# INDEX OF CONTENTS.

JANUARY TO JUNE, 1885.

## A

*ABIES grandis*, a large, 670; *A. Merten-*  
*siana*, 179; *A. religiosa*, 56  
*Abutilon*, double, 54  
Acclimatised Cedars, 114  
*Achillea ptarmica fl. pl.*, 286  
*Achimenes picta*, 57  
*Adiantum cuneatum*, 795; *A. farleyense*  
as a basket Fern, 319; *A. novæ-cale-*  
*donice*, 792; *A. pedatum*, 606  
Admiral Courbet Rose, 152  
*Echmea Barleri*, 825  
*Echmea glomerata*, 606  
*Adoxa moschatellina*, 826  
*Aërides Origiesianum*, 501  
African Narcissi, 89  
*Agapetes buxifolia*, 380  
*Agave americana*, 638, 703; *A. Oussel-*  
*ghemiana*, 703  
Age of the Victoria regia, 122  
Algeria, cultivation in, 734  
*Allamanda*, double, 704  
*Allium neapolitanum*, 536  
*Alocasia guttata var. imperialis*, 85; *A.*  
*macrorrhiza variegata*, propagation of,  
479; *A. reginæ*, 213  
*Alocasias*, potting and culture of, 377;  
propagation and culture of, 479; propa-  
gation from bulbils, 377; propaga-  
tion of, 377  
Alpine frame, 318  
Alpine Orchids, 25  
Alpine Pinks, nomenclature of, 822  
Alpine plants, 374, 767; early flowering,  
348  
*Alstroemerias*, 479  
*Amaryllis* at Westonbirt, 609  
*Amaryllis*-house at Messrs. J. Veitch &  
Sons', 373  
*Amaryllis*, the, 22, 282  
Amateur dealers, 122, 186; growers for  
market, 90; market gardeners, 20  
Amateur, what is an? 84  
Amateurs, Orchids for, 25, 78, 271, 376  
Amateurs, propagating case for, 478  
American botanic gardens, the earliest,  
448; exhibition, London, 605; florists'  
society of, 181  
*Amherstia*, 819  
Ammonia, sulphate of, per acre, 742  
*Amorphophallus virosus*, 759  
*Ampelopsis sempervirens*, 114  
Anatomy of Ferns, 180  
*Anchomanes dubius*, 668  
Anderson-Henry library, sale of the, 280  
*Anemone sport*, 733  
*Angræcum eburneum* at Biddhill, Clon-  
mel, 147; *A. fastuosum*, 533  
Annual report of Royal Horticultural  
Society, 248  
Annals, autumn sown, 802; new, 77  
*Athericum liliastrium*, 286  
*Anthoceras viscosa*, 766  
*Anthurium Adreanum*, 153; propaga-  
tion of, 83, 211; soil for, 211; from  
seed, 83; *A. Liodigi*, 215; *A. Mar-*  
*garitæ* x, 183  
Antwerp Botanical Congress, 573; exhi-  
bition, 307, 796  
*Aphelandra cristata*, 414  
Aphides, the first brood of, 382  
Apospory in Ferns, the discovery of, 338  
Apple and Pear exhibition, Exeter, 314,  
718  
Apple and soils, 78, 278, 395; *Blenheim*  
Orange, 152; *Bramley's Seedling*, 89;  
Congress, report of the, 90, 121; cul-  
ture, 176, 677; free growing, 319;  
Golden Spire, 16, 112; King of the  
Pippins, 377, 446, 570; influence of the  
soil and situation on the King of the  
Pippins, 481; Margil, 377; Mère de  
Ménage, 16; and Pears, 246; British,  
15, 503; Canadian, 82; imported into  
this country, 26; Leicestershire, 111;  
small for dessert after Christmas, 339  
Apricots, 151  
*Aralia chinensis*, 313  
*Araucaria imbricata*, 15  
*Araucarias*, 342; at Bushbridge Hall, the  
large, 146  
Arboretum, the, 15, 341, 342, 763

Arboriculture in Printing-house Square,  
766  
Argentine Republic, fruits of the, 793  
Artificial rural exhibition, 148  
*Artemisia finibritum*, 54  
*Aristolochia Siphon*, 794 (see Dutchman's  
Pipe)  
*Arnebia echinoides*, 767  
Aroids, new, 45  
Aromatic Apple, the, 377  
Artificial manure for bulbils, 383  
Ash, a Weeping, 57  
*Asplenium germanicum*, 80, 121, 206  
*Aster argophyllums*, 794  
Asters, notes on the cultivated, 13, 47,  
142, 208, 306, 501, 534  
*Astrapea Wallichii*, 85  
Aucubas, berried, 380  
Auricula and Carnation Society, the  
National, 24  
Auricula, origin of the garden, 757  
Auricula, Picotee, and Carnation Society  
(Southern Section), 86  
Auricula, the, 415  
Auriculas, laced, 576  
Auriculas at Didbury, 119; double, 676  
Australian Fern Paradise, an, 742  
Australian Grapes, 769  
Australia, Orchids in, 314  
Autumn sown annuals, 802  
Azalea, Indian or Chinese, 702; *A. in-*  
*dica* at Paris, 734; *A. i. Deutsche Perle*,  
448  
Azaleas, new Indian, 670

## B

BABYLONIAN Gardens, 642  
Bacteria on Orchids, 274  
Badminton, 405, 483  
Ragshot and Windlesham show, 20  
Bamboo, square, 278  
Bananas at Honduras, 802  
*Banksia cricifolia*, 150; *B. integrifolia*, 54  
*Barkeria elegans*, 83, 115  
Barking ("Forestry"), 569  
Bath show, vegetables at, 670  
Bean, the Lima, 77  
Beans, 13  
Bearwood, 798  
Beckwith's, Messrs., Lilies at, 412  
Bedding in small gardens, 11; perma-  
nent, 785

Beetle, the Truffle, 248  
*Begonia Mira* x, 574; *B. sceptum*, 378;  
*B. socotana*, 12, 606  
*Begonias*, new, 44; tuberous, 475  
*Begonia reticulata*, 346  
Belgium, Botanical Society of, 478  
Bentham, G., will of the late, 86  
Bentley Priory, 788  
Berceny Quetche, 60  
Berlin Botanic Garden, Year-book of,  
380  
*Bertolonias* from cuttings, 243; from  
leaves, 243; propagation of, 243  
*Bignonia venusta*, 346  
Bird's-nest Orchis, the, 110  
*Blenheim Orange Apple*, 152  
Boiler, a patent, 153; new horizontal  
tubular, 88, 510  
Boilers, 76  
"Boletim Annual," 540  
Booksellers as seedsmen, 671  
BOOKS NOTICED:—*Asclepiad*, The,  
576; Book-lore, 52; Botany, a Prac-  
tical Course in (F. O. Bower and  
S. H. Vines), 735; Bulbs and  
Bulb Culture (D. T. Fish); Bulletin  
de la Federation des Societies  
d'Horticulture de Belgique, 246; Cac-  
taceous Plants (Lewis Castle), 180;  
Cacti (Lewis Castle), 482; Christy's  
Guide to Poultry Rearing (T. Christy),  
246; Class-book of Commercial Cor-  
respondence, French and English (A.  
E. Ragon), 576; Clematis (Dr. Otto  
Kunze), 794; Cultivation of Vege-  
tables and Flowers (Sutton), 311;  
Der Garten (Jakob von Falbe), 25;  
Dew from the Roses in the Gardens  
of the Poets, the, 478; Dictionnaire de  
Botanique, 380; Electric Meteorology  
(G. A. Rowell), 414; English Flower  
Garden, the, 824; Fern Portfolio  
(F. G. Heath), 154; Forest Flora of  
South Australia (J. S. Brown), 794;  
Gardeners' Year Book, the (Dr. Hogg),  
188; Geology, Students', Elements of,  
Sir Charles Lyell's (P. Martin Dun-  
can); Malesia (Beccari), 180; Glennys  
Illustrated Garden Almanac, 180; Hen-  
frey's Elementary Course of Botany  
(Dr. M. T. Masters and A. W. Bennett),

Lanessan), 794; Landwirtschaftliche  
Samenkunde (Dr. C. Harz), 576; Or-  
chid Album, 702; Orchids: a Review  
of their Structure and History (L.  
Castle), 735; Paxton's Flower Garden,  
702; Practical Taxidermy (Montague  
Brown), 154; Rosarian's Year Book,  
154; Text Book of General Botany  
(Dr. W. J. Behrens), 735; Tree Gos-  
sip (F. G. Heath), 576; Unbeaten  
Tracks in Japan, 509; Where to Find  
Ferns (F. G. Heath), 794; Yarrell's  
British Birds, 794; Ye Narcissus  
(P. Barre & Sonnet), 188  
Botanic Garden, Birmingham, 637; Ja-  
maica, 574; Klausenberg, 278; Luck-  
now, 702; Oxford, 84; St. Petersburg,  
24; the earliest American, 448  
Botanical curiosities, 664; lectures, 572  
"Botanical Magazine," the, 54, 344, 540,  
702, 796  
Botanic Show, Orchids at, 823  
*Bougainvillea spectabilis*, 670  
Bouvardias, 731; new Continental, some,  
213  
Bramley's Seedling Apple, 89  
Branching Potatos, 80  
Brazilian Orchids, 25  
Breathing of Plants, Bonnier and Mangin  
on the, 180  
Brighton, Orchids at, 670  
British Apples, 15, 503  
British Beekeepers' Association, 245  
British Ferns, nomenclature of, 753  
British plants, sudden appearance of, 142  
Broccoli and Cauliflowers, 827  
Broccoli, Late Queen, 796, 802  
Brockhurst, Hellebores at, 114  
Bromeliads, Antoine's, 244; new, 44  
Brood of aphids, the first, 382  
Brooms and brushes, 723  
*Brownia grandiceps*, 380  
*Brugmansia sanguinea*, 385  
*Brunonia australis*, 797  
Brussels Sprouts, 59, 122, 250, 484; May's  
Northway Prize, 154, 284  
Buckinghamshire garden, notes from a,  
144, 272, 471, 598  
Buds out of place, 249  
Beurré Bosc Pear, 6, 112; B. Flon, 308  
Builders and designer of the temperate-  
house, Kew, 252  
*Bulbophyllum barbigerum*, 665  
Bulbous plants, new, 44  
Bulb show, the Haarlem, 444  
Bulbs, artificial manure for, 285, 383;  
hardy new, 76  
Bulbs of Orchids, 78  
Bull's Nursery, 147  
Burmah, cheroots, 607; paper-making  
in, 542

## C

CABBAGES, 610, 672  
Cabbage aphid, the, 741  
Cabbage, Early Warwick, 769  
Cactaceæ at New Orleans, 773  
Caladiums, starting, 119  
Calanthes at Greenland, 50  
Calanthe veratrifolia, 578  
Callispyche aurantiaca, 245  
Calceolarias at Bedford Hill House, 670  
Californian Citrus fruits, 606; Onion seed,  
153  
*Calotropis gigantea*, 798  
Camden Wood, Chislehurst Orchids at,  
608  
Camellias, 284; blooms losing their  
centres, 318, 384; exudation and smut  
on, 319; buds falling off, 27; leaves,  
exudation from, 287  
Camellias at Messrs. J. Veitch & Sons',  
479; at Walton Lea, Warrington, 570;  
potting, 545  
Canadian Apples, 82; fruit, 82; fruit, cost  
of production, 82; shipment of, 82  
Plums, 82  
Canker in Melons, 512, 671  
Canterbury Rose show, 20  
Cantua dependens, 802  
Caoutchouc, imports of, 314  
Cape Heaths, 110  
Cape Orchids, 25  
Cape, Pears from the, 444  
Canguata Andreana, "Continental  
Novelties," 213  
Carberry Tower, 473  
Carnations outdoors, 10  
Carnation and Picotee Society, the Oxford  
Union, 280  
Carnation, 703  
Carnations and Picotees, 415, 761  
Carter's Ashtop Fluke Potato, 285  
Carter's, Messrs., seeds for the micro-  
scope, 117  
*Castanea pumila*, 574  
Castle Freke, Rhododendrons at, 578  
Cat, fat Tommy, 579  
Cattleyas at Tring Park, 729; at Messrs.  
Veitch's, Chelsea, 277  
Cattleyas of the Amazon, notes on, 760  
Cattleya, a remarkable, 758  
Cattleya Brymeriana, 570; C. chocon-  
ensis, 178, 242; C. dolosa, 83, 115; C.  
Dowiana, fruit of, 501; C. gigas, 610;  
C. Lawrenceana, 374; C. Mossiae,  
770; C. Skinneri var. alba, 597; C.  
Trianae, an abortive, 118; C. T. Back-  
houseana, 309; C. T. delicata, 309;  
C. T. Emilie, 309; C. T. Emperor,  
309; C. T. Leeana, 309; C. T. mag-  
nifica, 309; C. T. Norman, 309;  
C. T. Osmani, 309; C. T. Victoria  
Reginæ, 309; C. Walkeriana and C.  
dolosa, 147  
Cauliflower roots, 11; Veitch's Early  
Forcing, 89, 122  
Cauliflowers, sowing, 119  
Ceanothuses, 791  
Ceara rubber in Ceylon, 314  
Cedars acclimatised, 114  
Cedars at Reelick, the, 243  
Cedar cones fertile, 146  
Celeriac, 154, 187  
Celery, 763; sowing, 119  
Céline Forestier Rose, 152  
Cement cisterns for water, 734  
Centropogon Lucyanus, 250  
Cerasus Mahaleb, 575  
Cercis siliquastrum, 763, 794 (see Judas  
Tree)  
Certificates of the Royal Horticultural  
Society, 84  
Cestrum (Habrothamnus), 184  
Château de Ferrières, 760  
Chelsea, 822  
Chemists and grocers as seedsmen, 579,  
610  
Cherley Court, 755; Yews, the, 308  
Cherries, 22, 667  
Chicory, crimson leaved, 214  
Chili, Miss North in, 77  
China, Northern and Eastern, 311  
Chinese Conifers newly discovered, 280  
Chinese Vegetation, Abbé David's, 311  
*Chionanthus retusus*, 729  
Chiswick Horticultural Society, 796  
*Chionanthus retusus*, 820  
*Choisya ternata*, 794  
Chrischurch Botanic Garden, 249  
Chrysanthemums and their culture, 509  
Chrysanthemums, late, 23, 282, 248;  
late flowering, 119; new, 671; new,  
from Japan, 244  
Chrysanthemum atratum, 286; C. La  
Nymphæ, 440  
Chrysanthemum blooms, undressed, 58

Chrysanthemum Society, National, the, 84, 118, 182  
Chrysanthemum, the, 282, 676  
Cinchona in Jamaica, 766  
Cinerarias at Woodside, Farham Royal, 446  
Cineraria Snowflake, 510  
Cineraria, the, 282, 676  
Cirrhopetalum picturatum, 243  
Citrus fruits, Californian, 606  
Clarke, Colonel Trevor, 764  
Clematis indivisa lobata, 384  
Climax punicus, 416, 702, 738  
Climbers for amateur's greenhouse, 246  
Clivia miniata at Lythe Hill, 284, 479  
Close fertilisation of Orchids, 773  
Clover and grass seeds, 85  
Clover sickness, 770  
Club, Horticultural, 118, 766  
Clutterbuck, Rev. J. C., 670  
Coal, 117  
Cockscomb in winter, 319  
Cocoa beans, a moth injuring dry, 800  
Codonopsis ovata, 792  
Cœlogyne cristata alba, price of, 279; *C. cristata* as a commercial plant, 504; *C. cristata* Lemoniana, 316  
Collections, educational, 182  
Colonial notes, 249, 577, 663  
Colorado Potato beetle, 572  
Colours, nomenclature of, 50  
Colour in flowers, 24  
Colouring matters of flowers and fruits, 794  
Columbia Market, the, 151  
Comelyna cœlestis, 114  
Common garden insects, 565, 703  
Common rights in Epping Forest, 346  
Conference, a Primula, 702; see Orchid  
Conifers, Chinese, newly discovered, 280  
Conservatory for Haarlem, 84  
Conservatory, the, 763  
Cool treatment of Nephthys, 737  
Coombe Wood, 759  
Cordylines, New Zealand, 788  
Cordylina australis, 802  
Coryanthes, 144; bloom, dissection of, 143, 144  
Cortusa Mathioli, 570; *C. pubens*, 570  
Corydalis Bigelowi, 773  
Cotton, is it an American plant? 769  
Cotton plant, a new, 182  
Covent Garden Lifeboat, 412; market regulations, 510  
Cowan's patent pottery, 280  
Cowper's country, 469  
Cranberries, 371  
Crassula pyramidalis, 545  
Crewe Hall, 75  
Crocus, spring, 314  
Crotalaria semper florens, 54  
Cryptomeria, excrescence on, 416  
Cryptostylis longifolia, 275  
Cucumbers, culture of, 79; forcing, 151  
Cucumber growing, 123, 187, 250  
Cultivation, and what it does, 542  
Cultivation in Algeria, 734; of Lettuce under glass, 502; of Plums under glass, 142  
Cultures, new, in South Australia, 85  
Culture of Cucumbers, 79; of plants in small pots, 513; the Potato, 439; of Vegetable Marrows under glass, 242  
Cupressus macrocarpa, 176; a large, 153  
Curiosities, botanical, 664  
Curious instance of fruit protection, 662  
Cutch, manufacture of, in Burmah, 606  
Cutler testimonial, 637  
Cyclamen, 23; a new type of, 536  
Cypripedium concolor, 758; *C. Godfreyi*, 49  
Cymbidium devonianum, 49; *C. Lowii*, 598; *C. pendulum* var. *atro-purpureum*, 759  
Cypripedium, the, 178  
Cypripediums, new, at Messrs. Veitch's, 277  
Cyrtoideira fulgida, 58  
Cypripodium Andersoni, 665; *C. car-diochilum*, 210, 243  
Cytisus, proliferous, 246; *C. Adami*, 739

D

DACRYDIUM cupressinum, 663  
Daffodils, doubling of the, 416, 448, 564, 578  
Daffodils, 470, 540; double seeding, 441, 471  
Daffodils, 502, 572; double, 502, 544, 564, 692  
Daffodils and insects, 671  
Daffodil, 34; Congress, 412  
Daffodil Committee, the, 444, 511  
Daffodil Sir Watkin, 502  
Daffodil names, 537  
Dahlias, bouquet, selections of, 452; ex-hibition, selection of, 416  
Dahlias, new, of, 1885, 240  
Dahlias, Pythium on, 23  
Dahlias, single, selections of, 452, 671  
Dahlia, Grand National Show, 20  
Dahlia reduplicata, "Continental Novel-ties," 213; Society, the National, 58

Dahlia, 216, 480, 761  
Daisy cutter, a new, 761  
Daisy, Hen-and-Chicken, 742  
Damage from hailstorm, 671  
Dammara australis, 663  
Daphne cneorum, 738, 767  
Darwin statue, the, 733, 764  
Date Palms at Lucknow, 762  
Date Palm, the, 52  
Dealers, amateur, 122  
Deformed Fir branch, 274  
Delphiniums, new, 316  
Dendrobiums, pruning, 219, 250, 285, 318, 538, 578; seedling, 768  
Dendrobium, a new seedling, 212  
Dendrobium cruentum, 243; *D. draco-nis*, 759; *D. Hasselti*, 210; *D. erosum*, 174; *D. nobile*, 570; *D. oobile* pruned, 538; *D. nobile* vars., 505  
Dendrobium speciosum, 180, 242, 243, 284, 319; *D. splendissimum*, 277;  
*D. Wardianum*, 377, 448  
Destruction of the Holt Elm, 46; of slugs and grubs, 58  
Devon notes, 801  
Dianella, petalody of the ovules, 576  
Didsbury, Auriculars at, 119  
Dieffenbachias, the propagation and cul-ture of, 506  
Dinner to *employés* at Harefield Grove, Uxbridge, 446  
Dion edule, 213  
Dipladenias, propagation of, 575  
Dischidia, pitcher of, 278  
Diseases and non-germination of Peas, 768  
Diseases of Orchids caused by fungi, 693

## P

PÆONIA arborea in pots at Gunnersbury House, 479, 511  
 Pæonies, tree, 82  
 Pachystoma speciosa, 598  
 Palms, 143; garden, 439

Palms, garden, *Catoblastus præmorsus*, *Ceratolobus glaucescens*, *Ceroxylon andicola*, 338  
 Palms at Kew, history of, 533  
 Palm-leaf labels, 412  
 Palm, the Date, 52  
 Pansies at Paris, 734; fancy, at Boreatton, 670  
 Panax Murrayi, 246  
 Pansies at the Botanic Show, 822  
 Pansy Society, Scottish, the, 825  
 Papaver umbrosum, 802  
 Papaw, the, 141  
 Paper making in Burmah, 542  
 Paradise and Victoria Nurseries, 728  
 Parasite of Henbane, 176  
 Parcel post, the, 380, 416, 545  
 Paris Horticultural Congress, 572  
 Paris International Exhibition, 278;  
*Azalea indica* at, 734; zonal *Pelargoniums* at, 734  
 Passiflora Constance Elliott, 575, 637  
 Pavia flava, 761  
 Peas, 449, 512; Bliss' Abundance, 214; competition in, 417; diseases of, and non-germination of, 768  
 Peaches, 661; and Nectarines, 22; in two stages of ripeness, 733  
 Peach trees under glass, 440  
 Peach, Waterloo, 570  
 Pear, Aston Town, 317; Beurré Bosc, 60, 112; Beurré Flon, 308, 446  
 Pear Congress, the, 764  
 Pear, Dunmore, 317  
 Pears from the Cape, 444  
 Pear, Josephine de Malines, 317; Madame Huin, 246  
 Pear trees, thinning buds on, 319  
 Pear, Triomphe de Jodoigne, 611  
 Peas in cold frames, 820  
 Pelargonium, the, 676; Parson's new, 384  
 Pelargoniums, new Continental, some, 213  
 Penrhyn estate, remarkable trees on the, 177, 242  
 Pentstemon digitalis, 824  
 Penzance district, market gardens in, 148; notes, 153  
 Percentage of the fruit crops in 1884, 46  
 Perennial Candytufts, 738  
 Perennials, new, 76  
 Perigord pie, the true and false, 48  
 Peronospora effusa, 480; *P. hyoscyami*, 176  
 Pescatorea Klabochorum, 412  
 Petaloid of the ovules of *Dianella*, 576  
 Phaius grandifolius, 380; *P. maculatus*, 598  
 Phalenopsis Parishii, 598; *P. Schilleriana* var. *advena*, 174; *P. violacea*, 570  
 Phaseolus vulgaris, 13; *P. multiflorus*, 13; *P. lunatus*, 13  
 Philesia buxifolia, 483  
 Philippine Islands, the, 447  
 Phloxes, herbaceous, 55, 385, 483  
 Phormium tenax, 671  
 Photinia serrulata, 25, 146, 728, 763  
 Phyllanthus mimosoides, 414  
 Phylloxera, the, 478, 508; laws, 56, 346  
 Phytium on Dahlias, 123  
 Piassava, 723  
 Picea Breweriana, 571; *P. Parryana* glauca, 125  
 Pickering Lodge, Orchids at, 49  
 Pine-apples, 21  
 Pine-apple culture in moss, 408  
 Pine needles, 769  
 Pink, the florist's, 761; Tom Thumb Scarlet, 83, 122  
 Pinus Coulteri, 415, 478; *P. Lambertiana*, 11; *P. patula*, 108; *P. Thunbergii*, 344  
 Piptanthus nepalensis, 794  
 Pitcairnia Maroni, "Continental Novelties," 213  
 Pitcher of *Dischidia*, 278  
 Plants and their culture, 21, 56, 87, 119, 151, 183, 215, 247, 281, 315, 342, 381, 411, 443, 475, 539, 603, 666, 699, 731, 763, 795, 823  
 Plants adapted for rooms, 186  
 Plants and cut flowers, 677, 760  
 Plants and the severe weather, 217; bulbous new, 44; diseases of, and sulphide of potassium, 276; Dr. Regel on the cultivation of, 111; English names for, 116; foliage, new, 44; for a dry bank, 580  
 Plants, hardy and half-hardy new, 76; importation of, into Germany, 702; in flower at Edinburgh Botanic Garden, 414; in small pots, culture of, 513  
 Plants, miscellaneous new, 44; new commercial and drugs, 574  
 Plants, protection of, 218; spring flowering, 318; stove, new, 44, sudden appearance of British, 142; suitable for present forcing, 151; syringing, 543; the hardiness of, 407; to bloom in winter for aquarium, 125; to Germany, 20  
 PLANTS, NEW, DESCRIBED.—*Eranthus leonis*, 726; *Aërides Burbridgei* splendens, 756; *A. marginatum*, 533; *A. Ortigiesianum*, 501; *Angræcum florulentum*, 787; *A. fuscum*, 726; *A. rostellare*, 726; *Anthurium inconspicuum*, 787; *Barkeria elegans* and *B. cyclotella*, 140; *Cattleya bicolor* Wrigleyana, 206; *C. (labiata Mossii)* Nalderiana, 756; *C. resplendens*, 692; *Citrus medica* var. *Riversi*, 344; *Cœlogyne lactea*, 692; *Cypripedium cardinale*, 270; *C. leucorrhodum*, 270; *Cypripodium Saintlegerianum*, 756; *Dendrobium euosmum*, 174; *Dioscorea crinita*, 344; *Eria Elwesi*, 438; *E. monostachya*, 532; *Epidendrum falsiloquum*, 566; *E. Paytense*, 726; *E. pseudo-Epidendrum*, 406; *Eulophia megistophylla*, 787; *Ipomœa Horsfalliae*, 566; *I. macrorrhiza*, 566; *I. ternata*, 567; *I. Thomsoniana*, 567; *Iris reticulata sophenensis*, 470; *I. Vartani*, 438; *Lælia anceps blanda*, 206; *L. a. leucosticta*, 206; *L. a. Sanderiana*, 140; *L. a. Schroederiana*, 342; *L. purpurea* var. *pallida*, 785; *L. purpurea* var. *Schroederi*, 786; *Liparis latifolia*, 532; *Lissocichus stylites*, 786; *Masdevallia acrochordonia*, 174; *M. Wallisi*, 174, 270; *Maxillaria Kalbreyeri*, 239; *M. præstans*, 566; *Narcissus jonquilla* var. *Burbridgei*, 756; *Neviusia alabamensis*, 344; *Odontoglossum Andersonianum* and *O. hebraicum*, 470; *O. Brassia*, 501; *O. cirrosum* *Hruby-anum*, 370; *O. Coradinei albidulum*, 787; *O. C. Kinlesidiana*, 787; *O. Pescatorei melanocentrum*, 239; *Oncidium ludens*, 756; *Phalenopsis Schilleriana* *advena*, 174; *Pleurothallis liparanges*, 532; *Pogonia Barklyana*, 726; *Rodriguezia Leeania*, 692; *Saccolabium celeste*, 692; *Solidago Drummondii*, 344; *Vanda Stangeana*, 406; *Vanilla Humboldtii*, 726; *Vitis pterophora*, 344; *Warrea cyanea*, 692; *Zygopetalum pentachromum*, 532

PLANT PORTRAITS.—*Acer Heldreichii*, 567; *Echmea cornui*, 317; *Agave Weissenburgensis*, 206; *Andersonia corulea*, 567; *A. depressa*, 567; *A. homolostoma*, 567; *Aphelandra cristata*, 141; *A. fascinator*, 567; *Angræcum Kotschyi*, 346; *Azalea* M. **CHARLES NOBLE, Bagshot.**

**HARRISON'S EARLY ECLIPSE**  
**PEA.**

The Earliest in the Garden.  
The Earliest in the Field.  
The Earliest for the Market.

See *Gardeners' Chronicle* and *Gardeners' Magazine*,  
December 6, containing a whole page of opinions.

The haulm is of a peculiar light colour, only 2 feet in  
height, the pods of a lively green and well filled, and is  
the heaviest cropper for an early variety we have ever  
seen. The seed is blue, and similar in appearance to the  
"Kentish Invicta," but it is harder and even earlier  
than that excellent variety.

This variety was selected by us from *Laxton's Har-  
binger* about eight years ago, and has no other origin.  
Many trials last season in different parts of the country  
have proved it to be the earliest Pea in cultivation.  
Although coming into blossom the same time as several  
other kinds, the pods fill so rapidly that they are ready  
for picking a week or ten days earlier.

Per Quart, 1s. 6d.; post-free for 2s.  
Per Bushel, 26s.

Highly recommended to Market Gardeners.

Price to the Trade on application.

Wholesale CATALOGUE free on application.

General CATALOGUE free on application.

## MARTIN'S PRESIDENT CAULIFLOWER

A very early and distinct variety, which has been grown in the East Riding of Yorkshire for the past six years, where it is held in great reputation.

It comes into use in May, and continues until the late summer varieties are ready for cutting. The heads are medium sized, beautifully close and white, and well protected by the foliage, which enables it to stand the dry hot weather, such as we experienced last summer.

The plant is dwarf and very compact, and can be planted three or four inches closer than any other variety.

Retail Price, 1s. 6d. per packet.

Mr. R. GILBERT, Gardener to the Most Noble the Marquis of Exeter, writes as follows:—

"Mr. Martin, Sir.—Your 'President' Cauliflower sent me for trial has turned out the very best of all I have grown this season: four heads in my first collection of vegetables at the Stamford Show were the admiration of all, and very far above any in the show." (Signed) R. GILBERT, *Burghley, Sept. 4, 1884.*

And then, to publish its merits to the gardening world, Mr. GILBERT writes to *The Garden*, September 20, 1884:—

"MARTIN'S PRESIDENT CAULIFLOWER."—"After giving this sort a good trial, I am now enabled to give my opinion respecting its merits. Amongst the varieties I am growing are Best of All, Snowball, Early Erfurt, Veitch's Giant, Walcheren, and the one in question. On September 2, I wanted a dish of Cauliflowers for a collection of vegetables. I have a large quarter of Cauliflowers planted, and I carefully searched for the best, this I found in Martin's President, which, to take into consideration the dry weather, was certainly an admirable production, being close and well protected by the foliage and perfectly white; in fact I took upon this Cauliflower in such seasons as we have just gone through, as a gardener's friend."—R. GILBERT, *Burghley.*

Many other Testimonials could be published, but the above will suffice to prove the superiority of my "President" Cauliflower over other varieties.

NORFOLK

ESTABLISHMENT

### NEW EARLY PEAS for 1885.

The Earliest and Best in Cultivation.

### DANIELS' GEM OF THE SEASON

SHOULD BE SOWN NOW.

From Mr. A. ARTHUR, Orwell Gardens, Cambridge.

"I sowed your Gem of the Season Pea March 29, and gathered them June 13, and sowed Laxton's Earliest of All March 15, and did not gather till June 29. This new Pea has proved what its name implies for earliness, productiveness, and flavour."

From Mr. T. NOTLEY, The Gardens, Stoke Hall,  
Stoke Holy Cross.

"The Pea, Gem of the Season, has proved itself a good one. I planted it at the same time and by the side of Day's Early Sunrise. I gathered from Gem of the Season ten days earlier, the pods were also full, averaging from seven to nine good sized Peas in each."

Height 2 feet, and very prolific.

Price, 3s. 6d. per quart, 2s. per pint, 1s. 3d. per half-pint.

Free by Parcels Post to any address.

### DANIELS' MIDSUMMER MARROW PEA.

The Earliest Blue Wrinkled Marrow in Cultivation.

Height 1½ to 2 feet. Splendid cropper and quality.

Should be sown now.

Price, 3s. 6d. per quart, 2s. per pint, 1s. 3d. per half-pint.

Free per Parcels Post to any address.

SECRETARY (*pro tem.*),  
Mr. F. M. EDWARDS.

OFFICES.  
DERRY DOWNS, ST. MARY CRAY.

The Company has been formed to carry on the business of Bee Farming on an extended scale, embracing the raising of Bees, the production of Honey, and the supplying of all necessary materials and appliances requisite for the modern systems of Bee Culture, as well as to deal in Honey, putting the same upon the Market in a manner attractive to the public taste.

2d. To carry on, in conjunction with the above, Fruit Farming and Preserving, Market Gardening and Dairying, as the public demand and local circumstances warrant.

3d. To acquire a Sub-Lease and the Goodwill of the Cray Valley Bee Farm, lately occupied and carried on by J. Garratt, Esq., at Hockenden, St. Mary Cray, Kent.

The increased production of Honey at the present time, owing to a great extent to the stimulus given to Bee-keeping by the exertions of the British Bee-keepers' Association and the County Associations affiliated thereto, renders an undertaking of this kind very opportune. The demand for Honey is very great, and its use, both in the natural as well as in applied forms, is rapidly increasing.

In inviting the co-operation of Bee-keepers especially, it may be somewhat superfluous to dwell at any length upon the profitable character of Bee-keeping, but to others less well informed it may be necessary to state that in an ordinarily favourable season a single Colony of Bees may

be looked to store from 60 to 100 pounds of surplus Honey, the latter figure being frequently exceeded.

The site selected by the Company for its first operations possesses eminent advantages for the purposes intended. Mr. Garratt, who is well known as an enterprising and successful Bee-keeper, has resided there for fourteen years. The Farm comprises 43 acres of highly productive land, divided into fruit plantations and arable, with residence and suitable out-buildings. It is situated about 12 miles by road from London, and is therefore conveniently placed for the carriage of its produce to all parts of the Metropolis. Its position is sheltered and warm. For the purpose of Bee-keeping it may be regarded as most favourable, being situated in the midst of fruit plantations, and Raspberry and Currant fields, as well as field crops of Honey-yielding kinds. The fruit produced on the Farm for a long series of seasons, has been both abundant and good. The land and the situation are also well adapted for such auxiliary branches as the cultivation of flowers, Tomatoes, Grapes, &c., for which there is a large demand.

The purchase-money to be paid by the Company to the Vendor for the Sub-Lease (having 9 years to run from 29th September last, at a rent of £125), and the Live and Dead Stock, as well as the well-appointed and fully equipped Apiary, including 60 Stocks of bees, is £750, of which it is agreed £550 shall be paid in cash and the remainder in fully paid-up shares.

*Full Prospectuses and every information can be obtained on application to the Secretary, as above.*

## THE GARDENERS' CHRONICLE

### FORM OF SUBSCRIPTION.

FROM

TO

W. RICHARDS,

41, WELLINGTON STREET, STRAND,  
LONDON, W.C.

1885

Please send me "THE GARDENERS' CHRONICLE" for \_\_\_\_\_ Months,  
commencing \_\_\_\_\_, for which I enclose P.O.O. \_\_\_\_\_.

Please Note that all Copies Sent Direct from this Office must be paid for in advance.

THE UNITED KINGDOM:—12 Months, £1 3s. 10d.; 6 Months, 11s. 11d.; 3 Months, 6s.; Post-free.

FOREIGN SUBSCRIPTIONS (excepting India and China):—Including Postage, £1 6s. for Twelve Months. India and China, £1 8s. 2d.

P.O.O. to be made payable at DRURY LANE, London, to W. RICHARDS.

Cheques should be crossed "DRUMMOND."

# WEBBS'

UNIQUE

# NOVELTIES

## THE SECRET OF SUCCESS.

The unprecedented success of Messrs. WEBBS' Introductions in Vegetables and Flowers is no doubt owing, in a great measure, to the fact that, before being offered to the Public, they are invariably subjected to a series of crucial trials, with other first-class varieties, at their Kinver Seed Farms,—which are the largest in the Kingdom. By this means inferior varieties are discarded, and only those kinds that are of distinctive merit become associated with Messrs. Webb's name.

### PEA—Webbs' New Wordsley Wonder.

The unparalleled qualities of this new Pea are verified by the numerous testimonials we have received in its favour from the principal authorities. 2s. 6d. per pint, post-free.

### PEA—Webbs' New Stourbridge Marrow.

A grand new second early Pea, suitable for exhibition or general purposes. 1s. 6d. per pint, post-free.

### BROAD BEAN—Webbs' Kinver Mammoth

Longpod. Exceedingly early, an enormous crop, and of excellent quality. 1s. per pint, post-free.

### BRUSSELS SPROUTS—Webbs' Matchless.

Early and robust, producing a profusion of compact sprouts, which are tender and of superior flavour. 6d. and 1s. per packet, post-free.

### BROCCOLI—Webbs' New Autumn White

A new and distinct kind, of dwarf habit; very hardy. 1s. per packet, post-free.

### CABBAGE—Webbs' Emperor.

A rapid grower, very hardy and early, with close compact heads. 6d. and 1s. per packet, post-free.

### CAULIFLOWER—Webbs' Early Mammoth.

A very compact variety, of exceptional merit, with large, firm, snowy-white heads. 1s. 6d. per packet, post-free.

### CUCUMBER—Webbs' Perpetual Bearer.

Very free bearing; fruit uniformly handsome in shape and of large size. 1s. 6d. per pkt., post-free.

### LEEK—Webbs' New Colossal.

A distinct and choice variety, of rapid growth and large size. 1s. per packet, post-free.

### LETTUCE—Webbs' New Wordsley Gem.

A new extra early Cos variety, of grand flavour. 1s. per packet, post-free.

### MELON—Webbs' Pride of Stourbridge.

A scarlet-fleshed variety, of handsome shape and splendid quality, specially suitable for exhibition. 2s. 6d. per packet.

### ONION—Webbs' Improved Banbury.

A most handsome kind, of mild flavour; good keeper. 6d. per packet, post-free.

### TOMATO—Webbs' Early Dwarf Red.

Very prolific, of large size, excellent in shape and quality. 1s. per packet, post-free.

## SAVE 20 PER CENT.

Our exceptional position as the largest Seed Growers in the Kingdom enables us to offer our pure Stocks of Vegetable and Flower Seeds at very moderate prices, which, on comparison, will be found some twenty per cent. lower than those of other Houses.

## CHARLES SHARPE & CO.'S

## SPECIALITIES, 1884-5.

### SHARPE'S PEA.

2s. 6d. per pkt.

### TRIUMPH.

Finest Dwarf Blue Wrinkled Marrow. Best flavoured and heaviest cropper—sixty-nine pods, with nine to eleven Peas in each, gathered from one plant.

### SHARPE'S PEA.

2s. 6d. per pint.

### PARAGON.

Hardest and earliest large Wrinkled Marrow. Successive crops can be had for four months. First-class Certificate. R.H.S., 1884.

### SHARPE'S PEA.

1s. per quart.

### PROLIFIC WHITE MARROW.

An excellent, large-podded, prolific, White Wrinkled Marrow.

### SHARPE'S PEA.

1s. per quart.

### INVINCIBLE.

Fine, long-podded, Blue Marrow. Peas deep green. A fine Market Garden Pea.

### SHARPE'S BEAN.

1s. per pint.

### CONQUEROR.

The longest-podded variety known. Pods often 16 to 18 inches long. Fine for Exhibition.

### SHARPE'S CUCUMBER

2s. 6d. per pkt.

### EPICUREAN.

The most prolific, earliest, deepest in colour, and finest in flavour of any variety grown. Fruit long and very handsome. It is simply perfection.

### SHARPE'S POTATO.

8d. per pound.

### VICTOR.

The earliest, quickest, and most productive kind for forcing or early planting—ready for table in from six to eight weeks.

### SHARPE'S POTATO.

4s. per stone.

### DUKE OF ALBANY.

Most valuable main crop variety—good to use from July to March.

### SHARPE'S TOMATO.

1s. 6d. per pkt.

### POMEGRANATE.

Fruit large, round, smooth, deep pink, suffused with violet. Flesh solid, very deep in colour, and of the finest flavour.

### SHARPE'S New Tomato.

2s. 6d. per pkt.

### ECLIPSE.

A remarkably prolific variety. Fruit globular, smooth, growing in large clusters at every joint, exquisite flavour, colour bright cherry-red.

### SHARPE'S PARSLEY.

6d. per packet.

### LINCOLN GREEN.

The perfection of garnishing Parsley.

### SHARPE'S ONION.

1s. per packet.

### PRIZE WHITE SPANISH.

The best type of the Banbury section of Onions.

### SHARPE'S MELON

1s. per packet.

### RAUCEBY HALL.

Finest flavoured green-flesh Melon in cultivation.

# B. S. WILLIAMS' SEED NOVELTIES

For 1885—Post-free.

The following three NOVELTIES are my own introductions, and are now offered for the first time:—

## SALVIA, BLUE BEARD (New).

A very handsome hardy Annual, growing about 18 inches high, of free branching habit, with square stems and Sage-like leaves. The spikes are furnished at the apex with a number of brilliant deep mauve-purple bracts, which give to the plant a most unique appearance. The flowers are produced in a series of whorls, are small, labiate shaped, of a bright purplish colour, with lower lip white. Suitable for large beds and borders, in which it has a very effective appearance. Sow in February. Sold only in sealed packets bearing my trade mark.

Per packet, 1s. 6d.

## TOMATO, WILLIAMS' GOLDEN QUEEN (New).

A very large, handsome fruit, of a rich deep golden-yellow colour, slightly ribbed, with smooth skin. This is without exception the finest and richest coloured of all the yellow section, producing fruit as large as the red varieties. It is very prolific, and for culinary purposes is equal to any of the red forms. I have every confidence in recommending this beautiful and useful variety, and feel convinced that it will become a popular favourite.

Awarded a First-class Certificate by the Royal Horticultural Society. Sold only in sealed packets bearing my trade mark.

Per packet, 2s. 6d.

## TOMATO, WILLIAMS' RED KING (New).

A very free cropper, fruit large and slightly sutured, smooth and even outline, rich crimson colour, flesh solid and of excellent flavour. Strongly recommended as a most valuable and serviceable variety. Sold only in sealed packets bearing my trade mark.

Per packet, 2s. 6d.

# SUTTON'S CHOICE NOVELTIES.

### SPECIAL NOTICE.

Why Messrs. Sutton's Novelties are reliable:—

MESSRS. SUTTON'S Experimental Trial Grounds—which are frequently referred to by leading Horticultural Papers—afford the opportunity of ascertaining the comparative value of every kind of Vegetable, Flower, and Potato. These trials are made under Messrs. SUTTON'S personal superintendence in the most careful and exhaustive manner. During 1883-84, nearly 10,000 plots were sown and records taken of the results for future guidance.

## SUTTON'S NEW TOMATO for 1885.

## SUTTON'S CHISWICK RED.

First-class Certificate R.H.S., Aug. 30, 1883.

A distinct and remarkably prolific variety, oval in shape, medium size, perfectly smooth, of bright red or crimson colour, and excellent in flavour. The fruit grows in large, heavy clusters, each cluster having from twenty to thirty fruit, and every plant bears from six to eight clusters. The entire stock of seed is in our hands, and every packet will bear our Registered Trade Mark.

Per packet 2s. 6d., post-free.

THE

# Gardeners' Chronicle.

SATURDAY, JANUARY 3, 1885.

THE EXTREME NORTH OF SCOTLAND.

JOHN O' GROATS.

"I THINK we shall have time enough, sir; this mare's the fastest in the stable, and a rare one for pace," says our driver, as we dash across the little bridge which spans the Thurso river. There is need for haste; we have 40 miles to drive before dinner, with horse-baiting midway, and the clock has already struck two. So away we go, between the acres of Oats and Rye, and in a short while are rattling through Castletown. What a change! We have left the bleak North, and can almost fancy ourselves in a Sussex village, so thick and strong grow the trees here—planted, it is true, in a favoured spot—but none the less lending that charm without which something seems wanting to all but grand scenery. However, we are soon beyond the trees, careering across the heather-clad moor, here and there broken by cuttings for the brick-like masses of stacked peats the stalwart peasantry are busily carrying to their cottages. The view is continually shifting; now we are close to the sands of Dunnet Bay, now clattering through some hamlet or a village, with its prim kirk; now out again in the open, with the wide wet moor on either hand, not desolate this afternoon, but gleaming coldly in the glorious sunlight. Yet though the day is cloudless and almost windless, one look at the cottages is enough to tell us a tale of the utter ruin that would overtake them but for the huge stones, suspended at the ends of ropes, passing over the thatch. Poor and comfortless seem these homes of the people, but what delicious contrasts of form and colour in gable and wall and outhouse they give, thrown up in fine relief on the background of moor and frith and distant cliff. Verily, when the sun is upon it, this is a land such "as would select some artist that his skill might never die," were he rash enough to admit the possibility—so fresh seems everything—so buoyant upon the flood of light which beats upon it without cessation.

Everybody knows the John o' Groat legend. How Johnny, the brother of a large and contentious family—laughing, doubtless, in his sleeve at the silly punctilios of life—dextrously hit upon a plan by which matters were brought to a friendly issue, by suggesting that the house in which the brethren met to discuss their concerns should have as many doors as visitors, whereby they would no longer be under the necessity of playing the game of follow my leader—a very unpopular one with these gentry, and one which there is reason for believing to have caused heartburnings at times in places less remote from centres of refinement than Caithness. In proof of this story you are shown a mound, now covered with grass, said to be the ruin of this house of peace; hard by we descend at the polygonal hotel built in imitation of the house, but entered in the ordinary manner. The hotel is at the verge of, and but a few feet above, the shore of the frith, yet, though there is no cliff here worth calling a cliff at all, we find ourselves at the bottom of a

gently sloping lofty down, battered on by sheep, except where there are counter-changes of narrow swamp, in which the pretty blossoms of the Bog Pimpernel (*Anagallis tenella*) may be pulled. Climb the down and a noble and never-to-be-forgotten prospect opens. A lofty growth of cliff facing the North Sea, which has wrenched away from it many scarred and furrowed columns of rock or "stacks;" round these the clear green water is lazily working itself into foam; no keel is ploughing any of the myriad acres of sea, but far away upon the horizon stand the bare masts of scores of fishing-boats gathering in the bountiful herring harvest. Northward across the frith glimmer the cliffs of Hay and the low coast-line of South Ronaldsha; further on frith and main sea meet round the huge headland of Duncansbay, upon one of whose crags a solitary eagle can be made out with the aid of the glass; landward there are miles upon miles of rolling moor flanked by the mountains bordering Caithness and Sutherland.

Very pleasant in the warm afternoon is a stroll along the northern shore, where one may revel in the deliciously pure white sand, or watch the advancing tide gently absorbing in the frith the coralline-studded pools of clear water: pleasant, too, as, after hastily remounting, we find ourselves whirling homewards, the sun still high in the heavens. But before reaching Thurso we are reminded, by the intense cold of the July evening, that this is a country where man has to barricade himself against Nature, and can gain a subsistence only at the cost of constant warfare against her inhospitable rigours.

#### THURSO.

We have left the mountains far behind, and have just been hurrying across a chilly moorland country, the sombreness of whose desolation is relieved by an occasional stretch of culture, in the midst of which stands some farmstead, jealously protected from the northern wind by a grove of stunted trees. The sea was lately caught sight of, and dim cliffs beyond; and now, the journey at length over, in front of us the waves of the North Atlantic shimmer in the sunlight, while at our feet, upon the verge of its bay, nestles the northernmost town on the mainland of Britain. And a fine bay it is, and well worth coming so far to see—large, well sheltered, its wide entrance guarded by two bastions of noble cliff—Holborn Head on the west, on the east the escarpment forming part of the long promontory of Dunnet. In the frith outside a strong current is running, but its impulse is scarcely felt within the bay by the tiny wavelets that gently seethe upon its white sands and lap a schooner or two anchored near the shore. An old man sunning himself, some children making sand-castles, a solitary bather in the distance—these are the only signs of life. Within the town all is quiet, no roll of cart or carriage through either of the two main streets breaks the monotony of silence, and the lanes leading from them seem almost as devoid of movement as the figures adorning the modern gewgaw structure which has taken the place of the ancient home of the Sinclairs. It is not the castle, however, that we feel interest in, nor even the town, as we stand in Wilson's Lane and notice the mean buildings on either side, for here, in one of the smallest of them, lived a more remarkable person than Thurso is likely to see for many a day—Robert Dick, baker and man of science.

With Mr. Smiles' biography well in remembrance, we may step inside and inspect the bakehouse, upon whose walls this singular genius exhibited his skill in drawing, and the little room, which served as a museum, and was always carefully locked against the profane dustpan. We may, in fancy, see him, having set his "batches" of dough, start off late at

night, or in the early morning, at a swinging pace, for forty or, perhaps, fifty miles have to be covered before he will return to set the next "batch," and his best speed will allow him but two short hours to search at his destination for a rare and long-wanted specimen, or to collect evidence in solution of some geological problem. Or, again, we may see him wearily walking homewards for the last time, conscious that the hand of death is upon him, and that the days to dawn can bring him but fortitude in suffering—suffering borne, let us be thankful to think, not without the consolation of a faithful and long-tried servant. How devoted, indeed, must that service have been when the mere mention of her employer's name suffices, after the lapse of nearly twenty years, to bring tears to her eyes, and sobs which drown her testimony to the virtues of her "good maister." Unhappily that service has had but scanty pecuniary reward—from the extreme humbleness of the room in the cottage close to Wilson's Lane, which Annie Mackay occupies, it is plain that her life is a desperate conflict with poverty.

We walk round the bay, past the ruins of the Bishop's Palace, and climb Holborn Head. The vegetation here is grass and such plants as spotted Orchis and Thrift in abundance, and, prettiest of all, the Scotch Primrose (*Primula scotica*), with its lovely trusses of dark purple flowers. The face of the sandstone cliff falls away vertically from the plateau upon which we stand; down below the green waves are swirling and gently lashing the "clett," a small rock island covered with a cloud of sea birds, its steep sides looking as if cut out by some gigantic chisel. Turning inland a short way we come upon a deep chimney-like opening, which widens out further down, and receives the confused splash of waves confined within bounds, for the rock here is twofold, soft sandstone and hard flag, and the sea, having quarried away the yielding stone, runs up the narrow breaches it has made—quietly, indeed, and as if caressingly now, but with such fierceness in storm time that the chimney, or "gyoe," will then smoke with the cast-up foam. In the far distance, embossed upon the southern sky, are Morven and its fellow mountains, the scene of much of Dick's wandering. Westward we can trace the dreary coast-line as far as Cape Wrath, knowing that this expanse of sea which beats against it rolls shoreless as far as the still more dreary headlands of Labrador. Across the frith the cold pale blue cliffs of Orkney stand like wardens of the northern world beyond; and beneath our feet, buried in their rocky grave, are the remains of scores upon scores of Darwinian fish. Here, then, where one cannot but feel doubly impressed with the eternities of space and time, the poor baker's lot was cast; and a happy one in many respects it must have been—shut up, as he was, in seclusion almost monastic, face to face with the great problems of man and Nature. But how that eager spirit must have beaten its mortal bars as it looked out upon lives that were not all labour, and thirsted while snatching knowledge amid the turbulent calls of self-preservation, for leisure to grasp it more securely than it could expect its utmost ardour ever to enable it to do. Filled with these thoughts we retrace our steps, carrying a handful of Primroses, which will, we trust, gladden for a day or two the home of her who through long years served the lonely philosopher and lightened, as far as she was able, his dark and rugged pathway.

HURST & SON.—We are informed that Mr. D. Webster, who for many years past has represented the Lawson Seed Company, will in future be connected with Messrs. Hurst & Son, of Houndsditch, London.

#### FLORISTS' FLOWERS FROM SEED.

OUTDOOR CARNATIONS.—For some years past I have been successful in raising a batch of seedlings in February from seed supplied by a leading London firm. There is infinite interest in watching the progress to the flowering stage of florists' flowers, and a certainty that a package of seed will contain many varieties, differing more or less. I have almost invariably found this to be the case, and the wonder to me is that every grower of florist flowers is not also a raiser of seedlings. You may not get, in the case of the Carnation for instance, a chance seedling better than those raised by Messrs. Douglas & Dodwell, but from a respectable firm you are morally certain to get some good double flowers well worth perpetuating. This has been my experience, and of thirty-five seedlings, *e.g.*, raised from a package of seed in 1883 that bloomed this year, all were double but two. Some were certainly worthless in colour, and about half-a-dozen were semi-double or with but two rows of petals—very floriferous, and no doubt would be useful for cutting. Some were very peculiar colours—shades of amber, cinnamon, and maroon. Curious enough, not more than one or two were noticeably sweet-scented. As showing the variety a packet of seed may contain I may also mention I had among them two tree Carnations—one a dark red, or purple, rose, of immense size, and so full of petals that in expanding the blooms always burst. The vast majority were, however, "sells," and most pleasing shades of pink, crimson, or rose, with one or two closely approaching deep scarlet. Rarest of all to find in this way from seed are yellow ground Carnations. I have, however, got three, but, like all yellow grounds, they seem of comparatively delicate constitution. Seemingly delicate, however, planted out in even such a fine year as 1884, is no guarantee that they would not be robust as pot plants under glass, and the coming year I shall further test them, but in the first instance I plant out all my seedlings on trial to see what they may come to. Coming to the crimsons their robust, free-blooming and warm colours tempt one to speak of them in the most glowing terms. They commence to bloom in a warm southern border the beginning of July, and persistently since have never ceased doing so—indeed this morning I see two blooms progressing rapidly, so much so that I may have them ready by Christmas eve to send in lieu of the customary greeting. Two come up to the *beau idéal* of the florist, and have smooth petal-margins; the remainder are "fringed" or serrated. I must confess I am so obtuse or unorthodox as to have a great liking for those fringed Carnations, especially if they happen to be sweet-scented. I have on a bright purple-pink, and another a warm flesh colour with a shade of maroon, I got as cuttings from Mr. Burbridge, Trinity College Botanic Gardens, some years since; both are "fringed," and I should be very reluctant to part with either. The present year I have been even more successful in raising seedlings, put in, in January, 1884, thinned where I could lay hold of them, and transplanted in a box in a cold frame, slightly heated with tan-bark, and ultimately transplanted to the open border, if I remember aright, in June last, or about that time. I consider it of immense consequence to have such seedlings out early in the borders. They grow firm and robust, get thoroughly hardened and matured, and lay the foundation of a fine "stool" for the following season. Out of about fifty of the present year's seedlings, all are pictures of health now with three exceptions, and this delicate trio are probably yellow grounds, "bizarres," or possibly good "flakes"—they can hardly be "sell" colours, as they are generally the most robust. Well, it will be a source of zest and pleasurable anticipation to look forward to, for the next six or seven months, and this is one of the real sources of gratification in raising seedlings, I might almost have said, of gardening generally. The pleasure is all the greater when you are discussing what the humblest can do—what the humblest can have. It only remains to add that at this season a mulching, say of horse droppings, around the neck of the plants, I have found very desirable for several reasons. *W. J. M., Dec. 23.*

## ROOTS.

**STRAWBERRY ROOTS.**—A plant of *Triomphe de Gand* Strawberry, the roots of which were examined by Mr. Goff, at the New York Agricultural Experiment Station, had roots extending nearly vertically downwards to the depth of 22 inches. The horizontal roots were few and short, the longest being traceable but 6 inches. The greater part of the roots extended nearly perpendicularly downwards, and nearly all of the fibrous roots were found directly beneath the plant. The new roots appeared growing out about an inch above the old ones. The longest of these had attained at this time a length of 6 inches. They were white, and were tipped at their extremities with a thickened point, in which respect they resembled the underground stem of the Potato. It would seem from these observations that as the roots cover an area scarcely larger than the leaves, there is little danger of injuring the roots of Strawberry plants by cultivation between the rows, even if the soil is disturbed to a considerable depth. The fact that the new roots grow out above the old ones each year explains why Strawberry plants appear to lift themselves upward as they become old, and suggests the importance of drawing earth toward the plants in hoeing them after the bearing season.

## TOMATO ROOTS.

The roots of the Tomato plant are, in their manner of growth, opposite to those of the Strawberry plant. In a plant examined at the New York Agricultural Station on August 13 last the greater part of the roots appeared to extend horizontally, and were about 8 inches below the surface. The horizontal roots were traced a distance of 24 inches on one side of the plant, and 30 inches on the other. From this it appears that the plant drew its nourishment from a circle about  $4\frac{1}{2}$  feet in diameter, or from an area of about 16 square feet. A single root was traced downward to the depth of  $2\frac{1}{2}$  feet. The tap-root was clothed with a multitude of fibrous roots to the depth of 8 inches, where it separated into many branches.

## CAULIFLOWER ROOTS.

The Cauliflower is a deep rooting plant, as appears from observations made at the New York Agricultural Station. Roots were traced downward to the depth of 3 feet, and many roots reached a depth of  $2\frac{1}{2}$  feet. The roots also extend horizontally about  $2\frac{1}{2}$  feet. It thus appears that the Cauliflower draws its sustenance from a greater area and depth than the Tomato plant. The fibrous roots, however, are less numerous in the upper layers of the soil.

## PINUS LAMBERTIANA.

THE accompanying sketch (fig. 1) is an attempt to convey an idea of the port and aspect of a *P. Lambertiana* (the Sugar Pine), about 230 feet high, as seen from a distance of a quarter of a mile or so. In so far as it shows a straight trunk, a very lanky contour, and a sparse ramification, it may convey a fair impression of that stupendous tree, which from a distance wants the picturesqueness of *P. ponderosa*, the bulk in proportion to height of a Sequoia, and the beautiful green colour of the *P. concolor*. In one striking character, however, it surpasses these and all other Pines known to me, and that is in the size and exceeding beauty of the living cones. It is impossible to give any idea in a reduced figure such as that of this woodcut of the appearance of these as they hang on the tree without grossly exaggerating them; the simple reason being that the observer must be near a tree of such proportions to see them at all, and then only a small portion of the trunk and branches comes within the area of vision. Then, indeed, the effect of these huge cones, which are, on the average, 12 to 18 inches long, and hang from the very tips of the branches, is strikingly beautiful, especially in sunshine, when they sparkle like pendants of diamonds, owing to the high refractive power of the resin that copiously exudes from them and hangs in drops to the scales.

The history of the discovery of *P. Lambertiana* by Douglas is too well known to require a notice here. It is one of the two Western United States representatives of the Weymouth Pine, *P. Strobus*, of the Eastern States, the other being its near ally, *P. monticola*, and it is not always easy to distinguish young specimens of these three in European arboreta.

In point of colour the Lambert and Weymouth are both dark, and the common form of *monticola* is a light green, but there is a dark variety of the latter. A better character is the more drooping attitude of the tassels of leaves towards the underside of the branches of the Lambert Pine near their tips, which is a very obvious distinction when the plants are side by side, but is difficult to carry away in one's memory. The cones, of course, distinguish them, but, singularly

posed to be, and will want extended observation previous to confirmation.

The timber of the Lambert Pine is described by Professor Sargent as heavier, coarser, stronger-grained, and probably less easily worked than that of the Eastern White Pine, *P. Strobus*. Its meridional range is very extensive, but its latitudinal one is restricted. Commencing in the North, in the mountains south of the Columbia River, lat.  $45^{\circ}$  N.; it runs along first the Cascades and then the coast ranges to  $33^{\circ}$  S., and along the Sierra Nevada throughout the length of the State of California. Its nearest Rocky Mountain ally is *P. flexilis*; in Mexico it is replaced by *P. Ayacahuite* and *P. Buonaparte*; in the Old World, proceeding westwards, *P. parviflora* is its comparatively insignificant representative in Japan; in the Himalayas *P. excelsa* takes its place, and resembles it much more closely; it extends into Afghanistan; and, lastly, this form of *Pinus* terminates in the isolated *P. Penke* of a few mountains of Macedonia, which has the cones of *P. excelsa* and the habit and dark colour of *P. Strobus* and *Lambertiana*.

The specimen here drawn grew near the hotel at Calaveras, and within a short distance of the grove of Wellingtonias. J. D. Hooker.

FIG. 1.—LAMBERT'S PINE.

(From a sketch taken from a native specimen by Sir Joseph Hooker.)

## LORD CATHCART ON THE POTATO DISEASE.

THE current volume of the *Journal of the Royal Agricultural Society*, 1884, vol. xx., p. 266, contains an essay from the pen of Earl Cathcart on the cultivated Potato. The paper is brightly written, and highly readable. There is a good deal of quiet humour throughout the essay, which sometimes develops into joking; for instance, the author says the authorities on the *Alert* were certainly not on the alert. The paper contains many new (or till now overlooked) historical facts. At several points it will provoke a smile, or even a hearty laugh, for Earl Cathcart has a keen eye for the amusing side of the subject. Throughout the paper there are none of the acrimonious examples of hyper-criticism so common in the writings of persons who set themselves up as great scientific authorities. No one in future who writes on the Potato disease can overlook this paper. The writer quotes many authorities, and he is careful to give foot-note references to all; some of these are possibly not accessible to the general public, as, for instance, the diary of the eighth Lord Cathcart.

After a few preliminary remarks the author gives De Candolle's historical account of the Potato, with a notice of Sir Walter Raleigh; he then gives us references to Gerard, Shakespeare, Bacon, and Buckland in the publications of the Royal Society in 1663; the Potato is in the latter position termed "food for swine, cattle, and poor people." He then refers to the Duchess of Buccleuch's *Household Book*, and says the cause of the Scotch people being at this time (1701) averse to the Potato was possibly because there is no mention of it in the Bible; and this fact, "in the strong language of those days, was 'damnable uncanny.'" The author goes on to mention a Potato farm of 50 acres near Edinburgh in 1734, and at this point mentions the comparative nutriment found in Potatoes, and gives a description of the "curl" as first noticed in 1764, and which after seventy years' experience was at length described as a hereditary disease. Referring now to the *Gentleman's Magazine* for 1764, Earl Cathcart quotes a precocious Jensenite, who at that time wrote, "Mould your Potatos up monthly—continue moulding-up," and elsewhere, "mould-up fortnightly." Earl Cathcart says, "moulding-up" or "earthing-up," sometimes called Jensen's system, is no novelty, and "earthing-up" appears rather in favour than otherwise, but should not be overrated." Experiments at Bedford in 1771 are quoted, and then the writer treats of the Potato in France in 1785, and conclusively shows that Parmentier in 1789 accurately described the effects of the now too familiar fungus of the Potato disease, even to "et ils exhalent une odeur infecte." The cultivation in Scotland is here returned to, and wet rot, dry rot, curl, taint, scab, and other maladies referred to, with numerous references. He now arrives at the disastrous year 1845, when the course becomes clearer, and *Peronospora*, *Fusisporium*, &c., are adverted to; the author, however, wisely declines to write at length on the fungi of Potatoes, but he gives, from his own point of view, a sketch of Potato physiology, and refers at some length to fungus spores

and germs, which are ever present in the air, with views derived from his own observations on the "balance of vegetation." He points out that in 1846 Poland escaped the great wave of the Potato blight. Here he describes the work of Professor De Bary, and correctly points out that dogmatism is found not so much with De Bary himself as in the "School of De Bary." No man has greater cause to wish to be "saved from his friends" (?) than the respected Professor of Strasbourg. The author makes a great point of the habits and nature of the Potato plant in a wild state, and laments our want of information on this head. He tells us, however, as much, or almost as much, as is known of the wild state of the Potato, although one or two of the more recent essays on this part of the subject have been overlooked. Lord Cathcart describes the re-introduction of the Potato from Europe to America, and adverts to its cultivation in the latter country at the present time. He tells us a good deal about *Solanum Maglia* and other species of *Solanum*, and criticises the action of the House of Commons and their decision in reference to disease-proof Potatoes, &c. He points out that in the *Admiralty Manual of Scientific Inquiry*, published by the Lords Commissioners of the Admiralty, whilst inquiry is suggested in South America as to sarsaparilla, balsam of copaiva, ipecacuanha, and the Cow-tree, not a word is printed about the grand old Potato plant. Earl Cathcart hopes that some day a competent person will be found on board one of Her Majesty's ships bound for South America ready to note and describe *Solanum tuberosum*, *S. Maglia*, &c., in their native haunts. The author speaks of the possible (or impossible) degeneration of the Potato through over-cultivation, and refers to the trial grounds and experiments of the Messrs. Sutton, of Reading.

Amongst the numerous works mentioned by Earl Cathcart no reference is made to Mr. Alfred Smee's work, *The Potato Plant*. This book was published in 1846, and is full of information. Mr. Smee considered that an insect called by him *Aphis vastator* was the inciting cause of the Potato disease. When the pantomime was produced at Drury Lane theatre at Christmas, 1846, an enormous Potato was brought in with an abnormally inflated insect upon it. The Potato was inscribed "*Aphis vast-tater*."

I do not say that the physiological points mentioned by Earl Cathcart will be accepted, but the essay has the one great advantage of showing how an unbiased mind has been influenced by facts. The observations of an original thinker, even if wrong, are better than the writings of a copyist—the former exhibits new mental impressions, whilst the latter is a mere imperfect reflection of some one else's impressions.

At p. 279, Earl Cathcart says, "Scab is a disease of the tuber, a fungus, *Tubercinia scabies*." Here we find a note which tells us how Fischer de Waldheim has altered the name to *Sorosporium*. No one wants to know about this party (like the pirate in Gulliver) and his new name. A note should have indicated the important fact that it is a mere popular error to suppose that scab is caused by *Tubercinia scabies* at all, as pointed out by Berkeley in his original description. The specific name *scabies* perhaps started the error. Berkeley, whose species it is, wrote "often confounded with the true Potato scab." *Tubercinia scabies* is the cause of the black Potato smut, a close ally of the familiar black smut of Oats and other cereals.

On p. 286 Earl Cathcart says, "The Potato fungus" (quoting from the *Journal of the Royal Agricultural Society*) "appears on *Lilium lancifolium* three weeks before the Potato is affected. This passes unchallenged, but a note would have been useful here to point out that the fungus on Lilies is most likely the destructive ally of *Peronospora* named *Oenularia elliptica* by Mr. Berkeley, and not *Peronospora infestans*. The disease described as occurring in South America, on p. 289, where the margins of Potato leaves take the "colour of tobacco with a whitish border," is probably due to *P. infestans*. The mould which causes the "snuff-dusted appearance" in South America, and which spreads to Lucerne (p. 289), and is termed "red-rust fungus" on p. 288, is undoubtedly *Rhizoctonia violacea*; the fungus has exactly the same habit in Europe, it sometimes extends to Asparagus. A note to this effect would also have been useful. At p. 285, where Earl Cathcart mentions Professor De Bary, and says that he (the author) had read the evidence of the writer of these lines with "particular pleasure," Mr. Baker inserts an astounding note to

this effect:—"The principal point at issue between the two is, that De Bary thought what he called *Pythium vexans* was a distinct organism, whilst Smith regarded it as a dimorphic form of the *Peronospora*." No statement could be more contrary to fact. Professor De Bary's *Pythium vexans* has never specially concerned me, and I have not gone out of my way to explain it. It has nothing whatever to do with *Peronospora infestans* or any other *Peronospora*. I cannot help thinking some one must have hoaxed Mr. Baker on this point.

If the essay is republished in book form the annotations should be dispensed with altogether or made more complete and correct. I entirely disagree with Mr. Baker's idea that the Potato in its present tuber-bearing state is in a disorganised, unhealthy condition, a fitting subject for the attacks of fungi and aphides. Parasitic fungi and aphides do not attack "disorganised and unhealthy plants." *W. G. Smith.*

## BEGONIA SOCOTRANA.

THE most attractive stove-plant in flower at Kew just now is this *Begonia*, which was introduced to Kew some three years ago, and which has since then annually proved itself of more than ordinary merit. It is grown in a loamy soil, the bulbs being shaken out of the old soil and potted into small pots about the end of July (this species goes to rest in summer). After being started in the propagating house the plants are removed into a greenhouse, where they are allowed plenty of light and moisture both overhead and at the root. This treatment induces the plants to make sturdy growth and large foliage of good substance. In October they are removed into a house with an intermediate temperature, where they soon push forth flowers which remain in beauty for six or eight weeks. Apart from the singular shape of its foliage, and the remarkable manner in which it reproduces itself by means of bulbils, this *Begonia* is possessed of characters of considerable beauty; the flowers are large, of the brightest rose-pink, and are produced in abundance by healthy strong plants. Moreover, they are extraordinary in that they last, both when left on the plant and when cut and placed in water, a much longer time than any other *Begonia*. In my opinion the plant has only to become better known to ensure its wide popularity as a winter flowering plant. At Kew there are several groups of it in the T-range, where they have been in beautiful flowering condition for about a month, and there is promise of quite as good a display for some weeks to come. This *Begonia* is also interesting in that it comes from an isolated corner of the world, far removed from the homes of other *Begonias*, and remarkable for its ugly gouty stemmed plants, rather than for those of beauty, such as is seen in this *Begonia*. A figure of the plant was given in these columns, p. 8, Jan. 1, 1881. *W. R.*

## THE NOMENCLATURE OF COLOURS.\*

THE subject of colour names is so vast and intricate that in the following paper I have confined myself to the consideration of those only which occur in Fries' description of the Agaricini in his *Hymenomyces Europæi*. Even in this restricted field I have found nearly 200 names of colours, although, with one or two exceptions, I have avoided reference to compound names; if I had considered the complete list that I originally made I should have had to describe about 840. Perhaps I have omitted some few as it is, for I have had to go over some 20,000 lines of concisely-written Latin to find those that I have gathered together for examination here.

In so long a list of names it is fortunate that not every one requires separate consideration. I have enumerated not only the colour-names used for descriptive purposes by Fries himself, but also most of those used as specific. And in making specific names there is a natural tendency to use a colour-name absolutely synonymous with another, simply from the fact of the most obvious one having been already used. For instance, a describer wishes to

name a white species *Agaricus albus*; but when he finds that name is preoccupied he names his species *A. candidus*. Still, we need not conclude that he had the strict classical Latin differences of the two words in his mind's eye; he probably never thought that *A. albus* was so named because it was of a dead white, nor in speaking of *A. candidus* need he have meant to imply that it was of a glistening white, as Cicero might have done. This exigency has lured the list of colour-names with a good deal of useless lumber, but the principle is one that, in the interpretation of specific names, must never be forgotten.

Another difficulty that constantly presents itself is the indistinctness with which colour-names were used in classical times. Perhaps the best instance of the vague way in which the ancient Romans used the names of colours is to be found in a line by Albino-vanus, a Latin poet contemporary with, and a friend of, Ovid's, who flourished about A.D. 28; he describes a woman's arms as whiter than the "purple" snow:—

"*Brachia purpurea candidiora nive.*"

Of course, "purple" here only means "glistening" or "dazzling," but such a use of words does not accord with modern ideas.

Much of the difficulty that surrounds the nomenclature of colours is also due to there being no authoritative code. In each branch of art or knowledge at the present day different names are used for the same colours. The "purple" of the cardinal is crimson; the "pink" of the huntsman is scarlet. An artist calls his colours by the names under which he buys them of his colour-man; but a milliner wants to invent a fresh name with each change of fashion, and the words we get from the fashionable journals are veritable marvels—*couleur de crapaud mort*, *eau de Nil*, *elephant-grey*, *London smoke*, *Mushroom-colour*, being specimens. Fortunately "they have their day, and cease to be." An amusing instance was given me lately by an omnibus-driver. One of his passengers had been much struck by a pair of horses he had been driving—a dun and a strawberry-roan, in the horsey man's language; the passenger, a tailor, described the one as "drab," and the other as a "claret-mixture."

Perhaps the only wonder is that there is such a limited number of colour names, after all. If we have a clear idea of a dozen colours we must remember that we can get 479,001,600 permutations out of them, by mixing each with every other, even in similar proportions. For our names to be of any use we must group around each one those shades which most closely assimilate to the named type, and indicate their differences as far as we can by compound words, or qualifying adjectives, or suffixes, or affixes. We all have an idea of the colour of gold, for example, but look at a sovereign, together with a dozen pieces of jewellery made at various times and places, and you will soon see what a very comprehensive, or, as the logicians say, extended, signification such a colour-name may have. And if a bright and definite colour may be so varied, how much more variable may a less pronounced one be!

Much has been written on the science of colours, but I know no book that deals at all exhaustively with their nomenclature. Field's *Chromatography* has a wide reputation among artists, but it is of little use to us. Neither is the classical work of Chevreul, the oldest professor in the world, who still, in his ninety-ninth year, lectures on chemistry in Paris.

We need not be much troubled about classification, for a very simple method is sufficient for our purposes. But it is as well to know how chromatographers ordinarily classify colours; and to this end I copy the following from one of the many editions of Field's book:—

Neutral colours ..	White, black.
Primary colours ..	Yellow, red, blue.
Secondary colours ..	Orange, green, purple.
Tertiary colours ..	Citrine, russet, olive.
Semi-neutral colours ..	Brown, maroon, grey.

I propose to group the whites and blacks with the greys that come between them; to range the oranges, citrines, and browns after the yellows; to include the russets and maroons as subordinate to the reds; to take the purples as variations of the blues; and to comprehend the olives under the greens. Sombre colours dominate so conspicuously among fungi that we understand their coloration best by regarding their lowly hues as variants from types that owe their names to their very brilliancy. Their complications are so

\* Read before the Woolhope Naturalists' Field Club, October 23, 1884, and reprinted from *Grevillea*, in view of the discussion upon this subject now going on in our columns.

great that it is often difficult, even as it is, to refer them to their proper types; a trouble that was ever present to me when I preliminarily essayed to classify them.

I would begin with the whites and the blacks, and their intermediate greys; I at once discard the trammels that the chromatographers lay down for our deception, when they say that these, in their extremes, are no colours at all.

#### WHITES.

And first of the whites. My list shows nineteen distinct terms for these. But most of them are made up on the principle that I have already laid down as of constant occurrence, viz., that they owe their appearance to the natural and obvious terms having been already used. The classical distinction of albus meaning a dead white, and candidus a shining white, has little prominence in Fries' description. To Fries albus is white, and perfect whiteness admits of no qualification. If albus, as a specific name, is preoccupied, albellus, albescent, albidus, albidus, and albescens, can only express the idea of whiteness, but seem used rather for "whitish." Albicans and candidans should strictly mean "becoming white." Argenteus and argyræus are a silvery-white, silvered. Dealbatus, white-washed or plastered—cerussatus, coloured with white lead—and argillaceus, like wild clay—seem to connote texture or surface along with whiteness. Eburneus, ivory-white; ermineus, ermine-white; niveus, snow-white; and virgineus, virgin or pure white, have no more distinction than the English terms by which they are naturally translated.

#### GREYS.

Between the extremes of white and black there may be great varieties of greys, and the pure greys run into the blues and browns, so that they are best studied in three groups. Of the pure greys canus and incanus are the nearest to white; just as we call white hair or a white horse "grey." Cineræus is the grey of wood-ashes, cinerascens is becoming such a grey; griseus seems to be a little darker, and lividus is darker still and inclining to brown. Cretaceo-pallidus is a pale chalky-grey. Nigrescens and nigricans do not mean so much dark grey as a grey that turns black with age.

Of greys that incline to blue caesius is the palest; it was the classical term for the blue-grey of the eye. Glaucus is a grey that inclines to green, and glaucescens denotes a paler shade of the same colour. Liveus and lividus are bluish or leaden-grey, much like molybdeus and plumbeus. Ardosiacus is a dull lead colour. Agaricus (Collybia) tylicolor and A. (Omphalia) oniscus seem to owe their specific names to their likeness in colour to a kind of cod-fish, known as oniscus, and so mean rather a light grey, and not the dark slate-grey of the woodlouse we describe under the name of Oniscus. Chalybaeus is a steel or iron-grey; Fries, under Cortinariæ sciophyllus, explains it as ocreo-fuscus, dusky blue.

Of the brown-greys, murinus, mouse-colour, is the palest (cf. Paxillus extenuatus, Fries, p. 402). Mycæus should have the same signification, but is used by Fries for a dusky umber. Argillaceus is a light brownish-ash colour. Fuscus, dusky, is rather a vague term, but it is almost too brown to be classed under the greys at all; fuscescens means becoming dusky. Ravus is a dark grey. Fumosus, fuliginæus, and fuliginosus are best translated smoky, and not, as the latter might be, sooty-black.

#### BLACKS.

Pure blacks, fortunately, do not admit of much variation, although since an absolute black is rarely seen, several terms occur. Ater is strictly a lustreless black, and niger is a glistening black; piccoater, black as pitch, and furvus, swarthy, come into the former category; coracinus, raven-black, with a tinge of blue, into the latter. Atratus and pullatus mean simply "clothed in black." Denigratus, "blackened," is used for a dark dusky brown, and not black at all. Nigerrimus, "black as black can be," seems rather pleonastic, but Fries uses it in his descriptions (Agaricus Panæolus hypomelas, p. 313).

#### YELLOWS.

The next group, the yellows, under which I range the oranges, citrines, and browns, presents the greatest difficulties of all, and it is hard to get them into satisfactory order. Canon Du Port, in the interesting paper which we had the pleasure of

hearing him read last year, cleared up many doubtful points; but his range was more limited than that which I set myself here.

The type of pale yellow seems to be luteus, like the flowers of the plant Wood (Isatis tinctoria). Paler than this are luteolus and sulphureus, sulphur-yellow. Stramineus, straw-coloured, denotes a paler and less pure yellow, Naples yellow, of which a deeper, duller shade is cerinus, croceus, saffron-yellow, being a fuller shade. Citrinus is our lemon-yellow, yellow of wax.

The type of full yellow is flavus, gamboge-yellow, which at its fullest brilliancy is flavissimus. Flavidus is a paler yellow, purer and richer than luteus. Vitellinus, like the yolk of an egg, is used by Fries, as the Canon reminded us last year, to describe the Chantarelle (Cantharellus cibarius). Not far off flavus is aureus, gold-coloured, which seems to me most like the Cadmium-yellow of artists; its diminutive, aureolus, does not seem to be a very different shade. Galbanus, the colour of the gum galbanum, is a greenish-yellow.

The orange-yellows, made up of yellow and red, not brown, are typically two—aurantius being a full orange, Cadmium-orange; and aurantiacus a paler orange, containing less red. Igneus and flammeolus, denoting the colour of flame; and fulmineus, that of lightning, come in this place, but seem to have no very certain application.

(To be continued.)

## NOTES ON THE CULTIVATED ASTERS.—VI.

(Continued from vol. xxvii, p. 681.)

SUBGENUS 1. EUASTER.—Bracts of the involucre dry at the base, furnished with distinct green leafy points. Heads copiously panicle, and stems abundantly leafy. The largest subgenus, confined to America.

Group IV. IIETEROPHYLLI.—Pubescence of the stem neither tomentose nor viscid. Lower leaves of the stem cordate, distinctly petioled.

26. *A. undulatus*, Linn. *A. paniculatus*, Nuttall.—Stems 3–4 feet long, pubescent from low down. Lower stem-leaves distinctly petioled, cordate ovate acute, subentire, with a blade 3–4 inches long, those of the panicle ovate or oblong lanceolate, sessile. Heads middle-sized,  $\frac{3}{4}$ –1 inch diameter, arranged in an ample deltoid panicle. Involucre campanulate,  $\frac{1}{2}$  inch long, well imbricated; bracts with short acute adpressed green tips. Ligules about twenty, lilac, oblanceolate, obtuse. Achene finally glabrous; pappus dirty white, flexuose,  $\frac{1}{2}$  inch long.

Canada to Kentucky, Arkansas, and Florida. *A. diversifolius*, Michx. (*A. asperulus* and Baldwinii, T. and G.), is a Southern variety with longer virgate branches bearing fewer laxer heads, beset with small rigid lanceolate leaves. *A. anomalus*, Engelm., a distinct Western species, not in our collection, has leaves most like those of *undulatus*, but much fewer larger heads, with long spreading tips to the bracts of the involucre, and about forty bright violet ray-flowers. It would be a desirable plant to have introduced now, when public attention is so much turned to the genus.

27. *A. Shortii*, Hook. — Stem slender, erect, 3–4 feet long, pubescent upwards. Lower stem-leaves cordate-ovate, acute, subentire, 4–6 inches long, hairy all over beneath; those of the panicle sessile, or nearly so, oblong-lanceolate. Heads  $\frac{3}{4}$ –1 inch in diameter, forming a lax deltoid panicle with subcorymbose branches. Involucre campanulate,  $\frac{1}{2}$  inch long; bracts well imbricated, with short adpressed deltoid green tips. Ligules about thirty, bright lilac,  $\frac{1}{2}$  inch long. Achene glabrous; pappus brownish-white, flexuose,  $\frac{1}{2}$  inch long.

Ohio to Georgia, Kentucky, and Illinois. Flowers with us early in October.

28. *A. aureus*, Lindl.—Stems slender, erect, 3–4 feet long, finely pubescent upwards. A few lower leaves cordate-ovate, with long petioles, with an acuminate blade 3–4 inches long, rough on both surfaces, pubescent beneath; leaves of the panicle and its branches small, sessile, lanceolate, rigid. Heads middle-sized, about  $\frac{3}{4}$  inch in diameter, forming a very lax panicle with corymbose branches. Involucre obconic,  $\frac{1}{2}$  inch long, well imbricated, the bracts with small deltoid erect foliaceous tips. Ligules 20–30, bright violet-blue,  $\frac{1}{2}$  inch long. Achene glabrous; pappus dirty white, flexuose,  $\frac{1}{2}$  inch long.

New York and Ohio to Minnesota, Arkansas, and Texas.

29. *A. cordifolius*, Linn. *A. paniculatus* and *heterophyllus*, Willd.—Stems 3–4 feet long, flexuose, finely pubescent upwards. Lower stem-leaves distinctly petioled, conspicuously cordate-ovate, sharply toothed, thin in texture, acuminate, 3–4 inches long; upper stem-leaves ovate or oblong, sessile. Heads small, not more than  $\frac{3}{8}$ – $\frac{1}{2}$  inch in diameter, arranged in very dense ample panicles. Involucre campanulate,  $\frac{1}{2}$  inch long, well imbricated, the bracts with short deltoid erect green tips. Disc-flowers purple. Ligules 10–12, pale lilac,  $\frac{1}{2}$  inch long. Achene glabrous; pappus white, flexuose,  $\frac{1}{2}$  inch long.

New Brunswick to Georgia, and westward to Wisconsin and Missouri. The commonest species of this group in cultivation, and one of the most floriferous of all the Asters. Flowers with us late in October.

30. *A. Drummondii*, Lindl.—Stem slender, pubescent, 3–4 feet long. Lower leaves petioled, cordate-ovate, serrated, thin, pubescent on both surfaces; upper small, ovate sessile, entire. Heads middle-sized, arranged in a lax panicle. Involucre campanulate,  $\frac{1}{2}$  inch long, well imbricated; bracts with lanceolate erect green tips. Ligules about twenty, pale lilac,  $\frac{1}{2}$  inch long.

Illinois and Minnesota to Texas. Scarcely worth separating as a species from *A. sagittifolius*.

31. *sagittifolius*, Willd., *A. paniculatus*, Muhl. *A. hirtellus* and *A. urophyllus*, Lindl.—Stems 2–3 feet long, erect, finely pubescent upwards. Lower leaves petioled, cordate-ovate, acute, but not so cordate or so much toothed as in *A. cordifolius*; central stem leaves narrowed gradually or suddenly into a short, often winged, petiole, not cordate; upper leaves sessile, lanceolate. Heads middle-sized, about  $\frac{1}{2}$  inch diameter, arranged in a dense deltoid panicle. Involucre campanulate,  $\frac{1}{2}$  inch long, well imbricated, the bracts with green lanceolate erect tips. Ligules about twenty, pale lilac,  $\frac{1}{2}$ – $\frac{3}{4}$  inch long. Achene glabrous; pappus dirty white,  $\frac{1}{2}$  inch long.

Canada and New York to Missouri, Dakota and Florida. Flowers with us at the end of September.

This concludes the series of the true Asters. *J. G. Baker.*

(To be continued.)

## BEANS.

THE different varieties of Bean ordinarily grown may be referred to seven more or less well-marked species belonging to the natural order Leguminosæ [omitting the Broad Beans, *Faba vulgaris*]. They may be somewhat popularly distinguished as follows:—

1. *Phaseolus vulgaris*, L.—The ordinary kidney Bean, either dwarf or running. Leaves trifoliate, leaflets triangular, ovate, more or less hairy, flowers axillary, single or in clusters of two or three, white running through the various shades of dark purple. Pods of medium size, slender, smooth.

2. *Phaseolus multiflorus*, Lam.—The Scarlet Runner. In many respects similar to the last, distinguished by its tuberous roots, tall running habit of growth, well-developed racemes of scarlet or white flowers and large rough pods. The cotyledons do not appear above ground in vegetation.

3. *Phaseolus lunatus*, L.—The Lima Bean, always running, leaflets narrower, more halberd-shaped, often mottled in two shades of green, smoother than *P. vulgaris*, flowers white, small, pod very broad, flat, leathery, Beans rather large, with peculiar lines radiating from the eye.

4. *Dolichos sesquipedalis*.—The Asparagus Bean, always running, leaflets plainly halberd-shaped, nearly smooth, flowers yellowish-purple, very large, pods in pairs, cylindrical, very long, 18 inches or more, Beans small, kidney form, very distant in the pod.

5. *Dolichos (sinensis) ?*.—The Southern Cow Pea, similar to the last, but distinguished by its dwarf form and shorter pods, with the Beans crowded in them.

6. *Vigna (—?)*.—The Chinese Bean, dwarf in appearance, resembling dwarf forms of the Kidney Bean, flowers yellow, pods small, cylindrical, straight, seeds small, hilum elongated.

7. *Soja hispida*, Mench.—The Soja Bean, not running, 18 inches to 2 or more feet high, leaflets broadly oval, whole plant, including pod, covered with rusty brown hairs, flowers axillary, very minute, white or purple pods short, straight, rarely containing more than two Beans. The cotyledons, after vegetation, develop into leaves.

The varieties of the ordinary garden or Kidney Bean are so numerous as to make the advantages of

some system of classification very apparent. The characters which seem to us to be of most use in forming such a classification are those obtained from the variation in size, shape, and colour of the ripe seed. This is a basis of the classification made by Martens in Germany, which we have to some extent followed. The colour of the edible pods, and the presence or absence of a climbing habit, are also of use in separating varieties. *New York Agricultural Station Report.*

## ON POTATO DISEASES.

(Continued from p. 788, vol. xxii.)

WET ROT (NASSFÄULE) has been known as a tuber-destroying agency for a great number of years, long before the *Phytophthora* appeared in Europe. Mr. Jensen informs me that in 1815 a well known and reliable agricultural writer, Mr. J. C. Drewson,\* says "that the Potatos ought to be preserved above-ground for he had more than once seen Potatos stored in holes in the ground completely rotten, probably on account of water having found its way into the pits." Mr. B. F. B. Ronne, in the same periodical, in the same year, says that "in 1813 the Potatos in the pits had rotted to a great extent, not only with him, but with some of his neighbours. He thinks this due to water having percolated into the pits from the snow that year having been unusually deep." In the following year, 1814, 240 bushels of Potatos rotted in one pit, which constituted the half of its total contents.

This affection of Potatos was described by Schacht,† as well as by other writers. It is one of the most important affections to which Potatos are subject. It attacks and destroys them while they are still in the ground in wet seasons, as well as after they have been lifted and stored in pits. The whole interior of a tuber affected with wet rot is rapidly converted into a fetid watery pabulum. The odour is quite characteristic, it is offensive and sourish. On the exterior appear various fungi, but these are the effect of the diseased condition into which it has passed, not the cause of it. Notably amongst these fungi are *Fusisporium solani*, a well known fungus, which Reinke and Berthold‡ have shown is not an autonomous species, but the conidia of one of the *Sphæriaceæ*, called by them *Hypomyces solani*, but which belongs rather to the genus *Lisea* of Saccardo. Another very common fungus is the *Spicaria solani* of Harting (fig. 5, D), figured and described by him as well as by De Bary,§ Schacht, and others, which Zopf|| has shown to be the conidia of a *Nectria*, *N. solani*, Zopf (fig. 5, A, B, C). Zopf also found a *Chaetomium*, to which he gave the name *C. bostrychodes*.¶ *C. crispatum*, Fekl.,\*\* also occurs here as well as many other species.

Wet rot is caused by one of the *Schizomycetes*, namely, *Bacillus amylobacter*, Van Tieghem (figs. 2, 3).†† This is the *Clostridium butyricum*, Praz.,‡‡ and is considered to be the ferment of butyric fermentation, the *vibron butyrique* of Pasteur. Reinke and Berthold§§ describe and figure two *Bacteria*, which they consider to be the cause of wet rot, namely, the *Bacillus subtilis* of Cohn and *Bacterium navicula*, but Prazmowski has shown that these are not two species, but only conditions of the same, which is not *B. subtilis* at all, but *B. amylobacter*. *Bacillus amylobacter* in the presence of water first attacks the parenchymatous cell walls, and by destroying them permits the starch cells to escape. These in their turn are attacked and disintegrated by the action of the *Bacillus*, the result of which is that the solid tuber becomes converted into a diffuent mass. The starch grains float about in this creamy offensive pabulum, resisting, as they do, longest the influence of the *Bacillus*, but eventually they become disorganised (fig. 4). The development of *Bacillus amylobacter*, as observed by Prazmowski, is given in fig. 3.

During the past winter (1883-84) I had ample

opportunities for becoming acquainted with wet rot while experimenting with *Phytophthora*. If conidia of this fungus be placed upon Potato slices, in the course of a few days, depending upon the temperature at which the culture is made, the slices become diseased; but it very often happens that, as well as being affected with the *Phytophthora*, they are

FIG. 2.—*BACILLUS AMYLOBACTER*.

A, various forms of the Bacillus; B, germination of the spores produced in three-quarters of an hour; C, other spores after one hour and three-quarters.

attacked by wet rot. It is often a race between the *Phytophthora* and the wet rot; if the former has had time to establish itself a crop of conidia is obtained, but if the wet rot gains the upper hand no conidia are developed. After several failures from this cause Mr. Jensen informed me how I could obtain a pure culture of *Phytophthora*. To infect fresh slices of Potato

FIG. 3.—*BACILLUS AMYLOBACTER*.

o, spindle-shaped; e, elongated and ellipsoidal forms; f, capitulate forms; g, vibrio-like forms; h, two linear series with separate swollen joints. (Figs. 2 and 3 after Prazmowski.)

the best plan is to shake up the conidia-bearing slices in a small quantity of water, and to dip the slices you wish to infect into this spore-charged water. It is obvious that when once wet rot gains admission into your material, which it is sure sooner or later to do, you will fail in obtaining conidia. In this case a pure

culture may be obtained by availing yourself of the fact that *Phytophthora* conidia can withstand a greater amount of desiccation without being killed than the organism or organisms causing wet rot can. It is only a question of degree, for when once the conidia are thoroughly dried they are killed. Having, then, dipped the fresh slices into washings of the old ones which contain both conidia and Bacilli, instead of at once placing them under a bell-glass, allow them to be exposed to the air until they are just dry on the surface, so that no fluid can be seen upon them. Of course the length of time necessary for this depends upon the temperature of the room in which the experiment is made; generally they will require to be turned over, so that both sides may be equally dried. They may be then placed under a bell-glass; the conidia will be alive, but the Bacilli dead, or, at any rate, in a state of quiescence, and a pure culture of *Phytophthora* will be obtained. If the precaution of drying be not taken, the slices in a few days will become soft and pasty, and eventually diffident, like cream, and horribly fetid. Hence it is obvious that there is nowhere for the mycelium of the fungus to grow, for it cannot develop amongst a mass of starch granules, and so it is that the wet rot is fatal to the *Phytophthora*. But this is not all; the presence of the mycelium of *Phytophthora* in a tuber predisposes it to wet rot. We know, as a matter of experience, that diseased tubers rapidly become soft and pass into a loathsome mass of sour-smelling offensive pulp. The mere presence of *Phytophthora* mycelium does not cause this, but it results from the advent of wet rot.

Wet rot is highly infective, one tuber will affect contiguous ones, provided always there is a sufficiency of moisture, especially if this be stagnant, as when they are in the damp ground. Wet rot takes place largely in Potato graves, and annually destroys immense numbers of tubers.

## DRY ROT (TROCKENFÄULE, OR STOCKFÄULE).

This condition is described and figured by Schacht.\* According to Kühn† it first appeared in Germany in 1830, when it caused much apprehension on the part of the Potato growers. Kühn met with it in 1841—42 in Saxony, where it occurred with such virulence that the attention of the Government was drawn to it, and measures were taken to obtain accurate information concerning it. Since 1842 it has been more or less common in Germany. It always makes its first appearance at the time the Potatos are lifted. Externally the affected tubers appear at first to be quite normal, but traces of the disease are to be found in their interior upon cutting them open. They soon, however, present a dead looking appearance externally, and upon section show in their centres brownish or bluish musty stains. They become hollowed, the cavity or cavities are surrounded by a brownish or blackish corky formation, which gives to the interior of the tuber a leathery consistence. By degrees the whole interior of the tubers becomes attacked with the dry rot; the surface then gets shrivelled, and various moulds appear upon it, which impart to the interior a variously coloured mottled look. The affected tubers have a disagreeable sweetish mouldy odour, and when the dry rot has advanced to this stage they are friable. The disease, Kühn says, "always spreads from the interior outwards, and may thus always be distinguished from the disease caused by *Phytophthora*, which spreads from without inwards." So that a tuber affected with dry rot may be quite decayed and mouldy inside, while the exterior shows no signs of disease. This affection must not be confounded with the *Phytophthora* diseased tubers which have been kept in a dry place, for although these may be "rotten and dry, yet they are not affected with dry rot." Reinke and Berthold‡ describe the dry rotted tubers as being internally spongy, and dry to the touch like tinder, having a marbled or spotted appearance. They are lighter than sound tubers. In the most advanced state the proper substance of the tuber is replaced, by a yellowish-white, friable, pulverulent, or a floccose, tinder-like substance. On section the affected tuber has a whitish, yellowish, reddish, or brownish marbled appearance. It does not appear that dry rot, as a distinct disease of the Potato, has been recorded hitherto in England, but the descriptions given above seem to recall to my

mind certain diseased tubers which I have from time to time seen. I find upon conversation with horticulturists that they, too, have noticed it, although never having their attention specially directed to it, have regarded it as a form of the Potato disease (Phytophthora).

Since the above was written I have had the opportunity of personally examining a true specimen of dry rot. The affected tuber was externally perfectly normal, showing no indication whatever of disease. It was cut in halves, however, for another purpose, and is represented at fig. 135, C, p. 788, vol. xxii. This figure, however, scarcely gives a correct idea of its appearance. The central part was rather darker than the sound part of the flesh, but not so much as the figure shows. It was surrounded by an inky-black marginal zone, the outer border of which was sharply defined, but towards the interior this became shaded off. One half of this tuber was exhibited to the Scientific Committee, the other half I sent to Prof. Kühn, who informed me that it was a typical specimen of dry rot in its early state.

(To be continued.)

## BRITISH APPLES.

I QUITE agree with Mr. Miller in his recognition of the value of Mr. Barron's book on British Apples, and I hope that, following another exhibition, those who may contribute information, both on the varieties cultivated and the soils from which have produced them, will enter more fully into particulars by giving an intelligent geological description of their local formations, and thus enable Mr. Barron to prepare an improved and more comprehensive edition of his useful work. There are doubtless many who, like myself, are desirous of obtaining more explicit information concerning the direct action of geological formations, of marked character, on fruit trees and fruit generally. These are circumstances that tend to modify the influence of soil, climate, elevation, and rainfall, amongst others, and these have to be accurately estimated and described. The effects of soil possessing in its composition those constituents of fertility necessary to the perfect growth of a fruit tree are demonstrated in the Apples exhibited by Mr. Fairgrove and grown in the Dunkeld Gardens, which are situated as far north as Perthshire and near the great Highland Pass. I have also seen very fine Apples grown in Lord John Manners' garden at Birnam, showing what vigour, induced by good soil, will do to counteract climatic influences. The soil here is river drift and loam, is derived from granite, Gneiss, Trap, and Old Red Sandstone; and not only fruit trees, but deciduous forest trees and Conifers, demonstrate its fertility.

The exceedingly varied character of the geology of the British Isles, the disturbance of formations by eruptive forces, the denudation to which each has been subjected, and the extensive deposits of displaced rocks and soil, the accumulation of glacial drifts, morasses, alluviums, make the determination of a local soil somewhat difficult; but these are not insuperable. It would convey but a partial idea of existing circumstances to say that an orchard is situated on the Triassic or New Red Sandstone formation. Subterranean forces may have thrown up the laminated sandstones of the Keuper, or denudation exposed the red marls, while in another case the beds of gypsum common to the formation may be found near the surface; all these, though marked generally by the presence of sulphate of lime, differ materially in structure and in working. Taking another division of the same formation, the Bunter, a very considerable difference exists between its several divisions—the conglomerates pebbly, poor, and siliceous; the marls deep, compact, and retentive; the sandstones warm, poor, receptive, and readily manageable. These are all New Red, but yet widely different, and calculated to affect the cultivation of fruit trees. The drifts and loams derived from this formation, and partaking of its mineral characteristics, also exhibit variations which deserve to be signified.

I may, perhaps, by way of illustration, mention another formation with which I am familiar—that division of the great Oolitic system styled the Lias, of which the Vale of Belvoir largely consists. Generally, I might say that my orchards are on the Lias; but that information would only imperfectly convey the circumstances it is desirable to communicate. I may be so low down in the lowest bed of the

Lower Lias as to be within reach of the Rhaetic, a rich and highly fossiliferous shell deposit between the Lias and the Red Marl; or higher up denudations may have given me a district, still Lias, but on the plain of Ammonites Bucklandi, with beds of rich fossiliferous limestone a few feet below the surface; or, still ascending, a plateau is obtained, the surface of which is still blue clay, but the plain of Ammonites

FIG. 4.—STARCH GRAINS ATTACKED BY BACILLI.

J, K, L, M, Starch grains in various degrees of disintegration. Magnified. (After Reinke and Berthold.)

semicostatus and Gryphea incurva, has been reached, and beds of these with other fossil shells within compass of the roots of plants, give advantages which the next plain, 50 feet higher, with its deep unbroken beds of pure clay, fails to offer. The Liassic series affords another and very striking illustration of my argument; the middle division being distinguished, not by clay and limestone, but by

FIG. 5.—NECTRIA SOLANI. (AFTER BERTHOLD.)

A, Slightly enlarged; B, Asci with sporidia, magnified 600 diameters; C, Sporidia, isolated; D, Spicaria solani, magnified 400 diameters (after De Bary.)

ironstone. This, although between the upper and lower clays of the series, differs in colour as in character, affords a light, easily worked soil—a substratum of stone, and is altogether highly ferruginous. The illustrations I have offered serve to show the necessity of precision in the reports of the soil and

position from which Apples or other fruits are produced.

Leicestershire was very indifferently represented at the Apple Congress. The show was early for our orchard fruit. I can scarcely agree with Messrs. Harrison, who say in their report that this is a county in which the Apple crop is not considered of much importance, and that the trees are allowed to grow without either manure or management. To show what the cold clays of this county can produce I propose to send a collection of Apples to be inspected by Mr. Barron and the gentlemen composing the Fruit Committee of the Royal Horticultural Society. William Ingram, Belvoir, Dec. 15, 1884.

## JAPANESE TEA.

TEA is one of the principal productions of Japan, and a large quantity of it is exported to the United States from the ports of Yokohama and Kobe. In Japan the use of Tea dates back to very early times, and at present it is more than ever a popular beverage. Whenever a guest presents himself at a person's house a cup of tea is at once offered him; the omission to do this is a breach of politeness. It revives the spirits, it allays the ennui incidental to old age, and promotes sociability. In most houses it is the leaf of the Tea plant called Sencha that is used, and not the powdered leaf at all. Powdered Tea, Matcha, is usually used only in the houses of nobles and of the rich. A ceremonious system of drinking tea has existed in Japan from very ancient times. A gathering of friends is held in a certain small room of fixed dimensions, in which ground or powdered Tea is served to them. This room is called *sukiya*, and is generally detached from the dwelling-house. Outside and about the room curious and valuable stones and plants are arranged, and inside old Tea utensils are displayed, also old scroll pictures and other paintings. At the time of a gathering various kinds of prepared dishes are placed on low stands before each guest. The host himself prepares Koicho (thick tea) in the presence of his guests, and offers a cup of it to all the guests (always five), to be taken in turn, after which *usucha* (weak tea) is handed to them. The great point about this tea-room is, not that it be gaudily decorated, but that it be neat and thoroughly clean.

The process of making tea for everyday use does not differ materially from that adopted in England, but in the matter of ceremonious tea-drinking it is necessary that great attention be paid to the selection and preservation of Tea, the selection of the water, the arrangement of the utensils, observation of the temperature of the water, and care in the washing of the utensils.

## The Arboretum.

ARAUCARIA IMBRICATA.—I send you for publication dimensions of a specimen *Araucaria imbricata*, that might compare favourably with one noted [at p. 492 of vol. xxii.] It stands in the grounds at Lough Fea Castle, the residence of S. E. Shirley, Esq., Co. Monaghan. The height is 34 feet 10 inches, girth at the base 8 feet 6 inches, and at 6 feet from the ground 5 feet 6 inches. It was with no small amount of difficulty these measurements were taken, from the fact that the bottom boughs are lying on the ground, covering a diameter of 34 feet, and all the way to the top they are literally heaped on each other. The healthful appearance of this truly noble specimen is rarely met with in one of its kind, but is sufficient proof that it is at home with soil and situation. R. McK.

## RETINOSPORAS.

The past season seems to have been particularly destructive to these much-admired and popular coniferous plants. The great heat and dryness, judging from our somewhat extended observations in many private gardens, as well as in several nurseries where these plants have been grown rather extensively, would seem to have very materially injured them; so much so that the greater number will have to be rooted up. As decorative plants in a small state they—especially the *plumosa aurea*—are extremely handsome and invaluable, but as specimen Conifers beyond a certain stage they seem to be utterly useless—excepting, it may be, in some moist sheltered situations. This result is extremely disappointing, so much having been expected of these plants. They are, in a sense, perfectly hardy,

although in some cases it has been noted that the stems of the plumosa and plumosa aurea have been severely affected by frost, causing them to split, and ending ultimately in the death of the plants. *R. pisifera* and *R. obtusa* may be said to be perfectly hardy, but the plants as they grow up become very naked. How much inferior these plants are to *Cupressus Lawsoni* and its endless variety, which no kind of weather seems to affect! As a golden Conifer there is nothing to equal *Cupressus Lawsoniana lutea*, excepting Young's Juniper, *Juniperus chinensis aurea*, which, as we noted them last autumn, were perfect pillars of gold, and perfectly hardy. This is, without doubt, the best golden Conifer in existence.

#### EUCALYPTUS COCCIFERA.

While looking round the Coombe Wood Nurseries of Messrs. J. Veitch & Sons a few weeks ago, in their trial ground I came across a plant of the *Eucalyptus coccifera*. I recognised it as being identical with the specimen we have growing here, which is now 63 feet high, with a girth of stem 9 feet at 3 feet from the ground; diameter of the branches, 45 feet. This specimen is nearly fifty years old, and was figured in your columns on July 26, 1879, and on March 27, 1880. At Coombe Wood it has proved quite hardy, and is now strong and healthy. My object in drawing attention to this variety, which has proved itself more hardy than any other, is to make known to those interested in the *Eucalyptus* family that in the same nurseries I saw a fine batch of strong healthy plants in pots of the true *coccifera variegata*. I have met with several kinds stated to be the true *coccifera* in the hands of others, but wrongly named; therefore, I trust my remarks as to where a true stock can be procured may be useful to some of your readers. *D. C. Powell, Powderham Castle.*

#### FRUIT NOTES.

**APPLE GOLDEN SPIRE.**—The plate, tab. 624, of the last number of the *Florist and Pomologist* has a double interest—it is the last of the series in that periodical to whose cessation we have elsewhere alluded, and it is the faithful representation of a very handsome and useful Apple. It is a large, conical, somewhat angular, fruit, with a shoot-stalk and deep set open eye, skin pure golden-yellow, flesh white, tender, acid. In season from October to Christmas. It is not much known about London, but we doubt not that the publicity now given to it, and the brave show it made at the Apple Congress last year, will induce a demand for it.

**MÈRE DE MÉNAGE APPLE.**—There are two Apples of the above variety exhibiting in the window of Mr. Coomber, of this town, which weigh 1 lb. 5 oz. each. Is not this an unusually large size? Both are well coloured, and of good form. *Harrison Weir, Tunbridge Wells.*

#### WHY DO OUR WOODS NOT PAY?

BECAUSE we are too late in beginning to thin them, and continue the work beyond the period when it should have stopped. It will be found on carefully examining the growing trees in the forest that from one or other of these two causes the value of the mature crop is much less, sometimes immensely so, than it otherwise would or should have been. The delay in commencing to thin is accounted for on various grounds, but the most common are first in order to be able to derive profit from the thinnings. This profit, though much talked of, and bulking largely in the minds of many proprietors, is little more than a vision or mirage in the desert. Having made several fair and impartial experiments of thinning in different parts of the country, and when and where the thinnings realised as high prices as they are ever likely to do again there or anywhere else, and we never in any case received as much for the first thinnings as paid the work. We have generally put the cost of thinning a Pine or Fir plantation done at so early an age that no profit was looked for, or expected, at 5s. to 6s. per acre, and this, as must appear self-explanatory, is simply adding that sum to the cost of forming the plantation. If not actually doing so, it practically is so, for it must be years yet before any profitable return ought to be obtained from the plantation. What is earnestly desired to be made plain is, that while there is an apparent loss incurred by thinning Pine and Fir plantations before they are capable of yielding profitable returns, there is yet actually less loss by this than by the other and more common

practice of delaying thinning till a certain amount of revenue is derived for the thinnings. The reason of this is that in thinning a plantation ten to fifteen years old a great number of the trees (even Larch) have to be cut, and yet nothing in the shape of money can be obtained for them. Some of them are necessarily dead, and consequently as hard as bones, and very difficult to cut; many more are crooked, and some too short for net or other stakes. Another adverse circumstance presents itself in the difficulty of handling the thinning axe. The trees had been planted at about 4½ feet apart, and if grown to fifteen years old, or even ten years in some cases, the tallest will be 15 to 20 feet high, and the side branches of the adjoining trees twisted and interlaced with each other; if quite dead they are easily broken off, at least in the case of Scots Pine, but if only partially dead, and the crop is Larch or Spruce, they are tough and wiry, and consequently entail much toil and labour in performing the work. The laborious, disagreeable, and expensive work of this first thinning is not yet over, for the thinnings, whether pruned out or taken out of the plantation with the branches on, require to be carried through a dense thicket of spray. The crop as now thinned stands at about 600 trees per acre of Scots Fir or Spruce, and about 1200 if Larch; but the trees have not yet shed their branches, nor are they to be pruned off by artificial means, not yet having fulfilled the end and purpose Nature designed by them.

It is thought by some to be bad economy, if not actual waste, to plant trees, allow them to attain a certain size, and yet cut them down before they are of any money value. A tree at six, eight, or even ten years' growth, is found to be of no actual money value at these ages, whereas if allowed a few years' more growth, say four to six additional years at most, they would be worth something approaching the cost of labour of cutting them. Now if the farmer were to reason and act thus in regard to his Turnip crop, Carrot, Mangel Wurzel, and suchlike, he certainly would fail in his efforts to grow profitable crops. It is needless to say there is a great and wide difference between agricultural cropping and that of forest trees; but while there are lines of difference there are also those of agreement and coincidence. The ideal commercial tree is a branchless trunk of cylindrical form—tall, clean, straight, and free from knots and blemishes. A branchless trunk, however, though a subject to be longed for, especially as a commercial product, is neither easy to secure nor to be regarded other than a prodigy equally rare and costly. It will be seen by any one who takes notice of it, that in a forest composed of trees of different sizes, but of nearly the same age, such as are common in the Pine forests and woods of Strathspey, Deeside, Morayshire, Inverness-shire, Ross-shire, and other parts of the country both north and south, that clean grown trees with fewest branches are soonest ripe and mature, but fall an early prey to disease. It is no rare thing to find a fine clean tree clear of branches to near the top, of 100 years' growth, containing only 10 cubic feet of timber, or even less, ripe and ready to cut, growing at the rate of a quarter of a cubic foot annually, and depositing layers of wood scarcely one-sixteenth of an inch thick, literally adding a quarter of a foot to the surface, and losing as much or more from natural internal decay, and worth only 5s. Beside this tree grows another, well branched, containing over 50 cubic feet, and still making wood; growing at the rate of 1½ cubic foot yearly, and depositing annual layers about one-eighth inch thick, and worth at least 25s. each. The large trees in order to be larger than the others must be well furnished with roots and branches, and these again must be provided in early life, otherwise they never can be established in any tree. The well rooted and branched tree not only grows faster than the imperfectly branched one, but it remains sound, and grows to older age than the other. Again it should be observed that owing to the surface of the large tree being so great, the annual deposit of woody matter (if the tree is healthy and of vigorous growth) is correspondingly great. Therefore the tree and consequently the forest or plantation pays best towards old age and maturity. The forester's problem to solve is, which class of trees pays best—the clean, fine trunk without branches, save a tuft on the top, or the less smooth and branchy one? The mean between the two extremes here is certainly that to make choice of. Fine grown, but profitless trees are the result of a paucity of roots and branches

[That is, of leaves. Ed.], while rough, coarse-grained fast-grown ones are the result of too many. The question therefore is, as already said, what is the due and proper quantity of branches the tree should have upon it, so as neither to be too fine grained and profitless, nor too coarse grained and worthless. By way of solving this difficulty, I selected in different parts of the forest what I regarded as good specimen trees grown on different soils, situations, &c., of which the following are examples in tabulated form, and from which deductions may at pleasure be made:—

Species.	Age.	Height of Tree.		Girth near the Ground.		Girth at Middle of Tree.		Weight of Stem.		Weight of Branches.		Total Weight of Trees.
		Ft.	In.	In.	In.	Lb.	oz.	Lb.	oz.	Lb.	oz.	
Scots Fir.	7	4	5	5½	2½	2	8	14	3	31		
"	10	15	10	13½	7½	38	8	28½		67		
"	10	11	4	11	6½	23	0	27		50		
"	19	23	0	16	12	126	0	99		225		
"	20	15	5½	13	5	14	12	14		28½		
"	26	20	4½	22½	9½	8	4	89½		175½		
"	36	27	8	30	13½	14	0	171½		335½		
"	38	31	0	37	10	238	0	121½		359½		
Larch	7	4	4	3½	1½	1	8	1		2½		
"	10	16	0	13½	6	29	0	20½		49½		
"	10	13	6	14	6	23	0	18		41		
"	19	27	0	10	10	91	0	25		116		
"	7	6	2	5½	10	2	1	3	12	5½		
"	5	4	6½	4	15½	1	10½	1	10½	2½		

It may be observed that in very young trees the stem is heavier than the branches, and by degrees to a certain age the branches bulk more and weigh heavier than the stem does; again the scale turns in favour of the trunk, and continues to gain and increase to the end of life. Not having actually weighed the branches of any full grown and matured Pine or Fir timber trees, the nearest I can indicate in regard to them is the result of what took place in connection with fifty extensive wood sales on different parts of the estate. In Scots Pine plantations of thirty-five to forty-five years' growth, the average results were 1½ ton or cartloads of branches to every ton or cartload of wood, which includes tops and a few inferior growths. With regard to full-grown timber trees of eighty to a hundred years' growth the results were about 10 cwt. of branches to every ton or cartload of timber; the branches here include also the rough and worthless tops, but no trees. *C. Y. Michie, Cullen House, Dec. 17, 1884.*

(To be continued.)

#### BEDDING IN SMALL GARDENS.

THE liberal employment of hardy plants in carpet-bedding has helped in some degree to reduce the cost of propagating and preparing the necessary stocks; but owing to the necessity for planting thickly, the numbers of plants more or less tender are very large in proportion to the area of the beds, and even the hardy subjects must have considerable attention paid to them to ensure their being in the best possible condition for filling the spaces assigned them. But the cost does not end with the planting of the beds, for, from the time the occupants commence to make new growth till the more tender of them are destroyed by the frost, they must have frequent attention. Probably the strongest argument that could be urged against the system is the large amount of labour required during the summer to keep the plants in proper trim. Not only must they be kept down to the desired height and within the allotted spaces, but the needful stopping must be done before they have grown far beyond the assigned limits which necessitates the pinching at frequent intervals. This point should be well considered by all classes of cultivators, and more especially by those who have charge of gardens in which the labour allowed is not in proportion to their area.

The uniformity in the appearance of the beds must not be overlooked; and it should be borne in mind that arrangements which produce a very pleasing impression on the mind when seen once or twice in the course of the season may, when constantly under the eye, become unpleasantly monotonous before the end of the season. With these facts before us it may be safely said that carpet-bedding should not in any

case be out of proportion to the labour available for keeping the beds in order, or leaf plants occupy a position otherwise than subordinate to those grown for their flowers. In small gardens it is particularly desirable to limit this style of garden decoration to a few beds, as there is necessarily not room enough for the production of many distinct features, and in gardens of all classes it is most important that it should be well done. "*Garden Oracle*" for 1885.

## HOW SOIL IS MADE FERTILE.

THE current number of the *Journal of the Chemical Society* contains a valuable communication from Mr. R. Warington on the subject of nitrification, being the result of five years' patient investigation in the laboratory of Sir J. B. Lawes at Rothamsted. We append an abstract of those portions of the paper which have a direct bearing upon the question of horticultural chemistry.

The author, in giving a brief history of what has already been done by others, says:—It is now shown for certain that the nitrifying organism is a member of the great family of Bacteria. Dehérain and Maquenne have proved that the reduction of nitrates in soils is due to the action of Bacteria; and to Gayon and Dupetit we owe the proof that the reduction of nitrites in sewage is accomplished by the same agency, and that this, as well as so many of the other transformations within the soil, is a result of life.

One substance indispensable to all life is phosphoric acid, and from numerous experiments made by Mr. Warington it would appear that the presence of phosphates is an essential condition for nitrification, and in this fact our author affirms we have corroboration of the theory which ascribes nitrification to the action of a living organism.

Nitrification in soils and water is found to be strictly limited to the range of temperature to which the vital activity of low organisms is confined. The action is also dependent on the presence of plant-food suitable to organisms of low character. It has been established by a variety of evidence that the special organism which nitrifies ammonia exists in abundance in the surface soil of all fertile land, but from examination of some subsoils taken from the experimental fields at Rothamsted in the autumn of 1883, Mr. Warington is disposed to conclude that in our clay soils the nitrifying organism is not uniformly distributed much below 9 inches from the surface. At the depths from 2 feet to 8 feet there is no trustworthy evidence to show that clay contains a nitrifying agent.

It is, however, probable that the organism may occur in the natural channels which penetrate the subsoil at a greater depth than in the solid clay. In the case of sandy soils it is assumed that the organism will be found at a lower depth than in clay. This shows that the nitrates found in the subsoil or in sub-soil drainage waters have really been produced in the surface soil, and have passed down by diffusion, or in a descending column of water.

Evidence of the nitrifiability of Rape-cake when applied to land as manure is afforded by the analysis of the drainage waters from the experimental Wheat field at Rothamsted. Each plot in this field has a drain-pipe 2 to 3 feet from the surface, running down the middle of it. On one plot coarsely-powdered Rape-cake is sown broadcast and ploughed in towards the end of October. On fifteen occasions during the last six years the winter drainage waters from the Rape-cake plot, and from two unmanured plots, have been simultaneously collected and analysed. The mean amounts of nitrogen in the drainage from the two unmanured plots were respectively 5.3 and 5.1 per million, while in that from the Rape-cake plot it amounted to 13.7 per million: proving clearly that vegetable substances are susceptible of nitrification, and that the amides and albuminoids of plants do not differ as to their capacity for nitrification from the same substances present in the animal body. It is, however, freely admitted by the author that in a given time ordinary vegetable tissue will yield far less nitric acid than animal tissue, partly from the obvious reason that it contains less nitrogen, but partly also because the excess of carbonaceous matters in the vegetable tissue has also to be oxidised. The available oxygen is thus shown in the case of vegetable tissue to be largely consumed in the production of carbonic acid, whilst in the case of animal tissue a much larger pro-

portion is devoted to the oxidation of nitrogen. There can be no doubt that the extremely rapid nitrification which certain nitrogenous matters undergo in cultivated soil is largely due to the immense mass of nitrifying organisms with which this matter is brought in contact.

As far as information goes at present, Mr. Warington thinks it probable that ammonia is, strictly speaking, the only nitrifiable substance, and that ammonium carbonate is the material from which nitric acid is in all cases produced. With this idea before him, he considers it safe to assert that all nitrogenous bodies are nitrifiable which yield ammonia when attacked by the organisms present in fertile soils.

The prejudicial influence of caustic lime on nitrification was noticed long since by Boussingault, and Mr. Warington deduces from his experiments that a heavy dose of lime applied to land will probably retard, or even suspend for a time, the process of nitrification in the surface soil, but that this action will soon cease as the lime unites with carbonic acid, and the final result will be favourable to nitrification if the land were originally deficient in lime.

It would further appear that nitrifying organisms find a difficulty in multiplying in very strong solutions, and in a series of experiments instituted to prove the amount of nitric acid produced in diluted urine of various strengths seeded with surface soil, May 6, 1884, it was found that nitrification commenced in a 1 per cent. solution of urine in eleven days, in a 5 per cent. solution in twenty days, in a 10 per cent. in sixty-two days, and in a 12 per cent. in ninety days. But in solutions of greater concentration than this no nitrification appeared.

### PRACTICAL INFERENCES.

The practical conclusions from these important results are obvious. The experiments clearly point out why liquid manures should always be applied to plants in a state of great dilution. The effect of liming soils will also be better understood. Further, when rich stable or farmyard manure is left exposed on the surface of the land, there is undoubtedly in dry weather a considerable loss of ammonia or plant-food, as the fermented urine in the dung is in a condition too concentrated either for nitrification or the retention of the ammonia by the soil. A similar loss of plant-food would occur in very dry weather when sheep or cattle are fed on the land.

## THE VICTORIA REGIA.

Extraordinary success has attended the culture of this rare and wonderful water-plant in the gardens belonging to Abraham Dixon, Esq., this year, at Cherkeley Court, Leatherhead. His magnificent plant, apart from the interest which must always belong to the Victoria as one of the wonders of the vegetable kingdom, has other claims to our notice by reason of the circumstances connected with the importation of the seed, and their sowing, and subsequent growth, until unusual perfection was attained on Mr. Dixon's own plan. It is also supposed that the Cherkeley Court variety is distinct from that hitherto grown in this country, it being brighter in the rose tint of its flowers, and more robust in its constitution. This may well be; as, since M. D'Orbigny sent the first account of it with specimens from Corrientes on the Rio de la Plata to the Museum of Natural History in Paris in 1828, the descriptions of the different travellers who noted the plant seemed to point to the fact that there were distinct varieties of it; indeed, M. D'Orbigny in 1835, in his *Voyages dans l'Amérique Méridionale*, himself mentions one which he considered different from that previously seen by him. Be that as it may, it may safely be asserted that Mr. Dixon's plant of the last season was one of the finest in foliage and in flower that has ever been produced in this country. The seeds were obtained from a friend on the Lago Grande, one of those large sheets of water for which the River Amazon is remarkable, the one in question being about 1000 miles up that river. On January 9, 1884, the seeds were planted directly into the soil in the heated tank, the usual method of sowing them in pots and afterwards transplanting them being departed from, and with advantage, for on germinating the plant grew with great freedom and increased rapidly in size and strength and without exhibiting that tardiness of growth which is usually the case after transplanting out of pots. On February 12 the first leaf appeared, and on May 1 five large

leaves were developed, so rapid had been its progress. Since May from sixty-five to seventy leaves have been produced, many of them measuring 6 feet to 7 feet in diameter, and having the raised border to the leaf standing up 6 inches or more, and thus in this particular quite eclipsing the 2-inch high raised edge which one of the travellers records of a plant which he saw growing wild on the Paraná. Reference to our illustration (fig. 6, p. 19) will serve to give a good idea of the marvellous strength of these leaves when in vigorous condition, as at Cherkeley Court. The secret of their great buoyancy is to be found on the under-side, where a wonderful provision of Nature for sustaining the gigantic leaves even in troubled waters is arranged along the entire system of ribs and nerves. Strong cellular structures, as in *Euryale ferox*, follow every nerve of the leaf, being thickest near the stalk and gradually tapering off to the edge of the blade, acting like continuous cork floats all along the ribs, the greatest sustaining power being placed exactly where most needed—near the leaf-stalk, so as the better to counteract or break the force coming from any sudden rise or fall of the water level. Indeed the whole plant, from the root to the flower, is a study of Nature's engineering. Altogether about sixty immense blooms, some of them 11 inches in diameter, have been produced by the plants in 1884, the first one having opened on May 21, and the last on December 15. On first opening they are white, but at the end of the first day the centre becomes pale pink, and after two days are completed the whole of the flower changes in two hours with an almost perceptible blush to clear rose-pink. During the whole of the time they are open they are delightfully fragrant. These data seem to prove that whilst but few gardens can boast of the luxury of a Victoria tank in their tropical-house, and but still fewer of those who have it can claim to have made it such a success as Mr. Dixon has done with the aid of his diligent gardener, Mr. John Page, who is a plantsman of the old school, but fertile in invention, and well up to date in practice, very many of our gardens have spaces devoted to, and elaborate contrivances for, some less worthy plants than the Victoria regia. The Cherkeley Court plant will be grown on for another year; already it has started into new and vigorous growth; but not content with these proofs of its vigour it has secured its perpetuity by spontaneously produced seedlings which are now coming on well. The tank is heated by hot-water pipes to a minimum of 75° in winter, and 80° in summer. Our illustration shows Mr. Dixon's adaptation of an old contrivance for keeping the water moving without much waste. It consists of a trough divided in the middle, with sloping sides swung on a pivot, with a dripping tap just over it. Each half of the trough is alternately presented for filling. After the tap has dripped into the end under process of filling long enough to destroy its equilibrium it tips over, and thus brings the other end under to be filled and tipped over in a like manner. The disturbance caused by the fall of the water at regular intervals seems to be of much benefit to the plant, and greatly to be preferred to a steady flow, which would not agitate the water so much. In the side tanks in the Victoria-house at Cherkeley Court all the obtainable Water Lilies are well grown, and give their harvest of lovely white, crimson, yellow, and blue flowers, even yet being good in foliage, and *N. dentata* is still in bloom. Later on they will be removed from the water, and only just kept moist, like any other plant requiring rest, until the time comes round to start them anew. The *Nelumbiums*, as will be seen by the leaf in the hand of the youthful navigator of the Victoria leaf in our illustration, are very fine at Cherkeley Court, where lovely white and pink varieties are grown, their beautiful flowers being succeeded by those curious capsules, like children's rattles, which contain the "Sacred Beans" of tradition. To such a size do the leaves grow here that they are often 30 inches across, and are borne on stalks 7 feet in height. There is a character about both leaves and flowers of *Nelumbium* which renders them pleasant objects wherever they may be. For the rest of the water-plants at Cherkeley Court it may be said that it would be difficult to name a cultivated species which would not be found there in superb condition, even the lovely blue *Pontederia* (*Eichornia*) *azurea*, which is reputed to be a very risky plant in winter, being there in the most vigorous condition. As a general embellishment to the house, festoons of *Allamanda*, *Stephanotis*, *Bougainvillea*, and other climbing plants run along the chains round the tanks and over the roof, and having a most charming effect.

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Jan. 5	Sale of Lilies in great variety, at Stevens' Rooms.
TUESDAY,	Jan. 6	Sale of the Fallowfield Orchids, at Protheroe & Morris' Rooms.
WEDNESDAY,	Jan. 7	Sale of Hardy Plants and Bulbs, at Stevens' Rooms.
THURSDAY,	Jan. 8	Sale of Liliun auratum and Roses, at Protheroe & Morris' Rooms.
FRIDAY,	Jan. 9	Sale of Imported Orchids and Lilies, at Stevens' Rooms.
SATURDAY,	Jan. 10	Sale of Imported Orchids, at Protheroe & Morris' Rooms.
		First Meeting of the Royal Botanic Society, 3-45 P.M.
		Sale of Plants and Bulbs, at Stevens' Rooms.

A GLANCE through the list of the "NEW PLANTS" of the past year, although it may not reveal anything of a startling or sensational character, will show that some really useful acquisitions have been secured in the several departments of the garden, a fair number of which seem likely to hold their place in public estimation for some time to come. The number of new things is probably as large as ever, the collector being now, to a very great extent, aided by the hybridiser, especially amongst the choicer class of subjects, such as Orchids. We cannot in this summary note down a tithe of the actual additions made to our garden lists; all we propose to do is to point out the plants which appear to us to be the most worthy of attention amongst those which have been exhibited or figured, or have in other ways occupied a prominent position.

## ORCHIDS.

This group is the most numerous amongst the novelties of the year, and no doubt contains the greater number of choice plants. At the head of the list we should place *Aërides Sanderianum*, a grand plant of the odoratum section, and remarkable for its vigorous habit, its short, broad, retusely bilobed leaves, and its long drooping racemes of large and handsome blossoms, which are coloured after the usual style, white, more or less deeply tipped and spotted with magenta-purple. The large three-lobed lip has a spur fully half an inch wide, with clear yellow dolabriform side lobes, crispy and toothed at the edge, the middle lobe also crispy and toothed, of a rich purple-magenta, and closely folded upwards between the side lobes, in which position it has the appearance of a brilliant purple crest, and comes into strong contrast with the bright yellow of the side lobes and the greenish-yellow of the tip of the spur. We are told it comes from Eastern Asia, which we may presume in this case means the Eastern Archipelago; and it is certainly the finest *Aërides* of this type that has as yet appeared. We have several other *Aërides* to record, namely, *A. Emerici*, from the Andaman Islands, a neat and pretty species, with rather small flowers; *A. Robbelinii*, a Philippine Islands plant, with the habit of *A. quinquevulnerum*, the rosy-lipped flowers of which have the side lobes yellow; and *A. Rohanianum*, another species from Eastern Asia, which has long dense spikes of rosy white-margined flowers with a yellow spur. Associated with these are the *Saccolabiums*, of which we have to record *S. giganteum illustre*, a very fine variety, in which the flowers are not only larger and more closely set, but the purple spotting is more definite, and the lip is of a deeper richer purple than in the type. *S. miniatum citrinum* is also a choice and distinct plant, with lemon-coloured flowers, having a dark centre.

The splendid group of *Cattleyas* and *Lælias* has been somewhat freely replenished with good things, beyond the acquisition of such admirable subjects as *C. Percivaliana*, *Gaskelliana*, *Whitei*, *Sanderiana*, &c. Thus *C. Eldorado ornata* adds to all the charms of the typical form the presence of petals having a large dark purple blotch at the tip; *C. Trianae splendissima* is quite a first-class form of this favourite species, the contrast between its white sepals

and petals and the rich magenta-purple lip being very strong and very striking; *C. Mossiae Arnoldiana* is a fine light coloured variety of that species, having the lip beautifully striate-veined with dark purple and orange, the front part sulphur, with a few purple lines; *C. speciosissima regina* is a splendid variety of the labiata set, with rich purple broad-petalled flowers, having a dark mauve-purple lip marked with eye-like yellow spots, and a reddish ferruginous line between the light rosy side lobes. A very fine hybrid *Cattleya* has to be recorded in *C. triophthalma*, raised between *C. exoniensis* and *C. superba*. It has the sepals and petals purplish-rose, the side-lobes of the lip whitish-yellow, purple at the end, the front lobe with a central transverse and two lateral areas of whitish-yellow, with the side angles and front margin rich purple, the three pitted areas suggesting the name. Amongst *Lælias* we must note the handsome and distinct *L. elegans alba*, with pure white sepals and petals, the front lobe of the lip of a carmine-magenta, and the incurved side lobes white. It is a product of St. Catherine's, Brazil. Here again we have *L. Crawshayana leucopetra*, a lovely plant, comparable to a small-flowered *L. autumnalis*, having the sepals and petals of a light rose colour, and the lip of a fine mauve-purple, with white side lobes, and sulphur crests on the disc. *L. Amesiana* is a fine hybrid novelty, raised from *L. crispata*, fertilised by *Cattleya maxima*; in this the sepals and petals are white, the three-lobed lip of the richest magenta, continued backwards between the pale mauve side lobes, the rest of the lip being yellow. Another lovely hybrid is *L. bella*, a cross between *L. purpurata* and *C. labiata*, the habit being somewhat intermediate, the flowers light lilac, with the broad, wavy front lobe of the lip of a very rich purple, varied by two oblong ascending zones of a light ochraceous white at the base, and two similar spots midway, the disc purplish, broken up by pale-coloured lines. Both these hybrids are due to the efforts of Messrs. VEITCH & SONS and their intelligent staff.

Another gem of the season is *Odontoglossum crispum Veitchianum*—so named, we believe, at the request of Baron SCHRÖDER, now the fortunate owner of the plant—a superb variety, which won high honours at the Regent's Park show under the name of *O. crispum mirabile* which was then attached to it; the flowers are individually large, collected into a bold raceme, the sepals and petals being unusually broad, the petals deeply toothed, and the margins strongly crisped, the ground colour white, freely blotched with purple-brown, but having within the margin a zone of dilute mauve-purple, leaving the extreme edge white; it comes from New Grenada, as also does *O. Dornianum*, a species forming a connecting-link between *O. crocidipterum* and *nævium*, and bearing dense racemes of stellate flowers with white sepals and petals marked with dark sepia-brown spots, and a lip tipped with a large brown spot, and marked with yellow (or yellow with red stripes) at the base. Amongst the figures published has occurred that of *O. Edwardi*, remarkable for its panicles of dark purple flowers, relieved only by bright yellow calli on the disc of the lip. Of another type are *O. Wilckeanum sulphureum*, and *O. Vuylstekeanum*, the first of which is a very fine thing, with sulphur coloured flowers, having one or two reddish-brown blotches on the lateral sepals, and a few similarly coloured spots and lines on the lip; the second is a natural hybrid in the way of *O. mulus sulphureum*, the sulphur-yellow flowers having the dorsal sepal, the petals, and the dilated lip blotched with the deepest orange, the lateral sepals being orange-coloured, except at the base. Both appear to be very fine things. Finally, of this group we have a very distinct and beautiful novelty in *O. Edithæ*, apparently a hybrid *crispum*, in which all the central

part of the sepals and petals is of a rosy tint, with an even edging of pale yellow and the usual spotting of rich brown; the flowers come in racemes.

One or two *Calanthes* are deserving of notice. *C. porphyrea*, a garden hybrid, is an exquisite plant, the product of *C. vestita rubro-oculata*, the mother, crossed with pollen of *Limatodes labrosa*; its hairy peduncle bearing a zig-zag raceme of very showy flowers, of which the sepals and petals are of the most dazzling purple, and the three-lobed lip of a fine purple in the anterior part, yellowish at the base, with small purple spots; it has the constricted pseudobulbs of *C. vestita*. It may also be mentioned that *C. sandhurstiana*, a hybrid of Mr. GOSSE's, has reappeared with much éclat. *C. Curtisii*, from the Sunda Isles, is a welcome addition, its racemose flowers being white inside with rosy borders, and rose coloured on the outer surface, the lip yellow with a purple callus. Another species, *C. proboscidea*, a near ally of *C. furcata*, has white flowers which change to ochre-coloured. This also comes from the Sunda Islands. *Brassia* is not a very popular genus amongst the growers of these plants, and yet it contains some strikingly showy plants, in proof of which, *B. Lawrenceana longissima* may be cited. We have a novel species to record here in *B. antherotes*, which is a really handsome plant, with erect racemes of long narrow-petalled yellow flowers heavily blotched with purple-brown, the bright yellow lip marked with smaller spots of purple and having an orange coloured crest on the disc; though narrow in their parts these flowers are very effective, since they measure about 6 inches in their longitudinal diameter. *Cœlogyne Dayana*, in the way of *C. tomentosa*, is a welcome addition to its genus, its flowers, which grow in drooping racemes, being of a pale ochre-yellow, the three-lobed lip marked on the side lobes with longitudinal stripes, and on the middle lobe with a crescent-shaped blotch of very dark brown. It comes from Borneo, the home of some of the finer species of this genus. *Oncidium Jonesianum*, from Paraguay, is a very pretty small-growing species, with terete subulate leaves, and racemes of prettily spotted flowers of a pale ochre-yellow, marked with numerous sepia-brown blotches, the lip having small bright yellow spotted auricles, and a broad subreniform bilobed white lamina, marked near the base with a few brilliant purple blotches. The colours and marking are very effective, and the general character of the plant distinct, so that it becomes a desirable acquisition. *Phalænopsis Reichenbachiana* is said to be a lovely plant, and one easy of recognition, partaking of the characteristics of both *P. speciosa* and *P. Luddemanniana*. The flowers are cream-coloured, strongly marked with ocellate reddish-crimson blotches, while the lip is rose-coloured, with an orange base, woolly, as in *P. tetraspis*. In *P. Veitchiana brachyodon* we have a variety with slightly mottled leaves, and an erect branched stem bearing white flowers, the lateral sepals, which are tinged with sulphur, have brown spots at the base on the inner upper side; the side lobes of the lip are purple at the tip, white at the base, and the whitish-ochre front lobe is spotted with purple, its retuse apex dark purple. Like most of the Moth Orchids, it is well worth growing. The *Trichocentrum porphyrio* is an extremely pretty bulbless plant, producing large flowers of a brownish-red, edged with yellow, the broad obconate emarginate lip being porphyry-red, edged with white in front, the disc bearing a sulphur-coloured blotch, and three purple lines at the back of it. Another very pretty though scarcely a showy plant, is the *Zygopetalum Burkei*, the flowers being of unusual colours; they are produced in racemes, the sepals and petals greenish-yellow, heavily barred with deep chocolate-brown, the broadish lip pure white, with a ruff or collar at its base, consisting of

about thirteen rosy-purple plaits; it comes from British Guiana.

To the popular genus *Dendrobium* a few useful additions have been made, but nothing very strikingly novel. Thus *D. superbum* Burkei is a fine white-flowered variety of that well-known species, the yellowish-white lip having two blush rose spots, one on each side the disc. This species, it will be remembered, is that which bears rhubarb-scented flowers, and formerly bore in gardens the name of *D. macrophyllum*, which really belonged to another plant. *D. profusum* is an elegant species with the general habit of *D. superbum*, only con-

popular favour, as they well deserve to do, from their free habit and the beautiful colour of their blossoms. We especially allude to those of the Schlimii and Sedeni race, *Cypripedium calurum*, *C. cardinale*, and *C. Schröderæ*, which have won golden opinions wherever seen in public. To these we have to add two more hybrids, *C. grande*, and *C. Leeaunum*. The first is one of the most robust of the whole race, 3 feet or more in height, with great shining green leaves and branching flower stems bearing several large flowers in which the dorsal sepal is yellowish-green with olive-green veins; the petals are pendulous, ribbon-like, 9 inches

oval dorsal sepal is white, with a base of emerald-green, and the centre marked by a bold dotted bar of purplish-red; the petals are decorated by reddish-brown longitudinal stripes, and the lip or pouch is of a shining brownish-red. Among the imported acquisitions we have a floral gem in *C. Godefroyæ* from Cochinchina, a species closely related to *C. niveum*, having the same dwarf compact habit, and flowers of similar form, white, heavily blotched and striped with rich chocolate-brown. The *C. Robbelinii*, from the Philippine Islands, is another good thing in the way of *C. philippinense* (*levigatum*), which has the dorsal sepal

FIG. 6.—THE VICTORIA LILY AT CHERKLEY COURT. (SEE P. 17.)

siderably more slender in habit, its long drooping stems bearing a profusion of flowers which have yellowish-green sepals purple at the base inside, purple dotted petals, and a pandurate yellow lip bearing in the centre a dark spot. It comes from the Philippines; while *D. signatum*, from Siam, is in the way of *D. Bensoniæ*, the flowers white, and the large squarish lip sulphur-coloured, with a broad radiating dark brown spot on the disc. Some good varieties of *D. nobile* have also been flowered, as *D. nobile album*, *D. n. Schneiderianum*, and *D. n. Tollianum*, the records of which will be found in our pages.

The hybrid *Cypripedia* which we referred to last year have increased immensely in

long, yellowish veined with green at the base, and rosy-crimson towards the tips, and the lip prominent greenish-yellow, the incurved lobes whitish spotted with red, and the staminode pale yellow, fringed on the upper edge with blackish-red hairs. It was raised from *C. Roezii*, crossed by the pollen of *C. caudatum*, and like the three varieties above mentioned belongs to the *Selenipedium* group which Mr. Benthams in the *Genera Plantarum* admits to generic rank. *C. Leeaunum* is a very different, but a very distinct and handsome plant, a cross between *C. Spicerianum* and *C. insigne* Maulei, and partaking much of the habit and character of the former, being dwarf and compact, with green leaves and large flowers, of which the flat

whitish, with dark purple veins, and the lip yellowish. Finally, *C. Lindleyanum*, a plant described half a century ago, has at length been introduced in the living state; "it has smooth green leaves, and paniced stems 2 feet high, the sepals and petals red-brown, with darker veins, the lip green, and the staminode yellow, covered with stiff hairs." It comes from Guiana, and will no doubt be well appreciated when it comes to be established. Other novelties in other groups will come under review at another time.

— THE ALMANAC.—It is decreed by circumstances that the Almanac shall be published with the first number of the New Year as a new year's greeting to our friends and subscribers. The plan is,

however, not without its disadvantages. Owing to the date of publication it is impossible to insert all the fixtures for local flower-shows and other similar appointments, the precise date for which is not fixed till later on in the year. Nevertheless, in the Almanac issued with the present number, the dates of all the more important metropolitan shows are given, such as those of the Royal Horticultural and Royal Botanic Societies; the meetings of the Linnean Society; of many Scottish and provincial Societies; indeed of all that came to hand up to the end of December. The table of temperatures represents the adopted mean for every day in the year at Chiswick, and is taken from Mr. GLAISHER's elaborate reduction of the observations of upwards of forty years. Holidays and festivals are noted; the time of sunrise and sunset at particular periods indicated, as well as the periodic phases of the moon. In short, as much information is crowded in as the small space at our disposal will allow.

— THE INTERNATIONAL FORESTRY EXHIBITION.—We are glad to hear that the Executive Committee of the Forestry Exhibition, Edinburgh, has now resolved to publish a report, and a selection of the prize essays on forestry subjects. It is also stated that the authorities of the India and Colonial Offices have agreed to the suggestion of the committee, and are to publish the general list of awards made at the Exhibition in the official Indian and Colonial *Gazettes*.

— DR. GILBERT, F.R.S., Professor of Rural Economy in the University of Oxford, and the associate of Sir J. B. LAWES in the Rothamsted Experimental Work, has been offered and has accepted the post of Honorary Professor of Agricultural Chemistry at the Royal Agricultural College, Cirencester, rendered vacant by the death of the late Dr. VOELCKER.

