one sees in double flowers of the variety major of *N. Pseudo-Narcissus*. When the corona is split up we have such forms as *N. Telamonius pleus*, *N. spurius fl.-pl.*, forwarded by Mr. Burdige; *N. obvallaris fl.-pl.*, from Mr. Brockbank; and *Hales' Silver and Gold*, where, owing to the difference in colour of the perianth and of the coronal segments respectively, we have alternating zones of light and deeper yellow. In other cases the diversity of colour is even more striking from the presence of a deep green colour on the edges of the segments, which forms a pretty contrast to the crown and is indicative of a partial reversion of the segments to the state of leaves. It is in these repeatedly duplicated flowers that we find what are called *Rose Daffodils* (forms of the variety major). In these flowers, in addition to the changes already mentioned, the axis or thalamus of the original flower divides into from two to six subdivisions, each of which bears a flower whose perianth is reduplicated as in the primary one. Of course the ovary of the primary flower does not exist in such cases, its place being occupied by the branched axis. These cases are instances of median proliferation.\*

This is hardly the place or time to enter upon the discussion whether or no *N. major* and its double forms are natives to this country; suffice it to say that, among the specimens sent from Devonshire by Mr. Archer Hind, and from Shropshire and Cornwall by another correspondent, and from Bangor by Mr. Webster, there were many, both double and single, and reputed wild, which went far to establish a complete series of links between the ordinary wild Daffodil as I know it in Kent and the Home Counties, and the large forms of major, and even of *Telamonius pleus*. Such a series can readily be found on comparing specimens from different localities? As to their really wild condition, I can say nothing definite or at first-hand.

#### POLYPHYLLY.

2. *Multiplication, or Polyphyly*.—By this is meant a condition in which the perianth is not repeated, but in which the individual members of the single whorl are increased in number. Thus in a specimen of bicolor sent by Mr. Hartland, there were eight perianth segments, four in each row, and as many stamens, the ovary, however, having three cavities as usual. Mr. Brockbank sent a similar specimen in a form of major, but the condition is not frequent and need not detain us long. Seeing that the ovary retains its ternary condition it seems probable that the additional segments here are the result, not of any absolute new growth, but of a subdivision or branching of the primary organs.

#### METAMORPHY.

3. *Petalody*.—The particular form of permutation which is most common, indeed which is all but universal in double Daffodils, is that called petalody, from the fact that the stamens and pistils, some or all, assume more or less completely the guise of petals or perianth segments. If it be complete of course neither pollen nor ovules can be produced, but such complete petalody is rarely met with, generally some of the stamens are present, even if distorted, and half an anther would furnish a considerable number of pollen grains. As to the ovary and ovules it is especially noteworthy that they are, as compared with the stamens, very rarely changed. Even in the most complex combination of pleiotaxy and petalody, it is rare for the ovary and ovules to be affected. The few exceptions will be mentioned in a subsequent paragraph. This affords matter for speculation as to the sexual changes in these flowers, and their possible antecedent and future condition. I must, however, content myself with noting the fact. It has already been mentioned that petalody most frequently accompanies pleiotaxy but not necessarily so, for I have had several double Daffodils in which the outer perianth was not increased, and in which indeed there was no change but that of the stamens and the styles (not the ovary) into petals. (*Gardeners' Chronicle*, Feb. 21, 1885, fig. 46.)

4. *Isolation of Parts*.—This is a very interesting condition, and none the less so, physiologically, because it is usually, but not always, attended by suppression of the stamens and of the ovary. In speaking of the ordinary course of development of the flower it was shown how after the formation of the parts of the flower as separate members (exclusive of the

\* For a coloured figure of this change see C. Morren in *Bull. Acad. Belg.*, t. xx., part 2, p. 272.

pistil), they were united below into a tube, or more correctly speaking, that they ceased to be separated, a tube being thus formed and pushed up from below the lower part of this tube enclosing the ovary, the upper edge bearing the perianth segments. In the class of cases now to be considered neither the flower-tube nor the ovary exists, but the solid flower-stalk, or thalamus gives off from its upper edge row after row of segments, each segment wholly distinct from its neighbour from base to apex. Some of the flowers so constituted have a corona split up into segments, so that each segment of the perianth has its own coronal segment in front of it. This is the condition in Mr. Hartland's "Rip Van Winkle," and when the flowers open perfectly the appearance

however, be considered legitimate to offer a few considerations based upon the known laws of growth as detailed in an earlier part of this paper. It has been shown that, both in the case of the bulb and of the flower, there is primitive uniformity and subsequent change; that in both there are periods of activity and periods of arrest; that the intensity of growth is now in this direction, now in that; that at one time the organs of the flower are formed in one way or order, at another time in another. Thus in the most common form of doubling, by pleiotaxy, continuance of growth in organs which are developed in succession produces a repetition of the perianth segments, while arrest of development (as distinguished from mere growth)

abundant moisture. Stamens, pistils, dry fruits, and especially seeds, are more specially favoured by mineral manures and low diet generally. It may, however, be remarked that no condition of manuring, high or low, has been observed to favour the production of double flowers at Rothamsted in the very numerous and long-continued experiments there conducted under the auspices of Sir John Lawes. But besides these outward and visible causes, account has to be taken of less tangible but more potent inward forces peculiar to the individual plant, such as heredity and natural variation, of differences in the sexual proclivities, and other idiosyncrasies, the only knowledge of which that we possess is that derived from their effects. Into the consideration of these matters, which are for the most part purely speculative, it is better at this time not to enter. *Maxwell T. Masters.*

FIG. 102.—SPRING INSECTS.

is far from unpleasing. (See *Gardeners' Chronicle*, Feb. 21, 1885, fig. 44.) Another instance of the same kind is the form called "eystettensis," or "capax," in which the corona is not present, but in which the whorls of flat segments alternate with such regularity that the segments appear piled one upon the other in six rows—a condition of things to which I have elsewhere alluded at length. (See also *Gardeners' Chronicle*, 1883, vol. xix., p. 412, fig. 62.)

Such, omitting many minor particulars, are the principal conditions met with in double flowered Narcissi. The specimens examined have chiefly been forms of *N. Pseudo-Narcissus*, but the remarks here made will apply equally well to the other species.

As to the causes that produce these changes it were well to say nothing definite till the results of the experimental cultivation now undertaken at Chiswick and Kew furnish more definite evidence. It may,

accounts for the absence of the stamens, or permutation accounts for their partially petal-like appearance. Whatever then be the actual causes producing these changes, they may be expected to act differently, according to the state of activity or of rest in which the plant may happen to be at the time, and especially according to the stage of development arrived at; thus, if the organisation of the flowers were nearly completed at the time of the onset of any exciting cause, little effect would be produced proportionately to what would have occurred at an earlier stage.

Rich nitrogenous food is well known, especially from the results of direct experiment at Rothamsted, to be specially propitious to the development of foliage and cellular structure generally. Mineral food, with less nitrogen, on the other hand, favours the formation of woody matter, tends to early maturity and seed production. The petals of flowers belong of the two rather to the succulent cellular foliage, whose growth is enhanced by nitrogenous manures, rich soil, and

## COMMON GARDEN INSECTS.

To a naturalist a garden is always attractive. Its interest does not cease at the approach of winter, to revive again in spring-time, nor is it entirely dependent on the carefully tended flowers and foliage; indeed, one need be no naturalist to observe how abundant and varied in its insect population is the most commonplace garden, and to what an extent the little creatures affect the condition of the vegetation. Proverbially a garden is above all places the abode of crawling and flying things. Gardeners well know how numerous, and frequently how destructive to the objects of his toil is the small life we are about to describe; and insects play even a larger part in gardening processes than most people are aware. They are not all destructive. The soil is tilled, aerated, manured, and cleansed from impurities by

the direct agency of insects and allied creatures. Some of our favourite flowers are propagated by means of insects, other plants catch and feed upon insects. On the other hand the preventable ravages of insects costs the country many thousands of pounds every year. Yet, notwithstanding the importance of the subject few people interested in gardening matters care to devote adequate attention to it. No outdoor study is more interesting and none more profitable to the gardener, nurseryman, or forester than that of entomology.

The variety of the insect life inhabiting every garden is very great. A history thereof would comprise a history of the garden itself and of every plant it contains. The soil is the abode of centipedes, slaters, spiders, and analogous creatures (which, though not scientifically considered insects, are yet popularly so named), but in the present paper only such things as caterpillars, beetles, &c., are alluded to. The crevices in tree bark abound in insect life, the wood itself is burrowed by beetles and flies, the leaves and branches of fruit and blossoms of trees are the abode of, and often the victims of, a large army of insects, some of which are beneficial, but most of them injurious. Every flower shelters a host of insects, and a large proportion is invariably destroyed by them. Every rubbish heap, as well as every corner and crevice of the best tended garden, is used for the propagation of innumerable insects, which, when the warm season arrives, come forth in countless numbers. Nor do these hosts live and die without leaving their marks; they do not pass their short-spanned lives in idleness, and somewhere or other their work may be traced. Look where we will, and in whatever garden, we shall find no spot, scarcely a leaf or a stone, on which is not impressed the work of some insect. Healthy trees and plants are stripped of their leaves, their tissues are reduced to pulp, which, commingling with the soil, is finally decomposed and forms new soil.

Dead trees are completely eaten up, save a little dust that is quickly dispersed by the wind; new flowers spring up, new trees take root, and old ones disappear; decaying animal and vegetable matter is completely disposed of, and various offensive matters are effectually removed—all through the agency of insects.

The first warm days of spring invariably bring forth an almost incredible number of insects of all kinds. Where they all come from is to most people a puzzle. However hard the winter's frost may have been, they come out in almost as great force as after a mild winter. The disappearance of the vast multitudes of insects as winter comes on, and their unfailing re-appearance the next year, is one of the wonders of entomology.

In winter-time the garden is a quiet place; nothing seems to be stirring, but yet there is abundant life hidden out of sight in a state of torpidity or hibernation, being confined in cells, crevices and corners in and near the ground, under bark, and in such places. Some are protected in snug little chambers or nests by a covering of warm material, such as woollen or silken material. Some exist in the larval, others in the pupal, and many in the perfect state. Thus the well-known cockchafer lives as a larva through three winters in a semitorpid condition; most butterflies and moths survive the winter by existing in the pupa form, whilst many beetles live through the cold months in a fully developed condition.

The most conspicuous of hidden insects that come out early—in fact, before the winter is quite over—are ground beetles and their larvæ or grubs. Fig. 102 represents a few square inches of a garden corner and a group of insects, all drawn the natural size. The central figure is the Violet Ground Beetle (*Carabus violaceus*). The first part of its name, *Carabus*, refers to its carnivorous habits; in the drawing it is pursuing, with threatening jaws, a small beetle. The second part of its name, *violaceus*, has reference to its colour, which is deep blue-violet, with a hollow ridge round its body of deep red-violet. This beetle must be considered a friend of the gardener, as it, both in the larval and perfect states, lives upon small creatures, many of which are injurious to the gardener. It is mostly nocturnal in its habits, and an examination of the garden at night by lamp-light will frequently reveal great numbers in gardens which were supposed to be free of all such pests, busily engaged in devouring smaller fry. When caught in the hand this beetle can inflict pain by biting, and, moreover, possesses

the additional curious protective ability to discharge from its tail or dorsal appendage an irritating fluid of most offensive odour—a provision which effectually repels many of its enemies. Sometimes when stones, &c., are lifted from the ground, white specimens of this and other beetles are found, and which are soft and apparently defenceless; these are individuals which have recently emerged from the pupa state, and have not yet had time to complete their development. When exposed to the light and air they gradually darken and harden until similar in appearance to the older insect.

On the left of *C. violaceus* is portrayed its larva or grub, which is of even more voracious habits than the parent, as may be judged from its large and menacing jaws. It destroys hundreds of small insects in the course of the season. In the left-hand bottom corner of our drawing is seen a handsome beetle, which is of a deep brooze colour, beautifully ornamented on the back in relief. Its name is *Carabus granulatus*, and it does not differ materially in habit from *violaceus*, and is found in similar situations.

In fig. 103 is represented a pretty little beetle named *Suobiner*, or scientifically *Amara obsoleta*, life-size and magnified. This insect is one of the earliest harbingers of spring—the first sunshiny days of March are nearly always certain to bring out these very lively little creatures. They are of a shining coppery lustre, and run with astonishing speed. There are no less than twenty-four species of beetles belonging to the genus *Amara*, which seem never to be so much at home as when basking in the full blaze of sunshine, or flying in its warm rays, for it must not be forgotten that these little creatures have delicate and beautiful wings carefully packed away beneath their hard and glossy backs or elytra. There exists a curious superstition concerning sun-beetles, that it is unlucky to kill one, as by so doing storms may be produced.

## New Garden Plants.

### EPIDENDRUM FALSILOQUUM, n. sp.\*

THIS *Epidendrum*, kindly forwarded by Mr. W. Bull, is a very deceptive plant. At first sight you think it ought to be *Epidendrum verrucosum*, Swartz (not Lindley, later corrected by the illustrious author as *verrucosum*, Lindl.). It is, however, an *Amphiglossum*, as shown by the narrow oblong side lacinia of the lip, which at once distinguish it well from *Epidendrum floribundum*, H. B. K., whose calli it has. The anterior lacinia of the lip has its from its narrow base two diverging linear blunt shanks, just as in *Epidendrum verrucosum*, Sw. The leaves are linear acuminate with purple lines on the sheaths. The dimensions are those of a well-developed *Epidendrum verrucosum*, Sw. The general colour of the paniculate flowers is a whitish-ochre for the sepals and petals; the lip is white with three linear acute depressed mauve keels, the semi-ovate basilar calli being white. There is a single purple spot on each side lacinia of the androclinium. *H. G. Rehb. f.*

### MAXILLARIA PRÆSTANS, n. sp.†

The best thing in the cucullata group, exceeding in size by two-thirds every one of those species. It was sent me in April, 1884, and again this year, by Messrs. H. Low & Co., who received it from Guatemala, where it had been gathered by Mr. J. C. Lehman.

\* *Epidendrum (Amphiglossum) falsiloquum*, n. sp.—Ultra pedale, vaginis foliorum purpureo-livatis; laminis linearibus acuminatis (m. 0.14 : m. 0.05); panicula de foliis distante, vaginis quibusdam inter folia et paucis acuminatis; ramis inflorescentiæ bene floridis; sepalis oblongis margine involutis lateralibus acutis; tepalibus linearibus obtusis; labello trifido, lacinia lateralibus oblongis angustis; lacinia mediana a basi lato lineariter bicorni, cruribus divaricatis linearibus retusis sinu amplo separatis; callis semiovariis duobus in basi parvis, carinis depressis acutis crasse approximatis terius in disco. *H. G. Rehb. f.*

† *Maxillaria præstans*, n. sp.—Affinis *Maxillariæ cucullatæ*, Lindl.; pseudobulbo aciculi utriusque convexo; folio cucullato ligulato obtuse acuto; pedunculo late vaginato; bractea cucullata acuta ovarium non omnino æquanti; sepalis ligulato-trifidis; tepalibus linearibus obtusis; labello trifido, lacinia lateralibus humilibus obtuse acutis, lacinia mediana cucullato oblongo acuta, crassa, callo labelli a basi in basin, lacinia acutæ antice abrupte crasseque obtusato, lateribus argute marginato, callo altero trilobo in basi columnæ. Guatemala. *H. G. Rehb. f.*

The bulb is oblong aciculous, with convex sides, nearly as shining as those of *Odontoglossum citrosolum*. The leaf is of parchment texture, cucullate ligulate, blunt acute. The sheaths of the peduncle are wide and aciculous, as is the bract, which does not quite equal the stalked ovary. Sepals ligulate acute. Tepals narrow, shorter, acuminate, 1884, blunt, acute, 1885. All of a honey colour, yellow, with brown spots on base. Lip trifid, side-lacinia short, blunt triangular, mid-lacinia cucullate oblong acute, very thick brownish-yellow, with very numerous small brown spots, the basilar lacinia are whitish with purple spots. Callus ligulate, blunt in front, margins argute. Columna trigonous, yellow, with many purple spots in front below, and a trilobed orange callus at the base. I had it in April, 1884, without bulb and leaf, and now a second time with those necessary additions, which enable me to describe it finally. *H. G. Rehb. f.*

### IPOMÆA HORSFALLIÆ, et aff.\*

Some year or two ago a very handsome white-flowered *Ipomœa* was introduced to our gardens under the name of *Ipomœa Horsfalliæ* alba. A comparison, however, soon showed that the plant in question could hardly be appropriately referred to *I. Horsfalliæ*, and it was subsequently described and figured in these columns as *Ipomœa Thomsoniana*. In the course of the necessary researches it was ascertained that no wild specimen of *I. Horsfalliæ* existed in the Kew herbarium, and that nothing definite had been added to our knowledge of its native country since Sir William Hooker wrote in 1835 (*Botanical Magazine*, t. 3315) that the plant was introduced from "seeds received by Charles Horsfall, Esq., either from Africa or from the East Indies." So far as Africa is concerned there is no evidence of its occurrence in that continent, and the plant is not mentioned in the recent revision of Indian *Convolvulaceæ*, by Mr. C. C. Clarke in Hooker's *Flora of British India*, nor is it included in Grisebach's *Flora of the West Indian Islands*.

Against this negative evidence I have now to offer the positive testimony of Mr. Hart, who, noting what was said as to the insufficiency of our knowledge of the native country of this species, kindly informed me that *I. Horsfalliæ* was a native of Jamaica, and who has recently been so good as to send specimens from that island in support of his assertion, without, however, specifying the precise locality from which they were obtained. The wild specimens of *I. Horsfalliæ* sent by Mr. Hart agree so closely with the cultivated plant that there is no doubt of their specific identity. The leaves are glabrous, somewhat leathery, ovate orbicular in outline, quinate digitate, the central leaflet largest, all ovate lanceolate, tapering at the base, but not stalked, the apex acute or prolonged into a long acumens. The inflorescence is a many-flowered, relatively dense, fan-shaped or umbellate, dichotomous cyme, with straight, radiating, slender branches. The flowers are about 1½ to 2 inches long, cylindrate-campanulate, purplish-red, with the limb slightly reflected.

### IPOMÆA MACRORHIZA.†

Together with this specimen Mr. Hart sends specimens of *Ipomœa macrorhiza*, R. S., a common Jamaica species, with glabrous, leathery, ovate-orbicular 3-7 foliolate leaves, the leaflets shortly stalked, broadly ovate, acute, or acuminate. The inflorescence is a loose, much-branched, many-flowered cyme, with divaricate, curved, rather thick branches. The flowers are 2½ inches long, red, purple, or white, and broadly funnel-shaped or campanulate, with a spreading limb.

Mr. Hart also sends an *Ipomœa* with blue flowers, which appears from the dried specimens to be merely a form of *I. macrorhiza*, with which it seems to agree in all points except in smaller stature.

\* *Ipomœa Horsfalliæ*, Hook., *Bot. Mag.*, t. 3315 (1835) — Char. auct. glabra; foliis subcoriaceis ovato-orbicularibus quinotidigitatis, foliolis sessilibus ovato-lanceolatis acutis vel acuminatis, basi angustatis; inflorescentia flabellatim acuminata, pedunculis gracilibus rectis radiantibus; floribus ad 2 poll. long, rubro-purpureis cylindrate-campanulatis. — Ex Jamaica, ubi spontanea, misit cl. Hart.

† *Ipomœa macrorhiza*, R. S. ex Grisebach, *Fl. Brit. W. Indies*, p. 471. — Glabra; foliis valde coriaceis ovato-orbicularibus 3-7-foliolatis, foliolis sessilibus vel stipitatis, late ovatis acutis vel abrupte acuminatis; inflorescentia magna pluriflora laxè divaricatum cymosa, pedicellis crassiusculis arcuatis; floribus 2½-3 poll. long, rubris-purpureis vel albis, late infundibuliformi-campanulatis, seminibus pilosis.

## IPOMŒA TERNATA\*

of Jacquin is considered by Grisebach (p. 471), and probably with justice, as a variety of the preceding, with white flowers and ternate leaves. As figured by Jacquin, *Hort. Schönbr.*, t. 37, the leaves have a great resemblance to those of *I. Thomsoniana*, but the leaflets are more nearly sessile, not so broad, much more acuminate; the flowers are smaller, and the peduncles solitary, axillary, one-flowered. Probably this last character is inconstant, otherwise it would be a marked point of difference.

## IPOMŒA THOMSONIANA,†

for garden purposes, may be kept distinct, though botanically it is probably, like *I. ternata*, a mere form of *I. macrorhiza*. Its marked characteristics, well shown in our figure, 817, Dec. 29, 1883, are the thick ternate leaves, the leaflets of which are distinctly stalked, ovate-suborbicular acute, but not acuminate, while the much-branched inflorescence is like that of *I. macrorhiza*, but with larger flowers.

The species of *Ipomœa* vary so greatly in form of leaf, size, and colour of flower, that there is little doubt that for strictly botanical purposes the forms above-named are referable to two species, *I. Horsfallii*, which is, as things go, very distinct, and *I. macrorhiza*. *M. T. M.*

## PLANT PORTRAITS.

ACER HELDREICHII, *Gartenflora*, t. 1185.

ANDERSONIA DEPRESSA, A. CERULEA, A. HOMOLOSTOMA.—Three pretty Epacrids, all three with bluish flowers, figured in the *Gartenflora*, t. 1180.

APHELANDRA FASCINATOR, *Revue de l'Horticulture Belge*, April.

BOMAREA CALDASIANA, Herbert, *Illustration Horticole*, t. 560.

BRUNSVIGIA MAGNIFICA, Lind. et Rodigas; *Illustration Horticole*, t. 562.—Flowers like those of a *Crinum*, segments white, with a central red band.

KOROLKOWIA SEWERZOWI.—A species with tall erect stems, broadly lanceolate leaves and erect racemes of brownish-green flowers, the six segments of which are marked with a triangular blotch at the base. *Gartenflora*, t. 1181.

LILIUM NEILGHERENSE, *Garden*, April 18.

LEPTOSPERMUM ANNE, Stein., *Gartenflora*, t. 1184.

PHILLYREA VILMORINIANA, *Bot. Mag.*, t. 6800; *Gard. Chron.* 1883, p. 494.

## NARCISSUS NAMES.

THERE is one point in connection with the resolution that was passed at the Congress last year which was not expressly considered at the time, and to which I should like now to draw attention, because it is clear from recent discussions that different people understand the matter in different senses.

The resolution, which was passed unanimously, ran as follows, "That in the opinion of this Conference uniformity of nomenclature is most desirable, and that garden varieties of *Narcissi*, whether known hybrids or natural seedlings, should be named and numbered in the manner adopted by florists, and not by botanists;" and upon this basis we proceeded to class out the different types into species, subspecies, varieties, forms, and monstrosities.

The question which arises now, which we did not expressly consider at the Conference, is—how does this resolution bear upon the names of a number of types which have been duly described and characterised under Latin names by botanical authors, but which we do not consider distinct enough to rank even as well-marked varieties? Such are the Scuticus form of *Pseudo-Narcissus*, the spurius and maximus forms of major, the major, media, and minor forms of *Jonquilla*, and the *Campanelli*, *trilobus*, and *rugulosus* forms of odorus. For my own part I never for one moment understood the resolution as implying that such names as these were to be abolished and replaced by vernacular names. All those which I have just cited were employed and defined in Haworth's *Monograph* in 1838. They

have also been adopted and defined in Roemer's *Monograph of the Amaryllidaceæ*, and in Kunth's *Enumeratio*, and without definition in the two editions of Steudel's *Nomenclator*—three books which have been universally circulated amongst botanists. To get rid of them after they have had such a wide circulation, however desirable it might be in the abstract, is in practice perfectly impossible. The only chance there is of getting our resolution carried out is to understand it (as for my own part I understood it at the time of passing) as applying to all forms not distinct enough to be worth regarding as varieties in a botanical sense, which had not already received Latin names, accompanied by a definition, according to the ordinary botanical usage. If we draw the line at this point I think there is a fair and reasonable chance of the resolution being carried out, and that it will set an excellent precedent in the naming of other garden plants. *J. G. Baker.*

## THE RETICULATA GROUP OF IRISES.

THIS new plant from Kharput (see *ante*, p. 470) makes the fifth of five *Irises* all closely related to each other, all very different from other *Irises*, and thus forming a well defined group, which may be fitly called the "reticulata group." Their diagnostic characters are: true bulbs, with netted coats, single flowers, and tetragonal leaves. No other bulbous *Irises* as yet known have netted coats, those of *I. sisyrinchium* not being truly netted,\* and the aberrant *Iris tuberosa*, or *Hermodactylus tuberosus*, the so-called Snake's-head

FIG. 103.—ANARA OBSOLETA. (SEE P. 565.)

*Iris*, is the only *Iris*, as far as I know, which has similar tetragonal leaves.

What the purpose of these square cut leaves is I do not know, nor do I understand why each is armed with a sharp point; it is not in order to pierce the soil, for the point becomes sharper and more pointed after it has appeared above the ground. In ignorance of its causation it is impossible to judge of the value of this character as a differential token, and it is consequently impossible to say whether the possession of the same kind of leaf indicates a real affinity between the *reticulata* group and *Iris tuberosa*, or whether this point of resemblance is wholly superficial. The flower of *I. tuberosa* is very different from that of *I. reticulata*, the ovary of the former is singular among *Irises* in being, not three-chambered, but one-chambered (or, rather, three chambers thrown into one), and the resting phase is a tuber, not a bulb. These facts point to an enormous difference between the two forms, and, indeed, the characters of the ovary in *I. tuberosa* have led botanists to make a genus, *Hermodactylus*, out of the single form. I must confess that the splitting, so to speak, of the ovary (or rather the failure of its segments to unite) seems to me a freak of subordinate taxonomic value; and with regard to the tuberous character it must be remembered that *I. tuberosa* is in the first year from seed in superficial appearance a bulb, wholly unlike what it afterwards becomes,

though I cannot say that I have determined its real character by dissection. On the whole I am inclined to think that the affinities of *I. tuberosa* to *I. reticulata* are strong, and the differences not so striking as they at first appear. However, these differences are in any case sufficient to separate the one from the other.

The geographical distribution of the *reticulata* group is limited. Their habitat, as far as is at present known, extends from Palestine through Asia Minor and the Caucasus to Persia, where they seem to die out. They are wholly absent from Europe and North Africa, and among the many new *Irises* from Central Asia with which Russian energy has enriched science no member of this group has yet appeared, *I. Kolpakowskiana* being allied to *I. sisyrinchium*, and not to this group.

The two best known members of this group are (A) the typical *Iris reticulata* of Bieberstein, and (B) the form known as *Iris Krelagei*, or *I. reticulata* var. *Krelagei*. They may be distinguished from each other as follows:—

In A the prevailing colour is a deep blue-purple; in B a red-purple, varying much in degrees of blueness or depth. In A the lateral part of the claw of the fall is of a nearly uniform colour, the veining being indistinct; in B the veins on these parts stand out conspicuously on a paler ground, becoming confluent, however, at the extreme edge.

In A the falls (and the styles) are longer in proportion to their breadth than in B, and a slight constriction or notch at the junction of the claw and blade of the fall is more marked in B than in A. In B also the blade of the fall is rounder and broader, with a greater tendency to be reflexed than in A, in which it is rather more pointed.

In A the tube is exerted, rising above the spathe valves for 1, 2, or even 3 inches, whereas in B it frequently surpasses them by less than an inch; but this is an extremely variable character, and cannot be depended on. As far as I have seen the capsule of A is long and slender, three times as long as broad, and borne up from the ground on a peduncle, whereas that of B is short and broad, and remains half-buried in the ground. A is delightfully fragrant, with an odour somewhat like that of the Violet. B is quite inodorous.

The red-purple or plain colour of B, and the compactness given by its shorter, broader parts enable any one at a glance to distinguish its flowers from the deep blue-purple, slender, more open flowers of A.

In B the flowers vary very much indeed in size and in depth of colour. Some blooms are nearly as large as those of *I. xiphion* (the Spanish *Iris*), while others have falls hardly much more than an inch in length. In some blooms the falls are of a pale miserably washed-out red-purple or "plum" colour; in others the falls have a most beautiful deep rich hue, at times so deep and dark as to be nearly black. The differences thus appearing are, however, too slight and the different forms pass too gradually the one into the other, to permit the use of distinctive names.

The form, however, distributed by Haage & Schmidt two years ago, under the name of *I. reticulata cyanea*, is in many respects a very distinct variety. The flowers, as far as shape, stature, and want of fragrance are concerned, are like the ordinary *Krelagei*, but they are small, and their colour is distinctly blue, the red having almost wholly disappeared. The standards and styles are of a light bright blue, which may perhaps be called cyanic, i.e., a blue intermediate between sky-blue and indigo, though to my eyes it is not quite correctly described by this term. The claw of the fall is of a somewhat darker tint and the lamina of the fall is a much darker blue, nearly an indigo. The pollen instead of being white or bluish-white, or yellow, is in my specimens olive-green. My friend, Mr. Max Leichtlin, however, speaks of his specimens as having yellow pollen. The plant appears to be native in the Caucasus, and is so distinct as to deserve a separate name. The differences in colour appear at first sight to make this kind as distinct from B as B is from A; but the more important resemblances of form seem to me to indicate a close relationship to B. It might be called *I. reticulata Krelagei* var. *cyanea*, or more shortly *I. Krelagei cyanea*.

The typical *I. reticulata*, A, varies much less than does the *Krelagei* form B, as far as my experience goes. The late Mr. Nelson raised some seedlings having all the characters of the type, including the fragrance, except that the prevailing tone of colour is a light blue,

\* *Ipomœa macrorhizavar. ternata* (= *I. ternata*, Jacquin).—Folius ternatis, foliolis subsessilibus, pedunculo axillari solitario r-fiori.

† *Ipomœa macrorhiza* var. *Thomsoniana*, Mast.—Glabra; foliis valde coriaceis ternatis, foliolis suborbicularibus acutis, valde petiolulatis; inflorescentia ut in typo. Mast., in *Gard. Chron.*, Dec. 29, 1883, p. 817, c. icon.

\* Each of the many coats of a bulb of *I. sisyrinchium* presents a lattice-work, the secondary veins passing from the primary veins obliquely, leatherwise, and joining the neighbouring veins, but not crossing each other. In the truly netted coats of the *reticulata* group the secondary veins cross over and join each other in many directions, forming a network, with irregular but elongate rhomboidal meshes.

some being lighter than others. These plants are very beautiful, but they do not seem to be sufficiently distinct to warrant other than trivial names being allotted to them. The same may be said of another of Mr. Nelson's seedlings, called by him *I. reticulata* major, distinguished by its size, and especially by its tallness as well as by the more spreading character of the fall; it also has rather more blue in its purple than has the type.

My friend Mr. Max Leichtlin has very kindly sent me seedlings of his raising, which appear, like some seedlings of my own, to be the offspring of both A and B; at least they combine certain characters of both. They are as tall as A, the shape of the flowers partakes rather more of B than of A, and the colour, though variable, seems to run towards a red-purple; one of them is so dark, however, as to appear nearly black; and he has others which I have not seen. These also, I think, should receive trivial names only.

The name *reticulata* was first used by M. von Bieberstein (*Cent. Pl. Kar. Ross. i., t. 11.*), and Regel states that the plant which Bieberstein described was of the form A; this name should, therefore, be kept for this form. The form B Krelagei was first described by Regel (*Animad.*, 15; also *Gartenflora*, xxii., p. 354), his attention having been drawn to the differences between it and the type by Mr. Krelage. Regel states that A is found in Iberia, Cachetia, and Palestine; whereas B is found in the Caucasus, Transcaucasus, and Persia, the plants near Tiflis seeming to be all of this form. The plant figured in Loddiges' *Bot. Cab.*, t. 1829, said to have come from Iberia, is the form B Krelagei, as is also the figure in Sweet, *Brit. Fl. G.*, 2d ser. ii., t. 189, from a plant said to have been brought from the Crimea (?). It is difficult to be quite sure which form is represented in *Bot. Mag.*, t. 5577, the plant figured coming from Persia, but it is probably B Krelagei. *Gartenflora*, t. 779a, represents A, and B of the same plate represents B. The plant originally described by Bieberstein is said to have come from Georgia. In all probability the two forms have no absolutely distinct geographical areas, and it is also possible that intermediate forms corresponding to the seedlings spoken of above may prove to exist in a wild state.

In respect to beauty, A must always hold the front rank, the light blue Nelson seedling, called by him *coerulea*, being, perhaps, no less lovely than the type. The larger deeper coloured Krelagei forms are also very beautiful, but the smaller and lighter coloured ones are very inferior. The variety *cyanea* is particularly charming, and all the Krelagei forms have this merit, that they flower some weeks, or at least, many days, before the type A, the variety *cyanea* being especially precocious, as far as two years' experience will enable me to judge.

c. *I. Histrio* differs from the above in the following points:—The spathe-valves are nearly colourless instead of being green. The leaves shoot up to a greater height before the bud appears and are taller at flowering time, being sometimes nearly a foot or more high, whereas those of *I. reticulata* are at that time generally about 6 or 8 inches or even less, though after flowering they become as tall as those of *I. Histrio*. The flower is larger and broader in its parts than even *I. Krelagei*, the falls being especially broad, and the constriction between the claw and blade well marked, and the lamina is perhaps rather more pointed. The crests of the style are perhaps larger and longer than those of *I. reticulata*; but this cannot be insisted on, for the crests of the latter vary in size and form a good deal in different individuals. The style is more triangular, that is, narrowed at the base. The colour is a light blue with conspicuous blue-purple blotches or spots on the creamy-white ground of the lamina of the fall. It is not fragrant, and flowers before either *I. reticulata* or *I. Krelagei*, often blooming before Christmas in the open in favoured places in England. In all other respects, including the characters of the bulb, *I. Histrio* does not seem to me to differ from *I. reticulata*, though I cannot speak as to the capsule, which I have not seen. The colour is undoubtedly strikingly different, but colour is admittedly an unsafe differential feature; and if this be put on one side, *I. Histrio* is, it seems to me, less removed from *I. Krelagei* than is *I. Krelagei* from the type. And indeed Regel has described it (*Gartenflora*, t. 797) as *I. reticulata*  $\gamma$  *cyanea*.\*

\* This might be an objection to giving the name *cyanea* to the Haage and Schmidt's form described, but no difficulty will arise if the word Krelagei be always used in speaking of this form.

d. The new form, which I have described at p. 470 under the name of *sophenensis*, differs from the foregoing, in its low stature, in the appearance of flowers while the leaves are as yet hardly visible, in the flower being more spreading, less turbinate, and smaller, in the very long narrow claw and obtuse blade of the fall, in the presence of a slight crest on the claw of the fall, and in colour.

e. The form which I have described at p. 438 as *I. Vartan* differs from all the above in the bulb being a more elongated oval, in the contrast presented in the fall between the narrow claw and the much broader lanceolate blade, in the fairly conspicuous ridge or crest on the claw of the fall, in the remarkably long and pointed crests of the style, in colour, and (probably) in the time of flowering. M. Foster.

(To be continued.)

## GERMINATION OF VICTORIA REGIA.

THE accompanying sketch (fig. 104) shows the gradual development of parts in the course of germination. If allowed to drop naturally into the tank where grown, the seeds will germinate in from two to four months, if the water be kept at 80° Fahr. The water at the bottom of a tank is generally, if not always, perceptibly colder than at the top; it is, therefore, obvious that the seeds germinate, though slowly, at a lower temperature than the above-mentioned. A in the figure represents a vertical section of the seed magnified. The greater bulk of the interior is occupied by a floury perisperm, generally called albumen, and consists for the greater part of starch, for which reason the seeds have been used as food. At B the little embryo is shown, surrounded by the endosperm, filling the embryo sac. This latter character is far from being common amongst seeds. At C the two cotyledons are removed from the seed. Naturally, however, they remain in the testa till all the reserve material has been used up, and the radicle at R (which never develops to any size), and the first internode at D, all decay. Adventitious roots are freely produced at the second node, E, where the first true leaf arises, constituting the base of the persistent rootstock or rhizome of the plant. The figures refer to the order of development of the leaves. The fourth leaf is the first one that becomes peltate, showing a remarkable advance on the first, which is merely a naked petiole. This shield-like leaf will be thrown to the surface of the water, even should it be 1 or 2 feet deep. After a few more gradations the leaf produced will assume the adult round form. F.

## FORESTRY.

### WHY DO OUR WOODS NOT PAY?

BECAUSE the different species of trees are not grown in groups or masses by themselves, and do not grow fast enough and long enough to attain their size and natural perfection. Some of the most valuable crops of Oak timber I have ever seen, or known, have been grown in groups or masses by themselves.

Possibly one of the greatest evils attending the culture of Oak timber is that of overcrowding the trees in their young state, either by standing too close to one another, or, what is more common, and usually more fatal, by confining them amongst other species, as Spruce, Scotch Fir, and others by way of what is termed nursing. The term "nurse" is a very kindly one, and possesses a sort of natural charm, even the very sound has music in it. With the term "nurse," however, we find no fault, but the practice of growing Oak timber amongst thickly branched and densely foliated trees, either of its own or other species, so as to interfere with their proper development, is a practice that cannot be too severely reprobated. Before pronouncing judgment, however, it will probably be the wiser course to pass the subject in review and bring all available evidence to bear upon it, so as to make it perfectly clear. About thirty years ago I had for some time the management of a piece of Oak plantation of about 3 acres on the Buckhurst Park estate in Sussex, which had been most judiciously and successfully managed from its earliest growth. When I first knew it, it was about thirty years old, and the trees were in every respect in splendid condition and standing about 15 feet apart, or about 190 trees to

the acre. They were not mixed with any other species, but consisted entirely of Oak. The trees were all well branched, and their girth and height duly proportioned in every way. When at full maturity at 150 years' growth the crop may consist of about 100 trees to the acre, and there is strong presumptive evidence that each tree at 150 years old will contain about 60 cubic feet on an average—equal to 9000 feet at 1s. 6d. per foot = £675. My unqualified opinion is that no money value should be put upon the thinnings during the growth of the plantation, because during the greater part of that time there are considerable expenses entailed in maintaining the plantation, and the value of the thinnings, which should not be great if properly managed, may well be allowed to stand as an offset against such expense. Oak plantations grown as this was require very little personal attention at any time except thinning and a little pruning, consisting of removing, by means of the pruning chisel, any branch projecting from the main stem at so small an angle that the two surfaces of the bark are so compressed that a very serious defect is thereby ultimately produced in the tree, which either induces the limbs to divide and split off by storms, or so to grow that when the tree is cut into planks or otherwise it is so seriously defective at that part as to be of little value. Another example of an opposite character of an Oak plantation which I once had charge of in the South of Scotland may be cited as an example of the common but to my mind quite a wrong system of management. It was planted with the original intention of making it an ideal Oak plantation. The Oaks were originally planted about 10 to 12 feet apart, and the intervening space made up to 4½ feet with a mixture of Ash, Elm, Spanish Chestnut, Larch, and Norway Spruce. The plantation, which is mostly upon a sloping bank of good soil, had been very well attended to by way of thinning from its earliest years, and the Oaks especially had every possible attention paid them at every stage of their growth throughout. The plantation is now about sixty years old, may be regarded as faultless in every respect except perhaps one, namely, of far too little money value. The twofold defect is, that the trees are individually too thin of branches, consequently too small of size, and too few of them upon the ground. They were uniformly sufficiently thinned at all stages of growth, that is to say, kept as far distant from each other as young Oak trees should be. Neither were the Spruce, Larch, or others growing amongst them, as nurses, ever allowed to approach, much less to touch the tenderly and duly cared for Oaks. In spite, however, of all kindnesses and attentions bestowed, failure, rather than success, has been the certain result. By this time (sixty years) the trees should individually have been making about 1 cubic foot annually, whereas the best of them are scarcely making over one-third of that quantity; and, taking the plantation all over, the average yearly growth of the whole trees can scarcely be said to exceed one-fourth of a cubic foot. The number of trees as they now stand upon the ground is about 75 per acre, whereas there should have been at least 100. These facts speak for themselves, and it is wisdom to listen to their voice. There is, in the first place, in point of numbers, a loss to the extent of one-quarter, and in point of individual growth a loss of three-quarters. To make this still more plain, I will assume the value of the trees to have been 20s. each under proper treatment = £100, and the annual increase of each tree, 1 cubic foot, at 1s. 6d. per foot, equal to £7 10s. per acre annual growth. The plantation, however, as already shown, comprehends only seventy-five trees to the acre, instead of a hundred, as above, and therefore the annual growth per acre would only be worth £3 12s. 6d. The annual growth, however, instead of being 1 cubic foot, as above computed, is only a quarter of a foot, equal to only £1 17s. 6d. per annum.

Now had this plantation been composed of Oak alone, instead of being mixed with Spruce, Larch, &c. (the so-called nurses), it would have been of such increased value as to constitute it a very paying and profitable subject, instead of one of comparative loss and failure. The trees at no time of their history had ever such sufficiency of branches upon them as to enable them to grow as fast as was necessary for them in order to make them a paying and profitable crop. What is to be seen in this plantation is unfortunately to be witnessed in by far the larger number all over the country.

If Oak and all others as well were grown in such a way as to attain at once their proper size, age, and maturity, it would fill many with much surprise, and prove a benefit and blessing alike to landed proprietors and the whole nation. Individual giant Oak trees have from time to time commanded prices quite marvellous. Mr. Stening, an extensive timber merchant in East Grinstead, Sussex, told the writer many years ago he had paid as much as £50 for a single tree; adding, "others have doubtless paid much higher prices than that." However much is paid for a single tree, it by no means follows that such monarchs actually pay the grower better than a crop of much smaller trees. I attended a timber sale of Oak at Pens Rocks, near Tunbridge Wells, in Sussex, on April 20, 1854. The lot consisted of a hundred trees, and the sum at which they were sold was £1000. I examined the trees very carefully the day preceding the sale, and found that rather more than that number would have grown upon an acre. They were fine trees certainly, and well grown, but none of them of large size, few exceeding 60 cubic feet, and a few below 30 feet. Counting the rings indicating the annual growths, they were about 150

every arrangement made to commence work as soon as the bark will "run." Where convenient, portable drying sheds, or, failing these, tarpaulins, are of the greatest value in wet seasons; indeed even in ordinary seasons a first-class sample of bark cannot easily be produced without them. As each district has its peculiarities as regards the stripping and harvesting of bark, as well indeed as tools in use, elaborate directions regarding such are unnecessary. Previous to felling the trees we may, however, state that it is well to remove a few feet of the body bark, not only for greater convenience in stripping, but to prevent unnecessary damage and waste. The larger trees should be peeled where they fall, but it will be found convenient to have the smaller carried out to the stacking ground and stripped, while one end rests upon a large piece of timber or horse specially constructed for the purpose. In removing the bark the ordinary hammering or beating should, as much as possible, be avoided, as such a process lessens its value very materially, and also adds to the risk of successful harvesting. The body bark should be removed in not less than 3 feet lengths, and that on the branches in any sizes found most convenient.

Keep the boys constantly going in the borders as the weeds begin to grow, the important but oft neglected point being never to allow a weed to go to seed. Early weeding is especially necessary in young seed beds, for when the weeds gain strength and attain full size, their removal interferes materially with the young plants. Pay attention to recent grafts, and never allow the clay to become cracked and fall off. Remove suckers or shoots from the stock, should such put in an appearance.

Coniferous seeds, if not already sown, should at once be committed to the ground, and the surface of early sown beds should be loosened by means of a light roller. Refuse materials for forming compost heaps may be collected as opportunity offers. Where ditch scourings, mud or road scrapings are used, lime should be freely mixed in the composition, as such raw materials are unfitted for nursery work without the addition of some such active quickening power as that of ordinary lime or chalk. Look over newly planted ground and firm any of the trees that have become loosened by the wind. The stakes and moorings of large transplants will also require attention, so that all damages may be rectified at once. Large trees or evergreens in the nursery borders that are ultimately intended to stand singly or as specimen plants should have ample room provided previous to their final shift, so as to induce a well balanced head and also to harden them. *A. D. Webster, Penryn Castle, North Wales.*

## PRIMROSES.

(Concluded from p. 53.)

In the section of Primroses which are not thoroughly terrestrial nor completely rock-loving, and for which *P. viscosa* may be given as a type, we find:—

*P. Clusiana*, Tausch, the most beautiful of all the Tyrolean species. The flowers are of a very bright rose colour, large and brilliant. They produce a charming effect as much by their numbers as by the size and colour of their corollas. This plant likes lime, and does not mind exposure to the sun. However it is as well to let it have, like all alpine Primulas, an eastern aspect.

*P. carniolica*, Jacquin.—This pretty little plant grows in the dry and sunny territories of the Alps of Carinthia and Carniola. It has a beautiful foliage, and deep lilac flowers with a centre of pure white. It flowers in May or June.

*P. calycina*, Daby.—Southern Alps. Has large flowers of a clear lilac and glossy foliage. It resembles the preceding species, but is stiffer in habit, and differs also in colour. May to June.

*P. Muretiana*, Moritz, is a beautiful species, from the high Alps. It is perhaps a hybrid between *P. viscosa* and *P. integrifolia*. This plant is very vigorous, easy to cultivate in deep light soil, and in a cool position. We have some beautiful specimens in the gardens which are covered with buds. This plant supports Darwin's theory, that hybrids are more vigorous than their parents.

*P. viscosa*, Allioni.—A native of the granitic Alps. This is especially a rock-loving species, and is found more often in shaded clefts of rocks than on grassy slopes. It is, next to *P. Auricula*, the species which is most widely distributed in the Swiss Alps. It forms sometimes a regular carpet of purple flowers, which produce a fine effect. To succeed well it must be planted in a well-drained soil, rich in humus, not very deep, or in the fissures of rocks looking to the east or west. It flowers well in cultivation, and with *P. Auricula* makes hybrids. With us it flowers in April or May. There is a variety with pure white flowers.

*P. villosa*, Wulfen, is a species perfectly distinct from the preceding, with which it is often confounded. The true *P. villosa* is not found in the Central Alps; it is only met with in Carinthia and in the districts where crystalline limestone predominates. The flower is twice as large as that of *P. viscosa*, of a deep purple-rose, with a white centre, and an orange-yellow eye at the top of the tube. It is a very fine plant, requiring, in order to flower it well, a cool position and a stony soil. I add a little sphagnum to the soil, and it succeeds well. Under cultivation it flowers in April.

*P. hirsuta*, Allioni.—This is a still larger species than the preceding. The flowers are of a pale lilac colour, with a centre still paler. Its foliage is downy. It is found in Eastern Switzerland and in Tyrol at

FIG. 104.—GERMINATION OF THE SEED OF VICTORIA REGIA. (SEE P. 568.)

years old. The ground they grew upon was natural pasture, worth in its natural state about 10s. per acre for grazing. *C. Y. Michie, Cullen House, Cullen, Banffshire, March 26.*

(To be continued.)

## BARKING.

THE genial nature of the past season has enabled all forestry operations to be carried on with despatch, and foresters should now be well prepared for the bark stripping season, which in most districts will commence about the middle of the present month. In many of our Oak plantations the sap is already showing signs of activity, and as the richest and best bark, for which the highest price can be obtained, is stripped from the trees immediately after the sap commences to flow freely, not a day should be lost in commencing operations, and continuing them with the utmost expedition till the intended fall is completed, or the season ends.

In our variable climate the securing of first-rate bark and the highest market price is no easy task, and the forester, to be really successful in obtaining these, should not only be well supplied with all the necessary tools and appliances for saving the bark, but

Branches down to 1 inch in diameter may be peeled. As soon as stripped, the bark should be removed to the drying ground and carefully arranged on the stages with the fleshy side always downwards. The drying stages, it is almost unnecessary to state, should be erected in an open, airy part of the wood—a southern or western exposure is preferable, and as close to clearance roads as possible.

## DRYING THE BARK.

With careful stacking, and during an ordinary season, little or no turning will be necessary, but should unfavourable weather intervene it may be found desirable to rearrange the bark on the stages during a fine day. About fourteen days in stack, with ordinary fine weather, will put the bark in order for delivery, when it should be of a bright creamy-white, a brownish hue indicating little tanning matter, or injury from exposure to rain.

## NURSERY WORK

should still be prosecuted with unabated vigour, and all transplanting finished as soon as possible. It is a good plan to add to the ordinary nursery hands a few extra men and boys, so that the general routine of early May work may be speedily accomplished.

an elevation of 6500 feet. Culture same as for the preceding species. May to June.

*P. oinensis*, Thomasini.—A native of Tyrol, and of the Eastern Swiss Alps. It grows at a height of from 6500 to 9800 feet. It is a very pretty plant, of small size, and with large pale rose coloured flowers, with a white centre. The same culture as for the preceding. May to June.

*P. pubescens*, Jacquin.—A very pretty species from Tyrol, which is met with at an elevation of 6500 feet; it is of modest dimensions, bearing few flowers, but of a very bright and brilliant rose colour, with a centre of golden-yellow, borne on a slender and graceful stem.

*P. alpina*, Schleicher, has large flowers of a very brilliant violet-purple. It is found at from 6500 to 9800 feet in the Grisons, and bears large and beautiful flowers. These two species may be hybrids between *viscosa* and *Auricula*; they are brilliant in colour, but of very small size. They require a porous soil mixed with sphagnum.

*P. commutata*, Schott.—Eastern Alps. A rare and very pretty species, which is only found in the porphyritic region. May to June. It is a vigorous species, which requires a sunny position but porous soil, furnished with sphagnum, rich in humus, and well drained. It has large and pretty bright rose-coloured flowers.

*P. ciliata*, Schrank.—Tyrol. A species with purple flowers, with broad petals and very hairy. May.

*P. confinis*, Reichenbach.—Piedmont. This species approaches the former, but is larger and more vigorous, and possesses flowers of such a deep rose colour as to pass sometimes into brown. The blooms are much ciliated. May to June.

*P. pedemontana*, Thomasini.—Piedmont. Limb of the corolla borne on an elongated tube, and of a bright rose colour, sometimes pale lilac with a yellow centre. May to June.

#### SECTION IV.

In the fourth section, including Primroses with rhizomes, we find:—

*P. cortusoides*, Linnaeus, with all its varieties. I mention this species because it is the type of this section, although it is not alpine, and strictly should not figure in this list. The cultivation is easy. There is no need to speak of it here. But with it I will mention the *Cortusas* which belong to our alpine ranges, and which are closely allied to the Primulas.

*Cortusa Mathioli*, Linnaeus.—Tyrolean and Austrian Alps. It is met with also in the Grisons in Switzerland. It has a pretty little flower of a bright rose colour, borne on a red hairy stem and framed in fine and bright foliage. From twelve to fifteen flowers spring from the same stem, and form very handsome little tufts. It likes a cool and slightly shaded position in a well-drained and porous soil. May to June. There is a variety with large flowers which bloomed very abundantly last year in the Garden of Acclimatization.

*Cortusa pubens* of the Eastern Alps is an elegant species, smaller than *C. Mathioli*; it needs the same cultivation.

We are growing in the Garden of Acclimatization a certain quantity of alpine Primroses which have not yet flowered, and of which I can only say that all are in good health, and promise a successful result. I will give an account of them at a future time. They are:—*P. Berninae*, Kerner (*hirsuta* × *viscosa*), Tyrol; *P. biflora*, Hüter (*Flörkiana* × *minima*), Tyrol; *P. Kitaibeliana*, Schott, Tyrol; *P. Portae*, Hüter, Tyrol; *P. stricta*, Horner, Tyrol; *P. arcuata*, Kerner (*Auricula* × *hirsuta*); *P. Hüeri*, Kerner (*Flörkeana* × *glutinosus*), Tyrol.

The geographical distribution of Primulas is very curious to note. Whilst the Eastern and Tyrolean Alps are singularly rich in species and hybrids the Western Alps, on the contrary, have but very few species, and only include one (*P. marginata*) absolutely peculiar to them. I have not been able, in spite of many searches, to find a hybrid in our Western Swiss Alps. Why is that? Can it be because we possess fewer of those fertilising insects needed for hybridising species? According to H. Müller Primroses are for the most part diurnal flowers, i.e., those in which the fertilisation takes place during the day. It would be very easy to study and observe the cause of hybridisation in the course of alpine excursions. I may add that Primulas spread themselves easily by means of seed in a compost of one third peat, one-third

sphagnum (sifted), one-third sand. They germinate in about four or five months. *Henry Correvon, Geneva.*

## Orchid Notes and Gleanings.

### DENDROBIUM NOBILE.

THIS is one of the most useful and beautiful plants we have; it is very easily managed, and with careful treatment can be kept in bloom four or five months of the year, so that no garden should be without it. Also it is useful for the drawing-rooms and the conservatory, where it will keep in perfection for three or four weeks. The first of my plants to bloom come in about the 1st of January, and keep up a succession until April, and could be kept much longer if required. I grow about thirty plants in 5-inch, 8-inch, and 9-inch pots. I find the most successful treatment is to grow them on in heat. As soon as they have done flowering they should be placed on a shelf in a hot-house or Pine-stove, where they flourish capitally, and make shoots  $2\frac{1}{2}$  to 3 feet long by the end of August, and some will have formed their flower-buds; many of them three parts the length of their bulbs are covered by the small dots, which can easily be seen on each side of the bulbs. They then should be removed to a cool, dry, airy house, such as one of the early vineries where the Grapes have been cut, and the house is thrown open day and night, and only shut up to exclude frost. The plants are kept very dry, with only sufficient water to keep the bulbs from shrivelling.

The plants are kept there till the end of November, when those with the most prominent flower-buds are chosen, and placed in the Pine-stove. They receive good watering, and syringing every fine day, and about a month from the time of placing them in heat they are in full bloom. The night heat is kept at 65°, the day at 70°. When nearly in full bloom the plants are removed to the conservatory or wherever they are required.

They keep longer in bloom in the conservatory if kept rather dry, which also tends to prevent them from losing their bloom by damp. They will succeed well in baskets treated in the same way, and I find them much more suitable for mixing with other plants, and for placing in vases in the drawing-rooms, &c. There are many more species of this beautiful genus that succeed almost equally well under the same treatment; such are *D. densiflorum*, *D. fimbriatum*, *D. chrysanthum*, &c.

Propagation is done by detaching one or more of the bulbs when in a dormant state, taking care when dividing them to injure the roots as little as possible. They should then be potted into good turfy peat and charcoal, raised above the edge of the pot, and mossed over, then placed in a strong moist heat of from 70° to 75°, and well supplied with water and syringed every day till they finish their growth, then placed under cold treatment as recommended above. *Wm. Smythe, Basing Park, Alton.*

### LÆLIA PERRINI NIVEA.

A beautiful evergreen variety, with flowers 6 inches across, flat, with a projecting lip; sepals oblong, petals oblong ovate, lip sheathing at the base, white, with a flattish ovate crenulate pink disc, and a whitish throat. The plant is a native of Brazil. *Orchid Album*, t. 181.

### PHALÆNOPSIS VIOLACEA.

A compact species with broad strap-shaped leaves and oblong flowers,  $2\frac{1}{2}$  by 2 inches, segments oblong, creamy-white, the two lower ones striped with purple; "lip clawed, three-lobed, the lateral lobes small, bifid, yellow, tipped with red, and with a golden-yellow callus—the front lobe clawed, obovate, oblong apiculate, deep reddish-purple; column deep purple, projected over the lip." A native of Singapore. *Orchid Album*, t. 182.

### ONCIDIUM JONESIANUM.

One of the section with quill-like foliage and long many-flowered racemes. The individual flowers are flattish oblong, 2 by  $1\frac{1}{4}$  inch, the segments roundish oblong, greenish, with bright chocolate spots, and a lip the front portion of which is transversely oblong, white. A native of Paraguay. It should be grown on a block suspended from the roof, with just suffi-

cient water to keep the bulbs and foliage in a plump condition. *Orchid Album*, t. 183.

### CATTLEYA BRYMERIANA.

Flowers  $5\frac{1}{2}$  inches across, sepals linear-oblong, rosy-lilac, like the oblong ovate petals; lip projecting, sheathing at the base, expanding in front into a rounded two-lobed magenta-coloured disc; throat golden-yellow. A native of Brazil. It flowers in September. The plants require all the light they can have. *Orchid Album*, t. 184.

## CAMELLIAS AT WALTON LEA, WARRINGTON.

At the gardens of J. Crossfield, Esq., a house is entirely devoted to the culture of this beautiful genus of plants, and at the present time there is such a magnificent show of bloom that many interested in gardening in Liverpool, Manchester, and the neighbourhood, daily make excursions thence. I had opportunity to inspect the plants last year, and lately in company with a gardening friend I had again the pleasure of viewing some thousands of Camellia blooms, set off by foliage of a rich dark green colour. The plants, of which there are about two dozen, are planted in the borders; a path traversing the centre of the house, and the house having a hip-span, one side is of necessity a little higher at the back than in the front. The plants along the front side, perfect pyramids with leaves down to the border, and flowers almost as low, are about 10 feet high by about 4 feet in breadth, and they have grown so that they have almost touched each other, so that they have been trained upwards rather than sideways. The first plant seen on entering is candidissima, a finely flowered plant, pure white; Duc de Bretagne, bright rose; fimbriata, beautifully fringed; Hendersoni, Lady Hume's Blush, Napoleon III., Jenny Lind, Comtesse Lavinia Maggi, and Jubilee. On the border at the back the plants are larger, and eight plants only are accommodated, but such models of perfect growth and flowering and wonderfully free. Hundreds of blooms are open on each, for all the sorts seem to succeed equally. On this side are Alba-plea, in several varieties; next to this is one that has rather interested me since seeing the gardening papers of Saturday, the 15th inst., viz., Commendatore Betti, a plant 12 feet by 5 feet, covered with flowers; ochroleuca, imbricata, Chandleri elegans, De la Reine. These plants are from 11 feet to 12 feet high by 5 feet in width, and are mostly perfect in shape. On a trellis at the back and end of the house are trained plants that are blooming equally well. One of reticulata covers a large space, its immense blooms, of a bright rose, and yellow stamens, being very remarkable. Mathotiana, also on a trellis, is blooming finely. Mr. W. Kippis, the gardener, has tended these and brought them to a state of perfection that deserves the highest praise. *W. Swan, Fallowfield.*

## FRUIT NOTES.

**WATERLOO PEACH.**—An early American variety, with kidney-shaped glands, medium-sized fruits, with a prominent nipple. The skin deep red on the sunny side flaked and spotted with brown. The flesh is free, white-reddish, with a good flavour. It is figured in the *Revue Horticole*.

### APPLE KING OF THE PIPPINS.

A Yorkshire correspondent expresses surprise at King of the Pippins having had most votes at the Apple Congress. He says:—"In this soil and climate it is our most useful dessert Apple, both for appearance and as a good bearer. It ripens well, keeps good to the end of December, and has a pleasant flavour. Cox's Orange Pippin never ripened well till last year. We still have Orange Pippin, Allen's Everlasting, Nonpareil, Claygate Pearmain, Northern Spy, Alfriston, and Dutch Mignonne, of which I found out the name at Chiswick in 1883, and was told it was a poor Apple. Anise is very good, both for table and kitchen, and the best bearer in the gardens. Alfriston is now a rich yellow colour, and has excellent flavour for dessert. Mother and Northern Spy are two of our richest flavoured Apples after Cornish Gilliflower. Blenheim Orange, rich with some sharpness. Dumelow's Seedling and Kirke's Lord Nelson the richest flavoured baking Apples. Elevation 340 feet above sea, soil rather light loam resting on

Danstone, a trap rock, soft in some places, hard in others, and porous. Ground can be worked readily three days after continuous heavy rain. A hill between this and the sea, no land as high as this between us and Dartmoor to the north-east. A King of the Pippins which I grafted on Ribston Pippin is richer coloured and more red striped than on the free stock." *H. R. R. N.*

## The Arboretum.

### NEW CONIFER: PICEA BREWERIANA.

MR. SERENO WATSON thus describes a new Californian Conifer:—Branches slender, often elongated and pendent, puberulent: leaves 5 to 12 lines long,  $\frac{1}{2}$  to nearly 1 line wide, strictly sessile upon the slender base, obtuse, smooth and rounded or slightly carinate above, stomatose beneath on each side of the slightly prominent mid-nerve; cones 3 inches long, narrowly cylindrical, attenuate at base; bracts linear-oblong (2 lines long), a fourth of the length of the puberulent scale, which is obovate, with the rounded thickish summit entire; seed  $1\frac{1}{2}$  line long, the wing 4 lines long by  $2\frac{1}{2}$  broad. This unusually distinct species has been found (by Thomas Howell, in June, 1884), only at high elevations in the Sierran Mountains, California, on the head waters of the Illinois river, in rather dry rocky ground. It grows to a height of from 100 to 150 feet, and a diameter of 1 to 3 feet. Bark reddish. The specific name is given in compliment to Professor W. H. Brewer, who in connection with the California State Geological Survey had so much to do with the botany of the State, both in the field and in the after disposal of the collections of the Survey. As he took special interest in the trees of the coast, and collected a large amount of material for their study, it is fitting thus to connect his name with the forest trees of California." *Proceedings of the American Academy*, 1884, p. 378.

### LARGE MOUNTAIN ASH.

Seldom indeed is it that one sees the above approaching what may be called tree size, the usual dimensions being from say 12 feet to 20 feet in height, with a stem of perhaps a foot in diameter. That it does, however, in a few cases exceed these, its prescribed dimensions, was forcibly brought under my notice some days since, when in a rather out-of-the-way corner I came across a specimen which measured as follows:—The stem girth at a yard up is 7 feet 8 inches, and the spread of branches covers a space of 42 feet in diameter. It is in perfect health, with a large well-balanced head, and must when in flower during summer be a very conspicuous ornament of the rather inconspicuous corner it so nobly fills. *A. D. Webster.*

## SAWDUST.

It not unfrequently happens on estates where steam or water power is employed that there are large accumulations of sawdust. In many cases, however, materials from the stables and homesteads, and the gatherings and sweepings of woodlands, lawns, and walks are so plentiful and readily available that there is no need to resort to the use of the apparently harsh and implacable residuum of the sawyard. But even in such exceptional instances, if the soil happen to be a clay or tenacious loam, a liberal admixture and incorporation of sawdust improves the texture of the soil very considerably.

It is not everywhere, however, that the gardener can direct his subordinates to the stable-yard or a huge wall of top spit of meadow or mound of leaf-mould for the means of restoring fertility to the soil. It may not, therefore, be without its uses to revert to some of the applications of sawdust for various purposes connected with the garden which have borne the test of practical experience.

The subject suggested itself to me lately while passing a neighbour's garden. Adjoining the garden, the soil of which consisted of the ordinary adhesive loam, with subsoil of clay, characteristic of the Thames Valley, was a vacant plot until lately occupied by a sawpit. The timber most frequently sawn was Elm, for coffin-boards. Ninety per cent. probably of the material in and around this old pit consisted of Elm

sawdust. There was enough to form a coating 18 inches deep on a space 20 yards by 10. My neighbour, a somewhat lazy gardener I fear, simply thrust in half a bushel of Magnum Bonum Potatoes, without taking the trouble even to fork over the soil. The material was pure Elm sawdust, some of it black with age, some of a rich amber, some of a snuff colour. The texture of the darkest was light, smooth, and silky to the touch, and would have formed, with the admixture of some silver-sand, admirable stuff for potting Heaths. Last September he lifted the crop, simply by taking hold of the haulm, and the Potatoes were a remarkably good crop of handsome tubers. Tyros like myself are so apt to forget, in preparing the beds for Potatoes, that the tuber can only grow in its normal shape by displacing the earth around it, and the more friable, soft, and yielding this is the better the chance of a shapely tuber.

Sawdust is not unfrequently used as bedding for horses and pigs. It is valuable as an absorbent for liquid manures, and especially in the case when applied to light porous soils, where these liquids would pass away too rapidly. It is chiefly valuable, however, when applied to heavy soils, which it tends to make porous and light. An objection has been urged against its use in a fresh condition, as it is liable to engender fungus, and on this account charring has been recommended previous to its application as a mulching or manure. Thoroughly incorporated with excrement from the farmyard, however, or saturated with liquid-manure, it forms a valuable dressing for ordinary farm and garden crops. Mixed with horse-droppings it has been found excellent material for Mushroom and Cucumber beds, and when used fresh furnishes a mild but lasting bottom-heat for plunging. Care must be taken to keep the drainage clear, as the sawdust is liable to clog and harden beneath the pot. There is no doubt that well decomposed sawdust, mixed with a bushel of common salt and a third of a bushel of lime per cubic yard, forms an excellent manure for fruit trees and Roses. *T. W. Harrow.*

## The Flower Garden.

### THE ROSE GARDEN.

ROSES are looking most promising this spring, after so mild a winter, and give great promise for the coming season. All pruning and tying should now be finished, and the beds well dressed with rich dung, which will invigorate the plants, and greatly tend to prolong the flowering season.

### THE SPRING GARDEN

is now looking well, although very late. *Myosotis dissitiflora* and *M. d. alba* are very gay, flowering abundantly, and not the least injured by the late frost. Climbers are looking well. Clematis and *Maréchal Niel* Rose are uninjured here on the south wall, and look promising.

### SUBTROPICAL PLANTS.

should be removed into a cool-house or cold pit. *Wm. Smythe, The Gardens, Basing Park, Alton.*

## FRUITS UNDER GLASS.

### PINES: FRUITERS.

If the plants that started into fruit about last February are in a satisfactory state of health, the fruit will swell off fairly well under any reasonable treatment; but at the same time it should be borne in mind, that plants which are subjected to the most congenial conditions, will in the end far exceed others; for this reason no efforts in the way of giving them proper treatment should be relaxed in any way.

### WATERING.

This, which, in my opinion, is the most important matter, and requires more experience to perform it properly than any other operation connected with Pine culture, must be seen to regularly. Every plant in a large pot should be examined by hand once a week at this period of the year. It may appear to some a tedious and troublesome process, but it is most essential, for as a rule more Pine plants are brought into a sickly state of health by injudicious watering than from any other cause; let, this matter, therefore, have the attention it deserves. Give diluted guano-water at a temperature of 80° to 90° to

every well-rooted plant plentifully when it needs it, and pour it into the centre around the fruit-stems of fruiting plants, so that the axils of the leaves may be well moistened and retain some of it afterwards.

### SUCKERS.

Assuming that one sucker has been left on each plant to perpetuate the stock, others which may appear should be screwed out by hand, otherwise they would take much nourishment away from the fruit.

### THE FRUIT.

As this increases in size and weight it must be supported in an erect position. I use for this purpose two sharp-pointed stakes which are carefully driven into the ball of earth in the pot on either side of the plant. A piece of moderately sized soft string is fastened to one stake and then twisted so as to inclose the fruit beneath the crown and tied to the other, which keeps the fruit and crown upright, and thereby enhances its appearance and value.

### TEMPERATURE.

Enough artificial heat should be supplied to keep the temperature required uniformly in the bed at 85° or 90°, the house at 75° at night and 80° in the daytime whenever unless weather prevails; on the contrary, slightly ventilate at 80°, and ventilate according to circumstances subsequently so as to maintain 90° or 95° when the place is fully opened. A proper course of airing is very essential in the fruit department in order to keep the subjects from becoming unduly tender and rendering them fit to withstand solar influences, unshaded; too much sunshine cannot be had in this climate to develop and perfect both the growth and fruit.

### SYRINGING, &c.

At the time of closing the house for the day, which with sun-heat should be at 90°, moisten all available parts of it and syringe the plants overhead with clear tepid water. Some growers incline to the course of syringing the surface of the bed between the plants. I disapprove of this practice because, unless it is most carefully done the soil about the collars of the plants will in the course of time become saturated, unwholesome, and thereby injurious. In suitable places, where the supply of moisture is inadequate, it is far better to sacrifice a row of plants in front of the place, and keep this space for saturation alone.

### SUCCESSIONS.

The successional batch of fruiting plants should be treated identically, except in the case of any that may be in flower, when perhaps the most prudent course is to avoid wetting the fruit until after this process is over. Plants which were started a short time ago, after being disrooted and repotted, will by this time have made new roots. These plants should now be watered in the usual way, and be shifted into pots 2 inches larger before the roots in the present pots are too much matted together. The chief point to aim at at the present time is to make them sturdy in habit; for this purpose they should be placed near the glass, and not too thickly together. Give them about 80° at the roots, a night temperature of 60° or 65°, and 70° in the day, with 5° or 10° more by sunshine; ventilate at 75° slightly, and increase it as the heat rises to 85°, when plenty of it should be admitted until closing time, which on sunny days will be at about 3 to 4 o'clock. As soon as the plants are sufficiently rooted to enable them to withstand sunshine, discontinue shading at once. *G. T. Miles, Wycombe Abbey.*

## The Kitchen Garden.

### FORCING DEPARTMENT: IN FRAMES WITHOUT HOT WATER.

POTATOES are turning out well. The tubers should be dug a day or two before they are required for use, previously allowing the soil in the frame to become rather dry, for the purpose of giving firmness and flavour to the tubers. As frames become vacant by the removal of such crops no time should be lost in starting a successional one.

Vegetable Marrows may be planted, and if syringed and closed with sun-heat Marrows may be had long before obtainable from outdoor plants started under handlights.

Similar remarks may be applied to French Beans.

Water the Turnips and Carrots freely, and keep the beds free from weeds. Our Early Milan Turnips are now ready to pull.

Advancing crops of French Beans should be kept well mulched in land that is very light. *G. H. Richards, Sonerley Gardens, Ringwood, Hants.*

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	May 4	Sale at Caversham Park, Reading, of the Collection of Plants formed by the late Mrs. Crawshaw, by Mr. Stevens (two days).
WEDNESDAY,	May 6	Sale of Carnations Picotees, &c., at Protheroe & Morris' Rooms. Meeting of the Linnean Society.
THURSDAY,	May 7	Sale of Imported and Established Orchids, at Stevens' Rooms.
FRIDAY,	May 8	Sale of Leasehold Property, known as Hill's Nursery, Fulham, by Protheroe & Morris. Sale of Imported and Established Orchids, at Protheroe & Morris' Rooms.

IN compliance with the wish of the Daffodil Committee an account is given in another column of the principal morphological changes which occur in what are called DOUBLE DAFFODILS. It is clear that several different changes are vaguely lumped together under the term "double," and it is probable that the conditions for their production may be correspondingly different. On this part of the subject, however, it is perhaps best to reserve any expression of opinion, especially one that would in any way savour of dogmatism. Certain facts are well established, others are not so. There is plenty of work to be done in the attempt to lessen the latter category, and when the task is completed we shall be in a position to draw sounder inferences. It is enough to say at present that, so far as the alleged change of single to double Daffodils under certain circumstances is concerned, there is, *within necessary limitations*, no structural reasons why it should not be. All depends upon the particular time and the stage of development of the embryo flower at which the change in condition occurs. The interest attaching to these double flowers on the part of the morphologist is very great, as an instance we may cite the case of the petaloid development of the ovules in *Dianella* figured in the present issue, p. 576—the first case of the kind, so far as we know, on record. To gardeners the production of double flowers has always been a matter of interest, but to the Daffodil Committee must be assigned the credit of being the first to endeavour to solve the matter by practical experiments.

But in the summer season events march fast, and long before the Daffodil mystery can be thrashed out the members of the Horticultural Press will have to be thinking of Orchid Conferences. Each flower has its turn, and the Royal Horticultural Society, very wisely as we think, affords an opportunity to the lovers of each to bring forward their favourites in their turn and to invite discussion thereon. On May 12 the ORCHID CONFERENCE at South Kensington will be opened, and in all probability a grand show will be got together. The subjects for discussion have already been announced.

In order to keep touch with a movement in which the conductors of this journal are, and have ever been, so peculiarly interested, we propose during the next two or three weeks to devote a large share of our space to the subject of Orchids. Next week, in anticipation of the Conference, we propose to present our readers with a lithographed map, prepared by Mr. F. W. BURBIDGE, and representing the geographical distribution of Orchids over the surface of the globe in relation to temperature and rainfall. In the same issue we hope to give an eight-page Supplement, containing a complete alphabetical list of all the genera of Orchids, compiled from BENTHAM and HOOKER's *Genera Plantarum*, and annotated by Mr. F. W. BURBIDGE. It is hoped that much information of a character likely to be useful to all Orchid growers will thus be supplied, together with references to illustrations, and especially to the copious literature and numerous illustrations given in these columns during the last forty years. Other matters of great interest to Orchid lovers will be adverted to in the two or three following numbers, such as the production of double Orchids, the most approved methods of cultivation, and other matters.

— THE ORCHID DINNER.—We are requested to state that the members of the Orchid Conference propose to dine together at the "Albion" Tavern, Aldersgate Street, on Tuesday, May 12, at 6.30, under the Presidency of Sir TREVOR LAWRENCE, Bart., Pres. R.H.S. It is expected that a large and influential gathering of the principal Orchid growers will take place. The tickets for the dinner (inclusive of wine) are priced at 25s. Gentlemen proposing to be present should communicate without delay to WM. LEE, Esq., Downside, Leatherhead.

— SACCOLABIUM BLUMEI.—Originally introduced from Java just fifty years ago, and since that time frequently received from various parts of India, the plant has always been well represented in collections, and from its free growth and floriferous habit it has been a general favourite. *S. Blumei* succeeds best in baskets in a very light situation on the stage, or suspended near the glass in an intermediate-house, ranging in temperature from 65° to 70° by day, with an extra 10° or more when the sun-heat gives it, the temperature being allowed to fall to near 60° at night, as nothing is more injurious to *Saccolabiums* than a high night temperature. The illustration (fig. 105) was taken from a plant grown by Mr. A. SIMPSON, gardener to the Right Hon. Lady ASHBURTON, Melchet Court, Romsey. Mr. SIMPSON says, "The plant photographed is growing in a basket 16 inches wide and 12 inches deep, suspended in a light airy position, within 2 feet of the glass, which is slightly shaded during summer. Our mode of treatment is very simple. About the end of February we pick out all the sphagnum moss and peat, without removing the large pieces of charcoal and crocks, as the thick fleshy roots are so easily damaged; we then top-dress with sphagnum moss and a little peat. During summer the basket and air roots are well supplied with moisture, but in winter less is required." Other fine *Saccolabiums* of the same section doing well with and under treatment similar to that given to *S. Blumei* are *S. guttatum* and its varieties, *S. præmorsum*, *S. giganteum*, *S. retusum*, *S. Harrisonianum*, and *S. violaceum*.

— PROFESSOR RODIGAS.—On Sunday, May 3, at Ghent, a presentation banquet in honour of Professor RODIGAS will be given, when a portrait by M. LÉON HERBO will be presented to him, together with an album containing the photographs of the subscribers to the picture.

— INTERNATIONAL INVENTIONS EXHIBITION.—A railway guide and route book has been published (to be had of Messrs. CLOWES, and at the railway book-stalls), which shows how the Exhibition may be reached and quitted from any station within 25 miles of London without need of waterproof or umbrella. The attractions for the public seem as great or greater than before. We observe with some surprise that nothing is said as to the series of shows to be held by the Royal Horticultural Society during the period of the Exhibition.

— MR. BULL'S ORCHID EXHIBITION.—Mr. BULL has issued invitations for his Orchid exhibition, available on Tuesdays, Thursdays, and Saturdays during May, June, and July.

— "PLANT LIFE."—An American edition of Dr. MASTERS' work on this subject, treating on vegetable physiology as applied to the cultivation of plants, has been published, and a French version is appearing in the *Belgique Horticole*.

— BOTANICAL LECTURES.—Mr. J. G. BAKER will deliver a course of twelve lectures on Botany on Saturdays in May, June, and July, at 3 P.M. The lectures will be delivered in the garden of the Apothecaries' Society at Chelsea, and are open not only to medical students, but to other gentlemen, on application for tickets to be had of the Bedell, Apothecaries' Hall, Blackfriars, E.C.

— SEEDS AS WEIGHTS.—In many provinces of India the seeds of *Abrus precatorius* are used as weights, the unit of weight or seed being called the "retti," the latter term applying especially to the weight. The weight, as appears from an article by Mr. CHUBB in the *Pharmaceutical Journal*, varies from 1.92 grains to 1.979 grains. *Mucuna capitata* is the seed which is the origin of the "massa" = 8 "retti."

— PARIS HORTICULTURAL CONGRESS.—This Congress will be held from May 21 to 23 inclusive, at the rooms of the Society, 84, Rue de Grenelle. The questions proposed for consideration have reference to the following matters:—Railway tariffs, nomenclature of hybrids, influence of electric light and of moonlight on plants; the effect (if any) of the age of seeds on the nature of the seedling; the possibility of ascertaining by an examination of the seed of a dioecious plant the sex of the seedling plant; the possibility of ascertaining by an examination of the seed whether flowers derived from it will be double or striped; the explanation that the ovary of an Orchid will swell to full size although not fertilised and producing no seed; the relation between the changes in flowers effected by cultivation and those produced in the other organs of the plant; the utility of watering plants with water of a temperature higher than that of the air; the causes of variegation; the explanation of the fact that some *Caladiums* grow well although they contain no chlorophyll; the utility of bottom-heat and the limits to which it may be carried; what foundation there is for the theory of VAN MONS, according to which fruits of indifferent quality are obtained before those of better qualities; what grounds there are in support of the opinion of LOUIS VILMORIN that a striped flower is not produced until after a pure white flower has been produced; the best method of sowing Orchids; the use of charcoal in Orchid culture, &c. The Secretary is Mr. ERNEST BERGMAN, the President M. DUCHARTRE.

— DISEASES OF PLANTS.—Dr. ZIMMERMANN, of Halle, has published the first number of an *Atlas der Pflanzenkrankheiten*, devoted to the illustration and description of the fungi which cause disease in plants. The plates are photographs from the microscope, and represent various Puccinias and *Æcidia*. The book is published for the special benefit of agriculturists, foresters, and gardeners, to whom indeed it may prove very useful.

— "LETTS' POPULAR ATLAS."—In these days a good Atlas is almost indispensable. Unfortunately hitherto such productions have been costly; such cannot be said of the present series of maps, which are very clearly printed, and which are published at a low price.

— KÖHLER'S "MEDIZINAL PFLANZEN."—The coloured plates of this periodical maintain their accustomed excellence. Although mainly confined to medicinal plants, yet many of the plants figured are, of course, of interest to gardeners.

— "THE HORTICULTURAL DIRECTORY OF THE UNITED STATES."—This is a list of florists and nurserymen following their calling in the several States and Territories of the United States. It is compiled by Mr. C. F. EVANS, of "BENNETT Pedigree Rose" repute, and cannot fail to be of great utility to all who have business relations with our cousins over the water. Merely to turn over the pages affords much information as to the social condition of the people in the various States; thus in Alaska there are no nurserymen, in Wyoming one, in Massachusetts the list extends to some seven 8vo pages, in Pennsylvania to ten, in New York State to fifteen. The publisher is Mr. ISAAC D. SAILER, of Philadelphia.

— MR. BOWIE, OF CHILLINGHAM CASTLE.—It will be with much pleasure that the friends of this much-respected gardener will hear that he has been given a pension for the rest of his days by the Earl of TANKERVILLE. The family of BOWIE has been settled on the borders of Scotland and England for generations, and the subject of the present notice was gardener at Chillingham for a great many years, and for some time he held the appointment of steward on the estate.

— THE COLORADO POTATO BEETLE.—"It is," writes Prof. RILEY, "an interesting fact (as showing how a new habit may be acquired under favourable circumstances) that last summer this insect was positively found feeding upon the Cabbage, which is botanically so very distinct from the Nightshade family. It would be sad indeed if so all-important an esculent should in the future be doomed to suffer, with the Potato, from the insatiate appetite of such a pest, and I have no idea that Cabbage raisers need fear anything of the sort; yet stranger

FIG. 105.—SACCOLABIUM BLUMEL. (SEE P. 572.)

things have happened, and certain it is that it was found devouring Cabbages by Mr. H. H. MCAFEE, Superintendent of the Wisconsin University Experimental Farm, while Miss MARV E. MURTFELDT, of Kirkwood—in whose testimony I can place the utmost reliance—found that in parts of Northern Illinois it did considerable injury to growing Cabbages, and was even breeding in great numbers upon them.”

— PRIMULA SIEBOLDI.—This species is now being developed rapidly in the hands of a few special growers into many varieties, in some of which

brighter colours than the original Sieboldi are seen, and others are pure white, or have intermediate shades of colour. For pot culture, or on rockeries, the species is a very desirable one, flowering early, and usually abundantly. We received lately a pretty lot of *P. Sieboldi* hybrids from Mr. T. WARE, Tottenham.

— ANTWERP BOTANICAL CONGRESS. — The committee of the Congress has, we are officially informed, determined to devote a portion of the discussion, which will take place on that occasion to the question of the exploration of the valley of the Congo,

in which, as it is well known, His Majesty the KING of the BELGIANS has taken so munificent and enlightened a part. With this view the committee of the Congress have addressed to the settlers on the different stations along the Congo a series of questions, as follows :—

1. What is the composition of the soil of the regions which you have hitherto explored ?
2. What is the altitude of the district which you describe ? What are the minimum, maximum and mean temperatures of these regions ?
3. What are the climatal conditions of these regions ?
4. What are the natural advantages and inconveniences which these regions present with respect to cultivation ?

5. What are the vegetable products of these regions, e.g., alimentary, medicinal, poisonous, or industrial.

6. What is the character of the flora of these countries which you have explored?

7. What resources does Central Africa offer to botanists for the study of tropical and physiological botany? Have you yet met with plants which can throw light on certain botanical questions, or which will augment the value of our collections of growing plants?

8. How can vegetable culture be established along the Congo?

9. What from a cultural point of view are the principal injurious elements—(a) animal, (b) vegetable.

10. To what degree can European botanists and horticulturists be useful to the explorers of the Congo, with respect to experiments in cultivation and acclimatisation, or in any other way?

The general questions proposed for discussion at the horticultural Congress are the following:—

1. The function and organisation of botanical laboratories.

2. The best method of preparing monographs of genera with numerous species.

3. Since the Parisian Congress of 1878, what botanical progress has been realised in the principal countries of the world? Botanical establishments, museums, laboratories, &c. What is at present, in these same countries, the influence of botanical studies on the progress of horticulture?

4. What is the best method to adopt for instruction in botany in various grades of teaching?

5. Describe the best methods of teaching theoretical and practical botany in the schools of horticulture and agriculture? Mention what should be included in this teaching.

6. What prominence should be given to a course of vegetable pathology in the schools of horticulture and agriculture.

7. To what extent is it desirable to develop instruction in botany and horticulture in middle-class schools?

8. What steps should be taken to diffuse instruction in horticulture in rural centres? What are the best methods for encouraging gardening among the working classes?

9. On the employment of artificial manures for the cultivation of plants in conservatories, apartments, and gardens.

10. The utilisation of the sewage of our large towns. What results have been obtained in different countries? What steps should be taken to generalise this practice?

11. What is the best system of labels (a) for botanic gardens, (b) for public parks, (c) for private gardens, (d) for greenhouses?

12. Advantage of uniformity of thermometric scales. Method of securing the general adoption of the Centigrade system.

13. What are the fruits and vegetables the cultivation of which can be extended and made advantageous for internal consumption and for exportation? Establishment of markets.

14. Are our methods of cultivating fruit trees capable of being improved?

15. What is the best method of teaching elementary vegetable physiology by means of popular lectures?

16. Can the cultivation of useful fungi be extended? A list is required of edible species which are most common, and the poisonous species which most resemble them.

17. What remedies have hitherto been employed against the ravages of aphids, and what results have been obtained?

18. What remedies have hitherto been employed against Phylloxera, and with what results?

19. On the desirability of creating benefit societies in horticultural centres for the advantage of gardeners and their families.

20. International Phylloxera Congress at Berne. Provision for securing uniformity of action in all countries.

21. Tariffs and transport of plants by railway.

The reports sent in on these subjects will, we understand, be published in a separate volume at the conclusion of the Congress. The Congress will open on August 1.

— THE ROYAL HORTICULTURAL SOCIETY'S GARDENS, CHISWICK.—The various fruit-houses, including the large conservatory, give every evidence of satisfactory results in due season. A small house looks very gay with a massive bank of intermixed varieties of Caladium; on the front stage is a nice lot of Gloxinias in flower, and up the stay-rafters are trained fine pieces of Asparagus plumosus nanus. Other houses are gay with large quantities of small Azaleas for decorative purposes at South Kensington; also a nice well-grown batch of Caladium argyreum. The prickly-stalked Cape Pelargonium echinatum, and three varieties, Compton, Ariel,

and Rosy Morn, are blooming freely. What sweetly pretty flowers these are! and yet one seldom observes them in places where they would be most useful for a variety of purposes, and contrast well with their larger brethren. In the succession-houses large quantities of nice young decorative plants, such as Fuchsias, Pelargoniums, &c., are looking exceedingly well, having nice dwarf, clean, stocky foliage, and strong short-jointed shoots. A very fine batch of tuberous-rooted Begonias are also in the very pink of condition, and will shortly make a gorgeous display.

— THE SEASON ON THE WEST COAST OF SCOTLAND.—Rhododendrons, Violas, and Pansies, are now in full flower, and the earlier sorts of Rhododendrons are flowering in perfection.

— CASTANEA PUMILA.—This bush-like species of Chestnut was described by the older arboriculturists, BORCHMEIER, DUROC, and others, but is yet rarely to be met with in our gardens. It is therefore time to call attention of the lovers of pretty flowering shrubs to this useful member of the Chestnut tribe.

— THE SHROPSHIRE HORTICULTURAL SOCIETY.—We are informed that this Society will hold a summer show on August 19 and 20, at Shrewsbury.

— BEGONIA MIRA ×.—This is said to be a hybrid between B. diadema, out of B. gogoensis. B. Mira resembles the former in habit, and the female parent in the coloration of the leaf. B. diadema is a Bornean species, while B. gogoensis is a native of Sumatra. The leaves of the present plant are obliquely ovate, sharply lobed, green, with irregular milk-white blotches above and purple beneath. It is figured in the April number of the *Revue de l'Horticulture Belge*.

— HEMEROCALLIS FULVA, VAR. LONGITUBA.—This is a new Japanese variety of the old well-known species remarkable for the long tube to the flower. It is figured in t. 1187 of the *Gartenflora*.

— CORYDALIS GORTSCHAKOWII, SCHRENK.—A species from the mountains of Turkestan, with deeply cut, Parsley-like leaves, and terminal clusters of yellow flowers.

— NEW COMMERCIAL PLANTS AND DRUGS.—Mr. T. CHRISTY has published the eighth part of his publication on these subjects, comprising a history of the Kola Nut, together with remarks on gutta percha, the tuberous Solanums, the genus Myristica, Cuca (Erythroxylon Coca), Cuprea barks, and other matters. A paste made from the seeds of Kola acuminata, it appears, can be used with advantage to mix with inferior cocoa. "Chocolate made with Kola paste is ten times more nutritious than chocolate made with cocoa . . . and a workman can, on a single cup taken at breakfast time, go on with his work through the day without feeling fatigued." Such statements are likely to be received with incredulity save by travellers and botanists who have long been aware of the composition and effects of these seeds, though it is only now that public attention is being drawn to them. It is many years since Dr. DANIELL published an account of the plant, and his statements have formed the staple of what has been given to the world since up to quite recent times. The good effects of the Kola appear to depend upon the large amount of proteid (nitrogenous matter) and of caffeine. The fatty matter of cocoa is here replaced by a large quantity of starchy material, which, of course, adds to its nutritive properties. The male or Bitter Kola is a seed produced from a species of *Garcinia* or some allied genus, of which a figure and description were given by Dr. MASTERS in the *Journal of Botany* for March, 1875. The description given by Messrs. HECKEL and SCHLAGDENHAUFEN adds nothing to the account given in the work cited, which appears to have been overlooked by the two writers cited by Mr. CHRISTY. The planting of the true Kola tree in low damp situations in the Tropics is counselled by Mr. CHRISTY, and doubtless he has good reasons for so doing, for the good qualities attributable to the true Kola are by no means mythical. We say the true Kola (*Kola acuminata*, R. BROWN, MASTERS in OLIVER, *Flora Trop. Africa*, i., 220), because the Bitter Cola is probably less valuable and devoid of the caffeine which renders the true sterculiaceous Kola so valuable. Mr. CHRISTY also recommends the planting in our colonies of the Cuca (Erythroxylon Coca), which in addition to its

properties as a stimulant and restorative has lately come into use as a local anæsthetic. It may be well to say that the name Cuca has been proposed and adopted to avoid the confusion arising between Coca, Cocoa, and Cocoa-nut, all three referring to different things. The Papaw and its derivative papaine also comes under notice, and here again the valuable results already obtained suggest the culture of the plant on an extensive scale in suitable localities. A similar remark may be made about the Simaba cedron, the seed of which is useful in the treatment of fevers. It will be seen from these remarks that Mr. CHRISTY is doing good service in introducing to the knowledge of commercial men and practical cultivators a number of plants whose good qualities have, at least in many cases, been well known to and published by botanists. But practical men would no more think of looking into such books as the *Flora of Tropical Africa* for the special information they required than botanists would consult the trade lists of the merchants to ascertain the names and descriptions of commercial plants. Mr. CHRISTY's publication is a medium between the two, and a very serviceable one.

— BOTANIC GARDEN, JAMAICA.—In a review of the public services of Jamaica, Governor Sir HENRY NORMAN, K.C.B., C.I.E., speaks as follows of the botanical department in that island:—"The Royal Commissioners fully admit the necessity that exists in a country like Jamaica for a well organised department of gardens and plantations; they acknowledge the good work that has been effected by the department, and give credit to Mr. MORRIS, the Director, for his able management. In the views thus expressed I most heartily concur. The department is, to use the Commissioners' own word, 'invaluable.' It has effected much good, and not only does Mr. MORRIS manage the department with much zeal and ability, but he is ever ready to aid individuals and the public with assistance and advice in the various matters of which he has special knowledge. Indeed, Mr. MORRIS is untiring in endeavouring to induce persons to commence new industries calculated to develop the resources of the island, and to bring about a condition of prosperity which would go far to counterbalance the depression under which the sugar industry of Jamaica now labours."

— ENGLISH versus AMERICAN GROWN PEAS.—Among the trials to be carried out at Chiswick during the coming summer will be one that will test the relative growth and character of certain varieties of English and American grown Peas, and especially of one-year-old seed. For this purpose a collection has been forwarded by Mr. JOHN T. BURNELL, of the Ilop Exchange, Southwark Street. It is contended that American grown Peas, being invariably harvested in such excellent condition, it follows that any shrinkage through picking does not exceed 5 to 7 per cent., and that one-year-old seeds keep much better, and maintain a much higher percentage of growth, than do English grown varieties. The invariable character of the American climate in the great Pea-growing districts of Cape Vincent enables the Peas to be harvested in perfect condition, thoroughly ripened, and without latent moisture. Of late years the English summers, up to and inclusive of 1883, proved wet, and samples were not only indifferently, but required a considerable outlay in the matter of picking, and consequent waste. The samples of American grown Peas seen this season, both round and wrinkled, are very fine, and it is said that in consequence of good development, and change of seed from a place so far distant, better crops are borne. Thus this trial will prove one of special importance.

— PROTEINOPHALLUS RIVIERI.—In the Begonia-house at Kew several specimens of this highly ornamental foliaged plant have lately been flowering. This is not of frequent occurrence except in freshly imported tubers, although the present instance amply demonstrates there is no reason they should not flower. Like bulbs or anything else of similar habit, flowering must be preceded by inducing a free growth. This must be done the season previous, so that a good supply of reserve material may be stored up in the tuber. One leaf only is developed each season with a long petiole simulating a stem, and a ternately divided much branched limb. It is this character, common to many other allied Aroids that constitutes their value as decorative plants. The inflorescence precedes the leaf, and consists of a large trumpet-like spathe of a deep chocolate-brown, except at the base

externally, with a long projecting spadix of the same colour, at the base of which the male and female flowers are seated. The odour emitted during the shedding of the pollen is rather disagreeable at close quarters. The plant is figured in the *Botanical Magazine*, t. 6195, and is included by the *Genera Plantarum* under *Amorphophallus*, from which it differs by having an elongated stalk to the inflorescence and a broadly funnel-shaped oblique spathe. An excellent representation will be found in our columns, May 3, 1873, p. 610.

— VIOLET LADY HUME CAMPBELL. — As grown by Mr. J. GOUGH, at Harefield Grove, this Violet is not only distinct from *devoniensis* in regard to the colour of the flowers, but is in every respect a much better grower. It came into the possession of Mr. G. J. BRUSH of High Grove Gardens, having been sent from Italy; and finding it to be quite distinct from *devoniensis*, was named by him Lady Hume Campbell, and distributed by Mr. C. TURNER. At Harefield Grove the two are growing in the same frame, and the manifest difference both in the colour of the flowers and vigour of growth and habit can be at once seen. Somehow or the other it does not appear to have found its way into general cultivation.

— PASSIFLORA CONSTANCE ELIOTT. — Messrs. LUCOMBE, PINE & CO., of the Exeter Nursery, have sent us some very pretty flowers of their hardy white Passionflower (*Passiflora Constance Elliott*), figured and described in these columns, p. 701, vol. xxi., 1884: they are very chaste and delightfully fragrant. It will be remembered that this lovely variety was awarded the First-class Certificate of the Royal Horticultural Society of London last May. All the parts of the bloom excepting the styles are white, the fringe or hairy appendage of the corona and the petals being of ivory whiteness. The plant is as hardy as the common Passionflower, with the same beautiful foliage; and these features will doubtless make it one of the most popular of recently introduced plants.

— CERASUS MAHALEB. — Among early flowering trees this is an excellent companion for the Almond. The latter can always be seen in full bloom in the suburbs of London during the spring months, being prominent in forecourt gardens, but how seldom one sees *C. Mahaleb*. It is perhaps earlier if anything than the Almond, it has an elegant habit of growth, is wonderfully free of bloom, and its white flowers are pleasantly fragrant. Every year appears to see it flowering profusely, a conspicuous object against a background of naked branches of deciduous trees. Perhaps it is because it is in so much demand for stock that it is so seldom planted in shrubberies.

— MAGNOLIA CONSPICUA. — The fine specimen of this at Gunnersbury House, Acton, though not so free of flowers as last year, is now in the finest condition, unharmed and unstained by the spring frosts that last year so grievously affected it. It shows how the tree was affected by them in that on the sides exposed to the north and north-east there are patches naked of flowers. The tree is now to be seen in all the beauty of its snowy purity. It may not be generally known that half-developed flowers, if cut from the tree, will enlarge and open in water, and be an attractive object in a sitting-room for many days.

— PEAR TREE BLOSSOM. — As all the leading Pears are flowering this season with such marvellous freedom it seems almost invidious to select any one for its wealth of blossoms; but from what we have seen we should award the palm to the Jargonelle. Large standard trees of this Pear are literally wreathed in blossom, the clusters of bloom are enormous, and continued all along the branches, and where grown as a standard it appears always to flower well. Then *Bon Chrétien* and *Louise Bonne* of Jersey are very rich in blossom also, so is *Beurré Clairgeau*. In a garden that we know of is a comparatively young standard tree of *Chaumontel*, with a head 5 feet in diameter—a mass of the purest white. It invariably bears well, but, except in such a season as last year, rarely fully matures its fruit, though they reach a good size.

— GARDENING APPOINTMENT. — CHARLES GRANT, late General Foreman at Benham Park Garden, has been appointed Head Gardener to G. A. FULLER, Esq., The Rookery, near Dorking, Surrey.

## THE PROPAGATOR.

### THE PROPAGATION AND CULTURE OF DIPLADENIAS.

IN the propagation of these beautiful climbing plants it is absolutely necessary that the wood selected for cuttings should be quite ripe, and the foliage well developed and hard. To put in soft wood as cuttings would only be a loss of time and labour. Each cutting should have two leaves, and  $1\frac{1}{2}$  inch of the main stem attached, the base of the latter being made level with a sharp knife. It is not necessary to make the cuttings at a joint, although where there is a joint to spare use should be made of it. They can be potted each into a long thumb-pot, taking care that the soil is firmly pressed around each cutting, the eye of which should be placed just below the level of the soil. After having watered them they should be allowed to stand a short time (until the soil becomes rather dry) before they are put into the cutting frame, which should be a shallow one, and situated upon a good bottom-heat. The cuttings should be watered as they become dry, and should be shaded from the sun.

For ventilation the lights of the case should be taken off for an hour night and morning, but after five days the lights, instead of being taken off for an hour, can be raised an inch, and allowed to remain so day and night. Immediately the cuttings have rooted they should be turned out upon the open bottom-heat, because they are liable to rot off if left in the cutting case long after they have rooted. At the end of four or five days the plants should be potted into large 60's, which should be well drained. The soil should be firmly pressed around each plant; a stick, 1 foot in length, should also be fixed in the soil for the purpose of loosely tying up the shoots. After having been watered they can be replaced upon the open bottom-heat.

Dipladenias must be watered carefully; too much water will, as a rule, rot the root-tubers which these produce in such numbers, and thus destroy the plant. They should now be syringed twice a day, and shaded from the strong rays of the sun. They should also be allowed a good supply of air upon every fine day. When they have well rooted through their present pots they can be potted into large 48's, placing to each a stick 2 feet in length, to which the plant should be securely tied, and when they have been lightly watered with a rose-pot they should again be placed upon the open bottom-heat, but as soon as they have grown into strong and well-developed plants they can be taken to a house of intermediate temperature, and placed upon a cold bottom.

Should large plants be required they can again be potted into large 24's and trained around a trellis. For ordinary purposes this can be made of six Bamboo-canes, or other suitable rods, 4 feet in length, placed at equal distances around the edge of the pot, the tops of the sticks being secured by a piece of strong wire, and it will hardly be necessary to say the shoots should all be trained in one direction. The plants should not be watered for a week after they have been potted in 24's, and after that time the gardener must be very careful in watering them.

Dipladenias can also be rooted from single eyes; that is, taking a strong piece of the plant consisting of  $1\frac{1}{2}$  inch of the main stem having two leaves attached, and cutting the main stem down the centre, thus making, as it were, two cuttings of one, each having a leaf attached, and putting these in as cuttings. They can be treated in the same way as the ordinary cuttings, with this addition, that immediately the cutting is put in a small stake should be fixed beside it, to which the one leaf of the cutting should be loosely tied up.

The gardener should be on the look-out for a small fungus to which the plants are subject. It is not unlike a spider's-web, and spreads over the pots, cuttings, and surface of the soil, and if not noticed in time will destroy every cutting. The best way to check this pest is to wash the cuttings and to dredge a small quantity of sulphur both on the surface and underneath the leaves. Besides this they should be shaken out of the soil and potted into fresh pots, keeping them dry for three or four days, and then treating them as before stated.

The soil to be used for the cuttings should consist of half good peat, one-fourth loam, and one-fourth

sand, as well as some finely broken potsherds, and a small quantity of broken charcoal. This soil should be well mixed together, and rubbed through a  $\frac{1}{4}$ -inch sieve before it is used. When the cuttings are potted into 60's the following soil should be used, viz., half good turfy fibrous loam, one-fourth peat, and one-fourth sand, well mixed with small quantities of ballast and charcoal broken into pieces of Walnut size. If the soil is too dry it should be sprinkled with water before it is used, which can be done as it is being turned over in mixing.

The following are the principal varieties, and which deserve the attention of the gardener, viz., *D. amabilis*, *D. Brearleyana*, *D. hybrida*, *D. Williamsii*, *D. boliviensis*, *D. amœna*, *D. profusa*, *D. insignis*, *D. splendens*, *D. atropurpurea*, *D. crassinoda*, and *D. Houtteana*. The colours of the flowers are light pink, crimson, white with yellow throat, dark purple, and yellow.

In conclusion, we may say it is an erroneous idea that *Dipladenias* can only be grown in high temperatures, and upon strong bottom-heat, for as a matter of fact they grow very well in an ordinary stove or intermediate-house, and keep much cleaner. T. O. B.

### SOME WEST INDIAN FIBRE PLANTS.

IN the celebrated Lace-bark of Jamaica (*Lagetta lintearia*), an arboreal *Daphne*, we have a bast or inner bark-fibre which is found enclosing the stem, and consisting of numerous concentric layers, which interlace in all directions, presenting in a great degree, and especially when well prepared, a resemblance to the finest lace.

The purposes to which this lace is applied in the island—for the manufacture of doyleys and light fancy articles—are well known. Formerly, when more abundant than it is now, it was manufactured into ropes, whips, and other articles. It can, however, even at the best, be hardly included amongst fibre-plants likely to be useful on a commercial scale. A similar remark would apply to the bast or inner bark fibre of the Mahoe (*Paritium elatum*), known in commerce—from the fact of its having been exported from the neighbouring island—as Cuba bast; as also fibres yielded by such trees as Spanish Elm (*Cordia gerascanthus*), the Down Tree (*Ochroma lagopus*), the Trumpet Tree (*Cecropia peltata*), the Burn-nose Tree (*Daphne tinifolia*), the Screw Tree (*Helicteres jamaicensis*). All these yield fibres of certain qualities, samples of which, prepared by the late Mr. Nathaniel Wilson, are still to be seen in the Museum of the Institute of Jamaica.

Of plants belonging to the natural order *Malvaceæ* there are numerous species besides the Mahoe belonging to the genera *Paritium*, *Sida*, *Abutilon*, *Hibiscus*, and *Pavonia*, which are remarkable as affording the everyday fibre-plants of the West Indies used by Europeans and natives alike for tying up produce, and indeed for all purposes when a convenient and cheap material is required for securing and binding.

The fibre contained in the Sugar-bark of the mountains (*Malvaviscus arboreus*) possesses wonderful strength and tenacity, and probably ranks next in these respects to the bast fibre of the Lace-bark Tree (*Lagetta lintearia*).

Amongst obscure and little known plants which yield fibrous material, mention might be made of *Anthurium* (*Pothos*) *violaceum*, which is described by Mr. Wilson in the following words:—"Where strength and lustre of appearance is an object, this plait will be found equal, if not superior, to the best Leghorn plait Italy ever produced. This plant, though an epiphyte, and growing plentifully at the roots and on the tops of the highest trees, at an elevation not under 1000 feet, may readily be cultivated in woodland and moist places to any extent. The part of the plant made use of is the petiole, or foot-stalk of the leaf, which grows from 18 inches to 2 feet long, and is readily divided into strips of any dimensions, and contains a strong fibre not existing in the common plat of the Fan-Palm. It has a durable colour."

Remarkable and valuable, however, as the fibre yielded by these plants may be in a rural sense, they are not likely, at least at present, to be rendered of commercial value; and I refer to them only for the purpose of supplying a general review of plants capable at all of yielding fibre and for the purpose of bringing into notice what may be termed the possible

ultimate resources of the West Indies as regards fibre-plants. From a lecture by D. Morris, M.A., Director of Public Gardens and Plantations, Jamaica.

## GUNNERSBURY HOUSE, ACTON.

THIS well managed little place is looking very gay and neat, considering the busy time of the year, when everything seems to demand attention at once, and during which season gardeners have to draw upon their ingenuity in no slight degree to overcome obstacles, which are always surmounted by them in a quiet unobtrusive manner, and with an address that generally ensures complete success. The Peach and Nectarine trees here are carrying a good crop of nice fruit, and the trees are clean and healthy; the Vines, too, are very promising. A rather curious occurrence may be seen in one of the vineries here. A strong root from a Black Hamburgh has forced its way into a tank of water inside the house, and in it formed a large mass of roots, which we were informed continue to grow the best part of the year. The most interesting part is that the water is icy cold always, but it does not seem to affect the health of the Vine in any way. The Muscats are looking very well. In the plant department a nice, clean, well grown lot of decorative stuff is to be seen. Crotons well grown and coloured, &c., some fine pieces of well done Anthurium Scherzerianum, a fine type of Vanda tricolor, a very large healthy specimen of Asparagus plumosus nanus, a fine piece of Davallia bullata, and Gleichenia Mendelii, a fine batch of Gloxinias showing large quantities of bloom. A pleasing feature in one of the plant-houses is a wall splendidly covered with Adiantum Capillus-Veneris. The conservatory is tastefully decorated with Azaleas, Eupatoriums, Camellias, Choysia ternata, Deutzias, &c., and some splendid specimens of the lovely Sparmannia africana. We must not omit to mention the forced Strawberries, which are very fine indeed.

## Florists' Flowers.

### LACED AURICULAS.

THIS is just the section of Auriculas which young amateur growers should take in hand first. They are very beautiful—I think almost more so than are any of the other kinds—and they are easily cultivated; they also seed freely, and reproduce their best features and some improvements. I have a large batch from last spring's sowing blooming delightfully. They were planted up thickly in a soil bed in a cool-house, whilst in another part of the bed a batch of seedlings from a sowing early in March are just showing rough leaf. These youthful plants when a little bigger will be dibbled up into shallow boxes for the summer, and be kept in a shady place, where they will make good growth for Auriculas, and in the autumn will be dibbled out in the house, as were last autumn the batch now blooming. As there are in the seedlings variations of quality, I can thus select the very best as they bloom, and pot them, whilst the remainder will go into the open air. I think it is fortunate that the strain throws up also some remarkably fine showy border forms. The pure florist, who has eyes only for points of refinement, would not regard these coarser but very showy forms with pleasure, but the lovers of hardy flowers do, and having them to bloom in the open ground, as they will henceforth, are delighted with the wondrous beauty which a packet of seed has produced.

Some day, perhaps, the National Auricula Society will give special encouragement to the growth of laced Auriculas by granting to them a class or division; at present laced forms are so far tolerated that they are permitted to appear in the fancy class, where their beautiful markings count for nothing. It is true that they are practically alpine, and as such may be shown in the alpine classes, but the best laced forms do not produce big flowers, and therefore cannot compete with the larger and bolder self and shaded alpine. There can be no doubt but that one of the strongest features of a good alpine—viz., a golden centre—should be found in any good laced flower. The ground may be of any shade or colour, and the edging also, provided it be clear and well defined. Some have such broad margins that they differ little from shaded flowers, although the transition from ground to shading is perhaps too abrupt. I cannot too strongly recommend to Auricula lovers these laced forms. A. D.

## DIANELLA: PETALODY OF THE OVULES.

OVULAR changes of any kind are very uncommon among monocotyledons. Why it should be so it is difficult, nay impossible, to say. The discovery of petaloid ovules, in some double flowered ovules of Dianella cerulea is, therefore, of interest. The ordinary flowers are replaced by globose collections of petaloid scales, as shown in the illustration, offering various intermediate conditions between stamens and pistils and petaloid scales. It is not necessary here to detail all the changes that were observed; suffice it to note that the most remarkable consisted in the continued separation of the carpels in the presence of bluish-purple petaloid outgrowths from the placentas, and of similar petaloid ovules as shown in the illustration (fig. 106). The ovules consisted solely of rather thick petal-like plates, with no trace of nucellus. The specimens were sent by Baron Ferd. Von Mueller, and are interesting as agreeing with

FIG. 106.—DIANELLA CERULEA, VAR. CONGESTA.

Above, in the centre, are shown two of the globose collections of scales, replacing the flowers, natural size. The other figures represent the ovaries of different flowers, enlarged and showing the purple petal-like ovules, and the petaloid outgrowths from the placentas.

D. congesta of R. Brown, which is thus shown to be merely a malformed variety. M. T. M.

## Notices of Books.

Landwirthschaftliche Samenkunde. ("Description of Agricultural Seeds.") Von Dr. C. Harz. Berlin: Paul Parey.

This is another of those now very numerous German publications which inspire us with a feeling of shame and apprehension—shame that we have nothing at all comparable to it, apprehension at the probable results of the marvellous activity in the promotion of science and its application to industrial and agricultural purposes shown by Germany, the United States, and other countries, and our own sluggishness in this matter. What English botanist is there who would draw up a volume of over 1300 pages devoted entirely to the anatomy, chemical composition and agricultural qualities of seeds? What publisher would be so insane as to issue it if he did so? And

yet we have here before us such a book, comprising, first, a general account of the seed-vessel and of the seed—of the method of fertilisation—of the microscopical appearances and chemical composition of the several parts; and next, a detailed account of the seeds of the principal plants of economic importance, including weeds treated with equal fulness. The plants are arranged on a system not familiar to English readers, and one to which objection might easily be raised; but that is quite a minor matter in a work of this character, as an alphabetical index enables the student to find what he wants with facility. The work, moreover, is illustrated with a large number of woodcuts, and comprises by far the fullest account of the seed that we are acquainted with.

### Tree Gossip. (Field & Tuer.)

Mr. F. G. Heath must have some other standard by which he wishes the book recently issued under this title judged than that by which critics are likely to be bound. He would argue that the title "gossip" shows that the writer had no serious intention; but it is a serious matter to take up time and labour, and it is unsatisfactory to find such a discrepancy between the time so well spent by printer and publisher and that by the author of the present publication. As gossip is often mischievous, so we submit the circulation of ill-authenticated statements, given as if they were records of actual facts, is not less injurious. What grounds are there, for instance, for assigning a height of 150 feet to the female, and one of 50 feet only to the male trees of Araucaria imbricata? or how could even a gossip pen such an extraordinary paragraph as that on spiral growth? Surely before publishing his work the author should have secured the assistance of some botanical friend.

### The Asclepiad. (Loogmans.)

This publication is mainly addressed to medical men, but it is written in such a style that it may be perused with interest and profit by intelligent laymen. The article on the hygienic treatment of pulmonary consumption is full of sound practical sense, free from taint of quackery so rampant, when the ear of the general public is to be gained. The sketch of the life and labours of Vesalius is a capital instance of Dr. Richardson's clear and brisk style.

Class Book of Commercial Correspondence, French and English By A. E. Ragon. (Hachette.)

Many persons who can read French fairly well find a difficulty in writing a French letter, and especially so if it is to be one of a commercial character. The mode of addressing letters, of beginning and ending them properly, to say nothing of the main subject-matter, often present difficulties to the inexperienced—difficulties which the present little book is well calculated to remove. Numerous forms suitable to the varied exigences of commercial intercourse are given, and a very useful vocabulary of commercial terms.

## WINTER GARDEN AT FOLKESTONE.

MANY are the travellers who have cause to be thankful for the comforts offered by the "Pavilion at Folkestone." Those who are weather-bound, or who purpose taking up their residence for a time, will now find the resources of the establishment enhanced by the recent erection of a winter garden by Messrs. Weeks & Co. (fig. 107). It consists of a central nave with lantern 43 feet high, and six aisles, three on either side of the central one, the whole having a frontage of about 168 feet, and a width of 51 feet. All the roofs are hipped back at each end, and an iron cresting runs along the ridges, finished at the ends with an ornamental finial. The front and one end consist of moulded pilasters, with moulded transome and cornice. The transome is broken out at each pilaster, forming a cap, and a shaped console is planted on each mullion between the cornice and the transome. The bottom portion is filled with sashes sliding on brass rollers, and the top with fanlights. The back and one end are built in brickwork up to cornice line, and finished in cement. The building stands on brickwork 1 foot above floor line, and at the end, built in brickwork, is a boiler-house and potting-shed constructed of wood and glass to within 2 feet 6 inches of the floor, with a door in the centre and the roof hipped back to match the rest of the building. The winter

garden has three entrances, each of which has a vestibule, one being connected to the hotel by a glass corridor, enabling visitors to enter the winter garden from the hotel without exposure to the weather. The cross gutters are supported by ornamental columns on stone bases. A bed for plants, with moulded edging, runs all round the building. In front of the bed and through the centre of the building are hot-water pipes laid in four brick chambers covered with ornamental gratings. In each of these chambers there are six 4 inch pipes, running the whole length of the building and across the two ends. These pipes are heated by two of J. Weeks & Co.'s patent duplex upright tubular boilers, set in the boiler-house at the end of the building, and the apparatus is so arranged that the heat can be regulated at pleasure, thus enabling an even temperature to be maintained in any weather. About 110 tons of prepared wood, glass, and ironwork, have been used in its construction.

Appended are a few interesting details as to dimensions, &c.:—Height of transome from floor, 9 feet 3 inches; height of main cornice, 11 feet; height of cornice in centre span, 14 feet 6 inches; height of ridge in centre span, 25 feet; width of centre span,

grand primæval forests, and New Zealand will be suffering under worse difficulties than if she had never possessed a tree.

Somehow or other the bulk of the people do not seem to understand or grasp the vast importance of arboriculture. Subjects of no importance compared with this engage the master minds of the world, perplex statesmen, agitate nations, and sway thousands of people, as if their very existence and that of the whole world depended upon them. Royal Commissions are issued, millions of pounds are spent, and thousands of lives lost in advocating and carrying out projects which (compared with what lies hidden under the term arboriculture) are of very little importance to the future welfare of men, nations, and the world. Persons who have never considered nor given attention to the matter of tree planting and timber cultivation are always inclined to look upon the whole thing as a fad, and stamp those who occasionally call attention to the subject as "hobby riders." But whoever will look at the economical, social, commercial, and climatic side of the science of arboriculture, will be convinced of its importance, and the beneficial results

awful in their results. However, it would be a waste of space to give an account of my experience in such affairs, for I know full well that the evil consequences of forest destruction have been often and often brought before the readers of the *Gardeners' Chronicle* by abler pens than mine, and that many of my readers know more than I do about the subject. Still to any who doubt or think lightly of arboriculture and forest conservation, I would say, Go to the dry, treeless tracts of South Africa, now subject to innumerable drawbacks, and almost valueless for the want of those trees which once covered extensive strips; to Palestine, now dry and parched, but once a land flowing with milk and honey; to South Australia, once the best grain growing part of the universe, now worn out and on the decline as a farming country because her forests have fallen before the hand of the settler; to Cyprus, several of the West Indian Islands, India, and then come to this country, where the effects are just beginning to show themselves. All who have viewed the subject in a fair light are unanimous in accepting the following conclusions as facts:—That arboreal vegetation acts beneficially upon the atmo-

30 feet; height to top of lantern, 43 feet; width of span in middle spans, 22 feet; height of ridge, 18 feet 6 inches; width of end spans, 16 feet; height of ridge in end spans, 17 feet; extreme length of building, 168 feet; length of stokehole front, 18 feet; total width of building, 51 feet.

## COLONIAL NOTES.

NEW ZEALAND.—Before commencing the pleasant task of penning what I know and have seen about the plants worthy of cultivation and a place in every British garden which are indigenous to this colony, I must devote a little time to what is of more importance to New Zealand, and perhaps of greater consequence to commercial England—I mean the timber-producing trees of these forests. New Zealand certainly stands first in quality and variety of timber trees, and, considering the small area of these islands, first in quantity. This speaks well for the colony, but when I have to state that she also stands first in negligence of forests and backwardness in arboriculture, the fact of possessing the above advantages counts for nothing, because in a few years' time, unless the present rate of annihilation be brought to an end, there will be little left to tell the tale of these

accruing from a prosecution of its mandates and teachings.

Follow the footsteps of races of men throughout all ages, and the same warning footprint meets our gaze on every hand. Mountain slopes once covered with nutritive herbage and belts of forest, now bare, rugged, and disintegrated by rushing torrents of water, which, unchecked, roll on and unite in inundating the valleys, once the home of busy husbandmen, their flocks, and crops; countries once smiling under the regularity of seasons, now subject to periods of drought, or long continuations of rainfall, scouring and cutting up the face of the land; mountain valleys once beautiful with the glistening dash of running water, now parched and valueless, because the source from which the flocks obtained the means to quench their thirst is dried up. Districts depopulated, lands rendered useless, sources of revenue destroyed, and a thousand other evils lie in the wake of ruthless men, who, heedless of the future, make all things subservient to themselves, and never think that there is such a thing as economy in Nature. I could enumerate many instances of evil wrought by the destruction of forest, which have been impressed upon my mind during the many sojourns I have made in all quarters of the globe, some of them remarkable in the quickness of their effects and

sphere, weakens the power of strong winds, checks storms, increases the temperature, protects springs of water and originates streams, retains moisture in the earth and causes rain to sink deeper, adds fertility to the soil and gives shelter to cattle and materials to man without which he could not exist.

In the face of these assertions which are now beyond the reach of controversy it seems incredible that any body of men holding the future of a country in their hands, should never give even as much as a thought towards that science which is destined to turn the most barren parts of the earth's surface into spots of fertility. That we in this favoured land of the South, now enjoying the cup of plenty and dwelling under the influence of all that Nature can furnish, are slowly but surely sapping and destroying the very roots and source from whence the bulk of our advantages originate; that we are, for purposes of present gain, working out the certain ruin of one of the best and fairest of lands this world can boast of. Now in drawing attention to the almost total absence of forest conservation and timber cultivation in this colony, I am in strong hopes that some abler pen than mine will take the matter up and so attract the notice of British arboriculturists to the extensive field for operation which awaits them here. There is a grand

future for the science of arboriculture, millions of square miles, at present worthless or nearly so, only want the arboriculturist to render them habitable and capable of supporting millions of people. The societies in England and Scotland must extend their influence and operations to British possessions, where their labours could be on a gigantic scale, and bear results which would be universal in their effects. Nothing of great importance will ever be done in the direction of forestry in these and other colonies until those who are supposed to know all about the matter, take the initiative step, give the start, and set an example. Once let authorities on forestry commence operations in these colonies, and timber cultivation will become a recognised established pursuit, and not, as it now is, a fad, hobby, or myth, only to be thought of and written about. However, putting all this surmising on one side, something must be done towards preventing some of the most valuable trees Nature has bestowed upon man from being lost to the world. In the following brief glance at some of New Zealand's forest trees I will for want of time and space limit my remarks to those generally known. Flat-leaved Conifers occupy the principal place amongst the timber-producing trees of these forests. They are unique in their appearance, of great variety, and in some districts form extensive forests in themselves. *Chris. Mudd, Plant Collector.* [We think our correspondent is not fully aware of the steps that have been taken by the New Zealand Government, at any rate we have reason to know that the subject has not been so entirely ignored as our correspondent seems to think. ED.]

(To be continued.)

## HOME CORRESPONDENCE.

**Pruning of Dendrobiums.**—I have been much interested and amused with the discussion on this subject, and fearing the matter may get shelved in an unsatisfactory manner I am tempted to give my experience on the pruning system. Sixteen years ago I took a plant of *Dendrobium nobile* to regulate the young growths, and while arranging them to best advantage, that light might play upon the foliage, I asked myself the question, Why leave in all these old growths? They have bloomed, lost their foliage, and are shrivelling; they are crowding out the light, are unsightly and in the way—cut them out. Therefore all the old leafless growths were cut away. Just a year after, in the month of June, this same *Dendrobium* was exhibited in a class of six stove and greenhouse plants in bloom; one of the judges, who was a gardener from London, specially complimented me at the show for the clean, well flowered, healthy plant. The pruning has been carried on every year in the same way, and the same plant was exhibited every year, special mention being made of it in the pages of the *Gardeners' Chronicle* at the time. I had said nothing about the pruning to any one, but one grower of Orchids, who came to look round sometimes, once told me that he could not understand how it was that our plants were always so richly clothed with foliage and so free to bloom; and then he asked how it was he could never see any old bare growths—did I cut them out? "Yes." "Ah," he said, "I should have been afraid to do that." But, to return, this same specimen behaved so well that a note in its praise was recorded in the *Gardeners' Chronicle* on January 29, 1881. Growing freely it soon became a large mass, and last year (1884) I shook it out, divided it, and repotted it, making out of it two fair specimens; and as I wanted one of them retarded so as to bloom in August, I put it into the coolest place which I had. My object was attained; it was exhibited in August well flowered, but the season had so far advanced that the growths made after flowering were both fewer and weaker than usual—the result of the retarding, not of the pruning. But notwithstanding these drawbacks I would not be ashamed to send it to the Conference in May; but I cannot see that any useful purpose could be served thereby, for the critics would be able to see nothing that would satisfy them that the plant had been pruned every year for the past fifteen years. I have a small basket with a plant in it now in fine condition, but the colour will be faded by May 12, and therefore unfit for exhibition; but if any persons are desirous of satisfying themselves on the point of pruning they may come here, and I will prune this

plant before them, just as I prune all the others. They may set their mark upon it, and call again next year to see the result. That I think should be the plan to adopt. I prune them, but not in the way "T. B." mentions he did years ago, and failed; for to prune or divide for the purpose of increasing stock is one thing, and to prune away useless wood is something quite different. Then David Walker must have made some great mistake, and his failure should count for nothing as against the system; but as "A. D.'s" note and questions seem to me the most sensible of all the correspondence on the subject I will try to answer him. He asks "If the old bulbs throw vigour into the new?" I answer—yes, for a certain time, for the young growth draws its sustenance from the back growths wholly until it makes roots, and then continues to get some benefit from the old for some months—for, it may be, a year more or less according to circumstances; and if we prune too close we should do damage. But all that has been urged on the point is to cut away the three or four years' old growth. And why cut these out?—because they have done all the good they can do. They have bloomed, lost their foliage, are shrivelling, crowding out the light, and unsightly. Having yielded all the support to their offshoots they possess, they settle down to a long but certain death, therefore cut them out. But when? I always prune mine when the new growths are from 6 to 10 inches high, and are making roots freely. They then require regulating, and one or more back bulbs of every crown are cut away; this makes room for the foliage to develop, and get a greater share of light—a very important matter this. I have only been speaking of *Dendrobium nobile*, of which we have eight specimens, all obtained from a few small pieces got in exchange for some bedding *Pelargoniums* seventeen years ago. All are treated as described, and all flower very freely every year. This season one was in flower at Christmas with 200 blooms. This plant grew in a pan 4 inches deep and 10 inches in diameter; another of the same size had 230 blooms, and came into bloom in February; one in a basket is in fine condition with 180 blooms, and one just opening, but recently potted; and so they succeed each other till all have bloomed. If interesting, I will speak of varieties and species that must not be pruned by-and-bye. [Yes, certainly. ED.] *E. Blandford, Moor Hill, Westend, Southampton.*

**Calanthe veratrifolia.**—This pretty commonly grown Orchid is to be found in great perfection at Ardgowan Gardens, Inverkip, Wemyss Bay. The pure white flowers which are produced very freely are invaluable for cutting purposes. It succeeds well under the treatment the gardener, Mr. Lunt, gives it. There is always something interesting at this fine place, and should any of our Southern friends be this way they will receive a hearty welcome from Mr. Lunt, and I will assure them they will be well repaid for a visit. *A. O.*

**Rhododendrons at Castle Freke.**—Being precluded by ill health from visiting much and thus comparing floral varieties, I write to describe in your columns the *Rhododendrons* at Castle Freke (Lord Carberry's residence in the south-west of the county of Cork), as I was very much struck by their proportions but do not know whether they are exceeded in size in our isles, though I am aware that in variety the collection of Mr. Crawford, of Lakelands, far excels any other I have seen. Of the deep scarlet I took three approximate measurements. Two measured 18 feet in height, one about 50, the other nearly 70 feet in circumference. Both these are more of the growth of trees with naked stems, but the heads umbrella-shaped, and one mass of flowers. I think John Waterer is the name. The third is a beautifully grown circular bush of about 90 feet in circumference at 4 feet from the ground, and about 18 feet in height, and will also shortly be one mass of bloom but of a softer rosy shade, more like Lady A. Cathcart, as far as my memory helps me. *Leopold Shaldham.*

**Daffodils Doubling.**—Being rather interested in the different articles that have appeared in the *Gardeners' Chronicle* for some time back I have made a minute examination of our collection. We have planted them very extensively for some years past, but about ten years ago we planted several hundreds of the single *Daffodil* in one part of the grounds, and a few hundreds more of the double in another, but a good way separate from one another. But among

all our collection of single I cannot find one attempt to change from that state to the double. It is possible that doubles may come up from seedlings where soil and climate are suitable for the ripening of seed, but I cannot see that we have any seedlings amongst our lot. No doubt they have increased very much from the bulbs, for they are now large clumps, having been planted single bulbs. Had these been seedlings they would be spread round about instead of compact clumps, as they are. I noticed a week or two ago that the neighbourhood of Alloa was one of the places where the single *Daffodil* had come double. I have made enquiry, and am unable to hear of a case. I may add that I am writing from a place distant 3 miles from Alloa. I send you specimens of *Daffodils* now in flower here in the open air. *J. Lamont.*

—Permit me to remark that the circumstance referred to by "E. V. B.," p. 511, is not uncommon. Last year I sent to the office of your contemporary, *The Garden*, a bunch of *Narcissus Incomparabilis* in all stages, from perfect singles to perfect doubles, gathered in the lawn attached to Mr. Gough's residence, Birdhill, near this town, and this year I have just sent Mr. Burbidge, to whom all *Narcissophils* are so much indebted, a similar bunch, singles with a few stamens becoming petaloid, semi-double, and perfectly double, which he considered very interesting. All were growing together in the same clump. *W. J. Murphy, Clonmel.*

**Magnolia alba.**—Although this tree succeeds well as a specimen on a lawn, yet the prevalence of late spring frosts and boisterous weather soon mar, or possibly utterly destroy, the flowers. To reap the full benefits of its beauty it should be planted and trained against a south or west wall, and protected (when coming into flower) in adverse weather. It will amply repay a little attention bestowed upon it. There is one growing on the terrace-wall here, and is at present a beautiful object to behold, and gratifying to the olfactory sense, emitting a delicious odour suggestive of Orange blossoms. *W. J., Hafodunos, North Wales.*

**Melon Canker.**—In reference to this subject I beg briefly to say, that if due allowance is made in forming the hillocks, after the plants have been set therein at the same depth in the soil as they were in the pots, and soil has been added afterwards to cover the roots as they push through the sides of the hillocks, and 3 inches higher than the soil surrounding them to prevent water lodging about the stems, "canker" will be prevented from attacking them. Moreover the soil should be made very firm about the roots, as well as all over the bed at the time of planting, and at each of the subsequent soiling up of the roots. Many practical fruit growers are agreed that the soil getting too wet about the stems of the plants is the cause of canker, inasmuch as the plants show the injury at the point of contact with the wet soil. This being so, what remedy more natural or simple than that indicated above? the adoption of which I have often advocated in your columns. In conclusion, I need hardly say that the plants should not be watered about the stems, and that the fact of their being elevated a few inches on mounds (which should slope sharply towards the surface of the bed on which they are formed) will not prevent sufficient water from reaching every root of the plants. In short, I opine that canker is caused by the plants being set out too deeply, and the mould becoming too wet around the stems, gainsay it who can. *H. W. W.*

**Magnolia Campbellsii.**—As the sender of the blooms of the above named magnificent Himalayan flowering tree which were shown (I fear in a somewhat mangled condition) at the last meeting of the Floral Committee at South Kensington (which I forwarded at the request of my friend, Mr. W. Crawford, who is now absent from home in London), I have read with considerable interest the remarks you make on this most interesting if, alas! imperfect exhibit, on page 542 of your last issue, and should like with your permission to make a few additional remarks. It seems quite evident to me after closely comparing one of the Lakelands flowers with the splendid portrait of this fine plant in Cathcart and Hooker's fine work that either Mr. Crawford's tree must be an altogether different and paler flowered variety of this magnificent species to what is figured in the above-named work, or if (as is still just possible) they are one and the same, then I fear that if after the exceptionally hot summer and mild winter of last

year, the tree, which is apparently in most vigorous and robust health, will only produce these pale and perfectly unicolor flowers such as it is now opening, then we can never hope to see this grand species in its full beauty in these temperate climes. Any one looking at Cathcart and Hooker's plate will at once see that the inside colour of the petals as there depicted is of a pale rosy-flesh colour, while that of the outside petal is a fine deep carmine, whereas the flowers of Mr. Crawford's plant are entirely unicolor, of the palest shade of rosy-flesh colour on both sides of petal, and without even the slightest trace of the deep carmine outer colouring as shown on the plate. The impression I know prevails that this fine tree has bloomed annually for some years past on the banks of the Lago Maggiore, in Italy, in the gardens of Messrs. Rovelli, but I have every reason for believing that this is not the case, and that the Magnolia which was mistaken for it by persons unacquainted with the real plant, was in reality *M. Lennei*, a variety of somewhat similar colouring, but of much smaller size. Messrs. Rovelli possess a specimen of *M. Campbelli*, and hope to bloom it soon. I regret to say that the flowers of *M. Campbelli* do not keep fresh in water; the bloom that I got simultaneously with those sent to London, though most carefully brought down in a tin box with moist moss and placed in water some four hours after being cut, was quite withered next morning. *W. E. Gumbleton.*

**Fat Tommy.**—In 1872 you did our cat the honour to figure him with his wire and tub in the *Gardeners' Chronicle*; since that time "Fat Tommy" has been a favourite with all the neighbourhood, being always happy and good-tempered; he has come to an untimely end; having been badly bitten by Sir Wm. Topham's dog, he had to be killed recently. He was so well known in the gardening world that you may, perhaps, insert this notice. We have an excellent portrait of him, painted by Couldery. *George F. Wilson, Heatherbank, Weybridge.*

**Chemists and Grocers as Seedsmen.**—I venture to address your readers and the trade in particular on what is now taking place in the seed trade of this country. For some time past I have observed in the windows of chemists and small grocers, &c., cards to which are attached packets of flower seeds at 1d. each. This is surely an innovation, that chemists and grocers should turn seedsmen; and I should much like to know if any of your numerous readers can inform me who is guilty of supplying these packets to the above retailers, for I feel assured that the trade in general will unite with me in saying that we will do our utmost to discountenance the firm or firms who supply them by reserving all orders for those who stick to the trade only. I shall be glad to have this matter thoroughly ventilated. *E. Wilson Serpell.*

**Narcissus Disease.**—Can any one tell about a disease from which I lose many Daffodils every year? The flower comes prematurely, and stunted, and the half-grown leaves are withered in the upper part. On digging them up no roots have been formed, but the base from which the roots ought to grow is found to be rotten. The coats of the bulbs are loose, and the intervals filled with water. The double *N. moschat* is most liable to it; then comes the single *N. moschat*, and next to these *N. maximus*. I first attributed it to wet soil, but bulbs seem equally liable to it on raised beds with dry soil. I enclose specimens [reserved for examination]. *C. Walley Dod, Edge Hall, April 24.*

**Proposed Gardeners' and Foresters' Benevolent Institution for Scotland.**—When this was first proposed in your columns public opinion was at the same time invited for or against the Institution. I gave mine freely and conscientiously against the formation of a second society, and in last week's number of the *Gardeners' Chronicle*, p. 544, a correspondent signing himself "J. M. L.," says, that "gardeners in Scotland are not inclined to take any interest in the London Institution." In this he is quite mistaken [We think so too, Ed.], for I have had several private letters from the North approving of what I had said, and it will make "J. M. L.," I think, open his eyes when I tell him that one gardener in Scotland wrote and told me that he, last winter, collected £105 towards the London Gardeners' Benevolent Institution. This looks

like taking an interest in the concern, so that your correspondent errs in this, and also I think in not seeing that both Mr. Grieve and myself were influenced by the purest of motives, viz., the welfare of our brother gardeners north of the Tweed; and also I think from his offhand letter he does not know that we both hail from the North, and are naturally interested in our country and countrymen. The brotherly love which prompted the Scotch nobleman (when he met his countryman in London) to say, "Come awa, Sandy; we maun aye help ane anither," is not quite dead yet [And we trust never will be! Ed.]. *J. Rust, Eridge Castle.*

**Imported Orchids.**—Referring to my letter on p. 544, I state, at the request of my gardener and Orchid grower, Sidney Cooke, that the reading public must not imagine I attend solely to my Orchid collection of over 1500 plants. He and I are together agreed on every point mentioned in that letter. Had I not done so to the plants therein mentioned he would have done the same thing. The "dipping in a tub" is such an uncommon practice (most people recommend sparing and careful syringing only) that I put to it the words "with my own hand," to back up this statement most emphatically as being true and not nonsense as some might fancy. For his satisfaction, I state the plants after their "bath" have been entirely attended to by him. The word "my" attached to "result" meant I, as owner, and having paid "value" for plants, was quite satisfied with my investment of fifty white *Lælia* acceps at 4s. 9d. each. The last sentence admits of a doubt on the part of the public who know nought of either of us. "We put all Cattleyas and *Lælias* into their permanent quarters and heat at once," would seem better explained the *finale* of the treatment. The public can now see, if they did not know it before, how much I value my man, *De B. Crawshaw.*

**Primroses and Polyanthus.**—"A. D.," writing on the above at p. 535 of your issue of April 25, criticises the different strains of these most beautiful spring flowers. In doing so he appears to have rather overstepped the bounds of fair criticism by introducing Mr. Waterer's name, particularly so as the remarks are detrimental to Mr. Waterer, and considerably to his own advantage. Mr. Waterer is not the only grower of the so-called fancy Primroses and Polyanthus, and if he were he has never presumed to try to please the florist. His object has been to please the general public, who care but little whether their plants have thrum or pin-eyes. In this respect it may be said he has succeeded to his heart's content. As far as he is concerned it is a hundred to one against the florists' flowers. Letters innumerable are being received bearing testimony to the satisfaction the Knap Hill Primroses are giving. *G. T.*

**Horticultural Education.**—In your issue of March 7 you give the letter of a fellow-worker in the field of horticulture, emphasising the good done by the examinations held by the Horticultural Society and the Society of Arts in former years, and quoting his own experience as an example. A few known to me—now in India—must have passed with your correspondent, who are now drawing salaries of from £200 to £600 per annum, and I dare say there are many more not known to me; but such examples should incite the young gardeners of to-day to study and qualify themselves for such positions. Allow me, through the medium of your widely-read paper, to inform the young gardeners of to-day, that the men now holding these appointments were not frequenters of the village ale-house, nor did they spend their evenings at the "big house" (as it is known among us gardeners)—time so spent never leads up to much. They had not even the pay of to-day to assist them, but by studying in season and out of season, and under many difficulties, such as sitting in front of the furnace when attending to the fires in the long winter nights, and finding out secluded spots in the summer evenings, where they made their private study. In the same issue another correspondent, a Scotch gardener, touches a point which appears to me to be at the root, if not the cause, of much that is radically wrong in the present system, viz., that of nurserymen supplying gardeners to gentlemen, and under-gardeners to gardeners. Take an example. Two under-gardeners about the same age, No. 1 the son of the gardener to the Duke of —, but of no ability; No. 2 a young man of ability, well up in his profession, but with no

previous connection in the gardening fraternity. Watch the different places the two young men get. No. 1 gets the best place available, while No. 2 is shunted off into any place. Nurserymen are not to blame in this—they have nothing to guide them but their own interests; whereas, if all young men were graduated as to qualifications, then nurserymen would know what they were doing, and gentlemen would be certain that their valuable collections of plants and gardens were being intrusted to men qualified to look after them, and the man of ability would get his proper position, wages would rise, and the unfit would be weeded out; gentlemen would value their gardeners, and find in them companions, and not, as now, often only servants. How to bring about this appears to be the problem. I do not think there is much difficulty in the matter. We have an efficient staff of examiners in our various botanical establishments who, I am certain, would only be too glad for a small remuneration to examine all papers sent to them. The next question is text-books; these, I think, are also available, if the Government would publish a list of them for the benefit of those willing to go up for examination. "Last, but not least," we have to enlist the services of employers on our behalf, get them to see and learn and understand that men passing through such examinations are more qualified to take charge of large establishments than those who have only a labourer's knowledge of the profession. I regret to say my experience has been on the other side. I know myself what my early studies and my sojourn in the Royal Gardens of Kew have done for me, although my certificates have scarcely seen the light of day since I got them; but I am at this time reaping my reward, like your correspondent, in an enhanced salary. I think he is a little hard on nurserymen; many a nurseryman would be glad to be free of the trouble of exchange in gardeners, and of finding them employment, it may be at a time when he has little work for them, and many of us must be as useless as a common labourer in a nursery; but custom demands that he should employ him, or trade would leave him. If the present system is to be changed, some kind of a trade union would be necessary, paying gardeners a small amount when out of employ; the nurserymen find them employment now, which is equivalent, and gentlemen have to pay enhanced prices for their plants and seeds. As the present gardener is not a free agent, he feels himself under a certain obligation to the nurseryman who got him the situation, therefore he purchases plants and seeds from him. The whole system is rotten to the core. *Hortus, Bengal.*

**Does Fruit Farming Pay?**—This subject has been so often mentioned in the *Gardeners' Chronicle* that it might appear rather out of place at the present time; but I am not asking for information for myself, only simply to give to your readers a few facts that have come under my notice for several seasons past. There are very few growers who care to acknowledge the paying part, but plenty who will do the grumbling part. Two questions arise out of this subject as proofs in point—first, if it does not pay, why do the growers keep planting, as many acres have been planted of different kinds again this season? Secondly, when plantations are for sale by auction or treaty, what induces so many buyers and fruit salesmen to offer such high prices if there are no profits? Last season's was considered generally as a slack crop, but a great quantity of fruit was grown in many plantations, realising high prices, damaged Apples selling at 4s. per bushel, which prevented cider-making at that price. Damsons, the Cluster, are being largely planted (the best kind for market); a cottager last season, with only a fair sized garden, grew twenty-two half sieves, worth 10s. a sieve, besides a quantity of soft fruit, and more vegetables than his family could consume, also abundance of flowers; in another plantation one tree—an old one of the same kind—produced fourteen half sieves; and some few years since a plantation of 4 acres, young trees, not all Damsons, being mixed with some Plums and Black Currants between, produced 700 bushels of Damsons. Cobs carry a heavy crop sometimes when planted with Plums or Apples or both between them. I have known a mixed plantation of this kind to produce one ton of nuts per acre before the trees were fairly grown. In 1824 an Apple orchard with a few Plums, under 7 acres, sold for £175 at an auction sale. One tree of Graham's Russets produced 30 bushels. The same orchard in 1883 sold at £160

with a larger crop of fruit—about 2000 bushels. In 1855 the same sold at £65, set at 1100 bushels; again in 1853 it realised £100, the crop being about 2000 bushels. In the years of 1854 and 1856 the crops were very slight, and fetched only about £50; but then it should be borne in mind it is good pasture land, with plenty of food for sheep the whole season, excepting when the fruit is fit for use, the greater part being late kinds. The outlay also being very small, generally, surely no one would say this is not paying its own way as a profitable crop. Of this I am quite satisfied on my own part, having lived in the centre of fruit districts for more than thirty years, and seen the working. *A Looker-on.*

April 23.—Showers of rain. Dull day and night.

— 24.—Dull day; gleams of sunshine at times.

— 25.—Dull day; strong wind.

— 26.—Fine day.

— 27.—Very fine till 9 A.M.; dull afterwards.

— 28.—Very fine day; rain falling about 8 P.M.

— 29.—Heavy rain in early morning. Fine day, dull at times; very fine night.

LONDON: *Atmospheric Pressure.*—During the week ending April 25, the reading of the barometer at the level of the sea increased from 30.16 inches at the beginning of the week to 30.32 inches by 9 A.M., decreased to 30.29 inches by 1 P.M., increased to 30.33 inches by 5 P.M. on the 19th, decreased to 29.60 inches by 1 P.M. on the 23d, increased to 29.66 by 9 A.M. on the 24th, decreased to 29.37 inches by 9 A.M. on the 25th, increased to 29.44 inches by 1 P.M. on the same day, and was 29.41 inches by the end of the week.

The mean reading of the barometer for the week was 29.87 inches, being 0.04 inch lower than last week, and 0.07 inch below the average of the week.

*Temperature.*—The highest temperature was 72° 5, on the 20th; the highest on the 24th was 61° 2. The mean of the seven high day temperatures was 66° 2.

The lowest temperature was 39° 5, on the 19th; on the 22d and 23d the lowest temperature was 47° 5. The mean of the seven low night temperatures was 43° 8.

The greatest range of temperature in one day was 32°, on the 20th; the smallest was 14° 5, on the 23d. The mean of the seven daily ranges was 22° 4.

The mean temperatures were—on the 19th, 51° 8; on the 20th, 56° 3; on the 21st, 56° 6; on the 22d, 57° 2; on the 23d, 52°; on the 24th, 51° 4; and on the 25th, 53° 8; and these were all above their averages by 4° 6, 8° 9, 9°, 9° 4, 4°, 3° 2, and 5° 5 respectively.

The mean temperature of the week was 54° 2, being 8° 9 higher than last week, and 6° 4 higher than the average of the week.

The highest reading of a thermometer with black-

ened bulb in vacuo placed in the full rays of the sun was 142°, on the 19th. The mean of the seven readings was 118° 5.

The lowest reading of a minimum thermometer placed on grass was 29° 2 on the 19th. The mean of the seven readings was 36° 2.

*Rain.*—Rain fell on the 23d and 24th, to the amount of 0.17 inch.

ENGLAND: *Temperature.*—During the week ending April 25, the highest temperatures were 74°, at Cambridge, 72° 5 at Blackheath, 69° 8 at Nottingham; the highest temperature at Newcastle was 58°, at Preston 61°, at Liverpool 61° 9. The general mean was 66° 6.

The lowest temperatures were—at Hull, 32°, at Truro, Cambridge, and Sheffield, 34°; the lowest at Liverpool was 40° 4, at Newcastle 40°, at Bristol and Blackheath 39° 5. The general mean was 36° 5.

The greatest ranges were 40° at Cambridge, 39° at Hull, 35° at Truro; the smallest ranges were 18° at Newcastle, 21° 5 at Liverpool, 23° at Preston. The general mean was 30° 1.

The mean of the seven high day temperatures was highest at Cambridge, 67° 8, at Blackheath 66° 2, at Nottingham 64° 3; and was lowest at Newcastle, 55° 6, at Sunderland 56° 1, at Preston, 57° 1. The general mean was 60° 7.

The mean of the seven low night temperatures was highest at Liverpool, 45° 9, at Brighton and Preston 44° 9; and was lowest at Wolverhampton, 40° 4, at Bolton 40° 5, at Cambridge 41° 5. The general mean was 43° 2.

The mean daily range was greatest at Cambridge, 26° 3, at Wolverhampton and Hull 22° 5; and was least at Liverpool, 11° 8, at Newcastle 12° 1, at Preston 12° 2. The general mean was 17° 5.

The mean temperature was highest at Blackheath, 54° 2, at Cambridge 53°, at Nottingham 52° 5; and was lowest at Bolton, 47° 4, Newcastle, 48°, at Sunderland 48° 1. The general mean was 50° 4.

*Rain.*—The largest falls were 1.61 inch at Truro, 1.06 inch at Plymouth, 0.61 inch at Preston; the smallest fall was 0.06 inch at Leeds, 0.07 inch at Nottingham and Bradford. The general mean fall was 0.43 inch.

SCOTLAND: *Temperature.*—During the week ending April 25, the highest temperature was 66° 3, at Leith; at Greenock the highest temperature was 60°. The general mean was 62° 9.

The lowest temperature in the week was, Dundee, 34°; at Paisley the lowest temperature was 40° 3. The general mean was 37°.

The mean temperature was highest at Edinburgh, 51° 2; and lowest at Greenock, 49°. The general mean was 50°.

*Rain.*—The largest fall was 2.82 inches at Greenock; the smallest fall was 0.45 inch, at Glasgow. The general mean fall was 1.05 inch.

JAMES GLAISHER, F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, April 27, 1885; issued by the Meteorological Office, 116, Victoria Street, London, S.W.:—The weather has been generally dull and rainy in the west and north-west, but in most other parts of the kingdom the sky has been comparatively clear, and the falls of rain less frequent and heavy. At many of the English and Irish stations thunderstorms were experienced—chiefly on the 25th or 26th.

The *Temperature* has continued a little below the mean in "England, S.W.," and "Ireland, S.," while in "England, N.W.," and "Ireland, N.," it has been about equal to its normal value; but in all other districts an excess is shown, the amount over the north-east and east of England being as much as 4°. The maxima, which were generally registered on the 21st, varied from 55° in "Scotland, N.," and 59° in "Scotland, W.," and "Ireland, S.," to 72° or 73° over central, southern, and eastern England. The minima, which were recorded in most places on the 27th, ranged from 31° in the "Midland Counties" to 37° in "England, E.," and to 44° in the "Channel Islands."

The *Rainfall* has been about equal to the mean in "England, E.," and a little less in "England, S.," but more in all other districts, the excess in "Ireland, S.," being very considerable.

*Bright Sunshine* has been less prevalent than it was last week. The percentages of the possible duration varied from 20 in "England, N.E.," and between 22 and 24 over Ireland to 47 in "England, S.," and 52 in "England, E.," and the "Channel Islands."

*Depressions observed.*—During nearly the whole of this period, depressions—some of which have been large—have passed in a north-east direction outside our western and northern coasts, while several shallow subsidiary disturbances have moved in a similar direction over our islands. South-westerly to southerly winds have consequently been more prevalent, and, although moderate or fresh generally, they reached the force of a gale on almost all our coasts on the 25th. At the end of the period a small depression had appeared over France, causing the wind on our southern coasts to shift to the northward or north-eastward.

ACERS: *E. C. C. D.* The shoots in flower are those of *Acer platanoides*, and the others are possibly varieties of that species—perhaps *A. p. palmatum*, or *A. p. dissectum*—but not enough developed for us to say which. — *Barr & Son.* One of the innumerable varieties of Japanese Maple.

BERRIES OF SNOWBERRY AND AUCUBA: *Diss.* The seeds of each, if not absolutely poisonous, are unwholesome.

COMMON PRIMROSES PLANTED ROOT UPPERMOST: *H. W.* We have no experience.

CORRIGENDA — *MONSTERA DELICIOSA.* — Mr. De B. Crawshaw wishes to say that this plant (see p. 544) did not bloom at his place, as his note seems to infer, but at his mother's, Bradbourne Hall.

ELECTRIC LIGHT AND FRUIT: *Newcastle.* See pp. 404, 407, and 436 of *Gardeners' Chronicle*, vol. xvi., 1881.

FUNGUS ON JUNIPER: *H. M. T.* 1. The tree is a *Juniperus*, probably *J. sinensis*. 2. The fungus is *Podisma juniperi*, which also attacks the Hawthorn in one stage of its existence, and then assumes the totally different appearance characteristic of *Ræstelia lacerata*. The fungus deforms the *Juniper* branches, and also the Hawthorn, and therefore the affected branches should be at once cut out and burnt. For our own part, the interest is so great and the damage so little, that we should put up with the latter for the sake of the former. By some the connection of the two fungi is doubted.

MULLEIN: *R. H. B.* Yes, *Verbascum Thapsus*; but we earnestly caution you not to place implicit credence in any alleged "cure" for consumption. The plant has medicinal properties which may be useful in some cases, but it is a dangerous plant in the hands of the inexperienced.

MUSHROOMS: *J. H. R.* An uncommonly fine sample—and for which you unkindly fined us 1s. for carriage hither.

NAMES OF PLANTS: *Enys.* A Pear, not a Crab. The shrub is *Staphylea pinnata*. — *D. M. C. K.* *Weigela rosea variegata*. — *Cooper.* 3. *Pteris serrulata*; 5. *Lastrea aristata variegata*. — *X.* 1. *Sanguinaria canadensis*; 2. *Fumaria solida*; 3. *Omphalodes verna*; 4. *Sedum album*. — *Enquirer.* *Ornithogalum nutans*. — *W. J. M.* 1. *Lamium album*; 2. *L. purpureum*; 3. *Kleinia*; 4. *Narcissus Pseudo-Narcissus*; 5. *N. incomparabilis* (Butter and Eggs); 6. *N. major*. — *Cooper.* 4. *Charies* (formerly *Kaulfussia*) *ameloides*, sometimes called Blue Marguerite. The other specimens, however good when you sent them, were utterly unrecognisable when they reached us. — *W. M. C. D.* Varieties of *C. barbatus*. — *J. Prece.* *Selaginella filicina*. — *W. H.* *Epidendrum equitans*. — *Camjee.* *Cypripedium hirsutissimum*. — *F. R.* The blooms of *Nuttallia* are male; the other plant sent is not a *Eucalyptus*, but we will endeavour to answer the question shortly.

NIPHETOS: *X.* The proper pronunciation is Niph'etos, the *e* being short. The word signifies snow.

PEACH LEAVES: *John Layton.* The brown spots are caused by drip and exposure to the sun when the leaves are wet. — *J. K. W. D.* The cause seems to be identical with the foregoing.

PLANTS FOR A DRY BANK WHERE ARE RABBITS: *H. C.* Single and double Gorse; white and yellow Brooms; Thorns in variety; *Berberis dulcis*, *B. Aquifolium*, *B. Darwini*, *B. stenophylla*; double-flowered Cherries; *Spiræa* in many varieties; some kinds of Firs, as *Pinus maritima*, *P. sylvestris*, *P. Cembra*, *P. Mugho*; *Juniperus communis*, *J. prostrata*, *J. tamariscifolia*, *J. Sabina*; *Clematis flammula*, *C. florida*, *C. cœrulea*, *C. viticella*, and *C. montana*. These last named plants to be allowed to climb over rocks or roots, or to form natural clumps.

PLANTS FOR EXHIBITION: *M. B.* *Asparagus tenuissimus* may be shown in the class for decorative plants or as a foliage plant.

**PRUNING OF DENDROBIUMS.**—We have received a large amount of correspondence on this subject, much of which, in view of the success attained by Mr. Prinsep, as seen at the last meeting of the Royal Horticultural Society, has now no further value, and which for want of space cannot be published. Those of our correspondents who too literally understood Mr. Prinsep's challenge to show his plant only if some one would pay the cost of its transit to South Kensington, must accept this statement of ours as final.

**SOOT: N. Y. Z.** It is an excellent manure for Peas, Onions, and Carrots. It can be applied to plants in pots as a liquid manure if mixed with rain-water in the proportion of one tablespoonful of soot to 1 quart of water, and should be given when clear. It is good for bulbs, and must not be given to plants in their resting state. Its beneficial properties are due to the salts of potash and soda, 24, and salts of ammonia, 426, in 1000 parts, which it contains.

**FOREIGN SUBSCRIBERS** sending Post-Office Orders are requested to send them to the Publisher of this journal, 41, Wellington Street, Covent Garden, and to make them payable to William Richards, at the Post-Office, Drury Lane, London, W.C.

### CATALOGUES RECEIVED.

## Markets.

### COVENT GARDEN, April 30.

[THE subjoined reports are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list weekly, and are responsible for the quotations. It must be remembered that these quotations are averages for the week preceding the date of our report. The prices fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the price at any particular date, still less can they be taken as guides to the price in the coming week. Eo.]

**HOTHOUSE** goods are reaching us in increased quantities. Prices lower all round. Large consignments of foreign vegetables realising low values. Business as last week. *James Webber, Wholesale Apple Market.*

### SEEDS.

**LONDON: April 29.** There is still some sowing demand for Clover and other seeds; but overshadowing this a considerable speculative inquiry has lately sprung up for holding over, under the influence of which rates all round have substantially advanced. Several lots of American red Clover seed, not only from England, but also from the Continent, have recently been reshipped to the United States. Italian Rye-grass is again dearer. There is a better demand for white Mustard. Rape seed is firmer. There is no change in bird seeds. Blue Peas have been in improved request. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

### CORN.

At Mark Lane on Monday prices of Wheat were about 1s. above those of Monday's night. Flour was but slightly dearer on the week, and met a dull sale. Barley showed 6d. advance from the previous Monday, but moved off slowly. Beans were in moderate supply, and 6d. to 1s. dearer, and Peas were firm at full values. Oats did not move off very readily, but maintained a rise of 3d. to 6d. Wednesday's trade was slow, but prices continue to harden as events apparently drift towards war. Business in Wheat was limited, but in some cases 1s. advance was reported to have been obtained. Flour was quiet, and not apparently altered in value. Barley, Beans, and Peas were firm, and tended against buyers. Flat Maize showed 6d. advance. Oats were held firmly; buyers, however, operated with more reserve, and the market was quiet.—Average prices of corn for the week ending April 25:—Wheat, 36s. 8d.; Barley, 32s. 6d.; Oats, 22s. 6d. For the corresponding period last year:—Wheat, 37s. 2d.; Barley, 31s. 2d.; Oats, 20s.

### CATTLE.

At Copenhagen Fields on Monday the beast market was rather firmer, but not to any quotable extent. The sheep trade was firmer and more cheerful. Fat sheep and ewes were not better in price, but wethers of handy weights in some cases realised rather more mooney. Our quotations are now for clipped sheep. Lambs sold decidedly dearer, and calves at about steady value. No pigs were on offer, and quotations nominal.—Quotations:—Beasts, 3s. 4d. to 4s. 6d., and 4s. 8d. to 5s.; calves, 3s. 8d. to 5s. 4d.; sheep, 4s. 2d. to 4s. 6d., and 4s. 8d. to 5s. 2d.; lambs, 7s. 8d. to 8s.; pigs, 4s. to 4s. 6d.—Thursday's cattle trade was quiet and featureless. There was nothing doing in beasts, and prices were nominally the same as last week. Sheep were in fair demand, particularly for small breeds, for which full prices were paid. Lambs were quieter, and calves and pigs about the same.

### HAY.

Tuesday's Whitechapel market report states that there was a very dull trade with a fall in the top price of Clover and hay, which was reduced to 105s. and 98s. respectively. Quotations:—Clover, prime, 85s. to 110s.; prime second cut, 80s. to 105s.; inferior, 46s. to 75s.; hay, prime, 76s. to 102s. 6d.; inferior, 25s. to 60s.; and straw, 22s. to 35s. per load.—On Thursday there was a large supply, and the trade was dull, with lower prices for the best hay.—Cumberland Market quotations:—Clover, best, 90s. to 105s.; inferior, 60s. to 84s.; meadow hay, best, 84s. to 95s.; inferior, 45s. to 75s.; and straw, 30s. to 34s. per load.

### POTATOES.

The Borough and Spitalfields Markets reports state that there were good supplies and moderate demand at the following quotations:—Scotch Regents, 80s. to 95s.; Kent ditto, 70s. to 85s.; Champions, 40s. to 50s.; Magnum Bonum, 50s. to 60s.; and Victorias, 70s. to 90s. per ton.—The imports into London last week consisted of 10 bags from Hamburg, and 637 boxes 47 packages from Malta.

**Government Stock.**—Consols closed on Monday at 95½ to 95¼ for both delivery and the account. Tuesday's figures were 95½ to 95¼ for both transactions. The closing prices of Wednesday were 94½ to 95¼ for delivery and the account. Thursday's closing prices for both delivery and the account were 94½ to 95¼.

### 12-oz. Sample Packets, free by post, 12 stamps.

**FIBROUS PEAT FOR ORCHIDS, &c.**—**BROWN FIBROUS PEAT**, best quality for Orchids, Stove Plants, &c., £66s. per Truck. **BLACK FIBROUS PEAT**, for Rhododendrons, Azaleas, Heaths, American Plant Beds, 15s. per ton per Truck. Sample Bag, 5s.; 5 Bags, 22s. 6d.; 10 Bags, 45s. Bags included. Fresh SPAGNUM, 10s. 6d. per Bag. **SILVER SAND**, Coarse or Fine, 55s. per Truck of 4 tons. **WALKER AND CO.**, Farnborough Station, Haats.

## HORTICULTURAL PREPARATIONS.

The best and most effectual yet introduced.

**FOWLER'S LAWN SAND**, for destroying Daisies, Dandelions, Plantains, Ribbed Grass, Thistles, and other weeds on Lawns, Croquet Grounds, Bowling Greens, Parks, &c.; at the same time acting as a fertiliser, and improving the growth and colour of the grass. Price in tins, 1s., 2s. 6d., and 5s.; kegs, 20 lb., 10s.; 56 lb., 19s.; 112 lb., 36s.

**GARDENER'S INSECTICIDE**, for destroying all the various insects infesting plants and trees. It is easily applied either by dipping, syringing, or spooning; will not injure the most delicate flower, fruit, foliage, or root. In jars, 1s. 6d., 3s., 5s. 6d., and 10s. each; and in kegs, 28 lb., 21s.; 56 lb., 42s.; 112 lb., 84s. each.

**FOWLER'S MEALY-BUG DESTROYER**, for the special eradication of this most troublesome of stovehouse insect pests. It is easily applied, is instant destruction to both insect and ova, and does not injure the foliage. In bottles, 1s., 2s. 6d., 5s. and 10s.; half-gallon, 21s.; one gallon, 42s. each.

## RANSOMES' LAWN MOWERS.

**THE "WORLD" LAWN MOWERS**  
 are the best for cutting long grass, and are constructed on the  
 American system with the special advantages of English  
 materials and workmanship.

They are made in nine sizes, 8 to 24 inches.  
 Prices from 45s. to £10.

**THE "REVERSIBLE" LAWN MOWERS**  
 are suitable for small gardens and borders. They roll the  
 grass as well as cut it, and can be used either side upwards.

They are made in three sizes, 6 to 10 inches.  
 Prices from 27s. to 45s.

**THE "AUTOMATON" LAWN MOWERS**  
 are the best machines for general purposes and gardeners' use.  
 They leave no ribs in the grass but produce a perfect surface.

They are made in eight sizes, 8 to 23 inches.  
 Prices from 55s. to £8 10s.

**THE HORSE-POWER MOWERS**  
 are the best for Large Lawns, Cricket and Lawn Tennis Clubs.  
 They are used on the Cricket Grounds of the Oxford and Edin-  
 burgh Universities and numerous Colleges and Public Schools.  
 They are made in six sizes, 26 to 48 inches.

Prices from £14 10s. to £32.

Complete Price LISTS may be obtained from any respectable Ironmonger, or  
**RANSOMES, SIMS & JEFFERIES (Ld.), IPSWICH.**

# FIR TREE OIL

## INSECTICIDE (SOLUBLE IN WATER)

Destroys all Insects and Parasites without injury to Flowers, Fruit, Roots or Foliage.

Useful alike in Greenhouse, Vinery, Fernery, Orchard, Vegetable, Flower and Hop Gardens. Cures Mildew and Blight. Kills all Grubs, Aphis, Lice, Red Spider, Thrip, Mealy Bug, Caterpillars, &c. Applied by means of the Fir-Tree Oil Spray Pump, the Aphicide (hand spray producer), or by dipping. The trouble will be amply repaid by the healthy appearance of the foliage and the abundance of Fruit and Flowers. Always effectual, economical, and safe. Quickly removes all Insects from the coats of animals. It will cure Ringworm and all Parasitic Skin Diseases, and is perfectly harmless to the Hands and Skin.

Sold by Seedsman and Chemists, 1s. 6d., 2s. 6d., and 4s. 6d. a Bottle. Per Post 3d. extra. Tins— $\frac{1}{2}$ -gallon 7s. 6d., 1 gallon 12s. 6d.; Drums—5 & 10 gallon 11s. per gallon, Carriage Paid.

A Treatise on FIR TREE OIL, as an Insecticide, its application to Plants and Animals sent Post Free on receipt of address, by the Manufacturer,

Special Quotation for Quantities.

Special Quotation for Quantities.

## RANSOMES' NEW PATENT EDGE CUTTER.

Any Gardener can use it with ease.

The only really practical Edge Cutter yet brought out.

THIS Machine is a light, simple, strong, and useful substitute for Hand Shears, for trimming the edges of Lawns. It can be guided with the greatest ease either in a straight line or round the edges of flower beds, &c. The depth of cut can be varied to suit the depth of the edge by simply tilting the conical roller more or less. The knives can be adjusted to the fixed blade as they wear, and can be readily removed for sharpening. After a little practice with this Machine, a man can trim the edges as fast as he can walk, thus doing from five to ten times as much work as with the ordinary shears.

Price . . . . . 35s.

Carriage Paid to any Railway Station.

RANSOMES, SIMS & JEFFERIES (Limited), Ipswich.

## DEANE & CO.'S SPAN-ROOF GREENHOUSE.

No. 4.—A plain but substantial Greenhouse, Planthouse, or Vinery of the best construction; a really useful house at a very moderate price.

ESTIMATES.—The prices given are for ERECTING COMPLETE, by our own men, within 15 miles of London Bridge, including building dwarf wall 2 feet 6 inches high in 9-inch brickwork all round, and erecting, painting, and glazing greenhouse in the best style.

HEATING APPARATUS.—This consists of a Loughborough Hot-water Apparatus, complete with syphon, flue-pipe, and a double row of 4 inch pipe along one side of the houses under 12 feet wide one side and one end of houses 12 feet to 16 feet wide, and both sides and one end of houses above this width, all fixed, studded, painted, and left in proper working order.

