-green foliage and pale green nerves and veins—pretty; *Aralia regina*, with finely divided leaf segments; *Pan-cratiun calathinum*, with two white blooms standing on a very strong flower-stalk, the perianth projecting much beyond the flower; *Ochna multiflora*, with green berries and red calices; a new red Beet, with straplike foliage, likely to prove a useful subject in the flower garden, came from the Holloway Nurseries.

Mr. Ballantine, gr. to Baron Schröder, The Dell, Egham, showed several fine things, as *Lælia bella*, the splendid hybrid raised by Messrs. Veitch & Sons, Chelsea, the gorgeous purple lip, with, as it were, the edge of a silver lining seen on the margin, being of great development; *Dendrobium macrophyllum* *Burkei*, a very vigorous spike of creamy coloured flowers, having the faintest trace of pink at the base of the petals; some *Cattleya Trianae* flowers, and a spike of *Odontoglossum crispum*, spotted like *O. Ruckerianum*—very fine in the markings, and the spike of considerable size.

John Day, Esq., Tottenham, showed the rarely seen *Vanda coriulensis*, a spike small and compact, with blooms 1 inch across, rosy-lilac-sepals and petals, and a crimson lip, the crest tipped white. Mr. Denny, gr. to S. W. Marriott, Esq., Down House, Blandford, showed *Ornithogalum gracile* and a large bloom of *Anthurium Andreanum*. Mr. C. W. Scott, Woodbank, Dumfries, showed a hybrid *Odontoglossum crispum*, with suffused pink petals and brown spots (six) on each, the crest being lemon coloured. Mr. Ross, gr., Welford Park, showed *Dracena Eyrei*, a dwarf compact variety, with red, green, and white foliage markings. Messrs. Heinrich, Altona, Hamburg, exhibited a new hybrid (?) *Cactus*, *Epiphyllum Russellianum* var. *Gertneri*, with the growth of a *Cereus* and *Epiphyllum* combined, the flowers being numerous and of a vivid scarlet colour. Mr. Douglas, Great Gearies, Ilford, had show *Auricula* *Dr. Kidd*, a smooth white-edged flower, and Mrs. Moore, an equally good grey-eyed bloom.

From Mr. C. Turner, Slough, came *Carnations* *Snowball*, a white, fairly full flower; *F. W. Girdlestone*, yellow ground, scarlet flake, a distinct flower of its class; *A. H. Kennedy*, a beautiful crimson, full, regular, and particularly smooth in outline; others of lesser merit were *Antonio*, *Heroine*, and *Salamander*. From the same nursery were *Azalea indica* *Elise Lieber*, a large white, here and there spotted and barred with cerise, and having a few abortive petals in the centre of the flower; and *Rose Gloire Lyonnaise* (Guillet), new H.P., but with a slight suspicion of a Tea derivation as to fragrance.

H. M. Pollett, Esq., Ferside, Bickley, showed a spike of *Odontoglossum Pollettianum*—a dense spike of this much spotted variety. *C. Dorman*, Esq., The Firs, Laurie Park, had *Dendrobium Dormanianum*, white sepals and petals, purple tipped, as is likewise the lip, this last being cupped, and of a fine lively golden colour, relieved by two brown spots on either side; *Odontoglossum constrictum*, a small inconspicuous bloom of greenish-yellow; *Dendrobium Domini*, a variety of *D. nobile*.

Messrs. Collins Bros. & Gabriel, 39, Waterloo Road, had a large collection of numerous varieties of *Daffodils*, *Galanthus Elwesii*, *Anemone apennina*, *Erythronium muscari*, fine flower sprays of *Berberis Darwini*, &c.; fine double yellow *Wallflowers*, and a very choice lot of *Anemones*, striking in colour and markings. The Silver Banksian Medal was awarded for this collection.

Messrs. J. Veitch & Sons, Chelsea, had a large collection of *Daffodils*, *Anemones*, &c., of the choicest varieties, which, along with Messrs. Barr & Son's collection, formed a bank of the different shades of yellow, which was most happily relieved with small *Palms*, &c., and which without these auxiliaries would not have produced such a pleasing display. Both exhibitors received equal honours—the Silver-gilt Banksian Medal. Messrs. W. Cutbush & Son, Highgate, had six fine dwarf robust plants of *Laurustinus lucidus* in 8-inch pots, very well flowered; also five new varieties of *Azaleas*, viz., *A. Imperatrice des Indes*, a fine semi-double salmon, edged with white, and spotted with dark crimson—a sweet flower; *A. King of Whites*, a very large white flower, with distinct foliage—a good thing; *A. Bignonia flore-pleno*, fine semi-double deep rose; *A. Queen of Whites*, fine large flower, with very large petals, which, being crimped, gives the flower a very distinct appearance; *A. La Flambeau*, most brilliant crimson—rather a small flower, but very telling. Rev. C. Wolley Dod, Malpas, had a collection of *Daffodils* of much interest, as showing the origin of some of the double varieties, and as affording links between the wild *Daffodil*, *N. Telamonius*, *N. major*, and bicolor varieties. One form of the *Daffodil* was a self white from a field near Bicester. The New Plant and Bulb Company, Colchester, had a nice collection of *Daffodils*. Mr. J. King, Rousham, Aylesbury, had several seedling *Primroses*, amongst others *Rousham Blue*—hardly blue, but approaching as closely to it as any variety we have seen. Messrs. Paul & Son, the "Old" Nurseries, Cheshunt, showed a select interesting collection of alpine and other plants, consisting of fine plants of *Convallaria multiflora* (Solomon's Seal), *Muscari*, *Fritillarias*, the charming little *Polygala chamaebuxus*, and *P. c. purpurea*, several double *Primroses* of different shades of colour, *Saxifragas* in variety, *Primula Cusii* and *P. Obstris*, the yellow-flowered *Rosa berberifolia* var. *Hardyi*, *Rosa microphylla rubra plena*, *White Pet*, and *White Baroness*, H.P.; *Gentiana verna*, *Aubrietia purpurea variegata*, *Doronicum austriacum*, *Impatiens Sultanii* *alba*, *Viola gracilis*, the parent, so far as known, of the garden *Pansy*; and the new H.P. *Rose Gloire Lyonnaise*.

Mr. R. Clark, Twickenham, had again a fine choice lot of dwarf *Cyclamens*, also a white one, mentioned elsewhere, which was much admired; he was awarded the Bronze Banksian Medal. Dr. Brown, Hull, had a small collection of *Daffodils*. Mr. T. S. Ware, Tottenham, a large group of *Daffodils*, intermixed with *Muscari*, *Scillas*, *Anemones*, *Saxifragas*, *Doronicum caucasicum*, *Dielytra spectabilis*, *Iris*, *Galanthus*, *Lachenalia*, *Primulas*, &c., receiving a Silver-gilt Banksian Medal. Messrs. E. H. Krelage & Son, Haarlem, Holland, showed *Pseudo-Narcissus variegatus plenus*, *princeps*, *maximus* (true), *lobularis*; a novelty to be named (*Pseudo-Narcissus*); and another *Pseudo-Narcissus*, which was named *Spurius coronatus* by the committee. A small collection of *Daffodils* was shown by Mrs. Lloyd Williams, of Coed Coch; three *Clivia* *superbum*, from the Royal Horticultural Society's Gardens, Chiswick; Captain C. J. Nelson, R.N., a collection of *Daffodils*, neatly arranged with *Isolepis* and *Lycopodium*. Miss Jekyll, of Munstead Place, Godalming, had a group (arranged in moss that would have had a by no means bad effect had greener moss been chosen).

The plan was that of an undulating bank of moss, highest at one end, backed up by drooping sprays

of *Solomon's Seal*, and of *Alexandrian Laurel* (*Ruscus*). In the moss were studded at intervals groups of *Daffodils* of various kinds, of *Primula rosea*, *P. denticulata*, *Heuchera*, *Iris stylosa*, *Oxlips*, &c. The whole group furnished a valuable lesson to flower-show exhibitors, for it was evident that such an arrangement as this might frequently be adopted with great advantage even when, as in *Rose* shows, it is desirable to have the competing kinds side by side for comparison. So far as beauty and general interest is concerned, the advantages of this plan are beyond question, though, of course, it is not always practicable. A Bronze Medal was awarded for the group—none too high a commendation. Mr. J. Tyerman, Penlee, Tregony, had a small collection of *Daffodils*, also seedling *Triteleias* and *Hellebores*. Messrs. J. Dickson & Sons, Chester, showed a few varieties of *Daffodils*. A splendid group of most of the known kinds of *Daffodils* was exhibited by Mr. J. Walker, Whittom, Middlesex, which contained many most beautiful specimens, excellently grown and well set up, a Silver-gilt Banksian Medal being well bestowed.

The collection staged by Messrs. Barr & Son contained, along with a large and varied collection of *Daffodils*, examples of *Muscari*, *Scillas*, several of the curious terrestrial *Ophryses*, *Clivia nobile*, *Fritillarias*, the rare *Placea arze*, *Orchis Robertsoniana*, *Anemones*, *Amaryllis* *hybrida*, dark velvety-crimson; and *Corydalis bracteata*. Messrs. J. Green & Nephew, 107, Queen Victoria Street, St. Paul's, E.C., exhibited Munstead flower glasses, made of fine quality glass, and varied in size and shape, admirably adapted for floral devices.

#### FIRST-CLASS CERTIFICATES.

To Mr. J. Douglas, for *Auricula* Mrs. Moore.  
To Messrs. J. Veitch & Sons, for *Amaryllis* *Lady Howard de Walden*.

To MM. Krelage & Sons, for *Narcissus spurius coronatus*.

To Mr. M. Heinrichs, for *Epiphyllum Gaertneri*.  
To Mr. Chas. Turner, for *Carnation* *F. W. Girdlestone*.

To Mr. Ballantyne, for *Lælia Bella* x.  
To Mr. Jas. O'Brien, for *Odontoglossum Andersonianum pictum*.

To Mr. Ballantyne, for *Dendrobium macrophyllum Burkei*.

#### VOTES OF THANKS.

To the New Plant and Bulb Company, for a collection of *Daffodils*.

To Mr. Denny, for *Anthurium* flowers.  
To Messrs. James Green & Nephew, for Munstead flower glasses.

To Mr. T. S. Ware, for *Ornithogalum lacteum*.  
To Mr. Owen Thomas, for cut blooms of *Camellia reticulata*.

#### Fruit Committee.

Present:—Harry J. Veitch, Esq., in the chair; and Messrs. John Lee, W. Paul, S. Lyon, J. E. Lane, G. Bunyard, C. Ross, J. Willard, G. Goldsmith, J. Woodbridge, W. Denning, H. Weir, J. B. Haywood, R. D. Blackmore.

A collection of *Rhubarb* came from the Royal Horticultural Society's Gardens, Chiswick, and consisted of the following:—*Buck's Early Red*, *Hawke's Champagne*, *Dancer's Early Red* (good), *Crimson Perfection*, *Baldrey's Scarlet Defiance*, *Albert or Early Red*, and *Linnaeus*. Mr. C. Ross, Welford Park, Newbury, showed a collection of thirty-two dishes of Apples, the major part of them being in a capital state of preservation; the finest were *Cox's Orange Pippin*, *Northern Spy*, *Northern Greening*, *Brabant Bellefleur*, *Annie Elizabeth*, *Cox's Pomona*, *Baldwin*, *Blenheim Orange*, *Cornish Aromatic*, *Stamford Pippin*, *Sturmer Pippin*, *Lord Raglan*, *Tower of Glamis*, *Mère de Ménage*, *Lane's Prince Albert*, *Loddington Seedling*, *Lord Burleigh*, and others.

#### EDINBURGH BOTANICAL: April 9.

THE Society met this evening at 5, St. Andrew's Square, Professor Dickson, President, in the chair, when the following papers were read:—

I. "An Obituary Notice of the late Professor T. C. Archer, Director of the Edinburgh Museum of Science and Art." By Alexander Galleley.

II. "A Note on *Sansevieria longiflora*," plants of which have been raised from seeds sent to the Edinburgh Botanic Garden by Mr. John Buchanan, of Blantyre, East Africa. By Andrew Taylor.

III. "Exhibition of Photographs of Botanical Interest taken during the voyage of H.M.S. exploring ship *Challenger*." By Hugh Cleghorn, M.D., LL.D.

IV. "Report on the Progress of Vegetation at the Royal Botanic Garden, Edinburgh." By Robert Lindsay, Curator.

V. "Report on Temperature, Vegetation, &c., in the Gardens of the Royal Botanic Institution of Glasgow." By Robert Bullen, Curator.

The following flowering plants in pots were exhibited from the Royal Botanic Garden:—

<i>Primula viscosa</i>	<i>Saxifraga diapensioides</i>
" <i>marginata</i>	<i>Narcissus rupicola</i>
" <i>ciliata</i> (seedling)	<i>Corbularia bulbocodium sul-</i>
" <i>acaulis</i> (purple seed-	phureum
ling)	" <i>Graellsii</i>
" <i>integrifolia</i>	<i>Chionodoxa Lucilliae</i>
<i>Saxifraga retusa bryoides</i>	" <i>sardensis</i>

"Report on the progress of vegetation at the Royal Botanic Garden, Edinburgh, for March, 1885."—During the past month the weather has been excessively cold and dry, vegetation generally has in consequence made

very little progress and is still about three weeks behind. The thermometer fell below freezing point on nineteen nights; collectively, 82° of frost were registered for the month as against 26° for the corresponding month last year. The lowest readings occurred on the 9th, 23°, 14th, 25°, 22d, 25°, 23d, 21°, 28th, 26°. The highest morning readings were, on the 8th, 40°; 11th, 40°; 17th, 45°; 26th, 45°; 29th, 44°. The lowest day temperature was 39°, which occurred on the 9th; and the highest, 55°, on the 28th. Flowers of *Rhododendron Nobilaeum* were injured by frost on the 23d. Deciduous trees and shrubs are late in developing their leaves; Thorns, Poplar, and Lilac, which usually have their leaves more or less expanded by the end of March, had not a single leaf fully developed at that date this year. Willows and Elms are flowering most abundantly, and on walls, *Pyrus japonica*, *Ribes sanguineum* (single and double flowering), and *Forsythia viridissima* have not been so finely flowered for some years back. Magnolias, double-flowering Peach, and other plants on walls are well set with flower-buds. Spring flowering bulbs are vigorous, and flowering well, notwithstanding their lateness in opening; cold east winds are shortening their period of flowering considerably, which a few genial showers of rain would do much to prevent. The season has been most favourable for seed sowing, the ground being in splendid condition for that purpose. The extremely dry state of the ground causing a scarcity of worms is probably the reason why the various birds which abound in the Botanic Garden are so assiduously stripping the flowers of Crocuses and Primroses as soon as they expand in some portions of the garden. Formerly their depredations were mainly confined to newly sown seeds, Holly berries, and the like; as there are abundance both of seeds and berries, their preference for a floral diet seems all the more remarkable.

On the rock garden a large number of plants is now in flower. Sixty-five species came into bloom during March, exclusive of those which opened in the previous month, many of which are still flowering. Among the most interesting which opened in March were the following:—

<i>Chionodoxa Lucillie</i>	<i>Narcissus pumilus</i>
„ <i>sardensis</i>	<i>Puschkinia scilloides</i>
<i>Crocus nevadensis</i>	<i>Primula marginata</i>
<i>Corbularia ovalis</i>	„ <i>ciliata purpurata</i>
<i>Helleborus colchicus</i>	„ <i>Wulfeniana</i>
<i>Iris reticulata</i>	<i>Rhododendron præcox</i> , &c.
<i>Korolkowia Sewerzowii</i>	

Of the forty spring-flowering plants whose dates of flowering are annually recorded to the Society, the following seventeen came into flower, viz.:—

	1885.	1884.
<i>Scilla sibirica</i> .. .. .	March 1	Jan. 30
<i>Nordmannia cordifolia</i> .. .. .	„ 1	Feb. 15
<i>Rhododendron Nobilaeum</i> .. .. .	„ 5	„ 2
<i>Iris reticulata</i> .. .. .	„ 6	„ 18
<i>Mandragora officinalis</i> .. .. .	„ 7	„ 9
<i>Sisyrinchium grandiflorum album</i> .. .. .	„ 7	„ 12
<i>Aubrietia grandiflora</i> .. .. .	„ 8	„ 10
<i>Sisyrinchium grandiflorum</i> .. .. .	„ 9	„ 14
<i>Scilla bifolia</i> .. .. .	„ 10	„ 14
„ <i>alba</i> .. .. .	„ 12	„ 21
„ <i>taurica</i> .. .. .	„ 14	„ 24
<i>Narcissus pumilus</i> .. .. .	„ 15	„ 28
<i>Orobis verus</i> .. .. .	„ 15	„ 9
<i>Erythronium Dens-canis</i> .. .. .	„ 22	March 12
<i>Ribes sanguineum</i> .. .. .	„ 28	Feb. 20
<i>Draba aizoides</i> .. .. .	„ 30	„ 12
<i>Omphalodes verna</i> .. .. .	„ 31	„ 14

“Report on temperature, vegetation, &c., in the garden of the Royal Botanic Institution of Glasgow, for March, 1885.”—The thermometer has been at, or below, the freezing point twenty-one times during the month; the remaining night readings also being low. The lowest was 22° during the night of the 22d. The mean day temperature has also been low for the month, with cold and variable winds. The weather has been mostly dry, and favourable for working heavy soils; but the frequent frosts have prevented seed sowing to any great extent. Most trees and shrubs have a backward look. The leaf-buds of Lilacs are ready to burst, but the only shrub in actual leaf and bloom is the common *Ribes sanguineum*. Some forms of *Salix* and *Ulmus* are in bloom. Several herbaceous plants, which may frequently be seen in bloom here in February, such as *Pulmonaria officinalis* and *azurea*, *Helleborus viridis*, and some of the early *Scillas*, are not yet developed. Owing partly to the absence of severe frosts, and partly to the drier weather that has prevailed during the dormant season, the latter class of plants have suffered much less than is usual here.

#### MASSACHUSETTS HORTICULTURAL.

Boston: *March 19 and 20.*—The annual Azalea and Rose show, the first exhibition for the current season, was held in the Society's upper hall, and was, considering the state of the weather, remarkably successful, it being very cold for this time of the year, and plants could be brought only with the greatest trouble and care in packing; but, notwithstanding, it was the best exhibition the Society has ever made. The Orchids occupied one end of the large hall, and were backed by groups of Palms and Ferns, and the display is said to have surpassed anything ever shown in this city or any other one in this country.

F. L. Ames was the largest contributor, and he showed some very curious and interesting plants, among which we noticed *Phalaenopsis Brymeriana* (one of the only two plants in this country), *P. Stuartiana*, *P. Schilleriana*, *Laelia anceps*, *Masdevallia triangularis*, *Coelogyne cristata*, *Cymbidium eburneum*, *Cattleya amethystoglossa*, *Dendrochilum glumaceum*, *Ada aurantiaca*, *Schomburgkia crispata*, *Cypripedium Harrisianum*, *Dendrobium Ainsworthii*, *Odontoglossum Pescatorei*, &c.; and Mr. H. H. Hunnewell exhibited a large collection, including *Phalaenopsis grandiflora*, *P. Schilleriana*, *Lycaste Skinneri*, *Odontoglossum Rossii*, *O. Insleyi*, *Coelogyne cristata*, *Dendrobium nobile*, *D. Ainsworthii*, *rosea*, *Cymbidium Lowianum*, and *Calanthe nivalis*. Mr. E. W. Gilmore showed *Masdevallia tovarensis*, *Dendrobium chrysotoxinum*, *Laelia harpophylla*, *Odontoglossum Rossii majus* and *O. Roezlii*. Mr. David Allan, gr. to Mr. R. M. Pratt, filled a large table with Orchids and other flowers.

President Moore took the 1st prize for twenty-four cut blooms H.P. Roses, seven named varieties. He was also awarded 1st prize in the class for six cut blooms; also 1st prize for a single cut bloom H.P. Mr. Jackson Dawson, of the Arnold Arboretum, showed H.P. Roses on the Japanese stock, and took the 1st prize for three plants; also 1st prize for single plant. He also exhibited *Kalmia latifolia*, and a large collection of hybrid *Primulas* (English). Mr. James Cromley, gr. to Mrs. F. B. Hayes, filled a stand with fine Roses and greenhouse plants, among which we noticed *Rhododendron Veitchianum levigatum*, which formed the centre of the group. In the classes of tender Roses, twelve Bon Silene, Mr. S. Niel took the 1st prize. Twelve of Catherine Mermet—the 1st prize went to Mr. C. M. Hovey. Twelve *Cornelia Cook*—Messrs. Dclay & Meade took the 1st prize, and also the 1st prize for twelve *Souvenir de la Malmaison*, and twelve *Niphetos*. Hon. M. P. Wilder and Mr. A. W. Blake were the principal exhibitors of Azaleas, Mr. Wilder filling a platform with fine large old specimens. Mr. Blake contributed a collection of young plants of the newest varieties, among which we noticed *Duchesse de Jernan Nunez*, *La Flambeau*, and *Amœna Caldwellii*. Mrs. F. B. Hayes filled a table with *Camellias* of many varieties. Mr. W. A. Manda, gr., Harvard Botanic Gardens, contributed a collection of plants, including *Lilium tenuifolium*, *L. pulchellum*, *Trillium grandiflorum*, *Aquilegia glandulosa*, *Primula Sieboldii*, *Vertheimia glauca*, *Doronicum caucasicum*, and *Mesembryanthemum acinaciforme*, also *Dendrobium Pierardi*. In the centre of the hall there was a platform running the length of the hall, with an elevated centre devoted mainly to spring flowering bulbs. All the newest varieties of *Hyacinths*, *Tulips*, *Narcissus*, *Jonquils*, *Crocuses*, *Anemone coronaria*, and *Lilies of the Valley*, were shown in large numbers. Among the *Narcissus*, Sir Watkin is a new variety, shown here for the first time. The Tenby *Daffodil* is also quite new here, and the *Narcissus Pocius ornatus* attracted its share of attention. Mr. J. L. Gardner took the 1st prize for specimen greenhouse plant with *Imantophyllum miniatum*. There were also large collections of *Cyclamens* and *Cinerarias* from different contributors.

Mrs. P. D. Richards, West Medford, Mass., contributed a collection of Mosses, all carefully named, which were to many the most interesting collection in the hall.

## The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON,  
FOR THE WEEK ENDING WEDNESDAY, APRIL 15, 1885.

15.—Dull day and night.

LONDON: *Atmospheric Pressure.*—During the week ending April 11, the reading of the barometer

at the level of the sea decreased from 29.91 inches at the beginning of the week to 29.25 inches by 5 P.M. on the 6th, increased to 29.59 inches by 5 P.M. on the 8th, decreased to 29.56 inches by 9 A.M. on the 9th, increased to 29.63 inches by 5 P.M. on the same day, decreased to 29.55 inches by 9 A.M., and increased to 29.57 inches by 1 P.M. on the 10th, and was 29.73 inches by the end of the week.

The mean reading of the barometer for the week was 29.55 inches, being 0.52 inch lower than last week, and 0.37 inch below the average of the week.

*Temperature.*—The highest temperature in the shade in the week was 55°.2, on the 7th; the highest on the 9th was 43°.5. The mean of the seven high day temperatures was 50°.1.

The lowest temperature was 30°.2, on the 5th; on the 9th the lowest temperature was 38°.9. The mean of the seven low night temperatures was 45°.7.

The greatest range of temperature in one day was 23°.3, on the 5th; the smallest was 4°.6, on the 9th. The mean of the seven daily ranges was 14°.4.

The mean temperatures were—on the 5th, 40°.9; on the 6th, 44°.7; on the 7th, 41°.9; on the 8th, 40°.4; on the 9th, 40°.9; on the 10th, 40°.2; on the 11th, 41°.6; and these were all below by 4°, 0°.3, 3°.3, 5°, 4°.7, 5°.5, and 4°.2 respectively.

The mean temperature of the week was 41°.5, being 1°.3 lower than last week, and 3°.9 below the average of the week.

The reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 114°, on the 5th. The mean of the seven readings was 84°.7.

*Rain.*—Rain fell on two days to the amount of 0.17 inch.

ENGLAND: *Temperature.*—During the week ending April 11, the highest temperatures were 55°.2, at Blackheath, 54°.7 at Cambridge, 53° at Brighton; the highest at Sunderland and Newcastle was 40°, at Hull 47°. The general mean was 50°.2.

The lowest temperatures were 23° at Cambridge, 25° at Wolverhampton and Hull; the lowest at Liverpool was 36°.1, at Sunderland 32°, at Plymouth, Preston and Newcastle 31°. The general mean was 29°.

The greatest ranges were 31°.7 at Cambridge, 26°.5 at Bristol and Wolverhampton; the smallest ranges were 12°.9 at Liverpool, 14° at Sunderland, 15° at Newcastle. The general mean was 21°.2.

The mean of the seven high day temperatures was highest at Blackheath, 50°.1, at Truro 50°, at Plymouth 49°.1; and was lowest at Sunderland, 44°.2, at Newcastle 44°.5, at Hull 44°.7. The general mean was 47°.1.

The mean of the seven low night temperatures was highest at Liverpool, 38°.5, at Sunderland 37°.8, at Leeds 37°.4; and was lowest at Wolverhampton, 33°.3, at Bolton 34°.1, at Cambridge 34°.6. The general mean was 33°.9.

The mean daily range was greatest at Blackheath, 14°.4, at Cambridge 14°.2, at Truro 14°; and was least at Sunderland, 6°.4, at Bradford 8°.6, at Leeds 8°.7. The general mean was 11°.2.

The mean temperature was highest at Truro, 41°.6, at Blackheath 41°.5, at Plymouth 41°.2; and was lowest at Hull, 38°.6, at Bolton and Newcastle 38°.7. The general mean was 41°.2.

*Rain.*—The largest falls were 1.06 inch at Bradford, 0.96 inch at Sheffield, 0.82 inch at Sunderland; the smallest falls were 0.17 inch at Blackheath, 0.28 inch at Nottingham and Preston. The general mean fall was 0.55 inch.

SCOTLAND: *Temperature.*—During the week ending April 11, the highest temperature was 54°.4, at Edinburgh; at Aberdeen and Leith the highest was 49°. The general mean was 51°.1.

The lowest temperature in the week was 27°, at Glasgow; at Leith the lowest temperature was 33°. The general mean was 31°.5.

The mean temperature was highest at Paisley, 42°.5; and lowest at Leith, 40°.6. The general mean was 41°.4.

*Rain.*—The largest fall was 1.08 inch, at Edinburgh; the smallest fall was 0.20 inch, at Greenock. The general mean fall was 0.57 inch.

JAMES GLAISHER, F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United

Kingdom, for agricultural and sanitary purposes, for the week ending Monday, April 13, 1885; issued by the Meteorological Office, 116, Victoria Street, London, S.W.:—The weather has been generally fair or fine in the extreme west and north-west, but unusually dull and gloomy for the season in most other parts of the kingdom, with occasional falls of cold rain.

The temperature has continued below the mean in all districts, the deficit varying from 1° to 3° in Scotland, and between 4° and 5° over England and Ireland. The maxima, which were recorded on the 12th or 13th, ranged from 48° in "England, N.E.," and 49° in "Scotland, E.," to 55° in "England, S.," and "England, S.W." The minima, which were registered on different dates in the various districts, ranged from 26° in "Ireland, N.," to 33° in "England, N.W.," and 39° in the "Channel Islands."

The rainfall has been more than the mean in "Scotland, E.," "England, N.E.," and "England, E.," but considerably less elsewhere.

Bright sunshine shows an increase in "Scotland, N.," but a decrease in all other districts. In "England, N.E.," only 2 per cent. of the possible amount of duration was recorded; in the "Midland Counties," 67, and in most other parts of England between 10 per cent. and 16 per cent.; in "Scotland, W.," however, 33 per cent. was registered; in "Ireland, S.," and the Channel Islands, 35 per cent., and in "Scotland, N.," as much as 53 per cent.

Depressions observed.—As the period commenced, the barometer was highest over Scandinavia, while a depression lay over the Bay of Biscay, the winds in our islands consequently being moderate or fresh from the eastward. On the following day this disturbance had disappeared, but another was approaching the North Sea from the Netherlands. This depression, after reaching the southern part of the North Sea, and remaining almost stationary, finally developed into a large trough of relatively low readings stretching from the South of England to North Germany and Russia. As this disturbance appeared the winds over the United Kingdom backed to the northward, and on our east coasts, and blew strongly, but subsequently became light or moderate, and generally north-easterly or easterly.

NOTICE TO QUIT SERVICE: X. In England, when the service was entered into without any particular agreement, the law construes the hiring to be for a year; and in Scotland the yearly hirings fix the term. A quarter's notice must be given in the first-named country prior to the expiration of the term.

POPLAR: B. The Canada Poplar is *Populus monilifera*; the Black Poplar *P. nigra*. Neither is native to this country.

RHODODENDRON COUNTESS OF DERBY: G. L. This beautiful variety, and many others of the same type, are the offspring of a cross between R. Edgeworthii and R. multiflorum, which latter variety sprung from intercrossing R. virgatum, Hook., with R. ciliatum, Hook.

SELECT FRUITS: L. G.—Six kitchen Apples: Hawthorned, Keswick Codlin, Worcester Pearmain, Gravenstein, Warner's King, Lane's Prince Albert. Six dessert Apples: Early Harvest, Red Astrachan, Golden Reinette, Cox's Orange Pippin, Adam's Pearmain. Claygate Pearmain. Six early Pears: Citron des Carmes, Jargonelle, Clapp's Favourite, Bon Chrétien (Williams), Beurré Superfin, Beurré d'Amanlis. Six late Pears: Marie Louise, Van Mons, Glou Morcean, Beurré d'Arenberg, Marie Benoist, Easter Beurré. Three Pine-apples: The Queen, Charlotte Rothschild, Smooth Cayenne. Six black Grapes: Black Hamburg, Espérance, Alnwick Seedling, Alicante, Lady Downe's, Madresfield Court. Six white Grapes: White Muscat of Alexandria, Chasselas Musqué or St. Albans, White Frontignan, Buckland Sweetwater, Foster's White Seedling, Royal Muscadine. Four Strawberries: Amy Robsart, Keens' Seedling, Pioneer, Loxford Hall Seedling. Four Gooseberries: Champagne Red, Early Green Hairy, Bright Venus, Warrington Red. Two red Currants: Red Dutch and Houghton Castle. Two white Currants: White Dutch and Blanc de Versailles. Four Plums: Green Gage, Reine Claude de Bay, Jefferson, Denyer's Victoria. Two Apricots: Rivers' New Large Early and Moor Park. Six Peaches and Nectarines: Royal George, Barrington, Dymon. Peaches: Balgowan, Elruge, Pine-apple. Four Cherries: May Duke, Late Duke, Black Tartarian, Monstreuse de Metz.

## SEEDS.

LONDON: April 15.—Messrs. John Shaw & Sons, of 37, Mark Lane, report that a fairly active demand for Clover and other seeds still continues. As regards values there is no important change to be noted. Prices all round remain extremely moderate, and holders appear quite indifferent whether they clear out what little stock they have still on hand or keep some over. More money is asked for blue Peas. Haricot Beans are also in better demand. There is no variation in the prices of spring Tares; sowing orders come in freely. Mustard and Rape seed are steady. In feeding Linseed the tendency is upwards. Canary, Hemp seed, and Millet are firm.

## CORN.

At Mark Lane on Monday the market was slightly dearer than on Friday's close, and on the week quoted 4s. dearer for both English and foreign Wheat, and 3s. per sack on flour. Barley was quoted 1s. 6d. to 2s. above Wednesday last; Maize showed a rise of 1s. 6d.; Oats were 3d. to 6d. dearer than quoted on Friday last, making the rise 2s. Since this day fortnight Beans and Peas show a rise of 1s. to 2s., and Lentils 1s.—On Wednesday a somewhat calmer feeling with regard to political affairs checked the excitement in the grain trade. Business opened with a very quiet tone, and the market became weaker during the day. At Monday's advance there were no buyers of Wheat or flour, and to have made sales at least 6d. less must have been accepted for Wheat. In the absence of business in Barley, Beans, and Peas, off stands rates nominally unaltered, but the tendency was against the seller. For Oats the market closed without improvement upon Monday's prices. Maize was steady in value, without activity.—Average prices of corn for the week ending April 11:—Wheat, 33s. 3d.; Barley, 31s. 2d.; Oats, 20s. 11d. For the corresponding period last year:—Wheat, 37s. 9d.; Barley, 31s. 4d.; Oats, 19s. 11d.

## CATTLE.

At Copenhagen Fields on Monday the cattle trade opened about steady and finished slowly, prices where any change was apparent, being rather in favour of the buyers. A heavy supply of sheep and lambs met a dull market. Prices opened easier, and finished worse for the former; but for the latter rates were fairly steady. There was a bad trade for calves, and the pig trade nominal from absence of supply. Quotations:—Beasts, 3s. 8d. to 4s. 6d., and 4s. 8d. to 5s. 4d.; calves, 3s. 8d. to 5s. 8d.; sheep, 4s. 8d. to 5s. 2d., and 5s. 2d. to 5s. 8d.; lambs, 7s. 6d. to 8s.; pigs, 4s. to 4s. 6d.—On Thursday trade was quiet, the unfavourable weather telling against the demand. Both beasts and sheep sold slowly, and were weak in value. Lambs were neglected, and calves were lower to sell.

## HAY.

Tuesday's Whitechapel market report states that supplies were very short, with an advance in the top prices for Clover and hay. Quotations:—Clover, prime, 85s. to 110s.; prime second cut, 85s. to 110s.; inferior, 46s. to 75s.; hay, prime, 76s. to 100s.; inferior, 46s. to 75s.; and straw, 22s. to 35s. per load.—Cumber and Market quotations:—Clover, best, 90s. to 105s.; inferior, 60s. to 84s.; hay, best, 84s. to 95s.; inferior, 45s. to 75s. and straw, 30s. to 34s. per load.

## POTATOS.

The Borough Market report informs us that supplies are fully adequate to demand, which is dull. Quotations:—Scotch Regents, 80s. to 95s.; Kent ditto, 70s. to 90s.; Champions, 40s. to 50s.; Magnum Bonums, 50s. to 80s.; and Victorias, 60s. to 90s. per ton. The imports into London last week consisted of 573 bags from Hamburg, 439 Bremen, and 43 boxes from Lisbon.

Government Stock.—Consols closed on Monday at 95 to 95½ for both delivery and the account. Tuesday's figures were 94½ to 95 for both transactions. The final figures recorded on Wednesday were 95½ to 95½ for both delivery and the account. Consols closed on Thursday at 95½ to 95½ for both transactions.

## Answers to Correspondents.

BOILER CRACKING, &c.: G. H. The metal at the points mentioned may have been very thin, and thus has corroded through in four years. You will find your boilers remain in better condition full of water than empty during the time they are out of use; and for ordinary use cast-iron is far to be preferred to wrought. For the office a flow and return pipe of 4-inch size will be ample, if it run along the two longer sides of the room.

BOOK, "MUSHROOMS FOR THE MILLION": Mushroom. This useful work, by Mr. J. Wright, is published at the office of the *Journal of Horticulture*, 171, Fleet Street, E.C., price 6d.

CORRIGENDA: ROYAL CALEDONIAN HORTICULTURAL SHOW.—In the report of this show, forwarded to us, an error has crept in, with reference to the awards made to Messrs. Ireland & Thomson and Messrs. R. B. Laird & Sons, the first-named firm not gaining all the first prizes in the six classes in which it exhibited, but, namely, five firsts and one second, the latter for new and rare plants, the first prize in this class falling to R. B. Laird & Sons.

CURIOUS FORM OF CATTLEYA TRIANÆ: R. B. W. Thanks for specimen, which was forwarded to Prof. Reichenbach as requested.

DISEASED CAMELLIA LEAVES: Waterside. We can find no fungus on the leaves.

DISEASED PALM: K. W. The spots may be due to a fungus, but it is in too immature a condition to be determined.

FIXTURES: RIGHT OF LEASEHOLD TENANT TO REMOVE: C. Taylor. No, if they stand on brick walls, and are attached by bolts or nails to these; or if they are of brick, and standing in the ground. Utensils used in trade, fixed in such buildings, may be removed. In cases of this kind it is always the best policy to consult a solicitor.

MASDEVALLIAS: P. W. We are not able to point out the difference between the alleged varieties. All seem to be forms of *M. chimæra*.

NAMES OF PLANTS: L. C. We cannot undertake to name detached leaves only.—*A. Subscriber*. Juniperus communis.—*F. W. B.* *Eria ferruginea*, probably.—*S. Young*. *Allium neapolitanum*.—*H. B.* Both varieties of *Lycaste Harrisoniae*.—*W. B. C.* *Dendrobium crepidatum*.—*A. J. Hemmerle*. *Oncidium O'Brienianum*.—*Hon. Mrs. E. V. Boyle*. 1 and 2, *Narcissus Telemonius plenius*; 3, *N. moschatius*; 4, *Spurius*.

(Wm. St.)

Oil Paint no Longer Necessary.

**HILL AND SMITH'S BLACK VARNISH,**  
for Preserving Ironwork, Wood, or Stone.  
(Registered Trade Mark)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertiser, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used to the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

### UNSOLICITED TESTIMONIAL.

"Pierrefield Park, June 21, 1876.—Sirs,—I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chepstow.—I am, Sirs, yours respectfully, Wm. Cox."

**CAUTION.**—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large illustrated CATALOGUE of Fencing Hardies, Field and Entrance Gates, &c., sent free on application to HILL AND SMITH, Briarley Hill Ironworks, Staffordshire; 118, Queen Victoria Street, London, E.C.; and 196, St. Vincent Street, Glasgow.

**W. H. LASCELLES & CO.,**  
HORTICULTURAL BUILDERS,  
121, BUNHILL ROW, LONDON, E.C.

W. H. LASCELLES AND CO. will give Estimates for every description of HORTICULTURAL WORK, free of charge, and send competent assistants when necessary.

LASCELLES' NEW ROCKWORK material in various colours. Samples can be seen and prices obtained at 121, Bunhill Row, and 35, Poultry, Cheapside, E.C.

Illustrated Lists of Wooden Buildings, Greenhouses and Conservatories, and Concrete Slabs for walls, paths, and stages, sent post-free on application.