— THE BEE AND FRUIT FARMING COMPANY.—This is the comprehensive title of a speculation about to be undertaken in this country. The business, which should be a profitable one if economically conducted, will also combine, if the public demand and local circumstances warrant, those of dairying, market gardening, and fruit preserving. The property intended to be acquired is situated at Hockenden, St. Mary Cray, Kent, where bee farming has been lately carried on by J. GARRATT, Esq. We can always welcome any addition to our present inadequate supplies of milk and honey, and likewise the preservation of soft and other fruits for winter consumption, and wish the projected industry every success.

— THE LIFEBOAT SERVICE.—Quite recently a lifeboat was established at Walton-on-the-Naze, through the generosity of the Honourable Artillery Company and of a gentleman well known to readers of the *Gardeners' Chronicle*—Mr. ROBERT WARNER, who presented the land on which the boat-station is erected. No long time elapsed ere the lifeboat was put to use, for on Friday last, December 26, the crew succeeded in safely landing twenty-five sailors from a German ship that ran aground in a snowstorm on Christmas morning. The next time Professor REICHENBACH—so felicitous in his choice of names—has to name an Orchid in compliment to Mr. WARNER, this incident may furnish a hint for an appropriate name.

— GRAND NATIONAL DAHLIA SHOW.—We have received the following communication from Mr. THOMAS MOORE, Hon. Secretary and Treasurer of the Grand National Dahlia Show, to be held on September 4 and 5 next:—

"The Directors of the Crystal Palace Company are preparing their programme for 1885, and are desirous to know from the Dahlia growers whether they intend to hold next season a show of that flower similar to those of the last three years. The Company, I am informed, are willing to continue their grant of £50 in aid of the Prize Fund. I may state that several of the exhibitors have expressed a hope that the show may be continued, so that it seems desirable to go forward with it if possible. The decision rests with the subscribers.

"Most of the present subscribers, if not all, are aware that the subscriptions from the growers have hitherto fallen slightly short of the sum necessary to provide the fairly liberal prizes heretofore offered, and also to cover the small but necessary expenses connected with the carrying out of the show. The deduction of a portion of the prize-money won by the larger prize-takers has

consequently had to be made in order to balance the accounts. This is not satisfactory; and, on consultation with Mr. C. TURNER, who has throughout taken much interest and undergone much labour in trying to raise the necessary sum, we have determined to appeal to the subscribers and prize-takers of the last two years in order to learn what sum each one is now willing to contribute. One gentleman has suggested that every subscriber of half-a-guinea should double his subscription; that would be a real help. Another plan of augmenting the total sum would be to induce a larger number of individuals to contribute, when an augmentation of the amount in each case would not be necessary.

"If the response to this appeal is hearty and liberal, we shall be able to hold the show as before, to keep up the amount of the prizes and possibly to increase their number. If it is penurious and wanting in spirit, we must either lower the amounts in the prize-list in order to meet the means which the growers are willing to provide, or cut out some of the classes or the prizes; or else we must adopt a rule that all prizes awarded shall be subject to a *pro rata* deduction if the subscriptions do not provide for paying them and the expenses in full."

— SENDING PLANTS TO GERMANY.—In reference to this subject Messrs. R. H. VERTEGANS, the Chad Valley Nurseries, state as follows:—"Everybody who sends plants abroad must know that plants of any kind (with the exception of Grape Vines) in all cases may be sent under the conditions that they be accompanied by a certificate from a magistrate in reference to Phylloxera. Only during a very short period, was it prohibited to send plants of any sort into Germany. In accordance with requests from many quarters the above regulations were adopted, so that plants of any description might be sent providing the certificate is at hand."

— BAGSHOT AND WINDLESHAM FLOWER SHOW.—This meeting will take place, as usual, in Bagshot Park, on June 30 and July 1, when several special prizes will be offered for cut Roses in the open classes.

— IMPATIENS HOOKERIANA.—Notwithstanding the beauty of the flowers of this species, and the fact that they are generally considered the largest of any, we seldom hear of its being successfully flowered in this country. Compared with *I. Sultani* and *I. flaccida* it is evidently not very floriferous even in Ceylon, its native habitat. The two latter, and *I. Sultani* especially, will flower in a small state either from seed or cuttings, but the species under notice must be grown to a considerable size, and towards the end of summer subjected to a ripening process by full exposure to light, with merely moisture sufficient to prevent flagging. The fleshy stems under this treatment will be induced to plump their flower-buds, which will flower well into winter. The blossoms are pure white with blood-red dots and lines on the two lower petals. The white spur is curved and remarkably attenuated. There is a figure of the species in the *Botanical Magazine*, and well flowered species may be seen in the Begonia-house at Kew.

— SEED TESTING.—At the New York Agricultural Station an apparatus is used as follows:—A 12-inch square earthen seed-pan is filled with a fine sand, pressed in, and the surface properly smoothed. This seed-pan is then placed in a copper tray 1 inch deep. Over the seed-pan, and fitting within the tray, a copper box with a glass cover is placed. The seeds, generally one hundred of a sort, are carefully counted and placed in parallel rows upon the surface of the sand, and left exposed to observation. Water being supplied to the tray capillary attraction keeps the sand in the seed-pan evenly moistened, while evaporation keeps the air within the apparatus and in contact with the seed thoroughly saturated. Each day the rows of seed are carefully gone over, and such seeds as are found germinated are counted as they are removed.

— SALVIA BOLIVIENSIS VAR. VERTICILLATA.—Several specimens of this are distributed through the greenhouse No. 4 at Kew, and are very effective among other late flowering subjects at this season. Several species are flowering more or less, but excepting the variety *Braunti* none rival the brilliancy of colour exhibited in the flowers of the plant under notice. The corollas are of a glowing scarlet, and the size of the flower is materially augmented by the breadth of the middle segment of the lower lip. The

type is figured in the *Flore des Serres*, t. 1148, and in the *Botanical Magazine*, t. 5947, under the name of *S. erubescens*. The present plant seems to be more robust than that figured, and the inflorescence of the leading axis is less inclined to branch, which, however, may be merely the result of cultivation.

— AMATEUR MARKET GARDENERS.—A "Nurseryman" writes to us in the following terms. From his point of view the matter is one of very great importance:—

"In the discussion on gardeners and salesmen a point has been raised which is to myself and some hundreds of other readers of the *Gardeners' Chronicle* of greater interest than the original question at issue, viz., the fact that the market gardener, and latterly the nurseryman, has not only to contend against bad seasons, tithes, ordinary and extraordinary, rates and taxes, &c., but also against competition from the majority of large gardens all over the country. Being an advocate for Free Trade, I have not a word to say against the level of trade being raised by an influx of aristocratic members, but I would point out that the present state of Free Trade is not Fair Trade. If the rates and taxes of the amateur and professional market gardener or nurseryman be compared, it will be seen that the latter are handicapped in the proportion of ten to one. The time has passed when the matter was glibly explained as the mere disposal of a little surplus stock, as every one conversant with the matter could name dozens of establishments in his own neighbourhood which are now managed solely for profit, and where the gardener's position depends on his ability to show a balance, as much as that of any head of a department in a business. This being the case the injustice of the present unequal distribution of the burden of taxation does not need a lengthy dissertation, the kernel of the matter is how the inequality is to be levelled. If anything is to be done an association must be formed of those most interested all over the country; mere local agitation will not be of any avail, as not only has the ordinary *vis inertia* to be contended with, but the fact that all local assessment committees, &c., are too much under home influence to be easily stirred. The time will come when the question cannot be shelved, and the sooner the better. Grapes, Cucumbers, &c., are now during most of the season sold under cost price, cut flowers arriving at the same state, and plants, Orchids, &c., are following rapidly. *Nurseryman*."

— CANTERBURY ROSE SHOW, 1885.—We are informed by the Honorary Secretary of the above-named Society that this show is arranged for June 27, instead of July 27, as was stated in our issue for December 27.

— THE CAMBRIDGE BOTANIC GARDEN.—The Botanic Garden Syndicate have recommended the increase of the stipend of the Curator of the Botanic Garden from £150 to £200. The Syndicate have watched with interest the zeal and skill with which Mr. LYNCH has applied himself to the conduct and development of the garden. The improvement during his curatorship has been very considerable—in fact remarkable; and the reputation of the garden among botanists and horticulturists, both at home and abroad, has risen so much that it is now considered to hold a place in England second only to the Royal Gardens at Kew. Sir JOSEPH HOOKER has said that the garden, under Mr. LYNCH's able management, is rapidly rising to eminence as one of the very best in Europe. The Syndicate express their strong approval of the assistance which Mr. LYNCH's intelligent appreciation of the requirements of botanical teaching has enabled him to render to the University.

— SCIENCE TRAINING AT CAMBRIDGE.—The Senate has sanctioned the recommendation that £700 be expended on the purchase of microscopes for the biological classes, on which sum interest at 4 per cent. is to be paid, a small terminal charge being made to the students for the use of the microscopes.

— GARDENING APPOINTMENTS.—Mr. A. BROOKS, late Foreman to Mr. L. JENKS, Brambletyre, has been appointed Head Gardener to W. S. STOOBRIDGE, Esq., Albury Hall, Herts.—Mr. W. HOLMES, late Gardener at Cromwell Range, Fallowfield, as Gardener to CHARLES MOSELEY, Esq., Grangethorpe, Rusholme, Manchester.—Mr. JOSEPH HEARD, late Foreman at Floors Castle Gardens, has been appointed as Head Gardener to H. ANDREWS, Esq., Swarland Hall, Felton, Northumberland.

## The Flower Garden.

### HARDY FERNS.

IN many gardens there are some unsightly places that might easily be made to suit hardy Ferns, and give great effect, such as the north aspects of walls or buildings, or raised bank or mounds, if the space is sufficient, but only a partly shady place—that is, avoiding the mid-day sun, which must be kept from them. After the site is decided upon collect the materials. Those in which I find Ferns flourish best are the refuse and sweepings of the garden which have been laying for two or three years, or old leaf-mould, or any loose sandy rubbish, and old heaps of mould of a sandy nature, or common peat would do to mix together. After all is arranged ready for the job, stoops, the larger the better for effect, must be obtained, for which, if not of easy access, I have often substituted large logs of wood and tree stumps and clinkers from the stovehole, which can be cemented together with good stone lime to form large massive pieces, so as to give the appearance of large stones. Then place the stones irregularly over the banks and mounds, and avoid making straight lines, giving as natural an appearance as possible. Next, plant the Ferns between the stones, taking care to put the small and delicate species and varieties in front. They do best put between two flat stones with some mould, pressing the stones somewhat together. I find such kinds as *Asplenium fontanum*, *Ruta muraria*, and *viride*, *Trichomanes cristata*, *Woodia ilvensis*, *Ceterach officinarum*, *Adiantum Capillus-Veneris*, *A. pedatum*, the Royal Ferns, *Osmunda regalis*, *O. cristata*, *O. cinnamomea*, and *O. spectabilis* require a damp situation, and should be planted low, with a good depth of soil, and kept well watered during the summer months. *Struthiopteris pennsylvanica*, *S. japonica*, *S. germanica*, are fine flowering Ferns, all very handsome, and make a handsome feature in hardy ferneries. *Lastrea cristata*, *L. dilatata*, *L. crispum*, *L. Filix-mas*, *L. cristata*, *L. Standishii*, *Athyrium Filix-femina* *Victoria*, *A. multifidum*, *A. cristatum*, *A. Applebyanum*, *A. Goringeanum* *tricolor*, *Polypodium cambricum*, *P. phegopteris*, *Polystichum cristatum*, *P. lonchitis*, *P. proliferum*, *Scolopendrium crispum*, *S. Kelwayi*, *S. marginatum*, *S. endive-folium*, *S. cristatum*—these Ferns are all good for the hardy fernery, and will do well in pots if placed in a compost of good peat and stiff loam and sand well mixed together and plunged in leaf-mould or any light loose material at the back of a north wall. *Wm. Smythe, Basing Park, Alton.*

## The Hardy Fruit Garden.

### PLANTING: PREPARATION OF THE SOIL.

PLANTING and pruning are the most important operations during this month. The first thing to be considered in planting fruit trees is the preparation of the ground, for if this is not in a good condition it is almost waste of time and money to plant; so if this operation has been delayed no time should be lost, always bearing in mind that fruit tree planting, as a rule, is intended to be permanent, hence it is very important that a good soil and situation should be chosen. Should the ground intended to be planted be damp, means should at once be taken to thoroughly drain it. Strong heavy ground should never have drains more than 3 feet deep, and if a foot of rubble can be placed on the top of the drain-pipes so much the better. I have planted fruit trees in borders concreted for 8 or 9 feet from the wall, and also on well-drained borders without concrete, and from experience I much prefer the latter. When planting the latter I prefer placing a good barrowful of broken brickbats under each tree, with a few slates laid flat so as to form a sort of table to plant on. Planted in this manner with about 18 inches of good loamy soil they will form a mass of fibry roots, which being kept near the surface are well under command as to feeding and watering. In transplanting remember to take up a sufficiently large ball. By the diagram, fig. 7, where the position of the circle

indicates the usual relative size of the ball, it will be seen that most of the feeding roots are outside the circle, and consequently sacrificed if the ball be too small.

### PRUNING.

The pruning of fruit trees should be pushed forward as expeditiously as possible. Old-established trees should be looked over carefully, removing all small, crowded shoots; and should the middle of the tree be a mass of small growths, a few large branches should be entirely removed, which will be found better than having to cut away so much young wood.

### MANURING.

Advantage should be taken of frosty mornings to place a good dressing of rotten dung on the surface of any fruit trees that are weak or unhealthy; this will encourage surface roots to form. Where the ground is of a strong heavy texture, dig between the rows of dwarf bush trees so as to allow the air to pulverise and sweeten the soil, always being careful not to dig too near the roots of the trees or bushes. Where the ground is of a light sandy nature it is better not to disturb the soil, merely hoeing and keeping the ground free from weeds. This is a good time of the year for placing a good dressing of manure on the surface of the ground of the latter nature. If Strawberry beds have not had a good dressing of manure placed on the surface of the beds it should now be done—or even over plants and all; it will do no harm if spread broadcast over the whole beds.

### WALL TREES.

The nailing and pruning of wall trees may be proceeded with as opportunity offers. I prefer

FIG. 7.—POSITION OF ROOTS, TO ILLUSTRATE THE NECESSITY FOR A LARGE BALL IN TRANSPLANTING.

nailing the north and east walls first; on south and south-west walls we prefer leaving all young shoots of Peaches, Nectarines, and Apricots loose from the walls at present, merely securing all the older shoots so as to save time when the busy season arrives. Let any one try this plan, and they will find that these trees will flower a week or ten days later, which often means a crop or no crop. It is a good plan before nailing the trees, or even after, to give the walls and trees a good washing with soap-suds either with the syringe or the engine. *J. Smith, Mentmore, Bucks.*

## Plants and their Culture.

### GENERAL REMARKS.

It will be found most advisable at this, the commencement of the New Year, to review the successes and failures of the past season or two, and endeavour, by the experience gained thereby, to attain to even better results in the future. We have all of us a great deal yet to learn in the minor details of plant culture; some apparently complex problems relating to the success in the culture of any given class of plants become very simple when well thought out and acted upon. The

requirements for the successful culture of many plants can be, as it were, anticipated by many practical cultivators almost at a first sight of the subject to be taken in hand. The most essential requisites, such as regards soil, exposure or non-exposure to the full influence of sunshine, and that (not easily mastered) knowledge of applying water at the right time or in a proper quantity to develop a healthy root-action, should be thoroughly understood and acted upon.

### WATERING.

Some plants on the one hand will, when in a healthy state, take an almost unlimited supply of water, thriving far better when never allowed to become dry at the root; whilst on the other hand there are such as require careful watching, suffering if allowed to become dry, yet never able to absorb large quantities. To this latter class belong most of the plants with fine hair-like or fibrous roots; to the former we may ascribe those with thick fleshy feeders, such as the Palms, that are in a healthy condition, and not over-potted. Most of the Ferns, too, have fleshy roots, though much finer than those of Palms; this will indicate their power of dealing with a larger quantity of water at the period of active growth. As a matter of course, the health of any given plant must be duly considered; if a plant is showing indications of exhaustion from weak root-action (this is soon found out by the soil remaining an undue length of time moist), more careful attention must then be paid to it, and the first opportunity taken to examine the roots and to repot into fresh soil. This advice will apply more especially to choice plants of an enduring nature, albeit the general outline must be followed in most cases where practicable.

### INSECTS.

Insect pests, again, are not always easily overcome, for they are very persistent in their attacks, and increase very fast under nearly all conditions. What horticulturist is there who has not had more experience than they ever desired to have of that pest of our hothouses, the mealy-bug? Yet by unremitting attention I venture to assert that this, even this insect, can be much reduced in numbers and eventually extirpated in the majority of cases, the persevering use of the best insecticides generally proving successful. It is now many years since the bug was allowed any lodgment here, and the advantage that has accrued in exterminating it has been very great, not to mention the ease of mind that is felt when, for want of room, the plants are shifted into the vineries or other fruit-houses. No fear in such cases of the bug reaching the Vines and ending their course, in some instances, only when the bunches are placed upon the table. Having once got rid of this pest, on no account allow it to gain headway either on cuttings, small plants, or specimens. We make it a practice to grow all of our specimen plants from the small state, thus running no risk in that direction, having the pleasure besides of seeing their development through all stages. Small plants and cuttings are kept in quarantine, so to speak, for some weeks, till a clean bill of freedom can be granted to them, but this is rarely ever needed, though always practised for safety. When once one is clear of this pest doubtful sources are carefully avoided from whence a fresh stock is likely to proceed. *James Hudson, Gunnersbury House, Acton.*

## FRUITS UNDER GLASS.

### PINES.

If there is one operation that demands more attention than another in the process of Pine-apple cultivation it unquestionably may be ascribed to watering the plants at the roots; no matter how complete or satisfactory other arrangements and conditions of treatment may be, if this matter is not judiciously done it will be a primary cause of diminishing the energies and constitution of the plants to such an extent that the ultimate issue with respect to the fruit will be far from satisfactory; for this reason the consequences cannot well be too plainly indicated, more especially at the present season, which of all the rest is a time this matter requires most discretion. As the means employed in cultivation differ in character, so will the requirements vary accordingly in respect to supplies of water. For instance, plants situated in beds heated by means of hot-water pipes will need much more water than others in beds of fermenting materials only; in the former case every plant should be examined by hand at least once in every ten days, and have a liberal supply of water if necessary. On the other hand, those plants plunged in fermenting

beds will want but little of it during the winter months; in fact it is under such conditions far preferable to have them somewhat dry at the roots than otherwise, as in the event of the soil becoming soddened worms will penetrate it more readily and much mischief will ensue from their depredations, watering should therefore be deferred until such time as it is absolutely necessary. Although these beds are not so commonly used in Pine culture as they were formerly, yet under good management they are still the best means to employ for growing the young stock of plants. The plants which are expected to show fruit next month should now have the advantage of a good position near the glass where light and sunshine can operate freely about them. Liberal treatment in the way of heat and surface moisture should also be afforded; the former should range about 70° at night with 5° more in the day; air should be given sparingly at 80°, and before the temperature falls much below this point the place should be closed and moistened with the syringe. Plants which are to come into fruit after the foregoing ones are over need not have a higher temperature than 60° to 65° at night, and about 5° more in the daytime during the present month. My plants are still in fermenting beds under these conditions, and will remain so until they are placed in a fruiting pit, where they can have an abundance of heat both at top and bottom by means of hot-water pipes which will be regulated as required. Young plants and suckers which merely require to be kept in a healthy state until starting time next spring will not need a temperature of more than 55° or 60°. Tepid water ready for use at all times is an essential required in connection with Pine culture, and must be provided; in my own case it is obtained by carrying the flow-pipe from one of the boilers through a large tank made with bricks and cement: from this for many years past I have at all times ready an ample supply of it, not only for the purpose in question, but likewise adequate for the rest of the subjects which are forced in this establishment.

#### PEACHES AND NECTARINES.

In those houses which were closed at the beginning of last month, and forcing operations have been applied since that time, growth in the trees will already be excited, and in the case of those which have been subjected to these operations for some years past they will be in full blossom by this time. At this early period bees do not generally abound, and the loss of their aid in fertilisation will have to be supplemented by artificial means. Experience has already revealed the fact that it is possible at this critical period to keep the air too dry for the purpose of securing a good set of fruit, and we have found it prudent to continue to syringe the trees lightly every day during the time they are in flower. I also, to avoid any risk of failure, brush the blossoms over with a camel's-hair pencil two or three times in the week when in flower. A low temperature for the present should rule here, 50° at night, 55° in the daytime, and from 60° to 70° by natural influences will be safe; ventilate at 60°, and close up at the same point. In the next division the necessary preparations for starting should demand attention. Too much pains cannot well be bestowed in eradicating insect pests, if such abound, by well washing the trees, &c., which if done carefully, in my opinion, is all that is necessary under ordinary circumstances. I have abandoned the slow practice of besmearing the trees and buds with compositions made up with various ingredients, some of which, if not discreetly used, are calculated to do very much more harm than good, and recommend others to do so likewise. After the trees are regulated and tied to the trellis, fork the borders over 2 or 3 inches deep. Remove inert and useless soil, and replace it with fresh compost; afterwards add 2 or 3 inches of partly decomposed manure as a surface dressing, and, if needful, give the borders a liberal watering; in order to have the fruit ripe by the time that in the early division is over forcing should be proceeded with not later than the beginning of next month. Later houses should have all preparatory work executed as speedily as possible, and if the fruit is not wanted in advance of those from out-of-doors, they should be well ventilated both at night and in the daytime; also trees in pots in cool structures should have their requirements attended to. If the shifting and disrooting of these is not already done, it is expedient to do it without delay, and afterwards mulch the surface soil with manure, and see

that watering when necessary is duly attended to. This place should be kept as cool as possible, particularly where means are not furnished for supplying heat.

#### CHERRIES.

As an advocate for many years past for the extension of the cultivation of Cherries under glass, it is satisfactory to notice of late years a marked increase in the number of houses devoted to this purpose, and if it were not for prejudices existing in the mind of many practical men much more progress would in all probability have been made by this time. The season of no kind of stone fruit can be advanced more readily and at a less cost under glass than Cherries, and the fact of being able to get them ripe during the months of May and June ought of itself to be a sufficient recommendation for their cultivation. Should this be contemplated any good class of house which is amply ventilated will answer the purpose, I prefer planting the trees out in restricted borders, and to have them on trellises about a foot or so under the glass, or on a back wall. In this case only one single rod should be run up under the rafters, otherwise they will not get sufficient light and air. Good friable loam with an admixture of sharp sand will be suitable as a composition. This should be from 2 to 3 feet deep, and be well drained. At the warmest end of the house plant *Frogmore Prolific*, *May Duke*, or *Governor Wood*, and follow out with *Black Circasian*, *Elton Bigarreau*, and *Bigarreau Napoleon* at the coldest part. Of course time must be given for the trees to become established, after which they can be gradually advanced by forcing means. The Cherry-house here containing established trees is just closed. During the present month 40° at night and 50° in the daytime will be the artificial state. At 55° the house will be ventilated and closed again at the same degree. Above this point plenty of air will be admitted. A slight sprinkling occasionally when necessary will be required. *G. T. Miles, Wycombe Abbey.*

## The Kitchen Garden.

IN commencing the Calendar for the new year I shall enumerate the different varieties of vegetables which I have found and proved to possess the most essential qualities in their respective classes. Many other gardeners undoubtedly can say as much in favour of other existing kinds; however, the best plan to follow is to adhere to varieties which have proved to be suitable to soil and climate, at the same time trying new varieties which have come prominently before the public notice—and in some classes especially there has been marked improvement of late years.

Vegetables, I need hardly remark, succeed and vary considerably on different soils and in various situations. For standard and important sowings varieties must be chosen which have been well tested, or in all probability a continuous supply will not be maintained.

*Asparagus*.—*Connover's Colossal*.

*Beans* (kidney varieties, for general outdoor cropping).—*Canadian Wonder* and *Ne Plus Ultra*; and for forcing, *Fulmer's* and *Ne Plus Ultra*. Broad varieties.—*Windsor*, *Veitch's Improved Long-pod*, and *Leviathan*. Runners.—*Scarlet Champion*.

*Broccoli* (spring varieties).—*Veitch's fine Spring White*, *Cooling's Matchless*, *Leamington*, and *Penzance Early White*; for autumn and winter use, *Veitch's Protecting Autumn*, *Grange's Cauliflower Broccoli*, and *Snow's*; and for late use, *Lauder's Goshen*, *Ledsham's Latest of All*, and *Model*.

*Brussels Sprouts*.—Any good selected variety.

*Borecole*.—*Asparagus*, *Read's New Hearting*, and *Cottager's*.

*Cabbage*.—For autumn sowing to cut early in spring: *Ellam's Dwarf*, *Mill's Incomparable*, and *Wheeler's Imperial*. For general summer use: *Allan's Dwarf Incomparable* (a splendid Cabbage), *Nonpareil*, and *Endfield Market*.

*Carrot*.—*Early Nantes*, *James' Intermediate*, and *Long Red Surrey*.

*Cauliflower*.—*Early London*, *Snowball*, *Walcheren*, and *Veitch's Autumn Giant*.

*Celery*.—*Major Clarke's Red*, *Cole's Crystal White*, and *Wright's Giant*, fine for exhibition.

*Endive*.—*Batavian Improved Round-leaved* and *Green Curled*.

*Leek*.—*Musselburgh* and *The Lyon*, the latter for exhibition.

*Lettuce* (Cabbage).—Summer varieties: *Hardy White Dutch*, *Neapolitan*, and *Drumhead*. Winter varieties: *All the Year Round*, *Stanstead Park*, and *Lee's Hardy Green*.

*Cos Lettuce*.—Summer varieties: *Paris Green* and *Paris White* are the two best; and for winter crops, *Hick's Hardy* and *Brown Cos*.

*Onion*.—*Banbury Improved*, *Giant Zittau*, and *James' Keeping*, for spring sowing; and *The Queen*, *Early Naples*, *Giant Rocca*, and *Italian Tripoli* for autumn sowing.

*Parsnips*.—*Hollow-crowned*.

*Peas*.—For growing in pots and frames: *American Wonder* and *Chelsea Gem* (also these two are the best dwarf varieties for sowing early on a south border); to follow, *William I.* and *Ringleader*. Second earlies: *Champion of England*, *Gladiator*, *John Bull*, *Laxton's Supreme*, *Telegraph*, and *Telephone*. For late use: *Ne Plus Ultra*, and *Sturdy* and *Veitch's Perfection* may be included.

*Potatoes*.—*Kidney* varieties: *Improved Ashleaf*, *Woodstock*, and *Covent Garden Perfection*; also *Magnum Bonum*. Round sorts: *Radstock Beauty*, *Grampian*, *Schoolmaster*, and *Champion*.

*Turnips*.—*Early Milan*, *White Stone*, *Veitch's Red Globe*, and *Orange Jelly*, or *Chirk Castle*.

#### GENERAL WORK.

Peas above-ground must receive timely attention on the approach of sharp frosts, also during cutting winds, by giving them some kind of protection. There is nothing like sowing the earliest Peas in heat, in 3-inch pots (to be planted out later on), and gradually hardened off prior to planting on a south border. I recommend for this sowing *William I.* and *Ringleader*. Simultaneously a sowing of the same varieties should be made out-of-doors, and including *American Wonder* and *Chelsea Gem*. About January 6 or 7 will be early enough to make both these sowings, and the pot Peas will be ready for planting out a month later. Draw a little soil to both Peas and Broad Beans that are above-ground. Broad Beans may now be sown in boxes in heat, and when thoroughly hardened off planted out, or they may be sown out-of-doors at once in light soil. Expose freely in favourable weather all young Cauliflower plants. Have protecting material in readiness for Celery, in case of severe frosts or snow. Keep the rows of all growing crops free from weeds, and ply the Dutch hoe when the soil can be caught in a moderately dry state. Proceed as fast as possible with all digging and trenching. After the ground for Peas and Beans has been prepared (if not already done), the ground for early Potatoes should receive attention. This, along with the ground for Carrots, Parsnips, and Beetroot, should have been trenched weeks ago, and henceforth it should be pricked over with a fork (and left lying rough) as often as labour will admit, that is, if produce of the finest quality and size is desired. *W. Richards, Normanton Castle.*

#### SEASONABLE NOTES ON GREENHOUSE FLORISTS' FLOWERS.

##### THE AMARYLLIS.

AT p. 532 of the last volume the remarks on this gorgeous spring flower had brought it up to the point when the bulbs had arrived at the resting period. They had nearly, if not quite, passed through this period, and it is now time to see to the repotting of the bulbs, and their arrangement where they are to flower. We prepare our compost for potting about two months before it is required for use. This year it is formed of two parts loam, one of peat, and one of very decayed stable manure, from a yard where peat litter is used, and with it a small quantity of bones and prepared fish manure. The Amaryllis does not seem very particular as to the compost, but it will do with a richer material than is generally used, and the roots push vigorously into the spent tan over the sides of the pots, and seem to derive more vigour from that than from the compost in which they are growing. Our largest bulbs are potted in 8-inch pots, the others in smaller ones, according to the size of the bulbs,

but it is better to under rather than overpot them. When a bulb is placed in a pot that is too large for it, the chances are that it will not do well. We have bulbs now in 60-sized pots as large as ducks' eggs. In potting the compost should be pressed in firmly round the bulbs, which should not be covered more than half their depth with compost. After potting plunge the pots in tan or any other medium that will give a bottom-heat of about 80°. This cannot be obtained in every garden. If it is not possible to give them bottom-heat, they may be placed on the stage or a shelf near the glass, but in neither case should they be watered at the roots until the bulbs have made some roots into the new compost.

#### THE HYACINTH, THE TULIP, AND POLYANTHUS NARCISSUS.

These are all placed in the category of florists' flowers, and after they are taken out of the plunging material require very much the same treatment. Even the latest flowering plants ought to be taken inside about the second or third week in January. Any of them intended to flower very late had better be placed in a cold frame behind a north wall. Those that are to come into flower about the third week in March or for exhibitions at that time must be placed in a heated pit or greenhouse near the glass. We usually invert a small pot over the crowns until they are inured to the light. They require plenty of air in the early stages of their growth. This free air and a judicious application of weak liquid manure-water favours the production of stout green leaves, which are as brittle as glass. When the leaves are fully developed, with the consequent production of a mass of healthy roots, a little artificial heat will cause a better development of the flowers. They must be shaded from hot sunshine when in flower, and also be sheltered from cutting winds. The house should be aired on the side opposite to that from which the east wind blows.

#### THE CYCLAMEN.

There are many different methods of cultivating these very pretty greenhouse flowers, and some growers who cultivate them successfully sow the seeds at one time, and others, equally successful, sow at another. On one occasion I sowed the seeds in January, and had a nice batch of plants in flower, with a dozen blooms or so on each, in twelve months. January is not the best time to sow the seeds. The best of the market growers who grow for profit sow the seeds early in July. They are pricked out as soon as a leaf or two is formed on the plants; they are not of large size even now, being yet in thumb-pots only. The pots are arranged on a shelf near the roof-glass, in a temperature of about 50° at night; this is necessary to keep them growing freely, and as soon as the plants are large enough they are shifted into small 60's, the object being to keep them growing freely, and the leaves are well developed if the plants are freely exposed to light and air, as they are sure to be close to the glass. The treatment subsequently is different from that usually pursued, but that will be described at the right time. For some time yet let them remain near the glass in a temperature of 50°.

#### PRIMULAS.

The Chinese Primulas are now in full bloom and growth, they are greatly valued at this season of the year for their bright and varied colours. The colours are not only brighter within the last few years, but some of the soft pink or peach coloured kinds are of large size and good form, as well as exquisite in colour. I have noticed during the last few months that some presumably new varieties had very large flowers of good substance, but wanting in form. It is certainly an error to cultivate for size, or colour either, at the expense of form. The object of the florist is to work for form, and from that point cultivate for size, colour, and substance. At this season the plants, if kept in an ordinary cool greenhouse, are very liable to damp off at the neck; this is avoided by keeping up a higher temperature and a comparatively dry atmosphere. We keep our plants in the house where zonal Pelargoniums are in flower. J. Douglas.

#### LATE CHRYSANTHEMUMS.

Valuable as the early kinds of these are, the late sorts are even more so, as December is a very dull time for flowers, but with a few varieties of late Chrysanthemums a house may be kept

gay till quite the end of the year. The best with us at the present time are Ethel, Meg Merrilies, Splendens, Goldeo Thread, Bouquet Parfait, Nelly, and Baron de Prailly. Ethel is a very useful substitute for Elaine and Fair Maid of Guernsey, as it is a pure white, the only fault being that the lady has a black eye, and yet all do not regard that as a defect, for it was only to-day that one of the fair sex remarked that the dark eye added to Ethel's beauty, and gave her a mark of distinction. Be this as it may, those who do not like the orb staring at them can pluck it out if they have the heart, and if not they can blind, or hide it by dressing, as the latter seems coming into vogue, and a little manipulation will make Ethel perfect. Meg Merrilies is a loose formed, ragged, Japanese kind, of rather a dingy yellow shade when the blooms first open, but they improve greatly with age, and come of a rich cream, running off into white at the edges. Splendens is a splendid yellow with narrow petals, and not over-large flowers, and these being light are of great service for cutting—a purpose for which Golden Thread is specially adapted, as it is very feathery and irregular in outline, and, therefore, dresses well in a vase. Bouquet Parfait is one of the oldest of the pompons, which are fast going out of favour, as most of them are too button-shaped and formal; but this one is not so, and is quite worth keeping. The flowers are medium-sized and creamy-white, fading off more to the latter colour as they get old; and Nelly is lilac, and much smaller in size. There is one thing against these late Chrysanthemums, and that is that they lose their foliage, which seems to go shabby as soon as that on the others, so that by the end of the time they have done blooming they become nearly leafless below. Is it not possible to cross some of the autumn or winter flowering kinds with Chrysanthemum frutescens, and so get perpetual bloomers? If it can be done what a gain it would be, and those who succeed would reap their reward, as a great sale would be found for the plants. J. Sheppard.

#### FORESTRY FOR JANUARY.

##### PLANTING.

Arrears of planting will still demand the forester's principal attention, although much will depend on the state of the weather in determining the work to be done in the woodlands during the present month. When frosty or wet weather intervenes all hands may be advantageously employed in pitting and otherwise preparing such tracts of ground as are intended for spring planting, although work of this kind, more especially the draining and pitting, would, for future results, have been much better performed three or even six months ago.

When inserting plants during the present month great care is necessary to prevent either the roots becoming damaged by frost and the cold cutting winds to which they are frequently subjected, or their being planted in ground containing particles of frost. In conveying plants from the nursery to the planting ground pay particular attention to having the roots well covered either with mats or damp hay, as half of the losses reported in newly formed plantations may be attributed either to this cause or planting them during frosty weather or in ground, as before stated, containing particles of frost.

##### THINNING.

Continue the general thinning of plantations, and finish the cutting of hedgerow timber, advantage being taken of frosty weather for the removal of such from woods and fields. At this season the winds are often pretty severe, and numbers of trees are not unfrequently blown down by their violence. Where such is the case have these cut up and cleared off at once, as few things about the policy grounds have a more unsightly appearance than fallen trees lying about with upturned roots. The simplest and most effectual method of disposing of tree roots is to dig a deep pit immediately behind them, and into which they will fall when severed from the trunk. In some cases, more especially where the soil is stiff or rocky, it may be advisable to resort to splitting the roots with dynamite or gunpowder.

Prepare for timber sales by having the various kinds lotted and valued. The trees should be collected into various sized lots to suit purchasers, and, if possible, near to good roads—few things enhancing the value of timber generally like ease of removal. The following are the average prices of the various woods in this district:—

Per cubic foot.—s. d.		Per cubic foot.—s. d.	
Larch .. ..	1 2	Beech .. ..	0 7
Scotch Pine ..	0 7	Birch .. ..	0 10
Spruce .. ..	0 7	Alder .. ..	0 10
Silver Fir .. ..	0 7	Willow .. ..	0 10
Oak .. ..	1 6	Poplar .. ..	0 7
Elm .. ..	1 6	Chestnut (Spanish) ..	1 3
Ash .. ..	1 4	.. (Horse) .. ..	0 6
Sycamore .. ..	1 6	Hornbeam .. ..	0 6

The prices of Larch and Oak timber are, however, considerably affected by local demand, arising from shipbuilding on the Menai Straits.

##### NURSERY WORK.

In the home nursery all young stock not required for planting out this season should, where time permits, be gone carefully over and thinned out by removing every alternate plant. When lifting the plants, insert the spade or fork (the latter is always preferable) well under the rows, so as to prevent root-fracture. Pulling the plants out is a most pernicious practice, and should never be allowed. Ridge up or dig over roughly all vacant plots, and leave them so until wanted for planting in spring. Where the ground has been previously under nursery stock a green crop may be taken, at the same time adding a fair quantity of well decomposed farmyard manure. Pay attention at frequent intervals to the rot-heap, and seeds that have been stowed away for spring planting or sowing.

##### FENCING.

As recommended last month, pay strict attention to all fences, hurdles, tree guards, and rabbit-proof wire-nettings, and, where necessary, have all omissions set right at once. Tarring the stems of standard trees is not, although frequently resorted to, satisfactory, neither as regards the plant's health nor appearance, cages made of wire-netting, or a piece of bark placed around the stems of such trees as require protection, is far preferable. As the staking of ornamental standards generally falls on the fencers, a little extra vigilance will at this season be necessary, so as to preserve the Moorings in a perfect and safe condition.

##### HEDGING.

Where not already done, preparation for the planting of young Quicks should be pushed forward, but it is well to remember that both these operations would have been far more satisfactorily performed three months ago. Dig and clean the sides of existing fences and remove all Ivy or other injurious vegetation therefrom. This is an operation that is far too seldom attended to, but one which, nevertheless, is of vital importance as regards the growth and value of the fences.

##### GENERAL WORK.

Ground work improvements of all kinds may be satisfactorily carried out during favourable weather in the present month. New roads, walks, terraces, and turf laying may especially be brought under notice. Attend to woodland drains and ditches, and remove from their course all obstacles. Cut new drains where, from the dampness of the plantations, it may be deemed advisable. As great damage is often done to trees and shrubs by heavy falls of snow, it will be necessary during such weather to have it shaken off. A few men with long poles will soon clear considerable numbers of such as are most valuable. Cart timber to the saw-mill, and have it prepared as early as possible for estate purposes during the present year.

Clear up and remove all fallen leaves and branches from lawns or pleasure grounds, or where they are likely to become scattered about during windy weather. Fork shrubby beds and borders, and, where necessary, prune overgrown bushes of Rhododendrons and other shrubs. Straggling branches of Laurel or Rhododendron may, where extension of the shrubberies is aimed at, be pegged down and covered with a spadeful of soil to assist the process of rooting. Where faggots and firewood are required for home consumption they should be tied up and either stacked or brought home and housed until wanted for use. A. D. Webster, Penrhyn Castle, North Wales.

## HOME CORRESPONDENCE.

**The St. Petersburg Botanic Garden.**—In my notes upon this establishment, I wrote a name inadvertently, by which a Bromeliad came to be compared with a Palm, viz., *Glazioviana insignis*. For this I intended to write *Vriesia Glazioviana*, like which I saw a probably new species, differing however in its spiny-margined leaves. About this Mr. Watson of Kew kindly wrote me. Some information of *Pandanus nitidus*, which we have not in this country, may be of interest. Of the name I could find no mention, and therefore on receiving the plant (unfortunately dead), I forwarded a few leaves to Mr. Baker, who kindly wrote me that full information is given in Seemann's *Journal*, vol. v. (1867), p. 103, informing me also that it is a Malayan species perfectly, distinct from *P. Forsterianus*, from which it differs according to my recollection, in having much narrower leaves, in branching more freely, and in being generally more graceful. Without confirming the name for the leaves sent, Mr. Baker appears to think it correct, but adds that there is no authentically named specimen in the Kew Herbarium. It is thus of interest botanically, and being handsome also, I hope to see it successfully introduced. One of the plants which struck me particularly was a Bamboo named *Guadua latifolia*, and I am indebted to the Rev. Canon Ellacombe for writing me with reference to my description, which gave the stems as purple. He informs me that General Munro does not mention the purple stems, but describes the culms as "*kete virens*," so the name must be wrong, as the stems are purple or purple-black in a marked manner. The plant, however, appears to be unknown in this country. I do not remember having seen a coloration at all like this in a species of its habit, and I understand from Kew that there is no plant there now which answers the description. Mr. Jenman, of Demerara, informs me that the stems of the plant he knows are green. *Spathartum* is a misprint for *Spathantem*, and *Hydrosma* for *Hydrosme*. These genera belong to the Aroidæ, and are unknown probably in our collections, unless recently introduced. *Spathantem heterandrum* is not mentioned in Engler's monograph in De Candolle's *Monographic Phanerogamarum* of 1879. R. Irwin Lynch.

**Market Sale of Fruit and Flowers.**—Beginners lack probably experience more than uprightness, as is confirmed by their asking for articles that would be misleading. The experience of Messrs. Pope & Son seems somewhat limited, and the suggestion sounds like an attempt to blow their own trumpet. Messrs. Pope & Son's figures are not clear, unless they mean cost of carriage is *nil*. To auction English produce is quite a new mode, adopted in London even only by a few, for the late arrivals. Many have tried and found about 20 per cent. less than market value was being realised, except when supplies have been unusually short. When the market is in such a state that goods become unsaleable privately, then, senders, beware of making consignments for the dung-cart. My objection to the mode of selling applies to English produce, and more especially to produce costing much to raise. The sale for this is generally arranged the day before the arrival, and herein lies one of the secrets of success to growers as well as to the *Covent Garden Salesman*.

**Colour in Flowers.**—I send you herewith an apt illustration of the effects comparative absence of light may cause in flowers of rich hues. The one sent is from a plant of a climbing *Tropæolum* growing in a cool house, and in a somewhat dull place removed from the glass. Properly the flowers should be of a rich crimson-scarlet, but now they are of a pale yellow hue, and might, under all ordinary circumstances, be regarded as from a yellow flowered kind. It is rather curious to know that not a few yellow flowered

kinds of the *Tropæolum*, both climbing and compact, will give reddish hues at certain periods, as, for instance, when too much moisture rules, or there is too much draught. But what is remarkable about the flowers sent is the fact that, although the rich hue of the petals is absolutely wanting, yet that the spots at the base of each petal naturally obliterated in brilliant hued flowers, but nearly always seen in yellow ones, are clearly defined, and almost as rich in colour as the flowers should be. These spots must be an inheritance from ancient progenitors, and it would seem cannot be obliterated, whilst the rich colour of the flowers is of more modern growth, and is not absolutely fixed. All flowers would not show this fleeting nature in the coloration under the same conditions. Chinese Primroses, zonal Pelargoniums, and others keep their rich soft hues under adverse conditions of light. A. D.

**The Gardeners' Royal Benevolent Institution: Augmentation Fund.**—I was very much interested in Mr. Coleman's letter in a recent number of the *Gardeners' Chronicle*, and can endorse what he says, that a widow was better off with a pension of £15 a year than a man with £20 a year. I have taken an interest in the Augmentation Fund for the last three years, and although not so successful as Mr. Coleman has been, yet have done what I could to help to increase the fund, and I think it a very good suggestion for the members of the committee to take into consideration at their next meeting—whether the pensions should be increased four to five as at present contemplated, or from three to four as Mr. Coleman suggests. John Malcolm, *The Gardens, Cholmondeley*.

**Narcissus viridiflorus.**—Mr. Wolley Dod, I fear, will find very few, if any, who have yet flowered any of the bulbs distributed by Mr. Maw or himself. I possess bulbs from both sources, as well as from an earlier importation; all have vegetated in a cold pit, but those derived from the latter source are much the strongest. I have found that the African species have a great dislike to have the bulbs baked, as is frequently done, on a hot shelf during summer. They prefer a frame or pit where they can be protected from rain after flowering, but not dried till they lose their fibrous roots. At the present time *N. viridiflorus* is 6 inches high, varying in degrees of strength; *N. canariensis* is coming strong, *N. pachybulbus* showing flower, *N. serotinus* has flowered well, and the rare *N. Broussoneti* in the open border under a hand-glass is 9 inches high, and very strong. If it is once let get thoroughly dry so as to lose its roots it requires one or two years to recover. One word more. If the bulbs are growing let them alone, as they dislike frequent moving. H. C.

**The National Auricula and Carnation and Picotee Societies (Southern Section).**—I trust to your fairness to permit me to say that the announcement at p. 813 of your last issue as to the holding of the exhibitions of these societies is, at least, premature. By an overwhelming vote, by fifty-three against twenty-two, who from making no return, were regarded as giving a passive assent to the action of the meeting of October 14—by this overwhelming vote the action of that meeting was disapproved by the supporters of the societies—as shown by a return I placed in the hands of the chairman, alike of the meeting of October 14, and on the latter date, December 9. This expression of opinion was refused recognition by a narrow majority of one, a result due to accident, one of the signatories of the protest, who attended the meeting of December 9, expressly to condemn the action of the meeting of October 14, having from a misunderstanding voted against the amendment moved by me, viz., "that the minutes be not signed," instead of for that amendment as he really purposed, another gentleman having held up his hand, and being received as a *bona fide* voter, whereas he was not a member, never having contributed a penny to the funds of either society. Unfortunately, I was not personally acquainted with Mr. Walker prior to the vote, and was not aware that the hand held up in the rear of Dr. Hogg was that of Mr. Wright until the close of the meeting. At the time the vote was taken the gentlemen present supporting the action of the meeting of October 14 were Messrs. Hlibberd (in the chair), Rolt, Douglas, Pearson, Kirtland, Ware, Laing, Turner, and Dr. Hogg. In fairness the latter gentleman was not entitled to vote, his subscriptions for 1883 being unpaid; but I did not care to moot

trifles. Those present adverse to the action of the meeting were Messrs. Dean, Wilkins, Lakin, Rowan, Dodwell, W. H., Dodwell, E. S., Tomes, Pohlman, Kew, and Walker. At a later period Dr. Masters and Mr. Pohlman, jun., were present, but throughout the upholders of the action of the meeting of October 14 were in a minority, and but for the accidents described the proceedings of that meeting would have been summarily suppressed. Before this will reach the public eye I hope to place in the hands of the members of the societies a review of the extraordinary and unparalleled action whereby, of their own will merely, and in defiance of a duly constituted and existent authority, a numerically insignificant minority have seized upon place, and maintain it despite the distinctly expressed wish of an overwhelming majority. I regret that the utter prostration of severe illness has delayed this, and therefore that I am at this time without knowledge as to what may be the resolve of that majority as to future action. But this much I am sure I may venture to say, the gentlemen who with such disregard of right and regularity of procedure seized upon place will not be accepted as the representatives either of the Auricula or of the Carnation and Picotee Society, or as expressing the mind and will of the majority of the supporters of those societies. That position, sir, belongs to me—the senior honorary and financial secretary, and your obedient servant, E. S. Dodwell, Oxford, Dec. 29, 1844.

**Eucharis amazonica.**—On looking through the pages of the *Gardeners' Chronicle* the other day, I read "*A. E.*'s" account of his *Eucharis amazonica*, and think it might be useful to many to show how I overcame the unhealthy state of my own stock of this useful bulb. In last July my *Eucharis* were in the same state of health as "*A. E.*'s" were, and I was puzzled to tell what the reason could be. I had them in the stove always, but I took them from that house into a cooler temperature, where they remained at rest until late in August, by this time they had lost all their leaves; then taking them to the potting shed I turned them out of their pots, when I found the roots in a bad condition. I then cleaned the bulbs and potted them into pots of different sizes, allowing six good sized bulbs to a 7-inch pot. After potting them I did not put them straight into bottom-heat, but stood them on a stage in a heat of 75° by day, 60° by night, until they had made a little start. Then I prepared a hotbed of leaves which was left for a week to settle, and when it had got a nice gentle heat the pots were plunged three parts of their height. They were left in this hotbed for a fortnight, after which cocoa fibre was added to the surface to keep the leaves from springing up and covering the pots, and which also made the work look more finished and tidy. By this mode of treatment, at the present time, they are looking very healthy, and the trouble they have caused me is being repaid by their healthy growth, and I hope in the latter end of February by plenty of good strong blooms. The compost in which they were repotted consisted of two barrowloads of good loam with two shovelfuls of soot added, a 6-inch potful of bones, half a barrowload of fibry peat, half a barrowload of dry cowdung, some charcoal and silver-sand, enough to keep the soil open and sweet. *A Young Gardener*.

—Mr. Hudson and his correspondent have started a topic very interesting to all growers of *Eucharis*, and I have no doubt you will have other communications besides mine, there being a very decided opinion prevailing that there is a disease affecting the *Eucharis*, the symptoms exactly corresponding with those described in your issue of last week. I enclose a few leaves picked from different pots out of a collection of 300 plants, and one bulb just as taken out of the pot, for your opinion. I had them as offshoots in September, 1883, and put them in boxes in cocoa-fibre till they started to grow; then they were potted, four or five bulbs in a 5-inch pot, using rough loam and rotten manure and sand. They grew away fast with good dark leaves till April, when they were taken and placed under a *Stephanotis* growing all over the roof of a half-span greenhouse, and my own idea is they got saturated with moisture from the heavy syringing of the overhead creeper, the broad leaves catching all the water and guiding it to the pot. The yellow edges then began to come, till the whole lot of plants were so affected. In last September I shook them all out of the soil, washed the roots of the worst, and potted them into 6 inch pots, using plenty of crocks, charcoal, good

sweet loam, and rotten leaf-mould; but it is at this time I think my misfortune began, as I had taken my hot-water apparatus to pieces, and could not get a higher temperature than 60°. Now they are all in a house where the warmth will not be less than 65°, and are throwing up some healthy green leaves; and as they grow I intend to give them some cow-manure and soot-water, so as to assist them to overcome the disease. I quite agree with Mr. Hudson that they would be better plunged, but I have no place to plunge them in. As to the disease theory, a well-known grower for market has lost the whole of his large stock, but that case I attribute to the hard flowering they were subjected to. Another well-known grower said to me that he would not put one of those yellow-leaved ones near his plants, as he was quite sure it would infect the whole batch of them; and at an auction sale in the spring of this year one house of healthy looking plants sold for from 5s. to 7s. a pot, whilst another houseful of yellow-leaved plants at the same place hardly found purchasers at any price. I should be glad to know the opinion of your experienced readers if it is bad treatment and too little warmth that is the cause of this bulb doing ill, or is there really a disease in the *Eucharis* not known to gardeners. *W. B.*

*Photinia serrulata*.—We have a plant growing on a wall here which is showing flower. Is it an unusual thing for it to do so in this country? I have never seen the bloom. Owing to the lateness of its appearance I am afraid the frost will destroy it. I have stood a sash against a part of the plant and buds to try to preserve it. *Wm. Edwards, Babraham Hall, Cambs.*

**The Royal Horticultural Committee.**—The resolution which the United Floral Committee agreed to forward to the Council of the Royal Horticultural Society, and which you have published, can hardly be said to err on the side of boldness. If it had been worded to the effect that the members of the committee reported to the Council that the arrangement which had existed during the past year of dividing the committee into two portions had at once detracted from the prestige of its awards and of its usefulness, and in consequence expressed a resolve to revert to the old state of things, the Council would have accepted the situation without demur. The committee might have been even bolder and have intimated that henceforth it was desirable in the interests of horticulture and of the future usefulness of that body that ample power should be given to the members to arrange their own terms of taking office in so far that one-fourth should go off every year, the selection of retiring members being first made from the lists of most irregular attendants, and failing that then by ballot, and farther that the committee should at its last meeting in each year have the power to nominate a list of not less than twice the number of persons for which vacancies were created and submit the same to the Council for final selection. Of course those who have served their specified term on the committee should not be eligible for re-appointment until a full year had elapsed. It would, assuming this arrangement were carried out, however, be needful that some safeguard should be taken against official nominations or lists, indeed, any member of the Council should be esteemed ineligible to nominate, because he would still have a veto in respect to the final selection. I fear it will not be possible to devise any scheme that will prevent personal considerations from entering into nominations or final appointments on the committees, for members of both committees and Council are but mortal. Still a loyal desire in the first place to secure on the committees the services of the very best men to be had, and in the second place to make such appointments really honourable rewards for long and faithful horticultural work, should always operate in the actions of a body of English gentlemen far beyond what personal or petty intrigues can accomplish. Most certainly I would make certain exceptions to the proposed method of tenure and selection in the shape of honorary appointments commensurate with other considerations to be given for special services rendered to horticulture in various ways, but these honorary appointments, which should be of a permanent character, should be few, and held by the recipients in the highest esteem. It is just now a specially important time in reference to the future constitution of these committees, not only because

they are, owing to the time of year, in a somewhat tentative position, but also because every year shows that their work is becoming the most important and valuable the Royal Horticultural Society is accomplishing. Let the most complete confidence in the fitness and integrity of the committees be established, and then work will grow rapidly. At present the provinces do not share in that work to anything like their full capacity. If the Council would aspire to perform national functions, it must strive to give to its operations a national basis. *A. B. C.*

**Tarred Hot-water Pipes.**—Having noticed in last week's *Gardeners' Chronicle* that Mr. Bishop is still at a loss to know how to take the tar off his hot-water pipes, I would advise him to try salt butter, and rub it well into the tar. If that fails to loosen the tar, there must be something more than tar varnish on his pipes. I have never known salt butter to fail in loosening tar. It would give me much pleasure to let Mr. Bishop know a good paint for hot-water pipes. *D. Wilkie, Sundrum, Ayr, N.B.*

— I think that if Mr. A. Bishop tries wetting his pipes thoroughly with turpentine, and scraping them whilst moist, he may succeed in removing the Brunswick Black. I have often taken it off wood by means of turpentine, but, of course, it may not succeed so well with iron. *P.*

## Notices of Books.

*Der Garten.* By Jakob v. Falbe. (Williams & Norgate.)

THE writer, after reviewing briefly the state of horticulture in ancient times, beginning with the first pair in Eden, asserts that the love of gardening has always existed among the most diverse nations that possessed a settled dwelling and a fixed civilisation. The modes of laying out a garden are broadly defined at the outset into two widely differing classes—the architectural, in which Nature is made to bend to the will of the designer, and is not allowed to assert herself except in the minor features, which of themselves do not give character to the design; and the other in which Nature is not only copied, but invited into the garden, and supplies the major part of the decorations. These two styles are found in their sharpest contrast in the French—as at Versailles, and in the English, or more truly the Chinese garden. He then points out the proper employment of the two styles, or modifications of them, and would not have town gardens or parks partaking of any other than the architectural style. Various examples are given of gardens in this style, viz., the Versailles park and garden, as seen from the terrace in the year 1688; the garden of Boboli at Florence, in which there is much statuary, basins, terraces, shells, spouting nymphs, dolphins, &c., but with fine Cypresses and other pyramidal forms as contrasts to the great number of horizontal lines in the masonry. We have then several gardens, as at Schönbrunn at Vienna, Augnien in Belgium, illustrating gigantic topiary work, as seen in the immense walls of clipped trees. Of the natural style examples are given of a fine landscape with water at Guisard, in France—a rock scene at Mortefontaine. After describing the various styles, a historical account is given with a light hand of some celebrated Egyptian and other antique gardens, together with plans. The English style, which he acknowledges carried the palm against all other European styles during the last century, and after which model many celebrated gardens were renovated, is described in somewhat contemptuous terms. A lake or pool with Weeping Willows on the margin, the landscape strewn over with single trees, a little height with a summer-house, a milkhouse, a hermitage; but of

talent, invention, or originality, there was no trace. In the last chapters the author puts England in its proper place as the apostle of the true and improved methods of laying out a garden—giving Sydenham, the Royal Horticultural Society's Garden at South Kensington, the parterre at Kew, and the private pleasure grounds at Windsor Castle, as samples of good styles. The book will be of service to any one intending to lay out a garden architecturally, and who is in want of an authority to decide for him, because he at present hesitates between the two broadly-defined methods of treatment. But it will be thought that the places selected as illustrations of the modern English garden are unfortunately chosen, as these are examples that find small favour amongst ourselves, being at the present time thought formal and stiff.

## ORCHIDS FOR AMATEURS.

(Continued from p. 687, vol. xxii.)

ALTHOUGH it is very desirable to have Orchid-houses, those who have not such structures are by no means precluded from the enjoyment of growing Orchids. Many may be grown with great success in a warm greenhouse with other plants, others in an ordinary intermediate-house or stove. Orchids are for the most part only beautiful when in flower, so that many persons care nothing for them at other times. In a greenhouse or stove their want of foliage is not observed and their blossoms never look so well as when surrounded by other plants. Success, however, under these conditions can only be attained by attention to details and the judicious selection of the proper plants.

For purposes of cultivation Orchids may be well grouped in the following classes:—1. Alpine Orchids; 2. Cape Orchids; 3. Brazilian Orchids; 4. Insular Orchids; 5. Tropical Indian Orchids; 6. Temperate Orchids.

### 1. ALPINE ORCHIDS.

These plants come from the mountain ranges in the tropics; they are usually called "cool Orchids," and include in their number some of the loveliest plants in the world. The temperature necessary for their health is not a high one, indeed they will only flourish under cool treatment, but cool treatment may be carried too far. I believe, with plenty of sun and air, there is little need for fire-heat except during severe frosts; but in the neighbourhood of London, with dark, murky weather, fire-heat is, I find, very necessary in winter. These plants do not rest, but need to be kept growing constantly, with but a slight check when their year's growth is complete, to ripen the bulbs and encourage the formation of flowers. This is produced by giving less water for a few weeks, but they must never become dry or shrivelled. The *Masdevallias* have no bulbs, and therefore need water in abundance throughout the year. The following are well-known examples:—*Odontoglossums*, many *Oncidiums*, and *Masdevallias*.

### 2. CAPE ORCHIDS.

These are chiefly of little interest, except to botanists, with the exception of the remarkable *Disas*. They are terrestrial Orchids, that is, they grow in peat and sand. The distinction of terrestrial and epiphyte Orchids is not easily drawn. Most of the tropical species grow upon dead trees and branches, such are spoken of as epiphytes; others grow on the ground, or in sphagnum beds, and are called terrestrial, but as epiphytes often flourish on hollow stems, thrusting their roots into the vegetable mould which accumulates in them, the distinction is frequently of little value to the cultivator. Many *Cypripediums*, which are naturally epiphytes, succeed in cultivation as terrestrial Orchids, planted in peat and sand. I shall hereafter give rules drawn from the structure of the roots which I have found very useful. The *Disa* succeeds with Cape Heaths, and needs the same treatment. It is useless, I believe, to attempt its cultivation under other conditions.

### 3. BRAZILIAN ORCHIDS.

These are the *Cattleyas*, *Laelias*, *Miltonias*, *Pescatoreas*, &c., and are equally if not more magnificent than the *Dendrobiums*. They need both heat and moisture in the growing season and a mild equal temperature during the dull months of winter. Properly treated they are easy to grow. These plants are marked by some as "cool Orchids;" nothing is

more fallacious, they must have plenty of heat during their growth, and an atmosphere loaded with moisture. It is true they will live and grow with "cool treatment," but to expect these plants to produce flowers under such treatment is, I believe, futile. *Cattleya Mossiae* is a good plant for the amateur to try his hand on, as it is cheap, and a splendid result may be attained. I should recommend the following treatment to any one with a warm greenhouse. If a small "stove" can be utilised, so much the better. When the other plants are turned out put a few *Cattleyas* into the house and keep up a minimum temperature of 60°, and a maximum of 80°. Keep the paths and benches well watered, syringe the plants once or twice a day. Keep them growing until the house is wanted for the ordinary greenhouse plants. They will by that time have made fine bulbs, and will need rest. During the winter they will require a moderate supply of air, a temperature not under 45° or over 55°, and very little water. Such plants would undoubtedly flower in the spring as soon as the average temperature of the house rises to 60° or 65°. This should not be delayed beyond April, or the growing season will be shortened. They would flower earlier by one or two months under the same conditions as *Pelargoniums*. If a small stove could be utilised for them during the growing season they would be a magnificent addition to a conservatory. When in flower they may be kept at 50° or 55°, and will remain in splendid condition for a month or six weeks. Most of the Brazilian Orchids will flower under such treatment.

#### 4. INSULAR ORCHIDS.

Those from Moulmein and the Philippines come under this category. Such are the beautiful Moth Orchids and many *Cypripediums*. They need a constant temperature of from 60° to 65° or 70°, and 80° or 90° in sunny weather; and cannot stand the direct rays of the sun and need an abundance of moisture in the air. I find salt strewn on the floor under the pipes very conducive to the health of such plants. They are exceedingly easy to grow if not kept too hot, but must never get cold. One cold night, say under 40°, would be fatal to most of the Moth Orchids.

#### 5. INDIAN ORCHIDS.

The majority of the *Dendrobies* come under this head. The key to their growth is found in the impressive words of Lord Macaulay:—"In Calcutta we are boiled for four months, baked for four months, and have the remainder of the year to get over it as we can." It is possible to imitate these conditions artificially in the following manner. From the middle of March to the end of June you need a great command of fire-heat, and the house must be kept in a steam at a temperature of 75° to 80° or higher on bright sunny days. Do not let it go above 100° if you can help it, and give air when above 80°. During July and August you must bake your plants in the sun out-of-doors, and carry this treatment on until September is as far advanced as possible. I used to put my *Dendrobies* on the top of the furnace all last September when the sun was out. The stones on which they stood were quite warm to the hand from the fire beneath. During the baking they need just enough water to keep them from shrivelling. They must not be left out at night or in the rain. During the remainder of the year they need a genial warmth of 60° to 70°, and very little water until the flower-buds begin to form. They need a moist atmosphere at this time, but not one loaded with water. With such treatment I can confidently predict great success.

#### 6. TEMPERATE ORCHIDS.

I include under this head terrestrial Orchids from Europe and North America. There are also numerous glorious species in Australia, but they are little cultivated, as they are especially difficult to manage. I do not pretend to any special knowledge of their culture, but it is undoubtedly very difficult. The plants seem to die off in a year or two at most, and I believe that any one who could discover the proper treatment needful for success would if so disposed soon make a considerable fortune. *B. T. L.*

(To be continued.)

### SOURCES OF TIMBER SUPPLY.

At a meeting of the Society of Arts, in their rooms, John Street, Adelphi, on December 17, 1884, a paper on "Present and Prospective Sources of the Timber Supplies of Great Britain," was read by Mr. P. L. Simmonds. Sir Charles Tupper, C.B., High Commissioner for Canada, took the chair. In view of the diminishing supply of timber from nearly every foreign country, extended official inquiries, the lecturer said, were set on foot by the Colonial and Foreign Offices some six years ago, to ascertain how far we could depend upon our own possessions to supply our undoubted deficiencies at home. The information thus obtained, although useful to a certain degree, was very incomplete. The committee of the Edinburgh Forestry Exhibition invited essays on this subject, and the present paper was one of those rewarded. The immense importance of the extraneous supply of wood to this country was proved by the magnitude of our imports as shown in the Board of Trade returns for the last two years. These exceeded £18,000,000 in value, to say nothing of our home supply of wood, and other forest products, brought the total value to over £31,500,000. In 1883, out of 6,647,211 loads imported, only a little over 1,529,000 loads came from India and our colonies. According to the latest official returns the areas under woods and forests in the principal countries of Europe amounted to 726,829,119 acres. The great importance of North America for the future timber supply of the world might be deduced from the fact that Canada possessed almost 1,000,000,000 acres of timber lands, and the United States nearly as much. But the United States, judging by the declared value of her exports of timber, could not be looked upon for any continuous supply, the shipments for some few years past having become almost stationary at a little over £3,000,000 sterling in value. British India and the other parts of Asia, however, furnished useful supplies of wood, and would contribute more as the forests were more easily reached by rivers and roads.

The South American forests had as yet furnished but little timber to Europe, except small supplies from Mexico, Central America, and British Guiana. The magnificent forests of Brazil, with their large varieties of wood, had yet to be drawn upon, but at present were for the most inaccessible to the wants of commerce. Having referred to some of the more valuable woods of India and Australasia, calling attention especially to the little appreciated qualities of many kinds of timber growing in New South Wales, in Queensland, in Western Australia, and in New Zealand, he described some of the many beautiful varieties of woods suitable for furniture to be obtained in Jamaica and other dependencies of England, and remarked that the raw material at the disposal of joiners and cabinet makers was practically unlimited. All that was required was a little boldness and originality in seeking out and utilising new woods. In conclusion, he observed that it behoved all timber producing countries to husband their resources, and by judicious forestry regulations to prepare increased supplies for the future demands of the world. In the discussion which followed, Mr. Simpson showed specimens of Jarrah wood from Western Australia, which had been exposed to bush fires, and for many years to weathering and the attacks of insects in the ground and in water without suffering any injury. Mr. Cornish, confirming what had been said of the wonderful durability of Jarrah, mentioned that it was proposed to provide this wood for piles throughout the Suez Canal in order to prove its value for such purposes. Sir Charles Tupper, speaking of the vast resources of Canada in the forests to be found between Nova Scotia and British Columbia, said that, although they had not woods so enduring as Jarrah or as Teak, they had a great variety of woods valuable for other purposes. It was satisfactory to find that all the woods and timber we required could be procured from different parts of the British Empire.

**APPLES.**—The quantity of Apples imported into this country from various countries in 1882 amounted to 2,386,805 bushels, valued at £783,906. In 1883 the quantity was 2,251,925 bushels, the value being stated in the Agricultural Returns for 1884 as £553,488.

Dec. 18.—Rain at times during the day, dark dull night.  
 19.—Very fine day, overcast at night.  
 20.—Heavy rain in early morning and nearly all day; strong wind at night.  
 21.—Fine day and night.  
 22.—Fine clear morning, dull afternoon and night.  
 23.—Dull day and night, slight rain in evening.  
 24.—Dull cold day.

**SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE** in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, December 22, 1884; issued by the Meteorological Office, 116, Victoria Street, London, S.W.:—The weather has been cloudy or dull generally, with somewhat frequent falls of rain, hail, or sleet. Thunderstorms occurred in some parts of central England on the 18th or 19th, and in many other places lightning was observed.

The temperature has been considerably lower than of late in all districts. In "England, N.E.," "England, E.," "England, S.," and the "Channel Islands" it has been about equal to the mean for the season, but in all other districts it has varied from 1° to 3° below. The maxima, which were registered at most stations on the 18th, ranged from 53° in "Ireland, S.," and the "Channel Islands" to 44° in "Scotland, E.," and 43° in "Scotland, N." The minima, which were recorded on various dates, ranged from 23° in "Ireland, N.," to 32° in "England, N.W.," and 36° in the "Channel Islands."

The rainfall has been rather less than the mean in "Scotland, N.," and the "Channel Islands," and about equal to it in "Scotland, E.," "England, N.E.," and "Ireland, S.," but in excess over all other districts.

**Bright Sunshine**, though more prevalent than it was last week, has still been very deficient, the percentages of the possible duration ranging from 2 in "England, N.E.," to 19 in "Scotland, W.," and to 24 in "England, S."

**Depressions Observed.**—During the earlier part of this period the barometer continued highest over France, and rather large cyclonic systems moved in a north-easterly or easterly direction to the northward of Scotland. The wind was consequently fresh or strong from between south and west, and occasionally reached the force of a gale—especially in the north and west. By 8 A.M. on the 20th, however, the centre of a new and deep depression, which had advanced rapidly from the west-north-westward, lay a little to the eastward of Yarmouth, producing violent gales from the westward or north-westward over our south-western coasts and the north and west of France, and moderate or fresh gales at most of our western stations and over the greater part of England. By the following morning the depression was disappearing over the Gulf of Genoa, the barometer in our islands had risen with unusual rapidity, and the gales had subsided. At the close of the period a large anticyclone, which stretched east-north-eastward from Ireland to the south of Sweden, had been formed, and the wind on our south-eastern and southern coasts had shifted to the north-eastward.

**POTATOS IN NEW YORK STATE.**—It is calculated in the Census report that in 1880 33,644,807 bushels were raised from 343,536 acres.

LONDON: Atmospheric Pressure.—During the week ending December 27, the reading of the barometer at the level of the sea increased from 29.66 inches at the beginning of the week to 30.22 inches by 9 A.M., decreased to 30.20 inches by 3 P.M., and increased to 30.22 inches by midnight on the 22d, decreased to 30.05 inches by midnight on the 23d, increased to 30.13 inches by 2 P.M. on the 24th, decreased to 29.94 inches by 3 P.M. on the 25th, increased to 30.10 inches by 9 A.M. on the 26th, decreased to 30.07 inches by 3 P.M. on the same day, increased to 30.24 inches by 9 A.M. on the 27th, and was 30.17 inches by the end of the week.

The mean reading of the barometer for the week was 30.11 inches, being 0.39 inch lower than last week, and 0.07 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 42° 5, on the 22d; the highest on the 27th was 37°. The mean of the seven high day temperatures was 39°.

The lowest temperature was 33° 5, on the 26th and 27th; on the 21st the lowest temperature was 37°. The mean of the seven low night temperatures was 34° 4.

The greatest range of temperature in one day was 8° on the 22d; the smallest was 3° 5 on the 27th. The mean of the seven daily ranges was 4° 7.

The mean temperatures were—on December 21, 38° 4; on the 22d, 38° 6; on the 23d, 36° 7; on the 24th, 36°; on the 25th, 36° 1; on the 26th, 34° 9; on the 27th, 35° 6; and these were all below their averages by 0° 9, 0° 2, 1° 7, 2° 2, 1° 9, 2° 9, and 2° respectively.

The mean temperature of the week was 36° 6, being 3° 7 lower than last week, and 1° 7 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 61°, on the 22d. The mean of the seven readings was 49° 2.

The lowest reading of a minimum thermometer with its bulb placed on grass was 24° 5, on the 22d. The mean of the seven readings was 26° 7.

Rain.—Rain fell on three days to the amount of 0.04 inch.

ENGLAND: Temperature.—During the week ending December 27 the highest temperatures were 48°, at Truro, 45° 2 at Plymouth, 43° at Leeds. The highest at Sheffield and Preston was 40°, at Wolverhampton and Bolton 40° 2. The general mean was 41° 9.

The lowest temperatures were 25°, at Sheffield, 25° 9 at Bolton, 27° at Leeds and Sunderland; the lowest at Blackheath was 33° 5, at Brighton 32°, at Plymouth 31° 5. The general mean was 29°.

The greatest ranges were 20°, at Truro, 16° at Leeds, and 15° at Sheffield and Sunderland; the smallest ranges were 9°, at Blackheath, 9° 3 at Brighton, 10° 5 at Bristol and Preston. The general mean was 12° 9.

The mean of the seven high day temperatures was highest at Plymouth, 42° 2, at Truro 42° 1, at Leeds 40° 7; and was lowest at Bolton, 37°, at Wolverhampton 37° 1, at Preston 37° 9. The general mean was 39°.

The mean of the seven low night temperatures was highest at Nottingham, 34° 8, at Blackheath 34° 4, at Plymouth 34° 3; and was lowest at Wolverhampton, 29° 3, at Bolton 29° 7, at Sunderland 30° 5. The general mean was 32° 4.

The mean daily range was greatest at Truro, 9° 7, at Plymouth 7° 9, at Wolverhampton 7° 8; and was least at Brighton and Blackheath, 4° 7, at Cambridge and Nottingham 5° 2. The general mean was 6° 6.

The mean temperature was highest at Plymouth, 38° 3, at Nottingham 37° 4, at Truro 37° 3; and was lowest at Wolverhampton, 33° 2, at Bolton 33° 3, at Sunderland 34° 4. The general mean was 35° 7.

Rain.—The largest falls were 0.76 inch at Hull, 0.14 inch at Truro, 0.13 inch at Sunderland; the smallest fall was 0.01 inch at Sheffield and Bradford. No rain fell at Bristol, Wolverhampton, Liverpool, Bolton, or Preston. The general mean fall was 0.09 inch.

SCOTLAND: Temperature.—During the week ending December 27, the highest temperature was 44°, at Leith; at Dundee the highest was 40° 4. The general mean was 42° 4.

The lowest temperature in the week was 20°, at Glasgow; at Aberdeen the lowest temperature was 28°. The general mean was 24° 6.

The mean temperature was highest at Leith, 35° 2; and lowest at Dundee, 31° 5. The general mean was 33° 8.

Rain.—The largest fall was 0.12 inch, at Aberdeen. No rain fell at Glasgow, Edinburgh, Greenock, Leith, or Paisley. The general mean fall was 0.02 inch.

JAMES GLAISHER, F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, December 29, 1884; issued by the Meteorological Office, 116, Victoria Street, London, S.W.—The weather has been cold and dull in all parts of the kingdom, with a good deal of mist or haze. Very little rain or snow, however, has fallen, and at many of the English stations there has been none at all.

The temperature has been about equal to the mean in "Scotland, N.," but below in all other districts; over the "Wheat producing" districts the deficit ranged from 3° to 4°, while in most of the "grazing" districts it varied from 5° to 7°. The maxima, which were recorded on different dates, varied from 49° in "Ireland, S.," to 41° in "England, E." Over central Ireland and the central and north-western parts of Eogland the maxima on some days were only a few degrees above the freezing point. The minima, which were registered on the 24th in Ireland and on various dates over Great Britain, were as low as 19° in "England, N.W.," 20° or 21° in Ireland, 22° in the east and west of Scotland, and between 25° and 30° in most other districts, while in the "Channel Islands" the thermometer did not fall below 33°. At Killarney the minimum (20°) was lower than any reading recorded since December 14, 1882.

The Rainfall has been considerably less than the mean in all districts.

Bright Sunshine has again been very deficient, the percentages of the possible number of hours varying from 14 in "England, S.W.," and 11 in "Scotland, E.," to between 4 and 8 in most other places, while in "England, N.E.," the weather was quite sunless.

Depressions Observed.—Beyond some large low-pressure systems far to the northward of our islands, and a smaller disturbance which was shown over the north-east of Spain on the 28th, no depressions of importance have appeared in our neighbourhood. The high-pressure band noticed at the close of last week has been established over the central parts of the United Kingdom and the North Sea, causing easterly or north-easterly winds in the south, southerly to westerly breezes in the north, and light variable airs over the intervening districts.

## Answers to Correspondents.

APPLE: W. & J. Brown. We have no knowledge of the fruit having reached this office.

CAMELLIA BUDS FALLING OFF: C. W. The young buds of the size of a marble seemed quite healthy and plump. These plants will frequently shed their buds when standing near the heating apparatus, the drier air there causing it; dryness at the root, induced by withholding water, or brought about by too much drainage; but in your case we are more inclined to attribute the failure to flower to be an inherent defect in the variety itself or the stock on which it is grafted.

DISQUALIFIED CHRYSANTHEMUM: C. P. "Large-flowering" would include specimens of any large-flowered class, unless certain varieties were distinctly disallowed in the schedule. There was a want of clearness in the wording, hence the unpleasant occurrence.

EUCHARIS: W. B. There are no indications of disease:

The plant appears, as do many others we have observed, to be suffering from unsuitable cultivation—from violent checks, and equally violent means to bring it into bloom; all indications of failing vigour being only hints to give doses of manure, when the plants really require rest and less exciting treatment. As a rule, the plants which grow under more natural modes of treatment suffer least, or not at all, from being grown artificially, as the life of a pot-plant really is.

NAMES OF FRUIT: A. V. Z., Drayton. Pears: 1, not recognised; 2, quite decayed; 3, Broom Park. Apples: 4, King of the Pippins; 5, Hambleton Deux-ans; 6, not recognised; 7, Tom Putt.

NAMES OF PLANTS: W. J. C. Eranthemum pulchellum.—A. R. L. Cymbidium sinense.—N. Langford. 1, Areca lutescens, Hyophorbe indica? 2, Coccoloba platycladon; 3, Tussilago fragrans.—H. Thompson. 1, Cyrtopodium longifolium; C. venustum.

ROSEY, OR ROSARY: Q. Whichever you please. Rosary is a more exact rendering of the Latin *rosarium*, but rosary is more consistent with the English language, and also avoids confusion with the string of beads also called a rosary. The Latins also used the word "rosetum," to signify a place where Roses are grown; so that "three courses are open to you," and each would be correct. What a happy state of things!

UNFRUITFUL ORCHARD: H. Hanson. As the ground is stiff and undrained, you ought to drain it, if you can get sufficient fall for the outlet drain, at 3½ to 4 feet deep, and 27 feet asunder, letting these follow the slope of the ground. Rubble drains are better than pipes where trees are to stand, as they do not get filled with roots nearly so readily as the latter. In filling in the drains turn the grass sod, if there is any, on the rubble first. In planting new trees, plant on broad hillocks or throw the orchard into "lands," as then the surface water will run off into the furrows. Work in straw manure, burnt earth, and lightening materials generally, and plough or dig in the autumn.

HOLLIES NOT BEARING BERRIES: C. Pocock. These shrubs are polygamous, frequently bearing male and female blooms on the same or on different specimens, or sometimes the flowers are hermaphrodite, so that

FIG. 8.—HOLLY BLOOMS, MALE AND FEMALE.

yours are probably all of one sex, most likely males. The little figures show their structural peculiarities, 4, 5, 8 being the male, 1, 2, 3, neuter, 6 and 7 the female.

## SEEDS.

LONDON: Dec. 31, 1884.—There was scarcely any business doing on to-day's seed market, the attendance being small; as regards values, there is consequently no change to be noted. American red Clover-seed continues quite a dead letter, whilst the supply of English exceeds the demand. Spring Tares are neglected. Canary and Hemp seed sell slowly on former terms. Feeding Linseed is firmer. The colder weather tends to harden prices of Blue Peas and Haricot Beans. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

## CARTERS'

## IMPORTANT FACTS.

It is generally admitted that the Vegetable and Floral Novelties introduced of late years by Messrs. CARTER possess sterling qualities to a degree that finds few competitors. J. C. & Co. have only to refer to the splendid introductions Stratagem, Telephone, and Pride of the Market Peas, Leviathan Beans, Heartwell Cabbage, Model Cucumber, Leckham Favourite Tomato, &c., to confirm the statement, and it is a notable fact that Messrs. Carters' Novelties, unlike many others, do not fade from public favour, but are generally recognised as necessary in every garden, whether for Exhibition or for the table.

## The Champion Peas of the World

	Per pint.	Post-free.
CARTERS' STRATAGEM ..	2s. 6d.	3s. 0d.
CARTERS' TELEPHONE ..	2s. 0d.	2s. 6d.

# FERRIS' PERSIAN FOOD

(SALAP MISREE PERSIANA).

REGISTERED.

- "PERSIAN FOOD." Perfectly Pure.
- "PERSIAN FOOD." Most Nutritious and Strengthening.
- "PERSIAN FOOD." Easy of Digestion.
- "PERSIAN FOOD." Flesh-forming.
- "PERSIAN FOOD." Fat-forming.
- "PERSIAN FOOD." Bone-forming.
- "PERSIAN FOOD." For all Persons, Young or Old.
- "PERSIAN FOOD." Equal to Meat for Delicate Stomachs.
- "PERSIAN FOOD." Children take it with Avidity."
- "PERSIAN FOOD." Everybody likes it.

## "PERSIAN FOOD"

IS RECOMMENDED by the MOST EMINENT MEMBERS of the MEDICAL PROFESSION.

REPORT OF J. MACPHERSON, Esq., M.A., M.D.

"35, Curzon Street, London, W., Jan. 17, 1880.

"Dear Sir,—I have not employed any test of the purity of the 'PERSIAN FOOD' of which you have sent me a specimen; but I have made a trial of it, and am much pleased with it, as supplying a light, bland, and pleasant form of nutriment.—Yours faithfully,

"J. MACPHERSON."

OPINION OF W. B. O'SHAUGHNESSY, M.D., F.R.S., &c.

"Two drachms afford a sufficient meal for an invalid. Good 'PERSIAN FOOD,' carefully prepared, is in truth one of the best articles of diet a convalescent can use."

## INDIGESTION ABOLISHED.

Those who suffer from the tortures of indigestion should not fail to try "PERSIAN FOOD." It is pleasant to the taste, thoroughly satisfying, and easy of digestion. It is, in fact, the most remarkable Food that was ever introduced.

## FOR CONVALESCENTS.

Aged Invalids who have tried this remarkable Food have found it most health restoring and re-invigorating. It is pleasant to the taste, and has a rich aroma. A very small quantity of "PERSIAN FOOD" rapidly produces a most marvellous effect on even the most aged and infirm systems. "PERSIAN FOOD" is of the purest quality, and is the greatest boon ever offered to healthy as well as suffering humanity.

Sold in Bottles, 2s., 3s. 6d., and 10s. 6d. Directions on each Bottle.

To be had of all Chemists, Medicine Vendors, &c., or sent by Parcels Post on receipt of Remittance.

Sole Proprietors:—

FERRIS & CO., 49, FLEET STREET, LONDON, E.C.

**BELGIAN GLASS for GREENHOUSES, &c.**

Can be obtained in all sizes and quantities of

**BETHAM & SON,**

9, LOWER THAMES STREET, LONDON, E.C.

B. & Son have always a large stock in London of 20 in. by 12 in., 20 in. by 14 in., 20 in. by 16 in., 20 in. by 18 in., in 16-oz. and 21-oz.; and also large sizes in all qualities for cutting-up purposes, in 200-ft. and 300-ft. cases.

Oil Paint no longer Necessary.

**HILL AND SMITH'S BLACK VARNISH,** for Preserving Ironwork, Wood, or Stone. (Registered Trade Mark)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received. Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gal' on carriage paid to any Station in the Kingdom.

### UNSOLICITED TESTIMONIAL.

"Pierceland Park, June 21, 1876.—Sirs,—I have this day forwarded from Chepstow to your address, a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierceland Park, Chepstow.—I am, Sirs, yours respectfully, Wm. Cox."

**CAUTION.**—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large illustrated CATALOGUE of Fencing Hurdles, Field and Entrance Gates, &c., sent free on application to HILL & SMITH, Brierley Hill Ironworks, Staffordshire; 118, Queen Victoria Street, London, E.C.; and 196, St. Vincent Street, Glasgow.

Horticultural Engineers to Her Majesty the Queen,  
CALL SPECIAL ATTENTION TO THEIR  
PATENT  
WROUGHT-IRON TUBULAR  
HOT-WATER BOILERS,

And others with SHELVES, and Hollow or Ordinary Cast-iron GRATE BARS;

### SADDLE BOILERS,

With WATERWAY BACKS, and WELDED BOILERS, which are Specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c.

They are the neatest, cheapest, most effective, and durable of any extant.

The Tubular ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention. This pattern

Had the First and Highest Prize, a Silver Medal, Awarded to it at the Royal Horticultural Society's Exhibition, South Kensington, London, on June 3, 1884.

The *Journal of Horticulture* of June 9 says:—

"HEATING APPARATUS.—A great number of boilers, valves, &c., were exhibited by eight competitors, and considerable interest was manifested in the verdict of the judges, and much discussion was brought to bear on the merits and shortcomings of the different boilers. The apparatus for which the Silver Medal was awarded was a wrought-iron saddle boiler, with a series of intersecting tubes, somewhat in the form of a letter X, but the tubes in one form, in the crown of the boiler. Most gardeners who examined the boiler expressed a favourable opinion of it. It is no doubt a quick and powerful boiler without being complex, the latter condition having, no doubt, had weight with the judges."

The *Garden* of June 11 says:—

"The premier prize, a Silver Medal, was taken by Messrs. Green & Son for their new patent tubular saddle boiler. It is a modification of their original patent, the boiler being longer and not so high. It is found to be a powerful and efficient boiler, and beats a large quantity of water quickly with a small consumption of fuel."

Descriptive Illustrated Price List may be had free on application. Estimates given for all kinds of Heating Apparatus, and Hot-water Fittings of every variety supplied on the shortest notice. Galvanized Iron Cisterns, from 4d. to 1s. 6d. per gallon.

**IMPROVED VINE ROD FASTENER**

**BAYLISS, JONES & BAYLISS,**  
VICTORIA WORKS, WOLVERHAMPTON  
And 3, Crooked Lane, King William Street, London, E.C.

# THE GARDENERS' CHRONICLE

(Established 1841)

CONTAINS ARTICLES ON ALL DEPARTMENTS OF

GARDENING, PRACTICAL AND SCIENTIFIC,

REPORTS OF EXHIBITIONS,

REVIEWS of BOOKS, and NOTICES of all HORTICULTURAL MATTERS of  
CURRENT INTEREST,

HOME, COLONIAL, and FOREIGN CORRESPONDENCE.

Special attention is given to the following subjects:—

ALPINE PLANTS.  
ARBORETUM—The.  
BEDDING PLANTS.  
BEES.  
BOTANY.  
BULBOUS PLANTS.  
CHEMISTRY OF PLANTS.  
CONIFERS.  
DISEASES OF PLANTS.  
EVERGREENS.  
EXHIBITIONS.—FERNS.  
FLORISTS' FLOWERS.  
FLOWER GARDENS.

FORCING.  
FORESTRY.  
FRUIT CULTURE.  
GREENHOUSE PLANTS.  
HERBACEOUS PLANTS.  
IMPLEMENTS.—INSECTS.  
KITCHEN GARDENING.  
LANDSCAPE GARDENING.  
LAWNS—LILIES.  
MACHINES.  
MANURES—Analyses of.  
MARKET GARDENING.  
NEPENTHES.

ORCHIDS—including a complete List of those in cultivation.  
PALMS.  
PLANTING.  
PLEASURE GROUNDS.  
POMOLOGY.  
POTATOS.—POULTRY.  
RHODODENDRONS.  
ROCKERIES.  
ROSES.  
SHRUBS and SHRUBBERIES.  
STOVE PLANTS.—SOILS.

SUCCULENT PLANTS.  
TOWN GARDENING.  
TRAINING.  
TRAVEL—Notes of.  
TREES—Deciduous and Evergreen.  
VEGETABLE CULTURE.  
VEGETABLE PHYSIOLOGY.  
VINES.  
WALKS.—WALLS.  
WEATHER.—WEEDS.  
WINDOW GARDENING.  
WOODS, &c., &c., &c.

Illustrations by W. H. FITCH, F.L.S., W. G. SMITH, F.L.S., W. J. WELCH, and Others.

**THE "LANKESTER" HOT-WATER BOILER.**—A Cast-iron, Solid, Waterway End Boiler, distinguished for its Durability, Efficiency, and Economy of Fuel. Entire Waterway Back, Two Side Flues, Two Waterway Flue Dividers. We guarantee this Boiler as the best with which we are acquainted.

\* Comprises full size double furnace door, asphit door and regulator, cranked dead plate, bearing bars, fire bars, three cleaning doors, damper, &c.

Says a *Gardener of great experience*:—"It is a wonderful Boiler. It is the best for keeping at night that I know. It burns anything." "It will become a universal favourite."

Out of a great number in use of these Boilers not one has been complained of. It will last out three wrought-iron Boilers.

**FOR SMALL CONSERVATORIES,**  
for Heating from 50 to 100 feet of pipe.

An Independent Boiler, with furnace front, doors, fire bars and dead plate complete, and 6 feet of funnel. This is called the "LITTLE WONDER." It is fixed to the end or side wall of conservatory by any bricklayer; the funnel running up just outside the glass. It can be applied almost everywhere. It will keep in all night. It is worthy of its name. Price complete, 50 feet size, £4 15; 100 feet size, £5 15.

If cheque is enclosed with order 5 per cent. Discount may be deducted; if not, reference to Banker required.

**LANKESTER & SONS,**

Horticultural Heating Engineers, Southampton.  
We send capable men to fix work in all parts of the Kingdom. Estimates given. Drawings of Patent and Special Appliances for Heating Dwelling Houses and Churches sent on application.

## RICHARDSON'S

## X TAKE NOTICE OF X

X The Future Boiler for X  
Nurserymen and Gardeners,

Heating any amount of 4-inch Pipe up to 15,000 feet. Advantages over all other inventions:—The greatest amount of heat from

less fuel. As seen by diagrams some tubes are in the very centre of the fire and others surrounded by fire. This Boiler is a combination of tubes, to meet the requirements of the times.

Price List  
on  
application,  
free.

T. WOOD,  
RUDGEWAY HOUSE, EASTVILLE,  
BRISTOL.

Preliminary Notice.

WEST END OFFICE will shortly be opened in REAUFORT STREET, CHELSEA, owing to expiration of Lease of 33, Highgate Road, Keotish Town, N.W.

## POSTAL ORDERS.

## TO ADVERTISERS, SUBSCRIBERS, and OTHERS.

*It is very important in Remitting by Postal Order that it should be filled in payable at DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.*

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

## Now Ready.

Part VIII. of the Third Series of

**WARNER'S SELECT ORCHIDACEOUS PLANTS**, published by ROBERT WARNER, Esq., F.L.S., F.R.H.S., with illustrations of *Aëdis roseum superbum*, *Odonoglossum Wilkeanum*, *Cattleya Mossiae Mariana*, admirably executed and coloured by hand.

The 1st and 2d series, which comprise together seventy-nine beautifully coloured plates, and which are complete with the most reliable descriptions, form admirable volumes for the table of every drawing-room.

This work is by permission specially dedicated to the Queen, and to which a 1st-class Certificate and Prize Medal were awarded at the Calcutta Exhibition, 1884.

Published at 25 and 27, The Crescott, Jewin Street, Cripple-gate, London, E.C.

## The Best Family Newspaper

in the North of England.

## THE LEEDS TIMES. Saturday, Weekly.

Price Two-pence. Established, 1837. The "Leeds Times" is one of the largest and most popular family newspapers extant. In addition to a judicious digest of the local, district, and general news of the week, it contains some columns of carefully selected literary matter, thus making it a welcome guest in every family circle. It circulates largely in Leeds, Bradford, Huddersfield, Dewsbury, and most of the towns and villages in the West Riding, and is thus one of the best advertising mediums in Yorkshire.

Offices, 49A, Briggate, Leeds.

**WANTED**, in a Fruiterer's and Greengrocer's Trade, an experienced FEMALE ASSISTANT.—E. EVANS, 4, Beauchamp Terrace, Malvern.

## WANT PLACES.

*\*\* Gardeners and others seeking situations are WARNED to be careful in their dealings with so-called Horticultural Agents, and are CAUTIONED NOT to SEND STAMPS or MONEY to any Agent unless they have good reason to know that he is a responsible man, likely to be able to fulfil his engagements.*

*They are also specially advised not to send ORIGINAL TESTIMONIALS to Advertisers who may be unknown to them, without a special application for the same by letter.*

**RICHARD SMITH AND CO.** beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

**SCOTCH GARDENERS.**—JOHN DOWIE, Seedsman, 144, Princes Street, Edinburgh, has at present on his list a number of SCOTCH GARDENERS, waiting re-engagements, at wages ranging from £50 to £100 per annum, and he will be pleased to supply full particulars to any Nobleman or Gentleman requiring a trustworthy and competent Gardener.

**R. B. LAIRD AND SONS** (successors to the late Firm of DOWNIE & LAIRD) can at present recommend with every confidence several first-rate SCOTCH GARDENERS, whose character and abilities may be thoroughly depended upon, either for Large Establishments or Single-handed Situations; also FOREMEN, UNDER GARDENERS, and FARM BAILIFFS.—17, Frederick Street, Edinburgh.

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS.

**JAMES CARTER AND CO.** have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 237 and 238, High Holborn, W.C.

**GARDENER (HEAD)**, in a good establishment.—Age 28, single; thirteen years' experience in good places.—F. NORRIS, The Gardens, Copley, Neston, Cheshire.

**GARDENER (HEAD)**.—J. H. PHILLIPS, Birr Castle, Parsonstown, King's Co., Ireland, desires a re-engagement as above. Well versed in all horticultural branches. Full particulars on application.

**GARDENER (HEAD)**.—Age 33, married, one child, Scotch; thorough knowledge of the profession in all its branches. Three years' character.—A. M., Mr. McIntosh, Cbalk Farm, Down Place, Guildford.

**GARDENER (HEAD)**, where two or three are kept.—Age 30; thirteen years' experience in leading places. Thoroughly practical in all branches, Forcing of Fruit, Flowers, and Vegetables, Orchard Growing, and Kitchen Gardening. Good character.—W. E., Cross Lanes, Bedale.

**GARDENER (HEAD)**.—Thorough practical knowledge of the profession in all branches. Wife good Cook and first-class Dairywoman. Two children. Three years' undeniable character.—H. DOWNS, Park House, Boxley, Maidstone, Kent.

**GARDENER (HEAD)**, Land and Woods if required.—Age 34, married; upwards of twenty years' sound practical experience in some of the leading establishments of the country.—HAROLD, Mr. Myatt, Hamber Lane, Preston, Wellington, Salop.

**GARDENER (HEAD)**; age 28.—Mr. BODDEY, Burwarton Hall, Bridgeorth, will be pleased to recommend his Foreman, J. Leese, to any Lady or Gentleman requiring the services of a thoroughly competent and trustworthy man.—Full particulars on application.

**GARDENER (HEAD)**.—A GENTLEMAN wishes most strongly to recommend his Head Gardener as thoroughly competent to manage any place. Leaving through no fault.—G. PIGGOT, Esq., Pembroke Lodge, Sunningdale, Berks.

**GARDENER (HEAD)**; age 28.—Mr. BODDEY, Burwarton Hall, Bridgeorth, will be pleased to recommend his Foreman, J. Leese, to any Lady or Gentleman requiring the services of a thoroughly competent and trustworthy man. Fourteen years' experience in good establishments. Full particulars on application.

**GARDENER (HEAD)**.—Mr. HARDWICK, of Holladen, Tonbridge, wishes to highly recommend his Head Gardener (G. Goldsmith), who has lived with him eight years, and six years with previous proprietor. Leaving on account of family moving to town.—For particulars apply to P. C. HARDWICK, Esq., address as above.

**GARDENER (HEAD)**.—NEIL SINCLAIR, Gardener to the Marchioness of Downshire, Easthamstead Park, Wokingham, Berks, will be pleased to recommend his Foreman, H. Howell, to any Lady or Gentleman requiring the services of a thorough practical man in all branches of the profession. Total abstainer.

**GARDENER (HEAD)**.—An honest, sober, and industrious Scotchman desires a situation at the new year. Has had long experience, and is a thoroughly practical man; therefore, those only who appreciate good gardening and are willing to remunerate good services need apply. First-class references and testimonials.—P. K., The Oaks, near Epsom, Surrey.

**GARDENER (HEAD)**; married.—W. SWAN, Gardener to W. Leech, Esq., Oakley, Fallowfield, Manchester, begs to offer his services to any Nobleman or Gentleman requiring a thoroughly practical man. Twenty-eight years' experience. Thorough knowledge of Orchids, Stove and Greenhouse Plants, Flower and Kitchen Gardening. Leaving through the establishment being broken up. Twelve years' excellent character.—Address as above.

**GARDENER (HEAD)**, or ESTATE BAILIFF.—Age 40; is now open to re-engagement. Long and successful experience in all branches. Has held both public and private situations; last place eight years. Well educated, highly recommended, and thoroughly trustworthy.—G. L. Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

**GARDENER (HEAD WORKING)**.—Age 32, married; understands Early and Late Forcing, also Stove and Greenhouse Plants, Flower and Kitchen Gardening. Eight years' good character.—S. R., 89, Stoke Newington Road, N.

**GARDENER (HEAD WORKING)**.—Married, no family; thoroughly acquainted with the routine of gardening in all its branches. Good character. Wife no objection to looking after poultry.—W. S., Epping Green, Hertford, Herts.

**GARDENER (HEAD WORKING)**.—Age 41, married; thirty years' practical experience in all branches of the profession. Over two years' good character from last place, four and a half previous.—WOOSTER, High Street, Crayford Kent.

**GARDENER (HEAD WORKING)**.—£10 bonus given to any one being the means of procuring the advertiser a situation as above. Character and abilities undoubted. Total abstainer.—N. A. Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

**GARDENER (SINGLE-HANDED, or otherwise)**.—Age 32, single; Melons, Cucumbers, Vines, Greenhouse, &c., Flower and Kitchen Gardening. Two years' good reference, five in previous.—H. WILLIAMS, 55, Upper Park Road, Hampstead, London, N.W.

**GARDENER (SECOND)**, in a good establishment.—Age 26, married, no family; thoroughly understands the profession. Can be thoroughly recommended. Abstainer.—E. WATERS, Pains Hill, Cobham, Surrey.

**MANAGER, or FOREMAN**, in an establishment where Flowers are grown extensively, either for Market or Private Trade.—H. E. B., Mr. R. Coxall, Cemetery Road, East Grinstead.

**FOREMAN**.—Age 28; twelve years' experience in the cultivation of Fruit, Flowers, &c. Two and a half years' good reference.—W. H., 46, Railton Road, Brixton, S.W.

**FOREMAN**, in a good establishment, or good Single-handed.—Age 24, single. Good references. Bothy preferred.—F. GODFREY, 92, Delaford Road, Iderton Road, Rotherhithe, S.E.

**FOREMAN**; age 24.—Mr. FOSSEY, Gardener to E. C. Goodhart, Esq., Langley Park, Beckenham, can with confidence recommend his Foreman to any Gardener wanting a thorough practical energetic man.

**FOREMAN**.—Accustomed to producing in quantity Tea Roses, Bouvardias, Cyclamens, Pelargoniums, Double Primulas, &c. Well up in Bouquets, Wreaths, and Floral Decorating in general.—H. KELSALL, Frances Street, Cheale, Manchester.

**FOREMAN**, in the Houses.—Age 26; twelve years' experience in all branches of the profession in large establishments. Can be well recommended from last and previous employer. Bothy preferred.—T. W., 284, High Street, Walford, Herts.

**FOREMAN (GENERAL, or otherwise)**; age 28.—Mr. NICHOLAS, Castle Hill, South Molton, can recommend his Foreman to any Gardener, as a good practical and trustworthy man as above.

**FOREMAN and PROPAGATOR, or PROPAGATOR under Glass**.—Age 25, single; well up in Growing and Forcing Plants and Cut Flowers for Market. Good Salesman, Bouquets, Wreaths, &c. First-class references.—A. S., 120, Upper Thurst Street, Northampton.

**FOREMAN, or FIRST JOURNEYMAN** in the Houses.—Age 24; eight years' experience in large establishments. Can be well recommended from present and previous employers. Bothy preferred.—J. T., The Gardens, Ashby Hall, Lincoln.

**JOURNEYMAN**, in a good establishment.—Age 21; 6 years' experience. Good references.—W. WOOD, The Gardens, Bladon Castle, Burton-on-Trent.

**ASSISTANT**, in a Seed and Florist, or Nursery Business.—Age 22; knowledge of Book-keeping. Five years' experience. Good references.—W. STREET, The Gardens, Stoke Place, Slough, Bucks.

## GRATEFUL—COMFORTING. EPPS'S COCOA. BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." *Civil Service Gazette.*

Made simply with boiling water or milk. Sold only in Packets labelled thus:—**JAMES EPPS & CO., Homoeopathic Chemists, London, England.**

**Asthma, Consumption, Coughs, Colds, and Bronchitis,** rapidly cured by

**DR. LOCOCK'S PULMONIC WAFERS.**—Nurse SHORRITH, Chilmark, Salisbury, writes:—"I don't like being without the Wafers, and only wish every other nurse, as I do, could keep a store in hand; they would save much suffering in life, let alone the boon of having a reliable medicine in need. I could send you some particulars of cures," &c., &c. They instantly relieve and rapidly cure Asthma, Consumption, Bronchitis, Coughs, Colds, Shortness of Breath, Phlegm. Pains in the Chest, Rheumatism, and taste pleasantly. Sold at 1s. 1/2d. and 2s. 9d. per box.

**HOLLOWAY'S PILLS.**—Nervousness and loss of energy.—Who first the nerves feel unstrung, and listless supplants energy, the time has come to take some such alternative as Holloway's Pills to restrain a disorder from developing itself into a disease. These excellent pills correct all irregularities and weaknesses. They act so kindly yet so energetically on the functions of digestion and assimilation, that the whole body is revived, the blood rendered richer and purer, while the muscles become firmer and stronger, and the nervous and absorbent systems are invigorated. These pills are suitable for all classes and all ages. They have a most marvellous effect on persons who are out of condition; they soon rectify whatever is in fault, restore strength to the body and confidence to the mind.

A large and select stock is now offered for sale.

The Illustrated and Descriptive CATALOGUE OF FRUITS post-free.

The Descriptive CATALOGUE OF ROSES post-free.

THOMAS RIVERS & SON, The Nurseries, Sawbridgeworth, Herts.

## HARRISON'S EARLY ECLIPSE PEA.

The Earliest in the Garden.  
 The Earliest in the Field.  
 The Earliest for the Market.

See *Gardeners' Chronicle and Gardeners' Magazine*, December 6, containing a whole page of opinions.

The haulm is of a peculiar light colour, only 2 feet in height, the pods of a lively green and well filled, and is the heaviest cropper for an early variety we have ever seen. The seed is blue, and similar in appearance to the "Kentish Invicta," but it is hardier and even earlier than that excellent variety.

This variety was selected by us from *Laxton's Harbinger* about eight years ago, and has no other origin. Many trials last season in different parts of the country have proved it to be the earliest Pea in cultivation. Although coming into blossom the same time as several other kinds, the pods fill so rapidly that they are ready for picking a week or ten days earlier.

Per Quart, 1s. 6d.; post-free for 2s.  
 Per Bushel, 26s.

Highly recommended to Market Gardeners.

Price to the Trade on application.

Wholesale CATALOGUE free on application.

General CATALOGUE free on application.

N.B.—We have Posted a Copy to all our Customers; any one not having received the same, on information, another Copy will be sent.

SEED MERCHANTS, 43 and 45, CORPORATION STREET, MANCHESTER.

**REMEMBER THIS! OUR SEEDS ARE NOT THE CHEAPEST BUT THE BEST** grown in the Garden of England, where the soil and sunny clime has been known for centuries and now MORE and MORE for its fruitfulness. The near perfection of our flowers exhibited both in England and on the Continent at all seasons surprised and astonished all, and at the last great shows in Belgium and Germany, where Gold and other Medals were awarded, what is even more conclusive proof that our country is more favourable for flowers than even that of any on the Continent, it was throughout these exhibitions said—and in general conversation admitted—that Cannell's flowers were the flowers of the whole show. Both King and Queen requested to see us, and expressed their surprise and admiration. Beyond this we think it perfectly unnecessary to say more in favour of our home-grown-and-saved Seeds, which we ask all to come and see, and be sure they are the best as they flower. Delivered post-free to everybody's door in the world.

SEND FOR A CATALOGUE.

## CANNELL'S BEGONIA SEED.

TUBEROUS BEGONIAS, AWARDED  
GOLD MEDALS and MANY FIRST-  
CLASS CERTIFICATES.

As many leaps and bounds as we have made in the improvement of flowers, our five houses of these last year exceeded all, and acknowledged to be of better habit, larger and more perfect flowers, and altogether superior to the ordinary varieties.

W. E. GUMBLETON, Esq. (our greatest authority), writes:—"Sir, Your six-inchers are indeed huge blooms, finer in substance by far than I expected them to be."

T. BAINES, in *Gardeners' Chronicle*, says:—"Doubles are as large and resembling small Peonies, and others a well-formed cupped Rose. Singles I measured flowers fully 6 inches over, of a deeper and brighter crimson than Zonal H. Jacoby."

Seeds from these flowers 2s. 6d. and 5s. per packet.  
Doubles, 7s. and 7s. 6d. per packet.

Send for the best ILLUSTRATED DESCRIPTIVE CATALOGUE, containing by far the best treatise and most correctly how to raise from seed up to grand plants.

# WEBBS'

UNIQUE

# NOVELTIES

## THE SECRET OF SUCCESS.

The unprecedented success of Messrs. WEBBS' Introductions in Vegetables and Flowers is no doubt owing, in a great measure, to the fact that, before being offered to the Public, they are invariably subjected to a series of crucial trials, with other first-class varieties, at their Kinver Seed Farms,—which are the largest in the Kingdom. By this means inferior varieties are discarded, and only those kinds that are of distinctive merit become associated with Messrs. Webb's name.

### PEA—Webbs' New Wordsley Wonder.

The unparalleled qualities of this new Pea are verified by the numerous testimonials we have received in its favour from the principal authorities. 2s. 6d. per pint, post-free.

### PEA—Webbs' New Stourbridge Marrow.

A grand new second early Pea, suitable for exhibition or general purposes. 1s. 6d. per pint, post-free.

### BROAD BEAN—Webbs' Kinver Mammoth

Longpod. Exceedingly early, an enormous crop, and of excellent quality. 1s. per pint, post-free.

### BRUSSELS SPROUTS—Webbs' Matchless.

Early and robust, producing a profusion of compact sprouts, which are tender and of superior flavour. 6d. and 1s. per packet, post-free.

### BROCCOLI—Webbs' New Autumn White

A new and distinct kind, of dwarf habit; very hardy. 1s. per packet, post-free.

### CABBAGE—Webbs' Emperor.

A rapid grower, very hardy and early, with close compact heads. 6d. and 1s. per packet, post-free.

### CAULIFLOWER—Webbs' Early Mammoth.

A very compact variety, of exceptional merit, with large, firm, snowy-white heads. 1s. 6d. per packet, post-free.

### CUCUMBER—Webbs' Perpetual Bearer.

Very free bearing; fruit uniformly handsome in shape and of large size. 1s. 6d. per pkt., post-free.

### LEEK—Webbs' New Colossal.

A distinct and choice variety, of rapid growth and large size. 1s. per packet, post-free.

### LETTUCE—Webbs' New Wordsley Gem.

A new extra early Cos variety, of grand flavour. 1s. per packet, post-free.

### MELON—Webbs' Pride of Stourbridge.

A scarlet-fleshed variety, of handsome shape and splendid quality, specially suitable for exhibition. 6d. per packet.

### ONION—Webbs' Improved Banbury.

A most handsome kind, of mild flavour; good keeper. 6d. per packet, post-free.

### TOMATO—Webbs' Early Dwarf Red.

Very prolific, of large size, excellent in shape and quality. 1s. per packet, post-free.

## SAVE 20 PER CENT.

Our exceptional position as the largest Seed Growers in the Kingdom enables us to offer our pure Stocks of Vegetable and Flower Seeds at very moderate prices, which, on comparison, will be found some twenty per cent. lower than those of other Houses.

## The Finest Scarlet-fleshed Melon

## SUTTON'S SCARLET INVINCIBLE.

Introduced by us last year, and has acquired a reputation unequalled by any other Melon known. Form somewhat globular; skin orange-red, finely and evenly netted; flesh thick, bright scarlet, and of exquisite flavour. On June 26, 1883, it was awarded a

First-class Certificate by the Frutt Committee of the Royal Horticultural Society,

and in every competition we are acquainted with it has taken 1st Prize.

Per packet, 1s. 6d. and 2s. 6d., post-free.

"A scarlet-fleshed variety of the most distinct character and highest excellence." *Gardeners' Magazine*, June 30, 1883.

READING.

## THE

# Gardeners' Chronicle.

SATURDAY, JANUARY 10, 1885.

## THE LATEST NOVELTIES.

IN continuance of our remarks on the newly introduced plants of the last year (see p. 19) we have now to mention the Ferns, Lycopods, and Stove Plants.

### FERNS AND LYCOPODS.

Some good new Ferns have appeared during the past year, the majority of them of supposed hybrid origin. The finest is *Gymnogramma Lathamiae*, which is believed to be a hybrid between *G. decomposita* and *G. schizophylla*. It forms an erect caudex, from which the fronds arch out in all directions; they are oblong-lanceolate, about 2½ feet long, quadripinnate, with shortly stalked ascending obliquely-elongate triangular pinnæ, and sessile deltoid pinnules, cut down to the rachis into small narrow segments, the larger of which are forked or trifid, and the smaller entire. The sori form short lines on the narrow segments, the spore-cases being embedded in a white waxy secretion. The stout stipes and rachis are bright chestnut-brown. It was raised in the Birmingham Botanic Garden, and is named after Mrs. Latham. Another fine Fern, also of hybrid origin, is of the Maidenhair race—*Adiantum rhodophyllum*—and is of a very ornamental character, on account of the rich colouring of its young fronds. The plant is evergreen, with triangular tripinnate fronds, the pinnæ few, pinnate or bipinnate, the pinnules rhomboid-trapezoid, with incised-lobate margins; its aspect is intermediate between that of *A. Victoriae* and the larger pinnuled forms of *A. tenerum*, and being of free growth, with a gracefully curving contour, it makes a fine decorative Fern, the more so as all the young fronds come of a brilliant tint of rosy-purple, which lasts for a considerable time, and then passes through soft coppery shades until the full green hue is acquired. As the plants are continually making new growth, the colour effect is almost constant. A curiosity, and yet a pleasing variety, is found in another hybrid, which bears striking evidence of its origin—*A. cuneatum deflexum*. It is *A. cuneatum* in all respects, except that its pinnules are deflexed, so as to appear drooping, exactly as in *A. Bausei*, which is believed to be one of its parents. Another remarkable variety of this prolific species is *A. cuneatum strictum*, a variety remarkable for its erect spriggy, branchy habit of growth, quite unlike the spreading habit of the type; it is a neat decorative Fern, so distinct in character as to be useful in grouping, but we know nothing of its origin. *Adiantum Fergusoni*, a curious abnormal looking Fern from Mr. Ferguson's greenhouse in Ceylon, has triangular-ovate tripinnate fronds, with the pinnules various in form, but requires to be better known before its true value and position can be determined.

In *Selaginella viridangula* we have a climbing Club-moss of elegant character, much in the way of *S. canaliculata* and *S. Willdenovii*. The ultimate divisions of the pinnæ terminate in long quadrangular spikelets, which differ from those of *S. Willdenovii* in having the bracts long and acuminate, instead of short and ovate.

It has been introduced from the South Sea Islands.

#### STOVE PLANTS.

Commencing with the flowering division, we think the first place for beauty, combined with distinctness of character, belongs to the new Brazilian *Amasonia punicea*, a plant of the Verbenaceous order, and a near ally to *Clerodendron*, for which a brilliant future may be predicted. It is of shrubby habit, with opposite oblong or elliptic-lanceolate serrated leaves, and large erect panicles of flowers, which have five-parted red calyces and tubular creamy-yellow corollas with projecting curved stamens—these flowers being accompanied by very persistent brilliant red bracts, from 2 to 4 inches long and ovate lance-shaped in form, which remain for many weeks on the plant, and add very much to its effectiveness. It ought to be a good subject for summer shows. To the same family belongs *Clerodendron illustre*, a fine, bold habited stove shrub, in the way of *C. squamatum*, having glabrous, cordate, stalked, repandly-toothed leaves and large terminal panicles of brilliant scarlet flowers, the exerted stamens of which have vermilion filaments. These shrubby *Clerodendrons* were the glory of our summer shows some thirty or forty years since, and if the art of growing them successfully has not departed with our old showmen, it is much to be desired that the introduction of this new species may be the means of again drawing the attention of exhibitors to their grand effect on the exhibition tables. In the *Dichotrichum ternatum* we have a showy stove plant of creeping habit, the hairy stems rooting, like those of ivy, against a damp wall; it produces large, stalked, roundish-ovate hairy leaves, and axillary, long-stalked, umbellate corymbs of assurgent tubular scarlet flowers of great beauty. It is allied to *Æschynanthus*, and will be well suited, like the species of that showy family, for covering the back walls of plant stoves.

*Ipomœa Thomsoniana*, briefly referred to previously as *I. Horsfalliæ alba*, may be claimed for the present sketch on account of the rectification of its name; it is a very charming stove climber, with much of the habit and aspect of *I. Horsfalliæ*, but differs in its fleshy ternate leaves, which have stalked leaflets, as well as in its much larger pure white flowers, which are so freely produced as to render the plant one of a very ornamental character. It was figured in these columns December 29, 1883. The *Sumatran Rhododendron Curtisii* proves to be one of the forms of *R. multicolor*, which, as the name imports, produces flowers of various colours. One of the prettiest flowering plants of the year is the supposed Central American *Aphelandra Margaritæ*; it is dwarf in habit, with cylindrical hairy stems, clothed with decussate elliptic leaves, furnished on the upper side with about half a dozen bars of white on each side the midrib, and terminated by a short terminal spike of bright orange or apricot coloured flowers, which issue from the axils of pectinate bracts. It is one of the neatest and most manageable of the species, and thoroughly distinct in colour.

#### BROMELIADS.

As usual, some fine Bromeliaceous plants have come into notice. One of them, *Bilbergia Sanderiana*, a brilliant acquisition to the group, has long spinose leaves and nodding scapes, supporting elongate panicles of handsome flowers, which emerge, several together, from the axils of rosy-pink bracts, and consist individually of a greyish-green calyx tipped with blue, a corolla, which is green below, heavily tipped with deep blue, and yellow stamens. The plant, being an abundant bloomer, ranks high as a decorative object. *Vriesea Duvaliana*, a Brazilian species, which has a tuft of recurved green leaves tinted with purple, bears a long

distichous spike of yellow flowers, emerging from keeled bracts, which are scarlet, tipped with green, and give the plant a very striking and ornamental aspect. *Vriesea fenestralis* is a very handsome plant of a totally different type, its beautifully tessellated leaves growing in a rosulate tuft, from the centre of which arises the erect elongated distichous spike of yellow flowers. The chief beauty of this species lies in the foliage, which is pale green, with crowded cross bars of a deeper green, the surface between the markings being in many parts white, like ivory. Another of this genus is *Vriesea hieroglyphica*, a splendid plant, with large rosulate tufts of loriform smooth leaves, which are suddenly contracted to a point, of a brilliant green, sometimes a bright yellow, marked with transverse irregular bands of deep green; these markings more or less broken up to form a close series of coloured arabesque or hieroglyphical characters on the leaf surface. All these come from Brazil.

#### BEGONIAS.

The genus *Begonia* has been augmented by a few handsome species, besides the grand florists' varieties of the tuberous section, the improvement of which has been rapid and striking beyond precedent. Thus *Begonia Lubbersii* is an ornamental sub-shrubby species, of branching habit, with cylindrical green stems, distichous, narrow oblong rhomboid peltate leaves, which are dark shining green, marked with irregular oblong white blotches, and axillary nodding cymes of large white flowers, which are tinged with green. It is of Brazilian origin, and was accidentally introduced to the Botanic Garden at Brussels attached to the stem of a Tree Fern. The Mexican *Begonia Lyncheana*, is a very beautiful plant, grown sometimes as *B. Roetzlii*, but not the true plant so named. It has now been renamed, in honour of Mr. Lynch, of the Cambridge Botanic Gardens, by whom it has been very successfully grown and exhibited. It has tuberous rhizomes, tall thick fleshy branching stems, large oblique roundish-oblong ovate leaves, and bold axillary corymbiform panicles of bright scarlet flowers produced in the winter period.

#### BULBOUS PLANTS.

Of this series there remains to notice a few stove bulbs of an interesting character. One of the most strikingly handsome is *Crinum Sanderianum* from Sierra Leone, a distinct novelty, with small globose bulbs, ensiform leaves, and umbels of three or four sessile large expanded flowers with lanceolate perianth segments, white with a conspicuous crimson band down the centre. *Crinum leucophyllum* from Damara-land is a fine bold plant of the asiaticum type, with large ovoid bulbs, distichous lanceolate leaves, and lateral two-edged scapes bearing large umbels of thirty to forty flowers, which have very long tubes, and narrow linear spreading segments of a bluish-white colour, the outer surface being of a deeper rose tint. *Crinum zeylanicum radiculatum* is a dwarf compact-growing and very floriferous bulb from Zanzibar, with small long-necked bulbs, ensiform ciliated leaves, and umbels of four green-tubed white flowers which are marked by a red central band, and have declinate stamens. *Hæmanthus Katherinæ* is a noble species from Natal, and would probably succeed in a warm greenhouse. It has elliptic-oblong acute leaves whose stalks are sheathed so as to form a kind of cylindrical stem, and the cotemporary scape supports a globose umbel of scarlet flowers. *Hymenocallis eucharidifolia* is a fine South American species, with large bright green leaves, and umbels of four or five flowers, which have a green tube, white linear perianth-segments, and a funnel-shaped white corona, with two marginal teeth between each pair of stamens. In *Ismene Andreana* we have a handsome new

bulb of distinct character, and probably only requiring greenhouse treatment. It comes from the Andes of Ecuador, and has bulbs of considerable size, producing several glabrous linear cotemporary leaves, and solitary flowers, of which the perianth is white, with lance-shaped undulated segments, and the corona broadly funnel-shaped, white, with a green band opposite each sinus, from the top of which a white filament with its anther is projected inwards. We are glad to see that the fine race of bulbous plants is again attracting the notice of cultivators, since, though long neglected, it comprises some of the grandest and gayest of flowers.

#### MISCELLANEOUS PLANTS.

Of another type is the *Sagittaria montevidensis*, a most charming tropical aquatic. This plant has a tuberous rootstock, hastate leaves, and panicles of white flowers having at the base of each of the three petals an ovate spot of a rich brown bordered with yellow. This will be quite an acquisition for the aquarium. In the tropical East African *Streptocarpus Kirkii* we have a distinct type of that interesting genus of Gesnerads; it is an elegant little plant, with erect leafy stems 4 to 6 inches high, which are furnished with opposite ovate cordate leaves, and slender dichotomous cymes of curved tubulose-campanulate flowers of a pretty bright lilac colour; it is quite different in its style and habit from the more familiar species of *Streptocarpus*, and will be a neat little subject for a pet plant. *Kalanchoë farinacea*, a Crassulaceous succulent from the island of Socotra, appears to be a handsome plant, of erect habit, with fleshy stems, orbicular-spathulate leaves, and terminal umbellate panicles of scarlet flowers, the whole plant, saving the flowers, covered with a white mealy powder, which gives it a greyish hue. *Bomarea Kalbreyeri* represents one of the beautiful climbing *Alströmerias*, which have latterly come more prominently into notice, owing to the introduction of several fine new species. The present is a free growing climber, bearing large terminal umbels of flowers, of which the outer segments are brick-red, and the longer inner ones orange-yellow, spotted with red. It came from New Grenada.

#### FOLIAGE PLANTS.

In the section of Fine-foliage Plants we have less novelty to record than usual, the run upon these subjects having apparently somewhat abated; but there are, nevertheless, a few good things worth notice. *Alocasia Sanderiana* is certainly one of the finest of the metallic-leaved Arads, strikingly distinct, and remarkably effective. It comes from the Eastern Archipelago, has tuberous rootstocks, brownish-green, striately mottled erect petioles, and large deflexed leaf-blades, which are peltately affixed, glossy, arrow-shaped, with three lateral lobes on each side, the surface green, with metallic-blue reflections, and the midrib and margin ivory-white. *Dieffenbachia Jenmanni*, a species lately imported from British Guiana, is one of the most elegant of its family. It is dwarfish in habit, with long narrow oblong-lanceolate leaves, of a bright green, marked with oblique elongate white blotches parallel with the primary veins, and extending in broken lines from the costa nearly to the margin, these being mingled with smaller spots and blotches scattered over the whole of the leaf surface. We believe it will prove very useful as a decorative plant of this class, not being so unwieldy as many of them are, and at the same time being elegant both in its form and marking.

*Begonia sceptrum*, from Brazil, is a handsome species of novel character, with obliquely ovate leaves, which are cut on one side into deep blunt lobes; the raised spaces between the sunken veins are marked with large blotches

mixed up with smaller spots of silvery-grey, and have a very pretty and distinct appearance. The *Kæmpferia ornata*, recently discovered in Borneo, is an effective plant, about a foot high, throwing up a mass of stalked leaves, which are narrowly lanceolate, dark green at the edges, with a distinctly serrated silvery-grey band up the centre, the under-surface of a dull reddish-purple. The flowers are yellow, but the chief interest of the plant will be in its foliage, which has nothing of coarseness about it.

#### AROIDs.

Some very fine *Alocasias* and other fine-foliage plants were brought forward at the St. Petersburg Exhibition. They include *Alocasia*

true, more elongated in form. The flesh is firm, yellow, and of good flavour, and as Mr. Bull received the fruit direct from California, whence it arrived in good condition, nothing further need be said as to its qualifications as a traveller. The tree was introduced from Japan to California in 1871. According to the *Pacific Rural Press*, the tree is very prolific, and Messrs. Hammon & Co., of Oakland, who have propagated it, claim for it these merits:—

- "1. Its wonderful productiveness is unsurpassed by any other Plum, either native or foreign. 2. It comes into bearing at the age of two to three years, and continues with great regularity, blossoms frequently appearing on yearling trees. 3. The fruit is of very large size, being from 7 to 9 inches in circumference, and specimens weighing 6½ oz. each, and it has a remarkably small pit. 4. It is very attractive in appearance, being of a rich

made leaves the size of a half-crown piece; but on account of their having sprouted late in the season, and our not being acquainted with the true nature of the plants, they both died in November of the same year.

From that time several attempts were made to introduce it, both by roots and seeds, but none succeeded till January, 1849, when seeds were received, sent in a phial of water from Demerara, by Dr. Boughton, which vegetated, and in March six plants had become fully established and grew rapidly, occupying shallow water-tubs, successively increasing in size, the last being 9 feet in diameter, which was occupied by one plant.

Applications were now made to the Commissioner of Works for a large tank to grow it in; in the meantime advantage was taken of the heated slate floor of

FIG. 9.—NEW JAPAN PLUM.

*imperialis*, figured in the last number of the *Illustration Horticole*, and *A. regina*: these rank amongst the best new plants of the year. *Philodendron Regelianum*, in the way of *P. crinipes*, and *Pothos Enderiana*, remarkable for its black-green foliage, are also well spoken of. All of them are Bornean plants. The remarkable *Arisæma fimbriatum* was recently figured in these columns (p. 680, Nov. 29, 1884), and is at this moment in bloom in M. Bull's Nursery. *T. Moore*.

(To be continued.)

#### JAPAN PLUM.

THE Plum of which we give an illustration (fig. 9), from the pencil of Mr. Fitch, was exhibited before the Fruit Committee on October 14 last, by Mr. Bull. The fruits attracted much attention, being much more like Nectarines in colour than Plums, though, it is

yellow nearly overspread with a bright red, with a lovely bloom. It is heart-shaped. It ripens from first to last of September, at a most favourable time for harvesting and marketing the crop, the larger part of the Plum crop being gone. 5. It is of superb quality, melting, rich, and juicy; in fact, to some tastes, at least, has a more satisfying flavour than any other Plum. For cooking, jelly, or preserving in any manner it has no equal. Its large size renders the paring of the fruit as practicable as in the Peach, which is quite a novelty in the line, and excels all other canning Plums. As a dried fruit it is destined to take the lead, equal to if not surpassing the best dried Prunes or Peaches for drying results."

#### VICTORIA REGIA.

In August, 1846, seeds of this remarkable water-plant, of which an illustration was given in your last number, were first sent to this country by Mr. Thomas Bridges, a plant collector, who discovered it in Bolivia. Two of these seeds were purchased for Kew, at a guinea each, both of which vegetated and

No. 6, and it was formed into a tank by fixing slate sides 2 feet deep, thus forming a tank 25 feet long by 11 feet wide; and on the 21st of August a heap of soil was placed in the centre and the first plant was planted. It grew rapidly, and on November 24 produced a flower-bud, which, on account of the dull weather at that season of the year, did not come to perfection, and during the winter it dwindled and died.

Sir W. Hooker promised a plant to the Duke of Devonshire, provided he would have a tank made for it, which he did, and on August 3, 1849, Mr. Paxton called early one morning and took our second-sized plant, which I had carefully packed ready for him, and the next day it was to be seen in the Chatsworth tank. It thus had three weeks start of the Kew plant. It flowered on November 1, and thus Chatsworth got the credit of being the first to flower it in this country. [An illustration of this flower appeared in our columns, with a full history of the plant, on November 24, 1849. Ed.] Having preserved plants through the winter of the previous year's

second the number of stations from which reports were sent, the third the three degrees of quality under which the returns for the respective fruits have been classed; the other columns show the proportionate values of the respective fruit crops. Having already explained under which head I have classed the varied expressions used in the returns to express the quantity or quality of the crops, I would here say that in those few instances where no returns were made for any particular fruit they have been classed here as "under" average, as being the least liable to error. Possibly this table may be open to some objections, but these I venture to hope will not seriously affect its accuracy as a ready means of ascertaining at least an approximate idea of the actual and relative quantity and value of the respective crops. The right-hand column gives the total number of reports made on all fruits from each district, while the figures at the base show the summary of averages of the respective fruits at the aggregate stations. The second series of tables is intended to show the percentage of each crop. In calculating these the "over" and "average" crops have been added together, and the percentage then taken from the whole returns: for example, in Scotland there are in Apricots seven "over" and six "average," which added together make thirteen, and thirteen in forty-two equal thirty-one per cent. These two quantities have been added together, so as to obtain as nearly as possible the numbers of what may be called good crops. In each table the district in which the best results occur have been placed first, so as to be more convenient for comparison.

## GENERAL RESULTS.

Some of the results as tabulated are very striking, and show most plainly how great and general the failure was in respect to some fruits. Apricots, Peaches, and Nectarines, or what may be termed the tender wall fruits, do not appear to have suffered so severely as the harder kinds; this result may perhaps be best accounted for in two ways: first, by their having safely passed the most sensitive period of fertilisation before the most severe weather occurred; and, second, from the fact that they were more generally protected artificially from the destructive frosts which occurred in the middle of April for several nights in succession, when nearly all the blossom and young fruit on unprotected trees was destroyed.

Apricots show somewhat the best results in the Eastern, Midland, and Western divisions; the Southern, Scotland, and Northern show but very moderate results, while in Ireland, Wales, and the Channel Islands, they appear to have been a comparative failure. This failure, however, does not appear, judging from the weather reports from those districts, to have been caused so much by severe frosts as by the unusually hot and dry weather which prevailed during the late spring months causing the young fruit to shrivel and drop.

Plums may be described as a total failure throughout England, not a single return of "over," and only one "average," result being returned from either the Midland, Western, or Eastern Counties, while from the Northern it was even less favourable. In Wales, Scotland, and the Channel Islands, the returns were somewhat better, while in Ireland very fair results were obtained. The mean percentage, however, was exceedingly low, being only fourteen.

Cherries show, with the exception of small fruits and Strawberries, the best average of any fruit. The Western district appears to have been the most favoured, showing the respectable average of 76 per cent. In Ireland and Scotland the returns are also good, while in the English counties and in Wales they are moderately so.

Peaches and Nectarines in the Eastern district show a good result; in the other English counties, except the Northern, the returns were fair, while in Ireland, Wales, Scotland, and the Northern Counties, they were but moderate.

Apples, on the whole, may be called only a moderate crop; while the Western district and the Channel Islands show a good percentage, the other districts give but very moderate averages, and that of Scotland is exceedingly poor. In the latter country, as also in the Northern and Eastern districts, not a single return of "over" average was given; the same remark also applies to Ireland, Wales, and the Channel Islands.

Pears appear to have suffered more than any other fruit. There is not a single return of "over" average from any station; and from the Eastern Coun-

ties, also from Ireland and Wales, there is not even an "average" return. With the exception of the Channel Islands, the Pear crop was perhaps the worst that has occurred generally within the last half a century.

Small Fruits were, with very few exceptions, abundant everywhere. From Scotland, also from the Northern and Western Counties, as well as Wales, there was not a single "under" average return made; in the Midlands and in Ireland, only one each; and in the Southern only four, while the general average is 95 per cent.

Strawberries were also plentiful everywhere, the Northern, Midland, as well as Wales and Ireland, having no return "under" average. The Eastern, Western, and the Channel Isles, only one each; Scotland two, and the Southern Counties five.

Nuts appear to have been only a moderate crop in the Midland and Eastern Counties, and more especially so in all other districts.

All Fruits.—The Western Counties obtain the premier position, showing the best general average for all kinds of fruit, beating the Channel Isles, while the Midland and Eastern districts, although next in order of merit, are much lower down the scale. The Southern Counties, being equal with Ireland, are next in succession. Then appears Scotland, 5 per cent. lower in the scale, closely followed by Wales and the bleak Northrons.

(To be continued.)

## PORANA PANICULATA.

THIS fine climber is seldom heard of in Europe. It is now in full bloom here, and a most charming thing it is. It is a twining plant of the family of the Convolvulaceæ. Besides the twining branches, it gives off, on a level with the ground, long straight shoots, which have no tendency to twine, but root readily in favourable places. This is a common feature in various perennial Convolvulaceæ. The largest leaves of this Porana are about 5 inches across, and have a rather rough surface. The stems and small leaves are covered with a greyish down. Single panicles are frequently a foot long and 4 inches across, but often terminal compound panicles are 3 and 4 feet long. The flowers are of the purest white, a quarter of an inch across, and bell-shaped, with a yellowish tube, and sweet-scented. The beauty of the inflorescence consists in the panicles having most of the flowers open at once, from tip to base, so that the climber is covered with pure white minute bells in cloud-like masses, with here and there long and gracefully drooping panicles. Fine as this plant is in the open, when in full bloom, either by sun or moonlight, it is unsurpassed by any other for internal decoration. It is on dining tables, in hanging baskets, and on stands, with a long panicle entwined round their stems, that it should be seen. The colours which best suit this fluffy white mass of florets are a brilliant crimson, with some delicate green foliage. Once, at a private dinner party, in Lucknow, I saw both drawing and dining rooms decorated with this fine thing. The dining-room was separated from the drawing-room by Saracenic arches, with curtains drawn across them. From the tops of the arches hung baskets with the charming Porana panicles drooping carelessly out of them, and interspersed with crimson and green. In one corner was a flower-stand with the same elements, and with a long panicle neatly entwined round its stem. On the dining-table were three crystal long-stemmed epergnes, decorated with these milk-white masses of tiny flowers, single crimson Roses, and Maidenhair Fern. The specimen glasses all round the table were *en costume*, and similarly got up. As dinner was announced, the curtains drawn, and the guests walked into the dining-room, they exclaimed, "How lovely!" and it was a truly lovely combination of forms and colours—exquisite through their very simplicity. The Porana paniculata flowers in November, when there is little else in the way of flowers. It ought to do well in a cool-house in England, as it stands a moderate degree of frost. Here it is at its best, rambling in its own way among and over bushes, or running up the sunny side of some dark-foliaged tree. I have never seen it seed, and I know several other perennial Convolvulaceæ which do not seed. In lieu of seed, they produce immense straight stems along the ground, which root at the joints. Every joint acts as a seed, and probably this is the reason why, in the struggle for existence, such plants had no need of seed to keep them from extinction. *E. Bonavia, M.D., Etawah.*

## NOTES ON THE CULTIVATED ASTERS.—VII.

(Continued from p. 13.)

**SUBGENUS II. CALLIASTRUM.**—Differs from *Euaster* only by its narrower achenes, more rigid pappus-bristles, and fewer and larger heads of flowers.

32. *A. amellus*, Linn. *A. amelloides*, Roem. *A. pseudo-amellus*, DC., non Hook, fil. *A. tinctorius*, Wallr. *A. bessarabicus*, Bernh. *A. ibericus*, Steud.—Stems 1—1½ foot long, erect, hairy, bearing a few corymbose heads. Leaves numerous, growing gradually smaller from the lower part of the stem to the upper, firm in texture, scabrous beneath, the lower ones oblong, about 1 inch broad, entire or obscurely serrated, tapering gradually into a short petiole, the upper sessile and oblong-lanceolate. Involucre broadly campanulate, ½ inch in diameter, not much imbricated, the bracts oblong-lanceolate, obtuse, with large foliaceous spreading tips, the outer not much shorter than the inner. Ligules about thirty, bright lilac, ½ inch long. Achene oblong-lanceolate, compressed, hispid, ¼ inch long; pappus of very numerous pale red bristles of firm texture, ¼ inch long.

Widely spread through Central and Eastern Europe, and extending to Armenia and the Caucasus. *A. bessarabicus* and *ibericus* are fine varieties, with larger heads than in the type. The closely-allied West Himalayan *A. pseudo-amellus*, Hook. fil., differs mainly by its very large outer involucre bracts, which exceed the inner in length.

33. *A. spectabilis*, Ait.; Lindl., in Bot. Reg., t. 1527. *A. elegans*, Willd. *A. speciosus*, Hornem.—Stems 1—1½ foot long, erect, slightly hairy towards the top, bearing a few heads arranged corymbosely. Leaves smooth, moderately firm in texture; lower oblong 1—1½ inch broad, entire or obscurely serrated, narrowed gradually into a short petiole; upper distant, oblong or lanceolate, sessile, amplexicaul. Involucre campanulate, ½ inch in diameter, well imbricated; bracts in several rows, lanceolate, with very distinct, squarrose, foliaceous tips. Ligules 20—30, bright lilac, ½ inch long. Achene narrow, slightly pubescent, ¼ inch long; pappus copious, moderately firm, reddish-white. ¼ inch long.

Sandy soil near the coast, Massachusetts to Delaware.

34. *A. surculosus*, Michx.—Closely allied to the last, but with a long trailing underground rootstock. Stems slender, erect, ½—1 foot long, bearing a few corymbose heads. Lower leaves oblong-lanceolate, entire, or obscurely serrated, narrowed into a petiole, which is sometimes as long as the blade; upper sessile, lanceolate, amplexicaul. Involucre campanulate, ¼—½ inch in diameter; bracts in several rows, all with distinct, squarrose, green tips, of firm texture. Ligules about twenty, bright lilac, ½ inch long. Achene slender, hairy, ¼ inch long; pappus dirty-white, flexuose, twice as long as the achene.

Coast of New Jersey southward to Georgia, and abundant on the Blue Ridge Mountains in North and South Carolina.

35. *A. sibiricus*, Linn. *A. montanus*, Richardson. *A. Richardsonii*, Spreng. *A. espenbergensis*, Nees. *A. Prescottii*, Lindl.—Stems pubescent, varying in length from a few inches to 1½ foot. Stem-leaves oblong-lanceolate, sessile, acute, sharply serrated, the lower 1 inch broad. Heads few, arranged corymbosely, sometimes in the dwarf mountain forms solitary. Involucre broadly campanulate, ½ inch in diameter; bracts in few rows, all with large erect green pilose leafy points. Ligules about twenty, lilac, ½ inch long. Achene slender, pilose, ½ inch long; pappus dirty-white or reddish, moderately firm in texture, rather longer than the achene.

A widely diffused species of boreal geographical type. It occurs in Lapland and stretches through Siberia to Arctic America, and southward along the Rocky Mountains to Wyoming and Montana.

36. *A. Radula*, Ait. *A. nudiflorus*, Nutt.—Stems slender, erect, 2—3 feet long, slightly hairy towards the top. Stem leaves sessile, oblong-lanceolate, acute, sharply serrated, thin in texture, scabrous, the lower 3—4 inches long, about 1 inch broad. Heads few, arranged in a lax corymb. Involucre broadly campanulate, ½ inch in diameter, well imbricated; bracts with short obtuse, rather spreading, green leafy tips. Ligules about twenty, bright lilac, ½ inch long. Achene cylindrical, glabrous, ¼ inch long; pappus pale red, firm in texture, rather longer than the achene.

Delaware to Massachusetts and Pennsylvania, and thence northward to Nova Scotia, Newfoundland and Labrador. *A. strictus*, Pursh. (*A. biflorus*, Michx.),

is a dwarf mountain variety, closely resembling forms of the preceding.

37. *A. Curtisii*, Torrey and Gray.—Stems 2–3 feet, long, slightly hairy upwards. Lower leaves oblong, acute, sharply serrated,  $1\frac{1}{2}$  inch broad, narrowed suddenly to a long petiole; stem-leaves sessile, lanceolate. Heads few, arranged in a very lax deltoid panicle. Involucre broadly campanulate,  $\frac{3}{4}$ – $\frac{1}{2}$  inch diameter; bracts in several rows, furnished with large spreading green tips, of firm texture. Ligules thirty, bright lilac,  $\frac{1}{2}$  inch long. Achenes compressed, oblanolate, glabrous; pappus dirty white or pale reddish,  $\frac{1}{2}$  inch long.

Alleghanies of North Carolina and Tennessee, in dry soil on the margin of woods. A fine species for garden purposes.

38. *A. Hoveyi*, A. Gray. *Biotia commixta*, DC. *Eurybia commixta*, Nees.—Stems slender, erect, 2–3 feet long, slightly hairy towards the top. Root-leaves and lower stem-leaves distinctly petioled, oblong, acute, finely serrated,  $1\frac{1}{2}$ –2 inches broad, narrowed suddenly at the base; upper stem-leaves lanceolate, sessile. Heads few, arranged in a lax corymbose panicle. Involucre campanulate,  $\frac{1}{2}$  inch diameter, well imbricated; bracts all with small deltoid erect green tips. Ligules about twenty, linear, lilac,  $\frac{1}{2}$  inch long. Achene slender, hairy,  $\frac{1}{2}$  inch long; pappus dirty white, flexuose, twice as long as the achene.

Massachusetts and Rhode Island. A very rare species, suspected by Dr. Gray to be a hybrid between *spectabilis* and *macrophyllus*. At any rate, it connects this subgenus with the next. *J. G. Baker.*

(To be continued.)

## MANURES.

TIME was when, with few exceptions, manure was looked on simply as manure, and provided it was of a sufficiently potent nature to be visibly effective in the increased development of some or other of the parts of the plants to which it was applied, it was considered sufficient, and all that was required. Manures of the commonest kind, rich in ammonia, and consequently conducive to the promotion of leaf-growth, were often supposed as all that was necessary; and unfortunately it may be set down as a certainty that too much of this happy-go-lucky sort of proceeding is still followed with many of the ordinary garden crops—fruits, as well as common vegetables. This especially applies to the host of amateur gardeners, and to the doings of the so-called gardeners who are intrusted with the management of the smaller run of gardens; not but that such mistakes are often to be seen where better things might be looked for. Yet, that the majority of cultivated plants are not only benefited by, but absolutely require more variety in the food supplied to them than has hitherto been generally supposed necessary, is exemplified by the marked results that invariably follow a mixed diet in the shape of different kinds of manure, when these are applied with judgment—that is, with sufficient knowledge of the requirements of the particular kind of plant to be dealt with.

Amongst those engaged in the cultivation of garden produce there are few, if any, whose practice goes so far to confirm this as that of the leading market gardeners in the different things they cultivate. Pot-plants, Grapes, and culinary vegetables, in their hands, alike show what can be done by the use of different manures. The extraordinary growth and profusion of flowers present in plants grown in pots small out of all proportion to the plants they hold—such as may be seen in thousands in any of the leading market gardens—and the astonishing weight of highly-finished Grapes which Vines under their management annually produce, are conclusive evidence of what can be done by the use of different manures, each rich in some or other of the various elements required to give the highest results attainable with the plants and fruits in question.