Length.	Width.	Price of House.	Heating Apparatus.

palm before all other plant labels, as the very first in merit."  
Samples and Price Lists free.  
**J. SMITH, The Royal Label Factory, Stratford-on-Avon.**

Oil Paint no Longer Necessary.  
**HILL AND SMITH'S BLACK VARNISH,**  
for Preserving Ironwork, Wood, or Stone.  
(Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on  
all outdoor work, while it is fully two-thirds cheaper. It was  
introduced upwards of thirty years ago by the Advertisers, and  
its genuine good quality, notwithstanding a host of unprincipled  
imitators, is fully attested by its constantly increasing sale. It  
may be applied by an ordinary labourer, requires no mixing  
or thinning, and is used cold. It is used in the grounds at  
Windsor Castle, Kew Gardens, and at the seats of many  
hundreds of the Nobility and Gentry, from whom the most  
flattering testimonials have been received.  
Sold in Casks of about 30 gallons each, at 12. 6d. per gallon,  
at the Manufactory, or 15. 8d. per gallon carriage paid to any  
Station in the Kingdom.

UNSOLICITED TESTIMONIAL.  
"Pierrefield Park, June 21, 1876.—Sirs.—I have this day  
forwarded from Chepstow to your address a black varnish cask,  
to be filled and returned with as good Varnish as the last we  
had, which I candidly admit was the best we ever had. Address  
Varnish to Pierrefield Park, Chepstow.—I am, Sirs, yours re-  
spectfully, Wm. Cox."

CAUTION.—HILL & SMITH would particularly warn their  
Customers against the various cheap Varnishes now so much  
advertised.

H. & S.'s Varnish has been an article of common use on most  
of the large estates in the kingdom for upwards of thirty years;  
and their constantly increasing trade in it, and the numerous  
Testimonials they receive, stamp it as a truly genuine article.  
Every cask is legibly marked with their name and Registered  
Trade Mark as above, without which none is genuine.

Large illustrated CATALOGUE of Fencing Hurdles, Field  
and Entrance Gates, &c., sent free on application to  
**HILL AND SMITH, Brierley Hill Ironworks, Staffordshire:**  
118, Queen Victoria Street, London, E.C.; and 196, St. Vincent  
Street Glasgow.

33A, Turner Road, Lee, Blackheath, S.E.

## WANT PLACES.

## GRATEFUL-COMFORTING.

## EPPS'S COCOA.

## BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." *Civil Service Gazette.*

Made simply with boiling water or milk. Sold only in Packets, labelled thus:—  
**JAMES EPPS & CO., Homoeopathic Chemists, London.**

**HOLLOWAY'S OINTMENT and PILLS.**  
—Safety and Security.—When the severities of winter have yielded to the genial spring, invalids should make a determined effort to regain their lost health; when, through confinement indoors, want of appetite, and disturbed sleep, the entire system has been weakened, and the spirits have been broken down, Holloway's remedies are equal to the occasion. The Ointment rubbed over the regions of the stomach and liver, aided by the internal administration of his Pills, will rectify the digestion, regulate the bile, and purify the blood—three sanitary actions which will speedily confer renewed vigour, brace up the failing nerves, confirm the flaccid muscles, and restore to the ailing cheerfulness, that great charm of existence.

# SEND FOR A PRICE LIST OF JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS,

For Raising Water for the Supply of Towns, Villages, Irrigation, Railway Stations, Mansions, Fountains, Farms, &c.

*No Cost for Motive-Power, which is obtained from a Stream of Water passing through the Rams.*

NO OILING OR PACKING REQUIRED.

Made in Sizes to Raise from 300 to 500,000 Gallons per day. Will Force to a Height of 1500 feet.

SPECIAL RAMS for HIGH FALLS to send up Two Gallons out of every Five Gallons passing through them.

Blake's Special Ram, to work under small falls. The patterns vary with the different sizes.

This Ram will force a part of the same water that works it, or will force clean water from a well or spring whilst worked by a stream of impure water. Rams on this principle can be supplied to force to a height of 1500 feet.

This Ram, for deep working falls, is capable of sending up two gallons out of every five gallons passing through it.

## SUPPLEMENT TO THE GARDENERS' CHRONICLE.

## ORCHIDS.

## GEOGRAPHICAL DISTRIBUTION.

(WITH MAP.)

HE geographical distribution of Orchids is an interesting study, and one to which the amateur and cultivator may devote some little attention with advantage. Generally speaking, Orchids are very widely distributed, being found in

all but the most arid or the most frigid of climates. As a rule, we find the terrestrial species in the more temperate regions, while the more showy epiphytal kinds mainly exist between the isothermal lines of  $70^{\circ}$  on either side the Equator, forming, as it were, a comparatively narrow zone or belt around the earth. I need scarcely say here that all Orchids, however rare and valuable at home in our gardens, are found growing in a perfectly wild state in their respective natural habitats, and a glance at the sketch map, and the accompanying list of the principal genera of Orchids, will show their natural distribution better than any written description could possibly do.

There are one or two points of interest which present themselves to our notice with regard to particular genera. Thus, *Cypripedium* is found in three out of the four quarters of the globe, stretching from the American continent, through Britain and Northern Europe, and then away through India, as far north as Japan. Even a solitary species may puzzle the *savans*—to wit, *Spiranthes Romanzoviana*, which is found in a wet, rushy meadow in Co. Cork (Ireland), and nowhere else in Europe, although in North America it extends from the Atlantic to the Pacific coast! The genus *Cephalanthera* is found in all four quarters of the globe. Again, it is very singular to find Eastern *Bulbophyllums* represented in West Tropical Africa by the genus *Megaclinium*—much more so than it is to find the *Sobralias* of the West represented by the *Arundinas* of the East. Among European Orchids the most abundant are species of *Orchis*, and in Madeira and Northern Africa this genus reaches its highest stature and greatest beauty.

*Angræcum*, remarkable for its long spur, is further interesting, inasmuch as *A. funale* (like *Aërides tænale*) is quite leafless—much more so even than some African *Euphorbias*, *Rusci*, *Colletia*, or *Xylophyllum*—even the merest rudiments of true leaves are not observable. These two leafless epiphytes depend entirely upon the chlorophyll in their band or thong-like roots, which serve the double function of roots and leaves. Adaptive as all plants are to geographical or climatic conditions we have but

few, if any, examples more striking than are these two leafless Orchids.

The lesson they teach to practical Orchid growers is obvious. They show us that the roots of epiphytal Orchids have more extended functions than mere earth-loving roots are possessed of, and that these aerial roots can do good work, even when thrust out into mid-air, and that to bury such roots in crude, wet earth is to rob them of their healthy vigour. It is interesting to note in this connection the occasional occurrence of adventitious buds on the aerial roots of *Phalænopsis*, as recently recorded in a plant of Major Lendy's.

As every tyro in geography is aware, the heat of any portion of the globe is determined by latitude and by altitude. Now as to temperatures at sea level the isothermal lines on the map show it pretty plainly, but apart from latitude there is the question of altitudes to be considered, and these it is not at all easy to show clearly on a map of this kind.

Genera of Orchids only are named on the map, and some genera, *Oncidium* and *Dendrobium* for example, are represented by species growing at, or very little above sea-level, while others in the same genus grow at an elevation of 10,000 to 12,000 feet. *Oncidium nubigenum* rises to the last named altitude even if not higher, and *Epidendrum frigidum* is found growing at 14,000 feet, or only a little below the perpetual snow line! Whenever altitudes are given it is easy to calculate the approximate temperature in this way:—Note the mean temperature between the nearest isothermal lines, and for tropical or equatorial regions subtract  $3\frac{1}{2}^{\circ}$  for every 1000 feet elevation. This is not a perfectly accurate method, but it is amply sufficient for most practical purposes.

If the sketch-map of the Orchids be compared with a rain-chart, it will be seen that they agree in a remarkable way, inasmuch as the comparative proportions in which Orchids are naturally found is evidently dependent on light, heat, and rainfall. In cold countries, or in temperate countries having a cold winter season, perennial plants must either hide their vital organs (such as roots and stems) in the earth, or perish; but in the winterless tropics they can leave the protection of the soil and become epiphytal, or be fully exposed to the open air with impunity. The only adverse conditions they have to endure in tropical regions are the dry monsoons, and in order to resist the effects of these their savings-bank system of producing fleshy pseudobulbs, or swollen stems and leaves and petioles, has been developed. In a word, epiphytal Orchids store up material during their period of growth when moisture is most abundant, in order to tide over times of drought in the tropics, just as our terrestrial

kinds save up nutriment during summer, and store it in their underground tubers before winter arrives. The relative size of the pseudobulbs on any species of Orchid depends on the extremes through which its cycle of existence passes, and one reason why Orchids do not make their pseudobulbs so large under cultivation is, because they are not subjected to the great extremes of temperature and moisture which happen in their native habitats, and, as is now well known, the plants may bloom equally as well under cultivation as in their native forests.

There is reason to suppose that of all endogenous plant forms those having inferior ovaries are the latest among Dame Nature's fashions, and if this be true it is especially so in the case of the tree climbing Orchids (epiphytes) of the winterless regions of the globe. Were it likely to serve any useful purpose we might construct a sort of floral index or thermometer of Orchids alone, taking as our lowest starting point the terrestrial and hardy *Orchis* of Siberia, North America, or even of our English meadows, and ending with the maximum which the *Phalænopsis* and *Saccolabium* of the tropics afford us. The genus *Cypripedium* alone will give us some idea of how plants of the same genus, and essentially the same in floral structure, may and do vary under different climatic conditions. We can take the true Lady's Slipper (*C. calceolus*) of our northern woods—still there, but not abundant—as an example of the hardy terrestrial and herbaceous group. *C. calceolus* is a deciduous leaved species, whether found in Europe, in North America, or in Japan, as also are its congeners, the endemic species from North America and Siberia. But when we approach the equator in the east and in the west alike we find species of *Cypripedium* with evergreen foliage, persistent stems or rootstocks, and they are often epiphytal on tall forest trees. The most beautiful of all Orchids are the epiphytes, or tree-dwelling tropical species. True terrestrial *Disas*, some southern species of *Orchis*, *Eulophias*, *Cypripedia*, and *Sobralias* or *Arundinas*, are most lovely, but these are only the few exceptions which prove the rule, and are insignificant when we compare them with the epiphytal *Cattleyas* and *Odontoglossums* of the West, or with Eastern *Vandas* and *Phalænopsis*. Plants of epiphytal growth are common enough in Britain. You have only to go to Devonshire valleys to find the *Polypodium* Fern creeping overhead in the trees, and so in Ireland, beside the beautiful Wicklow streams, where rocks and trees alike are clothed with epiphytal Ferns and other growths. In the tropics it is not merely the Orchids, but many Ferns and *Bromeliads*, *Æschynanthus*, and the *Aroids*

also, which live in the trees; and wherever we meet with epiphytes in greatest abundance we find it mainly owing to two natural conditions, viz, excessive moisture and excessive tree shade.

The question why Orchids should live in the trees in hot countries, where the rainfall is excessive, is not at all a difficult one to answer. In a word, their doing so is not a bit more wonderful than is the climbing of the common Polypody in the Dargle or in Devon; indeed, the wild Roses and Honeysuckle in an English wood not unfrequently become sub-epiphytal from precisely the same causes. In the tall forests of the tropics, where many of the trees are both umbrageous and evergreen, all low-growing plants, dependent on the sunshine for life and strength to reproduce themselves, must do one of two things—they must either adapt themselves to the shade, or they must climb to the tree tops if they cannot live without the sun. The English Honeysuckle or the hedge Clematis do this by actually lengthening their stems—"more rope" so to say—but the Orchids and Ferns and Bromeliads do not climb in this way; if they do so, at least, it is but seldom. There are, in fact, some species—Oncids, Odontogloss, Epidendras, and the Burmese Erythrorchis scandens—which actually do rear themselves above the surrounding vegetation individually by means of an elongated stem or rhizome; but this is not the general way, and, as a rule, the Orchids owe their elevation to their seeds, which are blown about, and which grow only in those positions where light and moisture are most favourable. Their sawdust-like seeds are wafted among the branches when the latter are wet with rain or heavy dew. Thus, high up in the air and light and sunshine they exist, passing their whole lives on the tree-tops where the chattering apes are, and where the most beautiful of "unbidden guests"—the insects—make love among the curious blossoms. High up above the cloistered forest shade their delicate petals open just in time for the "butter-

fly's ball." The flowers are like insects, and the insects themselves gorgeous as are the blossoms; and while the insects are intent on the honeyed sweets of cup or nectary, they unconsciously augment the floral beauty on which they live by fertilising the waxy-petalled flowers. Whenever we talk of cross-fertilisation by insect agency, the great question of colour-variation crops up in quite a natural way, and after all it is not difficult to get another link or two in the chain of thought which leads us to believe that the most beautiful Orchids are as modern as they are beautiful.

It is easy to realise that great changes have taken place in Nature, but we must go a step further and recognise the fact that changes, slow but sure, are now taking place all around us. Nature is as busy in evolving new species to-day, even more active indeed than she was in times past; in a word, she is making us new Cattleyas and Odontogloss and Phalænopsids at this moment in her great wild garden, just as surely as our hybridisers are evolving new species of Orchids, &c., in our hothouses at home! The earliest of all blossoms, as we understand the word, were simply green leaves, modified in form and in function rather than colour. The green crescent shaped bracts of our native Euphorbias remain as examples of these green blossoms. Even yet we have green Roses in a double sense, we have Alchemilla still with green blossoms and simple leaves, and then we have the true Rose with green floral segments—a renegade, a reversion—a "bad lot" among blossoms, which may serve to remind us of the youngsters who even in our own day have a hankering after the cock-pit or the ring diversions peculiar to their great-grandfathers. It requires no great stretch of imagination to believe that all flowers were green in the beginning. Then comes a step forward, the green becomes lighter and brighter. Why the blue pigment vanishes we cannot say at present, but that it does so is a fact, and as the

result we have yellow flowers. Sometimes both blue and yellow vanish together, leaving us white flowers or flowers nearly white, for I never yet could find a flower without yellow and green colouring yet lingering about it somewhere or other. Red is a colour of a still higher grade—perhaps this is the reason why the poets, "who needs must love the highest," loved the red or purple-rimmed Narcissus the best, feeling in their hearts that it was the noblest of its race. At any rate red is a noble colour, as generals and cardinals are fully assured. But the highest of all floral colouring is blue—"heavenly blue;" and it is singular to find that we love the colour just as the father loved the prodigal—we welcome it "as a pilgrim returned." It is the first colour to flee from the earliest green petal, it is also the last colour to come back to us when floral development is at its highest and best. Now it may dawn upon the reader, as it has just dawned upon me, that but very few among the 7000 to 10,000 species of Orchids have blue flowers, and blue Vandas may be cherished and admired all the more in consequence. Ruskin somewhere compares a zone of soft blue alpine Gentians seen stretching across a mountain side, to a blue sash on a queen's bosom, and remembering how noble and rare blue as a colour really is in Nature, we can the more pity the generations of florists, now dead, who have laboured and sighed in vain for blue Dahlias, and longed even for a "blue Rose." When we find so many green, yellow, and white flowers among Orchids, and so few that are really entirely red, or entirely blue, we have biological evidence of their ancestry being a modern one. The Horse-tail in the wet ditch by the roadside marks an epoch in the history of the globe. Its ancestors were giants in the remote ages, as their fossil remains now testify; but the Orchis in the meadow is of a new dynasty, and its potentialities are those of a stripling—a glorious future. F. W. B.

## ALPHABETICAL LIST OF THE GENERA OF ORCHIDS.

THE following list has been compiled and rearranged from Hooker and Bentham's *Genera Plantarum*, vol. iii., pp. 460–636, and may be interesting to the numerous amateurs who cultivate Orchids. All the genera of Orchids recognised by the late Mr. Bentham are included, but only about one-third of the total number (334) are generally met with in cultivation; these are distinguished by being printed in black type. A few notes on culture and other matters of popular interest have been added, and each genus is numbered consecutively from 1 to 334, in accordance with the map issued with the present number, showing the generic distribution of all known Orchidaceous plants.

In the *Genera Plantarum* above cited will be found all the literary references necessary for the botanical student, together with many citations of plates and figures, which, from considerations of space, we are compelled to omit. The indications that are here supplied must therefore be considered as illustrative, but not exhaustive. On the other hand we have inserted references to the plates in the *Orchid Album*, and to the full enumeration of cultivated species of a large number of the genera, as drawn up by Mr. Hemsley, in our columns, and also to most of the figures given in the *Gardeners' Chronicle*, but not cited in the *Genera*. The \* indicates that a figure will be found in the volumes of the *Gardeners' Chronicle*. F. W. Burbidge.

1. **ABOLA**, Lindley.  
A small flowered epiphyte, of no beauty, from the Colombian Andes.
2. **ACACALLIS**, Lindley.  
One species, from Northern Brazil.
3. **Acampe**, Lindley.  
Eight or nine species, from India, China, South Africa, &c. This genus approaches *Sarcanthus*. Species not showy.
4. **Acanthephippium**, Blume.  
Three or four species, from India and the Malayan Archipelago. Flowers fleshy, on erect spikes, not very showy. See Bot. Reg., t. 1730, and 1846, t. 47; Bot. Mag., t. 4492. For list of species see *Gard. Chron.*, 1882, xviii., p. 565.
5. **Aceras**, R. Brown.  
One species, in Europe and North Africa. Rehb., Icon. Pl. Germanica, t. 357; Barla. Icon. Orch. Alp. Marit., t. 23.
6. **ACIANTHUS**, R. Brown.  
Seven species, from Australia, New Zealand, and New Caledonia. See Rehb. f., Xen. Orch., t. 187.
7. **Acineta**, Lindley.  
Eight species, from Colombia, Central America, and Mexico. Flowers resembling those of *Peristeria*, being fleshy, white, or yellow, and heavily spotted or dotted. Inflorescence pendulous, as in *Stanhopea*—like which, the plants should be grown in baskets. See Bateman's Orch. Mexico and Guatemala, t. 8; Bot. Mag., t. 4156, 4203; Bot. Reg., 1843, t. 78; *Gard. Chron.*, 1879, xi., 235.
8. **ACRIOPSIS**, Reinwardt.  
Three or four species, from Burmah and Malaysia. Not showy.

9. **Achrocæne**, Lindley.  
One species, from the Sikkim Himalayas. See *Gard. Chron.*, 1882, xviii., 428.
10. **Ada**, Lindley.  
One species only known, from the Colombian Andes. It was first called *Brassia cinnabarina* by Lindley. Showy spikes of vermilion tinted flowers. See Bot. Mag., t. 5435; *Orchid Album*, t. 53.
11. **AENOCHILUS**, Hooker.  
Two species only, from New Zealand and Australia.
12. **Aeranthus**, Lindley.  
Two species, both from Madagascar. See *Gard. Chron.*, 1879, xi., 235.
13. **Aerides**, Loureiro.  
Ten to fifteen species are found in India, Malayan Archipelago, Philippine Islands, China, and Japan. Nearly all the species are showy and fragrant, and some are variable. See *Orchid Album*, t. 21, 116, 160; Bot. Mag., t. 4049, 4139, 4427, 4982, 5278, 5798. The following species are figured in the *Gard. Chron.*:—  
\* *A. crassifolium*, 1877, viii., 493.  
\* *A. cylindricum*, 1875, iii., 537.  
\* *A. odoratum*, 1845, 436.  
\* *A. odoratum purpurascens*, 1881, xvi., 597.  
\* *A. quinquevulnera*, 1845, 100.  
\* *A. Schröderi*, 1880, xiii., 493; 1882, xvii., 341.
14. **AGANISIA**, Lindley.  
Six species, from Tropical America. See Bot. Reg., 1840, t. 32.
15. **Agrostophyllum**, Blume.  
Five or six species, from India and the Malayan Archipelago. For list of species see *Gard. Chron.*, 1882, xviii., 812.

16. **Alamania**, Llave and Lexarza.  
One species, from Mexico. See *Gard. Chron.*, 1883, xix., 764; 1879, xi., 235.
17. **ALTENSTEINIA**, Humboldt, Bonpland, and Kunth.  
Twelve species are known, from the Andes of Tropical America.
18. **Amblostoma**, Scheidweiler.  
Three species, from Brazil, Peru, and Bolivia. For list of species see *Gard. Chron.*, 1883, xix., 660.
19. **Angraecum**, Thouars.  
Twenty-five species are known, from Tropical and South-east Africa, Madagascar, Bourbon, and Mauritius. A. sesquipedale is the largest flowered of all Orchids, and also possesses the longest spur or nectary. A. funale is a rare leafless epiphyte, and the leaves of A. fragrans have been used as a kind of tea. A. falcatum is the most northern species, being found in Japan. See *Orchid Album*, t. 41, 162, 179; *Bot. Mag.*, t. 2097, 4159, 4295, 4370, 4761, 4782, 5113, 5170, 5389, 5624. The following species are figured in *Gard. Chron.*:—  
\*A. eburneum superbum, 1873, 217.  
\*A. Ellisii, 1875, iii., 277.  
\*A. fastuosum, 1885, xxiii., 533.  
\*A. funale, 1846, 135.  
\*A. Kotschy, 1880, xiv., 693.  
\*A. Scottianum, 1880, xiv., 137; 1882, xvii., 342.  
\*A. sesquipedale, 1857, 253; 1873, 255; plant, 1874, 346.
20. **Anguloa**, Ruiz and Pavon.  
Three species and several varieties are known, from Colombia and Peru. They are strong-growing plants, with the habit of Lycaste, and having great waxy flowers like Tulips, solitary on scapes springing from the base of the pseudobulbs. See *Bot. Mag.*, t. 4313, 4807, and 5384; *Orchid Album*, t. 19, 133.
21. **Anætochilus**, Blume.  
From ten to twenty species and varieties are in cultivation, and are mainly remarkable for the beauty of their foliage, which is velvet-like in texture, lined or suffused with golden, silvery, or bronzy lines. Borneo, Ceylon, India. See *Bot. Mag.*, t. 4123, 5208; *Bot. Reg.*, t. 2020.
22. **Ansellia**, Lindley.  
One species, originally found on the stem of a Date Palm at Fernando Po, but two or three remarkable varieties have since been introduced. Tropical and South Africa. See *Bot. Mag.*, t. 4965; *Bot. Reg.*, 1844, t. 12; 1846, t. 30.
23. **Anthogonium**, Lindley.  
Only one species known, from the Himalayas and Burmah. See *Gard. Chron.*, 1882, xviii., 812.
24. **APHYLLOCHIS**, Blume.  
Four or five species, native of India and the Malayan Archipelago.
25. **Aplectrum**, Nuttall.  
One species, known in North America as the "Putty Root," and a near relative of the Corallorhizas.
26. **APOSTASIA**, Blume.  
Four species, native of India, Malayan Archipelago, and Australia. Not showy, but of special interest to botanists.
27. **APPENDICULA**, Blume.  
Species twenty, from Malacca, Malayan Archipelago, and Pacific islands. Not showy.
28. **Arachnanthe**, Blume.  
Six species, from Malaya and the Himalayas. Vanda Lowii and V. Cartheartii have been included in this genus, which approaches Renanthera and Vanda. See *Bot. Mag.*, 5475, 5845.
29. **Arethusa**, Linnæus.  
One species, found in North America and in Japan. See *Bot. Mag.*, t. 2204; *Bot. Reg.*, 1072.
30. **ARGYNCHIS**, Blume.  
One species, from Java.
31. **ARNOTTIA**, A. Richard.  
Two species only known, from Mauritius.
32. **Arpophyllum**, Llave and Lexarza.  
About six species, from Mexico, Central America, and Jamaica. When well grown they are distinct and showy, fine examples having formerly been exhibited. For list of species see *Gard. Chron.*, 1881, xvi., 428; 1879, xi., 235.
33. **Arundina**, Blume.  
Five to ten species, from India, Malayan Archipelago, and South China. Of reed-like habit, with showy flowers, the Arundinas represent the Sobralias of the Western Hemisphere. See *Orchid Album*, t. 139. For list of species see *Gard. Chron.*, 1880, xiv., 636.
34. **Aspasia**, Lindley.  
Five or six species, from Brazil and Central America. See *Gard. Chron.*, 1879, xi., 235; *Bot. Mag.*, t. 3679, 3962; *Bot. Reg.*, t. 1907.  
BARKERIA (see Epidendrum), *Gard. Chron.*, 1879, xi., 235; *Orchid Album*, t. 148.
- \*B. elegans (cyclotella), *Gard. Chron.*, 1872, xliii., 80, 235. See *Bot. Mag.*, t. 3818.
35. **BARTHOLINA**, R. Brown.  
One species, from South Africa.
36. **BASKERVILLEA**, Lindley.  
One species, wild in Peru.
37. **Batemannia**, Lindley.  
One species, from Guiana. See *Gard. Chron.*, 1879, xi., 235; *Bot. Mag.*, t. 3818.  
\*B. meleagris, *Gard. Chron.*, 1881, xvi., 209.
38. **BICORNELLA**, Lindley.  
Two species, from Madagascar.
39. **Bifrenaria**, Lindley.  
About ten species, from Guiana and Colombia. See *Bot. Mag.*, t. 2789, 2927, 3597, 3629; *Bot. Reg.*, t. 879, 1566, 1875; 1830, t. 12.
40. **BIPINNULA**, Jussieu.  
Three or four species, from South America, outside the tropical limits. Not showy.
41. **Bletia**, Ruiz and Pavon.  
About twenty species, from Tropical America, China, and Japan. B. hyacinthina, B. Sherattiana, and one or two others are showy. See *Bot. Mag.*, t. 3736; *Bot. Reg.*, 1847, t. 60. For list of species, see *Gard. Chron.*, 1882, xviii., 681; see also *Gard. Chron.*, 1879, xi., 236.  
BOLLEA (see Zygopetalum).  
\*B. Patinii, *Gard. Chron.*, 1875, iii., 9.  
BOLBOPHYLLARIA (see Bulbophyllum), *Gard. Chron.*, 1879, xi., 236.
42. **Bonatea**, Willdenow.  
Two or three species are known, from South Africa. See *Bot. Mag.*, t. 2926.
43. **Brachionidium**, Lindley.  
Three species, from Colombia and Bolivia. Epiphytes, nearly related to Masdevalls and Pleurothallis. See *Gard. Chron.*, 1881, xvi., 172.
44. **BRACHTIA**, Reichenbach f.  
Three species, from Colombia.
45. **BRACHYCORVITHUS**, Lindley.  
Four or five species, from South and Tropical Africa.
46. **Brassavola**, R. Brown.  
About twenty species, from Tropical America and Mexico. Epiphytes, with terete foliage, except B. glauca and B. Digbyana. Flowers white and showy. See *Gard. Chron.*, 1879, xi., 236; *Bot. Mag.*, t. 543, 2878, 3229, 3722, 3761, 3782, 4021, 4734; and *Bot. Reg.*, t. 1465, 1561, 1911; 1839, t. 5; 1840, t. 39.  
\*B. striata, fruit of, *Gard. Chron.*, 1885, xxiii., 85, 505.
47. **Brassia**, R. Brown.  
About twenty species are known, from Tropical America, Brazil, and Mexico. Flowers greenish, spotted with brown, in spikes like Odonoglossum. See *Orchid Album*, t. 159; *Gard. Chron.*, 1879, xi., 236; *Bot. Mag.*, 1691, 3451, 3577, 3794, 4053, 5748; *Bot. Reg.*, t. 832, 1754; 1841, t. 18; 1847, t. 29.
48. **Bromheadia**, Lindley.  
Two species, native of Malacca and the Malayan Archipelago, forming reed-like growth in wet jungle. Showy, but not easy to grow. See *Bot. Mag.*, t. 4001.
49. **Broughtonia**, R. Brown.  
Three or four species from Jamaica and the West Indian Islands. Sun-loving epiphytes, growing best on bare blocks. See *Bot. Mag.*, t. 3076, 3536; Loddiges, *Bot. Cab.*, t. 793.
50. **BROWNLEE**, Harvey.  
Three or four species, from South Africa, related to Disa.
51. **Bulbophyllum**, Thouars.  
Eighty or a hundred species are known, from India, Malayan Archipelago, Tropical Africa, Australia, New Zealand, and South America. Very few are showy, but all are interesting. In the Eastern Tropics these plants take the place of the Western Masdevallias. Some Sarcopodia and other genera are now placed under Bulbophyllum. For list of species see *Gard. Chron.*, 1882, xviii., 52, 104, 172. See *Bot. Mag.*, t. 4532, 5408 (Sarcopodium), 3605, 4088, 4166, 4267, 5050, 5288, 5309, 5316, 5349, 6119, &c.  
Burlingtonia; see Rodriguezia, *Orchid Album*, t. 18.
52. **BURNETTIA**, Lindley.  
One species, from Tasmania, resembling Caladenia, but of different habit. Not showy.
53. **CALADENIA**, R. Brown.  
Thirty or forty, in Australia and New Zealand. Not showy.
54. **Calanthe**, R. Brown.  
About forty species, widely distributed. Japan, Pacific Islands, New Caledonia, Madagascar, Tropical and South-eastern Africa, Central America, Mexico, and West Indies. Limatodes rosea is now placed in this genus. See *Orchid Album*, t. 31, 134. For list of species see *Gard. Chron.*, 1879, xi., 267; 1883, xix., 636; *Bot. Mag.*, t. 2515, 4541, 4671, 5042, 5375, 6104 (Styloglossum), 4704, 5312.
55. **CALCANEA**, R. Brown.  
Three species, from South Australia.
56. **Calostylis**, Blume.  
One species only, from Java. See *Gard. Chron.*, 1882, xviii., 812.
57. **CALOGCHILUS**, R. Brown.  
Three species known, in Eastern Australia. See Fitzgerald's *Aust. Orchids*, and *Bot. Mag.*, t. 3187.
58. **Calopogon**, R. Brown.  
Four or five species, from North America. See *Bot. Mag.*, t. 116; Sweet, *Brit. Fl. Gard.*, t. 115.
59. **Calypso**, Salisbury.  
One species, broadly distributed in North Europe, Asia, and in North America.  
\*C. borealis, 1881, xvi., 656.
60. **Camaridium**, Lindley.  
About twelve species, in Colombia, Guiana, and elsewhere in Tropical America. See *Gard. Chron.*, 1879, xi., p. 267.
61. **CAMPYLOCENTRON**, Benthams.  
Fifteen species, from Brazil and West Indian Islands.
62. **Catasetum**, L. C. Richard.  
Forty to fifty species, including Myanthes and Monachanthus, principally Brazilian and Mexican. The group is curious, as showing an approach to a diocious development. Although not bright in colour these plants were formerly much grown. See *Gard. Chron.*, 1879, xi., 267; *Bot. Mag.*, t. 2559, 3262, 3329, 3514, 3590, 3802, 3823, 3923, 3929, 3937, 3942, 4017, 4792, 5202, 5399; *Orchid Album*, t. 83.  
\*C. incurvum, *Gard. Chron.*, 1855, 4.  
\*C. scurra, *Gard. Chron.*, 1877, vii., 305.
63. **Cattleya**, Lindley.  
About twenty species, and varieties innumerable, are known from, principally, Brazil and Mexico. Cattleyas and Laelias are the most showy of all Orchids. For one specimen of C. Trianae var. Lecana 250 guineas were paid, and several other varieties, such as C. Dodgsoni, Osmani, &c., have brought nearly as large a sum. The best known and most ornamental are C. labiata, C. Mossiae, C. Mendelii, C. Trianae, C. gigas, C. Dowiana, C. Gaskelliana, C. Percivaliana, C. Lawrenceana, &c. See *Orchid Album*, t. 3, 6, 20, 33, 45, 69, 81, 84, 108, 112, 115, 121, 125, 144, 150, 154, 166, 178, 184; *Bot. Mag.*, t. 2851, 3265, 3669, 3693, 3742, 3998, 4083, 4085, 4270, 4902, 4999, 4916, 5032, 5039, 5048, 5150, 5504, 5618, 5683. For figures, see *Gard. Chron.* as under:—  
\*C. Acklandiae, fruit of, 1885, xxiii., 544.  
\*C. amethystoglossa var. sulphurea, 1866, 315.

\*C. velutina, 1872, 1259.  
\*C. Warneri, 1883, xx., 369.
64. **CENTROPETALUM**, Lindley.  
Five or six species, from the Andes of Colombia. The pretty little Nasonia is now placed here.
65. **Cephalanthera**, L. C. Richard.  
One of the few world-wide genera of Orchids. About ten species are known.
66. **CERATANTRA**, Ecklon.  
Seven or eight species are known from South Africa.
67. **Ceratostylis**, Blume.  
About fifteen species, from India, Malaysia, and the Pacific Islands. For species, see *Gard. Chron.*, 1882, xviii., 812.
68. **CHEIRADENIA**, Lindley.  
One species only known, from Guiana.
69. **CHEIROSTYLIS**, Blume.  
Eight species known, from India, Malayan Archipelago, and Tropical Africa.
70. **CHLOGLOTTIS**, R. Brown.  
Six species, from Australia and New Zealand.  
CHLOIOIA (see Corymbia), *Gard. Chron.*, 1879, xi., 267.

71. **CHLORÆA**, Lindley.  
Eighty or more species are known, from South America, Chili being the head-quarters of the group.
72. **CHLOROSA**, Blume.  
One species only known, from Java.
73. **Chondrorhyncha**, Lindley.  
One or two species only known, from Colombia.
74. **CHRYSOCCYNIS**, Reichenbach f.  
One species only known, from New Granada.
75. **Chrysoglossum**, Blume.  
Three or four species, from Malayan Archipelago and Sikkim. See *Gard. Chron.*, 1882, xviii., 428.
76. **Chysis**, Lindley.  
Six or eight species known, from Mexico and Colombia. *C. bractescens* and others are showy, with large waxy flowers in spikes from young growth. For list of species see *Gard. Chron.*, 1879, xi., 267; 1882, xviii., 746; *Bot. Mag.*, t. 3617, 4576, 5186, 5265.  
\**C. Chelsoni*, *Gard. Chron.*, 1880, xiii., 717.
77. **CHYTROGLOSSA**, Reichenbach f.  
Two species known, from Brazil.
78. **Cirrhopetalum**, Lindley.  
About thirty species, from India, Malaysia, China, and Madagascar. Some of the species are very beautiful, but are now but rarely met with in collections. For list of species, see *Gard. Chron.*, 1882, xviii., 172, 364.
79. **CIRRHEA**, Lindley.  
Five species, from Brazil. See *Gard. Chron.*, 1879, xi., 267.
80. **CLEISOSTOMA**, Blume.  
Fifteen species, from India, Malay Archipelago, and Tropical Australia.
- CLEISTES** (see *Pogonia*), *Gard. Chron.*, 1879, xi., 267.
81. **Clowesia**, Lindley.  
One species, from Brazil.
82. **COCHLIODA**, Lindley.  
Six species, from the Andes of South America.
83. **Cœlia**, Lindley.  
Four or five species, from the West Indies, Central America, and Mexico. See *Orchid Album*, t. 51. For species see *Gard. Chron.*, 1882, xviii., 428; see also *Gard. Chron.*, 1879, xi., 267.
- CELIOPSIS**, *Gard. Chron.*, 1872, 9; 1879, xi., 267.
84. **Cœlogyne**, Lindley.  
About fifty species are known from India, Malayan Archipelago, and the South of China. Many species are in cultivation, *C. cristata* and its varieties being extremely popular. The *Pleiones*, or "Indian Crocus," now included here, are much grown for their beauty. See *Orchid Album*, t. 54, 63, 143. For species see *Gard. Chron.*, 1883, xix., 46, 576.  
\**C. brunnea*, 1848, 71.  
\**C. cristata*, 1877, vii., 597.  
\**C. Massangeana*. (Supplementary sheet, March 18, 1882.)  
*COHNIA*, *Gard. Chron.*, 1879, xi., 297.  
*COLAS* (see *Lycaste*), *Gard. Chron.*, 1879, xi., 267.
85. **Collabium**, Blume.  
Two species, one from Java, and the other is Bornean. See *Gard. Chron.*, 1882, xviii., 428.
86. **Comparettia**, Poeppig and Endlicher.  
Two species, from the Andes of South America. See *Gard. Chron.*, 1879, xi., 276; *Bot. Mag.*, t. 4980; *Bot. Reg.*, 1838, t. 68; *Orchid Album*, t. 65.
87. **Corallorhiza**, R. Brown.  
Ten or twelve species are known, but widely distributed in Europe, Temperate Asia, North America, and Mexico. See *Gard. Chron.*, 1879, xi., 267.
88. **Coryanthes**, Hooker.  
Four or five species, from Tropical South America. See *Orchid Album*, t. 98; *Gard. Chron.*, 1879, xi., 267; *Bot. Mag.* (Gongora), t. 2755, 3747; *Bot. Reg.*, 1841, t. 1793.  
\**C. elegantissima* (as *macrantha*), 1882, xvii., 593, 597.  
\**C. maculata* var., sections of, 1885, xxiii., 144, 145.
89. **CORYCIUM**, Swartz.  
Ten species, from South Africa.
90. **CORYMBIS**, Thouars.  
Six or seven species, broadly distributed in the Tropics.
91. **Corysanthes**, R. Brown.  
Fifteen species, in Australia, New Zealand, and in Malayan Archipelago. See *Bot. Mag.*, t. 5357.
92. **Cottonia**, Wight.  
Two or three species, from India and Ceylon. *C. (Vanda) peduncularis* is the type.
93. **Cranichis**, Swartz.  
About twenty species, from the Andes, Tropical South America, Mexico, and West Indies. See *Gard. Chron.*, 1879, xi., 268.
94. **CREMASTRA**, Lindley.  
One species, from Japan.  
**CRYPE** (see *Arethusa*), *Gard. Chron.*, 1879, xi., 268.
95. **Cryptarrhena**, R. Brown.  
Species two, one from Central America, and the other from the West Indies. See *Gard. Chron.*, 1879, xi., 268.
96. **CRYPTOCENTRUM**, Benth.  
Only one species known, from Ecuador.
97. **Cryptochilus**, Wallich.  
Two species, from the Himalayas. See *Gard. Chron.*, 1882, xviii., 812.
98. **CRYPTOPUS**, Lindley.  
One species, from Madagascar, resembling *Angraecum*.
99. **CRYPTOSTYLIS**, R. Brown.  
Species seven, from India, Malayan Archipelago, and Australia.  
\**C. longifolia*, *Gard. Chron.*, 1885, xxiii., 275.
100. **Cynoches**, Lindley.  
The "Swan Orchid." Eight species, from Guiana and Mexico. See *Bot. Mag.*, t. 3855, 4054, 4215; *Gard. Chron.*, 1879, xi., 268; *Bot. Mag.*, t. 3855, 4054, 4215.  
\**C. Warscewiczii*, 1879, xii., 493.
101. **Cymbidium**, Swartz.  
Thirty species, from India, Malayan Archipelago, and South China. *C. eburneum*, *C. Mastersii*, *C. giganteum*, and its variety *Lowii*, are often met with in collections. See *Orchid Album*, t. 25, 140, 170; *Bot. Mag.*, t. 387, 1751, 4884, 4907, 5126, 5457, 5574, 5710, 5851.  
\**C. eburneum*, 1884, xxii., 499; 1884, xxii., 77.  
\**C. Lowianum*, 1879, xi., 405.
102. **CYNORCHIS**, Thouars.  
Twelve species, from Tropical Africa and Madagascar.
103. **CYPERORCHIS**, Blume.  
Two or three species, from India and Malayan Archipelago. Near *Cymbidium*.
104. **Cypripedium**, Linnaeus.  
Forty species, widely distributed in Europe, Asia, and America. The South American species have been called *Selenipedium*. Many hybrids have been raised in gardens. *C. caudatum* and its abnormal form, *Uropedium*, are very remarkable. They are the "Lady's Slipper" Orchid of gardens, and the most beautiful North American species (*C. spectabile*) is called "the Mocassin Flower." See *Orchid Album*, t. 8, 22, 36, 70, 86, 88, 109, 119, 122, 136, 155, 177; *Gard. Chron.*, 1879, xi., 268; *Bot. Mag.*, t. 192, 216, 911, 2938, 3024, 3855, 5349, 5508, 5791, 5922, 6175, 6296, 6432, 6490.  
\**C. Ashburtoniae*, 1879, xi., 16.

\**C. spectabile*, 1877, viii., 689.  
\**C. Spicerianum*, 1880, xiii., 41.  
\**C. Stonei*, a monstrous, 1883, xx., 73.  
\**C. Stonei* var. *platyneurum*, 1867, 1118.  
\**C. vexillarium*, 1880, xiii., 781.  
**CYRTOPERA** (see *Cyrtopodium*), *Gard. Chron.*, 1879, xi., 268.
105. **Cyrtopodium**, R. Brown.  
Twenty species are known, in Asia, Africa, and Tropical America. See *Gard. Chron.*, 1879, xi., 268; *Bot. Mag.*, t. 1800, 3507.
106. **CYRTOSTYLIS**, R. Brown.  
Three or four species, wild in Australia and New Zealand. See *Fitzgerald, Aust. Orch.*, with plate.
107. **CYSTORCHIS**, Blume.  
Two species, from the Malayan Archipelago.
108. **Dendrobium**, Swartz.  
Over 300 species, and many varieties are known, from India, Malayan Archipelago, Ceylon, Japan, China, and Australia. Several hybrids have been raised. See *Orchid Album*, t. 13, 20, 38, 42, 92, 99, 103, 113, 141, 152, 165, 174; *Bot. Mag.*, t. 3608, 5019, 4619, 5439, 5537, 5285, 5444, 5459, 5549, 5936, 5968, 6013, 6226, 6383, 4993, 5482, 5515, 5679, 5823, 6007, 6030, 6199, 6319, 6438. For full list of species see *Gard. Chron.*, 1881, xvi., 624, 688; 1882, xvii., 18, 26, 306, 471, 528, 641, 735, 776, 799.

\**D. tortile*, 1847, 797.  
\**D. Wardianum*, 1877, viii., 240.
109. **Dendrochilum**, Blume.  
Nine or ten species are known, from the Philippines and other groups in the Malayan Archipelago. They are extremely graceful little epiphytes, and three or four species are now common in collections. For species see *Gard. Chron.*, 1882, xviii., 427.
110. **DENDROPHYLAX**, Reichenbach f.  
Three species, wild in the West Indies, and resembling *Angraecum*. See *Bot. Mag.*, t. 4295.
111. **Diacrium**, Lindley.  
Four species, wild in Guiana, Mexico, and other parts of Central America. See *Bot. Mag.*, t. 3332 (as an *Epidendrum*); *Gard. Chron.*, 1883, xix., 764.
112. **Diadenium**, Poeppig and Endlicher.  
Two species, from Peru and Para. See *Nenia Orch.*, i., 13, t. 6; *Saunders's Ref. Bot.*, t. 84; *Gard. Chron.*, 1879, xi., 268.
113. **Dichæa**, Lindley.  
Twelve species are known, from Mexico, Central America, and the West Indies. See *Gard. Chron.*, 1879, xi., 268.
114. **Dignathe**, Lindley.  
One species, wild in Mexico. See *Gard. Chron.*, 1879, xi., 268.
- DINEMA** (see *Epidendrum*), *Gard. Chron.*, 1879, xi., 268.
115. **Diothonea**, Lindley.  
Four species, from the Andes in Peru and Colombia. *Gard. Chron.*, 1883, xix., 700.
116. **DIPLOCENTRUM**, Lindley.  
Two or three species known, from India.
117. **DIPLOMERIS**, Don.
118. **DIPODIUM**, R. Brown.  
Six species, from the Malayan region, Australia, and the Pacific isles. See *Bot. Reg.*, t. 1980; *Paxt., Mag. Bot.*, xvi., p. 321 (as *Wailesia*).
119. **Disa**, Berg.  
Fifty species of *Disa* are wild in Southern and Tropical Africa, and in Madagascar, but only one species (*D. grandiflora*) is common in gardens, being one of the most beautiful of all terrestrial Orchids. Known to us from the Southern hemisphere, *Cypripedium* spectabile being the belle of the Northern one. See *Bot. Mag.*, t. 4073, 4091, 6529, 6532; *Bot. Reg.*, t. 324, 926; *Harvey, Thes. Cap.*, t. 41, 84, 86.  
\**D. grandiflora*, *Gard. Chron.*, 1875, iii., 441; 1882, xviii., 521.
120. **DISPERIS**, Swartz.  
Twenty species known from India, Tropical Africa, South Africa, and Madagascar. See *Harvey's Thes. Cap.*, t. 106, 148, 171, 172.
121. **DIURIS**, Swartz.  
Fifteen species, all wild, in Australia. See *Fitzgerald, Aust. Orch.*, with two plates; *Bot. Mag.*, t. 3156, 6201.
122. **DORITIS**, Lindley.  
Five or more species, from India and the Malayan Archipelago. Some species have been referred to *Dendrobium*, others to *Aërides* and to *Phalaenopsis*.
123. **DOSSINIA**, Morren.  
One species known, from Borneo.
124. **DRAKEA**, Lindley.  
Three species known, from Australia; *vide* *Rehb. f.*, *Nenia Orch.*, t. 189.  
\**D. elastica*, *Gard. Chron.*, 1848, 424.
125. **Drymoda**, Lindley.  
One species, from the Malayan Peninsula. See *Bot. Mag.*, t. 5904; *Gard. Chron.*, 1882, xviii., p. 427.
126. **Erina**, Lindley.  
Six or eight species known, from New Zealand and the Pacific islands. See *Gard. Chron.*, 1882, xviii., 812.

127. **Elleanthus**, Presl.  
Fifty species, from Tropical America, Brazil, Central America, and the West India Islands. See *Gard. Chron.*, 1879, xi., 334; 1883, xix., 659.
128. **EPIBLEMA**, R. Brown.  
One species, from South-west Australia and New Zealand.
129. **Epidendrum**, Linnaeus.  
Above 400 species are described, from Tropical America, extending as far north as Texas, where one species exists on trees of *Magnolia glauca*. A large proportion are fragrant, but with dingy white or greenish flowers. *E. vitellinum*, *E. nemorale*, *E. bicornutum*, and many others are, however, showy and generally cultivated. *E. cochleatum* and *E. fragrans* were the first epiphytal Orchids to flower in the Royal Gardens at Kew. See *Orchid Album*, t. 4, 74, 149, 157, 161. For full list of species see *Gard. Chron.*, 1879, xi., 334, 367. See also *Gard. Chron.*, 1883, xx., 42, 152, 204, 244, 477, 573, 606, 634; *Bot. Mag.*, t. 2831, 3013, 3534, 3557, 3631, 3638, 3765, 3885, 3898, 4067, 4094, 4197, 4572, 4656, 4784, 5333, 5491, 5664, 6093, &c.  
\**E. Endresii*, *Gard. Chron.*, 1885, xxiii., 504.
130. **Epipactis**, R. Brown.  
Ten or more species are known, and are widely distributed in Europe, Asia, and America, outside tropical limits. See *Gard. Chron.*, 1879, xi., 433.  
\**E. latifolia* var., 1852, 532.
131. **EPIPOGON**, Gmelin.  
Two species, from Temperate Europe and Asia.
132. **EPISTEMIUM**, Kunth.  
Six species, from Tropical South America. See *Bot. Mag.*, t. 5485.
133. **Eria**, Lindley.  
Eighty species, from India, South China, and the Malayan Archipelago. They are mostly weedy in habit, and produce inconspicuous flowers. For full list of species see *Gard. Chron.*, 1882, xviii., 468; *Bot. Mag.*, t. 3605, 4103, 5391, 5415, 5807, 5910.  
\**E. flava*, *Gard. Chron.*, 1882, xviii., 469.
134. **ERIOCHILUS**, R. Brown.  
Five or six species are known, all from Australia.
135. **Eriopsis**, Lindley.  
Three or four species, from North Brazil, Guiana, and Colombia. *E. biloba* is an interesting and showy species. See *Bot. Mag.*, t. 4437.
136. **Erycina**, Lindley.  
One species known, from Mexico, resembling *Ionopsis* in habit. See *Gard. Chron.*, 1879, xi., 433.  
*EUCNEMIS* (see *Gaveia*), *Gard. Chron.*, 1879, xi., 433.
137. **EUCOSIA**, Blume.  
One species, from Java.
138. **Eulophia**, R. Brown.  
Fifty species, wild for the most part, in Tropical and Southern Africa, Tropical Asia, and one from Brazil. Few have been introduced. See *Orchid Album*, t. 89; *Gard. Chron.*, 1879, xi., 433; *Bot. Mag.*, t. 2467, 5564, 5579, 5875, 6246.
139. **FARICARIA**, Lindley.  
One species, from South Africa.  
*FREGEA* (see *Sobralia*), *Gard. Chron.*, 1879, xi., 433.
140. **Galeandra**, Lindley.  
Six species, wild in Tropical America, Brazil and Mexico. See *Gard. Chron.*, 1879, xi., 433; *Bot. Mag.*, t. 4610, 4701; *Bot. Reg.*, 1840, t. 49; *Maudsl. Bot. Mag.*, t. 231.  
\**G. nivalis*, *Gard. Chron.*, 1882, xvii., 537.
141. **GALEOLA**, Lourieiro.  
Twelve species, from India, Japan, Malayan Archipelago, Australia, and New Caledonia.  
*GALEOTTIA*. (See *Zygopetalum*.)  
\**G. fimbriata*, *Gard. Chron.*, 1856, 660.
142. **GASTRODIA**, R. Brown.  
Seven species, from India, Western Asia, Malayan Archipelago, Australia, and New Zealand.
143. **Geodorum**, Jackson.  
Nine or ten species, wild in India, Malayan Archipelago, and Australia. See *Bot. Mag.*, t. 2195.
144. **Glomera**, Blume.  
Two species, from the Malayan Archipelago and Pacific isles. See *Gard. Chron.*, 1882, xviii., 812.
145. **GLOSSODIA**, R. Brown.  
Four species, wild in Australia.
146. **GLOSSULA**, Lindley.  
One species, from China and Cochin China; near *Habenaria*, or *Bonatea*.
147. **GOMEZA**, R. Brown.  
Six species, wild in Brazil, related to *Odontoglossum* or *Rodriguezia*. See *Bot. Mag.*, t. 2746 (*Pleurothallis*), t. 3497, 3504 (as *Rodriguezia*).
148. **GOMPHICHIUS**, Lindley.  
Four or five species, wild on the Andes of South America.
149. **Gongora**, Ruiz and Pavon.  
Twenty species, wild in Mexico and Brazil. The genus *Acropera* is now included. Some of the species are very interesting as grown in baskets, although not showy enough for modern collectors. See *Gard. Chron.*, 1879, xi., 433.
150. **Goodyera**, R. Brown.  
Twenty-five species, natives of Britain, Europe, Madeira, Asia tropical and temperate; Madagascar, North America, and New Caledonia. Velvety-leaved, low-growing plants, resembling the *Amietochili* of the Tropics. *G. discolor* and *G. Dawsonii* are common in collections. See *Gard. Chron.*, 1879, xi., 433; *Bot. Mag.*, t. 2540.
151. **GOVENIA**, Lindley.  
Ten species are known, from Brazil, Mexico, and the West Indies. See *Gard. Chron.*, 1879, xi., 433; *Bot. Mag.*, t. 3660, 4151.
152. **GRAMMANGIS**, Reichenbach f.  
Two species, one from Madagascar (see *Bot. Mag.*, 5179, *Grammatophyllum*), and one from Java (?). See *Bot. Mag.*, t. 5676 (as *Cymbidium Huttonii*).
153. **Grammatophyllum**, Blume.  
Three or four species, from Malayan Archipelago and Madagascar. They are large-growing epiphytes. See *Orchid Album*, t. 147.  
\**G. speciosum*, *Gard. Chron.*, 1878, x., 180.
154. **Grobya**, Lindley.  
Two species, wild in Brazil.
155. **GYMNOCILUS**, Blume.  
Two species, wild in Madagascar. Near *Goodyera*.
156. **Habenaria**, Willdenow.  
Four hundred species, from the temperate and sub-tropical regions, where they are widely distributed. Few are worth cultivating. See *Gard. Chron.*, 1879, xi., 433.
157. **HAFMARIA**, Lindley.  
Four species, wild in China, Cochin China, and the Malayan Archipelago. See *Bot. Mag.*, t. 2055; *Bot. Reg.*, t. 271.
158. **Hartwegia**, Lindley.  
One species, wild in Mexico and Central America, and rarely met with in collections as *H. purpurea*. See *Gard. Chron.*, xix., 764.
159. **HEMIPILIA**, Lindley.  
Two species, wild in India. Near *Habenaria* or *Bonatea*.
160. **HERMINIUM**, Linnaeus.  
Six species, wild in Europe and Temperate Asia.
161. **HERPYSMA**, Lindley.  
One species known, from the Himalayas.
162. **Herschelia**, Lindley.  
Two species, from Southern Africa. Near *Disa*. *H. caelestis* flowered at De Graaff's nursery in Leyden a few years ago.
163. **HETERIA**, Blume.  
Thirteen species, from India, Malaysia, Australia, and Tropical Africa. Near *Goodyera*, but not showy.
164. **Hexadesmia**, A. Brongniart.  
Four or five species, from Mexico, Central America, West Indies, and Brazil. See *Gard. Chron.*, 1883, xix., 700.
165. **HEXALECTRIS**, Rafin.  
One species, from Southern North America and Mexico, near *Coralorrhiza* and *Bletia*.
166. **Hexesia**, Lindley.  
Three or four species, wild in Mexico, Central America, and Brazil. See *Gard. Chron.*, 1879, xi., 434; 1883, xix., 700.
167. **HOFFMEISTERELLA**, Reichenbach, f.  
One species, from the Andes of Ecuador.
168. **HOLOTHRIX**, L. C. Richard.  
Eighteen or twenty species, from Abyssinia and South Africa.
169. **Hormidium**, Lindley.  
Seven species, from Tropical America, Brazil, Cuba, and Mexico. See *Gard. Chron.*, 1883, xix., 700; *Bot. Mag.*, t. 3233, 6314.
170. **Houlletia**, A. Brongniart.  
Five species, from Brazil and Colombia. See *Gard. Chron.*, 1879, xi., 434; *Bot. Mag.*, t. 4072, 6305.  
\**H. chrysantha*, *Gard. Chron.*, 1882, xviii., 437.
- HUNTLEYA. (See *Zygopetalum*.)
171. **HUTTONEA**, Harvey.  
Two species, from South Africa.
172. **HYLOPHILA**, Lindley.  
One species, from Malacca and Malayan Archipelago.
173. **Ionopsis**, Humboldt, Bonpland, and Kunth.  
Ten species are known, from Tropical America, Brazil, Mexico, and the West Indies. *I. paniculata* and others are showy, but difficult of prolonged cultivation. See *Gard. Chron.*, 1879, xi., p. 434; *Bot. Mag.*, t. 5541.
174. **Isochilus**, R. Brown.  
Four or five species, from South America, Brazil, Mexico, West Indies. See *Bot. Reg.*, t. 745; *Gard. Chron.*, 1879, xi., 434; 1883, xix., 764.
175. **Josepha**, Wight.  
Two species, from the Indian Peninsula and Ceylon. See *Gard. Chron.*, 1882, xviii., 812.
176. **Lacæna**, Lindley.  
Two species, known in Central America. See *Gard. Chron.*, 1879, xi., 434.
177. **Lælia**, Lindley.  
Twenty species or more, from Mexico and Brazil; differs from *Cattleya* in having eight pollen masses in each flower instead of four. All are showy, and much prized. See *Orchid Album*, t. 2, 9, 10, 23, 30, 44, 49, 60, 75, 97, 117, 123, 132, 135, 138, 146, 181; *Gard. Chron.*, 1879, xi., 559; *Bot. Mag.*, t. 3804, 3810, 3817, 3957, 4090, 4099, 4302, 4905, 5144, 5449, 5498, 5553, 5667, 6038. The following species are figured in *Gard. Chron.*:—  
\**L. autumnalis* var., 1872, 1003.  
\**L. Jongheana*, 1872, 425.  
\**L. majalis*, 1883, xix., 628.  
\**L. mylamiana*, 1876, ii., 740.  
\**L. purpurata*, 1880, xiv., 45.  
\**L. Veitchiana*, 1883, xx., 145 (Supplement).
178. **Læliopsis**, Lindley.  
Species three or four, from the West Indies and Cuba and St. Domingo. *Læliopsis domingensis* resembles *Broughtonia* in habit, with pale rosy flowers.
179. **Lamium**, Lindley.  
Species two only, from Brazil and Surinam. Near *Epidendrum*. See *Gard. Chron.*, 1883, xix., 660.
180. **Latourea**, Blume.  
One species, wild in New Guinea, with the habit of *Dendrobium*. See *Gard. Chron.*, 1882, xviii., 52.
181. **LEUCANORCHIS**, Blume.  
Two species, from Java and Japan, resembling *Aphyllorchis*.
182. **LEIOCHILUS**, Knowles and Westcott.  
Four or five species, wild in Central America, Mexico, and the West Indies. See *Bot. Mag.*, t. 3845.
183. **Lepanthes**, Swartz.  
Forty species, from Tropical America on the Andes, Mexico, and West Indies. See *Bot. Mag.*, t. 4112, 5259; *Gard. Chron.*, 1879, xi., 559; 1881, xvi., 136.
184. **LEPIDOGYNE**, Blume.  
One species, from Java.  
*LEPTOTES*. (See *Tetramicra*.)
185. **LEUCORCHIS**, Blume.  
Two or three species, from India, Malayan Archipelago, and the Pacific islands. Widely distributed.
- LINATODES*. (See *Calanthe*.)
186. **Limodorum**, L. C. Richard.  
One species, wild in the Mediterranean, Europe, and Caucasus.
187. **Liparis**, L. C. Richard.  
A hundred species, widely dispersed throughout the subtropical regions. *L. longipes* is now and then found in cultivation. See *Gard. Chron.*, 1879, xi., 559; 1881, xvi., 592; *Bot. Mag.*, t. 2004 (Malaxis), 2709, 3770, 5529.  
\**L. Laeslii*, *Gard. Chron.*, 1884, xxi., 144.
188. **Lissochilus**, R. Brown.  
Thirty species, from Tropical and Southern Africa. See *Bot. Mag.*, t. 2931 (*Eulophia*), 5486, 5861.
189. **Listera**, R. Brown.  
Ten species, in Europe and Temperate Asia and mountains of North America. See *Reich.*, Ic. Fl. Germ., t. 478 f. 3—5, t. 479, 480; *Hook. Fl. Bor. Amer.*, t. 205.
190. **Lockhartia**, Hooker.  
Ten species, from Tropical America, Brazil, West Indies, and Mexico. See *Gard. Chron.*, 1879, xi., 559; *Bot. Mag.*, t. 2715, 5592 (*Fernandezia*); *Bot. Reg.*, t. 1806 (*Fernandezia*).
191. **Luisia**, Gaudichaud.  
Ten species, from India, Eastern Asia, Malaysia, and Japan. See *Bot. Mag.*, t. 3648 (*Cymbidium*), 5558.  
\**L. Psyche*, *Gard. Chron.*, 1865, 842.
192. **Lycaste**, Lindley.  
Twenty-five species, from Tropical America, Peru, Mexico, and West Indies. *Paphinia* and *Colax* are now included here. Mostly showy. *L. Skinneri* and its varieties are very popular. See *Orchid*

- Album, t. 100; *Gard. Chron.*, 1879, xi., 559; Bot. Mag., t. 3146, 3395, 4081, 4193, 4445, 5616, 5706, 6251, 6303.
- \**L. flavescens*, *Gard. Chron.*, 1882, xvii., 523.
193. **Lycomormium**, Reichenbach, f.  
Two or three species, from Colombia and Central America. Habit of *Peristeria*. Flowers resembling *Cyrtopodium*. See Bot. Reg., t. 1953; Knowles and Westcott, *Floral Cabinet*, t. 70.
194. **LYPERANTHUS**, R. Brown.  
Five or six species, from New Caledonia, New Zealand.
195. **MACODES**, Blume.  
One species, from Java. See Blume, *Orch. Archip.* Ind., 119, t. 31, 36; Rehb. f., *Xen. Orch.*, t. 96, f. 1.
195. **Macradenia**, R. Brown.  
One or two species, from the West Indies. See *Gard. Chron.*, 1879, xi., 559.
197. **Malaxis**, Swartz.  
One little species (*M. paludosa*) is epiphytal on living sphagnum in Britain, Ireland, and North Europe. See *Gard. Chron.*, 1881, xvi., 463.  
\**M. paludosa*, 1884, xxi., 144.
198. **MANNIELLA**, Reichenbach f.  
One species, native of West Tropical Africa. Related to *Platyalepis*. Flowers small, not showy.
199. **Masdevallia**, Ruiz and Pavon.  
Species a hundred or more, wild in South America, Peru, Mexico, Brazil, Guiana, and West Indies, generally at considerable altitudes on mountains. Many are showy, and they are favourites in collections along with *Odontoglossa* from similar climates. *M. Veitchii*, M. Harryana, *M. Davisii*, *M. tovarensis*, *M. Chimera*, and others, are very beautiful. For full list of species see *Gard. Chron.*, 1881, xvi., 236, 305, 336, 409; 1879, xi., 559; *Orchid Album*, t. 5, 24, 62, 76, 105, 110; Bot. Mag., t. 4921, 5476, 5505, 5239, 5962, 5990, 6152, 6159, 6171, 6190, 6208, 6258, 6262, 6273, 6368, 6372. The following species are figured in *Gard. Chron.* :—  
\**M. bella*, 1880, xiii., 756; 1881, xvi., 237.  
\**M. Carderi*, 1883, xx., 181.  
\**M. chimera*, 1875, iii., 41; 1881, xvi., 113.  
\**M. coccinea*, 1868, 70; 1881, xvi., 236; 1884, xxi., 736.  
\**Masdevallia*, group of, 1881, xxi., 741.  
\**M. ignea*, 1872, 545; 1881, xvi., 305.  
\**M. Lindenii*, 1874, i., 385; plant, 1881, xvi., 336.  
\**M. macrura*, 1877, vii., 13; 1881, xvi., 337.  
\**M. nycterina*, 1881, xvi., 337; 1874, 639.  
\**M. polysticta*, 1875, iii., 657.  
\**M. racemosa* var. *Crossii*, 1884, xxi., 737.  
\**M. rosea*, 1880, xiii., 680, 681; 1881, xvi., 336; 1882, xvii., 644.  
\**M. Schlumii*, 1883, xix., 532.  
\**M. tovarense*, 1871, 1421; 1881, xvi., 409.  
\**M. triaristella*, 1876, vi., 559.  
\**M. Veitchiana*, 1871, 1421; 1881, xvi., 409.  
\**M. Wallisii* var. *stipenda*, 1885, xxiii., 473.
200. **Maxillaria**, Ruiz and Pavon.  
Above a hundred species are known, from Tropical America, Brazil, West Indies, and Mexico. *M. grandiflora* and *M. venusta* resemble *Lycaste* in having large flowers, solitary on basal scapes, but there are many inconspicuous species in the group. See *Orchid Album*, 106; *Gard. Chron.*, 1879, xi., 559, 686; Bot. Mag., t. 2729, 3154, 3613, 3945, 3966, 4374, 4434, 6477; Bot. Reg., t. 3614.
201. **Megacelinium**, Lindley.  
Nine species, wild in Tropical Africa, where they seem to represent the Eastern *Bulbophylla*. See *Gard. Chron.*, 1882, xviii., 364; Bot. Mag., t. 4028, 5836; Bot. Reg., t. 1959.
- MESOSPINDIUM. (See *Odontoglossum*.)
202. **Meiracyllum**, Reichenbach, f.  
Three species, from Mexico and Central America, with habit of *Pleurothallis*, and pollen resembling *Eria*. See *Gard. Chron.*, 1879, xi., 686; 1881, xvi., 428.
203. **MICROSACCUS**, Blume.  
Three or four species, from Malayan Archipelago and Malacca, somewhat resembling *Saccolabium*, with affinity with some *Dendrobates*.
204. **Microstylis**, Nuttall.  
Forty species are wild in Europe, Asia, and America, North and South. See *Gard. Chron.*, 1879, xi., 686; 1881, xvi., 463; Bot. Mag., t. 4103, 5403, 6225.  
\**M. histionantha*, 1881, xvi., 463.
205. **MICROTIS**, R. Brown.  
Six species, wild in Australia and New Zealand (? Java.)
206. **Miltonia**, Lindley.  
Ten species, from Peru and Brazil. Mostly showy when well grown. It is questionable whether the *Miltonia*-flowered *Odontoglossa* should not be included here, or are they hybrids, *Miltonia* and *Odontoglossum*? See *Orchid Album*, t. 46, 72, 146; Bot. Mag., t. 3793, 4109, 4204, 4425, 5436, 5572, 5843.  
\**M. Warscewiczii*, *Gard. Chron.*, 1871, 1258.
207. **MCERENHOUTIA**, Blume.  
One species, wild in the Society Islands. Not showy.
- MONACANTHUS. (See *Catasetum*.)
208. **MONADENIA**, Lindley.  
Twelve species, from South Africa, approaching *Disa*.
209. **Monomeria**, Lindley.  
Two species, one from Nepal and one from Burmah, resembling *Bulbophyllum*. See *Gard. Chron.*, 1882, xviii., 427.
210. **Mormodes**, Lindley.  
Fourteen species, from Colombia, Central America, and Mexico. Showy and interesting plants, requiring a hot, dry atmosphere like *Catasetum*. See *Gard. Chron.*, 1879, xi., 686; Bot. Mag., t. 3879, 3900, 4214, 4455, 4577, 5802, 5840, 6476. The following are figured in *Gard. Chron.* :—  
\**M. Cartoni* var., 1871, 447.  
\**M. luxatum eburneum*, 1882, xviii., 145.  
\**M. Oceana*, 1879, xii., 816, 817.
211. **MORMOLYCE**, Fenzl.  
One species, wild in Mexico.
- MYANTHUS. (See *Catsetum*.)
212. **MYRMECHIS**, Blume.  
Two species, from Java and Japan.
213. **MYSTACIDIUM**, Lindley.  
Twenty species, from Tropical and Southern Africa, near *Angraecum*.  
NANODES, Lindley. (See *Epidendrum*.)  
\**N. Meduse*, *Gard. Chron.*, 1867, 432.
214. **NEODRYAS**, Reichenbach, f.  
Three species, from Bolivia and Peru, approaching *Oncidium* (*O. Brunlesianum*).
215. **Neottia**, Linnaeus.  
Three species, from Europe, Northern Asia, in mountainous districts. Not showy.
216. **Nephelaphyllum**, Blume.  
Four species, from India, South China, and Malayan Archipelago. See *Gard. Chron.*, 1882, xviii., 780; Bot. Mag., t. 5332, 5390.
217. **NEUWIEDIA**, Blume.  
Three species, from Malacca and the Malayan Archipelago.
218. **Notylia**, Lindley.  
Eighteen species, from Tropical America (*Pleurothallis*). See *Gard. Chron.*, 1879, xi., 719; Bot. Mag., t. 5609, 6311; Bot. Reg., t. 759 (*Pleurothallis*).
219. **Oberonia**, Lindley.  
Fifty species, from Tropical Asia, Madagascar, Pacific islands, and Australia. Curious epiphytes, with distichous leaves and minute greenish flowers arranged in rat-tail-like spikes. See *Gard. Chron.*, 1881, xvi., 527; Bot. Mag., t. 4517, 5056.
220. **Ocotelesmia**, Benthama.  
Three species, from Jamaica, St. Domingo. See *Gard. Chron.*, 1883, xix., 700; Bot. Mag., t. 2823.
221. **Ocotomeria**, R. Brown.  
Ten species, described from Tropical America and the West Indies, Near *Pleurothallis*. See *Gard. Chron.*, 1879, xi., 719; 1881, xvi., 428; Bot. Mag., t. 2764.
222. **Odontochilus**, Blume.  
Ten species, from India, Malayan Archipelago, and the Pacific islands. Ornamental leaved plants, related to the *Anæctochiles*. See *Gard. Chron.*, 1883, xix., 608.
223. **Odontoglossum**, Humboldt, Bonpland, and Kunth.  
Eighty species, and numerous varieties; wild on the Andes of Tropical America, Bolivia, and Mexico. Nearly all the species are amenable to cool-house growth, the exceptions being *O. grande*, *O. Inseleyi*, *O. citrosum*, and the species of the *Miltonia* flowered, or *O. vexillarium* group. The genus *Mesospindium* is now included here. See *Orchid Album*, t. 27, 35, 40, 43, 47, 52, 58, 64, 66, 68, 71, 79, 82, 185, 90, 101, 111, 118, 127, 131, 151, 163, 167, 171, 175; *Gard. Chron.*, 1879, xi., 719; Bot. Mag., t. 3812 (*Zygopetalum*), 3955, 4272, 4878, 4919, 4923, 5691, 5697, 5736, 5778, 5993, 6029, 6144, 6229, 6237, 6265, 6317, 6455, 6502. The following species are figured in *Gard. Chron.* :—  
\**O. Andersonianum*, 1884, xxii., 44.  
\**O. Andersonianum* var. *lobatum*, 1884, xxii., 45.  
\**O. cirrosum*, 1878, ix., 181; 1876, v., 54, 503.  
\**O. coradinei*, 1872, 1068.  
\**O. Dowsonianum*, 1865, 1226.  
\**O. elegans*, 1883, xix., 721.  
\**O. gloriosum*, 1865, 578.  
\**O. grande*, fruit of, 1885, xxiii., 505.  
\**O. Hallii*, 1865, 962; 1873, 77.  
\**O. hebraicum*, 1881, xvi., 173.  
\**O. Kramerii*, 1868, 98.  
\**O. luteo-purpureum*, 1884, xxi., 585.  
\**O. lyroglossum*, 1882, xvii., 632. (Supplement, May 13, 1882.)
- \**O. membranaceum*, 1881, xv., 753.  
\**O. mulus* var., 1883, xxi., 469.  
\**O. nebulosum*, 1867, 572.  
\**O. nebulosum candidulum*, 1867, 710.

\**O. Warnerianum*, 1865, 579.  
\**O. Wilckeanum*, 1884, xx., 640.
224. **OEONIA**, Lindley.  
Four or five species, wild in Madagascar. They are related to *Angraecum*.
225. **Oncidium**, Swartz.  
Over 250 species are known from Tropical America, Brazil and Bolivia, West Indies, and Mexico. Many showy species are in cultivation. They vary much in habit, the sections being "small lipped" (*microchilia*), "iris-leaved" (*equitantia*), "round-leaved" (*teretifolia*), and "flat-leaved" (*planifolia*). *O. papilio* is the "Butterfly Orchid," and one of the first of Orchids to attract public attention in England. See *Orchid Album*, t. 1, 12, 32, 104, 120, 137, 183; Bot. Mag., t. 5632, 27773, 3393, 4130, 3568, 777, 1491, 2203, 2900, 3109, 3486, 3499, 3581, 3705, 3712, 3752, 3806, 3807, 3836, 5193, 6138, 6254, 6278, 6322. See also *Gard. Chron.*, 1879, xii., 43. The following are figured in *Gard. Chron.* :—  
\**O. bifrons*, 1857, 84.  
\**O. candidum*, 1883, xx., 233.  
\**O. Forbesii*, 1870, xi., 525.  
\**O. Forbesii* var. *Borwickianum*, 1879, xi., 525.  
\**O. Gardnerianum*, 1881, xvi., 86.  
\**O. Lanceanum*, 1884, xxi., 609.  
\**O. luridum* var. *purpureum*, 1848, 159.  
\**O. macranthum*, 1869, 739.  
\**O. microchilum*, 1856, 68.  
\**O. monachicum*, 1883, xix., 366.  
\**O. Rogersii*, 1870, 277.  
\**O. splendidum*, 1871, 42.  
\**O. varicosum*, 1870, 277.  
\**O. zehrinum*, 1872, 1355.
226. **Ophrys**, Linnaeus.  
Thirty species or more, wild in Europe, Temperate Asia, and Northern Africa. The likeness to insects, as shown by several species of *Ophrys*, has long been observed. The Spider, Fly, and Bee *Ophrys* belong to this group, and some European species and varieties are very beautiful. See Rehb. Ic. Fl. Germ., t. 443, 465; Barlee. Ic. Orch. Alp. Marit., t. 51, 62; Mogger. Fl. Ment., t. 19, 43, 46, 72. See *Gard. Chron.* for figures of the following :—  
\**O. tenthredinifera*, 1872, 605.  
\**O. scolopax*, 1869, 442; 1872, 1009.
227. **Orchis**, Linnaeus.  
Eighty species, widely distributed throughout the temperate regions of the Northern Hemisphere. The most showy species are from North Africa and the islands of Madeira, and those of the Canary group. The "long purples" of Shakespeare are supposed to refer to our *O. mascula*. The species of *Orchis* are more easily cultivated than are many other terrestrial species.  
\**Orchis*, Snipe (*Ophrys scolopax*), 1860, 442; 1872, 1009.
228. **OREORCHIS**, Lindley.  
Four species, from the mountains of Asia and India Siberia and Japan.
229. **Ornithidium**, Salisbaud.  
Twenty species, from Tropical America, Brazil, West Indies, and Mexico. *O. coccinea* is a pretty little red-flowered species, in cultivation. See *Gard. Chron.*, 1879, xi., 75; Bot. Mag., t. 1437 (*Cymbidium*); Bot. Reg., t. 1804; Saunders' Ref. Bot., t. 105 (*Maxillaria densa*).
230. **Ornithocephalus**, Hooker.  
Twenty species, from Tropical America, Brazil, and Mexico. Small-growing Epiphytes of no great beauty. *Gard. Chron.*, 1879, xii., 75.
231. **ORNITHOCILUS**, Wallich.  
Two species, from the Himalayas and Burmah.
232. **ORTHOCERAS**, R. Brown.  
One species, from Australia and New Zealand. Fitzgerald, *Australian Orchids*, with plate.
233. **OSYRICERA**, Blume.  
One species, from Java, approaching *Bulbophyllum*. See *Gard. Chron.*, 1882, xviii., 427.
234. **OTOCILUS**, Lindley.  
Three or four species, from the Himalayas and Burmah. Near *Ceologyne*. See Bot. Mag., t. 3921.
235. **PACHITES** (?), Lindley.  
One species, from South Africa.

236. **Pachyphyllum**, Humboldt, Bonpland, and Kunth.  
Six or seven species, from the Andes of Tropical America. Near Lockhartia, or Fernandezia. See Hooker, Icon Plant., t. 117; *Gard. Chron.*, 1879, xii., 75.
237. **Pachystoma**, Blume.  
Ten species, native of India, Malayan Archipelago, and Tropical Africa. *P. Thompsonianum* is a very beautiful species, now and then seen in cultivation. Ipsea is now included here. See *Gard. Chron.*, 1882, xviii., 500; *Bot. Mag.*, t. 5701, 6471.  
\**P. speciosum* Thompsoni, *Gard. Chron.*, 1879, xii., 625; 1882, xviii., 501.  
**PALUMBINA** (see *Oncidium*).  
\**P. candida*, *Gard. Chron.*, 1865, 793.
238. **Panisca**, Lindley.  
One or two species, from the Himalayas. Related to *Coelogyne* and *Bulbophyllum*. *Gard. Chron.*, 1882, xviii., 427.
- PAPHINIA** (see *Lycaste*), *Orchid Album*, t. 34, 145.
- PAPPERITZIA**, *Gard. Chron.*, 1879, xii., 75.
- PANTONIA** (see *Spathoglottis*).  
\**Pantonia rosea*, 1882, xviii., 532.
239. **PELEXIA**, Lindley.  
Seven or eight species, from Tropical America, Brazil, West Indies, and Central America. Near *Spiranthes* and *Cephalanthera*. Not showy.
240. **Peristeria**, Hooker.  
Two or three species, from the Andes of Colombia, and from Panama. *P. elata* is the "El Spirito Sancta," or "Dove Orchid," often met with in gardens, where it produces long erect spikes of fleshy-white, waxlike flowers. *Gard. Chron.*, 1879, xii., 75.  
**PESCATOREA** (see *Zygopetalum*), *Orchid Album*, t. 17, 57.  
\**P. Dayana* var. *candidula*, *Gard. Chron.*, 1875, iii., 343.  
\**P. Lehmanni*, *Gard. Chron.*, 1882, xvii., 45.
241. **Phaius**, Loureiro.  
Fifteen species, wild in Tropical Asia, Japan, Malaysia, Pacific islands, Australia, Madagascar, and in Tropical Africa. *Phaius grandifolius*, from Hong Kong, is naturalised in Jamaica, and is one of the oldest of cultivated Orchids. *Thunia* is now included under *Phaius*. *P. Wallichii* is only a form of *P. grandifolia*. See *Orchid Album*, t. 91; *Gard. Chron.*, 1882, xviii., 565; *Bot. Mag.*, t. 1924, 2719 (*Bletia*) t. 3960, 4078, 6032, 4442, 3991, 5694. The following species are figured in *Gard. Chron.*:—  
\**P. callosus*, 1848, 287.  
\**P. grandifolius*, 1872, 733; 1882, xviii., 565.  
\**P. irroratus*, 1867, 264; 1882, xviii., 565.  
\**P. tuberosus*, 1881, xv., 341; 1882, xviii., 595; 1884, xxi., 520.
242. **Phalænopsis**, Blume.  
Twenty to thirty species, from India, the Philippines, and Malayan Archipelago. These are amongst the most graceful and beautiful of all Orchids. *P. grandiflora*, *P. amabilis*, *P. Schilleriana*, and their varieties, are well known. See *Orchid Album*, t. 11, 39, 80, 158, 182; *Bot. Mag.*, t. 4297, 5184, 5351, 5630, 6622, 5212, 5523, 5527, 5815, 5570. The following are figured in *Gard. Chron.*:—  
\**P. amabilis*, 1848, 269  
\**P. amethystina*, 1870, 1731  
\**Phalænopsis* at home, 1879, xi., 597.  
\**P. grandiflora*, 1848, 39.  
\**P. Portei*, 1876, v., 369, 371.  
\**P. rosea*, 1848, 671.  
\**P. speciosa* var. *Christiana*, 1882, xviii., 745.  
\**P. Schilleriana*, 1875, iv., 169; 1881, xvi., 301.  
\**P. Stuartiana*, 1881, xvi., 752.  
\**P. sumatrana*, 1865, 507.  
\**P. violacea*, 1881, xvi., 145.
243. **Pholidota**, Lindley.  
About twenty species, from India, Malaysia, and South China. *P. imbricata* and *P. articulata* are met with in collections, but none are showy. See *Gard. Chron.*, 1883, xix., 608.
244. **Phreatia**, Lindley.  
Ten species, wild in India, Malaysia, Pacific isles, and Australia. *Oberonia* is included. See *Gard. Chron.*, 1882, xviii., 500.
245. **PHYMATIDIUM**, Lindley.  
Two species from Brazil. Near *Ornithocephalus*.
246. **Physosiphon**, Lindley.  
Four species, from Tropical America, Brazil, and Mexico. Near *Stelis*, and not showy. *P. Lodigesii* is sometimes grown in collections. See *Gard. Chron.*, 1879, xii., 75; 1881, xvi., 136; *Bot. Mag.*, t. 4869; Loddiges, Botanical Cabinet, t. 1601 (*Stelis*).
247. **Physurus**, L. C. Richard.  
Twenty species, wild in Asia and Tropical Africa. Low growing leafy Orchids, resembling *Goodyera* or *Anectochilus*. See *Gard. Chron.*, 1879, xii., 75; *Bot. Mag.*, t. 5305.
- PILUMNA** (see *Trichopilia*), *Orchid Album*, t. 128.
248. **Pinelia**, Lindley.  
One species, wild in Brazil, resembling *Restrepia*. See *Gard. Chron.*, 1883, xix., 764.
- PLATANThERA** (see *Habenaria*), *Gard. Chron.*, 1879, xii., 75.
249. **PLATYCLINIS**, Benthau.  
Eight species, from India and Malasia, resembling *Liparis*. See *Bot. Mag.*, t. 4853.
250. **PLATYCORYNE**, Reichenbach f.  
One species, wild in Madagascar, and approaching *Disa* in habit.
251. **PLATYLEPIS**, A. Rich.  
Five species, wild in Tropical and Southern Africa and Madagascar. Near *Goodyera*.  
**PLEIONE** = *Coelogyne*. See *Orchid Album*, t. 102.  
\**Pleione*, *Gard. Chron.*, 1874, i., 15.
252. **Pleuranthium**, Lindley.  
Five or six species, wild in Tropical America. Near *Ponera*. Not showy. See *Gard. Chron.*, 1883, xix., 764.
253. **Pleurothallis**, R. Brown.  
About 350 species are wild in Tropical America, Brazil, Bolivia, and elsewhere on mountains. Many are weedy. For full list of cultivated species see *Gard. Chron.*, 1879, xii., 75; 1881, xv., 784; xvi., 10, 42; *Bot. Mag.*, t. 3261, 3030, 3682, 3897, 4142.  
\**P. scapha*, *Gard. Chron.*, 1881, xv., 784.
254. **PLOCOGLOTTIS**, Blume.  
Eight species, from Malaysia.
255. **PODOCHILUS**, Blume.  
Twelve species, wild in India and Malayan Archipelago.
256. **Pogonia**, Jussieu.  
Thirty species, wild in all parts of the world, America and Asia, both Tropical and Temperate; also in Temperate and Tropical Africa. See *Bot. Mag.*, t. 6125.
257. **POGONOPSIS**, Reichenbach f.  
One species, wild in Brazil, and related to *Pogonia*.
258. **POLYCYENIS**, Reichenbach f.  
Three or four species, native of Tropical America. Pretty little plants, resembling *Gongora* in habit. See *Gard. Chron.*, 1879, xii., 75; *Bot. Mag.*, t. 4479 (*Cynoches*); *Bot. Reg.*, 1841, t. 69 (*Houlletia*).
259. **Polystachya**, Hooker.  
Forty species, wild in Tropical and Southern Africa, rarely found in Asia and America. But few species are worth culture. See *Gard. Chron.*, 1879, xii., 75; *Bot. Mag.*, t. 3707, 4161, 5586.
260. **Ponera**, Lindley.  
Four or five species, wild in Mexico and Central America. Near *Epidendrum*. See *Gard. Chron.*, 1883, xix., 764; xii., 107.
261. **Ponthieva**, R. Brown.  
Ten or twelve species, wild in Tropical and Subtropical America. Terrestrial herbs. Near *Neottia*. See *Bot. Mag.*, t. 842 (*Neottia*), and 6337; *Gard. Chron.*, 1879, xii., 107.
262. **PRASOPHYLLUM**, R. Brown.  
Twenty-six species, wild in Australia and New Zealand, and in New Caledonia. Terrestrial herbs. Not showy.
263. **Prescottia**, Lindley.  
Twenty species, from Tropical America, Brazil, West Indies, and Mexico. Not showy. See *Gard. Chron.*, 1879, xii., 107; *Bot. Reg.*, t. 1915; Lodd., *Bot. Cab.*, t. 990.  
**PROMENEA**, *Orchid Album*, t. 7. (See *Zygopetalum*.)
264. **Pseudocentrum**, Lindley.  
Four or five species, wild on the Andes of Southern and Central America, and in Jamaica. Not showy. See *Gard. Chron.*, 1879, xii., 107.
- PSITTACOGLOSSUM** (see *Maxillaria*), *Gard. Chron.*, 1879, xii., 107.
265. **PRERICHIS**, Lindley.  
Six species, wild in Tropical and Southern America. Terrestrial herbs. Not showy.
266. **PTEROGLOSSASPIIS**, Reichenbach f.  
One species, found in Abyssinia.
267. **Pterostylis**, R. Brown.  
Thirty-six species, from Australia, New Zealand, and New Caledonia. See Fitzgerald, Austral. Orch., with twelve plates; *Bot. Mag.*, t. 3085, 3086, 3172, 3400, 3401, 6351.  
\**P. Baptistii*, *Gard. Chron.*, 1878, ix., 273.
268. **PTERYGODIUM**, Swartz.  
Ten species, from South Africa.
269. **QUEKETIA**, Lindley.  
One species, wild in Brazil. Not showy.
270. **Renanthera**, Loureiro.  
Five species, from India and the Malayan Archipelago and China. *R. coccinea* is a showy species. See *Bot. Mag.*, t. 2997, 2998; *Bot. Reg.*, t. 1131; 1843, t. 41.  
\**R. Lowi*, *Gard. Chron.*, 1883, xx., 657.  
\**R. coccinea*, *Gard. Chron.*, 1845, 491.
271. **Restrepia**, Humboldt, Bonpland, and Kunth.  
About twenty species, from Tropical America, Brazil, and Mexico. In habit resembling *Pleurothallis*. See *Gard. Chron.*, 1879, xii., 107; 1881, xvi., 172; *Bot. Mag.*, t. 5257, 5966, 6288.  
\**R. elegans*, *Gard. Chron.*, 1881, xvi., 172.
272. **RHYNCHOSTYLIS**, Blume.  
Two or three species, wild in India and Malaysia. Resembling *Saccolabium*. See *Bot. Mag.*, t. 4108.
273. **Rodriguezia**, Ruiz and Pavon.  
Twenty species, including *Burlingtonia*, from Tropical America, Brazil, and Central America. See *Gard. Chron.*, 1879, xii., 107; *Bot. Mag.*, t. 3324, 4834, 5419; *Bot. Reg.*, t. 930; Lodd., *Bot. Cab.*, t. 676.
274. **Saccolabium**, Blume.  
About twenty species, wild in India and the Malayan Archipelago. *S. giganteum*, *S. guttatum*, *S. premorsum*, and others, are well known favourites, specimens bearing twenty to thirty spikes having been exhibited. Well grown they are very effective. See *Orchid Album*, t. 56, 107, 156, 169; *Bot. Mag.*, t. 4772, 5326, 5433, 5595, 5635, 5681, 5767, 6222.  
\**S. Blumei*, *Gard. Chron.*, 1885, xxiii., 523.  
\**S. guttatum*, *Gard. Chron.*, 1845, 364; 1874, i., 219.  
**SARGOPEDIUM**. (See *Bulbophyllum* and *Dendrobium*.)  
\**S. Dearei*, *Gard. Chron.*, 1883, xx., 108.
275. **Sarcanthus**, Lindley.  
Fifteen or twenty species, from India and South China, and the Malayan Islands. Scarcely any are showy. See *Bot. Mag.*, t. 3571, 4639, 5217, 5630.
276. **Sarcophilus**, R. Brown.  
Thirty species, from India, Malaysia, Pacific islands, and Australia. Not much cultivated, although *S. calceolus* is showy.
277. **Satyrium**, Swartz.  
Fifty species, from India, Madagascar, and Tropical and Southern Africa. Terrestrial herbs, many of which are beautiful, but not easy of cultivation. See *Bot. Mag.*, t. 1512, 2172, 6625; *Bot. Reg.*, t. 416, 703; 1840, t. 18; Lodd., *Bot. Cab.*, t. 104.  
\**S. nepalense*, *Gard. Chron.*, 1885, xxiii., 208.
278. **SAUNDERIA**, Reichenbach f.  
One species, wild in Brazil.
279. **Scaphoglottis**, Poeppig and Endlicher.  
Eight or ten species, from Tropical America. Not very showy. *Gard. Chron.*, 1879, xii., 107; 1883, xix., 700; *Bot. Mag.*, t. 4071; *Bot. Reg.*, t. 1901.
280. **SELOCHILUS**, Klotzsch.  
Three or four species, wild on the Andes of Tropical America, and resembling *Compertea*.
281. **SCHIZOCHILUS**, Sond.  
Four or five species, wild in South Africa.
282. **SCHIZODIUM**, Lindley.  
Ten species, from South Africa. Related to *Disa*, but not showy.
283. **Schlimmia**, Planch.  
Three species, from Colombia, resembling *Maxillaria* in habit.  
\**S. trifida*, *Gard. Chron.*, 1877, vii., 141.
284. **SCHOENORCHIS**, Blume.  
One species, wild in Java (? Australia), resembling *Saccolabium*.
285. **Schomburgkia**, Lindley.  
Twelve species, from Tropical and Central America. *S. tibicensis* has hollow pseudobulbs, and is the "Cow's-horn Orchid" of Honduras, and difficult to collect, owing to the ants which infest its sheltering stems. See *Gard. Chron.*, 1879, xii., 107; *Bot. Mag.*, 3729, 4476, 5172.
286. **Scuticaria**, Lindley.  
Two or three species, from Brazil and Guiana. Epiphytes with curious thong-like or terete drooping leaves. *S. Steclii* and *S. Hadweni* have long been grown in gardens. See *Orchid Album*, t. 55; *Bot. Mag.*, t. 4629 (*Bifrenaria*), 3572, 3573; *Bot. Reg.*, t. 1986 (*Maxillaria*).
287. **Selenipedium**, Reichenbach f.  
Ten species, from mountains of South and Tropical America. They are mostly grown as *Cypripediums*. *S. caudatum* is one of the most remarkable of Orchids, its petals growing 20 to 30 inches in length, a large proportion of which growth elongates after lower bud expansion. In *Uropeidium* Lindeni the lip is petaloid instead of saccate,

- and three stamens are present. See *Gard. Chron.*, 1879, xii., 107; *Bot. Mag.*, t. 5466, 5614, 5970, 6217 (*Cypripedia*).
288. **Seraphyta**, Fischer and Meyer.  
One species, from the West Indies, resembling *Aniblostoma*. See *Gard. Chron.*, 1883, xix., 700; *Bot. Mag.*, t. 3565 (as *Epidendrum diffusum*).
289. **Serapias**, Linnæus.  
Four or five species, wild in the Mediterranean region and extending to the Azores. They are so closely linked together by natural hybrid intermediates as to be scarcely distinguishable from a purely botanical point of view. See *Bot. Mag.*, t. 5868, 6255; *Bot. Reg.*, t. 1189; *Moggr.*, *Flor. Ment.*, t. 16, 94, 95.  
\**S. cordigera*, *Gard. Chron.*, 1883, xx., 341.
290. **SERTIFERA**, Lindley.  
One species only known, wild in Ecuador (*S. purpurea*, Lindl.).
291. **SIGMATOSTALIX**, Reichenbach f.  
Seven species, wild in Tropical America.
292. **Sobralia**, Ruiz and Pavon.  
Thirty species are wild on the Andes of Tropical America, Peru, Mexico, and Guiana. They are reedy herbs, bearing large Cattleya-like flowers, and represented in the West—the *Arundinas* of the Eastern Tropics. *S. macrantha* and its varieties are often met with in collections. See Lindl., *Sert. Orch.*, t. 29; Bateman, *Orch. Mex.*, t. 25, 37; *Bot. Mag.*, t. 4446, 4570, 4682, 4882; *Bot. Reg.*, 1841, t. 17.  
\**S. macrantha albidia*, *Gard. Chron.*, 1871, 906.
293. **SOLENIDIUM**, Lindley.  
Only one species, wild on the Colombian Andes, and allied to *Oncidia*.
294. **Sophranitis**, Lindley.  
Four or five species, mostly from the Organ Mountains in Brazil. They are showy little epiphytes, with scarlet, butterfly-like flowers. *S. coccinea* and *S. grandiflora* are very popular in gardens. See Lindl., *Sert. Orch.*, t. 5, f. 2; *Bot. Mag.*, t. 3677, 3709; *Flor. de Serres*, t. 1716.  
\**S. grandiflora*, *Gard. Chron.*, 1884, xxii., 561.
295. **Spathoglottis**, Blume.  
Ten or more species, wild in India, South China, Malaysia, Pacific islands, and Australia. Terrestrial herbs, often bearing showy flowers on erect spikes. "*Paxtonia*" is a pelorioid form of this genus. See *Gard. Chron.*, 1882, xviii., 532.  
\**S. Lobbi*, *Gard. Chron.*, 1882, xviii., 532.
296. **Spiranthes**, L. C. Richard.  
About a hundred species, of world-wide distribution. Few are showy, except one or two species of *Stenorhynchus*. *Spiranthes Romanzoviana* (= *S. gemmipara*), wild in the South of Ireland, is unknown elsewhere in Europe, but extends from the Atlantic to the Pacific in North America. See *Gard. Chron.*, 1879, xiii., 107; *Bot. Mag.*, t. 1568, 2026 (*Neottia*), 1562, 2730, 3277; *Bot. Reg.*, t. 602, 794, 823, 1934.  
\**S. Romanzoviana*, *Gard. Chron.*, 1881, xvi., 465.
297. **Stanhopea**, Forst.  
About twenty species known, from Tropical America, Brazil, and Mexico, strong-growing epiphytes, bearing peculiar sweet-scented flowers, all showy. They are well deserving of culture. The lip is peculiar, and variable in formation in different species. See *Gard. Chron.*, 1879, xii., 107. The following species are figured in *Gard. Chron.*:—  
\**S. ecomuta*, 1850, 295.  
\**S. florida*, 1881, xvi., 561, 565.  
\**S. guttulata*, 1848, 439.  
\**S. serrata*, 1850, 295.  
\**S. tricornis*, 1850, 295. See *Bot. Mag.*, 3359, 4197, 4885, 5278, 5289, 5300.
298. **Stauroopsis**, Reichenbach f.  
Eight or ten species, from the Malayan Archipelago and (?) India. Generally included under *Phalenopsis* in gardens. *Trichoglottis pallens* is sometimes met with in cultivation, and is a good type species. See Lindl., *Bot. Reg.*, 1846, t. 59; *Bot. Mag.*, t. 5189.
299. **Stelis**, Swarz.  
A hundred and fifty species are known in books, some few being in cultivation. They are wild in Tropical America, Brazil, Peru, Mexico, and the West Indies. See *Gard. Chron.*, 1879, xii., 107; 1881, xvi., 136; *Bot. Mag.*, t. 3975, 6521; *Bot. Reg.*, t. 935; Lodd., *Bot. Cab.*, t. 442, 1011.  
\**S. Bruchmüllerii*, *Gard. Chron.*, 1881, xv., 130
300. **Stenia**, Lindley.  
Two species only known, one from Guiana, and the other from Colombia. *S. fimbriata* is often grown in gardens.
301. **Stenoglossum**, Humboldt, Bonpland, and Kunth.  
One species, from the Andes of Tropical America. Near *Epidendrum* or *Diothonea*. See *Gard. Chron.*, 1883, xix., 700.
302. **STENOGLOTTIS**, Lindley.  
One species, wild in Southern Africa.
- STENORRHYNCHUS (see *Spiranthes*), *Gard. Chron.*, 1879, xii., 138.
303. **STENOPTERA**, Presl.  
Three species, from the mountains of Tropical America and the West Indies. Not showy.
304. **STEREOSANDRA**, Blume.  
One species, wild in Java.
305. **Sunipia**, Lindley.  
One species, from the Himalayas and Burmah. See *Gard. Chron.*, 1881, xvi., 463.
306. **SUTRINA**, Lindley.  
One species, from Peru.
307. **TENIOPHYLLUM**, Blume.  
Six species, from India, Malaysia, Pacific Isles, and Australia.
308. **Tainia**, Blume.  
Six or seven species, from India, South China, and the Malayan Archipelago. Allied to *Eria*. See *Gard. Chron.*, 1882, xviii., 780.
309. **TELEPOGON**, Humboldt, Bonpland, and Kunth.  
Forty or more species, from the Andes of South America.
310. **TETRAMICRA**, Lindley.  
Six species, from Tropical America, Brazil, and the West Indies. *Leptotes* is included here. See *Bot. Mag.*, t. 3098 (*Brassavola*), 3734.
311. **THECOSTELE**, Reichenbach f.  
Only one species, from Malacca and the Malayan Archipelago. Somewhat approaching the American *Stanhopeas*.
312. **THELASIS**, Blume.  
Eight species, from India, China, and the Malayan Archipelago. Not showy.
313. **Thelymitra**, Forst.  
Twenty species, from Australia, New Zealand, New Caledonia, and Malaysia.
- THUNIA (see *Phaius*), *Orchid Album*, t. 67, 150.
314. **TIPULARIA**, Nuttall.  
Two species, from North America and the Himalayan range. Near *Oreorchis* and *Corallorhiza*.
315. **Trias**, Lindley.  
Three species, from India, wild in Moulmein, and approaching *Bulbophyllum*. See *Gard. Chron.*, 1882, xviii., 426.  
\**T. albo-purpureum*, *Gard. Chron.*, 1866, 219.  
\**T. Flavii*, *Gard. Chron.*, 1882, xvii., 117.
317. **TRICHOCEROS**, Humboldt, Bonpland, and Kunth.  
Six or eight species, from Peru and Colombia.
318. **Trichoglottis**, Blume.  
Four or five species, from Malaysia; approaching *Sarcocylus*.
319. **Trichopilia**, Lindley.  
Sixteen or more species, from Colombia, and Central America, and Mexico. *Helcia* and *Pilumna* are now placed here. Several species are grown in gardens. See *Orchid Album*, t. 14; *Gard. Chron.*, 1879, xii., 139; *Bot. Mag.*, t. 3739, 4654, 4857, 5035 (*Pilumna*), 5550, 5949.
320. **Trichosma**, Lindley.  
One species, wild on the Khasia Hills, related to *Eria*, with the habit of *Coclogyne*. See *Orchid Album*, t. 113; *Gard. Chron.*, 1882, xviii., 812.
321. **Trigonidium**, Lindley.  
Seven or eight species, from Tropical and Central America, Brazil, &c. See *Gard. Chron.*, 1879, xii., 139.
322. **Trizeuxis**, Lindley.  
One species, from the Colombian Andes. See *Gard. Chron.*, 1879, xii., 139.
323. **TROPIDIA**, Lindley.  
Five or more species, from India, Malaysia, and the Pacific islands.
324. **UNCIFERA**, Lindley.  
Two species, wild on the Khasia Hills, and resembling *Saccolabium*.
325. **Vanda**, R. Brown.  
Twenty species and numerous varieties, from India, Malayan Archipelago, and Tropical Australia. *Vanda suavis* and *V. tricolor* are well-known favourites, varying greatly. *V. teres* and *V. Hookeri* are lovely representatives of the terete-leaved group. *V. Sanderiana* is one of the finest species. See *Orchid Album*, t. 15, 48, 59, 61, 73, 77, 124, 168, 172, 180; *Bot. Mag.*, t. 2245, 3416, 4114, 4432, 5174, 5611, 5759, 5811, 5834, 6173, 6328. The following species are figured in *Gard. Chron.*:—  
\**V. Bensonæ*, 1857, 180.  
\**V. Cathcartii*, 1870, 1409.  
\**V. cœrulescens*, 1870, 529.  
\**V. fuscoviridis*, 1848, 351.  
\**V. lamellat* (Boxall), 1881, xv., 87.  
\**V. Sanderiana*, 1883, xx., 440, 441.  
\**V. suavis*, 1872, 974.  
\**V. suavis*, Wingate's var., 1884, xxii., 237.  
\**V. teres*, 1883, xx., 273.  
\**V. tricolor Patersonii*, 1884, xxii., 236
326. **Vanilla**, Swarz.  
Twenty or more species, of world-wide distribution in tropical countries, and remarkable as affording delicious flavouring principle from their fruits. See *Gard. Chron.*, 1879, xii., 139.  
\**Vanilla*, fertilisation of, *Gard. Chron.*, 1867, 997.
27. **VRYDAGZENIA**, Blume.  
Eight species, from the Malayan Archipelago, and the Pacific islands. Near *Heteria* or *Anæctochilus*.
328. **Warrea**, Lindley.  
Two species, from Colombia and Peru. See *Bot. Mag.*, t. 4235 (*Maxillaria*), Loddiges, *Botanical Cabinet*, t. 1884 (*Maxillaria*).
- WARSCIEWICZELLA (see *Zygopetalum*), *Orchid Album*, t. 126.
329. **WULLSCHLEGELIA**, Reichenbach f.  
Two species, from the West Indies and North Brazil. Near *Cranichis*.
330. **XYLOMUM**, Lindley.  
Sixteen species, from Tropical America, resembling *Maxillaria*. See *Bot. Mag.*, t. 2805, 2955, 2981.
331. **YOANIA**, Maximowicz.  
One species, wild in Japan, resembling *Epipogon*.
332. **ZEUNINE**, Lindley.  
Sixteen, from India, Malaysia, and Tropical Africa. Not showy.
333. **Zygopetalum**, Hooker.  
Forty species, from the warm parts of South and Central America, Brazil, and the West Indies. *Hundleya*, *Bolkea*, *Warszewiczella*, and *Promœrea* are now included in this genus. See *Orchid Album*, t. 28, 50, 78, 87, 142; *Gard. Chron.*, 1879, xii., 139; *Bot. Mag.*, t. 2748, 2819, 3402, 3585, 3674, 3686, 4766, 4830 (*Warren*), 5046, 5567, 5582, 5598 (*Hundleya*), 6003, 6331, 6458.  
\**Z. aromaticum*, *Gard. Chron.*, 1868, 75.
334. **ZYGOSTATES**, Lindley.  
Three or four species, from Brazil; approaching the genus *Ornithocephalus*. Not showy.

# SKETCH-MAP OF THE GENERIC DISTRIBUTION OF ORCHIDS.

THE ISOTHERMAL OR WAVY LINES INDICATE THE MEAN OR ANNUAL AVERAGE TEMPERATURE AT SEA-LEVEL.

WHEN ALTITUDES ARE KNOWN SUBTRACT  $3\frac{1}{2}$  DEGREES FAHR. FROM THE TEMPERATURE AT SEA LEVEL FOR EVERY 1,000 FEET TO INDICATE APPROXIMATE TEMPERATURES.

THE FIGURES ON THE MAP CORRESPOND TO THOSE OF THE GENERA AS GIVEN IN THE ACCOMPANYING ALPHABETICAL LIST.

# THE GARDENERS' CHRONICLE.

BURLEY** is favoured with instructions from the Official Receiver in Bankruptcy, to SELL by PUBLIC AUCTION, on the premises, THURSDAY, May 14, at 10 for 11 o'clock, the whole of the valuable NURSERY STOCK and UTENSILS IN TRADE, comprising about 2000 Herbaceous Plants in pots, of the most approved kinds, collection of Ferns, Palms, Orchids, Camellias, Azaleas, Spiræas, Hybrid Perpetuals, and Tea Rose, in pots, fine plants of Marseillaise Niel Rose, quantity of large flowering Pelargoniums and Chrysanthemums, &c., 1000 Zonal, Golden and Silver Tricolor Geraniums, Peonies, Shrubs in pots, Standard and Trained Fruit Trees, Standard and Dwarf Roses, Three Nests of Seed Drawers, Horticultural Sundries, Iron Safe, Scales and Weights, nearly new Wheelbarrow, Sundry Tools, Eighteen Round Baskets, and a quantity of Seeds; 400 feet of 1-inch Boards, 160 feet of 2-inch Hot-water Pipes, Boiler, quantity of Bricks and Flower Pots, &c.

On view morning of Sale. Catalogues may be obtained of C. GODFREY, Esq., Romford; of TAYLOR, Solicitor, High Street, Brentwood; of Mr. LAMING, on the Premises; and of the Auctioneer and Valuer, High Street, Brentwood.

**WANTED TO PURCHASE,** a good WORKING NURSERY and SEED BUSINESS, or a PARTNERSHIP in an Old-established House. Enquiry per letter only.

T. F. S. Hurst &amp; Son, 152, Houndsditch, London, E.

**TO BE SOLD or LET,** the well known FREEHOLD MARKET GARDENS, 9 miles north of London, and five minutes from Whetstone Station (G.N.R.), on account of the ill-health of occupier. They contain about 80,000 feet 27-in. Glass, with every modern improvement, erected within the last few years. Large Boilers, thousands of yards of Hot-water Pipes. Well stocked with Vines, Camellias, Cucumbers, Plants, &c.—one Camellia 20 feet by 20 feet through; all in a high state of cultivation. Good House and Out-buildings, Cottages for men, Vans, Horses, Tools, &c.; occupying about 5 Acres. Part of Purchase-money can remain on Mortgage. There are, further, 13 Acres of Land which may be reserved for Building purposes.

May be seen by applying to Mr. DAVIDSON, the premises; or Mr. DAVIS, Friern Lodge, Hereford; or Messrs. PROTHEROE AND MORRIS, 67 and 68, Cheapside, London, E.C.

Bledlow, Bucks.

4 miles from Thame, and close to Bledlow Station, G.W.R. To NURSERYMEN, MARKET GARDENERS, and INVESTORS.

**TO BE LET, or SOLD,** an attractive and valuable FREEHOLD PROPERTY, fronting the main road between Bledlow Station and Towersey and Thame, the Ground being profusely planted with choice Fruit Trees in their full bearing. The Premises are compact, and have a long roadside frontage, and contain about 33, or 6p. They are watered by an unfailing stream which passes through the ground. The Land is a deep loam of a very yielding quality, and the Trees are all young and are now in, or approaching, their full bearing. Upon the ground are two brick, stucco, and tiled Cottages and Woodhouses, with slated Shed at end, one being occupied by Widow Bowler as caretaker. There is also a row of four old brick and thatched Cottages, with large Packing Shed at end and tiled Shed behind with small Greenhouse. These Cottages are either used as Store Houses or are untenanted. There is also an old four-roomed Cottage by the high road with a 50 feet span Greenhouse near. There are a few ornamental Fruit trees, and the remainder of the land is covered with Fruit Trees which in good seasons yield a large return.

Particulars may be obtained of DANIEL CLARKE, Esq., Solicitor, High Wycombe; or of Messrs. VERNON AND SON, Land Agents, &c., Great George Street, Westminster, S.W., and High Wycombe, Bucks.

**TO LET, a FLORIST and JOBBING BUSINESS,** 14 years' unexpired Lease; can have 21 years more on Lease if required. Leaving through sickness. Is situated in the County of Middlesex. Good opening for any one requiring a Florist's Business. Capital required, about £100. Apply, by letter, to G. T., Mr. Jacklin, Alma Villas, Twickenham.

To Florists, Market Gardeners, and Others.

**TO LET, at Fulham, 1½ Acre of GARDEN GROUND,** with nine Glass Houses. Suitable for the business of a Florist or Seedsman.—For particulars apply to Messrs. ROSE AND JOHNSON, Solicitors, 26, Great George Street, Westminster, S.W.

To Florists.

**TO BE LET, RENT FREE, EXTENSIVE SPACES and CONSERVATORY in the ROYAL AQUARIUM,** for Exhibition and Sale of Flowers, Shrubs, and Plants.

For conditions and other particulars, apply personally to the MANAGER.

**PROTHEROE AND MORRIS, HORTICULTURAL MARKET GARDEN and ESTATE AUCTIONEERS and VALUERS,** 67 and 68, Cheapside, London, E.C., and at Leytonstone, E. Monthly Horticultural Register had on application.

ORCHIDS A SPECIALTY. — The stock at the Clapton Nursery is of such magnitude that, without seeing it, it is not easy to form an adequate conception of its unprecedented extent. The glass structures cover an area of upwards of 236,000 superficial feet.

HUGH LOW & CO.  
cordially invite Gentlemen interested in Horticulture to inspect the Nurseries.

## NEW CATALOGUE FOR 1885.

*Beautiful Flowers for Indoors, selected from an immense stock. Our Glasshouses cover nearly 2 acres.*

Wm. Clibran & Son's New List  
(90 Pages Double Column)

Of the newest and finest varieties of all classes of Plants for Greenhouses, Stoves, &c., may now be had for two stamps. It includes only the best varieties of their respective classes. Every season new sorts are added. Comparisons of the varieties when in bloom carefully made, and the inferior kinds discarded. Intending purchasers may rely, when selections are ordered as under, on being supplied with varieties of merit only.

The following cheap Collections of finest named kinds consist entirely of our selection. Purchasers may select from the Lists at Prices as per CATALOGUE, which please see before ordering elsewhere.

#### New Bedding Plant.

**I RESINE FORMOSA.**  
Awarded First-class Certificates by the Royal Horticultural and other Societies.

This beautiful Iresine (as described by the *Gardeners' Chronicle*, *Journal of Horticulture*, *The Garden*, &c.) will be found to excel every other foliage plant of its form as a Bedder, and as a Decorative Plant, either for Table or Conservatory, it is superb, equaling any Croton in colour, and preferable for winter use on account of its hardiness, as it may be easily grown in an ordinary greenhouse. The Raiser can confidently recommend it as being worthy in every respect of all that has been said about it.

Price, well-rooted Cuttings, 1s. 6d. per dozen; established in pots, 2s. per dozen.

**ALTERNANTHERA AMENA SPECTABILIS**, extra strong and well rooted, 6s. per 100, 50s. per 1000.

Trade price on application.

" Happy Thought, C. P. Gem, May Queen, 2s. per dozen, 12s. per 100, from single pots.

**LOBELIA** (true), from cuttings, " Emperor William," 2s. 6d. per 100, 20s. per 1000.

**DAHLIAS**, Single, White Queen, Paragon, and other named sorts of all shades of brilliant colours, 2s. 6d. per dozen, 15s. per 100, from single pots.

" strong, named seedlings, 1s. 6d. per dozen, 10s. per 100.

" Double, best named show varieties, 3s. per dozen, 25s. per 100, from pots.

Liberal allowance to the Trade for large quantities. Package free. Plants allowed for carriage. Terms cash. CATALOGUE gratis.

**H. I. HARDY**, Stour Valley Florist Grounds, Bures, Suffolk.

#### FIVE THOUSAND PELARGONIUMS.

Must be sold. Clean, large bushy stuff, to flower early. Established in 48-pots, including all the best named varieties, as Dr. Masters, Duchess of Bedford, Bridal Bouquet, Kingston Beauty, &c., 7s. 6d. per dozen for cash. Also ditto in 60s., ready for 48-pots, at 4s. per dozen for cash.

Address, MANAGER, The Hill Nurseries, Sandiacre, Notts.

#### GILBERT'S PRIMROSE HARBINGER

has won the heart of the R.H.S. Floral Committee, beat all the Critics, and solved the great problem at last. More valuable for cutting than White Azaleas. Pure white, very large flowers; no myth, but a Sampson in strength. Firm young off-shoots, well-rooted, 5s. per dozen. Cash with order. Carriage paid. Apply to

**R. GILBERT**, High Park Gardens, Stamford.

## HERBACEOUS

And ALPINE PLANTS.

CATALOGUE of fifty pages, containing full information as to colour, height, situation, time of flowering, &c., free on application.

Black Fibrous Peat, 4s. 6d. per sack; 5 for 20s.; 10 for 30s.  
Coarse Bedford Sand, 1s. 6d. per bushel; 14s. per 1/2-ton; 25s.  
per ton. **SPECIALITE TOBACCO PAPER**, 10d. per lb.;  
28 lb., 21s.; cwt., 70s. Second quality, 7d. per lb.; 28 lb. 16s.  
Finest Tobacco Cloth, 8d. per lb.; 28 lb. for 18s. Leaf-Mould,  
5s. per sack. Peat-Mould, 4s. per sack. Yellow Fibrous Loam,  
3s. per sack. Charcoal, 2s. 6d. per bushel. Bones, Guano,  
Sphagnum, &c. LIST free. Special prices to the Trade for  
cash. **W. HERBERT AND CO.**  
HOP EXCHANGE WAREHOUSES, SOUTHWARK STREET, S.E.  
(near London Bridge).

## NORWEGIAN FISH-POTASH GUANOS.

Composed of Pure Flesh and Bone of Cod and  
Herring and Refined Potash.

A Perfect Fertiliser for Garden and Greenhouse,  
Lawns and Tennis Courts, Vegetables,  
Flowers, Exotics and Fruit Trees.

Prices, carriage paid, on receipt of Post-office Order:  
28 lb., 6s. 6d.; 56 lb., 10s. 6d.; 1 1/2 cwt., 20s.; 2 cwt.  
30s.; 5 cwt., 60s. Bags free.

Larger Quantities at Special Prices, for which, and for  
Analysis, &c., apply to

**J. JENSEN & CO.,**  
10, ST. HELEN'S PLACE, LONDON, E.C.  
Manufactory—  
**BRETTESEN, LOFFOTEN ISLANDS, NORWAY.**

**EPSS'S SELECTED PEAT.**—Forty sacks,  
2s. 6d. per sack; 30 ditto, 2s. 9d.; 20 ditto, 3s. 6d.;  
10 ditto, 4s. 6d.; sacks, 6d. each. In trucks of 14 cubic yards,  
11s. per yard. For Rhododendrons and common purposes,  
14s. per ton, not less than four tons; sample sack, 2s. 6d.  
**LOAM, SAND, LEAF-MOULD, SPHAGNUM, &c.**  
See Special List, also for the Trade. Ringwood, Hants.

## GARDEN REQUISITES.

Two PRIZE MEDALS.  
Quality, THE BEST in the Market. (All sacks included.)  
PEAT, best brown fibrous .. 4s. 6d. per sack; 5 sacks for 20s.  
PEAT, best black fibrous .. 3s. 6d. " 5 sacks for 15s.  
PEAT, extra selected Orchid .. 5s. 0d. " "  
LOAM, best yellow fibrous ..  
PREPARED COMPOST, best .. 1s. per bush. (sacks included).  
LEAF MOULD, best only ..  
PEAT MOULD ..  
SILVER SAND, best only .. 1s. per lb.  
RAFFIA FIBRE, coarse, 1s. 3d. per bush., 12s. half-ton, 22s. ton  
TOBACCO CLOTH, finest imported .. 8d. lb., 28 lb. 18s.  
TOBACCO PAPER .. (Speciality) 8d. lb., 28 lb. 18s.  
MUSHROOM SPAWN, finest Milltrack .. 5s. per bushel.  
SPHAGNUM MOSS, all selected, 2s. per bush., 6s. per sack.  
COCOA-NUT FIBRE REFUSE (by Chubb's special process),  
sacks, 1s. each; 10 sacks, 9s.; 15 sacks, 13s.; 20 sacks, 17s.;  
30 sacks, 25s.; 40 sacks, 30s. Truck-load, loose, free on rail,  
25s. Limited quantities of G., special quality, granulated, in  
sacks only, 2s. each. Terms, strictly Cash with order.

## STANDEN'S MANURE.

ESTABLISHED 20 YEARS.  
This old-established Manure is acknowledged by most of the  
leading practical Gardeners in the United Kingdom and the  
Colonies to exceed all others in general fertilising properties and  
staying powers. It promotes a rapid, healthy, and robust  
growth in plants generally. It is a clean and dry powder,  
with very little smell, which renders it particularly adaptable  
for ladies interested in plant culture.

The highly fertilising properties of this Manure render its  
money value, in comparison with other manures, at least double,  
as users will find that very small quantities will produce  
favourable results.

Sold in TINS, 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each;  
and in BAGS or KEGS, at reduced prices, 28 lb., 12s. 6d.;  
56 lb., 23s.; 112 lb., 42s. each.

May be obtained from all Nurserymen and Seedsmen in the  
United Kingdom and the Colonies.

SOLE MANUFACTURERS,  
**CORRY, SOPER, FOWLER & CO.**  
(LIMITED),  
18, FINSBURY STREET, LONDON, E.C.

## BEESON'S MANURE

Is the best for all Horticultural Purposes.  
Sold in Tins at 1s., 2s. 6d., and 10s. 6d. each; also in  
Sealed Air-tight Bags, containing 1 cwt., 13s.

The 10s. 6d. Tins serve as a strong substantial receptacle to  
refill from the 1 cwt. bags.

Supplies can be obtained through all respectable Nurserymen,  
Seedsmen, and Florists in the Kingdom; or, in districts where  
no Agents reside—Carriage Paid for Cash with Order—direct  
from the MANUFACTURER,

**W. H. BEESON, Carbrook Bone Mills, Sheffield.**  
Testimonials from the Rev. Canon Hole, and most of the  
leading Gardeners, free on application.  
Pure Crushed Unboiled BONES, any size, for Vine Borders,  
&c. WHOLESALE AGENTS, LONDON,  
**CORRY, SOPER, FOWLER & CO. (Limited).**

**EXTRA CHOICE NAMED**

CARNATIONS and PICOTEES, 1s. 3d. per pair, or 6 pairs 6s.

PYRETHRUMS, double, choice named variety, 4s. per dozen.

PHLOX, Herbaceous, choice named variety, 4s. per dozen.

PANSIES, extra selected, in 12 varieties, both Show and Fancy, 2s. 6d. per dozen, 18s. per 100.

VIOLAS, the best varieties of White, Yellow, Peach, Blue, Sulphur, Purple, &amp;c., 1s. 6d. per dozen, 10s. per 100.

CHRYSANTHEMUMS, in 12 of the very best varieties, either Japanese, Incurved, or Reflexed, 1s. 6d. per dozen, 10s. per 100; more varieties if required.

The above are all grand plants, from single pots. Send for CATALOGUE. All are Carriage Free for Cash with Orders to

**MESSRS. FLETCHER, SON & CO.,**  
FLORISTS, &c., CHESTERFIELD.**TEA-SCENTED, NOISETTE,  
AND OTHER ROSES.**

The large "ROSE" is full of Flowers and Buds, and will continue in its beauty for some time. Open to all Visitors from 6 A.M. to 6 P.M.

Vide *Gardeners' Chronicle* of February 28, page 269. "WILD ROSE," says:—"They range from the tiny house of the suburban lover of ROSES to the grand, 'UNEQUALLED' house of the Crauston's Company at Hereford."**CRANSTON'S NURSERY and SEED CO.**

## SPECIAL NOTICE

GRAND EXHIBITION  
OF  
ORCHIDS,Stove and Greenhouse Flowering  
and Foliage Plants.

Open to the Public from May 11 to  
June 30, from 9 a.m. till dusk daily (Sundays  
excepted).

ADMISSION FREE to those who have  
received Invitations,  
OR UPON PRESENTATION OF CARD.

A large Show House, 100 feet  
long by 22 feet wide, and an Odonto-  
glossum House, 80 feet long, will be  
especially devoted to the Orchid Ex-  
hibition, and visitors may rely upon  
seeing these beautiful Plants with  
the greatest degree of comfort, the  
ventilation and means of ingress and  
egress, as well as the great width of  
the paths, being all that can be  
desired. The other Show Houses  
will be gay with our large collection  
of Stove and Greenhouse Flowering  
and Foliage Plants, which have  
figured at the leading Shows, both  
at home and abroad, for many years,  
with uninterrupted success. In ad-  
dition, the large Winter Garden,  
100 feet long by 40 feet wide, will  
be filled with a fine show of Foliage  
and Flowering Plants, and will  
form an agreeable lounge to those  
wishing to avail themselves of this  
cool retreat.

B. S. WILLIAMS,  
Victoria and Paradise Nurseries,  
UPPER HOLLOWAY, N.

## NEW ROSES.

## WM. PAUL &amp; SON,

Rose Growers by Appointment to  
Her Majesty the Queen,

WALTHAM CROSS, HERTS,

respectfully invite attention to the following  
New Roses:—The "WALTHAM CLIMBING" ROSES,  
Nos. 1, 2, and 3.

Crimson Roses, of different shapes, and distinct shades of  
colour; No. 1 being the lightest, and No. 3 the darkest. They  
are seedlings from Gloire de Dijon, possessing all the good  
qualities of that well-known variety, and are recommended as  
supplying a long-felt want in the garden, namely, good bardy  
crimson autumn-flowering Climbing Roses, with fine foliage.

Plants ready the end of May, 10s. 6d. each,  
or 21s. the set of 3 varieties.

W. F. BENNETT (Hybrid Tea-scented).

This Rose is recommended by the raiser (Mr. H. Bennett),  
as the finest red Rose yet introduced for winter blooming and  
cut blooms at all seasons. The flowers sent to Covent Garden  
have always realised higher prices than other red Roses in the  
market at the time. It is of the same colour as Général Jacquie-  
minot, and from its size and the freedom with which the blooms  
are produced, it has been likened to a crimson "Niphetos."

WM. PAUL & SON have been appointed Sole Agents for the  
sale of this Rose in Europe. Plants will be ready about June 1.  
The following prices are for nett cash, and include packing:—  
Single Plants, 15s.; 5 Plants, £3 15s.; 10 Plants, £5 17s.  
Special Prices for larger quantities.

WM. PAUL &amp; SON'S

## NEW ROSES OF 1884.

CHARLES LAMB (H.P.) Clear bright red.	} Garden Roses.
GARDEN FAVOURITE (B.P.) Fresh pink.	
ELLA GORDON (H.P.) Bright cherry colour.	} Show Roses.
LADY OF THE LAKE (H.P.) Peach colour.	
EMPEROR (H.P.) Very dark, almost black.	} Buttonhole Roses.
EMPRESS (H.P.) White with pink centres.	

Strong Plants, Price 3s. 6d. each.

SUNSET (Tea-scented).

A sport from Perle des Jardins, with deep Apricot flowers,  
beautiful in bud; fine for forcing and cutting. First-class  
Certificate to Wm. Paul & Son.

Price 2s. 6d. to 3s. 6d. each.

GLOIRE LYONNAISE (H.P.).

A yellow Hybrid Perpetual, partaking of some of the charac-  
teristics of the Tea Roses; flowers chrome-yellow, large and full.

Price 3s. 6d. each, 36s. per dozen.

QUEEN OF QUEENS (H.P.)

(Wm. Paul &amp; Son).

Pink with blush edges, perfect in form, every shoot crowned  
with a flower-bud. First-class Certificate. Equally good as a  
garden and exhibition Rose, and decidedly the finest Rose of its  
colour.

Price 2s. 6d. to 3s. 6d. each.

All other New Roses, both English and Foreign, in strong  
plants at moderate prices.

Also a large stock of the older varieties, in pots, for spring  
and summer planting, pot culture, climbing, &c.

Priced descriptive Catalogue, post-free, on  
application.

See House of Roses, &c., at the Inventions Exhi-  
bition, South Kensington, S.W. (near the Concert  
Room).

PAUL'S NURSERIES,  
WALTHAM CROSS,  
HERTS.

THE

## Gardeners' Chronicle.

SATURDAY, MAY 9, 1885.

ORCHIDS, DOUBLE AND  
SINGLE.

IT is only the other day that we were called  
on to record the vagaries in which sportive  
Daffodils incontinently indulge, and now a  
similar task lies before us as to Orchids. The  
flowers of Orchids, under ordinary circum-  
stances, are so peculiar in the appearance and  
arrangement of their parts that it would seem  
at first sight as if no amount of "doubling"  
would increase their peculiarities; and in point  
of fact it diminishes them. Doubling in Orchids  
for the most part, exceptions disregarded, is  
little more than an undoing of the complexity  
which characterises the ordinary flower—a dis-  
integration and isolation of parts usually con-  
solidated. The chief interest, therefore, attach-  
ing to double flowered Orchids lies in the key  
they afford us as to the peculiarities of the  
normal structure, the insight they give as to  
the history and lineage of the race, of the modi-  
fications from a simpler plan, which have made  
an Orchid what it now is, and of the possible  
potentialities of the future. Hitherto gardeners  
have looked at these productions as mere in-  
constant sports, generally the reverse of orna-  
mental; but it depends very much on the  
cultivator himself whether these productions  
are to remain capricious and inconstant, or  
whether by the systematic and persistent  
exercise of the same processes of selection and  
elimination followed in other cases, they are to  
be developed, "improved," and rendered  
relatively constant. There are limits no doubt  
beyond which the gardener cannot go, but he  
has not reached them yet, indeed, so far as this  
matter is concerned, he has not even touched  
its fringe, nor will he be able to do so to any  
purpose till he becomes familiarised not only  
with the superficial appearance and arrangement  
of the parts of an Orchid flower, but with the  
clues to its origin and course of development  
and with the indications of the real plan of its  
structure as given by the study of the mode of  
development from the embryo stage to the adult  
condition, by its minute anatomy and by the  
comparative study of the varied forms of Orchid  
flowers and of the malformations they present.

Much that was said relating to double Daffo-  
dils (see p. 563) applies equally well, with the  
requisite modifications, or with no modifications  
at all, to Orchids, and need therefore not be  
repeated. On the other hand there are a few  
changes in Orchids which may conveniently be  
treated of here, although in strictness they  
should fall under the head, not of double, but of  
"peloriated" flowers. As these illustrations of  
"peloria" are essential to our comprehension  
of the structure of the normal Orchid flower  
they may appropriately be introduced here with  
double flowers proper.

## THE NATURAL CONFORMATION.

But first of all we must briefly allude to the ordi-  
nary structure of the flower of an Orchid, Cypris-  
pedium being in many ways exceptional will require  
special notice. As in the Narcissus and Daffodils the  
ovary of Orchids is placed beneath the flower, by the

operation of the same causes as those which were alluded to previously (p. 564).

The ovary is surmounted by the flower, and is usually (but not always) twisted, so that what was originally the top of the flower becomes in course of growth the lower. The flower of an Orchid (see fig. 108), like that of a Narcissus, has a perianth of six pieces, three outer, three inner; the three outer are the sepals, the three inner are the petals, and of these petals one is usually different in size, colour, and form from the rest, and, therefore, receives a distinct name, the "labellum," or "lip." Every one is familiar with the large extent to which the peculiarities and the beauty of Orchids depend on the marvellous variety in form and colour of the lip. Within the petals, in the centre of the flowers, stands the "column" directly continuous with the ovary. This column is a composite structure—a simple column it looks, but it is far from being so in reality. As we see it superficially, it consists of a thick body, erect or bent, with an anther at or near the top, and with a cup-like cavity in front beneath the anther, more or less filled with a viscid secretion, and which is in fact the stigma. The column (fig. 108, D; fig. 109, p. 597) then superficially consists of at least one stamen and one style, which in course of growth have developed in union one with the other. The anther has a little cap, easily removed by the point of a pencil or the proboscis of an insect, and when removed it reveals the pollen, not in the form of detached grains or powder, as in most flowers, but aggregated together into two, four, eight waxy masses or "pollinia" (fig. 108, L). Stamen, pollen, style, stigma, lip, are all specially adapted to secure the fertilisation of the flower by insects. The insect attracted by the colour, sweet smell, or nectar in the flower, alights on the lip; once there it is guided or forced to take a certain direction by the plates or warts or other peculiarities of the lip, and in his course he knocks off the anther cap, when out springs the pollen by a mechanism which we cannot stay to describe here, but which is one of the most marvellous contrivances in the vegetable world. Released from the anther the pollen masses attach themselves to the head or proboscis of the insect, and weighted with them he flies off to some other flower. Arrived there he is compelled to follow the same course as before, and consequently the pollen would be knocked up against the anther. But to prevent this mishap another marvel occurs: the pollen masses while still in the anther have a more or less erect position, but no sooner are they removed than they change their position, they bend downwards or sideways, at any rate in such a way that, when the insect visits another flower, these pollen masses instead of knocking up against the anther, fall against the stigma—the very place where they are required to ensure the fertilisation of the seeds.

All this is not new to botanists, and the general public, even, has become somewhat familiarised with it from the interesting researches and experiments of Darwin. No amount of familiarity, however, can lessen the marvel of adaptation as here presented to us. But this is a part of the subject to which our limits will not allow us to allude further. We must go back to the column. Instead of being composed of one stamen and one style, as appears to be the case, it is really made up of six stamens and three styles. Of the six stamens five are usually undeveloped, one only coming to perfection; the others present only traces of their original existence to the scrutinising eye of the botanist. No ordinary observer without special means would detect them. In *Cypripedium* two of the stamens are developed, and so we have an anther on each side of the column. Of the three styles one only is developed, and it needs the special opportunities of the botanist to find the two others.

It may, therefore, be said that in an Orchid there are, potentially at least, fifteen parts in five rows of three each—three sepals, three petals (including the lip), three outer stamens, one only of which is fertile, three inner stamens (all abortive, except in *Cypripedium*, where two are fertile), and three styles. Of the presence of these three latter organs any one may convince himself by cutting across the ovary, when the threefold placenta on which the ovules are attached will at once show the existence of three "carpels," consolidated into one ovary and one style.

The highly irregular flower of an Orchid is, then, not so irregular as it seems. The individual flower,

however strange it becomes hereafter, begins by being nearly regular in the form, size, and disposition of its parts. The baby Orchid flower is nearly, but not always, regular; it is only as it grows on to maturity that the changes occur which render the adult flower what it is, and which enables it to be fertilised by insect agency, as we have just sketched out.

#### ANCESTRAL STATE.

As the baby flower is so nearly regular, we assume, with a near approach to certainty, that its ancestors were regular also; and we assert, though we cannot prove it by direct means, that the Orchids, with all their present irregularity, are descendants from an

flowers as *Thelymitra*, *Oncidium candidum*, or *Tetramicra*, where the flower, as regards its perianth, is regular, and in which the lip is either no bigger and no different from the other petals, or only very slightly so. These are normal flowers; they are not sports; and, from our point of view, they ought to be looked on with great respect as "survivals," showing what the Orchids of the past were like. Every now and then a flower is produced on a *Cattleya* or other Orchid which shows the same thing. For some reason or other—why, we generally cannot tell—the lip, instead of running off into strange forms, is developed in a regular way, and is thus said to "revert" to the primitive simplicity. Fig. 110 shows an instance of

FIG. 108.—FLOWER OF *LÆLIA*, TO SHOW ITS PARTS.

earlier simpler type—the same, in fact, as that from which Irids and Narcissus and Amaryllids have descended, while they in their turn are the modified descendants of still simpler types, such as Lilies and Rushes. Those to whom these propositions are new, may regard them as much too wonderful to be true, and require to be furnished with evidence. To this very natural requirement we must refer them not only to the teachings of anatomy, morphology, and development—matters we cannot possibly enter into here—but to the evidence afforded by "sports" and "double flowers," which alone we can deal with, and then of course only in outline.

In the first place, attention may be directed to such

this in *Cattleya pumila*. Such a flower, we might imagine, would offer less facilities for cross-fertilisation by insect agency, so that in course of time, by selection, we might get a close or self-fertilising flower.

#### PELORIA.

Be this as it may, such flowers as we are speaking of illustrate the possible regularity of Orchid flowers, and are instances of "regular" Peloria, in which a habitually irregular flower becomes regular by the decrease of its irregular parts—by reversion, in fact. The opposite condition, in which the flower becomes regular by the increase in number of its habitually irregular parts, is shown in fig. 111 wherein the two

side petals are shown as brightly coloured as the lip. Lately a variety of *Dendrobium nobile* with the lateral petals as bright coloured as the lip was shown, and sometimes one meets with flowers of *Cypripedium* with three lips, arising from the presence of two additional lips, yet not additional, as they are only extra developments of the lateral petals.

Some of the five missing stamens are sometimes developed, and I have elsewhere given a list of cases known to me in which, in some cases, two, three, or in one or two cases, all six stamens were present.

#### PETALODY.

A petalodic condition of the stamens is not uncommon; the missing stamens, indeed, frequently present themselves in the guise of petals. One of the most remarkable cases of this kind is figured at fig. 112, p. 601. *Cypripedium* have two of their three sepals joined together, so that it appears single, s 2, while the upper sepal, s 1, is free. In addition, they have two petals, p, p, one lip, l, and a column bearing two side anthers, a barren rudimentary anther, in the form of a shield, and a stigma. In the flower now figured (fig. 112, p. 601), and which was kindly sent by T. B. Haywood, Esq., the sepals, s<sup>1</sup>, s<sup>2</sup>, the petals, p p, and the lip, l, were normal, but the column, instead of its usual form, was split into five petals. On examination of their relative position it was seen that one of the outer stamens, a<sup>1</sup>, was present, the other two being absent; all three of the inner stamens, a 1, a 2, a 3, were present—the last, it is

FIG. 109.—COLUMN OF VANILLA.

a, Anther; r, Rostellum over 2, the stigma.

worth note, being in the form of a lip partially concealed within the true lip. One of the styles, G<sup>1</sup>, was also present as a folded petal at the top of the flower, the other three being absent. Here, then, we have clearly a semidouble *Cypripedium*. In this case, although the ovules were formed, there was no pollen and no true stigma, so that it would be hopeless to propagate by seed, but possibly the plant may next season produce other flowers less fatally affected, and from these in time a double-flowered race of *Cypripedium* might be obtained.

The earliest double-flowered Orchis on record is that of *Orchis mascula*, in Jacob's *Plantæ Faver-shamenses*, 1777. This case, together with other more recent specimens sent by the late Dr. Moore of Glasnevin, has been considered at length by the present writer in the *Journal of the Linnean Society*, vol. viii., p. 207, and vol. ix., p. 347. Not to weary the reader with detail we must here merely mention that we every year receive numerous specimens of great interest as showing the true nature and history of the flower, and as the forerunners of a race of double Orchids—whenever the gardener sets to work to ensure their production. Whether they would be any improvement æsthetically, is another matter. We don't think it would, but when fashion rules, taste has to take a second place. M. T. M.

**BAD WEATHER IN ST. PETERSBURG.**—Our correspondent says that after some days of fine weather winter has again set in, and on April 30 there was an inch of snow on the ground.

## Orchid Notes and Gleanings.

### CATTELEYA SKINNERI VAR. ALBA.

A PLANT of this rare variety of the popular old *C. Skinneri* is now in flower at Kew, and is exceedingly beautiful. Although introduced into English collections by the Messrs. Veitch in 1877, the white-flowered form has continued to be extremely rare, importations of it invariably proving a deception to those deluded into purchasing the plants before they have been tested in this country. In Costa Rica and Guatemala, where ordinary *C. Skinneri* is said to be very abundant, the white-flowered variety is said to

surface smooth and slightly glaucous. From the base of the plant a short decumbent raceme is produced, which bears four flowers clustered together, and which are more like *Saccolabium* than *Sarcochilus* flowers. They are an inch long from the top of the hooded dorsal sepal to the base of the curiously formed saccate lip, and are creamy-white, with a faint tint of purple about the mouth of the pouch of the labellum. This pouch is compressed, and about its mouth are three horn-like processes, two lateral and club-shaped, and one in front and pointed. Judging from its name it is probable this species was brought home by Lieutenant Berkeley, who visited the Andaman Islands a few years ago and brought back with him some good Orchids. Most likely "the Professor" knows the history of this plant, which is very distinct from the Australian *Sarcochilus* (S. Fitzgeraldi and S.

FIG. 110.—REGULAR FLOWER OF CATTELEYA PUMILA. (SEE P 596.)

occur only very rarely. The Kew specimen was obtained from the former country two or three years ago, and is now flowering for the first time. It is a small plant, having six pseudobulbs, the largest a foot high, and bearing a raceme of six flowers. These are pure white, except for a small purplish blotch on the spreading portion of the lip, a tinge of pale sulphur on the lower part, and a blotch of dark purple inside the lip at the base of the column. Not every one of the "albinos," for which high prices are paid, can be said to have any particular charm except whiteness and value in the Orchid market; but this white-flowered variety of Skinner's *Cattleya* is a charming thing, and would be considered so if it were as plentiful as the type is at the present time. W.

### SARCOCHILUS BERKELEYI.

This is a small but pretty Orchid, now flowering at Kew, the name of which appears to be as yet unpublished. The plant is about 2 inches high, and bears three leaves, which are 3 inches long by three-quarters of an inch wide, the tip unequally notched, and the

Hartmanni), and which, whatever its name, is a charming little Orchid. At Kew it is growing in a bunch of Fern-stem fibres, with a piece of sphagnum in the middle, and hanging in a warm house. W.

### PONTHIEVA MACULATA.

In addition to the singular structure and pretty markings which are found in the flowers of this rare Orchid there is the character, not common among Orchids, of hairiness, the whole plant, including flower-stalks and flowers, being clothed with long soft hairs. There is a striking absence of hairiness in the Orchid family, at least among those cultivated in gardens; in fact, if we except one or two *Erias*, only met with in botanical collections, this *Ponthieva* is the only garden Orchid with a distinctly hairy character. The Kew specimen of this plant is now bearing four flower-spikes, one of which is 18 inches high, and bears about a score of flowers, the form and variegated colours of which are very attractive to all except those connoisseurs whose standard of beauty stops at *Cattleyas* and other "big" flowers.

I heard from Herr Wendland a short time ago that in his garden at Hanover he had large pans of this plant growing quite thirty years back. Large quantities of it were imported at that time by M. Linden, and no doubt the figure of it which appeared in the *Gardeners' Magazine* about that period had been obtained from some Continental source. For its cultivation *P. maculata* requires a position near the glass in a Masdevallia-house; in a warm house it will not thrive. It likes plenty of water when growing, and a short period of drought after it has flowered. *W.*

#### PACHYSTOMA (IPSEA) SPECIOSA.

This pretty yellow-flowered *Bletia*-like Orchid has been in flower at Kew for several weeks, and is still to be seen in perfection, like the *Spathoglottis* and some of the *Bletias*, such as *B. Shepherdii* and *B. hyacinthina*, it thrives best when allowed to rest for two or three months after flowering, and to afford this rest it is a good plan to place the pans in which the tubers are planted on a sunny shelf in an intermediate-house, allowing them to remain till they show signs of new growth, when the tubers (really underground pseudobulbs), should be repotted into a compost of sandy peat with a good layer of drainage beneath. If placed in a moist tropical temperature and kept well watered the erect flower-scapes are soon developed, generally two flowers being borne on each scape. These flowers are 2 inches across, and are composed of rather broad sepals and petals, and a broad three-lobed scoop-shaped lip, upon which are several ridges coloured red, the rest of the flower being golden-yellow. *P. speciosa* is a native of Ceylon, from whence it was first introduced into England through Kew, Mr. Bateman being the first to flower it in 1868. Since that time plants of it have frequently flowered at Kew, as well as in other collections, but it is still a rare plant in gardens, though plentiful enough in some parts of its native country. *W.*

#### TREATMENT OF LÆLIAS.

I have much pleasure in noting the treatment Mr. Crawshaw adopts with his *L. anceps*, and congratulate myself on having hit on a somewhat similar method. To commence with, I selected what looked to me promising samples of *L. anceps alba*, *L. Sanderiana*, *L. Stella*, and *L. Schroederiana*, from the St. Albans importation, and from Messrs. Carder's a mass full of green leaves—in all sufficient to make 139 lots; these were carefully cleaned, all decayed or damaged parts cut away, and each one washed in a bath of tepid water. A somewhat curious circumstance had occurred with a lot I acquired about a week prior to this. Being short of room my gardener suggested we might for a few days place the imported *L. anceps* between the stages on a layer of shells. This was done, and, much to my surprise, I found the bulbs at once plumping up and the roots starting so freely that I determined to try the same method with the *L. anceps alba*, and I think the result has shown the correctness of this decision. Out of the whole of my purchase not one has failed to start. I found the *L. Schroederiana* much more shy in starting than the others; but on one piece of *L. Sanderiana* I have twenty-four breaks, of which nine are back ones, and roots 7 inches long. The growths on the lot are from 2 to 6 inches long, strong and healthy. I was so satisfied there was some "winkle" that I tried some imported *O. Edwardii* and *O. Klabochorum* (which I have previously had some trouble to start); I also placed *Cattleya Lawrenceana* on the same stage, and obtained the same result as with the *Lælia* anceps. We syringed the *L. anceps* freely while on the stage. On removal they were placed in baskets close to the glass, and kept at a temperature of 65° to 70°. Now, as to the construction of the house and stage on which they started. This house has three-eighths hammered glass from floor-line to underside of stage sill, four rows of 4 inch pipes, the two upper rows with evaporating troughs 9 feet long, 16 inches below the stage. The bottom stage is made of 1-inch boards, 3 feet 4 inches wide, with a layer of shells on top. Above this is the *Phalenopsis* lath stage, the lowest lath being 8 inches above the shell-covered stage, and rising back to the side of the glass 5 inches at a time. The back is of 21-oz. sheet-glass, so that we have the full light always, except when it is necessary to shade the house. Free ventilation is given, and a small spray of water constantly playing in the tank. This makes the atmosphere always feel soft and humid, and the plants appear perfectly at home

in it. I trust other lovers of Orchids will give you the results of any more successful methods, so that we may gain more wisdom and pleasure in the cultivation of these beautiful flowers. *R. H. M., The Woodlands, Streatham, April 25.*

#### PHALÆNOPSIS PARISHII.

Although wanting the size and gracefulness which characterise the large-flowered section of *Moth Orchids*, this species has much beauty to recommend it, as well as its free-flowering and free-growing habit when intelligently cultivated. At Kew there are several pans and blocks of it now bearing their little clustering racemes of white and rosy flowers, those in pans looking especially happy, the flowers being surrounded by foliage and green sphagnum, and the whole having the appearance of a nest of pretty-headed birds. The flowers are placed thickly together upon the spikes, which spring from the base of the very short stem. The ovate, pointed, glaucous-green foliage forms a pretty contrast with the flowers. Like all the *Phalænopsis*, this species requires to be kept continually moist, and thrives well if planted in sphagnum, with a few pieces of charcoal among it. Although said to be from regions less hot than the homes of the large-flowered species, yet *P. Parishii* appears to prefer as much warmth as they when in cultivation; at all events, this is borne out by what is done at Kew, where this little Burmese species is to be seen growing and flowering every year. Under the same treatment some healthy specimens of *P. Lowii* are also to be seen at Kew. *W.*

#### PHAIUS MACULATUS.

This is an old garden plant, having been introduced over fifty years ago, and since then for a long time cultivated under the names of *Bletia Woodfordii* and *Bletia flava*. It belongs to the large growing, free-flowering species of *Phaius*, represented in the well-known *P. grandifolius*, but owing to its having been treated as a tropical Orchid it was rarely seen in good health. Grown in a cool Orchid-house it is, however, an ornamental species, both in its spotted foliage and in the large yellow handsome flowers, which are produced on erect scapes. In the Kew collection there is now a specimen of it with five stout flower-spikes, each bearing from ten to twelve flowers, which are about 2 inches across, the petals and sepals overlapping each other, and partly surrounding the labellum. The margin of the latter is crisp, and rosy-red in colour. *P. maculatus* is a native of India, from whence are obtained all our garden *Phaiuses* except the beautiful *P. tuberculatus*, which is a native of Madagascar. At Kew the genus is represented by flowering specimens of *P. Wallichii*, *P. grandifolius*, *P. (Thunia) albus*, and *Marshallii*, and the above; whilst plants of the rare *P. bicolor* are rapidly developing flower-spikes. Last year this species continued in flower nearly six months. It is the plant which was shown some time ago under the name of *P. luridus*. *W.*

#### CYMBIDIUM LOWII.

A fine specimen of this distinct species is now in flower at Gunnersbury Park. It has thrown four spikes of flower; one contains twenty-four flowers, the other three twenty-three each—ninety-three blossoms in all. It is a fine plant, well grown and bloomed, but the individual flowers fall far behind those of *C. eburneum*, blooming by the side of it. This is one of the most chaste and beautiful of Orchids. *R. D.*

**THE DEMAND FOR TIMBER.**—The continuous extension of railways in different countries causes an immense demand for timber. The sleepers, or "ties," as they are termed in America, vary in dimensions according to the gauge. They range from 10 feet x 10 inches by 5 inches on the broad gauge to 6 feet x 6 inches by 4½ inches for the narrow gauge. They may be taken, however, to average 9 feet long by 8 inches by 4 inches (or say 3 cubic feet). Assuming the distance apart at which ties are placed at 3 feet, this requires 1760 ties for each mile of single line. The average duration of ties appears to be from five to seven years; therefore one-seventh, at least, of the original number of ties must be supplied every year. The railroad companies in America almost invariably require young and growing trees, such as are large enough to make one tie for each cut. Trees of this size will not average more than two cuts each; consequently the construction of the existing roads in North America alone must have taken 90,178,880 trees. *P. L. Simmonds, in "Journal of the Society of Arts."*

## NOTES FROM A BUCKINGHAMSHIRE GARDEN.

APRIL 3.—

"'Ay, there's easting in it,'  
The white-haired sailor said,  
As he looked on the sweep of tossing grey  
And the flying flakes of snowy spray,  
Wind-borne o'er the great pier-head.

"'Ay, there's easting in it,'  
Said the herd, who his moor-watch kept;  
'The lambs crouch clustering under the Oak,  
And last night a sound like sea-waves broke,  
As the wind my turf-walls swept.' "

Yes, "there's easting in it," this dry hard day, under the hard pitiless blue. Day after day, a cold sun shines down upon the parched and dusty world. The sun shines, but there is none of the sovereign delight of sunshine. The sky is as steel and brass; the grass is white with frost morning after morning, and there has not fallen one April shower to set the sap running within the black bare trees and loose the young leaves and blossoms bound up within their hard buds. There is no life in the fields, no balm in the air, "nothing grows," as the saying is. Everything looks pinched and unhappy, and I thick no living thing enjoys the east wind, except, perhaps, the skylarks. They, dear souls, spring up and glory in the open heaven above them. They rise quivering and carolling up to the very gates! Doubtless they in their joy are singing "Blow thou wind of God!" How beautiful are the Daffodils just now; and how their pure cold yellow seems in harmony with the freezing sunshine! But they are none the better for it, and never were there so many imperfect, unaccomplished flowers among them. One or two in almost every clump come uncomfortably green, or open unkindly, and as if they could not make up their minds to be either good green leaves, or fair yellow flowers! These unhappy ones are rather amusing, but they are certainly very ugly: "there's easting in it." The great mass of Daffodils, however, were never finer. I am comparing the common single long-tubed Daffodil, *Telamionus plenus*, with Sir Watkin. The former would surely be thought almost the handsomer of the two, but for Sir Watkin's star-like corolla and erect carriage. Our cernuus, a new possession, is in bloom: it seems almost too delicate for the open border. But in the Bocage, there grows the joy o' my eyes, a lovely group of cream-white Daffodils! On the grass in the Orchard, a brilliant multitude of all sorts have succeeded the Crocuses. Some are wild, transplanted hither from the sweet wild meadows of Derbyshire. They are modest little things, most palely delicate in colour, their bent heads all turned one way, south-east. There is something peculiarly neat and pretty in the half-opened bud, the long tube being fulled round the edge as if drawn in by a thread—a bit of Dame Nature's neatest needlework! We are trying these wild ones also in a garden border, but I do not expect them ever to double. The single long-tubed Daffodils never have doubled in this garden, though they grow as at first planted, both separately, and mixed in the same clumps with the double ones. Hardly one of my favourite star-shaped, short-cupped single Daffodils remain now unspoilt. They go on doubling for ever! In the broad new border 'of the Bocage and in the Fantaisie, heavily scented Jonquils flourish in perfect peace, their deep content plainly visible, as it always is with some flowers. "Blue Roses" would give one little pleasure; but how exquisite is the idea of a White Jonquil. There are times when I am possessed with the wish for coloured flowers to be white. A white *Camellia japonica*! a white Chinese Currant! At this moment, however, a crowd of pure white Daffodils is the desire of my heart. In the garden of that castle in Spain there shall be a long green walk, bordered thickly on each side, under the Pomegranate trees, with white and golden Daffodils, both single and double!

Here we have only a short grass walk, where one passes through the shimmering pink of large bushes of Chinese [? Californian] Currant (*Ribes sanguineum*). As yet they are only in rosy bud; but there is something fairy-like in the extreme lightness of these interlacing branches, tipped with clustered points of pink; it is better than when the flowers are full, for then a little green begins also to show and there is something gone from the beauty of them. Better still than the magic of this roseate mist, there is a certain sweet and

silvery charm begun to spread over all the garden, quite low on the ground, almost noder foot. The seeds may have lain there long, first carried by the birds, perhaps. We have never before observed this overspreading of white Violets. In every corner where there may be any little bit of border not dug, under trees, even niched into the walls, in all parts of the garden are white Violets. We should not be content with always white instead of purple; but yet there is some kind of strange little spell about the white, so that sometimes I am compelled to put on my hat and hasten out into the garden, just for a moment's look at their fresh pleasant faces, and to inhale their scent. There is no "easting" in their perfume, whether they come white or blue! and indeed I think these white Violets must be here "for luck." It matters not if we have to-day's chill sunlight, or if a black north-easter blows, the silvery Violet patches shioe on unheeding in serene and genial lowliness. Ah, how ungrudgingly would we not—if this might be—pass them on into the grey life of one or two, to cheer them for a space, when they sigh, "Ay, there's easting in it," . . . sighing sadly

"O for the perfect work of time;  
O for the other shore!  
Where the riddles of years are read at last,  
And the east wind blows no more."

Violets are very little flowers, but somehow there's much to say about them! Under a sunny hedgerow of the Walk meadow blue and white Violets grow together, with a third kind in which the blue seems to run into the white; white Violets dashed with blue or lilac. And two or three years ago under another quickset hedge in our lane I scattered some seeds of purple Violets for the delight of our village children, or for any little wayfarers in the spring. The seeds did not seem to come up, and I forgot all about them till the other day, when I saw, with great satisfaction, a little boy and his big brother happily engaged gathering dark Violets under the barren hedge, and making them up into posies with a few scant early Daisies. I sowed many seeds that year along our dull roadside banks—common things that might well have grown, and I counted on the children's pleasure and surprise when they found such lovely things in bloom—there were Campanulas and Stocks and Poppies, Snapdragons, Primroses, Foxgloves, and yellow Broom, and Virginian Stock. But never a plant came up, excepting just one Foxglove, whose fine spire of buds was untimely plucked—and now the Violets.

I do not know if the east wind has to answer for our Forget-me-Nots coming red. Most of the blue is more freely mixed with pink than usual, and one root, under a Chestnut tree near the watercourse, has fairly gone into deep crimson. If the seeds can be saved, we might possibly get from them a new variety. But a crimson Forget-me-Not would be unpoetical, and unreal, and like the dark blue which appeared a few years ago, interesting only as a curiosity. There was some failure in the seed last year, so that our *jaire of turquoise* will not this season be quite so extensive as usual. Brilliant and close-flowering, however, as our garden Myosotis is, the pleasure of it never could compare with the image, glassed I suppose in almost every mind, of the clear quiet pool, set in some sequestered meadow, on whose green margin grew the blue Forget-me-not. Or of the place where it bloomed just out of reach in the little stream among wavering weeds, shedding starlets of Heaven's blue upon the water, under the Willows. Those were the real *Vergissmichnicht* of our youth, and when we sat on the bank beside them, or wet our feet in gaining difficult possession of them, we thought upon the dear old half-sad, half-foolish German romance,—but never remembered in the garden!

April 13.—At last a gracious rain has fallen. A sort of quickening thrilled at once through all the garden, and now the grass gives out a green answer to the precious drops. There is to-day, at the southern end of the broad walk, in the untidy—because too full—border facing the east, a new beautiful colour of Pæonies in their first young growth. I do not remember them before the rain; now the strong healthy stalks pushing up above the ground are a full crimson red. The colour is so vivid, it almost has the effect of some strange flowers seen from a little distance. At the opposite end of the walk the Onion flavour of the Crown Imperials is not so unpleasantly perceptible as it sometimes has been. I remember it was long before we discovered the source

of the strong odour pervading that part of the garden. Not an Onion anywhere near, there seemed nothing to account for it. Gerard says, "the whole plant do savour or smell very like a fox." I think we may well forgive our Crown Imperials their smell, however, for the stately show they make; and if taste and fashion did not change with flowers as with other things, they might still be among the choice favourites of spring. Ours ought to be somewhat taller, a fine Crown Imperial should rise so high that a little child might stand under the yellow bells and look up into the moonstone circlet within; for "in the bottom of each or these bells there is placed six drops of most clear shining sweet water, in taste like sugar." In another place are also saffron-coloured Crown Imperials, coming into bloom. They are commoner and less beautiful than the yellow.

I never dwell upon failures in the garden: they are never many, and are soon forgotten. Here may be the place, however, to record one small disappointment. Round the stone floor of the garden porch we had made an outer rim of gold and silver Thyme. The intention was that with every passing step, crossing over to the gravel, or with the sweep of a trailing gown, should arise sweet thymy odours on the air. But the thing did not succeed. The gold and silver Thyme all died away before any one had enjoyed it much. And yet perhaps the idea is worthy of another trial. Perhaps Thyme or wild Mint might be induced to grow upon the lawn, and in the mowing or the treading it would smell deliciously. A trimly shaped Rosemary in bloom is about as pleasant a sight as can well be seen on an April day. The "sweet gaping flowers" of bluish-grey, set not too thickly among the dark green narrow leaves, give such a sense of neatness; they look so clean and cool, that the wonder is the sweet-smelling shrub should not be a greater favourite. Two hundred years ago it seems to have been planted in every garden. Then there were gilded Rosemarys and Rosemary of the poets, and several wild Rosemarys—all grown for physical or civil purposes. It was used at weddings and at funerals, and a bundle of it was a welcome gift bestowed upon friends. Where Rosemary flourishes nigh the house, there the wife is said to rule. It is by no means for any such reason, however, that so shapely and fine a bush of it grows beside our south porch! It is because it worships the sun, and when the sun shines the bees are about it all day long. E. F. B.

## COVERING UP ORCHIDS IN WINTER.

WE are so accustomed to see our Orchid-houses devoid of all covering, albeit the thermometer in our capricious climate may sometimes register 32° of cold for some few days in succession, that we do not consider how our Orchid growing friends on the Continent have to contend in some parts with Arctic cold for periods of from three to six months together. In such countries the contrivances employed are not for use to-day, to be thrown aside to-morrow, but are made to bear much hard usage, and to keep out several degrees of frost by themselves alone. The usual method of "covering up" is by means of board shutters of 1½–2 feet in width, the length being usually that of the roof, at the apex of which is a weather-board, underneath the overlapping part of which the protecting shutters are shoved. Should a house have a sunless or northern slope of roof, that is kept covered throughout the cold season, and is usually protected further by a layer of straw mats next to the glass; but not in all instances, for should the slope be of no great length, and the roof be a well made and strong one, the snow is permitted to lie on it about a foot in thickness, forming an excellent blanket against further ingress of frost. On this sunless side it will rarely thaw, so that the shutters could not be removed even if it were desirable, every part being fast frozen. The shutters on the sunny side get thawed early in the morning, if the sun should shine, and as soon as that has taken place they are removed by sliding them downwards, with their lower ends resting on the ground; or they are laid alternately one over the other, so that at least one half of the sunny side gets opened to the light. In snowstorms happening during the day-

time the coverings are kept on entirely, or if it should occur that these are withdrawn before the storm they are at once put on at its approach. It will be readily understood by those accustomed to stoves and forcing-houses that these roof coverings keep up a genial heat and a pleasant moist atmosphere within the house, owing to the warmth of the glass preventing all condensation of the water that is present in the air, and the temperature will remain steady at any given degree without involving any great amount of care on the part of the stoker.

It is necessary that all plants therein should be brought well up to the light either by hanging up the plants or by other means. The principal thing that is observed is not to use any more moisture about the house than is requisite to prevent the air from becoming dry, not to water the plants themselves more than is necessary, and keep the temperature during the night at 58° to 60°, with a rise of 10° to 15° in the daytime. M.

## FORESTRY.

### WOODLAND WORK.

GRASS seeds may still be sown on woodland drives and bare places, and afterwards rolled down. Wood hedges will now require their annual renewal before stock are turned into the adjoining fields. This should receive immediate attention, as if cattle or sheep once find their way into the woods the prevention of trespass is no easy task. Clean and loosen the soil along hedgerows by hoeing or light digging, which will much enhance their value as woodland fences. This will be found a suitable time for improvements or corrections of drainage, as damp places will now be readily detected. The pruning of evergreens should be finished early in the month, so that borders and lawns may be put in order, and walks receive their final gravelling and rolling.

Remove broken or twisted branches from such trees as are visible along the margins of woods from drives and walks. Plantation gates should now receive their annual renovation in the way of repairs and painting; wire fences may also be tarred, as well as tree-guards, pailing-fences, wire-nettings, and forest sheds. Oak timber after being barked should be removed from the woods, as delay is dangerous to the young coppice wood. The branches may be cut up and faggoted previous to removal. About the end of the month is generally the best time for budding trees, as the young bark then rises freely and is in the best state for manipulating, and the buds "take" quickly while the sap is well in motion. The ties which secure the buds should, in about a fortnight after the operation has been performed, be slackened and retied, as they are liable to become too tight, thereby injuring both stock and bud. In most cases the bud will have "taken" in about a month, when the ligatures may be entirely dispensed with.

Foresters who have charcoal to make should lose no time in setting about the work, as considerable advantages accrue from having long daylight while watching the kilns. This operation necessitates the carting in of a quantity of peeled Oak for charring purposes, which work should be well in hand previous to the men commencing their first kilns. Advantage should be taken of dry weather during the present month to get all Oak timber carted to the saw-mill, for, as they have often to be dragged a considerable distance before being laid on the cart or waggon, if done in wet, slushy weather, the trees get covered with gritty mud, which tells disastrously on the saws when the trees are being cut into boards.

### GENERAL WORK AND NOTES.

During dry, warm weather the tarring or varnishing of wood or iron fences should be proceeded with, as at such a time the tar is absorbed more readily, and the fences are consequently better fitted to ward off the attacks of rust or decay.

It should not be forgotten that in many parts of the country young plantations suffer severely from an overgrowth of rough vegetation, an evil which can be easily remedied during the latter part of the present month by attending to the worst places, and cutting off the tender tops with a hook or scythe. Hoe and clear carriage-drives and walks, at the same time preserving an equable surface for comfort in walking or driving.

In this district vegetation is generally ahead of what it was at the same time last year. The Larch, Horse-Chestnut, Maple, and Sycamore are already in leaf, soon to be followed by the Beech, Lime, Elm, and Oak, which are well furnished with plump, healthy buds. Seldom indeed have we seen such a gorgeous display of early-flowering plants as during the past two months. The *Laurustinus*, *Daphne Mezereum* and *D. laureola*, *Berberis Darwinii*, *Mahonia Aquifolia*, *Pyrus japonica*, *Forsythia viridissima*, and *Jasminum nudiflorum*, have been a complete blaze of colours, and are all well worthy the attention of planters for placing in the more prominent positions alongside drives and walks. *A. Webster, Penrhyn Castle, North Wales, April 28.*

## ORCHIDS IN LONDON NURSERIES.

THE large establishments for Orchids both in and around London are now gay with bloom, and any visitor to the "Conference" from a distance will be highly gratified by a visit to a few of the principal emporiums, most of which are within easy distance. Should such visitors not have seen any of them previously we predict an agreeable and instructive surprise for them, as all have extensive collections and each has distinctive features, of which nothing but a personal inspection can give a true and fair idea. All that we can do is to give a general idea of the plants that are now in bloom.

MESSRS. J. VEITCH & SONS.

The house that most visitors to this nursery of well-grown plants like to see is the new Cattleya-house that was finished in 1884. The cultural advantages of this large structure have fully vindicated themselves, so that plants which were formerly kept alive with difficulty in other houses, grow and flower abundantly in this one, and it is found that the important conditions of steady warmth of any required degree, and of an equally steady amount of moisture, are far easier of attainment than could possibly be the case in small houses, and there is, moreover, a sweetness, buoyancy, and a total freedom from stuffiness, in the air, thereby approaching the state of an out-of-doors position in a warm country.

There are a great number of very fine specimens in flower of *C. Mendelii*, most of them showing points of difference in form and colour, some being of extraordinary richness in lip tints; the rosy-purple *C. Skinneri* is likewise found in a few flowering examples, and many *C. Mossii*. *Lælia purpurata* is in fine abundance, and forms decidedly one of the leading features amongst those in bloom. This species is found to succeed here without check.

The small show-house, where the visitor has an opportunity of seeing the cool section of Orchids massed together, is more than full of *Odontoglossums*, *Oncidiums*, *Masdevallias*, &c., the front stage holding those at present in full bloom, whilst the back parts of the house contain the succession plants. The *Odontoglossums* are doubtless the pick of the collections, and beautiful indeed they are—*Andersoni*, *Pescatorei*, *cordatum*, *Halli*, *triumphans*, and others; the pretty *O. Humeum*, with a white lip and the markings of *O. membranaceum*. *Masdevallia Lindenii* *superba* is very rich, and is certainly an improvement on *M. Lindenii*. Many fine pieces of *Oncidium Marshallianum* lend a touch of rich colour to the whole. *Calanthe masuca*, of pale lilac with a lip of yellow, is a conspicuous plant, as is *Odontoglossum maculatum*, of the *O. Rossi* section, and which bears blossoms that have great lasting properties.