### PORTABLE PLANT FRAMES.

The above are without exception the most useful kind of Frame for Plant Growing, and every one with a garden should possess one. The sashes turn right over one on the other, and the boxes are put together with wedges, and can be taken apart in a few minutes. Sizes and prices, carriage paid to any station in England, ready glazed and painted:—

## RANSOMES' NEW PATENT EDGE CUTTER.

Any Gardener can use it with ease.

The only really practical Edge Cutter yet brought out.

THIS Machine is a light, simple, strong, and useful substitute for Hand Shears, for trimming the edges of Lawns. It can be guided with the greatest ease either in a straight line or round the edges of flower beds, &c. The depth of cut can be varied to suit the depth of the edge by simply tilting the conical roller more or less. The knives can be adjusted to the fixed blade as they wear, and can be readily removed for sharpening. After a little practice with this Machine, a man can trim the edges as fast as he can walk, thus doing from five to ten times as much work as with the ordinary shears.

Price ... 35s.

Carriage Paid to any Railway Station.

RANSOMES, SIMS & JEFFERIES (Limited), Ipswich.

PRIZE  
MEDALS  
SINCE  
1860.

THE MOST SUITABLE FOR  
SHADING ORCHIDS, FERNS,  
Palms and Stove and  
GREENHOUSE PLANTS.

It is a strong, durable Cotton Netting, woven in squares so close as to exclude the direct rays of the sun, but admitting the greatest amount of light attainable through shading.

It withstands the weather better than any other class of Shading, and may be beneficially used on account of the thickness of its texture, during cold weather, to keep the frost out. R. WARNER, Esq., Broomfield, Chelmsford, has employed this material for some years, and speaks very highly of it, pronouncing it to be the very best material for Orchids he has ever used.

Blinds made up and fixed complete.  
Sold in pieces, 30 yards long by 1½ yard wide.  
Price 45s. each. Sample submitted.

**WANTED, a MAN** able to do Carpentering and fill up his time in a Market Nursery; also a young MAN used to Potting and Tying.—H. BAKER, Plumstead Nursery, Kent.

## WANT PLACES.

**POSTAL ORDERS.**—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

**B. S. WILLIAMS** begs to intimate that he has at present in the Nursery and upon his Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Holloway, N.

**RICHARD SMITH and CO.** beg to announce that they are constantly receiving applications from Gardeners seeking situation, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

**SCOTCH GARDENERS.**—JOHN DOWNIE, Seedsman, 144, Princes Street, Edinburgh, has at present on his list a number of SCOTCH GARDENERS, waiting re-engagements, at wages ranging from £50 to £100 per annum, and he will be pleased to supply full particulars to any Nobleman or Gentleman requiring a trustworthy and competent Gardener.

**Journeyman and Foreman, Scotch.** JOHN DOWNIE, SEEDSMAN, 144, Princes Street, Edinburgh, has at present on his Books a number of first-rate Young Men who wish to go to England.—Particulars on application.

**TO LANDED PROPRIETORS, &c.—A.** MCINTYRE (late of Victoria Park) is now at liberty to undertake Formation and Planting of New Garden and Park Grounds, and Remodelling existing Gardens. Plans prepared. 115, Listria Park, Stamford Hill, N.

**GARDENER (HEAD).**—Age 37, married; thoroughly practical. Over twenty years' experience. First-class references.—HORTUS, 4, Norman Villas, Elm Road, Kingstoo-oo-Thames.

**GARDENER (HEAD).**—Understands Early and Late Forcing of Flowers, Fruits, and Vegetables. Fourteen years' character from late employer.—L. L'ANSON, Foxley, Hereford.

**GARDENER (HEAD).**—Age 35, single; thoroughly practical, active, and industrious. Character will bear the strictest investigation.—GARDENER, Coleridge Cottage, Clevedon, Somerset.

**GARDENER (HEAD).**—Age 26; ten years' experience in good places. Has lived nearly three years as Foreman in present place. Good personal character. House preferred.—A., 6, Goodyear Place, Addington Square, Camberwell, S.E.

**GARDENER (HEAD); age 31.**—The HEAD GARDENER, Avington Park, Winchester, can with confidence recommend his Foreman, who has been with him eight years, to any Lady or Gentleman requiring a thorough practical, energetic, and trustworthy Gardener.—Address as above.

**GARDENER (HEAD); age 29.**—A ALDERMAN, Head Gardener, Elm Court, Mitcham, can highly recommend his Foreman, James Wadham, to any Lady or Gentleman requiring the services of a competent, trustworthy man to General Routine of Gardening. Four years in present situation.

**GARDENER (HEAD).**—The advertiser begs to offer his services to any Lady, Nobleman, or Gentleman, requiring a man as above. Has had sound practical experience in all branches of Gardening. Particularly good references as to character and abilities.—FOREMAN, The Gardens, Wadhurst Park, Sussex.

**GARDENER (HEAD); age 37, married, one child (age 5).**—Mr. TILLYARD, Gardener to the Earl of Yarborough, Brocklesby Park, Ulceby, Lincolnshire, can with the utmost confidence recommend a thoroughly practical man, a high-class Fruit Grower, &c., and one fully competent to manage a large place. In last situation eight years as Head Gardener. Highest references from present employer.

**GARDENER (HEAD)** to any Lady, Nobleman, or Gentleman, requiring the services of a thoroughly efficient Gardener. Has had the entire Management of a Large Place, which he has conducted in a satisfactory manner for fifteen years, now leaving through the place being let. Character will bear the strictest investigation.—W. WASLEY, Radburn Hall, Derby.

**GARDENER (HEAD).**—Age 49, married; thoroughly practical in the General Routine of Gardening; experienced in the Cultivation of Stove and Greenhouse Plants, also Early and Late Forcing, and Flower and Kitchen Gardening. Six years' good character. Abstainer.—JAMES CHESHIRE, Francis James, Esq., Edgeworth Manor, Cirencester, Gloucestershire.

**GARDENER (HEAD).**—A. F. SKINNER is open for an engagement to any Lady, Nobleman, or Gentleman requiring a skillful Gardener. He has acquired practical experience in some of the first gardens in England, viz., at Sir J. Kenneway, Bart., M.P., Bloxholm Hall, and with his present employer, C. F. H. Boleck, Esq., for the last six years as General Foreman.—For practical information apply to the HEAD GARDENER, Marston Hall, Middleborough.

**GARDENER (HEAD); married.**—W. SWAN, for the past twelve years Gardener to W. Leech, Esq., is open to engage with any Nobleman or Gentleman requiring a thoroughly practical man. Thorough knowledge of the culture of Orchids, Stove and Greenhouse Plants, Flower and Kitchen Gardening, Laying out of Grounds, and Erection of Horticultural Buildings. Total abstainer. First-class references and character.—W. SWAN, Oakley, Fallowfield, Manchester.

**GARDENER (HEAD).**—Mr. P. C. HARDWICKE wishes to highly recommend his late Head Gardener, who lived fifteen years at Hollands, Tonbridge, to any one requiring a thoroughly practical man.—P. C. HARDWICKE, Esq., 2, Hereford Gardens, Park Lane, W.

**GARDENER (HEAD);** age 26, married, one child.—C. WILLIAMS, Gardener to J. Pulley, Esq., M.P., Lower Eaton, near Hereford, can with every confidence, recommend to any Lady or Gentleman a thoroughly practical Working Gardener, whose character will bear the strictest investigation.

**GARDENER (HEAD WORKING).**—Age 40, three children (youngest, five years old). Twenty years' experience.—WM. CLARKE, (late) P. Cazenove, Esq., Clapham Common, S.W.

**GARDENER (HEAD WORKING).**—Age 29, married when suited; thoroughly practical in all branches. Can be well recommended from present and previous employers.—J. MOSS, The Gardens, Eywood, Tutley, Herefordshire.

**GARDENER (HEAD WORKING);** single; Scotch.—E. M. BROWELL, Esq., highly recommends the Advertiser as a practical trustworthy man in all branches of the profession. Two years' highest reference.—J. CAMPBELL, Feltham, Middlesex.

**GARDENER (HEAD WORKING).**—Age 36, married; twenty-four years' experience in all branches. Well up in Orchids and Stove Plants. Two and a half years' good character, personal if required.—GARDENER, Woodlands, Nightingale Lane, Balham, S.W.

**GARDENER (HEAD WORKING);** age 36.—G. F. LUTTRELL, Esq., Dunster Castle, wishes to recommend his Head Gardener to any Gentleman requiring a thorough good Gardener.—HEAD GARDENER, Dunster Castle Gardens, Dunster, Somerset.

**GARDENER (HEAD WORKING).**—Age 41, married, no family; practical experience in growing Fruit and Flowers under Glass, Kitchen and Flower Garden. Abstainer. Fourteen months' present, five and a half, seven, and nine years' previous situations.—E. CAUSH, The Lodge, Penarroz, Croydon.

**GARDENER (HEAD WORKING).**—Age 29, married; thoroughly experienced in Orchids, Stove and Greenhouse Plants, Fruit Growing, Indoors and Out; also Management of Pleasure Grounds and Kitchen Garden.—W. WATKINS, The Gardens, Shrubland Park, Needham Market, Suffolk.

**GARDENER (HEAD WORKING),** where more are kept.—Married, no encumbrance. Twenty years' practical experience in Forcing Grapes, Peaches, Strawberries, Melons, Cucumbers, Stove and Greenhouse Plants. Thorough Flower and Kitchen Gardener. Excellent character.—D. N., 17, Sutton Road, Watford.

**GARDENER (HEAD WORKING).**—Age 33, married, one child; total abstainer twenty years. Thoroughly understands Vines, Melons, Cucumbers, and General Forcing, together with Stove, Greenhouse, and Conservatory; great experience in Bedding and Forcing Spring Flowers, and a thorough Kitchen Gardener. Leaving through estate changes. Ten years' excellent character and testimonials from previous employers.—A. GERARD, Dyrham Park, near Chippenham, Wilts.

**GARDENER (HEAD),** or **GENERAL MANAGER.**—Thoroughly efficient; upwards of twenty-five years' good character. Highest references.—J. S., 10, Hudson's Road, Kingston-on-Thames.

**GARDENER (HEAD, or good SINGLE-HANDED).**—Age 30, married, one child; good practical experience in all branches; good references.—J. D., 9, South Terrace, Ditherington, Shrewsbury.

**GARDENER (HEAD, or good SINGLE-HANDED).**—Age 25, single; twelve years' experience in all branches. Highest references.—HEAD GARDENER, Elmwood, Bickley, Kent.

**GARDENER (HEAD, or SECOND),** in a good establishment.—Married; thoroughly practical in all branches of the profession. Can have a thorough recommendation.—W. MASKELL, 35, Barrowell Road, Brixton, S.W.

**GARDENER (HEAD),** or good **FOREMAN.**—Age 27; thirteen years' practical experience in the general routine of Gardening. First-class certificates from present and previous places.—C. BREEZE, The Gardens, Caversham Park, Reading.

**GARDENER (HEAD),** or good **FOREMAN.**—Age 26; eleven years' practical experience, three years' previous as Foreman. Highest testimonials as to character and abilities.—H. GILBERT, Gardens, Chalfont Park, Slough.

To Noblemen and Gentlemen.

**GARDENER and BAILIFF, or GARDENER (HEAD WORKING).**—Age 44, married, no small family; thoroughly practical in all branches, Forcing of all kinds of Fruits, Flowers and Vegetables (Early and Late), Management of Land and Stock, Laying-out Grounds, &c. Eleven and a half years' good character.—E. A. H., 8, Violet Cottages, Gladstone Road, Maidstone, Kent.

**GARDENER.**—Thoroughly experienced; highly recommended.—A. B., Ranelagh Nursery, Leamington.

**GARDENER.**—Age 25, single; understands Vines and Kitchen Gardening; good experience with Vines and Glass Work. Good character.—E. KING, Purbrook, near Cosham, Hants.

**GARDENER.**—Married, small family; Vines, Cucumbers, Melons, Stove and Greenhouse Plants, Flower and Kitchen Garden, Home Farm (if required). Wife Dairy or Laundry. Twelve years' good character from last place.—C., 17, Ashburnham Terrace, Gipsy Hill, S.E.

**GARDENER (OUTDOOR or SINGLE-HANDED).**—Age 26, single; two and a half years' good character. Understands Cattle.—F. BATCHELOR, Hoxington, Shipston-on-Stour.

**GARDENER (SINGLE-HANDED),** or where help is given.—A. SELLS, Mereworth Castle Gardens, Maidstone (age 27), can be highly recommended to any Lady or Gentleman requiring the services of a steady hard-working man as above.

**GARDENER (SECOND, or SINGLE-HANDED).**—Age 23; nine years' experience; four and a half years in last place, and ten months in present; leaving through family going away.—B. BRACEY, Herringfleet Hall, Lowestoft.

**GARDENER (SINGLE-HANDED or Otherwise).**—Age 25, married; excellent character from present and previous situations.—E. F., 1, Rosslyn Villa, Granville Road, Tunbridge Wells.

**GARDENER (SINGLE-HANDED, or SECOND).**—Age 27; good practical experience. Three years' good character. Abstainer.—A. EMPSON, Greenford Green, near Harrow, Middlesex.

**GARDENER (SECOND).**—Three years' good character from present situation.—Please apply, stating full particulars, to S. LARGE, The Gardens, Lullington Hall, near Burton-on-Trent, Derbyshire.

**GARDENER (UNDER)** partly under Glass preferred.—Age 19; five years' good experience.—E. POTTER, The Gardens, Priory House, New Southgate.

**GARDENER (UNDER).**—Age 22; four years' experience Indoors and Out.—A. BIRCH, 150, Wellfield Road, Streatham, S.W.

**GARDENER (UNDER)** where three or four are kept.—Age 29; understands Vines, Peaches, Ferns, &c. Five years' character.—J. YOUNG, Bodicote House, near Banbury, Oxon.

**GARDENER (UNDER).**—Age 21; understands both Flower and Kitchen Gardening, with a knowledge of the Houses.—J. H. COLEMAN, Poulton Priory, Fairford, Gloucestershire.

**GARDENER (UNDER).**—Age 24; single; thoroughly understands both Flower and Kitchen Gardening, with a Knowledge of the Houses. Six and a half years' experience. Excellent character.—D. A., 1, Trelawn Road, Leyton, Essex.

**GARDENER (UNDER)** in a situation where he would have experience in Conservatory, Stove, &c., as well as in Outside Work; age nearly 18.—A GENTLEMAN wishes to recommend an intelligent and thoroughly steady young man as above.—JAMES WARDSON, A. H. Heywood, Esq., Ellerray, Windermere.

**ORCHID GROWER, or FOREMAN** in a good establishment (where Orchids are grown preferred).—Age 24; ten years' experience in good establishments. Highly recommended by present and previous employers. Abstainer. W. M., W. Pyman, Florist, Maldon, Essex.

**FOREMAN.**—Age 25; nine years' experience. Two years in present situation. Can be highly recommended.—W. HARDING, Ford's Farm, Bolney, Hayward's Heath, Sussex.

**FOREMAN.**—Age 25; thorough hard-working, where produce clears expenses. Thoroughly recommended from present and previous employers.—G. L., Houghton House, High Road, Tottenham, London.

**FOREMAN, where three or more are kept.**—Age 23; two years' good character from present employer. Abstainer.—C. B., 10, Mansfield Road, George Lane, Wanstead, Essex.

**FOREMAN, where three or four are kept;** age 23.—A GARDENER wishes to recommend his young man, with confidence, as above. Can give two years' good character. Abstainer.—Mr. STANDING, The Gardens, Snarebrook House, Wanstead, Essex.

**FOREMAN; age 27.**—Mr. STAGG, Gardener to P. Rawson, Esq., Woodhurst, Crawley, Sussex, would be pleased to recommend his Foreman, who has lived with him six years, to any one requiring a thorough trustworthy, energetic man. Eleven years' experience.

**FOREMAN, in a Gentleman's establishment.**—Age 25, single; twelve years' good experience in all branches of the profession. Seven years' good character from last situation.—D. J., W. Cole, Grove Vineyard, Feltham, Middlesex.

**FOREMAN, in the Houses.**—HENRY PARR, The Gardens, Givon's Grove, Leatherhead, would be pleased to recommend James Sheppard to any Gardener: a thoroughly trustworthy man. Has been Journeyman in the gardens here three years.—Address as above.

To Nurserymen.

**FOREMAN (GENERAL),** under Glass.—Age 42; thoroughly practical man; twenty years' extensive practice as above with leading London and Country firms.—W. E., 7, Mill Street, Altrincham, Cheshire.

To the Trade.

**FOREMAN and GROWER.**—Nineteen years' practical experience in Growing first-class Plants, Cut Flowers, &c.; well up in Bouquets, Wreaths, &c.; good Salesman. Disengaged end of April.—GEORGE PESTRIDGE, Hertingfordbury Road, Hertford, Herts.

**FOREMAN, in the Houses, or good SINGLE-HANDED.**—Age 25; highly recommended by present and previous employers.—J. ODELL, Witley, Godalming, Surrey.

**FOREMAN, or SECOND, in a Gentleman's garden.**—Age 27; good experience.—B. W., Elmwood, Saffron Walden, Essex.

**FOREMAN, or SECOND, in a good establishment.**—Age 24; good practical experience in all branches. Good character.—W. R., The Gardens, Hookfield Park, Epsom, Surrey.

**FOREMAN (or good SECOND)** in a large establishment.—Age 25; nine years' experience in Indoor and Outdoor Work. First-class character.—T. VAGG, The Gardens, Balls Park, Hertford.

**FOREMAN, or good SECOND, in a Gentleman's establishment.**—Age 23; nine years' experience in Fruit, Plants, and Gardening generally. Good references.—C. SNOW, Caversham Park, Reading.

To Florists, Nurserymen, &c.

**PROPAGATOR and GROWER** of all kinds of Plants for Market, Choice Cut Flowers, Grapes, Cucumbers, Tomatoes, &c.—Age 30, married; fifteen years' practical experience. Good references.—R. T., 1, Rose Cottage, Banstead Road, Caterham, Surrey.

**JOURNEYMAN (FIRST), in the Houses.**—Good testimonials from previous and present situations. Bothy preferred.—J. LUNN, Dorrington Manor, Lincoln.

**JOURNEYMAN.**—Age 20; seven years' experience Inside and Out. Nineteen months' good character.—B. DOWSON, The Gardens, Wood End, Chichester.

**JOURNEYMAN, in a Nursery or good Garden.**—Age 18; two years' experience under Glass.—C. J. R., 6, Laidler's Cottages, New Street, Hampton.

**JOURNEYMAN, in the Houses, in a good establishment.**—Age 21; bothy preferred. Five years' experience. Good character.—J. DEAN, Lower Eaton, Hereford.

**JOURNEYMAN, in Houses, in good establishment, or where Fruit and Flowers are grown for Market.**—Age 21; good experience. Good character. Abstainer.—J. FLETCHER, Harleyford Garden, Great Marlow, Bucks.

**JOURNEYMAN, or IMPROVER in the Houses.**—Age 20; three-and-a-half years' experience. Bothy preferred.—C. WILKINSON, Woolthorpe, Belvoir.

**IMPROVER in a Gentleman's Garden.**—Three years under Glass. Bothy preferred. Premium if required.—J. A., Bingham & Co., Broad Street, Bristol.

**IMPROVER, in a Gentleman's Garden;** age 17.—A. BROOKS, Gardener to W. S. Shorthridge, Esq., Albury Hall, Ware, Herts, will be pleased to recommend a youth as above. Five years' good character. Apply as above.

**TO SEEDSMEN and FLORISTS.**—Young man (age 27), well up in Plants, Ferns, and General Nursery Stuff. Been in the trade since leaving school. Unimpeachable references.—LOWDEN, 6 Duke Street, Blackfriars, S.E.

**TO HEAD GARDENERS.**—Wanted, by a Gentleman, a situation in some large private establishment where instruction could be gained in Gardening (both theoretical and practical) in all its branches, including Fruit Growing (Indoors and Out). Moderate Premium would be paid.—F., 10, Spring Gardens, Ventnor, Isle of Wight, Hants.

**TO NURSERYMEN or MARKET GROWERS.**—A young man (age 26) seeks employment under Glass. Well up in growing Cucumbers and Tomatoes. Two years' good character.—J. ELLIS, 50 Raymouth Road, Bermondsey, S.E.

**TO MARKET GARDENERS and NURSERYMEN.**—Youth (age 16) wants situation as Helper and to learn the Trade.—K. C. P., 31, Upper Bedford Place, London, W.C.

**TO NURSERYMEN and GENTLEMEN'S GARDENERS.**—A lad (age 17) seeks a situation in a Nursery or Gentlemen's Garden. Three years in Garden and Greenhouse.—W. STRONG, Littlehampton, Sussex.

**TO HEAD GARDENERS.**—W. B., Tout-mell Parva, Blandford, wishes to put a boy of 17 under a good Gardener as Improver. State terms.

**MANAGER.**—A person with some years' experience as Florist seeks an engagement to take Management of Business. Speaks German.—M. F., 36, Hart Street, Bloomsbury, W.C.

**CLERK, WAREHOUSEMAN, or SHOPMAN.**—Considerable experience. First-class reference.—A. B., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**SHOPMAN, or SECOND.**—Age 24; nearly eleven years' experience in all branches. Good knowledge of Plants, also Book-keeping. Good references.—B. W., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

GRATEFUL-COMFORTING.

EPPS'S COCOA.

BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." *Civil Service Gazette*.

Made simply with boiling water or milk. Sold only in

Packets, labelled thus:—

JAMES EPPS & CO., Homoeopathic Chemists,

London.

**HOLLOWAY'S OINTMENT and PILLS.**—Diseases of Advanced Years.—The grand climacteric being passed, mankind passes to old age. Then the digestion becomes impaired, the nervous system grows feeble, and the physical powers become enervated. Now arise congestion of the liver, lungs, or head, followed by dropsy, asthma, or apoplexy, which frequently afflict and often destroy the aged. As the liver usually becomes torpid, its activity may speedily be revived by rubbing Holloway's Ointment thoroughly over the pit of the stomach and right side, at least twice a day, and taking the Pills at the same time. This treatment also disperses all other congestions by varying the parts rubbed, according to the situation of the mischief.

SEND FOR A PRICE LIST OF

JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS,For Raising Water for the Supply of Towns, Villages, Irrigation, Railway Stations,  
Mansions, Fountains, and Farms.*No Cost for Motive-Power, which is obtained from a Stream of Water passing through the Rams.*

NO OILING OR PACKING REQUIRED.

Made in Sizes to Raise from 300 to 500,000 Gallons per day. Will Force to a Height of 1500 feet.

**\*\* ESTIMATES WILL BE GIVEN ON RECEIPT OF THE FOLLOWING PARTICULARS:**—First, the fall (in feet or inches), which can be obtained from the stream, spring, cistern, or other source of supply; Second, the height and distance to which the water has to be forced; Third, the approximate quantity falling per minute, and the number of gallons required to be raised in a day of 24 hours. Gun-metal is liberally used in the construction of these Rams, and the prices include gun-metal foot and stop delivery valve, &c. They are fitted up in a most substantial and workmanlike manner, the first cost being only a secondary consideration.

This view represents Fig. A. Ram forcing up a part of the same water that works it, which is supplied from a spring. Special Rams of A. make can be supplied to force to a height of 600 feet.

This View represents a Ram worked by impure river water, whilst pumping pure water from a well or spring, and forcing it to a reservoir on the hill, at an elevation of 295 feet, and a distance of one mile, from which reservoir the water is gravitated for fire extinguishing and general requirements of mansion, stables, farm, and village. Will force to a height of 1500 feet.

## TESTIMONIALS.

From Mr. J. A. RUTHERFORD, Agent to C. F. H. Bolckow, Esq., Estate Office, Marton Hall, Middlesborough September 26, 1883. "Dear Sir,—I am glad to say that the Rams you put down on the Hambleton Estate for Mr. C. F. H. Bolckow, are working very well. You undertook, with 16 gallons per minute, to send up 1500 gallons a day, and with enough water to work the Rams at full power, 2000 gallons a day. With a supply of 11½ gallons per minute they are lifting 2200 gallons, and when working full power, 3105 gallons per day are sent up to a height of nearly 400 feet. They made a clear start, and have gone well since." The Delivery Pipe, in the above case, is 900 feet in length.

From Mr. HENRY ROBINSON, Engineer to the Stockport District Waterworks Company, September 8, 1883. "Dear Sir,—I can now report well of the two Hydraulic Rams we have fixed to your structure for the supply of Disley Village. 40,000 gallons per day was the quantity you promised they would force to a height of 68 feet, but on testing them I am convinced that 53,000 gallons is not the limit of their power, whilst the quantity of waste water used in driving them is not equivalent to half the capacity of the 6-inch pipe by which they are fed, and I am inclined to the belief that a more simple and efficient pump cannot be found."

From J. SPENDER CLAV, Esq., Ford Manor, Lingfield, Surrey, August 9, 1880.—"In reply to your letter of enquiry, I am glad to be able to say that the two Hydraulic Rams which you fixed here are working satisfactorily, and that out of 13 gallons 3 quarts per minute, the maximum yield of the spring, they deliver to the top of my house, distant a full mile from the spring, 4 gallons 1 quart per minute, or 6120 gallons per 24 hours, being 120 gallons above the quantity you guaranteed."

From J. R. SHAW, Esq., Arrowe Park, Cheshire, August 31, 1883.—"I have much pleasure in testifying to the excellence of the two Rams you fixed here. One forces 7000 gallons per day of turbid water, and the other 4000 gallons per day of spring water, through more than 1000 yards of delivery pipe, to an elevation of 110 feet, and the working of the Rams is as satisfactory as the workmanship is creditable."

From Sir ROBERT MENZIES, Bart., of Menzies, Rannoch Lodge, Rannoch, August 20, 1880.—"The Hydraulic Ram which you fixed for me to supply water to Rannoch Lodge and Camesurich, two houses three-quarters of a mile apart, is a complete success. The extreme distance the water is carried is a mile and a quarter, and it is raised fully 100 feet, and though the elevations of the two houses are different, there is a regular supply of 7 quarts per minute to each house, which has never ceased since the Ram was set going about three months ago. Your Ram took the place of one previously tried on the same spot, and which did not succeed, and was in fact a complete failure."

From T. H. SIDEBOTTOM, Esq., Etherow House, Hadfield, February 22, 1882.—"Induced by the good report of my cousin, Mr. J. A. Sidebottom, as to the working of the Hydraulic Ram he had from you, I ordered the one you fixed here a year ago, which I am pleased to say has since worked well night and day. Yet the two Rams you fixed at Snow's Hill Manor Gloucestershire, for my brothers and myself, &c., I think, a still more remarkable example of your success. We had a Ram fixed by a well-known firm, which proved a miserable failure, and which your Rams displaced. They are forcing the water through three-quarters of a mile of delivery pipe, a little in excess of the quantity you guaranteed, to an elevation of 340 feet, and without the slightest hitch to the time of the last report from our tenant."

From the Right Honourable the EARL of GRANARD, Castle Forbes, March 1, 1880.—"The Hydraulic Ram erected for me at Castle Forbes has answered perfectly. Considering the very small fall obtainable by the nature of the ground, it is a great success, and throws up water to a cistern on the top of a tower 80 feet high. When Mr. Blake first proposed to put it up I doubted the possibility of its succeeding, owing to the nature of the ground, but I have been most agreeably undeceived.—GRANARD."

From the Right Hon. the EARL of ROMNEY, 56, Eaton Place, S.W., June 12, 1880.—"Sir,—In reply to your inquiry, I have pleasure in stating that the Hydraulic Ram which you erected for me at Gayton does its work remarkably well, and is a great success. I think the work is especially creditable to you on account of the very small fall of but 3 feet with which you had to deal, and I shall always be glad to recommend you.—Yours faithfully, ROMNEY."

From Captain GANDY, Castle Bank, Appleby, February 11, 1883.—"The self-acting Hydraulic Ram you erected for me is an excellent example of strength and good workmanship. Whilst working with 3 feet 4 inches fall it forces water 73 feet high, and so far gives me every satisfaction. It will do more work in one day than the old Ram of another make could do in a week."

From Mr. WILLIAM LAIT, Architect and County Surveyor, Compton Verney, Warwick, January 16, 1882.—"I have very much pleasure in stating that the Patent Hydraulic Ram I had from you for the Rev. J. Cardwell Gardener, of the Vicarage, Butler's Morstan, and which you fixed there is, I consider, remarkably successful as indicated below:—4200 gallons of water per day are passing through the Ram with a descent of 13 feet 8 inches. Out of this small quantity 1080 gallons are sent up to a height of 44 feet, showing 78 per cent. of useful effect, and the noise of it working is so slight as to be almost inaudible."

From V. F. BENNETT-STANFORD, Esq., M.P., Pyrl House, Tisbury, Wilts. August 20, 1880.—"I have no hesitation in saying your Self-acting Hydraulic Ram and apparatus for extinguishing fire, which you laid down here, including about one mile of pipes, are very satisfactory. The Ram forces upwards of 2000 gallons per day to a service-reservoir holding 25,000 gallons, at an elevation of 20 feet, being 70 feet above the roof of the house, from which reservoir the water is distributed to the house, stables, home farm, and several cottages; and in case of fire four jets can be thrown on the house from different sides at a great force and large volume. I consider your work has been done well and efficiently, and does you credit."

From JOHN ROWE BENNION, Esq., Nursted House, Petersfield, August 25, 1883.—"I have much pleasure in saying that the two Hydraulic Rams you put down for me, and which are supplied from a spring, now yielding in this dry season only three gallons per minute, are sending up an ample supply of water to my house and the home farm, distributing the supply through more than 2000 feet of pipes, and to an elevation of 137 feet. Of this result I think you have as much reason to be proud as I have to be satisfied."

From Captain TOWNSHEND, Wincham February 10, 1877.—"In answer to your inquiry, I am glad to say the Hydraulic Ram you sent me in November, 1875, is working exceedingly well, and gives no trouble. It will work when quite immersed, as it has been several times during the floods this winter, forcing up water through a delivery pipe 930 yards long at the rate of 83,000 gallons per day, although you only promised 57,000."

JOHN BLAKE, ENGINEER, ACCRINGTON, LANCASHIRE.

## CHOICE SEEDS.

### CINERARIA.

#### DIXON'S SUPERB GIANT.

This splendid strain is unsurpassed for form, size, and colour.  
The plants are very dwarf and compact. The flowers are rich  
in colour and produced in massive heads. The dimensions of  
some of the flowers are an enormous size.

1s., 2s. 6d., and 5s. per packet.

### CALCEOLARIA.

Extra choice strain, of dwarf, robust habit, producing im-  
mense trusses of beautifully-shaped flowers, large, and colours  
rich and well varied.

1s., 2s. 6d., and 5s. per packet.

### CYCLAMEN.

#### PERSICUM and GIGANTEUM.

Splendid mixed varieties.

1s. and 2s. 6d. per packet.

### PRIMULA.

Superb strain, the plants being dwarf, compact, and vigorous  
habit, with large, stout, and beautifully fringed flowers well  
above the foliage. Crimson, white, or mixed.

1s., 2s. 6d., and 5s. per packet.

### PETUNIA.

Splendid strain of single varieties, very large, distinctly  
coloured, robust in habit.

1s. and 2s. 6d. per packet.

**EDMUND PHILIP DIXON,**  
THE YORKSHIRE SEED ESTABLISHMENT,  
HULL.

### Prize Florists' Flowers.

**JOHN DOWNIE** begs to intimate that his  
CATALOGUE of the above is now ready and will be sent  
post-free on application. It comprises the finest varieties of  
Pansies, Violas, Penstemons, Phloxes, Antirrhinums, Dahlias,  
double and single, &c.  
As I am now in business solely on my own account, and from  
a long and varied experience in the cultivation of Florists'  
Flowers, purchasers may rely on nothing being sent them but  
what is really first-rate. Selection and not collection is my  
style of doing business.  
Beechhill Nursery, Murrayfield, Edinburgh.

**CHRYSANTHEMUMS.**—Specialty. — 420  
varieties, guaranteed true to name. One of the largest  
and cheapest Collections in the Trade. Plants, purchaser's  
selection, 2s. 6d. per dozen, 16s. per 100; cuttings, 1s. 6d. per  
dozen, 10s. per 100; W. E.'s selection, cheaper. For the new  
English and Continental varieties see CATALOGUE, with  
Essay on Cultivation, one stamp.

The Nurseries, Sawbridgeworth, Herts.

## NEW CATALOGUE FOR 1885.

Beautiful Flowers for Indoors, selected from an immense stock. Our Glasshouses cover nearly a acres.

Wm. Clibran & Son's New List  
(90 Pages Double Column)

Of the newest and finest varieties of all classes of Plants for Greenhouses, Stoves, &c., may now be had for two stamps. It includes only the best varieties of their respective classes. Every season new sorts are added. Comparisons of the varieties when in bloom carefully made, and the inferior kinds discarded. Intending purchasers may rely, when selections are ordered as under, on being supplied with varieties of merit only.

The following cheap Collections of finest named kinds consist entirely of our selection. Purchasers may select from the Lists at Prices as per CATALOGUE, which please see before ordering elsewhere.

- |                                                                                                |                                                                                            |

## OUR NURSERY.

IS there a more cheering sight than a well-stocked and well-kept business-like nursery? Just now walking round the "Home of Flowers" is most attractive. Novelties, good and best varieties, meet the eye at every turn. Our Lord Beaconsfield and other Primroses, Zonals, and other Pelargoniums, Pansies, Violas, and Hardy Plants, Calceolarias, Narcissus, and numerous other families are now lovely, and almost incredible until seen. All should have the following, as they are good and distinct:—Heliotrope Swanley Giant, Streptosolomon Jamesoni, Fuchsia Frau Emma Topfer, Double Abutilon Cineraria "March Past," Begonia "Carriette," Lion's Tail, Dahlia Cineraria "March Past," Pelargonium "Queen of the Belgians," "Picta Formosissima," Pelargonium "Mrs. Lily Cannell," and Carnation "Henry Cannell," and Violet Swanley White.

SEND FOR OUR FLORAL GUIDE.

H. CANNELL & SONS,

## NEW VIOLA, with Red Flowers.

VIOLA ODORATA RUBRA (Paillet).

L. PAILLET is now sending out this fine new Viola, which is unique in its colour; flowers of a very fine rich purple-red colour, very free bloomer. Price 5s. per plant, £2 10s. per dozen; few extra strong plants 8s. each, £4 per dozen.

VIOLA BELLE DE CHATENAY, CERULEA PLENA (Paillet). A variety of the well known fine variety, Belle de Chatenay (Paillet), from which it is a seedling, but it differs by the colour, which, instead of being white, is of a very deep blue colour; flowers very large, nearly 2 inches across, very fragrant. One plant 2s. 6d., £1 8s. per dozen, £4 per 50 plants. Orders must be sent direct to L. PAILLET, Chatenay, near Paris, France. Established 1837.

## CUTBUSH'S MILL-TRACK MUSHROOM SPAWN.

—Too well known to require description. Price 6s. per bushel (1s. extra per bushel for package), or 6d. per cake; free by Parcel Post, 1s.

None genuine unless in sealed packages and printed cultural directions enclosed, with our signature attached.

**J. JENSEN & CO.,**

10, ST. HELEN'S PLACE, LONDON, E.C.

Manufactory—

**BRETTESENÆS, LOFFOTEN ISLANDS, NORWAY.**

**STANDEN'S MANURE.**

ESTABLISHED 20 YEARS.

This old-established Manure is acknowledged by most of the leading practical Gardeners in the United Kingdom and the Colonies to exceed all others in general fertilising properties and staying powers. It promotes a rapid, healthy, and robust growth in plants generally. It is a clean and dry powder, with very little smell, which renders it particularly adaptable for ladies interested in plant culture.

The highly fertilising properties of this Manure render its money value, in comparison with other manures, at least double, as users will find that very small quantities will produce favourable results.

Sold in TINS, 1s., 2s. 6d., 5s. 6d. and 10s. 6d. each; and in BAGS or KEGS, at reduced prices, 28 lb., 12s 6d.; 56 lb., 23s.; 112 lb., 42s. each.

May be obtained from all Nurserymen and Seedsmen in the United Kingdom and the Colonies.

SOLE MANUFACTURERS,

**CORRY, SOPER, FOWLER & CO. (LIMITED),**

18, FINSBURY STREET, LONDON, E.C.

**FIR TREE OIL INSECTICIDE**

(Soluble in Water)

Effectually clears all Insects and Parasites from the Roots or Foliage of Trees and Plants. Kills all Vegetable Grubs, Turnip Fly, &c. Cures Mildew and Blight. Clears Grapes from Mealy Bug, &c., and makes a good Winter Dressing. Of all Seedsmen and Chemists, 1/6, 2/6, 4/6 a bottle. Per gallon 12/6, or less in larger quantities. A Treatise on "Fir Tree Oil," and its application, sent free on receipt of address, by the Manufacturer, **E. GRIFFITHS HUGHES, MANCHESTER.** Wholesale from **HOOPER & CO.**; **CORRY, SOPER, FOWLER and Co.**; **W. C. E. OSMAN & Co.**, and from all the London Seed Merchants and Wholesale Patent Medicine Houses.

**GISHURST COMPOUND**, used by leading Gardeners since 1869 against Red Spider, Mildew, Thrips, Green Fly, and other Blight. 1 to 2 ounces to the gallon of soft water; 4 to 16 ounces as winter dressing for Vines and Orchard-house Trees; and in lather from the cake against American Blight. Has notified many preparations intended to supersede it. Boxes, 1s., 3s., and 10s. 6d.

**GISHURSTINE** keeps Boots dry and soft on wet ground. Boxes, 6d. and 1s., from the Trade-Wholesale from **PRICE'S PATENT CANDLE COMPANY (Limited)**, London.

# Gardeners' Chronicle.

SATURDAY, APRIL 25, 1885.

## PRIMROSES.

WE are growing at the present time in the Garden of Acclimatisation at Geneva sixty-four distinct species of *Primula*, of which forty are of alpine origin; it is of these last alone that I propose to speak here.

The flowers in the genus *Primula* are particularly rich in bright and pleasing colours. Nothing is more beautiful than to see the crannies of the rocks in the high Alps adorned with these flowers, of rose, yellow, or lilac colour, the delicate form and charming grace of which captivate the traveller. Attempts have often been made to transplant them into gardens, but most people have been disappointed, and only those persons who are acquainted with the proper method of culture of alpine plants have succeeded well with them. When it is wished to transplant a *Primula* from the mountains it is necessary to secure the uppermost roots—those which are nearest to the surface—entire, or as nearly so as possible. Generally rock-growing *Primroses* have a stock or underground stem, which supports the plant, and from which all the roots diverge. The older the plants the more numerous, the longer and more developed are the upper roots; the inferior ones dwindle away little by little, and form in time humus in the soil, while new roots are produced above the others. Moreover, the plant has a tendency to force its way out of the ground. Observe *Primula* discolour, or any other species of the same section, and it will be seen that when it arrives at a certain stage of development the strongest roots are level with the surface of the soil, and some even come off from the stem above the ground, and grow down into the earth like adventitious roots.