It is scarcely necessary to point to the practice named as being diametrically different to the course often followed with vegetable crops in old gardens, where for a generation or more nothing has been done but the annual application of stable manure, with possibly the occasional addition of vegetable mould in some shape or other, and with Vines that have had their roots for an indefinite time in borders with nothing to assist them beyond a repetition of the same manure, in which horse-droppings are all but the sole ingredient. Not that there is room to find

fault with this well-proved fertiliser, that has the further merit of being readily obtained and easily applied, but it does not alone contain all the elements required to reach the highest standard in the cultivation of the plants under notice, particularly in soil that has been, with little change, long under the same kind of crop. The highest results attainable in the cultivation of the various plants here noticed, and of most others, can only be reached by providing them with mixed food, varied according to the requirements of the different things to be grown, and still further regulated by the nature of the particular soil with which the cultivator has to deal.

This is a subject which young gardeners who feel an interest in the advancement of the pursuit would do well to direct their attention to. The great body of those engaged in agriculture in this country have long been taunted with groping their way, rather than making acquaintance with sound practice. But the schoolmaster, in the shape of the experimental chemist, is now abroad in earnest, and there is abundant evidence that the intelligent portion of those who cultivate the broad acres have their eyes wide open to receive the lessons taught and put them in practice. Gardeners collectively would do well to avail themselves of the teaching, which, taken in a broader sense, is equally applicable to the crops they cultivate. *T. B.*

## PERIGORD PIE, TRUE AND FALSE.

A YEAR or two ago we showed in the *Gardeners' Chronicle* how, after a microscopic examination of

FIG. 10.—A, TRUE, AND B, FALSE TRUFFLE SPORES.

numerous samples, it could be seen of what vile compounds Mushroom ketchup is often made, and how very innocent it too frequently is of all connection with pasture Mushrooms. We have also shown how in a few moments London publicans can make artificial "fungus," or false *Zasmidium* cellare, out of soot, cobwebs, and sawdust, wherewith to garnish their bottles of "prime old port," five minutes in bottle.

Most of the readers of this paper know what Perigord pie is: it is often termed *pâté de foie gras*, or patty of fat liver. The pie is made of the abnormally fat livers of geese; the live geese are said to be fastened to boards at Strasbourg and other places, and then fixed near a fire or stove; the unfortunate geese are allowed no fresh air or exercise, and they are fed on greasy food. When the greasy geese become sufficiently ill and distended they are killed, and the fat livers are taken out, for use as one of the ingredients of Perigord pie. The carcasses are sold cheap to cook-shop keepers. There is plenty of goose at Strasbourg. Mixed with the liver is—or should be—a quantity of black stuffing, made from a delicious underground fungus or Truffle, named *Tuber melanosporum*. There is as much difference between the taste of this delicious Truffle of Perigord and the Truffle of Britain as between chalk and cheese; one is food for the gods, the other is only fit for aldermen. The first, as we have said, is *Tuber melanosporum*, the second *T. aestivum*.

There are different qualities of Perigord pie, the varieties differ according to the views of the makers. The true and luxurious *pâté de foie gras* consists of greasy livers mixed with *Tuber melanosporum*. We are not sufficiently skilled to be able to distinguish the liver of a fat goose from one extracted from a dead donkey (when chopped up and made into a pie), but the pie-

making does not destroy the characteristic points of the Truffles. The spores in their little transparent sacs remain intact. In A, fig. 10, we have engraved, enlarged 400 diameters, the fruit of the genuine Perigord Truffle, taken from a true Perigord pie; and at B a fragment of the black mass, enlarged to the same scale, which sometimes does duty for it. Fungologists will see that the spores at B belong to the internally black, worthless, and often disgusting fungus named *Scleroderma vulgare*, a fungus which is no Truffle at all. We have not only seen *Scleroderma* spores in Perigord pie, but the spores of at least four different species of Truffle, which fact shows that some *pâté* manufacturers are not very particular as to the sort of Truffle they use so long as it is black. We have seen the spores of the offensive white Truffle, *Cheromyces meandriformis*, in Perigord pie.

In some parts of London cooked turkeys are sold, "stuffed with Truffles," at so much a pound. At some shops these birds may be real turkeys, and the black patches real Truffles of some sort. We have not yet been able to detect Truffles of any sort. The black patches generally belong to the abominable fungus named *Scleroderma vulgare*. During the *Scleroderma* season our "turkey" cooking friends hailing from France and Italy visit Epping Forest, where the *Scleroderma* is extremely common, and there they nett a grand harvest, and the fungi are preserved in a dry state all through the winter and summer till the next *Scleroderma* season. The visitors go to Epping Forest on the Saturday, and have a grand long spell at *Scleroderma* hunting all day on Sunday. The *Scleroderma* has got a very hard skin, or rind—hence its name, and any one who can eat and digest it even with a goose or turkey must be a *Sclerogastric* diner. *W. G. Smith.*

## HOPETOUN HOUSE.

THIS fine demesne is situate in Abercorn parish, Linlithgowshire, near the southern shore of the Frith of Forth, and about twelve miles north-west of Edinburgh. On a warm sunny day it is a delightful drive from Edinburgh, over Dean Bridge, by Comely Bank, through the village of Blackhall, with the finely wooded Corstorphine Hill on the left, over Cramond Brig, the "scene of the gallant King James' encounter with the gipsies, and his rescue by John Howieson, who little thought that 'the Gudeman o' Ballangeich' was his sovereign until James discovered himself at Holyrood."

Hopetoun House, the seat of the Earl of Hopetoun, is a stately classical structure; it consists of a centre erected in 1702, from designs by Sir William Bruce, of Kinross, to which, many years after, Robert Adam added north and south wings, that surmounted by octagonal dome-roofed towers and connected with the body of the house by sweeping colonnades. The rooms are spacious, and embellished by many fine works of art. The north wing is occupied by extensive stables, and the spacious apartment—100 × 39 feet—which forms the south wing, and was formerly used as a family riding school, was a few years ago converted into a ball-room on the occasion of the coming of age of the present Earl.

Standing on a raised natural terrace the house commands a magnificent prospect of the Forth's basin, to Ben Lomond, and down the blue widening Forth to the Isle of May. The grounds are of singular beauty: there are 12 acres of garden laid out like those of Versailles, a deer park, &c.; the trees are unrivalled for size and beauty. The grounds are peculiarly rich in Hollies, which attain large proportions, but they were severely punished by the frosts of 1860–61. Then they were cut down almost without an exception; all the branches had to be pruned off, and they subsequently started again into a good growth. There are grand old Yews and venerable Cedars, chief among them one planted in 1748; spreading Chestnuts and tall Oaks—some of the latter prodigious in girth. There is a very fine *Abies Morinda*, a remarkable specimen of the Canadian Tulip tree—a "dark avenue of Beeches, a cluster of noble Oaks, an avenue of fourteen Ash trees, &c."

"The Seaview Walk affords visitors an opportunity of enjoying the glorious panorama of the Forth. This walk is protected on its precipitous side by a Yew hedge so thick and admirably trimmed that one

could walk comfortably upon it for several hundred yards. The shifting view from this delightful terrace walk is enchanting as seen in late summer. The dark and detached mass of Blackness Castle, projecting far into the bosom of the Forth, the bright and variegated colours of the low Fife hills, the density of the dark green woods, and the bold magnificence of the bluffs, with the whitewashed villages nestling on the sheltered beach, or lining the recesses of the creeks, combined with the moving sails of the vessels, or trailing smoke of the steamers, to give life, expression, and feeling to the exquisite picture." At the end of the terrace is the Glen of Abercorn, along what is known as Lord Hope's Walk. Near here is an abrupt knoll crowned by a group of fine Cedars. "This is the site of the old Monastery of Abercorn, mentioned by the Venerable Bede, and of Abercorn Castle, the scene of an historic incident in the annals of Scotland. It was the seat of the gallant Sir John the Grahame, the friend of Wallace, who fell at Falkirk in 1298." It then passed into the hands of several of the historic families of Scotland, and at the time it was held by the Douglasses sustained the memorable siege in which it was dismantled by the forces of James II., in 1455. Eventually it passed into the hands of the Hopes. The ancestor of the Hopetoun family was a cadet of the Craighall or Pinkie Hopes, Sir James Hope of Hopetoun, Lanarkshire, 1614-61. His grandson, Charles, was created Earl of Hopetoun in 1703; and the fourth Earl feasted George IV. at Hopetoun House in August, 1822, prior to the King's embarkation for England, at Port Edgar. The present Earl is the holder of large estates in different parts of Scotland.

There are several of what may be termed arboricultural curiosities in Hopetoun grounds, including an *Abies Morinda* grafted on a Norway Spruce. Mr. Smith, who was gardener here nearly fifty years ago, had a notion of grafting the newer coniferæ on a hardy stock, and this is one of many scattered about the grounds. This particular specimen is some 50 feet in height with the *Moriada* foliage and habit very characteristic. On the west side of the house is the south lawn, and here are some memorial trees—specimens of *Cedrus atlantica*, planted several years ago by the King of Denmark and the Princess of Wales: with others near them. Here also are a pair of very ancient Cedars of Lebanon, nearly 150 years old. It has been observed that the Cedars at Hopetoun are of a more glaucous character of foliage than is generally observed—more like *C. atlantica* than the generally accepted Cedar of Lebanon. This is supposed to be in proof of Sir Joseph Hooker's theory, that all the Cedars are offsets from a common stock.

The pinetum is said to be one of the finest in Scotland, and was begun about thirty years ago on a piece of waste land adjoining the home nursery. The arrangement is admirable, and the health and vigour of the trees remarkable. It embraces numerous specimens of every Conifer introduced into this country, and days might be spent in a detailed study of the progress of the different varieties. In the centre is a Fern bower, in which fossil Conifers are artistically employed to aid the rustic beauty of the secluded wild. A lake also enhances the beauty of the pinetum.

The flower and vegetable gardens, together with the plant-houses, occupy a warm slope falling away towards a valley. Of the plant-houses it is simply necessary to state they are filled with plants of varied character to suit the requirements of each establishment. The vineries and other fruit houses are well managed, and good crops have resulted. The flower garden was charming, thoroughly gay with flowers and foliage; in front of a range of vineries was a fine lot of East Lothian Stocks full of flower, and invaluable for cutting from, both in autumn and spring. *Chrysanthemum frutescens*, between a line of single *Dablias* at the back and one of blue *Ageratum* in the front, was very effective. The old *Gazania splendens* was simply superb, rich in colour and full of flowers, and effectively used in various ways. Mr. Muir keeps somewhat to the old lines of flower-gardening, and makes effective riband borders; but it is all harmonious, and in keeping with the surroundings. *Violas* play an important part at Hopetoun, the moist climate suits them exactly. There was a long border of them, 70 yards long by 7 feet in width. This was charmingly planted with white, yellow, blue, purple, and mauve-coloured varieties,

and was extremely effective. Sunflowers are largely grown, and most useful for the decoration of the walls, Mr. Muir using them with the happiest effect on festal occasions. *R. D.*

## Orchid Notes and Gleanings.

*SACCOLABIUM BLUMEI*, *Orchid Album*, t. 169.

A very handsome Orchid, with evergreen strap-shaped distichous leaves, and pendulous cylindrical racemes densely crowded with rose-tinted flowers, the lip bright rosy-purple. It flowers in August. It requires a high temperature, shaded from the direct sun, but where it can be exposed to plenty of light. It is best grown in baskets suspended from the roof.

*CYPRIPEDIUM GODEFROYÆ*.

This distinct novelty has recently flowered with Baron de Rothschild, at Ferrières, France, and with Mr. Lee, Downside, Leatherhead. In habit of growth this species resembles *C. niveum* in fact, the two plants when not in blossom are undistinguishable the one from the other; the flowers, however, though similar in shape to those of *C. niveum*, are totally distinct, being heavily spotted both on the front and back of the sepals and petals with rich purplish-brown.

FIG. 11.—*CYPRIPEDIUM GODEFROYÆ*: PURPLISH-BROWN SPOTS ON A WHITE GROUND.

The lip is also slightly spotted. In Mr. Lee's flower the spots towards the centre of the petals are so numerous as to form a broken line from base to tip, but in Baron de Rothschild's flower this peculiarity was not apparent. This plant was introduced from Cochin China by M. Godefroy, of Argenteuil, France. Our illustration (fig. 11) is taken from a photograph issued with a recent number of the *Orchidophile*.

*CYMEIDIUM DEVONIANUM*.

An evergreen species, with small pseudobulbs and narrow lanceolate leaves, racemes pendulous from the base of the pseudobulbs of numerous loosely arranged flat flowers, with five ovate oblong acute greenish segments spotted with red, and a trowel-shaped lip of a violet colour, with two side-blotches of darker colour. It is a native of the Khasya Mountains, blooming in this country in June. Mr. Williams recommends it to be grown in rough fibrous peat, with good drainage and a moderate supply of water. *Orchid Album*, t. 170.

*VANDA CATHCARTI*.

An evergreen species, with thick oblong obtuse emarginate leaves; flowers racemose, each about 3 inches across; sepals oblong obtuse, yellowish, with very numerous densely crowded purplish-brown transverse stripes; petals ellipsoidal acute, similarly marked; lip 3-lobed, lateral lobes small, falcate, whitish, with purplish stripes; central lobe projecting, with a long stalk, marked with two purplish streaks, and a central portion cordate, roundish, with an upturned yellow margin. Native of hot valleys in the Eastern Himalaya. *Orchid Album*, t. 168.

## ORCHIDS AT PICKERING LODGE, TIMPERLEY.

THE spirited manner in which Mr. G. Hardy has gone into the matter of Orchid growing is now pretty well known. The many fine groups he has put up at the various exhibitions in connection with the Manchester Botanical Society have always been characterised by examples of high-class culture and exceptional success in the matter of blooming. The end of December certainly is not the season for the grandest of displays, but to a lover of these plants there is a pleasure in looking upon the champions in the past competitions, and also in viewing those plants which are likely to figure in future contests. Whether, however, on exhibition stages, or as now in their present positions, arranged to make a floral display at home, it is interesting to take note and watch their progress, so that future shows may find us in a degree prepared for the wealth of beauty which will certainly be spread out for us. It is not my purpose to go through the different houses and note all deserving of mention. Still, where there are so many, it is difficult to pick out those most worthy, as it is certain to be the case that many not mentioned are equally as fine as those that are described. Some idea of the number of plants grown may be gathered from the fact that there are four ranges of glasshouses each from 70 to 90 feet long, some having three and four divisions.

The Cattleya-house is 80 feet long by about 18 wide, without a break in it, the whole filled with plants, Orchids entirely represented in most divisions, the exception being some grand plants of *Eucharis amazonica* and *candida* and fine-foliage plants in one house, with a few greenhouse plants, &c., in another. Besides these a long range of forcing pits, a fine conservatory filled with *Camellias*, *Palms*, *Rhododendrons*, &c., and a range of vineries 70 feet long, that has recently had a new roof put to it, with the beautiful fernery, the Ferns now getting well established, gives some idea of the resources of the garden and the extent of the collection of plants. The specimen *Hollies*, *Coniferæ*, and choice *Rhododendrons* in the borders are in their way equally perfect, and withal as pleasing, as the best trained and well bloomed plants under glass. Entering the Orchid-houses, some ninety plants of *Odontoglossum vexillarium* arrest attention; these are in robust health, clean, free from spot, and of good colour. One plant, a variety of special merit, has twenty-six leading growths; the flowers of this plant are of a brilliant colour, and its name, *O. v. roseum superbum*, gives no idea of its real beauty. Other grand masses have twelve, sixteen, and twenty leading growths, and many others with only a few. These plants, in their season, will be wonderfully fine. Many plants of *Maxillaria grandiflora* are here mostly just out of flower; a very fine variety has kept its bloom till now—this is broad in the divisions, with a good lip. The late Mr. Snyers always had a favourable word to say for this plant, and it is worthy of all the encomiums that have been passed upon it. It should be more generally grown. *Oncidium crispum*, *O. Forbesi*, *O. Marshallianum*, on rafts and blocks, were making good progress. Several *Lycaste Skinneri alba* are doing well in baskets, in company with such *Masdevallias* as *chimera*, *M. Backhousiana*, *M. bella*, and others. *Ada aurantiaca* was a mass of healthy and green foliage, that produced last spring forty-five spikes of its distinct orange-scarlet blooms.

*DENDROBIUMS*.

These are largely grown, *D. Wardianum* in good clumps, one plant having eighteen flowering stems, many other pieces less in size; a good piece of the white variety is showing well in bloom. Good plants of *D. chrysotoxum*, *D. Farmeri*, *D. suavisimum*, *D. thrysiflorum*, and a nice piece of the true *D. Griffithianum* have made up nice bulbs and will shortly be showing flower. Here was to be noticed a large plant of *D. Paxtonii*, an old acquaintance that some will remember as being one of the showiest varieties that was grown some twenty years ago, and though the flowers are short-lived, still it makes an attractive object. This plant has made growths 5 feet in length, twenty-four being new ones, and the old bulbs number fifty; last spring it produced 123 spikes carrying 126 of its gorgeous golden-orange and purple blooms. *D. clavatum* is also well represented. Numerous plants in baskets of *D. Ainsworthii*, *D. primulinum*, *D. crepidatum*, and *D. crassinode* were getting forward for bloom. *D. Findlayananum* also,

the plants that were first exhibited at the Town Hall, Manchester, when many growers were enabled to see this choice species for the first time, were also doing well—the good stout bulbs now ripening for flower. Mr. Hardy is also very successful with *D. Jamesianum* and *D. infundibulum*, and specimens of these were now looking well.

#### CATTLEYAS.

In the Cattleya-house were a multitude of splendid specimens of *Lælia purpurata*, many established recent importations also furnishing some of the largest masses. The same may be said of *Cattleya Gaskelliana* and *C. Warneri*. These plants, in a short time, will be objects of surpassing beauty. For *C. gigas*, *C. Sanderiana*, and other varieties to be met with in these types, Mr. Hardy is famous. One or two plants of exceptional merit were perhaps among the finest ever seen. *C. Trianae*, *C. Mendelii*, and *C. Mossiæ* are here by scores, stout, healthy, and of good colour. The *Trianae* section just commencing to flower, *C. Skinneri oculata*, a grand plant with fifteen leading growths, a plant with a history; two other masses of *C. Skinneri* 4 feet through, *C. crispa amethystoglossa* were fine plants, whilst among the gems mention must be made of *C. Trianae nobilis*, *C. Mossiæ Rothschildiana*, *C. Trianae Leeana*, *C. Bluntii*, and *C. exoniensis*, the plant that bore the spike with seven flowers exhibited at the Town Hall, Manchester, on the occasion of the *Chrysanthemum* show in November last. *C. Mossiæ Hardyana*, and *C. Trianae Hardyana* (a grand form, and a piece that, strange to say, made no attempt at growth for three years, but during the last season threw out roots in quantity) has developed a nice plump bulb. I need hardly say Mr. Hill showed me this plant with much pleasure and satisfaction.

Many plants of *Lælia anceps* were in flower, and besides the ordinary type there were plants of *Dawsoni*, *Hilli*, and *Williamsii*, in bloom; these latter pure white forms with variously marked labellums are very chaste and beautiful. Of *Cypripediums* there are all the leading sorts. *Sedeni* had eight flower-spikes, and *C. Lowi* and *C. Roezlii* were in flower; *C. Dominianum*, *C. Stenei*, *C. levigatum*, with *C. Lawrenceanum*, *C. Spicerianum*, and *C. niveum*, were in quantities; *C. Schlimii album* and *C. Parishii* were in flower. A fine piece of *Odontoglossum coronarium* is doing well in a basket—its near ally, *O. brevifolium*, just showing three flower-spikes. *Coelogyne cristata* is freely grown, as are the new varieties, such as *C. Lemoniana* and the *Chatsworth* and *Trentham* varieties. On blocks were some large masses of *C. citrina* doing well, some of them just showing for bloom. *Cattleya Wallisii* with pure white flowers and an orange-coloured throat, is in flower, as was *Lælia peduncularis*.

#### THE PHALÆNOPSIS

are good—have made fine leaves during the past season, and are now opening flowers on many spikes. *P. Schilleriana* was seen by dozens with stout and strong leaves, a span to a foot long, firm and of a fine colour; *P. amabilis*, *P. grandiflora*, and *P. g. aurea* were likewise good. *Odontoglossums* occupy two large houses, there being about 1000 plants in all leading sorts, masses of *Masdevallias* being placed among them. In this cool-house a fine plant of *Nanodes Medusæ* was growing in a basket, and which flowers freely. *W. Swan, Fallowsfield.*

#### ORCHIDS AND OTHER PLANTS IN FLOWER AT KEW.

I HAVE visited during the last few years many collections of Orchids near London during the winter months, and I do not think that I have previously seen better or more perfect development in the flowers than was evident at Kew during the closing weeks of December. Entering the large range of span-roofed houses from the cool end, the first and greatest attraction is a very fine group of *Cypripedium insigne*, containing well grown and well bloomed plants of the ordinary kind, and one good plant of the variety *C. Maulei*. This species and its varieties stand in the very front rank, because of their easy culture, long lasting properties, and, in the case of the varieties with nearly white dorsal sepals, their great beauty. In our own collection we have a plant of the ordinary kind which stands in the corner of the cool-house; it is potted once in two years, and does not fail to reward the small attention it receives by flowering profusely for three months out of the twelve. The *Masdevallias*

comprise *M. Chelsoni* and *M. ignea*, both are very brilliant and a striking contrast to *M. towarensis*, also in flower. *M. velifera* is distinct, and though not handsome, is interesting if not examined too closely. *Odontoglossum cariniferum* has a peculiar spike, the flowers having yellowish-brown pointed sepals, and petals with white lip. *Dendrochilum uncatum* is a very pretty species, with arching spikes, like *D. glumaceum*; flowers closely set on the spike, and greenish-white. *Burlingtonia decora picta*, a very richly coloured and handsome form; the lip is white, the sepals densely marked with peculiar maroon-purple spots. *Oncidium excavatum* formed a dense spike of yellow and brown blotched flowers, while the handsome *O. tigrinum* made a brave show with its large primrose coloured lip and powerful perfume. In a warmer house is *Ansellia africana*, a handsome upright growing Orchid, with pale yellow flowers, yellow lip; the sepals and petals marked with brown spots and blotches. *Cattleya luteola* is no great beauty; the flowers are not large, five on a spike, and pale yellow. *Cypripedium longifolium* and *C. Roezlii* were both well in flower; large handsome plants both of them are. *C. Sedeni* and *C. Dominianum*, arranged with those two and also in flower, had a very good effect. An Orchid to be avoided in a well ordered collection is *Liparis cylindrostachya*. It has no beauty, and the smell of it is disgusting.

It is interesting at all times to walk through the various greenhouses, &c., to note and critically examine plants and flowers seldom met with anywhere else. In the succulent-house is a flowering specimen of *Senecio macroglossus*, trained to the rafters for a distance of 30 or 40 feet. The leaves resemble those of the Ivy, and the flowers, which are pale yellow, remind one of Paris Daisies. In the greenhouse there is planted out and in fine flower an excellent specimen of *Luculia gratissima*. Its numerous cymes of pale pinkish flowers charm with their beauty and fragrance. In the temperate-house small plants in pots were also finely in flower. Plants of *Peristrophe speciosa* (*Justicia*) were nicely in flower in the Palm-house; the bright reddish-purple flowers were very attractive. A group of plants in one of the stoves of *Begonia Socotrana* claimed attention; the deep rose flowers, more freely produced than usual, could not fail to please. *Canarina campanula*, a very old plant, was nicely in flower in the Heath-house. It was introduced from the Canary Islands so long ago as 1696. The flowers are formed like those of a *Campanula*; they are orange-red in colour, streaked with bright red. Placed near it in the same house was a flowering plant of *Campanula Vadilii*, a distinct and good species, with smallish white flowers on erect spikes. *J. Douglas.*

#### CALANTHES AT GREENLANDS, HENLEY-ON-TIAMES.

FOR winter decoration this plant has no equal. Some grand examples of cultivation now adorn the houses. Amongst many other novelties at this establishment grand spikes of *Veitchii*, upwards of forty flowers, a good deep bright rose variety (the best I have seen); *vestita lutea* and *vestita rubra* wonderfully good also. These are grown here in very large quantities for indoor decoration, and when mixed with graceful Palms and Ferns produce a grand effect.

#### LÆLIA ANCEPS

is grown also for the same purpose, and will succeed the former nicely. Mr. Perkins is to be congratulated upon his success in the cultivation of these and other useful decorative plants for the same purpose. His demand is very great, but he copes well with it by doing these in large quantities. *A. Outram.*

ORCHIDS AT A RECENT SALE.—It may be interesting to note a few of the highest figures brought by Orchids at the sale of the Fallowfield plants by Messrs. Protheroe & Morris:—A white variety of *Lælia anceps*, from St. Albans, fetched 24 guineas; a fine *Odontoglossum Pescatorei*, with a dark spot on the lip, 20 guineas; another, 10 guineas. A remarkably fine variety of *Cattleya chocoensis* realised 11 guineas. A specimen of the handsome *Cypripedium selligerum* was sold for 20 guineas. The final portion of the Fallowfield Orchid collection will be sold on Tuesday, February 3.

## THE NOMENCLATURE OF COLOURS.

(Concluded from p. 13.)

PERSICINUS AND PERSICOLOR are difficult to describe more intelligibly than by peach coloured. *Armeniacus*, apricot-coloured, is explained by Fries as tawny-cinnamon (*fulvo-cinnamomeus*) or yellowish-tan (*helvolo-alutaceus*).

#### BROWNS.

The browns are as extensive as the greys, and comprise every tint between impure yellow and the deepest burnt-umber. Their distinctions are best understood by grouping them into yellow-browns, red-browns, and true browns.

Of the yellow-browns cinnamonous, cinnamon, a light yellowish brown, is the palest and most familiar. *Gilvus* is a yellower shade; *Agaricus* (*Clitocybe*) *splendens* may be taken in illustrating the type of the colour, a yellowish tan, as it was formerly known as *A. gilvus*; classically, *gilvus* was an epithet of a dun or cream-coloured horse. *Alutaceus* has rather a wide signification, but it seems best translated by buff or tan. When it is lighter and yellower it is *helvolus*, the epithet of "white" wine and "white" grapes in Pliny; in describing *Cortinarius iliopodius*, Fries explains *helvolus* by *alutaceus*, but there must have been some distinction in his mind between the two terms, for he uses the compound, *helvolo-alutaceus* as "dusky cinnamon," a fact which appears to show that even Fries himself was not so clear in the application of colour-names as we should like to be. *Crustulinus* seems to be the colour of toast, much darker and warmer than that of a cracknel-biscuit. *Ochraceus* is yellow-ochre, and *melleus*, honey-yellow, is dingier and less yellow; *luridus*, sallow or wan, is still paler and less yellow, almost like that which builders call "stone-colour." *Rhabarbarinus* is the light brownish-yellow of Turkey Rhabarb. *Isabellinus* is a light brownish-yellow or dirty cream-colour. The word has a history, and was first used of unwashed linen. The Infanta of Spain, daughter of Phillip II., made a vow in 1601 that she would not change her linen until her husband had taken Ostend; as that city did not fall till three years after, she must have saved her washing-bill at the price of some discomfort.

Fawn-colour does not fall very conspicuously into any of my three divisions of browns, but most of us know the hue so denoted; *cervicolor*, *cervinus*, and *hinnuleus* all seem to mean much the same. *Cervinus* is applied to the darkest shade, and Fries explains *hinnuleus* as a tawny-cinnamon (p. 380).

The brownish ochrey-yellow colour known to artists as "gall-stone," only with an inclination to a dirty green, is denoted by *ictericus* or *icterinus*.

The brightest of the red-browns is *lateritius*, the colour of old red tiles; its paler shade, that of *A. (Hypopholoma) sublateritius*, is familiar to us all. *Testaceus*, brick-coloured, is a reddish-brown or rusty bay, almost Venetian-red. *Fulvus* is tawny, the colour of a lion, and is also known as *leoninus* or *leochromus*; *fulvellus* seems to be paler and redder, and very like that which gives its name to *A. (Collybia) nitellinus*, dormouse-colour. *Ielvus* is a light bay or "cow-colour," like *vaccinus*. *Badius* is a reddish-brown, the colour of a "bay" horse; *spadiceus*, date-brown, is a duller and darker shade. *Hepaticus*, liver-coloured, is a darker and redder brown than bay. *Ustalis* denotes a warm reddish bay, between red-ochre and brown-madder.

Of the true browns, the type is *brunneus*, Vandyke-brown. *Colectus*, like roasted coffee, is very similar. *Ligneo-brunneus* is a lighter or wood-brown. The apparently extinct *A. (Lepiota) Poulletii* is described by Fries as *colore "de noisette,"* which must mean a light nut-brown or hazel. *Umbrianus* is a dark brown, brown umber, the colour of a "brown" horse; indeed, the scale of colours used in describing horses, from dun through chestnut, bay, and brown to black, shows how, in ordinary language, the name of a colour is always taken as of a very extensive connotation, because it is hard to decide where one colour ends and another begins.

#### REDS.

We now come to the reds and their varieties. The palest is *carneus*, with *carneolus* and *incarnatus*, flesh-coloured. *Ilysinus* is a more distinctly red flesh-colour. *Rosceus* and *rosaceus* imply a rosy-pink; *rosellus* seems to mean inclined to pink.

There must be some difference between the shades of scarlet or vermilion distinguished as cinnabarinus and miniatus, because each is compounded with the other as cinnabario-miniatus, but I have not succeeded in finding out what the difference is. Coccineus, cochineal red, is a deeper scarlet, carmine. Sanguineus, blood-red, is nearly similar. Rufus, ruber, and rufus are less pure reds. Rubescens is merely becoming red. Rubellus, rufidulus, and rufulus are reddish. Rubens is a brick-red; rutilus, rutilans a purplish brick-red. Vinaceus is reddish rather than claret-coloured, but it does not seem to be ever used in descriptions. Less pure reds are castaneus, chestnut; ferrugineus and rubiginosus, rust-red; and puniceus, which is an almost purple red.

#### BLUES

Are so rare among fungi that very few names are required for them. Cœruleus is a pale blue, azure; cœrulescens is becoming blue. Azureus, luzulinus, and cyaneus are, rather ultramarine. Cyanellus is almost sky-blue. Purpureus is a bluish-purple; violaceus, violet, is a reddish-purple; lilacinus is lilac or mauve. Ianthinus and ionides alike refer to a violet colour. Porphyroleucus should mean purplish-white, but A. (Tricholoma) porphyroleucus, Bulliard, is described by Fries as "sooty or dusky, becoming red."

#### GREENS.

The type of the greens is viridis, but it is of no definite hue; virescens and viridans mean turning green. Virgineus and eruginosus refer to a verdigris, or rather bluish-green. Olivaceus is olive-green, olivascens denoting the preliminary stage of becoming green. Pausiacus describes precisely the same green, from pausea or pausia, a variety of olive; for Fries says of A. (Clitocybe) pausiatus that the gills are olivaceous. H. T. Wharton, in "*Grevillea*."

### JAPANESE VEGETABLE FOOD PRODUCTS.

(Concluded from p. 782, vol. xxii.)

**KASADYUKE.**—This is a preparation of white Melons, To prepare it the Melons are cut open, and the seeds removed with a Bamboo spatula; a small quantity of salt is spread over them. After the juice of the Melons has been absorbed into cotton cloth, a mixture of Sake residuum (a kind of spirit from Rice), and a certain proportion of alcohol, is gradually poured upon the bottom of an empty tub; upon this the salted Melons are laid, then a layer of wine residuum, and another layer of Melons, and so on, till the cask is full; it is then headed up, and kept for four or five months before using.

In Japan at the present day this substance is served at the close of every meal, when warm water or tea is drunk. When taken after eating meat or fish it is very wholesome and delicious. At breakfast, when there is only boiled Rice and miso soup, and no fish or vegetables it helps to complete the meal. It is also a good accompaniment to a cup of tea.

#### SOY.

Two preparations from the Soy Bean (Glycine soja), besides that already referred to, deserve mentioning—namely, miso, a fermented substance; and shoyu, or soy itself. The first is a curious preparation, described as follows:—There are many ways of making miso, differing very little from each other; the kind containing the largest quantity of yeast is considered the best. The usual mode is after soaking Soy Beans in water for about two hours to put them into a suitable vessel and steam them; then, after mixing them with salt and yeast, they are removed to wooden plates; then the ingredients are very evenly mixed, the liquid is put into casks, and is then left untouched for upwards of a year. Another method is to soak a quantity of yellow Soy Beans in water for a night, then boil them in a large kettle, and as soon as the water in the kettle has evaporated, and the beans show a reddish-yellow colour, they are removed to a mortar and pounded, after which they are placed on mats. When they are thoroughly cooled they are shaped into balls as large as hand-balls, cut with a knife into flat pieces about an eighth of an inch thick, and placed on mats shaped like scales of fish. As soon as mould appears upon them they are taken, crushed into small pieces, and exposed to the rays of the sun for a day or two. When nearly dry, salt and

water are added to them, and the whole is pounded in a mortar and then left in a cask for a month or two, and sometimes longer, when the preceding process will be repeated. Finally, if it is sealed up in casks it will never deteriorate. It is in prime condition when three years old. It forms one of the most necessary articles of food in Japan, and has been used from time immemorial, both by nobles and men of inferior rank. It is made into a soup, and is one of the courses served up as a principal article of everyday diet. The mode of preparing the soup is to rub the miso around an earthen bowl, into which a suitable quantity of water has been poured. It is then filtered through a sieve, and vegetables added according to taste; the whole is then boiled and served up. Miso is also used to give an agreeable flavour by mixing it with other food, and it is likewise mixed with condiments, as Japanese Pepper, Ginger, Horse-Radish, Chillies, Sesame, Poppy seeds, &c.

Soy or *Shoyu*, is perhaps the chief product of the Soy Bean. It consists of a mixture of these Beans, Wheat, salt, and water. The mode of preparing it is to thoroughly boil, after washing in a cask with water, fifty parts of Beans, and to parch about fifty parts of Wheat in a pan for a little while and thoroughly boil it, after grinding on a stone mill: when these two substances are mixed together and kept in a warm room for about four days, the substances are converted into a yellow flour-like matter: this is yeast. This yeast is then thrown into a mixture of salt and water, and afterwards thoroughly cooled, then boiled in a large kettle, and stirred with a Bamboo instrument twice a day in summer, and once a day in winter. After the lapse of three years, the sediment is poured into a bag then put into a small tub and submitted to strong pressure by means of a bar at the end of which hangs a heavy weight. The fluid expressed is poured into a kettle and submitted to a heat of not more than 80°; it is again removed to a large tub and set away for a night, when it becomes a deep black colour, and acquires a very delicious taste.

Soy is one of the most valuable foods, and is in daily use; mixed with several kinds of food it imparts to them a delicious flavour. It is universally liked, and is really indispensable in the Japanese kitchen. The quantity annually consumed in Japan is extremely large, and of late years the article has been exported.

### EUCHARIS AMAZONICA.

THE columns of the *Gardeners' Chronicle* have for some time borne strong evidence of the fact that this fine old plant is rapidly becoming a cultural puzzle not easy of solution, and when such recognised clever cultivators as Mr. Hudson have nothing more to offer than the good old-fashioned remedy, "Gregory's Powder," for all diseases—"cleanliness," "size of pot," "airy shading," "moisture," &c.—it is quite clear to me that a correct diagnosis has not been attained of the typical case of Eucharis disease referred to by "A. E." (p. 746, vol. xxii.) and others. I shall, therefore, endeavour to throw a little light upon the subject, with the hope that it may be of some use to such puzzled and muddled mortals as myself. I have been a large grower of Eucharis amazonica for more than twenty-five years, and have been in the habit of keeping up almost a perpetual display of bloom by managing batches of plants for this purpose, and the magnificent "black-green, leathery leaves" and large size of the flowers produced by my plants have been the admiration of thousands of persons during these years.

To some growers having no practical acquaintance with a diseased stock of Eucharis, such as described by "A. E.," it appears somewhat ridiculous that a plant requiring such simple cultural treatment should, in the hands of very clever cultivators, prove quite unmanageable, and distressed mortals like myself are treated to "thick leathery leaves"—twenty, thirty, forty—ah! more—flower-stems on a plant, the usual "Gregory's" regimen of culture, a few egotistical flourishes, and then the writer seems to think that the unfortunate possessor of unhealthy plants has had a great boon conferred upon him. Bah! I have seen

these jaundiced Eucharis in the hands of some of my friends—men capable and excelling in the cultivation of all kinds of plants, however "miffy," except this one of simple requirements—Eucharis amazonica: and a little friendly sarcasm was always at hand to comfort and enlighten them in their difficulties—very valuable ail, no doubt. But my eyes were opened a little when I saw about the grandest stock of large plants in this country smitten and dwindle away month by month, and defying all efforts to revive them to a state of decent health and vigour, well knowing that no man had cultivated Eucharis more successfully than my friend had for many years past. Why, these very plants, house after house, had been the subject of panegyric in your pages and other gardening periodicals time after time, and never did place stink so of the odour of Eucharis as this place, for the flowers were grown to be looked at. I had great faith in my friend's abilities, but having no experience in such an "affected" stock of Eucharis, I wished to experiment upon a plant at home, and the opportunity was cheerfully given. As "cleanliness is next to godliness" in a moral life, so it occupies a very advanced position in successful cultivation. Very careful washing of bulbs took place—most unerring mixture of compost—studied adjustment of size of pot to bulbs—and all the usual "Gregory" of culture most carefully carried out. The plant was placed in a pit not devoted to growing Eucharis, duly labelled, and in the course of a few weeks had made such satisfactory progress that I began to fancy the friend from whom I had obtained the plant must have forgotten his school lessons—had indeed found so much interest in examining and admiring the hairs upon gnat's toes and other similar objects under the revelations of a 25th object glass, that he had neglected the simple guide-posts of culture in Eucharis. A few more weeks, however, dispelled this notion, for the plant failed to make satisfactory progress; more washings of bulbs and transference into new pot, new soil, &c., took place, and the progress was slow, and I somehow lost sight of the plant for several months—indeed forgot all about it. A change had taken place in the charge where this plant was located. A most worthy and methodical young gardener had considered that one plant of Eucharis alone, where there were houses after houses of them, must have been an oversight, and considerably placed it amongst brethren. Some months after this I found this same plant in one of my houses looking pale and sickly, with the usual yellow leaf-margins, and at once had it moved to the rubbish yard. Some six months after this some of our grand plants began to show signs of distress—paler green, and less substance in the leaves—and soon it was clear that Eucharis disease had been introduced. Plant after plant was smitten: I became alarmed, collected all the still healthy plants into one house; still they sickened. I plied lens and microscope vigorously. I could discover neither fungus nor insect to account for the change. More lens and more microscope brought me in sight of game which I must tell you about next week. Z.

— Respecting the inquiry from "A. E.," I quite think with Mr. C. E. Pearson, that disease is the cause of his failure and the bad state of his bulbs, and I have no doubt but they are attacked with the same disease I have seen in some other collections. When so attacked by disease the roots turn to a red colour at the points, and a gummy juice oozes from them; the young rootlets decay as fast as they come, and make but very little leaf, which latter turn yellow and die off, although the bulbs themselves look pretty sound. After trying everything for two years to get them into good health without avail, they had to be thrown away in each case; and I should advise "A. E.," or any one else, to destroy them at once, and start a fresh healthy stock, which readily increase if kept in heat. I consider the cause of the disease and failure to grow to be the result of the treatment the plants received. One lot had been divided and repotted too late in the season, viz., September, and then kept too damp before they had made fresh roots; the other lot consisted of as fine bulbs as I could wish to see; they were in 10 inch pots, well filled with fine bulbs; these were put into a cold house to rest, and kept too damp, and they became diseased in the same way, and had to be destroyed. I always keep my Eucharis in heat when resting them, but keep them tolerably dry for two or three weeks. When growing I give them manure-water. They flower three times in the year. Wm. Smythe, Basing Park.

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Jan. 12	Sale of Immense Importation of Lilies, Seeds, &c., at Stevens' Rooms.
TUESDAY,	Jan. 13	Royal Horticultural Meeting: Meeting of Fruit and Floral Committees, at 11 A.M.; Scientific Committee, at 1 P.M.
WEDNESDAY,	Jan. 14	Sale of Roses, Border Plants and Bulbs, at Stevens' Rooms.
		Sale of Lilies, Roses, and Bulbs, at Protheroe & Morris' Rooms.
THURSDAY,	Jan. 15	Linnean Society meets at 8 P.M.
		Sale of Valuable Imported Orchids from Mr. F. Sander, at Stevens' Rooms.
		Sale of Glass Erections, at The Hills Nursery, Fulham, by Protheroe & Morris.
FRIDAY,	Jan. 16	Sale of Established Orchids, at Protheroe & Morris' Rooms.
SATURDAY,	Jan. 17	Sale of Roses, Hardy Plants and Bulbs, at Stevens' Rooms.

**P**ROFITABLE MARKET GARDENING depends on the accumulation of fertility in the soil, and on the existence of a good available market for the produce. If a map could be prepared showing the occupations of the people, market gardens would be found clustered about the centres of population and within reach of the manure of towns; so that whatever industry farmers may aspire to, besides their own special calling—and we have known them thrive as dealers, brewers, publicans, millers, seed growers, tanners, auctioneers, and even as bankers—the business of market gardening is usually beyond their reach. In certain localities, no doubt, they may dabble in it a little, but, as a general rule, farmers can and do find numerous outlets for their enterprise, including not merely the avocations we have mentioned, but also such sports as hunting and shooting, but they cannot, in the long run, farm and garden on the same spot.

A few years since the experiment of market gardening was strenuously urged upon farmers, and examples were given of large profits by the growth of Sprouts and Cabbages, Turnip-tops, and Carrots. Mr. RANDELL, of Worcestershire, told the Commissioners, on the occasion of the inquiry into the causes of agricultural depression, that he had made money by selling Cabbages sometimes instead of giving them to sheep, and Mr. ROBERT RUSSELL, of Kent, has done exactly the same thing, as certain over sanguine writers are in the habit of stating in the agricultural papers. It seems to us that if farmers read the agricultural and gardening papers—and those who contribute to them have bitterly complained that they do not—they would meet with a great deal of very dangerous advice on the subject of growing vegetables. All the world knows that Wheat is at the present moment an unprofitable crop, in most cases, but that is no reason why farmers should speculate in the cultivation of crops which are still more unprofitable, while Barley and Oats and live stock have considerably risen in value. There is really nothing new in regard to the subject before us. Mr. RUSSELL is a large sheep farmer whose pet crop is the Thousand-headed Cabbage. He humorously admitted at the London Farmers' Club, that he had "Cabbages on the brain." But he knows his business well, and in seasons when green stuff is scarce in London, he allows his sheep rather more corn and spares some Cabbages for market. Mr. RANDELL does the same, and the same thing has been done this thirty years past in scarce seasons, when Turnip-tops and other hardy Greens have always come by train from unusual distances. But farmers know better than their inconsiderate advisers appear to do that constant markets are necessary to the development of a great industry. They know that the same horse has never won the Derby two years in succession, and they are not so foolish as to invest heavily in Turnip-tops because they may have gained a trifle on that crop last year. The annual yield of home-grown Wheat is from 12,000,000 to 13,000,000 quarters, worth about £25,000,000—a large sum to be made up by the cultivation of garden crops as substitutes. Farmers, it would seem, have lost the profit of a crop that has usually covered about 3,500,000 acres, and they are

told to seek it in the extension of market gardens, which in England and Wales cover less than 40,000 acres. Mr. RANDELL has added a few hundreds to his income by selling Cabbages in the fertile Vale of Evesham in a dear time, and farmers are exhorted and scolded for not doing likewise to the tune of £25,000,000. The industry and zeal of some writers are admirable, but they should remember that Mr. RUSSELL is a great sheep farmer, and not a market gardener. His sheep are the best in Kent, and he grows green crops for sheep, not for market. He was listened to with interest lately on the subject of agricultural depression, and these misleading writers will perhaps observe that, amongst his remedies, he omitted to mention farm gardening and occasional Sprouts as matters beneath notice in the discussion of an industry so extensive as that of farming.

Those who need instruction on the subject of a very interesting occupation, and farmers who would pick up valuable hints on a system of intensive husbandry, which may teach them much, though they cannot emulate, or, at all events, copy it exactly, might spend a pleasant day in the season among the market gardens of Barking and the surrounding districts. The farm gardens extend as far as carts can travel to and from London, carrying vegetables and bringing back manure. The system of cultivation is dependent on the supply of manure from outside the farm, so that the gardening is strictly confined in its limits, and is replaced by farming beyond them. Other points of great importance upon which an enquirer should satisfy himself by accurate observation, are that the art of market gardening is special in its character, like that of stock farming; that masters and men in market gardens should have served an apprenticeship to their business; and that the union of gardening and farming has rarely proved successful. Manure is "the soul of agriculture;" in market gardening it is soul and body too. "The more manure the more Rhubarb," is a common saying among men who sometimes apply 100 tons of dung per acre at a cost of £30 or £40. In opposition to a great deal of misleading counsel in the papers farmers have had the advantage of listening to Mr. GLENNY, of Barking, who discoursed upon our subject, with full knowledge of all its details, before the London Farmers' Club. Some time since, when we saw Mr. GLENNY's market garden, it consisted of 116 acres under vegetables, the manure bill amounting to about £800 a year, and the labour bill to £1500, the number of horses engaged in cultivation and in the cartage of produce and manure a distance of 8 miles, to and from London, being a dozen, instead of only four which an ordinary farm would require. A prudent farmer living outside the proper limits will pause before he enters upon such a business as Mr. GLENNY's.

In regard to vegetable markets and to those "big Gooseberries" which farmers are advised to cultivate, there are no other markets and no other articles which suffer such sudden depressions, and such violent fluctuations. The "big Gooseberries," too, must be brought to market rapidly and disposed of at once, or they spoil like fish at Billingsgate in summer, and become worthless. All we can hope to do in an article is to bring forward reliable evidence on matters of fact, leaving the verdict to those who are interested. You cannot silence a critic. As regards the occasional over-supply of the vegetable markets, when "big Gooseberries" and other articles become even more unprofitable than Wheat itself, the critics buzz like bees around the subject. London has five great vegetable markets—Covent Garden, Spitalfields, the Borough, Farringdon, and Stratford—and it has hundreds of streets wherein Lord SHAFTESBURY'S friends, the costermongers, ply their trade at a small profit, besides a very large number of "cutting shops," which have greatly

increased in recent years, where vegetables and fruit are sold at a narrow profit. The critics say "break down the monopoly of markets and you may at once double the consumption of market-garden produce, and prevent the glut you complain of;" but surely if the critics cannot or will not farm so as to put their advice to the test in that direction they might and should try what they can do to supply those parts of London which they say are at present almost deprived of vegetables. They might work by barrow or by means of cheap shops, and in spite of the supposed monopoly, in spite of high quotations in the trade journals, they will find that they can purchase in the wholesale market as cheap as they could wish. But we fear our programme will not suit them. They will probably prefer, as heretofore, to stroll about Covent Garden at noon and test the strength of the monopoly by comparing the price of a single Cabbage in the Central Avenue with the value of Mr. GLENNY's waggonload, sold in the street. They might as well complain of the price of a pint of bird seed in the retail shop—and bird seed will keep—as compared with the value of a cargo in the Thames.

On the whole, Mr. ALBERT PELL, M.P., was not far wrong when he applied to these statements of the critics the unvarnished epithet, "Humbug!" But none know better than the farmers that the management of their business must be directed by practice, not by theory. Have any of these critics tested their adventurous policy? French journalists are accustomed to put their names to their articles, and on a point of practical management, involving profit or loss, the critics we refer to may be reasonably asked to produce their credentials. Have they grown these "big Gooseberries" themselves, or only dreamt of them?

— THE DATE PALM.—We have on various occasions alluded to the culture of the Date Palm at Bordighera and other places in the Riviera for decorative purposes. The leaves are tied together, and thus blanched, and after drying are gilded and used on Palm Sunday and other festivals of the Roman Church. But besides this, which was, we believe, the primary use to which they were put, the leaves are now largely used in the manufacture of ornamental baskets and similar elegancies. Our illustration (fig. 12) shows a portion of a plantation of Date Palms, *Chamerops*, *Latania*, &c., belonging to Mr. WINTER, of Bordighera, from whom we lately received illustrations of very elegant bouquet-holders and similar articles fabricated from the Palm leaves. Although the Date Palm flourishes so well in the Riviera climate, the heat is not sufficient to induce it to flower, though at Genoa on one occasion we remember to have seen a spike of fruit which promised to ripen with the protection of a hand-glass fastened over it.

— NEW ORLEANS INTERNATIONAL EXHIBITION.—Messrs. CHEAL & SONS, of Crawley, Sussex, have been awarded the Gold Medal for the best collection of one hundred varieties of Apples, also five Silver Medals for other collections and classes of Apples and specimens of fruit trees, and money prizes to the amount of 420 dols. The whole collection consisted of about 2000 fruits, in 200 varieties.

— ROYAL APPOINTMENTS.—We are informed that Messrs. ROBERT VEITCH & SONS, seedsmen and nurserymen, Exeter, have been recently appointed seed merchants to Her Majesty the QUEEN.—Messrs. THOMAS GIBBS & Co., Down Street, Piccadilly, London, the seedsmen to the Royal Agricultural Society of England, have received the Royal Warrant appointing them seedsmen to Her Majesty the QUEEN, this firm having for many successive years had the privilege of supplying Her Majesty.

— "BOOK LORE."—This is the title of a new "magazine devoted to old-time literature." It is substantially got up and clearly printed. The articles are varied and interesting. It is published monthly by ELIOT STOCK.

— MR. FORSYTH JOHNSON.—We are requested to state that this gentleman has resigned the management of the proposed Forestry Exhibition at the Alexandra Palace. Mr. JOHNSON'S offices have been removed to Albion Chambers, 60, Haymarket.

— VARRELL'S BRITISH BIRDS (VAN VOORST).—The last part of this new edition, now edited by Mr. HOWARD SAUNDERS, contains the history of the herons, storks, bitterns, and allied birds, and is consequently of exceptional interest. It is needless to say anything in commendation of this well-known publication.

— CALENDAR OF OPERATIONS.—One of the most concise of these is issued by Messrs. ROBERT VEITCH & SONS, Exeter, containing as it does an almanac filled in each day with a single line indicating some seasonable work to be done; thus fulfilling its task of a useful reminder to the gardener by profession and the amateur.

— THE "BOTANICAL MAGAZINE."—The January number of this, the oldest of all horticultural periodicals, opens with a figure of the magnificent *Magnolia Campbellii*, t. 6793. The representation is taken from a tree which flowered in Mr. CRAWFORD'S garden near Cork. The cultivated flowers are very inferior in size and colour to the superb flowers illustrated in the *Illustrations of Himalayan Plants* from specimens collected by Sir JOSEPH HOOKER. The species is near *M. Yulan* and has deciduous leaves. The wood is valuable.

*Idesia polycarpa*, t. 6794, is a large Japanese tree, hardy at Kew, with broad cordate ovate leaves and pendulous slender much-branched many-flowered racemes of small yellowish flowers. The plant belongs to Bixaceæ, and has unisexual flowers, those now figured being the females. The berries, which are as large as small Grapes, stain the herbarium paper black or dark brown, and might possibly be used as a dye.

*Fuchsia triphylla*, t. 6795.—The history of this *Fuchsia*, the type upon which the genus was founded, was given in our columns by Mr. HEMSLEY, 1884, vol. xxii., p. 263. The coloured figure here given is very characteristic.

*Dentaria polyphylla*, t. 6796.—One of the most elegant of spring-flowering plants with a scaly rootstock, pinnately-cleft leaves with lanceolate segments and tall corymbs of white flowers (Cruciferae). Native of mountains in Central Europe.

*Torenia cancolor*, t. 6797 A.—Perhaps a variety of *T. asiatica*, from which it differs in its uniformly-coloured violet flowers.

*T. Fordii*, t. 6797 B, is a less attractive form, with cordate pubescent leaves and greenish-yellow flowers, spotted with violet. Native of the Lo-fan-shan Mountains, opposite Hong Kong. The *Torenia*s are very attractive stove plants, flowering for many months in succession.

— LINNEAN SOCIETY OF LONDON.—A meeting will be held on Thursday, January 15, at 8 P.M., when papers will be read on:—1. "On Plants Collected by Mr. JOSEPH THOMSON in the Mountains of East Equatorial Africa;" by Sir J. D. HOOKER and Professor OLIVER. 2. "The Flora of Madagascar;" by Mr. J. G. BAKER. 3. "The Orchids of Madagascar;" by Mr. H. N. RIDLEY. 4. "On Japanese *Colydiidæ*;" by Mr. D. SHARP.

— THE WESTERHAM NURSERIES.—We are informed that the partnership previously existing between Messrs. T. W. EDMUNDS and JEFFKINS, trading as ARTHUR JEFFKINS & CO., late JOHN CATTEL, has lately been dissolved, and that the business of these nurseries will be carried on under the title of the Westerham Nurseries & Seed Co.

— ARISÆMA FIMBRIATUM.—This extremely interesting new plant, described and illustrated in our columns on November 29 last, pp. 680 and 689, is now in flower in Mr. WILLIAM BULL'S Establishment for New and Rare Plants, King's Road, Chelsea. From the peculiar fringed character of its spadix it is totally unlike any other of the family we have seen.

— POTATOS.—According to some experiments carried out at the New York Agricultural Station, single eyes used as seed yielded a satisfactory crop per hill, and more uniform crop per hill than whole Potatoes or ordinary cuts. Single eyes yielded a smaller

percentage of smaller Potatoes than did ordinary cuts or whole Potatoes used as seed. Ordinary cuts, upon the whole, yielded more favourable results than whole Potatoes, markedly so when the seed used is subtracted from the crop gained. Single eyes cut deeply so as to contain some substance gave a far superior yield to eyes cut shallow. The small seed-end eyes gave results by no means inferior, but rather superior, to those gained from central and butt-end larger eyes. Early planting showed far more favourably in crop than later planting, not alone in quality, but in total yield. Too close planting diminished the yield of good Potatoes, and increased the yield of small Potatoes, by measure. Fertiliser left over from last year's application exercised a marked influence upon the crop.

— DOUBLE ABUTILON.—Some week or two since Messrs. CANNELL were so good as to forward us blooms of a double Abutilon Thomsoni which were unusually perfect and regular. The flowers will surely be welcomed by lovers of double flowers and florists, while those who are not usually enamoured of such flowers will not fail to recognise the merits of the present plant. Botanically it is of much interest as furnishing another illustration of the coincidence of variegated leaves and double flowers, which at one time was denied, and which is indeed a rare occurrence. The flowers in this case are doubled by the substitution of petals for stamens. A coloured plate of the same or a closely allied form is given in the *Revue de l'Horticulture Belge* for 1885.

— LAPAGERIA IN THE OPEN AIR.—The Hon. and Rev. J. T. BOSCAWEN, of Lamorran Rectory, Cornwall, has forwarded to us a fine spray of this plant, dark red in colour, firm in texture, and uninjured in any part. He says:—"I can't help sending you a spray of *Lapageria rosea* growing in a north-west angle of my house. It has been there for ten or a dozen years, and has never been much injured by frost but once during that time, and then only that part of it that was exposed and had grown to the top of a chimney. It was cut at the time in full blossom. It is now a lovely sight in spite of the hard frost we had early in November, and some days since. I am sure that there are many angles facing N.W. in houses 'up the country,' as we say down here, where *Lapagerias* would do well. The white one this year was most striking, and is, if anything, hardier than *rosea*. This is on a north wall not quite to the top of the house, but *rosea* is now climbing over the slates."

— DWARF TREES.—The manner in which the Chinese produce their dwarf trees is stated by the *Gartenflora* to be as follows. The pulp of an Orange is removed by an aperture the size of a florin, and filled with cocoa-nut fibre, tow, and powdered charcoal. In the centre is placed a seed of the tree it is wished to grow. The Orange is placed in a glass or other vessel, and the compost kept moist. The seedling germinates, the stem protrudes through the hole in the Orange, the roots penetrate the rind. The roots as soon as they reach this stage are cut off close to the rind, and this is continued for two or three years. The tree ceases to grow, and assumes the aspect of an old tree. The roots equally cease to grow, and the rind of the Orange is painted and varnished. It would be easy to put this to the test.

— THIRINAX GRAMINIFOLIA.—An elegant Palm with a three-sided stem, and numerous elegant leaves with graceful spineless stalks, and roundish, deeply, palmately-cut limbs, the segments linear-lanceolate. Count de KERCHOVE describes it as especially suitable for room or table decoration. The temperature of a warm greenhouse suits the plant well. It is figured in the *Illustration Horticole*, t. 542.

— THE SOIL OF NEW SOUTH WALES.—The Colony contains an abundance of soil of the richest description for the support of a very large population, when the conditions shall be more favourable for the pursuit of agriculture, for which in most districts the climate is very suitable. On the coast strip eastward of the dividing range there is a large area of very rich land in the river valleys. It has been extensively cleared, and in the southern part of the Colony is mostly under Lucerne, Corn, and Potatoes, and yields immense crops. On the northern river-flats splendid crops of Sugar-cane are grown, as well as of Corn. The Tobacco-plant flourishes on this strip of land, as

well as almost all the cereals and fruits of temperate and semi-tropical climates. Wheat crops formerly were grown extensively here, but for many years past the area planted with Wheat has been very much reduced, owing to the extreme liability of the grain to rust when coming into ear. It is this that has doubtless rendered the production of Wheat in the Colony so far behind the yield of the southern Colonies. However, when we get on to the table-lands we find a large area of soil of very rich quality among the surrounding rocks and country of granite formation, and this promises to be the future granary of the Colony. At present the yield of the crops in some instances amounts to as much as 30 and 40 bushels per acre from the virgin soil of this part of the Colony. Here flourish the English fruits—Gooseberries, Cherries, Currants, and the like. As you go further westward the climate becomes less and less favourable for agriculture, owing to the uncertainty of the rainfall, and, as far as present appearances indicate, the great salt-bush plains of the interior, unrivalled for fattening stock, will for generations to come be chiefly devoted to that pursuit. With regularity of seasons agriculture might be possible, but the rainfall is very irregular in that part of the colony. Briefly summed up, we may say that the coast climate and soil favour the production of almost all kinds of vegetation found in temperate and semi-tropical regions; that the table-lands, with a magnificent climate, will produce all the cereals and fruits of the temperate zone; while away westward are hundreds of thousands of square miles of the finest stock-fattening country to be found in any part of the world.

— SAGITTARIA MONTEVIDENSIS.—A beautiful stove aquatic with erect racemes of flowers, each about 2 inches across, with three roundish petals, each white with a reddish-purple spot at the base. It is an indispensable plant for the aquarium, large or small; in the former case it assorts well with larger species, in the latter it is in itself so beautiful that having it one need not regret the absence of others. It is figured in the *Illustration Horticole*, t. 543, and in a recent number of the *Garden*.

— BANKSIA INTEGRIFOLIA.—Although this is one of the larger species, ultimately attaining treelike dimensions, it forms a conspicuous object for a large and cool conservatory during the winter season. A plant about 10 or 12 feet high has been flowering for many weeks in one of the octagons of the winter garden, Kew. The inflorescence consists of an oblong, erect, dense spike of pale yellow flowers, which, although individually small, are very effective in the aggregate. This cone-like spike becomes woody, persisting for years, and presenting a peculiar appearance shared in by other members of the genus. The leaves are long and lance-shaped, with an entire margin, and white beneath. This species is synonymous with *B. macrophylla* and *B. oleifolia*, and is figured in the *Botanical Magazine*, t. 2770. It belongs to the section *Eubanksia*, or true *Banksias* of the *Genera Plantarum*.

— CROTALARIA SEMPEFLORENS.—Few of these plants are cultivated at the present day, notwithstanding the fact that about 200 species are known to science, and numerous species have been introduced from time to time. They are widely dispersed in tropical countries of both hemispheres, and the plant under notice was originally introduced more than half a century ago from the East Indies. The yellow flowers are produced in axillary racemes, and are rendered rather attractive by the large size of the upper petal or standard. It is figured in VENTENAT'S descriptions of new or rare plants in the garden of J. M. CELS (t. 17), and has been reintroduced lately. A plant in a small pot in the Palm-house, Kew, is well furnished with long arching or drooping, twiggy shoots, and ample foliage of a firm or rigid texture.

— GARDENING APPOINTMENTS.—Mr. ROBERT THOMPSON, late Foreman at Alwicks Castle, as Gardener to J. L. RIDDELL, Esq., Felton Park, Northumberland.—Mr. G. BASKETT, late Foreman to Mr. DEEDMAN, Plants, has been appointed Head Gardener to L. W. DOLMAN, Esq., Elm Croft, Parkstone, Dorset.

## THE PROPAGATOR.

### PROPAGATION AND CULTURE OF RHOPALAS.

FOR decorative purposes the Rhopala is amongst the most useful plants the gardener has. For its graceful and ornamental appearance it is demanded and used with advantage at every season of the year. It is used for the decoration of the stove in mid-winter, and when the space taken up is at length required for the development of incoming and more tender plants, the Rhopalas can be removed to decorate the intermediate house; while in the summer and autumn months they can be utilised for the same purpose in the cold greenhouse and conservatory. At all times they are beautiful and lasting objects for indoor decoration.

#### 1. FROM CUTTINGS.

Cuttings of the Rhopala may be taken at any time during the year, provided always that they are fit to be taken, *i.e.*, the wood must be thoroughly ripe, the foliage quite hard, and the top growths well finished up. It is a waste of time to put in soft cuttings, and can only lead to the vexation of the gardener. The cuttings should be selected from the weakest growths and the tops of shoots and each cutting should have three or four leaves upon it. Before potting them the bottom of each one should be cut off with a sharp knife, which should be twice drawn across the level surface, thus made so as to form an X. This operation is favourable to the production of roots.

In potting them long thumb-pots should be used, and the soil must be pressed very firmly around each cutting. In order to economise the room in the case it is well to put a stick to each pot, tying the main stem of the cutting in two places, and then looping up the leaves one by one, as erect as possible without damaging them. After they have been well watered they can be placed in a cutting case or frame which must be situated upon a gentle bottom-heat. While the cuttings are in the case the cocoa-nut fibre, or whatever material is used in the bottom of the case must be well turned, well mixed, and watered once a week, and for ventilation the lights or glasses should be removed for an hour early each day. They should neither be allowed to become dry, nor should they be watered overhead, but they should only be watered with a fine spout-pot. For shading, which is necessary during bright sunshine, a newspaper can be used.

When the cuttings have rooted they should be placed outside the frame for a fortnight to strengthen them before potting into large 60's. As soon as they have been potted they should be placed upon the front platform of the house upon a cold ash bottom until they have again well rooted through, and then the strongest plants can be potted into 32-sized pots, and the remainder into 48's. It is now necessary to remove them to a house of intermediate temperature, and here they must be well supplied with water at the roots, but they must never once be syringed overhead, especially during the formation of new growths. They can be again potted when occasion demands it. The soil for the cuttings should be composed of three-quarters good peat and one-quarter river-sand, to which should be added a small quantity of finely broken potsherds, the whole being well mixed together and sifted through a  $\frac{1}{4}$ -inch sieve; but for the cuttings that have rooted the proportions vary thus:—half turfy loam, half peat, and one-quarter river-sand, a small quantity of finely broken potsherds or ballast being added. The treatment given above can be applied to *R. corcovadensis*, *R. creolata*, *R. Skinnerii*, *R. complicata*, *R. aurea*, *R. elegantissima*, *R. Vervaeana*, *R. granadensis*, *R. magnifica*, *R. javanica*, *R. Leboniana*, and *R. De Jonghii*. The last-named plant is a very strong grower, and the only successful way of propagating it from cuttings is to cut down the old plant, and as fast as it breaks into growth the tops of the shoots should be pinched out until they are hard, and in a fit state for propagating purposes.

#### 2. FROM GRAFTS.

It is necessary to graft *R. De Jonghii* and *R. elegantissima*, for which purpose *R. aurea* and *R. magnifica* should be respectively used as stocks. Side grafting is the best. Beginning with the stock, it should be cut down to within 4 or 5 inches of the soil, the top of the stem should be

made quite level, and down the side of which a cut,  $\frac{1}{4}$  inch in length, should be made; the knife should, however, be withdrawn without completing the cut, which should be done from the outside by an inward and downward cut, so as to leave a cleft, upon which to rest the end of the graft. Care should be taken in making the graft to see that it fits the place made for it on the stock, to which it should be securely bound at both ends with Russian matting. After well watering them place them in a cutting-case or frame upon a gentle bottom-heat, to receive the following treatment:—Ventilation should be regulated and increased by degrees. For the first week the glasses or lights should be taken off for half an hour every morning; after that time they may be removed for an hour each morning. Those that have become dry should be watered, but great care must be taken not to wet the matting the grafts are tied on with, and they should be shaded from all sunshine. When the grafts have thoroughly united a little more ventilation should be given them both day and night for three or four days before they are removed from the frame to be placed in the open part of the house. Here they should remain for about three weeks, to harden and fit them for potting. They can be potted into suitable sized pots, placing a stick to each plant, tying it in such a manner as to prevent the graft being knocked off by accident.

The plants should now be removed to a good growing house, keeping them well supplied with water at the roots, but never syringing them during the formation of young growth, because the woolly covering of the young leaves, if wetted, is liable to cause the foliage to become deformed and stunted. As soon as the plants are strong enough they can be removed to an intermediate-house, and placed upon a cold ash bottom until they are ready for the gardener's use. *T. O.*

#### HERBACEOUS PHLOXES.

TAKEN as a whole the genus *Phlox* may be said to be one of, if not the most useful genera among hardy plants, and one which receives more attention probably at the hands of gardeners generally than do the majority of hardy plants. There is much to be said of these *Phloxes*, too much, indeed, for my present brief note, in which I will endeavour to assist your correspondent and as many more who may wish for similar assistance. Strangely enough, the numerous varieties of the genus *Phlox*, which, taken as a whole, are free seeders, are seldom raised from seed in English nurseries. Nine-tenths of the varieties of these charming flowers owe their origin to the enterprise of Continental florists. There is, however, nothing to prevent their being raised with equal freedom on this side of the Channel. The herbaceous or decussate section seed much more freely than do the alpine section, seeing that the flowers and fertilising organs are much larger, as is also the tube. As with all other florists' flowers, the numerous fine kinds of *Phloxes* now in commerce are the outcome of many thousands—of seedlings, all of which, while not attaining the standard of perfection, are good and useful for the shrubbery. The only special mode of fertilisation is in the judicious selection of varieties about to be operated upon. After the crosses are made the heads may be covered with fine muslin, and secured to the main stem, so as to shut out the bees, who invariably work busily among them, and especially so among the more fragrant kinds. It will not be necessary to have many covered up, seeing that the panicles in most cases are large; consequently several crosses may be made upon each, numbering or marking them separately if occasion requires.

Special attention should be paid to good formed flowers, vigorous constitution, fine proportioned trusses, and so forth. There is no better time for sowing the seed than the end of the year or the early part of the new year, or as soon as possible after being collected and dressed. Seeds thus treated will not germinate till the ensuing spring, and these, if grown without a check, will flower during the early autumn months, making, as a

rule, a good succession to the general collection. With regard to the rarity of self-sown plants, to which a correspondent alludes, a word or two may suffice to make it obvious. It must be borne in mind that the flower-stems, if allowed to remain on the plants, will retain the capsules intact for several months; in fact, I have known instances where they have remained as stated till several inches of new growth has been made, but the flower-stems being removed the seed goes with them to the rubbish-heap. Another reason why self-sown plants are rare is from the extreme and unusual hardness of the capsules, so much so that they may be buried for months in the soil and remain uninjured, and the seeds which it contains, being uninfluenced by light and heat, remain dormant. Seeds may, if placed in air-tight vessels, be kept till February, and then sown in pots or pans and placed in slight warmth. Liberal treatment, a deep, well enriched soil, and an abundance of water at flowering time are essential. Of the many and various means of employing them I may refer on a more seasonable day. *E. Jenkins.*

#### THE POLYANTHUS.

THESE are wintered in cold frames in the same way as *Auriculas* are, but they do not thrive if allowed to become very dry at the roots. *Auriculas* would, perhaps, not suffer much if they did not receive any water from now until the end of January, but the *Polyanthus* would; they are quite as liable to be attacked by greenfly as the *Auricula*. Their desperate enemy is red spider which attacks them during the summer months; they suffered very much last season, and the pest has considerably reduced our stock of plants. I had some hope of growing them in our new garden, where the soil is heavy with a clay subsoil underneath, but they gradually disappear with the double *Primroses*, or any other of the named kinds. Our greatest success with all classes of *Polyanthuses* and *Primroses* has been by raising seedlings annually. The seeds are sown in March for the laced *Polyanthuses*, and in April for the fancy kinds.

The seeds of the poorest quality will perhaps produce the best quality plants; and in order to get the thin and poor seeds to vegetate well we place the pots or pans containing the seeds on a hotbed with a very mild bottom-heat. As soon as the plants are well up they are removed to a cold frame, and when large enough are pricked-out in boxes an inch apart, to be planted where they are to flower after they have grown to a considerable size in the boxes. The seedlings possess sufficient vigour to withstand the assaults of red-spider. *J. Douglas.*

## The Flower Garden.

#### ROSES.

ALL dead plants should be made good; remove 18 inches of the surface soil and replace it with rotten dung and fresh loam, and afterwards have all staked and made secure. They will be greatly benefited if mulched with manure, which will also serve to protect them from frost. If the Rose Briers are not planted this should be looked to at once, as the sooner those that are intended for budding in July are got in the better. Cuttings of *Manetti* should be put in at once if not already done. Hard, well-ripened wood strikes freely if planted in light sandy soil in rows 18 inches apart and 6 inches in the rows. Make the cuttings 6 inches in length and plant 4 inches deep, making them very firm in the soil.

#### BEDDING ROSES.

I prefer for bedding-out Roses those on their own roots, such plants throwing no suckers; and most of the hybrid perpetuals strike freely from cuttings if taken off with a slight heel of the old wood and planted as above described for *Manetti*. They make nice plants in twelve months, and prevent much of the disappointment that is occasioned by the loss of plants from improper pruning of worked stocks. I find to grow Roses successfully, if the soil is poor and sandy or exhausted, it is much better to remove it altogether to the depth of 18 inches and replace with rich soil. *Wm. Smythe, Basing Park, Alton.*

## Plants and their Culture.

### INSECTS.

NEXT to the mealy-bug, I consider the white-scale to be the most troublesome insect; there is some of this but not on the Pines, I am glad to say. The conservatory climbers have been troubled with it but now I hope to get rid of it from among them. Had I feared it as I do the bug, there would not have been any left. Our practice for white-scale has been to use an insecticide at double the strength advised on printed instructions; this I have found to be more than they can withstand. Brown-scale, thrips, red-spider, and aphides, are likewise very troublesome pests. A watchful eye needs be kept on each and all of them, and measures taken to destroy them. It is grievous to see the damage that is done by omitting to take such matters in hand at an early date, the effects not being obliterated for a long time to come in some cases. At the present season I strongly advise means to be taken to ensure cleanliness in each department before the increased amount of work presses upon us. A clean start in the spring will go a long way towards securing a healthy growth and eventually a more satisfactory floral and foliar display.

### FUTURE ARRANGEMENTS.

All arrangements for the ensuing season should be well considered. Any fresh introduction or variation, whether in the kinds or quantities of plants that are to be grown, or any diversity that can be made in the mode of arrangement, should receive attention. It is always a good plan to vary the features as much as can be done; the mode of procedure of one season being repeated again and again, even if it is ever so good, will be monotonous, and should be avoided where possible. If in any particular instance there should have been a partial failure during the past season endeavour by extra attention to that particular case to prevent its recurrence. If it is observed that any particular plant is not of service in some form or other then it will be by far the better way to dispense with it, and so make more room for those that are more valued. *James Hudson, Gunnersbury House Gardens, Acton, W.*

## The Kitchen Garden.

### FORCING DEPARTMENT.

**ASPARAGUS.**—Where the old system of forcing this on stable-litter and leaves is still practised, considerable labour must be employed in keeping up a supply. The most expeditious way is to force in frames heated with hot-water at this time of the year; here it can be given more air, and at the same time a steady temperature can be maintained during all kinds of weather. The "grass" is equally as fine under this treatment, and certainly of a better colour and flavour, at least so we find it. I force it in an old Pine pit, where it succeeds admirably.

### FRENCH BEANS.

Keep up the supply by planting in 8-inch pots three-parts filled with light soil. As soon as the Beans are 2 or 3 inches above the rims of the pots earth them up, and supports may be placed to them at once. Place them as near the glass as possible, and do not apply any stimulants until the Beans commence setting.

### CUCUMBERS.

A few seeds of Telegraph should now be sown, in order to have some plants for early planting. Plants in bearing will now require careful treatment in the way of watering and airing.

### TOMATOS.

Old plants with still a few fruits on must be kept thin, and regularly tied once a week, to give all light and sun possible to the fruit. Some seed should now be sown to raise plants for planting-out under glass, or pot work.

### POTATOS AND RADISHES

well above ground, must be freely aired during mild

and sunny weather, and in the absence of cutting winds. The first-named of course will be in hot-water frames, or growing in pots or boxes in houses.

### TARRAGON, CHIVES, AND MINT.

A few roots of each should be put in heat at intervals.

### SALADS.

**Endive.**—Lift from the store frames according to demand, plant in boxes, and place in the Mushroom-house, or in a dark cellar free from frost, where it will blanch, and be fit for use in five or six days.

**Chicory** can be put in suitable sized pots, eight or ten in a pot, and placed in gentle heat in a dark place. *G. H. Richards, Somerley, Ringwood.*

## THE MEXICAN SILVER FIR.

**ABIES RELIGIOSA.**—I forward you cones of two forms of the above Silver Fir. Seldom have we the two forms in cone at the same time; but these, like many other Pines, coned very freely last season, and thus I have the opportunity of sending them for comparison. The dark coloured cone was taken from a tree that was introduced here from Messrs. Veitch's nursery, of Exeter, about thirty-five years ago, I think, under the name of *Picea sp. nova*. A few years ago I was requested by Sir Joseph Hooker to send cones to Kew, and on comparing them with dried specimens of *P. religiosa* it was found to be identical. The lighter coloured cone is taken from a tree that has a more spreading habit than A, and, although it is at the same elevation, and only 40 yards from A, it is much more tender, having had the top and some side branches killed by frost in 1880 and 1881. The leaves of this specimen are not so dark, neither is the tree so healthy in appearance. This may, in a great measure, be caused by the difference in the age, the latter being much older than the other. *W. Osborne, Fota Island, Co. Cork.*

[The specimens sent are of much interest, and both of much beauty.]

The branches of A, with the dark purple cones, are cinnamon-brown in colour; the young shoots brownish above, olive-coloured beneath, slightly hirtellous. The largest leaves measure  $1\frac{1}{2}$  inch, linear-pointed, curved, deeply grooved on the deep green upper surface along the midrib, silvery-grey on the under-surface between the prominent midrib and the strongly recurved margins.

The leaves start from all sides of the branches, but are so twisted as to form about four lines, one on each side of the branch, from which the leaves come off, at an angle of about  $40^\circ$ , and two others disposed along the centre of the horizontal branches, the individual leaves being given off at an angle of  $10^\circ$ , the lateral leaves thus spreading more or less horizontally away from the branch, the uppermost ones appressed to it, and more or less parallel in direction to it. The buds at the end of the lateral shoots are subglobose, covered with whitish or pale violet obtuse scales.

The cones are erect, 5 by  $2\frac{1}{2}$  inches, cylindric, oblong, slightly narrowed towards the top, rich dark violet covered with whitish resin, with prominent bracts ending in an acuminate point and markedly reflected.

On a cross section of the leaf the deep central groove on the upper surface is very conspicuous, as also are the revolute margins, the two resin canals are close to the epidermis on the lower surface, and the strengthening cells or hypoderm do not form a continuous layer, but are broken up into detached masses.

In the second specimen, B, the old wood is not so deeply coloured though the rind on the younger shoots is more so and more hirtellous, but both in colour and amount of hairiness there is a considerable range of variation.

The leaves are arranged as in the other specimen, but shorter ( $1-1\frac{1}{4}$  inch), narrower, and of a yellowish-green colour. The buds, too, are smaller. The cone is of the same form and dimensions, but not so deep violet.

A cross section of a leaf shows a narrower leaf not so much depressed in the centre, with the same general

arrangement as in the other specimen, but with continuous hypoderm.

The variations in this beautiful Silver Fir are interesting, because they serve to elucidate its history, and they show, as Mr. Osborne says, that some varieties are hardier than others, and hence that there is a possibility that the disparagement expressed against this tree by reason of its insufficient hardihood may be obviated by careful selection of variety as well as by judicious choice of locality. At one time A. hirtella was considered distinct from religiosa, the latter being said to have glabrous shoots. The specimens before us show considerable variation in this respect, and Seemann, who investigated the matter, came to the conclusion that the two forms are specifically identical. The condition of the layer of woody fibres beneath the epiderm is also variable. In the darker green, healthier specimen sent, these fibres do not form a continuous layer, but are broken up into detached masses. This is of some moment, because there is in the Kew Herbarium a specimen collected by Skinner in Guatemala, a good deal south of the Mexican habitat, which Dr. MacNab refers to religiosa, but in which "the hypoderm cells are more scattered."

From our own observations we are not inclined to place much reliance on the hypoderm as a character, for in the two specimens sent to us, as has been shown, the arrangement differs; while an examination of a leaf from the same Guatemalan specimen as that examined by Professor MacNab showed distinctly continuous hypoderm; indeed, it might be expected that this, which is a mere mechanical arrangement, would vary according to altitude, exposure to wind, &c. In all the native Mexican specimens examined by us (Bourgeau 1143, Linden, three, Parry and Palmer 847) we found the hypoderm continuous.

*Abies religiosa* is one of the most beautiful of the Silver Firs, forming a tree of 150 feet high on the mountains ranging between  $15^\circ$  and  $22^\circ$  of N. latitude, and ascending to an elevation of 9000 feet. It derives its name "religiosa" from the fact that the Mexicans make use of the branches to decorate their churches.

The tree produced cones some years ago in Mr. Boscawen's garden at Lamorran, Cornwall, from one of which our figure, here repeated (fig. 13), was taken. It corresponds almost exactly with Mr. Smith Barry's, above described. *Ed. J.*

## HOME CORRESPONDENCE.

**The Phylloxera Laws.**—In the *Gardeners' Chronicle* of January 3, p. 20, a note is given from Mr. Vertegans, to the effect that plants of any kind, except Grape Vines, can be introduced freely into Germany under the conditions that they be accompanied by a certificate from a magistrate in reference to Phylloxera. This is certainly the case if the plants come from countries which have adhered to the Convention of Berne, but I doubt very much if it is actually the case for plants coming from other countries, especially from Great Britain. Such plants are accepted with the said certificate without any difficulty into the kingdom of the Netherlands, but for Germany—as far as I know, at least—there is wanted for every consignment the permission of the imperial authorities, which, however, it is said, is usually given with a very short delay. The latest documents about this question have been published in the *Garten Zeitung* of Dr. Wittmack, published at Berlin, No. xlix., pp. 580-589 (1884). There will be found, as I suppose, the exact particulars of the present state of the question. In that article it is said that plants may be easily sent through Holland to Germany. This is not the case, and those who would like to try it would certainly be disappointed. I have sent a note to the Editor of the *Garten Zeitung* to contradict this statement. *J. H. Krelage.*

—Mr. R. H. Vertegans' note in the last number of the *Gardeners' Chronicle*, referring to the sending of plants to Germany, might lead English plant merchants exporting to Germany to believe that a certificate of any sort from a magistrate in reference to Phylloxera is sufficient. This, however, is not the case. I had quite lately a package of plants from England refused entry at Hamburg, though accompanied by a certificate from a magistrate, and furthermore testified to by a German Consul. The certificate, which contained everything

that would have satisfied a practical man, was pronounced insufficient by the authorities, and even an appeal to the "Reichskanzler" himself proved of no avail. To protect others from loss and annoyance, I may be allowed to state that the certificates, signed by the sender and a magistrate respectively, are of no use unless drawn up in the exact wording of the forms published in your paper of February 23, 1884, p. 246—never mind its repetitions and apparent contradictions. We have tried, and continue to try, hard on this side to rid ourselves of these nearly disastrous *Phylloxera* regulations, but while the respective laws are in force the only thing to be done is to comply strictly with their requirements. *Otto Putz, Erfurt.*

tion. Apart from its uses as an arbour, its beauty as a tree is deserving of notice, and, as seen from the house, shows to full advantage. I do not know of any tree of the same species in the area of the metropolis covering a similar space, but if one exist I should be glad to be informed through the medium of the *Gardeners' Chronicle*. *G. Woodman, Moray Lodge, Kensington.*

*Achimenes picta*.—This old, bright-flowered winter variety has almost gone out of cultivation. The flowers are as vivid as the brightest of the summer flowering section, and it does really well under winter cultivation. When plants have been accustomed to be started in August and September,

with me proceeds downwards, from the top of the outer scales. This is less injurious and less rapid in destruction than when it commences below, for once this "rot" takes hold of the central root-stem—if I may use the term—destruction is inevitable. Now I want some information about this so-called "rot." Perhaps Mr. Worthington Smith, or some of your correspondents, have made microscopical observations thereon, and can tell us is it of fungoid origin? Is it imported in an incipient state, with the bulbs, or has it its origin in this country or its atmosphere? Before I come to the next point I want information on I may remark that for several years I have had mine from a large London firm, imported directly, and received invariably in fine condition.

FIG. 13.—MEXICAN SILVER FIR, *ABIES RELIGIOSA*: CONE PURPLISH-BROWN. (SEE P. 56.)

**Large Weeping Ash.**—It may be interesting to some of your readers who are admirers of specimen trees to learn that in the grounds of A. J. Lewis, Esq., Moray Lodge, Campden Hill, Kensington, there is a magnificent specimen of the well-known Weeping Ash, measuring round the outer branches 150 feet. Iron girders with upright iron supports radiate from the trunk and sustain the branches in a horizontal position; other girders cross the former ones, and form a circle at some distance from the trunk. From the outside ring of girders the branches are allowed to droop to the ground, thus forming in the summer months, when the tree is clothed with its dense foliage, a natural arbour—a retreat to which in the hot days of July and August is indeed a pleasure. An additional charm is that any one when inside is so obscured from view that the birds—which, by the way, are plentiful here—slog on the branches of neighbouring trees without the least fear of interrup-

and grown on in a warm pit or pine stove, they can be had in bloom at Christmas and onwards. After the bloom is over the plants can be dried off gradually, not otherwise, the stems and foliage being of a considerable size and substance. When the stems are dry they can be cut off close to the soil, and the pots of rhizomes stored away in any dry, cool place during the summer months. *M. W.*

**Imported Lily Bulbs and their Treatment.**—I recently drew attention to this subject, but there is still much to say and much to learn. Mr. Richard Dean (p. 790, last volume) says:—"It is well known that imported roots of Japan Lilies die in large numbers; a kind of rot sets in at the base of the scales of the bulb, and the decay works upwards from the base to the apex, effectually destroying it." My experience is very similar to this, with but the trifling exception that rot in nine cases out of ten

But Potatoes might similarly be sent from this country to Japan or California, arrive in apparently a healthy condition, and yet be latently infected with the "resting-spores" of a fungus. I use this as an illustration, for the progress of the rot in both presents some features in common. Lastly, has any satisfactory remedy been found, either partial or complete? I have been carrying on experiments for some years as to the best method of treating the bulbs when received, so as to minimise, if not wholly prevent, this rot. One of the great points to aim at is immediate root-action. This is most difficult. Heat or cold—drought or moisture—soil or fibre, or their combinations, will not, so far as I saw, start bulbs received in the end of November before the middle of January. In the meantime this fell rot is active. I have potted up and put into a hotbed some years ago—that was bad; but potted and put into a cold frame was worse—that is, the fraction of losses was more. You, about

three years since, recommended cocoa-nut fibre to plunge in until roots are emitted, and then to pot. This is a far better system. This year I used slightly moist peat-mould with river-sand beneath the roots, and roots are now peeping. But I have had to examine them four times within six weeks, cut out the fungus or fungoid parts, and dress with powdered charcoal. But still we want more information in the interests of exporters and purchasers. Has any one tried dipping the bulbs when received in any of the mineral oils, and with what result? *W. J. M.*

*Cyrtodeira fulgida*.—This is a pretty plant for a warm greenhouse or stove; the soft velvety foliage and bright scarlet tubular flowers making it an admirable plant to grow in a pan, or in a basket, to be suspended. It will form a pleasing contrast to the rather monotonous edgings of *Panicum variegatum* and *Isolepis gracilis* that is so often found bordering beds and benches in warm houses. Fastened to a wall with *Fittonias*, *Begonias*, and the like, it makes such places bright with the scarlet colour of its flowers. *M. W.*

**The Proposed Forestry Exhibition.**—I observe the prospectus for another Forestry Exhibition is issued, to be held this year. I consider such an exhibition, following so close upon the one just closed in Edinburgh, cannot be received by foresters and foreign countries with much attention. It cannot be expected that exhibitors who contributed to the last will care to join. They may not have the time or means to come forward for the same object every year. Surely one exhibition a year is enough. Is there not to be a very interesting exhibition of inventions, &c., at South Kensington? How many of the London public will visit the Alexandra Palace? The position of an exhibition is everything. Let a Forestry Exhibition be held at South Kensington in 1886, and then it will receive full support both at home and abroad. *F. Alexander, Ceylon, Dec. 6, 1884.*

**The National Dahlia Society.**—Whilst trusting that Mr. Moore's appeal on behalf of this Society may meet with a hearty response, I would still urge upon the committee the desirability of endeavouring to do something to meet the more popular requirements in Dahlias, because it must be admitted that the plants and the flowers they produce are valued chiefly according to their decorative capacities. A show Dahlia is, without doubt, a noble, massive, and wondrously perfect flower, but it has the demerit, on the other hand, of being so large, so massive, and so perfect, that these absolutely massive and perfect flowers sooner pall upon the public taste than do those more irregular in form, and more amenable to cultural improvements. Hence it is that, grand as the show Dahlia may be, it yet fails to command so much popularity as does the single kinds, or even those irregularly formed doubles of the *Juarez* type that are such valuable aids for decorative purposes in the autumn. At a National Dahlia Show we see hundred after hundred of big round painfully and monotonously perfect blooms, duplicates of each other, following in constant succession. Naturally so much sameness produces satiety, even in the breast of a florist, whilst in the minds of the general public, lovers of flowers in the widest sense, it is presently apt to create a sense of disappointment. The introduction of boxes of pompon, bedding, and single forms, hardly saves a great Dahlia show from monotony, because even these flowers also are set up in what is at the best a stereotyped form—showily, no doubt, but still artificially. The Dahlia-loving public now want to learn something more than has been shown in the past of the habits of the plants which produce these flowers, their height, their floriferousness or otherwise, their adaptability for common garden cultivation, and the sort of figure they cut when so grown. Notoriously the exhibition blooms are produced by plants upon which skill and labour and high cultivation have been lavished, conditions such as could not be afforded ordinarily. To learn how Dahlia plants would figure under ordinary conditions of culture is of the first moment to the public, and the Dahlia committee should endeavour to supply the information. Why not call for Dahlia plants in pots, especially of those kinds that are specially recommended for garden decoration and the furnishing of cut blooms? Classes of twelve plants in pots, for both double and single kinds, would, if filled, enable intending purchasers to see whether habits and flowers were conveniently allied. As long

as flowers may be shown in a cut state only, no inducement whatever is given to raisers or growers to produce plants that are dwarf, compact, and free blooming. To secure a race of Dahlias that have these features in common is now of more value than is the production of show blooms only, however fine or perfect. The Dahlia has a very limited constituency indeed of fanciers, but now has a remarkably wide one of lovers. Perhaps the Chrysanthemum stands at the head of all flowers in the breadth of its popularity, then comes the Rose, and it seems now as if, thanks to the numerous decorative and single kinds, the Dahlia took third place in the public estimation. If the committee of the National Dahlia Show will get outside the small circle of Dahlia florists, they may find much sympathy and support. *D.*

**Flowers by Post.**—There is no doubt, I think, but that the parcel post would be made more use of for sending flowers [and fruit if the boxes did not get smashed in the way they do, which damage I believe occurs not so much from the stamping, as from putting a large number of packages in one hamper, which gets pitched into a cart in such a rough manner, and out again on to the station platform, that boxes must be strong indeed if they can withstand the concussion. Sent singly by rail they go much safer, as there is none of that banging about that there is when they are together in bulk, for when at all heavy, neither postmen nor porters ever think of lifting anything, but let whatever it may be down, or throw it up all of a lump, when things, unless of great strength, get shaken to pieces. If the Post-office hampers are to be left to the mercy of *employés*, and used so roughly, they ought surely to be padded or have springs, after the manner of mattresses, when perhaps it would be possible to send things a little safer than they go now. Deal boxes, unless very stout, get split to pieces, and arrive in a state of collapse, but though tin becomes bent about a good deal, one generally has the satisfaction of receiving them whole, although the contents are not often in that happy condition. Why flowers travel best in tin boxes is, that they mostly fit tight, besides which, they are non-absorbent, and this is a fault with wood which, in its dry state, sucks the moisture out of flowers, and leaves them withered up or flagging if they remain long enclosed. To counteract all this I find it is a good plan to soak the boxes before using them, as, instead of robbing the flowers then, the gradual escape of moisture keeps the internal air damp, and both petals and foliage look as fresh after a long journey as they do when the blooms are fresh cut from the plants. Tin boxes do very well if they are packed in a non-conducting cover, such as brown paper, but without something of the sort over them they are quickly affected by cold or heat, and the contents become frozen or roasted according to what the weather may be, and the amount of exposure they get. *J. S.*

**Undressed Chrysanthemum Blooms for Exhibition.**—Not a year passes but complaints are made that Chrysanthemum flowers are far too much dressed at shows, and thereby presented in a form altogether different to what the flowers are produced naturally on the plants. It is said that a skilful dresser can do so much to give a character to the flowers, that another cultivator who can produce equally good flowers but is not so successful in dressing them for the exhibition table, stands no chance in competition with him. Growers for exhibition purposes throw the whole strength of a plant into two or three or more flowers according to the variety. There is nothing to complain of in this, as it is a universal practice. But some varieties will come with loose, open, mop-like flowers, and in order to transform these into the fine symmetrical blooms one sees on the exhibition table a certain amount of waxing or dressing has to be gone through. As the blossoms advance the irregular florets are pulled out; the petals that are inclined to reflex rather than become incurved are poked up towards the centre by a process well known to dressers, and the centre of the flowers is made to close up in a complete manner: or if this be not already accomplished, it is consummated after cutting the bloom, when the stem is drawn down into a cup or some such vessel, which operates to squeeze the back petals up, and makes an otherwise loose bloom compact. These are a few of the methods of dressing resorted to by exhibitors. For many years past protests have occa-

sionally been entered against the practice, and resolutions have been passed by societies that only undressed flowers should be exhibited, but they have come to nought. The difficulty appears to be to make an authoritative statement that such and such flowers are undressed. Every year the National Chrysanthemum Society is adjured to provide classes for undressed flowers, but the difficulty just stated has to be faced and overcome. Unless the entire system of dressing flowers for exhibition is set aside, the difficulty is how to legislate in the case of one particular subject. Auriculas are subject to a good deal of dressing, so are Carnations, Picotees, Pinks, and Dahlias. Rough blooms of Pansies otherwise perfect can be flattened into shape by placing weights upon them. Pelargoniums can be made shapely by a judicious manipulation, and if it is irregular to gum the petals of Roses, why should it be permitted in the case of Pelargoniums? Unless all dressing can be put aside (and it is not easy to see how this can be brought about), dressed Chrysanthemums cannot be banished from our autumn exhibitions. *R. D.* [Why not have separate classes for dressed and undressed flowers? *ED.*]

**Destruction of Slugs and Grubs.**—Those who have had any experience in the cultivation of old gardens, where the land happens to be of a heavy tenacious nature, are familiar with the destruction effected by slugs, grubs, and the like pests that often abound in quantities in soil of this description, especially when it happens that the labour available is not sufficient to keep the hoe and other tools often enough at work, for it is a well known fact that where means do not exist to carry out a system of high cultivation by frequently stirring the surface, these marauders are plentiful to an extent that often makes it a difficult matter in showery spring weather to prevent Lettuce, young Peas, and other important crops being devoured, to say nothing of the trouble they give in the autumn and winter by preying on everything that suits their taste. The ordinary manures applied to gardens do nothing to discourage the increase and ravages of such pests as these, but there are other things, such, for instance, as gas-lime and salt, that, independent of their manurial properties, are much more effective in the destruction of the pests in question than those would imagine who are located where these materials are not so plentiful as to admit of their being used to such an extent as they might be, or at all. A good dressing of salt at this time of the year to those parts of a garden that are not occupied by crops, letting it lie at the top for some weeks until it has time to dissolve, destroys a vast amount of grubs, slugs, and also the eggs of the latter. Gas-lime is even more effective in ridding the land of their presence; the lime should be scattered about half an inch thick on the ground, and allowed to remain for three or four weeks before being dug in; it is more lasting in its effects for the purpose in question than salt. Soot, well known as it is for its manurial properties, and also for the dislike that animal life in any form has to it, is much less used for garden purposes than it might with advantage be. A good dressing every other year or so is an excellent means for the destruction of slugs and the embryo of insects, with the farther advantage that it can be applied to ground occupied by crops in a way not possible with salt or gas-lime. The destructive effects of newly slaked lime on slugs and their eggs is so well known as to make a reminder unnecessary; it and the soot are best applied in spring, whereas the winter affords the best opportunity for using the other materials. *T. B.*

**Transplanted Trees and Shrubs.**—At this season of the year, nurserymen's catalogues of forest, fruit trees, &c., are very plentiful, and in looking over them the reader sees remarks similar to the following: "1-year transplanted, 2-year do," and so on. This is a matter of much more importance to the planter than appears on the face of it. It is of great importance that trees and shrubs intended to be transplanted should not be left more than two years without being moved. The longer they remain in the soil undisturbed, the greater is the risk in transplanting. It is a practice in nurseries to "spade" trees that have grown into size preparatory to moving them. The process consists in passing the spade round and under the ball of the tree so as to cut off the tap-root, and confine the branching roots within a given space. It is customary to do this early in the autumn, the earlier the better, because it affords time for the roots within the ball to put forth other root-

lets. Plants treated in this way can be moved with success; when moved to a new locality, and the ball surrounded with fresh soil, they soon push forth fresh roots without being appreciably inconvenienced by the removal. As an invariable rule trees bear removal from light soils better than they do from heavy soils. "The reason is," writes an experienced planter, "that in light and porous soils the roots are mostly globed into fibrous tufts near the stem, whereas in strong land the roots of plants wander further in search of moisture, &c., and through a denser medium, so that they become elongated and coarse." It is an axiom with planters that tap-rooted plants, whatever may be the predisposing cause of the root taking this shape, should be transplanted young, otherwise the chances of surviving the process are small. It is very difficult indeed to lift such plants with balls of earth about the roots. It is different with plants forming fibrous roots, the soil is gathered about them in a dense mass, and they can be transplanted in safety and with comparative ease. The Rhododendron furnishes an admirable illustration of this fact. Planters found the subsoil very dry this autumn: what rains did fall had but moistened the surface, and scarcely reached root-deep. Many delayed planting in consequence until the autumnal rains fell. Those who find themselves under the necessity of planting at once, must see to it that the subsoil be moistened in plenty. The season, so favourable generally to outdoor gardening operations, is clearly against planting, unless adequate precautions be taken. *D. E. G.*

**Brussels Sprouts.**—This has been an unfavourable year for this useful vegetable, the dry summer and numerous insects in many districts have all but destroyed them. The flat under my charge is as good as could be wished, only the Sprouts are pronounced at table too large. A new disease has now attacked them; the firm hard Sprouts, apparently perfect, when cut in two are found to have a layer of decayed black leaves near the centre, so that it is requisite to cut each Sprout in half before cooking, which spoils the appearance for table. Any that remain the day after cooking give out a very offensive smell. So extensive is the disease in some of the Midland Counties, that they are unusable. *Ebor.*

**The Committees of the Royal Horticultural Society.**—I had hoped that my letter of November 29, 1884, would have met with some response, and that many horticulturists would have given their ideas publicity. This lethargy and silence bodes ill for horticulture pure and simple, and makes one fear that the downward tendency of the committees has become too pronounced for any, short of the most radical, remedies. Although speaking of committees in the plural I refer especially to the effete "A." and "B." sections of the Floral Committee, whose principal use appears to consist in its being a nursery to raise members for the Fruit Committee. Some might argue that this is only following Nature, since flowers are produced before fruit; however, be this as it may, certain it is that the business of the Fruit Committee seems to be conducted on much higher principles, and to be less biased by what "A. B. C." calls "personal considerations" than that of the Floral one, and this is the most serious phase of the whole matter, for there seems to be some apprehension that undue influence is used by the selectors of the committee, and certainly there has been no meeting during the last twelve months without signs of disapproval, smothered for the time, but sure to gain strength and burst forth again more powerful for their temporary suppression. "A. B. C." justly urges that the counties are not sufficiently represented; indeed, with the exception of a few "speciality" men, who are valuable, but who should not be in the ascendant, they are scarcely represented at all. In my opinion, age and experience, and the having had opportunity for travel, should have far greater weight than the special study, conducted possibly in one or two Orchid-houses, or from visits to ten or twenty gardens in different counties. The counties should select their best men—men of ability and varied attainments, who, without undue bias, would honestly adjudicate on what they saw before them, without reference to what Mr. So-and-So had seen at Mr. —'s place, or to what Mr. So-and-So had left at home; there might then be a chance of escape from the puerility that occupies meeting after meeting in

discussing whether a Primrose be blue or slate-colour, or if a Chrysanthemum or Aster be more incurved or quilled by the thousandth part of an inch than any previously seen—questions of interest doubtless, but whose importance to horticulture is not comparable to the introduction of a new hardy tree or shrub. Take, as an instance, Mahonia Aquifolium, and Mignonne—the originals are beyond all praise, and the former remains the sterling and valuable thing it was, but the latter has been "improved" (word of now evil omen, and more especially so in our culinary products) beyond the comprehension of the unsophisticated lover of beauty, who fails to see in the rough, coarse, "big brother," lacking even that delicacy of perfume which is the plant's greatest charm, any resemblance to his cherished "little darling" of years ago. Yet while much time has been spent in adjudicating on these "improvements," certain sections of hardy shrubs are never brought before the committee at all, nor have been for years, although the varieties raised might be counted by fifties or even hundreds. Why is this? Simply because raisers have no confidence in the committee's judgment, and prefer to introduce their novelties to the public in their own way, which they, for the most part, do successfully. If something be not quickly done to restore confidence, the central authority is doomed. Once let the counties form their own committees, and we shall be riven in all directions, never again to unite. Let us make a mighty effort before it is too late—let us strive to make the committees more representative in every way, let us increase the members, if necessary, a hundredfold, and give permanent seats to those who have done good service and earned experience, but whose energies may, perhaps, be flagging, and who cannot always face the wild north-easter as they did in years gone by. Let us—But enough: after all I am but a wandering stranger, who in his passings to and fro has heard and seen sufficient of the general feeling to fear that the forthcoming list will probably contain names (forgive the bull) "not in it!" *A Wandering Pleiad.*

**Premature Growths.**—It is sometimes said that the past summer and autumn were what is termed "rushing"—that is to say, that plants came forward with great rapidity, and developed their flowers earlier than usual, and almost all together. And this rushing tendency appears to have imparted itself to some of the Cape and other bulbs. *Ixias* and *Sparaxis* that flowered in pots last spring that were stood out-of-doors and repotted in August, when at rest, have come away unusually early, though standing in a cold frame on a north border without any covering, and the plants are now 4 to 5 inches in height. *Gladiolus Colvillei albus* may be said scarcely to have rested, for almost as soon as the foliage died down the bulbs again commenced to grow, and the growths from pots in the open air are 1 foot or more in height. These are representative cases. Probably the dry weather and marked absence of rain has kept the soil warm and assisted growth; many hardy plants in the open ground have grown quickly almost up to the middle of November. *R. D.*

**The National Auricula, Carnation and Picotee Societies (Southern Section).**—In reference to Mr. Dodwell's letter at p. 24, wherein I am accused of foisting a fictitious vote upon the meeting, I beg to say that the accusation is unfounded. Mr. Wright joined the Societies some weeks before the general meeting. The want of rules is constantly being felt. There is none to say how members are to be received, or what amount of subscription gives them power to vote; but the usual course was followed with Mr. Wright. He had paid his subscriptions of a guinea before he voted. No one complained of the *status* of most of the unknown men who came to vote for Mr. Dodwell. Young Mr. Pohlman, for instance, has long been accustomed to attend the exhibitions with his father; but I do not find his name on the last list of subscriptions. How much was his subscription—when, or for what purpose was it paid? Dr. Hogg was not entitled to pay any subscription in 1883; he had previously resigned, but at my solicitation he again became a member. Again, I declare that the meeting of October 14 was summoned in the usual way, and with no evil intention on my part, as has been alleged. It was summoned in the same way as that of July 8, for instance, which was called by Mr. Dodwell. There was a complaint at that meeting that some members

had been left out. Probably Mr. Dean was forgotten, at any rate he was not present. Mr. Fraser is not a member of either Society, consequently he was not invited, and was not present. Mr. Dodwell objects to Dr. Hogg and Mr. Veitch being present. They both attended at the meeting on July 8, hence they were asked to attend on October 14. It may seem to outsiders not quite in order to ask members not on committees to take part in the proceedings, but it had been done before as a matter of courtesy. So few members of committee used to attend, and if there happened to be any members present at the Royal Horticultural Society's meetings who had knowledge of the business, they were invited to sit down. It was a graceful act of courtesy: it had been done before with the approval of Mr. Dodwell. I see nothing objectionable in the practice, nor did Mr. Dodwell hitherto. If there were rules to say that the business should be transacted by a committee, and that no other member on any account should be present, that would make all the difference. When Mr. Dodwell claims freedom of action for himself he should allow the same to his co-secretary, and not be so ready to impute bad motives without cause. I must allude here to Mr. Dean's grievance. Mr. Dean's last attendance at a meeting, either general, special, or committee, was on March 14, 1882. When a member of any society absents himself from its meetings for two years and seven months, and when at the end of that time he gets up at a meeting and declares his deep interest in the society he has thus neglected, the secretaries may be pardoned if they forget to send him a notice. I say emphatically that Mr. Dodwell had not a majority of votes in his favour on December 9. I come now to the question of proxy voting. Mr. Dodwell put his case to the members in his own way, very pathetically. There was no other side. Nobody asked for votes but Mr. Dodwell. He sent the members a circular containing a copy of a letter he had addressed to the Editor of the *Gardeners' Magazine*. It was a one-sided letter altogether. Mr. Dodwell ought to have sent my answer to it, which appeared in the same paper. He brought his proxies to the meeting, but they were very properly not admitted. He says he had a vote in his favour—fifty-three against twenty-two.

It may be a fair question to ask who are the twenty-two? I answer that question. Amongst them are the foremost florists in the Northern and Southern Sections. When there are no rules to guide the Executive of any society it would puzzle the wisdom of Solomon to know how to act so that Mr. Dodwell should find no fault, if he felt inclined to do so. Mr. Dodwell objects to rules. He says in a circular dated December 27, 1884 (the fifth or sixth of the series)—it is addressed to Mr. Shirley Hibberd—"Rules by their very nature restrict; I resist restriction." Just so. He is an autocrat in his way, and acts just as he pleases. Last summer, for instance, he would not be controlled. I draw particular attention to his words, "I will maintain the position of leader I was pressed into eight years ago; and except as following a direct vote of the committee, which I shall always uphold, I will tolerate no interference with my direction." At this time he was involving the President of the Carnation Society, the Vice-Presidents and committee, in legal proceedings, entirely without their knowledge and consent. I tried in vain to restrain him, warning him that the committee would not support him in such irregular proceedings—and what was the result? He summoned a committee for July 8, with the President of the Carnation Society in the chair, and the committee unanimously refused to support Mr. Dodwell in any further action. He might have got out of his difficulty in the usual way, but he retained office. Before this he "would always uphold a direct vote of the committee;" but after the rebuff he received on July 8 he could not be very sure of their support in future.

Besides Mr. Dodwell's action in this matter, he sent other letters, telling me that "he had received indications from men high in office that they would not suffer me to lead." To save my self-respect, I determined to act no longer as co-secretary with Mr. Dodwell. This proceeding I could not avoid, and yet on this honourable action Mr. Dodwell pours his gall, and shamefully misrepresented me. As soon as I determined to resign I told him first, and asked him to summon a meeting to allow me to do so. He sent an evasive reply. The

subsequent results are well known. I will just allude to another circular from Mr. Dodwell—the seventh, I think, of the series—in which it is stated by Mr. Dodwell that I perpetrated a fraud on the societies; it is dated December 30: and yet another from Mr. Dean, dated December 31, repeating the libel in another form. Mr. Dean's circular was sent in the form of a "statement" to the Editor of a contemporary, but was returned as unsuitable for its pages. When communications are unsuitable for publication in the usual gardening papers they can be issued in the form of circulars, but their authors must not forget that there is a law for libel. I shall make no more comments on any circulars or letters published by Mr. Dodwell or Mr. Richard Dean. *J. Douglas, Great Gearies, Ilford.* [Mr. Dodwell and Mr. Douglas having now expressed their views on the question at issue we must request them to reserve any further statements for the meetings of the Society, or seek publicity in whatever other form they please. We can insert no more communications on the subject. ED.]

## ON POTATO DISEASES.

(Concluded from p. 15.)

SCAB.—This well-known affection of the exterior of the tubers compared to the Phytophthora and other diseases is comparatively unimportant. Certainly it spoils the look of the Potatos, and injures them to a certain extent. Kühn\* seems to have regarded scab ("schorf" or "grind") as being caused by *Rhizoctonia solani*, a fungus which is frequently seen, but which appears to me neither to be the cause of scab on the one hand, nor to have anything to do with *Tubercinia scabies* on the other. The last-named fungus was described many years ago by Mr. Berkeley,† and figured by him as well as by Martius.‡ I have never met with it myself. Specimens were published by Dr. Cooke,§ but in my copy of his *Exsiccati* no spores exist.

Of the cause of true scabbing we know very little. As usually met with, each scab consists of a circumscribed cork formation of the rind of the tuber, as if each spot had at some earlier period of its existence been the seat of an injury. Most likely this precursory injury will be found to be due to a fungus of some sort, possibly to some mould, to prevent the penetration of which the tuber has developed a cork plate. I am the more inclined to adopt this surmise because in the early part of this summer I brought home some tubers affected with the early stages of scab and placed them in a damp atmosphere under a bell-glass. In the course of a few days each affected spot gave origin to a minute pustule of some whitish fungus, which to the naked eye looked very much like a mould, but which, owing to the pressure of other matters, I had not the opportunity of further investigating.

MOTTLED OR SPOTTED TUBERS. (See fig. 135 B, p. 788, vol. xxii.).

As far as I am aware this affection is not mentioned by any writer upon the subject. It may be, however, for aught I know, for there are few subjects which have been written more about than Potato diseases. Twenty years ago De Bary speaks of over two hundred separate memoirs and communications on this subject which existed at that time, so that to obtain a perfect acquaintance with the literature of the subject is well nigh impossible when it is remembered that these communications are scattered over the literature of every European country. In September last many of the Potatos grown at Chiswick were found to be curiously marked internally with brown spots or discolorations, which bore a very close resemblance to the brown spots produced by *Phytophthora*, so much indeed was this the case that they were regarded at the time that they were first observed by all who saw them as being due to this cause. In two particulars, however, they differed from true disease spots. Firstly, they were confined to the interior of the tubers, which externally appeared perfectly healthy. Secondly, the spots were neither so opaque, nor so dry, nor so deep in colour as the true *Phytophthora* spots are. Having obtained specimens I carefully examined them for mycelium, but failed entirely in finding any trace whatever of it. It is very easy to say offhand that

mycelium does or does not exist in any tissue of a Potato plant, but those who have had most to do with searching for it amongst the discoloured or the healthy tissues will bear me out when I say that it is easier to say it exists than to demonstrate its presence satisfactorily. Of course it can be traced, and I have traced it myself many times, but I felt that mere negative assertions on my part would deservedly have but little weight one way or the other. Slices of the mottled tubers were placed under a bell-glass, but gave rise to no conidia formation. Mr. Henslow also kindly examined these spots for me, but, like myself, found neither mycelium nor conidia. Specimens were sent to Mr. Jensen, who likewise failed to discover mycelium or to induce the development of conidia.

I then sent specimens to Professor De Bary, who most kindly examined them, and informed me by letter that he found neither *Phytophthora*, nor any other fungus, nor *Bacterium* in the discoloured spots. He further investigated the affected tubers, but found by culture under bell-glasses no conidia were produced. Of course, his dictum, that the brown spots were not due to *Phytophthora*, was amply sufficient to settle the question, for it is to him we owe nine-tenths of our information concerning the physiology of this fungus. He found, however, that after keeping the slices under observation some days (as also occurred to myself and to Mr. Rostrup) that a minute *Verticillium* or *Acrostalagus* appeared upon the slices; this *Verticillium* I had observed many times during the past winter upon my cultures, and it has, I believe, nothing to do with the mottling of the tubers.

Mr. Rostrup also examined specimens of the Chiswick tubers, with the same result. Mr. Jensen then suggested that these mottlings might possibly be the incipient stage of dry rot. I therefore sent specimens to Professor Kühn, of Halle; he, too, very kindly examined them, and found, like De Bary, neither fungi nor bacteria in the spots. He informed me that he was familiar with the affection for many years, but was unable to assign any cause for it or give me any further information about it. Moreover, he added, that it had nothing whatever to do with dry rot. More recently Mr. Murray has examined this mottling, with the same result. Hence it is obvious that we have to do with a disease affecting the interior of the tubers which bears a close resemblance to the browning caused by *Phytophthora*, but that this fungus has nothing whatever to do with it. This conclusion has not been hurriedly arrived at, for the affection has been examined by the most eminent authorities upon Potato diseases on the continent of Europe—Professors De Bary and Kühn, Mr. Rostrup, and Mr. Jensen—and the above is their unanimous verdict; besides which it has been examined by Mr. Henslow, Mr. Murray, and myself, with a like result. Further investigations of this affection, extending over the winter months, are desirable for the elucidation of this obscure affection, but the prospects of elucidating its cause are not hopeful when so many eminent authorities have been baffled by it.

An instance has recently come under my notice in which a crop of Potatos have been rendered unsaleable from this disease. The grower, an intelligent working man, recognised the difference between it and the "old disease." The crop was unsaleable because it is impossible to tell how many tubers are affected, their exterior being perfectly healthy. The same grower noticed the disease last year, but not to so great an extent. *C. B. Flourish.*

## FRUIT NOTES.

BERZENCY QUETCHE.—The Quetche, or Prune Damsen, are as yet not commonly found here, but as fruit preserving by drying and otherwise is likely to form an important industry in the near future, these sugary, prolific, perennial bearing varieties will be largely grown. All of them are less juicy than our best Plums, and, therefore, contain a smaller quantity of water to be got rid of by boiling or drying. The above-named excellent sort is commonly grown in Upper Hungary, in the cool mountainous region, near the sources of the Theis, and should prove well adapted to our climate. Its other name is Muskataly Szvilva, or Muscat-flavoured Plum.

RASPBERRY MERVEILLE DE QUATRE SAISON.

This is an excellent late fruiting kind, well worthy of being grown on a large scale. It is almost a continuous fruiter, of robust growth, therefore requiring

plenty of space and liberal manuring. The fruit is dark crimson, large, and bluntly conical, coming in clusters. It bears fruit freely to the end of October.

BEURRE BOSC.

As a market Pear this is highly recommended in the December number of the *Bulletin d'Agriculture*, where a coloured figure is given. It should be grown as a standard, and if not very productive when quite young, is a good and regular cropper at a later period. The shape of the Pear is elongate, top-shaped, the skin reddish-brown, the flesh very white, of good quality. Season, October and November.

## Reports of Societies.

### Scottish Horticultural Association.

THE PROGRESS OF HORTICULTURE.—A meeting of the above Association was held on Tuesday last, at 5, St. Andrew Square, Edinburgh, Mr. MacKenzie in the chair. Mr. James Grieve read a paper on the progress of horticulture during the last quarter of a century. He enumerated the improvements effected and new introductions made within that period in Conifers, ornamental trees, shrubs, florists' flowers, stove plants, fruits, and vegetables. Among other points referred to was the great increase of Orchids, which were said to have been of late years placed within reach of the million. In regard to table plants, it was stated that the amount of money now changing hands for these alone would astonish the wisacres who were for ever talking of the good old days. As to cut flowers, again, what with births, deaths, and marriages, and the decoration of churches at Christmas, as much money now changed hands in a week as did in a year twenty-five years ago. Of fruit trees the Apple had been very much improved, and several varieties, if not new in the correct sense of the word, had been brought to the front to displace sorts formerly recommended. The Pear had not been so much improved; we had any quantity of fine Pears, but what we wanted in regard to this fruit was a better climate. In Peaches and Nectarines great changes had been introduced, especially with very early and very late sorts. The Apricot had not been so much taken in hand as it ought; and the Cherry remained, to a great degree, what it was twenty-five years ago. Of Gooseberries, Currants, and Raspberries the number had been thinned, the better sorts having come to the front and been retained. Strawberries had become a great favourite; various sorts had been added, and there were 10 acres grown in Scotland now for one twenty-five years ago. There had also been a great increase in the growth of vegetables. The wages of working men in nurseries had increased about 50 per cent.; and although at present horticulturists, like every other profession, were undergoing a season of dull trade, they trusted soon to see a return to the golden harvests of former years.

In the course of some discussion that followed Mr. Todd said there might be some flowers better developed than twenty-five years ago, but, with the exception of Roses, there had been very little progress; and the progress made had not been made in recent years, but in the beginning of the quarter of a century under review. In vegetables many things had been improved, but the improvement had not been so very great. Peas had been introduced that were to be ten days earlier, or to produce double the crop; but still their Peas came in about the same week, and they had just about the same quantity. A great many of the introductions mentioned by Mr. Grieve had improved gardens immensely. The great change that had taken place during the last twenty-five years had been that the people had interested themselves more, and had become greater lovers of flowers and plants; but he was not quite sure that horticulture as a science had very much advanced during that period. The great increase in the means of communication had in some cases contributed to progress, while in some it had rather hindered progress by bringing the gardener into competition with foreign growers who enjoyed a better climate. Proceeding to ask if the gardener was a better gardener than twenty-five years ago, he desired to mention, as showing that he was not, a sad fact that took place last year. The Council of the Royal Caledonian Horticultural Society, having to award the Neil Prize, which was given once in three years to the most distinguished horticulturist of his time, could not find in Scotland a gardener worthy of it, and so had to give it to an amateur, and not one gardener in Scotland could be found to raise his voice against the award.—Mr. Lindsay contended that, on the whole, there could be no question that during the last twenty-five years horticulture had progressed very much.—Mr. Munro remarked that the teaching of Mr. Darwin, although it had not done all that it ought to have done, had done more for horticulture as a science than anything else that had occurred during the last twenty-five years.—The Chairman submitted that there had been as great progress in practical horticulture during the period in question as there had been in the science of that period. Gardeners all over the country at the present day were in possession of modes of cultivation and produced results that the gardeners of dukes, earls, and princes could not produce thirty years ago. Some horticultural specimens were afterwards exhibited.

LONDON: *Atmospheric Pressure.*—During the week ending January 3, the reading of the barometer at the level of the sea decreased from 30.17 inches at the beginning of the week to 29.78 inches by 3 P.M. on the 29th, increased to 30.41 inches by 9 A.M. on the 1st, decreased to 30 inches by 3 P.M. on the 3d, and was 30.09 inches by the end of the week.

The mean reading of the barometer for the week was 30.08 inches, being 0.03 inch lower than last week, and 0.05 inch above the average of the week.

*Temperature.*—The highest temperature was 40° on December 31. The highest on January 1 was 34°. The mean of the seven high day temperatures was 36°.

The lowest temperature was 26°, on January 1; the highest on December 28 was 35°. The mean of the seven low night temperatures was 30°.

The greatest range of temperature in one day was 12° on December 31; the smallest was 2°, on December 28. The mean of the seven daily ranges was 5°.

The mean temperatures were—on December 28, 35°; on the 29th, 35°; on the 30th, 32°; on the 31st, 36°; on January 1, 30°; on the 2d, 31°; on the 3d, 33°; and these were all below their averages by 1° 6', 2° 1', 4° 4', 0° 6', 6° 4', 5°, and 3° 6' respectively.

The mean temperature of the week was 33° 8', being 2° 8' lower than last week, and 3° 4' below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 54°, on December 31. The mean of the seven readings was 43°.

The lowest reading of a minimum thermometer with its bulb placed on grass was 18°, on January 1. The mean of the seven readings was 23° 2'.

*Rain.*—No rain fell during the week.

ENGLAND: *Temperature.*—During the week ending January 3 the highest temperatures were 52°, at Truro, 49° at Plymouth, 43° at Bristol. The highest at Bradford was 36° 8', at Sheffield 37°, at Nottingham 37° 2'. The general mean was 40° 3'.

The lowest temperatures were 22° at Cambridge, 24° 9' at Wolverhampton, 25° at Sheffield; the lowest at Plymouth was 32° 5', at Truro 32°, at Sunderland and Preston 30°. The general mean was 27° 7'.

The greatest ranges were 20°, at Truro, 16° 8' at Bristol, 16° 5' at Plymouth; the smallest ranges were

8°, at Bradford, 8° 4' at Nottingham, 9° at Sunderland. The general mean was 12° 6'.

The mean of the seven high day temperatures was highest at Truro, 46° 3', at Plymouth 42° 7', at Sunderland 38°; and was lowest at Wolverhampton, 33° 9', at Bolton, 34° 3', at Liverpool 34° 9'. The general mean was 37° 2'.

The mean of the seven low night temperatures was highest at Truro, 36° 7', at Plymouth 35° 5', at Sunderland 31° 6'; and was lowest at Bolton, 27° 6', at Wolverhampton 27° 9', and at Cambridge 30°. The general mean was 31° 2'.

The mean daily range was greatest at Truro, 9° 6', at Leeds 7° 3', at Plymouth 7° 2'; and was least at Liverpool, 3° 6', at Preston 4° 7', at Brighton 4° 9'. The general mean was 6°.

The mean temperature was highest at Truro, 41° 4', at Plymouth 39° 1', at Sunderland 34° 6'; and was lowest at Wolverhampton and Bolton, 30° 8', at Cambridge 32° 8'. The general mean was 34° 1'.

*Rain.*—The largest falls were 0.22 inch at Truro, 0.05 inch at Sunderland, 0.03 inch at Preston; the smallest falls were 0.01 inch at Cambridge, Nottingham, and Bradford. The general mean fall was 0.02 inch. No rain fell at Brighton, Bristol, Blackheath, Wolverhampton, Sheffield, Liverpool, Bolton, or Leeds.

SCOTLAND: *Temperature.*—During the week ending January 3, the highest temperature was 43° 2', at Leith; at Perth the highest was 38° 5'. The general mean was 41° 7'.

The lowest temperature was 22°, at Glasgow; at Greenock the lowest temperature was 29° 2'. The general mean was 26° 7'.

The mean temperature was highest at Aberdeen, 37° 1'; and lowest at Perth, 32° 5'. The general mean was 34° 3'.

*Rain.*—The largest fall was 0.43 inch, at Aberdeen, and the smallest fall was 0.07 inch at Greenock. The general mean fall was 0.09 inch. No rain fell at Edinburgh, Dundee, Leith, or Paisley.

JAMES GLAISHER, F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, January 5, 1885; issued by the Meteorological Office, 116, Victoria Street, London, S.W.—The weather has continued very dull, cold, and dry over England, but in Ireland and the west and north of Scotland it has been unsettled and milder, with showers of rain, hail, or sleet.

The temperature has been 1° or 2° above the mean in Ireland and "Scotland, N.," but elsewhere it has varied from 1° to 4° below. The maxima, which were recorded on the 4th or 5th, ranged from 54° in "Ireland, S.," to 47° in "England, E." The minima were registered on different days in the various parts of the Kingdom, and ranged from 21° in "England, S.," and between 23° and 28° in most other districts, to 33° in "Ireland, N.," and 34° in "Scotland, N." The diurnal range over England was generally very slight.

The rainfall has been a little more than the mean over Ireland and about equal to it in "Scotland, W.," but less in all other districts. Over the greater part of England the fall has been scarcely appreciable.

*Bright sunshine* has been unusually deficient. In "England, N.E.," "England, N.W.," and "England, S.," none at all has been recorded, while elsewhere the percentages of the possible number of hours have varied from 2 in "Scotland, N.," to 7 in "England, E.," and to 10 or 11 over Ireland.

*Depressions observed.*—A large area of high pressure has held steadily over the Continent, but soon after the commencement of the period the barometer fell at our western stations, and depressions began to move northwards outside the Irish and Scotch coasts. On January 3 an irregularly shaped disturbance had appeared over our south-western districts, on the 4th a large and rather deep depression was passing north-north-eastwards off the west of Scotland, while on the 5th some subsidiary disturbances were passing in a similar direction over the United Kingdom. Under these conditions fresh or strong southerly winds have prevailed at all our western and north-western stations, while light or moderate south-easterly to southerly breezes have been general in the south-east and east.

## Obituary.

### DEATH OF MR. KINGSBURY, OF SOUTH-AMPTON.

THE South of England has been deprived by death of one of its well known trade horticulturists in the person of Mr. James Kingsbury, of the Bevois Valley Nursery, Southampton, who expired at his residence on the 27th ult. A few weeks previously, when engaged in advising a local tradesman in one of the principal streets of the town with respect to the best arrangement of some shrubs, Mr. Kingsbury stepped back and unfortunately fell down an open trap, and though his fall was materially broken, yet the injuries received sufficed to bring about his decease at the age of sixty-three years. Coming to Southampton some years ago, somewhat in the capacity of an amateur florist, the deceased joined himself to the business then being in course of establishment by the late Mr. Windebank, and though the business was a comparatively small one, yet as a florist's it was very active. Mr. Kingsbury possessed great taste for floral hybridisation, and taking in hand Chinese Primroses, raised many fine double forms, and secured one of the best single strains to be found in the kingdom sixteen years ago. With the zonal Pelargonium in its various forms very great things were done, especially in the production of beautiful tricolors, bronzes, silver bicolors, and plain-leaved kinds. Kingsburyana is still well known as a silver bicolor in many gardens, and one of the finest double Fuchsias bears the same name, and is but one of Mr. Kingsbury's many triumphs as a raiser. A record of all that he accomplished in this direction would indeed be full of interest. He was an active promoter of the Southampton Horticultural Society, and amidst a wide circle was greatly esteemed and respected.

BEGONIA: *A. Carter.* B. metallica folio variegata; the spray is Goldfussia anisophylla.

BOOK: *C. Warner.* Kemp's *How to Lay Out a Garden.* It is published by Messrs. Bradbury, Agnew, & Co., Bouverie Street, Fleet Street.

B.S.C.: *J. R.* By all means make yourself practically familiar with the use of the simple and of the compound microscope. Read Hentley's *Elementary Course*, 4th edition, and Sach's *Text-Book*, the 2d English edition, or, if you read French, Van Tieghem's *Traité*.

CAULIFLOWER FOR TRIAL: *Seedsman.* You can send it to Mr. A. Barron, the Superintendent, Chiswick, for that purpose, free of cost.

GOUTY SWELLINGS ON CONIFERS: *Lower Norwood.* See our columns for July 22, 1882. The remedy for the attacks is Fir-tree Oil.

CHRYSANTHEMUMS, &c.: *Rash Behary Roy.* The list of Mr. Ware, of Hale Farm, Tottenham, or that of Mr. Charles Turner, Slough, will give you the names of the best in each section. There is none that describes the whole of the old as well as the new kinds. We do not know any sort named "Hillieg." Six sweet-scented annuals for Calcutta might consist of Martynia fragrans, Mignonette, Ten-week Stocks, Sweet Peas, Marigolds, common, French and African, Heliotrope, and Petunias. To get seeds of Sweet Rocket and Larkspur in an unimpaired state, have them balled in soft clay, which can then be hardened by drying in the sun, or in an airy shady place. This is a good method to pursue with any seeds going to a hot climate when the transit takes some months. — *H. H.* The Chrysanthemums, if for show purposes, must be propagated in the autumn, as soon as it is possible to get good cuttings. Some plants are shy of making cuttings at that time; these may be encouraged late in the winter by gentle warmth to produce them, when they can be taken off. Early autumn-struck cuttings do very well in a cold frame, but for those later struck a very mild bottom-heat, in a bed covered with fine coal-ashes, in which the pots are plugged, may be employed. These late-struck cuttings will require considerable attention to prevent them damping off.

The Amaryllis will take about seven or eight weeks to bring into bloom in the winter season. To make sure of having plants in bloom when you want them the stock should be a large one. It is better to top-dress with rich sandy loam, unless the plants are very much potbound.

Spiraea japonica may be started any time during the next few months. Do not take them at once from the cold outside bed and plunge them into bottom-heat, but let the process of starting be a more gradual one. You may then expect good results.

The preparatory stage need not be more than two or three weeks—not five or six. You will not succeed with these unless the clumps have been well grown. They will require about two months in a mild heat from first introducing them from outside.

GRAPE VINE: *J. N.* The Claret Vine; so named from the leaves assuming a claret colour in autumn.

GROS COLMAR GRAPE: *E. Bland.* Such doubling of the berries is not at all unusual.

PRIMULA BLOOMS: *C. Whitaker.* These were uncommonly fine in colour and size, with forms sufficiently good for all decorative purposes.

### CATALOGUES RECEIVED.

JOHN DOWNIE, Edinburgh—Descriptive Catalogue of Vegetable and Flower Seeds, Gladioli, &c.

IRELAND & THOMSON, Edinburgh—Vegetable and Flower Seeds.

ALF. WATKINS, Hockerill and North Street, Bishop's Stortford—Flower and Vegetable Seeds.

### SEEDS.

LONDON: Jan. 7.—During the last few days there has been rather more business doing in field seeds, and some quantity, more particularly of red Clover seed, has changed hands. As regards Alsike, white, and Trefoil, there is no quotable variation. In grasses there is nothing doing. Spring Tares are dearer. Blue Peas and Haricot Beans, in sympathy with the advance in corn, are firmer. Feeding Linseed still tends upwards. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

### CORN.

At Mark Lane on Monday there was a more animated trade than for some time past, partly speculative, political as well as statistical movements having influence. English Wheat sold quite 2s., and foreign 2s. to 3s., above the rates of Monday se'night, the white Wheats showing the largest rise. Flour sold at a general advance of 2s. per sack, and the official top price of town flour was raised 4s., making 37s. the present quotation. Maize advanced 6d. to 1s. for the week, malting Barley 1s., grinding Barley 6d., and Peas 1s. per quarter. Beans remaining firm at late rates.—On Wednesday the rates for Wheat above recorded were not readily obtainable. The market for flour was quiet, and prices nominally unaltered. Barley was firmer, and met a good inquiry forward. Maize was firm on the spot, but weaker forward. Oats showed an occasional advance of 3d. over Monday.—Average prices of corn for the week ending Jan. 3:—Wheat, 31s. 11d.; Barley, 31s. 4d.; Oats, 19s. 6d. For the corresponding period last year:—Wheat, 39s.; Barley, 32s.; Oats, 19s. 3d.

### HAY.

Tuesday's Whitechapel Market report states that the Clover trade was dull; hay was in good demand, and the top price of straw advanced 1s. Supplies moderate. Quotations:—Clover, prime, 90s. to 107s.; inferior, 46s. to 73s.; prime second cut, 90s. to 100s.; hay, prime, 80s. to 95s.; inferior, 30s. to 63s.; and straw, 22s. to 36s. per load.—The Cumberland Market report states that there was a fair supply, with better demand, at the following rates:—Clover, best, 95s. to 108s.; inferior, 50s. to 80s.; meadow hay, best, 80s. to 90s.; inferior, 50s. to 70s.; and straw, 26s. to 35s. per load.

### POTATOS.

The Borough and Spitalfields Markets reports state that the demand was slow, and supply plentiful. leading Gardeners, free on application.

Pure Crushed Unboiled BONES, any size, for Vine

Borders, &c.

WHOLESALE AGENTS IN LONDON,

CORRY, SOPER, FOWLER & CO. (Limited).

## EUREKA!!

## INSECTICIDE.

Prepared by

WILLIAM SMITH, Chemist, Stockbridge, Edinburgh

Highest Award, Forestry Exhibition, Edinburgh.

"Clovefords," by Galashiels, N.B., July 25, 1883.

"Mr. Smith, Dear Sir,—We have now tried your Insecti-

cide on all the Insects we can find on any of our Plants, includ-

ing Orchids, and used as directed by you we find it instant

destruction to them all, while it neither stains nor injures the

tenderest leaf. We shall in future use no Fir-tree Oil, or other

Insecticide but yours.—We are, yours truly,

"WILLIAM THOMSON AND SONS."

WHOLESALE AGENTS—

CORRY, SOPER, FOWLER & CO.,

18, Finsbury Street, London, E.C.

Oil Paint no Longer Necessary.

HILL AND SMITH'S BLACK VARNISH

for Preserving Ironwork, Wood, or Stone.

(Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on

all outdoor work, while it is fully two-thirds cheaper. It was

introduced upwards of thirty years ago by the Advertisers, and

its genuine good quality, notwithstanding a host of unprincipled

imitators, is fully attested by its constantly increasing sale. It

may be applied by an ordinary labourer, requires no mixing

or thinning, and is used cold. It is used in the grounds at

Windsor Castle, Kew Gardens, and at the seats of many

hundreds of the Nobility and Gentry, from whom the most

flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon,

at the Manufactory, or 1s. 8d. per gallon carriage paid to any

Station in the Kingdom.

UNSOLICITED TESTIMONIAL.

"Pierrefield Park, June 21, 1876.—Sir,—I have this day

forwarded from Chepstow to your address a black varnish cask,

to be filled and returned with as good Varnish as the last we

had, which I candidly admit was the best we ever had. Address

Varnish to Pierrefield Park, Chepstow.—I am, Sirs, yours respec-

tfully, Wm. Cox."

CAUTION.—HILL & SMITH would particularly warn their

Customers against the various cheap Varnishes now so much

advertised.

H. & S.'s Varnish has been an article of common use on most

of the large estates in the kingdom for upwards of thirty years;

and their constantly increasing trade in it, and the numerous

Testimonials they receive, stamp it as a truly genuine article.

Every cask is legibly marked with their name and Registered

Trade Mark as above, without which none is genuine.

Large illustrated CATALOGUE of Fencing Hurdles, Field

and Entrance Gates, &c. sent free on application to

HILL AND SMITH, Brierley Hill Ironworks, Staffordshire;

118, Queen Victoria Street, London, E.C.; and 196, St. Vincent

Street, Glasgow.

Catalogues and Lists post-free.

**THE MOST POWERFUL BOILERS IN EXISTENCE.**

**Patent Horizontal Tubular Boilers A 1.**  
Have been giving unqualified satisfaction more than 20 years. Thousands in successful use. Possess the greatest area of heating surface. Will heat a greater length of pipe with less fuel than any other boiler of same size. Require a shallow smoke hole. Have no joints at the ends of the tubes as in other tubular boilers. Will last longer than any other boiler.

The following Unsolicited Testimonial speaks for itself:—

"The Gardens, West Ashby, Horncastle, Oct. 11, 1884.  
"Dear Sirs,—We have got the boiler fixed (a Horizontal Tubular A 1 Patent Dennis Boiler) and well tried. I am very pleased with it, both in its working and stoking. It makes the pipes so hot that we cannot bear our hands on them, although the arrangement of the pipes is very complicated. I never charged it yet more than half full of coke. We have another range of houses heated with a saddle which gives us a lot of trouble, and it it wants anything doing to it I will have it replaced by one of yours.—I am, yours truly (signed) GEO. MURRAY."

New, Revised, and Reduced PRICE LIST, just published, post-free on application.

**CRUMPTON AND FAWKES** (formerly T. H. P. Dennis & Co.), Heating Engineers and Manufacturers, Anchor Works Chemsford (London Office: Mansion House Buildings).

\* Comprises full size double furnace door, ashpit door and regulator, cranked dead plate, bearing bars, fire bars, three cleaning doors, damper, &c.

Says a Gardener of great experience:—"It is a wonderful Boiler. It is the best for keeping in sight that I know. It burns anything." "It will become a universal favourite."

Out of a great number in use these Boilers not one has been complained of. It will last out three wrought-iron Boilers. FOR SMALL CONSERVATORIES, for Heating from 50 to 100 feet of pipe.

An Independent Boiler, with furnace front, doors, fire bars and dead plate complete, and 6 feet of funnel. This is called the "LITTLE WONDER." It is fixed in the end or side wall of conservatory by any bricklayer: the funnel running up just outside the glass. It can be applied almost everywhere. It will keep in all night. It is worthy of its name. Price complete, 50 feet size, £4 15; 100 feet size, £5 15s.

If cheque is enclosed with order 5 per cent. Discount may be deducted; if not, reference to Banker required.

## WANT PLACES.

**POSTAL ORDERS.**—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at DRURY LANE, to W. RICHARDS; as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

**B. S. WILLIAMS** begs to intimate that he has at present in the Nursery and upon his Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Holloway, N.

**SCOTCH GARDENERS.**—JOHN DOWNIE, Seedsman, 144, Princes Street, Edinburgh, has at present on his list a number of SCOTCH GARDENERS, waiting re-engagements, at wages ranging from £50 to £100 per annum, and he will be pleased to supply full particulars to any Nobleman or Gentleman requiring a trustworthy and competent Gardener.

**RICHARD SMITH AND CO.** beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

**NOTICE.**—The undersigned, having several years' experience as a Planter in the Cultivation of all Tropical Products, is prepared to visit and Report on Forest Land, Cultivated Estates, &c., in any of the British Colonies. Can also devote some attention as a Plant Collector.—J. ALEXANDER, Uda Pusalawa, Ceylon.

Can be highly recommended for Bouquets, Wreaths, Crosses, Sprays, Epergnes, &c.—**F. P., Bon Marche des Fleurs, Westbourne Grove, London, W.**

#### GRATEFUL-COMFORTING.

### EPPS'S COCOA.

#### BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." *Civil Service Gazette*.

Made simply with boiling water or milk. Sold only in Packets, labelled thus—  
**JAMES EPPS & CO., Homoeopathic Chemists, London, England.**

**HOLLOWAY'S OINTMENT AND PILLS.**  
—Rheumatism and Gout.—These purifying and soothing remedies demand the earnest attention of all persons liable to gout, sciatica, or other painful affections of the muscles, nerves, or joints. The Ointment should be applied after the affected parts have been patiently fomented with warm water, when it should be diligently rubbed upon the adjacent skin, unless the friction should cause pain. Holloway's Pills should be simultaneously taken to reduce inflammation and to purify the blood. This treatment abates the violence and lessens the frequency of gout, rheumatism, and all spasmodic diseases, which spring from hereditary predisposition, or from any accidental weakness of constitution. The Ointment checks the local pain. The Pills restore the vital powers.

# CLEVELAND'S ALASKA PEAS.

THE QUICKEST BLUE PEA ON RECORD.

FROM the time this Pea was first chosen by the raiser, as being a model of a first-class FIRST EARLY BLUE PEA, the greatest pains have been taken in maintaining the type, and it is now considered perfection. Its height is about 2 feet, compact in growth, wonderfully productive, pods well-shaped and filled from end to end, six to eight Peas in each, ripening at one time—a most desirable feature to be maintained in a First Early Pea; flavour delicious and undoubtedly the earliest BLUE PEA introduced, and its hardy nature enables it to resist unfavourable weather. *Stock being limited it can be sold only in Sealed Packets.*

Half-pints, Retail, 2s. 6d. each.

# CLEVELAND'S R. N. Y. PEAS.

THIS FIRST EARLY PEA is now offered in quantities suitable to MARKET GARDENERS and others desirous of at once testing this highly recommended Early Pea. They will be sold under the name as above, in *original Sealed Packages*—

Two Bushel Bags, Sealed, 30s. per Bushel; One Bushel Bags, Sealed, 32s. per Bushel; Quarter Bushel Bags, Sealed, 35s. per Bushel.

*As the Stock in the hands of the raiser is very limited, early orders are solicited, it being desirable that they should be distributed as widely as possible.*

Seeds—white. Is beyond all doubt the earliest Pea yet introduced. It is of robust and branching habit, thus requiring less seed to the acre, and in a fair season presents the appearance of being clothed with pods. It is not only the earliest and most hardy, but the most productive, and it ripens so uniformly that the haulms can be stripped of 80 to 90 per Cent. of the pods in one picking. The pods are very large, and contain from six to nine Peas, of a flavour almost equal to that of a green Wrinkled Pea. Height 2 feet. No Pea has been put out with broader claims, nor been subjected to more severe tests.

To be had of—

Messrs. HENRY CLARKE AND SON, King Street, Covent Garden, W.C.  
Messrs. F. and A. DICKSON AND SON, Chester.  
Messrs. HOWCROFT AND WATKINS, Tavistock Row, Covent Garden, W.C.  
Messrs. HURST AND SON, 152, Houndsditch, E.  
Messrs. HARRISON AND SON, Leicester.

Messrs. W. W. JOHNSON AND SON, Boston, Lincolnshire.  
Messrs. NUTTING AND SON, 116, Southwark Street, S.E.  
Messrs. WAITE, NASH, HUGGINS AND CO., 79, Southwark Street, S.E.  
Messrs. JACOB WRENCH AND SONS, 39, King William Street, London Bridge, E.C.  
Mr. ROBERT COOPER, 90, Southwark Street, S.E.  
Mr. SAMUEL YATES, Manchester.

# SHARPE'S EARLY PARAGON PEA.

THE EARLIEST  
WRINKLED MARROW.

SEALED PACKETS.

One Pint 2s. 6d.; Half-pint 1s. 6d. each.

SEALED PACKETS.

THE EARLIEST  
WRINKLED MARROW.

First-class Certificate Royal Horticultural Society, 1884.