The Vanda-house contains a gem in a large plant of *V. cœrulescens*, with seven fine spikes. This plant is so distinct in habit, if not in colour, from *V. cœrulea*, that it is a pity it is not more commonly grown. *Chysis Limminghi* is nicely in bloom, the brown, yellow, and purple tints in the flower making a very attractive example. Many *Vandas* are in bloom or showing for bloom, such as *V. teres*, *V. suavis*, and *V. tricolor*. Of *Dendrobiums* there were numbers of thyrsoiflorum loaded with bloom, strong and showy to a degree. The striking white *Dendrobium Fitchianum* (*barbatulum*) has several spikes open on various plants. *Dendrobium macrophyllum*, a Javan species, with erect racemes of flowers, the sepals yellow, shaded with green, and petals white, and the yellowish-green streaked with purple, is also in bloom. Amongst *Phalaenopsis*

the richly tinted *Luddemanniana*, *Sanderiana*, and *Brymeriana* (*Portii*) may be seen in flower.

A plant of *Coelogyne Massangeana* with two massive racemes, and one of *Chysis bracteescens*, with two spikes of bloom, are interesting plants in one of the houses, as is a strong plant of *Lycaste Skinneri* *labellum*, remarkable for the rich colour of the lip, which is of richest crimson. A few *Cypripediums* were still in bloom of the *barbatum* section, and *C. ciliolare*, *C. niveum*, and others.

Of new Orchids raised from seed, and to which naturally much interest attaches, botanically as well as commercially, we were fortunate in seeing *Cypripedium tessellatum* *porphyreum* × *barbatum* and *concolor*, the former being the seed bearer; *C. microchilum* × *Druryi* and *niveum*, the latter the seed bearer; another was a × *longifolium* and *Schlimii* *album*; *C. Mastersii*, a species from Java, but which came from Kew, was in bloom, the cupped green hood (dorsal sepal) broadly and distinctly margined with white, greenish-brown pouch, and darkly marked sepals borne on a hairy petiole of a dark colour, marking it out as a remarkable flower, if not a particularly handsome one. A fine *Chysis*, named *Chelsoni* × *bracteescens* and *Andrea*, the ground colour

those of *S. curvifolium*; *Masdevallia peristeria*, with a dove-like form of bloom; *M. Schlimi*, of rosy-brown and yellow—a distinct kind; *M. splendens*, a rich coloured flower of the *Harryana* section, and a variety producing a large quantity of bloom simultaneously; *M. trochilus*, *M. acanthifolia*, a rosy-purple—one of the freest flowerers; *M. conchiflora*, a handsome cupped crimson.

*Odontoglossums* are very abundant, and consist of many fine species and varieties, very pretty, being *O. citrosum* *carneum* *superbum*, a great improvement, if we regard colour, on *O. citrosum*. *O. crispum* show many pleasing and massive spikes, in which there was much deviation in size and tints. These plants are disposed generally through the house, and are sometimes placed in little groups, this being an arrangement often adopted with small growing things, as *Odontoglossum Rossi* *major*, *O. membranaceum*, *Sophranites grandiflorum*, and others. One of the finest plants of *O. Pescatorei* in the country is carrying a splendid crop of spikes; the newer importations of this species show finer qualities as regards colour and form than the older ones. *O. citrosum* *superbum*, *O. triumphans*, *O. Halli*, and *O. Ruckerianum*. A new *Odontoglossum* resem-

FIG. III.—A REGULAR-FLOWERED LÆLIA. (SEE P. 596.)

REFERENCES:—C, Section of column along the line A B; D, Section lower down; E, Plan of Flower.

being pale yellow, spotted red and brown. Several *Phalaenopsis* were bearing seed-pods, *P. rosea* being usually made use of as the male parent.

### MR. BULL'S NURSERY, CHELSEA.

The display of Orchids during the early summer months, which has now become a regular occurrence at this nursery, is if possible finer than that witnessed last year, whether estimated by the number of plants of choice species and varieties or by the excellence of the plants themselves. The arrangements, which must have cost no small amount of trouble, indicate excellent taste, and show the teachings of experience, consequently with results that strike the observer as being very pleasing. The centre table, running down the length of the span-roofed house, has a row of plants, consisting of *Palms*, of which a nice piece of *Phœnicophorium seychellarum* faces the visitor on entering; *Philodendron nobile*, *Anthurium Veitchii*, *A. elephantipes*, both with beautifully developed foliage; and *Ferns*. These plants, standing in a line, divide the house lengthwise into two portions, and serve as a background for the flowers.

Of new and comparatively new introductions may be noticed *Saccolabium miniatum* *citrina*, with orange flowers, and shorter and blunter leaves than

being *Andersonianum* is a gem, as is likewise *O. gloriosum* *pretiosum*, with a rich yellow ground colour and crimson spots. Several other new *Odontoglossums* are to be seen of pleasing tints, notably *O. bellinum*, with a white lip and a dark large blotch on the sepals and petals, the tips being greenish. The *O. vexillarium*, of which this nursery possesses so many, are to be seen in great numbers, and show some striking variations in colour and dimensions of flower—one named *Chelsoni* showing a very deep rose tint, with the uncommon width of 4 inches across the flower; another, named *giganteum*, was still larger. These varieties of *O. vexillarium* form the chief feature at the entrance to the house. The long-blooming *Calanthe veratriflora* is observed in several examples, one plant having thirteen robust spikes; *C. Domia*, resembling *C. masuca*. *Cattleya Mendelii* is conspicuous by the rich colours of the different varieties, especially *C. M. pulcherrima*, a pale kind; as are also the plants of *C. Mossii*, that are in great numbers. A fine plant of *C. amethystoglossa* stands at one end of the house, and compels attention; *C. gigas* *imperialis*, a grand bloom, with rosy-mauve petals and sepals, and a large expanded labellum of deep crimson; *Lælia hesperia*, of pale creamy-white, with a white lip and tube, some purple

stripes going right into the latter, had several fine blooms open; *L. elegans Schilleriana*, having pure white sepals and petals and deep purple lip.

Of *Dendrobiums* there are many examples of *devonianum*, *D. thyrsiflorum*, *D. albo-sanguineum formosum*, with a crimson throat. *Cymbidium Lowi* is represented several very large specimens, one having seven spikes and 154 blossoms. Other plants in bloom are *Chysis Limminghi* and *C. bractescens*, the spotted, small-flowered *Aërides decorum*, that has flowered for the first time; *Cypripedium ciliolare* and *C. Lowi*, *Anguloa uniflora*, *Oncidium cucullatum*, *Cœlogyne Massangeana*, *Lycaste leucantha*, *Lælia purpurata*, *Brassia verrucosa major*, *Oncidium concolor* and *O. sphacelatum*, a very strong plant; several *Vandas*, including *V. Boxalli*, the minute rosy-purple blossoming *Epidendrum Frederici Gulielmi*, with upright flower-stalks; *E. glumaceum*, of a pale rose colour; *Myianthus barbatus*, a green flower,

*D. fimbriatum*, *D. oculatum*, some fine bits of *D. Wardianum*, *D. crassinode*, *D. Bensonæ*, *D. Pierardi*, *D. devonianum*, *D. aggregatum*, *D. moschatum cupreum*, *D. pulchellum*, *D. Farmeri aureum*, and *D. rhodopterygium*, which, notwithstanding its formidable name, has but a small sweet little flower. *Phalenopsis Schilleriana*, *P. Stuartiana*, *P. amabilis*, and *P. Manni* are all carrying good spikes. The late-flowering *Calanthes Sanderiana*, *C. veratrifolia*, *C. Dominiana*, and *C. masuca* are all good subjects to intermix with decorative stuff. *Lycaste virginialis*, pure white; *L. plana*, a fine plant; and *L. Harrisoni rosea*, are all in bloom. The *Vandas* at Holloway just now are looking exceedingly well, and *V. Denisoniana*, *V. suavis*, *V. tricolor*, *V. tricolor superba*, *V. tricolor insignis*, *V. tricolor*, *Dalkeith var.*, *V. tricolor*, *Patersoni*, a fine type; *V. tricolor formosa*, and *V. cœrulescens* had all fine spikes. *Odontoglossums*, too, make a fine show, a

*Mesospinidium sanguineum*, and the botanically curious *Pleurothallis tridentata*. The *Oncidiums* are represented by *O. Gardneri*, *O. pratextum*, *O. fuscatum*, *O. Weltoni*, *O. Marshallianum*, *O. macranthum*, *O. cucullatum*, *O. concolor*, and *O. dasyle*.

This collection of Orchids, owing to the admixture of the different varieties, always presents an agreeable appearance to the visitor, and is in that way an improvement on some collections where the species are kept more by themselves, nor does the health of the plants suffer thereby.

MR. JAMES, CASTLE NURSERY, LOWER NORWOOD.

Here are to be found a goodly number of species and varieties of Orchids in bloom. Mr. James has for a number of years been celebrated for fine highly coloured, fine formed *Cattleya Warneri*, and many are either in flower, or are throwing up their strong sheaths of bloom—one noticeable plant, large and robust, having pushed up three spikes. *C. Mossiæ alba*, a rare variety, is likewise showing for bloom. This is a strong plant, which may be taken to be doing well. *Oncidium Marshallianum*, with flower-spikes measuring from 5 to 6 feet, is seen in several examples; *O. concolor* was doing well in the same house. *Masdevallia Lindenii* and *M. Veitchii* are crowded with flower-spikes, as is *Dendrochilum filiforme*. As a remarkable example of repeated flowering may be mentioned a *Lælia elegans*, which has bloomed three times in the last twelve-months, and is at present throwing up several sheaths of bloom.

Of *Aërides*, there are *A. Larpentæ* showing bloom-sheaths, the long dark green foliage of which well set off the light rose and cream-coloured flowers in due season; *A. roseum*, a much dwarfier species than the foregoing, and with spotted foliage, and *A. Dayanum*, are showing for bloom. *Dendrobium chrysotoxum* is represented by a good specimen bearing thirteen racemes of flowers. Several very fine plants of *Cattleya Trianae* are still in bloom at this rather late period of the year. Mr. James' varieties of *C. Mendelii* include some splendid flowers of rare dimensions. *Oncidium sculptum*, of green and brown-coloured blooms; several *Dendrobiums*, especially *fimbriatum oculatum*; Veitch's variety of *Vanda suavis*, in excellent condition, with foliage down to the pot, and bearing one strong spike of bloom; *Anguloa Clowesii*, with fourteen blooms about to open; *Odontoglossum citrosimum*, *Lycaste eburnea*, *Aërides Fieldingii*, *Oncidium Harrisoni*, with ten spikes not yet open; *Brassia verrucosa*, with a dozen and a half of flower-spikes; and an immense plant of *Cypripedium Stonei*, are amongst the more notable plants to be seen at this little nursery.

MESSRS. HUGH LOW AND CO., CLAPTON NURSERY, E.

have a very extensive collection; they are constantly receiving large importations, and as Orchids in every stage, from those just out of the packing cases to established specimens, are always to be seen, the visitor here can form an idea of the rapid distribution which Orchids have, for unless that were so Messrs. Low would never be able to house the imports as they arrive. In the department devoted to *Cypripediums* there is to be seen at present a remarkable sight. It is a large house, about 80 feet in length, in which is a bed about 10 feet broad, and on this are placed as thick as they can stand fine healthy plants of *C. Lawrenceanum* in full flower; the effect can be more easily imagined than described. In the same house, in flower, but not in such large quantities, are *C. Lowianum*, *C. lævigatum*, *C. ciliolare*, *C. niveum*, *C. Roelzii*, *C. Harrisianum*, and *C. barbatum*. Many houses are devoted to *Cattleyas*, and a nice sprinkling of bloom is to be seen. One house (principally *Trianae*) will be a fine sight in a very short time, as the buds and sheaths are both numerous and strong. Various forms of the following *Cattleyas* are in bloom:—*C. Mendelii*, *C. Trianae*, *C. intermedia*, *C. Aclandii* (very fine), *C. gigas*, and *C. Lodgesii*. A very fine plant, not in bloom, of *C. Dowiana*, was very flourishing. Messrs. Low's large imports of *Odontoglossums* are well known, but in such large batches we certainly expect to have found more "starry" ones than there are; in fact, in a very large houseful of *O. Alexandræ* just flowering there was not a single spike but what would be called a good one. There was a nice selection of these favourites in bloom, consisting of *O. Alexandræ*, *O. claviceps*, *O. Sanderianum*, *O. Coradinei*, *O. triumphans*, *O. pul-*

REFERENCES:—*S¹*, *S²*, Sepals; *P*, *P*, Petals; *L*, Lip; *a¹*, one of three outer petal-like stamens; *a²*, *a³*, three inner stamens, of which two are petal-like, one lip-like; *Q¹*, a petal-like style.

spotted with black. Many other plants, too numerous to be detailed, are to be found in the collection.

MR. B. S. WILLIAMS' NURSERY, HOLLOWAY, is, perhaps, as well known and noted for its Orchids as for any other branch of the trade, and at present the display will well uphold the honour of the firm. Amongst *Cattleyas* fine pieces of *C. Mossiæ*, *C. Mendelii*, *C. citrina*, *C. gigas*, *C. Schilleriana*, *C. intermedia*, *C. Skinneri*, and *C. Warneri* are in bloom, also very fine pieces of *C. Mendelii speciosissima*, a large, much spotted variety, very telling; a good lot of *Cypripediums*, including *C. caudatum*, *C. Argus*, *C. ciliolare*, *C. superbiens*, *C. barbatum*, *C. Lowi*, *C. lævigatum*, *C. Lawrenceanum*, *C. Harrisianum*, *C. niveum*, *C. Sedeni*, *C. barbatum Warneri*, *C. longifolium*, *C. vernixium*, *C. villosum*, *C. microchilum*, and *C. Druryi*. A fine lot of *Dendrobiums*, too, is scattered about in various houses, the following are in bloom:—*D. thyrsiflorum*, *D. densiflorum*, *D. chrysotoxum*, *D. Jamesianum*, *D. draconis*, *D. nobile Wallichii*, *D. anosmum*, *D. macrophyllum*,

large number of the different varieties being in bloom, including fine types of the following:—*O. vexillarium splendens*, very fine; *O. citrosimum*, *O. Roelzii* and *O. Roelzii alba*, several very fine; *O. Alexandræ*, *O. luteo-purpureum*, *O. hystris*, *O. Rossi*, *O. Pescatorei*, *O. roseum*, *O. radiatum*, *O. triumphans*, *O. sceptrum*, *O. niveum majus*, fine pieces of *O. Halli* and *O. Halli leucoglossum*, and the pretty little *O. Oerstedii*. *Masdevallias* in bloom are not so numerous, but among them are *igneæ*, *Harryana*, *Veitchii*, *amabilis*, and *Shuttleworthii*. In the cool-houses *Acineta Humboldtii* was in bloom, as was *Ionopsis paniculata*; *Trichopilia coccinea* has a curious colour. Of *Cymbidium*s mention may be made of *C. Lowi* and *C. eburneum*, *Cœlogyne lactea*, a pretty flower; *Lælia elegans evectum*, *Epidendrum vitellinum majus*, a nice piece of *Aërides Fieldingii*, and some specimens of *Camarotis purpurata*. Large pieces of *Sobralia macrantha* are throwing up blooms, as also *Anguloa Clowesii*, *A. Ruckeri sanguinea*, and a very fine piece of *Saccolabium ampullaceum*, the showy *Sophranites grandiflora* and *Ada aurantiaca*,

chellum, *O. roseum*, *O. mirandum*, *O. Ruckerianum*, *O. luteo-purpureum*, the pretty little *O. Oerstedii*, *O. melus*, several forms fine of *O. gloriosum*, *O. Andersonianum*, the gorgeous *O. tripudians*, and in contrast the fine *O. Rossi majus*, *O. Pescatorei*, *O. nebulosum*, *O. Roezlii* and *O. Roezlii alba*, and *O. caudatum*. The bright coloured genus *Oncidium* is well represented by *O. Forbesii*, *O. crispum*, *O. varicosum*, *O. cucullatum*, *O. concolor*, and *O. Weltoni*. Of *Masdevallias*, *M. triangularis* and *M. Wallichii* are in bloom. The *Dendrobiums* are well represented here, and the following were blooming:—*D. tortile rosea*, *D. thyrsoiflorum*, *D. Bensoniae*, *D. devonianum*, *D. onomum* Dayi, *D. Parishii*, *D. eburneum*, *D. albo-sanguineum*, *D. xanthinum*, *D. giganteum superbum*, *D. Lowii*, and *D. Jamesianum*. The *Phalenopsis* at Messrs. Low's have frequently been favourably commented on, and at present they lack none of their former vigour, a piece or two of *P. Sanderiana*, *P. amabilis*, and *P. grandiflora* were in bloom, but of course the majority are over. The following miscellaneous species were also in bloom:—*Camarotis purpurea*, *Aerides Fieldingii*, *Vanda Denisoniana*, the sweetly pretty little *Ionopsis paniculata*, *Gongora grossa*, *Utricularia montana*, *Vanda cœrulescens*, *Epidendrum odoratissimum*, *Saccolabium retusum*, *Burlingtonia fragrans*, *Lycaste aromatica*, the brilliant *Sophronites grandiflora*, and the rare *Rodriguezia Lezana* var. *picta*, something like a beautifully spotted *Burlingtonia*.

## THE FERTILISATION OF ORCHIDS.

THE pollen of Orchids, when it falls on the stigma, undergoes rapid development; it is nourished by the secretion of the stigma. I have frequently seen the pollinia of *Cattleya* grow to five or six times the size of those in the anther in two days when they have been placed on the stigma, and each pollen grain then contains eight or sixteen young pollen grains, which are afterwards set free. This process occurs in other plants in the anther, and not on the stigma. The ovary, or young seed-vessel, in most plants, is closed, and the pollen sends a tube from each grain through the loose tissue of the style; but in most Orchids the style is hollow, and opens by a large pore on the surface of the stigma. In the flowers of *Dendrobium Pierardi* and *D. primum* the tube is as large as the cavity of the ovary, so that the ovules lie, as it were, in a deep open cup. I have not yet traced the pollen-tube into its interior, but hope to do so soon. The whole of this tube as well as the surface of the stigma is covered with fine, very transparent hair-like cells, resembling the mycelium of a fungus more than anything else I have seen. They are undoubtedly concerned in the nourishment of the pollen.

In the Orchid flower we see manifold temptations to catch insects for the purpose of insuring fertilisation; many, it is well known, closely resemble insects, and I could not have so clearly recognised this in a number of cases if I had not cultivated and watched the plants themselves. Take the genus *Phalenopsis*, for instance. I never realised the true import of the name, which signifies like a moth, until I saw the flowers of *Phalenopsis grandiflora* in the moonlight swaying with a fluttering moth-like movement in a gentle breeze. Those of *Gongora* look like a swarm of sand-wasps, and emit a powerful scent of Violets in the early morning when the sand-wasps are at work. This perfume entirely disappears before noon, and every entomologist knows that the sand-wasps go to rest before the middle of the day, like many other hymenopterous insects. The flowers of the curious *Oncidium macrochilum* resemble a flight of large gnats or small crane-flies, and here again the deception is greatly enhanced by the flightlike movements of the flowers in a gentle breeze. It may appear fanciful, but at a distance the flowers of *Cypripedium insigne* look as if a crowd of white butterflies were hovering over them, and the quaint blossoms of *Zygopetalum Mackayi* appear as if a large beetle, *Buprestis*, were just emerging from the flower. Some Orchids are undoubtedly attractive to insects from their abundant nectar, others by their perfume, others by their curious movements, and others because they appear like insects. I am sure that much has still to be learned that will throw light on the purpose of the many bizarre and beautiful modifications of these remarkable plants, and would urge on those who cultivate them for their beauty, to watch them carefully and consider them in relation to their natural conditions. The movements of

Orchid blossoms in a gentle breeze is a subject which has hitherto been completely neglected, and I feel sure it cannot fail to afford many interesting facts and suggestions to the careful observer. *B. T. L.*

## ORCHIDS FOR AMATEURS.

(Continued from p. 546.)

**TEAK BASKETS.**—For many there is nothing so good or so convenient as Teak baskets, and these should never be too large for the plants. One great advantage of a Teak basket is the ease with which it can be taken to pieces, in order to remove the plant, and put together again; another is its perfect drainage. My practice is to fill the basket with small branches of charcoal, to place the plant upon these, and then to cover its roots with living sphagnum or peat fibre, binding it in with a few turns of fine copper wire. The price of Teak baskets with neat wire suspenders is so moderate that few would, I think, attempt to make them for themselves, unless they were required in great numbers. Small pans, flat on one side, which is raised above the pan, and provided with a hole to hang it upon a nail on one of the walls of the house, are very useful, as they enable small plants to be hung up just under the glass, especially for *Sophronites* and the smaller species of *Cattleya*.

As a rule, plants grown upon naked blocks do not do well except in a few cases. Many *Oncidiums* so planted only flower once and never do any good afterwards, but to this there are exceptions: for instance, I find *Oncidium Papilio* and *Krameri* do better upon a piece of virgin cork, hung up, than when placed in a pot, although some growers prefer to place the block on which it grows in a pot. Wood blocks without bark or moss are not, I think, very good for any Orchids, rafts made of Teak with moss bound over the plants are better, but I think baskets or shallow pans are far better than blocks. Pots perforated with numerous holes are especially adapted for Orchids, as they permit a free circulation of air; and whenever there is only one hole, as in an ordinary pot, the pot should stand on two slips of wood to ensure a free circulation of air, a plan invariably adopted in the Orchid-houses at the Royal Gardens, Kew. The free circulation of air in the compost about the roots is essential to the health of the roots, a fact which cannot be too forcibly impressed on the amateur cultivator, and one which cannot be neglected with any chance of success in the case of Orchids. Ordinary plants are dependent on the air absorbed by the surface of the soil, but Orchids, at least the epiphytes, grow on the branches and trunks of trees, so that the air permeates the mass of roots on all sides.

There are some Orchids the flowers of which are produced from scapes which grow downwards into the compost in which they are planted; the buds grow, in fact, in darkness, and are thrust out and developed below the plant. Such are the *Stanhopeas* and *Acinetas*. Of course, these would never flower in pots, as the flower-buds could not pass out into the air, and in planting them in baskets it is necessary to place the charcoal rods on which they are supported so that there is plenty of room for the flowering stalks and buds to pass between them. Other plants, as the *Trichopiliias* and *Gongoras*, have pendent flowers, the scapes of *Gongora* often being a yard or more in length; the plants in that case must be suspended from the roof, and baskets are far more suitable than anything else.

### BASKETS OR POTS.

Many Orchids may be planted either in baskets or pots; such are the *Phalenopsis* and *Dendrobiums*, and there is some difference of opinion as to which is the best treatment. I have already spoken on this subject with regard to *Phalenopsis*, and the very numerous species of *Dendrobium* need different treatment. I think the smaller kinds do best in baskets, and the larger in perforated pots, or even in ordinary pots if these are not too large.

Another group of plants, *Vandas* and *Saccolabiums*, is essentially an epiphyte group and is certainly very ill-suited for pots. Even the large *Vandas* do best in good-sized Teak baskets standing on the bench, or, better still, over a tank in summer and upon a bench in winter. The roots of these plants are chiefly aerial, and in their natural condition, cling to the bark and limbs of trees, or hang freely in the air. I remember seeing a magnificent *Saccolabium* in the house of an amateur friend which produced numerous young

plants and flowered splendidly every year; it was attached to a large piece of cork, and hung over a tank. The roots of this plant will grow to within 2 or 3 inches of the water in the tank. I made a very curious observation with regard to these roots. My tank is filled by the rain-water from the roof, so that the level varies considerably, and I found that as the water rose the roots of a *Saccolabium* suspended above it turned up, so that they always kept about 3 inches above the water, for these roots became straightened as the water fell again. I do not know that this has been observed before. All true epiphytes if planted in pots must be raised well above the rims, for small plants 2 inches, and for large ones 6 or 8 inches, or even a foot. This is not advisable, however, with the semi-epiphyte or terrestrial kinds. *Cattleyas* as a rule do best, I think, in pots, and *Lælias* may either be planted in pots or baskets. A very excellent method with both is to fix several logs of hard wood of suitable size across the top of the pot, in pyramidal fashion.

Very pretty baskets may be made out of branches of any hard wood to fit the corner of a bench, which serve well for *Lælia purpurata*. The corners are always difficult places to deal with, and I know no better method of utilising them. The basket should be raised an inch or two from the bench, to ensure drainage and ventilation.

I always encourage the growth of Ferns and small Heath when they come up spontaneously amongst my Orchids, as they are capital indications of the state of moisture of the compost, and they add much to the beauty and picturesque effect, and I believe their roots are congenial to those of the Orchids. Occasionally, however, plants of large dimensions occur as weeds. A *Yucca* came up once with me in a large pot of *Cattleya*, and I had to cut it out, as it usurped too much room, but I felt very sorry to destroy it, and I should certainly have let it grow on if room had not been an object. I do not think the *Cattleya* would have been any the worse, but in this I may be mistaken. *Cypripediums* are generally all grown in pots, but the Comte du Buysson strongly recommends that the more truly epiphyte forms should be grown in baskets: such are *C. Hookeri*, *barbatum*, and *Lowii*. He says that they do much better in this way, whilst the *Selenipedium section* and *lævigatum*, *Stonei*, and the like should be planted in large deep pots, and well below the rim, just as a *Pelargonium* should be planted; they must, however, be well drained or they will not succeed.

There is one group of Orchids which forms an apparent exception to all others, so far as I know, with regard to drainage—the *Disas*, and the most successful growers recommend that the pots should stand in saucers with a little water always in them even in winter, but the compost must be loose, open, and sandy, or they will not succeed. These are marsh plants, and cannot tolerate any drought; on the other hand, anything like a sodden compost is inevitably fatal to their welfare.

Speaking of sand reminds me that all the most successful growers of *Odontoglossums* and *Masdevallias* add coarse sand to the compost, and I have always found that the roots cling strongly to this sand—a certain indication that it is beneficial to the plants. The sand should be coarse and sharp, otherwise it will impede the drainage. Some growers speak of the unnecessary expense entailed in using charcoal and sharp sand, but surely this is false economy; with such valuable plants no expense of this kind can be of the slightest moment—a few pence expended on each plant is such a trifle that one would suppose no serious person could make such an objection. My own impression is that most amateurs plant *Odontoglossums* in too loose a compost: it is an error I fell into myself, and I am now convinced that it is a serious mistake. *B. T. L.*

(To be continued.)

**ORNITHOGALUM ARABICUM.**—This appears to make a useful forcing plant, judging from what can be seen of it at Ilarefield Grove. A few bulbs potted singly in small pots have thrown up stems surmounted with large white flowers having a glistening black ball-like blotch in the centre. Not only does it make an attractive and useful decorative plant for a warm greenhouse or conservatory, but it has a decided value for cutting from. The bulbs are white, like those of the ordinary white Roman Hyacinth, but larger. In suitable situations it must make a fine subject for the open border. When well grown this charming plant produces large umbels of flowers,

## THE KILMARNOCK ORCHIS.

THE mild winters, followed by the severe frosts of March in the years 1883 and 1884, proved in my garden very destructive to many terrestrial Orchises, especially to the varieties of *O. latifolia* and *O. maculata*, which formerly did remarkably well here in peat beds made for Lilies. The finest of these, which used to be offered in many nursery catalogues by the name of *O. maculata superba* (the Kilmarnock Orchis), is extinct here, and from enquiries I fear it is almost everywhere a lost plant. It was one of those forms, apparently intermediate between *O. latifolia* and *O. maculata*, which are often found where these plants grow together, the two species being confluent, either by crossing or by natural affinity. It was brought into prominent notice a few years ago by the late Miss Ilope, of Wardie Lodge, where it used to flower and increase remarkably well. About ten years ago that lady gave me three bulbs, which flourished and had increased to a dozen, when the frost or a blight attacked them two years ago, and the leaves withered and the bulbs perished. Being lately in correspondence with Kilmarnock I asked whether this Orchis is still in existence there, and received the following interesting notice concerning it:—"I am very sorry that I cannot send *O. maculata superba*; I am afraid it is hardly in existence now. I think it has been killed by kindness. It was found by Mr. Fulton, of Fenwick, growing in Fenwick Moor, and being an extra specimen, he took it home and grew it, when it increased freely, and was given away to friends till a great many to this neighbourhood had it, and our local nurserymen, Messrs. W. & J. Samson, had a large bed, which I saw in fine bloom, and got it from them. After it was figured in the *Garden*, there was such a run upon it that it was entirely exhausted, and I think the repeated liftings to increase it caused it to decay. I have not seen it for many years. I was anxious to get it myself, and last autumn applied to Mr. Fulton, but he could not give it, and I believe that there is not a plant hereabouts. I went yesterday to a gardener who I knew had it and grew it well, as I remember seeing one spike 10 inches in length and as thick as a Hyacinth; but he had lost all. Fenwick is the coldest place in Ayrshire; the harvest of Oats never ready before the middle of October, and in late seasons not ripening; so that the transplanting to warmer regions has apparently not agreed with it."

It is a curious circumstance, bearing upon this last remark, that the only terrestrial Orchis which does not seem to have suffered at all during the seasons so fatal to our native Orchises is the Madeira Orchis, *O. foliosa*. This seems to be less particular about the conditions it requires in order to thrive than any terrestrial Orchis I have ever tried. I have had it for at least ten years, and I do not know that I have ever lost a bulb, and after severe or mild winters it seems equally vigorous. *C. Wolley Dod, Edge Hall, Malpas, March 26.*

## The Flower Garden.

THE time has now arrived when all the spring bedding plants must be removed, to make room for the summer and autumn plants; when the same garden is made to serve the purposes of a spring and summer display there is no help for it, as often before the flowers are past their best the beds will be required for the summer plants. The beds should be manured and well dug and trodden firmly, and all made ready to receive the summer occupants. All plants intended to be used should be ready, so that a commencement may be made when the weather becomes favourable for the operations. Care should be taken in planting out all kinds of bedding stuff to avoid the common error by planting too shallow; and make the soil quite firm round each plant.

I prefer watering newly bedded out plants early in the day, so that they may get dry before night, as then they are not so likely to get hurt by frost. In the removal of such bulbs as Narcissus, Crocus, Hyacinths, Tulips, &c., they should be safely named and laid in some light mould till their foliage has decayed, then the bulbs should be dried in some cool

airy place. All such plants as Pansies, Daisies, Aubrietias, Arabis, Violas, Primroses, Polyanthus, and all winter bedding plants should immediately on removal be cut back and divided where necessary and transplanted into the reserve garden, planted in rows and made firm, and watered for a few days till they root. *W. Smythe, Basing Park, Alton, Hants.*

## Plants and their Culture.

## FLOWERING STOVE PLANTS.

As previously noted, the major part of these delight in sunshine, the growth made under this treatment being conducive to flowering. The foliage itself may not be of so deep a green, but shorter jointed wood and greater substance in both will be the result of such treatment. Allamandas, to be grown and flowered as they ought to be, should never be shaded even when in flower. Bougainvillea glabra, Rondeletia speciosa major, and the Vincas should come under the same régime. Clerodendrons, Stephanotis, Francisceas, and Dipladenias, during the flowering period, may receive partial shade; it is doubtful, however, if much benefit is derived by shading the latter genus even then.

In order to secure an even set of flowers on Allamandas, Bougainvilleas, Vincas, and the shrubby Clerodendrons (as *C. fallax*), it is most essential to pinch the shoots to produce an even break all over the plant. One pinching is sufficient for the two former genera, allowing about twelve weeks from that operation till the plant is needed to be in bloom. The two latter genera grow like weeds when well treated; they may be pinched at every second pair of leaves as long as is desirable, giving them six weeks to come into flower from the last stopping. Whilst this rapid growth is being made two or three shifts may be given, but none after the last pinching. Rondeletia speciosa major requires the same treatment as the Allamandas in this respect, but should be allowed sixteen weeks to get into flower. These hints should be useful to intending exhibitors who have not hitherto adopted this course, having ourselves proved their efficacy over and over again. Particularly is this noticeable in regard to the Rondeletia just named, which, when thus treated, is one of the grandest flowering stove plants that we possess for the autumn months; when thus grown it becomes a dense bush, not a semi-climbing plant, as it is seen more often than not.

Hoyas that have been kept moderately dry during the resting season will now need more water at the root, the old and new trusses will then soon send forth a crop of flowers, which, in the case of *H. carnosa*, will be repeated later in the season, allowing an interval of rest. If there should be duplicates of Stephanotis of flowering size, one or more, as the case may be, can be retarded for later flowering when growth has not commenced, by removing such to a temperate-house and keeping the soil on the dry side, even to the sacrificing of the greater part of the foliage: when the Stephanotis is found to be shy in flowering this will be a good plan to follow, pruning somewhat severely before reintroducing into heat; twelve weeks will be found a sufficient time wherein to get them into flower when thus treated. The Gloriosas, after a winter's rest, ought now to be in active growth; when the plants have attained sufficient strength, a trellis of proportionate size will be necessary; the last shift must, however, be given before that is fixed upon. *James Hudson, Gunnersbury House, Acton, W.*

## The Rosery.

## ROSE MARÉCHAL NIEL.

I ENCLOSE a few blooms of the above for your inspection; they are cut from a plant growing here in the Camellia-house. The plant is trained on the roof, and covers a space of some 54 square feet, all but a few feet at the base being of last year's growth. Recently there were quite 250 expanded blooms, and many buds—a sight to gladden the heart of the most fastidious rosarian. When the bloom is over the

Rose is cut back close to the base of the previous year's wood, and the strong breaks it soon sends out are carried along in place of the wood cut away. I am not at all anxious about getting the wood thoroughly ripened, as I find the soft points of the long shoots give flowers as freely and as fine as the more matured wood at the base. I may mention that the Rose is planted out in good loam, and since the buds appeared has had at intervals liberal supplies of manure-water. *F. Blackburn, Elmstead Grange, Chislehurst.* [Beautiful perfect blooms. Ed.]

## The Hardy Fruit Garden.

## WALL TREES.

ALL protection is better removed now, the weather being milder; continuing it would only encourage weak growth. Insect pests, such as greenfly, should be looked sharply after, and not be allowed to establish themselves on the trees. A ter disbudding the Peach trees, a good syringing early in the afternoon will do them good, and tend to keep greenfly in check, which is often troublesome early in the season; but this should be done early, so as to allow the trees to become dry before evening. Pears on walls have set a fine crop, and orchard trees, on grass are in full bloom, and look most promising.

## ORCHARD TREES.

Trees planted in spring should be carefully staked, as much injury is often done by the trees being shaken by high winds. Where rotten dung cannot be spared to place on the surface of recently planted trees a little long litter will help to keep the ground moist, and save watering. A few small branches placed over the litter and pegged down will keep it from being blown away, and give a tidy appearance. Suckers growing round Plum trees should be removed at once.

## SMALL FRUITS.

Raspberries should have the young shoots thinned out to the number required for each root, say two or three to each, otherwise they crowd each other, and cannot become strong if six or eight are allowed to each root, as is often the case. Gooseberries should be watched for the first appearance of the caterpillar or the magpie moth. Immediately this is detected the bushes should be dusted over with white hellebore powder, and timely attention will prevent it spreading. *F. Smith, Mentmore, Bucks.*

## The Kitchen Garden.

## SEED SOWING.

SEEDS of Chicory, Salsafy, and Scorzonera may now be put in, or be left a couple of weeks later if spare ground be not available. If a succession of Broad or Longpod Beans be desired, a second sowing should now be made; but few appreciate them when other choicer vegetables are at hand. About the middle of the month make the last sowing of Brussels Sprouts, and also a successional one of Cauliflower—not omitting a bed of Veitch's Autumn Giant; this latter will come into use in late autumn; in fact, a still later sowing of this valuable variety is advisable. About the end of the month, or during the first week in June, make a sowing of early Savoy.

## PLANTING OUT, &amp;c.

Forethought will be required in allotting the remaining uncropped ground to the best advantage. Potato planting should be finished by this time. Commence tying Lettuce—the Brown Cos of last autumn's sowing, which will then be well blanched in the hearts and ready, after the Cabbage Lettuce is used up from ground at the foot of walls, or from the frames.

## TOMATOS AND MARROWS.

About the 15th of the month Tomatos should be got out, previously exposing the plants freely to the weather on all favourable occasions. The same remarks apply to Vegetable Marrows. If the Tomatos cannot be accommodated on walls or fences they should be assigned a very sunny position in the open, planted 1 yard apart each way, and should have a stake placed to them of sufficient strength to last throughout the summer and capable of supporting the weight of the fruit. If stakes are plentiful, three may be given later to each plant, thus giving the fruit, by spreading out the branches, more light. Before sticking successional Peas, all weeds should be removed from between the plants in the rows. *G. H. Richards, Somerley Gardens, Ringwood.*

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	May 11	{ Sale of Imported Orchids, at Protheroe & Morris' Rooms. Orchid Conference, and Exhibition of Orchids, at the Royal Horticultural Society's Gardens, South Kensington (two days).
TUESDAY,	May 12	{ Royal Horticultural Society: Meeting of Fruit and Floral Committees, at 11 A.M.; Scientific Committee, at 1 P.M.; National Rose Society: Meeting of Executive Committee, at 3 P.M.
WEDNESDAY,	May 13	{ Sale of Carnations, Plants, &c., at Protheroe & Morris' Rooms. Special Sale of Orchids in Flower, at Protheroe & Morris' Rooms.
THURSDAY,	May 14	{ Great Clearance Sale of Plants, at the Royal Nursery, Feltham, by Protheroe & Morris.
FRIDAY,	May 15	{ Sale of Imported Orchids, at Protheroe & Morris' Rooms.

AMONGST English growers of Orchids there seems to be a very general prejudice against any attempt to place other plants in the same houses, so that in spite of the great

amateurs can only afford a small number of Orchids, and never expect anything but outlay to result from their favourite pursuit. That a perfect paradise can be produced with a very moderate expenditure is undoubted, as Orchids have been grown, and successfully grown, over and over again, under such conditions. The amateur may, therefore, choose between growing Orchids in the usual way, without regard to the general view presented by his Orchid-house, or he may attempt their culture in a more congenial surrounding, and if he pays sufficient attention to details he will succeed in producing an arrangement which must excite the admiration of every one who sees his collection.

No Orchid grower would consider the Comte DU BUYSSON an unsuccessful cultivator, yet he is most enthusiastic on this

compared with that of the professional horticulturist, where all the Orchids are arranged on stages, and present an *ensemble* of naked stems; and he adds:—"I love Orchids much—perhaps more than any other plants—but I would at once renounce their culture if I were compelled to see them under such an aspect."

The objections to such an arrangement are manifest, as well as its advantages, otherwise we suppose no one would ever have attempted to grow Orchids under any other circumstances, except as a commercial speculation. First, and perhaps foremost, is the difficulty arising from the harbourage of insect foes, and this is a real difficulty, without doubt.

Of all insect foes the West Indian cockroach is the most terrible; but even this dreaded pest may be kept down by a very simple expedient, which has been successful in the great Palm-

FIG. 113.—A BIRD'S NEST OF ORCHID STEMS, AND A BIRD AS A GARDENER. (SEE P. 605.)

beauty of the flowers of their favourites, there is always an air of emptiness and barrenness about an Orchid-house. It is, however, open to question whether, for amateurs at least, the true method of growing and enjoying the beauty of these plants consists in the imitation of the natural conditions in which they flourish, so far as circumstances allow. No doubt there are practical difficulties in the way of culture under such circumstances, yet they are difficulties which are capable of being overcome by judicious selection and proper management. The shade and luxuriance of a tropical forest are the natural home of most of the cultivated species of Orchids, yet the very suggestion of imitating the natural conditions of their native home usually excites ridicule on the part of the English Orchid grower. That such a method of cultivating Orchids would never do for those who grow their plants for profit may be at once admitted, but most

subject; a house devoted exclusively to Orchids seems to fill him with horror. To give these beautiful plants a barren house, showing nothing but benches and rafters, is almost sacrilege in his sight; and he goes so far in his taste for the æsthetic that he has arranged an Orchid-house so that the temperature is graded from one end to the other, without any partitions, except those formed by masses of foliage plants and artificial rockwork. He says:—"One may imagine the difference which a house presents if the plants are artistically arranged, where the glass is masked in parts by climbing plants with showy flowers, where there are domes of verdure of variegated tints formed by the elegant fronds of Palms and Ferns, by the giant leaves of Musas, and where the walls are concealed by a carpet of Ficus repens, and variegated Tradescantias, mixed with Ferns and Selaginella, with a parterre of Gloxinias, Achimenes, and Caladiums, when

house and in the Orchid-stove at Kew. It consists in placing wide glass vessels, about 6 inches deep, with half an inch of treacle at the bottom, about the house. The West Indian cockroach is very greedy for the syrup, and cannot escape when once it touches the tenacious liquid. All that is necessary is to place the glasses so that these pests can reach the brim, and their fate is sealed.

Thrips, scale, and aphids should not appear at all, and when they do it is a certain sign that there is some defective treatment, and affected plants should be at once removed. No one would advocate a crowding together of plants, and amongst climbers a very judicious selection must be made, or the experiment will fail. The luxuriant Passion-flowers and Tacsonias are too free-growing, and the fall of their magnificent blossoms is very destructive to all beneath them. It is amongst the Apocynæ, the Asclepiads, and Mal-

pihiaceæ that the most suitable climbers are found. *Echites nutans*, *Dipladenia splendens*. *Hoya*, *Ceropegia*, *Stephanotis*, and *Banisteria* are perhaps amongst the best for the purpose. Like the Orchids they need abundant water in summer, and little or none in winter.

Whatever arrangement be adopted it is needful that every Orchid should be so placed that it may receive individual attention, and the same may be said of every plant in the house; the idea that a general syringing or watering once a day is sufficient is, of course, the idea of a novice. Whether the horticulturist wishes to grow a variety of Ferns with his *Odontoglossums*, or of tropical forest plants with his *Cattleyas* every plant must have its share of attention. Another objection is that you cannot grow so many Orchids if you divide your attention and your house with other plants, and that is true, but it will be no objection to those who wish to enjoy a few Orchids, rather than to collect a great number.

Those Orchid growers who have ornamental conservatories into which the Orchids are brought when in bloom grow their plants with that object, and need not trouble about their surroundings. We have now in view those only who have but one stove or greenhouse, and especially those who grow their plants themselves, for the ordinary gardener seldom has either the time or special knowledge for the culture of Orchids. We believe that if the cultivation of suitable plants were considered carefully that, now many Orchids are cheap, hundreds might enjoy a luxury which is still almost confined to very wealthy or very enthusiastic lovers of plants. Twenty or thirty well selected Orchids, arranged in a suitable stove, intermediate, or greenhouse, would form a delightful occupation and a never-ceasing source of pleasure to thousands. The benches might be covered with an artificial rockwork with light iron stands for the Orchids, whilst upon the rockwork *Ficus repens*, various *Selaginellas* and Ferns, variegated *Tradescantias* and *Fittonias*, would form a beautiful bank for the reception of the pots of Orchids. To these many other plants, such as *Hoya bella*, and the various *Eranthemums*, may be added, whilst the climbers already named might be planted close to the sashes, and trained over the roof. The centre of the house might contain a group of Palms, Tree Ferns, and Musas, beneath which the shade-loving Moth Orchids could be suspended. The taste and skill of the individual would of course be taxed, and some experience would be needed in arranging the different plants to the best advantage.

One of the great features in the culture of Orchids is the small size of the pans and baskets in which they are easily grown with the greatest success. Since the time of Mr. Dominy, Orchid growers have rather lapsed from the perfection which he attained in potting his plants; blocks and small hanging pots need in no case be unsightly; the *Cypripediums* might be sunk in well-drained receptacles in the rockwork, so that the whole appearance might be of a garden under glass rather than of an unsightly collection of flower-pots, containing what to most is at best, when without flowers, a collection of very uninteresting plants.

— OUR SUPPLEMENT.—With our present number we offer to our readers a special Supplement and Map, prepared by Mr. F. W. BURBIDGE. The map shows the geographical distribution of the genera of Orchids; the Supplement contains a complete list of the genera admitted by Mr. BENTHAM in the *Genera Plantarum*, and is published by the kind permission of Sir JOSEPH HOOKER. References to many illustrative plates are given, as well as to the whole of those figured in the *Gardeners' Chronicle* from 1841 to the present time. Such a condensed mass of information has never before been offered to the Orchid-loving fraternity, and we would fain hope that it may be preserved for reference, and that it may be found useful in every garden where Orchids are cultivated. The cost and labour of production preclude the possibility of reproduction. It is therefore requisite that those who desire extra copies should at once apply to the Publisher.

— OUR NUMBER.—The present issue, in anticipation of the Orchid Conference next week, is largely occupied with matter relating to the conformation, internal structure, and cultivation of these plants.

SIR TREVOR LAWRENCE.

A brief notice of some of the principal Orchid nurseries and private establishments is given, as well as a portrait of Sir TREVOR LAWRENCE, the President of the Royal Horticultural Society and of the Orchid Conference. Of the Supplement mention is made in another paragraph.

— OUR NEXT NUMBER.—In our next number we hope to lay before our readers a double-page engraving, representing a group of Orchids, a portrait of Professor REICHENBACH, a notice of the insects that attack Orchids, by Professor WESTWOOD, a similar notice of the injurious fungi by Mr. WORTHINGTON SMITH; numerous cultural articles, and a full illustrated report of the proceedings at the Orchid Exhibition and Conference.

— THE ORCHID EXHIBITION.—We are informed that the space at command in the Conservatory will admit of the admission of duplicate specimens, should exhibitors desire to send them. Application should be made at once to Mr. BARRON, at the Royal Horticultural Society, South Kensington.

— THE ORCHID DINNER.—If it be not too late to alter the arrangements, it might be well, it is

suggested, to substitute a luncheon at South Kensington, in the club room, on the Tuesday. This has been proposed to us by some who feel that after the labours of the day at Kensington they will not be disposed to assume the dimorphic guise of dinner dress, and rush off into the City to dine. The arrangements for the luncheon could readily be made on the spot at a day's notice.

— THE GARDENER-BIRD.—When the illustration of this bird, and Signor BECCARI's notice of its peculiarities, were first published in our columns, on March 16, 1878, there was such a "run" on the paper that the Publisher soon had to report "O. P."—out of print. We do not anticipate such a result now, but as he is frequently asked for the number in question, we reproduce the engraving on an occasion when it seems specially appropriate. Referring the reader to the number in question for a plan of the nest, and for full details, we may here say that the bird in question (*Amblyornis inornata*), a native of New Guinea, makes a conical nest, entirely of the dry pseudobulbs of a *Dendrobium*, and thus furnishes a *raison d'être* for pruning those organs as recently recommended.

In front of the nest the bird forms a lawn of moss, on which it deposits, for the delectation of its mate, various brightly coloured flowers, insects, fungi, &c. The objects are of varied character, but always brightly coloured. Some Philistine has remarked that Orchids are of no use. The New Guinea bower-bird is of a different opinion, and the Orchid-lover may find vindication for his fancy (should he need it) in the recollection that his taste is a purely natural one, shared in by the fowls of the air—and garden.

— AMERICAN EXHIBITION, LONDON, 1886: BOTANICAL DEPARTMENT.—Among the attractions of the American Exhibition to be held in London next year will be a garden comprised solely of American trees, shrubs, and hardy plants; in fact, it is intended that the whole of the Exhibition grounds shall contain no plants except those of North America. The intention is to make a representative gathering of the United States flora, taken in latitudinal and longitudinal directions. The former will represent the characteristic vegetation of each State taken seriatim from New York to California, the latter from the Canadian frontier to Texas and Florida. The Orange and Citron groves of Florida and other Southern States, together with representations of their Cotton, Maize, and Tobacco fields, will be made. As the

North American flora is of peculiar richness, such an exhibition will not only be novel, but attractive, for no country is so rich in beautiful hardy trees, shrubs, and herbaceous plants, and an idea of the resources of the North American flora will thus be represented to the visitor at a glance. From the opening day in May till the close of the Exhibition in October it is hoped that the grounds will not only prove interesting and instructive to visitors, but attractive also on account of the peculiar nature of American plants to flower in continuous succession. With the ordinary American flowering shrubs, such as *Rhododendrons*, *Azaleas*, *Kalmias*, English people are well acquainted, but it is hoped that this Exhibition will comprise large numbers of trees, shrubs, and plants, which are comparatively little known in this country. The wealth of the herbaceous plant flora of the States will be a special feature, and it is intended to import direct from the States representative collections of wild trees and plants, particularly of the most attractive kinds.

— A FLORA OF THE ENGLISH LAKE DISTRICT.—Mr. BAKER does not allow his researches into the flora of Madagascar, nor his exhaustive monographs of monocotyledonous and other plants, to wean him from

his early love and study of British plants. Of this we may be glad for his sake, for what delight is greater than that experienced by the keen hunter after wild plants?—and glad for the sake of botany, as the larger experience and wider views of a botanist like Mr. BAKER, who has worked over so large a field of systematic botany, must tell favourably on the frequently limited investigation of British plants. The total number of species admitted for the Lake districts is 893 out of 1425 for the whole of Britain, and of the 893 fifty are of the Highland, and fifty-four of the Scottish type, while only eleven are Germanic, and twelve Atlantic. Leaving out of consideration the great mass of plants of the "British," *i.e.*, general type, and the few (five) local plants, the number of Scottish and Highland plants affords a good index to the nature of the country, as also does the fact that no fewer than twenty-eight plants belonging to WATSON'S mid-arctic zone are included in the Lake district, while they are entirely absent from Northumberland, Durham, and North Yorkshire. Such plants, moreover, would be more abundant on the hill-tops, were there any stations for them to grow in. The climate is not unsuitable, but there is, so to speak, no place for the soles of their feet. Mr. BAKER includes several "aliens" and "casuals," and the interest of his volume would have been enhanced had he been able to give us a general notice of the date and source of their introduction and the circumstances of their distribution. In the enumeration of the plants the names are preceded by the number which they bear in the *London Catalogue*, which is rather puzzling at first, though explained in the preface.

— THE WEATHER OF 1884.—Mr. EDWARD MAWLEY has issued his admirable summary of the climatal phenomena of the past year in the vicinity of London, to correspond with those which he has issued since 1879 (STANFORD). These reports have been so exceedingly well contrived for the advantage of cultivators that we learn with great regret that, owing to a change of residence, this is to be the last of the series. The general outcome is that 1884 was "singularly warm, rather dull, and extremely dry, with a dry atmosphere and winds of about average strength. Barometer exceptionally high." It was the warmest year (near London) for twelve years, the driest for twenty, and, with one exception, the least cloudy for eight years.

— *ÆCHMÆA GLOMERATA*.—This plant is figured in the *Voyage of the French Frigate, Bonite*, t. 63, as *Pironneava glomerata*. Of the numerous known species of this genus many are highly ornamental in several respects, and it is to be regretted that their cultivation is not more universal in gardens. Apart altogether from the conspicuous and showy nature of their flowers, the latter are frequently supported or protected by highly coloured bracts that are as attractive as the flowers themselves. When we consider the duration of the bracts (and the species under notice is an excellent instance), the perishable nature of the flowers becomes a matter of less importance than it would otherwise be. The inflorescence is branched and dense, consisting of terminal and lateral heads formed of deep scarlet bracts enclosing the calyx, and persist in good condition for many months. The tips of the calyx and the petals are of a deep blue, forming an attractive contrast to the bracts. The plant is well represented in the *Botanical Magazine*, t. 5668. A plant is in flower in the stove at Kew.

— FLOWERS AND PLANTS FOR THE LONDON POOR.—The Hon. Secretary of the Kyrle Society writes:—"The Kyrle Society will this year again take up the work of distributing flowers and plants among the London poor, and I venture to remind your readers how gratefully any greenery they have to spare will be received for them. The gifts of past years have afforded the greatest delight, and as the Society becomes more widely known it has more requests both for flowers and plants. The latter are greatly needed for the gardens opened in various parts of the metropolis, as not only fresh spaces are secured which require planting, but from the difficulty of keeping plants in the impure atmosphere, those in the older established gardens require frequent renewal. We are very anxious also for plants in pots, for the wards in hospitals, workhouses, and workhouse infirmaries. As in my previous appeals, I will ask those who are kind enough to respond to them, not

to send packages direct to the office, but to write to me in the first place, when I will give the addresses to which they may be forwarded, either of parish, institution, or sick and aged poor in their own homes; and I will ask farther that they will tell me how often or on what day of the week, and what quantity of flowers or plants they will like to send. Especially shall I be glad to know whether the supply would be continued regularly through the season, that I may judge what address it will be best to furnish. F. E. TRIPP, *Office of the Kyrle Society, 14, Nottingham Place, London, W.*

— *ADIANTUM PEDATUM*.—This pretty member of a useful family will succeed in light peaty soil, in sheltered situations, out-of-doors, provided care be taken to protect it from injury to the growth by late spring frosts. It is a very early grower, and shoots up rapidly, so that by the beginning of May, in warm sites, the fronds are 1½ foot in height. In winter they die down to the ground.

— CALIFORNIAN CITRUS FRUITS.—An Associated Press telegram, dated New Orleans, April 4, says:—"To-day California has been awarded the sweepstakes Gold Medal against the world for the best varieties of Citrus fruits; also, two other Gold Medals, eleven silver ones, and thirty premiums. The most formidable competitor was Florida, which had the advantage of nearness to the place of exhibition, and made great efforts to carry off the prize. Her advantage was overcome by the liberality and public spirit of the Southern Pacific Railroad Company, which not only carried exhibits free of charge, but made special efforts to excite the interest of Californian fruit-growers in the contest. Over 100 car-loads of goods were carried gratuitously to the Fair from California. Great strides have been made in fruit-growing within a comparatively recent period. There are now no less than ninety-eight varieties of bearing Orange seedlings in Los Angeles and San Bernardino counties that were unknown to our soil fifteen years ago. California Oranges, Lemons, and Limes are now formally and officially declared to be the best in the world."

— SELF-FERTILISED FLOWERS.—In "*Samenkunde*" Dr. C. D. HARTZ says:—"The facts connected with this subject are very interesting; for instance, there are many plants on which several flowers, and sometimes the whole of them, that are incapable of fertilisation with each other, while the same is easily effected with flowers from other individuals. HILDEBRAND fertilised sixty-three flowers of *Corydalis cava* with the pollen from another plant of the same species, obtaining fifty-eight fruits with four and five seeds in each. He then attempted the fertilisation of sixteen flowers with the pollen from other flowers of the same individual plant, and obtained only three fruits, of which only one contained two seeds. At last he dusted over twenty-seven flowers with their own pollen, and did not obtain a single fruit. GÄRTNER was not able to get seed from two plants of *Lobelia fulgens* by using their own pollen, they remaining always sterile, notwithstanding they were able to be crossed with much success with other species, and the results were similar by *Verbascum nigrum*. The same peculiarity was witnessed in Orchids by SCOTT, FRITZ MUELLER (DARWIN'S *Variation of Species*), while seed-bearing pods were produced when the fertilisation took place by pollen from other species. Still it will occur that the fertilisation of a bloom will remain without any result when the pollen is obtained from another bloom, because the relationship of the two species is not sufficiently near, or from the plants operated on having sprung from seeds formed in the same capsule, while the crossing of the flowers of two not allied or distinctly allied species resulted in abundant fruit and seed formation—so, says F. MUELLER, happened with a Brazilian *Abutilon* and a *Bignonia*."

— JAMAICA FERNS.—Jamaica, as, is well known, is particularly rich in Ferns. Although the island is comparatively so small, it contains about 500 species of Ferns, which is one-sixth of the Ferns of the whole world. To express its richness in another form, it is mentioned in the last report of the Botanic Gardens of Jamaica that within an area about the size of Wales, Jamaica contains twelve times the number of Ferns found in the British Islands, and more than ten times the number of Ferns found in the

whole of the United States. The Jamaica Ferns are remarkable, not only for their number, but also for their great variety and beauty. They are found in all sizes, from those scarcely a quarter of an inch long to large tall-towering trees 40 to 50 feet high, and with stems 6 feet in circumference. Again they are widely distributed and found in all districts, from the arid plains of St. Catherine and Clarendon to the highest peaks of the Blue Mountains; from the calcareous rocks of the northern coasts, bedewed with ocean spray, to the cloud-capped ridges of the highest mountains.

— NARCISSUS EMPEROR AND N. EMPRESS.—These varieties seem quite as much at home in Messrs. J. BACKHOUSE & SONS' nurseries at York as in the warmer Home Counties, judging by some beautiful examples forwarded to us recently from these nurseries.

— POT ROSES.—Mr. WILLIAM PAUL has published a sixth edition of his *Observations on the Cultivation of Roses in Pots* (KENT & CO.). The well-earned repute of the author, and the fact of a sixth edition absolve us from any necessity of commending the book. The autobiography has been revised, and the pot Rose has become a little sarcastic. No Rose without a thorn, but some thorns have the points downwards, and it would have been better if this one had arms reversed also.

— VEGETATION IN HIGH LATITUDES.—According to M. SCHÜBBLER most plants produce seeds of larger size in high northern latitudes than plants of the same species grown further south. The dwarf Bean, taken from Christiana to Drontheim, was found to increase the weight of its seeds 60 per cent. Thyme, taken from Lyons to Drontheim, augmented the weight of its seeds 70 per cent, and a similar increase was noted in the case of Wheat. This increase in weight is manifested in the ternary compounds (such as starch) only, and not in those containing nitrogen. The leaves of trees and shrubs, and especially of fruit trees, are larger and deeper in colour in the North than in the South. The same rule applies to kitchen garden plants and to flowers, plants producing white flowers in the South forming violet flowers in high latitudes. These effects, which are analogous in some respects to those witnessed in the vegetation of mountains, are doubtless due to the greater intensity of the light, and perhaps to a longer period of uninterrupted sunshine. The late Dr. JAMESON, of Quito, published in these columns some statements to a similar effect with regard to the vegetation of the Quitoian Andes, and asserted that the movements exerted by the parts of the flower in opening and closing were more marked at greater altitudes.

— "BEGONIA SOCOTRANA," says M. DU-CHARTRE, "besides its natural reproduction by means of seeds, possesses a rapid means of multiplication, thanks to the abundance with which it produces on the lower and underground portions of the stem bud-shoots of a special organisation, which develop rapidly after a period of repose into a new floriferous stalk. It is also remarkable that, contrary to that which is the case in many other vegetables, this facility of multiplication by means of natural cuttings does not interfere in the least with the accomplishment of the reproductive faculty; but it may be said that other Begonias are even more favoured than this one in these two respects. There is, above all, the charming *Begonia gracilis*, KUNTIL., var. *Martiana*, A. DC. (B. *Martiana*, LINK et OTTO), which not only produces a great quantity of seed, but also gives birth, in the axil of each of its leaves, to a numerous group of true shoots of small size, but nevertheless all equally susceptible to become rooted, and in time to develop into a new shoot."

— THE MANUFACTURE OF CUTCH IN BURMAH.—The manufacture of the well-known astringent substance, Cutch, from the wood of *Acacia Catechu*, so much used for tanning purposes, is carried on in Burma chiefly in the Thayetmyo, Prome, and Tharrawaddy districts. Three men generally work together, one to cut down the trees and to drive the buffaloes that drag them to the site of the furnace, another to clear off the sapwood and to cut the heartwood into chips, and a third to attend to the fires and boil the

chips down. The chips are put into cauldrons filled with water, each cauldron holding 4 gallons, and the whole is boiled for twelve hours. The chips are then taken out, and the liquid placed in large iron pans, and boiled and stirred till it attains the consistency of syrup, when the pans are removed from the fire, but the stirring is continued till the mass is cool. It is then spread on leaves in a wooden frame and left for the night; in the morning the substance is dry, and ready for cutting into cakes for the market. The daily outturn varies from 25 lb. to 36 lb. It is calculated that three men working steadily for eight months can make about 3650 lb. of Cutch.

— **USES OF VEGETATION.**—The proper function, or one of the right uses of all vegetation, is to produce food and clothing for us from the refuse matter of our large towns. Every little green leaf, apart from its individual beauty, has a share in the great work of purification which all leaves carry on. In malarious countries the Blue or Fever Gum tree is now largely planted, because it grows rapidly, and its roots and leaves suck up moisture so rapidly that a few of these trees actually drain any swamp or marsh near or in which they are planted. It is so with our own Poplar trees, which in wet low-lying places act most efficiently as the best of natural drains for a stagnant bit of marsh land. Now, if you drain a swamp in the ordinary way you simply carry pollution from one place and deposit it in another place; but tree roots suck up offensive matter, and tree leaves actually purify it. The leaves throw off pure water by evaporation, and with it life giving oxygen, instead of the poisonous gases of the atmosphere. What is true of large trees is in degree equally true of the smallest window plant. The highest mission of plants is not merely to please our eyes with colour, our mouths with delicious fruits; not only do they do this and more, but they are ever silently but surely eating up what is impure and injurious to ourselves in the atmosphere and in the earth all around our homes; and any dwelling in which plants are well and healthily grown will be more likely to be clean and healthy house than if the plants were not there.

— **BURMAH CHEROOTS.**—The following account of cigar making in Burmah is given in a recently issued official report. Little or none of the native grown Tobacco it seems is used, the only kind made up into cheroots being imported from Madras and Rangoon. The cheroots are made somewhat in manilla shape, but they are about the same thickness at both ends. The leaves are first damped and then put away for a day; they are then rolled very carefully with small wooden rollers to smooth out the creases, and are kept for four or five days wrapped up in a cylindrical form, they are then ready for manipulation into cigars. Women only are employed in this manufacture. One woman can make about 400 to 500 cigars in a day of twelve hours. No machinery is used, the leaves are simply cut into their proper shape by scissors, and then rolled by hand into cheroots. The small ribs are not removed as is often done in Havannah, and this omission often gives the Burmah cheroots a rough uneven appearance.

— **GESNERA MACRANTHA.**—Although the numerous species constituting this genus present almost the same monotonous uniformity of colour throughout there is nevertheless a great variety in the habit and leafage that gives the plants an engaging appearance when scattered about in a mixed collection. The stems are unusually dwarf, not exceeding 1 foot in height, and the broad soft leaves are almost shaggy, with long woolly hairs. The bright scarlet flowers surmount the simple unbranched stems in clusters. Several specimens from the collection of the late Mr. Joad are very conspicuous in one of the stoves at Kew, and one of these presents a curious and interesting anomaly. Two flowers occupying the apex of the stem have become completely fused, so that they stand erect, forming one flower, with a regular shallowly ten-lobed mouth. There are eleven stamens, although in a typical flower of this order there are only four. The two styles are straight and erect instead of being curved at the apex, as they would be normally.

— **GARDENING APPOINTMENTS.**—Mr. W. M. BAILLIE, Gardener to the Earl of WILTON, at Heaton Park, has been appointed Head Gardener to His Excellency the Danish Minister, Luton Hoo Park, Beds.—Mr. ANDREW ROCHE has been appointed Head Gardener to Lord STAFFORD, Coosey Park, Norwich.

## SIR TREVOR LAWRENCE.

THE genial and popular President of the Royal Horticultural Society affords an illustration of the law of hereditary transmission. His father was the eminent surgeon and physiologist, Sir William Lawrence, so well known to old "Barts." men, and who obtained such notoriety by the expression of opinions on scientific matters then thought "advanced," but which now-a-days have mostly passed into the region of admitted facts disputed by no one. Sir Trevor's mother was the well-known Mrs. Lawrence, of Ealing Park, whose specimen plants were the envy of all rivals, and the memory of whose garden parties survives to this day. Sir Trevor himself served as a medical officer in the Indian army, and on his retirement took up Orchid growing with a zest that has resulted in the possession, not only of the finest, but of the best cultivated collection in the country. This result has been attained in no slight degree by the personal attention which Sir Trevor bestows on his plants. He treats them as carefully and conscientiously as if they were patients—and he has his reward.

Sir Trevor is M.P. for Mid-Surrey, and however great may be the esteem in which he is held by his political constituents, it is quite certain that it is not greater or warmer than that experienced by the horticultural community over which he presides.

## LEAF-STRUCTURE OF ORCHIDS.

THE microscopic structure of plants has never been taken up, to any extent, by practical gardeners, nor is it at all wonderful that this should be the case. The lengthened apprenticeship required, the patience and continued observation requisite, the delicacy of manipulation that is essential, all stand in the way of the practical gardener attaining any degree of proficiency in the use of the microscope, and by microscope we mean what we say, and do not intend the ordinary magnifying glass or pocket lens which people dignify with the name of microscope. A magnifying glass of this description can be used by any one without special training, and should be in the possession of all gardeners without exception. But for our present purpose we refer to a "compound microscope," and although circumstances must prevent most working gardeners from themselves using the instrument, there is no reason why amateurs with the requisite leisure should not become proficient in its use, and there can be no reason why gardeners should not avail themselves of the results obtained by their fellow labourers in other departments.

We have at least one public botanical laboratory where research of this kind could be carried on, and we can only wish that before long some competent observer may avail himself of the facilities there offered by investigating the minute structure of plants with special reference to their requirements under cultivation. These considerations have been suggested to us by an examination—a very cursory and incomplete one we admit—that we have made of the leaf structure of some forty or fifty species of Orchids of various genera selected for the purpose, and including evergreen, terrestrial, epiphytic, thick-leaved, thin-leaved species, and so forth.

We may add that, with reference to this question of structure as indicative of the natural conditions under which the plant grows, that a large number of the specimens examined by us in the first instance, were under number only, so that we did not know at the time to what species they belonged. Nevertheless, we were enabled to state the conditions as to light and shade and supply of water that the plants required, and these conclusions were found on consultation with practical cultivators to be near approximations to the truth in almost all cases. Our examination, however, has been so superficial that, in alluding to some of the results, we do so with a full sense of their lack of completeness, and with the sole hope of inducing those interested in the microscopical structure of plants and in Orchid cultivation to follow up the subject. Although the general structure of plants has been known for more than 200 years (by the way, one of the pioneers was our own countryman, Nehemiah Grew—1682), yet it is only recently that attention has been drawn by Naegeli, Hanstein, and others to the development and co-ordination of the several layers of

cells, and still more recently—only yesterday, as it were—that such men as Stahl and Vesque have attempted to show the relation between structure and function. But before proceeding further, let us sketch in outline the generalities of leaf-structure, and then point out some modifications that occur in Orchids. In the leaves of plants this is what we find—a central spongy mass, consisting of cells traversed by threads of woody tissue (the veins so called), and enveloped above and below by a skin. In different plants we find variations in the skin, in the central spongy mass of cells, and in the arrangement and number of the woody threads. The skin is evidently a protective organ, and by means of sundry pores or apertures, generally on the under-surface, and which open or close according to the dryness or moisture of the atmosphere, it allows of the passage in or out of the leaf of air and vapour. The central spongy mass is made up of cells, but it rarely happens that all the cells are arranged in the same way, or have the same size and form—generally they are in easily recognizable layers; generally, too, they vary in the same leaf, in form, in size, in colour and in office. Some are empty or filled with air. Some are filled with water. Some contain food in the shape of starch grains. Some are provided with the green colouring matter, "chlorophyll," to which leaves owe their colour, and in no slight degree their vitality. Some are charged with red or purple-coloured fluids. Some give shelter to crystals of various shapes. The fibrous strings are composed of wood-cells, hard and tough, which serve the part of the bony framework or skeleton of animals, and of sundry thinner, more delicate vessels of various modifications, and which play a part in the transmission from one part to another of nutritive juices or of air.

In the leaves of Orchids we have the component structures apparently arranged with reference to the conditions under which the plants grow naturally. Some grow in full sunshine, and are constructed accordingly. Some would thrive in diffused light. Some would bear a long period of drought uninjured, others could not endure the privation of water for a few hours even. Some would be torn to shreds by a gale of wind, others would withstand a hurricane. Some are so constructed as to adapt themselves to varied conditions with little trouble, and these, of course are the plants, which the gardener finds it easy to cultivate; in others the adjustment is so delicate that they cannot suffer any change without inconvenience. These are the plants the gardener has a difficulty in keeping alive, these are the plants which even in their native countries are dying out, elbowed out by their more robust and less exacting brethren, on the principle of the survival of the fittest.

We may now give a few illustrations of the appearances as seen under the microscope. The illustrations are shown as magnified 40 diameters, but, unfortunately for our own present purpose, the artist has omitted to indicate the presence of the various contents of the cells—an omission we must endeavour to supply in words. This is, so far as cultivation is concerned, the all-important thing. The fibrous strings (fibro-vascular bundles of the botanists) are merely shown diagrammatically, to have done so in correct detail would have necessitated much larger illustrations, and up to the present time the precise relation of the differences in these fibro-vascular bundles to cultural requirements is not in any degree made out.

Fig. 115 shows a cross cut of a leaf of *Dendrobium nobile*, a deciduous species with rather thin leaves. Proceeding from above downwards there is first the structureless cuticle forming an unbroken layer over the whole leaf and resisting evaporation of water from the interior, then a single layer of cells which, in section, look like bricks in a wall and which are the epidermal cells, immediately beneath which is a layer of colourless cells filled with air or water, then follow eight or ten layers of long egg-shaped cells in close approximation, and whose long diameter is transverse—these are filled with green colouring matter or chlorophyll; then follow two or three other layers of shorter cells of similar form with a little chlorophyll, but less closely packed, so that they leave interspaces between them which communicate with the outer air by means of the pores or stomates, of which five are shown breaking the line of the lower epidermis and cuticle. In the centre are indicated three fibro-vascular bundles, F, cut across; these contribute to the strengthening of the leaf and to the passage of fluids, &c. Exposure to direct sunlight would seem not to be needed in this case, for reasons to be

given hereafter; but a copious supply of water is requisite, as the means for storage are not great.

Fig. 116 shows a cross section of the leaf of *Lycaste Harrisoni*. Essentially the structure is similar to the preceding, and needs no detailed explanation further than to call attention to the numerous small fibrous bundles which traverse the leaf immediately above the lower epidermis between it and the larger central bundles. The leaf thus has a very stringy appearance when torn. The structure indicates no necessity for direct solar exposure. *L. Skinneri* has a similar but not identical structure.

Fig. 117 is taken from a transverse section of *Cattleya Lawrenceana*. Above, at A, is shown the cuticle; at B the epidermal cells, at C three layers of globular colourless cells, filled with water; at D three layers of elongated cells, which have a direction at right angles to the surface of the leaf, and which are closely packed. These cells, from their peculiar appearance, resembling the pales of a fence, are called "palisade cells," and they are crammed with chlorophyll. The central tissue of the leaf is formed of oblong cells closely packed above E, less so beneath G, where interspaces may be seen. These cells, or the uppermost of them, contain some chlorophyll, but little as compared with the palisade cells above. One of the principal fibrous and vascular bundles is indicated roughly at F, while at H are shown several minor bundles, consisting almost exclusively of woody fibres, giving great strength to the leaf. At J are shown the epidermal cells, with their investing cuticle, K; and at L the stomata, or breathing pores, communicating with the outer air and with the air cavities left between the cells at G. The important things in this section are the long straight palisade cells at D, which are not present in either of the two preceding plants. These palisade cells are always full of deep coloured chlorophyll when in health, and their numbers, size, and intensity of coloration are always (in other plants as well as Orchids) in direct relation to the amount of light. If these palisade cells be well developed it is a sure sign that in their native countries the plant is exposed to bright sun. At the same time the thick texture of this leaf, its abundant cells filled with water indicate the necessity for a copious supply of water during the growing season, while during the dry season of rest the thick rind impedes the undue evaporation of water from the interior and enables the plant to resist the ill effects of drought. *C. Mossiæ* has a similar structure.

*Cypripedium niveum* (fig. 118) has as usual cuticle and epidermis, immediately beneath which is one layer of long vertical cellular prisms which might be mistaken for palisade cells, but which contain no chlorophyll. In some or all of them is coiled up a fine fibrous thread (not shown in the illustration). These long cells are colourless and filled with water. They give a most striking appearance to the leaf. Beneath them is the chlorophyll layer of globular closely packed cells, in the midst of which are the fibro-vascular bundles; the cells beneath this contain a pinkish colouring fluid. The other points of structure need not be detailed as they are similar to that of other Orchids. Shade and a copious supply of water are the cultural indications to be derived from the structure. *C. insignis* has a similar structure, and so have *Masdevallia othodes* and *M. porcellipes*, the appearances in the latter plant being very remarkable, the thick layers of colourless cells resembling the "icing" on a cake. *C. barbatum* is destitute of these peculiar long cells.

*Dendrobium Jenkinsii* (fig. 119).—The leaves of this plant are small and thick, with cuticle, epidermis, a subjacent layer of colourless water, containing cells, then two layers of palisade cells above the spongy tissue, the cells of which latter abound in clusters of crystals (raphides).

The structural details of this plant point to the necessity for full exposure to light, and a copious supply of water during the growing period.

The chief feature in the structure of *Oncidium Lanceanum* is the presence in its spongy leaf-tissue of large globular or ovoid cells, with a finely reticulated fibrous network. Similar cells occur in many Orchids—*Oncidium pumilum*, *O. pulvinatum*, *Saccolabium*, &c., and are constantly found in the aerial roots (see fig. 117), whose structure also is well worthy of attention, but which must here be dismissed with the mere mention.

The leaves of *Aërides virens* are remarkable for the very long tufted unbranched "spicular" cells which occur in the central tissue of the leaf.

The most important structural peculiarities just alluded to may be thus indicated:—

1. Leaves with well marked palisade cells, presumably requiring full solar exposure, e.g., *Cattleya Mossiæ*, *C. Lawrenceana*, *Oncidium pulvinatum*?, *O. flexuosum*, *Dendrobium Jenkinsii*, &c.

2. Leaves without palisade cells, presumably needing diffused light only:—*Epidendrum crassifolium*, *Oncidium Lanceanum*, *O. pumilum*, *unicorne*, *Vanda tricolor*?, *Phaius grandifolius*, *Dendrobium nobile*, *Aërides virens*, *Cypripedium insigne*, *C. niveum*,

FIG. 115.—*DENDROBIUM NOBILE*: TRANSVERSE SECTION OF LEAF.

A, Epiderm overlain by cuticle; B, Water-cells; C, Green cells; F, Fibro-vascular bundles; G, Spongy tissue.

FIG. 116.—*LYCASTE HARRISONI*: SECTION OF LEAF.

FIG. 117.—*CATTELEYA LAWRENCEANA*: SECTION OF LEAF.

(For explanation, see text.)

*Masdevallia othodes*, *M. porcellipes*, *Lycaste Harrisoni*, *L. Skinneri*.

The above remarks, fragmentary and incomplete as they are, may yet serve to call attention to the subject, and if so the object in writing them will have been obtained. *M. T. M.*

## AMONG THE ORCHIDS.

ORCHIDS AT CAMDEN WOOD, CHISLEHURST.—This remarkable collection of Orchids is looking just now exceedingly well, and contains many novelties in flower. In the East India-house noticeable are *Phalaenopsis Sanderiana*, the varieties of which vary very much, but all are good; *P. Ludemanniana* is also good; *Cypripedium Stonei*, *C. Lawrenceanum*, *C. levigatum*, *C. barbatum*, *C. Boxalli*, *C. Sedeni*, *C. Harrisonianum* are all in flower; also a pretty little *Galeandra*; *Odontoglossum Roezlii* and *O. R. alba* also. The *Cattleya*-house contains fine varieties of *C. Trianae*, one being particularly fine and very distinct, called *rosea*; a fine variety of *Dendrobium nobile*, and *D. pendula*, *D. primulinum giganteum*, a very fine variety; *D. Farmeri aurea*, *Ceologyne ocellata*, *Epidendrum Pseudo-Epidendrum*, *Trichopilia coccinea*, *Odontoglossum citrosum* and *O. roseum*, *Lælia harpophylla*, very bright; and a fine *Cymbidium Lowii*, a good variety, five spikes, over ninety flowers. The cool-house was very gay with *Odontoglossum Alexandræ*, including many fine forms; also *O. Pescatorei*, *O. Cervantesi*, *O. gloriosum*, *O. Sanderianum*, *O. Halli*, *O. maculatum*, *O. citrosum*, *O. deltoglossum*, *O. Wilckeanum*, *O. triumphans*, *O. Rossi majus*, *O. pardinum*, *O. Oerstedii*, *O. roseum*, *O. sceptum* were all flowering freely; *Ada aurantiaca*, *Restrepia elegans*, *Lycaste Skinneri*, many. *Masdevallias* were also good, viz., *M. Chimæra*, *M. Chelsoni*, *M. triangularis*, *M. Veitchii*, *M. ignea* varieties of *M. Lindeni*, *M. Shuttleworthiana*, *M. Estradæ*; the pretty bright *Sophronites grandiflora* also figures conspicuously. There are many other varieties showing flower in the various departments, and a grand succession of flowers will be the result for months to come.

SYLVERDALE LODGE, SYDENHAM: W. COBB, ESQ.

Orchids are here well done; in fact, it would be a difficult matter to particularise any class in which Mr. Cobb, the gardener here, excels, as all plants under his care seem to thrive admirably. At the time of our visit most of the houses were very gay with bloom, as will be seen from further remarks. *Dendrobiums*, unpruned, but still in vigour sufficient to question the advisability of that process, were in strong force, and nice pieces of *D. thyrsiflorum*, *D. Wardianum*, *D. Farmeri*, *D. japonicum* thriving admirably on a block; *D. fimbriatum oculata*, *D. Ainsworthii*, *D. crassioide*, and *D. c. Barberianum*, a very bright variety, from Siam; *D. Pierardi*, and *D. P. latifolia*, a newer species, were in bloom. *Cattleyas*, too, are well done, and several good forms of *C. Meadei* are quite deserving of special notice; *C. Mossiæ*, *C. Skinneri*, one fine piece with seven spikes carrying five blooms each; *C. granulosa*, an uncommon variety of a general dun colour, with dark brown spots and bright lip; nice bits of *C. citrina*, and many other varieties, giving evidence of the care bestowed on them. *Lælia purpurata* and *L. elegans* are well represented. *Vandas tricolor*, *suavis*, and *coerulescens* are all well bloomed. *Masdevallias* and *Odontoglossums* appear to thrive well together here, and a nice selection of both are in bloom. Amongst the former, *M. Harryana*, *M. Lindeni*, *M. Shuttleworthi*, *M. amabilis*, very fine variety; *M. cochiflora*, *M. Harryana regalis*, and *M. Wagneriana*; and the latter are represented by several fine forms and varieties of *O. Alexandræ*, *O. triumphans*, *O. Oerstedii*, *O. Pescatorei*, *O. citrosum*, *O. polyanthum*, *O. maculatum*, *O. gloriosum*, *O. luteo-purpureum*, and *O. Andersonianum*. The majority of *Cypripediums* here receive moderately cool treatment, and appear to thrive under it. The following varieties are in bloom; *C. barbatum*, *C. superbum*, *C. Lawrenceanum*, a good piece; *C. Warneri*, *C. ciliolare*, *C. levigatum*, and *C. niveum*; *Oncidium cucullatum*, *O. concolor*, *O. dasytyle*, and an exceedingly fine variety of *O. varicosum*, with very large bright coloured flowers, are flaunting their showy blooms amongst the other species, and contrasting strikingly with them. *Epidendrum vitellinum majus*, *E. bicornutum*, *Sophronites grandiflora*, *Trichopilia suavis*, *T. crispa*, claret colour; *Maxillaria tenuifolia*, *Miltonia cuneata*, *Lycaste Harrisoni*, and *L. Skinneri*, with bright coloured lobes and a pure white lip; *Phalaenopsis rosea*, *P. grandiflora*, *P. Sanderiana*, and *P. Ludemanniana*; *Chysis Limminghi*, like *Cymbidium eburneum*, very delicately marked with

violet; and *Ada aurantiaca*, marked and dotted with black spots, also contribute towards making this collection attractive.

#### THE FIRS, SYDENHAM: C. DORMAN, ESQ.

The display of bloom is highly creditable. The collection contains some curiosities, besides some fine plants. In bloom are *Dendrobium luteolum*, *D. tenuifolium*, *D. anosmum*, *D. Wardianum*, *D. crassinode*, *D. nobile*, *D. Dalhousianum*, a noble Orchid; *D. Ainsworthii*, *D. Freemanni*, *D. heterocarpum*, *D. Jamesianum*, with fifty flowers on a spike in a 5-inch pot; *D. japonicum*, *D. infundibulum*, and a nice piece of *D. Jenkinsonii* doing very well on a block; and the rarely flowered *D. cambridgeanum*, bad to flower in general, like a yellow *Wardianum* with a heterocarpum lip, very showy, it does not require much water while growing, but when flower-buds are formed is treated to both heat and moisture. Amongst *Cattleyas* several forms of *C. Trianae*, *C. Schilleriana*, *C. Skinneri alba*, *C. Mendelii*, *C. maxima*, *C. citrina*, and some fine bits of *C. Mossiae*, some with sixteen blooms in 8-inch pots; and one very fine one, 8½ inches in breadth, across the sepals 2½ inches, breadth of lip 2½ inches, and length of ditto 3½ inches. *Lælia flava*, fine bright yellow; *L. elegans*, and *L. cinnabarina*, bright deep orange. A small collection of *Anæctochilus* is doing better than is generally seen. *Cypripediums* make a fine show with the following varieties:—*C. Stonei*, *C. concolor*, canary-coloured; *C. niveum*, *C. Swianum*, *C. Lowianum*, *C. Lowi*, *C. Warneri*, *C. lævigatum*, *C. ciliolare*, *C. Dayanum*, *C. villosum*, *C. Sedeni*, and a nice plant of *C. Boxalli*. *Cologyne Massangeana*, with seventeen flowers on a spike, and *C. ocellata*. A fine piece of *Oncidium Marshallianum* has thirty-six flowers; and amongst *Odontoglossums* a large selection are in bloom:—*O. Roezlii* and *O. R. alba*, *O. Pescatorei*, *O. citrosum*, *O. Andersonianum*, *O. Alexandræ*, *O. gloriosum*, *O. Rossi majus*, *O. triumphans*, *O. polyanthum*, *O. sceptrum*, *O. cucullatum*, *O. Edwardii*, *O. Jenningsianum*, *O. Ruckerianum*, *O. Cervantesii*, *O. Oerstedii*, *O. nebulosum*, *O. citrosum*, and *O. Sanderianum*. *Masdevallias* make a gallant show with *M. Chelsoni*, *M. Veitchii*, and *M. V. grandiflora*, *M. Estradæ*, *M. Shuttleworthi*, *M. Arminæ*, *M. triangularis*, *M. Stobartianum*, *M. ignea*, *M. Harryana*, *M. Lindeni*, *M. Houtteana*, and *M. ignea majus*; *Vanda suavis*, *Trichopilia Backhousiana*, a fine white variety; *Cymbidium Lowi*; the pretty little *Leptotes bicolor*; *Aspasia lucata*, a pretty *Miltonia*-looking flower; *Lycaste Skinneri*, *Sophrontes grandiflora*, *Utricularia montana*, and the rare species *Polystachia pubescens*, a small yellow flower, all contribute their beautiful flowers to enrich this interesting collection.

#### LAWRIE PARK, SYDENHAM: A. SILLAN, ESQ.

At this place Orchids in general have found a home suited to their requirements, and some of those known as "bad to do" are here thriving nicely. Such plants as *Barkeria spectabilis* and *Cattleya Acklandii* are doing very well and flowering freely enough. *C. citrina* is here represented by a very fine type of a very deep colour, and of great substance of bloom; *C. Mossie* by a magnificent plant of nineteen flowers of a fine colour and large, the leaves and pseudobulbs being very small. *C. Schilleriana* *Regnelli*, also reckoned by most growers as a "bad 'un" to grow, is here doing very nicely on pieces of Tree Fern. There are large pieces of *Cymbidium Lowi*, *Lælia elegans*, a nice lot of *Dendrobiums*, including *D. thyrsiflorum*, *D. densiflorum*, *D. Jamesianum*, *D. Pierardi latifolia*, *D. tortile rosea*, *D. primulinum*, *D. crystallinum*, *D. microphyllum gigantea*. The *Odontoglossums* are exceedingly well represented here, several of the varieties being remarkable both for size and colour. The following are in bloom:—*O. vexillarium*, *O. Roezlii*, *O. R. alba*, *O. Lehmanni*, *O. Cervantesii*, *O. Oerstedii*, *O. Pescatorei*, *O. hystris*, *O. leucoglossum*, *O. polyanthum*, *O. membranaceum*, *O. Uro-Skinneri*, and some of the most lovely forms of *O. Alexandræ*. *Cypripediums* are represented by *C. Dominionum*, *C. Argus*, *C. villosum*, fine var.; *C. Boxalli*, *C. Pearcei*, *C. caudatum*, *C. Stonei*, and a grand form of *C. Lawrenceana*; *Oncidium sessile*, *O. ampullaceum majus*, and a fine plant of the curious *O. metallicum*; *Masdevallia ignea*, *M. Veitchii*, *M. Harryana*, *M. amabilis*, *M. polysticta*, *M. bella*, *M. Lindeni*, *M. Shuttleworthi*, and *M. triangularis*; *Epidendrum cochleatum*, more

curious than beautiful; *Lycaste cruenta* and *L. Lawrenceana*, *Aërides japonicum*, *Scuticaria Steeli*, a curiosity as regards foliage, but the flower is decidedly

FIG. 118.—LEAF SECTION OF *CYPRIPEDIUM NIVEUM*.

FIG. 119.—LEAF SECTION OF *DENDROBIUM JENKINSONII*.

FIG. 120.—SECTION OF ROOT OF *SACCOLABIUM*, SHOWING THE CELLS WITH SPIRAL THREADS.

pretty; *Saccolabium curvifolium* and *Phalænopsis Sanderiana*, all doing well and carrying fine spikes. Many other Orchids here at present not in bloom are well worthy of notice, but space will not allow.

#### GUNNERSBURY PARK, ACTON, MIDDLESEX.

THIS well known place is just now in its early spring raiment, looking exceedingly well both inside and out. In the vineries and Peach-houses the trees are remarkably clean and healthy and carrying large crops. The forced Strawberries, of which 7000 are annually used, are superb. The varieties forced are *Vicomtesse Héricart de Thury*, *Keens' Seedling*, *British Queen*, and *President*. A house of early Melons was carrying a fine crop. The first fruit was cut on April 24. Early Figs were still bearing large quantities of fruit, which they have been doing since the middle of March. In the orchard-house a very fine set of Cherries has been secured, which look very promising.

In the plant-houses the hard-wooded plants, *Cape Heaths*, *Azaleas*, &c., were full of bloom and vigour. In the Orchid-houses a nice display of bloom was to be seen, consisting of *Cypripedium Lowii*, *C. Harrisonianum*, *C. Stonei*, &c.; *Phalænopsis Ludemanniana*, a fine form; and the curious *P. Manni*. A nice show of *Dendrobiums*, including *D. densiflorum*, *D. devonianum*, *D. fimbriatum oculatum*, *D. nobile*, *D. Wardianum*, *D. Farmeri*, *D. F. aureum*, a fine thing; and *D. cirrosum*; *Saccolabium ampullaceum*, *Calanthe veratrifolia*, *Phaius albus*, *Epidendrum bicornutum*, *Trichopilia suavis*, *Oncidium Weltoni*, *Lycaste Skinneri*, *Cymbidium eburneum*, and *Odontoglossum gloriosum*, *O. maculatum*, *O. Rossi majus*, *O. Pescatorei*, *O. tripudians*, and *O. caudatum*. *Gardenias* in pots were looking very clean and healthy; and the large quantity of *Ixoras* were growing like Willows—a marked contrast to the starved looking objects one is accustomed to see.

#### HOME CORRESPONDENCE.

**Amaryllis at Westonbirt.**—Those who admire and are interested in the cultivation of the *Amaryllis* should without delay visit the collection of R. S. Holford, Esq., Westonbirt, Tetbury, Gloucestershire, a pleasant drive of about 5 miles from Malmesbury station on the Great Western Railway. I think I may safely say that Mr. Holford's is the largest private collection in the country, and one of the oldest, if not the oldest cultivated, and many new and beautiful varieties have been the result of Mr. Holford's careful crossing and intercrossing. The object that has been kept in view has not so much been size as shape, richness of colour, and distinctive character. The *Amaryllis*, like many other flowers, may be increased in size until they become coarse, and consequently colours not well defined. It would be useless to give a list of what is in flower at one visit, as the *Amaryllis* are in flower here nearly all the year; this has also been an object Mr. Holford has kept in view—to make them as nearly perpetual as possible. And now the *Amaryllis* has become such a favourite flower it would be a great assistance to cultivators if Mr. Holford would give them the benefit of his experience, also a list of the best and most choice varieties that he has raised and named, with about the time of year for flowering. Mr. Chapman, the enthusiastic gardener, seems perfectly at home among them, knows the parentage of nearly every flower, and seems as if he could never leave off talking about them. *A Visitor*.

**Early Mushrooms.**—It is unusual, is it not, for Mushrooms to spring up on grasslands in the month of April? I had two large dishfuls brought to me very early in last month, and felt a little doubtful at first as to whether they were the true meadow Mushroom or a poisonous kind, but a closer examination satisfied me that they were right, so they were cooked and eaten at breakfast. The only difference I detected between them and the summer kind was that they produced less juice, or catsup; but, nevertheless, they had the real flavour of the *Agaricus campestris*. *Helen Watney*.

**The Hardy Fruit Crop.**—The display of blossom upon all kinds of hardy fruits has this spring exceeded anything I have witnessed during the last quarter of a century. Each kind has vied, not only in quantity, but the quality of the blooms with others. The habitually poor display of blossom made by *Williams' Bon*

Chrétien Pear has given place this year to wreaths of white bloom. Apricots, Peaches, and Nectarines against walls, to which no protective coverings were applied, have set their crops abundantly. All kinds of Apples, even young trees of Blenheim Orange, are a mass of perfect blooms. The old Catshead Apple, one of the finest of our flowering trees, has clusters of immense size. The crop will be so excessive that, unless we experience some frosts to thin the fruit, the trees will be overcropped, to their future injury. As I write (May 4) hail is falling, and some amount of frost may, therefore, be anticipated. *W. Earley.*

**Chemists and Grocers as Seedsmen.**—I have read with much interest in last week's issue Mr. E. Wilson Serpell's opinion on this subject, and agree with him that it is an innovation, and indeed a very common one throughout the country. I do not think it gives professional seedsmen a fair chance, as chemists and grocers, and I may add ironmoogers, consider in most cases the seed business only of secondary importance, and contrive to sell generally at a very low figure. A seedsman who has to contend against some of these opponents in a locality has often to make his prices correspond with theirs, even if his quality of seeds is of a very superior description. With reference to Mr. Serpell's remark, "that the trade in general will unite with me in saying that we will do our utmost to discountenance the firm or firms who supply them by reserving all orders for those who stick to the trade only," I think he would find the latter few and far between. If Mr. Serpell would take the trouble to inquire who supplies seeds to grocers and chemists, he would find that their supplies come from some of the most respectable wholesale houses in the country. I know from several years of experience in one of the largest wholesale houses that chemists and grocers are very valuable customers, not only for vegetable and flower seeds, but also for agricultural seeds. As to the flower seeds in packets at *1d.* each, I think I am not mistaken if I state that several houses make a specialty of these articles for the parties referred to. I hope with Mr. Serpell that this matter may be ventilated, but I myself have not the slightest idea how the state of affairs might be improved, as there will always be plenty of sources from whence grocers and chemists can procure their supplies. *E. F. W. H.*

—We have a grocer here as a seedsman who not only supplies seeds in *1d.* packets but also in any quantity, of many kinds of vegetable and flower seeds, and at about half the prices of any ordinary retail catalogue. This man advertises his seeds in the local newspaper here, and he is supplied by a wholesale seed merchant in London. *A. Watkins.*

**Curious Record of a Hail Storm.**—In a very old farmhouse at Biscot, near Luton, Bedfordshire, the following inscription is engraved on an old stone chimney-piece:—"There was hailstones fell July 23 of this bigness and likeness, 1666. T. T." One "likeness" shows a circular stone, half an inch in diameter, another is oval, and measures an inch in length. *W. G. S.*

**Cattleya gigas.**—I have a plant of *Cattleya gigas* started in a pan last September, now about to expand five blooms on its first-made bulb. I think this is unrivalled. *De B. Craschay.*

**Strawberry Plants for Forcing.**—It seems probable that the old plan of stacking up Strawberry plants intended for forcing in pyramids on their sides during winter will soon become an obsolete practice. No one can look through the forcing houses at Gunnersbury Park and witness Mr. Roberts' Strawberry forcing, or witness what his neighbour, Mr. Hudson, is doing in the garden adjoining, without being struck with the quality of their Strawberry plants, their massive crowns, and the fine crops of fruit they are producing. Now both these clever gardeners have abandoned the practice of piling up their plants in pyramids during the winter, but plunge them in sunken beds either in cocoa-fibre or leaves, thus allowing autumn and winter rains to fall upon them as they like. This appears far better than drying off the plants, and so ripening the crowns to induce an early growth. The plants exposed all the winter make vigorous tufts, and when placed in heat they come away quickly and with a great profusion of bloom, that sets and fructifies into fine fruit. Gar-

deners, in common with other workers in different departments of practical work, are found breaking away from old traditions and practices, and with advantage. During the past few years many old methods have given way to others suggested by new experience and larger knowledge. *D.*

**Cabbages.**—As spring Cabbage are now turning in it is a good time for comparing notes and taking stock as to which are the best; and if this were done annually, or the different kinds got together and compared, many that are now grown would be discarded and the public benefited by the weeding out, as there always is, and must be, a loss from having bad sorts. Among those that stand out superior above all others for first cutting, I should place Ellam's Early, which is a close little Cabbage that has few outer leaves, and a tight conical heart, and which is tender and delicious when cooked. Wheeler's Imperial used to be a great favourite, and is still cultivated extensively in the west of England; but it is very inferior to Ellam's, as is shown conclusively by rows of it we have side by side with the latter, which are regular and good all through, while Wheeler's are the reverse, and many of them bolting although sown on the same day as Ellam's. No doubt much of the great regularity and evenness of the last named is due to careful selection in saving the seed, and it is a good plan for those who are particular in having fine Cabbages to pick out and mark one or two for stock each year and let the stalks stand, by doing which a pure strain may be kept. This is what cottagers usually do, and it is quite common to see them with excellent beds in their garden. The kind they generally run on is the Battersea or Fulham, which is rather large, and a first-rate Cabbage when true. The Enfield Market is also good, but these two turn in later than Ellam's, which may be planted closer than these two and quite as much weight got off from the ground. Atkin's Matchless I shall grow no more, as that is the worst variety we have this year; but I was greatly pleased with a bed of Gilbert's Improved Nonpareil that I saw at the Chantry, near Ipswich, the other day, all the Cabbages in which looked as if they had been cast in one mould, so good were they all through the piece. *J. Sheppard.*

**Gardenias and their Culture.**—Under this heading a great deal has been written of late, and as the results I am now obtaining are satisfactory, perhaps the mode of treatment adopted here may be of service to some, so with that end in view I will briefly give the course of treatment pursued. In the beginning of March last year I had a number of cuttings inserted in 6-inch pots, about a dozen in each pot; they were then plunged into brisk bottom-heat, the result being that they all emitted roots in a short time. As soon as they were struck they were potted off singly into 3-inch pots, and were again plunged into heat. Here they remained until the roots reached the outside of the ball, when they were again potted into 5 and 6-inch pots. They were again returned to the bottom-heat, where they remained until they were ready for their final shift into 7, 8, and 10-inch pots; that being effected, the plants made rapid progress. Through every stage they received a liberal supply of manure-water, and were never allowed to get dry at the roots. At no period was much air admitted to the pit where they were growing. They were kept well pinched until the end of July, and were heavily syringed twice a day. On several occasions they were dipped in a large bath of warm water, to which a mixture of paraffin-oil, soft-soap, and tobacco had been added. They also had some good drenchings of cold water from a hose fixed on an inch pipe with a good force. From the beginning they were potted in good fibrous loam, with a little coarse sand added. Some fifty plants have from sixty to 120 bloom-buds on each plant. As it is only thirteen months since the cuttings were put in I think they are a very satisfactory lot indeed. I may add that one bloom I cut a few days ago measured 4 inches in diameter. *George Malcolm, Willington Hall.*

**Primula Sieboldi.**—This race of fine Primulas was not so well represented at the Auricula show on the 21st ult. as might have been expected, and the illustrations of it seen were of a character to injure it in public estimation. It had been necessary to subject them to some forcing to get them into flower, and it is a plant that does not force well, as leaves and flower-stalks alike take on a drawn and weakened appearance. The plants may be brought on in a cold

frame or house, supposing that air can be freely given when required, and then they show themselves in their natural character. But handsome as they are, and varied in character, it is surprising into how many gardens one may go, and not see a specimen of *P. Sieboldi* itself. Is it because the varieties are not known, or because they are difficult to grow? A few years ago there did appear to be something like a run upon them; but they are now seldom seen, more's the pity, for it is open to doubt whether there is a more useful race of hardy Primulas. It has just been stated they are varied in character. In addition to the varieties raised by Messrs. Dean, Allen, Victor Lemoine, and others, a remarkable advance has been seen in some varieties raised during the past few years by Mr. George Geggie, of the Waterloo Nursery, Bury. This season he announces a batch of twenty new varieties. It must be admitted that Mr. Geggie has been more successful in raising quantities of new varieties than has fallen to the lot of any previous one engaged in this work. *P. Sieboldi* is a somewhat perplexing plant as regards seedling in that fine plump seed-pods develop themselves to all appearance full of seed, but which when gathered, do not contain a single grain. Cross-fertilisation does, undoubtedly, assist in the production of seed as well as ensuring variety of character in the seedlings. Some of the new varieties now in course of distribution by Mr. Geggie were last year seen at one of the meetings of the Royal Horticultural Society, and the high award of a First-class Certificate of Merit was made to two or three of them. The complete list is as follows:—Arthur, deep rosy-pink, stout and of good form; Blushing Bride, white, flushed with rose, very prettily fringed and excellent quality; Blanche, white, the reverse pink—large bold truss and dwarf habit; Brilliant, rich rosy-crimson—an extra fine variety of excellent properties and good habit; Charmer, white, pencilled with pink—large and fine; Crimson King, rich deep crimson—large flowers of extra fine form and substance; Delicata, clear pale lilac—large flowers deeply fringed; Gem, deep reddish-purple—fine stout flowers of the best form and good habit; Harry, crimson and white, large fringed flowers of good form—a very fine and distinct variety; Jane, white, tinted with rose—large flowers of extra fine form; Mars, reddish-purple, handsomely fringed—dwarf good habit; Mrs. Geggie, clear rosy-pink, large fringed flowers of the finest form—an extra fine variety; Mrs. Crossley, pale rose—a charming variety of excellent form; Novelty, pale lilac, softening to white, very prettily fringed—quite distinct and very pleasing; Othello, very dark purple—good habit; Pearl, white, with a delicate tinge of lilac, changing to pure white with age—large and of fine form; Polly, pale rose, large flowers of the finest form, forming a noble truss; Parity, white, perhaps the finest white variety yet raised—flowers stout and massive; Purple King, clear purple, large and well formed flowers of excellent quality; and Victor, rosy-red, large, stout, and extra fine—good habit. With such a remarkable addition to the lists of varieties already being grown there need be no difficulty in forming a very fine and select collection. It is to be hoped that the projected Primula Conference, to take place in April next, will do something towards bringing prominently into notice the value of the varieties of *P. Sieboldi* as hardy spring decorative plants. *R. D.*

**Lux Calor Gas Stove.**—I have had one of these in my flower shop more than a year, and find it heats the shop beautifully without the least injury to flower or foliage, and emits no smell of gas. In the spring I placed it in the fireplace of a sitting-room where a fire was only wanted during the evening, and it answered just as well. *J. Sander, Newnham Nursery.*

**Eucharis Mite.**—What a pity it is there should be so much difficulty or dispute in deciding to whom belongs the credit of having been the first to introduce the *Eucharis mite*, to the great vexation of the plantsman, but evidently to the delight of the enquiring entomologist. Culturists with whom I have been in conversation, seem to incline to the belief that the mite has been invited or created through a predisposition of the plants having that end as the result. The predisposing causes may have been various, such as over or under watering, over or under heating, over or under shading. All these, severally or combined, although given by mistaken kindness, may have brought it all about. It is, I believe, an acknowledged fact that,

both in the animal and vegetable kingdom, every plant and animal has its respective and peculiar parasite existing in the form of either mite, grub or worm, attacking both externally and internally. These are induced or encouraged in the first instance by neglect or mismanagement, carried on amongst healthy individuals by contagion. Were it in remoter days, when witchcraft was more generally believed in than it is now, we might—as would have been the case in those days—have believed that some old lady of that ilk had looked “mityly” spiteful at Mr. Stevens’ *Eucharis*, throwing amongst them those destructive pests which caused the plants to so collapse suddenly. When living in Staffordshire I remember reading, amongst other legends, one which described a farmer as being cruelly tormented by a witch, in the form of a black beetle, which kept constantly buzzing about his head, and so prevented him from ever having quiet and comfortable ruminations on the probable profits of the return of the farm; and in a similar degree it was also said to have very much interfered with the intensity of his usual religious devotions. How long this purgatorial state of torment continued I do not remember; suffice it to say, that after many a futile clutch, the farmer at last made a lucky snatch, captured the black Coleopterous witch, and had the presence of mind of having it at once interned in his snuff-box—so ended his trouble. We sincerely wish the mite of Trentham could be brought to a similar end. *Wm. Miller.*

## FRUIT NOTES.

**FRUIT PROSPECTS IN SOUTH BUCKS.**—In comparing the condition of the fruit crops out-of-doors at the present time (April 25) with those at the same period last year, I find they are at least a week later. This I take to be an advantage, and augurs well for the future this season. Although climatal conditions this springtime have not been very detrimental to the crops, nor perhaps altogether such as might be desired, still frost has not been severe enough to do any material damage, and if we are spared this infliction a week or two longer our fears in this respect will disappear, and our hopes be partly consummated in regard to the fruit crops. In the gardens in this district, generally speaking, Apricots, Peaches, and Nectarines are fairly well set, and promise to yield a good crop. Pear, Plum, and sweet Cherry trees are loaded with blossom. Although the Apple trees are not in bloom they are abundantly furnished with it. Morello Cherries on northern aspects, which suffered much damage from the frost which did so much mischief on the 19th and 20th of last April, are only just opening their blossoms. All sorts of Currants are showing plentifully. Gooseberries are somewhat advanced in growth, and are a fair crop. Raspberries, which were much damaged last year, are now full of promise, and exceedingly strong and clean. The Apple trees in orchards are teeming with buds and flowers, and the Plums, now going off, were most profusely covered with bloom. This county is somewhat famed for its Cherry orchards, which are numerous, and some of them very extensive; the existence of these may doubtless be ascribed to the fact of the species being indigenous, and now the wild Cherry tree abounds in the Beech-woods in this part of the shire, showing unmistakably that the nature of the soil, and other existing matters, are suitable to its development. I gather from this a primary reason for the numerous trees and orchards which were formerly so extensively planted. Neither frost nor rain have impaired or marred the beauty of the Cherry bloom this season; it is therefore exceptionally fine, and in the current week the trees have been a sight of beauty worth a journey of some distance to behold. The appearance of the wild Cherry trees also, in their normal condition in the woods, “where they attain a large size, and form a valuable timber tree,” now presents a pleasing prospect on the otherwise more sombre appearance which the surface of a Beech-wood now naturally presents. *G. T. Miles, Wycombe Abbey*

### TRIUMPH VON JODOIGNE PEAR.

This fine Pear was raised from seed by M. Bouvier, Bürgermeister of Jodoigne, in Belgium. The fruit is large, sometimes very large, and of regular form. The flesh is white, very fine in the grain, with much grittiness near the core, very juicy, almost melting and refreshing, with a fine astringent sweet flavour. Ripe end of November, and keeps good for about four

weeks. The tree does not make a good pyramid, but grows well and fruits early on the Quince. *Oester-ungarischer Obstgarten.*

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, MAY 6, 1885.

MONTH AND DAY.	BAROMETER.		TEMPERATURE OF THE AIR.					HYGROMETRIC DEDUCTIONS FROM GLAISHER'S TABLES 6th Edition.		WIND.	RAINFALL.

April 30.—Fine morning. Dull afternoon and night.

May 1.—Very fine and bright in early morning, showers of rain during the day.

2.—Very fine and bright morning, dull afternoon and evening.

3.—Very fine throughout.

4.—Dull morning. Fine afternoon. Dull night.

5.—Frequent showers of rain during the day and night.

6.—Heavy rain in early morning. Showers of rain during the day and night.

**LONDON: Atmospheric Pressure.**—During the week ending May 2, the reading of the barometer at the level of the sea increased from 29.41 inches at the beginning of the week to 29.74 inches by 1 P.M. on the 27th, decreased to 29.73 inches by 5 P.M. on the same day, increased to 29.76 inches by 9 A.M., decreased to 29.65 inches by 5 P.M. on the 28th, increased to 29.87 inches by 9 A.M. on the 30th, decreased to 29.48 inches by 1 P.M. on May 1, increased to 29.68 inches by 5 P.M. on the same day, and was 29.64 inches by the end of the week.

The mean reading of the barometer for the week was 29.69 inches, being 0.18 inch lower than last week, and 0.26 inch below the average of the week.

**Temperature.**—The highest temperature was 69°.5 on the 28th; the highest on May 2 was 58°.5. The mean of the seven high day temperatures was 62°.8.

The lowest temperature was 40°, on April 30; on the 29th the lowest temperature was 47°. The mean of the seven low night temperatures was 43°.

The greatest range of temperature in one day was 27°, on the 28th; the smallest was 15°, on the 29th. The mean of the seven daily ranges was 19°.8.

The mean temperatures were—on the 26th, 53°.7; on the 27th, 53°.4; on the 28th, 56°; on the 29th, 52°.4; on the 30th, 50°.8; on May 1, 48°; on the 2d, 48°.5; of these the first five were above their averages by 5°.2, 4°.7, 7°.1, 3°.3, and 1°.4 respectively, and the last two were below by 1°.8, 1°.6 respectively.

The mean temperature of the week was 51°.8, being 2°.4 lower than last week, and 2°.6 above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 132°.5, on the 28th. The mean of the seven readings was 113°.8.

The lowest reading of a minimum thermometer placed on grass was 31°.5 on May 2. The mean of the seven readings was 35°.4.

**Rain.**—Rain fell on five days to the amount of 0.54 inch, of which 0.40 inch fell on April 29th.

**ENGLAND: Temperature.**—During the week end-

ing May 2, the highest temperatures were 69°.5, at Blackheath and Cambridge, 66° at Hull; the highest at Bristol and Liverpool was 59°, at Bolton 59°.8. The general mean was 63°.1.

The lowest temperatures were 33°, at Truro and Hull, 33°.1 at Wolverhampton; the lowest at Newcastle was 42°, at Brighton, 41°.5, at Blackheath, Sunderland, and Preston, 40°. The general mean was 37°.4.

The greatest ranges were 33° at Hull, 32°.5 at Cambridge, 30° at Sheffield; the smallest ranges were 18° at Newcastle, 20° at Preston, 20°.4 at Liverpool. The general mean was 25°.7.

The mean of the seven high day temperatures was highest at Cambridge, 63°.4, at Blackheath 62°.8, at Nottingham and Sheffield 60°.3; and was lowest at Plymouth, 55°.5, at Newcastle 55°.8, at Bolton 56°. The general mean was 58°.6.

The mean of the seven low night temperatures was highest at Newcastle, 45°.5, at Brighton 44°.5, at Preston 43°.9; and was lowest at Wolverhampton, 38°.5, at Bristol 40°.4, at Bolton 40°.5. The general mean was 42°.5.

The mean daily range was greatest at Cambridge, 20°.9, at Wolverhampton 20°.1; at Blackheath 19°.8; and was least at Newcastle, 10°.3, at Plymouth 13°, at Sunderland 13°.3. The general mean was 16°.1.

The mean temperature was highest at Blackheath, 51°.8, at Cambridge 51°.4, at Nottingham and Leeds 50°.2; and was lowest at Bolton, 46°.6, at Wolverhampton 46°.9, at Bristol 47°. The general mean was 48°.9.

**Rain.**—The largest falls were 1.09 inch at Truro, 0.92 inch at Plymouth, 0.71 inch at Hull; the smallest falls were 0.17 inch at Sheffield, 0.20 inch at Cambridge, 0.23 inch at Nottingham. The general mean fall was 0.49 inch.

**SCOTLAND: Temperature.**—During the week ending May 2, the highest temperature was 60°.9, at Leith; at Aberdeen the highest temperature was 57°.6. The general mean was 59°.6.

The lowest temperature in the week was 35°.8, at Aberdeen; at Greenock and Paisley the lowest temperature was 40°.2. The general mean was 38°.6.

The mean temperature was highest at Edinburgh, 50°; and lowest at Aberdeen, 46°.4. The general mean was 48°.7.

**Rain.**—The largest fall was 1.55 inch at Perth; the smallest fall was 0.73 inch, at Edinburgh. The general mean fall was 1.01 inch.

JAMES GLAISHER, F.R.S.

## Obituary.

WITH regret we announce the death of Mr. GEORGE PHIPPEN, of the Victoria Nursery, and 108, Broad Street, Reading, which took place on the 1st inst., at the age of forty-nine, from cancer. No tradesman in Reading was more deservedly respected than he was for his real goodness of heart, his unassuming manner, and steady assiduity in his business. The Reading Horticultural Society loses in him an efficient helper as its Curator, and the Corporation of the town will also miss him, he having been their contractor for the keeping in order of the Forbury Gardens and recreation grounds.

**BOOKS:** *F. T. Henfrey's Elementary Course* (Van Voorst) contains more recent information and fuller particulars, but is not so well illustrated as the work you mention, which you ought now to buy more cheaply.

**CABBAGES GOING BLIND:** *Exon.* We are not acquainted with the reason for this, and do not think it is owing to insect agency. It is usually observed most where thick seeding has been done, but that may be owing to greater numbers of plants coming up, showing more affected plants, although the proportion of abortive plants to sound ones may be the same as would be observed with their seeding.

**FUNGUS ON SAVIN:** *C.R.* See the answer to a correspondent last week, p. 580.

**FLOWER FROM NICE:** *M. E.* An *Ixia*, but not a native of that place.

**MATERIAL TO PLACE UNDER FRUIT TREES TO PREVENT DEEP ROOTING:** *H. W.* You may use 6 inches of chalk rammed hard and level, or the same thickness of screened coal-ashes—any hard material of the nature of concrete, using lime or cement as the binding material. In some parts of the country, slabs of stone, slate, &c., joined securely at the edges, will be found the cheapest substances to employ. The stations should not be more than 6 feet square, and in the case of dwarf trees 3 or 4 feet is large enough; and the floors ought not to be more than 2 feet from the surface, nor less than 1 foot, and that only in very wet ungenial soils. In dry soils trees with floors under them suffer from drought in summer and autumn, so that abundant watering has to be done to keep the trees in good health.

**MELON LEAVES SPOTTED:** *G. S.* These may have been burned by inferior glass whilst they were wet, or the appearance might be caused by the fumes from strong ammoniacal manure-water.

**NAMES OF PLANTS:** *J. Morton.* *Santolina incana*—not an *Artemisia*, from which *absinthie* is fabricated. —*Ivy Silverton.* *Trachelospermum jasminoides*, white; *Euphorbia splendens*, red; *Forsythia viridissima*, yellow. —*H. C. E.* *Fritillaria meleagris*. —*F. R.* It is barely possible to name *Eucalyptus* from leaves only. It is near both *E. platyphylla* and *E. polyanthemos*, but we think it is *E. cornuta*. —*W. P. Biern.* *Epidendrum fragrans*, and a very good form of it. —*C. W.* *Orchis Morio*, *Magnolia conspicua*, *Omphalodes verna*. —*R. B. White.* *Odontoglossum Alexandræ* variety. —*H. S.* *Fritillaria meleagris*. —*A. S.* *Narcissus Tazetta* variety, near the form called *N. Panizykanus*, but rather larger.

**PEACH LEAVES:** *P. L.* The circular holes, or those with a nearly regular outline, are caused by drip and subsequent exposure to sun; the long jagged holes look more like the work of insects, but may be from drip also.

**POTATOS FOR IRELAND:** *Paddy.* Improved *Ashleaf*, *Monia's Pride*, *Duke of Albany*, as early as *Myatt's Ashleaf* and a heavier cropper; *Magnum Bonum*, *Rector of Woodstock*, *Schoolmaster*, *Paterson's Victoria*, *Champion*.

**VINE ROOTS DECAYED:** *F. W.* The state of the roots could hardly be worse; the tips were dead, and had been so for a year or more, and there were no feeding rootlets. We cannot say what has brought them into this state—bad drainage, water stagnant in the soil, strong pungent manures, would cause it.

**YELLOW BEGONIA:** *J. B. & Son.* A very fine full bloom of a sulphur-yellow tint. Why not call it *Isabella*? We shall be glad to see any varieties you may think worth your while to send.

### SEEDS.

LONDON: May 6.—There was but little business doing on the seed market to-day, the attendance being small. The home sowing demand seems about over, but some business has been doing in Clover seeds for export. Stocks generally prove smaller than was supposed, and the movement in prices is upwards, where values show any change. More money is asked for Mustard and Rape seed. There is no variation worthy of remark in the trade for Canary and Hemp. White Millet is firmly held at advancing rates. Blue Peas and Haricot Beans sell on former terms. Feeding Linseed is depressed. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

### CATTLE.

At Copenhagen Fields on Monday trade was decidedly better than last reported, both cattle and sheep realising fully 2d. to 4d. per 8 lb. advance. No improvement was quotable in the calf trade; and in the absence of supply, quotations of pigs were nominal. Quotations:—Beasts, 3s. 8d. to 4s. 8d., and 4s. 10d. to 5s. 4d.; calves, 4s. to 6s. 8d.; sheep, 4s. 8d. to 4s. 10d., and 5s. to 6s. 6d.; lambs, 7s. 8d. to 8s.; pigs, 4s. to 4s. 6d. Thursday's trade was very quiet, but prices were maintained.

### HAY.

Tuesday's Whitechapel Market report states that there was a very dull trade, with large supplies. Quotations:—Clover, prime, 80s. to 105s.; prime second cut, 85s. to 110s.; inferior, 45s. to 75s.; hay, prime, 70s. to 96s.; inferior, 25s. to 60s.; and straw, 22s. to 35s. per load.—On Thursday there was a rather larger supply, and trade very dull, at previous prices.—Cumberland Market quotations:—Clover, best, 85s. to 102s. 6d.; inferior, 60s. to 84s.; hay, best, 84s. to 94s.; inferior, 45s. to 75s.; and straw, 30s. to 34s. per load.

### POTATOS.

The Borough Market report states that trade is slack, and supplies fully adequate to demand. Quotations:—Scotch Regents, 80s. to 95s.; Kent ditto, 70s. to 85s.; Champions, 40s. to 50s.; Magnum Bonums, 50s. to 60s.; and Victorias, 70s. to 90s. per ton.—The imports into London last week consisted of 556 bags from Malta and 15 sacks from Rouen.

### COALS.

The following are the prices current at market during the week:—Ravensworth West Hartley, 14s. 9d.; Walls End—Tyne (unscreened), 11s. 3d.; Hetton, 15s. 6d.; Hetton Lyons, 14s.; Lambton, 15s.; Wear, 14s.; East Hartlepool, 14s. 9d.

**Government Stock.**—Consols closed on Monday at 97½ to 97¾ for delivery, and 97½ to 97¾ for the account. The final quotations of Tuesday were 98 to 98½ for both transactions. Wednesday's prices were 98½ to 98½ for both delivery and the account. The closing prices on Thursday, for both delivery and the account, were 98½ to 98½.

## R. HOLLIDAY, HORTICULTURAL IRON AND WIRE WORKER, GARDEN IMPLEMENT MAKER. SWING WATER BARROWS.

## Manufacturers,

DARLINGTON BROS., CHATHAM.  
Old TOBACCO ROPE, very strong, for fumigating, 14 lb., 4s. 6d.; 28 lb., 8s.; 56 lb., 15s.; cwt., 28s.

## Roshers' Garden Edging Tiles.

THE ABOVE and many other PATTERNS are made in materials of great durability. The plainer sorts are specially suited for KITCHEN GARDENS, as they barbour no Slugs or Insects, take up little room, and, once put down, incur no further labour or expense, as do "grown" Edgings, consequently being much cheaper.

GARDEN VASES, FOUNTAINS, &c., in Artificial Stone, very durable and of superior finish, and in great variety of design. F. ROSHER AND CO., Manufacturers, Upper Ground Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.; Kingsland Road, E.

Agents for LOOKER'S PATENT "ACME" FRAMES, PLANT COVERS, and PROPAGATING BOXES; also for FOXLEY'S PATENT BEADED GARDEN WALL BRICKS.

Illustrated Price LISTS Free by Post. The Trade supplied.

ORNAMENTAL PAVING TILES, for Conservatories, Halls, Corridors, Balconies, &c., from 3s. per square yard upwards. Pattern Sheet of Plain or more elaborate Designs, with Prices, sent for selection.

WHITE GLAZED TILES, for Lining Walls of Dairies, Larders, Kitchen Ranges, Baths, &c. Grooved and other Stable Paving of great durability. Wall Copings, Drain Pipes and Tiles of all kinds. Roofing Tiles in great variety, Slates, Cement, &c.

F. ROSHER AND CO., Brick and Tile Merchants. See Addresses above.

SILVER SAND, fine or coarse grain as desired. Price, by post, per Ton or Truckload, on Wharf in London, or delivered direct from Pits to any Railway Station. Samples of Sand free by post. FLINTS and BRICK BURS for Rockeries or Ferneries. KENT PEATS or LOAM supplied at lowest rates in any quantities.

F. ROSHER AND CO.—Addresses see above.

N.B.—Orders promptly executed by Rail or to Wharves. A liberal Discount to the Trade.

## "Gather Honey from Your Flowers."

## NEIGHBOUR'S Celebrated BEEHIVES.

Silver and Bronze Medals awarded at the International Health Exhibition, 1884, to Geo. Neighbour & Sons.

## NEIGHBOUR'S

IMPROVED

## COTTAGE BEEHIVE,

as originally introduced by them, working three bell-glasses or a tray of sectional supers, is neatly and strongly made of straw; it has three windows in the lower Hive.

This Hive will be found to possess many practical advantages, and is more easy of management than any other that has been introduced.

Price .. .. £1 15 0  
Stand for ditto 0 10 6

## NEIGHBOUR'S FIFTEEN

## SHILLING FRAME-HIVE.

This hive has been designed to supply a want long felt by those who desire a Hive at once tasteful in appearance and moderate in price. The walls are built of straw neatly bound with cane. Ample means for ventilation in summer, and sufficient warmth in winter are thus secured. Nine Frames, of the standard size, fitted with metal ends, and a dummy for reducing the Hive, are enclosed therein, a double quilt to place over the Frames, a case of American one-piece sections for supering, and a substantial

cover of wood, to protect from the weather, are also included. Price, complete, 15s.

Also BAR-FRAME HIVES, from 7s. 6d. to 42s. each.

"THE APIARY," by ALFRED NEIGHBOUR. Price 5s., post-free.

CATALOGUE of Improved Beehives and Appliances may be had on application to

## GEO. NEIGHBOUR &amp; SONS,

127, HIGH HOLBORN, LONDON, W.C.,  
and 149, REGENT STREET, LONDON, W.

They are the **nearest, cheapest, most effective, and durable**  
of any extant.

The Tubular ones are remarkable for their great heating  
power, slow combustion, and the length of time the fire will  
burn without requiring attention. This pattern

Had the First and Highest Prize, a Silver Medal,  
Awarded to it at the Royal Horticultural Society's Exhibition,  
South Kensington, London, on June 3, 1881.

The *Journal of Horticulture* of June 9 says:—  
"HEATING APPARATUS.—A great number of boilers, valves,  
&c., were exhibited by eight competitors, and considerable in-  
terest was manifested in the verdict of the judges, and much  
discussion was brought to bear on the merits and shortcomings  
of the different boilers. The apparatus for which the Silver  
Medal was awarded was a wrought-iron saddle boiler, with a  
series of intersecting tubes, somewhat in the form of a letter X,  
but the tubes in ogee form, in the crown of the boiler. Most  
gardeners who examined the boiler expressed a favourable  
opinion of it. It is no doubt a quick and powerful boiler with-  
out being complex, the latter condition having, no doubt, had  
weight with the judges."

The *Garden* of June 11 says:—  
"The premier prize, a Silver Medal, was taken by Messrs.  
Green & Son for their new patent tubular saddle boiler. It is a  
modification of their original patent, the boiler being longer and  
not so high. It is found to be a powerful and efficient boiler, and  
beats a large quantity of water quickly with a small consumption  
of fuel."

Descriptive Illustrated Price List may be had free on application.  
Estimates given for all kinds of Heating Apparatus, and Hot-  
water Fittings of every variety supplied on the shortest notice.

Oil Paint no Longer Necessary.

**HILL AND SMITH'S BLACK VARNISH,**  
 for Preserving Ironwork, Wood, or Stone.  
 (Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 15. 6d. per gallon, at the Manufactory, or 15. 8d. per gallon carriage paid to any Station in the Kingdom.

### UNSOLICITED TESTIMONIAL.

"Pierrefield Park, June 21, 1876.—Sirs,—I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chepstow.—I am, Sirs, yours respectfully, Wm Cox."

**CAUTION.**—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large illustrated CATALOGUE of Fencing Hurdles, Field and Entrance Gates, &c. sent free on application to  
 HILL AND SMITH, Brerley Hill Ironworks, Staffordshire: 118, Queen Victoria Street, London, E. C.; and 196, St. Vincent Street, Glasgow.

THE AUTOMATON.

## RANSOMES' LAWN MOWERS.

### THE "WORLD" LAWN MOWERS

are the best for cutting long grass, and are constructed on the American system with the special advantages of English materials and workmanship.

They are made in nine sizes, 8 to 24 inches.

Prices from 45s. to £10.

### THE "REVERSIBLE" LAWN MOWERS

are suitable for small gardens and borders. They roll the grass as well as cut it, and can be used either side upwards.

They are made in three sizes, 6 to 10 inches.

Prices from 27s. to 45s.

### THE "AUTOMATON" LAWN MOWERS

are the best machines for general purposes and gardeners' use. They leave no ribs in the grass but produce a perfect surface.

They are made in eight sizes, 8 to 22 inches.

Prices from 55s. to £8 10s.

### THE HORSE-POWER MOWERS

are the best for Large Lawns, Cricket and Lawn Tennis Clubs. They are used on the Cricket Grounds of the Oxford and Edinburgh Universities and numerous Colleges and Public Schools.

They are made in six sizes, 26 to 48 inches.

Prices from £14 10s. to £32.

Complete Price LISTS may be obtained from any respectable Ironmonger, or

## BUY ONLY ENGLISH THREE-QUARTER PLATE WATCHES.

BENSON'S NEW PATENT (No. 4658)  
"LUDGATE" WATCH,

SILVER,

£5 5s.

GOLD,

£12 12s.

Is a "Special Strength" Silver English Lever, my best London make, with Three-quarter Plate Movement.

Jewelled throughout.

Chronometer balance, with damp and dust-proof

Patent ring-band, and extended barrel, in

Massive sterling silver dome cases

With crystal glass front.

Winds, set hands and opens at back.

The superiority in value, accuracy, and durability of the "Ludgate" Watch over the Swiss and American Keyless and Non-Keyless Watches, made in imitation of and sold as English work, and the ordinary Full-plate English Watch enormous. The "Ludgate" Watch is compact, strong, handsome, and durable. Being Three Quarter Plate, it is superior in value and appearance to any £10 Watch sold, and, being compensated, it keeps perfect time; fitted with crystal front, it combines the strength of the Hunter, and convenience of the open face. Of my best London make, it will last a lifetime, stand rough usage of all and every kind without damage, and, being made in three sizes, it is for the above reasons suited for Home, Indian, and Colonial use by

Gardeners, Workmen, and Gentlemen.

The "Ludgate" Watch is far superior

To any Watch at the price yet made, and

Will be sent free and safe at our risk

To all parts of the world for £5 5s.

Cash or P.O.O.; or in hunting cases, £6 6s.

Price in 18-carat gold, crystal glass cases,

Twelve Guineas

**SPECIAL NOTE** that J. W. BENSON is the only Maker of a Three-Quarter Plate English Watch for £5 5s. in Silver, or £12 12s. in Gold, and that our Patent "Ludgate" Watch cannot be had through or of any Watchmaker in the Kingdom. Any infringement of the Patent Rights will be proceeded against. A BOOK explaining the advantages of this Watch over the Full-plate English Watches sold by all other makers, will be sent Post-free on application to

J. W. BENSON,

Watchmaker to Her Majesty the Queen, The Steam Factory, 62 and 64, Ludgate Hill, E.C.

Price 1s., by Post 1s. 1d.,

## COW-KEEPING by FARM LABOURERS.

By HENRY EVERSLED, Author of "The Supply of Milk to Labourers," *Journal of the Royal Society of England*, 1880.

On behalf of the Royal Agricultural Society, the Author of this pamphlet visited the principal estates where Cow-keeping by Farm Labourers is encouraged, including that of Lord Toller in Cheshire, where nearly 300 labourers and cottagers keep cows, and insure them in admirably managed cow clubs, presenting the most successful example of Cow-keeping on a well-organised system in England. The pamphlet contains numerous Communications on Cow-keeping by Land Proprietors, and others, with Plans of Cottages, Cowhouses and Outbuildings.

HENRY EVERSLED, Hurstmonceux, Sussex.

#### GRATEFUL—COMFORTING.

**EPPS'S COCOA BREAKFAST.**

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." *Civil Service Gazette*.

Made simply with boiling water or milk. Sold only in Packets, labelled thus—  
**JAMES EPPS & CO., Homœopathic Chemists, London.**

**HOLLOWAY'S PILLS and OINTMENT.**—Rheumatics and Gout.—These purifying and soothing remedies deserve the earnest attention of all persons liable to Gout, Sciatica, or other painful affections of the muscles, nerves, or joints. The Ointment should be applied after the affected parts have been patiently fomented with warm water, when it should be diligently rubbed upon the adjacent skin, unless the friction causes pain. Holloway's Pills should be simultaneously taken to diminish pain, reduce inflammation, and purify the blood. This treatment abates the violence and lessens the frequency of Gout, Rheumatism, and all Spasmodic Diseases which spring from hereditary predisposition, or from any accidental weakness of constitution. The Ointment checks the local malady while the Pills restore vital power.

# GREEN'S PATENT "SILENS MESSOR" AND OTHER, LAWN-MOWING, ROLLING and COLLECTING MACHINES for 1885.

THE WINNERS OF EVERY PRIZE IN ALL CASES OF COMPETITION.

Appointed by Royal Warrant Makers to Her most Gracious Majesty the Queen and His Royal Highness the Prince of Wales, and patronised by the King of the Belgians, the late Emperor of the French, the Emperor of Russia, and most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. *The "Journal of Horticulture," of June 9, says:—* "Mowing Machines.—After a critical examination the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. Green & Son, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 125,000 of these Machines have been sold since they were first introduced in the year 1856,

And thousands of unsolicited Testimonials have been received testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every prize that has been given.

The following are their advantages over all others:—

- 1st. Simplicity of Construction—every part being easily accessible. 2d. They are worked with much greater ease than any other. 3d. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

## SINGLE-HANDED LAWN MOWER.

To cut 6 inches, can be worked by a Lady	Price £1 15 0
To cut 8 inches, do, do, do	2 10 0
To cut 10 inches, do, by a strong youth	3 10 0
To cut 12 inches, do, by a man	4 10 0
To cut 14 inches, do, do, do	5 10 0

## DOUBLE-HANDED LAWN MOWER.

To cut 16 inches, do, one man on even lawn	£6 10 0
To cut 18 inches, do, man and boy	7 10 0
To cut 20 inches, do, do, do	8 0 0
To cut 22 inches, do, two men	8 10 0
To cut 24 inches, do, do, do	9 0 0

\* If made stronger, suitable for Donkey, 30s. extra.

Prices of Donkey, Pony, and Horse Machines, including Patent Self Delivery Box, or Side Delivery, with Cross-stay complete, suitable for attaching to Ordinary Chaise Traces or Gig Harness:—

### DONKEY and PONY MACHINES.

To cut 26 inches	£14 0 0
To cut 28 inches	16 0 0
To cut 30 inches	18 0 0
Leather Boots for Donkey	1 0 0
Leather Boots for Pony	1 4 0

### HORSE MACHINES.

To cut 30 inches	£22 0 0
To cut 36 inches	26 0 0
To cut 42 inches	30 0 0
To cut 48 inches	34 0 0
Leather Boots for Horse	1 9 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machine makes little noise in working, the most spirited animal can be employed without fear of it running away, or in any way damaging the machine.

Packing Cases as per List.

## GREEN'S PATENT "MULTUM IN PARVO" LAWN MOWER.

### PRICES,

With Grassbox.  
To cut 6 in. £1 5 0

**MESSRS. PROTHEROE AND MORRIS** beg to announce that in consequence of the Whitsun Holidays their **NEXT SPECIAL SALE of ORCHIDS** in Flower will take place on **TUESDAY**, June 3, for which they will be glad to **RECEIVE NOTICE of ENTRIES** as early as possible.

Wednesday Next.

**NOTICE of IMPORTANT SALE of WELL-GROWN BEDDING and GREENHOUSE PLANTS, &c.**

To Owners of Ornamental Grounds, Gentlemen, Florists, Nurserymen, and Others.

**MR. J. A. SMITH** having received instructions from Mr. F. Herridge, will **SELL by AUCTION**, on the Premises, known as the Nursery, 47, Fulham Palace Road, Hammersmith, W., on **WEDNESDAY**, May 20, at 1 o'clock punctually, about 25,000 *PLANTS*, splendidly grown, for Bedding, Greenhouse, and Window Decoration, comprising *Geraniums* (including Prince of Wales, Henry Jacoby, Atala, Leander, Niobe, Iris, Guido, Eureka, Olive Carr, Miss Herridge, Gloire de Cerbeay, Master Christine, Madame Vaucher, Madame Crousse, Vesuvius), double pink and white *Ivies*, &c., *Pelargoniums*, *Fuchsias*, *Calceolarias*, *Golden Gem*, *Mesembryanthemums*, *Lobelias*, *Alternantheras*, all ready for sale removal. Viewed the day prior and morning of Sale. Catalogues on the Premises, and at Mr. J. A. SMITH'S Auction, Land, and Estate Offices, 58, King Street East, Hammersmith, W.

To Gardeners and Others.

**TO BE SOLD**, with Gardening and Florist's Business, a 4-roomed **FREEHOLD COTTAGE**, with handsomely fitted Conservatory for Sale of Plants, &c.; Shed and Yard in rear, front and back entrance. Good opportunity for beginners. Owner going abroad on account of ill-health. Price £550; could be mortgaged for nearly the amount. Apply, by letter, to S. JACOB, Nurseryman, Garden Road, St. John's Wood, N.W.

Acton, W.

**FOR SALE**, the **FREEHOLD PROPERTY**, known formerly as Sir John Sebright's Fancypoultry Farm, comprising a nice old-fashioned Residence, with three Reception Rooms, five Bedrooms, Dressing-room, and fitted Bath-room, beautiful Gardens planted with Ornamental Trees and Shrubs in luxuriant growth, Fruit Trees, and some 2000 specimen Rose Trees of the best varieties, Glass Houses and Forcing Pits, Poultry Houses and Run, Yard, two-stall Stable, Gig-house, &c.

May be viewed, by cards only, which, with full particulars, may be obtained of Messrs. FAREBROTHER, LYE AND PALMER, 8, Lancaster Place, Strand, London, W.C.

**NURSERY FOR SALE**.—Five Houses, new and well stocked. Only 5 miles from City. Doing a good London and home trade. Rent £50. Lease twenty years unexpired. Sufficient ground for several more erections. Ill-health the cause of leaving; or would **TAKE PARTNER** on easy terms: should prefer one who would work the business.

Address A. H. GARDENERS' Chronicle Office, 41, Wellington Street, Strand, W.C.

**FOR SALE**, a **FREEHOLD MODEL**

**FARM**, within 8 miles of London and seven minutes of rail, comprising a well-built eight-roomed Villa Residence, a Cottage, Dairy, Two-stall Stable, Coach-house, Cow and Cart Sheds, Figgeries and Fowl-houses, large well-stocked Garden, Meadow and enclosure of rich Arable Land. Price £1800. Part can remain. Stock, if required, at valuation. Owner leaving country.

Apply to A. AND G. GUIVER, Land Agents, Ponder's End, Middlesex

**To Nurserymen, Landscape Gardeners, Florists, and SEEDSMEN.**

**FOR SALE**, an **OLD ESTABLISHED BUSINESS**, in one of the best suburbs of Birmingham, owing to a very serious accident in the present proprietor. The Nursery contains about 2½ Acres, and is well stocked with Shrubs, Trees, and Herbaceous Plants, and Four-Glass Houses, Seed Warehouse, Frames, &c., together with a Stall in Market Hall. The above is thoroughly genuine, and will be sold as a going concern. Possession can be had at once. Price £750. Full particulars from FLEETWOOD AND GOODEVE, Auctioneers and Valuers, 42, Cherra Street, Birmingham.

**TO BE SOLD or LET**, the well known **FREEHOLD MARKET GARDENS**, 9 miles north of London, and five minutes from Whetstone Station (G.N.R.), on account of the ill-health of occupier. They contain about 80,000 feet 21-in. Glass, with every modern improvement, erected within the last few years. Large Boilers, thousands of yards of Hot-water Pipes. Well stocked with Vines, Camellias, Cucumbers, Plants, &c.—noe *Camellia* 20 feet by 20 feet through; all in a high state of cultivation. Good House and Out-buildings, Cottages for men, Vans, Horses, Tools, &c.; occupying about 5 Acres. Part of Purchase-money can remain on Mortgage. There are, further, 13 Acres of Land which may be reserved for Building purposes.

May be seen by applying to Mr. DAVIS, on the premises; or Mr. DAVIS, Friern Lodge, Hereford; or Messrs. PROTHEROE AND MORRIS, 67 and 68, Cheapside, London, E.C.

To Florists.

**TO BE LET**, Rent Free, **EXTENSIVE SPACES and CONSERVATORY** in the **ROYAL AQUARIUM**, for Exhibition and Sale of Flowers, Shrubs, and Plants.

For conditions and other particulars, apply personally to the MANAGER.

**TO BE LET, on LEASE**, a **NURSERY**, comprising 2 Acres of good Garden Ground, Dwelling-house, nine Greenhouses (heated), Pits, Frames, &c. On opposite side of road, 12 Acres of Ground, large Dwelling-house, Stable, Barn, &c. Part stock taken at valuation. Established 20 years.

For particulars, address 31, Market Hill, Cambridge.

**T. HARPAM, PRACTICAL ROCK BUILDER** and **GENERAL HORTICULTURAL DECORATOR** for Caves, Waterfalls, Fountains, &c., 107, Church Street, Edgware Road, London, W.

LIST free. Special prices to the Trade for cash. **W. HERBERT AND CO.**, HOP EXCHANGE WAREHOUSES, SOUTHWARK STREET, S.E. (near London Bridge).

## HORTICULTURAL PREPARATIONS.

The best and most effectual yet introduced.

**FOWLER'S LAWN SAND**, for destroying Daisies, Dandelions, Plantains, Ribbed Grass, Thistles, and other weeds on Lawns, Croquet Grounds, Bowling Greens, Parks, &c.; at the same time acting as a fertiliser, and improving the growth and colour of the grass. Price in tins, 1s., 2s. 6d., and 5s.; kegs, 20 lb. 10s.; 56 lb. 10s.; 112 lb. 10s.

**GARDENER'S INSECTICIDE**, for destroying all the various Insects infesting plants and trees. It is easily applied either by dipping, syringing, or sponging; will not injure the most delicate flower, fruit, foliage, or root. In jars, 1s. 6d., 3s., 5s., 6d., and 10s. each; and in kegs, 28 lb. 21s.; 56 lb. 42s.; 112 lb. 84s. each.

**FOWLER'S MEALY-BUG DESTROYER**, for the special eradication of this most troublesome of stovehouse plant pests. It is easily applied, is instant destruction to both insect and ova, and does not injure the foliage. In bottles, 1s., 2s. 6d., 5s. and 10s.; half-gallon, 21s.; one gallon, 42s. each.

**POOLEY'S WORM DESTROYER**, for eradicating every kind of Worm from pots, lawns, &c. It is easily and cheaply applied, and will not harm the most delicate plant. In bottles, 1s., 2s. 6d., 5s., and 12s. 6d. each.

**EWING'S MILDEW COMPOSITION**, for the prevention or destruction of Mildew on all plants. In bottles, 1s. 6d. and 3s. each.

**ELLIOTT'S IMPROVED "SUMMER CLOUD"** Shading for Greenhouses, &c. For efficacy, economy and lasting effects this article remains unrivalled. In packets, 1s.; 10 lb. 28s.; 28 lb. 50s. See that the Packets have the above Trade Mark, without which none are genuine.

**CORRY, SOPER, FOWLER & CO., Limited**, SOLE MANUFACTURERS, LONDON.

## NORWEGIAN FISH-POTASH GUANOS.

Composed of Pure Flesh and Bone of Cod and Herring and Refined Potash.

A Perfect Fertiliser for Garden and Greenhouse, Lawns and Tennis Courts, Vegetables, Flowers, Exotics and Fruit Trees.

Prices, carriage paid, on receipt of Post-office Order: 28 lb., 6s. 6d.; 56 lb., 10s. 6d.; 1½ cwt., 20s.; 2 cwt., 30s.; 5 cwt., 60s. Bags free.

Larger Quantities at Special Prices, for which, and for Analysis, &c., apply to

**J. JENSEN & CO.**, 10, ST. HELEN'S PLACE, LONDON, E.C. **Manufactory**—**BRETTESENES, LOFFOTEN ISLANDS, NORWAY.**

# PAUL AND SON, THE "OLD" NURSERIES, CHESHUNT, N.,

HAVE THE PLEASURE TO OFFER

THREE NEW ENGLISH-RAISED ROSES for 1885.

*Ready June 1—strong plants in pots—the set for 21s.*

## Hybrid Perpetuals.

**PRIDE OF REIGATE** (Mr. J. Brown and Paul & Son).—The finest striped with white crimson perpetual Rose. Light crimson of Comtesse d'Oxford, from which it sported, charmingly striped with white. As tried here it seems constant and novel, and every care has been taken to fix it permanently. Plants in pots, June 1, 10s. 6d. each.

**MADAME NORMAN-NERUDA** (Paul & Son).—A new flower of the Beauty of Waltham type, but of lighter cherry-carmine. Of medium size, perfect form—a good autumnal. 7s. 6d. each.

**LONGFELLOW** (Paul & Son).—Rich violet-crimson, fine Charles Lefebvre shape: may be called a violet form of that Rose. A desirable addition to the real hardy perpetuals. 7s. 6d. each.

**CHESHUNT-RAISED ROSES** and those sent out by **PAUL & SON**—as **LORD CLYDE**, **DUKE of EDINBURGH**, **CHESHUNT HYBRID**, **ANNIE LANTON**, **SULTAN of ZANZIBAR**, **DUKE of TECK**—named in the *CATALOGUE*.

## PELARGONIUM, "VOLONTÉ NATIONALE ALBA."

Awarded First-class Certificate Royal Horticultural Society, May 12, 1885.

## FREDERICK PERKINS

Has great pleasure to announce that he is now prepared to distribute this splendid new Geranium, which is a sport from the well-known favourite *Volonté Nationale*, with splendid large fringed flowers, of the purest white. A strong grower and continual bloomer, and will be invaluable for cut flowers and every description of decorations.

Strong Plants, 10s. 6d. each. Post-free for cash.

*Sample Flowers sent to intending purchasers.*

## SPECIAL NOTICE.

## GRAND EXHIBITION

OF

## ORCHIDS,

Stove and Greenhouse Flowering and Foliage Plants.

Open to the Public from May 11 to June 30, from 9 a.m. till dusk daily (Sundays excepted).

ADMISSION FREE to those who have received Invitations,

OR UPON PRESENTATION OF CARD.

A large Show House, 100 feet long by 22 feet wide, and an Odontoglossum House, 80 feet long, will be especially devoted to the Orchid Exhibition, and visitors may rely upon seeing these beautiful plants with the greatest degree of comfort, the ventilation and means of ingress and egress, as well as the great width of the paths being all that can be desired. The other Show Houses will be gay with our large collection of Stove and Greenhouse Flowering and Foliage Plants, which have figured at the leading Shows, both at home and abroad, for many years, with uninterrupted success. In addition, the large Winter Garden, 100 feet long by 40 feet wide, will be filled with a fine show of Foliage and Flowering Plants, and will form an agreeable lounge to those wishing to avail themselves of this cool retreat.

## B. S. WILLIAMS,

Victoria and Paradise Nurseries,

UPPER HOLLOWAY, N.

## NEW ROSES.

## WM. PAUL &amp; SON,

Rose Growers by Appointment to Her Majesty the Queen,

## WALTHAM CROSS, HERTS,

respectfully invite attention to the following New Roses:—

## The "WALTHAM CLIMBING" ROSES, Nos. 1, 2, and 3.

Crimson Roses, of different shapes, and distinct shades of colour; No. 1 being the lightest, and No. 3 the darkest. They are seedlings from Gloire de Dijon, possessing all the good qualities of that well-known variety, and are recommended as supplying a long-felt want in the garden, namely, good hardy crimson autumn-flowering Climbing Roses, with fine foliage.

Plants ready the end of May, 10s. 6d. each, or 21s. the set of 3 varieties.

## W. F. BENNETT (Hybrid Tea-scented).

This Rose is recommended by the raiser (Mr. H. Bennett), as the finest red Rose yet introduced for winter blooming and cut blooms at all seasons. The flowers sent to Covent Garden have always realised higher prices than other red Roses in the market at the time. It is of the same colour as Général Jacqueminot, and from its size and the freedom with which the blooms are produced, it has been likened to a crimson "Niphetos."

WM. PAUL & SON have been appointed Sole Agents for the sale of this Rose in Europe. Plants will be ready about June 1. The following prices are for nett cash, and include packing:—

Single Plants, 15s.; 5 Plants, £3 15s.; 10 Plants, £5 17s. Special Prices for larger quantities.

## WM. PAUL &amp; SON'S

## NEW ROSES OF 1884.

CHARLES LAMB (H.P.) Clear bright red.	} Garden Roses.
GARDEN FAVOURITE (B.P.) Fresh pink.	
ELLA GORDON (H.P.) Bright cherry colour.	} Show Roses.
LADY OF THE LAKE (H.P.) Peach colour.	
EMPEROR (H.P.) Very dark, almost black.	} Buttonhole Roses.
EMPRESS (H.P.) White with pink centres.	

Strong Plants, Price 3s. 6d. each.

## SUNSET (Tea-scented).

A sport from Perle des Jardins, with deep Apricot flowers, beautiful in bud; fine for forcing and cutting. First-class Certificate to WM. PAUL & SON.

Price 2s. 6d. to 3s. 6d. each.

## GLOIRE LYONNAISE (H.P.).

A yellow Hybrid Perpetual, partaking of some of the characteristics of the Tea Roses; flowers chrome-yellow, large and full.

Price 3s. 6d. each, 36s. per dozen.

## QUEEN OF QUEENS (H.P.)

(Wm. Paul & Son).

Pink with blush edges, perfect in form, every shoot crowned with a flower-bud. First-class Certificate. Equally good as a garden and exhibition Rose, and decidedly the finest Rose of its colour.

Price 2s. 6d. to 3s. 6d. each.

All other New Roses, both English and Foreign, in strong plants at moderate prices.

Also a large stock of the older varieties, in pots, for spring and summer planting, pot culture, climbing, &c.

Priced descriptive Catalogue, post-free, on application.

See House of Roses, &c., at the Inventions Exhibition, South Kensington, S.W. (near the Concert Room).

THE

## Gardeners' Chronicle.

SATURDAY, MAY 16, 1885.

## THE ORCHID CONFERENCE.

IN the following pages we give the text of the papers read at this meeting. The discussion upon them is briefly reported at another page. For the use of the illustrations which accompany Mr. Harry Veitch's paper we have to acknowledge the courtesy of the *Journal of Horticulture*. Professor Reichenbach's communications had reference to the formation of buds on roots, to the occurrence of three lips and of pelorioid flowers, as described and figured in our last issue, and to the affinities of the genus *Luddemania*.

## PROLIFEROUS ROOTS OF ORCHIDS.

There have been various records of buds originating on roots of Orchids lately, as in the instances quoted by Messrs. Lendy and Salter. I have long since attached great interest to such cases, but I have made only a few observations, one plant only having showed me this method of propagation. It is the Bird's-nest Orchid, *Neottia Nidus-avis*, which very often perishes after having flowered, while in other cases it produces fresh shoots from the axils of certain sheaths. In other cases it produces a fresh plant at the very top of a root-fibre. I saw this as long ago as 1849, when I observed the fact at Tharant. I learned very lately that it had been observed before by T. P. E. Vaucher, in 1841. After Vaucher and myself it was seen by Irmisch, Prillieux, Hofmeister—who got it from me; then it was formally denied by Drude, but re-observed and neatly described by Warming, the excellent Scandinavian botanist.

The second case was observed in my *Phalænopsis deliciosa*, gathered in 1843 by Zollinger. My specimen shows a young plant on a root having just emitted a small rootlet of its own as described by Mr. Salter. This specimen can be seen in my herbarium.

The third case is a sad one. A *Cyrtopodium* (if I remember well, a savannah plant from Venezuela) produced a fine shoot from a root in Consul Schiller's collection, under Mr. Schmidt's able management, I believe, in 1867. I watched it carefully, but at length a young assistant gardener broke it accidentally, and threw the shoot and part of the root away, hoping the loss would never be remarked.

The last case is that of *Saccolabium micranthum*, Lindl. Director Lucien Linden lately sent me a fine Cochinchinese plant, with a young two-leaved shoot on a root. The whole plant was boiled and carefully dried. It may be seen in my herbarium.

## THREE-LIPPED ORCHIDS.

I had seen various monstrous accidental cases of this kind. In all these there were no anthers developed at all, and the genuine free style had a terminal upright stigmatic hollow, without the least pronation (deflexion). The finest thing of this kind that ever came in my reach was a grand flower of

*Oncidium Papilio* with three lips, three sepals, and a fusiform Apostasioid style, without the least indication of anthers or filaments. It was most kindly presented me by my excellent second eldest English correspondent, Mr. J. Day. I remember to have seen a very fine Cattleyoid flower of this kind (if I remember aright, *Lælia elegans*) in the hands of Mr. Thistelton Dyer.

All these cases were accidental, and as the stamens were absent I adopted the view of an *antagonismus* [compensation], the column being reduced, and partly made normal, to pay the vast expense of the luxury of three lips.

Some instances have, however, occurred to me, in which, together with three lips, the column was normal. This was observed a second time on the next shoots of the same plants.

The first case was that of *Oncidium prætexum* Leeanum. The Sanderian traveller, Mr. Osmer, was struck by a panicle laden with such flowers, so that he made the laudable, but unusual, attempt to dry them. They are now, thanks to Mr. Sander's liberality, by my side, eight in number. The plant itself is in the glorious collection of Mr. William Lee, where it produced equal flowers, eleven of which lie before me, thanks to the kind possessor, who will, I hope, watch his precious unique, telling us how long it lasts trilabelliac.

The second case was observed by my highly valued correspondent, Major Lendy, both in 1884 and 1885. It is not quite so evident as the just quoted *Oncidium*, inasmuch as the *Phalænopsis Stuartiana* Lendyana has but one normal lip. Yet the petals approach much more lips than petals. The blunt triangular blades are unguiculate, and bear a callus over the mid base of the lamina.

The third case is that of *Dendrobium nobile* Cooksonianum of Mr. Norman C. Cookson. The flowers are very distinct from those of the *D. nobile* Tollianum, having the petals very thick and hairy over the base, and with the same colour as the lip.

#### LÜDDEMANNIA (CYCNOCHES) PESCATOREI.

This so-called "genus" has proved exceedingly vexatious. It was the late Schlim who discovered it near Ocaña when these were fresh hunting grounds. Director Linden sent a plant to the late Pescatore, of La Celle de St. Cloud. There it flowered. I think but one flower is preserved in Dr. Lindley's collection. I have four of that typical inflorescence. Dr. Lindley took it to be a new *Cycnoches*, an opinion we have seen lately re-accepted by an author, who acting on his own principles, should have avoided doing so, as both the leaves and bulbs are those of an *Acineta* in our plant, while all the *Cycnoches* have them like those of *Catasetum* and *Mormodes*. As soon as I obtained both garden and wild-grown materials I published my genus *Luddemannia* in honour of my late friend Luddemann, who had flowered it.

Director Linden having secured what one then called a great supply, let us say thirty plants, sent them to his correspondents, and acquired, by-the-by, a certain stoicism in enduring the most unfriendly letters from his customers, who accused him of sending *Acinetas* for *Cycnoches*, and asking for the genuine plant. I believe Mr. Louis Schlim sent a second lot, all of which flowered as *Acinetas*. I remember to have seen Mr. Kefenstein, of Kröllwitz bei Halle a. S., quite angry about this, my *Acineta erythroxantha*, which he had paid for as a *Cycnoches*, 1856. Director Linden, after having fully acknowledged Mr. Schlim's so often proved accuracy, told me all his bad experiences, finally adding, "*Je n'y vois que du feu.*" As to poor Schlim, who may have got *des lettres à cheval* from Mr. Linden, he expressed his sentence on a label I have, stating, "*monstre d'un Peristeria.*" The case was nearly forgotten: almighty Time had washed away the bad impression.

The "genus" reappeared with Messrs. Veitch. A fine rich plant was literally laden with pendent

young inflorescences, none of which had developed and proved to appear a fresh *Luddemannia*, showing fine marks of distinction. Messrs. Veitch were so very kind to let me have the plant. Unfortunately all the inflorescences perished *en route*, notwithstanding the excellent packing of the firm, but when the plant flowered next year it showed me the abominable inflorescence of *Acineta erythrocantha*.

A quite different *Luddemannia*, the third one, appeared with a stiff erect inflorescence and quite peculiar flowers. It was discovered in January, 1878, by the late Wallis, who stated that it had the bulb of an *Acineta* and the leaf of a *Peristeria*. I am afraid Wallis made a mistake. I suppose Wallis intended to write that it had the bulb of a *Peristeria*, and thus it might be a sexual form of *Peristeria elata*. Grand inflorescences of the old *Luddemannia* *Pescatorei* were collected and admirably dried for me by Mr. B. Roezl.

Finally, good plants of *Luddemannia* were gathered by Messrs. E. Klaboch and Lehmann, perhaps on the same spot. I am not sure who came first. The majestic likeness presented at the sale is well known. I was led to regard Mr. Lehmann's plant as a new type from his representation and description, and the one dried inflorescence. The other inflorescence and two fresh ones proved to be the typical *L. Pescatorei*. I had the first from Consul Kienast Zölly, Hinslanden, Zurich; the other from an English benefactor, whose name will be, I hope, kindly supplied by Mr. F. Sander, who forwarded me a very well grown grand specimen.

It is my ardent desire to receive once more fresh illustrations of the pleiomorphic state of those flowers which may be sexes of *Acineta*, perhaps also of *Peristeria*. I have obtained well developed seeds from the *Acineta erythroxantha* produced from the *Luddemannia* of Messrs. Veitch. I hope much from the most skilful observer, Herr Consul Kienast Zölly, and of the English gentleman who had such fine flowers. I expect Director Linden, of Brussels, will feel a certain satisfaction if reading this note.

#### HYBRIDISATION OF ORCHIDS.\*

HISTORY.—In a communication "On Hybridisation among Vegetables," by Dean Herbert, of Manchester, published in 1847 in the second volume of the *Journal* of the Horticultural Society of London, I find the following remarkable passage:—"Cross-breeding amongst orchidaceous plants would perhaps lead to very startling results; but, unfortunately, they are not easily raised from seed. I have, however, raised *Bletia*, *Cattleya*, *Herminium monorchis*, and *Ophrys aranifera* from seed; and if I were not, during the greater part of the year, absent from the place where my plants are deposited, I think I could succeed in obtaining crosses in that order. I had well-formed pods last spring of *Orchis* by pollen of *Ophrys*, as well as of other species of *Orchis* which had been forced; and if I had remained on the spot I think I should have obtained some cross-bred orchidaceous seed. An intelligent gardener may do much for science by attempts of this kind if he keeps accurate notes of what he attempts, and does not jump at immature conclusions."

This is the earliest authentic information I have been able to obtain of attempts to raise new forms among Orchids by cross-breeding, and with what success the Dean himself has told us in his own words. At that time, and for some years afterwards, there was a prevalent notion among gardeners that muling among Orchids was an impossibility; and, so far as I am aware, no one attempted it besides Dean Herbert till it was taken up by Dominy at our Exeter nursery about the year 1853. The cause of the prevalent belief of that age in the impossibility of hybridisation among Orchids is not, I think, far to seek.

Dean Herbert was a man of science, and was well acquainted with the structure of Orchid flowers; to him their fertilisation by hand presented no difficulty. To horticulturists and gardeners it was quite different; not only had they, in common with many others, not the slightest suspicion of the fertilisation of Orchids by insect agency, but, moreover, very few of them possessed even an elementary knowledge of botany. They could, it is true, distinguish accurately the stamens and pistils of many flowers familiar to them, and they were aware of the functions of those

organs, but the confluence of those organs into the solid column of an Orchid flower was to them a profound mystery. It was unfortunate, too, that Dean Herbert's injunction to keep accurate notes of what was attempted was not followed in the early days of

Orchid hybridisation, whence the uncertainty that still hangs over the parentage of some of the earlier acquisitions.

It was Mr. John Harris, a surgeon of Exeter, who suggested to Dominy the possibility of muling Orchids, and who pointed out to him the reproductive organs seated in the column, and showed

\* Paper read by Mr. H. J. Veitch, F.L.S., at the Orchid Conference, held at South Kensington, Wednesday, May 13.

that the application of the pollinia to the stigmatic surface was analogous to the dusting of the stigma of other flowers with pollen. This simple fact being once fairly grasped, the work of hybridisation proceeded apace. The flowers of showy species of *Cattleya*, *Lælia*, *Calanthe*, &c., were fertilised with the pollinia of other species, and even the flowers of supposed different, but of course allied genera, were also operated upon in the same way. Capsules were produced in abundance, which in due course proved their maturity by dehiscing, and thus the long and anxiously desired seed was at length at hand.

#### THE RAISING OF SEEDLINGS.

Then arose a great difficulty—a difficulty which still exists, and which our long experience has enabled us to make only a short step towards overcoming—to discover the most suitable method of raising seedlings and getting them established. The seeds of Orchids are minute chaffy bodies of extreme lightness. So minute are they that an ordinary pocket lens is powerless to enable one to know whether the seeds are likely to contain a germ or are mere lifeless dust. When growing wild it is evident that the contents of the mature capsules after dehiscence are more or less scattered by the wind—perhaps wafted to great distances until they settle on the branches of trees, on shelving rocks, or other suitable situations, where the seeds can germinate, and the seedlings firmly affix themselves.

Following, or at least believing that we were following, Nature so far as the altered circumstances of artificial cultivation allowed, every method or available means that could be thought of was brought into request to secure the germination of the seed. It was sown upon blocks of wood, pieces of Tree Fern stems, strips of cork, upon the moss that surfaced the pots of the growing plants—in fact, in any situation that seemed to promise favourable results. But as it was in the early days of Orchid hybridisation, so it is now, we seem as far off as ever from hitting upon a method by which at least a moderate amount of success may be calculated upon; failures were at first, as now, innumerable, and numberless such are without doubt inevitable.

#### CAUSES OF FAILURE.

Among the most cogent causes of failure in the raising of seedling Orchids there can be no doubt that the altered conditions of climate, especially the deficiency of sunlight, and the artificial treatment to which the plants are necessarily subject in the glass-houses of Europe, are the greatest. The capsules neither can nor do attain the perfection natural to them in their native countries, and it is more than probable that, independently of the capsules grown in our houses being the production of cross-breeding, they do not yield a fractional part of the quantity of good seed they would do in their native land. And so with their progeny; the tender seedlings are brought into life under circumstances so different from what they would have been in their native land that it is not at all surprising that multitudes of them perish in their earliest infancy. The capsules are not only less perfect in our houses than they would be in a state of Nature, but they also require a longer time to arrive at maturity, a circumstance that must tell against the progeny. The cause of this is also climatic—chiefly, of course, the enormous diminution of sunlight and sun-heat.

To make this clear I will adduce one illustration, and for that purpose I select the New Granadian *Cattleyas* of the Labiata group, because they are among the best of subjects for the operations of the hybridist. These *Cattleyas* have their home chiefly in the ravines and valleys of the Cordilleras, at elevations ranging from 2000 to 5000 feet above sea-level, and between the 2d and 10th parallels of north latitude. The plants, by being transferred from proximity to the equator, where on clear days the sun darts his rays either perpendicularly upon the place in which they are growing, or at a comparatively small angle to them, to a high latitude like ours, where the smallest angle at which the sun's rays can fall upon our houses is about 28°, and that only for a few days at mid-summer, an angle which daily increases till at mid-winter it reaches 75°, suffer an enormous diminution of solar light. Now light, in passing through the atmosphere, even under the most favourable circumstances, is subject to absorption, or is intercepted by it, but the amount varies with the angle; thus it has been shown that, of a given quantity of light falling perpendicularly upon a given point, one-fifth of it is

FIG. 126.—SEED OF EUCYPRIPEDIUM.

FIG. 127.—SEED OF SELENIPEDIUM.

FIG. 128.—A, SEEDLING CYPRIPEDIUM, SIX MONTHS; B, CYPRIPEDIUM, NINE MONTHS.

FIG. 129.—CYPRIPEDIUM, TWELVE MONTHS.

FIG. 130.—CYPRIPEDIUM, SIXTEEN MONTHS.

FIG. 131.—CYPRIPEDIUM, TWO YEARS.

absorbed or intercepted by the atmosphere; if it fall at an angle of 50° more than one-fourth is intercepted, and at an angle of 75° fully one-half. Hence in the winter months, even when the days are clear and bright, we can get no more than five-eighths (a little more than one-half) of the solar light these New Granadian *Cattleyas* receive in their native country, on the assumption that other circumstances remain the same. It is quite evident, then, at what a disadvantage we are placed as regards the ripening of capsules of Orchids whose native home is near the equator, to say nothing of local difficulties, such as the smoky atmosphere and fogs of London.

#### TIME REQUIRED FOR RIPENING.

It is not unreasonable to infer, in the absence of more accurate knowledge obtained by direct observation, that the capsules of the New Granadian *Cattleyas* require but a short period to attain maturity in their native country, and that this period extends only over the two or three months of what is there called the dry season, but which in that region is subject to frequent showers. In our houses the time required for maturing the capsules of *Cattleyas* of the labiata group ranges from eleven to thirteen months; for *Lælia purpurata* it is about nine months; for *Phalenopsis Schilleriana* six months; *Cypripedium Spicerianum* eleven to twelve months; *C. insignis* ten months; *Masdevallia* four months; *Calanthe* three to four months; *Zygopetalum Mackayi*, when crossed with *maxillare*, about six months; *Odontoglossum maculatum*, *Dendrobium aureum*, *Anguloa Clowesi*, *Chysis bracteata*, and *Maxillaria Harrisoniana*, each about twelve months. But of course these periods are only approximate; the time required for the ripening of the capsules is considerably influenced by the state of the weather and external circumstances, especially by the amount of direct sunlight during the year. I note that our experience does not differ essentially from that of M. Bleu, of Paris, who has published in the *Journal of the Société Nationale d'Horticulture* the periods of ripening of the capsules of several Orchids crossed by himself, although it might be expected that in the warmer and drier climate of Paris the periods would be somewhat shorter.

Adverse as are some of the influences under which we work to obtain capsules, there is but little difficulty in getting them, and in abundance, too—sometimes even from crosses that, to the systematic botanist, would seem almost beyond belief; but then comes the *crux*.