Further, there are certain species, such as *Primula crenata* and *P. marginata*, whose stem raises itself above the soil, and branches out so as ultimately to resemble a little tree. These are true arborescent *Primroses*, and we have just now on our rockwork *Primula marginata*, which forms a veritable shrub covered with its pretty lilac flowers. When from some reason or other the branches lie upon the surface of the ground they produce roots which penetrate the earth and form new centres; thus they may be multiplied by division of the aerial stems. The species which form this section rarely form offsets, raise themselves out of the soil, but do not spread upon the surface and form tufts.

Another section is formed of terrestrial species purely, such as *P. glutinosa*, *P. minima*, *P. Wulfeniana*, *P. longiflora*, *P. farinosa*, &c., and possessing roots all coming from the same point, and spreading in every direction; the stock ultimately divides above, each portion being provided with a few roots, so that each may form an independent plant. In the autumn a certain quantity of plants may thus be procured from an old stock which in spring was undivided. It follows of necessity that as the plants grow they get larger and increase in width, forming tufts which may,

easily be divided. These may be multiplied by dividing the stock in autumn before the other roots separate naturally. The same thing occurs in the Dodecatheon of North America. The same plan may be employed with certain Himalayan Primroses, among others *P. rosea* and *P. denticulata*.

Another group comprises species which are partly rock-growing and partly terrestrial, and which are met with in the gravelly soil of high regions, or in stony and gravelly pasturages. These are the most difficult species to cultivate and multiply; such are, for example *P. Balbisii*, *P. pubescens*, *P. alpina*, *P. ciliata*, *P. hirsuta*, &c.

Finally, there is a fourth section comprising the species which live in the less elevated regions, which grow in the roughest soil, and in which the roots spring from an underground stock, which never comes above-ground, and constitutes a rhizome. These are *P. cortusa*, *P. cortusoides*, *P. acutis*, &c. They are multiplied by division of the underground stem, which is much branched, and forms so many different plants.

In the first section we find—

*P. Auricula*, Linnæus.—This plant is met with on the calcareous rocks of the Alps, at from 3000 to 6500 feet in elevation, and in the greater part of the calcareous mountains of Eastern Europe. It is not of shrubby habit, but has the same tendency as the arborescent species, and according to the conditions under which it grows it forms an erect stock and gives off adventitious roots which penetrate into the ground. This species, the type of Auriculas of the gardens, is of easy cultivation; but if it is desired to procure the full golden colour in the flower, the mealy appearance of the leaf, and the sweet perfume of the flower, care must be taken to place the plant in the sun, in a soil rich in humus mixed with limestone well drained with pieces of limestone or coke. It flowers from April to June.

*P. Balbisii*, Lehmann, is a superb species like *P. Auricula*, but is distinguished from it by a glossy foliage without any mealy powder on the leaves. It has no perfume, but the flower has some hairs in its throat. It is a rare plant of the Baldo, Vallarsa, and of the Alps of Southern Tyrol. May.

*P. venusta*, Host., of Southern Tyrol, is a magnificent plant, with large clear rose-coloured flowers; it requires a sloping and partially shaded position in the chinks of rocks, and flowers from March to June.

*P. discolor*, Leybold, of the Western and Southern Tyrolean Alps, is a very beautiful species, with flowers of a purple-lilac tint, growing above 6500 feet in elevation, in fissures of granite rocks. Under cultivation it flourishes best when on a slope in rocks, and in a light soil rich in humus. April.

*P. crenata*, Jacquin, of the Eastern Alps, is a species with cut foliage, crenate on the margins, and looks as if bordered with silver. March to April.

*P. marginata*, Curtis, of the Alps of Dauphiné, is a fine species with large, clear lilac flowers, and foliage similarly bordered by a band of silver. February to April.

These two species are closely allied, but have the foliage distinct. They are absolutely arborescent in habit, and form little shrubs which are covered with lilac flowers in the months of March and April.

*P. graveolens*, Kerner, of Tyrol, has fine rose-purple flowers. An arborescent plant, liking a cool situation on granite. March to April.

*P. integrifolia*, Linnæus.—Native of the Swiss Alps at 7000 feet, and of the Pyrenees. A dwarf plant, covered with purple-lilac flowers in June and July. It is cultivated like Muretiana, but rots more easily, and requires a well drained soil.

## SECTION II.

In the second section we find—

*P. farinosa*, Linnæus.—Common in all the mountainous bogs of Central Europe, and is so also in Asia. It is so well known that it is not necessary to describe it. It is a plant that is met with under two absolutely different forms, according as it is found in the marshes in the low grounds, or in the alpine pasturages. In the first case it has a flower of a lilac colour, borne on a long and slender stem, with narrow petals. In the Alps,

on the contrary, it shines with a bright tint, and is of a rose colour, supported on a short stem, and bearing extremely broad and bright petals. This difference refers evidently to the fertilisation of the flowers by insects, as referred to by Dr. H. Müller (*Alpen Blumen und ihre Befruchtung*, p. 364). That naturalist cultivated at Geysenheim some specimens of *P. farinosa* from Pomerania side by side with specimens from the Bavarian Alps. This pretty species succeeds in the open ground in a slightly moist soil rich in humus. It produces seeds readily, and forms tufts, by division of the stalk, as previously indicated. It flowers from March to June, and again in autumn. There is a fine variety with white flowers.

*P. longiflora*, Linnæus.—A superb species, belonging to the grassy regions of the high Alps, between 4900 and 6500 feet. It is larger in all particulars than *P. farinosa*; the limb of the corolla is brilliant and broad, borne on the top of a tube which is four times longer than that of *P. farinosa*. It belongs exclusively to the granitic regions of the high Alps, and prefers a light soil, composed of one-third peat, one-third leaf-mould, one-sixth granite-sand, and one-sixth loam. It likes an eastern or western aspect, and a shallow, well drained pit to the rock. As in *Soldanella alpina* it is necessary to give it plenty of water as soon as the plant flowers, and to do it so that the water runs off rapidly. Under cultivation it flowers from May to the end of June.

*P. Warei*, Stein.—Eastern Alps. A charming little species, approaching *P. farinosa*, with an eye of a brighter yellow, bordered with shaded lilac.

*P. glutinosa*, Linnæus, of the Austrian granitic Alps, belongs to the glacial region, and grows as high as an elevation of 9800 feet. The flowers are of deep lilac, larger than those of *P. farinosa*, and of the dimensions of *P. longiflora*. A glutinous and sticky plant, very difficult to flower. There are now clumps in the Garden of Acclimatisation in bud. It was placed in a niche which received the sun in the morning and which is well drained with pieces of coke. I have made a soil composed of one-third of sphagnum, one-third peat, and one-third leaf-mould, to which I have added granite-sand. It seems to be doing very well, and those which we have in pots seem to me to be equally good. It flowers from April to May.

*P. Flörkeana*, Schrader, of the Swiss and Tyrolean granitic Alps. This species appears to be a hybrid between *P. minima*, of which it possesses the graceful foliage, and *P. glutinosa*, of which it has the flowers. It is cultivated like the last, but seems to be more easily raised.

*P. minima*, Linnæus, of the calcareous Alps of East Switzerland and Tyrol, is one of the most distinct and prettiest of the Primroses. It is met with at an elevation of 4900 to 8200 feet; it is a completely dwarf, tufted plant. Its dentate and crenate foliage forms tufts from which proceed the flowers. It prefers a calcareous soil and an eastern or western aspect; the soil should not be deep but well drained. May to June.

*P. Facchinii*, Schott.—A species of South Tyrol, belonging to the granite region. Leaves extremely graceful, and flowers rose. Culture like that of *P. minima*. May to June.

*P. Wulfeniana*, Schott.—Southern Alps. Altitude 4900 feet. A rare and very pretty plant, flowering profusely under cultivation. It prefers an eastern or western aspect, and a light and calcareous soil. May to June.

*P. spectabilis*, Trattinick.—South Tyrol and Austria, 4900 to 6500 feet. Has large deep lilac flowers, leaves shiny and glabrous. It succeeds well in a light soil. May to June.

*P. Tyrolensis*, Schott.—Tyrol. April to May. A charming dwarf species with large flowers. Culture as for *P. glutinosa*, but it must be kept dryer. *Henry Correvon, Geneva.*

(To be continued.)

GUMMING OF FRUIT TREES.—The formation of gum in wood has been examined by B. Frank in a number of Leguminous and Rosaceous trees. He finds that it is the universal product of special conditions, and can always be induced by the production of these conditions, as, for instance, by wounding any part of the stem. After four or five weeks the cells of the medullary rays are nearly filled with gum, its formation commencing in the cavities of the vessels and wood-cells, which assume a more or less yellow or red colour, due to small granules resulting partly from metamorphosis of starch grains. The purpose of the internal formation of gum appears to be to form air-tight plugs to the vessels, this object being aided by the formation of thylæ or cells inside the vessels. *Journal of Microscopical Society.*

## New Garden Plants.

ZYGOPETALUM PENTACHROMUM, nov. hybr. Angl.

A ZYGOPETALUM seedling raised from Zygopetalum Mackayi, fertilised with Zygopetalum maxillare. Thus the parents are the same as those of Zygopetalum Sedeni, but reversed. The bulb growth has the same strength as in Zygopetalum Mackayi; the habit resembles more nearly that of Zygopetalum maxillare. Longest leaf, 16 inches. The seeds were sown in 1876, and are now flowering for the first time, according to Mr. Harry Veitch, who sends a four-flowered raceme and a leaf. The sepals and petals are scarcely undulate, green, with a dark brown marbling. They remind one of Zygopetalum maxillare. The lip is cuneate obovate, nearly retuse, white, with numerous mauve blotches and lines, which are thicker here and there. The callus is like that of Zygopetalum Mackayi, with adhering acute falcate side laciniae, like those in Sir Trevor's great rarity, Zygopetalum obtusatum, Rehb. f. The upper and anterior part of the column under the fovea is of the darkest purple, base whitish. *H. G. Rehb. f.*

ERIA MONOSTACHYA, Lindl.

This species has at length appeared alive in the Botanic Garden of Leyden, grown by Mr. Witte, the enthusiastic Curator. It was imported from the Fenger Mountains, in Java, by Mr. F. Otolander.

The plant ranks very near *Eria paniculata*, Wall.; and though polymorphous has much narrower leaves, compound inflorescences, and a very distinct lip. Our plant has leaves exceeding an inch in breadth. The inflorescences are simple. The tomentum consists of stellate hairs. The bracts are far more inconspicuous. The whole tomentum is far less developed and shorter than in *Eria paniculata*. The inflorescences themselves might be compared to those of *Eria æroidostachya*. They stand in pairs in the fine garden specimen at hand, and in threes in one of my wild specimens. The sepals and petals are of the lightest greenish-yellow. The lip has nearly the general shape of that of *Eria paniculata*, though the anterior lacinia is usually (not always) very small. The anterior callus is very small when compared to that of the above-named species, and there is a profusion of mealy substance in the midlobe, resulting from broken hairs. The chief character consists in the two angular calli near the sinuses between the lateral laciniae and anterior lacinia. The white column is bordered with purple-brown. *H. G. Rehb. f.*

PLEUROTHALLIS LIPARANGES, n. sp.\*

A delicate small thing, a few inches high. The petiolate oblong blunt acute leaf is of a fine green. The upper surface is embellished with a number of scattered purple-mauve small spots, and the lower surface is nearly all mauve, with a few green blotches, chiefly near the apex. The one-sided raceme is very few flowered. The flowers are remarkably thin, pellucid, of a light reddish-ochre. The sepals are linear; the petals nearly so, but broader at the base. Lip oblong, blunt, acute, rounded at the base, light ochre with an orange margin at the apex. Column semiterete, green, with semi-elliptical, angulate wings near the fovea, as long as the column. Pollinia two, markedly pedicellate. This little curiosity was sent by the excellent Curator of the Leyden Botanic Garden, Mr. Witte. It was obtained from Mons. G. M. Binot, from Brazil. *H. G. Rehb. f.*

LIPARIS LATIFOLIA, Lindl., Gen. et Sp. Orch. 30.

This plant was published as *Malaxis latifolia* by the late Blume, in 1825. After nearly sixty years it appears at last in Europe as a rather stately species amidst its congeners. The strong light green bulb is compressed pyriform, and with a few furrows on it. The inferior sheaths are exceedingly thin, and

\* *Pleurothallis liparanges*, n. sp.—Aff. *Pleurothallis ephemeræ*, Lindl. *Cespitosa*; caule secundario breviteretisculo; folio petiolato cucuato oblongo acutiusculo violaceo maculato seu suffuso; racemo paucifloro secundifloro; floribus tenuibus membranaceis longis; sepalis tepalique conniventibus, apice dissisiis, linearilanceis; tepalis basi bene dilatatis, labello a basi subcordata ligulato obtuse acuto; columna labello æquilongâ, juxta foveam angulatâ alata. E. Brasilia, ioid. cl. Witte, Lugduci Batavorum. *H. G. Rehb. f.*

whitish-ochre. The solitary leaf is cuneate, oblong-ligulate acute, protected by a well-developed acute sheath, as in a *Cattleya*, and exceeding 1 inch in length. The peduncle at hand is nearly a span in length, and is light ochre coloured, like the bracts, stalked ovaries, sepals, and petals. The long raceme is rather shorter than the sheath, and is very lax. Bracts lanceolate, nearly half the length of the stalked ovaries. Sepals oblong ligulate, the lateral ones bent down so as to touch one another by their backs. Tepals linear, reflexed. Lip cuneate dilatate, emarginate, two-lobed, with toothletted anterior margins dark ochre coloured, reddish-brown in the disc. As is the rule in *Liparids* there are two small angulate keels in front of the cordate base of the lip. Column white, green at the top. I had lately the pleasure of seeing my old acquaintance alive, it having been kindly sent from the garden of Leyden by its able Curator, Mynheer Witte. *H. G. Rehb. f.*

*ÆRIDES MARGINATUM*, n. sp.

A lovely *Ærides*, with rather broad bilobed

Trevor Lawrence's collection. The flower is ivory-white in colour, and the lip is as in the one first described, narrow and acutely pointed. It is a native of Madagascar.

### HISTORY OF THE INTRODUCTION OF PALMS, AND OF THE KEW COLLECTION.

PALMS were termed by Humboldt the "Princes of the Vegetable Kingdom." About a thousand species are known to botanists, the greater number being widely spread throughout the tropical regions of both hemispheres, a few only extending into the temperate zone. They vary considerably in their places of growth, some, as the dwarf Palm of North Africa, and the Palmetto of the Southern United States, occupy large tracts of desert country. Others grow in marshy ground, while some form forests on mountain slopes. They vary in height from a few feet to 100 feet or even, it is said, to 200 feet. Their tall cylindrical stems, bearing a crown of pinnate or

"Guava, 13 feet high, 7 inches round, spreading 9 feet.

"Female Papaw, 17 feet high, 2 feet 3 inches round the stem, and bears plenty of fruit every year.

"Anotta (*Bixa orellana*), 14 feet high, 11 inches round.

"Plantain or *Musa*, 24 feet high, the leaves 12 feet long and 3½ feet broad, 3 feet 2 inches round the stem, and has abundance of fruit.

"A large Palm, 14 feet high, 4 feet round.

"*Cereus* (Cactus), 24 feet high, 1 foot 4 inches round.

"Male Papaw, 20 feet high, 3 feet 9 inches round, with several branches 7½ feet long.

"*A. rosa sinensis* or *Ketmia* (*Hibiscus*), 25 feet high, 1 foot 4 inches round.

"One Sago Palm (*Toddapanna*), 8 feet high, 2 feet round the stem—a fine plant, with a great number of very large plants, whose names would be too long to mention here.

"The backs of these stoves had trellises, against which were placed, in beds of earth, all the sorts of

FIG. 96.—*ANGRÆCUM FASTUOSUM*: FLOWERS IVORY-WHITE.

leaves, keeled underneath the midrib. The flowers may be compared to those of *Ærides quinquevulnerum*, but their colours and the shape of the lip are totally distinct. They have lightest yellowish sepals and petals, with an anterior purple border. The rounded side-lacinia of the lip are toothletted in front, and deep orange. The mid-lacinia is ligulate, toothletted, porrect, yellow, ultimately deep sepia-brown. The spur is conical, light green. It has a linear transverse callus in front side at the orifice, and a similar narrower one at the back. It is very unusually coloured, and was introduced by Mr. Sander. *H. G. Rehb. f.*

### ANGRÆCUM FASTUOSUM.

THIS plant was first described by Professor Reichenbach in our columns, December 10, 1881, and again December 31, 1881. Our illustration (fig. 96) was taken from a specimen that flowered lately in Sir

an-shaped leaves, impart to them an aspect very different to that of the forest trees of Europe, and thus caused them to become early objects of interest and curiosity to the botanists and horticulturists of this country. The introduction of these and other tropical plants, led to the erection of hothouses for their cultivation, the first and most important being those of Robert James, Lord Petre, at his seat, Thorndon Hall, in Essex, of whom Peter Collinson in a letter to Linnæus, dated January 18, 1743, says, "The death of the worthiest of men, the Right Hon. Lord Petre, has been the greatest loss that botany or gardening ever felt in this island. He spared no pains nor expense to procure seeds and plants from all parts of the world, and then was as ambitious to preserve them. Such stoves the world never saw, and may never again. His greatest stove was 30 feet high, and in proportion long and broad. In it were beds of earth, in which these plants, as under, were planted, and flourished wonderfully:—

"The *Hernandia* was 10 feet high, 5 inches round the stem.

Passion-flowers, Clematides of all kinds that could be procured, and creeping *Cereus*."

I have been favoured by Lord Petre with a copy of a manuscript list of Palms grown at Thorndon Hall in 1736, the original having been written by the then Lord Petre's gardener, of which the following is a copy, and being anti-Linnean, it may be considered as a curiosity. The Linnean names in brackets are what I suppose them to be:—

"1. *Palma dactylifera* major, C. B. P.; Date Tree. (*Phoenix dactylifera*.)

"2. *P. braziliensis* prunifera folio plicateli sen flabelliformi radicesquamato Raii, Palmetto. (*Chamærops palmetto*?)

"3. *P. humilis* sen. *chamæraphis*, J. B.; dwarf Palm. (*Chamærops humilis*.)

"4. *P. americana* acaulis fructu clavato, Houst. (*Chamærops serrulata*.)

"5. *P. foliorum* pediculis spinosis fructu pruniformi luteo oleoso, Sloane Cat. (*Elaeis guineensis*.)

"6. *P. altissima* non spinosa fructu pruniformi minori racemoso sparso, Sloane Cat.; Cabbage Tree. (*Areca oleracea*.)

"7. *P. americana* humilis flabelliformis fructu ro-

\* *Ærides marginatum*, n. sp.—Aff. *Æridi quinquevulnere*, Lindl.; folio lato emarginato bilobo lorato inferne carinato; labelli lacinia lateralibus semiblobo lorato inferne denticulatis, lacinia mediana oblongoligulata denticulata porrecta, calcar

conico sub labelli lamina aotrorso callo lineari transverso in pariete calcaris antico, callo simili breviori inferius in pariete postico. *H. G. Rehb. f.*

tundo minore; dwarf Carolina Palm. (*Chamærops llystrix*?)

"8. *P. yucca foliis fructu cerasiformi*, Rand.; the Dragon Tree. (*Dracena Draco*.)

"9. *P. prunifera japonensis*, H. L. B.; Coddapanna, Hort. Mal." (*Corypha umbraculifera*.)

This may be considered as the first collection of Palms cultivated in this country.

With regard to the origin of the Kew collection, we find in Hill's *Hortus Kewensis*, published in 1768, eight years after the establishment of the gardens, six species of Palms are enumerated, namely, *Phoenix dactylifera*, *Chamærops humilis*, *Cocos nucifera*, *Calamus Rotang*, *Corypha umbraculifera*, and *Borassus flabelliformis*.

In Aiton's *Hortus Kewensis* (1787) the number was increased to ten species, and in the second edition of the same work, published in 1813, twenty species are recorded, of which the following is a list:—*Areca Catechu*, *A. oleracea*, *Cocos aculeata*, *C. fusiformis*, *C. nucifera*, *Corypha umbraculifera*, *Chamærops humilis*, *C. palmetto*, *C. serrulata*, *Caryota urens*, *Elaeis guineensis*, *Elate sylvestris*, *Borassus flabelliformis*, *Phoenix dactylifera*, *P. farinifera*, *P. reclinata*, *Rhapis acaulis*, *R. arundinacea*, *R. flabelliformis*, *Thrinax parviflora*, *Bactris minor*. In 1823 the Palm collection came under my charge, and, with the exception of *Corypha umbraculifera*, *Borassus flabelliformis*, and *Rhapis arundinacea*, I found all the above. In addition to these there were about half a dozen species, which, judging by their size, had evidently been introduced before the publication of *Hortus Kewensis*, but they are not recorded in that work, the principal of these being two plants of *Sabal umbraculifera*, *Corypha australis*, and two plants of *Thrinax excelsa*. They then occupied a lean-to house, called the Palm-house, which stood about 100 feet north of the west end of the present Fern-house: it was 60 feet long, 16 feet wide, and 15 feet high at the back; it also contained a large plant of *Pandanus odoratissimus*, which, with the *Sabals*, *Corypha australis*, and *Strelitzia Augusta* were continually pushing their leaves through the glass; consequently in 1828 pity was taken on them, and the house was raised 4 feet, and in order to secure their safe removal at some future period, I deemed it expedient to have the roots of each of these four enclosed in brickwork.

In 1830 the collection had increased to forty species, which necessitated placing some of them in other houses. During the latter years of the reign of George III. and George IV. a new Palm-house was contemplated, and a plot of ground set apart for its erection; but nothing was done until the accession of William IV., who took much interest in improving the gardens, and a plan for a spacious Palm-house was prepared by the celebrated architect, Sir Jeffery Wyattville, and on October 17, 1834, a spot was selected, and the length of the house marked out in the presence of the King, half-way between the Orangery and pond. It was to be a wooden structure, 200 feet in length, 50 feet in width with the side wings, and 40 feet in height to the lantern roof; but in the meantime it had been decided to remove two of the conservatories attached to Buckingham Palace, and that one of them should be erected at Kew, which was done in 1836. It is 80 feet in length, 40 feet in width, and 26 feet high (span-roof). The original consisted only of the upright framework of wood and glazed roof, which on being set up at Kew was encased in stonework, and is now known as No. 1, or King William's conservatory (the Aroid-house). It may be worthy of record that the six pillars at each end may be considered historic, having originally formed the colonnade in front of Carlton House, in Pall Mall. The death of King William in the following year (1837) led to the abandonment of his Palm-house.

Shortly after the appointment of Sir William Hooker as Director, in 1841, the subject of the new Palm-house was again brought forward, and in 1844 the architect, Mr. Decimus Burton, received instructions from the Commissioners of the Board of Works to furnish a design and estimate, which, being approved, led to the erection of the present Palm-house, which was completed in August, 1848, and the whole of the Palm collection and tropical woody plants were placed in it, but their future progress, unfortunate end of many, and history of the house must be left for another occasion. It may, however, be mentioned that at the time of my retirement in 1864 the collection amounted to 143 species. *John Smith, ex-Curator, Royal Gardens, Kew.*

## POTATOS.

ALTHOUGH I consider that the use of complete artificial manures involves too great a cost for their employment in the growth of ordinary farm crops, perhaps an exception may be made in regard to Potatos, a crop which requires a large supply both of potash and nitrogen.

At Rothamsted we have grown nine crops of Potatos in succession upon land which for fifteen years previously had received no yard manure, and the average yield of the last three crops has been 400 bushels per acre, calculating the bushel to weigh 50 lb. The manure used each year has been 300 lb. of sulphate of potash, 350 lb. of superphosphate of lime, and 400 lb. of salts of ammonia; while in another experiment, instead of the salts of ammonia, 540 lb. of nitrate of soda were applied. The produce from both manures has been almost identical.

The sulphate of potash supplies about 130 lb. of potash—and we find very nearly the same amount in the crop. The phosphoric acid, on the other hand, is much in excess of the requirements of the crop, and it might be reduced one-half. The salts of ammonia and the nitrate each supply about the same amount of nitrogen—87 lb.: and of this the crop does not take up more than 50 lb.; there is, apparently, therefore, a considerable loss of this substance: but at the same time, any reduction in the amount of these manures would be followed by a reduction in the crop. The loss of this costly manure ingredient is a most serious matter, as unfortunately there is but little prospect of recovering, in succeeding crops, any appreciable amount of the 37 lb. not taken up by the first. By means of the same mineral manures alone we have grown—over the same period—one-half the crop we obtained by the application of minerals with nitrogen, the soil having supplied a sufficient amount of that substance to give a product of 200 bushels; but one-half of the minerals applied remained inactive in the soil; these, however, might be made available to the crop by an application of nitrogen.

The quantity of potash removed in Potatos is very large. In the 400 bushels it amounts to about 130 lb. Compare this with the amount removed by animals. An ox, weighing 1400 lb., which was killed for the purpose of analysis, contained only 2½ lb. in the whole carcase and offal. Hay is another crop which takes a good deal of potash from the soil, and farmers in England rarely grow either hay or Potatos for sale unless there are facilities for the purchase of town dung. Artificial manures are certainly not used alone by practical farmers in the growth of their crops.

In our experimental field, the character of the manure is represented in the stem and leaves of the plant. Ammonia and nitrate without minerals give a low stem and greenish-brown leaves, which in the evening appear almost black. Minerals without nitrogen give a thin, low stem and yellowish-green leaves; while mineral and nitrogen together give a luxuriant, and sometimes an over-luxuriant, stem, with leaves of a bright green. There is no difficulty in accounting for these peculiarities. A plant takes up whatever food is most abundant in the soil, with the hope, as I sometimes put it, that sooner or later it may find the food which suits it best. In the dark-green leaves the nitrogen is in excess; but starch cannot be formed without potash, and the supplies of potash are not sufficient to use up the nitrogen. It is far more easy to change the yellowish-green of the mineral-manured Potatos into a dark green than it is to lighten the colour of Potatos which receive nitrogen: a solution of nitrate of soda will effect the one in a very few days, but as both potash and phosphoric acid form the insoluble compounds with the soil, they are much more slowly taken up by plants.

We always, however, obtain a larger crop of Potatos where we apply the mineral manures alone, than where we apply the nitrogen without the minerals, though in the next field, salts of ammonia applied without minerals for thirty-nine years in succession, have grown larger crops of Wheat over the whole period than mineral manures without ammonia. To explain this apparent inconsistency we must consider the great difference in the character of the two crops.

Wheat in England is sown in the autumn, and being a deep-rooted plant, it has a greater range of soil to obtain a supply of mineral food than the spring-sown Potato. The relation between the potash and the phosphoric acid and nitrogen in the two crops is also very different. In the Wheat crops grown by salts

of ammonia alone, mixed samples, taken over a period of ten years, give the products per acre of the total crop—straw and grain—as follows: nitrogen, 36 lb.; potash, 23 lb.; phosphoric acid, 13 lb. The relation, therefore, between these two important minerals and nitrogen is as one to one.

In the Potato crop, on the other hand, the proportion of nitrogen to the minerals is nearer one of nitrogen to three of minerals, the demand upon the soil for potash being much greater in the case of Potatos than where Wheat or Barley is grown. It must be a very large Wheat crop indeed which removes 50 lb. of nitrogen from the soil; but in some of our Potato crops we carry off more than 100 lb. of that substance per acre.

As very few soils could furnish so large an amount as this from their own resources, when Potatos are continuously grown, it becomes necessary to furnish a supply of potash either in dung or chemical salts. The following table gives the products of the crop grown in 1883, being the ninth in succession without any change in the manures.

	Potatos per Acre in Long Tons.	Cwts.
1. 14 tons of dung .. ..	6	..
2. Minerals without nitrogen ..	5	..
3. Nitrogen without minerals ..	3	3
4. Minerals and ammonia .. ..	8	19
5. Minerals and nitrates .. ..	8	2

Amount of mineral matter and nitrogen per cent. in dry tubers:—

	Mineral Matter.	Nitrogen.
1. .. .. .	3.5	1.9
2. .. .. .	3.85	0.73
3. .. .. .	2.61	1.47
4. .. .. .	3.67	1.08
5. .. .. .	3.86	1.37

The character of the manure is most clearly shown in the composition of the crop. In No. 2, manured with minerals, the minerals are five times as high as the nitrogen; while in No. 3, where ammonia or nitrates are used, the minerals are considerably less than double the amount of nitrogen. In both cases there is a waste of power, shown by small crops, and unused manures. The loss, however, is not equal in both cases, as the minerals remain in the soil to be taken up at some future time, while the nitrogen is probably lost. *Sir John Lawes, in "Rural New Yorker."*

## NOTES ON THE CULTIVATED ASTERS.—XII.

(Continued from p. 502.)

SUBGENUS XIV. — *MACLERANTHERA*. — Stems mostly annual or biennial. Involucre multiserial; bracts rigid in texture, furnished with large spreading leafy tips. Leaves many-toothed or pinnatifid. Entirely Western American.

62. *A. Bigelovii*, A. Gray. A. Townshendi, Hook. fil., in Bot. Mag., t. 6430. — Stems annual or biennial, 1–2 feet long, branched from low down. Root-leaves oblanceolate, obtuse, entire, ½ foot long, narrowed gradually into a winged petiole; stem-leaves few, sessile, ovate-lanceolate. Heads few, large, arranged in a lax corymbose panicle; peduncles glandular hispid. Involucre campanulate, ¾ inch diameter; bracts linear, foliaceous, glandular-hispid, very squarrose. Ligules very numerous, linear, bright lilac, ¾ inch long. Achene flat, closely ribbed, ¾ inch long; pappus soft, flexuose, whitish, as long as the achene.

Colorado and New Mexico. A very fine plant, still rare in cultivation.

63. *A. canescens*, Pursh. A. biennis, Nutt. *Maccleranthra canescens*, A. Gray. *Diplopappus incanus*, Bot. Mag., t. 3382. *Dieteria canescens*, pulverulenta, divaricata, viscosa, and sessiliflora, Nutt. — Biennial, or sometimes perennial. Stems 2–3 feet long, much and loosely branched, canescent or glabrous. Stem-leaves sessile, linear or lanceolate, rigid, incise-dentate, the lower 2–3 inches long. Heads many, arranged in a lax corymbose panicle. Involucre campanulate, ¾–1 inch in diameter; bracts multiserial, lanceolate, with squarrose green tips. Rays very numerous, linear, bright

lilac,  $\frac{1}{2}$  inch long. Achene densely pubescent; pappus flexuose, moderately firm in texture,  $\frac{1}{2}$  inch long.

Western side of the North American continent, from the Saskatchewan and British Columbia, southward along the Rocky Mountains, and through California to Mexico. Very variable.

64. *A. tanacetifolius*, H. B. K. *Machraeranthra tanacetifolia*, Nees; Bot. Mag., t. 4624.—Stems erect, hairy, branched from the base,  $\frac{1}{2}$ —1 $\frac{1}{2}$  foot long. Leaves sessile, oblong, 1—2 inches long, deeply pinnatifid with distant, simple, or compound lanceolate segments. Heads few, laxly corymbose. Involucre campanulate,  $\frac{1}{2}$  inch in diameter, multiseriate, with very distinct spreading green tips. Ligules numerous, bright lilac,  $\frac{1}{4}$ — $\frac{1}{2}$  inch long. Achene very pubescent; pappus flexuose,  $\frac{1}{2}$  inch long.

Arizona and Nebraska, southward through California to Mexico. Well marked by its annual duration and compound leaves.

This concludes the enumeration of the cultivated types. We have only about one in three of the known kinds in cultivation, but all the subgenera that are worthy of the attention of the cultivator are represented in the series. The greater number of the non-cultivated species are Euasters, from the Rocky Mountains, and Orthomeris types from Asia and various parts of the United States. J. G. Baker.

## PRIMROSES AND POLYANTHUSES.

IN alluding to these beautiful spring flowers let it not be imagined that I am referring to those favoured children of the few florists who grow them—gold-laced Polyanthuses—but rather to those varied and large flowered forms which we better know under the designation of fancy Polyanthuses. The season has so far been backward that the undue precocity so often seen in these flowers here in the South is not this spring apparent. The fine group of these early spring flowers shown at both the South Kensington and Botanic Shows the other day, told of the exceeding beauty to be found in such hardy border plants, although these were seen under the disadvantage, that having been for a time under glass, the habits of blooming were not quite so correct as is seen in plants naturally cultured. Very many of Mr. Waterer's forms are of that uncertain strain known as hybrid Primroses, by which term is meant that the plants have in combination features incidental to both the Primroses and Polyanthuses, but are neither positively. I cannot say that I am a great admirer of this strain, and heartily wish that with my own plants they would not crop up. There is no reason to assume that any intercrossing of flowers of the two common sections tended to this variation or rather intermingling form of blooming. Primroses and Polyanthuses are very much alike in all respects, except that, when true to name, the one has no visible scape of flowers, but produces them on separate single stems, whilst the other has a prominent scape of flowers produced on one prominent stout stem. Constant seeding and renewed culture or reproduction through seed suffices to develop in many of the seedling Primrose plants certain latent powers to produce scape stems, whilst in the Polyanthuses the common habit of the Primrose section to produce its flowers singly on single stems is developed. Hence from both sections we get in seedling plants very many that are neither Primroses nor Polyanthuses proper, but have more or less the habits of both, the Primrose stems and flowers coming first. The Primrose is always the most precocious of the two, the Polyanthus stems and flowers following. One result—and it is an unsatisfactory one—is that in the first case we never get that charming cluster of flowers which always marks the Primrose proper, and in the second case the heads of bloom always lack that solidity, density, and compactness which marks the flower heads of a true Polyanthus. Whilst the Primrose and Polyanthus competitions on the 21st did not bring better, or, say, more showy flowers than were seen on the Bagsbot plants the other day, yet without doubt there was better form and greater substance—that is, such form and substance in flowers as the florists desire to find.

There is a certain perversity in these garden spring flowers in their exceeding tendency to produce pinched flowers, even though only thrum flowers be parents. Still it is but right that due weight should be given to all flowers possessing the essential and

always refined thrum, for it needs but half an eye to observe that the thrum flower is always the most pleasing, and in the florist's sight the most perfect. However unimportant may be a feature of this kind when masses of flowers in beds or borders are concerned, it is not possible to ignore its value when dealing with pot plants or individual blooms, for a good thrum is the very apple of the eye of a flower. A number of plants that have been growing for several weeks under glass fail to give a very correct notion of their real habit and characteristics when grown in the open air. The confined situation and closer atmosphere of a house or frame causes elongated leafage and stems that give often a loose, ragged appearance. Thus it is best to see plants either in the open ground or just as lifted from the open, that a correct estimate may be formed of their value for garden decoration. Two or three year old plants, well grown, then form chubby and wondrously floriferous clusters of bloom, and where there is considerable variety of colouring the charm they give is much enhanced. It is true that for massing, white, yellow, red, crimson, and purple hues are best, but there is an infinitude of diverse shades and markings which cannot be described or classified. It is a capital time to sow seed now, and best in a frame, to ensure ample germination. If the plants can be dibbled out into a square patch in the kitchen garden in June for the summer a good quantity of strong ones will be available for autumn planting, and will give rich heads of bloom next spring. A. D.

## EFFECT OF MANURES ON THE GROWTH AND QUALITY OF FRUIT.

PRACTICE and science have for years worked hand in hand to study the influence of physical and chemical agencies on the production of vegetable growth, and the recently introduced practice of supplying our markets with special fertilisers for particular plants or soils, if carried beyond a limited generalisation deserves attention on account of the purposes of dealers to meet the desire of gardeners rather than on account of either good economy or of a superior knowledge in regard to the special wants of a particular kind of crop raised under all conditions.

This remark applies with extra force to the use of such manures in horticulture, because the composition of most garden products, including fruits, is far less known than that of the majority of our farm crops.

The presence of mineral constituents in an available form in the soil is not only essential for the reproduction of any plant from its seed but is indispensable for the complete development of a plant through all the various stages of its life. Further, when the ash ingredients of a plant—potash, phosphoric acid, and lime—are waiting in the soil, the plant may perhaps come to blooming, yet cannot produce a perfect and well formed seed; hence the time-honoured practice of using wood-ashes, bones, lime, chalk, and marl for manuring purposes.

Some years ago Dr. C. A. Goessmann instituted a series of experiments in the grounds of the Massachusetts State Agricultural College at Amherst, U.S., for the purpose of testing the action of chemical manures on the production and composition of certain fruits, and on their aid in the prevention of plant diseases, the results of which are briefly summarised below.

### EXPERIMENTS WITH GRAPE VINES.

Manurial substances supplying soluble phosphate, potash, and nitrogen when applied as a dressing to Grape Vines imparted a much more vigorous growth, and the leaves as a rule retained their vitality longer in autumn than in the case of unmanured Vines; they escaped repeatedly a serious attack of mildew when the remainder of the vineyard suffered more or less from the disease.

On an analysis of the juice of the ripened berries it was found that the sugar in the juice had somewhat increased in the fruit from the manured Vines, and this increase of sugar was accompanied by a marked rise of potash, and at the same time a remarkably reduced percentage of lime in the inorganic portion of the fruit.

Of course, as Dr. Goessmann remarks, sugar alone does not control the quality of fruits, yet the fact that its amount can be altered by manurial ingredients applied to the soil shows the existence of still untried modes of treatment to promote the interests of horticulture.

### EXPERIMENTS WITH STRAWBERRIES.

The varieties used for this experiment were the President Wilder and the Charles Downing. The fruit of the common wild Strawberry contains usually one part acid to two of sugar, whilst it changes in the cultivated varieties from one of acid to four and more of sugar. The experiments with the Charles Downing variety were carried out for the purpose of studying the effect of five different kinds of special chemical manures on the ash constituents of the fruit. And, as on analysis, the mineral matters of the ripened berries showed similar changes in relative proportion as those with Grapes, it is assumed by Dr. Goessmann that there would be corresponding changes in the organic substances and in the quality of the fruit.