PARAGON shows in many respects a great improvement upon any variety at present in the trade. It is a Blue Wrinkled Marrow of fine flavour; height from 3 to 4 feet. The pods are produced two and three together in such abundance as to almost conceal the foliage. They are of an unusual size, broad and thick backed, containing from twelve to fourteen immense Peas packed in a double row as shown in the illustration.

Paragon is the earliest of the large Wrinkled Marrows, being ready before Prizetaker. It is very hardy, and will stand earlier sowing than any Pea of its class. It is most valuable for succession crops as it is not liable to mildew, and a constant supply of Peas for four months can be obtained from this one variety.

TRADE LIST OF SPECIALITIES ON APPLICATION.

## HARRISON'S EARLY ECLIPSE PEA.

The Earliest in the Garden.  
The Earliest in the Field.  
The Earliest for the Market.

See *Gardeners' Chronicle* and *Gardeners' Magazine*, December 6, containing a whole page of opinions.

The haulm is of a peculiar light colour, only 2 feet in height, the pods of a lively green and well filled, and is the heaviest cropper for an early variety we have ever seen. The seed is blue, and similar in appearance to the "Kentish Invicta," but it is harder and even earlier than that excellent variety.

This variety was selected by us from *Laxton's Harbinger* about eight years ago, and has no other origin. Many trials last season in different parts of the country have proved it to be the *earliest* Pea in cultivation. Although coming into blossom the same time as several other kinds, the pods fill so rapidly that they are ready for picking a week or ten days earlier.

Per Quart, 1s. 6d.; post-free for 2s.  
Per Bushel, 26s.

Highly recommended to Market Gardeners.

Price to the Trade on application.

Wholesale CATALOGUE free on application.

General CATALOGUE free on application.

ESTABLISHMENT

## NEW EARLY PEAS for 1885.

The Earliest and Best in Cultivation.

## DANIELS' GEM OF THE SEASON

SHOULD BE SOWN NOW.

From Mr. A. ARTHUR, Orwell Gardens, Cambridge.

"I sowed your Gem of the Season Pea March 29, and gathered them June 13, and sowed Laxton's Earliest of All March 15, and did not gather till June 29. This new Pea has proved what its name implies for earliness, productiveness, and flavour."

From Mr. T. NOTLEY, The Gardens, Stoke Hall,  
Stoke Holy Cross.

"The Pea, Gem of the Season, has proved itself a good one. I planted it at the same time and by the side of Day's Early Sunrise. I gathered from Gem of the Season ten days earlier, the pods were also full, averaging from seven to nine good sized Peas in each."

Height 2 feet, and very prolific.

Price, 3s. 6d. per quart, 2s. per pint, 1s. 3d. per half-pint.  
Free by Parcels Post to any address.

## DANIELS' MIDSUMMER MARROW PEA.

The Earliest Blue Winkled Marrow in Cultivation.

Height 1½ to 2 feet. Splendid cropper and quality.  
Should be sown now.

Price, 3s. 6d. per quart, 2s. per pint, 1s. 3d. per half-pint.  
Free by Parcels Post to any address.

*Daniels Bros*

Seedsmen to H.R.H. the Prince of Wales,  
NORWICH.

GENUINE

SEEDS.

# JAMES VEITCH & SONS,

## ROYAL EXOTIC NURSERY, CHELSEA, LONDON, S.W.

*Have pleasure in directing attention to the following choice NOVELTIES and SPECIALITIES, which are all of great merit and sterling quality:—*

**LETTUCE, Veitch's Superb White Cos.**

The largest and best self-folding variety in cultivation, of superior quality, very crisp and fine flavoured.

Per packet, 1s. 6d.

**CABBAGE LETTUCE, Veitch's Perfect Gem.**

First-class Certificate, Royal Horticultural Society.

A most distinct, compact growing variety, of a rich deep green colour, forming very early a close solid heart, beautifully crisp, juicy, and tender, and of excellent flavour.

Per packet, 1s. 6d.

**NEW VEGETABLE MARROW, PEN-Y-BYD**  
(THE BEST IN THE WORLD).

This new, most distinct, and exceedingly prolific variety is by far the best of Mr. Muir's hybrids, and superior to any yet in commerce; the fruit (weighing 4 or 5 lb. each), is of handsome globular form, creamy white in colour, of finest table quality, and particularly delicate flavour.

Per packet, 1s. 6d.

**BRUSSELS SPROUTS, Veitch's Exhibition.**

Unequalled for exhibition or for general use. The stems are entirely covered from top to bottom with fine large sprouts, which are very firm and solid, remarkably tender, delicate in flavour, and remain a long time fit for use.

Per packet, 1s. 6d.

**BEEF, PRAGNELL'S EXHIBITION.**

A remarkably handsome and distinct variety, with flesh of a deep rich crimson colour, eminently suitable for exhibition, and one of the best for general purposes.

Per packet, 1s. 6d.

**CABBAGE, ELLAM'S EARLY SPRING.**

First-class Certificate Royal Horticultural Society, 1884.

The earliest spring variety, of dwarf, close, compact habit, forming firm, solid hearts of excellent quality.

Per packet, 1s.

**MELON, HIGH CROSS HYBRID.**

Awarded First-class Certificates by the Royal Botanic and Royal Horticultural Societies.

The finest green-fleshed Melon, of handsome oval shape and beautifully netted; flesh of great depth, exceedingly tender and melting, and of the richest flavour.

Per packet, 1s. 6d.

**NEW TOMATO, Hackwood Park Prolific.**

Two First-class Certificates Royal Horticultural Society, 1883 and 1884.

The finest Tomato in cultivation for exhibition or main crop, enormously prolific, handsome, large, smooth, fruit of bright scarlet colour; flesh, firm and solid, of finest quality, excellent flavour.

Per packet, 1s. 6d.

**NEW CAULIFLOWER, Veitch's Pearl**

The best main crop variety for general use, pure white heads of fine texture, medium size, and finest quality; perfectly distinct and very desirable.

Per packet, 2s. 6d.

**NEW PEA, VEITCH'S CHELSEA GEM.**

The longest podded, greatest yielding, and best first early dwarf Pea yet introduced; gives a much larger crop than any other early dwarf kind: Peas, when cooked, are rich, sugary, and of marrow-like flavour.

Per pint, 2s. 6d.

## VEITCH'S NEW POTATOS, MISS FOWLER and M.P.

Each awarded First-class Certificates International Potato Exhibition, October 8 to 10, 1884; and also received the Highest Awards for Cropping and Table Quality from the Royal Horticultural Society, 1884.

### MISS FOWLER.

A handsome, late white Kidney, very heavy cropper, and a thorough disease-resister; tubers of moderate size, very even and of finest table quality.

Per pound, 1s. 6d.; per 4 lb., 6s. 8d.; per 7 lb., 8s. 6d.

### M.P.

A grand round white variety, of dwarf, stout growth; an enormous cropper, tubers all of most useful table size, and the quality is all that can be desired.

Per pound, 1s. 3d.; per 4 lb., 4s. 6d.; per 7 lb., 7s. 6d.

*For full descriptions of the above and other Varieties of Choice VEGETABLE SEEDS and POTATOS see CATALOGUE for 1885, forwarded, post-free, on application.*

# ROYAL EXOTIC NURSERY, KING'S ROAD, CHELSEA, LONDON, S.W.

# WEBBS'

—UNIQUE—

## NOVELTIES

### THE SECRET OF SUCCESS.

The unprecedented success of Messrs. WEBBS' Introductions in Vegetables and Flowers is no doubt owing, in a great measure, to the fact that, before being offered to the Public, they are invariably subjected to a series of crucial trials, with other first-class varieties, at their Kinver Seed Farms,—which are the largest in the Kingdom. By this means inferior varieties are discarded, although they may be oew, and only those kinds that are of distinctive merit become associated with Messrs. Webb's name.

## WEBBS' MATCHLESS BRUSSELS SPROUTS

From Mr. WILLIAM COX, Head Gardener to the Right Hon. the Earl Beauchamp.  
"Webbs' Matchless Brussels Sprouts is a fine dwarf variety. It is very productive and closes well."

From Mr. J. PATTERSON, Head Gardener to William Hambury Leigh, Esq.  
"Your Brussels Sprouts are rightly named 'Matchless.' It is the best strain I ever saw."

THE BEST STRAIN in CULTIVATION  
6d. and 1s. per packet, Post Free.

## SAVE 20 PER CENT.

Our exceptional position as the largest Seed Growers in the Kingdom enables us to offer our pure Stocks of Vegetable and Flower Seeds at very moderate prices, which, on comparison, will be found some twenty per cent. lower than those of other leading Houses.

Webbs' Spring Catalogue

# SUTTON'S

CHOICE

## NOVELTIES.

NEW MARROW PEA.

## SUTTON'S "SATISFACTION."

By far the most robust medium-cropping Pea in cultivation, and in productiveness is unsurpassed. The pods are produced in pairs, and are thickly set on the haulm. The Peas are remarkably large, and sometimes as many as ten are contained in a pod. When brought to table they are of a beautiful green colour, and even when quite old they retain their sweet and delicate flavour. The haulm is very stout, resists drought and mildew, and is easily distinguished from that of all other Peas. Height 3 feet.

Per quart, 3s. 6d.

THE

## Gardeners' Chronicle.

SATURDAY, JANUARY 17, 1885.

CREWE HALL, CHESHIRE.

QUITTING the great junction at the railway town of Crewe, ten minutes' walk brought me to the park and entrance gates of an old and noble family demesne. From the midst of a mushroom town which has been almost as sudden in its growth as some of the cities of the United States, you pass by a curious and immediate transition into a park of old timber where the feudal system still holds sway, however much it may be modernised, and however benignant in its operation.

Crewe is a town of very great interest, not merely on account of the workshops of the London and North-Western Railway Company with their cyclopean smithies and vast mechanical establishments, such as Sir Francis Head described them some years since, but for the admirable institutions established by the company for the instruction and welfare of their workpeople. But I am to notice here, not the town, but the family of Crewe, and the residence of the nobleman who bears the name. The Crewes date as a family of note from the early part of the twelfth century, and on tracing their genealogy we find that the main line failed at the close of the thirteenth century when a female succession took place, the lady marrying and losing her name of Crewe in 1294. It seems at first sight remarkable that the main line failed at the close of the thirteenth century when a female succession took place, the lady marrying and losing her name of Crewe in 1294. It seems at first sight remarkable that the mortality of sons should have exceeded that of daughters when we remember the frequent dangers that assailed the former as knights and soldiers during the Crusades and other wars such as those with France in the days of Agincourt and Cressy, the civil wars in the time of Simon de Montfort, the fatal wars of the Roses, which swept away half the landed proprietors of England, besides frequent family feuds and domestic strifes, in which the sons alone were involved.

In 1578 another misfortune occurred to this estate on the occasion of its sale to Sir Christopher Hatton. Luckily, it again came on the market, and as all men feel a natural affinity for their native earth, a Crewe came forward and purchased it. This new owner was no other than Sir Randal Crewe, Lord Chief Justice of England, and the brightest ornament of his family. Change, however, is the law of life, and very often vicissitude accompanies change. It was thought a great calamity, no doubt, when heirs male again failed in 1684; but the best and only remedy was soon applied, and as tinkers patch the pots that need repair, so great families solder up their ancestral lines. There is hardly a great family that has not been braced in this way—as, for example, when Sir Hugh Smithson married the greatest heiress of her time, and became a Percy by Act of Parliament. All that concerns us in regard to the gentleman who married the heiress of the house of Crewe, 150 years ago, is that he assumed, by authority, the name of his wife. His grandson was created Lord Crewe in 1806. Returning to Randal, the Lord Chief Justice, it was he who built the Hall after a design by Inigo Jones. It was worthy of the architect

being a handsome specimen of a house of the seventeenth century. Most unfortunately Crewe Hall incurred a common fate of houses of its class by the fire of 1866, when the beautiful structure of Inigo Jones was almost entirely destroyed, with the exception of the outer walls and the ornamental stacks of chimneys. A new house soon rose on its site, however, handsomer than the old one, and similar in its general style, being of red brick toned down in colour and relieved by stonework, so that its appearance is already as pleasing as those of any of the old Jacobean mansions, which are so much admired. The body of the building is of brick, but the door-cases, mullions of the windows, coinings, strings and cornices are of stone, and each front is broken by the projection of large bay windows affording relief to its otherwise straight lines, as well as agreeable light and shade. All these excellent effects are increased by the open work of handsome battlements, by stately clustered chimneys, and by the graces of a well-proportioned building. How superior is this architecture to that of our usual public buildings in London and elsewhere. The new house was completed in 1870, and consecrated by the Archbishop of York, the Bishop and Canons of Chester, and the clergy of the diocese.

Mr. Whittaker has charge of the gardens, which are comparatively small but well kept, with the help of five gardeners. The park is somewhat flat, but the house is raised slightly above it, and there are pleasing views of grass and old timber, seen through the intervals of great clumps of Portugal Laurels and Rhododendrons. These are all within the enclosure of a low wall, which fences the park from the house, and is in the same style of red brick, relieved by openings and by solid stone coping and strings. The family lions and griffins guard the gateway.

The north and east side of this handsome quadrangular hall are laid down respectively in lawn and flower garden, and across these and the large piece of ornamental water beyond them there are delightful views, with masses of distant trees which would anywhere be handsome, and by the water-side are still more so. Near the lawn, towards the kitchen garden, and easy of access for any member of the family who loves flowers, there is a large conservatory, well built and well planted and kept. Yew and Holly hedges bespeak the length of time that must have elapsed since the gardens were formed. In the park I noticed a great many old Hornbeams, weeping, as they always do when old, and far more ornamental than younger trees on that account. Part of the park is of heavy soil, and planted with Oak; the house is on dry, hard ground, with many Beeches and Limes upon it. I felt great interest in visiting this place, having heard that Lord Crewe's estate is in perfect order, the houses of his tenantry being in as good repair as his own, and knowing, too, that he is one of several landowners in Cheshire who encourage the farm labourers in cow-keeping, adding thereby to their comfort, and inducing thrift and good conduct, just as good large gardens do in other localities where the dairy is not so well understood. *H. E.*

**BOILERS.**—A trial of heating apparatus was held during the past year, at Paris, under the auspices of the National Horticultural Society. The tests were the rapidity with which a temperature of 85° C. could be obtained, the maintenance thereafter of an equable temperature as tested in all the competing apparatus at the same time every quarter of an hour, the quantity of fuel consumed per hour, and for an even temperature of 85° C. In addition, the facility of cleaning, of effecting repairs, the probable durability, and their practical application to horticultural purposes were tested. The first prize was withheld, but several minor ones were awarded.

## THE LATEST NOVELTIES.

(Concluded from p. 45.)

### GREENHOUSE PLANTS.

THERE is nothing very striking in this group. One of the most interesting is *Canna liliiflora*, originally introduced by Warszewicz some thirty years ago, but almost lost sight of until brought fresh into notice by M. André. It is a fine thing, but wants peculiar treatment, which our summers do not secure to it, and therefore its growth needs carrying forward in a warm greenhouse. It grows from 6 to 10 feet high or more, and is therefore just suited for planting out in a well-ordered intermediate conservatory, after being reared and brought forward in a pot. The stems are short, the leaves large, musæform, the flowers racemose, the individual blossoms 4 to 5 inches in length, tubular, the outer segments reflexed, tinged with green, the inner straight and recurved only at the top, white, with a slight tinge of yellowish-green, and the whole flower exhaling the odour of Honey-suckles. *Bouvardia scabra* is a very pretty and attractive plant, 1 to 1½ foot high, with hairy stems, ovate acuminate leaves, and dense corymbose cymes of bright pink flowers, having the throat of the tube whitish. It is a Mexican plant, and should work in well with those already in cultivation. *Echeveria metallica decora* is a handsomely variegated form, in which the leaves are variously striped with rosy-pink and creamy-white; it will require some attention to keep it from sporting back to the original glaucous green. In *Pentapterygium serpens* we have a very handsome *Vacciniaceae* shrub, of Indian origin and epiphytical habit. It has a remarkable deformed tuberous rootstock, from which grow out the pendulous branches, which are clothed with ovate-lanceolate, or oblong-ovate coriaceous evergreen leaves, and numerous axillary tubular flowers more than an inch long, pentangular, bright red, obscurely cross-barred with darker red. At Kew it is cultivated in a basket, from which its branches hang down, flowering about May.

Under this head, perhaps, but of course requiring something of special treatment for their successful cultivation, may be noted some dozen or so of hybrid *Sarracenias*, which are, even in their juvenile state, not only interesting and distinct, but really beautiful from the coloured venation. They are severally called *S. Atkinsoniana*, *excellens*, *exculpta*, *exornata*, *formosa*, *illustrata*, *Maddisoniana*, *Mitchelliana*, *rubra acuminata*, *Swaniana*, *Tolliana*, and *Wilsoniana*. Two or three of them have perhaps been mentioned previously, but the whole of them will prove attractive to the plant lover, and when they come to develop their flowers may turn out even more worthy of admiration than in the present leafy stage.

### HARDY AND HALF-HARDY PLANTS.

We shall divide these into the Shrubby, the Perennial, the Bulbous, and the Annual groups, and shall have one or two useful plants to mention under each.

One of the finest in the shrubby division is the *Yucca Whipplei violacea*. This handsome novelty was raised in the Jardin d'Acclimation at Hyères. It has the flowers drooping, 2 inches long and 1 inch across, and differs from the type in their being of a greenish-white, with the upper half deep violet-purple, the colours blending in the middle part of the flower, the anthers being also purple. It is a hardy plant, of much beauty. *Viburnum Tinus aureo-variegatum* is a pretty variety of the common *Laurustinus*, in which the leaves are margined with pale yellow. *Ilex Aquifolium*

*laurifolia aurea marginata* is rather a long name for a very handsome Holly. It is a golden-edged form of that variety in which the spines of the leaf-margins are nearly or quite suppressed, and which bears the name of *laurifolia*. *Hedera Helix aurantiaca*, a handsome Ivy, with bright orange-coloured berries, which has attracted some notice in France, and of which a coloured figure was published in the *Revue Horticole*, seems to be, the same as that known in this country as *H. H. himalaica*. *Kalmia latifolia major splendens*, though an old plant, is comparatively scarce, and, when exhibited, was much appreciated; its merits are that its flowers are larger and of a deeper colour than in the ordinary form of the species, the colour, when in the bud state, being of a bright cherry-red.

In *Cupressus Lawsoniana Fleetii* we gain a handsome silvery-leaved or glaucous variety, which has the silvery aspect in a much more marked degree than in other so-called silvery-leaved Conifers, and hence is all the more to be prized. *Acer japonicum aureum* has appeared at some of the shows, and is a very handsome Japanese Maple, differing from those ordinarily met with in the golden hue of the foliage, hence it is rather a desirable addition to the numerous varieties already grown, and the more so if it should prove to be a free grower as an outdoor plant. Finally, *Berberis congestiflora hakeoides*, from Chili, is rather an attractive Berberry, probably evergreen, forming a stout bush 6 or 7 feet high, the terminal branches elongate and decurved, and crowded with leaves and flowers, of which the first are nearly orbicular, with spinulose-dentate margins, and the second are deep orange-yellow, crowded along the branches in the axils of the leaves.

### PERENNIALS.

The perennial division includes *Callirrhoe lineariloba*, a pretty *Malvaceae* plant, with numerous trailing stems radiating from the crown; the leaves pedate-partite, the flowers nearly 2 inches across, blue, with a broad even edge of white on each side each petal; from Texas. *Eremurus Bungei* and *E. robustus* are two ornamental Central Asian *Liliaceae* plants of a genus not yet very familiar in gardens. The first grows 1½ foot high, with a long crowded spike of bright yellow starry flowers, having orange-red anthers. The second grows 4 to 6 feet high, with a spike 2 to 3 feet long, of pinkish-red flowers with a brownish centre rib to each of the six segments. *Campanula turbinata pelvisiformis* is a more modern form of the fine old *turbinata*, in which the pale blue flowers, instead of being cup-shaped, are almost flat or shaped, like a saucer.

*Pentstemon labrosus*, a very fine Californian species, is allied to the well known *P. barbatus*, and grows from 2 to 5 feet high, bearing profusely slender panicles of bright crimson-scarlet flowers, which differ from those of *P. barbatus* in wanting the beard or fringe of hairs at the mouth of the tubular corolla. *Primula dolomitica*, from the Tyrol, is a beautiful dwarf alpine species of the *Auricula* group. It has a tuft of oblong sessile hairy leaves, white, and minutely ciliate at the edge, and an umbel of bright lemon-yellow flowers, having a broadly funnel-shaped limb of obovate emarginate segments. The Indian *P. prolifera*, known also as *P. imperialis*, is another yellow-flowered species, blooming in whorls like *P. japonica*. It has long obovate-oblong leaves, and from two to six superposed whorls of faintly sweet-scented pale golden-yellow flowers, three-fourths of an inch across. It affects high elevations, growing in Sikkim at 12,000—16,000 feet, in Java at 8000—9000 feet, and in the Khasya Mountains at 4000—6000 feet.

### HARDY BULBS.

Of the bulbous group we have records of

*Allium macranthum*, from the Eastern Himalayas, a plant of Leek-like habit, with linear-lanceolate leaves a foot long, and tall scapes bearing a large umbel of dark purple flowers, and well adapted for the hardy flower borders. *Calochortus Benthani* is a little gem in its way, the flowers bright yellow, and produced abundantly. *Fritillaria imperialis inodora purpurea* is a brownish-purple variety of the Crown Imperial collected in Bokhara by Dr. A. Regel, and which, it is stated, has not the disagreeable smell of the garden form, which seems to have been obtained from Afghanistan. In this purple variety the crown or tuft of leaves is shorter, and the flowers at first stand erect.

## ANNUALS.

The annuals form a more limited group. We have to record *Papaver Hookeri*, a showy branching hairy plant, 3 to 4 feet high, with bipinnatifid leaves, and large flowers varying from bright rose to pale crimson with either a white or black spot at the base of the petals. It appears to be larger flowered than *P. Rhœas*, which it much resembles. The *Phacelia campanularia* from California, now for the first time being distributed, fairly comes within our range, and deserves special notice for the brilliancy of its corulean blue flowers. It is a dwarf branching hairy plant, with stalked

## MISS NORTH IN CHILI.

THE following is an extract from a letter written by Miss North to Professor Allman, here published by permission of the writer.

Miss North left this country last autumn with the view of studying the vegetation of the western side of the Andes, especially in the Chilean region, where she is now engaged in painting the characteristic features of that portion of the Andean flora, hoping thereby to fill up almost the only gap still remaining in her marvellous gallery at Kew.

One of Miss North's special objects in visiting that part of the world was to find an opportunity of painting the *Araucaria imbricata* in its native haunts. She had not yet, however, reached the proper region of

FIG. 14.—PLANTATION OF LIMA BEANS.

This scentless form, observes Dr. Regel, at present surpasses all the known forms in beauty, and with these advantages should quickly spread with its varieties through our gardens. Sundry new Tulips have also been introduced by way of St. Petersburg, chiefly from Turkestan. The most showy are *T. Alberti*, with bright red flowers marked at the base of each petal with a bifid obtuse yellow blotch; *T. Kesselringii*, with smallish yellow flowers; *T. Borszczoni*, with undulated foliage, and deep crimson flowers with the perianth segments apiculate, and having an oblong black blotch at the base; and *T. Ostrowskiana*, with bright vermillion flowers marked at the base with six small black angular spots margined with yellow.

roundish-ovate sinuately-toothed leaves, and terminal open cymes of campanulate flowers of the deepest brightest blue, rivalling that of the Gentian. *T. Moore*.

## THE LIMA BEAN.

THIS is a tall runner Bean, not much grown in this country, as it is considered to be too tender, though a correspondent at Abergavenny, to whom we are indebted for the photograph whence this illustration (fig. 14) was taken, is not unnaturally of a different opinion. In cold wet summers it rarely ripens its pods. For our tropical and semi-tropical colonies it is quite a different matter. The plant is a native of Brazil, where also it has been cultivated from time immemorial, seeds having been found in the ancient Peruvian tombs.

the *Araucaria*, which is at a considerable distance from her present quarters, but has made the necessary preparations for the journey, and hopes soon to get studies of this singular and characteristic form of Chilean vegetation.

Though reference to the *Araucaria* is thus necessarily omitted in her letter, Miss North's graphic account of the vegetation amidst which she is living will be read with no little pleasure by every one interested in the geographical distribution and physiognomy of plants, and in their significance as elements in the landscape.

"Apoquindo, Chili, Oct. 28, 1884.

"Dear Dr. Allman,—Again I am going to bestow on you the glories of a vegetable, too magnificent and unique to be appreciated by ordinary mortals. Last spring botanical journals told every one to go and see the Puya in the Cactus-house at Kew, and I made a hurried sketch in the midst of all my 'fixings' and vexations in the gallery. [A figure of *P. corulea* alias *Whytei* was given in our

columns, October 1, 1831.] I did not like to propose that such a precious plant should be taken into my room. Its relations here would not even own it! I have a flower of one leaning against the post of the verandah before me now, which is just as much as I can lift with difficulty. The flower-spike is over a yard long, its stalk 6 feet. It has sixty spikes, arranged screw fashion, round its stalk, each about a foot long, and round these are rosettes of flowers and some score of buds of the tenderest green or lemon colour. The great heads before the flowers come out are wrapped up in covers of white kid, tinted with salmon, getting darker as they fall aside and the lemon buds push themselves out, and the first flowers, which open round the base of the spikes near the stalk, are of the purest turquoise-blue; the new rosette which replaces them is darker, metallic-blue, and then all the others seem to get more and more green and faded the farther they get from the centre stalk, and more separate, with a background of brown bracts or leaves (the original white kid covers). Yesterday I rode and scrambled on foot far into the hills, and saw masses of these huge flowers. On one mass of silvery Pine-like leaves there were twenty-six flower-stalks, most of them brown heads of last year, with the seeds shaken out, and all growing on the steepest slopes, and having as companions giant Cacti, with a *Loranthus* parasite covering their sides, facing east or south; they are now covered with scarlet berries, which grow white when ripe, and are not bad to eat, tasting like Roses; the juice from the stalk of the white trumpet flower of the Cactus is also good. I am black and blue from the falls I have had on those steep banks, with no foothold but sliding stones and prickly bushes for hands to grasp as help, but it is worth some trouble to see such things. Every bush seems prickly or poisonous here, the 'Nettle,' a plant with red and yellow flowers (*Blumenbachia*) raises watery, blister-like burns, which last days on one's hands. When I see you, I shall ask you to tell me how and why it does it. I had a theory that it did not sting till the flowers had opened, but touched the buds once too often, and will not theorise in that way again. The common *Acacia* (much like the *Dornboom* or *Bauhub* of Africa and India) is terribly thorny, yet seems quite a favourite place for birds to build nests in, and one clever weaver makes his home of the very thorns, lining the inside with the soft gold ball flowers. I tried in vain to get the nest to take home—I brought out only bleeding hands, but it is painted; and I hope to get the bird from Dr. Philippi at the Museum. Another bird's nest with two eggs I found in a hollow dead Cactus pillar, made entirely of feathers, and one of the thorny sort wedged between two live Cacti. We went to a grand waterfall yesterday, the young landlord acting as my guide, and close under it I saw Darwin's Berberry. The tree, whose bark is used for soap, was growing in quantities there (*Quillaia*), with *Erecomarcus* hanging from it, and the tiny scarlet *Tropæolum* all over the lower bushes; also a lovely pink flowering creeper, whose name I forget. The other flowers are very tiny; several *Vetches* of different colours, *Oxalis*, *Lilies*, scentless *Heliotropes*, *Verbenas*, yellow *Forget-me-Not*, yellow and lemon *Calceolarias*, hanging from the rocks, and *Maidenhair*, which stands upright, not hanging. *Marianne North*."

## ORCHIDS FOR AMATEURS.

(Continued from p. 26)

**SORTS TO OBTAIN.**—After careful consideration of the class of Orchids which are most suitable for his house the beginner should get a few plants of the commoner kinds. It by no means follows that these are the least beautiful. A *Cattleya* costing 5s. to 10s. may, to the inexperienced eye, appear a far better plant than one which sells at as many guineas. The rich collector is anxious to possess something new; it may differ only in some small character from the commoner kind, yet it will often bring a large sum. There are two reasons for a high price being given for any Orchid. The first is its rarity in collections. A rare variety or a new one is always valuable. The second is the length of time some plants need for cultivation before they come to maturity and produce flowers.

As an example of the first I may mention such plants as the true autumn-flowering *Cattleya labiata*, of which I understand there has been but one small importation. The flower is a fine one. The plants in this country are very few. It grows well and flowers freely, hence its high price. White flowered *Cattleyas* and *Lælias* are also very rare and much coveted. As an example of the second the beautiful hybrid *Cattleya exoniensis*, reared by Messrs. Veitch, may be cited. This is a cross between *Cattleya Mossiæ* and *Lælia purpurata*, and if the labour and patience necessary for its growth be remembered, a plant is well worth the thirty or forty guineas which it brings in the market.

## SEEDLING ORCHIDS.

The rearing of an Orchid from seed is the work of a lifetime. Many years are frequently needed to grow a seedling into a flowering plant. The seeds of the *Cattleya* are as fine dust, they require months of sedulous attention before they begin to germinate, and then the young plants are too small to handle for years. Each succeeding season produces its small bulb. The first bulbs are very minute, those which follow are larger each year, but there is a long series between a bulb half an inch or an inch in length and one measuring a foot. Then there are the great risks the young plants are subjected to and the large number of failures. Let any one try to rear hybrid Orchids from seed and then he will see that such plants must always be very valuable. Again large plants of *Vanda Saccolabium*, and *Aërides*, require years to attain the size of flowering plants and are proportionately expensive.

## INEXPENSIVE VARIETIES.

Fortunately for those who wish to grow Orchids large numbers are fairly inexpensive. As a rule, recently imported plants, if good, bring high prices, as every one is on the look-out for something new. Large numbers are established by growers in the hope of getting a new variety or species. After they have been flowered they are sold, often for less than they cost in the first instance, certainly at a very moderate price, not because they are worthless or without beauty, but simply because they belong to varieties which are well known. Beginners often buy imported plants, which are difficult to establish and which cannot be expected to do any good for two or three years, and if they fail, as they are almost sure to do in inexperienced hands, they give up the attempt. It is better to buy established plants, which may be purchased cheaply enough, and learn to grow them; if they deteriorate, it is the fault of the grower. It stands to reason that if a plant is once established it must improve if properly treated; each succeeding growth should be better than, or at least as good as, that which preceded it. The bulbs grown in this country are usually much smoother than those made in its native place. Compare the new bulbs with the old ones; if each succeeding one is better than the one before, its success is assured. They may not be as good or as large as the imported bulbs, but that is not always to be expected; the great thing is that the plant should not deteriorate from year to year. In order to judge of the vigour and health of a plant, the following points should be observed:—

## RIPENESS OF THE BULBS.

The bulbs must be completely formed before the new growth starts, or at any rate soon after. A bulb scarcely grows after a new bulb begins to form from its base, therefore it must be fully formed in one season. Counting back from the growing point, the second bulb should be as large, or larger than any formed in this country. Many of the bulbs have eyes at the base, but the leading bulb, that next the shoot, in all those species which have perennial bulbs, is the only one which generally grows. If this is damaged or dies another eye will grow, but it is usually several years before the new growth attains sufficient strength to make flowering bulbs.

## KINDS OF ORCHID BULBS.

Some Orchids, as *Pleione*, have annual bulbs; each makes several shoots, and each shoot develops a flowering bulb, and the old bulb shrivels away at the end of the season. Imported plants, in which the leading bud grows during the voyage, seldom form a bud from it. The only chance for such plants is the development of a "back eye," an eye from one of the other bulbs. Such plants are sure to be some years before they flower. The roots of Orchids are produced from the base of the growing shoot, or from old roots; they very seldom grow from back bulbs; so that when they are once destroyed or damaged, one season at least will be lost. They generally grow before the leaves are fully formed, and must be well developed, or the bulb of the new growth will be feeble. The old bulbs supply the young growth with nutriment, and act as leaves, but unless the new growth gets roots of its own, they suffer in the process.

## THE ROOTS.

A plant without healthy roots depends entirely on the old bulbs and leaves for nourishment and moisture. The Rev. G. Henslow showed conclusively, in a

valuable paper read before the Linnean Society, that leaves drink in moisture from their surface, and there are no plants in which this process is more active than in Orchids. I have seen the leaf of a shrivelled plant become quite plump and healthy in two or three days when it has been sponged twice a day with warm water. This treatment will often save a valuable orchid. Dipping the leaves and bulbs, and draining off the water by inverting the plant, is equally efficacious in small specimens. Water must not collect in the cups of the leaves, the scales, or about the necks of the bulbs, or the plant will die.

## POTTING.

If the purchaser of a plant is quite satisfied with its appearance, and can trust the vendor, it need not be disturbed; but it often happens that Orchids are sold which are very badly potted. I generally turn mine out as soon as I get them, and repot them, except when I am satisfied with the potting. A plant is properly potted when its drainage is perfect. To test this immerse the pot in water up to the rim, not cold, but 10° above the average temperature of the house. The water should enter freely, the air should rush out at the top, and when the pot is lifted out the water should run from it in a full stream, drawing air into the compost with a hissing noise. Unless this happens there is something wrong. Most beginners and some nurserymen pot their plants too hard, or in non-porous compost: this is a fatal error.

*Cypripediums* and other semiterrestrial Orchids will bear much harder potting than the epiphyte kinds, but even these appear to me to do much better when planted in perfectly porous material; nothing does an Orchid so much harm as stagnant water, as it takes the oxygen from the roots. Plenty of air near the roots is absolutely necessary, and stagnant water acts as a poison, not only to Orchids, but to the greater number of flowering plants. *B. T. L.*

(To be continued.)

## DRAWING.

I NOTICE in the *Gardeners' Chronicle* for December 20 "A Young Gardener" would like a few directions as to how to set about "plan drawing." Well, although I am conscious that the space at my disposal is limited, and consequently I cannot go into minute details, I will endeavour to give "A Young Gardener" as many directions as I think he will need.

Although I have known a few isolated persons who could draw plans fairly well, and put their ideas on paper to a scale, who had not a knowledge of geometry, I should never counsel any one to attempt plan drawing without first making themselves familiar with at least the principal problems in geometry; and if "A Young Gardener" will procure a shilling book on geometry, a sixpenny plain paper exercise-book, and a box of compasses, and set himself diligently to work out the problems in the book, I promise him that he will find a great deal of pleasure in the knowledge of having worked out a knotty problem successfully, and he will be surprised to find what a variety of uses he can put his knowledge to to facilitate him in his work, &c. I confess to the fact that a glimpse of a work on geometry has rather a tendency to impress one with the idea that it is a lot of dry stuff, still I maintain that, like many other things, "it's not so bad as it looks."

Well, presuming our young friend has "waded" through the geometry, he will need to add to his appliances a drawing-board, T-square, parallel ruler, &c. I should then advise him to procure an old plan, and first of all to make a correct copy; then I should say reduce or enlarge the scale, and draw the plan over again to the new scale; and I feel confident, after going through these preliminaries, any young fellow will be competent to draw a correct plan of the place he is engaged at.

These directions, I am afraid, will induce many to think that it is rather a lengthy process; still I assure them it looks a great deal more formidable than it really is. Of course I do not mean to say that you can acquire either this or any other branch of education in a night or two—nothing can be learnt without patient application—but I always think that one feels quite recompensed by success for all the pains and trouble he has put himself to. If "A Young Gardener" makes a commencement, I trust he will try to do his best, and I heartily wish all who make the attempt a full measure of success. *F.*

## THE CULTURE OF CUCUMBERS.

**THE FITS.**—A good supply of Cucumbers throughout the year, but more especially during the summer and autumn months, is indispensable in most gardening establishments. The most suitable house to grow summer and autumn Cucumbers in is a low span running east and west, having the glass bedded in the best linseed oil putty, and on either side the central pathway a bed about 2 feet deep and the same width, with a flow and return hot-water pipe fixed from 2 to 4 inches above the floor-line in the centre of each for supplying bottom-heat, and these should be provided with gun-metal screw valves for regulating the bottom-heat; the air being admitted through the front sashes (about 21 inches deep and 4 feet wide), and a box 10 inches deep and the same width fixed in the ridge—the lid being raised and lowered by means of a crank and piece of sashline.

### THE BED.

Over the pipes about 3 inches thick of old brick rubble, the finest on the top, should be placed for drainage, to be followed with 18 inches deep of long stable-dung (including the horse-droppings), trodden firmly together, then a surfacing of short dung, after which the mounds of soil, consisting of three parts light loam, and one of short well-rotted dung and leaf-mould, well incorporated, can be made 3 feet apart along the centre of each bed, and about 1 foot deep, covering at the same time the short dung in the intervening and surrounding space with a couple of inches thick of the same compost, so that it may retain the ammonia arising from the fermentation of dung and droppings, and which would otherwise be spent in the atmosphere of the house, and perhaps injuriously affect young plants on shelves near the apex, unless the precaution under the circumstances has been taken of leaving a slight space open to let out the steam.

### THE PLANTS.

Meantime young plants of Rollisson's Telegraph and Tender and True, or any other variety, according to fancy, which may be had true to name—but which is sometimes a matter of difficulty—should be raised by sowing seeds singly in 3-inch pots three parts filled with light soil, consisting of three parts of light loam and one of leaf-mould. Cover the seeds with a little of the same soil, and then plunge the pots to the rim in a box of leaf-soil or sawdust, covering the latter with a square of glass; place over the hot-water pipes, where, after a few days, the little plants, if the seeds were good, will appear. They should then be placed on a shelf near the glass, and after they have made 2 inches of growth be top-dressed with soil, which should have been slightly warmed prior to being used, and so soon as the plants have made a few true leaves, and before the pots become full of roots, they should be turned carefully out—being thoroughly moist at the roots before doing so—and planted on the mounds. The soil should be pressed moderately firm about the roots, and afterwards watered with tepid water to settle it. Then put a stick for support, sufficiently long to allow for the beds subsiding 9 or 10 inches during the three following weeks, and meanwhile tie loosely to the first wire of the trellis, which should not be nearer to the glass than 15 inches, so that the plants and sticks may sink with the soil.

### TREATMENT AFTER PLANTING.

Shade the plants from bright sunshine until the roots have pushed well into the soil, after which it should be discontinued. Syringe the plants overhead morning and afternoon on bright days, to prevent the attacks of red-spider, and ventilate freely during favourable weather to secure a short-jointed sturdy growth in the plants. As the roots push through the sides of the hillocks, add a couple of inches of the same compost as that in which the plants are growing, and continue to make such additions until the intervening space is filled with soil. The base of the plants and the soil within 6 or 8 inches should, however, be left a couple of inches higher than that between the plants, to prevent the stems and the soil immediately surrounding them from becoming too damp by the lodgment of water. If this simple precautionary measure were more generally observed in the planting of Cucumbers and Melons, fewer complaints would be heard of the plants being affected

with canker. But should this preventible disease attack the plants, a mixture of lime and soot rubbed into the diseased portion of the stems will prevent its spreading, but as "prevention is better than cure," a little powdered charcoal should be placed around the collars of the plants, which will prevent a superabundance of moisture from settling in that quarter.

### RAPID FORCING.

If the object be to get Cucumbers as soon as possible from these plants, stop them as soon as they have reached the third wire of the trellis, and the shoots—fruit-bearing shoots—resulting from this stopping should again be pinched at one joint beyond the fruit, and leave only one of the latter to a shoot.

### GATHERING THE FRUITS.

Cucumbers should be cut before they lose that dark green colour and heavy bloom which indicate freshness and crispness, and not be left until a shade of yellow spreading over the fruit pronounce them to be overgrown and consequently unfit for salading purposes. The fruit should be stood on end in a saucer containing half-an-inch of water in a cool room until required for use. Train the young growths regularly and thinly over the trellis until the latter is furnished with fruit-bearing wood.

### SUBSEQUENT TREATMENT.

After the plants have been fruiting a couple of months, cut out some of the old shoots occasionally to make room for young wood, for herein, other cultural points being properly attended to, lies the secret of securing a regular supply of fruit from the same plants throughout the year. When the plants show signs of exhaustion lay on a surface dressing an inch thick of the same compost as that in which they are growing, and to which add a little of Beeson's manure, which is an excellent fertilising agent, at the rate of 3 lb. to a bushel of soil.

### PLANTS IN POTS.

A good supply of Cucumbers may also be obtained from plants grown in 12-inch pots, by keeping the roots well supplied with tepid weak manure-water when the plants are in bearing, and in other respects treating them the same as those growing in borders, which latter, owing to their having more scope for root action, will not require water at the roots so often. But regarding this matter no hard and fast line must be drawn.

### WATERING.

§ The cultivator must be guided in the application of water to the roots and leaves by such circumstances as the condition of the weather, the health of the plants and condition of the soil in which they are growing, together with the drainage and the mode by which bottom-heat is supplied to the roots. When, however, the condition of the soil and plants indicate dryness at the roots, let the supply of water be sufficient to thoroughly moisten the whole mass. Plants growing freely in borders prepared as indicated, and in which their roots have become a network, may have liberal supplies of tepid liquid manure given to the same without any fear of the plants being overwatered. Indeed such waterings are under the circumstances necessary to keep the plants in a healthy fruit-bearing condition. A humid rather than an arid atmosphere will be congenial to the plants in all their stages of growth.

### TEMPERATURE.

A night temperature of from 65° to 70°, according as the weather is cold or mild, should be aimed at, and 70° to 80° during the day with fire, running up 10° higher with sun-heat, and plenty of atmospheric moisture at shutting-up time in the afternoon. In the matter of putting on and taking off air, the cultivator should also be guided by the nature of the weather, and the stages of growth at which the plants may have arrived, but cutting winds must be guarded against, as such would check the growth of the plants.

### DISEASES AND INSECTS.

Should mildew occur as a result of a low temperature, and at the same time over-moist atmosphere, or red-spider, brought about by circumstances the opposite of those just stated, and perhaps dryness at the roots—apply flowers of sulphur through a distributor for the former (when the leaves are damp), and a soft-soapy water sponge to the latter, which will be the means of arresting their mischievous incursions; and should green or black-fly be troublesome, fumigate lightly with

tobacco-paper two evenings in succession, which will be more effective and safer than filling the house too full at one time. Syringe the plants well the succeeding mornings, and ventilate the house somewhat freely (weather permitting) for a couple of days afterwards. *H. W. Ward, Longford Castle.*

## VICTORIA REGIA.

It is a great pleasure to read of the success of this fine Water Lily, for when well grown there is no doubt but what it is one of the greatest attractions to any garden. No matter how extensive the collection of plants may be, visitors will crowd to see it. When reading the success which has been attained at Kew, and also at Mr. Dixon's at Leatherhead, it struck me a few words respecting the one growing here might not be out of place.

The plant in question was planted in April, 1840, and went on well without any check, which I think is the keynote to success, producing both leaves and flowers very fast. The following is the amount of flowers produced:—The first year after planting it produced thirty-two flowers and over forty leaves; the second year after planting it produced sixty-five flowers and about seventy leaves; the third year it produced seventy-six flowers and eighty-five leaves. This year there have been more flowers produced than even last year, but not quite so many leaves, neither have they been quite so large. The largest leaf was produced in August of last year, measuring 6 feet 8 inches across. It will be seen that this Lily has produced more numerous leaves and flowers than any on record.

The tank in which the plant is growing is 30 feet across. Although it may seem ample room for one plant to grow in, it has occasionally pushed some of its leaves over the brickwork, thus rendering amputation necessary. Twelve leaves on the plant at a time are quite sufficient, for if more be allowed to remain they crowd the tank, for if clear water is seen round the leaves it adds to their appearance.

The Victoria regia has been grown here for many years past, and I believe one plant attained the age of two years, but I think no plant has attained the age of four years in England before. When the plant can be kept over the winter there is a great advantage in the appearance of both leaves and flowers much earlier than on young plants raised the same year, thus rendering the season much longer.

We find the Lily-house, as it is called here, a centre of attraction to the many thousands of people who visit these gardens on certain days, hence it is a wonder there are so few Lily-houses in our large gardens. *C. Penford, Leigh Park Gardens, Havant.*

## APPLES AND SOILS.

I CORDIALLY agree with Mr. Ingram in his wish to see an exhaustive report of the soils, climate, &c., on which Apples exhibited are grown, but it is undeniable that to draw up such a report would be no easy task. To begin with, the geological formation on which any given garden may stand, as shown in the maps of the Geological Survey, would probably mislead anybody who attempted to generalise from it, inasmuch as in most cases it is covered with such a thickness of drift deposits (clay, sand, or gravel, as the case may be) that the roots of trees would never approach the actual rock. In this city, for instance, the New Red Sandstone (Bunter) only comes to the surface in a few spots, and the soil there is sandy and warm. But in most places it is covered by a varying thickness of sand or clay, or both, and there are gardens within a few hundred yards of each other standing respectively on a thick bed of drift sand, or still thicker bed of boulder clay, which underlies the former.

As regards climate, which is even more important than soil, both rainfall and temperature—and as regards the latter both the summer maxima and the liability to late frosts—have to be considered.

Further, there is the difficulty of ascertaining the names of the most prolific varieties, and the questions—arise of mode of growth (*i.e.*, whether on *Cross* west-Paradise stocks, whether standards, pyramids, at 7 P.M., or espaliers, aspect of garden, and will be read, the others which will present themselves to the ensuing year will deliver his

Probably the best way would be country into districts, somewhat like rainfall districts, and have separate ext one for early and one for keeping Apri

district. Local committees should be appointed to get up the required information on the points alluded to above. I venture to think that, if properly worked out, the result in increasing the production of this valuable fruit would amply compensate for the trouble. *Alfred O. Walker, Chester, Jan. 4.*

### EPIPHYLLUMS.

FEW, if any, stove or intermediate-house plants are more useful than these, for, besides their gorgeous beauty, they may be grown in a variety of ways, and they come naturally into bloom at a season when flowers are scarce, and last a long time in full beauty. For table decoration during the dead of winter they are quite unrivalled, as they may be grafted on stocks of suitable height and made to form neat symmetrical heads, which, owing to the gracefully pendulous habit of the Epiphyllums, and the brilliant blossoms hanging from the ends of the shoots show off to the greatest advantage.

To prepare them for the purpose referred to, two stocks are suitable, the one *Cactus speciosissimus*, and the other *Pereskia*, the latter being most in favour, as it may be propagated readily, and got to a size large and long enough to work in a year. The operation of grafting is a very simple and easy affair, as all that is necessary is to cut the stock back to any length that may be decided on, and then to make a slit in the end, about an inch down, in which to place the graft. This should be selected from among the ripe shoots of the Epiphyllum, and when taken off the way to trim it is to slice away each side of the end, so as to make it wedge-shaped, when it will be ready for inserting, and after this is done it may be made secure in its position by binding it round with moss and soft matting, the moss being required to keep the air out, and the scion moist and plump, till the stock and graft are united. This is soon effected, especially at this season, which is perhaps the best time for working Epiphyllums, as the scions are less likely to shrivel, and being done thus early they make their growth soon after and flower the following winter.

If pyramids are desired the *Pereskia* must be worked at certain distances all up its stem, varying the sides from top to bottom that the grafts may be opposite all round, and thus form regular plants, clothed from base to summit, which when in bloom will make a magnificent show. The way to insert the scions when grafting for pyramids is to make an incision through the bark just into the wood, extending downwards an inch or so, which will form a tongue-like flap, and when the grafts are prepared in the manner alluded to above, by making the end wedge-shaped, they should be bound in by using moss and matting, in the same way as the standards.

Not only may Epiphyllums be grown as pyramids and standards, but by running the *Pereskia* up under the roof of a house they may be worked on its branches and allowed to droop down, in which way they produce a striking effect, and also when suspended in baskets. For this purpose, and also for forming dense low plants in pots, they are best on their own roots, and to get the cuttings to strike all that is necessary is to take any of the firm shoots off with a heel, or break them off at a joint, and then insert them in sharp sandy soil, and place them on a light shelf up near the glass, where they can have a little heat to give them a start. As soon as rooted they should be potted on, or placed in the baskets, which need not be large, as at no time do Epiphyllums require much soil, but they will live and thrive with their roots in a very limited space, if kept well supplied with water when growing and blooming, a season when liquid manure is a great help. Plants that have become too large, or heavy in the head, will bear pruning or thinning, as all that is requisite to get them into shape, or lighten them, is to shorten them back, or break out shoots where they are too dense, as after this is done they soon start again at the ends. To encourage them to do this they should be stood where they can have a brisk temperature, and syringed occasionally with tepid water; but at the same time they ought only to be kept just moist at the cover, till young growth appears; and to have this hybrid *Cactus*, not it well ripened, the plants should be potted on, and to have this Mossiae and *Laelia* will harden the half-succulent shoots, patience necessary to set plenty of flower-buds. As plant is well worked, have done this they may be kept cool by it brings in the air the ventilator will admit, and a dry cold be pursued at the same time, which

will give them a rest, but when autumn sets in they must again have warmth by placing them in an intermediate-house, or cool stove, where if the atmosphere is not moist they will last a long time in full beauty.

To support standards or pyramids there is nothing equal to an iron rod made with triangular feet, and if wire stays are run from the top to the rims of the pots it will remain perfectly rigid, and appear neat at all times. Wooden stakes are very unsafe, as they rot quickly, and snap from the weight of the plants, several of which I have seen spoiled completely in the moving of them about.

Excepting greenfly when making their growth, or swelling their flower-buds, Epiphyllums are not subject to insects, and therefore are no trouble in keeping clean, as a syringing with tobacco-water, or fumigating, will settle the aphids and set the plants free. *J. S.*

### ASPLENIUM GERMANICUM.

HAVING always entertained a strong doubt of the supposed hybridity of *Asplenium germanicum* I have for many years, during occasional visits to Switzer-

FIG. 15.—ASPLENIUM GERMANICUM.

land, kept a close look-out for any forms which might serve to throw additional light on this debated subject, and, having always observed it associated with *A. septentrionale* and never with *A. rutamuraria*, it seemed to me highly improbable that it could be anything more than a mere variety of the former, an opinion which I am pleased to find is also held by our President, Mr. Boyd, who has kindly informed me of the facts which he recently brought under your notice touching this question. If my memory serves me, however, it was on one or two occasions found in company with both *A. rutamuraria* and *A. septentrionale* by the late Professor Balfour.

In 1877 I found some specimens on the Maloja Pass, above Chiavenna, similar in form to that recently exhibited by Mr. Boyd to the Botanical Society, having distinct fronds of *A. germanicum* growing from the same root with *A. septentrionale*, but there were unfortunately no intermediate forms proving their common origin, and I was unable to bring the roots home in a sufficiently good state to enable me to keep them alive.

In 1882 I was more fortunate in finding, near the same locality, several other specimens bearing on the same root every intermediate form betwixt *A. germanicum* and *A. septentrionale*. A few which are

here figured (fig. 15), will, I venture to think, help to decide the question. The roots which were brought home are still flourishing, and have put up a goodly crop of fronds, which are all typical forms of *A. germanicum*. This fact is especially interesting when viewed side by side with the instance noted by Mr. Boyd, who informs me that his specimen, varying betwixt the two forms, finally developed into *A. septentrionale*.

In the figures which I have given it will be observed that only the intermediate forms are figured, but there were on the same root other fronds, having the distinctive characters of each species. I need scarcely add that extreme care was taken to satisfy myself that there was only a single root, all the fronds being observed to issue from the same point. *John Lowe, M.D., King's Lynn, Botanical Society of Edinburgh.*

### BRANCHING POTATOS.

THE Potato of which we give an illustration (fig. 16) might have formed part of the stock-in-trade of the apothecary whom Romeo sought out on a memorable occasion. A similar one was shown at the Royal Horticultural Society on Tuesday last. The explanation we take is that a Potato, for some reason or other, takes to branching, the branches becoming tuberos, like the main tuber from which they spring. The phenomenon is of a similar character to that which produces fasciation in the Cockscomb, Asparagus, Pine-apple, &c., but the separation of the buds is carried to a greater extent.

### MESSRS. WEBB AND SONS' SEED FARMS.

THE HOME ESTABLISHMENT.—The pages of the *Gardeners' Chronicle* have, on not a few occasions, illustrated the remarkable progress made by several of the leading seed houses, both in London and the provinces during the past twenty years. A spirit of enterprise stimulated by a brisk competition, both at home and abroad, has done wonders in the way of developing business relationships, and the growth of these has made necessary the acquisition of large breadths of land suited for the cultivation of plants bearing seeds, an extensive plant in the way of appliances and machinery, warehouses of large extent, and a staff of foremen and assistants undreamed of by the seed trade half a century ago. Seed houses then, and later, doing a moderate business, and some who have launched their venture since, have steadily grown into enormous concerns, and made world-wide reputations. The efforts put forth to gain business notoriety (and they are some of the leading features of horticultural enterprise during the past quarter of a century) have operated to arouse the interest of thousands in the delightful pleasures experienced in the culture of plants and flowers, and so extended business ramifications. A large business—if properly worked—must in the nature of things grow, and grow rapidly too, and when this stage is reached the very accretion of business is enormous, customers are counted by thousands and tens of thousands, and if some drop away annually others come forward to take their places. The enterprise, forethought, daring, skill, and general business capacity required to work a large concern successfully can perhaps be imagined. It is sometimes said, in disparagement of large concerns [in the seed trade, that, like Aaron's rod, they swallow up many a small venture, but this is probably an exaggeration. It would not be difficult perhaps to prove that they are helpful in not a few ways to small businesses. That they are one of the facts of the age cannot be questioned, and we hope their influence is on the whole decidedly beneficial to the best interests of practical horticulture.

The seed business of Messrs. Edward Webb & Sons is, in so far as the garden and flower seed departments are concerned, one of comparatively modern development. The family have long been established at Wordsley, a busy village or township three miles or so distant from Stourbridge, in the direction of Dudley, Wordsley being the seat of the fine art glass trade. The Webbs have for a long time past been manufacturers of fine art glass, they are Hop and wool factors, they are corn merchants, in the sense that they deal largely in Wheats, Barleys, Oats, &c.; while grasses, Clovers, Turnips, and other agricultural seeds are traded in to a large extent.

That the departments of vegetable and flower seeds should be grafted into such a business will occasion no surprise, and their rapidly increasing business connections testify to the wisdom of this step. In order to accommodate the growing trade, new seed corn warehouses have just been erected at Wordsley, the whole series of business premises forming a block. These new warehouses are 120 feet long by 45 feet wide, they contain five floors, each 13 feet in height, and will be devoted exclusively to the seed corn trade.

#### KINVER FARMS.

Messrs. Webb & Sons being large growers of the

time to time, such as Electric Light, a main crop Marrow Pea, well adapted for exhibition purposes; Triumph, a prolific blue wrinkled variety; Stourbridge Marrow, another good exhibition variety; Kinver Gem, an early round blue type of dwarf growth, and highly productive; Perfection, a white round, of much the same type; Kinver Marrow, a second early variety, that is largely grown in the district; and lastly, one of the best Peas of modern introduction—Wordsley Wonder—the result of a careful cross, and, as we have seen it in gardens in different parts of the country, a valuable main-crop variety. In addition could be seen several seedlings of promise.

Monstrous in Lettuces; and others too numerous to mention. Specialities are now the order of the day: the better in character they are the greater is the sale they command.

#### POTATOS.

The Wordsley firm do an extensive trade in Potatoes. Of these there were some 65 acres at Kinver. Of such sorts as Reliance, a new white round of handsome appearance, and a good cropper; Webb's Early Ashleaf, selected strains of Magnum Bonum, Schoolmaster, &c., together with some seedlings undergoing a rigid test. Large breadths of Cabbage for seed were to be seen, especially Webb's Emperor, Early Drumhead, and other leading varieties, both for garden and farm purposes.

#### FLOWER SEEDS.

Flower seeds are grown in good quantities, and here were to be seen representatives of the most useful hardy annuals, with trials of Stocks, Asters, Balsams, Zinnias, Phlox Drummondii, Petunias, &c. We need scarcely state that the strains of these were all good and satisfactory.

#### SEED CORN.

Of especial interest for the agriculturist were the extensive crops of seed corn and other products for the farm. There were 172 acres of Wheat, including a new white Wheat, known as Webb's Kinver Giant; Webb's Challenge White, winner of the Gold Medal in France in 1882; and other important prizes; Webb's selected Golden Drop, and several others suited to varying soils and purposes. Of Barley there were some 250 acres, including Webb's new Barley Golden Grain, Webb's Kinver Chevalier, Webb's Beardless, &c. Of Oats there were 167 acres, including Webb's New White Tartarian, Webb's Prolific Black Tartarian, Webb's Challenge White Canadian, &c. Harvest operations with

#### ROOTS,

Swede and Turnip seeds, were in full force on the occasion of our visit, while large breadths of Mangel were within a few days of being ready to cut. The bulk of the Swede, Turnip, and Mangel seeds is grown for them in other suitable districts from stock seeds supplied by themselves to those who hold contracts. We saw many acres of Webb's Imperial or Great Swede, of Mangels and common Turnips, and of those growing on the Kinver Farms; they looked exceedingly well. These were being grown to produce roots to be selected and transplanted in 1885 for the purposes of obtaining stock seeds.

#### MISCELLANEOUS.

A good portion of the Kinver grounds is devoted to the growth of Strawberries, of such leading sorts as Eliza, Keeos' Seedling, Black Prince, James Veitch, President, Sir J. Paxton, Sir C. Napier, British Queen, and Dr. Hogg; Rhubarb, Seakale, Asparagus, Artichokes, herbs, &c. Then there were large breadths of Carrots, Parsnips, Kohl Rabi, &c. That a firm so extensively engaged in the agricultural seed trade, and so famous for the displays of roots, seeds, &c., it makes at the annual meeting of the Royal Agricultural Society of England and other important gatherings, should from time to time secure important awards need not be a matter for surprise. These are made directly to themselves or to their customers, and they testify to the value of the stocks of seed supplied by them. The garden and flower seed warehouses at Wordsley, as well as the offices for clerks, &c., are in keeping with so large a business, and the well-being of their employes is not overlooked by Messrs. Webb & Sons. Elaborate catalogues are issued, the compilation of which must necessitate a heavy outlay. At every hand numerous details of an instructive and interesting character arrest the attention of the visitor. We have simply endeavoured to focus some of the leading details; a great deal more can be imagined than can possibly find a place in a necessarily abridged report.

ROYAL METEOROLOGICAL SOCIETY.—The annual general meeting of this Society will be held, by permission of the Council of the Institution of Civil Engineers, at 25, Great George Street, Westminster, on Wednesday, the 21st inst., at 7 P.M., when the report of the Council will be read, the election of officers and Council for the ensuing year will take place, and the President will deliver his address.

FIG. 16.—A TUBEROUS PALM! (SEE P. 80.)

seeds they sell, have extensive seed farms. The Kinver Seed Farms occupy an elevated position on a fertile ridge some 6 miles or so from Wordsley; they exceed 1600 acres in extent, a great portion of the land being freehold; in addition, large contracts are taken by farmers and others, both here and on the Continent. The soil of the Kinver Seed Farms is particularly suitable for the growth of crops, and one of the principal uses to which they are put is to grow selected stock for seed purposes, all of which are "rogued" with the utmost rigour.

#### NEW PEAS.

The growing crops at Kinver during the past summer included a trial of some 130 reputed sorts of Peas; among them we had opportunity of inspecting some new kinds put into commerce by this firm from

#### SEED TRIALS.

A special feature of interest in a seed farm of this character is the trials of selected stocks. Experience has taught that at times stocks of high character will sometimes deteriorate from causes not always apparent, and thus it is that Messrs. Webb & Sons, in common with other large seed firms, are always on the alert to obtain special selections, in order to maintain their supremacy. Here was Webb's Dark Red Beet, medium size, good in shape, and with bright blood foliage—a model Beet of the Dell's type; a selected Scarlet Runner, the Victoria Dwarf French Bean, the Kinver Mammoth Longpod variety; Webb's Matchless Brussels Sprout; a fine main crop Broccoli, appropriately named Webb's Perfection; their Champion Cabbage, an early handsome type; Webb's new Summerhill Cabbage, and

## The Arboretum.

### PROTECTION TO RECENTLY PLANTED EVERGREENS.

In severe winters the lowest temperatures may usually be looked for during the last week or two of the old year, and the corresponding time at the beginning of the new; yet still there have been and no doubt again will be, exceptions when destructive frosts have come later on, and it is not always the lowest temperatures that do the most injury to recently planted evergreens. The keen cutting winds that sometimes accompany frost of less severity are often the most destructive, and although up to the time of writing we have so far escaped frost of any consequence, still it is well-to be prepared for the biting winds, with or without frost, that are all but certain to come later on. Where the work of planting evergreens has been delayed until near the end of the year, as in many cases this season has been unavoidable, it will be well-spent labour to give such things as usually suffer most a little protection. Hollies, Arbutus, Portugal Laurels, Berberies, and others of like character, with the better kinds of Conifers, generally suffer most through late autumn planting, particularly in exposed situations; but it is often surprising what a little protection it takes to make the difference between injury or death and their coming through the ordeal scatheless. A Spruce branch, a stout piece of Gorse, or in fact anything in the shape of an evergreen stuck firmly into the ground at the windy side of the recently moved plant, will frequently be sufficient to tide it over the trying time. Even in such mild winters as the two last were, when in many parts of the kingdom there was scarcely frost enough to kill bedding Pelargoniums, when the keen easterly winds came later on, such slight protection as afforded by the above simple means had a marked influence in preserving evergreens that were planted too late to make roots before the close of the year. *T.B.*

### CANADIAN FRUIT.

FROM an interview with A. H. Johnson, of Wolfville, Nova Scotia, an active and promiscuous member of the Fruit Growers' Association, we learn that there are some splendid openings for settlers, both in Nova Scotia and New Brunswick, to enter into the cultivation of fruit for local and other markets. There is also a specially fine opening for experienced nurserymen, with a moderate capital, to open nurseries for supplying fruit trees in those provinces, nearly all trees now used requiring to be brought a long distance, and at a considerable expense and risk, by railway from Ontario or the United States nurseries.

The demand for the fruit products of those provinces far exceeds the supply, and is rapidly increasing as its quality becomes known. The climate is exceptionally well adapted for the growth of many varieties of fruit. It is generally admitted that the fruit grown in that locality, especially in the "Annapolis Valley," so called, in Nova Scotia, has a finer flavour than any American Apple. This is to be in some measure accounted for by the dampness of the climate, by the absence of extreme heat, by the position of the lands protecting them from the damaging winds, and especially by the shorter summer season of the northern latitude, ensuring more rapid maturing of the fruit.

The proximity of the fruit-growing portion of those provinces to the seaports of St. John and Halifax, which are open all the year round, in addition to their direct and rapid communication with the largest consuming markets of the United States, as well as with this country, gives them exceptional facilities for this special trade.

#### COST OF PRODUCTION.

Good improved Apple growing lands, well situated, can be purchased for 20 dols. (£4 to £6) per acre, and even less. In some cases, where they are situated off main roads, or where society is not so good, this price would include ordinary buildings. It of course rarely occurs that a whole farm would be adapted for fruit growing, but it is not advisable in that country to depend entirely upon fruit—the most successful mode being mixed farming, having

only moderate sized orchards, where position and soil are best suited.

In preparing for a new orchard, and to do it full justice, it would cost about 12 dols. 50 cents (say, £2 10s.) per acre. If the land, as in most cases it is, were under a proper state of cultivation, the cost would not be nearly so much. The cost of the trees, about fifty per acre, would be about 12 dols. 50 cents (£2 10s.). With the same preparation of the earth it is customary to plant Plum trees between the Apple trees, without in any way interfering with them. These trees will cost 12 dols. 50 cents (£2 10s.) per acre. In the meantime, while waiting for the growth of the Apple and Plum trees to their bearing maturity, it is customary to use the land for what is known as "hoed crops," such as Indian corn (Maize), Potatoes, Peas, Beans, Carrots, Turnips, thus keeping the soil mellow, and the top-dressing used for these crops gives sufficient nourishment for the trees. These crops are generally sufficient to pay for all expenses of cultivation, except probably interest and taxes on the original outlay.

#### PLUMS.

The Plums will begin to bear fruit in about three years, and some in two years. Allowing a fair average product for the third year of, say, 25 bushels per acre, worth, say, 75 dols., these will then increase rapidly in their product, reaching, say, in the sixth or seventh year, about 1½ and even 2 bushels per tree, or about 225 dols. (£45) per acre. If carefully packed, boxed, and properly handled, even 50 per cent. better prices can be obtained.

#### APPLES.

The Apple trees will begin to bear to a considerable extent in from seven to ten years, in seven years many producing a half barrel, and in ten years a barrel per tree, say 50 barrels per acre at 2 dols. (8s.) per barrel (a fair average price on the ground). In about fifteen years their yield will increase to about 2 barrels per tree; at 2 dols. (8s.) this will give 200 dols. (£40). With these, as with the Plums, judicious picking, packing, and selling will materially add to the price.

Windfalls and inferior grades of Apples can be used for evaporating, cider making, &c., and should pay for barrels, expense of gathering, &c. In making calculations it is well to remember that Apple trees produce more abundantly every alternate year, while an occasional loss of Plums by frost will have to be allowed for.

In most cases the Plum trees will last twenty years, being productive without interfering with the Apple trees.

#### SHIPMENT.

As regards the shipment of Apples, particularly for the English market, considerable experience and great judgment are required to do it successfully. At the present time many mistakes are being made, and much valuable fruit lost by shipping at improper seasons, also in sending fruit not suited to the market.

Shipments should be as follows:—First, Gravensteins, commencing from October; they should not be shipped later than November 1. Golden Ball, fall Jennetting, Duchess, Oldenburgh (Russian Apple), Munson Sweets, Snow Apple (Fameuse), as well as the Emperor, may be included in this shipment, but there shipment is not advised unless the crop should be short in England.

No. 2 shipment from November 1 to December 1, should include Ribston Pippins, Blenheim Pippins (Blenheim Oranges), King of Tompkins County (known as Kings), Spitzenburg, Blue Pearmain, Hubbardston's Nonsuch.

It is not wise to ship to London market after December 1 until about January 10, or so as to reach there about January 20, the market always being dull for some time after the Christmas sale.

No. 3 shipments may be made from the middle of January, or say the 20th, to about February 15, and should mainly consist of Baldwins, Rhode Island Greenings, and Golden Russets; Vandeveres, if shipped at all, should be included in this lot, but they are not liked in the London market, and their shipment is not advised. This variety is poor in quality, but splendid keepers, and would do for reshipment, country orders, &c.

No. 4 shipments, from February 20 as late as March, and even April, consist of the Nonpareil (Russet) and Northern Spy. These comprise the main varieties exported. Besides these there are a number which have but limited shipment, such as

the Baltimore Pippins, King of the Pippins, Twenty-ounce Pippins, Calkin's Pippins, Westfield Seek-no-farther, Pomme Grise, Cayuga Redstreak, Pound Sweet, Yellow Bellefleur, Porter, &c.

The markets for Plums are mainly local, but large quantities are shipped to Boston, New York, &c. The leading varieties are the Nectarine, Washington, Imperial Gage, Red Gage, Yellow Gage, and Green Gage, Duane's Purple, Prince of Wales, Bradshaw, Smith's Orleans, Black Damson, Magnum Bonum, several varieties of native Plums, including Blue Plums.

Other kinds of fruits grown include almost all varieties of Cherries—Black Heart, White Heart, common Kentish (red Cherry), Black Eagle, Black Tartarian, Yellow Tartarian, Yellow Spanish, and other varieties. Peaches, Quinces, Apricots, and Grapes, in great variety, grow in the open air, and without protection, as even wall fruit. Crab Apples of all varieties are plentiful. Strawberries, Raspberries, Blackberries, Blueberries, Whortleberries, high and low bush Cranberries, are abundant in both wild and cultivated states. These berries are now becoming a large article of export, both tinned and otherwise preserved, but especially in the shape of syrups. The wild varieties are acknowledged to produce the finest fruit syrups obtainable, and large shipments are now being made to the United States and the Western Provinces, as well as to this market.

A large establishment has also recently been constructed for evaporating these and other fruits, and is meeting with great success. *Canadian Gazette.*

## The Herbaceous Border.

### TREE PÆONIES.

I NOTICED a few weeks since an article on the herbaceous varieties of Pæonies. I am at a loss to understand why it is that so few of these beautiful and truly gorgeous plants are to be found in our gardens. Why are they not more grown? For years I have had about thirty varieties, and when in bloom I deemed them a sight worth seeing, but if so, still more their neighbours in my garden, the grand and, if possible, yet more gorgeous, the Tree Pæonies (Moutan). Look at them how you will, either as to their foliage, its form, or its colour, or the grand flowers, whose size and (if I may use the term) presumptive contour, will take the attention of one passing, by storm as it were. It is this one grandest of flowering shrubs that is such a favourite with both the Chinese and Japanese artists, pictured as it so often is on their pottery and other art productions. For some years I had but two or three varieties, two of which I got from Belgium, when I was so fortunate as to have a note from Dr. Wallace, of the New Plant and Bulb Company, telling me of the number of forms of beauty that the late Robert Fortune had imported. This ended by my getting together about thirty, different in colour both of foliage and flower, and well was I rewarded for my venture. I had some of the most noble, the most gorgeous-looking blooms I ever beheld on any plant: I measured one, a brilliant deep rose colour, and found it to be 1 foot in diameter, or 3 feet in circumference. This was the largest, but there were many others of great pretensions in this direction. Their colours were varied, chaste, and charming. The single sorts had attractions of their own, but I much preferred the double varieties. When out of bloom how elegant is their foliage, so very different from their surroundings, both in form and colour, scarcely any two alike—here a purplish-green, there a red, and now an emerald. On a lawn or a shrubby border, well backed up with evergreens, they are admirable. Care should be taken that they are planted in such a position that they do not get the morning sun, as the young leaves are apt to get scalded, otherwise I have found them perfectly hardy. Unfortunately, I lost most of their names, some being carried off, I think, by magpies or mice, as I found one or two in a wood close by. I remember a fine white as the Bride of Chusan, then there was the Beauty of Nankin, a blush; a very bright deep rose was Robert Fortune, and a reddish-lilac Cordelia, then there was a Mandarin, light purple. But I trust I have said enough to draw attention to a noble family of plants, which, with all their boldness of colour and line, have not yet attracted from the lover

of brilliant colour in the garden that attention which they most justly and decidedly deserve. *Harrison Weir*.

#### PINK TOM THUMB SCARLET.

I remember several years ago being at a show in the Old Deer Park, Richmond, and seeing a splendid basketful of this exhibited by Messrs. Veitch, of Chelsea. The plants were very dwarf and the flowers bright scarlet; in every way, as far as I could judge, a plant likely to become exceedingly popular, but I have never seen a plant in flower since, and I have failed to get it, and understand Messrs. Veitch cannot now supply it. Can any reader of the *Gardeners' Chronicle* supply any information about it? I presume it is but slowly increased. *R.*

## THE PROPAGATOR.

### THE PROPAGATION AND CULTURE OF ANTHURIUM.

SECTION I.—*ANTHURIUM SCHERZERIANUM* AND ITS VARIETIES.—These plants are admirably fitted for the decoration of the stove and conservatory; they are of an evergreen character and flower very freely, each flower, or rather spathe, blooming in perfection for several weeks, and, what adds greatly to their value, they are in flower nearly all the year round. Unlike many other beautiful plants which cannot be used for decorative purposes because of their delicacy, the Anthurium, with its elegant foliage of a leather-like substance and beautiful persistent spathes, will stand a great deal of rough usage in the way of decoration. *A. Scherzerianum* var. *alba* forms an admirable contrast in a group of plants with *A. Scherzerianum*, and a greater beauty will be added to this if it is edged round with *Adiantum* var. *Lycopodium*. Of the other varieties of *A. Scherzerianum*, *A. S. pygmaea*, as its name indicates, is a dwarf variety which is well suited for the front row; *A. S. giganteum* is an exceedingly fine variety, having very large spathes of rich colour; *A. S. Cyphertii* is a truly noble variety, and produces in great profusion immense spathes of fine colour, 6 inches in length by 4 inches in width, borne on flower-spikes from 18 inches to 2 feet in length. *A. S. Wardii* has also a splendid form.

All these varieties will grow well in a temperature from 55° to 65°. They should be placed in a shady part of the house and kept well watered at the roots during the summer months, although in the winter water need not be given them unless they are getting dry. They should also be syringed, but this must be withheld during the flowering time. In fine weather plenty of air should be given them, and the injurious effect of the fierce rays of the sun can be checked by light shading, but as soon as the sun has disappeared the shading should be removed. When the plants are making young growths, and also while they are throwing up flower-spikes, the greenfly often proves very troublesome, and in order to prevent the damage they do it is necessary to smoke the house very moderately for three nights in succession when occasion requires it. Heavy smoking, which often does more damage than people are aware of, should at all times be avoided, and three moderate smokings is far better for the plants than a single night of heavy smoking. The present is the time for potting these varieties, and they will grow in almost any soil, but they will last longer in good health and produce a greater quantity of roots when potted in the following mixture of soil, viz., half good fibrous peat, quarter turfy loam, and quarter river sand, to which should be added a small quantity of finely chopped sphagnum moss, a little charcoal broken into pieces of Walnut size, and finely broken potsherds or ballast, or a little broken sandstone. In potting these plants their crowns should be kept about an inch above the level of the pots rims, and the soil must be very firmly pressed around the plants.

#### FROM SEED.

If large quantities of the plants are required they can only be obtained from seed, but as purchased seed is not always to be depended upon, occasional fertilisation becomes necessary. In doing this a fine brush should be drawn up and down the spadix to ensure a large quantity of seed. As soon as the seed is ripe it should be sown, first, however, separating it from the glutinous substance surrounding it. Well

drained pans filled with the soil above given sifted and rubbed through a  $\frac{1}{4}$ -inch sieve should be prepared for the seed. The soil should be solidified and levelled by a good watering, and should be allowed to stand for an hour before the seed is sown, which should be done lightly and on the surface. The seed-pans must be placed in a cutting case or frame upon a gentle bottom-heat, watering them as soon as dry and shading them from the sun, and for an hour each night and morning air should be given them. As soon as the seeds have germinated, and the seedlings have grown an inch in height, they can be taken from the cutting case and placed upon the open bottom-heat, where they should remain for about eight days to harden them for potting. After potting them separately into small thumb-pots in the soil above-named they must be well watered and placed in a good warm growing house upon a moist shelf on a front platform. The pots should stand on an inch of river-sand or sifted ashes. The plants should be sprinkled night and morning with a fine rose pot, and as soon as they are strong enough they can be potted into small 60's, but whenever they are potted the crown of the plant should be kept about an inch above the top of the pot. The plants in 60's must be kept well watered at the roots, besides being lightly syringed twice daily, and on every fine day a good supply of air should be given them. They should be treated in this way until they are strong, when they should be potted, the strongest in large 48's, and the rest into small 48's. After well watering them replace them upon the platform, and as they grow stronger more air should be given them. They can be potted into larger sizes as occasion demands.

There is another way of increasing Anthuriums—i.e., by cutting a piece about 1½ or 2 inches long out of the top or trunk of the plant; care must, however, be taken to see that each piece so cut out has two or three roots upon it. Pot up the pieces, putting a little sand at the bottom of each piece, which should also be kept in its place by three sticks to which the three strongest leaves should be tied. When they have been well watered place them upon a gentle bottom-heat in a close warm house, but as soon as they have well rooted they should be removed to a cooler house. With regard to the old plants that were cut down, a little dry sand should be placed on the new cut for three or four successive days, in order to prevent the sap from exuding, and then put a stick to the middle of each plant, looping up to it three of the principal leaves. These also form good stock plants, for they are continually throwing up young growths from the base, which can be taken off and potted in the usual way. *T. O.*

(To be continued.)

## Orchid Notes and Cleanings.

### ORCHIDS AT LYTHE HILL.

ON visiting Mr. Evans the other day at Lythe Hill, the beautiful seat of J. Stewart Hodgson, Esq., I saw some fine Orchids in bloom of the following species:—*Vanda insignis*, *V. tricolor*, *V. suavis*, Veitch's variety, the latter splendidly furnished down to the pot, having twenty-five pairs of leaves upon it in good condition, the leaves being beautifully green; *Phalenopsis violacea*, *P. Schilleriana*; *Cypripedium Harrisianum*, several flowering double; *C. barbatum*, *C. barbatum nigrum*, and a very handsome plant of *C. Sedeni*, measuring over 3½ feet through, it having sixteen beautiful branched spikes of flowers on it; *C. Spicerianum*, in the same house, was doing well. Of *Calanthes*, which are grown very extensively, being much employed for dinner-table decoration, there really was a grand display—upwards of 250 spikes of flowers; some of *C. Veitchii*, measuring 4 feet long; among them were some grand dark varieties. They were tastefully arranged with foliage plants, which gave them a very pretty effect. *C. vestita lutea oculata* and *C. Turneri* were just showing flower. *Pilumnus fragrans*, *Maxillaria maculata*, *Lycaste Skinneri*, *Odontoglossum grande*, *O. Roezlii*, *O. Rossi majus*, *O. Alexandræ* were finely in bloom. Some fine types of these with large flowers and broad lip much barred and fringed were seen, one having a spike of fourteen fully expanded flowers. I noticed also a variety with a narrow lip nearly white, part of an importa-

tion by Messrs. Veitch some fifteen years ago. *Masdevallia bella*, *M. tovarensis*, *M. amabilis* were growing in a cool house with the *Odontoglossums* and doing well: they will shortly make a good show. Some fine pans of *Coelogyne cristata* will be open soon, *C. ocellata* and *C. intermedia* just showing. There were some good plants of *Sophranites grandiflora* also in bloom. The whole were in good health, and doing Mr. Evans great credit as an Orchid cultivator. *W. L.*

#### CATTLEYA DOLOSA.

I see that Mr. O'Brien says that *Cattleya dolosa* has yet to be introduced; that all that have hitherto been sold have been varieties of *C. Walkeriana*. This is true, I think, of those lately imported; but the plant sold some years ago as *Cattleya* sp. from Minas (and which until lately was labelled at Kew *Lælia minus*) is, I believe, *Cattleya dolosa*. It has long upright bulbs, and flowers from the full-grown bulbs, and not, like *C. Walkeriana*, from small flowering bulbs. The *Cattleya* from Minas grows freely with me, but has only once flowered. I sent the flower to Prof. Reichenbach, and he named it for me *Cattleya dolosa*; and the plant at Kew is the same as mine, but I do not know that it has ever flowered. *C. W. Strickland*.

#### BARKERIA ELEGANS.

Mr. Bateman, in his magnificent work on the *Orchidaceæ of Mexico and Guatemala*, refers to this, the rarest of all the *Barkerias* as "among the most refractory of the tribe. To maintain it alive is all that the utmost skill of the cultivator is usually able to accomplish." (See note under *Barkeria Lindleyana*, plate 28.) A plant of the true *B. elegans* is now in flower with Mr. Phillbrick, Oldfield, Bickley [and shown at the Royal Horticultural Society on Tuesday last], where it has been grown the last year or two with others of the genus, and treated in the manner described in the *Orchid Album* for 1884 (type 148) under *Barkeria cyclotella*, figured from the same collection. In the *Gardeners' Chronicle* for July 12 (vol. xxii., n.s., p. 44), we gave an extract from some notes on *Barkeria* cultivation supplied by Mr. Phillbrick. The plant that has in recent years been frequently taken for *B. elegans* among cultivators is really *B. Skinneri*, a very different and far smaller flower, by no means so striking in appearance, and not uncommon in collections. Once seen the true *B. elegans* can never be mistaken: it thoroughly justifies its appellation as the most elegant and chaste of the genus. It is extremely rare in its native habitat, Guatemala, where it is found growing with *B. cyclotella* and *B. Skinneri*. The slender pseudobulbs are from 9 to 12 inches in length, and the leaves narrower than in the two last named species; their colour is pale green, and the growth and habit generally less robust. The flowers are formed in a spike at the end of the new growth, and are fewer in number than in other *Barkerias*. The individual flower when expanded measures about 2½ inches across, the sepals and petals are light, suffused with a tinge of pink. The labellum is of the purest white, with a large central spot of the richest crimson. The upper surface of the column is densely spotted with small crimson spots, and its anterior part touched with yellow. The colouring is puce and beautifully distinct, rendering it one of the most attractive of this charming family. In Williams' *Orchid Growers' Manual* two varieties, "one not so good as the other," are mentioned, but the description of the sepals and petals as "dark rose, lip edged with a lighter colour," hardly corresponds with the specimen now in flower with Mr. Phillbrick, but there can be no question Mr. Williams rightly says this is "the finest of the genus, and very rare." It must be matter of regret to Orchid growers that this plant is so rare, and still more that it should prove so intractable under cultivation. Mr. Heims, the head gardener at Oldfield, may well be congratulated on his success with *Barkerias* generally, and especially with this lovely variety.

#### LÆLIA AUTUMNALIS.

At the present time there is a very fine specimen of this beautiful Orchid flowering in the Victoria Nurseries of Mr. B. S. Williams. It has 450 pseudobulbs and twenty-four flower-spikes.

#### ODONTOGLOSSUM VENILLARIUM SUPERBUM.

A splendid variety, flowered in Sir Trevor Lawrence's collection, and figured in the *Orchid Album*, t. 171. The flowers are deep in colour, especially the lip, which is deep rose with a basal blotch of a lozenge shape, and deep magenta-purple.

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Jan. 19	National Chrysanthemums Society's Annual General Meeting, "Four Swans" Hotel, Bishopsgate Street.
		Sale of 5000 <i>Lilium auratum</i> and other Bulbs, at Stevens' Rooms.
WEDNESDAY,	Jan. 21	Sale of Lilies, Roses, and Irises, at Protheroe & Morris' Rooms.
		Sale of Roses, Fruit Trees, and Hardy Plants and Bulbs, at Stevens' Rooms.
THURSDAY,	Jan. 22	Sale of Imported Flowering Orchids, at Stevens' Rooms.
		Sale of Imported Orchids, at Protheroe & Morris' Rooms.
FRIDAY,	Jan. 23	Sale of Natural History Specimens, at Stevens' Rooms.
		General Meeting of the Royal Botanic Society of London, at 3.45 P.M.
SATURDAY,	Jan. 24	Sale of Hardy Plants, at Stevens' Rooms.

THE annual meeting of the GARDENERS' ROYAL BENEVOLENT INSTITUTION was held on Wednesday last at the Bedford Hotel, Covent Garden, EDWARD TIDSWELL, Esq., Treasurer, in the chair. Strictly formal in its character the report of the committee and the satisfactory balance-sheets were read and adopted with unanimity. The election of the Duke of WESTMINSTER, K.G., as President, in place of the late Duke of BUCCLEUCH; of GEORGE LAMBERT, Esq., as Vice-President; of Mr. TIDSWELL as Treasurer; of Messrs. LEE, WILLARD, and MESTON as Auditors; of Messrs. JOHN LEE, B. S. WILLIAMS, CHARLES PILCHER, THOMAS MOORE, ALEX. T. DICKSON, and WILLIAM RICHARDS, new members of the Committee of Management; and of Mr. CUTLER as Secretary for the forty-fourth consecutive year, was voted with like unanimity. Three claimants, having fulfilled all the requisite conditions, were made pensioners by right, under Rule No. 6; and eight others, standing highest on the list, were also admitted to supply vacancies created by the decease of former pensioners, by a plurality of votes. It is a fact worth mentioning, that several voting papers were rejected, and properly so, because they were not signed, or for some other informality easily avoided by a little care.

The report touched on the principal events of the year, the success of the annual dinner, the efforts made to secure a reserve fund sufficient to secure the increase of the pensions, and a sub-committee was appointed to make such revisions of the rules as were necessitated by the successful result of the efforts made to increase the income of the Society. Bald as this statement is, it must be considered eminently satisfactory. The principal points on which the Institution may fairly be congratulated are the munificent donation of £500 by a gentleman who desires to preserve his *incognito*, and the success of the efforts to increase the pension fund. It is specially satisfactory to know that the munificence of the anonymous donor has been productive of good that cannot be measured by the amount of his donation, large though it be. He has been the means of stimulating the gardeners themselves to renewed efforts, and has done much to remove the stigma that the gardeners themselves, as a class, were apathetic in supporting an institution from which they alone derive benefit. Having watched the way in which the business is conducted, the manner in which the books are kept, conversant with the untiring energy of the Secretary, the whole-hearted way in which the Committee does its duty, and the absolute impartiality with which the claims of the applicants are dealt with, we are in a position to commend the Institution to the continued support of the gardeners. Its power of continuing its good work and specially its ability to afford its benefits to a larger number of applicants, depends essentially on the increase of its regular subscribers. Spasmodic efforts are very valuable for specific purposes, but for steady growth and power to meet the constantly increasing demands made upon it, steady persistent support is needed, and this we earnestly hope will be forthcoming. Any gardener may need its help, whether he get it or not depends almost entirely on his own exertions and forethought.

Subscribers who are gardeners have the satisfaction of knowing that on fulfilment of certain conditions they have a right to demand the help the Society can give. Those who do not, and possibly never will, require its assistance have the unspeakable comfort of knowing that they have done their best to help their less fortunate brethren.

— THE OXFORD BOTANIC GARDEN.—This old garden has charms which attract all visitors; its beauty, its history and associations, all combine to give it a unique position among similar establishments. On another occasion we purpose to give a fuller account of this memorable garden. For the moment we content ourselves with giving an illustration of the Water-Lily house (fig. 17), a light structure of iron, with ridge-and-furrow roof, which was erected during the professorship of the late Professor DAUBENY. Here Mr. BAXTER has for many years past succeeded in maintaining an almost complete collection of Nymphæas, Nelumbiums, and other stove aquatics which yield to no rivals in beauty and interest. All the Nymphæas are beautiful, and many of them so easily cultivated that it is surprising we do not find them more generally cultivated. On these and other matters we defer further comment.

— WHAT IS AN AMATEUR?—This question received a fresh answer at the hands of the committee of the National Auricula and Carnation Society the other day. According to their ruling an amateur is one who does not in any way advertise his plants for sale, nor, indeed, sell them at all—with the exception of seedlings raised by himself. In the abstract we should exclude any one who sold his produce, but in practice this strict definition, it is said, would work injuriously. But inasmuch as a recognised dealer sells seedlings raised by himself we fail to see wherein a so-called amateur who does likewise can lay claim to the privileges he demands as an amateur.

— A CONSERVATORY FOR HAARLEM.—Our horticultural friends, the Dutch, with that deep appreciation of the useful and the cheap, sometimes find it of advantage to come to this country for garden structures, especially if these be of iron. We are reminded of this by Mr. A. GRAY, of Danvers Street, Chelsea—the successor and son of JAMES GRAY, whose decease was noticed in our columns a little over a year ago—sending us a section of two fine domes which the firm is erecting for a gentleman at Overveo, Haarlem; these are intended to form the ends of a rectangular orangery and plant-stove of 200 feet in length and 35 feet in height. The construction is exceedingly light-looking and elegant in appearance, which is still further enhanced by doors having an outside porch; the latter is a feature worthy of copying even here; the outer one being shut on entering prevents the injurious admission of cold air into the house on opening the inner door. The ribs are of rolled iron, inserted into a cast-iron wall-plate, the wide spaces between the ribs being filled with straight sheets of glass. From this it will be seen that although the general form of the ribs is that of the segment of a circle, such is not really the fact, as each is bent obtusely at long intervals to accommodate the straight glass. The means of ventilation are both ample and ingenious.

— ROYAL HORTICULTURAL SOCIETY: *The Certificates*.—It seems desirable that the nature of the certificates awarded should be more strictly defined. At present a First-class Certificate may mean a number of things: it is given to a promising novelty, it is given to a meritorious old acquaintance, it is given to a Pelargonium, possibly a little better than hundreds of others of similar character; it is given, or perhaps not given, to a plant whose merits are of a totally different character. It would seem preferable to give a Botanical Certificate to new introductions, a First-class Certificate to praiseworthy varieties of old plants, "Cultural Commendation" to old or new when called for, Votes of Thanks to meritorious exhibits of whatever character, and simple acknowledgments to exhibitors who take the trouble to send exhibits of a character that will not entitle them to higher awards. At present a Botanical Certificate is looked on as inferior in repute to a First-class Certificate. This is not right.

If anything a new plant of merit should rank higher than a good variety of an older plant. The certificates are adjudged too much from the point of view of commerce and fashion. So far as possible they should be awarded to abstract merit apart from commercial or fashionable considerations, or, if this is asking too much of human nature, at least the Botanical Certificate of first or second class should take equal rank with ordinary first or second class certificates. New plants of whatever character should be adjudicated upon by a special sub-committee after careful examination. This sub-committee they be told off to do its work and to report to the general body, who should confirm the verdict of the special sub-committee or otherwise as seems best. Much, very much, depends on the action of the managers of the shows, and specially of the chairman of the day. A miscarriage on the part of the committee is as often as not due to the omissions or inadvertence of the chairman.

*The Committees*.—While attention is being attracted to the composition of these bodies it is only right to remember the difficulties that lie in the way of selection of fit persons. The Society is in no position to be able to pay its committeemen, and consequently those who serve have to sacrifice a half, or, it may be, a whole day, and to bear their own expenses. It follows from this that many most competent and desirable members, who live at a distance, are precluded from attending, and thus the choice of members is seriously limited.

*Names of Plants*.—Much greater stringency should be exercised by the committee in the matter of names. In the case of Botanical Certificates no award should be given till the Scientific Committee, or a sub-committee specially appointed for the purpose, has verified or ascertained the correct name, or, where that cannot be done, has agreed to some suitable provisional name. In the case of First-class Certificates the Society should exercise the right it has of rejecting unsuitable or inappropriate names, and of conferring amended names, under which latter alone the plant should be certificated. If the owner choose to retain the name of his own adoption there is nothing to restrain him, but the Society should be responsible only for names approved by itself. A sub-committee to consider the question of nomenclature, and to draw up general rules, should be appointed.

— THE COMMITTEES OF THE ROYAL HORTICULTURAL SOCIETY.—The first meeting of the present year was held in the conservatory at South Kensington on Tuesday. The members of the old committees mustered in force, the new committees not having yet been appointed. Section A, and Section B, of the Floral Committee were amalgamated, under the Chairmanship of Mr. WILSON, so that the dual control is a thing of the past. An announcement was made that the Council had acceded to the request of the committees and conceded the very important matter that the committees themselves should suggest certain names each year to fill up vacancies, instead of the selection being left wholly to the Council.

— THE NATIONAL CHRYSANTHEMUM SOCIETY.—A general meeting of this Society will be held on the 19th inst. at the "Old Four Swans," Bishopsgate Street Within, City, E.C., when E. SANDERSON, Esq., will take the chair at 7 o'clock. The above Society is making an opportune endeavour to get country and local Chrysanthemum Societies to become affiliated branches of this the first in rank of the metropolitan societies, and in furtherance of this object circulars have been issued, which contain the proposed general conditions of such affiliation. One of these is, that such societies will have three different classes of medals—Gold, Silver, and Bronze—placed in the desired numbers in their hands to be disposed of for Chrysanthemums, cut blooms, and specimen plants only; another condition being the payment of an annual affiliation fee of half-a-guinea.

— A NEW RAFFLESIA.—A flower of a newly discovered *Rafflesia*, from Mindanao, one of the Philippines, is figured in the *Gartenflora*, t. 1177, now edited by Garten-Inspector STEIN and Professor ENGLER. The species was named by the late Professor GOEPFERT, in honour of its discoverer, Dr. SCHADENBERG. The flowers are parasitical on the roots of *Cissus*, each nearly a yard across with a somewhat five-sided, fleshy, short tube, from the sides of which emerge five oblong obtuse, strongly reflected segments of a purplish-brown colour, thickly warted

with fleshy prominences. In these days of rapid transit we may fairly hope to see these vegetable monsters occasionally in our stoves. A figure of one was given in our columns, p. 91, vol. xxi., 1874. Though one of the wonders of the vegetable world we doubt if the Floral Committee would grant it a First-class Certificate.

— *ALOCASIA GUTTATA* VAR. *IMPERIALIS*.—Some years ago Mr. BURBIDGE introduced for Messrs. VEITCH the type of the species. Latterly a very handsome variety has been introduced by the Compagnie Continentale of Ghent, in which the leafstalks are of a deeper green, the limb of the leaf is rather more obtuse, blackish-green above with a

root as they extend over the damp surface. A loamy soil, with a good admixture of sand and leaf-mould, will grow it to perfection. Pans might be filled in spring with rooted cuttings, and kept in the shadiest part of a cold frame, and covered with a hand-light or bell-glass to preserve a moist atmosphere. It might be removed to a cool-house in winter together with the hand-light. So treated at Kew it lasts for months in perfect condition, and may be seen in the Heath-house. Without this protection the clear white variegated margins of the leaves soon get discoloured and lose their attractive appearance.

— *ASTRÆA WALLICHII*.—The huge heart-shaped leaves of this plant being evergreen are always

an interesting report from the Conservator of Forests in South Australia has been laid before Parliament on the question of the cultivation of Olives, Dates, and white Mulberries for sericulture. The different kinds of Olives flourish in almost every part of the colony, and are very profitable. The Date Palm, *Phoenix dactylifera*, also grows well; a hundred trees are also growing well in Adelaide, and though fruits have formed, it is stated that they have not ripened. The reporter considers, however, that this will probably be obviated further north, where the climate is hotter, and suggests that the *employés* on the Overland Telegraph line should make experiments in planting the Date Palm. The white Mulberry grows splendidly in many places. The extensive planting

FIG. 17.—THE WATER-LILY HOUSE IN THE OXFORD BOTANIC GARDEN. (SEE P. 84.)

large pale green triangular spot between some of the lateral nerves (not shown in the coloured plate in the *Illustration Horticole*, tab. 541). The lower surface is uniformly purple. The plant was exhibited at the recent International Horticultural Exhibition at St. Petersburg, where the Emperor was so struck with its magnificent appearance that he requested that the plant might be dedicated to him. The coloured figure hardly done justice to the description.

— *SIETHORPIA EUROPÆA* VARIEGATA.—When the conditions are favourable, this charming variety of a native weed cannot fail to give a great amount of satisfaction with a minimum of trouble. In a wild state the type is scattered about in a few localities in the southern part of the country, as well as South Europe and the Azores. It loves a moist, shady place, where its slender trailing stems may

conspicuous amongst a mixed collection of stove plants. Although by no means a tall plant nor a rapidly growing one, it is best suited for a large house on account of the bulky nature of its foliage. Being a native of Madagascar it enjoys a warm atmosphere, and flowers annually in the Palm-house at Kew, in association with Cycads, the various species of *Clavija*, and its near allies the *Sterculias*, one of which, *S. mexicana*, has been flowering for weeks. The rosy flowers of the *Astræa* are collected in involucre heads which are pendulous at the end of slender axillary peduncles. According to the *Genera Plantarum*, it is a species of *Dombeya*, and associates easily with that genus. It is figured in the *Botanical Magazine*, t. 2503.

— NEW CULTURES IN SOUTH AUSTRALIA.—A recent number of the *Colonies and India* states that

of all these plants is recommended as a means of transforming some of the arid places in the north into oases, thereby increasing the production of the colony generally.

— CLOVER AND GRASS SEEDS.—The annual circular issued by Messrs. HURST & SON, of Houndsditch, shows that in nearly all the producing districts large breadths of English red Clover and Cow-grass have been saved, and judging by what has already been marketed the yield per acre is perhaps above the average. The seed generally is well ripened, showing good colour, but is, probably owing to the drought, small in grain. Fine bold samples of unmistakable English seed are decidedly scarce. Large crops of foreign red Clover have been matured in France and Germany, but, like the English, it is small in grain, and very full of weed also especially the supplies

from France. The American crop is reported large, but any superior samples have not, as yet, come to hand. The Canadian crop is small; and it is doubtful whether, after supplying their own requirements, the growers will be able to export any to this country. Taking into account the large yield of English grown seed, foreign seed will not be needed to the extent usually required, and prices all round should rule moderate. The crop of English white Clover is a fair one, but not so large as last year, in quality it is exceptionally fine and bright; on the other hand the German crop is reported as above the average, and prices are opening moderate in tone. Some very clean stocks have come to hand. There is a good crop of English Alsike, but it is of medium quality only; and large Continental harvests will keep prices within a moderate range, but the quality is much finer than for some years past. Of Trefoil the English crop is not large, but good in quality. The foreign samples are characterised by very fine quality, and are opening at extremely low prices. Of Lucerne but a short crop is forthcoming from Provence, but it is good in the more northern French districts. Prices will be about the same as last year. Sainfoin is represented by a moderate crop of good quality from France, and a larger of Giant in England, but that of common Sainfoin is reported as a short one. The French crop of Italian Rye-grass is barely an average one in yield, and generally of inferior quality; superior upland grown samples are scarce, and command advancing prices; the English crop shows about an average of heavy seed; the produce from Ireland is represented by a large crop of good weight per bushel. There is an abundant crop of perennial Rye-grass in every district. It is doubtful if these grasses have before been so low in price. The heavier weights, being so much to be preferred because so much cleaner, are really proportionately cheaper in price, and should cause a great demand to be made for them, so that before the end of the season it is pretty certain their value will be increased. On the other hand, in the matter of natural grasses many varieties are as scarce and dear as they have been for several years past, so much land having been seeded down during the past few seasons that the supply of some of the finer grasses is barely equal to the demand. As large a demand is anticipated this season as last, and there are good samples of the true *Alopecurus pratensis*, *Anthoxanthum odoratum*, *Avena flavescens*, *Cynosurus cristatus*, *Dactylis glomerata*, *Festuca pratensis*, *Poa pratensis*, *P. nemoralis*, and *P. trivialis*. Of white Mustard there is an average crop of good quality, but of Rape a very small crop: fine samples of genuine English growth will be both scarce and dear.

— **LILIUM MARTAGON.**—The *Gartenflora* notes that a plant of this Lily at Eisenach, last year, produced forty-eight flower stems, each with fourteen to eighteen flowers, so that the total number may be estimated at 720.

— **EALING, ACTON, AND HANWELL HORTICULTURAL SOCIETY.**—This society celebrates its majority during the present year, having held its first exhibition in 1864. A specially extensive and attractive exhibition will be held during the second week in July, and by the kind permission of Sir NATHANIEL DE ROTHSCHILD, Bart., M.P., and his brothers, it will take place in the beautiful grounds of Gunnersbury Park. This is the first time these famed grounds have been used for such a purpose, and a very large attendance may be anticipated.

— **WILL OF THE LATE GEORGE BENTHAM.**—According to the *Illustrated London News*, the will (dated August 17, 1883), of Mr. GEORGE BENTHAM, late of 25, Wilton Place, Knightsbridge, who died on September 10 last, was proved on the 11th ult. by Sir JOSEPH DALTON HOOKER and the Right, Hon. Sir NATHANIEL LINDLEY, the executors, the value of the personal estate amounting to over £23,000. The testator bequeaths £8000 to Madame WALLON, the granddaughter of his late sister; £2000 to Sir H. J. J. BRYDGES, Bart., the brother of his late wife; £1000 each to the Linnean Society of London and the Royal Society Scientific Relief Fund; and legacies to his executors, trustees, servants, and others. The residue of his real and personal estate is to be held upon trust to apply the same in preparing and publishing botanical works, or in the purchase of books or specimens for the botanical establishment at Kew, or in such other manner as his trustees

may consider best for the promotion of botanical science.

— **PRINCE ALBERT VICTOR'S MAJORITY.**—We hear that Messrs. WILLS & SEGAR, of South Kensington, had the honour of presenting to Prince ALBERT VICTOR, by permission of H.R.H. the Prince of WALES, a lovely bouquet, composed of Lily of the Valley, Parma and Russian Violets, Gardenias, and arching spikes of *Odontoglossum Alexandræ*.

— **GARDENERS' ROYAL BENEVOLENT INSTITUTION.**—The following are the names of the successful candidates who were put on the list of recipients of pensions from the above Institution on the 13th inst.:—W. BURKETT, R. HAWKINS, MARTHA SWANBOROUGH, G. URQUIHART, ANNA M. ALLAN, ELIZABETH FOULIS, ELIZABETH PARR, MARY RABBITT.

— **NATIONAL AURICULA AND CARNATION AND PICOTEE SOCIETIES (SOUTHERN SECTIONS).**—A meeting of the committees of these Societies was held at South Kensington on Tuesday last, SHIRLEY HIBBERD, Esq., in the chair. There were present: Dr. Masters, Dr. Hogg, Messrs. Veitch, Laing, Turner, B. S. Williams, James E. Hill, Cannell, Mr. Douglas, Secretary, and Mr. Rolt, Treasurer. The exhibition schedules of both Societies for 1885 were prepared and adopted, and judges appointed. The following regulations for the exhibitions were also adopted:—

1. An exhibitor can win one prize only in one class, except in the classes for seedlings, in which there is no limit; and in single specimens he may not exhibit more than two in each class, but may win two prizes with both exhibits.
2. At the time when the judges commence their work all persons present save the officers and their assistants shall retire from the exhibition. The decision of the judges shall be final.
3. All plants and flowers shown in the schedule classes must have been the *bona fide* property of the exhibitor, or his employer, at least two months previous to the date of the exhibition.
4. Plants and flowers submitted for certificates must be staged separately from collections, in a place allotted by the committee, and shall be adjudicated upon by the judges only, save that the judges may, at their discretion obtain the assistance of other persons in making their decisions.
5. No person shall be allowed to compete as an amateur who publishes a list of plants for sale, or who advertises them in any form whatever, with the exception of seedlings of his own raising.

The Treasurer was instructed to apply to Mr. E. S. DOBWEILL for a statement of the accounts of the two societies, and for a remittance of the balance of cash in his hands belonging to the respective societies.

— **STAMP DUTY.**—The attention of house agents, builders, and the public generally is called by the authorities to the law regulating the stamp duty on agreements for letting lands and unfurnished houses. Such agreements are chargeable, not, as is often supposed, with the uniform duty of 6*d.*, applicable to ordinary agreements under hand, but with the same rates of duty as if they were actual leases for the term and consideration mentioned, according to the following scale:—

		If the term is definite, and does not exceed 35 years, or is indefinite.	
		£	s. d.
Not exceeding £5 per annum .. ..		0	0 6
Exceeding—			
£5 and not exceeding £10 .. ..		0	1 0
£10 .. ..	£5 ..	0	1 6
£5 .. ..	£20 ..	0	2 0
£10 .. ..	£25 ..	0	2 6
£15 .. ..	£50 ..	0	5 0
£20 .. ..	£75 ..	0	7 6
£25 .. ..	£100 ..	0	10 0
£100 .. ..			
For every full sum of £50, and also for any fractional part of £50 thereof ..		0	5 0

Such agreements, if not drawn upon stamped paper, must be presented for stamping within two months after the date of the first execution thereof. After that time a penalty of £10 may be imposed. An unstamped or insufficiently stamped agreement cannot

be enforced in any court of justice, or before any arbitrator or other competent authority. A lease made subsequently to, and in conformity with, an agreement duly stamped is chargeable with the duty of 6*d.* only. Postage stamps cannot be used for stamping agreements for letting lands and unfurnished houses (other than dwelling houses, or any part thereof, for any definite term less than a year, where the rent does not exceed £10), but such agreements must either be brought to the Stamp Office to be stamped with the proper impressed stamp, or be left for that purpose at the office of a distributor, or sub-distributor of stamps, or of a postmaster.

— **LILY OF THE VALLEY.**—It is not generally known, even by gardeners, that the young plants of Lily of the Valley do not bloom until they are fully three years old, and even then the size and beauty of the blooms will depend on their having been well grown in the interval. They will not do much good if they be not separated from the mother plant and planted in well manured (cow manure) light soil in a warm sheltered place, and be kept watered during dry weather. That is one reason why crowns produce better blooms and foliage than clumps, and also why old Lily beds become productive of small blooms, and a great mass of crowded ill-developed young plants. Lily of the Valley that have once bloomed do not die, nor do the plants flower again for two years, hence the waste of time in forcing pots or clumps of Lilies the first and second years after blooming.

— **GARDENING APPOINTMENTS.**—Mr. JOHN STOCK, late of Cavendish Gardens, as Gardener to — MCKINNEL, Esq., Elm House, Clapham Common, Surrey.—Mr. J. DOWNER, late Fruit Foreman at Possingworth Gardens, Hawkhurst, succeeds Mr. DENCH as Gardener to Sir GEORGE R. PRESCOTT, Bart., Isenhurst Park, Cross-in-Hand, Sussex.

## GAS-LIME FOR WEEDS.

THAT the earth is mother of the weeds, but only stepmother to many of the plants cultivated on it, is a not inapt way of accounting for the healthy and abundant crops of weeds. The weeds are always with us, and only by watchfulness and much labour can they be kept under. It may be safely said that there is no work in which there is worse economy than in letting weeding run unattended to, want of the proverbial stitch in time causing need for nine is much more than realised in the matter of weeds if unchecked. Of the many plants that come under the category of weeds, when growing where they are not wanted, grass on walks, pebble pavement, and little used roads, such as many carriage drives through parks or other grounds, when the traffic, as it often happens, is not sufficient to keep the surface clean, becomes the most troublesome of weeds, for on roads of this kind, even where diligently weeded before the seeds have time to fall, there is an inexhaustible supply always coming from the land adjoining that makes it an endless task, only varied by the different means in different cases resorted to to destroy them. Those who have had anything to do with such work need not be told that hand-weeding of this kind is slow work; the use of hoe and rake is objectionable; salting, either with the dry article, or in the shape of scalding brine, is costly in labour and material; whilst the use of diluted arsenic or vitriol, in addition to the expense in material and labour, is objectionable in different ways. Where gas-lime can be had there is nothing that will be found more effectual, and, in most cases, economical, scattered on the surface in the way that salt is applied, and allowed to remain for about three weeks. It will not only destroy all the grass and weeds, but will also kill any seeds that may be present but not yet vegetated, in addition to which it will prevent any growing for a couple of years. After being allowed to remain long enough to kill the weeds the material may be swept up and used in the way of manure. It is scarcely necessary to say that the lime is more powerful in its effect for the purpose under notice when fresh than if it has lain for some time after it comes from the gas-maker. There may be some objection to the use of gas-lime in the manner described on account of its powerful smell, but even in the vicinity of a dwelling there are often times when it can be applied without giving annoyance through this cause, *T. B.*

# The Flower Garden.

## PREPARATORY WORK.

JANUARY is a month of preparation, and very much can be done to forward work throughout the year by careful attention to all that is requisite at this period. There is now much work that can be done if the weather keeps open, such as improvement in the grounds and all kinds of alterations, making new flower-beds and borders, and planting trees and shrubs, cutting out all dead wood and dying branches from similar subjects. Gravel walks can be turned, turf relaid and made good where required, new labels affixed to plants needing them. Attention to all these matters will save much valuable time in the busy season coming on.

## WINTER BEDDING.

Where the winter and spring bedding is not finished it should be completed as early as possible. I sub-join a list of plants used here, which have been much approved of. Evergreen shrubs have a very pleasing effect if planted in the centre of the beds; if trained into spiral forms, others as low bushes, they make a variation from that flatness which is often seen in flower gardens. The tallest and conical shaped shrubs should be planted in the centre of each bed, such as *Thuja aurea pygmaea*, *T. lutea*, *Cupressus erecta viridis*, *C. variegata*, and many other varieties. *Thuopsis dolabrata* and *T. borealis*, *Retinospora plumosa*, *R. nana aurea*, *R. ericoides*, *Aucuba variegata*, and many of its fine varieties, are most useful. *Berberis Hookeri*, *B. stenophylla*, *B. aquifolium*, the small-leaved Box, and the variegated kinds are very pretty and easily managed. Golden and Silver Yews, *Eunymus aurea variegatus*, *E. alba variegatus*, *E. radicans variegata*, and hardy Heaths, such as *Erica carnea* and herbacea. I then plant the following herbaceous plants, which keep the gardens gay till May—till the beds are wanted for summer bedding out:—*Helleborus niger giganteum*, *Myosotis dissitiflora* and *alba*, *Heptatica*, red, white and blue; *Iberis canadensis*, *I. semperflorens*; *Anemones* of sorts, and *Schizostylis coccinea*; Pansies, yellow, blue, and mixed; Violets, *Marie Louise*, *Victoria regina*, *Czar*; *Primulas*, double white, red and purple; *Ajuga reptans purpurea*, *Arabis albida*, *Aubrietia purpurea variegata*, *alpine Auriculas*. For edging the beds *Thymus aureus* and its varieties, *Sedums*, *Sempervivums*, *Saxifrages*, *Daisies*, red and white; *Pyrethrum aureum*. By edging all the beds with the small growing kinds a nice finish is ensured. The dark-leaved Beets, such as *Dell's dwarf*, mixed in the flower-beds, look very pretty amongst the other foliage plants. I save and use all the small ones from the kitchen garden.

## PROPAGATION.

Propagating pits should at this time receive every attention, so as to get a full stock of plants by the time they are required for summer bedding out. Such plants as *Heliotropes*, *Iresines*, *Lobelias*, *Coleus*, *Fuchsias*, *Petunias*, *Ageratums*, *Alternantheras*, *Pelargoniums* of all kinds required, may now be placed in warmed pits or houses, or any convenient heated place. *W. Smythe, Basing Park, Alton.*

## The Orangery.

### ORANGE TREES IN POTS.

I WOULD advise the culture of the Tangerine Orange trees in pots, even for those who have no other accommodation for them than that of a vinery and Cucumber-house. It is now quite time to start the trees in an early vinery, and no better place is available than this, especially if a bed of leaves and manure has been placed inside the house to afford a bottom-heat. The manure should not be used fresh out of the stables, but ought to be heated outside first to throw off the injurious fumes; over this the trees should be placed. They start into vigorous healthy growth, and soon come into bloom. By the time the Vines overhead shade them too much they ought to be removed into a house with a temperature of 65°. The earliest fruit will be ripe in September, and a succession will be obtained from the later kinds. Orange trees, if they once become infested with insects,

are not easily kept clean. It is much better to get them made thoroughly clean, and see that any further attempts of parasites to gain a footing on the leaves is frustrated in their first attempt. *J. Douglas.*

## Plants and their Culture.

### GENERAL REMARKS.

STOVE PLANTS.—Unless it be in cases of urgency, it will not be advisable to increase either the day or night temperatures beyond that recommended in one of our later Calendars (p. 782, vol. xxii.). Should the weather appear to be favourable for making a start in the way of repotting and other work preparatory to inducing the plants to commence a fresh growth, one should not be led away by these signs too soon in the New Year. We may yet have to experience some severe and trying weather, that will tend to check a healthy development of growth. This will be very prejudicial to most plants that have been recently potted, particularly those which have had their roots pruned and partially shaken out of their surrounding soil. It will pay in the long run to wait a while longer yet, as in a few more weeks the sun's rays will have greater warmth and will therefore be more conducive to a healthy growth that will far outstrip any temporary gain that has been obtained at a great cost in firing alone.

### GARDENIAS, EUPHARIS, STEPHANOTIS.

In urgent cases—such, for instance, as an early batch of *Gardenias*, *Stephanotis*, *Eupharis*, or the like—it will be far more expedient and economical to bring them forward in a forcing-pit by themselves, where a few extra degrees in the temperature can be maintained without much extra firing. In such a place the plants can be specially treated as regards atmospheric moisture and bottom-heat if needs be. If leaves and stable litter are used for a plunging material, clear tepid water would be all that is necessary for producing the necessary moist condition of the atmosphere; if tan or cocoa fibre are employed, then we would advise the use of manure-water for damping down with during the latter part of the afternoon, when no personal inconvenience would be experienced thereby. In these forcing-pits the maximum amount of light should be secured by keeping the glass in as clean a condition as is possible; in the most favoured spots this advice needs be followed out.

### COVERING MATERIAL FOR THE EXTERIOR OF HOUSES AND PITS.

Should cold searching winds or sharp frosts prevail, then by all means employ some covering material to regulate the temperature with greater accuracy, and to prevent the escape of moisture to a great extent. Mats are frequently employed for this purpose, and I have used such for many years; unless sown together, however, they are apt to be troublesome during stormy weather. Again, when several are joined, then there is the difficulty of drying them after having become wet. I am now giving trial to a far lighter covering, made of canvas of the required size; after ordering this it occurred to me that it would be far more durable if tanned before being brought into use; this I have had done, and so far I am very well pleased with this novel material, in place of the somewhat heavy and cumbrous mats. It is taken off and put on the range of pits with the greatest ease by employing a small wooden roller to wind it on. It absorbs but little moisture, and, lying close also to the glass, it is not nearly so liable to be penetrated by a keen cutting easterly wind to which we are much exposed. Its neatness, and the little room that it occupies when not in use, are of themselves sufficient to recommend its use for all forcing-pits and low houses with accessible roofs. There is also another point in its favour, viz., by inserting brass eyelets at intervals of 3 or 4 feet it can be secured by strings to the sides of the pit instead of lying on strips of wood, which, if not very carefully done,

break much glass, when such damage is most undesirable. It is not always advisable during mild weather to use this covering when darkness first sets in; but if at banking-up time there are any symptoms of a frost coming on before the break of day, it can be applied in a few minutes, and will thus guard against any rapid fall in the temperature of the structure. In covering up all warm pits into which there are no means of access without sliding down the top-lights to inspect the thermometer, some considerable care need be exercised not to allow the temperature to run up beyond its normal standpoint for the night. This will often occur if the heat in the pipes is not somewhat checked, resulting perhaps in a higher degree of heat during the night than is obtained by day; this we need hardly say should not by any means be allowed to occur. *J. Hudson, Gunnersbury House, Acton.*

## FRUITS UNDER GLASS.

### STRAWBERRIES.

A VERY suitable place to start Strawberry plants into growth at this season is a lean-to pit having a hot-water pipe or two running along the front of it, and in which there is room enough to put a sufficient quantity of fermenting materials to generate a little warmth. This bed should be made up so that when the plants are stood upon its surface they will be up near the glass. Under such conditions, with very careful attention to watering and airing, so as to let the plants start slowly, they will flower vigorously.

At this period it will be advisable to remove them to a place where more air and a rather drier atmosphere exists, in order to get them to set freely, after which the fruit should be thinned out to about eight on each plant, and be accelerated with more heat, if necessary, to get them ripe at the earliest period. For very early work I prefer *Vicomtesse d'Éléricat de Thury*, as being the best if quality is considered. Advanced plants which are placed on shelves in forcing-houses will need daily attention in the way of watering, syringing, &c.; the latter operation is most essential in dry places to keep the foliage clean and as far as possible to check the depredations of the red-spider. The general stock of plants will need to be looked over occasionally and watered.

### COLD FRAMES

unquestionably afford the best winter quarters for these plants, provided they are freely ventilated whenever favourable weather prevails, and the lights put on when heavy rain, snow or frost abounds. When a good set of fruit on the plants is secured, the fruit will advance and finish off in any place with a reasonable amount of heat; at the same time, for the sake of quality, they should be more or less ventilated every day. Successional plants in pots should have a low night temperature of about 45°, or 50°, with a slight rise by day, with air admitted at the same time.

### MELONS.

To have these ripe in May the seeds should be sown at once in a place where the temperature will range from 70° to 80° constantly. They can be sown either singly in small pots, or together in large ones; in this case the plants must be potted off when they are fit for the purpose. At this season Melon plants are excessively tender, and require careful treatment to secure sturdy plants. After the seeds are sown they may be induced to vegetate and make growth more speedily by being plunged in a fermenting bed; but unless this can be arranged to be pretty near the glass they had better be raised altogether on a shelf in a clean, moist pit close up to the glass, as the additional time required this way will be more than compensated for in the character of the plants. It is very important—in order to avoid disappointment—to have seed true to name, especially in regard to the early batch of Melons; as time is of consequence seeds should therefore be taken from true stock. As a rule the old green-fleshed strains are infinitely superior in quality to the scarlet ones; this should be a consideration in making choice of kinds, as a bad-flavoured Melon is not equal to a good Turnip to eat. For early work *Victory of Bath* and *Eastnor Castle* cannot well be surpassed for sowing now, when all points in connection with them are considered collectively. *Hero of Lockinge*, a white-

fleshed kind, is also to be recommended. Scarlet varieties at this time I discard altogether. Moderately stiff yellow loam is most suitable for Melon culture; if this was properly stacked up last autumn it will now be fit for use, and can be taken from the heap to where it is wanted. For early plants an addition of sharp sand and horse manure from a spent Mushroom-bed to the extent of a third will be beneficial. *G. T. Miles, Wycombe Abbey Gardens.*

## The Hardy Fruit Garden.

PRUNING, nailing, staking, and planting are the operations mostly requiring to be pushed on in this department. Where orchard trees are to be planted no time should be lost in getting the ground prepared, so as to be able to take advantage of the first favourable opportunity for planting. I prefer using a rod 21 feet long for measuring the distance between the trees on grass land. This distance allows ample space on such land, as it is most important not to have the trees crowded. Good stakes should be placed to newly planted trees: Larch stakes are to be preferred for this purpose, as these will last for a number of years.

### BUSH FRUIT.

Gooseberry bushes may now be pruned, always bearing in mind that the largest berries are produced from young shoots. I am well aware that good crops can be produced by cutting these hard back to one or two eyes. I have even seen the young shoots clipped over with the hedge shears and heavy crops produced. To those who are much troubled with small birds I would recommend this plan to be tried.

There are many plans adopted for keeping sparrows, &c., off bush fruit trees, where they do much damage at this season of the year. One of the simplest plans I know of is to have a good supply of fresh lime and soot, well mixed up together, ready to be applied the first dull, damp morning. My plan is to throw it all over the bushes when they are damp. This not only keeps the birds away, but is a good manure for the bushes. Apples, Pears, and Plums are often dressed in the same manner. Black Currants should only have any badly placed shoots cut away, no shortening of the young wood being necessary. Red Currants are all the better for having some young wood left at pruning. Where large fruit of Raspberries are desired but few bearing shoots should be left to each root, say from two to three; these may be cut to 4 feet high. There are various ways of training these; some prefer stakes, others tie them to rails, &c. I have not used either for years, merely thinning out the shoots and cutting those left back to about 4 feet high; by this means good crops are always secured.

Vines on walls should now be pruned, for if left too late they are apt to bleed, which should be avoided if possible. Filberts should have all suckers cut clean away, or, better still, pulled off; and when they have become crowded thinned out. *J. Smith, Mentmore, Bucks.*

## The Orchard House.

### GENERAL CONDITIONS.

I HAVE made no allusion to this matter since November 1 (p. 559 of vol. xxii.), nor has it been necessary to do so, as the trees have mostly been out-of-doors, with the pots plunged to the rim in cocoa-nut fibre refuse. We have now arrived at the period when active operations must be commenced, especially if one of the houses has to be forced. In November instructions were given to have every part of the house clean. The pots and trees should also be thoroughly cleansed.

### STARTING THE TREES.

It is now quite time to start the trees with a little heat. It will not do to start them too rapidly at first, 40° to 45° will be quite enough, with from 5° to 10° more by day. If the trees were also forced last year, the buds will swell rapidly, and the trees will be in full blossom by the middle of February. At this season of the year the blossoms will not set well, unless care is taken to keep up a dry atmosphere with the air cir-

culating through the house freely by day, and the ventilators open a little all night. Unless the frost should be intense, a little air on at night will not be injurious even if the temperature falls 10° below the freezing point. Of course the temperature can be kept up by artificial heat.

### FERTILISING THE BLOOM.

Now is the time to warn those in charge of Orchard or Peach-houses of the necessity of fertilising the blossoms, crossing the flowers of a shy setting kind, such as the golden variety, Exquisite, with the pollen of such as Royal George, Bellegarde, &c. Walburton Admirable and Barrington are both shy setters during unfavourable weather. In *The Orchard House*, by Mr. Rivers, the author says, "give the trees a rap with a stout stick." This certainly disperses the pollen, but unless care is taken the bark is bruised and gum exudes, to the serious injury of the trees. It is easy to shake the trees by tapping the main branches with the fingers. A very slight shake distributes the pollen.

### WATERING.

It is also necessary to allude to watering the roots of the trees, especially those that were top-dressed. The rich surface compost is easily wetted, and it does not dry very rapidly; there are but few roots in it, while the old compost underneath is as hard as a cricket-ball and a mass of fibrous roots. The cultivator must make sure that his roots underneath are sufficiently moist. Trees that were repotted in the autumn will not suffer from careless watering because it is easier to see when they are dry. I advise that houses be well fumigated with tobacco smoke before the blossoms open. *J. Douglas.*

## The Kitchen Garden.

### FORCING DEPARTMENT.

As the management of forcing frames, heated by hot-water pipes, requires in many respects different treatment from those heated by fermenting materials I will describe clearly the cultural methods to be followed in each case. It is advisable (at any rate for a time) to treat them under two distinct headings. There are a few places where frames heated by hot water have been erected specially for the culture of early vegetables, and they are quite necessary if high-class vegetables are required by the earliest date possible. After the first outlay the annual cost is not much. Considerable labour must be employed to get early produce in frames by the aid of stable litter, such as making up linings and placing abundance of night protection on the glass before the gardener can feel assured his early Potatoes and French Beans are safe.

### HEATED FRAMES.

The occupants of these will be mainly Beans, Peas, Potatoes, and Asparagus. French Beans in bearing should receive occasionally a soaking of tepid liquid manure; airing must be done carefully during the morning; syrioging with chilled water, and closing with sun-heat, and guard against dry places beneath the pipes, which will quickly develop red-spider. Beans will bear freely at a temperature of 60° to 65° during the day and 55° to 60° at night, or even warmer if Beans are wanted quickly.

### PEAS

will not stand high temperature. They must be forced very steadily, maintaining a circulation of air day and night and the lights drawn clean off on favourable days.

### FRAMES WITHOUT HOT WATER: CARROTS.

A hot-bed should now be prepared for these, and after the rank heat has passed off place 1 foot of nice light soil on the bed, and when this becomes warm sow the seed broadcast and fairly thick; it is better to spend a few hours thinning than to be disappointed with a miserable half crop. Sandy soil is best for Carrots. Make the bed firm before sowing, and after the latter is done and the seed covered pat the soil over with the back of a shovel.

### RADISHES

commencing to show the rough leaf should be thinned.

### POTATOS.

Water must be given carefully until the young tubers commence forming, they should then receive a good watering, but only sufficient should be given to just penetrate the soil, so that the bed beneath does not become saturated and cold. Water should be given at a temperature of 65°. Earth-up when 6 inches high. A second or third frame should now be got in readiness for planting. Arrange to have the sets placed in boxes in a warm structure, so that they are grown out about an inch by the time the soil on the hot is in readiness to receive them. Our first frame Potatoes without hot water are just passing through. Keep them sturdy by giving plenty of air on all favourable opportunities, and place 6 or 8 inches of light covering material over the glass on cold frosty nights. Great care will be required to preserve this lot from frost.

### RHUBARB.

One more lot may be lifted to force indoors. The pots should now be placed over some outdoors to follow on.

### SEAKALE.

Put into the Mushroom-house seven or eight dozen of roots every ten days. If the Mushroom-house has not hot-water pipes, force in one of the houses. *G. H. Richards, Somerley Gardens, Ringwood.*

## NEW HORIZONTAL TUBULAR BOILER.

OUR illustration (fig. 18) shows an entirely new adaptation of the tubular boiler, the principal boiler-makers constructing these usually on the perpendicular plan. The water passes through the return pipe into the box A, thence through pipes B, B, B, B, B, B, B, to box C; thence through pipes D, D, to box E; thence through pipes F, F, F, F, F, F, F, to boxes H, H; thence through pipes I, I, I, I, to boxes K, K; and thence into box L. The idea should be considered a good one, as the tubes intersect the upward and natural direction of the flames and heated air in the fire-box, and take the direction of the latter when they cease to rise, but travel horizontally to the flues and smoke-shaft. Messrs. Foster & Pearson, of Beeston, Nottinghamshire, have informed us that a boiler 6 feet long will heat 2000 feet of 4-inch pipe, one of 9 feet 2600 feet, a 12-foot long heating 3400 feet, and the largest size, 18 feet, being capable of heating 4800 feet of the same dimensions of pipe. Like all tubular boilers it is easy to get up heat when it is required at short notice, as when frosts and cold winds occur with suddenness, in that way alone making tubular boilers of great utility to horticulturists, and to those who have charge of public assembly-rooms, churches, &c.

## HOME CORRESPONDENCE.

**Primula floribunda.**—This beautiful and interesting species is almost always in flower. Quite tiny seedling plants raised from seed sown last summer, plants barely 2 inches in diameter, are carrying small bright yellow flowers. Like *P. obconica*, it is an evergreen species, and the two are the most persistent bloomers among the whole series of hardy Primulas. Though in a cold house, and in spite of heavy, dull, foggy days, and sharp frost, more than half a dozen plants of *P. floribunda* are in bloom, and it has been noted that almost before the flowers have faded on one corymb another is put forth, and this is continued; the stronger the plants the greater number of corymbs are put forth. *P. obconica* is equally free and persistent. Both of them possess a delicate beauty of their own, and while they lack the majestic proportions of *P. japonica* or *P. Sieboldi*, the propensity to continuous blooming makes up for lack of a more striking character. *P. obconica* is especially a charming plant in a greenhouse during summer and autumn. *D.*

"Sclerotoids" of the Potato.—About a year ago Mr. A. S. Wilson very kindly sent me some preparations of these. Wishing to follow out the expe-

riments of Messrs. Murray, Flight, Smith, and others, I carefully isolated some of the bodies, and applied strong nitric acid, which rapidly dissolved the coloured material, but, just as Mr. Wilson found, there was left a mass of protoplasm which remained many hours undissolved. The interior granular portion seemed, after a while, to differentiate itself from the outer, giving somewhat the appearance of a cell wall. A second dose of acid did not dissipate the mass, which is now distinctly visible—seven hours since the application of the solvent. This is, I think, directly corroborative of Mr. Wilson's observations. I have repeated the experiments three times, and each time with exactly similar results; once there was no solution at all, the body being doubtless not a sclerotoid. *Greenwood Pim, M.A., F.L.S., Jan. 13.*

**Cauliflower, Veitch's Early Forcing.**—The present time is opportune for calling the attention of those who are unacquainted with this Cauliflower to its merits, and this I can do with every confidence, having grown it annually since its introduction with

at a given temperature. Asphaltin is simply obtained from a solid bituminous or resinous substance found on the shores of the Dead Sea, in Trinidad, and other places. It is, doubtless, of vegetable origin, and is probably produced by the putrefaction of vegetable matter at ordinary temperatures, very similar to that process of decay which under ordinary circumstances converts woody fibre into peat, ligoite, and coal. Some chemists, however, believe it to be a product of the destructive distillation of coal occasioned by the exposure of coal-bearing strata to volcanic heat. When Brunswick Black is made from this substance, I believe it may be applied to hot-water pipes without the least fear of injury to the tenderest plant, but when mixed, as it undoubtedly sometimes is, to a large extent, with artificially distilled coal tar, it is, when heated sufficiently to throw off vapour, most destructive to vegetable life. It was from the use of the latter mixture by a painter that I once suffered, and it is from a similar one, I fear, Mr. Bishop is now suffering, and I sincerely sympathise with him, and would again say to him, Burn it off. *T. S. C.*

**Premature Growths.**—*Apropos* to "R. D.'s" remarks in the last issue of the *Gardeners' Chronicle* (p. 59), I may mention a large batch of *Narcissus biflorus* in Messrs. James Dickson & Son's nurseries at Chester, the leaves of which are now 6 inches or more high. I watched this batch all through last summer. The foliage never wholly died down, neither were the bulbs ever without active roots; in the autumn, after some rainy weather, they were stimu-

over which it has full control, I think that its practical refusal to affiliate societies holding two or more days' exhibitions, is of questionable expediency. Some of the revised regulations for exhibitions just promulgated by the society are to be binding on all affiliated societies, and No. 2 of these states "No exhibition of Roses held by this society, or by any society affiliated with it, shall extend over more than one day." This appears to me to be very hard on affiliated societies, as well as on those not so connected with the National Rose Society. For instance, here at Ealing we have for years past offered handsome special prizes for cut Roses, open to all comers, and we get competing contributions of Roses from Messrs. Turner, Paul & Son, Prince, Keynes & Co., Rumsey, Piper, and others. Hitherto we have held but one-day exhibitions, but this year we shall celebrate our twenty-first anniversary, and hope to hold our annual exhibition in the grounds of Gunnersbury Park, for the first time. It is proposed to make a special effort to secure a show worthy of the occasion, and in order to give the thickly populated districts which lie all round us, and especially on the east and south sides, full opportunity to see these beautiful grounds, it is suggested that a two days' show shall be held. Our society is not only prevented from affiliating itself as last year, with the National Rose Society, but the Rose growers I have named, being all members of the National Rose Society, would be bound in honour to conform to its rules, and would, I imagine, refuse to bring their Roses as heretofore. The rule of the National Rose Society can then be held *in ter-*

FIG. 18.—THE CHILWELL BOILER. (SEE P. 88.)

increasing appreciation of its sterling worth. From the first year of its being put into commerce I have entirely abandoned autumn sowing for an early supply, and have come to look upon the practice as entirely unnecessary—at least in the South of England. Seed sown now in heat, and pricked out into boxes when in the rough leaf, and in due course hardened off and planted out on a south border 12 to 15 inches apart, will come into use towards the latter part of May, and before the last batch of Broccoli are cut. *J. Horsefield, Heytesbury.*

**Tarred Hot-water Pipes.**—Mr. Bishop (p. 790, vol. xxii.) says, "Again referring to 'T. S. C.'s' remarks, in which he says if my pipes are painted with Brunswick Black I need have no fear; but one of those who communicated with me stated that tar is the foundation of all varnishes recommended for iron." This assertion I believe to be correct to some extent, but what I now wish to explain is the great difference between the component parts of genuine Brunswick Black and those inferior compounds which too often are substituted for it. The genuine or "best Brunswick Black," is, I believe, composed of American spirits of turpentine and asphaltin dissolved

lated into fresh growth, and they have been furnished with green foliage ever since. *R.*

**Bramley's Seedling Apple.**—It would be useful to some here in the South if Mr. Merryweather would state in your pages the names of the places to which he has sent Bramley's Seedling Apple trees and given the highest satisfaction. We could then judge whether our soil and situation would be likely to suit this variety of Apple. *Enquirer.*

**Gas-lime for Gardens.**—Practical gardeners will know how to act on the advice given by "T. B." on p. 58, but many amateurs and others read the *Gardeners' Chronicle* as well, and possibly practise what they read, so that it is not well to let the above remark pass without mentioning that gas-lime, if applied to that extent, will prove a remedy far worse than the disease. I quite agree that it would banish the slugs, &c.; they would not appear again for some time either, where there was nothing for them to eat. *W. H. Divers, Ketton Hall.*

**The National Rose Society and Affiliated Societies.**—While the National Rose Society should be at perfect liberty to make rules for exhibitions

over the heads of provincial societies that do not care a rap for the National Society. I regard this as an infringement of the liberty of the subject, and especially so of horticultural societies, many of whom find it to their advantage, and greatly please their supporters by holding two-days shows. I should think the rosarians who framed this arbitrary regulation altogether failed to see to what inordinate lengths it could be applied. I have endeavoured to set forth one of these in the foregoing remarks. *Richard Dean, Hon. Sec. Earling, Acton, and Hamwell Horticultural Society.*

**African Narcissi.**—The note of "H. C." about these on p. 24, of which the only fault is its brevity, is instructive to collectors of Narcissi, though it may excite their envy. No doubt it will have been generally read, but I call attention to it because about this time last year we were advised by more than one expert to bake our bulbs (without disturbing the soil in which they were) of African Narcissi all through summer on a south shelf in a greenhouse. I have little experience in their cultivation except in failure; but the sun-drying system, which I have adopted in the past season, so favourable for it, has made such bulbs as

*N. triandrus*, *N. juncifolius*, and *N. bulbocodium*, start with unusual vigour. Indeed I have tried the same plan of baking under a south wall, but out of the ground, for such things as *Daffodils* and *Anemone fulgens* and they rushed up in such a way directly they were replanted that I thought I had discovered a plan worth patenting. Still I quite believe in the treatment adopted by "H. C.," whose advice is commended by the results he mentions. It is the first instance I have heard of the successful cultivation of *N. canariensis*. About ten years ago I joined the late Mr. Harpur Crewe in importing some bulbs of this *Narcissus*, of which I distributed several to clever gardeners—but neither he nor I could ever hear that any of these bulbs reached flowering. *W. D.*

**Lime and Potash to Remove Tar from Hot-water Pipes.**—In returning thanks to your several correspondents for the information given to me through the medium of the *Gardeners' Chronicle* respecting the tar varnish on my hot-water pipes, I will state the means which have been adopted to clean them, and which, so far as I can at present ascertain, is quite a success. In the first place I was recommended to apply new lime fresh from the kiln, to about half a peck of which I added 7 lb. of washing soda dissolved in boiling water, and made the whole into a paste about the thickness of treacle. This, while hot, was applied to the pipes, and I let it remain on for about three hours, when it was washed off with a scrubbing-brush and soft water. I was very pleased to see this brought a considerable portion of the tar off, but I had to apply two more dressings before I could satisfy myself that it had effectually done its work. I need scarcely say this was only applied to a small portion of the pipes for trial. I was then recommended to use potash in place of the soda, and this proved to be much stronger than the former, as it brought nearly every portion of the tar off with one dressing. After we had completed this operation I received a letter from a gentleman who recommended sal-ammoniac. I, therefore, had all the pipes washed over with it, and where there seemed to be a particle of tar left the sal-ammoniac removed it. I have now had the pipes painted over with the composition as recommended by me in my first letter on this subject. *Alfred Bishop.*

**Carter's Ashtop Fluke Potato.**—At p. 815, vol. xxii., Mr. Murphy speaks of this Potato as being one of the earliest varieties, and suitable for forcing purposes. May I ask if there are two under this name?—if not Mr. Murphy must have another kind, probably Carter's First Crop Ashleaf. I have grown the Ashtop Fluke since first sent out, and want nothing better; but it is certainly a second early kind, and has always been classed as such in the catalogues. It is one of the best keepers I am acquainted with. I have kept it over the year till the second season, when it dressed excellently. Mr. M.'s statement is misleading to those not acquainted with this variety, and which deserves to be more extensively cultivated as a main crop. *W. Divers, Wierton, Jan. 5.*

**Eucharis amazonica.**—I see that your correspondent, "W. B.," seems to think that there is a disease among the above at present in different parts of the country. I cannot say that I have seen anything yet in your columns to justify this assumption; on the contrary, I am satisfied that the so-called disease on foliage is nothing but the result of mismanagement and starvation. A dry, hot atmosphere is most injurious to them, and will cause leaves to flag and show red spots. They are great absorbents of moisture, and whether at rest in a temperature of 55° to 60°, or forcing from 65° to 75°, should never be allowed to get too dry either in the pots or in the atmosphere of the house where they are. Should your correspondent pot them in such materials as "Young Gardener" (p. 24) has done his, and give them plenty of moisture, there will be no red spots, but they will flourish luxuriantly, and will soon bloom plentifully. The greatest pest they are subject to that I am aware of is mealy-bug; it gets underneath the leaves, and can only be dislodged by sponging. *A. Macdonald, Cheadle.* [Our correspondent has overlooked the fact that in one of the worst cases noticed in our paper the plants were plunged in a very moist bed of decayed cocoa-nut fibre, which had the effect of keeping the soil unhealthily wet; and another had stood his plants under roof creepers that were heavily

syringed, when consequently the *Eucharis* had again too much water for their good. *ED.*]

—I am glad this subject has cropped up once more, and I hope it will be properly threshed out, for as a stove flowering plant it stands in the front rank when properly grown. For several years they grew with me like weeds, and flowered profusely. I have had as many as fifty-seven spikes on a plant in an 18-inch pot, averaging from five to seven flowers on a spike—a sight worth seeing. This was when I flowered them once a year; but after I was led to flower them twice and three times a year the plants that once were from 3 to 4 feet across are now in a yellow sickly condition, and much reduced in size, the bulbs in many cases gone off altogether. This has doubtless been brought about by hard flowering—at least, such is my thorough belief. *C. Lucas, Belmont, Taunton.*

**The Report of the Apple Congress.**—This seems well received by the public, and, doubtless, deservedly so, the name of A. F. Barron as Editor is a sufficient guarantee for the usefulness of the book; but I have no wish to discuss the usefulness of the book. I am surprised to hear many of the exhibitors have not yet seen a copy. If the Royal Horticultural Society really wish to advance the cause of horticulture, possibly they may yet be able to present a copy to each exhibitor of fruit at the Congress. I was not one myself, and it matters but little to me. However, I had the pleasure of assisting largely in getting up one of the finest private collections, and I know that many of the exhibitors must have been upwards of £2 out of pocket. It seems rather too bad, after a man has spent as much as he could well afford in making the exhibition what it was, to expect him to pay a further sum in order to obtain a share of the information to which he contributed all he was able to do, and which was the sole object of the exhibition. *W. H. Divers, Ketton Hall.* [Fellows of the Royal Horticultural Society can obtain the report gratis for the asking for it, and we believe that any one having shown fruit at the Congress would receive equal consideration on applying to Mr. Barron. *ED.*]

**Amateur Growers for Market.**—Can you wonder that I am about to call my creditors together? Competition in the flower market is bad enough, but it is cut-throat work when head gardeners help to cut the ground from under genuine tradesmen's feet. Peruse the enclosed cutting from the *Exchange and Mart*. Now this man can have no anxieties or expenses to meet, as a struggling tradesman has, and I, for one, do not consider it fair for a gentleman to allow his gardener to become a regular advertising tradesman. *6d. in the £, Dunning Nursery.* [As a proof of what our informant alleges, we print a few paragraphs at the head of the advertisement in question, which in its entirety amounts to four fifths of a column of the paper. *ED.*]

No. 4, new list (commencing Jan. 7).—Lovely pot plants for greenhouse, conservatory, window or table decorations, all strong and good, at the nominal charge for bedding plants, three for 1s. 3d., six for 2s. 3d., twelve for 4s., free—worth three or four times the amount; correctly named, securely packed in wet moss, and waterproof boxes, by parcels post to all parts of Great Britain (arriving as fresh as when despatched). Consisting of magnificent tree or perpetual flowering Picotees, in twenty varieties of the finest foreign and English kinds grown, not an ordinary one in the collection, having cost from 1s. 6d. to 2s. 6d.; the colours are yellow, scarlet flaked, and striped, white, edged purple, mauve, crimson, slate, lilac, cerise, &c.: a fine opportunity for collectors and admirers of this beautiful genus of plants. Cultural directions sent. The other various plants are: *Epiphyllum crenatum roseum* (fine), *Alternanthera amena* (lovely bright magenta-crimson), *Alternanthera latifolia major* (dark crimson-maroon), *Alternanthera rosea superba* (new, splendid rose-orange and green), *Eupatorium fragrantissima*, *Eupatorium riparium* (both white winter bloomers)—should be in every greenhouse; five foreign *Lantanas* (pink, lilac, white, yellow, crimson), worth 1s. 6d. each; *Aralia Sieboldii*, handsome table plants, cheap at 1s. 6d., worth 3s. 6d. by summer; *Coronilla glauca* (yellow flowers), *Dactylis glomerata aurea elegantissima* (rare, golden foliage), *Erinus alpinus* (purple flowers), *Libonia floribunda*, *Libonia Panchosiana* (fine plants, both constant winter bloomers), double Tree Violets, *Sunray Fuchsias*, worth 1s. 6d.; *Hydrangea speciosa elegantissima*, worth 2s. 6d.; silver and gold foliage *Euonymus* (very ornamental), Maidenhair Ferns (nicesize, true), double bicolor *Aquilegia*, *Solanum variegatum* (rare), *Solanum atropurpureum*, *Solanum hybridum*

*Princess of Wales*, *Selaginella Kraussiana aurea* (golden, very handsome), *Selaginella denticulata* (lovely green)."