#### IMPERFECT SEED.

Good seed is the all-important factor in producing healthy seedlings, and this, unfortunately, from causes already partially adverted to, is obtainable but in a very minute proportion of the whole. Seed we get in profusion, but so little of it germinates that the patience of the most persevering is put to a severe test. The seeds of hundreds of capsules have been sown without yielding a single result. In very many cases only a solitary plant had been raised from a capsule that must have contained thousands of seeds; in very few instances indeed has the number of seedlings from one cross reached a hundred. It is true that we have raised many seedlings in the aggregate, but many of them have appeared when least expected, and when we consider the myriads of seeds that have been sown, and the comparatively few plants raised, we cannot be said to have achieved very great success. It may here be noted that, with the exception of *Cypripedium*, which bears the stress of fruit-bearing better than any other genus, many plants bearing capsules become greatly debilitated. During the season the capsule is being matured growth frequently ceases altogether, and when the plant operated upon is not strong it not infrequently perishes even before the seed is ripe. [Diagrams of seeds and seedlings in various stages of development were here referred to. See figs. 121—142.]

#### MANAGEMENT.

If the ripening of the capsules takes place under such adverse influences, the same influences are by no means propitious to the early infancy of the progeny. The period from germination to the formation of the first roots (which, for the want of a better phrase, I will call the thaloid state of the young plants), and which sometimes occupies several months, is the most critical in the life of seedling Orchids raised in glass structures; it is especially so with *Cypripedium*, *Calanthe*, and *Phalenopsis*, and seedlings of these we

accordingly find to be the most difficult to preserve prior to their getting firmly rooted. A succession of dull cloudy days in winter, and even a few hours of London fog, will cause a great mortality, not only among these, but among all seedlings in a similar stage.

The cares and solicitudes of the raiser of Orchid seedlings are by no means diminished when the infant plants are fairly rooted; they must still be constantly tended with the most assiduous care. To neglect the watering, for instance, for a single day, or even for a few hours in the height of summer, may prove fatal; and so, on the other hand, an excess of coddling, giving them too much heat or too much water, by stimulating them into growth before their natural season arrives, is equally a source of danger. Nor is it the only one. We know of an instance of the splendid *Dendrobium nobile nobilis* being crossed with *D. aureum*; the capsule was matured in due course, and the seed sown, but only one seedling was raised. This, as may be readily supposed, was tenderly cared for, but all to no avail; the seedling had grown to about half an inch, when one night a vulgar snail devoured the precious morsel at a single meal. We, too, have had our troubles. Among our earliest *Phalenopsis* crosses we succeeded in raising a single seedling from a capsule of *Phalenopsis amabilis* crossed with *P. rosea*, which we were particularly anxious to save, as it would have solved the question of the parentage of *P. intermedia* or *Lobbi*, which is a supposed hybrid between the same two species. The plant had made three healthy leaves; it was well established in a small pot, which, to be the more secure from danger, was placed upon an inverted pot that stood in a pan of water. One morning, to the great dismay of Seden, it was discovered that a slug had eaten off two of the best leaves, and would, if not trapped, certainly devour the remainder. Anxious to save the treasure, the plant was watched incessantly for hours in the expectation that sooner or later the marauder would make his appearance. To induce him to do so the moss was constantly plunged into water. The repeated duckings had at length the desired effect; the culprit issued from his lurking-place, and the plant was saved. The two little circumstances I have narrated speak for themselves.

#### TIME REQUIRED FOR FLOWERING.

And now, how long must the hybridist wait before his labours are rewarded with a sight of the flower whose appearance he has been awaiting with longing expectation, and upon which many hopes have been built, too often, unfortunately, to end in disappointment?

The shortest periods from the germination of the seed to the production of the flower yet observed are those of *Dendrobium*, that is, *D. aureum* crossed with *D. nobile* and *vice versa*, three to four years; *Phaius* and *Calanthe* about the same; *Masdevallia* four to five years; *Chysis* about the same. Then come longer intervals: *Zygopetalum* five to nine years, according to the cross, thus, *Z. maxillare* crossed with *Z. Mackayi* five years, *vice versa* nine years—a curious but, to us, unaccountable circumstance, as is the case of *Cypripedium Schlimi*, which, crossed with *C. longifolium*, flowers in four years, but the *vice versa* cross takes six years. *Lycaste* takes seven to eight years; *Lælias* and *Cattleyas* may be said to flower from ten to twelve years from the seeds. [Seedlings of different genera at various stages of growth were here shown.]

#### RESULTS.

I will now glance at some of the results obtained by us from muling. Dominy began to hybridise Orchids at our Exeter nursery in 1853, and continued his operations for some time after removal to Chelsea in 1864. Seden began at Chelsea in 1866, and has worked uninterruptedly from that time to the present. Our experience, therefore, extends over a period of more than thirty years, during which the field of operations has been greatly enlarged, especially of late years, our experiments being made upon a vast number of cultivated Orchids, including many hundreds of crosses, not only between allied species, but also between species of different genera.

Among the results obtained by Dominy at Exeter, *Calanthe Domini*, raised from *C. masuca* × *C. fucata*, will always be regarded with interest, as being the first hybrid Orchid that flowered. It flowered for the first time in October, 1856, on which occasion the spike was shown by my father to Dr. Lindley, who exclaimed on seeing it, "You will drive the

botanists mad," an expression quite characteristic of the rigid systematists who flourished prior to the publication of Darwin's *Fertilisation of Orchids by Insect Agency*. The first hybrid *Cattleya* that flowered was *C. hybrida*, a plant now lost, but which was soon followed by the flowering of *C. Brabantica*. The first hybrid *Cypripedium* to flower was *C. Harrisianum*, which justly commemorates the name of Dr. Harris. Among other noteworthy acquisitions raised at Exeter were *Cattleya Dominiana*, *Lælia exoniensis*, *Calanthe Veitchii*, and *Lælia Veitchii*. The last-named flowered for the first time at Chelsea. Dominy also raised some seedling *Vandas*, but they were afterwards lost. Seden's acquisitions are more numerous, and many of them unquestionably prove that substantial progress is being made, in spite of the innumerable difficulties that beset the raising of seedling Orchids. To any one who has compared *Cypripedium cardinale*, *C. Schroderæ*, and *C. Sedeni candidulum*, with the original *C. Schlimi*, this progress is manifest enough. And so with *C. cænanthum superbum*, *C. Leeaeum superbum*, and *C. Morganæ*; nor ought I to omit mention of *Lælia flammea* (still unique in colour among Orchids), *Masdevallia Chelsoni*, *Calanthe Sedeni*, also obtained by other operators, and *Dendrobium micans*.

The following details may prove to be of some interest. Among *Cattleyas* we find that all the members of the *labiata* group, and also the Brazilian species with two-leaved stems, as *C. intermedia*, *C. Aclandiae*, *C. superba*, &c., cross freely with each other, and with the Brazilian *Lælias*, which also cross freely with each other. It is worthy of note, too, that those hybrids which have a two-leaved *Cattleya* for one parent, and a one-leaved *Lælia* or *Cattleya* for the other, have some stems with one, and others with two leaves, and the flowering does not seem to be affected thereby. [A plant with this peculiarity here shown.] But neither the *Cattleyas* nor the Brazilian *Lælias* will cross freely with the Mexican *Lælia albida*, *autumnalis*, *majalis*, *rubescens* (better known in gardens as *acuminata*), &c. Numerous crosses have been effected both ways, and capsules have been produced, but the seed has always proved barren. *Lælia anceps* appears to be an exception, for it seeds freely whether crossed with a *Cattleya* or with any of the Brazilian *Lælias*. The period from the germinating of the seed to the appearance of the first flower varies immensely in the different crosses; thus, *Lælia triophthalma*, raised from seed sown in 1875, flowered in 1883—this is the shortest period known to us; *Lælia caloglossa*, from seed sown in 1858, flowered for the first time in 1877, or nineteen years—this is the longest period known; the others have taken periods that may be said to average from ten to twelve years.

Among *Cypripeds* some very curious facts have been elicited through muling. Thus, the East Indian species cross freely with each other, and a numerous progeny has resulted therefrom. The South American species, the *Selenipedia*, as they are called, also cross freely with each other, and many new forms have been obtained; the hybrids in both sections flower within a few years from the seed being sown. But in the case of the crossing of Indian with South American species, the process has been much slower in producing results. An infinitely smaller percentage of the seed germinates, and those seedlings that survive are so slow in arriving at the flowering stage, that up to the present time not a single plant has produced a flower, although the plants continue strong and healthy in appearance, and increase in size every year. One thing is certain, the three-celled ovary of the *Selenipeds* offers no impediment to fertilisation by the pollinia of *Cypripeds* with a one-celled ovary, for we have plants raised from *C. caudatum* × *C. barbatum*, and many other like crosses between other species have yielded seed.

*Cypripedium Sedeni* was a remarkable cross in many respects, it was in fact raised from two crosses—*C. Schlimi* × *C. longifolium*, and the same two *vice versa*. It will be observed that in this case one of the parents, *C. longifolium*, is much more robust in habit and growth than the other parent, *C. Schlimi*. [Plants of *C. longifolium*, *C. Schlimi*, *C. Sedeni*, here shown.] No perceptible difference was observed between the plant raised from the two separate crosses, they agreed in habit, foliage, colour of flower, in fact in every particular. No such similar result has been obtained by us among *Cypripeds*. A *vice versa* cross between the same two species produces seedlings that vary more or less from those produced from the first

cross. Thus *C. tessellatum* resulted from *C. barbatum* × *C. concolor*, and *C. tessellatum porphyrium* from *C. concolor* × *C. barbatum*. We have also an instance of two recognised species each being crossed by a third, but both crosses producing like results, thus *C. longifolium* × *C. Schlimi*, and *C. Roezlii* × *C. Schlimi* produced seedlings whose flowers are undistinguishable from each other, although, as might be expected, the foliage of the *C. Roezlii* progeny is like that of its parents, the more robust of the two; hence the specific rank of *C. Roezlii* is very questionable.

Not only do recognised species of each section, East Indian and South American, cross freely *inter se*, but the hybrids also cross freely with them. The beautiful *C. cænanthum superbum* has for its parents *C. Harrisianum*, itself a hybrid, and *C. insignis Maulei*. As regards the habit and foliage of hybrid *Cypripeds*, the progeny usually takes a form intermediate between the two parents, but sometimes it is more robust than either. [Plants of *C. grande* and its parents were shown.]

Large as is the field offered by the great genus *Dendrobium* for the operations of the hybridist, comparatively little has yet been effected. Dominy raised the hybrid that bears his name many years ago in our Exeter nursery. It was followed some years later by *D. Ainsworthii*, which appeared in Dr. Ainsworth's collection at Manchester in 1874—plants of the same cross raised by West having appeared about the same time in the Fairfield Nursery, near Manchester, and later, in the collection of Mr. Brymer, at Dorchester, by another operator, the parents being *D. aureum* × *D. nobile*. Subsequently Seden raised *D. splendissimum* from the same cross, and still later Mr. Swan obtained *D. Leechianum* from *D. nobile* × *D. aureum* or the *vice versa* of the others. The seedlings raised from all the crosses are found to be variable; members of one progeny approaching so closely varieties among the others that the original distinctions set up between them cease to be appreciable, but without egotism I venture to claim for *splendissimum* larger flowers with more substance in sepals and petals, caused probably through our having hybridised finer varieties of the two parents. Nevertheless, to avoid confusion, the progenies should, I think, to use an academical expression, be bracketed.

Of the eight hybrid *Dendrobes* that have already flowered *D. nobile* is one parent of five, and *D. aureum* of three of the same five, and of one other, so that only two, *D. micans* and *D. rhodostoma*, have yet flowered that have a parentage in which neither *nobile* nor *aureum* participated.

Crosses between species of *Phalenopsis* have been effected by several operators, and capsules readily obtained. We only know, however, of three instances besides our own where seedlings were raised; the first by Dadds, in 1868, in the collection of Sir John Greville Smyth, at Ashton Court, near Bristol, but they were afterwards lost; then Grey, gardener to the eminent orchidologist, Mr. Corning, of Albany, New York, raised some seedlings, but they, too, were afterwards lost; and, lastly, Mr. Hollington, at Enfield, who has, I believe, one seedling still living. Our own experience with *Phalenopsis* dates from 1875; our first cross was between *P. grandiflora* and *P. Schilleriana*, but with that and with several succeeding crosses no results beyond the capsules were obtained. The first capsule to yield seedlings was gathered from *P. grandiflora* × *P. rosea*; a few of these are still living. Then we obtained a few from *P. amabilis* × *P. rosea*, which grew with more vigour than their elder brethren, and may not improbably flower within the next two years. Still later we obtained seedlings from *P. Schilleriana* × *P. rosea*, *P. grandiflora* × *P. Luddemanniana*, and from two or three other crosses.

*Calanthe* has probably received attention from more operators than any other genus in the great orchidean family, a circumstance that can be best accounted for by results being obtainable in a shorter period than from any other genus. It may be that the *Calanthe* being more terrestrial than epiphytal, there is a predisposition to earlier maturity. The capsule of *Calanthe* usually ripens in three to four months, and the seed takes from two to three months more to germinate; the seedlings under favourable circumstances will flower in the third or fourth year; hence it happened that, although seedling *Cattleyas* were in existence before seedling *Calanthes*, the first hybrid Orchid to flower was a *Calanthe*. *Calanthe Veitchii* flowered

for the first time in 1859, and was at that time believed to be a true bigeneric cross, but as such it cannot be now regarded, as Mr. Bentham, in the *Genera Plantarum*, has referred the pollen parent, *Limatodes rosea*, to *Calanthe*. Not so, however, is *Phaius irroratus*, raised by Dominy from *P. grandifolius* × *Calanthe nivalis*, and *P. irroratus purpureus*, raised by Seden from *P. grandifolius* × *Calanthe vestita rubro-maculata*; and a third progeny that has not yet flowered, which was obtained by the last-named hybridiser from *Phaius grandifolius* and *Calanthe Veitchii*. These are entitled to be called bigeneric crosses. In one of the cases only a single

of the last ten years. Numerous crosses between various species, both Mexican and New Granadan, have been effected, and capsules with apparently good seed have been produced, but with the utmost care that could be bestowed no progeny has yet been raised. Mr. Cookson, of Newcastle, has, indeed, stated in *The Garden*, of February 10, 1883, that he succeeded in raising a fine lot of *Odontoglossum* seedlings, of which the pollen parent was *O. crispum* and the seed parent either *O. gloriosum* or *O. Uro-Skinneri*, but which he was not quite sure. He has

experience is the very opposite of this. *Vexillarium* crosses readily with the flat-tipped *Miltonias*, as *spectabilis*, although thus far we have failed to raise any progeny from these crosses, but not with the true *Odontoglossum*; often as it has been attempted, no capsules are produced. Thus, while our experience in muling among *Odontoglossum* goes far to disprove the statement I have just quoted, it at the same time confirms unmistakably Mr. Bentham's view as to the proper generic place of *vexillarium* and its allies *Roetzlii*, *Phalenopsis*, and *Warszewiczii*.

I have already taken up so much of your time that I must forbear entering into details of the crossings, and results of them, among other genera, and into the scientific aspects of hybridisation it is not my province

FIG. 132.—A, SEED OF DENDROBIUM; B, SEEDLING DENDROBIUM, FOUR MONTHS.

progeny is well nigh intermediate between two parents, being neither evergreen like *Phaius*, nor deciduous like *Calanthe*.

*Masdevallias* were taken in hand at an early date, but failures were frequent, caused, probably, by the plant was raised, and in each of the other two the number was very restricted. It is a curious fact, too, that in habit, aspect, and in other respects the

FIG. 133.—A, DENDROBIUM, SEVEN MONTHS; B, DENDROBIUM, TWELVE MONTHS.

*Masdevallia*, as a genus, is far more heterogeneous than was at first supposed, whence a mixture of the different sections may not possibly be effected. *M. Chelsoni* was at length raised from *M. amabilis* × *M. Veitchiana*; then *M. Fraseri* from *M. ignea* × *M. Lindlei*, by Mr. Fraser, of Dornie, Aberdeen; but the seedlings were reared by

to lead you. Nevertheless, I may be permitted to refer to a few facts that have come under our observation, that have a practical bearing as well as a scientific one.

It will be gathered from what I have already said that our hybridising operations have extended over a rather wide field; that they have not been confined

FIG. 140.—CATTLEYA, TWO YEARS.

us; and lastly, *M. Gairiana* from *M. Veitchiana* × *M. Davisii*. Capsules have been obtained from *M. Veitchiana* × *M. infracta*, *M. polysticta* × *M. tovarensis*, *M. Harryana* × *M. Veitchiana*, and a few others, but all attempts to intermix *M. chimera* and its allies with the brilliant flowered species have proved fruitless.

Great as is the difficulty of raising seedlings from Orchids requiring a high temperature for their cultivation, it is still greater in the case of those that receive "cool treatment," if we except *Masdevallia*. *Odontoglossum* affords a striking instance of this, paradoxical as it may seem, especially as so many undoubted natural hybrids between different species of this genus have appeared among the importations

since informed us that all of them have perished. And so with the *Miltonias*, usually classed with *Odontoglossum*, and grown in an average higher temperature, as *vexillarium*, *Roetzlii*, and *Phalenopsis*. The only seedlings we have been able to raise were obtained from a cross between the two last named, and these were unfortunately lost within a few months after the germination of the seed. I may here note that the late Mr. Bentham, when working up the Orchidæ for the *Genera Plantarum* must, I think, have been misinformed when he states under *Miltonia vexillarium*, p. 563, that "*sede hortulanorum facile cum Odontoglossis variis nec cum Miltoniis generis proles hybridæ gignunt.*" Our

to the crossing of different species of the same genus, but hundreds of experiments have been made between species of different genera. The question thence naturally arises: How will these bigeneric crosses affect the stability of the genera as at present circumscribed? And, what changes of nomenclature will be necessary to place the Orchidæ on an intelligible basis as regards names? Glancing over the whole range of our operations, and the results obtained from them, I may safely reply that thus far the stability of the genera is scarcely affected, and the changes in nomenclature need be very few indeed. Leaving the progeny derived from species of *Cattleya* × *Lælia* out of consideration, the last-named genus being confessedly an artificial one, only two bigeneric hybrids have yet

flowered; these I have mentioned above—*Phaius irroratus* and *P. i. purpureus*. Many years ago Dominy raised *Anæctochilus Domini* from *Goodyera discolor* *Anæctochilus xanthophyllus*, and *Goodyera Veitchii* from *G. discolor* and *Anæctochilus Veitchii*. Plants derived from both crosses are still in cultivation, but the names they bear are simply garden names. We have plants, but which have not yet flowered, raised from *Cattleya Trianae* crossed with *Sophranitis grandiflora*, and from *Cattleya intermedia* crossed with the same species of *Sophranitis*. We have besides a seedling whose parents are *Cattleya Trianae* and *Brassavola Digbyana*, but as the last-named is now referred to *Lælia*, this can hardly be regarded as a bigeneric cross. With these few cases I have exhausted the list. But when we enumerate the capsules with apparently good seed that have been obtained from bigeneric crosses, but from which no seedlings have been raised, the list is somewhat more formidable. Some of the most remarkable of these were produced by *Acanthophippium Curtisii* × *Chysis bractescens*, *Bletia hyacinthina* × *Calanthe masuca*, *Chysis aurea* × *Zygopetalum Sedeni*, *Odontoglossum bictonense* × *Zygopetalum maxillare*, *Zygopetalum Mackayi* × *Lycaste Skinneri*. But, on the other hand, we have obtained a large number of capsules of the normal size, and to all appearances externally perfect, not only from bigeneric crosses, but even from crosses between species of the same genus which contained not a single seed. And, lastly, I may note that *Zygopetalum Mackayi* has been crossed with several species of *Odontoglossum* and seedlings raised from some of the crosses, but every one that has yet flowered has proved to be simply *Zygopetalum Mackayi*.

The hybridisation of Orchids by the hands of the cultivator is still in its infancy, we are but on the threshold; and now that muling among them has become a pastime of absorbing interest with amateurs—amongst whom special mention must be made of Sir Trevor Lawrence, Sir William Marriott, Sir Charles Strickland, Mr. Bowring, of Forest Farm, Windsor, Mr. D. O. Drewett, of Newcastle, and Mr. Goss, of Torquay—it would be rash indeed to attempt to predict what may be in store. But reviewing the sum total of results already obtained, can we, considering the ceaseless watching and assiduous care seedling Orchids require before reaching the flowering stage, look upon them with unmixed satisfaction? How few of the best of them bear favourable comparison with the numberless lovely flowers borne by plants that owe their origin to the unerring instinct of the little winged tribe that unknowingly, and perhaps unconsciously, have performed their allotted task for ages past, and proving by the perfection of their work how inept an operator is man.

I cannot conclude this paper without availing myself of the opportunity the reading of it affords me of publicly expressing my personal obligation to Professor Reichenbach, for the great trouble he has taken in examining, reporting on, and naming our various hybrids, to do which has occupied much more of his valuable time than is generally supposed.

## THE CULTIVATION OF ORCHIDS.\*

THE subject of Orchid culture being almost inexhaustible, I shall only be able to touch briefly upon some of its phases, and in doing so, whilst endeavouring to make some remarks acceptable to all Orchid growers, I shall direct them principally towards the amateur. A glance at what has been written on the subject many years ago proves that there may be rules laid down for the culture of any or all of the Orchids, and that a good result once attained may always be secured by following the same line of treatment. Whenever I read a detailed account of the treatment given to an exceptionally fine plant by some grower of forty or fifty years ago, I find that in our practice of to-day we need not depart from it in the least to ensure the same good results, which ought, however, to be attained by us with much less trouble than by those of olden time, by reason of the much better accommodation we have.

Orchids, from the time of the earliest arrivals, have always been appreciated, and as early as the year 1800,

when the lovely *Aërides odoratum* and many other showy things were introduced, their habits and culture seem to have been understood fairly well, but the bad construction of the houses and their defective heating by means of flues and other contrivances militated sadly against the culture of the small growers and the varieties requiring cool treatment; and hence, while many continued the culture of the more robust kinds, and attracted visitors from distant parts to see them when in bloom, no general progress was made until the period between 1835 and 1850, which was perhaps the richest in importations of fine handsome Orchids.

During that period the fine discoveries of Messrs. Veitch's collector (Lobb) with *Aërides*, *Saccolabium*, and *Vandas*; Griffiths with his *Cymbidiums* and *Dendrobies*; Skinner, Barker, and Hartweg, in Mexico, Guatemala, and along the Andes; and other collec-

covered with bloom; *Epidendrum bicornutum*, with many spikes; *Oncidium ampliatum* majus, with many spikes, forming a head of golden flowers over 4 feet across, and *Odontoglossum grande*, quite worthy of being a leading plant in a collection. J. H. Schroder, Esq., of Stamford Green, is also credited with *Calanthe veratrifolia*, with eighteen spikes, and many other fine plants. J. J. Blandy, Esq., with *Saccolabium guttatum*, with eighteen flower-spikes. R. S. Holford, Esq., of Weston Birt, with *Aërides odoratum*, with twenty-seven to thirty spikes. Sigismund Rucker, Esq., also produced specimens which it is pleasant to read about; and among other things, Robert Hanbury, Esq., in November, 1845, exhibited a robust plant of the autumn-flowering *Cattleya labiata*, with four spikes, bearing sixteen flowers between them, and forming a specimen which any of our best collections would be glad to give room to at the present day.

Of plants described as being very fine in different places forty years ago, but which are yet rare, and in some cases the specimens mentioned are not to be matched, are *Repantia coccinea*, in the gardens belonging to A. Palmer, Esq., at Cheam, with seven panicles on a plant, each bearing from 100 to 110 flowers, and an equally good one of it in the possession of R. S. Holford, Esq., on one of the panicles of which were 117 of its showy scarlet flowers; good specimens are also mentioned of the yellow *Calanthe curculigoides*, from the Straits of Malacca; *Angraecum bilobum*, with a dozen long flower-spikes; the rose-coloured *Eulophia guineensis*; and in the gardens of the Horticultural Society, in 1847, a *Lælia superbiens* with nine large heads of bloom.

These notes show that the love for Orchids, which existed from the time the first plants came into the country, has steadily increased, and that their widely-diffused culture of the present day, far from being a modern fashion in flowers, is but the result of the steady progress of that which always existed, and always will exist, as long as that love for flowers, which is one of the chief characteristics of the inhabitants of these isles, remains. For those who want novelty as well as beauty, too, there is as good a prospect still as for those who wish simply for the beautiful, for if we turn to the works of Dr. Lindley, Professor Reichenbach, and other writers on Orchid lore, we there see such a host of lovely things figured or described, but not yet imported, as to prove bewildering even to one, like myself, who has made Orchids a study from childhood. So far as I am concerned, I never could see that there was any difficulty in growing the greater part of our handsomest Orchids, provided the one who took them in hand had a real liking for them, and a determination to use his own eyes and his best judgment for their benefit. In such a case success follows invariably, for Orchids, like the domestic animals, soon find out when there is one who is fond of them about them, and they seem to be happy and to thrive and establish an understanding with such a guardian, indicating to him their wants in many important matters as plainly as though they could speak.

It is this kind of understanding that should be aimed at, as it goes a great way towards securing success, as well as giving pleasure to the pursuit; and it is the existence or the want of this kind of relation between the plants and their cultivator which makes all the difference between a good grower and a bad one—between a healthy collection and a shabby one. Be sure, that without some one takes an unfeigned and steady interest in the plants, they will not thrive, but if one can be found to be watchful over their interests, and apply what knowledge he can get by what he sees or reads of in other collections, a good measure of success is sure; and hence some of our smaller amateurs, by their diligence and real liking for their plants, often grow things to perfection which have puzzled more scientific men. In growing a general collection of Orchids, however, many stubborn subjects will be met with, but as the bad-doers of the past have given way, those of the present will follow, no doubt, in the case of all who steadily persevere. Every point in Orchid culture is of importance, one neglected item often causing failure in some direction or other. Let us glance at a few of the most important matters, beginning with

### THE ORCHID-HOUSE.

In this particular we certainly have the advantage over those of former years, in that we now have compact, well-ventilated, and comfortably-heated

FIG. 141.—SEEDS OF ORCHIDS IN COURSE OF GERMINATION.

FIG. 142.—SEEDLING PLANT OF *DISA GRANDIFLORA*.

(The line to the left side indicates the real size.)

tors, made quite a revival among the Orchid growers, and the result of new energy being put into the matter was, that with some of the showier Orchids, such perfection was attained that I fear we could not even now match some of the specimens mentioned as being exhibited at the Horticultural Society's shows at the famed Chiswick Gardens, where in those days a good collection of Orchids was to be found. Among the best exhibits for many years appear those from Mrs. Lawrence's renowned collection at Ealing Park, that home where our worthy President, Sir Trevor Lawrence, first acquired that love for Orchids which he has turned to such good account in forming and keeping up, always in good condition, the best representative collection of Orchids which was ever got together.

Among the specimens exhibited in 1845-6-7 are enumerated: from Mrs. Lawrence, Ealing Park, *Aërides odoratum*, with sixteen leading growths and between thirty and forty flower-spikes; *Cattleya crispata*, with over twenty spikes; *Saccolabium præmorsum*,

\* Paper read at the Orchid Conference on May 13 by Mr. James O'Brien.

structures; but these changes were not made until the Orchid-growers themselves took to designing their own houses or advising with the builders about them; and from that time a new era in Orchid culture commenced; the running lights, which were so fond of slipping down in the night, were done away with; the swinging-sashes on a level with the plants on the side-stages were doomed; those neat little sliding-traps at the base of the house, and those convenient top ventilators substituted, and many other sanitary matters arranged, which any one may see to perfection in that fine new Cattleya-house, and those other recently built structures belonging to William Lee, Esq., at Downside, Leatherhead, where one of our largest, best, and best-housed collections will be found, many of the convenient arrangements in those houses being of Mr. Lee's own designing. At Baron Schröder's, too, at The Dell, Egham, some of the best of our modern improvements, combining usefulness and ornament, will be found; and as the plants contained in the houses are of the best and rarest, a visit to them is a great pleasure to any Orchid grower.

In former times it used to be considered imperative to build the Orchid-houses running east and west, and many adhere to that plan still; many also consider that a lean-to or three-quarter span facing north is the best for *Odontoglossums* and cold-house plants. For my part, I cannot say that houses of any other aspect are not as good as these, provided they be properly arranged in other respects. A north house is certainly very cool, and good for cold-house plants, and particularly *Masdevallias* in summer; but, from the very conflicting evidence I have gathered in different parts of the country, I should say any one having houses which they wish to devote to Orchids need not be deterred by their facing this way or facing that, or in building new ones, to greatly inconvenience themselves to make their houses run in any particular direction.

Tolerably low span-roofed houses are the best to build for most Orchids, and in building them no two should be placed together side by side, but such should be built apart, in order to allow of the bottom ventilation being effected by traps opening into the outer air. In some cases, where this has been neglected, chambers from end to end, with openings at intervals, and other intricate contrivances, have been resorted to, but all to no purpose, as the houses have gone back to the style of those of very many years ago, and are practically unventilated, as we now understand the word. It is to the even balancing of the ventilation, by means of the bottom ventilator opening into the outer air, and the top ones at the highest point of the house, that we, in a great measure, may attribute our much better culture of *Odontoglossums*, *Masdevallias*, *Cattleyas*, &c., than the Orchid-growers of former years displayed. Next in importance after the ventilation, comes

#### THE STAGING.

This, by common consent, seems to be best when an open woodwork staging is raised over a close one, containing either water or shingle which is kept moist. Some, indeed, grow moss on this close staging, and Ferns underneath them; but although such arrangement is perhaps beneficial whilst the Ferns keep clean, they are so liable to thrips and other insects that they are better kept out of the Orchid-houses, in my opinion. The open woodwork staging is certainly very good above the close and moisture-supplying one, and great need of it might be seen formerly in the presence of large numbers of inverted flower-pots for raising the plants.

As a further means of giving moisture and storing rain-water, which alone should be used wherever it can be obtained for watering Orchids, too much space cannot be devoted to open rain-water tanks under the stages. Plants watered with rain-water alone have a great advantage over those watered with water from any other source, and Mr. Bateman records his opinion that they are not attacked by those small snails which are so troublesome where they abound. From my own observation I can say that I believe there is a good foundation for the statement.

#### WATERING ORCHIDS.

The watering of Orchids is a matter on which much depends. It is now pretty generally understood that all evergreen Orchids, either terrestrial or epiphytal, require plenty of water when growing freely, and less when not growing; that those which lose their leaves, such as some *Dendrobes*, invariably require a period

of rest, during which water is entirely withheld and a lower temperature given, and that *Odontoglossums*, *Masdevallias*, and the other cold-house things, want water summer and winter, but I find the resting or drying-off system is often overdone, and plants injured accordingly, and that in some collections the plants would be much better if watered all the year round than dried as they are to such an extent that they cannot recover in the growing season what they lose in the so-called resting period.

My own opinion is that any drying-off which causes shrivelling is wrong, and that *Cattleyas*, *Lælias*, and similar plants, if properly potted, do best kept moist, even when not actively growing, but care must be taken to see that they are not in bad peat. As a rule,

FIG. 143.—CURCULIO ON ORCHID. (SEE P. 635.)

it would be much better for the plants we often see in small collections if they had one-half the quantity of potting material about them and twice the quantity of water they get given them. Syringing a house of Orchids should never be done, and the syringes should be only used for moistening the staging and back walls, or doing any other work on which it can be certainly employed without harm. When used on the plants the operator cannot tell what he is doing, and in the hands of a thoughtless person the syringe is the most mischievous instrument ever introduced. There can be no rule for its use among Orchids as a means for distributing water, and certainly no benefit that can be set against the loss of young growths and decayed flower-spikes which must follow an indiscriminate use of it.

#### ON POTTING ORCHIDS.

And now it will be well to notice a few matters connected with the potting and materials used. For

growing the epiphytal Orchids in the early days of Orchid culture, blocks or logs of wood were largely used, with, in many cases, wire baskets for the more spreading kinds. These baskets were first made of iron wire, but this being found to be objectionable on account of its rusting, copper wire was substituted. Soon it got found out that Orchid roots and young growths did not like metallic substances, and slate was employed to make baskets of different shapes, which were fitted with wire suspenders. Later on the designs were very varied and fanciful, baskets being made of scollop-shells, Cocoa-nut husks, rods of Hazel, Oak, and Maple, all of which were found objectionable for some reason or other.

During all this time the ordinary flower-pot was making way, disguised to meet the case by having holes and slits to accommodate the air-roots. This fashion of flower-pot at length became extensively used, but as it was alleged against it that it harboured insects, it had to give way to the plain, common garden pot, which is now doing such great service. But I am sure that we have allowed the common flower-pot to encroach too far, and that while we beat our predecessors with *Odontoglossums*, *Masdevallias*, and many other things which do perfectly well in pots, we have certainly lost ground with *Saccolabiums*, *Aërides*, and plants of that nature; so much so, that they are but poorly represented in many otherwise good collections. My own opinion is that it is solely through potting them instead of basketing them, and that in pots the chances are against them on many points. Their large fleshy roots do not get the air in pots that they do in baskets, and when potted they are generally placed on the stage too far from the glass, and retain the water given them longer than these plants like.

Against these arguments it is said, with much truth, that it is impossible to suspend everything, and that when baskets are used they are dangerous to the plant when decaying. To this it may be answered that if it is for the benefit of the plant, some means of raising it to a fair distance from the glass should be found, and if the *Saccolabiums* and *Aërides* have done well in baskets, which would have done badly in pots, the trouble of removing the old basket and replacing it with a new one ought not to be considered. The Orchid specimens at Mrs. Lawrence's, the specimen *Saccolabium* with twenty spikes at Mr. Blandy's, and all the others in those days, were in baskets, and I do not think their equals will ever be found in pots.

The Orchid baskets, too, are so much improved in the present day that all objection to them has been removed, and I venture to predict a great future for them. Those made by Mr. J. Bonny, of Downs Park Road, Hackney, are well finished, and the superior Teak of which they are made will cause them to last for years. Those of Mr. Wm. Gordon, of Twickenham, too, are excellent, being made of Teak, and well put together; and I should like those who are not satisfied with their *Saccolabiums*, *Aërides*, and smaller *Vandas*, to try them in baskets, using plenty of crocks and charcoal where obtainable, and only a little sphagnum moss.

In growing this class of plants, if the growers would but take the hint from the *Dendrobes*, which grow with them in their native habitats, and make the growing-time of the *Saccolabium* to correspond with theirs, they would give their plants less heat and water in winter, and more in spring and summer, and a better condition would come upon them. The excessive heat which is often given to *Saccolabiums* and *Aërides*, and given, too, in winter, and while they are so far away from what little light there is, stunts them, prevents their flowering, and makes it hard work for them even to live.

#### MATERIALS FOR POTTING.

Now as to materials for potting. Good living sphagnum for *Saccolabiums*, *Aërides*, *Vandas*, *Phalænopsis*, *Angræcums*, and others of like growth, and the fibre of peat composed of Fern root alone for *Cattleyas* and *Lælias* has always been considered the best. Unfortunately, much of the peat of late years has been of grass and heath root, which is liable to rapid decay, and consequently to cause injury to the plants. Various materials, such as cocoa-nut fibre, have been advanced to supersede peat, but none have proved acceptable. I therefore recommend all who wish their plants well, to keep to the sphagnum moss and the best peat they can get, using the less of the latter when it is not good, and to leave experiments to others. There are always plenty ready to try new things, and curiously enough it is never the learner

who carries the experiments to a serious conclusion, but the well-tried old hand, who, having done all that is good and reasonable, goes in for a new idea on a large scale.

I can call to mind several unaccountable instances of this kind, in one of which I remember a clever grower in the North, who had for years grown his plants to perfection, suddenly became possessed with the idea that chopped sphagnum, and what appeared to me to be road-grit, was the proper thing for all Orchids, and forthwith he proceeded to pot them in it. In another case I found that a previously well-grown collection had been potted in sphagnum moss and what I was told was prepared cocoa-nut fibre. How effectual the preparation was in getting the plants ready to depart this life I need not say.

Above all things, a steady perseverance in what others have found to be a correct method of treatment answers best, and it is better to leave doubtful experiments to their originators until they are proven. The worst of it is that wonder-workers are never tired of getting others to injure their plants by trying their schemes, and hence much mischief occurs. For my part, I have generally found that the extreme practices which we hear of from time to time in the end only go to prove the extraordinary tenacity of life in Orchids, and their adaptability to the different kinds of treatment they must necessarily receive at different hands.

#### SHADING AND HEATING.

Next comes the shading and heating of the Orchid-house. With respect to the shading, I am convinced that all Orchids should be shaded against the direct rays of the sun, and that the shading should, where possible, be varied in thickness according to the plants contained in the house. Some of those very thin materials we see exhibited, when strengthened with webbing, do admirably for *Lælias* and other Mexican and Brazilian plants; the medium textures for *Cattleyas*, and the thickest for *Cypripediums*, *Masdevallias*, and all cold-house plants, all East Indian Orchids, and all terrestrial Orchids, such as *Calanthe veratrilolia*, *Phaius Wallichii*, &c. These grow in dense jungles, and bright sunlight dwarfs them and altogether spoils them.

I saw a remarkable instance of this recently in a garden where a *Calanthe veratrilolia* had been kept in a sunny house for years, and had always been a miserable and stunted object. At length it was placed out of the way on the centre bed, and underneath the tall plants, which effectually hid it from view. In a very short time it became a robust, free-flowering plant. I have seen many similar cases where excessive sunlight under glass has had much the same effect as excessive cold would have done. I, therefore, assert that although most Orchids require a clear light, yet when grown under glass all of them should be sheltered from the unbroken rays of the sun from the time it gets the power to injure until its power wanes. For Orchids in flower a thick shading is absolutely necessary, as the flowers last twice as long shaded, and draw on the strength of the plants much less than they do when exposed to the sun. As regards the heating of Orchid-houses, I early found that it was necessary to have some plan, and to adhere to it, checking it by the thermometer. I therefore compiled the following scale for the whole year:—

Table of Temperatures for Orchid-houses.

Months.	Warm House. East Indian.		Cattleya, or Intermediate House.		Cool or Odon- toglossum House.	
	Day.	Night.	Day.	Night.	Day.	Night.
January ..	65-70	60	63-65	55	50-55	45
February ..	65-70	60	60-65	55	50-55	45
March ..	65-70	60	60-65	55	55-60	50
April ..	65-70	60	60-65	55	55-60	50
May ..	70-75	65	65-70	60	60-65	55
June ..	75-80	70	70-75	65	60-65	55
July ..	75-85	70	70-80	65	60-70	55
August ..	75-85	70	70-80	65	60-70	55
September ..	75-80	70	70-75	65	60-65	55
October ..	70-75	65	65-70	60	60-65	55
November ..	65-70	60	60-65	55	55-60	50
December ..	65-70	60	60-65	55	50-55	45

Degrees Fahrenheit. The higher day temperature to be attained by sun-heat when possible.

This scale cannot, of course, be followed to the letter, neither is it necessary that it should be; it is

intended rather to give a basis on which to operate, to enforce a strict guard over the regulation of the heating, and to the preserving of that lower night temperature which is of such vital consequence to the plants, and which should in all cases be insured by night ventilation and by every other means at command. In summer the prescribed temperature will often be exceeded, but it hardly matters by how much if the extra rise is due to sun-heat, and the houses in which the plants are properly shaded and kept moist.

#### ARRANGEMENT OF THE PLANTS.

And now the manner of the arrangement of the plants in the houses demands attention, as I am bound to confess that in all ages of Orchid culture, even down to this day, a great mortality has always prevailed among small growing plants; this arises probably, in many cases, from excessive heat and too little air, but in by far the greater number of cases by the lesser plants being made to occupy the front portions of the graduated stages, thus reversing the proper order of things and placing the strong plants near the glass and the weak and dwarf ones the farthest from it. From this cause I am sure the periodical scarcity of the *Ionopsis*, *Trichocentrum*, *Comparettias*, *Barkerias*, and such-like frail things may, in a great measure, be attributed to the distance they are grown from the glass. Indeed, it is of the highest importance that in general practice some attempt should be made to arrange the plants with relation to the distance from the glass of the roof according to their height and general growth. Hence, the very smallest should always be grown on blocks, rafts, or in baskets or shallow pans, and the others arranged according to their heights, as nearly as the necessity for occupying all the staging will permit.

Allowing 1 foot from the glass as the safety line, a good rough rule may be laid down that every small or medium-sized true epiphytal Orchid will do best if brought to within its own height of that line; thus, if a plant is 12 inches high it should be brought to within 2 feet of the glass of the roof; if 1 foot 6 inches, to 2 feet 6 inches; and so on until the larger and stronger growing kinds which will do in any position are reached.

The rule should be approached as nearly as possible with small things, but with large ones a distance of 3 feet from the glass is a convenient and good one. Of course this rule, like every other in such an elastic matter as Orchid culture, cannot be adhered to in all cases, but if steadily kept in mind and followed where practicable, it will be found of the greatest service in preserving the delicate subjects. *Cypripediums*, *Masdevallias*, cool-house Orchids generally, and terrestrial Orchids, although requiring some consideration in the same way, are not included in those which it is absolutely necessary to arrange after some modification of the before-mentioned plan. I may also add that fumigation, which is so injurious to many Orchids, claims many victims from the small growers, and it is better for each grower to find some safe liquid insecticide than to resort to fumigating at all.

And now, after I have endeavoured to gain converts by showing that Orchid culture is a pleasant occupation to those who possess some skill and much diligence, and who are willing to observe Nature and follow her dictates in the culture of their plants, demanding of them only twelve months' work in a year, exercising their judgment in all cases to the best of their ability, and maintaining the most scrupulous cleanliness in houses, plants, and everything around their plants, let me finish with a few observations as to the cost of the plants.

#### THE COST OF ORCHIDS.

On this head it may safely be said that never were good showy Orchids to be obtained at more convenient prices, and that the present regulation of supply and demand, while presenting to the wealthy collector rare plants for which he must pay well, at the same time offer to him who finds a congenial pastime in tending his one or two little houses of Orchids, plenty of beautiful things as well within the reach of his purse as any ordinary plant would be. Indeed, good things are cheaper now than ever they were, and with the exception of a few very high prices, those realised now-a-days are not the outcome of a new Orchid craze, as a comparison with former prices will prove.

Rare things, according to the esteem in which they are held in their day, have always commanded good prices. In March, 1846, at a sale of Guatemalan Orchids at Stevens', *Coelia macrostachya* realised £10 to £12 10s; *Barkeria spectabilis*, £5 to £17 each;

*Epidendrum Stamfordianum*, 5 guineas; *Lælia superbiens*, £13 to £15; *Mormodes* and *Epidendrums*, 5 to 10 guineas each, and *Arpophyllums*, £10 to £15 each; the 168 lots realising £600. In 1845 *D. aqueum* fetched £10 a plant, and later on *D. formosum* 15 guineas, other *Dendrobies*, £10 to £12 each; *Oncidium macranthum*, £5 to £8 each. In 1847 the imported plants of *Vanda Lowii* fetched from £10 to £25 each; *Acridis maculosum*, £20; *A. crispum*, £21; *A. odoratum*, £16, and others equally high prices; Mrs. Lawrence, the Earl of Derby, Mr. Rucker, and Mr. Schröder being the principal buyers. Notes taken at the same period also tell us that errors of description were more frequent in former times than in ours. *Ansellia africana* is described as having immense sprays of handsome flowers each as large as a Tulip, and in another case the auctioneer is entrusted with the sale of a bright scarlet *Vanda*!

It will therefore be seen that ever since Orchids were introduced they could command prices according to their beauty or rarity, and so no doubt it will continue to be. Let us hope that the now great facilities for obtaining handsome things, formerly very expensive, may with the aid of the display of their beauties at this Conference, induce many new growers to commence, each according to his means, for out of such ranks our great Orchid growers of the future will be recruited.

#### ORCHIS WEEVILS.

THE large importation of orchideous plants from all parts of the tropics into this country has been, as might naturally have been expected, accompanied by the advent of numerous species of phytophagous insects, which feed on, or in, the fleshy leaves, and especially on the roots and stems of those plants. In various numbers of the *Gardeners' Chronicle* during the last twenty-four years we have recorded the occurrence of various species of insects upon or within different orchideous plants.

In the *Gardeners' Chronicle* for 1859, p. 193, a species of *Acarus* was described which had been found infesting Orchids.

In our issue for November 27, 1869, p. 1230, we described an unknown coleopterous larva found by Mr. Bateman in the buds of an Orchid, and also a small hymenopterous insect (*Isosoma orchidearum*) found in the same situation. On December 11, 1869, p. 1279, the late Mr. Andrew Murray published a note describing a weevil under the name of *Centrinus epidendri*, which he considered to be the perfect state of the larva described in the preceding month by us.

A species of the curious genus *Embia*, found at the roots of an Orchid, is described and figured in *Gardeners' Chronicle*, 1876, p. 845; and a plant bug (*Capsus Cattleyiæ*), from South America, is described and figured in *Gardeners' Chronicle*, 1877, vol. viii., p. 244. Another plant bug, under the name of *Phytocoris militaris*, found on *Cattleya Aclandii*, is described and figured *Gardeners' Chronicle*, 1879, August 2, p. 137.

In the course of the autumn of 1884 we received from a correspondent numerous stems of a species of *Dendrobium* (probably from India or from one of the islands of the Indian Archipelago), each of which exhibited several small circular holes on the exterior, as shown in the accompanying wood-cut (fig. 143, p. 633). On cutting the stems open longitudinally, we found several small black weevils fully developed in the inside of each stem, from which indeed some of the insects had already escaped by making the little holes seen on the outside, the substance of the stems having been gnawed into channels by the larvæ of the weevils, all of which had arrived at the imago state, so that no larvæ were visible. These weevils are a quarter of an inch long (including the rostrum), of a black colour, thickly covered with fine granules on the head and prothorax, whilst the wing cases are marked with longitudinal rows of minute round punctures, there being about nine on each wing case, the outer or lateral rows being most indistinct. The insect is very like our common English weevil (*Notaris acridulus*) in size, shape, and colour, but differing in several characters. On submitting several specimens of the weevil to Francis P. Pascoe, Esq. (who has made a special study of the Curculionidæ), he informs me that the insect is allied to *Baris*, and particularly to his genus *Acythopeus*, of which he had described six species and possessed as many more unnamed. Mr. E. Saunders had sent him another new species from Borneo, imported with

Orchids, which they had attacked, and which he had brought before the Scientific Committee of the Horticultural Society on November 11 last (see *Gardeners' Chronicle*, 1884, p. 662), and as Mr. Pascoe proposed exhibiting and describing our species before the same committee we hesitate to propose a specific name for it.

From our engraving it will be seen that the rostrum is long and slender, and that the antennæ are inserted between its middle and the extremity, and that there is a short oblique groove at their base on each side, extending to the under-side of the snout; the femora are strong, with a notch near the extremity on the under side, which forms a small tooth in the forelegs.

M. Roelofs, who has also made a special investigation of the Curculionidae, sent to the Entomological Society of Belgium, on December 6 last, a note respecting two other species of Weevil, "trouvés dans les Orchidées de l'équateur," found living "sur des Orchidées à Londres." One of these was the *Cholus Forbesii* of Pascoe, which that gentleman informs me he had received from M. Morren's garden at Brussels; the other is a new species of *Sphenophorus* named *Sph. Morreni*, but which Mr. Pascoe refers to the genus *Nanophasis*.

In our fig. 1 (p. 633) the insect is represented of the natural size, and in fig. 2 as magnified. Fig. 3 represents one of the antennæ, the articulation at the base of the long basal joint having been accidentally omitted; fig. 4 part of the stem of the Orchid; and fig. 5 another stem cut open. *I. O. IV.*

## ORCHIDS IN BELGIUM.

M. F. MASSANGE has his collection at his Château de St. Gilles, which is twenty-five minutes' ride from the principal railway station at Liège. To tell of all the fine and rare things we saw there would take too much space; let us say that we saw here among a host of plants those which are to be found in most collections, such as *Odontoglossum brevifolium*, *O. nevadense*, *O. nevium majus* (true), *Anguloa Ruckeri* atropurpurea, one of the two plants known of this fine variety; *A. Reine des Belges* (a unique beauty); several splendid plants of *Oncidium macrothum hastiferum* (in bud), *Cattleyas* of every description, all in fine health. We counted over fifty specimens of *C. Warneri* in bud. We met with *Lælia Stelzneriana* there, and all the leading varieties of *Masdevallias* in numerous small and fine healthy plants; *M. macrura*, *M. trochilus*, *M. Harryana* (Bull's blood), *M. lata*, *M. Denisoni*, *M. atrosanguinea*, *M. rosea*, *M. chimæra*, *M. Davisii*, &c., a splendid lot of fine middle-sized specimens of *Cypripediums*, among which we found fine plants of *C. caudatum*, *C. superbiens*, *C. selligerum*, *C. Ashburtoniæ*, *C. superciliosæ*, a fine variety of *C. Sedeni*, *C. Chantini*, *C. Dalhousiæ*, &c. Some fine *Vandas* were in flower, among which we noticed *V. suavis*, *V. Veitchii*, and *V. formosa*. In one of the houses we saw a fine specimen of *Dracæna Massangeana*, and the famous *Massangeana tigrina*.

We think it hardly necessary to tell that we saw some fine plants of the beautiful *Cœlogyne Massangeana* here. M. Ferd. Massange had much pleasure in telling us the origin of this gem, and how the plant, which was despised by his gardener, was nearly lost. Happily M. Massange himself is a first-class amateur and connoisseur, and to give an idea of this let us say that he has had one of the largest rooms of his château so arranged that every side of it represents a true picture of the tropical countries from which Orchids are imported. This grand idea he carried out assisted by famous travellers and a clever artist. This has cost him much money, and has occupied five years. Here you see how Orchids grow in their natural habitat—you see them surrounded by their associated plants, and at the same time you see the wildness of the sites; so that for anybody who wishes to see Orchids as they naturally grow, need not expose his health and life—a single journey to St. Gilles realises the dream of so many Orchid-loving amateurs.

### BAILLONVILLE.

From Liège to Marche, which is the railway station from which one can reach M. D. Massange's château at Baillonville, we had more than one and a half hour's journey by rail. There are no express trains on this route, which passes through what is called La Petite Suisse, and the scenery is so beautiful and interesting that it would be a pity

to go through it by express. From Marche we have thirty-five minutes' ride to reach the château, and then we were where the most splendid Orchid collection is to be seen. *Cattleyas!* *Cattleyas!*—what fine plants they are when cultivated as they are here: no bulbs without their leaves; and what size of bulbs on those *Mendeliis*, *Trianeæ*, *Mossias*, and *Warneri*! What a fine thing *C. Trianeæ Massangeana* is, the flower with a broad stripe of the same dark purple as the labellum in both sepals and petals. *C. Trianeæ Veitchii*, grand specimen and variety. The true *Lælia præstans* in flower, different plants of *C. Trianeæ alba*; *C. labiata* (the true autumn flowering variety) is represented here by two or three varieties, and there are several plants of each; some masses of *C. Mendelii*, having their new bulbs of a size rarely seen, and carrying fifteen and sixteen spikes on one plant. Some rare varieties of *C. Mossie* were showing well for flowering. M. Massange himself quite understands the wants of his plants, and he may be proud of his success, in their culture, for we never saw plants of the Orchid family in a better state. Nowhere did we ever see *Cattleyas*, *Masdevallias*, *Cypripediums*, *Odontoglossums*, so well cultivated as they are here. Mr. Massange blooms any plant. *Lælia superbiens*, *Cattleya choconensis*, *C. bogotensis*, are in bloom here. He had one plant of *Restrepia antennifera* with 135 spikes in bloom last season. Two varieties of *Odontoglossum nevium* were in bloom; *O. Halli*, many *O. triumphans*, *O. blandum*, *O. coradinei*, the true plants, named by Professor Reichenbach; *O. Andersoni*, *O. Alexandræ* in variety, &c. The grandest specimens of *Masdevallia extant* are to be found here, and so healthy looking they are, and as free flowering as the middle-sized specimen, which size some growers consider may not be exceeded without exposing the plants to the risk of becoming shy flowering.

We should not forget to mention that the original plant (a large specimen) of *Cœlogyne Massangeana* is to be found here. *Cattleya exoniensis*, *Lælia elegans Turneri*, *Cypripedium expansum*, a unique variety of *Asburtonia*, as well as all the leading Orchids, are represented here, and all that are new and rare can be seen in strong and healthy looking specimens.

## THE FERTILISATION OF ORCHIDS.

OWING to the special arrangement of the reproductive organs in Orchids, they would remain sterile if they were not fertilised by the intervention of insects. I add to this element for successful fertilisation the laying bare of the masses of pollen by the removal of the cap which covers them, and which might be effected by a gust of wind or by a touch from the wing of a bird or insect in its flight, &c. Under these conditions the pollen masses are easily put in contact with the stigma, and fertilisation is thus brought about. But it is to be remarked that it only takes place on a very small number of flowers. I have often had the opportunity of seeing the imported Orchids, and horticulturists who receive these plants direct from their native country are able to confirm my statement that, with rare exceptions, only a few species, such as *Phaius grandifolius*, *Aërides affine*, and *Vanda Roxburghii*, fruit at all abundantly.

In cultivation I have only observed the following species as fertilising themselves naturally and with facility:—*Lælia cinnabarina*, *Cypripedium Schlimgii*, *C. javanicum*, *C. virens*, and *C. Bullenianum*. From this it may easily be understood how great is the certainty offered to the hybridiser. It is always easy to distinguish whether the stigma of the flower which it is proposed to fertilise has previously undergone impregnation or not, and that not only by the size of the pollen grains, but also by the swelling which the contact of the pollen produces on the stigma. During the greater part of the time that the flower remains open it can be fertilised. If it is desired to make a cross with a distant related species the flower must be operated upon as soon as it has expanded; its generating energy is then much more intense, and no hesitation must be made about sacrificing the flower.

When a flower has once been fertilised, it will not be influenced by any other pollen which may be borne

into the stigmatic cavity, but if the operator wishes to assure himself of the success of his experiment, it will be sufficient to cover the flower at once in a cap of soft paper well closed from top to bottom. The day following the fertilisation the flower which has been operated upon begins to close, the beautiful colours fade, the odour loses its delicacy, and the sepals, petals, and lip speedily fade. The ovary in its turn swells and enlarges each day in a truly surprising manner, and attains its maximum of development generally in a third of the time which it will take to arrive at maturity.

Another peculiarity which would not be suspected, and about which during my repeated observations I have no doubt, is that the mere extraction of the pollen produces on the flower from which it is taken an effect analogous to that of fertilisation itself. Some days after the extraction of the pollen the flower, and that one only, closes its sepals and petals, and soon fades. I have said that the fertilised flower closes the day following fertilisation in the majority of cases, but it is otherwise with *Cypripedium*. This very distinct tribe is exceptional on nearly all points, but the most important is that which concerns the duration of the flower; this duration is, in fact, but slightly abridged. I have at various times fertilised the flowers of *Cypripediums* which had been open for a month, and I have then had the satisfaction of preserving them quite fresh for three weeks more, and sometimes even longer. *Cypripediums* have two other remarkable exceptional peculiarities; the first is that the action of the pollen upon the stigma does not produce that swelling which is so marked in the pseudobulbous and epiphytal species; the second is that the enlargement of the ovary takes place slowly, and only assumes comparatively very small proportions. As concerning the seeds, the number contained in a *Cypripedium* capsule certainly does not reach a hundredth part of that which is contained in a pericarp of *Cattleya Mossie* or *C. gigas*.

When hybridisation is practised on one flower of *Lælia*, *Cattleya*, *Oncidium*, *Ansellia*, &c., only that particular flower closes. All those which are borne on the same spike, or on the same raceme, exhibit no alteration, and form a contrast with the first as curious as striking. Observations that I have made at various times on this phenomenon enable me to state the great durability of the generating power in *P. Schilleriana*, and very probably in *P. Stuartiana*.

I have in my collection a plant whereof the flower lasts for three months, and not wishing to lose the pleasure of such a long-lasting flower, and also desirous that it should serve for hybridising purposes, on April 18, 1882, I crossed it with the pollen of *Phalenopsis amabilis* on a flower which expanded on Jan. 26, that is to say, after three months, and the success was complete.

When fertilisation has been effected, the development of the ovary and growth is visible to the eye. After some months the fruit reaches its full development, it seems each day that it is just about to let its seeds escape. The seeds are of extreme smallness, and extremely numerous. Patience, however, must be exercised, for we must await the maturity of the seeds, which requires a period twice as long as that which has elapsed since the time of the operation.

The following list shows the number of months which each species takes to mature its fruit:—

	Months.		Months.
<i>Cattleya amethystina</i> toto	12	<i>Oncidium Papilio</i>	10
" <i>labiata</i> ..	13	<i>Peristeria alata</i> ..	8
" <i>Loddigesii</i> ..	10	<i>Stanhopea oculata</i> ..	5
" <i>bicolor</i> ..	10	<i>Lycaste tetragona</i> ..	5
" <i>gigas</i> ..	16	<i>Phalenopsis amabilis</i> ..	6
" <i>labiata Pescatorei</i> ..	17	" <i>grandiflora aurea</i> ..	6
" <i>Mossie</i> ..	11	" <i>Schilleriana</i> ..	5
" <i>Percivaliana</i> ..	13	<i>Odontoglossum vexill-</i>	
" <i>Warneri</i> ..	10	<i>larium</i> ..	8
<i>Lælia purpurata</i> ..	9 to 10	" <i>grande</i> ..	6
" <i>crispa</i> ..	11	<i>Angræcum sesquipedale</i>	7
" <i>Perrini</i> ..	13	<i>Cypripedium Chantini</i> ..	13
" <i>Fischii</i> ..	20	" <i>Bullenianum</i> ..	8
" <i>Leptotes bicolor</i> ..	12		

If artificial fertilisation has been done on a well established and vigorous subject, the fructification cannot injure the growth, as I have many times proved. Care should, however, be taken to avoid operating on weak and badly established plants, if it is not wished to expose them to the chance of being retarded for many years, and even of losing them altogether. Under this head Orchids make no exception; they revert, on the contrary, to the general rule. Condensed from a paper of M. A. Bleu in the "Journal de la Société Nationale d'Horticulture."

## APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY,	May 19	Clearance Sale of Plants, at Maesmynan Hall, by Frotheroe & Morris (two days).
		Royal Botanic Society, London, Summer Exhibition of Plants and Flowers, 2-7 P.M.
WEDNESDAY,	May 20	Horticultural Show at Paris. Sale of Imported and Established Orchids, Sarracenias, &c., at Stevens' Rooms.
		Sale of Imported Orchids, from F. Sander & Co. at Stevens' Rooms.
THURSDAY,	May 21	Clearance Sale of Greenhouse and Bedding Plants, at St. Mary's Nursery, Harlesden, by Frotheroe & Morris.
		Manchester Royal Botanical and Horticultural Society's Show (five days).
FRIDAY,	May 22	Crystal Palace Great Summer Show (two days).
		Sale of Imported Orchids, at Frotheroe & Morris' Rooms.
SATURDAY,	May 23	General Meeting, Royal Botanic Society, 3.45 P.M.

OUR present issue, like our last one, is necessarily almost entirely filled with matter relating to the ORCHID CONFERENCE and were our space four times greater than it is, we should not have room to include all that has been sent to us on the subject. A few generalities may, however, here be given relating to the Conference and to the Exhibition. In the first place, in spite of minor defects from which such efforts can never be free, both were unquestionably successful in the highest degree.

As to the Conference, it was the most largely attended of any similar gathering. The papers read were excellent; that of Mr. HARRY VEITCH alone would serve to stamp this Conference as of high value, conferring the greatest credit on himself, and reflecting honour on the Society. Never have two more valuable papers been read before the Society than those of Mr. VEITCH and Mr. O'BRIEN, and we sincerely trust that they will form part of that report which, doubtless, the Society will ultimately publish.

Mr. BORWICK'S paper on the application of manures to growing Orchids produced a lively discussion, but it is evident that before all things it is necessary to know a vast deal more of the anatomy, the physiology, and the chemical composition of the plants in all stages of growth and development, and to devise practical experiments based on this information. Mere empiricism is not to be despised, but it is dangerous, and should take a subordinate position in a society like the Royal Horticultural Society. We indicated in a previous number certain lines on which improved cultivation might be based, and we may take an early opportunity to refer to the subject again.

At the Conference an announcement was made of a new departure, so far as regards the awards of the VEITCH Memorial Medals. On this occasion, as no prizes were offered in the Exhibition, the Trustees, as we think, very judiciously, awarded the three medals to three gentlemen who have been mainly instrumental

in various ways in promoting a knowledge of Orchids.

First and foremost a medal was awarded to Professor REICHENBACH, whose portrait we give in the present issue. No one will doubt the appropriateness of that award. The only feeling experienced will be one of surprise that the orchidists of this country have not long ago combined to give effect to their feelings of admiration for his life-long services and gratitude for his never-failing assistance. The absence of Professor REICHENBACH was the one drawback to the full success of the Conference, but he sent three short communications, and the news of the award of this medal, and of the chorus of approbation with which the announcement was received, will vibrate

The third medal was awarded to Mr. SEDEN, who very aptly completed the trio representing science, exploration and practical cultivation. Following as he has done the steps of DOMINY, all Orchid lovers know what we owe to SEDEN. With equal taste and good feeling Mr. VEITCH made himself the exponent of opinions of which he may be allowed to have the largest share, but which are undoubtedly possessed by all interested in the culture and hybridisation of Orchids. We could almost have wished that a fourth medal could have been awarded to the veteran DOMINY. It may seem strange, perhaps, to some that his merits should not have been specially recognised on this occasion. The reason in all probability is to be sought in the fact that DOMINY'S services have already been

publicly recognised, and the turn had now fallen to his modest but energetic successor, SEDEN.

The subject of nomenclature was not only crowded out from a full programme, but it was wisely eliminated till such time as the great authority of Professor REICHENBACH could be effectively brought to bear upon it.

The Votes of Thanks to Mr. VEITCH for his paper elicited a racy speech in Mr. BATEMAN'S old style, and that of Mr. GASKELL in proposing a vote to Sir TREVOR LAWRENCE and the Council, will, we hope, strengthen that body in the pursuit of that excellent mode of increasing the popularity and practical utility of the Society that they have of late adopted. Prosaic Potatoes will no doubt come in for their share in the autumn, while Primroses of all hues will occupy attention next spring.

Adverting now to the EXHIBITION we need say little here, as a full report is given in another part of the paper. It was large, beautiful, and interesting; we remember to have seen more "specimen plants" on other occasions, but never an exhibition of greater interest or greater scientific value. It was noteworthy, too, as being in large measure the production of amateurs and private growers, and as

having been got together without any offer of prizes. It was thus entirely free from the advertising element, and represented a genuine exhibition for love of plants and of knowledge, without ulterior considerations of mercenary advantage. The thanks of the Society are due to Messrs. LOW, VEITCH, WILLIAMS, SANDER, and others who contributed to the success of the show doubtless at considerable personal inconvenience. As such it was in conformity with the higher traditions of a national society as distinguished from a floral bazaar. For those who really love Orchids for their own sake this was unquestionably the finest exhibition of its kind, considering the season, that has ever been held. Showy Orchids are sure

FIG. 144.—KEFERSTEINIA GRAMINEA: SHOWN BY SIR TREVOR LAWRENCE.

across the North Sea, and bear some faint testimony of the gratitude and esteem experienced for the learned botanical Professor at Hamburg by his English friends. The second medal was awarded to the Rev. C. PARISH. Since LINDLEY'S death REICHENBACH stands alone, but Mr. PARISH has merited the honour conveyed to him, not only for himself, but as a type and exemplar of a large body of zealous and courageous collectors who, always at the risk, and too often at the sacrifice of their lives, have enriched science with their collections, and adorned our gardens with their gatherings. Mr. PARISH'S labours in Birma and elsewhere have amply won him the distinction.

GROUP OF ORCHIDS, AFTER A DRAWING BY W. H. FITCH.

to be well represented on such occasions, but we were specially delighted to see a choice collection of curiosities of great interest from Kew—"rubbish," in the eyes of some people; but that we sadly fear is a term that might in such case be applied to the intelligence of the critic. The Royal Botanic Garden, Edinburgh, sent a solitary exhibit of this class, but a most remarkable one—"Megaclinium oxypterum." Some would class this among the rubbish—others would value it more highly than the *Cattleya Skinneri alba* which was sold for 200 guineas. Tastes differ, and on such occasions the proclivities of all should be satisfied as far as possible.

The dinner at the "Albion" on the Tuesday evening, under the presidency of Sir TREVOR LAWRENCE, was very successful, and afforded a much appreciated opportunity for a friendly gathering of Orchid-lovers from all quarters of the British Isles.

On such an occasion the reports of the several committees are of secondary importance, and we should not allude to them now if it were not for a short communication read by the Rev. GEORGE HENSLOW before the Scientific Committee, connecting the unfolding of leaves in the bud with the necessity for protection of the upper surface of the leaf from radiation. The paper was a very neat piece of work, and one likely to excite a good deal of interest, but the inexorable Orchids prevent our inserting it this week.

#### GROUP OF ORCHIDS.

—Orchid growers will recognise in our plate the following species:—*Cattleya citrina* in the upper left-hand corner, head downwards as usual; *C. gigas* in the centre at the top; to the right the spotted *C. Acklandiae*; the two lower *Cattleyas* are *C. amethystoglossa* to the left, and *C. exoniensis* to the right—the latter a fine hybrid.

#### OUR LAST NUMBER.

—In our last issue we presented our readers with a special Supplement and Map, prepared by Mr. F. W. BURBIDGE. The map shows the geographical distribution of the genera of Orchids; the Supplement contains a complete list of the genera admitted by Mr. BENTHAM in the *Genera Plantarum*, and is published by the kind permission of Sir JOSEPH HOOKER. References to many illustrative plates are given, as well as to the whole of those figured in the *Gardeners' Chronicle* from 1841 to the present time. Such a condensed mass of information has never before been offered to the Orchid loving fraternity, and we would fain hope that it may be preserved for reference, and that it may be found useful in every garden where Orchids are cultivated. The cost and labour of production preclude the possibility of reproduction. It is therefore requisite that those who desire extra copies should at once apply to the Publisher.

—ORCHIDS AT ANTWERP.—There was never before seen in Belgium a better collection of Orchids than was at Antwerp. M. D. MASSANGE exhibited, not for competition, 350 flowers of *Cattleya Mossiae* and *C. Mendelii*; all were extra fine and fresh, on about only plants. M. MASSANGE has in his houses over 350 flowers, which he will probably send to Paris. MM. PETERS (Brussels), JACOB MACKOY (Liège), and

BODAERT (Ghent), had fine collections of thirty plants in bloom, competing for the 20 guineas and medal.

—MR. MASSIE.—We understand that Mr. W. H. MASSIE, who has for some years past been connected with the firm of Messrs. LITTLE & BALANTYNE, Carlisle, has made arrangements to join the well-known and long-established firm of Messrs. DICKSON & Co., in Edinburgh.

—"THE FRUIT MANUAL."—The Royal Horticultural Society of Liège have conferred their Large Silver-gilt Medal on Dr. ROBERT HOOG, of London, in recognition of the merits of his *Fruit Manual*.

—CUTLER TESTIMONIAL.—Mr. JOHN LEE and Mr. BRUCE FINDLAY are the Honorary Secretaries of a committee appointed to afford a "signal commemoration" of the success which has attended the effort to increase the annual pension by £4 each. This it is proposed to do by raising a substantial testimonial to Mr. CUTLER. Mr. CUTLER joined the Institution when it had two pensioners

PROFESSOR REICHENBACH.

and an income of £60 a-year. For forty-four years he has acted as the energetic Secretary, and it is unquestionably mainly to his zeal and persistence that the Society has not only been able to increase the pensions by this annual addition of £4, but to accumulate a reserve sum of £21,000, and to contribute towards the relief each year of 104 pensioners. For our own part, while endorsing to the full all that is said of the value of Mr. CUTLER's services, yet, considering the numerous appeals that have been made to the public to support the Institution, we should have preferred that this testimonial should have been of a private character. Some excellent friends and supporters of the Institution, however, think otherwise. In any case we can but hope that the response will be adequate to the occasion.

—"LINDENIA."—The first number of this publication has been issued. It is to be devoted specially to the illustration and description of Orchids. For this purpose it will draw upon the resources accumulated by M. LINDEN, through whom, directly or indirectly, more than 900 species of Orchids have been introduced into cultivation, and it will give coloured illustrations of the numerous species intro-

duced by the collectors for the Compagnie Continentale d'Horticulture. The title *Lindenia* appropriately brings to mind the ten years' wanderings in Tropical America of the horticultural ULYSSES, and the services he has since rendered by his very numerous introductions. The first species figured is—

*Aerides Reichenbachii*.—This is a very handsome species, first found in Borneo, but subsequently, as we learn, introduced from the Philippines. It has the habit and foliage of *A. quinquevulnera*. The flower segments are pale rose, with a deeper spot at the tips; the spur of the lip is yellowish, with numerous brownish spots.

*Trichopilia suavis* var. *alba*, t. 2.—"A delicious" Orchid, with snow-white flowers, the disc of the lip being yellow.

*Odontoglossum nevadense*, t. 3.—The flowers of this species are in racemes, each flower 4 inches across, with lanceolate segments, cinnamon-brown, with a yellow border, lip three-lobed, the anterior lobe hastate, white, the lateral lobes falcate, white, with a few purplish-brown blotches.

*Dendrobium Falconeri*, t. 4.—A lovely species, with thin pseudobulbs, linear leaves, large transversely oblong flowers, segments spreading, outer linear lanceolate, inner ovate lanceolate, all white, with rosy-pink tips, lip ovate lanceolate, white, with a pink tip, throat with a large dark crimson blotch, broadly margined with yellow.

The plates are beautifully and artistically executed, and the text supplies adequate descriptive matter and excellent cultural directions.

—M. RODIGAS.—The banquet offered to our excellent friend and colleague, M. E. RODIGAS, on the occasion of the twenty-fifth anniversary of his entry on his professional career, took place on the 3d instant at Ghent. Count OSWALD DE KERCHOVE presided on the occasion, supported by M. CRÉPIN and a large gathering of friends. A portrait and several other presentations were made to the Professor, whose ability, zeal, indefatigable industry, and willingness to oblige have earned him the friendly regard of all his colleagues.

—BIRMINGHAM BOTANIC GARDEN.—The new Exhibition Hall and Plant-houses, recently erected in these gardens were opened on Tuesday last, with appropriate ceremonial, and a very fine exhibition of plants was got together.

—CONTRIBUTIONS FOR THE GARDENERS' BENEVOLENT INSTITUTION.—Mr. GOUGH, gardener to GEORGE WEBSTER, Esq., of Harefield Grove, Uxbridge, conjointly with Mr. QUICKENDON, seedsman, Harefield, on April 8, promoted a concert there on behalf of the funds of this Institution, which realised a clear profit of £10 12s. 6d., which sum was recently paid in to the funds of the above Institution.

—PASSIFLORA CONSTANCE ELLIOTT.—This hardy white Passion-flower seems to meet the taste of those possessing a garden, as we are informed, that the raisers, Messrs. LUCOMBE & PINCE, Exeter, have sold upwards of 2000 plants.

—EALING MICROSCOPICAL AND NATURAL HISTORY SOCIETY.—On the evening of May 9 two lectures were delivered by Rev. Prof. HENSLOW and Mr. R. DEAN: the first, entitled "A half-hour with the Primrose;" the second, "A half-hour with the Auricula." Both lectures were illustrated by

examples, and a select collection of Auriculas, representing all classes, staged by Mr. R. DEAN, was an object of interest to the audience.

— DARLINGTON ROSE SHOW.—The Darlington Rose Show will be held at Southend, Darlington, on Saturday, July 25 next.

— DOUBLE ORCHIDS.—Mr. BULL sends a flower of *Lælia purpurata* well on its way to be double. It possesses two supplementary lips in addition to the normal one. From their position it would seem as if the two lips represented two of the usually abortive stamens, A 1, A 2, A 3, in the now customary notation. The manner in which these supplementary lips are rolled up and overlap one another is suggestive of how such flowers become infertile, inasmuch as access of insects is much less practicable than under ordinary circumstances.

— THE INTERNATIONAL FORESTRY EXHIBITION, EDINBURGH.—The winding-up of the affairs of the International Forestry Exhibition has now been completed, and a statement of the accounts was submitted by the Honorary Treasurer, Mr. JAMES A. WENLEY, Treasurer of the Bank of Scotland, duly vouched for by the Auditor, Mr. J. TURNBULL SMITH, chartered accountant, to a meeting of the Executive Committee, held on May 7, at which they were duly approved and passed, the balance to remain in the Bank of Scotland for future disposal. The following is an abstract of the accounts, as attested by the auditor :—

Charge : 1, Amount taken at turnstiles, £16,517 14s. 11d.; 2, Season, excursion, and other tickets, £3207 2s. 10d.; 3, Space charges paid by exhibitors, £1094 3s. 8d.; 4, Catalogues sold, £602 11s. 3d.; 5, Rents of refreshment rooms, £652; 6, Cloak rooms, lavatories, &c., £193 8s. 1d.; 7, Subscriptions and donations, including sums subscribed for essays, £164 8s.; 8, Proceeds of wood and fittings sold, and sundry other receipts, £521 0s. 11d.—Sum of charge, £22,957 9s. 8d. Discharge : 1, Salaries, wages, and gratuities, £2250 5s. 4d.; 2, Cost of buildings, rent, furnishings, and decorations, £9797 18s. 8d.; 3, Advertising, printing, and stationery, £2213 16s. 10d.; 4, Electric light, illuminations, bands, &c., £4675 15s. 9d.; 5, Expense of steam power, fuel, &c., £625 19s. 1d.; 6, Executive, jurors, and professional expenses, £883 17s. 8d.; 7, Firemen, policemen, and watchmen, £699 0s. 1d.; 8, Carriages, insurances, repayments, and expenses for exhibits, £461 11s. 1d.; 9, Medals and awards for essays, £855 4s. 9d.; 10, Incidents and sundries, £202 6s. 5d.—Sum of discharge, £22,655 15s. 8d.; Sum of charge as before, £22,957 9s. 8d.—Balance of charge, being sum in bank as at April 1, 1885, £291 14s.

— ANEMONES.—“ST. BRIGID” sends us from the Emerald Isle some Anemones, which for vigour and size we have never seen equalled.

— MACKAYA BELLA.—The variable success achieved in the cultivation of this plant by the different gardeners is rather remarkable, but the results would be far less uncertain if a little attention were paid to its inherited likes and dislikes, brought about by its surroundings in a state of Nature. The conditions there are such as to necessitate a resting period in order to flower it in our hothouses. The main points to be observed are to induce a vigorous growth during summer, and as autumn advances to gradually withhold water till the inflorescence is well set as a result of the lessened degree of vegetative activity. In the greenhouse at Kew there are some well-grown pot specimens gradually opening their pale lilac flowers variegated with transverse veins of a deeper colour. The two recognised species are included by the *Genera Plantarum* in the genus *Asystasia*, from which they merely differ by the posterior pair of stamens having abortive anthers. There is a figure of the plant in the *Botanical Magazine*, t. 5797.

— AGAVE AMERICANA.—Signor DANIELLI, in the last number of the *Nuovo Giornale Botanico Italiano*, gives a most elaborate monograph of the so-called American Aloe, beginning with the account given by PETER MARTYR in 1533 down to writers in 1884. Every book accessible to the author in which “qualche parola” relating to *Agave americana* occurs seems to be noted, but we doubt not that, were it worth while to extend the list, it might readily be done, but a mere enumeration of such references

without special purpose is surely of little value. This historical introduction, which contains much of interest, precedes an exhaustive account of the conformation and internal fabric of the plant, of its chemical composition, and the uses to which it may be put. So thorough is the author that he even cites the amusing letter of Lieutenant JEKYLL to Canon HOLE, counselling the use of the plant as a support for telegraph wires.

— ROYAL METEOROLOGICAL SOCIETY.—At the ordinary meeting of this Society, to be held on Wednesday, the 20th inst., at 7 P.M., the following papers will be read :—“The Temperature Zones of the Earth in connection with its Biological Conditions,” by Dr. W. KÖPPEN, Hon. Mem. R. Met. Soc. “Velocities of Winds and their Measurement,” by Lieut.-Col. H. S. KNIGHT, F. R. Met. Soc., F.R.A.S. “Note on Mr. C. HARDING’S Paper on Wind Velocities,” by Dr. W. KÖPPEN, Hon. Mem. R. Met. Soc. “Note on a Peculiar Form of Auroral Cloud seen in Northamptonshire, March 1st, 1885,” by Rev. JAMES DAVIS: communicated by the President.

THE SETTING OF FRUIT AND INSECTS.—The cold winds seem to have told rather severely on Peaches and Nectarines, the blossoms of which are falling without many setting; but the weather having changed on the 18th with some warmer days the flowers of other fruit trees have come on and expanded rapidly till the trees are now a fine sight. As the air is so dry and genial, it would seem that a crop of all the hardier kinds of fruit is now a certainty, as very soon Plums, Cherries, and Pears will be set, and it is hardly possible for frost of sufficient severity to come after this to do either much harm. The check Peaches and Nectarines had gave the fly a chance to get on the shoots, all of which, except those wanted for laying in, should be taken off at once, as they only afford harbour for these insects, which curl up the leaves, and are then difficult to get rid of, as they cannot be got at and washed off. When the budding is done, the best remedy is tobacco-dust, as with that there is no danger of hurting the young tender fruit as there is when potent liquids are applied, which go at once through the skin and stop Peaches and Nectarines from swelling, and make them fall from the trees. To cleanse them from the aphid after the tobacco is used, the garden engine should be brought into play, and if tepid water be chosen and driven over the foliage just before the sun gets on in the morning or off in the afternoon, it will give both fruit and shoots a good start, and enable them to keep ahead of their enemies. J. Sheppard.

— RAINFALL AND SUGAR.—The report of the Botanic Gardens of Jamaica observes that the question of rainfall is one of great importance to the well-being of that island; indeed, the prosperity of its planting industries is dependent so directly and entirely upon the maintenance of a high rainfall that Mr. MAXWELL HALL has been able to form a comparison (stated in the “Jamaica Rainfall” published in the supplement to the *Jamaica Gazette*, October 4, 1884), between so many inches of rain per annum and so many casks of sugar per acre. These are indicated by the returns of several years, as follows :—1.559 cask per acre with 79 inches (preceding) rainfall and 1.441 cask per acre with 56 inches (preceding) rainfall, “so that,” as he says, “the difference due to a larger or smaller island rainfall is on an average nearly one-tenth of the island export (sugar) crop.” This one-tenth of export crop (for sugar and rum) represents in value nearly £100,000. If, however, we take into consideration coffee, pimento, and other island produce, the difference in export value dependent on good or bad seasons as regards rainfall would amount to a very considerable sum. These considerations indicate to a large extent that the present generation is responsible for the maintenance of forests on all well-marked lines of watersheds, for the protection of the feeders of the streams, and, in fact, for the care of all that concerns the preservation of rain-water and the due humidity of the climate.

— GARDENING APPOINTMENTS.—Mr. JOHN HAMMOND, as Head Gardener to General GUBBENS, Longmead, Bishopstoke, Hants.—Mr. JOHN EARLE has been appointed Head Gardener to General STANSFIELD, Esholt Hall, near Leeds.

## TERRESTRIAL ORCHIDS.

THERE is perhaps no class of plants which combines so much delicate beauty, curiosity, and botanical interest as terrestrial Orchids, and though for various reasons their culture has been much neglected yet there are signs of an awakening interest in them, as many persons who are unable to cultivate Orchids which require expensive glasshouses can enjoy these in perfection out-of-doors. Their culture, however, is with some exceptions by no means easy, and in many cases the best than one can hope for is to flower the plant once, after which, notwithstanding every care, it disappears. Some species whose roots are epiphytous on the roots of trees—for I hardly think parasitical is a proper term, since as far as we know no nourishment is derived from the roots—absolutely defy all efforts to grow them away from their native habitats, and I am not aware that any one has yet succeeded in raising any terrestrial Orchid from seed in the open air.

Terrestrial Orchids are found in almost all parts of the world, but very few tropical species are known in cultivation, and many of those which inhabit Australia, which have been so beautifully figured by Mr. Fitzgerald, in a work which does honour to colonial science and literature, are quite unknown, except from his descriptions. In North America and Europe, however, some of the most beautiful species are found in abundance, and though the conditions which suit them are very various, many of these can be grown by any one who will devote a little care to the subject. I have at one time or another had above a hundred species in cultivation and with some of them have succeeded very well, whilst I by no means regret my numerous failures, as the task of collecting them from their native haunts has led me into many of the most beautiful scenes which temperate climates can produce.

It will perhaps be best to consider the various genera of terrestrial Orchids separately, indicating the best species and the most successful means of growing them, and as *Cypripedium* are perhaps the most charming of all, we will take them first.

Besides the many splendid forms of this genus which inhabit the Eastern Tropics, and are well known to most Orchid growers, there are ten or twelve species in North America and Europe which can be grown out-of-doors.

They have long wiry roots radiating from a central axis on which the stem grows, and for the most part inhabit swamps or shady woods in a climate where the winter is long and severe and the summer warm. For this reason they must be kept from stagnant moisture in winter, and from extreme drought in summer, and with three or four exceptions they are best planted in frames. The best known and most easy to grow are :—

*C. calceolus*, our native Ladies’ Slipper, which, though almost extinct in England, is found here and there on the Alps, and is easily to be had from nurseries. I believe it is generally found on limestone soil; and at Messrs. Backhouse’s it is cultivated very successfully on rockwork.

*C. spectabile*, the Moccasin Flower of the United States, is commonly grown in the best English gardens, and is one of the finest of the genus. Though it will succeed out-of-doors in a bed of loose, light, well drained peat, I have never seen it so fine as in a frame, where it bears two or three pink and white flowers on stems 1½ to 2 feet high.

*C. pubescens* is another fine American species, which is even easier to grow than the last. Some of the forms, which are variable, are much like our *C. calceolus*, others are much finer.

*C. arietinum*, *C. candidum*, *C. parviflorum*, and *C. californicum*, all from North America, are in cultivation, but are not so showy, or easy to get and keep, as the last.

*C. acule* is a distinct and beautiful plant, easy to flower once or twice, if strong imported crowns can be got, but it is very hard to keep; it grows in leaf-mould, under shrubs on hill-sides in North America, and seems to like dryer treatment than *spectabile*. It is best kept in a pan sheltered by a frame.

*C. macranthum* and *C. guttatum* are natives of Siberia, where they grow in rich woods. I have cultivated the first with success in sandy soil, and have seen it growing well out-of-doors at Berlin; but I never was able to get living roots of the other, though Dr. Regel has sent it me more than once.

*C. japonicum* is a splendid and distinct plant from Japan, having broad, fan-shaped leaves, and a large flower, but it seems very difficult to grow, as I have never seen it in flower since it was introduced some years ago.

*C. trajectum* is a Mexican species which Messrs.

Backhouse used to grow well; but I think it is more of a cool-house than a hardy plant, though allied to *C. pubescens*.

There are also one or two fine hardy *Cypripedia* in the higher ranges of the Himalaya which I have taken much pains to introduce, but without success, as the roots perish in passing through the heat of the tropics. If they could be got quite fresh in November or December and sent by post in a small tin box packed in dry moss, they might come safely, but as they grow in remote situations, they are not easy to procure.

There are some other genera, such as *Cephalanthera*, *Ilabenaria* and *Epipactis*, which have a similar habit of root-growth to the *Cypripedia*, and may be cultivated in the same manner. Some of the North American species, as *Ilabenaria pycnodes*, *H. fimbriata*, and *H. blepharoglossis*, are very pretty plants, which can now be procured without difficulty, but I never had much success in their culture. *Cephalanthera grandiflora* is common in woods on limestone in some parts of England, and *C. rubra* is a very pretty plant, extremely rare in England, where it grows in one or two dense Beech woods in my district, but though it seems much particular about its situation in the Alps, where it grows among shrubs on rocky ground, I have never been able to keep it in a garden. *? H. Elwes*.

(To be continued.)

## ORCHID CONFERENCE: May 12 and 13.

### The Exhibition.

THIS had been heralded with great expectations for some few weeks past, but promised only at the last moment to develop into a show of these beautiful flower, worthy of the Society and of the greater exhibition at South Kensington, of which it formed a part, and that certainly not the least attractive one to the general public. It had the advantage of the patronage of the best known and most successful growers of Orchids in the South, if not in the North, of the kingdom, whose plants alone, had their possessors showed to their full ability, would have made an exhibition themselves. As it was, many amateurs and nurserymen showed who are, if not unknown at the usual shows of the Society, yet but rarely seen there, so that many fine things were brought to light which otherwise would not have been seen at all, had the show been a competitive one—competitive shows bringing only the biggest and showiest plants forward, as a matter of course. The collections of Orchids in general were seventeen, some of them consisting of between four and five score plants, excepting duplicates.

SIR TREVOR LAWRENCE.—Taking the collection of the President of the Society, Sir Trevor Lawrence, first, we find a fine lot of well-grown specimens, many of them remarkable for their rarity and beauty, or for their singular forms and markings. At the back of the group was *Luddemannia Pescatorei*, a most striking Orchid, golden-brown, reminding one of nothing so much as a cluster of bees, so closely packed are the blooms; the spikes measured nearly a foot in length. *Chysis crassifolia*, a spike much branched, bearing several small twigs, with catkin-like racemes of minute flowers; the curious not often seen *Epidendrum rhizoporum*, full of flower; an *Odontoglossum vexillarium* of pale tints, carrying ten sprays of bloom; *O. Halli*, *O. Wilckeana*, *O. Pescatorei*, a very good variety; *O. cornuaria* miniatur, carrying one spike of rich brown flowers, half of the lip being yellow; *O. citrosum* album, an exceedingly delicate flower; the rare *O. Ieue*, with a lip, the half deep rose colour and half pale rose; *O. guttatum*, with four fine sprays of bloom; *O. crispum guttatum*, a splendid form, with rich red markings and a glistening yellow crest; *O. luteo-purpureum*, and *O. facetum*, of one spike only, completes the list of the *Odontoglossum*. An *Aërides Veitchii*, with a five-branched spray; *Angulosa Clowesii*, with four flowers; a well flowered *Dendrobium Skinneri*; a small *Vanda teres*; *Aërides Houletianum*, with fawn sepals and petals, with a lip of bright rosy-crimson; the curious *Dendrobium rhodostoma*, having its small pinkish flowers on the tips of the pseudobulbs; *Bulbophyllum siamense*, a dull yellow flower, showing faint lines longitudinally on all its parts; *B. Dearei*, *Houlletia odoratum*, a deep brown coloured bloom, with a white lip, and deliciously scented; *Dendrobium Pierardi*, *D. Dalhousienum*, with a finely expanded bloom; *D. Bensonæ*, *D. Harveyanum*, gold colour with fringed petals, the sepals being destitute of fringe. *Cattleyas* were not particularly numerous, but several *C. Mendelii* and *C. Mossiae* were charming in colour, and of immense size; *C. Skinneri* alba was a telling plant, and beautifully flowered; a plant of *Saccolabium ampullaceum* had three spikes of very deep crimson-rose; *Aërides Lobbi* had a graceful spike of its pretty blooms. *Oncidium* mustered strongly in this collection, and we remarked *O. junceifolium*, *O. ibaguense*, with a corymb of bright rose; *O. pulchellum*, a pretty white and yellow crested variety, with small blossoms; *O. bifolium*, a small edition of *O. Marshalli*; *Acanthophippium bicolor*, a *Lycaste*-like bloom of creamy-white, tipped with purplish-rose. Of *Cypripediums* there were *C. Dayanum*, *C. ciliolare*, one bloom; a very large plant of *C. caudatum*, with twenty

blooms expanded. Many *Masdevallias* were included, as *M. Harryana acanthifolia*, a very rich colour in this section; *M. H. coerulescens*, and others. Plants in bloom were shown of *Uropedium Lindenii*, a curiously long-tailed flower, purplish, tinted with green and with a flat lip; and *Lycaste Lawrenceana*, having green sepals and petals, rose-spotted, fawn coloured lip, which has a white margin. *Lælia lobata* also appeared—a spike of two blooms. He also sent a large number of *Masdevallias*, including *M. Chelsoni* ×, very good; *Harryana acanthifolia*, *coerulescens*, *Denisoniana*, large masses, well-flowered; *ignea aurantiaca*, very pale fawn-yellow; *coccinea Massangeana*; large plant of *Lindenii* and *superba*, *Shuttleworthii*, and *S. xanthocarpa*, *triangularis*, *trochilus*, and a good *Veitchii gigantea* with thirty-six flowers; *Harryana regalis*, deep purple, with flowers measuring over 2½ inches across. Among *Cypripediums* the President exhibited *Cypripedium Dayanum* with three flowers; *C. barbatum*, *C. ciliolare*, *C. Hookeri*, *C. levigatum*, *C. caudatum*, five flowers; *C. Lowii*, three spikes, with three flowers on a spike; *C. seligerum Wallisii*, and a fine plant of the light-foliaged variety of *C. Swainianum*, with ten flowers; also a number of hybrid *Cypripediums*, including *grande* (parents *C. Roezlii* × *caudatum*), *Harrisianum* (*C. Barbatum* × *villosum*), *marmorophyllum* (*C. Hookeri* × *barbatum*), *seligerum* (*C. barbatum* × *levigatum*), and the dark-foliaged form of *Swainianum* (*C. barbatum* × *Dayanum*).

BARON SCHROEDER.—The collection of Baron Schroeder, The Dell, Staines, was a most meritorious one, comprising in a special manner the idea the Council at first appeared to have had in view, viz., excellent specimens of rare or choice forms. Here we noticed a grand plant of *Cattleya Skinneri* alba with five spikes of its delicate white flowers. The purity of the whiteness of this new form makes this at once an object of admiration. *Cattleya Skinneri* with over two dozen spikes, remarkably fresh and of excellent colour; *Cymbidium Lowii* with seven spikes; several *Cattleya Mossiae*, *Cattleya Schroederiana*, a fine form of *L. purpurata*, sepals and petals pure white, lip of an intense purple, with a clear white margin—a form distinct and showy. *Cattleya Mendelii selborneensis* with a dark-coloured lip; *Dendrobium macrophyllum Dearei*, pure white; *Ada aurantiaca*, with twenty-five of its bright orange-scarlet spikes of bloom; *Vanda coerulescens*, having four good spikes of its violet-coloured blossoms; *V. Denisoniana*, creamy-white; *Masdevallia Lindenii*, very full of flowers; *Oncidium pulchellum*, a charming thing, white and light rose blossoms borne on a thin branching spike—an old acquaintance but very pretty; *Maxillaria Sauderiana*, pure white ground with the centre of the flower deep purplish-brown spots and markings; *Odontoglossum crispum* in many forms, pure white, and those with rosy sepals and petals, but the most notable were the *O. crispum Veitchianum* with a spike of ten flowers, large in every way, densely blotched and spotted with its deep rose-coloured markings; *O. crispum Sauderianum*, seven flowers on a spike, in some respects approaching the former, but not so fine in form, size, or marking; *O. crispum Ballantini*, a beautifully spotted variety; *O. Cervantesii*, with six flowers on a spike; *O. polyanthum*, good; *O. radiatum*, several very good; *O. vexillarium Ruckerianum*; a lovely mass of *Promeneia citrina*, *Cypripedium caudatum roseum*, *Cypripedium Godefroyæ*, *Lawrenceanum*; and perhaps the most admired plant in the show, *Lælia bella*, a *Veitchian* hybrid of surpassing excellence, with two flowers on the spike, of large size, rich rose sepals and petals, spreading lip of deep purple, with bright rose shade, partaking in every good particular of the characters of its parents, *C. labiata* and *L. purpurata*.

W. E. BRYMER, Esq., M.P., Ilington House, Dorchester (gr., Mr. J. Powell), exhibited a fine plant of *Calanthe veratrifolia* with ten spikes, well opened; a good *Cattleya intermedia*, with six spikes; *C. Mendelii*, with twenty flowers open; *C. Mossiae*, fine in form and colour; a nice plant of *Restrepia antennifera*, with numerous flowers; *Phaleopsis Luddemanniana*, and a good plant of *Maxillaria Harrisoni*, full of flowers. Mr. Brymer also showed *Odontoglossum Andersonianum*, a fine spike and good variety; good *O. crispum*; *O. citrosum*, with fine spikes and flowers; *O. luteo-purpureum*, *O. Pescatorei* *prænitans*, and a capital *O. vexillarium*, very dark colour; *Cypripedium albo-purpureum*, *C. biflorum*, *C. Lawrenceanum*, and a pan of *C. niveum* with fifty flowers, many spikes bringing double flowers were also included in this collection. From the same exhibitor came a good plant of *Epidendrum vitellinum majus*, with fourteen spikes; also a species with a spike of green flowers with dark brown spots; *Dendrobium densiflorum*, a well flowered *D. Falconeri*, with nearly one hundred flowers on it; small block of *D. Jenkinsii*, *Saccolabium ampullaceum*, very fine rose colour; good *S. retusum*, *Vanda suavis*, also a *V. teres*, and a good *V. tricolor*, with five spikes.

MR. J. CYPHER, Exotic Nurseries, Cheltenham, had a large collection of good things, among which we noticed some fine *Cattleya Mossiae*, one especially fine, with lip nearly 2½ inches across; *Cattleya Mendelii* in quantity, also *Cattleya Trianae*, a very nice variety; a good *Calanthe veratrifolia*, good in foliage and well bloomed; *Cypripedium biflorum*, *Hookeri*, *Lowii*, *Lawrenceanum*, a fine piece of *levigatum*; a number of *Dendrobiums*, among which *albo-sanguineum*, *Bensonæ*, *chrysotoxum*, *nobile*, *Falconeri*, *macrophyllum*, *Parishii*, and *thyrseiflorum* were represented with several plants of each; *D. rhodostoma*, a hybrid between *sanguinolentum* and *Huttoni*, was nicely bloomed and very pretty; several *Lycaste Skinneri*, *Masdevallia Harryana*, several plants, among them being some choice varieties; the rare *racemosa* (Crossii), with just one of its deep orange, scarlet-shaded flowers open; *civilis* and *Reichenbachiana*; *Oncidium sphaclatum*, with twenty-six spikes;

several well bloomed *O. Marshallianum*, also the good old *O. ampliatum*, and a number of *O. Alexandre*, *O. Cervantesii*, *O. citrosum*, *O. cordatum*, and *O. luteo-purpureum*.

W. LEE, Esq.—In the group of W. Lee, Esq., Downside, Leatherhead, which contained over 100 plants, many grand examples of culture were to be found, exhibiting care, skill, and management on the part of Mr. Woolford, the gardener. Here were some large masses of *Cattleya Skinneri*, well bloomed, two particularly so, having over twenty spikes each—a most effective exhibition plant; *Cymbidium Lowianum*, two large plants with numerous spikes; *Cypripedium caudatum*, with six spikes; grand masses of *Cattleya Mossiae*, well bloomed; numerous *C. Mendelii*, of fine colour and great breadth of lip; *C. Mendelii selborneensis*, and *C. M. elegantissima*; *C. Warneri*, one of the few plants of this species in the show; a nice plant of *Calanthe igneo-oculata*, variety *gigantea*, a very late flowering form, and excellent in every respect; a *Cypripedium grande* (hybrid *C. Roezlii* × *C. caudatum*), a strong growing form just intermediate between the two species named; several good varieties of *C. ciliare*, *C. Godefroyæ*, *C. marmorophyllum*, good; *C. Schlimii* album, *C. seligerum majus*, large in form and dark in colour; a nice plant with three flowers of *Cypripedium Stonci platycnium*; several *Dendrobium thyrseiflorum*, with good spikes; *D. Cambridgeanum*, a nice piece of the white *D. crassinode*, good plants of *D. Jamesianum* and *D. litiflorum*. The lovely *Lælia elegans* var. *elegantissima* was well done, its pure white blossoms, with just a faint tinge of colour on the centre of the lip, are very charming and delicate; *L. elegans Schilleriana*, *L. purpurata alba*, *Leptotes bicolor* were well bloomed. Among *Masdevallias* × *Chelsoni* was in good colour; *M. Benedicta*, *M. chimæra*, *M. Roezlii* and its variety *M. rubra*, numerous *M. Harryana*, *Bull's* blood, conspicuous with flowers 2½ inches across; *M. Harryana*, *M. Denisoniana*, *M. Russelliana*, and *M. ignea*, fine *M. Lindenii*, the rare *M. Schlimii*, nice pieces of the lovely *M. Shuttleworthi* and *M. Wagneri*; several nice pieces of *Oncidium concolor*: its drooping canary-coloured flowers were very striking amongst so much rose and white. The *Odontoglossum* in this group were of great merit: *O. Chester-toni*, a large *O. crispum*, with very dark spots; *O. citrosum*, several *O. crispum*, white and rose coloured varieties, of excellent quality; a good spike of *O. Edwardi*, its small flowers of purple and violet on a freely branching spike were much admired; *O. elegans* var. *superbum*, *O. gloriosum*, a good plant of *O. Jenningsianum*, *O. maculatum*, *O. superbum*, some good plants of *O. Pescatorei*, *O. Rossi majus*, *O. scepterum*, a very fine form; *O. triumphans*, a good *O. vexillarium*, a capital plant of *Zygopetalum Sedeni*, with two good spikes of flower; *Vanda Denisouii*, large plants of *V. suavis*, *Veitch's* and other varieties; *V. tricolor*, *V. Patersoni*, and others of equal merit.

THE DUKE OF DEVONSHIRE, K.G., Chatsworth (gr., Mr. O. Thomas), had a large collection of plants, many of which were good specimens of cultivation, and others were new and rare. A stem of a Birch tree over which trailed a *Renanthera coccinea*, unfortunately not in bloom, came with this collection. *Coelogyne ocellata* was a well-flowered specimen, *C. cristata* was equally well furnished, *C. Lemoniana*; *Calanthe veratrifolia* had two spikes of bloom, and *C. Domini* the same number. Of *Dendrobiums* were noticed *D. Wardianum*, *D. Skinneri*, *D. densiflorum*, *D. devonianum*, and several others. A strong plant of *Cypripedium caudatum* had two open blooms, and a quantity still to expand; *C. villosum* had twelve blooms, *Colax jugosus*, densely barred interiorly; *Angulosa uniflora maculata*, a species pleasingly spotted on the white ground colour; a healthy plant of *Vanda tricolor* with carried two expanded spikes; *Maxillaria Harrisoni*, a white bloom, the lip purple in colour, and covered with fine hairs; this plant had many flowers, and bore a singular aspect. Of *Odontoglossums* there were a dozen, including *O. Pescatorei*, *O. Alexandre*, *O. citrosum*, *O. citrosum*, a well-coloured *O. vexillarium*, *O. triumphans*, *O. Rossi*, &c.; a plant of *O. macranthum* bearing a fine large spike; two *Lycastes*, *Acinetus Humboldtii*, *Bulbophyllum Lobbi*, and several *Masdevallias*, as *Harryana*, *Veitchii*, and amiable, being the rest of the noticeable plants in this collection. From the Duke also came a large plant of *Dendrobium nobile* about 4 feet through covered with bloom.

J. C. DUKE, Esq., The Glen, Lewisham, showed eleven plants, amongst them being *Dendrobium albo-sanguineum*, bearing two blooms, pale brown, with a deep crimson blotch in the throat of the flower; a particularly richly coloured *Cattleya Warneri*, with two blooms; a *C. Mendelii*, with sepals and petals of pure white; *C. nobilior*, the curious *Epidendrum Parkinsoni*, bearing two green and white blooms; *Odontoglossum Roezlii* album, *O. Uro-Skinneri*, carrying one spike of perfect blooms. The *O. vexillarium* in this group was of an unusually deep rose tint, and bore two sprays of bloom. These, with *Oncidium concolor* and *Lælia autumnalis*, comprised the whole of this exhibit.

HUGH LOW & Co., Clapton, had a group in which *Cypripedium levigatum* was shown with twelve spikes of bloom; a good pan of *C. Lawrenceanum*, *C. ciliolare*, *C. Lowii*, and *C. niveum*; a fine mass of *Dendrobium Bensonæ* full of flower, good mass of *D. Jamesianum*, *Cattleya Mendelii* in good form, *C. Adlandæ* on blocks, a very dark variety of *C. Leopoldi*, spike with eight flowers; *Dendrobium Lowii*, and *D. anosum*, *Odontoglossum Alexandre*, *Aërides Fieldingii*, and *Odontoglossum species*.

J. SOUTHGATE, Esq., Selborne, Leigham Court Road, Streatham (gr., Mr. C. J. Salter). The display of this exhibitor was very extensive and of good quality. Here the white *Cattleya Skinneri* was again to be observed, a good form; a nice piece of *Dendrobium*

*Brymerianum* (true), having a spike with three flowers of a bright golden-yellow and deeply fringed lip; *Oncidium cucullatum*, with ten spikes; *Pescatorea Lehmanni* *Cattleya Mendelii* *selbornensis*, a grand dark variety; good *C. Mossiae* and *C. Skinneri*; *Coleogyne elata*, *Cymbidium Lawi*, numerous *Cypripediums*, among which  $\times$  *C. selligerum,  $\times$  *C. Harrisonianum*, *C. ciliolare*, *C. Haynaldianum*, *C. Hookeræ*, *C. lævigatum*, *C. Druryi*, *C. Roezlii*, and *C. Schlimii* were conspicuous; *Dendrobium Falconeri*, *D. Jamesianum*, good, *D. Parishii*, and well bloomed *D. thysiflorum*; *Lælia cinnabarina* and *L. purpurata*; *Masdevallia Veitchii grandiflora*, with ten good blooms; *M. Shuttleworthii*, *M. Harryana*, *M. chimera*, and *M. Chelsoni*; a fine plant and spike of *Odontoglossum Wilckeanum*, good varieties of *O. polyanthum*, distinct and well done, the lovely *O. Erstedii*, *O. crispum*, *O. Cervantesi*, several with five flowers on a spike, *O. sceptrum*, and *O. phalaenopsis*. A good coloured *Saccolabium ampullaceum*, *Vanda suavis*, and *Uropedium Lindenii*.*

MR. B. S. WILLIAMS, Victoria & Paradise Nurseries, Upper Holloway, N., had a numerous lot, containing many good varieties and specimens; *Calanthe Sandieriana* that had been exhibited on two occasions in the month of March, was again in good condition, with flowers of a deep rose colour, with lip of a similar colour but much darker, certainly a most desirable form; *Calanthe variegata*, good, several *C. citrina*, *C. Mendelii*, and *C. Mossiae*, one of fine form named *C. splendens*; *Cattleya Regnellii* (*Schilleriana*), with three flowers on a spike; *Cypripedium Argus*, *C. lævigatum*, *C. Lowi*, and a good mass of *C. niveum*; *Epidendrum vitellinum majus*, with numerous spikes; *Dendrobium Jamesianum*, *D. rhodopterium*, and *D. thysiflorum*; some good forms of *Masdevallia*, including *M. Harryana* and *M. Harryana var. cerulescens*, *M. lateritia*, an intensely dark form; *M. lilacina*, *M. rosea*, *M. Veitchii*, and *M. Shuttleworthii*; grand forms of *Odontoglossum vexillarium splendens*, *O. triumphans*, *O. sceptrum*, *O. Hallii*, *O. Andersonianum*, and *O. Alexandræ*; one form of large dimensions named *O. giganteum*, good plants of *O. citrosum*, and *O. luteo-purpureum*; several good pieces of *Oncidium Marshallianum*, with long branching spikes and flowers of good size and colour; *Vanda cerulescens*, *V. suavis*, and *V. Denisoniana*.

C. NEVILLE WYATT, Esq., Lake House, Cheltenham, exhibited a good collection. Here *Ada aurantiaca* was to be seen with twelve drooping spikes; *Chysis bracteata*, *Cattleya Skinneri*, with eight spikes; good plants of *Cattleya Mossiae*, one with thirty flowers open; *C. Mendelii*, with twenty-four flowers, another with ten blooms, excellent examples; *Cypripedium caudatum*, with seven fine spikes of its long-tailed flower, two pieces of *Stonel* and *Lawrenceanum*; some strong plants with branching spikes of *Oncidium Marshallianum*, a most effective plant for the exhibition stages; good masses of *Masdevallia Lindenii*, several *M. chimera*, *M. amabilis*, and *M. Backhouseana*; good forms of *Odontoglossum crispum* and *O. Pescatorei*; of *D. Bensoniæ* several good plants were shown full of bloom, also *D. Falconeri* and *D. thysiflorum*.

Kew.—From the Royal Gardens, Kew, a number of species of botanical interest were shown, which if not as showy as many of the other collections, were nevertheless full of interest and well repaid close inspection. Of these we shall speak on another occasion. The most noteworthy, perhaps, was *Epidendrum bicoloratum* with six spikes of its pure white flowers, having only a little purple at the base of the labellum. *Saccolabium gemmatum*, a good basket of *Masdevallia Benedicti*, *M. ochthodes*,  $\times$  *Chelsoni*, *Maxillaria lutea alba* and *M. triangularis*, *Cirrhopetalum fimbriatum*, *Eria excavata*, *Phalaenopsis Parishii*, a lovely little gem, and others.

J. T. PEACOCK, Sudbury House, Hammersmith (gr., Mr. Vicary), showed a group that was strong in *Odontoglossums* of good points. *O. Alexandræ* had a fine spray, with blooms not over large; *O. Andersonianum* was again large, and the form and substance uncommon; *O. Halli* was a big piece, with six sprays; *O. hebraicum* had three, and *O. triumphans* and *O. Wilckeanum* two each. A fine strong plant of *Oncidium ampliatum* was shown, and the handsome *O. Papilio* bore a solitary bloom as usual. Some rare *Masdevallias*, as *M. Shuttleworthii*, *M. trochilus*, *M. Harryana*, *M. Houtteana*, and *M. simulæ*, were shown, together with *Cattleya Mendelii* and *C. Mossiae*.

S. CORTAULD, Esq., Bocking Place, Braintree (Mr. W. Gunn, gr.), had a small collection, consisting of *Coleogyne ocellata*, a pretty plant, full of flower; a *Cattleya Mendelii*, with five blooms; *C. Percivaliana*, about a dozen *Masdevallias*, among which we noted *M. tridactylites*, small crimson-brown blooms; *M. triangularis*, *M. Shuttleworthii*, *M. ludibunda*, *M. Estradæ*, *M. Veitchiana*, and *M. psittacina*; an *Odontoglossum vexillarium*, of a high colour and five spikes; *Lælia purpurata*, with two very fine spikes of bloom; *Dendrobium chrysotoxum*, well flowered; a *Cypripedium caudatum*, and a few other plants of less importance.

H. M. POLLETT, Esq., Fernside, Bickley (gr., Mr. Parks), was strong in *Odontoglossums*, there being more than a score of species and varieties; *O. Andersoni* was prettily spotted, *O. Ruckerianum* had four spikes, the spotting of the rose tinted blooms being very pleasing; *O. Wilckeanum* had two spikes of medium size, as was also *O. vexillarium*; *O. Polletianum* (hybrid) had a massive branching spray of bloom; *O. Andersoni superba* must be considered an improved form of *O. Andersoni*; *O. odoratum*, a stellate form, richly spotted on a yellow ground. The *Masdevallias* comprised *M. Harryana*, *M. Lindenii*, and *M. rosea*.

C. L. INGRAM, Esq., Elsted House, Godalming (gr., Mr. T. W. Bond), had a small group of ten plants, comprising mostly *Odontoglossums*, as *O. Halli*, a good form; *O. Alexandræ*, *O. polyanthum*, a very fine piece of *O. Pescatorei*, *O. vexillarium* was of a deeper shade

than usual; *Sarcopodium Dearei* had two of its spotted primrose-coloured blooms open on a small plant. *Cattleya Mossiae*, *C. Mendelii*, and *C. Warneri* were nice little pieces of good strains. One spike of a plant of *Cypripedium caudatum*, had four well opened blooms.

MR. BULL, 536, King's Road, Chelsea, sent three forms of *L. purpurata*, one with lip of deep intense purple, one with sepals and petals pure white, and labellum with scarcely any colour; and a third with white sepals and petals, lip very broad, very deep colour, colour fading away to the edge with a very pale margin. Mr. W. Bull also exhibited an *Odontoglossum* hybrid with three spikes, very distinct, in the way of *gloriosum*  $\times$  *crispum*.

DE B. CRAWSHAY, Esq., Rosefield, Sevenoaks (gr., Mr. S. Coope), sent a *Cattleya gigas*, imported last September, on the first growth of which a spike with five perfect blooms have developed—a very good piece of successful culture. *Lælia purpurata alba*, a fine plant in a pan, with several spikes of bloom, besides *C. Mendelii* and distinct varieties of *C. Mossiae*. H. Little, Esq., Hillendon, had *Cattleya Mossiae rosea*, several forms of *C. Mendelii*, distinct and well done.

Messrs. F. SANDER & Co., St. Albans, showed a very fine collection, including *Cattleya* as *Mendelii*, *C. Mossiae*, and *L. elegans* and *Schilleriana*; there were about thirty-six plants altogether, many large ones among them. The *Mendelii* included some excellent forms, one in which the lip measured nearly 2½ inches across; another dark variety, in which the throat was of deep orange colour. Of *Lælias*, some good *Schillerianas*, carrying numerous flowers, and dark *elegans*, one especially good, named *prasiata*, with several others of scarcely lesser note, made up a display of colour worthy to be compared with the best. Messrs. F. Sander & Co. also showed about thirty plants of hybrids, mostly of the *gloriosum*, *Andersonianum* and *Ruckerianum* form of variety; among them were many choice forms, rich in markings, and very diverse in their appearance. The same exhibitors had a good spike of the beautiful *Calanthe vestita oculata gigantea*, certainly a most useful form, coming much later and considerably larger than the type; the pure white *Cattleya Bluntii*, a fine specimen of *C. Wagneri* with many flowers on it; a plant with two spikes of *C. maxima*, a very fine *Perni* variety with ten flowers on a spike; also a mass of *Warszewiczella Wallesiana* covered with its purple blossoms.

From H. LITTLE, Esq., came a good *Cypripedium caudatum* var. *rosea*, with tails 2 feet long; *selligerum* majus, with three spikes of large flowers.

From R. WHYTE, Pentland House, Old Kent Road, Lee, came a small plant of *Dendrobium cruentum*.

R. EWING, Esq., Cheshunt, exhibited a *Dendrobium Fytchianum*, with thirty spikes, a most interesting and beautiful specimen.

From Mr. A. BORWICK, Higham Hill, Walthamstow, came a fine plant of *Cymbidium Lowianum* that has been fed since August last with J. Jensen & Co.'s fish-potash manure. This plant, which hitherto has done just moderately well, since the application of the fish manure has grown very strong, making six growths this year in the place of single ones in years previous, and now it is shown with two fine spikes, one with twenty-six flowers, the second with thirty-two; evidently it has obtained great strength very recently.

W. COBB, Esq., Silverdale Lodge, Sydenham (gr., Mr. A. G. Catt), exhibited *Chysis bracteata*, with three spikes of sweet-scented flowers of good size and substance; a small plant of *Chysis Limminghii*, a *Grammatophyllum* species, with a spike 3 feet long bearing green flowers with dark brown spots.

Mr. PRINSEPS again brought a very fine plant of *Dendrobium nobile*, which had been under his method of pruning for several years.

Mr. G. GORDON, Twickenham, exhibited a very fine example of *Odontoglossum crispum*.

E. HARVEY, Esq., Aigburth, Liverpool, sent a nice plant of *Dendrobium Brymerianum*, and a good plant of *Odontoglossum ferrugineum*.

From B. D. KNOX, Esq., Caversham, Reading, came a plant of *Dendrobium cruentum*, bearing its yellow and orange flowers among the foliage.

THE NEW PLANT and BULB COMPANY, Lion Walk, Colchester, sent a capital variety of *Cattleya Mendelii*, a good form of *L. purpurata alba*, *Odontoglossums*, among which *Alexandræ* was in good form; *O. lave*, *polyanthum*, and good *vexillariums*.

A number of plants, some not in flower, came from Messrs. E. VERVAET & Co., Mont St. Amand, Ghent. Among these we observed *Aërides Fieldingii*, *Bollea* species, *Bollea Patinii*, *Bollea Lalindei*, *Cypripedium Parishii*, several *O. crispums*, and a large variety of *Pescatorei*. *Masdevallia Houtteana*, a mass with over twenty flowers on it; also a beautiful form marked *Lælia Schroederi*, very like *L. purpurata*, but very pale in the lip.

From W. VANNER, Esq., Camden Wood, Chislehurst, came a nice plant of *Masdevallia Chelsoni*, and on either side were plants of *M. Veitchii* and *M. amabilis* (parents), showing how well it partakes of the characteristics of both.

Messrs. J. VEITCH & SONS, Chelsea, had a fine lot of hybrids raised in their nursery, including *Chysis Chelsoni* (*C. bracteata*  $\times$  *aurea*), *C. Sedeni* (*C. bracteata*  $\times$  *Limminghii*), *Cypripedium calurum*, most beautiful production (*C. longifolium*  $\times$  *C. Sedeni*), *C. graude* (*C. Roezlii*  $\times$  *C. caudatum*), *C. marmorophyllum* (*C. Hookeri*  $\times$  *C. barbatum*), *C. microphyllum* (*C. niveum*  $\times$  *C. Druryi*), *Cypripedium Sedeni caudiculatum* (*C. Schlimii*, *albiflorum*  $\times$  *C. longifolium*), *C. supercilare* (*C. barbatum*  $\times$  *C. Veitchii*), *C. tessellatum porphyreum* (*C. concolor*  $\times$  *C. barbatum*), *C. veruxium* (*C. Argus*  $\times$  *C. villosum*), *Masdevallia Chelsoni*, and *M. Gairiana* (*M. Veitchii*  $\times$  *M. Davisii*).

A. H. SNEE, Esq., The Grange, Wallington, Surrey, exhibited a number of *Orchids* grown for four

months last summer in the open air, from June till October, and plants as shown, and cut flowers also, were certainly as fresh, and in some cases even larger, than those grown by ordinary culture. The cut included a number of *Lycaste Skinneri*, in many shades and of very fine size and colour. Plants included *Oncidium concolor* and *O. Marshallianum*, good plants of *Odontoglossum crispum*, *Masdevallia Shuttleworthii*, *Brassia Keleana*, *Odontoglossum radiatum*, and others. From E. Wright, Esq., Gravely Hill, Birmingham, came a fine spike of *Odontoglossum hebraicum*.

From Mr. J. ROBERTS, Gunnersbury Park, came *Aërides Veitchii*, a fine plant bearing a spike with three laterals; the rare *Eupopsis biloba*, *Cattleya Mossiae*, *Dendrobium nobile* (well bloomed), one of the few *Dendrobium Farmeri* in the whole show; the true old *Odontoglossum naevium majus* with good spikes; grand specimens of *Oncidium Marshallianum*; a large form of *Masdevallia Veitchii* with numerous blooms; *Phalaenopsis Mannii*, the pretty *Vanda cristata*, *Odontoglossum Andersonianum*, *Coleogyne ocellata*, *Odontoglossum triumphans*, and *O. citrosum*.

R. RAVENHILL, Esq., Fern Hill, Windsor Forest, exhibited a plant of *Oncidium concolor*, with a spike from the base, also from the top of the bulb.

Rev. J. B. NORMAN, Whitchurch Rectory, Edgeware, showed a plant of *Oncidium Kienastianum*. A long spike of flower, very much like *seratum*, but larger and brighter, with petals spread out, not clipped together over the front of the flower as is usually the case with *seratum*.

A novelty came from W. MACDONALD, Esq., The Woodlands, Perth, in a plant of *Phalaenopsis Stuartiana* in a basket with roots clinging to the wood, on which three young plants had appeared, and were rooting—a very interesting specimen.

N. C. COOKSON, Esq., Oakwood, Wylam-on-Tyne, showed *O. crispum* *Cooksoni*, a grand variety, having pure white ground, with large spots of deep purple all over it; also a nice spotted hybrid.

From F. A. PHILLBRICK, Esq., Q.C., Oldfield, Bickley (gr., Mr. H. Heims), came a grand plant of *Odontoglossum Wilckeanum*, with two spikes of flowers, bearing over thirty blooms; also *O. Ruckerianum*, very good. Mr. Philbrick also had a good plant of *Cattleya Mendelii*, a hybrid between *C. Loddigesii* and *C. saccinissima*.

Messrs. SHUTTLEWORTH, CARTER & Co., 191, Park Road, Clapham, put up a group of *Odontoglossums*, in all about fifty plants, in which were some fine forms of *crispum*, a strong spike of *mulus*, several good *Andersonianums*, *gloriosums*, *hystrix*, *naevium majus* (Rchb. f.), *Pescatorei*, grand forms of *Rossi majus*, *triumphans*, and *Wilckeanum*—a very choice group.

#### CUT FLOWERS.

Messrs. IRELAND & THOMSON, Craigleith Nurseries, Edinburgh, had a grand display of cut flowers. Here were to be seen over sixty varieties in excellent examples—*Ada aurantiaca*, *Aërides Warneri*, *Brassia verrucosa grandiflora*, *Cattleya Mossiae*, *C. amethystoglossa*, *C. amethystina*, *Citrina Mendelii*, and *C. Skinneri*, *Coleogyne ocellata*, *Cymbidium Lowianum*, *Cypripedium Boxalli*, *C. barbatum biflorum*, *C. Domini*, *C. Lawrenceanum*, *C. lævigatum*, *C. Lowi*, *C. Roezlii*, *C. [Warneri]*, *Dendrobium Boxalli*, *D. chrysotoxum*, *D. Devonianum*, *D. Dalhousianum*, *D. Falconeri*, *D. infundibulum*, *D. Pierardi latifolia*, *D. thysiflorum*, *D. Wardianum*; *Masdevallia Veitchii* *cerulea*, *M. Bull's blood*, *M. Denisoniana*, *D. Estradæ*, *D. ignea*, *D. Houtteana*, *D. Lindenii*, *D. lutea*, *D. oculatum*, and *D. xanthium*; *Odontoglossum* (*Erstedii*, *O. Alexandræ*, *O. cordatum*, *O. Cervantesi*, *O. citrosum*, *O. citrosum*, *O. gloriosum*, *O. Halli*, *O. hebraicum*, *O. luteo-purpureum*, *O. niveum majus*, *O. Pescatorei*; *Phalaenopsis polyanthum*, *P. Roezlii*, and *P. triumphans*; *Oncidium concolor* and *O. tigrinum*; *Phaius Wallichii*, *Burlingtonia fragrans*, *Trichopilia tortilis*, *Vanda insignis*, *V. tricolor*, *V. Leopoldi*, and *V. suavis*.

A. PATERSON, Esq., M.D., Fernside, Bridge of Allan, N.B., also staged some fine groups of cut flowers, the spikes and flowers being of excellent quality; here we noticed *Aërides Fieldingii*, *A. roseum*, and *A. rubrum*; *Angraecum sesquipedale*, *Ansellia africana*, *Brassia Lawrenceana* and *B. verrucosa*, *Cattleya Mendelii*, *C. Mossiae*, and *C. maxima*; *Coleogyne ocellata*, *Cymbidium eburneum* *Lowi*, *Cypripedium caudatum*, *C. Argus*, *C. longifolium*, *C. Lawrenceanum hirsutissimum*; *Dendrobium glumaceum*, *Lælia purpurata*, *Lycaste Skinneri*, *Maxillaria aureo flava*, *Mesopidium vulcanicum* and *M. sanguineum*; *Odontoglossum Alexandræ*, *O. citrosum*, *O. Halli*, *O. nebulosum*, *O. Pescatorei*, *O. Rossi*, *O. triumphans*, *O. leucoglossum*; *Oncidium concolor*, *O. Marshallianum*; *Phalaenopsis Luddemanniana* and *P. Schilleriana*; *Restrepia antennifera*, *Saccolabium retusum*, *Trichopilia crispa*, *Uropedium Lindenii*, and different forms of *Vandas*.

Messrs. W. THOMSON & SONS, Clovenfords, Galashiels, exhibited nearly a score of spikes of different varieties of *Vandas*; also good forms of *Lælia elegans*, *Trichopilia crispa*, *Odontoglossum Pescatorei*, and others. From W. Thompson, Esq., Walton Grange, Stone, Staffordshire, came grand pieces of cut flowers, including most of the forms of *Odontoglossum*, among which *O. coronarium* stood out very prominently; also *O. Andersonianum*, *O. Cervantesii*, *O. crispum*, *O. gloriosum*, *O. Halli*, *O. luteo purpureum*, *O. maculatum*, *O. naevium majus*, *O. nebulosum*, *O. pardium*, *O. Pescatorei*, *O. polyanthum*, *O. pulchellum*, *O. Rossi majus*, *O. tripudians*, *O. triumphans*, *O. Uro-Skinneri*, *O. vexillarium*, *O. Wilckeanum*.

A fine display of cut flowers was also made by De B. Crawshaw, Esq.; also by E. Harvey, Esq., Liverpool.

First-class Certificates were awarded as follows:—

To Sir Trevor Lawrence, Bart., M.P., for *Ludemanniana* Lehmanni, a plant in growth much like *Acineta* Humboldtii, but very distinct in flower. It was shown with two grand spikes coming from the base of the bulbs and hanging down, producing numerous blooms, with sepals of light brown, petals bright yellow, with hastate shaped lip of the same colour.

To Baron Schröder, for the following:—*Odontoglossum crispum* Veitchianum, a nice plant, with a spike of ten flowers of fine size and substance, standing well out sepals and petals, densely spotted with reddish-brown, lip rather short, with a deep golden crest and numerous spots on the lower part. For *Odonoglossum crispum* Sanderiana, which was in many respects similar to the above, yet inferior, the tips of the sepals and petals turning towards the centre of the flower; flowers large, the whole being heavily mottled and spotted with deep red spots and with a bright yellow crest. Also for *Odonoglossum excellens*, doubtless a natural hybrid, perhaps between *O. Pescatorei* and *O. triumphans*, in size and form much like the former, but just a little narrower than a good form; pale yellow ground colour, shading off to white at the centre of the flower, with two and sometimes three large spots of brown; lip white, with one spot in the centre. And for *Cypripedium Godefroyi*, a species recently figured in these columns, resembling *C. niveum* in growth and in form, but the whole of the flower covered with spots of brown, the lip having spottings of smaller size than the upper part of the flower. For *Masdevallia Sanderionna*, a singularly looking dull white flower, which was stained and spotted at the base of the flower segments with rich brown, the lip being dirty white.

To Mr. B. S. Williams, for *Masdevallia Harryana* lateritia, a plant with five flowers of great size, measuring over 2½ inches, deep vermilion with purple shade.

To Mr. Cookson, for *Odontoglossum Cooksoni*, a plant with large *Alexandra*-like blooms, having pure white flowers, of fine substance, with large spots of indian-red on every division of the flower; one of the finest forms that could possibly be imagined.

To F. Sander & Co., for *Cattleya Wagneri*, with ten pure white flowers, with yellow throat and a faint tinge of rose in the centre of the lip. For *Cattleya Bluntii*, fine flower, pure white in every respect, similar to *Mendelii*. For *Cattleya Schröderiana*, pure white sepals and petals, with lip of intense amethyst, beautifully veined with white—a magnificent thing. For *Cattleya maxima peruviana*, an imported mass, with three spikes, the largest bearing fourteen flowers, large, with very dark lip, splendidly veined. Lastly for *Odontoglossum Ruckeraum punctatissimum*, spike with twelve flowers, heavily spotted with deep rose shade over the whole of the flowers.

To W. Lee, Esq., for *Cypripedium Godefroyi*, a very fine form.

### The Discussion.

Sir TREVOR LAWRENCE, Bart., M.P., President of the Council, occupied the Chair. The attendance was exceedingly good, and great interest was taken in the proceedings.

The CHAIRMAN in opening the proceedings said:—The business of the Conference on Orchids which we are now about to commence has largely to do with the botanical and scientific aspect of the cultivation of Orchids. I need hardly say that I should not venture to express any opinion whatever on matters of botanical science in connection with this subject; as it is only as a horticulturist that I have the honour to occupy the position which I do occupy, and therefore I must ask you to be so kind as not to suppose that I am in any way assuming or professing to give any opinion on botanical questions. I think you will one and all agree with me that the Conference Committee and Royal Horticultural Society have every reason to be satisfied with the success which has attended the Conference. I very much doubt indeed whether such a collection of Orchids has ever been gathered together as we have in the conservatory below; and I believe that it would be impossible to gather together such a collection of Orchids as is there displayed in any other part of the world. The thanks of the Conference Committee are due to those amateurs and to those members of the trade who have helped us on this occasion, and on behalf of the Committee I beg to tender you our very sincere thanks for your exertions and efforts to make the Conference and show a success. The Royal Horticultural Society has for many years been under a great debt of gratitude to the horticultural trade, who have at all times supported us to the best of their ability, and who have largely contributed to the success of this Conference and our show. Under the somewhat new aspect our horticultural trade has assumed, several principal nurserymen are at the present moment very much interested in shows of Orchids on their own premises, and therefore we could hardly have expected them to denude their own premises for two days of the principal attractions that they would have; and while we are considerably indebted to the horticultural trade for the help they have given us, there is no doubt that the great bulk of the show is made up by the contributions of amateurs about London. I hope on another occasion we may have help from amateurs all over the kingdom. We should very greatly like to see some of those magnificent Orchids of which so many of us have only read, from the neighbourhood of Liverpool and Manchester. I have reason to believe that visitors who have come to this Conference from those parts are fired by the spirit of emulation, and will do all they can to show that they can cultivate Orchids as well, if not better, in the North than we do in the South. With regard to the excellence of the show, I think

I may be allowed to quote the authority of no less a person than Sir Joseph Hooker. He expressed to me and to other persons his very great admiration for the show, and his great appreciation of its value in promoting the cultivation of Orchids; and when we consider that Sir Joseph Hooker, who, like a great many other persons who study the scientific aspect of botany, is not very enthusiastic on behalf of shows, as a rule, I think this testimony is all the more valuable. Referring to Kew, I think it is very much to be regretted that, mainly owing to the excessive economy with which money is given to that very valuable institution, there is no sufficiently representative collection of Orchids there at present. I believe the authorities at Kew are fully alive to the very great interest which is being taken in this subject throughout the length and breadth of the kingdom, and we hope that they will do their utmost to ensure this result—that the collection of Orchids shall be equal to those of the other natural orders of plants. In fact, it would be unwise if they should not do so, because it is very much the custom and very much the fashion with gentlemen who possess collections, when they leave this world, to leave their collections to public institutions; and I do not see the least reason to doubt that, if there are fine ranges of Orchid houses at Kew ready to receive plants, some wealthy bachelor will leave his collection to the public, as being, perhaps, on the whole his best heir. With regard to the absentees from the Conference, I am requested by Professor Reichenbach, to express his very great regret that threats of an attack of pneumonia prevented his being here. I know of the reality of his regret, for he has been longing, and has been most anxious to see the skill which has been displayed and enterprise which has been shown by English orchidists. He has been kind enough to send a paper, and he writes to say that had he been here he would have expressed his warm thanks to orchidists, and especially to John Lindley—a name than which, in connection with the science of Orchid growing, there is no other that commands greater respect. While in the absence of Professor Reichenbach we lose one of the best scientific exponents, the loss is also his, as he would have thoroughly enjoyed seeing the collection we have here. Dr. Paterson, of the Bridge of Allen, says how deeply interested he is in the objects of the Orchid Conference, and he sincerely wishes it every success, as for half a century he has derived very great pleasure and instruction from the cultivation of all kinds of plants. We also regret the absence of plants which might have been sent from the Duke of Sutherland's, as more splendid species of *Odontoglossum* than those at Trentham cannot be seen in any other part of England. I do not suppose in any family of plants there is anything approaching the extraordinary variety which Orchids display. You get what appear to be in all respects totally different flowers growing on the same plants. Almost all epiphytes grow upon trees. A most singular circumstance connected with Orchids is the peculiar contrivance by which it is hardly possible for them to become fertilised except by the intervention of insects or the hand of man. Nothing has been more remarkable than the rapid increase of our knowledge of this family. Looking back to the first volume of the *Botanical Magazine*, which appeared in 1787, I find in the first ten volumes—from 1787 to 1795—that there were only two Orchids illustrated out of 360 plates. If you go to the first ten volumes of the third series of the *Botanical Magazine*, which appeared in the years 1845 to 1854, you find, on the other hand, that there are a hundred different species of Orchids illustrated out of the same number of plates. Now, so far as the possibility goes, it would be quite possible to fill almost every number of the *Botanical Magazine* with new species of Orchids, if it were desired to do so. I may say I have occasionally, as a subscriber to that periodical, been disposed to complain that we do not get a few more Orchids in it. I think sometimes they might very worthily replace some of the rather insignificant foreign weeds which appear there. I believe there are hardly fewer than 5000 species of Orchids known. Of that number there are close upon 2000 in cultivation. With regard to one particular genus (the *Dendrobium*) I have had in my collection no less than a hundred species in cultivation at one time. There is another curious circumstance in connection with Orchids. I do not see that with regard to most of them there is any reason why they should ever die. Parts of Orchids are annually reproduced in a great many instances, and death need not take place except through being in captivity or from errors of cultivation. I suppose it is quite as possible to give to plants, especially Orchids, such constitutional diseases as we human beings suffer from, such as gout and other things; and it is quite as possible to give like diseases to plants by injudicious diet and by feeding them too well or on improper food. There is another curious circumstance with which I think the industry of collectors is making us better and better acquainted. There exist albinos in some of the principal genera of Orchids, such as *Cattleya* and *Dendrobium*, and this shows the contrariety of human nature in regard to these genera. We search and endeavour to secure albinos; and when we have flowers which are white we search and endeavour to secure coloured varieties. With regard to the collection of Orchids, in former years collectors were sent out by wealthy amateurs, gentlemen who desired to adorn their gardens with new plants, new flowers—gentlemen such as the Duke of Devonshire, the Duke of Northumberland, and other persons occupying similar positions. Of course this Society did a great deal of very good work by employing very enterprising, skilful collectors. All this, so far as private people are concerned, has come to an end, and I think, perhaps, on the whole, it is to the advantage of the cultivation of Orchids that this matter should have passed into the hands of business people, who collect Orchids as a matter of commerce. In refer-

ring to that for one moment one would not do justice to several of the persons to whom we owe so many of the beautiful species, if we were not to pay some personal tribute to them. The firm of Messrs. Hugh Low & Co. have for many years devoted themselves, their capital and enterprise, in this direction. Then there are Messrs. Veitch & Son, Messrs. B. S. Williams & Sons, Mr. Bull, and Messrs. Backhouse. Many other firms have in years passed devoted a great deal of enterprise to this matter. I have got a list of the countries that have been covered by the collectors of one firm only. These are—the Argentine Republic, Borneo, Brazil, Guiana, Ceylon, Costa Rica, Ecuador, Guatemala, British Honduras, British India, Upper Burma, Jamaica, Java, Labuan, Madagascar, Mexico, Celebes, Uruguay, Nicaragua, Panama, Malay Peninsula, Singapore, Philippine Islands, Trinidad, San Salvador, United States, Columbia, and Venezuela. This shows at all events that there has been no want of very wide travel on the part of the collectors, and perhaps it may lead some people to suppose that we have very nearly collected all the Orchids we are likely to get. I do not think this is the case. In regard to one Orchid, one of the principal importers of plants told me his collectors had been searching for it for many years although it was known about where it grew. I refer to the *Odontoglossum majus*. Perhaps some day it may be found in profusion.

With regard to one subject, I think the public seems to take great interest in Orchids. Anybody who is accustomed to attend auctions knows that every now and then some few foolish persons, like myself, are carried away by the momentary spirit of competition, and we give more than the plants are really worth, and this applies to all collectors. What I would venture to say in regard to the price of Orchids is this: it is never very wise or judicious to give a very large price for imported Orchids although they may be said to be extremely rare, because some collector may turn up to-morrow with a shipload of the same flower, and what you gave 60 guineas for one day would, perhaps, not be worth more than as many shillings the next.

I think it more reasonable for wealthy persons to give a considerable price for Orchids which have been raised by cross-fertilisation in this country, because they are the results of horticultural skill that cannot be imported from abroad. When you consider the vast amount of careful watching and labour which is involved in coaxing a seedling *Cattleya* into a flowering state, I think you may fairly admit there is some good ground for the persons who have succeeded in raising seedling *Cattleyas* to consider themselves entitled to charge a large price for them. I think I am correct in saying that the first seedling *Cattleya* that was ever raised in this country was seventeen years before it flowered, and during that time it required very careful watching. With regard to imported Orchids, I should instance that in the present Conference there are three very beautiful varieties in the collection which is shown, and for which we are indebted to Baron Schröder—*Odontoglossum crispum* Veitchianum and *Odontoglossum crispum* Sanderianum. One of them is suffused with a sort of port-wine stain, and another is very richly spotted. I believe we might spend a lifetime and flower hundreds and thousands before we could get three such varieties as these are. Of course you all know when you get any exceedingly rare, and at the same time beautiful plant, it is naturally competed for on all sides, and is sold for a large price, and I think there is full justification for its being so.

Mr. VEITCH's paper on Hybridization was received with the greatest applause, and in the discussion which followed:—

Dr. MASTERS, F.R.S., said:—As a botanist, I have listened to this paper with the utmost admiration. I have been struck with the value and number of facts brought forward, many of them of such great interest as to render this paper one of the finest which has ever been read before this Society. The only contribution I would make in the way of discussion is this—that among the hundreds, perhaps thousands of Orchid seeds that I have seen, not one-tenth have been perfect, and this is the reason, in all probability, why so few have germinated under Mr. Veitch's care. The perfect Orchid seed is a nearly circular or elliptical bag or membrane, with a minute microscopic germ inside. Not in one-tenth of the seeds I have seen has this germ been present. Of course this is absolutely necessary to germination, and without it no seed can germinate.

The CHAIRMAN said:—Mr. Veitch has mentioned my name as one who has had some experience of late years as a hybridist. I can entirely corroborate if it were necessary what has been said about the exceeding difficulty of getting fertile seed, and in Mr. Darwin's book on the *Fertilisation of Orchids*, he mentions having microscopically examined seeds sent to him, and he found there was in an entire pod perhaps one fertile seed. Every now and then—but this is most exceptional—seed-pods have produced a vast number of fertile seeds. I have bought a *Cypripedium* which has produced a large number of plants—so large a number, in fact, that we have been constrained to throw a large quantity away. This was owing to the crossing of two *Cypripediums*. With regard to *Dendrobium*, we have pods which have produced a very large number of plants. With regard to *Odontoglossum*, we certainly have had seed germinate, but it has only lived to arrive at a very small size, which could scarcely be distinguished, even with the aid of a microscope, and has very speedily died. So far as the very small experience that I have had as a hybridist goes, I should say it is far more difficult to raise seedlings of some of the hybrid crossings than to raise delicate children, and those errors that I referred to in my opening remarks on the importance of diet and treatment, which I am afraid all our intelligence has not enabled us to avoid in regard to children, the little experience we have had of the progeny of Orchids will not enable us to avoid similar

errors in regard to these flowers. Mr. Fitzgerald, in his book on *Australian Orchids*, shows the extreme difficulty with which, in Nature, Orchids are fertilised; but he refers to a magnificent *Dendrobium speciosum*, called the Brisbane Lily, which had as many as 40,000 flowers open on the same plant at the same time. The plant was quite open to the visits of insects of every description.

The CHAIRMAN then alluded to the award of the Veitch Medals, alluded to in our leading article.

Mr. VEITCH, as representing the Veitch family, said: I am gratified to see that the Medal founded in honour of my father's memory should have been given to Mr. Seden. He has been twenty-five years in our employ. He entered my father's service, and a more zealous and skilful foreman it would be difficult to find. Therefore, I wish to bear testimony to my pleasure at Mr. Seden receiving a Veitch Medal.

Mr. B. T. LOWNE:—One of the difficulties in rearing seedling Orchids arises, I believe, from the fact that the pollen is only developed from the proliferation of the mother cells after the pollinia are placed upon the stigma. It is possible, I think, that the stimulation due to the presence of the pollinia gives rise to the development of the capsule even whilst the ovules remain unimpregnated.

Mr. JAMES BATEMAN:—I have very great pleasure in proposing a vote of thanks to Mr. Veitch for his admirable paper. I am sure he and Mr. Dominy will know the effort it causes me to make this proposal, for I have been brought up with the very strongest aversion to hybridists. I fell into evil hands early in life. My first orchidist friend was Mr. Huntley. When I paid him a visit at his snug little rectory in Huntingdonshire, he pointed to his Cacti and Orchids and said, "I like these plants. They are the only plants I grow because those dreadful fiends (meaning hybridists), cannot touch them." You must make a little allowance for the botanist, because you hybridists do give botanists a little trouble. However strong my prejudices were I must confess that when I saw such plants as your Cattleya, if I was not converted, at all events, what came to the same thing, I was "shut up!"

Mr. JOHN DAY seconded the motion, which was carried with acclamation.

Mr. VEITCH in reply, said he was exceedingly obliged to the Conference for their kind vote. Mr. Bateman was a kind-hearted genial gentleman, and he had always asked himself what could be the reason of Mr. Bateman's conduct when that gentleman went to his house, because he always adopted a very severe manner when he went near a hybrid. He could understand the whole matter now, and he was glad to know that Mr. Bateman had lived sufficiently long to give up his horror of hybrids, and he hoped he would still be able to name one of those flowers after Mr. Bateman!

#### CULTIVATION OF ORCHIDS.

Mr. J. O'BRIEN then read his paper on "The Cultivation of Orchids."

At the close of the paper, Sir Trevor Lawrence having left the Conference during the reading of it, to welcome the Prince of Wales—Professor MICHAEL FOSTER occupied the chair, and said, as there did not seem to be any intention of discussing the last paper, he would propose a hearty vote of thanks to Mr. O'Brien.

The motion was seconded and carried with enthusiasm, and the Conference then adjourned till 2 P.M.

#### THE NOMENCLATURE OF ORCHIDS.

Mr. LEE took the chair in the afternoon, and intimated that the subject for discussion was "The Nomenclature of Orchids."

Dr. HARVEY, Liverpool, who opened the discussion, said:—I feel very great diffidence in speaking in the presence of men who have given so much attention to the subject, but my excuse must be that I feel strongly on the question. I think that if a conference was required for the nomenclature of Daffodils, it must be necessary for the nomenclature of Orchids. The great difficulty we have to contend with to-day is the absence of Professor Reichenbach. I do not think it is in the power of this committee to decide that the Orchid Conference shall be permanent, but something should be done in the way of that accomplished by the Daffodil Committee. The proper authorities of the Society should, on the recommendation of this meeting, make the Orchid Conference Committee a permanent one, and it should take steps to secure the presence of Professor Reichenbach on the future committee, which should go into this question in a systematic and scientific way.

Mr. LEE:—The question of the nomenclature of Orchids is an exceedingly difficult one; I am afraid it is one that cannot be dealt with on this occasion. When we put this question down for consideration it was always hoped and expected that Professor Reichenbach would carry out his promise to come to this Conference, and we intended to refer the whole question to him, and to get him to give us a paper on the nomenclature of Orchids.

#### MANURES FOR ORCHIDS.

The CHAIRMAN called on Mr. ALFRED BORWICK, who said:—I have some diffidence in complying with the request of Mr. Lee, because the idea of anything like a manure is horrible to most Orchid growers. It has often been a source of regret to me, and no doubt many gentlemen here have felt the same, to see so many Orchids dwindle, if not possibly pass out of existence—not from any want of care or devotion, for that is generally in excess of the demand, but apparently from deficiency of strength, or, in other words, "starvation." I am led to think this must be the case from information

conveyed by travellers and collectors, that birds throng the trees upon which Orchids are found, and that they supply in their dung a rich diet, containing, as it does, ammonia, phosphoric acid, and some potash, which is washed by the rains and dews into the interstices of the trunks, so that the plants not only enjoy the advantage offered by residence on living trees, but the stimulant and food provided by the birds. Terrestrial Orchids in the same way have the benefit of decaying vegetation, which supplies stores of ammonia. As soon as plants come into house cultivation there is at once an end to these rich manurial provisions, and they have to depend upon moss, peat, charcoal, and corks, with possibly occasional charges of liquid-manure, for their subsistence. In all the soils and ingredients used for potting Orchids there is little trace of potash or other manurial constituent, and nothing goes to promote the development of fibre in plants like potash. The aim is to produce bulbs of largest size and firmest growth, but that is impossible unless there are healthy roots in abundance, and these roots can obtain a sufficient amount of nourishment to supply the fibres, of which the bulbs mainly consist. The manure which I have used for some time is that of Messrs. J. Jensen & Co., 10, St. Helen's Place, E.C., who are engaged in the manufacture of fish manure at the Loffoten Islands, the seat of the great Norwegian Cod fisheries. When I tell you that this year, from early in February to Easter, no fewer than 32,000,000 of large fish were caught you can form some slight idea of the magnitude of the fisheries. The fish are gutted, the bodies salted for food, the livers go to make oil, while the heads and backs are available for manure. They are dried, pulverised, and reach England in the form and condition of flour. The average manurial constituents of dried codfish are 10.60 ammonia, and 30 phosphates. Grand as these ingredients are in themselves they are wanting in one thing, viz., potash. If this is absent it is impossible to obtain perfect fertilisation; wherever it is present in due degree the effect is astonishing in the vigour and rigidity of plant growth. Refined salts of potash and magnesia are added to the fish manure and at once produce a perfect fertiliser of similar constitution to bird-dung, and containing the essential constituents of ammonia, phosphoric acid, and potash, in the form most available for plants. In this manure there is no acid used. Fish-bone is very gelatinous, and when sufficiently pulverised dissolves in the soil, so none is needed. Seeing, as I did, the effect of this combination on all pot plants, it struck me that Orchids might like it also. Last August I began to experimentise upon a plant of *Cymbidium Lowii*, and requested my gardener to put half-an-ounce on the soil. We soon observed a darker colour in the foliage; in four or five weeks two strong growths appeared, which proved to be flower-spikes as they grew; more fish-potash was added from time to time. Since then there are five breaks, four of them of strength sufficient to content any one. I then ordered its use for all terrestrial Orchids, *Lycastes*, *Calanthes*, *Sophranites*, *Phaius*, *Zygopetalum*, *Odontoglossum*, *Masdevallias*, *Dendrobium*, and even for *Oncidium* and *Laelias*. So far vigour seems to be on the ascendant, and I see no reason whatever to retire from the line taken up, or to alter my views. The plan of operations is simple. My gardener uses more peat round the sides of the pots, and he merely dusts the peat with a pinch of the manure, and wherever the fish-potash is there the roots work. Mr. Wm. Bull told me a fortnight ago that it was a vexed question as to what extent manures could be used for the cultivation of Orchids, and one which demanded the consideration of growers. The manure to which I have alluded is very easily obtained and applied. I would not recommend any one to make trials, except on plants of little value, and then no harm can be done; if it is found serviceable in the way indicated, there will then be time to consider a wider application.

Mr. JAMES:—For some years past we have been in the habit of using horse urine, and it has proved very beneficial, especially in the growing season. We are using it largely for the stages and paths at night, when quickly there arises such a heavy dew. I think if we take into consideration what Mr. Borwick has already hinted at, that plants invariably suffer extremely after carrying their heavy spikes, and this seems to impress upon one the thought that there is some necessity for sustaining the strength. The question has been raised of late years as to whether Orchids benefit from having their spikes removed after they are formed. I have no doubt in my own mind that it is of advantage if you want to gain strength for the plant. I have instances of the best *Odontoglossum Alexandræ*. Two years ago we took very special care of it. Somehow a small slug got at it and ate the spike. It at once began to make two bulbs, but most unfortunately last year the spike got eaten off again. The result has been that this year it has made a double growth from each bulb, and it has now four leads to the plant, which has been accomplished in bad years; and marvellous to say it has sent up nine spikes to the flower—an instance which I have not seen before in an *Alexandræ*. One bulb has three spikes on the side of the double leaf. I take it for granted that this must be merely a question of strength from resting the plant. I think that as regards the question of nutriment, it is not so much a question of what kind is applied, but how it is applied. With reference to syringing we have always used weak liquid manure on to the surface of plants, and a moderately good practical rule is not to use it strong enough to injure the flower. I contend that the syringe is beneficial in the growing season especially when the nights are genial and there are no frosts. I think that manure is quite beneficial and I have satisfied myself on the many different things we have used. The difficulty with many in using artificial manures is, that they begin by applying it too strong. They should ascertain what

strength the plant is capable of bearing, and if this were done we should not have so many failures.

Mr. BURKHIDGE:—I have no doubt that taking the spikes off plants must be of the greatest possible benefit to the plant.

Mr. DREWITT:—I know an instance where a gentleman cut the spikes even before the last flower on the spike had expanded, and it was owing to this practice that the plants were the finest specimens I ever saw. Mr. James tells us we must not use the manure too strong. I think the best point in Mr. Borwick's speech was when he told us to use the manure on our common plants. Unless we have some more accurate data we are merely playing with fire.

Mr. HEATH (Cheltenham):—The question of watering Orchids with manure is a very difficult one. There is no doubt that many Orchid growers water their plants with manure, but they like to keep it to themselves. As regards Orchids, we have not used it over the tops of the pots. We had an *Odontoglossum Rossi*, and we used on several occasions cow manure, sheep manure, and horse manure, and we also used in addition a small quantity of soot. We found our plants were very vigorous for a year or two, but after that we were bound to wash the entire plants out, for we found they got rather a yellow hue. Since that time we potted them, and instead of watering them overhead, we have thrown down in the house nitrate of soda, and ammonia. We find that where ammonia has been thrown down the plants became of a most brilliant green colour. We have had thatnow for six years.

Dr. MASTERS said:—With reference to this question of manuring, we must go back to first principles. In the first place we do not know the chemical composition of the leaf or of the flower, nor indeed any part of the Orchid plant. Until we know that we cannot have any definite rule as to the right manure to supply and the right time to use so. It may, however, certainly be said without fear of contradiction that all plants (Orchids not excepted), want food. What is the right food to give them, and at what time? The proper food to be given them at one time is that which will make bulb and leaf, and which at another will enable them to form flower and seed. The structure of Orchids also is most extraordinarily diversified. The internal structure in the same genus differs widely, but whether the food to be given should be correspondingly different, must be found out in the future.

Mr. JAMES:—Do we understand that this Orchid Conference will be repeated at a future time? If so, I may suggest that on a future occasion we might exhibit plants that have been subjected to the various methods of treatment mentioned.

The CHAIRMAN:—I cannot give any promise that this Conference will be repeated, because we have hardly got so far as that. This Conference brings no grist to the mill of the Horticultural Society. It is done from a pure love of Orchid growing. I should say, speaking from my own feeling on the subject, that this Orchid Conference should be repeated.

After some further remarks the Conference broke up with the customary votes of thanks.

#### ORCHIS BEETLES.

IN the *Gardeners' Chronicle* of February 3, 1883, we gave a description and figure of the fleshy larva of a longicorn beetle found in the stem of a *Dendrobium*, and we have now to describe another coleopterous larva which came out of an imported Orchis root, purchased in London, which is evidently even more injurious than the insect previously mentioned. It was sent to us in July last by an esteemed correspondent, and is here represented in the annexed woodcut (fig. 146) of the natural size, being about 1½ inch long, nearly cylindrical, rather more than one-sixth of an inch thick, covered with a hard horny chestnut-coloured tegument, having much the appearance of a large wireworm, or larva of one of the Elateridæ, or click beetles. The most curious part of the insect is the large terminal segment, which is oval, flattened above, strongly punctured, and with the lateral margins raised so as to form a spoon-shaped impression on the upper side. The six legs are very short, so as not to be seen from above; they are, as usual, attached in pairs to the three segments of the body following the head. One is represented in the lower right-hand figure. The antennæ are very short, with two ring-like basal joints, the third joint being longer and more slender, terminated by a minute point. The large right-hand outline figure represents the underside of the head, the component parts of the mouth being very different from those of the larvæ of the click beetles. The mandibles (see the upper left-hand outline) are very robust, and strongly armed with several acute teeth, capable of inflicting much damage on the root on which the insect subsists. The lower jaws (see the lower left-hand figure) and the lower lip are furnished with very short palpi. A comparison of the structural details of this larva with those of the numerous species of Elateridæ, figured by Dr. Schiodte, as well as with the larvæ of *Callirhipis Dejeanii*, *Cebrio gigas*, and of species of *Blaps* and *Akis*, all published by the same writer,

would seem to remove this insect from the families Elateridae and Cebionidae, pointing out a nearer relationship to the Tenebrionidae. It is to be regretted that the precise locality of the plant attacked by this insect was not determined.

In our second accompanying woodcut (fig. 147), we have represented, of the natural size, a handsome bronzed beetle belonging to the genus *Camaria*, common in Brazil, which was found alive in an Orchid-house in England in July last. It is here represented in a flying position with its wings expanded. It was not observed to have injured any of the plants. From the relationship of the *Camaria* with the Helopidae and other Heteromera, it is barely possible that this

## Obituary.

CHARLES TURNER, whose loss the floral world has now to deplore, was born at Wilton, near Salisbury, on May 3, 1818, and died at Slough on May 9, 1885, thus having nearly accomplished the allotted span of "three score and ten" years, during which long period he had been a consistent and earnest champion of floriculture, and one of its most successful exponents. All honour to his memory as the King of the Florists—a title well conferred on him some time since by Canon Hole.

Our old friend—for we also must claim long acquaintance with him as one of the floral brotherhood—must have been a florist born, for at a very early age—in 1832, at fourteen years of age—we read of his being an exhibitor of Pinks, and, what is more, of winning the prize. He had been meanwhile apprenticed to a dyer, but this floricultural success seems to have been the turning point in his career, and led him to take up the florist's art, in which in after life he so greatly distinguished himself. No doubt the lessons learned of the dyer bore good fruit, in that nice appreciation of colour and effect which was one of Mr. Turner's great accomplishments as an exhibitor, and which has often proved to be the turning point which gained for him the victory. Besides this, his sympathies were large; he by no means limited his favours to one flower or one set of flowers, but was thoroughly catholic; one subject after another claimed and obtained his close study, and often a whole galaxy of beauty would be engrossing his attention at one moment; and whenever he took a flower in hand, he did not let it drop till he had effected his share in its improvement, for Mr. Turner was a thorough-going florist, keen in his perception of all the qualities which go to make a first-rate flower, knowing that all these qualities can be developed, if only there be sufficient perseverance and good judgment brought to bear upon the task, and ready to apply rigorously all the rules, stringent though they sometimes are, which tend to help forward this straining after perfection. The plant, he knew, was so plastic that the faintest indication of an improvement, of whatever kind, had but to be followed up to work out that peculiarity in the form most conducive to the fullest beauty, and none knew this better, or worked in more complete harmony with Nature, than the genial warm-hearted master of Slough—Slough being a name henceforward sacred to florists.

The numerous flowers which Mr. Turner has assisted to improve give some idea of the breadth and fulness of his esteem for floriculture. Pinks first, then Pansies, and Pelargoniums, of which latter the present improved mass of fancy varieties consist mainly, we believe, of varieties of his raising; Picotees and Carnations, Cinerarias and Verbenas, have largely profited by his labours, and so have Auriculas, especially the charming race of alpine Auriculas, which have in these days risen very high in popular favour; and last, but not least, there is the Dahlia, that queen of autumn flowers—the Dahlia in all its forms and phases, for which Mr. Turner has done very much, one of his latest works having been to revive in great measure the taste for these noble flowers, by his energetic efforts to establish and carry on a National Dahlia Show. We can scarcely imagine a means whereby the esteem of the floral community for their departed brother could be better testified than by taking care that the Treasurer is supplied with the necessary funds to make this show a very great success. Let the Dahlia show, his latest pet project, be carried on *In Memoriam*.

If as a raiser and improver of our floral pets our generous friend has occupied a prominent position, he has not been left behindhand as a cultivator, witness his noble specimens of Indian Azaleas, his grand pot Roses, and his profusely-flowered Pelargoniums, especially those of the fancy type; witness again his Rose blooms, his Dahlia blooms, almost always taking first rank, and again his Tulips, Carnations, Picotees, Auriculas, &c. Count up the first prizes he has won during the forty years and more that he has been proprietor of the Slough Nurseries, and then say if Charles Turner must not be put in the very front rank of high-class cultivators. On matters of business it is not for us to pass comment, but we may surely hope that all this high-class labour and effort has brought a substantial reward.

The services of Mr. Turner were much sought as a judge, and from having sometimes been associated

with him in this capacity we can bear witness what an excellent judge he was. His quick eye caught at once the merits and demerits of the exhibit, and his decision was made at once and without reserve. We have seen it noted that he used to claim having won and awarded more prizes than any other living man, and we think this would probably be borne out by the facts, could they but be ascertained. Some attempt to do this was made at p. 134 of our twentieth volume, n.s., 1883, where a portrait and a biography appeared. Mr. Turner was, for a few years, proprietor and editor of *The Florist*, and was an occasional contributor to this and other publications, but of late years his health, which has been failing, left him with but little inclination for literary work. He was always, however, ready to impart information to those who sought it at his hands.

Finally, we may say of Charles Turner, in connection with Floriculture, that, as a raiser, an exhibitor, as cultivator, and as censor, and, moreover, as a florist in the truest, fullest, and widest sense, we shall not soon look upon his like again.

—The death of Mr. JAMES BRIDGER, of Mitcham, the proprietor of the famous Mitcham Lavender, &c., Grounds, at his residence, the Manor House, on the 4th inst., removed one who was at the head of this particular business in this country. He had attained the ripe age of seventy-nine years. He was a central figure in the Mitcham district of Surrey, being the Lord of the Manor of Buggire and Tamworth; he had during the last forty years filled nearly all the leading parish offices, and he was also a large employer of labour, the Mitcham herb fields having a world-wide reputation. These grounds have been in the occupation of the Bridger family for at least two generations, and probably longer. From the age of twenty years Mr. James Bridger took an active part in carrying on the business, and in 1857, on the death of his father at the age of eighty, he became the sole proprietor. At Mitcham are grown large breadths of Provence and Damask Roses, Camomile, Mint, Lavender, Liquorice, Lovage, Poppies, Henbane, &c.; and not only was Mr. Bridger a large grower of these, but he was also a distiller on a large scale, distilling not only his own products, but those of smaller growers about him; and buying up also what they could produce. The soil about Mitcham, and also at Carshalton and Beddington, is of a warm, light character, and well adapted for the growth of these herbs. It is worthy of mention that only a fortnight or so before Mr. Bridger's death, his old foreman, who had been on the place for over fifty years, died at the end of a long service, and probably his death hastened that of his old master, who was an excellent employer, and kept his servants for a long time. The business will now be carried on by two sons of the deceased.

—We regret to announce the death, on the 6th inst., of Mr. JAMES DON, seedsman, at 20, Chapel Bar, Nottigham, at the early age of thirty-five years, from consumption. He was deservedly respected for his unassuming manner. The Notts Horticultural and Botanical Society loses in him a sincere friend, he having taken a most active part in its concerns as one of the Honorary Secretaries.

## Law Notes.

A FIGHT ON PRINCIPLE.—GODFREY v. WAITE, NASH & COMPANY.—Plaintiff, a florist, of Exmouth, was represented by Mr. Thorne, barrister (instructed by Mr. Vine, Exmouth), and Mr. Sparkes, Creditor, appeared for the firm of Messrs. Waite, Nash & Co., of London. Mr. Thorne announced that the case had been settled. Under its peculiar circumstances it required a little explanation. The action was brought by plaintiff against the defendant, the complaint being that whereas plaintiff ordered of Messrs. Waite, Nash & Co., Berlin Lily of the Valley roots, they sent Dutch roots instead. The case was originally launched as a breach of contract, and there was never a suggestion that what had taken place was of a fraudulent character. On this occasion he had had an interview with Mr. Sparkes, who had proved conclusively to him by documents that the roots were what they were described as being in defendants' invoices, viz., German Lily of the Valley roots. Plaintiff's object was to get an early crop, and disappointment in that particular induced him to believe they were Dutch. However, he (Mr. Thorne) was now perfectly satisfied that the roots were German. Mr. Sparkes (speaking on behalf of his clients) said that had the case been tried

beetle may be the perfect state of a larva like the one figured in our upper woodcut. J. O. W.

OLD IDEAS OF GARDENS.—The hanging gardens of Babylon were built by Nebuchadnezzar to gratify his wife Amytis. The gardens were over 400 feet square, built terrace above terrace until they were 27 feet higher than the walls, or 400 feet. The top was sustained by a series of arches one above the other, and each terrace was bound by a solid wall 22 feet thick. On the top arches were first laid flat stones, 16 feet by 4 feet; over these weeds and bitumen; then two rows of cemented brick covered by sheet-lead, upon which was laid earth sufficiently thick to nourish large trees. The gardens were filled with the blooming plants and shrubs which were admired by Queen Amytis in her native Media. The different terraces and groves contained fountains, parterres, seats, and banqueting rooms; in fact, all the splendour and magnificence of Eastern art seem to have been lavished upon these gardens by King Nebuchadnezzar in order that his Median bride should be happy in her new home. Pen cannot picture the grandeur of the conception, or the perfection of the execution, of these gardens, which have been, and are, the wonder of all ages. The greatest hanging structure now in existence is the Brooklyn Suspension Bridge, costing 15,000,000 dols. The whole length is 3475 feet, and it connects New York and Brooklyn by a clear span of 1595 feet. It is 135 feet above low-water mark, and 85 feet broad; it has also two platforms, one above the other. The piers are stone masonry, hollow, and sunk below the surface by means of caissons. As the details of this work are formidable, it is sufficient to say that it is the greatest engineering feat known. John Roebling was the engineer. *Building and Engineering Times*.

their answer would have been twofold. In the first place they would have repudiated any legal liability in the matter; but the broad moral answer was that the order sent in by plaintiff for German roots had been faithfully, honestly, and truly executed. He assured his Honour that this was not a question of account; and had the question been fought it would have been fought entirely on principle. The case was allowed to be settled accordingly.

### Answers to Correspondents.

*\*\* Owing to the extraordinary pressure on our space many matters must be held over.*

**BEGONIAS:** T. B. & S. Pretty, but there are many much better.

**BOOKS ON FRUIT GROWING:** *Sam. Rawson. Profitable Fruit Farming*, by C. Whitehead, F.L.S., F.G.S. Longmans, Green & Co. Price 11. Dr. Hogg's *Fruit Manual, Journal of Horticulture*, 171, Fleet Street, Price 15s. *Science and Practice of Grafting, Budding, and Training Fruit Trees*, from the French of M. Du Breuil. Kent & Co., London. *Profitable Gardening*, by Shirley Hibberd. *Manual of Injurious Insects*, E. A. Ormerod. Swann, Sonnenschein & Allan, London.

**CLEMATIS:** H. M. Judging from a single flower we cannot see much improvement on the type.

**DISEASED VINES:** G. T. We find no trace of Phylloxera on root or leaf. The warts on the latter indicate bad management as to ventilation. We cannot find the brown insects you mention, but in any case the Vine louse is not brown. Send other specimens.

**NAMES OF PLANTS:** W. M. Coronilla Emerus.—E. F. The pods are those of Colutea arborescens. The tree is *Pyrus pinnatifida*.—J. M. Amygdalus nana; the bulb next week.—J. Earle. *Epidendrum selliguerum*.—C. Dimmick & Sons. *Pittosporum undulatum*.

**PEACH FOLIAGE INJURED:** P & S. Exposure to sun when the leaves are wet, and bad glass, will produce the effect.

**WORM IN ORCHID-HOUSE:** W. H. D. The worm is allied to the Hair-worm (*Gordius aquaticus*). We believe it is not injurious.

*\*\* All communications intended for publication should be addressed to the "Editor," and not to the Publisher, or to any member of the staff personally. The Editor would also be obliged by such communications being written on one side only of the paper and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

**INTELLIGENT READERS, PLEASE NOTE.**—*Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and NOT to the Editor.*

**FOREIGN SUBSCRIBERS** sending Post-Office Orders are requested to send them to the Publisher of this journal, 41, Wellington Street, Covent Garden, and to make them payable to William Richards, at the Post-Office, Drury Lane, London, W.C.

THE WORLD.

THE AUTOMATON.

## RANSOMES' LAWN MOWERS.

## THE "WORLD" LAWN MOWERS

are the best for cutting long grass, and are constructed on the American system with the special advantages of English materials and workmanship.

They are made in nine sizes, 8 to 24 inches.

Prices from 45s. to £10.