### EXPERIMENTS WITH PEACH TREES.

The trees under special treatment were planted in the year 1870; for five years after the planting the trees received but little care, and not much manuring. No special manures were applied until 1876. The land has been kept light and mellow by means of a large cultivator, and by shallow ploughing once or twice. The trees had been planted 12 feet apart in every direction. Chemical fertilisers were applied in 1876, in a radius of 8 feet around the trees, taking care to keep off about 1 foot from their trunks. The results obtained showed that those Peach trees which received guano, potash, and dissolved bone, as manure, produced more and better fruit than any tree adjoining. In the case of some Pear trees which were manured in the same way, and at the same time, the best results in growth and in fruit were obtained by similar treatment, and these far surpassed the unfertilised trees.

### DISEASES IN FRUIT TREES.

From careful observations and study of the facts obtained by the application of different manures to Grape Vines, Currant and Peach trees in particular, Dr. Goessmann reports that they have greatly tended to strengthen his view that many of the troubles of horticulturists in regard to parasitic growth and diseases in plants are due to a general exhaustion in the soil of the mineral elements of plant food. He has repeatedly noticed that plants suffered seriously from mildew and blight, upon unmanured and exhausted lands, when upon adjoining richly manured soils no signs of disease could be discovered. J. W.

## MESSRS. B. S. WILLIAMS' NURSERY, HOLLOWAY.

ALTHOUGH the spring exhibition of flowers annually held at these nurseries is now over, there is still an interesting show of bloom in Orchids, Cliveas, Amaryllis, and varieties of greenhouse Rhododendrons so-called, but the plants not being concentrated, as they were at the period of the shows, the display is not to the casual observer so good. Our own opinion, however, is that when interspersed with nice healthy green foliage, as the Orchids and other plants here are, they show off to better advantage than when large quantities of bloom are brought together—the very best argument that can be given in its favour is that for the purpose of comparison it is the only satisfactory way.

A charming feature is the collection of Filmy Ferns, which is both extensive and in the very pink of health and vigour. The following summary of the principal Orchids in bloom will convey an idea of the grand spectacle the houses devoted to them present. Amongst Dendrobiums the following were the most conspicuous:—*D. devoniense*, *D. Wardianum*, *D. crassinode*, *D. fimbriatum oculatum*, *D. Jamesianum*, *D. pulchellum*, *D. aggregatum*, *D. draconis*, *D. Pierardi latifolium*, very fine; *D. chrysotoxum*, *D. macrophyllum giganteum*, and *D. anosmum*. Various forms of Lycaste are still in bloom, including *L. plana*, a curious, sweet, dull-coloured, rare flower; *L. virginalis*, pure white. Several fine varieties and forms of Cattleya were carrying their beautiful blooms in profusion, including *C. Mendelii*, *C. Warszewiczii*, *C. intermedia*, very choice; *C. Trianae*, *C. citrina*, and *C. Mossii* Hardy.

ana, heavily spotted variety, carrying nine blooms on two spikes, a fine vigorous plant; a fine form of *Lælia elegans* with a vivid purple lip, and stripe of same colour running right up into the throat. Some good *Epidendrums* were in flower, *E. radicans*, a smart little flower, *E. evectum*. A fine selection of *Odontoglossums* is in bloom, *O. vexillarium* splendens, of deep magenta, also a magnificent plant of *O. vexillarium*, with twenty-four spikes, *O. maculatum*, *O. Andersonianum*, various charming forms of *O. Pescatorei*, *O. triumphans*, *O. Cerdii*, *O. roseum*, *O. Halli*, *O. Rossii*, *O. niveum majus*, fine plant with twelve or fourteen spikes showing; *O. hebraicum*, *O. luteo-purpureum*, *O. cuspidatum*, *O. xanthoglossum*, *O. hystrix*, large pieces of *O. citrosum* showing strong spikes, and a new natural hybrid, evidently between *Pescatorei* and *triumphans* or *tripudians*, of fine form and very striking—having white petals deeply bordered with primrose and dark chocolate spots; *Coelogyne ocellata* and *C. new species*, something in the way of *ocellata*. A very fine plant of *Maxillaria lutea alba* was well bloomed. The pretty little *Ionopsis paniculata* and various *Oncidium* enliven the collection. *O. Weltoni*, *O. sarcodes*, *O. Marshallianum*, with 150 buds on three spikes—a fine piece; *O. cucullatum*, *Trichopilia coccinea*, *Phalænopsis Stuartiana*, *P. amabilis*, *P. Schilleriana*, &c.; *Vanda coerulescens*, *V. suavis*, *V. tricolor formosa*, *V. t. superba*, *V. t. insignis*, and *V. Patersoni* very fine; *V. teres* showing bloom profusely, *Lepidotes bicolor*, and *Cymbidium eburneum*. There was a grand show of *Cypripediums*, *Sophranites grandiflora*, *Masdevallias* in great variety—*M. Veitchii* had seventeen spikes, *Calanthe Sanderiana*, deep purple, and other of the genus. The stock of hard-wooded stuff, greenhouse *Rhododendrons*, *Azaleas*, &c., is looking very well, and it is needless to say much of the *Amaryllis* and *Cliveas*, as their quality has been witnessed in London and elsewhere on many occasions during the last few seasons.

## The Rosery.

### TEA ROSES IN APRIL AND MAY.

(Continued from p. 505.)

WHERE the soil is very heavy or wet the plan which Mr. Geo. Paul has recommended in *The Rosarians' Year Book* for 1884, of growing Tea Roses on raised beds, is an admirable one; they are very similar to what are called in Ireland "lazy beds" for Potatoes, but it is not laziness but sheer necessity. When Paddy has to make a continual fight with the elements, experience has taught him that if he plants in the ordinary way, in ridges, the moisture produced by the constant rains will rot his Potatoes, and so he tries to raise them up above it and to let what rain falls drain quickly off, and the raised beds for Tea Roses will answer the same purpose; it is, however, a comfort to know that the use of the seedling Brier as a stock and the introduction of a hardier race have materially diminished these difficulties.

Those who desire to grow Tea Roses can indulge their fancy even now, for all the Rose merchants keep a large supply of them in pots, and these if carefully planted out and treated judiciously will bloom well this summer. I have already, in writing on Tea Roses, named the choicest varieties, and will therefore merely say now that the following, being good growers, may be depended upon for out-of-door culture. *Anna Ollivier*, rosy-flesh shaded with buff; *Belle Lyonnaise*, deep lemon; *Bouquet d'Or*, dark yellow; these two are very vigorous and are perhaps better adapted for a wall than a bed; *Catherine Mermet*, light rosy-flesh; *Comtesse Riza du Parc*, bronzy-rose, the blooms, however, very often come quartered; *Francesca Kruger*, coppery-yellow shaded with peach, an improvement on *Adrienne Christophle*, which was always ragged looking; *Innocenta Pirola*, white, with a slight shading—at one time this was thought to be an improvement on *Niphetos*, but time has dispelled that illusion; *Jean Ducher*, salmon-yellow shaded with peach—one of the hardiest and best of the pure Teas; *Madame Angèle Jacquier*, light pink with shade of yellow—a hardy Rose; *Madame Charles*, bright apricot—a strong growing Rose, in colour like *Safrano*; *Madame Lambard*, salmon shaded rose, but most cameleon-like in the variation of its colouring—I have cut from the same

branch a light red and a pure yellow bloom—towards autumn it becomes deeper in colour; *Madame Willermoz*, creamy-white, centre tinted—an old but very favourite and durable Rose; *Marie Van Houtte*, a very vigorous yellowish-white Rose—at times the edge of the petals are distinctly margined with rose—it is one of the most dependable of Tea Roses; *Niphetos*, although not so vigorous as the others named, can hardly be left out, as it is certainly the best of the white Teas, and a universal favourite; *Perle des Jardins*, bright straw colour—the best of all the dwarf yellow Teas; the new American Rose, *Sunset*, is said to be an orange-coloured sport of this Rose; *Souvenir de Madame Pernet*, a roundish loose flower—the plant is vigorous, but I cannot say that I greatly admire the flower, as it lacks the exquisite form of the Tea class; *Souvenir de Paul Neron*, creamy-white with rosy tint—a very vigorous and pretty Rose; *Souvenir d'un Ami*, an old but very favourite rose-coloured Tea. I have omitted many very beautiful Roses, such as *Comtesse de Nadaillac* and *Souvenir d'Elise Vardon*, because, although very beautiful, they are more delicate in habit, and might disappoint the grower, whereas with those I have named success is pretty well assured. *Wild Rose*.

### A NEW TYPE OF CYCLAMEN.

MR. CLARKE, of Twickenham, has had the good luck to have developed a new type of *Cyclamen*,

FIG. 97.—A FRINGED CYCLAMEN.

which if it can be perpetuated, as no doubt it can be by patient selection, will be the progenitor of a new race which we doubt not will be received with favour. It consists in the development from the veins of the petals of a little lace-like frill, such as is shown in our illustration (fig. 97). Primroses of all kinds, and *Cyclamen* is one of them, are very apt to produce these outgrowths from the petals, familiar enough to botanists, but which hitherto have not been looked on with much favour by florists, for, to say the truth, from their point of view, such outgrowths, however interesting botanically, are not such as to commend themselves to the æsthetic taste of the florist. In this case, however, the outgrowths did find favour in their eyes. The growths in question are of the same nature as those so common in *Kales* and others of the *Cabbage* tribe, and they are of interest as showing that leaf and branch are not essentially so different as they appear to be. Here we have a petal branching just as a shoot may do, and to prove the point the leaves also show a similar tendency, though to a less degree.

**ALLIUM NEAPOLITANUM.**—This is an excellent spring-flowering plant, and one of its chief characteristics is its great freedom of bloom. As seen in excellent form at Harefield Grove, it was represented by four bulbs in a pot, and these had thrown up three and four fine umbels of pure white flowers each. It is a plant well adapted for culture in pots, because it does not flourish save in exceptional situations when planted in the open air, and it is equally valuable for cutting and decorative purposes at this season of the year.

### GOOSEBERRIES FOR MARKET.

GOOSEBERRIES are largely grown in Lincolnshire for market—much more largely perhaps than is generally known. Gooseberries are grown in company with Apple trees, doing well under their shade. Standard Apples are planted in lines, and until such times as they have been planted five years or so green and Potato crops are grown about them. When the Apple trees have reached the age named then Gooseberry trees are placed between them, two or three according to their size and growth between each tree. Then when the Apple trees have grown somewhat, and have made some shade, a line of bushes is planted on the north side. Supposing that the line of Apple trees runs from east to west, the trees are planted more rapidly on the north than on the south side of the line of trees, additional lines of Gooseberry bushes being added as shade is provided by the large trees.

Messrs. W. W. Johnson & Son, seed and fruit growers, of Boston, cultivate Gooseberries largely for market purposes, and the sorts they grow are *Crown Bob*, *White Smith*, *Warrington* or *Ashton* (*Aston*?) *Red*, and *Yorkshire Fillebasket*—the last an excellent sort, fully twenty-five years old, and apparently but little known outside the Boston district. But the Gooseberry of the district is *Crown Bob*, and five of this variety are said to be planted to one of the others; these are planted in about equal quantities. The *Crown Bob* is the earliest of all; it is quicker in maturing its fruit than any other variety. As a matter of course—the Boston district being on a flat and exposed coast—the Gooseberries are later in coming to maturity than about London, where there is more shelter and warmth. When there is a heavy crop a portion of it is picked in a green state; by doing this space is left for the others to develop. Early green Gooseberries invariably command a good price in the market.

There is this great advantage in planting Gooseberries under orchard trees, the bushes are thereby protected from the effects of early frosts. Those who plant prefer a three-year-old tree on a clean stem of about a foot in height, and having six or eight branches. The Gooseberry trees are pruned pretty closely in until good and shapely plants are formed; after this is attained pruning is done much more sparingly. As the fruit is generally borne on the younger growths, those experienced in pruning endeavour to keep the bearing branches as far from the ground as possible, especially as some varieties have a tendency to grow near to and spread upon the soil. This practice prevents the fruit from being splashed by heavy rains, and also tends to keep it out of the reach of birds.

The Gooseberry is a rather gross feeder, and does best in a good soil, which should be well fertilised with manure. A dressing is put on the surface of the land in autumn or early winter, after pruning is finished, and then forked into the soil to the depth of 3 or 4 inches, taking care not to injure the roots near the surface. Fish is an excellent fertiliser for Gooseberries. In the season sprats can be purchased on the coast at from 21s. to 25s. per ton, the purchaser fetching the fish in his own carts. A dressing of from 2 lb. to 5 lb. is given about the roots of each tree, and a great effect on the growth of the bushes results.

But there are drawbacks to Gooseberry culture. Certain birds rob the trees of the buds, especially the bullfinch, and what is locally known as the Willow-biter. These two especially eat the buds just when they begin to swell in early spring. Some aver that they hunt after an insect that secretes itself within the bud; but the general opinion appears to be that they are tempted by the saccharine matter stored in the bud. The havoc worked by these birds is greater in some seasons than in others. In cold seasons, when the food of birds is scarce, they attack the Gooseberry trees in greater force, and the measures adopted to prevent this as far as possible is to scatter over the brambles a dressing of lime, or lime and soot mixed, doing this in the early morning, when the dew is on the branches, or immediately after a shower of rain. This application should be repeated after it is washed off, and by persistently applying it it is found a great preventive.

Then the early frosts are occasionally destructive also, when they fall upon the bushes just when the leaf has burst, and flowers appear at the end of the embryo berry. The frost appears to have a kind of burning effect on the fruit, and in this way a large

portion of the crop sometimes suffers. In a single night great damage has been done where the bushes are exposed, and especially so if frost follows rain or sleet, which leave moisture on the trees. Then there is the Gooseberry caterpillar. This attacks the bushes very early—as soon as the fruit begins to swell. Such a painful experience as having the crop of a large breadth of Gooseberries entirely spoilt by this pest is known in Lincolnshire. More than that, the act of clearing the trees of leaves does them permanent injury. The theory held by the cultivators is that the larvæ of the Gooseberry caterpillar are deposited about

Sheffield, Leeds, Newcastle-upon-Tyne, and Sunderland. The longevity of the Gooseberry trees depends in a great measure upon the character of the soil, in a good deep fertile loam the plants will last for years.

In regard to pruning, Mr. A. Johnson is decidedly of opinion that Gooseberry trees are over-pruned. He holds the opinion, and carries it into practice, that the shoots should be simply shortened in, and any crowded wood taken away when they get into a bearing state. Pruning is generally finished by the end of January.

Gooseberries are propagated by means of cuttings

6 inches apart, and some 18 inches between the rows.

Generally, sufficient cuttings are obtained from the trees at the time of pruning; but where a large number are required it is customary to plant out "stools" as they are called, and large quantities of cuttings are taken from these. If the wood be well matured, and the cuttings when made are not kept too long out of the ground, from 80 to 90 per cent. of them will root. When the young plants have been transplanted two years they make good saleable stuff.

The Gooseberries that are allowed to remain on the trees are gathered when nearly ripe, and not quite fully coloured; they travel well in consequence, and colour completely in course of transit. They are generally sent to market in small packages; it is not a good plan to put large quantities together. R. D.

### HILLIA LONGIFLORA.

So long ago as 1804, Dr. Sims described and figured in the *Botanical Magazine*, tab. 721, this elegant stove plant—described then as very rare, and hardly less so now. Our figure, from a specimen sent by Mr. Burbidge (fig. 98), shows what sort of a plant it is, but we have to cite Dr. Sims' words in support of the statement that it fills "the whole house in the evening with its fragrance." Dr. Sims notes that it was named in honour of Sir John Hill, "author of several voluminous but useless botanical works"—a severe criticism, which "Sir John" brought upon himself by his questionable practices, which rendered him obnoxious at the time, though a later generation, knowing nothing of the man's faults, and appreciating only his works, may hesitate to adopt the adjective "useless," applied perhaps in a fit of spleen, excusable at the time, but not so now-a-days. If the man was a quack, he at least did some good, and we had better remember the good than the ill. The plant is a member of the Rubiaceæ order, not far from *Luculia*, and is a native of the West Indies.

### DAFFODIL NAMES.

LAST week a botanist said to me, "We have not time, even if we had inclination, to attend to the varieties of a single species, so that if we deal with them at all, we generally accept the names as we find them." This makes it more incumbent on those who give the names to give them carefully, and in the case of Daffodils a committee of experts has been formed for the purpose of settling names; it is on the work done by this committee, of which I have not been, and, as far as I know, am not a member, that I should like to make a few remarks. Daffodils proper may be divided into two sets, those which we believe to be of natural or wild origin, and those which are known to have been, or presume to have been, produced in gardens. In the latter set it has been generally agreed that fancy names should be given, no matter whether Tom, or Prince Poniowski Doldorowki (though those who have to write the labels would prefer the former), provided the names are distinctive and uniformly kept, and that the varieties are distinct, or at least not confusingly similar. But the wild varieties form a class to which greater scientific interest belongs, and it has been agreed that botanical or Latin names should be given to these. In doing this, some attempt has presumably been made to fix the old names upon those varieties to which they were originally given, and I am afraid that the committee have not been successful in this attempt. For want of a better authority reference has been made by them to Haworth's *Monograph of the Narcissus*. I have often tried to make something out of Haworth's *Monograph*, but the first difficulty is to determine in what language it is written; if it is intended for Latin, I can only say that in many sentences there is not the least clue to lead to the discovery which is the nominative case, which the accusative, which adjective agrees with which substantive, so that the meaning of the writer is left hopelessly obscure; but admitting that there are many parts of it in which one can divine the author's meaning, still, they often lead us to conclusions quite at variance with those at which the Naming Committee seem to have arrived. For instance, Haworth tells us that the leaves of *N. nanus* are "semiunciam lata," by which I presume he means "half an inch wide"—a description which will not fit the "nanus" of our gardens. Again, if there is one thing clear

FIG. 98.—HILLIA LONGIFLORA: FLOWERS WHITE.

the roots of trees, and so, early in the year when the bushes are breaking into leaf, a good sprinkling of soot is spread over the soil and pricked into the surface. It is also the practice when the caterpillars are feeding on the leaves to sprinkle powdered lime over them, following this up for a time. Hellebore powder is also found to be an efficacious remedy.

As a rule the Gooseberry makes a profitable crop. It is generally found advantageous to get a good proportion gathered in the early and green state, and especially so if there is a probability of a plentiful crop that would interfere with the sale, and also bring down prices. A great deal of the fruit is sent south and west of Lincoln, but the principal portion goes to

made of last year's wood, and they are preferred when they make cuttings 15 to 18 inches long. After being trimmed, the buds and thorns are cut away with the exception of three or four at the top of the cuttings, and about the end of October or in November they are planted in lines, leaving 4 to 6 inches of the cutting out of the ground; the cuttings are only an inch or so apart in the lines, and the rows about 8 inches from each other. They remain in these nursery rows for about two years, are then taken up, again trimmed, leaving sufficient roots at the bottom, and cutting the top growths back closely. The upper roots are cut away and then the young plants are planted out in nursery quarters 4 to

from Haworth's *Monograph* it is that he had himself no idea what characters he meant to indicate, or what Daffodil to describe by the name *obvallaris*, which, he says, he gives to a Daffodil which came to him from Truby, in Derbyshire. This name has now become attached to the Tenby Daffodil, for no reason that I could ever discover. This Tenby Daffodil was figured in the *Botanical Magazine* in the last century by the name *N. Sibthorpii* (or *N. major* var.  $\gamma$ ). Last week, assisted by Mr. Baker—who attended to my wants with the most patient courtesy—I went through all the Daffodils in the Kew herbaria. The only specimen of the Tenby Daffodil at Kew, which is one of the oldest, is named *N. Pseudo-Narcissus* var. *Sibthorpii*; and why this original name has been supplanted by one quite without meaning I cannot see.

Another name which is now applied to a different class of flower from that to which it was originally given is *N. bicolor*. The wild forms in the old Kew herbaria clearly belong to something close to the type of *N. Pseudo-Narcissus*, with narrow leaves, and the trumpet widening at the mouth. On referring to the *Historia Plantarum* of Linnæus, I find that he took the name and description of *N. bicolor* from his predecessor Rudbeck, and that he describes a form coming very near typical *N. Pseudo-Narcissus* except in colour, and certainly not the late flowering, broad, and fleshy-leaved kind with the cylindrical trumpet now accepted as the type of the class. It is true that we can hardly dispute the claims of such Daffodils as *Empress* and *Horsfieldi* to the title of "*bicolor*." Still they are very different from the old "*bicolor*" of the last century, and have sprung up recently from a class of which I feel sure that the wild original is to be found in that very variable Daffodil, the muticus or abscissus of the Pyrenees. Messrs. Collins & Gabriel were far nearer the true bicolor when they exhibited at the show on the 14th a Pyrenean Daffodil, closely allied to Mr. Barr's *pallidus præcox*, under the name of *bicolor minor*. Again, I cannot help thinking that this name, *pallidus præcox*, has been given somewhat prematurely. The Daffodil so named belongs to a distinct class of Daffodils of many forms and colours, and of great merit as garden plants, which I have grown experimentally for some years, having first got them from near Bayonne. To this whole class I should like to give the name var. *pyrenaicus*, because, as far as I know, they are confined to the Pyrenean district. When established in England they are neither earlier nor later than ordinary English Daffodils, certainly not so early as Tenby or nanus. A very elegant selection from them was presented to the Naming Committee on the 14th by Messrs. Ware, and wisely relegated for further acquaintance. It may be convenient and desirable at some future time to fix and name for garden purposes some of the best varieties of these: the present name of *pallidus præcox* is most indefinite, as any one who has grown it must own. Still, it covers only a small proportion of the whole series of var. *pyrenaicus*. *C. Wolley Dod, London, April 20.*

## Orchid Notes and Cleanings.

### PRUNED DENDROBIUM NOBILE.

The splendid specimen of this, over 4 feet across, and bearing 630 fine flowers, exhibited at the Royal Horticultural Society on Tuesday, by Mr. Prinsep, gardener to the Hon. Mrs. Portman, Buxted Park, Uckfield, and for which he was awarded a Cultural Commendation, seems to set at rest the question as to the practicability of pruning this plant hard, or even cutting it down when in flower, and yet by special treatment causing the then just springing growths to perfect themselves and furnish as good and as well flowered a plant in the next year, and so on. The following method of treatment, so cleverly and successfully pursued by Mr. Prinsep, may enable some who are sure that they possess the requisite accommodation to attempt a similar plan, but in my opinion the systematic pruning of any Orchid after the manner we read of is not likely to be good in general practice, although no doubt we often have plants which would both be and look all the better for having some of the two or three-year-old stuff cut

out of them. Twenty years ago or more I made observation on *D. nobile*, from which the pseudobulbs had been removed with the flower, and I then found that, although the plants came round all right and flowered, I should have preferred to have had the back bulbs left on. Mr. Prinsep's treatment from now, when his plants are in bloom, is to cut out all the flowering pseudobulbs with the flowers on them, leaving only the three or four leafy ones which have no flowers and the young shoots just springing up. The plants are at once placed in a moist house kept at a temperature of 80° to 100° Fahr., which during the summer may often rise to 120°. Here the growths rapidly form, and in the first week in September they are fully completed, and are then removed to a cold, airy house, which often gets down to 45° in winter, to ripen their growths. Early in February, the flower-nodes having begun to swell, the plants are, as they are required, removed into an ordinary intermediate stove heat, where by the end of March and April they bloom as in the previous year. The advantage of Mr. Prinsep's treatment, where practicable, is that a strong, tidy, well-bloomed plant is secured, which, by furnishing the pseudobulbs with the flowers, renders their value and usefulness when cut of much more importance than those which are cut short-stalked off the plants. The disadvantages in general practice are, that it is no use to attempt such culture unless the very hot growing-house and other requisites are available, for if any hitch takes place in any part of the treatment the plants cannot do the work required of them in a year, and having no old stores to fall back on the failure is complete. Any way Mr. Prinsep deserves credit for his success, and so will all who succeed as well by pruning their *Dendrobium nobile*, although we know that we can get them equally good unpruned. *James O'Brien.*

### A QUESTION FOR ORCHID GROWERS.

Does breaking out the spike of a *Cattleya* before the blooms are open benefit the bulb and the succeeding growth? Many growers will doubtless say, "Yes, of course." I thought so at one time, but I have quite changed my idea by experience of three years' duration. I had a *Cattleya Trianae*, a fine variety. I bloomed it once, and next year, wishing to ease the plant, and gain size of bulb, I pulled the sheath and spike out of two leaves when the latter was just emerging from the former. The result was that the bulb made afterwards was rather weaker than the one which did not carry "open flowers," and a spike of one bloom instead of two as two years previously. The third lead on the plant was a very large one, and has carried its three flowers annually. I may say that I shall never try to ease the lead, and persuade it to throw four. I think it will do so alone in time. Similar experience has been mine with a *C. Mossii*; though rather worse, for the bulb is half as large only. The plants have been grown along with all the others, which are well and happy. Now, again, with *C. Wallisii*. I bought a badly established plant that had evidently been bloomed almost to death; it made a puny bulb, with two puny leaves on it, one crippled; the next two bulbs were a little improvement, but the plant's life always hung on a thread, as it persisted in making roots that never lived long, but on my third bulb it produced one fine bloom. The bloom was a great strain on the plant, but as soon as it opened fully it was cut. The plant at once plumped up, and has rewarded me with a great quantity of root (for a small plant), and now is breaking well from two bulbs. I am convinced had I pulled out the sheath and bud in it I should have been a loser, whereas now I am gainer in an extra lead. Having detailed my effects I come to my cause. It all lies in a nutshell. The whole plant is green, the flowers are otherwise: are there certain juices in the plant for the bloom separate from those for the plant? [No; but the cell-contents are different, and the work done in them consequently is different. Ed.] If so, the very fact of the undeveloped bud being cut out imprisons the juices that would have gone into the flower. Naturally, these juices the plant would get rid of by blooming, and the unnatural care therefore damages it. If any one can help me to thrash out this subject I shall be obliged. But *en passant* I may as well say that I know cutting out an *O. crispum* spike materially enlarges the bulb and the next growth as well. This apparently upsets my theory, but *Cattleyas* and *Odontoglossums* grow in such different heats, that the "flower juices" in a

cool temperature may not damage the bulb though imprisoned in it—in fact, may not "generate gas," to use a far-off expression. I purposely write this now to enable any one who likes to start a discussion, if they so please, at the Conference. *Dr. B. Crawshaw.*

## FORESTRY.

### FELLING.

GENERAL forest thinning may still be continued, but in the case of hard woods, Oak excepted, this should speedily be brought to a close. Every forester who wishes to maintain a healthy state of vegetation in his woods should at once act upon the advice given in former articles on "Forest Work" respecting the clearing out of all dead and decaying matter.

### BARK STRIPPING.

Should the present mild weather continue bark stripping will in many districts commence towards the end of the present month. A sharp outlook should, therefore, be kept on the Oak, and on the first indication of the bark rising freely, which may be readily known by inserting a barking iron below the bark, no time should be lost in beginning the peeling operations. Have all tools in readiness, and the trees singled out and marked, so that no delay may be occasioned when once the work has been started.

### PLANTING.

Although the season is now far advanced for planting operations generally still where care and despatch in removing are insisted upon many trees and shrubs may still be removed with safety. Should dry weather after planting continue the free use of the watering can can only be relied upon as a safeguard against injury and a large percentage of losses. Syriaging overhead in the evening is of great value, and should where practicable, always be insisted upon.

### GENERAL WORK.

Road-making and repairing will now demand attention, indeed the present month is, perhaps, preferable to any other for this work. Clear and scour out plantation ditches, remove obstructions from the mouths of closed drains, and where it may be found necessary cut new ones for the removal of stagnant moisture. The lawn and shrubberies will now require attention, the former in the way of rolling and levelling, and the latter to see that shrubs have not become overgrown and infringing on each other. All dead or unhealthy trees and shrubs should be at once removed and others of robust growth substituted in their stead. Lawn improvements, such as levelling and turf-laying, can now be advantageously carried out, and bare patches of the ground forked slightly over and sown down with grass seeds, that is where the use of turf is not, for appearance sake, really required. *A. D. Webster, Penrhyn Castle, North Wales.*

## The Flower Garden.

### TREATMENT OF THE BEDDING PLANTS.

THE busiest time of the year for the flower garden is at hand. For the next two months it will require great care and attention to keep the work from falling into arrears. Summer bedding plants should now be hardening off in pits or cold frames, where they should have all the air possible, only just protecting them against frosts at night; and many of the hardier kinds may be transferred to the open air, provided they are hooped over or otherwise protected.

### OVERBLOWN SPRING BEDDERS.

As the spring plants and bulbs cease blooming they should be immediately removed to the reserve garden. The bed should then be manured and dug ready for the reception of the summer plants. Care should be taken to put out the hardier kinds first, such as *Calceolarias*, *Verbenas*, and *Lobelias*. The bed and borders can now be prepared, and all arrangements made for the summer garden by the time the plants are ready. I mostly bed out about May 12, taking care to have the plants well prepared previously, by exposing them to all the air possible night and day

about eight or ten days before I turn them out, and there are a large number of hardy plants that can be used with good effect which are already planted, and will save labour and assist at summer bedding for edges and the centre of beds.

#### SORTS OF HARDY BEDDING PLANTS.

The following are some of the plants used, all of which can now be planted, viz., Echeverias, Sedums, Saxifrages, Sempervivums, Festuca glauca and F. viridis, Arabis lucida variegata, Cerastium tomentosum and C. Biebersteini, Santolina incana, variegated Thyme, Ajuga reptans, Achillea aegyptiaca, Euonymus variegata, and sorts of Yuccas, Violas, Pansies, Aucubas of various sorts, Retinospora aurea, and others; Thuia pygmaea and T. pygmaea lutea, Thuinopsis dolabrata variegata. Planting arrangements must be left to individual tastes to arrange to give the best effect, but I may advise that high or glaring colours should not predominate, but the colours should be carefully blended so as to produce harmony rather than violent contrasts.

#### STOCKS, ASTERS, WALLFLOWERS, PHLOX DRUMMONDI, AND ZINNIAS.

These should now be pricked off from the seed-pots or boxes into other boxes and pans, and be placed in a frame till well established, and then in about three weeks they will be fit to plant out into the beds. The herbaceous garden should be carefully looked over, and all rubbish cleared away, and attention should be paid to thinning, tying, and staking the different plants before they become too thickly grown together or injured by the wind. *W. Smythe, Basing Park, Alton, Hants.*

## Plants and their Culture.

#### STOVE PLANTS.

WITH the more congenial weather of the past few days the plants in this division should have made rapid progress.

#### INSECTS.

Where mealy-bug exists that insect will increase with alarming rapidity during this warm season; if, however, my former advice on this point has been regarded, this parasite of our hothouse and other plants should either have been quite eradicated, or much reduced in numbers. A close watch will need to be kept on the various forms of scale, likewise thrips and aphids. Fumigation with tobacco-paper will soon settle the two latter. If the scale is caught in time before their bodies become hardened, a much weaker solution of insecticide will be found sufficient to kill them. Some ingenuity will be needed in the management of the entire collection of stove plants, in order to dispose of them in the other houses as the stove itself becomes crowded. Being free from bug here, I place some of them in the vineries and other forcing-houses without running any risk. Overcrowding the plants, now that they have started into free growth, will not only be prejudicial to the plants themselves, but render them liable to attacks from insects, and other evils. A lesser number of plants well grown will give better returns usually than a greater number badly done.

#### ARRANGING THE PLANTS

From now onwards the stove plants should be grouped into two sections, those that delight most in being exposed to increased sunlight should be so arranged, whilst such as are found to thrive best when more shaded should also be placed by themselves so far as it can be done. Of the former the flowering plants are those to be most studied and thus treated, the Crotons also delight in sunshine. From amongst the latter the fine-foliage plants should receive attention with the addition of the Ixoras, which when in growth will be found to succeed best with partial shade. Any plants that were not considered to be in want of a shift when the early spring potting was done, will now require it before they become over-much pot-bound.

#### TEMPERATURES.

As the temperature increases more frequent applications of the syringe will be needed to maintain an atmospheric moisture in the houses so as to make

them congenial to healthy growth. If we should have a return of easterly winds, the evaporating troughs must be kept constantly filled, as at such times the pipes will of necessity be heated more than usual, thus causing an aridity in the atmosphere. Should this weather occur, it will be better to diminish the night temperature a few degrees, and during the daytime be very cautious in the application of air. With a keen wind prevailing we would rather see the temperature rise somewhat higher than usual, modifying the same by an extra syringing, even if the sun be shining. The general run of temperatures may now be as follows, viz., by night 65° to 68°, a few degrees more or less being immaterial, having due regard to the prevailing weather. We would prefer to see the stove at 60° in the early morning than 5° higher when attained by sharp firing. The rise during the daytime should also be in accord with the weather, from 7° to 10° being ample if cold and cloudy, whilst during bright sunshine 85° may be regarded as the maximum except at closing time when 90° will be none too much; bottling up, as it were, the sun's rays in this manner will be a saving in firing. *J. Hudson, Gunnersbury House, Acton, W.*

## FRUITS UNDER GLASS.

#### THE ORCHARD-HOUSE.

CROPS of Peaches, Nectarines, Apricots, Cherries, and Plums in unheated houses of this kind are placed in peril at this season whenever the thermometer registers 8° of frost; surely a risk of this nature ought not to be undergone in these days, when the means of heating houses is not expensive, and is readily applied. An ordinary fruit-house would require one 4-inch pipe carried round the four sides of the house, to be put into use when frost threatened, which would prevent any mischief being done. Insect pests which usually infest the trees referred to above should be entirely got rid of before the flowers and foliage expand, the advantage resulting whenever this matter is properly done is such that it cannot be too often referred to. If due regard was given to it the trees will develop flowers, leaves, and fruit perfectly; otherwise they will be deformed, and, as a rule, abound with insects so enclosed and protected as to make their extirpation no easy task.

The cold murky weather and frosty nights we have experienced lately has stopped the growth of the trees in orchard-houses considerably, and deprived us of the help of the bees at a time when they are most required—that is, now the trees are in flower; it will therefore be advisable to lightly brush the flowers over occasionally, and the syringing, which I hold to be helpful in fructification, should be lightly done in the morning; it has further necessitated more care in ventilating. Cold currents of air should be avoided or modified when heat is available until such time as a favourable change comes, when plenty of air will be needful, and syringing should be regularly and forcibly done every day. As growth proceeds, remove all superfluous shoots. Pinch in at about the sixth leaf those which are to be retained, and the top and terminal shoots outside the trees may be allowed to run a foot before they are stopped. When the Apricots, Peaches, and Nectarines have attained the size of Peas they should be slightly thinned in the first instance, of course leaving those which are best placed or development. In the case of Cherries and Plums this operation should be deferred till after the stones are perfected.

Trees in pots will need every attention in the way of watering. In order to be satisfied on this point they should be looked over at least twice every week, and if water is necessary give it plentifully. As time proceeds, and root-action becomes more active, much more water will be required, when also some stimulant may be given, such as guano, &c. Trees planted out must not be neglected in this particular, but have an abundant supply of it when necessary. In every case when the surface-dressing in pots becomes full of roots add more material to it to further encourage their growth, and to assist in swelling off and ripening the fruit properly. *G. T. Miles, Wycombe Abbey.*

## The Hardy Fruit Garden.

#### BORDERS.

WHERE wall trees are grown under heavy copings the roots are apt to become very dry close to the wall, and this is often the cause of the fruit not setting. This is more especially the case with old trees of wall Apricots. When such is the case the trees should be well watered close up to the wall. Until all danger of frost is over it is necessary to continue the protection of wall trees.

#### INSECTS.

Peaches and Nectarines are very liable to become infested with greenfly early in the season. Tobacco-powder is one of the best remedies I know if applied on the very first appearance of the fly. It may be dusted all over the infested shoots in a dry state, and washed off in a few days with a syringe.

#### DISBUDDING.

Young trees should be gone over as soon as they begin to grow, and all shoots that are not required for forming the trees carefully rubbed off, or pinched back to form fruiting spurs.

#### APPLES AND PEARS

that are well covered with fruit-buds would derive much benefit by a good watering with manure-water, not close to the stems of the trees, but at the extremity of the roots, the whereabouts of which can be judged by the size of the trees and the time since which they have been root-pruned. Trees that are destitute of fruiting buds are better without any stimulant. I should advise these to be kept as dry as possible, so as to encourage them to form fruiting buds; for this reason these should never be mulched with manure in the same way as trees bearing a heavy crop of fruit.

#### STRAWBERRIES.

Plantations of these should have a good watering with manure-water immediately the flowers can be seen in the heart of the plants. When slugs are troublesome the beds should be dressed with hot lime before being mulched.

#### RASPBERRIES.

Should these not be growing satisfactorily, a good dressing of rotten manure should be spread all over the roots. This will effect a great improvement the first season. *J. Smith, Mentmore, Bucks.*

## The Kitchen Garden.

#### GENERAL WORK.

CAULIFLOWERS should be encouraged by waterings of liquid manure. Thin successive crops of Turnips and Spicach, also seedling Broccoli, Brussels Sprouts, Cauliflower, Cabbage and Lettuce. Undoubtedly the main plots of Carrots, Onions, and Parsnips should have had the Dutch hoe passed between the rows. Soil that has been rolled before and after the reception of seeds should be surface stirred immediately the young plants are visible should the weather permit. It is surprising how this operation when executed at the proper time invigorates the crops, especially in their younger stage of growth. Much good can be done by mulching some crops; but in the absence of artificial watering it should never be applied until it has been ascertained that the rain has penetrated to a sufficient depth for the maintenance of vigour in the crop. Young Carrots when well above ground should receive a good dressing of wood ashes and soot in equal parts. Not only will this prevent the ravages of insects, but will also stimulate the crop. For the next fortnight draw a little soil to Potatoes as they appear above-ground, finishing off with a general earthing-up at a later period. Wait for a good soaking rain, then mulch the Peas with half-decayed material and the crop will be independent of the weather in this respect. The early sowings of Brussels Sprouts, Cauliflowers, Cabbage, and Lettuce will have been, or should be when large enough, either planted into permanent quarters or pricked out into nursery beds, and during the present dry weather must be well watered. If water is not available wait a reasonable time for rain. In the absence of artificial watering or rain it would be useless moving them now (the 20th) the soil is dust-dry here. Endive should be blanched now in a cool dark shed.