**The Hymenocallis.**—All that your correspondent W. Garnett says in praise of *Pancratium caribæum* (more correctly *Hymenocallis caribæa*) is very true, but there are several other species of the genus as beautiful as *H. caribæa*, or more so. *H. rotata*, *H. macrostephana*, *H. fragrans*, *H. tenuiflora*, and one sold some years ago by Mr. Bull under the name of *H. elegans*, are all beautiful and very fragrant, and have the merit of being easy to grow. Of these the two finest certainly are *H. macrostephana* and *H. fragrans*. This last I think the finest of the genus, as it is also the commonest. It is sold also under the names of *H. speciosa* and *H. ovata*. It is distinguished by broadly lanceolate leaves, which spring up four or five at once, instead of in succession, as in most of the other species, and the six to ten flowers which it bears all open together. They open two at a time, in pairs, at opposite sides of the head of flowers; but the last pair are fully open several days before the first pair begin to wither, and nothing can be more beautiful than a fine spike of this with all the flowers open. *C. W. Strickland.*

## Reports of Societies.

### ROYAL HORTICULTURAL: Jan. 13.

THIS, the first meeting of the year, was held in the conservatory at the Royal Horticultural Society's Gardens, and owing, probably, to the inclement character of the weather, there were but few things to tax the energies of the amalgamated Floral Committees, nor those of the Fruit Committee.

#### Scientific Committee.

Sir J. D. Hooker, K.C.S.I., in the chair. Present: Messrs. Smee, MacLachlan, Pascoe, Wilson, Grote, Murray, Ridley, Boulger, Loder, Drs. Lowe, Foster, and Masters.

#### THE SCLEROTIIDS OF THE POTATO DISEASE.

The most important communications were those of Mr. A. S. Wilson, Professor Trail, of Aberdeen; and Mr. W. G. Smith, the two latter of whom independently confirmed Mr. Wilson's statement that the bodies discovered by Mr. Wilson are really masses of protoplasm, encrusted with oxalate of lime. After removal of the lime by acids the protoplasm was made manifest by appropriate staining reagents. In another column it will be seen that similar results have been obtained by Mr. Greenwood Pim. It was arranged that a conference to make further experiments should be held between Mr. Worthington Smith and Mr. George Murray.

The following is Professor Trail's communication:—

"A few days ago Mr. A. Stephen Wilson expressed a wish that I should, in his company, examine the bodies in Potato plants attacked by disease, to which he has given the name of 'sclerotiids,' and in regard to the nature of which a controversy has been carried on for some time. His chief desire was to obtain an unbiased verdict as to the effect on these bodies of treating them with nitric acid, as he felt convinced that the acid did not wholly dissolve these bodies, while Mr. Murray and Dr. Flight have asserted that in their experiments there was no residue left by the acid.

"Mr. Wilson brought a plentiful store of sclerotioids in pieces of leaves in spirits of wine. Of these specimens some were from the Potato crop of 1881, others from the crop of 1884. With some of this material we together experimented on January 5, 1885; and I have repeated and extended the experiments several times since.

"The conclusions to which I have been led in respect to the nature of these bodies are as follows:—The bodies, probably well known so far as concerns their appearance to all interested in their nature, are small ovals, though considerably larger than the cells among which they lie embedded. They are usually numerous in the tissues in which they are found, and when these tissues are examined by transmitted light they are very evident as dark opaque bodies. When examined by reflected light they are seen to be snow-white in colour, and their surface is slightly rough.

"On teasing a portion of tissue that contains them it is not at all difficult to detach them more or less completely from the tissue so as to isolate them for more accurate observation; and this is absolutely necessary in the application of tests to these bodies.

"Such reagents as glycerine, spirits of wine, and acetic acid produced no appreciable effect on them.

"Strong sulphuric acid acts on them but slowly and imperfectly. It renders them more easily broken up, though that is not difficult to do by pressure, or with the needles, under any circumstances. In the specimens crushed after being subjected to sulphuric acid there was the appearance of the mass being surrounded

with a multitude of very minute needle-shaped crystals of raphides distinct from the central substance which they surrounded.

"Nitric acid laid on a piece of tissue still enclosing the sclerotoids quickly caused their disappearance, so that one might readily have supposed that they had been totally dissolved. But on isolating one of them, and watching the process carefully from its commencement till its close, which I have done several times, I found in all cases that the body became more or less rapidly nearly transparent as the mineral deposit was dissolved, but that there remained a finely granular mass with all the aspect of protoplasm. This mass was nearly transparent, being faintly yellowish, but retained nearly the size and form of the sclerotoid. On removing the excess of acid and applying magenta to some preparations, and ossein to others, I found that the residual mass took up the dye and became coloured. I have no doubt that the sclerotoids are masses of protoplasm coated with calcium oxalate, probably in the form of minute raphides. *James W. H. Trail.*"

#### SEEDS GERMINATING IN THE FRUIT.

Mr. Boulger mentioned the occurrence of this in three Lemons observed by him.

#### GARDEN FLOWERS.

Dr. Masters exhibited, on the part of Mr. J. Mullins, a series of twelve quarto engravings coloured by hand, and published in 1730. They were issued by "Robert Furber, gardiner at Kensington," on the site now occupied by the Royal Horticultural Society's garden, and consist of twelve coloured engravings by H. Fletcher after drawings by Peter Castells, one for each month of the year. The flowers are well drawn and artistically arranged in vases. They are of considerable artistic merit and of much interest, as showing the flowers then in vogue. The selection is limited indeed in comparison with what we now have, and from this point of view, offers little or no advance upon what was known to Parkinson and Gerard a century previous. There are no New Holland plants, Rhododendrons, no Fuchsias, few Pelargoniums, no Dahlias, no Orchids. The plates show how vastly our gardens have been indebted, since those times, to such men as Douglas, Fortune, Lobbs, Cunningham, Hartweg. From another point of view it is curious to see the advance made in florists' flowers; the Polyanthus, Auriculas, Roses, Pinks, as such as would not pass muster now-a-days, and certainly need not make us regret the good old times.

#### GROWTH OF BRITISH ORCHIDS.

Dr. Masters read a communication from Mr. A. D. Webster, the substance of which appears in another column.

#### THE GHOST MOTH.

Mr. MacLachlan alluded to the caterpillars of this moth, *Helipalus humuli*, as feeding on the roots of Peonies.

#### THE DAFFODIL QUESTION.

Professor Foster moved the reappointment of a committee to examine the question as to the alleged conversion of the wild single Daffodil into the double form under cultivation.

#### CROCUS SPECIOSUS.

Dr. Lowe called attention to the extremely rapid growth of this plant. During the course of one night he had observed the flower-stalks of this plant to attain a height of 4-6 inches, the flowers thrusting themselves aboveground, and even through clumps of *Dianthus glacialis* to this height.

#### RED-SPOTTED POTATOS.

The Secretary read a communication from Mr. Hawkes, of Bournemouth, mentioning the presence of these spots in tubers grown on light sandy soil, as noticed by other observers.

#### DISEASED DEODAR.

The Secretary showed, from Mr. Sydney Ford, gr. to W. E. Hubbard, Esq., diseased stems of Deodar. The disease was considered to be due to the presence of the spawn of a fungus, possibly *Polyporus destructor*.

#### RENANTHERA LOWII.

A fine spike of this Orchid was shown, with its curious flowers of two colours, the two or three at the base being of a yellow colour, and much less spotted than those higher up. It appears, however, that the variation is in colour only, and not, as in some other cases, in sexual function also.

#### PRESENTATION TO THE LINDLEY LIBRARY.

Mr. Burbidge sent copies of his work on the *Chrysanthemum* and on cultivated plants. The Apple Congress Committee presented a copy of *British Apples*.

#### Floral Committee.

Present: G. F. Wilson, Esq., in the chair; and Messrs. Henslow, Masters, Bennett, Bealby, Herbst, Woodbridge, Douglas, Child, George, Killock, Hib-

berd, Ballantyne, Dominy, Hudson, Duffield, Williams, and Hill.

Mr. James, of the Castle Nursery, Lower Norwood, contributed *Cattleya chocoensis* amoena, a pale form with white sepals and petals, a lemon-coloured throat, with a small fan-shaped purple blotch on the labellum. A fine well-formed flower of *Sophronitis grandiflora* major, of the normal brilliant hue, but larger in size, came from the same nursery, as did *Odontoglossum aureo maculatum*, a variety with an upright, branching flower-spike, their deviation from the usual manner of carrying itself being now observed for the second season. The blooms open of a yellow colour, but become much paler afterwards. For these plants Mr. James was awarded a vote of thanks. He also exhibited *Odontoglossum Alexandrie Trianae*, a good white form of great substance, with faint blotches of brown on the sepals and lip; *O. Dormaniannum*, a very slenderly formed stalk and flower, of a bright yellow, spotted with chocolate colour. W. Vanner, Esq., Camden Wood, Chislehurst, contributed a new *Madevalla* in Armini, a curious example in purple and lilac, and bearing longish tails. Mr. Charles Noble, The Nurseries, Bagshot, also received a Vote of Thanks for a bunch of Rose Queen of Bedders, a quantity of unopened buds, and healthy leaves, gathered in the open air, speaking much for the mildness of the season in Surrey. R. H. Measures, Esq., The Woodlands, Streatham, showed a stately-looking *Odontoglossum Alexandrie*, hybrid var. Josephine.—the distinct dark chestnut spottings on the ivory petals and sepals and its bright canary coloured crest, making a handsome and desirable variety. The exhibitor was awarded a Vote of Thanks. From Sir Trevor Lawrence's garden came a large panful of a hybrid *Cypripedium*, between *punctatissimum* and *Spicerianum*; a *C. insignis* with the dorsal sepal of *C. Spicerianum*, pretty and distinct, and met with recognition in a Vote of Thanks. From the same garden came a densely spotted *Odontoglossum Schröderianum*. F. A. Phillbrick, Esq., Oldfield, Bickley, gr. Mr. H. Heims, showed the difficult and rarely seen *Barkeria elegans*, carrying a few of its beautiful blooms, with sepals and petals dark rose, crimson lip having spots of a lighter colour. From the Holloway nurseries of Mr. B. S. Williams came a strong plant of *Amaryllis Comte de Germiny*, with four of its cheerful rosy-pink flowers just going past their best. This is one of the race of perennial bloomers, the same bulb having borne flowers about nine months ago, and this, together with the ease with which it establishes itself after division and repotting, will make these plants of general request. There were some pretty *Cyclamens* of the grandiflorum type from Messrs. Page & Sons, Twickenham, one of the best being *Acme*, a smooth good form without coarseness—the colour purplish-rose; *C. alba plena* is almost a retrogression, there being evidences of doubling in the flowers, which can scarcely be looked on as "improvements" in such a flower as a *Cyclamen*; *C. Excelsior* was a large rough flower, but of a pure white. Mr. Child, gr., Garbrand Hall, Ewell, showed a white-flowered *Anemone Chrysanthemum* conspicuous for its pure colour and entire absence of an eye. From the Swanley gardens Mr. Cannell brought *Centropogon Lucyanus*, very well bloomed plants in 32's, and some plants of the originals of our present race of *Cinerarias*—*C. cruenta*—in several shades of colour. Messrs. Hooper & Co., Covent Garden, sent a small lot of tree *Caraagons*, amongst which we noticed Boisy, a good primrose-coloured bloom of fair form, and a decided acquisition as regards colour; and Melle Carle, a fine pure white, of good form. The following are the awards:—

#### FIRST-CLASS CERTIFICATES.

To Mr. Clark, Twickenham, for *Cyclamen Albert Victor*.

To Mr. B. S. Williams, Holloway, for *Amaryllis Comte de Germiny*.

To F. A. Phillbrick, Esq., Oldfield, Bickley, for *Barkeria elegans*.

To Messrs. Cannell & Sons, Swanley, for *Centropogon* To Sir Trevor Lawrence, Burford Lodge, Dorking, for *Odontoglossum Schröderianum*.

#### Fruit Committee.

Present: J. Lee, in the chair; and Messrs. Goldsmith, Lyon, Ross, Willard Blackmore, Roberts, Mudell, Burnett, Ellam, Denning, Bunyard, Stevens, and H. J. Veitch.

There was the minimum of work in this section, for with the exception of a few seedling Apples and some specimens of Ellam's early spring Cabbage, and a collection of thirty-five dishes of Apples from Mr. Ingram, gr. at Belvoir Castle, Grantham, there was nothing on the tables. The Belvoir fruit was sent to illustrate the orchard produce of Leicestershire and the capabilities of its heavy soil. It was interesting, if only to note how well some well known kinds keep after the thorough ripening they had—Cox's Orange Pippin, Ribston, Margil, and Golden Russet, being excellent in appearance, as were Bleheim Orange, Bramley's Seedling, Warner's King, Prince Albert, Peasegood's Nonsuch, Mère de Ménage, among the culinary kinds.

PETER LAWSON & SON (LIMITED).—A company has been formed under this title to acquire and carry on the seed department of the Lawson Seed & Nursery Company (Limited). The manager is Mr. David Syme.

## The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON.

Jan. 8.—Fine cold day and night.

9.—Dease fog from early morning till noon. Fine night.

10.—Heavy rain from early morning till 3 P.M. Fine clear night; windy.

11.—Fine mostly, slight rain during afternoon. Fine clear night.

12.—Dull day and night; cold wind.

13.—Snow falling nearly all day and night.

14.—Snow on ground all day; gleams of sun-hine in afternoon; rain began to fall at 9.30 P.M.

LONDON: *Atmospheric Pressure.*—During the week ending January 10, the reading of the barometer at the level of the sea increased from 30.09 inches at the beginning of the week to 30.15 inches by 9 A.M. on the 4th, decreased to 30.05 inches by 9 A.M. on the 5th, increased to 30.24 inches by 9 A.M. on the 6th, and decreased to 30.22 inches by 3 P.M. on the same day, increased to 30.43 inches by 9 A.M. on the 7th, and was 30.06 inches by the end of the week.

The mean reading of the barometer for the week was 29.96 inches, being 0.12 inch lower than last week, and 0.05 inch above the average of the week.

*Temperature.*—The highest temperature in the shade in the week was 50°, on the 10th. The highest on the 4th was 39°. The mean of the seven high day temperatures was 42° 5.

The lowest temperature was 27°, on the 9th; on the 5th and 10th the lowest temperature was 36°. The mean of the seven low night temperatures was 31° 7.

The greatest range of temperature in one day was 14°, on the 10th; the smallest was 7°, on the 4th. The mean of the seven daily ranges was 10° 8.

The mean temperatures were—on the 4th, 36°; on the 5th, 42° 2; on the 6th, 34° 8; on the 7th, 34° 8; on the 8th, 37°; on the 9th, 34° 3; on the 10th, 43° 6; of these the 5th, 8th, and 10th were above their averages by 5° 7, 1° 2, and 7° 3 respectively. The rest were below their averages by 0° 6, 1° 6, 1° 5, and 1° 9 respectively.

The mean temperature of the week was 37° 5, being 3° 7 higher than last week, and 1° 2 above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 68°, on the 8th. The mean of the seven readings was 55° 5.

The lowest reading of a minimum thermometer with its bulb placed on grass was 16°, on the 9th. The mean of the seven readings was 21° 9.

*Rain.*—Rain fell on two days in the week, to the amount of 0.36 inch.

ENGLAND: *Temperature.*—During the week ending January 10 the highest temperatures were 52°, at Truro, 51° at Plymouth and Bristol. The highest at Preston was 46°, at Wolverhampton 46° 9, at Brighton, Hull, and Sunderland 47°. The general mean was 48° 6.

The lowest temperatures were 24° 6 at Wolverhampton, at Truro 25°, at Bolton 25° 9; the lowest

at Leeds and Preston was 32°, at Liverpool 31°.6. The general mean was 28°.7.

The greatest ranges were 27° at Truro, 23°.8 at Bristol, 23° at Blackheath; the smallest ranges were 14° at Preston, 15°.8 at Bradford, 16°.5 at Brighton. The general mean was 19°.9.

The mean of the seven high day temperatures was highest at Truro, 50°.7, at Plymouth 47°.6, at Bristol and Liverpool 46°.7; and was lowest at Hull, 40°.4, at Wolverhampton 41°.3, at Preston 42°.1. The general mean was 44°.1.

The mean of the seven low night temperatures was highest at Liverpool, 35°.4, at Truro 34°.1, at Bradford 34°; and was lowest at Wolverhampton, 28°.1, at Bolton 29°.3, at Plymouth 29°.6. The general mean was 32°.1.

The mean daily range was greatest at Plymouth, 18°, at Truro 16°.6, at Bristol 16°; and was least at Preston, 8°.4, at Brighton 8°.7, at Bradford 9°.2. The general mean was 12°.

The mean temperature was highest at Truro, 42°.3, at Liverpool 41°, at Sheffield 38°.9; and was least at Wolverhampton, 34°.6; at Hull 35°.5, at Bolton 35°.9. The general mean was 38°.1.

**Rain.**—The largest falls were 1.76 inch at Bolton, 1.25 inch at Truro, 1.14 inch at Sheffield; the smallest falls were 0.07 inch at Leeds, 0.15 inch at Bradford, 0.18 inch at Sunderland. The general mean fall was 0.64 inch. Rain fell on every day in the week at Plymouth.

**SCOTLAND: Temperature.**—During the week ending January 10, the highest temperature was 51°, at Glasgow; at Perth the highest was 44°. The general mean was 48°.4.

The lowest temperature in the week at Dundee was 28°.5; at Paisley the lowest temperature was 32°.2. The general mean was 30°.5.

The mean temperature was highest at Paisley, 40°; and lowest at Dundee, 36°.3. The general mean was 38°.4.

**Rain.**—The largest fall was 3.11 inches, at Greenock, and the smallest fall was 0°.30 inch at Edinburgh. The general mean fall was 0.94 inch.

JAMES GLAISHER, F.R.S.

## Enquiries.

"He that questioneth much shall learn much."—BACON.

**CRINUM SANDESIANUM, &c.**—C. W. S. would be glad to know where bulbs of *Crinum Sandersonianum* and *Hymenocallis eucharidifolia* can be obtained.

**GENTIANA VERA ALBA.**—Is this plant still existing in any collection of alpine in this country? It is figured in *Maund's Botanic Garden*, No. 712, and in the text accompanying the excellent little figure the author says:—"We are indebted for it to the Messrs. Pope, of Handsworth, who never neglect to secure similar rarities." I should be greatly pleased to hear some one has it still, but dare not anticipate so much. R.

**ORCHID SEEDS.**—*Antares* writes:—"I have succeeded in ripening a pod of *Odontoglossum crispum*, *Alexandria*, which has just burst. The flower was fertilised from another plant of the same kind in February, 1884. The pod contains a quantity of exceedingly fine yellow seed, which appears to be the actual seed, and its aspect under the microscope is elongated, but plump. Should the seed be kept after sowing in the dark, or in the light, and in what temperature?" (To this question Mr. Seden, whose experience is probably greater than that of any other grower, kindly replies as follows:—"All Orchid seed should be sown as soon as ripe—that is, as soon as the seed-pods burst. Sow them on pots or pans, with good drainage, in a mixture of equal parts of peat and good sphagnum, with a few lumps of charcoal. After the seed is sown give as much light as possible without exposure to full sun. Keep the pots or pans where the seed is sown moist, not too wet, or the mixture will become sour, and the seed rot. If *Odontoglossum*, sow in *Odontoglossum*-house. The temperature required by the parent plants is required also by the seedlings.")

**VINES.**—Can any of your readers say from experience if Foster's Seedling is a reliable stock for a second variety to grow upon? H.

**WEIGHT OF GROS COLMAR GRAPE.**—Can any of our correspondents inform E. & Sons of the greatest weight on record of a bunch of Gros Colmar Grapes?

## Answers to Correspondents.

**BOOK ON EVERGREENS, &c.**: H. Smith. *Handy Book of Ornamental Conifers and Other Evergreen Plants*, by Hugh Fraser; published by W. Blackwood & Sons, Edinburgh.

**BROWN ORCHID LEAF: Alpha.** It looks like having been discoloured by the steam from the hot-water pipes. But how can we tell from a scrap an inch long, unaccompanied by any particulars?

**CHRYSANTHEMUM PROPAGATION:** F. G. These can be grown in a cold frame, under a hand-glass, in a half-shady spot, or in heat, and may be taken off at any time between January 1 and the end of March. Your method will answer if your leaf-bed does not give off too much steam. Ventilate carefully if it does.

**CLOVER MAGGOT:** *James Palmer.* You should, if it be possible, send the maggot, so that it may be determined.

**COLOUR OF PHALÆNOPSIS SANDERIANA:** M. A. This ranges from very faint pink to deep pink.

**DISEASED SPRUCE FIR:** H. James. This malady, which affects Conifers, and manifests itself by gouty swellings on the young shoots, is described in our pages (vol. xviii, p. 109), where also a branch showing the appearances common to the disease is figured. Fir-tree oil is the remedy.

**EUPHARIS AMAZONICA:** D. Bird. If you had perused our pages for the last three months you would have ascertained as much from them as we could now tell you of the reasons for their ill-health.

**GRASS:** J. R. Pearson & Sons. The bulbous variety of *Avena elatior*.

**INSECT ON VINES:** E. W. A weevil: very destructive. Trap them at night with pieces of Potato or Carrot hollowed on the under-side, and destroy them.

**LICHEN:** W. Polson. The word is derived from the Greek, and is pronounced as if spelt leiken.

**MR. GRANT ALLEN:** W. R. We do not know. Apply to Messrs. Macmillan & Co., Bedford Street, Covent Garden.

**NAMES OF PLANTS:** W. P. H. *Cattleya Loddigesii*.—*Rex*. *Laelia anceps*.—W. W. We think it is *Lycopodium amplum*. Please send a better specimen, and describe the plant.—F. P. 1, *Retinispora plumosa aurea*; 2, *R. squarrosa*, Siebold's variety.

**PEAR BUDS:** W. L. We presume there is something amiss at the roots, but there is no evidence to found an opinion upon.

**PRIMULA SINENSIS:** G. W. K. It is rather unusual for dark-leaved plants to produce white flowers. The flowers were very pure in colour, but we are unable to give the reason for these freaks of Nature.

**ROYAL APPOINTMENT:** C. C. You could apply in writing to the Comptroller of the Royal Household.

**SAXIFRAGE AND LONICERA:** H. Rowland. No to each question.

## SEEDS.

LONDON: January 14.—A somewhat improved tone is now noticeable in the trade for farm seeds. More inquiries are coming to hand from the country; there is generally more disposition to purchase. Clover seeds, meanwhile values all round remain without quotable variation. For Haricot Beans and blue boiling Peas there is a better demand, owing to the colder weather, Spring Tares meet with greater favour. Canary and Hemp seed sell on last week's terms. More money is wanted for feeding Linseed. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

## CORN.

At Mark Lane on Monday the trade was somewhat disappointing as regards Wheat. At the opening factors asked further advanced rates, but buyers held off, and eventually a moderate business was concluded at about the prices of the previous Monday. Flour also showed no quotable change on the week. Malting Barley ruled 1s. above the quotations of this day se'nnight, and grinding sold well, 3d. to 4d. dearer. Oats were in fair demand, and 6d. to 7d. higher on the week. Canadian Peas were 1s. dearer, and Maize very scarce and fully as dear. On Wednesday both Wheat and flour were dull of sale, though no appreciable change was made in quotations. Barley was firm; Maize was firm on the spot, from scarcity; Oats were steady; and Beans and Peas without quotable alteration.—Average prices of corn for the week ending Jan. 10.—Wheat, 32s. 7d.; Barley, 31s. 7d.; Oats, 19s. 11d. For the corresponding period last year:—Wheat, 38s. 9d.; Barley, 32s. 1d.; Oats, 19s. 4d.

## HAY.

Tuesday's Whitechapel Market report states that the supplies of straw and hay were short, and the Clover trade dull. Quotations:—Clover, prime, 90s. to 107s.; inferior, 46s. to 73s.; prime second cut, 90s. to 105s.; hay, prime, 80s. to 95s.; inferior, 30s. to 63s.; and straw, 22s. to 36s. per load.—On Thursday there was a short supply and quiet trade.—The Cumberland Market report states that there was a fair supply, with better demand, and trade greatly influenced by the weather. Quotations:—Clover, best, 95s. to 105s.; inferior, 50s. to 80s.; meadow hay, best, 80s. to 90s.; inferior, 50s. to 70s.; and straw, 26s. to 35s. per load.

## POTATOS.

The following are about the average prices for the week:—York and Lincoln Magnums, 50s. to 65s. per ton; ditto Regents, 55s. to 70s.; ditto Victorias, 55s. to 60s.; ditto Champions, 40s. to 50s.; Kent and Surrey Regents, 55s. to 75s.; ditto Magnum Bonums, 50s. to 70s.; ditto Champions, 45s. to 55s.; Cambridgehire Regents, 55s. to 65s.; ditto Magnum Bonums, 45s. to 60s.; ditto Champions, 40s. to 45s.—The imports into London last week consisted of 1411 bags 4 sacks from Hamburg, and 21 boxes from Lyttelton.

## COALS.

The following are the quotations current at market during the week:—East Wylam, 15s. 6d.; Broomhill West Hartley, 14s. 6d.; Walls End—Tync (unscreened), 11s. 3d.; Hetton, 18s. 6d.; Hetton Lyons, 16s. 6d.; Lambton, 18s.; Wear, 16s. 6d.; Hartlepool, 17s. 6d.; Hulam, 16s. 9d.; East Hartlepool, 17s. 9d.; Tees, 18s. 9d.

# RICHARD SMITH & CO., WORCESTER.

**EUREKA!!**

**INSECTICIDE.**

Prepared by

**WILLIAM SMITH**, Chemist, Stockbridge, Edinburgh

Highest Award, Forestry Exhibition, Edinburgh.

"Clovenfords, by Galashiels, N.B., July 25, 1883.

"Mr. SMITH,—Dear Sir,—We have now tried your Insecticide on all the insects we can find on any of our Plants, including Orchids, and used as directed by you we find it instant destruction to them all, while it neither stains nor injures the tenderest leaf. We shall in future use no Fire-Tree Oil, or other Insecticide but yours.—We are, yours truly,

"**WILLIAM THOMSON AND SONS.**"

**WHOLESALE AGENTS:—**

**CORRY, SOPER, FOWLER & CO.,**

18, Finsbury Street, London, E.C.

**FIR TREE OIL INSECTICIDE**

(Soluble in Water)

Effectually clears all Insects and Parasites from the Roots or Foliage of Trees and Plants. Kills all Vegetable Grubs, Turnip Fly, &c. Cures Mildew and Blight. Clears Grapes from Mealy Bug, &c., and makes a good Winter Dressing. Of all Seedsmen and Chemists, 1/6, 2/6, 4/6 a bottle. Per gallon 12/6, or less in larger quantities. A Treatise on "Fir Tree Oil," and its application, sent free on receipt of address, by the Manufacturer, **E. Special Designs in Garden Tables.

# FLOWER SEEDS.

Amongst our numerous experiments in hybridising and selecting from our large extent of flowers, and knowing as we do the public taste and requirements, we now have the pleasure of offering the following as not only new, useful, and beautiful, but such as will be highly thought of and become permanent favourites, as they have with us and all who have seen them in the "Home of Flowers":—

## AQUILEGIA, OUR HYBRIDS.

New shapes and colours, 1s. per packet.

## ASTER, WHITE VICTORIA.

Pure double white. For use and beauty a grand addition. Every one should make three sowings of this.  
1s., 2s., and 3s. per packet.

## SINGLE ANNUAL ASTERS.

For cut flowers, and other decorative purposes these quite surpass the doubles. Three sowings should be made of this.  
1s. per packet.

## CARNATIONS and PICOTEES.

We have again purchased all Mr. Dodwell's seed. This with our own it is well known none can be so near perfection.  
Each, 2s. 6d. per packet.

## CANTERBURY BELLS.

These are totally different in shape to the old varieties, being duplex, exactly like a teacup and saucer, one set in the other. Send for our Catalogue with every particular.  
1s. per packet.

## CHRYSANTHEMUM TRICOLOR "ECLIPSE."

New colour, new shape, and different to all others in this family. For cut flowers it is lovely.  
1s. per packet.

## CINERARIA, "MARCH PAST" and "VICTORY."

Well known to be much above anything before seen, both in colour, shape, and size. *First class Certificate.*  
Each, 2s. 6d. per packet.

## DAHLIA PICTA FORMOSISSIMA, or the Grand Old Dahlia.

Lovely gold and scarlet striped; semi-double.  
2s. 6d. per packet.

## TRUE WHITE CACTUS DAHLIA.

The true variety. For real use and beauty it is lovely.  
1s. per packet.

## MIDGET IMPROVED DAHLIA.

The smallest and most useful scarlet-crimson single variety ever raised. Shell-like shaped petals.  
1s. per packet.

## PANSY, "RAINBOW."

Entirely new colours. Very much the most brilliant and beautiful of all the family. Nothing like them ever seen hitherto.  
2s. 6d. per packet.

## GIANT or TRIMARDEAU PANSY.

For size is not only a novelty, but a surprise. Grand for garden decoration. 1s. 6d. per packet.

## BEACONSFIELD PRIMROSES.

Quite distinct, both in growth and size, to anything yet seen except in our nursery, having many shades of true blue and purple.  
1s. per packet.

## SUNFLOWERS (Single) MISS E. TERRY.

Lovely colour and shape; small. For house decoration a beauty.  
1s. per packet.

## LOBELIA, SWANLEY BLUE.

Of a more effective and prettier shade of blue than any other variety, and the best habit of all the dwarf Lobelias. *First-class Certificate.*  
1s. per packet.

## HELIANTHUS (Sunflower) IMPROVEMENT on UNIFLORUS (One Flower).

Large handsome flowers. The centre often measures 16 to 18 inches across. Quite a monstrosity, but wonderful object. Seeds scarce.  
1s. per packet.

## CYCLAMEN (Early White) PRINCESS OF WALES.

Pure white, dwarf, gigantic flowers. Where white flowers are in request at the commencement of the new year it is highly valuable. 2s. 6d. per packet.

## MYOSOTIS SPRING BEAUTY.

Much better than dissitiflora. The best of all the Forget-me-nots for all purposes.  
1s. per packet.

## HIBISCUS TRIONUM.

What a surprise if you have not before seen this lovely flower; size, about 2 inches across; colour, a lovely creamy white, with intense dark throat, nearly black. The contrast is so great, and yet pleasing, that all exclaim "What an exquisite flower! I must have it." Sow seeds in gentle heat in March; plant out in May half a dozen plants, and you will have flowers that you will never forget. *First-class Certificate.* 1s. per packet.

H. CANNELL & SONS, "THE HOME OF FLOWERS," SWANLEY, KENT.

## CUCUMBER.

2s. 6d. per Packet (10 Seeds).

Epicurean will produce Cucumbers all the year round.

Epicurean is a fortnight earlier than Telegraph—a darker green, longer—more prolific, and better in flavour.

Oil Paint no Longer Necessary.  
**HILL AND SMITH'S BLACK VARNISH**  
for Preserving Ironwork, Wood, or Stone.  
(Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertiser, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 15. 6d. per gallon, at the Manufactory, or 15. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.  
"Pierrefield Park, June 21, 1876.—Sirs.—I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chepstow.—I am, Sirs, yours respectfully, WM. COX."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large illustrated CATALOGUE of Fencing Hurdles, Field and Entrance Gates, &c., sent free on application to HILL AND SMITH, Brierley Hill Ironworks, Staffordshire; 118, Queen Victoria Street, London, E.C.; and 196, St. Vincent Street, Glasgow.

Rosher's Garden Edging Tiles.

THE ABOVE and many other PATTERNS

are made in materials of great durability. The plainer sorts are specially suited for KITCHEN GARDENS, as they harbour no Slugs or Insects, take up little room, and, once put down, incur no further labour or expense.

Edgings, consequently being much cheaper. GARDEN VASES, FOUNTAINS, &c., in Artificial Stone, very durable and of superior finish, and in great variety of design.

## PATENT WROUGHT-IRON TUBULAR HOT-WATER BOILERS,

And others with SHELVES, and Hollow or Ordinary Cast-iron GRATE BARS;

### SADDLE BOILERS,

With WATERWAY BACKS, and WELDED BOILERS which are Specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c.

\* They are the neatest, cheapest, most effective, and durable of any extant.

The Tubular ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention. This pattern

Had the First and Highest Prize, a Silver Medal, Awarded to it at the Royal Horticultural Society's Exhibition, South Kensington, London, on June 3 1881.

The *Journal of Horticulture* of June 9 says:—  
"The TUBING APPARATUS—A great number of boilers, valves, &c., were exhibited by eight competitors, and considerable interest was manifested in the verdict of the judges, and much discussion was brought to bear on the merits and shortcomings of the different boilers. The apparatus for which the Silver Medal was awarded was a wrought-iron saddle boiler, with a series of intersecting tubes, somewhat in the form of a letter X, but the tubes in one form, in the crown of the boiler. Most gardeners who examined the boiler expressed a favourable opinion of it. It is no doubt a quick and powerful boiler without being complex, the latter condition having, no doubt, had weight with the judges."

The *Garden* of June 11 says:—  
"The premier prize, a Silver Medal, was taken by Messrs. Green & Son for their new patent tubular saddle boiler. It is a modification of their original patent, the boiler being longer and not so high. It is found to be a powerful and efficient boiler, and heats a large quantity of water quickly with a small consumption of fuel."  
Descriptive Illustrated Price List may be had free on application.  
Estimates given for all kinds of Heating Apparatus, and Hot-water Fittings of every variety supplied on the shortest notice. Galvanized Iron Cisterns, from 4d. to 1s. 6d. per gallon.

**GRATEFUL—COMFORTING.**  
**EPPS'S COCOA.**  
**BREAKFAST.**

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." *Civil Service Gazette*.

Made simply with boiling water or milk. Sold only in Packets, labelled thus:—  
**JAMES EPPS & CO., Homoeopathic Chemists, London.**

**Cure of Cough and Inflamed Lungs by DR. LOCOCK'S PULMONIC WAFERS.**  
Extract of letter from Mr. LEITH, Harbour Master, Scrabster, Thurso, December 8, 1884.—"The two first boxes I got gave me immediate and great relief. I have had a cough for over two years, brought on by repeated attacks of inflammation of the lungs." They instantly relieve and rapidly cure Asthma, Consumption, Bronchitis, Coughs, Colds, Shortness of Breath, Pleurisy, Pains in the Chest, Rheumatism, and taste pleasantly. Sold at 1s. 1½d. and 2s. 6d. per Box, of all Druggists.

**HOLLOWAY'S OINTMENT and PILLS.**  
—In all outward complaints a desperate effort should be made to at once remove these annoying infirmities, and of establishing a cure. The remarkable remedies discovered by Professor Holloway will satisfactorily accomplish this desirable result, without any of those dangers or drawbacks which attend the old method of treating ulcerative inflammations, scrofulous affections, and scrofulous annoyances. The most timid invalids may use both the Ointment and Pills with the utmost safety with certain success, provided a moderate attention be bestowed on their accompanying "Directions." Both the preparations soothe, heal, and purify. The one assists the other most materially in effecting cures and renewing strength by helping exhausted Nature just when she needs such succour.

# PETER LAWSON & SON

(LIMITED),

## SEED MERCHANTS AND GROWERS, EDINBURGH,

RESPECTFULLY inform their Friends and Customers that they have now COMPLETED THE PURCHASE from "THE LAWSON SEED AND NURSERY COMPANY," LIMITED, of the OLD-ESTABLISHED SEED BUSINESS, carried on since the year Seventeen Hundred and Seventy, including the Entire Seed Stocks, Valuable Existing Contracts, Lease of the Premises here and Goodwill, and they are now carrying on the same in all the Departments as heretofore.

PETER LAWSON AND SON have been authorised by THE LAWSON COMPANY to Collect all Debts due to them, also to Dispose of the Produce of the said Company's Nurseries still being carried on.

The most valuable of the old *employés* still remain, and are largely interested in the concern. Undivided attention will henceforth be devoted to the Seed Department, therefore Customers may depend upon all Orders being executed in the best possible manner, whether in regard to Price, Quality, or Prompt Despatch.

If not already received, the *TRADE PRICE CURRENT* for the season will be posted upon application.

N.B.—Prospectuses of Peter Lawson & Son, Limited, may be had at the Registered Office of the Company, 1, George IV. Bridge; or of Messrs. T. AND W. J. McLAREN, W.S.; the Company's Solicitors, 51, Frederick Street, Edinburgh; and SAMUEL McDOWALL, Esq., 31, Nicholas Lane, Lombard Street, London, E.C.—*Edinburgh, January, 1885.*

## CHARLES SHARPE & CO., SLEAFORD.

NEW PEA—SHARPE'S TRIUMPH—Sealed  $\frac{1}{2}$ -pint Packets, 2s. 6d. each, post-free.

Triumph is the best of the many fine varieties we have sent out. It is a Blue Wrinkled Marrow, of exquisite flavour; the pods are large, well filled with large Peas. The habit is dense and bushy; height 2 to 3 feet. In constitution it is robust and hardy; and is the perfection of Peas either for exhibition or for ordinary use. Sixty-nine pods have been counted on one plant of Triumph—each pod containing nine to eleven large Peas.

*A New Edition. Fcap. Cloth. Price 7s.*

## CANNELL'S

We print the following from our greatest Artist and Professional Floral Critic of the day, simply to show all lovers of Flowers that our Catalogue ("FLORAL GUIDE") is of more importance and value than we have hitherto set upon it; and further, however good the Catalogue may be, our place, stock, quality, and facilities are even more so.

**HARRISON WEIR, Esq., F.R.H.S.**

"Henwick, Lansdowne Road, Tisbury Wells.

January 19, 1885.

"DEAR SIR,—I have duly received your marvellous Catalogue, for which I have much pleasure in enclosing a postal order, 1s. 6d. It is full of information, and is not only valuable from a COMMERCIAL point of view, as enabling those wishing for certain plants to know where to find them, but it is a veritable register of the floral beauties of TO-DAY—their price and qualities, and thus forms an excellent work for reference in years to come; as such I shall HAVE IT BOUND, and place it in my Library."

THE HOME OF FLOWERS,  
 SWANLEY, KENT.

**PALMS**, strong, healthy, splendidly foliaged.

—*Latania borbonica* and *Seaforthia elegans*, 20 inches high, 12s. per dozen; sample plant, 1s. 3d.; *Latania borbonica* and *Seaforthia elegans*, 12 inches high, 25s. per 100; sample dozen, 4s.; *Maidenhair FERNS*, *Adiantum cuneatum*, 20s. per 100; sample dozen, 3s. Packages and parcels post-free.  
 Postal Orders to the **GARDENER**, Holly Lodge, Stamford Hill, London, N.

**CHRYSANTHEMUMS**.—Specialty. — 420 varieties, guaranteed true to name. One of the largest and cheapest Collections in the Trade. Plants, purchaser's selection, 2s. 6d. per dozen, 16s. per 100; cuttings, 1s. 6d. per dozen, 10s. per 100; W. E.'s selection, cheaper. For the new English and Continental varieties see CATALOGUE, with Essay on Cultivation, one stamp. Inspection invited.  
**W. ETHERINGTON**, The Manor House, Swanscombe, Kent.

**SEAKALE**.—Fine Forcing and Planting.

**ASPARAGUS**, very fine, 3 years.  
**THE ROYAL NORFOLK NURSERIES COMPANY** (late EWINGS), Eaton, Norwich.

**PAUL and SON**, The "Old" Nurseries, Cheshunt, hold very fine stocks of the undermentioned:—  
**STANDARD TEA ROSES**, best kinds.  
**STANDARD HYBRID PERPETUAL ROSES**, vigorous kinds.

Knap Hill Nursery, Woking Station, Surrey.

**Martin's**  
**President**  
**Cauliflower**  
1s. 6d.  
per packet.

The earliest in cultivation, dwarf and compact in habit, head firm and pure white, and well protected by the foliage. It stands dry weather better than any other variety.  
Mr. GILBERT says it turned out the best of all he grew last season.  
Mr. E. STEPHENSON, Thorganby Hall, says:—"Your 'President' Cauliflower is not only the earliest but the most useful I have ever grown; we can plant it 3 or 4 inches closer than any other variety. The heads are very white and compact. I have grown it ever since it came out. I recommend it to all my friends."  
Post free on receipt of postal order or stamps for 1s. 6d.

WILLIAM E. MARTIN, Seed Merchant, Hull.

### Great Reduction in Prices of Roses.

STANDARDS and HALF-STANDARDS, best sorts, 15s. per dozen, 120s. per 100.

DWARFS, LARGE BUSHES, 7s. per dozen, 55s. per 100.

The following letter, selected from many hundreds of similar ones, is, I trust, a sufficient proof that the plants are of the best quality:—

"Hill Side, 203, Richmond Road, Putney, Nov. 26, 1884.  
"Sir,—I am much pleased with the fine healthy plants you have sent me. Both the Dwarfs and Standards are specimens of skilful cultivation. They are particularly well rooted, and are in every respect all that a Rose-grower can desire.—I am, yours faithfully,  
"B. G. COLEBY.

"To Mr. FRANK CANT, Rose-grower, Colchester."

A Descriptive CATALOGUE Post-free on application to

UPPER HOLLOWAY, LONDON, N.

## RICHARD SMITH & CO., WORCESTER.

(ESTABLISHED 1804.)

**BULBS** Lovely Flowers in Winter and Spring for a trifle.  
Ready in Autumn.

**ROSES (20 acres)** BUSHES, 8s. per dozen,  
60s. per 100;  
STANDARDS, 15s. per dozen, 105s. per 100.  
Packing and Carriage Free for Cash with Order.

**FRUITS (74 acres)** Best varieties of every form  
and kind of tree at low prices.

**SHRUBS, &c. (91 acres)** CONIFERS,  
TREES, FLOWERING PLANTS (&c. per dozen, 50s.  
per 100), FOREST TREES.

**ROSES IN POTS (80,000)** for CONSER-  
VATORY,  
FORCING, &c., 15s. to 36s. per dozen.

**ALPINE and Herbaceous Plants,**  
4s. per dozen, 25s. per 100 (R. S. & Co.'s Selection).

**STRAWBERRIES** PLANTING, 4s. per 100;  
FORCING, 16s. to 25s. per 100

**VINES** THOUSANDS of GRAND CANES,  
3s. 6d. to 10s. 6d. each.

**CLEMATIS** WHITE to DARK PURPLE, SINGLE  
and DOUBLE, 12s. to 24s. per dozen.

*Three Acres of Glass for Stove and Greenhouse Plants.*

FAMOUS PLANTING AND FORCING ASPARAGUS AND SEAKALE.

**VEGETABLE, FLOWER, and FARM SEEDS.**

*DESCRIPTIVE LISTS, containing an immense amount of useful  
information, free on application.*

WEBB'S

WORDSLEY WONDER.

A First Early Blue Wrinkled Marrow.  
Height, 2½ feet.

## TRIALS AND REPORTS.

Mr. W. Iggulden says:—

"It is the best novelty in the way of Peas."

Mr. R. Gilbert says:—

"It is calculated to suit the million."

Mr. W. Ingram says:—

"The Wordsley Wonder is altogether a very good Pea."

The "Gardeners' Chronicle" says:—

"Of great productiveness and good constitution."

Mr. William Crump says:—

"I am well pleased with Webb's Wordsley Wonder."

Mr. W. Kimpton says:—

"The flavour is all that can be desired."

Mr. Edward Tate says:—

"Very prolific, having from ten to twelve Peas in each pod; of first-class flavour."

Mr. Joseph Fitt says:—

"The best new Pea sent out for some time."

Mr. Whittington Landon says:—

"Strong grower—very prolific—delicious flavour."

THE QUEEN'S SEEDSMEN,

WORDSLEY, STOURBRIDGE.

SEEDSMEN BY ROYAL WARRANT

SUTTON'S  
CHOICE  
NOVELTIES.

## NEW POTATOS for 1885.

## SUTTON'S EARLY ECLIPSE.

Especially valuable for forcing, as well as for early borders. It is a white round variety, of good shape, and as regards quality a decided advance on any other early sort. Although the haulm is very small, the crop is large. We have had this Potato tested for three seasons at our Trial Farm, and also in other soils, and in every instance it has proved to be ready for table before every other variety.

Per 4 lb., 2s. 6d.; per 7 lb., 4s.

"A most useful Potato for early work, with but little haulm. Very heavy crop, free from disease, though others grown by its side are very badly diseased. Excellent when cooked."—Mr. C. HOWE, The Gardens, Benham Park.

## SUTTON'S READING RUBY.

A splendid new ruby-purple Potato, raised by Mr. R. Fenn, from a cross between Bountiful and an American variety. Beautiful shape, smooth skin, perfectly white and firm flesh; eyes on the surface. From a great variety of soils it has proved to be one of the best cooking Potatoes grown. We strongly recommend it for general crop, and especially for culture in gardens, as it gives a large crop with moderate haulm. It was awarded the first prize at the Northampton Seedling Potato Exhibition, September 21, 1882, as the best coloured Kidney, and for quality on being cooked. It took the same position again at the show held in September, 1884. Sutton's Reading Ruby was also awarded a First-class Certificate by the Committee of the International Potato Exhibition when tested under the name of James Abbiss.

Per 4 lb., 2s. 6d.; per 7 lb., 4s.

"A purple Kidney of great merit, quite free from disease, splendid when cooked, white, floury and excellent."—Mr. J. TEGG, Gardener to J. Walter, Esq., M.P.

THE

## Gardeners' Chronicle.

SATURDAY, JANUARY 24, 1885.

## A TRIP TO JEYPORE.

FROM Agra to Jeypore the country is very uninteresting. As far as the eye can see, on both sides of the railway, there are nothing but plains of *Saccharum moonja*, which was then (November) in flower. It is not unlike the Pampas-grass. There are also immense tracts of *Zizyphus nummularia*, plenty of *Calotropis Hamiltoni*, now and then some *Capparis aphylla*, especially on broken ground, and some other plants, which I could not identify from the railway carriage. Villages are few and far between. Crops, with few exceptions, are very wretched, although this year (1884) they say the rainfall was better than usual. Sorghum and *Penicillaria* were 2 and 3 feet high instead of 8 or 10 feet. Near Jeypore peacocks were feeding on the leaves of plants close to the railway, and some were actually perched on the boundary mud walls of the line. The train passing along did not in the least disturb them. They are evidently never harmed, and held in great reverence. The peacock appears to be the emblem of Jeypore, as I saw it in cast-iron miniature on the tops of the lamp-posts.

The city of Jeypore is rather curious; its main streets are wide and well kept; they are lined on both sides by a series of native house-fronts, the exterior of which reminds one very strongly of a cake in purple-pink, picked out with white. They are all of the same colour, except the fronts of His Highness's palace and stables, which are of yellow-ochre, picked out with white. The city is well furnished with gas-lamps, although when I left early in the dark morning not one was lit on the road to the station. There are also numerous watercocks along the main roads. Both these are novel features in native cities. The narrow side streets, however, had the usual oriental dirt and smells.

His Highness's palace consists of tier upon tier, making five or six storeys. It looks quaint, but I fancy the top storeys must be nice and cool, and fine places for bedrooms during the rainy season, it being a great advantage to sleep high above the chills and effluvia of the level of the ground. The public halls of audience look tawdry, and, as happens in other cases, there is an exhibition of barbaric grandeur, combined with ragged curtain blinds, and now and then dirty walls and corners. The Maharajah's garden is very extensive, and mostly taken up by an infinity of water-spouts placed in shallow fountains on the level of the ground. They say the jets are let off twice a year, on great festivals, and it is said they are fed from a reservoir near the hills. At the end of the Maharajah's palace garden there is a sort of belvedere, which looks over an extensive pond, in which turtles and crocodiles are kept. All this has a certain charm about it, but to show how tastes differ, I there met an American, who was staying at the same hotel as I was. I asked him how he liked His High-

ness' grounds and palace. "Well," he said, "if they were offered to me for nothing I would not have them."

In Jeypore there are many trees of *Ailantus excelsa*. It has very light wood, which is mainly used for sword-scabbards. They say that Mangos do not grow in Jeypore, and I do not remember seeing one. The city on one side is bordered by a crescent of low hills, which are not wooded, but which have low scrubby plants, *Euphorbias* and others, used only for firewood. On one of the hills is a fort and summer palace.

I visited the "Ramnewas" garden. The guide-book stated that "it is probably the most beautiful garden in India." It is extensive, and bears the stamp of having been designed on paper and then of an endeavour having been made to carry out the design on the ground. This, of course, can be easily done, but then the result will be probably such a garden as this. It has here and there little depressions, and some mounds, and several lawns, which could hardly be called green, as they were dotted with brown patches. It has all been recently done—some fifteen or sixteen years ago. The shrubs have grown fairly, but there is not a tree of any size. Some plants of *Cupressus sempervirens* were dotted about in lines and otherwise, looking rather unhappy. One thing I saw which was charming, viz., a "Neem" tree (*Melia azadirachta*) covered on one side with the deep rose sprays of *Antigonon leptopus*. It was so fine that it is a wonder this fine climber is not oftener sent up a "Neem" or other tree. The contrast between the deep rose flowers and the dark green feathery foliage of the "Neem" was perfect. It was the only one I saw, and it appeared to have gone up the tree by chance. A number of these simple natural combinations alone would light up the place, which, although extensive, I thought was not less monotonous. Climbers are tortured into espaliers, arches, and other unnatural positions. This garden, although recent, already shows signs of neglect. The fact is, this style of gardening, on an extensive scale, requires a small army of workmen to keep it in order, and an expenditure which would be enough to ruin any native potentate. It appears to be all non-productive. It would have been better if portions of it had been planted with groups of forest trees, which might have been made very ornamental in various ways, and which would, now and then, have afforded the eye an escape from the monotony of the scenery, and repose to the mind. When the present trees grow bigger—if allowed to do so—the garden may then look less monotonous. I was told, however, that now and then somebody orders them to be pruned. In all the gardens I have seen in native states there is too much chopping and chipping and bothering of plants.

Natives appear to have a fancy for this unnatural sort of gardening. The evolution of the art of gardening appears to necessitate this "stage of clipping." In olden times, in Europe, it was considered the proper thing, and as a relic of the past some gardeners in England still cultivate this fancy. I would say, "Give me one *Antigonon* trailing naturally up a 'Neem' tree, and keep all the clipped things to yourself!" There was an opportunity here for landscape gardening which, I think, has been allowed to escape, while great energy appears to have been expended on symmetry, steps, mounds, ponds, and seats. Where symmetry ought to have been, however, there it was not.

A small symmetrical yard near the aviary had four small plots in the four corners. One had an *Oreodoxa regia*, and the rest other kinds of Palms, which can never by their nature become symmetrical. As the Italians say—

*Qui ci andavano quattro Oreodoxa regia, or quattro something else, all of one kind.*

The aviary contained a number of interesting birds. One thing, however, was rather painful to look at, viz., a small shallow pond, enclosed with wire netting. It was 14 paces long and 12 paces wide, with side recesses of stone, and a small bit of dry ground. In this enclosure were twenty flamingos, several herons, storks, spoonbills, cranes, ibises, paddy-birds, bar-headed geese, knob-beaked geese, Brahmini ducks, and a variety of other ducks, teals of sorts, terns, water-hens, a cormorant, and a hill raven. The cormorant, with his traditional appetite, was diving for and devouring bits of meat in quick succession; herons and terns were doing pretty much the same thing, others were quarrelling. The water was dirty, and I was told was changed only once a week, the dirty water being discharged into a plot of Plantains. I think it ought to make fine liquid manure. Nineteen of the flamingos were having a foot bath, with their heads under their wings, the twentieth, and the finest of the lot, had evidently had enough of this sort of life, and was lying dead on dry land. The other nineteen were probably dreaming of a similar and not distant fate. About a stone's-throw from this aviary the Maharajah is building himself a new palace of marble and stone, and an extensive "zenana," to cost Heaven knows how many lacs of rupees. On charitable and sanitary grounds these poor water-birds might have a few of these rupees set apart for the purpose of giving them a little more space and cleaner water.

(To be continued.)

## PINUS PATULA.

THE branch and cones of *Pinus patula* (fig. 20) are figured from a tree of this graceful Mexican Pine now growing in the gardens at Carclew, Cornwall,

FIG. 19.—CROSS-CUT OF A LEAF OF *PINUS PATULA*, MAGN. (SEE TEXT.)

the seat of Lieut.-Colonel Tremayne, where there are three fine specimens of this rare half-hardy *Pinus*. They have borne female blossom and cones for some years past, in clusters from two to ten in number, but no male blossom has been observed as yet. As this tree is rarely met with, it may be interesting to notice the measurements of the few specimens that are known to us in the West of England. Of the three trees at Carclew, which were planted by the late Sir Charles Lemon soon after their introduction into this country, the stem measures in circumference—

	Girth at the Ground.	Girth at 3 feet from Ground.	Height.	Spread of Head: Diameter.
No. 1.	8 0	6 0	30	52 0
No. 2.	7 0	6 6	40	51 0
No. 3.	5 6	5 0	30	51 0

But perhaps the most ornamental and perfectly well grown specimen of this tree in Cornwall (though younger than others) is that now growing in the pinetum at Tregrehan, the seat of G. R. G. Carlyon, Esq. Its branches are perfect from the ground to the leading shoot to the height of 32 feet, and the girth of its trunk at the ground is 6 feet 9 inches, and at 3 feet from the ground 5 feet 10 inches, with a head spreading 40 feet in diameter. This tree has borne cones for a few years, but no male catkins have been noticed. The accompanying portrait of the tree

(fig. 22, p. 117) is from a photograph by F. A. Allchin, Esq. There are other single specimens of this *Pinus* at Lamorran, in the pretty grounds of the Hon. and Rev. J. T. Boscawen, where it is 24 feet 7 inches high, measuring at 3 feet from the ground 3 feet 10 inches, with a head in diameter 24 feet 7 inches. Another fine tree is at Pencarrow, near Bodmin, height 43 feet 6 inches, and girth at 3 feet, 7 feet 3 inches. Another is at Penjerrick, near Falmouth, a younger tree, but of fine growth. There were other plants at Antony, at Heligan, and at Menabilly, but these have been blown down or killed.

In Devonshire there are a few trees of *P. patula*, the finest being, it is believed, that growing at Bickton, in Lady Rolles' fine collection of Pines, which is 36 feet high, and its girth at the ground 8 feet.

The branch of *P. patula* which is drawn in Lambert's *Genus Pinus* does not show the graceful pendulous character of the foliage, and the cone is larger than those grown in Cornwall, having probably been drawn from a Mexican specimen. *J. R., Menabilly, December, 1884.*

[To the above account of a most graceful tree with which we were favoured by Mr. Rashleigh there is little that need be added, as the tree has been described by Lambert, Parlature, in *De Candolle's Prodromus*, xvi., 2, p. 397; and by Gordon, *Pinetum*, ed. 2, p. 278. We may add, however, as points that have hitherto been unrecorded, that the buds are clustered at the ends of the shoots, each from  $\frac{3}{4}$ —1 inch long, cylindric-conic, and very sharply pointed. The leaf in transverse section (fig. 19) has one convex and two concave sides, and when examined microscopically, may be seen to have a double layer of strengthening cells (hypoderm) beneath the epiderm, and a variable number of resin canals in the cellular tissue of the leaf (sometimes they are wanting). The central double bundle is surrounded by a well marked sheath or endoderm. The cones are borne on short horizontal stalks in whorls, some little distance above the base of the shoot of the year, at about a third or a fourth of the distance from the base to the tip, as pointed out to us by Mr. Rashleigh. The delicate thread-like foliage is not well shown in the engraving of the tree, as there must have been some motion of the leaves when the photograph was taken: in fact the foliage is too fine to be accurately represented on a reduced scale. *M. T. M.*]

## New Garden Plants.

### ODONTOGLOSSUM VIMINALE, n. sp.\*

A NEW *Odontoglossum* of some botanic interest, in the way of *Odontoglossum anthoxanthum*. It has a very long peduncle, much exceeding a foot in length, with few-flowered straight racemes. Flowers as large as those of *Oncidium gramineum*. Sepals and petals brown, with curious pale, whitish-sulphur borders, and linear spots around the margin, which are scarcely to be seen. Lip with an angle at each side of the base and lanceolate anterior part, light sulphur at base, deep yellow in front. There are two thick acute calli at the base. Column pallid green, with some mauve borders at the top. Leaves linear acute, exceeding a foot in length. Pseudobulbs equal to a large hen's egg, glaucous, narrower at the top. It is a new importation of Mr. F. Sander from the United States of Columbia. *H. G. Rehb. f.*

MANCHESTER HORTICULTURAL IMPROVEMENT SOCIETY.—The next meeting of this Society will be held on Thursday evening, January 29, when a paper will be read by Mr. E. Griffiths Hughes on "Insecticides." The chair will be taken at 7 o'clock.

\* *Odontoglossum viminale*, n. sp.—Affine *Odontoglossum anthoxanthum*, Rehb. f. Pseudobulbo oviformi magno demum minute ac varie ruguloso; foliis linearibus elongatis acutis; pedunculo elongato apice simpliciter racemoso, recto, sc. non fructifero; sepalis tepalisque cuneato-oblongis acutis paulisper undulatis; labello basi rhombeo antorsum lanceolato callis geminis oblongis crassis antice acutis parallelis in basi; columna utrinque sub margine androclinii obtusangula.—Ex U. S. Columbiae allatum dicitur. *H. G. Rehb. f.*

## THE BIRD'S NEST ORCHIS.

THE sudden and somewhat mysterious appearance and disappearance of several native Orchids, notably *Ophrys apifera*, *Neottia Nidus-avis*, and some species of *Epipactis*, have not only to the casual observer but to those who have gone deeper into the subject, proved rather difficult to account for. This is, however, not to be wondered at, when we consider that few tribes of our native plants are more imperfectly understood than the Orchideæ.

As this curious fact has been repeatedly brought under notice without eliciting any satisfactory information, the following notes, the result of close personal observation, may be of interest in throwing some light on the subject.

The extraordinary manner in which *Neottia Nidus-avis* springs up in a single season where it was never seen in a young state, and where there had been no intimation of its existence during the previous season, is no longer a mystery, for a careful examination of the rootstock has revealed the fact that the fleshy fibres, though dead at the base or end which had been attached to the old plant, are alive at the other end and gradually push forth young fibres.

The plant dies down after flowering, but is thus capable of reproducing a new plant from the point of the fibres after they have fallen apart, the extreme point becoming a bud or shoot, which increases in bulk underground till it comes to the flowering age, when it grows up vigorously, dies off, and is again propagated in the same extraordinary way. From examination of various roots, and taking the size and strength of the bud or eye into consideration I am inclined to believe that five years are required for the perfect development of the fibre from its young state to the flowering period. This, however, is on no authority, and must only be accepted for what it is worth, for, as the plant cannot be cultivated, a good deal of difficulty is experienced in arriving at trustworthy conclusions. Would the root only increase under cultivation reliable information could then be obtained, but for my own part several careful attempts at transplanting, so that the nature of the plant might be closely observed, have only turned out gigantic failures. The plant may, when in a young state and by having a good ball of earth attached, be removed to the garden, where it will in most cases perfect the flowering stem, but as regards increasing or reproducing its species all attempts have hitherto been productive of the most unsatisfactory results. As to whether all the root-fibres produce young plants I will not at present state positively, although observations tend to the inference that such is the case. Certainly the greater number do.

Another point regarding *Neottia Nidus-avis*, which has occasioned no small amount of comment, may be briefly noticed in passing, that is, as to its parasitic nature. That it is not so careful examinations of the roots long ago convinced me, although the opinions of others are equally strong on the opposite side. The late Charles Darwin, in one of his works, dwells at considerable length on this Orchid, and in a foot-note attached we read as follows:—"This unnatural, sickly-looking plant has generally been supposed to be parasitic on the roots of the trees under the shade of which it grows, but according to Irmisch (*Beiträge zur Biologie und Morphologie der Orchideen*, 1853, s. 25) this certainly is not the case."

Mr. E. C. Malan, who has devoted considerable time to the study of this Orchid, writes to me as follows:—"The opportunities of observing this most curious plant are certainly few and far between, for, besides its acknowledged scarcity, it does not always reappear in those particular localities where it progresses to grow. I have as yet only been able to find it in one place, namely, in a small Oak wood near here. The soil there is hard, cold, uncompromising clay, which, after a short absence of rain, becomes cracked, and on the surface like stone."

"I cannot say that I have been able to observe the *Neottia Nidus-avis* very accurately, for those plants which I placed in pots did not thrive, nor did others which I transplanted when just above-ground ever increase. I cannot say either that I have found them attached to the roots of trees, for the specimens above mentioned were free in the clay. The spot where the flowers grew in 1880 was entirely destitute in 1881, and also in 1882. But quite in a separate part of the same wood, both this summer and last, many

fine single plants were to be observed." For my own part, I could never detect any parasitical attachment either, although the plant is perhaps most frequently found beneath the shade of the Beech or Oak—the tannin matter from the decayed leaves being, in my opinion, the great secret of its growth in such places. [Mr. Webster's note is very interesting, and offers independent corroboration of German and French observations well known to botanists, but which have not found their way into British Floras. Ed.]

## EPIPACTIS PALUSTRIS

is propagated in a somewhat similar manner to the *Neottia*. The rootstock, which is composed of one thick fibre and several smaller ones, elongates each year, the point forming a bud or eye, which is destined to be the plant of the following season. From this eye, two of which are not unfrequently formed in the same year, several short roots are sent out, but between this point and the previous shoot, a distance of usually 2 inches, no rootlets are emitted. On lifting the plant I have frequently found the rootstock nearly 2 feet in length, and composed of a number of joints something similar in construction and appearance to what may be seen aboveground in our common *Ajuga*. Unlike the *Neottia*, however, the eye or bud of the *Epipactis* does not increase beneath ground until a flowering size, as during the growing season numerous plants of all sizes and destitute of flowers are to be observed. Another point of difference, to which it may be well to direct particular attention, is that in this plant the bud is produced from the thick rootstock, whereas in the *Neottia* it is formed at the point of the fibre or rootlet after becoming detached from the parent plant.

I have good reasons for believing, although my investigations have not yet been sufficiently conclusive to state positively, that the tubers of *Ophrys apifera* will increase underground in a somewhat similar manner to the root of the *Neottia*, and which, if true, would readily account for the well-founded statements that have frequently been made regarding the sudden appearance and disappearance of the plant. [Well accounted for by Prillieux's account of the life-history of this plant. Ed.] That the presence of foliage or stem is by no means necessary for the perfect development of the roots of several Orchids I have proved beyond a doubt in various other cases as well as that recorded above. In *Habenaria bifolia* and some species of *Orchis* the tubers if deprived of stem and leaves will become as it were cumulative, and increase in size beneath ground. In the former species especially I have repeatedly proved by experiment that by removing the stem and leaves when the plant is in full flower the succeeding year's growth will be much stronger than had the plant been left unmolested. This I have also proved to be the case with the bulbs of some kinds of Lily and the root of *Cypripedium acaule*.

## EPIPACTIS OVALIS.

It is well known that most recent writers and authorities on plants consider this but a strangely abnormal form of *E. latifolia*, the character of which has become altered by soil and situation. Having special advantages for studying this rare plant both in a wild and cultivated state I may be allowed to point out the wide difference that exists between it and *E. latifolia*, and which has led me, without hesitation, to regard the plants as distinct species. The first and greatest point of difference, and one which will be apparent to any accurate observer, is that the rootstock of *E. ovalis* is shortly creeping, the new buds or eyes being formed, one close to the old stem and the other at the end of a stout shoot, and at a distance of usually 2 inches from the parent plant. In *E. latifolia* the reproduction is very different, the new plant being produced alongside and quite close to the parent stem, and never at the point of the shoots. When examining numbers of the roots of *E. latifolia*, which occasion required when comparing it with *E. palustris*, I never saw a single instance in which the plant was propagated by extension of the root.

Three years ago, so as to study its nature more carefully, I transferred from the Orme's Head (one of the British stations of this plant) to my garden a plant of *E. ovalis*, which was placed in ordinary loam alongside a limestone boulder. The first season after being planted two stems appeared, one close to the old stem, and the other at a distance of 2½ inches. This season there were three plants, one each along-

side the former stem, and a third in a direct line 3 inches from that produced last season. From the above it will be seen that while *E. ovalis* approaches, in root formation, very nearly *E. palustris*, it is widely different from the species (*E. latifolia*) with which it is often associated.

It is also strange that this plant (if only a form of *E. latifolia*) should present little or no variation in the half-a-dozen British habitats from which it has been recorded, or that (if soil and situation are the cause) when planted in good loam it does not, in some degree, revert to the typical *E. latifolia*. That it does not my observations and experiments clearly show, for although planted in good loam and a shady situation it has not increased in stature since being transferred from the denuded limestone rocks of the Orme's Head to the more congenial surroundings of my garden. A. D. Webster. (A Paper read before the Scientific Committee of the Royal Horticultural Society.)

## THE SCLEROTIUM DISEASE OF POTATOS.

DURING last summer I received from Mr. Carroll, Director of the Albert Model Farm, Glasnevin, Co. Dublin, some Potato stems full of the growing mycelium of *Peziza postuma*. Some of this I applied to one or two Potato stalks growing singly—not as a crop—in my garden, with the view of infecting them. The mycelium appeared to die, and thinking the experiment a failure, I took no further note till, a week or so ago, noting the dead stem I examined it and found three or four sclerotia therein, not large, but unmistakable. A second stalk in the same group had no sclerotia, and to the best of my recollection I infected but one stem of that group. The other infected stem I could not find. This observation goes far to show that this disease is contagious, and can be communicated from one plant to another. It is of course possible that the sclerotia might have appeared without any assistance from me, but scarcely probable. The tubers which were produced were very fine and small. If I can obtain the live mycelium I mean to repeat the experiment on a larger scale next summer. Greenwood Pinn, M.A., F.L.S. [The disease here alluded to is that figured at p. 265, August 28, 1880, and 1883, September 15, p. 333. Ed.]

## CAPE HEATHS.

ON leaving the quaint-looking old city and environs of Cape Town, formerly settled by the Dutch in 1652, the enthusiastic traveller soon begins to meet here and there a variety of the small, handsome, evergreen *Ericas*, as a foretaste of what is in reserve for him as he journeys upwards and onwards. And presuming he is one of those inquisitive persons who let nothing escape their keen observation, his progress will be slow indeed.

On all sides, and especially while passing over the long stretches of undulating country, his attention will continually be drawn towards the increasing numbers, in many varieties, of these elegant miniature flowering shrubs. And if he fortunately knows their botanical names, he will be much pleased with the winsome features he joyfully recognises, like the meeting of old companions after many years. And numbers of free growing kinds, such as *Erica cerinthoides* major, from 5 to 6 feet high; *E. dichromata*, from 4 to 6 feet; *E. vernalis*, 6 to 7 feet; *E. Masoniana*, 8 to 9 feet; and *E. urceolaris*, 12 to 15 feet. He will occasionally meet, overlapping those of a more dwarf and compact habit, such as *E. comosa*, *E. nigrita*, *E. blanda*, *E. petiolata*, *E. minima*, *E. elegans*, and *E. carnea*. To specify individual kinds by name from upwards of five hundred indigenous varieties, would give the reader but a faint idea of what they are like unless well versed in botanical nomenclature. And as he approaches the rising ground, along the well beaten path which winds up the mountain sides, further on, these luscious gems assume a more symmetrical and sturdy habit, and if possible become more beautiful until the summit of Table Mountain is reached.

After hard and persistent struggling up and along the tortuous and rugged footpath, which frequently doubles and zigzags among immense masses of detached rocks, through deep defiles and apparently impassable chasms, along which the purest spring water comes splashing over precipitous cascades

from near the apex, the tired pedestrian will find an inviting resting-place in a natural alcove. To his great surprise, he will then see what may seem incredible to old Heath growers who have only seen them in pots under glass—namely, low bushes of *E. vestita elegans*, and *E. princeps*, flourishing with all the freedom of bog plants, in soil apparently never dry. While, *per contra*, *E. pumila*, *E. densiflora*, *E. incana*, and *E. penicillata*, seemed equally healthy, growing in small cracks or crevices in the fissured rocks, where it was high and dry, with only a few grains of sand to root in.

The writer was completely nonplussed at the sight of healthy blooming Heaths growing upon the face of precipitous rocks, upon the sunny sides of which it was unpleasantly hot to the touch, conditions fatal to them under cultivation.

Returning again to the subject, and following the ascending path, which to his intense delight will be found closely margined on each side with handsome Heaths, which absolutely cover every inch of soil possible to root in with masses of highly-prized species, the sight cannot fail to remind him of those he may have often admired at home. True there are no legends of the past wound around them, as there are about the Heath or Heather of other lands, of which the poet has often sung. Savage Hottentots and Caffres, who for ages have ignorantly wandered among them, keep no historical records; and although no charm of romance invests them with anything prosy or poetical, they are nevertheless most intensely interesting to those who admire frutescent beauty. And whoever has enjoyed a ramble among them will not be likely to ever forget the peculiar refreshing odour arising from the myriads of pretty blossoms.

And while still ascending, at every onward step brilliant colours and fresh forms of Heath beauty will delight the eye with pleasant changes, until, when near the summit, the novel sensation of passing above the fleecy clouds which externally drape the top of Table Mountain will be experienced. Even when in cloudland the somewhat stunted, though symmetrical, Heaths will still be there; and with every possible tinge or shade of green tiny leafage these compact little plants seem to vie with each other for the palm of grace and beauty. All of this large and interesting family are exquisitely bedecked with a profusion of delicate, lovely, wax-like flowers, from pure white to flesh and cream colour; yellow, dark green, light green, orange, and purple; red, pale red, red and green, red and yellow, red and orange, orange and purple, white and scarlet to brilliant scarlet, crimson, flame-colour, &c. *W. T. Harding*, in "*Gardeners' Monthly*."

## LEICESTERSHIRE APPLES.

THE splendid lot of Apples exhibited by Mr. Ingram from the orchards and gardens of Belvoir at the meeting of the Fruit Committee at South Kensington on the 13th inst., for which the Society's Bronze Medal was awarded, forms an excellent commentary on the remarks of Messrs. Harrison & Sons, of Leicester, in the report of the National Apple Congress.

Mr. Ingram's exhibit consisted of thirty-five varieties, many of which were of an exceptionally fine character; specially remarkable for colour and size were the examples of Blenheim Orange, which is the most popular Apple, judged as both a dessert and culinary variety, in cultivation. Peasgood's Nonsuch was also very large and fine; this variety promises to become very popular and useful. Bramley's Seedling was especially noteworthy, proving how well suited this Nottingham Apple is for the Midland Counties. Finer examples of Betty Geeson, an Apple raised somewhere in Mr. Ingram's neighbourhood, we have seldom seen; and the same remark applies to the examples of that most beautiful of French Apples, Mère de Ménéage. Rosemary Russet was unusually large and fine; this is a variety in great repute at Frogmore, and was largely cultivated there by the late Mr. Ingram. The examples of Frogmore Prolific are "Ingram" Seedling. The old Caldwell, or Rymer, Tower of Glamis, Lord Derby, and Northern Greening may also be mentioned as being specially fine amongst the culinary varieties; and amongst the dessert varieties the examples of Cox's Orange Pippin, Ribston Pippin, Margil, Old Nonpareil, King of the Pippins, and others of the leading sorts were all that could be desired.

No better illustration than this of Mr. Ingram's could have been submitted to demonstrate and to prove that Apples may and can be grown in Leicestershire equal to any in the country—ay, and further, we would submit, equal and superior in some respects to American produce. There is no question of the superiority of home-grown Apples in point of quality for culinary purposes; they have far more of that brisk acidity which is so much relished by most people. American Apples are flat and tasteless by comparison. In the matter of dessert Apples the American varieties surpass our own for the most part, having that peculiar short tender flesh that is extremely agreeable in an eating Apple; but not one of the American sorts is equal to our Cox's Orange or Ribston Pippins.

How comes it that doctors disagree? Messrs. Harrison take a somewhat pessimist view, and state that Leicestershire "is not a county in which Apples are grown extensively, or considered of much importance," and are of opinion that the "red clay" which predominates in their district is "too cold for Apples in most seasons." The elevated situation of Belvoir renders it probably the finest for fruit culture in the county, and there can be no doubt of their receiving the very best attention as to cultivation. The Lias clay subsoil existing here is evidently well suited for Apples, especially in hot and dry seasons like the past.

There is a very great deal in situation, and very great variety exists in comparatively small districts sometimes. Soils also and subsoils exert considerable influence. But positive neglect in regard to the pruning, &c., of the trees, and to the cultivation of the land, has more to do with the miserable condition of our orchards, and the disrepute into which home-grown Apples have fallen, than any other cause whatever. Messrs. Harrison subscribe to this when they state that "the trees are allowed to grow without either manure or management." Plant more trees, certainly, but plant with judgment in situations similar to those of Belvoir, and in particular pay attention to their after-management and cultivation. There are many places, not only in Leicestershire, but throughout the country, where Apples may and should be grown in far greater quantities and in better condition than they are at present. *A. F. B.*

## DR. REGEL ON THE CULTIVATION OF PLANTS.

SINCE the days of Sir Joseph Paxton but very few men in the gardening world have had so successful a professional career as Dr. Regel, of St. Petersburg. From the time of his instalment as Director of the Botanic Garden in the Russian capital, some twenty-five years ago, he has been indefatigable in his efforts not only to make that establishment one of the first in Europe, but also to spread a knowledge of gardening among the Russian people. Twice he has organised an International Exhibition on a very grand scale; the second especially may be considered as having been a decided triumph. The highest personages in the land have shown him every mark of favour and encouragement. His biography and portrait were published some four years ago in one of the most extensively circulated illustrated papers of the capital; and during the last ten years especially his books have increased in number, and have passed through many editions. Some of these are small treatises on the cultivation of Raspberries, Currants, Strawberries, and others, ranging from 15 copeks (about 6d.) upwards. One of the latest of these small books refers to the cultivation of fruit trees on walls and espaliers, and it may be considered as timely enough, for such modes of cultivating fruit trees are almost unknown in this country, where nobody has an idea of an enclosed fruit garden kept under lock and key. So far as I have seen, at least, fruit trees and forest trees grow together, and no kind of effective enclosure exists. Dr. Regel has therefore done well to write this treatise, for apart from the technical question of choice, planting, pruning, and training, it is quite clear that something must be done with respect to enclosures and the general arrangement of a fruit garden. No other writer in this country has so much authority on this subject as Dr. Regel.

But though his pen has been prolific enough during the last ten years, it is not my purpose to notice in detail all the smaller publications; my present object is chiefly to consider the merits of one which is allowed to be his most popular work among all intelligent amateurs in Russia, viz., *The Cultivation and General Treatment of Plants in Rooms*. Most people might think that such a matter would scarcely occupy more than a modest treatise, but Dr. Regel's work is a book of two good-sized volumes, extending to over

700 pages. This book Dr. Regel very appropriately dedicates to his friend and patron, General Greig, as a tribute of gratitude for the unfailing help and encouragement which that powerful Minister has always afforded him in his various undertakings.

It would be a long and fruitless task to enumerate all the subjects that are treated in this book, the "contents" at the beginning of the first volume alone occupy no less than four pages, and in making a cursory analysis of the material employed I am involuntarily led to the conclusion that the author must have lost sight of the object originally aimed at.

Amateurs who have a garden and greenhouse with a certain number of frames will find this book very useful, but most of those who live in towns are not likely to derive so much benefit from it.

No doubt all that Dr. Regel states is quite true. The same things have been said many times before, and it is only fair to infer that they will be repeated, with more or less variation, a good many times more. But the most enthusiastic lovers of flowers and plants will not consent to turn their saloons into regular greenhouses. They have something else to do with cellars and larders than store them with plants in winter, and there are but very few, if any, who would like to make a material change in the windows of their drawing-room in order to grow or propagate favourite flowers.

Most people are quite satisfied to have a certain number of fine plants in their rooms near the windows, so long as they do not interfere with mirrors, curtains, statues, pictures, and other ornaments of fashionable dwellings. And if ladies and gentlemen do not keep a gardener who can attend to their window plants, they are generally guided by the directions of the gardener or nurseryman from whom the plants have been bought. For the most part a few explanations about watering, ventilation, and cleaning, are all they require for their own guidance, the rest they willingly leave to a professional man. Now Dr. Regel sets out, apparently with the conviction that all he states is not only quite new to his readers, but that all his directions admit of being strictly followed. Everything relating to the cultivation of plants is carefully and minutely described. Everything that gardeners take years to learn in nurseries and private gardens is elaborately treated in this book—to enlighten refined people how to keep a few flowers and plants in their saloons. Upwards of one thousand genera or species are enumerated in the Latin index of one volume only. There are many respectable gardens in Russia at least, which do not contain so many.

The author is, no doubt, aware that the great majority of his readers are not likely themselves to undertake most of the operations which he has described at length, such as the composition and preparation of soils, planting, and sowing, &c. Still what is stated is quite correct if anybody requires such information. The quality and longevity of seed has received much attention, and a great many interesting facts have been brought together.

There are some people who have not the slightest idea as to how Ferns are constituted and propagated. I have known one or two myself who, though otherwise intelligent and well informed, really believed that the spore-cases were so many filthy insects. I once even found an old peasant (a gardener) who affirmed that that was quite true. Dr. Regel, very properly, does not leave this subject unnoticed. At the same time I think he might have been much clearer. It would have been well, for instance, to give figures of one or two fronds, showing the arrangement of the spores at the back, and the distinction between fertile and barren fronds, male and female. This is a subject on which he might have enlarged to great advantage without making it very special.

One of the most interesting and instructive parts of the first volume is devoted to some explanations respecting the distinctions between genera, species, and hybrids: the author points out how new varieties are obtained, and shows how amateurs may derive a fund of real pleasure by crossing one species with another, and watching the result. But on this subject Dr. Regel seems to have introduced a new word to the Russian language, that of bastard. This word in English jurisprudence means an illegitimate child, and though it passes current among gardeners I think it ought not to be used in a scientific work, especially as the word hybrid (*gémace*) is sufficiently expressive. If the learned Doctor is fond of introducing new or foreign words into the Russian language he has a very wide range. Many thousand such words are already

naturalised, and no doubt many thousands more will be added in the course of time. A language like the Russian always admits of being much softened, modulated, and improved, and for scientific terminology in particular there is still something to be done. In botany, for instance, there is not a definite and distinct term for species, that employed by botanists (*vid.*) has at least twenty different meanings all more or less expressive of view, form, aspect, appearance, &c. Now, as Dr. Regel has introduced the word *bastard* and one or two others, it might be worth his while to consider whether it is not possible to find a more precise term for species.

About the end of the fourth chapter, Dr. Regel has a good deal to say about the different parts of the flower. This lesson in elementary botany and the physiological process of fructification is intended to prepare the amateur for the work of hybridising and obtaining different varieties by crossing. It is a very learned chapter, but I fear not many of those who study it will find it easy in practice. A long chapter of about thirty pages is devoted to all the various other modes of propagation, such as cuttings, budding, grafting, layering, &c. Of course this is a subject which would exhaust a whole volume, but Dr. Regel has wisely confined himself to a certain limit, and I think most people will find that quite sufficient.

Respecting glass cases, such as the famed Wardian case, the author has a good deal to say, and even mentions that the first was introduced by Mr. Ward, of Clapham Rise. Dr. Regel employs a word which I have not noticed before, that of *Terrarium* as differing from *Aquarium*, and whatever its merits may be as a new term it is certainly more euphonious than his translation in Russian of the Wardian case. I think, however, such cases do not require so much attention as he advises. It is one of the chief merits of such cases that by the principle of evaporation and condensation the plants inclosed in them will thrive well enough for a long time without either ventilation or watering. We all know that plants sent from distant countries in closed cases arrive in England after a voyage of several months not only quite fresh but even sometimes in flower. The patterns which Dr. Regel has figured are well known, and pretty enough, and such modes of growing a certain number of plants in a saloon are much to be recommended.

Now, with respect to watering in general, this seems to be a subject which most amateurs find it very difficult to learn, and yet it is one of the most important in the cultivation of plants. Dr. Regel has treated it at length, but I cannot conceive that such large pumps and syringes as he recommends can ever be employed in an elegant drawing-room. I shall close for the present. *P. F. Keir.*

## PROTECTING POTATOS.

IN your issue of Nov. 22, 1884, I see that, in the experiments on protective moulding carried out at Chiswick, "it soon became obvious to the experimenters that Mr. Jensen's proposals would prove very costly to carry out, and that, as a matter of practice, the grower for market would have to face the problem whether, as a mere matter of cost the gain would be worth the candle." Will you allow me to observe that protective moulding by my system is carried out in many (I think I may say in thousands of) farms in Denmark, both by the means of the hand hoe and by means of a plough constructed for the purpose, and that up to the present time I have not heard the objection raised that this moulding is very expensive. As a matter of course in large fields the plough must be employed. I have before me now as I write an account from a Danish farmer in which it is stated that it took one and a quarter days for a man and a horse to mould up an acre of land (English measure) in the way designed by me. I suppose that at the very least it would take three quarters of a day to mould an acre of land in the common way; if so, the difference would be half a day, which for a man and a horse cannot, I think, be reckoned at more than about 4s. (in Denmark it would cost less than 3s.), so that at all events it does not cost much more to high-mould by means of a plough than to perform the moulding in the common way. But in reality I think the difference will be even less, or none at all, if, as it ought to be, the protective moulding be done before the time of flowering, when the plants are not high enough to incommode the plough; for in the case above referred to the plough was fre-

quently stopped on account of the size of the Potato tops. It is true that the ridges must be made much higher than in the case of ordinary moulding, yet all that is required is that the earth-cover on the uppermost tubers should be about 3 inches thicker than that produced by the old system of moulding. Again, it must be remembered that protective moulding shall be performed from one side only; this is a very great advantage, since it will save the man and the horse half the distance. Finally, it must be remembered that on account of the greater distance between the rows, which is rendered necessary by the protective system, the cost will be essentially reduced both as far as the planting, moulding, and lifting are concerned. Therefore, all things well considered, I think that the protective system may be carried out not only as cheaply, but undoubtedly even more cheaply than the common system of Potato growing. As for hand-moulding it has been experimentally stated by the Société Nationale d'Agriculture de France that high-moulding costs in that country 40 francs, or about 13s. per English acre. What the cost of hand-moulding in the common way is I cannot tell, but at all events it is evident that the difference, if any, can be of but little practical consequence. *J. L. Jensen, 162, Gamle Kongevej, Copenhagen, V., Dec. 13.*

## FASCIATED MEDLAR.

THE specimen from which our illustration (fig. 21) was taken was forwarded to us by Miss Owen. It will be seen that the fruit is curved like a ram's horn, and presents some forty calyx teeth instead of five. The explanation is that a tuft of perhaps eight flowers was in all probability formed in place of the ordinarily solitary flower, that these eight flowers instead of becoming separate in course of growth remained in union, or, as it is said, adhered one to another. The spiral twist is accounted for by the much greater and more rapid growth on one side, where growth was possible, than on the other, where it was necessarily restricted. But to be sure as to the way in which these malformations are brought about one ought to see them in their earliest stages and trace their growth onward.

## FRUIT NOTES.

**BEURRÉ BOSCH PEAR.**—The *Beurré Bosch* is a Pear to which I give my unqualified praise. It is large, pyriform, a little uneven, tapering long and gradually into the stalk, and of a rich delicious perfumed flavour. It bears singly, and not in clusters, looking as if thinned on the tree, whence it is always of fine size. It is a good and regular bearer; the fruit as it approaches maturity is subject to the attack of flies and wasps. This is rather remarkable, as they rarely or ever touch any of the other sorts of Pears that grow close by them. It should be grown as a standard. It grows freely, shoots long, brownish-olive; season in use, from the beginning of November to the end of December. It was raised, I believe, by Van Mons, and named *Calebasse Bosch*, in honour of M. Bosch, a distinguished Belgian cultivator. Having been received at the garden of the Horticultural Society of London under the name of *Beurré Bosch*, Mr. Thompson, I understand, thought it best to retain this name as less likely to lead to a confusion with the *Calebasse*, a distinct fruit. *M. Saul, York.*

### APPLE, GOLDEN SPIRE.

I can fully endorse all that has been published in *Fruit Notes* at p. 16 of *Gardeners' Chronicle* in favour of this most valuable Apple. Five years ago I was favoured with a number of Apple scions, then considered to be the leading varieties of the day. Having grafted all on the free stock, and with care and special attention, my results have been that *Golden Spire* has yielded two crops of good fruit, considering age and size of tree. Several of the others have rewarded me with one solitary fruit, therefore I have no hesitation in saying that the free stock is the proper one of this sort. Its keeping qualities are so good that it is usable long after Christmas. I doubt not that, wherever it is grown, it will soon become a favourite, as all who have seen it here were quite pleased with its habit of growth and the beauty of its fruit. *D. Wilkie, Sundrum, Ayr.*

### LATE GOOSEBERRIES TRAINED ON ESPALIERS.

Some of the best late varieties of these have such a drooping habit that they seldom make good bushes, the fruit lying in many cases within reach of rain splashing spoils the fruit. The following method of growing and training will amply repay for the trouble it entails, considering the facilities it affords for netting, to keep the fruit until the end of August and September. A shaded part of the garden or north border is a good situation for late Gooseberries. The soil best suited for them is a deep strong loam, which should be trenched 2 feet deep, working in plenty of good rotten manure. If a north border, say 15 feet wide, it will take five rows at a yard apart longitudinally, fix the wires for training 4 feet high, using iron posts at the end or straining posts let into stone with a stay to each; the intermediate posts can be of light iron with two legs, or if desirable use 4-inch Oak posts with Larch intermediate. A light gauge wire answers better than a stronger one, it does not require so much straining. Place them 9 inches apart. Plant either one or two-year-old trees that have not been cut back. One foot apart is a good distance to plant them. Let them grow as they like the first season, then cut them close down to the ground; the result will be one or two strong shoots that will nearly reach the top of the trellis, then train either upright or diagonally, and after they are established lay in a young shoot each season to replace the old ones. Another method is to put in cuttings where they are to remain, and fix the trellis afterwards when established, only fork amongst them lightly, and top-dress with good rotten dung in autumn for mulching in summer. The grass from the lawns is excellent for the purpose: it keeps the ground cool, prevents the fruit from being splashed with heavy rains; since using the grass, commencing with the first cut in March and letting it lie on 4 inches deep in summer, I have not been troubled with caterpillar. I should not like to say that it has kept it off. If it does make its appearance use *Hellebore powder*, dusting it on when the trees are damp. It is a certain cure. Some of the best late varieties are *Red Warrington*, *Slaughterman*, *Ploughboy*, *Yellow Leader*, *Rumbillior*, *Leveller*, green or white; *Whitesmith*, *Pitmaston*, *Green Gage*, *Antagonist*. *Wyeside.*

### A HOUSE OF GRAPES IN JANUARY.

It was very common during the summer and autumn months to read of the splendid crops of Grapes in vineries at different establishments, but it is not so common to hear of them in the month of January. In one of the divisions of the long range of vineries at Longford Castle the Grapes are now in splendid condition. The Grape which takes the eye on entering this house is *Roberts' Gros Guillaume*, producing, as it does here, splendid bunches, ranging from 10 lb. to 12 lb. in weight, well proportioned and well coloured. Some of the smaller bunches of this variety are very elegant, quite models of what a bunch of Grapes should be, being about 18 inches in length from the wood to the tip of the bunch, with no shoulders to tie up, and the berries all of a size, large, and sufficiently thick, so that to all appearance the bunch would preserve its form if laid on its side. It will probably be in the memory of some of your readers that in this establishment the variety *Gros Guillaume* and *Barbarossa* appeared distinct, but not sufficiently so to class them as distinct varieties, and Mr. Ward decidedly gives the palm to *Roberts' variety*. It was surprising to me to know how these huge clusters are preserved from damp through the dull, foggy weather through which we have lately passed. To all appearance not a damped berry has yet been cut out. Other varieties are equally good, viz., *Gros Colmar*, *Mrs. Pince*, *Lady Downe's*, and *Alicante*. There were many bunches of these from 2 lb. to 4 lb. in weight, well-coloured and handsome bunches. There were in the fruit-room some excellent bunches of *Trebbiano* and *Muscat of Alexandria*, especially the latter, and it would appear from the appearance of the two varieties named that the last-mentioned would run the other hard in its keeping properties, and if so there is no question as to which is preferable and best flavoured. *C. Warden, The Gardens, Clarendon Park, Salisbury.*

## TRADE MEMORANDUM.

THE address of Samuel Hawley, lately carrying on business at Forest Gate, is asked for.

## THE PROPAGATOR.

### ROOT PROPAGATION OF HARDY PERENNIALS.

YEAR by year, as the winter season comes round, the propagation of almost all classes of plants is reduced to a minimum, and none more so than hardy perennials. By the adoption of root cuttings, however, we are enabled to increase at this season of the year many good and choice plants which either do not flower sufficiently early with us to ripen seeds, or which are slow to produce cuttings. In either of these two cases the system of root-propagation is of great value, inasmuch as the root cuttings inserted now, or up to the end of January, will make really good plants by the middle of June, and there is no great amount of skill required in carrying out the work, and which may be briefly described in a few words. Where large stools of the plants I shall hereafter cite exist, one or more, according to the number of plants required, should be lifted, the roots carefully removed with a sharp knife, and, being duly labelled, taken to the potting shed. In the root-pruning process use sufficient discretion as not to permanently injure the several subjects which are destined to be operated on, for it is

great value is this: presuming we have a fine bed of seedling Gaillardias, much varied as they are sure to be in colour, among them are some exceptionally fine forms, but the seeds cannot be depended upon; amidst so many of inferior quality and growth cuttings are of little value; in this case we may mark the good kinds, lift them in autumn, and by the ensuing spring have a nice stock of selected kinds. By this very means I was enabled some three or four years ago to increase the stock of a very fine variety with flowers 4 inches across, which to my mind was a step in the right direction.

#### PLANTS THAT CAN BE INCREASED.

I will now briefly describe some of those plants which lend themselves to the process of root propagation, excluding those which produce stoloniferous growths in quantity. The first genus is the *Acanthus*, a stately and ornamental group of perennials, suited either for the large rockery, the border, or for isolated specimens on the lawn. Any and all of these are easily reproduced in the above way, the three most distinct being *A. latifolius*, *A. longifolius*, and *A. spinosissimus*. *Anchusa italica*, a highly decorative Boragewort and a free seeder, is a telling border plant. The largest roots of this may be quartered if required, and all will break from the top on the bark side. The next genus, that

dividing of which any spare roots must be carefully preserved, for the stock of this plant on this side of the Channel will never be too great.

In passing, the genus *Senecio* next presents itself, containing some remarkable and fine decorative plants. The finest and probably the best of the group is *S. pulcher*, which, while being among the most difficult to increase by means of seeds, breaks with unequalled freedom from root cuttings. Another fine member of this genus is *S. japonica*, also called *Erythrochete palmatifida*, a desirable and ornamental foliage plant, having lax panicles of golden-yellow flowers; it is uncommon, and should be increased. In specimen form, its distinctly palmate leaves on petioles 3 feet in length, have a unique appearance; indeed, it may briefly be stated to be distinct from any other plant.

The *Statice*, or "Sea Lavender," are the next most important group of which the species and varieties may be readily increased by root cuttings; the same remark may be applied with equal force to the tender species, *e.g.*, *S. Holfordii*, *S. profusa*, and so on. In close alphabetic order is *Stokesia cyanea*, a plant deserving of far more extended cultivation, seeing it is one of the few bits of blue among late autumn perennials. As a rule it is not easily increased by division, owing to the tufted or conglomerate growths on the root-stem. It makes abundance of roots,

FIG. 21.—FASCIATED MEDLARS. (SEE P. 112.)

not impossible to carry it to such an extent as to kill the plant outright. The next thing to be done is to cut the roots into lengths of from 1 to 2 inches, keeping the roots in straight lines, and so prevent their becoming reversed before being placed into the soil. Any good ordinary vegetable soil will be found to suit the purpose, making it rather sandy. The cuttings may be inserted in pots, pans, or boxes, in the ordinary way, excepting that in this case the apex of the cutting only shall be visible, the remaining portion being buried. After the cuttings are inserted they may be plunged in gentle bottom-heat among stove plants, or be placed under the stages in the greenhouse or stove—anywhere, in fact, where they will receive slight warmth till they show signs of life, when they must be removed to cooler quarters and receive more light; when large enough, pot them as required, placing them in pits and frames, and keep close till new roots are formed. It will be seen at a glance that there are no great secrets contained in the foregoing remarks, and in this the writer concurs; indeed, the only secret really is in the knowledge of those plants which not only readily submit to the process but pay for the trouble.

For example take the Japanese *Anemones*, which occupy a position second to none among autumn-flowering plants. No one would think of sowing seeds of these who wanted plants quickly, in preference to root cuttings.

#### GAILLARDIAS.

Another case in point where root cuttings are of

great value is this: presuming we have a fine bed of seedling Gaillardias, much varied as they are sure to be in colour, among them are some exceptionally fine forms, but the seeds cannot be depended upon; amidst so many of inferior quality and growth cuttings are of little value; in this case we may mark the good kinds, lift them in autumn, and by the ensuing spring have a nice stock of selected kinds. By this very means I was enabled some three or four years ago to increase the stock of a very fine variety with flowers 4 inches across, which to my mind was a step in the right direction.

of *Anemones*, or Windflowers, is an important one, and is propagated for the most part by dividing the tubers; but for such kinds as *A. alpina* and *sulphurea* together with *A. Pulsatilla*, which root deeply, root cuttings may be depended upon as making good plants. All the forms of *A. japonica* may be increased in this way, indeed in this case it is the best possible means. Next in order are *Doronicums* and *Echinops*, both good and useful, and possessing some interesting and ornamental species, also *Eryogonias*, a group well known among perennials, most of which are highly ornamental foliage plants. Now we come to *Gaillardia*, to which I have previously alluded, apart from which we have few genera possessing such excellent free flowering qualities, highly decorative and profuse flowering to a degree, valuable as cut flowers, and indeed so good are they that I feel sure they have a great future in store. The next plant to which I shall refer is *Jaborosa integrifolia*, an uncommon plant somewhat, having large tubular white fragrant flowers which nestle amidst its mass of deep green leaves. Though for the most part free seeders and generally rooting freely from cuttings, it will be nothing lost to remember that *Oenothera macrocarpa* and *O. missouriensis* come freely from root cuttings. The same remark applies to the Eastern Poppies, *Papaver orientale* and its numerous forms, in which I include *P. bracteatum* and others closely allied.

The genus *Primula* is next, and while many species may be had in this way, it must here give place to seeds, one solitary case excepted, and that the double crimson, *Primula acaulis rubra plena*, in moving or

however, and almost every particle will grow if treated as described above. All the *Symphytum*s may be propagated in this way; but, as decorative plants, it will only be necessary to select the best variegated forms. Many others might be enumerated; in the present note, however, I have merely mentioned those for the most part which do not exhibit any tendency to break from the root unless assisted in this way; others there are, such as *Harpalum rigidum*, *Zauschneria californica*, with some of the *Achilleas*, that produce stolons so abundantly as to soon overgrow their neighbours if allowed so to do. This is especially so with the first and last-named, and some *Asters*; but as these suggest all that is needed to keep them in bounds, I will not make further comment here. *E. Jenkins*.

### FLOWERS IN STAINED GLASS.

[The following note refers to the representation of a Tulip in the centre of a window of the chancel of the church of Tolleshunt D'Arcy, Essex, and a tracing of which was kindly sent us by Mr. R. M. Christy. The flower is white, shaded reddish-brown, and the glass is doubtless of Dutch origin, and possibly rather more than two centuries old. Similar flowers are represented in Dutch glass, to be seen in the Canterbury Museum, the Bodleian Library at Oxford, and elsewhere. In the present instance the Tulip has evidently been inserted amid fragments of glass of much earlier date, and containing heraldic cognizances

of the D'Arcy family. As to the Tulip it is a flamed Byblomen. ED.]

Mr. N. H. J. Westlake, F.S.A., author of *A History of Design in Painted Glass*, writes as follows:—"There is no difficulty about the portion of canopy-work and the bouquet. From 1400 to 1425 would probably be their date. It is, however, hardly possible to give an exact date without examining the glass itself. This refers, even more especially, to the Tulip, which may have been done at any time from A.D. 1500 to 1884. The probabilities are, however, that it dates about Dutch William's time. The enamel system of painting on glass was much cultivated in Lucerne in the sixteenth century, and in Holland and Flanders later on. It may, therefore (if ancient), be from Holland, and of the time of William; but, as I have said before, it is impossible to assign a certain date without examining the material and pigment."

Mr. F. Chancellor, a good ecclesiologist, and the architect for the diocese of St. Albans, writes of the portion of canopy work, that he imagines it to be of late fifteenth century work. The water-bouquet he considers of the same age, and believes it to have been the badge of the Bouchiers, Earls of Essex, who were slightly connected with the D'Arcy family. The Tulip, Mr. Chancellor says, puzzles him very much. He adds "It looks more like a drawing of the nineteenth century than of the sixteenth," and he intends to go and see it to clear up the doubt.

The Rev. Robt. Vernon Otley Graves, Rector of Tolleshunt D'Arcy, writes:—"I am sorry that I do not know more about the Tulip than I now send you. It has been there as long as people remember, and the window in which it is has for a long time been known as the 'Tulip window.' The fragments of glass you noticed round it are of a very much older date undoubtedly. I should think that the probable explanation of its (the Tulip's) presence there is that it was brought over from the coast of Holland by some of the refugees who fled from France at the time of the revolution of 1792—or, possibly, even at the time of the revocation of the Edict of Nantes—and by them or their descendants, got placed in the church, among fragments of older glass, of which there used to be a great number that have, of late years, disappeared. It is unlikely that a representation of the Tulip, whose cultivation in England dates from comparatively recent years, would have been produced by native talent, therefore the probability that it was brought by one of the refugees who, at both of the above dates, came in large numbers to that part of Essex," where their descendants may still be found.

## The Arboretum.

### ACCLIMATISED CEDARS.

I SAW lately in the *Gardeners' Chronicle* an account of some Cedars that had been successfully transplanted to this country, but I have not heard of an instance of cones proving fertile. In the neighbourhood of Inverness, N.B., there is a property which belonged to the late J. B. Fraser, author of the *Persian Adventurer*, the *Kuculbash*, &c., and who acted as interpreter for the Persian princes on the occasion of their visit to this country some twenty or thirty years ago. He brought home some Cedars, and planted them in his garden. It is not known exactly when, but they have thriven remarkably well. In July, 1878, I led a field club to the garden, and I have just come upon memoranda made at the time as to the Cedars at Reelig, a copy of which may be interesting to your recent correspondents:—

"The number of the Cedar trees in Reelig garden was thirty-three. Nothing of a certainty can be said as to when they were planted, or from whence they were brought. The tallest—of which a few are about the same height—may be about 60 feet. The largest girth within 1 foot of the ground is 13 feet 6 inches. The next largest similarly girthed, 12 feet 9 inches; girth of largest branch on said tree, 6 feet 1 inch; extent of ground covered by largest branches on said tree, 87 feet to inches."

The cones were well developed, as large as a good-sized Apple, but the gardener told me he had never succeeded in raising plants from the seed.

"*Cedrus Deodara* in the garden:—Height about 36 feet; girth within 1 foot of ground, 7 feet 3 inches."

I can give little or none of the history of the *C. Deodara*. I am told it had been planted by Mr. McCallum, present gardener at Greisacban, and which may have been about 1840. W. C., *Inverness*.

### AMPELOPSIS SEMPERVIRENS.

This will not cling to a wall, and it, therefore, will require to be fastened on or to be intermixed with some other plant that the tendrils can cling to. Its proper place seems to be over a rockery or similar place, but I have never seen it cling to a wall yet. Trails of it are very useful for decorations in winter, but it has very little in common with *A. Veitchii*. *Wyeside*.

## The Herbaceous Border.

### HELLEBORES, &c., AT BROCKHURST, DIDSBURY.

IT WAS with the idea of seeing Mr. Brockbank's Christmas Roses at home that I found my way to Didsbury recently, and was agreeably surprised with much besides them to interest one, even at such a dull time as the present is, in the open ground. But of course it is not every garden which contains within such an area so much to charm, nor was there anything which in the least was opposed to good taste; and, although I had never before seen the place, the conclusion was forced upon me that, go when one would, there was a vast amount of interest centreing there. But, to come to the Hellebores: they were simply astonishing. As Mr. Brockbank grows them everybody must be fascinated therewith; I should think in sufficient numbers to stock two or three nurseries; represented in many sizes, and under varying conditions; you meet with them everywhere—in the beds and borders, on sloping banks, in small flat beds in the wild garden—indeed, when one would have thought the stock had all been reviewed, from many a nook and corner they greet you; all those in flower protected with *cloches*, or covered with sheets of glass supported upon pegs fastened in three stakes, or small lights.

The most abundant are *H. altifolius* and *H. angustifolius*, sometimes called the "Brockhurst" variety, and synonymous with Mr. Burbidge's "St. Brigid's" variety. This, I believe, Mr. Burbidge now admits. *H. altifolius* is synonymous with *H. maximus* of many gardens and nurseries, but not of all. It is much the earliest, many of the plants being nearly over, but sufficient were in flower to show one what they were, and had been: large and beautiful, some of the flowers measuring 5 inches across, most of the peduncles carrying two flowers, most of the foliage looking very strong and healthy; although Mr. A. Mottershead, the excellent head-gardener, informed me in this respect they were not so conspicuous as at other seasons, owing, he presumed, to the late excessively dry season. The variety *H. angustifolius* was abundantly crowded with its white blossoms; some of the clumps will produce over a hundred flowers; some in pots were carrying from sixty to eighty flowers each. As seen here one feels convinced that this is a variety that will be much sought after. These fine clumps had, I understood, only been planted four years, and at the time of planting they were but small pieces—indeed, so well do they grow at Brockhurst that small single buds cut from the base of old stools, put in two years since, have now several good flowers. There are beds of *H. angustifolius* which have only been planted twelve months, and as in my experience after being disturbed, they present anything but a satisfactory appearance; but the second season they recover themselves, while those which have been planted three seasons are in full healthy condition. Many growers unacquainted with them are sadly disappointed with the outlook the first season, but about which there is no reason to despair; it may be taken as a sure indication that they do not like being often disturbed.

The soil at Brockhurst is light and blackish, but inclined to become clogged; consequently Mr. Brock-

bank finds it necessary to add sand and leaf-soil for the Hellebores; in addition to this it is deeply stirred, most liberally manured at the time of planting, and in the autumn the surface is well mulched with sawdust thoroughly saturated with stable-manure, which seems to be the very stimulant—or shall I say the right larder?—for them; other than this they do not appear to receive any special treatment. It seems pretty evident the stable sawdust is the chief factor in the production of such luxuriant foliage and fine large flowers.

Several other species and varieties of Helleborus are encouraged, some of which were in flower; conspicuous was *H. abchasicus*, with its purple-red flower-buds subtended by the green foliaceous bracts; and the variety *purpureus*, with extremely pretty purplish flowers, the inner surface of which is especially beautiful. *H. foetidus*, *H. dumetorum*, *H. guttatus*, *H. argutifolius*, and several hybrids, are now in or about to flower, while several others will be in flower later on, the whole forming an interesting series. *R.*

### COMMELINA CÆLESTIS.

This favourite of many of our forefathers appears to be in great danger of becoming a much neglected plant, if it has not already found its way into that category; and yet the beautiful clear blue of its flowers should make it a favourite, added to the fact that it is not difficult of management. As it is a true herbaceous perennial, the roots can be wintered when the stems die down, much as Dahlias are preserved. They should be lifted with care if they are growing in the open ground, so that their fleshy spindle-shaped tubers be not injured, and planted or potted entire in spring. In warm southern localities the roots can be left on the open ground all the winter if a heap of ashes or some kindred material be placed over them. During the growing and flowering season a rich light soil should be given them. The type *cælestis*, and its white variety, *alba*, can be propagated by means of seeds, which can be procured without difficulty, and by dividing the roots in spring after being placed in heat to break in growth. *R. D.*

## Orchid Notes and Gleanings.

### ORCHIDS AT MESSRS. LOW'S, UPPER CLAPTON.

THE best and most interesting feature during the winter season is the large house set apart specially for the culture of Phalenopsis. The lovely *P. amabilis* is just coming into bloom; the best varieties of this the "Queen of Orchids" are very lovely. *P. Sanderiana* is also in flower; it is a very distinct and beautiful species—the pale rose or lilac tints of the sepals and petals are distinct from those of *Schilleriana* or any other. There seem to be hundreds of plants of this fine kind established and starting into bloom. *P. leucorrhoda* was also in flower; this and the very pretty *P. casta* are supposed to be natural hybrids from the same parentage, but crossed in different ways. Messrs. Low consider that the first-named is better *P. amabilis* as the seed-bearer, and *P. Schilleriana* as the pollen-bearer; while *P. casta* is the reverse of this. Doubtless the pollen-bearer has the most influence in determining the character of the flowers.

In the *Cattleya*-house the advanced guard of *Cattleya Trianae* and *Dendrobium Wardianum* are just opening their flowers; a succession of the latter can be kept up for five months. A variety of this useful winter flowering *Cattleya* is very pale, almost white, and the flowers of large size. The pure white forms, and those with rich crimson blotches on the labellum, are the most esteemed; but between these there are many varieties of rare beauty.

The cool-houses are still filled to overflowing with *O. ontoglossums*. A few pretty hybrid forms are to be found amongst them, and occasionally a well-formed, richly spotted variety of *O. crispum*; and amongst the importations of *O. triumphans* the handsome *O. tripudians* was flowering.

There is a good importation, in one of the warmest houses of *Vanda Sanderiana*, but this handsome novelty will never be plentiful; it seems to be difficult to get at, and not easy to import. The true *V. insignis* is also plentiful, and no collection should be with-

out this distinct and richly marked species, now that good plants can be obtained at a guinea each. J. D.

#### BARKERIA ELEGANS.

On referring to the *Gardeners' Chronicle*, vol. xiii., n. s., p. 72 (January 17, 1880), our readers will find a figure (15) called *Barkeria cyclotella*, which accurately represents *Barkeria elegans*, as exhibited by Mr. Phillbrick at South Kensington on the 13th inst., when the Floral Committee awarded a First-class Certificate. Professor Reichenbach described *Barkeria cyclotella* in terms which do not entirely agree with the figure, the spotting of the column and lip being somewhat discordant from the learned Professor's description. The drawing shows a spotted column and a white lip, with deep blotch in the centre of the anterior portion. *Barkeria cyclotella* has a dark lip, with a white spot, instead of a white lip and dark spot, and is without the spotting on the column ("columna immaculata"), so that the drawing represents *B. elegans* and the letterpress describes *B. cyclotella*. At p. 716 of the same volume (June 5, 1880) the error is corrected, under a notice of a representation of the plant attributed to its right name, *B. elegans*, in the *Floral Magazine*, t. 394. From the remarks of Professor Reichenbach, he seemed to desire further information, but that the plant from Mr. Phillbrick's garden is the true old *B. elegans* admits of no doubt; its appearance excited keen interest, and it was at once identified by Mr. B. S. Williams and Mr. Dominy, neither of whom remembered to have seen so fine a variety.

#### VANDA INSIGNIS.

An evergreen with two rows of closely-packed, recurved, strap-shaped leaves, and numerous flowers loosely disposed in erect axillary racemes. Each flower is 2—2½ inches across, with spoon-shaped segments, yellow, heavily blotched with reddish-brown spots. The lip is contracted above the white base, and expands into a deep reddish-violet cup-shaped limb. It requires the temperature and moisture of the East India-house. *Orchid Album*, t. 172.

#### CATTLEYA DOLOSA.

Referring to a paragraph on p. 83 of the last number of the *Gardeners' Chronicle*, your correspondent Sir Charles Strickland will find figures and a full description of *Cattleya dolosa*, by Professor H. G. Reichenbach, if he refers to the number for April 1, 1876. I flowered it first in October, 1874, and again in 1875 and 1876, from a batch of plants received from Mr. Linden a few years before under the name of *Cattleya sp.*, from Minas. *John Day*.

#### ORCHIDS AT MR. J. E. BONNY'S, DOWNS PARK ROAD, HACKNEY DOWNS.

The collection of Orchids at this neat and model establishment fully bears out all the encomiums that have been passed upon it by those who have had an opportunity of inspecting it. The houses are rather small, but, as the space is limited, and every corner and passage is utilised for the growth of these interesting plants, the size is not so obvious. Having many opportunities of attending sales at the great auction marts in the city Mr. Bonny has made good use of them, and many fine pieces have thus been secured, which otherwise could not have been obtained so cheaply. But the buying is only one part of the matter, and by far the easiest, the successful culture and satisfactory flowering being of greater difficulty. Here, however, it would seem that this has all disappeared, as the collection all through is very healthy and vigorous, and sheaths and spikes are abundant and strong. Mr. Bonny is a great advocate for baskets and rafts. This is perhaps to be expected, and that it is the best method for many Orchids the condition of the plants here amply testifies. *Cattleya citrina* on rafts hanging close to a wall is in excellent health, making growths of a clear glaucous hue, and many just showing for bloom. Other large pieces in baskets are equally satisfactory. *Oncidium Marshallianum*, too, is growing strong. This is one of the most showy of the genus, but is often killed by permitting the spikes to remain too long on the plant. *O. cheiroporum* is here flowering most beautifully, its neat compact spike of small bright yellow flowers making it an object of interest. *O. concolor*, *O. nubigenum*, and *O. Rogersi* are also in good heart. *O. curtum*,

*O. Gardnerianum*, and *O. macranthum* are growing vigorously.

The *Cattleyas* and *Lælias* are exceptionally fine, that grand species *O. Mendelii* being represented by scores of specimens in fine condition, splendid in colour, and with numerous sheaths. Remembering something of the first plant of this that ever bloomed, a natural liking for good pieces of this is, perhaps, pardonable, for there is no gainsaying the fact a good *C. Mendelii* is one of the finest Orchids in cultivation. *C. Sanderiana*, on blocks, are growing well; many *C. gigas*, amongst them *C. Trianae* in quantity, also. A fine lot of the dwarf compact *C. Regnelli*, on rafts, are rooting and breaking freely. *Cologyne cristata Lemoiana* is represented by many nice plump-bulbed plants. This is a veritable gem, and should be found in every collection of Orchids. *L. purpurata* and *L. elegans* are numerous and good; *C. speciosissima*, on blocks, is doing well. In *Promenaea citrina* and *P. stapeloides* we found two old friends seldom met with now, but still pretty and pleasing to those who may have made acquaintance with them when the Messrs. Loddiges, of Hackney, grew and flowered them so successfully. Here, too, are many fine plants of *Zygopetalum rostratum*, on blocks, growing well and some showing flower; one plant, with ten leading growths, is exceptionally strong. Mr. Bonny has certainly hit upon the right method of culture with this sometime difficult grower.

The *Phalenopsis* here deserve mention. The leading varieties are grown into fine specimens, whilst some of the lesser forms, as *Lowii* and *tetraspis*, &c., are not overlooked or neglected. *Cypripediums*, too, are well done; that trying species, *C. concolor*, does well on a narrow shelf close to the glass, treated to abundance of water for a good part of the season, and never allowed to get dry; it is now flowering nicely. *C. niveum*, *C. Spicerianum*, *C. Dominionum*, *C. ciliolare*, *C. levigatum*, with the leading sorts, are all of them in robust health, and of a splendid dark green colour. *Aërides*, *Vandas*, and *Saccolabium*, are doing nicely; the specimens, however, of these are not quite so large as those of the *Cattleyas*, *Lælias*, and *Dendrobiums*.

Large numbers of plants suspended from the roof are in excellent health, the roots protruding through the baskets, though in many cases they are treated to but a very small quantity of moss or Peat. *Coryanthus macrantha* on rafts are thus managed, no soil of any sort being used; the plants, however, are growing freely and strong. A careful inspection of the various operations necessary to their culture, and a particular regard to the temperatures of the various divisions, more especially that the night readings are kept as low as can safely be done, has secured for Mr. Bonny one of the healthiest collections of Orchids it has been my good fortune to see for some time past. *W. Swan, Fallowfield*.

### MARKET GARDENING.

At no time has it been more needful for tenants who hire land for purposes of cultivation to extract therefrom the largest and best crops possible than at present. Whilst farming proper languishes, growers, who may be more properly called market garden farmers, nevertheless, generally hold their own. As a proof of the exceedingly depressed state of the farmer it is computed that no less than 60,000 acres of good corn land are bidding for tenants in this county of Essex alone. Nevertheless, market garden farms, which are lands lying in an extensive area round the metropolis, are still very highly rented, the mean charge for rent being an average of £3 per acre; indeed, instances occur where the price approaches nearer to £5. It will be seen, therefore, that very superior annual crop returns must be made to maintain a tenant's banking account against this first high charge, with its excessive additions in the form of tithes, rates, transit expenses, salesmen's commission, &c.

Very advanced theories are suggested by modern agitators regarding the "rights" of individuals, and suggested desirability of parcelling land out into minor holdings, &c., this being advanced as a panacea for many existing ills. No more fallacious suggestion can be made. Old-established growers only hold their

own by very careful attention to necessary "change crops," or a needful rotation, based on long experience of what is desirable, in reference to each space of ground, past and contemplated future markets, and seasons past, present, and future. These, added to the monopoly won by such experience, prove an all but insurmountable obstacle to all who would desire to obtain a "living" from an acre or two of land only devoted to vegetable growing for market. In a word, the smaller the grower's capabilities the more is he handicapped, and readers who contemplate competing under pressure of such disadvantage will do well to hesitate.

Past experiences of private gardens, and more intimate recent knowledge concerning market garden farming, have shown me how much the gardener may yet learn from the latter. Superficially this fact is readily shown by examination of the contents of private gardens generally, and the results of more extended farm culture, as represented at the several metropolitan fruit and vegetable markets throughout the year. Far too generally an old rule-of-thumb practice is adopted whereby certain limited quarters in private gardens are devoted year by year to their familiar thinly clad crops, consisting mainly of not more than two, during the twelve months, much time being lost, not only as regards space, but also in connection with a possible rapidity of succession.

The calendarial date for sowing and planting is, in fact, misleading. Calenders are well enough for the uninitiated amateur, &c., but master minds should not be curbed by such restraint, as future details in reference to special and separate crops and cropping will show.

#### PLOUGH AND SPADE.

Whilst the market-garden farmer depends exclusively on plough-work and cultivation, private growers use of necessity the spade, or its equivalent, the digging-fork. Spade husbandry is considered the best of the two. Judging by results, however, the difference cannot be so great as imagined, else why should the very best vegetables result from plough culture? No matter what subject we examine, whether it be Beans, Cauliflowers (as witness Veitch's Autumn Giant, which markets annually team with), Savoys, Cabbages, Coleworts, spring and autumn Onions, Carrots, Parsnips, Brussels Sprouts, &c., all afford proof; and yet the plough is, by comparison with the spade, to say the least, a shallow cultivator.

Where are we to find an explanation for this fact? On the one hand exists spade labour—deep, thoroughly manipulated culture; on the other, ploughed up ground, comparatively shallow, simply turned over in united ribbon lengths, and superficially disintegrated, or harrowed, and forthwith planted.

Our highly worked, frequently dug, spade-husbanded gardens, are too freely chopped down, broken up into minute particles by hand labour. Bulk of soil or clods are destroyed, and their coherent properties destroyed to such a degree that the firm roothold necessary does not exist. Nature nowhere unduly lightens up this plant-root abode so as to destroy this mechanical consistency. We have here, therefore, anything but a misleading finger-post. Fallen leaves, the debris of decayed portions of vegetation, feed the surface-soil, worms bring maiden lower strata to the surface, but generally a medium firmness exists where tree and every form of seedling plant grows and thrives. The firmness of soil-culture of market gardens may therefore advantageously be copied by private growers.

Market-garden farmers prepare their manures specially for the soil. They turn over their heaps of light straw, stable sweepings, &c., once or twice, as the case may be, until it becomes the best of its kind when in admixture with soil for immediate root-food. This is done always, regardless of the outlay, which is very considerable. In private gardens this is rarely or never done; certainly gardeners use up old Cucumber, Melon, or forcing-frame manures. These are generally dry, however, and greatly wanting in the high-class nutriment the above manures possess. It would be a great gain to mix the old frame manure, all fresh green manures, and cesspool emptyings together, and, as is the case with the market gardener, apply them to the land when made properly "short," without—and this is very important—any undue or excessive heating in process of fermentation, which, to say the least, is destructive of the best form of nutriment for roots and permanent enrichment of lands. *William Earley, Ilford*.

(To be continued.)

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Jan. 26	Sale of 5000 <i>Lilium auratum</i> and other Bulbs, at Stevens' Rooms.
TUESDAY,	Jan. 27	Special Sale of Orchids in Flower, at Protheroe & Morris' Rooms.
		Clearance Sale of Greenhouse Plants, at The Vineries, Wood Green, by Protheroe & Morris.
WEDNESDAY,	Jan. 28	Sale of Roses, Fruit Trees, Bulbs, &c., at Stevens' Rooms.
		Sale of Lilies, Roses, and Bulbs, at Protheroe & Morris' Rooms.
THURSDAY,	Jan. 29	Sale of Imported Orchids from Mr. Sander, at Stevens' Rooms.
FRIDAY,	Jan. 30	Sale of Imported Orchids, at Protheroe & Morris' Rooms.

THE desirability of employing ENGLISH NAMES FOR PLANTS has been once more brought under attention by Mr. WM. MILLER.\* At the request of Mr. W. ROBINSON, the Editor of the *Garden*, and at his expense, Mr. MILLER has compiled with care what is the most complete dictionary of the kind hitherto published, and for this he has won the thanks of all horticulturists. The retention of the old, or the adoption of new names is a matter in which the general run of gardeners, who care much for the beauty or utility of plants, and for little or nothing besides, will decide for themselves—as they have every right to do. But those whose interest in plants lies much deeper—the students of the family history of plants, the investigators of the machinery and of its mode of action, and even those whose concern is purely of a commercial character, will find—have found—that they have no choice in the matter. The botanical nomenclature is sometimes repulsive and offensive to the scholar, incomprehensible to the unlearned; but for all that, once it comes to a question of serious study or business, away go the popular names. Why is this? Surely, it might be argued, our own language is sufficiently expressive—surely we ought to retain and even cherish the old names handed down from our Saxon forefathers, made dear to us from their association with the language of authorised versions of Holy Writ, the sweet songs of CHAUCER, the touching notes of SHAKESPEARE, the homely strains of BURNS, or the learned lyrics of TENNYSON—the last-named more thoroughly abreast of the science of the day perhaps than any of his predecessors were. Well, we shall retain them, whether we will or no, and cherish them, too; but we must put them to their proper uses, and those only. As illustrations of the history of the language, of the habits, thoughts, and feelings of our predecessors, we shall surely retain them. For their sympathetic associations, for the appeals they make to some of the purest and best sentiments of our nature, they will be respected in the future as in the past. But for everyday use, in the library, the herbarium, the laboratory, the field, the garden, the office, these popular names are an embarrassment and a nuisance. Those who have to use these names most frequently know it but too well. Any one who for any serious purpose has occasion to deal with plants very soon finds out that the balance of advantage lies unmistakably with the “barbarous, uncouth, repulsive,” but nevertheless wholly indispensable system of botanical nomenclature. And the reasons are obvious. When the plants known in gardens might be counted by the score, or at most by the hundred, and when accuracy and minute determination were not as essential as they are now, a comparatively small number of names sufficed, and these might as well be English as not. But now garden plants are numbered by thousands. The old names will not fit the new-comers, and who will undertake to coin new ones, or, having coined them, will have power to enforce their adoption? Gardening has, happily, one qualification of science in general; it may be national, but it is cosmopolitan also. Every day makes it more so.

\* A Dictionary of English Names of Plants. . . . By WILLIAM MILLER. London: Murray.

The intercourse of the botanists is with the countries of the whole civilised world, that of the gardeners is daily extending to Germany, Holland, France, Belgium, Russia. These are all countries with which our gardeners have increasing concern. The “barbarous, uncouth, repulsive” nomenclature is understood by all these people, even by the Japanese. Are we, then, to complicate matters by sticking to our own vernacular, and leaving these outer barbarians to find out what we mean as best they can? That game can be played at by two persons, and if the Japanese horticulturists choose to retain their own system of names—no doubt as venerable, as poetic, as sympathetic as our own—we cannot find fault, however much inconvenience we may experience.

But the one great objection which dominates all the rest is the vagueness and want of fixity of application of the popular name. If a plant in popular language is called a Rose, a Laurel, a Lily, a Thistle, a Cedar, an Aloe, a Box, a Myrtle, a Fir, a Pine, a Reed, a Rush, a Daisy, a Primrose, a grass, a Syringa, ay, even a Cabbage, it is most probable that in the great majority of instances the name is wrongly applied—applied, that is, to plants which do not respond to their names. It is only needful to turn over the pages of the dictionary before us to see countless instances of this. Take, for instance, “Cabbage,” this might stand very well in a general sense for the Latin equivalent *Brassica*, but we find from the list before us at least nine other genera called Cabbage and not all Crucifers even, for one is a Saxitrage, and another is an Aroid! We should not prefer to have leaves of *Symplocarpus* cooked for Cabbage!

And this leads us to speak of another most serious objection to the use of popular names for other than popular purposes. In many cases the confusion and vagueness of application is of no great moment: the sciolist is satisfied with them, he wants no better; the botanist—even the amateur botanist—can generally find out what is meant, and so no harm is done beyond the loss of a little time. But the case is different when Aroids are mixed up with Cabbages, the aromatic Bay (the true Laurel) with the poisonous or “common” Laurel, which, by the way, is a Cherry and no Laurel. Instances of similar confusion attended with the greatest inconvenience occur in the commercial nomenclature of timber trees, the Deals, the Firs, the Pines, the pitch Pines, the Rosewoods, of which latter Mr. MILLER enumerates twelve widely different trees, neither of them, it is needless to say, being a Rose. The invaluable Gum trees (*Eucalyptus*) are in a similar state of confusion, a confusion mainly created by the haphazard, unsystematic way in which the colonists have done what they thought proper in their own eyes, and named things so that it is impossible for others to know what is meant. Such illustrations, and we might multiply them by the score, are sufficient to show the extreme inconvenience for commercial or business purposes of an unauthorised system of nomenclature, one amenable to no rules, and destitute of any but fanciful significance. By the side of the serious inconvenience that arises from the use of popular names, other things are of less importance, and, indeed, afford amusement, as in the endeavour to ascertain by what cross circumstances a *Helianthus*, already provided with a good English name in Sunflower, should be called a Jerusalem Artichoke, or the tree of Judæa (*Cercis*) get converted into Judas Tree by the same process that converts Hoary Morning Apple into Honeymoon, or the Josephine de Malines of the pomologist into the Joseph-on-the-Palings of the costermonger!

Mr. MILLER, in the work before us, endorses the view that good native names are rejected in

favour of some Latin name through mere contempt of homely things and affectation of novelty. We greatly doubt the truth of this statement; when homely things are dealt with, homely names are used—Onions, Cabbages, Carrots, Apples, Pears, Vines, Lettuces, and the like. With a pretty large acquaintance with botanists and gardeners, we never remember to have on a single occasion heard these plants spoken of by other than their popular names, unless when the occasion expressly demanded the use of the scientific name, so that the accusation of scholastic pedantry and social pretension seems rather void of foundation.

The compiler of the volume before us, in his advocacy of popular names, turns round upon the botanists for their long lists of synonyms; and there is much to be said on this score, but there are, what Mr. MILLER overlooks, synonyms and synonyms; some are the mere outcome of differences of individual opinions, others are evidence of insufficient knowledge, defective materials, or careless workmanship. It does not much matter, for instance, whether a Silver Fir be called *Abies* or *Picea*, but to call a true Pine, like the Scotch, a Fir, or to call a Cherry a Laurel is a much more serious matter. Mr. MILLER is unfortunate in the book he cites in illustration of the evils of synonymy. There are, it is true, a dozen or more synonyms quoted in GORDON'S *Pinetum* for many of the trees mentioned by him, but there is nothing to show whether the author had any grounds at all for his use of them. For aught that appears his relegation of so-called synonyms to particular species might have been effected haphazard, by guesswork alone, and without the comparative study which is expected of authors. This may have been, as it frequently is, unavoidable, but then the fact should have been stated. No one working after GORDON could take upon trust his synonymy, but must work it out for himself. But this very fact illustrates the reason why, in the competition between popular and so-called scientific names the latter survive, the former tend to disappear. For the names of the botanist—and for the synonyms that unfortunately encumber his lists, chapter and verse can be cited—GORDON failed to do this, or to tell us how he arrived at his conclusions, and his synonymy is consequently next to useless. But the synonyms of the botanist, when properly authenticated and verified, however objectionable from some points of view, are landmarks of history, signposts of progress, indicating by what gradual and conscientious, sometimes painful processes the truth has been arrived at.

Popular nomenclature owns allegiance to no laws but those of the Lord of Misrule—it may be harmless, it may be amusing—more often it is mischievous, sometimes it is dangerous—it does not concern itself with the truth. Botanical nomenclature, with all its faults, is regulated by code—it is a means to an end, and that end the pursuit of truth.

—MR. SHIRLEY HIBBERD.—Deep sympathy will be felt by horticulturists and friends for Mr. HIBBERD in the sad catastrophe which, as will be seen by reference to our Obituary column, has befallen him.

—MESSRS. VEITCH AND SONS.—Mr. HARRY VEITCH has, we learn, received a Royal Warrant appointing him nurseryman and florist to the QUEEN. Her Majesty has also permitted MESSRS. VEITCH to prepare and present the bridal bouquet on the occasion of the marriage of H.R.H. the Princess BEATRICE. This is the eighth time in which the firm have had a similar honour.

—“LINDENIA.”—Under this heading it is proposed to publish in monthly parts a series of coloured plates of Orchids, comprising many out of the 900 species discovered or introduced by M. LINDEN. The first part will be issued on March 15, and it will form to some extent a continuation of the *Pescatorea*, which is now scarce; woodcuts will also be given. The new publication will be issued under the auspices of the Compagnie Continentale d'Horticulture of Ghent.

— SOCIETY JOURNALISM.—Always in the worst possible taste, generally false, and too often malicious, it is to be hoped that this pestiferous form of literature, which had begun to invade journals of reputed respectability, will suffer a check to its further development from recent occurrences.

— THE JARDIN DES PLANTES.—We have received the annual list of seeds collected for exchange by the authorities of the Paris garden. The list occupies fifteen large quarto pages, each of four columns, so that the number of seeds offered is very large. Applications for exchange should be made without delay to M. le Professeur CORNU, Museum d'Histoire Naturelle, 27, Rue Cuvier, Paris.

present time in the market a consignment of Custard Apples (*Anona*). As in the case of most tropical fruits in this country, they do not bear out the high character given them in countries where they can be eaten under more favourable conditions. Under the quite erroneous name of *Granadillas* are also to be seen in the market the egg-shaped, orange-coloured fruits of *Cyphomandra betacea*, which may be eaten as Tomatos.

— SEEDS FOR THE MICROSCOPE.—Messrs. CARTER & CO. send us a little assortment of "seeds for the microscope," but they are mostly so large as readily to be seen by a pocket lens. There is a vast amount of beauty in seeds, and we have no doubt

is evergreen, firm and rigid in texture, amply clothing the stems and branches. There is a figure of the plant in the *Botanical Magazine*, t. 4688, and a good sized plant flowers regularly in one of the octagons of the Temperate-house, Kew.

— CONTINUITY OF PROTOPLASM.—At a recent meeting of the Boston Natural History Society, Dr. G. L. GOODALE, of Cambridge, read a short and instructive paper on the "Continuity of Protoplasm in some Vegetable Tissues," in which he stated that all the recent discoveries on this subject had been confirmed by the students at work in his laboratory at Harvard College. He said that by the new process of staining it had been proved that delicate threads

FIG. 22.—A MEXICAN PINE (*PINUS PATULA*), GROWN IN CORNWALL. (SEE P. 108.)

— M. SEVEREYNS.—This gentleman, on the proposition of the Minister for Agriculture, Industry, and Public Works, has been appointed by H.M. the King of the BELGIANS a Chevalier of the order of Leopold, in recognition of his services to commerce and science as a lithographer. M. SEVEREYNS is the chromo-lithographer by whom most of the coloured plates of this and of some other gardening journals have been executed.

— SNOWSTORM IN MALAGA.—The snowstorm in Malaga on the 16th lasted three hours. Such a fall of snow has not occurred since 1861. The frost and snow have entirely destroyed the Sugar-cane crop in the province, as well as damaged the plantations of Oranges and Olives.

— COYENT GARDEN.—Those on the look-out for curiosities for the dessert-table will find at the

Messrs. CARTER would have no difficulty in improving on the idea they now originate. For one thing we might suggest to them the foundation of small collections of authentically named grass seeds, and seeds of pasture weeds. Such collections would be valuable for reference, and would form desirable acquisitions in rural schools and agricultural colleges.

— VACCINIUM ERYTHRINUM.—The specific name, implying red, is here very appropriate, and applies, not only to the flowers, but to the whole of the young foliage, the shoots, and to the nerves of the leaves even in an adult stage. The flowers are deep brownish-red, and rather freely produced at the ends of the branches, in one-sided racemes. The species is a native of the mountains of Java, and accommodates itself accordingly to greenhouse temperature, where it keeps up a succession of bloom for many weeks during the winter months. The foliage

of protoplasm run through the cell walls and that the cells are not always separate, as previously thought. It has also been proved that protoplasm can escape through a thin, unbroken cell wall, as was previously suspected. These discoveries all go to prove STRASBURGER's generalisation, that all the protoplasm in a plant may be connected to form a whole.

— COAL.—At 50 feet below the surface a uniform temperature of 50° occurs, below which an increase of 1° for every 60 feet of depth takes place, so that at 4000 feet a temperature of 116° is obtained, one which, according to an article in *Nature*, renders the working of coal mines at that depth commercially unremunerative. The output of coal for 1881 was calculated to be sufficient to build fifty-five Great Pyramids, or to rebuild the Great Wall of China and add a quarter to its length; while the total output for thirty years would build a column 9 feet 4 inches in

diameter, which would reach 240,000 miles high, the distance of the moon from the earth!

— **CATTLEYA TRIANÆ.**—Mr. JAMES sends us a bloom with two additional lips. The sepals are normal, as also is one of the lateral petals; the other petal is developed as a lip like the normal one, which is present in the usual place. A third smaller lip is placed in front of the column, in the position occupied by the solitary stamen of the inner row of three, potentially present, but actually abortive. The ovary is altogether wanting.

— **ROYAL HORTICULTURAL SOCIETY.**—At the ensuing annual meeting the following changes in the Council and officers are proposed:—For President, in the room of Lord Aberdare, Sir Trevor Lawrence, Bart., M.P.; and as members of Council Hon. and Rev. J. T. Boscawen, Colonel Trevor Clarke, and W. T. Thibetson Dyer, Assistant Director, Royal Gardens, Kew, in place of Lord Aberdare, Lord Enfield, and the late Mr. Mangles. The election of Sir Trevor Lawrence will be hailed with acclamation by all horticulturists, who will rejoice to find the President's chair once more filled by a thorough horticulturist. The new members of Council are also men of the best stamp, and will be welcome acquisitions. To the newly formed Council we may in every confidence look for every effort to be made to secure proper meeting-rooms, offices, reading-rooms, and quarters for the Lindley Library.

— **MASSACHUSETTS HORTICULTURAL SOCIETY.**—A meeting of this Society was held at Boston on January 3, President MOORE in the chair. The President delivered his inaugural address, in which he first paid a tribute to his predecessor, the Hon. FRANCIS HAYES, the first President of the Society, who had died in office. Mr. HAYES was energetic in the performance of all his duties, a good manager of the financial affairs of the Society, an excellent presiding officer, urbane and courteous, and an enthusiastic lover of trees and plants, and everything pertaining to rural life. His country home at Lexington was fast becoming one of the notable estates in the suburbs of Boston. The founders of the Society, who have passed away, were remembered with gratitude by the President, who said that their successors, who enjoy the benefit of their labours, hold a trust which they are bound to improve for the good of those who come after them. At the same time we should not forget the debt of gratitude that we owe to the living, among whom the venerable ex-President, Hon. MARSHALL P. WILDER, who has devoted a long life to the advancement of horticulture, and who in his green old age is as interested in new fruits, flowers, and methods of cultivation, as a young beginner, was specially mentioned. The weekly shows of the Society have, during the past year, been better and more fully attended than usual. The four large shows, for which a small admission fee has been charged, have, under the energetic management of the committee of arrangements, proved more successful, not only in the quantity and quality of the exhibits, but in a financial point of view, than in previous years. The appreciation of the exhibitions evinced by the public has been most gratifying.

— **HORTICULTURAL CLUB.**—The usual monthly dinner and *conversazione* took place at the rooms, 1, Henrietta Street, Covent Garden, W.C., on Tuesday the 13th inst. Amongst those present were Mr. JOHN LEE, Chairman; Dr. HOGG, Rev. F. H. GALL, Messrs. COUSENS, C. T. DRURY, and L. UPCOTT GILL. Mr. DRURY exhibited pinæ of *Athyrium Filix-femina* clarissima, illustrating his recent discovery upon that Fern of the hitherto unknown phenomenon of "Apospory," i.e., the formation of archegonia and antheridia upon prothalli originating, not in the normal way, from the germination of spores, but by direct vegetative outgrowth from the fronds, like buds. An interesting discussion took place on the whole subject. The annual dinner of the Club will take place on Tuesday, February 10, under the Presidency of Mr. JOHN LEE, and, as it will be the tenth anniversary, a large attendance of members is expected.

— **SCUTICARIA STEELII.**—The most striking and characteristic feature of this plant is the long pendent twig-like leaves, often attaining a length of 2 and 3 feet, or even more. They are of a dull

glaucous green, about the thickness of a good-sized quill, with a channel on one side, representing the upper surface. They arise singly, and appear continuous with the apex of the excessively short stems on a branching rhizome. The short peduncle supports a solitary, large, and showy flower. The sepals and petals are pale yellow, blotched all over with deep dull purple. The large labellum is of a creamy-yellow, and beautifully striped with purple, and possessing a large bright yellow crest situated towards the base. The plant is figured in the *Botanical Magazine*, t. 3573, under the name of *Maxillaria*; but the plate scarcely does justice to it, owing to the limited space for the foliage. It is a native of Guiana, and may be seen in the Orchid-house at Kew. The only other known species, *S. Iladweni*, differs in the very much shorter, erect or arching leaves, and in details relating to the flower.

— **THE NATIONAL CHRYSANTHEMUM SOCIETY.**—The annual general meeting of the members of this Society was held at the "Old Four Swans," in Bishopgate Street, City, on Monday, the 19th inst., when there was a numerous attendance of members; E. SANDERSON, Esq., President, in the chair. The annual report, which was read by the Secretary, Mr. W. HOLMES, set forth that it was the thirty-eighth report and balance-sheet, that the first year of the National Society had been most successful, that the show in November last at the Royal Aquarium was the largest yet held, over 3000 blooms having been staged; that the establishment of a Floral Committee in connection with the Society had answered well; that a scheme for the affiliation of suburban and provincial societies had been promulgated; and that donors of special prizes had increased in numbers. The receipts from all sources for the year amounted to just over £300, the expenditure reached this amount, excepting a balance £1 6s. 6d. carried forward to next year; of this sum over £200 had been paid in prizes. The membership of the Society had increased in a remarkable manner, from 140 in 1883, to 260 in 1884. The following officers were then re-elected:—Mr. E. SANDERSON, as President; Mr. R. BALLANTINE, as Vice-President; Mr. J. STARLING, as Treasurer; Mr. W. HOLMES, as Secretary; Messrs. DRAIN, jun., and CRANE, as Auditors; and thirty-six members were elected on the General Committee. The appointment of a Floral as well as of an Exhibition Committee, and also of Judges at the Annual Show, were referred to the General Committee. A Schedule Sub-committee brought up a report recommending a few material alterations in the schedule, and a general augmentation of prizes in the leading classes. The class for a group of Chrysanthemums in pots covering a space of 100 feet is divided into two classes, one for incurved varieties only, the other for Japanese varieties only, and these will now be restricted to 60 square feet. The leading class for forty-eight blooms, twenty-four incurved and twenty-four Japanese, is also divided, and now forms two classes, one for twenty-four blooms of incurved varieties, the other for twenty-four Japanese, the prizes being in each £10, £6, £4. Several alterations of a less important nature, but not less useful in their results, were also made. Several special prizes were offered for various objects, among them for stands of single Chrysanthemums, also for English raised seedlings, and Mr. W. CULLINGFORD has placed at the disposal of the committee the sum of ten guineas, to be awarded in prizes for late-flowering Chrysanthemums, the competition to take place about the second week in January. This was considered a step in the right direction, and a supplementary exhibition will be arranged, probably at the Royal Aquarium, early in 1886. It is also intended that the sittings of the Floral Committee shall take place in the afternoon instead of the evening, as heretofore; and it is probable the meetings will take place at the Royal Aquarium. Among other novel features to be introduced to the schedule of prizes will be a class for the new Anemone-flowered Japanese Chrysanthemums. The result of the year's operations, and the enthusiasm which prevailed at the annual meeting, appeared to amply justify the Society in ceasing to be local, and taking on a national character.