## THE "REVERSIBLE" LAWN MOWERS

are suitable for small gardens and borders. They roll the grass as well as cut it, and can be used either side upwards.

They are made in three sizes, 6 to 10 inches.

Prices from 27s. to 45s.

## THE "AUTOMATON" LAWN MOWERS

are the best machines for general purposes and gardeners' use. They leave no ribs in the grass but produce a perfect surface.

They are made in eight sizes, 8 to 22 inches.

Prices from 55s. to £8 10s.

## THE HORSE-POWER MOWERS

are the best for Large Lawns, Cricket and Lawn Tennis Clubs. They are used on the Cricket Grounds of the Oxford and Edinburgh Universities and numerous Colleges and Public Schools.

They are made in six sizes, 26 to 48 inches.

Prices from £14 10s. to £32.

Complete Price LISTS may be obtained from any respectable Ironmonger, or

RANSOMES, SIMS &amp; JEFFERIES (Ld.), IPSWICH.

**NEIGHBOUR'S Celebrated BEEHIVES.**  
Silver and Bronze Medals awarded at the International  
Health Exhibition, 1884, to Geo. Neighbour & Sons.

## NEIGHBOUR'S

IMPROVED

## COTTAGE BEEHIVE,

as originally introduced by them,  
working three bell-glasses or a tray  
of sectional supers, is neatly and  
strongly made of straw; it has  
three windows in the lower Hive.

This Hive will be found to pos-  
sess many practical advantages,  
and is more easy of management  
than any other that has been  
introduced.

Price .. .. £1 15 0  
Stand for ditto 0 10 6

## NEIGHBOUR'S FIFTEEN

## SHILLING FRAME-HIVE.

This hive has been designed to  
supply a want long felt by those  
who desire a Hive at once tasteful  
in appearance and moderate in  
price. The walls are built of straw  
neatly bound with cane. Ample  
means for ventilation in summer,  
and sufficient warmth in winter are

thus secured. Nine Frames, of the standard size, fitted  
with metal ends, and a dummy for reducing the Hive, are en-  
closed therein, a double quilt to place over the Frames, a case  
of American one-piece sections for supering, and a substantial

cover of wood, to protect from the weather, are also included.  
Price, complete, 15s.

Also BAR-FRAME HIVES, from 7s. 6d. to 42s. each.

"THE APIARY," by ALFRED NEIGHBOUR.  
Price 5s., post-free.

NEW PATENT EDGE CUTTER.**Any Gardener can use it with  
ease.The only really practical Edge Cutter  
yet brought out.THIS Machine is a light, simple, strong, and  
useful substitute for Hand Shears, for trimming the edges  
of Lawns. It can be guided with the greatest ease either in a  
straight line or round the edges of flower beds, &c. The depth  
of cut can be varied to suit the depth of the edge by simply  
tilting the conical roller more or less. The knives can be  
adjusted to the fixed blade as they wear, and can be readily  
removed for sharpening. After a little practice with this Machine,  
a man can trim the edges as fast as he can walk, thus doing  
from five to ten times as much work as with the ordinary shears.Price 35s.  
Carriage Paid to any Railway Station.**RANSOMES, SIMS & JEFFERIES (Limited), Ipswich.**

Oil Paint no Longer Necessary.  
**HILL AND SMITH'S BLACK VARNISH**, for Preserving Ironwork, Wood, or Stone. (Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertiser, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.  
Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.  
"Pierrefield Park, June 21, 1876.—Sirs,—I have this day forwarded from Chestow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I cordially admit was the best we ever had. Address Varnish to Pierrefield Park, Chestow.—I am, Sirs, yours respectfully, Wm. Cox."  
CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.  
H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.  
Large illustrated CATALOGUE of Feeding Hurdles, Field and Entrance Gates, &c., sent free on application to HILL AND SMITH, Brierley Hill Ironworks, Staffordshire; 118, Queen Victoria Street, London, E.C.; and 156, St. Vincent Street, Glasgow.

**TO GARDENERS and NURSERYMEN. —**Wanted, to Apprentice a respectable youth (age 14), in a Gentleman's or Nurseryman's Garden.—Miss NEWMAN, Stanton, Harcourt, Oxford.

**TRAVELLER, &c. (WHOLESALE). —**Twenty years' first-class references, ten from one firm. Western Midlands, Western Counties, and South Wales. Shortly open for re-engagement. Moderate salary.—GRFCOLA, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**TO FLORISTS. —**A young Lady seeks a situation in a Florist's as an Improver.—E. C., 59, Ingram Street, Clapham Junction, S.W.

**HANDY MAN, on an Estate a few miles out. —**Married. Total abstainer. Fourteen and a half years' good character.—J. J. L., 16, Park Terrace, Drayton Park, London, N.

**CARPENTER, JOINER, and DECORATOR, on a Gentleman's Estate. —**A Lady wishes to hear of a situation for a most respectable man. Excellent character of seven years from a first-class London firm.—Mrs. CONWAY, Eastwood House, Red Hill.

**CARPENTER, on an Estate. —**Age 30, married; understands the Erection of Greenhouses, Farm Buildings, Painting and Glazing, and General Repairs. Good testimonials.—A. H., 12, Lurgan Street, Great Church Lane, Hammersmith, W.

**GRATEFUL—COMFORTING. EPPS'S COCOA. BREAKFAST.**

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." *Civil Service Gazette*.

Made simply with boiling water or milk. Sold only in Packets, labelled thus.—JAMES EPPS & CO., Homoeopathic Chemists, London.

**HOLLOWAY'S OINTMENT. —**Sores, Wounds, Ulcerations, and other Diseases affecting the Skin, are amenable by this cooling and healing preparation. It has called forth the loudest praise from persons who have suffered for years from Bad Legs, Abscesses, and Chronic Ulcers, after every hope of cure had long passed away. None but those who have experienced the soothing effect of this Ointment can form an idea of the comfort it bestows, by restraining inflammation and allaying pain. Whenever this Ointment has been once used, it has established its own worth, and has again been eagerly sought for, as the easiest and safest remedy for all Ulcerous Complaints. In Neuralgia, Rheumatism, and Gout, the same application, properly used, gives wonderful relief.

SEND FOR A PRICE LIST OF

# JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS,

For Raising Water for the Supply of Towns, Villages, Irrigation, Railway Stations,  
Mansions, Fountains, Farms, &c.

*No Cost for Motive-Power, which is obtained from a Stream of Water passing through the Rams.*

NO OILING OR PACKING REQUIRED.

Made in Sizes to Raise from 300 to 500,000 Gallons per day. Will Force to a Height of 1500 feet.

SPECIAL RAMS for HIGH FALLS to send up One-third of the Water passing through them.

FIG. A.  
This Ram raises a portion of the same water that works it.

Prices of Rams of figure A make, to force to medium heights:—

No. of the size of the Ram.	Number of Gallons per day of 24 hours the ram will raise where there is sufficient working fall as compared to the height the water has to be forced.	Price.

## ESTIMATES will be given on receipt of the following particulars:—

1st, the fall (in feet or inches) which can be obtained from the stream, spring, river, or other source of supply; 2d, the height and distance to which the water has to be forced; 3d, the approximate quantity falling per minute, and the number of gallons required to be raised in a day of twenty hours; and if a B Ram is required, the depth and horizontal distance from the Ram to the clean water should also be stated. Gun metal is liberally used in the construction of these Rams, and the prices include gun-metal foot and stop delivery valve, &c. They are fitted up in a most substantial and workmanlike manner, the first cost being only a secondary consideration.

BLAKE'S SPECIAL RAM.

To force to a height of 1500 feet.

BLAKE'S SPECIAL RAM.  
For deep working falls, will force up one-third of the water passing through it.

FIG. B.

This Ram, whilst worked by a stream of impure water, will pump clean water from a well or spring.

Prices of double-acting Rams of figure B make, to force to medium heights:—

No. of the size of the Ram.	Number of Gallons per day of 24 hours the rams will raise where there is sufficient working fall as compared to the height the water has to be forced.	Price.

STEVENS** begs to announce that his NEXT SALE OF ORCHIDS in flower will take place at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY, June 10, and he will be glad if gentlemen desirous of entering plants for the Sale will please send particulars of same as early as possible.

## PRELIMINARY NOTICE.

Amongst the Cattleyas.

Our Mr. EDWARD WALLACE having collected some magnificent CATTLEYA TRIANÆ in flower, in the best localities of the interior of Colombia, escaped with his plants down the river in a canoe, and having passed safely through the contending forces, sent on his cases to us, and proceeded to collect CATTLEYA MOSSIÆ in flower. He is now (D.V.) on his way home, having had the good fortune to obtain, amongst other fine forms, two most magnificent CATTLEYAS, the finest plant of the rare C. BRINCKIANA ever seen, and a Specimen of C. WAGNERI, with over 100 bulbs. Both were seen and collected in flower, and their blooms were very large and beautiful. These, with his other PLANTS, will be offered for SALE by AUCTION immediately on his arrival in England (MIDDLE OF JUNE). Further particulars later on. His rambles and adventures during the war are most interesting.

NEW PLANT and BULB COMPANY, Colchester.

**FOR SALE, a MARKET NURSERY,** 5 Glasshouses fully stocked and heated with Hot Water, 30 Lights of Pits, Sheds, &c., good Dwelling House; 10 years' lease unexpired. ## NEW CATALOGUE FOR 1885.

Beautiful Flowers for Indoors, selected from an immense stock. Our Glasshouses cover nearly 2 acres.

### Wm. Clibran & Son's New List (90 Pages Double Column)

Of the newest and finest varieties of all classes of Plants for Greenhouses, Stoves, &c., may now be had for two stamps. It includes only the best varieties of their respective classes. Every season new sorts are added. Comparisons of the varieties when in bloom carefully made, and the inferior kinds discarded. Intending purchasers may rely, when selections are ordered as under, on being supplied with varieties of merit only.

The following cheap Collections of finest named kinds consist entirely of our selection. Purchasers may select from the Lists at Prices as per CATALOGUE, which please see before ordering elsewhere.

## STANDEN'S MANURE.

ESTABLISHED 20 YEARS.

This old-established Manure is acknowledged by most of the leading practical Gardeners in the United Kingdom and the Colonies to exceed all others in general fertilising properties and staying powers. It promotes a rapid, healthy, and robust growth in plants generally. It is a clean and dry powder, with very little smell, which renders it particularly adaptable for ladies interested in plant culture.

The highly fertilising properties of this Manure render its money value, in comparison with other manures, at least double, as users will find that very small quantities will produce favourable results.

Sold in TINS, 1s., 2s. 6d., 6s. 6d., and 10s. 6d. each; and in BAGS or KEGS, at reduced prices, 28 lb., 12s. 6d.; 56 lb., 23s.; 112 lb., 42s. each.

May be obtained from all Nurserymen and Seedsmen in the United Kingdom and the Colonies.

SOLE MANUFACTURERS,

CORRY, SOPER, FOWLER & CO.  
(LIMITED),

18, FINSBURY STREET, LONDON, E.C.

R. HOLLIDAY, HORTICULTURAL IRON and WIREWORKER, The Pheasantry, Beaufort Street, Chelsea, S.W.

Oil Paint no Longer Necessary.

HILL AND SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone. (Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

## UNSOLICITED TESTIMONIAL.

"Pierrefield Park, June 21, 1876.—Sirs.—I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chepstow.—I am, Sirs, yours respectfully, W.M. COX."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large illustrated CATALOGUE of Fencing Hurdles, Field and Entrance Gates, &c. sent free on application to

HILL AND SMITH, Brierley Hill Ironworks, Staffordshire; 118, Queen Victoria Street, London, E.C.; and 196, St. Vincent Street, Glasgow.

Appointed by Royal Warrant Makers to  
Her Majesty the Queen and His Royal Highness the  
Prince of Wales.

## SPECIAL NOTICE.

# GRAND EXHIBITION OF ORCHIDS,

Stove and Greenhouse Flowering and Foliage Plants.

*Open to the Public during May and June, from 9 a.m. till dusk daily (Sundays excepted).*

ADMISSION FREE to those who have received Invitations,

OR UPON PRESENTATION OF CARD.

A large Show House, 100 feet long by 22 feet wide, and an Odontoglossum House, 80 feet long, is especially devoted to the Orchid Exhibition, and visitors may rely upon seeing these beautiful plants with the greatest degree of comfort, the ventilation and means of ingress and egress, as well as the great width of the paths being all that can be desired. The other Show Houses are gay with our large collection of Stove and Greenhouse Flowering and Foliage Plants, which have figured at the leading Shows, both at home and abroad, for many years, with uninterrupted success. In addition, the large Winter Garden, 100 feet long by 40 feet wide, being filled with a fine show of Foliage and Flowering Plants, will form an agreeable lounge to those wishing to avail themselves of this cool retreat.

## NEW ROSES.

## WM. PAUL &amp; SON,

Rose Growers by Appointment to  
Her Majesty the Queen,

## WALTHAM CROSS, HERTS,

*respectfully invite attention to the following  
New Roses:—*

The "WALTHAM CLIMBING" ROSES,  
Nos. 1, 2, and 3.

Crimson Roses, of different shapes, and distinct shades of colour; No. 1 being the lightest, and No. 3 the darkest. They are seedlings from Gloire de Dijon, possessing all the good qualities of that well-known variety, and are recommended as supplying a long-felt want in the garden, namely, good hardy crimson autumn-flowering Climbing Roses, with fine foliage.

*Plants ready the end of May, 10s. 6d. each,  
or 21s. the set of 3 varieties.*

## W. F. BENNETT (Hybrid Tea-scented).

This Rose is recommended by the raiser (Mr. H. Bennett), as the finest red Rose yet introduced for winter blooming and cut blooms at all seasons. The flowers sent to Covent Garden have always realised higher prices than other red Roses in the market at the time. It is of the same colour as Général Jacqueminot, and from its size and the freedom with which the blooms are produced, it has been likened to a crimson "Niphetos."

WM. PAUL & SON have been appointed Sole Agents for the sale of this Rose in Europe. Plants will be ready about June 1. The following prices are for nett cash, and include packing:—

*Single Plants, 15s.; 5 Plants, £3 15s.; 10 Plants, £5 17s.  
Special Prices for larger quantities.*

## WM. PAUL &amp; SON'S

## NEW ROSES OF 1884.

CHARLES LAMB (H.P.) Clear bright red.	} Garden Roses.
GARDEN FAVOURITE (B.P.) Fresh pink.	
ELLA GORDON (H.P.) Bright cherry colour.	} Show Roses.
LADY OF THE LAKE (H.P.) Peach colour.	
EMPEROR (H.P.) Very dark, almost black.	} Buttonhole Roses.
EMPRESS (H.P.) White with pink centres.	

*Strong Plants, Price 3s. 6d. each.*

## SUNSET (Tea-scented).

A sport from Perle des Jardins, with deep Apricot flowers, beautiful in bud; fine for forcing and cutting. First-class Certificate to WM. PAUL & SON.

*Price 2s. 6d. to 3s. 6d. each.*

## GLOIRE LYONNAISE (H.P.).

A yellow Hybrid Perpetual, partaking of some of the characteristics of the Tea Roses; flowers chrome-yellow, large and full.

*Price 3s. 6d. each, 36s. per dozen.*

## QUEEN OF QUEENS (H.P.)

(Wm. Paul & Son).

Pink with blush edges, perfect in form, every shoot crowned with a flower-bud. First-class Certificate. Equally good as a garden and exhibition Rose, and decidedly the finest Rose of its colour.

*Price 2s. 6d. to 3s. 6d. each.*

All other New Roses, both English and Foreign, in strong plants at moderate prices.

Also a large stock of the older varieties, in pots, for spring and summer planting, pot culture, climbing, &c.

*Priced descriptive Catalogue, post-free, on application.*

See House of Roses, &c., at the Inventions Exhibition, South Kensington, S.W. (near the Concert Room).

WALTHAM CROSS,  
HERTS.

THE

## Gardeners' Chronicle.

SATURDAY, MAY 23, 1885.

## WINDOW GARDENING.

AN old friend of mine who has travelled among the Japanese tells me that their love of flowers and growing plants is in reality an absorbing passion. In the smallest of dwellings there is an altar-like niche, in or upon which flowering plants are arranged; but they have in some districts a most remarkable custom in connection with window gardening which I will describe to you.

In houses wherein reside one or more daughters of a marriageable age an empty flower-pot of an ornamental character is encircled by a ring, and suspended from the window or verandah by three light chains.

Now, the Juliets of Japan are, of course, attractive, and their Romeos as anxious as those of other lands. But instead of serenades by moonlight and other delicate ways of making an impression, it is etiquette for the Japanese lover to approach the dwelling of his lady, bearing some choice plant in his hand, which he boldly, but, let us hope, reverently, proceeds to plant in the empty vase. This takes place at a time when he is fully assured that both mother and daughter are at home, and I need scarcely say that neither of them are at all conscious that the young man is taking such a liberty with the flower-pot outside their window. It is believed that a young lover so engaged has never been seen by his lady or by her mamma in this act of sacrilege—at any rate, my friend tells me that during his long residence in Japan he never heard of any one being detected in the act or interfered with in any way.

The fact is, this act of placing a pretty plant into the empty flower-pot is equivalent to a formal proposal to the young lady who dwells within, and this Eastern fashion is, as I think, a most delicate and harmless way of proposing to a lady. The youthful gardener having settled his plant to his mind retires, and the lady is free to act as she pleases. If he is the right man she takes every care of his gift, waters it, and tends it carefully with her own hands, that all the world may see, in a word, the donor is accepted as a suitor. But if he is not a favourite, or if stern parents object, the poor plant is torn from the vase, and the next morning lies limp and withered on the verandah or on the path below. In a word, if you are not the right man it is quite evident that this phase of window gardening must be a difficult and disappointing one to carry on in Japan.

But one really might go further and say that all kinds of window gardening must be carried on under difficulties. I know somewhat of the troubles of gardening in town, and shall not deceive you by saying that window gardening is easy, but there is so much of pleasure mixed up with the difficulties that if once those of you who have not done so will try it you will never regret contented until you succeed.

But how to begin?—that is the question. Flower-pots, seeds, plants, and even soil or earth in which to plant them, cost money.

Not much, perhaps, but still sufficient to deter some from making a commencement.

Now, a bit of turfy sod from the roadside is all you will at first want. If flower-pots are not obtainable, no one need be disheartened—an old tin can, a cigar-box—anything, in fact, which will hold the earth, and allow the waste water to run away. Of course, I know that you will do better than this; but even if some of you actually do resort to these homely makeshifts, you will not be the first to do so, and it is better to grow a few pretty plants of sweet Musk and Mignonette in an old starch or blacking-box than to have no flowers at all near your home in the town. This question of materials is our first difficulty, and there are several ways of meeting it. The first and best way is for each individual to do the best he can for himself or herself, and devise some successful way of meeting it; but window-garden societies and others interested might do much to give facilities for self-help. Thus one of the greatest of all the difficulties experienced by window gardeners in large towns would be removed if a dépôt or central store for simple gardening materials could be formed on some self-supporting plan. No doubt it is true that those really anxious to grow plants, may and will find out ways and means to gratify their tastes, but I am sure a great impetus would be given to plant culture in towns, if artisans and others could purchase good potting earth, healthy little plants and seeds, at a cheap rate. It seems to me that the formation of local dépôts of this kind would do more than anything else to encourage window gardening or domestic floriculture.

One of the great charms of window gardening is the interest it excites in us, and the amount of pleasure a window gardener obtains during his rambles, for I need scarcely say he will be most anxious to see the plants grown in other windows besides his own. Then at holiday times every excursion into the country is doubly attractive, for, of course, a few common Ferns or trailing bits of rooted Ivy will be carefully dug up and carried back to town for the little garden at home. A few Primrose roots from a mossy hedge-bank, or five or six bulbs of the common yellow Daffodil from the fields, will make the smallest window interesting in the spring. Of course I do not advocate the wholesale collection and destruction of our prettiest wild flowers in the way now common near most towns, but I feel sure no intelligent proprietor would begrudge the removal of a few roots if he were sure they really were not to be carried away wholesale and sold. In questions of this kind, again, a society or association would be allowed to collect and distribute wild plants by those who might reasonably object to the individual abuse of the privilege.

Apart altogether from the decorative or beautiful aspect of flowers and green things in windows, such things have a teaching power peculiarly their own, and this is especially so where there are children. One of the best of lessons to instil into the minds of children is that all flowers are beautiful, even the most common ones, for it is these that our greatest poets have most delighted to honour. Daisies, Bluebells, Primroses, Daffodils, Snowdrops, and Violets, wild Roses and Woodbine, have all been woven into song and story from the time of Chaucer to the days of Tennyson.

The one great charm which lingers around our garden blossoms is their beautiful reality. They are essentially genuine. If you put wax flowers or fruits into your windows, or on the tables of your rooms, no one with any taste will waste a second glance on them; even the child who at first was taken with their bright colours will soon forget them, but this is never so of real flowers; in fact the only thing I know that wins a child's attention from toys and toffee is a window full of real Fuchsias, Pelargoniums, and Musk plants all in full bloom.

The best soil or earth for Fuchsias and Pelargoniums—indeed, for all the ordinary kinds of plants grown in windows—is what a gardener calls “fibrous loam.” This is obtained from upland pastures and sheep-walks, and consists of a mellow, friable, nut-coloured earth, rich in vegetable fibre. This should be cut into turves or layers about 3 inches in thickness, and may be stacked up until wanted for use. The best earth of this kind costs from 6s. to 10s. per ton or load. Broken up into rough pieces the size of Hazel-nuts, this sort of earth contains all the elements

really necessary for a plant's existence. As before mentioned, a few sods of fibrous earth of this kind may often be obtained from a grassy roadside. When prepared for pots it should not be too finely pulverised. One of the most common of errors into which inexperienced window gardeners fall is that of using finely sifted earth for plants, that is to say, soil destitute of fibrous rootlets and other organic material. It is from this fibrous matter when acted upon by water, heat, and air, that the plants derive their food. The tips of the tiny roots of a Fuchsia or a Myrtle, for example, are really hungry little mouths eager to suck up nitrogenous matter soluble in water, so that the soil, apart from its mechanical use of retaining a plant firmly in an erect position, must contain organic or manurial matter, easily dissolvable in water. But if any ordinary earth be taken you may safely leave your plants to manage their own chemistry if you place good drainage material below the soil, and water regularly, of course keeping the leaves free from dust and insects. Broken bits of earthenware, or of flower-pots, are most generally placed as drainage beneath the soil, but the action of these is mechanical only, and as a substitute for these, oyster shells, broken bones, charcoal, nodules of common coal, or even cinders, may be used, containing as they all do plant food in a soluble form. It is a good plan to put a layer of moss over the drainage, to prevent the soil washing down and blocking up the drainage hole in the flower-pot. For all strong growing plants old broken bones may be mixed with the soil with advantage. (*From a lecture by Mr. F. W. Burbidge.*)

(*To be continued.*)

## SCHOOL OF FORESTRY.

WE are pleased to find that a committee of the House of Commons moved for by Sir John Lubbock has been appointed to inquire whether by the establishment of a forest school our forests and woodlands could be rendered more remunerative. We need not repeat the arguments used by Sir John Lubbock and Dr. Lyons, as they have been so often advocated in these columns, but the Prime Minister's statements are fresher and come from one who has a practical knowledge of the subject.

Mr. Gladstone.—I am disposed to contend that those who cut down trees are the only true conservators of our woods. There is a multitude of ill-managed woods in this country, because of the superstition of their owners, which prevents them from properly thinning and clearing their woods. I confess that the principle is capable of very wide application, but I may contend that nothing does more to increase the ground of complaint with respect to the condition of our woods and plantations than that superstition which leads owners to think that it is a kind of sacrilege to cut down trees, instead of regarding it as the only way of keeping them properly. I agree that it is quite worth while to appoint this committee, but I must make certain reservations. I do not wish to be bound that the Government will establish a forestry school. I will give the reason why there should not be any foregone conclusion on that subject. My hon. friend who made this motion has spoken of the forestry schools which have been instituted abroad. That was quite true, but there are two observations to be made upon it. First, they have to depend on direct aid; and, secondly, the scale of operation is infinitely larger. I think there is room for improvement in the management of our woods. Everything is done almost at haphazard. There is no fixed tradition, no authority to assist them. It is remarkable that land agents, who, as a rule, are gentlemen of great intelligence, are very rarely found with any practical knowledge on this subject. We find them admirably qualified for every other department, but not in the least degree able to lend assistance on this subject. I have said that I wish to be quite free on the question of establishing schools, and I will mention one reason for this. Allusion has been made to the study of forestry in India, and eulogiums have been passed on the leading servants of the Indian Government connected with that interesting subject. The Indian Government have had most special reasons for giving attention to it. First of all, it was found impossible to make forestry profitable. I certainly do hope that this subject is in course of being dealt with satisfactorily in India. We must, however, recollect that

there are important facts connected with the climate and with the due supply of moisture in the atmosphere in India which are not present in this country. The Indian Government has a school of forestry in India and also in England, and it should be known that the latter is not confined to the instruction of persons in India or contemplating residence in India. Any person who chooses to find the necessary fees for admission to the English school can receive instruction there. A great deal of difficulty in the way of studying forestry in this country arises from the limited scale of operations which can be conducted here in consequence of our woods being broken up into such small areas. The number of properties on which there is a sufficient amount of wood to admit of large operations or of systematic training is not great. I myself have had a great deal to do in connection with the forestry of one district, and that is certainly not a large one; and woods of 6000 or 7000 acres in extent are extremely rare in England. One great difficulty in the way of a proper culture of woods in this country arises from the fact of their being kept, not for purposes of profit, but of landscape beauty, or pleasure and sport. The interest which I take in this subject has caused me to pay particular attention to the way in which our woods are managed, and have led me to believe that we should gain a great deal if we were to have more common tradition upon the subject. There are some parts of the Midland Counties where the art of wood-cutting is practically unknown, and there are also many other parts of the country where scarcely any one knows how to cut down a tree. That is the result of a general want of attention to the subject. I think that great utility would result from the inquiries of this committee. Therefore, reserving to ourselves our freedom of opinion with regard to the recommendations which such a committee may make, I may say that we give our hearty approval to the proposal of the hon. member, and sincerely hope that great benefits may result to the country from the inquiries which the committee may make.

Sir W. Barttelot said few men knew how to thin a plantation, and scarcely two would agree as to the proper time when the thinning should take place. It was on this account that our plantations in England had suffered so severely. In the eastern division of Sussex they had turned their attention towards the cultivation of undergrowth and underwood, with the result that they found employment for large numbers of people during the winter months. In pursuing this course, however, they could not shut their eyes to the fact that the value of this underwood and timber had greatly depreciated, and it would not be until there was a diminution of the supply from abroad that the value of timber in this country would rise to a fair level. He was informed, however, that nearly all the timber near the watercourses of America, from Italy and Spain, had been cut, and there was but little chance of many large supplies reaching us in the future from those countries. He therefore hoped that we in this country would not neglect planting timber which would grow fairly well on land that was not good for agricultural purposes.

Dr. Farquharson was glad to hear that at length forest culture was to be placed in this country upon a satisfactory basis. In England a most haphazard mode of planting had been pursued for a long time. A great deal of waste land had been made use of for agricultural purposes, for which it was altogether unfitted, whereas it would have done admirably for planting trees. Where the planting of trees was properly carried out their culture paid admirably. He trusted that in future years it would not be necessary to have recourse to foreign schools of forestry, but that an efficient school would be established in this country.

Mr. Dawson thought the question might serviceably be brought before the committee on Irish industries, as there was no part of the United Kingdom where improved methods of forestry would be of more advantage than in Ireland. The hon. member for Dublin, who had made himself remarkable by devotion to this question, had dealt instructively with many branches of the subject, but there was one to which he had not referred. In the Black Forest and in Switzerland the young people were profitably employed in making the thousands of toys which were imported into this country. There was no reason why many thousands of our unemployed and starving population might not find the means of subsistence in this industry. The Prime Minister had deprecated the interference of the

State, but the State had in Holland reclaimed the land from the sea, and here at home was expending its resources in teaching many subjects to the children of the poor, which, from a wage-earning point of view, were absolutely useless. It would be much wiser that children should receive good technical training in the trades by which they were to make their living.

## PEACHES.

THE classification of Peaches is, we have reason to know, a mystery—a very shallow one—to beginners. To help them we have here inserted some illustra-

purpose of which is not known, but that it has some effect is made manifest by the circumstance that Peaches without glands are much more liable to mildew than those that are furnished with them. This fact was first made known to us by the late Mr. Rivers.

As to the freestone (fig. 149, F, p. 665) and clingstone fruits (fig. 149, F, p. 665) the difference arises from the fact that the fibrous cords which connect the pulp with the stones are unaffected in the one case, while in the other they rot at the point of junction with the stone. Why or how this happens we are ashamed to say we do not know. It is one of those everyday things that no

FIG. 148.—A, LARGE-FLOWERED PEACH; B, SMALL-FLOWERED PEACH; C, PEACH LEAF WITH GLOBULAR GLANDS; D, PEACH LEAF WITH KIDNEY-SHAPED GLANDS.

tions of our own and some copied from the *Revue Horticole*. If we turn to the *Fruit Manual* we shall find the varieties divided first of all into two groups according to the size of the flower—large or small (fig. 148, A, B, fig. 150). These two groups are then sub-divided into those which have no glands on the leaves, those which have globose glands (fig. 148, C), and those with kidney-shaped glands (fig. 148, D). Lastly come the characters derived from the adherence or otherwise of the flesh, or rather of the fibrous portions of it, to the stone—hence the division into freestone and clingstone. The size of the flower, the shape and the colour of its petals are points easily recognisable. The glands (when present) will be found continuous with the small teeth on the margins of the leaf, and are perhaps indications of a tendency to produce pinnate leaves like those of a Rose. At any rate these glands secrete a gummy secretion, the

one, so far as we know, has investigated, but which a little careful examination with the microscope would probably speedily unravel. One thing is certain, that, as usual in Nature, the limits are not fixed, but intermediate cases occur, which our French friends called semi-clingstones (fig. 149, F, p. 665). In the same manner the glands of the leaves sometimes vary, for which reason the French employ the term "mixed glands," to designate their intermediate types.

The illustration of the Nectarine flower (fig. 150, p. 665) shows the condition called technically "proterogyny," in which the stigma protrudes beyond the stamens, and is in advance of those organs in development. This stigma, therefore, will not be close-fertilised, *i.e.*, will not be set by the pollen from the same flower, but by that derived from some other source, and carried by insects or otherwise.

## The Rosery.

### THE COMING STRUGGLE.

WHILE the political atmosphere points to "stormy," and wars and rumours of wars alternate with hopes of peace, those who are interested in the welfare and exhibition of the Rose will not hear of peace. Their "voice is still for war," and, as far as their endeavours avail, they are prepared to fight it out to the bitter end. To them kings, ambassadors, and generals are nothing unless they bear the name of some favourite flower, and they have more regard for an old veteran like Général Jacqueminot than for all the Komaroffs, Alikanoffs, and other unpronounceable names in existence. There is no abatement in their zeal, and on every side they are preparing their weapons. Boxes are being painted, tubes examined, wires ordered, and every preparation made for the coming struggle. It may not, then, be uninteresting to look at the state of things, and see what are our prospects.

And now, with regard to Roses themselves, I have the opportunity of judging what their condition is not only from my own garden—for in such cases our ideas are apt to be given from a narrow field of survey, and are insensibly influenced by what we have constantly under our own eyes, and to make use in a wrong application of the old Latin saying, *Ex uno disce omnes*. I have had the opportunity of seeing many Rose gardens, and I have a very wide correspondence on the subject, extending even to the United States (of which more anon), and hence my opinions on the subject are formed from tolerably good data; it is my own opinion, and that in a quite unanimous way of all my correspondents, that we are, unless the unforeseen happens, likely to have one of the best Rose seasons that we have had for many years, and we have latterly had such abnormal seasons that it will be quite a treat to get one season moving in the ordinary manner. There are two reasons which I think lead us to hope that this may be the case: the exceptionally dry year of 1884 was very favourable to the ripening of the wood, and this forms a very important factor in having a good Rose season, for it is with that as with the fruit trees, ripened wood is the most desirable object to be attained, and I do not think I ever, in our fruit growing county (Kent), saw such a wealth of good healthy-looking bloom as this year—Plums, Cherries, and all small fruits promise a most abundant crop. I have had letters from correspondents in Scotland, the borders of Wales, Yorkshire, Lancashire, Cheshire, and the Northern Counties, from the Southern and Home Counties, and all tell the same tale—that if the weather continues favourable they look for grand things with their Roses.

Another reason for our good expectations is the character of the winter and spring: the winter was mild, yet unlike, in this respect, that of 1883-4—there were no spells of hot weather to force things prematurely forward, and there was sufficient lowness of temperature to keep them back. It will be remembered that in February of last year the Rose-beds looked almost as green as they generally do in summer, that the flower-buds, in many cases, were fully formed, and that very grievous damage, it was supposed, would be caused by the bleeding when they were pruned. This year there was nothing like this; the Roses were kept well back, and while there was no frost to injure the wood (for one never saw that discolouring of the pith which is a sure sign of frost damage), and since the pruning the weather has been such that the plants have had every chance of doing well. There have been some cold winds, but as they have not injured the fruit trees I do not fear for the Roses; much, of course, depends on the weather which we may have for the next six weeks. Last year our hopes were sadly dashed by that wave of cold weather we had in the end of May and beginning of June, when for weeks the Roses did not seem to move at all. There is a regular aspect about this season that makes one hope for the best, although the wish may be father to the thought. There may be disasters: let us hope not.

As far as individual flowers are concerned there is no great promise of excitement; the new candidate for favour, which has excited the hopes of the Rose grower and exhibitor, is one with the attractive title of a yellow hybrid perpetual—I mean *Gloire Lyonnaise*; it comes from Mons. Guillot fils, whose judg-

ment is good, and who has given us many fine Roses. It has been already exhibited by Mr. Geo. Paul. There was unquestionably a suspicion of yellow in it, but equally as decidedly a suspicion of Tea—in fact, as far as one could judge from a forced flower, it had somewhat of the character of Captain Christy, the flesh colour in that flower being replaced by a faint primrose tint; however, it is too soon to judge, as one can never determine the real character of Roses from forced plants.

Amongst the correspondents from whom I have received letters is one hailing from Boston, U.S.A.; in it he says, "We have had a very severe winter here—very long-continued cold, and my Roses, which I have just pruned, have been killed right down to the level of the ground. Here they are beginning to talk of the Japanese rugosa stock as suitable for our climate." He says also, concerning Roses in general, and in reference to the catalogue of exhibition Roses of the National Rose Society, that it much surprises him, when one considers the difference in climate between New England and the old country—great extremes of heat and cold, their droughts, &c.—that after all this, a good Rose with us in England is about sure to be the same with them. The list of exhibition Roses with us would be much the same with them. Perhaps A. K. Williams would be left out as a plant of too delicate a constitution, and that he should place *Marguerite de St. Amand* and *Gabriel Tournier* in the exhibition list on account of their good autumn qualities.

In the letter to which this was an answer I referred to what I called the fabulous prices for some new English Roses, and how it was to be accounted for; in reply to this he says, "You must remember that with us the fashionable season is from December 1 to the middle of April, and not as with you in London—June; so that at that time you see quoted a bloom of *Baroness Rothschild* at 1 dol.: therefore, with a Tea Rose which would be much more free in flowering the florists would be able to charge, if the colour was crimson, from December 1 to the middle of February, the same price for it as for *Jacqueminots*, that is, from 75 cents to 1 dol." This explains much that has heretofore puzzled me, but even so we have not yet got to the length, I believe, of giving 4s. for a Rose bloom.

With regard to the opportunities afforded for the exhibition of the Rose there is no diminution in their number or in the manner in which they are supported. The ball opens in the dear old sleepy city of Canterbury, which even two railroads do not seem to have much aroused from that beautiful lethargy which used to be characteristic of our cathedral cities, although the inventions of modern days have somewhat shaken them, as in such cases as Peterborough, Chester, and Lincoln. We have, then, Brockham on the same day, and to follow, \*Maidstone, June 30; Farningham, July 1; \*Reigate, July 2; \*Farnham, July 1; Tunbridge Wells, July 2; the two great shows of the \*National at South Kensington, July 7; and \*Manchester, July 11; \*Sutton, July 8; \*Bagshot, June 30; \*Cardiff, July 1; Croydon, July 1; \*Bath, July 2; Hitchin, July 2; \*Eltham, July 4; \*Crystal Palace, July 4; Sidcup, July 11; \*Hereford, July 9; Norwich, July 2; \*Christleton, near Chester, July 10; \*Wirkworth, near Derby, July 16; \*Wirral, July 18; \*Shrewsbury, July 9; \*Ludlow, \*New Brighton, July 25; Newcastle-on-Tyne, July 22; Peterborough, July 23; and \*Darlington, July 25.

In this list all those marked with an asterisk (\*) are Rose Societies pure and simple; the others, those in which Roses form not the principal features. Some names which have hitherto figured in the list of Rose Societies are no longer there, while new societies in other localities have taken their place, and I think we may safely venture to say that the Rose has now in no way lost its popularity, and that we may fairly anticipate a successful and busy season. *Wild Rose*.

#### ROSES AND ROSE BEDS.

The cold winds that prevailed during the greater part of April were rather against Roses, which have suffered from curl in the leaf, as the foliage was pinched and could not expand, and, as is usual under such adverse circumstances, fly and maggot are rife, which insidious enemies will do no end of harm if not checked or destroyed before they get further hold of the plants. In dealing with the fly there are many ways by which they may be successfully assailed, the one which is perhaps the best at this early stage of

growth of the shoots being to dust them with tobacco dust through a distributor, which discharges it regularly, and with sufficient force to drive it well amongst the leaves, where it soon discomfits the aphids, and either kills them outright, or makes them fall off.

To ensure getting rid of any disabled ones or stragglers, and to cleanse the shoots, it is a good plan to give the plants a heavy syringing with clean water, or, better still, to use the garden engine and well wash them, and the same after applying any other insecticide later on. One of the best and safest of these is nicotine soap, which contains the active properties of tobacco, and is very potent and destructive in its action on greenfly, but, when used according to the directions, harmless to the foliage, even in its most young and tender state. The most economical way of applying the liquid is to have it in a bowl, or other open vessel, and dip the shoots into it, which may be done easily as soon as they are long enough to bend over and bring down, till which time there is no help for it but to syringe the insecticide on. To do this without waste requires some one expert in the use of the implement named, when by dextrous handling and pressure of the finger over the jet, the liquid may be ejected in fine spray, so as to wet every part of the leaves above and below, which is a very important matter, as it must come into actual contact with the aphids to do any good. Soft-soap and quassia chips, boiled in water, make an excellent insecticide at a very cheap rate, and those who have many Roses to go over will find it quite worth while to have a store by them. The way to prepare it is to put the quassia chips into an old coarse bag and tie it up loosely, or they may be thrown into the water if that is strained after. The quantity necessary to get the requisite strength is about half a pound to the gallon, and 2 oz. of soft soap, which will make the liquid strong enough to kill any fly, but the maggot must be dealt with in quite a different manner, as insecticides will not reach him, so skilfully does he wind himself up in the foliage. To think of uncoiling this and picking him out is quite out of the question, as it is impossible to do it without bruising or tearing the leaf; the best way is to give each maggot a loving squeeze between the thumb and finger, which will cause a collapse of their soft tender sides, that are so distended by the juice of the Rose.

Another malady by which this plant is affected is the mildew, which in some seasons, and on some sorts, is very troublesome, but by timely attention it is easily kept under, and with a little perseverance destroyed altogether. The most effectual remedy known until recently has been sulphur, but according to some this has a rival in sulphide of potassium, and if this is as good as it is stated to be, and sufficient may be had for 1s. to make over 30 gallons of water strong enough to kill the fungus—it will be a great boon to all connected with gardens. As yet I have no experience of it myself, but I mean to try it at once, as, unfortunately, one has nearly always some mildew on one plant or another.

Up to the present I have always found sulphur water the best thing to apply for the destruction of the pest, as it is cleanly and leaves no deposit on the foliage like the sulphide of calcium or Ewing's blight composition, the lime in which forms a sediment, and this adheres to the foliage. The way to impregnate the water with sulphur is to put it in an old copper and make it boil for some time with the sulphur in it, and when it has cooled down a little the water will become perfectly clear, and then it is ready for use, and may be applied through a syringe; but every part of the affected plants must be wetted, as, like the insecticides, it only kills where it touches. Dry flowers of sulphur act in the same way on mildew, but it is difficult to make it reach every part, and the boiling it in water and using it so is therefore the best mode of applying it. What causes or helps to bring mildew on Roses is drought; and to avoid the plants suffering from that, the beds should be mulched with short stable manure, which will not only prevent moisture escaping from the soil, but enrich it, and thus feed and nourish the roots. *J. Sheppard*.

**BEDFORDSHIRE HORTICULTURAL SOCIETY.**—The annual show will be held at Bedford on July 15. Special prizes for Roses (open to all England) are offered. Mr. H. Telbs, Stoneleigh, Bedford, is the Secretary.

#### FRUIT NOTES.

**SOUTH WILTS.**—The prospect of good crops of all kinds of fruit, except Apricots and Plums, generally being secured in the year 1885 is, indeed, very promising in this district, notwithstanding the few degrees of frost which we had on the nights of the 7th and 11th inst. respectively, and which, in consequence of the sheets and pyramids of Cherry, Pear, and Apple blossoms being fortunately dry at the time, have not done much mischief in that direction. I do not remember having seen for several years past Apple, Pear, and Cherry trees so profusely flowered as they are or have been during the present season; the blossoms, too, are large and strong. Bush fruits and Strawberries are also very promising, Currant trees being unusually heavily laden. The Fig crop, as might be expected after the beautiful wood-ripening weather which we experienced last autumn, also promises to be an abundant one. The orchards in this locality present a beautiful sight at the present time—a picture which gives promise of well filled fruit rooms and cider casks. *H. W. Ward, Longford Castle*.

#### A CURIOUS INSTANCE OF FRUIT PROTECTION.

I have had here a remarkable illustration of the effect of very simple protection both upon the quantity and earliness of Plum tree blossoming. Near my house there is a row of Plums known as "French Gages." The trees are large bush-headed standards some 20 feet in height, and have bloomed fairly well generally for their kind. Some two years ago, during a very high wind, a crocheted lady's shoulder-wrapper was blown up into one of these trees. It became entangled in the branches, and has remained there ever since. Judge of my surprise to see early in the month of April past a dense mass of blossom expand amongst and all around this mantle, the bloom being nine-tenths more in quantity than upon any other parts of the other trees and a couple of weeks earlier! In these days of fruit-growing advice and the desire for protection from spring frosts, what thoughts may arise from so simple a fact. Beyond this, the moisture-absorbing capacity of this woollen material, whether of rain or dew, must have acted beneficially towards the formation of an excess of blooms. *William Earley*.

#### NADRESFIELD COURT AS A FORCING GRAPE.

In an early vineyard at Gunnersbury Park, in which some of the varieties are already colouring, Nadresfield Court stands out from all the rest for its size and development of bunch. Relatively the berries and bunches are much larger than those of Black Hamburgh, and Mr. Roberts hopes to cut from both in about a fortnight. So pleased is Mr. Roberts with it as an early forcing variety, that he states were he to force Grapes for market, he should grow it much more largely than any other variety, and have it fit for table by the middle of May. *E. R.*

#### DYING GRAPE VINES.

As far as my experience goes, an exceptional occurrence exists in connection with a few of my neighbours' Grape Vines in the Ilford district of Essex. Vines, which have hitherto grown and fruited exceptionally well, had, during the past early spring months, made an effort to grow; having, in fact, formed about three young leaves, when about a third of the upper part of each cane ceased growing, the buds shrivelled, and no more progress was made. Generally, however, a fair growth continued on the lower third portion of the rods. This has happened both to strong one-rod plants, and to such as are grown on the extension system. The illustrations occurred in distinct establishments. My impression regarding an amateur's house, first visited, was, that it was attributable to scald or scorch, owing to the fact that the structure may have been kept closed during the hot sunny days of the early spring. This idea received for contradiction, however, the fact that one Vine at the end of the structure had broken and grown freely throughout its whole length. Besides, both one-rod Vines and others upon the extended system in charge of an efficient gardener, treated on the retarding system, show precisely the same symptoms. Indeed, the gardener, as soon as he observed it, removed the bedding plants from one structure, and had resort to syringings and a close warm atmosphere, and the Vines so treated have in great

measure surmounted the disorder, and are doing much better than the adjoining house, still kept cool and retarded. Present appearances vary. In one house, where the strongest single-rod Vines exist, one-third of each rod, with the exception of the one referred to, is quite dead, and the wood becoming quite black. Singular to say, however, if the wood be scraped deeply on one side, or if a portion of a spur be cut off, sap immediately flows out copiously from both. There are here and there weak, unhealthy shoots scattered about the Vines which are growing and showing similar symptoms. One large Vine, having two very large rods, in an airy, high conservatory, appears quite dead. Though in one structure one-third of each infected Vine is quite dead, yet the Vines in another, though apparently smitten to an equal degree, have the wood yet green nevertheless. Have other growers experienced anything similar during this or any other season? When prosecuting my enquiries regarding it, thinking it might be due to excessive root-drought last season (though all carried their crops well and ripened off their leaves apparently as usual), my attention fell upon Apple trees near by, upon which I observed that the upper shoots, the strong robust ones of last season's growth, seemed more or less blind. Whilst the trees generally were leafing and the flowers presented a marvellous display, the majority of these young growths stood up above the general mass of growth, like the tips of lightning conductors, and the thought occurred whether root drought, along with aërial dryness, heat, &c., acting together, may not during the last peculiar summer have been the cause. In any case, I send you herewith examples of Vines and Apples, being unable myself to broach any theory beyond. [Specimen not received.] William Earley, Ilford.

## TERRESTRIAL ORCHIDS.

(Continued from p. 639.)

ORCHIS.—In this genus are included many pretty plants, some of them common in England, and many more in Europe, which, like their allies, the Ophrys, and the majority of terrestrial Orchids, have quite a different form of roots from those of Cypripedium. The root consists of two white fleshy tubers, connected at the top by a neck, from which a few thick white roots proceed. Every year, as the plant withers, one of the tubers of the roots shrivels up and dies. In autumn a bud is produced from the top of the other, and fresh roots are thrown out, whilst a new tuber commences to form, and grows through the whole winter. In spring the leaves and flower-stem are thrown up, and gradually exhaust the old tuber, which is left shrunk and soft, so that by the time the plant is in flower it may easily be distinguished from the new one, now of equal size. If at this time, or a little later, the new tuber be broken off and planted separately, it will grow and flower next season, while nothing will remain of the old plant, so that in collecting Orchids at a distance from home it saves much space and trouble to take only the new tubers. These tubers can be kept dry for two or three months without injury, but should be planted not later than August or September. If intended for open-air cultivation, they should be planted on a dry bank, excepting some which inhabit wet meadows, and, if possible, among some dwarf-growing plants or grasses, so as to imitate their natural conditions. Some species increase by offsets, but the majority by seeds only, and it is believed that the minute seeds germinate on the leaves of grasses, and afterwards descend to the earth.

Observations on the mode of germination and reproduction of terrestrial Orchids are very much to be desired, as the uncertain appearance and occasional disappearance of some species from their wild haunts seems to indicate that the seeds either remain some years dormant or that the seedlings are very slow in growth. Little or nothing is known about this subject. [The results are principally due to the peculiar growth of the tuber, as shown by Prillieux and others. Ed.] Among the best of our native Orchids are:—

- O. mascula*, the spring Orchis.
- O. maculata*, the spotted Orchis.
- O. Morio*, the Fool's Orchis.
- O. pyramidalis*, the pyramidal Orchis.
- O. ustulata*, the Burnt Orchis.

All of which succeed well in a garden if the soil is of a suitable nature. *O. militaris* is another fine native species, but rarer, and not so easy to grow as the others.

Among the finest of the European species are:—

- |                          |                         |
|--------------------------|-------------------------|
| <i>O. Robertiana.</i>    | <i>O. papilionacea.</i> |
| <i>O. provincialis.</i>  | <i>O. laxiflora.</i>    |
| <i>O. undulatifolia.</i> |                         |

All of which are abundant on the shores of the Mediterranean, and, with the exception of the latter, like protection in hard winters.

*O. foliosa* is a species from Madeira, which used to be grown very well by the late Mr. Atkins, of Painswick, and is very suitable for pot culture. It attains 2 or 3 feet in height, and is nearly, if not quite hardy.

*O. spectabilis* is a pretty and distinct American species, which I once had, but did not succeed in keeping more than two or three years.

*O. sambucina* is an alpine species, which has yellow or purple flowers, and does well on a rockery among Gentians or Anemones. There are at least twenty or thirty other species in Europe, which may be procured with a little trouble, and are all worth trying.

*Aceras hircinæ*, the Great Lizard Orchis, is one of the most remarkable and rarest of our native species. It is nearly, if not quite, extinct in England, but grows abundantly in poor damp meadows in Brittany and elsewhere. I have found it easy to grow in my soil, where it attains a height of 2 or 3 feet.

*Nigritella angustifolia* is a pretty and curious little alpine species worth growing on account of its agreeable smell, but not very easy to keep. H. J. E.

(To be continued.)

## COLONIAL NOTES.

NEW ZEALAND (concluded from p. 578).—DAMMARA AUSTRALIS, known by the Maori name Kauri, is a very remarkable tree, and produces timber second to none in the world. In the province of Auckland this tree forms large forests in itself, amounting altogether to about 150,000 acres, the most of which is, however, in private hands. It is limited in distribution, being confined to the northern parts of the North Island, and found in no other country. The tree, especially when matured, presents a bold appearance, is handsome and symmetrical in habit, and when matured presents a hole destitute of branches for upwards of 100 feet in height. The tendency to confine itself to an upward growth, and the smallness of its laterals, gives to this tree the unequalled scarcity of knots. Planks of any size can be obtained without a single knot; in fact it would be possible to build a large house without a knot in it. The wood is of a pale yellowish-grey colour, fine grained, easily worked, takes a good polish, and is almost indestructible. It is used for building purposes, mouldings, furniture, &c. Besides the source of wealth arising from the timber of this tree, which now amounts to an annual sale of more than 100,000,000 feet, it gives to this colony an item of export worthy of great consideration. Kauri gum, a varnish resin used extensively in the United States of America for the manufacture of varnish, is exuded from the trunk of this tree. The most valuable gum is that which has been produced by extinct forests and is dug out of the ground. Over 5000 tons of gum are now annually exported, and I believe the price ranges about £50 per ton. Hundreds of men, known as "gum diggers," obtain a living by unearthing and collecting this resin, which often occurs in lumps larger than a man's head. It greatly resembles amber in colour, but is much more brittle. The gum obtained from trees on being cut down is of a paler colour and of less value than that which has been buried. This noble tree, providing two articles of export, is fast disappearing; nothing has been done towards conserving it or planting it, so that in a few more years this tree, which stands without a rival, will become a thing of the past, and with it also Kauri gum.

In a young state *Dammara australis* forms a beautiful object, and is well worthy the attention of floral decorators and nurserymen. When young the branches are whorled like a *Picea*, the whole plant being conical in habit. The leaves are flat, sessile, oblong, thick, glaucous, and smooth, about 2½ inches long. As the tree matures the branches become irregular in distribution, the leaves diminish in size, and to a great extent its beauty is gone. This tree is the only New Zealand Conifer which produces a true cone. (See figure at p. 525, vol. xx., 1883).

PODOCARPUS TOTARA.—This tree is a rival of the former one in the estimation of the people in this country; indeed, when the merits of both trees are well considered, it is a question which should occupy the first place; still in my mind the Kauri,

with its bold and handsome form, deserves the foremost. The Totara tree attains to a height of over 100 feet, with a diameter often exceeding 8 feet. In habit it has a more spreading tendency than most of the Conifers; its leaves are flat, narrow, and about 1 inch long. The fruit is edible, and resembles a small red bad-shaped Plum. The wood is red in colour, close-grained, easily worked, takes a good polish, gives a variety of shades and grains, is exceedingly durable, posts of it having lasted for upwards of fifty years; stands well in water, and is almost impervious to the attacks of the teredo worms, which play such havoc in timber used for ships and marine purposes.

It is limited to this country, but is generally distributed throughout both islands. The variety known as "Mountain Totara" should be perfectly hardy in England, as I am sure it has to stand rougher and colder weather up in the Alps than is ever experienced in England. *Libocedrus Doniana*, the *Arbovitæ* of the colonists, is another fine looking tree, approaching 100 feet high. The wood is red, fine grained, hard and heavy, is very durable, and considered valuable for masts and spars. It is only found in a few localities, and when its rare qualities are more generally known it will be one of the first trees to become extinct. The other species of this small genus found in New Zealand is *L. Bidwillii*, and produces the *Pahautea* wood of the Maoris and Cedar of the colonists. The wood is darker in colour than *Doniana*, not so heavy, and is in most respects a more useful timber although not so durable. It is found in several localities throughout the mountainous parts of both islands.

The "Black Pine" or *PODOCARPUS SPICATA*, produces an exceedingly valuable timber, applied to more purposes out here than any other variety. Bridges, wharves, sleepers, machinery, houses, &c., are all composed chiefly of this timber. Its durability is wonderful, and when long seasoned it is almost impossible to drive a nail into it. Yellow, close grained, and susceptible of a high polish. Abundant throughout both islands. The "White Pine" or *Podocarpus dactyloides*, although not a durable timber when exposed, is very much sought after for all inside work owing to its light colour, toughness and smoothness in working. Both these species grow to 100 feet high.

*DACRYDIUM CUPRESSINUM*, the Rimu of the Maoris, and Red Pine of the colonials, is beyond a doubt one of the handsomest objects in the tree line which it has been my good fortune to drop eyes on when rambling through these forests. In a full grown state a great deal of its beauty disappears, but when young and ranging in height from 2 to 20 feet it has the appearance of a gigantic symmetrically formed *Lycopodium*. Instead of being called *cupressinum* I think *lycopodioides* would have been more appropriate. The young tree rising in height with a main slender axis (resembling a plant fishing-rod), gracefully drooping at its apex, gives off in a regular manner side branches diminishing in length from base to apex, so forming a perfect pyramid. Each lateral branches into several long pendulous slender branchlets completely covered with the closely imbricated scale-like leaves, until the whole tree, beautifully adorned with these weeping branches, presents a picture which my pen cannot describe. However, if my readers will imagine a 10 foot specimen *Araucaria excelsa*, with its branches as small as the stems of *Lycopodium Billardieri*, all elongated into drooping lengths, they will be able to conceive something very much like it. As a timber tree it is excellent, the wood is red, beautifully grained, and gives a great many varieties of shades and marks, which with its easily worked nature have made it a great favourite with furniture makers. For all work where not exposed to wet, it cannot be surpassed. Distributed in both islands. *PHYLLADENDRUM CHOMANOIDES*, the Celery Pine, or Tanekaha tree, is a very handsome Conifer of a medium height, only producing its true leaves when seedlings, being phylloid in its branches. The habit of the tree is very symmetrical and pleasing; its wood is of first-rate quality, pale red, very durable, strong, and close grained. This tree possesses a bark very prolific in tannin, and I may say is the most powerful tan bark in the world, containing more than 23 per cent. of tannin. It is, moreover, unsurpassed as a dye, and is used extensively at Grenoble, in France, to which place it is forwarded from this country. Last year over

£20,000 worth of bark was shipped from the north of this country.

This concludes the New Zealand Conifers ranking as forest trees worth receiving the attention of arboriculturists. In my next contribution I will continue the remarks on the principal timber trees. *Chris. Mudd, Plant Collector.*

## BOTANICAL CURIOSITIES.

THE object which the Royal Horticultural Society sought to accomplish at the recent Orchid Conference being to get together for purposes of comparison and study as many species and varieties of the Orchid family as was possible, the result was prolific in the number exhibited of kinds which were of very little value horticulturally as compared with the rich colours and large sizes of the more popular garden Orchids. This exhibition had, therefore, much greater attraction for the botanists than is usual at flower shows, and to show that such was the case the following descriptive list of those kinds which are usually termed "botanical curiosities" has been drawn up. Of course it is hardly necessary to state that botanists are no less interested in the larger flowered Orchids than in the smaller ones, but it so happens that whilst, generally speaking, the large gaudy coloured Orchids are well looked after in ordinary gardens, the smaller and less attractive kinds are only rarely to be seen in a living state. In this respect, Kew does good service in cultivating all that can be obtained of these little out-of-the-way Orchids, and in the little group of rarities sent from the Royal Gardens to the Exhibition there were not more than three or four species which were represented in any other of the groups shown.

As many large and exceedingly beautiful rarities among the exhibits, such as the marvellous plant shown under the name of *Luddemania Pescatorei*, also *Sarcochilus (Camarotis) purpurea*, *Pescatorea Lehmanni*, *Diacrium (Epidendrum) bicornutum*, &c., were duly mentioned last week, it is intended here to speak only of the humblest of the species shown, or, in other words, the botanical curiosities.

*Acanthophippium bicolor*.—A fleshy bulbous terrestrial Orchid, with bulbs like large Onions, but with nodes, and bearing short ovate plicated leaves. The urn-shaped rather large flowers, which are white, with crimson tipped petals and sepals, are handsome, but the members of this genus are somewhat difficult to manage. They are natives of Ceylon and India.

*Bolbophyllum Dearei* is a large-flowered species of this extraordinary genus, which now includes a portion of the genus *Sarcopodium*, to which *B. Dearei* should belong. It is not unlike *B. Lobbi*, except that the lip is not so large, nor at all like that species in form. The tongue-shaped upper portion of this organ swings on a very delicate pivot, so that the slightest touch causes it to shake backwards and forwards. The same character is observable in *B. Lobbi*, which was also shown. The flowers of this species are pale yellow, shaded with cinnamon, and spotted with brown; they measure 4 inches across. It is a native of Java.

*Cirrhopetalum fimbriatum*.—A tiny *Bolbophyllum* from Bombay, with small Gooseberry-like pseudobulbs in a cluster, and erect hair-like scapes bearing radiating heads of flowers, which are curiously formed; they are composed of two long lateral sepals which are parallel and united, and are pale green, the petals and other sepal being very small, and fringed with reddish hairs.

*Celia Baueriana*.—A short-spiked white-flowered species from Central America, which is remarkably sweet scented. There are two other species cultivated, viz., *C. bella*, a long-flowered kind, recently figured in *Bot. Mag.*; and *C. macrostachya*, which has red flowers.

*Calogyne Parishii*.—A rare plant in gardens. It has long Banana-shaped bulbs, and graceful spikes of pale green flowers, the column being coloured deep sea-green, and the three-lobed lip dotted with black and curiously warted and ridged. One of the Rev. Mr. Parish's introductions.

*Calogyne ochracea*.—Several plants of this were shown under the name of *C. ocellata*. The two are much alike, but the latter is not so tall in spike nor so clear coloured in the flowers as the former; this has white flowers with two sulphur-yellow blotches on the lateral lobes of the scoop-shaped lip, and pseudobulbs which are pale green with light-brown sheaths.

*Compartmentia falcata*.—A graceful little Orchid with hair-like arching spikes of rosy-red flowers with kidney-shaped lips and long spurs. *C. macroplectron* is a beautiful species, and is in cultivation.

*Cybidium Devonianum*.—An Indian tree species with long pendent racemes of flowers with brown and yellow sepals and petals, and a dark purple, almost black, tongue-shaped labellum. First introduced through Chatsworth in 1837.

*Dendrobium*.—Of this genus the most noteworthy among the smaller fry were *D. Harveyanum*, remarkable in having its petals beautifully fringed, whilst the lip is small, shell-shaped, and almost fringeless, so that the idea of monstrosity is suggested, the flower being like what *D. fimbriatum* would be if the fringe were removed from the lip and placed on the upper edge of the petals. *D. tetragonum*, an Australian species with four-angled pseudobulbs and brown and yellow long-tailed flowers. *D. rhodopterygium*, remarkable in being intermediate between *C. macrophyllum* and *D. Parishii*, but not possessed of the attractiveness of either; though, as the species is a recent introduction, it may possibly develop better garden qualities than either of the specimens shown had.

*Epidendrum raniferum*.—Two unnamed plants of what appeared to be this species were shown. The flowers are rather large and fleshy, and are yellow, thickly covered with purple-brown spots.

*Grammatophyllum*, sp. nov. (?).—A plant with the growth of *G. Ellisi*, but having a long spike of greenish flowers. It is most likely a new species.

*Ionopsis paniculata*.—A pretty plant, with rigid small leaves and long graceful branching racemes of delicate flowers, the labellum in which is large, white, with a purple blotch at the base; the sepals and petals are very small. *I. utricularioides* is apparently synonymous with this, which is said to show considerable variety both in colour and form.

*Kefersteina graminea*, or, more correctly, *Zygopetalum gramineum*, as the genus *Kefersteina* is now placed in *Zygopetalum*, where it was first placed by Dr. Lindley. This species is sometimes called *Huntleya fimbriata*. It is a stemless plant, with erect herbaceous leaves and short prostrate flower-stalks, with flowers  $1\frac{1}{2}$  inch across, their ground colour green, with brown spots, the labellum being yellow, with a rosy edge and dark brown blotches. Plants of this genus are known under *Maxillaria*, as, for instance, *M. stapelioides* and *M. galeata*. (See fig. 144, p. 636.)

*Maxillarias*.—These were represented by *M. triangularis*, which has strap-shaped leaves and numerous short single-flowered scapes, the flowers being rich brown and red, with a labellum almost black; *M. luteo-alba*, a broad-leaved robust-growing plant, bearing numerous short-stalked flowers, which are large, the sepals and petals twisted and coloured white and yellow, the lip being brown; *M. Turneri*, a species with flowers like the last, but smaller, and having somewhat flattened fusco-coloured pseudobulbs.

*Masdevallias*.—These were well represented by the large-flowered kinds, and by several small-flowered species, of which *M. racemosa*, the beautiful little *M. tridactylites*, which is more like a *Restrepia* than a *Masdevallia*, its spoon-shaped purple flowers with three orange tails, and the narrow, almost terete foliage, forming a little tuft through which the hair-like flower-scapes push their nodding flowers being very pretty; *M. simula*, which the Professor has called "quite a little wonder of beauty in colours," and which has flowers less in size than a common house-fly, and are coloured purple and yellow, with an almost black lip. *M. Reichenbachiana*, a rare species, distinguished by its cup-shaped, dark red flowers and white slender tails; *M. Schlimii*, with tawny-coloured flowers and long yellow tails, were among those shown. *Megacalinium oxypterum*, a singular ally of the *Bolbophyllums*, to some of which it bears a close resemblance in everything except the flower-scape, which bears a pair of broad wings, the whole appearing to have been hammered out to a width of three quarters of an inch, and along the middle, springing from node-like points, are the tiny flowers, to see the beauty in which one must be armed with a powerful magnifying glass. *M. purpuratum* is very closely allied to this.

*Odontoglossums*.—Among these were plants of *O. Schillerianum*, which is a species between *O. niveum* and *O. luteo-purpureum*, and has flowers with the sepals and petals yellow and brown, twisted, 1 inch

long, and a yellow-white lip with a purple blotch; *O. læve*, *O. facetum*.

*Oncidiums*.—Of these the most noteworthy among the small flowered species were *O. sphacelatum*, a free growing, tall spiked species, with numerous flowers to a spike, and coloured yellow and brown. *O. pulchellum*, a small bulbous kind with distichous rigid leaves and erect slender scapes, bearing clusters of pretty white and bright yellow flowers, the lip being the most conspicuous part. *O. aurosum* bears a tall arching raceme of large lipped flowers, which are coloured bright yellow, with bars of reddish-brown on petals and sepals. *O. Cebolleta (juncifolium)*, a curious species, with spindle-shaped leaves, and erect branched flower-scapes, bearing numerous green, brown, and yellow flowers.

*Phalenopsis Parishii*.—A pretty little rarity, recently noted to our pages. *P. Manni* was also represented by a specimen; it has pale yellow flowers, barred with brown, the lip being 3-lobed and lined with purple.

*Panisea (Calogyne) uniflora*.—A tiny plant, with short foliage and pale brown and yellow flowers.

*Promenaea citrina*.—A dwarf lemon flowered species, of which a pan of fine, well flowered plants was shown.

*Ponthieva maculata*.—The curiously marked, hairy Orchid noted in our pages recently as being in flower at Kew.

*Polystachya pubescens*.—One of the few Orchids in cultivation which are natives of South Africa. It has pseudobulbs like those of *Lælia cinnabarina*, small foliage, and erect spikes of bright yellow flowers which are not twisted, so that the lip may hang downwards as is usual with Orchids.

*Sarcanthus Parishii*.—A Vanda-like plant, bearing long, slender, curved racemes of small yellow and red flowers, which are pretty when seen in the mass.

*Stelis muscifera*.—A bronzy-leaved *Pleurothallis*-like plant, with erect hair-like spikes of small red flowers, which are curiously angled when in bud. It comes near to *S. Bruchmulleri* and *S. spatulata* of *Bot. Mag.*

*Tetramicra (Leptotes) bicolor*.—This pretty little species was well represented by some nicely-flowered specimens. It has terete, sickle-shaped leaves, and short 3-5 flowered peduncles, the flowers being white with a blotch of purple on the lip.

*Trichocentrum albo-purpureum*.—A beautiful little Orchid, allied to *Burlingtonia*, but distinct in having fleshy leaves and pendent racemes, each bearing a single flower, which is 2 inches long; petals and sepals brown inside; the lip large, two-lobed, white, with two large purple spots at the base.

*Vanda cristata*.—A dwarf species, with curiously formed, large-lipped flowers, which are yellow and green except the lip, this being closely streaked with blood-purple; in form the lip is much like a lyre. *W.*

## FORESTRY.

### UNMIXED versus MIXED OAK WOODS.

I THINK that very few practical planters will agree with Mr. Michie in thinking that Oak can be grown best and most economically by itself. Supposing, as he says, that for the first thirty years the thinnings will not do more than pay for the cost of thinning, the rent lost before the plantation began to pay anything would amount to more than double the value of the land; and for twenty years after that the thinnings of a plantation containing nothing but Oak would pay a very small rent, whereas if the Oaks were planted at from 4 to 6 yards apart, and the plantation filled up with Larch and Spruce Firs, these latter would have paid a fair rent for the land by the time that they were all thinned out; and I am quite certain that, if they be properly thinned, the Oaks ought to be at least as fine at fifty years as those which have been grown in a plantation of nothing but Oaks. I see a great deal in this neighbourhood of both ways of growing Oak, because many of the Castle Howard woods have been planted with Oak alone; and I am convinced that in this country a plantation which at twenty-five years' growth consisted of Spruce Fir and Oak in proper proportion, would grow as fine, and I believe finer, Oaks than one in which there were only Oaks. Of course, Oaks will grow finer by themselves than in company with Ash and Elm and Chestnut. It is the first time that I have heard these trees

called "burses" for Oak. I have always thought it impossible to grow Oaks at all in company with Ash, and almost so with the other two; but there certainly is not the slightest difficulty in growing them to perfection with Spruce and Larch, so planted that the Larch shall be thinned out first, and the Spruce afterwards. It certainly also costs considerably less to grow an Oak with these than with Oak alone. *C. W. Strickland.*

## Orchid Notes and Gleanings.

### ORCHIDS ROUND MANCHESTER.

*Cypripedium Andersonii*.—This interesting Orchid has just bloomed in the stoves of C. E. Schwab, Esq., Heyscroft, Didsbury. No pretence is made that this is, in any sense of the word, an Orchid establish-

ment, for the blooms, which are very numerous, are of a fine size and very good colour. *Dendrobium Dalhousieanum* also is represented with blooms of unusual breadth of sepals and petals, the two crimson spots in the centre of the labellum are large and very dark. *D. Parishii* in baskets will in a short time be a mass of flower—the bulbs are showing buds almost the whole of their length. *D. infundibulum eburneum*, besides many of the more common forms, are here to be met with doing exceedingly well.

### ORCHIDS AT FERNSIDE, BICKLEY (II. M. POLLETT, ESQ.).

This is one of these garden in which Orchids are given a specialty, and where they give a good return for the care bestowed on them by growing luxuriantly and blooming profusely. At present the various houses have a large quantity of plants in flower. *Odontoglossum*, of which there is a large collection of choice varieties are represented by fine types of the following:—*O. Cervantesi*, *O. vexillarium*, *O. basti-*

*Phalaenopsis Luddemanniana*, and a nice lot of the following *Masdevallias*—*M. Lindeni*, *M. coccinea*, *M. ignea*, *M. Shuttleworthi*, and *M. Houtteana*—were all in bloom. A small "show" house, with a *Gloire de Dijon* Rose in flower on the roof, is just now very gay with a miscellaneous selection of Orchids and other flowering plants tastefully arranged with foliage and Ferns; it is a little paradise of both scent and scene, and the person it would not satisfy must indeed be very fastidious.

### ORCHIDS AT MESSRS. JAMES BACKHOUSE & SON'S, YORK.

THIS firm has long been noted for the cultivation of Orchids, having maintained for several years collectors in Mexico, Chili, and New Grenada, as well as receiving direct importations from correspondents in other quarters of the globe. "Cool Orchids" have always been a specialty, Mr. Backhouse having been one of the first to direct attention to the cooler treatment requisite for the successful cultivation of

FIG. 149.—E, FREESTONE PEACH; F, CLINGSTONE PEACH; G, HALF-CLINGSTONE PEACH. (SEE P. 661.)

ment, yet a few are to be found amongst the occupants of the stoves. Calling here recently I was much pleased to find a plant carrying a spike 4 feet long with twenty-four flowers of a bright yellow colour. Strange to say, this species and *C. punctatum* are not often seen in collections, being considered too common, yet when they flower are as interesting and beautiful as many of the *Oncidium*s that are now so eagerly sought after. The plant in question was received about two years ago from Brazil, when Mr. J. Fletcher potted it in a mixture of loam, sand and crocks; last year a stout bulb was formed, and now this spring, with the new growth, a spike has appeared and produced the results described above. *Lælia cinnabarina*, too, was flowering very freely, and close at hand was a good plant of *Renanthera coccinea* in a basket trained along the roof, near the glass, but sufficiently far to be safe from scorching.

*Eulophyllum barbigerum* and *Trichoglottis fasciata* are two very rare and singular Orchids that may be seen in the gardens of Mr. Railton, Harewood Lodge, Whalley Range. Both were secured at the sale of the Manley Hall collection just twelve years ago. The former is still growing on the original block, but it has twined round it, so that now the block is covered with its little plump bulbs and leaves. This is perhaps one of the most singular Orchids in cultivation. Its greenish-brown flowers are produced on a short spike, and the lip, which is covered with dark brown hairs, is attached to the base in such an apparently loose manner that the least movement of air, even the closing of the door, will cause the lip to jerk backward and forward, as though it were an insect striving to regain its freedom. The *Trichoglottis* (*Gardeners' Chronicle*, 1872, p. 699) is somewhat like a *Renanthera* in growth, leaves narrow and a little glaucous, producing short spikes of yellowish-brown flowers.

Amongst some well bloomed *Dendrobiums* at present flowering in the Orchid-houses of L. Ward, Esq., Didsbury, are several good plants of *D. tortile roseum*. These are grown on blocks, and have evidently well ripened

FIG. 150.—FLOWERS OF NECTARINE, SHOWING THE STYLE PROTRUDING AND IN ADVANCE OF THE STAMENS.

labium, *O. cirrosum*, *O. triumphans*, in several remarkable forms; *O. crispum*, too, is well represented in several good forms; *O. sceptrum*, *O. roseum*, *O. Pescatorei*, *O. Halli*, *O. Andersonianum*, *O. concolor*, *O. luteo-purpureum*, *O. Ruckerianum* and *O. R. insigne*, *O. Pollettianum*, *O. Edwardi*, *O. Rossi majus*, *O. citrosum*, *O. vexillarium*, and *O. Krameri*. *Cattleyas* in bloom were *C. Mendelii*, *C. Trianae*, the lovely *C. amethystoglossa*, and several unnamed species. *Cypripedium caudatum*, *C. villosum*, *C. Harrisianum*, *C. ciliolare*, *C. niveum*, *C. Warneri*, *C. barbatum*, *C. b. Crossi*, and *C. Argus* were in flower—all nice examples. *Dendrobiums* do well here, and some fine pieces of *D. densiflorum*, *D. Wardianum*, *D. Pierardi latifolium*, and others were well bloomed. *Oncidium pulchellum*, *O. ampullaceum*, *O. cucullatum*, and *O. sarcodes* were in flower. *Zygopetalum crinitum*, *Cymbidium Lowii*, a fine plant with large flowers; *Cœlogyne ocellata maxima*, *Miltonia cuneata*, *Aërides Warneri*, some nice pieces of *Sophranites grandiflora*, the waxy-looking *Chysis bracteescens*, the bright *Ada aurantiaca*, *Bletia hyacinthina*, *Lælia Dayii*, *Trichopilia crispa marginata*,

the denizens of the higher mountain regions of South America, and by a long course of patient experiments to ascertain the conditions of temperature, shade and moist, suitable for them. So also with *Cattleyas*, his study of their requirements led him to the conclusion that the close shading of former times was not desirable, but positively injurious; and in a large house, 90 feet long by 30 feet wide, may now be seen a very fine collection of these plants, and of the allied genus *Lælia*, grown without shading, and well known amongst cultivators for their healthy robust growth and free flowering habit. Some hundreds of fine plants of *Cattleya Trianae*, comprising amongst them such magnificent varieties as *Backhousiana*, *eboracensis*, *magnifica*, and many others, are here, although passed out of flower for the season; but there are still fine examples in bloom of *Cattleya Mendelii* and *C. Mossiae*, *Lælia elegans*, *L. purpurata*, and *L. majalis*. *Cattleya Mendelii*—which, by the way, was introduced by this firm through their collector in Ecuador about fifteen years ago, and sold to Mr. Meudel, after being flowered as *sp. Ecuador*—may be seen in many varieties, but all very beautiful; the large white sepals and petals, with finely expanded and richly coloured lip still stamping it as one of the princes of this grand family. The *C. Mossiae* are just coming in, and already afford promise of many fine varieties. Of *Lælia elegans*, a grand mass may be seen with ten spikes of bloom; the flowers, of which there are five and six on a spike, are very large and beautiful, the almost snow-white petals contrasting finely with the broadly expanded rich purple lips. *Lælia majalis* (the Mexican "Flower of May") is also flowering freely, and is very lovely; whilst the better known *L. purpurata* forms a fine feature in the same house, various plants bearing amongst them about thirty spikes of its large and striking flowers. One grand specimen carries ten spikes, some with six flowers on a spike. In the same house may also be seen nice plants in bloom of *C. Skinneri*, *C. Warneri*, *C. citrina*, and *C. inter-*

media; whilst grand specimens of *C. Sanderiana* and others give promise of a wealth of flowers a little later. Of *Vanda* teres there are several plants flowering freely; *Dendrobium thysiflorum* and *D. chrysotoxum* are also gay; nice plants of *D. macrophyllum* have just passed their bloom. A good collection of *Cypripedium* is cultivated, amongst which the following are now flowering:—*C. Sedeni*, *ciliolare*, *Lawrenceanum*, *naevium*, *longiflorum*, *villosum*, *barbatum*, *Hookeri*, and *caudatum*—*C. ciliolare* and *Lawrenceanum* being very fine. Amongst "cool Orchids" *Masdevallias* and *Odontoglossums* occupy a principal place. A plant of *Masdevallia Lindeni* bears forty spikes, and a smaller one has ten; whilst of *M. Veitchii* and others there are many fine plants in very fine condition. The *Odontoglossums* have a long span-roofed house all to themselves, and present a very healthy vigorous appearance. A large number of *O. crispum*, *O. Pescatorei*, and *O. cirrosum* have done blooming; but there are still a few nice varieties in flower, as also of *O. membranaceum*, *O. nebulosum*, *O. sceptum*, and *O. Chestertoni*, with others not yet proved. *Ada aurantiaca*, with its dense spike of warm reddish orange flowers, does well in this house, and is quite attractive; *O. Roezlii*, *O. citrosum*, and *O. Phalenopsis* are also well grown in rather warmer quarters. In the Mexican-house large plants of *Laelia autumnalis* (of which many fine varieties have been distributed from this nursery), and *L. anceps*, with its varieties, *alba*, *amœna*, *bella*, &c., may be seen; but, of course, the beauty of this house is in the dull months, when autumn is fading into winter. Large numbers of *Coelogyne cristata* and *Cymbidium eburneum*, in strong plants which have just passed out of bloom, may also be seen.

#### HINTS FOR AMATEURS.

Now that one can procure bedding plants at such low prices from the market growers and others, persons having a small garden and greenhouse have in a great measure given over the propagation of bedding stuff for their plots, and obtain them from these sources. This, we admit, is the easiest way, but a great deal of pleasure may be obtained by propagating one's own plants, and it is very easily done if one only sets about it in the right manner. A great number of subjects suitable for bedding may be raised from seed, but one can never be certain of seedlings, although the strides towards improvement made of late years by seed growers and seedsmen have reduced failures to a minimum. Of course, *Asters*, *Stocks*, &c., must be raised from seeds, but it is a few words on propagation by cuttings that we intend giving.

*Pelargoniums* are best struck in August or September, either in boxes for convenience in housing, or in the open ground in a nice light border. Lift them when well rooted, and pot them in 3-inch or 4 inch pots; they will not require any more potting till they are planted out the following May. *Calceolarias* are best propagated by putting cuttings in a cold frame in September; they will require protection from severe frosts, and make better plants if they are planted out into nice light rich soil in March or April, where they can be well protected. By doing this they will lift with good balls, and there will be less chance of failure. *Pentstemons*, *Antirrhinums*, &c., may be treated in the same manner, only they can be transferred to the open ground in April or May. For the successful propagation of

such thiogs as *Alternanthera*, *Alyssum*, *Ageratum*, *Mesembryanthemum*, *Lobelia*, &c., a small hotbed and frame are necessary. Cuttings of the above in 5-inch pots and plunged in ashes inside the frame on the hotbed speedily emit roots, and soon become nice little plants.

*Mesembryanthemum* sometimes is apt to damp off in a dung frame. The best way to propagate it is to put the cuttings in shallow boxes over hot-water pipes, and withhold water till they are thoroughly rooted—of course watering them after they are placed in their striking boxes: care must be taken that there is no drip on them, or they will most assuredly damp off. After cuttings are struck in the hotbed they must be very carefully hardened off, or else they will not succeed. There is some trouble attached to raising your own plants, but one feels repaid by successful results for all the little "troubles that afflict" the amateur gardener.

## The Flower Garden.

#### CARPET BEDS.

In large flower gardens, where variety is of great importance, such plants as succulents and other carpet-bedders, now used in great numbers, should have proper attention. These elegant and chastely coloured beds are not only new to many, but can be made very charming additions to a garden, and my experience is that the beds come in for a great share of admiration. There are so many beautiful succulent plants which can be used for that purpose, and to show them to the greatest advantage they should be arranged in circular or oval beds. The beds should be in all cases slightly raised in the centre.

I will mention a few plants that are the most suitable for such beds, and I may add that the worst summer weather does not injure them, and they remain a long time bright after most other plants have faded. For the centre a large *Agave americana*, surrounded by variegated *Mesembryanthemums*; next to this *Sempervivums* of any desirable sort, *Kleinia repens*, *Echeveria*, *Cotyledons*, *Sedums*, and a great number of this class of plants can be used with good effect.

#### MISCELLANEOUS.

Old roots of *Dahlias* and *Salvia patens* may be planted out; *Sweet Peas*, *Tropæolums*, *Convolvulus*, and any climbing annuals should be staked.

#### BEDDING OUT.

The long continuance of north-easterly winds and nightly frost has hitherto prevented much progress being made in the planting out of the summer bedding-out plants, but when the weather changes for the better earnest efforts should be made to accomplish this work with all possible speed, so as to enable the plants to establish themselves early in their summer quarters. Great care should be taken in planting out, and as proper attention to watering the plants has much to do with their after-success, it is most essential that no pains be spared to perform the work well. Great care and attention should be bestowed on the soil, so as to have it in the most suitable condition in respect to moisture. The soil should be compressed firmly round the roots in planting. The advantage of mulching to all fresh planted plants cannot be over-estimated. The best mulchiog consists of short dung or leaf-mould or cocoa-nut fibre refuse.

#### ANNUALS.

If the weather is showery take advantage of it to plant out Ten-week *Stocks*, *Asters*, *Phlox Drummondii*, and any other half-hardy annuals. All will make a good display in autumn. It is also a good time to plant out *Antirrhinums*, *Pentstemons*, *Wallflowers*, and *Sweet Williams*, and the summer-flowering *Chrysanthemums* and *Pyrethrums*. With this varied colours are invaluable for cut blooms, for bouquets, and for glasses in rooms, as they last a long time fresh.

#### HERBACEOUS BORDERS

should also have attention to keep down all weeds. Stake and tie the plants to preserve them from injury.

#### BULBS.

As the foliage of bulbs dies away these blanks may be filled up by sowing or planting over them choice and suitable annuals.

#### ROSES.

Roses should receive abundant supplies of liquid manure; during the dry weather the surface of the beds should be kept loose and mulched with well decomposed manure, which will much assist their growth and the full development of their flowers. They should be kept free from insects, and the flower-buds freely thinned, if large blooms are required. *Wm. Smythe, The Gardens, Basing Park, Allon, May 18.*

## Plants and their Culture.

#### STOVE FINE-FOLIAGE PLANTS.

WHERE attention has been given to the culture of these, both in potting and various other minor details, their young growth should now be coming away in a satisfactory manner. Those plants that have been re-potted this spring will now be pushing fresh roots freely into the new soil, and therefore need a greater supply of water. Any of the stock that was not deemed to be in want of a shift then will possibly require it now, so as to give them a better chance of going through the summer months in a healthy condition; water will soon be needed in greater quantity, and those plants that have not then a good storehouse to draw upon must suffer to a considerable extent. After several months of growth (possibly a year or more) the soil becomes exhausted, and the nutritive elements have become assimilated by the plant. This is more frequently the case with fine-foliage plants than with others, they being grosser feeders as a rule, thus taking a greater quantity of water, which eventually results in an impoverished or an inert soil. Flowering plants, on the whole, need more careful watering for some time before the soil will sustain the plant; this is more particularly the case with plants of permanent growth. Almost without exception, it is by far the better plan with fine-foliage plants to keep a young thriving stock always coming on, so as to facilitate the doing away of those that are becoming unsightly or unwieldy in size. Palms may be taken as the chief exception, and these ought at all times to have their special requirements attended to, the plants being of value at all seasons of the year. When in a healthy condition, their chief needs are an almost unlimited supply of water to the roots, when these have well laid hold of the soil after a recent shifting. Nearly all of them will thrive far better when becoming pot-bound, even to the bursting of the pots themselves in some cases. We have particularly noted this in the case of the following genera, viz., *Areca*, *Chamædorea*, *Euterpe*, *Kentia*, *Phœnicophorium*, and *Seafortia*. We are quite confident that the old maxim "More haste less speed" may be applied to Palms where frequent shifts are given to endeavour to secure a rapid growth. When a *Croton* becomes leggy or shows symptoms of decreased vigour, it will be better to consign it to the rubbish heap, the same with the *Dracænas* (taking precautions against the decrease of the stock by securing suitable material for propagation). It will often happen at this period of the year that the *Alocasias* show signs of inactivity or a predisposition to produce flower-spikes rather than leaf-growth. In the former case, the best plan will be to shake them entirely out of the soil, provided this was not done early in the season, and then remake the plants to the size required; in the latter case, keep all the flower-spikes pulled out when long enough to be taken hold of by the thumb and forefinger; this is much better than cutting them off, in which manner the lower portion of the stem is left to decay. Afterwards, as an inducement to make flesh growth, the plants should be plunged in a brisk bottom-heat for a while. The fine-foliage section of the *Athuriums* need a similar treatment at such periods of their existence. *Cycads* and *Zamia*s that did not put forth a new crop of leaves last year should now be introduced into a higher temperature as an incentive to a fresh start. We have found this plan to answer well, taking every precaution against injury to the tender leaves when their rapid growth is being developed. *James Hudson, Gunnersbury House, Acton, W.*

## FRUITS UNDER GLASS.

### CHERRIES.

WITH the exception of Grapes we have no kind of fruit which is grown under glass in the ordinary way that will keep so long on the trees as Cherries, providing proper treatment be accorded for the purpose. If this is done they will hang on the trees and keep well six or eight weeks after they are ripe. This is one of the advantages connected with their cultivation under glass, and very significant in the case of those having to provide enough fruit to satisfy the demand and requirements of an establishment in London during the months of May and June. At the present time (May 7) the Cherry-house here affords an interesting sight. The clusters of black and white Cherries which hang profusely amongst the fully developed and healthy looking foliage of the trees produce a very pleasing and satisfactory effect. We gathered our first dish of Cherries—Black Circassian—on May 2, and that grand white variety, the Elton, is now fit; in fact, the whole crop is so far advanced towards maturity as to make it necessary to commence at once a course of treatment that will be most conducive to their preservation until they are required for use. This will consist in keeping a low temperature in the house at all times. Fire-heat will not be necessary here, and a free circulation of air should be allowed to pass through it whenever the thermometer does not fall below 50°; to counterbalance the effects of arid and sunbiny weather, the surface of the borders should be kept constantly moist, and the fruit entirely protected from rays of scorching sunshine. These conditions now will not only preserve the fruit, but will, moreover, be beneficial in retarding the maturation of the wood likewise, which in the case of Cherry trees subject to forcing operations year after year consecutively is an advantage.

### MELONS.

A first-rate Melon unquestionably is one of the most luscious fruits that we grow in an artificial way, and on the other hand a badly grown and ripened one is equally detestable; in point of excellence this kind of fruit varies more in its character than most others grown identically, and the reason doubtless arises from different causes, sometimes connected with the treatment or cultivation, but in my opinion more often primarily from the presence of that insidious enemy, the red-spider, if this pest abounds. Melon plants in all stages of growth are so susceptible to it, that they will sooner or later be infested, and then, even with every effort to kill or displace it, the pest will sometimes get the upper hand, and thus impair the foliage of the plants, and so deteriorate the quality of the fruit as to make it insipid and positively nauseous. First-rate Melons can only be procured when the vitality of the plant and the leaves are kept in a healthy state until the time the fruit is actually ripe; from a knowledge of these conditions alone are we able with any degree of certainty to estimate what the character of the fruit will be when it ripens. The notion that the quality of Melons can be determined by appearance or weight, is not worth contention; at all events the result of considerable practice leads me to such a conclusion; and the scores of Melons I have seen and tasted at the Committee meetings of the Royal Horticultural Society and elsewhere, some of which, as far as appearance, &c., was concerned, seemed to possess all the characteristics essential to constitute a first-class fruit, yet at the time of testing many failed from that all-important and indispensable element, quality, being absent; no pains should therefore be grudged that will tend to eradicate such a terrible pest. At many places houses and pits now filled with bedding stuff and other subjects will shortly be brought into requisition for Melon plants. Let them be well cleaned before they are used for this purpose. The walls and frames should be done over with hot lime-wash with some paraffin oil mixed in it. The surfaces should be removed, and fresh materials, of whatever description required, be put in. In the case of fermenting beds, if they are cold, fresh stuff should be added, and they should be turned over to renew the heat in them. See also that the plants in course of preparation for these places are being reared where spider does not abound. If the plants are to run over the surface of the beds, hillocks of ordinary soil should be put into the centre of each

light; put the plants in them firmly, and keep them above the ordinary surface level. If the pits are commodious, put two plants in the centre of each light, and stop them when they have made five or six leaves. This will induce the laterals to push forth readily. Four or five of these should be selected on each plant, and be run out regularly until they reach the limit desired—about 3 feet long in an ordinary way—when they should be pinched. Successional laterals will then be produced, which should be stopped at the first or second joint above that where the fruit exists. The airing and watering will demand the usual attention which has before been pointed out for this subject. The early crop of fruit, in some cases, will be ripe now, and in others it will be nearing the same state. Keep the heat about these plants well up at 75° at night and 80° in the daytime and utilise to the utmost solar influences, so that under its effects air can be admitted into the place freely without diminishing the temperature inside below 90°. As soon as ripening is indicated employ less moisture and avoid as much as possible wetting the Melons when in this state. If it be necessary to keep the Melons after they are ripe they should be cut when fit and be taken to a cooler, but not absolutely cold place. Successional crops will require attention in the way of stopping, training, and safely securing the Melons when they become heavy. Give copious syringings at noon, and in the afternoon, every day; ventilate at 80° and close up the house in the afternoon with sun-heat at about 90°. *Geo. Thos. Miles, Wycombe Abbey.*

## The Hardy Fruit Garden.

### WALL TREES

Will require constant attention for some time. Disbudding should be continued weekly. Pears, Apples, and Apricots, where thickly set, should be thinned without delay. Where the growing wood is crowded it may be thinned out with advantage to the trees, but the principal shoots had better not be stopped till the end of June, for if this is done too early it only encourages a thicket of small shoots to grow instead of forming fruit-buds.

### CURRENTS.

Red and black Currants should be mulched with straw or short grass to prevent the rains from spoiling the fruit about the time of ripening which often happens unless this is attended to.

### CHERRIES.

Morello Cherries should have the young shoots pinched out, except such as are required for laying-in later in the season. The trees will grow stronger and the fruit will be much finer if kept moderately thin of branches.

### STRAWBERRIES AND RASPBERRIES.

Both require abundant supplies of water when growing fast. King of the Earlies, Black Prince, and Vicomtesse H. de Thury are all in flower and appear like being ripe about the same time. Moss should be placed round Irish grafts and kept damp by syringing often.

### FIG TREES

should be looked over and the young shoots stopped when they have formed five or six leaves. *J. Smith, Mentmore, Bucks, May 18.*

## The Kitchen Garden.

### GENERAL WORK.

THE main crop of Carrots, Onions, and Parsnips should be thinned, if necessary, and hand-weeded between the plants at the same time, finishing off by passing the Dutch hoe between the rows. Neither should be thinned to the full distance in the first instance. Carrots may be left about 3 inches apart, the later thinning will then furnish delicate young roots for use. At the final thinning James' Intermediate should stand 6 inches apart in the rows, larger varieties 8 or 10 inches. If a good bed of autumn-sown Onion is on hand the greater part of the main spring sowing may be thinned out to the full distance as soon as the young seedlings are considered safe, leaving a few rows thicker for drawing for salad. Parsnips should be thinned in the first

instance to about 4 inches apart, finally thinning out to 1 foot.

Any plants which cannot be removed from the seed beds to permanent quarters should receive a second thinning if getting at all thick; the thinnings may be pricked out and watered if it is necessary to save them. This of course will not be needed (the second thinning) if the young seedlings were pricked out into nursery beds from the seed bed; but few gardeners can find time for this pricking out into nursery beds prior to finally planting out, neither is it necessary if a sufficiently large bed be sown and the young plants be thinned out twice, the last time leaving the plants 4 or 5 inches apart.

If not already done no time should now be lost in preparing the ground for the autumn and early winter Broccoli plants. This ground, if there is a sufficient depth of good soil, is best double dug, and the manure placed beneath the top spit. This double digging is much quicker than trenching, and has many of the beneficial effects of the latter on the crop.

Ground should also be held in readiness for planting out second early Brussels Sprouts, successional Cauliflowers and Lettuces. In making these plantations the weather should decide the time, and not the size of the plants. I have often planted large plots with young plants just in rough leaf (with the dibbler) during showery weather, and they have succeeded better than larger ones planted later with the trowel during less favourable weather, when it was necessary to water them at the time of planting. When placing them out into permanent quarters so early a few may be destroyed by slugs, these can easily be replaced and artificially watered for a time, or the making good can be postponed until rain comes again, holding some plants in reserve. When plants of Broccoli, Brussels Sprouts, Cauliflower, and Lettuce become large they should always be transplanted with the trowel, unless the ground should be well soaked with rain at the time of transplanting, and prospects of a little more coming down after it is completed, to finally settle the soil around them.

The trenches for the early Celery should now be got ready. I have found it a good plan, after the trenches are opened, to sow a row of Lettuce seed on the soil between, thinly and 1 inch deep. Give the seed a thorough good watering should the soil be dry. From now until the early winter sowing it is best to sow Lettuce in rows on the ground where it can remain to come to maturity (1 foot apart and 1 inch deep). It is not necessary to use more seed to grow it under these conditions than if sown in beds and transplanted. In some gardens slugs may prevent this system of cultivation.

### POTATOS.

As soon as the haulm is well above ground—say 3 or 4 inches—the hoe should be passed between the rows, in order to destroy any young weeds just starting into growth; it is important that the soil should be quite free from weeds before the final earthing-up takes place.

### UNHEATED FRAMES.

Plants of Cucumbers, Marrows, Tomatos, and French Beans must now be freely aired during the morning, and the plants well syringed or sprinkled and the frames closed with sun-heat in the afternoon. As soon as the Marrows commence bearing freely this treatment can be dispensed with and the lights removed. The lights should now be entirely removed from the Carrot frame, and also from successional crops of Potatos. Ashleaf Potatos planted in frames in February are now ripe, and the tubers will not increase in size, they should therefore be dug up and placed under sand or soil in a cool shed or cellar, where they will be much better than lying baking in the sun. Do not allow plants of French Beans to stand too thickly in the rows, they should at least be 1 foot apart, and a strong growing variety, such as Canadian Wonder, from 14 to 16 inches. To save continual watering give a good mulching of manure, such trouble will be well repaid by finer Beans of a superior colour. Potatos under walls should be finally earthed up and kept watered during dry weather.

### SEED SOWING.

This is the month to sow Ne Plus Ultra Pea for picking in the latter part of August and September. A sowing of Sturdy or a similar variety should be made at the end of the month. If not done, the last sowing of Celery should now be made. At the end of the month make a successional sowing of French Beans in good rich soil. Sow rotation crops of Spinach between Peas or on a semi-shaded border. Turnips (a few rows) should be sown now about every five weeks until the main winter sowing. *G. H. Richards, Somerley, Ringwood, Hants.*

## APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY,	May 26	Royal Horticultural Society: Meeting of Fruit and Floral Committees, at 1 A.M.; Scientific Committee, at 1 P.M.; General Meeting, at 3 P.M. Show of Pot Roses, Azaleas, &c.
WEDNESDAY,	May 27	Sale of Carnations, Plants, &c., at Protheroe & Morris' Rooms.
THURSDAY,	May 28	Sale of Imported Orchids, from Messrs. F. Horsman, and Shuttleworth, Carder & Co., at Stevens' Rooms.
FRIDAY,	May 29	Sale of Valuable Collection of Shells, at Stevens' Rooms.
SATURDAY,	May 30	Sale of Greenhouse Plants, at the Nursery, Latimer Road, Forest Gate, by Protheroe & Morris.

PUBLIC attention has been directed of late to the subject of FORESTRY by Dr. LYONS, Sir JOHN LUBBOCK, and others; a Forestry Exhibition has been held in Edinburgh, and an English Arboricultural Society has been founded which we hope may flourish, and hold discussions, and distribute information, as that of Scotland has done. There is no doubt as to the mismanagement which prevails in the cultivation of woods in all parts of England. The income of most estates might be largely increased by the felling of timber that has ceased to thrive, by adapting the trees to the soils, and by proper thinning, and filling the gaps in underwoods. "The waste and loss are dreadful."

Arboriculture is an art requiring much study and practice; it is a special industry, like that of the gardener. An untrained eye cannot detect the difference between a stunted tree, which ought to be felled, and another of the same size, which is growing fast, and should be saved. Few landed proprietors understand the rudiments of arboriculture, and persons whose knowledge is undisputed and who travel widely have assured us that the land stewards, even on timbered properties, are frequently as ignorant as their employers. In this matter our own personal experience is confirmed by that of the Premier. One may add to these strictures that if instruction in forestry was needed some years since, it has become still more necessary on account of the diminished resources of agriculture, the increased demand for timber, our dependence on foreign supplies, and the probability of an extension of those industries which require timber for their development. It is probable, too, that a large demand will be created by the necessity for increased shed-room for live-stock, especially in those parts of the country where the tendency is to diminish the size of farms and to extend the area of grass-land and increase the number of cattle. There is no need to fear the absence of a market for all the timber that may be planted.

The industry of basket-making, to cite only one case, is dependent on wood, and other kindred industries would grow out of it if the materials could be obtained. The land is here and its cultivation languishes, but the products most in demand, such as Willows, Ash and Chestnut poles are not easily obtained. Unfortunately there are no schools of forestry in England at present, though they exist in France and Germany, and are spoken of for England. The best seminaries for the training of a useful class of practical foresters are the great tree nurseries. The services of the various firms of nurserymen in the department of arboriculture have been very great, and one could not avoid observing this at the Forestry Exhibition. The grounds of the Exhibition at Edinburgh, planted as they were by competent nurserymen, were most instructive. Messrs. VEITCH'S *Sciadopitys verticillata* and *Quercus cuspidata* may or may not be the coming timber trees destined to shelter the bullocks of the future; but the enterprise which brought them here gave us many of the best of our trees—the Larch, for instance, and the Silver Fir, which is coming rapidly into use in the construction of

farm buildings, as well as the Corsican and Douglas Firs, which are both winning favour for their rapid growth and general usefulness. It is easy, then, to understand why Messrs. VEITCH were awarded a gold medal for rare specimens. At a former period novelties were introduced by noblemen and planters of wealth. Under the new régime of commercial activity they are due to the enterprise of private firms, to whom we owe the introduction from abroad, and the creation by breeding and crossing, of innumerable useful or beautiful specimens of trees, shrubs and flowers, in woods or gardens. The nurseries, then, have become the headquarters and schools where the most reliable information and soundest teaching upon forestry should be sought.

A column might easily be filled by describing the skilful planting and arrangement of shrubs in the various tree nurseries; how they are set in such form as to attract the visitor and render their inspection easy; how massed, the tallest behind, the low-growing sorts in front, forming a slope on either hand. The names alone of the attractive exotics that line this approach and introduce you to the forestry department further on would fill a column, and a slight sketch only of their history, whence they came, by whose enterprise imported, by whose skill, courage, and endurance as collector for the firm at home they were secured would fill a volume; in fact the reader may remember that the conveyance of several specimens of a single plant, the Breadfruit, formed the occasion of a volume,

FIG. 151.—ANCHOMANES DUBIUS.

Female flowers isolated and enlarged; one cut open to show solitary ovule.

the *Mutiny of the Bounty*; and he may remember the elaborate precautions which were found necessary in fitting up Captain BLIGH'S vessel for the conveyance of its unusual freight. GEORGE III., however, was not more interested in the voyage of the *Bounty*, and the treasure it was believed to carry, than the various members of firms must have been in the passage and arrival of many of the shrubs which now seem quite at home. The history of the introduction of the Cinchona into India is also most creditable to Government authorities, and especially to those at Kew.

The Corsican Pine (*Pinus Laricio*) is a tree which has awakened a great deal of interest among planters. The Corsican Pine is now used in those localities where the Larch was formerly planted. It is largely used for telegraph poles. The Corsican Pine requires to be several times transplanted when young. The books on forestry—excellent and full of sound information as some of them are—do not mention this peculiarity, and yet it is of vital consequence that the plants should be transplanted three or four times before the final removal, since this tree is less disposed to produce a vigorous mass of fibrous roots than either the Spruce, Larch, or Scotch Fir, and is therefore more difficult to establish. These operations increase the cost of the plants, and for the sake of economy they ought, in planting for profit, to be set thinly and mixed with inexpensive nurses, such as Larch, which is a particularly suitable nurse, the plants costing little, owing to the small amount of labour required

in raising them, and because they are useful as early as ten or twelve years after planting, so that they can be cut for hop-poles or stakes, when they are no longer required as nurses, and this would not be the case with any other Conifer, none possessing the early utility of the Larch.

Another great merit of the Corsican Pine is its accommodating disposition in regard to soil; it will thrive in the lightest or the heaviest, and BROWN says in *The Forester*, "We have seen healthy crops of it on most soils, from a stiff clay loam to a sandy soil." It need hardly be added that it makes timber fastest on a "good soil," and, like the Conifers generally, it prefers sandy loams that are light and dry, and have an open subsoil. It will grow, however, both on the sites that are natural to the Scotch Fir and on those cooler soils which the Silver Fir delights in. On stiff land it is absolutely essential that the surface-water should be removed by gripping.

The Corsican Pine is coming rapidly into favour, as Mr. BROWN predicted that it would do, because, as he remarked, it grows much more rapidly, and attains a larger bulk of timber in a given time, all circumstances alike, than the Scotch Fir; and the timber, which is well impregnated with resin, is easy to work and very durable. A tall tree which Mr. LOUDON regarded as one of the finest in the country, grows to a height of 80 feet or 90 feet on the left of the main entrance to Kew Gardens; but it has few side branches, and will not hold its own long, in growth, against other specimens having more foliage.

So far as hedge plants are concerned, there is none to beat the Quick or Hawthorn, but the Myrobalan Plum is a fast-growing shrub, suited for any soil. It has been scarce, owing to the difficulty of obtaining the plums. It is a more robust, or at least faster growing Thorn than the Blackthorn (*Prunus spinosa*), as any one may discover who sees the beds of seedlings of the two sorts side by side, where the *Prunus myrobalana* stood 4 feet high and the Blackthorn only half as high at the same age.

The Alder is in demand by planters for the growth of timber for clog soles and bobbins, which are used by the million. Some may think the Sycamore an unimportant tree. It is becoming a very profitable one, selling when large at 10s. per cubic foot, or 5s. to 7s. when smaller. One was sold by auction at Hawick last autumn at £30. Sycamores of such large size are of course only found on good land. The Wellingtonia, on porous soils—but not on the marls, where it makes poor progress—is the tree of fastest growth in this country, and of smallest utility perhaps! Next to it, for rapidity of growth, is the Poplar (*Populus canadensis*), which not only makes much timber but very useful timber, in quick time. Some of the finest trees we have seen grow by the Trent at Burton.

—ANCHOMANES DUBIUS.—In our volume for 1872 we figured one or two flowers of this plant detached from the spadix, but we had no opportunity at the time of figuring the spathe and spadix. *Anchomanes dubius* is one of those striking Aroids which from a thick fleshy tuber send up, first a spadix, and afterwards a large stalked much cut leaf of much beauty. The inflorescence here figured (fig. 152) is remarkable for its singularly delicate and unusual coloration, the outer surface being pale olive-purple, the interior glossy cream-coloured. The spadix is covered for five-sixths of its length with densely packed cream-coloured male flowers, the lower sixth with dull purple female flowers, each consisting of an ovary only, turned downwards and destitute of perianth. The pollen-grains are elliptic, granular, mixed with needle-shaped raphides. For the connoisseur this is a grand plant, and we thank Mr. BULL for affording us the opportunity of figuring it.

—THE QUEEN'S VISIT TO NETLEY.—On Her MAJESTY'S visit to Netley Hospital on Saturday last, Miss EDITH BRADSHAW, youngest daughter of F. BRADSHAW, Esq., J.P., of Abshot Hall, presented Her MAJESTY with a beautiful bouquet, consisting of good blooms of *Maréchal Niel*, *Carnations*, *Eucharis*, *Tuberoses*, *Gardenias*, *Stephanotis*, *Orchids*, &c. This

is the third bouquet Messrs. DROVER, of Fareham, have had the honour of making which has been presented to Her MAJESTY.

— THE SOUDAN.—The following extract from a letter from an officer on service at Ottao will be read with interest :—"The whole country is perfectly different to what I expected to find it. I thought to find a flat, sandy plain, with scarcely any vegetation. I was very surprised to find any amount of almost impenetrable bush and bunches of Cactus [Acacia?] growing over them here and there. I know you take

— AMERICAN EXHIBITION, LONDON, 1886.—The managers of the American Exhibition have succeeded in securing a location in London for their enterprise—Earl's Court; the selected site is but a short distance from South Kensington, and is situated in the best part of London. The property to be occupied by the Exhibition covers about 20 acres, and has railway advantages in advance of any exhibition ever held in London. The station for the District Railway will be in the Exhibition grounds, and another one will be at West Brompton, a few steps from the entrance to the main building. Every railway in

pod; Figs are coming away nicely, and showing fruit at every joint; Gooseberries are plentiful, Currants ditto, Cherries abundant, Plums are beautifully set, and promise well; while in Strawberries Black Prince is a sheet of bloom, and Apples—the most important crop of the lot—are truly lovely in their pink and white blossom. And what is more beautiful than a well-kept Apple orchard?—in spring the trees clothed with blossom, and in the autumn laden with rosy-cheeked fruit of various shades. The situation of the garden here is bleak, 400 feet high. And in my judgment all this abundant promise of fruit comes of well

FIG. 152.—ANCHOMANES DUBIUS: SPATHE PURPLISH OUTSIDE, CREAM-COLOURED AND GLOSSY WITHIN. (SEE P. 668.)

interest in botany, so I send you a small yellow flower that grows all over the place. The centre, as you will see if you open it, is a dark orange, and the leaf is soft, being covered with a sort of velvet [Abutilon]. There is a singular absence of Palms, even at the wells here, and all up the different routes they are not to be seen. The only few I have seen are just outside Suakim, in a place called Osman Digma's garden. The country here is so like Scotland, except for the Heather, only the mountains are much more blue, and much grander. Experiments show that the country here is full of copper. I sincerely hope the country will be opened up, and that the Arabs may prosper."

Great Britain will have facilities for immediate and direct connection with the Exhibition building—as the two great Exhibitions—the Colonial and the American—will thus be in almost direct contiguity, millions of visitors will be saved the trouble and expense of cab-fare from one part of London to another.

— FRUIT PROSPECTS.—A correspondent writes as follows :—"Never did I take up my pen to address you with greater pleasure than on the present occasion. Speaking for the county of Sussex, I think I may say that we are likely to be blessed with the most abundant crop of fruit I ever remember. Pears are set most abundantly; Peaches as thick as Peas in a

ripened wood from the drought of last year, and also from the lateness and dryness of the spring, so that the frost did not do the damage it usually does. 'Don't halloo till you are out of the wood,' says the sage; true, but we are nearing the houndary, and I cannot help shouting my joy."

— HORTICULTURAL CLUB.—The usual monthly dinner and *conversazione* took place on Tuesday last, when there was a good attendance, including Mr. JOHN LEE (Chairman), Messrs. COUSENS, GIRDLESTONE, WHEATSTONE, STOLLENHOFF, DRUERY, &c. In the evening an interesting discussion took place on Ferns, the subject being opened by Mr. C. T. DRUERY,

who very clearly, with the aid of diagrams, showed the difference of reproduction in the case of flowering and cryptogamic plants both in their normal and abnormal aspects, alluding in the latter to his own recent discovery of apospory, which has already been alluded to in these columns. Mr. COUSENS dwelt on the possibility of hybridising Ferns, notwithstanding the minuteness of their organs of reproduction; and during the discussion which followed many interesting facts were brought forward, such as the occurrence of abnormal forms of varieties of British Ferns, where only one plant has been found. It was announced that the subject for the meeting in June would be alpine plants.

— REV. J. C. CLUTTERBUCK.—The death is announced of the Rev. J. C. CLUTTERBUCK, M.A., well known as the "father of hydro-geology." Mr. CLUTTERBUCK, who was in his 84th year, was for fifty-five years vicar of Long Wittenham, Berks, and for many years rural dean of Abingdon. The deceased gentleman was an acknowledged authority on all matters relating to our water supply. The evidence which he gave before the Parliamentary Committee in 1865, regarding the abstraction of water from the Thames valley and the regulation of the supply in periods of drought, was the subject of complimentary allusion in the report last year of the Select Committee of the House of Commons. Mr. CLUTTERBUCK was elected a Fellow of Exeter College, Oxford, a position which he held until his marriage with LOUISA, daughter of the Hon. and Rev. W. R. CAPEL, son of the fourth Earl of Essex. Mr. CLUTTERBUCK was one of the earliest contributors to this journal.

— LINNEAN SOCIETY.—The day appointed by the charter for the anniversary meeting, May 24, falling this year upon Sunday, and therefore, by the byelaws, postponed to the day following, which is a Bank Holiday, the Council have considered that it would meet the convenience of the Society by holding the anniversary meeting *pro forma* on the 25th inst., and then adjourning it to Thursday, June 11, at 8 P.M., when a meeting will be held for the election of a Council and officers for the ensuing year.

— BOUGAINVILLEA SPECTABILIS.—There is an extraordinary plant of this often despised species flourishing in a lean-to greenhouse at Heathfield, Torquay, the residence of E. CROYDON, Esq. It was planted out in this house some twenty years ago, and its growths have been so cleverly manipulated and trained up under the glass that they now cover most perfectly a space of about 40 feet by 6 feet. The myriads of its brick-red and scarlet-shaded bracts are just at their height of perfection, and form a sight not easily forgotten, speaking well, as it does, for the patience and skill of the gardener, Mr. CASELEY. There is no artificial heat given save during the severe weather in winter.

— NEW INDIAN AZALEAS.—It is possible that the great interest and attraction attaching to the display of Orchids in the conservatory at South Kensington on Tuesday, the 12th inst., drew away attention from the fine display of Indian Azaleas brought from Ghent by M. LOUIS VAN HOUTTE. The plants were trained in that way which appears to commend itself to the Belgian cultivators, but they were well grown and grandly bloomed; indeed, it seemed as if the colours were much brighter and more striking than in the case of plants bloomed in this country, such as Baron N. de Rothschild, Madame Van Houtte, and Marquis of Lorne. The group consisted of a few varieties not previously seen in this country, and to two of these First-class Certificates of Merit were awarded, viz., Prince Baudouin, vivid crimson, very bright and telling, with dark maroon-purple markings on the upper segments—a very fine variety that will make a rare exhibition variety; and Princess Victoria, delicate pink, with white margins, and having rich rosy-carmine blotches—a very fine double variety. Other fine varieties were John Lyall, double, pale red, finely formed petals, and large flowers—extra fine and free; Miss C. Jarrett, creamy-white, with bright green spots on the upper segments—the flowers much fringed on the edges; Theodore Reimers, double, bright glossy purple, large and fine; Madame Auguste Lemoine, pink, with rosy-red flake, the upper segments spotted with purplish-rose, and somewhat fringed—good form; Czar Alexander III.,

semi-double, bright red, the upper segments spotted with dark—very free; Louis Lubber rich crimson, stout, and good form; Oswald de Kerchove, the flowers charmingly fringed; Joseph Lefebvre, white, flaked with carmine and pink, fine and free; Baron N. de Rothschild, bright purple, shaded with violet—very fine; Madame Louis van Houtte, bright rosy-salmon, edged with pure white; and Marquis of Lorne, orange-red, very bright and showy. The foregoing made a very good group of decorative varieties, that are certain to take a high place among growers.

— ROYAL NATIONAL TULIP SHOW.—The annual exhibition of this Society is announced to take place at the Botanical Gardens, Manchester, on Saturday the 30th inst. This date has been fixed upon as that best suited to the body of growers, but it will be too early for some to exhibit, among them Mr. S. BARLOW, whose flowers come on very slowly indeed, owing to the cold and somewhat sunless weather.

— CALCEOLARIAS AT BEDFORD HILL HOUSE, SURREY.—Mr. RAPLEY, the gardener here, has a very fine lot of these showy flowers in luxuriant health just now. There is a pretty large collection, and from the flowers that were sufficiently far advanced we could see that the strain was an exceptionally fine one; the leaves are large and firm, and the heads of bloom are gigantic. The dreaded "rot" disease, or whatever local name it has, is not to be seen, or any signs of it either; the plants are kept very cool, and are as creditable a lot as one could wish to see. In the same cool-house *Lapageria rosea* and *L. alba* were making extra strong growths.

— CHANGE OF ADDRESS.—The lease of premises at 33, Highgate Road, N.W., having recently expired, Mr. WARHURST has removed his office to 31A, Beaufort Street, Chelsea, S.W., which is very near to the well-known nurseries of Mr. WM. BULL and Messrs. VEITCH in King's Road. Every class of glasshouses and heating for horticultural purposes have been erected for many years by Mr. WARHURST and his predecessors Messrs. HEREMAN & MORTON (and whose old building works are continued at 81A, Highgate Road), but the frequent enquiries necessitated a separate establishment for the ironwork portion. This has been carried on for some time past in conjunction with Mr. HOLLIDAY at the Pheasantry Wire Works, Beaufort Street, to whose works and show rooms the new office is now connected.—STEVEN BROS. & CO., Hot-water Engineers and General Ironfounders, 35 and 36, Upper Thames Street, E.C., have secured the lease of new and extensive premises at 4, Upper Thames Street, E.C., opposite the *The Times* Office, Queen Victoria Street.

— FANCY PANSIES FROM BOREATON PARK.—A box of blooms of beautiful fancy Pansies sent by Mr. HENRY ECKFORD, from Boreaton Park, Baschurch, is sufficiently noticeable as illustrating what Mr. ECKFORD is doing in the way of producing flowers with distinct scarlet and crimson hues. He has been fertilising and selecting with a view of intensifying the hues of colour found in Thomas Grainger and other flowers of that class, and he has succeeded to a remarkable extent, for many of them are singularly bright and effective. And they are also remarkable for their size, stoutness, smoothness, and the size, density, and clearness of the blotches. Perhaps there is something in the soil and climate that helps both the lustre of the colours and size of the flowers. Whether it is the intention of Mr. ECKFORD to name any of these varieties is not made known. Fancy Pansies are now not only numerous, but very fine, and any additions to the named varieties should be made with caution and care. Mr. ECKFORD is too good a florist not to recognise this necessity; at the same time the development in the fancy Pansy, high as it is at the present time, is confined by no arbitrary limits, and there is no knowing what remains to be revealed in the way of novelty.

— ORCHIDS AT BRIGHTON.—It has been suggested that at the meeting of the Bath and West of England Society, to be held at Brighton on June 8, additional means be taken to secure a representative collection of Orchids. The Steward of the department will, we are informed, be happy to offer special

inducements and every possible facility to exhibitors. It is necessary that applications for space and for further information should be made without delay to the Hon. and Rev. J. T. BOSCAWEN, Oxford and Cambridge Club, Pall Mall, London, S.W.

— A "GRAND OLD GARDENER."—On Sunday last, the 17th inst., the Rev. H. T. ELLACOMBE, the respected Rector of Clyst St. George, returned public thanks that it had pleased the ALMIGHTY to spare him to enter his 96th year in health and senses. We understand that he generally reads the Lessons for the day "distinctly, and with an audible voice, standing" at the eagle lectern, and "turning himself as he may best be heard of all such as are present."

— BOOKS RECEIVED.—*The Dairy of the Farm*. By J. LONG and J. C. MORTON (BRADBURY, AGNEW & CO.).—*Report of Sussex Association for the Improvement of Agriculture*.—*Transactions of the Botanical Society of Edinburgh*.—*La Culture Maraichère*. By M. GILLEKENS.—*Birmingham Botanical Society, its History, &c.*

— GARDENING APPOINTMENTS.—Mr. JAMES LOCKHART has been appointed Head Gardener to Sir GILBERT GREENALL, Bart., Walton Hall, Warrington.

## HOME CORRESPONDENCE.

The Orchid Conference.—The *Gardeners' Chronicle* has devoted so much space to the Orchid Conference in all its connections and surroundings that I should hesitate to ask you to supply an omission, did it concern me alone. In your report of the proceedings of the Conference you have not mentioned the marked reference I made to the great energy and enterprise which have been displayed now for many years by Mr. F. Sander, of St. Albans, and his collectors. They have added to these qualities conspicuous skill and success in collecting and importing Orchids, the results of intelligent care and observation, and of long and varied experience. Mr. Sander has largely added to the genera and species of Orchids in cultivation, and among his introductions have been many novelties of great merit. While I am writing, permit me to add that I did not say "almost all epiphytes grow upon trees." What I said was that while a large majority of Orchids were epiphytal and grew upon trees, not a few had the habit of herbaceous plants, such as Disas, &c. I avail myself of this opportunity of thanking the *Gardeners' Chronicle* for the liberality and heartiness with which it has done its utmost to support the Conference, and to promote the scientific and practical objects with which it was constituted. *Trevor Lawrence.*

Large Abies grandis.—As the result of an accident we were, the other day, compelled to cut down what I believe was the finest specimen of *Abies grandis* in this country. It was 72 feet in height, 2 feet 2 inches in diameter at the butt end, and it contained upwards of 70 cubic feet of timber, all the result of about thirty-three years' growth. The wood, about which later on I shall have more to say, appears of excellent quality, and has a most agreeable perfume. That it is a rapid grower will be known when I state that several of the annual rings near the butt end measured an inch in thickness. Strange to say, this fine tree never bore cones, although both last season and this male blossoms were produced in abundance. This is quite the reverse of *Abies Nordmanniana*, which usually produces cones for several years previous to bearing pollen, and even then the pollen is so scanty that we have frequently had to resort to artificial fertilisation. In Ireland, where there are some of the finest specimens of *Abies Nordmanniana* I have seen, artificial fertilisation was for many years resorted to, owing to the scarcity of pollen. *A. D. Webster, Penrhyn Castle, North Wales.*

Vegetables at the Bath Show on the 13th.—Although the prizes offered for the above were not very encouraging, there was a very fair display for the time of year, I should say a much better competition than was expected by the committee. The competitors, with the exception of a few, were all local. Unfortunately the wording of the schedule in respect

to the collection of vegetables is anything but satisfactory and not likely to encourage any one but local exhibitors, as herein the same mistake is committed as in many other schedules, viz., not specifying the number of vegetables to be exhibited in each dish, but leaving it entirely to the discretion of each exhibitor to stage what he likes in regard to the number in each dish. As well as stating the number of varieties to be shown in a collection, it should also be clearly stated how many of each variety are to be shown. This mistake gives judges unnecessary work, and dissatisfaction often prevails amongst the exhibitors which otherwise would not be felt. Some exhibitors here staged three or four times the usual and proper number of many varieties. This may probably make a larger display, but it certainly makes a rougher one, whereas if a limit were placed on the number to be contained in each dish, exhibitors would have more time to arrange them, and the whole would look as an exhibition should do, as if tastefully arranged and not crowded, instead of which the vegetable stage presented much the same appearance as a crowded greengrocer's shop window. *Visitor*. [A greengrocer's shop window often presents a much finer display than we witness at vegetable shows. *Ed.*]

**Phormium tenax variegata.**—A fine plant of the above is blooming in the conservatory at Castle Hill House, Huntingdon, the residence of the Ven. Archdeacon Vesey. The specimen is in a No. 2 pot (15½ inches in diameter). The flower-spike is already 12 feet high, and seems likely to reach another 2 feet. The spread of the beautifully striped leaves is 13 feet, and altogether the plant forms a striking object in an angle at the garden entrance to the conservatory. *F. W. Cooper*.

**Insects Visiting Daffodils.**—With reference to your inquiries as to the insects that visit the flowers of *Narcissus*, I may say that I have observed a small fly (*Empusa livida*) remain for a considerable time in *Narcissus* Sir Watkin, and on the 10th of the present month I saw the humble bee visit the flowers of *N. minor muticus* and *N. bulbocodium*. In these cases the bees remained but a very short time in the flowers, from which I inferred that they contain a very small quantity, if any, of nectar. Would Sprengel's idea of Orchids being "sham honey flowers" apply to the Daffodils as well? They certainly contain a great quantity of pollen. *A. D. W., May 15*.

**Late Grapes.**—Calling on Mr. Ward, of Bishop Stortford, the once celebrated Pine grower, a few days since, I was a little surprised, and very pleased to see some first-class samples of old Grapes, and also some new ones ripe. The variety that had kept so well was Lady Downe's, and they looked as plump and fresh as if it were the middle of December, instead of five months later. Mr. Ward had kept them suspended in his patent troughs on the back wall of one of his vineries, till about six weeks back when the sun got too powerful for them. As his new Grape-room was not quite finished, he placed them in a nice cool thatched summer-house, where they were hanging when I saw them. *W. H. Divers, Kettle Hall*.

**Fertilisation of Orchids.**—A rather curious fact that I have noted on several occasions is that the viscid discs of several Continental Orchids, notably *Orchis pauciflora*, *O. provincialis*, and *O. sambucina*, are, when grown in this country at least, not sufficiently adhesive to remove the pollinia when they become attached to an insect. Several times I have noticed the pollinia only half drawn out, and on experimenting found that this was owing to the viscid discs being not sufficiently adhesive to bear the strain of their removal from the anther cells. Is this due to the climate of Britain being too cold to fully develop the various parts of these Orchids? For were they natives I fear their extinction, owing to non-fertilisation, would be simply a matter of time. *A. D. W.*

**Purple Wallflowers.**—A spike of a single wallflower of an extremely rich crimson-purple hue, has just been sent to me by a person who regards it as quite a novelty in colour. But it is not such a novelty as the sender supposes. The fact is that if seed of single Wallflowers be obtained from Germany, several flowers will be found among them having tints of purple more or less striking just as they can be found among the double German Wallflowers. We have

known these selected, the seeds saved and sown, but a very large majority of the progeny will revert to the single dark form. It is yet possible, by means of patient selection, to overcome this tendency to revert, and it would be well if some one would attempt it, taking care to grow nothing else in the way of Wallflowers near it. The attempt is worth making. As far as I have experience of the single German Wallflowers, they are of a tall leggy habit, quite unlike that dwarf bushy free branching habit one sees in the dark and yellow strains grown for the London markets. Seed of purple Wallflowers can be seen in some wholesale lists, so there should be no difficulty in obtaining a supply to begin with. *R. D.*

**Nomenclature.**—What Mr. Baker in his letter on *Narcissus* names, p. 567, points out as a future note for guidance in nomenclature, if applied to *Narcissi* cannot stop there, but must apply equally to all cultivated plants. "If garden varieties of *Narcissi*, whether known hybrids or natural seedlings, are to be named and numbered in the manner adopted by florists and not by botanists"—with the proviso that "those forms are excepted which have already received Latin names"—then it follows that the same rule must be applied to Lilies, Orchids, &c. At any future Conference some such resolution will no doubt be passed affirming the above principle. If such were done, the principle involved would be decisively adopted, and come into force for the future without exception. *Alexander Wallace, M.D.*

**Narcissus Disease.**—An account of this disease is found in a small publication, *Onderzoek der Ziekten van Hyacinthen en andere Bol en Knolgewassen*, door T. H. Wakker. ("Researches into the diseases of Hyacinths and other Bulbs," by T. H. Wakker.) I think your disease is the "Wit snot" in Holland so-called, and in German "Wussen rotz." *J. C. W. P.*

**The Weather in Midlothian.**—We have had a week of cold blustering weather, with showers of sleet and snow, but crops have stood it well on the whole, and in the Lothians I see no injury done to the fruit crops by the nips of 3° or 4° of frost on several nights this week. Trees are full of blossom, very healthy, and free from insects, and are looking most promising for a fine crop. *M.*

**Damage from Hailstorm.**—We were visited by an extremely heavy hailstorm accompanied with vivid lightning and loud peals of thunder on the evening of the 3d inst.; it lasted about half an hour, many of the stones being the size of Hazel-nuts, which fell with great force and wrought severe damage to various subjects. Perhaps the hardy fruit crop received the greatest amount of injury; it is pitiable to look at the Pears and Plums (which before the disaster were aglow with blossoms, unmarred by frosts, and gave promise of unusual abundant crops), and witness the havoc played amongst them. In many instances the embryo fruits are cleanly cut off, while in others, except some protected by spurs or branches, they are irretrievably injured by the battering they received. The trees have also received a serious check in growth by being denuded of much of their foliage and having the remainder more or less torn and bruised. Fortunately the Apricot wall was protected with copings, and a few of the Pears were likewise covered. Bush fruits suffered considerably, particularly Black Currants, the blossoms of which were stripped off. Roses have received injury in having their foliage and young shoots bruised and torn. Peas, Onions, Parsnips, Lettuce, and seed beds of Broccoli, &c., are much battered, as is also the Rhubarb. The hail did not disappear, in some places, until afternoon on Monday. *Thomas Coomber, Hendre Gardens, Mon.*

**Single Dahlias.**—Some writers are falling into the error of recommending a rich soil for single Dahlias. Surely this is a great mistake. The poorest soil appears to suit them, and in what might be termed hungry soils they flower more freely and with much more refinement of character: in this respect, unlike the large double varieties, which require rich feeding at the roots, and in the case of now a few varieties, considerable disbudding. Happily single and the pretty pompon Dahlias require no disbudding. The act of cutting for decorative and other purposes is the best disbudding system which can be applied.

Another reason for planting in a poor soil is that, taking the newer varieties, the flowers are quite large enough without the need for planting in good soil to make them come finer. In order to enable purchasers to make suitable selections of varieties of single Dahlias, Mr. T. S. Ware, in his new catalogue, just issued, has put them into groups, viz., those with flowers much reflexed, those with flowers partially reflexed, those with quite flat flowers, and those with stellate flowers. This will no doubt be found a convenient classification, and will be appreciated by lovers of the useful and popular single Dahlia. *R. D.*

**Melon Canker.**—I very much doubt whether the deep planting of Melon plants has any tendency to produce canker, provided no injury be caused to the stems during the operation. As far as my experience goes I can at any rate answer very decidedly that it does not, having grown Melons precisely as recorded in a previous note for nine years past without the slightest trace of canker. I never allow the soil to become "too wet;" many plants besides Melons soon go the wrong way when the rooting medium is in that state. At the same time I water freely, and with those growing in pots during the operation of watering it frequently covers the base of the stems; but good drainage is always provided, and the surface of the soil soon dries. Is it a fact that "H. W. W." has never seen Melon plants canker when planted on raised mounds with the "base of the stems 3 inches higher than the bed of soil," and the latter "sloping sharply towards the surface of the beds on which they are formed"? I should imagine with the soil pressed very firm, as it should be, some difficulty would be experienced in keeping the central portion of the bed sufficiently moist. In conclusion, I beg most emphatically to differ from "H. W. W.'s" opinion as to the only cause of canker, and believe it is more frequently occasioned by some sudden check, such as watering with cold water, or a sudden fall in the temperature either of the house or bottom-heat. Too much water will undoubtedly cause the sudden collapse of Melon plants, and this is the more likely to take place when growing in large beds of soil. *C. H.*

**The Old Double White Rocket Attacked by Larvæ.**—The grand old border favourite, *Hesperis matronalis alba plena*, now too seldom seen, is at this time of the year subject to the attacks of a grub, which will as effectually ruin the coming flower-buds as will the well-known Rose grub, which, except in colour, it much resembles. It weaves a cocoon around the leaves that encircle the central embryo flower-heads, draws them together, and in a short time both leaves and flower-buds have disappeared, except the mid-ribs of the leaves. This morning I examined some of them thus attacked, and in some flower-heads found as many as eight of those destructive greenish maggots, about three-eighths of an inch long. My plants are pure white, not flesh-tinted, and very double, unlike what is commonly sold as the true double Rocket. *W. J. Murphy, Clonmel*.

**Booksellers as Seedsmen.**—When at the Praed Street station of the Metropolitan Railway a few days ago, I noticed that the Right Hon. W. H. Smith, M.P., has also gone into the seed trade, and any person travelling on the railway may purchase at his bookstall flower seeds in gorgeously coloured floral packets at 1d. each. With dukes as market gardeners, and Privy Councillors as cheap seedsmen, where is the limit to be fixed? Very soon all ranks and degrees will be sellers, and one is led to wonder where the buyers will be found. Is it possible for seedsmen to start in the competitive race as dukes and Privy Councillors? *R. Dean, Ealing, W.*

**New Chrysanthemum.**—I beg to submit flowers of a new hybrid annual Chrysanthemum, the result of a cross between *C. coronarium* and *C. carinatum*, which has originated with Mr. Robert Owen of the Castle Hill Nurseries, Maidenhead, and which is likely to prove a valuable addition to this already favoured group. As regards the colour of the flowers, it is identical with that of the typical *coronarium*, the petals are somewhat broader probably, whilst the foliage is that of *C. carinatum*. On some of the plants now flowering in these nurseries the leaf character of both parents is developed, thus establishing beyond a doubt

the origin of the plant in question. It may also interest some of your readers to learn that the plants from which the enclosed flowers were taken have been perpetuated by means of cuttings, and have been producing flowers for the last three weeks, with a profusion of bloom to follow. This fact gives additional value to a plant which already possesses many charms for those who prefer pleasing combination of colour. For the cool conservatory just now it is simply charming. Later on Mr. Owen intends to exhibit it at one of the meetings of the Royal Horticultural Society. *E. Jenkins.* [The *Fuchsia* our correspondent sent for our inspection was a large single flowered kind, without any coarseness, the corolla a rich purple, with scarlet lines on the upper portions, sepals bright red, and much reflexed. The *Chrysanthemum* is a pretty yellow and white, with an orange coloured disk, and is likely to make a showy greenhouse plant. *Ed.*]

**Narcissus Disease.**—I have many beds of Daffodils, but the disease of which the Rev. Wolley Dod writes has not yet visited them. I plant my bulbs in any soil, wet or dry, and without manure. *W. D. G. O., Biarritz.*

**Cabbages.**—Spring Cabbages are now turning in plentifully, and your correspondent, Mr. Sheppard, wisely suggests comparing notes and taking stock as to which are the best varieties to grow. Vanack is our favourite here, it turns in nice little compact heads nearly a fortnight earlier than any other variety we grow, and scarcely a plant of this fine variety has run to seed. Wheeler's Imperial comes next; market growers in this locality depend entirely upon this variety, not only for spring use, but as an all-round Cabbage, and in our opinion it has few equals. Little Pixie is also very fine with us this season, the same may be said of Heartwell Early, which is rather larger and likewise later than the three former varieties. Dwarf Winningstadt we have grown this season for the first, and last, time; it may be a Winningstadt, but with us it is anything but a dwarf. We make it a rule to sow our Cabbage seed thin in beds during the last week of July, or the first in August, and like to have the plants in their permanent quarters by the middle of September. *A. Smith, Cardiff.*

**The Service Clause of the New Franchise Bill.**—The question has been mooted, How will the dwellers in "bothies" be affected by the application of this clause? It distinctly sets forth that servants otherwise duly qualified, occupying premises distinct from that in which their employer resides—such, for instance, as a gardener, or gamekeeper, or steward, or bailiff, &c.—are entitled to have their names placed on the list of voters soon to be prepared. It is in this relation that the matter of the occupiers of "bothies" has come to the fore. I submitted the matter to the opinion of an eminent member of Parliament, and he replies, "The general impression is that your 'bothy' friends cannot qualify, but it is a point for the decision of a revising barrister." It is a matter on which revising barristers are certain to be divided in opinion, and it is probable some claims of this nature will be admitted while others may be rejected, but it would be of importance to get a favourable decision from a revising barrister. Surely there are among the inhabitants of "bothies" many as well able to exercise a vote intelligently as the ordinary lodger, who can qualify by paying 4s. 6d. per week, or the ordinary occupier of a tenement however small and wretched, provided there is a residential qualification. My advice to all occupiers of "bothies" interested in this question, who have been in the same situation and occupied the "bothy" since July 1, 1884, and who therefore have a residential qualification, and are over twenty-one years of age, is to claim to vote. This they can do through the medium of the agents of the several political parties, who will provide them with forms for the purpose, which have to be sent in to the overseers of parishes by a given time. My impression is that revising barristers will be inclined to interpret the Franchise Act in a broad and generous spirit, and that the agents of the contending political parties will not interpose vexatious objections. The simple rights of citizenship should be enjoyed by all, and as political information by means of a cheap Press is now widely disseminated, it is not to be wondered at that the inhabitants of bothies take an interest in political questions of the moment. I repeat my advice—Claim! claim! and

let the revising barrister say yea or nay. *R. Dean, Ealing, W.* [We strongly incline to the belief that bothy men will, except under special circumstances, do much better by not mixing themselves up with party politics. *Ed.*]

The "Widow" or "Mourning" Iris.—Rising from a sunny bit of rocky soil, made still more dry and warm by the roots of Holly trees, we have a colony of this quaint little Florentine Iris. It is not so beautiful, perhaps, as the great white Iris of Florence, but merely an unassuming little flower of silky texture, and green in colour, except the tips of the outer petals or "falls," which are blotched with black velvety patches, as shown in our sketch (fig. 153). One might be excused for passing it by when in flower without seeing it, but if the blossoms are

FIG. 153.—IRIS TUBEROSA: FLOWERS APPLE-GREEN AND VELVETY BLACK.

brought near to the eye indoors its distinctness and sombre beauty are quite indescribable. The leaves are erect, and four-angled, very like those of *I. reticulata*, but its tuberous roots are quite different; hence, no doubt, its specific name, *Iris tuberosa*. *F. W. B.*

**Fruit Prospects in the North of Scotland.**—The effects of the fine warm season of 1884 are now apparent everywhere in this northern district by the fine display of strong and healthy fruit-buds on all kinds of hardy fruit trees. Apples, which carried a very light crop, had the advantage of early storing their fluids and building up strong and well matured fruit-buds previous to the period of shedding their leaves, and are in consequence in a more highly developed state than usual. From the cold and backward spring weather, and especially that of the last three weeks, they are later in opening their blossoms, and will now have a better chance of escaping injury by frost. Pears on walls have set their fruit well, so

also have both Peaches and Apricots. Plums on walls have, however, been thinner in fruit-buds than usual, I suppose owing to the dry ground and heavy crop last season; they are as yet scarcely at a stage to be certain about a crop, as they sometimes apparently set well, and swell on until they attain the size of plumlets and then stop and fall off. Standard Plums and Pears have both flowered profusely, while all kinds of bush fruit are very promising. Spring having been dry and cold seeds of all kinds have been got into the ground in excellent condition, and crops, although late, are promising well. The rainfall for the last five months is about an inch below the average for each month for this district, and a deficiency of water from springs may be expected in the end of summer and the autumn months. The following is an extract of the rainfall registered here for the last five months, viz. :—Dec., 1884, 1.34 inch. 1885: Jan., 1.58 inch; Feb., 1.79 inch; March, 1.54 inch; April, 1.25 inch; May, up to 16th, 0.61 inch. The average fall for this place is about 2½ inches. Four degrees of frost is the lowest registered here during the present month, and some Potatoes on wall border, 6 to 8 inches high, have escaped owing to the ground being dry at the time. *J. Webster, Gordon Castle Gardens, May 18.*

**Maurandya Barclayana.**—This beautiful climbing perennial was formerly more generally known than it is now. Notwithstanding the neglect it has fallen into it is a plant that merits a place in every garden. It is suitable either for the greenhouse or for cultivating in the open garden as a climbing annual. During the summer it will grow and flower abundantly against a south wall or a trellis, but it requires the protection of a greenhouse in winter. A light rich soil suits it. It is readily increased by cuttings planted under glass or from seed, of which it usually matures an abundance. I prefer raising the plants from seed sown in the autumn. If the plants are carefully attended to in shifting, when necessary, and in watering, and kept on a shelf near to the glass, they will make better plants than those from spring-sown seed, and may be planted out in the open air some time before plants from spring-sown seed. Towards the end of the season it looks very beautiful. *M. Saul, York.*

**How to Keep Hardy Fruit Trees Clean.**—As the conditions of cleanliness and its reverse have a great influence upon the health of mankind so also have they analogous influence upon the health and condition of trees and plants. Bearing this fact in mind no time should be lost in examining all trees of the Apricot, Peach, Plum, Cherry, &c., to ascertain—now that they are pushing into leaf—whether they are attacked by blight, of which the black fly is—especially on Cherry trees—the most troublesome as well as difficult to dislodge. However, this and aphides in general, which play such havoc with the young leaves and shoots, may be destroyed by syringing the trees, as soon as the blight is noticed and before the leaves curl, with a solution made of 1 quart of tobacco-juice (as supplied by Griffiths & Avis, of Coventry), to 4 gal. of clear water, which will, in addition to killing the aphids, render the foliage distasteful to any other insects during the remainder of the year. *H. W. Ward.*

**Narcissus poeticus var. verbanus.**—Messrs. Collins & Gabriel offered this variety in their catalogue of last autumn, and by to-day's post I received a flower grown from their bulbs sent to me from Ireland by Mr. Poë. The same post brought me another flower, precisely similar, sent from a garden at Frome, in Somersetshire, where bulbs of it have been for many years: the house of that garden was formerly occupied by a gentleman who brought many plants home from the Alps and Italy. The flowers and leaf correspond exactly with Herbert's description under the above name: the leaf is very narrow and linear, the flower very small, hardly as large as an ordinary flower of *N. biflorus*, the stalk slender, the limb of the flower tinged with yellow at the base more distinctly than that of any other variety of *N. poeticus* (see Herbert's *Amoryllidaceae*, p. 318). Herbert gave the plant its name, which is derived from Verbanus, the ancient name of the Lago Maggiore, on the banks of which it was first found. He seems to have felt reasonable doubt whether the name of the lake, Verbanus, was a noun, adjective, or substantive. At first he treated it as a substantive, as the Greek way of writing it shows it to have been,

and formed from it an adjective "verbanensis," but when he compiled the index to his work he changed the name to verbanus, which is more convenient and quite unobjectionable in form, and had better be adopted. *C. Wolley Dod, Edge Hall, Malpas, May 12.*

## Reports of Societies.

### NATIONAL AND CENTRAL HORTICULTURAL OF FRANCE: May 19—31.

PARIS.—The international gathering of this Society commenced on Tuesday, in the building on the Champs Elysées, that forms one of the existing portions of the Exhibition structures of 1878.

We were here almost in the heart of Paris, yet the wonderful bloom of the Chestnuts, the balmy air, and the absence of noise would almost have led one to suppose that the spot was miles away in the country. The invitation to send specimens of British horticultural productions, however, was not met in the spirit of enterprise that is usual amongst Englishmen, yet a few Orchids arrived at the last moment.

In the departments of heating and construction of garden buildings, tools, implements, and gardening appliances, there was likewise an entire absence of English competition, so that it remained for our neighbours to fill the immense localities set apart for the purpose, and exceedingly well it was done by them.

The main saloon, where the choicest plants were assembled, is a parallelogram of perhaps 40 yards by 60 yards, of corresponding height—proportions that cannot fail to be damaging to all but plants of large size; as it was, the tall Palms, Tree Ferns, Philodendrons, and Crotons, which skirted the red-coloured walls, in slightly wavy lines, compelled the onlooker to admit that that objection was well met, and that the general view of this portion, when observed from any point whatever, was of a pleasing character, as might be expected from such clever arrangers as the French always show themselves to be.

The main doorway was flanked by Palms and Ferns; immediately in front inside was a breadth of gravel, extending nearly the whole width of the building—an excellent idea, as it allowed a great number of persons to assemble at this point, from whence, of course, the best view was to be had. The rest of the surface was divided into large irregular plots of turf, slightly undulated, the different groups of plants occupying raised beds, of a size equal to the requirement of the exhibitor. The kind of plants permitted to be used in these were such as were sufficiently dwarf to be seen over by the spectator, thus interfering scarcely at all with distant views. Those nearest to the spectator at the entrance were Caladiums, Begonias, small-sized Azaleas, Pelargoniums, Bromeliads, &c., arranged in beds usually of an oval form. At the opposite side from the entrance was a short vestibule communicating with a large pavilion of white canvas, containing the Roses, annuals, fruit, and Calceolarias. Abutting on the side walls of the permanent building were annexes for Clematises, Azalea indica, Kalmias, in one; and colonial productions, fruit, vegetables (a most interesting collection), and more exhibits of Azaleas and American plants.

A canvas pavilion at one angle was set apart for Clematises, Roses, and annuals in pots, Rhododendrons, &c. Disposed in long lines under the avenue of Horse Chestnut trees the exhibits of glass-houses, garden pavilions, vases, pumps, boilers, and all manner of garden appliances and tools were arranged, and between these and the building and round about the latter were found the collections of hardy and reputed hardy trees and shrubs, and hardy plants suitable for bedding purposes.

#### FOLIAGE PLANTS.

MADAME LA BARONNE DOUARIÈRE DE ROTHSCHILD (gr., M. V. Lesueur) had a splendid group of foliage plants, filling up a large recessed part of the wall in the pavilion, all the plants being remarkable for the perfection of their foliage and their healthy appearance. *Medinilla magnifica*, covered with its long racemes of rosy blooms, was a plant 8 feet in diameter by 6 feet high. The background of the group consisted of tall Palms, of which we may specify *Areca sapida*, 20 feet high, a handsome specimen, as was also *A. flexuosa*, of an equal height, a very large *Phoenix dactylifera*. In front of these tall plants were fine specimens of *Anthurium*, viz., *Duchartrei*, *Warocqueanum*, *subsignatum*; *Philodendrons* *Schottii*, *cristatissimum*, *Lindeni*; *Diefenbachias* *Parlatorei*, *Bausei*, *Bowmanni*; many beautiful *Crotons*, not yet in their true characters; *Dracaenas*, Ferns, and good miscellaneous plants formed the outer fringe of this group. A large tree trunk, hollow, and planted with *Philodendrons*, *Vriesias*, *Gymnostachyum Pearcei*, *Nepenthes*, &c., was a pretty piece of work.

M. A. CHANTIN, Paris, showed a fine collection of Palms, many of them being of large size, and all of them in the best of health. They comprised *Arenga Bonnetii* *Phoenix* sp., from Pondicherry, with silvery meanness on the underside of the leaf; several *Coryphas*, *Thrinax parvifolia* and *T. elegans*, *Kentia Forsteriana*, *Caryota Chantini*, and others. He showed a collection of Cycads, including nine species of *Zamia*, and two of *Cycas*; also 2 beautiful symmetrical plants of *Catakid-ozamia* McLeayi, in another class, a plant fully 14 feet in diameter.

M. Chantin's other exhibits were a collection of *Araucarias*, consisting of some new kinds, as *A. Neprashki*.

a very robust-habited kind, with round branchlets an inch in diameter, habit erect; *A. Binoti*, with brownish-green foliage, and *A. Napoleon Baumann*, with glaucous-green foliage, which is broad and flat. A small collection of greenhouse Ferns, a fine lot of Tree Ferns of no great merit, and a collection of *Anthuriums* in variety; *Vriesia tessellata* was a beautiful plant. A massive plant of *Vriesia Hellegerrana*, *Puya gigas*, a drooping Pandanus-like plant, with spines on leaves wide apart; *Cyphanthus zonatus*, with white banded leaf; *Nidularium splendens*, with brilliant scarlet centre tuft; and *N. acanthocrater*, with violet tufts of foliage.

MM. CHANTRIER FRÈRES, nurserymen, Mortfontaine (Oise), exhibited a collection of *CROTONS*, most of them being of their own raising, fine in form, and so far as the season permitted, in colour were—*Bergmanni*, General Pajol, *Bachii*, and *magnoliaefolia*—this last having grand foliage of yellow and green. *Chomer* is also a distinct green, mottled with gold, that would develop well with more sunlight. The same firm showed *Anthurium trilobum*, very fine large metallic-green foliage of great breadth, and others.

In a collection of stove plants by M. DAVID, nurseryman, Versailles, we noticed a *Maranta Kerchoviana*, dwarf, of two shades of green; and *Eranthemum atropurpureum*.

M. S. CHEVIER, a cultivator of Palms (Aube), dépôt, 54, Rue Spontin, Paris, showed some of the finest and most compact Palms at the show; especially fine was a *Brahea Roezlii*, a rare plant; *Cocos campestris*, *C. Blumenavia*, *C. Romanzoffiana*, *C. Gaertnerii*, and *Kentia Balmoreana*.

M. VINCKE, Shepshald, Bruges, had a grand lot of Palms, including *Phoenix senegalensis*, *P. canariensis*, *Cocos Bonnetii*, which were capitally disposed in a recess of the pavilion, and which were rather remarkable for the smallness of their tufts.

M. A. D'HAENE, Ghent, showed a great mass of *Leptopteris superba*, the stem being nearly 3 feet thick, and but 2 feet high; also *T. africana*, smaller; several *Cyatheas*, *Alsophila Van Geerti*, and *Lomaria cycadifolia*.

MM. THIBAUT ET KETLEER, Sceaux (Seine), had a nice collection of *CALADIUMS*, new colours being seen in *Madame Motjana*, crimson; *Madame Margottin*, white ground, crimson veins. They showed also collections of *Tillandsias*, &c., *T. tessellata*, a beautiful specimen, 2½ feet high, perfect; and *T. argentea*, a curiosity, grey-leaved, and hanging apparently a dried object from a stick.

#### FLOWERING PLANTS, &c.

M. D'HAENE also exhibited twenty-five Indian Azaleas, wonderfully bloomed—*Wilson Saunders*, *James Veitch*, *La Victorie* (bright cerise), *Reine des Puybas*, *La Brillant*, being noticeable for their pleasing and new tints.

M. ALEXIS DALLIÈRE, Ghent, exhibited a brilliant group of twenty-five Azalea indica, round-headed, well-bloomed, and usually well-known varieties. Amongst the double kinds were *Princess Stephanie Clothilde*, creamy-white; *Docteur de Mil*, cerise; *Baron Georges de St. Génoise*, scarlet; *Sabuntale*, white, distinct; *Deablotin*, purplish-crimson, a new colour; very pretty. *Königin der Weissen* is a good form among the single ones—white; as was *Tollmanni*, a scarlet flower.

M. SAISON, Lierval, Neilly, showed fifteen Palms of the usual kinds, in very good examples; also fifteen stove plants, including *Crotons*, *Alocasias*, *Anthuriums*, and *Dracaenas*.

M. L. DALLÉ, Paris, showed in the class for one plant an example of good culture, at its greatest beauty—a *Caraganta cardinalis*, the stem of 15 inches in height being surmounted with a bright tuft of scarlet leaves and a spike of the same hue. For twenty plants of remarkable foliage he showed *Philodendron Lindeni majus*, *Anthurium Van Houttei*, *Aralia Chabrieri*, *Tillandsia tessellata*, and several other uncommon species. Also a collection of Palms from 10 feet to 25 feet in height, many being remarkable for their perfect development.

M. L. LANDRY, nurseryman, Paris, had a collection of foliage plants used as market plants, amongst them being many things seldom seen at our markets, as *Ruellia maculata*, a nice easily grown white-spotted leaved plant; *Hechtia*, *Nidularias*, *Vriesias*, *Alocasias*, &c.

M. CROUX FILS, Vallée d'Aulnay, showed a collection of RHODODENDRONS from 3 feet to 8 feet in height, mostly English varieties, the trusses of which were not so large as we are used to see them. This firm had good specimens of *Kalmias*, thirty plants in three varieties, viz., *K. myrtifolia*, *K. latifolia*, *K. l. rubra*, *K. l. alba*, well bloomed; likewise a nice lot of *Azalea mollis* and *A. pontica*, with charming variety of colour.

M. MOSER, nurseryman, Versailles, showed a collection of eighty Rhododendrons, the plants ranging from 3 to 12 feet high, well bloomed and grown, but rather small trusses. *Kalmias* and *Azalea mollis*, well done, came from this exhibitor.

Another exhibitor of Rhododendrons in quantity was M. HONORÉ DEPRESNE, nurseryman, Viry, whose plants were not nearly equal in merit to the foregoing lots.

M. ADOLPHE FOUCARD FILS, and M. POIVIER, both exhibited zonal Pelargoniums and Ivy-leaved varieties, which were a pretty bit of colouring on the turf.

A splendid mass of plants of *Anthurium Scherzerianum*, arranged as an oval bed, 12 feet by 6 feet, shown by M. BERTRAND, was a brilliant addition, and many good spathes were observed on them.

A fine group of *Calceolaria* plants, compact, and flowers large, was shown by MM. DUPANLOUP ET CIE.

M. C. VUYLSTEKE, Loochristy, by Ghent, showed a plant of *Anthurium Andreanum grandiflorum*, with broad brilliant spathes, this being for the competition of the best single specimen.

M. A. TRUFFAUT had a very extensive lot of BROME-

LIADS, the group in which they were deposited making one of the best features of the pavilion. We noticed *Nidularium princeps caulescens*, *N. concinnum*, *N. Innocenti*, several *Tillandsias*, *Æchmea miniata*, a brilliant scarlet spike of inflorescence; *Cyrtanthus Benckeri*, with zebra-like markings; *Caraguata cardinalis*, and species of *Encholirion*. From the same nursery came a collection of *Dracaenas*, *Pandanads*, *Dasyliropsis*, *Rhopala corcovadense*, *Diefenbachia*, and similar plants, shown for collection of market ware.

MM. DUVAL, Versailles, a rising firm of specialists, had fifteen hothouse plants, including *Artanthe magnifica*, *Tillandsia mosaica*, and *Dracena novæ-caledonia*.

From M. A. A. PEETERS, Brussels, came a grand bank of *Azalea indica*, arranged in three long lines, the plants just touching each other: it was a feature in the side annex—a blaze of colour, unrelieved, not perhaps to be commended, but yet serving as a ready means of contrasting and comparing varieties.

In the annex opposite was another still larger collection by MM. ROYER FILS' successor, Versailles, consisting of 320 varieties, the specimens ranging from 1 foot to 3 feet in height, round-headed, untrained, as were all, and comprising the best of the species. On another occasion we shall return to the novelties seen in this exhibit.

A great number of CLEMATISES, mostly of English origin, were seen in the annex belonging to M. L. CHRISTEN, Versailles, but they were tall and lanky, and deficient in bloom.

#### ORCHIDS.

M. O. NILSON, Rue d'Honneur, Paris, showed a collection which, if it was not conspicuous for many large plants, yet had some that were remarkable or rare. *Vanda suavis*, the larger variety, had a splendid spike; *V. tricolor aurea* was also in flower nicely. A small plant of *Saccolobium Blumei majus* had a neat spike, and the shy flowering *Masdevallia rosea* was carrying a crop of forty blooms. *Oncidium Papilio* had three spikes; *O. Marshallianum* had a strong branched spray of bloom. Two *Lelia purpurata* had twenty-six and twenty flowers, *Coclogyne Massangeana*, several *Odontoglossum crispum* of much beauty, *O. Pescatorei*, *O. vexillarium*, a large-flowered variety; *O. citrosimum roseum*, the slender-flowered *O. Lindleyanum*, pale yellow star-like bloom, with brown spots; several *Phalenopsis*, *Lælia Schilleriana*, *Epidendrum Stamfordianum*, the pretty *Trichopilia coccinea*, with two blooms; and *T. suavis*, with two spikes of five or six blooms each; and *Dendrobium chrysiflorum* were the more noticeable species and varieties in the group.

M. TRUFFAUT, Versailles, had a group standing free on a table forming a part of his general collection of plants, in which were to be observed several nice bits of *Cattleya Mossie*, *Odontoglossum Halli*, *O. Alexandræ*, *O. citrosimum*, *O. triumphans*, *O. luteo-purpureum*; *Oncidium prætextum*, *O. cucullatum*, with two small spikes; *O. Papilio*, a small piece of *O. concolor*, several *Phalenopsis*, *Cypripediums*, and *Masdevallias*.

M. DUVAL, Versailles, had his collection of Orchids sunk in some material at the foot of a pilaster. There was a good *Cattleya Mendelii* with eight blooms; *Odontoglossum luteo-purpureum*, *O. Pescatorei*, with two good sprays; a nice collection of the newer *Cypripediums*, about a dozen varieties; *C. longifolium*, having four flowers open; *Cattleya Harrisoni*, with mauve petals and sepals, the throat being of a lighter shade; several *Masdevallias*, as *Lindeni* and *Veitchi*; *Oncidium ampliatum majus*. Orchid growing not having been as yet taken up by rich amateurs, as by us, we do not find either so many, or such fine plants at French exhibitions, and seemingly those selected are more remarkable for their grace and elegance, than for massiveness or gorgeous colouring. Thus we find many a slender growing small-flowered species, which would find its place on a back shelf with us occupying a foremost place in these French collections.

M. LE BARON A. DE ROTHSCHILD, Ferrières, had an enormous plant of *Odontoglossum vexillarium* in a tub, surrounded by other smaller ones, all loaded with bloom—an unique sight, and one not easily matched. A *Vanda teres* in a tub 3 feet in diameter was another wonder amongst Orchids. We do not know if this mass had been grown as shown.

#### TREES AND SHRUBS.

The following are the most interesting of the trees and shrubs. MM. TRANSON FRÈRES, Orleans, exhibit a nice group of young plants of a fine variety of the common Beech, under the name of *Fagus purpurea tricolor*; the ground colour of the leaves being a bronzy purple, which forms a striking contrast to the broad rosy-tinted margins.

From CROUX ET FILS, Vallée d'Aulnay, came a good series of fine plants of Japanese Maples, and a considerable number of flowering plants in pots of a variegated *Euonymus* bearing the name of *E. radicans latifolius foliis variegatis*. This is simply ordinary *E. radicans* which has arrived at a flowering stage—the typical *E. radicans* with small leaves being a sterile juvenile state. *Kalmia myrtifolia*, apparently a dwarf-growing, narrow-leaved, floriferous variety of the mountain Laurel, is a charming plant with white flowers, the only touch of red being a line or small blotch just above each stamen. *Ilex japonica fureata* is the name under which the same firm exhibit a fine plant of *Ilex cornuta*, bearing both flowers and fruit. *Abies pectinata pendula*, a fine specimen of the Weeping Silver Fir, completes the list of the most remarkable trees and shrubs—from an English standpoint—which are exhibited by Messrs. Croux et Fils.

From M. L. PAILLET, Chateau-les-Sceaux, came several groups of deciduous trees and shrubs and Coni-

fers, the latter being smaller specimens than those exhibited by M. Moser, of Versailles. Both firms show collections of Japanese shrubs and trees, which are more familiar to English gardeners than to their French brethren. As M. Paillet's collection contains a few things not to be seen elsewhere, they are mentioned first. The tree Pæonies are especially noteworthy—a large series of cut flowers is staged; Gloire de France, a double form with pale salmon-coloured flowers, and Reine Elizabeth; another with very large double rosy-red flowers, being amongst the most remarkable. A seedling form of *Abies Douglasii* named *nigra* is worthy of a distinctive name by reason of its blackish-green leaves and young shoots. *Juniperus canadensis aurea* is a decidedly pretty garden variety of our native Juniper, J. communis. *Acer platanoides umbiculifolium compacta*, which it is announced will be distributed in the autumn of the current year, is sufficiently described by its name. Without pruning, grafted on stems about 6 feet high, it makes a round-headed tree. The *Osmanthus nova* species is simply a fixed sport of the polymorphous *Osmanthus ilicifolius*, and is identical with the variety named *myrtioides*, distributed some years ago by Messrs. Veitch. *Aucuba laurifolia* is a very large green-leaved female *A. japonica*. *Berberis Darwini longifolia* is a remarkable form, with much longer leaves than the type.

Amongst the very fine set of *Rhododendrons* sent by M. MOSER—who, by the way, obtains the "Grand Prix d'Honneur" for contributing most to the undoubted success of the exhibition—is an old friend under a new name, viz., *Rhododendron hybridum*, or *R. bigener*, one of the earlier hybrids, raised, if we remember rightly, by Dean Herbert; it is here called *R. azaleoides*. *Mahonia Sieboldii* is one of the most distinct of the innumerable forms of *M. japonica* which we have yet seen.

A group of cut flowers of double Lilacs shown by M. LEMOINE, of Nancy, is well worthy of notice; there are several unnamed seedlings; the best of the named ones are *purpurea plena* and *Émile Lemoine*, the latter having paler coloured but much larger flowers, in finer panicles than the former.

*Daphniphyllum Teyssmanni*, exhibited by M. ROYER FILS, of Versailles, if it proves as hardy as the *D. glaucescens* which was introduced a few years ago and widely distributed by Messrs. Veitch, will probably become a general favourite. It has long red-stalked, handsome leaves, deep green above, and paler—but not glaucous—beneath.

Some of the most interesting of a large collection of shrubs sent by M. HONORÉ DEFRESNE are the following:—Perhaps the most noteworthy of all is a fine specimen of *Abies Nordmanniana pendula*, a perfect plant, of graceful habit, 10 or 12 feet in height. The *Ilex Tarajo* of this establishment is evidently the old *I. latifolia* of Thunberg, a very large-leaved Japanese Holly, which is unfortunately not quite to be depended upon as hardy in Britain; here it is flowering freely. *Pinus Baccata* is to all appearance a very dwarf compact form of the Scotch Fir.

#### ROYAL BOTANIC: May 20.

The first great exhibition of this Society was held in the Regent's Park on the above date, and, as usual, an excellent display of foliage and flowering plants, Orchids, &c., was provided for the Fellows and visitors. The large specimen flowering plants were as usual a striking feature, and not being fagged out by the season's work, were fresh and beautiful.

For twelve plants, Mr. CYPHER, of Cheltenham, was well 1st, his centre plant being a magnificent *Erica Cavendishii*, flanked by *Pimelea spectabilis* and good *Azaleas*, and a magnificent example of *Darwinia tulipifera*; Mr. JAMES, Castle Nursery, Lower Norwood, was 2d; and Mr. G. F. MOULD, Pewsey, 3d.

For ten flowering plants Mr. CHAPMAN, gr. to J. Spode, Esq., Hawkesyard Park, Rugeley, was easily 1st, and he occupied the same position for six in the amateurs' class, all his plants being well grown and in capital condition. *Ixora Dixiana*, very fine; *Anthurium Scherzerianum*, well flowered. He had also a densely flowered plant of *Tremandra ericifolia*.

Mr. G. WHEELER, Regent's Park, was 2d, with a group of small plants; Mr. RANN, gr. to J. Warren, Esq., Handcross Park, Crawley, was 2d for six specimens, *Darwinia tulipifera* being very fine.

In the trade class for six Mr. Cypher was 1st, Mr. James, 2d; and Mr. E. Tudgey, Waltham Cross, 3d. The ORCHID BANK was not quite so well filled as usual, owing, perhaps, to the cold weather. Mr. A. G. Catt, gr. to W. Cobb, Esq., Silverdale Lodge, Sydenham, was the only exhibitor in the amateurs' class. He had a fine form of *Cattleya Mossiae*, the white-petalled form of *Lælia purpurata*, two fine forms of the brilliant *Masdevallia Harryana*, a handsome specimen of *Dendrobium thrysiflorum* with 13 spikes; *Lælia purpurata* with twenty-two flowers, &c.

In the nurserymen's class Mr. Cypher was placed 1st, with 12 Orchids, made-up specimens. A *Dendrobium thrysiflorum* had thirty fine spikes; *Cattleya Mossiae*, over thirty blooms, and other fine specimens. Mr. James was 2d; Messrs. Jackson, of Kingston, 3d. The Society offers prizes this year for single specimens: Mr. Cypher was 1st, Mr. James 2d, and Messrs. Jackson 3d.

#### ROSES.

Messrs. PAUL & SON, The "Old" Nurseries, Cheshunt, obtained the 1st prize for nine magnificent Roses in pots. The variety Charles Lawson was a huge bush covered with bloom; Céline Forestier was also very fine. Messrs. Jackman, of Woking, were 2d with smaller but well-flowered specimens; Mr. G. F. Mould was 3d. For twenty Roses in 9-inch pots, Mr. Turner, of the Royal

Nurseries, Slough, was 1st, beating his old and well-tried antagonists, Messrs. Paul, who were 2d, both exhibitors showing in their usual fine style.

#### AZALEAS.

Mr. TURNER was easily 1st for six specimen Azaleas, and he occupied the same position for twelve plants in 12-inch pots. All the plants were densely flowered and in perfect health. Mr. G. Roach, gr. to R. Thornton, Esq., The Hoo, Sydenham, was 2d for twelve. For six specimens Mr. Roach was 1st, the plants being very large and well cultivated.

#### HEATHS.

In the open class for six Heaths, Mr. Cypher gained the 1st prize, Mr. Tudgey the 2d, and Messrs. Jackson the 3d.

#### PELARGONIUMS.

Mr. TURNER, of Slough, was a long way ahead of all competitors for show and fancy Pelargoniums; easily winning the 1st prize, Kingston Beauty, Prince Leopold, and Amethyst, show varieties; The Shah, East Lynne, Ellen Beck, and Princess Teck, fancies, were excellent examples of good culture. Mr. F. G. Hill, gr. to H. Little, Esq., Hillingdon Place, Uxbridge, was 2d to Mr. Turner for fancies, the variety Lucy being very fine.

In the amateurs' class Mr. Hill was 1st for show varieties.