#### SEED SOWING.

Sow a second bed of Chervil, also a sowing of Sweet and Bush Basil should be made out-of-doors in a sunny position. The main sowing of Borecole should be made onward to the end of the month. *G. H. Richards, Somerley Gardens, Ringwood, Hants.*

## APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, April 28	{ Special Sale of Orchids, at Frotheroe & Morris' Rooms.
WEDNESDAY, April 29	{ Sale of Imported Orchids, at Stevens' Rooms.
	{ Sale of Valuable Established and Imported Orchids, at Frotheroe & Morris' Rooms.
THURSDAY, April 30	{ Sale of Established and Imported Orchids, at Stevens' Rooms.
	{ Sale of Carnations, Picotees, and Plants, at Frotheroe & Morris' Rooms.
FRIDAY, May 1	{ Sale of Imported Orchids, at Frotheroe & Morris' Rooms.

THE Royal Horticultural Society celebrated PRIMROSE DAY on Tuesday last. It must not for a moment be supposed that that venerable and now staid body attached any political signification whatever to the display made in the conservatory. It would, we imagine, be among the first to protest against any such desecration of the Primrose, or, indeed, of any flower whatever. It would, we have no doubt, had the question been brought before it, have even deprecated any partisan connection with the name of CHARLES DARWIN, whose memory, some well-meaning but as we think injudicious persons, wish to connect with Primrose Day, as a sort of scientific counterpoise to political partisanship. It is true that CHARLES DARWIN knew a great deal more about Primroses than Lord BEACONSFIELD, and that the world is indebted to the philosopher of Down for vastly more information concerning Primroses than to the politician of Hughenden. It is true, too, that the issues at stake, and the ultimate value of DARWIN'S researches, which are for all time, have far more widely reaching consequences than the relatively limited and temporary matters dealt with by the party politician. The march of a periwinkle, EDWARD FORBES was wont to say, was of far greater moment in the world's history than the progress of an ALEXANDER—a statement that, however exaggerated and strange it may seem, is, from the point of view of the naturalist, absolutely true: and on the same principle DARWIN'S researches and their consequences will have a value long after the strife of existing party politics has become matter of history; but for all that, we lament the attempt to make party capital out of flowers. As things are, however, the Primrose cult will no doubt wax for a season and then wane. Meanwhile, if it must be so—if enthusiastic Darwinians will adopt the Primrose, because the great master died on April 19—and eager politicians will do the like for analogous reasons—then in place of the humble, modest wildling with all its thousand beauties and associations so foreign to the nature of such displays, let our gardeners set to work, hatch the golden eggs, and grow the Primroses or whatever else is to be the badge, by the acre. No sentiment would thus be wounded, no harm would be done, woods and hedgebanks would not be rifled of their loveliest adornment, perhaps to its utter extinction, while, on the other hand, many would be benefited.

But Primrose Day at the Horticultural was troubled by no such reflections. The profane reader will smile as he reads that the great gathering of the "National Auricula Society (Southern Section)" was held on that day and on that spot—that collections were shown and prizes awarded even to the eighth degree of excellence for flowers, the differences between which it requires the training of a lifetime to discern. But for all that the word this time was writ large, and Auriculas, with all their quaintness of colour and their niceties of difference, were placed amicably side by side not only with laced Polyanthus, scarcely less exclusive and rigid than themselves, but with catholic minded Primroses of every shade, hue, and species: Primroses, like the Auricula, but as different—that is, superficially different—as two things bearing the same name could well be. For a report of the meeting we must refer to another column, and here only refer to what we consider a most wholesome sign

of the times—a gradual breaking away if we may so call it from the narrow trammels of party politics—we mean, of course, florists' standards!—and a steady march onward on broader lines with more natural and less arbitrary restrictions. Special societies have done good in their time, but in the new development of Congresses and Conferences (never mind the inappropriateness of the terms) they promise to do much more. However much we have admired the results of their labours, we have heretofore learned wonderfully little from the earnest enthusiasm of generations of ardent florists. They have, we fear, thrown away their opportunities. They have put before themselves an object, and they have stuck to it with good results from their point of view no doubt, but with how little benefit to the progress of knowledge, *i.e.*, the welfare of humanity! But now the age of Congresses has set in, and amid the flood of talk they bring with them there are waves of real progress—real diffusion of knowledge—real widening and deepening of thought and effort, so that the Horticulture of the future is certain to achieve even greater victories in the future than she has done in the past. Nothing is more easy than to get up a laugh at such Congresses, but the fact remains, that they stimulate progress and new development in matters where, according to the old *régime*, there was but little advance in a straight line, but much travelling in a continuous circle—much shaking of prearranged atoms in a kaleidoscope. The Apple Congress did a marked good; the Daffodil Congress has excited a most laudable desire to know what can be known—both, too, have hit the public taste. We cannot doubt that the Primula Conference of next year, to which that of this year was preliminary, will, in its turn, advance our knowledge of plant life, and thereby enhance our material and æsthetic welfare, and furnish an unexceptionable method of celebrating Primrose Day.

— THE OXFORD BOTANIC GARDEN.—It has often been our privilege to give illustrations of the botanic gardens belonging to the old universities of the Continent, and we have alluded to the manifold interest and picturesque beauty of these venerable institutions. Neither in interest nor in beauty of surroundings does our own Oxford come second—rather, may we say, it is a long way ahead. Our illustration (fig. 99) will recall a scene familiar to all Oxford men and to the army of visitors, and we shall have their assent when we say that for picturesqueness no garden scene of the kind can excel it, not even Pisa or Padua. As we intend shortly to give a further account of the old garden we reserve further comment now, and merely state that the exquisite tower is that of Magdalen College, the archway, so different from the tower in style, and yet so fine in its effect either singly or by contrast, forms the entrance to the garden.

— GLASGOW. Mr. F. ORPEN BOWER, M.A., F.L.S., Lecturer on Botany at the South Kensington Normal School of Science, has been appointed Professor of Botany in the University of Glasgow, *vice* Professor BAYLEY BALFOUR.

— A BOUQUET.—The bouquet and large basket of flowers that were presented to the Princess of WALES by Mrs. PIKE, on behalf of the citizens of Cork, was made at Besborough Court, and comprised *Phalenopsis* in variety, *Dendrobium nobile* and others, *Cattleya Trianae*, and Roses; besides *Stephanotis*, *Gardenias*, *Eucharis*, *Lily of the Valley*, and *Adiantum*.

— DAFFODILS.—Mr. HARTLAND of Cork sends us some fine specimens of large flowered Daffodils to show what Irish soil and early July planting can do. The specimens may all be referred to the variety *maximus* as the type, and comprise *Horsfieldi*, *Emperor*, and *Empress*. All are extraordinarily fine specimens—veritable giants. The bulbs, we are informed, were planted in July, and those of *Horsfieldi* ten days previously to the others. From Lord

BALFOUR, of Burley, we have received a similar collection, but not equal in size to the Irish specimens.

— A NATIONAL LAND COMPANY.—On April 24, at WILLIS' Rooms, a meeting will be held for the purpose of forming this Company. The Company intends to buy land in large quantities, *i.e.*, from 1 acre to 4 acres, and to sell out in small ones on a system of deferred payments. The Company will also let land where desirable.

— EARLY RHODODENDRONS.—Mr. BURBIDGE sends us from the Trinity College Botanic Garden Dublin specimens of *R. virgatum*, a dwarf Sikkim species of compact habit, leaves glaucous on the under-surface, and dense trusses of small white campanulate flowers. The plant is hardy (it grows at an elevation of 7000 feet), but the flowers were produced under glass. *R. glauco-hybridum*, is a very free-growing pink-flowered form like Early Gem.

— IRIS MILESII.—Prof. FOSTER showed at the Scientific Committee a Himalayan Iris of rare beauty and distinctness, which is, we believe, shortly to be illustrated in the *Botanical Magazine*, on which account we confine ourselves now to the recommendation to Iris lovers to secure what is certainly one of the most beautiful of its kind, intermediate in some respects between *Iris stylosa* and *Iris fimbriata*.

— LINNEAN SOCIETY OF LONDON.—This Society will hold a meeting on Thursday, May 7, at 8 o'clock, P.M., when papers on the undermentioned subjects will be read:—1. "Germination of Seeds after long Submersion in Salt Water," by JAMES J. WHITE. 2. "Fossil Ferns of the British Basalts," by J. STARKIE GARDNER.

— "THE BOTANICAL MAGAZINE."—The April number contains coloured figures and descriptions of the following plants:—

*Dracontium fecundum*, HOOK. F., t. 6808.—One of the section producing large, deeply cut, single leaves after the spathe, which is hooded and purplish in colour, as in D. elatum. The tuber throws up a profusion of small tubers above-ground, each about the size of Hazel-nuts. The plant is a native of British Guiana.

*Anthericum Elicheandroides*, BAKER, t. 6809.—A very curious Liliaceous plant, with tufted, lanceolate, undulate leaves, and upright racemes of star-shaped yellow flowers, each about an inch across, with spreading oblong segments, yellow, with green veins. It flowered in the Cambridge Garden, and is supposed to be a native of Mexico.

*Clematis stans*, SIEBOLD and ZUCCARINI, t. 6810.—One of the erect-growing species, with three-foliate leaves, and broad, ovate, coarsely-toothed segments, with erect many-flowered cymes of tubular bell-shaped flowers of a pale blue colour. It is a native of Japan.

*Chusquea abietifolia*, GRISEBACH.—A graceful little Bamboo, with small linear leaves, and loose pendulous spikes of violet flowers. Native of Jamaica, where "it climbs the loftiest trees, and its pendulous branches form feathery masses of great beauty."

*Salvia Greggii*, A. GRAY, t. 6812.—A shrubby species, with narrow oblong leaves, and racemes of labiate flowers, the lower lip largest, with two rounded crimson lobes. It is a native of Northern Mexico.

— "BOLETIN ANNUAL."—The last-issued part of the *Bulletin of the Brotero Society of Portugal*, published under the auspices of Prof. HENRIQUES, of Coimbra, contains a carefully compiled list of the Euphorbiaceæ of Portugal, with differential characters, synonyms, and bibliographical references, by M. DAVEAU. Prof. HENRIQUES contributes a note on the vegetation of the Serra do Marao, and Dr. WINTER continues his list of Portuguese fungi.

— HILLEBORUS ARGUTIFOLIUS.—Mr. BURBIDGE sends us specimens of this Hellebore—just the plant for an artist, so far as its bold and yet graduated forms are concerned. The botanist will appreciate the way in which the plant reveals the secrets of its growth in the gradual transitions from leaf to flower segment, and will wonder what are the insects which find an attraction in the green flowers. Has the flower a perfume to lure the insects to the nectar in those queer honey-pots inside the segments? That it

FIG. 99.—THE ENTRANCE TO THE OXFORD BOTANIC GARDEN. (SEE P. 540.)

does require cross-fertilisation is evident from the ripening of the stigma before the pollen is ripe.

— NORTH AMERICAN ROSES.—In the course of some remarks on these plants Mr. SERENO WATSON writes that, "The differences which have to be taken into consideration in determining the species of the genus *Rosa* are so variable, and present such a multitude of combinations, that there are few genera

which illustrate more fully the different views that can be taken by different botanists respecting the specific value of the same characters. The number of species admitted by LINNÆUS in 1762 was fourteen; by Sir J. E. SMITH, in 1816, fifty-seven; by LINDLEY, in 1820, seventy-eight; by SERINGE, in 1825, ninety-one, besides fifty-one which he classed as imperfectly known. BENTHAM and HOOKER, in the *Genera Plantarum* (1865), limit the

number of species then known to thirty. The number of species credited to Great Britain by LINDLEY was ten, by BAKER (1871), eleven; by HOOKER (1871), seven, with six sub-species; and by BENTHAM in the same year, five "probably real species." DÉSÉGLISE in 1876 makes the whole number of Old World species 410, of which 323 are European (sixty-six in Great Britain), seventy-five Asiatic, and four African, eight being of uncertain habitat. CRÉPIN's revision of the

European species (1869) accords in the main, at least provisionally, as respects the weight and number of species, with DESEGLISE. NYMAN in the *Conspectus Floræ Europæ* (1878) enumerates forty European species, with fifty-two sub-species. REGEL in his *Tentamen* (1878) recognises a total of fifty, six species of which occur in Europe, thirty-four are Asiatic, and five American; several of our species being referred to foreign types, as we have seen. On the other hand, GANDOGER (*Tabule Rhodolice Europæo-Orientalis*, 1881) distributes the Old World forms into twelve genera and 4266 species. A perfect agreement of opinion respecting the Roses of America is therefore not to be expected. In the following revision eighteen species are recognised. . . . In the general grouping I have followed nearly that of CRÉPIN. The species divide naturally into two series, one having the sepals persistent or breaking away at length by an irregular rupture above the base; in the other the sepals deciduous from the receptacle by a clear circumcission at the base. The first divides again into two groups, the one without, and the other with infrastipular spines."

— "STUDIES IN MICROSCOPICAL SCIENCE."—This admirable publication, already briefly noticed, is edited by Mr. ARTHUR COLE. The letterpress is well executed, the coloured lithographs are sufficient for the purpose—particularly as, together with the plate, is issued a microscopical slide. The work is divided into three sections, devoted to animal, botanical, and miscellaneous history respectively, so that students may provide themselves with all or either of the sections, as may suit their convenience. The value of such a publication depends on the excellence of all its parts; one department must be as well done as all the rest, else it is likely to mislead rather than aid the student. Speaking of the botanical section more particularly, we can most heartily commend the work to the notice of our readers. Messrs. BAILLIÈRE, TINDALL & COX are the publishers.

— BANGOR SHOW.—On Thursday and Friday, August 6 and 7, a show will be held of horticultural productions, combined with another of poultry, pigeons, cage-birds, and rabbits. The first show, which was held on September 10, 1884, was of such a character as to augur well for the success of future gatherings.

— SEATS.—In March last Mr. ALEXANDER TURNBULL, of London, presented to the Botanic Garden of Jamaica twelve large and eight small seats, which have been arranged around the central tank. Each seat is labelled with the name of the donor, and with the injunction, "Do not cut an old friend."!

— SALE OF ORCHIDS.—We notice that, at the sale of the plants at Garbrand Hall, Ewell, Surrey, by Messrs. PROTHEROE & MORRIS, the following Orchids were sold:—*Vanda suavis* Veitchi, for £42; *Oncidium ampliatum* majus, £31 11s.; *Cypripedium Stonei*, £84; *Aërides Fieldingi*, £22; *Aërides Lobbi*, £18 18s.; *Dendrobium Farmeri*, £37 16s. Other Orchids and some Azaleas also were sold for good prices.

— READING CHRYSANTHEMUM SOCIETY.—The annual exhibition will be held in the spacious municipal buildings on November 13. So much success attended last year's show that the schedule has been extended, and the prizes in the leading classes increased.

— CULTIVATION AND WHAT IT DOES.—Mr. ELWES has frequently exhibited specimens of Tulips after a few years' cultivation, and contrasted them with the same flower when first introduced. The contrast is remarkable, so much so sometimes that botanists might hesitate to consider them of the same species, and hair-splitters would be amply justified (history apart) in making not one but many new species. On Tuesday last Mr. ELWES showed a form of *Tulipa oculus-solis*, from Merv, and contrasted it with the same plant after cultivation. The fact is, the plant in its native country has to grow as it can, but when introduced to gardens it is protected from adverse influences and fostered, so that it grows out of all knowledge. It is curious to note that while in Tulips the principal effects of cultivation seem to be the increased size and the absence of undulated margin to the leaf, and the

greatly enhanced size and coloration of the flower, in Fritillaries the change seems to be from solitary flowers to racemes of two or three, without much change of size or colour. These matters are of interest, especially in relation to the alleged changes of Daffodils in cultivation.

— WINCHESTER HORTICULTURAL SOCIETY.—The exhibitions of this well conducted Society will be held on July 16 and November 17 and 18, when prizes will be bestowed on the usual liberal scale.

— STIPA.—Among the Russian sheep which find their way to the Paris markets are some whose fleeces are rendered painful to handle by the numbers of spines they contain. These spines are really, according to M. PRILLIEUX, the fruits of a species of Stipa, probably *S. capillata*, a grass whose seeds, or rather fruits, are surmounted by very long twisted awns, which uncoil and coil according to the greater or less humidity of the atmosphere. This hygrometric property, as is known, favours the burying of the seed in the ground, it being forced beneath the soil like a corkscrew, the process being facilitated by the hairs on the fruit, which are directed from below upwards, so that while it is easy for the point of the fruit beneath the screw to pass in a downward direction, it is almost impossible for it to pass in the opposite direction. The same construction causes it to penetrate the fleeces of the sheep, and to injure the hands of the butcher.

— ROOTS AND OXYGEN.—The necessity of a due supply of air (oxygen gas) to roots has long been admitted, both by physiologists and practical cultivators, some of whose tillage operations receive their justification from this very circumstance. It will, however, be novel to many to learn that the direction and curvature of the growing part of the root are influenced by the quantity and nature of the gases with which they come in contact. According to Herr MOLISCH, an abstract of whose paper will be found in the *Annales Agronomiques* for March, the growing parts of the root are directed towards or from the gas (supposing there is more on one side than on the other), the degree of curvature being dependent, not only on the amount of the gas, but on its nature. The depth to which roots penetrate, and the direction in which they go, are thus regulated to some extent by the amount of gas in the soil.

— ABERDARE HORTICULTURAL SOCIETY.—The annual show, combined with a display of cottagers' produce, will be held on August 6 at Aberdare.

— SIUM HELENIANUM.—Of the four known species probably this is the most interesting, from the fact of its being one of the few existent plants indigenous to the historic island of St. Helena. Nor would it appear in this country except by virtue of its property as an economic plant. The green stems have a peculiar but not disagreeable taste, reminding one of Samphire. They are sold in the markets of its native country under the name of Jellico (the name in all probability being merely a corruption of Angelica). Unlike our native species, the stems show a tendency to become shrubby, a character shown in many other representatives of the European flora under similar climatal conditions. The small white flowers are numerous produced in terminal umbels, and although unattractive are agreeably scented.

— SIKKIM RHODODENDRONS.—Mr. C. B. CLARKE, F.R.S., in the course of some remarks on a recent excursion made by him in the Sikkim Himalaya, makes the following remarks on these beautiful shrubs:—"I observed with interest the great variability of the Rhododendrons within a limited area (but with variety of level and aspect) on Sundukphoo. The common species there, *Rhododendron campanulatum*, D. DON, varies from white to mauve and pink, two shrubs close beside each other differing greatly in colour; moreover, the corolla varies in size and shape, some of the trees at lower levels having smaller and wider-mouthed corollas. *R. cinnabarinum*, HOOK. & ARN., is in general rather a dull-coloured species, the brick-red shading off into a tawny-yellow; but there were particular trees of this species, at various levels, on Sundukphoo of extraordinarily brilliant colour, the red having become a scarlet, and the orange entirely disappeared. For gardening purposes I can see that we must look to individuals, not

to species. The cultivators of Rhododendrons must send men to these upper levels to mark particular trees in spring, and the men must come again in autumn and collect the seeds of the marked trees."

— MAGNOLIA CAMPBELLII.—At the last meeting of the Floral Committee some flowers of this Magnolia were exhibited by Mr. CRAWFURD, from his garden near Cork. The flowers as shown but feebly represented the magnificence of the bloom as represented in Sir JOSEPH HOOKER'S *Illustrations of Sikkim Himalayan Plants*, and therefore received no higher award than a Vote of Thanks. The committee is not to be blamed for this, for they could only speak as to what they saw before them. The tree at Mr. CRAWFURD'S is 35 feet in height. Our nurserymen, though they have grown the plant for years and tried it grafted on a variety of stocks, have not yet succeeded in flowering it, but we have little doubt that now that it has made its appearance we shall not be long before we see it in all its beauty. Sir JOSEPH HOOKER in the *Botanical Magazine*, t. 6793, speaks of it as "in every respect (except in having deciduous leaves) the noblest species of the genus," and prior to the destruction of the forests by far the most notable tree of the outer ranges of the Sikkim Himalaya, the flanks of which are still rose-coloured in spring from its habit of flowering before the production of the leaves. It was named in honour of Dr. CAMPBELL, for many years political resident at Darjeeling, and to whom the rise and progress of that magnificent hill station are due. The flowers measure when full grown 10 inches in diameter, and are often of a deep rose colour. Sir JOSEPH HOOKER mentions having seen "four or five such on a branch 1½ foot long, resembling a bunch of Nelumbium flowers, but far more vividly coloured." That such a plant should only receive a Vote of Thanks is, to our thinking, a misfortune; and, although we freely admit the Floral Committee could do no other from the specimen before it, yet the Society, cognisant of the merits of the plant, should have signalled the first appearance of the plant at their meetings by a Botanical Certificate. It has been flowered, we believe, in Italy before it produced its blooms in Ireland.

— PAPER-MAKING IN BURMAH.—The following description of the method of making the black-paper memorandum books used in Burma and Siam will be interesting. A coarse kind of paper is commonly made from the barks of the Malaing (*Broussonetia papyrifera*), the Nyaung-Oyu (*Ficus Rumphii*), and the Ouhne (*Streblus asper*), but the bark of the *Broussonetia* being finer than the other two gives a paper of superior quality. The stalks of the plants are cut up into convenient sizes, and the bark being loosened by beating is taken off in strips and put with about a third of its weight of slaked lime and with a sufficiency of water into a six-gallon cauldron and boiled for twelve hours. The lime is put in to remove all extraneous matter from the fibre and also to break up the stringy nature of the fibre itself. The fibre is then taken out, the lime removed, and the stuff pounded into a pulp. This pulp is next thrown into a wooden frame with a coarse cloth bottom, and is evenly spread out and placed in the sun to dry. It is now a sheet of grey, somewhat limp, and very tough cardboard, about one-sixteenth of an inch thick, and has next to undergo a process of drying before it is ready for use. The charcoal obtained from the branches of the Yezawa and Daugywe (*Cassia tora*) is pounded into powder and finely sifted; this is mixed with a paste made from rice-flour, and rubbed into the paper until it becomes thoroughly black. The dyed paper is then placed while still wet on a smooth board and polished with a pebble. The paper is made up into books, opening both backwards and forwards. The books are employed in many places for memoranda and accounts, and as the writing can be rubbed out with Betel leaves, it will remain in use for many years, being similar, indeed, to the use of slates in Europe.

— GARDENING APPOINTMENTS.—Mr. W. KIDD, Gardener to Dr. PATERSON, Fernfield, Bridge of Allan, has been appointed as Head Gardener to R. B. WHITE, Esq., of Arddarroch, Garelochhead.—Mr. LEACH, late Gardener to E. P. MONCKTON, Esq., Fineshade Abbey, has been appointed Head Gardener to ARTHUR HODGSON, Esq., Clopton, Warwickshire.—Mr. JOHN SNOW, as Gardener to J. BRUCE, Esq., South Park, Wadhurst, Sussex.—Mr. W. JONES, as Head Gardener at Hafodunos, Abergelle, North Wales.

## HOME CORRESPONDENCE.

**The Hairs at the Tips of the Perianth Segments of Narcissus, &c.**—The presence of a tuft of minute white hairs at the tip of each perianth segment in the *Narcissus* is a point of interest, its apparent use being to attach the tips to each other, so as to prevent the flowers opening till ready for insect fertilisation. If this be so, the hairs on the segments of *N. capax*, in which variety neither pistils nor stamens have yet been found, are a good example of the continuance of hereditary peculiarities in plants after such peculiarities are no longer of use. That these tufts have been derived from very remote ancestors is proved by their presence not only in *Amaryllids* but in at least some *Liliaceous* plants (as in the enclosed flowers of *Crown Imperial*). It would be interesting to trace how far these tufts are characteristic of parallel veined plants. *C. M. Owen*. [We suggest that the hairs in question may prevent water from getting to the anthers, or, perhaps, shut out undesirable insects. The perpetuation of the tufts on the flower-segments of *N. capax* is hardly to be called a hereditary transmission, inasmuch as the plant is [multiplied by bulbs, not reproduced by seed. Ed.]

**Floore Notes.**—The alpine garden is now become interesting; vegetation is from three weeks to a month later than last year. Among plants in flower the rare *Polemonium confertum* is conspicuous. This seldom-seen flower is the darkest and dwarfiest of the family; the flower-stems rarely attain a height of 9 inches, the leaves alone being highly ornamental. *Lloydia serotina* is also just opening its flowers; though a British plant, this is one of the most difficult to keep alive in cultivation—much more to flower. It is doing well here. I have not heard of its flowering before under cultivation, but it may have done so. The very curious *Scolopus Bigelowii* has been in fine flower; its quaint form is sure to attract attention. Few appear to know anything about it, but no plant is more worthy of cultivation. The various *Trilliums* are showing very strong, and will soon be in full flower. *Draba Mawana* has been a sheet of bloom, and will be so for some time. *Primulas* of various species and varieties are more floriferous than usual this spring. Although it has not been a severe winter, there are many more blanks left than might be expected. *Aberia*.

**Potato Planting: How Not to Do It.**—I witnessed some Potato planting this week in South Bedfordshire. Potatoes had been grown on the same land for three years in succession. The seed Potatoes were during last autumn placed in old waste sacks on the spot where lifted, and covered with hot stable-dung. Last week the dung was forked off and the old sacks and their contents exposed. The sacks were perfectly rotten, and the shreds covered with mildews and moulds. About one-third of the Potatoes were in the horrible and well known "cream" condition, as brought about by Van Tieghem's *Bacillus Amylobacter*, the starch-destroying *Bacillus*. This precious "cream" (mingled with the juices of the dung) was running in every direction over the tubers. Many of the seed Potatoes had produced long weakly and diseased shoots. The stench round the heaps was sickening. The planting was going on in rain; the men were selecting the "best" specimens for the rows, and placing the over-diseased and too much grown ones in heaps by themselves. The rows were 1 foot apart, and the planted tubers correspondingly close. I asked one of the men what he intended to do with the waste examples. "We shall give them to some old sows," said he; "they're growa too much for Christians" (!). "They won't be up to much," I said, "after they are boiled." "We never biles Teaters for sows," said the man; "they loikes 'em better as

they are—they'll enjoy 'em, they will; some folks buys sows on purpose to eat Teaters like these." *W. G. S.*

**Syringing Plants.**—Applying water to the head of a plant with a syringe is an operation often looked on as so simple that any one with the use of his hands can manage it, which is correct so far as simply discharging the water on to the leaves and branches, in a way to moisten them, with a view to helping growth by making up to the leaves for the drain which the dry air of a hot sunny day has caused them. But in most cases this is not the only reason for syringing plants. Another, and an equally important object, is usually aimed at—to prevent the different kinds of insects to which the plants are subject from getting a footing on them, particularly such as red-spider, thrips, and aphides. It is scarcely possible that any one having much to do with the cultivation of plants should fail to see that the different kinds of insects named each follow their own instinctive course in the way they take up their quarters and operate on the plants they attack. At the same time it cannot fail to have been noticed that each of the insects named, although following the law of Nature that teaches them to shape their course with a view to their security and preservation, yet so far adapt themselves to circumstances that they do not behave alike on all plants, nor the same under all conditions of the plants. The fat aphides, for instance, that feed until they are ready to burst, are not able to move about freely, and generally first begin their operations at the underside of the leaves of the plants they attack, and on some things mostly remain there, whilst on others they congregate principally on the young shoots. Black thrips on most plants keep as much as they can out of harm's way on the undersides of the leaves, whilst on others they attack both sides alike. The little yellow thrips that affects *Allamandas* and *Crotons* keeps principally to the points of the shoots on the underside of the young leaves; red-spider generally begins on the underside of the leaves first, and as they get numerous become bolder, and betake themselves to the top as well. It does not require much observation to enable any one to see that when in syringing the water is let to reach the plants anyhow, or simply allowed to fall on the leaves like the rain they get when in the open air, very little is done to keep the insects named from getting a lodgment. Water is just what they dislike, and, if in place of using the syringe in an any-way sort of manner, care is taken to wet all sides of the plants and leaves alike nine-tenths of the attacks of these troublesome pests will be avoided. These remarks especially apply to plants grown under glass; the time for using the syringe daily to many things in this department is coming on, and if this simple work is done as it should be much after-labour and disappointment will be avoided. The work in question is so simple, and the effects when rightly carried out are so manifest, that it would seem scarcely necessary to allude to it were it not that there is plenty of evidence that in syringing plants little thought is often given to the double object that can so easily be attained. *T. Baines*.

**Magnolia conspicua.**—This *Magnolia* is rightly named *conspicua*, for it is indeed a telling object just now in the gardens, and it is the finest flowering tree of this season of the year. Unfortunately, we in the Thames Valley often get the blooms injured by frost; but the beautiful summer weather of late has brought the tree out grandly, and the perfume exhaled in the evening from the flowers is delicious. Planters would do well in planting this to associate it with some dark foliaged plants, such as dark green *Hollies*, &c., which show it out to perfection. I consider this a variety that contrasts well with *M. purpurea*, which has small purple veins in the flowers, but both ought to be in every pleasure garden where hardy flowering trees are admired. *J. C.*

**Improvement of Vegetables.**—Any one who has had the opportunity of growing or seeing many of the recent introductions or selections of culinary vegetables must confess that there has been a considerable improvement, and likewise must have found that some of the old sterling varieties are either lost or become deteriorated. Where is the old type of *Snow's Broccoli* as grown twenty years ago? I have not seen it for many years; at that time you could have picked it out of all the other sorts by its growth: the same may be said of *Walcheren* and *Penzance*—none of them are

so early as they were at that time. If these have deteriorated we have great improvement in *Veitch's Self-protecting Autumn and Spring White*. *Cattell's Eclipse* was at one time the best late *Broccoli*, but that is now superseded by *Veitch's Model*. Where is the original type of *Pine-apple Short-top Beet*? I have not seen it for some years although it is in many catalogues. *Omega*, which was sent out about four years ago, is an improvement, but I venture to say that *Pragnell's Exhibition*, sent out last year by Messrs. *Veitch*, will supersede them all for quality; it has not the earthy taste which most of the others have. If Mr. *Wilke* will try *Nonpareil Cabbage*, I think he will prefer it to *Enfield Market*; *Ellam's Dwarf* is an excellent early variety, but for a summer Cabbage, and one that is soon ready to cut, perhaps there is none equal to *Little Pixie*. As to *Celery* I believe there is none equal to what was sent out perhaps thirty years ago as *Cole's Solid Red*, and *Major Clarke's Red*; the first-named will never "bolt," will last longer than any other I know without running to seed, it is never pithy or hollow in the leaves: as to its qualities for eating raw, it is surpassed by none. I have tried several varieties but must keep to the old one. As to *Melons*, *Reed's Scarlet-flesh* and *William Tillery* are certainly an advance on *Golden Perfection* and *Beechwood*; but I must confess that I cannot keep them true. There is also an improvement in *Tomatos* in *Hackwood Park Prolific*, sent out last year by Messrs. *Veitch*. As to *Turnips*, we can pull them a month earlier since we have had *Early Munich* and *Extra Early Milan*: and where is there a *Turnip* equal in quality to *Veitch's Red Globe*? As to *Peas*, of course it depends upon the season you require them; the best early I consider is *William I.*; *Laxton's Prolific* is a good second early; *Gladiator* is very good; *Marvel* is extra good, so is *Champion of England*; but *Huntingdonian* is a selection from it, and much better for crop. Those who like a sweet *Pea* will probably prefer the two latter to any [other, otherwise *Ne Plus Ultra* will be preferred by many; it continues to grow very late, is a good cropper—a very fine *Pea* for late season. There is no doubt soil, locality, and methods of cultivation have much to do with the quality of vegetables as of fruit. If we could have the country polled with regard to the favourite varieties no doubt but there would be a great variety of opinion with regard to them. *David Walker, Dunorlan, Tunbridge Wells*.

**Forcing Tree Pæonies.**—That the above is an old practice in England the following facts will demonstrate. In April, 1853, I went under Mr. *Harley*, High Legh Hall, Cheshire, and took charge of the conservatory there, and I have yet a vivid recollection of the magnificent display of *Tree Pæonies* then in bloom. On expressing to Mr. *Harley* my admiration, he wondered they were not more grown, as all the time he had been at High Legh (then about forty years) he had found them most useful. *Persian Lilacs* and *Moss Roses* were also grand, and I found they were all treated alike, and grown in the same sized pots (about 15-inch ones). By the way, why cannot South-country gardeners, when speaking of pots, give the number of inches diameter instead of number so-and-so, which we North-countrymen do not understand? After blooming these were put into a cool-house for a month or so, top-dressed, and then plunged into a trench of ashes like a *Celery* trench in the kitchen garden, and regularly supplied with water during the summer, and were not forced again the next year, Mr. *Harley* having two lots, which he forced alternately. *T. Dobson, Whitburn Hall, Sunderland*.

**The Eucharis Mite.**—I am quite aware that defective drainage was the cause of the mischief to my plants, and that the red rust, or mites—the microscope shows that they are synonymous—was brought on in consequence. Daily experience teaches us, notwithstanding what Mr. *Michael* says to the contrary, that mites, and indeed pests of every description, are more partial to plants in an unhealthy state than to those in robust health, and his murderous *Rhizoglyphus* must be quite exceptional in their taste, should they prefer to attack the healthy. There are, however, only two cases yet mentioned in all the correspondence which has taken place on this subject, in which they have done so, viz., those at *Trentham* and those mentioned by Mr. *Lees* in your last issue. His statement is indeed quite startling, for he says it

is quite common. Surely this announcement requires corroboration. The failures stated by all your other correspondents were distinctly traceable to ill-treatment, either in over-forcing, over-watering, or some other mismanagement. I am happy to state that mine have entirely recovered their former vigour since they were repotted, and show no trace of mites now. I am still of opinion that we may regard mites with equanimity, murderers and all, if we continue to give justice to the plants in our treatment to them. I am bound to say that most of those gentlemen who have recently written on the subject are of the same opinion. It would be most interesting to your readers if Mr. Stevens would favour us with a short account of what state his plants were in as regards drainage, &c., when the *Rhizoglyphus* attacked them. *A. Macdonald, Cheadle, Manchester, April 20.*

**Imported Orchids.**—In your issue for April 11 (p. 483) Mr. Douglas asks for information as to present results of the lately imported white *Lælia anceps*. Mine are as follows:—I purchased large masses on Feb. 13, and immediately broke them up into over fifty plants; thirty of these had natural leads, the remainder are plants formed entirely of back bulbs. All those with leads are now in growth (some eight or nine still retain a leaf, all the others lost them as did Mr. Douglas', they having been almost all bent at the base, which is fatal), some roots are 2 inches long, and eyes have grown out 1 inch and some grew a little over. They look strong and I should judge twelve would bloom (some plants have but three bulbs); the "back bulb" plants have also rooted and pushed eyes out, but about two-thirds (or sixteen) of these still remain dormant, but all are plumped up and healthy, and I only see at present six deaths, four gone, and two going. Treatment was as follows:—All cleaned and washed carefully at once, dipped head over heels in a tub by my own hand, laid on the shingles on shady stage, syringed copiously on a fine day, all crocked up, and still syringed, then as roots began to emerge all were potted up as required: some of the "back bulb" plants are still in the crocks only. My result I consider most satisfactory, and next winter I shall be very pleased to show them to Mr. Douglas if he does not (but I hope he will whenever he likes) see them this summer, as well as all my other Orchids. I am quite convinced that all *Cattleyas* and *Lælias* have had enough drying by the time they arrive in England, and they want "a bath" at once. Some people have been surprised at my bathing them as I do, but they speak for themselves as to whether they like it, and summer or winter I give them all the same treatment at once on reaching home. I also put them into their permanent quarters at once. *De B. Crawshaw.*

**Fruit Prospects in the Eastern Counties.**—The weather has been rather trying for Apricots, but though this is so, they have set well on walls where protection has been afforded, and promise to be a good crop, as they are swelling slowly; but, as usual, there are symptoms of branch dying, the real cause of which has not yet been found out. Many think it is from cold, and as it generally occurs after frost, or in untoward seasons like the present, there would appear to be something in it, and if it originates through chill, little can be done by way of prevention or cure beyond sheltering the trees in the spring. The best protection that can be afforded is a light glass coping, which, in a great measure, prevents the escape of heat from the bricks at night by radiation, and, what is of almost equal importance, keeps the rain off, which, while the blossoms are open and the fruit small and tender, is a great gain, as Apricots will stand much cold when they are dry. The flowers of Peaches look a little weather-beaten, but so far as can be judged at present the injury only extends to the petals, the anthers and stigmas appearing all right, and all that is wanted now is warmth to give an impetus to the embryo fruit, and push it along, but the wind at the time of writing is still in the north, and the temperature low, with a clear sky that betokens more frost. This and the keen air we ward off our Peach wall by having the whole double-netted with fish nets, the meshes of which cross and sift the wind, thus taking the sting out of it, and giving the blooms a chance to set, which I have great hopes of their doing. Plums and Cherries are just opening, and will soon be a sight, as they are crowded with bud, especially the latter, which no doubt arises from the rest they had

last year, as they had little to carry. Pears, everywhere that I have seen them, are in the same satisfactory condition, but their fast-opening buds look brown and discoloured, which, however, only affects the scales, and these they will throw off with the first rains, as the flowers are only waiting a warm shower to open. Apples, like Pears and other fruits, are fortunately late, but full of promise, and bad weather must extend well into May if it harms them, as, unless a great change takes place, they will not be in bloom for three weeks or a month yet to come. *J. Sheppard, April 17.*

**Monstera deliciosa.**—Seeing your note in issue of March 28 on *Monstera deliciosa* in fruit, I may say that two years ago I had five fruits on my plant of *Philodendron pertusum* (which I believe is almost the same thing), and now it is carrying four again. *De B. C.*

**Orchid Fruit.**—We add still another illustration to those already given, with a view of showing the diversity of the seed-vessels of these plants, and of inducing those who have the opportunity of so doing

FIG. 100.—SEED VESSEL OF *CATTELEYA ACLANDIAE*.

to note and record the form of the seed-vessel, which may often be of use for purposes of discrimination, and for completing the history of particular plants. The present illustration (fig. 100) shows the seed-vessel of *Cattleya Aclandiae*, and should be compared with the descriptions and illustrations of those that have been previously given.