— **A BIRMINGHAM NATURALIST.**—The Linnean Society never has more than twenty-five Associates on its roll of members. Not only is it an honour to be elected an Associate, but the honour is all the greater, inasmuch as no one is elected who has

not done some really good work in at least one branch of natural history. This honourable distinction has lately been conferred on a much-respected Birmingham man, Mr. JAMES E. BAGNALL, who, at a meeting of the Linnean Society last week, was unanimously elected an Associate. Mr. BAGNALL is one of the Vice-Presidents of the Birmingham Natural History and Microscopical Society, of which he has for something like a quarter of a century been one of the most useful and hard-working members. He has devoted his principal attention to the study of botany—structural and systematic. Years since he won for himself a name as a bryologist. He has always been a ready helper to young beginners, and many local botanists have benefited by his assistance. Many of his contributions have appeared in the scientific journals. His most important published work is the latest and by far the best *Flora of Warwickshire*, which has appeared by instalments extending over several years in the *Midland Naturalist*. This important work will, we are informed, shortly appear in a thoroughly revised form, as an independent publication. Mr. BAGNALL has achieved his success as a scientific man in the leisure hours of a working life spent in one of our large manufactories, where he has been as "diligent in business" as he has been diligent in observation and study when the day's work has been finished.

— **APPLE AND PEAR EXHIBITION, EXETER.**—It is finally arranged to hold an exhibition of the above on October 22 and 23 for the year 1885. The number of classes are considerably increased, also many of the larger prizes to both trade and private growers. With the additions, the experience acquired by the late exhibition, and ample time before them to make their arrangements, the committee anticipate that a large and successful exhibition will be held. The committee at their last meeting presented their Hon. Sec., Mr. PENGELLY, with a very handsome clock, as a mark of their appreciation of his labours in connection with the late exhibition, as to him in a very great measure was due the success of the undertaking.

— **CHINESE PRIMULAS OF RECENT RAISING.**—Seven beautiful varieties of these favourite winter flowers have been sent us from Mr. BULL's establishment, Chelsea, which have colours and size of an unusual character. The colours range from rosy-purple through lilac and flesh-pink to pure white. *P. rosea flore-plena* is destitute of any eye, but has small malformed petals standing erect in the centre. *P. filicifolia striatiflora* is also a faint pink with crimson dots. *P. punctata elegantissima* is purple-rose with a large extended bronzy central patch, the whole bloom being spotted with white; *P. albo luteo-oculata* is like the second named, but the eye (yellow) is an inch across; *P. violacea* is a trifle darker than a Neapolitan Violet, the petals delicately margined with white; *P. rubra* is a very massive bloom of rich colour, and scarcely any eye; and *P. alba* is good, having a pentagonal orange eye.

— **NOTTINGHAMSHIRE HORTICULTURAL AND BOTANICAL SOCIETY.**—The annual meeting of this Society was held at the Mechanics' Institute, on Wednesday, January 14, Mr. EDMONDS, Head Gardener, Bestwood Lodge, in the chair. The report of the committee and the balance-sheet were read and adopted. Votes of thanks to J. Manning, Esq., J.P., as President for the past year; the Auditors, Messrs. Field and Sibley; the Treasurer, Mr. C. Pearson; the Chairman of Committee, Mr. A. Paige; and the Honorary Secretaries, Messrs. Don and Steward, were passed. The election of T. B. CUTTS, Esq., Malvern House, as President for the ensuing year, was carried unanimously. As one-third of the committee annually retire, the following were elected:—Messrs. Anderson, Bush, Bardell, Harvey, Locker, Gadd, Clements, and the Honorary Secretaries. A vote of thanks to the Chairman for presiding brought the proceedings to a close.

— **GARDENING APPOINTMENTS.**—Mr. W. WHIBBERLEY, late Gardener to the Countess of KINGSTON, Mitchelstown Castle, has been appointed Gardener to Sir PHILIP DE B. GRAY EGERTON, Bart., Oulton Park, Tarporley.—Mr. ROBERT WILSON, late Gardener to the Earl of Desart, Desart House, Kilkenny, succeeds Mr. WHIBBERLEY, at Mitchelstown Castle.—Mr. F. DAV, for the past five years Fruit Foreman at Lockinge, has been appointed to succeed Mr. THOMAS as Gardener to Colonel Sir B. LOYD LINDSAY, K.C.B., V.C., M.P., Overstone Park, Northampton.—Mr. F. J. THORNE as Gardener to Mrs. MORISON, Hampworth Lodge, Downton, Salisbury.

## Plants and their Culture.

### STOVE BULBOUS PLANTS.

THE Gloxinia is now, without doubt, one of the most popular plants grown. Where these are valued the first batch should be started without delay. Select those that have had the longest rest for this purpose, shake them out of the soil, and repot with fresh compost. A light friable loam and good peat in about equal proportions, with a liberal addition of silver sand and a few handfuls of bone-dust, will be found to suit their requirements. If a good sample of leaf-mould is at hand it may be substituted for the peat, or a portion of it, and a few bones crushed small can be placed next the drainage in lieu of the bone-meal. If any of the tubers show symptoms of shrivelling and do not feel so plump and firm as they should do, they had better be placed in a pail with some lukewarm water for a short time before being repotted. At this early period of the year they had better be placed in a brisk temperature, and near the glass, to prevent drawing of the stems. After having been once watered to settle the new soil, be cautious in giving water before active growth begins, but afterwards, and through their flowering stage, they should never become quite dry.

### SEED SOWING.

Where the stock of Gloxinias is somewhat short, a pinch of a thoroughly good strain of seed should be sown at once. With the great improvements that have been made in the quality of the flowers during the past few years no cultivator need now possess an inferior strain. Seed sown now will produce flowering plants by the end of June; some of the stock will continue to furnish successions to the earlier ones, and carry the flowering season well on into the autumn. If the requirements are such as to need flowering plants late in the year, then it will be better to sow again in a few weeks time.

### CALADIUMS.

Among all the varieties of this beautiful foliage plant few are more useful than *C. argyræ* in supplying materials for decorative purposes either as a small pot plant or in the cut state. Where a healthy lot of good sound bulbs is at command a portion may be shaken out and repotted at once, then, if given an extra amount of heat they will soon start into growth. A few also of the best coloured varieties may be started gradually; they will afford bright and cheerful tints at a time when there are not so many flowering plants in season. *James Hudson, Gunnersbury House Gardens, Acton, W.*

## FRUITS UNDER GLASS.

### FIGS.

No trees, in my opinion, are so well adapted for early forcing as those which have been cultivated in pots for a series of years, and attained a good size; and no method better than the plan of having in the house or pit a bed of Beech or Oak leaves to give a little warmth throughout the season, and also to induce the roots from the pots to take hold and permeate it by the time the fruit is ripening. Trees of this description which were started a month ago at a temperature of about 50° at night and 55° or 60° during the day, will now be showing fruit and breaking forth into leaf. As these growths proceed they should be stopped at an early stage at about the fifth leaf, and where too thickly placed some should be removed to give room for those remaining to develop properly. The atmospheric state of a house under the foregoing conditions will be such as not to need syrioging, and at this season it should only be done when the trees and surrounding surfaces have become dry; an artificial temperature of 60° daily should be maintained, and by natural influences from 70° to 80°, with air admitted so long as it will keep up to 70°, when the place should be shut up.

### SUCCESSION FIG-HOUSE: BORDERS.

Now is a good time to begin forcing another division to come in after the first crop from the fore-

going trees. In most cases this house will comprise trees planted out. Fig trees under these conditions are in some cases in restricted borders confined within brick-wall boundaries, which certainly are very ineffective barriers, as the roots will go through them and so defeat the purpose for which they were made. I find the best mode to deal with such trees is to provide a solid basis beneath the trees, to have a border about 6 feet square and 2 feet deep, and to confine the old roots to this mass only; outside it may be added 2 feet of fresh border, into which the fresh young roots will run readily, which, with the roots it contains, should be removed annually in the early autumn months and be replenished with a similar compost for the ensuing season. These means are calculated to somewhat restrict the growth, accelerate the ripening of the wood, and provide the roots with the nutriment necessary to obtain a good crop of fruit and finish it off perfectly. The temperature in this house should range from 55° at night to 60° or 65° in the day, and 70° to 80° when sunny weather prevails.

### LATE HOUSES.

The disrooting and adding of fresh compost, if not completed, should not be further delayed. The trees should be cleaned, taking care not to injure any fruit if it be in an advanced state. See that the borders are made thoroughly wet at this season also. *G. T. Miles.*

### THE AURICULAS AT DIDSbury.

THESE are wintered in small cold frames, which may be considered "models" for the work. They are 3 feet wide, so there is no difficulty in attending to the plants, and they have a sharp pitch; the divisions separating the lights are stout and deep; as it is by an ingenious yet simple adaptation of these that ventilation is effected. There are in each two round holes, one at the upper the other at the lower end, and in which stout round pegs can be placed when the light is raised, and upon which the latter rests when air is necessary; hence, when it is only desirable to admit air from the top of the frame the top pegs are put in, and *vice versa*. When desirable that a current should pass over the plants all the pegs are put in; and a current of air passes between the light and the plants. Another great advantage is, the lights may be pushed up and down without disturbing the pegs as they easily slide over them: hence the great superiority over the old method of tilting the lights with blocks. The plants are raised near the glass upon boards, and they are the very picture of health. I should say there are nearly a thousand plants, mostly large, and some very fine indeed: for example, those of John Simonite, than which we have never seen better; the same may be said of Colonel Taylor, Prince of Greens, and indeed of all the leading varieties. The collection is remarkable, because it is enriched by the stock of the late Mr. Tom Mellor, many of whose selfs are turning out very satisfactory, Mr. Brockbank holding the entire stock of several excellent varieties, although such stock in some instances is very limited. I may mention Lord Rosebery (Mellor), which gained the premier award at the Manchester show last year as a red self of no mean rank; there are also Miss Brockbank, Cymbaline, Mrs. Heap, and others, very desirable and uncommon in their way, and there are others to follow, as active progress has been made in crossing these varieties with others, and the progeny will be watched with enthusiastic pride.

### LATE-FLOWERING CHRYSANTHEMUMS.

Much the greater part of the work which the raisers of new flowering plants set themselves to do seems to be in one direction—that is, obtaining varieties that will bloom earlier. No one is likely to object to the bringing into existence of varieties that will lengthen the blooming season of any desirable plant, whatever it may happen to be; but it might not unreasonably be urged that it would be better if the work, so desirable in itself, was more evenly directed—that is, to the obtaining of later flowering sorts that would come in after all existing kinds were over. This especially applies to Chrysanthemums, which from their natural

disposition to bloom during the late months of the year, and their adaptability for decorative purposes, cutting included, may be said stand unequalled to an extent that causes a blank when they are over such as other kinds of plants that succeed them only partially fill. Of late years many new sorts have been raised, and old ones hunted up, that come into bloom during the latter part of the summer, or even earlier, at a time when there is no lack of material in the way of other flowers to choose from. Independently of their being then unneeded, there is somehow or other a feeling attached to these early flowerers that they are before their time—forecasting prematurely the waning season, with its fogs and dreariness, which comes soon enough without any reminder. More, we suspect, through accident than design, there are in existence a few varieties of this useful flower that bloom after the time when the greater portion are over; but might not more be done in this direction by saving seed and raising from these late sorts? So that those who have not an unlimited amount of glass wherein to grow other things more difficult to manage might "cut and come again" during the early months of the year in the way that a supply of Chrysanthemums admits of. The work does not present any particular difficulty. *T. Baines.*

—We have lately received from Mr. G. Stanton, of Park Place, Hlenley-on-Thames, an interesting lot of Chrysanthemums. Without exception the flowers were good of their kind, especially so Meg Merrilies, Madame C. Andiguer, Ethel, Princess Teck, Baron de Prailly, and Grandiflora. These Japanese kinds predominated, and show how readily they adapt themselves to a course of retarding. The sender tells us that fully a fortnight will elapse ere the bulk of them cease to be objects of attraction; so that we find the blooming period of the autumn flowering section extending from October to the end of January.

## The Kitchen Garden.

### SEED SOWING FOR THE NEXT FORTNIGHT

PROVIDING a sufficient supply of young Cabbage plants do not remain on the autumn-sown beds to make a planting to succeed those set out in the autumn, some seed should now be sown, either in boxes in one of the houses, or on a gentle hotbed in a shallow frame. If sown in boxes they can be pricked-out in a frame when commencing to show the rough leaf.

### CELERY.

A pan of some white kind may now be sown, simply to obtain a few early unblanched heads for flavouring, as this is indispensable in the kitchen.

### CAULIFLOWER.

If a good stock of autumn-sown plants are not on hand, sow in boxes (near the glass) in heat, and prick out in a frame later on. The above remarks also apply to Lettuce.

### LEeks.

To obtain exhibition productions a pan of seed ought to be put in soon, these when large enough should be potted into "Long Toms" and gradually hardened off prior to planting out.

### SPINACH

For the earliest crop is better grown alone. Select a warm open position, and if the soil is adhesive and heavy fill in the drills with lighter soil, such as siftings from the potting-bench, or old frame soil; treated thus, it will germinate much better than if covered with cold heavy soil.

BEANS and PEAS as advised in last Calendar.

### GENERAL WORK: SEED BEDS.

Assuming that the positions of the most important crops have been decided upon, and that the ground has been prepared accordingly, a piece of ground fully exposed to sun and air should be set aside for the general seed sowing. A moderate light soil is preferable to heavy soil for the purpose of raising young plants free from club. Sprinkle it over with lime and soot in equal quantities prior to digging, which should be done with a fork, leaving the surface lying rough for the present.

### MANURE.

If the ground is in good heart none will be required,

but if it is somewhat poor, only well decomposed stuff should be added, and it should not be charged with strong animal matter. I shall say more about this later on.

#### RHUBARB.

To have a constant supply of roots for forcing we must divide the roots and make fresh plantations according to demand; every division should have a good bold crown. A plantation can be made at any time before growth commences, but the sooner the better. Plant on trenched ground, and if planted for lifting to force indoors 1 yard apart each way will be sufficient space, but to be covered and forced on the ground under pots, plant 4 feet apart from plant to plant, and 5 to 6 feet between the rows.

#### SEAKALE.

Any Seakale roots laid in and intended for the making of cuttings should now get attention. When the cuttings are made lay them in a shallow pit or well drained ground, and cover over with 3 inches of fine light soil; over this a little protection can be given in sharp weather only. Here they will form a callus and make good "sets" for April planting. This system of raising plants is decidedly quicker and better in every way than the old method of sowing seed.

#### ROOT STORE.

Let this be carefully looked over on wet days. Seed Potatoes should be kept lying thinly, and be exposed to as much light and air as possible, provided no frost can enter. This applies especially to late varieties. *G. H. Richards, Somerley, Ringwood.*

### FUNGUS IN LILIUM AURATUM BULBS.

YOUR correspondent, "W. J. M.," p. 57, is quite correct as to there being a Japanese fungus which attacks Lily bulbs first in the warehouses of Japan, and whose rapid development in the hold of the steamers on the voyage, fostered by the high temperature, has brought death to thousands of imported bulbs. It is the one great difficulty importers have had to overcome. If "W. J. M." will turn to pp. 209—213 of my *Notes on Lilies* he will find further information about this fungus, and the means used to destroy it; and if he will take up a Lily bulb affected by this rot, and keep it in a warm moist place at a temperature of 60° or thereabouts, he will soon have abundant evidence to submit to his microscope of the nature of this fungus. Importers now take special protection against this evil. "W. J. M." should in future, if he wishes to avoid this risk, make a point of buying either home-grown bulbs, or those that have been at least three months in the country, not newly imported bulbs. Of course he will have to pay a higher price, but he will find it cheaper in the end. In fact it is an open question still whether imported bulbs may not bring with them into the garden these objectionable germs, so as to infect other neighbouring bulbs. We import every year thousands of choice Japanese Lilies, but we do not offer them to our customers till they are safe, that is, till they have been with us so long in a cold frame that root-action has commenced, and the bulbs are as firm, sound, and heavy, and as free from all fungus germs as home-grown bulbs. In this way, and in this way only, can we obtain results satisfactory to ourselves and our customers. If "W. J. M." will pay us a visit we shall be happy to show him our bulbs and explain the process we use to de-vitalise the fungus germ. *Alexander Wallace, New Plant and Bulb Co., Colchester.*

—"W. J. M.'s" remarks with respect to the mortality which he finds amongst imported bulbs of *Lilium auratum* amount almost to an indictment against dry foreign bulbs. What is desirable to learn is whether his experience is general or only singular. When we read of the sales of these bulbs from year to year, offered as they are in enormous quantities, one is tempted to ask what becomes of them all? and "W. J. M." supplies a clue to the mystery, assuming that the mortality which occurs in his dry bulbs is general. At the rate at which *Lilium auratum* bulbs are put into commerce, this Lily should be as abundant almost as Potatoes, and as cheap. Of course, if they die largely, their comparative scarcity is explained. The points for consideration are, first, whether the bulbs suffer from drying; and, second, from imperfect packing in transit. It

would be strange if it were found that the bulbs suffered from some fungoid disease on arrival here, because it seems evident that they must have been perfectly healthy during the previous season. If it is found at home that rotting and keeping the bulbs in soil, and slightly moist through the resting period, are essentials to future health, it seems obvious that the cleansing the bulbs from soil, and permitting them to become comparatively dry, must be productive of evil. It would be of exceeding interest to learn the experience of large buyers of imported bulbs here, and especially of any who may grow them for market. Still further, some definite information as to the longevity of home-raised bulbs as compared with that of imported ones would be full of interest. It may be that only comparatively few bulbs are raised at home, and if it be so then it is to be deplored, and the more so if such are the most enduring. It would also be interesting to learn how long lived an *auratum* bulb may be. Soon after this Lily was introduced we read of some grand specimens, one of the finest having been that grown by Mr. Cross, at Melchet Park, some sixteen or more years since. Are there any such bulbs now to be seen, and if so what are the secrets of their special vigor and longevity? As it is well known that so many dried bulbs show the first signs of decay at the base, might not that disease or rot arise from the withering or decay of the stout fleshy roots always found on these bulbs when lifted in the autumn, and which it is so important should be well preserved? Again, "W. J. M." finds that his bulbs largely decay from the points of the outer scales downward. Does this decay arise from injury caused to the scales in the process of packing and in transit, and though it may not be apparent, yet suffice as soon as the bulbs are moistened to promote downward decay? It is doubtful whether the effects of such injury have been fully considered. *A. D.*

### EUCHARIS AMAZONICA.

IN continuation of this subject, I mentioned lately that I had got within sight of "game," but for some time before that occurred I had lost all faith in systematic cultivation as a remedy capable of arresting the progress of this consuming disease. I felt convinced, that whatever might be the cause, it must be sought in the bulb itself, and that a process of "disinfecting" would probably lead to better results than persistence in remedial cultivation, however carefully carried out. Baths were prepared of quicklime and water, soot and water, solutions of soft-soap and tobacco-water, Fir-tree oil and water, &c., and thousands of bulbs had their leaves and roots cut off and were cast into these baths and allowed to remain immersed from three days to three weeks, after which the bulbs were "laid in" in a pot set apart for them, and duly labelled. They soon began to grow, the first batch that started being those bulbs subjected to a lime-and-water bath, and the last to start being those that had been immersed in soot and water. We potted them in 48-pots, in batches, as the bulbs began to root, and after they had developed a couple of leaves on each plant—'twas a sight "fair to view" indeed!—enthusiasm began to usurp the place of sense: I had evidently made a discovery—took an extra glass of "toddy" at night, complimented myself upon my good luck, began to speculate as to patenting the process. A fortune's to be made! —'s patent devil-killer! Cost price, 1d. a gallon; wholesale, 5s.; retail, 10s. 6d. Agents in every town, customers everywhere! These pleasant little dreams are cut short by my better half's reminding me that the room is becoming unbearably full of tobacco-smoke. Smoke, indeed! it may inconvenience some unsympathetic mortals, but it is a tremendous neighbour of enthusiasm. However, "all is not gold that glitters," and as my plants began to get into a stage of growth from which I might expect flower-stems to show, I began to observe leaves on some plants becoming of a paler green colour round their edges, and ultimately it was clear that the old enemy and only suffered a check, but was not conquered. I tacked about, gave up the hydropathic treatment, cut down a lot more affected plants, and "roasted" the bulbs upon galvanised sheets in a hot dry vinery, and it was at this stage of experiment and enquiry when, tearing up some bulbs, scale after scale, that I came upon the

"game" of which I have spoken—an insect which in habit and appearance reminded me much of *Phylloxera vastatrix*. The ordinary cultivator of *Eucharis amazonica* will have observed at times red spots or eruptions on the roots and outside the bulbs of even the most healthy stocks of *Eucharis*. I have examined these ruptured spots very often, but until now never could make out the agency by which they were produced. I sent some bulbs to a friend, an enthusiastic local entomologist. He informed me that "the little insect was a species of *Acarus*, or mite," which he could not then determine—"that they were considered to act merely as 'scavengers.'" "Scavengers," indeed! I want to know whether these little pests were prosecuting their legitimate business when I found them all through the bulbs, and invariably in these little red ruptures. My friend was just going to Cornwall, for a holiday with a congenial "chip," said to be very learned in mites, and I promised to send some affected bulbs—which I did—but my friend occupied some fisherman's cottage on some remote part of the coast, and they never reached him, so that I lost the assistance of the mighty (for he has written a monograph on them) in mites. However, with the exception of a few plants that had been put under process, I had all the bulbs of *Eucharis* that I had reduced scale after scale as far as the red ruptures could be found. Many were spotted to the very heart, and were cast away; others reduced to the size of a horse Bean, washed, and sown in pots. Time only will determine whether these "spawn" will remain healthy. In my experiments with these bulbs I have invariably found that the small leafless offset bulbs give better promise of renewed health than the main bulbs, and this fact is worth bearing in mind by those who love experiment. My experience leads me to the conclusion that the little insect—whatever it be—is the real cause of *Eucharis* disease, either by extracting the juices which nourish the plant, or by producing upon the nourishing elements something analogous to "blood poisoning," and, if I might be allowed to make a recommendation to "A. E." and all such cases, I should say—"Clear out your diseased stock; get a new start, and be sure it is from a clean stock;" and he will find it time saved and economy in the end. I know that diseased stocks of *Eucharis* flower, and flower freely; but with me it is a case of Hamlet's father—"Look on this picture—and look on that." Had I the ear of Her Majesty's Government I could suggest some valuable work for them to engage in. We pay thousands upon thousands every year to uphold establishments presided over by very scientific men, possessing every tool and facility for unravelling the aberrations of plant life, and yet how little advance has been made in vegetable pathology. *Z.*

—In reference to the culture of this much esteemed and free-flowering Lily I may be allowed to say that I have never experienced the slightest difficulty in growing and flowering it. Indeed we have plants of *Eucharis amazonica* in flower more or less throughout the year, and some of them have not been disturbed at the roots for several years—the last time they were potted in a compost consisting of three-parts good fibry loam, and one of pulverised cow-dung, charcoal and fine lime rubble. In potting the bulbs, which were sized at the time and kept close to the surface, the soil was pressed moderately firm about the roots, which were placed in their natural perpendicular position. The bulbs so potted were then placed on a retaining wall in a Pine-stove, and watered with tepid water to settle the soil about the roots. After this they received no water (excepting a sprinkling overhead morning and afternoon when the house was being damped with the syringe) until the roots had pushed well into the soil, which they did freely. Tepid liquid manure was afterwards given to the roots, with the result that by the end of July (four months from the time of potting) these plants had filled their pots with roots, and at the same time developed plenty of large dark green leaves of firm texture. Water was then withheld from the roots, when, after an interval of about three weeks' rest, most of the bulbs sent up a flower-spike, and then tepid liquid manure was again given to the roots—continuing the application for a few weeks' after the plants have done flowering, when water is again withheld from the roots until the flower-spikes appear, when it is again given. Thus treated this beautiful Lily, providing there are sufficient plants to be operated on in small batches—say from three to twelve plants—at short intervals—may be had in

flower all the year by giving it ordinary stove temperature. *H. W. W.*

— Just allow me to encroach on your space to make a remark or two in reference to the two cases you mentioned I had overlooked in last week's issue. I hold that the rule applies to all plants in pots, and even such great absorbers of moisture as Orchids should not be watered until the last watering is pretty well exhausted by evaporation and absorption. Of course if the plants of *Eucharis* were plunged in such material as sodden cocoa-nut fibre, the soil in the pots was certain to get too wet, and cause injury to the roots, but that would be the result of mismanagement, and although not a disease in itself it would develop a diseased condition of the entire plant. Plants in well-drained pots in stove heat can be watered every twenty-four. I do not plunge mine in the tan-bed in which I force them, but place them on the surface, and they do as well as it is possible for any to do. I am very sceptical about the second case. I syringe mine in the stove twice a day, and I may say it is covered with creepers, and it does them no harm. *A. Macdonald, Cheddle Royal Asylum Garden.*

I was surprised, on reading Mr. Macdonald's reply to my remarks in your last issue, that he certainly had not paid much attention while he was reading, or he would have seen that I did not give it as my opinion that there is a disease in the *Eucharis*, neither did I say anything about red spots. I have seen *Eucharis* which had red spots, and they were healthy plants compared to mine and others I have seen and read about. Certainly my plants have never been in a hot dry atmosphere, for if I err at all, as we all do sometimes with plants, it is not on the dry side. I gave an accurate account of the treatment of my plants from the time of starting them till the end of the year, leaving it to your readers to discuss through your columns whether or not the appearances are the result of a disease. I have had visits from cultivators of *Eucharis*, who saw my plants last April, and since this discussion began, and they told me they had never seen a finer or healthier lot of young plants. About that time they were moved out of that house into the one under the *Stephanotis*; and there they became affected as was stated in my former letter, saturated day after day with the syringe, and watered too. It was then they began to look sickly, at the same time I have a vague impression of having introduced amongst them some unhealthy specimens. But to return to the red spots. I should like to explain to Mr. Macdonald it is not red spots, but a rust beginning on the extreme edges of the leaves, and travelling towards the leaf-stalk from each margin for about  $1\frac{1}{2}$  inch; the leaf then withers up and the stalk gets flabby and eventually rots. My own opinion of it agrees with that of Mr. Lucas, that is, they are required to furnish too much bloom, no one seeming contented with natural results; and in trying to get two blades of a *Eucharis* where only one grew before, the plant fails to respond and eventually succumbs. I hope with Mr. Lucas now that the subject is started it will be thoroughly investigated, and that all who have diseased plants will describe their treatment; believing, as I do, that there is as much learned from people's failures as from their successes. *W. B.*

## METHOD OF KEEPING CUT GRAPES.

SINCE the inexpensive and excellent method of keeping late Grapes was introduced it has already necessitated at many places the conversion of some existing building for this purpose, which nowadays is properly termed the Grape-room, and which locality at this particular period of the year forms an interesting sight, when the produce of several vineries is brought together and arranged for easy inspection. As the growing of keeping Grapes extends these places will doubtless be more and more required, and on this account it may not be amiss to record any information which is calculated to be useful to others, who, in all probability, may have to provide accommodation for the same purpose.

For several years after the bottling process was first introduced I was in the habit of keeping late Grapes in the most suitable place I had at command, but from such causes as dust, sunshine, and others, that were inimical to the proper preservation of the fruit, I determined to have an appendage in the way

of a Grape-room, and made one, with which I am satisfied, as fully answering the purpose for which it was intended. The building selected is part of a range of tiled sheds, having a north aspect; its dimensions are 17 feet long, 10 feet wide, and 11 feet high; a ceiling was constructed beneath the roof, into which two wood ventilating flaps, 2 feet by 11 inches wide, are fixed; these, in connection with the windows in front of the building, form the means of ventilating.

### HEATING.

If but little heat is needful under ordinary circumstances for keeping late Grapes fresh and plump, yet it is well to have the means of driving out dampness in case of any excess being present; ours is furnished by means of a  $1\frac{1}{2}$ -inch flow and return pipe, with a valve inserted to regulate the heat, being run along the front and two sides of the building; these pipes are connected with a neighbouring boiler, and meet the requirements very satisfactorily.

### THE RACKS.

The accompanying sketch (fig. 23) will convey an idea of the plan adopted. The upright pieces are deal, 3 inches square; these are inserted and fixed flush with the walls, the racks consisting of two  $\frac{3}{4}$ -inch planed deal boards 9 inches and 10 inches wide—the former is placed at the top; these are nailed together,

FIG. 23.—GRAPE TROUGHS.

and are supported by angle iron brackets, 7 inches each way by 1 inch, made to fit, and fixed to the uprights in the wall. Circular holes 4 inches in diameter and 8 inches asunder from centre to centre form the receptacles for the bottles, which are partly filled with water and a few bits of charcoal added, into which the shoot, with the bunch attached, is inserted. The means by which late Grapes can be kept in excellent condition until the middle of May is an advantage in many respects, inasmuch as it does away in some measure with very early forcing, always an expensive operation, and one also under any conditions most exhausting to the Vines, and frequently ending with the results not altogether satisfactory. *G. T. Miles, Wycombe Abbey Gardens.*

## Notices of Books.

**Bulbs and Bulb Culture.** By D. T. Fish.  
L. Upcott Gill.

The term bulb is here used in an elastic sense, and is made to comprise in addition to bulbs proper, Anemones, Crocuses, Gladioli, Cyclamen, Ranunculus, Irises, Dahlias, Gloxinias, Alströmérias, Pæonies, Oxalis, Arums, Tropæolums, Mirabilis, &c. A short description is given of each of the principal species and varieties, and full directions for their culture given. So full are the details, that we fear the amateur may be alarmed at their appearance. For instance, under Lilies we find nearly thirty closely

printed pages of small type without break or division of any kind. The matter is excellent, but the form would be calculated to deter all but the most enthusiastic amateur. Side headings, devoted to soil, culture, seedlings, hybridisation, diseases, &c., would be an immense boon. Nevertheless, even as it is, the reader will find within the pages of this volume a perfect mine of practical information which it would be if not impossible, at least difficult and time-consuming to find elsewhere.

## HOME CORRESPONDENCE.

**Asplenium germanicum.**—The communication by Dr. Lowe, of King's Lynn, regarding the above Fern is to me of special interest, as the following instances will show. Some years ago a single specimen of *A. septentrionale*, which was found near here on the Snowdon range, was brought home, potted, and placed along with other Ferns in an unheated greenhouse. Gradually the young fronds developed into those of *A. germanicum*, and the plant, half of which is now in my possession, would to an ordinary observer be at once classed as that species. On closely examining this plant to-day I found fronds intermediate between the typical *A. septentrionale* and *A. germanicum* (none of the former now exist), several of which approached very closely in form the illustration given by Dr. Lowe. I can, so far, corroborate the late Professor Balfour's statement, that *A. septentrionale*, at least, has been found in company with a *A. Ruta-muraria* or at no great distance from it, as two years ago I saw in this country three remarkably fine specimens of *A. septentrionale* growing on an old wall and almost in company with *A. Ruta-muraria*. I may also state that at less than 100 yards from where these three plants grow several specimens of *A. germanicum* were at one time found—a fact which can be verified by a most reliable authority. When examining an old wall near Bangor on which almost numberless specimens of *A. Ruta-muraria* occur, I was agreeably surprised to find one plant bearing fronds of both *A. germanicum* and *A. Ruta-muraria*, the latter in greatest quantity. With no little difficulty I removed the plant from the wall but with such a miserable root that my best attempts at cultivation were of no avail. Fronds were, however, preserved which have more than once passed off as those of *A. germanicum*. The above cases, which have come under my own notice, combined with information received from various sources, have but added fuel to the flame of an opinion I have long entertained, and now publish with an amount of reluctance, viz., that two of the three plants—*A. germanicum*, *A. septentrionale*, and *A. Ruta-muraria*—are but forms of one species. *A. D. Webster, Llandegai, Bangor, North Wales.*

**The Report of the Apple Congress.**—I note the editorial remarks in reply to Mr. Divers (p. 90), which are calculated to convey a wrong impression if not explained. It is quite correct that Fellows of the Royal Horticultural Society may obtain the report on application. It is now the property of the Society, having been handed over to it by the committee. There is no arrangement or understanding to supply exhibitors, although in one way or another the greater number of them have received copies. Mr. Divers was not an exhibitor. The question that naturally arises is this—Who is to bear the expense? I have no copies at my disposal, but I shall be pleased to forward any application I may receive to the proper authorities. I was pleased to undertake the work of preparing the report, and my recompense is in seeing that my labours are not altogether unappreciated, and that a decided impetus is given to the cultivation of Apples—the most important fruit grown in this country. *A. F. Barron.*

— I was pleased to see W. H. Divers' letter in your last issue, and agree with his remarks. I sent a collection of Apples to the Congress, and expected a copy of the report when issued, if not free, at a reduced price, and as I could not afford to go to London expressly to see the exhibition I was naturally anxious to see a copy of the report; but to do so I had to forward 2s. 9d. to the publishers, although at the same time my employer was a Fellow of the Royal Horticultural Society, and did not receive a copy. I do not begrudge my labour, but it would have been a compliment to

have forwarded a copy of the report to all exhibitors, which would have been appreciated, particularly by those who had not the privilege of seeing the exhibition. If it was to be had for the asking, why was it not mentioned in the gardening Press? *Northern Exhibitor*.

**Ensilage.**—When paying a Christmas visit to Mr. McIntyre of Gwydyr-uchaf, near Llanrwst, I had the satisfaction of not only seeing the working of his patent silo, but also of testing the quality of the ensilage produced. This, I may say, is in every way satisfactory, the ensilage being of excellent quality and a beautiful colour, indeed in this latter respect it is superior to several other specimens sent from silos in the immediate neighbourhood, and with which I had the opportunity of comparison. In Mr. McIntyre's invention, pressure is obtained by means of water or other liquids which is conveyed to tanks placed above the crops in the silo, thus doing away with the expensive method usually adopted of placing stone or other weights thereon. The water is conveyed to the tanks by means of gravitation, and can, when required, be discharged by pipes or troughs from the bottom of the tank or over the top by syphons, pumps, or elevators. Several horses and cows belonging to Mr. McIntyre prefer the ensilage to well saved hay, as several experiments clearly proved. A cubic foot of the ensilage weighs 45 lb. *A. D. Webster*.

**Cauliflower, Veitch's Early Forcing.**—Your correspondent, Mr. Horsefield, has done well in praising the good qualities of the above fine variety, and which, from experience, I can fully endorse. I consider too much cannot be said in its favour. I would likewise recommend that useful vegetable, Veitch's Self-protecting Autumn Broccoli, which comes in when the Cauliflowers are done, and lasts till February, its foliage thoroughly protecting the head from frost. *W. C. Leach, Stamford*.

**Senecio elegans.**—Why are these called American Groundsels? Can it be that at some time or the other they were improved in America, and came to be known as American Groundsels? Certain it is, they are not natives of America, but of the Cape of Good Hope. It would seem that the single purple and single white, together with the double form of the latter, and the double red, were introduced from the Cape about 1700. At one time they were classed among the half-hardy annuals, now they find a place among the hardy annuals; and seed sown in the open ground in a good light soil will produce plants that flower freely the same season. In seed lists they will be found under the head of *Jacobæa*, probably because of the relationship of the common *Senecio jacobæa* of our fields and roadsides. Twenty years ago "*Jacobæas*" were looked upon as useful bedding-plants, and found a place in lists of bedding-plants in the same way as *Pelargoniums*, *Calceolarias*, &c. Cuttings struck in August, and also in heat in early spring, make capital plants, and especially so for pot culture for the greenhouse, growing into nice bushy specimens and blooming freely, and propagated plants made excellent subjects for bedding, coming into bloom before plants raised from seed; and in addition to being less vigorous bloom most profusely. The varieties of *Senecio elegans* are now among neglected plants—more's the pity. It is worth while paying a visit in their season to Messrs. Carter & Co.'s seed grounds in Essex, if only to see the masses of *Jacobæas* in all their beauty. There are two types—the older and taller-growing one in good soil reaching a height of from 15 to 18 inches, and a more modern dwarf type not more than 8 or 9 inches. Then there is a good variety of colour, the crimson-purple, rose-white, and flesh-coloured being the best; and there are as many varieties almost to be found among the dwarf strain. Let any one take the dwarf strain in hand, raise some from seed, and then select the best for propagation by means of cuttings. Some of the side-shoots can be taken off as early as July and August, put into cutting-pots in a light sandy soil, then, when rooted shifted singly into small pots, kept in cold frames until there is danger of a check from frost, and wintered in a warm frame with *Cinerarias*, or on the shelf of a greenhouse. In spring they require repotting as one would *Cinerarias*, and grown on similarly, stopping the leading shoots if large and bushy specimens are wanted. To many gardeners they are unknown, by some almost forgotten; but as one of the characteristics of the present day, that old plants are revived and received into the sphere of popu-

larity, there is no reason why the *Jacobæas* should not experience such a revival. Many amateur gardeners spend their time in cultivating plants not nearly so well worthy their attention as this old and useful plant. *R. D.*

**Seakale Growing and Forcing.**—Will some of your correspondents say if they find light or strong soils influence the growth and flavour and crispness of Seakale? Ours is a light sandy soil, and my employer complains of ours being bad flavoured, and a little stringy. I force the first batch in the Mushroom-house, later on out on beds. *E. T.*

**Lapagerias in the Open Air.**—Mr. Boscawen is to be envied in having *Lapagerias* in the open air, but those less favoured than he is by climate will do well to pause before venturing their plants out, or they will most likely lose them, for here, in the east of England, they will not live in sheltered spots without protection, as I have tried them again and again. We have one now in our hardy fernery, where it has been some years, but though taken every care of by covering it during winter, its progress is slow. It may be remembered that a shoot found its way out on to the roof of one of the houses at Gunnersbury Park, in which it was growing, and though in a good position there from lying on the glass with warmth under, it succumbed to the frost. If plants would only live out they would form lovely objects to clothe trellises over doors, but except in Cornwall, the Scilly Isles, or the Isle of Wight, I fear the *Lapageria* is not hardy enough. *J. S.*

**A Hint to Young Gardeners.**—I think your correspondent, "F.," p. 726, vol. xxii., could not have brought a more interesting and useful subject to the notice of young gardeners than drawing. I can assure them that I have spent many an hour in the evening in drawing that perhaps would have been spent far less usefully. I might further add that it has proved of great advantage to me, as it has enabled me to lay plans before my employers that I could not otherwise have done. When I was a young man in a botany I had an opportunity of attending a drawing-class at the village school. At the commencement of one winter I took up practical geometry and freehand drawing. In the following March I was examined in the second grade in both subjects by a Government inspector, and got "first-class" in each. Now I mention this to show others similarly situated what can be done, and to encourage them to "go and do likewise." After that I took up perspective and model drawing, all of which I have found very useful—geometry and perspective specially so. Instead of commencing with plan drawing, as "F." advises, I would strongly recommend "Young Gardener" (see p. 790, vol. xxii.) and others wishing to take the matter up, to get Gill's *First and Second Grade Practical Geometry*, which will cost him 6d., a box of instruments for 1s. or 1s. 6d., that will answer his purpose until he gets better acquainted with his work, a drawing-board and T-square (which any carpenter will make for him) will be all that he requires, except paper. The instructions are so plain and simple that any one can understand them, and I feel sure that it will prove highly interesting and useful to all who think well to take the matter up, and they will find, when thoroughly acquainted with geometry, plan drawing will be comparatively easy. *J. H.*

**The Age of the Victoria regia.**—I see it is stated in the *Gardeners' Chronicle* that the Victoria regia on one occasion lived over two years, and Mr. Williams, in his book on greenhouse and stove plants records of the Victoria that it has only on one or two occasions lived two years. Our plant here has lived four years, and has produced both leaves and flowers more than any other I have seen or read of. I, therefore, and others would doubtless like to know which was the oldest Victoria regia that has ever been known in England, as we are under the impression here that ours are the oldest on record. *C. Penford, Leigh Park, Havant*.

**Amateur Dealers.**—We are pleased to see "Nurseryman's" article in the *Gardeners' Chronicle* respecting gentlemen's gardeners turning nurserymen, seedsmen, florists, or rather the gentlemen doing it under cover. They certainly are now going too far, as they grow all they possibly can for sale, and cut the price down of legitimate tradesmen who have to

pay rates, income tax, and live out of their produce. We shall be glad to see more correspondence through the *Gardeners' Chronicle* on this point, as it will be doing the trade great service. *W. & J. Brown*.

—I observed in your valuable paper of December 20 an article on what the National Rose Society has in its byelaws headed "What is an Amateur?" You are perfectly right in saying you are afraid their decision will lead to disputes. It has done so already, and it is the Society that will be the loser. I would like to see the amateur now-a-days say No to a good offer. There are many kinds of amateurs. One disposes openly of what he does not require of his produce, and for that he is called, not an amateur; another disposes of his produce privately, and he is an amateur, in their eyes all right. Surely the line should be placed in a proper position. It would confer a very great favour on many if the nurseryman florist amateur were definitely and clearly defined, which is a matter not very clear to many of the committee of the National Rose Society. *What is an Amateur?*

**Pink, Tom Thumb Scarlet.**—This gem of the Pinks is now very scarce, and probably in a few years will become extinct. It is of very slow growth and difficult to increase, making but little grass. There are five plants of it in the collection at Floore, where it does well. *Dianthus*.

**Brussels Sprouts.**—"Ebor" (p. 59) asserts that this has been an unfavourable season for Brussels Sprouts, but though it may have been so with him I do not think it has with others, as I do not remember seeing better vegetables than are to be met with almost everywhere this winter, for the growth of all the Brassicas during the late summer and autumn was rapid. Why so many fail in growing good Brussels Sprouts is through not sowing early enough, as it is impossible to get good results without strong plants, and these can only be obtained by starting them in March, and planting them out in deep well manured ground as soon as they are large enough to be moved. To raise the first batch we generally sow on a gentle hotbed, and prick the plants out afterwards under glass, which is done in light leafy soil, as then they lift with good balls and may be transferred to the open quarters without feeling a check. Some noted growers of Brussels Sprouts sow them where they are to stand, and thin out so as to leave them at the required distance apart, which is a good plan, as under such treatment the plants get no roots broken, but start right away from the first. In beds, sown thickly as they often are, the plants become drawn, and when in that leggy condition they remain weaklings for some time, and never make Sprouts low on the stems. The finest lot I have ever seen are those where the rows were wide apart and Potatoes grown between, which system of management benefits both crops, as they get much more light and air than they do planted in the ordinary way. *J. S.*

—Your correspondent "Ebor" in last week's *Gardeners' Chronicle* will find that the so-called disease is brought about by the plants being infested by fly, or as the market gardeners call lousy—a complaint that has been very common during last summer. The fly or louse attacking the plants when young and the Sprouts small, the young leaves are thereby damaged, and as time goes on and the Sprouts get matured and hard, the leaves first attacked begin to decay, more so after rain and hard frost, and give out a very offensive smell, rendering many of the Sprouts unfit for use. But I have always found that Sprouts planted early in the season, and that have not received any check from the time they were sown, and put out on a good brake of ground, generally escaped the louse—A failure in not having good Sprouts being, that they were not sown early enough; in fact if you have a good strain of Brussels Sprouts, the sooner you sow them the better. I would mention that Colewort Cabbage, which should be planted early in July, are often attacked with the louse, and when fit for use are found damaged in the same way as "Ebor" describes his Sprouts. *W. C. Leach, Stamford*.

**Effects of the Past Dry Autumn.**—In hot countries where rain falls periodically and only at long intervals the marked effects of an alternate dry and a saturated condition of the soil are very evident; immediately the immense downpour comes deeply moistening the parched earth and charging the heated atmosphere with vapour to saturation point; under

these influences the rush of growth in plant life is such as to be scarcely conceivable by the inhabitants of cool climates, where the exciting effects of rapid transitions of this kind in the weather are unknown. The natural result of this quick development is that the season's growth is quickly completed; after this a stop is put to shoot extension by the exhaustion of moisture in the soil and its proportionate absence in the atmosphere, brought about by the dry rainless period that follows the deluging rainfall. Then comes stagnation, which in its turn extends for a longer or shorter period, according to the nature of the climate of the particular country. In parts of England, where the exceptional drought of the past summer and autumn was greatest, here was seen something of the influences which an over-dry condition of the soil annually exerts on plant life. The fine warm autumn through which we passed had not the effect of forwarding the growth of plants that usually start early into activity to near the extent that generally occurs in a mild autumn. Snowdrops, Crocuses, Scillas, and others, first to greet the dawning year with their leaves pushing through the soil, are backward. Many shrubs and trees that usually by the prominence of their buds at the commencement of the year show the effects of a protracted summer, are now small and motionless; fruit trees especially, as also bush fruits, are in this state—a condition, happily, which conduces in no slight degree to the chances of a favourable blooming time, which, needless to say, is indispensable to a fruitful season. *T. Baines.*

**Foster's Seedling as a "Stock."**—In reply to "H.'s" query as to whether Foster's Seedling Vine was a suitable stock for inarching upon, my experience leads me, without the least hesitation, to say Yes. I may mention Grapes (Maresfield Court) produced by the above union were awarded 1st prize at Reading and Crystal Palace shows, August, 1881. *E. Crump, Ranelagh Gardens, Leamington.*

**Cucumber Growing.**—Thinking probably Mr. Longthaw would communicate to the *Gardeners' Chronicle* the information asked for by your correspondent, "F. B. T.," respecting his (Mr. Longthaw's) method of Cucumber growing, I did not deem it prudent to reply at once to the observations made by the same correspondent on this subject respecting myself, but as no article has appeared in two recent issues of the *Gardeners' Chronicle* I think it my duty now to reply. In the first place I must ask "F. B. T." to read with more care the article of Mr. Longthaw before he criticises mine, as the question asked was for the average per plant, and not per square yard, as "F. B. T." seems to think; and he also states I was less successful as a grower than Mr. Longthaw by just 20 per cent. I suppose this is based on the average per square yard. Now I am one amongst many others who greatly object to this method of calculating the success of a Cucumber grower. For instance, should I plant a new vine with Cucumber plants (as I frequently have done) with a rafter of 18 or 20 feet, and get what would be termed a good crop of Cucumbers if they had been grown in a 13 feet span Cucumber-house, but taking into consideration the dimensions of the viney the crop would be insignificant. For I contend that if Cucumber plants are properly pruned and attended to they ought to cover a space of about 6 or 8 feet, that is, 3 or 4 feet on each side of the rafter. Those I grew to produce the average of over nine dozen did not exceed 5 feet in height, as my then employer can testify. *Alfred Bishop, The Gardens, Abbotsford, Burgess Hill, Sussex.*

**Selecting Potato Sets.**—There is a good deal in this, much more than people imagine, and one reason of Potato exhibitors growing such fine and handsome samples is owing to the care with which their planting sets are selected. The champion exhibitor of the season—Mr. J. Hughes, of Eydon Hall Gardens, states that when he proceeds to select the sets he intends to plant he chooses them according to the variety; if it is a weakly growing variety, good sized tubers are put on one side for planting; if the variety be a strong growing one, medium-sized sets will be selected, and these are cut in two at planting time, all the eyes being removed but one. In the case of varieties of medium growth, medium-sized tubers are also selected, but these are planted uncut, as in the case of the varieties of weakly growth, all the eyes being removed excepting those which Mr. Hughes

denominates the crown eyes. The planting sets are selected as soon as the Potato crops are lifted, they are then put upon shelves in a cool shed; care is taken to select sets of the best shape. Whether this helps the production of handsome tubers or not, Mr. Hughes is not prepared to say, but he adopts the practice on the ground that good-shaped tubers may just as well be planted as ungainly ones. *R. D.* [The fine samples seen at exhibitions are the produce of kinds that are too often quite unfit for the tables, such exhibitions proving a snare to those who do not know: there are Potatoes for eating, and others that are fit to please the eye only. *ED.*]

ROBERTSON v. RALSTON AND OTHERS  
ET E CONTRA

*Bowling Green Dispute at Campeltown, Argyleshire.*—This action, with the consent of both parties, was raised in the Sheriff Court of Ayr, and after several hearings before the Sheriff Substitute the case was remitted by consent of both parties to Mr. James Anderson, Meadowbank Nurseries, Uddingston, the Sheriff appointing Mr. Anderson judicial referee, and the following are his findings and notes, which sufficiently explain the nature of the case:—

In terms of your Lordship's remit of December 5, 1884, I made a personal inspection of the bowling-green at Campeltown; and after taking evidence of parties concerned in conjoined actions, and hearing procurators, find as follows:—

(1.) That in respect to the items in specification under the heading "stone bottoming," "engine-ashes bottoming," and "sand bottoming," that they have not been put down by the contractor in uniform layers in terms of specification, but that the committee or their inspector, or both, homologated the alterations while the work was proceeding.

(2.) That the item in specification under the heading of "turf" is not satisfactory, a part of first cargo, and nearly the whole of the second cargo, being wet when laid, and overheated in transit or in bulk on or about the premises, consequently the turf during the season contracted, and the grasses died, mainly from want of forethought and attention on the part of the contractor, and in part from not being watered when the turves were laid.

(3.) The extra items charged by the contractor have been mainly due to the interference, and have had more or less the tacit sanction, of the committee.

(4.) Find, on the whole, that on the contractor supplying and putting down on the grounds adjoining the Good Templar's Hall 500 square yards of Irvine turf, cut in terms of specification, that the committee pay him a balance of £84 8s. 11d. sterling, being the difference between items of specification amounting to £190, together with extras of £29 8s. 8d., and the sums paid on account either to or for the contractor.

(5.) Find each of the parties liable to pay their own expenses and half fees and costs in the conjoined actions.

(Signed) *James Anderson.*

January 14, 1885.

**NOTE.**—This contract from beginning to end has not been conducted on business principles. The contractor draws out his own specifications, the committee accept them unconditionally, and the work is little more than begun before extra excavation is suggested by the contractor, and permitted by the committee, and consequently additional expenses incurred.

The committee may have considered if the contractor sold the sand excavated beyond the cubical dimensions of what was scheduled, he was held bound to replace with a material of a satisfactory character, but there is no stipulation by letter or otherwise in evidence to that effect.

Then as to the respective layers of stone bottoming, ashes and sand, while the committee and their inspector declare in evidence that they were all along dissatisfied with the work as being disconform to specification, they not only allow it to proceed, but aid and abet the alterations, and latterly do a considerable portion of the foundation work during the contractor's absence.

As to the "rubble bottoming," which was specified to come from "Weir's Quarry," there seems to have been an abundance, but of a more costly character than the contractor had estimated for; and the committee, instead of exacting, as they might have done, for bottoming of this quality, conjoin to permit the contractor to break through this item of the specification, and go along with him to places at much greater distance to get

the requisite quantity, which appears according to evidence to have been of a very indifferent quality throughout. Therefore, in so far as regards the foundation work of the bowling green, the committee have, no doubt somewhat unwisely, homologated the doings of the contractor, and consequently are entitled to pay him for the several extra items charged in his statement of account.

The "turfing" is exceedingly unsatisfactory. The first and second cargos of turf particularly had been stowed away in the holds of the respective vessels along with other goods. The turves appear to have been shipped in a wettish condition, fermentation to a greater or less degree ensued, most of the grasses perished and what little life was left was not conserved as it ought to have been. Moreover, the turf, if placed at all in a rademanlike manner, closely fitting together at first (which looking to the green as it stands now is somewhat open to doubt), would never have contracted to the extent of each layer being separate on a moist winter day to the extent of a full inch throughout unless they had been thoroughly saturated when laid. No doubt, judicious sanding, watering, and rolling, together with close shaving or mowing from the month of July, when it was so-called finished, to the end of October, would have helped appearances much, but nothing has been done. What was both the contractor's and the committee's business to correct remains uncorrected. It is not denied that the committee through their convener or inspector ordered and paid of their own accord for the watering of the first portion of the turf when laid. By doing so they interposed authority and assumed a responsibility which generally belongs to the contractor, at least until the work is finished, and consequently the referee cannot rid them of a portion of the onus and its consequences of the bowling-green being in the plight that it is.

The award must therefore strike at both parties, the contractor to supply the 500 square yards of turves same as specified, 12 inches wide, by 14 inches by 2 inches, and the committee to engage their own man and provide the funds for the laying of the same and finishing it. *J. A.*

#### EDINBURGH BOTANICAL: Jan. 8.

The third meeting of the Society for the session was held at 5, St. Andrew Square, Professor Dickson, President in the chair.

##### PALMS.

Mr. Lindsay gave notes on some of the large Palms at present growing in the Palm-stove at the Royal Botanic Garden, Edinburgh, a portion of which will appear in our columns next week.

##### PYTHIUM ON DAHLIAS.

A note was communicated from Messrs. Owen, Gorey, Ireland, on "The Occurrence of *Pythium De Baryanum* on the Roots of Dahlias." The fungus at first appeared as brown patches, which gradually spread into the substance of the tuber. When microscopically examined it was identified by Mr. Worthington Smith as the above form. It was noticed that the cells invaded by the fungus hyphae were filled with bodies exactly resembling sphere crystals of inulin, while those in the normal condition had liquid contents.

##### SAPROLEGNIA.

Dr. Macfarlane exhibited and described specimens of a *Saprolegnia* from the body of a blackbird found floating in a water-cistern. The fungoid growth on the submerged part of the body was wholly zoogonidial, while the portion immediately above water was oogonidial. From several experiments subsequently made, he considered that the presence of the two generations under the above conditions was frequent. He drew attention also to the excellent results obtained by preserving such fungi in chrom-acetic acid, the microscopic appearances remaining quite as in the fresh state.

##### NEPENTHES, &c.

Dr. Macfarlane exhibited pitchers of *Nepenthes* and *Heliamphora nutans* received from Messrs. Burbidge and Veitch. The *Nepenthes* included *N. villosa*, *Edwardsiana*, *Harryana*, *Rajah*, *sanguinea*, *Norihiana*, *cincta*, *Lowii*, and *bicalcarata*. He mentioned that in *N. Lowii* the digestive glands at the bottom of the pitcher were so large and densely arranged as to resemble a piece of shagreen. In *Heliamphora nutans* he pointed out a very striking resemblance in the young state to pitchers of *Sarracenia rubra*, this being departed from more and more as the pitchers became older.

##### THE WEATHER AND THE PLANTS.

Mr. Lindsay gave a report on vegetation at the Royal Botanic Garden, Edinburgh, for December, 1884. —Frost was registered on twenty mornings during the past month of December, indicating collectively 88°; during the same month of 1883, 22° only were registered. Although frost has thus been pretty constant throughout the month, yet it has not been very severe at any particular time, the lowest point reached being 12° of frost. On the 23d more or less frost occurred every night from the 15th till the end of the month. A slight fall of snow took place on the evening of the 16th, which had not altogether disappeared by the end of the month owing to the recurring frost at nights. The highest day tem-

perature was 50°, which was registered on five occasions between the 6th and the 14th; the lowest was 29° on the 22d of the month. The lowest night readings were on the 22d, 22°; 23d, 20°; 26th, 22°; 29th, 24°; 30th, 27°; and the highest morning readings were on the 3d, 44°; 7th, 46°; 11th, 43°; 13th, 46°; 14th, 45°. The following six species of plants came into flower, on the rock garden, during the month, viz., *Crocus byzantinus*, *Helleborus niger angustifolius*, *H. orientalis*, *H. albicans major*, *H. purpurascens* var.; *Hepatica triloba*, as having flowered during the past year. At the meeting of the Society on January 10 last, Mr. Lindsay exhibited flowers of fifty-three species of plants which were gathered out-of-doors; to-day only twenty-six species could be found, none of which are typical spring flowers.

LONDON: *Atmospheric Pressure.*—During the week ending January 17, the reading of the barometer at the level of the sea decreased from 29.06 inches at the beginning of the week to 28.91 inches by 9 A.M. on the 11th, increased to 29.72 inches by 3 P.M. on the 13th, decreased to 29.71 inches by midnight on the same day, increased to 29.99 inches by 9 A.M., and decreased to 29.98 inches by 3 P.M. on the 15th, increased to 30.06 inches by 9 A.M. on the 16th, decreased to 29.99 inches by 3 P.M. on the same day, and was 30.11 inches by the end of the week.

The mean reading of the barometer for the week was 29.76 inches, being 0.20 inch lower than last week, and 0.15 inch below the average of the week.

*Temperature.*—The highest temperature in the shade in the week was 44°, on the 11th; the highest on the 13th was 35°. The mean of the seven high day temperatures was 38° 4.

The lowest temperature was 29° 5, on the 13th; on the 11th the lowest temperature was 37° 1. The mean of the seven low night temperatures was 31° 6.

The greatest range of temperature in one day was 8° 5, on the 15th; the smallest was 5° 5, on the 13th and 14th. The mean of the seven daily ranges was 6° 8.

The mean temperatures were—on January 11, 40° 1; on the 12th, 33° 1; on the 13th, 32°; on the 14th, 33° 2; on the 15th, 34° 6; on the 16th, 35° 4; on the 17th, 34° 9; and these were all below their averages (excepting the 11th, which was 3° 8 above) by 3° 3, 4° 4, 3° 3, 1° 9, 1° 3 and 1° 9 respectively.

The mean temperature of the week was 34° 8, being 2° 7 lower than last week, and 1° 8 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun

was 67°, on the 11th. The mean of the seven readings was 51° 7.

The lowest reading of a minimum thermometer with its bulb placed on grass was 20°, on the 13th. The mean of the seven readings was 22° 8.

*Rain.*—Rain fell on five days to the amount of 0.25 inch.

ENGLAND: *Temperature.*—During the week ending January 17 the highest temperatures were 51°, at Plymouth and Leeds, and 49° 7 at Nottingham. The highest at Bolton was 40° 2, at Hull 41°, at Liverpool 42°. The general mean was 45° 7.

The lowest temperatures were at Wolverhampton, 25° 1, at Cambridge 25° 2, at Bolton 25° 7; the highest at Leeds, 31°, at Liverpool 30° 9, at Nottingham 30° 8. The general mean was 28° 4.

The greatest ranges were 24° 4 at Wolverhampton, 22° at Plymouth, 20° at Bradford and Leeds; the smallest ranges were 11° 1 at Liverpool, 13° at Sheffield, 14° at Hull. The general mean was 17° 3.

The mean of the seven high day temperatures was highest at Plymouth, 42° 5, at Truro 42° 3, at Preston 40° 9; and was lowest at Bolton, 37° 4, at Hull 37° 6, at Brighton 37° 8. The general mean was 39° 4.

The mean of the seven low night temperatures was highest at Truro, 34° 3, at Liverpool 33° 8, at Preston 33° 6; and was lowest at Wolverhampton, 29° 7, at Cambridge 30° 2, at Bolton 30° 5. The general mean was 32° 1.

The mean daily range was greatest at Plymouth, 9° 3, at Wolverhampton 9°, at Bradford 8° 7; and was least at Liverpool, 4° 9, at Brighton 5° 8, at Sheffield 5° 9. The general mean was 7° 3.

The mean temperature was highest at Truro, 38° 1, at Plymouth 37° 7, at Preston 37°; and was lowest at Bolton, 33° 7, at Cambridge 33° 8, at Hull 33° 9. The general mean was 35° 6.

*Rain.*—The largest falls were 0.85 inch at Nottingham, 0.80 inch, at Hull, 0.64 inch at Bradford; the smallest falls were 0.03 inch at Liverpool, 0.06 inch at Truro and Bolton. The general mean fall was 0.33 inch.

SCOTLAND: *Temperature.*—During the week ending January 17, the highest temperature was 46° 7, at Edinburgh; at Dundee the highest was 39° 8. The general mean was 42° 7.

The lowest temperature in the week was 20°, at Perth; at Leith the lowest temperature was 31° 8. The general mean was 25° 9.

The mean temperature was highest at Leith, 36°; and lowest at Perth, 31° 1. The general mean was 34° 2.

*Rain.*—The largest fall was 0.49 inch, at Edinburgh and Aberdeen; the smallest fall was 0° 01 inch at Greenock. The general mean was 0.30 inch.

JAMES GLAISHER, F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, January 19, 1885; issued by the Meteorological Office, 116, Victoria Street, London, S.W.:—The weather has continued in a cloudy, gloomy condition in most parts of Great Britain, with some fog or haze and a few showers of cold rain or sleet; over Ireland, however, the sky has been rather clearer, and the rainfall very slight.

The temperature has been below the mean in all districts, the deficit ranging from 2° in "England, N.E.," to as much as 6° in "England, S.W.," and "Ireland, S.," and 7° in "Ireland, N.," and the "Channel Islands." The maxima, which were recorded on the 18th or 19th in Ireland and Scotland, and on various dates over England, ranged from 39° to 44° in most districts to 46° in "Ireland, S.," and the "Channel Islands." The minima were generally registered on the 15th, when the thermometer fell to 16° in "Scotland, N.," 18° in "Scotland, E.," and to between 23° and 31° elsewhere. During the greater part of the week the diurnal range was very slight.

The rainfall has about equalled its normal value in England, but has been less in all other districts, the percentages of possible duration varying from 32 in "Ireland, N.," and 28 in "Ireland, S.," to less than 4 over the greater part of England; while in "England, N.E.," bright sunshine has continued altogether absent.

*Depressions observed.*—Beyond an irregularly shaped

disturbance which was shown over Holland and the south of Denmark as the week commenced, there have been no depressions of importance in our neighbourhood, the distribution of pressure over north-western Europe being anti-cyclonic. During the earlier part of the time the highest pressures lay off our north-western coasts, and the lowest over the south of France; but as the week progressed the former was slowly transferred to the south of Scandinavia, and the latter to the south-west of our Islands. The wind, after blowing freshly from the north at the opening of the period, subsequently became fresh or strong from the north-east and east, and finally moderate or light from the east or south-east.

## Obituary.

DEATH OF MR. ROBERT T. VEITCH, OF EXETER.

WE regret to announce the death of Mr. R. T. VEITCH, of the Exotic Nurseries, Exeter, he being the last surviving son of the late Mr. James Veitch, of Exeter. Mr. Veitch had been in failing health for some time past, and had resided at Torquay during the last two winters, his death taking place at his residence there on Sunday, the 18th inst.

In early life Mr. Veitch studied farming near Slough. He then went out to Smyrna as manager of an extensive corn-growing estate there, some time after removing to the Cape of Good Hope, and settling down as a squatter farmer in that colony. In the winter of 1856 he returned to Exeter, and joined his father in the management of the well-known nursery there. Since the death of his father he has been the sole partner in the nurseries at Exeter, until about two years ago, when his son, Mr. Peter Veitch (who was previously at the Chelsea establishment), joined him as a partner in the Exeter nursery.

Mr. Veitch had an extensive knowledge of the pomology of the Western Counties, whilst he rendered service to horticulture in introducing and placing in commerce some plants of rare interest and beauty, such as, for instance, the greenhouse Rhododendron (*R. exoniense*), and the beautiful climber, *Tacsonia exoniensis*, the popular *Adiantum Farleyense*, &c. The Exeter newspapers, in a long obituary notice, speak highly of Mr. Veitch as a citizen. He was sixty-two years of age, and leaves a widow and eight children—four sons and four daughters.

The nurseries and seed business will be carried on by his son (Mr. Peter Veitch) under the same title as formerly, namely, Robert Veitch & Son.

MR. PETER CLIFFE.

The subject of this notice had served the Egerton family (of Tatton) as gardener for nearly half a century, first as foreman in the gardens at Tatton Park, and eight years subsequently as gardener to Lord Egerton of Tatton, at Mere Hall, till his Lordship's succession to the Tatton estates and title in 1857, when Mr. Cliffe went with him, fulfilling his duties with great ability and faithfulness until his Lordship's decease in the beginning of the year 1883. The death of his employer was a severe blow to Mr. Cliffe, whose health had been failing for many years, the result of severe inflammation. He, however, was one of those old servants chosen by the present Lord Egerton to continue his services at Tatton Park, which he did until September last, when he was obliged by his failing health to retire from active life, and there is no doubt that his retirement affected him painfully in his then weak state. His Lordship kindly allowed him to retire on a pension of £1 per week. During the last few weeks of his illness Lady Egerton constantly visited him, which cheered him very much, bringing fruit and flowers.

MRS. J. SHIRLEY HIBBERD.

On the 21st inst., at The Priory Park, Kew, of peritonitis, Ellen, second wife of J. Shirley Hibberd.

THE SURVEYORS' INSTITUTION. — The next meeting will be held on Monday, January 26, when a discussion will take place on a paper (taken as read at the last meeting) by Mr. R. W. Mann (Fellow), entitled, "The Enfranchisement of Urban Leases," and a paper to be read by Mr. H. Martin (Fellow), entitled, "Recent Proposals for Leasehold Enfranchisement."

## Enquiries.

"He that questioneth much shall learn much."—BACON.

**HORTICULTURAL BOILERS.**—*Cruciform* writes:—"While the correspondence is going on in your paper as to which is the most economical boiler for private and public gardens, will any reader kindly give his or their experience with the old Cruciform boiler (not the modern Cruciform saddle)? I fear, in these days of new inventions, this fine old boiler is nearly, or quite, lost sight of. If any one can give it a good word I will be pleased to add my testimony as to the value of the above old form of boiler."

**MYOSOTIDUM NOBILE.**—What is the proper soil and situation for this fine plant? *D.*

**NEPENTHES.**—Would any successful cultivator of *Nepenthes* give a few hints on their cultivation? *D.*

**RANUNCULUS LYALLII.**—Has any one succeeded in growing this fine New Zealand Buttercup?

## Answers to Correspondents.

**ADDRESS:** *W. Reid.* Botanic Garden, Chelsea, S.W.

**BOOKS:** *M. M. M.* The *Rose Amateur's Guide*, by T. Rivers, affords ample information as to the propagation of Roses and their culture in pots; published by Longmans, Green & Co., London. The *Clematis as a Garden Flower*, by T. Moore, F.L.S., and G. Jackson, of the Woking Nursery, is one of the best and cheapest works on the Clematis; sold by G. Jackson & Son, Woking Nursery, Surrey.—*W. W. Fruit Farming for Profit*, by G. Bunyard, Maidstone; to be had of E. Stanford, Charing Cross, or of F. Bunyard, 29, Week Street, Maidstone.

**CORRIGENDA.**—On p. 58, col. 2, fourteenth line from the bottom, "waxing" should read "coaxing."

**CYPRIPEDIUM INSIGNE:** *Constant Reader.* Yes, it is unusual for *Cypripedium insigne* to carry two flowers on one stalk. It is considered to be the result of extra vigour in the plant.

**DISEASED PINE TREE:** *E. F.* We are not able to say what caused the death of the tree. The bark is perforated by the grubs of a wood-eating beetle, but we do not think the insects caused the death of the tree.

**INSECTS:** *H. L.* The heart of your *Echeveria* is eaten out by the larvæ of the brown weevil (*Otiorynchus sulcatus*). Sift the earth carefully, and bake it, if necessary, before repotting the plants. *J. O. W.*

**LEAF FROM SURFACE OF APPLE:** *X.* Rare, but not unprecedented. Pliny describes a variety which produced one or two leaves from the side: "Melo-folius folium unum aliquando et geminum erumpit e latere medio." Lib. xv., cap. xiv.

**LIST OF PERSONS ELIGIBLE FOR PENSIONS FROM THE GARDENERS' ROYAL BENEVOLENT INSTITUTION:** *Constant Reader.* Ours was the correct one.

**NAME OF BUSINESS HOUSE:** *C. W. S.* A nurseryman at Cape Town, dealing largely in African bulbs, is Mr. Charles Ayres.

**NAMES OF FRUIT:** *Fowler, Leeds.* Your Apple is named the Plum Apple.—*J. H. R.* Not recognised.—*W. & G. Brown.* Probably Golden Reinette.—*T. Cripps & Sons.* 20, Beauty of Kent; 42, Osborn Golden Reinette; 74, Mannington's Pearmain.

**NAMES OF PLANTS:** *F. P. W.* So far as we can tell from small scraps without flowers your specimens are as follows. Another time please send not more than four at one time. 1, the Irish Yew; 2, *Taxus adpressa*; 3, *Picea orientalis*; 4, *Berberis dulcis*; 5, *Leucothoe axillaris*; 6, *Gaultheria Shallon*; 7, *Vaccinium nitidum*; 8, *Ruscus racemosus*; 9, *Cotoneaster* sp.; 10, *Tsuga canadensis*.—*E. Thrupp.* *Zygopetalum Mackayi*; the other indeterminate.—*H. W. Hartland.* Seedling varieties of *Gladiolus Colvilli*. It is a pretty variety, but an English name for it would be better than the French one.—*H. H.* No. 2 is *Trachelospermum jasminoides*, which will do in the stove, it the highest night warmth does not exceed 60° in the winter; it is properly a greenhouse plant.

**PICEA PARRYANA GLAUCA:** *Fir Cone.* The plants you mention are referable to two species, of each of which there is a glaucous variety, thus—*Picea Engelmanni* (*alias* *P. commutata*) and *P. Engelmanni* var. *glaucous*, *Picea pungens* (*alias* *Parryana*) and *P. pungens glauca* (*alias* *Parryana glauca*). The latter is by far the best as an ornamental tree.

**PLANTS FOR A TANK IN CONSERVATORY:** *A Constant Reader.* *Calla palustris*, white, from January to August; *Richardia ethiopica* (Abyssinian Lily), from January to May, white; *Cyperus alternifolius*, January to September, greenish-white; *Juncus zebrianus*, with zebra-like markings on the leaves; *Eichornia speciosa*, a few blooms in early spring; *Limnorchis Humboldtii*, sometimes in winter. The treatment the plants will receive will have much to do with having them in bloom during the time they are wanted, viz., from September to April, as not many species bloom in that period, unless compelled to do so by special treatment.

**POEY:** *A. D. W.* A contraction from "poesy," and originally applied to the copy of verses which accompanied the gift of a bunch of flowers, and ultimately, when versifying went out of fashion, to the flowers themselves.

**RAINFALL REGISTER:** *E. Gilman.* It is not desirable to insert any more tabulated matter concerning the rainfall than our weather record contains; were we to do so we should be deluged.

**SCALDED LEAVES:** *H. H.* Your *Allamanda* was scalded by the sun shining on the wet foliage.

**SECRETARY OF HORTICULTURAL SOCIETY:** *D.* A secretary should not vote; he is present rather to record the proceedings. At the same time you have no rule to preclude him from doing so, and he should be as impartial as possible.

**VERONICA:** *B.* Of the three possible ways of pronouncing this word we should say *Vero-ni-ca* is the most usual, *Vero-nica* the most pedantic, and *Vero-nicka* the most correct—that is, if the Continental method of pronouncing Latin names (which is admitted by scholars to be more correct than our own) be adopted, as it will probably be.

**VINE GROWTH:** *A. F.* The growth is due to an overgrowth of the cellular and vascular tissue of the Vine, the vessels in particular being greatly increased. It is probably the result of the puncture of an insect, but we do not know this for certain.

**FUNGUS-LIKE GROWTH ON CAMELIAS:** *B. of B.* These outgrowths of woody formation are peculiar to the genus, and also to others, and are often found on old trees which have snags from pruned-off branches, and decayed portions of stem in specimens that have been at any time in old age headed back. It will sometimes be seen in the stem when split by the wind.

FIG. 24.—WOOLLY EXCRESCENCE ON CAMELIAS.

twisting the head round. It is not in itself injurious although being usually a sign of declining vigour, and therefore is seldom seen in young bushes of the Camellia. It may be cut clean out, and the wound filled in with grafting-wax, "L'Homme Lefort," or plaster of Paris. Painting with gas-tar will also arrest its formation.

**VIVISECTION:** *B.* No doubt it is not right to do a little evil even for a vast good, but the question arises—What is evil under such circumstances? Is it evil to extract a tooth, or dose an unwilling child with castor oil? These things in themselves are evil, but they are not done with evil motive—quite the reverse; and so, we suppose, they will continue to be done in spite of abstract morality.

**WHITE CINERARIA:** *J. C. P.* It is not uncommon.

**FOREIGN SUBSCRIBERS** sending Post-Office Orders are requested to send them to the Publisher of this journal, 41, Wellington Street, Covent Garden, and to make them payable to William Richards, at the Post-Office, Drury Lane, London, W.C.

**INTELLIGENT READERS, PLEASE NOTE.**—*Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and NOT to the Editor.*

## SEEDS.

LONDON: Jan. 21.—An increasing activity is now observable in the trade for farm seeds. More inquiries come to hand from the country, and a greater disposition is shown to purchase Clover seeds. No change, however, as regards values can be noted. American quotations come very firm. In spring Tares the tendency is in holder's favour. For Canary and Hemp seed the sale is not brisk; values unaltered. There is a better trade for blue boiling Peas and Haricot Beans. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

## CORN.

At Mark Lane on Monday trade was decidedly flat for English and foreign Wheats. Both were offered at 6d. less money, and met very few buyers. Flour also was very dull, and country marks were obtainable on easier terms. Barley, with diminished supplies offering, hardened in value. Grinding descriptions must be written 6d., and desirable malting qualities 6d. to 1s. dearer on the week. There was no quotable change in the value of Beans or Peas. Lentils ruled 1s. over the previous Monday's rates. Round Maize was very scarce at dearer rates, but flat corn was cheaper at 2½s. Oats were firmly held, last Friday's advance of 3d. from the previous Monday being maintained.—On Wednesday Wheat was very flat, and to sell even in moderate quantity lower rates must have been accepted. Flour ruled dull, with a drooping tendency. Barley met a steady inquiry, and Monday's advance was well maintained on both malting and grinding descriptions. Beans and Peas were in moderate request, at steady value. Oats in some cases showed rather dearer rates. Round Maize continued firm, but flat corn was easier. Average prices of corn for the week ending Jan. 17:—Wheat, 34s. 2d.; Barley, 32s. 3d.; Oats, 20s. 1d. For the corresponding period last year:—Wheat, 38s. 9d.; Barley, 32s. 3d.; Oats, 19s. 3d.

## CATTLE.

At Copenhagen Fields on Monday, with a smaller supply of cattle, and especially the primer kinds, a few lots sold in the early trade at rather better prices, but the improvement was not general. Quotations were, however, more evenly supported. With full supplies, the sheep trade was slow, and our top quotation was rather exceptional, 5s. 10d. being a more general top figure. Very few prime calves were on offer, and rates in some measure nominal. Quotations:—Beasts, 4s. to 5s. 2d., and 5s. 4d. to 5s. 8d.; calves, 3s. 8d. to 5s. 8d.; sheep, 4s. 6d. to 5s., and 5s. 4d. to 6s.; pigs, 3s. 8d. to 4s. 4d.—Thursday's cattle trade was quiet. Beasts were in short supply, and sold slowly at barely Monday's rates. Sheep were dull of sale at the rates recorded above; and calves and pigs were quiet.

## HAY.

Tuesday's Whitechapel Market report states that there were large supplies, with an exceedingly dull trade, at a reduction of 1s. on the top price of hay. Quotations:—Clover, prime, 50s. to 107s.; inferior, 46s. to 73s.; prime second cut, 90s. to 107s.; hay, prime, 80s. to 94s.; inferior, 60s. to 65s.; and straw, 22s. to 36s. per load.—On Thursday there was a large supply. Trade was very dull, and hay sold for less money.—Cumberland Market quotations:—Clover, best, 90s. to 105s.; inferior, 60s. to 84s.; meadow hay, best, 84s. to 92s.; inferior, 60s. to 80s.; and straw, 26s. to 34s. per load.

## POTATOS.

The report from the Borough market states that the supply was good, and the demand quiet with prices steady. Quotations:—Kent Regents, 70s. to 80s.; Scotch ditto, 80s. to 100s.; Victorias, 70s. to 90s.; Magnum Bonums, 50s. to 80s.; Champions, 50s. to 60s.; French, 40s. to 50s. per ton.

## COALS.

The following are the prices current at market during the week:—Broomhill West Hartley, 14s. 6d.; Bebside West Hartley, 14s. 9d.; East Wylam, 15s. 6d.; Walls End—Tyne (unscreened), 11s. 3d.; Lambton, 18s. 6d.; Hetton, 19s.; Hetton Lyons, 17s.; Wear, 17s.; Hulham, 17s. 3d.; East Hartlepool, 18s. 3d.; South Hartlepool, 17s. 3d.; Tees, 19s. 3d.

**Government Stock.**—Consols closed on Monday and Tuesday at 99½ to 99½ for delivery, and 99½ to 99½ for the account. Wednesday's figures were 99½ to 99½ for delivery, and 99½ to 100 for the account. Thursday's closing figures were 99½ to 100 for delivery, and 99½ to 100½ for the account.

**50 Bushels**  
**BRANKNEY MARROW PEAS.**—The best Late Green Marrow Pea extant. Price 65s. per quarter. Sample on application.  
**JOHN ETHERINGTON DIXON,** 21 and 23, Lord Street, Gainsborough.

**New, Choice, and Rare Seeds.**  
**W. THOMPSON, SEEDSMAN, 34, Tavern Street, Ipswich,** begs to inform his numerous Patrons and Amateur Horticulturists in general, that the Thirtieth Edition of CATALOGUE of Flower Seeds is now ready, and will be sent to any intending purchaser, post-free. It includes many seeds not to be had elsewhere.

**JAMES MEREDITH, Seedsman, &c.,**  
12½, BRIDGE STREET, WARRINGTON.

## EUREKA!! INSECTICIDE.

Prepared by

**WILLIAM SMITH, Chemist, Stockbridge, Edinburgh**

Highest Award, Forestry Exhibition, Edinburgh.

"Clovenfords, by Galashiels, N.B., July 25, 1883.  
"Mr. SMITH,—Dear Sir,—We have now tried your Insecticide on all the Insects we can find on any of our Plants, including Orchids, and used as directed by you we find it instant destruction to them all, while it neither stains nor injures the tenderest leaf. We shall in future use no Fir-tree Oil, or other Insecticide but yours.—We are, yours truly,  
"WILLIAM THOMSON and SONS."

WHOLESALE AGENTS:—

**CORRY, SOPER, FOWLER & CO.,**  
18, Finsbury Street, London, E.C.

## VINE and PLANT MANURE.

The LIVERPOOL HORTICULTURAL COMPANY (JOHN COWAN), Limited, will in future sell their celebrated MANURE under the name of "COWAN'S VINE and PLANT MANURE," in place of "THOMSON'S VINE and PLANT MANURE." The composition will be the same, and the high quality in every way be maintained. Bags containing 1 cwt., 18s.; ½ cwt., 9s. 6d.; ¼ cwt., 5s.; 1 cwt., 3s. Circulars, with full particulars, on application to **THE LIVERPOOL HORTICULTURAL CO. (JOHN COWAN), LIMITED, THE VINEYARD, GARSTON.**

Sealed  
Packet  
Post-free.

2s. 6d.  
per  $\frac{1}{4}$  Pint.  
Sealed  
Packet  
Post-free.

Triumph is the best of the many fine varieties we have sent out. It is a Blue Wrinkled Marrow, of exquisite flavour; the pods are large, well filled with large Peas. The habit is dense and bushy; height 2 to 3 feet. In constitution it is robust and hardy, and is the perfection of Peas either for exhibition or for ordinary use. Sixty-nine pods have been counted on one plant of Triumph—each pod containing nine to eleven large Peas.

CHARLES SHARPE & CO., SEED MERCHANTS, SLEAFORD.

SIMPLEX

## PURE WOOD CHARCOAL

FOR  
VINE BORDERS, FRUIT TREES, STRAWBERRIES,  
ROSES, FLOWER BEDS, POTTING PURPOSES,  
AND GENERAL HORTICULTURAL PURPOSES.  
**HIRST, BROOKE, AND HIRST**, Manufacturers, Leeds,  
Yorkshire.

Rosher's Garden Edging Tiles.

**THE ABOVE** and many other PATTERNS are made in materials of great durability. The

plainer sorts are specially suited for KITCHEN GARDENS, as they harbour no Slugs or Insects, take up little room, and, once put down, incur no further labour or expense, as do "grow" Edgings, consequently being much cheaper. **GARDEN VASES, FOUNTAINS, &c.**, in Artificial Stone, very durable and of superior finish, and in great variety of design. **F. ROSHER AND CO.**, Manufacturers, Upper Ground Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.; Kingsland Road, E.

Agents for **LOCKER'S PATENT "ACME" FRAMES**, **PLANT COVERS**, and **PROPAGATING BOXES**; also for **FOXLEY'S PATENT BEADED GARDEN WALL BRICKS**.

Illustrated Price LISTS Free by Post. The Trade supplied.

**ORNAMENTAL PAVING TILES**, for Conservatories, Halls, Corridors, Balconies, &c., from 3s. per square yard upwards. Pattern Sheet of Paving or more elaborate Designs, with Prices, sent for selection.

**WHITE GLAZED TILES**, for Lining Walls of Dairies, Larders, Kitchen Ranges, Baths, &c. Grooved and other Stable Paving of great durability. Wall Copings, Drain Pipes and Tiles of all kinds. Roofing Tiles in great variety. Slates, Cement, &c. **F. ROSHER AND CO.**, Brick and Tile Merchants. See Addresses above.

**SILVER SAND**, fine or coarse grain as desired. Price, by post, per Ton or Truckload, on Wharf in London, or delivered direct from Pits to any Railway Station. Samples of Sand free by post. **FLINTS and BRICK BURS** for Rockeries or Ferneries. **KENT PEATS or LOAM** supplied at lowest rates in any quantities.

**F. ROSHER AND CO.**—Addresses see above.  
N.B.—Orders promptly executed by Rail or to Wharves.  
A liberal Discount to the Trade.

Oil Paint no Longer Necessary.

**HILL AND SMITH'S BLACK VARNISH** for Preserving Ironwork, Wood, or Stone. (Registered Trade Mark.)

This **VARNISH** is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.

"Pierrefield Park, June 21, 1876.—Sirs.—I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chepstow.—I am, Sirs, yours respectfully, Wm. Cox."

**CAUTION**.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large illustrated CATALOGUE of Fencing Hurdles, Field and Entrance Gates, &c., sent free on application to **HILL AND SMITH**, Brierley Hill Ironworks, Staffordshire; 118, Queen Victoria Street, London, E.C.; and 195, St. Vincent Street, Glasgow.

## THE LOUGHBOROUGH GREENHOUSE HOT-WATER APPARATUS.

Price as engraving with Boiler, open feed syphon, 12 ft. of 4-in. hot-water pipe, and 1 patent joint, complete, £4 4s. Delivered free to any Station. Discount for Cash.  
This is the simplest, cheapest, and most powerful apparatus made. It requires no brick setting, no stovehole, and no hot-water filter for fixing. The Boiler stands in the Greenhouse, the front only being outside and flush with the outer wall, so that the whole of the heat from the boiler itself is utilised.  
It burns over 12 hours without attention, at a nominal cost.  
"Loughborough" Boilers to heat up to 650 ft. of 4-in. pipe, with hot-water pipe, joints, &c., always in stock.

COST OF APPARATUS FOR HOUSES OF ANY SIZE ON APPLICATION.

The measurement of Greenhouse being given, every apparatus is delivered with pipes cut and fitted ready for fixing.

Illustrated LIST with full particulars, post-free.

NOTE.—All genuine Boilers have "The Loughborough Boiler" cast on.

&c., to wait on Customers and live in the house.—Apply, by  
letter, in own handwriting, stating wages required, references,  
&c., to W. MEADMORE, Market Place, Romford.

## WANT PLACES.

**B. S. WILLIAMS** begs to intimate that he  
has at present in the Nursery and upon his Register  
some excellent Men, competent either to fill the situation of  
HEAD GARDENER, BAILIFF, FOREMAN, or  
JOURNEYMAN. Ladies and Gentlemen requiring any of the  
above will please send full particulars, when the best selections  
for the different capacities will be made.—Holloway, N.

**SCOTCH GARDENERS.**  
—JOHN DOWNIE, Seedsman, 744, Princes Street, Edin-  
burgh, has at present on his list a number of SCOTCH  
GARDENERS, waiting re-engagements, at wages ranging  
from £50 to £100 per annum, and he will be pleased to supply  
full particulars to any Nobleman or Gentleman requiring a trust-  
worthy and competent Gardener.

**RICHARD SMITH AND CO.**  
beg to announce that they are constantly receiving  
applications from Gardeners seeking situations, and that  
they will be able to supply any Lady or Gentleman with  
particulars, &c.—St. John's Nurseries, Worcester.

**ORCHID GROWER and GARDENER.**  
—WILLIAM KIDD, Orchid Grower to Dr. Paterson, Fero-  
hill, Bridge of Allan, will be happy to engage to any Lady or  
Gentleman requiring the services of a practical Orchid Grower  
and Gardener. First-rate Plantsman, well up in all branches of  
the trade. Sixteen years' experience in leading places. Highest  
references from present and past employers. Strictly sober.—  
Address as above.

**THE LIVERPOOL HORTICULTURAL**  
CO. (John Cowan), Limited, The Vineyard and Nur-  
series, Garston, can recommend a first-class GARDENER to  
any Nobleman or Gentleman requiring the services of such.

**GARDENER (HEAD).—NEIL SINCLAIR,**  
Gardener to the Marchioness of Downshire, will be  
pleased to recommend his Foreman (H. Howell) to any Lady  
or Gentleman requiring the services of a thorough practical  
man in all branches of the profession. Total abstainer.

are kept.—Age 35, married, one child; twenty years'  
practical experience in all branches of the profession; six years  
with present employer.—L. TAYLOR, Gardener, Putney Park,  
Surrey, S.W.

**GARDENER (HEAD); age 31.—E. SIMPSON,**  
Head Gardener to Lord Wrottesley, Wrottesley, Wolver-  
hampton, can with confidence recommend his General Foreman,  
W. Holdcroft, to any Lady, Nobleman, or Gentleman, as a  
competent, trustworthy man, in the general routine of Gardening.  
Three years in present situation.

**GARDENER (HEAD).—Messrs. VEITCH**  
& SON would be pleased to recommend to any Lady,  
Nobleman, or Gentleman, a thorough good practical man in all  
branches of the profession and the Management of large  
Gardens.—Messrs. VEITCH AND SON, Exotic Nurseries,  
Exeter.

**GARDENER (HEAD).—Married; thoroughly**  
experienced in Early and Late Forcing, Stove  
and Greenhouse Plants, Flower and Kitchen Gardening. Successful  
Grower and Exhibitor of Orchids. Twenty-eight years' ex-  
perience, 12 years in present situation. Excellent character.—  
A. B., Mr. B. Findlay, Royal Botanic Gardens, Manchester.

**GARDENER (HEAD).—Age 32, married;**  
thoroughly experienced in the Management of Glass-  
houses, also in Flower and Kitchen Gardening. Has been a  
successful exhibitor. Eight years in present situation; leaving  
on account of death of late employer.—Mr. G. FISHER,  
Gardener, Glanbrydaw Park, Manordeillo, Carmarthenshire.

**GARDENER (HEAD).—Baron WM.**  
SCHRÖDER desires to recommend his Head Gardener to  
any Nobleman or Gentleman requiring a thorough practical  
man; age 39, Scotch, married, one son. Seventeen years'  
highest testimonials.—GEORGE STARK, Rookery Gardens,  
Nantwich, Cheshire.

**GARDENER (HEAD).—Mr. HARDWICK, of**  
Holland, Tonbridge, wishes to highly recommend his  
Head Gardener (G. Goldsmith), who has lived with him eight  
years, and six years with previous proprietor. Leaving on  
account of family moving to town.—For particulars apply to  
P. C. HARDWICK, Esq., address as above.

**GRATEFUL—COMFORTING.**  
**EPPS'S COCOA.**  
**BREAKFAST.**

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." *Civil Service Gazette.*

Made simply with boiling water or milk. Sold only in Packets, labelled thus:—  
**JAMES EPPS & CO., Homoeopathic Chemists**  
London

**HOLLOWAY'S OINTMENT and PILLS**  
—Abscesses, Erysipelas, Piles.—Unvarying success attends all who treat these diseases according to the simple printed directions wrapped round each pot and box. They are invaluable to the young and timid, whose bashfulness some times endangers life. Though apparently local, diseases of this nature are essentially blood diseases, but a little attention, moderate perseverance, and trifling expense will enable the most diffident to conduct any case to a happy issue without exposing secret infirmities to any one. The Ointment checks the local inflammation and removes the throbbing pains. These directions also clearly point out when and how Holloway's Pills are to be taken, that their purifying and regulating powers may assist by adjusting and strengthening the constitution.

# PETER LAWSON & SON

(LIMITED),

## SEED MERCHANTS AND GROWERS,

## EDINBURGH,

RESPECTFULLY inform their Friends and Customers that they have now COMPLETED THE PURCHASE from "THE LAWSON SEED AND NURSERY COMPANY," LIMITED, of the OLD-ESTABLISHED SEED BUSINESS, carried on since the year Seventeen Hundred and Seventy, including the Entire Seed Stocks, Valuable Existing Contracts, Lease of the Premises here and Goodwill, and they are now carrying on the same in all the Departments as heretofore.

PETER LAWSON AND SON have been authorised by THE LAWSON COMPANY to Collect all Debts due to them, also to Dispose of the Produce of the said Company's Nurseries still being carried on.

The most valuable of the old *employes* still remain, and are largely interested in the concern. Undivided attention will henceforth be devoted to the Seed Department, therefore Customers may depend upon all Orders being executed in the best possible manner, whether in regard to Price, Quality, or Prompt Despatch.

If not already received, the *TRADE PRICE CURRENT* for the season will be posted upon application.

**DAVID SYME, Manager.**

N.B.—Prospectuses of Peter Lawson & Son, Limited, may be had at the Registered Office of the Company, 1, George IV. Bridge; or of Messrs. T. AND W. J. McLAREN, W.S., the Company's Solicitors, 51, Frederick Street, Edinburgh; and SAMUEL McDOWALL, Esq., 31, Nicholas Lane, Lombard Street, London, E.C.—*Edinburgh, January, 1885.*

*With reference to the above Advertisement of "PETER LAWSON & SON, LIMITED," we respectfully thank our many Friends and Customers for the large amount of confidence reposed in us during past years, and inform them that, having disposed of the Seed Business to the New Company, we shall continue to carry on the Nurseries at Bangholm and Warriston, as heretofore, devoting, if possible, more strict personal attention to this department. The Stock was never in finer condition, and will be disposed of on moderate terms.*

*We have authorised "PETER LAWSON & SON, LIMITED," to collect all accounts due to us, also to dispose of our Nursery Produce, and all orders entrusted to them shall be carefully attended to. CATALOGUES and Special Offers may be had at 1, George IV. Bridge, or at the Nurseries.*

## SALES BY AUCTION.

## Tuesday Next.

New White Type of *LÆLIA ANCEPS SANDERIANA*. Most beautiful novelty, discovered and sent home by Mr. Arnold, who came across a batch in full bloom, and every plant found is offered. This magnificent *Lælia* has the lip similar to Dawsoni, it being pure white, with two crimson-purple blotches divided by a white line. The petals are very broad, and pure white, and the flower altogether of large size; as many as six were seen on spikes. The importation is in grand order—enormous masses among them, some with upwards of 300 bulbs, and to feet and more in circumference. The dried flowers will convey an idea of the beauty of the species.

**MESSRS. PROTHEROE AND MORRIS** have received instructions from Mr. F. Sander to sell the above splendid novelty at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on **TUESDAY NEXT**, February 3. On view morning of Sale, and Catalogues.

Tuesday Next.—*Odontoglossum Alexandræ*.

**MESSRS. PROTHEROE AND MORRIS** will include in their Sale at the Central Auction Rooms, 67 and 68, Cheapside, E.C., on **TUESDAY NEXT**, February 3, by order of Mr. F. Sander, a grand lot of *ODONTOGLOSSUM ALEXANDRÆ*. The Collector writes:—"These are the finest varieties ever sent home. They are from a new locality, flowers very large and round. Many deeply blotched and spotted forms will be among them."

On view morning of Sale, and Catalogues had.

## Tuesday Next.

## The FALLOWFIELD COLLECTION OF ORCHIDS.

**MESSRS. PROTHEROE AND MORRIS** are favoured with instructions to **SELL BY AUCTION**, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on **TUESDAY NEXT**, February 3, at half-past 12 o'clock precisely, the final portion of this important **COLLECTION OF ESTABLISHED ORCHIDS**, including, amongst other fine species—

<i>Masdevallia ignea</i> Massangeana	<i>Aërides odoratum nobilis</i>
" " <i>ana</i>	" " <i>purpurascens</i>
" " <i>Wioniana</i>	" " <i>malesumum</i> , true and rare
" " <i>Roezlii</i>	<i>Odontoglossum Alexandræ</i> , superb variety, in flower
" " and many others	" " <i>mulus</i>
<i>Cypripedium meirax</i> , fine hybrid	" " <i>asperum</i>
" " <i>curyandum</i> , splendid plant	" " <i>citrosomum roseum</i>
" " <i>Crossianum</i>	<i>Cattleya Sanderianum</i>
" " <i>Ashburnianum</i>	" " <i>calumnata</i> , fine hybrid

On view morning of Sale, and Catalogues had.

## Wednesday Next.

## LILIAM AURATUM.—TO THE TRADE.

**MESSRS. PROTHEROE AND MORRIS** will **SELL BY AUCTION**, at the Central Sale Rooms, on **WEDNESDAY NEXT**, 10,000 exceedingly fine **BULBS** of *LILIAM AURATUM*, including 1000 gigantic roots measuring 10 to 13 inches in circumference, and a consignment of **CONIFER SEEDS** from California.

On view morning of Sale, and Catalogues had.

## Wednesday Next.

## LILIAM AURATUM, ROSES, and BULBS.

**MESSRS. PROTHEROE AND MORRIS** will **SELL BY AUCTION**, at their Central Auction Rooms, 67 and 68, Cheapside, E.C., on **WEDNESDAY NEXT**, February 4, at half-past 12 o'clock precisely, 10,000 unusually fine **Bulbs** of *LILIAM AURATUM* (including 1000 gigantic roots), just received from Japan in splendid condition; 2000 double African *TUBEROSES*, 2000 Berlin crowns *LILY* of the *VALLEY*, an assortment of hardy English-grown *LILIES*, including extraordinary *Bulbs* of *L. giganteum*, *L. superbum*, *L. Humboldtii*; 400 Standard *ROSES* of the best named sorts from an English nursery; *CARNATIONS*, *CHRISTMAS ROSES*, a variety of *BULBS* for the garden and greenhouse, and a consignment of *CONIFER SEEDS* from California.

On view morning of Sale, and Catalogues had.

## Friday Next.

## VERY VALUABLE IMPORTATIONS.

**MESSRS. PROTHEROE AND MORRIS** are instructed by Mr. F. Sander to **SELL BY AUCTION**, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on **FRIDAY NEXT**, February 6, at half-past 12 o'clock precisely, a very grand importation of the beautiful golden-yellow flowered *ANGLOA CLOWESII*, and a large importation of *ODONTOGLOSSUM PESCATORII*, *O. HASLILABUM*, *ADA AURANTIACA*, *STANHOPEA Eburnea*, and the magnificent *MAXILLARIA SANDERIANA*, also many *CATLEYAS* and *ODONTOGLOSSUMS*.

On view morning of Sale, and Catalogues had.

## Thursday Next.—(Sale No. 6837.)

## LÆLIA ANCEPS, New White Type.

**MR. J. C. STEVENS** will **SELL BY AUCTION**, at his Great Rooms, 38, King Street, Covent Garden, W.C., by order of Mr. F. Sander, on **THURSDAY NEXT**, February 5, at half-past 12 o'clock precisely, a truly grand importation of a magnificent *LÆLIA ANCEPS*, white type. The flowers are very large and fine, petals very broad and pure white, and the flowers are nearly 5 inches across, lip pure white, the throat dark crimson, veined and blotched, the colouring being most vivid. A large quantity of dried flowers on view will convey an adequate idea of the great beauty and value of this species. The plants were collected by Mr. Arnold, and are in grand order, great masses being among them.

At the same time will be sold a fine light coloured form of *LÆLIA ANCEPS*. Mr. Bartholomæus, who collected this lot in a new locality, writes that the flowers are large, sepals and petals rose, lip very light coloured, in some varieties almost white, throat crimson veined.

On view morning of Sale, and Catalogues had.

## To Market Gardeners, Fruit and Flower Growers.

**MR. H. J. E. BRAKE** will **SELL BY AUCTION**, on **MONDAY**, February 9, at the "Royal Swan" Hotel, Blackwater, Hants, at 4 for 5 o'clock, several Plots of **LAND** at Crowthorne, Berks, and near to the Wellington College and Station, suitable for Market Gardening and Horticultural purposes, in plots from a Quarter of an Acre to 12 Acres. May be paid for by Instalments.

Plans, Particulars, and Conditions on application, or by Post, of the Auctioneer, Farnborough, Hants.

## To Gardeners, Florists, and Nurserymen.

200 Lots of Rare *ORCHIDS*, *HOthouse PLANTS*, and valuable *GARDEN EFFECTS*.

**MESSRS. LIDSTONE** will **SELL** the above by **AUCTION**, at Meyerton House, Polegate, Sussex, 1½ mile from Hailsham and Polegate Stations on the L.B. & S.C.R., on **FRIDAY**, February 7, at 12 o'clock precisely. Catalogues of the Auctioneers, 110, Cannon Street, London, E.C.

## To Nurserymen, Florists, Gardeners, and Others.

## FLORIST'S BUSINESS.

**FOR SALE**, by Private Treaty, as a going concern, all that well known and remunerative **FREEHOLD BUSINESS PREMISES**, called Guildford Street Nurseries, within two minutes' walk of the Barton Railway Station, Hereford, the property of Uriah Hain, Florist, who is relinquishing business on account of declining years. The Property comprises a modern and substantially brick-built Residence, called Bleenheim House, with several Perches of Freehold Garden Ground, a number of Span-roof and Lean-to Glass Houses, with Hot-water and other Heating Apparatus, Hot and Cold Pits, and Potting Sheds; together with the Stock-in-Trade, consisting of a well-grown and healthy lot of Bedding, miscellaneous assortment of useful Greenhouse and Hardy Outdoor Plants, in popular demand; small collection of useful Nursery Stock, Horticultural Requisites, Tools, and absolute Goodwill. A splendid opportunity of entering your man or gentleman's gardener with small capital desirous of retiring from service. One-half or so of purchase money can remain on mortgage, if required. For further particulars, apply to **GEO. H. BARLOW**, Estate and Property Agent, Hereford.

## A Well-established Nursery Business.

**TO BE DISPOSED OF**, in consequence of Proprietor's ill-health, about 6 ACRES of **LAND**, with several Glass Erection, well situated in a fast improving neighbourhood, 10 miles south of Covent Garden. Small premium. Stock at valuation, about £1000. Arrangements as to future payment of part might be made. Apply, in first instance, to **MESSRS. HURST AND SON**, 152, Houndsditch, E.

**TO BE DISPOSED OF, a WHOLESALE** and **RETAIL SEED BUSINESS**. A splendid going concern. One of the finest in existence, doing a large and profitable trade. An unusual opportunity. Apply (by letter only) to **MESSRS. PROTHEROE AND MORRIS**, 67 and 68, Cheapside, London, E.C.

## Important to Florists, Nurserymen, Market GROWERS, and OTHERS.

**TO BE LET, on LEASE, or SOLD** with possession, the valuable **FREEHOLD ESTATE** known as Osborn's Nursery, Sunbury, Middlesex, comprising 17 Acres of excellent Land with Dwelling-house, Stabling, Sheds, and all the extensive range of modern and recently-erected Greenhouses. The Estate having a frontage of 1100 feet to the high road, possesses a great prospective value for Building purposes. Full particulars may be obtained of **MESSRS. PROTHEROE AND MORRIS**, Auctioneers, 67 and 68, Cheapside, E.C.

**PROTHEROE AND MORRIS, HORTICULTURAL MARKET GARDEN and ESTATE AUCTIONEERS and VALUERS**, 67 and 68, Cheapside, London, E.C., and at Leytonstone, E. Monthly Horticultural Register had on application.

**T. MILLINGTON AND CO., ENGLISH and FOREIGN SHEET and PLATE GLASS, WHITE LEAD, MILLED LEAD, OILS, and COLOUR MERCHANTS**, 43, Commercial Street, E.

**JOHN KENNARD'S HORTICULTURAL** Sundries, Peat, Loam, Sand, and Berkshire Pottery Depot. Catalogue post-free of every Horticultural Requisite. Swan Place, Old Kent Road, S.E. Established 1854.

## THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.

At a **GENERAL MEETING** of the **MEMBERS** of this Institution, held on January 14, 1885, for the Election of **EIGHT PENSIONERS**, the following was the result of the Ballot:—

## CANONICATES.

Votes.	Name.	Age.
1910	WILLIAM BIRKETT .. .. .	76
1333	RICHARD HAWKINS .. .. .	69
511	WILLIAM ARCHER .. .. .	79
576	THOMAS BEST .. .. .	69
596	ROBERT PRYOR .. .. .	74
2308	MARTHA SWANBOROUGH .. .. .	87
1597	GEORGE URQUHART .. .. .	69
412	SOPHIA WARE .. .. .	68
1371	ANNA MARIA ALLAN .. .. .	76
1108	ELIZABETH FOULIS .. .. .	83
707	WILLIAM HARMAN .. .. .	59
1305	ELIZABETH PARK .. .. .	73
1515	MARY RABBITT .. .. .	64

The Meeting declared Martha Swansborough, William Birkett, George Urquhart, Mary Rabbitt, Anna Maria Allan, Richard Hawkins, Elizabeth Parr, and Elizabeth Foulis, as having the greatest number of votes, duly elected Pensioners from the 25th December last.

**EDWARD R. CUTLER**, Secretary.

14, Tavistock Row, London, W.C., January 20, 1885.

## NATIONAL AURICULA and NATIONAL CARNATION and PICOTEE SOCIETIES (SOUTHERN SECTION).

WRIGHT & DODWELL.

"Stanley Road, Oxford,

"January 27, 1885.

"To Mr. J. WRIGHT,  
"Of the *Journal of Horticulture*,  
"171, Fleet Street, E.C.

"I sincerely regret that through ignorance of the facts I characterised your having voted at the meetings of the National Auricula and National Carnation and Picotee Societies on December 9, 1884, as a fraud in the printed circular which I wrote and issued to the members of these two Societies; and I now beg to apologise to you for the error I have thus committed, and I hereby withdraw any imputation upon your action on that occasion. I also agree to bear the expense of inserting this apology in three leading gardening papers, and to pay your solicitor's charges relating to this matter."

"E. S. DODWELL."

## LILIAM AURATUM.—Special Offer.—

Another large consignment just to hand. Splendid firm sound *Bulbs*, 6 to 8 and 8 to 10 inches in circumference, 28s. and 35s. per 100, 4s. and 6s. per dozen. Cheapest for quality ever offered. Samples two stamps. Please order quickly.

**MESSRS. MORLE AND CO.**, 1 and 2, and 162A, Fenchurch Street, E.C.

**Garden and Flower Seeds.**  
**JOHN DOWIE, SEEDSMAN, 144, Princes Street, Edinburgh,** begs to intimate that he is now sending out the finest stock of the above that money can buy, and as J. D. is now in business solely on his own account, the most of the Flower Seeds have been saved under his own supervision, and may be thoroughly relied upon.

**New, Choice, and Rare Seeds.**  
**W. THOMPSON, SEEDSMAN, 34, Tavern Street, Ipswich,** begs to inform his numerous Patrons and Amateur Horticulturists in general, that the Thirtieth Edition of CATALOGUE of Flower Seeds is now ready, and will be sent to any intending purchaser, post-free. It includes many seeds not to be had elsewhere.

**Forcing Asparagus.**  
**R. AND G. NEAL** beg to offer the above planted by the hundred or thousand (own growth, and transplanted last spring). Samples with Price on application. Also beg to call the attention of Nurserymen, Builders, and others to their exceptionally fine stock of FRUIT, FOREST, and ORNAMENTAL TREES and SHRUBS.

The Nurseries, Wandsworth Common, S.W.

**RASPBERRY CANES.**  
An immense quantity of the choicest Carters' Prolific and Fastoff for disposal.

The Advertiser being the most extensive cultivator of Raspberries in England, special care will be taken to select Canes most suitable for a vigorous growth and an early fruiting. Lowest cash terms on application to  
R. BATH, Crayford, Kent.

**HENDER'S STRAIN OF NEW FRINGED PETUNIAS.**—After great care and attention we have obtained beautifully fringed flowers of our strain of Petunias. The Double Seed will turn out a good percentage of fine double fringed flowers, often far superior to named varieties. The Singles (now offered for the first time) are magnificent, flowers large and finely fringed. Colours very rich and varied in markings. Double, 3s. 6d. per packet; singles, 2s. 6d. per packet. HENDER'S BALSAMS, double, eight vars., 2s. 6d. per packet. HENDER'S PETUNIA GRANDIFLORA, singles, 2s. per packet.

HENDER AND SONS, Nursery, Plymouth.

**CHARLES NOBLE, Bagshot.**

**THE ROYAL SEED NORFOLK ESTABLISHMENT**

**NEW EARLY PEAS for 1885.**  
The Earliest and Best in Cultivation.

**DANIELS' GEM OF THE SEASON**  
SHOULD BE SOWN NOW.

From Mr. A. ARTHUR, Orwell Gardens, Cambridge.  
"I sowed your Gem of the Season Pea March 20, and gathered them June 13, and sowed Laxton's Earliest of All March 15, and did not gather till June 20. This new Pea has proved what its name implies for earliness, productiveness, and flavour."

From Mr. T. NOTLEY, The Gardens, Stoke Hall, Stoke Holy Cross.  
"The Pea, Gem of the Season, has proved itself a good one. I planted it at the same time and by the side of Day's Early Sunrise. I gathered from Gem of the Season two days earlier, the pods were also full, averaging from seven to nine good sized Peas in each."

Height 2 feet, and very prolific.  
Price, 3s. 6d. per quart, 2s. per pint, 1s. 3d. per half-pint.  
Free by Parcels Post to any address.

**DANIELS' MIDSUMMER MARROW PEA.**  
The Earliest Blue Wrinkled Marrow in Cultivation.  
Height 1½ to 2 feet. Splendid cropper and quality.  
Should be sown now.  
Price, 3s. 6d. per quart, 2s. per pint, 1s. 3d. per half-pint.  
Free by Parcels Post to any address.

Triumph is the best of the many fine varieties we have sent out. It is a Blue Wrinkled Marrow, of exquisite flavour; the pods are large, well filled with large Peas. The habit is dense and bushy; height 2 to 3 feet. In constitution it is robust and hardy, and is the perfection of Peas either for exhibition or for ordinary use. Sixty-nine pods have been counted on one plant of Triumph—each pod containing nine to eleven large Peas.

CHARLES SHARPE & CO., SEED MERCHANTS, SLEAFORD.

**TUESDAY NEXT.**

New White Type of *Lælia anceps*,  
**LÆLIA ANCEPS SANDERIANA.**

Most beautiful novelty, discovered and sent home by Mr. Arnold, who came across a batch in full bloom, and every plant found is offered. This magnificent *Lælia* has the lip similar to Dawsoni, it being pure white with two crimson-purple blotches divided by a white line. The petals are very broad and pure white, and the flower altogether of large size: as many as six were seen on spikes. The importation is in grand order, enormous masses among them, some with upwards of 300 bulbs, and 10 feet and more in circumference. The dried flowers will convey an idea of the beauty of the species.

**MESSRS. PROTHEROE AND MORRIS** have received instructions from Mr. F. Sander to **SELL** the above splendid novelty at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on **TUESDAY NEXT**, February 3.

*On view morning of Sale and Catalogues had.*

**WEDNESDAY NEXT.—(Sale No. 6836.)**

**WHITE LÆLIA ANCEPS**  
*IN MAGNIFICENT MASSES.*

**MR. J. C. STEVENS** will **SELL** by **AUCTION**, at his Great Rooms, King Street, Covent Garden, W.C., by order of Messrs. SHUTTLEWORTH, CARDER & CO., on **WEDNESDAY NEXT**, February 4, at half-past 12 o'clock precisely, a grand importation of the beautiful and rare **WHITE LÆLIA ANCEPS**, including magnificent masses with several hundred bulbs, in splendid condition. The finest importation ever introduced. (See dried flowers.)

Also **ODONTOGLOSSUM CRISPUM (ALEXANDRÆ)** the finest type possible to collect, grand masses, and in splendid condition; **CATTLEYA TRIANÆ**, from a new district; **LÆLIA AUTUMNALIS** (received as **ATRO RUBENS**), **LÆLIA ACUMINATA**, and **ONCIDIUM KRAMERIANUM**.

*On view morning of Sale, and Catalogues had.*

**THURSDAY NEXT.—(Sale No. 6837.)**

**LÆLIA ANCEPS—NEW WHITE TYPE.**

**MR. J. C. STEVENS** will **SELL** by **AUCTION**, at his Great Rooms, 38, King Street, Covent Garden, W.C., by order of Mr. F. SANDER, on **THURSDAY NEXT**, February 5, at half-past 12 o'clock precisely, a truly grand importation of a magnificent **LÆLIA ANCEPS**—white type. The flowers are very large and fine, petals very broad and pure white, and the flowers are nearly 5 inches across, lip pure white, the throat dark crimson veined and blotched, the colouring being most vivid. A large quantity of dried flowers on view will convey an adequate idea of the great beauty and value of this species. The plants were collected by Mr. Arnold, and are in grand order, great masses being among them.

At the same time will be sold a fine light-coloured form of **LÆLIA ANCEPS**. Mr. Bartholomæus, who collected this lot in a new locality, writes that the flowers are large, sepals and petals rose, lip very light-coloured, in some varieties almost white, throat crimson veined.

*On view morning of Sale, and Catalogues had.*

SEEDS.

# JAMES VEITCH & SONS, ROYAL EXOTIC NURSERY, CHELSEA, LONDON, S.W.

*Have pleasure in directing attention to the following Choice Floral Novelties and Specialties, which are all of great merit and can be confidently recommended:—*

**AMARYLLIS, Finest Hybrid.**

Saved from the magnificent collection grown at our Chelsea Nursery.

*Per Packet, 2s. 6d.*

**AQUILEGIA, Veitch's New Hybrid;**

Comprising many new, beautiful, distinct, and pretty sorts, of various shades, of which a coloured plate appeared in the *Garden*, October 11, 1884.

*Per Packet, 1s. 6d.*

**BALSAM, Veitch's Superb Strain.**

*In Eight Distinct Colours, Separate, 2s. 6d.*

*In Mixture, per Packet, 2s. 6d.*

**BEGONIA, Choicest Hybrid.**

Carefully hybridised and saved from our celebrated collection.

*Per Packet, 2s. 6d.*

**PANSY, Large Flowered.  
ENGLISH or SHOW.**

Of this popular flower we have grown extensive collections at our Seed Farm, and offer a very superior class of seed, saved from the finest varieties only.

*Per Packet, 1s. 6d.*

**CALCEOLARIA, International Prize.**

The finest strain in cultivation, remarkable for its free flowering qualities and the compact habit of its growth. The flowers are exceedingly rich and varied in colour, beautifully spotted and blotched, and of remarkably fine form and substance.

*Per Packet, 2s. 6d.*

**CINERARIA, Veitch's Superb Strain.**

Flowers of finest shape and substance, colours richest and brightest selfs, as also the most varied, showy and attractive sorts with clearly defined margins of various shades.

*Per Packet, 2s. 6d.*

**CYCLAMEN PERSIUM.**

Saved from the best varieties, and cannot fail to produce flowers of the finest substance, and of the most charming and diversified shades of colour.

*Per Packet, 2s. 6d.*

**Cyclamen giganteum magnificum.****Cyclamen giganteum roseum compactum.**

First-class Certificates, Royal Horticultural Society. Magnificent varieties, with flowers of immense size, beautiful colours, and massive substance.

*Each, per Packet, 3s. 6d.*

**DAHLIA, Single; Mixed Colours.**

Exceedingly floriferous and highly decorative; extremely valuable for cutting.

*Per Packet, 1s.*

**GLOXINIA, Veitch's Superb Strain.**

Saved from the magnificent collection, embracing all the finest varieties, grown at our Chelsea Nursery.

*Per Packet, 2s. 6d.*

**MARIGOLD, Veitch's Superb Striped.**

Remarkably handsome striped and perfectly formed large double flowers.

*Per Packet, 1s. 6d.*

**MIGNONETTE, CRIMSON KING.**

A new, distinct, and most desirable variety for pot culture, throwing up numerous stout flower-stalks, terminated by extremely broad spikes of delightfully scented bright red flowers.

*Per Packet, 1s. 6d.*

**NEW CYCLAMEN GIGANTEUM,  
Charming Bride.**

First class Certificate Royal Horticultural Society. This superb new and distinct variety is remarkable for the pure ivory-whiteness of its flowers, which are without any tinge of colour at the base. It is the largest and best pure white variety extant.

*Per Packet, 3s. 6d.*

**IMPATIENS SULTANI.**

Awarded Two First-class Certificates by the Royal Horticultural and Royal Botanic Societies.

Remarkable for its profuse and continuous flowering, and the gorgeousness of its flowers, which are of a brilliant and effective rosy-scarlet colour. Decorative alike for the stove, greenhouse, conservatory, dinner-table, or for summer bedding.

*Per Packet, 1s. 6d.*

**PETUNIA, Veitch's Superb Striped.**

Selected for many years with great care; very constant, and produces beautifully striped flowers.

*Per Packet, 1s.*

**PRIMULAS, Veitch's Superb Strain.**

**FINEST FRINGED, Red, White, and Mixed.**

These are the finest in cultivation, and were awarded a First-class Certificate by the Royal Horticultural Society for superior quality.

*Each, per Packet, 2s. 6d.*

**PRIMULA OBCONICA.**

First-class Certificate Royal Horticultural Society.

A new, pretty, and interesting Primula, with flowers of a soft lilac shade of colour, flowering continuously and profusely from spring till autumn.

*Per Packet, 2s. 6d.*

**TORENIA RUBENS.**

A charming and distinct variety, with beautiful deep violet-blue flowers.

*Per Packet, 1s. 6d.*

**WALLFLOWER, Veitch's Dwarf Dark.**

A new and very superior selection, of rich dark colour, dwarf growth and bushy habit; fine for Spring Gardening.

*Per Packet, 1s.*

**CAMPANULA calycanthema rosea.**

A new bright rose-pink variety. A most attractive and desirable addition to our hardy border plants, owing to its pretty colour and free-blooming habit, the flowers literally hiding the plant.

*Per Packet, 1s. 6d.*

**CARNATION, DOUBLE.**

Saved from an unequalled collection of the finest varieties.

*Per Packet, 2s. 6d.*

*For full particulars of above and other Varieties of Choice FLOWER SEEDS see CATALOGUE for 1885, forwarded gratis and post-free, on application.*

WORDSLEY WONDER.

A First Early Blue Wrinkled Marrow.  
Height, 2½ feet.

## TRIALS AND REPORTS.

Mr. W. Iggulden says:—

"It is the best novelty in the way of Peas."

Mr. R. Gilbert says:—

"It is calculated to suit the million."

Mr. W. Ingram says:—

"The Wordsley Wonder is altogether a very good Pea."

The "Gardeners' Chronicle" says:—

"Of great productiveness and good constitution."

Mr. William Crump says:—

"I am well pleased with Webbs' Wordsley Wonder."

Mr. W. Kimpton says:—

"The flavour is all that can be desired."

Mr. Edward Tate says:—

"Very prolific, having from ten to twelve Peas in each pod; of first-class flavour."

Mr. Joseph Pitt says:—

"The best new Pea sent out for some time."

Mr. Whittington Landon says:—

"Strong grower—very prolific—delicious flavour."

NOVELTIES.

## SUTTON'S

## MICHAELMAS WHITE BROCCOLI.

Comes in about Michaelmas day, and deserves a place in every garden. Heads firm, of fine texture, snowy white, massive, and of excellent quality.

Per packet, 2s. 6d., post-free.

"Your Michaelmas White is a splendid autumn Broccoli; comes in about the second week of September. I find it remarkably level and compact in growth, very firm, solid, white heads, and cooks particularly tender."—Mr. J. W. Bunn, *Gardener to E. M. Price, Esq., The Philberds.*"The Broccoli I had from you this season is now (the middle of September) a perfect wonder; very large and good in quality."—Mr. J. Hall, *Gardener to Mrs. Hammond, Kitterstone Hall.*

## The Finest Scarlet-fleshed Melon

## SUTTON'S SCARLET INVINCIBLE.

Introduced by us last year, and has acquired a reputation unequalled by any other Melon known. Form somewhat globular; skin orange-red, finely and evenly netted; flesh thick, bright scarlet, and of exquisite flavour. On June 26, 1883, it was awarded a

First-class Certificate by the Fruit Committee  
of the Royal Horticultural Society;

and in every competition we are acquainted with it has taken 1st Prize.

Per packet, 1s. 6d. and 2s. 6d., post-free.

"A scarlet-fleshed variety of the most distinct character and highest excellence." *Gardeners' Magazine*, June 30, 1883.SUTTON & SONS,  
Royal Berks Seed Establishment.  
READING.

THE

## Gardeners' Chronicle.

SATURDAY, JANUARY 31, 1885.

## THE KENTISH RIVIERA.

NO one approaching the grey shores of Albion from the "other side," and witnessing the low cliffs of Ramsgate or the barren sea wall between Dover and Folkestone, would imagine that westward of the latter town, between that rising port and the long low flats of Romney Marsh, there was a district which may fairly bear the title we have given it. Geologists and naturalists know that the Warren on the east is a place to revel in, but few of them would choose it as a winter residence, or think that within a mile or two westward there is an undercliff which from the mildness of its climate and the luxuriance of its vegetation might fairly vie, save in extent, with the better known district in the Isle of Wight; yet within a mile or two of Folkestone, at the base of the Greensand cliffs, is a district where Camellias grow into large bushes, covered in the season with thousands of blooms, which would do no discredit to a conservatory; where the Blue Gum, *Eucalyptus globulus*, rears its head regardless of frost (in ordinary winters); where the Hawthorn-scented *Aponogeton* clothes the pools with its singular white flowers; and where *Hydrangeas* luxuriate as they might in some corner of Devonshire: one measured some 45 feet round, by 5 feet in height. Yet all these may be seen at Enbrooke and at Encombe, both gardens at the back of the long straggling town of Sandgate, facing due south to the sea, and backed up on the north by cliffs of sand and clay—treacherous because filled with water, which percolates through the sand to the clay, and renders the latter slippery to a degree, that houses crack and have to be rebuilt on safer sites.

At Enbrooke, the seat of Lord Pelham, are the Camellias we spoke of. There, too, is a fine *Araucaria*, covered with male catkins; there is a massive Pine of the *Tæda* section, with groups of evergreen Oaks, Hollies, and Irish Yews. *Arbutus* thrives, and *Cupressus macrocarpa*, where not exposed to wind, forms a dense green shelter that recalls the glorious belts of the fine Conifers around the Laureate's residence at Freshwater. The Pinaster grows, it is true, to large size, but its gaunt trunks and scraggy branches, even though laden with cones, are not attractive. The mansion stands back on rising ground with a full view of the sea and backed by plantations nestling under the bare hills known to military men as Shorncliff. It is a house of many gables overlooking a terrace-garden with radiating flower-beds, glowing with colour even in November—*Vesuvius*, *Tom Thumb*, and *Beauty of Calderdale* *Pelargonium*, and the purple velvet *Spitfire* *Petunia* lending colour even so late in the season. *Erica arborea* forms bushes that once more recall the Genoese hills, and along one side of the property runs a ravine clad with *Rhododendrons* and *Ferns*, and ablaze in spring with *Narcissus*, *Hoop Petticoats*, and other bulbs which thrive as if to the manor born. The glass

is not of great extent, but here Mr. Wright, the gardener, had a good show of Chrysanthemums, and a crop of Trophy Tomatos to make one's mouth water.

A little further west is Encombe, an amphitheatre of wooded banks facing south, where Escallonia macrantha, big Myrtles, and a fine Eucalyptus testify to the mildness of the climate, but where the house about to be pulled down reveals cracks which remind one that it is not only earthquakes that have to be reckoned with. Magnificent Bay trees, Hydrangeas, Abutilons, Bouvardias all stand out-of-doors unburnt save in exceptional seasons; and here Richardia æthiopica (the so-called Arum Lily) and Aponogeton make the pools gay. The great enemy here is the south-west wind, which sometimes blows like a hurricane, covering the foliage with salt deposit. But for this, almost anything will thrive, the common Cherry Laurel being one of the exceptions. Eonymus japonicus, Ligustrum latifolium and L. ovalifolium form admirable seaside shrubs. Pittosporum Tobira forms no bad substitute for Orange blossom, and close to the sea the Tamarisk waves its elegant plummy branches and pink flower-spikes as if salt spray and rude winds did not exist. Encombe has lately changed proprietorship, but the gardener, Mr. Brown, takes a pride in showing what can be grown in a district where the ordinary observer confined to the dusty highroads or stony beach would imagine nothing but the hardest of hardy things would grow.

The Folkestone lower road, to the east, runs at the base of a Greensand cliff, also richly clad with wild flowers and permeated by winding paths with here and there groups of Austrian Pines. Much might be done here by judicious planting. Clematises and hosts of showy wild plants might be introduced, but we dread to make the suggestion lest the wildness of the spot, already marred by trenches, earthworks, and paths, that suggest military roads rather than walks for civilian visitors, should be still further "improved." With such resources as Folkestone has in its undercliff, the greatest judgment should be exercised to develop its natural beauties, or at least to prevent their destruction, by well-meaning but incompetent improvement committees.

## New Garden Plants.

*LÆLIA ANCEPS SANDERIANA*, n. var.

BOTANICALLY this might be regarded as the same as *Lælia* a. Dawsoni; as matters stand actually, it would be more than risky to put this grand plant into the trade under the above-quoted name; for there is a difference, and the difference is a well-marked one, recognisable by every one. In the elder variety there is an entire transverse purple zone on the anterior part of the mid-lacinia. In the fresh variety at hand there are two delightful purple eye-blotches at the same place, divided by a white area. The plant may fitly bear Mr. F. Sander's name. The sepals and petals are described as ivory-white. The markings of the disc are as vivid as in Dawsoni, the yellow would appear to be darker. *H. G. Rehb. f.*

*BARKERIA ELEGANS* AND *CYCLOTELLA*.

The writer of those lines in the last issue, p. 115, should look to *Gardeners' Chronicle*, xiii., not only to p. 72, but to p. 112, also in the very centre of the page. There it is stated that the woodcut represents probably *Barkeria elegans*, although the description is of *Barkeria cyclotella*, sent first by Mr. Bull, then in a most admirable state by Mr. Day. After all such venerable orchidic patriarchs as Messrs. B. S. Williams and Dominy could be trusted for knowledge than to name old well-known *Barkeria elegans*. *H. G. Rehb. f.*

## A TRIP TO JEYPORE.

(Concluded from p. 108.)

In the parrot-cage I saw five parrots near each other on the ground; their colouring was grey on the wings and back, purple-pink on the chest and neck, and white on the head. I had before seen this kind of parrot as single specimens, but was never struck with its beauty till I saw these five together. It is evident that repetition of the same thing, whether bird or plant, or anything else, often adds to its beauty. I once saw something like 5000 pink pelicans on a lake—a sight never to be forgotten! A soldier in uniform, whatever this may be, walking alone through Oxford Street, looks very much like carnival; but make a regiment in line of such specimens, and see how much grandeur the whole assumes. It is the same with trees. A single specimen may be a fine thing, but a group of the same trees, or an avenue, acquires totally different characters from the single specimen. An avenue 100 miles long, however, is likely to bore the mind like a street organ always playing the same tune. These are the little things which have to be kept in mind in planning out extensive gardens. The charm consists in variety; in studying the effect of different shades of colour and form of foliage, and in putting before the eye, now and again, surprises in various ways, which the visitor does not see, and cannot see, till he turns round some corner, and beholds a novel picture—a *coup d'œil*—some grand specimen, or a blaze of colour. Mr. Dewes' scheme of book classification puts landscape gardening under the heading of "Fine Arts," and I think he is right. The ordinary artist, by combining imaginary scenes on canvas, often paints a pleasing picture. The landscape gardener, if everything be favourable—though his art, I think, is the more difficult of the two—should be able to make a real landscape by employing trees, shrubs, water, grass, buildings, &c., instead of paint. Flower beds are matters of detail which need not enter into the general scheme of a fine landscape.

I visited the old capital of the Jeyapore State—the city of Ambèr, now in ruins. It is in a small valley adjoining a small lake, and about 6 miles out of the modern capital. The palace and fort are on the top of an adjoining hill, and are interesting places. The surroundings are picturesque, but hardly deserve the eulogium Bishop Heber is said to have given the spot, viz., "that he never viewed a scene so striking, picturesque, and beautiful." In the valley of Ambèr, close to the lake, I saw a few Mango trees, which appeared to do well. I do not know which is the more interesting—Ambèr itself or the road to it, strewn, as it were, on both sides with the ruined mansions of the grandees of past generations.

On the way back I went to see the crocodiles, in an immense tank in the city. This is a curious and rather interesting sight. Some meat is taken for these animals. They are called by the keeper from the feeding point, which is a sort of balcony overlooking the tank. The call is a hideous and prolonged shout, I suppose in crocodile language. Anyhow, they understand it perfectly, as, soon after, they start from all directions of the distant banks, and a number of crocodiles' noses are seen approaching towards the feeding point, each cutting the surface of the water, and producing two small diverging waves. When they all congregate under the balcony, a piece of meat is tied to a rope, and the crocodiles are played with and tantalised by dangling the meat before them. The interior of their enormous jaws is of a pretty primrose colour. It is stated there are several hundreds of them in that tank. There are also eight fine tigers in the city, and a young one, ten months old, said to have been born in the place.

The country on to Ajmere is the same as before described, with distantly scattered villages, and limited patches of cultivation. Many parts of the country have "Babool" trees (*Acacia arabica*), though stunted in growth. There does not appear any reason why millions of this tree should not be grown, for its bark, gum, and firewood. In one of the tanneries at Cawnpore I was told that Babool bark is richer in tan than Oak bark, and is extensively used there.

Rajputana appears to be well suited for horse-breeding, if rain were always to be depended upon. This year (1884) there is in many places plenty of grass; the climate is dry, and water, I was told, is not more than 30 feet below the surface, so that wells do not appear a difficult thing to sink. I fancy the real difficulties are people and money. Of these

there appears to be a sufficiency to make a good beginning, if the different princes were not oriental. In the cities a large part of the population is non-productive, consisting of mere hangers-on of the palace so that the waste of money in display is enormous.

### AJMERE

is a very interesting city, full of archæological remains, with many buildings and tombs of the time of the Mahomedan dynasty. Many of the latter are about 400 years old. Near a shrine, on the top of a hill, called "Tara Gur," I saw a Jessamine tree (*Jasminum grandiflorum*), with a stem 12 inches in circumference. From various cross-examinations which I was able to make, I came to the conclusion that it must be a hundred years old, if not more. There is one of similar circumference near another Mahomedan shrine in the city. Both were flowering as if age were nothing to them. Near the latter shrine I saw an old *Mimusops Elengi* (Mulseri), a Tamarind tree, and a *Mimusops Kauki* (Khirmi), which were said to have been planted at the time the shrine was built, that is, about 400 years ago. I had not, however, any means of ascertaining the truth of this. The trees looked old but healthy, and appeared as if there were still a long life in them.

In Ajmere there is a nice little public garden which would admit of being vastly improved and made picturesque, owing to its being on a hill side. On the upper part of this garden there is a small lake, bordered by several marble halls of the Mahomedan period. These, by a species of vandalism, were built up and turned into houses and offices, and the marble columns whitewashed. One of them is now being restored, and it is hoped, for the sake of the British name, that all the others will be also restored.

About 6 miles from Ajmere is Pūshkar, the holiest of all holy places of all India. It is the only place in India where there is a temple dedicated to Brahma. I visited this place on a holy day, the great fair and bathing day of the year, on the occasion of a full moon. There was a crowd of about 50,000 people, all in their holiday dresses. They looked very picturesque. There is a small lake, surrounded by hills, and edged on one side by bathing steps, the town, and its temples. A crowd of that size, staying there several days, does not retire without leaving dirt of all sorts. This dirt is washed down annually into the lake, the water of which is considered very holy. The people bathe in it and wash their underclothing in it. Most of them do not depart without drinking some of this very holy water. It contains turtles and crocodiles, and is of the colour of brown soup.

I did not notice any trees of any consequence on the way. The sides of some of the hills are clothed with small stunted trees, and the forest officers, I was told, are employed reforesting others. There can hardly be any doubt that, in olden times, these hills were covered with forest, now most of them are as bare as one's hand.

On the top of "Tara Gur" are barracks, which are used as a sanatorium for invalid European soldiers. Here I noticed a very strange thing. Drinking water on the top of this hill is very precious, as there are no springs; and yet the annual rain water from the flat clean roofs of the barracks and other houses, is allowed to run off and down the hill, while numbers of water-men are employed with bullocks and skins to fetch bad drinking water from the bottom of the valley, or from Ajmere, 1000 feet or more below the barracks! The water from the surface of the hill is caught in tanks, but is only fit for washing; while the best and cleanest drinking water (rain water) from the roofs of the houses and barracks is thrown away, or allowed to mix with the general drainage water! Yet every one you meet tells you the water of Ajmere is very bad!

Ajmere is the headquarters of the Rajputana-Malwa railway, and will probably one day become the Oxford of Rajputana. The Mayo College in marble is all but finished. This, with the boarding houses of the different states, each built in stone, and in a different style of oriental architecture form an interesting group of modern buildings. With so much engineering talent and learning looming in the future, Ajmere ought before long to be provided, not only with good water, but with many things that a civilised life may wish for.

### AGRA.

I never pass through Agra without staying to have a look at the Taj and its garden. The monument affords a repose to the mind which no other form of architecture appears to give; and the garden is still largely preserved in the old Mohammedan style, with

wide stone walks at right angles to each other, and shaded by old tall trees, many of which are common Mangos. Many of these trees, however, are now decrepid, and only fit for firewood. An attempt is being made to raise young trees, so as not to leave the walks bare when the old trees are cut down; but

Third, they can make little growth, as the roots of the old trees rob their soil of its water and its nourishment. A few years of open air and open soil would have made finer specimens of these young Mahogany trees than they are now ever likely to make. *E. Bonavia, M.D., Etawah.*

albumen and fibrin, and hence the explanation of its peculiar properties.

Papain has even been used successfully to soften and loosen the membranous outgrowth from the skin of the throat, which is attended with such fatal results in cases of diphtheria. Fig

FIG. 25.—PAPAW TREE : *CARICA PAPAYA*.

the operation is an instance of what bad gardening can do. Under some old Mango and other trees near the monument, an attempt is made to grow a row of young Mahogany trees. First, the lower branches of these young trees are removed, so that the stem and upper branches are imperfectly nourished, the main stem being thin and crooked. Second, the shade of the big trees is injuring the young ones beneath, so that what growth they make is weak and imperfect,

### THE PAPAW.

To those accustomed only to see small plants in hothouses, our illustration (fig. 25), showing the size to which the plant attains in Mexico, may come as a surprise. The Papaws are permeated by a milky juice, which has the singular property of rendering tough meat tender; in fact, the active principle, Papain, has been proved to have a soluble effect on

leaves, according to M. van Volxem, have similar properties.

In our stoves the Papaws are handsome shrubs or trees, with bold palmately-lobed leaves, and clusters of small cream-coloured bell-shaped flowers, containing, some stamens, others pistils. Sometimes the sexes are on different trees, sometimes on the same, and we have more than once met with flowers which bore stamens and pistils within the same flower. The

matter is of some importance because, of course, if a purely male plant be cultivated no fruit is obtained, and the fruit, though of little value as an article of diet in this country, is ornamental and striking in appearance. In the tropics it is used in a cooked condition, in curries, pickles, &c. There are several species, the best known is *C. papaya*; *C. cundinamarcaensis*, so-called from Cundinamarca, a State in New Granada, is of smaller stature; *C. erythrocarpa* has crimson fruit. *M. van Volxem* has raised various hybrids interesting for the beauty of their fruits, and of some of which we have given illustrations on a former occasion, vol. xix., 1883, p. 445.

### SUDDEN APPEARANCE OF BRITISH PLANTS.

AFTER the completion of a narrow-gauge railway on the Penryn Castle estate, I was not a little surprised to see in what an almost incredibly short space of time many plants appeared on the cuttings. First to attract attention was a goodly number of the Great Mullein (*Verbascum Thapsus*), which sprang up the following season on a rocky cutting near Port Penryn, and in a situation where I was not before aware of its existence although I had occasion, almost weekly, to pass the place previous to the formation of the railway. Other plants which appeared in quantity were the Foxglove (*Digitalis purpurea*), the trailing Hypericum (*H. humifusum*), and the wall Veronica (*V. arvensis*). The most remarkable appearance was, however, that of the Butterfly Orchis (*Habenaria bifolia*) which sprang up and flowered the following season after the completion of the railway. The cutting in which it appeared was in some places upwards of 20 feet in depth, and the plants came up at distances below the former level of the ground of from 6 to 10 feet. As this Orchid cannot flower from seed in a single season, it is apparent that the tubers must have remained dormant in the ground for a very long period, and until placed in a suitable medium for their development, for I certainly collected large well-formed spikes of bloom the following season, after the cutting was formed. The probability that the tubers may have been introduced with any surface-dressing is not consistent with facts, apart from the well-known difficulty that is always experienced in getting the plant established in a new habitat. A somewhat similar case to the above came under my notice a few years ago, in which the same Orchis appeared in great quantity in a newly-thinned plantation, and where I am fully convinced no plants had been seen for a number of years previously. *A. D. Webster.*

### NOTES ON THE CULTIVATED ASTERS.—VIII.

(Continued from p. 48.)

**SUBGENUS III, BIOTIA.**—Differs from *Euaster* by its unflattened achenes and shorter leafy points of the bracts of its multiserial involucre. Connects the genus *Aster* with *Olearia* (*Eurybia*) of Australia and New Zealand. Only two species, confined to North America.

39. *A. corymbosus*, Ait. *A. divaricatus*, Linn. Herb. *Eurybia corymbosa*, Cass. *Biotia corymbosa*, DC.—Stem, 1½–2 feet long, slender, flexuose, hairy upwards. Leaves cordate-ovate, all except the uttermost distinctly petioled, acuminate, thin in texture, sharply serrated, slightly hairy on both surfaces; upper leaves ovate-lanceolate, sessile. Heads many, arranged in a lax corymbose panicle. Involucre campanulate, ¼ inch in diameter, well imbricated; bracts all with short semi-orbicular erect green tips. Ligules 6–10, linear, whitish, ½ inch long. Achene cylindrical, glabrous; pappus pale red, ½ inch long.

Canada to Georgia, in woods and thickets.

40. *A. macrophyllus*, Linn. *Eurybia macrophylla*, glomerata, and Schreberi, Nees. *Biotia Schreberi*, latifolia, glomerata, and *macrophylla*, DC.—Stems stouter than in the last, 2–3 feet long, slightly hairy only towards the top. Leaves cordate-ovate, all except the uppermost distinctly petioled, acute, shortly serrated, firmer in texture than in the last; the lowest sometimes 5–6 inches long and broad, with a petiole longer than the blade; upper leaves sessile. Heads many, arranged in an ample panicle with corymbose branches. Involucre campanulate, ¼–½ inch diameter; bracts in several rows, all with semi-orbicular erect green leafy tips. Ligules

10–15, whitish or pale lilac, ½-inch long. Achene cylindrical, glabrous, ½-inch long; pappus pale red, moderately firm in texture, flexuose, a little longer than the achene.

Common in woodlands in damp or rich soil, from Canada eastward to Manitoba and southward to Georgia. As will be seen from the synonymy this is very variable, the name as interpreted by Dr. Gray covering four species as defined in De Candolle's *Prodromus*.

**SUBGENUS IV, ORTHOMERIS.**—Bracts of the involucre dry and uniform in texture throughout, with erect tips, generally well imbricated. Ray-flowers fertile; achenes rather flattened. Pappus moderately firm in texture. Next to *Euaster* this is the largest of the nineteen subgenera, but as adapted for gardening purposes it does not deserve a very high character. It contains altogether about forty species, five of which belong to the Eastern and sixteen to the Western United States, six to the Himalayas, one (*Aster Willkommii* of Schultz) to Europe, and the remainder to Siberia, China, and Japan, where it is the dominant type. I shall notice only the six species we possess at Kew at the present time in a living state.

41. *A. altaicus*, Willd. *A. angustifolius*, Lindl. *A. spartioides*, Clarke. *Calimeris altaica* and *canescens*, Nees. *Galatella juncea*, Lindl.—Stems many, from a woody rootstock, erect, varying from a few inches to 1½–2 feet in length, sometimes much branched. Leaves oblanceolate, obtuse, sessile, entire, scabrous, the lower not more than 1–2 inches long. Heads solitary or few, in a corymb at the end of the branches. Involucre campanulate, ¼ inch in diameter; bracts few, lanceolate, nearly equal in length. Ligules about twenty, whitish, under ½ inch long. Achene densely silky; pappus pale red, flexuose, nearly ½ inch long.

A characteristic Central Asian type, extending from Afghanistan and the temperate region of the Western Himalayas through Siberia to China.

42. *A. glaucus*, Torrey and Gray.—Stems 1–2 feet long, much branched, quite glabrous up to the very summit. Leaves lanceolate, entire, sessile, glaucous, glabrous, acute or subobtus, the lower 2–3 inches long. Heads numerous, forming a lax ample panicle with corymbose branches. Involucre campanulate, ¼ inch in diameter, well imbricated; inner bracts lanceolate; outer oblong. Ligules 12–15, bright lilac, linear, ¾–½ inch long. Achene hairy, ½ inch long; pappus pale red, flexuose, ¼ inch long, much protruded from the involucre.

Rocky Mountains, Wyoming, to Utah and Colorado. A very distinct type, introduced into cultivation from seeds collected by Dr. Parry.

43. *A. ptarmicoides*, Torrey and Gray. *Diplopappus albus*, Hook. *Heleastrum albus*, DC. *Doellingeria ptarmicoides*, Nees. *Eucephalus albus*, Nutt.—Stems tufted, erect, much branched, hairy upwards, 1–2 feet long. Leaves crowded, ascending, lanceolate, entire, acute, firm in texture, the lower petioled, 3–4 inches long, the upper sessile. Heads many, arranged in a lax corymbose panicle. Involucre broadly campanulate, multiserial, ½ inch in diameter; bracts green, but rigid. Ligules 20 or more, pure white, ¼ inch long. Achene glabrous, hardly at all flattened; pappus white, ½ inch long, its bristles very numerous, unequal, the largest thickened towards the tip, strongly ciliated.