#### CLEMATIS.

Messrs. G. JACKMAN & SON were the only exhibitors of Clematis in pots, and were awarded the 1st prize, for large handsome specimens—*Purpurea elegans*, very rich in colour; Fairy Queen, a magnificent variety, bluish, with a rose suffusion; Duchess of Edinburgh, fine double white; Jeanne d'Arc, very fine; Lady Caroline Neville, well flowered; and others.

#### FERNS.

Mr. BUTLER, gr. to H. H. Gibbs, Esq., Regent's Park, was 1st for exotic Ferns, Mr. George Wheeler being 2d.

#### FINE-FOLIAGE PLANTS

were much better exhibited than Ferns. Mr. Rann was 1st, with six excellent specimens, in the amateurs' class. Mr. Cypher was 1st in the trade class, *Croton Queen Victoria* being beautifully coloured.

#### ALPINES.

Messrs. CARTER & CO., of Holborn, were 1st for twelve alpine plants in pots, Messrs. PAUL being 2d, with smaller, though much rarer, species and varieties; *Globularia vulgaris*, *Geum montanum*, *Wulfenia carinthiaca*, and other choice things being represented in Messrs. Paul's group.

#### GROUPS.

The groups of plants (of which there were four) in the centre of the large tent formed an interesting and very effective feature; that from Mr. B. S. WILLIAMS, of Upper Holloway, contained choice Orchids, mostly *Odontoglossums*, *Cattleyas*, and *Masdevallias*; *Amaryllis*, of which an unnamed white one was most conspicuous. A pan of *Cypripedium ciliolare* was well grown.

Messrs. JOHN LAING & CO., of Forest Hill, were also well to the front, with an excellent assortment of Begonias, representing the greatest advance yet made in the tuberous section. Messrs. Laing have reason to be proud of their latest achievements—*Lady Falmouth*, a rosy-salmon, and W. Spinks, rosy-red, were each 6 inches across; Sir P. Lumsden, brilliant crimson-scarlet, 5½ inches, and of fine form. *Lady Lonsdale*, from the same seed-pod, evidently, as *Lady Falmouth*, is of excellent form, delicate salmon colour. *Lady Hulse* forms rosettes of sulphur-coloured double flowers. *B. formosa* seems an excellent variety for basket work, forming clusters of large rose-coloured flowers. *Caladiums* and *Palms* formed an excellent background to the Begonias.

Messrs. CUTBUSH, of Highgate, staged a group in which large dwarf standard Azaleas were a prominent though not over-pleasing feature; the background of Palms and Bononias, with an edging of Ferns, Heaths, and *Pimeleas*, had a good effect.

Messrs. E. G. HENDERSON & SON, Maida Vale, formed their group of well grown small stock, comprising *Caladiums*, *Palms*, and the usual run of small stove plants. A more artistic arrangement would have added to the effect of the group.

Messrs. PAUL & SON, Cheshunt, formed a most beautiful and interesting group of alpine plants in pots, and a box of cut flowers, some of the specimens being very rare and difficult to grow.

Mr. J. VAN DER REES, Exotic Nursery, Tooting, exhibited herbaceous and alpine plants in pots; *Saxifraga MacNabiana*, to which a Botanical Certificate was awarded, is very beautiful, with a good spike of white flowers thickly spotted with red in the centre. A pan of the charming *Sibthorpia europæa variegata* was well grown. A group of *Calceolarias* from Mr. W. Howard, of Isleworth, represented a good dwarf strain; and in a small group of plants from Mr. P. Perry, gr. to W. G. Rowlett, Esq., Cheshunt, six plants of *Mary Morris* Carnation were very fine.

Messrs. BARR & SON, Covent Garden, were still able to exhibit *Daffodils*; *Arum serotinum*, with white spathe, and dull purple flowers, internally striped, very curious; *Amaryllis formosissima*, in three forms, glauca longipetala, and the ordinary type.

Messrs. W. PAUL & SON, Waltham Cross, exhibited a splendid collection of Roses in pots, and sixteen boxes of cut blooms, as well grown as it is possible to cultivate the Rose. There were about a hundred pot Roses.

Mr. W. Rumsey, of Waltham Cross, also exhibited cut Roses and a few pot plants.

Mr. H. B. MAY, nurseryman, Edmonton, sent a capital collection of *Calceolarias*. The plants were well grown, and a strain of great merit. From Lady T. Guest, Hensbridge, Blandford, were sent cut specimens of *Aristolochia gigantea* [probably *A. brasiliensis* or *ornithocephala*, not *gigantea*.]

#### BOTANICAL CERTIFICATES.

Awards were made to Messrs. Veitch, of Chelsea, for *PHILADELPHUS MICROPHYLLUS*, a very handsome shrub, producing pretty white flowers very freely.

*RHODODENDRON CURTISII*, a neat-growing plant, with brilliant crimson flowers.

*ALLIUM KORATYIENSE*, a distinct species, with broad glaucous leaves, producing large round heads of inconspicuous greenish flowers on stems nearly a foot high.

*AMASONIA PUNICEA*, a beautiful stove flowering plant, producing pendulous flowers and brilliant reddish-crimson bracts.

*PIPER ORNATUM*, an elegant stove plant of scandent habit, with heart-shaped leaves of a bright green colour, marbled with rose; would be well adapted to train on walls or rockwork.

*DAVALLIA RETUSA*, a very elegant species, which will be greatly valued both as a distinct basket Fern and for exhibition.

*NEPHELOLEPIS BAUSEI*, a very handsome and distinct species of compact growth, producing bipinnatifid pinnae instead of entire. The same firm were awarded Floral Certificates for *Gloxinia Flambeau*, with brilliant crimson-scarlet flowers, erect flowering; and for *G. fulgens*, which has drooping flowers, rosy-red with dark red spots.

Messrs. Low of Clapton, received Botanical Certificates for:—

*CATTLEYA MENDELII STRIATA*, a fine form, with rich crimson lip, and a reddish-purple line in centre of petals.

*CATTLEYA SCHOFIELDII*, with brownish sepals and petals spotted dark red. The lip white, with violet lines in front.

*LÆLIA SCHROEDERI*, pure white, with merely a dash of purple in the throat; seems to be a form of *L. purpurata*.

The same awards were given to Mr. B. S. WILLIAMS, of Holloway, for

*LÆLIA PURPURATA WILLIAMSII*, a fine form, with rich crimson lip; sepals and petals purplish-rose.

*PAVETTA MONTANA*, a plant with large trusses of small white flowers; and

*HYMENOCALLIS MACROSTEPHANA*, a handsome species with delicate white flowers.

To H. Little, Esq. (gr., Mr. Hill), for *CATTLEYA MENDELII CARMINATA* and *LYCASTE SKINNERI PERFECTION*, a fine form with broad creamy sepals, the petals being rose-coloured.

Mr. H. B. May, of Edmonton, also received the Botanical Certificate for *PERIS CRETICA ALBO LINEATA* *ALCICORNE*, a beautifully crested form [which the Society should have disqualified for its preposterous name], and *Pteris serrulata cristata compacta*, very distinct and beautiful; also to W. V. Rees, for *SANIEFRAGA MACNABIANA*.

#### FLORAL CERTIFICATES.

The following plants were thus honoured:—*DECORATIVE PELARGONIUM VOLONTÉ NATIONALE ALBA*, a very beautiful free-flowering kind, with well formed flowers, from Mr. F. Perkins, Leamington.

*TREE CARNATIONS*:—Colonel Cox, large, full, crimson flowers; T. W. Girdlestone, buff, with broad scarlet flakes; Goliah, reddish ground, flaked scarlet—a showy and striking variety, from Mr. Turner.

*CALADIUM De Condeixa*, ornamental foliage; *BEGONIAS Formosa*, *Lady Hulse*, and *Sir Peter Lumsden*, from Messrs. Laing.

#### ROYAL HORTICULTURAL: May 12.

##### Scientific Committee.

Sir J. D. Hooker in the chair.

##### NICOTIANA HYBRID.

Colonel Clarke exhibited a plant which he has raised between *N. rustica* (female) and *N. Tabacum* (male). The flowers were intermediate in character, of a pale rose colour, and it proved to be completely sterile, the ovary only swelling, but containing no seed.

##### FORGET-ME-NOT.

The same gentleman exhibited a spray of the usually permanently red variety reverting to the blue form.

##### LACETTA LINTEERIA OR LACE-BARK TREE.

He also showed sprays of the flowers of this tree.

##### PUCCINIA VINCE.

A communication and specimens were received from Mr. Plowright, who states that, although the *Uredo* spores and *Teleuto*-spores were well known, he was now able to corroborate the statement that spermogones accompany the former. "The leaves thus affected exhaled a distinct odour. The plants bearing spermogones are taller than healthy ones. It is covered with dark brown spots, firm in structure. The leaves bearing them are dwarfed and thicker. The spots varied in size and colour, becoming paler with age, the oldest being surmounted by a delicate film of white dust. It consists of hyphae continuous

below with the mycelium, which pervades the whole plant, the threads being perpendicular to the surface. The free summits have colourless globose spores. In water they germinated. It is rare for *Æcidio* spores to be colourless, *Æ. rumicis*, however, being so. The life history is, therefore, as follows:—1. A perennial mycelium pervading the plant, which every spring produces spermatogones and *Æcidiospores*. 2. *Uredo* and *Teleutospores* which arise from the *Æcidiospores*, which probably have localised mycelia of short duration."

#### ÆCIDIDIUM BETÆ.

Specimens of this fungus on wild plants were also sent by Mr. Plowright, who writes as follows:—"The *Æcidiospores* of *Uromyces Betæ* are comparatively rarely seen. Having hitherto been unsuccessful in finding the *Æcidium* I determined to cultivate it from the *Uromyces Betæ*, which occurs so abundantly every year upon Marigolds. I succeeded about ten days ago in producing upon the foliage of two Marigold plants three or four clusters of the *æcidium* in question, but an accident happened to the culture, so that I am unable to exhibit them. Yesterday, however, I met with the *Æcidium* upon *Beta maritima* on the banks of the river Ouze, at West Lynn."

#### SACCOLABIUMS ATTACKED BY A LONGICORN BEETLE.

Mr. McLachlan exhibited living specimens, of *Dioxenes Taylori*, from Kew, and observed that it had been previously known upon *Phalenopsis* from the Philippine Islands, but it was very difficult to discover the real country.

#### DIOPEA PULCHELLA.

He also exhibited specimens of this moth, which was reported to have settled in hundreds upon a ship in latitude 0° 45' N. The nearest land was Brazil, but the probability was that they had been carried out to sea by the S.E. trade winds from the Cape de Verd Islands.

#### SILVER FIR ATTACKED BY COCCUS.

Mr. Boscawen exhibited a branch attacked by *Chermes abietis*, of very common occurrence.

#### VINE SHOOTS DYING.

Mr. Boulger showed specimens of leaves with impaired action, but it is not clear what the cause may be, though it might possibly have been scorching, as the appearances were the same on several sorts, and occurred at the same time.

#### HOLLIES AND QUERCUS ILEX ATTACKED BY INSECTS.

Mr. Sanders, of Lee, Kent, sent branches having the leaves much disfigured by some insect grubs. The Oak is a large specimen, and not a single leaf could be found which had escaped the attack. Mr. McLachlan said the Oak was injured by the caterpillar of a small moth, *Lithocolletis messaniella*; and the Holly by that small dipterous fly, *Phytomyza Ilicis*.

#### ADOXA MOSCHATELLINA DISEASED.

Mr. W. G. Smith sent specimens, with the following remarks:—"I send examples of *Adoxa* diseased with *Puccinia saxifragum*, Sch. According to the Floras, the *Puccinia* appears in summer, but I, this year, found it in abundance before the winter had fairly left us—viz., on March 15 last—infesting the subterranean parts only of *Adoxa moschatellina*. The examples were growing in a high bleak position on Dunstable Downs. On April 15 the leaves of the host plant were reached by the fungus, and on May 9 the floral organs and young berries were infested with the *Puccinia*, as the examples sent herewith show. In calling attention to the invasion of the floral organs and berries by the *Puccinia*, I have proof that not only does fungus mycelium often hibernates inside the membranes of seeds, but resting-spores are sometimes produced within the seed membranes, and these resting-spores germinate with the germinating seeds—in other words, many diseases of plants, as corn mildew, *Puccinia graminis*, are hereditary—i.e., the disease is transmitted from one generation to another through the seeds."

#### VERNATION.

Mr. Henslow called attention to the fact that leaves in unfolding assume the positions and conditions identically the same as in sleeping plants at night. As Mr. Darwin had suggested that the purpose of the latter might most probably be to protect them from radiation, so he would venture (apart from verification) to offer the same explanation for the behaviour and conditions of expanding and developing leaves. Those conditions being:—1. An erect or dependent position, so as to place the blades at right angles to the horizon. 2. To protect as much possible their upper surfaces. This was effected (i.) by contact of two leaves whenever they are "opposite;" (ii.) by

being conduplicate, or folding together of the two halves of a blade. A very common method, (iii.) by overlapping one another; (iv.) by rolling up the blades singly or together, laterally, or from above downwards (a rare case, as of the Tulip tree); (v.) radiation would be also reduced by a rough surface, as occurs in many leaves, as Horse Chestnut, &c.; (vi.) by temporary clothing of wool (Coltsfoot) or stellate pubescence (Ivy). Mr. Henslow illustrated all these cases. By exposing the leaves at night on grass instead of being protected as described, he found that Walnut and Lime showed marked effect from a moderate amount of frost. The other plants appeared better able to resist a few degrees. The experiment so far appeared to justify the inference that the conditions are most favourable for protecting the delicate growths from the effects of radiation.

#### FRUIT OF LAURUSTINUS.

Rev. G. Henslow showed sprays bearing fruit of last year. They were borne by a single shrub growing in a spot overhung by a Deodar, and otherwise shaded. Bushes well exposed bore none. The fruit is oval, of a bright metallic blue lustre. He remarked upon the curiously offensive odour given off by the *Laurustinus* when dying, especially when wet.

#### Floral Committee.

Present: G. F. Wilson in the chair, and Messrs. H. Bennett, W. Bealby, J. Fraser, A. Perry, J. Dominy, H. M. Pollett, J. O'Brien, J. Douglas, E. Hill, G. Henslow, J. James, H. Herbst, J. Walker, W. Wicks, H. Ballantine, H. Williams, J. Smith, H. Cannell, G. Duffield, W. B. Kellock, T. Bines.

Miscellaneous exhibits were not numerous, but such as were shown were of a high order of merit, and afforded a contrast to the lovely hues and tinges of the Orchids. Messrs. W. Paul & Son, Waltham Cross, Herts, had a collection of Roses in pots, profusely bloomed, and neatly arranged as to colour, &c., the whole bank being faced with tea boxes of cut blooms of various varieties not represented by plants. Mr. Louis van Houtte, Ghent, Belgium, had a collection of Azaleas, and a few other things that attracted considerable attention, not only for their quality, but also for the grand condition they were in after their journey; he had a grand plant of *Anthurium Andreanum* with splendid spathes, also a fine piece of *Sarracenia flava maculata*; his Azaleas were Louis Lubbers, semi-double dark scarlet, with a profusion of dark spots; Oswald de Kerchove, very bright pink, beautifully frimbriated edge; Madame Louis van Houtte, a noble-looking flower, flaked salmon, marked with purple at base of petals, and white-edged; Joseph Lefebvre, pure white, flaked with scarlet, and dotted with yellowish-green spots; Marquis of Lorne, semi-double brilliant scarlet; Baron Nathaniel de Rothschild, semi-double purple. New seedling Azaleas: Prince Baudouin, very deep dark crimson; Princess Victoria, double blush, with the colour deepening towards the base of the petals, where it becomes spotted and flaked with claret, white-edged; Miss E. Jarrett, fine frimbriated white, shaded with green spots; John Lyall, bright scarlet; Czar Alexander III., semi-double scarlet, shaded with dark spots; Theodore Reimers, semi-double purple, slightly spotted toward the base of the petals; Madame A. Lemoine, single pink, shaded with spots of a deeper colour.

Messrs. Paul & Son, the "Old" Nurseries, Cheshunt, had a choice collection of hardy flowers, conspicuous being *Kalmia laurina*, *Iris indicatifolia*, *Aquilegia canadensis*, *Thalictrum anemonoides plenum*, a dwarf white Meadow Rue; Gentians, *Fritillaria*, *Rubus arcticus*, *Daphne rupestris*, and various *Sempervivum* and Saxifragas.

Mr. Thomas S. Ware, Tottenham, had a neat collection of *Paeonies*, *Cypripedium calceolus* and *C. pubescens*, *Aquilegias*, *Primulas*, *Tulips*, and the pretty *Pinguicula caudata*. Messrs. J. Veitch & Sons, Chelsea, had a basket of *Acer polymorphum linearilobum*, *Spartium precox*, the pretty buff-coloured Broom, and *Rosa lucida*, or Rose Button. Messrs. Barr & Son, Covent Garden, had one of their choice collections of Daffodils, &c. Mr. W. Rumsey, Waltham Cross, had five fine boxes of cut Roses. A stand of *Amaryllis* from Messrs. Kelway & Sons, Langport, Somerset, exhibited great variety of colour. A seedling Rose crossed between John Hopper and the common Cabbage Rose, with the scent of the latter, named Mrs. House, was exhibited by Mr. J. House, Peterborough. Mr. J. Douglas, Great Gearies, Ilford, exhibited a new alpine *Auricula*, named Miss Mollie; and Mr. Ross, gr. to Sir George Macleay, Pendell Court, Bletchingley, exhibited flowers of *Brownea grandiceps*. Messrs. Waite, Nash & Co. had a small stand of Pansy blooms, which were very fine. The Lawson Seed and Nursery Company (Limited), Edinburgh, had some fine blooms of a white greenhouse *Rhododendron* of the Veitchii type. Mr. F. Perkins staged a few nicely grown white *Pelargoniums*, named *Volonté Nationale alba*; and Mr. Seidel, nurseryman, Striesen, near Dresden, exhibited a new *Rhododendron*.

#### Fruit and Vegetable Committee.

Present: Mr. H. Veitch, in the chair, and Messrs. F. D. Godman, J. Lee, C. Silverlock, J. Burnett, F. Rutland, S. Ford, J. Willard, G. T.

Miles, J. Woodbridge, J. Roberts, G. Paul, G. Goldsmith, S. Lyon, J. Ellam, H. Weir, R. D. Blackmore, C. Bunyard, W. Paul, T. B. Haywood, and A. Howcroft.

Mr. F. Perkins, Regent Street, Leamington, sent a collection of Leamington Improved Broccoli, for which a Vote of Thanks was given. Mr. Hunter, Lambton, Durham, sent a seedling Pine-apple, that the committee thought well of, but desired to see a specimen of ripened fruit. Mr. Sutton sent a collection of fourteen dishes of Apples, for which a Vote of Thanks was given, also *Vanilla aromatica*, which received a Cultural Commendation. Mr. W. Fyfe, Thames Ditton, sent two seedling Melons, one of which, a netted one, was awarded a Cultural Commendation as an early variety. Messrs. H. Lane & Sons, Great Berkhamstead, showed a collection of Apples, some of them being good for the season.

#### SCOTTISH HORTICULTURAL.

THE second ordinary meeting of this Association was held on Tuesday evening, the 5th inst., at St. Andrew's Square, Edinburgh, Mr. M. Todd in the chair. Mr. George MacLure, Trinity, read a paper on "Alpine Auriculas," giving an interesting account of the history and early cultivation of the plant. He said that a good border Auricula ought to have the following properties:—Stem erect and strong, high enough to carry the flower above the foliage; peduncles strong and elastic, so that each bloom may be distinctly seen; the number of pips should not be less than seven, and the truss round and compact; the anthers should nearly fill the tube and be flush with it; the eye should be a complete circle, the colour white, yellow, or cream; the ground colour bold and rich and equal on all sides of the eye.

The best season for propagating good sorts is about the beginning of August, either by division of the root or by side shoots, and planted in pots or a cold frame. Any ordinary potting soil will grow them; he had no confidence in the various nostrums in the way of compositions of soils which had been recommended. Every admirer of the flower should cultivate it from selected seed, to obtain which it was necessary to isolate the plants from inferior sorts to prevent cross-fertilisation. As the seed capsules ripen they should be picked and kept dry until the time for sowing. The month of August was considered the most suitable time, using wooden boxes and covering the seed very slightly with fine sifted soil, and placing over a sheet of glass, and shading until germination takes place. The after-process of pricking-off and growing was then described. He recommended its culture for town gardens, as it withstood the smoke.

Mr. A. N. McAlpine, B.Sc., Minto House, read a paper "On the Functions of the Root," giving a very instructive account of what takes place underground, and the process of growth was very successfully illustrated by means of the lantern. Mr. McAlpine used a combination of chemical substances, which he explained acted in the same way as the natural growth, and the artificial growth was so rapid as to be easily observed on the screen by those present. Both gentlemen received a hearty vote of thanks for their communications.

Several interesting exhibits were laid on the table. Mr. Young, Secretary of the Royal Caledonian Horticultural Society, showed a collection of seedling alpine and stage Auriculas; one of the former, named Mrs. McLeod, received a First-class Certificate; Mr. Black, West Calder, also received a First-class Certificate for a seedling alpine Auricula named Mrs. Black. A fine collection of *Narcissus*, said to be the finest ever exhibited in Scotland, comprising forty-five species and varieties, was shown by Mr. McKinnon, Melville Castle. The other exhibits included *Narcissus*, by Mr. Todd; a curious formation on the root of *Cupressus Lawsoniana*, by Messrs. McKay & Co., Cameron Bank; and seedling *Amaryllis*, by Mr. Garrett, Whittingham. The meeting concluded with a hearty vote of thanks to Mr. Todd for his conduct in the chair.

#### ANTWERP INTERNATIONAL EXHIBITION: May 10.

THE first of the series of horticultural shows at the International Exhibition at Antwerp opened to-day, and though the weather was very wet and cold for the season it attracted a large number of visitors. The chief features at this show were the Azaleas, Orchids, Palms, and Conifers. Orchids were never shown so largely in Belgium before; and really the bank of Cattleyas of some hundred plants shown by M. Massange de Louvrex was the *chef d'œuvre* of the show. In the other collections of Orchids, owing to the general bad taste of "making up" plants, which in some cases was strikingly offensive to the eye, and especially where several varieties of Cattleya and *Lælia* were seen in one pot, the cultural interest in them ceased. It is to be regretted the jury gave the palm to the collection in which this bad system was most practised. The plants of M. Massange were models of cultivation, and every plant was one plant cultivated as such. One of his *C. Mendelii* exceeded in beauty all other varieties, and the whole of his *C. Mossii* were good. The fifteen *Masdevallias* of Dr. Boddart were admirable examples of good cultivation, and so were his fifteen *Odontoglossums*. An imitation dead tree made up of *Trec Fera* stems and covered with flowering Orchids, Cattleya citrina predominating, was pretty and instructive to visitors, shown by Vervae & Co.

The thirty Azaleas shown by Mons. de Ghellinck de Walle were magnificent plants of the half-globe form so

commonly and persistently adhered to in Belgium. In time it is to be hoped there will be seen some other shapes, such as the pyramid form, on the model of these fine pyramid, *Laurus nobilis*. The collection of fifty Roses of M. Peeters were neat, fresh little plants of half-standard form. In this again there is room for great improvement in pot Rose cultivation, for we never see in France a pyramid-trained pot Rose such as what our Pauls and Turners produce in England; nor do we see a pyramid *Fuchsia*.

The large collection of Conifers of M. Charles van Geert & Sons was most refreshing to look at after the glare of the Azaleas, and were admirable specimens of the Fir tribe, for which this firm is famous. And the same remark may be applied to the Palms—for indeed a flower show is very tiring to look at without green, handsome foliage plants; and the large handsome temperate Palms here exhibited were examples of high cultivation.

It is to be hoped the committee will be a little more liberal with their next show, and not expect everybody to pay a franc for their catalogue and a franc to enter the show in addition to the entrance franc to the general exhibition.

## DEVON AND EXETER HORTICULTURAL.

The first exhibition of this Society was held on Friday, the 15th inst., in the Victoria Hall, Exeter. The exhibits were quite up to the average of former seasons; the collections of Azaleas being more in number, as well as of superior growth, of course formed a very great feature of the exhibition. Mr. Rowland, gr. to Wm. Brock, Esq., Parker's Well House, Exeter, took the lead in the principal classes for specimen stove and greenhouse plants, Azaleas, and Orchids. Mr. Seeward, gr. to Sir H. Davis, Creedy Park, Crediton, and Mr. Teed, gr. to Mrs. Ensor, The Bungalow, Topsham Road, shared the leading prizes in the other minor classes for specimen plants.

The classes for MISCELLANEOUS COLLECTIONS of plants arranged on stages 25 feet by 5 feet, and 15 feet by 5 feet, were very attractive features of the show, not only bringing out the cultural skill, but the taste for arranging of the plants as for conservatory work and especial displays, in which specimen plants cannot figure. As usual the local nurserymen rendered very valuable assistance by the loan of large collections of plants.

Messrs. Veitch & Sons made up a grand stand, composed principally of blooming subjects, backed up with Palms and Japanese Maples in variety. A great many novelties are generally introduced into the collections of this firm, both hardy as well as exotic subjects. A large pan of *Sarracenia flava* and other varieties was very attractive. Orchids in variety, such as *Dendrobium thyrsiflorum*, *D. densiflorum*, *D. Jamesii*, *O. Alexandræ*, *Cattleya Mossiæ*, and others, bore good spikes of bloom. Of course *Azalea indica* in great variety were introduced in quantity of neatly trained and abundantly flowered plants. *Pimelea spectabilis* and *P. Hendersoni* still retain their position as pretty decorative plants in a small state. Among hardy subjects, pans of dwarf *Phloxes*, *setacea* (The Bride), white and rubra, were very showy. They also exhibited the new white *Pelargonium* Queen of Whites, a superior form of *Madame Vaucher*. At one corner of their stand was a dish of Cabbage Lettuce, named Exeter Giant. This is a variety selected by this firm, and to be introduced for the first time next year. It is the largest and most perfect shaped Cabbage Lettuce grown, of immense size and perfectly round, and no doubt will take a leading position.

Messrs. Lacombe, Pince & Co., as usual, were strong in specimen plants. Azaleas, the flower of the season, were well represented, including several newly introduced varieties, *Empress of India*, *Theodore Reimers*, and *Souvenir de Vesta*; very fine specimens of *Anthurium Schzerianum majus*; Orchids in great variety, among them being *Epidendrum bicoloratum*, *Dendrobium thyrsiflorum aggregatum*, *Cattleya Mossiæ* and *C. citrina*, *Vanda bicolor*, *Odontoglossum Alexandri* and *O. ciriosum*. Some very fine plants of *Nepenthes Mastersii* and *Outrami* were very conspicuous, being suspended a little above the exhibit. This fine collection was backed by a fine *Latania borbonica*, *Cycas revoluta*, *Kentia Forsteriana*, *Cocos*, &c., and with the foregoing collection were great features of the exhibition.

### FLOWERS AND PLANTS IN POTS.

For twelve stove and greenhouse plants, half foliage and half in bloom, Mr. Rowland was awarded the Silver Cup. For six ditto, Mr. Teed was awarded 2d prize, Mr. Bartlett, gr. to Lady Hotham, taking 2d. For six stove and greenhouse Ferns Mr. Rowland took the lead. For a miscellaneous group of plants, arranged on a stage 25 feet by 5 feet, Mr. Seeward secured the £5 Silver Cup. Great taste was displayed in this arrangement, and the award was highly deserved. For a similar group, arranged on a stage 15 feet by 5 feet, Mr. Teed was awarded 1st, with a very pretty collection, composed almost exclusively of Palms, Ferns, and variegated grasses, a few *Amaryllis* and *Eucharis* being interspersed between them. Mr. Powell, gr. to the Earl of Devon, Powderham Castle, was 2d. For six Orchids, Mr. Rowland took 1st—also for six Azaleas, distinct, Princess Royal being magnificent.

### CUT FLOWERS.

Twelve Roses, one variety.—Mr. Barnes, gr. to J. C. Daniel, Stoodleigh, was 1st, with a splendid box of blooms of *Maréchal Niel* of immense size and substance. Twelve Roses, distinct varieties.—Mr. Barnes was again 1st, with a superb lot of blooms. Mr. Barnes also staged two dozen trebles in very fine form, which were awarded an extra prize.

### FRUIT.

Pine-apple.—Mr. Powell staged the only fruit exhibited. Three bunches of black Grapes.—1st, Mr. Lang, gr. to Lord Poltimore; 2d, Mr. James, gr. to Sir John Walrond, Bradfield, Culmpton. Three bunches of white Grapes.—1st, Mr. James. Strawberries, dish of eighteen fruit.—A good many competitors staged, all having excellent fruit. Mr. Leach, gr. to G. Drew, Esq., Park Villa, Kenton, took 1st, with James Veitch, very fine fruit, but colour absent. Apples were shown by several exhibitors, for which no prizes were offered, Royal Russet being the best staged by Captain Greatwood.

### VEGETABLES.

Vegetables were shown in large quantities for the season of the year, and seldom have they been of such good quality as on this occasion. Five competitors staged for the collection of six distinct kinds, Mr. James taking 1st, with American Wonder Peas, French Beans, Asparagus, Potatos, Cauliflower, and Cabbage; Mr. Main being a good 2d, with a fine dish of Early Nantes Carrots, French Beans, Potatos, Asparagus, Cauliflower, and Cabbage.

## Florists' Flowers.

### THE CINERARIA.

I WOULD fain impress upon those intending to grow the Cineraria well that the present month is the starting-point from whence we begin to grow our plants, whether they happen to be seedlings or named varieties. First, as to seedlings. Sow the seeds for the earliest flowering plants any time during the month of May. They will vegetate best in a gentle bottom-heat in an ordinary hotbed, care being taken to protect the seed pots from the sun until the seeds vegetate. If the surface of the soil should be scorched by the sun, or dried up in any way during the germination of the seeds, a complete failure may be looked for. As soon as the young plants are large enough they may be potted off, say three of them into a small 60. By the time the plants are this size the weather will be warm, and the best position for them is in a frame with its back facing to the south. The sun does not act injuriously upon the leaves if the glass-work of the frame is towards the north. We have grown our plants during the summer in a well-ventilated span-roofed house running nearly north and south, but in that position they are always shaded from hot sunshine. At no time are the plants allowed to become pot-bound; if they do, the leave become pale in colour, and the flowers are consequently of an inferior quality. The potting soil should be composed of good turfy loam, to which has been added a fourth part of leaf-mould, as much cow-manure, and a sprinkling of sand. Named varieties, or any choice selected seedlings, should be propagated by offsets. Those plants that we intend to take for stock have been cut down and placed in a light airy position, but protected from hot sunshine; as the offsets become large enough they are carefully removed and potted in small pots, placing them in close hand-lights until they are well established. Amateurs complain of the difficulty they experience in growing Cinerarias owing to the persistent attacks of insect pests. In the first place the plants must be kept vigorous and healthy from the first, and they must never be allowed to become badly attacked with aphids. Indeed this pest should be kept off altogether by regular fumigations, say, once a month.

### THE CHRYSANTHEMUM.

During this and the previous month there is some danger of these plants being neglected, not only from the pressure of work, but owing to the frames, pits, &c., being required for bedding and other plants. The Chrysanthemum, being hardy, has to be turned out sooner than is desirable to make room for plants that suffer more readily from frost winds or cold winds that may not be so low as the freezing point.

All plants intended to form large handsome specimens for exhibition should still be protected by glass lights, and it is better that they should be in such a position to admit of the lights being removed in fine weather; by that means the plants are kept in a very healthy and altogether satisfactory state, so that when the time comes to place them out-of-doors the tran-

sition state is not even felt by them. I remember on one occasion turning our plants out-of-doors the first week in May, tempted, of course, by fine weather; but a change came immediately, and we had 8° of frost on May 8; that is nearly twenty-five years ago, but I have not yet forgotten the lesson. We are not so careful of the plants intended for the production of large blooms. These plants may at any time be placed out-of-doors, they are not likely to suffer materially from frosts. The plants are now in 5 and 6 inch pots, and in these they will remain until the end of June, when they will be potted, one plant in an 8 or 9-inch pot, or two plants in a 10-inch one. These are cut back about the first week in June to within 9 inches or a foot of the surface of the pot; the re-potting takes place when the plants have made some growth, and as they want it very much by that time the rich compost gives vigour almost beyond belief.

### THE PELARGONIUM.

The earliest plants are now in flower, and those that are to succeed them later in the season are showing their flower-buds. It is a safe and good practice to fumigate the plants just before the first flowers open, and if they are at that time comparatively free from insect pests, this final smoking will probably keep the plants clean until the time for flowering is over. It does not answer to fill the house with smoke when the plants are in flower, as by doing so most of the fully expanded blooms will drop off. Continue to tie out and regulate the growths on late plants intended for exhibition from the middle to the end of June, and keep them close to the glass. The pots are by this time crammed full of roots, and it may be necessary to water them three times daily. If any of them should once get over-dry some of the leaves are sure to become yellow, and the flowers will be perceptibly reduced in size. Weak manure-water should be occasionally applied. Put in cuttings of zonal Pelargoniums to produce plants for flowering in November and December. *J. Douglas.*

### DOUBLE AURICULAS.

I send you some flowers from my collection of double Auriculas that you may see what improvements are being effected in them. At the recent Auricula show I exhibited one named *violacea*, of a very pleasing shade of violet suffused with a deeper tint; the flower sent is small and faded and from the plant that was exhibited at South Kensington; it is very free and pretty, and as some one described it, like a large double Violet. *Purpurea* is a very handsome, large, and full flower, and free in every respect. It throws a fine truss, and is striking when in flower. *Cleopatra* is a maroon-coloured flower dashed with purple; the example sent has faded, and is therefore under-sized. It is a very free and thoroughly good variety. *Hercules*, you will observe, is very distinct, and I regard it as the gem of my collection. It is difficult to describe. There is a mixture of purple, lilac, salmon, and buff. It is an extremely fine variety. *Delicata* is very fine and distinct; a good grower and very free. Thus, *Hercules* and *purpurea* remind one of Balsams, so large and full are the flowers. *Pandora* and *Juno* are two varieties of very dwarf growth and remarkably free; *Juno* is paler than the first-named, but I can send you flowers only of *Pandora*. I have also added flowers of the old and the double yellow, but both undersized, yet at their very best much inferior to the newer sorts, which I send with them. I have just received from Ireland flowers of a double yellow that is of a paler tint than the one sent, and has smooth rounded petals. The foregoing varieties do not exhaust my collection.

The double varieties are all late in flowering, and therefore I am not able to produce them in good form at present. They do well under the treatment given to my general collection of Auriculas. *R. Dean, Ealing, W.* [Mostly dull-coloured, uninteresting blooms, not nearly so pretty as the single flowers; one only might pass muster, a yellow. Ed.]

### THE ELEPHANT SUGAR-CANE IN JAMAICA.

The Elephant-cane, says Mr. Morris in the report of the Botanic Gardens of Jamaica, continues to maintain its preeminence as a rapid grower, with early maturity; but it requires very rich soil, a moist climate, and to be taken off as soon as it is ripe. It "ratons" well the second year, but, like most vigorous growers, it requires to be renewed in the third or fourth year. In favourable localities the Elephant-cane, where it has been tried, throws immense canes, looking almost like clumps of Bamboos; the yield per acre has not, however, been quite equal to the show of canes, but it has yielded at the rate of 2 to 2½ tons of sugar per acre, which is far beyond the average of ordinary canes in Jamaica.

## APPLE CULTURE.

EACH spring reminds me that Apple growers are in want of further information on some points in their trade. It is clear that those who think with me, that it is a risk "to put all their eggs into one basket," would find a list of trustworthy Apples, with the comparative dates about which they come into blossom, a most useful addition to their notebook for the year.

An orchard planted half-and-half with early and late blossomers would be more likely than a haphazard collection of varieties to ensure to its owner a good annual half crop (and this is as much as we want), owing to the certainty in favour of its escaping in part the season of cold spring wind, and the trying effect of morning frosts on wet bloom at setting time.

With this view I have secured the help of a friend in Kent, and if any of your readers will forward to me any notes made during this season, I shall have great pleasure in making known, with your co-operation, the results of our inquiry. I am also anxious to know whether the kind of stock used, Crab or otherwise, has any effect on the period of blossom.

There is not time now to dwell upon such other points as the great absence of practical instruction in the art of pruning, and the absolute necessity of wholesale destruction of the insects which are injurious to fruit; but if all growers would at once take example from neighbours who have set their orchards in order, and comply with the recommendations of Miss Ormerod, the energetic entomologist, who is now attached to the Royal Agricultural Society, depend upon it one year would show a marked advance in the history of the Apple, not only in Herefordshire, but elsewhere. These objects might be worthily taken up by our county agricultural and horticultural societies. *John H. Arkwright, Hampton Court, Leominster.*

## THE PROPAGATOR.

## THE PROPAGATION AND CULTURE OF DRACÆNAS.

IT will not be necessary to recommend the *Dracæna*. In every collection worth the name it holds a prominent place. In it are combined a diversity of beauty; it is graceful in appearance, symmetrical in form, and scarcely surpassed for the many shades and tints of colour in its leaves.

With regard to their propagation, this can be done first from seed. To raise new varieties, two plants, each as distinct from the other as possible, should be taken and fertilised every day while the flowers remain open, the pollen being conveyed from one plant to the other by a small camel's-hair brush. The best time for hybridising purposes is between 12 and 2 o'clock in the day. These plants should be set apart from the others in a part of the house where they will not get syringed. Care must, however, be taken not only to allow them to become dry at the roots, but also to prevent them becoming soddened with water; in both cases it would have an injurious effect upon the seed. As soon as the seed is ripe it should be taken from the pod and sown. Well-drained 48-pots or pans should be filled to within a quarter of an inch from the top with the soil given below, pressing it in firmly, and making the surface level, and after thioly sprinkling the seeds, the remaining quarter of an inch of the pot should be filled up with soil. After levelling the surface of the soil the seeds should be well watered with a fine rose-pot, and placed in a cutting-case or frame upon a good bottom-heat. Here they must be kept sprinkled when becoming dry and shaded from the sun; they should also be ventilated for an hour at night, and in the morning. When the seedlings have grown 1½ inch in height, they should be pricked off one by one into thumb-pots. They must be well watered and placed upon the open bottom-heat, to be sprinkled night and morning with a fine rose pot and shaded from the sun. As soon as the plants are strong and well rooted they can be potted into large 60's, putting a small stick to each plant and tying it only once at the bottom. This will not only support the plant, but will also prevent much injury should it happen to be knocked over in syringing or watering. They must be replaced upon the open bottom-heat, well watering them

beforehand, and keeping them carefully watered afterwards, as well as lightly syringing them beneath the foliage twice a day. They must be protected from the sun and moderately ventilated upon every mild day. When the plants have well rooted through 60-sized pots they can be potted into larger ones as many times as required until they are well developed.

To go back a little: as the seeds do not germinate regularly the seedling should be pricked off when they have grown to the required height, replacing the seed-pot in the case as many times as may be necessary until the whole of the seeds have been raised. It is a fact not generally known, that fertilised seed of one variety, even if saved off the same plant, will often produce a plant of different form, and this accounts for the many new varieties that have been introduced during the last ten years.

## FROM CUTTINGS.

*D. terminalis* and the varieties named at the end hereof.—In the first place the top of the selected plant should be cut off, together with about 2 inches of the main stem, and after the bottom of the cutting has been cut off it should be potted into small 60-pots pressing the soil in firmly. A little sand should be placed at the bottom of the cuttings, where the roots are produced. The cutting should be supported by a stick, to which it should be tied at the bottom, the leaves being also loosely looped up in an erect position. They should be well watered and placed in a cutting case upon a good bottom-heat. It has an injurious effect upon the cuttings to water them overhead, it is therefore much the better plan to take them out of the frame when they are to be watered, which should be done with a spout-pot, and replaced in the frame when this has been done. They should be watered as they become dry, as well as shaded from the sun. For ventilation the lights should be removed for an hour night and morning, but after seven days the lights can be raised an inch without being taken off day or night. When they are well rooted they can be turned out upon the open bottom-heat. In a few days they will have become hardened enough to be potted into large 48's. They should be watered and replaced upon the open bottom-heat until they have grown into well developed plants, and then they can either be potted again, if larger plants are required, or removed to any other warm house, where they be required for decorative purposes.

The plants the tops of which have been taken out for cuttings can be further propagated. They should be cut down to an inch below the bottom leaf, and cut up into pieces 2 inches in length. These pieces should be divided down the centre of the stem in such a way that if, for instance, there are two leaves upon the piece, one may be upon each of the two pieces it is divided into. They can then be potted each into a long thumb-pot, putting a stick to each one, to which the foliage should be loosely tied up. After watering them they can be put in the cutting case, to be treated in the same way as the top cuttings.

There is another way of propagating those plants which have a long stem without any leaves upon it, excepting at the top. The leafless part of the stem should be cut off and split down the centre, and then cut up into lengths an inch long. Some well drained 48-pots should be filled with the cutting soil firmly pressed in and a little sand placed upon the top; when the soil has been levelled twelve or eighteen pieces of stem can be dibbled in, allowing the top of each piece to appear a little above the surface of the soil. After watering them they should be placed in the cutting-case, and there they should be sprinkled as they become dry. When they have rooted and grown into small plants they should be potted off singly into thumb-pots; they can be further potted as required.

*Dracænas* can also be propagated by taking long leafless pieces of the main stem and cutting it into pieces from 6 to 8 or more inches long. These pieces should be laid upon the bottom-heat, and lightly sprinkled over with a little cocoa-nut fibre, but hardly covering them. They will produce a quantity of cuttings which, when they are strong enough, can be taken off and then treated as ordinary cuttings.

Root-cuttings can also be made. Pieces of the tap-roots 1½ inch in length can be put in a pot or pan and covered over with cutting soil, and after they have been in the cutting-case some time they will produce a quantity of cuttings, which should be taken off when they are strong enough, and treated in the same way as those above mentioned. The old

roots should not be thrown away, because they will continue for some time to produce cuttings.

The above-mentioned methods of propagation can be applied to the following varieties:—*D. anerleyensis*, *D. amabilis*, *D. alba nana*, *D. albo-marginata*, *D. Baptistii*, *D. Bausei*, *D. Berkeleyi*, *D. Cheltoni*, *D. Cooperi*, *D. elegantissima*, *D. Elizabethæ*, *D. Ernesti*, *D. Fraseri*, *D. Frederici*, *D. Guilfoylei*, *D. Hendersoni*, *D. hybrida*, *D. ignea*, *D. imperialis*, *D. Laingi*, *D. Leopoldi*, *D. Macarthuri*, *D. Mooreana*, *D. Mrs. Freake*, *D. Mrs. Wills*, *D. nigro-rubra*, *D. Princess Margaret*, *D. Rebecca*, *D. Regina*, *D. Robinsoniana*, *D. robusta*, *D. roseo-picta*, *D. rubra*, *D. Sidneyi*, *D. speciosa*, *D. stricta*, *D. superba*, *D. terminalis alba*, *D. Thomsoni*, *D. Weismanni*, *D. Willsii*, and *D. Ferax*, &c.

With regard to the soil, the following compositions should be used:—1st, for cuttings and seeds: one-half peat, one-quarter loam, and one-quarter sand, and a small quantity of finely broken potsherds. This must be well mixed together and sifted, and rubbed through a 4-inch sieve before it is used. 2d, for the plants the soil should be a mixture of good turfy loam, peat, a small quantity of leaf-mould, some well-decayed cow-manure, a little charcoal in pieces of Walnut size, and a small quantity of river-sand. *T. O.*

(To be continued.)

## PLANTS AND CUT FLOWERS.

It is a remark of most frequent occurrence amongst gardeners, that such large quantities of flowers are required now-a-days compared to what was considered sufficient some few years back as to cause much inconvenience to produce them. This is true in the majority of cases, the prevailing fashion being now so different to what it was in the memory of most of us. In order to be abreast of the times it is necessary to undertake the cultivation of such plants as are best calculated to give the greatest returns in the supply of flowers for cutting. I have in previous papers on plant culture advised the more general cultivation of some genera for this purpose; it is not on cultivation, however, that I wish now to offer a few hints, but on the selection and use of flowers in general.

Having regard to the uses for which plants are now needed, it becomes obvious that the slow-growing hard-wooded plants are in great danger of being discarded from our collections, by reason of the length of time needed to work them up to a useful size. In some cases the unsuitability of a few genera for these purposes is certainly thought to be by some a strong point against them, but there are others that can be advantageously grown to supply cut flowers, and out of the common run of plants grown for that purpose. Take, for instance, the whole family of the *Epacris*, what excellent subjects they are in a cut state, lasting ten days and more in good condition, as well as being capital flowers to travel. These are to be had in flower from October to May with ease.

Many of the Cape Heaths also are of equal value to the *Epacris*. It is not necessary to mention those that are seen in such numbers as *E. hiemalis* and others, but merely to name a few that are well worthy of the same amount of attention, viz.:—*E. Bowiciana*, *E. intermedia*, *E. cerinthoides coronata*, *E. metulæflora*, *E. Siodryana*, *E. mammosa*, and *E. verticillata*; these are all of good free growth, some of which, when in flower, can very well be afforded for cut purposes. There are several of the slower growing types on which several stray shoots can, with advantage to the plant even, be taken off when in flower and be found most useful for small specimen glasses on the table. The *Eriostemons* are also an excellent type of plant for the same purpose, supplying flowers that are always favourites with the ladies. *Boronias*, such as *B. elatior* and *B. megastigma*, will also be sure to be appreciated; these should be treated as we have often advised in the case of *Epacris*, *Adenandra fragrans*, *Aotus gracillimum*, *Dracophyllum gracile*, *Leschenaultia biloba major* (the latter unsurpassed in its colour), *Lagerstroemia indica*, *Pimelea spectabilis*, *Polygalas* in variety, *Statice imbricata*, and *S. profusa*, with *Swainsonia galegaefolia* and its white variety are each and all most useful plants for the supply of cut flowers. It may be urged against some of this genera that we have quoted that they are difficult of cultivation; all we have to say to this is, that the sooner their requirements are understood the better, and no harm will accrue, but the reverse, to those who over-

come their peculiarities, and are thereby enabled to produce a supply of cut flowers out of the common run of things. For some a greenhouse course of treatment is essential all the year round, and those who do not command a cold house cannot be expected to cultivate such things.

Amongst the climbing plants for the greenhouse there are many very useful subjects that are not nearly so often seen as they deserve to be. Take, for instance, the Chorozeas, especially *C. Chandleri*, *C. cordatum splendens*, and *C. Lawrenceanum*, all most profuse bloomers; *Lonicera sempervirens minor*, and *Trachelospermum jasminoides*, *Jasminum grandiflorum* (flowering freely in a temperate-house), with *Sollya Drummondii* and *S. linearis*; these are plants that do not make rank growth, which produces an undue amount of shade, more than greenhouse subjects require.

The Bignonias are best calculated for a lofty conservatory, so also are the climbing varieties of the Acacias. Where the opportunity is afforded of turning out a few plants of *Daphne indica alba* and *D. indica rubra*, far better returns may be expected; sufficient growth will then be made to admit of a good quantity being cut when in flower. Of bulbous plants that are not frequently seen we might quote the *Blandfordias*, the *Nerines* (in choicer varieties), and *Crocus aurea*, all being very useful for cutting.

We have thus far only noted some from amongst the greenhouse plants; there are, however, many occupants of the stove and intermediate-house that may with advantage be added to collections. The *Ixoras* are not half enough grown, the old tale of the mealy-bug is generally the excuse that is urged against them. The *Dipladenias* are also worthy of every attention, and if trained near to the roof will not occupy much room. The *Vincas* and *Rondeletias* are alike excellent, and of easy culture, bearing a liberal amount of cutting before any harm will accrue to the plants. Of tuberous-rooted plants there are *Gesnera Donckelaeri* and *G. Merckii*, *Streptocarpus* in variety, and *Urceolina aurea*, that are each useful in their season. *Hymenocallis macrostephana*, with its *Pancratium*-like flowers, will be more valued as it becomes better known.

Plants in pots of medium size will in most cases be found to give the best returns on the whole; when of excessive dimensions, the labour of moving them about is greatly increased. In the case of plants that are not annually pruned, a considerable amount of foresight need be used not to spoil the plant for another season. *Azalea indica* in its varieties will soon show signs of exhaustion if too severely cut, resulting in a few years in a stumpy, decrepid plant, and a corresponding crippling of the roots. I have not touched upon hardy herbaceous and other plants and bulbs; many of these, we are glad to see, are far more prized than they used to be, affording a great relief to the stock of plants in pots, thus allowing the greater amount of the latter to be so arranged to fit in when outside flowers are not so readily obtainable. If attention, however, can be directed to other sources of supply, so as to give diversity to the arrangements, it certainly should be practised when possible. The days of large specimen plants appear to be numbered in many places in order to give way to smaller and perhaps more useful plants. *J. Hudson.*

(To be continued.)

## FURZE DOWN, SURREY.

THIS fine establishment, the residence of C. Seely, Esq., at present presents a very charming appearance in its spring raiment, and we know of no place in such close proximity to the metropolis that presents a more "countryfied" aspect, or invigorates one more with a visit than this place does. The grounds are tastefully laid out, and the shrubberies are rich in uncommon and beautiful species of shrubs and trees, many of which at this season of the year afford striking contrasts, and none more so than a fine bush of the purple pinnatifid *Acer*, with a background of a fine *Pyrus luxuriant* in bloom. Many other happy combinations could be cited illustrative of the same subject. In a sheltered "cove" *Camellias* were flowering freely, and had every appearance of doing well. The Judas tree (*Cercis siliquastrum*), a tree that with the Elder divides the ignominy (?) of being that on which the arch traitor hung himself, is here

a fine specimen, and this year is literally covered with bloom from the base of the trunk to the top-most twig. A fine specimen of *Crataegus coccinea* is also very full indeed of flower. Perhaps the most charming feature here is the conservatory, which, at the time of our visit, was decorated with an amount of taste, and with as nice a selection of flowering plants as would do credit to any conservatory in the country. Although the arrangement may have been given before, we give it again for the benefit of those who may not have noticed it and have not the chance of a visit. Instead of stiff iron or wood stages being placed "all round and up the middle," a series of beds are here substituted planted with suitable subjects such as lofty Palms, tree Ferns, &c., on the stems of which are hung exceptionally fine pieces of Orchids, and on the beds are arranged "naturally" such things as *Imantophyllum*, *Amaryllis*, *Azaleas*, *Cinerarias*, *Cytisus*, *Primulas*, *Mignonette*, *Marguerites*, &c.—the whole arrangement harmonising most happily and presenting a charming view from the rooms of the mansion. Let into the back wall are three large glass cases for *Feros*, with a water arrangement, which have a very telling effect from the central walk.

We must not neglect to record the fine effect produced by *Berberis tenuifolia*, which is planted all round the base of the mansion and is blooming most profusely, as is also *Cytisus præcox*, a very telling "canary-buff" coloured, free-flowering Broom in the shrubberies. In the houses many meritorious examples of different subjects are to be seen. *Dracæna Laingii*, raised by the respected head gardener here, is a nicely variegated variety and harder than the other varieties that are suitable for table decoration, for which purpose the one in question is admirably suited. A very fine large plant of the graceful Palm, *Kentia gracilis*, is doing well. A large batch of *Anthurium Scherzerianum* is flowering freely. *Platycodon stemmaria* is a good variety of the Elk's-horn Fern.

The Peach-houses and vineries are looking very well just now, especially a house of *Muscats*. The *Roses*, trained up the stay rafters of the *Camellia*-house, are a sight worth seeing, so luxurious are they, and so floriferous. *Stephanotis floribunda* is also fine in one of the stoves. Orchids are well done here, and are mostly used for conservatory decoration; one of the most useful of these is *Dendrobium nobile*, which is here principally grown in 5-inch pots, and makes fine growths and flowers well; the variety known as *D. n. pendulum* is largely grown. Some fine pieces of *Cattleya Mendelii* and *C. Mossiae* are in bloom, also *Cypripedium barbatum*, *C. Hookeri*; *Phalaenopsis* look strong—*P. Luddemanniana* was in bloom. A nice lot of *Aërides*, *Saccolabium*, and *Vandas* are doing well and showing flower freely. A fine plant of *Phaius grandifolius* was just going out of bloom; *Epidendrum odoratissima* and *Dendrobium Parishii* were well in flower, and in a cool-house *Odontoglossum cirrosum*, *O. Alexandræ*, *O. Hallii*, *O. Andersonianum*, *Oncidium serratum*, and *Masdevallia Veitchii* and *M. Harryana*.

## Law Notes.

IS A HOTHOUSE A BUILDING?—At the Lambeth Police Court recently, Mr. E. B. Haynes, nurseryman and florist, of Penge Nursery, Beckenham Road, was summoned at the instance of Mr. G. Elkington, jun., surveyor, of Penge, with regard to the non-payment of a fee of £1, alleged to be due in surveying a hothouse upon the defendant's premises, according to the terms of the section of the Act of Parliament dealing with the erection of a building. The defendant declined to admit the claim, and submitted that the structure in question did not come within the real meaning of the Act.—The complainant said he found the defendant had erected a greenhouse some 22 feet long, and under the section of the Act considered the fee should be paid.—Defendant also urged that florists were not supposed to be liable to such costs where carrying on business as he did.—Mr. Chance said he believed it had been before now decided that a greenhouse was a building within the meaning of the Act.—The defendant said the complainant had made a discovery of the so-called building after it had been placed in position and was being painted, and then he wanted £1 for just looking at it. He (the defendant) had erected thirty-nine structures of a somewhat similar character upon his property, and until now had never

been asked for such a fee. It was not a question as to the amount, which he would willingly give to any charity, but he contested the case on principle, and in the interest of florists.—Mr. Chance said at present he could not see florists would be exempted from the terms of the Act.—Defendant denied that he had "built" the structure in question. It was already "built" when he bought it in Anerley Road, and had it removed by eight or nine men in his employ, and deposited on the ground.—The complainant said the structure was placed upon brick-work, and had it been movable in the ordinary way he might have summoned him for irregularity with regard to building.—Mr. Chance again repeated that he would not decide the case now, but give the defendant every opportunity to bring forward every argument he could.—The defendant said he looked upon it only as a question of principle, and in the interest of florists.—Mr. Chance said the defendant would first of all have to get over the argument as to whether the structure in question was a "building" or not within the meaning of the Act. He (Mr. Chance) considered at present it was, and it he gave a decision upon the facts now before him he should have to decide against the defendant. The proceedings were adjourned.

May 14.—Fine and bright at times, slight falls of rain.  
 — 15.—Dull morning, fine bright afternoon.  
 — 16.—Fine day, heavy rain from 5.15 P.M. to 5.30 P.M., cloudy night.  
 — 17.—Dull day, showers of rain, thunderstorm in afternoon.  
 — 18.—Fine and bright at times, dull mostly.  
 — 19.—Fine bright morning, dull day and night.  
 — 20.—Slight showers of rain during all day, fine night.

LONDON: *Atmospheric Pressure.*—During the week ending May 16, the reading of the barometer at the level of the sea increased from 29.91 inches at the beginning of the week to 29.94 inches by 1 P.M., decreased to 29.91 inches by 5 P.M. on the 10th, increased to 30.18 inches by 5 P.M. on the 11th, decreased to 29.80 inches by 5 P.M. on the 13th, increased to 29.87 inches by 9 A.M. on the 14th, decreased to 29.84 inches by 1 P.M. on the same day, increased to 30 inches by 9 A.M. on the 15th, decreased to 29.79 inches by 1 P.M. on the 16th, and was 29.81 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.95 inches, being 0.28 inch higher than last week, and 0.03 inch higher than the average of the week.

*Temperature.*—The highest temperature was 61°.5 on the 16th; the highest on the 10th was 56°.3. The mean of the seven high day temperatures was 58°.4.

The lowest temperature was 33° on the 12th and 13th; on the 16th the lowest temperature was 42°. The mean of the seven low night temperatures was 37°.3.

The greatest range of temperature in one day was 25°, on the 12th; the smallest was 15°.1, on the 10th. The mean of the seven daily ranges was 21°.1.

The mean temperatures were—on the 10th, 47°.6; on the 11th, 44°.6; on the 12th, 45°.2; on the 13th, 44°.2; on the 14th, 45°.5; on the 15th, 48°.8; and on the 16th, 50°.2; and these were all below their averages by 3°.7, 6°.6, 5°.9, 6°.9, 5°.8, 3°.1, and 2°.1 respectively.

The mean temperature of the week was 46°.6, being 0°.2 higher than last week, and 4°.9 lower than the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 121°, on the 14th. The mean of the seven readings was 110°.7.

The lowest reading of a minimum thermometer placed on grass was 23°.2 on the 12th. The mean of the seven readings was 28°.5.

*Rain.*—Rain fell on three days, to the amount 0.17 inch.

Thunderstorm on the 17th.

ENGLAND: *Temperature.*—During the week ending May 16, the highest temperatures were 62° at Truro and Hull, 61°.5 at Blackheath; the highest at Newcastle was 54°, at Bolton 54°.1, at Preston 54°.5. The general mean was 57°.7.

The lowest temperatures were 30° at Hull, 30°.5 at Wolverhampton, 30°.6 at Bolton; the lowest at Liverpool was 38°.8, at Brighton 38°, at Newcastle 37°. The general mean was 37°.5.

The greatest ranges were 32° at Hull, 30° at Truro, 28°.9 at Cambridge; the smallest ranges were 17° at Newcastle, 17°.2 at Liverpool, 20°.5 at Preston. The general mean was 24°.2.

The mean of the seven high day temperatures was highest at Blackheath and Cambridge, 58°.4, at Truro 58°, at Sunderland 50°.4, at Newcastle 51°, at Bolton 51°.8. The general mean was 54°.8.

The mean of the seven low night temperatures was highest at Liverpool, 41°.3, at Truro 41°, at Plymouth 40°.5; and was lowest at Wolverhampton and Hull, 34°.4, at Sheffield 34°.9. The general mean was 37°.5.

The mean daily range was greatest at Cambridge, 23°.1, at Hull 21°.9, at Blackheath 21°.1; and was least at Liverpool, 11°.5, at Newcastle 12°, at Sunderland and Preston 14°.5. The general mean was 37°.3.

The mean temperature was highest at Truro, 47°.8, at Plymouth 47°.4, at Blackheath 46°.6; and was lowest at Sunderland, 41°.4, at Wolverhampton, 42°.7, at Sheffield and Bolton 42°.8. The general mean was 44°.5.

*Rain.*—The largest falls were 1.08 inch at Sheffield, 0.63 inch at Bradford, 0.58 inch at Leeds, the smallest fall was 0.07 inch at Plymouth, 0.08 inch at Truro. No rain fell at Brighton. The general mean fall was 0.31 inch.

SCOTLAND: *Temperature.*—During the week ending May 16, the highest temperature was 58°.8, at Paisley, at Greenock the highest temperature was 54°. The general mean was 55°.6.

The lowest temperature in the week was 30°, at Glasgow; at Paisley the lowest temperature was 34°.9. The general mean was 32°.2.

The mean temperature was highest at Aberdeen and Paisley, 45°.4; and lowest at Dundee, 41°.2. The general mean was 43°.8.

*Rain.*—The largest fall was 1.31 inch at Aberdeen; the smallest fall was 0.35 inch, at Dundee. The general mean fall was 0.64 inch.

JAMES GLAISHER, F.R.S.

## Obituary.

WE regret to announce the death of MRS. EWING, which occurred at Bath on Wednesday last, from blood-poisoning, at the comparatively early age of forty-three. Mrs. Ewing, who was the second daughter of the Rev. Dr. and Mrs. Gatty (the latter authoress of *Parables from Nature*, and editor of *Aunt Judy's Magazine*), will long be remembered as the writer of many delightful tales for girls, notably of "Jan of the Windmill," "A Flat Iron for a Farthing," "Six to Sixteen, &c." Some of her shorter stories are equally charming, as for instance "Jackanapes," "A Brother of Pity," and "Daddy Darwin's Dovecot," the latter a prose idyl. Many of Mrs. Ewing's stories in verse are full of a quaint humour, and descriptive power not often met with in books written for children. Mrs. Ewing was very fond of flowers and of gardening. At the time of her death she had succeeded in establishing the Parkinson Society, intended to aid in the wider distribution of wild flowers and hardy garden plants, as well as to preserve those liable to become exterminated by thoughtless depredators. Mrs. Ewing's "Letters from a Little Garden" were much appreciated in *Aunt Judy's Magazine*, and had unfortunately to be discontinued in consequence of the illness of the writer.

— We also hear of the death of Mr. HUGH HUGHES, who for the past thirty years had been head gardener to Sir Gilbert Greenall, Bart., Walton Hall, Warrington. Mr. Hughes was in the seventy-eighth year of his age, and as he continued his duties until a few days before his death, which took place on the 9th inst., may be said to have died in harness. Walton Hall has long been noted for Pine growing, and, indeed, few establishments can boast of having kept up its high reputation for so many years.

— The death of Mr. EDWIN COOLING, on the morning of Tuesday, May 12, so soon after that of Mr. Charles Turner, removes from our midst another of that generation of florists who made their influence so powerfully felt in their day and generation, and did so much to foster a love for flowers throughout the Midland districts. For the past few years his health had gradually declined, and for some months he had been confined to his room, patiently waiting for the end he knew could not long be delayed. In quietness and peace he died, at the age of seventy-seven years, loved and regretted by his family and a large circle of friends.

Edwin Cooling was born at Beeston Field, Notts, in 1808. He was the son of Abraham Cooling, an enthusiastic florist and gardener of the old school, whose whole life was devoted to his profession, and who died at the ripe age of eighty-nine. A short notice of this fine old gardener appeared in the *Gardeners' Chronicle* at the time. About the year 1838 Edwin Cooling commenced business in Derby as a nurseryman and florist, and soon took a good position and made a reputation as a clever cultivator and a good administrator. He was associated with Mr. E. S. Dodwell and others in the formation of the Midland Horticultural Society, a Society which did much for the advancement of horticulture in the Midland Counties, its spring and summer exhibitions rivalling in interest those held in the metropolis of London. He was an enthusiastic lover of Ferns, and for many years the collection at the Mice Ash Nurseries was one of the most extensive in the trade. A general stock of plants was grown in the nurseries, and it was always to be seen in the best condition. And while a diligent man of business and successful horticulturist, he also took a keen interest in scien-

tific pursuits, and was a member of the British Association for the Advancement of Science, the Royal Geographical, the Royal Horticultural, and kindred Societies. He was for many years a member of the Derby Chamber of Commerce, and many undertakings having for their object the welfare of the town of Derby found in Edwin Cooling an ardent supporter. He was one of the earliest supporters of the Railway Servants' Orphanage, and the welfare of the working classes especially he had deeply at heart. Of him it may truly be said:—

"Life's work well done,  
 Life's race well run,  
 Life's crown well won,  
 Now comes rest."

BEDS, &c.: *Cheshire.* See Carter's Catalogue.

"DICTIONNAIRE DES ROSES." J. E. E. We do not know of any such publication. Do you mean the *Journal des Roses*?

DISEASED GESNERA: A. B. C. A common malady, the result of some bad management.

INSECTS ON VINES: G. T. The very minute, oval, slightly convex, dark chestnut coloured, and very glossy objects found on Vines (whereabouts is not stated), which look like tiny beetles, are a species of bark mite (more oval than the *Acarus geniculatus* figured by "Ruricola" in the *Gardeners' Chronicle*, May 27, 1843). Unless they appear in great numbers they are scarcely injurious; if they do so, they may be got off with a fine brush and Gishurst fluid. W.

LACED POLYANTHUS: J. C. None of them are good enough to be classed with the best named varieties. They are only worth growing as border flowers.

LICHENS, &c.: A. D. W. On large leaf, immature condition of *Strigula Babingtoni*, mixed with young *Capnodium Footii*; on small leaves, the conical condition of some *Capnodium* other than C. Footii. This stage is ordinarily known by the name of *Fumago vagans*. M. C. C.

NAMES OF PLANTS: *Camjee.* *Prunus triloba*, propagated by grafts or layers.—*L. P.* *Passiflora Imperatrice Eugénie*.—*X.* *Rhododendron campylocarpum*.—*C. W. S.* *Fritillaria macrophylla* (see figure in *Gardeners' Chronicle*, June 14, 1884).—*E. C. C. D.* *Corydalis nobilis*.—*C. S. & Co.* *Amelanchier vulgaris* (Savoy Medlar).—*W. W.* *Coronilla Emerus* (figured in *Gardeners' Chronicle*, July 23, 1881).—*C. W.* *Euphorbia amygdaloides*.—*J. Morton.* The bulb is, perhaps, *Hæmanthus Arnottii*, but leaf required; no other specimen was found in your letter.—*C. E. Reade.* 1. *Cupressus Corneyana*; 2. *Thuja nutkaensis*, syn. *Thuopsis borealis*; 3. *Epacris obtusifolia*; 4. *Erica mediterranea*.—*E. C. C. D.* *Lepidium sativum*.—*C. W. Dod.* *Cerastium arvense*.—*W. M. Beale.* *Rhododendron glaucum* and *Andromeda polifolia*.—*P. H.* 1. *Saxifraga crassifolia*; 2. *Trollius europæus*; 3. *Lamium purpureum*; 4. *Daphne pontica*; 5. *Aubretia deltoidea*; 6. *Scilla autans* var. *alba*; 7. *Aloe*, not known.—*Hortus.* *Lælia purpurata*.—*H. B.* *Pholidota pallida*.—*G. H.* *Dendrobium Calceolus*.—*E. R. K.* *Vanda tricolor*, in the way of V. Patersoni.

ORCHID: D. This word is used in the attempt to Anglicise "Orchidaceæ." Orchis is the name of one genus of Orchids; similarly Iris is a genus of Irids, or Iridaceæ. Unhappily perfect symmetry and consistency are unattainable. Lindley endeavoured to persuade botanists to adopt a uniform termination, "aceæ," for all orders, and to adopt a uniform system for English names, but the attempt has been only partially successful.

PORTUGAL LAUREL: X. The disease is only too well known in this shrub, as in Peaches, Plums, Almonds, and other allies of the Portugal Laurel, but no one has yet ascertained the cause, or suggested a remedy. The Rose is the double yellow Banksian, requiring a greenhouse or south wall.

PRIMROSES: W. Cauldwell. A fine lot in form, colour, and substance. Low Moor Beauty is a fine hose-in-hose variety.

SCORCHED VINES: G. C. Probably the glass is in fault.

STEPHANOTIS NOT FLOWERING: Young Gardener. It is at present too early for a planted-out specimen to flower much. You must either restrict the space in which the roots are, or wait some time longer for much bloom. Tie out the shoots thinly, and near the glass, and do not give manures till the plant seems to require them.

TESTIMONIAL: G. M. B. Now that the matter is launched it would be ungracious to discuss it further. Your opinions are shared by a large number of our correspondents.

INTELLIGENT READERS, PLEASE NOTE.—Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and NOT to the Editor.

## SEEDS.

LONDON: May 20.—There was scarcely anything doing on the seed market to-day, extreme quietness being the characterising feature. Stocks all round prove lighter than was supposed, and values for holding over show generally great firmness. There is an increasing inquiry for sowing Mustard and Rape seed; really fine parcels command long prices, and are with difficulty met with. A small demand is still experienced for spring Tares. In neither Mustard nor Rape seed is there this week any quotable variation. Rather less money is taken for feeding Linseed. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

## CORN.

At Mark Lane on Monday trade was dull and depressed, sales of Wheat were extremely difficult to effect, and prices were 1s. to 2s. lower on the week. Flour met an equally dull sale, and was 6d. to 1s. per sack down from the nominal rates of Monday se'night. On similar comparison, Oats and gridding barley were 6d. lower, with very limited sales. There was, however, rather more disposition to buy the former at the reduction. Beans and Peas were quiet and unchanged. American Maize remained at the 6d. reduction noted on Friday, round corn being more depressed.—On Wednesday there was extremely little doing in any description of Wheat, buyers holding off in view of easier prices. Flour remained inactive and drooping in value; Barley was steady, and Beans and Peas were quiet and unchanged. There was a steadier market for Oats, although the business was very limited. Maize was rather firm in all positions.—Average prices of corn for the week ending May 16:—Wheat, 37s. 5d.; Barley, 30s. 8d.; Oats, 22s. 10d. For the corresponding period last year:—Wheat, 37s. 10d.; Barley, 29s. 9d.; Oats, 21s.

## CATTLE.

At the Metropolitan Market on Monday beast supplies were rather less than on the previous Monday, but prices of British-fed stock were not quotably better, and trade slow. Foreign sold rather better. Sheep and lamb supplies were larger than on Monday week. The former sold slowly without quotable change, but a flagging trade; the latter showed decidedly lower prices. On the week calf trade dull, and prices lower. Quotations:—Beasts, 4s. to 4s. 8d., and 4s. 10d. to 5s. 2d.; calves, 3s. 8d. to 5s. 8d.; sheep, 4s. 8d. to 4s. 10d., and 5s. to 5s. 8d.; lambs, 7s. to 7s. 6d.; pigs, 4s. to 4s. 6d.—On Thursday a heavy tone characterised the trade, and prices favoured buyers. About an average supply of beasts met a slow trade at about late rates. As regards sheep, supplies were equal to the demand, which was wanting in animation, prices remaining about the same.

## HAY.

Tuesday's Whitechapel Market report states that best hay met a fair inquiry, but the trade otherwise was dull, especially for Clover and straw. Supplies were large. Quotations:—Clover, prime, 80s. to 105s.; prime second cut, 85s. to 105s.; inferior, 60s. to 75s.; hay, prime, 70s. to 100s.; inferior, 40s. to 60s.; and straw, 26s. to 36s. per load.—On Thursday there was a rather large supply on sale. The trade was dull at Tuesday's rates.—Cumberland Market quotations:—Clover, best, 85s. to 105s. 6d.; other quality, 60s. to 84s.; hay, best, 84s. to 92s. 6d.; other qualities, 45s. to 75s.; and straw, 30s. to 34s. per load.

## POTATOS.

The Borough Market report states that for best samples there was a steady demand, but the general trade was dull. Quotations:—Scotch Regents, 80s. to 95s.; Kent ditto, 70s. to 85s.; Champions, 40s. to 50s.; Magnum Bonum, 50s. to 60s.; and Victorias, 70s. to 90s. per ton.—The imports into London last week consisted of 4310 packages, 400 half boxes, and 14 boxes from Hamburg, and 205 bags from Harlingen.

## COALS.

The following are the prices current at market during the week:—Ravensworth West Hartley, 14s. 9d.; East Wylam, 15s. 6d.; Walls End—Tyne (unscreened), 11s. 3d.; Hetton, 16s.; Hetton Lyons, 14s. 6d.; Lambton, 15s. 6d.; Wear, 14s. 6d.; Chilton Tees, 14s. 9d.; East Caradoc, 16s.; East Hartlepool, 15s. 3d.; South Hartlepool, 14s. 9d.; Tees, 16s.

The final figures of Wednesday were 99½ to 99¾ for both transactions. Thursday's closing quotations were 99 to 99½ for both delivery and the account.

## Variorum.

A SPARROW'S NEST.—I think the accompanying interesting fact in natural history deserves a record:—The time of day is announced to the garrison and neighbourhood of Woolwich every day at 1 P.M. and at 9.30 P.M. by firing a blank charge of powder from a 9-pounder bronze gun. This gun is mounted, in the Gun Park, on a wooden travelling carriage, which is fitted with two axle-tree boxes, each about 1 foot square by 6 inches deep, with the inside divided into several compartments. This box is designed to carry case-shot and cartridges with the gun in action. The carriage is an old one, and the right axle-tree box has a small hole in one of its sides. Some days ago the gunner on firing the 1 o'clock gun observed a sparrow flying out of this hole, and an examination of the box showed that it contained, instead of case-shot, a sparrow's nest with five eggs. The box was carefully padlocked, so as to guard the nest from inquisitive boys, but the gun was fired twice a day as usual; and on the morning of Saturday, May 16, five little sparrows made their appearance, and are doing well. *W. H. Noble, Lieut.-Colonel R.A., Gun Park, Woolwich, May 16, in the "Times."*

BOULTON & PAUL,  
NORWICH,  
HORTICULTURAL BUILDERS AND  
HEATING ENGINEERS.

THOMAS GREEN & SON  
(LIMITED),

Smithfield Ironworks, Leeds.  
And Surrey Works, Blackfriars Road, London, S.E.  
Horticultural Engineers to Her Majesty the Queen,  
CALL SPECIAL ATTENTION TO THEIR  
PATENT

WROUGHT-IRON TUBULAR  
HOT-WATER BOILERS,

And others with SHELVES, and Hollow or Ordinary Cast-iron GRATE BARS;  
SADDLE BOILERS.

With WATERWAY BACKS, and WELDED BOILERS, which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c.

They are the nearest, cheapest, most effective, and durable of any extant.

The Tubular ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention. This pattern

Had the First and Highest Prize, a Silver Medal, Awarded to it at the Royal Horticultural Society's Exhibition, South Kensington, London, on June 3, 1881.

The *Journal of Horticulture* of June 9 says:—"HEATING APPARATUS.—A great number of boilers, valves, &c., were exhibited by eight competitors, and considerable interest was manifested in the verdict of the judges, and much discussion was brought to bear on the merits and shortcomings of the different boilers. The apparatus for which the Silver Medal was awarded was a wrought-iron saddle boiler, with a series of intersecting tubes, somewhat in the form of a letter X, but the tubes in open form, in the crown of the boiler. Most gardeners who examined the boiler expressed a favourable opinion of it. It is no doubt a quick and powerful boiler without being complex, the latter condition having, no doubt, had weight with the judges."

The *Garden* of June 11 says:—"The premier prize, a Silver Medal, was taken by Messrs. Green & Son for their new patent tubular saddle boiler. It is a modification of their original patent, the boiler being longer and not so high. It is found to be a powerful and efficient boiler, and heats a large quantity of water quickly with a small consumption of fuel."

Descriptive Illustrated Price List may be had free on application. Estimates given for all kinds of Heating Apparatus, and Hot-water Fittings of every variety supplied on the shortest notice. Galvanised Iron Cisterns, from 4d. to 1s. 6d. per gallon.

**FIR TREE OIL**  
**INSECTICIDE (SOLUBLE IN WATER)**

Destroys all Insects and Parasites without injury to Flowers, Fruit, Roots or Foliage.

Useful alike in Greenhouse, Vinery, Fernery, Orchard, Vegetable, Flower and Hop Gardens. Cures Mildew and Blight. Kills all Grubs, Aphids, Lice, Red Spider, Thrip, Mealy Bug, Caterpillars, &c. Applied by means of the Fir-Tree Oil Spray Pump, the Aphicide (hand spray producer), or by dipping. The trouble will be amply repaid by the healthy appearance of the foliage and the abundance of Fruit and Flowers. Always effectual, economical, and safe. Quickly removes all Insects from the coats of animals. It will cure Ringworm and all Parasitic Skin Diseases, and is perfectly harmless to the Hands and Skin.

Sold by Seedsman and Chemists, 1s. 6d., 2s. 6d., and 4s. 6d. a Bottle. Per Post 3d. extra. Tins— $\frac{1}{2}$ -gallon 7s. 6d., 1 gallon 12s. 6d.; Drums—5 & 10 gallon 11s. per gallon, Carriage Paid.

### Rosher's Garden Edging Tiles.

THE ABOVE and many other PATTERNS  
 are made in materials of great durability. The  
 plain sorts are specially  
 suited for KITCHEN  
 GARDENS, as they har-  
 bour no Slugs or Insects,  
 take up little room, and  
 once put down, incur no  
 further labour or expense,  
 as do "grown" Edgings, consequently being much cheaper.  
**GARDEN VASES, FOUNTAINS, &c.,** in Artificial Stone,  
 very durable, and of superior finish, and in great variety of design.

**ROBINSON**  
**AND CLEAVER, BELFAST.**

BUY ONLY ENGLISH THREE-QUARTER PLATE  
 WATCHES.

**BENSON'S NEW PATENT (No. 4658)**  
 "LUDGATE" WATCH.

SILVER, £5 5s. GOLD, £12 12s.

Is a "Special Strength" Silver English Lever, my best  
 London make, with Three-quarter Plate Movement.

Jewelled throughout.  
 Chronometer balance, with damp and dust-proof  
 Patent ring-band, and extended barrel, in  
 Massive sterling silver dove cases  
 With crystal glass front.  
 Winds, set hands and opens at back.  
 The superiority in value, accuracy, and durability of the  
 "Ludgate" Watch over the Swiss and American Keyless and  
 Non-Keyless Watches, made in imitation of and sold as  
 English work, and the ordinary Full-plate English Watch is  
 enormous. The "Ludgate" Watch is compact, strong, hand-  
 some, and durable. Being Three-Quarter Plate, it is superior  
 in value and appearance to any £10 Watch sold, and, being  
 compensated, it keeps perfect time; fitted with crystal front, it  
 combines the strength of the Hunter, and convenience of the  
 open face. Of my best London make, it will last a lifetime,  
 stand rough usage of all and every kind without damage, and,  
 being made in three sizes, it is for the above reasons suited for  
 Home, Indian, and Colonial use by  
 Gardeners, Workmen, and Gentlemen.

The "Ludgate" Watch is far superior  
 To any Watch at the price yet made, and  
 To be sent free and safe at our risk  
 To all parts of the world for £5 5s.  
 Cash or P.O.O.; or in banking cases, £6 6s.  
 Price in 18-carat gold, crystal glass cases,  
 Twelve guineas

**SPECIAL NOTE** that J. W. BENSON is the only Maker  
 of a Three-Quarter Plate English Watch for £5 5s. in Silver,  
 or £12 12s. in Gold, and that our Patent "Ludgate" Watch  
 cannot be had through or of any Watchmaker in the King-  
 dom. Any infringement of the Patent Rights will be  
 proceeded against. A Book explaining the advantages of  
 this Watch over the Full-plate English Watches sold by all  
 other makers, will be sent Post-free on application to

**GRATEFUL—COMFORTING.**

**EPPS'S COCOA.**  
**BREAKFAST.**

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." *Civil Service Gazette*.

Made simply with boiling water or milk. Sold only in

Packets, labelled thus:—  
**JAMES EPPS & CO., Homoeopathic Chemists, London.**

**HOLLOWAY'S PILLS and OINTMENT.**

—The combined ill effects of overcrowding, sedentary occupations and monotony of life are only too well known to those who have to pass the best part of their lives labouring in factories and crowded workrooms. The compulsory confinement weakens the general health and induces chronic constipation, indigestion, and various forms of skin disease. Holloway's remedies are of priceless value to persons of this class, for they can be used without entailing loss of work, being purely vegetable in their composition, and consequently act without harshness on the most delicate system. The experience of more than 40 years proves that no means surpass Holloway's remedies for Curing Bad Legs, Bad Breasts, Piles, and Wounds of all kinds.

## D I A L O G U E.

1st Orchidophilist *loquitur*.—"Have you heard the late news?"  
 2d Ditto.—"No. What?"  
 1st Ditto.—"Oh! the finest White Mossiae ever seen are coming over! Created quite a sensation at Caracas."  
 2d Ditto.—"Well they can't beat last year's fine pieces."  
 1st Ditto.—"They do. The Colchester people say, their flowers are larger and grander, and their plants are huge."  
 2d Ditto.—"Don't you believe all you hear? SEEING IS BELIEVING."  
 1st Ditto.—"TRUE: AND WE ARE TO SEE THESE AT STEVENS' SHORTLY. I SHALL BE THERE."

To Nurserymen, Florists, Seedsmen, and others.

**FOR DISPOSAL, the HOLYBOURNE VINERIES**, an eligible going concern, comprising Lease, Goodwill, Stock-in-Trade, and Plant of the above established Florist, Fruiterer, and Seedsmen's business, situated within 1 mile from Alton Town and Railway Station.  W. JACKSON, Blakedown, Kidderminster.

Oncidium Jonesianum.

**MONS. LOUIS DE SAINT LÉGERE**, the introducer of the beautiful ORCHID, *ONCIDIUM JONESIANUM*, has the honour to inform Amateurs and Nurserymen that he comes to England to resign to Messrs. F. HORSMAN AND CO., NURSERYMEN, Colchester, all the disposable stock. It is the only and sole depositary of this beautiful plant, found in 1878, on a voyage which he made to the province of Mato Grosso, Brazil, in the high forests bordering upon the Rio Paraguay. In these elevated parts the thermometer descends several times a year to zero.

As this Orchid is very difficult to meet with, it growing on a peculiar tree, it is necessary for Amateurs and Nurserymen who are desirous to enrich their collections, to direct their requests to Messrs. FRED. HORSMAN AND CO., for the stock of this plant is in their hands.

LOUIS DE SAINT LÉGERE, Desterro, Santa Catharina.—April 24, 1885.

American Plants.

**ANTHONY WATERER** begs to announce that the AMERICAN PLANTS at Knap Hill will be in their greatest beauty during the first fortnight in June, and will afford unquestionably the finest display of its kind that can be seen in any Nursery in the World. May be seen daily, Sundays excepted.

**CHARLES NOBLE, BAGSHOT.**

## AZALEA ROSEIFLORA

(Or BALSAMEIFLORA).

A native of Japan. Flowers very double, of a delicate rosy-salmon tint, shading into clearer rose towards the centre.

Very dwarf in habit and exceedingly floriferous, even in a young state, whilst older plants are almost obscured by the abundant blooms, most of which are 3 inches in diameter and of perfect symmetry. Easily grown in an ordinary cool greenhouse, being nearly, if not quite hardy, plants having stood out-of-doors during the last two winters.

For Conservatory Decoration it is most valuable from the long duration of the flowers, whilst for Cut Flower purposes its neatness of form and bright colour place its usefulness beyond any other sort.

Having a good stock of this beautiful species now in bloom, we are able to offer them with

Two to six flowers, at . . . . . 3s. 6d. each.

Larger plants . . . 5s., 7s. 6d., and 10s. 6d. . .

Extra strong . . . . . 15s., 21s., and 42s. . .

**J. BACKHOUSE & SON**, The Nurseries, York.

Price to the Trade on application.

## DAFFODILS—TO THE TRADE PRINCEPS, GRAND TRUMPETER.

One of the very earliest to bloom.

May be had in large quantity. For park planting one of the best.

Six other good sorts to offer the Trade, and "Little Book" post-free.

## NEW CATALOGUE FOR 1885.

Beautiful Flowers for Indoors, selected from an immense stock. Our Glasshouses cover nearly 2 acres.

**Wm. Clibran & Son's New List**  
(90 Pages Double Column)

Of the newest and finest varieties of all classes of Plants for Greenhouses, Stoves, &c., may now be had for two stamps. It includes only the best varieties of their respective classes. Every season new sorts are added. Comparisons of the varieties when in bloom carefully made, and the inferior kinds discarded. Intending purchasers may rely, when selections are ordered as under, on being supplied with varieties of merit only.

The following cheap Collections of finest named kinds consist entirely of our selection. Purchasers may select from the Lists at Prices as per CATALOGUE, which please see before ordering elsewhere.

## SPECIAL NOTICE.

# GRAND EXHIBITION

OF

# ORCHIDS,

Stove and Greenhouse Flowering and Foliage Plants.

Open to the Public during May and June, from 9 a.m. till dusk daily (Sundays excepted).

ADMISSION FREE to those who have received Invitations, OR UPON PRESENTATION OF CARD.

A large Show House, 100 feet long by 22 feet wide, and an Odontoglossum House, 80 feet long, is especially devoted to the Orchid Exhibition, and visitors may rely upon seeing these beautiful plants with the greatest degree of comfort, the ventilation and means of ingress and egress, as well as the great width of the paths, being all that can be desired. The other Show Houses are gay with our large collection of Stove and Greenhouse Flowering and Foliage Plants, which have figured at the leading Shows, both at home and abroad, for many years, with uninterrupted success. In addition, the large Winter Garden, 100 feet long by 40 feet wide, being filled with a fine show of Foliage and Flowering Plants, will form an agreeable lounge to those wishing to avail themselves of this cool retreat.

VICTORIA & PARADISE  
UPPER HOLLOWAY, LONDON, N.  
NURSERIES.

# NEW ROSES.

# WM. PAUL & SON,

Rose Growers by Appointment to Her Majesty the Queen,

WALTHAM CROSS, HERTS,

respectfully invite attention to the following New Roses:—

## The "WALTHAM CLIMBING" ROSES, Nos. 1, 2, and 3.

Crimson Roses, of different shapes, and distinct shades of colour; No. 1 being the lightest, and No. 3 the darkest. They are seedlings from Gloire de Dijon, possessing all the good qualities of that well-known variety, and are recommended as supplying a long-felt want in the garden, namely, good hardy crimson autumn-flowering Climbing Roses, with fine foliage.

Plants ready the end of May, 10s. 6d. each, or 21s. the set of 3 varieties.

## W. F. BENNETT (Hybrid Tea-scented).

This Rose is recommended by the raiser (Mr. H. Bennett), as the finest red Rose yet introduced for winter blooming and cut blooms at all seasons. The flowers sent to Covent Garden have always realised higher prices than other red Roses in the market at the time. It is of the same colour as Général Jacqueminot, and from its size and the freedom with which the blooms are produced, it has been likened to a crimson "Niphetos."

WM. PAUL & SON have been appointed Sole Agents for the sale of this Rose in Europe. Plants will be ready about June 1. The following prices are for nett cash, and include packing:—  
Single Plants, 15s.; 5 Plants, £3 15s.; 10 Plants, £5 17s.  
Special Prices for larger quantities.

## WM. PAUL & SON'S

# NEW ROSES OF 1884.

CHARLES LAMB (H.P.) Clear bright red.	} Garden Roses.
GARDEN FAVOURITE (B.P.) Fresh pink.	
ELLA GORDON (H.P.) Bright cherry colour.	} Show Roses.
LADY OF THE LAKE (H.P.) Peach colour.	
EMPEROR (H.P.) Very dark, almost black.	} Buttonhole Roses.
EMPRESS (H.P.) White with pink centres.	

Strong Plants, Price 3s. 6d. each.

## SUNSET (Tea-scented).

A sport from Perle des Jardins, with deep Apricot flowers, beautiful in bud; fine for forcing and cutting. First-class Certificate to WM. PAUL & SON.

Price 2s. 6d. to 3s. 6d. each.

## GLOIRE LYONNAISE (H.P.).

A yellow Hybrid Perpetual, partaking of some of the characteristics of the Tea Roses; flowers chrome-yellow, large and full.

Price 3s. 6d. each, 36s. per dozen.

## QUEEN OF QUEENS (H.P.)

(Wm. Paul & Son).

Pink with blush edges, perfect in form, every shoot crowned with a flower-bud. First-class Certificate. Equally good as a garden and exhibition Rose, and decidedly the finest Rose of its colour.

Price 2s. 6d. to 3s. 6d. each.

All other New Roses, both English and Foreign, in strong plants at moderate prices.

Also a large stock of the older varieties, in pots, for spring and summer planting, pot culture, climbing, &c.

Priced descriptive Catalogue, post-free, on application.

See House of Roses, &c., at the Inventions Exhibition, South Kensington, S.W. (near the Concert Room).

HERTS.

THE

# Gardeners' Chronicle.

SATURDAY, MAY 30, 1885.

## GILSLAND.

"And minstrels as they marched in order,  
Play'd 'Noble Lord Dacre, he dwells on the border.'"

THE Spa at Gilsland is a spot now fairly famous among the health and pleasure seekers of the North. It is situated among the moors that lie between Newcastle and the coast of Cumberland, a country famed in the narrative of English history, and since the publication of *Guy Mannering*, rich in that kind of romance which Sir Walter Scott best mastered, and which reproduced in vivid portraiture the people and the habits of past times.

A famous son of the Duke of Norfolk, who at nine years old beheld his father's execution at Tower Hill, Lord William Howard, known afterwards as "Belted Will," became Lord of Gilsland by marriage with the heiress of the Dacres.

The family of Dacre dwelt at Naworth Castle near Gilsland, during 260 years, and their motto, "*Fort en loialtie*," and the three scallop shells of their shield, still remain over the entrance gate. After the death of Mary, Queen of Scots, whom his father had served too well, Lord William Howard, of Naworth, was appointed Lord of the Marches, and in that capacity he prosecuted sixty-eight felons and hanged some of them.

A tree on which delinquents were suspended is still standing at Naworth. "Belted Will" was a student and accomplished man of letters, as well as a man of action, though the two characters are rarely combined, and one day, being in his library bending his ardent spirit to intellectual inquiries, an attendant who had captured a Moss-trooper burst into the apartment. "Oh, hang the man!" cried Belted Will, much vexed at the interruption; and the wretched Moss-trooper was hanged immediately. An hour afterwards the lord of Gilsland, who was punctilious in the performance of his official duties, ordered the captive into his presence. It was too late—the prisoner was swinging in the wind from a bough of the tree outside. No other Oak in England, probably, has borne so many such acorns.

In spite of the catastrophe which left Lord William a penniless orphan in his childhood, partly, perhaps, in consequence of the trials and troubles which awakened the natural energy of his character, he became one of the most illustrious members of the house of Howard, and the founder of its northern branches; his eldest son was the grandfather of the first Earl of Carlisle, his second son was the ancestor of the Howards of Corby Castle.

In the course of this short recital a few facts may be borrowed from the fiction of *Guy Mannering*, for Dandie Dinmont and Meg Merri-les are characters true to the life, and this part of the country and its customs have never been so well described as by Sir Walter in that delightful novel. Less than a hundred years ago, lonely Gilsland, situated on the edge of the great stretch of moorland on its northern

boundary, was held in very bad repute. The judges on their way from Newcastle to Carlisle were escorted through this dangerous district by dragoons, and the mails were conveyed by a circuitous route. They now come by rail to Gilsland station, and all visitors come that way too; and if you alight and proceed towards the Shaw's Hotel, a mile distant, where 200 guests can be "accommodated," on the banks of the river Irthing, in a spacious building perched on the high cliff of the river, you will presently reach a burn which flows into the Irthing, and is called the Poltress, and which divides just here the counties of Northumberland and Cumberland, the Irthing below forming their division for a distance of 18 miles further. Immediately over the bridge on the right, on the Cumberland side, amid the cluster of houses which mainly form the village, is Mumps' Ha', or Beggars' Hotel, the inn where Dandie Dinmont met Meg Merrilees and told her of the death of Ellangowan. Two of the landladies of this ill-famed inn, a mother and daughter, were as desperately bad as any of the gang of moorland robbers who infested Gilsland and frequented Mumps' Ha' in their time. Scott perhaps founded his character of Meg Merrilees on these two wild women, and if you visit their place of burial in the churchyard of Upper Denton you may still read the inscriptions on their headstones. Both the mother and her heiress are described in the brief inscriptions to their memory on the enduring whinstone as of "Mumps' Hall." The dates of their death are 1717 and 1777, and the ages of the two females, each renowned in her day, were ninety-eight and one hundred years. Some verses to the memory of Meg, the younger, run as follows:—

"What I was once some may relate,  
What I am now is each one's fate;  
What I shall be none can explain,  
Till He that called call again."

Quitting the little village by the bridge over the Irthing we reach the hotel, taste the Gilsland water at the "Holy Well," then take the path on the banks of the stream, and proceed up the glen of the river to a spot which derives its interest from an incident in the life of Sir Walter Scott. On his way to the English Lakes, he paused at Gilsland, where he met Miss Carpenter, his future wife, at the Spa. He accordingly changed his mind as to the Lakes, and remained some time on the banks of the Irthing.

A large grey block of stone near the bed of the river, and a Hawthorn bush on the strip of turf on its margin, a short distance from the hotel, are known in the homely language of Northern folk as the "Popping Stone" and the "Kissing Bush."

Shut in from the outer world the Irthing runs here through a ravine with high precipitous cliffs. The fame of Scott, and the convenience of the hotel, bring many tourists to this spot, and I soon met a party of young people returning from a visit to the "lions" of the place. "Which is the famous stone?" I asked. "Yon's it," replied one of the ladies. "And which is the 'milk-white Thorn'?" They seemed puzzled for a moment, so I declaimed the well-known verses of Burns, and the whole party brightened up at once and pointed to the object of my little pilgrimage close to the very tree where the "modest pair"—afterwards Sir Walter and Lady Scott—breathed out "the tender tale." Some middle-aged people were staring about. Was this the bush? They thought so, but "didn't know much about it," they said—nor did they seem to care.

I afterwards visited the house where Miss Carpenter resided with her guardians at the time of her meeting the great and good man, whose happiness she shared till she predeceased him by a few years. A steep slope

with a path through its woodland leads from the ravine, and in climbing it I sat down by the side of a stout and middle-aged visitor at the Spa. "Steep is it not?" I observed. "Yes," was the reply, "too steep for my aspirations! so I've set myself down to rest a bit." The house proved to be a small mansion, now used as a farmhouse, where visitors may find apartments; and I should say in conclusion, that all the old romance in Gilsland has grown mouldy, and that any visitor who would deal in that commodity must bring it with him. *H. E.*

## New Garden Plants.

WARREA CYANEA (Lindl.) ALBA, *n. var.*

MESSRS. J. VEITCH & SONS have just sent me a fine variety of this well-known species, with a pure white lip, in lieu of the sky-blue one. The peduncle is light reddish. *H. G. Rehb. f.*

CÆLOGYNE LACTEA, *n. sp.\**

This is an awkward plant. I have had it before—perhaps thirty years ago, but avoided its disagreeable publication. I have now to thank, for a fresh knowledge, Mr. J. Day, who most kindly sent me, both in 1884 and 1885, bulbs and racemes. Mr. Day well recognised its difference from *Cœlogyne*, in bulb and leaves, but the flowers come near those of *Cœlogyne flaccida*, though the raceme appears never to reach the same length and hanging direction. It has not those long dark bulbs and long petioled, narrow, nearly plaited, leaves, but a short, shining, thick, fusiform pseudobulb, with few blunt ribs (six) and short petioled broad leaves of parchment texture. The flowers are very much like those of the old *Cœlogyne flaccida*, Lindl., milk-white with brown veins on the lip, brown lines on the column, and some yellow spots on the disc. *H. G. Rehb. f.*

CATTLEYA RESPLENDENS, *n. hybr. nat.?*

Take a *Cattleya granulosa* and give it flowers of *Cattleya Schilleriana*, the long sepals being placed as in the first, and the very narrow long petals much undulated, then you have this plant. The dull olive-brown sepals and petals have thinly scattered purple spots, and remind one of *Cattleya guttata* Leopoldi. The lip is fine white, with warm amethyst keels and small warts of the same colour. The cuneate bilobed stalked mid-lacinia of the lip has numerous rough warts in the middle and many keels on the lateral parts, which, of course, are externally toothletted. The side-laciniae are much developed and very acuminate.

There is scarcely a year in which Mr. S. Low has not puzzled us with the *Cattleya* intricata, and now comes again such an individual which, finding no place anywhere under the known species, must get a proper name. Mr. S. Low and his staff think it a mule between *Cattleya granulosa* and *Cattleya Schilleriana*, and they may most probably be right. *H. G. Rehb. f.*

RODRIGUEZIA LEEANA (*Rehb. f.*) VAR. PICTA, *nov. var.*

The original type, dedicated to excellent Mr. Lee, had only mauve-purple on the ovary and column. A fine variety before me is quite covered with numerous mauve-purple lines and spots, which are almost circular on the fine lip. I had this neat novelty from my eldest English correspondent, Mr. S. Low, in firm Messrs. H. Low & Co. I must, however, confess I had the variety, though far inferior, as the spots were much less numerous, and not so dark before. My sketch, accidentally, has no remark about the source—no doubt an English stove. I well remember I then thought the individual not distinct enough to deserve a proper variety name—there are so many, many. *H. G. Rehb. f.*

\* *Cœlogyne lactea*, *n. sp.*—Pseudobulbo abbreviato crasso fusiformi paucicostato vemicio; foliis petiolatis cuneato oblongis acutis pergameneis; racemo porrecto paniculato; sepalis oblongis obtuse acutis; tepalibus linearibus; labello trifido angulatis late obtusatis; lacinia mediana porrecta; carinis crenulatis tenuis a basi in basin laciniae antice; androclinio trilobo; lobo mediano retuso. *H. G. Rehb. f.*

DENDROBIUM NOBILE COOKSONIANUM, *Rehb. f.*

A glorious variety. It is an improved *Tollianum*, having the median area of the petals covered by a very deep purple blotch, and the top of the petals with a purple border. The base of petals is hastate, thickened in the middle, and then with some velvet. I learn this curious plant appeared some years ago, that it has flowered each year constantly, and that similar plants have been propagated from it. It was kindly sent by Mr. Norman C. Cookson, Oakwood, Wylam-on-Tyne, whose name it justly bears. *H. G. Rehb. f.*

[This is the flower referred to by Professor Reichenbach in the *Gardeners' Chronicle*, May 19, 1883, and was taken from the plant exhibited at the Royal Horticultural Society's meeting on March 10, 1885, under the name of *Dendrobium nobilissimum*.]

SACCOLABIUM CELESTE, *n. sp.\**

One of the finest surprises I ever enjoyed. Take a short inflorescence of a white flowered *Saccolabium guttatum* (3 to 4 inches long), and imagine the dilated rhombic anterior part of the lip to be of the finest Italian sky-blue, 'as also to the tips of petals and sepals, a blue tint on both sides of the centre of the recurved spur, and then add brown anthers with a flush of mauve, and you will be able to form an idea of the lovely thing. It has also a botanic merit of its own. Inside the compressed, blunt, slightly recurved spur rise from the apex of the under-side two falcate subulate bodies against the mouth of the spur. I received this from Sir Trevor Lawrence, who kindly forwarded two fine inflorescences, informing me that the habit of the plant is that of *Saccolabium curvifolium*, Lindl. It is, to my taste at least, a lovely and most desirable thing. *H. G. Rehb. f.*

## DOUBLE DAFFODILS.

AMONGST the many points of interest discussed in the instructive article on p. 563, there are two or three to which I have paid particular attention, and I have made experiments about them. I will speak first of the condition of polyphyly, mentioned on p. 564 (column 3). That this is a mere accidental deformity, and not constant or extending beyond the individual flower in which it takes place, may easily be proved by any one who takes the trouble to mark a bulb producing it. It is easy in any large bed of wild Daffodils to find flowers with five, seven, or eight segments of the perianth, but the same bulb often produces one deformed flower, and two or three others normal in form. The flowers with eight segments are often very ornamental, the alternation of the outer and the inner segments, which may be of very different width, presenting a sort of double cross. I have marked these flowers, and found that next season they revert to the normal form.

I must add, however, that in this soil all double flowers show a tendency to undouble. Though I have carefully labelled my Daffodils, and watched them for many years, I have never even suspected one of changing from single to double, but I have seen many changes from double to single, especially the small wild double form of *N. Pseudo-Narcissus*, and both the typical and the Orange-crowned form of *N. incomparabilis*. It is rare to find a whole bunch of them perfectly single, and when I have selected perfectly single flowers, and tried to perpetuate them, they have, when transplanted, reverted to a form more or less double, showing that they continue to be "potentially" double. I have particularly noticed this because a question has been raised whether a Daffodil sold as *Mary Anderson* is the true single of the Orange-crowned *N. incomparabilis*, of which the double is sold as "*Orange Phoenix*." I have for three or four years looked out for and found perfectly single flowers amongst clumps of *Orange Phoenix*, and dug them up when in flower, but I have never succeeded in keeping a stock of perfectly single *Orange Phoenix*. I send specimens of *N. incomparabilis* which have undoubtedly reverted from double, and still retain slight traces of doubling.

Another interesting question is raised as to whether a series of links can be found connecting the small wild form of double *N. Pseudo-Narcissus* with the largest size of double *Telamonius*. In answer to this I say the

\* *Saccolabium celeste*, *n. sp.*—Racemo densifloro breviusculo sepalis tepalisque cuneato-oblongis obtusiusculis, labelli auriculæ sub columna angulatis micantissimis, lamina cum columnæ ascendenti subparallelæ unguiculatæ acutæ rhombico-obtusangulæ, calcaris compresso-obtusulo curvulo, aristis geminis, inclusis ab apice inferiore antrosoris Rhynchostylis celestibus. *H. G. Rehb. f.*

as far as a collection of the flower goes, undoubtedly it can. I have had hundreds of double flowers reputed to be "truly wild" sent to me from all parts of the kingdom, some of which I sent to Mr. Barr, and he confessed that he was quite unable to determine to which of the two varieties they belonged. But if asked to give an opinion, formed from my own observation and experience, I should certainly say that the two double Daffodils, *N. Pseudo-Narcissus* and *N. Telamonius*, however the latter may originate, are, when once made, quite distinct from one another. For several years I have received every season from different parts of the country both flowers and bulbs of single and double Daffodils found growing together in the same field. These are sent as an alleged proof of the conversion of the single into double. I have cultivated all the bulbs sent. Sometimes the doubles have proved to be the true wild Daffodil, but far more frequently the bulbs which have produced small and doubtful double flowers in their wild state have, after cultivation for one or two seasons, become precisely similar in the size and form of their flowers to the ordinary *Telamonius* of gardens. The only way to prove these bulbs is to grow them all for two or three years in the same soil and situation, and then their true nature is brought out. I find, in fact, that in 95 per cent. of the instances in which typical single *Pseudo-Narcissus* is found in fields mixed with double Daffodils, the double proves to be *N. Telamonius*. Whether it has been converted to double from the small single form is another question which it is impossible to answer, unless its past history is accurately known. I have planted single wild Daffodils and double garden Daffodils together in some of my fields, and both keep their characters distinct; and other gardeners a century or two ago may have been equally enterprising. In fact, it is difficult to prove that any spot in the kingdom where garden flowers may be found has ever been cultivated or inhibited. I have more than once been startled in the middle of a moor in the wildest parts of the Scotch Highlands by seeing a distinct ridge and furrow mark amongst the Heather.

Those who have read my notes in the *Gardeners' Chronicle* upon the metamorphosis from single wild Daffodil to double *Telamonius* may be surprised at my now arguing against myself; but I have always said that my own experience is quite at variance with that of others on this point, and I only have asked that the very full and detailed evidence of others should be fairly examined and tested, and not rejected at once on the ground of antecedent improbability. The soil of my garden, as I have said, is the opposite of doubling—chiefly, I believe, because it is cold. As the land here lies on a slope, in which beds of clay and sand alternate, the water with which the sandy strata are filled is forced upwards through thin parts of the clay in which it becomes spread, and though it cannot get through to the surface it keeps the subsoil so cold that the sun warmth penetrates to a very small depth. I find I can keep flowers double on raised beds under a south wall; but planted on north borders, however rich the soil, the same flowers soon turn single. I believe that doubling depends as much on such accidents as the power of soil for retaining warmth, as upon its chemical properties. According to accounts I receive doubles of Daffodils are produced more readily in the South of France, in Italy, and in Portugal, than in England; but about this I am trying to collect more certain information. *C. Wolley Dod, Edge Hall, Malpas, May 2.*

## DISEASES OF ORCHIDS AS CAUSED BY FUNGI.

THERE is probably no natural order of plants more free from the attacks of parasitic fungi than the Orchidaceæ, and the reason for this is fairly obvious. Parasitic fungi grow to the best advantage on plants having a soft and spongy texture, and which bear leaves which have a thin epidermis, slight development of cuticle, and large stomata, or organs for the transpiration of fine watery vapour. Many Orchids have very hard leaves, furnished with a very compact epidermis, an extraordinary development of thick cuticle, and very small stomata. The germinating spores of fungi cannot pierce the thick cuticle, or find sufficiently large openings for themselves in the very small stomata. The foliage of many Orchids is armour-plated and spore-proof.

The fungi of Orchids chiefly attack seedlings, very

young plants, or those species which have thin soft herb-like and tender leaves.

In imperfectly ventilated Orchid-houses a very minute white mildew often spreads from the sphagnum and compost on to the pseudobulbs, especially of very young examples of Orchids. In bad cases—which are far from uncommon—this fungus will sometimes in one night completely cover young plants, and cause their death. It is especially fatal to very small and very young and tender plants. I have many times grown this mould, but it seldom bears spores. With me it has always produced some common species of *Acremonium*, a genus of fungi peculiar to decaying leaves, twigs, and wood. The same fungus is very common in Fern-houses, it especially attacks the tender ends of the fronds of Ferns, especially *Todeas*. Bad ventilation and damp stagnant air are requirements this fungus most needs for its extension. A free current of air, without watery vapour, will cause the fungus to disappear. It never grows in well ventilated houses.

FIG. 154.—FUNGUS WHICH CAUSES DISEASE IN ORCHIDS (TRICHOBASIS LYNCHII)

A, Portion of leaf real size; B, Portion of under-surface, magnified; C, Stomata; D, Section through leaf; E, Spores.

A very serious plague of Orchids is the disease known as "black spot." There are two varieties of spot, one black and dry, the other less dark in tint, and moist; both are at times fatal to Orchids. I have seen examples of this disease so bad that every leaf in a house of certain genera, as of *Masdevallia*, has been spotted with black, like the leaves of *Orchis maculata*. In the damper spots a fungus is sometimes detected which the Rev. M. J. Berkeley has named *Protomyces concomitans* (see *Gard. Chron.*, 1882, p. 397, fig. 63). The mycelium of this fungus grows in necklace-like threads, which bear globular pale brown spores. There is no difficulty in finding the fungus when spots in the proper condition of moisture are lighted upon, but to me it has always appeared doubtful whether the fungus really causes the spot: it may, however, do so. All sorts of waifs and strays amongst fungi find themselves located under *Protomyces*, and many of the species are badly defined and very imperfectly understood. *Protomyces* is a sort of "cold-harbour," a refuge for destitute fungi, with poor accommodation. Some

forms are probably mere conditions of very diverse fungi. When "black spot" occurs in Orchid-houses the only plan for its extirpation is the removal and burning of the spotted leaves. Whether the *Protomyces* causes the disfigurement or not, this is the best and only plan for its destruction.

Messrs. Berkeley and Curtis have recorded a third fungus, named *Gloeosporium cinctum*, as growing upon Orchids in the Orchid-houses of Massachusetts. This fungus is a close ally of a species which causes disease in Cucumbers in this country, named *G. laticolor*. The Orchid fungus forms little scattered patches, on which small pustules are seated surrounded by the blackened cuticle.

British Orchids are sometimes invaded by an orange-rust fungus, named *Uredo orchidis*; till recent times this orange fungus was considered to be a variety of *U. confluens*, a parasite of *Mercurialis perennis* and *M. annua*. A variety of *U. confluens* was also said to grow on *Euonymus europæus*—this was called var. *euonymi*. The *Uredo* of Orchids is now generally believed to be a distinct species. The point is worthy of special note, for if *U. orchidis* is really distinct no fear need be entertained of an invasion from diseased plant of *Mercurialis* and *Euonymus*. British Orchids are also attacked by a yellowish Cluster-cup fungus, named *Æcidium orchidearum*. There is, of course, a possibility of this plant and *Uredo orchidis* invading certain genera of Orchids in Orchid-houses, but as far as my experience goes both are at present uncommon—may they always keep so.

It will be noted that a *Uredo*, an *Æcidium*, and, as I shall immediately show, a *Trichobasis*, all grow on Orchids. The gentlemen who believe that the *Æcidium* of Barberry bushes causes *Puccinia* (mildew) of corn, tell us that the *Æcidium* of Orchids is not genetically connected with the *Uredo* on its own leaves, but that the *Æcidium* is one form of a *Puccinia* found on a grass common in wet places, and named *Molinia cærulea*. What the ultimate condition of the *Uredo* of Orchids may be, or on what plant it flies to, to perfect itself, they say is "at present doubtful." The *Trichobasis* mentioned below is also probably "doubtful."—I have seen no reference to any of its supposed relations. The varieties or species of *Uredo*, named *U. confluens* and *U. euonymi*, are also both placed in the "doubtful" class; and all three species (including *U. orchidis*), are now called *Cocoma* by some botanists. The old name "*confluens*" has also been obliterated in favour of "*Mercurialis perennis*." If these particulars were not given, it would be simply impossible for any student to find the species here referred to in the more modern books on fungi.

One of the most interesting of Orchid fungi, allied to the orange-rust *Uredo* just mentioned, is a fungus detected at Kew by Mr. R. Irwin Lynch, of Cambridge, growing upon a species of *Spiranthes* from Trinidad. Mr. Berkeley has named this species *Trichobasis Lynchii*, and as I believe it has not hitherto been illustrated an engraving of it is given herewith (fig. 154). The example from which the illustration was made was obligingly lent by Dr. M. C. Cooke. A represents the end of a leaf of *Spiranthes* dotted over with the small, sometimes confluent, ochreous disease pustules; B shows a fragment of the lower surface of the leaf enlarged forty diameters: this shows the spore-masses of the fungus bursting through the ruptured epidermis; stomata are shown at C C. At D a section of the extremely thin leaf is given with the *Trichobasis* bursting through the lower and softer surface. The extraordinary thinness and looseness of the leaf will be remarked as compared with the very much thicker and more compact leaves of the different Orchids illustrated in former numbers. The fungus has clearly invaded a leaf exactly suited to its requirements. At E the yellow spores or reproductive bodies of this fungus are shown. The spores are interesting objects under the microscope, beautifully spinulose, and very large in comparison with the smaller and perfectly plain spores of *Uredo orchidis* and *U. confluens*. Wherever this fungus is seen it should be at once burnt, notwithstanding its beauty—"Beauty is as beauty does."

No doubt other fungi attack Orchids, but the species above mentioned are the only ones that have been specially noted by me. *W. G. Smith.*

POISONING BY SNOWBERRIES.—Mr. Amyot, of Diss, records in the *British Medical Journal* a case of poisoning by the berries of the Snowberry (*Symphoricarpos racemosus*). Four children suffered from acrid-narcotic poisoning in consequence of having eaten largely of these berries. No other cause could be assigned. This is the first time we ever heard of ill-effects from these fruits.

## MARKET GARDENING.

(Continued from p. 308).

It is not only spring-sown seeds and plants of the Brassica tribe market garden farmers consider and treat as being much harder than do professional gardeners. They adopt the same practice prominently with the culture of summer or autumn sown and planted Cabbages also. Within the area of enclosed and protected gardens, Cabbage seeds are generally only sown late in July. The young seedling plants which result from such a sowing are transplanted into a permanent bed late in the autumn; the invariable rule being, that the plants are small and not too leafy, else it is imagined they will not contend with such frosts as occur. Hence it is that "white hearts" are so late in the spring, indeed it is a fact that long before any signs of hearted Cabbages exist in gardens proper, they are being hurried into market by the waggonloads—and waggonloads are no small matter—from open and wholly exposed fields.

How is this great difference to be accounted for? The market gardener sows his seeds a month or earlier than the private grower. His seedling plants are double, or triple the size, and he does not hesitate to transplant such large plants, finally, into extensive fields, any time between the months of September and January. So large are these young Cabbage plants when transplanted, that they all but cover the fields with a mantle of green when first planted out. This is the usual practice around Rainham, the locality so celebrated in the metropolitan markets for early and fine Cabbages.

Such a practice and such results would seem more in keeping with sheltered and enclosed gardens than with extensive fields, but it is known such rules and results do not generally exist. Obviously, the supposed tenderness of these hardy plants has done much to deter from a practice which shows all gain in its favour.

It will serve no good purpose for me to give any but facts, regarding an important fallacy in the system of final transplanting this crop, as followed by professional gardeners, by contrast with the market gardener—a fallacy which, consists in considering the plants to be comparatively tender, owing to the fact that they occasionally rot at the collar or the base of the lower leaves. The latter drawback, when it does occur, is really attributable, oftener than not, to too deep planting—by which means the collar of each plant is brought in immediate contact with the soil with the adverse result as already given. The field grower is particular not to place more stalk, or stem, into the soil than such as is possessed of roots; such roots being made very firm in the ground. The professional gardener's plan of burying the whole stalk of each plant below ground destroys the chance of making the real roots quite firm. The evil of loose planting—it might not inaptly be called "hanging"—the plant is increased by the facts already referred to, of recent deep digging and the inherent looseness of the whole bed.

When it is known that a cabbage will grow from a wall equally well with a Wallflower, it will readily be seen that deep planting in loose soil is not exactly suited for it.

Many years ago I recommended in these pages the planting of autumn Cabbage plants upon old Onion-beds without digging them up; others have recommended the practice since, and the above facts show why crops succeed so much better upon such firm ground than upon loosely worked soil and with imperfect dibbling out of the plants.

## HARDY GREENS.

The field grower, again, produces fine hard-headed, white-hearted, winter Cabbages in abundance. These he names "hardy greens." They are the stay of markets during the long winter months. Kales, &c., upon which professional gardeners rely for their winter supply, being but secondary to these in a marketable and money point of view. Yet "hardy greens" are too generally absent from private gardens. To those who do not know them, it may be said they are very hardy counterparts of the late summer Coleworts, of the rosette type, and our markets are fully supplied with them from the month of September or October throughout the winter onward until Early York, Rainham, or Enfield Market summer Cabbages come in. On May 1 acres of seed-beds of such were to be seen in market garden farms, the seeds having

been sown, as before intimated, during the latter part of the month of February or early in the month of March.

Seedling plants in such seed-beds are often subject during dry springs to the ravages of Turnip-fly; growers, therefore, resort to the simple plan of sowing spent Hops thickly over the beds, which often prove a great deterrent to such attacks. Though these seed-beds are sown thus early, the tender young plants make good way against even cold frosty nights in April, and are often large enough for hoeing about the beginning of May.

The style of hoeing in market gardens is an admirable one also. Short-handled hoes are used, the workman bending down to his work, and by the dexterous use of the hoe he cuts out, right and left, with great rapidity, all seedling weeds, so that in a fortnight or so after the hoeing process the seed-bed presents one unbroken surface of young plants, densely packed together, of great uniformity and, I may add, beauty. The price paid per acre for such hoeing work is extremely low. Fields of Onions, both autumn-sown Lisbons and spring-sown Spanish, are rapidly and cheaply cleaned in the same way, women as well as men being engaged in the operation. Probably one of the finest sights in culture I have ever witnessed was the immense fields of pickling Onions upon certain farms in Essex, in company with Mr. Whitehead, of Maidstone, when I had the honour to judge them for the Royal Agricultural Society's prizes a few years ago. The fields, up hill and down, were more like one continuous fresh mown lawn than anything else I can liken them to.

The early and successional transplanting of hardy Greens, &c., I must defer for a future communication. William Earley.

(To be continued.)

## ZAMIA TONKINENSIS.

THERE are few families of which I suppose our collections have been, proportionately to their size, so enriched by nurserymen as the Cycadeæ. On the other hand there can be scarcely any of which the synonyms have been more cruelly confused at the same hands. *Zamia tonkinensis* is an extraordinary example. At first sight it will occur to any one interested in the family that, the geographical distribution of the genera being so closely circumscribed and so well ascertained, the occurrence of a true *Zamia* in the Old World is in the last degree improbable. I awaited therefore the appearance of the plate promised in the *Revue Horticole* of this species (t. 547) with no small interest. If I was not exactly surprised, I could hardly avoid a little feeling of wonder to find that it was no *Zamia* at all, but an undoubted *Cycas*. The presence of an obvious midrib in the pinnae makes the true attribution, as it were, "jump to the eyes." That the plant is one of considerable interest must however be freely admitted.

At first blush it recalls the *Cycas undulata* of Williams' catalogue of new plants for 1881, p. 24. That species is figured with unarméd petioles. But a friend obligingly communicated to me by Mr. Williams in 1882, shows that the figure is not quite correct in that respect. It may, however, be that in older plants the spines become somewhat evanescent, and that would confirm the opinion which I have formed that Mr. Williams' plant is nearly related to the *Cycas* of Fiji, C. Seemannii, in which the petioles tend undoubtedly to become spineless. But I am inclined to think that the so-called *Zamia tonkinensis* is to be identified with a *Cycas* which occurs in South China, but of which, at present, I have insufficient material to form a definite conclusion about. I have fronds most obligingly obtained for me by Mr. George Phillips, formerly H.M. Consul at Swatow. In this plant the pinnules have a coriaceous texture with highly polished upper surface and undulate margins, the totality of which points indicate a certain stiffness of habit different to what we see in *Cycas Rumphii*, or any of the Eastern types of the genus. But fairly agreeing with the plate in the *Illustration Horticole*.

Though I am obliged, therefore, to protest against the latter being called a *Zamia*, I am quite pre-

pared to see in it a distinct species when we get materials for studying its reproductive organs. W. T. Thielson Dyer.

## OPEN-AIR CULTURE OF ORCHIDS.

THE experiments that have been carried out by Mr. Smee and his intelligent gardener (Mr. Cummins) in his garden at Wallington have been repeatedly noticed in the gardening journals, the successful results following the adoption of the practice in regard to numerous genera and species finding, amongst amateur growers of Orchids many defenders and advocates.

Unfortunately few gardens possess the requisite conditions of sheltered position and numerous shady watercourses by which the culture of the plants is made possible. Mr. Smee's territory comprises almost as much water as dry land, so that the amount of dew deposited during the night-time, and the invisible mass of moisture present during the daytime in the months of July, August, and September, is much in excess of what is to be found in the generality of gardens.

But the easy and successful culture of many Orchids in the open deserves a fair trial where the conditions are at all favourable for it. Insect pests become much reduced, some dying out entirely on being brought into the open air—notably yellow thrips. The condensation of dew renders syringing in the morning needless; and although the foliage of some plants has not the grassy-green look of those grown under glass and artificial shading, but is bronzy, leathery, and stout, according to species, yet the flower development and strength of bulb which always accompany this are especially noticeable.

*Cypripedium insigne* has been left out for many years under a sheet of glass covering a small box, that is elevated above a ditch a few inches. This plant has not grown much, but it is fairly healthy, and its hardiness must be regarded as settled. *Dendrobium* are the plants which those gardens possessing a water-basin or small pool might manage very well, for they are found to delight in an open sunny a situation—with, of course, water beneath them—as the *Cactus* or the plants of New Holland. A *D. devonianum* has at this time (April 29) made just 6 feet of growth, half of which was made in the open, and the remainder since it was housed on October 1, 1884. *Masdevallias* are found to do as well in a thatched shed with wooden sides, light being admitted only by the glass door, as they did formerly in a well lighted house of the usual pattern. Seemingly the treatment that would be accorded a *Todea* or a *Killarney Fern* is just that which many *Masdevallias* require during the time preceding the blooming period.

Not all kinds of Orchids will endure open-air cultivation, but for the use of future experimentalists in this field we append a list of those found to do best, with short remarks on the behaviour of each. At the time of our last visit there were many plants in bloom which had passed four months outside in 1884, amongst them being *Odontoglossum Rossi*, *O. membranaceum*, many pieces of *O. crispum*, *O. Halli*, *O. sceptrum*, *Masdevallia Lirideni*, *M. Veitchii*, *M. Shuttleworthi*, *Ceoloyne ocellata*, *Dendrobium infundibulum*, *Ada aurantiaca*, *Oncidium concolor*.

Mr. Cummins has another aid to Orchid growing in Mushroom-beds, which he makes in his houses, the ammoniacal fumes from which exercise a beneficial influence on the growth of the plants subjected to them.

The following list, extracted from the *Journal of Horticulture*, will show what plants have been tried, and with what results:—

## Bloomed in Open Air.

<i>Acropera Loddigesii</i>	<i>Odontoglossum Alexandrie</i>
<i>Dendrobium chrysanthum</i>	cordatum
Wardiaoum	Lindleyanum
<i>Lycaste Sneeana</i>	Rossi varieties
<i>Masdevallia maculata</i>	<i>Oncidium dasylepis</i>
<i>Maxillaria grandiflora</i>	<i>Pleione lagoonaria</i>

## Showing Bloom when Taken In.

<i>Ceoloyne ocellata</i>	<i>Odontoglossum membranaceum</i>
<i>Cypripedium insigne</i>	" <i>Pescatorei</i>
<i>Dendrobium crassinode</i>	" <i>Alexandrie</i>
" <i>heterocarpum</i>	<i>Oncidium crispum</i>
" <i>nobile</i>	" <i>Forbesii</i>
Wardiaoum	" <i>macranthum</i>
<i>Epidendrum evectum</i>	" <i>seriatum</i>
<i>Lælia alba</i>	" <i>verrucozum</i>
" <i>autumnalis</i>	<i>Pleione maculata</i>
<i>Lycaste Skinneri</i>	<i>Trichostema suavis</i>
Deppai	<i>Vanda cœrulea</i>
<i>Odontoglossum bicornense</i>	

Tabulated Record of Experiments.

Date of Putting out.	Name of Plants.	Date of Housing.	Remarks.
July 12	Acropera Loddigesii	Oct. 6	Very strong, producing many flowers.
"	Vanda aurantiaca	" 3	Dark green foliage.
Aug. 4	Vandæum falcatum	" 4	Rooted freely.
July 5	Vanda Skinneri	" 3	Sickly when placed out, but made a quantity of fleshy roots in the open air.
" 3	" spectabilis	" 3	Ditto.
" 3	Brassia verrucosa	" 3	Made large pseudobulbs.
" 5	Cattleya Acklandiae	" 3	Remained at rest.
" 5	" citrina	" 3	Making strong growth.
" 5	Walkeriana	" 3	Ditto.
Aug. 11	Chysis aurea	" 6	Equal to those in houses.
July 18	Cœlogyne cristata	" 6	Larger growth than last year.
" 5	" ocellata	" 6	Ditto.
" 5	Cypripedium insigne	" 6	Good growth; made several leaves.
Aug. 11	Cyrtopodium Andersonii	" 1	Placed in full sun and rested well.
" 11	" punctatum	" 1	Ditto.
" 11	Dendrobium aggregatum majus	Sept. 27	At rest all the time.
" 11	" bigibulum	" 27	Completed good growth.
" 13	Boxalli	" 27	Ripened well in full sun.
" 13	calceolus	Oct. 1	Ditto.
" 16	Cambridgeanum	Sept. 27	Ditto.
" 16	" chrysanthum	" 27	Commenced growth after flowering.
" 16	" chrysotoxum	" 27	Well ripened.
" 11	" clavatum	Oct. 1	Ditto.
" 11	" crassicoele	" 1	Showing flower.
" 1	" crystallinum	" 1	Ditto.
" 11	Dalhouseanum	Sept. 27	Growing strongly.
" 11	" densiflorum	" 27	Fine growths, well ripened.
June 18	" Devonianum	Oct. 1	Very long pseudobulbs, well ripened.
Aug. 11	" fimbriatum	" 1	Strong.
" 11	" Findleyanum	Sept. 27	Strong and well ripened.
" 11	" formosum	" 27	Making strong growth.
" 1	" Freemannii	Oct. 1	Growing strongly.
July 18	" luteolum	Sept. 27	Rested.
" 18	" Jamesianum	Oct. 1	Enjoys cool night temperature.
Aug. 11	" macrophyllum	Spt. 27	Growing well.
" 13	" moschatum	Oct. 1	Ditto.
June 18	" nobile	" 1	Thick pseudobulbs, showing bloom.
Aug. 11	" " cœrulescens	" 1	Ditto.
" 13	" Paxtoni	" 1	Well ripened.
" 13	" Pierardi	" 1	Ditto.
June 18	" primulinum	" 1	Extra strong, lost nearly all leaves.
Aug. 13	" Schroederi	" 1	Well ripened.
June 18	" suavissimum	" 1	Ditto.
Aug. 13	" thysiflorum	Sept. 27	Ditto.
" 13	" transparens	" 27	Ditto.
June 11	" Wardianum	" 27	Very strong and blooming.
July 5	Disa grandiflora	Oct. 4	Made a flower-spike (damped off).
Aug. 11	Epidendrum evectum	Sept. 30	Making spikes and strong growth.
July 5	Lælia albida	" 3	Ditto.
" 5	" autumnalis	" 3	Ditto.
" 5	" majalis	" 3	Large pseudobulbs.
Aug. 14	" purpurata	" 30	Resting all the time.
July 5	Lycaste aromatica	Oct. 4	Growing freely.
" 5	" Deppei	" 4	Made good growth and showing bloom.
" 5	" Skinneri	" 4	Ditto.
" 5	" Smeekana	" 4	Large bulbs and bloomed in open.
" 5	Masdevallia coriacea	" 1	Made a number of leaves.
" 5	" ignea	" 1	Ditto.
" 5	" maculata	" 1	Ditto.
" 5	Maxillaria grandiflora	" 4	Large bulbs and leaves; bloomed.
" 5	Mesospidium sanguineum	" 4	Made satisfactory growth.
" 5	" vulcanicum	" 4	Ditto.
July 18	Odontoglossum Alex. andræ	" 6	Best varieties were potted and placed out last; made root and large broad leaves.
Aug. 13	" bictoniense	" 4	Good growth; showing flower.
July 5	" Cervantesi	" 4	The largest bulbs they have yet made.
" 5	" cirrosium	" 4	Growing well.

Tabulated Record of Experiments—(Continued).

Date of Putting out.	Name of Plants.	Date of Housing.	Remarks.
July 5	Odontoglossum cordatum	Oct. 4	Growing well and flowering.
" 5	" coronarium	" 4	Produced immense pseudobulbs.
" 5	" Ehrenbergi	" 4	Quite at home.
" 5	" gloriosum	" 4	Ditto.
" 5	" Hallii	" 4	Ditto.
" 5	" hystrix	" 4	Ditto.
" 5	" Lindleyanum	" 4	Ditto.
" 5	" membranaceum	" 4	Large pseudobulbs.
" 5	" nebulosum	" 4	Ditto.
" 5	" Pescatorei	" 4	Ditto.
" 5	" Erstedii	" 4	Growing very freely.
" 5	" ramosissimum	" 4	Ditto.
" 5	" roseum	" 4	Ditto.
" 5	" Rossi majis	" 4	Ditto.
" 5	" sceptrum	" 4	Ditto.
" 5	" triumphans	" 4	Ditto.
" 5	" Incidium Barkeri	" 4	Ditto.
" 5	" concinnum	" 4	Ditto.
" 5	" crispum	" 4	Made very large pseudobulbs; blooming.
" 5	" curtum	" 4	At home.
" 5	" dasystyle	" 4	Ditto.
" 5	" Forbesii	" 4	Similar growth to O. crispum.
" 5	" macranthum	" 4	Made good growth and long spike.
" 5	" Marshallianum	" 4	Growing well.
Aug. 10	" serratum	" 4	Equal to O. macranthum.
July 5	" stelligerum	" 4	Growing freely.
" 5	" verrucosum	" 4	Made good growth and branching spikes.
" 5	" Pilumna fragrans	" 4	Made good growth; showing flower.
Aug. 4	" Pleione lagenaria	" 4	Ripened well and bloomed.
" 4	" maculata	" 4	Ripened well; showing flower.
" 4	" Reichenbachiana	" 4	Ripened well.
July 5	" Soehroniis grandiflora	" 4	Plenty of fine growth.
Aug. 4	" Stanhopea tigrina	" 4	Commenced growing.
July 3	" Thunia alba	" 4	Well ripened in full sun.
" 3	" Marshalli	" 4	Ditto.
" 18	" Frichopilia suavis	" 4	Broad leaves and very healthy.
" 18	" Frichosma suavis	" 4	Good growth; showing well for flower.
Aug. 4	" Vanda cœrulea	" 4	Made leaves and flower-spike.
" 4	" cœrulescens	" 4	Healthy roots; foliage good colour.
" 4	" Denisoniana	" 4	Ditto.
" 4	" Roxburghii	" 4	Ditto.
" 4	" Zygopetalum Mackayi	" 4	Made a quantity of small growths.

## Dendrobiums that have Ripened Best in the Open Air.

Dendrobium densiflorum	Dendrobium nobile cœrulescens
" Devonianum	" Pierardi
" Cambridgeanum	" primulinum
" chrysanthum	" Schroederi
" crassicoele	" suavissimum
" Findleyanum	" thysiflorum
" heterocarpum	" Wardianum
" latiflorum	" Wallichianum
" nobile	" sanguinolentum

## Orchid Notes and Cleanings.

## ORCHIDS ROUND MANCHESTER.

*Smallwood, Fallowfield, Manchester.*—At this place, the residence of S. S. Whalley, Esq., a very nice collection of Orchids is being formed, and at the present time some really beautiful specimens are in flower. The first to attract attention is a nice plant of *Zygopetalum rostratum* growing in a basket; this is always hung up on the sunny side of the house, just above the Cattleyas, and would appear to like its position. The lip, which is the most prominent part of the flower, is broad, pure white striped with pink or rosy-purple, according to the variety—for like most species this varies very much in depth of colour. *Dendrobium Pierardi*, var. *latifolia*, is represented by a fine plant in a basket with bulbs 4 feet long, full of flower. *D. Paxtoni* is just coming nicely on with

fifty spikes of its rich golden-coloured flowers. Of *D. thysiflorum* a number of plants are flowering with from six to eighteen spikes; but perhaps among the *Dendrobiums* the most noticeable are some grand plants of *Dayanum*. These are in baskets, but the bulbs are now tied up, and the growths, which are 2 to 3 feet long, and have flowered about two-thirds of their length, present a most beautiful appearance. There are numerous flowering bulbs on each plant; the flowers, which are of a rich rosy-lilac with a fringed lip, are very compact in form, in this respect comparing very favourably with *D. macrophyllum*, which is much larger and more shaggy in appearance, though in other respects very similar. *Saccolabium premorsum* with six spikes is good; *Vandas* and *Aërides* are coming well on; of the latter some *Fieldingii* with branching spikes will be very good. *Cœlogyne pandurata* does very well here, and will in a very short time be opening its quaint flowers of black and green. Mr. G. Jackson has been successful with this species for several years past, never failing to flower it. *Cattleyas* and *Lælias* are just opening well, and soon will add considerably to the display.

*Wood Lawn, Didsbury.*—*Vanda teres* is again flowering freely with J. Broome, Esq., Wood Lawn, Didsbury. On the large plant already described in this paper we counted fifty spikes, which are producing four and five flowers each; two other plants are also showing, one with twelve spikes, the other four; if these should all open at one time there will be such a display of this magnificent Orchid as is very seldom seen. If *V. Hookeri* could be grown and flowered as freely as these plants, we should have a sight that would indeed be gorgeous. Amongst other *Vandas* are several specimens of *suavis*, variety *Gotteschalkii*. This form is stronger and stouter, the number of flowers on the spikes is more numerous than is usually met with, whilst the blooms are larger and very densely spotted. A grand plant of *D. devonianum* in a basket with twenty-five flowering bulbs, some 4 feet long, will shortly be a grand sight, and probably will be heard of again. *D. pulchellum* is well grown here—masses in baskets are covered with their snowy blossoms. Mr. A. Cole, who has recently taken entire charge of the glass erections here, is managing stove plants in a thoroughly practical manner, and the Orchids would appear to respond to the care and attention bestowed upon them.

## J. SOUTHGATE, ESQ., SELBORNE, STREATHAM.

This collection is well known amongst Orchid exhibitors; many are the fine examples it contains, and of course every year they are getting more numerous; all, however, whether specimens or not, display health and vigour in a manner plainly indicating that their requirements are well understood and supplied by Mr. Salter, the able gardener here. There is now a very good display of *Cattleya Skinneri* and *C. Skioneri alba*, *C. Mossii*, *C. Mendelii*, *C. Mendelii Selbornensis* (a fine variety), *C. Wagneri*, some fine types of *Lælia purpurata*, *Dendrobium Jamesianum*, *D. devonianum*, *D. crepidatum*, *D. Brymerianum*, *D. Parishii*, and *D. Falconeri*. *Masdevallias* are evidently "at home" here; a young plant of *Masdevallia Veitchii grandiflora* (carrying twelve spikes), *M. Chelsoni*, *M. Lindenii*, *M. chimera*, *M. ignea*, *M. Harryana*, *M. Shuttleworthii*, and *M. Reichenbachiana*—a good variety. In the *Masdevallia* house a nice piece of the curiously coloured *Restrepia antennifera* was in full bloom. A large selection of *Odontoglossums* are out just now, including *O. nebulosum*, *O. constrictum*, *O. Ruckerianum*, *O. sceptrum* and *O. sceptrum triumphans*, *O. Hallii*, *O. polyanthum*, *O. Erstedii*, *O. Cervantesi*, *O. Roezlii* and *Roezlii alba*, *O. triumphans*, *O. Rossi majis*, and *O. Andersonianum*. *Ada aurantiaca* was conspicuous amongst its less brilliant companions, which were contrasted also with various *Oncidium*s, such as the curious *O. cucullatum*, *O. macrothum*, *O. superbiens*, and *O. ampliatum*, *Pescatorea Lehmanni*, *Cœlogyne elata*, a fine large plant; *Huntleya velata*, *Lycaste Skinneri*, *Cymbidium Lowii*, a fine variety, with a grand labellum; *Maxillaria Farmeri* and *M. Harrisoni*, a grand variety of *Saccolabium ampullaceum*, *Phalænopsis Luddemanniana*, *Vanda suavis*, *V. Veitchii*, and *V. Patersoni*, *Epidendrum Wallisii*; a grand lot of *Cypripedium*s, consisting of *C. Schlimii*, *C. europæicum*, *C. Lindenii*, *C. selligerum*, *C. Roezlii*, *C. Harrisonianum*, *C. Haynaldianum*, *C. Druryi*, *C. Dominicanum*, *C. virens*, *C. niveum*, *C. Balleni*, and *C. lævigatum*; a fine plant of *Burlingtonia fragrans*,

with its delicate flowers and Hawthorn blossom scent was very sweet.

F. A. PHILLBRICK, ESQ., OLDFIELD, BICKLEY.

This is a beautiful little spot, and has about as choice a collection of Orchids as will be found round London. Each variety almost is worthy of description, but they are so numerous that it would be rather a lengthy process, and then would fall a long way short of conveying an adequate idea of the excellence of this valuable collection. *Phalaenopsis* grow well here. *P. grandiflora*, *P. rosea*, *P. Luddemaniaana*, and *P. Sanderiana* are in bloom. *Odontoglossums* are largely grown, and were represented in bloom by *O. Roetzlii* and *O. Roetzlii alba*, *O. vexillarium*, *O. Erstedi*, *O. Cervantesi*, *O. Rossi majus*, *O. Alexandræ*, *O. Ruckeriaeanum*, a fine variety of *O. nebulosum pardinum*, *O. Pescatorei*, *O. Wilckeanum*, *O. pulchellum majus*, a large piece of *O. citrosimum*, several bright varieties of *O. roseum*, and a large piece of *O. Reichenheimii*, a distinct angular-looking variety, much marked with dark brown, and a blush-violet lip; *Dendrobium thyrsiflorum*, a very deep-coloured *D. fimbriatum oculatum*, *D. Falconeri*, and a fine dwarf variety of *D. Jamesianum* were flowering well. The large genus of *Masdevallias* were represented by *M. Shuttleworthii*, *M. radiosa*, *M. Harryana*, *M. Harryana violacea*, *M. Harryana coerulescens*, *M. lilacina*, *M. conchiflora*, a superb variety of *M. Veitchii*, even better than the certificated *grandiflora*, being quite as long, and of much more breadth and substance of petal; and *M. ignea*. The following representatives of the genus *Cypripedium* occur:—*C. barbatum*, *C. barbatum grandiflorum*, *C. barbatum nigrum*, *C. Lowianum*, *C. mormophyllum*, *C. Warneri*, *C. selligerum*, *C. lævigatum*, *C. Pollettianum*, *C. biflorum*, *C. caudatum*, *C. villosum*, *C. hirsutissimum*, and *C. Boxalli*. *Epidendrum vitellinum*, *E. crassifolium*, *E. Wallacei*; *Oncidium cucullatum*, *O. ampliatum majus*; *Lycaste Skinneri*, and the lovely white variety *virginialis*; a fine form of *Saccolabium ampullaceum*, a fine plant of *Cymbidium Lowianum*, were all in flower. *Vanda tricolor*, *V. insignis*, *V. Veitchii*, *V. suavis*, and *V. Patersoni*, showed that *Vandas* are not neglected. *Cattleyas* are well represented by fine forms of *C. Mossiæ*, *C. Warneri*, *C. Mendelii*, *C. Skinneri*, *C. citrina*, a splendid *C. Skinneri oculata*, and *C. Mardelii*, one of *Veitch's* seedlings. *Lælia purpurata* is here represented by as fine a variety as one could wish for. Overhead, *Trichopilia crispata* and *T. crispata marginata* are flowering well.

### SISYRINCHIUM FILIFOLIUM.

THIS plant is known in the Falkland Islands as the "Pale Maiden," and has lately flowered with us for the first time. Our plants were brought home by Mrs. Brandon about a year ago, and seedlings sown at the same time are showing flower. The plant is of Rush-like habit, 6–8 inches high, and the bell-shaped flowers are erect, white, like porcelain, and each petal is delicately lined with pale purplish-red. Our sketch (fig. 155) shows the flowers natural size. Our plants have been grown in a cold frame, but no doubt it is perfectly hardy in mild localities. It is quite a dainty little beauty, well worth a place amongst rarities. It grows well in a mixture of peat and loam, and our strongest plant came over wedged tightly in a sod of *Lomaria alpina*. F. W. B.

### GARDEN WALKS.

IN starting to make garden walks, or in breaking up and reforming old ones, they should be dug out 6 inches deep, and when this is done, let a drain be made with strong tiles or pipes laid along in the middle or down one side, leading to a gradual fall where the water can be carried away into sewers, or got rid of by means of dead wells. Instead of laying drains, and having proper gratings leading to them, some make the great mistake of thinking that all they need do is to have plenty of rough material as a foundation to their walks, but there never was a greater fallacy, for though the rough material is necessary, it should never be in a loose state to draw off and hold water, but should be rammed down close and firm, for if not in this state the gravel above will always be shifting, and there will be a continuous hollow sound when walking over the surface, that will feel uncomfortable underfoot, and be unpleasant to the ear.

The best material for forming foundations is slag

or clinkers from ironworks or furnaces, which when broken up, are rough and rugged in outline, and bind well into the gravel, which soon becomes a solid mass, as if the two were welded together. If slag or clinkers cannot be obtained, broken stones and brickbats are a good substitute, but whichever is used it is advisable to throw over and amongst them some fine chalk, as that will help in holding them together, and keep down worms, which, without the chalk, often give a deal of trouble by throwing up casts and making the gravel look dirty. With 3 or 4 inches of foundation in and the brick and iron cesspools and gratings complete at regular intervals along the sides and at the right height the next thing is to give a layer of coarse gravel, and then finish off with another of finer stuff over the top. This, as previously remarked, should consist of about three parts of very fine stone, which,

the plant and moss shrivel up at once and leave their hold, and are swept away by the aid of a light twiggy broom. The only objection to the use of salt for garden walks is that it is dangerous for the edgings, but if these are of turf there is little or no risk if the salt is not placed too near to the sides, as the strength of it soaks down below the roots of the grass. Dilute vitriolic acid will also kill weeds on gravel, and is much used by some, but that, too, requires care in pouring it on, and is more expensive and dangerous than salt. J. S.

## The Rosery.

### POT CULTURE OF THE ROSE.

HEALTHY well grown Rose trees are greatly esteemed in season and out of season, that is if such a thing as being out of season could be thought of in relation to the blooming period of the Rose. Roses are ever seasonable and always welcome. Perhaps at no time are they more greatly esteemed than during the months of March, April, and May. I have given in previous numbers, and in considerable detail, the best method of pot culture for the entire season's growth, and would now urge the importance of carefully tending the plants after the flowering period is over. I am well aware that in most gardens it is very difficult indeed to find suitable accommodation for plants during the spring and early summer months, and nearly all plants, Roses included, that are grown to be forced are very much in the way when the flowering period is over, but it is very certain that unless the Roses are well cared for after the flowers are removed they will not flower so as to give satisfaction the following season. The plants have a sorry time of it at the best; wakened out of their winter's sleep at the dreariest season of the year, the young growths have to be made under conditions not akin to their nature, and it is the habit of plant life to resent this treatment. Roses do so more than most plants; they show by the thin texture and paler colour of their leaves that light and air has not been sufficient; and if the leaves show that they lack these essential elements so also will the flowers. The plants also suffer from the changes of temperature in transferring them from the forcing-house to the greenhouse or conservatory; but in this necessary state of transition the careful amateur will see that it is made as easy as possible. I may mention the way we successfully forced our own Roses for many years, as it may likewise be adopted by many gardeners. The early vinery was started about the last week in November, and to obtain a moist genial atmosphere a bed of some fermenting material was made up in the house. Over this the pots of Roses were placed, they were not plunged in it at first, as the heat would be excessive; subsequently, when it had cooled down somewhat, the Roses would have their pots plunged in it. Of course the usual treatment given to an early vinery is that best adapted to the Rose, and they used to grow, considering the circumstances, very vigorously; but before the flower-buds were sufficiently developed the Vine leaves crowded the space between the Roses and the glass, and they could not be expected to progress favourably—nor did they; we were enabled to take them out of this house and place them in the next vinery, which was started later. The temperature being much lower, and the leaves not having grown to obscure the light, the flowers made very satisfactory progress, and after remaining in this lower temperature for a week or two they will be ready to take their place in the greenhouse or conservatory. It is quite likely that the plants will be attacked by greenfly, mildew, or perhaps by both; but the remedy is easy and effectual if taken in time. Fumigate with tobacco smoke to destroy the greenfly, and dust with flowers of sulphur for the mildew. During the whole period of growth keep the plants quite as close to the glass as circumstances will permit, light and air being all important. When the plants have passed through the flowering period they must still be well cared for; place them in a light airy house if such is available preparatory to turning them out-of-doors. This refers principally to hybrid perpetuals and other hardy kinds. If possible such tender Roses as the *Teas* ought to be grown always under glass, with light and air freely admitted. Greenfly and mildew will appear on the plants under the best cultural conditions; but they are not so

FIG. 155.—SISYRINCHIUM FILIFOLIUM.

after being levelled with a rake, will be ready for rolling down, and this for the first time or two ought to be done when dry, but afterwards it is better to go over it immediately after rain, provided it does not lie up or become sloppy, as in a wet state it goes together and binds quickly after.

Old walks, though in fair condition as regards soundness, are often in an unsatisfactory state through moss and weeds on the surface, and many, to remedy these defects, make them look brighter, break them up, which, though it may destroy the weeds and give a fresher look, spoils the paths by mixing up the material they are constructed with, and making them loose and rough on the top. Instead of hoeing and stirring it is far better to apply salt, which, if used in the summer, when the weather is hot, will kill any weeds, and make the walks appear almost as good as if they were new. The way we manage is to sow it on thinly, and sprinkle with water from a fine-rosed pot immediately after, which helps to dissolve it quickly and carry it to the roots, when

liable to be attacked when they are kept in rude health by good treatment. It is during the summer months that Roses are so liable to be neglected out-of-doors in private gardens where they do not receive special treatment. I have seen plants placed in the front of a wall facing south, and there they stood through a long day in summer, no account being taken of the fierce heat reflected from the brick wall. The potting soil being dried up, and the leaves eaten up with red-spider, such plants could not possibly flower well the following season. The plants may well be placed out-of-doors after the middle of May, and they should have an open position exposed to the sun, and during dry, hot weather they ought to be syringed twice daily, in the morning and towards evening. The roots are kept in an equable temperature by the pots being plunged nearly to the rim in cocoa-nut fibre refuse. This treatment, with careful attention to watering, will keep the whole collection in healthy, vigorous growth during the summer. I repot once in a year, preferring to do this in August; at that time the roots take greedily to the new compost, and the plants become well established before their season of rest. They get injury by being exposed to continuous cold, late autumn rains, and it is best to place them in a dry, airy house, and keep moderately dry at the roots, before pruning them about the first week in November for another season's flowering. J. Douglas.

### FRITILLARIA MESSANENSIS.

This is a native of Sicily, and has a globose bulb; stems about 18 inches high, with 8—10 linear leaves. The bell-shaped perianth is nodding, with oblong obtuse segments, the outer ones more sharply pointed, vinous-purple, scarcely chequered, with a prominent green midrib, inner surface green with an ovate pit at the base. For the specimen figured (fig. 156), we are indebted to Messrs. Backhouse, of York.

### WINDOW GARDENING.

(Concluded from p. 692.)

Now as to the watering of your plants it is necessary to be methodical, and a little practice will teach you more than anything I can tell you. The best plan is to look over your plants every morning. As we have said, the soil itself is composed of particles through which air-spaces abound. The water must be just sufficient to keep these particles moist, and the air in the spaces is thus kept in the condition of moist air. The roots traverse these air-spaces, and it is, therefore, moist air which roots want rather than water. If it were water simply which plants wanted, we should cork up the bottom of the hole in the flower-pot, and prevent the water getting away. Instead of this we try to hasten the passing of the water through as much as possible, by not only keeping the hole as clear as possible, but often by putting pieces of broken material over the hole to act as drainage.

That plant will generally be the healthiest, therefore, which wants water most often. This will show that there are plenty of air-spaces, and that the roots are making good use of them. If it does not often want water it is in a bad way, and less water rather than more must be given.

The frequency of watering, then, should be according to the rapidity with which the water passes away. If, when you pour water on earth, it disappears almost instantaneously, it would be safe to water such plants every day. There are several methods adopted by professional gardeners in order to determine when a plant requires water:—

1. By the general appearance of the soil, or feeling it with the finger.

2. Tapping the pot with the knuckles. The pot has a sharp hollow sound or "ring" when the earth it contains is dry, and a dull heavy "thudding" sound when moist. Take a pot of dry soil and one recently soaked with water and try this experiment.

3. By lifting the pots and testing their weight, wet soil being, of course, much heavier than the same quantity when in a dry state.

Fill two pots with soil, water one only, and then lift them both for comparison. A little practical experience will soon enable you to tell when your plants are dry by each or all of the above methods.

Always use soft (*i.e.*, rain or river) water, in preference to that from wells or springs. In towns where water is supplied by the Corporation, expose

it to the sun in a wide tub or other vessel for a day or two before using it for your plants.

Never use cold water. Water for plants should be equal in temperature to the atmosphere of the room, case, or frame in which they are growing.

Never water a plant that is already wet; but when a plant is dry give it sufficient to moisten the ball of earth thoroughly.

Plants require water less frequently during dull damp weather than during the summer, when the sun is powerful and the light intense. Water for syringing or sprinkling should be quite free from mechanical impurities, as chalk or lime. Muddy water leaves spots and patches of dirt on the leaves after it has evaporated, and necessitates their being sponged clean.

If you notice a pot that does not get dry, but that appears to be in a wet and stagnant condition, turn out the sickly plant at once. Examine the crocks or drainage and displace it (without breaking the ball) if it is clogged up with wet soil. Look out for worms. If you see the holes and tracts, but no worms, tap the soil until they appear, and remove them. Now take a perfectly clean and dry pot (of the same size or even less), drain it, end turn your plant into it, pressing and shaking it down by gentle taps on the bench or

FIG. 156.—FRITILLARIA MESSANENSIS.

table. If the surface of the ball is moss-grown remove it with a blunt stick, and put a little fresh earth around it. Now your plant is in a fair way for recovery, and in nine cases out of ten, if carefully watered, it will recover its freshness and beauty.

Thus you will perceive that the four great essentials of healthy plant life are heat, air, light, and constant moisture. That all plants like heat rather than cold is proved by their rapid growth during the summer, as contrasted with their slow progress or absolute rest during winter. Air and light are as necessary for plants as for ourselves. I might even go a little further and say that when the plants grow up in your windows tall and thin, with wiry stalks and pale yellowish leaves, they indicate by their general appearance an insufficient amount of light and air. When this is the case more air and more light, through clean window-panes, would be beneficial.

We now come to the question of repotting or manuring. If you take a few Turnip or Mangel seeds and plant them in a field or garden they increase in weight and size very rapidly, so that what in the springtime was a pound of seed may, after growth for some months, become changed into several tons weight of produce. This increase of substance and weight is mainly the result of root-action, that is to say, the plants have absorbed all this weight of material from the soil in solution. It naturally

follows that the soil becomes less rich every time a crop is removed, and to supply the deficiency the farmer adds every year or two more plant-food in the shape of manures. Now what is true of the farm is true of the smallest plant in your window, the formation of every leaf and every blossom leaves the earth in your flower-pots poorer than it was before, hence after some months one of two things becomes necessary, you must either place the plant in a larger pot, adding at the same time more fresh earth, or you must add manure or plant food to the pot in which you wish the plant to thrive still longer. Sometimes it is convenient to retain plants in small pots, and then a pinch of guano or of sulphate of ammonia in a quart of water makes a first-rate stimulant, adding new life and vigour to any plants which had begun to show signs of stunted growth owing to their soil having become exhausted. As I said before, rain-water is best. Every gallon of fresh rain-water contains about half a grain of ammonia salts, and Liebig, the great agricultural chemist, calculated that this quantity per gallon is amply sufficient to nourish a forest of Oaks or other trees. Thus rain-water is the best you can use for your pet plants, and in towns it is rendered still more nourishing owing to the soot collected by it as it falls on the roof, ere it finds its way into your water-tub below.

I have alluded to plants as being perfect chemists in their way, selecting from the elements in the soil what they most require for building up their cells and fibres, their leaves and flowers. I have also alluded to some of our native wild flowers, and now I want you to distinctly understand that all the species, or distinct types of plants, even some of the rarest ones of our hothouses, are also wild in the temperate and tropical countries of the world. Again, every known plant has a Latin name given to it by botanists. This name is given along with a description of the plant, and is often accompanied by a plate or drawing; and the reason the name given is a Latin one is because Latin is understood of all scientific men throughout the world. But there is no necessity for you to call your pet plants by their Latin names, although Fuchsia, Geranium, Calceolaria, and many other Latin names are now firmly fixed in our own tongue; but you can follow the example of the poets, and call Campanula "Bell-flower," Primula sinensis simply "Chinese Primrose," and Mimulus moschatus will be none the less fragrant if you call it "Musk Plant," just as Viola odorata is quite as sweet under its more homely name of Violet. Now, if I were to read you a long list of the Latin names of the best window or room plants, some of you would not be quite sure what plants were intended, and so these plants have been brought here so that you may see exactly for yourselves what I mean. There are also some plants here which have actually been grown in windows and rooms, and kindly lent by their owners for this lecture, and these you will have an opportunity of seeing for yourselves. [Plants shown here.]

When we come to consider the plants most useful to window gardeners we find that they may be divided into two groups; first, such shrubs as Virginian and Japan creepers, Ivy, hardy bulbs, annuals, and other plants, which will thrive outside a sunny window; and, secondly, the little Dragon trees, small Palms, Acacias, indiarubber plants, and Begonias, which require more heat and shelter, and so thrive best inside the room.

For the outside, or window-sill, a stout wooden box is by far the best receptacle for plants. It should have a few holes at the bottom, to let out the waste water, and an inch or two of broken crockery or bricks, for drainage. Such a box, 2 to 4 feet long, may be a foot broad and 8 inches deep. Plants in boxes of this kind require far less attention than those in pots, which become parched up in hot or windy weather, besides which boxes of this size and weight are not so easily toppled over and broken by that most energetic of anti-gardeners in town—the domestic cat.

Here and there in town you may now and then see whole windows quite full of healthy plants, but not often, for I notice that in most windows their health and beauty is in inverse proportion to their numbers. My advice is, do not grow too many plants—few and good is the best watchword, especially for a beginner.

One of the best evergreen plants for a room is Aspidistra, green and variegated. This specimen has

been grown in a shady window in the Haddington Road for the last three years, and when first brought into the house it had six small leaves only, and it has never been reported or mentioned during that time. No other plant I know does better, and it is an especial favourite in France and Holland, where fresh and healthy evergreen room plants are highly appreciated. The indiarubber *Ficus* is another good room plant, as also is this graceful *Acacia lophantha*. Several kinds of green leaved *Dracena* are thoroughly reliable, as also are small plants of the Australian Blue Gum or "Fever tree." I have not a specimen of this plant here to-night, but I have seen a fine plant in the window of a drawing-room in Clare Street for the past two or three years. Some small Palms grow well in warm rooms—none better than the *Corypha australis*. Another favourite, especially at this season, is the Arum Lily, while the Scarborough Lily (*Vallota*) is very attractive when it throws up its cluster of scarlet Lily-like flowers in the autumn months, just before the *Chrysanthemum* comes into bloom.

Fortunately there is a good deal of healthy emulation amongst window gardeners, and a little ingenuity will enable any of you who may so desire to become possessed of plants not generally to be met with in rooms or windows. Orange and Lemon trees are very easily reared by sowing the seeds in a pot of earth and watering them now and then with warm water, not hotter than that you drink at your tea. It is most interesting to watch the growth of seeds of all kinds, and I recommend you to sow every seed you can obtain. I once saw a healthy little Date Palm, which its owner, a dock labourer, had reared from a stone. It obtained a prize at a flower show in London, much to the delight of its owner, who had grown it in a dingy little room in East London for nine or ten years. The common Grape Vine may be grown either inside or outside a sunny window, and is easily reared from the seeds you will best obtain from the over-ripe or damaged berries which too often beset the pavement near to shops in town.

An old lady living in an almshouse once asked me to name a plant she had grown for five years in her room, and it was none other than a real Tea tree—*Thea bohea*—the seed ("a little round thing," as she described it) of which she had accidentally found at the bottom of her tea-caddy. A few seeds of Maize, or Indian corn, sown in a large pot, or box, at this season will form a most graceful ornament outside on the sill of a sunny window; and if you want to hide a bit of bare wall, the common Scarlet Runner or Kidney Bean, sown now, and trained up sticks or twine, will do it effectively. The Castor-oil plant makes an interesting specimen, and seeds or beans of it may now be sown in a pot indoors, and when they get 2 or 3 inches high they may be placed on the sill outside. I may be a little too sanguine and enthusiastic on this subject, but my own opinion is that every window of every house ought to have a large window-box for plants and seeds on its outer sill. Moreover, I am glad to see that in some of the best of modern houses now being built in London and elsewhere, this want has been solidly, permanently, and prettily supplied by the architect and builder, rather than temporarily so by the carpenter; and I sincerely hope that those in authority will bear this in mind when the construction of model dwellings for artisans and labourers is being carried on.

It may be said, as has been said very often, that real wants must be first satisfied, and that it is next door to a sin to offer beauty to people who may be wanting bread; but I do not fully agree to this view. One of the greatest privations that could be inflicted on the cultured people of any town would be, not to take away their bread or wine, but to take away the flowers with which they love to surround themselves, and I know the self-same love of real and beautiful flowers exists in the hearts of most of you here to-night, and I am further sure that some of you now present will be among the successful competitors at a flower show which has been, or is about to be organised by the honorary members of this Association.

Last year I was one of those appointed to make the prize awards at a flower show at Lytton Hall, Leeson Park, and the perfection to which *Pelargoniums*, *Fuchsias*, *Petunias*, *Cactus* plants, and annuals had been brought was really surprising, when one remembers the difficulties and makeshift contrivances under which they had been grown. What most surprised me, however, was the little garden belonging to an inmate of the Blind Asylum—a little sunny corner, gay with flowers and creepers. This little plot had been made, planted, and tended by this blind woman—a Mrs. or Miss Morgan, and nothing could well be neater or show more loving care than did her flowers. She knew the position of every plant, and she seemed to see them actually with the tips of her fingers, and could tell me the names and show me each treasure almost as well as if she had had her sight. Now, great as your difficulties may be, you will own that those which this blind gardener surmounted were greater than any you may expect to encounter.

It would not be quite fair to conclude a lecture given under the auspices of this Association without making some reference to the sanitary or health question in relation to window gardening. I am sure I need not tell you that plants in reality belong to Nature's scavengers, and benefit us by eating up decomposing matter which if left unutilised by them would become a source of extreme danger to ourselves. Apart from such direct gifts as corn and wine, or fruit and timber, we must not forget the draining and disinfecting value of vegetation. (From a lecture by Mr. F. W. Burbidge.)

## NATIONAL AND CENTRAL HORTICULTURAL SOCIETY OF FRANCE.

(Concluded from p. 674.)

MAY 19-31.—In continuation of our notes on the more interesting items of this exhibition we may mention the novelties of merit in *Azalea indica* shown by M. Royer fils' successor, of Versailles—Notary Moens, a purplish-rose; Rosa Bonheur, a capital double flower—white; Mechtilda, a white, striped with rose; Frau Oberbürgermeisterin Cassian, a rich double rose-coloured bloom; Professor Frück, rose-pink; President Auguste van Geert, 1884, a scarlet, large, and semi-double; Proserpine, 1882, double rose; Oberst von Kukinski, 1882—a double scarlet; Dorothea, 1879, white and pink; General Hartmann, 1880, purplish-rose; and Herman Weigel, 1879, cerise.

MM. Croux et Fils exhibited *Rhododendrons* of fairly good quality, dwarf and excellently flowered; also *Kalmia myrtifolia*, and some umbrella trained *Clematises*.

### THE ROSES.

These, both standards and dwarfs, were arranged in tents, apart from the glowing colours of *Azaleas* and *Rhododendrons*, so that their effect might not be marred by the comparison. The specimens were as unlike anything we are accustomed to see at our shows as plants could well be, as was necessarily the object aimed at. In France pot Roses are grown for every one's enjoyment, and not merely as show pieces, only brought into notice when the grower is tempted by the chance of honour or profit to do so. There the Roses shown were just such as are to be found at any flower market in Paris or elsewhere during the Rose season; vigorous healthy plants of not more than two years old, and carrying open blooms and buds that would expand in succession. The standard plants are employed to brighten up groups of evergreen plants in conservatories, courts, and may be found of any height from 2½ feet to 7 feet if need be. It could not be said that the Roses looked at their best on the day of the opening of the show, but as they have to remain there ten days, each succeeding day will find an increasing quantity of bloom on the plants.

M. Jules Margottin, of Pierrefitte, near Paris, had a large number, of which were to be noticed one hundred standards of nicely flowered Teas, hybrid perpetuals, &c., good plants in 8-inch pots.

In the same tent a very good lot was brought by M. A. Rothberg, of Genevilliers (Seine), including Roses of all kinds as grown for the market.

In the larger Rose tent, M. Charles Verdier, 2, Rue de Choisy, Ivry, had several large groups, contributed as a fine collection of flowering plants, remarkable for their floriferousness. The best bed was arranged round a piece of bronze statuary, and formed decidedly the best feature in the tent. The Roses, and all others as well, were sunk in the ground to a little below the rims of the pots, so that the effect was that of Roses planted out. This eminent grower showed also in the competition for the best 200 standard Roses in 200 varieties, and in the class for 100 standards in 100 varieties, but differing from those in the larger lot. These were arranged in long rectangular beds, and would be in great beauty a little later.

M. Margottin, sen., had also a group in this tent, comprising 200 standards, fine plants, with plenty of flower present and to come, the bed in which these were being finished off at the sides with dwarf plants, root-grafted, or cuttings.

M. Leveque et Fils, Ivry, competed with 200 standards, and in 100, consisting of Teas, in as many sorts, these last a beautiful assortment. Good blooms were observed of *Niphotos*, Miss Edith Giffard, Reine Marie Henriette, David Pradel, Mrs. Lambert, Madame Docteur Tutte, and Mrs. Backer. The same firm also competed in the class for 100 standards, and in that for dwarfs, 200, in as many varieties. This does not quite exhaust the list of exhibitors, but goes well to prove the extent of the Rose competition, so far as plants are concerned.

### ANNUALS, BIENNIALS.

A class of plants gone out of fashion with us, but not with our neighbours, who seem not to change their love for old-fashioned flowers so readily as they do for their rulers, was well shown by two firms of nurserymen, viz., Messrs. Vilmorin, Andrieux et Cie, 4, Quai de la Mégisserie, Paris; and M. A. Legaron's successor, 20, same locality. These plants were in each case arranged closely together, had been grown all along in pots, and had formed part of a huge collection. The sunless, cold weather has not been favourable for them, and therefore some were rather destitute of fully open bloom. In most cases 8-inch pots were used, and the plants respectively of fair proportions, and for interest and variety would put ordinary bedding plants and the

like quite in the shade. There were *Phloxes* *Haageana* in variety, *Linum grandiflorum*, *Nemophilas* in considerable variety, beautiful *Mimulus*, *Iberis gibraltarica*, very fine; dwarf *Nasturtiums* in many shades of colour, *Pansies*, very large and varied; a dwarf *Ageratum*, named *grandiflorum album*, that is neat and yet elegantly irregular, and which does not form a "cushion"; a *Lobelia speciosa superba*, a blue of surpassing brilliancy; a pale blue variety of *Browallia* 6 inches high, single and double *Petunias*—Gloire de Segrez—after the colour of the old Countess of Ellesmere but larger, would make a good bedding kind; and a white *grandiflora* variety is also good for that purpose; *Verbenas*, *Clarkias*, *Schizanthus*, *Gilia*, *Tagetes pumila*, *Marigolds*, *Stocks*, *Leptosiphon*, *Androsace*, *Myosotis*, *Calichroya platyglossa*, *Acrocliniums*, *Eschscholtzias*, *Collinsias*, *Saponaria calabrica*, *Chrysanthemum tricolor*, and *Oxalis rosea alba*. The above comprise only a sample of those seen, which are one and all to be found during the season at the flower markets, or at the numerous nurseries.