**Double Daffodils.**—Mr. Brockbank, on p. 502, *Gardeners' Chronicle*, informs us he has in his garden double *Narcissus* of the varieties *Telamonius*, major, maximus, obvallaris, princeps, and cernuus. I have often heard of the first five, and, as opportunity offered, purchased or begged roots of them, and on all occasions found the five resolved themselves into one, and that *Telamonius plenus*. A double major, maximus, and obvallaris I am certain does not exist. A double form of princeps may yet be found, but the roots sold last year under this name are *N. Telamonius plenus*. I have observed that some one advanced the statement that *N. princeps* is Italian and found growing wild with double *Telamonius*, so that some enterprising amateurs may unearth double princeps; but till now there is, I think, no such plant in our gardens. If Mr. Brockbank still adheres to his statement, and will send roots to the Horticultural Gardens, Chiswick, of his *N. Telamonius plenus*, major *plenus*,

maximus *plenus*, obvallaris *plenus*, and princeps *plenus*, Mr. Barrow, I am sure, will carefully plant them, and those curious in such matters may visit the gardens, and judge between Mr. Brockbank and your correspondent. It is quite true, as Mr. Brockbank advances, that *Pseudo-Narcissus* in England takes a wide range in size, and, I would add, in colour. I have seen them the counterpart of that figured at p. 513, *Gardeners' Chronicle*, as Minnie Warren in size and pure white, and I have seen them nearly 4 inches long. It may, therefore, safely be advanced we have wild in England *Pseudo-Narcissus* in size from 1½ inch to 4 inches in length, and from pure yellow to snow-white. The whites, or albinos, if they may be so called, are not plentiful, but whether these different sizes and colours of the English *Pseudo-Narcissus* are represented by double forms is an unsettled question, and the committee on doubling would, I should say, be greatly assisted in their work if such men as Messrs. Brockbank and Wolley Dod would send their sets of gradation to the gardens at Chiswick. *Argus.*

—Any criticism on my statements on this subject I shall always esteem a favour, though, as I have said, I wait for the result of experiments before taking a farther active part in the controversy. In reply to "A Member of the Daffodil Committee," whose note appears on p. 511, I say that I have known for forty years that Daffodils will not flower unless the germ of a flower is formed the previous year during the decay of the leaves, but I also know from more recent experience that the form and parts of that flower may be much modified by the food the bulb receives during the early period of its growth after the decay of the leaves. I have reason to think that it is then that incipient filaments are converted into petaline or petaloid ligules, and that their number may be increased. In this way I have reason, founded upon experiment, for believing that the difference between a double and a single flower may be effected in one growth—say from July to April. I may here mention incidentally that from remarks made to me at the recent Daffodil show, there seems to be a belief that seven or more perianth segments in a Daffodil flower is an approach to doubling. This is a mistake; the first approach to true doubling always takes place inside the crown at the base of the filaments, which become thickened and twisted. In fact, though the normal filaments are not necessarily suppressed, the additional growth generally has the form of enlarged filaments. *C. Wolley Dod, April 20.*

**Proposed Foresters' and Gardeners' Benevolent Institution for Scotland.**—Mr. Rust and Mr. Grieve writing on the above institution feel inclined to think that there is no use for a Benevolent Institution for Scotland because there is a Benevolent Institution for the benefit of gardeners already existing. I beg to differ from Mr. Rust and Mr. Grieve. It is only two years since an appeal was made to the principal gardeners in Scotland for subscriptions and to become members of the society already existing in England; and if Mr. Grieve will take the trouble of looking over the subscription lists he will find that gardeners in Scotland were not inclined to take any interest in the Institution. But it is gratifying to know that the Institution in England owes some measure of its success to having so many northern members. We are told by Mr. Grieve that the Institution has the patronage of the Queen. Perhaps the proposed Scottish Benevolent Institution, if formed, will be fortunate in getting the patronage of the Queen and that of the Prince of Wales. For my part, I am strongly against joining the Institution in England, while I hope foresters and gardeners in Scotland will put their shoulders to the wheel, and try and get a Benevolent Institution formed in Scotland, and save the Institution in England the trouble and expense of having northern pensioners. *J. M. L.*

**Orchid Pruning.**—With your permission I should like to reply to the remarks of "T. B." on p. 484. I am not a little surprised that he does not accept the terms of my offer to send some plants of *Dendrobium nobile* to South Kensington, but calls it a piece of cool assurance. If anything be "cool," it is the lame attempt he makes to shift the burden of proving his own statements on to my shoulders, instead of proving them himself. It was not I, but he, who had the first word about pruning Orchids. He stated, but did not prove, that pruning was altogether

wrong, and all those who resorted to the practice were little better than acrobats, who delighted to put themselves into all kinds of unnatural contortions. I replied that I was a strong believer in pruning certain kinds of Orchids, and to back my opinion, so to speak, I sent the Editor a spike I had so treated, and which he was good enough to notice. I had previously informed "T. B." why I could not exhibit, and at the same time I said how and upon what terms he could see the plants. And now I am, forsooth, "cool!" Well, let that pass. Now, it so happens that the very spike I sent the Editor is the means of proving very conclusively that "T. B." knows nothing of *D. nobile* pruned or unpruned, for he says, from your remarks concerning it, it is a growth of 1883. Your readers will recollect that I said the specimen I sent you was by no means the finest I could have sent: neither was it. I could then, and can now, cut growths considerably longer, and with a great many more blossoms on them. But I sent that particular growth because it was leafy, and so would prove beyond doubt it was a last year's (1884) growth. No man living ever saw a two-year-old growth of *D. nobile* in bloom with leaves on it, not even "old hands" like "T. B." I wonder what "T. B." would say if he saw a *D. nobile* plant that has been pruned for the last four years, and has at the present moment over three dozen growths, not a few near 3 feet long, containing between 600 and 700 blossoms. Yet I have such a plant. Four years ago this very plant was in a 6-inch pot! This does not say much for "T. B.'s" "weakening" theory. Just a word about what "T. B." calls the lead. Nothing remains on the plant from which I cut your spike excepting two or three growths that were made late in the autumn, and which have not blossomed this year, but will do so next year after they have shed the leaves they have now on them. This year's growths have already started from the stems cut about a fortnight ago. They are quite as healthy as usual. In conclusion, I can only say I have no wish to show my plants for my own aggrandisement. I made my offer to "T. B." in perfect good faith, and on the assumption that he perfectly well knew there are employers who have no wish to have their plants taken about the country, but who simply grow them, or have them grown, for their own gratification and edification. I am still open to accept the terms I mentioned about showing at South Kensington, or I shall have the greatest pleasure in showing any one, who obtains the address from you, sir, the really magnificent plants I have been fortunate enough to grow. *D. N.* [We refer our readers to the description, at p. 538, of the magnificent specimen of pruned *Dendrobium* shown at South Kensington, and which at once puts at rest all question as to facts. As to the expediency of the practice as a general thing—that is quite another matter. *ED.*]

**The Parcel Post.**—There are doubtless many gardeners who have suffered inconvenience, if nothing worse, through the delay of parcels sent by the above. I have at different times despatched small parcels of flowers to be (as I thought) just in time for a particular purpose; but so far I have missed my mark, which is, to say the least, very annoying to both sender and receiver. I now send small parcels which weigh less than 12 oz. by the ordinary letter post, by which the cost is sometimes less, and never above a halfpenny more, whilst the delivery may be depended on, as in the case of letters. For heavier parcels I think the railway is the best, if at a convenient distance, as flowers packed in the morning might be sent almost any distance by evening, whilst by the parcel post they must in most cases have been cut at least the afternoon before, which is a great consideration. *T. T. W.*

**French Marigolds from Cuttings.**—Last summer Mr. J. Downie, of the Beechhill Nurseries, Murrayfield, Edinburgh, wishing to preserve some very fine French Marigolds, put in some cuttings early in September, which rooted, and have made nice plants by the present time. One result is that as soon as the cutting plants attained to anything like size, they commenced throwing flower-buds in the greatest profusion, and these have to be kept picked off in order to enable the plants to grow into anything like size. Perhaps this may be to some extent due to the culture of the plants under glass; something also is due to the fact that they are obtained from cuttings and not from seeds. It is obvious that flowers produced

under glass would lack the size and correctness and brilliancy of marking found in flowers produced in the open air; so some interest will attach to the character of the flowers when the plants bloom in the open air. The practice of growing French Marigolds is an old one, but the fact that it is so seldom followed probably indicates that the results were not satisfactory. Now that single flowers are in the fashion it is not surprising that strains of single French Marigolds are being offered. But it can scarcely be imagined they will ever take the place of the fine double varieties on the exhibition table, and especially in the Midlands and North, where striped double Marigolds are much more grown for exhibition than in the South. *R. Dean.*

**Crassula pyramidalis.**—The flowers of this plant are usually described as inconspicuous, but when accorded favourable conditions as to sunlight and a free circulation of air they are pure white and meritorious enough to deserve the epithet of pretty. They are borne in a dense cluster, terminating a stem that does not exceed 3 or 4 inches at most. Great interest is attached to the plant on account of the densely packed, four-rowed arrangement of the leaves,

FIG. 101.—*CRASSULA PYRAMIDALIS*.

that give it a very characteristic appearance. The whole forms an oblong piece of uniform width throughout, or nearly so, with little approach to pyramidal shape. The leaves are so densely placed one above another, that the stem is completely hidden. It merits a place in collections if merely out of curiosity. Like the rest of its numerous congeners it is a Cape plant, requiring cool treatment. A neat specimen may be seen flowering in the Cape-house at Kew.

### POTTING CAMELLIAS.

If this operation has been delayed, out of consideration for the numbers of unopened flower-buds with which the plants were until recently furnished, and which, had the latter been potted earlier—that is to say before the plants started into growth—would probably have dropped off in consequence of the check which the plants would have experienced, it should not be delayed any longer, as the plants are now beginning to make rapid headway. Experience tells me that the most suitable compost for Camellias to grow in is one consisting of good fibry sandy loam, lime rubble, small charcoal, and Beeson's Manure, in the proportion of one 10-inch potful of the latter ingredient, four of charcoal, half a barrowful of lime rubble, and four barrowloads of loam, the

whole being well incorporated before being used. Over-potting is an evil to be avoided. Plants in bad condition at the roots will require being put in pots smaller than those in which they have been growing, while plants having plenty of roots should have pots 3 or 4 inches larger than those which they previously occupied. Soil sufficient to raise the surface of the ball of earth and roots to within 2 inches of the top of the pot should be put over the sphagnum and made slightly firm, after which the plant should be placed in the pot, and, a little of the compost having been added, the space between the ball and the pot should then be filled with soil sufficiently dry not to stick to the rammers, which should be used to make the soil firm as the work proceeds. When the potting and arranging of them in the house have been completed give sufficient tepid clear water to settle the soil about the roots, after which it will have to be applied sparingly to the roots until the latter have pushed well into the new soil. During bright sunny weather syringe the plants overhead thoroughly in the early morning and in the afternoon at closing time. This should be varied from 3 o'clock in the afternoon to 4 during the next three months, when air should be admitted more freely, and a little left on at night to consolidate the young wood as much as to partially rest the plants. Plants recently potted should be shaded slightly till rooting takes place, when full exposure will do no harm whatever. *H. W. Ward.*

### ORCHIDS FOR AMATEURS.

(Continued from p. 486.)

**MANURES.**—The Count de Buysson recommends a still bolder treatment than that which I spoke of in my last: he speaks of syringing the plants with guano-water, or with a solution of carbonate of ammonia once or twice a week, or even, when in vigorous growth, on alternate days; and the solutions which he recommends are, in my opinion, very strong—so strong that at present I have not ventured to apply them in their full strength. The Count recommends 15 grains of guano to be added to a litre of water; he says the guano should be put into a muslin bag and soaked in rain-water for twenty-four hours. Now, a litre is something less than a quart. I have used the same quantity of guano to half a gallon repeatedly, with, I believe, great advantage. The leaves are syringed with this solution once or twice a week in the case of epiphytes, and I have freely watered *Cypripediums* with the solution with the most distinct advantage. A sickly *Cypripedium* often becomes quite healthy in a few weeks after five or six such applications. The solution of carbonate of ammonia recommended is made of the same strength, and used in the same manner as the guano-water; and here again I am disinclined to try a stronger fluid at present than one containing from 20 to 30 grains to a gallon of water. I believe some of the least floriferous Orchids will become regular flowerers under this treatment, and I hope, at no distant date, some of the readers of the *Gardeners' Chronicle* will give records of great success by the adoption of such simple methods. The use of manures must be confined to such plants as are in active growth, and a free supply of air should be given during the use of both guano-water and ammonia-water so long as any odour of either substance hangs about the house; but with the judicious application of the fluids I have recommended, the smell is very slight, even in the morning after the house has been shut up all night.

I will mention one case in which the effect of guano was absolutely marvellous. I bought a pan of *Cypripedium barbatum*, the leaves of which were very sickly and spotted with rusty-looking spots. In a month, with four applications of the guano, the plants had entirely recovered, and not a spot remained upon them, whilst young shoots were developing vigorously. This is exactly the result which might have been predicted with certainty after reading the observations of the Count upon the subject. It is well known that many species deteriorate under cultivation, such, for example, as *Dendrobium formosum* and *Cattleya citrina*; I am curious to know whether this may not be entirely obviated by the application of guano or ammonia, but at present I cannot speak with any authority on the subject, but I intend to make the experiment and am inclined to predict success.

### REPOTTING PLANTS.

The repotting of Orchids is a very important element in their successful culture, and is not well

understood by novices. I have myself made some very serious mistakes in repotting, but we learn as much by failures as by success, and I wish to warn my readers against falling into an error which is sure to lead to misfortune. The roots of Orchids, like the plants themselves, are at rest during a considerable portion of the year, and they are then very liable to be destroyed by any excess of moisture; indeed, in most Orchids they can hardly be kept too dry. In the autumn, when the plants require rest, the pots should be full of roots, the fuller the better, but beware of increasing the pot-room at this period: the time to repot is when the roots begin to manifest activity in the spring, and even then it is better to have too little than too much room. Sometimes in the autumn the roots are growing freely, and one is sorely tempted to repot the plants; I have done so myself on many occasions, and have always regretted it. After repotting the roots came to rest, and damage was always done to the plants.

I believe the spring is far the best time for repotting, and this should be performed after the roots have had their annual rest, when they recommence growing. Any plant which is not doing well should be repotted at any time, and especially if the compost appears to be clogged and the drainage imperfect; but I believe it is a fatal mistake to give such plants much pot-room. Plants which are doing well should certainly not be disturbed in autumn merely because they appear to want pot-room.

These remarks apply to the epiphyte species. The semiterrestrial kinds, *Cypripediums*, *Calanthes*, and *Pleiones* should be repotted when they start into growth; the *Calanthes*, which shed their leaves, pass into perfect rest after flowering, and where room is of consequence the bulbs may be stored in paper bags during the winter, like those of *Gloxinias*, and they are, I believe, much improved by such treatment. All the compost must be shaken from the old roots, and the ripe bulbs must be kept dry, and at a temperature of from 40° to 45° to ensure perfect rest. A number which I placed on a shelf in my cool house last winter were replanted early in March, and are now growing vigorously. The same treatment is advisable with *Pleiones*.

When Orchids have been top-dressed with sphagnum, unless the moss is growing, I think it well to remove it in winter, and replace it with some fibrous peat, from which every particle of soil has been shaken out; or, at any rate, this should be done in spring, unless some fresh growing sphagnum can be put in the place of that which is dead, for the decaying moss upon the pots is most prejudicial to the health of the plants.

Sphagnum varies very much in its vitality; some grows well, some very badly. I believe that which is taken from a heath, where it has had the full benefit of the sun, grows best where there is plenty of light, and that from a wood where shading is used freely. It is far better to do without sphagnum altogether than to have dead sphagnum about the plants; but for *Vandas*, *Phalenopsis*, *Dendrobiums*, and *Odontoglossums*, I do not think anything is so good as living sphagnum. *Cattleyas* and *Lælias*, on the other hand, appear to do better in good fibrous peat.

Whilst speaking of repotting Orchids, I would say a few words on the different kinds of receptacles in which they may be planted. *B. T. L.*

(To be continued.)

## Law Notes.

**IMPORTANT ACTION BY A FLORIST.**—At the Chard County Court, the other day, Mr. F. W. Laxton (Deputy Judge) was engaged in hearing actions between Mr. Edgar Jarman, seedsman, of Chard, and Mr. John Chisholm, florist, and for some time salesman in Jarman's employ. Chisholm sued Jarman for the sum of £32, being £6 arrears of salary due, and £26, being thirteen weeks' salary, which he claimed in lieu of a quarter's notice and wrongful dismissal. Mr. Jarman brought an action against Chisholm to recover possession of a house. From the evidence adduced it appeared that Jarman advertised for a salesman, and Chisholm and his wife (on the understanding that the situation was a permanent one) broke up their home in London and undertook the Chard business; but after about twelve months had elapsed Jarman reduced the salary 10s. per week, and ultimately gave the manager a month's notice to leave his employ, which led to the

present actions. The case devolved on the question as to whether there was an agreement between the parties to give and take three months' notice on either side to terminate the engagement. Ifis Honour decided that there was a verbal agreement between them, and gave judgment for Chisholm in the sum of £16 10s., with costs on the higher scale; he, however, ordered the latter to give up possession of the house in fourteen days. The case was one of great interest, and the Court was crowded. *A Correspondent, Chard.*

## Reports of Societies.

### ROYAL HORTICULTURAL and AURICULA: April 21.

This gathering, held in the conservatory, was the last of a series in which the Narcissi have played a prominent part. On this occasion the flowers looked in greater beauty than ever, but their demand on the public recognition was divided with the Auriculas, and other members of the genus *Primula*, which were displayed in considerable numbers.

#### Scientific Committee.

Sir J. D. Hooker in the chair. Present: Messrs. Elwes, Smece, Pascoe, Bennett, Lynch, Murray, Ridley, Houston; Professor Foster, Dr. Masters, Rev. G. Henslow.

#### TULIPS AND FRITILLARIAS.

Mr. Elwes exhibited the following species and varieties:—A magnificent form of *T. oculus-solis*, brought by Mr. Donovan from Merv. It has the habit common to Asiatic species of opening out flat in the sun like a plate, though Mr. Pascoe observed that it will also do so at Montpellier, though it is not usual with South European Tulips; *Fritillaria tenella*, showing the influence of cultivation, one specimen being double the height of the wild form; *F. obliqua*, which appeared to be a long-cultivated form of *F. tristis*, with the peculiarly twisted leaves; *F. græca* remains of a dwarf size; this, as well as *F. lycica*, become many-flowered, instead of remaining two-flowered, under cultivation. Mr. Elwes remarked how wild Tulips under cultivation lose the wavy margins to the leaves, while the flowered become much enlarged, &c. *Fritillaria delphinensis* appeared to be a seedling of *F. latifolia*, produced by bulbs from North Italy. He also exhibited *Narcissus calathinus* from the islet of Glénan off the Brittany coast. *Erythronium propallans*, and the lovely blue *Teophylax cyanocrocus* from Chili, and which is nearly if not quite hardy.

#### IRISES, &c.

Professor M. Foster exhibited several species of Iris as so-called *I. agrostifolia*, but the narrowest leaf was not so narrow as that of *angustifolia*. It seemed intermediate between *I. unguicularis* and *I. cretensis*, partaking more of the latter; *I. Milesii*, from the Himalayas, intermediate between *I. tectorum* and *I. fimbriata*; *I. æquiloba*, a form of *pumila*, but with nearly cylindrical ovary, that of typical *pumila* being trigonal. Another form of *pumila* remarkable for its beard was the smallest of the bearded Irises, and another form very strongly scented like the Tonga Bean, *Fritillaria amœna*, really *F. Sibthorpiana* (Boiss.).

#### HELLEBORES: HYBRIDS.

Dr. Foster read the following communication from the Rev. Mr. Ellacombe:—"In 1877 I received from Berlin a collection of hybrid Hellebores under the following names:—1, hybridus; 2, 3, albido-virescens; 4, reticulatus; 5, caucasicus purpurascens; 6, C. porphyromelas; 7, C. pallidus; 8, C. p. albus; 9, punctatus hybridus; 10, P. purpurascens. For three or four years these were all fairly distinct, but now the result is this—3 has entirely lost its mixed character and bears two distinct flowers, a large white and a pale pink; 1 has also gone into two colours, apparently guttatus and Olympicus; 5 is almost Colchicus; 4 is in two colours, a dull pink and a greenish white; 6 and 9 have become almost identical; 2 is a buff one, and apparently constant; 5 is also constant and a fine plant; 7 is constant; 10 has two very distinct colours, a good white and a very deep dull plum. These colours are not mixed in the flowers, but the plants bear the two distinctly, as much as if they were distinct plants placed close together, but they are not distinct plants, but are borne on one root. The change from the hybrid characters to the colours of the parents has been gradual."

#### HYDROCHARIS MORSUS-RANÆ: PROPAGATIVE BUDS.

Mr. Houston exhibited buds having two kinds of

leaves; the lower, curved downward, hanging down, appeared to have the use of balancing the plant so as to keep it erect.

#### IMPATIENS EPISCOPI.

Mr. Lynch exhibited some fine plants of this new species grown at the Botanic Garden, Cambridge, from the Usagara Mountains of Central Africa, 4000 feet elevation. He had succeeded in raising a hybrid between it and *I. Sultanii*, but it bore no pollen; but from the evidence of the fruit, apparently set and swelling, it will prove fertile with both parents.

#### MAGNOLIA CAMPELLI.

Mr. W. Crawford, of Lakelands, near Cork, sent blossoms gathered from a tree 35 feet high. It flowered for the first time three years ago, and has forty flowers this year.

#### WISTARIA SINENSIS, PODS OF.

Mr. Noble sent a fruiting peduncle bearing three pods near the end, but which had failed to ripen any seed; they were from a seedling plant brought by Mr. Fortune from China, and is the only one which bears pods, but never ripens any seed. Mr. Noble remarks that the old plants derived from cuttings do not appear capable of forming pods. The Rev. G. Henslow remarked on this circumstance that the formation of pods without seeds was probably due to the inefficient action of the pollen. As Max Wichura has shown in the case of hybrids, "The ovaries may swell and ripen, but not contain a trace of seed" (*Journ. Hort. Soc.*, vol. i., n.s., p. 63). Mr. Meahan in a paper in *Linn. Journ.*, vol. xvii., p. 90, stated that the fact the seedling standard Wistarias as a rule only have pods with ripe seeds at Philadelphia, the trained plants rarely fruiting unless they sent up a shoot free into the air and unsupported, just as Ivy flowers and fruits, only under the same conditions. Subjoined is his account of the plants as grown by him:—

"I have seventy-nine plants of *Wistaria sinensis*, standing about 3 feet from each other in one straight row. These plants were themselves seedlings, and therefore not subject to objections which might be made if they had been all raised by layers from one original plant. They were trained to stakes a few feet high until the stems were strong enough alone to sustain their heads. In this condition they are called standard or tree Wistarias, just as Roses budded on stems a few feet high are known as standard or tree Roses. These make no attempt at vigorous growth when compelled to sustain themselves, but they flower profusely every year, and always produce more or less seed. The interesting fact in connection with this seedling is that only the flowers towards the termination of the raceme are fertile, and the fact may be thus formulated—as the growth force in the rachis weakens the probability of fruit is increased.

"In order to present this fact clearly I have had thirty old flower-stalks counted, and find they bore on an average sixty-five flowers to a raceme. I have had 250 stems bearing one seed-vessel examined, and the number of flowers which fell before the seed-vessel was produced counted. The average of these is forty-eight, showing that in this number of cases more than two-thirds of the whole number of flowers on a raceme fall before one seed-vessel is produced. Of the seventy-nine plants a great number of the racemes produce no seed, and of those which do one pod is mostly all. But forty-four racemes produced two seed-vessels. These seed-vessels were some distance apart on each rachis; but the average distance has been taken, and then the average of the whole forty-four, and this shows that with this more favoured condition of nutrition only the forty-fifth flower bore seed. Seven out of the whole number on the seventy-nine trees bore three seed-vessels. In like manner these have been averaged, and the result gives 43.50 as the number of the flower successful in its seed-bearing object. There can be no question about the correctness of the position that it requires more nutrition to perfect three capsules than one. We might reasonably look for their appearance in what we should regard as the most vigorous portion of the raceme and the point best able to bear them, but we see that the average position of the three on the rachis is less in proportion to their numerical order than the two, and the two to that of the single seed-vessel, and that in all of the three classes the earliest two-thirds of the flowers fall, leaving the weakest portion of the rachis to bear the seed.

"All this has relation to nutrition. As regards pollinisation some remarkable experiences were obtained. In none of the early flowers of the raceme could we find a trace of pollen, though the anther-cells seemed perfect; but after about the half of the flowers had fallen some succeeding were found with a small quantity of pollen, and it would be of course from such as these that the seed-vessels came.

"So far it might appear that the whole question resolved itself into one of pollinisation. But alongside of these seventy-nine tree Wistarias is one very strong one of the snow-white variety. This had hundreds of racemes thereon, and every flower examined had a profusion of perfect pollen. But there is not a single seed-vessel on this plant. The branches of a tree of the common blue form freely interlace, and have the same but no greater degree of fertility than the trees elsewhere. The barrenness of the white would be remarkable, in view of the general rule that albinos have less vigour than their more dusky parents; and this vegetative vigour ought to weigh in favour of fertility in this case. But

the white Wistaria is an exception. It is more vigorous than the blue variety. Ten of the flower stems taken at random show an average length of 9 inches, while ten of the blue show but 6 inches. Ten racemes also give sixty-seven as the average number of flowers, while sixty-five is the average of the blue.

"From these facts I think there can be no doubt—

"First, that the Wistaria, when it grows vigorously, though it may produce an abundance of flowers, is unfertile.

"Secondly, that it is more fertile in proportion to the weakness of its vegetative force, even though that force should be inadequate to a large supply of pollen.

"Thirdly, that mere temperature can have little influence on these conditions, as when the branches of two varieties interlace, under the same conditions as regards temperature, one is barren.

"Fourthly, that the lack of pollen in itself can have little to do with fertility, as the flowers of the pollen-bearing white, as freely visited by bees as the blue variety is, gave no greater fertility to the interlacing branches of the blue than to the trees many yards away."

#### Floral Committee.

Present:—John Fraser, Esq., in the chair; and Messrs. J. O'Brien, J. Dominy, H. M. Pullett, H. Williams, H. Ballantyne, S. Hibberd, C. Noble, H. Herbst, J. Walker, W. Bealby, J. Hudson, H. Bennett, W. Kellock, Dr. Masters, Rev. W. Wilks, A. Perry, W. Turner, J. Douglas.

Messrs. Barr & Son staged one of the best lots of Narcissi, consisting of most of the known kinds and several newer and lesser known hybrids, a Silver Banksian Medal being awarded for the group. Mr. Thomas Ware, Hale Farm, Tottenham, had a very choice collection of Narcissi, Scillas, Fritillarias, Primula Sieboldi in variety, P. obconica maxima, the charming Muscari alba, Anemone stellata fulgens, and Trillium grandiflorum, pure white; a pretty panful of Veronica repens, the growth not more than 1½ inch in height. A Silver-gilt Banksian Medal was awarded.

Messrs. Paul & Son, the "Old" Nurseries, Cheshunt, showed a collection of alpine and herbaceous plants, amongst them being Anemone Robinsoniana, pale blue; Androsace Chamæjasme, Omphalodes Luciliae, the minute Saxifraga valdensis, white, dense flowered; and S. carophylla, similar, but with a stronger habit, and rather larger blooms; Fritillaria meleagris Themistocles, a flower of a white ground with small green dots; and a Continental variety of Aubrietia purpurea, darker by far than the usual form, deserved special notice. A Silver Banksian Medal was awarded for this interesting collection.

#### MISCELLANEOUS EXHIBITS.

Messrs. Hugh Low & Co., Clapton, exhibited a beautifully flowered specimen of Dendrobium anosmum Dayanum, the petals and sepals pale purple—the lip being of crimson-purple far into the interior of the throat, with an edge of same colour as the petals. Calceyia gigas, Trontino variety, with sepals and petals of rosy-purple, and throat and lip same colour, the edge of the latter being much crimped. A Vote of Thanks was awarded. Sir T. Lawrence, Bart., had a large plant of Maxillaria Turneri, profusely bloomed. The flowers, which are white and yellow, with a tube barred interiorly with purple on a white ground, are disappointing as to the effect produced, although very numerous. A Cultural Commendation was awarded. Messrs. J. Veitch & Sons had two semi-double Ghent Azaleas, rosy-pink and pale pink changing to one still lighter, named respectively Louise Amée Van Houtte and Mina Van Houtte. A Vote of Thanks was accorded. Mr. W. Bull showed a tall Crinum giganteum concinnum, white-flowered and drooping, showing merely the outside of the flower; Liliun elegans guttatum, a dwarf much spotted border variety. Mr. Ballantine, gr., The Dell, Egham, showed a plant in bloom of Phalenopsis Marie. Mr. R. J. Lynch, the Botanic Gardens, Cambridge, had Impatiens Episcopi, a species (?) from Eastern Africa, rose-coloured, and precisely similar in habit to I. Sultan. Messrs. W. Cutbush & Sons, Highgate Nursery, sent a large collection of the varieties of Epacris, Boronia serrulata (now but rarely seen), B. tetrandra, Choisya ternata, and the tiny-flowered Acacia Juniperiana, apparently a good bloomer; Laurustinus, Statice, and Anopterus glandulosus—a plant having upright shoots, terminated with spikes of pure white bell-shaped blooms. A Silver Banksian Medal was awarded for the group. Sidney Cortauld, Esq., Bockley Place, Braintree, exhibited an Odontoglossum Wilckeanum, good in colour; and O. mulus Cortauldianum, that possessed, as shown, but little merit. A Vote of Thanks was awarded. Mr. Charles Turner, Slough, showed some neat well-bloomed show Pelargoniums, measuring generally a yard across; and some small specimens of Azalea indica, well known kinds. A Silver-gilt Banksian Medal was awarded for the group. Messrs. James Carter & Co. exhibited sixty Cinerarias, well-bloomed, in 32-sized pots; the quality of the majority was very superior, the flowers being large, regular, smooth, and the colours all that could be desired. A Bronze Medal was awarded.

The show of Pansies from Mr. F. Hooper's nursery at Widcombe Hill, Bath, proved that the ability to grow these flowers to perfection has descended from the former to the present proprietor in no lessened degree. Mr. J. James, Woodside, Farnham Royal, showed a box of Cineraria blooms, and was awarded a Vote of Thanks. W. Crawford, Esq., Lakelands, Cork, showed blooms of the early-flowering Magnolia Campbelli, gathered, it was stated, from a tree 35 feet high, and which flowered for the first time in 1882, it having this year forty blooms.

Mr. Crawford was awarded a Vote of Thanks. H. J. Elwes, Esq., Preston Hall, Cirencester, showed Tulipa oculus-solis mervisensis, imported from Turkestan.

#### FIRST-CLASS CERTIFICATES AWARDED.

To Mr. Ballantine, for Phalenopsis Marie.

To Mr. H. J. Elwes, for Tulipa oculus-solis mervisensis.

#### Fruit Committee.

Present: Harry Veitch, Esq., in the chair; Messrs. J. Lee, J. Ellam, A. Howcroft, J. Burnett, W. Denning, A. Sutton, Harrison Weir, G. T. Miles, J. Woodbridge, G. Paul, T. F. Rivers, G. Bunyard, T. B. Heywood, G. Goldsmith.

Fruit was shown by Mr. James Dean, Limpsfield, Surrey, he having twenty-five dishes of well preserved Apples, amongst them, especially plump and fresh looking, being Northern Spy, Sturmer, Wellington, Yorkshire Greening, Winter Queening, Gloria Mundi, and Alfriston.

#### The National Auricula Society, Southern Section.

This exhibition took place as usual in the conservatory, and the exhibitors made a charming representation of the several representatives of the genus Primula, but not to the extent seen in previous years. Biting east winds, cloudy weather, and cold nights, followed by three or four days of brilliant sunshine and a hot atmosphere by day had, no doubt, told upon the flowers, and a good deal of roughness was observed in consequence. Not a few of the flowers were undersized also, as another consequence of trying atmospheric influences. But all who did show appeared to have done their very best, and "The best can do no more."

#### SHOW AURICULAS: COLLECTION OF FIFTY PLANTS.

Probably on no previous occasion were only two of these shown, as on Tuesday last, and their absence did affect the bulk of the exhibition. Mr. J. Douglas, gr. to F. Whitbourn, Esq., Great Gearies, Ilford, was well ahead with a very good lot, including the following:—Green-edges: Verdure (Douglas), Admiral Napier, Talisman, Lancashire Hero (shown generally on this occasion in its green character), and Lovely Ann; grey-edges: George Lightbody, Ajax (Horner), Confidence (Campbell), General Graham (Douglas), Mrs. Moore (Douglas), Lady Sophia Dumaresque, and Mabel (Douglas); white-edges: Glory, Smiling Beauty, Acme, Conservative, Sylvia, and Dr. Kidd; selfs: C. J. Perry, Blackbird, Ellen Lancaster, Duke of Albany (Douglas), Lord of Lorne, and Ad Sapphire (Horner). 2d, Mr. C. Turner, Royal Nursery, Slough, with green-edges Lancashire Hero, F. Knighton (Turner), and Dr. Horner; grey-edges: Mrs. W. Crown, Col. Chamneys, and Stapleford Hero; white-edges: Conservative, Acme, Beauty, Sylvia, Glory, and John Waterson; selfs: Topsy, Lord of Lorne, Mrs. Sturrock, Eliza, Clipper, Vulcan, Topsy, Mennon, and Miss Barney.

In the class for twelve varieties, the Rev. F. D. Horner, Lowfields, Burton-in-Lonsdale, Carnforth, was decidedly 1st with a fine lot of flowers, mainly of his own raising, consisting of—Green-edges: Monarch (Horner), The Rev. F. D. Horner (Simonite), and Greenfinch (Horner); grey-edges: Greyhound (Horner), a superb variety, coming as near to perfection as one can imagine an Auricula to be, having a splendid truss of a dozen or so of large, flat, finely formed pips full of life and expression, golden tube, thick paste, rich black ground well defined; altogether extra fine—this variety was selected as the Premier Auricula in the exhibition; Thetis (Horner), and George Lightbody; white-edges: Reliance (Horner), and Nigella (Horner); selfs: Heroine (Horner), Lynette (Horner), Mrs. Horner (Horner), of a fine magenta-purple, and Sapphire (Horner). 2d, Mr. J. Douglas, with green-edges Prince of Greens, Rev. F. D. Horner, Lancashire Hero, and George Lightbody (Douglas), having a good tube and fine solid pip; grey-edge Mrs. Moore; white-edges: Sylvia, Conservative, and Acme; and selfs Sappho, Pizarro, Duke of Albany, and Perfection (Douglas), shaded plum, good tube and solid pip. 3d, Mr. H. Pohlman, Parkinson Lane, Halifax, whose best flowers were Prince of Greens, Lancashire Hero, George Lightbody, Acme, John Simonite (white), Sapphire, Ellen Lancaster, and Brucette (Pohlman), a dark self. 4th, Mr. C. Turner.

In the class for six varieties the Rev. F. D. Horner was again 1st, with green-edges Monarch and the Rev. F. D. Horner; grey-edges George Lightbody, White Albattross (Horner); selfs Heroine (Horner) and Florence (Horner), a very pretty magenta-violet flower of good quality. These, like the varieties in the larger class, were well finished specimens. 2d, Mr. J. Douglas, with green-edges Prince of Greens and the Rev. F. D. Horner; grey-edge George Lightbody, white-edge Conservative; selfs Duke of Albany and a seedling deep puce-crimson variety; 3d, Mr. E. Pohlman, with Prince of Greens, Lancashire Hero, and Anna, George Lightbody, Sapphire, and Ellen Lancaster; 4th, Mr. R. Deao, Ranelagh Road, Ealing; 5th, Mr. C. Turner; 6th, H. A. Rolt, Esq., Hartfield Road, New Wimbledon.

In the class for four varieties Mr. W. Bolton, Wilderspool Road, Warrington, was 1st, with excellent specimens, staging well grown and flowered plants of Prince of Greens, Lancashire Hero, Frank Simonite, and Mrs. Wilson, a violet coloured self in the way of C. J. Perry; 2d, Mr. T. E. Henwood, Hamilton Road, Reading, with Prince of Greens, Dr. Horner, Beauty, and Gipsy

(Mellor), a dark self; 3d, W. Brockbank, Esq., Brockhurst, Didsbury, with Colonel Taylor, George Lightbody, Acme, and Negro (Mellor), also a useful dark self; 4th, Mr. C. Phillips, Hamilton Road, Reading; 5th, the Rev. E. L. Fellowes, Wimpole Rectory, Royston.

In the class for two varieties Mr. T. Henwood was 1st, with Acme and Mrs. Heap (Mellor), a deep blue self; 2d, J. Galsworthy, Esq., Conbe Warren (Mr. C. Orchard, gr.), who had George Lightbody and C. J. Perry; 3d, the Rev. E. L. Fellowes, with Alderman C. E. Brown (Grey) and Pizarro; 4th, Mr. W. Bolton; 5th, W. Brockbank, Esq.

In the classes for single specimens, the very proper rule that one exhibitor may not exhibit more than two plants in each class, reduced the number of specimens shown in each, but it broke down the monopoly the larger growers have hitherto enjoyed in this group of classes. The best single specimen green was Monarch, shown by the Rev. F. D. Horner; and he was 2d also, with Conquest, one of his own raising; 3d, Mr. C. Turner, with Justus Corderoy, a bright green-edge, but with a weak paste and pale tube; 4th, Mr. E. Pohlman, with Prince of Greens; 5th, Mr. W. Bolton, with the same. A seedling, and Lancashire Hero received the three remaining prizes. The best grey-edge was William Brockbank (Mellor), a fine bright-looking variety, described farther on; 2d, the same, with Lancashire Hero; 3d, Mr. Henwood, with Richard Headley; and 4th, with George Lightbody; 5th, Mr. Phillips, with the same; the Rev. F. D. Horner was 6th, with Alexander Meiklejohn; 7th and 8th with Lancashire Hero. The Rev. F. D. Horner was 1st and 2d in the white-edged class, having Miranda (Horner), very fine; and Magpie (Horner), also in admirable condition. Then followed Mr. Pohlman, with Acme; Mr. Henwood, with Frank Simonite; Mr. Douglas, with Acme and Conservative; and Mr. Brockbank, with Acme and John Simonite. In the self class, the Rev. F. D. Horner was 1st and 2d, with Heroine, very fine; then came Mr. Pohlman, with Mr. Douglas, and Negro; Mr. Henwood, with Othello and Pizarro; Brilliant and Pizarro bringing up the rear. It is always very difficult to compile a correct list of awards in these single classes, and it would be as well if a rule were made requiring that the name of the exhibitor be placed on each pot. This would obviate a good deal of unnecessary confusion.