A very distinct and widely spread species, extending from New England to Georgia, Colorado, Illinois, and the Saskatchewan.

44. *A. tenuifolius*, Linn. *A. flexuosus*, Nutt. *A. sparsiflorus*, Pursh. *A. Tripolium*, Walters, non Linn.—Stem weak, slender, erect, glabrous, 1–2 feet long, more or less branched. Leaves few, distant, linear, entire, the lower 3–4 inches long. Heads solitary, or few in a lax corymb at the end of the branches, involucre obconic, multiserial, ½ inch diameter; bracts lanceolate-acute; ligules bright lilac, lanceolate, ½ inch long. Achene hairy, ½ inch long; pappus soft, fragile, dirty white, rather longer than the achene.

Salt-marshes of the coast from New England southward to Florida. *A. Chapmanni* of Torrey and Gray is a rare nearly allied Floridan species. Both of them resemble in habit our European *Aster Tripolium*. The plant called *Chapmanni* in English gardens is totally different, and is a variety of *turbinellus*.

45. *A. nemoralis*, Ait. *A. uniflorus*, Michx. *A. ledifolius*, Pursh. *Galatella nemoralis*, Nees.—Stems slender, erect, densely leafy, pubescent, simple, 1–2 feet long. Leaves crowded, lanceolate, all small, sessile, and entire, the lowest only 1–1½ inch long. Heads few,

in a lax simple corymb, sometimes solitary. Involucre broadly campanulate, well imbricated, ½ inch diameter; bracts lanceolate, green, acute. Ligules 10–20, bright lilac, ½ inch long. Achene hairy, rugulose compressed; pappus copious, flexuose, pale red, ¼ inch long.

A boreal species, extending from Newfoundland and the shores of Hudson's Bay southward through Canada to New Jersey.

46. *A. acuminatus*, Michx. *A. divaricatus*, Lam. non Linn. *Diplostephium acuminatum*, DC.—Stems simple, erect, pubescent, flexuose, 1½–2 feet long. Leaves large, thin, obovate-oblong, acute, sessile, sharply serrated, the central ones 3–4 inches long, 1½–1 inch broad, narrowed gradually from the middle to the base. Heads numerous, arranged in a lax panicle with corymbose branches. Involucre broadly campanulate, ½ inch diameter; bracts few, pale green, lanceolate, acute. Ligules 10–12, linear, white or pale lilac, under ½ inch long. Achene slender, ½ inch long; pappus copious, flexuose, whitish, twice as long as the achene.

Damp, cool woods, Labrador to Pennsylvania, and along the mountains southward to Georgia. *J. G. Baker.*

(To be continued.)

### THE CULTIVATION OF PLUMS UNDER GLASS.

FROM a commercial point of view this mode may be deemed inexpedient, because whenever our crop of Plums fails out-of-doors, we get an abundant supply of others for our markets from other places. This is unquestionably the case with respect to culinary kinds if not with the choicer kinds; but apart from these considerations, and looking at the subject from a purely horticultural point of view, it is an inexpensive method that is full of interest, and, therefore, should be recognised and encouraged, and the crop secured, whatever conditions of weather may prevail outside. The season of ripening is entirely under control, the fruit is free from the depredations of insects and other pests if proper precautions against them are taken, and, above all, there is the pleasure and satisfaction of producing fruit when it fails out-of-doors, or otherwise is of an inferior description. Plum-houses are already established in some gardens, and form an interesting feature and a very attractive one when the trees are in blossom or laden with fruit. I consider that grand old variety, *Coe's Golden Drop*, to be worth a house almost everywhere in this country, and particularly in northern and cold districts where it only ripens properly in most favourable seasons, and then rarely assumes that beautiful golden appearance which is essential to get it to perfection.

Plum trees require a well ventilated structure, with plenty of light; in form a lean-to or span will answer. This should be furnished with about two 4-inch bot-water pipes all round, so that a temperature of about 40° at night and 50° in the daytime can be maintained under any circumstances. The border should be made of good calcareous loam, about 3 feet in depth, and should be drained properly. The trees may comprise those in cordon form, and be run up at about 18 inches beneath the rafters or bars of the house, at about 4 feet apart, or the trees can be trained on trellises, similar to Peaches, at the aforementioned distance from the glass. The following may be selected as being good kinds for the purpose, viz., *Rivers' Prolific*, *Green Gage*, *Jefferson's*, *Kirke's*, *Denyer's Victoria*, *Reine Claude de Bayay*, and *Coe's Golden Drop*; the latter kind should be plentifully planted, by reason of its keeping properties, as well as being the best Plum in cultivation.

Owing to the vigorous habit of these trees, it will be necessary to check growth in some degree; therefore, when the trees are fairly established in the border, the roots will need to be curtailed by cutting them back somewhat, or partially lifting them, in order to make the trees fruitful and keep them in a bearing state. Water should be given copiously throughout the growing season, and the borders should never be permitted to become very dry.

#### TREATMENT.

As Plum trees are very impatient of fire-heat, especially during the early stages of growth, particular care should be exercised in this matter. Use no artificial heat at night if the house will stand at 40°, and 50° by it will be ample in the daytime until such time as natural means will provide what more is required. It should be given at all times except when very severe weather prevails, and as liberally as the

surrounding circumstances will admit—scarcely too much of it can be admitted at favourable times. Ordinary attention to syringing, training the shoots, and stopping them, will of course be necessary, and after the cleaning of established trees is finished it is advisable, before the flowering time comes, to well fumigate the house, or else syringe the trees over with quassia or tobacco water to free them from any insects which may abound and subsequently prove very troublesome and detrimental to the well-doing of the trees. *G. T. Miles, Wycombe Abbey.*

## PALMS.

THE following notes refer to some of the larger Palms now growing in the Palm-stove of the Royal Botanic Garden, Edinburgh, and were originally laid before the Botanic Society of Edinburgh:—

On the completion of the new Palm-house at the Royal Botanic Garden in 1858 the late Professor Balfour read to the Society a paper giving a detailed account of this fine structure, including a description of some of the larger Palms then growing, and mentioning their respective heights. The late Mr. MacNab also communicated to the Society from time to time much information regarding them. The object at present is to record the progress that has been made during the last twenty-seven years by those plants which still exist, and also to give some information regarding younger plants, several of which give indications of ere long outstripping the older ones. Of the old Palms the largest is a fine specimen of *Livistona chinensis*. The height of this tree in 1858 was 42 feet; in 1875, 45 feet; and it is now 49 feet high, showing an increase of 7 feet in twenty-seven years. The circumference of the stem at the base was 6 feet in 1875; it is now 6 feet 3 inches. It has a clear upright stem, 33 feet in height up to where the lowermost leaf is given off, and is in vigorous health for so old a plant. Of *Scaevola elegans* there are two plants, now nearly equal in every respect. In 1858 the taller one measured 26 feet in height; both plants are now 47 feet 6 inches in height (an increase of 21 feet 6 inches in twenty-seven years). They have clear stems 30 feet high, and their circumference at the base is 3 feet 3 inches. For the latter measurements there exist no data for comparison. There are eleven fully developed leaves on each plant, averaging 14 feet in length. These two fine trees are in vigorous health, and are likely to go on improving for years to come. *Corypha australis* in 1858 measured 23 feet in height; it is now 41 feet. It has a clear stem of 20 feet 4 inches, and measures 3 feet 3 inches at the base. *Phoenix silvestris* in 1858 was 20 feet high; it is now 30 feet 4 inches, with a clear stem of 14 feet, the circumference at the base being 1 foot 7 inches. The leaves are 11 feet 6 inches in length, mostly curved downwards, and forming a fine canopy of foliage. The most remarkable of the older Palms is the well-known example of *Sabal umbraculifera*, the Bull Palm of the West Indies. This grand tree was 30 feet high in 1858, and it is now 36 feet 4 inches. In 1858 the circumference of the stem at the base was said to be 5 feet 6 inches; ten years later 5 feet 4 inches is given; it is now 5 feet 3 inches; it seems difficult to explain how this has happened. In 1874 it had a clear stem of 14 feet, and the circumference below where the lowermost leaf is given off was 3 feet. It has now 17 feet 4 inches of a clear stem, and the circumference at the top is 3 feet 1 inch. The greatest difference occurs in the length of the leaves, which was, then 16 feet, the leafstalk being 10 feet, and the blade 6 feet long by 5 feet 6 inches broad; now the leaves measure 12 feet 6 inches, viz., 7 feet of leafstalk, and 5 feet 6 inches of blade; there is an increase, however, in the breadth, which is now 6 feet 8 inches. The smaller size of the leaves made may probably be an indication of diminishing vigour, owing to the great age of the tree; otherwise it appears to be perfectly healthy, and is developing numerous young leaves and abundance of flowers and fruit. The latter is produced in such quantity that it requires to be cut off occasionally to prevent the tree from exhausting itself too much. Since its removal ten years ago to its present position in the centre of what was formerly the old Palm-house, it was grown until last spring in a wooden box 7 feet 10 inches square by 5 feet deep, and rested on the floor of the house, which formed the bottom. Owing to the heat and moisture the box had become very much decayed,

showing the roots of the plant protruding in several places; it therefore required to be furnished with a new box. As the tree was resting on the floor, and in the best possible position, in the centre of the house, where it gets the light all round, no advantage was to be gained by moving it. Instead of the usual wooden tub, it was thought advisable to have a permanent structure built round it. When the square boards were removed to allow of this being done, a dense mass of roots was disclosed. The corners were carefully forked out, and any old soil that could be got at taken away. The whole ball was then covered with mats, and soaked with water. A stone tub or wall 34 feet 6 inches in circumference, 18 inches thick at bottom, tapering off to 12 inches at top, and 5 feet deep, was then built round it; openings were left at the bottom for drainage, and spaces round the sides for Ferns and other plants to grow in when the building was finished, additional drainage material and fresh soil were inserted; Ferns, *Ficus stipularis* and other plants, were planted round the sides and margin so as to cover the stonework. Being circular it takes up less room than it did formerly, and has also a much better appearance. Regarding the age of this tree, the late Mr. MacNab gave some interesting facts in a communication to this Society in 1874. He says: "This tree cannot be less than sixty years old. It was removed from the stove of the old Botanic Garden at Leith Walk, in 1822, and was kept in a lean-to house in the present garden for thirteen years. This house being only 18 feet high at back and 7 feet in front, it was greatly hampered." Assuming the Palm to have been only 16 feet high when removed from this lean-to house in 1835, it has thus made 20 feet 4 inches in fifty years, to attain its present height of 36 feet 4 inches. This is equal to an increase of nearly 5 inches per annum. If the same ratio be applied to the 16 feet formed previous to 1835, that would give the age of our tree as being over eighty-eight years. We know, however, that during its infancy this species of *Sabal* makes very slow progress. For the first eight or ten years it produces long, simple, undivided leaves, after which it assumes the more or less divided palmate leaves characteristic of the adult plant. The seeds are consequently not in demand by nurserymen and others who require plants that will have a good appearance quickly. Many species of Palms, *Livistona*, *Scaevola*, *Chamaedorea*, and others, assume their characteristic adult foliage, though in miniature, in from three to four years from the time of sowing the seed, and then make useful plants for decorative purposes, whereas *Sabal umbraculifera* requires from sixteen to twenty years to become in any way effective.

A seedling from our Bull Palm, raised certainly not less than eighteen years ago, is now 6 feet high, measured to the tip of the leaf, and has 7 inches of stem. This is the largest of our young plants, and has thus increased at the rate of 4 inches per annum. Assuming that the old plant increased at the same rate while forming its first 6 feet of growth, and allowing the remaining 10 feet to have increased at the same rate which the plant has made during the last fifty years, viz., 5 inches per annum, this would give ninety-two years as the lowest approximate age of our tree.

Regarding some of the younger Palms which have not been measured hitherto, the largest is a fine plant of *Euterpe edulis*. It is now 47 feet 6 inches in height. It has a clear stem of 34 feet 9 inches, and the circumference at the base is 1 foot 10½ inches. This plant has made very rapid progress. It was removed from the east range of houses fifteen years ago, and was from 12 to 13 feet high at that time. It was then growing in an earthenware pot 16 inches wide, and is now in a tub 5 feet wide, by 3 feet 10 inches deep.

*Cocos plumosa* is 44 feet 9 inches high, and has 30 feet of a clear stem. The circumference at the base is 4 feet 8 inches, and it is about thirty years of age.

*Caryota excelsa* measures 37 feet 7 inches in height. It has a clear stem of 18 feet, and the circumference at the base is 3 feet 1 inch.

A young vigorous plant of *Cocos Romanzoffiana* is 34 feet 4 inches high, and it has a clear stem of 22 feet 8 inches, the circumference at the base being 3 feet 10 inches. This plant was received from the nurseries of Louis van Houtte, at Ghent, in 1865, and is now about twenty-six years old. These large Palms, with the exception of *Sabal umbraculifera*,

already mentioned, are all growing in round wooden tubs, made of Oak, and placed on rollers. The principal advantage of this system of having the plants in tubs instead of their being planted out in the ground of the house is the comparative ease by which they may be removed to other parts of the house, when they become crowded. It is just five years since most of the larger plants were retubbed and arranged. Several of them have already become so crowded that considerable rearrangement will be again necessary. Another important advantage is, that we are thus enabled, by occasionally turning the plants round, to assist them materially in keeping their stems upright. In certain portions of the house, when they remain too long in one situation, the leaves become drawn to the position of most light, which ultimately causes the stem to become bent. *W. Lindsay.*

## HISTORY OF ORCHIDS AT KEW.

ON considering the great number of exotic Orchideæ, now introduced and cultivated in this country, and the high prices they realise at public sales, it occurred to me that a brief history of the early introduced species, and their gradual increase, might be interesting to your readers. In the last edition of *Miller's Gardeners' Dictionary*, published in 1768, about thirty species of *Epidendrum* are noticed, of which he says "But as the plants cannot, by any art yet known, be cultivated in the ground, it would be to little purpose to enumerate them; though could the plants be brought to thrive, many of them produce very fine flowers of uncommon forms." He further says, that he had "Three species sent from America, which he planted with care in pots, and placed them in a stove where they showed their flowers, but the plants soon after perished."

In Aiton's first edition of *Hortus Kewensis* two species of *Epidendrum* are described, namely *E. cochleatum* and *E. fragrans*, as growing in the gardens in 1789, and Dr. (afterwards Sir J. E.) Smith says:—"We have scarcely seen any one species of this genus, except in a dry state, before the year 1787, when *E. cochleatum* flowered at Kew; nor was it till October, 1788, that *E. fragrans* of Swartz exhibited its fragrant and elegant bloom in the same rich collection. At present, several species are to be seen flowering in the spring and autumn. The following were in a thriving state in the Royal Gardens, Kew, in 1794:—*Epidendrum coccineum*, *E. secundum*, *E. lineare*, *E. ciliare*, *E. cucullatum*, *E. ensifolium*, *E. ophioglossoides*, *E. ruscifolium*, *E. fuscum*, *E. tripterum*, *E. Barringtoniæ sessile*, *E. altissimum sanguineum*, *E. natans*, and *E. glaucum*. They are all cultivated in the stove, with very great heat; being mostly parasitical they flourish best with fragments of half-rotten bark at their roots. They may be increased by parting their roots, or what is commonly called offsets, of which they generally have plenty." In the second edition of *Hortus Kewensis* (published in 1813) 115 species are enumerated, of which thirty-one are British and eighty-four exotics, the greater number being epiphytal and natives of the West Indies, a few of the East Indies, Cape of Good Hope, and New South Wales.

In the early part of the present century Dr. Roxburgh sent from India *Cymbidium aloifolium*, *C. præmorsum*, *Aërides odoratum*, *Geodorum purpureum*, *G. citrinum*, *G. dilatatum*, which, with the two recently introduced species of *Dendrobium*, *D. cucullatum* and *D. Pierardi*, and the West Indian epiphytal species, were in 1822 growing in pots on a back shelf of a low-roofed house, then called the propagation-house. In the spring of 1823 a collection was forwarded from New South Wales by Allan Cunningham, consisting of *Dendrobium speciosum*, *D. æmulum*, *D. linguæfolium*, *D. rigidum*, *D. pygmaum*, *Cymbidium reflexum*, and others.

### SPECIAL HOUSE FOR ORCHIDS.

It having become evident that the mode of cultivating these epiphytal Orchids was not successful, a portion of the end of the propagation-house was set aside for them, and a bed was formed, consisting of loose turfy soil interspersed with small portions of stems of trees, on which the plants were placed, where many of them grew freely, most of them rooting into the soil, and clinging to pieces of wood. He also between the years 1823 and 1828 forwarded about forty tuberous rooted species; they were planted in a bed of peat soil, mixed with chopped sphagnum and kept moist, contiguous to the preceding, where

they remained for several years, producing their curious flowers, all of which are figured in the *Botanical Magazine*. Between the years 1823 and 1825 a considerable number of species were received from Trinidad, forwarded by Mr. David Lockhart, the superintendent of the garden, amongst which were the first plants of *Stanhoea insignis*, *Oncidium Papilio*, *Lockhartia elegans*, *Catasetum tridecatum*, *Ionopsis pallidiflora*, and others, all of which were epiphytal, and many of them being sent growing on portions of branches as cut from the trees, which, being accompanied by instructions from Mr. Lockhart as to how they should be treated, led to the successful cultivation of epiphytal Orchids. A few species were also received from the Cape of Good Hope, one being the curious plant of *Bonatea speciosa*, and from Java and Australia *Calanthe veratrifolia*. On the removal of the house in 1836 they had to be transferred to another in which they did not thrive, and very few of these plants have since been imported.

Up to about 1830 Orchids were looked upon merely as curiosities in botanic gardens, and by a few amateur plant lovers, the only trade collection being that of Messrs. Loddiges, of the once celebrated Hackney nursery, who had early become interested in the cultivation of Orchids. Their list published in 1825 enumerates eighty-four species under thirty-one genera, but the flowering of *Stanhoea insignis* at Kew, and the splendid *Cattleya labiata*, *Mossiae*, and *crispa*, *Aérides odoratum* and *Saccolabium guttatum*, brought Orchids (then known by the general name of *Epidendrums*) into special favour with a few amateurs, one of the first and most enthusiastic being Mr. James Bateman, of Knypersly Hall, Cheshire. Their cultivation was taken up by the Horticultural Society at their gardens at Chiswick, where a house was set apart for their special cultivation, and led to houses being specially set aside for them elsewhere. They rapidly became popular and favourites at horticultural shows.

But to return to the progress of the Kew collection after 1826. New species were successively added, and in 1836 a low-roofed small house was altered and appropriated to their cultivation, in which they flourished for several years, growing and flowering freely. Shortly after the appointment of Sir W. Hooker as Director, in 1841, one of his first desires was to have the Orchid collection increased, and for that purpose a collection of 200 species of the commoner kind was purchased of Messrs. Loddiges. With this, importations, and presentations, the collection in 1848 amounted to 755; and in 1850 to 830 species and varieties.

By this time a large and spacious house was erected for their cultivation, but on account of its interior being fitted up with smooth stone and slate shelves, and its roof glazed with large squares of thick sheet glass, it was soon found that an atmosphere was generated ungenial to Orchids, and they had to be removed. Although placed under the management of three successive foremen recommended to the Director as adepts in the cultivation of Orchids, the collection greatly deteriorated under their management both in health and loss of species.

In 1862 the collection again revived, and lost species were restored; and in 1864, the time of my retirement, the collection amounted to 638, being 192 less than in 1850. *J. Smith, Ex-Curator, Royal Gardens, Kew.*

## CORYANTHES.

[IN our number for May 6, 1882, we gave a full description and illustrations of the extraordinary flowers of *Coryanthes elegantissima* (by mistake called *C. macrantha*). The article is too long for reproduction here, but we are glad to have the opportunity of adding the notes on the microscopical structure of an allied species, forwarded by Dr. Herdmann, which form a fitting complement to what has been before said. ED.]

On the surface of the column next the "pitcher," or lip, just above the entrance to the spout-like passage, the epidermal cells are prolonged into tooth-like projections or scales. These are arranged with considerable regularity in an imbricating manner, and all have their points directed downwards, i.e., towards the top of the column where the stigmatic surface is. Figure 26 shows the arrangement of these scales:—

A is a surface view, B is a small part of A more highly magnified, while C gives a profile view as seen in a section. This structure looks as if it was intended to prevent bees from climbing up the column instead of creeping through the passage.

The inside of the bucket-like lip itself is, so far as I examined it, perfectly smooth, being lined by epidermal cells with flat surfaces.

The "horn," H, fig. 28, which produces the slightly sweet fluid is somewhat difficult to sectionise on account of its softness and stickiness. First, I examined it fresh and made some sections, then I put the remainder in absolute alcohol for a week, and afterwards made a further examination of it, and took another series of sections. The superficial layer of cells all over is formed of moderately thick-walled, very protoplasmic cells, with distinct nuclei (fig. 29, A). They are nearly cubical, or in some cases elongated vertically. Fig. 29, C, shows a surface view of these cells. Underneath this layer lies ordinary thin-walled parenchymatous tissue (fig. 29, A). In the sections made from the fresh "horn," the protoplasm of the superficial cells contained a great many spherical clear bodies of various sizes, and these in many cases contained two or three smaller rounded bodies (see fig. 29, B, which is a highly magnified representation). These were not starch grains; they stain yellow with iodine. They were probably not oil globules, since they were apparently unaffected by the addition of ether and alcohol. The surface of the "horn" when fresh was covered by the slightly sticky secretion, and this showed under the microscope the same rounded clear bodies which were present in the sur-

FIG. 26.—CELLS FROM THE COLUMN OF CORYANTHES. (SEE TEXT.)

face cells. The rest of the secretion seemed a watery or slightly viscid fluid which took on a uniform stain with aniline blue or eosine, and showed no structure under a high power of the microscope. In the sections made from the pieces of the "horn" which had been kept for a week in alcohol, the clear rounded bodies were almost entirely absent. This seems to show that they are soluble under the prolonged action of alcohol. The plate or rounded projection from the base of the labellum is placed above the pitcher in the natural position of the flower. The upper surface, upon which bees would alight, is very decidedly convex. This structure is almost entirely formed of thin walled parenchymatous cells, and as the first series of sections which I made showed nothing else, I was unable to understand why the bees should eat this part of the flower,\* and was inclined to think that it might be the sweetest secretion from the "horns," which after all attracted them to the plant. Some other sections which I have made since, show, however, that one part of the plate (which part I am unable to say for want of material—the last sections were made from small fragments of the structure) has the surface layer of cells filled with granular protoplasm (fig. 27, A), and in some cases prolonged upwards into long finger-like projections (fig. 27, B). All intermediate conditions between A and B can be found, and in some places the projections are even longer than those shown in B. Fig. 27, C, represents a surface view of A. In all cases these cells are distinctly nucleated, and I have no doubt this is the tissue the bees feed upon, if, as Crüger says, it is the plate-like projection that they eat. *W. A. Herdmann, Zoological Laboratory, University College, Liverpool.*

THE VALUE OF ORCHIDS. — At Messrs. Protheroe & Morris' Sale Rooms, Cheapside, on the 23d inst., a very fine variety of *Laelia anceps*, with pure white sepals and petals, was knocked down to an eminent firm of nurserymen for 90 guineas (£94 10s.). Imported and unflowered pieces of white *Laelia anceps* realised 31 guineas, 17 guineas, and 13 guineas respectively; and an established plant of *Laelia elegans* in flower sold for 25 guineas.

\* See Darwin's *Origin of Species*, 6th ed., p. 154.

## FROM A BUCKINGHAMSHIRE GARDEN.

JAN. 10, 1885.—Fifteen moons of change and chance have waxed and waned above this little spot of garden ground—this green oasis in the wide fertile desert of Buckinghamshire cornlands—since last the pleasures and the pains of it crystallised into written words.

Drearly grey and bleak, the level fields lie all around us. So bleak, so limitless, when, as at this time, the horizon is shrouded in cold mists and fog, are they, that they have been compared to the Steppes of Tartary! Our oasis has enlarged itself during these long months. "The Bocage" has been created. From out of the forest gloom of the Fantaisie suddenly the path leads into the bright surprise of a broad band of flowers. If I shut my eyes for a moment I can recall it in all its summer bloom. Nearest to the wood-side a Beech, and a Silver Birch, and a deep green Portugal Laurel, grow together. Underneath among the stones, spreading out over them their glossy leaves, are large white-flowered Periwinkles from the Olive valley of Rocca-bruna. (Since this has been their home, however, the flowers have lost their first purity of whiteness.) Then, quite beyond the shadow of the wood, shines out a long perspective of brilliant colour, flowers in clumps, and lines, and patches quite filling up the whole length and sunny breadth of flower border. There was nothing in it rich or rare, but every sort of sweet-smelling old-fashioned flower seed was sown there, and most of them thrived to perfection in the newly trenched ground. There was Lady's Pincushion of all shades of velvet-brown and purple stuck full of the whitest pins, and smelling deliciously. Sweet Sultan (or the Sultan's flower, *Cyanus floridus turcicus*, Parkinson) lilac, yellow and white. The name is accounted for by the old herbalist because "the great Turk, as we call him, saw it abroad, liked it, and wore it." We had the Sultan's flower in lilac, white, and yellow, and the yellow is worth all three, though it is the least easy to grow. Somewhere it must do well, for the London flower-shops are full of it in its season. But something went contrary with yellow Sweet Sultan here. Then there was Marvel of Peru—old-fashionedly Mervale of the World—a West Indian plant, whose seed was long ago sent into Europe, and dispersed in almost every garden of note. It is "Bella Notte" in Italy, under the influences of whose sunshine it is said to be most fragrant when the sun goes down. We had some Italian seed also, but though coloured the same as ours—red, white and yellow, and striped—the flowers had no scent. Then there were whole beds of Mignonette (somewhere I have seen Mignonette translated "Old Man's Darling"), and Clove Carnations, and sad-coloured Night Stocks, and honey-scented Alyssum, beloved of honey-bees, and Sweet Peas, and Ten-weeks Stocks, and a hundred things that I forget; and later on came a deep glow of bronze-leaved *Lobelia cardinalis*, and auratum Lilies towered in perfumed splendour above the slighter annuals, and white stars of *Nicotiana glauca* shone in the dark evenings, and there was quite a thicket of *Dianthus superbus*; and behind all, along the back of the border, and against the line of young Alder hedge, grew great pillars of single Dahlias. So luxuriantly they grew in the new-made soil, so strong and rich in flower and foliage, that their tall, topmost flowers grew almost out of reach. The great hushes of red Juarez, alternate between the white, were a wonderful sight, when at last their slow-blooming buds had opened out all over them; but in a single night, with the first frost, their glory departed, and hanging their disrowned heads, they stood in black and shrivelled ranks. Along the walk between the flower border and "The Park" we planted a line of scarlet and pink Thorns, and made the first start with a Holly hedge. The young Hollies would do well but for Kitty, the domestic donkey! She is a handsome, wayward donkey, with well marked zebra legs, and whenever she sees me near she gallops up, and poking her nose between the bars of the iron rails nibbles off a young Holly shoot. It is done, of course, to tease me, for she cannot mistake them for Thistles. At the end the walk turns and skirts a broad space of seedling *Rhododendrons*. On the left a narrow turf walk leads off, winding through the thickest part of the Bocage. This turf walk is my pride. The plan of it may not be fault-

less; some of my friends say it is most like a wriggling snake. But when the underwood grows thicker, and the Firs and evergreens are larger, its course will be concealed at every bend, till suddenly and unexpectedly you come upon an open round of green grass, enclosed by a hedge of Juniper. This green space, in the midst of the closer grove, is named "Glorietta," after some delightful garden I have heard of under the blue sky of Spain. Through all the months of summer the Junipers were lit up with long garlands of a certain fiery-orange flowered Nasturtium with bluish leaves, that wandered all over them unforbid. The serpentine walk is planned to "wriggle" on beyond the Junipers into the older Fantaisie. A straight path passing under some

some single-flowering Camomile. Camomile loves to be trodden, and it is then, as you crush it under foot, that it gives up most freely its delicious aroma. The fresh delight of this rockery never failed during the whole summer long; it had been made in a way to give new pleasure every day. The stones, brought from a distance, are old and grey, dashed with warmer red, and they harmonise well with the colours of the rock garden. Every plant that we put into the many pockets of peat and leaf-mould looked content and happy, and every plant grew (except the Sundew, from a moor in Hampshire—it simply refused to live). There is nothing a plant loves so dearly for its home as a snug little pocket in a rockery, or, indeed, any kind of nook

of the Pyrenees, and which hates so heartily a garden bed or border—took at once to our rocks. Even through the snow to-day, little stars of it shine bluely here and there among the crevices; small delicate Irises crest the jagged upper edge or cornice. It is beautiful to look up at them, when the sun shines through the lilac or yellow of their petals. There are two vigorous Yuccas, and near them—just for a freak of dear remembrance of many a terraced Riviera wall—I put in a Globe Artichoke root. The grey leaves lean over Acanthus-like, and two or three Artichokes ripened slowly into bee-haunted, purple Thistle-crowns. Few plants, indeed, are more graceful in their growth than the common Artichoke, and I love it well, notwithstanding that dear old Parkinson in the *Garden of Pleasant Flowers* leaves out of his discourse "the Artichoke with all his kinds" and reserves them "for the kitchen garden, because (as all know) they are for the pleasures of the taste, and not of the smell or sight." Along the east side of the upper rock-walk, from August up to the latest hour that the Frost King gave them grace, flourished a fairy forest of Amaranthus or Love-lies-Bleeding. The knotted blooms of amaranthine velvet measure often 2 feet long, and the edges of the walk and down the other side streamed with purple. Children delighted in these long purples, and used to beg them for their "doll's feasts." Then amongst the true rock-dwellers there is *Geranium tuberosum*, lovely always, whether in its summer bloom, or when the leaves take on their autumnal red; *Sedums*—spirale corsicum, lydium, and *Sieboldii variegata*, *Saxifraga muscoides*, all over pink in spring, and in winter a cushion of emerald-green; *Saxifraga longifolia*, dentata, and ceratophylla. A root of *Polygonum nigrum* was put in, with small hope that it could ever live; but it has grown so large in one season, that it will have to be moved to another place. This quick-spreading creeper, with its little 'round' leaves, seems hardly so well known as it should be. Many a chance-sown seed of *Eschscholtzia*, with many another pretty old-world flower, has bloomed for our pleasure amongst the rocks: and a few green and violet-coloured Christmas Roses (from a garden in Cumberland) seem quite at home. They are difficult, and capriciously fanciful; but certainly they do not hate the stones, as they do our borders.

Just opposite the rockery and the Roman walk are some old Damask Roses, and the light shade cast when the afternoon sun was hot, seemed to comfort both the Roses and the rock plants. The great yellow tree Lupin once grew here, but it is dead, and in its place there came a Virgin's Thistle (Milk Thistle, Our Lady's Thistle, *Carduus Marianus*). It came of itself, as they always do, near where there have been monastic buildings—in whose gardens they used to be planted anciently—for the sake of the legend pertaining to them. This special plant is the finest of the kind I ever saw. Before the frost touched it, it seemed thoroughly to enjoy growing itself into a great clump of rich green, white-veined bands, 5 or 6 feet round! The Box edging was overwhelmed with the flood of leafage—leaves one dared scarce touch, they were so dangerously thorned. "Our Lady's Thistle" arises of her own sweet will in divers places all over the garden; but I cannot say she is always permitted to remain in the chosen spot. Thistles are not well everywhere. In some corner where nothing else is wanted to grow they are best. We have another kind which I wish to think may be the Blessed or Holy Thistle (*Carduus Benedictus*, of the gardens of former days, the same of whom Culpepper, in his *Herbal* (he was given to uncharitable remarks), says, "I suppose the name was put upon it by some who have little holiness in themselves. What a character that delightful old Culpepper was! He had faith in the doctrine of signatures, and he doctored with astrology as much as with medicine, declaring he could show "how and by what means, and also in what manner, the glorious host of Heaven doth act upon all terrene and terrestrial herbs, roots, plants, men and women and fishes," and the wonderful influence of the sun, moon, and stars upon everything. The Melancholy Thistle he esteems higher than *Benedictus*. "It is under Capricorn, and, therefore, under Saturn and Mars; one rides melancholy by sympathy, the other by antipathy. . . . The decoction of the Thistle in wine being drank, drives out superfluous melancholy, and makes a man as merry as a cricket." The Melancholy Thistle might be useful in these days when melancholy is said to increase upon the human race; but our chance of ever finding it seems small, for by the description it appears to be not much of a Thistle at all, as it "differeth from all other Thistles in its appearance."

FIG. 27.—CELLS FROM THE PLATE OF THE LIP OF CORYANTHES. (SEE TEXT.)

FIG. 28.—CORYANTHES MACULATA VAR.: SECTION THROUGH FLOWER.

PED., peduncle; SEP., 1, part of one of the lateral sepals; SEP., 3, section of median sepal; PE., one of the petals; COL., the column; STIG., the stigmatic surface; P., pollinia; T., tabular projection from base of L., the lip; PIT., pitcher-like enlargement of the labellum; H., horn. The direction of the arrow shows the course taken by the bees.

FIG. 29.—CELLS FROM THE "HORN" OF CORYANTHES. (SEE TEXT.)

great Elms unites "Glorietta" with the orchard and the "Allée Verte." It interested myself, perhaps, more than it would others, to find in an old gardening book, after my ill-designed turf walk was made, a plan as nearly as possible the same in detail, even including Glorietta! although the ancient Pleasance was on a grander scale.

To-day a heavy fall of snow, the first this winter, puts an end for the time to a great work begun on the south side of the garden. Here we built up last winter "the Roman walk"—a bank of limestone rocks (!), having a paved way on the top, reached by narrow rude stone steps at either end. We are now building up a sort of rampart at the southern end—a platform from whence the fields and a distant line of wooded hills may be surveyed. The air up here is finer, more invigorating than on the walk below. Upon the paved way between the stones we planted

under the shelter of a big stone, or a corner hemmed round with flints. If stone were as plentiful with us as bricks, I think there should not be a flat bed in the garden; the flowers should all be terraced up with stones. Our rockery I wanted to be dry and unheated. The aspect should be west, and it should be a little strip of garden, full of sweet and warm memories, without one spot of gloom or damp throughout its length of near 50 feet. So little many-coloured rock Roses with soft grey foliage crept down the heaped-up stones, overspreading them almost too quickly, and carrying their charm of rose and salmon-pink bloom far on in the year, unwilling, even when November came, to confess their long summer over. Portulacacs in scarlet and gold bloomed better than ever they did before in the open ground. The blue *Lithospermum*—which in April is found all over waste sandy places about Bayonne, and at the roots

## WALL COPINGS.

WHATEVER our climate may have been in former times, when it is said bountiful crops of Apricots and other choice fruits were grown with little difficulty, spring frosts have now become so disastrous that, except in very favoured situations, it is a rare occurrence that good crops of stone fruits can be obtained, even upon walls, without the aid of copings, or some other kind of protection; and so severe are frosts sometimes during the blossoming period (as was experienced last spring) that even any kind of ordinary protecting material is of little avail to insure a crop. Copings are, however, of service in most seasons, and should be generally made use of. They may be formed of various kinds of material, such as slate, wood, or glass; but those made of the latter, owing to their transparency, are the most desirable, and should be more or less in width, in accordance with the height of the wall upon which they are to be employed; the higher the wall the wider the coping should be.

For an ordinary wall from 12 to 16 feet in height, for instance, the coping should be 3 feet in width, and be made in a manner so as to be readily adjusted or removed. When they are of this width and substantially made, they become rather expensive items, if used for no other purpose than to protect trees when in blossom; but they can be so constructed as to be conveniently turned to many practical and profitable purposes, and thus be boons of considerable benefit, especially to those having limited accommodation. It is chiefly for the purpose of pointing out some of the uses for which they are applicable that I wish to draw attention to them, as after the experience of last spring some cultivators who have not already furnished their walls with them may now contemplate doing so, and those made in the usual manner are of comparatively little service further than for the one object. For the sake of utility they may be made in sections of 4 feet in length in the form of sashes, the framework being either of wood or iron; the latter is, of course, the most durable, and ours are made of it and are fixed to the walls by sockets and iron stays—a simple and secure method. Where not required for the trees, a time embracing the greater part of the year, sashes of this description can be made use of in forming the lights of span-frames, the frames being fixtures made of bricks and wood, or portable of wood, are valuable adjuncts to the garden. They form the best places in which to grow Primulas, Cyclamens, Carnations, Bouvardias, and kindred subjects. Cucumbers and Melons may likewise be produced in them during the summer months, and various bedding plants can be propagated in them. In the winter they are suitable for protecting Strawberries, Lettuce, Violets, *Helleborus niger*, Celery, and other plants. The sashes are also of use for covering outside Vine borders when the Vines are carrying crops of fruit in autumn and winter. *Thomas Coomber.*

## SEASONABLE REMARKS ON ORCHID CULTURE.

At p. 564, vol. xxii., I alluded to the treatment of Orchids in the early days of winter. Preparations must now be made for early spring. Work is not so very pressing as yet in many gardens, and it is a good plan to start now at one end of the house in which Orchids are grown, and examine every one of the plants carefully.

## CLEANING THE PLANTS AND SURFACING.

The first operation is to get some warm rain-water and dissolve in a gallon of it 2 oz. of soft-soap; with this and the aid of a soft sponge the plants are made thoroughly clean. At this time we surface-dress or repot the whole of them, beginning with those in the warmest house. Of course, many of them do not require repotting; they are in the middle of their growth, and disturbing the roots would injure them very much.

## POTTING.

In all Orchid growing establishments a potting-shed should be built, convenient to the houses, so that it will not be necessary to take the plants out-of-doors or into a lower temperature than that in which they have been growing. I have no such convenience, and rather than carry the plants out-of-doors and into a cold potting shed I pot them in the house where they are growing. The potting material in all cases is very much alike—good brown fibrous peat torn to

pieces by the hands, sphagnum moss well washed and freed from weeds and all extraneous matter, some clean potsherds and charcoal broken into small pieces—the broken charcoal must have the dust sifted from it. For the largest plants I mix the sphagnum and peat together in equal proportions. *Saccolabium*, which succeed best in this house, are potted in sphagnum only. There are a few handsome *Oncidium*s also grown in the East India-house, which should now be repotted.

## ONCIDIUM LANCEANUM.

The finest, perhaps, is *O. Lanceanum*. I bought a small plant of this twenty years ago, and it is now a large handsome specimen. When purchased it was growing in a pot, and succeeded fairly well for some years, but it was decided to place it in a Teak basket, where it has done much better; it is placed on the stage amongst other plants in summer, but during the winter season it is suspended from the roof in the warmest house, with the leaves almost touching the glass. It requires rebasketing once in three or four years.

Another *Oncid* not often seen doing well is *O. phymatocilium*. It requires the temperature and similar treatment to *O. Lanceanum*. It does well in pots if potted in the right way, that is, with the last formed pseudobulbs near the rim of the pot, so that the next formed bulb will be formed quite close to the rim, thus giving the roots an opportunity to grow mostly outside the pot; they prefer this, and form in considerable masses outside, where they remain in better condition than those formed inside.

## ODONTOGLOSSUM AMPLIATUM.

This is now throwing up its flower-spikes, and in a small state slugs or small snails are very partial to them. It is a plant that does best in a high temperature, but, unlike the other two, it does not form roots on the outside of the pot. This plant I have generally potted in the summer, and found that it succeeds well with that treatment.

## ODONTOGLOSSUM ROEZLII.

I find August or September a good time to repot *Odontoglossum Roezlii*. They grow very freely in this house, placed near the glass, and well supplied with water at the roots at all seasons. They are now in the middle of their growth, and should the pots be allowed to become dry, they would be sure to suffer. A rather moist atmosphere is quite necessary for many of the occupants of the *Odontoglossum*-house, including the *Angræcums*.

## CYPRIPEDIUMS.

Some of the *Cypripedium*s are now in a condition to be repotted. Of the heat-loving kinds *C. Spicerianum*, *C. Lowianum*, *C. Stonei*, *C. Lawrenceanum*, *C. lævigatum*, and *C. niveum* may be mentioned. I find the recently introduced *C. ciliolare* succeeds well in the Cattleya-house. *J. D.*

(To be continued.)

## The Arboretum.

## THE LARGE ARAUCARIAS AT BUSBRIDGE HALL.

I SEND you particulars and dimensions of an *Araucaria imbricata*, a male tree with catkins, the soil being a sandy loam; it is one of a double row of trees on either side of a walk, distance apart about 17 yards in line, the whole forming a short avenue of a novel and imposing appearance. They were transplanted about twenty years ago, then averaging about 6 feet in height. The one I wish particularly to mention is 34 feet high, girth at base 6 feet 3 inches, and at 6 feet from the ground 3 feet 6 inches, with a spreading diameter of branches of 20 feet. It is of very perfect form; its opposite neighbour is a female, bearing cones, but only one appears to have been fertilised by the catkins and is a very fine one, being some 7 or 8 inches in diameter, and of a reddish-brown colour. The position of the catkins on the tree is due south, and that of the cones south-west. They are about 30 feet apart—the latter 3 or 4 feet below the level of the former. In this instance the tree bearing cones is much coarser in growth, and quite as healthy looking as the male, though not nearly so compact and hand-

some in form, both having a few decaying sprays on the inner side near the trunks. Therefore, this would give the negative answer to the question raised by Mr. George Bushby on October 18, 1884. The decaying of the lower branches is met with in very small trees as well as the larger cone-bearing ones, and I am inclined to think it the result of some disease. This is the first time these trees have produced either catkins or cones. By-the-bye, Mr. Bushby does not give the diameter of his undoubtedly fine tree, so that one might gain an idea of its form, whilst the diameter mentioned by "R. McK." is somewhat remarkable, being nearly the same as the height of his tree, described in your issue of January 3, 1885, and which would, I should think, destroy its symmetry. *G. W. K.*

## PHOTINIA SERRULATA.

This handsome evergreen we have growing here (in Wales), on a south wall, its large handsome foliage always attracting attention, especially in winter, at which period the young growths assume a bronzy-red colour, and during which it never ceases to grow. I consider its foliage superior to a *Magnolia*, and to be a more rapid grower, although unfortunately it does not flower here. But for covering a wall with bold and bright foliage there are few plants to equal it, nor does the plant appear to be so generally known as it should be. It is a native of Japan and China, and yet no winter that we have had injures it, having withstood that of 1881 without suffering in the least, no protection whatever being given it. *W.*

## FERTILE CEDAR CONES.

My experience is at variance with that of your correspondent, "W. C., Inverness," concerning the fertility of Cedar cones ripened in these islands. Probably your correspondent's experience is, however, correct in regard to the northern district whence he writes, and where he probably resides. The idea as to the probability of these cones proving unfertile had never occurred to me before. Many years ago I noticed in a district very favourable to vegetation, in South Wales, that squirrels persisted in visiting certain Cedar trees in the park, and yearly plucked and tore to pieces the many beautiful cones with which the grand Cedar trees were laden. These mischievous rodents had, moreover, to traverse a wide piece of grassland to reach these trees—an additional proof that they found something more than empty cones to exert their jaws upon. More than this, for some months after all the cones had been destroyed I have seen these little animals hunting the ground beneath the branches of the trees, and occasionally finding some substance, which I imagined could be no other than stray Cedar seed, which had either dropped from the cones, or been buried by them there in the season of plenty in accordance with their instinct. Being curious as to the presence of seed or not, I procured some of the finest cones, and found from one to three perfect seeds within. Doubtless other readers can confirm my statement, that squirrels habitually do visit seed-bearing trees for the same purpose, and so set the matter at rest. But I have a more practical case than the above, which proves that the seeds are not only fertile in some cases, but that they possess strong germinative vitality. A lady living near Woburn, Bedfordshire, a few years since, sent me seeds from her Cedar growing upon the lawn near to her mansion. I sowed them in 60-sized pots, and had them placed upon a cool greenhouse shelf (at Valentines), and quite 60 per cent. germinated and grew, being subsequently potted off. The plants are probably in the above gardens still. *William Earley, Ilford.*

## POTATOS.

WHILST so much is just now being written about the Potato disease, permit me, in view of the fact that practically this fell disorder seems at present to be non-existent to try and forget all about a disagreeable subject, and revert to the Potato as an ordinary useful garden vegetable, popular and ever welcome, without having my thoughts of the favourite esculent clouded over, with nightmares of murrain, fungoid and sporadic monsters, with Messrs. Smith, Plowright, and other eminent scientists sitting up aloft as directors of the demoniacal array.

If Mr. Augustus Harris, of Drury Lane celebrity, wishes to attract the town with a great Christmas spectacular ghostly goblin horror, he should an-

nounce next winter the production of the great tentacular sporadic Fungoid Fury and the Fairy Potato, the whole of the scenery and characters reproduced for the occasion with scientific microscopic accuracy. Who should be the hero who would finally storm the stronghold of the Fungoid Fury and deliver the Fairy Potato from its horrid sporadic clutch I will not designate. Perhaps some others can supply the deficiency. But whilst all this scientific warfare is proceeding, the Potato seems to be calmly resting on its oars (I do not mean its resting-spores), healthy, robust, and full of vigour for another season's work and productiveness. The mildness of the early winter proved somewhat troublesome, as the ardour of the tubers to get to work was rather promoted than restrained; but now cold has come to the aid of growers, and the tubers, with becoming regard for the time of year, have quietly gone to rest.

As a rule Potatoes are very wide awake, and there is something truly singular in the association of the *genus homo* with large quantities of tubers, all with their eyes wide open, perhaps taking stock of the human being in their midst, and if endowed with intelligence, perhaps wondering whether he would be half as mealy as they are when cooked.

Just now, if the eyes of the tubers are open, they are not shooting. Those of the human race are often credited with shooting glances, sometimes tender, sometimes fateful; but the eyes of the Potato shoot something more tangible than these, for from them come growths fraught with all that is valuable in the tuber. These will shoot presently—all in good time; and if due care be exercised they will be strong, vigorous, and of a healthful purple or green hue.

Some one said the other day that it would be better to pull these shoots from off the early kinds than to plant early with them on, as they would be cut down with late frosts. How strange it should not have occurred to one who thinks himself to be a practical man that if these same tubers were kept out of the ground and planted a fortnight later the frost might be avoided, and all the value found in the strong shoots retained. There is at present every prospect of a good planting season, and should no excessive frost or rainfall intervene, planting of the later and more robust kinds may be started safely towards the end of February, for the tubers will not only lie cooler in the soil than out of it, but will also get a good root-hold of it ere they break up. Late kinds will not be through much the sooner if planted in February than those planted in April, but they come away very much the stronger, and the early planting materially forwards work. First early kinds that have been carefully wintered and have had head-shoots well pushed and hardened, if planted at the end of April will always be as forward as others planted in March, for with all early sorts the quicker the growth the better the crop.

If we are to have a comparatively dry winter we shall have little enough of moisture in the soil next summer, and therefore the early planting will prove of the greatest service in promoting tuberizing ere drought becomes master. As might have been anticipated, Potatoes are now securing better prices in the market, and those who have held stock over find an additional 20s. per ton to be worth waiting for. This slight rise will no doubt become greater in a month or so, and then, ere planting time sets in, we shall see such a fillip given to Potato trading as shall encourage growers again to plant largely, indeed the Potato breadths will no doubt be as great in the present year as in the past.

The comparative absence of disease during recent years has given growers so much encouragement that babbly they have come to regard Potatoes as one of the best of vegetable investments—an odd fact in the face of the jeremiad over the decline of the Potato which recently appeared in the *Times* newspaper. Just as there crop up now and then certain sensational matters, the which prove to be godsend to the papers in dull seasons for news, so do there seem to be in horticulture certain periods in which, for lack of more useful or interesting matter, it becomes the habit of some literary garden hacks to fall back upon the Potato, and to abuse those who claim to have made it a subject of special interest, right and left. Raisers are told they are fools and humbugs, and their new kinds impostors, and various other complements are flung about, the which it would be more proper if less polite to term abuse.

Happily, neither the Potato nor its admirers are the

worse for this outpouring. It is the product of a dull season. Last year was a fertile one in the production of new kinds. It so happens that some summers are more favourable than others for the production of pollen, and hence cross-fertilisation is rendered easy. Some five or six years later the products of those crosses come into commerce in the shape of new kinds of Potatoes, and certainly the majority sent out last year were first-rate novelties.

If the stereotyped abusers of new Potatoes had grown the sorts, and been disappointed, they might have some claim to consideration; but when they fall foul of these novelties, utterly ignorant of their various features and merits, it is just a trifle hard on the raisers. There will be more novelties put into commerce during the present year also—that is certain, and the Canutes of the ink-pen will not be able to stop the flow of the Potato current. The world has gained very much by the efforts of raisers of Potatoes, especially during the past ten years. It may well hope yet to gain much more; for, in spite of the fact that, for the past two years, Potatoes have been cheap and abundant beyond all precedent, the end has not yet come—indeed, is a long way off; and it looks as if we should continue to raise new kinds till the crack of doom. *A. D.*

## Orchid Notes and Cleanings.

### ORCHIDS AT MR. BULL'S, CHELSEA.

WE do not expect to see a great show of flowers in Orchid-houses at this season, but in the large nursery collections there is always something to be seen to please or to instruct the visitor. The cool-house easily bears away the palm for the number of the plants in flower. The weather had been very unfavourable previous to my visit, owing to the fogs that have prevailed, but there were still some beautiful spikes of *Odontoglossum crispum* and *O. Pescatorei* which were fine in variety, the colours of some being rich, while others were of snowy whiteness. The *Lælia albidula* made a fine show; the flowers of this species, when cut with long stems, may be made very useful for vases and the like. The varieties of it named *L. albidula bella* and *Marianæ* are richly tinted rose. *Sophranites grandiflora* made a nice group, the flowers being of very rich and varied shades of colour. *Cattleya marginata* was also in flower. *Ada aurantiaca* formed a glowing bit of colour. This, when grown into plants of large size, is one of the best exhibition plants, as it is often in flower during May. *Rodriguezia planifolia* is not worth cultivating except as a botanical species, but it is very interesting, and its small primrose-coloured flowers are sweetly scented. *Masdevallia tovarensis* was over, but *M. polysticta* was in full flower, while *M. ignea* was just coming into bloom. *Pleione humilis* seems to succeed best in the cool-house; its flowers, just opening, are very pretty. *Oncidium incurvum* is also in flower, while a very superior variety of it, named *O. incurvum albo-violaceum* has a pretty white lip, spotted with pale purple. Perhaps one of the richest coloured forms of *Odontoglossum Rossii* was in flower: it is named *splendens*. *Oncidium cheiroporum* is very sweet, its dense spikes of small deep yellow flowers being very pretty. *O. nubigenum roseum*, a white flower with a rose coloured centre, places it amongst the best of the elegant *Oncidiums*; it is very lovely. In a warmer house *Lycaste Skinneri* Vesta had large delicately rose-tinted flowers, while the variety *principis* had a rich crimson lip. A singular looking Orchid is *Microstylis metallica*, with dark shining bronzy-purple leaves and small brownish peculiarly formed flowers borne on erect spikes. *Cœlogyne Massangeana*, a recent species, was also in flower, so also was the North Australian *Dendrobium superbum*. A distinct form of *Oncidium Kramerii*, had a golden coloured lip, and the spotting was also very distinct from that of the normal form. What a richly coloured and beautiful Orchid too is *Barkeria Skinneri*; its neat and compact spikes of rosy-purple flowers add a charm to the most select collections. *J. D.*

### MASDEVALLIA TRIANGULARIS.

Although not remarkable for brilliancy of colour the flowers of this little *Masdevallia* have a prettiness of their own which, when seen in the mass, forms an attractive, albeit small picture. A plant in the Kew collection, growing in a 4-inch pot, shows well the good points of this *Masdevallia*, having a tuft of about thirty green leaves some 6 inches high, and peering just over the top of them more than fifty triangular flowers with a tail to each angle, the whole flower being tawny yellow thickly speckled with brown. Like most of the *Masdevallias* of which our gardens now possess scores, almost hundreds, of species, the above is as easy to grow as a *Primrose*, and requires treatment almost as cool, frost only being injurious to it. Some Orchid fanciers would refuse a place to *M. triangularis* because of its lack of brightness of flower-colour, and possibly because their idea of it has been formed from an indifferent specimen or poor variety. It would not require an effort on the part of any true gardener to see much beauty in this little Orchid when seen in such health and so gaily decked with flowers as the plant at Kew is. One could name a choice score of small *Masdevallias* that would grow in a little glass box placed in the window of a sitting-room, and from such a group much delight to the eye and intellect of a careful amateur would surely come. *W. A.*

### CATTLEYA WALKERIANA AND C. DOLOSA.

Many thanks for the history of *Cattleya Walkeriana*, syn. *bulbosa*, contained in your issue of December 20; but there still seems confusion in many minds as to *Cattleya dolosa*, the same plant having been bought under two different names, and some still think that the plants of *Cattleya Walkeriana* they bought as *C. dolosa* are the true variety. I have met with several such since your issue of December 20. What I wish to point out as misleading to some is the woodcut you have given us (fig. 133, vol. xxii.) as *Cattleya Walkeriana* var., whereas it is much nearer *C. dolosa* had the bulbs been made a little longer. *C. Walkeriana* rarely ever produces more than one leaf to the bulb, which is its special characteristic, whereas *C. dolosa* produces a pair of leaves on each successive bulb, and blooms from the fully developed bulb, from between the pair of leaves, similarly to the new *C. Schröderiana*, instead of the small flowering growth of *C. Walkeriana*, as described by Sir Charles Strickland (p. 83). Any one who has seen the two plants together would always recognise them as being perfectly distinct. *Henry James.*

### ANGRÆCUM EBURNEUM AT BIRDHILL, CLONMEL.

Looking over the Orchids at present in bloom in Mr. Gough's collection here, I am not sure that this is not the most elegant and chaste. The name is certainly suggestive, as it combines the soft massive velvety appearance of ivory with the tinge of greenish-white seen in the *Eucharis*. I had for comparison *Cattleyas*, *Dendrobies*, *Odontoglossa*, e.g., one evidently a distinct new sub-variety, *O. Alexandræ*, pure white sepals with crimson dots and blotch; *Lælias*, *Masdevallias*, *Calanthes*, *Cœlogyne*s, *Cypripedium*s, *Vandas*, &c., one or more varieties in bloom of each, yet I readily give this the preference. The plant is about ten years old, and has now in bloom a dozen blooms each on two massive spikes. *W. J. M.*

### XYLOBIUM ELONGATUM.

This is *Maxillaria elongata* of Lindley, but has been removed along with several other old *Maxillarias* to the above genus, of which sixteen species are enumerated, including *Maxillaria decolor*, *M. pallidiflora*, and *M. squalea*, which are still cultivated at Kew and in other gardens. *X. elongatum* is remarkable in having a long, cylindrical quill-like pseudobulb, 18 inches in length, and bearing at its apex two broadish leathery green leaves. From the bases of the pseudobulbs the flower-scape is produced, a short-stalked head of flowers, not more than 4 inches long, in this respect resembling *X. squalea*. There is also a similarity between the flowers of the latter and *X. elongatum* both in size, structure, and colour, so that although interesting because of its long, smooth pseudobulb, *X. elongatum* is not likely to find much favour as a flowering plant. Its nearest affinity is with *X. pallidiflora*, the pseudobulbs of which are thin and elongated, but which bears only a single leaf on each. *X. elongatum* has been introduced from Costa Rica. *W. A.*

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Feb. 2	Sale of 500 <i>Lilium auratum</i> , at Stevens' Rooms.
TUESDAY,	Feb. 3	Important Sale of Established and Imported Orchids, at Protheroe & Morris' Rooms.
WEDNESDAY,	Feb. 4	Sale of Roses, Border Plants, and Fruit Trees, at Stevens' Rooms.
		Sale of Lilies, Roses, &c., at Protheroe & Morris' Rooms.
THURSDAY,	Feb. 5	Meeting of the Linnean Society of London, at 8 p.m.
		Sale of Valuable Imported Orchids from Mr. Sander, at Stevens' Rooms.
FRIDAY,	Feb. 6	Sale of Imported Orchids, at Protheroe & Morris' Rooms.

FROM causes which it is not our province to inquire into here, the number of NEW FRUITS brought under notice during the past year is much smaller than usual. We have not this season to record the introduction of any new Grapes, or Pines, or Peaches—the nobility, so to speak, amongst the fruit classes; and amongst the other classes the prevalence of spring frosts no doubt materially interfered.

Apples, having been so thoroughly overhauled and investigated during the preceding year could scarcely have been expected to yield much novelty. In this, however, we have one important and welcome addition in Lady Sudeley, which, however, may be an old sort lost to view. This fine early Apple hails from Petworth, and first appeared as Jacob's Strawberry. It may be described as resembling a very highly-coloured specimen of Duchess of Oldenburgh, and is fit for use in the same season. Another Apple that met with considerable attention and received high honours was Perkins' A 1. It is doubtful, however, if it be really distinct from that beautiful and excellent variety Lane's Prince Albert. High Canons, a seedling raised by Mr. THROWER, is a large and handsome culinary sort, of excellent quality late in spring. Several Belgian Apples have been reported on favourably, but these require testing in this country before recommendation.

Pears and Plums present no novelty this season that calls for special notice. Amongst Strawberries Mr. LAXTON's new seedlings, The Captain, and King of the Earlies, are welcome additions, on account of their great size and remarkable earliness. New Melons do not appear in such numbers as usual. Messrs. CARTER's Emerald and Captain Larks may be cited as good and excellent sorts.

The number of new names applied every year to the different varieties of VEGETABLES seems to be ever on the increase. It has become the fashion now, and almost every seed vendor seems to consider it right, to rename the commonest article. This is a small matter to those who do not care for novelty, but to those who are on the search after novelty and improved varieties this wholesale manufacture of new names is full of embarrassment and annoyance. Potatoes, however, the foremost and chief of the vegetable products that the gardener has to deal with, present us with genuine novelty. Those receiving certificates from the Royal Horticultural Society may be first noted, viz., Charter Oak, an American variety from Mr. BLISS, large round white, with bright pink eyes—very handsome; Notts Victor, large oblong, somewhat resembling Beauty of Hebron; The Doctor (PRITCHARD), in the way of Schoolmaster; and Ellingtonia, a long kidney-shaped variety, with pale salmon skin, flaked with dark purple—of rather singular appearance, and wonderful good quality. The following were certificated by the International Potato Society:—Miss Fowler (ROSS), a white kidney seedling from the Woodstock Kidney; Pride of Eydon, also a white kidney, a cross between Myatt's Prolific and Beauty of Hebron; M.P. (ROSS), seedling from Paterson's Victoria; London Hero, Chancellor, and Harvester, three of Mr. DEAN's seedlings, deserve special note as decided improvements, and the same remark applies to Suketra, of HOLMES, now in the hands of Messrs. CARTER & Co.

Amongst other vegetables special note must be made of Hawke's Champagne Rhubarb, which, although not new, only seemed to have had its high merits fully recognised during the past year. Amongst Celeries a new variety, named White Plume, comes to us from Newark, N.J. This is a variegated sport, which grows so white naturally that it is presentable at table without the tedious process of earthing-up. It is not, however, tender or of good quality. Amongst Cabbages Messrs. VILMORIN's Early Etampes may be noted as the earliest of all. Ellam's Dwarf Early is also a very true and good sort. Vilmorin's Dwarf Brussels Sprouts are of very superior merit, the plant dwarf but loaded with Sprouts, which are of nice size and very firm. A great proportion of the Brussels Sprouts now grown are far too large and coarse, and quite out of character. Gilbert's Universal Savoy proved to be of excellent quality, being devoid of that coarse, strong flavour so objectionable in Savoys. Amongst Lettuces there seemed to be no very decided advance. Waite's new Cabbage Lettuce may be mentioned as a good sort; and amongst Onions Wroxton Hero and Sandy Prize deserve mention as excellent selections of the White Spanish.

Tomatos again furnish considerable novelty. Golden Queen (WILLIAMS), is a very fine and distinct large orange-yellow; Hackwood Park Prolific, Lord Wolseley, and Sutton's Reading Perfection, are all fine large smooth-fruited red sorts, that cannot fail to give satisfaction. The most extraordinary Tomato of the season was, no doubt, Chiswick Red, which for cropping qualities has no equal.

Of Peas, some decided and improved varieties have recently been introduced. Some twenty years ago it was rare to find a pod with nine Peas, now pods with ten, eleven, and twelve Peas are becoming common. Of the last year's novelties Sharpe's Early Paragon, a large-podded white marrow, may be noted, and Magnificent of Eckford, a very large podded green marrow of fine appearance and excellent quality. Several very promising varieties from the great Pea hybridist, Mr. LAXTON, have been tried, and will, no doubt, when a little more selected, meet with the recognition their fine appearance seems to indicate.

— HAKEA LAURINA.—This is one of the most beautiful of the much neglected Proteaceous shrubs. Its general appearance is sufficiently well indicated in the accompanying illustration (fig. 30), which, however, can give no idea of the delicate rosy-lilac tint of the flowers, nor of the charming colour of the shoots, which bear some resemblance to those of *Arbutus Andrachne*. This genus is by no means difficult of cultivation, and it is a great pity we do not find them commonly grown where large houses exist. Some of the Banksias and Hakeas are strong and fast growers planted out, but when grown in tubs and pots they will not extend at any great rate, and become floriferous at an early stage. The soil they need would suit an *Azalea indica*, with a trifle of burnt earth and leaf-mould. The pots should not be much larger than the mass of roots, and the drainage good. To keep large-grown plants in check, shaving off the roots for an inch all round the ball may be done with advantage. Repotting is best done in March, and the plants should be carefully watered until root-growth has commenced. Syringing daily and free ventilation in mild weather will keep them healthy and free from insects. During July, August, and the early part of September plants of *Hakea*, like most of the Australian hard-wooded plants, are benefited by being placed in a sunny, open, but sheltered spot in the reserve garden, or may be used to form groups in the pleasure-grounds. In gravelly soils, and in positions where small pots get dry quickly, plunging in coarse sand or coal-ashes is of benefit. We are indebted to Messrs. DICKSON, of Covent Garden, for the specimen from which the figure we give was taken. On the left of the illustration is seen a section of a flower-bud, showing imbricated scales and unopened flower within, below are pollen grains typical of the genus *Grevillea*. Further to the right

two views of flowers are given, showing how the pistil flies away from the conjoined anthers covered with its pollen.

— THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—We are informed that the legacy of £500, less duty, left by Mrs. JANE DODSON, of Blackburn, was paid to the Treasurer of the above Institution on Friday last. The Institution was brought to the notice of the late Mr. DODSON, at the Preston Horticultural Show, by the Secretary; he then became an annual subscriber, and promised that he would not forget the claims of the Institution.

— INTERNATIONAL POTATO EXHIBITION.—The trial culture of new seedling varieties entered for the International certificates will be carried out as in former years at Chiswick, by permission of the Royal Horticultural Society. Persons intending to enter seedlings for trial are requested to send not less than six tubers of each sort, with names and pedigrees, to the care of Mr. A. F. BARRON, Royal Horticultural Gardens, Chiswick, before March 31.

— ARGENTINE RURAL EXHIBITION.—At the end of April this year an exhibition will be held at Buenos Ayres, of agricultural products, machinery, implements, and live stock. In the classes for vegetable products are sections for cereals, grass seeds, roots, tubers, vegetables, fruits (fresh and dried), oil-seeds, textile fibres, flower seeds, hothouse plants, open-air plants, fruit trees, forest trees, medicinal plants, &c. The exhibition will be confined to products of the Argentine Republic, and will remain open about one month.

— "PLANT LORE, LEGENDS AND LYRICS."—Her Majesty the QUEEN has accepted a copy of Mr. FOLKARD's new work, *Plant Lore, Legends and Lyrics*, issued by SAMPSON LOW & Co.

— GRAFTING QUINCES.—EVELYN, *Pomona*, p. 355, asserts that the Quince, although it will serve as a stock for other fruit, yet that its own scions cannot be grafted on any other stock. He translates from PALLADIUS:—

"Though the Quince-stock admit all other Fruit,  
Its cyon with no other stock will suit,  
Scorning the Bark of Foreign trees, does know  
Such lovely fruit on no mean stem can grow;  
But the Quince graft, to the Quince Stock is joyned,  
Contented only to improve its kind."

Can any reader state whether these assertions still hold good?

— MARKET GARDENING IN THE PENZANCE DISTRICT.—The *West Briton* of January 22 contained the following note:—"Of late years the early Broccoli crop in this district has not proved very remunerative to the grower, and, consequently, the earliest kind has not been cultivated so extensively this year. Our gardeners have only sent a very small quantity to market, but the prices realised are better than they have been for several years. The good prices given for Broccoli have induced many growers in the Gulval district to prematurely cut their crops; in fact, a great number have been sent to market no larger than pigeons' eggs, a quart measure being capable of containing a dozen heads. As a natural result of this conduct the trade is injured, and if these growers are not more careful they will be liable to destroy the confidence which it is their best interest to preserve."

— CREWE HALL GARDENS.—In reference to this subject (see p. 75, Jan. 17), Mr. WHITAKER writes:—"The kitchen garden, with orchard attached, contains 5 acres, and the flower gardens and ornamental grounds about 45 acres. The quantity of glass is considerable, including large conservatory, Orchid-houses, stove, Camellia-house, Pine-stoves, several vineries and Peach-houses, pot vineries, Fig-house, Cucumber and Melon-pits, &c.; and the number of men employed is seventeen—six under gardeners and eleven labourers."

— LINNEAN SOCIETY.—At the meeting of this Society to be held on February 5, papers will be read on the following subjects:—"Morphology of Test in *Celopleurus* and *Arhacia*," by Professor DUNCAN and Mr. P. SLADDEN; on "Burmese *Desmidiæ*," by Mr. W. JOSHUA; and on "Generic Synonymy of Orthoptera to 1839," by Mr. W. F. KIRBY.

FIG. 30.—HAKEA LAURINA : A GREENHOUSE FLOWERING SHRUB : FLOWERS ROSY-LILAC. (SEE P. 148.)

— **POTATOS FROM DISEASED TUBERS.**—An Irish contemporary has received a report from Mr. JOHN CONWAY, agriculturist on the Rathdown Union Workhouse Farm, giving details of certain experiments conducted by him during the year 1883-84, with a view to determine the possibility of raising a sound Potato crop from diseased tubers. Mr. CONWAY says that in July he invited two of the guardians to inspect the plot planted with diseased tubers, and that they found it impossible to detect any difference between it and the adjoining plots either in foliage or vigour of growth. The following are the particulars of Mr. CONWAY'S experiment:—Extent of ground under experiment, 26 square yards. Date of planting, April 14. Date of digging out, October 12. Total produce of plot under experiment, 6 stones 7 lb. Quantity of sound tubers, 5 stones 4 lb.; of unsound tubers, 1 stone 3 lb. Estimated produce per Irish acre of sound tubers, 9 tons 19 cwt.; of unsound tubers, 2 tons 5 cwt.; total, 12 tons 4 cwt. Percentage of unsound to sound tubers, 18 per cent. Particulars of experiment with sound "sets."—Extent and quality of ground, mode of culture, time of planting and lifting, the same as in foregoing. Total produce of plot, 5 stones 5 lb. Quantity of sound tubers, 4 stones 8 lb.; of unsound tubers, 11 lb. Estimated produce per Irish acre of sound tubers, 8 tons 12 cwt.; of unsound tubers, 1 ton 9 cwt.; total, 10 tons 1 cwt. Percentage of unsound to sound tubers, 14 per cent. No manure was applied at time of planting, but the previous crop was well manured. The "sets" were planted whole or cut, with two eyes, in drills 3 feet apart, with 9 inches between the "sets."

— **SNOW MOUNTAINS OF EASTERN AFRICA.**—At the last meeting of the Royal Geographical Society Mr. H. H. JOHNSTON read a paper on an expedition to Mount Kilimanjaro and the Snow Mountains of Eastern Africa. Mr. JOHNSTON said that he went to the alpine district of Eastern Africa as head of an expedition planned by the British Association and the Royal Society. Leaving Mombasa towards the end of May last at the head of 120 men, of whom about a quarter deserted on the road, he reached Kilimanjaro at the beginning of June. The cultivated zone, he found, ended at a height of 5500 feet. At 10,000 feet the thermometer descended every night 1° or 2° below zero. While mentioning this fact he gave details showing that the land even up to that elevation is both beautiful and fertile. He reached a height of 16,315 feet on Mount Kilimanjaro—something like 2500 feet from the summit—where the fog prevented him from seeing anything but stones and snow. Notwithstanding the latter, his thermometer recorded a temperature 3° above freezing point. The lecturer went on to describe his attempt to ascend Kibô, the monarch of the range. Here he learned that the buffalo, the koodoo, and the elephant wander as high as 13,000 or 14,000 feet. He reached the snow region of Kibô, but not the summit, being compelled by bad weather and unwilling followers to return. The Rev. Archdeacon FARLER, as one familiar with the country visited by Mr. JOHNSTON, pointed out that the lower slopes of the Kilimanjaro Mountains were very suitable for European settlers.

— **BANKSIA ERICIFOLIA.**—The leaves of this species are so dissimilar to Banksias in general, and bear so remarkable a resemblance superficially to those of a Heath, that no one probably would guess as to its relationship except when in flower. They are slender, revolute at the margin, shortly two-pointed, and densely cover the twigs on all sides. Their characters, as well as that of the flowers, refer them to the section *Oncostylis* of the *Genera Plantarum*. The cone-like inflorescence is cylindrical and erect, several inches long, and rather conspicuous. A large plant in the Temperate-house, Kew, is well furnished with these cones in all stages of development, from those that are green to the fully expanded yellow ones that ultimately become a deep amber-yellow. This species is figured in an early volume of the *Botanical Magazine*, t. 738.

— **CHRYSANTHEMUM CULTURE.**—Mr. JOHN BRADNER, of Arley Hill Nursery, Bristol, gave a lecture in the Institute Hall, Veovil, on Friday evening, on "Chrysanthemums and their Culture." Local gardeners attended in good numbers, the lecturer's success as a prize winner having made

his name famous amongst growers of the queen of autumn flowers. The lecture was full of valuable information from beginning to end. As Mr. BRADNER has given up exhibiting he freely gave the results of his long and varied experience, and answered a host of questions after the lecture. At the request of those present he consented to publish the lecture in pamphlet form.

— **INTERNATIONAL FORESTRY AND HORTICULTURAL EXHIBITION.**—We are informed that the arrangement of the Exhibition to be held at the Alexandra Palace, has been entrusted to Messrs. DICK RADCLIFFE & Co. The general programme is as follows:—

#### Class I.—PRACTICAL FORESTRY.

- Section 1.—Implements and tools used in forestry; draining, enclosing and surveying instruments, chains, dendrometers, &c.  
 „ 2.—Models of foresters' huts, drying sheds, charcoal kilns, timber slips, sluices, bridges, locks and weirs.  
 „ 3.—Plans of river embankments, rafts and appliances for floating timber.  
 „ 4.—Machinery or models for transporting timber and transplanting trees.  
 „ 5.—Saw mills, wood-working machinery or cork-cutting machinery of every description, and pulping apparatus in motion or otherwise.  
 „ 6.—Fencing materials of all kinds, including gates and stiles.

#### Class II.—FOREST PRODUCE, RAW AND MANUFACTURED.

- Section 1.—Collections of timber specimens and ornamental woods:—A, indigenous or naturalised; B, exotic.  
 „ 2-26.—Various applications of wood to industrial and ornamental purposes.

#### Class III.—SCIENTIFIC FORESTRY.

- Section 1.—Botanical specimens of forest flora.  
 „ 2.—Microscopic sections of woods.  
 „ 3.—Parasites; fungi and lichens injurious to trees.  
 „ 4.—Edible fungi; in their natural state or preserved.  
 „ 5.—Forest fauna injurious to woods.  
 „ 6.—Forest entomology, useful and noxious insects, with specimens illustrative of the damage done by the latter.  
 „ 7.—Preservative processes applied to timber.  
 „ 8.—Specimens and diagrams illustrating the geological formations adapted to the growth of trees.  
 „ 9.—Fossil plants; collections illustrative of the trees of the coal measures, &c.  
 „ 10.—Trees found in bogs—Oak, Fir, &c.

#### Class IV.—ORNAMENTAL FORESTRY.

- Section 1.—Growing specimens of rare and ornamental trees and shrubs, in tubs or otherwise.  
 „ 2.—Rustic work; arbors, bridges, gates, seats, &c., in wood or virgin cork.  
 „ 3.—Dried specimens of ornamental objects, including foliage.  
 „ 4.—Plans and designs for landscape gardening, &c.

#### Class V.—ILLUSTRATIONS OF FORESTRY.

#### Class VI.—FOREST LITERATURE AND HISTORY.

#### Class VII.—ESSAYS AND REPORTS.

#### Class VIII.—LOAN COLLECTIONS.

#### Class IX.—ECONOMIC CONDITION OF FORESTERS AND WOODMEN.

#### Class X.—HORTICULTURE.

Spaces in the grounds will be allotted for collections and displays of trees, shrubs, and nursery stock and produce generally. Collections from private gardens, &c. Landscape gardening, plans, designs, garden literature, floral and other illustrations, &c.

#### Class XI.—SEEDS, AND GARDEN APPLIANCES OF ALL DESCRIPTIONS.

#### Class XII.—MICELLANEOUS.

Lawn-mower competition will be arranged. If possible, arrangements will be made also for boiler, glazing, fumigating, watering apparatus, and other similar competitions.

Applications for space should be made immediately to DICK RADCLIFFE, 129, High Holborn, W.C.

— **GUTTA-PERCHA SUBSTITUTES.**—Chemical substitutes for gutta-percha have recently been brought to notice in France and Germany. A patent has been taken out quite lately in Paris which consists

of boiling Birch bark, especially the outer layer, in water over an open fire and concentrating the extract by evaporation, after which there remains in the evaporation dish a black liquid mass, which on exposure to the air quickly becomes solid and very compact. This mass possesses all the properties of gutta-percha and may be applied to the same uses. It has further this advantage that it does not crack on exposure to the air, it is more solid, and its production is cheaper. It may also if desired be mixed with either gutta-percha, or indiarubber. Another substitute for gutta-percha for which a patent has been obtained in Germany consists of powdered opal, sublimed sulphur, oil of turpentine and petroleum. The mass is heated in a boiler provided with a stirring apparatus, to a temperature of 150° Centigrade. It is then allowed to cool to 38°, when it is mixed with a weak solution of eosine in ammonia-water, to which wood spirit has been added. It is then beaten to its former temperature and boiled with a solution of nut-gall. It is stated that this artificial gutta-percha cannot be detected from the real article, and that it wears equally well, while its price is much lower.

— **MOHWA SUGAR.**—A note on Mohwa sugar from *Bassia latifolia* was recently communicated to the Agricultural and Horticultural Society of India. In this communication the writer refers to the presence of sugar in the petals of the flowers, and says that this "indicates that the rising sap of the tree in spring, and just before the flower-buds swell, must be rich in saccharine matter, and if so tapping the Mohwa trees in the same manner that the Sugar Maple (*Acer saccharinum*) of North America is tapped may lead to the production of sweet sap, which on being boiled and concentrated would yield sugar." It is suggested that it would be well worth while tapping or bleeding the species of *Bassia* for their sap, and if this should be found to contain true sugar, the discovery would be one of considerable importance, for a large and very profitable trade would be called into existence in India.

— **LACHENALIA PENDULA.**—If a selection of half-a-dozen of the best kinds of this numerously represented genus of Cape bulbs were made this one should, by all means, be included. The robust growing erect scape attains a height of 12 or 15 inches. The bright green leaves are quite spotless, as are the flower-scapes—a rather unusual feature amongst the species usually cultivated in gardens. The flowers are amongst the largest in the genus, and orange-red or scarlet, with thickened points of a dull purple and green colour. It is figured in the *Botanical Cabinet*, 267, and is perfectly distinct from *L. quadricolor*, figured in the *Botanical Magazine*, t. 588, and by some authorities considered as a variety of *L. pendula*. The latter is flowering in the Cape-house at Kew.

— **POISONING BY RHODODENDRONS.**—A well authenticated case of the poisoning of ten sheep is reported from West Middlesex; these, with some 200 others, having broken down a fence in Whitton Park, near Hounslow, and eaten freely of the Rhododendron foliage, which was abundant in the shrubberies. A local veterinary surgeon, who examined the dead sheep, found the stomachs full of partly digested Rhododendron leafage, and gave as his opinion that this was the cause of death. Certainly no information is afforded as to the kind of Rhododendron consumed, but probably it was the common ponticum. Further, though the sheep were reported as poisoned, it is not clearly stated whether death was, in the estimation of the veterinary surgeon who examined them, caused by distension of the stomach, arising from excessive feeding, or whether the leafage did absolutely and clearly poison the animals. No doubt there are many cases in which the one thing is mistaken for the other, though vastly differing in character, but that death was due to the eating of the Rhododendron foliage there could be little doubt. It may be taken for granted that a case of this kind would be much less likely to occur in the season of the year when pasturage was abundant, and sheep, or, indeed, any cattle, found ample food in the herbage. But when hungry, animals will often feed upon vegetable matter that they would if well supplied with proper food disdain to touch. No doubt the clearing up of the point as to whether death arose from distension or poisoning would bring the owner of the sheep cold comfort, but at least it would be useful to have it so cleared in the interest of science. In any case, this should be a warning to all who have charge of sheep, that they

keep them secure, well fed, and safe from similar temptation to wander from the path of safety.

— COLUMBIA MARKET.—On Saturday last an important and interesting gathering took place at the Guildhall Tavern, to celebrate the anniversary of the reopening of Columbia Market. About sixty salesmen and gentlemen directly interested in the fruit, vegetable, and fish business, carried on at this centre were present. After referring to the building of the market, the idea of which originated with the Baroness BURDETT-COUTTS, Mr. BURDETT-COUTTS, who occupied the chair, went in detail into the causes of its previous failure, the chief of which was that it had never had the trade within it. And that was exactly where the event they now celebrated differed from those which had gone before, and the chief reason for confidence in the future. They, the salesmen, represented in their individual and corporate capacity the trade itself, bringing their own supplies and their own customers; they had moved voluntarily and in a body into the market, and were throughout determined to make it go.—Mr. WILDERSPIN, in proposing "The Columbia Market Salesmen's Association," said:—I would remind you that the necessity of associating together so as to act in a body was felt by the leaders of the salesmen to be of the utmost importance from our first coming to the market. We, I believe, are the first body of salesmen who have taken upon ourselves this plan of forming into one body instead of acting individually, and as we stand in this strong position to-day, I trust we shall continue so for many years to come.—Mr. SCOTT was able to say that in the first month, commencing on January 17 last year, the weight of business done in Columbia Market was 3520 tons, and in the last month—December—the weight was 4009 tons. This is an increase of only 500 tons in the month, and the reason is want of room; he knew from his own knowledge that the market authorities were almost daily refusing applications for room in the market. But every market man knew that besides open space ample warehouse-room was required, and this is proved by the fact that most of the salesmen who had to discontinue selling at the Bishopsgate depot have kept on their premises at considerable cost and inconvenience for warehouses.

— MARKET GARDEN FARMING.—At the meeting of the salesmen of Columbia Market above alluded to, Mr. GEORGE BROWN said that it seemed as if every one except the farmer knew how to farm. One great panacea for the depression was to advocate a duty on corn, but he for one was not of that way of thinking. He did not believe in running after a shadow, and he felt certain that a duty of five shillings on Wheat would not of itself advance the price to the grower half-a-crown. What would do more good would be for our legislators to repeal those bad old laws which had almost become obsolete, but which now appear to be restored and to be more arbitrary than ever. In proof of this he pointed to the fact that all the vegetables required by a million of people had to be brought to one spot, and so have a toll put on them at the will of a private individual, an obligation under which East London can never be properly supplied with vegetable food. Whilst such a state of things existed it would be like putting a rent of five shillings per acre on all land that has any pretension to grow vegetables. Bad as that is, it is trifling in comparison to the injury it will do to the consumer, for it is quite impossible to feed such a great number of people properly from one spot by small carts, from and to remote distances. The consequences is that the prices have to be put so high that the public does not get half enough. Only last year he had ploughed into the ground 40 acres of vegetables, which he should have brought to market if he could have realised nearly one farthing per pound, and at that very time the consumer was paying one penny per pound in London for precisely the same class of vegetables as he had to destroy. Much larger quantities of vegetables would be consumed if they could be properly conveyed to the consumer in sufficient quantities at reasonable prices, and the best way to increase and distribute such food would be to introduce railway communication direct into a market. It is not generally known that if green vegetables do not reach the consumer on the same day that they are brought to market, their value goes down from 50 to 100 per cent., so that in forty-eight hours they are worthless. It is monstrous that in this day our horses should be compelled to drag all vegetables six miles through London, and then other horses drag them back again, all in consequence of a foolish charter.

— GARDENING APPOINTMENT.—Mr. G. H. HARDING has been appointed Gardener to the Hon. W. LOWTHER, M.P., The High House, Campsea Ash, Wickham Market.

## The Flower Garden.

### PROTECTION OF BEDS.

THE last two or three weeks of snow and frost and north-easterly winds have stopped all progress in the winter and spring garden, and many of the early plants are damaged by wind and frost. Just before the frost set in many of the bulbs were showing above-ground, and such plants as Winter Aconites and Crocuses were even showing their blooms, but now everything shows the effect of the late change of the weather, so that if not already done lose no time in giving protection by means of Fir branches, pieces of some other evergreen, or Bracken stuck in all over the flower-beds. Leaf-mould may be spread evenly over the beds, for which this makes a good warm covering and looks neat and clean. All branches can be removed as soon as the weather changes to mild, so as to have all the beds and walks in a presentable state.

### THE HERBACEOUS BORDER

had better be left untouched until the weather becomes warmer, when it will require a thorough looking over and rearranging.

### VACANT BEDS AND SHRUBBERIES.

Manure, dig, or trench all beds and borders that contain no plants, the shrubberies also should undergo a thorough inspection, carefully thinning out all dead wood; cut out and remove any shrubs that are standing too thickly together, and give all single specimens plenty of room to grow in; and if not already done dig all shrubberies, and trim the grass edges, so as to improve the look of the verges. *W. Smythe, Basing Park, Alton.*

## Plants and their Culture.

### FORCED PLANTS AND BULBS.

THESE should now be rendering a good return for all the past attention paid to them, and both now and onwards for some weeks to come will yield the staple product for the supply of flowers for cut purposes, as well as being most useful in the conservatory. Suitable houses or pits are not often allotted to our craft as a rule for the production of these barbingers of the coming spring time; it cannot be wondered at, therefore, if we fail to produce flowers in such a successful manner as our brethren in the trade, who know full well the importance of special treatment for certain subjects, and who, therefore, place together in one structure only those plants that will give the maximum return under one mode of treatment. Those of us who have to deal with the smaller supply of a private garden do not need such large quantities at one time; a succession according to the demand has rather to be aimed at; and it is well known that a small number of any given plant often gives as much trouble as a greater number of the same would do.

### SUITABLE PLANTS FOR PRESENT FORCING:

#### AZALEAS.

Of these the early flowering Azalea indica are among the best. The easiest to induce to flower early are, of whites, *A. narcissiflora* and *A. indica alba*; of striped kinds *A. punctulata* and *A. vittata elegans*, two of the quickest that can be grown; whilst *A. Marie Vervane* and the newer form of *A. Roi Leopold* (*A. Roi Leopold alba* of catalogues), are two varieties of much desirability; of selfs for early work *A. Roi Leopold* (salmon) is one of the freest, *A. Model* (rose) also being a good reliable kind. Azalea amœa is well known as one of the best of its colour; both this and the improved forms of it that have been introduced during the last few years readily start into flower early in the season. *A. obtusa* closely resembles *A. amœa* in habit, but with flowers of an orange-crimson—a pleasing

and distinct shade of colour at this season of the year. Why this species has been so long neglected we cannot conceive; it is of equal value to the latter variety, and where one is grown the other should also find a place. We are glad to see that its merits are now appreciated as they deserve to be. Azalea mollis may now be introduced, but not into too brisk a heat at first. We have a stock of these plants that have been in pots for three or four years; more or less they have flowered well each year, every alternate season, however, being the best as a rule. This season they have departed from this course, and are promising well the second season in succession; so also is another species of this type, *A. altaclarensis* of catalogues. I think this may be fairly attributed to the unusually dry and sunny weather of last summer. This deciduous section of Azaleas can, therefore, be retained in their pots from year to year with good prospects of a full crop of bloom at least every alternate season, in a similar way as with *A. sinensis*. *J. Hudson, Gunnersbury House, Acton.*

## The Hardy Fruit Garden.

### MORELLO CHERRIES.

THESE varieties may be planted on east and north walls. The wood on established trees should be well thinned out, so as to allow space for laying-in a portion of young wood every year, as it is mostly on the current year's growth that the best fruits are produced. To obtain fine fruit the shoots should never be closer than 8 or 9 inches apart. It is always more satisfactory to have fine large fruit than a quantity of inferior produce, and this can only be obtained by good cultivation.

### APRICOTS.

Trees on walls may be pruned any time before the end of February. In old trees, if the fruit-bearing spurs have become long and 8 or 9 inches away from the wall, these long spurs should be thinned out so as to encourage growing shoots to break away close to the wall. The Apricot being a native of the sunny slopes of the mountains of Central Asia and elsewhere, the soil, no doubt, in such positions is hard, dry, and warm; this being the case we should by all means plant our trees in the warmest positions at command. The covering of wall trees should be deferred as late as possible. When covered early it only encourages them to come into flower, and our object should be to retard the blossoming period as late as we possibly can. *J. Smith, Mentmore, Bucks.*

## The Kitchen Garden.

### FORCING CUCUMBERS.

PLANTS obtained from the first sowing will now be ready for planting out. Before this is done the house should be thoroughly cleansed by washing all the woodwork and glass, and by applying a good coating of lime wash to the brickwork. Whether the plants are to be grown and fruited in pots or planted out in brick beds specially constructed and supplied with bottom-heat pipes, ample drainage must be provided. The bottom-heat pipes are much better if surrounded by water. Assuming that the above is provided the following preparation to receive the plants will answer well. Thick slates or something equivalent will form the bottom of the bed, with holes pierced through or space left between for the double purpose of allowing heat to ascend and water to pass down. Over the slates place a layer of clinkers, next a layer of good fibrous loam, from which as much of the soil should be shook out as possible without breaking the turves. If the latter is not available thin cakes of porous peat will answer the purpose. The layer of clinkers will allow a free circulation of warm air from the pipes beneath. The hillocks to receive the plants should be composed of fibrous loam and leaf soil, and allowed to become thoroughly warmed prior to planting.

### MUSHROOMS.

Have material prepared in readiness to replace exhausted beds. If a shed is available it will be found a

considerable advantage for this purpose. Dung, for forming beds, should be collected every morning as it is removed from the stables. Do not follow the old plan of rejecting the whole of the short straw and using the droppings only; the system is unsound and unnecessary, and if followed takes a long time in most places to collect enough material for each bed. One-third short stained straw at the least should be retained, as in the preparation this will quickly decompose and become scarcely perceptible, providing the heap is managed well and turned regularly and thoroughly mixed.

Wheel the stuff direct to the shed, and after five or six barrowloads have been placed together thickly, in three or four days fermentation will commence; then the turning and purifying should begin: every fresh addition to the heap should be well mixed and distributed through the mass. Do not spread it out thinly, the quicker the dung is purified and placed in the Mushroom-house, with the least loss of ammonia, the more lasting will be the crop. After the bed is made up it should not become very hot, or the compost will be too dry to encourage the rapid spread of the spawn, and the Mushrooms will appear only immediately above the places where the spawn was inserted, instead of coming up all over the surface of the bed.

#### TOMATOS.

Before young plants approach a pot-bound state they should be repotted. Place a stake to each, and keep them near the glass, to induce a short, sturdy growth. Cuttings which were struck last autumn, or plants raised from seed sown about that time, will now possess some good firm wood, and should be encouraged by repotting, or they may now be planted out in the position in which they are to fruit. *G. H. Richards, Somerley Gardens, Ringwood, Hants.*

### The Rosery.

#### CELINE FORESTIER ROSE.

THIS is a most valuable Noisette Rose for early forcing. The half-opened blooms, of a deep yellow in the centre and deliciously scented, are well adapted for button-hole work. We have been cutting nice blooms of it since Christmas, which it is needless to say are much appreciated. Cuttings taken off now with a heel of last year's wood and inserted round the edge of 3-inch pots filled with sandy loam, and having a surfacing of sand, watered, and then plunged to the rim in sawdust in a box sufficiently deep to admit of a square of glass being placed over it without coming in contact with the cuttings and placed over the pipes in a forcing-house, will soon root; after which they should be potted singly into 3-inch pots, watered through a rose to settle the soil about the roots, and be placed in a forcing pit near the glass, subsequently pinching out the points of the shoots to make them branch, and shifting the plants into 6-inch pots as soon as they have partly filled the 3-inch ones with roots. Afterwards they should be gradually hardened off and be plunged to the rim of the pots in coal-ashes in a sunny situation out-of-doors, and be liberally treated and kept very clear of fly and other insects. They will be good plants for forcing in November. *H. W. W.*

#### ROSE ADMIRAL COURBET.

A new hybrid perpetual, said to be a chance seedling, raised by Mr. F. Dubreuil. Flowers of moderate size, cup-shaped, "bright carmine, the back of the petals magenta." Very sweet-scented.

#### ROSE MADAME PAUL MARMY.

A seedling from Gloire de Dijon, with large well-formed flowers, clear yellow in the centre, the outer petals pale rose-coloured. According to the *Journal des Roses*, in which this Rose is figured (January 1, 1885), M. Marmy, the raiser of this Rose, collected the seeds of Gloire de Dijon, Madame Berard, Madame Faicot, and other Roses in Algeria, stratified them in a large flower-pot which accompanied him on his travels through Algeria, thence to Paris, and ultimately, after a lapse of some months, to Portugal, where he settled down and planted out what remained of his seedling Roses. The beautiful variety now figured was one of them, and is now in the hands of M. Cochet, of Suisses.

### THE POPPY GALL-FLY.

THE remarkable diversity in the shape, size, and general appearance of the different kinds of galls, which are vegetable protuberances growing from the roots, stems, leaves, and even seed-vessels of various plants and trees, raises a great variety of physiological enquiries as to the mode of operation of the insects which are the cause of such abnormal growths, and the reason why the minute amount of matter deposited with the eggs should result in such great diversity of structure and texture in the growths originating therefrom even in the same kind of plant. It was the fancy of some writers that the portion of the plant in which the eggs were deposited, being interrupted in its normal growth, had sent out a structure which was regarded as an incipient attempt to reproduce the real growth of the plant; thus the spine-growing stem of the wild Rose was supposed to reproduce an abortive mass of spines, beset with smaller spines, in the large mass well known as the pin-cushion gall. It need scarcely be said that such a fallacy is disproved by the investigation of almost every species of gall. The large, hard, woody gall of the Willow stem, the large, soft gall of the Oak, well

FIG. 31.—THE POPPY GALL-FLY (*AULAX RHŒADIS*, HARTIG).

known as King Charles' Oak-apple, the Currant-like galls and the Artichoke galls of the Oak are other well-known instances of the diversity which must have taken place in the parts of the same tree affected by different kinds of Cynipidae, and we now bring to the notice of our readers another kind of gall, in which the capsule containing the seeds of the common Poppy (ordinarily hollow, but divided by several slender plates into so many cells, in which the seeds are placed) is transformed into a solid mass, in which are a number of small round cavities, each occupied by a fat footless grub or larva, which feeds on the mass of the gall surrounding its cell.

We received a specimen of this kind of Poppy-gall in February, 1836, from the late Dr. Dickson, at which time the enclosed insects were in the pupa state, and were of a brown colour. Other specimens subsequently obtained produced the perfect flies, which proved to be the *Aulax Rhœadis* of Hartig (*German's Zeitschr.*, bd. ii., p. 195). In July, 1884, we also received from G. H. Sawyer, Esq., capsules of *Papaver dubium*, taken near Guildford, which contained numbers of small circular cells not more than half a line in diameter, each enclosing a minute white, soft, plump larva, with a very small head, furnished with two three-toothed mandibles. The perfect insect reared from these galls is represented of the natural size in the circle in the lower part of our woodcut

(fig. 31), and highly magnified in the large figure; the wings are quite transparent, with a small cell in the middle of the forewings. This little cell is more triangular than represented in our figure, being narrowed towards the anterior margin of the wing, where it joins the large marginal cell; it has chestnut-coloured feet; the antennæ of this female are long and slender, and fourteen-jointed. The ovipositor with which the female pierces the capsule to deposit her eggs therein is like a very fine needle, and is seen at the extremity of the body in our figure, in which we need scarcely say that the antennæ, wings, and legs on only one side of the body are represented, to avoid confusion in the details. *I. O. W.*

### FRUIT NOTES.

**PATCHING VINES.**—Last year a few rather strong growing young Vines of Muscat of Alexandria, Lady Downe's, and Mrs. Pince not breaking so regularly as I could wish, some of my friends advised me to cut the young rods down to the regular break, and then take up fresh leaders. This advice I could not see the desirability of doing, seeing that the evil thus sought to be remedied was just as likely to repeat itself, and instead of following it the shoot immediately below the bare portion of each Vine was trained up the stem, and inarched thereon, having in each case the lower bud of the shoots so treated, and which will produce shoots this year, and fruit if necessary, as close to the base as possible. They were then bound together with matting, after which a little moss was tied round at the point of contact for the purpose of retaining the moisture which was applied three or four times a day with the syringe. In one or two cases the same lateral was used to supply two separate shoots at about 15 inches apart this year. As far as I know this mode of "stopping gaps" on Vines is as novel as it is efficacious, as I have never read nor heard of any one having practised it before. Hence my object in recording the *modus operandi*, the results of which I hope to supply to the readers of the *Gardeners' Chronicle* in due season. *H. W. Ward, Longford Castle.*

#### BLenheim ORANGE

is the Apple *par excellence* in this neighbourhood, and last season quite surpassed itself in the heavy crop produced, which always finds a ready sale at remunerative prices, which ranged from 6s. to 12s. per cwt. during the past season, commencing at the former, and ending with the later price, at Christmas. I gathered 25 cwt. from the only two trees of that variety in an orchard of 12 acres, which made me wish there had been more of the same kind. Now an orchard of Blenheims, the extent of the one mentioned, planted 30 feet apart each way, would give forty-eight trees to the acre; and suppose they bear every other year (for I find it is a bionial as a rule) 2 cwt. each, worth 8s. per cwt. on an average, would give an annual value of £19 4s. per acre. After deducting cost of gathering and marketing, which I reckon to cost about 1s. 6d. per cwt., a very good return is left. Blenheims do not bear young; they are strong, vigorous growers, and there is plenty of other varieties that surpass it for early bearing, but it is a sort that makes a tree to last, and having a good reputation in the markets there is no difficulty in disposing of them, for dealers only know a few sorts of Apples, and Blenheims stand at the head of their list; most other kinds are sold under the term of pot-fruit in this district at a much lower price. One of our largest nurserymen informed me the other day that there was such an extraordinary demand for Blenheim trees now that it could not be supplied. Planters for market do not plant a number of varieties now, but stick to what are in request—an example that all might follow who are not collectors or exhibitors. I find Blenheims vary a great deal from different situations in size and colour. They show it most at the time of gathering; after storing for a time there is not so much difference in colour. *Wyeside.*

#### BRITISH APPLES.

Having read the report of the Apple Congress, and finding there were only two collections from Ireland, and those not large, I will give a list of those kinds that were fruitful in the cold summers of 1879, 1880, 1881, in the North of Ireland. Culinary kinds:—Ringer, Domino, Keswick Codlin, Lord Suffield, Hawthornden (old), Warner's King, Rymcr, Cellini,

Dessert kinds:—King of Pippins, Court of Wick, Yellow Ingestre, Mr. Gladstone, Duchess' Favourite, Blenheim Pippin. The above form part of a collection of over 150 bush-trained trees from fifteen to twenty-eight years of age, and consist of upwards of forty kinds. *Pomona*.

## HOME CORRESPONDENCE.

**Retarding Blossoms on Wall Trees.**—Our gardening friends seem chiefly occupied with devising more or less expensive contrivances for warding off the effects of frost from Plums, Apricots, Peaches, and Pears. It seems to me that this protection of the bloom in these various ways will not be generally adopted because of its expense and the great labour required in fixing and removing it, and also because of its inefficiency at the critical time. As many think our winters tread more on the heels of summer than was their wont, which is by no means proved, why not in some manner retard the flowering of the trees to a more favourable period in the spring months? No transparent substance as glass or oiled canvas is so good for screening trees from frost as opaque ones. This is one, and perhaps the sole cause of the loss of bloom under wide copings of these with only a moderate degree of frost. They do not arrest radiation of warmth from the border nor from the wall to the same degree as straw, wood, or slate. I found that no form of open protection was so good in retarding the growth of the buds, the

fruit on it in a garden at "Burry Port," in South Wales. The garden belongs to Captain T. Edmunds, and I last month heard of a fine Laburnum tree, one half of which was then in full bloom on the lawn at Killymaen Llwyd, the residence of Marcus Bees, Esq., which is in the immediate vicinity of "Burry Port." *Helen Watney, Liss, Hants.*

**Penzance Notes.**—The weather here, with the exception of a few days, has been remarkably mild—a fact which, of course, has material influence upon vegetation. Fuchsias, Pelargoniums, and many other subjects in the open still exhibit traces of "departed glory." The handsome Passion-flower, *Passiflora cœrulea*, is practically a hardy evergreen on the walls of houses around this town; its showy Orange-like fruit renders it singularly attractive, and the plant itself flourishes with remarkable vigour within a few feet of the sea. Market gardeners have already commenced, to some extent, putting in Potatoes; in a few favoured localities I have noticed that the first leaves are already above the surface of the soil. The Cucumber-forcing industry of this district has made most rapid strides within the past three or four years, half a dozen men having no less than sixty-two houses in full swing; of this number three or four structures are devoted to Vines and Peaches. *Bevis.*

**A Patent Boiler.**—This form of vessel, in which water may be heated, before flowing into the glass-houses (fig. 32), is noticed, not because it is "the most powerful and economical boiler ever invented,"

FIG. 32.—A PATENT BOILER.

nearest approach to it being found in boards of 11 inches wide resting on iron supports, and having Frigi Domo covered frames, placed almost upright against the edge of the board. All such blinds are apt to get blown over or torn into shreds by the boisterous March winds, failing just when most wanted. The best methods of keeping the bloom in check were covering the trees with straw or bast mats at a short distance (6 inches) from the wall, the first being the better for the purpose, or by using the Frigi Domo frames at the same distance. These are better put on in the daytime and removed during the night until the trees come into flower, when the procedure must be reversed. All this is very troublesome, but it paid in returns of more than average crops. The gardener must begin in January or February, the latter month in severe winters being usually early enough. The best of all retarding material is undoubtedly Spruce Fir branches put on the wall thickly, fastening with nails or tying them to the wires, if the wall is wired. It is sufficient if the edges of the branches just touch each other all over the surface of the trees—they will keep the wall cool during the sunny days of late winter, but as the sun gains power it will cause the "needles" to fall off gradually and lessen in size individually, so that the branches will both hinder the too early opening of the bloom and well protect it when open. The spray must remain on the wall till all danger from frost is over, by which time it will have lost all its foliage, so that the removal of it will cause no check to healthy growth, and an abundant crop of fruit will be found underneath. *M. W.*

**Unusual Blooming of Trees.**—There is now, I am informed, an Apple tree with a large crop of

but because we perceive an apparently useful deviation from the general saddle form in vogue. Of its power or economy we can say nothing; still, its form, encased in corrugated iron, embodying the advantages of the tubular boilers without that multiplicity of parts existing in them, should favour the rapid rise of the temperature of the contained water, and this latter, being of considerable bulk, should retain its heat for a comparatively long period of time, and so assist in keeping the circulation up after the fire has got low. The makers are Messrs. Wood & Milton.

**Eucharis amazonica.**—Like your correspondent, A. Macdonald, I have not seen or heard anything to justify the belief in the so-called disease in this plant. The symptoms mentioned by numerous writers in your columns of late have been amply demonstrated in my own plants from time to time, but the evil has generally proved to be the same, viz., loss of roots, the soil having become like paste, which is not to be wondered at, however full of fibre the compost may be at the time of potting, and especially if kept, as many of your correspondents' plants are, in a strong heat and deluged with water from one year's end to the other. With us when a plant shows signs of exhaustion, as soon as it has done flowering I shake it out and wash the bulbs thoroughly, then with a good rough compost, similar to what "Young Gardener" mentions at p. 24, I repot, having first sorted the bulbs in three sizes, and plunge in cocoa-nut fibre up to the rims; bottom-heat is applied and they commence to grow at once. I may mention that some so treated just twelve months ago, and that had not a vestige of a leaf, are now in perfect health again. As soon as they have made a good leaf or two I gradually lift

them from the plunge-bed which they only inhabit at such times as when not established, as I consider it has a tendency to destroy the fibre in the compost and turn it sour much sooner than when the pots are stood on the stage in the ordinary way. Thrips are great pests and will soon make headway if the atmosphere is allowed to become dry for any length of time: unremitting attention in the way of damping down and syringing will soon lessen their numbers, and be highly beneficial to the plants. Until by some means we introduced the mealy-bug three years ago, we had no difficulty whatever, but the constant cleaning and dressing has sadly disfigured our best plants which were then 5 feet across, but although disfigured they are none the less healthy, and now that the bug is stamped out we hope to have our turn again. *J. Prevett, Swiss Nursery, Hammersmith, W.*

**Gas Lime.**—Your correspondent, Mr. Divers, must not think this the destructive agent to vegetation he makes out if applied to the land with judgment for the destruction of slugs: I have never used it, and do not intend to; but for preventing the attacks of wireworm on Carrots and Parsley, it has been used here successfully for years—indeed we should not think of sowing these crops without the application of gas-lime first. For Carrots we manage to dig in about a quantity equal to half an inch in depth some time before Christmas—that is for the main crop; but for late Carrots, and also for Parsley, we have often dug in gas-lime, and sown directly upon it, and I have never yet witnessed the ill-effects; on the contrary, whereas these crops used to melt away like butter before the sun, now they come to perfection. Beyond this I do not intend to preach, but as recommended for the destruction of weeds on walks by "T. B.," p. 26 (I wonder if he practises what he preaches?), I should say it would be a disagreeable nuisance, worse than the weeds, and which no rational man would attempt. Fancy a good shower of rain on a coating of gas-lime. What a delightful mixture for carriages, boots, &c. *J. Corbett.*

**Lapageria rosea: Hardiness of the White Variety.**—At p. 54 the Rev. J. T. Boscawen makes the remarkable observation that the white variety of this plant is, "if anything, hardier than rosea." Readers of the *Gardeners' Chronicle* will remember that Mr. Darwin has pointed out that a number of white varieties of plants are decidedly less hardy than the coloured ones, but the fact seems to be that no generalisation of this sort will hold good, as numerous instances are known (in addition to one adduced by Mr. Boscawen), where a white variety is equally hardy with, if not harder than, the coloured form. *W. G. S.*

**A Large Cupressus macrocarpa.**—On Dec. 20 a *Cupressus macrocarpa* was blown down by a north-westerly gale. It was set up on the 22d and stayed with four pieces of fencing wire secured to posts driven nearly 3 feet into the ground. On Jan. 15 it was blown down by an easterly wind, which drew the posts out of the ground. The tree was planted early in 1867 when 3 feet high, and measures—height, 40 feet; circumference at 3 feet from ground, 40 inches, at 5 feet 36 inches. Soil light, resting on dum stone. The roots are very brittle. *H. R. R. N.*

**Anthurium Andreanum.**—A very fine variety of the above is in flower in the gardens of J. S. Hodgson, Esq., Lythe Hill, Haslemere. The flower-spikes are about 8 inches long and 6 wide; the foliage is both healthy and strong, which is one thing essential for producing large flowers. The plant in question is potted in a mixture of rough fibrous peat, sphagnum moss, crocks, and charcoal. The top is surfaced with live sphagnum moss, which the roots delight to run in, and which gives the plant a neat and finished appearance. *A Visitor.*

**Californian Onion Seed.**—California has for some years past been considered an important State for the growth of Onion seed to supply the principal American markets, and it bids fair to come into competition in providing also for the markets of the Old World. In October last we had three samples of Californian-grown Onion seed handed to us by the London agent of a seed firm doing a large business at Santa Clara. We carefully tested the growth of this seed, and we found, although it was 1883 seed,

that it germinated very strongly, producing a high percentage of plants, and everything on this score was perfectly satisfactory. But we were not satisfied with this, and asked to have some bulbs sent over, in order to judge of the different stocks. In due course these arrived, and we were highly pleased with them, the size, shape, and colour being all that a gardener or seedsman need wish. One sample of Danver's large flat yellow Onion seems the most suitable for our markets, and is a really first-rate Onion—large size, good substance, and an excellent keeper, superior to and quite distinct from the Danver's Early Yellow of France and Germany. The other sorts were red varieties, one a large flat, and the other a globular-shaped Onion, and very excellent stocks they appear to be. We propose growing a good breadth of the large Danver's Yellow in our own market gardens, and shall certainly not fail to bring this variety before the notice of our friends, and in due course we shall have pleasure, if you think well, in giving you the results of our crops [Please do so]. As we venture to think this may be of some interest to many of your readers we are sending you some specimen bulbs for your inspection, and we should be glad to have your opinion respecting them. *W. W. J. & Son.* [A sound medium-sized sample of perfectly ripened bulbs, differing from our Danver's Yellow in being a little more oblate and in the darker tint of the skin. If it should prove a late sort it would rank with our best late-keeping ones. *ED*]

**Tobacco Growing in Ireland.**—A very interesting debate took place at the meeting of the Statistical Society on Tuesday, in Dublin, as to the feasibility of again resorting to the growth of Tobacco as a remunerative crop. When grown before its growth seems to have been confined to a few places, of which this was one. Old people say it was subject to many vicissitudes—and this seems not unlikely, when a temperature of from 70° to 80° Fahr. is said to be indispensable to mature the leaf; while, on the other hand, all are aware 1° of frost will ruin the crop. Can a minimum profit of £25 per statute acre be realised on a successful crop after paying 3s. in the pound tax? If so it would be a Heaven-sent blessing to the Irish, and, I presume, English farmers. Would one correspondent discuss the matter impartially in your columns? *W. J. M.*

**Brussels Sprouts.**—Having some seed sent me by Mr. May of a variety called May's Northaw Prize, I must say, after a fair trial with several sorts, I have found nothing to compare with it; the buttons are medium-sized, very firm and clean, which is a great advantage in its keeping qualities. *W. A.*

**Celeriac.**—These uncouth but toothsome additions to our winter salads are now common in Covent Garden, and are wholly of Continental growth. This should not be, as the root will grow just as well in Essex or at Isleworth as in Southern France or Northern Germany. The preparatory cultivation of the plant is identical with that of our blanched Celery, and, like it, it requires plenty of water in dry weather, and rich soil to grow it large. If planted at the same distance apart, on flat ground, made up into 5 feet beds, with an alley of 18 inches wide, as medium growing Cabbages are set out, it will have room to develop its head. It dislikes crowding, but requires a sunny open spot, and the only cultivation wanted in summer is keeping the soil stirred on the surface, watering, and some time in August cutting off close to the bulb a few of the oldest leaves, so that sun and air can mature the root. No earthing-up is needed, and nothing extraordinary in the amount of manure to be dug in. The roots are taken up on the approach of frost, in October or November, and stored in a cool moist root cellar. A few of the heart leaves may be left, although that is immaterial, provided the roots are not trimmed too closely. They can be stacked with the crowns outwards in steep banks of damp seed or mould, and should not be kept quite dark. They may be used stewed in a little soup, or boiled till tender in salt and water, when they are good eaten with Beet-root or waxy-fleshed Potatoes, all cut into slices, and eaten with salad dressing or salad oil and vinegar. *M. W.*

**Fungus in Imported Japanese Lilies.**—You must allow me a few lines to thank Dr. Wallace for his notes (p. 120), confirmatory of my first impres-

sions that this fungus was of Japanese origin. Permit me to repeat his remarks:—"Your correspondent is quite correct as to there being a Japanese fungus which attacks Lily bulbs first in the warehouses of Japan, and whose rapid development in the hold of the steamers on the voyage, fostered by the high temperature"—I presume on or during the voyage through the tropics—"has brought death to thousands of imported bulbs." This is very important to all concerned, inasmuch as the first step towards the remedy of any effect is to find out the cause. Hitherto that has been, at the most, merely conjectural—so much so that your correspondent, "A. D.," same page, speaks of it as "a clue to the mystery;" and to my own knowledge several able gardeners and amateurs have been blaming themselves, their method of treatment, the soil, the importers, and so on. All this is now disposed of, for Dr. Wallace has not only found the cause, but also found an antidote, for he says, "We . . . keep our imported bulbs in cold frames until root action has commenced, and the bulbs are as firm, sound, and heavy, and as free from all fungus germs as home-grown bulbs." He then adds, "In this way, and this way only, can we obtain satisfactory results, both to our customers and ourselves," then most kindly concluding, "If 'W. J. M.' will pay us a visit we shall be happy . . . to explain the process we use to devitalise the fungus germs." Permit me to say business in France the coming year may enable me to accept this kind invitation *en route*; but apart from that, the gist of the whole matter is in the last phrase—"The process we use to devitalise the fungus germs." Now, I am strongly tempted to ask Dr. Wallace to explain in your pages his method of devitalising or destroying the fungus germs, and thus become a public benefactor; but I am restrained from doing so, on consideration, for, so far as I know, the matter is still a secret, and may therefore be worth money to the representative of an important bulb firm. However, I mean next year to continue my experiments with some of the mineral oils, &c., if in the meantime the point is not definitely known. Buyers, and importers, and the public, however, now have definite information. *W. J. M.*

## Notices of Books.

**The Rosarian's Year Book, 1885.** (Bemrose.)

We have come to look on this as the record of the year's work, its hopes, its fruition, its anticipations as far as regards Roses. The present issue opens with a portrait of Mr. George Paul, to whose intelligence, zeal, and cordial good feeling the editor does fuller justice than the photographer. Pruning occupies a considerable share of attention, but is a matter on which we may hope to have in future a much fuller treatment. Roses in the Azores are touched on, a *resumé* of the work for the year of the National Rose Society follows; and lastly, that admirable annual summary of the relations of plant life, as exemplified by Roses, to meteorological conditions which Mr. Mawley has taught us to look for. For these articles alone the Year Book is worth a place on the shelves as a book of reference. Pruning is so very much a matter for the zealous amateur that we looked with some interest to the opinions of the various writers. Should it be done early or late? The general tenour of the answers given, subject to circumstances, seems to be that early pruning is best, if the conditions be favourable. The plants break more slowly and evenly after, and escape injury from late frosts. Hard pruning is generally recommended, though some of the writers advocate the retention of as much of last season's well-ripened wood as possible. The question really turns upon a physiological point. If the matured wood is left the new growths get their food and their building materials from that wood; if the matured wood is cut away, the Rose has double work to do—it has to accumulate in a short space of time the material requisite for the formation of flower-buds. If it were a question of seed production or even of fruit forming there would be no hesitation in preferring the safer course of relying on the matured wood and its accumulated hoard of food-supply, but as we only require the flower and are mostly indifferent as to pollen formation and its quality, as also to the formation of ovules and embryo plants, then we may well content ourselves with the new growth provided the climatal conditions be such as to secure

rapid and uninterrupted growth. Unfortunately, we cannot anticipate what the weather is likely to be, and so the teachings of physiology and the demonstrations of experience in any one year are only partially applicable to the circumstances of the next. On all grounds, however, we concur in the opinion of the Rev. Mr. Pemberton, who tells us that the quicker and steadier the growth from pruning to blooming, the more perfect will be the flowers. Late pruning produces a quick growth. As we have adverted to physiological matters we may indicate some most questionable statements put forth on p. 11, but which assuredly no physiologist would now admit to be correct. It is probable, from the context, that these antiquated statements have been accepted as gospel from some so-called popular books which propagate and perpetuate error in a rather exasperating manner, and would lead to the inference that botany has made no progress, and that physiology has retrograded, during the last half-century. It is only right to say, however, that these matters are mere specks in an article full of sound practical teaching. There are a few awkward misprints that have escaped observation, such as *Coupe d'Hobé*, but these, too, do not detract from the utility of this pleasant little volume.

**The Fern Portfolio.** By F. G. Heath. (Society for Promoting Christian Knowledge.)

A series of quarto plates, representing fronds of all our British Ferns, of life-size. The character of the venation is shown, but the arrangement of the spore-cases is little more than indicated. No attempt is made to show the habit of the plant, or to convey any information beyond what is apparent on superficial inspection. Within the limits expressly prescribed by the author himself we have nothing but praise to bestow, as the representations of the fronds are life-like and accurate, and the colouring more faithful than is usual in such productions generally. Surely, however, Mr. Heath is much too self-complaisant in general and specially in error when he says that no attempt (the italics are his own) has ever been made to produce an absolute fac-simile in form, colour, and venation. *Vixere fortes ante Agamemnonem.* Mr. Heath must have overlooked the splendid work of Mr. Thomas Moore; but that was necessarily costly, while this series of plates is published at a low cost. As an original work it is of little value, and this makes the omission of reference to its predecessors the more to be regretted.

**Practical Taxidermy.** By Montagu Browne. (L. Upcott Gill.)

Most of us are familiar with the very remarkable productions, supposed to be stuffed birds, which one meets with in country museums, and which, by some curious association, the significance of which we fail to unravel, are also to be met with in third-rate barbers' shops in the back streets of our towns. These were the admiration of our youth, when in the collecting stage of existence, before the sense of beauty, the fitness of adaptation, the significance of form and colour had dawned upon us. The richness of our collections, apart from any intrinsic appreciation of the beauty of the objects, or any real knowledge of them, was then the main object of pursuit. The joy was in collecting and possessing, and we would not undervalue these delights even now. But with increasing knowledge comes increasing appreciation, and the grotesque masks no longer satisfy us, but jar on our sensibilities.

With us the awakening began in 1851, when the stuffed animals from Württemberg in the Great Exhibition formed as it were a revelation. Since then taxidermy—"bird stuffing," shall we say? though it includes mammals and fishes as well as birds—has made great strides. In our museums whole skins and skulls, wings, and feet are stowed away in drawers for the use of the student. Well mounted groups, illustrative of the life-habits of the creatures, charm the public, and reveal fresh points of interest to the student. Let the visitor compare the really admirable groups now to be seen in the Natural History Museum at South Kensington with the ghastly abortions of the barber's window, or the apothecary's shop, as mentioned by one Romeo, and he will feel as if a new world had been opened to him, and derive all the more satisfaction from the knowledge that the cases and drawers contain, in

convenient form for study and examination, hundreds more illustrations of types and species than were possible under the old system.

How all this can be done, and how museums can be made at once attractive and really useful to the student, is well told in the volume before us. We cannot go into detail here, but we may most earnestly commend Mr. Browne's eminently practical treatise to all concerned in the preservation of birds and other creatures for purposes of study or otherwise. No one with a passion for collecting and preserving, specially no museum curator, should be without it.

## ROYAL HORTICULTURAL SOCIETY'S COMMITTEES.

THE following gentlemen have been appointed to serve on the different committees for the year 1885:—

### SCIENTIFIC COMMITTEE.

*Chairman.*—Sir Joseph Dalton Hooker, K.C.S.I., M.D., C.E., F.R.S., V.P.L.S., Royal Gardens, Kew.  
*Vice-Chairmen.*—Rev. M. J. Berkeley, F.R.S., Sibbertoft, Market Harborough; Dr. Michael Foster, F.R.S., Shelford, Cambridge; Grote, Arthur, F.L.S., 42, Ovington Square, S.W.  
*Secretary.*—Rev. G. Henslow, F.L.S., F.G.S., Drayton House, Ealing.  
 Baker, J. G., F.R.S., Royal Herbarium, Kew.  
 Balfour, Professor I. Bayley, Oxford.  
 Beddome, Colonel, Sispura, West Hill, Putney, S.W.  
 Bennett, Alfred W., M.A., B.Sc., F.L.S., 6, Park Village East, Regent's Park.  
 Boulger, G. S., 9, Norfolk Terrace, Bayswater, W.  
 Burbidge, F. W., Trinity College Gardens, Dublin.  
 Church, A. H., F.C.S., Royston House, Kew.  
 Clarke, Colonel R. Trevor, Welton Place, Daventry.  
 Glaisher, James, F.R.S., Dartmouth Place, Blackheath.  
 Houston, D., F.L.S., 179, Mayall Road, Herne Hill, S.E.  
 Loder, Edmund Giles, Floore, Weedon, Northamptonshire.  
 Lowe, Dr. W. H., Woodcote, Inner Park Road, Wimbledon.  
 Llewelyn, J. T. D., F.L.S., Penllegare, Swansea.  
 Lynch, R. Irwin, A.L.S., Botanic Gardens, Cambridge.  
 Masters, Maxwell T., M.D., F.R.S., Mount Avenue, Ealing, W.  
 McLachlan, R., F.R.S., Limes Grove, Lewisham.  
 Michael, Albert D., Cadogan Mansions, Sloane Square, S.W.  
 Moore, Thos., F.L.S., Botanic Gardens, Chelsea, S.W.  
 Murray, G., F.L.S., Natural History Museum, South Kensington, S.W.  
 Pascoe, F. P., F.L.S., 1, Burlington Road, Westbourne Park, W.  
 Plowright, C., F.L.S., 7, King Street, King's Lyon.  
 Ridley, Henry N., F.L.S., B.A., Natural History Museum, South Kensington, S.W.  
 Smee, A. H., The Grange, Wallington, Surrey.  
 Smith, Worthington G., F.L.S., 38, Kyverdale Road, Stoke Newington, N.  
 Wilson, A. Stephen, North Kimmund, Summerhill, Aberdeen.

### FLORAL COMMITTEE.

*Chairman.*—Geo. F. Wilson, F.R.S., Heatherbank, Weybridge Heath.  
*Vice-Chairmen.*—Maxwell T. Masters, M.D., F.R.S., Mount Avenue, Ealing, W.; John Fraser, Lea Bridge Road Nursery, Leyton; Shirley Hibberd, 1, Priory Road, The Green, Kew.  
*Secretary.*—Archibald F. Barron, Royal Horticultural Society, Chiswick, W.  
 Bailes, Thomas, Fern Cottage, Palmer's Green, N.  
 Ballantine, H., The Dell Gardens, Egham.  
 Bealby, William, The Laurels, Roehampton Park, Putney Heath, S.W.  
 Bennett, H., Shepperton, Walton-on-Thames.  
 Canonell, Henry, Swanley.  
 Child, Jas., The Garden, Garbrand Hall, Ewell.  
 Dominy, John, 11, Tadema Road, Chelsea, S.W.  
 Douglas, J., The Gardens, Great Gearies, Ilford, E.  
 Duffield, G., The Gardeos, Bamford Lodge, Winchmore Hill, W.  
 Herbst, H., Kew Nursery, Richmond, Surrey.  
 Hill, E., The Gardens, Tring Park, Tring.  
 Hudson, James, The Gardens, Gunnersbury House, Acton.  
 James, J., Woodside, Farnham Royal, Slough.  
 Kellock, W. B., F.L.S., Stamford Hill, N.  
 Kinghorn, F. R., Sheen Nursery, Richmond, Surrey.  
 Laing, John, Stanstead Park, Forest Hill, S.E.  
 Llewelyn, J. T. D., F.L.S., Penllegare, Swansea.  
 Noble, C., Sunningdale Nursery, Bagshot.  
 O'Erico, James, West Street, Harrow-on-the-Hill.

Perry, Amos Isaac, Stamford Road, Page Green, Tottenham.

Pollett, H. M., Fann Street, Aldersgate Street, E.C.  
 Smith, J., The Gardens, Mentmore, Leighton Buzzard.  
 Turner, Harry, Royal Nursery, Slough.  
 Walker, J., Whitton, Middlesex.  
 Wilks, Rev. W., Shirley Vicarage, near Croydon.  
 Williams, Henry, Victoria Nursery, Upper Holloway.

### FRUIT COMMITTEE.

*Chairman.*—F. Du Cane Godman, F.R.S., 10, Chandos Street, Cavendish Square, W.  
*Vice-Chairmen.*—H. J. Veitch, F.L.S., Royal Exotic Nursery, Chelsea, W.; John E. Lane, Berkhamstead; Blackmore, R. D., Teddington.  
*Secretary.*—Archibald F. Barron, Royal Horticultural Society, Chiswick, W.  
 Bunyard, George, The Old Nurseries, Maidstone.  
 Burnett, J., The Gardens, Deepdene, Dorking.  
 Denning, W., The Gardens, Londesborough Lodge, Norbiton, Surrey.  
 Ellam, Joseph, The Gardens, Cliveden, Maidenhead.  
 Ford, The Gardens, Leonardslee, Horsham.  
 Goldsmith, O., The Gardens, Hollanden, Tunbridge.  
 Haywood, T. B., Woodhatch Lodge, Reigate.  
 Hogg, Robert, LL.D., F.L.S., 99, St. George's Road, S.W.  
 Howcroft, Anthony, 14, Tavistock Row, W.C.  
 Lee, John, 78, Warwick Gardens, W.  
 Lyon, S., The Gardens, Sundridge Park, Bromley.  
 Mason, Major E., The Firs, Warwick.  
 Miles, George T., The Gardens, Wycombe Abbey, High Wycombe.  
 Paul, George, The Old Nurseries, Cheshunt, Herts.  
 Paul, William, Waltham Cross, N.  
 Rivers, T. F., Sawbridgeworth.  
 Roberts, J., The Gardens, Gunnersbury Park, Acton.  
 Ross, Charles, The Gardens, Welford Park, Newbury.  
 Rutland, F., The Gardens, Goodwood, Chichester.  
 Sheppard, J., The Gardens, Woolverstone Park, Ipswich.  
 Silverlock, Charles, 412, Strand, W.C.  
 Sutton, Arthur W., Reading.  
 Webb, Henry, Redstone Manor House, Redhill.  
 Weir, Harrison, Tunbridge Wells, Kent.  
 Willard, Jesse, Holly Lodge Gardens, Highgate, N.  
 Woodbridge, John, The Gardens, Syon House, Brentford, W.

## The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, JANUARY 28, 1885.

MONTH AND DAY.	BAROMETER.		TEMPERATURE OF THE AIR.					HYGROMETRIC DEDUCTIONS FROM GLAISHER'S TABLES 6th Edition.		WIND.	RAINFALL.
	Mean Reducing to 32° Fahr.	Departure from Average of 40 years.	Highest.	Lowest.	Range.	Mean for Day.	Departure of Mean from Average of 40 years.	Dew Point.	Degree of Humidity.		
Jan. 22	29.86	+0.11	35.0	22.5	12.5	30.3	-7.1	29.2	95	E.	0.00
23	29.91	+0.16	35.5	27.8	8.0	31.0	-6.5	30.3	96	E.	0.00

Jan. 22.—Dull day and night.

— 23.—Dense fog from early morning till 1.30 P.M. Dull night.

— 24.—Very cold morning; dull day and night.

— 25.—Very fine bright day; fine clear night.

— 26.—Dull day and night.

— 27.—Dull day. Fine and clear at night.

— 28.—Dull day and night.

LONDON: *Atmospheric Pressure.*—During the week ending January 24, the reading of the barometer at the level of the sea increased from 30.11 inches at the beginning of the week to 30.25 inches by 9 A.M. on the 19th, decreased to 30.06 inches by 3 P.M. on the 20th, increased to 30.08 inches by midnight on the same day, decreased to 29.97 inches by 3 P.M. on the 21st, increased to 30.02 inches by 9 A.M., decreased to 30 inches by 3 P.M. on the 22d, increased to 30.10 inches by 9 A.M. on the 23d, decreased to 30.06 inches by 3 P.M. on the 23d, and was 30.17 inches by the end of the week.

The mean reading of the barometer for the week was 30.10 inches, being 0.34 inch higher than last week, and 0.18 inch above the average of the week.

*Temperature.*—The highest temperature in the shade in the week was 38°, on the 19th; the highest on the 21st was 31°.5. The mean of the seven high day temperatures was 35°.6.

The lowest temperature was 22°.5, on the 22d; on the 18th the lowest temperature was 34°. The mean of the seven low night temperatures was 28°.

The greatest range of temperature in one day was 12°.5, on the 22d; the smallest was 3°, on the 18th. The mean of the seven daily ranges was 7°.6.

The mean temperatures were—on January 18, 35°.4; on the 19th, 34°.9; on the 20th, 31°.1; on the 21st, 27°.9; on the 22d, 30°.3; on the 23d, 31°; on the 24th, 32°.2; and these were all below their averages by 1°.5, 2°.1, 6°.2, 9°.4, 7°.1, 6°.5 and 5°.5 respectively.

The mean temperature of the week was 31°.8, being 3° lower than last week, and 5°.5 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 64°, on the 21st. The mean of the seven readings was 50°.6.

The lowest reading of a minimum thermometer with its bulb placed on grass was 15°, on the 22d. The mean of the seven readings was 21°.6.

Rain.—No rain fell during the week.

ENGLAND: *Temperature.*—During the week ending January 24 the highest temperatures were 48°, at Truro, 46°.8 at Plymouth, 41° at Bristol, Leeds, and Sunderland; the highest at Wolverhampton was 35°.8, at Nottingham 37°.5, at Cambridge 37°.8. The general mean was 40°.1.

The lowest temperatures were 50°, at Cambridge, 21° at Sheffield, 21°.2 at Wolverhampton; the lowest at Plymouth, 32°.8, at Sunderland 27°, at Liverpool 26°.6. The general mean was 24°.2.

The greatest ranges were 24°, at Truro, 18° at Sheffield, 17°.8 at Cambridge; the smallest ranges were 11°.9, at Nottingham, 12°.1 at Liverpool, 13°.6 at Bradford. The general mean was 15°.9.

The mean of the seven high day temperatures was highest at Truro, 44°, at Plymouth 41°.9, at Sunderland 38°; and was lowest at Wolverhampton, 33°.5, at Liverpool 34°.8, at Nottingham 34°.9. The general mean was 36°.9.

The mean of the seven low night temperatures was 36°, at Plymouth; at Truro 35°.6, at Sunderland 31°.7; and was lowest at Wolverhampton, 27°.3, at Blackheath 28°, at Bolton 28°.6. The general mean was 30°.5.

The mean daily range was greatest at Truro, 8°.4, at Blackheath 7°.6, at Hull 7°.5; and was least at Liverpool, 4°.4, at Nottingham 4°.7, at Brighton 5°.1. The general mean was 6°.4.

The mean temperature was highest at Truro, 39°.6, at Plymouth 38°.8, at Sunderland 34°.7; and was lowest at Wolverhampton, 30°.2; at Blackheath and Sheffield 31°.8. The general mean was 33°.4.

Rain.—The largest falls were 0.25 inch at Truro, 0.17 inch at Plymouth, 0.15 inch at Bradford; the smallest fall was 0.02 inch at Nottingham and Bolton. No rain fell at Brighton, Blackheath, Cambridge, Hull, or Sunderland. The general mean was 0.07 inch.

SCOTLAND: *Temperature.*—During the week ending January 24, the highest temperature was 42°.3, at Aberdeen; at Dundee, Greenock and Paisley the highest was 40°.2. The general mean was 40°.7.

The lowest temperature in the week was 2°.2, at Glasgow and Edinburgh; at Dundee the lowest temperature was 26°.8. The general mean was 24°.

The mean temperature was highest at Aberdeen, 37°.1; and lowest at Glasgow, 32°.4. The general mean was 34°.

Rain.—The largest fall was 0.07 inch, at Aberdeen; the smallest fall was 0°.01 inch, at Leith. The general mean was 0.02 inch. No rain fell at Glasgow, Dundee, or Greenock.

JAMES GLAISHER, F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, January 26, 1885; issued by the Meteorological Office, 116, Victoria Street, London, S.W.:—The weather has been less cloudy than of late in the south-east of England, but dull or gloomy elsewhere, with showers of rain over Ireland and the extreme south-west of England.

By the end of the period the unsettled, rainy condition had extended to the entire kingdom. Much fog or haze was experienced during the earlier part of the period at some of the English stations.

The temperature has been 2° above the mean in "Ireland, S.," and about equal to its normal value in "Scotland, N.," but below in all other districts, the deficit ranging from 1° in "Ireland, N.," to between 4° and 6° over nearly the whole of England and in the east of Scotland. The daily maxima were generally low over the greater part of England and Scotland, but towards the end of the week they became higher, till by the 26th the thermometer had risen to between 42° and 51°, while in the "Channel Islands" and "Ireland, S.," readings of 53° and 54° respectively were recorded. The minima, which were registered on different days in the various localities, ranged from 22° to 28° in the "grazing districts" to 20° in the "Midland Counties," 19° in "England, E.," and 11° in "Scotland, E." (at Nairn).

The rainfall has been less than the mean in all districts, especially in the south of England. At some of the south-eastern stations, in addition to the rain, there was a succession of heavy dews which caused sufficient water in the gauge for measurement.

Bright sunshine shows a decided increase in the east and south-east of England; but elsewhere very little has been recorded. The percentages of the possible duration varied from 2 in "Scotland, E.," and "England, S.W.," and between 4 and 9 in most other districts to 31 in "England, E."

Depressions observed.—No depressions appeared in our immediate neighbourhood until the period drew towards its close, when the high-pressure area recently established over Scandinavia moved slowly southwards, and depressions began to skirt our extreme western coasts. Moderate to light breezes between south-east and south prevailed during the greater part of the week, but in the West they at times blew freshly or strong, and at some of the more exposed spots attained the force of a moderate or fresh gale.

## Obituary.

DR. GWYN JEFFREYS.

DR. JOHN GWYN JEFFREYS, the well-known conchologist, died suddenly on Friday last. Dr. Jeffreys was born at Swansea, in 1809. His tastes were rather scientific than legal, though he practised at one time as a solicitor. In 1869, 1870, 1871, and 1875, he either conducted or took part in exploring voyages in the North Atlantic and on the north-eastern coast of the United States. In 1880 he joined the French Sounding and Dredging Expedition in the Bay of Biscay. He is probably best known by his principal work, *British Conchology*, in five volumes. Dr. Jeffreys was an occasional correspondent of this journal, and a referee on matters relating to conchology.

MR. JAMES HARDIE.

We regret to announce the death of Mr. James Hardie, of the firm of Messrs. Laird & Sinclair, nurserymen and seedsmen, Dundee, which took place suddenly at his residence on the 23d inst.

## Answers to Correspondents.

BOOKS: *T. M.* Half-a-crown.—*W. J. M.* We have no copy of the work you name that can be spared.—*T. W.* We do not know what you signed. If you committed yourself to take the whole book, we fear you have no remedy. Such books are usually inferior compilations, and persons should be more circumspect, and not commit themselves to take what they do not want.

CAMELLIA LEAVES: *R. V. & Sons.* Apparently eaten in places by a weevil, of which there are many species. Let the depredator be caught, and then identify him.

CUSTARD APPLE: *H. M.* *Anona reticulata*; native of the West Indies, but cultivated in the East Indies; trees or shrubs. Its yellowish pulp is not so much relished as that of other kinds of *Anona*. There is no record of its having been fruited in this country.

GUMMING CAMELLIAS: *Amateur.* As you do not describe the appearance of the affection, which may be a black mould (*Dematiel*), or some other parasitic fungus, please send a few affected shoots.

HABITAT OF *POPULUS TREMULA*: *F. C. D.* Middle of Asia; Europe; the North American variety, *P. greeca*, from Carolina—Canada.

LATIN WITHOUT A MASTER: *Enquirer.* Get *Initia*

*Latina*, by Dr. Smith. Yes, you will find the language of much use to you as a gardener.

MARGUERITES: *Mrs. F. H. Allen.* You should be able to get the seeds you name from Messrs. Cannell & Sons, Swanley, Kent.

NAMES OF FRUIT: *D. K.* Apples, not known.

NAMES OF PLANTS: *W. F.* *Arbor-vitæ* (*Thuia Elwan-giana*).—*H. J.* *James, Lower Norwood.* *Pothos cannaefolia*.—*O. O.* A species of *Eupatorium*. From what country does it come?

PEACH BUDS FALLING OFF: *Constant Reader.* The shoots are not well developed; we suspect it is not want of water at the root. Examine closer, and send then further particulars if you think it necessary.

PUSLEY: *B.* The "fat ground-clinging spreading greasy thing, and the most propagacious," is our Purslane, used as a salad on the Continent, and which has spread as a weed over most warm countries. The brilliant *Portulacae* of our gardens are its brethren.

RATING GREENHOUSES IN TRADE GARDENS: *D. W.* Yes, they are rateable.

## Enquiries.

"He that questioneth much shall learn much."—BACON.

INTRODUCERS OF PLANTS: Can any of our readers say who were the introducers of *Clerodendron illustre* and *Aphelandra Margaritæ*?

PLANTS ADAPTED FOR LIVING-ROOMS.—Will any of our correspondents give "W. M. S." their experience with regard to the following plants being well adapted or otherwise for standing in living-rooms from October to April?—Palms in variety, requiring but small pot-room, Anthurium, Pothos, green-leaved *Dracænas*, Ferns, Cissus, Ivy, Philodendrons, Hoya, *Coffea arabica*, *Cucurigo*, *Arundo Donax*, and *Bambusa*. The light is fairly good, aspect south and south-west, gas being used in some rooms and not in others; the air-warmth ranging from 65° in the day to 50° by night. The proprietor an amateur, who does not trust the watering of his plants to "Jeamies."

DIED, on January 23, aged sixty-three years, Mr. JOHN STEVENSON, The Nurseries, Timperley.

## Markets.

COVENT GARDEN, January 29.

GRAPES have well maintained the rise of last week, samples generally being good and well kept. Good samples of Apples also are meeting better prices, but business generally is still quiet. *James Webber, Wholesale Apple Market.*

## SEEDS.

LONDON: Jan. 28.—Messrs. John Shaw & Sons, of 37, Mark Lane, E.C., report that there is no change of any importance to be noted in connection with farm seeds. The demand keeps steady, but no great activity is looked for until next month. Of English red Clover there is still an abundant supply; choice samples, however, are becoming scarcer. Trefoil, being unprecedently cheap, is attracting attention. White Clover and Alsike are without change in value. Italian and perennial Rye-grasses continue to sell at the extremely low prices now ruling. There is a very dragging sale for bird seeds.

## CORN.

At Mark Lane on Monday English Wheats were reported down a full shilling per quarter on the week. Foreign Wheats were also noted 1s. lower, with limited sale at the decline. Flour was 6d. lower than on Monday's night. Barley showed a steady value for both malting and grinding parcels, with not more than a moderate business in either. Beans and Peas quiet and unchanged. Maize was rather steadier, but flat corn easier on the week. The trade in Oats was slow, at the prices of the previous Monday.—On Wednesday the extremely meagre business concluded in Wheat was at a further slight reduction from Monday's reduced rates. Flour remained inactive. Barley was quiet on the spot, and the turn easier floating. Beans and Peas on retail sales were without quotable change. Maize was dull. Oats were unchanged.—Average prices of corn for the week ending Jan. 24:—Wheat, 34s. 11d.; Barley, 32s. 5d.; Oats, 20s. 4d. For the corresponding period last year:—Wheat, 38s.; Barley, 32s. 8d.; Oats, 19s. 5d.

## POTATOES.

The Borough and Spitalfields Markets reports state that there were good supplies, but a dull trade. Quotations:—Scotch Regents, 80s. to 100s.; Kent ditto, 70s. to 80s.; Champions, 50s. to 60s.; Magnum Bonums, 60s. to 80s.; and Victorias, 70s. to 90s. per ton.—The only imports into London last week were 2 bags from Harlingen.

## COALS.

The following are the prices current at market during the week:—Ravensworth West Hartley, 14s. 9d.; Broomfield West Hartley, 14s. 6d.; East Wylam, 15s. 6d.; Walls End—Tyne (unscreamed), 11s. 3d.; Hetton, 18s.; Hetton Lyons, 16s.; Lambton, 17s. 6d.; Wear, 16s.; Tunstall, 16s.; Hartlepool, 17s. 3d. and 17s.; South Hartlepool, 16s. 3d.; East Hartlepool, 17s. 3d.; Tees, 18s.

Government Stock.—Consols closed, on Monday at 99½ to 99¼ for delivery, and 99½ to 99¼ for the account. Tuesday's figures were 99½ to 99¼ for delivery, and 99½ to 99¼ for the account. The closing figures of Wednesday and Thursday were 99½ to 100 for both delivery and account.

## SHARPE'S EARLY PARAGON PEA.

THE EARLIEST  
WRINKLED MARROW.

SEALED PACKETS.

One Pint 2s. 6d. ; Half-pint 1s. 6d. each.

SEALED PACKETS.

THE EARLIEST  
WRINKLED MARROW.

First-class Certificate Royal Horticultural Society, 1884.

PARAGON shows in many respects a great improvement upon any variety at present in the trade. It is a Blue Wrinkled Marrow of fine flavour; height from 3 to 4 feet. The pods are produced two and three together in such abundance as to almost conceal the foliage. They are of an unusual size, broad and thick backed, containing from twelve to fourteen immense Peas packed in a double row as shown in the illustration.

Paragon is the earliest of the large Wrinkled Marrows, being ready before Prizetaker. It is very hardy, and will stand earlier sowing than any Pea of its class. It is most valuable for succession crops as it is not liable to mildew, and a constant supply of Peas for four months can be obtained from this one variety.

## EUREKA!!

## INSECTICIDE.

Prepared by

WILLIAM SMITH, Chemist, Stockbridge, Edinburgh.

Highest Award, Forestry Exhibition, Edinburgh.

"Clovenfords, by Galashiels, N.B., July 25, 1883.  
"Mr. SMITH.—Dear Sir,—We have now tried your Insecticide on all the Insects we can find on any of our Plants, including Orchids, and used as directed by you we find it instant destruction to them all, while it neither stains nor injures the tenderest leaf. We shall in future use no Fir-tree Oil, or other Insecticide but yours.—We are, yours truly,  
"WILLIAM THOMSON AND SONS."

## WHOLESALE AGENTS:—

CORRY, SOPER, FOWLER & CO.,  
18, Finsbury Street, London, E.C.