### CALADIUMS.

A beautiful collection of *Caladiums*, which were placed by themselves in one of the exhibited glasshouses, deservedly attracted the greatest attention, the liking for these brilliant summer foliage plants still having a hold on the fancy of the public, whilst it has so waned with us that we rarely find many kinds in collections. The plants were sent by M. Blen, the well known raiser of this genus, and whose name will be familiar to English readers. Amongst the more striking colours may be instanced *Emilie Verdier*, a white ground mottled green, with green nerves and ribs, foliage longer than broad; *Reine de Marie de Portugal*, leaf to inches broad, crimson, margin green, ribs and nerves brilliant scarlet; *Aurora*, crimson, the middle of the leaf red, veins crimson, and the margin grey—large size; *Ludemannii*, large, ground green, blotched white, nerves and ribs crimson—extra; *Pyrrhus*, large, crimson ground and ribs, a 2-inch margin of green; *La Corege*, green and crimson, very fine; *Gluck*, a deep pink ground, a thin green edge, ribs crimson, of a deep tint; *Lepaschinski*, with crimson centre and a blotched cerise and green area around it; *Luteum auratum*, yellowish-green, distinct; *Rubens*, very large, bronzy-green foliage, crimson nerves, the colours running out to a green edge; *Comtesse Maille*, white ground, crimson nerves, green margin; *Charlemagne*, deep cerise, nerves crimson. Seedling No. 12 is a sort quite destitute of chlorophyll excepting at the base of the ribs, and in the flower-stalks and spathe. *Caladiums* were shown likewise by MM. Thibaut et Keteleer, Sceaux. The collection was of no mean merit, M<sup>me</sup>. Margottin, M<sup>me</sup>. Motjana, *Salvator Rosa*, and Princess Alexandra being remarkable in colour.

### MISCELLANEOUS.

M. C. Vuysteke brought a small number of *Odontoglossums*, including a nice piece of *Coradinei grandiflorum*, a sparsely spotted white ground variety; *radiatum maximum* was a very fine variety with sepals of brown and green. It is not so fine in its way as *O. hystrix*. M. A. Dalhère showed *Philodendron imperialis* from the Solomon Isles; the leaves are of a greyish colour, and cordate. *Fritcharia grandis*, a distinct round-leaved Palm of an apparently dwarf habit of growth; it is Bornean.

The collection of Tree *Paeonies* from the garden of M. Paillet, Sceaux, were remarkable for variety, and should have a longer notice if space permitted.

The *Iris susiana* of M. Delahaye were wonderfully large, and very beautiful. This species is getting rarer every year in France, so that a good lot was a matter of remark.

*Echeveria gibbosa* is a curiously variegated plant, with broad bands of brownish-creamy colour in the leaf; it may be of use in carpet-bedding.

M. André, 30, Rue Chapal, Paris, showed some plants, rare, if not beautiful in the garden sense, viz., *Ononis Drakeana*, a blue-flowered Composite from New Grenada, with foliage, as shown, not of a pleasing character; *Ficus Portmani*, with thick green leaves, club-like in shape; and *Epidendrum arachnoglossum* (Rchb.), having pink corymbs of flowers. The *Pansies* were very large and in abundance, and it were invidious to select those of any one exhibitor.

The *Calceolaria hercacea* was exceedingly well done, but the plants were in some parts of the arrangement awarded a place of honour that they scarcely deserved. The strain has a dwarf habit, with rather flatish flowers, and great abundance of them. In the Rose tents MM. E. Fourgeot et Cie, MM. Vilmorin, Andrieux et Cie. showed the best of these, the latter firm contributing an excellent lot of *Cinerarias*, both single and double-flowered. M. Bernard Debrie had a most effective decoration for a doorway leading into the grand saloon. On one side of the steps leading to the door was a rustic wheelbarrow made of closely fitted Bamboo. This was filled with Rose blooms cut with long stalks; opposite was a large handsome basket, 4 feet long and 3 feet high, filled also in the same manner, two shields of black velvet hung right and left of the doorway, one having a great bunch of *Carnations*, and the other one of *Roses* hanging rather negligently, with their flower-heads downwards. The angles at the sides of the portal were filled in with plants of *Cocos Palms*, and slender plants in flower, overhead being a shelf with little pink *Azaleas* and a Palm or two.

A considerable number of fruiting Vines in pots were shown, viz., by M. J. Margottin, who had Foster's Seedling, *Gradiska*, a white oval Grape; *Boudaler*, a black round one; *Gros Colmar*, *Buckland Sweetwater*, and *Chasselas de Fontainebleau*. These plants carried from four to six fair sized bunches, the plants being eighteen months old. M. E. Salmon also exhibited Vines consisting of *Chasselas Napoleon* (*Chasselas*

d'Algiers), Breane Sucrée, a white oval formed berry; and collections of Grapes of last year preserved in bottles of water. They had been plucked in September, and were still quite plump if wanting in flavour. Ripe Cherries were well shown by M. Simon. M. Millet, gr., Bourg la Reine, had capital ripe Grapes in pots, grand Strawberries in pots, any one of which, had they not been bundled up, would have covered a circle 3 feet in diameter, the varieties being both native and foreign, Dr. Moreire seemingly being a kind much preferred, the fruit having size and colour. A few Pine-apples were seen of the kinds Smooth Cayenne and Charlotte de Rothschild.

#### FRUIT AND VEGETABLES.

the produce of French colonies, shown by M. He-diard, comprised many articles novel to Europeans, as red and white Yams, Loquats in quantity, Dioscorea bulbifera roots, Arachis hypogaea and Cajou nuts, seed-pods of Mimosa scandens from Martinique, Ginger. Amongst Apples shown were Belle Duboise Reinette du Canada, Calville Rouge, Calville Blanche, Reinette Brodee, Reinette Brise, Reinette d'Or, and Reinette Grise.

The vegetables were as good as the season and the skill of French gardeners could produce them, and this was especially true of the great varieties of Lettuces, Radishes, Cauliflowers, Cabbages (mainly varieties of the Oxheart), Endive, Potatos, such as Joseph Rigault, Belle de Vincennes, Heinaut, all nice looking kidneys of this season's growth. The Asparagus was enormous, much having been noticed that was 1 inch in diameter 6 inches from the tip. Tomatos were not so plentiful as might have been expected, nor were Kidney Beans of very good quality.

It may be remarked on the method of showing Potatos that the entire produce of a plant is shown, top included, so that all can see the habit and prolificacy of the sort. It does not make a show of tubers often misleading, as we do it, but it has its merits, which arrangers of shows may gather a useful hint from. Boxes full of young seedling plants of Potatos were shown of various ages, from the seedling onwards to full cropping stage.

## TERRESTRIAL ORCHIDS.

(Concluded from p. 663.)

OPHRYS.—We now come to the great genus Ophrys, which, among a large number of European species, includes some of the most perfect gems that can be imagined. The forms and colours of the flowers are very varied, and resemble nothing else in the floral world.

The culture of these plants is not difficult, as has been shown by the great success of Mr. Needle, formerly gardener to the Comte de Paris, who used to exhibit pots of them in great perfection at the spring shows in London, but as most of them are natives of the shore of the Mediterranean, and will not endure our winters without protection, it is useless, with few exceptions, to try to grow them in the open air.

The abundance and variety of Ophrys on limestone soils in some parts of Italy, Turkey, and Asia Minor is quite wonderful. I once collected in Lycia a bushel of tubers in a day, including at least a dozen species, and some of the Olive groves of Italy are carpeted by these lovely plants.

The principal points to be noticed in growing them are to place the tubers, which should be procured as fresh as possible, against the side of the pot in light limestone soil; to keep the pots plunged, but not too damp during winter, in a frame or house where there is plenty of air but no frost; and lastly, to keep down greenfly, which is very partial to these plants, and injures them very much. If these directions are followed they will bloom at various seasons from February to May, and after flowering should be plunged in a frame and kept without water until August or September, when they may be repotted and the new growth encouraged by gentle rains. Among the best sorts are:—

*O. apifera*, the Bee Orchis, and *O. muscifera*, the Fly Orchis, which, being British plants, are quite hardy. *O. lutea*, *O. speculum*, *O. ferrugineum*, *O. bombyliflora*, *O. fusca*, *O. Bertoloni* are all good sorts, which I have grown successfully. *O. ferrum equinum* attains as much as 1½ foot high, but most of them do not exceed 8 or 9 inches.

#### SERAPIAS

is another genus, distinguished by a dull reddish colour, and the large hanging labellum. It has the new tuber at the end of a fleshy root, not close to the old one as in Orchis.

There is a very rare and beautiful plant called *Serapias triloba*, which is believed to be a natural hybrid between *Serapias lingua* and *Orchis papilionacea*, and is figured in *Bot. Mag.*, t. 6255 from a plant grown by me. Though the colour is rather too high in this plate, it certainly represents one of the most beautiful and rarest plants in the whole family.

Then we have some charming, though delicate, plants which grow in the sphagnum bogs of North America—*Calopogon pulchellus*, *Arethusa bulbosa*, and others which may be kept a year or two in pots of iving sphagnum, and the lovely and rare little *Calypto boreale* found in the deep mossy arctic Pine

woods of northern Europe and America, but very hard to get alive in a garden.

In the Cape Colony and Natal are a great variety and abundance of curious and beautiful terrestrial Orchids, the queen of which, *Disa grandiflora*, has become common in collections, and the culture of which is now better understood. *Disa megiceras* is another grand species which I once had in perfection from a tuber sent me by my esteemed friend Max Leichtlin. It is figured in *Bot. Mag.*, t. 6529, but the plate by no means does justice to the plant, which unfortunately died after flowering, and as far as I know it is not now in cultivation. The conditions which suit the Cape Orchids are various, and few of them seem easy to grow; but I have seen some of the fine species of *Satyrion* growing in peaty sand in the nursery of M. de Graaf, of Leyden in Holland, in great strength and luxuriance. He informs me that many of them are not so delicate as supposed, and that he is now devoting increased attention to them; so it is to be hoped that others will follow his example, and bring to light some of these hidden treasures.

*Bonatea speciosa* is one which should be in every collection, as it is most easy to grow, and pretty though not showy in colour. One of the most curious things in Nature is the way in which the large yellow pollen masses of this plant fly from their places of concealment and attach themselves firmly by an adhesive root to the fingernail, or head of an insect, on touching the entrance to the flower. Many similar cases are known in which the fertilisation of Orchids is effected by insect agency; but nothing that I have seen can compare with the magic way in which the two great yellow antenna-like pollen-masses fly from this plant.

There are many fine though little known terrestrial Orchids in the Himalaya and mountains of Southern India. *Habenaria gigantea*, or *Platanthera Susanna*, is one of the most splendid. It grows 3 or 4 feet high, and has a yellow or white labellum, 4 inches broad, fringed with long slender waving tails.

There is another temperate region where, from the accounts of travellers, Orchids are remarkable for their abundance and beauty, namely, the Andes of Southern Chili, the home of the *Araucaria*, the *Lapageria*, and many beautiful shrubs, but hardly visited of late years by botanists or collectors. Here are many species of yellow and purple *Chloreas*, and other Orchids, waiting for some one to introduce them. Now that facilities for obtaining all small objects by parcel post from distant parts of the world are on the point of being given, it is much to be hoped that we shall know more of the Orchids of this country, as no plants are so ill adapted for drying, or lose their beauty so completely in the herbarium; and it cannot be disputed that half-a-dozen species of such plants give more interest and value to a garden than a house full of *Pelargoniums* or *Begonias*, which seem to monopolise the attention of too many of our amateurs. *H. J. Elwes.*

## Plants and their Culture.

### PROPAGATION.

THE clearance of the latest of the plants and cuttings from the propagating-pit for bedding-out purposes will now have been finally effected for this season. No time should therefore be lost in turning attention to the necessary amount of material required for late autumn and winter flowering, cuttings of *Euphorbia jacquiniæflora*, *Poinsettias*, *Begonia insignis*, *B. Knowsleyana* and *B. Moonlight*, *Centropogon Lucianus*, *Eranthemum pulchellum*, *Plumbago rosea*, *Burchellia capensis*, and *Thysacanthus rutilans* should all be got in as soon as possible in order to have good well established plants that may be relied upon to give the best possible return in flower during their season. Later batches of each will of course be useful, but by starting at once the requisite stock of suitable size can be obtained without having to push forward the growth too rapidly to secure stocky dwarf plants. Old plants of *Thysacanthus rutilans* should be retained to provide an extra tall set of plants to be used with excellent effect for training over pathways or up rafters, in either way they produce a beautiful appearance when in flower.

Of other flowering stove plants, the *Ixoras* will now strike freely with a brisk bottom-heat, *Gardenias* of the best kinds (*G. florida intermedia* in particular), *Rondeletias*, *Stephanotis*, *Tabernaemontanas*, *Allamandas*, *Clerodendrons*, *Bougainvilleas*, *Dipladenias*, and *Vincas*, should each receive attention to keep up a healthy stock. Each of these genera it taken

in hand at once will produce capital plants by another spring for growing on. Seedlings of such subjects as *Anthurium Scherzerianum*, *Aphelandra aurantiaca Roelzii*, *Ardisia crenulata*, *Amaryllis* (hybrids), *Impatiens Sultani*, *Streptocarpus biflorus*, *Torenia Fournieri*, and *Gloxinias* should each receive that attention which each requires to raise a healthy lot of plants, bearing in mind two essential points, viz., early pricking off from the seed-pan, and a position near the glass to keep them dwarf.

#### FOLIAGE PLANTS.

The propagation of these should also be carried on to the required extent for producing a succession stock for decorative purposes. Several of the *Crotons* will now have made a good spring growth of characteristic colour; these shoots can be struck as freely as Willows. When established in safety, the tall and scrubby plants can with advantage be dispensed with entirely. Tops of *Dracenas* will at this season of the year strike freely without the tedious process of rooting them off, as is frequently done. At the base of *Pandanus Veitchii* on established plants will be found in many cases small grassy shoots that are, generally speaking, of good variegation; these will make the best of plants for vases and table decoration, partaking of a much more graceful habit than in the case of strong suckers. It will take the best part of a year longer in such cases to produce a plant of proportionate size, but when attained, there is no comparison in the appearance between them and those that are propagated from the stronger suckers. *Sonerila margaritacea superba* should also be struck from cuttings now. Each one if inserted in a thumb-pot will quickly take root, to be shifted later on into 4-inch pots, in which they make capital stock for the autumn, providing us with effective edging plants for the stove, that are handsome both in their foliage and flowers, the latter of which are freely produced. *Fittonia argyrea*, *F. gigantea*, *Tradescantia discolor*, *T. Madame Legueuse*, *Panicum variegatum*, and *Selaginella Kraussiana*, should all be worked up to the desired numbers, where any quantity of vase work or other forms of household decoration is carried out.

#### GREENHOUSE SOFT-WOODED PLANTS, &c.

The *Eupatoriums* will need to be propagated as soon as suitable cuttings can be had. *Azalea indica* will strike freely from the half-hardened wood, and many of the most useful sorts make quite as good plants in this way as when they are worked on to a commoner kind by grafting. A batch of the best kinds of *Salvias* may still be got in; very good plants can yet be secured by the autumn—better, perhaps, in many ways than plants of large dimensions when storing time comes round again. A useful stock of *Pompon Chrysanthemums* can be obtained by placing about three cuttings together in a small pot and shifting on only once afterwards; in this way they will not grow away strongly. A selection ought also to be made of the single *Chrysanthemums* (Paris Daisies) for conservatory work during the latter part of the summer; with these, in conjunction with scarlet and pink zonal *Pelargoniums*, a very good display can be made. For late autumn work the bouquet *Dahlias* of the "White Aster" type make most useful plants to provide cut flowers just prior to the advent of the *Chrysanthemums* in force; spring-struck plants of this kind in particular may be kept in pots during the summer, shifting them on as required. *James Hudson, Gunnersbury House Gardens, Acton, W.*

## PLANT PORTRAITS.

AZALEA M. JACQUET, *Revue Horticole*, May.—An "Indian" variety, with narrow green segments intermixed with its irregular rose-coloured petals.

BARKERIA LINDLEYANA VAR. CENTERE, *Garden*, May 2.

CAMELLIA MADAME P. DE PANNEMAKER, *Illustr. Hort.*, t. 545.—A very regularly imbricated variety, with pink veins on a white ground.

GALEANDRA NIVALIS, *Illustr. Hort.*, t. 545.

LEONOTIS LEONURUS, *Garden*, April 25.

MASDEVALLIA CHIMERA, *Revue de l'Horticulture Belge*, May.

PTERIS JAPONICA, *Revue de l'Horticulture Belge*, May.

SEDUM CORSICUM, *Garden*, April 11.

## APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY,	June 2	{ Special Sale of Orchids in Flower, at Protheroe & Morris' Rooms.
THURSDAY,	June 4	{ Linnean Society Meeting. Sale of Imported Orchids, from Mr. F. Sander, at Stevens' Rooms.
FRIDAY,	June 5	{ Sale of Imported Orchids, at Protheroe & Morris' Rooms.

THE very limited number of *Eucalypti* capable of cultivation in this country does not convey to the mind any idea of the vast importance of this genus to the great Australian continent, nor of the large number of species which it comprises, although, according to Baron F. VON MUELLER, it is second only to *Acacia* in this respect. The *Eucalyptus* trees, he tells us in his valuable *Eucalyptographia*, "form the principal timber vegetation nearly all over the wide Australian continent, and for all ages the inhabitants of this part of the globe will have to rely largely, if not mainly, on *Eucalyptus* for wood supply." The rapidity of growth of some of the species and their salubrious effect in miasmatic districts have led, in great measure through Baron von MUELLER'S energetic and persevering efforts, to their widespread cultivation in other countries, wherever the climate has been found suitable, so that the leaves and oil obtained from *Eucalyptus globulus* grown at Nice already form articles of export from the South of France.

It is now nearly a century since the first *Eucalyptus* was described by L'HERITIER (A.D. 1788) under the name of *E. obliqua*, and since that date new species have been discovered nearly every year, the number now known being estimated at 140.\* Although the *Eucalypti* are practically confined to Australia and Tasmania, none being known in New Guinea, and only a few extending to New Zealand, Timor, and the Moluccas, many of the species are very locally distributed. From the great similarity of leaf and habit, and the difficulty of procuring flowers and fruits experienced by ordinary travellers, without cutting down a tree for the purpose, there is great difficulty in describing and classifying the species in a truly natural manner. This is, moreover, increased by the fact that the barks, which are very characteristic in most of the species, cannot well be inserted in herbaria. It is not surprising, therefore, that although Baron MUELLER began to collect materials for a monograph of the genus in the year 1847, the publication of it has been delayed until 1879. The first ten decades, containing in all 100 species, are now before the public, and form one of the most valuable contributions to the science of forestry ever published, and may well serve as a model of what such monographs should be.

While fully keeping in view the fact that the chief use of botanical knowledge lies in the possibility of its practical application, everything that might conduce to a thorough scientific knowledge of the life history and development of the species, or which might indicate the most natural method of classification, has been carefully recorded and summarised. The labours of M. NAUDIN at Antibes on the embryonic development of the species of the genus have been laid under contribution, and a table is given illustrating the variation of form of the cotyledonary leaves in different species. The medical journals of all countries have also been searched for information concerning the medicinal uses of the various gums, gum resins, or oils produced by the different kinds of *Eucalyptus*. The result is a mass of information as thoroughly exhaustive as it is possible even for a German to make it, so much so that even the relative size of the pollen grains, the microscopic structure of the different timbers and the comparative number of stomata on the

leaves of different species have been tabulated and recorded. It is only to be regretted that this information is scattered irregularly throughout the work without any indexical guide to its position. Each species is separately treated, the description being accompanied by an illustrative plate; but the interrupted account of the *Eucalyptus* products is apparently given under those species which yield the particular product, or those of which the description is short enough to allow room for additional notes. Under these circumstances it may be of interest to our readers to indicate, so far as our space will allow, the species under which such details may be found, and to point out those of especial horticultural, economic, or forestal interest.

Comparatively few of the species are suitable to the English climate, only *E. coccifera*, *E. Gunnii*, *E. pauciflora*, *E. urnigera*, and *E. vernicosa* being able to brave frosts and snowstorms. Neither of these are remarkable for beauty. *E. globulus* will not bear severe winters, but forms a very effective shrub for planting out in summer, and will withstand mild winters. *E. Gunnii* contains so little volatile oil in the leaves that it is readily browsed upon by sheep and cattle, whereas the dwarf procumbent form of the tree is met with near the coast. The young foliage of *E. pauciflora* must also be possessed of some value as fodder, for opossums are so fond of it that the tree often dies out where these animals are not kept down by the hand of man. The sugary *Eucalypt* (*E. corynocalyx*) appears to be the only other species attractive to cattle, which readily feed on its sweetish leaves. This species, however, is better fitted for arid deserts, being capable of bearing the protracted droughts and extreme heat of such regions. Other species also suitable for such districts on account of their rapid growth are *E. bicolor*, *E. ochrophloia*, *E. polyanthema*, *E. salmonophloia*, *E. terminalis*, and *E. salubris*. The last named is also remarkable for the large quantity of volatile oil contained in the leaves.

The species which possess ornamental value are few in number and are suitable only for cultivation in countries free from frost. These are *E. ficifolia*, *E. megacarpa*, *E. miniata*, *E. phœnicia*, and *E. ptychocarpa*. The first is a most beautiful tree, with shining dark green leaves, like those of the indiarubber plant (*Ficus indica*), and handsome trusses of scarlet flowers. It is said to form a most gorgeous object in the landscape in January and February when covered with blossom. The second is a shrubby plant with large ashy-grey leaves and flowers 2 inches in diameter, with bright orange or scarlet filaments. Its beauty attracted the notice of Miss NORTH when in Australia, and her painting of the flowers may be seen in the collection so generously presented by her to the Royal Garden at Kew. *E. Preissiana* has also a bushy habit, but the flowers have bright yellow stamens. It is suitable for greenhouse culture in a cool climate. Directions for rearing the *Eucalypti*, which are extracted from Mr. J. E. BROWN'S *Practical Treatise on Tree Culture*, will be found under *E. decipiens*.

One of the most important economic products of the *Eucalypts* is the volatile oil obtained from the leaves. This varies very considerably in amount in the different species. Although *E. globulus* is often mentioned as the source of the *Eucalyptus* oil of commerce, this is by no means always the case, and for the simple reason that it does not yield so much oil as other species. A table given under *E. amygdalina* shows that, whereas 1000 lb. of fresh leaves of *E. globulus* yield only 120 ounces of oil, the same quantity of *E. oleosa* gives 200 ounces, and of *E. amygdalina* 500 ounces. The two last-named species have been until lately the principal source of *Eucalyptus* oil, which is

now prepared also from *E. dumosa*. Further details concerning the percentage of oil in other species may be found under *E. oleosa*. *Eucalyptus* oil is stated to be produced in Mr. J. BOSISTO'S factory to the extent of 12,000 lb. annually, and is extensively used as a solvent of various resins, especially of the Kauri resin, asphalt, and some varieties of copal. It also dissolves indiarubber, and is used in antiseptic surgery. The odour of the oil of a few species is remarkably pleasant—*E. citriodora*, which is regarded by Baron MUELLER as a variety of *E. maculata*, possessing that of the Citron in a remarkable degree, and *E. Staigeriana* that of Verbena, so much so, that the oil might easily be mistaken for that of the oil of Verbena of commerce.

The sap of several species contains a considerable amount of astringent matter, consisting of kino-tannic acid, mixed with a variable amount of a resinoid substance, the first constituent preponderating in some species, and the second in others. This gum, as it is called, either exudes from the bark or collects in fissures in the trunk. It is most abundant, according to a table given under *E. leucoxylon* in that species, and *E. macrorhyncha*, the former being said to yield 21.94 per cent., and the latter 13.41 per cent. of kino-tannic acid. Several varieties of this astringent exudation have from time to time been sent over to this country under the name of kino, but have not met with a ready sale, owing to insufficient care having been taken to collect the kind most soluble in cold water; that of *E. obliqua* is, however, stated to dissolve completely in boiling water and to remain clear when cold; that of *E. Planchoniana* is recommended for its great astringency. For tanning purposes it is quite possible that a small percentage of resinous matter might prove advantageous rather than otherwise in enabling the leather to better resist external disintegrating influences.

The species of *Eucalyptus* which are most valuable as sources of timber appear to be those in which resinoid matters are present in larger proportion than the kino-tannic acid. Of these, *E. marginata*, yielding the celebrated Jarrah wood is one of the most important to the colony; white ants will not touch it, it is unsurpassed as regards durability, and is worked with greater ease than most other *Eucalyptus* woods. *E. rostrata* also affords a much prized timber which is capable of bearing an enormous downward pressure, and is only slightly subject to longitudinal shrinking, and is very durable in wet ground and in fresh or salt water, but is harder and more difficult to work than the Jarrah wood. *E. leucoxylon* also yields timber of extraordinary hardness and strength. These three woods are placed in the first class for ship building by the Australian Lloyds, and *E. globulus*, which is valuable chiefly for its extreme rapidity of growth, is placed in the second class; *E. corymbosa*, *E. diversicolor*, and *E. obliqua* come next in value; *E. redunca*, *E. resinifera*, and *E. cornuta* are also mentioned as yielding excellent timber.

A remarkable use is made by the natives of the roots of *E. micranthera*. These are lifted up from the depth of about a foot, and at a distance of about 15 feet from the tree; they are then cut up into pieces, about as thick as a man's wrist and about 18 inches long, and are allowed to drain into a vessel, or blown into by the mouth at one end. In this way a quart of water may be obtained from good samples in about half-an-hour. Roots nearer the stem are less porous, and do not yield water so easily. The water is stated to be beautifully clear, cool, and without any unpleasant taste. The roots of *E. oleosa* and *E. populifolia* are used for the same purpose, but yield water less readily.

In conclusion we may add that those of our readers who are interested in structural details

\* A list of the dates of discovery of the different species is given in the *Eucalyptographia* under *E. hæmastoma*.

FIG. 157.—PALMS IN THE LUCKNOW BOTANIC GARDEN. (SEE P. 702.)

will find information under *E. pachyphylla* and *E. phœnicea*; concerning the comparative number of stomata in the leaves, diagrams of sections of the anthers under *E. populifolia* and *E. tetraptera*; measurements of the pollen grains under *E. erythrocorys*; illustration of the epidermis under *E. microthera*; details of the microscopical structure of the wood under *E. Behriana* and *E. diversicolor*; figures illustrating the varied forms of the fruit under *E. Preissiana*; and a description of the relative size of the seeds under *E. megacarpa*.

— LUCKNOW BOTANIC GARDEN.—The young Palm which forms so conspicuous an object in our illustration (fig. 157) is *Wallichia disticha*, a tall growing Palm, with leaves in two ranks, the base of the stalks covered with a coarse fibrous network, the blades pinnately divided into numerous oblong segments toothed or notched at the end. To the left is seen the clean stem of *Eucalyptus citriodora*, and in front a *Chamærops*. We have already given illustrations from these gardens, and we shall shortly publish an account of their history.

— A PRIMULA CONFERENCE will be held at South Kensington at the end of April, 1886. The first day will be occupied with the business arising directly out of the exhibition, which is likely to be extensive and beautiful. On the second day papers will be read and propositions discussed. The promoters have determined to place the affair on a broad basis by inviting the co-operation of botanists and horticulturists of Europe and America. The National Auricula Exhibition (Southern Section) will form a feature—and a fine one—of the general display of Primulaceous plants.

— LINNEAN SOCIETY OF LONDON.—The following papers will be read at the meeting to be held on Thursday, June 4, at 8 P.M.:—1. "Vernation and Development of Foliage from Buds," by Rev. GEORGE HENSLAW; 2. "Supplementary Notes on *Restiaceæ*," by Dr. MAXWELL T. MASTERS; 3. "Occurrence of *Lycopodites Vauxemi* in Britain, with Remarks on its Affinities," by R. KIDSTON.

— IMPORTATION OF LIVING PLANTS INTO GERMANY.—The present official position of matters with regard to the importation of living plants from Great Britain into Germany does not seem to be understood. The ordinance now in force was signed by the Emperor of GERMANY, July 4, 1883, at Ems. It appeared to the Kew authorities that this ordinance could only be interpreted, as regards the United Kingdom, as totally prohibiting the importation into Germany of living plants. Our Embassy at Berlin did not at first read the ordinance in this light; but on inquiry at the German Foreign Office it was ascertained officially that this was its intention. There appeared to be some ground for believing that the severity of this regulation had been relaxed. The following correspondence, however, dissipates this hope. A living plant of botanical interest can only therefore be transmitted to Germany by first consigning it to some correspondent in a country which has adhered to the Berne Convention.

(Copy.)

"Office of Committee of Privy Council for Trade.  
May 18, 1885.

"Sir,—With reference to your letter of February 23, last, addressed to Mr. BATEMAN of this department, inquiring whether any relaxation has been made in the Phylloxera regulations by the German Government, I am directed by the Board of Trade to forward to you the accompanying copy of a dispatch upon the subject from Her Majesty's Ambassador at Berlin, which they have received through the Secretary of State for Foreign Affairs. It will be observed that His Excellency states that the German Foreign Office are not aware that the restrictions imposed in Germany under the provisions of the Berne Convention have been in any way relaxed.

"I am, &c.,

(Signed)

"R. GIFFEN.

"W. T. THISELTON DYER, Esq., C.M.G.,  
Assistant Director,  
Royal Botanical Gardens, Kew."

(Copy.)

"Berlin, May 9, 1885.

"My Lord,—In reply to your Lordship's despatch (No. 19 of this series) of March 9, I have the honour to state that, in reply to an inquiry addressed by Mr.

SCOTT to Dr. BUSCH, Under-Secretary of State for Foreign Affairs, His Excellency has informed him that he was not aware that the restrictions imposed in Germany under the provisions of the Berne Phylloxera Convention on the introduction of live plants into this country have been to any extent relaxed.—I have, &c.,  
(Signed) "EDWARD B. MALET.

"The Earl GRANVILLE, K.G., &c."

— ONCIDIUM LURIDUM.—Much has been written about Orchids lately, and among other things about doubling. An instance of the latter occurs at Kew, probably not yet recorded in the same species. A fine specimen in a pot exhibits five long branching peduncles. On one peduncle, having about twenty of its flowers expanded, fully a third of them some traces of doubling. A number of them have two lips, differing but slightly from the normal type, except in the smaller or less dilated limb. Two or three of the flowers have developed four sepals, the supernumerary one being exactly in front and beneath the labellum. Three rudimentary lips are produced in another flower, exactly at the base of the column and above the labellum proper, which is slightly deformed and smaller than usual. In one of the flowers having four sepals the column is deformed and petaloid on one side, apparently at the expense of one of the anther cells. In another of the flowers possessing four sepals the column is forked. One fork has two rather deformed anther caps and two petaloid segments, while the other has one anther cap and a petaloid segment. Two lips are present, making in all five extra pieces in one flower besides the forking of the column. The *Oncidium* in question was obtained from Trinidad last year, and it would be interesting to know whether this peculiarity will be perpetuated the next and following years. The species is figured in the *Botanical Register*, 727.

— AT WHITEWAY, CHUDLEIGH, the home of the Dowager Countess MORLEY, among the many grand horticultural subjects to be found there, are two famous Tree *Pæonies* 6 to 7 feet in height. One of them measures quite 16 paces around, and both are covered with their large and gorgeous blossoms. This somewhat scarce plant certainly demands a more extended cultivation, and it is singular that nurserymen neglected their culture, inasmuch as they generally have no plants in stock when asked for. Near by there is also a noble specimen of *Abies Douglasii taxifolia* aspiring to a height of some 70 feet, and sweeping the ground in an almost unbroken circle which is upwards of 48 paces. It is a treat to be escorted over the grounds here by Mr. NANSCAVEN, the chief gardener, who, by the way, is a worthy son of that veteran gardener at Mr. TRELAWNEY'S place at Menheniot.

— SHEPPERTON.—The horticultural show for this place and the adjoining localities will be held on Thursday, July 2, in the pretty grounds of Sunbury Court, Sunbury, by the kind permission of Lieut.-Col. W. H. HARFIELD.

— INDIAN OR CHINESE AZALEAS.—Many of our readers will doubtless be surprised to know that these popular plants are frequently treated as hardy subjects in certain favoured localities of Devonshire and Cornwall. At Mr. HOLE'S park, Bovey Tracey, we lately noticed a splendid bed some 30 paces in circumference devoted entirely to them, mostly the white variety, *Azalea indica alba*. They form a colossal mound of floral wealth, and are now covered with tens of thousands of their beautiful flowers and buds.

— CLIANthus PUNICEUS.—This glorious flowering plant, sometimes known as the Parrot's-bill, is not so frequently cultivated as it should be. Now and again, however, we meet with it, and it was our good fortune to notice a fine example recently at Ideo, Bovey Tracey, the seat of C. A. BENTINCK, Esq. It is flourishing on the back wall of the orchard-house, and covers one corner, where it revels in all its beauty. The gardener, Mr. HAMELY, planted it there when quite a small plant some four years ago, and it now completely clothes a space of about 12 feet by 10 feet. This fine specimen has been in bloom ever since early spring, and at the present time is clustered with its pendulous racemes of brilliant boat-shaped scarlet flowers. We should have expected to have found it infested with red-spider in such a house, but such was not the case,

and the gardener has had no trouble whatever in this respect. There is a larger plant than this one at the nurseries of Messrs. LUCOME, PINCE & Co., at Exeter, and on the open wall there.

— PAXTON'S "FLOWER GARDEN."—We have received the third volume of the reissue of this periodical, published by Messrs. CASSELL, which does not remove the objections we raised when the two first volumes were published. We are glad to get to Mr. BAINES' annotations on the newer plant, and glad to get the plates and figures (embarrassing as they are from the change of numbers), but we protest earnestly against such injustice to the memory of PAXTON and LINDLEY as has been unconsciously and unintentionally, no doubt, but none the less truly, perpetrated. We trust that no more such new editions may be published.

— M. JULES MARGOTTIN.—This well known hybridiser and grower of Roses, formerly of Bourg la Reine, is now removing to Pierrefitte, near Paris. It was in consequence of this disturbance of his business that he was unable to show, to the extent he usually does at Paris shows.

— THE "ORCHID ALBUM."—The May number of this periodical contains the following figures:—

*Batemannia Wallisii major*, t. 185.—A native of Costa Rica, chiefly remarkable for its large flat five-starred flowers; sepals lanceolate, purplish-brown; petals ovate lanceolate, of the same colour, but with purple stripes at the base, surrounded by a white border; lip shorter than the segments, cordate ovate acute, deep purplish-brown.

*Odontoglossum cordatum*, t. 186.—Flower segments lanceolate acuminate, yellow, heavily blotched with cinnamon-brown; lip cordate acuminate, white. Mexico.

*Odontoglossum Josephina*, t. 188.—A supposed natural hybrid, with the habit of *O. crispum*; the segments white, with cinnamon-coloured blotches.

— EXHIBITION OF TULIPS AT HAARLEM.—In the nursery grounds of Messrs. E. H. KRELAGE & SON, of Haarlem, there has been for the last fortnight a splendid show of late Tulips—violets, roses, and bizzarres. The Tulips were ranged, under canvas, in two parade beds, each of one hundred rows, seven plants in a row, the highest in the middle, and gradually lessening to the sides, all different varieties, to the number of 1400. A great number of the much valued varieties of late Tulips might be seen here in very perfect examples. The tent was decorated with ornamental and flowering plants in a large and fine group at the end. In consequence of the large spring show in March it was preferred not to make a show of Hyacinths, but to substitute one of late Tulips. Formerly such shows were very much in fashion in the Haarlem nurseries. Messrs. KRELAGE were the last who had such an exhibition, in 1861, so that after about twenty-five years of rest a similar one, but on a much larger scale than ever before, has been opened. Messrs. KRELAGE intend to repeat the show next year.

— PALMS IN THE OPEN AIR.—The cultivation of these noble plants is fast making way in Southern France and Algeria. Some that are shown at the Exhibition of Paris by M. S. CHEVIER, of the domain Aube, in the Riviera, were grand robust specimens, abundant in foliage, exceedingly handsome, and capable of withstanding much ill-usage, as house decorative plants. In our account of M. S. CHEVIER'S exhibit in the report of the show last week the species cultivated are noted.

— "BOTANICAL MAGAZINE."—The plants figured in the May number are:—

*Philodendron Glaziovii*, t. 6813.—A climbing Aroid with stalked lanceolate leaves, open yellow spathe with a crimson blotch at the base, and a yellow spadix. It is supposed to be a native of Brazil.

*Streptocarpus caulescens*, t. 6814.—A curiosity with a swollen stem, but of little value as a decorative plant. East Tropical Africa. We are glad to see appended a note as to the singular germination of these plants.

*Macroscelis obovata*, t. 6815.—A singular climbing Asclepiad, more or less covered with rust-coloured hairs, with obovate acuminate leaves and tufts of five-parted brown flowers.

*Eucomis bicolor*, t. 6816.—See BAKER in *Gardeners' Chronicle*, vol. x., 1878, p. 492.

*Dendrobium Phalenopsis*, t. 6817.—See FITZGERALD in *Gardeners' Chronicle*, vol. xiv., July, 1883; see also *Orchid Album*, t. 187—a much finer specimen.

— GARDENING APPOINTMENT.—Mr. F. C. BAILEY has been appointed Head Gardener to J. F. LEESE, Esq., Send Holme, Woking, Surrey.

## GARDEN INSECTS.

(Continued from p. 567.)

In the illustration, fig. 158, is seen another interesting and bright coloured beetle, named *Anchomenus dorsalis*. The head and thorax, or chest, are of a brilliant green colour, and of metallic lustre; the body, or rather elytra, are dull green, with a patch of bright red near the base of each elytra, and long red legs. This pretty insect is exceedingly common under stones and in the crevices in walls, &c., and they frequently are to be found in colonies of fifty or sixty under stones. When such a colony is discovered and the light admitted to their private quarters, the scene is a lively one—they rush about in all directions with such rapidity that in a few moments not one is to be seen. If there are some of them that cannot get entirely out of sight, they jostle their heads in any crevice, or behind any small object at hand, somewhat after the manner of the poor ostrich, which buries its head in the sand when too exhausted to run further.

The minute insect represented in fig. 159 is *Bembidium bipunctatus*, also a pretty and brilliant beetle, the back, or elytra, of which have two conspicuous large depressions, hence the specific name. They are found plentifully in most damp situations. This beetle lives, probably, upon the countless forms of minute life, such as ground mites, which exist in almost all rich and damp soil.

## HOME CORRESPONDENCE.

*Narcissus triandrus*.—Having just come down from the Gerez, perhaps a few notes respecting *Narcissus triandrus* may be acceptable. I find it widely distributed and in full bloom from 2000 feet up to 3500 feet, when *N. nivialis* takes its place, which I found abundant at the top of Borreria, about 4600 feet. My friend M. Henriquez, of Coimbra, assures me it differs from *Bulbocodium*, the white colour of the bulb being one great mark. The triandrus and nivialis are never found growing together, but amongst the latter I found three bulbs of a triandrus with blooms bright yellow (whole coloured), apparently a hybrid. I could only find these three after considerable search, and my friend, Mr. Alfred Tait, of Oporto, says they are unique as far as his observation goes. I found four or five variations in triandrus albus, differing in size of flower, length and breadth of perianth, and especially in the cup. In colour they were all the delicate primrose-white, with an occasional yellowish-green tint. Within a space of 3 feet I gathered four variations, some of the calathinus type, others with the very short cup. To my mind they are so similar in all general characteristics that, as M. Henriquez says, "he could not give them any other designation than triandrus." I am writing this with a number of the flowers before me, and enclose a few to show the variations. One note of warning: A friend here tells me that many bulbs have been collected to be sent over to England, *Bulbocodium* and triandrus mixed, so that very great disappointment may be experienced unless the source can be traced from whence the bulbs are received. From what I have noticed, the increase of triandrus is very slow, as I found very few bulbs with offsets. The smallest bulbs seem all to bloom with one, two, three, or four flowers on each. *Scilla unifolia* and *S. odorata* are also very abundant. *Octavius Corder, Norwich.*

*Agave Ousselghemiana alba picta*.—It may interest horticulturists to know that the above rare and beautiful plant is now showing signs of flowering. I do not think it has before flowered in this country. The one now alluded to has a flower-stem nearly a yard high. Last year it showed signs of flowering by making smaller and narrower leaves, but it appeared suddenly to stop, and one day, to my surprise, it began to show growths by the side of the then visible stem, which in course of time sent up two hearts by the side of the very young stem and grew away in the usual manner, but the flower-stem still being at a standstill; but this year it began to grow away and made the growth as stated. It is the colour of the *A. Ousselghemiana*, with the white stripe in the leaf very clean and nice looking, in fact it always catches the eye of the casual observer. The latter flowered with me three years ago; that I believe was

the first that flowered in England, and after flowering it produced two hearts, and is now a nice healthy plant. Also *Agave Celsiana* (said to be) flowered last year, and that also produced two hearts, but it very frequently happens that the plants die after flowering. The above three plants are about twenty years old. *Agave maculosa* flowered with me on two occasions and died in both instances, but the three others spoken of as flowering were treated in a different way, hence the production of growths instead of dying off. That is my opinion on the matter. Should any one have succeeded in flowering the above-named plant, perhaps they would kindly inform us in the *Gardeners' Chronicle*. There is also a very fine specimen of the *Agave xylinaantha mediopicta* which seems inclined for flowering; it has thirteen or fourteen leaves between 2 and 3 feet long, some of them, and growing fast also; this is, I think, very rare also in collections—at least, I have

FIG. 158.—ANCHOMENUS DORSALIS.

never seen any but the ones I have in my possession, viz., four plants; one of which, however, died. The large one alluded to is a very beautiful plant, but its growth is very remarkable; the leaves being so much twisted as to make it very noticeable. *Aloe aristata* var. is also showing flower-stems, which is a distinct plant from the one figured in the *Gardeners' Chronicle* which flowered in this collection a few years ago. *J. S. C.*

The "Widow" or "Mourning" Iris.—Is not your correspondent, "W. F. B.," wrong in calling *Iris tuberosa* the "Widow" or "Mourning" Iris?

FIG. 159.—BEMBIDIUM BIPUNCTATUM.

I have hitherto known it as the "Snake's-head," and *Iris Susiana* as the "Mourning" Iris. The sombre colouring and almost weird look of *I. Susiana* is certainly suggestive of mourning, but there is nothing funereal about the cheerful green and velvety-black of *I. tuberosa*. Whilst writing of Irises may I ask how *I. pavonia* may be persuaded to flower freely? I have treated it like *Ixia* in pots in a cold frame, but only once had it in flower. The bulbs break up into a number of small ones. *J. S. W.* [Other correspondents write to the same effect. ED.]

*Agave americana* (American Aloe).—It may be of interest to the horticultural world and the community at large to know that this wonderful plant is now throwing up a magnificent spike of bloom in our large conservatory. The plant itself is a very fine specimen, and it has been here a great number of years, but its exact age we cannot say. The flower-stalk is growing very rapidly. It is now about 12 feet high, and was only observed about three weeks ago;

but the flowers will not, I should imagine, be open until the latter end of July or beginning of August, as August, I believe, is the flowering season. At the present rapid rate of growth it will undoubtedly attain a great height, and when the flowers are fully expanded it will be of very great interest. *James Coombes, The Gardens, Englefield, Reading.*

**Carnations.**—It may perhaps be interesting to know that the blooms of Carnations and Picotees forwarded to you are the production of seedling plants; being side blooms they are smaller and less brilliant than the first flowers. The seed was sown in March of last year, the young plants were planted out during the summer, and lifted into 5-inch pots early in October, and they have been growing in greenhouse temperature since that time. I have also some plants of last year's layers (from selected seedlings of previous years) coming into bloom freely. My beds of seedlings from the same strain are also looking remarkably well. No. 1, bright pink, No. 2, flesh colour, and No. 3, Picotee, all commenced to bloom end of February last; No. 4, Picotee, commenced to bloom early in December; No. 5, bright pink, commenced to bloom early in April. *R. H. Versteeg, Chad Valley Nurseries, Edgbaston.* [Very bright and pretty. ED.]

**Melon Canker.**—In replying to "C. H.'s" remarks on this subject at p. 671, I would ask him in future to be more careful in quoting the opinions of others, as I did not say at p. 578 that deep planting was the only cause of canker appearing in the stems of Melon plants, though I have no hesitation whatever in saying that in nine cases out of ten—all other cultural details being properly attended to—canker in the plants is the direct result of deep planting and its evil consequences. With a view to clearing the mist which would appear to surround this question in some quarters, I will reply to the concluding part of your correspondent's note first, wherein he says, "I beg most emphatically to differ from 'H. W. W.'s' opinion as to the only cause of canker, and believe it is more frequently occasioned by some sudden check, such as watering with cold water, or a sudden fall in the temperature either of the house or bottom-heat." And further down he says, "Too much water will undoubtedly cause the sudden collapse of Melon plants, and this is more likely to take place when growing in large beds of soil." As an emphatic statement, however strong, goes for naught unless it be supported by good sound reasoning, I should therefore like to ask "C. H.," who, in the beginning of his paragraph, "doubts very much whether the deep planting of Melon plants has any tendency to produce canker," to explain how it is, if the temperature of the house has anything to do with the appearance of canker, that the latter always shows itself in that portion of the stem which is buried in the soil in preference to that above it, which is more exposed to atmospheric influences? And, furthermore, if canker is the result of change of temperature at the roots, or of cold water having been applied thereat, will he explain how it is that decay in the buried stem always precedes that of the roots? And again, will he say why it is that the latter remain sound and plump until the final collapse of the plants, when, in consequence of the communication between root and branch being severed, they become soft and decomposition ensues? As your correspondent readily admits that too much water at the roots would cause canker—which means the underground decay of the stem, in consequence of its having been set too deeply in the soil—I need not say any more on this point. "C. H." does not bury the stems of his Melon plants so deeply in the fruiting pot as he at first sight may appear to some to do, for he tells us, at p. 347, that he "sows the seed in 5-inch pots, not quite half full of soil, and that as soon as the seedling plants have attained to 12 or 15 inches high they are shifted into No. 2-sized pots (14 inches deep) two-thirds full of soil." Thus it will be seen that the base of the plants would not be many inches below the rim of the fruiting pot, consequently the stem of the individual plants would not be buried very deeply in the soil. I have myself at one time grown Melons most successfully in a small way on a shelf resting on a flue in the back wall of a Pine stove, in a similar manner to that indicated by your correspondent. Only in my case the plants were raised singly in 3-inch pots three-parts filled with mould, and subsequently—as soon as they had made a few rough leaves—set on hillocks, consisting of rather more than three-parts good turfy loam and a

little lime rubble, raised to within 4 or 5 inches of the rim level of well drained pots, afterwards adding sufficient soil at short intervals to cover the roots as they protruded through the surface of the miniature mounds until the space between the base of the plants as the pots were filled, making the soil firm in doing so. However, I would remind your correspondent—whose experience in Melon culture would appear to be confined chiefly to that of plants in pots—that there is a wide difference in the conditions under which plants are grown in well-drained pots, and those planted out in pits, frames, or dung beds, and even in properly made narrow borders, having hot-water pipes for supplying the bottom-heat. In the case of plants grown in pots there is necessarily a quicker passage of the water applied to the roots when necessary through a small body of soil permeated with hungry roots than would be the case in the best and most carefully made border; and to this fact "C. H." may attribute his immunity from canker, inasmuch as the soil about the collar of plants thus grown never remains moist long enough to affect the stem, as it gets dry once or twice in every twenty-four hours, notwithstanding the fact of the pots being filled brimful every time water is given to the roots. In order to remove the difficulty which would appear to have arisen in the mind of "C. H." regarding the keeping plants elevated on mounds sufficiently and uniformly moist at the roots, I may be allowed to say that the base of the mounds, which are 3 inches higher than the otherwise level surface (when the landing-up process has been completed) of the body of soil in which the roots are growing, is about 6 inches in diameter, and 3 inches less at the top, hence there is no difficulty whatever experienced in keeping the soil about the roots sufficiently moist. Moreover, I beg in conclusion to inform "C. H." that "it is a fact"—as is all matter which I contribute to the horticultural press, as I have no wish to mislead any one, but the reverse, if I can—that during the fourteen years I have been in my present position I have grown Melons largely in pits and frames and in properly constructed Melon-houses, and during the whole of that time, planted as indicated above, I do not remember one instance of losing a plant through canker (which I may state in passing is no disease, but an indication that the conditions under which the plants are grown are not congenial to their requirements), neither do any of my gardening friends who have been in the habit of paying me a visit more or less frequently during the time I have been in charge of these gardens, nor do any of the young men who have lived under me during that time, though I have had several cases of canker brought under my notice elsewhere. Knowing that statements of this kind are not worth much unless the name and address of the writers be given, as they afford no opportunity for verification to those who otherwise would be in a position to see and believe, I therefore give my name and address, as is my wont whenever I make a statement, the correctness of which might otherwise be doubted. *H. W. Ward, Longford Castle Gardens, Salisbury.*

**Gaillardia picta.**—The flower which I send with this is the produce of seed gathered in August, 1883, on the trail from Calgary to a rancho on the foot hills of the Rocky Mountains. I conclude it is one of the dwarf Canadian Sunflowers, but it lacks the deep claret centre which I observed in several of the plants I found there, and from which I endeavoured to choose the seed. I suppose it to be a biennial, for the seed was sown in the spring of 1884, and the plants did not flower last year. They have shown this strange peculiarity—those planted out flourished through the summer and autumn but were killed by the winter: two or three, by accident left in a frame, survived and are now in flower, and yet in their native country they have to bear a winter temperature of 30° or 40° below zero. *H. W. W.* [The flower is that of *Gaillardia picta*. Ed.]

## DOUBLE ALLAMANDA.

SOME flowers double by the replacement of their stamens, or pistils, or both by petals; others, like the Allamanda before us, by a repetition of the corolla, producing a hose-in-hose arrangement. We do not remember to have seen this in Allamanda before, and have considered it of sufficient interest to give an illustration (fig. 160).

## Reports of Societies.

### ROYAL HORTICULTURAL: May 26.

#### Scientific Committee.

A. Grote, Esq., in the chair.

#### LILAC.

Colonel Clarke exhibited a spray from a tree which he had cut deeply back, according to a practice adopted in Paris, so that the autumn shoot produced flowering wood for the next season. Dr. Lindley had thought that it could not be done in this climate. The bunch of flowers was not so large, but apparently of finer colour than ordinarily.

#### LILY OF THE VALLEY DISEASED.

Specimens were received from Mr. G. Lee, of Clevedon, apparently attacked by some fungus. They were referred to Mr. G. Murray for examination and report.

#### ACIDIUM GROSSULARIÆ.

Leaves of Currant and Gooseberry with large patches of this disease were sent by J. Cleland, of Downpatrick.

#### CUCUMBERS DISEASED.

Mr. J. Heptinstall sent some fruit showing gummy exudations. The cause was not apparent, and they were referred to Mr. Murray for examination. No fungus or insect was visible, and it was thought by some to be due to too much manure.

#### LYCOPERDON SP.

A fine young specimen of a Puff ball, about 9 inches in height, was received from Mr. Grant, of Christ Church, Ilants. It was entrusted to Mr. Murray to name.

#### SAPONARIA OCYMOIDES.

Mr. Loder exhibited specimens of varieties of this plant, which appeared to surpass in richness of colour the form known as "splendens;" he proposed to call it *atro-coccinea* or *atro-rubens*—another variety he named *grandiflora*.

#### FASCIATE PEDUNCLES.

A *Narcissus*, with several flowers fused; a *Polyanthus* with a quadrate stem, due to the fusion of four peduncles; and *Primula obtusifolia* were exhibited by Mr. Smee, Col. Beddome, and Mr. Loder respectively.

#### LILIUM LONGIFOLIUM, BULBIFEROUS.

Mr. Wilson exhibited a stem which had borne aerial bulbs instead of flowers, and of which bulbs had grown into shoots a foot or more in length while still upon the parent plant.

#### MORELLO CHERRY, DOUBLE.

Mr. Wilson showed a spray of this variety. Some of the flowers had the two foliaceous carpels similar to the common double Cherry; others had additional flower-buds within the two carpels.

#### DENDROBIUM WARDIANUM, MONSTROUS.

Dr. Masters exhibited blossoms with supernumerary labella, &c., from Mr. Douglas, upon which he will report at a future occasion.

#### HELLEBORES, HYBRIDS.

Rev. G. Henslow exhibited branches from the same plant of *H. albidovirens*, described at the last meeting, and received from Mr. Ellacombe. One bore bright green foliage and pure white flowers, the serratures of the leaves being rather coarse. The other had purple flowers, and foliage of a purplish-green, the serratures being finer than in the other. The specimens indicated a separation of the parental elements on distinct branches of the same plant, somewhat similar to the well-known case of *Cytisus Adami*.

#### INSECTIVOROUS PLANTS IN THE OPEN.

Fine specimens of *Darlingtonia*, *Dionaea*, *Sarracenia purpurea*, and other species, as well as species of *Drosera*, were received from Miss Owen, Knockmullen, Gorey, Ireland, all of which were grown out-of-doors in small "bog beds;" the first three for one year, but the other for several years.

#### STRAWBERRY, QUINQUEFOLIATE LEAVES OF.

The Rev. G. Henslow exhibited specimens received from Mr. Lovell, of Driffield. He also brought specimens of *Fragaria monophylla* (from the garden of the late Mr. Borrer) to show how the five-leaved form was derived from the monophyllous (which is characteristic of seedlings). Two basal lobes become detached from the single blade, and then two more from the basal lobes of the former. A similar process is characteristic of the Blackberry, but in the

Raspberry both pairs of leaflets are successively taken from the terminal one. Mr. Dyer, in a notice of Duchesne's *Histoire Naturelle des Fraisières* (*Nature*, xxix., 215) alludes to the origin of *F. monophylla* and its retaining in the adult state the character of a seedling. He also showed specimens of transition from simple to compound states in the leaves of *Rhus heterophylla*, *Ampelopsis Veitchii*, *Clematis cirrosa*, and *Elm*.

#### MONSTROSITIES.

The Rev. G. Henslow exhibited three blossoms of garden Anemone, in one of which the bracts of the involucre were sub-petaloid, in the other a supernumerary coloured leaf grew from within the involucre; also a Passion-flower received from Mr. Pim with a sub-petaloid stigma, the rest of the flower being normal.

#### CLOVER SICKNESS.

Mr. Plowright sent the following, with illustrations:—"The cause of this affection of Clover is but little understood. Possibly it may be induced by more than one cause, or rather that several diseases which cause injury to the Clover crop have been loosely called Clover sickness. Not the least important of these is due to the presence of a parasitic Peziza, which at one period of its growth develops a sclerotium upon the roots of the Clover. Having been anxious for some time past to meet with this fungus, I have examined several plants from a field of Clover which is sick, near King's Lynn, which were from time to time brought to me by my friend Mr. Thomas Brown. The only abnormality I can discover, however, consists in the presence of those little nodular enlargements upon the roots of the Clover which have been so carefully investigated by Eriksson in his paper, 'Studies öfver Leguminosernas rotknölar.' The specimen sent herewith shows the condition which Eriksson describes. Each knot is about the size of a pin's head, of an oval form, rather soft internally, and attached by one end to one of the smaller roots. Similar bodies may not unfrequently be seen upon roots of the cultivated Pea and Bean. If a section be cut from one of these root-knots from the Clover, and examined under a power of 400 or 500 diameters, it will be seen that the central part of the knot consists of a mass of cells full of granular contents. These granules escape when the cell wall is ruptured, and float about as a cloud of minute specks. The central part of the root-knot is paler in colour and more transparent than the external enveloping tissue. The structure of the internal mass enclosed in the cells reminds one of plasmodiophora. I have been unable to observe the peculiar cruciate bodies which Eriksson figures, t. iii., f. 40 and 41, as 'Corpora vibriorum similia aut ramosa.'"

The Editor of the *Gardeners' Chronicle*, describing these tubercles on the Leguminosæ, alludes to Professor Frank's observations as follows:—"He was always able to distinguish two foreign elements—namely, undoubted slender threads or 'hyphæ' traversing the cell walls and cell cavities, and very small cell-like corpuscles, free from each other, and the protoplasm of the cells of the inner tissue, in which they are at present in extraordinary numbers." (*Gardeners' Chronicle* 1879, vol. ii., pp. 112, 114, and vol. xii., p. 209.)

#### NICOTIANA HYBRID.

Rev. G. Henslow showed drawings of the hybrid raised by Colonel Clarke, and exhibited at the previous meeting. The pollen grains were spindle-shaped, with one to three grooves, colourless, and exhibited little or no change in water; in glycerine a small drop of granular fluid matter exuded. The grains did not give the appearance of health, and had hitherto proved ineffectual in producing good seeds.

#### Floral Committee.

G. F. Wilson, Esq., in the chair. Present: Messrs. Henslow, Kellock, Fraser, Wilks, Child, Bealby, James, Walker, Hudson, George, Noble, Masters, Dominy, Pollett, H. Williams, T. Baines, H. Hill, Turner, Bennett.

At this committee numerous objects were presented. At first, till the committee warmed to their work, they were chary of giving certificates, but by-and-bye Mr. Turner's Carnations—a group of three—waked the latent fire, and all three were duly honoured. Colonel Cox is a rich orange-crimson self, very lustrous; Goliath is worthy of the name, the ground colour is pale pink, striped with red; T. W. Girdlestone has yellowish flowers, striped with red. Having catered for the florists, the "hardy" men were conciliated by an award to *Dodecatheon splendens*, a rich magenta-coloured flower, with a golden eye. The compact-growing, large-flowered *Polemonium Richardsoni* was next honoured. It is a Californian and improved edition of our wild Jacob's Ladder. Messrs. Veitch sent a very interesting lot of things—a grand *Hydrangea*, with enormous trusses of large blue flowers, called *H. nianchurica*, a Japanese species; *Philadelphus microphyllus*, a small bushy plant, with wiry branches, minute ovate leaves, and small flowers. This deserved a Certificate, but did not get it. The very curious

climbing *Hydrangea*, called *Schizophragma hydrangeoides*, was more lucky. It clings to walls by means of roots like Ivy, has glossy Lime-like leaves and trusses of white *Hydrangea*-like flowers. *Olearia Gunnii* also received a Certificate. It is a fine hardy shrub, with small greyish, coarsely toothed leaves, and heads of white Aster-like flowers along the ends of the branches. A Lilac called *Marie Lagrange* created something like a sensation, on account of its fine trusses and large well formed substantial white flowers. *Pride of Primroses*, a Carnation of a clear yellow colour, received an award in proportion to its merits. A *Heliotrope* called *Roi des Noirs*, of dwarf habit, very dark purple flowers, also received recognition. A Russian *Allium*, called *Karataviense*, one of the most remarkable of its class, received a Certificate; it had very broad greyish strap-shaped recurved leaves, and large globose heads of whitish star-like flowers. *Piper ornatum* is a stove climber with peltate cordate ovate-acute leaves of a shiny green, speckled with white; it did not take the fancy of the committee, and indeed there are many better plants of this class. *Phyllanthus Chantrieri*, a stove shrub with spreading pinnate bright green leaves, from the under-surface of which depend minute reddish flowers, was deemed worthy of a Certificate. Two grand *Odontoglossums* from Mr. Pollett followed; one, *O. crispum lilacinum*, had large flowers of a deep lilac, the lip being yellow—and *O. roseum punctatum*, one of the most remarkable varieties we have seen, having numerous minute brown spots on a rosy-lilac ground. *Cattleya*

bushes considering the size of the pots in which they were grown; *Celine Forestier*, a superb pot Rose; *Madame Willermoz*, very fine; *Madame Lacharme*, *Innocenta Pirolo*, &c., were the best. Messrs. Paul & Son, The Old Nurseries, Cheshunt, were a good 2d, their plants being well grown though smaller. *Madame Lacharme* was again fine, and *Violette Bowyer*, a fine white Rose. Mr. W. Rumsey, Waltham Cross, was 3d.

#### ORCHIDS

were well represented from the gardens of De B Crawshay, Esq., Rosefield, Sevenoaks (gr., Mr. S. Cooke), and from H. Little, Esq., Hillingdon Place, Uxbridge (gr., Mr. F. Hill). The centre plant in Mr. Crawshay's collection was the splendid *Vanda suavis* which gained the 1st prize at the Crystal Palace. The other plants with few exceptions, are described in the report of that show.

Mr. James, of Lower Norwood, was the only competitor in the nurserymen's class, and gained the 1st prize with a good group of nine. *Cattleya lobata* had four spikes, with four flowers on each; *Odontoglossum citrosium*, three spikes; *Cattleya Mendellii*, fourteen open flowers; *Odontoglossum Alexandre* and *O. Pescatorei* were in good form.

Mr. Turner was the only exhibitor of AZALEAS, but he obtained the 1st prize, with splendid examples. *Bernhard Andreas alba* is a beautiful double white, very free in flowering; other varieties were the same as shown at the Crystal Palace.

Mrs. F. Bennett, Tulse Hill House (gr., Mr. J. Howes), was a good 2d, the plants not being quite out.

#### CLEMATIS.

Messrs. Jackman again exhibited their splendid collection of Clematis, and were awarded the 1st prize in that class—the varieties being *Fairy Queen*, *Lady Caroline Neville*, *Blue Gem*, *Mrs. Kennett*, *Madame Van Houtte*, white; *Mrs. Hope*, pale blue; *Duchess of Edinburgh*, double white; and *Belle of Woking*, double blue.

Tree Carnations from Mr. Charles Turner formed a most attractive exhibition of themselves; the plants were clean, and the flowers well developed. *Colonel Cox*, fine scarlet; *Mrs. McLaren*, crimson bizarre; *Sir Evelyn Wood*, purple; *Lady Rose Molyneux*, fine white; *Juliette*, deep rose; *The Queen*, white; *Mrs. Llewelyn*, rose; *Andalusia*, fringed yellow; *Goliath*, large, pale red ground, scarlet flakes; and many other fine varieties composed the group.

#### HARDY PLANTS.

Collections of hardy herbaceous plants in the form of cut flowers were exhibited by Messrs. Paul, of Cheshunt, and Mr. Ware, of Tottenham. Messrs. Paul were 1st. Their collection contained no less than sixty-four species and varieties the most conspicuous being *Arnebia echinoides*, *Anemone alpina sulphurea*, *Preonia peregrina*, fine rosy-purple; *Anemone sylvestris*, *Trollius asiaticus*, *Ranunculus acris plenus*, *Cheiranthus alpinus*, *Primula japonica* and *P. Munroi*, and *Ranunculus Gowiana*. In Mr. Ware's collection were fine bunches of *Polemonium Richardsoni*, numerous Irises, and other seasonable flowers.

#### PANSIES.

Collections of sixty Pansy blooms in thirty varieties were exhibited by Mr. H. Hooper, of Bath, Mr. J. Forbes, of Hawick, N.B., and Mr. F. Hooper, of Bath, who took the prizes in the order of their names. The varieties were all of the fancy section, those from Bath being the largest, but Mr. Forbes exhibited his blooms in capital condition, though smaller.

#### MISCELLANEOUS GROUPS

of plants formed as usual a very important feature in the exhibition, and were interesting in their multifarious variety. Messrs. Paul & Son, The Nurseries, Waltham Cross, were awarded the Silver-gilt Medal for a collection of Roses in pots and cut Roses, both being worthy of the name of Paul. The pot-plants were conspicuous for their clean, beautiful foliage and splendid blooms; the best were *Lady Sheffield*, *Queen of Queens*, a full, well-formed beautiful Rose; *Star of Waltham*, crimson; *La France*, superb; *Alfred Colomb*, *St. George*, and *Merveille de Lyon*.

Mr. B. S. Williams obtained a Silver Medal for an extensive and very interesting group of stove and greenhouse plants, comprising some well-grown Orchids—*Cattleya Warneri*, very fine; *C. gigas*, *C. Skinneri*, *C. Mossii*, &c.

Mr. Rumsey was awarded a Bronze Medal for cut Roses and pot plants of the same; amongst them some well-grown standard Tea Roses, *Souvenir d'un Ami*, very fine; *Catherine Mermet*, and *Marie van Houtte* were the best.

Mr. Noble, of Bagshot, also exhibited well-grown Clematis, amongst them Mr. Gladstone, pale blue; Lord Beaconsfield, very fine pale lilac-blue; *Pirate King*, purple; *Countess Gleichen*, pale lilac bluish; *Lady Constance Kennedy*, very fine double white; *Sir Joseph Hooker*, perfectly double flowered purplish-blue variety.

Mr. Ware made a capital exhibition of herbaceous plants in pots, comprising choice hardy Orchids, such as *O. papilionacea*, *O. spectabilis*; fine examples of *Polemonium Richardsoni*, *Dodecatheon splendidum*, very bright; the pretty *Houstonia cerulea alba*, *Tulipa persica*, *Onosma taurica*, *Trollius Loddigesianus*, the best of the globe flowers; *Pinguicula grandiflora*, and last, but certainly not least, *Lachenalia rubida*, a very fine species, with rose-coloured flowers, marked with rosy-red spots.

Messrs. Kelway, of Langport, made a very pretty exhibition of cut flowers, including a good strain of *Amaryllis* single *Pyrethrums*, and a few cut herbaceous flowers.

Mr. W. Stacey, nurseryman, Dunmow, sent very fine cut *Verbenas*—*Lord Brook*, scarlet, white eye; *Lilacina*, bright pale blue; *Striata*, prettily striped variety; *Purity*, large white; *Ophelia*, rose; *Hamlet*, scarlet, distinct, and very good.

A well grown group of *Caladiums* from the Chiswick Gardens of the Society, well arranged, added a distinct and handsome feature to the exhibition.

#### SPECIAL PRIZES

were offered by Messrs. Webber & Co., Covent Garden Market, for a box of Strawberries, to be sent by rail, for the purpose of illustrating the best method of packing. The 1st prize was awarded to Mr. J. Vert, Audley End Gardens, Saffron Walden; the fruit was packed so that it did not move in transmission, the stems of the fruit being uppermost, and each specimen enclosed in a separate leaf: the variety was *President*. The 2d prize was awarded to the Earl of Radnor (gr., Mr. S. Haines), the fruit being well packed as for exhibition: the variety was *Sir J. Paxton*. 3d, Hon. Col. W. R. Talbot (gr., Mr. C. Waite).

#### VEGETABLES AND FRUIT.

Messrs. Sutton & Sons, of Reading, offered prizes for the best brace of Cucumbers, to include Sutton's Cluster or Sutton's Purley Park Hero. All the prizes fell to the variety *Purley Park Hero*. The specimens exhibited were well grown, and the variety is evidently a good exhibition kind. The Earl of Radnor was 1st; 2d, *Sir R.*

FIG. 160.—DOUBLE ALLAMANDA. (SEE P. 704.)

*Schofieldiana*, a remarkable species with large flowers, the sepals and petals green with numerous red spots, the lip three-lobed, the anterior lobe stalked and semi-orbicular, clothed on the upper surface with small conical purplish processes. *Lobelia superba*, shown by Mr. Weedeo, a variety of dwarf habit, and with very dark blue flowers striped with white, received a First-class Certificate. *Clematis*, *Sir Joseph Hooker*, shown by Mr. Noble, is a double flowered variety, very full, and of a dark lilac colour. C. Lord Beaconsfield, a very large flowered single lilac, obtained no award, probably because it was not considered sufficiently distinct. *Aerides Wilsoniana*, a species in the way of suavisimum, with white flowers and a yellow spur, received a Certificate. *Saxifraga Macnabiana*, a species like *pyramidalis*, but of dwarf habit and with white flowers spotted pink, also obtained an award. A Cultural Commendation was decreed to a well grown plant of *Yucca filamentosa variegata* in flower. *Azalea Miss Buiet*, a dwarf variety, with pure white flowers of moderate size and good substance, received a Vote of Thanks. In sheltered situations in the South this would make an admirable plant for the rockwork.

#### Show of Pot Roses, Azaleas, &c.

The schedule on this occasion was made up of nineteen classes only, but what was lacking in quantity was amply made good in quality, most of the productions exhibited being exceptionally good. Large Roses were not invited, the one class being for eighteen in pots, not exceeding 9 inches in diameter. Mr. Charles Turner, The Royal Nurseries, Slough, was well 1st with really handsome specimens in wonderful health and large

#### AMARYLLIS.

It is almost too late for these, but Mr. Little exhibited a nice collection of twelve, and gained the 1st prize.

Twelve PELARGONIUMS, comprising show and fancy varieties, brought out the largest and best specimens from the Slough collection. *Kingston Beauty*, a fine show variety, could scarcely be surpassed for size of plant and quality of the flowers; *Amethyst*, beautiful colour; *Ritualist*, large flowers, of fine quality; *Claribel*, the finest white; and *Illuminator*. The best fancies were *Princess Teck*, *Lady Carrington*, and *Thomas Ring*. Mr. Turner was also 1st for the eighteen plants in small pots, and Mr. Little 2d. *Madame Marie Knecht*, fine white; *Joe*, *Sister of Mercy*, and *Madame C. Keteleer*, were conspicuous in Mr. Turner's collection.

The exhibition of herbaceous CALCEOLARIAS was remarkable for a splendid collection of fifty plants exhibited in competition by Mr. James, of Farnham Royal, Slough. It may be safely said that no such specimens have ever been exhibited before, taking into account the condition of the plants, the profusion and quality of the blooms. The colours were so brilliant and so varied as almost to defy description. One was noted as of a rich orange-scarlet colour, others crimson, crimson-scarlet, crimson with magenta tints, most of them being also richly spotted. Messrs. Carter, of 237, High Holborn, obtained the 2d prize with an excellent group and a capital strain—the plants being well grown.

The 1st prize in the amateur's class was awarded to J. C. Lanyon, Esq., Birdhurst (gr., Mr. Ford), with a very fine group; his yellow self being very prominent;

F. Sutton, Bart., Benham Park, Newbury (gr., Mr. C. Howe); 3d, The Hon. W. P. Talbot, Glenhurst, Esher. The same firm offered prizes for Melons to include Sutton's Scarlet Inviacible, Sutton's Masterpiece, or Sutton's Hero of Lockinge. The specimens were very handsome in appearance, and considering the season fairly good in quality. Mr. C. Herrin, Chalfont Park Gardens, Gerard's Cross, was 1st; Sir R. F. Sutton, 2d; and the Earl of Radnor, 3d. Mr. Herrin sent Hero of Lockinge, Sir R. F. Sutton sent Inviacible and Masterpiece, the Earl of Radnor Best of All and Hero of Lockinge. From the gardens of N. W. Dick, Esq., Thames Ditton, were sent very good Black Hamburg and Foster's White Seedling Grapes; from Messrs. W. & E. Wells, Croxby House, Hounslow (gr., Mr. G. Thompson) was sent magnificent examples of Sir C. Napier Strawberry plants bearing fruit, in pots, and a basket of gathered specimens. Well kept Lady Downe's Grapes from H. J. Atkinson, Esq., Gunnersbury House, Acton (gr., Mr. Hudson), were also exhibited. There was also a very fine dish of Brown Turkey Figs from Mr. S. Lyon, Sunridge Park, Bromley. Cucumber, Benham Park Hero, from Mr. C. Howe, a cross between Challenger and Telegraph, is a very fine white-spined variety. Four well grown Melons were sent by Mr. Howe, to one of which, a scarlet-flesh Benham Beauty, a First-class Certificate was awarded. Mr. P. Penford, Leigh Park Gardens, Havant, sent a green-flesh Melon, and Mr. Justus Corderoy, Blewbury, Didcot, four dishes of Apples well kept.

#### FIRST-CLASS CERTIFICATES

were awarded as follows:—

- To Mr. C. Turaer, for Carnation (Tree) T. W. Girdlestone.
- To Mr. C. Turner, for Carnation (Tree) Colonel Cox.
- To Mr. C. Turner, for Carnation (Tree) Goliath.
- To Mr. T. S. Ware, for Polemonium Richardsonii.
- To Mr. T. S. Ware, for Dodecatheon splendens.
- To Messrs. J. Veitch & Sons, for Phyllanthus Chantieri.
- To Messrs. J. Veitch & Sons, for Carnation Pride of Penshurst.
- To Messrs. J. Veitch & Sons, for Gloxinia Flambeau.
- To Messrs. J. Veitch & Sons, for Heliotrope Roi des Noirs.
- To Messrs. J. Veitch & Sons, for Allium Karataviense.
- To Messrs. J. Veitch & Sons, for Hydrangea mandschurica.
- To Messrs. J. Veitch & Sons, for Schizophragma hydrangeoides.
- To Messrs. J. Veitch & Sons, for Olearia Gunnii.
- To Messrs. J. Veitch & Sons, for Syringa vulgaris Marie Legrange.
- To H. M. Pollett, Esq., for Odontoglossum crispum var. lilacina.
- To H. M. Pollett, Esq., for Odontoglossum roseum var. punctatissima.
- To Mr. T. W. Bond, for Cattleya Schofieldiana.
- To Mr. G. Weedon, for Lobelia superba.
- To Mr. C. Noble, for Clematis Sir Joseph Hooker.
- To Messrs. F. Sander & Co., for Aferides Wilsonianum.
- To Mr. J. V. Rees, for Saxifraga Macnabiana.

#### CULTURAL COMMENDATION.

- To Mr. H. James, for Yucca filamentosa variegata.

#### VOTES OF THANKS.

- To Messrs. James Carter & Co., for Calceolaria Victor Hugo.
- To Mr. B. S. Williams, for group of plants.
- To Mr. T. J. Seidel, for Rhododendrons.
- To Mr. W. Stacey, for cut Verbenas.
- To Mr. G. W. Cummins, for Cattleya Mossiae Saneana.

#### FRUIT COMMITTEE.

##### FIRST-CLASS CERTIFICATE.

- To Mr. C. Howe, for Melon Benham Beauty.

##### CULTURAL COMMENDATION.

- To Mr. S. Lyon, for Fig Brown Turkey.

#### VOTES OF THANKS.

- To Mr. C. Howe, for Cucumber Benham Park Hero.
- To Mr. W. Fyfe, for Grapes.
- To Mr. J. Hudson, for Grapes.

### MANCHESTER HORTICULTURAL AND BOTANICAL: May 22—29.

MANCHESTER has once more come to the fore in a manner peculiarly its own. During the Whitmas week it held at the Botanical Gardens, Old Trafford, an exhibition at once extensive and high-class, and certainly one of the best that has been held there since they were first established. It is now eighteen years since this series of exhibitions was commenced, and Mr. Bruce Findlay, the then able Curator of the Gardens, and now Secretary to the Society, and those who have so generously supported him, have abundant reason to congratulate themselves upon the success of their bold scheme.

The large show-house was, as usual, full to repletion, and here were Orchids, stove and greenhouse foliage and flowering plants, stately Palms, graceful Ferns, brilliant Anthuriums, and magnificent Ericas; here, too, were some Gleichenias, such as perhaps could not be found outside the Manchester district, the singular Pitcher-plants and Sarracenias, always a leading feature at this great show, and the numerous groups of new and rare plants sent by the London and provincial nurserymen. Here there was something more than a large and varied exhibition in itself.

#### ORCHIDS.

These were very numerous, and they were seen in the finest condition. With those included in the miscellaneous collections, sent by Messrs. F. Sander & Co., and Fisher, Son & Sibray, there were enough to form a fringe—and a particularly effective fringe, too, they made—running almost the length of the plants placed round the house. Mr. Findlay had grouped them so well that they were seen to the best advantage. This show served to bring to the fore one new exhibitor of Orchids—A. Heine, Esq., Fallowfield, Manchester (Mr. J. Cragg, gr.), who proved very successful on this occasion. Mr. Heine was 1st in the leading class for fifteen specimens, having a magnificent Dendrobium Wardianum, D. Dalhousianum, D. thyrsoiflorum, D. nobile, a splendid Cattleya Mossiae with about seventy flowers, C. Mendelii, Lælia purpurata, Oncidium vexillarium, with twenty-four spikes of blossoms; Odontoglossum Alexandre, with eighteen or twenty spikes of bloom expanded and unexpanded; Cyrtopidium Lawrenceanum, Vanda suavis, and V. suavis Pescatorei. 2d, Joseph Broome, Esq., Didsbury (Mr. A. Cole, gr.), who had a fine piece of Vanda teres, V. suavis, Phalenopsis amabilis, Cattleya Mossiae, very fine; 3d, C. Mendelii, Dendrobium Freemanii, D. nobile, D. devonianum, Odontoglossum vexillarium, Lælia purpurata, Epidendrum vitellinum, E. prismatocarpum, Cyrtopidium barbatum, and Aferides Fieldingii. Mr. Heine also had the best nine specimens, staging excellent examples of Cattleya Mossiae, C. Mendelii, Dendrobium devonianum, D. thyrsoiflorum, Lælia purpurata, Odontoglossum cirrosium, O. Alexandre, and Vanda suavis. 2d, S. S. Whalley, Esq., Fallowfield (Mr. G. Jackson, gr.), who had good examples of Dendrobium Paxtonii, D. thyrsoiflorum, Lælia purpurata, Cattleya Mossiae, D. crassinode, D. Bensoniae, Aferides Fieldingii, and Saccobium premorsum.

In the class for six specimens the veteran Dr. Ainsworth was 1st, Mr. Mitchell staging admirably managed specimens of Vanda suavis, with eight spikes of flowers; Phalenopsis amabilis, with fifty spikes at least; P. grandiflora, with twelve spikes; Dendrobium thyrsoiflorum, Aferides Fieldingii, and Cyrtopidium barbatum giganteum. 2d, John Heywood, Esq., The Grange, Stretford (Mr. R. E. Elphinstone, gr.), with Dendrobium thyrsoiflorum, Lælia purpurata, Cyrtopidium barbatum, Cattleya Mossiae, Cyrtopidium caudatum, and Odontoglossum Roezlii.

In the class for ten Orchids, *bona fide* specimens, Mr. A. Heine was again 1st, with a very fine lot, including such a grand piece of Dendrobium Paxtonii as is seldom seen—a specimen fully 3 feet through; D. thyrsoiflorum, D. nobile, Lælia purpurata, Cattleya Mossiae superba, and C. Mossiae aurantiaca, Vanda suavis, V. tricolor formosum, Odontoglossum Hallii, and Calanthe veratrifolia. 2d, Mr. J. Broome, with good samples of Cattleya Mossiae, Dendrobium Wardianum, D. nobile, D. thyrsoiflorum, D. clavatum, D. pulchellum, D. Falconeri, Cyrtopidium Stonei, Aferides Fieldingii, and Lælia purpurata. Mr. Heine had the best six Cattleyas, staging fair sized well flowered examples of Mossiae (3), C. Mossiae superba, and C. Mendelii (2). Mr. Broome came 2d with four well coloured plants of C. Skinneri, and two of C. Mossiae. Mr. Heine also had the best three Vandas, very good indeed, the varieties being V. tricolor insignis, V. t. formosa, and V. suavis Gotschalkii. S. S. Whalley, Esq., was 3d with two plants of V. suavis and one of V. teres, all good examples; and Mr. Broome came 3d with three excellent plants of V. suavis.

In the nurserymen's class for sixteen Orchids the competition was confined to Mr. James Cypher, of Cheltenham, and Mr. J. James, of Lower Norwood, the former taking the 1st prize with a thoroughly good representative collection consisting of Cyrtopidium villosum, C. barbatum biflorum, C. Lawrenceanum, Lælia purpurata, Cattleya Mossiae, C. Mendelii, C. Mossiae aurantiaca, Odontoglossum cirrosium, Oncidium sphecelatum, O. Marshallianum, Dendrobium Jamesianum, D. suavisimum, D. chrysotoxum, D. thyrsoiflorum, and D. nobile. Mr. H. James, who was placed 2d, had Dendrobium thyrsoiflorum, Phalenopsis amabilis, Oncidium Marshallianum, Vanda suavis, V. suaveolens, Cattleya Mossiae, Odontoglossum Alexandre, O. vexillarium, Anguloa Clowesii, Cyrtopidium Lawrenceanum, and Masdevallia Harryana. The same exhibitors were again 1st and 2d in the class for ten specimens: Mr. Cypher had Cattleya Gaskelliana, C. Mendelii, C. Skinneri, Dendrobium thyrsoiflorum, D. nobile, D. chrysotoxum, Cyrtopidium barbatum grandiflorum, C. Lawrenceanum, and Masdevallia Harryana. Mr. James had Vanda suavis, also Rolisson's variety, Cattleya Mendelii, C. Mossiae, Odontoglossum vexillarium, O. Alexandre, O. Pescatorei, Cyrtopidium Lawrenceanum, and Masdevallia Harryana.

#### STOVE AND GREENHOUSE PLANTS.

It was generally admitted that these were very good, especially the ten plants staged by Mr. Cypher. In the amateurs' class for eight specimens, S. Schloss, Esq., Bowdon (Mr. A. Paul, gr.), was 1st, with a very good lot, consisting of Anthurium Scherzerianum with fifty spathes, large and well coloured; Dendrobium fimbriatum occultatum, Clerodendron Balfourianum, a fine piece of Boronia elatior, a fine white Azalea Fielderi, A. Duc de Nassau and one other, and Erica Victorice. 2d, John Rylands, Esq., Stretford, with good plants of Darwinia Fuchsoides, Ixora Williamsii, I. Pilgrimii, Anthurium Scherzerianum, A. Andreanum, Clerodendron Balfourianum, Azalea Roi Leopold, and Erica coccinea minor.

Mr. Cypher's 1st prize collection in the class for ten specimens consisted of a wonderfully fine Erica Cavendishiana, E. depressa, Anthurium Scherzerianum, Hedera tulipifera, Aphelexis macrantha purpurea, Pimelea spectabilis, P. Hendersoni, Clerodendron Balfourianum,

Azalea Stella, and a very fine A. magnifica. Mr. James had Erica Lindleyana, E. ventricosa magnifica, E. coccinea minor, E. depressa, Anthurium Scherzerianum, A. Andreanum, Statiche profusa, Darwinia Hookeriana, and two Azaleas, 3d, Mr. Tudgey, Waltham Cross, whose best plants were Anthurium Scherzerianum, Aphelexis macrantha purpurea, Erica Victorice, and Azalea Criterion.

#### AZALEAS.

The best six came from J. Broome, Esq., well grown, good sized, admirably flowered plants of Criterion, Madame Marie Lefebvre Trotteriana, Stella, Madame Iris Lefebvre, a charming delicate pink variety; and Imperatrice Josephine; 2d, J. Brown, Esq., Heaton Mersey (Mr. Jas. Grier, gr.), with Chamer, very fine; Souvenir de Prince Albert, Chelsoni, Magnet, Lou's Morgottin, and Roi d'Hollande; 3d, Mr. J. Rylands. Singular to state, nothing was furnished to the nurserymen's class of eight varieties.

#### ERICAS.

The best six in the amateur class came from Joseph Broome, Esq., who had nice examples of affine, Victoria, ventricosa coccinea magnifica, ventricosa coccinea minor, ventricosa tricolor, and suaveolens; 2d, S. Baerlin, Didsbury (Mr. G. Williams, gr.), who had Victoria, ventricosa coccinea minor, tricolor dumosa, and two others.

In the nurserymen's class Mr. Cypher had the best six, good specimens of E. Cavendishiana, ventricosa magnifica, coccinea minor, tricolor Wilsoni, impressa, and Lindleyana. 2d, Mr. E. Tudgey, with a fine affine, Cavendishiana, Lindleyana, ventricosa tricolor, and Victoria.

#### MISCELLANEOUS FLOWERING PLANTS.

The only exhibitor of six Sonerilas was Mr. Broome, but none of them were in flower, still they were well grown specimens, and in good character. The forms were argentea, Nelly, Hendersoni, marmorata, Rowly, and amœnea.

Gloxinias were represented by good sized, well grown and flowered examples. The best ten came from Mrs. C. Sergeant, Temple Villa, Sale, the plants having from twenty to thirty flowers each. Mr. Z. A. Ward, Didsbury, was 2d, and Mr. G. B. Blair, Whalley Range, 3d. Mr. W. Hayes, jun., Chorlton House, Sale, had three very fine specimens of Lilium auratum, well grown, dwarf, and bearing thirty to forty flowers each. They well deserved the 1st prize in this class.

Calceolarias were somewhat largely and well shown, foliage and flowers alike good. Mr. S. Baerlin had the best eight; Dr. Adanson, Didsbury, being 2d.

#### ROSES.

On this occasion the large plants occasionally seen from Cheshut and Slough, were wanting, and the amateurs' plants were better than those shown by the trade. Mr. Broome had the best six specimens, staging nice fresh, well grown and flowered plants of La France, Annie Wood, Comtesse de Serenye, Madame Lacharme, Niphetos, and Marquis de Castellane. 2d, Mr. John Heywood, his best examples being Duke of Edinburgh, Charles Lawson, and Anna Alexieff.

In the nurserymen's class for twenty plants in pots, not more than 9 inches across, the 1st prize was withheld, the 2d going to Mr. John Hooley, Stockport—nicely grown specimens, a little overblown, the best varieties being Général Jacqueminot, Marie Guillot, Anna Alexieff, Souvenir d'un Ami, John Hopper, and Paul Néron.

In the class for thirty plants, in any sized pots, the 1st prize was again withheld, the 2d going to Messrs. G. & W. Yates, nurserymen, Stockport, the varieties much as already stated.

#### CLEMATIS.

We were pleased to note an improvement in the culture of these useful decorative plants at Manchester.

In the nurserymen's class for fifteen specimens, Messrs. Richard Smith & Co., of Worcester, had good-sized, admirably grown and flowered examples of Marie Lefebvre, Grand Duchess, Sensation, Countess of Lovelace, Marie van Houtte, purpurea elegans, Lucie Lemoine, Lady Caroline Nevill, J. A. Henry, Duke of Norfolk, Fairy Queen, Gloire de St. Julien, and Princess of Wales. There was no other competitor. In the class for specimens shown by amateurs, T. Dickson, Esq., Broughton (Mr. H. Bennett, gr.), was 1st with Fairy Queen, purpurea elegans, Henry, lanuginosa candida, Lucie Lemoine, and Mauve Queen; 2d, Mr. J. Heywood, whose best varieties were Lady Caroline Nevill, Marie Lefebvre, purpurea elegans, and Sensation.

#### PANSIES AND VIOLAS.

These were largely shown in pots, and they made a very effective display, but there was to be noticed a general uniformity of appearance in the height of the plants, and number of flowers on each, that led the judges to examine them somewhat closely, when it was found that in some cases mere cuttings with flowers on them were stuck into wet soil, which was firmly pressed about them; the plants were, therefore, made up for the occasion. If we are rightly informed, this method has been so generally adopted that the judges thought it best to award the prizes according to the merit of the specimens. The best six show Pansies in 8-inch pots came from the Children's Hospital, Pendlebury (Mr. J. Blower, gr.). Mr. J. Broome being 2d, and Mr. G. Wilkes 3d. Mr. Blower was also 1st with six fancy Pansies, Mr. C. Sergeant being 2d. The best six Violas also came from Mr. Blower, Mr. D. MacLure, Heaton Nursery, being 2d. In the nurserymen's class for twenty Pansies, Mrs. E. Mellor, Chorlton, was 1st, and Mr. J. Hayward, Cheshire, 2d. Mrs. Mellor

was also 1st for twenty fancy Pansies, and Mr. T. Wakenen 2d. The best twenty Violas came from Mr. J. Hayward, Cheadle, Mr. A. J. A. Bruce being 2d. We refrain from giving the names of varieties, because the method of making up specimens gives no reliable information as to their adaptability for culture in pots. Possibly *boni fide* culture will be made an indispensable condition in the next schedule of prizes.

#### PELARGONIUMS.

The only exhibitor of show and fancy Pelargoniums was Mr. C. Ryland, nurseryman, Ormskirk, and he staged eight very nice specimens of each. Of the former he had Queen Bess, Digby Grand, Duchesse de Morny, Claribel, Royal Bride, Venus, Roi Leopold, Gaiety, and Pericles. His fancy varieties were Fanny Gair, Advancer, Barbet, Lucy, Roi des Fantaisies, Evening Star, Mrs. Mendel, and Sarah Turner. Several collection of zonal Pelargoniums, and some excellent Ivy-leaved Pelargoniums were shown in the miscellaneous.

#### GROUPS OF PLANTS ARRANGED FOR EFFECT.

These are always a leading feature at Manchester, and on this occasion they were specially attractive and interesting. They made an effective display in the annex, and the two 1st prize groups especially were greatly admired. In the amateurs' division Mr. John Rylands was 1st, and his clever gardener must be awarded high praise as a floral decorator, for it was universally acknowledged to be "beautiful work." It was arranged in the form of a square, with the sides scalloped out, and there were elevations that were in thorough harmony with the main design. In the foreground was a marvellous plant of *Adiantum speciosum*, then a fine bed of Maidenhair and other small Ferns, rose Crotons and other foliaged plants, *Alcacia Lowii* and *Anthurium crystallinum* being especially noticeable, with sufficient dwarf flowering plants dotted about to make the arrangement piquant and delightful. Mr. S. Schloss came in 2d, with a charming group; Mr. E. C. Glover being 3d, and Mrs. Hodgkinson, Bowden, 4th. In the nurserymen's class Messrs. R. P. Ker & Son, nurserymen, Liverpool, were placed 1st, with something so well carried out as to appear to distance all that this firm had hitherto so well done at Manchester. It was arranged on a slightly sloping bank; there was a dense carpet formed of *Adiantum cuneatum* and *A. Lathomi*; at the back was a large plant of *Kentia Balmoreana*, flanked by *Dracena lineata*, the base of these being clothed by dwarf foliaged and flowering plants, such as Pelargoniums, Azaleas, &c. There were two little groups of *Lilium candidum*, and from the bed of Fern rose richly coloured plants of such Crotons as *Excelsior*, *Saintianus*, *aneitumensis*, *multiformis*, a variety that appears to be made up of pieces of several others; Warreni, and Flambeau. The margin was made up of *Dactylis glomerata variegata* and *Selaginella laevis* alternately, with here and there tiny flowering plants of double Ivy-leaved Pelargoniums; and behind these small specimens of Crotons Hawkeri and Mortii. Messrs. W. & J. Birkenhead were placed 2d, with a fine group, composed wholly of hardy Ferns of a valuable character arranged with considerable skill.

#### FINE-FOLIAGED PLANTS.

Mr. J. Rylands had the best collection of ten, very fine and massive examples of the following being staged:—*Pritchardia pacifica*, *Cibotium regale*, *Lantana borbonica*, *Anthurium crystallinum*, *Gleichenia rupestris*, *Croton Weismanni*, *C. Williamsii*, *Alcacia Lowii*, and *Cycas revoluta*; 2d, Sir Wilfrid Lawson, Bart., M.P., Brayton, Carlisle (Mr. Hammond, gr.), who had *Cycas revoluta*, *Phoenix rupicola*, *Chamerops humilis*, *Macrozamia Fraseri*, *Croton D'Israeli*, *Bonaparteia junceaefolia*, *Dasylium glaucum*, and *Encypharallus villosus*; 3d, Mr. E. C. Glover; 4th, Mr. S. Schloss. In the nurserymen's class for eight plants Mr. J. Cypher was 1st, with large and well developed specimens of *Areca Baueri*, *Lantana borbonica*, *Kentia Fosteriana*, *C. australis*, *Cycas revoluta*, *Dasylium glaucum*, *Encypharallus villosus*, and *Croton Weismanni*; 2d, Mr. H. James, with a good group, conspicuous among which was a huge plant of *Stevensonia grandifolia*. Mr. J. Broome had the best six *Dracenas*, staging good plants of Youngi, Lindeni, *anerleyensis*, *Baptisti*, *Robinsoniana*, and *Weismanni*; 2d, Mr. S. Baerlin, with *Veitchi*, *Youngi*, *amabilis*, *Shepherdii*, *Bausei*, and *indivisa*; 3d, Mr. J. Rylands. Messrs. R. P. Ker & Son were 1st with an admirable group, finely grown and coloured, consisting of *Baptisti*, *Gladstonei*, *Hendersoni*, *amabilis*, *Bausei*, *Lindeni*, *nigrescens*, *recurva*, *Mooreana*, *speciosa*, *Weismanni*, and *Robinsoniana*; 2d, Mr. H. James, with *Baptisti*, *Goldiana*, *Shepherdii*, *amabilis*, *elegantissima*, *Nycteria*, *Mooreana*, *Youngi*, *regina*, *Gladstonei*, *Bausei*, and *Weismanni*. Messrs. R. P. Ker & Son had twelve magnificent Crotons, large, splendidly grown and coloured examples of *Carrierei*, *Courti*, *Evansianus*, *Queen Victoria*, *Mortfontainensis*, *Hawkeri*, *Mortii*, *D'Israeli*, *Pergmanni*, and *Baronne Rothschild*, and had the 1st prize. In the class for six specimens, Sir W. Lawson was 1st with *Williamsi*, *interruptus-auratus*, *Earl of Derby*, *Rex*, and two seedlings; 2d, Mr. J. Broome with *Andreanus*, *D'Israeli*, *Majesticus*, *Evansianus*, *Burtoni*, and *Williamsi*; 3d, Mr. E. C. Glover. Mr. J. Rylands had the best four *Yuccas*, staging three plants of *aloifolia variegata*, and one of *quadricolor*. Mr. Broome was 2d with rather smaller but very neat and bright plants of *aloifolia* and *Stokesi*, two of each. Mr. S. Baerlin had the best four *Palms*, staging *Kentia australis*, *Geonoma Schottiana*, *Areca lutescens*, and *Cocos Weddelliana*; Sir W. Lawson was 2d with *Chamerops humilis*, *Areca Baueri*, *Phoenix rupicola*, and *Acanthorrhiza aculeata*.

#### FERNS.

The group of eight stove and greenhouse Ferns staged

by Mr. Paul for S. Schloss, Esq., was one of the features of the exhibition, the *Gleichenias* being stupendous in size and grandly developed. A plant of *G. spelunce* was fully 9 feet through, and not greatly below these in dimensions were *Mendelii*, *rupestris*, *rupestris glaucescens*, and *flabellata*. *Alsophila Williamsii*, *Dicksonia antarctica*, and *Goniophlebium subauriculatum*; 2d, R. P. Gill, Esq., Woodley Hall, Ashton (Mr. Plant, gr.), with *Dicksonia antarctica*, *Davallia Mooreana*, *Adiantum Williamsi*, *Alsophila excelsa*, &c.; 3d, Mr. E. C. Glover. Mr. Arthur Birley, Woodbank, Pendlebury, was the only exhibitor of twelve hardy Ferns, staging an excellent lot, among them *Athyrium F. f. pluniosus*, *Craigii*, *Fieldii*, and *stipitatum*, *Osmunda cinnamomea*, *O. gracilis*, and *Lastrea phillypteris*. Messrs. W. & J. Birkenhead had the best twelve in the nurserymen's class, all of a handsome character, the leading varieties being *Osmunda gracilis*, *Struthiopteris germanica*, *Adiantum pedatum*, &c.; 2d, Mr. C. Ryland.

#### PITCHER PLANTS.

The best collection of these came from Mr. Joseph Broome, and very interesting they were—the plants well grown, the pitchers abundant, large, and finely coloured. In this group were some of Mr. Wrigley's new hybrid *Sarracenias*, viz., *Swaniana*, *illustrata*, *Maddisoniana*, *Mitchelliana*, and an unnamed hybrid from *purpurata* and *variolaris*, *flava maculata*, *variolaris*, and *purpurata*; and the following *Nepenthes*—*Lawrenceana*, *Morgana*, *Mastersiana*, *Rafflesiana*, *sanguinea*, *Hookeriana*, *anerleyensis*, a variety of *Mastersiana* with brighter red pitchers, and *Cephalotus follicularis*. 2d, J. Fildes, Esq., Chorlton (Mr. J. Morton, gr.), whose leading plants were *Sarracenias Chelsoni*, *atrosanguinea*, *flava maxima*, *Fildesi*, *Stevensi*, *Mitchelliana*, and *Williamsi*; *Nepenthes Dominiana*, *Mastersiana*, *Henryana*, with *Drosera capensis*, and *D. dichotoma*. In the nurserymen's class for ten specimens Mr. A. J. Bruce, nurseryman, Chorlton, was 1st, with small but well done plants of *Nepenthes Chelsoni* and the following *Sarracenias*—*Stevensi*, *Williamsi*, *Fildesi*, *Chelsoni*, *variolaris*, *Maddisoniana*, *formosa*, *Tolliana*, and *purpurea*. 2d, Mr. H. James, with *Nepenthes robusta*, *Mastersiana*, *hybrida*, *Dominiana*, *intermedia*, *Rafflesiana*, *Courtii*, *rubra*, &c.

#### HARDY PLANTS.

These were, as is customary in Manchester, in strong force, well-grown and flowered, varied, and full of interest. Here, again, Mr. Joseph Broome was to the fore, as he had the best thirty hardy herbaceous and bulbous plants, staging *Lilium croceum*, *L. umbellatum*, *L. dalmaticum*, *Thalictrum purpurascens*, *Funkias*, *Geum aurantiacum*, *Caltha palustris*, fl.-pl., *Cardamine pratensis*, fl.-pl., *Narcissus Bulbocodium*, *Polemonium reptans*, *Trillium grandiflorum*, *Spiraea ulmaria*, fl.-pl., *Trollius asiaticus*, &c. This was the only collection.

In the class for thirty alpine plants, Mr. Broome was again 1st, with *Linum alpinum*, *Campanula Portenschlagiana*, *Saxifraga cristata*, *S. muscoides purpurea*, *S. pyramidalis*, *Campanula abietina*, *Bellis rotundifolia* var. *caerulea*, *Scilla*, *Delphinium*, *Scilla campanulata*, *Iberis gibraltarica* *hybrida*, *Auriculas*, *Funkias*, *Lily of the Valley*, &c., many being repeated in duplicate. In the class for sixty hardy herbaceous and bulbous plants, in or out of flower, some of the best subjects were shown, and Mr. Thomas Walkenden, nurseryman, Marsland Road, Sale, was 1st, with *Campanula calycanthema alba*, *Iberis gibraltarica*, *Primula farinosa*, *Aquilegia*, *Doronicum plantagineum excelsum*, *Gladiolus Colvillei alba*, *Gentiana acaulis*, *G. verna*, *Narcissus bulbocodium*, double *Primrose Cloth of Gold*, and a pan of the old double *Crimson Velvet*, *Polyanthus Cheshire Favourite*, *Centaurea montana alba*, *Cypripedium spectabile*, *Trollius europæus*, *Leucium æstivum*, *Dodecatheon elegans*, &c. Messrs. James Dickson & Sons were 2d, their best specimens were *Trillium grandiflorum*, *Spiraea aruncus*, *Gentiana acaulis*, *Lilium auratum*, *Dodecatheon Jeffreyanum*, *Lilium californicum*, *Anthericum liliatum*, *Ornithogalum umbellatum*, *Lilium Harrisii*, *Narcissus* Sir Watkin, *Campanula glomerata*, *Cypripedium calceolus*, *Gladiolus Colvillei albus*, &c.

The best twelve alpine plants, in or out of flower, came from Mr. Joseph Broome; Mr. E. Wright, Northenden, being 2d, and Mr. J. Mellor 3d. The best forty alpine plants, in or out of flower, came from Messrs. F. W. & A. Stansfield, Sale; who had *Primula luteola*, *Cypripedium pubescens*, *Gentiana verna*, *Veronica repens*, *Erysimum pulchellum*, *Antennaria dioica rosea*, and various *Saxifragas*, all in large pans, and very neatly shown; 2d, Messrs. James Dixon & Sons, who had *Trillium grandiflorum*, *Polemonium Richardsoni*, *Campanula muralis*, *Gentiana acaulis*, *Erinus alpinus*, *Armoria maritima*, *Phlox pilosa*, *Linaria pallida*, *Primula Sieboldi*, *Antirrhinum asarina*, *Alpine Auricula George Lightbody*, and *Mercury*, &c. Mr. Walkenden had the best twenty-four *Pyrethrums* in pots, a very good lot, well grown and flowered; the leading varieties were *Niveum plenum*, *Marquis of Bute*, *Rosy Morn*, *J. N. Twedy*, *Progress*, *Amethyst*, *Mont Blanc*, and *Solfaterra*; and was the only exhibitor. The classes for twenty and twelve *Anemones* in pots brought no competition.

#### CUT FLOWERS.

These were invited only in a few classes. The best stand of twelve blooms of Tea-scented Roses came from A. Tate, Esq., Roseleigh, Woolton (Mr. R. G. Waterman, gr.), who had charming blooms of *Madame Willmott*, *Belle Lyonnaise*, *Niphetos*, *Jean Ducher*, *Madame Trifle*, *Ilomère*, and *Comtesse Riza du Parc*—two or so being shown in duplicate. Mr. J. Broome was 2d, with twelve admirable blooms of *Catherine Mermet*. The class for eighteen cut blooms shown by nurserymen brought no competition. Prizes were offered for a stand of twenty-four cut blooms of *Pyrethrums*, and but one appeared, badly set up, and the flowers of a poor character—and to this the judges awarded a prize of £3. The flowers would have been dear at 3s. Messrs. J. & R. Pearson had a stand of cut blooms of zonal Pelargoniums in great variety and beauty.

#### FRUIT.

Mr. G. T. Miles, gr. to Lord Carrington, Wycombe Abbey, was the only exhibitor of eight dishes of fruit, having an excellent lot, consisting of Black Hamburg and Foster's Seedling Grapes, Elton and Black Circassian Cherries, Brown Turkey Figs, Golden Gem and Scarlet Premier Melons, and a fine Queen Pine. Mr. Miles had the best two Pine-apples, staging Queens, averaging 4 lb. each in weight. Mr. Speed, gr. to Lord Penrhyn, Bangor, was 2d. Mr. Miles had the best single fruit, staging a good Queen in this instance. There was a good competition in the classes both for black and white Grapes. The best two bunches of the former came from J. F. Campbell, Esq., Wood-leat, Uttoxeter (Mr. J. Hollingsworth gr.), Thomas Slater, Esq., Stand Hall, Whitfield, being 2d, in each case with Black Hamburgs. Mr. Miles had the best two bunches of white Grapes, staging good examples of Foster's Seedling, Mr. Ackers being 2d with Duke of Buccleuch, and Mr. Campbell 3d with Foster's Seedling. A first-class Certificate of Merit was awarded to Mr. Speed, Bangor Castle, for Penrhyn Seedling Melon, a golden-skinned variety, with a white flesh, and stated to be of the highest quality. The best twelve pots of Strawberries came from the Hon. W. Meynell-Ingram, Temple Newsam, near Leeds; Mr. Upjohn, gr. to the Earl of Ellesmere, being 2d.

#### MISCELLANEOUS COLLECTIONS OF PLANTS

were shown by Mr. B. S. Williams, Victoria Nursery, Holloway; Messrs. R. P. Ker & Son, F. & A. Dickson & Sons, Upton Nurseries, Chester; The Liverpool Horticultural Company, Messrs. Fisher, Son & Sibray, Handsworth Nurseries, Sheffield, included a fine lot of Orchids; by Messrs. F. Sander & Co., St. Albans, a charming lot of Orchids; Messrs. Cutbush & Sons, nurserymen, Highgate; and Messrs. W. & J. Birkenhead. Messrs. G. Legge & Co., Waterloo Nursery, Bury, had a very interesting collection of varieties of *Primula Sieboldi* of their own raising; and Messrs. J. Laing & Co., Stanstead Park Nurseries, Forest Hill, S.E., had an excellent lot of Begonias. To both these special certificates were awarded.

Extra prizes were awarded to Mr. J. Cypher for a group of specimen plants; to Mr. Miles, for some fine Stamliordian Tomatoes; to Mr. C. E. Thornycroft, for a dish of excellent Nectarines; to Mr. G. B. Blair, for three brace of Telegraph, and the same of All the Year Round, Cucumbers; to Mr. Birley, for a good collection of Cinerarias; to Mr. W. Hayes, jun., for zonal Pelargoniums; and to Mr. C. Sergeant for the same.

#### FIRST-CLASS CERTIFICATES OF MERIT

were awarded to Mr. B. S. Williams, for *CATTLEYA GIGAS* var., *HENNEROCALLIS MACROSTEPHANIA*, *CYPRIPEDIUM CILIOLARE*, *C. DRURYI*, *AMARYLLIS* Mrs. B. S. WILLIAMS, and *ODONTOGLOSSUM PRIONOPETALUM*; to Messrs. Fisher, Son & Sibray, for *VANDA TRICOLOR* and *PHALANOPSIS*, both very fine Handsword varieties; to Messrs. R. P. Ker & Son, for *ANTHURUM CARNÆUM*, *ALCASCIA SANDERIANA*, *SPIRÆA ASTILBOIDES*, *AZALEA SOUVENIR DE FRANÇOIS VÉRYANE*, *VRIESIA HIEROGLYPHICA* and *HARDY AZALEA AVALANCHE*; and to E. Loder, Esq., Flore, Weedon (Mr. T. Short, gr.), for *MYOSOTIDUM NOBILE*.

#### CRYSTAL PALACE: May 22 and 23.

THE great flower show of the season was held on the above dates, and as a floral exhibition was a gratifying success. Most of the classes were well filled, and with few exceptions the quality of the productions was fully up to the high standard obtained at these exhibitions. The arrangement of the plants in the exhibition was also very good. In one or two instances the exhibitors of stove and greenhouse plants were placed at a disadvantage, the plants having been trained to face one way, but being placed in the centre of the annex of the building the sides of the plants not furnished with flowers suffered in comparison with those trained in a more natural manner. In these same classes exception might be taken to the way some of the plants were over-trained; even if a plant has been grown into its natural bush form it is not improved in appearance by having the flowers closely tied down to a regular surface by a perfect network of string. It is a great waste of time and force misapplied. Judges would not be slow to recognise a more natural system of training if some good grower would break loose from a bad system.

#### STOVE AND GREENHOUSE FLOWERING PLANTS

were exhibited here as were reported upon at the Royal Botanic last week. Mr. Chapman, gr. to J. Spode, Esq., Hawkesyard Park, Rugeley, was 1st for nine specimens in the open class, and also for six in the

amateurs' class; Mr. H. James, of Castle Nursery, Lower Norwood, being 2d in the former class; and Mr. C. Rann, gr. to J. Warren, Esq., Handcross Park, Sussex, 2d in the latter.

#### GREENHOUSE AZALEAS

were exhibited in the form of large specimens, and in capital condition. The contest for the premier position in the class for nine large specimens was between Mr. G. Roach, gr. to R. Thornton, Esq., The Hoe, Sydenham Hill, and Mr. Turner, of the Royal Nurseries, Slough, the 1st prize being awarded to the amateur. Mr. Roach was the only exhibitor in the amateurs' class for Azaleas, and received the highest award.

Mr. Turner and Mr. Roach also competed in the class for eighteen Azaleas in 9-inch pots, the first-named being easily 1st, with superb specimens, in beautiful variety. The best of them were—Apollo, Baron N. de Rothschild, Comtesse de Flandres, Grandis, Jean Vervaeke, Louise Pynaert, Mlle. Marie Lefebvre, fine white variety; Mlle. Marie van Houtte, Marquis of Lorne, Mrs. Turner, Reine des Pays Bas, Roi de Hollande: these should all be in the most select collection.

#### ORCHIDS.

The competition for these was very spirited, many well grown specimens being exhibited.

In the class for nine distinct Orchids, Mr. J. H. Hill, gr. to H. Little, Esq., Hillingdon, near Uxbridge, obtained the 1st prize. He had two good varieties of Cattleya Mendelii, Dendrobium thysiflorum, many spikes; Cattleya Mossiae, nine fine flowers; C. Leopoldi, a handsome Lycaste Skinneri, Aerides Fieldingii, a large pan of Cypripedium ciliolare, and one of Odontoglossum crispum. Mr. Salter, gr. to J. Southgate, Esq., Selborne, Streatham, was a good 2d; Cymbidium Lowii had two fine spikes, Coelogyne pandurata, with its singular green and black flowers, had two spikes; Dendrobium Falconeri was also fine. Mr. H. James was 3d.

The best specimen Orchid was sent by Mr. S. Cooke, gr. to De B. Crawshaw, Esq., Sevenoaks; it was a well grown specimen of Vanda suavis with four spikes and fifty-five flowers. Mr. Salter was 2d, with a fine Dendrobium Falconeri.

In the amateurs' class for six Orchids, Mr. Cooke was well 1st, with, amongst other fine things, a Cattleya Mossiae, eleven splendid blooms; a Vanda suavis, two spikes; Epidendrum vitellinum majus, &c. Mr. Salter was 2d. Mr. A. Luff, gr. to R. R. Hyatt, Esq., Hithered, Leigham Court Road, was a good 3d; he had a fine Phalaenopsis amabilis, and a good plant in fine bloom of Cattleya gigas.

Collections of not less than forty Orchids "arranged with a few Ferns and Palms for effect," made an interesting exhibition. Mr. Salter easily gained the 1st prize, followed by Mr. H. James and Mr. A. Luff. Odontoglossum polyanthum, Cattleya Mendelii, C. Mossiae (white form), Laelia purpurata, &c., were fine in Mr. Salter's collection. Mr. James showing fine forms of Odontoglossum crispum and O. Pescatorei.

#### FINE-FOLIAGE PLANTS

were very large in size, and most of the specimens were well cultivated. The whole of the 1st prizes were awarded to Mr. Rann, who grows this class of plants to a large size, and maintains them in good condition. His Cycas revoluta was a splendid specimen, so also was C. circinalis and Croton albicans, distinct and good. In the class for six specimens his Bonapartea stricta was very pretty; Gleichenia Mendelii well furnished to the base, and Croton Queen Victoria rich in colour.

Mr. J. W. Penfold, fgr. to the Rev. Canon Bridges, Beddington, also exhibited good foliage plants.

Mr. J. R. Bird, gr. to H. Canston, Esq., Lodgemore, Alleen Park, Dulwich, was awarded both prizes for Crotons; the plants were large in size, though not so well coloured as the smaller specimens from Messrs. Hooper, of Covent Garden, who obtained the 2d prize in the open class; Mr. Wakeham being 2d in that for amateurs.

Messrs. Hooper were 1st in the open class for Dracaenas, and Mr. Bird in that for amateurs. They made a good feature in the show.

Caladiums made a grand display of rich and varied colour. Perhaps no finer specimens were ever exhibited than the nine huge plants which gained the 1st prize for Messrs. Laing, of Stanstead Park, Forest Hill. The most distinct of them were Leopold, Robert, candidum, albo-luteum, Souvenir de Madame Bernard, Mithridate, and Madame Marjolijn Scheffer. Mr. J. Sharpe, gr. to F. Hatchett, Esq., Parkfield, Lee, S.E., was a good 2d.

#### FERNS

were well exhibited by Mr. Penfold; his six specimens comprised Davallia Mooreana, D. polyantha, both of large size; D. filijensis, Adiantum cardiochlena, with large massive fronds: the 1st prize was awarded, Mr. J. Wakeham also exhibited well in the open class for nine specimens, beating Mr. James.

Several miscellaneous collections of plants were exhibited, which added greatly to the interest of the exhibition, particularly the hardy plants from Mr. J. Vander Rees, of Tooting; Messrs. Paul & Sons, of Cheshunt; and Messrs. Carter, of High Holborn. Messrs. W. Paul & Son, of Waltham Cross, and Mr. Runsey exhibited excellent cut Roses; Messrs. Barr plants and cut flowers, Messrs. Hooper a good group of Tree Carnations, and Messrs. Jackman pot Roses.

#### FIRST-CLASS CERTIFICATES

were awarded to Mr. V. Rees for SAXIFRAGA MAC-NABIANA.

Mr. F. Perkins, for VOLONTÉ NATIONALE ALBA PELARGONIUM.

Messrs. Laing, for BEGONIAS FORMOSA, LADY HULSE, SIR PETER LUMSDEN; and also for NEPENTHES MASTERSIANA and N. MASTERSIANA "red variety."

And to Mr. J. Ford, for CALCEOLARIA GOLDEN PLESH, a neat dwarf-growing variety.

## Law Notes.

IS A HOTHOUSE A BUILDING?—The adjourned hearing of the case against Mr. Haynes, nurseryman, of Penge, reported in our issue of May 23, was taken at the Lambeth Police Court, before Mr. Chance, on Thursday week. Mr. E. B. Haynes, nurseryman and florist, of Penge Nursery, Beckenham Road, appeared to answer an adjourned summons taken out at the instance of Mr. G. Elkington, surveyor of Penge, with regard to the non-payment of a fee of £1, alleged to be due in surveying a greenhouse or hothouse upon the defendant's premises, according to the terms of the Act of Parliament dealing with the erection of buildings. Upon the first hearing the defendant declined to admit that the structure in question was a building within the meaning of the Act. The defendant still contended that, according to the meaning of the section of the Act, the erection in question was not a building, and pointed out certain decisions given by magistrates upon the point. Two cases had been so decided in this court. He further contended that as a trade adjunct the structure could not be termed a building according to the terms of the Act.—Mr. Chance said, according to the terms of the section of the Act, it was clear a greenhouse, so far as all sashes, doors, and frames were concerned, would be exempt; but the other part of the section clearly showed, where there was a foundation of brickwork, &c., that it would come under the terms of such Act. The Act distinctly pointed out that greenhouses were exempt under certain circumstances.—The defendant said he had purchased the structures in question for £5, and the surveyor knew nothing about it until it was placed upon the ground, and now he wanted £1 for fees. A discussion then followed as to what fees were allowed under the Act, supposing the structure in question should be considered as a building. Mr. Chance said no doubt there was a great difficulty in deciding what really was a building, but it was to his mind clear that greenhouses would be exempt under certain conditions, but not where brickwork was used in the construction.—The defendant said doubtless that was Mr. Elkington's best point, but five magistrates had decided in favour of the points raised.—Mr. Chance said he had decided against it. He had full respect for the decision of his colleagues, but he certainly could not agree with them entirely. He was against the defendant upon the points raised, and certainly must look upon the structure in question as a building within the meaning of the terms of the Act. Under all the circumstances, he must therefore order the defendant to pay the amount claimed. He made an order upon the defendant to pay the amount claimed, but declined to grant anything beyond the ordinary costs.

## Obituary.

JAMES DREWETT.

ON Wednesday, May 20, was laid in his last resting place, at the Norbiton Cemetery, Kingston-on-Thames, all that remained of one that belonged to the good old English school of gardeners, Mr. James Drewett, late of The Denbies, near Dorking, who died on the 14th inst. at Kingston-on-Thames (where for the last seven years he has lived in retirement with his brother), at the ripe age of eighty-five. He carried his age wonderfully well, and up to a few weeks before his death he took his daily long walks in the neighbourhood, with the firm step of a man much less advanced in years. He retained his faculties to the end, and passed peacefully away, highly honoured.

For twenty-five years the deceased was in charge of the gardens of G. Cubitt, Esq., at the place above-mentioned, retiring from them about eleven years ago, on a comfortable stipend from his late employer. In a series of notices and portraits of British gardeners published in the *Gardeners' Chronicle*, Mr. Drewett's labours were thus referred to:—"The name of Mr. Drewett is well known in the world of horticulture, being very prominently associated with the production of some of the handsomest Muscat Grapes which have perhaps ever graced an exhibition table. Mr. James Drewett was born in the year 1800, in the neighbourhood of Bristol, and entered on his horticultural career in the gardens of Himley Hall, Staffordshire, the seat of the Earl of Dudley and Ward. In 1825 he came to London, and was employed over a period of seven years

in the Royal Forcing Gardens at Kensington and Cumberland Lodge, and in the Royal Botanic Gardens, Kew.

"Mr. Drewett has held three head situations, the first as manager of the estate, gardens, woods, &c., of the late D. Baillie, Esq.; the second as gardener to Sir W. Heathcote, at Hursley Park, near Winchester, Hants; the third with the late Thomas Cubitt, Esq., at The Denbies, near Dorking, Surrey. This latter situation he entered in 1850, and has held it to the present time. During this period very extensive groundwork operations have been carried out under his directions, and much planting has been done, while a new kitchen garden and fruit orchard have been formed. Mr. Drewett designed the range of forcing-houses at this place, and planted the Vines which are assisted by heated chambers under the outside borders. It is these Vines that produced the fine samples of Frontignan, Canon Hall Muscat, Muscat of Alexandria Grapes, which were so much admired at the metropolitan exhibitions in 1857, and in succeeding years, and which were moreover so successful in obtaining first prizes."

MRS. HERBST.

We regret to hear of the sudden death of Mrs. Herbst, at Richmond, on last Saturday, May 23. It appears that during a thunderstorm (of which she always experienced a dread) she was stricken with an attack of apoplexy, from which she never rallied, and died on the same evening. Mr. Herbst was, previous to coming to Richmond, Curator of the Botanic Gardens, Rio de Janeiro, and it was there where Mrs. Herbst, during a violent thunderstorm, experienced a severe shock, which she could never forget. Mrs. Herbst was in her fifty-second year.

MR. GEORGE BAKER.

By the death of Mr. Baker, of Reigate, the National Rose Society has lost a most useful supporter and constant exhibitor, and Reigate will have sustained a great loss, and especially the district Rose Association, which he had assisted in raising to a very high pitch of eminence. His communications to the *Rosarians' Year Book* will have endeared him to a wide circle of readers. In the last issue of the *Year Book* a valuable article on Rose pruning appeared, which ended with a premonition of what has actually happened.

MR. W. J. EPPS.

The death is announced of Mr. W. J. EPPS, of Somerley View, Ringwood, which occurred on the 18th inst., in the sixty-eighth year of his age. Mr. Epps was formerly in business as a nurseryman at Maidstone, and became well known as a cultivator of Cape Heaths; he was also one of the first raisers of seedling Fuchsias.

## The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, MAY 27, 1885.

May 21.—Heavy rain in early morning, dull morning, fine afternoon.

— 22.—Rain nearly all day.

— 23.—Fine bright morning, thunderstorm from 11.55 to 12.30 P.M., fine afternoon.

May 24.—Fine, cloudy at times.  
— 25.—Dull, showers of rain.  
— 26.—Fine day and night.  
— 27.—Fine, bright, hot day and night.

LONDON: *Atmospheric Pressure.*—During the week ending May 23, the reading of the barometer at the level of the sea decreased from 29.81 inches at the beginning of the week to 29.72 inches by 9 A.M. on the 17th, increased to 29.91 inches by 9 A.M. and decreased to 29.89 inches by 1 P.M. on the 18th, increased to 30.03 inches by 9 A.M. on the 19th, decreased to 29.39 inches by 1 P.M. on the 21st, increased to 29.40 inches by 5 A.M. on the 21st, decreased to 29.14 inches by 9 A.M. on the 22d, and was 29.79 inches by the end of the week.

The mean reading of the barometer for the week was 29.65 inches, being 0.30 inch lower than last week, and 0.27 inch below the average of the week.

*Temperature.*—The highest temperature in the shade in the week was 61.2 on the 23d; the highest on the 18th and 22d was 56°. The mean of the seven high day temperatures was 58.1.

The lowest temperature was 39.1 on the 21st; on the 22d the lowest temperature was 44°. The mean of the seven low night temperatures was 41.3.

The greatest range of temperature in one day was 21.8, on the 21st; the smallest was 12°, on the 22d. The mean of the seven daily ranges was 16.7.8.

The mean temperatures were—on the 17th, 47.1; on the 18th, 45.4; on the 19th, 47.3; on the 20th, 57.8; on the 21st, 48.4; on the 22d, 47.3; and on the 23d, 49.9; and these were all below their averages (excepting the 20th, which was 4.1 above), by 5.7, 7.8, 6.3, 5.5, 6.8, and 4.4 respectively.

The mean temperature of the week was 49°, being 2.4 higher than last week, and 4.6 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 117°, on the 21st. The mean of the seven readings was 98.5.

*Rain.*—Rain fell on five days, to the amount of 0.78 inch.

ENGLAND: *Temperature.*—During the week ending May 23, the highest temperatures were 63° at Brighton, 61.8 at Cambridge, 61.2 at Blackheath; the highest at Liverpool and Sunderland was 55°, at Bolton and Bradford 55.1. The general mean was 57°.

The lowest temperatures were 31.1 at Wolverhampton, 33.6 at Bolton, 34° at Hull; the lowest at Brighton was 39.6, at Blackheath 39.1, at Liverpool 38.6. The general mean was 36.6.

The greatest ranges were 27° at Cambridge and Hull, at Wolverhampton 25.3; the smallest ranges were 16.4 at Liverpool, 17.9 at Bradford, 18° at Sunderland. The general mean was 21.2.

The mean of the seven high day temperatures was highest at Brighton, 59.2, at Blackheath, 58.1, at Cambridge 57.1, and was lowest at Sunderland, 50°, at Bolton 51.3, at Newcastle 51.6. The general mean was 54.3.

The mean of the seven low night temperatures was highest at Brighton, 43.2, at Plymouth 43°, at Liverpool 42.7; and was lowest at Wolverhampton and Hull, 38.4, at Bolton 38.5. The general mean was 40.8.

The mean daily range was greatest at Cambridge, 18.1, at Blackheath 16.8, at Brighton 16°; and was least at Sunderland, 9°, at Liverpool 9.9, at Preston 11.3. The general mean was 13.5.

The mean temperature was highest at Brighton, 49.5, at Blackheath 49°, at Plymouth 48.1; and was lowest at Bolton, 43.2, at Sunderland and Newcastle 43.8. The general mean was 45.9.

*Rain.*—The largest falls were 1.97 inch at Plymouth, 1.51 inch at Bristol, 1.44 inch at Brighton; the smallest falls were 0.48 inch at Preston, 0.55 inch at Liverpool, 0.60 inch at Nottingham. The general mean fall was 0.97 inch.

SCOTLAND: *Temperature.*—During the week ending May 23, the highest temperature was 60.7, at Dundee, at Greenock the highest temperature was 54.2. The general mean was 57°.

The lowest temperature in the week was 35°, at Glasgow; at Leith the lowest temperature was 39.1. The general mean was 37.6.

The mean temperature was highest at Glasgow and Paisley, 47.2; and lowest at Greenock, 45.7. The general mean was 46.6.

*Rain.*—The largest fall was 1.28 inch at Perth; the smallest fall was 0.75 inch, at Leith. The general mean fall was 1.03 inch.

JAMES GLAISHER F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, May 25, 1885, issued by the Meteorological Office, 116, Victoria Street, London, S.W.:—The weather has remained in a very unsettled and rainy condition in all parts of the kingdom: thunder and lightning were again experienced in various localities, accompanied in some places by showers of hail.

*Temperature* has continued below the mean, the deficit ranging from 2° in the N. and E. of Scotland, to as much as 5° or 6° in most other districts. The maxima were generally registered on the 24th or 25th, and varied from 55° in "Scotland, N." and 56° in the "Channel Islands" to 62° in "Scotland, E.," "Scotland, W.," and "Ireland, N." The minima, which were recorded at most stations on the 19th, ranged from 43° in the "Channel Islands" and 37° in "Ireland, S.," "England, E.," and "Scotland, E.," to 32° in the East of England, and 31° in the "Midland Counties." Some sharp grass frosts again occurred over the inland districts.

*Rainfall* has been more than the mean in all districts, the excess in most parts of Great Britain and in the "Channel Islands" being considerable. Bright sunshine shows a decided decrease, the percentages of the possible duration ranging from 24 in "England, E." to 33 in "England, S.," and 43 in the "Channel Islands."

*Depressions observed.*—The most important depressions noticed during this period were one which travelled in a north-easterly direction over Ireland and Scotland on the 20th, and subsequently moved away to the north-westward of our islands, at the same time partially filling up; and a subsidiary disturbance which advanced over South England during the night of the 22d, and afterwards moved north-north-eastwards to the south of Norway. With the former the winds were south-westerly to westerly in the southern and south-eastern parts of the kingdom, and south-easterly to easterly in the North; but during the passage of the latter, fresh or strong westerly or west-north-westerly winds were felt on our southern coasts, and light easterly airs over central England. In the rear of this disturbance the westerly wind in the Channel rose to a moderate or fresh gale. At the close of the period another depression was approaching Ireland, and the winds over our islands had returned to the south-westward, southward, or south-eastward.

## Answers to Correspondents.

ALNWICK SEEDLING GRAPE NOT SETTING: F. W. O. It is owing to the flowers not setting perfectly. "not at all an uncommon occurrence with this variety." The flowers should have been impregnated artificially with pollen taken from the Hamburg.

APPLE TREES: *Pomona*. Apply to Mr. Meehan, Germantown, Philadelphia, or Messrs. Elwanger & Barry, Rochester, U.S.A.

BOOKSELLERS AS SEEDSMEN.—Messrs. W. H. Smith & Son write, in allusion to the letter at p. 671, "that they have not, and never had, any bookstall at Praed Street Station," and the correspondent who made the statement writes to regret the error into which he fell.

CALCEOLARIAS: W. K. Very good, but not up to first-class mark as seen at the London shows. The sport of the Pelargonium is curious but not unusual.

DOUBLE CINERARIAS: P. K. Good in form and colour, and worth propagating.

ELÆAGNUS: R. S. H. This plant is polygamous—i.e., sometimes monœcious sometimes diœcious. Your flowers are males. We doubt it being *E. longipes*.

FUNGUS: R. L. The young state of a fungus, which, as it develops, becomes atrociously foetid, *Phallus impudicus*. Pray do not eat it instead of Truffles, unless you prefer to do so.

GARDENERS OUT OF SITUATION: A. B. must excuse us. The advertising columns are open to him, but we cannot undertake to make known his qualifications otherwise.

HEATING APPARATUS AND GREENHOUSES: W. W. The first is a business utensil, and is removable. The removal of a greenhouse will depend on the method of

its fixture, whether standing on brickwork or otherwise. In all such important affairs it is money saved to get legal advice.

MELON CANKER: A. C. B. We do not know the address of the maker of the composition you refer to.

NAMES OF PLANTS: A. N. *Scilla nutans alba*.—*J. W. Moon*. *Blandfordia marginata*, a plant long since introduced, though not often seen in cultivation. Other species are still more handsome.—*C. E. F.* *Luzula silvatica*.—*C. D. & Sons*. *Illicium anisatum*.—*A. P.* *Ranunculus aconitifolius*.—*J. Day*. 1, *Saxifraga granulata*, double flowered variety; 2, *S. hypnoides*; 3, *Gnaphalium dioicum*.—*F. J. O'B.* *Phallus impudicus*. See reply to R. L. above. —*T. Gaskell*. *Cattleya amethystoglossa*.—*W. T.* *Alchemilla arvensis*.—*E. W.* *Spiraea prunifolia*. —*L. P. & C.* *Magnolia acuminata* and *M. purpurea*. —*Colonel Clarke*. *Narcissus gracilis*.

NARCISSUS: S. & M. A case of union of two or more flowers, not in common.

ORCHIDS: *Edipus* will find the plant alluded to had special mention, if not in the place mentioned, yet elsewhere.

PHOTOGRAPHS OF ORCHIDS, &c.: A. W. We do not suppose Mr. Stevens has photographs of these plants, but you could apply to him at his rooms, King Street, Covent Garden, London, W.C.

SCILLAS: C. B. & G. 1 and 2, both forms of the white variety of *Scilla nutans*, sometimes called *S. belgica* in gardens.

TULIPS: J. C. The presence of two or three flowers on one scape is not very unusual.

## SEEDS.

LONDON: May 27.—The seed market to-day was of quite a holiday character with scarcely any business doing. Clover seeds of all kinds are now altogether neglected. Some attention is being given to Trifolium, but the prices asked for new French seed for future delivery are above the views of English buyers. Mustard and Rape seed sell freely at the recent advance; the latter article continues in small supply. Feeding Linseed is firm. There is no change to be noted in the trade for bird seeds. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

## CORN.

Monday last, being a Bank Holiday, the market at Mark Lane was closed. On Wednesday the attendance was small, and on the part of buyers there was no apparent disposition to resume business. The absence of transactions in Wheat or flour on the spot left prices undecided, but the tendency was decidedly downwards. Barley, Beans, and Peas were quiet, and nominally unchanged. Maize was dull in all positions. Oats were in good supply, and met a very quiet demand, but sales were not pressed at any decline.

## CATTLE.

At Copenhagen Fields on Monday really prime stall-fed cattle were a reduced quantity, and for these rather better prices were obtained, whilst second and plain qualities were extremely dull of sale, with a tendency in buyers' favour. Imported cattle sold above steady value, but slowly. Sheep and lamb supplies being lighter, prices of the former ruled fully 2d. higher, in some cases even more; and the latter sold much better than on the previous Thursday, but not over the value of Monday se'nnight. The calf trade remained as dull as previously reported, and no change was exhibited in the pig trade. —Thursday's business was dull. Trade in beasts was very flat, and prices weak, the best qualities not making more than 5s. 2d. per 8 lb. As regards sheep, the market was inactive and weak. Lambs, also, were only saleable on lower terms. There was a fair demand for calves at full prices, whilst pigs were dull and weak.

## HAY.

Tuesday's Whitechapel Market report states that the trade was exceedingly dull, with short supplies. Quotations:—Clover, prime, 80s. to 105s.; prime second cut, 85s. to 105s.; inferior, 60s. to 75s.; hay, prime, 70s. to 100s.; inferior, 40s. to 60s.; and straw 26s. to 36s. per load.—On Thursday there was a moderate supply, and trade was dull with a weak tendency. Cumberland Market quotations:—Clover, best, 85s. to 102s. 6d.; other quality, 60s. to 84s.; hay, best, 84s. to 92s. 6d.; other qualities, 45s. to 75s.; and straw, 30s. to 34s. per load.

## POTATOS.

The Borough Market report states that the demand is quiet for all descriptions, at the following prices:—Scotch Regents, 80s. to 95s.; Kent ditto, 70s. to 85s.; Champions, 40s. to 50s.; Magnum Bonums, 50s. to 60s.; and Victorias, 70s. to 90s. per ton.—The imports into London last week consisted of 30 bags from Harlingen, and 3772 packages from Lisbon.

## COALS.

The following are the prices current at market during the week:—Ravensworth West Hartley, 14s. 9d.; Walls End—Tyne (unscreened), 11s. 3d.; Hetton, 16s.; Hetton Lyons, 14s. 6d.; Lambton, 15s. 6d.; Wear, 14s. 6d.; East Hartlepool, 15s. 3d.; South Hartlepool, 14s. 9d.; Tees, 16s.

**Government Stock.**—The Stock Exchange was closed on Monday, and no transactions took place in public securities. Consols closed on Tuesday at 99½ for both delivery and the account. Wednesday's prices were 100 to 100½ for both transactions, and the closing prices of Thursday were 100½ to 100½ for both delivery and the account.

Liverpool, 1872—Manchester & Liverpool Agricultural Society—1st Prize Medal.

FOLLOWS AND BATE (Limited), beg to direct attention to the variety of LAWN MOWERS they manufacture, all of which are made of the best materials, and with due regard to those essential points necessary to ensure durability as well as PERFECTION IN WORKING. The large demand that has existed for several years for their Machines (which are sold by all respectable Ironmongers), together with the highest distinctions gained by them in various International Exhibitions and Public Contests—including Paris, Vienna, Brussels, London, Birmingham, Manchester, Liverpool, Wigan, &c.—sufficiently attest their merits.

THE WORLD.

THE AUTOMATON.

## RANSOMES' LAWN MOWERS.

## THE "WORLD" LAWN MOWERS

are the best for cutting long grass, and are constructed on the American system with the special advantages of English materials and workmanship.

They are made in nine sizes, 8 to 24 inches.  
Prices from 45s. to £10.

## THE "REVERSIBLE" LAWN MOWERS

are suitable for small gardens and borders. They roll the grass as well as cut it, and can be used either side upwards.

They are made in three sizes, 6 to 10 inches.  
Prices from 27s. to 45s.

## THE "AUTOMATON" LAWN MOWERS

are the best machines for general purposes and gardeners' use. They leave no ribs in the grass but produce a perfect surface.

They are made in eight sizes, 8 to 22 inches.  
Prices from 55s. to £8 10s.

## THE HORSE-POWER MOWERS

are the best for Large Lawns, Cricket and Lawn Tennis Clubs. They are used on the Cricket Grounds of the Oxford and Edinburgh Universities and numerous Colleges and Public Schools.

They are made in six sizes, 26 to 48 inches.  
Prices from £14 10s. to £32.

Complete Price LISTS may be obtained from any respectable Ironmonger, or  
**RANSOMES, SIMS & JEFFERIES (Ld.), IPSWICH.**

## RANSOMES' NEW PATENT EDGE CUTTER.

Any Gardener can use it with ease.

The only really practical Edge Cutter yet brought out.

THIS Machine is a light, simple, strong, and useful substitute for Hand Shears, for trimming the edges of Lawns. It can be guided with the greatest ease either in a straight line or round the edges of flower beds, &c. The depth of cut can be varied to suit the depth of the edge by simply tilting the conical roller more or less. The knives can be adjusted to the fixed blade as they wear, and can be readily removed for sharpening. After a little practice with this Machine, a man can trim the edges as fast as he can walk, thus doing from five to ten times as much work as with the ordinary shears.

Price .. 35s.

Carriage Paid to any Railway Station.  
RANSOMES, SIMS & JEFFERIES (Limited), Ipswich.

"Oather Honey from Your Flowers."  
NEIGHBOUR'S Celebrated BEEHIVES.  
Silver and Bronze Medals awarded at the International Health Exhibition, 1884, to Geo. Neighbour & Sons.

### NEIGHBOUR'S

IMPROVED COTTAGE BEEHIVE,

as originally introduced by them, working three bell-glasses or a tray of sectional supers, is neatly and strongly made of straw; it has three windows in the lower Hive.

This Hive will be found to possess many practical advantages, and is more easy of management than any other that has been introduced.

Price .. £1 15 0  
Stand for ditto 0 10 6

### NEIGHBOUR'S FIFTEEN

SHILLING FRAME-HIVE.

This hive has been designed to supply a want long felt by those who desire a Hive at once tasteful in appearance and moderate in price. The walls are built of straw neatly bound with cane. Ample means for ventilation in summer, and sufficient warmth in winter are thus secured. Nine Frames, of the standard size, fitted with metal ends, and a dummy for reducing the Hive, are enclosed thereon, a double quilt to place over the Frames, a case of American one-piece sections for supering, and a substantial

cover of wood, to protect from the weather, are also included.  
Price, complete, 15s.

Also BAR-FRAME HIVES, from 7s. 6d. to 42s. each.  
"THE APIARY," by ALFRED NEIGHBOUR.  
Price 5s., post-free.

Oil Paint no Longer Necessary.  
HILL AND SMITH'S BLACK VARNISH,  
for Preserving Ironwork, Wood, or Stone.  
(Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

#### UNSOLICITED TESTIMONIAL.

"Pierrefield Park, June 21, 1876.—Sirs,—I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chepstow.—I am, Sirs, yours respectfully, Wm. Cox."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large illustrated CATALOGUE of Fencing Hurdles, Field and Entrance Gates, &c. sent free on application to HILL AND SMITH, Brierley Hill Ironworks, Staffordshire; 118, Queen Victoria Street, London, E.C.; and 196, St. Vincent Street, Glasgow.

assistance is given. Must be thoroughly competent in  
Growing Grapes and Peaches.—E. H. FORWOOD, Crown  
Court, Old Broad Street, E.C.

**WANTED, an experienced WORKING**  
GARDENER, married, without family. Must under-  
stand Management of Glass, and Hot and Cold Frames. Wife  
must be able to do House-work, and take care of House where  
they will reside. Two other gardeners kept.—Address, L. A.,  
Messrs. Street & Co., 30, Cornhill, E.C.

**WANTED, a GARDENER, used to Grow-**  
ing for Market. Must understand Vines, Cucumbers,  
Tomatoes, Cut Flowers, &c., as well as Outdoor Work, and  
active and willing to work. Wages £1 per week and cottage.—  
Apply to J. E. ALLEN, The Vineries, Countesshorpe, Rugby.

**WANTED, a GARDENER, unmarried, for**  
two Small Gardens, close together, in London. Must  
well understand Vines, Mushrooms, and Chrysanthemums.  
Wages 25s. per week, first year.—Apply by letter only, J. L.  
HANNAY, 33, Porchester Terrace, W.

**WANTED, a GARDENER, who under-**  
stands Glass. Help given with Lawns. Aged 28 or  
30. Good personal character.—Apply, by letter only, to J. W.,  
Devonshire Club, St. James', S.W.

**WANTED, a GARDENER and WIFE—**  
former to attend to Small Garden and Hothouse;  
wife to take care of Shooting Cottage and Cook when required.  
No children.—MONTAGU WILLIAMS, Esq., 5, Crown  
Office Row, Temple, E.C.

**WANTED, a good OUTSIDE GAR-**  
DENER. Must be well recommended. Industrious,  
sober, and trustworthy. Four men kept. Third place vacant.  
—Dr. KIRBY, Kelsey Park, Beckenham.

**WANTED, a man and wife—the man as**  
GARDENER and GENERAL MAN, the wife as  
good LAUNDRESS. Cottage found.—W. H., The Buagolow,  
Halliford-on-Thames.

**WANTED, a good SECOND GARDENER,**  
with Mother or Sister, or Wife (without family), to  
live with him in the lodge and attend to the gate.—  
GARDENER, The Grove, Epsom.

## Nurseryman (Working).

**WANTED, an industrious intelligent man**  
for entire Management of Small Nursery; share profit  
capital required, £250.—PROVINCIAL, Gardeners' Chronicle  
Office, 47, Wellington Street, Strand, W.C.

**WANTED, a married MAN, for Inside and**  
Out. Must have a general knowledge of Vines,  
Peaches, Roses, and Greenhouse Plants. Wages, £1 per week  
with lodge.—Apply, with testimonials as to character and ability,  
to J. HOWELL, The Gardens, Thurcoft Hall, Rotherham, Yorks.

**WANTED, SECOND and THIRD**  
HANDS for the Gardens. Apply personally before  
9 A.M., at Bishopwood House, Highgate. Must be total  
abstainers.

**WANTED, a single young MAN, in a**  
Market Nursery, who has been accustomed to Water-  
ing and Tying under Glass, to make himself generally useful.  
One with some knowledge of Strawberry Forcing preferred.—  
Reply, by letter only, stating what wages required, to H.  
BENNETT, Pedigree Rose Nursery, Shepperton, Middlesex.

**WANTED, a HEAD SHOPMAN,**  
thoroughly acquainted with the Seed Business, one  
with a knowledge of the Nursery Trade preferred. Also, as  
SECOND HAND, a respectable young man with a knowledge  
of the Seed Trade, capable of Assisting Behind the Counter.  
Apply, with full particulars, references, &c., to CRANSTON S  
NURSERY and SEED CO. (Limited), King's Acre, Hereford.

## WANT PLACES.

**POSTAL ORDERS.—To Advertisers,**  
Subscribers, and Others.—It is very important  
in Remitting by Postal Order that it should be  
filled in payable at DRURY LANE, to W.  
RICHARDS, as, unless the Number of a Postal  
Order is known, and it has been made payable  
at a particular office, and to a particular person,  
it is impossible to prevent any person into whose  
hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting  
is by POST-OFFICE ORDER.

Letters addressed "Poste Restante" to initials  
or to fictitious names are not forwarded,  
but are at once returned to the writers.

**B.** Post Office, Fenny-Stratford, Bucks, is  
requested to send his Name, as he cannot be com-  
municated with under initials, see above Postal Notice.

**TO LANDED PROPRIETORS, &c.—A.**  
McINTYRE (late of Victoria Park) is now at liberty to  
undertake Formation and Planting of New Garden and Park  
Grounds, and Remodelling existing Gardens. Plans prepared.  
115, Listeria Park, Stamford Hill, N.

**FIVE GOLD MEDALS**  
**BORWICK'S**  
**BAKING**  
**POWDER**  
FOR PASTRY, PUDDINGS, TEA-CAKES  
AND WHOLESOME BREAD.

**RICHARD SMITH AND CO.** beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

**TO NOBLEMEN, GENTLEMEN, &c.,** requiring smart, sound, and thoroughly competent **STEWARDS, GARDENERS, &c.**—We have on hand Applications from several Men of tested ability, and shall be pleased to Assist any Nobleman, &c., in Obtaining Men specially suitable for the requirements.—**VICARS COLLYER AND CO., Leicester; A. W. CREWS, Manager.**

**B. S. WILLIAMS** begs to intimate that he has at present in the Nursery and upon his Register some excellent Men, competent either to fill the situation of **HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN.** Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Holloway, N.

**GENERAL HAND (good), with London and Provincial experience in all branches.**—Age 25; desires re-engagement. First-class references.—**S. BASTON, Muswell Hill, Hornsey, London, N.**

#### GRATEFUL-COMFORTING. EPPS'S COCOA, BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." *Civil Service Gazette.*

Made simply with boiling water or milk. Sold only in Packets, labelled thus:—**JAMES EPPS & CO., Homoeopathic Chemists, London.**

**DR. LOCOCK'S PULMONIC WAFERS.**—**Mr. Hadfield, 246, Ribbleson Lane, Preston,** writes:—"I always feel a pleasure in offering **Dr. Locock's Wafers,** knowing that they are a genuine article. They instantly relieve and rapidly cure Bronchitis, Asthma, Consumption, Coughs, Colds, Rheumatism, and taste pleasantly." Sold at 1s. 1½d. and 2s. 9d. per box.

**HOLLOWAY'S PILLS.**—This cooling medicine has the happiest effect when the blood is overheated and a tendency to inflammatory action is set up in the system; one Pill taken shortly before dinner does away with the indigestion, fulness, and flatulency—indications of a weak stomach, or disordered liver. A few Pills taken at bedtime act as alteratives and aperients; they not only relieve the bowels, but regulate every organ connected with them, overcome all acrid humours, and encourage a free supply of all the secretions essential to our well-being. Holloway's Pills thoroughly cleanse and perfectly regulate the circulation, and beget a feeling of comfort in hot climates and high temperatures, which is most desirable for preservation of health.

# JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS.

BLAKE'S PATENT A HYDRAULIC RAM,  
Forcing Lake Water up to a Hotel.

BLAKE'S PATENT A RAM,  
Supplying Water to a Brewery.

## TESTIMONIALS.

From Mr. HENRY ROBINSON, *Engineer to the Stockport District Waterworks Company, September 8, 1883.*—"Dear Sir,—I can now report well of the two Hydraulic Rams we have fixed to your instructions for the supply of Disley Village. 40,000 gallons per day was the quantity you promised they would force to a height of 63 feet, but on testing them I am convinced that 50,000 gallons is not the limit of their power, whilst the quantity of waste water used in driving them is not equal to half the capacity of the 6-inch pipe by which they are fed, and I am inclined to the belief that a more simple and efficient pump cannot be found."

From Captain TOWNSEND, *Wincham, February 10, 1877.*—"In answer to your enquiry, I am glad to say the Hydraulic Ram you sent me in November, 1875, is working exceedingly well, and gives no trouble. It will work when quite immersed, as it has been several times during the floods this winter, forcing up water through a delivery pipe 900 yards long at the rate of 80,000 gallons per day, although you only promised 50,000."

From Mr. J. A. RUTHERFORD, *Agent to C. F. H. Bolckow, Esq., Estate Office, Marston Hall, Middlesborough, September 26, 1883.*—"Dear Sir,—I am glad to say that the Rams you put down on the Hambleton Estate, for Mr. C. F. H. Bolckow, are working very well. You undertook, with 16 gallons per minute, to send up 1500 gallons a-day, and with enough water to work the Rams at full power, 2000 gallons a-day. With a supply of 11½ gallons per minute they are lifting 2200 gallons, and when working full power, 3105 gallons per day are sent up to a height of nearly 400 feet. They made a clear start and have gone well since." The Delivery Pipe in the above case is 9000 feet in length.

From J. SPENDER CLAY, Esq., *Ford Manor, Lingfield, Surrey, August 9, 1880.*—"In reply to your letter of inquiry, I am glad to be able to say that the two Hydraulic Rams which you fixed here are working satisfactorily, and that out of 13 gallons 3 quarts per minute, the maximum yield of the spring, they deliver to the top of my house, distant a full mile from the spring, 4 gallons 1 quart per minute, or 6120 gallons per 24 hours, being 120 gallons above the quantity you guaranteed."

From HORATIO R. B. PEILE, Esq., *Commissioner to Sir Michael Shaw Stewart, Bart., Mansion House, Greenock, August 13, 1883.*—"I am glad to say the Ram you fixed at Castle Farm in November last for Sir Michael Robert Shaw Stewart, Bart., continues a great success. The smallness of the driving water—2½ gallons per minute—is not more wonderful than the large proportion of water it sends up—viz., 720 gallons per day—through about 400 yards of delivery pipe, to an elevation of 75 feet."

From Mr. T. BARHAM FOSTER, C.E., 23, *John Dalton Street, Manchester, October 12, 1883.*—"Dear Sir,—I have tested the Ram you contracted to fix on the Hints Estate, Staffordshire, for James Chadwick, Esq., to force 10,000 gallons per day of spring water through 800 yards of delivery pipe, to an elevation of 208 feet, whilst

worked by river water falling 5 feet 9 inches, and am pleased to find that when at full power the Ram sends up 13,500 gallons per day to the height and distance named; and though the Ram is now adjusted to work at only three-fourths its power, the work done represents over 57 per cent. of useful effect."

From Mr. E. W. STREETER, F.R.G.S., *Diamond Merchant, Bond Street, London, and Sackville Park, Sussex, October 1, 1883.*—"Dear Sir,—When you surveyed the site at Sackville Place, Buxted, for the purpose of fixing a Ram with one mile of collecting and distributing mains, I was surprised and pleased when you named the quantity of water you could send up from the resources available. My bailiff prepared the ground to your instructions, and in twelve days from the arrival of your men the Ram was in operation, sending up 20 per cent. more water than you promised to a height of 110 feet, and distributing a supply to a farm and several cottages on the way. I have pleasure in recording my entire approval of the work."

From Mr. WILLIAM LAIT, *Architect and County Surveyor, Compton Verney, Warwick, January 16, 1882.*—"I have much pleasure in stating that the Patent Hydraulic Ram I had from you for the Rev. J. Cardwell Gardner, of the Vicarage, Butlers Marston, and which you fixed there, is, I consider, remarkably successful, as indicated below:—4120 gallons of water per day are passing through the Ram, with a descent of 13 feet 8 inches. Out of this small quantity 1080 gallons are sent up to a height of 41 feet, showing 78 per cent. of useful effect, and the noise of its working is so slight as to be almost inaudible."

From Sir ROBERT MENZIES, Bart., of *Menzies, Rannoch Lodge, Rannoch, August 20, 1880.*—"The Hydraulic Ram which you fixed for me to supply water to Rannoch Lodge and Camesurich, two houses three-quarters of a mile apart, is a complete success. The extreme distance the water is carried is 1½ mile, and it is raised fully 100 feet, and though the elevation of the two houses are different, there is a regular supply of 7 quarts per minute to each house, which has never ceased since the Ram was set going, about three months ago. Your Ram took the place of one previously tried on the same spot, and which did not succeed, and was, in fact, a complete failure."

From FRED. J. TURNER, Esq., *Agent to His Grace the Duke of Portland, Mansfield, Woodhouse, August 30, 1883.*—"Dear Sir,—I have much pleasure in stating that the Hydraulic Rams which you erected last year for His Grace the Duke of Portland, at Lyndhurst, near Mansfield, and at Skeldon, Ayrshire, are working very well, and they are most satisfactory in every way."

From Captain GANDY, *Castle Bank, Appleby, February 11, 1880.*—"The Self-acting Hydraulic Ram you erected for me is an excellent example of strength and good workmanship. Whilst working with 3 feet 4 inches fall, it forces water 73 feet high, and so far gives me every satisfaction. It will do more work in one day than the old Ram of another make could do in a week."

Dissolution of Partnership.

NOTICE IS HEREBY GIVEN, that the

Partnership which has for some years past existed between the undersigned, James Robertson Garaway, and William Alexander Garaway, in the Trade or Business of Nurserymen, Seedsmen, and Florists, carried on by them at Durham Down Nurseries, Bristol, at Longreach, near Keynsham, in the county of Somerset, and at Downend in the county of Gloucester, under the style or Firm of JAMES GARAWAY & CO., was this day dissolved by mutual consent.

The Business carried on by the late Partnership will in future be carried on by the said W. A. GARAWAY alone, on the same Premises, and under the same style or Firm as before; and he is entitled to the assets, and will discharge the liabilities of the late firm.

As witness our hands this 1st day of June, 1885—

JAMES ROBERTSON GARAWAY—

WILLIAM ALEXANDER GARAWAY.

Witness to both signatures—

EDWARD THOMAS, Solicitor, Bristol.

May be had in large quantity. For park planting one of the best.

See Six other good sorts to offer the Trade, and "Little Book" post-free.

WM. BAYLOR HARTLAND,

SEEDSMAN, &c., 24, PATRICK STREET, CORK.

## AZALEA ROSÆFLORA

(Or BALSAMÆFLORA).

A native of Japan. Flowers very double, of a delicate rosy-salmon tint, shading into clearer rose towards the centre.

Very dwarf in habit and exceedingly floriferous, even in a young state, whilst older plants are almost obscured by the abundant blooms, most of which are 3 inches in diameter and of perfect symmetry. Easily grown in an ordinary cool greenhouse, being nearly, if not quite hardy, plants having stood out-of-doors during the last two winters.

For Conservatory Decoration it is most valuable from the long duration of the flowers, whilst for Cut Flower purposes its neatness of form and bright colour place its usefulness beyond any other sort.

Having a good stock of this beautiful species now in bloom, we are able to offer them with

Two to six flowers, at .. .. 3s. 6d. each.

Larger plants .. 5s., 7s. 6d., and 10s. 6d. "

Extra strong .. 15s., 21s., and 42s. "

J. BACKHOUSE & SON, The Nurseries, York.

Price to the Trade on application.

## 100,000 VERBENAS, VERBENAS.

Our Verbenas are again this year unusually strong, well-rooted, vigorous, and clean. Quite equal to previous years; which, according to unsolicited testimonials received, have given great satisfaction.

## NEW CATALOGUE for 1885.

Beautiful Flowers for Indoors, selected from an immense stock. Our Glasshouses cover nearly 2 acres.

## Wm. Clibran &amp; Son's New List

(90 Pages Double Column)

Of the newest and finest varieties of all classes of Plants for Greenhouses, Stoves, &c., may now be had for two stamps. It includes only the best varieties of their respective classes. Every season new sorts are added. Comparisons of the varieties when in bloom carefully made, and the inferior kinds discarded. Intending purchasers may rely, when selections are ordered as under, on being supplied with varieties of merit only.

The following cheap Collections of finest named kinds consist entirely of our selection. Purchasers may select from the Lists at Prices as per CATALOGUE, which please see before ordering elsewhere.

# WM. PAUL & SON'S

## NEW HARDY CRIMSON AUTUMN-FLOWERING CLIMBING ROSES.

Waltham Climber No. 1.  
Waltham Climber No. 2.  
Waltham Climber No. 3.

These Roses are seedlings from Gloire de Dijon, possessing all the good qualities of that well-known variety: they are all red Roses, but of different shapes and distinct shades of colour — No. 1 being the lightest, and No. 3 the darkest. They flower abundantly and until late in the autumn, and are recommended as supplying a long-felt want in the garden, namely, good hardy Crimson Autumn-flowering Climbing Roses, with fine foliage.

Strong Plants, in 5-inch pots, now ready, 10s 6d. each; the set of three varieties for 21s.

WM. PAUL & SON also desire to call attention to Mr. Bennett's New Crimson Hybrid Tea Rose, "W. F. BENNETT," the finest red Rose yet introduced for forcing and cut bloom, and for the sale of which in Europe they are the Sole Agents. For full description and price of this and other NEW ROSES (including Wm. Paul & Son's New Varieties of 1884, the Yellow H.P. "GLOIRE LYONNAISE," the new American variety "SUNSET," H.P. "QUEEN of QUEENS," &c.), see WM. PAUL & SON'S

readers of the *Gardeners' Chronicle* the  
subject which stands at the head of this article.  
Brooms and brushes are so thoroughly cos-  
mopolitan that they belong to no class in parti-  
cular, neither to any country or people. In  
some form or other they are known and used  
in every corner of the world; so varied, indeed,  
is their structure, and the materials of which  
they are made, that sufficient matter could  
easily be got together to form a long and  
interesting article on brooms and brushes in  
general, seeing that the materials of which they  
are made are for the most part of vegetable  
origin. In this assertion, however, we do not  
forget the great use of bristles. Though we  
may recur to this at some future time, our  
intention now is to describe, somewhat briefly,  
a visit to a large brush factory, where the  
brooms and brushes are turned out by  
machinery at an amazingly rapid rate. Every-  
body knows a bass or Piassava broom when  
they see it, for most people, whether for gar-  
dens or for domestic purposes, use these  
brooms. If the general public do not know  
what bass or Piassava really is, but are  
still content to look upon it as whale-  
bone, which it was thought to be when  
first introduced, the bulk of our readers will at  
once recognise it as the strong woody fibre  
which is found abundantly at the base of the  
leaf-stalk of two Palms, *Attalea funifera* in  
Bahia, and *Leopoldinia Piassava* in Para.  
The fibre of the former is, for brushmaking,  
superior to that of the Para kind, on account of  
its being stiff and "springy," so that it can be  
used in long lengths. Though the Para sort is  
of a brighter colour and more flexible, it can  
only be used in short lengths, or supported by  
a stronger fibre. Bahia fibre can be obtained  
very strong and thick, or very fine. Para is  
never so strong or thick. The two fibres are  
distinct in appearance. Bahia being round,  
and Para somewhat flat; it is very light in  
weight compared with Bahia, and though not  
really finer is often more expensive.

### PIASSAVA.

The introduction of the use of Piassava, or  
Piassava, as it is sometimes spelt, for broom  
and brush making, not only in England, but also  
in France, Belgium, and Denmark, is mainly, if  
not exclusively, due to the exertions of Mr.  
Arthur Robottom now nearly forty years since.  
Mr. Robottom travelled through the forests of  
Brazil, and describes the Palms as thriving  
more abundantly in various districts situated in  
the province of Bahia, Brazil. Mr. Robottom  
describes the collection of the fibre as follows:—

"The natives climb the trees, which are from 30 to  
40 feet high, and make a nick in the first leaf, which  
bends, so that the man can stand on it with safety.  
The Piassava is then cut down, each tree giving from  
20 to 30 lb. The natives have a great objection to cutting  
it during rainy weather, as in the wet season the venom-  
ous snakes are known to conceal themselves within the  
trees for shelter. After being cut down the Piassava is

taken to the nearest village and cleaned in a rough way by fixing pieces of stick in the ground with sharp points, and the Piassava is drawn through this rude cleansing apparatus, so as to remove the flossy fibre, the bulk of which is sold for consumption in Brazil for making ropes to tie poles together or for making fences, &c.; and in several native villages that I have visited I found the huts were made entirely of poles fastened together by this Piassava rope, and covered with leaves from the Piassava tree. This fine and flossy part, which is useless in this country, is much esteemed in some parts of Brazil, for I noticed that many of the mules going up to Farra St. Anna, a district situated a long way from where the Piassava is grown, were loaded with this flossy Piassava. After being cleaned the Piassava is taken to the sheds, which are generally erected by the side of the rivers, to be pressed. It is then packed in bales and bundles and put on board the launches to be taken to Bahia, from whence it is shipped to Europe and elsewhere. The Piassava is sent principally to London, Liverpool, Hamburg, Antwerp, Havre, and some small quantity to Portugal, and sold to the bass dressers, who employ men to cut it into lengths from 5 to 14 inches. It is then sold in this state to the brush-makers, and manufactured into brooms (called 'bass' brooms) for sweeping yards, stables, roads, streets, &c. The brooms used by the sweepers of the London streets and of many provincial towns are made of this material. In some parts of England the brooms are misnamed 'whalebone' brooms; on shipboard they are called 'coir'; while in Yorkshire they are known as 'weed' brooms. I was told in Bahia that the name 'bass' brooms was given to the Piassava owing to the dealers in the early days of the trade having paid for it in Bass's pale ale. Piassava was first introduced into this country in the form of long ropes, and the 'fenders,' now so well known and used for placing by the sides of vessels when passing through the docks or when coming in contact with other ships. Shortly after its introduction a portion of one of the fenders got into the hands of a working brushmaker. He made a broom which answered well. About this time the bulk of the sugar which was shipped from Bahia was packed in cases of about 16 cwt. each, and small quantities of Piassava were used as dunnage, and lots of 2 to 3 tons would come forward, principally to Liverpool."

In consequence of the great demand for Piassava, Mr. Robottom recommends the cultivation of this Palm, or at least advocates the planting of fresh trees as the old ones are cut down. The Para Piassava from Leopoldinia Piassava is sometimes called Monkey Bass. These trees are described as growing by the side of the White River and other streams that flow into the Orinoco and the Barra de Rio Negro, the fibre being sent down to Para for shipment to England; this kind is finer than the Bahia sort from *Attalea funifera*, realises a much higher price, and is used for making small brushes for cleaning clothes, &c.

#### KITTOOL.

Piassava is undoubtedly of all vegetable fibres the most extensively used for brush-making, but another fibre has recently taken a prominent position in the brush trade, which has been introduced more as a substitute for bristles in the manufacture of soft hair brooms and for mixing with horsehair for stuffing cushions, &c., than for the stiffer sorts of brushes. The article in question is known as Kittool fibre, and is the produce of *Caryota urens*, a brief description of which appeared at p. 84 of the *Gardeners' Chronicle* for July 19 last. Kittool fibre is by no means a new article of trade in this country. It has been known for some thirty or thirty-five years, but like other new products it has met with considerable opposition, and it is due to the exertions of Mr. Robottom, as in the case of Piassava, that Kittool has taken the position it now has in broom and brushmaking. The only thing against it seems to be that it is too durable, and lasts too long, and for this reason manufacturers have not persevered in its use; one firm, however, namely, "Horsey's Patent Broom and Brush Manufacturing Company, Limited," are at the present time using Kittool in large quantities. I lately had the privilege of being introduced to Mr. John G. Horsey, the managing director of the company, who, finding that I was interested in the subject, kindly invited me to visit the works, and I was well repaid for the

hour and a half spent in following the life-history of a brush, more especially as every detail was carefully pointed out and explained by the very intelligent and obliging manager of the works, which are situated in Copperfield Road, Mile End. Enormous quantities of bass or Piassava, as well as Kittool, are used by this company, and as they have large contracts both for the Government as well as for some of the principal railway companies, are always very busy. At the time of my visit the *employés* were for the most part at work on Piassava.