#### ALPINE AURICULAS.

These, as is usual, attracted a great deal of attention from exhibitors; their brilliant colours appeared to suit the popular taste. Mr. Turner was in strong force, his own seedlings being very fine and striking. He had the best twelve, having of gold centres, Viscount, Sunrise, Placidia, Troubadour, J. J. Colman, and Duncan; cream and white centres, Philip Frost, Mabel, Mr. McGeorge, Selina, Mrs. Kingston, and Edith. 2d, Mr. J. Douglas, with gold centres, Unique, Princess of Waldeck, Hebe, Amelia Hardwidge, and Mr. Douglas; cream and white centres, George Lightbody, Slough Rival, and Lady Howard de Walden; seedlings making up the number. With six varieties Mr. C. Turner was also 1st, having gold centres Pallas and Unique; cream and white centres, Edith, Tennyson, Mrs. Lamb, and Placidia; 2d, Mr. Douglas, with Princess of Waldeck, Diadem, Ada Hardwidge, Sensation, and a seedling; 3d, Mr. R. Dean, with Sensation, Phoenix, Colonel Scott, George Lightbody, and Jessie Dean, a pretty gold-centred laced variety; 4th, Mr. A. Spurling, The Nest, Blackheath; 5th, the Rev. E. L. Fellowes.

In the class for single specimens, the best gold centre was Rosalind (Turner), from Mr. Turner; 2d, Ladybird, from Mr. J. Douglas; 3d, Lucretia, from Mr. Turner; 4th, Minstrel, from Mr. J. Douglas; 5th, Diadem, from the Rev. E. L. Fellowes. Mr. Turner was 1st and 2d in the class for white centres, having Philip Frost and Chastity; 3d, Mr. Douglas with Ada Hardwidge, and 4th with Diadem; 5th, the Rev. E. L. Fellowes, with George Lightbody and Beatrice.

#### FANCY AND LACED AURICULAS.

Mr. J. Douglas was 1st in this class with twelve plants, having golden-edged varieties, but characterised by much sameness of character; 2d, Mr. R. Dean, with nearly all laced varieties, a new double, named Violaeca, being shown in the collection.

#### SEEDLING AURICULAS.

Two money prizes were offered for seedlings in the classes for green, grey, and white edges, and selfs. In that for green-edges the Rev. F. Horner was 1st, with Redwing (Horner), good tube and excellent paste; rich black ground colour and smooth edge of deep green; fine pip and truss. 2d, Mr. R. Dean, with Criterion (Dean), good tube and paste, rich black body colour, and edge of deep green; not fully expanded but highly promising. The judges expressed a wish to see this again. The best grey-edge was William Brockbank (Mellor), rich golden tube, dense paste, broad deep black ground and excellent edge of grey; a fine bright and effective variety, but a little rough in the pip as shown, which was in all probability only an accidental defect. This was also awarded a First-class Certificate of Merit. The Rev. F. D. Horner was 2d, with Hyperion (Horner), an effective and pleasing variety, likely to prove very useful; good tube and paste, and rich black ground. No seedling white-edged varieties appeared to be forthcoming, or at least good enough for awards.

In the class for selfs Mr. W. Bolton was placed 1st, with Mary Grainger (Bolton), a rich deep plum-coloured variety, very smooth, and of good substance; good tube, but thin in the paste; should this come of a denser character with cultivation it will form a perfect self. 2d, Mr. W. Brockbank, with Bluebell (Mellor), a pleasing

blue-purple self, good tube and paste, very pretty and distinct.

#### SEEDLING ALPINES.

Here Mr. Turner carried all before him, having a large group of fine seedlings. The best golden centre was Rosalind, having a deep golden centre and maroon ground, broadly edged with rusty-salmon; 2d, Lobelia, much in the same way, yet quite distinct. The best white centre was Albion, dark ground, edged with pale mauve; 2d, Marion, dark, edged with bright mauve.

#### POLYANTHUSES: GOLD-LACED.

These were well shown, good plants, and well bloomed. Mr. J. Douglas had the best six, staging capital examples of John Bright, Prince Regent, Laocer, Formosa, Elliott's Red Ground, and George IV.; 2d, Mr. W. Brockbank, with George IV., Exile, Cheshire Favourite, Prince Regent, Lord Derby, black ground; and Blackbird, also a dark variety; 3d, Mr. R. Dean, with Exile, Saderson's Beauty, Prince Regent, Cheshire Favourite, John Bright, and George IV. The best three came from Mr. Brockbank, who had Exile, President, and Cheshire Favourite; 2d, Mr. J. Douglas, with Elliott's Red Ground, Prince Regent, and George IV.; 3d, Mr. R. Dean, with William IV., Prince Regent, and George IV. In the class for single specimens the Rev. F. D. Horner was 1st and 2d with Cheshire Favourite, and Mr. Brockbank 3d with the same; then followed in the order of merit, Cheshire Favourite again, Prince Regent, and George IV.

#### SEEDLINGS: GOLD-LACED.

In the class for a red ground variety the 1st prize and a First-class Certificate of Merit was awarded to Red Rover, rich red ground, finely laced, shown by Mr. Douglas.

#### FANCY POLYANTHUSES AND PRIMROSES.

Mr. R. Dean, Ealing, was 1st, with twelve plants of fancy Polyanthuses, and also 1st with the same number of Primroses; and while the former were very good, the latter were especially so—large plants, crowded with bloom; 2d, Mr. J. Douglas, in both classes; Mr. F. Hooper, of Bath, being 3d with Primroses. The class for twelve Primroses brought but two collections. Mr. J. Douglas was 1st with three varieties of P. Sieboldi, P. Nelsoni, P. rosea, P. marginata, P. obconica, P. nivea, and P. intermedia; 2d, Messrs. Paul & Son, nurserymen, Cheshunt, with a choice lot, comprising the pretty blue P. glutinosa, P. Obistri, P. ciliata purpurea, P. pulcherrima, P. pubescens, P. nivea, &c.

#### ROYAL BOTANIC: April 22.

The second show held by this Society this year took place on Wednesday last, in the corridor and part of the large conservatory in their gardens, and was the means of bringing together an excellent display. Numerous exhibits were decidedly above the average, and although the entries were not large, the show must be considered a success. Messrs. Paul & Son, The "Old" Nurseries, Cheshunt, had between forty and fifty standard and dwarf pot Roses arranged at the west end of the conservatory. People who have seen Paul & Son's Roses will understand what an imposing spectacle this group presented when told that the quality of the exhibit was equal to the usual specimens shown by them. In this group Marie van Houtte, Merveille de Lyon, Maréchal Niel, Madame Marie Verdier, Madame de Montchateau, Madame Margottin, Leon Renault, Duke of Connaught, Madame Falcot, &c., were exceptionally fine. They were awarded a Large Silver Medal. Mr. H. James, Farnham Royal, Slough, had a group of his famous Cinerarias, which were of fine form and substance, and very dwarf. Mr. T. S. Ware, Tottenham, London, had a large stand of choice cut blooms of Narcissus, &c., for which he received a Large Bronze Medal. A group of Cinerarias from Messrs. Carter & Co., Holborn, with large heads of bloom, bright coloured but rather small flowers, also was awarded a Large Bronze Medal. Messrs. Barr & Son, Covent Garden, had a choice collection of Narcissus, which contained large quantities of the favourite types, also five new ones of exceptional merit, viz.:—Mrs. Langtry, very fine, almost like a Eucharis; Katherine Spurrell, fine pure white perianth with yellow cup; M.M. de Graaff, fine rounded white perianth with a wide cup; Flora McDonald, like the latter, but with more pointed perianth segments; Sulphureus Beauty, fine form of the loocomparable type, with faint white bar down the centre of each segment of the perianth. A Large Bronze Medal was awarded for the group. Messrs. J. Veitch & Son, Chelsea, also received a Large Bronze Medal for a splendid collection of Narcissus, &c. Messrs. Collins Bros. & Gabriel were awarded a Bronze Medal for a similar collection. Messrs. Paul & Son, Cheshunt, were awarded a Large Bronze Medal, and Messrs. J. Carter & Co. a Bronze Medal, for collections of alpine. Mr. J. Douglas, Great Gearies, Ilford, and Mr. C. Turner, Slough, had each a choice collection of Auriculas, for which they were respectively awarded Large Bronze Medals. Mr. W. Bull, Chelsea, had a few rare plants, including fine pans of Hæmantaen Kalbreyeri maximus, Vriesia Janieirensis variegata, Sarcocolla Toliana, Clivia princeps, Alocasia Sanderiana (a fine thing), Tillandsia principis, Pinguicula caudata, &c. Messrs. Todman & Son, Upper Tooting, showed Azaleas British Queen, fine double white; Edith Todman, semi-double, deep rose. Messrs. Cutbush & Son, Highgate, were awarded a Large Bronze Medal for a nice collection of plants, consisting of Epacris, Ericas, Azaleas, Acacias, Boronias, &c., Azalea Phœbus, semi-double rose, very fine. Messrs. J. Veitch & Son exhibited

some fine Amaryllis, amongst them Prince George of Wales, vivid crimson, with distinct white eye, was very fine. The same firm also showed double Ghent Azaleas Louise Aimée Van Houtte and Mina Van Houtte. Three baskets and two stands of superb cut Roses shown by Mr. J. Walker, Thame, Oxon, were awarded a Small Silver Medal.

For six greenhouse Azaleas, nurserymen, Mr. C. Turner, Slough, was 1st, with well flowered examples, as seen the day previously at Kensington; Mr. H. James, Lower Norwood, was 2d, with good examples of Duc de Nassau, Concinna, La Victorie, Duplex, Maculata, Roi de Hollande, and Apollon; Messrs. T. Todman & Sons were 3d. Six ditto, amateurs.—1st, Mr. G. Wheeler, gr. to Lady Louisa Goldsmith, St. John's Lodge, Regent's Park, with Duchesse de Nassau, Criterio, Stella, Magnificans. Mr. H. Eason, gr. to B. Nokes, Esq., Hope Cottage, Highgate; and R. Butler, gr. to H. Gibbs, Esq., St. Dunstan's, Regent's Park, were placed equal 3d. Twelve Rhododendrons.—Messrs. H. Lane & Son, Berkhamstead, were 1st—Queen of the West, Mrs. R. Sturgiss, Nero, Snowflake, Marchioness of Downshire, Verschaffeltii, Cynthia, Rowena, Fastuosum flore-pleno, W. E. Gladstone, Lord John Russell, Etendard de Flandres, and Bodaertianum. The same firm were 1st for twelve hardy Azaleas. For twelve alpine Auriculas Mr. C. Turner and Mr. J. Douglas were respectively 1st and 2d. For twelve prize Auriculas the positions were reversed, with Mr. E. Pohlman, Parkinson House, Halifax, 3d.

For twelve hardy herbaceous plants Messrs. Paul & Son, Cheshunt, were 1st, with a fine collection. For nine Cinerarias Mr. J. James was 1st; 2d, Mr. J. Douglas; 3d, J. Carter & Co.; all with good stuff, but Mr. James' strain decidedly superior to the others. For twelve stove and greenhouse plants Mr. H. James was 1st, with good specimens of Epacris miniata splendens, Azaleas Hercules, Apollon, and Jean Vervaine, Ericas Victoria and Marnockiana, Eriostemon pulchellum, Gardenia intermedia, Anthurium Andreanum and Scherzerianum, Franciscea confertifolia; 2d, Mr. G. Wheeler, with good Azaleas Duchesse de Nassau and Fieldingii, Adenandra fragrans, Anthuriums, &c.; 3d, Mr. R. Butler. Mr. Perry, gr. to G. Rowlett, Esq., The Woodlands, Cheshunt, was 1st for six forced Roses, amateurs, with good examples of Ferdinand de Lesseps, Alba rosea, Étoile de Lyon, Madame Victor Verdier, John Hopper, Magna Charta, Duke of Teck, and Caroline Kuster. For nine forced Roses, Messrs. Paul & Sons, Cheshunt, were 1st, with magnificent plants of Innocenta Pirola, Madame Clemence Joigneaux, Duke of Edinburgh, Céline Forestier, Madame Lacharme, Beauty of Waltham, Caroline Kuster, La France, and Madame de St. Joseph. Mr. J. Douglas was 1st for twelve Amaryllis, all good. Fairlop Oak received a Floral Certificate, being the best—a very vivid crimson, of great substance and fine form. Mr. C. Turner, Slough, was 1st for nine Pelargoniums. Messrs. B. S. Williams exhibited some good Amaryllis, among which A. magnæfolia, very vivid crimson, pure white star, and Mr. Walford, something similar, but the stars, more flaked, were the most remarkable.

Botanical Certificates were awarded to Mr. W. Bull, Chelsea, for Alocasia Sanderiana and Vriesia Janieirensis variegata; and to Messrs. J. Carter & Co., for Saxifraga Vandellii.

Floral Certificates were awarded to Messrs Collins Bros. & Gabriel, for Narcissus spurius coronatus; to Mr. J. James, for Cineraria Countess, Amy Robsart, and The Bride; to Mr. W. Nicoll, Lower Merton, Surrey, for Azalea Princess of Wales; to Mr. C. Turner, for alpine Auricula Chastity, and Rosalind and Sunrise show Auriculas; to Messrs. J. Veitch & Son, for Amaryllis Prince George of Wales; to Messrs. Barr & Son, for Narcissus MM. de Graaf.

#### NEWCASTLE SPRING FLOWER SHOW:

April 15 and 16.

The spring show of the Durham, Northumberland, and Newcastle Botanical and Horticultural Society, which was held in the Town Hall and Corn Exchange, Newcastle, was an entire success. On its merits as a floral exhibition it will favourably compare with any of the Society's previous spring shows; and when it is remembered how cold and backward has been the season this year this fact acquires greater significance. The exhibits were numerically in excess of those of last spring; they were drawn from a wider field of competition, some of them having been sent from London, and others from Scotland, and in variety and beauty it is difficult to imagine how they could have been excelled. As has been the case with the Society's exhibitions for some years, the strongest department was that of plants in bloom, of which there was a magnificent display, including two fine collections sent by Messrs. Smith & Co., Worcester, and Messrs. Fell & Co., Hexham, respectively, which, though not for competition, enhanced considerably the general effect of the exhibition. Auriculas, Cinerarias, Dielytras, and Tulips were all strongly represented. Of Roses there was a somewhat small but very fine collection. Hyacinths, with their wealth of colour and delightful odour, are ever a popular exhibit, and they were on this occasion deserving of every commendation. A feature of curiosity was the exhibition of a few hothouse Strawberries, sent by a local gentleman. The arrangement of the exhibits was much the same as in former years, except that the plants in bloom were placed in the centre of the Corn Exchange, on the ground formerly occupied by the Hyacinths, which were ranged along the west side of the building—an alteration which improved the general effect of the display. The Secretary (Mr. Gillespie) and committee of the Society

were indefatigable in their management, and left nothing to be desired in the general arrangements of the show.

In the open classes the 1st prize for four dissimilar plants was awarded to Mr. F. C. Ford, who likewise was 1st for four Azalea indica. For six Dielytra spectabilis, Mr. McIntyre was 1st. For six Deutzias Mr. W. R. Armstrong was 1st. Mr. J. Wood securing the 1st prize for three Genistas. Mr. Noble was 1st for six Spiræas, Mr. J. Blackwood was 1st for six Cinerarias, Mr. J. Short was 1st for six Primula sinensis; Mr. D. Thompson for six Cyclamen. Mr. W. J. Watson won the 1st prize for his splendidly grown Lily of the Valley, and Mr. W. L. Thompson took honours for table decorations. The winners in the Auricula classes were Mr. W. H. White for twelve, Mr. Alfred Holms for six, and Mr. W. L. Thompson for four plants—in these classes alpine varieties being excluded. The best prizes in the Hyacinth competition were bestowed on Mr. W. J. Watson for twenty-four pots and twelve pots, for nine pots of Tulips, and likewise for six pots of Polyanthus Narcissus. Mr. F. C. Ford was 1st for twelve Camellia blooms and for twelve Rhododendron blooms. Mr. J. Short was awarded the 1st prize for twelve bunches of Azalea blooms in not less than six varieties, and Mr. Wright for twelve Rose blooms.

In the open class, from which nurserymen were excluded, Mr. J. McIntyre was placed 1st, for two Azalea indica; Mr. A. Methven, for an Acacia; Mr. McIntyre, for three Dielytra spectabilis. The prizes for twelve Hyacinths, six ditto, and six pots of single Tulips, were won by Mr. J. Wood, Mr. W. Sanderson, and Mr. J. Wood respectively.

Amateur exhibits were numerous and generally of much merit.

## The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON

LONDON: Atmospheric Pressure.—During the week ending April 18, the reading of the barometer at the level of the sea increased from 29.73 inches at the beginning of the week to 29.79 inches by 9 A.M., decreased to 29.78 inches by 5 P.M. on the 12th, increased to 29.94 inches by 9 A.M. on the 13th, decreased to 29.89 inches by 5 P.M. on the same day, increased to 29.92 inches by 9 A.M. on the 14th, decreased to 29.75 inches by 9 A.M. on the 16th, increased to 30.17 inches by 9 A.M., decreased to 30.14 inches by 1 P.M. on the 18th, and was 30.16 inches by the end of the week.

The mean reading of the barometer for the week was 29.91 inches, being 0.36 inch higher than last week, and 0.01 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 65° 3, on the 18th; the highest on the 16th was 51°. The mean of the seven high day temperatures was 56° 2.

The lowest temperature was 35°, on the 14th; on the 16th the lowest temperature was 40°. The mean of the seven low night temperatures was 37° 2.

The greatest range of temperature in one day was 29° 3, on the 18th; the smallest was 11°, on the 16th. The mean of the seven daily ranges was 19°.

The mean temperatures were—on the 12th, 44° 6;

on the 13th, 43°; on the 14th, 42°·5; on the 15th, 43°·6; on the 16th, 44°·7; on the 17th, 48°·6; on the 18th, 49°·8; and these were all below their averages (excepting the 17th, which was 1°·8 above) by 1°·3, 3°·1, 3°·8, 2°·9, 1°·9, and 2°·8 respectively.

The mean temperature of the week was 45°·3, being 3°·8 higher than last week, and 2° below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 130°·5, on the 18th. The mean of the seven readings was 110°·8.

The lowest reading of a minimum thermometer placed on grass was 28°·7 on the 13th. The mean of the seven readings was 31°·6.

*Rain.*—Rain fell to the amount of 1·18 inch during the week, of which 1·15 inch fell on the 16th, and 0·03 inch on the 17th.

**ENGLAND: Temperature.**—During the week ending April 18, the highest temperatures were 66°·7, at Cambridge, 65°·6 at Brighton, 65°·3 at Blackheath; the highest at Newcastle was 54°, at Truro 57°, and at Plymouth 58°. The general mean was 61°·2.

The lowest temperatures were 28°, at Cambridge, 30° at Truro, 31°·5 at Sheffield; the lowest at Plymouth was 37°, at Brighton 35°·4, at Bristol and Blackheath 35°. The general mean was 33°·2.

The greatest ranges were 38°·7 at Cambridge, 30°·3 at Blackheath, 30°·2 at Brighton; the smallest ranges were 19° at Newcastle, 21° at Plymouth, 26° at Sunderland. The general mean was 28°.

The mean of the seven high day temperatures was highest at Blackheath, 56°·2, at Brighton 55°·9, at Cambridge 55°·1; and was lowest at Bradford and Newcastle, 46°·8, at Sunderland 48°·1. The general mean was 50°·8.

The mean of the seven low night temperatures was highest at Plymouth, 39°·8, at Brighton 38°·9, at Liverpool 38°·1; and was lowest at Wolverhampton, 33°·8, at Hull 34°, at Cambridge 34°·3. The general mean was 36°·6.

The mean daily range was greatest at Cambridge, 20°·8, at Blackheath 19°, at Truro 17°·9; and was least at Newcastle, 9°·5, at Nottingham and Sunderland 11°. The general mean was 14°·2.

The mean temperature was highest at Brighton 45°·9, at Blackheath 45°·3, at Plymouth 44°·2; and was lowest at Wolverhampton, 39°·6, at Bradford 39°·7, at Hull 40°·2. The general mean was 42°·2.

*Rain.*—The largest falls were 1·18 inch at Blackheath, 0·61 inch at Wolverhampton, 0·54 inch at Nottingham; the smallest fall was 0·01 inch at Sunderland, 0·06 inch at Newcastle, 0·09 inch at Bolton and Hull. The general mean fall was 0·31 inch.

**SCOTLAND: Temperature.**—During the week ending April 18, the highest temperature was 63°, at Leith; at Greenock the highest temperature was 57°. The general mean was 60°·8.

The lowest temperature in the week was 29°, at Perth; at Greenock the lowest temperature was 34°·2. The general mean was 31°·4.

The mean temperature was highest at Paisley, 45°·3; and lowest at Perth, 41°·4. The general mean was 42°·9.

*Rain.*—The largest fall was 0·10 inch, at Dundee; the smallest fall was 0·01 inch, at Edinburgh. No rain fell at Glasgow, Greenock, Leith, Paisley, Perth. The general mean fall was 0·02 inch.

JAMES GLAISHER, F.R.S.

## Answers to Correspondents.

**BULBS:** *A Member of the Daffodil Committee.* The foundation is laid, and the general arrangement concluded, but not to such a degree as necessarily to prevent modification in point of detail according to circumstances as growth goes on. You will see that we are in accord in all essentials.

**CINERARIA WONDER OF THE WEEK:** *Lucombe & Pince.* Very good blooms, equalling anything seen at metropolitan shows, so far as size, form, and colour go. Why pack in that injurious cotton-wool?

**DEFORMED GARDENIA BLOOMS:** *X.* We cannot say for certain; it is sometimes the result of a surfeit of rich stimulating manures, and consequent poor assimilation, and is not often seen under rational treatment.

**DOUBLE ALLAMANDA:** *E. P.* We do not remember to have seen a double Allamanda before. Your flower is a very curious hose-in-hose sort of production, with a second complete corolla inside the first, the lobes of the second being placed exactly in front of those of the first, not alternate with them.

**DOUBLE SPATHED CALLA:** *Woolton Wood.* By no means rare.

**HYACINTHS:** *W. P. & Sons.* The presence of three flowers on one stalk, as in your specimen, is very unusual and interesting. We will examine and report.

**NAMES OF PLANTS:** *C. B. M.* *Odontoglossum Alexandrie*; a fine form of it. — *W. H. D.* 1, *Primula elatior* (true); 2, *Anemone hortensis*; 3, a *Valeriana* (specimen insufficient); 4, *Anemone ranunculoides*; 5, *Dondia epipactis*; 6, *Narcissus incomparabilis*, var. "Butter and eggs." — *W. E.* Only a form of the wild Daffodil showing a tendency towards the "major" form. It is not sufficiently distinct to have a separate name, though fat catalogue makers might be of another opinion. — *K. S. L.* *Narcissus incomparabilis*, var. "Butter and eggs;" 2, one of the forms of *N. major*; 3, *N. Telamonius plenus*; 4, one of the forms of *N. tazetta*; 5, *N. cernuus*. — *W. & G. B. N.* *cernuus*. — *W. M. B.* *Senecio Ghiesbreghtii*, so far as we can tell from the leaf alone. — *R. P. F.* 1, *Cephalotaxus drupacea*, male; 2, *Cephalotaxus pedunculata*, also male. You will find the history of these plants in *Gardeners' Chronicle*, Jan. 26, 1884; 3, *Retinospora decussata* of gardens. It is apparently an infantile form of some Juniper. — *W. & G. B.* *Narcissus Pseudo-Narcissus*, variety *cernuus*. — *J. W.* *Phalenopsis Ludemanniana*.

**ORCHIDS:** *D. B. C.* 6, Withered and crushed beyond recognition; 470, *Laelia*—curious. We will examine and report; 132, a good form of *O. crispum*.

**PERIODICALS, AMERICAN AND FRENCH:** *Fruit. Gardeners' Monthly*, edited by Thomas Meehan; *Revue Horticole*, edited by MM. E. A. Carrière and Ed. André.

**PHOTINIA SERRULATA:** *W. E.* Many thanks. We shall figure your specimen, but we do not think it is quite so rarely seen in flower as you imagine. In any case it is not common. The young leaves are very beautiful.

**ROSES:** *Rash Behary Roy.* The Roses you mention may be obtained from Mr. Henry Bennett, Rose grower, Shepperton, Middlesex.

**STEPHANOTIS:** *C. B.* Fasciation. We have not seen this before in this plant, but probably it would occur on any. It is a sign of over-rapid, vigorous and disproportionate growth.

**WORMS ON LAWN:** *E. H.* Water with clear decanted lime-water in the evening, and sweep up the worms in the early morning. To make the grass grow use finely-sifted loam and wood ashes, two-thirds of first to one-third of last named; or, failing the ashes, use the loam alone, or mixed with guano in the proportion of one part guano to twenty of loam.

**WHITE CINERARIA:** *W. Tyte.* A good variety, its large number of substantial petals being greatly in its favour, and well set off with a neat violet eye.

## CATALOGUES RECEIVED.

**JAMES COCKER & SONS, Aberdeen**—Florists' Flowers. **BRUNAT, Boulevard Saint Cyrien, à Poitiers, Vienne, France**—General Catalogue of Flowering Plants. **RICHARD SMITH & CO., Worcester**—Rose List.

**COMMUNICATIONS RECEIVED**—*J. Lamont, J. Snow, W. H. R. D., A. B. Prowse, W. M., J. B., J. S., J. S., Hortus, C. V. Riley, G. F. W., Leopold Shulham, J. F. A. O., H. W. W., E. Bonavia, H. E., J. W., Harrow, J. M., W. Swan, W. H. D., N. Blanford, W. T. T. D., J. H. Bedford, Miss Owen, H. Nettelfield, W. E., Cassell & Co., J. T. B., M. Henry, Baroda, Dr. King, Calcutta.*

## Markets.

COVENT GARDEN, April 23.

TRADE more brisk, with a better demand for forced goods. Several samples of new Grapes from the Channel Islands to hand, making fair value. *James Webber, Wholesale Apple Market.*

## SEEDS.

LONDON: April 22.—The attendance of buyers on to-day's market was thin, and the business doing was of small extent. Sowing orders for Clover and other field seeds still come to hand, but the wholesale consumptive trade for this season is now, of course, drawing to a close. Some speculative enquiry, however, for holding over has been springing up, as present rates all round are temptingly low. Rape seed is rather dearer. There is no change in Mustard. For Canary and Hemp seed the sale is slow. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

## CORN.

At Mark Lane on Monday hopes of peace getting stronger the grain trade got weaker, and prices were even worse than on Friday. For the week English and foreign Wheat may be quoted 2s. to 3s. lower. Towards the finish to-day the tone grew steadier. Flour was 6d. to 1s. per sack lower. Malt Barley upheld late value, but grinding sorts were 6d. to 1s. lower. Beans and Peas were not altered in value, arrivals being very light. Oats were 6d. cheaper, with very dull sale. Maize off stands was 6d. lower; round corn in some cases 1s. lower. —On Wednesday, owing to the explanations in Parliament on the previous night there was a very unsettled feeling in the grain trade; higher prices were asked all round, but the result at the close was considered disappointing. A sale of two of English Wheat had been made at 1s. above Monday's rates, and also in foreign at a partial advance of 6d. to 1s. Flour ruled very quiet. Barley showed a partial advance of 3d. on grinding descriptions. Beans and Peas remained unaltered; Oats showed a partial improvement of 3d. per quarter; and Maize was held dearer. —Average prices of corn for the week ending April 18: —Wheat, 34s. 1d.; Barley, 31s. 3d.; Oats, 20s. 11d. For the corresponding period last year: —Wheat, 37s. 3d.; Barley, 30s. 10d.; Oats, 19s. 5d.

## HAY.

Tuesday's Whitechapel market report states that trade was very dull with larger supplies. The market had a drooping tendency. Quotations: —Clover, prime, 83s. to 110s.; prime second cut, 85s. to 110s.; inferior, 46s. to 75s.; hay, prime, 76s. to 102s. 6d.; inferior, 25s. to 60s.; and straw, 22s. to 35s. per load. —On Thursday the moderate supply on sale met with a fair demand at Tuesday's rates. —Cumberland Market quotations: —Clover, best, 90s. to 105s.; inferior, 60s. to 84s.; hay, best, 84s. to 95s.; inferior, 45s. to 75s.; and straw, 30s. to 34s. per load.

## COALS.

The following are the prices current at market during the week: —Beeside West Hartley, 14s. 9d.; East Wylam, 15s. 6d.; Ravensworth West Hartley, 14s. 9d.; Walls End—Tyne (unscreened), 11s. 3d.; Hetton, 18s.; Hetton Lyons, 16s. 6d.; Lambton, 17s. 6d.; Wear, 16s. 6d.; Tunstall, 16s. 6d.; Binchester, 16s. 6d.; Tees, 18s.

**Government Stock.**—Consols closed on Monday at 95½ to 96½, and on Tuesday at 95½ to 95½ for both delivery and the account. Wednesday's prices were 95 to 95½ for both transactions. Thursday's closing figures were 95½ to 95½ for both delivery and the account.

## PAXTON'S STRAWBERRY CRINOLINE.

Extensively used for Growing Strawberries to preserve them from Slugs, Contact with the Soil, Superfluous Moisture, and other Nuisances, dispensing with the usual litter. See testimonials.

And Surrey Works, Blackfriars Road, London, S.E.  
Horticultural Engineers to Her Majesty the Queen,  
CALL SPECIAL ATTENTION TO THEIR

PATENT  
WROUGHT-IRON TUBULAR  
HOT-WATER BOILERS,

And others with SHELVEs, and Hollow or Ordinary Cast-iron  
GRATE BARS;

SADDLE BOILERS,

With WATERWAY BACKS, and WELDED BOILERS,  
which are Specially adapted for Heating Greenhouses, Conserva-  
tories, Churches, Chapels, Schools, Public Buildings, Entrance  
Halls, Warehouses, Workshops, &c.

They are the neatest, cheapest, most effective, and durable  
of any extant.

The Tubular ones are remarkable for their great heating  
power, slow combustion, and the length of time the fire will  
burn without requiring attention. This pattern

Had the First and Highest Prize, a Silver Medal,  
Awarded to it at the Royal Horticultural Society's Exhibition,  
South Kensington, London, on June 3, 1881.

THE JOURNAL OF HORTICULTURE OF JUNE 9 SAYS:—

"HEATING APPARATUS.—A great number of boilers, valves,  
&c., were exhibited by eight competitors, and considerable in-  
terest was manifested in the verdict of the judges, and much  
discussion was brought to bear on the merits and shortcomings  
of the different boilers. The apparatus for which the Silver  
Medal was awarded was a wrought-iron saddle boiler, with a  
series of intersecting tubes, somewhat in the form of a letter X,  
but the tubes in ogee form, in the crown of the boiler. Most  
gardeners who examined the boiler expressed a favourable  
opinion of it. It is no doubt a quick and powerful boiler with-  
out being complex, the latter condition having, no doubt, had  
weight with the judges."

The *Garden* of June 11 says:—

"The premier prize, a Silver Medal, was taken by Messrs.  
Green & Son for their new patent tubular saddle boiler. It is a  
modification of their original patent, the boiler being longer and  
not so high. It is found to be a powerful and efficient boiler, and  
heats a large quantity of water quickly with a small consumption  
of fuel."

BUY ONLY ENGLISH THREE-QUARTER PLATE  
WATCHES.

BENSON'S NEW PATENT (No. 4658)  
"LUDGATE" WATCH,

SILVER,

£5 5s.

GOLD,

£12 12s.

Is a "Special Strength" Silver English Lever, my best  
London make, with Three-Quarter Plate Movement.  
Jewelled throughout.

Chronometer balance, with damp and dust-proof  
Patent ring-band, and extended barrel, in  
flexible sterling silver dome cases  
With crystal glass front.

Winds, set hands and opens at back.

The superiority in value, accuracy, and durability of the  
"Ludgate" Watch over the Swiss and American Keyless and  
Non-Keyless Watches, made in imitation of and sold as  
English work, and the ordinary Full-plate English Watch is  
enormous. The "Ludgate" Watch is compact, strong, hand-  
some, and durable. Being Three-Quarter Plate, it is superior  
in value and appearance to any £10 Watch sold, and, being  
compensated, it keeps perfect time; fitted with crystal front, it  
combines the strength of the Hunter, and convenience of the  
open face. Of my best London make, it will last a lifetime,  
stand rough usage of all and every kind without damage, and  
being made in three sizes, it is for the above reasons suited for  
Home, Indian, and Colonial use by

Gardeners, Workmen, and Gentlemen.

The "Ludgate" Watch is far superior  
To any Watch at the price yet made, and  
Will be sent free and safe at our risk  
To all parts of the world for £5 5s.,  
Cash or P.O.O.; or in hunting cases, £6 6s.  
Price in 18-carat gold, crystal glass cases,  
Twelve Guineas

SPECIAL NOTE that J. W. BENSON is the only Maker  
of a Three-Quarter Plate English Watch for £5 5s. in Silver,  
or £12 12s. in Gold, and that our Patent "Ludgate" Watch  
cannot be had through or of any Watchmaker in the King-  
dom. Any infringement of the Patent Rights will be  
proceeded against. A BOOK explaining the advantages of  
this Watch over the Full-plate English Watches sold by all  
other makers, will be sent Post-free on application to

J. W. BENSON

Watchmaker to Her Majesty the Queen, The Steam Factory,

Oil Paint no Longer Necessary.

**HILL AND SMITH'S BLACK VARNISH,**  
 for Preserving Ironwork, Wood, or Stone.  
 (Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

### UNSOLICITED TESTIMONIAL.

"Piercefield Park, June 21, 1876.—Sirs.—I have this day forwarded from Chep-tow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Piercefield Park, Chepstow.—I am, Sirs, yours respectfully, Wm. Cox."

**CAUTION.**—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large illustrated CATALOGUE of Fencing Hurdles, Field and Entrance Gates, &c., sent free on application to

## RANSOMES' LAWN MOWERS.

**THE "WORLD" LAWN MOWERS**  
are the best for cutting long grass, and are constructed on the American system with the special advantages of English materials and workmanship.

They are made in nine sizes, 8 to 24 inches.

Prices from 45s. to £10.

**THE "REVERSIBLE" LAWN MOWERS**  
are suitable for small gardens and borders. They roll the grass as well as cut it, and can be used either side upwards.

They are made in three sizes, 6 to 10 inches.

Prices from 27s. to 45s.

**THE "AUTOMATON" LAWN MOWERS**  
are the best machines for general purposes and gardeners' use. They leave no ribs in the grass but produce a perfect surface. They are made in eight sizes, 8 to 22 inches.

Prices from 55s. to £8 10s.

**THE HORSE-POWER MOWERS**  
are the best for Large Lawns, Cricket and Lawn Tennis Clubs. They are used on the Cricket Grounds of the Oxford and Edinburgh Universities and numerous Colleges and Public Schools. They are made in six sizes, 26 to 48 inches.

Prices from £14 10s. to £32.

Complete Price *LISTS* may be obtained from any respectable Ironmonger, or

**WANTED, a HANDY-MAN, for Packing,** Making-up Bouquets, &c., for Market.—W. MILES, West Brighton Nurseries, Hove, Sussex.

## WANT PLACES.

**POSTAL ORDERS.**—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

## Journymen and Foremen, Scotch.

**JOHN DOWNIE, SEEDSMAN, 144, Princes Street, Edinburgh,** has at present on his Books a number of first-rate Young Men who wish to go to England.—Particulars on application.

**RICHARD SMITH AND CO.** beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

**To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS.**

**JAMES CARTER AND CO.** have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter.—Enquiries should be made to 237 and 238, High Holborn, W.C.

**TO LANDED PROPRIETORS, &c.**—A. MCINTYRE (late of Victoria Park) is now at liberty to undertake Formation and Planting of New Garden and Park Grounds, and Remodelling existing Gardens. Plans prepared. 115, Listra Park, Stamford Hill, N.

**GARDENER (HEAD).**—Age 30, single; thorough knowledge of Gardening in all branches. Four years' good character from present employer.—E. VINE, The Gardes, Manor House, Sevenoaks.

**GARDENER (HEAD).**—Understands Early and Late Forcing of Flowers, Fruits and Vegetables. Fourteen years' character from late employer.—L. L'ANSON, Foxley, Hereford.

**GARDENER (HEAD).**—Age 37, married; thoroughly practical. Over twenty years' experience. First-class references.—HORTUS, 4, Norman Villas, Elm Road, Kingston-on-Thames.

**GARDENER (HEAD), with one or two under him;** married, no children.—The Countess of ASHBURNHAM highly recommends a Man as above.—J. MAXTON, The Pound, Ashburnham, Sussex.

**GARDENER (HEAD), to any Lady or Gentleman** to go abroad.—Single; can have good testimonials from last employer.—S. S., 28, Brooker Street, West Brighton, Sussex.

**GARDENER (HEAD).**—Mr. P. C. HARDWICKE wishes to highly recommend his late Head Gardener, who lived fifteen years at Hollenden, Tonbridge, to any one requiring a thoroughly practical man.—P. C. HARDWICKE, Esq., 2, Hereford Gardens, Park Lane, W.

**GARDENER (HEAD).**—Age 26; ten years' experience in good places. Has lived nearly three years as Foreman in present place. Good personal character. House preferred.—A., 6, Goodyear Place, Addington Square, Camberwell, London, S.

**GARDENER (HEAD).**—Age 27; thoroughly experienced with Orchids, Flower and Fruit Forcing, and General Routine of Gardening. Well recommended.—H. PAYNE, 1, North's Terrace, Blackhorse Lane, Walthamstow, Essex.

**GARDENER (HEAD).**—The advertiser begs to offer his services to any Lady, Nobleman, or Gentleman, requiring a man as above. Has had sound practical experience in all branches of Gardening. Particularly good references as to character and abilities.—FOREMAN, The Gardens, Wadhurst Park, Sussex.

**GARDENER (HEAD);** age 37, married, one child (age 5).—Mr. TILLYARD, Gardener to the Earl of Yarborough, Brocklesby Park, Ulceby, Lincolnshire, can with the utmost confidence recommend a thoroughly practical man, a high-class Fruit Grower, &c., and one fully competent to manage a large place. In last situation eight years as Head Gardener. Highest references from present employer.