## FIR TREE OIL INSECTICIDE

(Soluble in Water)  
Effectually clears all Insects and Parasites from the Roots or Foliage of Trees and Plants. Kills all Vegetable Grubs, Turnip Fly, &c. Cures Mildew and Blight. Clears Grapes from Mealy Bug, &c., and makes a good Winter Dressing. Of all Seedsmen and Chemists, 1/6, 2/6, 4/6 a bottle. Per gallon 12/6, or less in larger quantities. A Treatise on "Fir Tree Oil," and its application, sent free on receipt of address, by the Manufacturer, E. GRIFFITHS HUGHES, MANCHESTER. Wholesale from Hooper & Co.; CORRY, SOPER, FOWLER and Co.; F.C. E. OSMAN & Co., and from all the London Seed Merchants and Wholesale Patent Medicine Houses.

## LEMON OIL INSECTICIDE (Registered).

—Soluble in water. The cheapest, safest, and most effectual Insecticide extant. Harmless to flower and foliage, instant death to Mealy Bug, Scale, Thrips, Red Spider, Green and Black Fly, American Blight, Mildew, Ants, &c. As a winter dressing unequalled. See circulars, with testimonials, from many of the leading gardeners on its behalf. Sold by most of the leading Nurserymen, Seedsmen, and Garden Manure Manufacturers, in tins—per pint, 1s. 6d.; quart, 2s. 9d.; half gallon, 5s.; gallon, 9s. Directions for use with each tin. Wholesale, J. W. COOKE, Market Place, Winstford; and A. LAING, Rawcliffe, Selby, Yorks; also Messrs OSMAN AND CO., 15 Windsor Street, Bishopgate, London; and W. FRASER, 124 High Street, Perth.

## GISHURST COMPOUND, used by leading

Gardeners since 1859 against Red Spider, Mildew, Thrips, Green Fly, and other blight. 1 to 2 ounces to the gallon of soft water; 4 to 16 ounces as winter dressing for Vines and Orchard-house Trees; and in later from the cake against American Blight. Has outlived many preparations intended to supersede it. Boxes, 1s., 3s., and 10s. 6d.

## GISHURSTINE keeps Boots dry and soft on

wet ground. Boxes, 6d. and 1s. from the Trade. Wholesale from FRICE'S PATENT CANDLE COMPANY (Limited), London.

## SILVER SAND, coarse, 6s., 8s. and 10s. per

ton. Sussex and Kent PEAT and LOAM, 6s., 8s. and 10s. per cubic yard. Free on rail by truckloads, 10 sacks at moderate prices.—W. SHORT, Horticultural Company, Midhurst, Sussex. Established 1862.

Made of prepared Hair and Wool, a perfect non-conductor of heat or cold, keeping a fixed temperature where it is applied.

"I have just laid out about 14,000 plants, and keep the greater part under your 'Frigi Domo,' and have done so for the last three years, and every one who sees my plants is astonished to see how healthy and well they are without the use of glass."

— From a —  
GARDENER,  
October 22,  
1856.

To be had  
2 yards,  
3 yards and  
4 yards wide,  
of all Nursery-  
men and Florists,  
or from the Sole  
Proprietor and Maker,  
BENJAMIN EDGINGTON  
2, DUKE STREET,  
LONDON BRIDGE, S.E.

Ask for "Frigi Domo," and see that it is stamped "Frigi Domo," Registered Trade Mark.

GREENHOUSES, CONSERVATORIES, VINERIES, and PLANT HOUSES, from 15 feet to 50 feet in length, to be erected very cheap on account of the great depression of trade. 25 per cent. reduction from the original prices. Plans and estimates free on receipt of size required.

R. STEVENS, Horticultural Builder, Bromley, Kent.

 And Surrey Works, Blackfriars Road, London, S.E.

Horticultural Engineers to Her Majesty the Queen,  
 CALL SPECIAL ATTENTION TO THEIR

### PATENT

**WROUGHT-IRON TUBULAR  
 HOT-WATER BOILERS,**

And others with **SHELVES**, and Hollow or Ordinary Cast-iron GRATE BARS;

### SADDLE BOILERS,

With **WATERWAY BACKS**, and **WELDED BOILERS**, which are Specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c.

*They are the neatest, cheapest, most effective, and durable of any extant.*

The Tubular ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention. This pattern

Had the First and Highest Prize, a Silver Medal, Awarded to it at the Royal Horticultural Society's Exhibition South Kensington, London, on June 3, 1881.

The *Journal of Horticulture* of June 9 says:—

"HEATING APPARATUS.—A great number of boilers, valves, &c., were exhibited by eight competitors, and considerable interest was manifested in the verdict of the judges, and much discussion was brought to bear on the merits and shortcomings of the different boilers. The apparatus for which the Silver Medal was awarded was a wrought-iron saddle boiler, with a series of intersecting tubes, somewhat in the form of a letter X, but the tubes in ogee form, in the crown of the boiler. Most gardeners who examined the boiler expressed a favourable opinion of it. It is no doubt a quick and powerful boiler without being complex, the latter condition having, no doubt, had weight with the judges."

The *Garden* of June 11 says:—

"The premier prize, a Silver Medal, was taken by Messrs. Green & Son for their new patent tubular saddle boiler. It is a modification of their original patent, the boiler being longer and not so high. It is found to be a powerful and efficient boiler, and heats a large quantity of water quickly with a small consumption of fuel."

Descriptive Illustrated Price List may be had free on application.

**BRITANNIA CO., COLCHESTER.**  
 Special Designs in Garden Tables.

Oil Paint no Longer Necessary.

**HILL AND SMITH'S BLACK VARNISH**,  
 for Preserving Ironwork, Wood, or Stone.  
 (Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

### UNSOLICITED TESTIMONIAL.

"*Pierrefield Park, June 21, 1876.*—Sirs,—I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chepstow.—I am, Sirs, yours respectfully, Wm Cox."

**CAUTION.**—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

## WANT PLACES.

**POSTAL ORDERS.**—To Advertisers,  
Subscribers, and Others.—It is very important  
in Remitting by Postal Order that it should be  
filled in payable at **DRURY LANE, to W.**  
**RICHARDS**, as, unless the Number of a Postal  
Order is known, and it has been made payable  
at a particular office, and to a particular person,  
it is impossible to prevent any person into whose  
hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting  
is by **POST-OFFICE ORDER**.

To Noblemen and Gentlemen requiring Land Agents,  
STEWARDS, BAILIFFS, or GARDENERS.

**JAMES CARTER AND CO.** have at all  
times upon their Register reliable and competent MEN,  
several of whom are personally well known to Messrs. Carter.—  
Enquiries should be made to 237 and 238, High Holborn, W.C.

**RICHARD SMITH AND CO.**  
beg to announce that they are constantly receiving  
applications from Gardeners seeking situations, and that  
they will be able to supply any Lady or Gentleman with  
particulars, &c.—St. John's Nurseries, Worcester.

**SCOTCH GARDENERS.**  
—**JOHN DOWNIE**, Seedsman, 144, Princes Street, Edin-  
burgh, has at present on his list a number of **SCOTCH**  
**GARDENERS**, waiting re-engagements, at wages ranging  
from £50 to £100 per annum, and he will be pleased to supply  
full particulars to any Nobleman or Gentleman requiring a trust-  
worthy and competent Gardener.

**THE LIVERPOOL HORTICULTURAL**  
CO. (John Cowan), Limited, The Vineyard and Nur-  
series, Garston, can recommend a first-class GARDENER to  
any Nobleman or Gentleman requiring the services of such.

**GARDENER (HEAD).**—Age 32, married;  
experienced in Stove and Greenhouse Plants, Forcing,  
Fruits, Flowers, and Vegetables, Kitchen and Flower Gardening.—**JAS. HOWELL**, Lodge, Thurocroft Hall, Rotherham.

**GARDENER (HEAD).**—Thoroughly  
practical; would not object to a Single-handed place.  
Can be highly recommended.—**J. SLADE**, 72, South Street,  
Isleworth, Middlesex.

**GARDENER (HEAD); Land and Woods if**  
required.—Age 34, married; upwards of twenty years'  
sound practical experience in some of the leading establishments  
of the country.—**HAROLD**, Mr. Myatt, Hamber Lane,  
Preston, Wellington, Salop.

**GARDENER (HEAD).**—Age 33, married;  
twenty years' experience in the Cultivation of Fruit and  
Flowers under Glass, Orchids, &c., in large establishments,  
also Flower and Kitchen Gardening. Six and a half years as  
Head. Well recommended.—**E. W.**, Webbeath, Redditch.

**GARDENER (HEAD).**—Age 29, married  
when suited; experienced from childhood. Well  
acquainted with Forcing of Flowers, Fruit, and Vegetables, and  
General Routine of Gardening.—**W. HASKELL**, Broad Mar-  
Cottage, Weston, Bath, Somerset.

**GARDENER (HEAD).**—**NEIL SINCLAIR**,  
Gardener to the Marchioness of Downshire, Eastham-  
stead Park, Wokingham, Berks, will be pleased to recommend  
his Foreman, H. Howell, to any Lady or Gentleman requiring  
the services of a thorough practical man in all branches of the  
profession. Total abstainer.

**GARDENER (HEAD); age 31.**—**E. SIMPSON**,  
Head Gardener to Lord Wrottesley, Wrottesley, Wolver-  
hampton, can with confidence recommend his General Foreman,  
W. Holdcroft, to any Lady, Nobleman, or Gentleman, as a  
competent, trustworthy man, in the general routine of Gardening.  
Three years in present situation.

**GARDENER (HEAD).**—Age 32, married;  
thoroughly experienced in the Management of Glass-  
houses, also in Flower and Kitchen Gardening. Has been a  
successful exhibitor. Eight years in present situation; leaving  
on account of death of late employer.—**MR. G. FISHER**,  
Gardener, Glanbrydaw Park, Manordeilo, Carmarthenshire.

**GARDENER (HEAD); age 28.**—**MR.**  
**BOODEY**, Gardener to the Right Hon. Viscount Boyne,  
Burwanton Hall, Biddigh, will be pleased to recommend his  
Foreman (J. Leese) to any Lady or Gentleman requiring the  
services of a thoroughly competent and trustworthy man. Four-  
teen years' experience in good establishments.—Address as  
above.

**GARDENER (HEAD).**—Age 38, married, one child; thoroughly understands the profession in all its branches. Seven years' character.—G. H., 33, Market Place, Keighley.

**GARDENER (HEAD).**—Mr. HARDWICK, of Holland, Tonbridge, wishes to highly recommend his Head Gardener (G. Goldsmith), who has lived with him eight years, and six years with previous proprietor. Leaving on account of family moving to town.—For particulars apply to P. C. HARDWICK, Esq., address as above.

**GARDENER (HEAD);** age 28.—**GEORGE CHANNING**, Gardener to Colonel Lloyd, Lillesden, Hawkhurst, Kent, would be pleased to recommend to any Lady or Gentleman a thoroughly trustworthy man. Has been principal Foreman in the Gardens here two years. Can also be highly recommended by Mr. NORMAN, Gardener, Hatfield House, Herts. Has had experience in some of the principal Gardens in England.—Address as above.

**GARDENER (HEAD WORKING).**—Eight years in last situation, highly recommended.—B. L., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

## GRATEFUL-COMFORTING. EPPS'S COCOA. BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame." *Civil Servants Gazette.*

Made simply with boiling water or milk. Sold only in

Packets, labelled thus:—

**JAMES EPPS & CO., Homoeopathic Chemists, London.**

**The Speediest Remedy for Throat and Chest affections.**—'In spite of the many novelties and largely advertised "new preparations" for the Chest and Lungs, I find

**DR. LOCOCK'S PULMONIC WAFERS** still rank as affording the speediest relief in Throat and Chest affections."—Signed W. H. TURNER, M.P.S., Tottenham, Bristol. They instantly relieve and rapidly cure Asthma, Consumption, Bronchitis, Coughs, Colds, Shortness of Breath, Phlegm, Pains in the Chest, Rheumatism, and taste pleasantly. Sold at 1s. 1½d. and 2s. 6d. per Box, by all Druggists.

**HOLLOWAY'S PILLS.**—The chief Wonder of modern times.—This incomparable medicine increases the appetite, strengthens the stomach, cleanses the liver, corrects biliousness, prevents flatulency, purifies the system, invigorates the nerves, and reinstates sound health. The enormous demand for these Pills throughout the globe astonishes everybody, and a single trial convinces the most sceptical that no medicine equals Holloway's Pills in its ability to remove all complaints incidental to the human race. They are a blessing to the afflicted, and a boon to all that labour under internal or external disease. The purification of the blood, removal of all restraint from the secretory organs, and gentle aperient action are the prolific sources of the extensive curative range of Holloway's Pills.

**PALMS**, strong, healthy, splendidly foliaged.

—*Latania borbonica* and *Seaforthia elegans*, 20 inches high, 125 per dozen; sample plant, 1s. 3d. *Latania borbonica* and *Seaforthia elegans*, 12 inches high, 25s. per 100; sample dozen, 4s. Packages and parcels post free. Postal Orders to The GARDENER, Holly Lodge, Stamford Hill, London, N.

WANTED, a FLORIST'S BUSINESS.

—Address FLORIST, 26, Westoo Street, Upper Norwood, S.E.

TO BE DISPOSED OF, a WHOLESALE and RETAIL SEED BUSINESS. A splendid going concern. One of the finest in existence, doing a large and profitable trade. An unusual opportunity.  
Apply (by letter only) to MESSRS. PROTHEROE AND MORRIS, 67 and 68, Cheapside, London, E.C.

TO BE DISPOSED OF, a First-class FLORIST, SEED, and JOBBING BUSINESS, in a main thoroughfare, about 7 miles from London. All in good working order.  
Address L. Nurseryman, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TO BE DISPOSED OF, a NURSERY, SEED, and CUT FLOWER BUSINESS, doing a first-class trade, one of the best manufacturing districts in the North of England, consisting of Flery, three large Vineries, two Peach Houses, and the following Houses, all separate, Camellia and Lapageria, Eucharis and Melon, Rose and Show, with Seed Shop, Pits and Frames, Sitable, Packing Sheds, and a good Dwelling House. All well fitted up, in good repair, and first-class working order. Well stocked with plants. All Freehold property standing on an acre of ground. Satisfactory reasons given for owner's selling.  
For particulars apply to HURST and SON, 152, Houndsditch, London, E.

To Nurserymen, Florists, Gardeners, and Others.  
FLORIST'S BUSINESS.

FOR SALE, by Private Treaty, as a going concern, all that well known and remunerative FREEHOLD BUSINESS PREMISES, called Guildford Street Nurseries, within two minutes' walk of the Barton Railway Station, Hereford, the property of Uriah Hais, Florist, who is relinquishing business on account of declining years. The Property comprises a modern and substantially brick-built Residence, called Blenheim House, with several Perches of Freehold Garden Ground, a number of Span-roof and Lean-to Glass Houses, with Hot-water and other Heating Apparatus, Hot and Cold Pits, and Potting Sheds; together with the Stock-in-Trade, consisting of a well-grown and healthy lot of Bedding, miscellaneous assortment of useful Greenhouse and Hardy Outdoor Plants, in popular demand; small collection of useful Nursery Stock, Horticultural Requisites, Tools, and absolute Goodwill. A splendid opportunity for an enterprising young man or gentleman's gardener with small capital desirous of retiring from service. One-half or so of purchase money can remain on mortgage, if required. For further particulars, apply to GEO. H. BARLOW, Estate and Property Agent, Hereford.

Pottery and Brickwork.

Near three Railway Stations, in a good neighbourhood, and within 6 miles of the City.

TO BE LET on LEASE, or FREEHOLD SOLD, a well-established increasing BUSINESS, comprising nearly 9 Acres very superior quality of Clay. Machinery all modern, and in full work. Advantageous terms.  
Apply to Mr. E. JACKSON, Land Agent, 15, King Street, Cheapside, London, E.C.

**WM. CUTBUSH AND SON**  
 (Limited), Nurserymen and Seed  
 Merchants, Higbgate Nurseries, N.

### For Present Sowing.

The earliest in cultivation, dwarf and com-  
 pact in habit, head firm and pure white, and  
 well protected by the foliage. It stands dry  
 weather better than any other variety.

Mr. GILBERT says it turned out the best  
 of all he grew last season.

Mr. E. STEPHENSON, Thorngayby Hall,  
 says:—"Your 'President' Cauliflower is not  
 only the earliest but the most useful I have  
 ever grown; we can plant it 3 or 4 inches closer  
 than any other variety. The heads are very white  
 and compact. I have grown it ever since it  
 came out: I recommend it to all my friends."  
 Post-free on receipt of postal order or stamps  
 for 1s. 6d.

**WILLIAM E. MARTIN, Seed Merchant, Hull.**

**Martin's  
 President  
 Cauliflower.**

## WHITE LÆLIA ANCEPS IN MAGNIFICENT MASSES.

**MR. J. C. STEVENS** will **SELL** by **AUCTION**, at his Great  
 Rooms, King Street, Covent Garden, W.C., by order of Messrs. SHUTTLEWORTH,  
 CARDER & Co., on **THURSDAY NEXT**, February 12, at half-past 12 o'clock precisely, a  
 grand importation of the beautiful and rare **WHITE LÆLIA ANCEPS**, including magnificent  
 masses, many of them with several hundred bulbs, in splendid condition. The finest importation  
 ever introduced. (See dried flowers.)

Also **ODONTOGLOSSUM CRISPUM (ALEXANDRÆ)**, the finest type possible to collect,  
 grand masses, and in splendid condition; **ONCIDIUM KRAMERIANUM**, with perfect leaves;  
**CATTLEYA TRIANÆ**, **LÆLIA SPECIES**, found growing with the **White Lælia**, very distinct-  
 looking; **L. AUTUMNALIS** (received as **ATROBUBENS**), **EPIDENDRUM NEMORALE**,  
 &c. Also **ESTABLISHED MASDEVALLIA RACEMOSA CROSSII**, **M. SHUTTLE-**  
**WORTHII**, **M. TROCHILUS**, **M. SCHLIMII**, **M. MACRURA**, and **M. HARRYANA**.

**FRIDAY NEXT.**

## LÆLIA ANCEPS—NEW WHITE TYPE.

**MESSRS. PROTHEROE AND MORRIS** are instructed by Mr.  
**F. Sander** to **SELL** by **AUCTION**, at their Central Sale Rooms, 67 and 68,  
 Cheapside, E.C., on **FRIDAY NEXT**, February 13, at half-past 12 o'clock precisely, a truly  
 grand importation of a magnificent **LÆLIA ANCEPS—WHITE TYPE**. The flowers are very  
 large and fine, petals very broad and pure white, and the flowers are nearly 5 inches across; lip  
 pure white, the throat dark crimson, veined and blotched, the colouring being most vivid. A large  
 quantity of dried flowers on view will convey an adequate idea of the great beauty and value of  
 this species. The plants were collected by Mr. Arnold, and are in grand order, great masses being  
 among them.

Also three unsold masses of **LÆLIA ANCEPS SANDERIANA**, a grand lot of **LÆLIA**  
**ALBIDA**, **ANGULO CLOWESII**, a very large and magnificent lot of a superb type of **ODON-**  
**TOGLOSSUM ALEXANDRÆ**, **O. TRIUMPHANS**, **WARSCWICZELLA WENDLANDI**,  
**EPIDENDRUM MACROCHILUM**, **SOBRALIA VIRGINALIS**, and many other fine things.

On view morning of Sale, and Catalogues had.

## MARTIN'S PRESIDENT CAULIFLOWER.

A very early and distinct variety, which has  
 been grown in the East Riding of Yorkshire for  
 the past six years, where it is held in great  
 reputation.

It comes into use in May, and continues until  
 the late summer varieties are ready for cutting.  
 The heads are medium sized, beautifully close  
 and white and well protected by the foliage,  
 which enables it to stand the dry hot weather,  
 such as we experienced last summer.

The plant is dwarf and very compact, and  
 can be planted three or four inches closer than  
 any other variety.

Retail Price, 1s. 6d. per packet.

The following firms have ordered a  
 supply:—

<b>BACKHOUSE, J. AND SON</b> ...	York.
<b>FELL, W. AND CO.</b> ...	Hexham.

To the Trade only.

**CHAS. KERSHAW** offers strong Crowns  
 of his **PARAGON RHUBARB** at 25s. per 100. Strong  
 plants with several crowns—price on application.

**DECIDUOUS SHRUBS** in variety, fine transplanted stuff,  
 £5 per 1000.

He can still supply extra strong plants in pots of **MARE-**  
**CHAL NIEL**, **GLOIRE DE DIJON**, **BELLE L'ONIAISE**,  
**REINE MARIE HENRIETTE**, and other ROSES.

The Slead Syke Nurseries, Brighouse.

**ROSES.—ROSES.—ROSES.**  
 An immense quantity of Standards, Half-standards,  
 low budded on Manetti and on Briar roots. Best Trading  
 sorts are disposable as well. 300,000 Own Roots of every kind—  
 Perpetuals, Noisette, Tea, Moss. The whole at an exceptionally  
 low price.

**ROSE STOCK.**

150,000 **MANETTI**, 15s. to 20s. per 1000.  
 28,000 **LA GRIFFERAYE**, 30s. per 10,000.  
 1,000,000 **BRIER SEEDLINGS**, 1-yr. and 2-yr. transplanted,  
 all fine stocks, for sale at very low prices, from £4 to £6 and  
 £8 per £10,000; transplanted 2 years, £10 per 1000.

CATALOGUE, published in English, will be sent on  
 application to  
**L. FAILLET**, Nurseryman, Chateau (Seine), near Paris,  
 France. Established 1827.

**PYRAMID PEARS.**  
 Extra fine, well furnished, fruiting trees, 5 to 7 feet high,  
 with splendid roots, viz.:—*America*, *Comte de Lamy*, *Beurré*  
*Diel*, *Beurré Racer*, *Brown Beurré*, *Autumn Colmar*, *Conseiller*  
*de la Cour*, *Citron des Carmes*, *Doyenné du Comice*, *Easter*  
*Beurré*, *Glou Morceau*, *Huyshe's Bergamot*, *Louise Bonne*,  
*Napoleon*, *Syrion* or *Keele Hall Beurré*, and other sterling  
 varieties. Price very moderate. For further particulars apply to  
 R. P. KER AND SONS, Aigburth Nursery, Grassendale,  
 Liverpool.

# SUTTON'S CHOICE VEGETABLE NOVELTIES for the SEASON.

## SUTTON'S NEW TALL LATE WRINKLED PEA.

### SUTTON'S DUCHESS of EDINBURGH.

From Mr. ROBERT COCKS, *Gardener to Lord Auckland*.—"Duchess of Edinburgh" is, without exception, the best Pea I have ever seen: it is a wonderful bearer, the pods are all well filled, and the flavour is most delicious."

"Your Duchess of Edinburgh is, without exception, the very best Pea."—Mr. G. LINCOLN, *Gardener to T. Cozens Hardy, Esq., Spruiston*.

Per quart, 2s. 6d.

## SUTTON'S READING ALL HEART CABBAGE

Introduced by us in 1883, since which time it has become increasingly popular. As evidence of its remarkably quick growth we may mention the fact that a plot of land sown with Cabbage at our Experimental Grounds on March 20 was fit to clear and receive another crop on August 12.

Per packet, 1s., post-free.

"Certainly the finest type of a Garden Cabbage I have ever seen."—Mr. WM. WILDSMITH, *Gardener to the Right Hon. Viscount Eversley*.

"For a spring-sown Cabbage to turn in quickly, I find none better than Sutton's Reading All Heart."—Mr. C. F. PRANGNELL, *Gardeners' Chronicle*, May 3, 1884.

"A superb and distinct little Cabbage."—Mr. J. MUIR, *Gardener to C. R. M. Talbot, Esq., M.P.*

"One of the best Cabbages I have ever tried."—Mr. J. BURNETT, *Gardener to Mrs. Hope, Deepdene*.

"From your All Heart Cabbage, sown in April, I cut first-class Cabbages in July."—Mr. J. SMITH, *Wellingborough*.

## SUTTON'S NEW TOMATO FOR 1885.

### SUTTON'S CHISWICK RED.

FIRST-CLASS CERTIFICATE, R.H.S.,  
August 30, 1883.

A distinct and remarkably prolific variety, oval in shape, medium size, perfectly smooth, of bright red or crimson colour, and excellent in flavour. The fruit grows in large, heavy clusters, each cluster having from twenty to thirty fruit, and every plant bears from six to eight clusters. The entire stock of seed is in our hands, and every packet will bear our Registered Trade Mark.

Per packet, 2s. 6d., post-free.

#### SPECIAL NOTICE.

Why Messrs. Sutton's Novelties are reliable:—

Messrs. SUTTON'S Experimental Trial Grounds—which are frequently referred to by leading Horticultural Papers—afford the opportunity of ascertaining the comparative value of every kind of Vegetable, Flower, and Potato. These trials are made under Messrs. SUTTON'S personal superintendence in the most careful and exhaustive manner. During 1883-84 nearly 10,000 plots were sown and records taken of the results for future guidance.

Gratis and Post-free on application.

Royal Berks Seed Establishment,  
READING.

## SUTTON'S NEW MEDIUM HEIGHT MAIN CROP PEA.

### SUTTON'S "SATISFACTION."

By far the most robust medium-cropping Pea in cultivation, and in productiveness is unsurpassed. The pods are produced in pairs, and are thickly set on the haulm. The Peas are remarkably large, and sometimes as many as ten are contained in a pod. When brought to table they are of a beautiful green colour, and even when quite old they retain their sweet and delicate flavour. The haulm is very stout, resists drought and mildew, and is easily distinguished from that of all other Peas. Height 3 feet.

Per quart, 3s. 6d.

## SUTTON'S SCARLET INVINCIBLE MELON.

Introduced by us last year, and has acquired a reputation unequalled by any other Melon known. Form somewhat globular; skin orange-red, finely and evenly netted; flesh thick, bright scarlet, and of exquisite flavour. On June 26, 1883, it was awarded a

First-class Certificate by the Fruit Committee  
of the Royal Horticultural Society;

and in every competition we are acquainted with it has taken 1st Prize.

Per packet, 1s. 6d. and 2s. 6d., post-free.

"A scarlet-fleshed variety of the most distinct character and highest excellence."—*Gardeners' Magazine*, June 30, 1883.

"A brace of very handsome fruit of a new kind, Sutton's Scarlet Invincible, oval in form, finely netted, were well placed first, the flesh proving soft, luscious, and richly flavoured."—*Gardeners' Chronicle*, July 26, 1884.

SEASON 1885.

Is now offered to the Public for the tenth year, and the Manufacturers have again much pleasure in stating that it is still increasing in popularity.

They are, however, sorry to find that it is still necessary to CAUTION the Public against, under any circumstances, accepting it, unless in their PACKETS or SEALED BAGS, as they will not be responsible for its genuineness under any other conditions.

Where no Agent resides in the neighbourhood they will forward a Sample Bag, carriage paid, on receipt of Cheque or Post-office Order.

Sold in Packets, ONE SHILLING each, and in

## Gardeners' Chronicle.

SATURDAY, FEBRUARY 7, 1885.

## MORTUARY FLOWERS.

THE author of a work on *The Wonderful Years* (1603), when Queen Elizabeth died, and the country was stricken with the plague, remarks, "Rosemary, which had wont to be sold for twelve pence an armefull, went now at six shillings a handfull." Shakespeare makes Friar Lawrence say in *Romeo and Juliet*—

"Dry up your tears, and stick your Rosemary on this fair corse."

Gray says of strewing flowers upon graves, as we read in the Rev. Hilderic Friend's interesting account of "Flowers and the Dead" (*Flowers and Flower Lore*, vol. ii.):—

"Upon her grave the Rosemary they threw,  
The Daisy, Butter'd-flower, and Endive blue."

Old persons may remember that the practice of strewing graves with flowers was common in English villages early in the century. It was so hundreds of years previously, not only in England, but throughout the Continent, and not merely among modern nations, but among the ancient Greeks and Romans, and earlier, as we have seen, in these columns, in Mr. Hemsley's account of the wreaths discovered in the tombs of Ramses II. and other kings of Egypt 3000 years ago (*Gardeners' Chronicle*, vol. xix., June 23, 1883). The funeral plants of old Egypt were numerous, and, in fact, all inoffensive plants and flowers are appropriate as tokens of affection for the dead, since the appropriateness, though it may possibly be increased by the use of plants that fade slowly, or those of special beauty, lies mainly in the sentiment of affection, which the lowliest flower may express.

How eager man has been to lift the veil which separates him from those he has loved and lost; and if he has failed, he reaps the reward of his solicitude, and of his affection for the memory of those who have gone before him, for thinking of them brings him among the angels.

Rosemary is used because it is common and long-enduring. It played its part at weddings too. Herrick says—

"Grow for two ends; it matters not at all  
Be 't for my bridal or my burial."

It was dipped in scented water at weddings, in plain water at funerals. Like Laurel, Ivy, and other evergreens, it was, we are told, regarded as a symbol of immortality. But this could hardly have been the leading idea of village folk in the use of Rosemary. What do those best authorities, the poets, say? We read of the attendants at a funeral in the following lines—

"Prythee see they have  
A sprig of Rosemary dipped in common water,  
To smell at as they walk along the streets."

Another poet says—

"Sprigg'd Rosmary the lads and lasses wore,  
While dismally the parson walked before."

In "A Maiden's Song for her Dead Lover," more than 200 years ago, these lines show that the modern custom of using numerous kinds of flowers in honour of the dead was the old one too. The maiden says—

"Let him have faire flowers enough,  
White and purple, green and yellow,  
For him that was of men most true."

On the grass-covered grave of Charles Kingsley at Eversley some of his humble parishioners, who loved the man and revered the spot where he rests, strewed many kinds of flowers, such as the Heath, Thyme, and Forget-me-Not, years after his death. Flowers used in honour of the dead may be looked upon as messages to the departed, and any pleasing flower may carry our unspoken thoughts as well as another. Mr. Friend observes that the tombs of Michelet, Baroche, and Thiers are still heaped up with flowers. It is touching to read occasional notices in the papers of the afflicted Empress—who, in her bereavement, is more welcome to our Queen than when she filled a throne—bearing wreaths to the chapel where her husband and son lie. The flowers may be costly, like those which were placed on behalf of the Queen on the bier of President Garfield, but they carry their message no better than the simplest flowers that grow. The Queen's wreath for the coffin of the young Prince Waldemar was composed of white Roses, white Camellias, and Passion-flowers. In the hour of mourning all give their best, as the poor old peasant woman did when, at the funeral of the Princess Alice, she timidly approached and laid by the side of the rare and costly flowers that well-nigh hid the pall from view, her wreath of Rosemary with two small white blossoms. Another pathetic touch of Nature is seen in the tribute of a shepherd on the death of his master's wife. Having asked permission to see her once more, he placed two Snowdrops in the coffin, observing, "She was fond of them."

If it were not for the greenhouse flowers, such as the Eucharis, Stephanotis, white Lapageria, and others, the use of flowers would be more restricted. The white Chrysanthemums, which abounded last autumn were available, however, for the humblest country funerals. It is part of the business of florists to supply wreaths, but ladies in the country are often skilful in fashioning these sad but appropriate adornments; and in a house of most sincere mourning for an aged but bright and much loved relative, the relief of mind occasioned by the making of wreaths and the arrangement of flowers were manifest in the household, and when the wreaths and crosses covered the grave late on that grey and still November day, the one most admired was home-made. It was beautiful from contrast, being composed entirely of autumn leaves and blushing Roses.

In Germany garlands and crowns made of flowers are placed on the graves of young men and maidens. The author of *Flowers and Flower Lore* attended the funeral of a youthful damsel in Devonshire, and five such garlands of white flowers, each the present of a friend, were placed on the coffin and laid afterwards on the grave. Shakespeare says of Paris in *Romeo and Juliet*—

"He came with flowers to strew his lady's grave."

The poet knew the customs of his own country and that other countries share them. In Ireland, says an old writer, "when a virgin dies, a garland, made of all sorts of flowers and sweet herbs, is carried by a young woman on her head, before the coffin," and two other maidens went before with a basket of flowers which they strewed along the road. Such an observance must always be subject to the season of the year, and accordingly it was said of a certain "faire and happy milkmaid," "All

her care is that she may die in the spring time, to have store of flowers stuck upon her winding-sheet." In Wales, in the flower season, the coffin and room were bedecked and the grave overspread with flowers. Graves were again dressed in the same way on Whit Sunday and other festivals at the time of year when flowers abounded, and many kinds of sweet-scented flowers—but those only—were planted on the graves. Such flowers, especially the Pink or a sprig of Thyme, were gathered by friends and worn in remembrance. It was anciently believed that Paradise was planted with sweet flowers. There can hardly be a Paradise on earth without them, and perhaps it may be the maimed life that must be led in great cities, where the culture of gardens is unknown, which has rendered them from Babylon downwards, as Edmund Burke protested, "Sinks of iniquity and graves of genius." If we attach a locality to Heaven, the streets we know by Revelation are paved with gold, and we may feel sure that flowers and gardens abound. No wonder that the love of flowers from the time of our first parents should be universal, and that it should have extended from that one spot in the East, the Garden of Eden, throughout the world, in every country among all people.

Even the aborigines of Australia used green leaves at funerals, and a custom of similar character prevailed among the native tribes of India, and the islanders of that Paradise in the Pacific, Tahiti, which Lady Brassey has described so well, excelled them all, as their climate enabled them to do, in the profusion of wreaths and garlands of choice flowers. The Buddhists are lavish in this way, and their monasteries have large gardens, and Lotus ponds attached to them, for the provision of mortuary flowers without stint.

The Periwinkle in Italy has gained the name of "Death Flower," and in Mexico the Indian Carnation is called the "Flower of the Dead." Among the Greeks the Amaranthus ("undying"), or Prince's Feather, symbolises the immortality of the soul, and Mr. Friend mentions that the passage in St. Peter, "a crown of glory that fadeth not away," would be correctly translated, "an amarantine crown of glory." Milton, in sublime verses, represents the angels in the act of adoration, wearing such crowns:—

"Their crowns inwove with Amaranth and gold—  
Immortal Amaranth, a flower which once  
In Paradise fast by the tree of life  
Began to bloom."

The use of evergreens alone has to some extent given place to floral decoration, among the wealthy at any rate, but only for the reason already intimated. All kinds of evergreens are excellent—Yew, Cypress, Arbor-vitæ, Bay, Box, or Myrtle, and many others unknown by our forefathers. As an emblem of Victory the Bay is particularly appropriate as a funeral plant when the life of the departed has been long and meritorious. It was thus used lately by one who placed sprigs of Bay where the shepherd placed the Snowdrops, without knowing at the time how widely the plant has been employed with a similar sentiment in England as well as other countries. *H. E.*

**THE TREE TOMATO (CYPHOMANDRA BETACEA).**—The plant (belonging to the natural order Solanaceæ) is of shrubby habit, and 5 or 6 feet high. It is not generally known, and seldom used in Jamaica, but it is without a doubt a fruit that should be more largely cultivated, as it answers in every respect the purposes for which the ordinary Tomato is esteemed. Plants are easily raised from seed, which come into bearing in about two years. They are very prolific bearers, and the fruit is available during the winter months—November to March—when ordinary Tomatoes are not so easily obtained. *D. Morris.* [A plant bearing fruit may now be seen in the Temperate-house at Kew. *Ed.*]

## New Garden Plants.

MASDEVALLIA ACROCHORDONIA, *Rehb. f.*

*Xenia Orchidaceæ*, ii., p. 213.\*

"Masdevallia acro-acro-chor-donia?" Yes, acrochordonia, published as early as 1874 from a single specimen kindly given by Messrs. Backhouse & Sons, discovered in Ecuador, by Mr. Krause of Leipsic, who died as a doctor, a collector of Orchids and an officer of the Chilean navy, celebrated for his heroic deeds. It is very near Masdevallia Ehippium, *Rehb. f.*, 1873, which is much better known by its later name as Masdevallia Trochilus, Lindl., or even as Masdevallia Colibri (*cui?*). This last has a curious history. Gustav Wallis, its discoverer, sent a very glowing description to his patron, Director Linde, as travellers do but too often, over-excited as they often are by their fatigues and hunger and thirst. Having seen some metallic sheen on the flower, he compared it to that of a humming-bird, and by-and-bye imagined the flower was of the finest blue! "How blue!" (*Wie blau!*) say Berlin people when they allude to something they do not believe, and in the Berlin sense the stately flower was blue indeed. (Now poor Gustav Wallis, of course, did not behave as the collector who sent to his patron a big mass of Cattleya Trianae and suggested that the proprietor of a hacienda had asserted that the flowers might be snow-white. And when they flowered they were purple.)

Now my Masdevallia acrochordonia is quite the worthy sister of M. Ehippium, though it never was declared to be blue. It has (always?) narrower leaves. The petals are acuminate. The lip is much narrower with an undulate median keel on the upper part and an acuminate top. The inner surface of the sepals shows numerous warts. The usual number of flowers appears to be six to ten. I have, however, a peduncle with vestiges of more than fifteen flowers (!), whereas my richest peduncle of Masdevallia Ehippium shows the scars of more than twenty-one flowers. One might guess such a peduncle had lasted a year, though with us nobody would permit the plant to be so long a time in flower provided it were not of an exceptional strength. The plant has at last appeared in Europe. Mr. F. Sander has a few living plants, the remainders of hundreds and hundreds gathered and sent by Mr. Hübisch. That is the final lot of those lovely things. *H. G. Rehb. f.*

DENDROBIUM EUOSMUM, *hyb. artif.*

This is a new Veitchian production, a hybrid between Dendrobium endocharis and D. nobile. The flower is cream-coloured, and marked with fine purple. The tips of the median sepal and of the petals are purple. The disc in the middle of the lip rich purple, as also the apex. There are purple parallel veins on each side near to the superior outer margin. A white cushion of hairy bodies is set before the base in the mid, and numerous parallel longitudinal stripes before. Column light green, with purple longitudinal lines under the fovea. Anther fine purple, with a small white area at the base. The flower exceeds in size that of Dendrobium endocharis. The rhombic form of the lip speaks of the descent from Dendrobium aureum (heterocarpum). The plant has a grand quality in its fine sweet powerful perfume, that even lasted after the trip to Hamburg during frost. The bulbs are said to be in the way of those of Dendrobium nobile. *H. G. Rehb. f.*

PHALÆNOPSIS SCHILLERIANA (*Rehb. f.*) VAR ADVENA.

A lovely variety of Phalænopsis Schilleriana like Schilleriana immaculata. This bulb has mauve borders to the side lacinie of the lip. Our plant has also a quite spotless flower, lightest purple sepals and petals, with a mauve-purple line at the foot of the

\* *Masdevallia acrochordonia*, *Rehb. f.*, l. c.—Valde affinis *Masdevallia ehippium*, *Rehb. f.*; pedunculo latius alato (semper?) plurifloro 15–16; bracteis compressis argute dorso carinatis, pedicellis bene casatis; tubo ampliculo; sepalis superioribus triangularibus longe caudatis; sepalis lateralibus proparte linearibus oblongis longe caudatis intus tricarminatis et multiverrucosis porrectis; tepalibus ligulatis acuminatis supra basin angulatis, intus carina una d. curvante; labello a basi ad medium lineari angusto ibi lamella quadrata utrinque oblique extrorsum spectante; parte anteriori ligulata acuminata; carina flexuosa a basi in medium labellum, androchii membrana trifida. Ecuador, *Rehb. f.*

column. Lip white, with yellow callus and yellow on the side lacinie. Two light rose-purple spots are set before the callus, and mauve-purple on the sides of the column. It has been sent several times by Messrs. Hugh Low & Co. *H. G. Rehb. f.*

### K E W.

A DULL day in February is perhaps not the one that would be chosen for a visit to the garden, nevertheless it will amply repay the trouble. The maintenance and condition of the plants in most departments is admirable; the Temperate-house in particular shows to great advantage. The grand Tree Ferns, massive Araucarias, and stately Dracenas are in splendid condition, and there is ample promise of a wealth of flowers shortly on Acacias, Rhododendrons, and Camellias. The group of Cycads at the south end of the Palm-stove furnishes one of those sights which, when seen for the first time, makes one catch one's breath, and even when familiarity has taken off the edge of surprise, the noble outlines and monumental substance of the plants impresses one as much as ever. The Orchids have greatly improved of late years. Just now, perhaps, there are fewer in flower than there were a few weeks ago, but there is still much to interest the *connoisseur* in such plants as *Cattleya chocoensis*, *Lælia anceps*, *Dendrobium aureum*, *Agrostem sesquipedale*, various *Calanthes*, *Dendrobium Falconeri*, *Maxillaria venusta*, &c. In the Succulent-house—that repository of what is strange in form and gorgeous in colour among plants—numerous Aloes are in bloom, quite lighting up the part of the house in which they are placed. *Senecio macroglossus* hangs its golden stars from the roof, and *Restio subverticillatus*, misnamed *Willdenowia teres*, waves its elegant plumes. Out-of-doors the buds show that they are preparing for action, and in the new rockery, which must absorb much time and labour to keep in such perfect order, the *Hellebores* make a brave show.

### "LA PETITE CULTURE."

I DIFFER, with all due respect, from so good an authority on market gardening as is Mr. W. Earley, in his estimate of the value of small holdings. Happily it is a subject that can be discussed without referring to Georgian theories or Socialistic ideas, because the question of converting large farms that are admitted failures into small holdings which may and often do prove successes, is one of the most practical ones of the day. The great value of small holdings of land is found first in the strong tie with which they bind the holder—literally the peasantry—to the land upon which they are born; second, small holdings necessitate, indeed are dependent for success upon, actual manual labour, and specially upon hand tillage. In fact, small holding culture becomes in expert hands gardening; hence, as we see in gardening, the land is made to produce double that farming gives; hence small holdings are necessarily creative of far more labour and greater produce than are large ones. Probably there are few market gardens of the present day—and I know some ranging from 200 to 600 acres—literally huge garden-farms—but what originated from small holdings. If the present grower was not, some years since, the cultivator of a few acres, no doubt his father, or predecessor, was one before him; indeed, numberless cases occur which prove that if a man is a good gardener, industrious and energetic, he will inevitably convert his small holding in time into a larger one, simply because he has been prosperous. I do not think that Mr. Earley actually means to condemn small holdings for market garden purposes, but really he does so. Now, it may be a fair matter for debate, whether the small holder—that is, the occupier of some 6 to 10 acres—is in a position to compete in the metropolitan market with growers who have ample capital and broad acres to back them. But then even London is not all fed through its markets, for great quantities of vegetables and fruit are sent into it, and sold by the small men in and about the suburbs, who put their produce down at the shops, and, gathering up the straggling heaps of manure in the locality, return home neither empty in cart nor in pocket. But then there are other populations in the kingdom besides that of London; and, although the provincial markets may seem to be of less importance than are the metropolitan ones, yet the consumption in them of garden produce is vast, and these are far more largely

supplied by small growers than by large ones. It must not be by any means concluded that the largest holders of land display the best culture. Having ample capital and more horse labour at disposal, they may perhaps manure the most heavily, but it cannot be admitted that in filling the soil with manure until it almost stinks is to be found the highest element of culture. Without doubt, deep culture, or working of the land, and keeping it clean, are more valuable cultural elements, and there the small grower may show even in a more marked degree than can his neighbour who has six times the extent of land to oversee, simply because such oversight can only be intermittent and not constant. The really practical cultivator who finds manure a costly item prefers not only to plough deep but also to subsoil, whilst the smaller cultivator not only digs his soil deeply and thus works it more thoroughly than ploughs can, but also, if he be alive to its value, trenches a portion of his holding annually, with the result, that his crops are of the finest and most profitable. Market gardening is so far in advance of farming that it employs thrice the labour, gives much better wages, and it also creates from out the soil a wonderfully enhanced produce. It calls into play the most useful intellectual faculties, and creates in the worker a totally different being from the farmer or his labourer. *La petite culture* would add immensely to our garden produce, it would add to public security, and increase the national wealth. It is almost the only method by which it will be possible to grapple with the needs of the public in relation to eggs and poultry, and indeed of milk and butter also. The small holder was always a keeper of live stock of the domestic order—the large grower of any form regards these elements as troublesome. In a hundred ways the consuming public suffer, and in many country districts, because of the absence of small cultivators, simple produce cannot be obtained, all the large growers sending it to the towns. *A. D.*

### ORCHIDS FOR AMATEURS.

(Continued from p. 78.)

#### PLANTING ORCHIDS.

ORCHIDS are either planted on blocks of wood, on rafts, in baskets, or in pots. Some species do better in pots, others with less compost, or none at all, on blocks or rafts, but many growers have a special predilection towards different methods of growing the same species.

#### PHALENOPSIS.

Take, for instance, the genus *Phalenopsis*. It is usual to grow these beautiful Orchids in baskets, but some unusually fine specimens have been grown in pots, and my own experience leads me to prefer the latter form of culture, at least during winter. The warmth of the bench directly over the pipes is very conducive to the health of these plants, and keeps the roots active in the cold dark months. In summer they may hang from the rafters of the house in baskets, but in winter, except in a very warm house—which, in my opinion, is not good for these plants—the roots suffer from change of temperature and drought in a basket.

I place the basket in a pot, and surround it with living sphagnum for the winter, and find it saves my plants from injury, and keeps them plump and healthy, or I place the baskets upon the bench over the pipes if the roots are confined to their interior, and dispense with the pot; by this simple device *Phalenopsis Schilleriana* and *P. amabilis* will stand a temperature of 50° in the night without suffering, provided the house rises to 60° or 65° in the course of the day. I attribute success entirely to the warmth stored in the compost, which cools far more slowly than the air of the house, and the fact that the benches themselves and the pots they support are always 5° or 6° warmer than the air at night. Perhaps in a house where the average temperature is 10° higher such plants would succeed better hanging from the roof than standing on a bench.

#### COVERING PLANTS TO KEEP THEM WARM.

A good plan in very cold weather is to cover such plants at night with a sheet of white cotton wool. I have often saved tropical plants in a cold greenhouse by this means. I should adopt it with the more delicate Orchids if at any time I found I could not maintain a sufficient temperature. Of course it would only do good for a time, unless heat were supplied to

the plant from the bench beneath it. The experience of Russian gardeners shows that many tropical plants can be kept healthy in the dark for months; this is only done, however, by giving no more heat than is necessary to keep the plant alive without stimulating its growth.

#### ENFORCED REST.

I find most grown plants—and I use this term to distinguish them from half-grown plants and seedlings—can be kept in a torpid state for a long time without damage. *Phalenopsis Schilleriana* does not grow at a temperature under 60°, but it does not suffer at 50°, and flowers all the better for a few months' enforced rest at a temperature between 50° and 60°.

#### THE COMPOST.

The compost I use consists of fibrous peat, small pieces of crock, fragments of wood charcoal, and sphagnum moss; equal parts of these ingredients by bulk, not weight, is the best mixture in my opinion. The peat must consist entirely of fibre; more failures arise from clogged peat, peat full of earth, sand, or decaying vegetable matter, than from anything else. Fibrous peat, freed from all earth by pulling it to pieces, and shaking out the dust, should be used in portions varying in size from a Cobnut to a Walnut. It should feel quite elastic between the finger and thumb, and should be dry, otherwise it cannot be freed from dust. It should then be of a light brown or golden-yellow colour. Black or dark brown peat is quite unfit for any Orchid.

It is sometimes very difficult to get the proper kind of peat; under such circumstances it is better to plant the Orchids in the above compost without peat than to use black peat, replanting them as soon as the proper material can be obtained. I once dispensed with peat for six months, and lost no plants by its want. I do not, however, recommend such treatment except when it cannot be avoided.

*Masdevallias* and *Cypripediums* do not suffer from the use of small pieces of inferior peat so much as the epiphytes, such as *Cattleyas*, *Brassias*, *Lælias*, &c.

#### THEIR WANTS SHOWN BY THE ROOT.

The colour of the roots of Orchids is a great indicator of their wants: those covered with a white epidermis, which looks like porcelain glaze, cannot endure any decaying vegetable matter in their neighbourhood; those with brown or black roots only suffer from stagnant water, and some growers even add old manure to the compost in which they plant them. I do not recommend an amateur to risk such treatment.

The charcoal should be in pieces the size of a Cobnut for small plants, larger for large ones. I believe its great power of absorbing carbonic acid gas and oxygen is the secret of its utility; it certainly keeps the compost sweet, and the roots cling to it firmly. Cocks are, like charcoal, absorbent bodies, and keep the compost open; perhaps they only serve the same purpose as the charcoal less efficiently, but I use them with it and have no reason to give up this addition to the compost; the roots cling to cocks firmly, the variety of material suits the plants, and the cocks keep the compost firm by their weight. I have already spoken of the necessity for drainage: from half to two-thirds of the pot should be filled with cocks, or a small pot may be inverted in a large one and surrounded and covered by cocks, this lightens the whole—a very important point, as it greatly lessens the labour of dipping the plants. A layer of sphagnum is then spread over the cocks and the Orchid planted in the compost above described. It may be necessary to secure it with sticks driven into the cocks below, to which the bulbs may be secured with bast.

#### FASTENINGS.

The parts tied to the sticks should be carefully examined from time to time, as these often swell as the plant starts into growth, and may easily be damaged by the pressure of the unyielding bast. String must never be used, as it is sure to swell with moisture, and damage the plant by constriction.

#### THE ROOTS.

The roots should be spread out near to or on the surface of the compost, and the whole covered with a layer of living sphagnum, the tops pulled off about three-quarters of an inch, or an inch, from the growing end of the moss, or, better still, when possible, cut from the surface of a bed of sphagnum. The moss

should grow, and if it dies should be replaced. It is not to be expected, however, that the sphagnum will keep bright and green all the year, especially on resting Orchids; but it ought to grow when the plant is growing. Too much water will kill the sphagnum, and so will hard water; rain-water is essential for its maintenance.

#### WHEN TO REPOT.

Orchids require repotting every year or two. This should be done when they are resting; it is usually necessary to break the old pot, or the roots will be damaged by attempting to remove the plant. Cattleyas and other plants adhere very firmly to the pot; in such cases I break away the bottom of the old pot with a hammer, and then plant the remainder in a pot an inch larger each way, and so avoid any serious disturbance of the roots. *B. T. L.*

(To be continued.)

### THE NAME VERONICA.

A QUESTION was asked about the pronunciation of Veronica, which is answered on p. 125. I do not wish to dispute the truth of that answer. Whether generic names in botany are no more than fancy combinations of letters, as is often the case with those now given, or are real Latin or Greek words, in either event whatever pronunciation custom sanctions I willingly adopt, even though inconsistent with ancient usage. But the name Veronica is so old, and so seldom referred to its true origin, that I hope I may be allowed to say a few words about it. I will not repeat the well known legend of the relic in St. Peter's at Rome, the "vera-icon" or "true likeness," but will only say that this derivation obtained such universal currency in France, that we find in classical French a man spoken of as "*la Veronique*" of another, just as we might say "the very image." But we need not stop to inquire why, in that case, the name is not "*Vericonia*," because the ancient ecclesiastics were at least good scholars, and would not have been guilty of the barbarism of thus mixing Latin and Greek in a compound word. It is likely enough, however, that the name is in some way connected with legends concerning the woman who was healed by touching the hem of our Saviour's garment. A very early tradition gives her name as Prounike, which was probably a corruption of Peronike, or Berenike, a name very fashionable in Egypt and Syria about the time of the Christian era, the most celebrated of the Jewish nation who bore it being the sister of Herod Agrippa, and the owner of the famous diamond ring so much coveted by the ladies of Rome. It is in fact the Macedonian form of the ancient Greek name "*Pherenike*" ("*Winner of Victory*"), which occurs in the *Odes* of Pindar, as having been given to a celebrated racehorse of his time. The transition from Pherenike, or its corrupted form Peronike, to Veronica is easy and natural. *C. Wolley Dod, Edge Hall, Malpas, Jan. 24.*

### PARASITE OF HENBANE.

#### PERONOSPORA HYOSCYAMI, P.

Now that so much attention is directed to raising new Potatoes with *Solanum Maglia*, Sch., as one of the parents, it may be well to remind Potatogrowers that the dreaded *Peronospora infestans*, Mont., is not the only *Peronospora* found on the Solanaceæ of Britain. A second species occurs on the common Henbane named *Peronospora Hyoscyami*, P. The study of the Potato fungus has shown that its attacks are by no means confined to *Solanum tuberosum*, L., as it spreads to other species and genera of the Solanaceæ, and even to a different natural order of plants, the Scrophulariaceæ.

We do not say that it is probable that *Peronospora Hyoscyami*, P., will attack Potatoes which have a different constitution from *Solanum tuberosum*, L., such as *S. Maglia*, Sch., or Potatoes containing blood of the latter plant. Judging, however, from what we know of the habit of *Peronospora infestans*, Mont., this is at any rate possible. *Hyoscyamus* is generally esteemed a somewhat rare plant in Britain, but it is not everywhere rare; we have seen it in such abundance in South Wales, in wild places washed by the sea at high tide, that it might have been mown down like corn.

The accompanying illustration (fig. 33), drawn from Nature, will give a good idea of what *Perono-*

*spora Hyoscyami*, P., is like when enlarged 400 diameters. It is a large sturdy species, with somewhat dull-coloured conidia or spores, even larger than those belonging to *P. infestans*, Mont. Professor De Bary, who is generally very exact, says, in describing this species (we suppose by a slip of the pen) "*conidia parva*." The spores are full of lustrous convoluted protoplasm, and are said to germinate by bursting at the side. Sometimes they germinate at the top, as shown, on the left of the illustration. Zoospores with vibrating flagella and resting-spores have not been observed in *P. Hyoscyami*, P.

Dr. Rabenhorst considered this fungus to be a variety of *P. effusa*, Grev., a parasite of Spinach; this, although undoubtedly very near indeed to the plant now before us, has still larger conidia, and apparently differs a little in other ways from *P. Hyoscyami*; Dr. Rabenhorst also altered the spelling to *Hyosciami*—an alteration which has not been approved or accepted. Few acts of botanists create more con-

FIG. 33.—HENBANE FUNGUS, GROWING FROM THE LOWER SURFACE OF THE LEAF; REVERSED IN THE ILLUSTRATION.

fusion than the unnecessary and uncalled for alterations of names. *W. G. Smith.*

### APPLE CULTURE.

In England Apple culture does not keep pace with the times, nor is it likely to do so until some alteration is made in our laws. Who is encouraged to start plantations? The landlord waits for the improvement, to reap a permanent benefit; the Government, to grasp more rates and taxes; and railway companies to demand rates for carriage nearly prohibitory. An instance only recently came under my notice of a lease running out of land which when taken consisted of poor grass and copse. The tenant during fourteen years improved it, planted Apples and other fruit trees. He desired a new lease, which was granted for a 20 per cent. rise, coupled with the condition of same acreage of orchard as now being left at end of new term, and this followed by being assessed up to rental. An instance also occurs of railway rates demanded exceeding the through charge for Apples from New York *via* Liverpool to London, the distance not much exceeding that from Liverpool. Orchardists all know that the full benefit of a new

plantation cannot be secured until a lapse of nearly fourteen years, and success is not always certain; so when handicapped as above who can wonder at the culture not keeping pace?

Now that land is such a glut something might effectually be done by landowners as well as Government to foster Apple culture and such permanent improvements, thereby keeping the monied land grabbers from roaming to other climes, for success without capital is impossible.

Among all fruits cultivated we as a nation are further behind in Apple culture in comparison with requirements than in any other kind suitable to our climate. To find an orchard of one kind is the exception, they generally will be found containing Apples of all colours as also for all purposes. To manage successfully a mixed orchard is not an easy matter, and often the fruit is marked as "mixed," which means quite 40 per cent. off the value. The idea of planting orchards of one kind and covering wide areas has only been grasped at present by the few.

Good examples of Apple culture are weekly arriving from America, and the knack of sending each sort separately enhances much the value of the produce. The supply to Great Britain alone during this season to end of December last was nearly 600,000 barrels, which represents about half the supply for the season, and quite apart from Canada, including the prolific island of Nova Scotia, whose supply may be calculated about half as much. Taking 60 barrels per acre, average value 15s., we get the grand total of 30,000 acres, and gross value of £1,350,000 supplied us by that continent.

These figures to the uninitiated, no doubt, will appear staggering, but they can be borne out by facts. To incite tenants of land to go in for Apple culture thoroughly will demand very much thought from our "G. O. M." *J. B. T.*

### CUPRESSUS MACROCARPA.

THE accompanying figure (fig. 34), is reproduced from a sketch of a group of trees of *Cupressus macrocarpa* taken in the dusk of the evening at Cypress Point, Monterey, California, in September, 1877, about 80 miles south of San Francisco. The trees were growing on rocky granite soil near the sea, and exposed to the westerly Pacific gales. Their well-known likeness to Cedars as I saw them in the old grove on the Lebanon itself struck me forcibly, and except that the trunks of the Cupresses were more silvery-grey (an appearance I never saw them put on in this country) I could not from a little distance recognise any character whereby these two botanically dissimilar plants could be distinguished.

The form here represented is that with widely spreading limbs, which goes in our arborescence by the name of *Cupressus Lambertiana*, and it is the only one which I saw at Cypress Point. How and when the columnar form—*var. fastigiata*, Knight—which is by far the most common in cultivation, originated, is a mystery to me, for there is no other known native locality for this Cypress than that here given, and no one has there seen other forms than the one I have attempted to portray. Watson, in the *Botany of California*, says of it:—"The trees at this, the only certain locality, very much resemble the Cedar of Lebanon in habit, with wide-spreading branches." On the other hand, I saw in California countless cultivated plants of *Cupressus macrocarpa*, but never one with the Cedar habit; all were columnar. The natural inference is, that the Cypress when brought into cultivation at once took to sporting, and that the fastigate form appeared soon to become the favourite, and very constantly reproduced its kind. I am far from saying that the spreading form does not occur in Californian gardens; all I can affirm is, that I looked for it in vain as I drove or rode along in town and country.

This tendency of spreading trees suddenly to assume a fastigate habit is a very singular one; it is conspicuous in the common Cypress, and in many deciduous-leaved trees, notably the Poplar (Lombardy), and Oak (*Robur fastigiata*), but perhaps the most striking instance of all is in the *Cupressus Lawsoniana* *var. erecta viridis*, which is too well known to require further description. Except possibly the *Retinosporas*, this Cypress is the most variable plant in habit known to me. The only trees of it which I have seen in a native state were on the Sacramento River, south of

Shasta, at what is perhaps the extreme southern limit of its range: there were but few trees of it growing amongst rocks by the margin of the river, they had slender trunks about 60 feet high, with large spreading and drooping branches, reminding me somewhat of *C. funebris* as it grows in the Eastern Himalayas, and totally unlike any fully-developed state of the tree as I have seen it in England; though possibly *var. gracilis*, of which I have only seen young plants, may grow into it.

To return to *C. macrocarpa*. Gordon (*Pinetum*, ed. 2, p. 92) says of the two forms, "That there is some difference in the shape of the plants may be, but then that arises from all those plants known under the name of *C. Lambertiana* being raised from cuttings, whilst all those called *C. macrocarpa* are seedlings, and have a more pyramidal shaped head, whilst the cutting plants (*C. Lambertiana*) have a horizontal, or rather flat-headed appearance." To this he adds a foot-note, to the effect that seedlings of *Lambertiana* have the erect habit of *macrocarpa*; and that if the points of the leading shoots are taken off young seedling plants of *C. macrocarpa*,

history of the Lambert Cypress, except that I do not see it noticed that it occurs in a forest of Pious insignis, which as it grows there in wretchedly poor soil, appeared to me to be a singularly ugly Pine, totally unlike its progeny in England; and that the *var. Cripsii* of *C. macrocarpa* with rigid acute spreading sharp leaves, of a silvery hue, was a very common form in Californian gardens. *J. D. Hooker*.

## The Arboretum.

### REMARKABLE TREES ON PENRHYN ESTATE.

PLEASANTLY situated near the entrance to the Menai Strait, and backed up by the great Snowdonian range of hills, this estate affords peculiar advantages for the successful cultivation of most timber trees, but more particularly of the rarer and less hardy Conifers of recent introduction. The climate of Carnarvonshire is remarkably mild and humid, more especially

the height of 10 or 12 feet there is but little diminution in the circumference. In its heyday this must have been one of, if not the finest, trees of its kind in Britain; but unfortunately, some years ago, the top was broken over at about 24 feet from the ground by the force of the wind which at times sweeps along the hill-side, near the base of which the farm is situated, with terrific fury, more especially when blowing from the south or south-west. It is still, however, in a fairly healthy state, as the number of fresh shoots shot out annually clearly shows. The butt for a short distance up is quite hollow, and was last season taken possession of by a hen in which to rear her offspring, and afterwards by a thief in which to secret her stolen goods. Another of almost equal dimensions, and in a perfectly healthy state, grows by the side of a mountain stream close to the road at Penybryn farm, or, more correctly, on the left side of the road between the entrances to Penybryn and Tyddynisa farms. This is a noble specimen, with girths at 3 and 5 feet of 18 feet 2 inches and 16 feet 2 inches respectively. As it is growing on a sloping ditch bank, one side of the stem is about 4 feet below the level of that opposite, which renders accurate or reliable measurements somewhat difficult, indeed the measurements given might be greatly extended, were exaggerations and not a fair average size—everything being taken into consideration—recorded. The branches of this tree cover a large area of ground, but the height is not in proportion to the immense size of the somewhat stunted stem.

In the village of Aber, almost opposite an artificial mound, near which was the site in olden days of one of Prince Llewellyn's mansions, stood until lately a remarkably fine Ash tree, of which, I need hardly add, real necessity demanded the removal. At 3 and 5 feet it girthed 16 feet 6 inches, and 15 feet 5 inches. Nineteen feet in length of the butt contained, after due allowance for bark, exactly 161½ cubic feet of timber. The whole tree, including the tops and larger branches, contained considerably over 200 feet of wood, all of which was in a perfectly sound and healthy condition. A special saw had to be procured for felling this tree, which occupied some time, as there were five stones embedded in the wood near the base. Another in the same parish, growing in the rectory field, is 14 feet 3 inches in circumference of stem at a yard up. Two others, one growing on the south-west of the Castle and the other near the sea coast at Port Penrhyn, the first being at 3 feet from the ground 12 feet 3 inches, and at 5 feet 12 feet in circumference of stem; the second, at 3 and 5 feet, 14 feet and 12 feet respectively.

### OAKS.

Of Oaks considered worthy of note the finest are those growing in close proximity to the Castle, but more particularly to the north-west of the flower garden, where many large clean specimens with boles rising over 70 feet in height and with timber of the finest quality are to be seen. Many of these trees contain from 150 to 180 cubic feet of wood, and the stems, which are usually straight and well tapered, girth from 10 to over 12 feet at 3 feet up. One particularly worthy of note, which was pollarded some few years ago so as to prevent injury to the flower garden wall, stands close to the northern doorway. It is a very ornamental tree—in fact, contrary to the usual opinion, has been much improved by removing the upper branches, numberless shoots having sprung out all over the stem, and thus giving to the tree the appearance of youth in old age. A number of gnarled old Oaks grow eastward from the chapel, their peculiar formation giving them a very picturesque and reverential appearance. The Turkey Oak is also abundant, and many fine specimens of 60 feet and upwards are visible from the drives and walks. This tree does well at Penrhyn, but it is only valuable for ornamental purposes, the timber being, comparatively speaking, worthless. Evergreen Oaks with girths varying from 6 to 7 feet are also liberally distributed throughout the park, the largest, however, occupies a very exposed situation on a farm near Talybont, and is, in spite of the breezy situation, the finest and best furnished tree of its kind on the estate.

### SYCAMORE.

The Sycamore is not abundant as a woodland tree generally, although all over the estate numberless specimens of not only ornamental appearance, but gigantic proportions, are to be met with. Near the little village of Pentir, and in a somewhat secluded

FIG. 34.—OLD TREES OF CUPRESSUS MACROCARPA: FROM A SKETCH BY SIR JOSEPH HOOKER.

the plants will afterwards assume the same spreading habit as those known as *C. Lambertiana*.

Now, if this theory is to hold good, it must be proved that all the native trees at Cypress Point, as sketched above, had the points of their leading shoots taken off while young—an improbable but not an impossible assumption; for in countries where goats or other browsing animals abound, mutilated trees of abnormal habit are not unfrequent. A more valid objection is that numerous as are the specimens of *C. macrocarpa* at Kew of which I have seen the leading shoots destroyed, not one has altered its habit on that account. So, too, with the common Cypress; wherever I have seen a partial change from the fastigate to the spreading form, it has been, as far as I could judge, a natural process, and not the effect of accident, disease, or injury. According to Gordon the fastigate variety of *C. sempervirens* is the only one known in its native country (Asia Minor), but Boissier (*Fl. Orient.*, iv., p. 705) contradicts this, saying that both varieties occur in the mountain region, but that the pyramidal is the most frequently cultivated; thus affording a parallel to *C. macrocarpa*.

I have nothing further of novelty to add to the

in the peninsular part; indeed, in this respect it almost equals that of some of the southern English counties, as the fact of such plants as the greenhouse Azaleas, Fuchsia Riccartoni, Cunninghamia sinensis, and many others standing our ordinary winters unscathed clearly proves. In the following paper I intend giving a short description of such trees as may, from their age or other remarkable features, be considered worthy of note. While none of these are connected with historic records, yet from the following dimensions it will be seen that they can favourably compare with many of the same kind growing in this country. As these trees are nearly all growing on the same sort of soil it will suffice to state that it generally consists of sandy loam, or in some places alluvial deposit, resting at no great depth on shaly slate rock. The altitudes range from 30 to 700 feet.

### ASH.

Beginning with the Ash, the largest specimen, as well as the largest tree on the estate, grows at Tynhendre Farm, the residence of Mr. Ellis, midway between Llandegai and Aber. At 3 feet up it girths 20 feet 3 inches, and the taper is so gradual that at

spot around the remains of an old mansion, are some of the finest Sycamores I have seen. Many of these have fine clean boles of from 20 to 30 feet in length, and with girths varying from 10 to 15 feet at 3 feet up.

When thinning these trees some time since, owing to the clo-eness of individual specimens, some idea of their general size was gleaned from the fact that six trees, at 19 feet lengths, contained 370 feet of timber, or an average, independent of tops and limbs, of 61 cubic feet each.

As an ornamental park tree or for planting on poor thin soils near the sea the Sycamore has no equal, and for these reasons has been freely interspersed throughout the park and surrounding grounds, as well as in our maritime woods generally. The Norway Maple has, for the sake of its handsome glossy deep green leaves, received a fair amount of attention, and may be seen of a fair size as well as in luxuriant growth in a small wood on the banks of the Ogwen river at Talybont. Several good specimens of the Oriental Plane grow in a small dell near the home nursery. They are trees of considerable beauty, and have the singular property of throwing off their old bark in hard plates of irregular size and form. The largest is about 60 feet in height.

#### ELMS.

Both the English and Scotch Elm are well represented on this estate, not only as woodland trees but as single specimens. The finest of the former grow in the park, to the south-west of the Castle, many of which have attained goodly proportions both in trunk and branch. At the home farm several over 70 feet in height, with trunks girthing 12 feet at a yard up, and containing upwards of 230 feet of measurable timber, are to be seen. The Scotch or Mountain Elm is inferior in point of size though more valuable as regards the quality of timber produced. It rarely attains a greater height than 40 or 50 feet, with a short thick stem, not unfrequently 17 feet in girth. The largest specimens are usually found as hedgerow trees, many of which, especially those in the park, have seen more than a century come and go. The Cornish Elm (*Ulmus cornubiensis*) has been planted pretty extensively, and many fine specimens are to be seen in the park near Port Penrhyn. When viewed from a distance this tree might readily enough be mistaken for the Lombardy Poplar, than which, however, it is usually more branched and the habit rarely so fastigiate. It is a tree admirably adapted for planting alone or along the outskirts of plantations, in either of which places its decided character can best be seen. The wood is rather brittle, but superior in graining to either the Scotch or English form. Several of these trees throughout the park have a height of over 80 feet, and stems girthing from 7 to 8 feet at 1 yard up.

#### BEECH.

A number of fine Beech trees are distributed all over the estate, but those of largest size are confined to the park and surrounding grounds. On the side of the narrow gauge railway running between Port Penrhyn and the slate quarry, and near the Bishop's Mill, are some of these trees that have attained goodly dimensions. At 3 feet up the circumference of stem is from 6 to 9 feet, and many of the trees contain close on 100 cubic feet of wood. In the park immediately behind Llandegai Church are, however, the largest trees of the Beech on this estate, some of which, growing on average good soil, girth 11 feet 3 inches at 3 feet up, and contain considerably over 100 feet of clean sound timber. Here also is a peculiar amalgamation of a Beech and Ash tree, the former appearing as if it had been planted in a recess at the root of the Ash. Both trees grow together, or rather within a few inches of each other, and perfectly parallel for 20 feet, at which point the Beech sends out a large branch right into the stem of the Ash, thus uniting the two both at base and summit.

#### CHERRY.

Close to the works in connection with the building department of the estate are a number of remarkably fine specimens of the Gean, or wild Cherry. Specimens that are not excelled even by the famous trees that are growing along the banks of the Findhorn and Deveron, and about which so much has been written of late. These trees are growing on well-drained alluvial deposit, and seem from their healthy, vigorous appearance to be perfectly suited both as regards soil and situation. The largest measures

6 feet 10 inches in girth at a yard up, is fully 70 feet in height, and contains 94 feet of measurable timber. Others but little inferior in point of size are conspicuous alongside the drive leading from the Castle to the grand entrance.

A fine specimen of the Bird Cherry (*Cerasus padus*) grows on the banks of a mountain stream at a considerable elevation above sea level. At 3 and 6 feet this tree girths 4 feet 3 inches and 3 feet 9 inches respectively, and is upwards of 30 feet in height. It has suffered severely from its high-lying situation, many of the top limbs and branches bearing unmistakable evidences of the fury of the mountain blast.

#### POPLARS, &c.

The Lombardy Poplar occurs but sparingly in this county, and usually as a hedgerow tree. Several of gigantic proportions are, however, to be met with on this estate, notably one growing on the banks of a small river or hill-stream at Nantheilny, near Aber, which is in girth at 3 feet 10 feet 9 inches, and at 5 feet 10 feet 8 inches. The taper is very gradual, as at 10 feet in height the stem girths nearly as much as at 3 feet. Others of less size occur on the roadside at Wig Farm. Of trees in Bangor remarkable for their size may be mentioned a Walnut at Tanrallt, which is over 70 feet in height, and girths at 1 foot up 18 feet 3 inches. It was planted 150 years ago. *A. D. Webster.*

## Orchid Notes and Gleanings.

### THE CYPRIPEDIUM.

DURING the last few years this genus of Orchids has become a very popular one in our gardens, and the favour in which they are held seems to increase. The collectors who daringly explore unknown regions in search of new species of plants cannot claim all the credit for adorning our glasshouses with new forms of the Ladies' Slippers, as for some of the handsomest productions we are indebted to the patient workers at home. I have visited the large collections of Orchids in Messrs. Veitch's nursery three times during the present winter season, and each time I have found that this genus contained more species and varieties in flower than any other. They have not the rich gorgeous beauty of the *Cattleya*, but most of them are quaintly formed, and many are beautifully marked in flower and foliage. There are few Orchids more easily hybridised, and the young seedling plants speedily grow into a flowering size. Further than this, no other genus of Orchids, taking it as a whole, is more easily cultivated, and the hybrids raised in this country in most cases grow with greater vigour than the original species. By far the largest proportion of them will grow in a mixture of tough fibrous peat and sphagnum used in equal proportions, with a good sprinkling of bits of charcoal and clean potsberds. As a rule the pots should be rather more than half full of drainage. Some of the species succeed best if some turfy loam is mixed with the compost, in about equal proportions of loam and peat. Of those that prefer loam the lovely *C. niveum* is one of the most charming. *C. Spicerianum* is one that prefers some loam with the peat, but I must say that it does very well without any loam in the compost. There is this to be said in favour of good brown fibrous peat, that it is much more lasting in its nature than loam of any kind. There are not a great many *Cypripediums* that will succeed all the year round in the cool-house, but the good old *C. insigne* is one of them. It was introduced from Nepal so long ago as 1819. This species and its varieties with the white and spotted dorsal sepals are not only beautiful in themselves, but they have become the parents of the finest hybrid yet raised, viz., *C. Leeatum* and *C. Leeatum superbum*, the latter the produce of a more richly developed parentage than the former. The largest proportion of the evergreen *Cypripediums* succeed best in the *Cattleya*-house, or rather the warm *Cattleya*-house. *C. villosum* is a vigorous free growing kind, and was the parent of one of the earliest, if not the first hybrid *Cypripediums*, viz., *C. Harrisianum*. A singular characteristic of this hybrid is that both the parents, *C. villosum* and *C. barbatum*, are summer flowering, while the produce of the cross made, always flower about mid-

winter. *C. Lawrencianum* is proving itself to be a robust growing species, which flowers in the summer and is the best of the *C. barbatum* group. The most recent, *C. ciliolare*, seems to be a dark coloured form of *C. superbiens* (Veitchii), and will also I fancy be sought after by exhibitors, owing to its time of flowering. There is rather a pretty hybrid now in flower at Messrs. Veitch's, *C. Sallieri*. It is a cross presumably between *C. insigne* and *C. villosum*; the lateral sepals resemble those of *villosum*, the dorsal sepal that of *insigne*, while the slipper seems to be between the two supposed parents. The whole flower is more yellow than any of its parents. There is also a new Chelsea hybrid; the first flower had just opened about January 20—a quaintly formed and lovely soft rose-pink coloured flower. *C. cardinale*, also in flower, seems to increase in beauty as the plant gains in strength. I made out a list of *Cypripediums* in flower on January 22, and found fifteen, mostly Chelsea-raised hybrids, and fourteen original species.

The Hybrids were:—	The Original Species were:—
<i>Cypripedium calceolus</i>	<i>Cypripedium barbatum majus</i>
„ <i>Crossianum</i>	„ <i>Boxalli</i>
„ <i>Domini</i>	„ <i>Dayanum</i>
„ <i>Harrisianum</i>	„ <i>Hayaldianum</i>
„ <i>Sedini</i>	„ <i>insigne</i>
„ <i>Selligerum</i>	„ <i>longifolium</i>
„ <i>Leeatum</i>	„ <i>Spicerianum</i>
„ <i>superbum</i>	„ <i>tonsum</i>
„ <i>Sallieri</i>	„ <i>venustum</i>
„ <i>cardinale</i>	„ <i>villosum</i>
„ unnamed seedling	„ <i>Hookeri</i>
„ <i>cenanthum superbum</i>	„ <i>Maulei</i>
„ <i>marmorophyllum</i>	„ <i>Schlumi album</i>
„ <i>tesselatum superbum</i>	„ <i>purpuratum</i>
„ <i>niveum</i>	
„ <i>veitchianum</i>	

J. Douglas.

#### LYCASTE SKINNERI.

Mr. Donaldson of the Gardens, Keith Hall, sends us two flowers of this useful Orchid produced on separate pseudobulbs, but on the same plant. In one the petals are white in the centre and at the base, and have deep rose-coloured margins. The lip of this flower is white slightly flushed with rose. In the second flower the sepals have a well-marked central stripe of rose-pink. The petals are deep rose-lilac in the centre and at the base, and studded with minute points. The lip also is widely different in colour from the preceding one, being so heavily tinged with deep magenta that but little of the white ground colour is seen except at the extreme tip. If the two were seen separately, there would be ample reason to make two varieties with names and prices to match.

#### CATLEYA CHOCOENSIS.

The flowers of this comparatively recent introduction are large, conspicuous and distinct in appearance. Their beauty, however, would be far more appreciated if the sepals and petals were more expanded to show the different parts. The petals are unusually broad in proportion to their length in this or perhaps any other species, and pure white. Their objectionable feature, however is the semi-erect position whereby they partly hide the lip, owing to the nodding or somewhat drooping flower. The lip is folded so as to form a large tube, with a short oblique orifice representing the limb, and undulated or crisped at the margin. It is a pale lilac-purple in varying shades, with a yellow or orange band along the centre, and an obversely heart-shaped blotch of rich purple at the apex. The flowers are seen to best advantage when staged above the level of the eye. The plant is figured in the *Illustration Horticole*, n. s., p. 120. Its habit is well displayed in a flowering specimen in the warm division of the Orchid-house at Kew.

## FORESTRY.

### REASONS WHY WOODS DO NOT PAY.

(Continued from vol. xxii., p. 683.)

BECAUSE each "kind" of tree is not grown in a way and manner suited to its nature, and so as to fulfil the general objects had in view in planting and growing it. The Sycamore may very properly be taken as a suitable example, and will illustrate what should be done with other species. The Sycamore wood, or timber, is only of real use and value when old, of large size, and well grown. Its commercial value is greatly enhanced by growing it so that the veins, waves, convolutions, and grain of the wood may show to advantage. In order fully to attain this object the tree should be grown with limbs, or arms, bent or crooked rather than straight. Regular uniformity of branches, and single upright stem or trunk, so much desiderated in many other species, are not to be sought for in the Sycamore. The most valuable and beautiful part of the tree is that obtained from the part at the junction between the stem and

limb. A limb emerging from the trunk at an acute angle is exceedingly objectionable for several reasons, and should be carefully avoided in the culture of this tree. On the contrary, only such limbs should be encouraged to grow as divide or project from the main stem at an obtuse angle, the nearer a right angle the better. Young and small Sycamore trees, and, indeed, small wood of almost all kinds, are of comparatively little commercial value, and it is, therefore, only mature and large Sycamore timber that should be grown, and which at the present day pays well, probably as well, if not better, than any other British timber tree. Now the question of questions in connection with this tree is, how most profitably to grow it.

From what we have seen and experienced of the Sycamore, we are of opinion that it should be planted and grown in masses by itself, and not mixed with other trees. Amongst other reasons for adhering to this opinion the following may be adduced:—First, when one species alone is grown instead of a mixture, thinning can be done to much better advantage than it could possibly otherwise be effected. Every tree student knows from experience that some species as well as individual trees grow much faster than others, and their growth can never by any means at command be made to go on equal. Again, in some individual trees the branches or limbs grow out from the stem at a very small angle, while others diverge at a great angle. Now, under these conditions, if the crop is all of one kind of tree, the proper and necessary power is invested in the hands of the forester, by which he can take away or leave such trees as he thinks proper and best, doubtless leaving only those of known merit, and such as will, when grown to maturity as timber, command the highest price. On the other hand, if the group is mixed with, say, one-half Ash or Elm, and the other half Sycamore—under these circumstances the power of selecting the good and proper trees, and rejecting the bad and profitless ones, is very seriously curtailed, if not altogether taken out of his hands. When thinning we have often stood perplexed and confounded in this unenviable position, hesitating what to do, having to consult so many and such grave and conflicting circumstances. The result of such entanglements inevitably is, that we are either compelled to leave many trees on the ground that should have been cut down as worthless wood, or leave wide and unprofitable spaces of ground unoccupied. But as we have already said, and endeavoured to point out, some trees on certain soils grow so much faster than others, that if the fast growers are to constitute the permanent crop the less vigorous ones will have been kept down, and made such slow progress, that they will require to be thinned out before they are of any use, or almost any commercial value. On the other hand, if the slow growers are to constitute the crop, they will have already sustained such serious harm by the tops of the fast growing ones wind-lashing them, as to be almost useless at a stage of growth long before the fast growers are of almost any value to thin out. Much has been said in favour of Ash as a nurse to Sycamore to thin out for profit. That the root cuts of Ash trees are very valuable there can be no doubt, but that the Ash tree pays better than most other forest trees is, to say the least of it, very doubtful. In cutting a fall of Ash here some time ago we found that for every ton of valuable timber the trees yielded, they contained nearly 2 tons of wood fit only for fuel. On this estate, richly and well wooded with every description of timber trees, the Ash pays worse than most of the others. Not that the price per foot is low, for we obtain fully 2s. to 3s. per foot for it, but there is in almost every Ash tree such a large proportion of the timber unfit for any industrial purposes, and therefore sold as fuel cheap, on that account. The Sycamore, let it be borne in mind, is a tree that must either be grown fast, or grown profitless. It requires to be grown with more room than perhaps any other forest tree; the reason for this is, that it must grow fast, in order to attain the desired large size before the diseases incident to old age overtake it. It is also a tree very impatient of confinement, and if once checked in growth rarely if ever regains it. It will be observed that the Sycamore requires from its earliest growth a great profusion of branches and foliage, and in any case, where these are even slightly deficient, the tree invariably falls into a state of slow growth and delicate health. Not that the tree becomes actually diseased or dies, but its growth becomes so slow that

it dies either of old age or disease incident to it before it attains the size which profitable Sycamore requires to attain. I have no desire either to ignore or wink at the difficulty attending the profitable occupancy of the ground during the early years of its growth. I have a piece of Sycamore plantation under my charge planted about twelve years ago. The trees were lifted from a home nursery when about 10 or 12 feet in height, and planted about 15 to 18 feet apart, or about 170 trees to the acre. The surface of the ground is fine, sweet grass, which it would be waste not to turn to profitable account, and, therefore, sheep graze it during the summer season, doing no visible harm to the trees, which are growing remarkably well. By planting trees so large and well-developed, it could be well determined in selecting them what their respective merits were, and thereby, in an important sense, accomplish what under ordinary circumstances would require to have been done by thinning. I have seen the ground under similar circumstances cropped with Potatoes, and also with corn; but this cannot be recommended as practicable, except upon a small scale. Basket Willows have also been grown with considerable success, and proved a very profitable crop during the early years of a Sycamore and Oak plantation, and as they are easily and cheaply propagated and find a ready market, there is no risk in growing them so long as the trees do not overshadow them so as make their culture unprofitable.

Different results are looked for by different foresters—some, no doubt, unreasonably high; but so long as the present demand continues, and current prices are maintained, it appears to me that little more is to be desired or even looked for. For good trees at our auction sales of late years 4s. to 5s. per foot have been readily obtained. During the last fifteen years or so good Sycamore trees have sold well all over Scotland, realising at auction sales by public competition from 4s. to 5s. per foot. By turning to page 40 of the May number of 1884 of the *Journal of Forestry*, the following statement will be met with:—"A. Oliver & Son, Ilawick (Roxburghshire), sold by auction last Friday ten Plane trees (Sycamore), belonging to the Earl of Minto, the average price per tree being £27 5s.; the two highest being £50 and £40 respectively. It may be interesting to know that these trees were grown at an altitude of between 700 and 800 feet above sea-level." Being well acquainted with the Minto estate, and also with the forester, Mr. Robertson, I took the opportunity last August of ascertaining full particulars of the trees referred to, and found that they had grown upon the ground at about 100 trees per acre; 100 multiplied by 27½ gives £2725 as the value per acre. The trees are about 200 years old, and therefore £2725 divided by 200 gives £13 12s. 6d. as the yearly return per acre, from which, of course, reductions have to be made for interest on money invested in planting, maintaining, &c.; but even after making all legitimate allowances there is here a very handsome margin in favour of planting far exceeding in profitableness any other crop the soil could produce. The trees cut were only a few of the large group still growing, and further particulars will be gladly furnished to any who may wish it.

It is improbable that any area of one or more acres of wood ever actually yielded the preceding value, but it is well to show what is within the bounds of possibility, and to indicate by what means it may either be attained or approximated. C. Y. Michie, Cullen House, Banffshire, January 13.

(To be continued.)

## ABIES (TSUGA) MERTENSIANA.

THIS very elegant Hemlock Spruce is the representative on the north-west or Pacific side of the American continent of the Atlantic Hemlock, *A. (Tsuga) canadensis*. In Japan another species exists—the *A. Tsuga* or *Tsuga Sieboldi*. These three are so much alike that there need be little hesitation in coming to the conclusion that they may have all sprang from one common ancestor not so very long ago—that is, if we consider we are dealing, not with centuries, but with æons. Other species there are which present greater differences, such as *A. (Tsuga) Hookeriana*, *A. (Tsuga) Pattoni*, and the common ancestor of these and the three first-mentioned must be of more remote antiquity still, unless, as is possible, they are mere forms or offshoots from one or other of the others. Why indulge in such unpro-

fitable speculation?—some will say, Why attempt to solve the insoluble? First, simply, because we do not admit that it is insoluble. In this, as in other cases, observation of the progressive development, of the internal structure, or of the good fortune offered by some so-called "sport," may solve the mystery sufficiently to satisfy any reasonable mind. But in the present instance, this happy consummation has not yet been arrived at. Those who would hasten it might do good service by studying the minute anatomy of each form, observing the mode of germination and development of each. At one time *A. (Tsuga) Albertiana* was considered to be a distinct form from *Mertensiana*, and this view was held by our late friend, Andrew Murray, and indeed is still held by some folk. Mr. Murray's views are given at length in the *Punctum Britannicum*, in the *Proceedings of the Horticultural Society*, vol. iii., p. 149, and repeated with the figures in our columns on April 11, 1863. In our opinion the alleged differences are so trifling, even when they are observable at all, that it is not at all worth while to make two species. We append from the second volume of the *Botany of California*, p. 121, the late Dr. Engelmann's descriptive account of this tree:—

"*Tsuga Mertensiana*.—A very large tree, 100–200 feet high, with rather thick red-brown bark; ultimate branchlets very slender, roughish, and when young long, hairy; leaves linear, 4–9 lines long, and about ½ line wide, abruptly petioled, entire, or usually minutely spinulose-serrate towards the rounded tip, shining above, when young with two white bands beneath; male flowers 2–2½ lines in diameter, shorter than the stipe; cones oblong cylindrical pointed, slightly pubescent; bracts truncate, scales longer than wide; seeds 1–1½ lines long, the wing twice as long or more, scarcely widened towards the base; cotyledons three, sometimes four. . . . Peculiar to the Pacific coast from Marin County to Alaska. It differs from *canadensis* thus:—A larger tree with finer, straighter grained wood and redder bark, principally distinguished by the more elongated scales of the cone, and proportionately much longer and straighter wings of the seeds. Hypoderm characters not reliable."

In the *Botanical Gazette* for June, 1881, Dr. Engelmann further gives the distinguishing characteristics, as follows:—

"*T. Mertensiana*.—Larger leaves, with two bands, each of 7–9 series of stomata; strengthening cells few on the edges, and very sparse on the upper and lower side of leaf; cones 6–12 lines, long (not 1½ inch, as sometimes stated); scales oblong, mostly a little narrowed in the middle; bracts slightly cuspidate; seeds smaller, with few oil vesicles, wings twice as long as the body of the seed.

"*T. canadensis*.—Leaves of the mature tree smaller (4–7 lines long), obtuse, with five or six series of stomata on each side of the keel below, destitute of any strengthening cells; scales of cone in ½ order, orbicular-oblong, with broad truncate bracts; wing very broad at the base, tapering, scarcely longer than the seed, which shows two or three large oil vesicles."

To this we may add that in cultivation the tree is more elegantly pyramidal in habit than is *A. canadensis*. The branches, moreover, are more thinly set, more horizontally disposed, more slender, and therefore more curved at the tips. The buds are clavate-oblong, not resinous, the bud-scales ovate oblong, coriaceous, dark brown, hairy, one-nerved, the upper ones much longer, thinner, and nerveless. Dr. Lyall mentions having met with native trees of *Mertensiana* 150–200 feet high, with a perfectly clear bole of 60–70 feet. Mr. Hutchison has collected in the *Transactions of the Highland Agricultural Society of Scotland*, 1879, some statistics relating to this tree as cultivated, from which it appears that the tallest tree known to the writer was one at the Cairnies, Perth, growing in hard retentive clay, which was planted in 1851, and which had in 1879 attained a height of 46 feet. But these dimensions are exceeded by those cited in the *Journal of Forestry*, February 17, 1883, wherein the following measurements are given of a specimen of this species growing at Hafodunos, Denbighshire:—Height (1882), 65 feet; girth at 1 foot from the ground, 5 feet 8½ inches; at 3 feet, 4 feet 11 inches; and at 10 feet from the ground, 4 feet 6½ inches. The greatest spread of branch is 32 feet. The same tree when measured in 1879 had a height of 56½ feet, and a girth at 10 feet of 44 inches. From the same journal we quote (January 10, 1880) the dimensions of a tree at Leslie House, Fife, which had attained a height of 40 feet and upwards, and a spread of branches of 78 feet.

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Feb. 9	{ Sale of 5000 <i>Lilium auratum</i> , at Stevens' Rooms. Royal Horticultural Society: Meeting of Fruit and Floral Committees, at 11 A.M.; Scientific Committee, at 1 P.M.; Annual General Meeting, 3 P.M.
TUESDAY, Feb. 10	{ National Rose Society: General Meeting, 3 P.M. Sale of Valuable and Established Orchids, at Protheroe & Morris' Rooms. Sale of Roses, Fruit Trees, and Border Plants, at Stevens' Rooms.
WEDNESDAY, Feb. 11	{ Sale of 10,000 <i>Lilium auratum</i> , at Protheroe & Morris' Rooms. Sale of Imported Orchids from Messrs. Shuttleworth & Co., at Stevens' Rooms.
THURSDAY, Feb. 12	{ Sale of Valuable Imported Orchids, at Protheroe & Morris' Rooms.
FRIDAY, Feb. 13	{ Sale of Roses, Fruit Trees, Bulbs, and Plants, &c., at Stevens' Rooms.
SATURDAY, Feb. 14	

FOR some time past complaints have reached us from various quarters as to the existence of DISEASE in the EUCHARIS. Gardeners accustomed to the management of this most beautiful and indispensable plant all on a sudden found themselves baffled. The plants ceased to thrive, the leaves turned yellow, no flowers were produced, and dismay and disappointment resulted. Over and over again specimens of the yellow foliage were sent to us, but as we could detect neither insect nor fungus we attributed the disease to some defect in treatment. One correspondent sent us some bulbs, but these appeared to be healthy, and the presence of a few mites near what appeared to be a bruise did not excite our suspicion, as it ought to have done. Quite lately another correspondent, "Z," also furnished us with a bulb, and expressed himself as so strongly convinced that the mites were at the root of the mischief (if the pun may be permitted), that we felt that our notion that the mites that were present were scavengers whose office it was to clear away rotten or decaying tissues must be submitted to more careful scrutiny. To this end we applied ourselves to the leading authority on these matters, Mr. A. D. MICHAEL, and that gentleman entirely confirms our correspondent's notion, that the mite is the real culprit. An extract from Mr. MICHAEL'S letter will best tell the story:—

"The *Acarus* is *Rhizoglyphus Robini*, and the generic name [root-cutter] will be sufficient to tell you that it really is the cause of the evil. The mite gets in between the scales of the bulb and eats the tissue. The red spots seem to be caused by a gummy secretion, which may be practically an effort of Nature to repair the wound. The creature does not confine its attacks to *Eucharis* bulbs, it consumes others as well, indeed with much greater avidity, but I presume it is more noticed in the case of the *Eucharis* from its greater value. *Hyacinth* bulbs and even *Dahlia* roots are quite acceptable to it; the former it eats up in an astonishing manner. I think it is coming over in great quantities this year with the Dutch bulbs, and I would desire to call attention to the importance of examining imported bulbs before mixing them with others of value.

"It is not very easy to suggest a remedy that will kill the mite without injuring the bulb. Desiccation is the best thing if the bulb will bear it. Sulphur and carbolic acid are useful where they can be used. Infected bulbs which are too much injured to be used should be burnt, and every care taken to prevent the dispersion of the insect."

The mite in question is closely allied to the cheese and flour mites, and is noted by the late ANDREW MURRAY (*Economic Entomology*) as occurring on Potato tubers as well as on *Hyacinths* and *Dahlias*. It is so far satisfactory to have ascertained the cause of the mischief. As in so many analogous instances the practical inference may be expressed by the phrase—Prevention is better than cure.

— ROYAL HORTICULTURAL SOCIETY. — We may remind our readers that on Tuesday, February 10, will be held the annual general meeting of this Society, at South Kensington. The meeting commences at 3 P.M., after the close of the other business of the day.

— CACTACEOUS PLANTS. — Under this title, Mr. LEWIS CASTLE, of the *Journal of Horticulture*, has published a little treatise on the history and cul-

ture of these plants, to which we must refer more at length on another occasion. For the moment we content ourselves with saying that it is to be had at 171, Fleet Street, E.C.

— "KÖHLER'S MEDIZINALE PFLANZEN." — This series of coloured plates of plants yielding medicinal products is so excellent that we commend it to the notice of all concerned. The price is 1s. for each part of four plates.

— GLENNY'S "ILLUSTRATED GARDEN ALMANAC FOR 1885" contains, in addition to the usual calendar matter, articles on the "Pansy," "Revivals in Horticulture," devoted specially to the Fox-whelp Apple and the Taynton Squash Pear—the one for perry making purposes, the other for the production of cider. "Manures," "Grape Culture," "Greenhouse Building," "The Daffodil Conference," all come in for a share of attention.

— THE BREATHING OF PLANTS. — The results of the experiments undertaken by Messrs. BONNIER and L. MANGIN with reference to the respiration of leaves as given in the *Annales des Sciences*, t. 19, 1884, show, in opposition to the opinions of M. DEHÉRAIN, that there is a distinct and constant relation for a given plant under given circumstances between the volume of carbonic acid gas exhaled and the amount of oxygen absorbed during respiration, whatever be the temperature. The results obtained by experiments on green leaves in the dark are the same as those previously acquired from experiments on tissues devoid of chlorophyll.

— PLANTING SLOPES. — MM. VILMORIN ANDRIEUX ET CIE. recommend steep banks, such as those of railway cuttings, to be sown with Poppy seed in October or March. In the course of a month the root-development is sufficiently advanced to keep the soil in place, and prevent it slipping. The Poppy being only an annual, when it dies down the ground is in a condition for permanent planting.

— DENDROBIUM SPECIOSUM. — A fine plant of this shy-blooming Dendrobe is just now finely in flower with J. MOORE, Esq., The Mount, Sevenoaks (Mr. CHARMAN, gr.). It has three spikes, carrying seventy-two, fifty, and forty-two blooms respectively.

— "MALESIA." — Under this title the eminent Italian traveller, BECCARI, publishes from time to time observations on the plants of the Malay and Papuan Archipelagos, collected during the years 1865—1878. A part is now before us devoted to the history of certain "*Piante ospitrici*" or plants which constantly form cavities and nests inhabited by ants and other insects. Signor BECCARI only includes plants in which this hospitable tendency is constantly met with, and prefaces his systematic studies by a general review of certain points of structure and function which plants possess in common with animals. The plants which form nests for insects here figured and described belong to the genera *Myristica*, *Endospermum*, *Clerodendron*, *Macaraya*, *Acacia*, *Cecropia*, *Korthalsia*, *Rubiaceæ*, such as *Myrmecodia*, *Myrmedonia*, *Hydnophytum*, &c. It was in this latter named family that the phenomenon was first observed and commented on. Signor BECCARI treats the subject very fully and with abundant reference to the literature. Twenty full, well executed, quarto plates illustrate this valuable treatise on a very interesting subject.

— FRENCH WALNUT. — The finest and most costly of the veneering woods, says Mr. P. L. SIMMONDS, is what is known as French Walnut, but which does not come from France at all, but from Asia Minor and Persia. The tree is crooked and dwarfed, and is solely valuable for its burrs.

— VINES. — M. PLANCHON has recently completed an exhaustive study of the species of Vine. As a result of his investigations he restores *Vitis* to its old limits, including Vines with petals cohering into a hood—a character not possessed by the other genera of the order. For cultural purposes the separation of the genera *Vitis*, *Ampelopsis* and *Cissus* is a convenience. Under a new genus, *Ampelocissus*, is included a number of tropical species with the habit of ordinary Vines, but with bisexual flowers, and spreading very rarely hooded petals. The disc adheres partially to the base of the ovary. The seeds are elliptical, with

a strongly marked ridge separating two deep furrows. The habit is peculiar, inasmuch as the species have thick, fleshy rootstocks of large size, from which shoots spring every year. The species of this group are found in Tropical Africa and Asia. To this group belong the Cochinchina and Soudan Vines. Specimens of some of these may be seen at Kew in the Succulent-house, and are of much interest, though it is to be feared of little economic importance.

— SUNSHINE RECORDERS. — The Council of the Royal Meteorological Society has arranged to hold at 25, Great George Street, S.W. (by permission of the President and Council of the Institution of Civil Engineers), on the evenings of March 18 and 19 next, an exhibition of sunshine recorders, and solar and terrestrial radiation instruments. The committee will also be glad to show any new meteorological apparatus invented or first constructed since last March; as well as photographs and drawings possessing meteorological interest.

— SAHARUNPORE BOTANIC GARDENS. — Considerable improvements have been planned and partially carried out in the Saharunpore Gardens. One lakh and 46,000 plants and 6994 lb. of seeds were distributed, and 1022 lb. of various drugs supplied to medical depôts. Some valuable additions were made to the official and ornamental plants of the garden, and to the museum and herbarium, and a large number of useful publications were received in the library. The progress made in acclimatisation and in other experimental cultivation is fully described by Mr. DUTHIE in his report. The continued success of acclimatised vegetable seeds is noticed with satisfaction. Of the new introductions the Japan Pea has been so far a failure, and the Scotch Champion Potato, though superior in quality, still fails to yield a fair return compared with some of the local varieties. The propagation of the Salt-bush (*Atriplex nummularia*) has scarcely passed out of the experimental stage.

— THE ANATOMY OF FERNS. — Among the lowest groups of plants, growth results from the subdivision, in regular order and sequence, of a single primary cell at the apex of the growing points. This cell is called the "apical" cell. In higher plants, instead of one such cell there is a group occupying the corresponding position, and forming the successive tissues of the plant by subdivision, as in the case of the single cell. Intermediate or transitional cases occur in the roots of *Marattiaceæ*, where two such cells occur, as also in some species of *Selaginella*. Mr. BOWER in a memoir in the *Quarterly Journal of Microscopical Science*, indicates further intermediate stages, and shows from a consideration of the minute anatomy and mode of development alike of the root and of the leaf, that the *Osmundas* are intermediate between ordinary Ferns and *Marattiaceæ*. It is extremely interesting to find that minute research into the origin and mode of growth of these plants brings to light evidence of the filiation and probable course of descent of plants. Thus in the paper before us we are told that the structure of the apex of the root in *Marattia* shows a tendency towards the structure characteristic of *Gymnosperms*—affords a link, in fact, between the Ferns and the Conifers.

— LEEKS. — Last year we had occasion to notice the peculiar growth of a Leek (June 14, 1884, p. 763). M. CARRIÈRE, in a recent number of the *Revue Horticole*, points out that the plant, though usually treated as a biennial, is really perennial. When treated in the ordinary way the stem is single, with a slight bulbous dilatation at the base. But if this stem be cut the plant will produce suckers or offsets and form a tuft of stems. If these are again cut off and the bulbs allowed to remain they form immense tufts which produce no flowers, and thus a state of things analogous to that of the Chives (*Ciboulette*), or the Leek may develop true globose bulbs and propagate itself by their means. It is thus possible to transform the Leek into a tufted perennial or into a bulbous plant.

— KENNEDYA MARRYATTÆ. — According to our leading authorities about eleven species are included in this genus. Great diversity of opinion existed amongst the older authors, and various other species placed here are now referred to *Glycine* and *Hardenbergia*. Most of them are free-flowering and moderate-sized greenhouse climbers of considerable beauty. In this respect possibly the species under notice is unexcelled by any, as a very floriferous specimen in

the greenhouse No. 4 at Kew amply testifies. The slender stems are trained on wires under a rafter, and bear axillary clusters of large bright scarlet flowers throughout the greater part of their length. The ternate leaves are very hairy, with large oval leaflets

of such a delightful occupation, to collect and diffuse from the best sources information that shall be beneficial to all its members, to care for and instruct all in the best modes of carrying on a successful business, to help those overtaken by misfortune and form a

Company is generally conceded, and it will receive careful thought and prompt action on the part of the Society at its first annual meeting in Cincinnati. Practical papers—short, concise, and full of instruction—will be read at the meetings, and printed with

FIG. 35.—ABIES (§ TSUGA) MERTENSIANA: YOUNG TREE. (SEE P. 179.)

that are wavy at the margin. As a winter-flowering climber it deserves extended cultivation on its own merits. There is a figure of it in the *Botanical Register*, tab. 1790.

— THE SOCIETY OF AMERICAN FLORISTS.—The aim of this newly formed Society is "to lift up and carry forward all that tends to advance the growth

brotherhood worthy of the goddess FLORA. The plan of action is to have a yearly meeting at one of the larger cities; in connection with these there will be an exhibition—at such meetings the business of the Society will be conducted, the transactions of the year previous will be presented, and the programme for the ensuing year laid down. The desirability of forming either a Hail Fund or a Hail Insurance

the reports of the Society each year. No new plant or flower, no device or invention of merit, will go unrewarded. Medals and certificates will be given for deserving exhibits. The Society will take especial care to have everything reported in the best manner. The constitution and bye-laws are in preparation, and will be presented at the first general meeting. At a meeting of representatives from eight different States,

held in Chicago on June 19, 1884, this Society was organised by the election of the officers and committee. The first meeting will be held in Cincinnati, O., between August 12 and 25, 1885. All florists, gardeners, seedsmen, nurserymen, superintendents of parks, manufacturers of heating apparatus, greenhouse builders, and dealers in florists' supplies in the United States and Canada are eligible to membership in this Society. The annual subscription is 2 dols., entitling members to all privileges of the Society. E. G. HILL, Sec., Richmond, Ind."

— **SUCCESSOR TO THE LATE DR. VOELCKER.**—At a meeting of the Council of the Royal Agricultural Society of England yesterday Dr. JOHN AUGUSTUS VOELCKER was appointed Consulting Chemist and Director of the Society's Laboratory, in succession to his father, the late Dr. AUGUSTUS VOELCKER.

— **THE SURVEYORS' INSTITUTION.**—The next meeting will be held on Monday, February 9, when a paper will be read by Mr. H. ROBINSON (Fellow), entitled "Some Recent Phases of the Sewage Question." The chair to be taken at 8 o'clock.

— **A NEW INSECTICIDE DISTRIBUTOR.**—We have lately been shown a small machine for use in gardens and nurseries that supplies a want that has been long felt. The old method of applying liquid insecticides was always wasteful of the substance used, and frequently injurious to plants with tender foliage and delicate blossoms; whereas, with the apparatus of Messrs. S. OWENS & CO., the liquid sent out is as fine as a Scotch mist, and the plant operated on becomes rapidly moistened in all parts without any more being used than is necessary for the purpose. For using the dear preparations of the present day, or the cheaper quassia-water, tobacco-water, or soap-suds, on Roses, wall trees, tender stove and greenhouse plants, Auriculas, fruit trees in houses, and Hops, it will be very useful; and so economical is it, that one man using it constantly cannot empty the smaller size, holding 4 gallons, in an hour. We intend shortly to give an illustration of the machine.

— **EDUCATIONAL COLLECTIONS.**—Messrs. SUTTON & SONS have been so obliging as to send for our inspection a handsome case, fitted for museums, lecture or school rooms, and containing samples of the dried plants and of the seeds of our pasture-grasses. Such cases have been presented by Messrs. SUTTON to a large number of museums and agricultural institutions at home and abroad. Further, Messrs. SUTTON have studied the convenience of students by enclosing in cylinders of glass, closed at each end, dried specimens of grasses, &c., accurately named, and by providing small sample bottles of the seeds duly labelled. These are admirably adapted for the purpose, and we should like to see them in every school in the pastoral districts of the country. A knowledge of the distinguishing features of the common grasses, and of their marvellous structure, would not only be more directly useful but more mentally serviceable than much that is taught in schools. Messrs. SUTTON have evidently gauged the need and supplied it.

— **ORCHID SALES.**—At a recent sale by Messrs. PROTHOROE & MORRIS, fifty-four lots of *Lælia anceps* Sanderiana brought £5 to—one very fine mass, 8 feet in circumference, fetching 36 guineas, others 26 guineas, 46 guineas, 38 guineas, 23 guineas, 20 guineas, and 19 guineas, the lowest price for any one plant being 11 guineas. A *Cymbidium eburneum* went for 25 guineas, and an *Odontoglossum Alexandræ* for 15 guineas. The remainder of the Fallowfield collection was sold on this occasion.

— **MIDDLESEX BEE-KEEPERS' ASSOCIATION.**—The annual meeting of the members of this newly-formed Association took place at 149, Regent Street, on the 30th ult., the Hon. and Rev. H. BLIGH, the Vicar of Hampton, presiding. The annual report showed that some substantial progress was being made with the Association, that the county had been arranged into seven divisions, and that local secretaries had been appointed in four of these, and it was hoped that local agents would be established in the other three during the spring. The accounts showed a small balance in hand. The Chairman stated that an impression was abroad that the Middlesex County Association was in antagonism to the

British Bee-keepers' Association, but, as a prominent member of the latter, he could state that it was a helper in the good work, and that the establishment of county associations was looked upon with great favour by the central association. A scheme for extending the Association during the summer was considered, and referred to the Committee of Management for carrying out.

— **EARLY CABBAGES.**—We are informed by Mr. GILBERT, of Burghley Gardens, that he intends to exhibit at the committee meeting of the Royal Horticultural Society on Tuesday next specimens of his Selected Imperial Spring Cabbage, and Ellam's Dwarf Early variety. It would be of advantage to determine the relative earliness of sorts if others would show specimens of their favourite early kinds.

— **THE NATIONAL CHRYSANTHEMUM SOCIETY.**—A fully attended meeting of the General Committee of this Society was held at the "Four Swans" Inn, Bishopsgate Street, E.C., on Monday, January 26, the President, E. SANDERSON, Esq., in the chair. Among the more important items of business that came under the consideration of the committee was Colonel MALLARD's proposal to offer special prizes for undressed Chrysanthemums. The committee had made a proposition to Colonel MALLARD to the effect that his prizes should be given for the purpose of encouraging the best method of staging Chrysanthemums without cups, and that a stand of twelve incurved blooms should be required, to be distinct; that any means of setting up might be adopted, with or without boards, upon which they are generally shown; but the right of withholding the prizes is to be reserved, unless a method of general practical value be illustrated. The matter again came under consideration at this meeting, and it is expected that the conditions of the competition will be finally settled by the time the committee again meet—a week hence. The judges at the show to be held in November next at the Royal Aquarium were appointed, and also an enlarged Exhibition Committee; the Floral Committee was also appointed, and extended from eight to fifteen members. Mr. W. HOLMES, the Secretary, announced that he had had an interview with Captain HOBBSON, of the Royal Aquarium, and he had promised the use of a room at the Aquarium for the purpose of the committee. The Floral Committee will sit at 2.30 P.M., instead of in the evening, as heretofore. Mr. CULLINGFORD's offer to give the sum of ten guineas as special prizes for Chrysanthemums to be shown during the second or third week in January was further considered, and the conditions of the competition settled, as follows:—Class 1, twelve blooms of incurved flowers; class 2, twelve blooms of Japanese; class 3, twelve blooms of any other sort; class 4, a collection of late-flowering Chrysanthemums; class 5, six incurved; class 6, six Japanese. It was understood that any Chrysanthemums in good condition in the month of January should be accepted as late varieties. Mr. T. S. WARE and others offered special prizes for single Chrysanthemums, and a class was formed, as follows:—Twenty-four bunches, not less than three trusses in a bunch, and not less than twelve varieties to be shown. A few other classes of lesser importance were added to the schedule of prizes, and the committee broke up, after a protracted sitting.

— **A NEW COTTON PLANT.**—Mr. A. A. LUBER, of Macon, Georgia, has (we quote from the *Times*) been experimenting for several years to hybridise the Cotton plant that grows wild in Florida [?] with the common Ochra, and he appears to have been at last successful. The new plant retains the Ochra stalk and the foliage of the Cotton. Its flower and fruit, however, are strikingly unlike either Cotton or Ochra. The plant has an average height of 2 feet, and each plant has only one bloom. This is a magnificent flower, very much like the great *Magnolia* in fragrance and equally as large. Like the bloom of the Cotton plant the flower is white for several days after it opens, after which it is first pale pink, and gradually assumes darker shades of this colour until it becomes red, when it drops, disclosing a large boll. For about ten days this boll resembles the Cotton boll, and then its growth suddenly increases until it reaches the size of a Cocoa-nut. The lint does not appear until this size is reached. Then its snowy threads begin to burst from the boll, but are securely held in place by the Ochra-like thorns or points that line the boll. Each boll is said to produce about 2 lb. of

very long-stapled Cotton—superior to Sea Island Cotton [!]. There are no seeds in the lint—from four to six seeds, resembling those of Persimmon, being at the bottom of the boll. The new Cotton consequently, it is stated, needs no ginning, and it is thought will revolutionise the Cotton industry of the South. The Ochra, we may add, is known to botanists as *Hibiscus* or *Abelmoschus esculentus*, the pods of which are used to thicken soups, they being rich in mucilage. It is not many years since that a statement of the same kind was made with reference to a so-called hybrid Cotton raised in Egypt, between the Cotton *gossypium herbaceum* and the *Bamia*, or Ochro (see *Gardeners' Chronicle*, n. s., vii., p. 561, and vol. ix., 1879, p. 16); but we believe the hybrid character of the plant was not borne out, and the account given by the *Times* is assuredly not one that should be accepted without evidence. The size of the boll and capsule, and the quantity of Cotton as given are so large as to lead one to doubt very strongly.

— **EXTRAORDINARY TITHES: INDIGNATION MEETING.**—On Friday last four auction sales under distress for Extraordinary Tithe took place at Leeds, Kent, under the direction of the Ecclesiastical Commissioners. Altogether 114 sheep were seized to cover tithes and costs amounting in the aggregate to £146 3s. Previous to the sale notices were posted throughout the Hop growing districts, and post-cards sent to the most important farmers throughout Kent calling their attention to the proceedings, and inviting their attendance at an "indignation meeting," to be held immediately after the sale. At this meeting Mr. J. CHAPMAN proposed the following resolution:—"That this meeting agrees with the recommendation of the Select Committee of the House of Commons to the effect that Extraordinary Tithes are an impediment to agriculture, hampering new cultivation; that it is expedient that they should be abolished, and urges upon the Government to embody this recommendation in a Bill at the earliest opportunity, and calls upon the representatives of the people to give their earnest support to such a measure." He agreed with JOSEPH HUME, who, at the time of the commutation, had protested against the Extraordinary Tithe as a tax upon industry, for garden cultivation deserved to be ranked not so much as an agricultural pursuit as a manufactory, and the impost was not only unjust and cruel, but most unwise as well. With keen foreign competition and heavy rents farmers could hardly live, and if their corn crops did not pay their friends would tell them how foolish they were not to turn their attention to something else, while they knew well themselves that if they grew fruit or Hops they had more to pay in consequence. The question was not a political one, and he thought agriculturists of all classes ought to be entirely as one upon the subject. The imposition gave rise to local injustice, some parishes being free and others heavily taxed, and farmers and labourers in the latter districts were deprived of the benefit they might hope to secure from the cultivation of Hops or fruit.—The Rev. H. RYLETT supported the motion as a consumer of garden produce, and occasionally of the commodity obtained from the Hop. The taxes upon agricultural produce finally percolated down to the consumer, and the urban populations were interested in getting their food at a cheap rate, consequently they would be glad to see the burdens on land removed, but would be sure to oppose the imposition of any tax upon imported food.

— **PROLIFIC MUSHROOMS.**—Some very remarkable bunches of these were sent for our inspection by Messrs. VEITCH & SONS, Chelsea, which had been forwarded to them by Mr. BREESE, the gardener at Petworth, Sussex. The bunches, of which there were two, were fully a foot across, and comprised Mushrooms mostly of one age and size, one clump having had as many as seventy-five specimens on it. The inference is, either that the spawn was of more than usual potency, or else had been used in exceptional large masses. The Mushrooms were deficient in substance, from their inability to get enough nutriment.

— **GARDENING APPOINTMENTS.**—Mr. E. C. WHEELER, as Gardener to Major G. W. BEST, Parker House, Box'ey, Maidstone.—Mr. JOHN HILL, lately Gardener at Potter's Park, Chertsey, as Gardener to C. J. STRONG, Esq., Thorne Hall, Peterborough.

## THE VINERY.

In early started houses, when the Vines are coming into flower, it will be advisable to avoid wetting the hot-water pipes whenever they are very hot, because the effects of the steam which then arises is the cause of that disfigurement of the Grapes which is commonly called rust, that mars the appearance and reduces the value of the Grapes considerably when they are ripe. The effect is most plainly indicated on bunches which are situated in close proximity to the pipes.

### SETTING THE BLOOMS.

To obtain a good and perfect set, it will during the flowering process be advisable to gently shake the Vines occasionally, or otherwise brush the bunches over with a camel's-hair pencil, and in the case of uncertain setting kinds, to obtain the pollen from the Hamburgh bunches and fertilise them in the ordinary way. Immediately the Grapes are large enough for thinning out this operation should be done at once, leaving in all the terminal and other best developed berries in sufficient number as when swelled out to form a perfect bunch. To do this properly a knowledge of the state of the Vines is indispensable, or otherwise the operator should have an indication by example. In the case of very early Grapes required to ripen as soon as possible, large bunches should be reduced in size, and the Vines should not be overburdened.

### STOPPING.

The growths will advance quickly, therefore attend to stopping them—the side shoots at the first or second leaf above the bunch, and the laterals above the first leaf; the terminals may extend to the limit required, when they should be topped. Cease to syringe the Vines overhead when they come into flower, and a genial state should be kept up by moistening the borders and other available places in the house. The artificial heat at night should be from 60° to 65°, and 75° by day; above this point a little air should be given, and in favourable weather the heat may stand at from 80° to 90°, and be finally closed for the day at the former degree.

### THE BORDER.

As the final result chiefly depends on the condition of the roots, attention to these is indispensable. When these extend beyond the limits of the house into outside borders they must be protected from the sudden changes to which they would otherwise be exposed. I am inclined to believe this is best effected by means of long litter being placed on the border and protected from wet, &c. It is much more reasonable than to attempt to force heat downwards into a border.

### SUCCESSION-HOUSES.

In these, seasonable influences will now cause a more satisfactory state of progress, therefore avoid using means which promote growth too rapidly, and which tend rather to impair than to improve its character: 60° at night and 70° by day artificially is enough heat for the present; ventilate at 75°, and close up with sun-heat at 80°. Attend to disbudding, stopping, &c., in the same way as indicated for the early house. In later houses, where the Vines naturally break forth into growth without the aid of artificial heat, especially in the case of Hamburgh and similar kinds, the house should be fully aired at all times, except in severe weather.

### MUSCAT-HOUSES

For late work should also be subject to similar treatment, and also the latest houses, in which Lady Downe's and Alicantes are grown from which the fruit has recently been removed. All work in the way of cleaning should be accomplished as soon as possible. Let the house be thoroughly cleaned with soft-soap and water, and if the Vines be free from bug or thrips they need not be divested of their natural covering of bark, but merely washed with a little soap and water, and tied up, without that customary dressing which formerly was considered to be indispensable and now gradually is becoming obsolete.

### POT VINES.

The fact of being able to keep late Grapes in excellent condition until the middle of May does away with much of the necessity for very early forcing, as

permanently planted Vines accustomed to forcing operations, "which are by far the best," started before the middle of December, will yield ripe fruit by the time it is required; it is, nevertheless, an interesting method, and wherever practised the chief things to observe and avoid are over-cropping and giving too much heat at the roots. If a bed of fermenting leaves is used the roots should be encouraged to strike out into it both at the base and surface of the pots. The same temperatures as recommended for the early house will be applicable to these, and the watering, which is the most important point in the management at this season, should be done judiciously, and contain some stimulating agent in a mild form.

Really good pot Vines can now-a-days be readily procured, which are grown under the best conditions possible, so that propagation in private places is not much needed; otherwise now is the time to put in the eyes, individually and firmly, into small 60-pots; these should be plunged in a warm bed, where growth will soon be excited. *G. T. Miles, Wycombe Abbey Gardens.*

## Plants and their Culture.

### MISCELLANEOUS FORCING PLANTS.

AMONG these the *Deutzia gracilis* when treated as we have at times advised in previous Calendars, is to be relied upon to produce a good crop of flowers every spring. When they are nearly in flower, and until they are faded, a good supply of water at the roots is needed, as any approach to dryness there during these periods will hinder the perfect formation of the flowers. Of Lilacs, the variety known as Charles N. is a well proven kind and excellent for pot culture. For the supply of a large quantity of bloom, however, we recommend large bushes to be grown in the open ground in sufficient quantity; thus treated they would do good service each alternate season by being lifted and placed into a growing atmosphere as may be desired. *Staphylea colchica* would also be an excellent companion in pots with the Lilac, being amenable to similar treatment. *Rhododendrons* of the choicer hardy kinds had better not be introduced at present; but *R. Early Gem* would be the best to bring on in heat now. The later kinds with the *Kalmias* and *Andromedas* will give a more satisfactory return if allowed to advance more slowly. The flowers of the *Guedres Rose* (*Viburnum opulus*) will also be found more lasting, if treated in a similar manner.

### ROSES IN POTS.

The Tea-scented kinds will be the best for earliest uses, to be followed by well established plants of the hybrid perpetuals. I find that by far the best return from forced Roses is obtained when I have an odd plant or two turned out in available corners of a Peach and Nectarine house. *Hoteia* (*Spiraea japonica*) will also give better satisfaction if covered, but plunging in this case is not so necessary. Unless specially desired *Dielytra spectabilis* should be retained for later uses; early in the season, and without much sunshine the flowers will be of a flimsy character and faint in colour.

### BULBOUS PLANTS.

There are now abundance from which to choose. Of Lilies of the Valley, the single crowns will still be found the most reliable. Plunge the pots in a brisk heat and cover them with cocoa-fibre, and keep the same moist. In the forcing of these the chief object to secure is an advance for the flower-spikes before that of the foliage. From the stock of *Hyacinths* continue to introduce a few at a time into heat, keeping them near the glass to prevent the spikes being drawn up to too great a length. Choose those which from their appearance bid fair to come away the quickest.

### TULIPS AND NARCISSUS.

The early kinds of single and double Tulips will also be available, and can now be depended upon to produce good flowers of durable quality. The single

variety, *Vermilion Brilliant*, will be much more appreciated for early work when its excellent and reliable qualities become better known. The *Polyanthus Narcissus* will give better satisfaction if brought on slowly, excepting the Roman and Paper-white varieties.

### AMARYLLIS.

The spring flowering section of *Amaryllis* will soon be making a move; if, on inspection of the roots, these are found in a healthy and thriving condition, we fail to see the necessity of shaking them out of their present soil if that is not too much exhausted. A few of the stock of these handsome bulbous plants should be induced to make a move at once, retarding others, so as to prolong their flowering season. *James Hudson, Gunnersbury House Gardens, Acton, W.*

## The Kitchen Garden.

### GENERAL WORK.

A GOOD sowing of second early Peas should now be made; this will follow in well after the earliest varieties, which were sown about the second week in January. Some of the varieties which are suitable for second earlies are enumerated at p. 22. When a constant and large supply of Peas is in demand throughout the season, it is not advisable to dabble with too many varieties for general picking, but greater satisfaction will be derived from making liberal sowings of two or three varieties; that is to say, for the supply of large establishments. Where the Peas have to be packed and sent by rail to the town residence of a family, or elsewhere, it is certainly a disadvantage to have many varieties, as the pods of each must be kept separate, and this does not facilitate packing. And again, if they are kept separate in the garden, they get mixed in the kitchen. Varieties on trial, &c., can be sown by themselves, and the results carefully noted for future guidance. Peas which grow 6 feet in height should be sown as many feet apart between the rows; afterwards prick over the ground, and sow Spinach between the rows.

### ASPARAGUS PLANTING.

If new beds are to be formed this spring the ground should soon be prepared. Land insufficiently drained has probably much to do with sickly produce; as, during winter, many of the roots decay. Asparagus succeeds well on light, well-drained land, planted in single rows, and the soil not raised above its natural level, but only on land of this description should the above system be entertained. I may remark that I have some growing as just mentioned, in rows 4 feet apart, and when the grass is allowed to grow to its natural size the soil between the rows is quite hidden. Heavy wet land is the worst on which to grow Asparagus successfully, and on such it should always be treated on the bed system, 3 feet beds with three rows of plants (two if very large produce is required) in each bed, and 2 feet alleys are the most convenient size, as they can be easily weeded and the produce gathered without any treading on the beds. On very heavy land two rows of drain pipes, 1 foot beneath the plants in the beds, may be introduced with great advantage, and the expense is not much in consideration.

### LETTUCE.

Some plants of *Brown Cos* may now be set out (in a sunny position) from the autumn-sown seed bed. The plants in our bed, sown August 29 last, are nice sturdy stuff.

### HERE BEDS.

These should now be thoroughly cleared of weeds, pricked over lightly with a fork and top-dressed with short well decayed manure. Tarragon, in many soils, is better transplanted into fresh beds every season. Old Mint-beds may be treated the same. Garlic and Shallots should now be planted by simply pressing the bulbs into the soil with the hand. *G. H. Richards, Somerley Gardens, Ringwood, Hants.*

**ANTHURIUM MARGARITÆ** ×.—Under this name a cross out of *Anthurium Scherzerianum* by *A. Andreanum* is mentioned in the last number of the *Illustration Horticole*. The habit and foliage are those of *A. Scherzerianum*; the spathe is of the same shape as *Andreanum*, but of a delicate rose colour.

## SEASONABLE REMARKS ON ORCHID CULTURE.

(Concluded from p. 146.)

**CATTLEYA-HOUSE.**—There is now a good display of bloom in the Cattleya or intermediate-house, and I find the flowers develop themselves much better if the temperature be not allowed to fall below 50° to 55° as a minimum. The beautiful blooms of *C. Trianae*, for instance, are of small size, and do not open well in a temperature allowed to fall to 50° or under it, while they open well if it is between 55° and 60°. They may be removed into the warmest house, but this is not always convenient. I need not say that the flowers open much more freely if the plants are placed near the glass, and where at this season they may have the full benefit of the sun. The plants of *Cattleya gigas* and *C. Dowiana* have up to this time been kept comparatively dry and at the warmest end of the Cattleya-house. Some growers keep them comparatively cool and very dry during the resting period. I tried this plan once, and that was once too often: they will not be forced into bloom by any such treatment as that. It is not during the resting period that such shy blooming Orchids as these can be made to bloom, but during the season of growth, and the treatment must be begun at once. Let the plants be placed in a position with the leaves almost touching the glass, the temperature of the house to be about 60° as a minimum. The young growths are now starting with great vigour, as *C. gigas* seems to make the strongest growths of any of them. In July, as the bulbs are finishing up their growths, the flower-spikes will appear, and after this it requires some judgment to prevent a second growth; both *C. gigas* and *C. Dowiana* have an inveterate habit of making a second start. The recent large importations of Cattleya have done much to place the very finest species and varieties within the reach of everybody who appreciates fine flowers. The season of flowering has also been greatly prolonged. It was a very pleasant surprise to see such richly coloured Cattleya flowers of the species *C. Percivaliana* as were exhibited on January 13 last at the meeting of the Floral Committee at South Kensington. The beautiful forms of *C. Trianae* will continue in flower until *C. Mendelii* and *C. Mossiae* come in. Some of the *Coelogynes* just starting to grow may also be potted. Indeed this is a sure guide to the Orchid cultivator, if he can find time, to repot his plants as they are starting into growth, or rather just before they form a fresh lot of roots. The good old *C. cristata* and its varieties, *C. Lemoniana* and *C. alba*, are well adapted for culture in any warm house where they can be well exposed to the light and air. The handsome *Odontoglossum citrosum* is still at rest, the roots are kept so dry that the pseudobulbs begin to shrink up; this thorough resting period seems to be quite necessary to the healthy growth and free-blooming character of this species. The Cattleya-house still contains a number of plants removed for the winter season from the cool-house. The elegant *Odontoglossum citrosum* succeeds best in the Cattleya-house during the winter months, and a number of species of *Masdevallias* prefer it.

### THE COOL ORCHID-HOUSE.

In the cool-house itself there is a continual growth taking place, especially in the large section of *Odontoglossum crispum*, but the growth is not rapid, indeed it is better to keep the house cool and moderately dry for some time longer. The temperature may be about 45° or 50°, and if it is seen that the delicate white *Odontoglossum* blooms do not become spotted nor the foliage injured, the course of treatment pursued hitherto may be continued. About the end of February or early in March, any plants requiring repotting may be seen to.

### DENDROBIUMS.

Plants of the type of *D. Wardianum* and *D. crasinode* are now coming into bloom; *D. nobile* is also in flower, a succession of these can be maintained up to June with but little trouble. The plants of the deciduous species grow best, and the flowers open better, if they are suspended in baskets from the roof.

### MASDEVALLIAS.

Some growers recommend the repotting of *Masdevallias* at this time. They may be repotted now if they really require it, but this is not a good time to

divide them. The flowers are either pushing up from the base of the leaf-stalks or they have made considerable growth. In dividing *Masdevallias* it is better to pull the large plants carefully to pieces with the fingers. If a knife is used some of the roots may be severed, which is very injurious to the plants; it will probably kill some of them. This may easily be avoided, as such plants are easily divided by a very gentle pressure with the fingers.

### HARDY CYPRIPEDIUMS.

It is now a good time to repot the hardy *Cypripediums* and other Orchids of this type; some of them, such as *C. spectabile*, require peat; others, as *C. pubescens*, a little loam with the peat. *J. D.*

## THE CESTRUMS (HABROTHAMNUS).

THE genus *Cestrum* embraces some of the most beautiful of our cultivated plants, so handsome indeed

continuing throughout the whole summer, we have frequent accounts of their marvellous beauty as outdoor wall plants in many of the more genial parts of the British Isles, and by these accounts we learn that in few cases where the plants have been given a favourable situation under a south wall have they failed; it may, therefore, be concluded that the *Cestrums* are by no means excluded from our open-air garden, and that experiment will prove them to be even harder than we now believe them to be. W. E. Gumbleton, Esq., of Belgrove, Queenstown, Co. Cork, who is so well known as an acclimatist of tropical plants, had in flower last May and onward throughout the season in great beauty in the open garden, *C. Newellii*, *C. fasciculatum*, and *C. corymbosum*; at Truro, in Cornwall, *C. fasciculatum* both flowered and fruited outdoors; Mr. Ewbank, at the Isle of Wight, also flowered *C. fasciculatum* as a hardy plant; last summer *C. Newellii* was in wonderful beauty, with its dense sprays of bright crimson flowers, in Lord Annesley's garden at Castlewilliam, Co. Down, where it had been outdoors for six years;

FIG. 36.—CESTRUM ROSEUM.

are they that ever since their introduction a continued current of praise has been kept up about them as one after another they have appeared in great beauty in the different gardens where they have been grown. It is a pity, however, that such worthy plants should or the greater part be confined to botanic gardens and to large private establishments, and that, too, while thousands of enquiries have been made by those who want just such rambling and trailing plants for their conservatories. It may be that in many cases the *Cestrums* are often excluded on account of their free growth seeming to require more space than can be afforded them, but this consideration should at once be cast aside, as they are the most tractable of plants, their keeping within certain limits or occupying a high roof being quite a matter under the control of their cultivator; it is to be feared, therefore, that they are not so much grown as they would be on account of their being not sufficiently known. As climbers or as pillar plants for cool conservatory or cold greenhouse the number of plants with showy flowers available are not large enough to allow of the *Cestrums* being disregarded, but even here their usefulness does not stop, for every year, commencing about the first week in May, and

and these and others of the genus have proved themselves hardy in many parts, not only living but coming to perfection, in spite of their being often cut down in winter, flowering and fruiting well every season. The cool conservatory, however, seems the best home for the *Cestrums*, and in it they seem to be in flower or fruit all the year round, their most showy time being in the winter, when the large Grape-like clusters of rose to crimson berries lend their cheering influence to the cool houses at Glasnevin, Chiswick, Kew, Regent's Park Botanic Garden, &c. With respect to the name *Cestrum* it is now generally admitted to be the proper one for that section denominated *Habrothamnus*, as there is no botanical difference to warrant the adoption of the latter as a generic name, indeed, if we regard the much wider differences which exist in the different species of other genera it would be something like splitting hairs to allow the name to hold good, although that section has most of the showier kinds in it, and the name—*Habros*, gay, and *thamnus*, shrub—would need but little excuse were it not that the scientific side of the question rendered it desirable that the name *Cestrum*, by right of priority, should be retained and applied to those introductions of 1842-3-4, to which the

name *Habrothamnus* was given. Further strengthening this view of the case, and connecting the rose-coloured with the old *Cestrum* that beautiful shrub, *Cestrum roseum* (H. B. K., *Nov. Gen.*, iii., 197), the subject of our illustration (fig. 36) may be cited, as it was named and described long before the name *Habrothamnus* was given, indeed, it seems to be the same plant as that grown in some gardens as *H. corymbosus*. It is a Mexican species, and with its

cases where better forms are obtained by unhybridised seeds the name of the parent will precede the distinctive title of the seminal variety.

The following selection is ranged in the order of merit as showy garden plants, commencing with the best:—

*Cestrum (Habrothamnus) Newellii*.—A garden variety, which received a First-class Certificate at the Royal Botanic Society, May 24, 1876, and a First-class Certifi-

*C. (H.) purpureum* of Van Houtte seems only to be a darker form of *C. fasciculatum*.

*C. (H.) elegans* is perhaps the most generally known, as it is one of the best of the dark rose-coloured kinds and also a good fruiter. The Glasnevin plant is marvellously beautiful with its berries hanging like bunches of small Grapes every winter.

*C. (H.) elegans variegata*.—A variety of the preceding, with prettily variegated leaves. If any have a love for variegating plants they have only to get this and graft

FIG. 37.—*CESTRUM FASCICULATUM*. (SEE P. 184.)

profusion of rosy flowers and bright coloured fruits it is one of the best of the family either for indoor or out. No one who has studied the different species of *Cestrum* can fail to come to the conclusion that many of them are seedling forms of the leading kinds only, many of the greenish flowered varieties having a strong affinity to *C. foetidissimum*, and at least three of the red ones being suspiciously near to *C. fasciculatum*. That they are liable to vary from seed is proved by that beautiful form *C. Newellii* (*Habrothamnus*), raised by Mr. Newell of Royston Hall, Downham Market, which should induce further efforts in that direction, but it is to be hoped that in all

cate at the Royal Horticultural Society, June 7, 1876. Flowers in dense sprays, bright reddish crimson, fruits crimson. Hardy in many places.

*C. (H.) roseum* (see fig. 36).—Flowers bright rose, fruits dark crimson. Hardy in mild districts.

*C. (H.) corymbosum*.—Introduced by Low of Clapton, 1843. Flowers in dense thyrses, rose coloured, very like *C. roseum*. Hardy in Ireland, Isle of Wight, &c.

*C. (H.) fasciculatum*.—This may be regarded as the type of the inflated tubed, small petalled varieties (fig. 37). It first flowered with Messrs. Lucombe, Pince & Co., of Exeter, in 1843, and proves to be one of the best and hardiest of the carmine flowered showy fruited species.

other species on it, and all the kinds may easily be variegated by the communication from the stock to the scion or *vice versa* it more convenient.

*C. (H.) Hartwegii*.—A bright rosy-crimson variety; also of the *C. fasciculatum* section.

*C. (H.) Hartwegii pubescens* differs mainly from the preceding in having the calyx softly pubescent. Flowers bright crimson. Both are lovely varieties.

*C. aurantiacum* is deservedly at the head of the true *Cestrum*s, its bright orange flowers in winter and spring are lovely, and borne in the greatest profusion. Whoever has room for a pillar or wall plant in a cold greenhouse and has not got it should get it at once. It

came from Guatemala about 1841, and is the best of the yellow flowered species.

*C. nocturnum* (see illustration *Gardeners' Chronicle*, December 15, 1883).—This is a very free-flowering species with pale greenish-yellow flowers, its chief attraction being the delicate odour which it gives off at night. It is a native of Cuba and consequently not so hardy as those previously named.

*C. fastigiatum*.—Flowers white on sprays, leaves shiny green. Very pretty when well grown. Introduced 1815.

*C. bracteatum*.—Flowers greenish-yellow with white line in the petals. Leaves lanceolate and smooth. Flowered in the Edinburgh Botanic Garden, December, 1829.

*C. alaternoides*.—Flowers greenish-yellow, produced in bunches in the axils of the leaves. Received from Trinidad and flowered in the Glasgow Botanic Gardens in 1829.

*C. latifolium*.—Flowers white. Trinidad, 1818.

*C. foetidissimum*.—This and its probable varieties placed below it should certainly be put at the bottom of the list by reason of the bad odour which they give off. They have all greenish-yellow flowers.

*C. Parqui*.—Probably a variety of the preceding.

*C. angustifolium* and *C. laurifolium* are most likely seedling forms of *C. foetidissima*.

#### PROPAGATION AND CULTURE.

With respect to the multiplication of the Cestrum little need be said, as they are as easy to increase by cutting as the Fuchsia, and require managing for that purpose in a similar manner. Any season of the year will do, but spring is the best, for at that time plenty of sufficiently hard growth cuttings, and not flowering shoots, can be obtained, which will strike readily if placed in small pots and put on a moist shelf in an intermediate-house, or under a bell-glass in a cool-house. At any season the short growths which come out from the old wood are preferable to the points, which are often flowering growth. The Cestrum are most at home planted out as trailing or pillar plants in cold conservatories, and when so grown a judicious use of the knife after flowering can restrict them to any space allotted to them and yet quantities of flower and berries may be obtained even on the smallest plants. We have also shown that many of them are hardy in milder districts, and we should therefore recommend those who have spare plants to plant them out under a south wall and carefully tend them, giving the borders a thick dressing of leaves or ashes in winter in order to help them over that season.

As pot plants the Cestrum are very beautiful, but the largest pots which can conveniently be given them should be allowed, and whilst they are making their growth a frequent soaking of weak liquid-manure works wonders in producing bloom.

As standards in pots, grown from cuttings, run up to the required height as single stems, and then allowed to make heads, they are beautiful objects when their showers of drooping heads of flowers and fruits are on them. So grown they require pruning back annually, like a standard fruit tree in a pot, and liberally watering with weak liquid-manure while growing and until the berries colour.

## Foreign Correspondence.

#### RANUNCULUS LYALLI.

DUNEDIN, NEW ZEALAND: December 5.—I enclose herewith a view of one of our New Zealand native plants, *Ranunculus Lyalli*, grown by Mr. A. C. Purdie in our University gardens here. Mr. Purdie is an enthusiast in native plants, and a frequent correspondent of [the late] Mr. Isaac A. Henry and other Edinburgh botanists. The first of these plants was brought by me to Dunedin from the MacAndrew range of mountains, altitude 3300 feet, situate on the west side of Dusky Sound, Otago, in December, 1867, just seventeen years ago. It is found in different parts of the province of Otago on mountain tops over 2000 feet in elevation, and passes among the settlers as the Shepherd's Lily; it is also plentiful on Mount Cook, and is called Mount Cook Lily by the residents around, and has been brought to Dunedin since from several of these localities. Whether this particular plant is descended from my original stock, many plants of which were raised from the seed, or from some other source, cannot be determined, and is a matter of secondary consideration.

Mr. Purdie has succeeded in producing the finest specimen I have ever seen, and it is peculiar from the

size of the flowers (nearly 4 inches diameter), the semi-double character, the substance and form of each individual petal, the number on the stalk (twelve, not all in bloom at one time), and the colour, which is a dazzling white. The plant is deficient only in the number and size of its petiole leaves. Plants hitherto cultivated with us were single, and thin in the petal, and the colour a sort of bleached white.

It is a remarkable sight to see this plant growing in its native habitat in patches, away up amidst the snows of winter, almost the only representative of vegetation—at least, such was the case when I first got it. Attempts have been made to grow it in Britain, but I am not aware if success has continued to attend them, and shall be glad to know if such is the case. *Jas. McIndoe.*

## HOME CORRESPONDENCE.

**Plants Adapted for Living Rooms.**—Though your correspondent "W. M. S." facetiously refers to a probable "Jeames" as being a member of his establishment—a fact suggestive that he may be the possessor of glass structures—we are, nevertheless, left in the dark as to whether this be the case or not; yet such a consideration has great bearing on the question at issue. With plant-houses, whether in town or country, whence relays of fresh healthy plants are obtainable periodically as needed, there is no difficulty in maintaining a perfect display with an immense variety of plants. If no plant-houses exist, the plants that are adapted for permanent indoor culture are somewhat limited in number. The following comprise some of the best Palms for this purpose:—*Latania borbonica*, *Kentia Balmoreana* and *K. australis*. Continuing to quote from your correspondent's list, *seriatim* *Anthurium* and *Pothos* are not likely to succeed; *Dracæna australis* is excellent, and a better house plant than *Cordyline indivisa* does not exist. Ferns comprise *Didymochloa trunculata*, *Pteris tremula*, *P. cretica*, *P. cretica albo-lineata*, *Platynerium alcorni*, *Asplenium flaccidum*, *Phlebodium sphaerodocarpum*, *Blechnum corcovadense*, *Cissus*, *Ivy*, and *Philodendrons* do not appear to succeed for any length of time; *Hoya carnosa*, with proper treatment, tolerably well. *Coffea arabica*, or the Coffee of commerce, is not at all adapted. *Bambusa* succeed moderately well; to ensure success, however, a very regular system of treatment must be undertaken, and all should be grown on the small shift, or small pot system. The air-warmth will suffice well; and now I will explain the regular system I suggest. Small pots are advised, both for convenience and appearance, and also because they are better for maintaining the plants in good health during the winter. As with plants maintained in health in glass structures, so also such as are in dwelling-rooms must receive their periodical "shifts" or change of soil. We may be said at this date to be commencing the year, and assuming that all such subjects are root-bound in small pots, they should be potted towards the end of the month of February. Proper soils are indispensable, and each plant must be potted firmly and neatly. Should another pottling be requisite during the year it must be given before the end of the month of July. By this means the roots will be plentifully formed before the growing season ends, so that undue root-waterings will not be needed then. Air-giving is important, and leaf sponging and syringing indispensable. The latter is easily given by taking the plants into the bath-room or pantry. During active growth, especially during the months of April, May, and June, artificial manures in liquid form are very necessary. Probably the handiest inodorous form, and one very efficient, is "Flor-vita." *William Earley, Ilford.*

**Mushrooms at High Temperatures.**—I have forwarded two samples of Mushroom, with which I intended sending a more lengthy article describing my method of culture, but as time is not at my command at present I should be glad if you would favour me with an opportunity at a future date of placing before your readers my notes as to the decided advantage of spawning at a high temperature compared with results obtained by the general rule of spawning at 80° to 85°. In sample No. 1, in which the Mushrooms are large and firm, averaging 6 inches in diameter, is seen the produce of a bed that was spawned on December 6, 1884, of 103° Fahr.