#### BRUSH-MAKING.

The first room visited on the ground floor contained stack after stack of brush or broom stocks, namely, the wooden "backs," as they are often called, into which the bristles or fibre is planted. These stocks are all in the rough, being simply shaped for the several requirements for which they are to be made. The woods mostly used are Beech and Ash. Leaving this store, however, we are conducted into a spacious room, where are numerous bales of Piassava; these bales, as they arrive from Brazil, weigh about  $\frac{3}{4}$  cwt. each, and measure 3 feet long by 18 inches wide, and 1 foot thick. Bass or Piassava is bought here by weight, and is very often much adulterated by the natives, sand and stone being frequently tied up in the centre, and Mr. Horsey told me that he once saw a human skull filled with wet sand taken from a bundle. This system of adulteration causes serious losses to the buyers. Piassava also comes in bundles measuring 3 feet by 2 feet, and 1 foot thick. Both the bales and bundles are very tightly compressed, and when opened expand so much that it is at once seen how much more fibre is contained in one of these bales than at first sight appears. When a bale is opened out the fibre is found to be twice or even thrice the length of the bale itself, being bent or folded to bring it into the required size. In cutting the fibres into lengths it is necessary that they should be very straight, consequently the bent ends of the bundles were formerly cut off and thrown away. As much of the very best fibre was thus sacrificed, one bend always occurring in the very centre of its entire length, a system has been adopted of steaming the whole bale, which causes the fibre to become pliable, so that these bends may be straightened out, and used with the remainder of the fibre. The steam-bath is ingeniously constructed of brick, with iron lids. A perforated pipe passes along the bottom, and the waste steam, which is thus utilised, is let in or turned off by a valve at pleasure. This bath holds about half a ton of fibre. After steaming the bundles of fibre are removed to an adjoining house where they are cut into uniform lengths by a powerful single blade knife, like a guillotine, which is worked by steam, and with one stroke cuts clean through an entire bundle of fibre. These lengths are then passed on to an adjoining bench where they are pulled open, still steaming hot, and bundles of about a double handful taken out and drawn through a hand-hackle, consisting of numerous upright iron spikes set close together—just such a hackle, indeed, as was formerly used for hackling flax. The workman grasps one end of this bundle of fibres, and, throwing it into the top of the hackle, draws it towards him; this combs away all the loose and short fibres, and moreover cleans those that remain. When thoroughly cleaned the fibres are made into bundles of uniform bulk, and of lengths required for the several kinds of brushes. The combings or short fibres left on the bench after hackling are shaken together and made into bundles suitable for scrubbing and similar brushes, so that there is very little real waste. After the fibre has passed through the systematic manipulation here described, it is bright in colour, uniform in thickness, as

straight as a dart, and as rigid as whalebone—very different, indeed, from what it was in the bundle or bale.

The fibre is now ready for fixing in the stocks, or heads. To prepare them to receive the fibre they are taken from the large store previously referred to into a workshop fitted with lathes driven by steam-power. The workman takes one of the solid blocks, and with a kind of drill or gouge set in the machine he bores as many holes as there should be bundles of fibre in the broom or brush, dexterously inclining the block alternately to the right or left, so that the fibres may spread out when they come to be fixed. In the position, incline and depth of the holes, he has nothing but his practised eye to guide him, and a whole block is bored with marvellous rapidity. It will be noted that the holes are not bored through, as is the case with ordinary brushes, where the bundles of bristles or fibres are pushed through and a thin wire threaded through the whole at the top, over which a thin plate of wood is tacked. When this piece of wood comes away, and a wire rusts through or breaks, the whole system is shaken, and the fibres come out bundle after bundle. Neither are the bundles fixed with pitch, which melts with heat and sets them free, but the bundles are simply fixed each with a separate piece of stout steel wire, and in this lies the great advantage of Mr. Horsey's patent. The fixing the bundles into the wooden blocks is done by one of the most ingenious machines it is possible to conceive. Six of these machines are arranged in a row, and are worked simultaneously by steam power, one girl presiding at each machine. Ordinary bass brooms were being made at the period of my visit. After the blocks have been bored, as previously described, they are brought to these machines; the manipulator places one under the machine, a piece of steel the size of the drill that gouged the hole comes down into the hole, apparently to see that all is right and ready for the reception of the fibre; it is immediately withdrawn, and an automatic finger and thumb, so to speak, rakes out of a box attached, which is kept filled with the fibre cut of the proper length, just exactly the right quantity of fibre to fill the hole; it doubles it in half, pushes it into the hole, rams it well home, brings down a piece of steel wire from an adjoining drum upon which it is wound, cuts it off exactly the right length, pushes this into the hole across the bend in the fibre; the two ends of the wire become embedded in the wood, and so the fibre is firmly fixed—so firmly, indeed, that it cannot be got out without cutting through the solid wood. The more the fibre is pulled at, the tighter does the wire become, and the more secure is the fibre; indeed, it cannot possibly become detached; and even if it did, it would not affect the other bundles in the least, seeing that they are all put in separately. After the block is filled with the fibre it has to go under an operation of trimming, as the ends of the fibres are somewhat irregular in length; to effect this a girl takes the broom, lays it on its back on an iron table or bench, and pushes it forward, at the same time a series of revolving knives, exactly like those of a mowing-machine, pass over the top, clipping it to a perfectly level surface. When this is done, the ends of the blocks are sawn off very straight and very neatly by a fine circular saw, and the sides and backs planed by a steam plane: all this is effected in a marvellously short space of time. An ordinary brush takes 20 minutes to make—one by Horsey's patent is turned out in  $1\frac{1}{4}$  minute; in fact, the "life history" of a broom or brush is so rapidly gone through, that the propagation of the species is sufficiently plentiful to meet all demands, very large quantities being turned out each week by the company.

The preparation of Kittool fibre for broom-making is somewhat different from that adopted

FIG. 161.—“A BIT” IN THE OXFORD BOTANIC GARDEN. (SEE P. 732.)

with Piassaba. The fibre arrives in long hanks or bundles, and is of a dusty or dingy black or brownish colour. By steeping in oil it is at the same time strengthened and made more flexible, and of a more perfect or brighter black. It can be expanded nearly 50 per cent. by

steady pulling on both ends. The fibre, after being cut in suitable lengths, is drawn through hand-hackles, as is the case with Piassaba, and made up into very neat bundles, ready to be utilised for brooms and brushes in the same way as Piassaba.

The use of this fibre is spreading rapidly for brooms; being soft, it is stated that it will do all the work that is done by hair-brooms, that it is much more durable than the best hair-brooms, and can be sold at about a third the price of ordinary hair-brooms, and less than a quarter

of that of the best hair-brooms. These brooms are not only used in this country, but are being shipped in very large quantities to the European continent and to the British colonies.

Samples of Para and Bahia Piassava fibre and of Kitool fibre, and brooms and brushes made from them, are exhibited in the Museum No. 2 at Kew. *John R. Jackson, Museum, Royal Gardens, Kew.*

## New Garden Plants.

### VANILLA HUMBLOTTII, n. sp.\*

A NEW leafless African Vanilla. The two nearly allied species, *Vanilla Roscheri*, Rehb. f., and *V. Phalænapsis*, Rehb. f., I have studied in excellent condition. Omitting all other features, both have keels with hairs on the base of the lip, more conspicuous in *Vanilla Roscheri*, but I can find no such keels in Moos, Humblot's plant, but numerous twisted strong hairs scattered from base to disc. The flowers are very large. Sepals ligulate acute; tepals rhombic, acuminate, broad, blunt-edged both sides. The lip is rhombic, blunt-angled, much undulate in front. There is a curious dark zone like a broad ribbon over the anterior part of the disc. Never before have I seen such well dried Vanilla flowers. They have been evidently prepared in hot sand—an excellent idea. The peduncles are long, showing scars of at least twenty flowers. This great ornament of the African flora was discovered by my excellent friend, Mons. Leon Humblot, to whom it is dedicated with great pleasure. *H. G. Rehb. f.*

### ANGRÆCUM FUSCATUM, H. G. Rehb. f.

When I named this plant I had no idea that it was so fine a species. I have before me well dried inflorescences from M. Humblot, with eighteen fully expanded flowers, and the stem grows taller than I thought. *H. G. Rehb. f.*

### ANGRÆCUM ROSTELLARE, n. sp.†

This looks a diminished *Angræcum fuscum*. Its cuneate oblong leaves are emarginate, bilobed at the apex, and unusually soft, so that I believe they may last so. The numerous peduncles (I have four on one small plant) are loaded with flowers of the shape of those of the grand *Angræcum fuscum*. They have a distinct, long, ascending, linear rostellar process, spatulate apiculate petals, and a similar lip. Were it not for these features I should have regarded this discovery of M. Leon Humblot as a reduced *Angræcum fuscum*, Rehb. f. *H. G. Rehb. f.*

### EPIDENDRUM PAYTENSE, Rehb. f.; Seemann, *Bonplandia*, iii., 24; Walp. Ann., vi., 391.

It is many years since I have seen this lovely member of the group *Amphiglotium Schistochila carinata*. It has come once more into my hands from Dr. Wallace, whose son gathered it in the United States of Columbia, while Von Warscewicz discovered it in Peru. Dr. Wallace most kindly forwarded me a plant at once, whose stiff shoots have purplish-brown sheaths, and the short very strong oblong acute leaves are also tinted with a hue of the same colour. The flowers are of a most brilliant scarlet-vermilion, with some orange on the lip, which is also marked with some darker spots of the same hue. They are quite equivalent to those of *Epidendrum Schomburgkii*, cinnabarinum, and radicans. Lovers of this affinity will be satisfied to see this plant. *H. G. Rehb. f.*

### ÆRANTHUS LEONIS, n. sp.‡

A magnificent discovery of Mons. Leon Humblot, of course dedicated to this intrepid traveller, to whom we are indebted for so many fine things.

\* *Vanilla Humblottii*, n. sp.—Aphyllæ Africane; racemo multifloro; sepalis ligulato-lanceolatis obtusiusculis; tepalibus rhombico-obtusangulis acuminatis; labello cuneato flabellato rhombico antice obtuso crispulo pilis numerosis in disco; columna brevi basi cum labello connata. Cl. Leon Humblot dicata. *H. G. Rehb. f.*

† *Angræcum rostellare*, n. sp.—Humile, aff. *Angræcum fuscum*. foliis cuneato-oblongis inæqualiter bilobis mollibus; pedunculis plurifloris; bracteis amplis cucullatis ovaris pellicellatis multo brevioribus; sepalis lanceolatis; tepalibus cuneato-oblongis apiculatis; lamina labelli cuneato oblonga apiculata (spatulata apiculata), calcaris filiformis ovario pedicellato plus duplo longiori; columnæ processu rostellari lineari longissimo. *H. G. Rehb. f.*

‡ *Æranthus Leonis*, Rehb. f., n. sp.—Foliis ensiformibus late falcatis, curvis; pedunculis plurifloris, racemosis numerosis erectis; bracteis cucullatis obsoletis acutis amplis, brevissimis; ovaris pedicellatis dipertitis elongatis; sepalis lineari triangularibus acutis linea mediana extus carinatis; tepalibus basi multo latioribus.

The stem is not long as it appears. It has numerous swordlike, falcate leaves, a span long or nearly so, standing close together, of a very stout texture. They are a little slit at the base over the articulation. The laminae break away, leaving two aristate ears at the base. The apparently ivory-white flowers may be compared to those of *Æranthus sesquipedalis* (*Angræcum sesquipedale*). The spur, however, is much shorter, infundibuliform at its base, then filiform, and bent in all the flowers before me. There are as many as seven such flowers belonging to the one raceme. The fruits appear to be dimorphous; some are nearly globular, others are egg-shaped. All have two prominent wings, as has the ovary. A very stately thing, quite novel as to leaves, taking little space, and bearing large flowers—is this not sufficient to make a collector's heart beat with satisfaction? *H. G. Rehb. f.*

### POGONIA (NERVILIA) BARKLYANA.\*

This grand *Pogonia* was first made known to me by a sketch in colours, prepared, I believe, by Lady Barkly, and sent by Sir Henry Barkly, 1870, to Kew, where I was permitted by the liberal authorities to take a copy. It was but justice to name it after Sir Henry and Lady Barkly, who were such great promoters of natural history. It is a grand plant; by far the most stately of all the *Nervilias*. The peduncles reach nearly 2 feet in length, and one of my dried specimens shows eleven flowers. Sepals lanceolate acuminate. Petals broader and shorter. Lip trifid, side-lacinia angulate, mid-lacinia acuminate, reflexed at apex. They are represented green, with a darker green flush, and there is a fine network of veins on the mid-lacinia of the lip. The large leaf is roundish, apiculate sinuate, cordate at the base, a span broad, on a petiole also a span high. The tuber is a soft great oblongo-cylindrical body. Thanks to M. Leon Humblot, I am able to verify my description.

It is well known there are not only two (as was asserted recently) but numerous *Pogonias* in South Eastern Africa. Our plant does not correspond well with any of the described species.

I must state that the leaves at hand show remarkable asperities on the under-surface, which might have been described as hairs, though they are much more like scales. When these scales are wetted, and placed under the microscope they show legs, and heads, and abdomens, and breasts, being, no doubt, hemipterous insects, rather like the wretched *Phylloxera*.

As to the author of numerous ill-described species he speaks of Mayotte, V.C.I. This celebrity, however, would appear to be a collector, and not an island. *H. G. Rehb. f.*

## THE RETICULATA GROUP OF IRISES.

(Concluded from p. 563.)

THE five Irises previously mentioned form, as I have said, a very distinct group. The differences between I. Vartani and the other four are far greater than those existing between any two of the four. The four, in fact, form a group with which I. Vartani may be considered equipollent. The differences between the several members of the group of four are on the whole nearly equal if the members be arranged in the order sophenensis, reticulata, Krelagei, Ilistris. Thus, though the differences between sophenensis and Ilistris are very great, those between sophenensis and the typical reticulata are not very much greater than those between the typical reticulata and Krelagei, or between Krelagei and Ilistris; and in none of these cases are the differences so great as between any one of them and I. Vartani. If each of the four be considered a species then some term indicative of greater divergence ought to be employed to denote the relationship of I. Vartani. This would seem undesirable. On the other hand, to call these four kinds varieties would cut away our means of recording differences observable within each of the four; and that would be equally undesirable. I would, therefore, propose to speak of them as subspecies, and of differences obtaining within each subspecies as constituting a variety. The whole group as at present known might then be described as follows:—

triangulis acuminatis, labelli lamina oblonga seu obtusangula quadrata uno apiculo antice mediano abrupto basi cucullata; calcaris basi infundibuliformi amola filiformi vulgo varie flexo ovarium pedicellatum non aequante. Leon Humblot amice dicatum. *H. G. Rehb. f.*

*Pogonia Barklyana*.—Folio longo petiolato circulari apiculato undulato basi cordato, spithamam usque lato; pedunculo pedali sesue bipedali, basi hinc vaginato; racemo laxo; bracteis linearilanceis viridulis deflexis, ovaria pedicellata nunc excedentibus; sepalis linearilanceis acuminatis; tepalibus latioribus brevioribus, labello expanso antice trifido, lacinia lateralibus angulatis, lacinia mediana producta plus minus acuminata, limbo nunc crispulo nudato, hinc geminis elevatis per discum.—Il. Equiti Barkly ejusdem uxori obedientissime dicata. *H. G. Rehb. f.*

RETICULATA GROUP.—Bulbs with netted coats, tetragonal leaves, and single flowers.

### SPECIES I.

I. reticulata.—Bulbs ovate, blade of fall not much wider than claw, crest on claw absent or inconspicuous, crest of style not more than twice as long as broad.

### Subspecies.

I. s. sophenensis.—Flower dwarf, appearing before or as soon as the leaves; spreading; falls and claw very narrow, blade of fall obtuse; colour blue, merging into red-purple. [See p. 470, April 11, 1885.]

I. s. reticulata.—Flowers turbinate, not appearing till after the leaves have appeared; claw of fall much longer than blade; colour blue-purple; lateral veins on claw of fall slightly marked; sp. valves green.

I. s. Krelagei.—Flowers turbinate, not appearing till after the leaves have appeared; claw of fall not much longer than blade; colour red-purple; lateral veins on claw of fall conspicuous; spathe-valves green.

I. s. Ilistris.—Flowers turbinate, not appearing till after the leaves have appeared; claw of fall as long as, and nearly as broad as blade, which is conspicuously marked with blue-purple spots; spathe-valves nearly colourless.

### SPECIES II.

I. Vartani.—Bulbs elongate-ovate; blade of fall much wider than claw; crests of style more than twice as long as broad. [See p. 438, April 4, 1885.]

In this scheme the blue form of I. s. Krelagei, described above, would find a place as a variety, or I. s. Krelagei cyanea. But in pursuance of what seems to be the wise decision of the Narcissus Conference, to restrict Latin names to forms known to occur wild, and to employ trivial names for forms known to be the result of cultivation, I would propose to call the late Mr. Nelson's blue seedlings by his or some other name, e.g., I. s. reticulata "John Nelson," his large seedling as I. s. reticulata "Captain Nelson," and so on; but I do not know that I have any right to decide which names should be used.

Some of my own seedlings and some of those of Mr. Max Leichtlin seem to me to be hybrids between I. s. reticulata and I. s. Krelagei, and Mr. Max Leichtlin tells me that he has flowered a seedling which he felt sure was from seed borne by I. s. Ilistris, crossed by I. s. Krelagei, but concerning which he is in doubt, since the offspring seems almost entirely Krelagei. I see, however, no reason in this to invalidate his result, for I have grounds for thinking that Krelagei "blood" is very potent and able to assert itself preponderantly in any of its hybrid offspring.

It will before long be necessary to take decided steps towards arranging such a nomenclature of hybrids as will in some measure indicate their origin. I would venture to suggest, that where the parentage is exactly known a word might be formed out of the initial portion of each parent's name, the seed-bearer coming first. Thus offspring of I. s. reticulata crossed by pollen of I. s. Krelagei might be written I. × reticulæ, while I. × Ilistris would signify I. s. Ilistris crossed with pollen of I. s. reticulata. By taking some little care, words of commendable shortness and yet smooth to speak might be invented, and any sense of uncouthness they might at first suggest would soon wear off.

It will be seen from the above that it has been my good fortune to be able, within a few months, to extend the number of Irises of this group from three to five, i.e., nearly to double them, and that without insisting on any but veritable and marked differences; and the moral which I would venture to draw from this is that between the Mediterranean shores and the eastern limits of Persia or Afghanistan, there must be other as yet unknown members of the same group, some of which would probably serve to bridge over the wide gap which at present seems to exist between this group and that of I. sisyrinchium on the one hand, and that of I. xiphion on the other; moreover, the fact that one of these two new forms, and that the most distinctive, should have lain so long unnoticed in the much trodden and tourist ridden land of Palestine tells a tale.

### CULTIVATION.

With regard to the cultivation of these Irises, I do not feel able to say anything very definite. When I have said that they enjoy full sunshine, that they hate being water-logged in winter and enjoy being dry in

\* The letter s before the name might be used to denote subspecies. Thus I. reticulata would mean the whole species of four forms; I. s. reticulata the typical sub-species.

summer, that as far as mere cold is concerned they are perfectly hardy, I have said almost as much as I know. Being true bulbs, without permanent roots, they may be "lifted" in summer without injury, but they should probably be planted early, for, like Hyacinths, they send out their roots very early. They are difficult to grow in pots; that is to say, plants grown in a pot will not readily yield, after flowering, plump, sound bulbs, even when some care has been taken to water with judgment, and to ripen properly. With me *me I. s. Krelagei* is stronger and more robust than the type, but this may not be the case everywhere.

In many instances the bulbs suddenly or rapidly "go off" and disappear. This with me is especially the case with the type, and I am much inclined to attribute the failure, not to soil, but to some disease due to the attacks either of an animal or a fungus, though I cannot at present speak with certainty.

Nor do I feel at present quite sure what is exactly the best soil for these Irises, for I know of their "doing" and their "not doing" in many very different kinds of soil. If I were restricted, however, to one soil, I should be inclined at present to choose one rather rich and fat, but at the same time open and sandy, loam; yet, provided good drainage is present, I believe they may be grown anywhere provided that the sunshine is adequate, and that their slender foliage is not too much vexed with fierce gusts of wind. *M. Foster.*

## MAY-DAY EVE IN THE MORNING!

THE hour from 8 to 9 A.M. is often the quietest in all the day. Everybody has gone to breakfast, and the garden is deserted. Thrushes and blackbirds are breakfasting all over the meadow, and the distant singing heard among the further Elm trees gives emphasis to the nearer silence. Even the bees are gone home to breakfast; only here and there a lumbering old humble-bee grumbles alone in the blossoming fruit trees. It is time for the young nestlings' second or third meal, and the tame redbreast (who, though it is no longer winter, still visits my window) is hurriedly packing a slender worm in her bill, and then, by the direction of her flight, betrays the cherished secret of her treasure. Yet it must be confessed that when the air is less chilly the hour is often fuller of murmuring stir among the birds and bees than it is to-day. Cold as it is, there is one tall white Iris—just one among a thousand huddling now in double file throughout the garden—carefully, slowly opening. It rises above all the other Irises—first and fairest, as the first of every flower is—and to-morrow it will be full-blown, in honour of the day. The eve of May-Day should be full of mysteries in earth and air. A great change is approaching, and all Nature knows it. I myself but dimly guess and feel what it may be. It may be that the birth of summer is at hand, and already a few of Nature's loveliest children "haste to die." Snowdrops are forgotten, and Primrose-tide is fading from the woods. Under the yellow Berberis yellow petals lie in little heaps or lines of yellow drift; and every peary bud on the white Cherry trees has opened wide. There is no wind, but they will not last; another day or two, and the fruit will be set, and we shall see twin Cherries swelling greenly all over each long length of blossomed bough. Either to-day, or on May-Day, one ought to see the fairies, according to old Scottish legends! No fairies appeared this time, but I saw a good deal between eight and nine, looking from the broad walk upon our old kitchen garden walls, bright with the eastern sun. How shall the charm of these old brick walls be described? Words could never paint it. In the clear glow of morning light the reds are so delicately pure and warm, and they are mottled with such varied greys and many-tinted yellows. There are stout old buttresses, too, mossed and ferny, and grey with eld. Ancient rugged Pear trees grow up against it, and their outstretched knotted old limbs are set now with bunches of flowers, and young, tender leaves, and the half-transparent shadow of every flower and leaf lies still, or trembles on the wall. One of these Pear trees, quite worn out and decayed with age, had been cleared away last winter, leaving a broad vacant space, a space that is not bare, but full of interest. Little incidents and details, unobserved before, were plainly seen this morning. There is a curious arrangement of wood-bricks built in regular order amongst the others.

Worm-eaten and decayed, they have weathered to the same colour as the greyer of the bricks, and are so inconspicuous as to pass usually unremarked. These wood-bricks must have been devised for the more careful nailing up of fruit trees. The fine new garden walls of those days might not be disfigured with nails! some have fallen out, leaving recesses convenient for wrens' and other nests. Suddenly appeared a curved line of bricks set end-wise, showing where once had been a low-browed narrow doorway, bricked up long since. There is another as low and narrow faintly visible farther down. Carlyle wrote of the days "when dresses were smaller and thoughts were larger." Certainly our modern doorways are mostly wider than those of older date. The old walls, with the sunlight discovering upon them traces of Time's landmarks, are enough to set one dreaming of those former days, and for the moment it is easy to live in many a bygone scene; to fancy the precise training of the fruit trees to the wood-blocks; the daily traffic through that little doorway. I could see the gardeners with their quaint old-fashioned wheel-barrows and watering-pots going in and out; and I recalled the day named in Evelyn's Diary, when George Evelyn and his cousin John Evelyn of Sayes Court, walked through the door together—George, showing his gardens with due pride—John, with grave observant eye, noting how they were "exquisitely kept though large." That afternoon was July 23, 1679. The sunny wall stood then in deep shade on this side, and where now, on May Eve, two centuries after, Pear blossoms whitened all over it, George Evelyn's young trees were ripening their first fruits. Along the top of the wall grow wild grasses and crested moss. There is a plant of Shepherd's Purse with glorious spread of seed and flower, luxuriating up there in lofty, safe seclusion. Seen from below, so freshly green against the blue, these wild things do but—to us—enhance the picturesqueness of the old wall; and while looking up at them thus, one feels in some degree that curious sense of infinity, the reason of which no one ever has explained. The Evelyns in their day would have treated them as unruly weeds, and would have made short work with them. Not half an hour hence, when the Traveller turns the corner, and his gold face looks the other way, the old door and the wooden bricks, with the vision of that summer-day 205 years back, will fade fast, and be lost in shadow. Another old wall on the other side of the lawn is also propped at intervals with heavy buttresses. The aspect is north, and on these rude masses of old bricks grow my wild gardens. The buttresses are gnarled and irregularly scored and furrowed by huge Ivy stems veiled under moss and lichen. The finest of the two "gardens" is that one nearest the Syringa and the greenhouse door. There a Nut tree of 6 inches, and a Yew 3 inches high, are thrown into the shade by two great Moon Daisies and a giant Broom. These are my forest trees! The Broom don't care for so much cold shade, and every season makes rampant efforts to reach above it and catch the sun upon its golden plumes. It is all but at the top now. If I look down very closely a miniature landscape may be discerned—strips of flower garden inwoven with a wild scene of mossy caves and deep ravines. The edges of all these tiny fissures are at this time faintly blue with Eyebright of microscopic littleness. One must almost use a glass to see plainly the tiny perfect flowers, no bigger than a pin's head, with little leaves and stalks to match. Delicate small grasses overhang the mouth of the caverns, where small wild beasts of insect race lie lost after the night of rapine. Weird jungle of grey Cup-moss and lichen skirts the garden side, and sheaves of mimic Bulrush wave gold-brown heads in a morass of greenest moss; and then we come upon a brilliant little Daisy, every stalk a-flower in the very perfection of blithe good humour, though not one single ray of sunshine has ever touched its silver. A rather coarse Polypody Fern in part supports the Daisy's roots, and one or two more tender Ferns droop gently near it. The group is fringed below with a lilac patch of chance-sown Aubrietia. Perhaps a scarlet wood Strawberry will ripen late on the tufted pink runners that are always climbing higher up the buttress; and I shall soon look for the pretty *Draba verna*, which, with one or two sister weeds—all microscopically small—will in their courses bloom and fade here through the summer, that is, if they are not overtaken by the doom already threatening.

Along the upper ledges young leaves of *Cymalaria*

are coming thick and fast. The lovely, well-known little *Antirrhinum* is more or less common all over Europe, I believe, however named—whether Mother of Thousands, as in the old stone fences of Somersetshire, or the *Fronde della Madonna* of the rocks and carved pediments of Italy. Wherever old stone or marble is, there—with the universal Pellitory—we find the sweet enrichment of our Toad Flax. Soon it will be breaking in avalanches all down the old buttress, and at close of summer a thick green curtain will have long been drawn over my small enchanted wild.

May 21.—To-day there is heavy rain, and the gardener has just come in to announce the first blooming of a new Iris. A plant of pale grey Iris was given to me last summer, and we have looked anxiously for its flowering. The Iris procession begins this year with the white and purple in lavish profusion. They flower together for the first time, alternately, along the line of Holly hedge. The purple are too impatient usually to wait for the blooming of the white. These stand now in multitudes under the dining-room windows, and along the south walk. Someone has compared them to the company of St. Ursula's white-robed virgins. Our Irises begin to know that they are especial favourites here, and their great size and luxuriance is bewildering. Of course they would tell me it is only because their roots have become established, as we say. Both *Ensata* and the *Fleur-de-Lys* bear forcing well, and we have never been without either since January. The fine broad foliage of the *Fleur-de-Lys* was welcome, for its masses of fresh green in winter, when the flowering plants were brought into the house. The white flowers send forth, however, when thus forced, a fragrance that some find too powerful, as Gerard says of Lilac, "troubling and molesting the head in a strange manner, with a Ponticke and unacquainted savour." It is strange that Iris germanica, whose scent I have sometimes known at Rome (and notably where it grows round the tomb of *Cæcilia Metella*) to make the sweet air still more delicious, has here no kind of scent. A pleasant chance of colour comes near the entrance court: it is purple Iris growing with a clump of amber-edged yellow Tulips. And still more refined and lovely is the contrast upon a south wall of a large flowered mauve Clematis, with *Gloire de Dijon* Rose and the brown shoots of *flexuosa* Honeysuckle intermixed with white Iris below. The Tulips in the Tulip parterre are over, after a brilliant existence of nearly four weeks. One day they were seen to shine like lamps of coloured fire, through the thinner spaces of a large black Irish Yew. The beautiful effect never returned again; it was perhaps due to some strange accident of light. Light does often use "lawful magic" marvellously under the pure intensity of a morning sky, or just before the sun goes down. I have seen the *Phillyreas* in the garden in the early hours, reflect back positive blue from their dark foliage, and there is a Persian Lilac in bloom whose colour is gorgeous at such a time. It is absolutely dazzling. Birds, too, flash past with colours that might vie with those of oriental plumage. Greenfinches on the wing or among the branches are emerald-green like real green parrots, or a timouse fits from tree to tree in "azurn sheen" as blue as any kingfisher. It is the way the sun strikes at this sweet hour. At sunset, I have seen the great Elms all glorious within, the straightness of their massive stems burning with a lurid glow from root to tree-top behind the leaves; and last evening when, after the rain, the sunset shone upon a Cypress, a million rain-drops twinkling all over it became lustrous diamonds of the purest water, darting long rays of rainbow hues. No springtime could ever be more perfect in its outward beauty than this May is, though indeed the rain and cold do somewhat spoil our full enjoyment. It must have been in a spring like this that Jean Paul wrote of "winter painted green." Yet there were days when the perfume of Apple blossoms was borne through all the garden as balmily as if the breezes had not been ice. Never were Apple trees more snowily, rosily radiant. It was as beautiful as a dream to pass along underneath their flower-laden branches; and so abundant was the bloom that when it fell the petals lay so thick upon the grass that the thrushes tripped up and stumbled in their haste to run through it. Lilac, too—a more lasting pleasure—is in finer bloom than ever I remember it. Lilacs do not usually take the place they are worthy of in our gardens. In former

days, when the "Blew-pipe tree" was a novelty, they planted it in the front ranks; but now, somehow, it seems always pushed out of the way; and yet the loveliness of Lilac trees in May can be scarcely equalled, while one feels that the first whiff of their perfume in the garden is as the very heart and soul of memory. Our old trees at the back of the Broad Walk border are scarcely seen from the garden. They cheerfully give their beauty to the other side, overhanging the tarred paling of the potting-house yard, and glorifying its business like surroundings with a world of fragrant colour. From an upper window of the house I look down upon a distant view of this tossing sea of Lilac. Two or three young Lilac bushes were planted a few years back in the orchard; they are better placed: one can enjoy them more intimately, walk round them, or pull down a branch to smell the lilac cones. But our white Lilac, most refined and loveliest of all, grows nowhere unencumbered with shrubbery. If the Forest of the Fantaisie were but half a mile round, instead of half a rood, it would be perfect. Its position gives variety, that quality which charms as much in a garden as does the play of expression in a human face. It is as if in following the green garden ways we went "from grave to gay, from lively to severe."

From the sunny masses of pink and white Phlox repens, blue Gentian, and Narcissus poeticus, in the wildest profusion, ending in a wholly indescribable glow of Azalea mollis, the path winds along smooth grass and close-trimmed Laurel into the woodland shade, between great clumps of purple Iris growing among stones and flints, over-run with Stonecrop, Violas, and Fumitory. Here, though so tiny that some one the other day took it for a child's garden, there is something of the dim quiet of a wood. Every wild plant that makes its home in it is welcome; even Dandelions, and Stellaria, and Wood Sorrel (flower of the Holy Ghost), one little flower of which has just remembered it is Whitsuntide and opened its veined petals. The Bluebells nodding to each other under this sun-chequered living green of spring are fresh joy to me every morning and every evening. I suppose wide sheets of them, a very "Heaven's upbreathing from the earth," might give greater pleasure; but only in extent—scarcely in degree. My "wood" is but a little chink of heaven, yet the delight of it is as pure as it is small. There was a fear lest these wild Hyacinths might deteriorate in land not poor enough to keep them humble; that downward curve of the slender stalk, which is grace itself, and the glory of Bluebells, seemed about to be lost in over-luxuriance; the heads of flower bent low enough, however, after they were fully blown. There are countless groups of white, and blue, and pale mauve Hyacinths that once were wild, dispersed about the borders; but the cultivated ground seems to give a certain fatness to leaf and stalk and flower, which takes just so much from perfect beauty.

Coming out of the wood a sharp turn to the left leads one into a fair round green, and Glorietta smiles out of the enclosing thicket. Parrot Tulips flaunt in yellow and scarlet rags, amid purple Iris and red Anemones, round one-half of the charmed circle; the other half, being turned from the sun, can only boast of late green buds. A deeper interest lies in the Jupiers above the budding Tulips, for there the birds build, and know themselves secure. *E. V. B.*

## PARADISE AND VICTORIA NURSERIES, UPPER HOLLOWAY.

THE Orchid show at Mr. B. S. Williams', which has attracted so many distinguished visitors of late, is spread pretty generally throughout the Orchid-houses, but centres in the long show-house; and here, arranged beneath the tall Palms and among the graceful Maidenhair Ferns and showy scarlet Anthuriums, may be seen the realisation of the Orchid grower's dream—a profusion of healthy plants of good varieties well flowered and skilfully arranged. A glance along the noble banks of flowers shows the advantages which such an old cultivator as Mr. Williams has when arranging such a roomy building. In it, ordinary plants without the aid of a great many old and well grown specimens would make but a poor display, and here the telling effect of the great masses of *Lælia purpurata*, *Cattleya Warneri*, *C. crispata*, *Vanda tricolor*, *V. suavis*, and many others, which take years to get into good flowering condition and which Mr. Williams has always been carefully selecting and growing on, comes in. Among such plants may be

noted as noble examples of the reward of steady good culture some grand *Cattleya Mossiae* with from twenty to thirty flowers each; *Dendrobium moschatum* cupreum with sixteen spikes; *Aërides Fieldingii* with five long branched spikes; a noble specimen of the true *Anguloa Ruckeri sanguinea*, and many grand plants of *Lælia purpurata*. Of this last named, a famous collection is in bloom, and the specimens yet to open have considerably over one hundred spikes between them. The best by far in point of size and richness of colouring is the handsome *L. purpurata Williamsii*, recently certificated by the Royal Botanic Society, although there is a very lovely white-petalled and purple-lipped form in bloom which, if it were not too widely distinct from *Williamsii* for comparison, would run it hard. Next, as being beautifully distinct, comes *L. purpurata Nelissii*, with rose tinged petals and peculiar lip of reddish-crimson, and the dark *L. p. atropurpurea*. *L. Stelznerianum* and *L. Russelliana* may also be regarded as of the *purpurata* section, and the fine collection in bloom (some with five or six flowers on a spike) at Holloway gives excellent opportunity for comparing them, as quite a dozen first-class and distinct varieties of *L. purpurata* may be there selected. At every step along the showy and fragrant arrangement rare things meet the view; here the unapproachable *Saccolabium guttatum* Holfordi, with its brightly spotted ruby-lipped flowers, and near by in marked contrast the curious *S. difforme*, *Phalaenopsis*-like in growth, but with long sprays of curious yellow and black flowers, with fiercely moustached labellums.

Further on is a fine specimen of the rare *Odontoglossum cuspidatum xanthoglossum*, with yellow, white, and chestnut flowers, like an improvement on *O. mulus*; two good plants of the rare *O. prionopetalon*; *Cœlogyne Massangeana*, in fine order; *Scuticaria Hadweni*, with large waxlike flowers of yellow, brown, and rose, and with short ascending leaves: this plant, although very old, is but little known; and *S. Steellii*, which is frequently imported, is often confounded with it. The beauty of *S. Hadweni*, and its distinctness, should make it well sought after. The crimson *Calanthe Sanderiana*, too, is a great acquisition. Among the rare *Masdevallias* *M. Harryana gigantea*, *M. H. purpurea*, and a new reddish-orange coloured form of *M. Harryana*, which is here flowering for the first time, show themselves to be of the highest merit, the last-named as well as the pale *M. H. rosea* being useful to arrange with and show up the darker coloured varieties. At the entrance of the show-house stands a novel arrangement of Orchids in bloom growing on an ornamental tree stump, planted behind a great mass of *Odontoglossum vexillarium* in full flower. On the branches of the rustic stand are various *Odontoglossums*, *Mesospidium sanguineum*, *Dendrobium Farmeri*, *Epidendrum vitellinum majus*, *Aërides crassifolium*, and several *Bromeliads*. The arrangement has the charm of novelty, but from a cultural point of view it is arranged rather to show what can sometimes be done than what should be done in all places. *Odontoglossum crispum* and *O. vexillarium* in great quantities are spread through the house, and arranged with them several well bloomed plants of *Calanthe veratrifolia*, *C. Dominiana*, *C. masuca*, *Cattleya intermedia*, *C. elegans*, *C. Walkeriana*, *C. labiata Warneri* (about twenty-five spikes), *Vanda suavis*, *V. tricolor*, *V. Denisoniana*, *Oncidium Gardnerianum* (true), *Cypripedium Druryi*, *C. ciliolare*, *C. Argus*, *C. barbatum superbum*, *C. superbiens*, *C. Lowii*, *C. caudatum*, *Maxillaria gigantea*, *Trichopilia crispata*, *Odontoglossum hystrix*, *O. Andersonianum*, *O. Roelzii album*, *Galeandra Devoniana*, *Dendrobium Jamesianum*, *D. densiflorum*, *D. thyrsiflorum*, and some dwarf plants of *Vanda teres*, whilst overhead the drooping sprays of *Odontoglossum citroszum roseum*, *O. c. album*, and others heighten the effect of the arrangement. The whole display is admirable, and it should be visited by all who are interested in these lovely plants.

In the long cool house a rival display to that in the show-house, but on a smaller scale, will be found the chaste arrangement of great quantities of fine forms of *Odontoglossum crispum* with their snowy flowers among the violet, crimson, mauve, and orange *Masdevallias*, appealing strongly to the sympathies of all lovers of the beautiful. The colours named are the prevailing in this house, and some of the brightest are given by *Masdevallia Harryana lata*, reddish-crimson; *M. H. splendens*, dark violet; and *M. H. magnifica*, mauve; and blooming in the

other Orchid-houses are *Vandas* and *Saccolabiums*, *Anguloa Ruckeri*, *A. Clowesii*, some handsome *Aërides*, *Sobralia macrantha*, Woolley's var.; some good *Cattleya gigas*, a grand *C. labiata Pescatorei*, very rare (not yet out), *Odontoglossum citroszum*, with nine spikes; many *Cattleya Mendellii*, with three and four flowers on a spike; *Dendrobium superbiens*, and many other beauties well worth seeing.

For the rest of the nursery it is all in summer garb; each department of this, one of the finest of general nurseries, giving its own show of flowers. The specimen *Azalea*-house is full of bloom, the *Amaryllis*-house is still gay, the New Holland-houses full of Heaths and other hard-wooded plants, the great show-house, with its gigantic specimen Palms, Tree Ferns, resplendent with *Pelargoniums*, *Azaleas*, *Hydrangeas*, *Crassula jasminum*, and pretty *Marguerites*; one little group of *Adiantum farleyense*, scarlet *Anthurium Andreanum*, and white *Hymenocallis macrostephana*, arranged together, being very lovely.

The *Nepenthes*-house is also in fine order, and the noted collection of Ferns equally good, that portion devoted to *Gleichenias* and Filmy Ferns being very extensive and containing many unique specimens. Among the worthy novelties in the Fern-houses are *Adiantum macrophyllum bipinnatum*, *A. cuneatum grandiceps*, *A. dolabriforme*, *A. Williamsii* (a golden Maidenhair), and *Gleichenia dicarpa bipinnata*.

## PHOTINIA SERRULATA.

THIS hardy evergreen tree is worth growing were it only for its bold shining dark green foliage, and the beauty of its unfolding buds. It is hardy in most parts of England, but does not often flower, unless against a wall. The specimen figured (fig. 162) was sent us from Lord Cadogan's garden, at Bahraham Hall, Cambridgeshire, by Mr. Edwards, the gardener, and the illustration will show that the flowers are as ornamental as the leaves. The tree is a native of Japan and China, and may be grafted or budded on the Thorn or Medlar.

One of the largest specimens of this distinct foliaged plant is at St. Nicholas Vicarage, Shaldon, South Devon, where it assumes the dimensions of a tree, so to speak. It is upwards of 21 feet in height, and some 18 feet through, and is a dense mass of foliage. The brown tints of the young growths against the sombre green of the matured leaves, together with the clusters of its white *Laurustinus*-like flowers, present a most pleasing contrast. It was planted in its present position some thirty years ago by the present gardener, Mr. Styles, but was unfortunately placed too near the carriage drive—a frequent error by some planters. The Vicar, the Rev. H. Wrenford, has in consequence been obliged to have many limbs lopped off, nevertheless it is a unique plant, and one of which the possessor may well be proud.

## NOTES FROM FRENCH NURSERIES.

THE visitor to Paris should, if he is a lover of plants, pay a visit to the nurseries at Versailles, and others not far removed from the city. We will take two in the town of Versailles as specimens, as showing well the modes adopted in growing the classes of plants most in favour with the Parisians of the present day. These differ greatly from ours, in so far as the preference is given to plants with hard foliage, capable of withstanding the evils of confinement in living rooms at all seasons without losing their foliage, hence *Ficus*, *Bromeliads*, *Philodendrons*, *Anthuriums*, *Dracenas*, and *Palms* form the largest section amongst the foliage plants, as do *Azalea indica*, *A. mollis*, *Gloxinias*, *Lilac* in variety, and the so-called Paris Daisies amongst the floral section.

MM. DUVAL.

One of the newest of these plant manufactories at Versailles is that founded about two years ago by MM. Duval, situated in Rue d'Hermitage, on the outskirts of the town. The *Azalea indica* is grown here to the number of 60,000 annually. Most of the plants are struck from cuttings in February; some thousands are likewise raised by means of grafting, but the first-named method is mostly employed. These are grown in low span pits in shallow boxes or pans, standing

at the time of our visit on the side tables, but to be afterwards, in June, transferred to the many parallel beds of a width of 4 feet and a length of 20 yards, which occupied almost one-half of the nursery.

These beds are composed of a kind of forest soil resembling peat in texture, but which is made up chiefly of leaf-mould permeated with the roots of Ferns and other low growths. It is light, rich in the materials the Azalea requires, and is to be had for the carting. In these beds they make nice

barred varieties, like zebрина. These are likewise plentifully crossed, with the result of obtaining many remarkably novel forms. *Ficus elastica* is found here in large numbers, with fine foliage, but the wood somewhat long jointed. These plants are of Algerian growth, and the transit being reasonable, and the time required to bring them over not long enough to cause injury to them, it is found preferable to have them grown there under a hotter sun, and where the conditions all the year round are favourable to their cheap cultivation. The same holds good of Phoenix

houses worthy of adoption under certain circumstances. Owing to the rather limited area the span-houses are built almost touching each other; at any rate, there is only a space of about 1½ foot between the side walls. These narrow passages are closed with brick-work, fitted with small doors at either end, and covered over with zinc, the side walls being furnished with air inlets, so that by opening the doors at the ends to any desirable extent air can be let into the house or houses with the minimum of trouble, and it is also warmed during its journey through the passage, and impinges on the plants at a lower degree of warmth than that of the house. The zinc covering over the space enclosed is constructed with a running-level, so that it acts as a wide gutter to the roofs, which dip towards it. A lath-roofed construction was seen covering many rods of ground, stood aside from the houses, which is used during warm weather to retard Rhododendrons, Azaleas, Roses, &c., in bloom, and Ferns—a useful fitting for any garden, and better than the north side of a wall for the purpose intended.

#### M. TRUFFAUT.

M. Truffaut's is another good establishment at Versailles, situated a considerable distance from that of M. Duval. Here *Dracænas* are much grown; very primitive looking frames of 3 or 4 feet in height and sufficiently large to accommodate six or eight plants were placed on slight hotbeds of stable manure and leaves, the plants being plunged up to the rims of the pots therein. The steamy ammonia-laden air causes rapid healthy growth, and the lower leaves are rarely lost—a great desideratum in a *Dracæna*. *Vriesias*, *Encholirions*, *Caraguatas*, are treated in much the same way as in the other nursery noticed, and several houses were filled with them. *Ficus elastica* forms an important item, as many as 4000 being annually sold. A beautiful stock of saleable plants of *Azalea indica* (about 12,000) were growing in rough looking frames, which had withstood the winter with nothing more than straw mats over the glass, and some amount of dung linings; the plants were even in size and the foliage all that could be desired. They were enjoying full exposure, the lights being used for other purposes. A beautiful *Azalea* was observed in Joseph Lefebvre, a single-flowered white, with crimson stripes and spotting. *Cyclamens* are done very well at this nursery, and form one of its specialties.

The collection of Orchids which M. Truffaut is getting together will be in time one of the most important trade collections in the neighbourhood of Paris. The bulk of the flowering plants were at the time of our visit at the great show in the Champs Elysées, but the more numerous unflowered specimens test at home promised to become strong and healthy. We should think that the great difficulty will be found with *Masdevallias* during the hot weather, and less so with *Odontoglossums*. Collections of the best of the *Cattleyas*, *Dendrobiums*, *Cypripediums*, *Phalænopsids*, *Lælias* were found, as were also fine masses of *Ceologyne Massangeana*, the late-flowered creamy form. Many Phoenix and *Latanias* from Algiers were here, quite recent importations, newly potted, and taking hold of the new soil, but showing no trace of having lately taken so long a journey. The plants are arranged for transit on racks in large crates, the heads facing each other, the plants lying on their sides just as Pine-apples reach us from Madeira. Raising Cycads from seed is another special culture with M. Truffaut, and many were seen, but in a state too small to show their true characters. *Rhododendron hybridum* was planted on either side of the main walk alternately with specimen Hollies, and beds of *Aralia Sieboldi*, *Dracæna australis*, *Amaryllis*, *Azalea mollis*, *Phormium tenax* were noticed. Under a lath structure fine masses of *Struthiopteris germanica* were found, and doubtless these places are always made use of for Fern growing during the warm weather. Nothing could be more suitable.

#### MESSRS. VILMORIN, ANDRIEUX & Co.

The large seed grounds of this famous firm at Verrières are almost always worthy of a visit, as perhaps nowhere else can so many samples of flowering, vegetable, and agricultural plants be seen together as here. The day of our visit was, unfortunately in one sense, also the occasion of a meeting of all the leading nurserymen of western continental Europe, who had been invited by M. Vilmorin to partake of a *déjeuner* at the nursery. A short period could only be allowed for a stroll through the well kept quarters, and a

FIG. 162.—*PHOTINIA SERRULATA*: FLOWERS WHITE. (SEE P. 728.)

bushy plants, far in advance of what is possible under pot culture. House after house was filled with Azaleas of different ages, but few old plants were seen, and nothing larger than 2 feet high, and perhaps 3 feet in diameter; the imposing, but unwieldy, and expensive pyramids formerly seen in our nurseries, were nowhere visible.

Bilbergias are grown in almost as great quantities as the Azaleas, and much hybridisation is intelligently carried on. The seeds are sown thinly in very shallow pans of sphagnum, in which they lie a long period before germinating; but when once they start the progress is very rapid, so that in three years, in some cases, saleable plants are obtained. *Vriesias* are favourite plants, especially the distinctly

dactylifera, *P. leonensis*, and other Palms, whole pits and houses full being found of splendid bushy stuff, the like of which cannot be had from pot culture in houses. *Aspidistra lurida variegata* is much grown at this nursery, as are foliage Begonias. Amongst the latter were some pretty new forms in Charles Weber, Mdlle. Veillard, Madame Ziegler, Stellata, La Belle France, and Jeanne Marie. Seedling Anthuriums are raised in quantity, the raising of novelties being practised as with Bromelias. The *Gloxinias* are celebrated at this nursery, and as many as 20,000 are sold yearly. *Adiantum cuneatum* is another specialty, and several long span pits were filled with them.

There are some points of construction noticed in the

cursorily glance at a few of the plants in bloom. Least, but not last, must be mentioned the Daisies, which are here found in great variety. They play a great part in all early summer bedding displays in northern France. The colours are decided, and of much diversity, and we think a garden could be made beautiful with these alone during April, May, and June, if planted judiciously. Most of the kinds are raised from seeds obtained from the semi-double flowers that are produced abundantly as the days get hotter. Columbines and Scabious were coming beautifully into bloom, and exceedingly telling was a large patch of *Scabiosa caucasica*, which is getting rather rare in Europe. *Verbascum* were found in variety, dark red, white, and other colours; the dark red-purple phœnicium being remarkable for the richness of its tints. *Centaurea babylonica* is a bold, large, grey-leaved plant; standing in leaf, 2 feet high, it would associate well with subtropical plants, or make a magnificent border to a bed of dark green shrubs. The Papavers were splendid in vigour of foliage and size of bloom, several of *P. orientale* and *P. bracteosum* being 5 feet in height, and blooms 10 inches in diameter. *Viola cornuta alba*, of a pure white colour, is a good thing, quite as free and as enduring as its pale blue congener. Two of the finest *Abies Pinsapo*, fifty-two years of age, stand in the grounds near the dwelling. They were two weak plants left in the seed bed, as being hardly worth planting out at the time, and now they will measure 50 feet in height, and fairly well furnished with branches throughout.

(To be continued.)

## FORESTRY.

### OPERATIONS FOR JUNE.

THE prevalence of dry weather with cold easterly winds during the greater part of May has somewhat retarded barking operations, although in most districts the work is now well in hand, and will, during the early part of the present month, be brought to a successful close, the bark itself seldom being finished off in better condition for the tanner. Prices of bark again rule low, and £5 per ton in the yard, or delivered on rail, may be taken as somewhat above the average of this district. In the woodlands little can now be done except cleaning young plantations, removing or burning all brushwood and other rubbish, and lightening the heads of weak-stemmed hardwoods. Pruning generally may be commenced about the end of June, as healing is more rapid at that season than at any other time of the year.

As the Oak-stools will soon throw up young shoots, all timber, firewood, and branches should be removed from the interior of the plantations as soon as possible. The smaller spray may be burned in an open part of the woodland, the larger bound up for faggots, and the firewood and timber removed to the clearance roads unless otherwise required. Prevent Ferns or other rough vegetation from interfering with the growth of recently planted-out trees. Pinch off or disbud all contending leaders and strong lateral shoots from young Conifers, and at the same time pay strict attention to their moorings so as to prevent wind shaking and all its attending evil results. This is very essential, and ought not, under any circumstances, to be neglected. To resist the inroads of stock keep all plantation fences in a good state of repair, as likewise tree guards, gates, and hurdles.

Continue the erecting of fences, and paint and varnish during dry, warm weather all outdoor erections—gates, fences, tree-guards, and tool-huts. In tarring gate-posts and fences have all grass removed, so that the brush may be used down to, and even under, ground level.

Advantage should be taken of the present dry weather to repair river-sides that have become damaged by the winter rains, to clear out woodland drains generally, and to make good any defects in drainage which may have been noted during wet weather. In the nursery uncover all seed-beds, paying attention to weeding and watering where necessary. Elm seeds may be collected during the present month, and sown at once on well prepared beds of fine rich soil, the covering to be light and evenly distributed. Prune with the switching-bill all Furze edgings, which will prevent seedling, and render the fence much more compact and lasting than when allowed to spread at will. Hawthorn, Privet,

Holly, and other hedges should be thoroughly cleared along the base, to keep down weeds and allow of a free circulation of air. Where Elder is used as a fence it should receive two annual trimmings—once in June, and again about the middle of October, thus checking the loose rampant growth and giving a compactness of form.

Finish the removal of evergreens as soon as possible, where any such work is still to do; and during dry, windy weather give a good soaking of water until the plants become established in their new abode. Syringing overhead in the evening is of the utmost value, and should always be insisted on where a command of water is readily obtained.

Clear carriage drives, roads, and walks, and by edging the sides at least once in each season, the roads will not only be kept to their proper line and size, but look much better, and are easier kept in a good passable condition. Prune back all branches that infringe upon the walks and drives, clear water-courses along their margins, and keep the surface as clear of inequalities as time and other circumstances permit. Where weeds are extra troublesome, salt or carbolic acid may, with caution, be used with very satisfactory results. Material for road repairing should now be got ready and placed in some convenient position for use when required. Loosen the bandages from grafts, and renew the clay where necessary, more especially on such as were operated upon late in the season. Hollies may now be budded, the stems having previously been cleared of all superfluous branches so as to direct the sap upwards.

The variegated and yellow-berried species are particularly worthy of increase, and as they cannot be raised from seed, nor readily propagated from cuttings, grafting and budding is usually resorted to.

Whenever a temporary lull in the forest work occurs advantage should be taken of the chance for pitting, digging, trenching, draining, and enclosing of ground intended for planting next autumn. This work cannot be taken in hand too soon during the summer.

Although the season is somewhat late, yet we have seldom seen such vigorous strong growth produced in June as is now observable. Deciduous trees are richly clothed with a most luxuriant mantle of verdant foliage, while the pale green of the young shoots of coniferous trees offers a striking contrast to the dark green of the old foliage. As an ornamental lawn tree few have been more conspicuous this season than the Horse Chestnut. Although, as regards value of timber, this tree cannot even gain middle rank, still it is to be seen in every ornamental plantation, park, and pleasure-ground in the kingdom.

Several other kinds of Horse Chestnut are most ornamental, but, unfortunately, they are not half so well known as their merits deserve. Amongst these the red-flowered (*Æsculus rubicunda*) is one of the best and most attractive flowering trees that can be introduced into any ornamental grounds. The Pavias, or yellow-flowered Horse Chestnuts, are very desirable ornamental trees, of average size, symmetrical habit, and the easiest culture. *P. flava*, of strict habit, produces in favourable localities its elegant spikes of yellow flowers in abundance; while another dwarf form, *P. rubra*, with flowers not unlike those of the red-flowered Horse Chestnut, is valuable for planting in confined spaces or within easy distances of drives and roads. Another very ornamental tree of dwarf growth is the Bird Cherry (*Prunus Padus*), and which at present has quite a decided character, from its terminal racemes of white flowers and doubly serrated leaves. *A. D. Webster.*

## HARDY SHRUBS.

**CHIONANTHUS RETUSA.**—Messrs. Veitch send us from Combe Wood sprays of this fine hardy shrub. The broad lanceolate leaves are dark shining green on the upper surface, downy beneath. The flowers are in axillary clusters, with long slender stalks, bearing nodding bell-shaped flowers about 1 inch long, and with four snow-white linear petals. The shrub is a native of Japan.

### RHODOTYPUS KERRIODES.

We met with this pretty shrub in bloom in the Oxford Botanic Garden. Its leaves are like those of the old *Kerria japonica*. The flowers white, like those of a single Bramble, surrounded by a large leafy calyx.

### HYBRID RHODODENDRON.

Messrs. Veitch send us trusses of a magnificent hardy Rhododendron with fine bold trusses of white

flowers, the peculiar calyx of which reveals the influence of one of the parents, *R. Aucklandiæ*. We hope shortly to give a figure of this.

### WEIGELA ABEL CARRIÈRE.

The Weigelas (*Diervillas*) are flowering with great freedom this year, and their remarkable beauty should help forward the taste for hardy flowering shrubs, which furnish a greater amount of beauty at less cost of money and trouble than any other class of plants. The variety above-mentioned has very rich crimson flowers, and is in full beauty in Mr. Bull's nursery.

### VERONICA HULKEANA,

treated as a greenhouse plant, when it was first imported from New Zealand, is capable at least of withstanding mild winters under favourable circumstances. Mr. Burbidge sends us fine sprays of its pale lilac flowers, the thick green leaves showing much more substance than when grown under glass.

## Orchid Notes and gleanings.

### CATTLEYS AT TRING PARK.

THE Cattleyas contained in the two spacious houses at Sir Nathaniel de Rothschild's have been more than usually fine this year, the plants under Mr. Hill's skilful treatment having steadily improved since the commencement until now they are equal to the best examples in cultivation. Some time ago the *Trianae* house was a grand sight, with its large specimens clad with gorgeous blooms; then followed the *Mendelii*, equally good, and now the display of *C. Mendelii* and *C. Mossiæ*, aided by the show of *Odontoglossum vexillarium*, is a sight to be remembered. It is pleasant to note by the gradually increasing vigour of the pseudobulbs every year what a reward good cultivation brings to the grower. One sturdy plant of *C. Mossiæ* seems to have attained the highest point of excellence, for one of its pseudobulbs bears four massive flowers, each 8 inches across and of fine form; the variety, too, is superb in colouring. All the plants are densely crowned with flowers—no wonder they are such favourites. The collection, too, is rich in the various white forms of *C. Mossiæ*, one great mass of *C. Wagneriana* having over twenty buds. All the other Orchids at Tring Park are in equally good condition—the *Odontoglossums* robust, healthy, and laden with bloom—the *Phalenopsis* house grand, two of the plants of *P. Schilleriana* being perhaps the largest in the country, one of them having leaves 2 feet in length, and the other (a rounder leaved form) leaves 6 inches across. The hundreds of dwarf plants of *Vanda teres* planted out on the front of the warm house are literally aglow with their large rose-coloured blooms, and constitute a sight well worth a journey to Tring to see.

### STANHOPEA GRANDIFLORA.

This is the large flowered, ivory lipped *Stanhopea*, which was named *S. eburnea* by Lindley, and which appears to be rather widely distributed over Tropical South America and the West Indies. A plant of it is now flowering at Kew, where, among the tropical Orchids, its powerful fragrance extends over the whole house. Measuring the flowers from tip to tip they are at least 6 inches across; but the broad, white, wavy-looking petals and sepals are somewhat recurved, displaying the large, fleshy boat-shaped lip, with its curious horns and purple-spotted cavity. Over the lip, and extending out from the flower some 3 inches, is the green, curving, broad winged column. If *Stanhopeas* have a fault it is the short time they remain in flower; but even this, when it gives us such a large, beautiful, and fragrant blossom of very extraordinary structure, is a sufficient return for the little care the plants need to keep them healthy and cause them to flower. Certainly the large genus *Stanhopea* is deserving of much more attention from Orchid growers than it appears to receive at present. *H.*

## The Flower Garden.

Titze summer bedding-out ought now to be completed, the weather of the last few weeks having been favourable for this description of work; the rains will have assisted the plants, and enabled them to become quickly established, and have promoted early growth. Constant attention will be required in tying, pegging, and stopping the young shoots till they have filled their allotted space, and until this is accomplished all the bloom should be picked off so as to encourage free growth. After planting, the surface soil should be frequently loosened. When they have become established the Pelargoniums, Calceolarias, Verbenas, &c., will be benefited by the occasional application of liquid manure in a weak state. When the unavoidable litter connected with bedding-out has been cleared away let the walks and edgings receive attention; the former should be hand-weeded, and well rolled in showery weather. Box edging may now be clipped, but care should be taken not to cut into the old wood. Evergreen hedges, such as Privet and Yew, should now be clipped; but common and Portugal Laurels and Arbor-vitæ look best if pruned with the knife.

### SUBTROPICAL BEDS.

Where subtropical plants are grown, such plants as Castor-oil, Wigandias, Acacia lophantha, Ficus elastica, Solanums, and Abutilons, and all plants likely to be injured by wind, should be staked at once, most of them having large foliage, which the wind has great power over. If beds or masses of large growing subtropical plants, which must necessarily be planted thinly, were covered with an undergrowth of some low-growing plants their appearance from the first would be much improved. For this purpose the following kinds are suited, viz., Vincas, variegated and green; Euonymus, the variegated varieties; Pelargoniums Lady Plymouth and Manglesi variegata; Iresine, Coleus, Amaranthus, Golden Feather, and other variegated plants, could be used, and if well selected go well with the taller subtropicals.

### ROSES.

Since the favourable change in the weather these have grown rapidly. Examine them for the leaf-rolling grubs, and have them carefully picked off and burnt, and if greenfly should appear syringe with soapsuds and tobacco-water. All Roses will require a good supply of manure-water from time to time to bring them to perfection. Advantage should be taken of showery weather to transplant annuals, biennials, and perennials, which have been sown and prepared in frames or beds. To protect them from slugs and snails, dust them with soot and lime mixed in equal quantities, which is the best protection of anything I have tried. *W. Smythe, Basing Park, Alton.*

## Plants and their Culture.

### SEASONABLE WORK: BOUVARDIAS.

WITH the very favourable change of weather during the past week it may now be considered safe to plant out the stock of Bouvardias that are not intended specially for pot culture. An open border where they will have the full benefit of the sunshine will be the best suited to their requirements. In such a position, and in soil that has not been heavily manured, they will be found to succeed, but should the soil be of a retentive character it must be modified to suit their requirements by the addition of some light compost, such as the siftings from the potting-shed, refuse peat, or leaf-soil. Presuming that the plants were cut back into the hard wood, and a good break has resulted, the balls reduced in size, and the plants potted afresh early in the year, there will not be much to do to the roots beyond pricking up the surface and liberating the roots somewhat around the sides, the crocks likewise being renewed. Should, however, the preliminary work have been passed over it is not too late now to make a start with any scrubby plants that have not been touched since their blooming period. In such cases the best plan

will be to prune them back hard at once and shake them out of the exhausted soil, just as in the case of old plants of Fuchsias; then plant them out, as previously recommended, and better plants will by this means be obtainable by the autumn than by any mode of pot culture. When active growth commences regular attention to pinching the stronger shoots to secure a more even and compact plant will be advisable; regard should also be had to watering and other minor details as occasion may demand.

### SOLANUM CAPSICASTRUM VARS.

These should receive a somewhat similar treatment to that just recommended for the Bouvardias. In my own case I have found some trouble to result from attacks of aphid when the plants have been pruned early, and kept in warmth to induce them to break into fresh growth. To avoid this, after being removed from the conservatory, the plants were stood in a sheltered spot in the open air and allowed to remain dormant for a time; having now been pruned back hard for some few weeks they are fit for planting out. When this is done in their case, all the soil will be shaken away from the roots, and these cut back also. This seems rather hard treatment, but it ensures a moderate break that will be found more productive of early bloom, with a corresponding early set of berries. *James Hudson, Gunnersbury House, Acton, W.*

## FRUITS UNDER GLASS.

### STRAWBERRY PLANTS IN POTS.

IN order to produce Strawberry plants in pots in a proper condition for early forcing and fruiting in March and April subsequently, it will be needful to give immediate attention to layering when the runners are fit for it, and, further, to encourage the plants to root quickly, so that they can speedily be potted into fruiting pots, and thereby become well established in them at an early date, in order to obtain ample time for them to develop and mature a growth, and also afford the needful time requisite for rest before they are started into growth again. I believe if this matter had more attention, the many complaints of the fruit imperfectly setting and partial failures with early forced plants would be diminished if not altogether avoided. For early work early and vigorous runners are indispensable. To get these I consider it worth while to sacrifice the fruit on a certain number of the runners that were planted out last autumn, for the sake of the runners only, and thus ensure a supply of both strong and sturdy plants. It is advisable as far as practicable to get the young stock of plants from those in the prime of vigour; layering, therefore, should proceed as they become fit for the general crop, and for planting purposes also. My custom is to plant a certain number of strong runners in the open quarters every year, and destroy an equal quantity of the oldest plants likewise. We employ small 60 flower-pots, and peg the runners firmly into the soil, which consists of well enriched stuff of a light character.

The runners will need good attention in the way of watering, especially in dry periods, as soon as the plants are fairly well rooted. Proceed with potting them into the fruiting pots of 5 or 6 inches diameter and put them into a shady place until such time as the new roots have taken hold of the fresh soil. The compost should consist of moderately strong loam, about a sixth of thoroughly decomposed manure, some roadside cuttings, with a little soot added; this should be turned over and well mixed up together and afterwards be stored where it will not become over dry. In the process of potting well dust the crocks over with soot and ram the soil very firmly into the pots, taking care to keep the crown of the plant when the operation is finished just above the surface of the soil. At this advanced season fruiting plants in heated houses will need much attention in the way of watering; if this matter be neglected the prospect of having first-class fruit will be somewhat doubtful. The plants should be looked over twice every day, and more frequently if dry and sunny; ply the syringe over them in the morning, and again at shutting-up time every day until such time as the fruit begins to colour. We contrive, as far as possible, to get a good batch of strong plants into cold pits or frames at about the beginning of May, these come to maturity just before those in a natural way out-of-doors, and

often prove to be a more valuable crop than some of the preceding ones which come in at an earlier date.

### FORCED STRAWBERRY PLANTS,

after the fruit is gathered, make excellent plantations, and yield as much fruit the subsequent year as can be obtained from the runners that were planted out last autumn, but in all probability the fruit will not be so fine in point of size, neither will the runners from them be so early or strong; but when fruit is the chief consideration, this is an excellent way. For this purpose select only the best plants; reduce the balls of earth somewhat, and plant them firmly in the ground; water them well, and keep them free from runners for the rest of the season. *G. T. Miles, Wycombe Abbey.*

## The Hardy Fruit Garden.

### APPLES.

WHERE dwarf, pyramidal or bush trees are grown on the Paradise stock, they will generally be found to have set a heavy crop of fruit. These should now be looked over and thinned out, leaving only sufficient to form a moderate crop, but which must depend on the size and vigour of the trees and the variety. Small growing varieties, such as Cox's Orange Pippin, Margil, Scarlet Nonpareil, Court Pendu Plat, Yellow Ingestree, Downton, Golden Pippin, &c., should be left much thicker than larger growing kinds, such as Ribston, Blenheim Orange, Lady Henneker, Hoary Morning, &c.

### PEARS.

Pears should also be well thinned, both on walls and on bush trees. The same rule applies to these as to Apples. In thinning them a quick eye and nimble fingers will get over a number of trees in a day, and I am sure the extra quality and size of the fruit will well repay the labour.

### STRAWBERRIES.

The rainfall up to this date being under the average, plantations of these should be well watered; first, with ordinary rain-water, and after the ground is well moistened, a good watering with manure-water will be of great benefit to the fruit. Early varieties, such as Black Prince, are sure to suffer unless kept moist, and growing freely. The least check is sure to produce mildew, which should by all means be guarded against.

### BUSH FRUITS

of all kinds have also set good crops. Black Currants delight in a cool, moist soil, so if they are not already mulched with dung, or long stable-manure, they should at once receive attention. Gooseberries should also be mulched to keep the fruit clean and the trees healthy. *J. Smith, Mentmore, Bucks.*

## The Kitchen Garden.

### SCARLET RUNNER BEANS.

If obtainable, the stakes or poles for this crop should be 8 or 10 feet long, and the plants should not be stopped, but allowed to run up the whole height, so that the longer the poles the larger the crop. Preparations should be made for making a second sowing about the middle of the present month, not forgetting that they pay for growing on well-dunged trenches.

### KIDNEY BEANS.

Two sowings will be necessary this month, one at the beginning, and one at the latter part.

### PEAS.

About the middle of June make the last sowing of the large wrinkled varieties, such as Ne Plus Ultra and Sturdy; then such as William I. must come into use again for the last sowing out-of-doors at the end of June or beginning of July.

### MISCELLANEOUS SOWINGS.

Sowings of the following should be made about the dates given:—Savoy: main sowing middle of June; a later sowing beginning of July. Coleworts: first sowing end of June. Parsley, about the end of the month. Rampion, any time in June. The ground for this crop should be well worked, and be in a semi-shady position. Sow in shallow drills 1 foot apart, and cover with fine-sifted soil or sand. *G. H. Richards, Sonnerley Gardens, Ringwood.*

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	June 8	Sale of Imported Orchids, from Mr. Leon Humbert, at Stevens' Rooms.
		Royal Horticultural Society: General Meeting to Elect Fellows, &c.; Meeting of Fruit and Floral Committees, at 11 A.M.; Scientific Committee, at 1 P.M. Orchid Show.
TUESDAY,	June 9	National Rose Society: Meeting of Executive Committee, at 3 P.M. Sale of Natural History Specimens, at Stevens' Rooms. Sale of Imported and Established Orchids, at Protheroe & Morris' Rooms. Sale of a Grand Collection of Orchids in Flower, at Stevens' Rooms.
WEDNESDAY,	June 10	Sale of Carnations, Ficoles, and Plants in Flower, at Protheroe & Morris' Rooms. Linnean Society Meeting.
THURSDAY,	June 11	Sale of Imported Orchids in Great Variety, at Stevens' Rooms.
FRIDAY,	June 12	Sale of Imported Orchids, at Protheroe & Morris' Rooms.

THE OXFORD BOTANIC GARDEN possesses charms that many an establishment of greater pretensions might well envy. Its site, overshadowed by the exquisitely proportioned Magdalen Tower, recalls the similar gardens at Pisa and Padua—so like and yet so different, the spires and frequent chimneys remind one of the booming bells one hears so often in the garden at Ghent. And then the history and the manifold associations connected with the place, the long line of professors and curators, the generations of scholars and statesmen, of wits and divines, who have frequented this little enclosure, invest it with a charm such as no other garden in the kingdom can lay claim to. It is not alone for its associations with bygone ages and with men long since gathered to their fathers that the Oxford garden claims respect—we might properly enough use a stronger expression; its present condition, though it has somewhat fallen from its high estate, still affords the visitor an abundance of interest; and although those who knew the garden a few years ago will miss some of the specialties which then rendered the garden pre-eminent, yet enough remains to render a visit one of genuine pleasure to the plant lover.

We have no intention here of compiling a guide to the garden, but we may allude to a few matters that struck us on a recent visit, and first of the Succulent-house. This is a span-roofed house of considerable dimensions, and filled with a remarkable collection of succulents, many of large size, whose health and well-being testify to the care bestowed on them, and to the suitability of the house to their requirements. It is of no use crying over spilt milk, but in view of the excellent collections of *Cereus*, *Echinocactus*, *Mamillaria*, and the like still existing, one cannot help regretting the transfer of the unique collection of *Stapelia*s, *Mesembryanthemums*, &c., to Kew. The step may have been necessary—of that we cannot judge—but we may nevertheless regret that it was necessary.

A small establishment with slender means—one in which few save those immediately concerned take any genuine scientific interest—cannot hope to compete with larger and better endowed establishments. Any attempt of the kind would only afford a fresh illustration of the story of the frog and the ox. But, on the other hand, such small establishments are just the places where some specialty may be taken up and developed to an extent which could hardly be done in a garden of a more general character. A university garden must provide illustrations of the principal groups of plants, and abundance of specimens of representative plants for the use of the Professor and his pupils; and having fulfilled these, its primary duties, it may well turn its attention to some specialty which shall insure it a reputation among similar establishments. What that specialty shall be must, of course, depend upon circumstances, and the predilections of the authorities. To some extent these requirements are still fulfilled at Oxford in what remains of the collection of succulents, alpine plants, and specially of stove aquatics. The stove aquarium has long been

noted for its rich illustrations of the genus *Nymphaea* and plants of similar requirements. These fill the tank once allotted to the Victoria. That queen of Lilies demanded an amount of space quite out of proportion to the dimensions of the garden. Its place, then, has been judiciously occupied by the collection of other aquatics. One such plant which originated in the gardens—*Nymphaea Daubeniana*—holds its place as one of the best of its class, not only for its beauty, but for the length of time in which it continues to produce its flowers. For more than half the year this beautiful plant adorns the tank. Just now the chief attraction is the *Eichornia azurea*, which grows here like a weed, and produces in abundance its magnificent spikes of pale blue flowers; the central or uppermost petal is darker than the rest, toothed at the margin, and provided with a bright orange spot near the base. Mr. BAXTER grows it in a box, sunk in the tank to a depth of 6 inches, and when it grows too rampant it is easily divided, each division readily throwing out fresh roots and becoming a new plant.

While this plant flowers very freely, its near ally, *E. crassipes* (better known as *Pontederia*), remarkable for the balloon-like dilatations of the leaf-stalk, more rarely flowers. Quite recently this plant, which is so commonly grown for the singularity of its appearance, has produced spikes of its chaste and beautiful flowers, fifteen in number, of the most delicate colour, approaching that of opal, except the upper petals, which are considerably darker and have a diamond shaped marking of yellow in the centre, margined with purplish-mauve. Its

FIG. 163.—A HEATING APPARATUS OF THE OLDEN TIME.

treatment has from time to time been varied with the hope of inducing it to flower, but, until now, without any favourable result. At the commencement of this season the plants, too, were in better condition than usual, and from early in March last they have been subjected to a rather higher temperature (75° to 80°) than hitherto at that time of the year. The division of the tank the plants are now growing in is about 4 feet square by 1 foot deep, and the average height of the foliage and flower-spikes above the water level 18 inches, the inflated petioles having become elongated. *Canna Ehemanni* is also producing its brilliant spikes of bloom, while *Nelumbiums*, always attractive for their foliage, are showing for bloom; *Brasenia peltata*, *Limncharis Humboldtii*, *Sagittaria montevidensis*, *Justicia pedunculata*, the yellow spathed *Richardia melanoleuca*, *Herpestis Monnierii*, are among the plants now in bloom, while the botanist will be interested in the abundance of *Pistia*, *Salvinia*, *Azolla*, and *Riccia* which are to be found here. The striped form of *Arundo donax* is a very striking plant, contrasting finely with the elegant *Papyrus*. In one or other of the houses may be seen the variegated *Phormium tenax* coming into bloom, a fine plant of *Dracena Draco*, good specimens of *Dioon edule* and *Platynerium alcornocorne*, a large bush of *Ficus diversifolia*, laden with fruit; *Malva umbellata*, and, what will please the botanist, the very curious balls of *Conferva ægagropila*, which have been grown here in a pan in a shaded place, for many years, and seem as much at home as in the Shropshire meres.

These few illustrations must suffice to show how much of beauty and interest is still to be found in the old garden. Of other plants we

may take an opportunity of speaking more fully on another occasion; meanwhile, as a curious matter of history, we may refer to the illustration at fig. 163. This contrivance was made of iron lattice-bars, and was intended to hold glowing charcoal. It will scarcely be credited that this apparatus was in use in the old conservatory or orangery (now used as a lecture-room) within the memory of the present Curator. Hot-water pipes were not then in use, and flues were not existent even so late as fifty years ago. To keep a warm temperature in winter the contrivance here figured was placed first in one corner of the building, then in another, and was occasionally drawn to and fro throughout the house for several minutes at a time, with a view of ensuring the necessary diffusion of heat. The world has progressed since then!

The herbarium and library, priceless in their interest, the lecture-room and laboratory, are at present in a transition state, but when the arrangements are completed the establishment will be singularly compact, and under the auspices of Professor BALFOUR we may confidently look for the development at no distant period of a singularly complete botanical school. The garden is in the charge of Mr. BAXTER and his son—worthy inheritors of the name and repute of WILLIAM BAXTER, the friend and teacher of a race of Oxford men, most of whom are no longer among us. The BAXTERS take an honoured position in the history of the garden along with the SHERARDS, the DILLENIIUS, the SIBTHORPS, the BOBARTS, and the DAUBENEYS of the past.

## THE PARKS.

Some five-and-twenty years ago or thereabouts the University secured a large area destined as a recreation ground. At that time neither Keble College, nor the New Museum, nor the Physiological Laboratory in course of construction, and all of which adjoin the Parks, were in existence. The purposes to which the "Parks" were destined necessitated a large central space to be kept open. It is bordered on all sides by a belt of trees and a narrow border for shrubs and herbaceous plants. As the trees have grown up they have been thinned, wider grass borders have been secured, to the great improvement both in boldness of design, repose, and general picturesqueness of effect. Much might still be done to relieve the monotony of outline and of surface, and now that the University has secured additional meadow land by the Cherwell, the landscape effect and sense of distance might be immensely enhanced by the removal or the breaking up of the lines of hedgerow or ditch-row timber, by the isolation of fine trees or groups of trees, and various devices such as a judicious landscape gardener would employ. At present the impression is that the authorities have not availed themselves nearly so freely as they might have done of the art of the landscape gardener. Perhaps a multiplicity of counsellors and curators has impeded the carrying out of a consistent plan and of a bold landscape style of treatment. The selection of trees and shrubs is admirable. From its limited space it was impossible to illustrate properly the wealth and variety of arboreal vegetation in the Botanic Garden. This deficiency is, in a considerable measure, supplied in the Parks, where may be found the foundation of an excellent arbo-retum. The number and variety of specimens are alike striking, the collections of *Crataegus*, *Beech*, *Elms*, *Hollies*, *Pyruses*, as well as of flowering shrubs, being very rich. It is to be regretted that this choice collection which would serve the new Sibthorpean Professor with so many illustrations of arboricultural science, and which would afford so many of the landed proprietors and landscape gardeners of the future a means of becoming acquainted with trees and shrubs suitable for forest growth or for ornamental planting, is almost if not quite destitute of labels. There are not many persons who can boast of

such a full knowledge of plants and trees as Mr. BAXTER (to whom also the supervision of the Parks is entrusted), but even he, obliging as he is known to be, cannot supply the place of a skilfully devised and carefully maintained system of labelling.

— THE DARWIN STATUE.—This memorial to the great naturalist will be unveiled on Tuesday, June 9, at 12 o'clock, by the President of the Royal Society, Professor HUXLEY. The Prince of WALES, on the part of the Trustees of the British Museum, will receive the memorial as a gift to the nation. The statue is placed on the central landing in the Great Hall of the Natural History Museum at South Ken-

matters of pure science, but also in the application of science to practical cultivation. Miss NORTH's gallery of paintings is another illustration of the fact that, once an establishment has gained the confidence of the public, and the managers are seen to be doing good work, donations of an unexpected character flow in. The new rock garden as an educational feature is as important in its way as the laboratory, and much more attractive to the general public. It forms one of the most satisfactory bits of landscape work in the whole garden, independently of its botanical value. These departments are, of course, duly mentioned in the Guide. The new arboretum and pleasure grounds also come in for fuller description than heretofore—a circumstance the more to be commended because even among horticulturists comparatively little is

— PEACHES IN TWO STAGES OF RIPENESS ON THE SAME TREE.—We received recently from Mr. HARRIS, of the Singleton Gardens, Swansea, two Peaches of Royal George, both gathered from the same tree, but the branch from which the ripe fruit was gathered has shown signs of earlier ripening than the remainder for several years, but this year it was much more early—quite a fortnight. Of the sample of fruits sent, one of them was 10½ oz. in weight, true to name, juicy, and well coloured; the other, the un-ripe one, required fourteen days' bright sunny weather to bring it up to an equal degree of ripeness. The probability is that the particular roots supplying the earlier ripening branches found themselves in a warmer part of the border than those from which the late branches derived their root-food.

FIG. 164.—VIEW IN THE OXFORD BOTANIC GARDEN. (SEE P. 732.)

sington, and has been executed by Mr. BOEHM, R.A.

— A TWENTY-NINTH EDITION!—"Some school-book, perhaps," will be the impression made on those who read this heading, and, indeed, it applies to a book of high instructional value, if not in the technical sense a school-book. It is eminently satisfactory to record that the book thus in its twenty-ninth edition is the Official Guide to the Royal Gardens at Kew. Of so well known and appreciated a guide there is little necessity to say much. Some of the newer features, however, demand notice, as showing how Kew grows, how large and important are the additions and extensions that are being made to this unrivalled establishment. In this edition, for instance, we find mention of the physiological laboratory, from which we may hope much in future, not only in

known of the treasures here to be found, and the labour, skill, and knowledge brought to bear on them. Unfortunately the poverty of the soil, the low altitude and proximity to the river, and to the noisome vapours of Brentford, interfere to some extent with the rapid growth of the trees and shrubs. Nevertheless, there is a very large collection of carefully named trees and shrubs, comprising many that the fickle taste of the day has banished from our nurseries. The "dell" is, in its way, as attractive as the rockery, while the collections of trees on the northern or western half of the pleasure-grounds form a most interesting study for the botanist, and should certainly attract the attention of foresters and woodreeves, who are too often signally deficient in their knowledge of trees and their mode of growth—a deficiency which has even attracted the attention of the Prime Minister.

— ANEMONE SPORT.—We have had sent us a single Anemone bloom on the stem of which is seen a petal exactly resembling those which form the flower but growing out from the fringed involucre or collar always seen in Anemone stems, indeed a segment of this collar has changed from its normal green fringed form into a perfect floral petal. Those with green collars are often seen showing colour identical with that of the flower, but so striking an evidence of floral development as this is rarely seen. It almost leads to the conviction that a race of duplex and hose-in-hose Anemones might be in time created. The bloom sent is but a small one, being almost the latest of the bed from which seed is being now fast collected.

— ERODIUM HYMENODES.—A pretty herbaceous perennial, with oblong pinnately-lobed and crenate leaves, thinly covered with longish white

hairs, the erect peduncles, like the calyx, more densely clothed with spreading glandular hairs, and thus preventing access of marauding insects from below. The flowers are in umbellate cymes, each one about an inch across, and with five spreading obovate petals, pale pink, with darker veins, and in the case of the two uppermost petals with a purplish blotch at the base, as in true *Pelargoniums*. The plant is marked as half-hardy, but under the shelter of a south wall in a warm dry border in the Oxford Botanic Garden it sows itself and is quite at home. The base of the petals exudes a quantity of nectar, and the anthers open before the stigmas unfold (protandrous). The pedicels, which are at first erect, afterwards spread horizontally, and as the ovary ripens into the fruit they bend sharply downward, turning up at the extreme points.

— **MORELLO CHERRIES.**—A correspondent sends for our inspection sample shoots of Morello Cherries, and relates, for our information, that they were gathered from trees growing in a market garden orchard near Iloumslow that but a week or two since were singularly beautiful when in bloom, promising a wondrous crop of fruit. Now nearly all the trees—large standards some eighteen years planted—look as if seared with fire. He says:—"I have been familiar with these trees for fourteen years, and have never seen such a sight as they now present. Some seem as if every shoot were thus killed. Others have two-thirds, one-half, and lesser numbers of the points thus destroyed, but the general aspect of the trees is most distressing. What is so strange, assuming this to have resulted from frost, is that Apples, Pears, Plums, sweet Cherries, and bush fruits intermixed with and surrounding these Morellos, are quite unharmed. Still farther, those seem to have suffered most that were the least exposed to weather. The damage must have been done towards the end of the blooming stage." We are unable, from the evidence before us, to give any satisfactory explanation of the phenomenon.

— **WHITE HERCULES RANUNCULUS.**—Mr. HARTLAND, of Cork, sends us blooms of this, 3 inches across, perfectly double, *i.e.*, without a trace of stamens or pistils, but with a vast number of regularly overlapping whitish petals instead. CLAY'S Fertiliser had been used as a manure, and the specimen before us is a good illustration of the effect that nitrogenous manures have of forcing on growth, and preventing that arrest of growth and change of developmental energy requisite for the formation of stamens and pistils.

— **PANSIES AT PARIS.**—The beds of these seen at the Jardin d'Acclimatation and other places quite put our smaller varieties in the shade for size and substance. Flowers of 3 inches in diameter, and even more, are found in great masses, sometimes of one colour, and likewise mixed together. English kinds, as Lord Beaconsfield, Maggie, and Marquis of Kintore, grow there of far greater size than at home. The Pansy beds are usually made up as bold mounds, with turf sides, and are bordered with white Daisies or white varieties of Pansy.

— **SHROPSHIRE FLORAL AND HORTICULTURAL SOCIETY.**—The summer exhibition of this very successful Society is to be held at Shrewsbury on August 19 and 20. The prizes in the principal classes are on the same liberal scale as heretofore. In the class for twenty stove and greenhouse plants, not less than ten in bloom, £25, £20, and £15, are offered; for nine stove and greenhouse plants, not less than five in bloom, £10, £6, and £4. None of the classes are now confined to exhibitors residing in Salop and Montgomery, but are thrown open to all-comers. In thus acting we consider that the committee have taken a wise course, as exhibitors who come long distances are necessarily sufficiently handicapped to give local competitors all the advantage they can reasonably hope for. Ample provision is made for amateur exhibitors in special classes, apart from those that are open. The schedule is fully comprehensive, numbering ninety-eight classes for plants, flowers, fruits, and vegetables, independently of the cottagers' division.

— **LANCASHIRE SHOW TULIPS.**—It is the intention of SAMUEL BARLOW, Esq., J.P., of Stakehill House, Castleton, Manchester, to exhibit at the

next meeting of the Royal Horticultural Society, on June 9, a collection of his famous Tulips. By that time many of his flowers will be in good character, and as the finer varieties of the florists' Tulips are now seldom seen in London, some interest will attach to this exhibition. For thirty years at least Mr. BARLOW has been a cultivator of Tulips, and during that time all the finest varieties that have been raised have come into his hands for cultivation, and at the present time his collection is unequalled. It is a flower full of interest, for, apart from its historical associations, it is a charming subject to cultivate, and it always imparts lively satisfaction to those who undertake it. A perfectly marked broken Tulip is a flower of great beauty and attractiveness, while the self-coloured varieties are very handsome and unique. A leading feature of interest on the 9th inst. will be Mr. BARLOW'S Stakehill Tulips.

— **A NEW FRUIT TREE.**—Baron VON MUELLER informs us of the discovery of a new fruit tree called by him *Bassia Erskineana*, and native of south-eastern New Guinea.

"For many years," writes the Baron, "it has been known, that in the south-eastern parts of New Guinea a tree exists, which affords a fruit so wholesome and palatable, that it is largely consumed not only by the natives, who know it as Posi-Posi, but also by the European and other settlers. It is said to have a flavour like that of the Pear but quite distinct. Hitherto no means were available of tracing this fruit to the particular species of tree affording it. My wish to obtain full material for placing this highly useful plant on phyto-graphic record having been rendered known to the worthy missionaries of New Guinea, I was recently supplied with flowering and leafy branchlets and also seeds of the tree in question by the Rev. Wm. WYATT GILL, and thus I am now enabled to offer a diagnosis of this interesting species, which promises to become important for tropical culture.

"*Bassia Erskineana*.—A tree attaining a height of 60 feet. Branchlets robust, glabrous; leaves large, crowded at the summit of the branchlets, ovate-lanceolate, glabrous, bluntly acuminate, narrowed into a short stalk, very spreadingly veined, faintly reticular-venulated; flowers in terminal almost umbelliform fascicles, very numerous; stalklets not much longer than the flowers; calyces rather small, several times shorter than the corolla, four-cleft to the middle, as well as the stalklets, brownish, silky-hairy, its lobes almost semi-orbicular, slightly pointed, the two inner broadly membranous towards the margin; corolla white, eight-cleft; its tube not very turgid, somewhat silky outside; its lobes almost ovate, narrowed towards the base, and there ciliolated and somewhat bearded; stamens sixteen; filaments densely short-downy, about as long as the anthers; the latter somewhat silky-downy at the back, the blunt protruding portion of the connective short-bearded; style and ovary glabrous; fruit large, globose; seeds large, oblique-ovate, somewhat compressed; testa crustaceous, rather brittle, dark-coloured, not shining; umbilical area cymbiform, occupying about one-third of the surface of the seed.

"Two other congeneric trees with esculent fruits are likewise known from New Guinea—namely, *Bassia Cocco* (SCHEFFER in *Annales du Jardin Botanique de Buitenzorg*, i., 134), the 'Nate' of the aborigines, a species bearing only small fruits; then *Bassia Maclayana* (F. v. M. in *Victorian Naturalist*, i., 168), the 'Dim' of the natives, which has globular fruits of fully 5 inches diameter, with copious pulp.

"New Guinea is almost sure to yield from some of its *Bassias* and other Sapotaceous trees new sources for gutta-percha."

— **ZONAL PELARGONIUMS AT PARIS.**—Some of these, which were shown in groups at the late flower show by M. POIVIER, nurseryman, of Versailles, were of novel tints, and all seemed to be of a dwarf habit, fitting them for either beds or pot culture. Theodore Lindauer, scarlet, had a fine full truss, and regular pips; Clytie, a pretty rosy-scarlet, was also a good sort; Comtesse de Bellevue, with rose coloured margin, the centre of the flowers being white, suffused with rose, a distinct soft-coloured flower with a good-sized full truss; Marie Miotte was a compact cerise-red, of much regularity in form of florets and truss; Duchesse de Cas was one of the best white forms seen, the growth being close and dense. Some capital sorts were observed in a similar group shown by M. ADOLPHE FOUCHARD FILS, 6, Avenue de Brimont, Paris. Paul Louis Carrière was an excellent crimson; Jules Grévy, a fine rose-coloured, compact, with a petiole shorter than is common. M. Cazelle had very large trusses of pink flowers of good quality.

— **AZALEA INDICA AT PARIS.**—Among the great number of new varieties of these popular plants turned out by the continental raisers may be mentioned the following, as being remarkable for new tints of colour or for other good points:—*Empereur de Brésil*, a regular flower, flesh colour, with bright crimson spots; *Baron Georges de St. Genoise*, a fine scarlet; *Imperatrice des Indes*, a pale rose coloured bloom, having a margin of white; *Camille Vervaene*, a rosy-crimson, very showy, large; *Antigone*, a striking variety, white with a purple stripe on the petals; *Herman Seidel*, a beautiful red; *Diablotin* has quite a novel colour, and is very distinct, it is brilliant purplish-crimson; *Daphne* and *Marie Planchon* are both fine white varieties; and *Theodore Reimers* has beautiful perfect blooms of a purple colour, one of the best of the class. All the above-named have double flowers. In singles we noticed *Königin der Weissen*, a very fine white; *Tothmanni*, a crimson; *Wilson Saunders*, bearing white flowers and pink ones in about equal proportions; *Bijou de Paris* is a fine white form striped slightly with rose.

— **CEMENT CISTERNS FOR WATER.**—Cisterns are not usually objects of art, and when employed about a house or garden are consigned to some out-of-the-way corner. Some of a better form were seen at the Paris Horticultural Show made of grey cement, so strong that in no case were the sides more than  $\frac{3}{4}$  inch in thickness. They were made of various sizes, from 2 to 4 feet in height and diameter. The form is circular, with upright sides, and the material of which they are made, being quite smooth, it would admit of being painted or otherwise treated decoratively on the outside. We saw in villa gardens such cisterns placed on pillar-like supports built of brick and cemented over, with creeping plants, as Ivy, Clematis, &c., trained up the side, that were really pretty objects.

— **CULTIVATION IN ALGERIA.**—The cultivation of cereals in Algeria is declining, in consequence of the irregularity of the crops, due to the uncertainty of the seasons. A series of good years, it is stated, is often succeeded by droughts, when the agriculturist hardly gathers in the amount of corn he has sown. Competition abroad is so great that he cannot obtain remunerative prices for his produce, and in some places, where the land is best, the means of communication are so defective that it will hardly pay the Arab to take his grain to market. Near the sea the production of early vegetables and fruit for the markets of Europe promises to be successful, but beyond all doubt the great hope of Algeria is in the Vine. The gradual recovery of this plant from Phylloxera in the South of France will probably prevent the colonists in Algeria from making as rapid fortunes as appeared probable when that scourge first commenced its ravages, but there is every chance of the wine of Algeria commanding a remunerative price both at home and abroad. There is no reason why the European should not imitate the Kabyle, who cultivates his small patch of mountain land with the care usually devoted to an orchard or market garden.

— **SARMIENTA REPENS.**—No one who has noted the rate of progress made in the growth of this attractive little gem during the last two or three years at Kew, could fail to perceive that the humid atmosphere of the Orchid-house is far more agreeable to its welfare than that of the Heath-house, which is distinctly of a dry character. Being in the cool end of the Orchid-house the treatment of the plants in both cases was similar or identical with regard to temperature. The plants are grown on pieces of Fern stem, which suits their epiphytial habit. The growth at best is slow, but the general vigour of the plants after a season in the moist atmosphere is quite evident. The slender trailing stems and small opposite leaves remind one of our native *Linnaea borealis*, but of course the flowers are larger, of a bright scarlet colour, borne in the axils of the upper leaves (generally in the uppermost pair), and altogether different in shape. The nearest resemblance to it we find in *Mitraria coccinea*, and certainly that is the nearest relative. The plant is figured in the *Botanical Magazine*, t. 6720, and in the *Floral Magazine*, ii., t. 112.

— **GARDENING APPOINTMENT.**—Mr. WILLIAM HARDING, late Foreman, Andover, Hants, has been appointed Gardener to WILLIAM MOON, Esq., River Mead House, Sunbury.

## Notices of Books.

### Botanical Text-Books.

*Henfrey's Elementary Course of Botany*, 4th ed., by Dr. M. T. Masters, assisted by A. W. Bennett. London. 1884.

*Text-Book of General Botany*, by Dr. W. J. Behrens; translated by Miss Harris Smith, and revised by P. Geddes. Edinburgh. 1885.

*A Course of Practical Instruction in Botany*, by F. O. Bower and S. H. Vines, D.Sc. London. 1885.

We are glad to see that the fourth edition of "Henfrey" has been called for, as, in our opinion, it is by far the best book of its kind. Several alterations and improvements have been made in this edition, and many new illustrations (previously a weak feature of the book) added. Under "Ramifications" a more prominent distinction is made between the monopodial and polypodial kinds, though any new term introduced, as "botryose," should have been explained. We hope to see fig. 152 expunged from the fifth edition, as perpetuating the erroneous interpretation of the scorpioid cyme, which is, however, explained under "Boraginææ." The change from poly to dialy seems inadvisable, as prolonged usage outweighs the inaccuracy of the prefix "poly," many doing duty for separate, especially as the Editor has wisely followed Bentham and Hooker in the systematic part, where Polypetalæ (p. 185) forms a prominent heading to the first subclass of Dicotyledons; moreover, "polyphyllous" is retained (p. 115). The classificatory department has been thoroughly recast and modelled on the *Genera Plantarum* (the Editor observing rightly that all "natural" systems must be to some extent "artificial," and that it is the underlying principle that makes a classification one or the other. This is more fully explained on p. 162, but we think the difference is not quite so absolute as the reader might imply. A dictionary (as the Editor remarks) is on the whole artificial, yet just as numbers of cognate words are grouped together with a single character in common, or the "root," so Linnæus' "Tetradynamia" and "Syngenesia" &c., are based on single characters, and are yet recognised as "natural" groups. It is, in fact, a question of degree in many instances, and not of kind. Classifying by means of one, two, or very few characters, one runs the risk of being "artificial," thus the presence of two stamens would unite the Ash tree, a grass, and Duckweed together, whereas, classifying by many, or, better still, all the constant characters observable, the result will be "natural." Numerous valuable additions in morphology have been added to the "orders," but one feels a doubt as to the usefulness of the floral formulas adopted, as being too troublesome, e.g., the vertical line for adhesion, not standing between the organs united, seems undesirable. No explanation is given on p. 102 of the fractions used; while  $\frac{3}{2}$  is presumably a misprint for  $\frac{2}{3}$  on pp. 287 and 290. The histology has been revised and brought up to date by Mr. A. W. Bennett, who has also entirely recast the account of the Alge, a like service for the physiological portion having been effected by the Editor. The description of the fig. 578 of the development of the pollen tube of the Spruce Fir does not seem to correspond with the text—an error in the previous edition. Several valuable additions have been made to the illustrations, notably those showing the development of flowers on pp. 546-548, borrowed from Luerssen. Space will not allow of further notice, but comparing this edition with the last we can safely put it in the hands of students as placing before them the science of botany in its present aspect.

The object in publishing an English translation of Dr. Behrens' work, which has "rapidly attained wide circulation and usefulness throughout the schools and colleges of the German-speaking countries" is, the reviser tells us, twofold—(1), "to explain in the simplest language the elementary facts of botany;" and (2), "to awaken the interest and enthusiasm of the student . . . by introducing him to the fresher fields of the science." He particularly alludes to fertilisation, to which no less than sixty pages (out of 353, 8vo) are devoted. Admitting the subject as a most attractive one to beginners, we regret that the significance of "self-fertilisation" is thoroughly misrepresented; thus, the author states categorically (p. 169),

Usually fertilisation is only effective when the

pollen is brought to the ovule from another flower of the same species." Again: "Cross-fertilisation produces the greatest number of seeds capable of germinating, while self-fertilisation tends to produce few or no seeds capable of germinating;" then follows further extension of these statements. It is now well known that it is only now and then relatively true of plants normally requiring intercrossing, but the rule breaks down even with them under repeated self-fertilisation, as Darwin showed in the cases of *Ipomæa*, *Mimulus*, and *Dianthus*—a fact familiar to all florists, in the case of self-fertilising *Primulas* and *Auriculas*. H. Müller, after a long discussion on the relative importance of the two, points out that the supposed great importance of inter-crossing is over-rated, and concludes with the very limited "question"—"There is good foundation, therefore, for the demand that the explanation of floral mechanisms shall rest only on the sufficient and demonstrable assumption that cross-fertilisation yields more vigorous offspring than self-fertilisation." Let us hear Mr. Darwin. In cultivating *Mimulus luteus* a self-fertilised form appeared. "It prevailed in all the later self-fertilised generations, to the exclusion of every other variety . . . The self-fertilised plants belonging to this variety were not only taller but more fertile than the intercrossed plants (*Cross and Self-Fertilisation of Plants*, p. 348), so that this last resource for evidence in favour of cross-fertilisation breaks down. With reference to details there are unfortunately numerous inaccuracies, e.g., rhizome of Scabiosa is called a root; the diagrams of a centrifugal inflorescence, and of a scorpioid cyme are quite wrong—the latter repeating the old mistakes. Anthodium is distinguished from capitulum on p. 64, but the figure of the latter is used as descriptive of the former on p. 67. Similarly winged nut is distinguished from a samara, yet the same figure of Elm fruit is described by each term. There is a similar confusion between achene grain and Caryopsis and Schizocarp; Cruciferae are said to have four short stamens and two long. A foot-note to "Cucurbitaceæ" says:—"New lat. Pepo, a Gourd; fero, I bear." We fail to see the significance of the note. With regard to classification, that usually adopted in this country is De Candolle's, and it is of the utmost importance that students should learn by degrees to localise the sequence of orders in their minds. To put before them a totally different arrangement from that with which they will have to become familiar in all our Floras and the *Genera Plantarum* is not only inconvenient, but positively harmful. Thus, to find "Cucurbitaceæ" standing between Boraginææ and Campanulacæ is somewhat startling. Four elaborate tables or keys are given, each description terminating in a floral formula; and this illustrates what probably the author may think a great merit, but which we would designate a grave error—that it tends to "artificialise," if we may coin the word, instead of leading a student to become familiar with the principles of natural classification; and any young student who tries to study botany by this book alone will have to rearrange in his mind a great deal when he tries to use the standard Floras of this country. The descriptions of the orders, too, are often inaccurate, while the terms "family," "genus," and "species," are used for one another in a very loose way.

The little work by Dr. Vines and Professor Bower is an invaluable one of its kind. It is, as Mr. Dyer says in the preface, the outcome of the methods of instruction adopted at South Kensington, which had for their object to "embrace the leading morphological facts of every important type in the vegetable kingdom." A succession of types are treated exhaustively, the student being thoroughly instructed how to make his preparations, what micro-chemical reagents are required, and how to use them, how to dissect and describe his observations correctly; and any student who will patiently and conscientiously work by means of it, will acquire a large mass of knowledge on anatomy. The only danger that we see in advocating this system of practical botany is that it tends to lay too little stress on the necessity of a preliminary study of morphology proper. It is an opinion based on long experience of tuition, that beginners should thoroughly master the characteristic features of types of the leading families of plants, and be able to describe them accurately, in botanical terms, before such an elaborate system of examination is attempted as is proposed in this work. To say the least of it, a knowledge of floral structure, the processes for fertilisation, the variety of forms and uses of stipules, various methods

of climbing, and a variety of other things excite an interest in the study of morphology which renders that branch of the science by far the most attractive to beginners, and at the same time lays a solid foundation for deeper researches such as are aimed at in this work. //

### Orchids, a Review of their Structure and History.

Under this title Mr. Lewis Castle, of the *Journal of Horticulture*, has published a little treatise giving a popular account of the conformation and other peculiarities of these now favourite plants. It is a useful little book, which will give many readers an insight into Orchid structure which they would not trouble themselves to get from more pretentious works. Mr. Castle is, however, hardly sufficiently clear in his exposition of Orchid structure, and his definition of "homology" is one against which we must protest. The chapter on "Orchid mysteries" is left mysterious still, though Darwin, whom Mr. Castle so frequently quotes on other points, has done much to clear up what was before obscure. The *History of Orchids* comprises a compact and serviceable account of their importation into this country from 1763 to the present time. Altogether Mr. Castle has contrived to compress into a few pages information which the class of readers for whom he caters would otherwise have a difficulty in procuring.

### INDIAN NOTES.

THE LUCKNOW HORTICULTURAL GARDEN.—On December 27, 1860, the Agri-Horticultural Society of Oudh was set on foot. The local Government gave a piece of land for experimental and acclimatising purposes, and subsidised the Society with a donation and a monthly allowance. I was asked to undertake the uphill task of making a garden from a treeless waste; not the least unpromising part of the task was, that there was not a single well on the whole ground. It had to be terraced and levelled, and wells had to be sunk.

I began by making experiments with all sorts of plants. Soon after the American Civil War was on, and the Government at home were directing their attention to India as a field for Cotton growing. I experimented with various kinds. I tried to cross the New Orleans with the native Cotton, but did not succeed. I succeeded, however, in obtaining a cross between the New Orleans and Egyptian Cotton. The first pod of the crossed plants I watched with great interest. When it burst, great was my disappointment to find that, instead of white Cotton, there was nothing but smooth black seeds, without a trace of Cotton on them! This was hardly encouraging, and I only mention it as one of the curiosities of hybridising. All other pods, however, gave a very good fibre, which was favourably reported on by Calcutta experts. Further sowing of this crossed seed was not productive of better Cotton than that of pure New Orleans grown on the same ground. The conclusion all my own experiments led to, as well as others made elsewhere, was that the soil and climate of Oudh were not favourable to foreign Cotton growing on an extensive scale.

Another curiosity of hybridising was a cross which I effected between the American Squash and the native Pumpkin (*Cucurbita moscata*), using the pollen of the Squash. The Pumpkin grew and ripened, but when I cut it there was not a single seed in it.

Soon after the garden was started I introduced the Casuarina tree by seed. Then there were no Casuarina trees in Lucknow, now many are to be seen in various places.

The Mulberry tree and silkworms were tried for a long time, and with great care and patience, both with the monthly and annual varieties of worms. Although valuable silk was easily produced it was found that the crop was too troublesome for natives of Upper India, who could raise other crops with much less labour and expense.

Flax seed was procured from Riga and Belgium. It grew very well, but always produced too much luxuriance of plant and coarseness of fibre. Probably this was owing, to a great extent, to the amount of sunlight the plant got. I find stated in my report for 1864, "In Europe, at the season in which Flax is grown, the weather is, to a great extent, cloudy. The immediate effect of this condition would probably be to make the Flax plant grow thin and tall. On the contrary, in Oudh, in the winter, the only time in which Flax could be grown,

the sky is cloudless, so that the amount of light which the plant gets is very great. Native Flax, grown solely for its seed, however, is much more slender than the foreign kinds, in spite of the light; but it will take years of cultivation and selection till we can produce it of the necessary length."

In 1863 I introduced, by seed, the Inga dulcis, from Madras. This thrived wonderfully. It was found useful, not only for hedges and firewood, but also for the sweet arillus which its screw-like pods contained, and which natives ate greedily. Hundreds of pounds of its seed were afterwards distributed, with a view of introducing it among native villages as a plant useful in famine times.

In this same year I obtained a few seeds of the Cuzco Maize of the Andes—a large white variety. I managed to obtain a cross between this and the native Maize—a very small grained yellow variety. The result of the first crossed seed was encouraging. It produced a Maize of large size of a light yellow colour. Further experiments with it produced curious varieties. Some plants threw out branches where the ears or cobs should have formed; others, among the head of male flowers, on the summit of the stem, produced grains resembling those of Sorghum, but larger. This phenomenon led me to believe that the relationship between the Maize (which is monoecious) and the Sorghum is more intimate than one would have at first supposed. I had proposed to myself to make some further interesting, and probably useful, experiments with this hybrid; but a few months' absence from Lucknow put an end to them. On my return I could not find the seeds, and the native gardener could not account for their having been lost. Lately I perceive that Mr. Duthie of the Saharunpore Botanic Garden has effected a similar cross. I hope he may be more successful than I was, and that he may be able perhaps to prove that the Zea and the Sorghum are not, after all, distinct genera! With regard to the original Cuzco Maize nothing could be made of it. It was evidently not suited to the plains of India, its habitat being in the Andes.

In November, 1863, I imported some plants of various kinds of Oranges from Malta, as well as the Malta Lemon. The latter is identical with the Portugal and Sicilian Lemons (*Citrus limonum vulgaris* of Risso). The Lemon plants thrived wonderfully, and produced as fine trees and as good fruit as in their own country, and are now to be found disseminated all over Oudh, the North-Western Provinces, and the Central Provinces. Not so the Oranges. With the exception of a large round Orange the soil and climate did not appear to suit them. The Blood Orange lost its blood, and some of the others their original fine flavour. The origin of the Seville Orange in Lucknow (*Citrus Bigarodia* of Risso) is rather curious. In Malta they bud on the Seville stock. One of the original plants imported died, and the stock on which it was budded threw out a few branches, from which buds were taken and inserted into the common native stock. Hence the origin of the true Seville in Lucknow. The Orange produced by the native stock is probably a variety of the Seville. Its pulp is very acid, but it wants the bitterness of the true Seville. Its leaves also have not the sweet scent of the latter.

A little after the importation of the above I introduced the Nagpore Orange, a good loose skinned sort, and having obtained some seeds of the Sylhet Orange from Calcutta, I sowed them. The latter eventually fruited and proved to be very good, and equal to those procured in Calcutta, under the name of Sylhet Oranges.

Most of the flowering trees and shrubs of India were introduced into this garden, besides many exotic ones. In 1863 I obtained some seeds of the wonderful Poinciana regia, a tree which astonishes by its blaze of colour. The seeds germinated and the trees thrived, and from these many of the Poinciana regias found in Oudh and the North-Western Provinces have descended. Properly speaking this fine tree belongs to a more southern climate, but by sowing the seed grown in Lucknow it has now become acclimatised also in Upper India. *E. Bonavia, M.D., Etawah.*

(To be continued.)

NEWCASTLE-UNDER-LYNE.—This town will this year hold its first annual exhibition of Roses, flowers generally, fruits, and vegetables at the Town Hall on July 21. There are altogether forty-one classes of competitions, but of which only four classes, two for amateurs and two for nurserymen, are open to all.

## TACSONIA ANDERSONI ×.

A CORRESPONDENT, signing himself "Y. Z.," sends us flowers of a hybrid raised by him out of *T. insignis* by *T. Volxemii*. We cannot judge of the habit from the flowers sent, but they have the long flower-stalks of *T. Volxemii*.

Singularly enough the same cross was produced some few years since by Mr. Anderson, whose account, as given in the *Gardeners' Chronicle* of August 7, 1875, we reproduce, with an illustration (fig. 165). It is most interesting to find that the same peculiarities that marked Mr. Anderson's plant are reproduced in that now before us. Apart from the great botanical interest, there is the probability of a double-flowered race, which would be valuable for horticultural purposes:—"Tacsonia insignis never seeds with me unless it be artificially impregnated, and then not freely with its own pollen, but more so with that of *Van Volxemii*. The colour is intermediate between the two parents, more a scarlet than either; the size from 5 to 6 inches in diameter. The internal formation of all the flowers is the same as in the one I sent. Out of forty plants raised from two seed-pods all, with one exception, have the divided leaf of the male parent, while one seems in every respect a true *insignis*. Only one plant has flowered thus far. I have *insignis* growing freely on a south

FIG. 165.—TACSONIA ANDERSONI ×: THE PETALS REMOVED TO SHOW THE PETALOID STAMENS.

wall out-of-doors; should it prove hardy I will let you know."

Mr. Anderson's note is interesting as confirming the fact that *Passifloras* often set better with foreign pollen than with their own. The internal conformation of the hybrid flower is very curious, and affords the first stage towards a double flower. The calyx, corolla, and corona are all normal, but the stamens, instead of bearing anthers, are surrounded by petals, as shown in the illustration. Beneath the filaments, previous to their separation one from another, form a tube, from whose edge springs an additional corona, just as the corona springs from the flower-tube at the base of the petals in ordinary cases. We have here, then, not only a very interesting malformation, but the germ of a double Tacsonia. "Y. Z.'s" flowers present exactly the same peculiarities as those of Mr. Anderson.

## ROSEMARY.

ROSEMARY is still used at funerals in many parts of South Wales, together with Southerwood, there called "Hên-dyn" (Old Man)—a local name it still bears in many parts of England, but I never heard the Rosemary spoken of in the Welsh language except as the "Rhosmair," which I then imagined to be a corruption of Rosemary. It was one of the examples which my father, an Englishman, used to cite when

he wished to provoke me by saying that the Welsh had not a language of their own, and only Welshified English words. This was only, of course, said in fun, to tease me, I being at that time intensely Cambrian in my feelings.

I think that Rosemary is used at funerals because it is said to represent fidelity in love, as well as remembrance after death. Gay evidently was of this opinion, for he says, in his "Shepherd's Week":—

"To show their love, the neighbours far and near  
Followed with waitful looks the damsel's bier:  
Sprigged Rosemary the lads and lasses bore."

Shakespeare, too, in several of his plays alludes to this idea, for he makes Ophelia say—

"There's Rosemary for you, that's for Remembrance;  
pray you, love, remember."

And Perdita gives Polixenes and Camillo, Rosemary and Rue, as significant of grace and remembrance; so I believe that your American correspondent, who writes so agreeably, may depend on it that the use of the Rosemary at funerals (as at weddings) originated in its being emblematical of remembrance.

The generic name is a combination of *ros*, dew, and *marinus*, of the sea, but I cannot throw any light on other derivations, though I have looked through many botanical works, and in one of them I find the old tale, that this plant never thrives well in any garden where the husband is master of his castle—alluded to as being a Gloucestershire superstition. What curious notions some people possess with regard to various plants. A Berkshire lady came to me in sad trouble one day. "How could you," she asked, "bring that horrid House Leek here? It is going to bloom, and Mr. B. will surely die." I found on inquiry that it was believed in her county that whenever the House Leek flowered the head of the house died within the year, and as I had brought a fine root back from Petersfield and planted it on the sloping roof a lady, who was, like myself, a guest at the old house scolded me well when my pet blossomed. This was six years ago, and I am happy to say the head of the establishment is still alive. The Welsh say that Thyme never grows when planted by certain people. You must be what they term "born to luck," in order to insure this herb thriving after your planting it. *Helen Watney.*

## THE PROPAGATOR.

### THE PROPAGATION AND CULTURE OF DRACÆNAS.

(Continued from p. 677.)

*DRACÆNA GOLDIEANA* is truly a distinct and noble plant, which well deserves a place in every collection; but if a little extra care and attention is given in propagating it, a good result could almost be guaranteed.

For a cutting, 6 inches of the top of a shoot must be taken, being very careful that the centre leaf is fully developed and hard. It should be pointed out in regard to the length of the cutting that it is not safe to have it less than six inches because the base of the centre leaf growth is some distance, down the stem, and if this is not long enough the cuttings will be lost. To return to the shoots that have been selected for cuttings, the bottom of each stem should be levelled with a sharp knife which should also be gently drawn across it twice so as to form an X. It will be found that this operation has the good effect of producing a larger and more equal quantity of roots. Long thumb-pots should be used in potting and the soil should be very firmly pressed around each cutting, the main stem of which should also be tied to a stick. After having given them a good watering with a fine-rose pot they should be allowed to stand out for half-an-hour before they are put into the cutting case. In the cutting case or frame, which should be placed over a gentle bottom-heat, the pots should be plunged into cocoa-nut fibre or other similar material, and this must be so done that not only the leaves of one cutting do not touch the leaves of another, but also that the tops of the cuttings may be as near the glass as possible.

While the cuttings are in the case they should never be watered over the foliage, but water must be given them with care through a small-spout pot as they become dry; they must be shaded from all sun, and for ventilation the lights or glasses should be taken off for an hour both night and morning. But as soon as they have well rooted the lights can be raised an inch, and left so day and night, in order to harden

the plants a little, that they may not suffer when they are turned out upon the open bottom-heat, which should be done as soon as the plants are strong enough. After having stood four or five days upon the open bottom-heat they should be potted into large 60-pots, and watered with a fine-rose pot, and placed upon the open bottom-heat. When they have well rooted through this size pot they should be potted into large 48's, and again replaced upon the bottom-heat, where they must now be carefully watered as they become dry, as well as lightly syringed morning and evening; they must still be shaded from the sun, and well ventilated on every fine day. When the plants have well rooted through the 48-pots they can be moved into another warm house and placed upon a cold bottom. If larger plants are required they must be potted into larger pots, and put on the open bottom-heat, from whence they should not be removed to the cold bottom until they have attained the requisite size.

#### D. GRACILIS AND D. G. MARGINATA.

In small pots these are elegant varieties for decorative purposes. They cannot be propagated from roots, like most *Dracenas*; this must, therefore, be done from the top growths of the plants. The tops of the plants should be taken off, having about 3 inches of the main stem attached; and after making the bottom of the stem level, they can be potted each into a thumb-pot. The soil should be firmly pressed around each cutting, the leaves of which should be tied up to a stick provided for the purpose. When they have been watered they can be placed in the cutting case, where they can be treated in the same way as *D. Goldieana*. It is a good plan to save a few of the plants which have been cut back for cutting purposes if they are varieties which will not form plants from the roots.

#### D. ARBOREA

is a free-growing green variety, but can only be propagated from top-growth. It can be treated in the same manner as *D. gracilis*. The soil for the cuttings should be composed of one half good peat, one quarter loam, and one quarter sand, to which small quantities of finely broken charcoal and finely broken potsherds should be added. The whole should be well mixed together, and sifted and rubbed through a  $\frac{1}{4}$ -inch sieve before it is used. When the plants are potted into 60-sized pots, and subsequently, the following should be the component parts of the soil used, viz., one half good turfy loam, one quarter peat, and one quarter river sand, a small quantity of charcoal broken up into pieces of Hazel-nut size, and a few finely broken oyster-shells. If the soil is very dry it should be sprinkled with water before it is used. T. O. B.

(To be continued.)

### ORCHID PRUNING.

IN speaking of *Dendrobiums* which should not be pruned I take, by way of contrast, *D. moschatum*, and in this case also will only give my own experience and practice. Other growers who may have different accommodation, who may be in a different position of altitude, or have different local surroundings, may be favourably or unfavourably affected to a greater or less degree, and therefore may not find my description agree with their experience; but something on this head may be said another time.

*Dendrobium moschatum* is a strong grower, and retains its foliage for two or three years. If the growths are thoroughly matured bloom will be produced on them the second year, but if not, several years may elapse before they bloom, as I will show. On one plant we have a growth made six years ago which only bloomed last year, but there is every appearance of its pushing out spikes again this year; while another growth made four years ago produced its first spike last year, and has two strong ones appearing this year; and another growth made two years ago flowered last year, and has still every leaf perfect its whole length. And yet one other made nine years ago commenced to bloom the third year, and has produced a spike annually for six years, and is now as plump and fresh as ever to all appearance. The whole plant has nineteen growths from 2½ to 6 feet in height, and produced thirteen spikes of bloom last year. I have thus described this plant and its manner of flowering to lead up to the interesting question of pruning, and what

can be said in its favour? Why, when I have cut away the old flower-spikes I put my knife in my pocket, for since we grow Orchids for the sake of their flowers, and this species seems to be almost an everlasting bloomer, we must not cut away the back growths till they are very old—how old I know not; it may be twenty years.

Now having given this plant as a type of *Dendrobies* that should not be pruned, and *D. nobile* as a type of a class that may be, I have left the whole intermediate species for the present; but before leaving the subject I may as well state my manner of dealing with them, and that is to ascertain, if possible, whether the back growths are of any further service to the health, value, or beauty of the plant; and if I see nothing to encourage the opinion that they are still required then I cut them out. I would, however, advise the inexperienced in Orchid culture to be cautious of a too free use of the knife, and thus keep on the safe side; and in practice "be not the first to cast the old aside;" while to those who are head and shoulders above myself in skill and experience I would give the other half of the adage—"be not the last by whom the new is tried."

I believe that we have a great deal yet to learn

FIG. 1'6.—SEED-VESSEL OF *LYCASTE SKINNERI*.

respecting the nature and requirements of this great and beautiful family of plants, and having struck out an independent line of culture for myself some years ago, I am, from the results accomplished, more strongly convinced of the fact. I will, in concluding this note, give a case. I have a special desire to get this very *Dendrobium moschatum* to produce a spike of bloom on every growth, old and young, at the same time. If this is not attained I believe my treatment will be at fault. Last year thirteen out of sixteen had a fine spike; but I cannot hope to see the feat accomplished this year, as it is four years since the plant was shifted, and must now be repotted; and do this as careful as we may, some disarrangement in Nature is sure to follow, but I shall keep a record of its behaviour every year; the results in some other cases shall form the subject another time.

I beg to thank Mr. J. Child for his answer of April 4, and apologise for the apparent indifference. His forty puts our thirty-eight in the shade. N. Blandford.

### FRUIT OF *LYCASTE SKINNERI*.

IN continuation of the series of illustrations of seed-vessels of Orchids we now add that of *Lycaste skinneri*. After the explanations that have already been given it is needless to add description to the illustration (fig. 166). We may, however, call attention to the singular manner in which the "column" not only

remains attached but becomes thickened as the fruit ripens, and remains attached to it. We may here also take note of the similar phenomenon which occurs in some species of *Phalenopsis*, as pointed out to us lately by Mr. Harry Veitch, and in which, after fertilisation, the sepals and petals, instead of withering, become thick, and green in colour, just as happens in some of the *Hellebores*. The species pointed out to us in a recent visit were *Phalenopsis violacea*, *Luddemanniana*, and *Cornu cervi*. The seeds of these plants are exceedingly small, and the swelling and succulence of the fruit and of the persistent perianth may be connected with the necessity for adequate supply of water during the ripening of the seed which otherwise might not obtain sufficient moisture; but this is mere surmise.

### NEPENTHES UNDER COOL TREATMENT.

HEREWITH I send you a photograph of a basket of *Nepenthes distillatoria*, which has been grown in a comparatively cool house since it was a small seedling, and now forms a more picturesque object than *N. distillatoria* often presents. Its history is as follows:—Some years ago I received it from the late Dr. Moore of Glasnevin. It was then a seedling about 2 or 3 inches high, and has since been grown in an intermediate temperature, often falling under 50° in winter. It made two stems a couple of feet long, and flowered several times. As it then showed considerable inclination to break from below and to form pitchers there, when several were formed we cut off the two main branches, and the result has been the formation of a cluster of healthy, ruddy pitchers, not very large, but well formed and much nicer to look at than the straggly plants commonly seen in this species. The house it is in is a very small one, and contains a miscellaneous collection of Ferns, intermediate Orchids and soft-wooded plants. I have just counted twenty-five fully formed (*i.e.*, open-lidded) pitchers, and about a dozen more in various degrees of development. The largest is about 4 inches long. Greenwood Pim

### HOME CORRESPONDENCE.

*Gentiana verna*.—This grand floral gem is now in excellent condition in several parts of the Royal Botanic Garden, Edinburgh. As this used to be considered very difficult to cultivate, it is a pleasure to see large clumps flowering freely and looking so healthy and well. The white variety, *Gentiana verna alba*, was in flower the other week; this will make a good contrast when more plentiful. Another Teesdale gem, *Myosotis alpestris*, is also flowering here; this is worth while going to Teesdale to see. I remember seeing it very grand on Micklefell, in company with my late lamented friend, Mr. J. C. Niven, in 1853—the date I have taken from my dried specimen gathered on that occasion. W. E. D.

*Habrothamnus Newellii* and *Magnolia*.—Mr. R. T. Wilkins is the fortunate possessor of one of the largest plants we know on an outdoor wall of the *Cestrum* (*Habrothamnus*) *Newellii*. It is flourishing vigorously at his place at the mouth of the Dart, in Devonshire, and is a beautiful picture just now, reflecting much credit on the gardener, Mr. Allen, who must have taken considerable trouble to train such a beauty. Every growth is neatly fastened to the wall, and nearly every shoot carries a large dense terminal cluster of brilliant crimson flowers. This fine example covers a space of some 12 feet by 9 feet, and is exposed to the south-west gales of the English Channel. Within gunshot is a grand tree of the true Exmouth *Magnolia*, of some antiquity, and its deliciously perfumed flowers are beginning to open; 35 feet is about its entire height, and it is well branched from the bottom, being about forty paces around. The trunk at 3 feet from the ground is 39 inches in circumference. It is truly a noble specimen. W. Napper.

White of Chavigny Cabbage Lettuce.—I sent you a note concerning this fine Cabbage Lettuce last year, and its merits again deserve notice. It is one of those admirable novelties introduced by Messrs. Vilmorin, of Paris, and does not seem yet to have found a place in English seed lists, unless it has unhappily been renamed. A very fine solid hearting white form, it is a remarkably long-standing sort,

refraining from bolting to seed longer than any other kind, and in that respect alone it is most valuable, especially in hot dry summers. It is tender, crisp, and sweet, and contains almost as much material as do many much larger looking Cos Lettuces. It has the merit, too, of being very hardy, and in that respect deserves the attention of market growers. I think this Lettuce will be found a really useful and desirable novelty or improvement upon older kinds. *A. D.*

*Rosa rugosa*.—Have any of your readers tried budding Roses on *Rosa rugosa*, the Japanese Rose, as a stock? It will have, I think, many advantages. I have stocks prepared, and mean to try it this season. *G. F. Wilson.*

The "Widow," or "Snake's-head" Iris (p. 703).—I am afraid I got a little off the track in calling *Iris tuberosa* the "mourning" Iris, seeing that the latter name belongs to *Iris susiana*, but that it is the "Widow" Iris of Florence is, as I imagined, a well-known fact. If "J. S. W." will turn to that classical little volume, *Days and Hours in a Garden*, p. 112, he will find proof of what I have said. I will quote "E. V. B.," however, in case the book is not handy to other of your readers. Speaking of *Iris tuberosa*, "E. V. B." says:—"On the 7th (April) appeared, as I knew she would sooner or later, the little 'Vedova' Iris of Florence. Under the south wall, where we did not think to seek, there she was for the first time after these eight years' seclusion, and still she wears her 'weeds of green and black!'" Old Parkinson (1629), who figures and describes *I. susiana*, notices its resemblance to a "ginnie hen," and when I saw clumps of *Iris iberica* blooming in Professor M. Foster's Cambridge garden the other morning, they somehow reminded me of little partridges sanding their wings in a sunny place. *Iris florentina*, the pale lilac-tinted white, is now most lovely, its satin-like petals shimmering in the soft warm wind. Its rhizome dug and dried equals the "Orris root" of the shops, and is a welcome addition to home-grown or garden perfumes. "J. S. W." must be careful to add *Iris* after his English name "Snake's head" as applied to *Iris tuberosa*, as the term "snake's head" alone refers to the chequered Fritillary (*F. meleagris*) of the meadows near Pinner and Oxford. I think the "Widow Iris" or "Vedova" is by far the prettier name as used by the Florentines to-day. *F. W. B.*

—"F. W. B." is quite correct in naming *Iris tuberosa*, or the Snake's-head Iris, "The Widow." It is popularly known as the Vedova (Widow) in Italy, where it grows wild with yellow Tulips about the vineyard trenches near Florence and elsewhere. *E. J. B.* [We do not wish to use strong language, but this use, or misuse, of popular names is very provoking. What has this elegant Iris done to be associated with widows or snake's-heads, what a cruel insult to the bereaved one to bracket her with snake's-heads! *Ed.*]

"Queen's Prize" *Mimulus* from Seed.—On February 22 last, I sowed a box of this brilliant strain on a tan bed, under a frame. There was little heat, and owing to the persistent low temperature almost up to the present, vegetation was very slow, so much so that, like Auriculas, tuberous Begonias, and other similar small seeds, one begins to doubt ever seeing the tiny seedlings. Now after three months they are coming in quantity and vigorously. I mention this so that any of your readers who may not see such seeds coming up rapidly may be induced to have patience and not hastily blame their seedsmen. *W. J. Murphy, Clonmel.*

*Saxifraga Macnabiana*.—In your issue for May 30 I noticed that *Saxifraga Macnabiana* received an award from the Floral Committee of the Horticultural Society (p. 705), and that a Mr. Rees obtained a First-class Certificate for it at the Crystal Palace (p. 708). Can any of your readers give the history of this form? I suspect it is a garden hybrid; but it is not mentioned either in Engler's *Monograph*, Focke's *Mischlinge*, or Nyman's *Conspectus*. *G. C. Churchill.*

*Daphne encorom*.—This appears to be one of those unaccountable plants that only succeed here and there, as it is seldom one meets with it in good condition, and I have been told by several that they entirely fail with it, and yet here, where no trouble whatever is taken with it, it grows luxuriantly and

spreads in such a way as to form dense masses, more than a yard across, and all these are now covered with its lovely pink sweet-scented bloom. If it were only in one position where this *Daphne* does so well, we should come to the conclusion that it was the soil or situation of the particular spot that suited it, but the plants are equally good in full sun or shade, and on raised banks among pieces of rock as they are on the flat in the borders. The only difference I can see in them is, as might be expected, that those which are in the sun are first in flower; but with that exception it does not appear to affect them, as those on a bank at the north end of a span-roofed house have nearly every shoot terminated with a truss, or trusses, of blossom. Our soil is naturally sharp and light, and we planted the *Daphne* in all the places they occupy without any preparation, and their dying off with us is a thing quite unknown. The way we increase them is by layering any of the outside branches, which we do by just digging out a little of the soil and dropping the whole of that part of the plant down and covering the stems, which, after a year or so, root freely, and are then taken off, if wanted, or left to go on as they are. *J. S.*

The Gardener's Friend.—The above is the very appropriate name, as results of a trial of it here fully testify, of a preparation in a perfectly liquid form for destroying weeds of every description on garden walks, carriage drives, &c., also for the destruction of Plantains on lawns, &c. This "celebrated weed-killer" was first brought under my notice by a gentleman visiting these gardens a short time since, who remarked respecting it "that paved stable yards which he knew involved a considerable expense annually in keeping free from weeds by hand-weeding prior to 'Weed Killer' being used, are kept perfectly free from weeds at a trifling annual cost." This good news led to an order for a 16-gallon cask (which cost £1 8s.) being given; and the results of a trial are so thoroughly satisfactory, that I feel I cannot well say too much in its favour, nor make the fact too widely known among gardeners, amateurs, &c. One pint of the "weed-killing" liquid—which is perfectly clear—mixed with 3 gallons of cold water, and applied with a watering-can and rose to walks, &c., infested with weeds and moss, when the ground is tolerably dry, and in sufficient quantity to allow of its reaching the roots of the weeds, will not only kill the latter and their fallen seed, but renders the ground most unfavourable for the germination of any seeds blown thither from uncut grass lawns and untrimmed walk-margins. The effect of this preparation when applied to the weeds is not, however, immediate, but is complete ten or twelve days after its application, in which care must be taken not to allow it to come in contact with grass verges, nor other living edgings of any description. To destroy Plantains and Dandelions we fill a champagne bottle or blacking jar with the "Weed Killer" (unadulterated), and place it in a small box in such a position that it is not likely to get upset through the box being moved, and into this bottle or jar a piece of thick wire about 15 inches long, pointed at one end, and having a couple of inches turned to form a handle at the other, is dipped prior to thrusting it through the "crowns" of the individual plants in a perpendicular direction to the depth of 6 or 9 inches. In order to facilitate the application of the "Weed Killer," I find it is best to have, exclusively for this special purpose, a 3-gallon watering-pot, labelled "Poison," and having an oblong rose, so that the liquid can be applied to weedy walks almost close to, but without touching the grass verges or other live edgings. For the information of your readers I may be allowed to say that the "Weed Killer" is in iron drums and casks, each containing 4, 8, 16, and 40 gallons, and that 1 gallon, when mixed, will cover an area of about 12½ square yards. *H. W. Ward, Longford Castle Gardens, Salisbury.*

Perennial Candytufts.—These are a most useful and highly ornamental class of plants during the spring and early summer months. The following species are now in flower in the York Nurseries, viz., *Iberis semperflorens*, which forms a compact bush 12 to 18 or more inches high, the whole covered with pure white flowers. This species continues to flower for many months. *I. gibraltarica* has large thick fleshy leaves and handsome heads of white or lilac-coloured flowers. There is a variety of this, *I. gibraltarica* "hybrida," with smaller leaves and deeper

coloured flowers. *I. petraea* is another valuable kind, very dwarf and pretty. The same may be said of *I. granatensis*, *I. saxatilis vera*, *I. Bubanii*, *I. Pruiti*, *I. coraeifolia* and *I. sempervirens* are well known garden plants—the former is decidedly the more beautiful of the two. There is a variety of *I. sempervirens* named "superba," which is a decided improvement on the type. There is also a variety with double flowers, but I have not yet seen it, so cannot speak of its merits. There is another very beautiful species of Candytuft, but which I believe is now lost to our English gardens—*I. carnosa*; it is a native of the Pyrenees, and is I believe biennial. *I. linifolia*, another biennial, is also very showy when grown in dry, rather poor soil. I have met with it in abundance in the South of France, near the sea. *R. Potter, Holgate, York.*

*Clianthus puniceus*.—Enclosed please find a small flowering piece of the Glory Pea of New Zealand, taken from a large plant, some three years old, growing in the front of a house here, and which is blooming so superbly, as to be the wonder and admiration of passers-by. The plant covers an area, of some 5 feet high, and the same in width, and though so richly flowering is also making new growth which is showing large numbers of bud racemes which will probably produce luxuriant bloom in a few weeks hence. The aspect is south-west, the soil common garden and gravelly. The plant was raised by its lady owner from seed sent here direct from New Zealand, and it is greatly to her credit that she should thus have in her little garden, having wintered it without protection, something so beautiful and so uncommon in gardens. *A. D., Bedford.* [A nicely bloomed shoot of this fine plant, the hot weather of last season having developed the flower-buds to a greater extent than usual. *Ed.*]

Plant Nomenclature. — Dr. Wallace's note on this important subject (p. 671) sets forth what most people interested have felt to be necessary for a long time, viz., that all garden plants, whether hybrids or seedlings, should have popular names applied to them, and not scientific or Latin ones. If we could once for all settle this question it would be a step in advance of incalculable importance. I originally drew attention to this question in the *Garden* for April 19, 1884, p. 318, and in a subsequent number (May 17, p. 401) Mr. J. G. Baker, of Kew, clearly pointed out that all questions of nomenclature must be discussed and settled on general grounds. What I would propose is that a general Conference be held in London next year to consider, arrange, draw up and pass a set of simple rules on which all future plant-naming shall depend. The question is such a broad and many-sided one that we must face it in a thorough manner, and to this end the principal botanists and horticulturists, not only of Britain but of Europe, should be invited to attend. Trade dealings and amateur enterprise is now so varied and reaches so widely that this question of nomenclature should be threshed out from a broadly international point of view, and not merely from an insular standpoint. I trust that other botanists and amateurs will give attention to this matter, and state their views in these pages. *F. W. Burbidge.*

*Kalmias*.—I am much disappointed to find that my *Kalmias* have turned out such a light pink. As I have been told that soil and aspect have a deal to do with colour, I should be obliged if some one would tell what is the best soil and aspect to grow *Kalmias* in so as to get them of a darker hue. *Fanshawe.*

Flowering Shrubs at Gunnersbury Park.—In addition to the fine forms of *Berberis* lately to be seen in flower, foremost, and unequalled for the marvellous plenteousness of bloom, is the white Portugal bloom, the *Cytisus albus* of some, *Spartium album* or *multiflorum* of others. This is a hardy shrub, to be grown by every one. Mr. Roberts has it in a front line of shrubbery, with *Rhododendrons* behind it, and an emerald lawn before and below it, and its beauty and floriferousness attract the eye at a considerable distance from it. Close by are seen the bright red buds and pale coloured expanded flowers of *Pyrus malus floribundus*, and, like all its congeners, flowering this season with extraordinary prolificacy. It rises from out of a mass of varied coloured *Rhododendrons* just bursting into blossom. Not far distant is Waterer's Cherry, with clusters of large double flowers produced in threes; it is at the back of dwarf shrubs and every

year increases in size and beauty. Then there is the pretty *Lithospermum prostratum*, with its rich blue flowers striped with red; it is an occupant of a bed of other dwarf things: no blue flower in the open ground can touch it for its brilliant hue. These are but the forerunners of many things of equal value hastening on to furnish their quota of flower in due time. *R. D.*

**Cytisus Adami.**—In the pleasure grounds at the Royal Château of Laeken this curious plant is unusually plentiful on two Laburnums standing side by side. Some of the tufts are more than a foot in diameter, and flowering in a most profuse manner. On the two Laburnum trees there will be more than twenty tufts, large and small, and they do not seem to be anything the worse for the close embrace of their relative, judging from the profusion of yellow and purple flowers they are bearing and their general health. It is, moreover, remarkable that the Laburnum branches beyond the tufts are as healthy and floriferous as any of the other parts of the tree. This sport, moreover, is increasing yearly. It may also be mentioned that the Laburnums are standing in the midst of a mass of Lilacs and other flowering shrubs, with a Larch or two, and an Acacia and a Spruce Fir as close companions on the east side; while buildings and plantations surround the whole within a distance of 100 feet, so that this curious plant is well protected and sheltered from harsh winds during summer, but in winter it is fully exposed to north winds and blasts. *H. K., May 24.*

**Early Potatoes Becoming Frost-Proof.**—The May frosts, resulting from a general lowering of the temperature over Europe, has played sad havoc among early Potatoes. Owing to our insular position we suffered less than any other country of the same latitude, or even 20° more south. It is certainly remarkable to find it recorded that six people were frozen to death in the streets of Vienna in the middle of May, and the Vine crop destroyed. I brought some gardening friends to see recently two borders of early Potatoes, 8 and 9 inches high, some showing signs of dower, perfectly unscathed, and which had no protection whatever. "Protection is a humbug," said one of them; "I lifted straw on and off every evening for the past fortnight off mine, but forgot it in the hurry last night, and they are ruined." This always happens. We arrived at the conclusion that mine escaped because they were hardened and strong, and able to resist a few degrees of frost. The varieties were Pride of America, Eight Weeks, Myatt's Ashleaf, and a few of Eureka. *W. J. Murphy, Colonel.*

## THE INSULAR DISTRIBUTION OF ORCHIDS.

THE vegetation of oceanic islands presents many striking peculiarities, not the least remarkable of which is the great rarity or total absence of Orchids, and, indeed, of petaliferous monocotyledons generally. I allude especially to the more remote islands, though this peculiarity is common, in a less degree, to islands and groups of islands comparatively near to the great continents. This fact forced itself more strongly on my mind during the preparation of my now just completed *Botany of the "Challenger" Expedition*, and I was led to extend my investigations of the subject beyond the scope of that work, the results of which I will briefly summarise, first giving some figures and following with some observations thereon:—

### Orchids in Insular Floras.

	Number of Species.	Number of Specie.
<b>I. Arctic Ocean:</b>		
Nova Zembla ..	0	
Spitzbergen ..	0	
<b>II. North Atlantic Ocean:</b>		
Iceland ..	13?	
Azores ..	3	
Bermudas ..	1	
Madagascar ..	4	
Canaries ..	6	
Cape Verde group ..	1	
<b>III. South Atlantic Ocean:</b>		
Fernando Noronha ..	0

St. Helena ..	0	
South Trinidad ..	0	
Tristan da Cunha group ..	0	
South Georgia ..	0	
South Orkney ..	0	
Falklands ..	4	
<b>IV. Indian Ocean:</b>		
Socotra ..	1	
Seychelles ..	13	
Rodriguez ..	5	
Keeling ..	0	
Marion ..	0	
Crozet ..	0	
Kerguelen ..	0	
Heard ..	0	
Amsterdam ..	0	
St. Paul ..	0	
<b>V. North Pacific Ocean:</b>		
Sandwich ..	3	
Guadalupe ..	0	
<b>VI. South Pacific Ocean:</b>		
Galapagos ..	2	
Tahiti ..	19	
Juan Fernandez ..	0	
Masafuera ..	0	
Norfolk Island ..	5	
Kermadec ..	1	
Chatham ..	10	
Auckland ..	9	
Campbell ..	2	
Macquarie ..	0	

The foregoing selection of islands and islets covers a wide area of the globe, and embraces as great a variety of climate and physical conditions as oceanic islands offer. Beginning with Nova Zembla and Spitzbergen, it may seem probable at first that their climate is too severe for Orchids; yet when we remember that *Platanthera hyperborea*, *Habenaria alba*, and *Listera cordata* are abundant and luxuriant on Disco Island, Davis Straits, in about 69° 15' N. lat., climate does not adequately explain the absence of Orchids from the islands in question, because the warm northward currents in the Atlantic would more than counterbalance the slight difference in latitude, in Spitzbergen at least. Coming to Iceland, the number recorded is just about double of what are known, on indisputable authority, to occur, and it appears that the only common species is the otherwise arctic *Platanthera hyperborea*. All the species recorded, except two, are British. The question arises, are Orchids disappearing from the Icelandic flora? Judging from the fact that formerly the vegetation was much more luxuriant than the present and therefore afforded more shelter both for Orchids and the insects probably necessary to effect their fertilisation, the answer would be in the affirmative. I may mention in passing that seven species are recorded from the Faroes, seven from the Shetlands, and eight from the Orkneys. The Azorean Orchids are *Serapias cordigera*, a South European species, and two endemic species of *Habenaria*. The solitary one found in the Bermudas is *Spiranthes tortilis*, a West Indian species. Altogether there are only eight species in Madeira and the Canaries, whereof three are endemic and the rest Mediterranean; and there is one species of *Habenaria* in the Cape Verde Islands. Not one Orchid has been collected in Fernando Noronha, Ascension, St. Helena, South Trinidad, or any of the southern islands, from the Tristan da Cunha group eastward to Amsterdam, St. Paul, and the Macdonald group. Dr. Bayley Balfour discovered only five in Rodriguez, and one in Socotra, during his recent tolerably thorough exploration of these islands, and out of ten known to grow in the Seychelles two are endemic. Of the four found in the Falkland Islands one is endemic, and the others also inhabit Fuegia, Chili, &c. It is remarkable that Juan Fernandez does not possess a single species. Turning to the small islands in the New Zealand region, we find that ten are recorded from the Chatham, and nine from the Auckland, while only two have been collected in Campbell Island, one in the Kermadec group, and none in Macquarie Island. With one exception, the Orchids found in these islands also occur in New Zealand itself, a fact pointing, as I think, to a former land connection. In some of the larger islands of Eastern Polynesia Orchids are not uncommon, though endemic genera are almost unknown, but none has been found, I believe, in the extreme eastern islands, such as Pitcairn, Elizabeth, and Easter. The three inhabiting the Sandwich Islands are endemic; they are all three terrestrial, and two of them belong to the genera peculiar to the Malay Archipelago and Polynesia, while the third is a species of the widely-spread *Liparis*, and described as intermediate between the American *L. lilifolia* and the European *L. Loeselii*. Guadalupe, off the coast of Lower California, is not known to support a single Orchid; and the Galapagos, on the equator, and opposite the richest Orchid region in the world, have hitherto only yielded two species, an endemic *Epidendrum* and a doubtful species of *Govenia*. I have now produced sufficient evidence of the great rarity or absence of Orchids in oceanic islands, and one naturally turns to examine the probable causes. It is not because the physical conditions are in all cases unfavourable, and it is not because possible means for the dispersal of Orchids are wanting. If the seed of any flowering plants are adapted for transport long distances by winds it is those of Orchids, for they are, as a whole, perhaps lighter than those of any other plants, not greatly exceeding the weight of the spores of some Ferns [They would dry up very rapidly. Ed.]. Darwin calculated that a single capsule of *Orchis maculata* contained 6200 seeds, and a single plant 186,300; so that after deducting 12,000 as bad there would remain sufficient to cover an acre of ground 6 inches apart. By the same computation the next generation would cover a space larger than the Isle of Anglesea; and the fourth generation would yield sufficient seed to carpet the whole surface of

the land in the world. But these numbers are infinitely exceeded by some Orchids. Fritz Mueller, by carefully weighing and counting, estimated the number of seeds in the capsule of a species of *Maxillaria* at 1,756,440, and as the species in question often matured six capsules, we have the astonishing total of ten millions and a half from one plant [A very large proportion would probably not be perfect. Ed.]. Yet, in spite of this wonderful production of seed, light enough to be conveyed by winds, to say nothing of other means of dispersal, few Orchids have a very wide geographical area. I only remember one that is found in both the Northern and Southern hemispheres, namely, *Spiranthes australis*, which ranges from Afghanistan to Sachalin and Japan, and southward to Australia, New Caledonia, and New Zealand. The only reason that I can suggest why Orchids are so rare in oceanic islands is the probable absence of the insects necessary to effect their fertilisation. Darwin, Delpino, Fritz and Hermann Mueller, and others, have proved beyond all doubt that fertilisation does not take place unassisted in very many Orchids, whilst in some few self-fertilisation is either occasional or usual. To the latter category belongs *Platanthera hyperborea*, which, as I mentioned before, is apparently the only Orchid now at all common in Iceland. It is almost superfluous to add that there is still a wide field for research in the direction indicated by the facts I now bring forward. *W. B. Hemsley.*

## RUSCUS HYPOPHYLLUM VAR. LATIFOLIUS.

THIS used to be the name of a very interesting plant, the broad-leaved Butcher's Broom. In the South of Italy, and especially in Malta, it is used in pots for decorating halls, &c., under the name of *Belladonna*. I have seen it in halls which were almost dark, and only lighted when the street door was opened. Under such circumstances it not only lived but thrived, and its mature foliage, or pseudo-foliage, was always of a dark green, and the stems grew 3 feet high and upwards. It requires no attention, little water, and remains green for years. Knowing all its fine qualities for indoor decoration, many years ago I imported some of this *Ruscus* into the Lucknow Horticultural Garden from the South of Europe, with the view of using it for verandah gardening. It took a little time to get acclimatised, but now it appears to feel quite at home, and grows plentifully in the shade of trees and bushes. I have now in my verandah fourteen pots of it. There is, in my opinion, no plant more suitable for verandah gardening in India than this interesting *Ruscus*. Every year towards the approach of winter it throws up a number of shoots, like those of *Asparagus*, of a delicate shiny pale green colour. On one occasion a "Padre Reverendo" told me that these young shoots, in Sicily, were used as *Asparagus*, and were very good: this, however, I have never tried. As the shoot matures its colour passes into a pistachio-green, and finally into the deepest green ever seen in foliage. The leaves are of the consistence of thick and tough paper. They are alternate, oval, and pointed at both ends, with a very short petiole. In the centre of this leaf, and usually on its underside, there is a small tuft of flower-buds, hence, I fancy, its specific name of *hypophyllum*. This of course botanically is no "phyllum" at all, although it acts the part of one. It is merely an expansion of the peduncle on both its sides and beyond it, leaving the inflorescence as if it were sessile, in the centre of the pseudo-leaf, which is often several inches long. The real leaf is a minute thing, narrow and pointed, varying from one-half to a quarter of an inch long and only visible in the young shoots, as it drops off later on leaving only a minute scar. The pseudo-leaves come out of the axillæ of the true and temporary leaves; all the young pseudo-leaves have to show that they are expanded peduncles is a minute bract in the centre of their lower or upper surface, from the axilla of which a small tuft of minute flowers, opening usually one at a time, grows. The flower is very insignificant, and consists of a whorl of six minute green petals, in the midst of which is a purple club-like column tipped with pollen. The ovary appears rudimentary, and is enclosed at the bottom of this hollow column. Some of the pseudo-leaves are barren, that is, have no inflorescence; and the terminal ones are generally so. I have

never seen the fruit of this *Ruscus* in India, but in the South of Europe one of the flowers is sometimes followed by a vermillion-coloured little oval berry about the size of a small marble, and containing one seed surrounded by a whitish pulp. I have never seen it propagated by seed, but always by division of the roots or underground stems. The whole world is often ransacked for some plants that will thrive indoors, and yet here is one which appears to possess all the necessary qualifications for admittance into ballrooms, drawing-rooms, and other indoor places, and no one seems to care about it. I should say for the darkest corners of rooms it is admirably suited, and, as I said, it scarcely requires any attention, rarely any water, and, even when much neglected, it does not seem to mind it. Its pseudo-foliage is so coriaceous that it can stand the hottest wind of India. Of course if suitable soil and conditions are given, like everything else, it grows luxuriantly; bad soil, however, and neglect will not kill it, but only make it stunted. For these reasons I should say it is admirably suited to the heated rooms of England, where fires and gas in winter render the air very dry. I think this interesting *Ruscus hypophyllum* certainly deserves attention for the purposes above indicated.

While discussing the subject of indoor gardening I certainly think that a more æsthetic form of pot might be devised than the ordinary conical one, which, while being prettier in outline, would meet the necessity for ease in shifting. I have in my verandah a form of pot with the above *Ruscus* which has a much prettier outline than the ordinary conical pot, and plants look much more elegant in it. On one occasion the potter here had none of the ordinary pots, which in India might usually be called "frights." He had ready, however, a number of earthen pots used by sweetmeat sellers for keeping curds in, and other similar things. They have a pretty outline. So, making a virtue of necessity, I took some of these, bored holes in their bottoms, and used them as flower-pots. Afterwards I found that the *tout ensemble* of pot and plant (especially when *Dracæna*, *Ruscus*, *Canna*, and *Calamus* were planted in them) was far more pleasing to the eye than when the old-fashioned pot was used.

By allowing the ball of earth to dry before shifting, it shrinks sufficiently to enable it by a little management to come out by a half revolution. If the interior is spherical, this half revolution will be more easily effected. The ingenuity of English potters, however, might devise a somewhat conical interior, while the external outline remained "æsthetic." Glazed and decorated vases of this shape for drawing-rooms and halls might be made very picturesque. The ordinary pot is very convenient for nurserymen, and for raising plants in quantity, but for verandah and indoor gardening, something with a more elegant outline might, I think, be easily devised, so as to please the eye and not bother the gardener. *E. Bonavia, M.D., Etawah.*

## Reports of Societies.

### ROYAL NATIONAL TULIP: May 30.

This annual exhibition took place in the Botanical Gardens, Old Trafford, Manchester, on the above date, and it may be said to have made the ninth day of Mr. Findlay's great horticultural carnival. The large show-house, bereft of its inhabitants, which made so much of the great Whitsun show, was now handed over to the Tulip-men, who placed their flowers on the tables running along the centre of the spacious conservatory. As many as twenty-two exhibitors staged their flowers, and they covered a considerable space of tabling. The show was scarcely so large as usual, and the quality, with but few exceptions, was not nearly so apparent as on previous occasions; the fixture was too early to suit some growers, and notably the worthy President of the Society, Samuel Barlow, Esq., who was scarcely able to cut a flower from his famous Tulip garden at Stakehill. He will this season bloom some 5000 flowers, and his beds are full of promise, but they will not be at their best for a week or ten days. What flowers Mr. Barlow was able to show came from Shim, his new place at Llandudno. The Rev. Mr. Horner was in strong force, and he brought from his northern home at Burton-in-Lonsdale some remarkable flowers of the highest quality; he took a high position in the leading classes, and was the fortunate possessor of the three premier flowers.

A few new flowers were staged, but they could not be regarded in their present form as superior to the leading varieties of the past few years. Some of the rectified flowers were in excellent character, and the breeders were as usual most attractive in their unbroken rich and delicate self colours. A selection of the finest flowers

taken from the entire exhibition would show the following result:—Feathered bizarres: Commander, Masterpiece, Royal Sovereign, William Wilson, and Hepworth's Seedling, the latter very fine, and like a seedling of the Sir Joseph Paxton type. Flamed bizarres: Sir J. Paxton, Polyphemus, Dr. Hardy, and Orion. Feathered roses: Heroine, Charnier, which does not appear to differ from Mabel; Industry and Modesty. Flamed rose: Annie McGregor, Old Aglaia, so ancient as to possess an almost prehistoric reputation; Triomphe Royale, also a very old variety, and Mabel, the last named of a kind of slated-scarlet colour. Feathered bybloemens: Mrs. Cooper, extra fine; Friar Tuck, King of the Universe, Alice Grey, May Queen, and the new John Hart. Flamed bybloemens: Talisman, Chancellor, May Queen, and Walker's Duchess of Sutherland. A grower having the foregoing varieties might aspire to the highest honours in Tulip showing.

### BROKEN OR RECTIFIED TULIPS.

The principal class was for twelve dissimilar Tulips, two feathered and two flowered in each class of bizarres, roses, and bybloemens. Six stands were staged, and the Rev. F. D. Horner, of Burton-in-Lonsdale, appeared to be as invincible as with Auriculas, as he set up an excellent stand, to which the judges had no hesitation in awarding the 1st prize, consisting of feathered bizarres Hepworth's Seedling and William Wilson (Hardy); flowered bizarres Polyphemus (Barlow) and Sir Joseph Paxton; flowered roses Heroine and Charnier; flowered roses Aglaia and Annie McGregor; feathered bybloemens Mrs. Cooper, a charming flower, and Friar Tuck; flowered bybloemens Talisman and Walker's Duchess of Sutherland, William Wilson, Mrs. Cooper, Friar Tuck, Hepworth's Seedling, which is very fine both in form and colour; Annie McGregor, very rich; Barlow's break of Polyphemus, Sir J. Paxton, finely flamed, and Heroine, were very fine indeed, and seen in their best form. 2d, Mr. D. Woolley, druggist, Stockport, with feathered bizarres Masterpiece and Photo; flowered bizarres Sir J. Paxton and Masterpiece; feathered roses Mrs. Lea and Julia Farnese; flowered roses Mabel and Aglaia; feathered bybloemens Bessie and King of the Universe; flowered bybloemens Duchess of Sutherland and Chancellor. 3d, Mr. Thomas Haynes, Church Street, Warwick, with a good lot; 4th, Mr. William Whittaker, Peru Street, Salford; 5th, Mr. James Thurstan, Wolverhampton.

Class 2, for six Tulips, one feathered and one flamed of each class, brought eight competitors, and the Rev. F. D. Horner was placed 1st, with beautiful blooms of feathered bizarre Masterpiece, feathered bizarre Sir J. Paxton, feathered rose Mabel, and flamed rose Annie McGregor, feathered bizarre Mrs. Cooper, and flamed bybloemen Talisman. 2d, S. Barlow, Esq., Stakehill House, Castleton, was 2d, showing smaller but charming flowers of feathered bizarre Dr. Dalton, flamed bizarre William Lea, feathered rose Hepworth's Seedling, flamed rose Mabel, feathered bybloemen Talisman—shown also in a flamed character. 3d, Mr. D. Woolley; 4th, Mr. T. Haynes; 5th, Mr. J. H. Wood, Royton; 6th, Mr. James, Thurstan.

Class 3 was for the same number of Tulips, but the competition was confined to those who subscribe half-a-guinea only, on the ground that they represent the small growers, and should be encouraged. Four stands of flowers were staged, and Mr. H. Housley, Edward Street, Stockport, was 1st, with feathered bizarre Royal Sovereign, flamed bizarre Sir J. Paxton, feathered rose Mrs. Lea, flamed rose Lady Catherine Gordon, feathered bybloemen Adonis, flamed bybloemen Duchess of Sutherland. 2d, Mr. Wright Prescott, Bedford Leigh, Lancashire, with feathered bizarre Royal Gem, flamed bizarre Sir J. Paxton, feathered rose Lady Lylford, flamed rose Mrs. Woollar, feathered bybloemen Guido, flamed bybloemen Adonis. 3d, Mr. R. Wolfenden, Thorpe, Royton; 4th, Mr. A. Fearnley.

Class 4, for three feathered Tulips, brought five competitors, and here the Rev. F. D. Horner was 1st, with charming flowers of bizarre Commander, rose Modesty, and bybloemen Mrs. Cooper; 2d, Mr. W. Dymock, Warren Street, Stockport, with bizarre Mr. Mill, rose Alice, and bybloemen King of the Universe; 3d, Mr. D. Woolley, with bizarre Magnum Bonum, rose Kate Connor, and bybloemen Bessie; 4th, Mr. T. Haynes; 5th, Mr. James Boydell. In the class for three flamed flowers, always more numerously represented than the feathered varieties, there being on this occasion thirteen competitors, the Rev. F. D. Horner was again 1st, with bizarre Orion, rose Annie McGregor, and bybloemen Talisman; 2d, S. Barlow, Esq., with bizarre Dr. Hardy, rose Mabel, and bybloemen May Queen; 3d, Mr. T. Haynes, with bizarre Sir J. Paxton, rose Triomphe Royale, and bybloemen Walker's Duchess of Sutherland; 4th, Mr. D. Woolley; 5th, Mr. A. Fearnley; 6th, Mr. H. Housley.

Then came a class for two Tulips, one feathered and one flamed, reserved for maiden growers, but there was only one entry, from Mr. Thomas Boydell, who had feathered bizarre Duke of Rutland, and flamed bizarre Sir J. Paxton. But in the open class for the same there were fourteen competitors, and Mr. H. Housley was placed 1st, with feathered bizarre Royal Sovereign and flamed bizarre Sir Joseph Paxton; 2d, the Rev. F. D. Horner, with flamed rose Triomphe Royale and feathered bybloemen Mrs. Cooper; 3d, Mr. Thomas Haynes, with feathered bizarre Ajax and flamed rose Aglaia; 4th, Mr. John Morris; 5th, S. Barlow, Esq.; 6th, Mr. W. Whittaker.

Then followed prizes for single blooms in each of the six classes, viz., feathered and flamed bizarres, feathered and flamed roses, and feathered and flamed bybloemen; from sixty to seventy flowers being staged in each.

In the class for feathered bizarres Mr. T. Baker was 1st, with Masterpiece; 3d, with Captain Winslow; and

5th, with Duke of Devonshire; Mr. H. Housley 2d, with Royal Sovereign; the Rev. F. D. Horner 4th, with Hardwick's Seedling; and 6th, with Masterpiece. With flamed bizarre the Rev. F. D. Horner was 1st, with Sir J. Paxton; and 3d, with Orion; S. Barlow, Esq., 2d, with Excelsior; Mr. T. Baker 4th, with Overshaw; the Rev. F. Tynons, Baskin Hill, Drumconna, Dublin, 5th, with Sir J. Paxton, a flower that should certainly have been nearer the 1st place; 6th, Mr. T. Haynes, with William Lea.

The Rev. F. D. Horner was very strong in the class for feathered roses, for he was 1st, with Heroine; 2d, with Charnier; 3d, with Industry; and 6th, with Modesty; S. Barlow, Esq., 4th, with Modesty; and Mr. D. Woolley, 5th, with Heroine.

In the class for flamed roses Mr. D. Woolley was 1st, with Aglaia; and 4th, with Mabel; Mr. T. Haynes 2d, with Aglaia; and 3d, with Industry; S. Barlow, Esq., 5th, with Lady Sefton; and 6th, with Anastasia. With feathered bybloemen Mr. W. Dymock was 1st and 2d, with John Hart; 3d, with a seedling; and 4th, with Lord Denman; Mr. D. Woolley 5th, with King of the Universe; and the Rev. F. D. Horner 6th, with Mrs. Jackson.

In the class for flamed bybloemens the Rev. F. D. Horner was 1st, with Talisman; Mr. T. Haynes 2d, with Queen of the Universe; 3d, with Alice Maud; and 5th, with Duchess of Sutherland; and Mr. T. Baker 6th, with Bessie.

### BREEDER TULIPS.

Of these there were, as is usual, a large number, many of them self flowers of great beauty. In the class for six flowers, two of each, Mr. James Thurstan, who has during the past few years obtained a fine lot of seedlings, was 1st, with medium sized but excellent blooms of bizarre Sir J. Paxton and a seedling rose, Annie McGregor and a seedling, and two seedling bybloemens; 2d, the Rev. F. D. Horner, with a fine lot of flowers of large size and great beauty, having bizarre Sir J. Paxton and Dr. Dalton, rose Lady Burdett Coutts and Lady C. Grosvenor, bybloemen Talisman and Glory of Stakehill; 3d, S. Barlow, Esq., with beautiful blooms of bizarre William Lea and Sir J. Paxton, roses Annie McGregor and Mr. Barlow, bybloemen Nimbus, and a seedling; 4th, Mr. T. Haynes; 5th, Mr. T. Whittaker.

In the class for three breeders the Rev. F. D. Horner was again 1st, with bizarre Dr. Dalton, rose Lady Burdett Coutts, and bybloemen Glory of Stakehill; 2d, S. Barlow, Esq., with bizarre Lord Denman, rose Annie McGregor, and bybloemen Glory of Stakehill; 3d, Mr. W. Whittaker, with bizarre Sir J. Paxton, rose Mabel, and bybloemen Delicata; 4th, Mr. H. Housley; 5th, Mr. A. Fearnley; 6th, Mr. John H. Wood.

In the classes for single blooms of breeder Tulips a large number were staged. In the class for bizarres the results were—1st, Mr. T. Haynes, with Sir J. Paxton; 2d, the Rev. F. D. Horner, with Dr. Dalton, and 3d with Excelsior; 4th, Mr. W. Whittaker, with Sir J. Paxton; 5th, S. Barlow, Esq., with Lee's No. 9, and 6th with Lord Delamere.

### ROSE BREEDERS.

1st, the Rev. F. D. Horner, with Mrs. Barlow, and 2d with Lady Burdett Coutts; 3d, Mr. D. Woolley, with Mabel, and 4th with Lord Derby; 5th and 6th, S. Barlow, Esq., with seedlings.

### BYBLOEMEN BREEDERS.

1st, the Rev. F. D. Horner, with Miss Harding, 2d with Ashmole's seedling, and 6th with Alice Grey; 3d, S. Barlow, Esq., with Nimbus, and 4th and 5th with seedlings.

### PREMIER FLOWERS.

It is customary to offer prizes for the best feathered, flamed, and breeder flowers, selected from the whole show. On this occasion the Rev. F. D. Horner supplied the flowers for all three awards. The best feathered bloom was Mrs. Cooper, bybloemen, in his 1st prize stand of twelve varieties; the best flamed flower Sir J. Paxton, in his 1st prize stand of six varieties; and the best breeder, Glory of Stakehill, in his 2d prize stand of six flowers.

A First-class Certificate of Merit was awarded to Mr. W. Dymock for feathered bybloemen John Hart, a seedling of much promise, raised from Adonis.

### EDINBURGH BOTANICAL: May 14.

THE Society met in the class-room, Royal Botanic Garden, Professor Dickson in the chair.

The following communications were read:—

I. "Note on *Strophanthus hispidus* from Mr. John Buchanan, with Exhibition of Specimens." By Professor T. R. Fraser, M.D., F.R.S.E.

Professor Fraser announced that he had discovered how the active principle of this plant, used by the natives on the Shire, East Africa, as well as many other districts of that continent, for poisoning their arrows, is of incalculable benefit in cardiac diseases. Though acting in the same manner, it far surpasses the principle of digitalis in intensity.

II. "Notes on the Vegetation and Vegetable Products of Blantyre and Zomba Districts, Africa." By John Buchanan.

Mr. Buchanan gave many details as to the trees, fruits, and economic plants of these districts. The Baobab is conspicuous in districts lower than 2000 feet in elevation; while the *Muska*, *Napala* *Kirkii*, is characteristic of the highlands. This latter tree, which is usually 12 feet or so high, and about a foot in diameter, yielding a wood not unlike mahogany, is the most important one of the Zomba district. Its fruit is much eaten by the natives.

A native substitute for the Mangosteen—a species of *Garcinia*—is also fairly edible, while the native *Damson* is the fruit of *Ximenia americana*; *Rubus rigidus* is now extensively sold by the natives. Amongst the native representatives of the Leguminosae are many well worthy of a place in our home greenhouses, such as *Tephrosia Vogeli* and *purpurea*, several *Crotalaris*, and *Clematis Kirkii*, as well as *Hibiscus*, *Abutilons*, *Convolvuli* are characteristic features of the forest scenery; *Liliaceae* are sparse, though there is a fine *Crinum*, and twenty or thirty species of ground *Orchids*. The top of *Zomba* is rich in *Heliochrysums* and *Alyssums*, as well as in a tall *Polygala*, whose flowers, distinct in colour from the surrounding vegetation, stand out in fine contrast with it. There are also many Tree Ferns on this high mountain summit; *Adiantum*, *Asplenium*, and *Pteris* abound in the district, while a species of *Scaginella* may be found almost everywhere in damp shady places. Mr. Buchanan, who is enjoying a furlough at his native village of Muthill, Perthshire, purposes returning to Mount Zomba early in July.

III. "Preliminary Note on the Evolution of Oxygen by Seaweeds." By J. Rattray, M.A., B.Sc., F.R.S.E.

IV. "Exhibition of a new arrangement for demonstrating Botanical Microscopical Objects by aid of the Lantern." By Dr. Foulis, F.R.C.S.E.

V. "Register of spring-flowering plants, showing the dates when the first flowers opened, of forty selected plants at the Royal Botanic Garden, Edinburgh, during the years 1884 and 1885."—