**GARDENER (HEAD), to any Lady, Nobleman, or Gentleman** requiring the services of a thoroughly efficient Gardener. Has had the entire Management of a Large Place, which he has conducted in a satisfactory manner for fifteen years, now leaving through the place being let. Character will bear the strictest investigation.—W. WASLEY, Radburne Hall, Derby.

**GARDENER (HEAD).**—A. F. SKINNER is open for an engagement to any Lady, Nobleman, or Gentleman requiring a skilful Gardener. He has acquired practical experience in some of the first gardens in England, viz., at Sir J. Kenesway, Bart., M.P., Bloxholme Hall, and with his present employer, C. F. H. Bolckow, Esq., for the last six years as General Foreman.—For practical information apply to the HEAD GARDENER, Marston Hall, Middlesbrough.

**GARDENER (HEAD WORKING).**—Age 40, married, three in family (youngest five years); twenty years' practical experience. Understands Stock.—CLARKE, late Mr. Cazenove's, Clapham Common, Surrey, S.W.

**GARDENER (HEAD WORKING), where** more are kept.—Understands Gardening in all branches; also knowledge of Land or Stock. Wife good Dairy and Poultry Woman, or small Laundry if required.—G. DAWES, Feltham, Middlesex.

**GARDENER (HEAD WORKING), where two** others are kept.—Age 30, married, one child. Three years' good character. Understands the Management of Land if required.—GARDENER, Cross Oak, Great Berkhamsted, Herts.

**GARDENER (HEAD WORKING);** age 30, single, Scotch.—E. M. BROWELL, Esq., highly recommends the Advertiser as a practical trustworthy man in all branches of the profession. Two years' highest reference.—J. CAMPBELL, Feltham, Middlesex.

**GARDENER (HEAD WORKING).**—Age 29, single until suited; thoroughly experienced in all branches of Gardening. Ten years' good character from present situation.—E. FORD, S. Morley, Esq., M.P., Hall Place, Tonbridge, Kent.

**GARDENER (HEAD WORKING);** single (sister lives with Advertiser)—J. J. LITCHFIELD, Gardener to Lord Charles Russell, Woburn, Beds, seeks a re-engagement; thoroughly practical. Abstainer. Highest recommendation.

**GARDENER (HEAD WORKING).**—Married, no family; thoroughly understands the forcing of Flowers, Fruits, and Vegetables, also Flower and Kitchen Gardens and Grounds. Wife as Cook or Dairywoman. Four years' good character from present situation, sixteen years' previous.—PETER STODDART, Hall Street, Long Milford, Suffolk.

**GARDENER (HEAD WORKING).**—Mr. BALLARD can highly recommend to any Nobleman or Gentleman a Gardener thoroughly experienced in Early and Late Forcing of Fruit, Cut Flowers, Stove and Greenhouse Plants, Flower and Kitchen Garden, Land and Stock.—A. C., 23, Salisbury Road, Upper Holloway, London, N.

**GARDENER (HEAD WORKING).**—Age 41, married, no family; practical experience in growing Fruit and Flowers under Glass, Kitchen and Flower Garden. Abstainer. Fourteen months' present, five and a half, seven, and nine years' previous situations.—E. CAUSH, The Lodge, Penanroz, Croydon.

**GARDENER (HEAD WORKING, or good SINGLE-HANDED).**—Married, one child; thoroughly understands the profession in all branches, particularly Grapes, Melons, Cucumbers, Mushrooms, and Landscaping. Two years' good character.—G. L., 4, Carlton Terrace, Lower Tooting, S.W.

#### To Nurserymen and Gardeners.

**GARDENER (HEAD WORKING or otherwise).**—Age 31, married, one child.—4s Bonus will be given to any one securing the advertiser a situation as above. Sixteen years' good practical experience in all branches. Good reference.—F. W., Mr. Lawrence, Newsagent, 39, Richmond Street, Maida Hill, London, N.W.

**GARDENER (HEAD WORKING),** where two or more are kept.—LOUISA Lady ASHBURTON is desirous of recommending a Gardener, who has been in her service nearly two years, as above. He thoroughly understands Vines and Vegetable and Flower Gardening in every branch; is unmarried, honest, and sober, and leaving his situation for no fault.—T. G., Messrs. Street & Co., 30, Cornhill, E.C.

**GARDENER (HEAD WORKING, or good SINGLE-HANDED).**—Age 39, married; twenty-two years' experience. Thoroughly competent in all branches. Three and a half years in present situation.—J. R., 9, Price's Place, Romford Road, Ilford, Essex.

**GARDENER (HEAD), or GENERAL MANAGER.**—Twenty-six years' experience in Improvements in last place. Thorough knowledge of Planting and Gardening in all its branches.—GEORGE LONGLEY, Messrs. C. & E. Lookey, Nurserymen, Rainham, Sittingbourne, Kent, or personally to the Houblie. R. HARRIS TEMPLE, 2, Bolton Row, Mayfair, London, W.

**GARDENER (HEAD), or GARDENER and ESTATE MANAGER.**—Married; Protestant. Advertiser is desirous of negotiating with any Lady, Nobleman, or Gentleman requiring the immediate services of above named. Well versed in all branches, as testimonials will certify.—Full particulars obtained on application to HORTUS, Messrs. Dickson & Sons, Newtown Nurseries, Chester.

**GARDENER (HEAD), or good FOREMAN.**—Age 26; eleven years' practical experience, three year's previous as Foreman. Highest testimonials as to character and abilities.—H. GILBERT, Gardens, Chalfont Park, Slough.

**GARDENER (HEAD, or SINGLE-HANDED).**—Age 32, married, one child; understands Vines, Peaches, Melons, Cucumbers, Stove and Greenhouse Plants, and Flower and Kitchen Gardening.—J. HORN, 45, Flask Walk, Hamstead, N.W.

**GARDENER (HEAD, or SINGLE-HANDED in a good place).**—Age 26, single; has had good experience in the Garden, Vines, Cucumbers, Melons. Well understands Glass Work. Good references.—E. KING, Nurbrook, near Col. h.m., Hants.

#### To Noblemen and Gentlemen.

**GARDENER and BAILIFF, or GARDENER (HEAD WORKING).**—Age 44, married, no small family; thoroughly practical in all branches, forcing of all kinds of Fruits, Flowers and Vegetable (Early and Late), Management of Land and Stock, Laying out Grounds, &c. Eleven and a half years' good character.—F. A. H., 8, Violet Cottages, Gladstone Road, Maidstone, Kent.

**GARDENER, good, by a steady industrious man.** Well up in Vines, Fruit and Flowers. Four years' good character.—A. B., Woodward, Newsagent, High Road, Chiswick.

**GARDENER.**—Age 34; experienced in Vines, Melons, Plants, Flower and Kitchen Gardening, and all General Work. Good references. Abstainer.—T. R., 14, Park Lane, Waltham Cross, Herts.

**GARDENER.**—Age 30, married, without incumbrance; industrious, respectable. Three years' good character. Reason for leaving, family gone abroad.—Please to state wages, &c., to C. FOSTER, Oak Cottage, Strode Road, Willesden, N.W.

**GARDENER, where another is kept, or good SINGLE HANDED.**—Understands Vines, Peaches, Melons, Flower and Kitchen Garden, Early and Late Forcing, &c. Eight years' good character from last employer.—E. T., Church Street, Prestegigne, Radnorshire.

**GARDENER (JOBBER or otherwise).**—Over twelve years' experience in all branches of Gardening. Suburbs preferred. Good references.—C. BURNELL, Compton, Sherborne, Dorset.

**GARDENER (where some assistance is given, or SINGLE-HANDED).**—Thoroughly practical and experienced. Thorough good knowledge of the routine of Kitchen and Flower Gardening. Has had experience in town and country, and can be highly recommended.—JOHN GOLDSON, 1, Wat's Cottages, Red Hill, Surrey.

**GARDENER (OUTDOOR or SINGLE-HANDED).**—Age 26, single; two and a half years' good character. Understands Cattle.—F. BATCHELOR, Honington, Shipston-on-Stour.

**GARDENER (SINGLE-HANDED).**—Age 28, married, one child. Good character.—G. V., 4, Rothschild's Road, Acton Green, Middlesex.

**GARDENER (SINGLE-HANDED).**—Age 24, single; total abstainer. Eleven years' experience. Two years' good character; leaving to better himself.—G. L., 4, Myrtle Cottages, Upper Caterham, Surrey.

**GARDENER (SINGLE-HANDED), or where help is given.**—Age 33, no family; understands Greenhouse, Flower, and Kitchen Gardening, also Melons and Cucumbers. Wife good Laundress. Good references.—C. W., Mr. White, 62, George Street, Croydon.

**GARDENER (SINGLE-HANDED or otherwise);** age 30, married, no family.—Major RAIKES wishes to recommend a man as above, having lived with him nearly three years. Wife useful.—W. SIMPKINS, Hillash, Dymock, Gloucestershire.

**GARDENER (SINGLE-HANDED, or good SECOND).**—Age 26, single; seven years' good character. Well up in all branches.—F. C., 33, Torre Square, Torquay, Devon.

**GARDENER (SECOND, or good THIRD),** in a Gentleman's establishment.—Age 21; good experience In and Outdoor.—A. G., Gothic Cottage, Charles Street, Sydenham, S.E.

**GARDENER (UNDER),** Outside; could assist under Glass if required.—Age 23; good character from present and previous employers.—J. M., 1, Lynton Place, Goat Road, Enfield.

**GARDENER (UNDER).**—Age 21; has had five years' experience in a large Kitchen Garden. Five years' good reference.—R. WRIGHT, The Lodge, Heydon, Norwich, Norfolk.

**GARDENER (UNDER), to assist Inside and Out.**—Age 21; six years' experience. Good character. State wages.—C. GODFRAY, 3, Stanke's Cottages, Northwold Road, Upper Clapton, E.

**GARDENER (UNDER), to assist Inside and Out preferred—used to both.** Six years' experience. Good character.—G. PROSSER, Porthkerry, Cowbridge, Glamorgan.

**GARDENER (UNDER).**—Has a practical knowledge of Stove and Greenhouse Plants, Flower and Kitchen Gardening. Good character.—McLAREN, 5, Pixholm Grove, Dorking, Surrey.

**GARDENER (UNDER),** where three or four are kept.—Age 20; has had three years in a Gentleman's garden, three and a half in Market Nursery. Good character from each place.—H. THOMAS, 4, Myrtle Crescent, Elms Road, Swanley Junction.

**GARDENER (UNDER).**—Age 21; understands Stove and Greenhouse Plants, Ferns, Cucumbers, Melons, Peaches, and has a fair knowledge of Vines. Abstainer. Good references.—W. F., The Gardens, Sunnyside, South Hampstead, N.

**GARDENER (UNDER).**—Age 24, single; thoroughly understand both Flower and Kitchen Gardening with a knowledge of the Houses. Six and a half years' experience. Excellent character.—D. A., 1, Trelaw Road, Leyton, Essex.

#### To Gentlemen and Market Growers.

**MANAGER.**—Seventeen years' experience. To Grow Fruit, Flowers, and Vegetables, in quantities. Highest testimonials.—ONWARD, 4, Herbert Road, Plumstead.

**FOREMAN, several years' practical experience** in various branches, Wholesale and Retail. Good Correspondent and Salesman.—H. BROWNE, Cemetery Road, East Grinstead.

**FOREMAN, in the Houses; age 26.**—HENRY PARR, The Gardens, Givon's Grove, Leatherhead, would be pleased to recommend James Sheppard to any Gardener: a thoroughly trustworthy man. Has been here three years.—Address as above.

**FOREMAN, in a Gentleman's establishment.**—Age 25, single; twelve years' good experience in all branches of the profession. Seven years' good character from last situation.—D. J., W. Cole, Grove Vineyard, Feltham, Middlesex.

**FOREMAN; age 27.**—Mr. STAGG, Gardener to P. Rawson, Esq., Woodhurst, Crawley, Sussex, would be pleased to recommend his Foreman, who has lived with him for six years, to any one requiring a thoroughly trustworthy energetic man. Eleven years' experience.

**FOREMAN, in a good establishment.**—Age 27; twelve years' experience. Has served at Enville and other large Noblemen's places. Can be highly recommended. Two years' late Foreman at Brodsworth Hall, Doncaster. South of England preferred.—ANDREW PIPE, Enville, Stourbridge, Worcestershire.

**FOREMAN, in the Houses, or good SINGLE-HANDED.**—Age 25; highly recommended by present and previous employers.—J. ODELL, Witely, Godalming, Surrey.

#### GRATEFUL—COMFORTING.

**EPPS'S COCOA.**  
BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." *Civil Service Gazette.*

Made simply with boiling water or milk. Sold only in Packets, labelled thus:—  
**JAMES EPPS & CO., Homoeopathic Chemists, London.**

**HOLLOWAY'S OINTMENT and PILLS.**  
Never at fault.—In all irritations of the skin, sores, ulcers, burns, scrofulous enlargements of the glands, &c., Holloway's Ointment presents a ready and easy means of cure, which never disappoints the most favourable expectations. It manifests a potent and peculiar power in restraining inflammation, removing stagnation, cooling the heated blood, and checking all acrimonious or unhealthy discharges. Whilst thus acting locally, the Pills are no less remarkable for their power in improving the general condition and habit of body, which renders the cures complete and permanent. Under the general influences of these potent remedies the puny infant becomes the robust child; the pale and emaciated regain colour and flesh, and dyspeptics eat freely, without fear.

## Orchid Conference Week.

## IMPORTANT to EXHIBITORS.

**MESSRS. PROTHEROE and MORRIS** beg to call the attention of intending Exhibitors (who would prefer selling their Orchids to taking them back from the Show) to the special SALE of ORCHIDS in Flower, to take place at the Central Auction Rooms, on **THURSDAY, May 14**, the day following the Conference.

Messrs. P. and M. will be glad to receive an early intimation from Gentlemen proposing to enter their plants.

## Orchid Conference Week.

## SPECIAL SALE OF ORCHIDS in FLOWER.

**MESSRS. PROTHEROE and MORRIS** beg to announce that they purpose holding a special SALE of ORCHIDS in flower at their Central Auction Rooms, 67 and 68, Cheapside, E.C., on **THURSDAY, May 14**, the day following the Show.

Messrs. P. and M. will be glad to receive from intending Exhibitors an early intimation of their desire to include any Lots they may wish to dispose of.

## Maesmyrnan Hall, Caerwys, Flintshire.

About five minutes' walk from the Caerwys Station. **IMPORTANT CLEARANCE SALE** of a Valuable Collection of **STOVE and GREENHOUSE PLANTS**, &c.

**MESSRS. PROTHEROE and MORRIS** (in conjunction with Mr. John Pritchard) are instructed by Wm. Pickstone, Esq., to **SELL BY AUCTION**, without reserve, on the Premises, as above, on **TUESDAY and WEDNESDAY, May 19 and 20**, at half-past 12 o'clock precisely each day, the whole of the celebrated **COLLECTION OF STOVE and GREENHOUSE PLANTS**, comprising several handsome **Tree Ferns**, **Palms**, splendidly grown **Fuchsias**, **Geraniums**, and **Pelargoniums**, fit for exhibition; **Camellias**, **Azaleas**, fine **Eucharis**, **Tea** and other **Roses**, **Vines**, several **thousand Plants** for **Bedding** purposes, a large and complete collection of 2000 **Chrysanthemums**, a considerable number of **Rhododendrons**, several tons of **STALACTITE**, **MOWING MACHINE**, **GARDEN POTS**, &c.

On view the day preceding the Sale. Catalogues (6d. each, returnable to purchasers) may be had of Mr. JOHN PRITCHARD, Auctioneer and Land Agent, Bodhyfryd, Bangor; and of the Auctioneers and Valuers, at their Central Auction Rooms, 67 and 68, Cheapside, London, E.C.

N.B. The Maesmyrnan **FREEHOLD ESTATE**, of about 1200 Acres in extent, with the Mansion, the Manor and Court Leet, will be offered for **SALE BY AUCTION in JULY NEXT**, unless previously **Sold by Private Treaty**.

## Harlesden, N.W.—Clearance Sale.

**MESSRS. PROTHEROE and MORRIS** are instructed by Mr. J. Tibbles (who is relinquishing the business through ill health) to **SELL BY AUCTION**, on the Premises, the **St. Mary's Nursery**, Harlesden, N.W., on **THURSDAY, May 21**, the first portion of the well grown stock, comprising the whole of the **BEDDING PLANTS**, a large quantity of *Imantophyllum*, *Agapanthus*, 150 fine plants of *Anthurium Scherzerianum*, &c.

N.B. The **VALUABLE NURSERY**, with the **GLASS ERRECTIONS**, is for **SALE** upon moderate terms.

Apply to **MESSRS. PROTHEROE and MORRIS**, 67 and 68, Cheapside, E.C.

## Important Sale of Hothouse Plants.

**MESSRS. W. H. PHILLIPS and CO.** (late H. R. FARGUS, PHILLIPS, and CO.) have received instructions from the Executor of the late Mr. Daniel Bloodworth, of the Exotic Nurseries, Kingswood Hill, Bristol, to **SELL BY AUCTION**, at their Sale Rooms, 4, Clare Street, on **THURSDAY, May 7**, about 100 fine full grown **SPECIMEN PLANTS**, amongst which may be mentioned the following:—

**DIPLADENIA**—Brearleyana, insignis, and amabilis (the former variety well set with bloom).

**CROTON**—Fasciatus, Johannis, Weissmani, and majestica.

**COCOS PALM**—Weddelliana, 6 feet high.

**ORCHIDS**—Grand specimen of *Coleogyne cristata*, *Dendrobium nobile*, *Laelia anceps rosea*, and others.

**EUCHARIS**.—Twelve fine specimens.

**DASYLIRION**—Acrotichum—a grand plant, 5 feet in diameter.

**ERICA BARNESII**.

**DIERFENBACHIA WEIRII SUPERBA**, 6 feet high.

**PANDANUS VETICHI**.

**STATICE PROFUSA**, imbricata, and Holfordii.

**STEPHANOTIS FLOREBUNDA**, well set with bloom.

Four **BOUGAINVILLEA GLABRA** (100 spikes of bloom).

## NEW CATALOGUE FOR 1885.

Beautiful Flowers for Indoors, selected from an immense stock. Our Glasshouses cover nearly 2 acres.

Wm. Clibran & Son's New List

(90 Pages Double Column)

Of the newest and finest varieties of all classes of Plants for Greenhouses, Stoves, &c., may now be had for two stamps. It includes only the best varieties of their respective classes. Every season new sorts are added. Comparisons of the varieties when in bloom carefully made, and the inferior kinds discarded. Intending purchasers may rely, when selections are ordered as under, on being supplied with varieties of merit only.

The following cheap Collections of finest named kinds consist entirely of our selection. Purchasers may select from the Lists at Prices as per CATALOGUE, which please see before ordering elsewhere.

It is simple in construction, easily adjusted, is well adapted  
for mowing small plots, cutting borders, verges, round flower  
beds, the edges of walks, &c. It is a most handy, serviceable  
machine, and very easy to work.

### GREEN'S PATENT GRASS EDGE CLIPPER.

With Chain and Wheel Motion.

A most useful Machine.

Price, £1 16s.

Packing Case, 2s.

### GREEN'S PATENT No. 2412 LAWN TENNIS COURT MARKER.

Price 20s.

Small Bag of Marking Compo-  
sition, Mat, and Packing, 12. 6d.

Price List free on application.

The above Machines can be had of all respectable Iron-  
mongers and Seedsmen in the United Kingdom, or direct from  
the Manufacturers,

**THOMAS GREEN & SON**  
(LIMITED),  
SMITHFIELD IRONWORKS, LEEDS; and  
SURREY WORKS, BLACKFRIARS ROAD, LONDON, S.E.  
Carriage paid to all the Principal Railway Stations in  
the United Kingdom.

## ORCHID EXHIBITION.

One of the most beautiful sights in London.

**ORCHIDS.**—Mr. WILLIAM BULL'S ORCHID  
EXHIBITION will Open on TUESDAY, May 5,  
and continue on view every TUESDAY, THURSDAY,  
and SATURDAY, 10 to 5 o'clock, throughout MAY,  
JUNE, and JULY, to Patrons of the Establishment and  
those having received cards of invitation.

Establishment for New and Rare Plants, 536, King's  
Road, Chelsea, London, S.W.

**ORCHIDS.**—"Must be seen to be realised."

**ORCHIDS.**—Specimens in Flower from  
Brazil, Columbia, Mexico, Ecuador, Madagascar, Central  
America, Peru, Burmah, Borneo, and various other parts  
of the Eastern Archipelago.

**ORCHIDS.**—Mr. WILLIAM BULL'S EXHI-  
BITION will be Open to the Public WEDNESDAY,  
May 6, and FRIDAY, May 8, and every following  
MONDAY, WEDNESDAY and FRIDAY, 10 to 5  
o'clock, throughout May, June and July. Admission  
each day, 2s. 6d.

**ORCHIDS.**—The EXHIBITION at Mr.  
WILLIAM BULL'S will be quite astonishing and en-  
chanting; many beautiful kinds new to Science and this  
country in blossom. The Exhibition not only unparalleled  
in connection with Horticulture and Botanical Science,  
but one of the most beautiful sights in London.

Establishment for New and Rare Plants, 536, King's  
Road, Chelsea, London, S.W.

**ORCHIDS.**—Private View, TUESDAY  
May 5; THURSDAY, May 7; SATURDAY, May 9;  
and every THURSDAY, THURSDAY and SATURDAY  
throughout May, June and July, to Patrons of the  
Establishment and those having received Cards of  
Invitation.

**ORCHIDS.**—Open to the Public, WEDNES-  
DAY, May 6; FRIDAY, May 8, and every following  
MONDAY, WEDNESDAY and FRIDAY throughout  
May, June and July. Admission each day, 2s. 6d.

**ORCHIDS.**—The Exhibition must be seen to  
be realised, at Mr. WILLIAM BULL'S Establishment for  
New and Rare Plants, 536, King's Road, Chelsea,  
London, S.W.

## NEW PLANTS FOR 1885.

## MR. WM. BULL'S NEW CATALOGUE FOR 1885.

JUST ISSUED, PRICE 1s.

Contains Names, Descriptions, and Prices of the following New  
Plants, which he is now sending out for the first time:—

ARDISIA PICTA.  
ARISEMA FIMBRIATUM.  
BEGONIA ALBO-PICTA.  
BIGNONIA REGALIS.  
CAMOENSIA MAXIMA.  
CLERODENDRON DELECTUM.  
CRINUM SANDERIANUM.  
CURCULIGO DENSA.  
DICHÆA VAGINATA.  
DRACENA EXCELLENS.  
ERYTHRINA VESPERTILIO.  
GOVENIA DELICIOSA.  
HELIOTROPIMUM INCANUM.  
HEMIAGRAPHIS COLORATA.  
IXORA EMINENS.

"GEMMA."  
MARANTA CONSPICUA.  
NEPENTHES RAFFLESIANA INSIGNE.  
ODONTOGLOSSUM VEXILLARIUM INSIGNE.  
PHILODENDRON NOBILE.  
PINANGA SANDERIANA.  
SCHISMATOGLOSSUM SIAMENSIS.  
STYRAX CALIFORNICA.

Also New FUCHSIAS, New GLOXINIAS, New PELAR-  
GONIUMS, &c.

Just Published.

**NEW PLANTS.**—Mr. WILLIAM BULL'S  
New Illustrated Plant Catalogue for 1885 is now ready.  
Price 1s.

**NEW PLANTS.**—Vide Illustrations in Mr.  
WILLIAM BULL'S Catalogue for 1885. Price 1s.

**NEW PLANTS.**—See Description in Mr.  
WILLIAM BULL'S New Catalogue for 1885; just issued.  
Price 1s.

**MR. WILLIAM BULL,**  
Establishment for New and Rare Plants,  
536, KING'S ROAD, CHELSEA, LONDON, S.W.

## R. HOLLIDAY, HORTICULTURAL IRON and WIRE WORKER, GARDEN IMPLEMENT MAKER. SWING WATER BARROWS.

GARDEN ENGINES and ROLLERS.

GARDEN PLANT TRUCK and WHEELBARROW.

GARDEN SEATS and CHAIRS.

SEATS with Awnings.

CHAIRS with Spring Bottom and Back.

CHAIRS in Rustic Iron Work.

A GREAT VARIETY ON SHOW TO SELECT FROM.

PAXTON'S STRAWBERRY CRINOLINE.

R. HOLLIDAY,  
HORTICULTURAL IRON and WIREWORKER,  
The Pheasantry, Beaufort Street, Chelsea, S.W.

## NEW SPRING CATALOGUES.

The following CATALOGUES are now ready, and  
may be had upon application:—

### HARDY PERENNIALS, ILLUSTRATED.

Thoroughly revised, contains many Plants not pre-  
viously offered, and includes nothing but really first-class  
showy plants. Also selections of Hardy Terrestrial  
ORCHIDS, PRIMULA SIEBOLDI, AQUATIC and  
BOG PLANTS, Ornamental GRASSES, BAMBOOS,  
HELLEBORUS, &c.

### HARDY FLORISTS' FLOWERS.

Including Show, Border, Clove, Tree and Yellow  
ground CARNATIONS, DELPHINIUMS, PHLOXES,  
PEONIES, VIOLETS, PYRETHRUMS, PINKS, &c.

### CHRYSANTHEMUMS.

A most complete CATALOGUE, including all the really  
first-class varieties of each section, and the new ones of  
the present season.

### HARDY CLIMBERS.

One of the most complete ever issued, comprising  
almost every Hardy Climbing, Creeping, or Trailing  
Plant of real worth.

**THOMAS S. WARE,**  
HALE FARM NURSERIES, TOTTENHAM, LONDON.

## WHOLESALE CATALOGUE OF AGRICULTURAL SEEDS.

Containing List of MANGELS, SWEDES, TURNIPS—  
all the best sorts. Also GRASSES and CLOVERS of best  
quality and samples. Mixtures of the best sorts for Permanent  
Pasture, Lawns, &c., made to suit different soils. Special low  
quotations for Mangels, &c., in large quantities.

CATALOGUE sent on application.

**WATKINS & SIMPSON,**  
EXETER STREET,  
STRAND, W.C.

Seed and Trial Grounds, Feltham and Twickenham, Middlesex

SEASON 1885.

Is now offered to the Public for the tenth year, and the Manufacturers have again much pleasure in stating that it is still increasing in popularity.

They are, however, sorry to find that it is still necessary to CAUTION the Public against, under any circumstances, accepting it, unless in their PACKETS or SEALED BAGS, as they will not be responsible for its genuineness under any other conditions.

Where no Agent resides in the neighbourhood they will forward a Sample Bag, carriage paid, on receipt of Cheque or Post-office Order.

Sold in Packets, ONE SHILLING each, and in

Sealed Bags,

7 lb.	14 lb.	28 lb.	56 lb.	1 cwt.
2/6	4/6	7/6	12/6	20/-

**CLAY & LEVESLEY,**  
TEMPLE MILL LANE,  
STRATFORD, LONDON, E.

Clay & Levesley also supply CRUSHED BONES, BONE DUST, PERUVIAN GUANO, SULPHATE OF AMMONIA, and NITRATE OF SODA, of the best quality only.

ROYAL HORTICULTURAL SOCIETY

## ORCHID CONFERENCE

AT SOUTH KENSINGTON, MAY 12-13.

TWO SPECIAL NUMBERS

OF THE

GARDENERS' CHRONICLE.

THE

## GARDENERS' CHRONICLE

for MAY 9 will contain a

## SPECIAL 8-PAGE SUPPLEMENT,

CONTAINING AN ALPHABETICAL

LIST of all the GENERA of ORCHIDS,

TOGETHER WITH A

## MAP

(2 feet 3 inches by 1 foot 7 inches),

Showing their Geographical Distribution according to

CLIMATE, RAINFALL, &amp;c. ;

PORTRAIT of Sir TREVOR LAWRENCE, Bart., M.P.,

President of the Royal Horticultural Society and  
of the Conference,  
&c., &c.

THE

## GARDENERS' CHRONICLE

for MAY 16 will contain a

DOUBLE-PAGE ENGRAVING REPRESENTING A

## GROUP OF ORCHIDS,

A PORTRAIT OF

PROFESSOR REICHENBACH,  
the Historian of the Orchid Family; and aFULL REPORT OF THE ORCHID EXHIBITION  
AND CONFERENCE,  
&c., &c.Both Numbers will contain a variety of Illustrated Articles  
relating to

## DOUBLE-FLOWERED ORCHIDS,

to the Structure, Conformation, and

MODE OF CULTIVATION  
of these Plants,and to the Insects and Parasites that attack them, together with  
much information of interest to

AMATEURS AND PROFESSIONAL CULTIVATORS.

Either of the above Numbers will be sent, post-free,  
for 5½d. stamps, or both for 11d. stamps.May be had of all Booksellers and News Agents, and at the  
Railway Bookstalls.

## NOTICE TO ADVERTISERS.

Applications for Space in these Numbers  
should be made as early as possible.

W. RICHARDS, 41, Wellington Street, Strand, W.C.

THE

## Gardeners' Chronicle.

SATURDAY, MAY 2, 1885.

## DOUBLE DAFFODILS.\*

IN attempting to comply with the request the committee has done me the honour to make, I shall, as far as possible, confine myself to such facts as may be verified by any observer. I cannot, however, entirely pass over the possible physiological explanations of these facts—a much more difficult and debatable matter, but one the relevancy of which to the questions the committee has set itself if possible to determine, will not be denied.

To start with, we have the concrete fact of the existence of flowers double, and we have to account as best we can for their existence. The attempt will be no empty scholastic exercise, of no value to the cultivator. On the contrary, the experiments and observations made under the superintendence of the committee, if successful, are sure to be of direct practical importance. Proceeding in our quest from the known to the unknown, these questions arise—(1) whether these doubles can originate in the way it is asserted they do? and (2) whether they really do so? To the second question it is beyond my commission to attempt to reply, that must be left to be declared in the final summing up of all the evidence from various quarters and different points of view. To the first question I should be disposed to give an affirmative reply, for reasons which I shall hereafter give. This being so, I shall be immediately asked, How can these things be? and this will at once bring me to the particular part of the work which the committee has entrusted to me—the consideration of the structure of these so-called double flowers.

Before any satisfactory conclusion can be arrived at as to the causes which produce "doubling" in Daffodils, it is therefore requisite to know in what that doubling consists. It is obvious on the most cursory examination that the process is not uniform, but that it presents many diversities. These diversities may be absolute, or they may be merely the result of different degrees of intensity of the same essential condition.

## GROWTH OF THE BULB.

Previous to detailing the specific alterations of floral construction which constitute the double condition, a few generalities may be indulged in, if only for the sake of making what is to follow more clearly intelligible. The general structure and mode of growth of the bulbs, leaves, and flowers of the Daffodils are known to all lovers of these flowers, and need, therefore, not be adverted to here in detail; but there are certain points on which it is desirable to lay special stress with reference to this present inquiry. And first of all as to the bulbs. The bulbs are at once nests in which the young flowers are formed, and nurses by which they are nourished. It is not necessary to describe so well known a bulb as that of the Narcissus, but it is of importance to notice its mode of growth. For a time from its short axis or central stem proceed, on this side and on that, in regular sequence and in definite order, thick

\* This article was prepared at the request of the Daffodil Committee.

fleshy scales, which wrap round and encompass the bulb. Presently these fleshy scales give place to green leaves. These die down, and scales are again produced. The scales are the nursing mothers of the bulb and of its offshoots. In them are stored much of the water, the salts, the other elements which directly or indirectly are required for the maintenance and building up of the plant. The leaves exposed to light wrench from the carbonic acid of the air the carbon the plants require, and generally serve to collect and to manufacture the stores of food, or materials capable of conversion into food, which are stored up in the scales. If the scales of a bulb in full growth be stripped off one by one, it may easily be seen that scales and leaves are continuous, that the one is but a modification of the other, and in spite of their different look no one would say that they were essentially different.

Should any one object that all this is very trite and rudimentary, it may be answered that this is a case where first principles eminently need to be insisted on, and the principles involved so far are these—(1), *primitive uniformity of conformation*; (2), *subsequent differentiation*, one set of leaves being told off to do one duty, another set of leaves being modified to fulfil some other description of work; (3), *alteration in the mode and purposes of growth*, as just explained; and (4), *a period of rest or quiescence* (not absolute, but relative) between the stages, growth manifesting itself in two different methods and to two different ends—and arrest of growth between the acts. Such, in brief, is the regular course of events in the parent bulbs.

But now we have to consider the flower born in that bulb, and that consideration will again introduce some first principles of which further cognisance must be taken in endeavouring to understand the *rationale* of double flowers. Some bulbs there are whose central stem, after having given origin on this side and on that to scales or leaves, or both, winds up its career by the crowning glory of a flower. In such cases scales, leaves, stalks are but as the pedestal on which the floral statue is raised. The Onion and the Tulip have bulbs of this character, in which the central stem of the bulb ends in a flower. Such bulbs are known as "definite" bulbs, because the growth of the stem is limited or defined by the formation of the flower at its extremity. Once the flower completed there is no further development in that direction. Arrest of growth takes place, and under ordinary circumstances that arrest is decisive and permanent.

Other bulbs there are whose manner of growth is different, and the Hyacinth and Narcissus are among them. Here the central stem of the bulb does not end in a flower, but in a growing point. Arrest of growth, indeed, takes place, but only to be resumed after a period of rest, and when circumstances become propitious. Such bulbs are called "indefinite." In such bulbs the flowers are borne from the sides, not the end of the stems, and in the "axils" of the scales.

In the definite bulbs the main stem dies every year, provision being previously made for side growth in the following season. The consequence of this is that in the second season there is little or nothing left of the growth of the first. In the Hyacinth and Narcissus, on the other hand, the main stem, or at least its central growing point, lives on from year to year; its base dies away, and so do the whole side flower stems, provision being made as in the other case for new side growths in the shape of small bulbs or scales. These two classes of bulbs illustrate two great principles of floral development, *permanent arrest of growth and temporary intermission*, and, as a consequence of these, deflection in the current or direction of growth or continuance in the same direction.

#### GROWTH OF THE FLOWER.

It is of course quite unnecessary to occupy time with the description of the parts of a flower in an ordinary Narcissus, but in its development and mode of growth there are several circumstances which may aid us in understanding the way in which double flowers may be brought about. The flower begins as a hemispherical globule or pimple of very minute size, without trace of parts. From its circumference, below the extreme tip, emerge in succession, first three, afterwards three more pimples similar to the one from which they sprang. These six pimples ultimately develop into the six parts or segments of the perianth, which are free at their tops but remain in union below, thus forming a tube pushed up from below during growth, and enclosing and surmounting the ovary.

In the case of the perianth, then, the six segments originate in two sets, three outer and three inner. After the formation of the six parts of the perianth, as above described, three other pimples emerge from the primary dome or pimple—these three emerge all at one time, and are followed by three more which are also developed all together. These are the six stamens, free for great part of their length, but inseparable from the flower-tube beneath. Immediately after the first beginnings of the stamens, or it may be just prior to that period, the little central dome or pimple from which the parts of the flower have proceeded is seen to be depressed in the centre; the depression becomes gradually deeper, so that a tube or cavity, already referred to, is formed. The reason for this introduces us to another peculiarity of growth—its inequality. Here the outer or lower portions of the dome grow faster than the central ones, and the result is the formation of a tube. From the sides of this tube proceed three more little pimples, formed simultaneously, the tips of which alone remain free (as the stigmas), the other portions remaining adherent not only one to another, but to the side of the tube from which they originally sprang. As this lengthens the whole ovary—for such it is—becomes, as it were, imbedded in it; and in the mature flower we have the little green knob below the flower, called, from its position, the "inferior ovary."

It is not necessary to extend this summary account of the mode of growth of the flower further than to mention that the cup, trumpet, or corona (I prefer the latter term, as comprehensive of all the varieties), that the corona is an outgrowth from the top of the flower-tube or extreme base of the flower-segments, that it is not a distinct organ, or set of organs, as was at one time supposed, but is a mere secondary outgrowth, of use probably in directing insects in which way they should go.\*

#### DOUBLE FLOWERS.

It now remains to speak of the different modes of doubling met with in Daffodils. For the purposes of this communication I have been favoured with letters and specimens from a large number of correspondents—specimens so numerous and so varied that I could not undertake to describe the particular variations sent me by each contributor.† The variations admit of being reduced to two or three principal groups, the complications arising from the combination in the same flower of several different conditions.

The doubling of Daffodils is therefore due to—

1. A reduplication of the perianth as a whole.
2. To a multiplication, or increased number of parts in a particular series (polyphyly).
3. To a metamorphosis or permutation of parts.
4. To the isolation or separation of parts generally united.

These exist in different degrees in different flowers, sometimes, but rarely, separately, much more frequently in various degrees of combination in the same flower. And then there is a variation, which has been sent me by more than one correspondent, and which consists merely in the union, more or less complete, of two or more flowers side by side. These illustrations of "synanthi" may fairly be excluded from the category of doubles, as being inconstant, and not necessarily involving any change in the flower itself, and outside the limits of this inquiry.

#### PLEIOTAXY.

1. The *duplication of the perianth* (pleiotaxy) is perhaps the commonest change met with. It consists in the repetition of the perianth-segments without, or generally with, the corona, and without, or generally with, changes in the stamens and styles. The ovary with the contained ovules is usually quite unaffected. In its more perfect state the corona retains its tubular form, particularly the outermost one, as

\* It scarcely comes within the scope of this article to discuss the question of the fertilisation by means of insects of these flowers, but as the question is one of great interest and is not without bearing on the subject immediately under discussion, it would be very desirable if observers would indicate what insects visit the flowers of Narcissus. Müller, the great authority on the subject, says nothing as to the Daffodil, and suggests that *N. tazetta* is fertilised by night-flying insects. The comparative rarity with which seed-pods and perfect seeds are found even in single Daffodils seems to point to the absence at the proper time of the requisite insect, and, if this be really so, to the ultimate extinction of the plant! It is to be feared, however, that peripatetic flower-sellers may contribute even more speedily to their destruction—so even for which the introduction of a *Victoria regia* or *Vanda Sanderiana* would be but a sorry compensation.

† Among these I may mention the Hon. and Rev. J. T. Boscawen, the Rev. C. Wolley Dod, Messrs. Barr, Hartland, Burdige, A. D. Webster, Brockbank, Archer Hind, W. W. Fisher, Frank Miles, Lord Balfour of Burleigh, Hon. Mrs. Boyle.
